In storage management today, breaking the cycle of increased complexity and explosive data growth can be a big challenge. The old ways of buying and managing storage have become less effective. Due to resource constraints—both physical storage resources and human resources—IT organizations must act quickly to optimize and simplify their infrastructure. Unchecked complexity and growth will only become bigger problems over time.

Small and midsize organizations also may suffer from a range of challenges:

- Disruptive migrations
- Difficulty deploying tiered storage
- Inability to share storage among servers
- Reduced productivity and increased cost caused by isolated server and storage management tools
- Inability to use virtualized storage, like virtual servers, as a tool for optimizing expenditures, resources and capabilities

To stand up to these challenges and allow businesses to respond to a rapidly changing marketplace, IBM Storwize® V7000 is a virtualized storage system to complement virtualized server environments that provides unmatched performance, availability, advanced functions, and highly scalable capacity never seen before in midrange disk systems. IBM Storwize V7000 is a powerful midrange disk system that has been designed to be easy to use and enable rapid deployment without additional resources. Storwize V7000 is virtual storage that offers greater efficiency and flexibility through built-in SSD optimization and “thin provisioning” technologies. Storwize V7000 advanced functions also
enable non-disruptive migration of data from existing storage, simplifying implementation and minimizing disruption to users. IBM Storwize V7000 also enables you to virtualize and reuse existing disk systems, supporting a greater potential return on investment (ROI).

Managing the information infrastructure
The need to increase storage efficiency has led many IT organizations to turn to consolidation, virtualization and automated tiering to reduce capital and operational expenses. IBM offers solutions today that can become part of your highly efficient, highly capable, next-generation information infrastructure, whether your storage environment supports a small or midsize organization or a large, complex data center.

Consolidation
Optimizing resources through consolidation can reduce costs and improve productivity. Consolidation also can lead to more efficient maintenance and management of your information infrastructure. By enabling you to scale storage efficiently, consolidation can deliver the capacity you need within the budget you have for the performance you want.

Virtualization
Virtualizing your storage infrastructure can optimize your expenditures, resources and capabilities. It allows you to more easily scale system capacity and performance to meet your growing information infrastructure needs, reduce the complexity of management and reduce the risk to your business of system failure. In server environments, virtualization technologies often are used to improve server utilization, reduce complexity, speed provisioning, consolidate application migration and provide improved flexibility in disaster recovery plans. Storage virtualization is designed to provide similar advantages for your storage environment. Combining storage and server virtualization can build a more powerful virtualized infrastructure for your business and provide greater benefits than either virtualization solution deployed alone.

Tiering
Tiering optimizes storage by enabling data to be located in a way that can improve system performance, reduce costs and simplify information management. Tiering can enhance performance and reduce operating expenses by automating data movement. And tiering allows you to scale storage performance based upon your business needs. Using the Easy Tier technology, you can deploy solid state drives (SSDs) confidently, effectively and economically by automatically and dynamically moving only the appropriate data to the SSDs in the system, based on ongoing performance monitoring. Such effective storage tiering enables users to enjoy the performance benefits of SSDs without requiring administrators to create and manage storage tier policies—and without the excessive costs associated with placing too much of the wrong data on these relatively expensive drives.
Introducing IBM Storwize V7000
IBM Storwize V7000 is a powerful storage system that combines hardware and software components to provide a single point of control to help support improved storage efficiency. By enabling virtualization, consolidation and tiering in midsize organizations, it is designed to improve application availability and resource utilization. The system offers easy-to-use, efficient and cost-effective management capabilities for both new and existing storage resources in your IT infrastructure.

Enhancing access with IBM System Storage Easy Tier
Easy Tier provides automatic migration of frequently accessed data to high performing solid state drives, enhancing utilization efficiencies. Operating at a fine-grained granularity, the Easy Tier function automatically repositions pieces of the data to the appropriate class of drives based on IO patterns and drive characteristics with no further administrative interaction. Easy Tier also includes the ability to manually and non-disruptively relocate full logical volumes, providing additional flexibility and control for organizations looking to more effectively align system performance with their application needs.

Easy Tier makes it easy and economical to deploy SSDs in your environment. A hybrid pool of storage capacity is created containing two tiers: SSD and HDD.

- The busiest portions of volumes are identified and automatically relocated to high-performance SSDs.
- Remaining data can take advantage of higher capacity, price-optimized drives for the best customer value.

Volumes in an SSD or HDD managed disk group are monitored and can be managed automatically or manually by moving hot extents to SSD and cold extents to HDD.

Using thin provisioning to optimize efficiency
Using thin provisioning, applications can grow dynamically, while consuming only the space they are actually using. Designed to keep business overhead low, thin provisioning optimizes efficiency by allocating disk storage space in a flexible manner among multiple users, based on the minimum space required by each user at any given time. This reduces use of storage hardware but also can save electrical energy use, lower heat generation and reduce hardware space requirements.

For example, a database might be planned to grow to 100TB but is only 10TB today. Using thin provisioning, a storage administrator can allocate 100TB of virtual capacity to meet expected future requirements while consuming only 10TB of physical capacity. As the database grows, the Storwize V7000 allocates additional physical capacity as required. This approach minimizes the amount of physical capacity consumed and helps enable a more efficient approach to storage purchases while also minimizing future configuration changes as the database grows.
Avoiding disruptions with dynamic migration

IBM Storwize V7000 uses virtualization technology to help insulate host applications from physical storage changes. This ability can help enable applications to continue to run without disruption while you make changes to your storage infrastructure. Your applications keep running so you can stay open for business.

Moving data is one of the most common causes of planned downtime. Storwize V7000 includes a dynamic data migration function that is designed to move data from existing storage into the new system or between arrays in a Storwize V7000 system, while maintaining access to the data. The data migration function might be used, for example, when replacing older storage with newer storage, as part of load balancing work or when moving data in a tiered storage infrastructure.

Using the IBM Storwize V7000 dynamic migration capabilities can provide efficiency and business value. Dynamic migration can speed time-to-value from weeks or months to days, minimize downtime for migration, eliminate the cost of add-on migration tools, and may help avoid penalties and additional maintenance charges for lease extensions. The result can be real cost savings to your business.

Protecting data with replication services

IBM Storwize V7000 includes a very rich FlashCopy function that is designed to create an almost instant copy of active data, which can be used for backup purposes or for parallel processing activities. Up to 256 copies of each volume may be created.

When combined with IBM Storwize V7000 thin provisioning, you can create copies using only a fraction of the amount of storage needed for a full physical copy. This type of copy, called a “snapshot” is designed to help improve overall storage utilization and reduce the amount of capacity required for copies.

IBM Storwize V7000 supports incremental FlashCopy operations, which improve efficiency by copying only the portions of the source or target volume that have been updated since the FlashCopy function was last used, and also “copies of copies” where one copy is itself further copied. These abilities could be used to help maintain and update a test environment based on production data.

IBM Tivoli Storage FlashCopy Manager is designed for today’s business world, where application servers are operational 24 hours a day—yet data must remain fully protected. If you have a 24×7 environment, you can’t afford to lose any data; you also can’t afford to stop critical systems for hours so you can protect the data adequately. IBM Tivoli Storage FlashCopy Manager exploits Storwize V7000 snapshot capabilities to provide high speed, low impact applications, integrated backup and restore functionality. Automated policy based management of multiple snapshot backup versions together with a simple and guided installation and configuration process provide an easy to use and quick to deploy data protection solution that enables the most stringent database recovery time requirements to be met. IBM Tivoli Storage FlashCopy Manager can help deliver the highest levels of protection for mission critical IBM DB2, SAP, Oracle, Microsoft Exchange and Microsoft SQL Server applications via integrated application-aware snapshot backup and restore capabilities. And custom application support offers the ability to extend FlashCopy Manager capabilities to any application on IBM AIX®, Linux®, and Solaris.
The Metro Mirror and Global Mirror functions operate between IBM Storwize V7000 systems at different locations to help create copies of data for use in the event of a catastrophic event at a data center. Metro Mirror is designed to maintain a fully synchronized copy at “metropolitan” distances (up to 300 km) whereas Global Mirror is designed to operate asynchronously and so helps maintain a copy at much greater distances (up to 8000 km). Both functions are designed to support VMware vCenter Site Recovery Manager to help speed disaster recovery.

IBM Tivoli Storage Manager FastBack provides an additional complementary capability to replicate highly-efficient deduplicated snapshots over TCP/IP connections to a remote FastBack Disaster Recovery hub, efficiently storing the DR snapshots on a Storwize V7000. This option helps provide a lower cost approach to delivering effective disaster recovery capability.

Leverage Proven ISV Solutions
IBM is committed to continuous improvement and seamless application integration to optimize your business results and minimize time-to-value. Our commitment is visible through ongoing work and enduring partnerships with ISVs such as Microsoft, Oracle, SAP, Symantec and VMware.

Combining the Storwize V7000 with leading ISV applications can provide increased flexibility and deliver a more robust information infrastructure for your business. Solutions have been qualified for the Storwize V7000 for select applications which focus on key solution areas including backup/restore, disaster recovery, clustering, server virtualization, and database and performance optimization. IBM is also committed to certifications with key ISVs aligned with various industries including healthcare, financial services, telecommunications, and the public sector.

Integrated management
This solution provides a tiered approach to management designed to meet the diverse needs of different organizations. The Storwize V7000 management interface is designed to give administrators intuitive control of the system. For organizations looking to manage both physical and virtual server infrastructures and the storage they consume—including provisioning and monitoring for higher availability, operational efficiency, and infrastructure planning—Storwize V7000 is integrated with IBM Systems Director Storage Control. A single administrator can manage and operate IBM servers (System x®, Power Systems™, and BladeCenter®) along with networking infrastructure and IBM Storage (including IBM Storwize V7000) from a single management screen. For organizations looking to improve the operational efficiency of storage specialists, IBM Tivoli Storage Productivity Center is designed to provide a SAN-wide perspective of storage health, I/O path performance analytics, and capacity utilization for the Storwize V7000 and the surrounding storage infrastructure.

High-performance SSD support
For applications that demand high disk speed and quick access to data, IBM provides support for solid state drives in 300 GB 2.5-inch E-MLC (enterprise-grade multilevel cell) SSDs, or up to 72 TB of physical capacity in a single system enabling scale-out high performance SSD support.

External storage virtualization
External storage virtualization is the ability of the IBM Storwize V7000 system to manage capacity in other disk systems. When Storwize V7000 virtualizes a disk system, its capacity becomes part of the Storwize V7000 system and is managed in the same way as capacity on internal drives within
the Storwize V7000. Capacity in external disk systems inherits all the functional richness and ease-of-use of the Storwize V7000 system including advanced replication, thin provisioning, and Easy Tier. Virtualizing external storage helps improve administrator productivity and boost storage utilization while also enhancing and extending the value of an existing storage asset.

**IBM Storwize V7000 system description**
The IBM Storwize V7000 storage system is packaged in 2U rack-mountable enclosures that house up to twenty-four 2.5-inch drives or up to twelve 3.5-inch drives. Control enclosures contain drives, redundant dual-active intelligent RAID controllers and dual power supplies, batteries and cooling components. Expansion enclosures contain drives, switches, power supplies and cooling components. You can attach up to nine expansion enclosures to a control enclosure, enabling the system to scale up to 240 drives. Other components and characteristics of the system include:

- **Internal storage capacity**—Up to 24 TB of physical storage per enclosure using twelve 2 TB near-line SAS disk drive modules or up to 14.4 TB of physical storage per enclosure using twenty-four 2.5-inch 600 GB SAS disk drive modules
- **Disk drives**—SAS disk drives, near-line SAS disk drives and SSDs. Intermix of these drive types within the IBM Storwize V7000 RAID controller and storage expansion enclosures add flexibility
- **Cache memory**—16 GB cache memory (8 GB per internal RAID controller) as a base feature—designed to improve performance and availability
- **Ports**—Eight 8 Gbps FC host ports (four 8 Gbps Fibre Channel ports per RAID controller) and four 1 Gbps iSCSI host ports (two 1 Gbps iSCSI host ports per RAID controller), with an RJ-45 connector for each port

IBM Storwize V7000 control and expansion enclosures are each available in two models—one with twelve 3.5” disk drive bays or one with twenty-four 2.5” disk drive bays. The system supports intermixing 12-bay or 24-bay enclosures in a single system. The expansion enclosures connect to the control enclosure using four SAS 6 Gbps disk expansion ports.

- **Control enclosure**—supporting attachment of up to nine expansion enclosures with configurations up to 240 TB physical storage capacities
- **Expansion enclosure**—packaged in a 2U rack-mountable enclosure that houses twenty-four 2.5-inch drive bays or twelve 3.5-inch drive bays and dual power supplies with cooling components. Physical storage capacity of up to 24 TB per storage expansion enclosure using twelve 3.5-inch 2 TB near-line SAS disk drive modules and up to 14.4 TB per storage expansion enclosure using twenty-four 2.5-inch 600 GB SAS disk drive modules.

**Electrical power**
- 12-bay and 24-bay control enclosures: 120 - 240 V ac, 3.8 - 9.0 A, 50/60 Hz
- 12-bay and 24-bay expansion enclosures: 100 - 240 V ac, 3.2 - 8.0 A, 50/60 Hz
**Power and cooling (typical environments)**

**Why IBM?**

The performance and availability of your storage environment can either enhance or hamper your business processes. That’s where IBM comes in. As a market leader in the storage industry, we can help you handle the challenges, whether you are a small to midsize company or an enterprise.

Innovative technology, open standards, excellent performance, a broad portfolio of proven storage software, hardware and solutions offerings—all backed by IBM with its recognized industry leadership—are just a few of the reasons you should consider IBM storage solutions, including IBM Storwize V7000.

With IBM, you get some of the best storage products, technologies, services and solutions in the industry without the complexity of dealing with different hardware and software vendors and system integrators.

IBM Maintenance and Technical Support solutions can help you get the most out of your IT investment by reducing support costs, increasing availability and simplifying management with integrated support for your multiproduct, multivendor hardware and software environment.

IBM offers tailored financing solutions to credit-qualified clients that can be customized to address your specific IT needs from great rates to flexible payment plans and loans.
For more information
To learn more about IBM Storwize V7000, please contact your IBM sales representative or IBM Business Partner, or visit the following website: ibm.com/storage/storwizev7000

Additionally, financing solutions from IBM Global Financing can enable effective cash management, protection from technology obsolescence, improved total cost of ownership and return on investment. Also, our Global Asset Recovery Services help address environmental concerns with new, more energy-efficient solutions. For more information on IBM Global Financing, visit: ibm.com/financing
