You can use the IBM-provided model profile @MDLHSS to configure this RTE or you can configure it from scratch.

## Before you begin

In the model profile, the self-describing agent feature (SDA) is enabled by default. SDA requires that a z/OS® UNIX® System Services Hierarchical File System (HFS) or zSeries File System (zFS) be created or set aside for storing the SDA data files. The file system must be mounted before the RTE is configured and it must have access to a Java™ runtime environment running under IBM®'s 31-bit or 64-bit Java™ SDK Version 5 (or higher) on an HFS or zFS file system. If you intend to leave SDA enabled, ensure that the file system is available.

## About this task

If you do not want to maintain this RTE after you have completed testing or proof of concept, you can delete the RTE or reconfigure it to a different sharing type. You can also reconfigure the monitoring server from a hub to a remote.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the RTEs that share the same global properties is stored, and provide the high-level qualifier that together with the RTE name uniquely identifies the data sets for this RTE.

## Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV: _____ / _____ /
                                HLQ of SMP/E target (TK*) datasets  -----  -----

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```
KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL: _____
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: _____
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME: _____ (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.
```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN . IDTST . PARMGEN . JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN . IDTST .

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

## RTE\_NAME

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: `%RTE_PLIB_HILEV%.%RTE_NAME%.WCONFIG(%RTE_NAME%)`.

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the primary options menu.  
The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.
```

5. Press Enter.  
The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.
```

Description	Job/Label	Status	Date
1. Set up/Refresh PARMGEN work environment.	KCIJPCFG		
2. Customize PARMGEN configuration profiles.	SYSA		
3. Create this RTE's runtime members and jobs.	\$PARSE		
4. Submit batch jobs to complete PARMGEN setup.	SUBMIT		
5. Perform post configuration steps.	POSTCFG		
R Create next RTE - Reset fields.	New RTE		

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the primary options menu.  
The first Set up PARMGEN work environment for an RTE panel is displayed.

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:      +
Specify the RTE model profile to use:
==> -----
- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSMEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=OM-----
==> /** 0 0 RTE_NAME=%RTE_NAME% SYSMEMBER=%SYSMEMBER%-----
==> /** \_~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)

```

2. To use the IBM-provided model RTE, type ? in the first field and select @MDLHSS from the list of model profiles that is displayed. When you select the model, you are returned to the set up panel. To create the RTE from scratch, leave the field blank.

3. As appropriate, specify the Install Job Generator output library and job card data.

#### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.

The **Set up PARMGEN Work Environment for an RTE (2 of 3)** panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:
  UNIT   /  STORCLAS /
  VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV: IBM.TARGET.ITM63055----- / ----- /
                  HLQ of SMP/E target (TK*) datasets ----- / -----

GBL_SYSDA_UNIT:  SYSDA___
                  Work datasets UNIT name

GBL_REGION:     OM-----
                  JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

5. Review the values on the panel and override them as necessary.

#### GBL\_TARGET\_HILEV

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

### GBL\_SYSDA\_UNIT

Specifies the non-VSAM disk UNIT for global work data sets.

### GBL\_REGION

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/ M suffix (ex.: 4096K, 0M). The default is 0M.

6. Press Enter to proceed to the next panel.

**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed. If you selected the model profile, the panel contains the values shown in the following figure. If you are configuring the RTE from scratch, the panel displays the IBM® defaults.

```
KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Sharing-w/-SMP RTE w/ Static Hub TEMS/Agents____ More:  +
RTE_TYPE:             SHARING_      (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:     _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:   _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:   _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y      (Y, N)  (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                    (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE: SMP _____ ("SMP" value or *&rte_share)
                    (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y      (Y, N)  (Is RTE updater of R0 shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: N      (Y, N)  (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y      (Y, N)  (Fold password to upper case)
RTE_SECURITY_CLASS:  _____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y      (Y, N)  (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:        HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:     __      (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:    1918_____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:      IBM_____ (1-4 char.started task prefix)
```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Note the **More: +** which indicates that there is additional content on the panel.)

7. If your environment is not SMS-managed, specify the VSAM values.

- If you are using the IBM-provided model, you do not need to make any further changes unless you want to specify values that meet site-specific requirements, such as prefixes for started tasks.
- If you are setting up the RTE from scratch, customize the following parameters as indicated:
  - **RTE\_TYPE=SHARING**
  - **RTE\_SHARE=SMP**

Optionally, you can customize the following parameters:

- **RTE\_TEMS\_NAME\_NODEID**
- **RTE\_TCP\_PORT\_NUM**
- **RTE\_VTAM\_APPLID\_PREFIX**
- **RTE\_STC\_PREFIX**
- **RTE\_X\_SECURITY\_EXIT\_LIB**

8. Press Enter to proceed to the next panel.

The **Include Products in this PARMGEN RTE** panel (KCIP@PGI) is displayed. All the products that are installed in the target libraries are listed and selected.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>                                     Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
-----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181
/ KDS Tivoli Enterprise Monitoring Server V630
/ KD4 ITCAM for SOA Agent V711
/ KD5 OMEGAMON for DB2 PE V550
/ KGW OMEGAMON for CICS TG V550

/ KRW Tape Optimizer for z/OS Agent V220
/ KS3 OMEGAMON for Storage V540
/ KYN ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

9. Select additional products, or deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
10. Review the JCL to understand what the job is doing, then submit the job and return to the Workflow - Primary Option Menu.  
The KCIJPCFG jobs submits a second job, KCIJPPRF. Wait for both jobs to complete successfully before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, and populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided as you set up the work environment. They also contain default values for all required parameters and some optional parameters. The amount of additional customization that is required depends upon how much your environment differs from the model or product-provided defaults. At a minimum, you must supply certain site-specific values. You must also enable and configure any features you want to exploit. To save time and effort, you can run the KCIJPDn jobs to automatically pre-populate the configuration files.

### About this task

If you have IBM® Discovery Library Adapter for z/OS® (DLA) installed in an LPAR that the PARMGEN configuration jobs can access, you can use the KCIJPDn jobs to automatically pre-populate the LPAR RTE user profiles for some product parameters customized in the user profiles. This reduces the time and effort in creating accurate configuration files. See [Preparing the configuration profiles by running the KCIJPDn jobs](#) for details.

In the RTE configuration profile, you might need to configure one or more of the following parameters:

- Specify the z/OS® UNIX® System Services directory to be used for SDA data (**RTE\_USS\_RTEDIR**).
- To automate APF-authorization of all generated started tasks by generating the required commands for all libraries concatenated within the STEPLIB and RKANMODL DD names of the started tasks, set **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** to Y.
- To collect historical data for display in either the Tivoli® Enterprise Portal or the OMEGAMON® Enhanced 3270 user interface, data sets are allocated to store the data. You might need to change the product-specific number of sequential files allocated to the group for each product (**Kpp\_PDS\_FILE\_COUNT**) and the product-specific number of cylinders that will be divided among the files (**Kpp\_PD\_CYL**).

The parameters discussed here are not the only parameters for which you must either accept or override the default values in the configuration profile for the runtime environment. After you set the parameters shown here, review the configuration profiles to ensure the parameter values are correct for the configuration you want. [Customizing the runtime environment configuration profile](#) discusses the values and features that are typically customized in the RTE configuration profile.

In the global configuration profile, you must provide a site-appropriate value for the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

### Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDn job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDn jobs, see [Preparing the configuration profiles by running the KCIJPDn jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
4. Select 2 to edit the \$GBL\$USR global profile.

### What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

- From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name  Status    Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

- Select option 1 to submit the composite job. The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
- If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - Type 1s in pane KCIP@PR1, and then go through the validation report.
  - Correct the parameter values.
  - Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

- From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

Quick Configuration Mode

GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME: SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
Enter n (1-5) to perform tasks.
Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status    Date
-----
1. Set up/Refresh PARMGEN work environment.    KCIJPCFG
2. Customize PARMGEN configuration profiles.   SYSA
3. Create this RTE's runtime members and jobs. $PARSE     Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT     Enter 4 for details.
5. Perform post configuration steps.          POSTCFG
R Create next RTE - Reset fields.             New RTE
Press F1=Help for more information. Type U or UTIL to access utility menu.
```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>
```

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.  
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.  
Enter ns (1s-12s) for detailed job/task status.

Description	REQ	Job Name	Status	Date
1. Composite SUBMIT job (See JCL comments) ** or **		KCIJPSUB		More: +
2. Allocate runtime RO and RW datasets	(Yes)	KCIJPALO		
3. Copy SMP/E mbrs from TK*->RK* RO libs	(Yes)	KCIJPLOD		
4. Run product security steps	(Yes)	KCIJPSEC		
5. Update variable-named runtime mbrs	(No )	KCIJPUPV		
6. (Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7. Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8. Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9. Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10. Verify the configuration jobs	(Tip)	KCIJPIVP		
11. Back-up RK* product execution user libs	(Tip)	KCIJPCPR		
12. Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

Press F1=Help for more information. Type UTIL to access utility menu.

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. Any job marked as REQ AUTH/Yes, require authorization to run. In the case of job 8, "Copy runtime mbrs to system libs," authority is required to update system libraries. If you don't have that authority you can have someone else submit the job or you can create your own version of the system libraries: PROCLIB for started tasks, VTAMLIST for major nodes, and VTAMLIB for the LU62 table. Other jobs, such as z/OS® UNIX® System Services system setup, might also require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

Make sure all jobs listed as "REQ=(YES)" run to proper conclusion.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)
- The *Planning and Configuration Guide* for each product.

## Scenario QCF12: Creating a sharing-with-base runtime environment with a hub monitoring server

A sharing-with-base runtime environment (RTE) shares its read-only runtime libraries with other RTEs. The configuration software automatically creates the base RTE when you configure the first RTE that shares it. Sharing RTEs configured subsequently can then reference that base RTE.

### About this task

It is recommended that you configure the RTE by using the IBM-provided model.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV:  _____ /  _____ /
                   HLQ of SMP/E target (TK*) datasets  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.    SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.           POSTCFG
R   Create next RTE - Reset fields.            New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYJOBNAME=%SYJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. Choose a method to create the RTE

- To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select **@MDLHSB** from the presented list of models and press Enter. The configuration software then populates the field with the fully-qualified name for the RTE.
  - To create an RTE from scratch, leave the field blank.
3. As appropriate, specify the job card data.

**Jobcard data**

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.  
 The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>

                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      DEMO

Enter parameter values appropriate for your environment:
  UNIT   /  STORCLAS /
  VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: TDITNT.DEV.ITM63053_____ / _____ /
                  HLQ of SMP/E target (TK*) datasets  ----- / ----- /

GBL_SYSDA_UNIT:  SYSDA___
                  Work datasets UNIT name

GBL_REGION:     0M_____
                  JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.
  
```

5. Review the values on the panel and override them as necessary.

**GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/ M suffix (ex.: 4096K, 0M). The default is 0M.

6. Press Enter to proceed to the next panel.  
**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed with pre-defined values according to the model you selected.

- RTE\_VTAM\_APPLID\_PREFIX
- RTE\_STC\_PREFIX
- RTE\_X\_SECURITY\_EXIT\_LIB
- RTE\_SECURITY\_CLASS

8. Press Enter to proceed to the next panel.

The **Include (Configure) Product(s) in this LPAR RTE** panel (KCIP@PGI) is displayed. All the products that are installed in the target libraries are listed and selected.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>                               Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
  -----
 / KAH System Automation Monitoring Agent V350
 / KC5 OMEGAMON for CICS V550
 / KDO Tivoli Decision Support for z/OS Agent V181
 / KDS Tivoli Enterprise Monitoring Server V630
 / KD4 ITCAM for SOA Agent V711
 / KD5 OMEGAMON for DB2 PE V550
 / KGW OMEGAMON for CICS TG V550
 / KI5 OMEGAMON for IMS V550
 / KJJ OMEGAMON for JVM V540
 / KMQ OMEGAMON for Messaging - MQ V750
 / KM5 OMEGAMON for z/OS V550
 / KNA NetView for z/OS Agent V621

 / KQI OMEGAMON for Messaging - Integration Bus V750
 / KRG Advanced Audit for DFSMSShm Agent V260
 / KRH Advanced Reporting and Management for DFSMSShm Agent V260
 / KRJ Advanced Allocation Management Agent V330
 / KRK Automated Tape Allocation Manager for z/OS Agent V330
 / KRN Advanced Catalog Management Agent V260
 / KRV Advanced Backup and Recovery for z/OS Agent V240
 / KRW Tape Optimizer for z/OS Agent V220
 / KS3 OMEGAMON for Storage V540
 / KYN ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

9. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
10. Review the JCL to understand what the job is doing, then submit the job.  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPPIPE and SNA defaults, and the like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the Command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLn jobs, see [Preparing the configuration profiles by running the KCIJPDLn jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
  - If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.
  - If one or more of the following products are configured in this RTE, see [Configure OMEGAMON monitoring agents and other components](#) for the parameters that you must configure at a minimum.
    - OMEGAMON® AI for Db2
    - OMEGAMON for IMS on z/OS
    - OMEGAMON for Networks
  - You can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).
4. Select 2 to edit the \$GBL\$USR global profile.  
At a minimum, if you enabled SDA, you must provide a value to the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

      Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles. KCIJPUP1

1. Create runtime members/jobs in all WK* libs. $PARSE

Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KCIQPGB  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

       Description                               Job/Label  Status      Date
       -----
1.  Set up/Refresh PARMGEN work environment.     KCIJPCFG
2.  Customize PARMGEN configuration profiles.    SYSA
3.  Create this RTE's runtime members and jobs.  $PARSE    Enter 3 for details.
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT    Enter 4 for details.
5.  Perform post configuration steps.           POSTCFG
R   Create next RTE - Reset fields.             New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>
```

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.  
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.  
Enter ns (1s-12s) for detailed job/task status.

	Description	REQ	Job Name	Status	Date
				More:	+
1.	Composite SUBMIT job (See JCL comments)		KCIJPSUB		
	** OR **				
2.	Allocate runtime RO and RW datasets	(Yes)	KCIJPALO		
3.	Copy SMP/E mbrs from TK*->RK* RO libs	(Yes)	KCIJPLOD		
4.	Run product security steps	(Yes)	KCIJPSEC		
5.	Update variable-named runtime mbrs	(No )	KCIJPUPV		
6.	(Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7.	Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8.	Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9.	Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10.	Verify the configuration jobs	(Tip)	KCIJPIVP		
11.	Back-up RK* product execution user libs	(Tip)	KCIJPCPR		
12.	Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

Press F1=Help for more information. Type UTIL to access utility menu.

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

### What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)
- The *Planning and Configuration Guide* for each product.

## Scenario QCF13: Creating a full runtime environment with agents only and variables enabled

There is no TEMS configured in this local RTE because this RTE model assumes that a TEMS (Hub or Remote TEMS) is already deployed in another RTE (if the TEMS is running on z/OS platform), or is already deployed in another non-z/OS platform (z/Linux, Windows, or AIX machines). By using variables in the new RTE, you can quickly reconfigure operational values without recreating the RTE, or clone the RTE and transport it to other LPARs.

### About this task

It is recommended that you configure the RTE by using the IBM-provided model.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV:  _____ /  _____ /
                   HLQ of SMP/E target (TK*) datasets  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.    SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.           POSTCFG
R   Create next RTE - Reset fields.            New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:    +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYJOBNAME=%SYJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. Choose a method to create the RTE

- To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select **\$MDLAFV** from the presented list of models and press Enter. The configuration software then populates the field with the fully-qualified name for the RTE.
  - To create an RTE from scratch, leave the field blank.
3. As appropriate, specify the job card data.

#### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.  
The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```
KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>

                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      DEMO

Enter parameter values appropriate for your environment:
  UNIT   /  STORCLAS /
  VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: TDITNT.DEV.ITM63053_____ / _____ /
                  HLQ of SMP/E target (TK*) datasets  ----- / ----- /

GBL_SYSDA_UNIT:  SYSDA___
                  Work datasets UNIT name

GBL_REGION:      0M_____
                  JCL REGION (specify K/M suffix)
```

Note: Type BACK to go back one panel. Type UTIL to access utility menu.

5. Review the values on the panel and override them as necessary.

#### GBL\_TARGET\_HILEV

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

#### GBL\_SYSDA\_UNIT

Specifies the non-VSAM disk UNIT for global work data sets.

#### GBL\_REGION

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, 0M). The default is 0M.

6. Press Enter to proceed to the next panel.  
**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed with pre-defined values according to the model you selected.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Full RTE w/ Agents only-no local TEMS w/ vars.____
More:                +

RTE_TYPE:             FULL_____ (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_____ (ex.: TDITN.IDTST
                        (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
                        (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:      _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:    _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:    _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                        (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
                        (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y (Y, N) (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: Y (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   &OMEGSAF._____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.CDLID.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: N (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:        HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:     __ (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:     &RTE_PORT._____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: K&SYSCLONE._____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:       IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is additional content on the panel.)

7. Modify the values in the panel based on the RTE that you are creating.
  - If your environment is not SMS-managed, specify the VSAM values.
  - Provide values to parameters that are required by the RTE:
    - If you are following the IBM-provided model, no further change is required.
    - If you are creating the RTE from scratch, provide values for the following parameters:
      - **RTE\_TYPE=FULL**
      - **RTE\_SYSV\_SYSVAR\_FLAG=Y**
      - **RTE\_TEMS\_CONFIGURED\_FLAG=N**

**Note:** **RTE\_TEMS\_CONFIGURED\_FLAG=N** means there is no TEMS configured in the RTE, and KDS\* parameters are ignored.

- You can change the following parameters to meet site-specific requirements:
    - RTE\_TEMS\_NAME\_NODEID
    - RTE\_TCP\_PORT\_NUM
    - RTE\_VTAM\_APPLID\_PREFIX
    - RTE\_STC\_PREFIX
    - RTE\_X\_SECURITY\_EXIT\_LIB
    - RTE\_SECURITY\_CLASS
8. Press Enter to proceed to the next panel.  
The **Include (Configure) Product(s) in this LPAR RTE** panel (KCIP@PGI) is displayed. All the products that are installed in the target libraries are listed and selected except for KDS.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)

Kpp Component or Product Name and Version
-----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181

/ KYN ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

9. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
10. Review the JCL to understand what the job is doing, then submit the job.  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPIPE and SNA defaults, and the

like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

## About this task

The RTE profile inherits the symbolics specified on the KCIP@PG3 panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, &SYSNAME.), except for the **RTE\_NAMESV** parameter instance. You can assign symbolics to additional parameters, but see [“Parameters ineligible to use variables” on page 1248](#) for parameters that must be excluded from use of symbolics. You must also edit the variables profile to set the resolution value of the symbolic assigned to the RTE name.

If you assign symbolics in either the RTE or the global configuration profile to parameters that are concatenated in or part of started task procedures, you must follow the MVS™ rules governing the use of symbolics in started task procedures and JCL. In the RTE profile, these are the following parameters:

- **RTE\_NAME**
- **RTE\_HILEV**
- **RTE\_VSAM\_HILEV**
- **RTE\_X\_HILEV\_SHARING**
- **RTE\_SHARE**
- **Kpp\_\*\_VTAM\_APPL\_\***

In the global profiles, these are the following parameters:

- **GBL\_DSN\_DB2\_\***
- **GBL\_DSN\_IMS\_\***
- **GBL\_DSN\_CICS\_CTG\_DLL**
- **GBL\_DSN\_WMQ\_\***
- **GBL\_DSN\_CSF\_SCSFMODE0**
- **GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA**

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLa job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
  - Configure the components in this RTE to connect to a TEMS. Provide values to the following parameters to specify the communication protocols, ports, TEMS host, TEMS node, TEMS VTAM, and agent's local VTAM and logon information.
    - **Kpp\_AGT\_COMM\_PROTOCOLn**: Specify the communication protocols in priority sequence, for example, IPPIPE, and SNA.
    - **Kpp\_TEMS\_TCP\_PIPE\_PORT\_NUM**: Specify protocol port numbers for the agents to connect to TEMS.
    - **Kpp\_TEMS\_LOCAL\_CONNECT\_FLAG**: Because the primary TEMS that this agents connect to is configured on another RTE, or running on a non-z/OS platform, specify N to this parameter.
    - **Kpp\_TEMS\_NAME\_NODEID**: Specify the node ID of the non-local primary TEMS that the agents connect to, for example, SYSA:CMS.
    - **Kpp\_TEMS\_TCP\_HOST**: Specify the host of the TEMS that the agents connect to, for example, SYSA.
    - **Kpp\_AGT\_TCP\_HOST**: Specify the agent local TCP/IP information.

- **Kpp\_TEMS\_VTAM\_\***: Specify the primary TEMS VTAM information.
  - **Kpp\_AGT\_VTAM\_\***: Specify the agent's local VTAM information and APPLIDs.
  - If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.
  - If one or more of the following products are configured in this RTE, see [Configure OMEGAMON monitoring agents and other components](#) for the parameters that you must configure at a minimum.
    - OMEGAMON® AI for Db2
    - OMEGAMON for IMS on z/OS
    - OMEGAMON for Networks
  - You can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).
4. Select 2 to edit the \$GBL\$USR global profile.  
At a minimum, if you enabled SDA, you must provide a value to the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.
  5. Select 3 to edit the variables profile.  
Provide values for any user-defined variables that you add, any variables that whose values differ from the IBM-provided default resolution values, and any variables whose values cannot be automatically discovered from the system IPL PARMLIB data set. See [Customizing the variables profile](#) for more information on customizing variables.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

      Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles. KCIJPUP1

1. Create runtime members/jobs in all WK* libs. $PARSE

Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job.

The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.

3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```
KCIQPGB  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE    Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT    Enter 4 for details.
5. Perform post configuration steps.          POSTCFG
R Create next RTE - Reset fields.            New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.
```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
   ** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs    (Yes) KCIJPLOD
4. Run product security steps               (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files     (Yes) KCIJPUSF
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps   (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

More: +

Press F1=Help for more information.  Type UTIL to access utility menu.
```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

2. Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

3. If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.

For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)
- The *Planning and Configuration Guide* for each product.

## Scenario QCF14: Creating a full runtime environment with agents only

There is no TEMS configured in this local RTE because this RTE model assumes that a TEMS (Hub or Remote TEMS) is already deployed in another RTE (if the TEMS is running on z/OS platform), or is already deployed in another non-z/OS platform (z/Linux, Windows, or AIX machines). You can use an IBM-provided model to create the RTE and do minimal customization to get up and running, or create the RTE from scratch and customize to your exact requirements.

### About this task

It is recommended that you configure the RTE by using the IBM-provided model.

### Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```

KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM

```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```

KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV: _____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:

```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.    SYSA
3.  Create this RTE's runtime members and jobs.  $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.           POSTCFG
R   Create next RTE - Reset fields.           New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYJOBNAME=%SYJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. Choose a method to create the RTE

- To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select **@MDLAF** from the presented list of models and press Enter. The configuration software then populates the field with the fully-qualified name for the RTE.
  - To create an RTE from scratch, leave the field blank.
3. As appropriate, specify the job card data.

#### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.  
The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```
KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>

                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      DEMO

Enter parameter values appropriate for your environment:
  UNIT   /  STORCLAS /
  VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: TDITNT.DEV.ITM63053_____ / _____ /
                  HLQ of SMP/E target (TK*) datasets  ----- / ----- /

GBL_SYSDA_UNIT:  SYSDA___
                  Work datasets UNIT name

GBL_REGION:      0M_____
                  JCL REGION (specify K/M suffix)
```

Note: Type BACK to go back one panel. Type UTIL to access utility menu.

5. Review the values on the panel and override them as necessary.

#### GBL\_TARGET\_HILEV

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

#### GBL\_SYSDA\_UNIT

Specifies the non-VSAM disk UNIT for global work data sets.

#### GBL\_REGION

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, 0M). The default is 0M.

6. Press Enter to proceed to the next panel.  
**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed with pre-defined values according to the model you selected.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Full RTE w/ Agents only-no local TEMS_____
  More:      +
RTE_TYPE:             FULL_____ (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:     _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:   _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:   _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                    (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
                    (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y (Y, N) (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: N (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   _____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.CDLID.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: N (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:        HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:     -- (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:    1918_____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:      IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is additional content on the panel.)

7. Modify the values in the panel based on the RTE that you are creating.
  - If your environment is not SMS-managed, specify the VSAM values.
  - Provide values to parameters that are required by the RTE:
    - If you are following the IBM-provided model, no further change is required.
    - If you are creating the RTE from scratch, provide values for the following parameters:
      - **RTE\_TYPE=FULL**
      - **RTE\_TEMS\_CONFIGURED\_FLAG=N**

**Note:** **RTE\_TEMS\_CONFIGURED\_FLAG=N** means there is no TEMS configured in the RTE, and KDS\* parameters are ignored.

- You can change the following parameters to meet site-specific requirements:

- RTE\_TEMS\_NAME\_NODEID
- RTE\_TCP\_PORT\_NUM
- RTE\_VTAM\_APPLID\_PREFIX
- RTE\_STC\_PREFIX
- RTE\_X\_SECURITY\_EXIT\_LIB
- RTE\_SECURITY\_CLASS

8. Press Enter to proceed to the next panel.

The **Include (Configure) Product(s) in this LPAR RTE** panel (KCIP@PGI) is displayed. Except for KDS, KM5, and KS3, all the products that are installed in the target libraries are listed and selected.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)

End of data
```

9. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
10. Review the JCL to understand what the job is doing, then submit the job.  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPIPE and SNA defaults, and the

like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
  - Configure the components in this RTE to connect to a TEMS. Provide values to the following parameters to specify the communication protocols, ports, TEMS host, TEMS node, TEMS VTAM, and agent's local VTAM and logon information.
    - **Kpp\_AGT\_COMM\_PROTOCOLn**: Specify the communication protocols in priority sequence, for example, IPPIPE, and SNA.
    - **Kpp\_TEMS\_TCP\_PIPE\_PORT\_NUM**: Specify protocol port numbers for the agents to connect to TEMS.
    - **Kpp\_TEMS\_LOCAL\_CONNECT\_FLAG**: Because the primary TEMS that this agents connect to is configured on another RTE, or running on a non-z/OS platform, specify N to this parameter.
    - **Kpp\_TEMS\_NAME\_NODEID**: Specify the node ID of the non-local primary TEMS that the agents connect to, for example, SYSA:CMS.
    - **Kpp\_TEMS\_TCP\_HOST**: Specify the host of the TEMS that the agents connect to, for example, SYSA.
    - **Kpp\_AGT\_TCP\_HOST**: Specify the agent local TCP/IP information.
    - **Kpp\_TEMS\_VTAM\_\***: Specify the primary TEMS VTAM information.
    - **Kpp\_AGT\_VTAM\_\***: Specify the agent's local VTAM information and APPLIDs.
  - If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.
  - If one or more of the following products are configured in this RTE, see [Configure OMEGAMON monitoring agents and other components](#) for the parameters that you must configure at a minimum.
    - OMEGAMON® AI for Db2
    - OMEGAMON for IMS on z/OS
    - OMEGAMON for Networks
  - You can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).
4. Select 2 to edit the \$GBL\$USR global profile.  
At a minimum, if you enabled SDA, you must provide a value to the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
   reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
   WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

      Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles. KCIJPUP1
1. Create runtime members/jobs in all WK* libs. $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KICIPQGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

                Description                               Job/Label  Status      Date
-----
1.  Set up/Refresh PARMGEN work environment.             KCIJPCFG
2.  Customize PARMGEN configuration profiles.            SYSA
3.  Create this RTE's runtime members and jobs.          $PARSE     Enter 3 for details.
4.  Submit batch jobs to complete PARMGEN setup.         SUBMIT     Enter 4 for details.
5.  Perform post configuration steps.                    POSTCFG
R   Create next RTE - Reset fields.                     New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KICIP@SUB) is displayed.

```

KICIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

                Description                               REQ  Job Name  Status      Date
-----
1.  Composite SUBMIT job (See JCL comments)             KCIJPSUB
    ** OR **
2.  Allocate runtime RO and RW datasets                 (Yes) KCIJPALO
3.  Copy SMP/E mbrs from TK*->RK* RO libs              (Yes) KCIJPLOD
4.  Run product security steps                         (Yes) KCIJPSEC
5.  Update variable-named runtime mbrs                 (No ) KCIJPUPV
6.  (Re)Create USS runtime mbrs in RKANDATV            (Yes) KCIJPUSP
7.  Create USS dirs./ (Re)Copy USS files               (Yes) KCIJPUSS
8.  Copy runtime mbrs to SYS1-type libs (Caution)     KCIJPSYS
9.  Run post-SMP/E RKANMODU ASM/LINK steps             (Yes) KCIJPLNK
10. Verify the configuration jobs                      (Tip) KCIJPIVP
11. Back-up RK* product execution user libs           (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs           (Yes) Enter 12 for details.

                More:      +

Press F1=Help for more information.  Type UTIL to access utility menu.

```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)

- The *Planning and Configuration Guide* for each product.

## Scenario QCF15: Creating a sharing-with-base runtime environment with agents only and variables enabled

A sharing-with-base runtime environment (RTE) shares its read-only runtime libraries with other RTEs. The configuration software automatically creates the base RTE when you configure the first RTE that shares it. Sharing RTEs configured subsequently can then reference that base RTE. There is no TEMS configured in this local RTE because this RTE model assumes that a TEMS (Hub or Remote TEMS) is already deployed in another RTE (if the TEMS is running on z/OS platform), or is already deployed in another non-z/OS platform (z/Linux, Windows, or AIX machines). By using variables in the new RTE, you can quickly reconfigure operational values without recreating the RTE, or clone the RTE and transport it to other LPARs.

### About this task

It is recommended that you configure the RTE by using the IBM-provided model.

### Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
                z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>
```

PARMGEN stores configuration values in the TSO user's ISPF profile. If this is the first-time your TDITNT TSO user ID is invoking PARMGEN, enter the GBL\_TARGET\_HILEV-related values appropriate for your deployment:

```

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: _____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  ----- / ----- /

```

**Note:**

If this is not the first time your TDITNT ID is invoking PARMGEN, this panel is also presented if the GBL\_TARGET\_HILEV stored value changed from the last time you invoked PARMGEN. Verify GBL\_TARGET\_HILEV, UNIT, VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:

```

GBL_USER_JCL:
RTE_PLIB_HILEV:
RTE_NAME:
Last GBL_TARGET_HILEV:

```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```
KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>
```

Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

```

GBL_USER_JCL: _____
                (For example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

```

```

RTE_PLIB_HILEV: _____
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

```

```

RTE_NAME: _____ (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

**GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN . IDTST . PARMGEN . JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

**RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN . IDTST .

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

## RTE\_NAME

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
You have asked to configure a new RTE profile.  
  
Proceed to configure a new RTE profile.  
  
Press ENTER to continue. Press F3 to abort.
```

5. Press Enter. The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----  
Option ==>  
  
Quick Configuration Mode  
  
GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL  
RTE_PLIB_HILEV: TDITN.IDTST  
RTE_NAME: SYSA  
  
Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.  
If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.  
Enter n (1-5) to perform tasks.  
Enter ns (1s-5s) for detailed job/task status.
```

	Description	Job/Label	Status	Date
1.	Set up/Refresh PARMGEN work environment.	KCIJPCFG		
2.	Customize PARMGEN configuration profiles.	SYSA		
3.	Create this RTE's runtime members and jobs.	\$PARSE		
4.	Submit batch jobs to complete PARMGEN setup.	SUBMIT		
5.	Perform post configuration steps.	POSTCFG		
R	Create next RTE - Reset fields.	New RTE		

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>

                                Quick Configuration Mode

                                More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSMEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=OM-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSMEMBER=%SYSMEMBER%-----
==> /*** \_~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
(Type ? for last referenced JOBGEN library discovered, if any.)

```

2. Choose a method to create the RTE:

- To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select **\$MDLASBV** from the presented list of models and press Enter. The configuration software then populates the field with the fully-qualified name for the RTE.
- To create an RTE from scratch, leave the field blank.

3. As appropriate, specify the job card data.

**Jobcard data**

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.

The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      DEMO

Enter parameter values appropriate for your environment:

                                UNIT   /  STORCLAS /
                                VOLSER /  MGMTCLAS /
GBL_TARGET_HILEV: TDITNT.DEV.ITM63053_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  ----- / ----- /

GBL_SYSDA_UNIT:   SYSDA___
                   Work datasets UNIT name

GBL_REGION:      OM_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

- Review the values on the panel and override them as necessary.

**GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=OM value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, OM). The default is OM.

- Press Enter to proceed to the next panel.

**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed with pre-defined values according to the model you selected.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Sharing-w/-Base RTE Agents-no local TEMS w/vars.
  More:      +
RTE_TYPE:             SHARING_          (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:      _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:    _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:    _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y   (Y, N)   (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                    (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
                    (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y   (Y, N)   (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: Y   (Y, N)   (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y   (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   &OMEGSAF._____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.CDLID.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: N   (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:         HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:      --   (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:     &RTE_PORT._____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: K&SYSCLONE._____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:       IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is additional content on the panel.)

7. Modify the values in the panel based on the RTE that you are creating.
  - If your environment is not SMS-managed, specify the VSAM values.
  - Provide values to parameters that are required by the RTE:
    - If you are following the IBM-provided model, provide value for the following parameter:
      - **RTE\_X\_HILEV\_SHARING**
    - If you are creating the RTE from scratch, provide values for the following parameters:
      - **RTE\_TYPE=SHARING**
      - **RTE\_SYSV\_SYSVAR\_FLAG=Y**
      - **RTE\_X\_HILEV\_SHARING=base\_rte\_hlq**
      - **RTE\_TEMS\_CONFIGURED\_FLAG=N**

**Note:** RTE\_TEMS\_CONFIGURED\_FLAG=N means there is no TEMS configured in the RTE, and KDS\* parameters are ignored.

- You can change the following parameters to meet site-specific requirements:
    - RTE\_TEMS\_NAME\_NODEID
    - RTE\_TCP\_PORT\_NUM
    - RTE\_VTAM\_APPLID\_PREFIX
    - RTE\_STC\_PREFIX
    - RTE\_X\_SECURITY\_EXIT\_LIB
    - RTE\_SECURITY\_CLASS
8. Press Enter to proceed to the next panel.  
The **Include (Configure) Product(s) in this LPAR RTE** panel (KCIP@PGI) is displayed. Except for KDS, KM5, and KS3, all the products that are installed in the target libraries are listed and selected.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
  -----

End of data
```

9. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
10. Review the JCL to understand what the job is doing, then submit the job.  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPIPE and SNA defaults, and the like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

### About this task

The RTE profile inherits the symbolics specified on the KCIP@PG3 panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, &SYSNAME.), except for the **RTE\_NAMESV** parameter instance. You can assign symbolics to additional parameters, but see [“Parameters ineligible to use variables” on page 1248](#) for parameters that must be excluded from use of symbolics. You must also edit the variables profile to set the resolution value of the symbolic assigned to the RTE name.

If you assign symbolics in either the RTE or the global configuration profile to parameters that are concatenated in or part of started task procedures, you must follow the MVS™ rules governing the use of symbolics in started task procedures and JCL. In the RTE profile, these are the following parameters:

- **RTE\_NAME**
- **RTE\_HILEV**
- **RTE\_VSAM\_HILEV**
- **RTE\_X\_HILEV\_SHARING**
- **RTE\_SHARE**
- **Kpp\_\*\_VTAM\_APPL\_\***

In the global profiles, these are the following parameters:

- **GBL\_DSN\_DB2\_\***
- **GBL\_DSN\_IMS\_\***
- **GBL\_DSN\_CICS\_CTG\_DLL**
- **GBL\_DSN\_WMQ\_\***
- **GBL\_DSN\_CSF\_SCSFMODE**
- **GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA**

### Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
  - Configure the components in this RTE to connect to a TEMS. Provide values to the following parameters to specify the communication protocols, ports, TEMS host, TEMS node, TEMS VTAM, and agent's local VTAM and logon information.
    - **Kpp\_AGT\_COMM\_PROTOCOLn**: Specify the communication protocols in priority sequence, for example, IPPIPE, and SNA.
    - **Kpp\_TEMS\_TCP\_PIPE\_PORT\_NUM**: Specify protocol port numbers for the agents to connect to TEMS.
    - **Kpp\_TEMS\_LOCAL\_CONNECT\_FLAG**: Because the primary TEMS that this agents connect to is configured on another RTE, or running on a non-z/OS platform, specify N to this parameter.

- **Kpp\_TEMS\_NAME\_NODEID**: Specify the node ID of the non-local primary TEMS that the agents connect to, for example, SYSA:CMS.
  - **Kpp\_TEMS\_TCP\_HOST**: Specify the host of the TEMS that the agents connect to, for example, SYSA.
  - **Kpp\_AGT\_TCP\_HOST**: Specify the agent local TCP/IP information.
  - **Kpp\_TEMS\_VTAM\_\***: Specify the primary TEMS VTAM information.
  - **Kpp\_AGT\_VTAM\_\***: Specify the agent's local VTAM information and APPLIDs.
- If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.
  - If one or more of the following products are configured in this RTE, see [Configure OMEGAMON monitoring agents and other components](#) for the parameters that you must configure at a minimum.
    - OMEGAMON® AI for Db2
    - OMEGAMON for IMS on z/OS
    - OMEGAMON for Networks
  - You can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).
4. Select 2 to edit the \$GBL\$USR global profile.  
At a minimum, if you enabled SDA, you must provide a value to the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.
  5. Select 3 to edit the variables profile.  
Provide values for any user-defined variables that you add, any variables that whose values differ from the IBM-provided default resolution values, and any variables whose values cannot be automatically discovered from the system IPL PARMLIB data set. See [Customizing the variables profile](#) for more information on customizing variables.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```

KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1

1. Create runtime members/jobs in all WK* libs.  $PARSE

Press F1=Help for more information. Type UTIL to access utility menu.

```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

Quick Configuration Mode

GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME: SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
Enter n (1-5) to perform tasks.
Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status   Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5. Perform post configuration steps.         POSTCFG
R Create next RTE - Reset fields.           New RTE

Press F1=Help for more information. Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>
```

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.  
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.  
Enter ns (1s-12s) for detailed job/task status.

	Description	REQ	Job Name	Status	Date
				More:	+
1.	Composite SUBMIT job (See JCL comments) ** or **		KCIJPSUB		
2.	Allocate runtime RO and RW datasets	(Yes)	KCIJPALO		
3.	Copy SMP/E mbrs from TK*->RK* RO libs	(Yes)	KCIJPLOD		
4.	Run product security steps	(Yes)	KCIJPSEC		
5.	Update variable-named runtime mbrs	(No )	KCIJPUPV		
6.	(Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7.	Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8.	Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9.	Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10.	Verify the configuration jobs	(Tip)	KCIJPIVP		
11.	Back-up RK* product execution user libs	(Tip)	KCIJPCPR		
12.	Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

Press F1=Help for more information. Type UTIL to access utility menu.

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

### What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)
- The *Planning and Configuration Guide* for each product.

## Scenario QCF16: Creating a Sharing-with-base runtime environment with agents only

A sharing-with-base runtime environment (RTE) shares its read-only runtime libraries with other RTEs. The configuration software automatically creates the base RTE when you configure the first RTE that shares it. Sharing RTEs configured subsequently can then reference that base RTE. There is no TEMS configured in this local RTE because this RTE model assumes that a TEMS (Hub or Remote TEMS) is already deployed in another RTE (if the TEMS is running on z/OS platform), or is already deployed in another non-z/OS platform (z/Linux, Windows, or AIX machines).

### About this task

It is recommended that you configure the RTE by using the IBM-provided model.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV:  _____ /  _____ /
                   HLQ of SMP/E target (TK*) datasets  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.    SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.           POSTCFG
R   Create next RTE - Reset fields.            New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYJSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. Choose a method to create the RTE

- To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select **@MDLASB** from the presented list of models and press Enter. The configuration software then populates the field with the fully-qualified name for the RTE.
  - To create an RTE from scratch, leave the field blank.
3. As appropriate, specify the job card data.

#### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.  
The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```
KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>

                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      DEMO

Enter parameter values appropriate for your environment:
  UNIT   /  STORCLAS /
  VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: TDITNT.DEV.ITM63053_____ / _____ /
                  HLQ of SMP/E target (TK*) datasets  ----- / ----- /

GBL_SYSDA_UNIT:  SYSDA___
                  Work datasets UNIT name

GBL_REGION:     0M_____
                  JCL REGION (specify K/M suffix)
```

Note: Type BACK to go back one panel. Type UTIL to access utility menu.

5. Review the values on the panel and override them as necessary.

#### GBL\_TARGET\_HILEV

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

#### GBL\_SYSDA\_UNIT

Specifies the non-VSAM disk UNIT for global work data sets.

#### GBL\_REGION

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, 0M). The default is 0M.

6. Press Enter to proceed to the next panel.  
**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed with pre-defined values according to the model you selected.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Sharing-w/-Base RTE w/ Agents only-no local TEMS
  More:      +
RTE_TYPE:             SHARING_          (Full, Sharing)

RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:          HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:      --          (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:      1918_____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:        IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is additional content on the panel.)

7. Modify the values in the panel based on the RTE that you are creating.
  - If your environment is not SMS-managed, specify the VSAM values.
  - Provide values to parameters that are required by the RTE:
    - If you are following the IBM-provided model, provide value for the following parameter:
      - **RTE\_X\_HILEV\_SHARING**
    - If you are creating the RTE from scratch, provide values for the following parameters:
      - **RTE\_TYPE=SHARING**
      - **RTE\_SYSV\_SYSVAR\_FLAG=N**
      - **RTE\_X\_HILEV\_SHARING=base\_rte\_hlq**
      - **RTE\_TEMS\_CONFIGURED\_FLAG=N**

**Note:** RTE\_TEMS\_CONFIGURED\_FLAG=N means there is no TEMS configured in the RTE, and KDS\* parameters are ignored.

- You can change the following parameters to meet site-specific requirements:
    - RTE\_TEMS\_NAME\_NODEID
    - RTE\_TCP\_PORT\_NUM
    - RTE\_VTAM\_APPLID\_PREFIX
    - RTE\_STC\_PREFIX
    - RTE\_X\_SECURITY\_EXIT\_LIB
    - RTE\_SECURITY\_CLASS
8. Press Enter to proceed to the next panel.  
The **Include (Configure) Product(s) in this LPAR RTE** panel (KCIP@PGI) is displayed. All the products that are installed in the target libraries are listed and selected except for KDS.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
  -----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181
_ KDS Tivoli Enterprise Monitoring Server V630
/ KD4 ITCAM for SOA Agent V711
/ KD5 OMEGAMON for DB2 PE V550
/ KGW OMEGAMON for CICS TG V550

/ KRN Advanced Catalog Management Agent V260
/ KRV Advanced Backup and Recovery for z/OS Agent V240
/ KRW Tape Optimizer for z/OS Agent V220
/ KS3 OMEGAMON for Storage V540
/ KYN ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

9. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
10. Review the JCL to understand what the job is doing, then submit the job.  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPIPE and SNA defaults, and the like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

### Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLa job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
  - Configure the components in this RTE to connect to a TEMS. Provide values to the following parameters to specify the communication protocols, ports, TEMS host, TEMS node, TEMS VTAM, and agent's local VTAM and logon information.
    - **Kpp\_AGT\_COMM\_PROTOCOLn**: Specify the communication protocols in priority sequence, for example, IPPIPE, and SNA.
    - **Kpp\_TEMS\_TCP\_PIPE\_PORT\_NUM**: Specify protocol port numbers for the agents to connect to TEMS.
    - **Kpp\_TEMS\_LOCAL\_CONNECT\_FLAG**: Because the primary TEMS that this agents connect to is configured on another RTE, or running on a non-z/OS platform, specify N to this parameter.
    - **Kpp\_TEMS\_NAME\_NODEID**: Specify the node ID of the non-local primary TEMS that the agents connect to, for example, SYSA:CMS.
    - **Kpp\_TEMS\_TCP\_HOST**: Specify the host of the TEMS that the agents connect to, for example, SYSA.
    - **Kpp\_AGT\_TCP\_HOST**: Specify the agent local TCP/IP information.
    - **Kpp\_TEMS\_VTAM\_\***: Specify the primary TEMS VTAM information.
    - **Kpp\_AGT\_VTAM\_\***: Specify the agent's local VTAM information and APPLIDs.
  - If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.
  - If one or more of the following products are configured in this RTE, see [Configure OMEGAMON monitoring agents and other components](#) for the parameters that you must configure at a minimum.
    - OMEGAMON® AI for Db2
    - OMEGAMON for IMS on z/OS
    - OMEGAMON for Networks
  - You can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).
4. Select 2 to edit the \$GBL\$USR global profile.  
At a minimum, if you enabled SDA, you must provide a value to the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

### What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

- From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
   reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
   WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

- Select option 1 to submit the composite job. The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
- If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - Type 1s in pane KCIP@PR1, and then go through the validation report.
  - Correct the parameter values.
  - Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

- From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KICIPQGB  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1.  Set up/Refresh PARMGEN work environment.  KCIJPCFG
2.  Customize PARMGEN configuration profiles. SYSA
3.  Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5.  Perform post configuration steps.        POSTCFG
R   Create next RTE - Reset fields.         New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KICIP@SUB) is displayed.

```

KICIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
1.  Composite SUBMIT job (See JCL comments)  KCIJPSUB
    ** OR **
2.  Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3.  Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4.  Run product security steps              (Yes) KCIJPSEC
5.  Update variable-named runtime mbrs      (No ) KCIJPUPV
6.  (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7.  Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8.  Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9.  Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

More:      +

Press F1=Help for more information.  Type UTIL to access utility menu.

```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)

- The *Planning and Configuration Guide* for each product.

## Scenario QCF17: Creating a Sharing-with-SMP/E runtime environment with agents only and variables enabled

A sharing-with-SMP/E runtime environment (RTE) contains LPAR-specific libraries and references the read-only target libraries managed by SMP/E. Because an RTE that shares the SMP/E target libraries is updated when the SMP/E maintenance is applied, a sharing-with-SMP/E configuration is good for testing maintenance before other RTEs are updated. There is no TEMS configured in this local RTE because this RTE model assumes that a TEMS (Hub or Remote TEMS) is already deployed in another RTE (if the TEMS is running on z/OS platform), or is already deployed in another non-z/OS platform (z/Linux, Windows, or AIX machines). By using variables in the new RTE, you can quickly reconfigure operational values without recreating the RTE, or clone the RTE and transport it to other LPARs.

### About this task

It is recommended that you configure the RTE by using the IBM-provided model.

### Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
                z Systems Management Suites

Option ===>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>
```

PARMGEN stores configuration values in the TSO user's ISPF profile. If this is the first-time your TDITNT TSO user ID is invoking PARMGEN, enter the GBL\_TARGET\_HILEV-related values appropriate for your deployment:

```

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: _____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  ----- / ----- /

```

**Note:**

If this is not the first time your TDITNT ID is invoking PARMGEN, this panel is also presented if the GBL\_TARGET\_HILEV stored value changed from the last time you invoked PARMGEN. Verify GBL\_TARGET\_HILEV, UNIT, VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:

```

GBL_USER_JCL:
RTE_PLIB_HILEV:
RTE_NAME:
Last GBL_TARGET_HILEV:

```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```
KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>
```

Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

```

GBL_USER_JCL: _____
                (For example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

```

```

RTE_PLIB_HILEV: _____
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

```

```

RTE_NAME: _____ (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

**GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN . IDTST . PARMGEN . JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

**RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN . IDTST .

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

## RTE\_NAME

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
You have asked to configure a new RTE profile.  
  
Proceed to configure a new RTE profile.  
  
Press ENTER to continue. Press F3 to abort.
```

5. Press Enter. The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----  
Option ==>  
  
Quick Configuration Mode  
  
GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL  
RTE_PLIB_HILEV: TDITN.IDTST  
RTE_NAME: SYSA  
  
Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.  
If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.  
Enter n (1-5) to perform tasks.  
Enter ns (1s-5s) for detailed job/task status.
```

	Description	Job/Label	Status	Date
1.	Set up/Refresh PARMGEN work environment.	KCIJPCFG		
2.	Customize PARMGEN configuration profiles.	SYSA		
3.	Create this RTE's runtime members and jobs.	\$PARSE		
4.	Submit batch jobs to complete PARMGEN setup.	SUBMIT		
5.	Perform post configuration steps.	POSTCFG		
R	Create next RTE - Reset fields.	New RTE		

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>

                                Quick Configuration Mode

                                More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSMEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=OM-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSMEMBER=%SYSMEMBER%-----
==> /*** \_~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
(Type ? for last referenced JOBGEN library discovered, if any.)

```

2. Choose a method to create the RTE:

- To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select **@MDLASSV** from the presented list of models and press Enter. The configuration software then populates the field with the fully-qualified name for the RTE.
- To create an RTE from scratch, leave the field blank.

3. As appropriate, specify the job card data.

**Jobcard data**

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.

The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      DEMO

Enter parameter values appropriate for your environment:

                                UNIT   /  STORCLAS /
                                VOLSER /  MGMTCLAS /
GBL_TARGET_HILEV: TDITNT.DEV.ITM63053_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  ----- / ----- /

GBL_SYSDA_UNIT:   SYSDA___
                   Work datasets UNIT name

GBL_REGION:      0M_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

- Review the values on the panel and override them as necessary.

**GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, 0M). The default is 0M.

- Press Enter to proceed to the next panel.

**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed with pre-defined values according to the model you selected.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==> Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Sharing-w/-SMP RTE Agents only-no local TEMS var
  More:      +
RTE_TYPE:             SHARING_      (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:     _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:   _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:   _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y      (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                    (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE: SMP_____ ("SMP" value or *&rte_share)
                    (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y      (Y, N) (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: Y      (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y      (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   &OMEGSAF._____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:   _____
GBL_DSN_ACF2_MACLIB1:  _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: N      (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:         HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:     --      (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:     &RTE_PORT._____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: K&SYSCLONE._____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:       IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is additional content on the panel.)

7. Modify the values in the panel based on the RTE that you are creating.
  - If your environment is not SMS-managed, specify the VSAM values.
  - Provide values to parameters that are required by the RTE:
    - If you are following the IBM-provided model, provide value for the following parameter:
      - **RTE\_X\_HILEV\_SHARING**
    - If you are creating the RTE from scratch, provide values for the following parameters:
      - **RTE\_TYPE=SHARING**
      - **RTE\_SHARE=SMP**
      - **RTE\_SYSV\_SYSVAR\_FLAG=Y**
      - **RTE\_X\_HILEV\_SHARING=base\_rte\_hlq**
      - **RTE\_TEMS\_CONFIGURED\_FLAG=N**

**Note:** RTE\_TEMS\_CONFIGURED\_FLAG=N means there is no TEMS configured in the RTE, and KDS\* parameters are ignored.

- You can change the following parameters to meet site-specific requirements:
    - RTE\_TEMS\_NAME\_NODEID
    - RTE\_TCP\_PORT\_NUM
    - RTE\_VTAM\_APPLID\_PREFIX
    - RTE\_STC\_PREFIX
    - RTE\_X\_SECURITY\_EXIT\_LIB
    - RTE\_SECURITY\_CLASS
8. Press Enter to proceed to the next panel.  
The **Include (Configure) Product(s) in this LPAR RTE** panel (KCIP@PGI) is displayed. All the products that are installed in the target libraries are listed and selected except for KDS.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
  -----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181
_ KDS Tivoli Enterprise Monitoring Server V630
/ KD4 ITCAM for SOA Agent V711
/ KD5 OMEGAMON for DB2 PE V550
/ KGW OMEGAMON for CICS TG V550
/ KI5 OMEGAMON for IMS V550
/ KJJ OMEGAMON for JVM V540
/ KMQ OMEGAMON for Messaging - MQ V750
/ KM5 OMEGAMON for z/OS V550
/ KNA NetView for z/OS Agent V621
/ KN3 OMEGAMON for Networks V550
/ KOB OMEGAMON Enhanced 3270 User Interface V750
/ KQI OMEGAMON for Messaging - Integration Bus V750
/ KRG Advanced Audit for DFSMSHsm Agent V260
/ KRH Advanced Reporting and Management for DFSMSHsm Agent V260
/ KRJ Advanced Allocation Management Agent V330
/ KRK Automated Tape Allocation Manager for z/OS Agent V330
/ KRN Advanced Catalog Management Agent V260
/ KRV Advanced Backup and Recovery for z/OS Agent V240
/ KRW Tape Optimizer for z/OS Agent V220
/ KS3 OMEGAMON for Storage V540
/ KYN ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

9. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
10. Review the JCL to understand what the job is doing, then submit the job.  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPIPE and SNA defaults, and the like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

### About this task

The RTE profile inherits the symbolics specified on the KCIP@PG3 panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, &SYSNAME.), except for the **RTE\_NAMESV** parameter instance. You can assign symbolics to additional parameters, but see [“Parameters ineligible to use variables” on page 1248](#) for parameters that must be excluded from use of symbolics. You must also edit the variables profile to set the resolution value of the symbolic assigned to the RTE name.

If you assign symbolics in either the RTE or the global configuration profile to parameters that are concatenated in or part of started task procedures, you must follow the MVS™ rules governing the use of symbolics in started task procedures and JCL. In the RTE profile, these are the following parameters:

- **RTE\_NAME**
- **RTE\_HILEV**
- **RTE\_VSAM\_HILEV**
- **RTE\_X\_HILEV\_SHARING**
- **RTE\_SHARE**
- **Kpp\_\*\_VTAM\_APPL\_\***

In the global profiles, these are the following parameters:

- **GBL\_DSN\_DB2\_\***
- **GBL\_DSN\_IMS\_\***
- **GBL\_DSN\_CICS\_CTG\_DLL**
- **GBL\_DSN\_WMQ\_\***
- **GBL\_DSN\_CSF\_SCSFMODE**
- **GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA**

### Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
  - Configure the components in this RTE to connect to a TEMS. Provide values to the following parameters to specify the communication protocols, ports, TEMS host, TEMS node, TEMS VTAM, and agent's local VTAM and logon information.
    - **Kpp\_AGT\_COMM\_PROTOCOLn**: Specify the communication protocols in priority sequence, for example, IPPIPE, and SNA.
    - **Kpp\_TEMS\_TCP\_PIPE\_PORT\_NUM**: Specify protocol port numbers for the agents to connect to TEMS.
    - **Kpp\_TEMS\_LOCAL\_CONNECT\_FLAG**: Because the primary TEMS that this agents connect to is configured on another RTE, or running on a non-z/OS platform, specify N to this parameter.

- **Kpp\_TEMS\_NAME\_NODEID**: Specify the node ID of the non-local primary TEMS that the agents connect to, for example, SYSA:CMS.
  - **Kpp\_TEMS\_TCP\_HOST**: Specify the host of the TEMS that the agents connect to, for example, SYSA.
  - **Kpp\_AGT\_TCP\_HOST**: Specify the agent local TCP/IP information.
  - **Kpp\_TEMS\_VTAM\_\***: Specify the primary TEMS VTAM information.
  - **Kpp\_AGT\_VTAM\_\***: Specify the agent's local VTAM information and APPLIDs.
  - If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.
  - If one or more of the following products are configured in this RTE, see [Configure OMEGAMON monitoring agents and other components](#) for the parameters that you must configure at a minimum.
    - OMEGAMON® AI for Db2
    - OMEGAMON for IMS on z/OS
    - OMEGAMON for Networks
  - You can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).
4. Select 2 to edit the \$GBL\$USR global profile.  
At a minimum, if you enabled SDA, you must provide a value to the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.
  5. Select 3 to edit the variables profile.  
Provide values for any user-defined variables that you add, any variables that whose values differ from the IBM-provided default resolution values, and any variables whose values cannot be automatically discovered from the system IPL PARMLIB data set. See [Customizing the variables profile](#) for more information on customizing variables.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```

KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1

1. Create runtime members/jobs in all WK* libs.  $PARSE

Press F1=Help for more information. Type UTIL to access utility menu.

```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

Quick Configuration Mode

GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME: SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
Enter n (1-5) to perform tasks.
Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status   Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5. Perform post configuration steps.         POSTCFG
R Create next RTE - Reset fields.           New RTE

Press F1=Help for more information. Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>
```

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.  
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.  
Enter ns (1s-12s) for detailed job/task status.

	Description	REQ	Job Name	Status	Date
				More:	+
1.	Composite SUBMIT job (See JCL comments) ** or **		KCIJPSUB		
2.	Allocate runtime RO and RW datasets	(Yes)	KCIJPALO		
3.	Copy SMP/E mbrs from TK*->RK* RO libs	(Yes)	KCIJPLOD		
4.	Run product security steps	(Yes)	KCIJPSEC		
5.	Update variable-named runtime mbrs	(No )	KCIJPUPV		
6.	(Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7.	Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8.	Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9.	Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10.	Verify the configuration jobs	(Tip)	KCIJPIVP		
11.	Back-up RK* product execution user libs	(Tip)	KCIJPCPR		
12.	Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

Press F1=Help for more information. Type UTIL to access utility menu.

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

### What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)
- The *Planning and Configuration Guide* for each product.

## Scenario QCF18: Creating a Sharing-with-SMP/E runtime environment with agents only

A sharing-with-SMP/E runtime environment (RTE) contains LPAR-specific libraries and references the read-only target libraries managed by SMP/E. Because an RTE that shares the SMP/E target libraries is updated when the SMP/E maintenance is applied, a sharing-with-SMP/E configuration is good for testing maintenance before other RTEs are updated. There is no TEMS configured in this local RTE because this RTE model assumes that a TEMS (Hub or Remote TEMS) is already deployed in another RTE (if the TEMS is running on z/OS platform), or is already deployed in another non-z/OS platform (z/Linux, Windows, or AIX machines).

### About this task

It is recommended that you configure the RTE by using the IBM-provided model.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV: _____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
               (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
               Specify the dataset name of the PARMGEN common/global
               library for the different LPAR runtime environments (RTEs).
               Use the same dataset for managing the different LPAR RTEs.
               Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.    SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.           POSTCFG
R   Create next RTE - Reset fields.            New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:    +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYJSJOBNAME=%SYJSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. Choose a method to create the RTE

- To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select **@MDLASS** from the presented list of models and press Enter. The configuration software then populates the field with the fully-qualified name for the RTE.
  - To create an RTE from scratch, leave the field blank.
3. As appropriate, specify the job card data.

**Jobcard data**

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.  
 The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>

                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      DEMO

Enter parameter values appropriate for your environment:
  UNIT   /  STORCLAS /
  VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: TDITNT.DEV.ITM63053_____ / _____ /
                  HLQ of SMP/E target (TK*) datasets  ----- / ----- /

GBL_SYSDA_UNIT:  SYSDA___
                  Work datasets UNIT name

GBL_REGION:      0M_____
                  JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.
  
```

5. Review the values on the panel and override them as necessary.
- GBL\_TARGET\_HILEV**  
 Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**  
 Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**  
 Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, 0M). The default is 0M.

6. Press Enter to proceed to the next panel.  
**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed with pre-defined values according to the model you selected.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Sharing-w/-SMP RTE w/ Agents only-no local TEMS_
  More:      +
RTE_TYPE:             SHARING_      (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:      _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:    _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:    _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y      (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                    (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE: SMP_____ ("SMP" value or *&rte_share)
                    (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y      (Y, N) (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: N      (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y      (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   _____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: N      (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:        HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:     --      (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:    1918_____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:      IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is additional content on the panel.)

7. Modify the values in the panel based on the RTE that you are creating.
  - If your environment is not SMS-managed, specify the VSAM values.
  - Provide values to parameters that are required by the RTE:
    - If you are following the IBM-provided model, provide value for the following parameter:
      - **RTE\_X\_HILEV\_SHARING**
    - If you are creating the RTE from scratch, provide values for the following parameters:
      - **RTE\_TYPE=SHARING**
      - **RTE\_SHARE=SMP**
      - **RTE\_SYSV\_SYSVAR\_FLAG=N**
      - **RTE\_X\_HILEV\_SHARING=base\_rte\_hlq**
      - **RTE\_TEMS\_CONFIGURED\_FLAG=N**

**Note:** RTE\_TEMS\_CONFIGURED\_FLAG=N means there is no TEMS configured in the RTE, and KDS\* parameters are ignored.

- You can change the following parameters to meet site-specific requirements:
    - RTE\_TEMS\_NAME\_NODEID
    - RTE\_TCP\_PORT\_NUM
    - RTE\_VTAM\_APPLID\_PREFIX
    - RTE\_STC\_PREFIX
    - RTE\_X\_SECURITY\_EXIT\_LIB
    - RTE\_SECURITY\_CLASS
8. Press Enter to proceed to the next panel.  
The **Include (Configure) Product(s) in this LPAR RTE** panel (KCIP@PGI) is displayed. All the products that are installed in the target libraries are listed and selected except for KDS.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
  -----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181
_ KDS Tivoli Enterprise Monitoring Server V630
/ KD4 ITCAM for SOA Agent V711
/ KD5 OMEGAMON for DB2 PE V550

End of data
```

9. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
10. Review the JCL to understand what the job is doing, then submit the job.  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPPIPE and SNA defaults, and the like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

### Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLa job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
  - Configure the components in this RTE to connect to a TEMS. Provide values to the following parameters to specify the communication protocols, ports, TEMS host, TEMS node, TEMS VTAM, and agent's local VTAM and logon information.
    - **Kpp\_AGT\_COMM\_PROTOCOLn**: Specify the communication protocols in priority sequence, for example, IPPPIPE, and SNA.
    - **Kpp\_TEMS\_TCP\_PIPE\_PORT\_NUM**: Specify protocol port numbers for the agents to connect to TEMS.
    - **Kpp\_TEMS\_LOCAL\_CONNECT\_FLAG**: Because the primary TEMS that this agents connect to is configured on another RTE, or running on a non-z/OS platform, specify N to this parameter.
    - **Kpp\_TEMS\_NAME\_NODEID**: Specify the node ID of the non-local primary TEMS that the agents connect to, for example, SYSA:CMS.
    - **Kpp\_TEMS\_TCP\_HOST**: Specify the host of the TEMS that the agents connect to, for example, SYSA.
    - **Kpp\_AGT\_TCP\_HOST**: Specify the agent local TCP/IP information.
    - **Kpp\_TEMS\_VTAM\_\***: Specify the primary TEMS VTAM information.
    - **Kpp\_AGT\_VTAM\_\***: Specify the agent's local VTAM information and APPLIDs.
  - If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.
  - If one or more of the following products are configured in this RTE, see [Configure OMEGAMON monitoring agents and other components](#) for the parameters that you must configure at a minimum.
    - OMEGAMON® AI for Db2
    - OMEGAMON for IMS on z/OS
    - OMEGAMON for Networks
  - You can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).
4. Select 2 to edit the \$GBL\$USR global profile.  
At a minimum, if you enabled SDA, you must provide a value to the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

### What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job. The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KICIPQGB  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1.  Set up/Refresh PARMGEN work environment.  KCIJPCFG
2.  Customize PARMGEN configuration profiles.  SYSA
3.  Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5.  Perform post configuration steps.         POSTCFG
R   Create next RTE - Reset fields.          New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KICIP@SUB) is displayed.

```

KICIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
1.  Composite SUBMIT job (See JCL comments)  KCIJPSUB
    ** OR **
2.  Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3.  Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4.  Run product security steps              (Yes) KCIJPSEC
5.  Update variable-named runtime mbrs      (No ) KCIJPUPV
6.  (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7.  Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8.  Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9.  Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

More:      +

Press F1=Help for more information.  Type UTIL to access utility menu.

```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)

- The *Planning and Configuration Guide* for each product.

## Scenario QCF19: Creating a Sharing-with-SMP/E runtime environment with a hub monitoring server and variables enabled

A sharing-with-SMP/E runtime environment (RTE) contains LPAR-specific libraries and references the read-only target libraries managed by SMP/E. Because an RTE that shares the SMP/E target libraries is updated when the SMP/E maintenance is applied, a sharing-with-SMP/E configuration is good for testing maintenance before other RTEs are updated. By using variables in the new RTE, you can quickly reconfigure operational values without recreating the RTE, or clone the RTE and transport it to other LPARs. This RTE has a Hub TEMS, enhanced 3270 user interface (TOM), and OMEGAMON for JVM (KJJ) Agent only.

### About this task

It is recommended that you configure the RTE by using the IBM-provided model.

### Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
                z Systems Management Suites

Option ==>>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>
```

PARMGEN stores configuration values in the TSO user's ISPF profile. If this is the first-time your TDITNT TSO user ID is invoking PARMGEN, enter the GBL\_TARGET\_HILEV-related values appropriate for your deployment:

```

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: _____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  ----- / ----- /

```

**Note:**

If this is not the first time your TDITNT ID is invoking PARMGEN, this panel is also presented if the GBL\_TARGET\_HILEV stored value changed from the last time you invoked PARMGEN. Verify GBL\_TARGET\_HILEV, UNIT, VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:

```

GBL_USER_JCL:
RTE_PLIB_HILEV:
RTE_NAME:
Last GBL_TARGET_HILEV:

```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```
KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>
```

Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

```

GBL_USER_JCL: _____
                (For example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

```

```

RTE_PLIB_HILEV: _____
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU, IKANPARU, IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU, WKANPARU, WKANSAMU)
                - &hlq.&rte_name.WCONFIG

```

```

RTE_NAME: _____ (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

**GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN . IDTST . PARMGEN . JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

**RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN . IDTST .

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

## RTE\_NAME

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
You have asked to configure a new RTE profile.  
  
Proceed to configure a new RTE profile.  
  
Press ENTER to continue. Press F3 to abort.
```

5. Press Enter. The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----  
Option ==>  
  
Quick Configuration Mode  
  
GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL  
RTE_PLIB_HILEV: TDITN.IDTST  
RTE_NAME: SYSA  
  
Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.  
If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.  
Enter n (1-5) to perform tasks.  
Enter ns (1s-5s) for detailed job/task status.
```

	Description	Job/Label	Status	Date
1.	Set up/Refresh PARMGEN work environment.	KCIJPCFG		
2.	Customize PARMGEN configuration profiles.	SYSA		
3.	Create this RTE's runtime members and jobs.	\$PARSE		
4.	Submit batch jobs to complete PARMGEN setup.	SUBMIT		
5.	Perform post configuration steps.	POSTCFG		
R	Create next RTE - Reset fields.	New RTE		

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
                More:      +
Specify the RTE model profile to use:
==> -----
- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSMEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=OM-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSMEMBER=%SYSMEMBER%-----
==> /*** \_~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
(Type ? for last referenced JOBGEN library discovered, if any.)

```

2. Choose a method to create the RTE

- To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select **\$MDLHSSV** from the presented list of models and press Enter. The configuration software then populates the field with the fully-qualified name for the RTE.
- To create an RTE from scratch, leave the field blank.

3. As appropriate, specify the job card data.

**Jobcard data**

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.

The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      DEMO

Enter parameter values appropriate for your environment:

                                UNIT   /  STORCLAS /
                                VOLSER /  MGMTCLAS /
GBL_TARGET_HILEV: TDITNT.DEV.ITM63053_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  ----- / ----- /

GBL_SYSDA_UNIT:   SYSDA___
                   Work datasets UNIT name

GBL_REGION:      OM_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

- Review the values on the panel and override them as necessary.

**GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=OM value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, OM). The default is OM.

- Press Enter to proceed to the next panel.

**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed with pre-defined values according to the model you selected.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Sharing-w/-SMP RTE w/ Hub/TOM/KJJ Agent w/ vars.
  More:      +
RTE_TYPE:             SHARING_          (Full, Sharing)
RTE_HILEV:           TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:      _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:    _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:    _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y      (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                    (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE: SMP_____ ("SMP" value or *&rte_share)
                    (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y      (Y, N) (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: Y      (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y      (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   &OMEGSAF._____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1:  _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y      (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: &SYSNAME.:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:         HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:      --      (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:      &RTE_PORT._____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: K&SYSCLONE._____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:        IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is additional content on the panel.)

7. Modify the values in the panel based on the RTE that you are creating.
  - If your environment is not SMS-managed, specify the VSAM values.
  - Provide values to parameters that are required by the RTE:
    - If you are following the IBM-provided model, provide value for the following parameter:
      - **RTE\_X\_HILEV\_SHARING**
    - If you are creating the RTE from scratch, provide values for the following parameters:
      - **RTE\_TYPE=SHARING**
      - **RTE\_SHARE=SMP**
      - **RTE\_SYSV\_SYSVAR\_FLAG=Y**
      - **RTE\_X\_HILEV\_SHARING=base\_rte\_hlq**
  - You can change the following parameters to meet site-specific requirements:
    - **RTE\_TEMS\_NAME\_NODEID**

- RTE\_TCP\_PORT\_NUM
- RTE\_VTAM\_APPLID\_PREFIX
- RTE\_STC\_PREFIX
- RTE\_X\_SECURITY\_EXIT\_LIB
- RTE\_SECURITY\_CLASS

8. Press Enter to proceed to the next panel.

The **Include (Configure) Product(s) in this LPAR RTE** panel (KCIP@PGI) is displayed. All the products that are installed in the target libraries are listed with KDS, KJJ, and KOB selected.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>                               Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
  -----
  _ KAH System Automation Monitoring Agent V350
  _ KC5 OMEGAMON for CICS V550
  _ KDO Tivoli Decision Support for z/OS Agent V181
  / KDS Tivoli Enterprise Monitoring Server V630
  _ KD4 ITCAM for SOA Agent V711
  _ KD5 OMEGAMON for DB2 PE V550
  _ KGW OMEGAMON for CICS TG V550
  _ KI5 OMEGAMON for IMS V550
  / KJJ OMEGAMON for JVM V540
  _ KMQ OMEGAMON for Messaging - MQ V750
  _ KM5 OMEGAMON for z/OS V550
  _ KNA NetView for z/OS Agent V621
  _ KN3 OMEGAMON for Networks V550
  / KOB OMEGAMON Enhanced 3270 User Interface V750
  _ KQI OMEGAMON for Messaging - Integration Bus V750

  _ KRH Advanced Reporting and Management for DFSMSshm Agent V260
  _ KRJ Advanced Allocation Management Agent V330
  _ KRK Automated Tape Allocation Manager for z/OS Agent V330
  _ KRN Advanced Catalog Management Agent V260
  _ KRV Advanced Backup and Recovery for z/OS Agent V240
  _ KRW Tape Optimizer for z/OS Agent V220
  _ KS3 OMEGAMON for Storage V540
  _ KYN ITCAM for Application Diagnostics, TEMA V710.03
  End of data
```

9. Deselect any products that you do not want to include in the RTE, then change `Confirm ==> N` to `Y`, and press Enter.

The JCL for the KCIJPCFG job is displayed.

10. Review the JCL to understand what the job is doing, then submit the job.

The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPPIPE and SNA defaults, and the like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

## About this task

The RTE profile inherits the symbolics specified on the KCIP@PG3 panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, &SYSNAME.), except for the **RTE\_NAMESV** parameter instance. You can assign symbolics to additional parameters, but see [“Parameters ineligible to use variables” on page 1248](#) for parameters that must be excluded from use of symbolics. You must also edit the variables profile to set the resolution value of the symbolic assigned to the RTE name.

If you assign symbolics in either the RTE or the global configuration profile to parameters that are concatenated in or part of started task procedures, you must follow the MVS™ rules governing the use of symbolics in started task procedures and JCL. In the RTE profile, these are the following parameters:

- **RTE\_NAME**
- **RTE\_HILEV**
- **RTE\_VSAM\_HILEV**
- **RTE\_X\_HILEV\_SHARING**
- **RTE\_SHARE**
- **Kpp\_\*\_VTAM\_APPL\_\***

In the global profiles, these are the following parameters:

- **GBL\_DSN\_DB2\_\***
- **GBL\_DSN\_IMS\_\***
- **GBL\_DSN\_CICS\_CTG\_DLL**
- **GBL\_DSN\_WMQ\_\***
- **GBL\_DSN\_CSF\_SCSFMODE0**
- **GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA**

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
  - If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.
  - You can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).
4. Select 2 to edit the \$GBL\$USR global profile.  
At a minimum, if you enabled SDA, you must provide a value to the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.
5. Select 3 to edit the variables profile.  
Provide values for any user-defined variables that you add, any variables that whose values differ from the IBM-provided default resolution values, and any variables whose values cannot be automatically discovered from the system IPL PARMLIB data set. See [Customizing the variables profile](#) for more information on customizing variables.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

          Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.    KCIJPUP1
1. Create runtime members/jobs in all WK* libs.    $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KICIPQGB  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1.  Set up/Refresh PARMGEN work environment.  KCIJPCFG
2.  Customize PARMGEN configuration profiles.  SYSA
3.  Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5.  Perform post configuration steps.         POSTCFG
R   Create next RTE - Reset fields.          New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KICIP@SUB) is displayed.

```

KICIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
1.  Composite SUBMIT job (See JCL comments)  KCIJPSUB
    ** OR **
2.  Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3.  Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4.  Run product security steps              (Yes) KCIJPSEC
5.  Update variable-named runtime mbrs      (No ) KCIJPUPV
6.  (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7.  Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8.  Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9.  Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

More:      +

Press F1=Help for more information.  Type UTIL to access utility menu.

```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)

- The *Planning and Configuration Guide* for each product.

## Scenario QCF20: Creating a Sharing-with-SMP/E runtime environment with a hub monitoring server

A sharing-with-SMP/E runtime environment (RTE) contains LPAR-specific libraries and references the read-only target libraries managed by SMP/E. Because an RTE that shares the SMP/E target libraries is updated when the SMP/E maintenance is applied, a sharing-with-SMP/E configuration is good for testing maintenance before other RTEs are updated. This RTE has a Hub TEMS, enhanced 3270 user interface (TOM), and OMEGAMON for JVM (KJJ) Agent only.

### About this task

It is recommended that you configure the RTE by using the IBM-provided model.

### Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
              z Systems Management Suites

Option ===>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>
```

PARMGEN stores configuration values in the TSO user's ISPF profile. If this is the first-time your TDITNT TSO user ID is invoking PARMGEN, enter the GBL\_TARGET\_HILEV-related values appropriate for your deployment:

```

UNIT      /  STORCLAS /
VOLSER    /  MGMTCLAS /
GBL_TARGET_HILEV: _____ / _____ /
                    HLQ of SMP/E target (TK*) datasets  ----- / ----- /
```

**Note:**

If this is not the first time your TDITNT ID is invoking PARMGEN, this panel is also presented if the GBL\_TARGET\_HILEV stored value changed from the last time you invoked PARMGEN. Verify GBL\_TARGET\_HILEV, UNIT, VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:

```

GBL_USER_JCL:
RTE_PLIB_HILEV:
RTE_NAME:
Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```
KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>
```

Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

```

GBL_USER_JCL: _____
                (For example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.
```

```

RTE_PLIB_HILEV: _____
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG
```

```

RTE_NAME: _____ (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.
```

3. Provide the requested values to define the RTE that you want to create.

**GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN . IDTST . PARMGEN . JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

**RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN . IDTST .

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

## RTE\_NAME

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
You have asked to configure a new RTE profile.  
  
Proceed to configure a new RTE profile.  
  
Press ENTER to continue. Press F3 to abort.
```

5. Press Enter. The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----  
Option ==>  
  
Quick Configuration Mode  
  
GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL  
RTE_PLIB_HILEV: TDITN.IDTST  
RTE_NAME: SYSA  
  
Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.  
If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.  
Enter n (1-5) to perform tasks.  
Enter ns (1s-5s) for detailed job/task status.
```

	Description	Job/Label	Status	Date
1.	Set up/Refresh PARMGEN work environment.	KCIJPCFG		
2.	Customize PARMGEN configuration profiles.	SYSA		
3.	Create this RTE's runtime members and jobs.	\$PARSE		
4.	Submit batch jobs to complete PARMGEN setup.	SUBMIT		
5.	Perform post configuration steps.	POSTCFG		
R	Create next RTE - Reset fields.	New RTE		

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>

                                Quick Configuration Mode

                                More:      +

Specify the RTE model profile to use:
==> -----
- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSMEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=OM-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSMEMBER=%SYSMEMBER%-----
==> /*** \_~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
(Type ? for last referenced JOBGEN library discovered, if any.)

```

2. Choose a method to create the RTE

- To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select **\$MDLHSS** from the presented list of models and press Enter. The configuration software then populates the field with the fully-qualified name for the RTE.
- To create an RTE from scratch, leave the field blank.

3. As appropriate, specify the job card data.

**Jobcard data**

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.

The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      DEMO

Enter parameter values appropriate for your environment:

                                UNIT   /  STORCLAS /
                                VOLSER /  MGMTCLAS /
GBL_TARGET_HILEV: TDITNT.DEV.ITM63053_____ / _____ /
                  HLQ of SMP/E target (TK*) datasets  ----- / ----- /

GBL_SYSDA_UNIT:   SYSDA____
                  Work datasets UNIT name

GBL_REGION:      OM_____
                  JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

- Review the values on the panel and override them as necessary.

**GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=OM value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, OM). The default is OM.

- Press Enter to proceed to the next panel.

**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed with pre-defined values according to the model you selected.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Sharing-w/-SMP RTE w/ Hub/TOM/KJJ Agent only____
More:                +

RTE_TYPE:             SHARING_          (Full, Sharing)
RTE_HILEV:           TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:     TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:     _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:   _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:   _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y   (Y, N)   (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                    (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE: SMP_____ ("SMP" value or *&rte_share)
                    (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y   (Y, N)   (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: N   (Y, N)   (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y   (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS: _____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB: _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y   (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:        HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:     --   (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:     1918_____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:       IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is additional content on the panel.)

7. Modify the values in the panel based on the RTE that you are creating.
  - If your environment is not SMS-managed, specify the VSAM values.
  - Provide values to parameters that are required by the RTE:
    - If you are following the IBM-provided model, provide value for the following parameter:
      - **RTE\_X\_HILEV\_SHARING**
    - If you are creating the RTE from scratch, provide values for the following parameters:
      - **RTE\_TYPE=SHARING**
      - **RTE\_SHARE=SMP**
      - **RTE\_SYSV\_SYSVAR\_FLAG=N**
      - **RTE\_X\_HILEV\_SHARING=base\_rte\_hlq**
  - You can change the following parameters to meet site-specific requirements:
    - **RTE\_TEMS\_NAME\_NODEID**

- RTE\_TCP\_PORT\_NUM
- RTE\_VTAM\_APPLID\_PREFIX
- RTE\_STC\_PREFIX
- RTE\_X\_SECURITY\_EXIT\_LIB
- RTE\_SECURITY\_CLASS

8. Press Enter to proceed to the next panel.

The **Include (Configure) Product(s) in this LPAR RTE** panel (KCIP@PGI) is displayed. All the products that are installed in the target libraries are listed with KDS, KJJ, and KOB selected.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>                               Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
  -----
  _ KAH System Automation Monitoring Agent V350
  _ KC5 OMEGAMON for CICS V550
  _ KDO Tivoli Decision Support for z/OS Agent V181
  / KDS Tivoli Enterprise Monitoring Server V630
  _ KD4 ITCAM for SOA Agent V711
  _ KD5 OMEGAMON for DB2 PE V550
  _ KGW OMEGAMON for CICS TG V550
  _ KI5 OMEGAMON for IMS V550
  / KJJ OMEGAMON for JVM V540
  _ KMQ OMEGAMON for Messaging - MQ V750
  _ KM5 OMEGAMON for z/OS V550
  _ KNA NetView for z/OS Agent V621
  _ KN3 OMEGAMON for Networks V550

  End of data
```

9. Deselect any products that you do not want to include in the RTE, then change `Confirm ==> N` to `Y`, and press Enter.

The JCL for the KCIJPCFG job is displayed.

10. Review the JCL to understand what the job is doing, then submit the job.

The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPPIPE and SNA defaults, and the like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLn jobs, see [Preparing the configuration profiles by running the KCIJPDLn jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
  - If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.
  - You can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).
4. Select 2 to edit the \$GBL\$USR global profile.  
At a minimum, if you enabled SDA, you must provide a value to the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

## Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status    Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.

- a. Type 1s in pane KCIP@PR1, and then go through the validation report.
- b. Correct the parameter values.
- c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE    Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT    Enter 4 for details.
5. Perform post configuration steps.         POSTCFG
R Create next RTE - Reset fields.           New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.
```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4. Run product security steps              (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information.  Type UTIL to access utility menu.
```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

2. Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

3. If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.

For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)
- The *Planning and Configuration Guide* for each product.

## Scenario QCF21: Creating a Sharing-with-base runtime environment with a hub monitoring server and variables enabled

A sharing-with-base runtime environment (RTE) shares its read-only runtime libraries with other RTEs. The configuration software automatically creates the base RTE when you configure the first RTE that shares it. Sharing RTEs configured subsequently can then reference that base RTE. By using variables in the new RTE, you can quickly reconfigure operational values without recreating the RTE, or clone the RTE and transport it to other LPARs.

### About this task

It is recommended that you configure the RTE by using the IBM-provided model.

### Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```

KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM

```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```

KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV: _____ / _____ /
                                HLQ of SMP/E target (TK*) datasets  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:

```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.    SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.           POSTCFG
R   Create next RTE - Reset fields.            New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYJOBNAME=%SYJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. Choose a method to create the RTE:

- To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select **\$MDLHSBV** from the presented list of models and press Enter. The configuration software then populates the field with the fully-qualified name for the RTE.
  - To create an RTE from scratch, leave the field blank.
3. As appropriate, specify the job card data.

**Jobcard data**

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.  
 The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>

                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      DEMO

Enter parameter values appropriate for your environment:
  UNIT   /  STORCLAS /
  VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: TDITNT.DEV.ITM63053_____ / _____ /
                  HLQ of SMP/E target (TK*) datasets  ----- / ----- /

GBL_SYSDA_UNIT:  SYSDA___
                  Work datasets UNIT name

GBL_REGION:     0M_____
                  JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.
  
```

5. Review the values on the panel and override them as necessary.
- GBL\_TARGET\_HILEV**  
 Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**  
 Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**  
 Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/ M suffix (ex.: 4096K, 0M). The default is 0M.

6. Press Enter to proceed to the next panel.  
**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed with pre-defined values according to the model you selected.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==> Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Sharing-w/-Base RTE w/ Hub TEMS/Agents w/ vars._
More:                +
RTE_TYPE:             SHARING_      (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_  (ex.: TDITN.IDTST
                        (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_  (ex.: TDITN.IDTST
                        (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:      _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:    _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:    _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y   (Y, N)   (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                        (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
                        (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y   (Y, N)   (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: Y   (Y, N)   (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y   (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   &OMEGSAF_____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y   (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID:  &SYSNAME.:CMS_____ (e.g.,DEMO:cms)))
KDS_TEMS_TYPE:         HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:     --   (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:     &RTE_PORT._____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: K&SYSCLONE._____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:       IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is additional content on the panel.)

7. Modify the values in the panel based on the RTE that you are creating.
  - If your environment is not SMS-managed, specify the VSAM values.
  - Provide values to parameters that are required by the RTE:
    - If you are following the IBM-provided model, provide value for the following parameter:
      - **RTE\_X\_HILEV\_SHARING**
    - If you are creating the RTE from scratch, provide values for the following parameters:
      - **RTE\_TYPE=SHARING**
      - **RTE\_SYSV\_SYSVAR\_FLAG=Y**
      - **RTE\_X\_HILEV\_SHARING=base\_rte\_hlq**
  - You can change the following parameters to meet site-specific requirements:
    - **RTE\_TEMS\_NAME\_NODEID**
    - **RTE\_TCP\_PORT\_NUM**

- RTE\_VTAM\_APPLID\_PREFIX
- RTE\_STC\_PREFIX
- RTE\_X\_SECURITY\_EXIT\_LIB
- RTE\_SECURITY\_CLASS

8. Press Enter to proceed to the next panel.

The **Include (Configure) Product(s) in this LPAR RTE** panel (KCIP@PGI) is displayed. All the products that are installed in the target libraries are listed and selected.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>                               Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
  -----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181
/ KDS Tivoli Enterprise Monitoring Server V630
/ KD4 ITCAM for SOA Agent V711
/ KD5 OMEGAMON for DB2 PE V550

End of data
```

9. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
10. Review the JCL to understand what the job is doing, then submit the job.  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPPIPE and SNA defaults, and the like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

## About this task

The RTE profile inherits the symbolics specified on the KCIP@PG3 panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, &SYSNAME.), except for the **RTE\_NAMESV** parameter instance. You can assign symbolics to additional parameters, but see [“Parameters ineligible to use variables” on page 1248](#) for parameters that must be excluded from use of symbolics. You must also edit the variables profile to set the resolution value of the symbolic assigned to the RTE name.

If you assign symbolics in either the RTE or the global configuration profile to parameters that are concatenated in or part of started task procedures, you must follow the MVS™ rules governing the use of symbolics in started task procedures and JCL. In the RTE profile, these are the following parameters:

- **RTE\_NAME**
- **RTE\_HILEV**
- **RTE\_VSAM\_HILEV**
- **RTE\_X\_HILEV\_SHARING**
- **RTE\_SHARE**
- **Kpp\_\*\_VTAM\_APPL\_\***

In the global profiles, these are the following parameters:

- **GBL\_DSN\_DB2\_\***
- **GBL\_DSN\_IMS\_\***
- **GBL\_DSN\_CICS\_CTG\_DLL**
- **GBL\_DSN\_WMQ\_\***
- **GBL\_DSN\_CSF\_SCSFMODE0**
- **GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA**

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLn jobs, see [Preparing the configuration profiles by running the KCIJPDLn jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
  - If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.
  - If one or more of the following products are configured in this RTE, see [Configure OMEGAMON monitoring agents and other components](#) for the parameters that you must configure at a minimum.
    - OMEGAMON® AI for Db2
    - OMEGAMON for IMS on z/OS
    - OMEGAMON for Networks
  - You can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).
4. Select 2 to edit the \$GBL\$USR global profile.  
At a minimum, if you enabled SDA, you must provide a value to the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.
5. Select 3 to edit the variables profile.  
Provide values for any user-defined variables that you add, any variables that whose values differ from the IBM-provided default resolution values, and any variables whose values cannot be automatically discovered from the system IPL PARMLIB data set. See [Customizing the variables profile](#) for more information on customizing variables.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job. The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KICIPQGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

                Description                               Job/Label  Status      Date
-----
1.  Set up/Refresh PARMGEN work environment.             KCIJPCFG
2.  Customize PARMGEN configuration profiles.            SYSA
3.  Create this RTE's runtime members and jobs.          $PARSE    Enter 3 for details.
4.  Submit batch jobs to complete PARMGEN setup.         SUBMIT    Enter 4 for details.
5.  Perform post configuration steps.                    POSTCFG
R   Create next RTE - Reset fields.                     New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KICIP@SUB) is displayed.

```

KICIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

                Description                               REQ  Job Name  Status      Date
-----
1.  Composite SUBMIT job (See JCL comments)             KCIJPSUB
    ** OR **
2.  Allocate runtime RO and RW datasets                 (Yes) KCIJPALO
3.  Copy SMP/E mbrs from TK*->RK* RO libs               (Yes) KCIJPLOD
4.  Run product security steps                         (Yes) KCIJPSEC
5.  Update variable-named runtime mbrs                 (No ) KCIJPUPV
6.  (Re)Create USS runtime mbrs in RKANDATV            (Yes) KCIJPUSP
7.  Create USS dirs./ (Re)Copy USS files               (Yes) KCIJPUSS
8.  Copy runtime mbrs to SYS1-type libs (Caution)     KCIJPSYS
9.  Run post-SMP/E RKANMODU ASM/LINK steps             (Yes) KCIJPLNK
10. Verify the configuration jobs                       (Tip) KCIJPIVP
11. Back-up RK* product execution user libs           (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs           (Yes) Enter 12 for details.

                More:      +

Press F1=Help for more information.  Type UTIL to access utility menu.

```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)

- The *Planning and Configuration Guide* for each product.

## Scenario QCF22: Creating a Sharing-with-SMP/E runtime environment with a hub monitoring server and variables enabled

A sharing-with-SMP/E runtime environment (RTE) contains LPAR-specific libraries and references the read-only target libraries managed by SMP/E. Because an RTE that shares the SMP/E target libraries is updated when the SMP/E maintenance is applied, a sharing-with-SMP/E configuration is good for testing maintenance before other RTEs are updated. By using variables in the new RTE, you can quickly reconfigure operational values without recreating the RTE, or clone the RTE and transport it to other LPARs.

### About this task

It is recommended that you configure the RTE by using the IBM-provided model.

### Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>
```

PARMGEN stores configuration values in the TSO user's ISPF profile. If this is the first-time your TDITNT TSO user ID is invoking PARMGEN, enter the GBL\_TARGET\_HILEV-related values appropriate for your deployment:

```

UNIT      /  STORCLAS /
VOLSER    /  MGMTCLAS /
GBL_TARGET_HILEV: _____ / _____ /
                    HLQ of SMP/E target (TK*) datasets  ----- / ----- /
```

**Note:**

If this is not the first time your TDITNT ID is invoking PARMGEN, this panel is also presented if the GBL\_TARGET\_HILEV stored value changed from the last time you invoked PARMGEN. Verify GBL\_TARGET\_HILEV, UNIT, VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:

```

GBL_USER_JCL:
RTE_PLIB_HILEV:
RTE_NAME:
Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```
KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>
```

Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

```

GBL_USER_JCL: _____
                (For example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.
```

```

RTE_PLIB_HILEV: _____
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG
```

```

RTE_NAME: _____ (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.
```

3. Provide the requested values to define the RTE that you want to create.

**GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN . IDTST . PARMGEN . JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

**RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN . IDTST .

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

## RTE\_NAME

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
You have asked to configure a new RTE profile.  
  
Proceed to configure a new RTE profile.  
  
Press ENTER to continue. Press F3 to abort.
```

5. Press Enter. The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----  
Option ==>  
  
Quick Configuration Mode  
  
GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL  
RTE_PLIB_HILEV: TDITN.IDTST  
RTE_NAME: SYSA  
  
Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.  
If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.  
Enter n (1-5) to perform tasks.  
Enter ns (1s-5s) for detailed job/task status.
```

	Description	Job/Label	Status	Date
1.	Set up/Refresh PARMGEN work environment.	KCIJPCFG		
2.	Customize PARMGEN configuration profiles.	SYSA		
3.	Create this RTE's runtime members and jobs.	\$PARSE		
4.	Submit batch jobs to complete PARMGEN setup.	SUBMIT		
5.	Perform post configuration steps.	POSTCFG		
R	Create next RTE - Reset fields.	New RTE		

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
                More:      +
Specify the RTE model profile to use:
==> -----
- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSMEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=OM-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSMEMBER=%SYSMEMBER%-----
==> /*** \_~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
(Type ? for last referenced JOBGEN library discovered, if any.)

```

2. Choose a method to create the RTE

- To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select **@MDLHSSV** from the presented list of models and press Enter. The configuration software then populates the field with the fully-qualified name for the RTE.
- To create an RTE from scratch, leave the field blank.

3. As appropriate, specify the job card data.

**Jobcard data**

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

4. Press Enter to proceed to the next panel.

The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      DEMO

Enter parameter values appropriate for your environment:

                                UNIT   /  STORCLAS /
                                VOLSER /  MGMTCLAS /
GBL_TARGET_HILEV: TDITNT.DEV.ITM63053_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  ----- / -----

GBL_SYSDA_UNIT:   SYSDA___
                   Work datasets UNIT name

GBL_REGION:      OM_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

- Review the values on the panel and override them as necessary.

**GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=OM value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, OM). The default is OM.

- Press Enter to proceed to the next panel.

**The Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed with pre-defined values according to the model you selected.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Sharing-w/-SMP RTE w/ Hub TEMS/Agents w/ vars.____
More:                +

RTE_TYPE:            SHARING_          (Full, Sharing)
RTE_HILEV:           TDITN.IDTST_____ (ex.: TDITN.IDTST
(&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
(&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:      _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:    _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:    _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y   (Y, N)   (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
(&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE: SMP_____ ("SMP" value or *&rte_share)
(*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y   (Y, N)   (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: Y   (Y, N)   (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y   (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   &OMEGSAF._____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y   (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: &SYSNAME.:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:        HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:     __   (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:     &RTE_PORT._____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: K&SYSCLONE._____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:       IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is additional content on the panel.)

7. Modify the values in the panel based on the RTE that you are creating.
  - If your environment is not SMS-managed, specify the VSAM values.
  - Provide values to parameters that are required by the RTE:
    - If you are following the IBM-provided model, provide value for the following parameter:
      - **RTE\_X\_HILEV\_SHARING**
    - If you are creating the RTE from scratch, provide values for the following parameters:
      - **RTE\_TYPE=SHARING**
      - **RTE\_SHARE=SMP**
      - **RTE\_SYSV\_SYSVAR\_FLAG=Y**
      - **RTE\_X\_HILEV\_SHARING=base\_rte\_hlq**
  - You can change the following parameters to meet site-specific requirements:
    - **RTE\_TEMS\_NAME\_NODEID**

- RTE\_TCP\_PORT\_NUM
- RTE\_VTAM\_APPLID\_PREFIX
- RTE\_STC\_PREFIX
- RTE\_X\_SECURITY\_EXIT\_LIB
- RTE\_SECURITY\_CLASS

8. Press Enter to proceed to the next panel.

The **Include (Configure) Product(s) in this LPAR RTE** panel (KCIP@PGI) is displayed. All the products that are installed in the target libraries are listed and selected.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>                               Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
  -----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181
/ KDS Tivoli Enterprise Monitoring Server V630
/ KD4 ITCAM for SOA Agent V711
/ KD5 OMEGAMON for DB2 PE V550
/ KGW OMEGAMON for CICS TG V550
/ KI5 OMEGAMON for IMS V550
/ KJJ OMEGAMON for JVM V540
/ KMQ OMEGAMON for Messaging - MQ V750
/ KM5 OMEGAMON for z/OS V550
/ KNA NetView for z/OS Agent V621
/ KN3 OMEGAMON for Networks V550

/ KRH Advanced Reporting and Management for DFSMSshm Agent V260
/ KRJ Advanced Allocation Management Agent V330
/ KRK Automated Tape Allocation Manager for z/OS Agent V330
/ KRN Advanced Catalog Management Agent V260
/ KRV Advanced Backup and Recovery for z/OS Agent V240
/ KRW Tape Optimizer for z/OS Agent V220
/ KS3 OMEGAMON for Storage V540
/ KYN ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

9. Deselect any products that you do not want to include in the RTE, then change `Confirm ==> N` to `Y`, and press Enter.

The JCL for the KCIJPCFG job is displayed.

10. Review the JCL to understand what the job is doing, then submit the job.

The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPPIPE and SNA defaults, and the like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

## About this task

The RTE profile inherits the symbolics specified on the KCIP@PG3 panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, &SYSNAME.), except for the **RTE\_NAMESV** parameter instance. You can assign symbolics to additional parameters, but see [“Parameters ineligible to use variables” on page 1248](#) for parameters that must be excluded from use of symbolics. You must also edit the variables profile to set the resolution value of the symbolic assigned to the RTE name.

If you assign symbolics in either the RTE or the global configuration profile to parameters that are concatenated in or part of started task procedures, you must follow the MVS™ rules governing the use of symbolics in started task procedures and JCL. In the RTE profile, these are the following parameters:

- **RTE\_NAME**
- **RTE\_HILEV**
- **RTE\_VSAM\_HILEV**
- **RTE\_X\_HILEV\_SHARING**
- **RTE\_SHARE**
- **Kpp\_\*\_VTAM\_APPL\_\***

In the global profiles, these are the following parameters:

- **GBL\_DSN\_DB2\_\***
- **GBL\_DSN\_IMS\_\***
- **GBL\_DSN\_CICS\_CTG\_DLL**
- **GBL\_DSN\_WMQ\_\***
- **GBL\_DSN\_CSF\_SCSFMODE0**
- **GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA**

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLa job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
  - If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.
  - If one or more of the following products are configured in this RTE, see [Configure OMEGAMON monitoring agents and other components](#) for the parameters that you must configure at a minimum.
    - OMEGAMON® AI for Db2
    - OMEGAMON for IMS on z/OS
    - OMEGAMON for Networks
  - You can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).
4. Select 2 to edit the \$GBL\$USR global profile.  
At a minimum, if you enabled SDA, you must provide a value to the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.
5. Select 3 to edit the variables profile.  
Provide values for any user-defined variables that you add, any variables that whose values differ from the IBM-provided default resolution values, and any variables whose values cannot be automatically

discovered from the system IPL PARMLIB data set. See [Customizing the variables profile](#) for more information on customizing variables.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status     Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job. The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KCIQPGB  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1.  Set up/Refresh PARMGEN work environment.  KCIJPCFG
2.  Customize PARMGEN configuration profiles.  SYSA
3.  Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5.  Perform post configuration steps.         POSTCFG
R   Create next RTE - Reset fields.          New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCI@SUB) is displayed.

```

KCI@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
1.  Composite SUBMIT job (See JCL comments)  KCIJPSUB
    ** OR **
2.  Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3.  Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4.  Run product security steps              (Yes) KCIJPSEC
5.  Update variable-named runtime mbrs      (No ) KCIJPUPV
6.  (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7.  Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8.  Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9.  Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

More:      +

Press F1=Help for more information.  Type UTIL to access utility menu.

```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)

- The *Planning and Configuration Guide* for each product.

## SMP/E maintenance and upgrade scenarios

---

During maintenance and upgrades, only a subset of the PARMGEN KCIJ\* jobs need to be rerun to refresh the read-only product execution runtime libraries and the product-specific RKANDATV library. The steps that you need to take depend upon the maintenance or upgrade scenario you are implementing.

At a minimum, the KCIJPLOD load job must be run. The jobs that need to be regenerated or resubmitted in addition to the KCIJPLOD job vary depending upon the scenario:

1. Applying SMP/E maintenance to an existing RTE with no new configuration changes.
2. Applying SMP/E maintenance to an existing RTE with new configuration changes, but use or run with IBM-supplied configuration defaults.
3. Applying SMP/E maintenance to an existing RTE with new configuration changes and use new features or override the IBM-supplied configuration defaults.
4. Upgrading the SMP/E environment to new FMID versions and upgrade an existing RTE with no new configuration changes.
5. Upgrading the SMP/E environment to new FMID versions and upgrade an existing RTE with new configuration changes, but use or run with IBM-supplied configuration defaults.
6. Upgrading the SMP/E environment to new FMID versions and upgrade an existing RTE with new configuration changes and use new features or override the IBM-supplied configuration defaults.

For scenario 1, only the KCIJPLOD job is required. For all the other scenarios, the KCIJPCFG job is also required. For 3 and 6, you must edit the RTE profile.

For more information about upgrade paths and scenarios, see the topics in .

### Scenario SMPE01: Applying maintenance to an existing runtime environment without changing the configuration

If no new members or parameters are introduced by the maintenance that is being applied to an existing runtime environment (RTE), the only configuration job that you need to run is KCIJPLOD. The KCIJPLOD job copies the members of the products' SMP/E target libraries to the RTE's read-only RK\* runtime libraries. You can run the job in WKANSAMU, or use the PARMGEN Workflow tool. You can load RTEs individually or load all RTEs at one time.

#### About this task

The KCIJPLOD job loads the runtime libraries with IEBCOPY in a two-step process:

1. All members are copied from the SMP/E target libraries to the runtime libraries.
2. The runtime libraries are compressed.

#### Procedure

- Run the KCIJPLOD job using one of the following methods:
  - Submit the KCIJPLOD job in the %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WKANSAMU library.
  - Submit the KCIJPLOD job from the PARMGEN Workflow interface:
    - a. Enter a question mark (?) in the **RTE\_NAME** field on the first Workflow panel. The Runtime Environments (RTEs) panel is displayed.

KCIP@RTE ----- RUNTIME ENVIRONMENTS (RTEs) ----- Row 6 to 10 of 17

Command ==> Scroll ==>  
PAGE

Locate the RTE you want to process from the list of RTEs inventoried from the PARMGEN global library (QISUN.IDTST.PARMGEN.JCL).  
See F1=Help for additional cross-RTE Actions/RTE Commands available.

Single RTE Actions: Type the action character next to the RTE name:

- "S" or "/" Switch to an RTE.
- "P" Display the products configured in an RTE.
- "D" Delete an RTE. You cannot delete the active RTE.

Multiple RTE Actions: Type the action character next to one or more RTEs:

- "L" Copy read-only (RO) elements from the SMP/E target libraries to the RO RK\* runtime libraries (KCIJPL0D job).

Multiple RTE Commands: Type the indicated command on the command line:

- "LOADALL" Submit multi-load (KCIJPL0D) job for all listed RTEs.
- "SHOWDESC"/"HIDEDESC" Show/Hide RTE Description for all listed RTEs.

RTE Name	Read-only (RO) shared libraries (SHRLIBs)	Load SHRLIBs?	VARs?
_ DEMO	N/A (TSTEST.CCAPI.DEMO.RK* FULL RTE libs)	N/A (FULL RTE)	N
_ DEMOHA	N/A (TDITN.IDTST.DEMOHA.RK* FULL RTE libs)	N/A (FULL RTE)	N
_ DEMOMVS	N/A (TSTEST.CANDLET.XEGA.DEMOMVS.RK* FULL RTE)	N/A (FULL RTE)	N
_ PGN3MVSE	TSTEST.BASE2.RK* base libs	Y	Y
_ PLBHAHUB	N/A (TSTEST.&userid.PLBHAHUB.RK* FULL RTE libs)	N/A (FULL RTE)	N

- b. Type L to select the RTE or RTEs you want to load, then press Enter, or enter LOADALL to load all RTEs listed in the global JCL library.

If any members in the IEBCOPY steps are not found in the source libraries, a return code of 4 (which is acceptable) is generated.

For further information, see the comments in the KCIJPL0D job if you use option 1, or KCIJ@LOD from GBL\_USER\_JCL if you use a LOADDATV function.

## Result

The runtime environment is updated with the maintenance. The runtime members in the production user libraries (RKANCMU, RKANPARU, RKANSAMU, RKD2PAR\*\*, RKD2PRF\*\*, RKD2SAM\*\*) are running with the original runtime members without any new parameters or members possibly introduced with the maintenance. For example, without any new parameters in RKANPARU(KppENV), or without new members that would typically be populated in the RK\* user library. Similar processing is done for the PARMGEN WK\* work libraries.

## Scenario SMPE02: Applying SMP/E maintenance with configuration changes to an existing RTE and using IBM-supplied configuration defaults for new features

If the SMP/E maintenance that is applied includes new product features that introduce new configuration parameters or members, you must refresh the work environment to add them to the global libraries and regenerate the RTE members and jobs. You might also have to submit jobs in addition to the KCIJPLOD job. However, you do not need to update the RTE-specific configuration profiles.

### About this task

You can stage the new product configuration parameters for each runtime environment by adding new parameters and members to the runtime libraries. Typically, Interim Feature (IF) or Fix Pack (FP) configuration changes are delivered as benign, and IBM-supplied configuration defaults are supplied, so you do not need to edit the configuration profiles. To stage the new parameters, complete the following steps:

1. Refresh the work libraries.
2. Regenerate the RTE members and jobs.
3. Submit the jobs that complete the setup of the RTE.

At a minimum, you need to copy the SMP/E target libraries to the read-only runtime libraries (KCIJPLOD) and the updated work libraries to the user libraries (KCIJPCPR and KCIJPW2R). You might need to run additional jobs, depending upon product-specific requirements spelled out in ++HOLD data.

**Tip:** Each site has different change-control procedures. Certain sites deploy these types of changes by renaming the current production RK\* libraries to a backup set like RK\*.Dyymdd, then renaming the latest WK\* set to RK\*. Sample backup and deployment jobs WKANSAMU(KCIJPCPR) and WKANSAMU(KCIJPW2R) provide helpful samples.

### Procedure

1. Refresh the work libraries.  
This step updates interim libraries and recreates the configuration profiles with any new parameters.

- a. From the Workflow main menu, select **Set up PARMGEN work environment for an RTE**.  
The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>
```

```
While configuring an existing RTE profile, you have asked to  
navigate to the KCIJPCFG option to review or make changes to the  
KCIJPCFG job, which was run with highest condition code RC= 00000  
on 2017/07/27. In most cases, if you change any KCIJPCFG  
parameters, you will have to rerun the KCIJPCFG job and certain  
subsequent PARMGEN configuration jobs.
```

```
Press ENTER to continue with KCIJPCFG changes.
```

```
Press F3 to abort.
```

- b. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
- c. Step through the presented panels by pressing Enter to accept the current configuration values.  
(On the Include Products in this PARMGEN RTE panel, enter y to confirm the current choices.)  
After you confirm the current product selection, you are prompted to provide a name for the backup copy of the RTE profile.

```
KCIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES -----  
Command ==>
```

If you changed any JVM RTE configuration values on the "SET UP/REFRESH PARMGEN WORK ENVIRONMENT" KCIJPCFG navigation panels, or changed the configured product mix or upgraded product versions, then you must regenerate/resubmit the KCIJPCFG/KCIJPPRF jobs. You must also refresh the PARMGEN profiles.

Specify a backup member name for the LPAR RTE to automate the resubmission and refresh process. A default backup member is provided. Blank-out the field if you do not want to refresh the profiles.

```
DEMO Backup member name ==> _____ (Required for KCIJPPRF)
```

PARMGEN automatically backs up the RTE profile in TDITN.IDTST.PARMGEN.WCONBACK, refreshes templates in IK\* datasets, rebuilds the profiles with the new values, merges in the profiles values from the backed-up LPAR RTE user profile, and generates a delta report.

Press F1 for information about the automated process.

If you do not provide a backup name, KCIJPCFG does not update the interim libraries and merge back in the current values.

- d. Provide a name for the backup, then press Enter.  
The KCIJPCFG JCL is displayed.
  - e. Review the notes, then submit the job.  
The KCIJPCFG job creates new RTE profiles that contains the new parameters, then runs the KCIJPPRF job. The KCIJPPRF job updates the interim libraries and merges the current values from the backed up profile into the new profiles. Return to the main Workflow panel. Wait until both KCIJPCFG and KCIJPPRF have completed before proceeding to the next step. No return code is displayed on the Workflow main panel until both jobs have completed.
2. Regenerate the RTE members and jobs.
    - a. Select **Create the RTE members and jobs**.  
The **\$PARSE /\$PARSESV: Create the RTE Members and Jobs** panel is displayed.
    - b. Select option 1 to submit the composite job.  
TUTORIAL INFORMATION If the updates affect only one set of libraries, you can submit the library-specific job instead of the composite job. Press F5 to create runtime members and jobs in an individual library (WKANCMDU, WKANPARU, or WKANSAMU).  
  
The \$PARSE job takes the product templates from the %RTE\_PLIB\_HILEV%.%RTE\_NAME%. IK\* staging libraries, applies the customized values from the configuration profiles, and creates the runtime members in the work libraries (WK\*).
    - c. Return to the main Workflow panel.
  3. Submit the jobs to complete the setup of the RTE.
    - a. Select **Submit batch jobs to complete PARMGEN setup**.  
The Submit Batch Jobs to Complete PARMGEN Setup menu is displayed.

```

KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                                REQ  Job Name  Status  Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
   ** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4. Run product security steps               (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files     (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs      (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps   (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information. Type UTIL to access utility menu.

```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- b. Submit the following jobs and any other jobs indicated by a Yes in the REQ column.

**KCIJPLOD**

This required job copies members of the target libraries that were installed by SMP/E to the read-only RK\* libraries.

**KCIJPW2R/KCIJPW1R**

These jobs (Option 12) copies the WK\* work output libraries to the respective production RK\* runtime libraries. If you run either of these jobs, run KCIJPCPR to back up the RK\* production libraries. KCIJPW2R is run by default when the composite submit job KCIJPSUB is run. KCIJPW2R replaces all RK\* members with members from WK\*. It will leave non-PARMGEN managed members in RK\* libraries. KCIJPW1R deletes all RK\* members except for the ones that are added in the IBM provided WKANSAMU(KCI\$IW2R) and user defined WCONFIG(KCI\$XW2R) exclude lists, and then copies WK\* members to RK\* libraries. You must add members they want saved to their RTE WCONFIG(KCI\$XW2R) member.

You might also have to run one or more of the following jobs:

- KCIJPSEC (if upgrade introduces changes in security) to create security-related members (load modules, encryption key, and other elements) based on the product security requirements
- KCIJPALO (if the upgrade introduces new data sets are introduced)
- KCIJPUSP and KCIJcUSS (if upgrade introduces changes in z/OS® UNIX® System Services requirements)
- KCIJPLNK (if OMEGAMON for IMS on z/OS is installed)
- KCIJPSYS (if upgrade introduces new started tasks or nodes)

**Result**

The runtime members and WKANSAMU jobs are updated with the new parameters using the IBM-supplied defaults.

# Scenario SMPE03: Applying SMP/E maintenance with new configuration changes to an existing RTE and overriding the IBM-supplied configuration defaults

Typically, configuration changes introduced by Interim Features or Fix Packs are delivered as benign, and IBM-supplied configuration defaults are supplied. However, you might need to edit the configuration profiles to exploit new features or to set custom values for new parameters.

## About this task

There are four main steps involved in this scenario:

1. Refreshing the work libraries.
2. Editing profiles and override embed members, as necessary.
3. Regenerating the RTE members and jobs.
4. Submitting the jobs that complete the setup of the RTE.

At a minimum, you need to copy the SMP/E target libraries to the read-only runtime libraries (KCIJPLOD) and copy the updated work libraries to the user runtime libraries (KCIJPW2R). You might need to run additional jobs, depending upon product-specific requirements spelled out in ++HOLD data.

**Tip:** Each site has different change-control procedures. Certain sites deploy these types of changes by renaming the current production RK\* libraries to a backup set like RK\*.Dyymmdd, then renaming the latest WK\* set to RK\*. Sample backup and deployment jobs WKANSAMU(KCIJPCPR) and WKANSAMU(KCIJPW2R) provide helpful samples.

## Procedure

1. Refresh the work libraries.

This step backs up (renames) the existing LPAR profile, updates the interim libraries, recreates the configuration profiles with any new parameters, and merges the backup profile with the newly created one.

- a. Select the runtime environment to which you want to apply maintenance.
- b. From the Workflow - Primary Options Menu, select Set up PARMGEN work environment for an RTE to regenerate and resubmit the KCIJPCFG job.

The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
While configuring an existing RTE profile, you have asked to  
navigate to the KCIJPCFG option to review or make changes to the  
KCIJPCFG job, which was run with highest condition code RC= 00000  
on 2017/07/27. In most cases, if you change any KCIJPCFG  
parameters, you will have to rerun the KCIJPCFG job and certain  
subsequent PARMGEN configuration jobs.  
  
Press ENTER to continue with KCIJPCFG changes.  
  
Press F3 to abort.
```

- c. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
- d. Step through the presented panels by pressing Enter to accept the current configuration values. (On the Include Products in this PARMGEN RTE panel, enter y to confirm the current choices.) After you confirm the current product selection, you are prompted to provide a name for the backup copy of the RTE profile.

```
KCIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES -----  
Command ==>
```

If you changed any JVM RTE configuration values on the "SET UP/REFRESH PARMGEN WORK ENVIRONMENT" KCIJPCFG navigation panels, or changed the configured product mix or upgraded product versions, then you must regenerate/resubmit the KCIJPCFG/KCIJPPRF jobs. You must also refresh the PARMGEN profiles.

Specify a backup member name for the LPAR RTE to automate the resubmission and refresh process. A default backup member is provided. Blank-out the field if you do not want to refresh the profiles.

DEMO Backup member name ==> \_\_\_\_\_ (Required for KCIJPPRF)

PARMGEN automatically backs up the RTE profile in TDITN.IDTST.PARMGEN.WCONBACK, refreshes templates in IK\* datasets, rebuilds the profiles with the new values, merges in the profiles values from the backed-up LPAR RTE user profile, and generates a delta report.

Press F1 for information about the automated process.

If you do not provide a backup name, the interim libraries are not updated and the current values cannot be merged back in.

- e. Enter a name for the profile backup member.  
The KCIJPCFG job is displayed.
  - f. Review the notes, then submit the job.  
The KCIJPCFG job creates new RTE profiles that contains the new parameters, then runs the KCIJPPRF job. The KCIJPPRF job updates the interim libraries and merges the current values from the backed up profile into the new profiles. Return to the main Workflow panel. Wait until both KCIJPCFG and KCIJPPRF have completed before proceeding to the next step. No return code is displayed on the Workflow main panel until both jobs have completed.
2. Edit profiles and override embeds to customize new features or parameters as required.
    - a. Select **Customize PARMGEN configuration profiles**.  
The **Customize PARMGEN Configuration Profile Members** panel is displayed.
    - b. Select the RTE, global, and variables profiles in turn as necessary and make the required customizations. If required, edit the appropriate embed members.

#### Tips:

- In a scenario where you have also added a new product to configure to this runtime environment, ensure that you also customize the new product's *Kpp\_\** PARMGEN profile parameters that are added into the refreshed RTE configuration profile.
- Compare the updated \$CFG\$IBM and \$GBL\$IBM to your customized profiles to determine what parameters have changed or been added.
- Update or customize any new or modified embed files as desired.

3. Regenerate the RTE members and jobs.
  - a. Select **Create the RTE members and jobs**.  
The **\$PARSE /\$PARSESV: Create the RTE Members and Jobs** panel is displayed.
  - b. Select option 1 to submit the composite job.  
TUTORIAL INFORMATION If the updates affect only one set of libraries, you can submit the library-specific job instead of the composite job. Press F5 to create runtime members and jobs in an individual library (WKANCMDU, WKANPARU, or WKANSAMU).  
  
The \$PARSE job takes the product templates from the %RTE\_PLIB\_HILEV%.%RTE\_NAME%. IK\* staging libraries, applies the customized values from the configuration profiles, and creates the runtime members in the work libraries (WK\*).
  - c. Return to the main Workflow panel.
4. Submit the batch jobs necessary to complete the set up of the environment:

- a. Select **Submit batch jobs to complete PARMGEN setup**.  
The Submit Batch Jobs to Complete PARMGEN Setup menu is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                                REQ  Job Name  Status  Date
-----
1. Composite SUBMIT job (See JCL comments)    KCIJPSUB
** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs    (Yes) KCIJPLOD
4. Run product security steps               (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files     (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps   (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIPV
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information.  Type UTIL to access utility menu.
```

- b. Submit the following jobs and any other jobs indicated by a Yes in the REQ column.

**KCIJPLOD**

This required job copies members of the target libraries that were installed by SMP/E to the read-only RK\* libraries.

**KCIJPW2R/KCIJPW1R**

These jobs (Option 12) copies the WK\* work output libraries to the respective production RK\* runtime libraries. If you run either of these jobs, run KCIJPCPR to back up the RK\* production libraries. KCIJPW2R is run by default when the composite submit job KCIJPSUB is run. KCIJPW2R replaces all RK\* members with members from WK\*. It will leave non-PARMGEN managed members in RK\* libraries. KCIJPW1R deletes all RK\* members except for the ones that are added in the IBM provided WKANSAMU(KCI\$IW2R) and user defined WCONFIG(KCI\$XW2R) exclude lists, and then copies WK\* members to RK\* libraries. You must add members they want saved to their RTE WCONFIG(KCI\$XW2R) member.

You might need to run one or more of the following jobs:

- KCIJPSEC (if upgrade introduces changes in security) to create security-related members (load modules, encryption key, and other elements) based on the product security requirements
- KCIJPALO (if the upgrade introduces new data sets are introduced)
- KCIJPUSP and KCIJcUSS (if upgrade introduces changes in z/OS® UNIX® System Services requirements)
- KCIJPLNK (if OMEGAMON for IMS on z/OS is installed)
- KCIJPSYS (if upgrade introduces new started tasks or nodes)

**Result**

The maintenance is applied, and any customizations you made are in effect.

## Scenario SMPE04: Upgrading an existing runtime environment with no configuration changes

If you apply maintenance that contains upgraded FMIDs but does not contain features that require configuration changes, you only need to refresh the work libraries (to update the version) and load the read-only files from the SMP/E target libraries to the runtime libraries.

### About this task

If you are upgrading in place (that is using the same target libraries and the same runtime product libraries, follow these instructions. Otherwise, follow [“Scenario SMPE05: Upgrading an existing runtime environment with configuration changes but using IBM-supplied configuration defaults” on page 199](#) and change the high-level qualifiers as appropriate.

**Note:** If you are upgrading it to V6.3.0 Fix Pack 6 and you have a V6.2.3 z/OS hub monitoring server with SDA enabled and you elected to retain the previous behavior (no granular controls), follow the steps in [“Scenario SMPE05: Upgrading an existing runtime environment with configuration changes but using IBM-supplied configuration defaults” on page 199](#). If you are upgrading a monitoring server at a version prior to V6.2.3 to V6.3.0 FP6, you must also follow [“Scenario SMPE06: Upgrading an existing runtime environment and overriding defaults” on page 201](#). In the first case, the load job needs to be refreshed to add the REPROKFA step to the load job. In the second scenario, new VSAM libraries need to be allocated, so the KCIJPALO and KCIJPLOD jobs need to be refreshed as well.

Perform an upgrade with no configuration changes involves the following steps:

1. Refreshing the work libraries.
2. Submitting the jobs that complete the setup of the RTE.

At a minimum, you need to copy the SMP/E target libraries to the read-only runtime libraries (KCIJPLOD) and the updated work libraries to the user libraries (KCIJPCPR and KCIJPW2R). You might need to run additional jobs, depending upon product-specific requirements spelled out in ++HOLD data.

### Procedure

1. Refresh the work libraries.
  - a. From the Workflow main menu, select **Set up PARMGEN work environment for an RTE**. The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
While configuring an existing RTE profile, you have asked to  
navigate to the KCIJPCFG option to review or make changes to the  
KCIJPCFG job, which was run with highest condition code RC= 00000  
on 2017/07/27. In most cases, if you change any KCIJPCFG  
parameters, you will have to rerun the KCIJPCFG job and certain  
subsequent PARMGEN configuration jobs.  
  
Press ENTER to continue with KCIJPCFG changes.  
  
Press F3 to abort.
```

- b. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
- c. Step through the presented panels by pressing Enter to accept the current configuration values. (On the **Include Products in this PARMGEN RTE** panel, enter y to confirm the current choices.) After you confirm the current product selection, you are prompted to provide a name for the backup copy of the RTE profile.
- d. Provide a name for the backup, then press Enter.  
The KCIJPCFG JCL is displayed.
- e. Review the notes, then submit the job.

The KCIJPCFG job creates new RTE profiles that contains the new parameters, then runs the KCIJPPRF job. The KCIJPPRF job updates the interim libraries and merges the current values from the backed up profile into the new profiles. Return to the main Workflow panel. Wait until both KCIJPCFG and KCIJPPRF have completed before proceeding to the next step. No return code is displayed on the Workflow main panel until both jobs have completed.

2. Submit the jobs to complete the setup of the RTE.

a. Select **Submit batch jobs to complete PARMGEN setup**.

The Submit Batch Jobs to Complete PARMGEN Setup menu is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status  Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
** OR **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4. Run product security steps               (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information.  Type UTIL to access utility menu.
```

b. Submit the following jobs and any other jobs indicated by a Yes in the REQ column.

**KCIJPLOD**

This required job copies members of the target libraries that were installed by SMP/E to the read-only RK\* libraries.

**KCIJPW2R/KCIJPW1R**

These jobs (Option 12) copies the WK\* work output libraries to the respective production RK\* runtime libraries. If you run either of these jobs, run KCIJPCPR to back up the RK\* production libraries. KCIJPW2R is run by default when the composite submit job KCIJPSUB is run. KCIJPW2R replaces all RK\* members with members from WK\*. It will leave non-PARMGEN managed members in RK\* libraries. KCIJPW1R deletes all RK\* members except for the ones that are added in the IBM provided WKANSAMU(KCI\$IW2R) and user defined WCONFIG(KCI\$XW2R) exclude lists, and then copies WK\* members to RK\* libraries. You must add members they want saved to their RTE WCONFIG(KCI\$XW2R) member.

You might need to submit one or more of the following jobs:

- KCIJPSEC (if upgrade introduces changes in security) to create security-related members (load modules, encryption key, and other elements) based on the product security requirements
- KCIJPALO (if the upgrade introduces new data sets are introduced)
- KCIJPUSP and KCIJcUSS (if upgrade introduces changes in z/OS® UNIX® System Services requirements)
- KCIJPLNK (if OMEGAMON for IMS on z/OS is installed)
- KCIJPSYS (if upgrade introduces new started tasks or nodes)

## Scenario SMPE05: Upgrading an existing runtime environment with configuration changes but using IBM-supplied configuration defaults

Upgraded FMIDs can include new product features that introduce configuration changes (such as new product configuration parameters in RKANPARU(KppENV), or new RK\* runtime members). Typically, these types of configuration changes caused by new product versions are delivered as benign, and IBM-supplied configuration defaults are supplied, so you do not need to customize the configuration profiles to incorporate them. However, you do need to stage the changes by refreshing the work environment and recreating the runtime members and jobs.

### About this task

This scenario involves the following steps:

1. Refreshing the work libraries.
2. Regenerating the RTE members and jobs.
3. Submitting the jobs that complete the setup of the RTE.

At a minimum, you need to copy the SMP/E target libraries to the read-only runtime libraries (KCIJPLOD) and the updated work libraries to the user libraries (KCIJPCPR and KCIJPW2R). You might need to run additional jobs, depending upon product-specific requirements indicated in ++HOLD data.

**Tip:** Each site has different change-control procedures. Certain sites deploy these types of changes by renaming the current production RK\* libraries to a backup set like RK\*.Dyymmdd, then renaming the latest WK\* set to RK\*. Sample deployment and backup jobs WKANSAMU(KCIJcCPY) and WKANSAMU(KCIJcW2R) provide helpful samples.

To stage the new configuration parameters, complete the following procedure.

### Procedure

1. Refresh the PARMGEN work environment.  
This step update interim libraries and recreates the configuration profiles with any new parameters.
  - a. On the main Workflow panel, specify the name of the runtime environment to which you want to apply maintenance.
  - b. From the Workflow - Primary Options Menu, select **Set up PARMGEN work environment for an RTE**.  
The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
While configuring an existing RTE profile, you have asked to  
navigate to the KCIJPCFG option to review or make changes to the  
KCIJPCFG job, which was run with highest condition code RC= 00000  
on 2017/07/27. In most cases, if you change any KCIJPCFG  
parameters, you will have to rerun the KCIJPCFG job and certain  
subsequent PARMGEN configuration jobs.  
  
Press ENTER to continue with KCIJPCFG changes.  
  
Press F3 to abort.
```

- c. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
- d. Press Enter to continue through the following screens.  
TUTORIAL INFORMATIONOn the Include Products in this PARMGEN RTE panel, change the **Confirm ==> N** field to **Confirm ==> Y** to continue.  
The following panel is displayed:

```
KCIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES -----  
Command ==>
```

If you changed any JVM RTE configuration values on the "SET UP/REFRESH PARMGEN WORK ENVIRONMENT" KCIJPCFG navigation panels, or changed the configured product mix or upgraded product versions, then you must regenerate/resubmit the KCIJPCFG/KCIJPPRF jobs. You must also refresh the PARMGEN profiles.

Specify a backup member name for the LPAR RTE to automate the resubmission and refresh process. A default backup member is provided. Blank-out the field if you do not want to refresh the profiles.

```
DEMO Backup member name ==> _____ (Required for KCIJPPRF)
```

PARMGEN automatically backs up the RTE profile in TDITN.IDTST.PARMGEN.WCONBACK, refreshes templates in IK\* datasets, rebuilds the profiles with the new values, merges in the profiles values from the backed-up LPAR RTE user profile, and generates a delta report.

Press F1 for information about the automated process.

- e. Enter a name for the profile backup member.  
The modified KCIJPCFG job is displayed.
  - f. Submit the job.  
The KCIJPCFG job creates new RTE profiles that contains the new parameters, then runs the KCIJPPRF job. The KCIJPPRF job updates the interim libraries and merges the current values from the backed up profile into the new profiles. Return to the main Workflow panel. Wait until both KCIJPCFG and KCIJPPRF have completed before proceeding to the next step. No return code is displayed on the Workflow main panel until both jobs have completed.
2. Regenerate the RTE members and jobs.
    - a. Select **Create the RTE members and jobs**.  
The **\$PARSE /\$PARSESV: Create the RTE Members and Jobs** panel is displayed.
    - b. Select option 1 to submit the composite job.  
  
TUTORIAL INFORMATION If the updates affect only one set of libraries, you can submit the library-specific job instead of the composite job. Press F5 to create runtime members and jobs in an individual library (WKANCMDU, WKANPARU, or WKANSAMU).  
  
The \$PARSE job takes the product templates from the %RTE\_PLIB\_HILEV%.%RTE\_NAME%. IK\* staging libraries, applies the customized values from the configuration profiles, and creates the runtime members in the work libraries (WK\*).
    - c. Return to the main Workflow panel.
  3. Submit the jobs to complete the setup of the RTE.
    - a. Select **Submit batch jobs to complete PARMGEN setup**.  
The Submit Batch Jobs to Complete PARMGEN Setup menu is displayed.

```

KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                                REQ  Job Name  Status  Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs    (Yes) KCIJPLOD
4. Run product security steps                (Yes) KCIJPSEC
5. Update variable-named runtime mbrs       (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV  (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files      (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps    (Yes) KCIJPLNK
10. Verify the configuration jobs             (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information. Type UTIL to access utility menu.

```

- b. Submit the following jobs and any other jobs indicated by a Yes in the REQ column.

**KCIJPLOD**

This required job copies members of the target libraries that were installed by SMP/E to the read-only RK\* libraries.

**KCIJPW2R/KCIJPW1R**

These jobs (Option 12) copies the WK\* work output libraries to the respective production RK\* runtime libraries. If you run either of these jobs, run KCIJPCPR to back up the RK\* production libraries. KCIJPW2R is run by default when the composite submit job KCIJPSUB is run. KCIJPW2R replaces all RK\* members with members from WK\*. It will leave non-PARMGEN managed members in RK\* libraries. KCIJPW1R deletes all RK\* members except for the ones that are added in the IBM provided WKANSAMU(KCI\$IW2R) and user defined WCONFIG(KCI\$XW2R) exclude lists, and then copies WK\* members to RK\* libraries. You must add members they want saved to their RTE WCONFIG(KCI\$XW2R) member.

You might have to submit one or more of the following jobs:

- KCIJPSEC (if upgrade introduces changes in security) to create security-related members (load modules, encryption key, and other elements) based on the product security requirements
- KCIJPALO (if the upgrade introduces new data sets are introduced)
- KCIJPUSP and KCIJcUSS (if upgrade introduces changes in z/OS® UNIX® System Services requirements)
- KCIJPLNK (if OMEGAMON® for IMS™ on z/OS® is installed)
- KCIJPSYS (if upgrade introduces new started tasks or nodes)

**Result**

The new product features are implemented and the defaults are in effect.

## Scenario SMPE06: Upgrading an existing runtime environment and overriding defaults

Typically, configuration changes introduced by upgrade FMIDs are delivered as benign, and IBM-supplied configuration defaults are supplied. However, you might need to edit the configuration profiles to exploit a new features or to set custom values for new parameters.

**About this task**

There are four main steps involved in this scenario:

1. Refreshing the work libraries.
2. Editing profiles and overriding embed members, as necessary.
3. Regenerate thing RTE members and jobs.
4. Submitting the jobs that complete the setup of the RTE.

At a minimum, you need to copy the SMP/E target libraries to the read-only runtime libraries (KCIJPLOD) and copy the updated work libraries to the user runtime libraries (KCIJPW2R). You might need to run additional jobs, depending upon product-specific requirements spelled out in ++HOLD data.

**Tip:** Each site has different change-control procedures. Certain sites deploy these types of changes by renaming the current production RK\* libraries to a backup set like RK\*.Dyymdd, then renaming the latest WK\* set to RK\*. Sample backup and deployment jobs WKANSAMU(KCIJPCPR) and WKANSAMU(KCIJPW2R) provide helpful samples.

## Procedure

1. Refresh the work libraries.  
This step backs up (renames) the existing LPAR profile, updates the interim libraries, recreates the configuration profiles with any new parameters, and merges the backup profile with the newly created one.
  - a. Select the runtime environment to which you want to apply maintenance.
  - b. From the Workflow - Primary Options Menu, select Set up PARMGEN work environment for an RTE to regenerate and resubmit the KCIJPCFG job.  
The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
While configuring an existing RTE profile, you have asked to  
navigate to the KCIJPCFG option to review or make changes to the  
KCIJPCFG job, which was run with highest condition code RC= 00000  
on 2017/07/27. In most cases, if you change any KCIJPCFG  
parameters, you will have to rerun the KCIJPCFG job and certain  
subsequent PARMGEN configuration jobs.  
  
Press ENTER to continue with KCIJPCFG changes.  
  
Press F3 to abort.
```

- c. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
- d. Step through the presented panels by pressing Enter to accept the current configuration values.  
(On the Include Products in this PARMGEN RTE panel, enter y to confirm the current choices.)  
After you confirm the current product selection, you are prompted to provide a name for the backup copy of the RTE profile.

```
KCIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES -----  
Command ==>
```

If you changed any JVM RTE configuration values on the "SET UP/REFRESH PARMGEN WORK ENVIRONMENT" KCIJPCFG navigation panels, or changed the configured product mix or upgraded product versions, then you must regenerate/resubmit the KCIJPCFG/KCIJPPRF jobs. You must also refresh the PARMGEN profiles.

Specify a backup member name for the LPAR RTE to automate the resubmission and refresh process. A default backup member is provided. Blank-out the field if you do not want to refresh the profiles.

DEMO Backup member name ==> \_\_\_\_\_ (Required for KCIJPPRF)

PARMGEN automatically backs up the RTE profile in TDITN.IDTST.PARMGEN.WCONBACK, refreshes templates in IK\* datasets, rebuilds the profiles with the new values, merges in the profiles values from the backed-up LPAR RTE user profile, and generates a delta report.

Press F1 for information about the automated process.

- e. Enter a name for the profile backup member.  
The KCIJPCFG job is displayed.
  - f. Review the notes, then submit the job.  
The KCIJPCFG job creates new RTE profiles that contains the new parameters, then runs the KCIJPPRF job. The KCIJPPRF job updates the interim libraries and merges the current values from the backed up profile into the new profiles. Return to the main Workflow panel. Wait until both KCIJPCFG and KCIJPPRF have completed before proceeding to the next step. No return code is displayed on the Workflow main panel until both jobs have completed.
2. Edit profiles and override embeds to customize new features or parameters as required.
    - a. Select **Customize PARMGEN configuration profiles**.  
The **Customize PARMGEN Configuration Profile Members** panel is displayed.
    - b. Select the RTE, global, and variables profiles in turn as necessary and make the required customizations. If required, edit the appropriate embed members.

**Tips:**

- In a scenario where you have also added a new product to configure to this runtime environment, ensure that you also customize the new product's *Kpp\_\** PARMGEN profile parameters added into the refreshed RTE configuration profile.
- Compare the updated \$CFG\$IBM and \$GBL\$IBM to your customized profiles to determine what parameters have changed or been added.
- Update or customize any new or modified embed files as desired.

3. Regenerate the RTE members and jobs.
  - a. Select **Create the RTE members and jobs**.  
The **\$PARSE /\$PARSESV: Create the RTE Members and Jobs** panel is displayed.
  - b. Select option 1 to submit the composite job.  
  
TUTORIAL INFORMATION If the updates affect only one set of libraries, you can submit the library-specific job instead of the composite job. Press F5 to create runtime members and jobs in an individual library (WKANCMU, WKANPARU, or WKANSAMU).  
  
The \$PARSE job takes the product templates from the %RTE\_PLIB\_HILEV%.%RTE\_NAME%. IK\* staging libraries, applies the customized values from the configuration profiles, and creates the runtime members in the work libraries (WK\*).
  - c. Return to the main Workflow panel.
4. Submit the batch jobs necessary to complete the set up of the environment:
  - a. Select **Submit batch jobs to complete PARMGEN setup**.  
The Submit Batch Jobs to Complete PARMGEN Setup menu is displayed.

```

KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                                REQ  Job Name  Status  Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
   ** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4. Run product security steps               (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information.  Type UTIL to access utility menu.

```

- b. Submit the following jobs and any other jobs indicated by a Yes in the REQ column.

**KCIJPLOD**

This required job copies members of the target libraries that were installed by SMP/E to the read-only RK\* libraries.

**KCIJPW2R/KCIJPW1R**

These jobs (Option 12) copies the WK\* work output libraries to the respective production RK\* runtime libraries. If you run either of these jobs, run KCIJPCPR to back up the RK\* production libraries. KCIJPW2R is run by default when the composite submit job KCIJPSUB is run. KCIJPW2R replaces all RK\* members with members from WK\*. It will leave non-PARMGEN managed members in RK\* libraries. KCIJPW1R deletes all RK\* members except for the ones that are added in the IBM provided WKANSAMU(KCI\$IW2R) and user defined WCONFIG(KCI\$XW2R) exclude lists, and then copies WK\* members to RK\* libraries. You must add members they want saved to their RTE WCONFIG(KCI\$XW2R) member.

You might have to submit one or more of the following jobs:

- KCIJPSEC (if upgrade introduces changes in security) to create security-related members (load modules, encryption key, and other elements) based on the product security requirements
- KCIJPALO (if the upgrade introduces new data sets are introduced)
- KCIJPUSP and KCIJcUSS (if upgrade introduces changes in z/OS® UNIX® System Services requirements)
- KCIJPLNK (if OMEGAMON for IMS on z/OS is installed)
- KCIJPSYS (if upgrade introduces new started tasks or nodes)

**Result**

The runtime environment is upgraded and any values you customized are in effect.

**Scenario SMPE07: Staging an upgrade using a cloned environment**

By cloning runtime environments (RTEs) and installing new versions into the cloned environments, you can continue to apply maintenance to and reconfigure RTEs that contain previous versions of products and components. You create a runtime environment (RTE) that contains the same product set and configuration values as the old environment, but which contains upgraded versions of products and components. You install new product versions in a new set of SMP/E target libraries, point the runtime environment at the new libraries, clone the work and production libraries from an old environment, and then merge its configuration values into a

new RTE with the same name that points to the new installation libraries. In the process, you upgrade any products and components installed in the old environment.

**Note:** This scenario assumes a PARMGEN to PARMGEN upgrade.

## About this task

This task involves the following steps:

1. Installing the products into a new set of SMP/E target libraries.
2. Cloning the GBL\_USER\_JCL global library.
3. Setting up the new PARMGEN work environment.
4. Cloning the WCONFIG members from the model runtime environment.
5. Updating the interim libraries and create the configuration profiles for the new environment.
6. Merging the values from the model LPAR configuration profiles.
7. (Conditional) Customizing the profile parameter values.
8. Creating the runtime members and jobs.
9. Submitting the jobs to create the runtime environment.

## Procedure

1. Install the products into a new set of SMP/E target libraries using the Install Job Generator (JOBGEN).
  - a. Launch the installation and configuration software in an existing installation:

```
EX '%HILEV%.%MIDLEV%.TKANCUS'
```
  - b. On the Welcome page, select option 4 (SMP/E-install z/OS® products with Install Job Generator).
  - c. Supply the values as prompted.
  - d. Submit the file-tailored KCIJG\* SMP/E jobs to complete the installation.
  - e. Exit JOBGEN and then exit the software configuration software.
2. Clone the GBL\_USER\_JCL global library for runtime environments (the library specified by the CONFIG DD statement in started tasks) to the new high-level qualifier.
  - a. Clone %GBL\_USER\_JCL%.
  - b. In the cloned %GBL\_USER\_JCL% library, edit the member named KCIDJP02.
  - c. Do an EXCLUDE FIND on GBL\_USER\_JCL and change all references to the original data set to the name of the cloned GBL\_USER\_JCL data set.  
For example:

The KCIJPCFG job submits a second job, KCIJPPRF, to update the libraries and generate the profiles. Wait until both jobs have completed before returning to the Workflow - Primary Options Menu. The status code on the panel is not updated with a return code until both jobs have completed.

4. Clone the WCONFIG members for the new RTE from the model RTE's WCONFIG library:
  - a. On the Workflow - Primary Option Menu panel, type UTIL on the command line.  
The Utilities panel is displayed.

```

KCIPQPGU ----- UTILITIES -----

 19. Generate $SYSVAR autodiscovered system/user symbols report. $PARSEDV

Submit a utility job (Maintenance):
      Description                                     Job/Label
-----
 20. Refresh IK* templates/WCONFIG *$IBM profiles. KCIJPP11
 21. Convert an ICAT RTE Batch member. KCIJPCNV
 22. Merge profile from a backup LPAR RTE profile. KCIJPMCF
 23. Validate PARMGEN profile parameter values. KCIJPVAL
 24. Back-up WK* work user libraries. KCIJPCPW
 25. Back-up RK* product execution user libraries. KCIJPCPR
 26. Recall migrated DEMO RTE datasets. KCIJPHRC
 27. Compare work and runtime user libraries. KCIJPSPC
 28. Empty runtime members in RK* user libraries. KCIJPMTY
 29. Copy WK*->RK* user libraries keeping EXCLUDE members. KCIJPW1R
 30. Restore back-up user libs. to current set. KCIJPB2R
 31. Resolve system symbolics in PARMGEN jobs. KCIJVSrv
 32. Collect diagnostic information for this RTE. KCIJPCOL
 33. Delete RTE: DEMO KCIJPD11

Submit a utility job (Clone/Transport):
      Description                                     Job/Label
-----
 34. Clone customized WCONFIG members. KCIJPCCF
 35. Allocate read-only base RK* libraries. KCIJPBSA
 36. Load read-only base RK* libraries. KCIJPBSL
 37. Clone customized data from another RTE. KCIJPCLN

Press F1=Help for more information.

```

- b. Page down if necessary and select **Clone customized WCONFIG members** (option 24). The WCONFIG(KCIJPCCF) job is presented.
- c. Review the job to determine if you need to further modify the library concatenated in the OLDWCNFG DDNAME.  
By default, this DDNAME already points to the WCONFIG library that you specified in the RTE profile library field of the first work environment set-up panel. If necessary, modify the job to point

to an existing WCONFIG library that contains the customized members you want cloned over to the WCONFIG library for the new runtime environment.

- d. Submit the job and return to the main Workflow panel.
5. Customize the PARMGEN configuration profiles.
    - a. From the Workflow main menu, select **Customize PARMGEN configuration profiles**. The **Customize PARMGEN Configuration Profile Members** panel is presented. Customization of the RTE profile is required. Customization of the \$GBL\$USR global profile is optional, but you might want to review the profile to determine if there are changes you want to make.
    - b. Select option 1 and change all instances of \*HILEV\* in the RTE profile to the high-level qualifier for the new environment.

TUTORIAL INFORMATION If you made any changes to the corresponding RTE values on the KCIP@PG3 panel, make the same changes to the *Kpp* versions of the following parameters:

- Started task prefixes
- VTAM applid prefixes
- Port numbers
- RTE high-level qualifier
- VSAM high-level qualifier

If the new FMIDs contain new components or configuration values you want to customize further, you can also make those changes. See [Customizing the configuration profiles](#) for more information about parameters typically customized in the RTE profile.

If you intend to clone customized data such as monitoring situations stored in VSAM data sets or enhanced 3270UI profiles or workspaces stored in UKANWENU or UKOBDATF data sets, set the following two parameters:

- **RTE\_CLONE\_FROM\_HLQRTE**
- **RTE\_CLONE\_FROM\_VSAM\_HLQRTE**

- c. Press F3 to close and save the RTE configuration profile and return to the Customize PARMGEN Configuration Profile Members panel.
  - d. Select 2 to review the \$GBL.\$USR profile and make any appropriate changes. See [Customizing the global configuration profile](#) for parameters that should be reviewed.
  - e. Press F3 to exit the \$GBL.\$USR profile.
  - f. For an RTE with variable support enabled: If you kept the same RTE name, the variables profile from the original RTE has been cloned. If you gave the RTE a new name, you must replace the contents of the new GBL\_USER\_JCL(%RTE\_NAME%) variables member with the contents of the variables profile of the cloned RTE. You can also rename the GBL\_USER\_JCL(%RTE\_NAME%) members of the cloned RTE to the name of the new RTE. Review the variables profile to determine if you need to make any changes for this RTE.
  - g. Return to the main Workflow panel.
6. Create the runtime members and jobs.
    - a. Select **Create the RTE members and jobs** from the Workflow main menu. The Submit \$PARSE Batch Jobs to Complete PARMGEN Setup panel is displayed.
    - b. Select option 1 to submit the generated \$PARSE composite job. The \$PARSE member is presented.
    - c. Review the member for any jobs that need to be submitted manually, then submit the job. Return to the main Workflow panel.
  7. Submit the batch jobs to set up the RTE.
    - a. Select **Submit batch jobs to complete PARMGEN setup** from the Workflow main menu. The Submit Batch Jobs to Complete PARMGEN Setup (KCIP@SUB) panel is displayed.
    - b. Select option 1 if you want to submit the KCIJPSUB composite SUBMIT job, or select the other options to submit each job individually. If you select option 1, review the KCIJPSUB job first, and edit the job according to which of the conditional jobs need be submitted automatically and which need to be submitted manually (for example, for reasons of authorization).

- c. Submit the job.

## Result

You have cloned and upgraded the selected runtime environment.

## What to do next

Complete any configuration steps required outside the software. Then repeat steps 2 - 8 for every runtime environment you want to upgrade.

**Important:** The cloned environment inherits configuration values from the original RTE, including started task names. However, if the RTEs use the same PROCLIB, there can be only one set of STCs. The simplest way to deal with this is to create a temporary PROCLIB on the system or systems you upgrade that contain the new procedures. Then, once every RTE is upgraded, copy the procedures from the temporary PROCLIB to the normal PROCLIB. You might want to schedule a change control window when you can switch libraries.

## Runtime environment reconfiguration scenarios

After you have set up your runtime environments, you may occasionally need to modify them. For example, you might need to add, reconfigure, or delete products, or you might need to change parameter values to tune monitoring performance. The steps you take to reconfigure the RTE depend upon the scenario you are enacting.

### Scenario RTE01: Adding a new product to an existing PARMGEN runtime environment

You have an existing runtime environment (RTE) to which you want to add a new product. The product is SMP/E installed, but it is not yet configured in the RTE.

#### About this task

The key to adding a new product to an existing RTE is the Include Products in this PARMGEN RTE panel (KCIP@PGI). You regenerate the KCIJPCFG setup job and add the new product by selecting it on the Include Products panel. After you submit the job, the RTE configuration profile is updated with the parameters for that product. Then, you can customize those parameters by editing the profile. You run the \$PARSE job to recreate the runtime members and jobs, and then resubmit the jobs to complete the reconfiguration of the RTE with the new product.

#### Procedure

1. Recreate the work environment.  
This step adds the new product, updates interim libraries, and recreates the configuration profiles with any new parameters for the new product.
  - a. Select the RTE to which you want to add the product by providing the fully-qualified RTE name (RTE\_PLIB\_HILEV and RTE\_NAME).
  - b. From the Workflow - Primary Options Menu, select **Set up PARMGEN work environment for an RTE**.  
The following message is displayed, notifying you that you need to resubmit the modified KCIJPCFG job after you make changes:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
While configuring an existing RTE profile, you have asked to  
navigate to the KCIJPCFG option to review or make changes to the  
KCIJPCFG job, which was run with highest condition code RC= 00000  
on 2017/07/27. In most cases, if you change any KCIJPCFG  
parameters, you will have to rerun the KCIJPCFG job and certain  
subsequent PARMGEN configuration jobs.  
  
Press ENTER to continue with KCIJPCFG changes.  
  
Press F3 to abort.
```

- c. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
- d. Press Enter until the Include Products in this PARMGEN RTE panel (KCIP@PGI) is displayed.  
Any products already configured into the environment are indicated by a slash (/).
- e. Select the new product you want to include by typing a slash (/) next to its product code.  
In the following example, a monitoring server, the OMEGAMON® enhanced 3270 user interface, and all of the OMEGAMON® products except OMEGAMON® for Storage are already configured in the runtime environment. To add OMEGAMON® for Storage, a slash is placed next to KS3.

```

----- INCLUDE PRODUCTS IN THIS PARMGEN RTE - Row 1 to 19 of 26
Command ==>                               Scroll ==> PAGE

Select (/) product(s) to CONFIGURE those product(s) in RTE=PLB1SP13
Products configured in the model RTE have been preselected (/).
Select or deselect products to include or exclude from configuration.

When finished, change "N" to "Y" to confirm selections.  Confirm ==> N (Y, N)

  Kpp  Product Name/Version
-----
- KAH  System Automation Monitoring Agent V350

End of data

```

- f. Type Y in the **Confirm ==>** field, then press Enter to continue.  
The following panel is displayed:

```

KCIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES -----
Command ==>

If you changed any JVM RTE configuration values on the
"SET UP/REFRESH PARMGEN WORK ENVIRONMENT" KCIJPCFG navigation
panels, or changed the configured product mix or upgraded product
versions, then you must regenerate/resubmit the KCIJPCFG/KCIJPPRF jobs.
You must also refresh the PARMGEN profiles.

Specify a backup member name for the LPAR RTE to automate the
resubmission and refresh process.  A default backup member is provided.
Blank-out the field if you do not want to refresh the profiles.

  DEMO Backup member name  ==>  _____  (Required for KCIJPPRF)

PARMGEN automatically backs up the RTE profile in
TDITN.IDTST.PARMGEN.WCONBACK, refreshes templates in IK* datasets,
rebuilds the profiles with the new values, merges in the profiles values
from the backed-up LPAR RTE user profile, and generates a delta report.

Press F1 for information about the automated process.

```

- g. Type a name for the profile backup member and press Enter.

The modified KCIJPCFG job is displayed.

- h. Submit the job.  
The KCIJPCFG job submits the KCIJPPRF job, which updates the libraries and merges the backed up profile with the newly generated one containing the new product parameters.
  - i. Return to the Workflow - Primary Options Menu. Wait until both jobs have completed. No return code is displayed on the Workflow main panel until both jobs have completed.
2. Edit the configuration profiles, as required.  
TUTORIAL INFORMATION See the *Planning and Configuration Guide* and *Parameter Reference* for the new product for information on parameters that you might want to customize or features you might want to enable. Note that the new product inherits any global runtime environment parameters specified in the Set up PARMGEN Work Environment for an RTE (3 OF 3) panel (KCIP@PG3), such as started task prefixes.
  3. Recreate the RTE members and jobs.
    - a. From the Primary Options Menu, select **Create the RTE members and jobs**.  
The \$PARSE/\$PARSESV: Create the RTE Members and Jobs (KCIP@PRS) panel is displayed.
    - b. Select option 1 to submit the generated \$PARSE or \$PARSESV composite job.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

      Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles. KCIJPUP1
1. Create runtime members/jobs in all WK* libs. $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

Note that you see the second option only if the RTE is enabled for variables.

The \$PARSE or \$PARSESV member is presented.

- c. Review the member for any jobs that need to be submitted manually, then submit the job.  
Return to the Workflow - Primary Options Menu.
4. Submit the batch jobs to complete reconfiguration of the RTE.
    - a. From the Primary Options Menu, select **Submit batch jobs to complete PARMGEN setup**.  
The Submit batch jobs to complete PARMGEN setup (KCIP@SUB) is displayed.

```

KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                                REQ Job Name  Status  Date
-----
1. Composite SUBMIT job (See JCL comments)   KCIJPSUB
** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4. Run product security steps               (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files     (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs      (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps   (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information. Type UTIL to access utility menu.

```

- b. Select option 1 to submit the KCIJPSUB composite submit job, or select the other options to submit each job separately.  
If you select option 1, first review the KCIJPSUB job, and edit the job according to which of the conditional jobs can to be submitted automatically.
- c. Check for good condition codes.

**Note:** The WSUPERC step will encounter an informational condition code of 4 if OMEGAMON® AI for Db2 is not configured in this runtime environment as there are no xKD2\* libraries to compare.

- d. If you do not receive good condition codes, review the resulting output:
  - \$IVPRPT report, which is stored in the WCONFIG library
  - WSUPERC SYSTSPRT report, which is stored in the WSUPERC sequential library

Correct any errors, and rerun any jobs that did not complete successfully.

### What to do next

See the *Planning and Configuration Guide* for the new product to complete any configuration steps required outside the configuration software.

## Scenario RTE02: Upgrading a single product or component in an existing runtime environment

If the runtime environment (RTE) is pointing to the target libraries where the new version is SMP/E installed, the product is automatically upgraded when you refresh the work environment.

### Procedure

1. Refresh the PARMGEN work environment to include the latest installed version of the product. This step updates interim libraries and recreates the configuration profiles with any new parameters introduced by the upgrade.
  - a. Identify the RTE in which you want to upgrade the product by specifying the fully-qualified name of the RTE (**RTE\_PLIB\_HILEV** and **RTE\_NAME**).
  - b. From the Workflow - Primary Options Menu, select **Set up PARMGEN work environment for an RTE**.

The following message is displayed, notifying you that you need to resubmit the modified KCIJPCFG job:

```
KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

While configuring an existing RTE profile, you have asked to
navigate to the KCIJPCFG option to review or make changes to the
KCIJPCFG job, which was run with highest condition code RC= 00000
on 2017/07/27. In most cases, if you change any KCIJPCFG
parameters, you will have to rerun the KCIJPCFG job and certain
subsequent PARMGEN configuration jobs.

Press ENTER to continue with KCIJPCFG changes.

Press F3 to abort.
```

- c. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
- d. Press Enter until the Include Products in this PARMGEN RTE panel (KCIP@PGI) is displayed.  
The products already configured into the environment are indicated by a slash. However, the version currently installed in the target libraries is displayed, not the version currently configured. If the versions are different, the product is upgraded to the version shown when you submit the KCIJPCFG job.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE

Select ("S" or "/" ) products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)

End of data
```

- e. Specify Y in the **Confirm ==>** field to confirm the current selection of products, then press Enter to continue.  
The following panel is displayed:

```
KCIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES -----  
Command ==>
```

```
If you changed any JVM RTE configuration values on the  
"SET UP/REFRESH PARMGEN WORK ENVIRONMENT" KCIJPCFG navigation  
panels, or changed the configured product mix or upgraded product  
versions, then you must regenerate/resubmit the KCIJPCFG/KCIJPPRF jobs.  
You must also refresh the PARMGEN profiles.
```

```
Specify a backup member name for the LPAR RTE to automate the  
resubmission and refresh process. A default backup member is provided.  
Blank-out the field if you do not want to refresh the profiles.
```

```
DEMO Backup member name ==> _____ (Required for KCIJPPRF)
```

```
PARMGEN automatically backs up the RTE profile in  
TDITN.IDTST.PARMGEN.WCONBACK, refreshes templates in IK* datasets,  
rebuilds the profiles with the new values, merges in the profiles values  
from the backed-up LPAR RTE user profile, and generates a delta report.
```

```
Press F1 for information about the automated process.
```

- f. Type a name for the profile backup member and press Enter.  
The modified KCIJPCFG job is displayed.
  - g. Submit the job.  
The KCIJPCFG job submits the KCIJPPRF job, which updates the libraries and merges the backed up profile with the newly generated one containing the new version of the product. Wait until both jobs have completed and you receive a successful return code before proceeding to the next step.
2. The next steps depend on whether or not you have configuration changes to make:
- If you do not need to make any further configuration changes (for example, you can use the product defaults and no new features need to be configured), regenerate the RTE members and jobs by submitting the \$PARSE (or \$PARSESV) job and submit the jobs that complete the setup of the RTE.
  - If you want to exploit new configuration changes (such as enabling the self-describing agent feature) or override the product-supplied configuration defaults, edit the configuration profiles as necessary. Then regenerate the RTE members and jobs by submitting the \$PARSE (or \$PARSESV) job and submit the jobs that complete the setup of the RTE.
  - At a minimum, you need to copy the SMP/E target libraries to the read-only runtime libraries (KCIJPLOD job) and the updated work libraries to the user libraries (KCIJPCPR and KCIJPW2R jobs). You might need to run additional jobs, depending upon product-specific requirements spelled out in ++HOLD data..

## What to do next

Select the **Perform post configuration steps** in the PARMGEN Workflow - Primary Option Menu to the readmes for the installed products. See also the *Planning and Configuration Guide* for the upgraded product for any configuration steps that need to be completed outside the configuration software.

## Scenario RTE03: Changing parameters in an RTE

After the initial configuration, you might need to change, add, or delete parameter values in the runtime environment (RTE) configuration profile.

For example, you might not want to enable security for the Tivoli® Enterprise Portal or the enhanced 3270 user interface logon until you have verified that all components are configured and communicating correctly. After you have verified that you can successfully view data in the Tivoli® Enterprise Portal client or the OMEGAMON® Enhanced 3270 user interface, you can go back and set **KDS\_TEMS\_SECURITY\_KDS\_VALIDATE** to Y to enable authentication of Tivoli® Enterprise Portal user IDs and passwords. Or you can enable security for the enhanced 3270 user interface by providing a security authorization facility (SAF) resource class using the **RTE\_SECURITY\_CLASS** parameter.

### About this task

This task involves three main steps:

1. Editing the configuration profiles as necessary.
2. Recreating the RTE and jobs by submitting the appropriate \$PARSE/\$PARSESV job.

3. Copying the runtime members from the work libraries to the production libraries by using the KCIJPW2R job.

If system variables are enabled in the RTE, you must also run the KCIJPUPV job to populate variable-named members application-specific *KppJPUPB* composite IEBUPDTE members in the WK\* work output libraries, before you run the KCIJPW2R job.

The WCONFIG(\$PARSE) composite job (or the \$PARSESV job if the runtime environment is enabled for variables) copies all IK\* interim libraries to WK\* user libraries. If you need to regenerate only the parameters in a single library, you can also submit the library-specific \$PARSE%% jobs (where %% = CM for CMDU, SM for SAMU, PR for PARU) in WCONFIG. You can specify a specific member or set of members within each library to regenerate.

For example, if you are adding a new parameter to the WCONFIG(KAG\$PENV) global agent override imbed and the WCONFIG(KDS\$PENV) monitoring server override imbed, you only need to update the WKANPARU(*KppENV*) members. Similarly, if you make a change to the **KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST** and the 25 **Kpp\_AGT\_TCP\_KDEB\_INTERFACELIST** KDEB\_INTERFACELIST parameters that need to be implemented globally across all products, only the WKANPARU(\*ENV) members need to be reprocessed by \$PARSEPR.

To implement this example scenario, edit the SELECT MEMBER=(\*) statement in the USER SECTION: CONFIG/SELECT MEMBER section of the \$PARSEPR job to SELECT MEMBER=(\*ENV):

```

EDIT      IBM.userid.LPAR1.WCONFIG($PARSEPR)
Command ==>
000110 * ----- BEGIN - USER SECTION: CONFIG/SELECT MEMBER ----- *
000111 * *****
000112 * USER SECTION: CONFIG/SELECT MEMBER *
000113 * *****
.
000121 CONFIG MEMBER=(WCONFIG:$GBL$IBM)
000122 * 4. $CFG$IBM IBM-supplied PARMGEN CONFIG profile (RTE-specific)
000123 CONFIG MEMBER=(WCONFIG:$CFG$IBM)
000124 * 5. $GBL$USR Customer-overridable PARMGEN CONFIG profile (SMP-related
000125 * and other global parameters)
000126 * Note: (OPTIONAL) Customize WCONFIG:$GBL$USR accordingly. It is
000127 * ideal for copying to other WCONFIG RTEs if these global system
000128 * libraries are typically the same across LPARs.
000129 CONFIG MEMBER=(WCONFIG:$GBL$USR)
000130 * 6. TESTSYSG Customer-overridable PARMGEN CONFIG profile
000131 * (RTE-specific applicable to this LPAR)
000132 CONFIG MEMBER=(WCONFIG:LPAR1)
000133 SELECT MEMBER=(*ENV)
000134 * ----- END - USER SECTION: CONFIG/SELECT MEMBER ----- *

```

This change tells the \$PARSEPR job to recreate only the \*ENV members.

You can also code SELECT MEMBER=( \*ENV, K??SYSIN) if you want to regenerate only the *KppENV* members, and all members matching the K??SYSIN wildcard. These are just a few examples how flexible the SELECT MEMBER= parameter is.

Note that the library-specific \$PARSE%% jobs regenerate the runtime members in the PARMGEN work libraries (such as WKANPARU and WKANCMDU) because PARMGEN supports a staged deployment and does not update the running production user libraries and execution libraries (such as RKANPARU and RKANCMDU). You must run the WKANSAMU(KCIJPW2R) job to deploy runtime members from the WK\* libraries to the RK\* production user libraries. However, if you would like the \$PARSE\* jobs to update the production user libraries directly, without having to run KCIJPW2R, update the SYSUT2 DD to point to RK\* instead of the WK\* PARMGEN work libraries, as shown in the example \$PARSEPR job:

```

EDIT      IBM®.userid.LPAR1.WCONFIG($PARSEPR)
Command ==>
000091 /* *****
000092 /* WKANPARU Step: IKANPARU-->WKANPARU
000093 /* Process the PARMGEN members from IKANPARU to WKANPARU based on $CFG*
000094 /* CONFIG and/or converted PARMGEN RTE Batch deck profile settings.
000095 /* *****
000096 //WKANPARU EXEC PGM=KCIPARSE,
000097 // PARM='MV=32000,MAXL=32000,ML=500,MI=255,MS=20000,LV=Y,LG=10'
000098 //STEPLIB DD DISP=SHR,
000099 //          DSN=IBM.TARGET.TKANMOD
000100 //INPUT1  DD DISP=SHR,
000101 // DSN=IBM.ITM62351.LPAR1.IKANPARU
000102 //INPUT2  DD DISP=SHR,
000103 // DSN=IBM.ITM62351.LPAR1.WKANPARU
000104 //WCONFIG DD DISP=SHR,
000105 // DSN=IBM.ITM62351.LPAR1.WCONFIG
000106 //SYSUT2  DD DISP=SHR,
000107 // DSN=IBM.ITM62351.LPAR1.WKANPARU <<<-- change to RKANPARU

```

To test the parameter changes quickly before moving the members from WK\* to RK\* production user-libraries, modify the new USER%%U PROC symbols in the PARMGEN-created started tasks to run from the WK\* libraries.

Complete the following procedure to change configuration parameters.

## Procedure

1. Edit the configuration profile.
  - a. Select the RTE in which you wish to upgrade the product by specifying the fully-qualified name of the RTE (%RTE\_PLIB\_HILEV%. %RTE\_NAME%).
  - b. From the **Workflow - Primary Options Menu**, select **Customize PARMGEN configuration profiles**. The **Customize PARMGEN Configuration Profile Members** panel is displayed.
  - c. Select option 1 to edit the RTE configuration profile. The profile member is displayed.
  - d. Complete the necessary changes. For example, locate the **KDS\_TEMS\_SECURITY\_KDS\_VALIDATE** parameter and change N to Y. Edit the values for all required related parameters, such as **RTE\_SECURITY\_USER\_LOGON** to specify what security system is used to validate Tivoli® Enterprise Portal users.
  - e. Save the changes and return to the **Workflow - Primary Options Menu** panel.
2. Recreate the runtime environment members and jobs.
  - a. From the menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel is displayed.
  - b. Select the \$PARSE (or \$PARSESV) composite job or the appropriate \$PARSE%% library-specific job. The JCL is presented.
  - c. Review the job and make any required adjustments, then submit it and return to the **Workflow - Primary Options Menu** panel.
3. Edit and submit the batch jobs to complete the setup.
  - a. Select **Submit batch jobs to complete PARMGEN setup** from the menu. The **Submit Batch Job to Complete PARMGEN Setup** panel is displayed.

```

KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                                REQ  Job Name  Status  Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
   ** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs    (Yes) KCIJPLOD
4. Run product security steps                (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files     (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs      (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps   (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information.  Type UTIL to access utility menu.

```

- b. If system variables are enabled, select option 5 and submit the KCIJPUPV job.
- c. (Optional, but best practice) Select option 11 and submit the KCIJPCPR job to backup the production libraries.
- d. Select option 12 and submit the KCIJPW2R job to copy the work libraries to the production libraries.

## Result

The configuration profile for the RTE is updated.

## Scenario RTE04: Converting a hub monitoring server to a remote

If you add a high-availability hub, or you clone a runtime environment (RTE) which has a hub monitor server in it, you might need to convert a hub monitoring server to a remote. In addition to converting the monitoring server, you must configure it to report to a hub.

### Before you begin

Launch the PARMGEN Workflow interface as described in .

### Procedure

1. Select the RTE in which you want to convert the monitoring server by specifying the fully-qualified name of the RTE (**RTE\_PLIB\_HILEV** and **RTE\_NAME**).
2. From the Primary Options menu, select **Customize PARMGEN configuration profiles**. The **Customize PARMGEN Configuration Profile Members** panel is displayed.

```

KCIP@PG6 ----- CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS -----
Option ==>
                Quick Configuration Mode
(Required) Customize the RTE profile and the $GBL$USR user profiles:
(Tip) Review KCIJPDLA autodiscovery job in Utility menu or type DLAJOB cmd.

    *1. SYSA RTE LPAR-specific CONFIG profile in WCONFIG (User copy)
    *2. $GBL$USR Global parameters CONFIG profile in WCONFIG (User copy)

(Required) Customize the Variables profile if RTE_SYSV_SYSVAR_FLAG=Y:
    *3. SYSA Variables (system, user) CONFIG profile in GBL_USER_JCL PARMGEN
        global library (TDITN.IDTST.PARMGEN.JCL).
        Add/Modify system/user-defined symbols and their
        resolution values, for override variables used as parameter
        values in the $DOCRTE RTE and $GBL$USR global profiles.

(Tip) Review/Customize WCONFIG Kpp$C*/Kpp$P*/Kpp$S* user imbeds:
(Cloning Tip) Review KCIJPCCF job in Utility menu prior to customization.
    4. WCONFIG TDITN.IDTST.$DOCRTE.WCONFIG

(Tip) Review if you want to compare with IBM-supplied default profile values:

    5. $CFG$IBM RTE LPAR-specific CONFIG profile in WCONFIG (IBM copy)
    6. $GBL$IBM Global parameters CONFIG profile in WCONFIG (IBM copy)

(Optional) Override SYSIN member to supply additional (User) profiles:
    7. $SYSIN $PARSE/$PARSESV SYSIN controls (CONFIG/SELECT MEMBER)

Press F1=Help for more information. Type UTIL to access utility menu.

```

3. Select option 1 to edit the RTE configuration profile.
4. Reconfigure the monitoring server as follows.

#### TUTORIAL INFORMATION

If the environment is enabled for system variables, use variables to configure these values. You will also need to customize the variables profile before returning to the main Workflow panel.

- a. Change the **KDS\_TEMS\_TYPE** value from HUB to REMOTE.

```

ISREDDE2 TSTEST.&userid.LPAR1.WCONFIG(LPAR1)
Command ==>
***** ***** Top of Data *****
000602 KDS$ BEGIN *----- TIVOLI ENTERPRISE MONITORING SERVER -----*
000603 ** *****
000604 ** PARMGEN CONFIG Parameter PARMGEN CONFIG Value
000605 ** *****
000606
000607 ** TEMS configuration values:
000608 KDS_TEMS_TYPE REMOTE * HUB or REMOTE *
***** ***** Bottom of Data *****

```

- b. Do an EXCLUDE FIND on all **KDS\_HUB** references. (For information on the XF ("EXCLUDE FIND") macro, see ["XF edit macro" on page 426.](#)) Then specify the values for the hub to which this remote monitoring server will connect.

```

SP22      TSTEST.&userid.LPAR1.WCONFIG(DEMO)
Command ==> XF KDS_HUB                               Scroll ==> CSR
000829
000830 ** Note: The KDS_HUB_* values populate the xKANPARU(KDCSSITE) member
000831 **      that Remote TEMS reads to know how to connect to its Hub.
000832 KDS_HUB_TEMS_NAME_NODEID      "PLBHUB"
000833
000834 ** If the TEMS is a Remote and requires VTAM SNA support:
000835 KDS_HUB_VTAM_APPL_GLB_BROKER   ""      * Hub KDS_TEMS_VTAM_APPL_GLB_BROKER
000836 KDS_HUB_VTAM_NETID             ""      * Hub KDS_TEMS_VTAM_NETID
000837
000838 ** If the TEMS is a Remote and requires TCP/IP support:
000839 KDS_HUB_TCP_HOST               "OMEGHUB"
000840
000841 ** If the TEMS is a Remote, specify port numbers of its Hub:
000842 KDS_HUB_TCP_PIPE_PORT_NUM       nnnnn  * Hub KDS_TEMS_TCP_PIPE_PORT_NUM
000843 KDS_HUB_TCP_UDP_PORT_NUM        nnnnn  * Hub KDS_TEMS_TCP_UDP_PORT_NUM
000844 KDS_HUB_TCP_PIPE6_PORT_NUM      ""      * Hub KDS_TEMS_TCP_PIPE6_PORT_NUM
000845 KDS_HUB_TCP_UDP6_PORT_NUM       ""      * Hub KDS_TEMS_TCP_UDP6_PORT_NUM
000846 KDS_HUB_TCP_PIPE6S_PORT_NUM     ""      * Hub KDS_TEMS_TCP_PIPE6S_PORT_NUM
000847 KDS_HUB_TCP_PIPE6S_PORT_NUM     ""      * Hub KDS_TEMS_TCP_PIPE6S_PORT_NUM
- - - - - 853 Line(s) not Displayed
***** ***** Bottom of Data *****

```

- c. Press F3 to save the changes and return to the main Workflow panel.
5. Select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV : Create the RTE Members and Jobs** panel is displayed.

**Note:** If you are reconfiguring an RTE in which variables are enabled, the \$PARSESV panel is displayed instead of \$PARSE, as in the following example.

```

KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.

```

6. Select option 1 to submit the generated \$PARSE (or \$PARSESV) composite job.  
The JCL for the \$PARSE (or \$PARSESV) job is displayed.
7. Review the job and submit it, then return to the main Workflow panel.

**Tip:** If you receive a bad return code (over 0004), enter 3s to view detailed status for the job. Use the online help to understand the error messages.

8. From main menu, select **Submit batch jobs to complete PARMGEN setup**  
The **Submit Batch Jobs to Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.
9. Depending upon your environment, complete one of the following sets of steps:
  - If your environment does not have system variables enabled:
    - a. Select option 1 to submit the KCIJPSUB composite submit job, or, to submit each job individually, select the other options.

```

KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP
-----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

Date                Description                REQ Job Name  Status
-----
-----
+
1. Composite SUBMIT job (See JCL comments)      KCIJPSUB
   ** or **

2. Allocate runtime RO and RW datasets          (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs       (Yes) KCIJPLOD
4. Run product security steps                   (Yes) KCIJPSEC
5. Update variable-named runtime mbrs          (No ) KCIJPUPV

6. (Re)Create USS runtime mbrs in RKANDATV     (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files        (Yes) KCIJPUSP
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS

9. Run post-SMP/E RKANMODU ASM/LINK steps      (Yes) KCIJPLNK
10. Verify the configuration jobs               (Tip) KCIJPIVP

11. Back-up RK* product execution user libs    (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs    (Yes) Enter 12 for details.

Press F1=Help for more information.  Type UTIL to access utility menu.

```

If you select option 1, first review the KCIJPSUB job, and edit the job according to which of the conditional jobs need to be submitted automatically.

- If your environment has system variables enabled:
  - a. On the Submit Batch Jobs to Complete PARMGEN Setup, select option 1 if you want to submit the KCIJPSUB composite SUBMIT job, or select the other options to submit each job individually. If you select option 1, review the KCIJPSUB job first and edit the job according to which conditional jobs need be submitted automatically. If you select option 1, you are prompted with the following message:

```

----- PARMGEN MESSAGES
-----
Command ==>

The KCIJVSUB composite job submits several PARMGEN
configuration jobs via TSO SUBMIT commands. Some of
those SUBMIT commands are commented out. Carefully
review the comments in the JCL to determine which
of those jobs you do or do not want to submit.
Uncomment the SUBMIT commands of those jobs that
you want to submit.

Do NOT delete any SUBMIT commands as they may be
needed in the future.

```

- b. Press Enter.  
The following message is displayed:

```

----- PARMGEN MESSAGES
-----
Command ==>

In a system variable environment, job KCIJVSUB runs $PARSESV
to customize then submit the KCIJPSUV job. EDIT and modify
the KCIJPSUV job as appropriate. See comments in the JCL for
further information.

DO NOT MANUALLY SUBMIT THE KCIJPSUV JOB!

```

- c. Press Enter to edit the KCIJPSUB job.  
Jobs that require authorization or are conditional are not submitted automatically. You must either submit them manually, or uncomment them to run automatically.
- d. Press F3, and you are automatically be presented with the KCIJVSUB job for submission.  
Submit the job. Check the status of each of the jobs submitted. The allocation and load jobs must run successfully, or others jobs will not run.

## Result

You have reconfigured the runtime environment's hub monitoring server as a remote monitoring server and connected it to a hub monitoring server running on a different LPAR.

## What to do next

If your KCIJPSYS job is pointing to your own version of the following libraries, you must refresh the production version.

```

GBL_DSN_SYS1_PARMLIB
GBL_DSN_SYS1_PROCLIB
GBL_DSN_SYS1_VTAMLIB
GBL_DSN_SYS1_VTAMLST

```

Restart the remote monitoring server.

## Scenario RTE05: Deleting a product or component from a runtime environment

Occasionally, you might need to remove a product or component from a particular runtime environment. For example, you might want to remove z/OS Management Console, now that it has been incorporated into OMEGAMON for z/OS.

### About this task

The procedure for deleting a product or component is similar to adding a new product as outlined in [“Scenario RTE01: Adding a new product to an existing PARMGEN runtime environment”](#) on page 209. The difference is that here you need to *exclude* an already configured component or product on the Include Products in this PARMGEN RTE panel (KCIP@PGI).

### Procedure

1. Refresh the PARMGEN work environment.  
This step updates interim libraries and recreates the configuration profiles with any new parameters.
  - a. Select the RTE to which you want to add the product by providing the fully-qualified RTE name (RTE\_PLIB\_HILEV and RTE\_NAME).

- b. From the Workflow - Primary Options Menu, select **Set up PARMGEN work environment for an RTE**.

The following message is displayed, notifying you that you need to resubmit the modified KCIJPCFG job after you make changes:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
While configuring an existing RTE profile, you have asked to  
navigate to the KCIJPCFG option to review or make changes to the  
KCIJPCFG job, which was run with highest condition code RC= 00000  
on 2017/07/27. In most cases, if you change any KCIJPCFG  
parameters, you will have to rerun the KCIJPCFG job and certain  
subsequent PARMGEN configuration jobs.  
  
Press ENTER to continue with KCIJPCFG changes.  
  
Press F3 to abort.
```

- c. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
  - d. Press Enter until the **Include Products in this PARMGEN RTE** panel (KCIP@PGI) is displayed.  
Any products already configured into the environment are indicated by a slash (/).
  - e. Deselect (remove the slash next to) any product that you do not want to include in the runtime environment.  
In the following example, z/OS Management Console is being deleted from the RTE, as it has now been incorporated into OMEGAMON for z/OS.

```

----- INCLUDE PRODUCTS IN THIS PARMGEN RTE - Row 1 to 19 of 26
Command ==> Scroll ==> PAGE

Select (/) product(s) to CONFIGURE those product(s) in RTE=PLB1SP13
Products configured in the model RTE have been preselected (/).
Select or deselect products to include or exclude from configuration.

When finished, change "N" to "Y" to confirm selections. Confirm ==> N (Y, N)

  Kpp Product Name/Version
-----
_ KAH System Automation Monitoring Agent V350
_ KC5 OMEGAMON for CICS V550
_ KHL OMEGAMON z/OS Management Console V410

End of data

```

- f. Specify Y in the **Confirm ==>** field then press Enter to continue.  
The following panel is displayed:

```

KICIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES -----
Command ==>

If you changed any JVM RTE configuration values on the
"SET UP/REFRESH PARMGEN WORK ENVIRONMENT" KCIJPCFG navigation
panels, or changed the configured product mix or upgraded product
versions, then you must regenerate/resubmit the KCIJPCFG/KCIJPPRF jobs.
You must also refresh the PARMGEN profiles.

Specify a backup member name for the LPAR RTE to automate the
resubmission and refresh process. A default backup member is provided.
Blank-out the field if you do not want to refresh the profiles.

  DEMO Backup member name ==> _____ (Required for KCIJPPRF)

PARMGEN automatically backs up the RTE profile in
TDITN.IDTST.PARMGEN.WCONBACK, refreshes templates in IK* datasets,
rebuilds the profiles with the new values, merges in the profiles values
from the backed-up LPAR RTE user profile, and generates a delta report.

Press F1 for information about the automated process.

```

- g. Enter a name for the profile backup member.  
The modified KCIJPCFG job is displayed.
- h. Submit the job.  
The KCIJPCFG job submits the KCIJPPRF job, which updates the libraries and merges the backed up profile with z/OS Management Console deleted.
- i. Return to the **Workflow - Primary Options Menu** panel. Wait until both jobs have completed before taking the next step. No return code is displayed for this step on the Workflow main panel until both jobs have completed.
2. Recreate the runtime environment members and jobs.

- a. From the Primary Options Menu, select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PRS) is displayed.

```

KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                                     Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.

```

- b. Select option 1 to submit the generated \$PARSE or \$PARSESV composite job.  
The \$PARSE or \$PARSESV member is presented, depending upon whether or not variables are enabled in the RTE.
  - c. Review the member for any jobs that need to be submitted manually, then submit the job.  
Return to the main Workflow panel.
3. Submit the batch jobs to complete the PARMGEN setup:
    - a. On the Workflow main panel, select **Submit batch jobs to complete PARMGEN setup**.  
The **SUBMIT Submit batch jobs to complete PARMGEN setup** panel (KCIP@SUB ) is displayed.
    - b. Select option 1 to submit the KCIJPSUB composite submit job, or select the other options to submit each job separately.  
If you select option 1, first review the KCIJPSUB job, and edit the job according to which of the conditional jobs need to be submitted automatically.
    - c. Check for good condition codes.
    - d. If you do not receive good condition codes, review the resulting output:
      - \$IVPRPT report, which is stored in the WCONFIG library
      - WSUPERC SYSTSPRT report, which is stored in the WSUPERC sequential library

**Note:** The WSUPERC step will encounter an informational condition code of 4 if OMEGAMON® AI for Db2 is not configured in this runtime environment as there are no xKD2\* libraries to compare.

- e. Correct any errors, and rerun any jobs that did not complete successfully.

## Result

The product is removed from the RTE.

## Scenario RTE06: Deleting a runtime environment

Occasionally, you may want to delete an entire runtime environment (RTE). For example, you may want to decommission a test RTE, or an ICAT RTE that you have converted to PARMGEN.

### About this task

There are two means of deleting an RTE: from the **List of Runtime Environments (RTEs)** panel, and from the **Access PARMGEN Utilities** panel.

From the **List of Runtime Environments (RTEs)** panel you delete any RTE except the currently selected RTE.

From the **Access PARMGEN Utilities** panel, you can delete only the currently selected RTE.

All the libraries are deleted, except for the persistent data store libraries. These libraries are deliberately *not* deleted to accommodate another Tivoli Enterprise Monitoring Server in another runtime environment that uses the same sysplex-level persistent data store libraries.

If you think you might want to recreate the RTE at another time, back up the WK\* work libraries. Backing up the work libraries means that you can easily recreate the RTE by running the \$PARSE job to recreate the runtime members and jobs and then submitting the appropriate batch jobs to complete the setup of the RTE.

## Procedure

- To delete an RTE from the **Runtime Environments (RTEs)** panel, complete the following steps.
  - a. Enter a question mark (?) in the RTE\_NAME field on the Workflow main panel.  
The **Runtime Environments (RTEs)** panel is displayed.
  - b. Type D next to the name of the RTE or RTEs that you want to delete, then press Enter.  
A message is displayed warning you that the RTE is about to be deleted without possibility of recovery.
  - c. Press Enter to delete the RTE.
- To delete an RTE from the **Access PARMGEN Utilities** panel, complete the following steps.
  - a. Enter UTIL on the command line of any Workflow panel.  
The **Access PARMGEN Utilities** panel is displayed.
  - b. Select **Delete RTE: %RTE\_NAME%** (option 25)  
A message is displayed warning you that the RTE is about to be deleted without possibility of recovery.
  - c. Press Enter to delete the RTE.

## Deployment scenarios

---

After you have configured one or more runtime environments, you can clone them and deploy them to other LPARs. Cloning runtime environments allows you to deploy environments with considerably less customization.

## Cloning an existing PARMGEN runtime environment

You can quickly create a new runtime environment (RTE) by cloning an existing one that is already configured to your requirements and then modifying the configuration as required for the new RTE, for example by converting a hub monitoring server to a remote.

## Defining the runtime environment

To identify the runtime environment (RTE) that you want to configure, you specify the name of the RTE, the library where the JCL for the configured runtime environments (RTEs) is stored, and the high-level qualifier that together with the RTE name uniquely identifies the data sets for this RTE.

## Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```

KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM

```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```

KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV: _____ / _____ /
                                HLQ of SMP/E target (TK*) datasets  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:

```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the values for the new RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARAMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIQPGB) is displayed.

```

KCIQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                      Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.   SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.          POSTCFG
R   Create next RTE - Reset fields.           New RTE

```

## Setting up the work environment

The work environment for a cloned runtime environment (RTE) is based upon the values inherited from the existing RTE. You can then modify those values to customize the new RTE. For example, you can add new products or convert a hub monitoring server to a remote.

### About this task

To base a new RTE upon an existing RTE, you identify the RTE you want to clone, so that the configuration software can import values from that RTE.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```

KCIQPGB1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:    +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> //  MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /** \_~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)

```

- In the first field, specify the fully-qualified name of the RTE configuration profile of the existing RTE that you want to clone: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).
- Review the following fields and make any changes required.

#### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*.TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

- Press Enter to proceed to the next panel.  
The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed.

```

KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:
  UNIT   /  STORCLAS /
  VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: IBM.TARGET.ITM63055_____ / _____ /
                  HLQ of SMP/E target (TK*) datasets  _____ /
GBL_SYSDA_UNIT:   SYSDA___
                  Work datasets UNIT name
GBL_REGION:       OM_____
                  JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

- Review the values on the panel and override them as necessary. Make sure that the **GBL\_TARGET\_HILEV** points to the libraries from which you executed TKANCUS for the new RTE.

#### GBL\_TARGET\_HILEV

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

#### GBL\_SYSDA\_UNIT

Specifies the non-VSAM disk UNIT for global work data sets.

#### GBL\_REGION

Specifies the JCL REGION value override if other than the REGION=OM value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, OM). The default is OM.

- Press Enter to proceed to the next panel.  
The **Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed. The values on this panel are taken from the RTE that you are cloning, including any symbolics, if variables were enabled on that RTE.

KCIP@PG3 ---- SET UP PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----  
 Command ==> Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.  
 Press F1=Help for more information.

More: -

```

RTE_DESCRIPTION: -----
RTE_SMS_PDSE_FLAG:      Y (Y, N) (Allocate Non-VSAM PDSE libs)
RTE_SMS_UNIT:          ----- (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:        ----- (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:      ----- (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:      ----- (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME:   ----- (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: ----- (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: ----- (VSAM disk STORCLAS)

RTE_TYPE:              FULL_____ (FULL, SHARING)
RTE_HILEV:             TDITN.IDTST_____
                      (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:        TDITN.IDTST_____
                      (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If RTE_TYPE is SHARING:
  RTE_X_HILEV_SHARING: -----
                      (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
  RTE_SHARE:           ----- ("SMP" value or *&rte_share)
                      (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
  RTE_LOAD_SHARED_LIBS: Y (Y, N) (Is RTE updaters of R0 shared libs)

If symbolics (system variables or user-defined variables) will be used:
  RTE_SYSV_SYSVAR_FLAG: N (Y, N) (System variable flag)
  RTE_X_SYSV_OVERRIDE_SYMBOLS: N (Y, N) (Override local system symbols)

Security settings:
  RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
  RTE_SECURITY_FOLD_PASSWORD_FLAG: Y (Y, N) (Fold password to upper case)
  RTE_SECURITY_CLASS: -----
  RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
  GBL_DSN_ACF2_MACLIB: -----
  GBL_DSN_ACF2_MACLIB1: -----

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
  RTE_TEMS_CONFIGURED_FLAG: _____ (Y, N) (Configure TEMS in this RTE)
  RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g.,IDTEST:cms)
  KDS_TEMS_TYPE:          HUB_____ (Hub, Remote)
  KDS_TEMS_HA_TYPE:       --_____ (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
  RTE_TCP_PORT_NUM:      1918_____ (1-65535 port number)
  RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
  RTE_STC_PREFIX:        IBM_____ (1-4 char.started task prefix)
  
```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Note the **More: +** which indicates that there is additional content on the panel.)

7. Review the parameter values and provide any LPAR-specific values for the new RTE. For example, you might want to change the description of the RTE, or change the monitoring server type from a hub to a remote.  
 If support for variables is enabled, you do not need to made any changes to this panel. If variables are not enabled, you must make the following changes:

- Change the value of **RTE\_TEMS\_NAME\_NODEID** to the host name of the new RTE (*old\_rte*:CMS changed to *new\_rte*:CMS).
- If this is a shared DASD environment, you must modify the following parameters to keep them unique:
  - **RTE\_VTAM\_APPLID\_PREFIX**
  - **RTE\_STC\_PREFIX**

If you make changes to any of the following RTE parameters on this panel, you must make the same changes to the corresponding product-specific parameters in the RTE profile (for example, **\*\_STC\_PREFIX**), as the values of those parameters will be inherited from the cloned RTE.

- **RTE\_SMS\_UNIT**
- **RTE\_SMS\_VOLUME**

- RTE\_SMS\_MGMTCLAS
- RTE\_SMS\_STORCLAS
- RTE\_SMS\_VSAM\_VOLUME
- RTE\_SMS\_VSAM\_MGMTCLAS
- RTE\_SMS\_VSAM\_STORCLAS
- RTE\_HILEV
- RTE\_VSAM\_HILEV
- RTE\_SECURITY\_USER\_LOGON
- RTE\_TEMS\_NAME\_NODEID
- RTE\_TCP\_PORT\_NUM
- RTE\_VTAM\_APPLID\_PREFIX
- RTE\_STC\_PREFIX

8. Press Enter to proceed to the next panel.

The **Include Products in this PARMGEN RTE** panel (KCIP@PGI) is displayed. This panel lists all the products installed in the product target library. The products configured in the RTE you are cloning are indicated by a slash (/).

```
KCIP@PGI ----- INCLUDE PRODUCTS IN THIS PARMGEN RTE - Row 1 to 19 of 26
Command ==>                                     Scroll ==> PAGE

Select (/) product(s) to CONFIGURE those product(s) in RTE=$DOCRTE
All installed products have been preselected (/).
Select or deselect products to include or exclude from configuration.

When finished, change "N" to "Y" to confirm selections. Confirm ==> N (Y, N)

  Kpp Product Name/Version
  -----
  / KAH System Automation Monitoring Agent V350
  / KC5 OMEGAMON for CICS V550
  / KD0 Tivoli Decision Support for z/OS Agent V181
  / KDS Tivoli Enterprise Monitoring Server V630
  / KD4 ITCAM for SOA Agent V711
  / KD5 OMEGAMON AI for DB2 V610
  / KGW OMEGAMON for CICS TG V550
  / KI5 OMEGAMON for IMS V550
  / KJJ OMEGAMON for JVM V540
  / KMC OMEGAMON for Messaging - WebSphere MQ Configuration V730
  / KMQ OMEGAMON for Messaging - MQ V750
  / KM5 OMEGAMON for z/OS V550
  / KNA NetView for z/OS Agent V621
  / KN3 OMEGAMON for Networks V550
  / KOB OMEGAMON Enhanced 3270 User Interface V750
  / KQI OMEGAMON for Messaging - Integration Bus V750
  / KRG Advanced Audit for DFSMSHsm Agent V260
  / KRH Advanced Reporting and Management for DFSMSHsm Agent V260
  / KRJ Advanced Allocation Management Agent V330
  / KRK Automated Tape Allocation Manager for z/OS Agent V330
  / KRN Advanced Catalog Management Agent V260
  / KRV Advanced Backup and Recovery for z/OS Agent V240
  / KRW Tape Optimizer for z/OS Agent V220
  / KS3 OMEGAMON for Storage V540
  / KYN ITCAM for Application Diagnostics, TEMA V710.03
  End of data
```

9. Deselect (by removing the slash) any products that you do not want to include in the new RTE. (For example, you might not want to configure another instance of the OMEGAMON enhanced 3270 user interface in this RTE.) Select any products that you want to add to the new RTE.
10. Change Confirm ==> N to Confirm ==> Y to confirm your choices, then press Enter. The modified JCL for the KCIJPCFG job is displayed.
11. Review the JCL to understand what the job is doing, then submit the job and return to the Workflow - Primary Options Menu.

The KCIJPCFG job submits the KCIJPPRF job, which updates the work libraries and merges the values from the existing RTE. You will see a status of SUBMITTED until both jobs have completed. Do not proceed to the next step until you see a successful return code.

## Result

The configuration software allocates the work libraries, creates the configuration profiles with values taken from the model RTE or specified on the KCIP@PG3 panel, and populates the PARMGEN templates in IKAN\* libraries with runtime members for the products that are selected for configuration.

## What to do next

Now you can review or customize the configuration profiles for the RTE.

## Customizing the configuration profiles

The amount of editing required to customize the configuration profiles for the new runtime environment (RTE) depends upon how much the new RTE differs from the RTE you are cloning it from. Presumably, you are cloning the RTE because you want the new RTE to have the same values as the RTE you are cloning it from, so the configuration should be minimal, especially in a variable-enabled RTE. You can clone the customized WCONFIG members, including the global configuration profile, from the model RTE and copy its variables profile. You can also clone any customized data such as situation definitions or enhanced 3270 user interface profiles or workspace definitions. However, there are a few LPAR-specific values you must change in the RTE configuration profile of the new RTE.

## About this task

In the RTE configuration profile, make the following changes:

- Replace any occurrences of the RTE name with the name of the new RTE.
- If there is a monitoring server configured in this RTE, modify the IP host name to the IP host where the agents and monitoring server will run.
- If you changed the **RTE\_STC\_PREFIX** and **RTE\_VTAM\_APPLID\_PREFIX** on the KCIPQPG3 panel, make the same changes to the corresponding agent parameters:
- If you changed a hub monitoring server to a remote, configure the remote monitoring server parameters that define where the hub is.
- Customize any the parameter values for any agents or framework component that are specific to this RTE.

To use the override embeds and \$GBL\$USR member already customized for the RTE you are cloning, use the KCIJPCCF job to clone the customized members. Then, review the cloned \$GBL\$USR member and make any required RTE-specific changes. At a minimum, you must customize the **GBL\_HFS\_JAVA\_DIR1** parameter to a site-appropriate value. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

To copy other customized data from the model RTE, use the KCIJPCLN job. The job must be run after the \$PARSE job is run. See [“How to: Clone customized data from an existing RTE” on page 484](#) for more information on running this job.

If variables are supported in the RTEs, replace the contents of the variables profile of the new RTE with the contents of the variables file for the RTE you are cloning (copy %GBL\_USER\_JCL%(%OLD\_RTE%) to %GBL\_USER\_JCL%(%NEW\_RTE%)).

## Procedure

1. Select **Customize PARMGEN configuration profiles** from the Workflow main options menu. The Customize PARMGEN Configuration Profile Members panel is displayed.

```

KCIP@PG6 ----- CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS -----
Option ==>
                Quick Configuration Mode
(Required) Customize the RTE profile and the $GBL$USR user profiles:
(Tip) Review KCIJPDLA autodiscovery job in Utility menu or type DLAJOB cmd.

    *1. SYSA RTE LPAR-specific CONFIG profile in WCONFIG (User copy)
    *2. $GBL$USR Global parameters CONFIG profile in WCONFIG (User copy)

(Required) Customize the Variables profile if RTE_SYSV_SYSVAR_FLAG=Y:
    *3. SYSA Variables (system, user) CONFIG profile in GBL_USER_JCL PARMGEN
        global library (TDITN.IDTST.PARMGEN.JCL).
        Add/Modify system/user-defined symbols and their
        resolution values, for override variables used as parameter
        values in the $DOCRTE RTE and $GBL$USR global profiles.

(Tip) Review/Customize WCONFIG Kpp$C*/Kpp$P*/Kpp$S* user imbeds:
(Cloning Tip) Review KCIJPCCF job in Utility menu prior to customization.
    4. WCONFIG TDITN.IDTST.$DOCRTE.WCONFIG

(Tip) Review if you want to compare with IBM-supplied default profile values:

    5. $CFG$IBM RTE LPAR-specific CONFIG profile in WCONFIG (IBM copy)
    6. $GBL$IBM Global parameters CONFIG profile in WCONFIG (IBM copy)

(Optional) Override SYSIN member to supply additional (User) profiles:
    7. $SYSIN $PARSE/$PARSESV SYSIN controls (CONFIG/SELECT MEMBER)

Press F1=Help for more information. Type UTIL to access utility menu.

```

2. Type DLAJOB in the command line and press Enter to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.
3. Select option 1 to edit the RTE configuration profile as follows.
  - Do a **CHANGE ALL** to replace the name of the cloned RTE with the name of the new RTE.
  - If there is a monitoring server configured in this RTE, do an **EXCLUDE FIND** on TCP\_HOST and change the host name of the cloned RTE to the IP host name for this RTE. This change reconfigures the agents and components to report to the local monitoring server.
  - If this RTE shares DASD with the RTE it was cloned from, change all occurrences of **Kpp\_VTAM\_APPLID\_PREFIX** and **Kpp\_STC\_PREFIX** to ensure that these values are unique.
  - If you changed a hub monitoring server to a remote when you cloned the RTE, perform an **EXCLUDE FIND** on all references to KDS\_HUB and change the value of these parameters to the hub values. For example, change **KDS\_HUB\_TEMS\_NAME\_NODEID** to the name of the hub monitoring server and **KDS\_HUB\_TCP\_HOST** to the hub's IP host name.
  - If you intend to clone customized data using the KCIJPCLN job, set the following two parameters to the appropriate values:
    - **RTE\_CLONE\_FROM\_HLQRTE**
    - **RTE\_CLONE\_FROM\_VSAM\_HLQRTE**
  - Customize any agent parameter values specific to this RTE. At a minimum, you must configure the following parameters.
    - If OMEGAMON® AI for Db2 is configured:
      - **KD2\_DBnn\_DB2\_SSID**
      - **KD2\_DBnn\_DB2\_VER**
    - If OMEGAMON for IMS on z/OS is configured:
      - For each subsystem, uncomment the following block of parameters.

```

KI2_I1          BEGIN          * Table begin *
KI2_I101_ROW    01
KI2_I101_CLASSIC_XMIT 00
KI2_I101_CLASSIC_IMSID IMSA * Not eligible for symbolics *
KI2_I101_CLASSIC_STC  IBMOIO

```

KI2_I101_CLASSIC_IMS_RESLIB	DFS.V12R0M0.SDFSRESL	
KI2_I101_CLASSIC_MPREFIX	M0	
KI2_I101_CLASSIC_VTAM_NODE	CTDOI0N	
KI2_I101_CLASSIC_VTAM_APPL_LOGON	CTDOI0	
KI2_I101_CLASSIC_LROWS	255	
KI2_I101_CLASSIC_USER_PROFILE	/C	
KI2_I101_CLASSIC_CTRL_UNIT_ADDR	XXXX	
KI2_I1	END	* Table end *

- At a minimum, customize the following two parameters:
    - **KI2\_I101\_CLASSIC\_IMSID**
    - **KI2\_I101\_CLASSIC\_IMS\_RESLIB**
  - If OMEGAMON for Networks is configured in the RTE, for each monitored TCP/IP stack customize the following parameters:
    - **KN3\_TCPXnn\_TCPIP\_PROFILES\_DSN**
    - **KN3\_TCPXnn\_TCPIP\_PROFILES\_MBR**
4. Press F3 to save the changes and return to the Customize PARMGEN Configuration Profile Members panel.
  5. Clone the customized WCONFIG files from the RTE you are cloning.
    - a. Enter **UTIL** on the command line.  
The **Utilities** panel is displayed.
    - a. Select option 24 (Clone customized WCONFIG members).  
The KCIJPCCF JCL is displayed.
    - b. Review the JCL to ensure that the //OLDWCNFG DDNAME is set to the WCONFIG of the RTE you are cloning.
    - c. Submit the job and return to the Customize PARMGEN Configuration Profile Members panel.
  6. Edit the cloned \$GBL\$USR profile as follows:
    - a. From the **Customize PARMGEN Configuration Profile Members** menu, select option 2.
    - b. Customize the GBL\_HFS\_JAVA\_DIR1 parameter with a site-appropriate value. [Customizing the global configuration profile](#),
    - c. If password encryption (KAES256) is enabled, set the value for the ICSF system library: **GBL\_DSN\_CSF\_SCSFMODE0**.
    - d. Edit the following product-specific parameters.
      - If OMEGAMON® AI for Db2 is configured in the RTE:
        - Uncomment and customize the following parameters as applicable to your Db2 environment:
          - **GBL\_DSN\_DB2\_SDSNLOAD**
          - **GBL\_DSN\_DB2\_LOADLIB\_V11**
          - **GBL\_DSN\_DB2\_LOADLIB\_V12**
          - **GBL\_DSN\_DB2\_RUNLIB\_V11**
          - **GBL\_DSN\_DB2\_RUNLIB\_V12**
          - **GBL\_DSN\_DB2\_DSNEXTIT**
      - If OMEGAMON for CICS TG is configured, uncomment and customize the following parameter:
        - **GBL\_DSN\_CICS\_CTG\_DLL**
      - If OMEGAMON for IMS on z/OS is configured, uncomment and customize the following parameter:

- **GBL\_DSN\_IMS\_RESLIB**
  - If OMEGAMON for Messaging on z/OS is configured, uncomment and customize the following parameters:
    - **GBL\_DSN\_WMQ\_SCSQANLE**
    - **GBL\_DSN\_WMQ\_SCSQAUTH**
    - **GBL\_DSN\_WMQ\_SCSQLOAD**
7. Press F3 to save the changes and return to the **Customize PARMGEN Configuration Profile Members** panel.
  8. If support for variables is enabled, replace the contents of the variables profile of the new RTE with the contents of the variables profile for the RTE you are cloning.
    - a. Select option 3. The variables profile for the new RTE is opened in edit mode.
    - b. Delete the contents of the profile using the standard TSO command.
    - c. Replace the contents of the profile with the contents of the variables profile of the cloned RTE.
  9. Press F3 to save the changes, then press F3 to return to the main Workflow panel.

## Creating the runtime environment members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job (or \$PARSESV if variable support is enabled). This job generates a set of jobs that extract the profile parameter values specified during set up and in the configuration profiles. The jobs then generate the runtime environment (RTE) members and jobs required to complete the creation of the RTE.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
   reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
   WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information.  Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job.

### Result

The runtime members and jobs are created.

### What to do next

Submit the jobs to complete the set up of the RTE.

## Completing the PARMGEN setup

To complete the setup of the runtime environment using the Parameter Generator configuration software, you submit the batch jobs created by the \$PARSE job in the previous step. These jobs allocate the runtime libraries,

copy members from the target libraries to the runtime libraries, run required security jobs, and the like, using the values you supplied during the configuration process. You will have to complete additional tasks outside of the configuration software.

## Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```
KCIPQPGB  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE    Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT    Enter 4 for details.
5. Perform post configuration steps.         POSTCFG
R Create next RTE - Reset fields.           New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.
```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4. Run product security steps              (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs          (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

More: +

Press F1=Help for more information.  Type UTIL to access utility menu.
```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

2. Choose one of the following approaches.
  - To submit the full set of actions within a single job, choose option 1.
  - To submit each action individually in turn, choose options 2 through 12, as required.

Note that some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization. If you decide to submit all the jobs automatically, submit the composite KCIJPSUB job. Otherwise, submit the jobs individually.

## KCIJPALO

This required job allocates the RK\* runtime libraries for all the products and components in the runtime environment.

## KCIJPLOD

This required job copies members of the target libraries that were installed by SMP/E to the read-only RK\* libraries.

The job also deletes any runtime members from the different libraries based on the product versions' FMID requirements if, for example, the latest version of the product removes or renames any SMP/E elements. If any of the libraries listed in the DELRUN DDNAME is part of the system link libraries, or the library may be in use, the KCIJcLOD RTE load job may not be able to delete these elements if the libraries are enqueued. If either of these situations is true, run the BUILDDEX/DELRUN step when those libraries are available.

## KCIJPSEC

This job is required if the product-specific IBM®-supplied security exit or input must be customized. The job creates security-related members (load modules, encryption key, and other elements) based on the product security requirements.

Review the *KppSUPDI* "Modify Classic command table" security steps. The *KppJPSCO* input members to the composite KCIJPSEC security job point SYSIN DD to your security exit library (RTE\_X\_SECURITY\_EXIT LIB). Also see the RTE\_X\_SECURITY\_EXIT\_LIB parameter in the RTE profile.

## KCIJPUSP

This job is required if you are configuring at least one product that requires z/OS UNIX. The job creates the z/OS UNIX-related members in the RKANDATV runtime library for use in the composite KCIJPUSS job.

**Tip:** This job is required if you enabled the self-describing agent feature.

## KCIJPUSS

This job is required if you are configuring at least one product that requires z/OS UNIX. The job creates the Hierarchical File System (HFS) or the zSeries File System (zFS) directories and subdirectories, and copies files to HFS or zFS.

**Tip:** This job is required if you enabled the self-describing agent feature.

## KCIJPSYS

This job copies the product started tasks and VTAM major node members for the products and components into system libraries, and assembles and links product modules into system libraries. The job requires write access to system libraries.

## KCIJPLNK

The job assembles and links elements into the SYSLMOD RKANMOD\* load library.

## KCIJPUPV

If system variables are enabled (RTE\_SYSV\_SYSVAR\_FLAG = Y), this job must be submitted in the target LPAR where the symbolics are resolved. This job populates variable-named members contained in the application-specific *KppJPUPB* composite IEBUPDTE members in the WK\* work output libraries. See the KCIP@SUB help panels for more information.

## KCIJPCPR

This job clones the existing production runtime user libraries (RK\*).

## KCIJPW2R/KCIJPW1R

These jobs (Option 12) copies the WK\* work output libraries to the respective production RK\* runtime libraries. If you do not run this job, you must copy the work output libraries to the runtime libraries by some other method, following your normal change control process. If you run either of these jobs, run KCIJPCPR to back up the RK\* production libraries. KCIJPW2R is run by default when the composite submit job KCIJPSUB is run. KCIJPW2R replaces all RK\* members with members from WK\*. It will leave non-PARMGEN managed members in RK\* libraries. KCIJPW1R deletes all RK\* members except for the ones that are added in the IBM provided WKANSAMU(KCI\$IW2R) and user defined WCONFIG(KCI\$XW2R) exclude lists, and then copies WK\* members to RK\* libraries. Users must add members they want saved to their RTE WCONFIG(KCI\$XW2R) member.

3. If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

## Result

The new RTE is created.

## What to do next

Complete any configuration required outside of the configuration software. To see the required steps, return to the Workflow - Primary Option Menu and select **Perform post configuration steps**. This option displays a set of readme files that describe the additional configuration steps that must be taken for the components and products that are configured in this RTE. For additional information, see [Completing the configuration outside the configuration software](#) and the *Planning and Configuration Guide* for each of the configured products.

## Cloning an existing runtime environment

You can clone an existing PARMGEN runtime environment to create a new environment that runs on a different LPAR but uses the same values and has the same products configured. In this scenario, nothing changes, except LPAR-specific values.

### Before you begin

This scenario uses the PARMGEN Workflow user interface to set up the work environment, customize profiles, and create and submit the jobs that create the runtime environment RTE). For instructions on launching the interface, see [“Accessing the Workflow menu” on page 428](#).

### About this task

In this scenario, you use the configuration values from one PARMGEN runtime environment to create another on a different LPAR. There are 8 main steps involved in the scenario:

1. Set up the PARMGEN work environment for the new runtime environment.
2. Clone customized WCONFIG library members from the model runtime environment to the WCONFIG library for the new runtime environment.
3. Update the interim libraries and create the PARMGEN configuration profiles.
4. Merge the configuration profile parameter values from the model runtime environment into the new one.
5. Customize the configuration profiles for the new environment.
6. Validate the profile parameter values.
7. Create the runtime members and jobs.
8. Submit the jobs to complete create the runtime environment.

If the LPAR on which the new runtime environment is being configured does not share DASD with the LPAR on which the runtime environment will run, the PARMGEN libraries must be copied to the target LPAR. (See [PARMGEN transport scenarios](#) for more information.) Where each of these steps is performed depends on the transport method being used to deploy the new environment.

**Note:** In this scenario, system variables are not enabled. If you intend to clone an environment which uses system variables, see [“Cloning an existing environment with system variables enabled” on page 876](#).

## Procedure

1. Set up the PARMGEN work environment for the new RTE.
  - a. On the PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU (KCIPQPGA) panel, specify the parameters to identify the new RTE and press Enter.

Note that if you did not invoke the R (RESET) option, the values for GBL\_USER\_JCL, RTE\_PLIB\_HILEV, and RTE\_NAME are carried forward from the last environment you created. If the values for the GBL\_USER\_JCL library and the high-level qualifier for the work libraries are correct, change the RTE\_NAME to the name you want to use for the new environment.

### GBL\_USER\_JCL

Specify the dataset name of the PARMGEN global user JCL library for the new runtime environment. If the dataset does not exist, you are prompted to correct the name or allocate the data set.

### RTE\_PLIB\_HILEV

Specify the non-VSAM high-level qualifier you want to use for the PARMGEN work libraries for the new runtime environment.

### RTE\_NAME

Unique name for the runtime environment you are configuring. The name you specify is appended to the RTE\_PLIB\_HILEV values to make each set of PARMGEN and runtime libraries unique.

The PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU (KCIPQPGB) panel is displayed.

- b. Select option 1 from the menu.  
The Set up PARMGEN Work Environment for an RTE (1 of 1) (KCIPQPG1) is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>

                                Quick Configuration Mode                                More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
(Type ? for last referenced JOBGEN library discovered, if any.)
```

- c. Complete the fields as appropriate, then press Enter to continue.

### RTE model profile

The information you provide in the RTE model profile field determines what jobs the configuration software will run after the work environment is set up. To create (clone) an RTE based on an already configured PARMGEN RTE, provide the WCONFIG profile library and member name for that RTE (for example: *hilev.rte.WCONFIG(rte\_name)*, where *rte\_name* is the member you want to clone from).

If a value is supplied, PARMGEN queries the member to determine what products or components are already configured within the RTE to tailor the configuration parameters set. If the specified data set or member does not exist, you are prompted to correct the name.

## Install Job Generator (JOBGEN) output library

Specify the Install Job Generator (JOBGEN) output library if you want PARMGEN to reuse parameter values from the JOBGEN output library repository. These are values such as the jobcard, CALLLIBS override data, and other CSI values such as:  
If the specified dataset does not exist, you are prompted to correct the name.

**Note:** For more information about the JOBGEN output library, refer to the Installation Job Generator Utility section in the product's Program Directory.

## Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If a job card is not available and if you did not specify a JOBGEN output library, the job card is harvested from the &gbl\_target\_hilev.TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from there. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                                Quick Configuration Mode
                                More:      +

Specify the RTE model profile to use:

=> &hlq.&rte.WCONFIG(&clone_from)-----

- To create an RTE from scratch, leave this field blank.
- To create an RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create an RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create an RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(&rte_name))

- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITN.IDTST.DEMO.WCONFIG(&rte_name))

Customize jobcard data:
=> //KCIJPPGN JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
=> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
=> /***  0 0  RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
=> /***  \~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
=>
   (Type ? for last referenced JOBGEN library discovered, if any.)
```

- d. Press Enter to proceed to the next panel.  
The Set Up PARMGEN Work Environment for an RTE (2 OF 3) panel (KCIP@PG2) is displayed.

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                                Quick Configuration Mode
GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:

                                UNIT / STORCLAS /
                                VOLSER / MGMTCLAS /
GBL_TARGET_HILEV: IBM.TARGET.ITM63055_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets _____ / _____ /

GBL_SYSDA_UNIT:  SYSDA___
                   Work datasets UNIT name

GBL_REGION:      OM_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

- e. Review the values for GBL\_TARGET\_HILEV and GBL\_SYSDA\_UNIT and correct them if necessary. These values for the parameters on this panel are read from the RTE you are cloning from. You might want, for example, the new RTE to point to a different set of target libraries which has newer versions of the products installed.
- f. Press Enter to proceed to the next panel. The third setup panel (KCIP@PG3) is displayed. Depending on your screen resolution, you may have to scroll down (PF8) to see all the parameters. (Note the More: + indicator.)

KCIP@PG3 ---- SET UP PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----  
 Command ==> Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=&rte\_name.  
 Press F1=Help for more information.

More: +

RTE\_DESCRIPTION: &rte\_name-----  
 RTE\_SMS\_PDSE\_FLAG: N (Y, N) (Allocate Non-VSAM PDSE libs)  
 RTE\_SMS\_UNIT: ----- (Non-VSAM disk UNIT type)  
 RTE\_SMS\_VOLUME: ----- (Non-VSAM disk VOLSER)  
 RTE\_SMS\_MGMTCLAS: MCSTD\_\_\_\_\_ (Non-VSAM disk MGMTCLAS)  
 RTE\_SMS\_STORCLAS: SCTSTEST\_\_ (Non-VSAM disk STORCLAS)  
 RTE\_SMS\_VSAM\_VOLUME: MCSTD\_\_\_\_\_ (VSAM disk VOLSER)  
 RTE\_SMS\_VSAM\_MGMTCLAS: ----- (VSAM disk MGMTCLAS)  
 RTE\_SMS\_VSAM\_STORCLAS: SCTSTEST\_\_ (VSAM disk STORCLAS)

RTE\_TYPE: FULL\_\_\_\_\_ (FULL, SHARING)  
 RTE\_HILEV: TDITN.IDTST\_\_\_\_\_ (&hlq portion of Non-VSAM RK\* HLQ=&hlq.&rte\_name)  
 RTE\_VSAM\_HILEV: TDITN.IDTST\_\_\_\_\_ (&hlq portion of VSAM RK\* HLQ=&hlq.&rte\_name)

If RTE\_TYPE is SHARING:

RTE\_X\_HILEV\_SHARING: \_\_\_\_\_ (&hlq portion of shared RTE's HLQ=&hlq.&rte\_share)  
 RTE\_SHARE: \_\_\_\_\_ ("SMP" value or \*&rte\_share)  
 (\*&rte\_share portion of shared RTE's HLQ=&hlq.&rte\_share)  
 RTE\_LOAD\_SHARED\_LIBS: Y (Y, N) (Is RTE updater of R0 shared libs)

If symbolics (system variables or user-defined variables) will be used:

RTE\_SYSV\_SYSVAR\_FLAG: N (Y, N) (System variable flag)

Security settings:

RTE\_SECURITY\_USER\_LOGON: NONE\_\_\_\_\_ (RACF, ACF2, TSS, NAM, None)  
 RTE\_SECURITY\_FOLD\_PASSWORD\_FLAG: Y (Y, N) (Fold password to upper case)  
 RTE\_SECURITY\_CLASS: -----  
 RTE\_X\_SECURITY\_EXIT\_LIB: TSTEST.&userid.&clone\_from.RKANSAMU\_\_\_\_\_  
 GBL\_DSN\_ACF2\_MACLIB: -----  
 GBL\_DSN\_ACF2\_MACLIB1: -----

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:

RTE\_TEMS\_CONFIGURED\_FLAG: Y (Y, N) (Configure TEMS in this RTE)  
 RTE\_TEMS\_NAME\_NODEID: &clone\_from:CMS \_\_\_\_\_ (e.g.,CLONETST:cms)  
 KDS\_TEMS\_TYPE: HUB\_\_\_\_ (Hub, Remote)  
 KDS\_TEMS\_HA\_TYPE: -- (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:

RTE\_TCP\_PORT\_NUM: 1918\_\_\_\_\_ (1-65535 port number)  
 RTE\_VTAM\_APPLID\_PREFIX: TS1\_\_\_\_\_ (1-4 char.VTAM APPLID prefix)  
 RTE\_STC\_PREFIX: TSS1\_\_\_\_\_ (1-4 char.started task prefix)

Note: Type BACK to go back one panel.

Any changes made on this panel are preserved when the existing RTE is cloned, but not all changes are inherited by the corresponding component and product-specific parameters in the RTE profile of the new RTE. If you change any of the following parameters, you must edit the corresponding product and component parameters in the RTE profile to the same values as you specify here.

- Started task prefix
- VTAM applid prefix
- Port number
- RTE high-level qualifier
- VSAM high-level qualifier

At a minimum, make the following changes to convert the new RTE to a sharing RTE with a remote monitoring server that connects to the hub in the cloned-from RTE:

- i. Change the type of runtime environment to Sharing-with-SMPE by setting RTE\_TYPE to SHARING and RTE\_SHARE to SMP.
- ii. Change RTE\_TEMS\_NAME\_NODEID to &rte\_name:CMS.
- iii. (Optionally) Change RTE\_X\_SECURITY\_EXIT\_LIB to TSTEST.&userid.&rte\_name.RKANSAMU. If you are sharing the same security settings and permission as the model runtime environment, you can use the same library.

- iv. Convert the hub to a remote by setting KDS\_TEMS\_TYPE to REMOTE.
- g. Press Enter to proceed to the next panel.  
The Include Products in this PARMGEN RTE panel (KCIP@PGI) is displayed.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE

Select ("S" or "/" ) products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)

End of data
```

This panel lists the products installed in the runtime environment and therefore available for configuration.

This panel lists all the installed products that are available for configuration by product code (*Kpp*) and product name and version. The products marked with a slash (/) are the ones already configured in the RTE being cloned, but the version represents the latest version available. If you include these products, they will be upgraded to the version in the target libraries. In this example, a monitoring server, OMEGAMON for z/OS, OMEGAMON for CICS, and the OMEGAMON enhanced 3270 user interface are already configured.

- h. If you want to install additional products, select them by typing a slash next to the product code. Deselect any products you do not want to include in the new RTE. Then, change **Confirm ==> N** to **Confirm ==> Y** and press Enter.  
The KCIJPCFG job is displayed, tailored with the values you have configured.
  - i. Review the notes and values and submit the job, then return to the Workflow main panel.
2. (Optional) Clone customized members from the model runtime environment (&clone\_from).
- a. Type U or UTIL from the Workflow main menu.  
The UTILITIES (KCIPQPGU) panel is displayed.
  - b. Type the option number for the **KCIJPCCF** job that clones customized members (*Kpp\$C\**, *Kpp\$P\*/Kpp@P\**, *Kpp\$S\**), \$JOB CARD, and the \$GBL\$USR global profile) from an existing WCONFIG library to a new one.
  - c. Review the job to determine if you need to modify the library concatenated in the OLDWCNFG DDNAME.  
By default, this DDNAME already points to the WCONFIG library that you specified in the RTE profile library field of the first work environment setup panel. If necessary, modify the job to point to an existing WCONFIG library that contains the customized members you want cloned over to the WCONFIG library for the new runtime environment.
  - d. Submit the job and return to the main Workflow panel.

The specified members are copied to the WCONFIG library for the new runtime environment.

3. Merge the configuration profile parameter values from the model runtime environment into the new one.
  - a. Type U or UTIL from the Workflow main menu.  
The UTILITIES (KCIQPGU) panel is displayed.
  - b. Type the option number for the **KCIJPMCF** job.
  - c. Review the job and make any required changes.  
By default, the OLDMEM(&value) parameter is already set to the runtime environment you specified in the first setup panel (in this example, TSTEST.&userid.&clone\_from.WCONFIG(&clone\_from)).

```

=====
EDIT TSTEST.&userid.&rte_name.WCONFIG(KCIJPMCF)
Command ==>                               Scroll ==> CSR
000068 /* MERGECHG Step:
000069 /* Merge the changes in %OLDMEM% into %NEWMEM% member.
000070 /* *****
000071 //MERGECHG EXEC PGM=IKJEFT01,DYNAMNBR=99,REGION=4M
000072 //SYSEXEC DD DISP=SHR,
000073 // DSN=TSTEST.ITM62351.TKANCUS
000074 //SYSTSPRT DD SYSOUT=*
000075 //SYSPRINT DD SYSOUT=*
000076 //SYSTSIN DD *
000077 KCIPLBX +
000078 BATCH +
000079 SKIPVAR(TSTEST.ITM62351.TKANCUS(KCIDPGNX)) +
000080 OLDMEM(TSTEST.&userid.&clone_from.WCONFIG(&clone_from)) +
000081 NEWMEM(TSTEST.&userid.&rte_name.WCONFIG(&rte_name))
000082 /*
=====

```

- d. Review and submit the job and return to the Workflow main menu.
4. Customize the configuration profiles for the new environment.
  - a. From the Workflow menu, select option 2.  
The Customize PARMGEN Configuration Profile Members panel is displayed.

```

KCIQ@PG6 ----- CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS -----
Option ==>
Quick Configuration Mode
(Required) Customize the RTE profile and the $GBL$USR user profiles:
(Tip) Review KCIJPDLA autodiscovery job in Utility menu or type DLAJOB cmd.

*1. SYSA RTE LPAR-specific CONFIG profile in WCONFIG (User copy)
*2. $GBL$USR Global parameters CONFIG profile in WCONFIG (User copy)

(Required) Customize the Variables profile if RTE_SYSV_SYSVAR_FLAG=Y:
*3. SYSA Variables (system, user) CONFIG profile in GBL_USER_JCL PARMGEN
global library (TDITN.IDTST.PARMGEN.JCL).
Add/Modify system/user-defined symbols and their
resolution values, for override variables used as parameter
values in the $DOCRTE RTE and $GBL$USR global profiles.

(Tip) Review/Customize WCONFIG Kpp$C*/Kpp$P*/Kpp$S* user imbeds:
(Cloning Tip) Review KCIJPCCF job in Utility menu prior to customization.

4. WCONFIG TDITN.IDTST.$DOCRTE.WCONFIG

(Tip) Review if you want to compare with IBM-supplied default profile values:

5. $CFG$IBM RTE LPAR-specific CONFIG profile in WCONFIG (IBM copy)
6. $GBL$IBM Global parameters CONFIG profile in WCONFIG (IBM copy)

(Optional) Override SYSIN member to supply additional (User) profiles:
7. $SYSIN $PARSE/$PARSES SYSIN controls (CONFIG/SELECT MEMBER)

Press F1=Help for more information. Type UTIL to access utility menu.

```

- b. Select option 1 to customize the LPAR configuration for the new runtime environment.  
Change any instances of &clone\_from inherited from the model environment to &rte\_name, and change any LPAR-specific values, such as host name.

- c. After you complete any necessary changes, press F3 to return to the Customize PARMGEN Configuration Profile Members panel.
  - d. If necessary, edit the \$GBL\$USR and &rte\_name system variables configuration files, then return to the Customize PARMGEN Configuration Profile Members panel.
  - e. Run the DLAJOB to auto-discover other RTE-specific parameters by typing DLAJOB in the command line and pressing Enter.
  - f. Submit the DLAJOB and return to the main Workflow panel.
5. Validate the configuration profile values that you supplied:
    - a. Type U or UTIL from the Workflow main menu.  
The UTILITIES (KCIPQPGU) panel is displayed.
    - b. Type the option number for the **KCIJVAL** job.
    - c. Review the notes and submit the job.  
The parameter validation report is written to &hilev.&rte.WCONFIG(\$VALRPT). Enter option number + s, for example 23s, in the UTILITIES menu to view the report.
    - d. If the job gets a condition code greater than 4 (COND CODE 0004), review the \$VALRPT. Return to the previous step and correct the parameter values, then resubmit the validation job.
  6. Create the WK\* runtime members and the WKANSAMU jobs:
    - a. Select option 3.  
The CREATE THE RTE MEMBERS AND JOBS (KCIP@PR1) panel is displayed.
    - b. Select option 1 to submit the generated \$PARSE composite job.
    - c. Review the job, then submit the job.  
Return to the main Workflow panel.
  7. Submit the batch jobs to complete the setup of the runtime environment:
    - a. Select option 4 from the Workflow main menu.  
The Submit Batch Jobs to Complete PARMGEN Setup (KCIP@SUB) panel is displayed.
    - b. Select option 1 if you want to submit the KCIJPSUB composite SUBMIT job, or select the other options to submit each job individually. If you select option 1, review the KCIJPSUB job first, and edit the job according to which of the conditional jobs need be submitted automatically and which need to be submitted manually (for example, for reasons of authorization).

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.
```

Description	REQ	Job Name	Status	Date
1. Composite SUBMIT job (See JCL comments) ** OI **		KCIJPSUB		
2. Allocate runtime R0 and RW datasets	(Yes)	KCIJPALO		
3. Copy SMP/E mbrs from TK*->RK* R0 libs	(Yes)	KCIJPLOD		
4. Run product security steps	(Yes)	KCIJPSEC		
5. Update variable-named runtime mbrs	(No )	KCIJPUPV		
6. (Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7. Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8. Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9. Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10. Verify the configuration jobs	(Tip)	KCIJPIVP		
11. Back-up RK* product execution user libs	(Tip)	KCIJPCPR		
12. Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

```
Press F1=Help for more information. Type UTIL to access utility menu.
```

- c. Submit the job.

## Result

You have created a customized copy of an existing runtime environment.

## What to do next

If necessary, copy the PARMGEN libraries to the target LPAR. Complete any of the configuration required outside of the configuration software and start the products.

## Cloning an existing environment with system variables enabled

This scenario clones an existing runtime environment (RTE), which currently runs on LPAR SYSG, to create a new RTE, which will run on LPAR SP14. Support for system variables is enabled, to facilitate the deployment of the cloned RTE to other RTEs.

### Before you begin

This scenario uses the PARMGEN Workflow user interface to set up the work environment, customize profiles, and create and submit the jobs that create the runtime environment. For instructions on launching the interface, see [“Accessing the Workflow menu” on page 428](#).

### About this task

This task involves 8 steps:

1. Create the PARMGEN work environment.
2. Clone the customized WCONFIG members from the model runtime environment.
3. Update the interim libraries and create the configuration profiles for the new environment.
4. Merge the LPAR profile from the model environment with the LPAR profile for the new environment.
5. Customize the profiles for the new environment.
6. Validate the profile parameter values.
7. Create the runtime members and jobs.
8. Submit the jobs to create the runtime environment.

Where these steps are run depend upon the transport scenario you are following (see [PARMGEN transport scenarios](#)).

Complete these steps to create sample runtime environment PLB3SP14.

### Procedure

1. Set up the PARMGEN work environment for the new RTE.
  - a. On the PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU (KCIPQPGA) panel, specify the parameters to identify the new RTE and press Enter.  
Note that if you did not invoke the R (RESET) option, the values for GBL\_USER\_JCL, RTE\_PLIB\_HILEV, and RTE\_NAME are carried forward from the last environment you created. If the values for the GBL\_USER\_JCL library and the high-level qualifier for the work libraries are correct, change the RTE\_NAME to the name you want to use for the new environment.

#### **GBL\_USER\_JCL**

Specify the dataset name of the PARMGEN global user JCL library for the new runtime environment. If the dataset does not exist, you are prompted to correct the name or allocate the data set.

#### **RTE\_PLIB\_HILEV**

Specify the non-VSAM high-level qualifier you want to use for the PARMGEN work libraries for the new runtime environment.

#### **RTE\_NAME**

Unique name for the runtime environment you are configuring. The name you specify is appended to the RTE\_PLIB\_HILEV values to make each set of PARMGEN and runtime libraries unique. PLB3SP14 is used in this example

The PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU (KCIPQPGB) panel is displayed.

- b. Select option 1 from the menu.  
The Set up PARMGEN Work Environment for an RTE (1 of 1) (KCIPQPG1) is displayed.

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>

                                Quick Configuration Mode

                                More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /***  0 0 RTE_NAME=%RTE_NAME% SYSTEMEMBER=%SYSTEMEMBER%-----
==> /***  \~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
(Type ? for last referenced JOBGEN library discovered, if any.)

```

- c. In the first field, specify the fully-qualified name of the RTE profile for the RTE you want to clone. In this example, the model environment is TSTEST.&userid.PLB3SP13.WCONFIG(PLB3SP13). If appropriate, supply the Install Job Generator output library and job card information.

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>

                                Quick Configuration Mode

                                More:      +

Specify the RTE model profile to use:
==> TSTEST.&userid.PLB3SP13.WCONFIG(PLB3SP13)-----

- To create an RTE from scratch, leave this field blank.
- To create an RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create an RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create an RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(PLB3SP14))
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITN.IDTST.DEMO.WCONFIG(PLB3SP14))

Customize jobcard data:
==> //&userid.J JOB (ACCT),'%SYSTEMEMBER% -
NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /***  0 0 RTE_NAME=%RTE_NAME% SYSTEMEMBER=%SYSTEMEMBER%-----
==> /***  \~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Press F1=Help for more information. Type UTIL to access utility menu.

```

- d. Press Enter to proceed to the next panel.  
The second set up panel is displayed:

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                                Quick Configuration Mode
GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:

                                UNIT / STORCLAS /
                                VOLSER / MGMTCLAS /
GBL_TARGET_HILEV: IBM.TARGET.ITM63055_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  _____
GBL_SYSDA_UNIT:   SYSDA___
                   Work datasets UNIT name
GBL_REGION:      OM_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

- e. Review the values on the panel and override them as necessary. These values for the parameters on this panel are read from the RTE you are cloning from. You might want, for example, the new RTE to point to a different set of target libraries which has newer versions of the products installed.
- f. Press Enter to display the next panel. The third set up panel is displayed:

```

KCIP@PG3 ---- SET UP PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>  Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=&rte_name.
Press F1=Help for more information.

RTE_DESCRIPTION:      &rte_name-----
RTE_SMS_PDSE_FLAG:    Y (Y, N) (Allocate Non-VSAM PDSE libs)
RTE_SMS_UNIT:         ----- (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:       ----- (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:     ----- (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:     ----- (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: ----- (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: ----- (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: ----- (VSAM disk STORCLAS)

RTE_TYPE:             SHARING____ (FULL, SHARING)
RTE_HILEV:            TSTEST.&userid-----
                      (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:       TSTEST.&userid-----
                      (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If RTE_TYPE is SHARING:
  RTE_X_HILEV_SHARING: TSTEST-----
                      (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
  RTE_SHARE:           BASE&SYSALVL.----- ("SMP" value or *&rte_share)
                      (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
  RTE_LOAD_SHARED_LIBS: Y (Y, N) (Is RTE updater of R0 shared libs)

If symbolics (system variables or user-defined variables) will be used:
  RTE_SYSV_SYSVAR_FLAG: Y (Y, N) (System variable flag)

Security settings:
  RTE_SECURITY_USER_LOGON: NONE----- (RACF, ACF2, TSS, NAM, None)
  RTE_SECURITY_FOLD_PASSWORD_FLAG: Y (Y, N) (Fold password to upper case)
  RTE_SECURITY_CLASS: -----
  RTE_X_SECURITY_EXIT_LIB: TSTEST.&userid.PLB3&SYSNAME..RKANSAMU-----
  GBL_DSN_ACF2_MACLIB: -----
  GBL_DSN_ACF2_MACLIB1: -----

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
  RTE_TEMS_CONFIGURED_FLAG: Y (Y, N) (Configure TEMS in this RTE)
  RTE_TEMS_NAME_NODEID: PLB3&SYSNAME.:CMS----- (e.g.,CLONETST:cms)
  KDS_TEMS_TYPE:         REMOTE (Hub, Remote)
  KDS_TEMS_HA_TYPE:      -- (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
  RTE_TCP_PORT_NUM:      1918----- (1-65535 port number)
  RTE_VTAM_APPLID_PREFIX: TS&SYSCLONE.----- (1-4 char.VTAM APPLID prefix)
  RTE_STC_PREFIX:        TSS3----- (1-4 char.started task prefix)
Note: Type BACK to go back one panel.

```

The values on panel are taken from the RTE that you are cloning (TSTEST.&userid.PLB3SP13.WCONFIG(PLB3SP13), in this case). Because this is a sharing RTE, you should set RTE\_LOAD\_SHARED\_LIBS to N, so that only one RTE is loading the shared libraries. You do not need to make any other changes on this panel. However, if you do make changes to any of the following parameters, you will need to make the same changes to the corresponding Kpp\_\* parameters in the RTE profile of the new RTE.

- Started task prefix
- VTAM applid prefix
- Port number
- RTE high-level qualifier
- VSAM high-level qualifier

g. Press Enter to proceed to the next panel.

The Include Products in this PARMGEN RTE panel (KCIP@PGI) is displayed.

This panel lists all the installed products that are available for configuration by product code (Kpp) and product name and version. The products marked with a slash (/) are the ones already configured in the RTE being cloned, but the version represents the latest version available. If you include these products, they will be upgraded to the version in the target libraries. In this example,

a monitoring server, OMEGAMON for z/OS, OMEGAMON for CICS, and the OMEGAMON enhanced 3270 user interface are already configured.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>>                               Scroll ==>> PAGE

Select ("S" or "/" ) products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp  Component or Product Name and Version
-----
/ KAH  System Automation Monitoring Agent V350
/ KC5  OMEGAMON for CICS V550
/ KDO  Tivoli Decision Support for z/OS Agent V181
/ KDS  Tivoli Enterprise Monitoring Server V630
/ KD4  ITCAM for SOA Agent V711
/ KD5  OMEGAMON for DB2 PE V550
/ KGW  OMEGAMON for CICS TG V550
/ KI5  OMEGAMON for IMS V550
/ KJJ  OMEGAMON for JVM V540
/ KMQ  OMEGAMON for Messaging - MQ V750
/ KM5  OMEGAMON for z/OS V550
/ KNA  NetView for z/OS Agent V621
/ KN3  OMEGAMON for Networks V550
/ KOB  OMEGAMON Enhanced 3270 User Interface V750
/ KQI  OMEGAMON for Messaging - Integration Bus V750

/ KRK  Automated Tape Allocation Manager for z/OS Agent V330
/ KRN  Advanced Catalog Management Agent V260
/ KRV  Advanced Backup and Recovery for z/OS Agent V240
/ KRW  Tape Optimizer for z/OS Agent V220
/ KS3  OMEGAMON for Storage V540
/ KYN  ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

- h. If you want to install additional products, select them by typing a slash next to the product code. Deselect any products you do not want to include in the new RTE. Then, change **Confirm ==> N** to **Confirm ==>Y** and press Enter.  
The KCIJPCFG job is displayed, tailored with the values you have configured.
  - i. Review the notes, then submit the job.  
You are returned to the main Workflow panel. Wait until you see a successful return code before you proceed to the next step.
2. Clone the customized members from the model environment.
    - a. Type U or UTIL from the Workflow main menu.  
The UTILITIES (KCIPQPGU) panel is displayed.
    - b. Type the option number for the **KCIJPCCF** job that clones customized members (*Kpp\$C\**, *Kpp\$P\*/Kpp@P\**, *Kpp\$\$\**), \$JOB CARD, and the \$GBL\$USR global profile) from an existing WCONFIG library to a new one.
    - c. Review the job to determine if you need to further modify the library concatenated in the OLDWCNFG DDNAME.  
By default, this DDNAME already points to the WCONFIG library that you specified in the RTE profile library field of the first set up panel. Modify as needed to point to an existing WCONFIG library that contains the customized members you want cloned to the WCONFIG library of the new runtime environment.
    - d. Submit the job.  
You are returned to the main Workflow panel.
  3. After you return to the main Workflow panel, merge the values from the model RTE profile into the new environment:
    - a. Type U or UTIL from the Workflow main menu.  
The UTILITIES (KCIPQPGU) panel is displayed.
    - b. Type the option number for the **KCIJPMCF** job.
    - c. Review and customize the KCIJPMCF job.

The WCONFIG(KCIJPMCF) job merges or clones another version of the WCONFIG profiles (the %RTE\_NAME% RTE LPAR profile and \$GBL\$USR) into a refreshed copy or cloned copy. In this case, the PLB3SP13 runtime environment has already been fully customized; its PARMGEN profile already uses symbolics. So to save time, clone its values into PLB3SP14 by editing the OLDMEM() parameter to point to the WCONFIG(PLB3SP13) value.

```

=====
EDIT TSTEST.&sysuid.PLB3SP14.WCONFIG(KCIJPMCF)
Command ==>
                                Scroll ==> CSR
000068 /* MERGECHG Step:
000069 /* Merge the changes in %OLDMEM% into %NEWMEM% member.
000070 /* *****
000071 //MERGECHG EXEC PGM=IKJEFT01,DYNAMNBR=99,REGION=4M
000072 //SYSEXC DD DISP=SHR,
000073 // DSN=TSTEST.ITM62351.TKANCUS
000074 //SYSTSPRT DD SYSOUT=*
000075 //SYSPRINT DD SYSOUT=*
000076 //SYSTSIN DD *
000077 KCIRPLBX +
000078 BATCH +
000079 SKIPVAR(TSTEST.ITM62351.TKANCUS(KCIDPGNX)) +
000080 OLDMEM(TSTEST.&userid.PLB3SP13.WCONFIG(PLB3SP13)) +
000081 NEWMEM(TSTEST.&userid.PLB3SP14.WCONFIG(PLB3SP14))
000082 /*
=====

```

- d. Submit the job.
4. Customize the configuration profiles for the new RTE.
    - a. From the Workflow menu, select option 2.  
The Customize PARMGEN Configuration Profile Members panel is displayed.

```

KCIP@PG6 ----- CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS -----
Option ==>
                                Quick Configuration Mode
                                (Required) Customize the RTE profile and the $GBL$USR user profiles:
                                (Tip) Review KCIJPDLA autodiscovery job in Utility menu or type DLAJOB cmd.

                                *1. SYSA RTE LPAR-specific CONFIG profile in WCONFIG (User copy)
                                *2. $GBL$USR Global parameters CONFIG profile in WCONFIG (User copy)

                                (Required) Customize the Variables profile if RTE_SYSV_SYSVAR_FLAG=Y:
                                *3. SYSA Variables (system, user) CONFIG profile in GBL_USER_JCL PARMGEN
                                    global library (TDITN.IDTST.PARMGEN.JCL).
                                    Add/Modify system/user-defined symbols and their
                                    resolution values, for override variables used as parameter
                                    values in the $DOCRTE RTE and $GBL$USR global profiles.

                                (Tip) Review/Customize WCONFIG Kpp$C*/Kpp$P*/Kpp$S* user imbeds:
                                (Cloning Tip) Review KCIJPCCF job in Utility menu prior to customization.

                                4. WCONFIG TDITN.IDTST.$DOCRTE.WCONFIG

                                (Tip) Review if you want to compare with IBM-supplied default profile values:

                                5. $CFG$IBM RTE LPAR-specific CONFIG profile in WCONFIG (IBM copy)
                                6. $GBL$IBM Global parameters CONFIG profile in WCONFIG (IBM copy)

                                (Optional) Override SYSIN member to supply additional (User) profiles:
                                7. $SYSIN $PARSE/$PARSES SYSIN controls (CONFIG/SELECT MEMBER)

                                Press F1=Help for more information. Type UTIL to access utility menu.

```

- b. Customize the LPAR configuration profile.

TUTORIAL INFORMATION

  - i. Select option 1 to display the LPAR profile:
  - ii. Change any references to PLB3SP13 (the model environment) to PLB3SP14 (the current environment).

**Important:** In a system variables scenario, the only parameters that *must* have a nonsymbolic value are RTE\_NAMESV, RTE\_HILEVSV, and RTE\_VSAM\_HILEVSV parameters, as these are used directly in the WKANSAMU(KCIJV\*) jobs. In the following example of the RTE\_NAMESV parameter, the value must remain PLB3SP14:

```
ISREDDE2 TSTEST.&userid.PLB3SP14.WCONFIG(PLB3SP14)
Command ==> C PLB3SP13 PLB3SP14 ALL                               Scroll
==> CSR
***** ***** Top of Data
***** *****
- - - - - 354 Line(s) not
Displayed
==CHG> RTE_NAMESV   PLB3SP14
- - - - - 904 Line(s) not
Displayed
***** ***** Bottom of Data
***** *****
```

- iii. You must also change any Db2, IMS subsystem names, CICS regions specific to the LPAR, MQ manager and subsystem names, and their related load libraries, inherited from the model runtime environment.
- c. Customize the system variables configuration profile to define all user symbols used in the LPAR profile.

#### TUTORIAL INFORMATION

- i. From the Customize PARMGEN Configuration Profile Members, select option 3. The TSTEST.SYSPLEX.PARMGEN.JCL(PLB3SP14) system variables profile is displayed.
- ii. Because the PLB3SP14 LPAR profile inherited its symbolics from the cloned PLB3SP13 LPAR profile, simply replace the contents of TSTEST.SYSPLEX.PARMGEN.JCL(PLB3SP14) with the TSTEST.SYSPLEX.PARMGEN.JCL(PLB3SP13) system variables profile parameters, then change the LPAR-specific symbolic values accordingly.

```
ISREDDE2 TSTEST.SYSPLEX.PARMGEN.JCL(PLB3SP14) - 01.16 Columns 00001
00072
Command ==> C SP13 SP14 ALL                               Scroll ==>

```

Since a secondary monitoring server was enabled for these agents, each backup (secondary) monitoring server now points to the same hub monitoring server (the static hub monitoring server, started task TSSODSH1, in the PLB3SP14 environment).

If you need the PLB3SP13 remote monitoring server and agents to use other values, make further edits to the TSTEST.SYSPLEX.PARMGEN.JCL(PLB3SP14) variables profile.

- iii. Save the changes and exit the profile. Press F3 to return to the main Workflow panel.

5. Validate the profile parameter values you specified.
  - a. Type U or UTIL from the Workflow main menu. The UTILITIES (KCIPQPGU) panel is displayed.
  - b. Type the option number for the **KCIJPVAL** job.
  - c. Review the notes and submit the job. The parameter validation report is written to `&hilev.&rte.WCONFIG($VALRPT)`. Enter option number + s, for example 23s, in the UTILITIES menu to view the report.
  - d. If the job gets a condition code greater than 4 (COND CODE 0004), review the \$VALRPT. Return to the previous step and correct the parameter values, then resubmit the validation job.
6. Create the WK\* runtime members and the WKANSAMU jobs:
  - a. Select option 3. The CREATE THE RTE MEMBERS AND JOBS (KCIP@PR1) panel is displayed.
  - b. Select option 1 to submit the generated \$PARSE composite job.
  - c. Review the job, then submit the job. Return to the main Workflow panel.
7. Complete the setup of the environment.
  - a. Select option 4 from the Workflow main menu. The Submit Batch Jobs to Complete PARMGEN Setup (KCIP@SUB) panel is displayed.
  - b. Select option 1 to submit the KCIJVSUB composite SUBMIT job, or select the other options to submit each job individually. If you select option 1, review the KCIJVSUB job first, and edit the job according to which the conditional jobs can be submitted automatically, and which must be submitted manually by someone with the required authority. If you select option 1, you are prompted with the following message:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

The KCIJVSUB composite job submits several PARMGEN
configuration jobs via TSO SUBMIT commands. Some of
those SUBMIT commands are commented out. Carefully
review the comments in the JCL to determine which
of those jobs you do or do not want to submit.
Uncomment the SUBMIT commands of those jobs that
you want to submit.

Do NOT delete any SUBMIT commands as they may be
needed in the future.

```

- c. Press Enter. The following message is displayed:
 

```

KCIP@PGP ----- PARMGEN MESSAGES -----
Command ==>

In a system variable environment, job KCIJVSUB runs $PARSESV
to customize then submit the KCIJPSUV job. EDIT and modify
the KCIJPSUV job as appropriate. See comments in the JCL for
further information.
DO NOT MANUALLY SUBMIT THE KCIJPSUV JOB!

```
- d. Press ENTER to edit the KCIJPSUV job, then press F3, and you are automatically presented with the KCIJVSUB job for submission.

#### TUTORIAL INFORMATION

### Result

You have created runtime environment PLB3SP14.

### What to do next

Perform the applicable "Complete the configuration" steps in your planning and configuration guides.

---

## How-tos

*How-tos* provide some best practices and instructions for performing specific tasks. The topics in this section tell you *how to* perform these tasks. These instructions are meant to help you complete commonly used processes.

**Note:** For more *how to* topics, see the following sections:

- [“How-tos using Configuration Manager” on page 356](#)
- [“How-tos using PARMGEN” on page 481](#)

---

## How to: Write a message to the console for a situation

You can use the Take Action command **ZOSWTO** (z/OS WTO) to write a message to the z/OS operator console for a situation.

### Before you begin

You can use the Take Action command **ZOSWTO** when creating a situation using any of the available methods (such as, Tivoli Enterprise Portal, enhanced 3270 user interface, **tacmd** CLI).

**Note:** The information in this topic describes the use of the **ZOSWTO** command to issue a message to the console for a situation. You can also use the **SEND** command. For more information, see [Using the Enhanced 3270 UI to create an ITM situation that writes a message to the z/OS console](#).

### About this task

When defined for a situation, the Take Action command **ZOSWTO** writes a multi-line write-to-operator (WTO) message to the operator console when the situation occurs. The multi-line WTO is issued on the z/OS monitoring server (TEMS) that an agent is connected to or on a z/OS monitoring agent (TEMA). The message is produced when the situation is true or false. Any data that follows the command name will be present in the multi-line message.

To use the command, when creating a situation, include the **ZOSWTO** Take Action command in the following format:

```
ZOSWTO user_supplied_content
```

Where the *user\_supplied\_content* defines the content to include in the WTO message and can include text and product variables.

When the situation is triggered, message [K041041I](#) is issued in the operator console in the following format:

```
K041041I SITUATION EVENT situation_event_id  
situation_name:node_name <optional_display_item_value> T|F user_supplied_content
```

The situation event is identified in the multi-line message by the *situation\_event\_id*. *situation\_name* is the name of the situation, and *node\_name* is the origin node related to the event.

*optional\_display\_item\_value* is the display item, if one is defined for the situation. The message is produced when the situation is true (T) or false (F). The *user\_supplied\_content* is the content as defined in the **ZOSWTO** command. When the situation is false, the values of substitution variables in the *user\_supplied\_content* are N/A.

The message data is divided into 70-character sections on a maximum of five consecutive lines.

**Tip:** If you will be using automation to react to a situation based on the message in the operator console, when you define the **ZOSWTO** command for a situation, consider adding identifying information in the *user\_supplied\_content*, such as a unique identification number or a label. Because every triggered situation with a defined **ZOSWTO** command will produce message K041041I, you will need to parse other details to differentiate the messages. The ability to scan for unique, known information can help to quickly identify the messages for a specific situation.

By default, **ZOSWTO** uses the WTO options routing code 2 (operator information) and descriptor code 12 (important information). You can change the default values for these options by specifying parameters **ZOSWTO\_ROUTE\_CODE** and **ZOSWTO\_DESCRIPTOR\_CODE** in the *KppENV* member of *RKANPARU*, where *pp* is the code for the OMEGAMON product or component that you want to update. You can also override these values when specifying the **ZOSWTO** command using the following format:

```
ZOSWTO [routing_code/descriptor_code] user_supplied_content
```

**Note:** In addition to defining the **ZOSWTO** command as an action in a situation, you can also use the Tivoli Enterprise Portal Take Action feature to manually enter the **ZOSWTO** command, which requires the following format to override the routing code and descriptor code:

```
ZOSWTO [*routing_code/*descriptor_code] user_supplied_content
```

## Procedure

- Using any of the available methods (such as, Tivoli Enterprise Portal, enhanced 3270 user interface, **tacmd** CLI), create a situation that includes Take Action command **ZOSWTO** and defines the content (including product variables) to appear in the WTO message. When the situation occurs, message K041041I, with a maximum of five consecutive lines, is written to the operator console.

This example describes how to use the **ZOSWTO** command to write a message to the console for a specific situation that is detected by the IBM OMEGAMON for Messaging on z/OS, IBM MQ Monitoring agent. This example provides implementation steps for both the enhanced 3270 user interface and the Tivoli Enterprise Portal, and also provides sample output messages.

The scenario for this example is to detect when the MQ Event for Queue Depth High has occurred, and, when this event occurs, to issue a message to the operator console that provides the name of the MQ queue manager, the name of the MQ resource (queue name), and the label MQ01W, which will be used for message identification in the log.

**Tip:** Using a label is optional and can help simplify automation if there are multiple situations using the **ZOSWTO** command.

The following **ZOSWTO** command contains the label, the custom text, and the appropriate product variables to report to the operator console for this event:

```
ZOSWTO MQ01W Event queue depth high for Qmgr:&{Current_Events.Reporting_MQ_Manager_Name};  
Queue:&{Current_Events.Resource_Name}
```

To associate this WTO message with the situation, you must define it as a Take Action System Command in the situation. The following sections show how to do this in the enhanced 3270 user interface and the Tivoli Enterprise Portal. Examples of the produced messages in the operator console are also provided.

### Define the **ZOSWTO** command using the enhanced 3270 user interface

Use the Formula tab in the Situation Editor to define the criteria for the situation, as shown in the following figure:

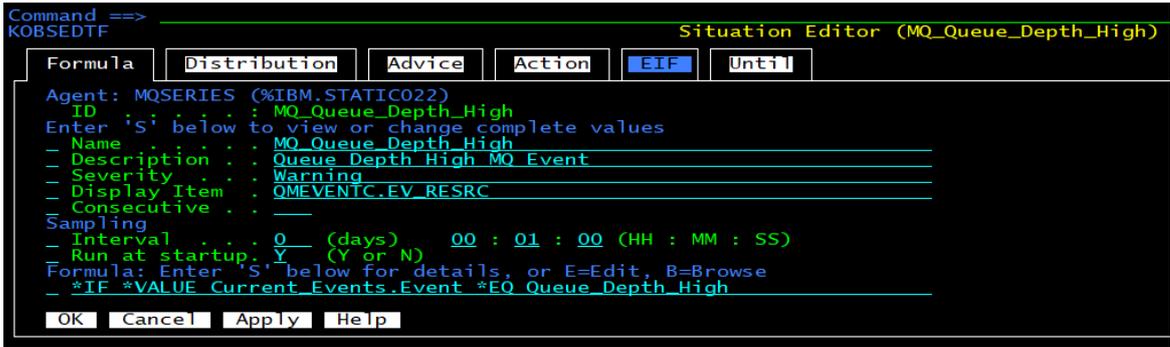

Figure 94: Defining the situation formula using the enhanced 3270 user interface

Notice the following in this example:

- A display item is set so that it will become true for each possible queue. The display item will be included in the WTO message (as *<optional\_display\_item\_value>*) when the situation event occurs.
- The formula for this situation is as follows:

```
*IF *VALUE Current_Events.Event *EQ Queue_Depth_High
```

Then, use the Action Tab of the Situation Editor to enter the **ZOSWTO** command as a System Command. You must type S next to **Command** to enter the complete value of the command, as shown in the following figures:

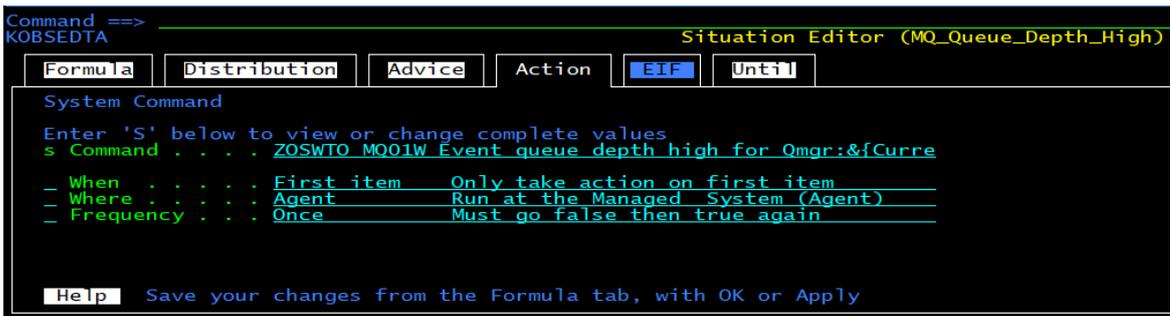

Figure 95: Defining the situation action using the enhanced 3270 user interface

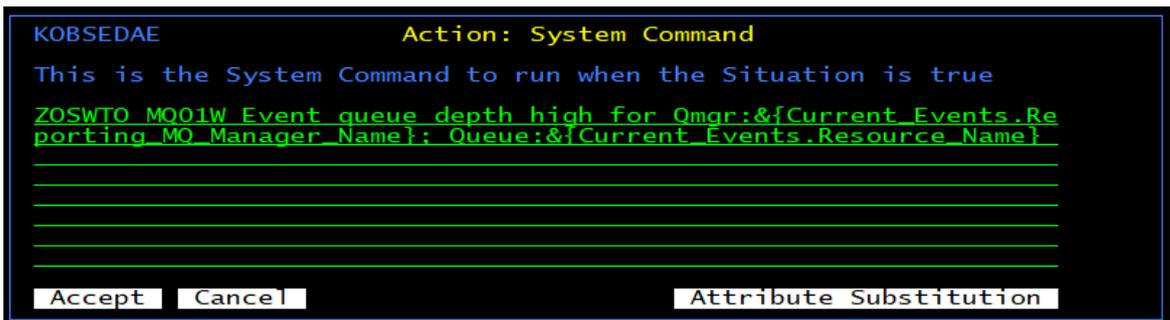

Figure 96: Defining the ZOSWTO command using the enhanced 3270 user interface

### Define the ZOSWTO command using the Tivoli Enterprise Portal

Use the Formula tab in the Situation Editor to define the criteria for the situation. For this example, the formula is the == Queue Depth High event, as shown in the following figure.

**Note:** This situation also has a display item set so that it will become true for each possible queue. The display item will be included in the WTO message (as *<optional\_display\_item\_value>*) when the situation event occurs.

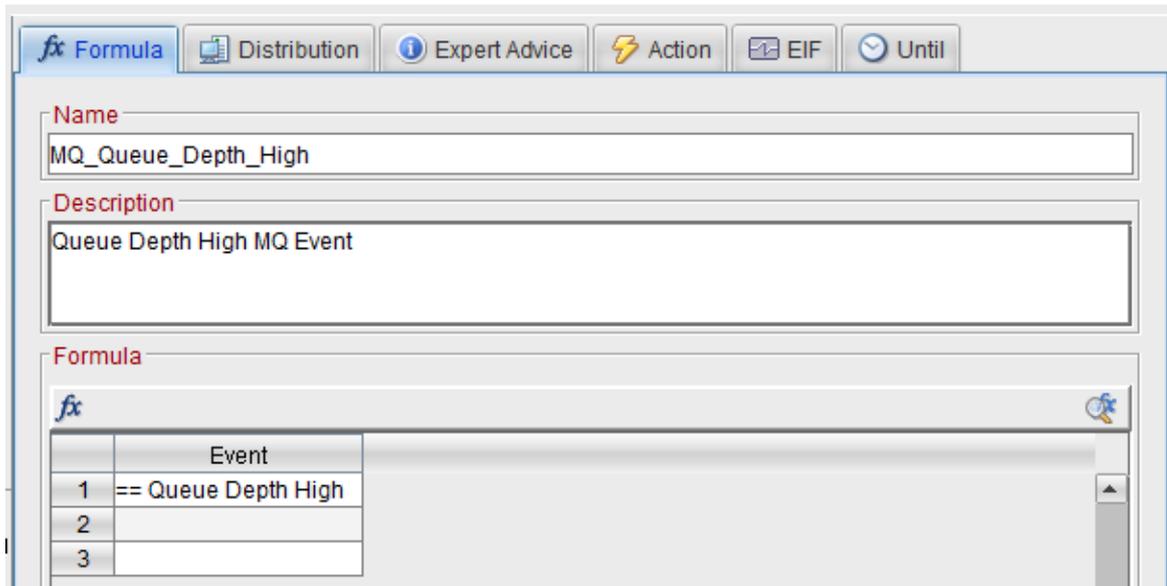

Figure 97: Defining the situation formula using the Tivoli Enterprise Portal

Then, on the Action Tab of the Situation Editor, enter the **ZOSWTO** command as a System Command, as shown in the following figure:

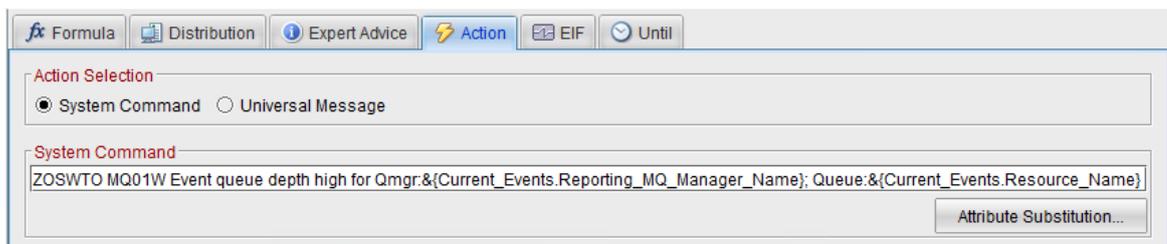

Figure 98: Defining the **ZOSWTO** command using the Tivoli Enterprise Portal

### View the WTO messages in the operator console

When this situation occurs (that is, when the situation is *true*), the following WTO message appears in the operator console:

```
2023096 11:53:18.36 S0780082 00000090 K041041I SITUATION EVENT 607
607 00000090 MQ_Queue_Depth_High:QK20:RSB2:MQESA<ABCAPPL_TYPE2_RECEIVING_Q> T MQ01W
607 00000090 Event queue depth high for Qmgr:QK20; Queue:ABCAPPL_TYPE2_RECEIVING_Q
607 00000090
607 00000090
607 00000090
```

Figure 99: Example WTO message when the situation is true

When this situation clears (that is, when the situation is *false*), the following WTO message appears in the operator console:

```
2023096 12:02:18.35 S0780082 00000090 K041041I SITUATION EVENT 621
621 00000090 MQ_Queue_Depth_High:QK20:RSB2:MQESA<ABCAPPL_TYPE2_RECEIVING_Q> F MQ01W
621 00000090 Event queue depth high for Qmgr:N/A; Queue:N/A
621 00000090
621 00000090
621 00000090
```

Figure 100: Example WTO message when the situation is false

### What to do next

Optionally, based on the occurrence or resolution of the situation event, you can parse the WTO message to drive automation or notify the z/OS systems programmer of the situation.

## How to: Create an HTTP request for a situation

You can use the Take Action command **HTTPRQ** (HTTP Request) to create an HTTP request for a situation.

## Before you begin

You can use the Take Action command **HTTPRQ** when creating a situation using any of the available methods (such as, Tivoli Enterprise Portal, enhanced 3270 user interface, **tacmd** CLI).

## About this task

When defined for a situation, the Take Action command **HTTPRQ** creates an HTTP request when the situation occurs.

To use the command, when creating a situation, include the **HTTPRQ** Take Action command in the following format:

```
HTTPRQ url;hheader;drequest_body
```

Where:

- *url* is the URL address for the request
- *header* is the HTTP header for the request
- *request\_body* is the HTTP request body

The maximum length of the command is 256 characters.

**Note:** In addition to defining the **HTTPRQ** command as an action in a situation, you can also use the Tivoli Enterprise Portal Take Action feature to manually enter the **HTTPRQ** command.

## Procedure

- Using any of the available methods (such as, Tivoli Enterprise Portal, enhanced 3270 user interface, **tacmd** CLI), create a situation that includes Take Action command **HTTPRQ**. When the situation occurs, the HTTP request is issued.

## Example

The following examples show how to define the **HTTPRQ** command:

### Plain text

The following example shows how to echo plain text:

```
HTTPRQ http://ip_address:port/echo;hContent-type: text/plain ;dText
```

### Application

The following example shows how you could use the **HTTPRQ** command to post a message to the Slack application when the situation for which it is defined is true. This example also includes product variables.

**Note:** The example shows each part of the request on a new line for better visibility.

```
HTTPRQ https://hooks.slack.com/services/T00000000/B00000000/XXXXXXXXXXXXXXXXXXXXXXXXX;  
hContent-type: application/json;  
d{"text": "&{Address_Space_CPU_Utilization.Job_Name} CPU use is  
&{Address_Space_CPU_Utilization.CPU_Percent}%"}}
```

---

# OMEGAMON product interfaces

OMEGAMON provides different interfaces that you can use to access data gathered by the OMEGAMON monitoring products.

The following interfaces are available:

- [OMEGAMON® enhanced 3270 user interface](#), an ISPF application

**Note:** “[OMEGAMON multi-tenancy](#)” on [page 1061](#) is a mode in the OMEGAMON enhanced 3270 user interface that allows the monitoring of distinctly separate sets of resources.

- [IBM Z® OMEGAMON® Web UI](#), a graphical user interface that uses Grafana dashboards
- [Tivoli Enterprise Monitoring Server REST services](#), a REST API
- “[IBM Z Service Management Explorer](#)” on [page 1128](#), a web application

**Note:** IBM Z Service Management Explorer requires Tivoli Management Services for z/OS 6.3.1.

- “[Tivoli Enterprise Portal](#)” on [page 1186](#), a thin Java client application

For more information about which user interface is the best choice for you, see “[Decision 10: Which user interfaces to use](#)” on [page 161](#).

---

## OMEGAMON® enhanced 3270 user interface

The OMEGAMON® enhanced 3270 user interface (enhanced 3270UI) is the latest generation of user interfaces for the OMEGAMON® monitoring products on z/OS®. Using the enhanced 3270UI in conjunction with OMEGAMON® monitoring agents and the Tivoli® Enterprise Monitoring Server, you can monitor the performance of the z/OS® systems, applications, and devices in your environment and identify and troubleshoot problems with those monitored resources.

**Tip:** You can access the latest documentation, including a list of new features, using the online help in the product. Navigate to the **Help and Workspace Directory** as follows:

- Expand the **HELP** menu and select **H Help Contents**.
- Issue an **h . h** fast path mnemonic in the upper left portion of your screen.
- Issue the **HELP** command from any workspace.

## Product overview

The OMEGAMON® enhanced 3270 user interface (enhanced 3270UI) is the latest generation of user interfaces for the OMEGAMON® monitoring products on z/OS®. Using the enhanced 3270UI in conjunction with OMEGAMON® monitoring agents and the Tivoli® Enterprise Monitoring Server, you can monitor the performance of the z/OS® systems, applications, and devices in your environment and identify and troubleshoot problems with those monitored resources.

The enhanced 3270UI offers the following features:

- Plex-wide and single-system views of data
- Autodiscovery of and autoconnection to data sources
- Dynamic behavior and operation

- User-customizable workspaces
- Data filtering
- Cross-product embedded data.
- Near-term History

The enhanced 3270UI supports screen sizes up to 62 x 160, sorting by column, and lateral and vertical scrolling.

In the interface, data is presented in workspaces. The monitoring products that support the enhanced 3270UI provide predefined workspaces that you can use to quickly and easily diagnose problems with monitored resources and take action to correct them. You can customize the workspaces to suit your requirements, and design and create your own workspaces and navigation.

Because the enhanced 3270UI exploits data collected by OMEGAMON® monitoring agents, viewing data in the interface requires that at least one Tivoli Enterprise Monitoring Server is installed in your environment, in addition to any monitoring agents that support the interface. When you navigate to a workspace, one or more data queries are sent to the Tivoli Enterprise Monitoring Server. The monitoring server collects the data from the target agent or agents and sends the data to the interface for display in the workspace.

The following products support both the OMEGAMON Subsystem and the OMEGAMON Enhanced 3270 User Interface features:

- OMEGAMON for CICS (KC5)
- OMEGAMON® AI for Db2 (KD5)
- OMEGAMON for IMS on z/OS (KI5)
- OMEGAMON for z/OS (KM5)
- OMEGAMON for Storage on z/OS (KS5)

The following products support the OMEGAMON Enhanced 3270 User Interface feature and are installed in the same CSI as the OMEGAMON Enhanced 3270 User Interface:

- OMEGAMON for CICS TG (KGW)
- OMEGAMON for JVM (KJJ)
- OMEGAMON for Messaging - MQ (KMQ)
- OMEGAMON for Messaging - Integration Bus (KQI)
- OMEGAMON for Networks (KN3)

The following product supports the OMEGAMON Enhanced 3270 User Interface feature and are installed in a separate CSI from the OMEGAMON Enhanced 3270 User Interface:

- IBM Db2 Query Monitor for z/OS V3.2 (KQQ)

The following products support TSO and ISPF interface OMNIMON Base feature as an alternative to logging onto Classic OMEGAMON via VTAM interface:

- OMEGAMON for CICS (KC5)
- OMEGAMON® AI for Db2 (KD5)
- OMEGAMON for IMS on z/OS (KI5)

## What's new in the OMEGAMON enhanced 3270 user interface (previous updates)

The topics in this section introduce new features and enhancements to the OMEGAMON enhanced 3270 user interface.

**Tip:** You can also access a list of the latest features and enhancements using the online help in the product, by expanding the **HELP** menu and selecting **W Whats New**.

## OMEGAMON enhanced 3270 user interface V7.5.0 PTF UA93322 (3Q17)

OMEGAMON enhanced 3270 user interface 7.5.0 PTF is UA93322 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) 7.5.0:

### Situation Editor enhancement

A more user-friendly way of editing the formula of a situation via the Situation Formula workspace (KOBSEDPA). The formula is displayed in the workspace as a set of rows and columns. Each column is the name of a monitoring system attribute or the name of another situation. When you edit the cells by typing the E action character in the cell, a series of pop-up windows will display with the following items to choose from:

- Available tables and columns
- Available functions (VALUE, AVERAGE, etc.)
- Available operators (EQ, NE, etc.)
- Available values (strings, numbers, and ENUM values.)

## OMEGAMON enhanced 3270 user interface PTF UA83356 for APAR OA51564

APAR OA51564 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) with APAR OA51564 (PTF UA83356):

### Situation Editor

You can use the Situation Editor to create, view, and edit situations (including the formula, distribution, expert advice, action, and until conditions) that can monitor important conditions in your environment. Each situation monitors your environment constantly by testing a formula at time intervals that you set up, for example, every 5 minutes. You can view the overall status of your environment in the Situation Status tree. Type / to select option rows. Move between areas in the Situation Editor by selecting a tab on top.

Some screens contain highlighted push buttons, through which you can access additional Situation Editor features.

### Object Editor

You can use the Object Editor to organize managed systems and situations into name groups which you can reference in distribution lists.

The tree shows the types of object groups that are available and groups that have been created.

There are 2 types of groups available to be created.

#### Managed System

Any set of managed systems that are related, such as business function or by geography, can be organized into a managed system group for assigning to situation distributions. The tree lists all available managed system types including All Managed Systems for creating managed system groups that combine multiple managed system types.

#### Situation

For a set of frequently distributed situations, you can create a situation group to save time and ensure consistency in applying your best practices.

**Note:** Situation groups can be added to other situation groups.

### Security Requirements

The new Situation Editor and Object Editor functions that are introduced in this PTF are disabled by default due to possible performance impact of certain situations. The following security resource profiles must be defined for these editors.

- **KOBUI.ADMIN.SITEDITOR**

- **KOBUI.ADMIN.OBJECTEDITOR**
- **O4SRV.\*\***

Use combinations of read, update, or none for the profiles to control the access to the editors.

- To view the editors, the users must have either read or update permission to the corresponding editor profiles (**KOBUI.ADMIN.SITEDITOR** for the Situation Editor and **KOBUI.ADMIN.OBJECTEDITOR** for the Object Editor). Users with none permission to the profiles are not able to access the editors.
- To save updates in the editors, the users must have read or update permission to the **O4SRV.\*\*** profile, as well as either read or update permission to the corresponding editor profiles. Users with none permission to the **O4SRV.\*\*** profile are not able to save updates in the editors.

## OMEGAMON enhanced 3270 user interface PTF UA82170 for APAR OA50563

APAR OA50563 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) with APAR OA50563 (PTF UA82170):

### Memory Display/Zap workspace

You can display or modify the memory within any address space on a system where an OMEGAMON on z/OS agent connecting to the selected HUB TEMS is running. To list memory, select the Memory option from the enhanced 3270UI View pull-down menu (fastpath V.M). The Memory Display/Zap workspace is displayed. This workspace can also be invoked from another workspace in the enhanced 3270UI. To invoke this panel in context, the ASID and ADDRESS variables must be set before invoking the Memory Display/Zap workspace via the ACTION statement in the callers' workspace. Both the ASID and Address fields must be integer values when the Memory Display/Zap workspace is invoked.

### The new first workspace after log in

The new first workspace is a tabbed dialog from which you can choose the tab that you want to see first. You can choose the first tab by using **Edit > Preferences**, or invoking **Help > What's New**. By default, the first tab shows workspace KOBSEVTS.

The first tab shows information about active situations that are running in the connected Hub TEMS. If the OMEGAMON Dashboard edition is installed in the e3270UI address space, the situations are displayed as a status tree instead of a simple summary. The status tree shows historical information of each situation so that you can assess the overall health situation from one screen.

Other tabs display information of different OMEGAMON agents. Place your cursor on the tab and press Enter to enter the tab. If you have the 3270 emulator configured for mouse operations, double-click the tab that you want to enter.

## OMEGAMON enhanced 3270 user interface PTF UA80299 for APAR OA49686

APAR OA49686 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) with APAR OA49686 (PTF UA80299):

### Product support

New support has been added for the following products:

- OMEGAMON for JVM on z/OS
- OMEGAMON for Messaging on z/OS: IBM Integration Bus Monitoring agent

### KOBSTART alternate workspace

The OMEGAMON Products workspace (KOBSEVTS, which displays events) is a useful alternative to the existing Enterprise Summary workspace (KOBSTART) as the first workspace when you log on. You can select this workspace as your initial workspace with the following steps:

1. Click on **E** (Edit)
2. Click on **P** (Preferences)
3. Click on the **Session/Logon** tab

4. Select one of the following options:
  - Change "First workspace to be displayed" to KOBSEVTS
  - Click on "Help" and follow instructions to make the currently viewed tab of the workspace be your new first workspace

#### **User filter support**

User filter support has been expanded to include all subpanels in a workspace.

#### **Performance improvements**

APAR OA49686 (PTF UA80299) introduces the following performance improvements for environments where the ITM installation contains many distributive systems:

- Much less data is requested and processed when performing a registry refresh
- CPU load reduction in Hub TEMS and TOM
- TCP traffic volume reduction between the TOM, DRA address spaces, and Hub TEMS
- Performance data availability improvement in TOM

### **OMEGAMON enhanced 3270 user interface PTF UA76751 for APAR OA46867**

APAR OA46867 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) with APAR OA46867 (PTF UA76751):

#### **Concurrent user sessions**

Up to 100 concurrent enhanced 3270 user interface sessions are supported.

#### **Support for non-APL emulators**

There are new options for running emulators with limited or no APL characters, and a Screen Test for determining which APL characters are supported.

#### **BACK and HOME buttons**

For enhanced navigation, the BACK and HOME buttons are available on every workspace.

#### **On-screen indicator for off-screen threshold condition**

For enhanced problem determination, the highest severity off-screen threshold condition is indicated by the color of the left or right arrow.

#### **Ability to cancel enhanced 3270 user interface users**

If correct SAF authorizations are in place, users can be selectively cancelled from the list shown in Tools -> Active 3270 Users.

#### **Product table and attribute displays**

Creating new workspaces is facilitated by Object Definition Interchange (ODI) support, which lists products, tables and column definitions that can be used in QUERY statements.

#### **Filter indications**

Filters icons are shown on-screen in the column heading as Green (Defined) or Yellow (Active), to indicate if all data rows in the subpanel are displayed. The icons are also zoom-selectable for editing.

### **OMEGAMON enhanced 3270 user interface V7.3.0**

#### **Enhanced 3270UI near-term history display**

The Enhanced 3270UI now supports the display of near-term history collected by OMEGAMON® XE and IBM® Tivoli® Monitoring agents. Near-term history display provides the ability to investigate problems in the recent past. Security authorization checks have been extended to include access and updates to near-term history collection.

If your security implementation is configured to deny access to undefined SAF resources by default, you must update your configuration to secure near-term history (NTH) configuration actions. To secure history

updates, the O4SRV.\*\* resource must be added to either the global security class (RTE\_SECURITY\_CLASS) or the query class (K0B\_SAF\_QUERY\_CLASS\_NAME) if it is used. To secure access to the near-term history workspaces, the K0BUI.ADMIN.DEFINEHISTORY.<hub name> resource must be added to the security class used to control user interface interactions such as navigation.

To enable collection of NTH data, you must allocate data sets to store the collected data, configure maintenance of those data sets, and configure what data is collected.

### **Dynamic hub switching**

You can now dynamically specify which hub you want to view data from. Previously, you had to modify the user profile to change hubs. Now you can switch hubs from the interface without modifying the profile.

### **Multi-hub support**

You can use the multi-hub support feature to select a secondary hub monitoring server connection.

### **Continuous operation**

The address space no longer needs to be recycled when an agent is upgraded.

### **Support for IPv6**

Support for IPv6 has been added to the existing IP capability, enabling configurations that employ IPv4 only, IPv6 only, or mixed IPv4 and IPv6.

### **Enhanced 3270UI embedded data**

The Enhanced 3270UI embedded-data feature can be used to bring relevant data from other products into the workspace of the hosting product. The embedded-data feature imports data from other products in a seamless manner that can enable the user to navigate in context directly to other product workspaces.

### **New user preference options**

- You can choose whether your tab key can be used to move between action bar options and also whether it can be used to move to and between push buttons.
- You can configure various history configuration settings.

### **Display of alias commands**

You can use the **View** menu to see a list of Alias commands that can be used on the action and command lines.

## **OMEGAMON enhanced 3270 user interface V7.0.0 Interim Feature 1 (APAR OA42127)**

APAR OA42127 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) for OMNIMON Base V7.0.0:

- Security authorization checks have been extended and enhanced. For more information, see [“Security” on page 901](#).
- User preferences can be customized by using the User Profile Member workspace. For more information, see [“Customizing a user profile” on page 937](#).
- You can use the new K0BSITEC workspace to display IBM® Tivoli® Monitoring Situations status information in the enhanced 3270UI. The status information is similar to the information provided by the Tivoli® Enterprise Portal Situation Event Console, that is, situation status for current situations events and situation event history. For more information, see [“Customizing K0BSITEC as the initial workspace” on page 939](#).
- Workspaces are introduced to support viewing and browsing the Runtime environment (RTE). For more information, see [“Runtime environment viewing” on page 973](#).
- Workspace source can be viewed and browsed. For more information, see [“Viewing a workspace source” on page 975](#)
- Cloning and customization
  - The capability to view and copy product provided workspaces, thresholds, and profiles is introduced. You modify workspaces, thresholds, and profiles by first cloning (making a copy) and then editing the copy by using a file editor such as the ISPF editor. For more information, see [“Workspace viewing and](#)

[cloning](#)” on page 943, [“Preparing for threshold member cloning”](#) on page 963, and [“Profile viewing and cloning”](#) on page 977.

- Guidance on the customization of product provided workspaces is included. For more information, see [“Customization of product provided workspaces”](#) on page 947.
- The action bar has updated menu and context-sensitive capabilities. For more information, see [“Menus”](#) on page 908.
- The User Interface drawer is introduced. For more information, see [“Drawer”](#) on page 907.
- Hub connectivity administration is used to validate that a requested hub Tivoli® Enterprise Monitoring Server is reachable through a TCP/IP connection during the operation of the enhanced 3270UI. For more information, see [“Hub connectivity administration”](#) on page 981.

## OMEGAMON® Enhanced 3270 user interface component summary

The following OMEGAMON® components facilitate the display of data in the OMEGAMON® Enhanced 3270 user interface (enhanced 3270UI).

### OMEGAMON® Agents

The OMEGAMON® V5.1.1 and V5.3.0 agents (for example, OMEGAMON® for CICS® or OMEGAMON® for z/OS®, among others) deliver capability that builds on the enhanced 3270UI infrastructure to provide OMEGAMON® capability on the enhanced 3270UI.

### Hub Tivoli Enterprise Monitoring Server

Monitoring servers are part of the Tivoli® Management Services infrastructure that is shared by OMEGAMON® agents. The enhanced 3270UI requires Tivoli® Management Services V6.3.2 or higher.

The *hub monitoring server* is the monitoring server that acts as the focal point for data collection and distribution; it communicates with monitoring agents, with the enhanced 3270UI, and with other Tivoli® Management Services components.

Monitoring servers that communicate only with the monitoring agents that report to them and with the hub monitoring server are referred to as *remote monitoring servers*. The hub monitoring server receives data requests from the enhanced 3270UI through the data retrieval agent (KOBAGENT) and drives OMEGAMON® agents for data collection and retrieval. The hub monitoring must be seeded with OMEGAMON® V5.3.0 agent data.

### OMEGAMON® Enhanced 3270 user interface address space

The enhanced 3270UI address space provides data retrieval and user interface 3270 interaction functions. One or more enhanced 3270UI can be deployed in a specific z/OS® Sysplex.

### OMEGAMON® Enhanced 3270 user interface data retrieval agent (KOBAGENT)

This component runs in any z/OS® monitoring server or Tivoli® OMEGAMON® Agent address space. The enhanced 3270UI data retrieval agent receives data requests from the enhanced 3270UI and connects to the hub monitoring server to drive data collection by OMEGAMON® V5.3.0 monitoring agents.

There must be at least one enhanced 3270UI data retrieval agent that is deployed and running in the Sysplex where components of a specific configuration (hub or remote monitoring servers and agents) are running to enable enhanced 3270UI data retrieval and display. The enhanced 3270UI must also run in the same Sysplex as the OMEGAMON® Enhanced 3270 user interface data retrieval agent.

The components that are mentioned earlier must be installed, configured, started, and running to enable successful rendering of OMEGAMON® agent data on the enhanced 3270UI. The OMEGAMON® agent configuration step that adds support for the V5.3.0 monitoring agent to the hub monitoring server must be performed to enable successful rendering of OMEGAMON® agent data on the enhanced 3270UI.

### Communications and data retrieval

The enhanced 3270UI uses WLM Services to discover Data Retrieval Agents that are running in its Sysplex. The interface uses TCP/IP services to communicate with Data Retrieval Agents.

The Data Retrieval Agent uses TCP/IP services to communicate with the hub monitoring server. The Data Retrieval Agent uses WLM Services to register or publish their existence within the Sysplex.

The OMEGAMON® monitoring agents use TCP/IP or SNA services to communicate with the monitoring servers. The monitoring agents register with the hub monitoring server as part of the startup process.

The enhanced 3270UI uses VTAM services when you log on and communicate with the interface. You log on to the enhanced 3270UI through a VTAM APPLID that is opened during startup of the interface.

The following figure shows the OMEGAMON® configuration that includes deployment of these enhanced 3270 interface components:

- OMEGAMON® Enhanced 3270 user interface address space
- OMEGAMON® Enhanced 3270 user interface Data Retrieval Agent (KOBAGENT)

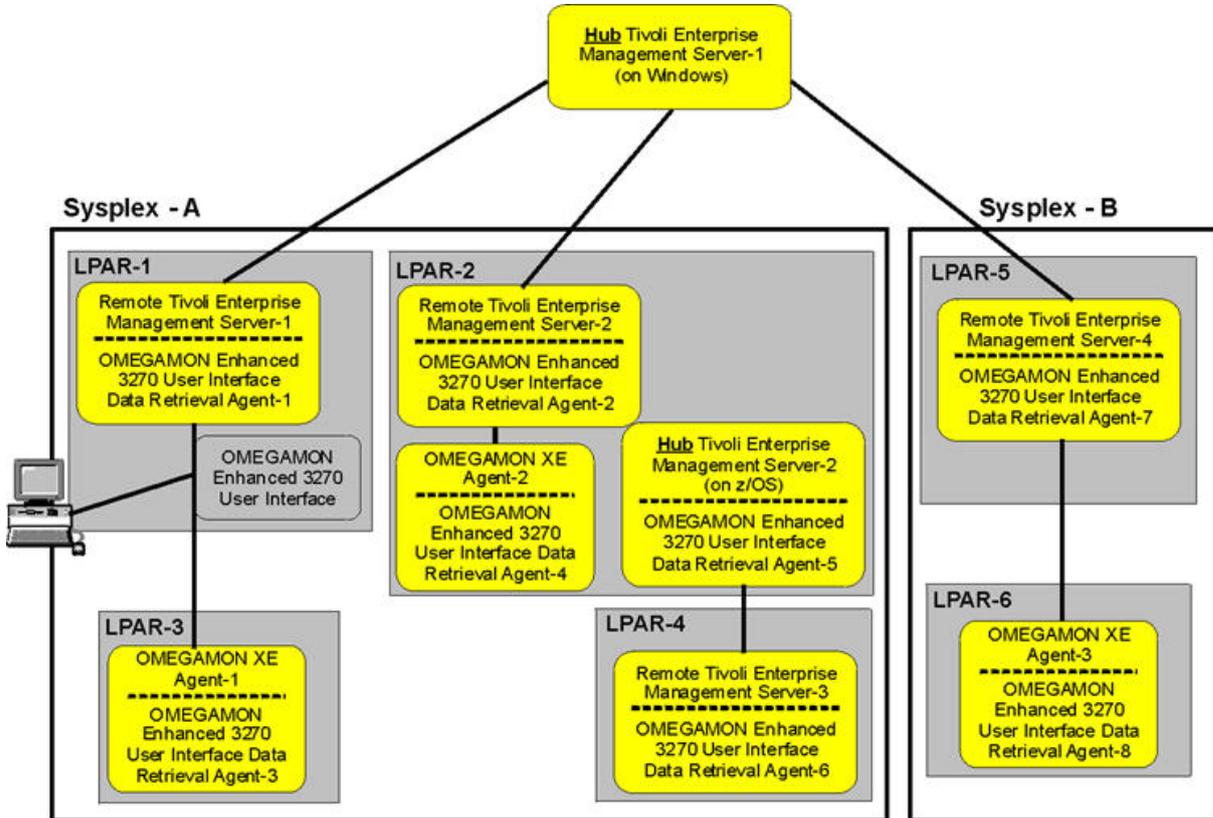

Figure 101: OMEGAMON configuration that includes deployment of the enhanced 3270 interface components

### Minimal configuration

The following minimal configuration must be addressed to enable the enhanced 3270UI to select and connect to a hub monitoring server:

#### OMEGAMON® Enhanced 3270 user interface logon profile

You must create one or more custom logon profiles. These profiles specify the settings for the hub monitoring server from which data is collected. The `RKOBPROF DD` statement in the enhanced 3270UI started task JCL procedure specifies the data set that contains the site and user logon profile settings. The customized site or user profiles are stored as members of the `rte.UK0BDATF` data set. When you log on, the enhanced 3270UI looks for a profile member named `user_id` (the ID of the logged on user) or `CUASITE` (a site-customized profile) to establish profile settings for the session.

You can establish a site or `user_id` named logon profile member by copying (and renaming) the `KOBCUA` product provided profile member from the target `thilev.TK0BDATF` library or the runtime `rte.TK0BDATF` data set to the runtime `rte.UK0BDATF` data set.

From Tivoli® Management Services Version 6.3.2 (APAR OA42127), you can use the **User Profile Member** workspace to customize user profiles. For more information about customizing a user profile, see [“Customizing a user profile” on page 937](#).

For an alternative method of creating and customizing a logon profile, see [“Profile viewing and cloning” on page 977](#).

#### Hub monitoring server settings

##### Tivoli® Management Services V6.3.2 (APAR OA42127) or later.

The settings for the hub monitoring server settings are specified in the logon profile member. By default, the following setting statements are provided:

```
HUBNAME=HUBNAME
HUBIPADDRESS=: :ffff:HUBADDRESS
HUBPORTNUMBER=HUBPORTNUMBER
```

Edit the profile member copy to specify the wanted hub settings; locate and update the statements.

For example:

```
HUBNAME=HUB1:CMS
HUBIPADDRESS=: :ffff:9.44.44.22
HUBPORTNUMBER=55555
```

### **Tivoli® Management Services V6.3 or earlier (pre-APAR OA42127).**

The settings for the hub monitoring server settings are specified in the logon profile member. By default, the settings are provided as commented statements:

```
/* HUBNAME=HUBNAME
/* HUBIPADDRESS=: :ffff:HUBADDRESS
/* HUBPORTNUMBER=HUBPORTNUMBER
```

Edit the profile member copy to specify the wanted hub settings; locate, uncomment, and update the statements; for example, remove the leading `/*` and move the setting statements to begin in column one.

For example:

```
HUBNAME=HUB1:CMS
HUBIPADDRESS=: :ffff:9.44.44.22
HUBPORTNUMBER=55555
```

### **HUBNAME**

The configured name of the hub monitoring server. The monitoring server might be configured to run on the z/OS or distributed system; for example, Linux. Often a hub monitoring server is configured to run on distributed systems that employs a mixed-case or all lowercase naming convention. The value that is specified in your profile setting statements *must* match the case of the configured value.

### **HUBIPADDRESS**

The TCP/IP address of the host system where the hub monitoring server runs. The setting *must* be an TCP/IP address as shown in the preceding example; do not specify a TCP/IP host name.

### **HUBPORTNUMBER**

The TCP/IP port number of the configured hub monitoring server. The default port number is 1918.

## **Component startup and operation**

The following components comprise the startup and operation environment for the OMEGAMON® Enhanced 3270 user interface and the OMEGAMON® agents:

### **OMEGAMON® Enhanced 3270 user interface address space**

Although startup of the enhanced 3270UI address space is relatively fast, it is ideally the last component in the startup sequence; because the interface requires that all other components in its environment (the OMEGAMON® monitoring agents, the Data Retrieval Agent, and the hub and or remote monitoring servers) be initialized and running before it is able to retrieve data.

### **OMEGAMON® Enhanced 3270 user interface local registry**

The enhanced 3270UI startup process discovers registered Data Retrieval Agents and connects to related hub monitoring servers to establish a local registry of data source information; that is, managed systems names and managed system lists. After startup, by default, the registry is refreshed on a 5-minute interval.

### **OMEGAMON® agent and OMEGAMON® Enhanced 3270 user interface Data Retrieval Agent**

The OMEGAMON® V5.3.0 agent address spaces run both an instance of the product agent and also an instance of an enhanced 3270UI Data Retrieval Agent. The Data Retrieval Agent uses WLM services to publish or register its existence. The product agent registers with the hub monitoring server; these registration processes facilitate enhanced 3270UI discovery of OMEGAMON® agents. Some OMEGAMON®

agents, such as OMEGAMON® for z/OS®, run under a remote z/OS® monitoring server; the enhanced 3270UI Data Retrieval Agent also runs under remote z/OS® monitoring servers.

### OMEGAMON® agent startup process

There might be cases where an OMEGAMON® agent startup process requires up to 10 minutes to complete startup and registration. As a result, the enhanced 3270UI cannot retrieve data for that agent during this period.

### OMEGAMON® agent recycle

There might be cases where an OMEGAMON® agent address space is terminated (for example, LPAR shutdown, goes offline) and, in some cases, the agent is performing the role of a *proxy agent*. As a result, the enhanced 3270UI cannot retrieve data for that agent until the offline agent condition is resolved; for example, in a multi-LPAR configuration another agent assumes the *proxy-agent* role.

### Hub Tivoli® Enterprise Monitoring Server

To enable the enhanced 3270UI data retrieval, the hub Tivoli® Enterprise Monitoring Server must be:

- Running Tivoli® Management Services V6.3.2 or higher
- Seeded with IBM OMEGAMON® for Db2 Performance Expert on z/OS V5.3.0 or higher agent data
- Started and connectable through TCP/IP; listening on the configured TCP/IP port
- Be connected or online IBM OMEGAMON® for Db2 Performance Expert on z/OS V5.3.0 or higher agents

## Configuration

The enhanced 3270 user interface is controlled and configured by a set of runtime libraries and parameter files. The configuration process defines the address space controls and logical VTAM connections required to run the interface.

The interface can be configured by using PARMGEN or Configuration Manager. For instructions on configuring the interface, see [Configuring products and components on z/OS](#).

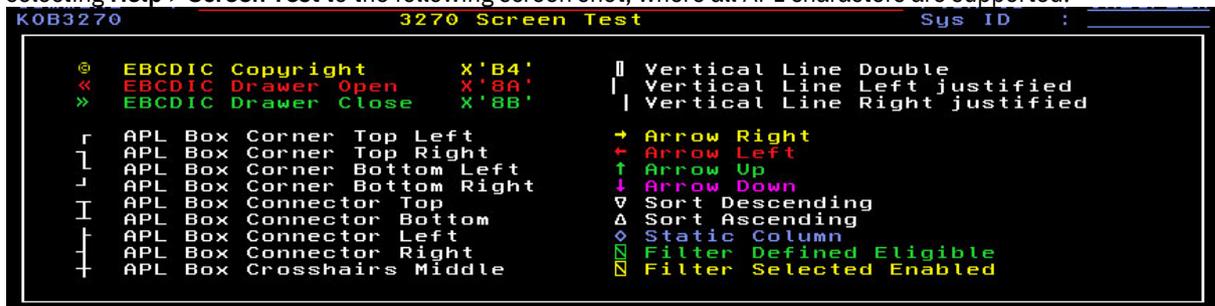

See [“Administration” on page 973](#) for information on customizing interface settings and modifying workspaces.

## Supported emulators and screen sizes

The enhanced 3270 user interface can be used with any 3270 emulator that supports the APL character set. The interface supports screen sizes of 24 x 80, 32 x 80, 43 x 80, 27 x 132, and 62 x 160.

Although a 24 x 80 screen size is supported, given its limited area, use a larger screen size if possible. The minimum suggested screen size is 43 x 80.

Some 3270 emulators do not support the APL characters that the enhanced 3270 user interface requires. An option is available for running the enhanced 3270 user interface with limited APL characters. To view all APL characters that are used by the enhanced 3270 user interface, select the **Help > Screen Test** menu option. To determine if your 3270 emulator supports the APL characters used by the interface, compare the results from selecting **Help > Screen Test** to the following screen shot, where all APL characters are supported:

To change the level of APL graphics support for your emulator, select the **Edit > Preferences** menu option. On the **ISPF** tab, select one of the following options for your emulator:

### FULL

Full APL graphics support.

## LINE

APL graphics support for box lines only.

**Note:** Some (non-IBM) emulators can require LOGMODE settings such as D4A32XX3.

## Logging on and off

The enhanced 3270 user interface supports authorization, when you log on. A valid user ID defined to the security system in force on the system is required. Typically, this ID is a TSO ID.

### Logging on

You log on to the enhanced 3270 user interface by using its Applid (for example, LOGON APPLID(OMEGUI), and then enter your user ID and password at the logon panel. Typically, this ID is the TSO user ID. Your site might also require a group name and password. The interface also supports a password phrase (passphrase) of 9 or more characters, up to the available screen width.

### Before you begin

The enhanced 3270 user interface address space, the OMEGAMON monitoring agents for which you want data, and the hub Tivoli Enterprise Monitoring Server from which you will be requesting data, must be started before you log on to the interface. If security is configured for the interface, you need a user ID. The user ID must be defined to the system authorization facility (SAF) and can be different from the ID used to log on to the Tivoli Enterprise Portal interface.

### About this task

To log on, use the following procedure.

### Procedure

1. Start a new VTAM 3270 session.
2. At the VTAM logon panel, enter the following command, where *applid* is the VTAM Applid that is assigned to the enhanced 3270 user interface address space:

```
LOGON APPLID(applid)
```

The enhanced 3270 user interface logon panel is displayed:

3. Enter your user ID and password (typically, this ID is one of your TSO IDs). Mixed-case IDs are supported. The interface also supports password phrases up to the available width of the screen. Your site can also require a group name and password.
4. Press **Enter**.  
The initial workspace is displayed. By default, you see an overview workspace for all installed products that support the user interface (KOBSTART). However, a different initial workspace might be specified in your site or user profile. If a hub monitoring server is not specified in your profile, the **Hub Connectivity**

**Administration** workspace is displayed. For more information, see [“Logon administration and customization” on page 940](#).

## Logging off

There are several ways to log off from the enhanced 3270 interface. Use any of the methods described.

## Procedure

- From the action line or the command line of any workspace, enter EXIT, LOGOFF, QUIT, or =X.
- From the initial logon workspace, press F3 to display an Exit menu with the choice of exiting or resuming. Enter 1 or X to exit, or 2 or R to resume working with the interface.
- From the File menu, select **Exit**, then press **Enter**.

## Security

The enhanced 3270 user interface (enhanced 3270UI) authenticates user identity by using the system authorization facility (SAF) interface. All authentication or authorization failures are logged. All Take Action requests are logged.

### System Authorization Facility

The existence of the SAF user ID and its validity are always checked. The enhanced 3270UI also runs a number of SAF authorization checks to check whether the user has authority to do the following activities:

- Log on to this instance of the enhanced 3270 user interface
- End User activities
  - View data for a specific attribute group (table) on a specific managed system
  - Transmit a Take Action request to a specific managed system
  - Change auto-update preferences
  - Entry of any command on the command line
  - Create and modify a profile member name with the same name as the user ID of the user
  - Use a specific hub Tivoli® Enterprise Monitoring Server
- Administrative activities
  - List enhanced 3270 user interface users, and optionally end a user's session
  - Save a data set member
  - Start or stop user interface tracing
  - Start or stop internal tracing
  - Modify (Save As) any PDS member that is named with a different user ID to that of the current user
  - Near-term history configuration

User permissions and the amount of security that is imposed are assigned by site administrators. Authorization works as follows:

- If no SAF security class is supplied (value for RTE\_SECURITY\_CLASS is missing or blank), users can log on to the OMEGAMON® enhanced 3270UI, can access data through queries, but cannot issue Take Action commands.
- If a SAF security class is supplied, but the class is not defined and active in SAF, no one can log on to the OMEGAMON® enhanced 3270UI.
- If a SAF security class is supplied, and is defined and active in SAF, but no logon profile is defined, no one can log on to the OMEGAMON® enhanced 3270UI.

- If a user is able to log on, and a different security class than the one used for logon is used for queries or for Take Action commands (but is not activated or resources are not defined in that security class), everyone can view data for any managed system and perform other commands and activities, but all Take Action commands are denied.
- If a security class name is configured, resource profiles must be defined to control log on, data access, and Take Actions, and users must be given access to those profiles.

### Enabling e3270UI PassTicket generation

Requests to either display or zap memory from the e3270UI require a secured sign-on from the enhanced 3270UI to the OMEGAMON on z/OS monitoring agent. The enhanced 3270UI will generate a PassTicket (a one time only password) and send it to the OMEGAMON on z/OS monitoring agent in the data request. In this way the monitoring agent can authenticate the request that comes from the user logged into the enhanced 3270UI.

In order for a PassTicket to be generated, the PTKTDATA security class must be activated. To activate the PTKTDATA class and the SETROPTS RACLIST processing, run the following command.

```
SETROPTS CLASSACT(PTKTDATA) RACLIST(PTKTDATA) GENERIC(PTKTDATA)
```

By using the PassTicket key class the security administrator can associate a RACF secured sign-on secret key with a particular mainframe application that uses RACF for user authentication. All profiles that contain PassTicket information are defined to the PTKTDATA class.

### Configuring security resource profiles

See [Enable security for the OMEGAMON enhanced 3270 user interface](#) for information about how security works and how to configure security resource profiles.

Starting from OMEGAMON enhanced 3270 user interface PTF UA83356 for APAR OA51564, you can use the Situation Editor and Object Editor for situation and group management. However, the new Situation Editor and Object Editor functions that are introduced in this PTF are disabled by default due to possible performance impact of certain situations. The following security resource profiles must be defined for these editors.

- **KOBUI . ADMIN . SITEDITOR**
- **KOBUI . ADMIN . OBJECTEDITOR**
- **04SRV . \*\***

Use combinations of read, update, or none for the profiles to control the access to the editors.

- To view the editors, the users must have either read or update permission to the corresponding editor profiles (**KOBUI . ADMIN . SITEDITOR** for the Situation Editor and **KOBUI . ADMIN . OBJECTEDITOR** for the Object Editor). Users with none permission to the profiles are not able to access the editors.
- To save updates in the editors, the users must have read or update permission to the **04SRV . \*\*** profile, as well as either read or update permission to the corresponding editor profiles. Users with none permission to the **04SRV . \*\*** profile are not able to save updates in the editors.

### Data Facility Storage Management System (DFSMS)

The following activities are separately secured by the Data Facility Storage Management System (DFSMS):

- Display a member list for a data set
- Browse the contents of a data set member
- Save a data set member

### User Experience

When users are not authorized to run an activity, they are prevented from running the activity regardless of the attempted method, for example, whether by using a menu item, command line, or function key.

When users attempt to run an activity that they are not authorized to, a message similar to the following is displayed on their screen:

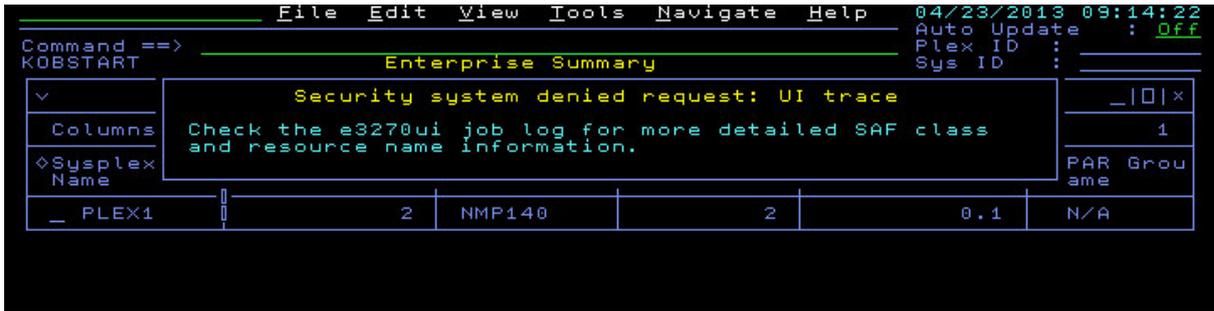

Figure 102: Security system denied request message.

The administrator can check the SYSPRINT log file to see additional details about the request that is denied. For example, for the message shown an entry similar to the following can be found in the SYSPRINT log file:

```
USER2    KOBUICS2I SAF R15=00000008 CLASS($KOBTEST) RESOURCE(KOBUI.ADMIN.TRACE.UI.BASIC )
RC=00000008 RSN=00000000
```

## Getting help

You can view column and menu help, and a general Help Directory in the enhanced 3270 user interface. If help information is available for a specific workspace you are viewing, then that Help information will be displayed in place of the Help Directory when you enter the **HELP** command.

### Column help

You can get help for any workspace column by positioning your cursor in the field with the column name and pressing **F1**. A menu is displayed containing a description of the attribute for the data that is being displayed. A question mark (?) entered in column 1 of a summary type subpanel also displays help for the column. For an example, see [“Help for column headings” on page 915](#).

### Menu help

The action bar **Help** menu displays information about the following enhanced 3270 user interface items:

- Commands
- PFKeys
- Icons
- Navigation
- Auto Update
- Refresh
- Screen Test
- Help Contents
- About OMEGAMON
- What's New

For more information about menus, see [“Menus” on page 908](#).

The enhanced 3270 user interface displays all of the information from the **Help** menu in a tree structure in the [Help and Workspace Directory](#).

## Help and Workspace Directory

You can use this workspace to view all menu help and navigate to OMEGAMON and enhanced 3270 user interface workspaces.

Within a workspace, there are three ways to navigate to the **Help and Workspace Directory (KOBHLDIR)** workspace:

- Issue the **HELP** command from any workspace.
- Issue an **h.h** fast path mnemonic in the upper left portion of your screen.
- Expand the **HELP** menu and select **H Help Contents**.

The **KOBHLDIR** workspace is presented in a tree structure, meaning you can expand branches by selecting the plus sign (+) and collapse branches by selecting the minus sign (-). Within this workspace, you are able to access all topics from the **HELP** menu and navigate to several Overview workspaces within the current enhanced 3270 user interface session.

The following is an example of the **Help and Workspace Directory (KOBHLDIR)** workspace:

Figure 103: Help Tree.

## Workspaces

Workspaces are panels that display collected data and analytic, diagnostic, or explanatory information. Workspaces can contain up to 15 subpanels, displaying various type of data or information. Workspace panels can be overlaid by pop-up panels that present navigation or action options, help for a particular field, or additional information. You navigate among workspaces by zooming to preset destinations, entering an action code in an input field, or by selecting a destination from an action popup panel.

**Note:** You are free to copy, modify, use, and distribute the data and information in all workspaces in the RKANWENU dataset.

### Parts of the workspace

A typical workspace consists of an action bar, a header, up to 15 subpanels, and a footer.

#### Action bar

The action bar is the first line of the workspace. The bar has an input field on the left side, and a set of dropdown menus across the length of the line. You can use the input line to enter navigation and action commands and mnemonics of up to 16 bytes. The date and time of the session is displayed to the right of the action bar.

## Header

```
File Edit View Tools Navigate Help 02/14/2013 12:12:47
Auto Update : Off
Plex ID :
SMF ID :
Command ==>
KMSPLXQ Enterprise Sysplex Overview
```

The workspace header consists of the following parts:

### Command line

The command line beneath the action bar is also used to enter navigation, action commands and mnemonics, but allows as many bytes as can fit on your screen (that is, the number of bytes allowed depends on the size of the screen).

### Panel ID

The identifier of the workspace. The panel ID is the name of the PDS member in which the workspace panel is defined. The panel ID is located in the upper left corner of the workspace below the Command line. You can use the panel ID to navigate to a specific workspace. An alias may be assigned to a panel ID by IBM® or by your site to simplify navigation.

### Workspace title

A descriptive title that identifies the content of the workspace as a whole.

### Auto Update status

An indicator of whether automatic refresh is in effect or not. This field is adjustable by the user. If the auto update feature is enabled, the field displays the refresh interval in effect. If the auto update feature is disabled, the field displays `Off`. If auto update is automatically suspended, the field displays `SUS`.

### Plex ID

This field identifies the plex (IMSplex, Sysplex, CICSplex) for which data is being displayed. The label and purpose of this field may vary from workspace to workspace and from monitoring product to monitoring product. The field may be blank, for example in a multiproduct workspace such as KOBSTART, or if the fields are locked.

### System ID

This field, under the Plex ID, identifies the subsystem, LPAR, or region for which data is being displayed. The label and purpose of this field may vary from workspace to workspace and from monitoring product to monitoring product. The field may be blank, for example in a multiproduct workspace such as KOBSTART, or if the fields are locked.

## Subpanels

There are four types of subpanels: detail, summary, ISPF, and HTML.

In detail panels, multiple data points for a single resource are displayed. The name of the attributes for which data is being displayed appears to the left of the value.

In summary subpanels, data for multiple resources is presented in tabular form, one row for each resource, with columns providing values for the system or application attributes being monitored by the agent, such as Disk Name and Disk Read/Writes Per Second.

If defined thresholds are reached, data is highlighted with colors indicating the status of the item.

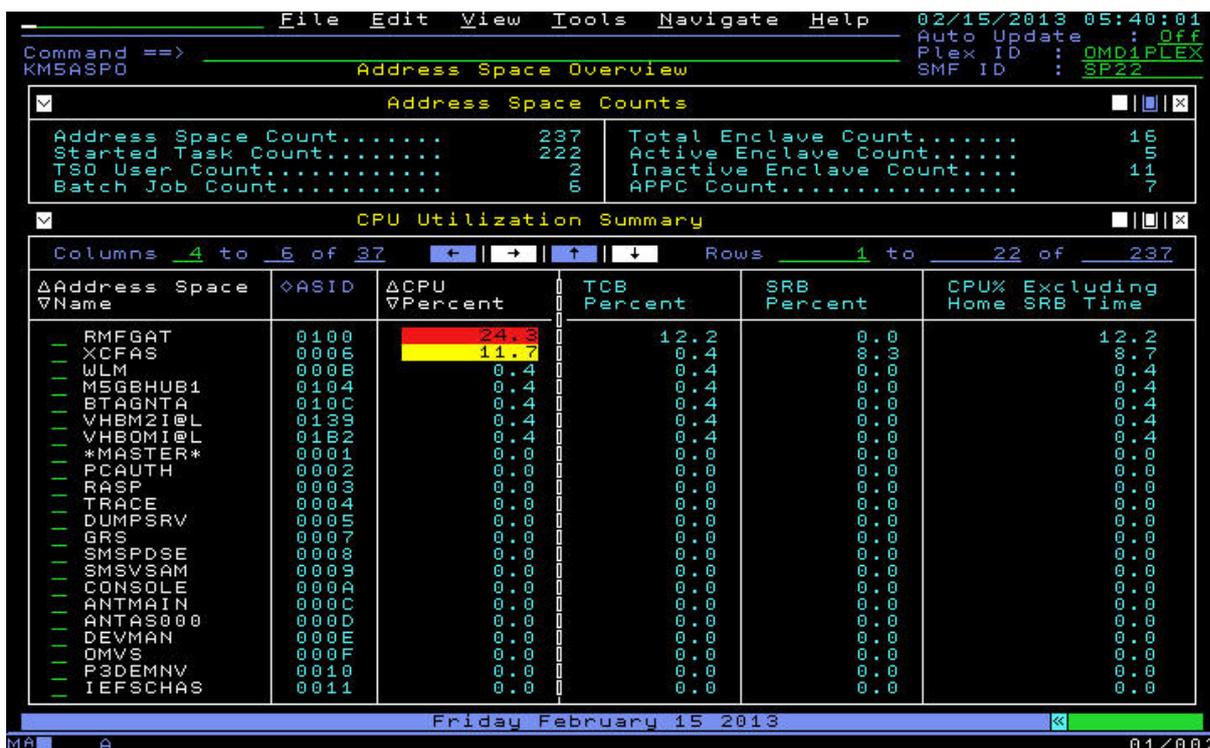

Figure 104: Workspace with detail and summary subpanels

Summary and detail subpanels can contain some or all of the following elements:

**Header**

A descriptive title for the subpanel.

**Collapse and Expand controls**

Selecting the

control collapses the contents of the subpanel so only the header is displayed. If the subpanel is collapsed, selecting the  icon expands the subpanel. See “Collapsing and expanding subpanels” on page 920 for more information.

**Columns \_\_\_ field (summary subpanels only)**

A writeable field that indicates at which column of data the scrollable part of the display begins. Entering a column number in the field and pressing Enter scrolls the display to that column. If no further columns are available, the field is blue.

**Left, right, up, down scrolling arrows (summary subpanels only)**

Scrolls the width or depth of the subpanel. If there is a threshold condition off to the left or right of the data that is presented on the screen, the left or right arrow will reflect the color of the highest severity off-screen threshold.

**Minimize, maximize, close controls**

**Minimize** removes the subpanel from the workspace and puts the subpanel title in the minimize bar at the bottom of the workspace. Placing your cursor under the title in the bar and pressing **Enter** expands the subpanel to its former position.

**Maximize** expands the subpanel to fill the entire screen. The icon changes to indicate that the subpanel is maximized.

The

**Close** control closes the subpanel entirely.

See “[Minimizing and maximizing subpanels](#)” on page 920 and “[Closing subpanels](#)” on page 921 for more information.

### Rows \_\_\_ field (summary subpanels only)

Indicates at which row of data the display begins. If the field is green, entering a row number in the field and pressing **Enter** scrolls the display to that row. If no additional rows are available, the field is blue.

### Subpanel footer

Contains additional information about the data in the subpanel.

ISPF and HTML subpanels consist of an optional header and text that provides additional information about the workspace, such as why the user was brought to this workspace.

### Footer

The workspace footer contains a minimize bar. If subpanels are minimized, their headers appear in the bar. If there is more data available than is displayed on the screen, a MORE indicator is displayed. Up or down arrows beside the text indicate the direction of the additional data that is not currently displayed on the screen. If Trace is enabled, a TRACE indicator is displayed; however, if there is more data to be displayed, the MORE indicator takes precedence over the TRACE indicator.

Figure 105: Minimize bar with ECSA subpanel minimized to bar and MORE indicator with down arrow

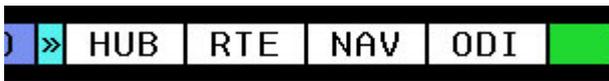

### Drawer

The drawer is an alternative way to go quickly to administrative workspaces, and products from the footer area. The drawer can be opened to reveal navigation icons or closed to hide the icons.

In the closed position, the drawer is signified by the **Open Drawer** icon <<.

To open the drawer move your cursor to the **Open Drawer** icon, and press **Enter**, or double-click the icon, if this method is enabled for your 3270 emulator session. For more information about enabling double-clicking, see “[Associating a mouse click with the Enter key](#)” on page 1060.

When the drawer is open, a number of icons are available. To go to the workspace or action that is associated with a specific icon, move your cursor to the icon and press **Enter**, or double-click the icon. The following icons are available:

#### HUB

Use this icon to go to the **Hub Connectivity Administration** workspace.

#### RTE

Use this icon to go to the **Runtime Environment** workspace.

#### NAV

This icon opens a lateral navigation area in the footer area. In the lateral navigation area, push buttons represent products or workspaces that you can navigate to, for example, these push buttons can be used to navigate to installed products:

To go to a specific product, move your cursor to the icon and press **Enter**, or double-click the icon.

#### Tip:

- To open the lateral navigation area, press the **PF9** key.
- When the lateral navigation area opens, the drawer closes.

#### ODI

Use this icon to display the list of products that are installed in the Enhanced 3270 User Interface. You can display the products, tables and column definitions that are defined in the Object Definition Interchange. When creating new workspaces, for example, this view shows you the actual table and column names to use in a QUERY statement.

When the drawer is open, the **Close Drawer** icon >> is available. To close the drawer, move your cursor to the **Close Drawer** icon >>, and press **Enter**, or double click the icon, if this method is enabled for your 3270 emulator session. For more information about enabling double-clicking, see [“Associating a mouse click with the Enter key” on page 1060](#).

## Menus

The enhanced 3270 user interface contains a menu bar at the top of the screen. Any item in the menu bar can be selected by pressing the Enter key while the cursor is on the item. A pull-down menu will then appear showing additional menu items.

You can access the menus in three ways:

1. Place your cursor on the menu item and press **Enter**.
2. Select the menu item with your mouse if this method is enabled for your 3270 emulator session (usually a double click or a single click from a mouse button). For more information about enabling mouse selection, see [“Associating a mouse click with the Enter key” on page 1060](#).
3. You can use fast path commands to select a menu item by entering an abbreviated command on the action line or command line. The letters that you enter in the abbreviated fast path command are listed under each menu. For example, you can enter the fast path command **v . s** as an alternative to selecting the menu option **View > S Workspace Source**. Similarly, you can enter the fast path command **e . p** as an alternative to selecting the menu option **Edit > P Preferences**.

The following menus are available:

#### File

The options that are enabled are context-sensitive. Some options might not be available either because they are not available from the current workspace or because they are not available in this version.

#### N New

This option is not available in this version.

#### **O Open**

Opens the **Runtime Environment (Workspaces)** workspace, which provides directory lists for the user workspace data set (UKANWENU DD) and the runtime environment workspace data set (RKANWENU DD). You can use this workspace for browsing and locating workspaces.

#### **S Save**

This option is not available in this version.

#### **A Save As**

Saves a copy of the current workspace. This option is available when viewing a workspace PDS member or an in-memory PDS member.

#### **P Print Screen**

Writes a copy of the current screen to SYSOUT1.

#### **X Exit/Logoff**

Exits the current interface session.

### **Edit**

The **Edit** menu offers the following selections:

#### **S Situations**

Invokes the **Situations Editor**, which you use to create *situations* that monitor important conditions in your enterprise.

#### **O Objects**

Invokes the **Object Group Editor**, which you use to organize managed systems and situations into groups that you can reference in distribution lists.

#### **P Preferences**

Displays user profile information. For more information, see [“Customizing a user profile” on page 937](#).

#### **W First Workspace**

Invokes the **Customize your First Workspace Display**, where you specify which system or subsystems to include on the status tree and select which views to include for each product tab.

### **View**

The **View** menu offers the following selections:

#### **F Filters**

Displays a list of filterable items for the current workspace, if any are defined.

#### **T Thresholds**

Displays the **Runtime Configuration** workspace for viewing Threshold definition members. The workspace displays information for the RTE data sets that contain the threshold definition members.

**Tip:** Product-provided threshold definition members are named IBMSITE, CUASITE, or KppTHRESH, where *pp* is the two-digit product code identifier; for example, M5 for the OMEGAMON® for z/OS® product.

#### **A Alias Commands**

Displays a list of alias commands that you can type on the action line or command line to go directly to a workspace view.

#### **S Workspace Source (On Disk)**

Displays the contents of the RKANWENU PDS member used to create the current on-screen workspace.

#### **W Workspace Source (In-memory)**

Displays the in-memory, resolved (parsed) version of the RKANWENU PDS member for the current on-screen workspace.

### **M Memory**

Invokes the **Memory Display/Zap** workspace, which is part of the OMEGAMON for z/OS product. Use this workspace to browse memory in target subsystems, such as CICS, IMS, and Db2.

### **H History Configuration**

Use this option to configure historical data collection for an application.

### **R History Refresh**

Use this option to refresh the historical data view. This option is available only when viewing history data.

### **I History Timespan**

Use this option to select the time period to view for historical data.

### **Q Last Query Performance**

Displays time measurements for the last workspace ENTER key cycle. You can also use the **SHOWQUERY** command to display this information.

### **P Session Performance**

Displays SQL performance metrics for the entire enhanced 3270 user interface session. You can also use the **PERF** command to display this information.

## **Tools**

The **Tools** menu offers the following options:

### **I Trace (User Interface)**

Engages trace for the current session. You select the process that you want to enable trace on from a pop-up menu.

**Important:** Do not use this option except as directed by IBM® Software Support.

### **A Trace (Address Space)**

Engages trace for the entire address space. You select the component that you want to enable trace on from a pop-up menu.

**Warning:** When you engage trace, the volume of messages that are written to the output log files increases (typically JES output). If trace is engaged for an extended period, the output can exceed site limits and cause an enhanced 3270 user interface address space termination.

**Important:** Do not use this option except as directed by IBM® Software Support.

### **R Registry Refresh**

Refreshes the registry that lists all managed system names, managed system lists, and data retrieval agents.

### **T Threshold Refresh**

Refreshes the threshold definitions from disk.

### **U Active 3270 Users**

Displays a list of active users and details about their sessions.

### **H Current Hub Information**

Displays information about your hub connection.

#### **P Products Installed in Hub**

Displays the products that are installed on the hub.

#### **S Switch Between Hubs**

Switches the hub to use for queries, if secondary hub support is in effect.

#### **D Discard the Secondary Hub**

Removes the secondary hub assignment for this session, with the option of updating the user's profile, if secondary hub support is in effect.

#### **E Runtime Environment**

Displays information about the Runtime Environment (RTE).

#### **G Global Timeout Control**

Displays the workspace query timeout value.

#### **V Internal Variables**

Displays a list of internal variables.

#### **O ODI (Object Definitions)**

Displays the list of products that are installed in the enhanced 3270 user interface. You can display the products, tables and column definitions that are defined in the Object Definition Interchange. When creating new workspaces, for example, this view shows you the actual table and column names to use in a QUERY statement.

#### **F SDA (Self-Describing Agents)**

Displays any self-describing agent (SDA) status information.

### **Navigate**

Use the **Navigate** menu to navigate to different products. Products that are available are shown in the color white. Products that are not available are shown in the color blue. Products that are installed locally in the interface but are not available in the connected hub monitoring server are shown in the color yellow.

#### **Z z/OS**

z/OS® summary.

#### **C CICS**

CICS® summary.

#### **G CICS/TG**

CICS® Transaction Gateway summary.

#### **I IMS**

IMS™ summary.

#### **D DB2**

Db2® summary.

#### **N Networks**

Network health summary.

#### **M MQ**

MQ summary.

#### **B Integration Bus**

Integration Bus summary.

#### **S Storage**

Storage summary.

## **J JVM**

JVM summary.

## **H Home**

First workspace.

## **E Events Console**

Enterprise Status Tree.

## **Help**

The **Help** menu displays help for the enhanced 3270 user interface. The following topics are covered:

### **C Commands**

Help for commands and the command line.

### **P PFKeys**

Help for the Program Function (PF) keys.

### **I Icons**

Help for the enhanced 3270 user interface icons.

### **N Navigation**

Help for navigating by using commands, PF keys, icons, and pull-down menu options.

### **U Auto Update**

Help for the OMEGAMON® Auto Update feature.

### **R Refresh**

Help for different types of refreshes: History, Registry and Thresholds.

### **S Screen Test**

Helps determine if the 3270 emulator in use can display the APF characters used by the interface.

### **H Help Contents**

A tree displaying the help topics and available workspaces for the current enhanced 3270 user interface session.

### **A About OMEGAMON**

A pop-up window that lists the following information for the current enhanced 3270 user interface session:

- enhanced 3270 user interface version and level
- User ID
- VTAM® applid
- Jobname
- LPAR ID
- Operating System
- Sysplex
- TCP/IP host and address
- Dashboard Edition (enabled or disabled)
- OMEGAMON monitoring product and component versions

### **W Whats New**

Navigates to the **Help and Workspace Directory** and expands the **New Features** branch, which displays recent updates to the enhanced 3270 user interface.

## Registry Refresh

The registry refresh process is used to obtain current component information for display in the Enhanced 3270 User Interface (enhanced 3270UI). The information gathered is about Hub Tivoli Enterprise Monitoring Servers, Data Retrieval Agents, Managed System Lists, and Managed System Names.

The enhanced 3270UI uses information (names, IP addresses, member lists, etc.) about hub monitoring servers, Data Retrieval Agents, Managed System Lists, and Managed System Names to satisfy queries issued from the enhanced 3270UI workspaces. This information changes over time as hub monitoring server, remote monitoring server, and managed systems are started, stopped, and recycled. The enhanced 3270UI must have up to date information about each of these components to successfully retrieve complete information for display in the enhanced 3270UI.

The process used by the enhanced 3270UI to obtain current information about these components is called *Registry Refresh*. The *Registry* is the cache of information (in each Tivoli Omegamon Manager address space) about each of these components (hub monitoring servers, Data Retrieval Agents, Managed System Lists, and Managed System Names) that is *Refreshed* periodically to maintain currency with component changes. Typically, this *Registry Refresh* occurs within a Tivoli Omegamon Manager address space every five minutes, and this refresh obtains current information about each of the components listed in the previous sentence. This refreshed information is obtained by performing queries to several monitoring server *tables*, namely the O4SRV.INODESTS and O4SRV.TNODELST tables.

If component changes occur between Registry Refreshes (an OMEGAMON agent is started or stopped, or a CICS region (a *managed system*) is started, for example), the Registry is *out of date* until the next Registry Refresh occurs, which means an enhanced 3270UI workspace that attempts to gather data from that OMEGAMON agent or about that CICS region will not result in complete data being returned to the enhanced 3270UI. If you view a workspace and there appears to be missing data rows for any part of the workspace, you can manually force a Registry Refresh.

There are three ways to force a Registry Refresh:

1. On the enhanced 3270UI command line, type: `r refresh`
2. Select **Tools > Registry Refresh** from the menu bar.
3. Use the MVS modify command from the system console as follows: `/F eif,REGREFRESH`, where *eif* is the started task for the enhanced 3270UI address space.

## Status indicators

Status lights are highlight colors that indicate the status of monitored system components. The status is determined by a set of thresholds applied against the component.

By default, the colors and the statuses they represent are as follows:

### GREEN

OKGOOD

### YELLOW

WARNING

### RED

CRITICAL

### BLUE

IDLE

### TURQUOISE

HIGHLIGHT

### BLUE

UNKNOWN

**Note:** By default, status of OK or GOOD is not indicated (that is, there is no highlighting).

Thresholds may also be defined in terms of ranges. The default colors and the ranges they represent are as follows:

**GREEN**

Ranges 1–3

**YELLOW**

Ranges 4–6

**RED**

Ranges 7–9

The values or range represented by each status are set in threshold definitions. You can change the colors assigned to each threshold in the interface profile for your site or for individual users (see “Customizing status indicators” on page 963). Each monitoring agent provides predefined thresholds with its workspaces. You can modify these preset threshold criteria to suit your site (see “Modifying predefined thresholds” on page 963). In subsequent releases, you will be able to set your own thresholds.

**Example**

In the following example, the Performance Index values are all in the Warning range:

**Workspace colors**

In workspaces, colors identify types of text and fields.

The following list defines the default colors for various elements of a workspace:

**WHITE**

Boxlines, items available for selection or zooming

**YELLOW**

Main header, subpanel header, subpanel footer

**TURQUOISE**

Column header, body text

**GREEN**

Input, command line

**BLUE**

Action bar, panel ID

These colors are controlled by the interface profile in effect for the user (the KOBQUA, CUASITE, or user profile). You can modify any of these colors.

## Help for column headings

Help is provided for column headings in workspaces.

Within a workspace, you can place your cursor on a column heading or anywhere within the column, and press **PF1** to view help about the column.

The following is an example for the **Enterprise Summary KOBSTART** workspace:

1. Place your cursor on the **LPAR Group Capacity Limit** column of the **All Active Sysplexes** panel.
2. Press **PF1**.

The help for **LPAR Group Capacity Limit** is displayed:

Figure 106: Column heading help.

A question mark (?) entered in column 1 of a summary type subpanel also displays help for the column.

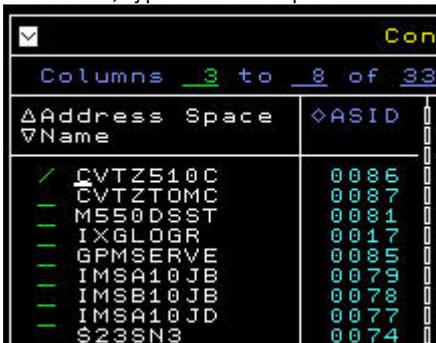

## Screen operations

Within a workspace, you can scroll up, down, left, and right in subpanels using PFKeys or commands, or by entering column or row numbers in input fields. In summary subpanels, you can also use scrolling icons. You can sort the data in columns and add, modify, and remove filters on eligible columns. You can also reset the context for the data displayed in the workspace.

## Action codes

Action codes are entered in the input area associated with a field.

In summary subpanels, the items in the first column are typically selectable. To view a list of actions applicable to an item, type / on the input field in front of the item and press **Enter**:

The Options Menu is displayed:

```
Options Menu
Select an option and then press ENTER
- 1. ! Take Action on Address Space
   2. C - Cancel Address Space
   3. A Address Space Bottlenecks Summary
   4. B Bottleneck Analysis for Address Space
   5. D Storage Usage by Address Space
   6. M Storage Usage by all Address Spaces
   7. S Address Space CPU Usage Details
   8. T TCB Storage and LSQA for Address Space
   9. W WLM Service Class Resources
```

The Options Menu displays the available actions and the possible navigation alternatives for that item, along with the action code for those options. Type the list number or the letter for the action in the entry field on the menu and press **Enter** to select an option. The actions available and the action codes associated with them vary from workspace to workspace.

If you know the letter associated with a particular action item, you can enter it directly on the workspace. Type the letter in the input field in front of an item and press **Enter**. Entering S selects the default action (or navigational option). You can also select the default action by placing the cursor in the input field and pressing **Enter**.

### Take Action commands

You can issue certain commands from the enhanced 3270 user interface. These commands are referred to as Take Action commands.

Individual commands may be listed in the Options Menu popup. They are prefixed by a hyphen (-):

```
Options Menu
Select an option and then press ENTER
- 1. ! Take Action on Address Space
   2. C - Cancel Address Space
   3. A Address Space Bottlenecks Summary
   4. B Bottleneck Analysis for Address Space
   5. D Storage Usage by Address Space
   6. M Storage Usage by all Address Spaces
   7. S Address Space CPU Usage Details
   8. T TCB Storage and LSQA for Address Space
   9. W WLM Service Class Resources
```

Additional commands may be available in a list of Take Action commands accessed from the Action Command menu. The list of Take Action commands is invoked by entering an exclamation point (!) in the Action Command menu, or by entering it in the input field for the applicable item.

```
KMSACT    Take Actions for Address Space M540DSST
Select an action and then press ENTER
- 1. C Cancel Address Space
   2. D Cancel Address Space with Dump
   3. R Cancel Address Space with Restart
   4. M Cancel Address Space with Restart Dump
   5. K Kill Address Space
   6. E Reset Address Space Service Class
   7. Q Quiesce Address Space
   8. U Resume Address Space Service Class
   9. T Change Time Limit
  10. S Swap In Address Space
  11. N Mark Address Space Nonswappable
  12. W Mark Address Space Swappable
```

## Scrolling

The enhanced 3270 user interface uses two types of scrolling: local and global. The type of scrolling that takes effect depends on the location of the cursor.

If the cursor is set in a subpanel when a scrolling command is executed, scrolling is local; that is, only the subpanel in which the cursor is located is affected. If all the subpanels in the workspace are displayed and the cursor is set outside a subpanel (for example, on the command line), scrolling applies to all the subpanels in the workspace. If there are subpanels that are not displayed (so the MORE indicator appears at the bottom of the screen), vertical scrolling with the cursor set outside the subpanels scrolls down an entire screen to display the remaining subpanels. If a subpanel is maximized, the MORE indicator at the bottom of the screen is suppressed and full screen scrolling is disabled. You can only scroll the contents of the maximized subpanel.

Use any of the following methods to scroll within all subpanels or within a specific subpanel.

- To scroll to the last or first *n*-number of rows or columns (where *n* is the maximum number of rows or columns that can be displayed on the screen), use any of the following methods:
  - Type DOWN *M*(AXIMUM), UP *M*, LEFT *M*, or RIGHT *M* on the COMMAND or action line and then press **Enter**.
  - Type *M* on COMMAND or action line and then press **PF8** (down), **PF7** (up), **PF10** (right), **PF11** (left), or use the corresponding assigned PFKeys.
  - Type TOP or BOTTOM on the COMMAND or action line and then press **Enter** to display the last or first *n*-rows
- To scroll a specified number of rows or columns, use either of the following methods:
  - Type DOWN *nnn*, UP *nnn*, RIGHT *nnn*, or LEFT *nnn* on the COMMAND or action line and then press **Enter**.
  - Type *nnn* on the COMMAND or action line and then press **PF7**, **PF8**, **PF10**, **PF11** (or the corresponding assigned PFKeys) to scroll down, up, right, or left.
- Remember: To scroll within a specific subpanel, set your cursor in the subpanel before you press **Enter** or the appropriate PFKey.

Use the following methods to scroll within a specific subpanel:

- To go to a specific column, overwrite the "from" column number in the subpanel header and press **Enter**.
- To go to a specific row, overwrite the "from" row number in the subpanel header and press **Enter**.
- To scroll to the next *n*-number of rows or columns, use the cursor-sensitive arrow controls in the subpanel header. Arrows highlighted in white are currently usable for the subpanel. Click on an arrow, then press **Enter** to scroll in the selected direction.

If there are subpanels that are not displayed, a MORE indicator appears at the bottom of the screen, next to the minimize bar. Arrows appear beside the MORE indicator to show if there is more data before or after the data displayed, or both **ΔMORE∇**. Placing the cursor on a directional arrow and pressing **Enter** scrolls the screen in that direction.

## Lateral column scrolling

Some columns contain more data than can be displayed in a fixed width. These columns may have lateral (left and right) scrolling enabled.

Columns with lateral scrolling enabled have left and right scrolling arrows in the column heading:

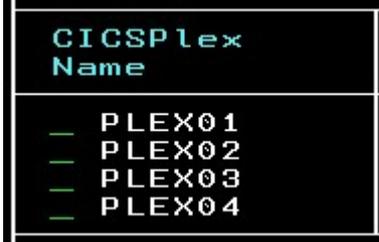

You can scroll by placing the cursor on an arrow and pressing Enter, or by placing the cursor in the data area of the column and pressing the PF10 or PF11 keys.

## Selecting

Selecting items lets you perform actions associated with those items, such as navigating to a workspace that displays detailed information for the selected item, issuing a command that affects a selected resource. By default, selectable items are displayed in white.

In summary subpanels, the items in the first column may be selectable. Selectable items are preceded by an input field ( ):

To select an action associated with the item, place the cursor on the input field using the arrow keys or the mouse and then perform one of the following actions:

- Press **Enter** or type S and press **Enter** to execute the default action associated with the item. Typically, this is navigating to a related workspace.
- Type / and press **Enter** to display a popup menu with a list of actions you can apply to the selected entry. On the popup menu, type the number or code of the action you want to perform and press **Enter**.
- If you already know the action code for the action you want to perform, type it in the input field and press **Enter** to perform a specific action.
- Type ! and press **Enter** to display a popup menu with a list of take action commands you can apply to the selected entry.

**Note:** Items that are selectable are zoomable, but zoomable items are not necessarily selectable. In detail subpanels, for example, items can only be zoomable. See [“Zooming” on page 922](#) for more information.

## Sorting

You can sort data in eligible columns in ascending or descending order using the sort icons.

The column headings of columns that are eligible for sorting display a sort icon. The appearance of the sort icon depends upon the status of the sort.

### Sort icon

### Status

Column is sortable, but sorting is not in effect.

Sorting is in effect and column is sorted in ascending order.

Sorting is in effect and column is sorted in descending order.

To sort using the icons, place the cursor over the heading of column you want to sort and press **Enter**. If sorting is in effect, pressing **Enter** reverses the sort order. If sorting is not in effect, pressing **Enter** sorts the list in descending order. To restore the original sort order, you must **F3** out of the workspace and redisplay it.

Transaction ID	Transaction Status	Program Name	ΔUse ∇Count	ΔRestart ∇Count	ΔStorage ∇Violations
CEGN	Enabled	DFHCEGN	0	0	0
CEHP	Enabled	DFHCHS	0	0	0
CEHS	Enabled	DFHCHS	0	0	0
CESC	Enabled	DFHCESC	0	0	0
CESD	Enabled	DFHCESD	0	0	0
CETRA	Enabled	DFHCETRA	0	0	0

## Filtering

Columns in a summary subpanel may be designated as eligible for filtering. Some of these columns may have predefined filters. You can view a list of all the eligible columns and existing filters. You can add, modify, or remove filters for any column in the list. Only the columns in the first summary panel in a workspace can be filtered. Columns that are eligible for filtering are denoted with a green icon:

Columns that have a filter in effect are denoted with a yellow icon:

You can view the list of filter-eligible columns by pressing **PF4**, entering the **FILTER** command or clicking on the filter icon within the column header. The list of columns is displayed in a popup panel:

Filter(s)	
1.	CICS Region Name..... = CICSR*
2.	CPU Utilization..... < 50
3.	Transaction Rate..... < 20
4.	VTAM Applid..... n/a
5.	VTAM Generic Applid..... n/a
6.	XCFGROUP..... n/a
7.	System ID..... = SP22

To enable, modify, or disable a filter:

1. Enter the number of the filter you want to modify.  
A popup menu is displayed with the details of the filter definition:

Filter Detail	
Column	CICS Region Name
Compare	= (< > > < >= <=)
Value	CICSR* (compare to this)
UCTRAN	Yes (Y or N, uppercase)

Use UCTRAN to specify whether the uppercase translation option is to be set (Yes), or if the value is to be used as it is typed in (No). The UCTRAN option can be used to filter lower or mixed-case values. The default is Yes.

2. Take one of the following actions:
  - To add a filter, type the appropriate Compare operator and overwrite N/A with the desired value, then press **Enter**.
  - To modify a filter, type the appropriate operator and value, then press **Enter**.
  - To remove a filter, erase either the operator or the value in the existing expression, then press **Enter**.

If you press **Enter**, the filter list is redisplayed.

The following comparators are supported:

- = or EQ (equal to)
- <> or NE (not equal to)

- > or GT (greater than)
- < or LT (less than)
- >= or GE (greater than or equal to)
- <= or LE (less than or equal to)

The Value field supports strings or numbers. A trailing asterisk wildcard is supported, but not a leading asterisk. For example, C\* but not \*C. To indicate that a number is a substring rather than an integer, enclose the value in quotation marks. For example, in the preceding screen, specifying the value as “1234” displays all CICS regions whose names begin with the substring “1234”.

If no columns have been designated as eligible for filtering, you will see the following message after you enter the FILTER command or press F4:

```
Filter(s)
This workspace has no filters defined
```

## Minimizing and maximizing subpanels

Minimizing a subpanel from its original size minimizes it to the minimize bar at the bottom of the workspace. Minimizing a subpanel allows additional subpanels, if any, to appear in the workspace. Maximizing a subpanel expands it to fill the entire screen, allowing you to see more data without scrolling.

To minimize a subpanel, set your cursor on the  icon and press **Enter**. The header of the subpanel appears in the minimize bar.

To restore the subpanel, set the cursor on the header in the minimize bar and press **Enter**.

To maximize a subpanel, set the cursor on the  Maximize icon and press **Enter**. The subpanel expands to fill the entire screen. While a subpanel is maximized, MORE and TRACE indicators are suppressed and full screen scrolling is disabled. You can only scroll the contents of the maximized subpanel. To reduce the subpanel to its original size, set the cursor on the Normalize icon  and press **Enter**.

## Collapsing and expanding subpanels

Collapsing a subpanel leaves just the header on display and allows additional subpanels, if any, to be displayed in the workspace. If a subpanel is collapsed, only the subpanel heading is displayed. Expanding the subpanel displays the data rows and columns again.

A down arrow  in the left corner of a subpanel header indicates that the subpanel can be collapsed. Collapsing the subpanel turns the down arrow into a right arrow  (see “Figure: Workspace with collapsed subpanel” on page 921).

To collapse a subpanel, set your cursor on the down arrow  and press **Enter**. To expand a subpanel, set your cursor on the right arrow  and press **Enter**.

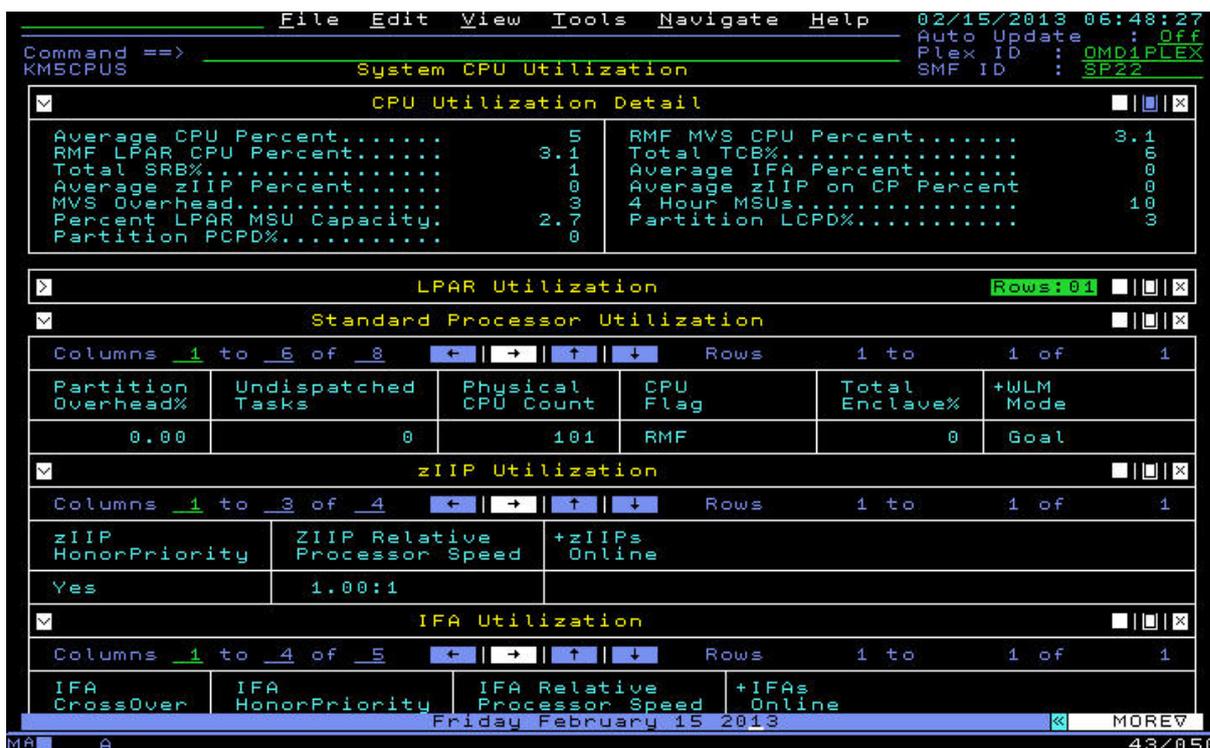

Figure 107: Workspace with collapsed subpanel

If a collapsed subpanel contains no data, the text “No Data” will be displayed in the right corner of the title bar. In some collapsed subpanels that contain no data, the subpanel title might be replaced by explanatory text.

## Closing subpanels

You can close subpanels to increase workspace real estate or focus only on data of concern. The subpanel will reappear the next time the workspace is accessed. If you want to be able to view the subpanel again without exiting the workspace, collapse or minimize the subpanel instead of closing it.

To close a subpanel, set your cursor on the close icon in the subpanel header and press **Enter**.

## Changing context

The **Plex ID** and **SMF ID** fields, which are located in the upper right corner of a workspace, display the currently selected plex and subsystem or region. If these fields are displayed in green, you can overwrite them to switch the context to view data for another plex or subsystem.

For example, in the workspace shown below, you can overwrite the **SYS** value in the **SMF ID** field with the SMF ID for another LPAR, then press **Enter** to see data for that LPAR instead of **SYS**.

If these fields are blue, they cannot be overwritten.

## Auto Update

The Auto Update feature refreshes the data displayed in a workspace at a set interval. By default, the feature is disabled. You can enable the feature by specifying an interval for the refresh.

The **Auto Update** field in the upper right corner of a workspace controls the refresh of data in the workspace:

```
Auto Update : Off
```

If the feature is enabled, the **Auto Update** field displays the selected interval:

```
Auto Update : 005
```

To turn on refresh, overwrite the field with a desired interval, in seconds. To disable the refresh, overwrite the interval with Off.

If the interface runs untouched in auto-update mode, it will eventually suspend auto update. A popup informs users that updates have been suspended, and the field displays SUS. The suspend interval is determined by the auto-update interval, so the larger the auto-update value, the longer the time before updating is suspended. The algorithm is  $n * 6 * 60 * 8$ , which equals 8 hours when auto update runs at a 10 second interval.

The Auto-Update suspension value can be customized in the user's profile, using the AUTOSUSPEND=*nnnn* keyword, where *nnnn* is a number between 0 and 9999. If 0 is specified, the AUTOSUSPEND function is disabled.

## Workspace navigation

In the enhanced 3270 user interface, you can navigate between workspaces by zooming, as well as by selecting options from an action menu. You can display a trace showing where you are and how you got there, you can return to where you started, and reset the tracing.

## Zooming

One or more columns in a summary subpanel, or one or more items in a detail subpanel may be "zoomable". Zooming provides context-sensitive navigation to a predefined destination workspace. Zooming might even take you to a workspace for another OMEGAMON product.

Items that are zoomable are highlighted in white. To zoom, click your cursor anywhere in the item and press **Enter**.

The contents of the destination workspace may be "filtered" based on the key values in the source workspace. For example, a destination workspace may show data for a specific CICSplex, Region, and Transaction ID.

## Where am I?

Sometimes it is useful to know how you arrived at a particular workspace. For example, queries or processes might be driven silently to derive the data that is being displayed. The **SHOWNAV** or **WHEREAMI** commands display the current internal navigation trace table in a scrollable popup window. The table provides a history of the workspace navigation and the variables that are involved in arriving at the current workspace.

To view the navigation trace table, on the **Command** or action line, enter **SHOWNAV** or **WHEREAMI**. Use the **HOME** command to return to the first workspace in a navigation chain. Returning to the first panel resets the navigation trace. Use the **RESETNAV** command to reset the trace table from the current workspace.

## Situation Status Tree

This customizable workspace displays OMEGAMON situations in a tree structure on your OMEGAMON enhanced 3270 User Interface (enhanced 3270UI). Through the Status Tree, you can see a complete picture of your enterprise monitoring status.

OMEGAMON monitoring agents generate events when certain performance thresholds, which are defined in your OMEGAMON Situations, are exceeded. You are able to view these situations through the Situation Status Tree. You can navigate to the Situation Status Tree the following ways:

- Issue the **events** or **alerts** command from any workspace
- Expand the **HELP** menu and select **10. Events Console**
- Issue an **n.e** fast path mnemonic in the action bar in the upper left hand portion of your screen
- Expand the **Enterprise Status** branch in the **Help and Workspace Directory**. Drill down on **KOBSITST**

**Note:** To view and customize a Situation Status Tree, you must have OMEGAMON Dashboard Edition on z/OS V5.3.0 installed, and APARs OA48298 (PTF TBA) and OA47760 (PTF UA7724) applied.

The status tree is an outline in which you can expand and collapse different branches in the tree. You expand and collapse branches to see greater or fewer details about the Situations that make up the status tree. The status tree can be compared to the Tivoli Enterprise Portal (TEP) Navigator.

Branches have a plus sign (+) or minus sign (-) near the left edge whenever that branch contains any children. The children for a branch are visible when a minus sign (-) is displayed.

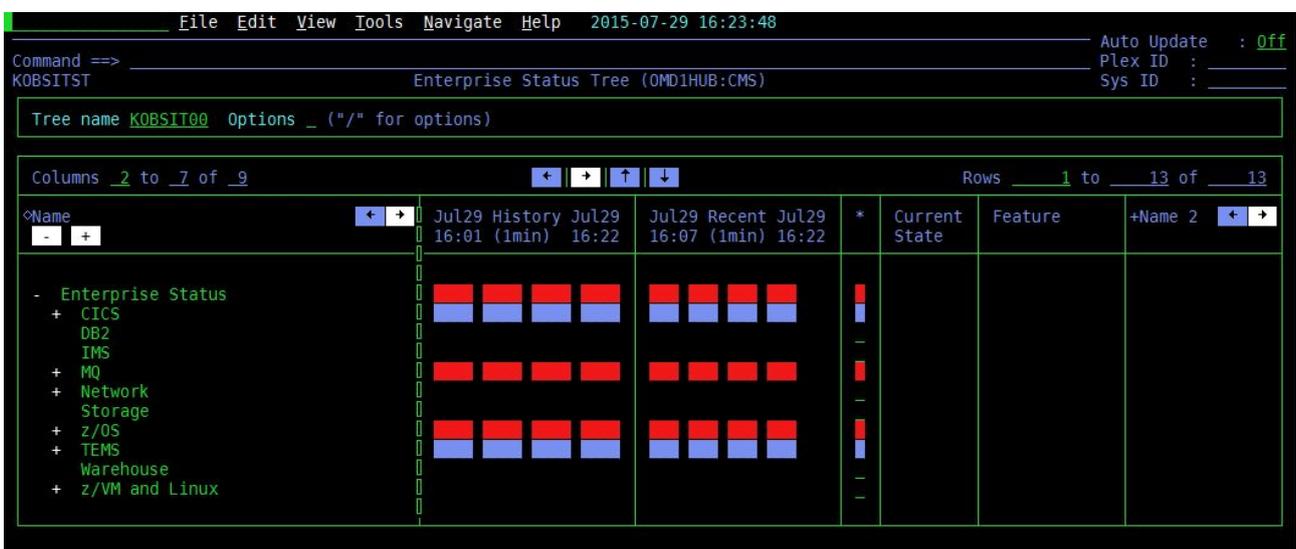

Figure 108: Default Situation Status Tree

Enter a "/" in the **Options** field to display the pop-up menu of Status Tree Options. From this panel you can customize how your status tree is displayed. You can adjust the hierarchy of your branches, choose hour and date display formats, and adjust the width of your history columns.

Figure 109: Status Tree Options

With the Status Tree, you have flexibility similar to the TEP Navigator and TEP Custom Navigator views. You can group together situations based on **Managed System Name** or you can group situations together based on any combination of **Managed System Name** (msn), **Situation Name** (sit), **Display Item** (atom), **Managed System Group** (ms1), and **Affinities** (aff).

For example, to create a part of the Status Tree where only situations that match a certain naming convention are displayed, you could supply a Status Tree filter like this:

```
{ "type": "sit", "filter": { "sit": "My_SITNAMEs_XXX.*" } }
```

The Situations that are displayed in a Status Tree are ones that have become 'true' at some point within the time intervals being monitored. Enhanced 3270UI configuration values can be used to control the time span (minutes, hours or days) of situation data used for the Status Tree displays. When you change any of these configuration values, you must restart the enhanced 3270UI address space for the new values to be implemented.

Using the Status Tree, you are able to see which Situations are currently true, and which Situations have been true over some past time span. Viewing historical data helps you to more fully monitor the status of your systems and applications.

#### Example:

You can configure the Status Tree data collection to cover three days. Then on a Monday morning, for example, the system shows situation history since Friday morning. You can then select a particular status cell of interest, to get details of the situation history behind that status cell. If a status cell is red in a Sunday evening time slot, which might mean a critical problem, you can immediately drill down to the situation details that cover that point in time. The situation details tell you all the OMEGAMON values collected for that situation at that point in time. These details help you diagnose what was occurring in your environment.

The enhanced 3270UI provides a default Enterprise Status Tree that automatically discovers all of the OMEGAMON situations defined on your system; that is, defined to whichever Hub TEMS you are using. The default Enterprise Status Tree displays Situations in a hierarchy that consists of branches, where each branch is a different OMEGAMON performance monitor. For example, one branch is for the CICS® version of OMEGAMON, another is for z/OS®, and so on.

For more information on customizing the Status Tree, expand the **New Features** branch in the **Help and Workspace Directory** (KOBHLDIR) and select **Status Tree** to reach the KOBHLRTT workspace. For more information on reaching this workspace, see [Help and Workspace Directory](#).

**Note:** To view the comprehensive list of instructions for customizing the Status Tree, you must visit the [Help and Workspace Directory](#).

## Situation Editor

The Situation Editor is a group of Workspaces that is used to create, view, and edit situations (including the formula, distribution, expert advice, action, and until conditions) that can monitor important conditions in your environment. Each situation monitors your environment constantly by testing a formula at time intervals that you set up, for example, every 5 minutes.

The following Workspaces are included in the situation editor.

### Create New Situation (KOBSEDCN TREE)

Use the Create New Situation pop-up window (KOBSEDCN) to create a new situation. You supply the situation's name, description, and type.

Situations are one of two types: Standard or Correlated.

### Select Conditions (KOBSEDPD TREE)

The Select Conditions workspace (KOBSEDPD) is where you select the tables and columns or embedded situations that make up your situation's formula. This workspace is displayed when you create a new situation and when you 'add columns' to an existing situation.

### Correlated Situation Selection (KOBSEDCB TREE)

The Correlated Situation Selection workspace (KOBSEDCB) is where you select a 'Situation + Managed System' pair to be included in a correlated situation you are editing. This workspace is displayed when you first create a correlated situation and when you choose 'Add column' while editing a correlated situation.

### Create Copy of a Situation (KOBSEDCC TREE)

Use the Create Copy of a Situation pop-up window (KOBSEDCC) to create a copy of an existing situation. You supply a new situation name and description.

### Formula Tab (KOBSEDTF TREE)

The Formula tab displays a workspace (KOBSEDTF) that contains summary information about a situation like Agent, ID, Name, Description, and other fields. Typical things to do in the Formula tab are to edit the formula, to change the situation name, and to change the situation severity.

#### Name (KOBSEDEA TREE)

Use the Situation Name pop-up window (KOBSEDEA) to enter a name for the situation. The name may be up to 256 characters in length.

#### Description (KOBSEDEB TREE)

Use the Situation Description pop-up window (KOBSEDEB) to enter a description for the situation. The description may be up to 64 characters in length.

#### Severity (KOBSEDEC TREE)

Use the Situation Severity pop-up window (KOBSEDEC) to enter a severity value for the situation. The severity value is one of seven (7) choices.

When you display situations in the Enhanced 3270 User Interface Enterprise Status Tree (KOBSTITST) or in the Current Situation Status screen (KOBSTITMN), then the severity values are converted to colors, to help you locate the most important exceptional events on your system.

#### Display Items (KOBSEDED TREE)

The Display Items workspace (KOBSEDED) is where you can select one attribute (a column name from a table) that is a 'key' item, which enables you to see multiple events from a single situation.

#### Persistence (KOBSEDEE TREE)

Use the Situation Persistence pop-up window (KOBSEDEE) to enter a value for the number of times the condition must occur before the Situation turns 'true'.

#### Sampling Interval (KOBSEDEF TREE)

Use the Situation Sampling Interval pop-up window (KOBSEDEF) to specify how often the situation's formula should be evaluated. The sampling interval must be at least 30 seconds.

#### **Startup (KOBSEDEG TREE)**

Use the Situation Startup pop-up window (KOBSEDEG) to specify if the situation should be started automatically (sampling should take place) when a monitoring system associated with this situation is 'on line.'

#### **Formula Editing (KOBSEDPA TREE)**

Use the Situation Formula workspace (KOBSEDPA) to view and update the monitoring conditions that are tested during periodic sampling. This workspace is displayed when you select the Formula line item from the Formula tab workspace (KOBSEDTF).

#### **Select Conditions (KOBSEDPD TREE)**

The Select Conditions workspace (KOBSEDPD) is where you select the tables and columns or embedded situations that make up your situation's formula. This workspace is displayed when you create a new situation and when you 'add columns' to an existing situation.

#### **Correlated Situation Selection (KOBSEDCB TREE)**

The Correlated Situation Selection workspace (KOBSEDCB) is where you select a 'Situation + Managed System' pair to be included in a correlated situation you are editing. This workspace is displayed when you first create a correlated situation and when you choose 'Add column' while editing a correlated situation.

#### **Choose a Function (KOBSEDP5 TREE)**

Use the Formula Editing: Choose a Function pop-up window (KOBSEDP5) to select the function to use for the current formula cell.

**Note:** Only those functions that are valid for the cell's particular attribute and data type are displayed in this pop-up window.

#### **Choose an Operator (KOBSEDP6 TREE)**

Use the Formula Editing: Choose an Operator pop-up window (KOBSEDP6) to select the comparison operator to use for the current formula cell.

**Note:** Only those operators that are valid for the cell's particular attribute, data type, and function are displayed in this pop-up window.

#### **Enter a Value (KOBSEDP7 TREE)**

Use the Formula Editing: Enter a Value pop-up window (KOBSEDP7) to directly type the value (a number or character string) for the current formula cell.

#### **Value Choices (KOBSEDP8 TREE)**

Use the Formula Editing: Value Choices pop-up window (KOBSEDP8) to select one or more values from a list of choices. Each item you select is then copied into the cell's value after you select the 'Accept' button.

#### **Enter a Value (KOBSEDP9 TREE)**

Use the Formula Editing: Enter a Value pop-up window (KOBSEDP9) to enter a value for the cell by typing into a special form for any of these functions:

- STR
- SCAN
- Compare date and time (DATE)
- Compare to time delta (TIME)

#### **Distribution Tab (KOBSEDTD TREE)**

The Distribution tab displays a workspace (KOBSEDTD) where you assign the managed systems and managed system groups where the situation should run.

#### **Advice Tab (KOBSEDE TREE)**

The Advice tab displays a workspace (KOBSEDE) where you can view and edit any advice associated with a situation. A value of '\*NONE' or blanks is displayed if there is no advice defined for a situation.

#### **Action Tab (KOBSEDTA TREE)**

The Action tab displays a workspace (KOBSEDTA) that enables you to associate an 'action' (a command or a message) with a situation. When the situation turns 'true' then the action specified with the situation will be executed.

#### **Action Type (KOBSEDAA TREE)**

The Action Type pop-up window (KOBSEDAA) is where you select the type of action (a command or a message) to run when this situation turns 'true'. When the situation turns 'true' then the action specified with this situation will be executed.

#### **When to Run the Action (KOBSEDAB TREE)**

The When to Run the Action pop-up window (KOBSEDAB) is where you select what happens if the condition is true for more than one monitored item.

#### **Where should the Action run (KOBSEDAC TREE)**

The Where should the Action run pop-up window (KOBSEDAC) is where you select the location of the system on which the action should run.

#### **How often should the Action run (KOBSEDAD TREE)**

The How often should the Action run pop-up window (KOBSEDAD) is where you select how frequently the action should run if the condition stays true over multiple intervals.

#### **System Command (KOBSEDAE TREE)**

The Action: System Command pop-up window (KOBSEDAE) is where you enter the system command to run when this situation turns 'true'. When the situation turns 'true' then this system command is executed.

#### **Universal Message (KOBSEDAF TREE)**

The Action: Universal Message pop-up window (KOBSEDAF) is where you enter a message to be issued when this situation turns 'true'. When the situation turns 'true' then this message is issued to the Universal Message Console, which is viewable in the TEP or here:

```
_ (KOBITMLG WENU) ITM Operations Log and Universal Message Console
```

#### **Select Attribute (KOBSEDAS TREE)**

The Select Attribute workspace (KOBSEDAS) is where you select a column (also called an attribute) to be included in the action for the situation. (An action is optional for a situation.) This workspace is displayed when you are editing an action and then select the Attribute Substitution button.

#### **Until Tab (KOBSEDTU TREE)**

The Until tab displays a workspace (KOBSEDTU) that enables you to specify the conditions needed to 'close' this event. The Until settings provide a way to automatically close an event by turning a true situation to false when another situation is true or when the close interval expires. This is particularly useful for pure events that might occur frequently. If no options are selected in this workspace, the situation will remain 'open' until the conditions that caused the situation to turn 'true' are no longer true.

#### **Select Situation (KOBSEDSA TREE)**

The Select Situation workspace (KOBSEDSA) is where you select a situation to be included in the Until settings for the situation. (Until settings are optional for a situation.) This workspace is displayed when you are using the Until workspace and select the Choose Situation button.

## Embedded data

The Enhanced 3270UI embedded data feature brings relevant data from other products into the workspace of the hosting product in a seamless manner that can enable the user to navigate in context directly to other product workspaces.

Each IBM® provided workspace within the Enhanced 3270 user interface (enhanced 3270UI) is hosted by a specific product, for example, OMEGAMON® for z/OS®, CICS®, IMS™, Db2®. A workspace from the OMEGAMON® for z/OS® product, for example, will show details about a z/OS® address space.

The integration of relevant data from other products by the embedded data feature can speed up problem determination and help you to better understand the data. Embedded data makes it easier to diagnose problems, as relevant data is automatically provided by other monitors when available. This presentation of data helps you to learn the relationships between components and data.

An enhanced 3270UI workspace typically consists of one or more sub panels.

When a workspace from one product includes a sub panel definition from another product, the sub panel appears if:

- The other product is installed and configured for the current environment.
- The agent for the other product is running and reporting to the same Tivoli® Monitoring environment.
- The other product has data relevant to the data that is being displayed by the hosting product.

The user does not do anything to see this additional data. If it is there, it appears and if not then it does not.

For example, you might be looking at the OMEGAMON® for z/OS® Address Space Details workspace for a specific address space. If the address space you are looking at is a CICS® region that IBM® Tivoli® Monitoring knows about, you can see data from the CICS® agent on the workspace if the OMEGAMON® for z/OS® Address Space Details workspace includes an appropriate sub panel from the OMEGAMON® for CICS® product.

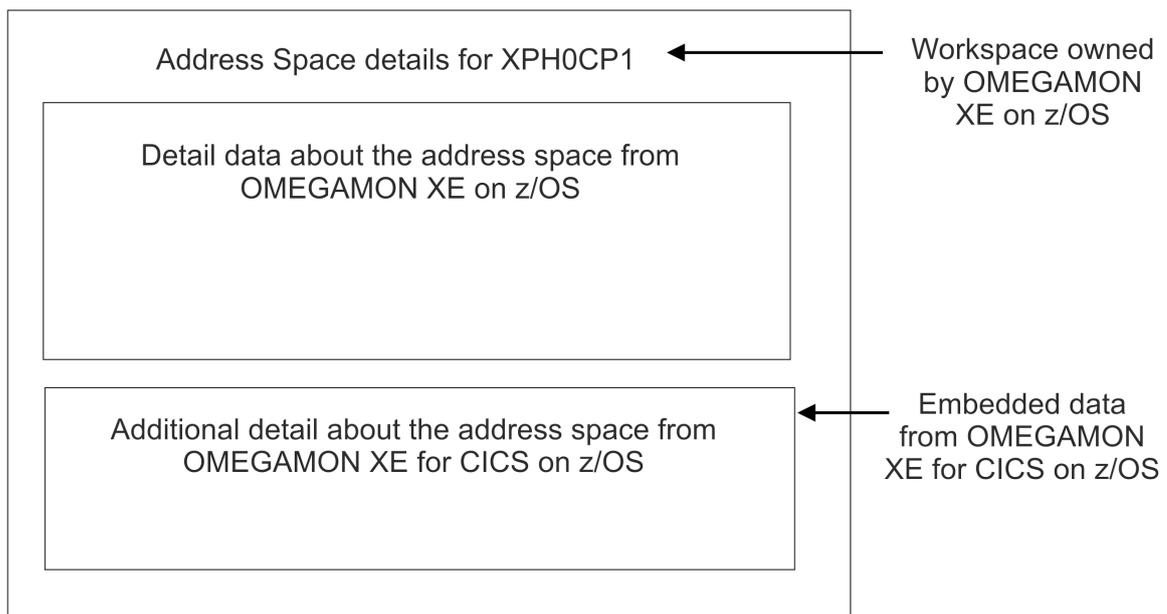

Figure 110: Representation of a workspace from one product that contains embedded data from another product.

## Navigating from embedded data subpanels

You might be able to navigate from enhanced 3270UI embedded data sub panels directly into relevant workspaces for that product. When available, you can use this feature to quickly move to relevant product areas to see more data without having to return to the higher level views and then find the data in another product area.

## Near-term History

Near-term History provides the capability to investigate problems that occurred in the recent past by using the enhanced 3270 user interface. Near-term History provides intuitive access to historical data collected by both agents and IBM® Tivoli® Monitoring.

There are two types of historical workspace available, the historical summary and the historical snapshot.

## Viewing the Historical Summary workspace

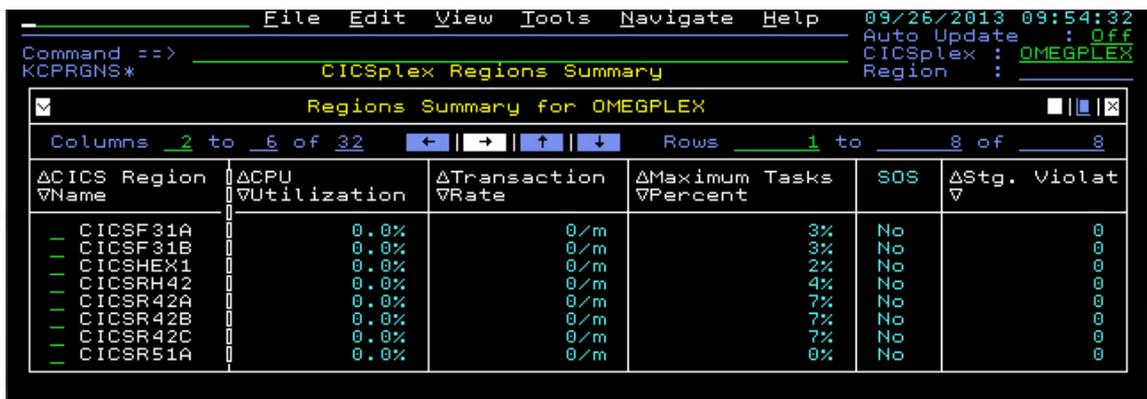

Begin troubleshooting problems that occurred in the recent past by using the **Historical Summary** workspace to view a summary of historical data.

## About this task

The **Historical Summary** shows a historical view of a selected data row from a real-time data summary display. It shows data for the selected row of data that goes back over time.

## Procedure

1. Open a **Historical Summary** workspace view by entering the historical navigation character (H) for a row on an existing summary display. For example, to open a historical **CICSplex Regions Summary** view, place your cursor before a **CICS Region Name** in the normal **CICSplex Regions Summary** workspace, type H and press **Enter**.

The screenshot shows a terminal window with a menu bar (File, Edit, View, Tools, Navigate, Help) and a status bar (09/26/2013 09:54:32, Auto Update: Off, CICSplex: OMEGPLEX, Region: ). The main display is titled "Regions Summary for OMEGPLEX" and shows a table of CICS regions. The table has columns for Region Name, CPU Utilization, Transaction Rate, Maximum Tasks Percent, SOS, and Stg. Violat. The data is as follows:

ΔCICS Region Name	ΔCPU Utilization	ΔTransaction Rate	ΔMaximum Tasks Percent	SOS	ΔStg. Violat
- CICSF31A	0.0%	0/m	3%	No	0
- CICSF31B	0.0%	0/m	3%	No	0
- CICSHEX1	0.0%	0/m	2%	No	0
- CICSRH42	0.0%	0/m	4%	No	0
- CICSR42A	0.0%	0/m	7%	No	0
- CICSR42B	0.0%	0/m	7%	No	0
- CICSR42C	0.0%	0/m	7%	No	0
- CICSRS51A	0.0%	0/m	0%	No	0

Figure 111: CICSplex Regions Summary workspace

The **Historical Summary** workspace opens. The workspace shows a historical view of the selected data row. A **HISTORY** indicator is highlighted in the header and footer areas to clearly distinguish that the workspace contains historical rather than current data.

File Edit View Tools Navigate Help 09/26/2013 10:38:06

08:55:00	CICSF31A	0.0%	0/m	3%	No
08:50:00	CICSF31A	0.0%	0/m	3%	No
08:45:00	CICSF31A	0.0%	0/m	3%	No
08:40:00	CICSF31A	0.0%	0/m	3%	No

26 September 07:25 to 26 September 09:25 HISTORY

Figure 112: Example of a **Historical Summary** workspace

- View the data row summaries that go back through time to identify a time period when problems occurred.
  - In the view that is shown in “[Figure: Example of a Historical Summary workspace](#)” on page 930 the summary row of historical data at the **Recording Time** 09:50:00 indicates that a short-on-storage (SOS) condition occurred for region CICSF31A. The **Transaction Rate** and **Maximum Tasks Percent** are also highlighted as being above threshold alarm values.
  - Use indications such as the **SOS** and threshold alarms in the previous bullet to identify when problems occurred and to look at the highlighted time interval in more detail. For example, you can select the 09:50:00 interval and view more detailed snapshots of the data available for that period. For more information about viewing historical snapshot data, see “[Viewing the Historical Snapshot workspace](#)” on page 931.
  - You can configure the time interval between the recorded data snapshots. For more information about configuring the historical data collection, see “[Configuring near-term history data collection for an application](#)” on page 933
  - You can configure the time-span over which data snapshots are shown in the history summary workspace. For more information about configuring the history time-span view, see “[Configuring the history time-span](#)” on page 932.

**Restriction:** If a workspace is not configured to show a historical summary, the following message is displayed after you enter H and press **Enter** from the workspace.

Place your cursor over the message and press **Enter** to go to the relevant historical configuration workspace. For more information about configuring the historical data collection, see “[Configuring near-term history data collection for an application](#)” on page 933

## Viewing the Historical Snapshot workspace

Troubleshoot problems that occurred in the recent past in more detail by viewing a historical snapshot of a workspace at a specific point in time.

### Before you begin

Use the **Historical Summary** workspace to begin troubleshooting problems that occurred in the recent past. For more information about the **Historical Summary** workspace, see [“Viewing the Historical Summary workspace” on page 929](#).

### About this task

The snapshot view can be either a summary, detail, or combined summary and detail panel.

### Procedure

1. Place your cursor before a specific **Recording Time Interval** in a historical summary workspace, type / and press **Enter** to view the **Options Menu**. The **Options Menu** is displayed.

**Tip:** The options that are displayed usually mirror the options available from the equivalent real-time workspace.

2. Choose an option from the **Options Menu** to open the associated **Historical Snapshot** workspace. For example, to open the **CICS Region Overview (History)** workspace that is shown in [“Figure: Example of a Historical Snapshot workspace” on page 932](#),
  - a. Place your cursor before a **Recording Time Interval** in the historical **CICSplex Regions Summary** workspace, [“Figure: Example of a Historical Summary workspace” on page 930](#), type / and press **Enter**. The **Options Menu** is displayed.
  - b. Type s and press **Enter** to choose the **CICS Region Overview**.

A historical snapshot view of the **CICS Region Overview** workspace opens. A **HISTORY** indicator is highlighted in the header and footer area to clearly distinguish that the workspace contains historical rather than current data.

The time of the current snapshot is highlighted in the footer area. Scrolling arrows are available either side of the current snapshot time. Use these arrows to scroll forwards or backwards to the next or previous snapshot. Alternatively you can enter the commands **NEXT** and **PREVIOUS** on the command line.

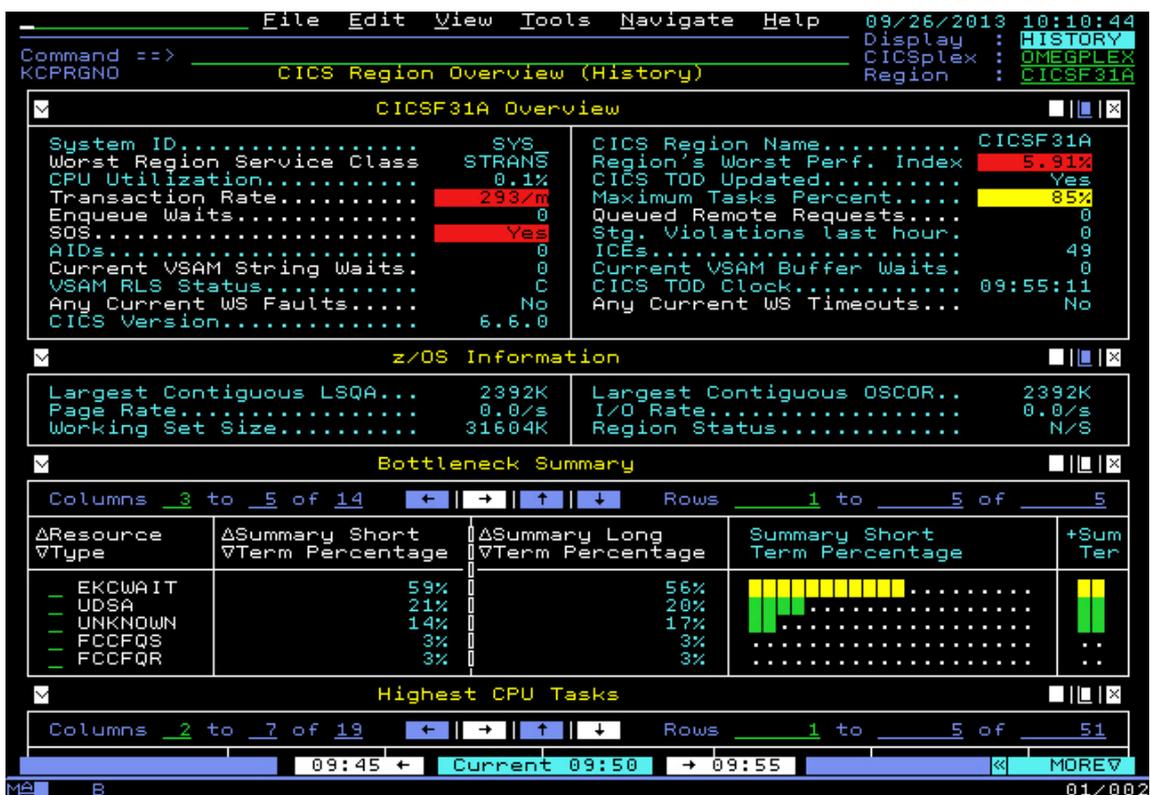

Figure 113: Example of a **Historical Snapshot** workspace

**Restriction:** If the first subpanel in a workspace (generally the most important) is not eligible to show a historical snapshot, the equivalent real-time workspace opens. However, if the first subpanel is eligible to show a historical snapshot and another subpanel is not eligible, the following message is displayed for the ineligible subpanel.

Place your cursor over the message and press **Enter** to go to the general historical configuration workspace to show which attribute groups can be configured for near-term history data collection. For more information about configuring the historical data collection, see [“Configuring near-term history data collection for an application”](#) on page 933.

## Configuring near-term history

You can configure near-term history data collections, their frequency and various other parameters associated with the collections.

## Configuring the history time-span

You can configure the time-span over which data snapshots are shown in the history summary workspace.

## Before you begin

Go to the history summary workspace for the product you want to monitor.

## Procedure

- Make one of the following choices:
  - From the menu bar select **View > History Timespan**.
  - Move your cursor over the **HIS** icon in the drawer and press **Enter**.

The **History Selection** pop-up window opens.

Figure 114: History Selection pop-up window

You can select from the following history time-span configuration options

#### Historical Last *nnn* Minute(s)

This option when selected shows the history data summary over the last *nnn* minutes. You can configure the number of minutes that are specified by *nnn* by entering a value and selecting **OK**. The default value is 10 minutes.

#### Historical Last *nnn* Hour(s)

This option when selected shows the history data summary over the last *nnn* hours. You can configure the number of hours that are specified by *nnn* by entering a value and selecting **OK**. The default value is 2 hours.

#### Historical Time Range

This option when selected shows the history data summary over the time range that is specified in the **Start** and **End** fields. You can configure the start and end times, and dates, by entering values in these fields and selecting **OK**.

### Selecting an application to configure for Near-term History

You can select an application to configure for Enhanced 3270UI near-term history data collection

#### Procedure

1. From the menu bar select **View > History Configuration**.  
The **PDS Historical Collection Control** workspace opens.

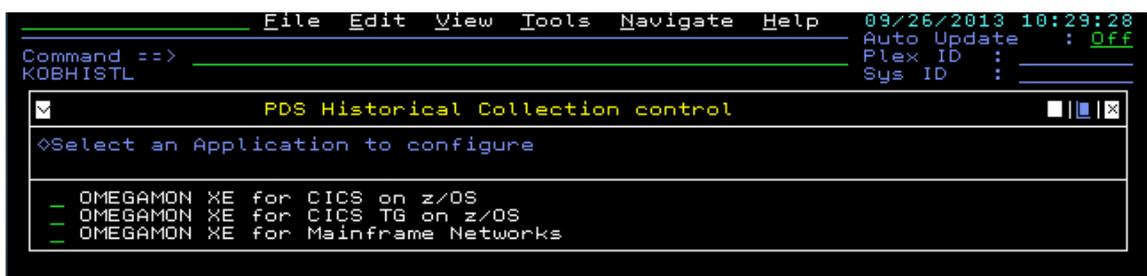

Figure 115: PDS Historical Collection control workspace

2. Place your cursor before the application name that you want to configure for near-term history data collection and press **Enter**.  
The **Historical tables** workspace opens. For more information about configuring historical tables, see [“Configuring near-term history data collection for an application”](#) on page 933

### Configuring near-term history data collection for an application

You can configure Enhanced 3270UI near-term history data collection for application-specific attribute groups. You can specify that the data for the attribute groups is collected over specific *Managed Systems* and *Managed System Lists*. You can also specify whether the data is stored at the monitoring server or at the monitoring agents. Storing data at the monitoring agents is preferred. The historical configuration procedure creates Tivoli Monitoring situations that are employed to control historical data collection.

## Before you begin

Go to an application-specific workspace and select **View > History Configuration** from the menu bar, or select an application to configure for Near-term History. For more information about selecting an application to configure for Near-term History, see [“Selecting an application to configure for Near-term History” on page 933](#). After you do one of these actions, the **Historical tables** configuration workspace opens. The attribute groups that can be configured for near-term history data collection for your chosen application are listed in the workspace.

Figure 116: *Historical tables workspace*

**Restriction:** You cannot use the procedure that is described here to change or delete historical data collections that use Tivoli Data Warehouse. Collections that use Tivoli Data Warehouse are configured with another interface, such as the Tivoli Enterprise Portal. If you do try to change or delete collections that use Tivoli Data Warehouse, a pop-up message warns that you cannot configure the collection with the enhanced 3270UI. Use the Tivoli Enterprise Portal to change or delete such collections.

## Procedure

1. Place your cursor before the attribute group name that you want to configure for near-term history data collection and press **Enter**.  
The **OMEGAMON History Configuration** workspace opens. The view defaults to the **General** tab.

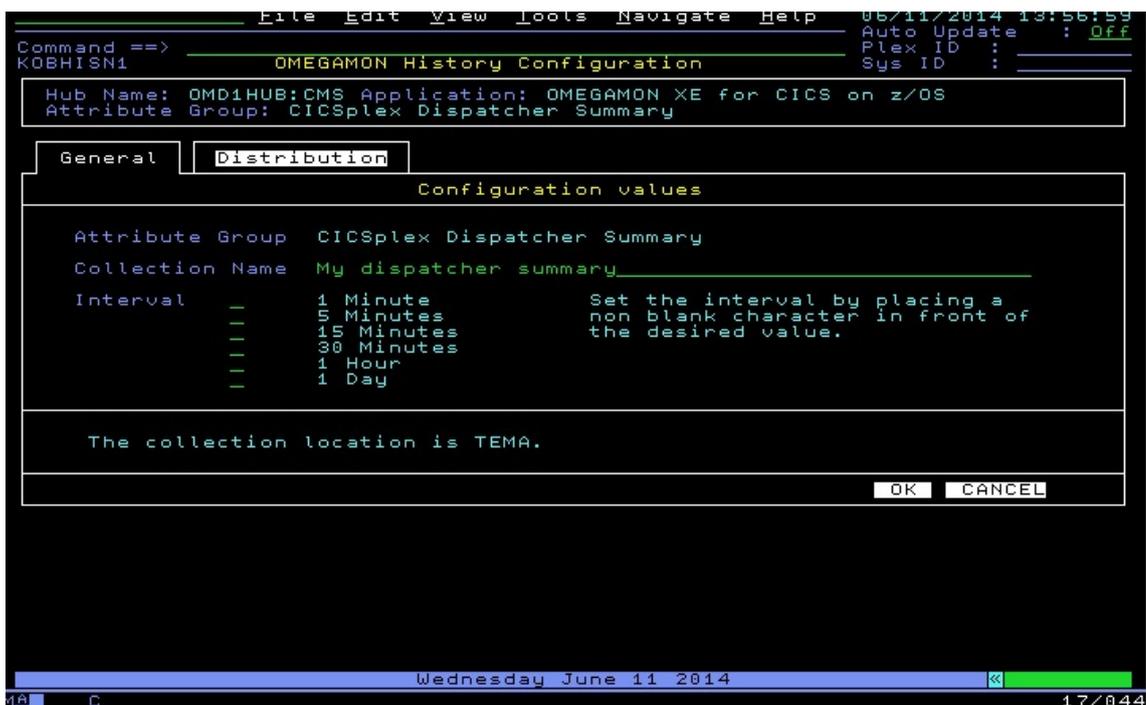

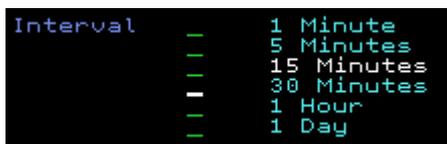

Figure 117: General tab of the OMEGAMON History Configuration workspace.

2. Enter a name for this data collection in the **Collection Name** field and press **Enter**.
3. Select the **Interval** time that you want for this collection, by placing your cursor before an interval time, typing s, and pressing **Enter**.  
The selected interval changes color.

4. The location of the collection might be configurable. If so, the following shows in the middle of the screen:

Select the **Collection Location** by placing your cursor before **TEMA** (monitoring agent), or **TEMS** (monitoring server), and pressing **Enter**.

In many cases, the location is predetermined for many attributes. In this case, the view looks as follows:

or

In this case, no selection can be made. If the Tivoli Enterprise Portal was used to create the collection, it is possible that collection is configured in a way that cannot be replicated by the TOM. In this case, the following can occur.

No changes are allowed to this collection.

5. Select the **Distribution** tab and press enter to go to that tab.  
The **Distribution** tab opens.

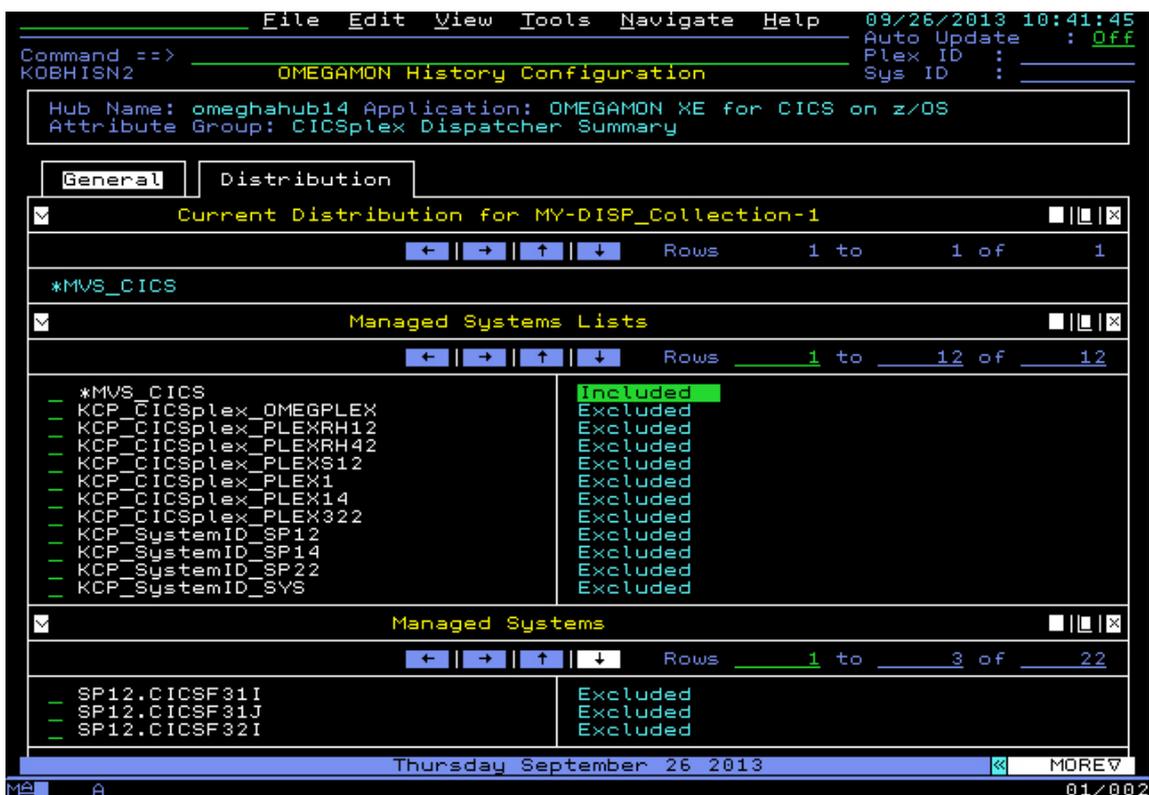

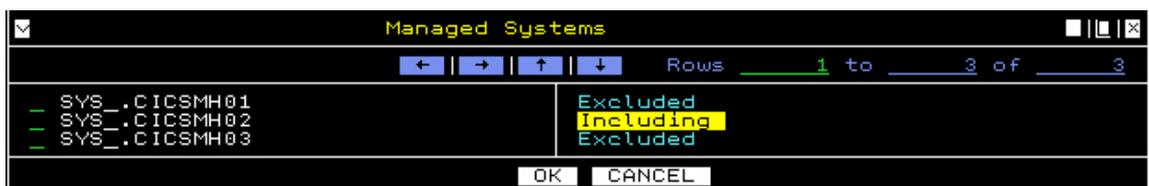

Figure 118: Distribution tab of the OMEGAMON History Configuration workspace.

Use this tab to set up your data collection to run either on specific Managed Systems or for a Managed System List.

**Tip:** Specifying a Managed System List usually indicates collection for one or more Managed Systems.

6. Select one or more Managed Systems or Managed System Lists for your collection by placing your cursor before the system or list name, typing **s**, and pressing **Enter**. The selected distribution's collection status changes from **Excluded** to **Including** to indicate that you are including them in the collection.

7. To save your collection, place your cursor over **OK** and press **Enter**. To exit without saving your collection, place your cursor over **CANCEL** and press **Enter**. Alternatively, if you navigate away from the **General** or **Distribution** tabs, your changes will not be saved.

## Result

You are returned to the **Historical tables** configuration workspace. If you saved your data collection, it is listed under the Attribute Group and **Collection name** that you chose at step “2” on page 935.

## User Preferences

The OMEGAMON® enhanced 3270 user interface provides administrative workspaces to assist subject matter experts and other users to set up and customize their preferences.

Workspaces that assist subject matter experts and other users to set up and customize their preferences are:

- User profile customization

- Log on Administration and customization

## Customizing a user profile

To customize your user profile, use the **User Profile Member** workspace.

### Procedure

1. From the menu bar select **Edit > Preferences**.  
The **User Profile Member** workspace opens.

Figure 119: User Profile Member workspace

The **User Profile Member** workspace contains a number of tabbed panels that contain user profile settings that you can change and save. The following settings are available:

#### Date/Time

This panel contains the following date and time format settings

##### Date begins with

Enter MM for the American format, MM/DD/YYYY.

Enter DD for the European format, DD/MM/YYYY.

Enter YY for the Mathematical format, YYYY/MM/DD.

##### Date separator

Enter your preferred separator character. You can use any displayable character.

##### Time Clock

Enter 12 or 24 for 12 or 24 hour clock format

##### Time separator

Enter your preferred time clock separator character. You can use any displayable character.

#### Colors

This panel contains color assignments for various workspace elements and indicators. You can enter your preferred color in the input field for each item.

#### Session/Logon

This panel contains settings that apply to your logon session to the interface.

### **First workspace to be displayed**

Specifies the workspace that you want to be displayed at logon, the default is KOBSTART.

### **First NAV1 Plex-level Value**

Specifies the plex (Sysplex, CICSplex, IMSplex) for which data is displayed on the first workspace. The value is a simple text string.

### **First NAV2 System-level Value**

Sets the system, subsystem, or region within the plex for which data is displayed. The value is a simple text string.

### **Engage Trace**

You can choose whether to engage trace at the start of your logon session by entering Y or N.

### **Global Query Timeout Value**

Specifies the number of seconds that a workspace waits before timing out all queries combined. Each subpanel is apportioned a percentage of this value that is based on each query definition. You can enter a number in the range of 0 - 999. If you enter 0, the timeout mechanism is disengaged.

## **Auto/Update**

This panel contains auto update settings that determine the refresh frequency of the data that is displayed in a workspace.

### **Auto Update Frequency**

You can enter the auto update frequency. The allowable range is 5 - 999 seconds.

### **Auto Update Suspend Cycle Count**

You can enter the number of refresh cycles that are allowed before auto update is automatically suspended. The allowable range is 10 - 9999 refresh cycles.

## **Hub Check**

### **Hub Check when no data is displayed**

The interface detects when a workspace displays no data, and can automatically check the connection to the hub Tivoli® Enterprise Monitoring Server. The **Hub Check when no data is displayed** setting controls the number of consecutive *No Data* displays before a hub connectivity check is triggered. The allowable range is 0 - 9 cycles. A setting of 0 means no hub connectivity check. Any positive number drives the hub connectivity check, and if the hub is found to be unresponsive, the interface goes to Hub connectivity administration. For more information about Hub connectivity administration, see [“Hub connectivity administration” on page 981](#).

### **Limit Hub Check to Auto/Update**

To limit the Hub connectivity check to when Auto Update is enabled, set to Y, otherwise set to N.

>>

Click the >> tab to access more menu items (detailed in the following entries).

<<

Click the << tab to return to the previous set of tabs.

## **ISPF**

This panel contains options for controlling the behavior of the tab key on your keyboard, within the enhanced 3270 user interface.

### **Tab to action bar**

To use the tab key to navigate between action bar options, set to Y, to disable, set to N.

### **Tab to point-and-shoot fields**

To use the tab key to navigate to push buttons, set to Y, to disable, set to N.

## **History**

Use this panel to configure the time period that is shown in your historical data.

#### Historical Last *nnn* Minute(s)

This option when selected shows the history data summary over the last *nnn* minutes. You can configure the number of minutes that are specified by *nnn* by entering a value and selecting **OK**. The default value is 10 minutes.

#### Historical Last *nnn* Hour(s)

This option when selected shows the history data summary over the last *nnn* hours. You can configure the number of hours that are specified by *nnn* by entering a value and selecting **OK**. The default value is 2 hours.

2. Make one of the following choices:

- Click **OK** to save and view your settings for the current session only. Your settings are saved for the current session and you are returned to the workspace you were in before you set preferences.
- Click **Save** if you are satisfied with your settings and want to save them permanently to a profile member. The **Profile Save As** dialog box opens:

Figure 120: User Profile Member workspace

Your user ID is already entered in the **Member Name** field.

- Press **Enter** to save the profile to the member name in the **Member Name** field. If the member already exists, it is updated. If it does not exist, a new member with that name is created.

## Customizing KOBSITEC as the initial workspace

The **ITM Situation Status & Message log** (KOBSITEC) workspace can be a useful alternative to the default initial workspace, if you use Tivoli Enterprise Portal Server situation monitoring.

### About this task

You can use the **ITM Situation Status & Message log** (KOBSITEC) workspace to display IBM Tivoli Monitoring Situations status information in the enhanced 3270 user interface. The status information is similar to the information provided by the Tivoli Enterprise Portal Situation Event Console, that is, situation status for current situations events and situation event history. KOBSITEC also enables navigation to OMEGAMON products high-level workspace via the situation status row action selection. To change the default initial workspace KOBSTART to KOBSITEC, use the following procedure.

### Procedure

- Use the procedure that is detailed in [“Customizing a user profile” on page 937](#) to change the setting **First workspace to be displayed** to KOBSITEC.  
When you log on the KOBSITEC workspace is now displayed as the initial workspace.
- Optional: Enter =KOBSITEC in the action bar or command line and press **Enter** to go directly to the KOBSITEC workspace.

### Result

The screenshot displays two tables within the ITM Situation Status & Message log workspace. The top table, 'Current Situation Event Status', lists various system events with columns for status, situation name, MSN event source, HUB event time, agent event time, and display item. The bottom table, 'Situation Event Message Log', provides a detailed log of these events, including monitoring server information.

Figure 121: ITM Situation Status & Message log workspace.

The ITM Situation Status & Message log (KOB SITEC) workspace provides the following subpanel attributes:

**Status**

The Tivoli Monitoring Situation event status; for example, OPEN, ACKNOWLEDGED, REOPENED.

**Situation Name**

A unique name that identifies the Tivoli Monitoring Situation.

**MSN Event Source**

The name of the managed system where the situation is being monitored.

**HUB Event Time**

A time stamp that indicates the time the event occurrence or situation condition was recorded by the Hub Tivoli Enterprise Management Server.

**Agent Event Time**

A time stamp that indicates the time the event occurrence or situation condition was observed by the originating managed system.

**Display Item**

A related attribute that helps identify a unique instance of a situation event in the case where there are multiple instances/rows (that is, events) for a specific situation.

**Type**

The type of situation event, that is, a pure type where the situation has no sampling interval and the related alert notification is unsolicited, or, a sampled type where the situation condition is sampled on a specified interval.

**Logon administration and customization**

When you log on to the enhanced 3270 user interface (enhanced 3270UI) for the first time, **Hub Connectivity Administration** can assist you to specify a hub Tivoli® Enterprise Monitoring Server connection.

**Procedure**

1. Log on to the user interface in the standard way.  
For more information about logging on, see [“Logging on” on page 900](#).

**Tip:** You can browse overview status information about each hub from this workspace. For more information about the **All Known Hubs (KOBHUBS)** workspace, see [“The All Known Hubs workspace” on page 992](#).

3. On the **All Known Hubs (KOBHUBS)** workspace, place your cursor next to a hub monitoring server name and press **Enter**.  
The **Action Confirmation** panel is displayed. The panel lists information about the hub monitoring server to be used for your workspace queries. On the **Action Confirmation** panel, you can enter Y to confirm the action or N to cancel the action.
4. Enter Y to confirm the action. The **Hub Verification Complete (KOBHUB04)** workspace is displayed and shows two green information boxes that indicate a successful TCP/IP connection.

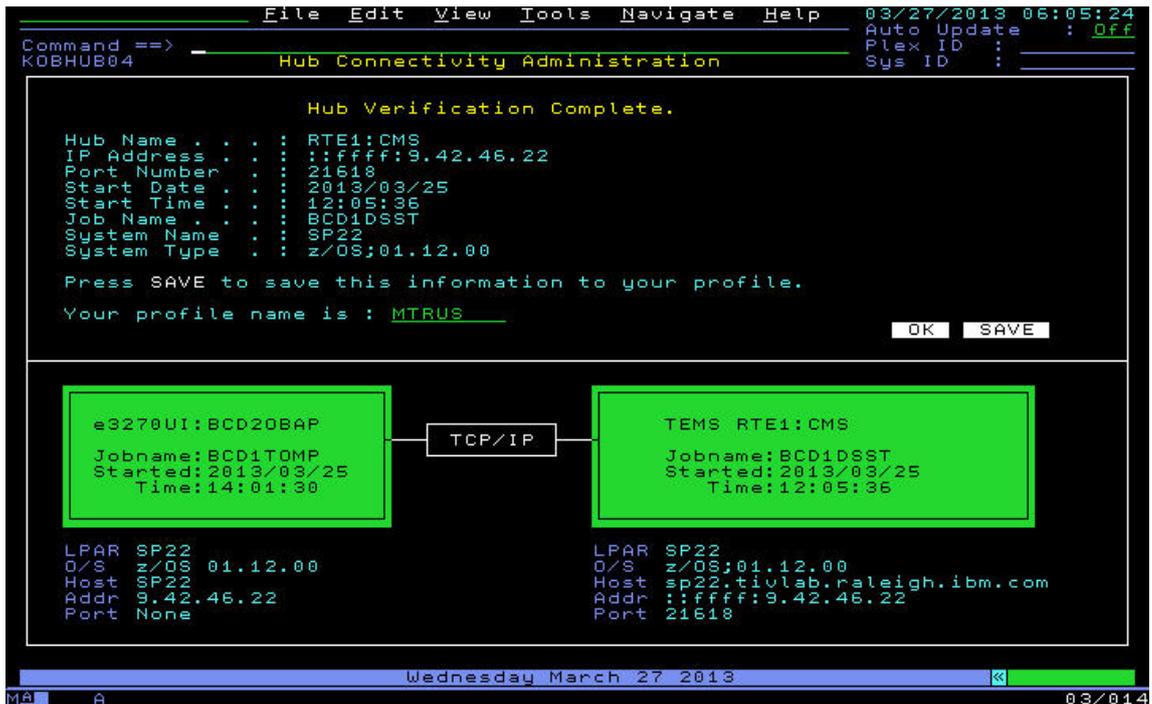

Figure 124: Hub Verification Complete (KOBHUB04) workspace that shows a successful hub connection

- a. To save the hub monitoring server name to your user profile, select **SAVE**.
- b. To use the selection for your current enhanced 3270UI session, select **OK**.

## Result

Your session goes to the first workspace name specified in your logon profile, by default the **Enterprise Summary (KOBSTART)** workspace.

## Customization

The OMEGAMON® enhanced 3270 user interface (enhanced 3270UI) provides workspaces to help subject matter experts customize workspace views for site specific and required use.

## Customizing workspaces

Every OMEGAMON product that supports the enhanced 3270 user interface (enhanced 3270UI) provides a set of predefined workspaces that can be used to resolve common problems. These workspaces can be modified to display exactly the information that you want to most effectively use the OMEGAMON monitoring agents in your environment. You can also create your own custom workspaces.

## Workspace viewing and cloning

The OMEGAMON® enhanced 3270 user interface (enhanced 3270UI) provides the capability to view and clone product provided workspaces.

Workspace viewing and cloning can be used to provide the user with the capability to customize the standard product defined workspaces that are delivered with the enhanced 3270UI. Modify or create workspaces by first cloning (copying) the workspace. Then, use a file editor such as the ISPF editor to edit the cloned workspace.

### Preparing for workspace cloning

In preparation for workspace cloning by an enhanced 3270UI user, complete the following administrative steps:

1. Ensure that the interface user has the required authority.  
The cloning process copies a standard product provided workspace from a configuration runtime environment data set to a user workspace data set. The runtime environment data set is read only and the user workspace data set is writeable. The user that wants to clone a workspace must have the authority to create new members in the user workspace data set. The default user workspace name is `<hilev>.<rtename>.UKANWENU`.
2. Ensure that the user workspace data set is the first data set that is specified in the `RKANWENU DD` statement. The user workspace data set is pointed to by the enhanced 3270UI started task `JCL UKANWENU DD` statement.  
If you ensure that the user workspace data set is the first data set, workspace testing is facilitated when customization changes are applied.

**Important:** It is important that the same `<hilev>.<rtename>.UKANWENU` data set is specified first in both the `UKANWENU DD` and `RKANWENU DD` statements.

3. Minimize potential disruptions to other enhanced 3270UI users.  
Because the cloning and customization process modifies product provided workspaces, the process must be done in a configuration that is not disruptive to ongoing normal usage of the enhanced 3270UI. For example, a separate enhanced 3270UI address space with a unique instance of the user workspace data set might be employed during the customization and testing process. Following customization and testing, the changes might be deployed to a shared development or production configuration by copying the customized workspaces into a corresponding data set that is specified in the shared development or production configuration enhanced 3270UI started task `JCL`.

## Related information

[Cloning a workspace](#)

[Browsing, locating and cloning a workspace](#)

### Cloning a workspace

Make a copy of a workspace and save it to your private data set.

### Before you begin

You must complete some administrative steps before you clone a workspace. For more information about completing these steps, see [“Preparing for workspace cloning” on page 943](#).

### Procedure

1. Go to the workspace to be cloned.  
The workspace name is beneath the command-line entry area of the workspace display. For example, in the following workspace view the workspace name is **KOBSTART**.

Figure 125: Identify the workspace name

2. Select **View > Workspace Source**  
The **Partitioned Dataset Member** (KOBPDSD) view opens showing a view of the KOBSTART workspace content.
3. Select **File > Save As** to clone the workspace that is being viewed.  
For example, to clone the KOBSTART workspace, place the cursor on **File** on the menu bar and press **Enter**. Then, from the **File** menu, select option 4, **Save As** by typing a or 4 and pressing **Enter**.

**Fastpath:** You can fast path to **File > Save As** by entering `f . a` in the action line.

Figure 126: Cloning a workspace by using the **File > Save As** menu option.

When you press **Enter**, the **Member Save As** dialog box opens:

Figure 127: Cloning a workspace - the **Member Save As** dialog box

4. Enter the workspace name that you want to use for the cloned workspace.  
If you are cloning a product provided workspace under the assumption that it is to supersede the product provided instance of the same workspace, the **Save As** name that you enter must be identical to the name of the product provided workspace, for example as shown in “[Figure: Cloning a workspace - the Member Save As dialog box](#)” on page 944.  
The saved workspace is written to the user workspace data set. The original product provided workspace is preserved intact in the runtime environment data set.  
When you press **Enter**, the **Save As** action is confirmed and you are returned to the **Partitioned Dataset Member** (KOBPDSD) view.
5. Optional: Go to the **Runtime Environment (Workspaces)** workspace to view your saved workspace  
For more information about browsing and locating workspaces, see “[Browsing, locating and cloning a workspace](#)” on page 945

## What to do next

When the workspace cloning is complete, the next step is to edit and test the workspace, customizing its contents to your requirements. Use a file editor such as the ISPF editor to edit the workspace.

## Related information

[Preparing for workspace cloning](#)

[Customization of product provided workspaces](#)

[Browsing, locating and cloning a workspace](#)

## Browsing, locating and cloning a workspace

You can use the **Runtime Environment (Workspaces)** workspace to browse the available workspaces and to locate a specific workspace for cloning.

## Before you begin

You must complete some administrative steps before a workspace is cloned. For more information about these steps, see [“Preparing for workspace cloning” on page 943](#).

## Procedure

1. Go to the **Runtime Environment (Workspaces)** workspace to browse the available workspaces. There are a number of ways you can go to this workspace:
  - Select **File > Open**. To do this, place the cursor under **File** on the menu bar and press **Enter**. Then, from the **File** menu select option 2.
  - Select **Tools > Runtime Environment** from the menu bar. The **Runtime Environment** workspace opens. Then, move your cursor over the **Workspaces** button and press **Enter**.
  - Move your cursor over the **RTE** icon in the drawer and press **Enter**. The **Runtime Environment** workspace opens. Then, move your cursor over the **Workspaces** push button and press **Enter**.

When you make one of the previous three choices, the **Runtime Environment (Workspaces) KOBWENU** workspace opens. This workspace presents two workspace subpanels that provide directory lists for the user workspace data set (UKANWENU DD) and the runtime environment workspace data set (RKANWENU DD).

The screenshot shows a terminal window with the following content:

```

Figure 128: Runtime Environment (Workspaces), locating the workspace member.

2. Enter the **Locate** command at the command line, specifying the workspace that you want to search for as an argument and press **Enter**. For example, if you enter **Locate KOBSTART**, the directory view positions similarly to [“Figure: Runtime Environment \(Workspaces\), locating the workspace member.” on page 945](#).

**Fastpath:** You can shorten the **Locate** command to **L**. For example, you can enter **L KOBSTART** to search for the KOBSTART workspace.

- Place the cursor in the input field of the workspace name that you want to clone and press **Enter**. For example, to select the KOBSTART workspace, place the cursor in the input field that precedes the workspace name and press **Enter**. The **Partitioned Dataset Member** (KOBPDS) view opens showing a view of the KOBSTART workspace content.
- Select **File > Save As** to clone the workspace that is being viewed. For example, to clone the KOBSTART workspace, place the cursor under **File** on the menu bar and press **Enter**. Then from the **File** menu, select option 4, **Save As** by typing a or 4 and pressing **Enter**.

**Fastpath:** You can fast path to **File > Save As** by entering **f . a** in the action line.

Figure 129: Cloning a workspace by using the **File > Save As** menu option.

When you press **Enter**, the **Member Save As** dialog box opens:

Figure 130: Cloning a workspace - the **Member Save As** dialog box

- Enter the workspace name that you want to use for the cloned workspace. If you are cloning a product provided workspace under the assumption that it is to supersede the product provided instance of the same workspace, the **Save As** name that you enter must be identical to the name of the product provided workspace, for example as shown in [“Figure: Cloning a workspace - the Member Save As dialog box”](#) on page 946. The saved workspace is written to the user workspace data set. The original product provided workspace is preserved intact in the runtime environment data set. When you press **Enter**, the **Save As** action is confirmed and you are returned to the **Partitioned Dataset Member** (KOBPDS) view.
- Press **PF3 (End)** to return to the **Runtime Environment (Workspaces) KOBWENUS** workspace.

## Result

The workspace directory view for the user workspace data set now lists the cloned workspace:

Figure 131: User workspace data set that shows a cloned workspace

**Note:** When you clone a product provided workspace, the cloned instance of the workspace is used by the enhanced 3270 user interface. Cloned or user customized workspaces are identified by an asterisk (\*), which is displayed after the workspace name:

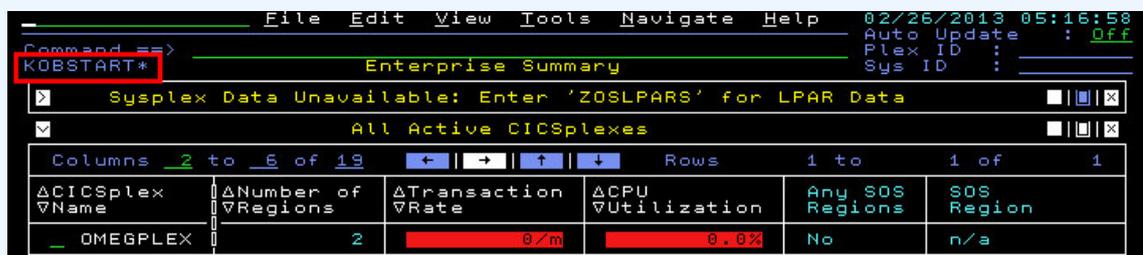

Figure 132: A cloned workspace is denoted by an asterisk character (\*) after the workspace name

## What to do next

When the workspace cloning is complete, the next step is to edit and test the workspace, customizing its contents to site requirements. Use a file editor such as the ISPF editor to edit the workspace.

## Related information

[Preparing for workspace cloning](#)

[Customization of product provided workspaces](#)

## Customization of product provided workspaces

Guidance on customizing cloned workspaces.

Before customizing a workspace, you must first clone it. For more information about cloning a workspace, see [“Cloning a workspace”](#) on page 943.

Use a file editor such as the ISPF editor to customize a workspace. Save the cloned workspace in the user workspace data set, that is, the data set pointed to by the enhanced 3270 user interface (enhanced 3270UI) started task JCL UKANWENU DD statement.

**Important:** Product provided workspaces rely on both the workspace content and supporting REXX code to control context and navigation. Customization changes must avoid modifications that might have unintended results; for example; loss of context.

The following examples are workspace customization actions that a user might want to perform.

- Change the order of columns that are displayed in a summary data subpanel.
- Change the columns that are displayed. For example, remove some columns in a summary subpanel, and eliminate some of the attribute values in a detailed data subpanel.
- Change the workspace header.
- Change the workspace default (on entry) cursor position.
- Change the workspace default sort columns.
- Change the statically defined columns in a summary subpanel.
- Change the Agent filter that is specified in a subpanel query.
- Add local Filters to a summary subpanel.
- Change the number or order of subpanels that are displayed in the workspace.
- Combine data from two or more input tables and generate output in a singular view.

You can achieve these types of customization by editing and changing workspace definition statements and associated keywords in the cloned workspace source. For more information, see [“Customizing a workspace” on page 950](#).

**Tip:** Consider the following things before you change workspace definitions or view the source definition for a specific workspace:

- The absence of workspace definitions statements and or associated keywords (modifiers) is usually an indication that defaults are being used. For example, in the DISPLAYCOLS statement, there is no requirement for the specification of the CAPTION or WIDTH keywords. These keywords would more likely be used when the defaults are not adequate or preferable.
- The syntax that is used in the workspace definition language is important. Keyword spelling, column name spelling, commas, spaces, quotation marks, parentheses, and other syntax cannot be ignored or excluded; for example, quotation marks and parentheses must be balanced. Although the enhanced 3270UI provides comprehensive parsing of the workspace source definitions statements, runtime errors and in some cases unexpected results might occur if the syntax is incorrect. For more information about the workspace definition language, see [“Workspace panel definitions” on page 1024](#).
- The workspace definition language specifications employ the internal column name to refer to a specific application product and table column/attribute. Taking note of the displayed workspace column order position along with the workspace DISPLAYCOLS definition (specified column order position) can be useful as a technique for correlating displayed columns with their corresponding internal column names.

**Remember:** When customizing product provided workspaces, when the changes are deployed for use by a wider audience, the changes affect all users of a given enhanced 3270UI address space. Consider the other users when customizations of this type are done. The customization must benefit all of your users.

## Related information

[Cloning a workspace](#)

## Modifying the initial workspace

By default, the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) is configured to specify the Enterprise Summary (KOBSTART) workspace as the initial workspace displayed after a user logs on. You can change which workspace is displayed when you first log on, or customize the Enterprise Summary workspace to better suit your needs.

### About this task

Customizing the initial workspace involves two tasks:

- Creating a custom definition for the workspace
- Modifying the user's logon profile to specify the custom definition

The definition of the Enterprise Summary workspace imbeds a subpanel for each the products that supports the enhanced 3270UI. The default imbed statements in the KOBSTART workspace definition are:

Names and descriptions of default imbeds in Enterprise Summary workspace

<i>Table 73: Default imbed statements in the Enterprise Summary (KOBSTART) workspace</i>	
<b>Imbed statement</b>	<b>Description</b>
IMBED=KM5STRTI	Imbed for OMEGAMON for z/OS
IMBED=KCPSTRTI	Imbed for OMEGAMON for CICS
IMBED=KGWSTRTI	Imbed for OMEGAMON for CICS Transaction Gateway
IMBED=KDPSTRTI	Imbed for OMEGAMON for Db2/PE on z/OS
IMBED=KIPSTRTI	Imbed for OMEGAMON for IMS on z/OS
IMBED=KMQSTRTI	Imbed for OMEGAMON for Messaging on z/OS
IMBED=KS3STRTI	Imbed for OMEGAMON for Storage on z/OS
IMBED=KN3STRTI	Imbed for OMEGAMON for Networks

Subpanels are displayed only for products that are installed. However, you might not want to see data for all of those products, or you might want to display additional subpanels. You can delete some of the imbedded subpanels and specify other subpanels that you want to imbed. Complete the following steps to customize the workspace definition.

### Procedure

1. Copy or clone the product-provided KOBSTART member and rename it as appropriate, for example ZOSFWS.  
Use the workspace viewing and cloning feature of the interface to complete this step. For more information about workspace viewing and cloning, see [“Workspace viewing and cloning” on page 943](#).
2. Copy or clone the product-provided KOBCUA member and rename it as appropriate: CUASITE for a site profile or user\_id for a user-specific profile.  
Use the workspace viewing and cloning feature of the interface to complete this step. For more information about workspace viewing and cloning, see [“Workspace viewing and cloning” on page 943](#).
3. Edit the copied instance to apply the required customization.  
For example, you might modify the list of imbeds to delete the KCPSTRTI, KGWSTRTI, KDPSTRTI, KIPSTRTI imbed statements. These changes create an initial workspace that contains data for only the OMEGAMON for z/OS, OMEGAMON for Storage, and OMEGAMON for Networks products.  
For more information about customizing workspaces, see [“Customization of product provided workspaces” on page 947](#)
4. Save your modified workspace.
5. Modify any appropriate logon profile members to specify the modified workspace definition as the initial workspace.  
In this example, you change the logon profile setting from FIRSTWS=KOBSTART to FIRSTWS=ZOSFWS.
6. Save your updated logon profile members.

### Result

When you log on to the enhanced 3270 user interface using any of the modified profiles, the ZOSFWS workspace is displayed.

## Customizing a workspace

Complete some preparation steps before customizing a workspace.

### Before you begin

Identify and clone the workspace to be customized. For more information about locating and cloning a workspace, see “[Browsing, locating and cloning a workspace](#)” on page 945. In the procedure that follows, the starting point is a cloned workspace. The workspace that is used as an example is the **ITM Situation Status & Message Log** (KOBSITEC) workspace. When you successfully clone a workspace, it is identified by an asterisk (\*), which is displayed after the workspace name, as shown in the following example:

Figure 133: A cloned workspace is denoted by an asterisk (\*) after the workspace name

### About this task

This task lists the preparation steps that you must complete each time that you want to customize a cloned workspace.

### Procedure

Preparation steps:

1. Go to the cloned workspace.  
For example, the **Situations Status and History** (KOBSITEC) workspace.
2. Go to the workspace source view by selecting **View > Workspace Source** from the workspace view.  
The contents of the workspace source, (KOBSITEC) in this example is displayed in the **Partitioned Dataset Member** (KOBPDSD) workspace view.

Figure 134: Workspace source view of the product provided *ITM Situation Status & Message Log* (KOB SITEC) workspace.

3. Start an ISPF file editor session in parallel to your enhanced 3270UI session. To start an ISPF editor session, use a TSO logon, then locate and edit the workspace to be customized from your user workspace data set.  
For example, the KOB SITEC workspace in the user workspace data set (*hilev.rtename.UKANWENU*).

Customization steps:

4. Choose and complete the customization that you want from the following choices:

Change a workspace and subpanel header	See <a href="#">“Changing a workspace and subpanel header” on page 951</a>
Change the order of displayed columns	See <a href="#">“Changing the order of displayed columns” on page 953</a>
Change a column caption and width	See <a href="#">“Changing a column caption and width” on page 954</a>
Remove a subpanel	See <a href="#">“Removing a subpanel” on page 956</a>
Adjust the number of filterable columns and filter location	See <a href="#">“Adjusting the filterable columns” on page 957</a>

## What to do next

For more information about other definition statements that can be used to customize workspaces, see [“Other workspace customization” on page 960](#).

## Related information

[Browsing, locating and cloning a workspace](#)

[Cloning a workspace](#)

## Changing a workspace and subpanel header

Customize a workspace by changing the workspace and subpanel headers.

## Before you begin

Follow the preparation steps that are detailed in [“Customizing a workspace” on page 950](#).

## Procedure

1. To change the workspace header statement, use the ISPF file editor session.  
For example, in the K0BSITEC workspace you can find the workspace header definition statement just after the <WORKSPACE> tag statement:

```
000014 /*****  
000015 <WORKSPACE>  
000016 HEADER='ITM Situation & Message log'
```

For example, you might change the header definition as follows:

```
000014 /*****  
000015 <WORKSPACE>  
000016 HEADER='Situation Status and History'
```

2. To change subpanel headers, use the ISPF file editor session.  
For example, in the K0BSITEC workspace, further on in the workspace source, you can find the first subpanel header definition statement:

```
000021  
000022 /*****  
000023 /*  
000024 /*          SUBPANEL 1  
000025 /*  
000026 /*****  
000027  
000028 <SUBPANEL>  
000029 TYPE=SUMMARY  
000030 HEADER='Current Situation Event status'  
000031 TOFROMHEADER=Y
```

For example, you might change the first subpanel header definition as follows:

```
000021  
000022 /*****  
000023 /*  
000024 /*          SUBPANEL 1  
000025 /*  
000026 /*****  
000027  
000028 <SUBPANEL>  
000029 TYPE=SUMMARY  
000030 HEADER='Current Situation Alerts'  
000031 TOFROMHEADER=Y
```

Further on in the example workspace source, you can find the second subpanel header definition statement:

```
000102  
000103 /*****  
000104 /***  
000105 /***          SUBPANEL 2 -  
000106 /***  
000107 /*****  
000108  
000109 <SUBPANEL>  
000110 TYPE=SUMMARY  
000111 HEADER='Situation Event Message Log'  
000112 TOFROMHEADER=Y
```

For example, you might change the second subpanel header definition as follows:

```
000102  
000103 /*****  
000104 /***  
000105 /***          SUBPANEL 2 -  
000106 /***  
000107 /*****  
000108  
000109 <SUBPANEL>  
000110 TYPE=SUMMARY  
000111 HEADER='Situation Alerts History'  
000112 TOFROMHEADER=Y
```

- Use the ISPF file editor session to save your workspace source changes.
- Press **PF3 (End)** in your enhanced 3270 user interface session to close the workspace source view. As the **PF3 (End)** action is processed, a refreshed view of the modified workspace is displayed, that is, the KOBSITEC workspace in this example:

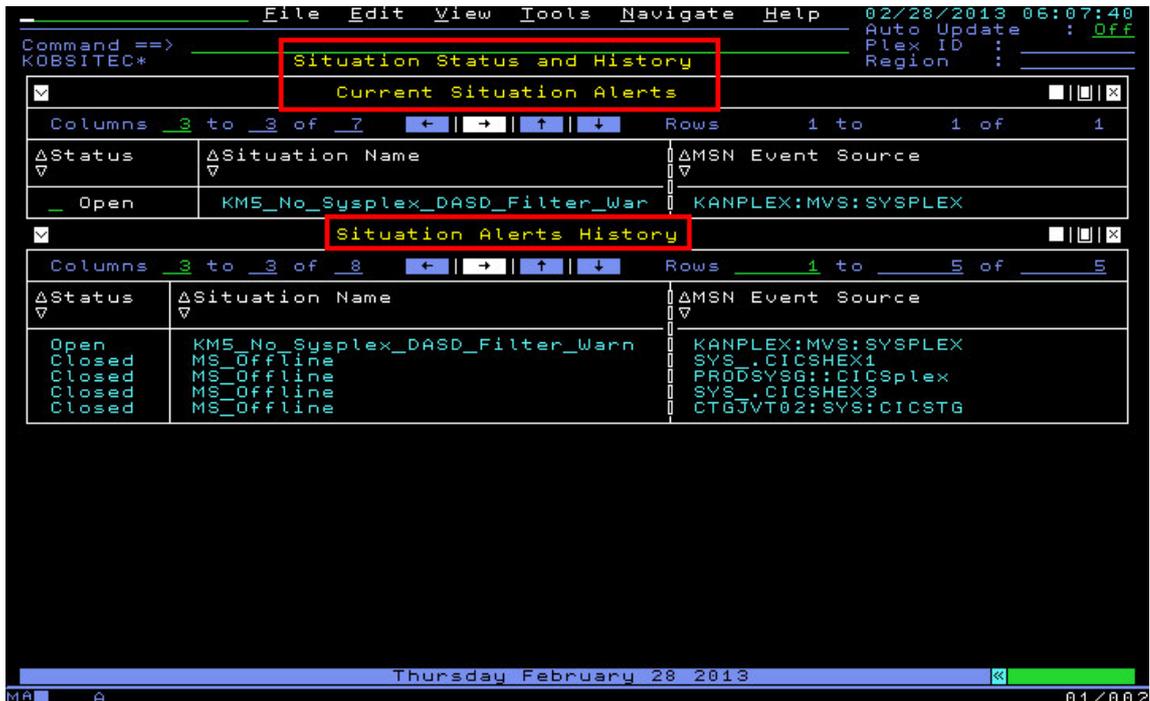

Figure 135: Customized workspace view that shows updated workspace and subpanel headings for the ITM Situation Status & Message Log (KOBSITEC) workspace

**Tip:** While the KOBSITEC workspace is refreshed when a **PF3 (End)** action is processed, a refresh might not occur for a different workspace. If a refresh does not occur, you can exit and reenter the modified workspace to see your changes.

## Changing the order of displayed columns

Customize a workspace by changing the order of the displayed columns.

### Before you begin

Complete workspace customization preparation. For more information about these preparation steps, see [“Customizing a workspace”](#) on page 950.

### Procedure

- Use the ISPF file editor session to locate the DISPLAYCOLS workspace definition statement. For example, in the KOBSITEC workspace, scroll beyond the DISPLAYCOLS statement to find the first <SUBPANEL> tag statement:

```
000079 DISPLAYCOLS='DELTASTAT(CAPTION='Status',WIDTH=7),
000080 SITNAME(CAPTION='Situation_Name',WIDTH=30),
000081 ORIGINNODE(CAPTION='MSN_Event_Source'),
000082 GBLTMSTMP(CAPTION='HUB_Event_Time',DATETIME),
000083 LCLTMSTMP(CAPTION='Agent_Event_Time',DATETIME),
000084 ATOMIZE(WIDTH=30,SCROLL),
000085 TYPE(CAPTION='Type')'
```

- Use the ISPF file editor session to change the order of the display columns. You might want to change the order of display columns. For example, to move the **MSN Event Source** header definition from the third column position to the second column position, adjust the DISPLAYCOLS statement as follows:

```

000079 DISPLAYCOLS='DELTASTAT(CAPTION='Status',WIDTH=7),
000080 ORIGINNODE(CAPTION='MSN_Event_Source'),
000081 SITNAME(CAPTION='Situation_Name',WIDTH=30),
000082 GBLTMSTMP(CAPTION='HUB_Event_Time',DATETIME),
000083 LCLTMSTMP(CAPTION='Agent_Event_Time',DATETIME),
000084 ATOMIZE(WIDTH=30,SCROLL),
000085 TYPE(CAPTION='Type')'

```

3. Use the ISPF file editor session to save your workspace source changes.
4. Press **PF3 (End)** in your enhanced 3270 user interface session to close the workspace source view. As the **PF3 (End)** action is processed, a refreshed view of the modified workspace is displayed, that is, the KOBSITEC workspace in this example:

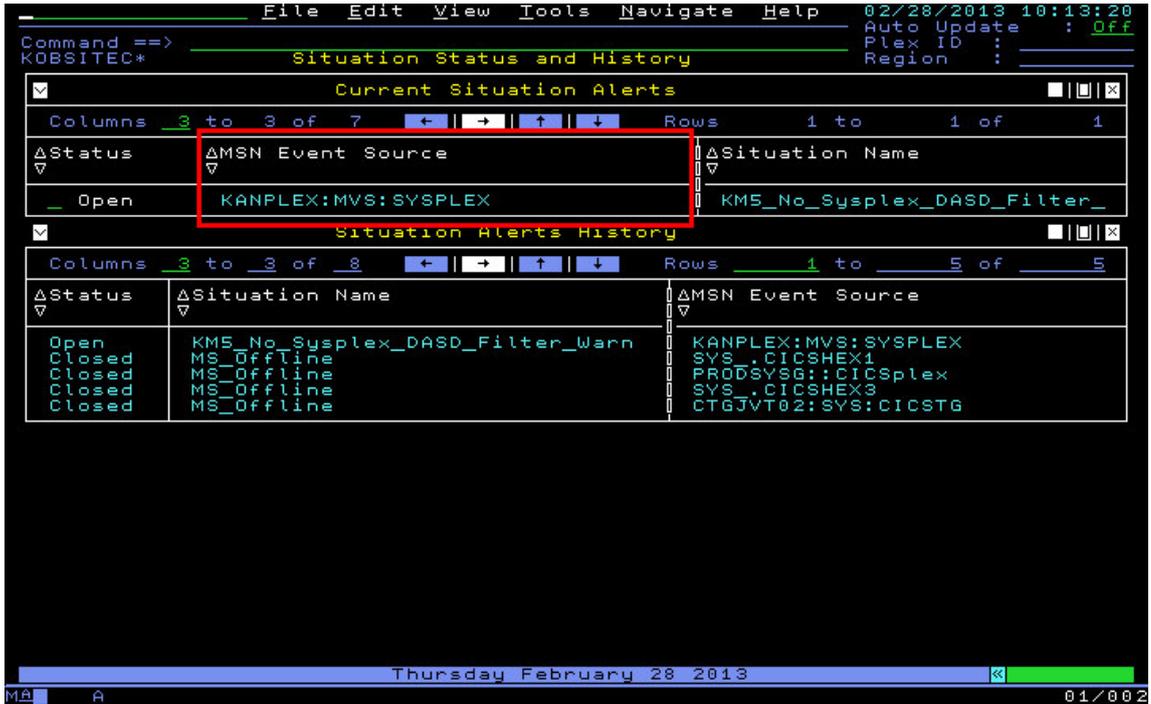

Figure 136: Customized workspace view that shows the **MSN Event Source** moved to the second column position

**Tip:** The KOBSITEC workspace is refreshed following a **PF3 (End)** action. A different workspace might not be refreshed following a **PF3 (End)** action. If a refresh does not occur, you can exit and reenter the modified workspace to see your changes.

## Changing a column caption and width

Customize a workspace by changing a column caption and width.

### Before you begin

Complete workspace customization preparation. For more information about preparation steps, see [“Customizing a workspace” on page 950](#).

### Procedure

1. Use the ISPF file editor session to locate the DISPLAYCOLS workspace definition statement. For example, scroll beyond the first <SUBPANEL> tag statement in the KOBSITEC workspace to find the DISPLAYCOLS statement:

```

000079 DISPLAYCOLS='DELTASTAT(CAPTION='Status',WIDTH=7),
000080 SITNAME(CAPTION='Situation_Name',WIDTH=30),
000081 ORIGINNODE(CAPTION='MSN_Event_Source'),
000082 GBLTMSTMP(CAPTION='HUB_Event_Time',DATETIME),
000083 LCLTMSTMP(CAPTION='Agent_Event_Time',DATETIME),
000084 ATOMIZE(WIDTH=30,SCROLL),
000085 TYPE(CAPTION='Type')'

```

2. Change a column heading caption name.

By default, the column heading caption is defined by the Object Definition Interchange (ODI) definition. However, it is possible to specify an override in the DISPLAYCOLS statement. For example, in the KOBSITEC workspace subpanel definition, to change the **Situation Name** caption to say Name, you can adjust the DISPLAYCOLS specification as follows:

```

000079 DISPLAYCOLS='DELTASTAT(CAPTION='Status',WIDTH=7),
000080 SITNAME(CAPTION='Name',WIDTH=30),
000081 ORIGINNODE(CAPTION='MSN_Event_Source'),
000082 GBLTMSTMP(CAPTION='HUB_Event_Time',DATETIME),
000083 LCLTMSTMP(CAPTION='Agent_Event_Time',DATETIME),
000084 ATOMIZE(WIDTH=30,SCROLL),
000085 TYPE(CAPTION='Type')'

```

3. Change a column width.

You might want to adjust the space on the screen that is available for a specific column. For example, in the modified KOBSITEC workspace subpanel definition, to change the Name column width, you might adjust the DISPLAYCOLS specification as follows:

```

000079 DISPLAYCOLS='DELTASTAT(CAPTION='Status',WIDTH=7),
000080 SITNAME(CAPTION='Name',WIDTH=32),
000081 ORIGINNODE(CAPTION='MSN_Event_Source'),
000082 GBLTMSTMP(CAPTION='HUB_Event_Time',DATETIME),
000083 LCLTMSTMP(CAPTION='Agent_Event_Time',DATETIME),
000084 ATOMIZE(WIDTH=30,SCROLL),
000085 TYPE(CAPTION='Type')'

```

4. Use the ISPF file editor session to save your workspace.
5. Press **PF3 (End)** in your enhanced 3270 user interface session to close the workspace source view. As the **PF3 (End)** action is processed, a refreshed view of the modified workspace is displayed, that is, the KOBSITEC workspace in this example:

Figure 137: Customized workspace view that shows a column with a modified caption and width

**Tip:** The KOBSITEC workspace is refreshed following a **PF3 (End)** action. A different workspace might not be refreshed following a **PF3 (End)** action. If a refresh does not occur, you can exit and reenter the modified workspace to see your changes.

## What to do next

In the example, the first caption change in the modified KOBSITEC workspace introduced an inconsistency between the first and second subpanel views because both panels contain a Situation Name column. You might want to apply the same changes to the second panel for consistency. You can apply the same changes to the second subpanel by scrolling down in the editor to the next DISPLAYCOLS statement and repeating the procedure.

## Removing a subpanel

You can customize a workspace to remove a workspace subpanel that is not of interest to you.

## Before you begin

Complete workspace customization preparation. For more information preparation steps, see [“Customizing a workspace” on page 950](#).

## About this task

For more information about subpanel start and end statements, see [“Number and order of workspace subpanels” on page 962](#). The following procedure details the removal of a subpanel from a workspace.

## Procedure

1. Use the ISPF file editor session to locate the second <SUBPANEL> workspace definition statement. For example, in the KOBSITEC workspace, scroll to the SUBPANEL 2 heading to find the second <SUBPANEL> statement:

```
000102
000103 /*****
000104 /***
000105 /***          SUBPANEL 2 - Message Log
000106 /***
000107 /*****
000108
000109 <SUBPANEL>
000110 TYPE=SUMMARY
000111 HEADER='Situation Alerts History'
000112 TOFROMHEADER=Y
000113 SCROLLBAR=Y
```

2. Add a <WORKSPACEEND> tag statement before the <SUBPANEL> tag statement. The <WORKSPACEEND> tag statement signifies the end of the workspace eliminating the following <SUBPANEL> definition:

```
000102
000103 /*****
000104 /***
000105 /***          SUBPANEL 2 - Message Log
000106 /***
000107 /*****
000108 <WORKSPACEEND>
000109 <SUBPANEL>
000110 TYPE=SUMMARY
000111 HEADER='Situation Alerts History'
000112 TOFROMHEADER=Y
000113 SCROLLBAR=Y
```

3. Use the ISPF file editor session to save your workspace source changes.
4. Press **PF3 (End)** in your enhanced 3270 user interface session to close the workspace source view. As the **PF3 (End)** action is processed, a refreshed view of the modified workspace is displayed, that is, the KOBSITEC workspace in this example:

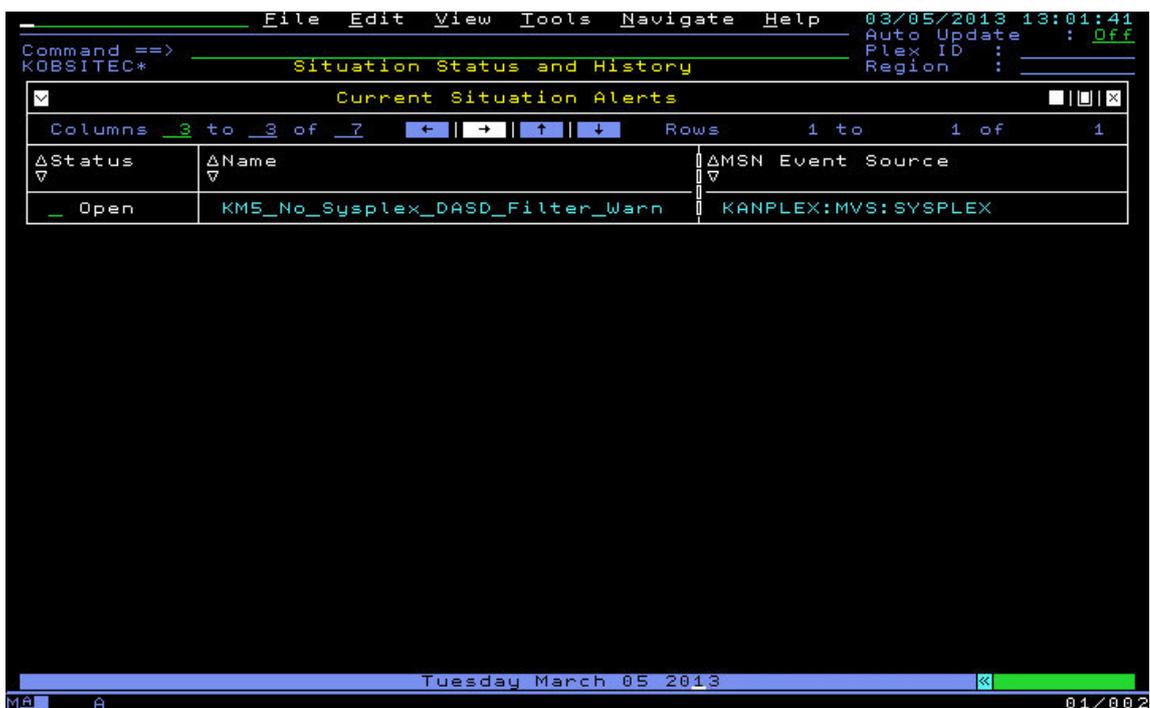

Figure 138: Customized workspace view that shows the second subpanel removed from the (KOB SITEC) workspace

**Tip:** The KOB SITEC workspace is refreshed following a **PF3 (End)** action. A different workspace might not be refreshed following a **PF3 (End)** action. If a refresh does not occur, you can exit and reenter the modified workspace to see your changes.

## Adjusting the filterable columns

Customize a workspace by adjusting the number of filterable columns and the filter location.

### Before you begin

Complete workspace customization preparation. For more information about preparation steps, see [“Customizing a workspace” on page 950](#).

### About this task

For more information about filterable columns and filter definitions, see [“Local or agent filter definitions” on page 961](#). The following procedure details how to adjust the number of filterable columns in a workspace. The procedure uses the **ITM Situation Status & Message Log (KOB SITEC)** workspace as an example.

### Procedure

1. Use the ISPF file editor session to locate the FILTERCOLS workspace definition statement. For example, in the KOB SITEC workspace scroll towards the end of the first subpanel definition to find the FILTERCOLS statement:

```
000084 ATOMIZE(WIDTH=30, SCROLL) ,
000085 TYPE(CAPTION='Type') '
000086
000087 FILTERCOLS=' SITNAME '
000088
000089 SORTCOLS=ALL
```

2. Modify the FILTERCOLS definition statement to add another filterable column. For example, in the KOB SITEC workspace, use the ISPF editor to make the following update:

```

000084 ATOMIZE(WIDTH=30, SCROLL),
000085 TYPE(CAPTION='Type')'
000086
000087 FILTERCOLS='SITNAME, ORIGINNODE'
000088
000089 SORTCOLS=ALL

```

- Optional: Add the FILTERWHERE=LOCAL statement to specify that filtering is locally applied. For example, in the KOBSITEC workspace, use the ISPF editor to make the following update:

```

000084 ATOMIZE(WIDTH=30, SCROLL),
000085 TYPE(CAPTION='Type')'
000086
000087 FILTERCOLS='SITNAME, ORIGINNODE'
000088 FILTERWHERE=LOCAL

```

- Use the ISPF file editor session to save your workspace source changes.
- Press **PF3 (End)** in your enhanced 3270 user interface session to close the workspace source view. As the **PF3 (End)** action is processed, a refreshed view of the modified workspace is displayed.

**Tip:** The KOBSITEC workspace is refreshed following a **PF3 (End)** action. A different workspace might not be refreshed following a **PF3 (End)** action. If a refresh does not occur, you can exit and reenter the modified workspace to see your changes.

- Press **PF4**, enter the FILTER command or click on the filter icon within the column header to start the filters dialog. The filters dialog pop-up, shows the filterable columns, as shown in this example:

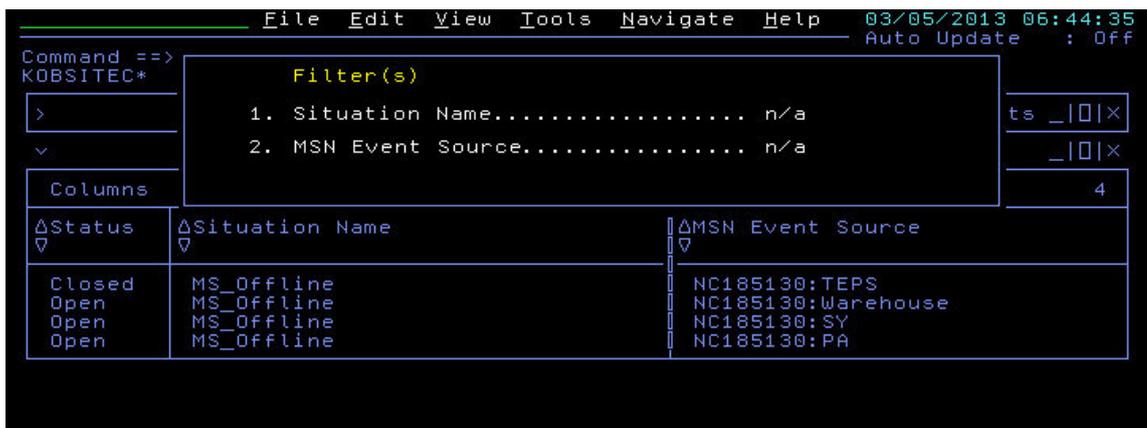

Figure 139: Filter dialog pop-up that shows the added filter column

## Joining multiple tables into a singular view

You can customize workspaces by combining data from two or more input tables to generate a new output table.

Combining data from several input tables is referred to as a relational join, and is a way of aggregating the rows and columns from two or more tables into a new table with a singular view. You might consider joining several tables into a new table to create a consolidated view of certain performance data, rather than viewing the data in multiple subpanels and workspaces.

You are able to join data from up to 15 input tables. Those tables can be from a single version of OMEGAMON or from any number of different OMEGAMON products. For example, you might combine data from one OMEGAMON for z/OS® table with data from one OMEGAMON for IMS™ table and display the result in a single table of your own design.

CICS Region Name	CPU Utilization	Transaction Rate	Maximum Tasks Percent	SOS	Stg. Violations last hour	Region's Worst Perf. Index	Worst Region Class Name	Service	Any Current WS Faults
CICSR42A	0.0%	0.7%	5%	No	0	0.00%	n/a		No
CICSR41A	0.0%	0.7%	5%	No	0	0.00%	n/a		No
CICSR42A	0.0%	0.7%	5%	No	0	100.0%	CTRANS		No
OMASR442	0.0%	6.4%	12%	No	0	0.00%	n/a		No

Figure 140: Sample table join that shows a workspace with two OMEGAMON for z/OS tables and a CICS table joined.

Detailed instructions on table join customization are located in the online help for your enhanced 3270UI session. Follow these steps to navigate to the Help panel for the KOBJOIN1 workspace, where the customization process is documented.

1. Navigate to the Help and Workspace Directory KOBHLDIR. See [Help and Workspace Directory](#) for more information on how to reach the KOBHLDIR workspace.
2. Expand the **New Features** branch.

Item	Description

+ OMEGAMON	OMEGAMON performance data
+ Enhanced 3270 UI	3270 UI Framework Workspaces

Figure 141: New Features

3. Drill down on the **Joining Data** row.
4. You arrive at the Help panel for the KOBJOIN1 workspace. Expand each branch to find step-by-step instructions on the customization process.

1. Table JOIN Overview

2. Steps to take

3. Input tables

You want to take several existing input tables and join them into a results table. The first step is to find the input tables that contain the data you need. You can find the tables you need by looking at existing workspaces on your 3270.

Select here to view available OMEGAMON tables

When you find the data you'd like to use, you can enter the 'v.s' command on the top left command line (v.s is View->Workspace Source). With that command you're taken to a display of the 'source code' for the workspace. Within this source code (a member of the RKANWENU dataset), you can find the QUERY='...' statements for the data you are interested in. The QUERY statements identify the application (KMS, for example) and the table (KM5MSUCAP, for example) that are used in the QUERY.

Continue the process of browsing for relevant data and write down the list of applications and tables that contain all the data you're interested in.

You should also note (copy and paste, for example) each of the QUERY statements that produce that data for your input tables. The QUERY statements consists of a SELECT keyword followed by column names and various conditional (WHERE) clauses.

Once you have the complete list of QUERY statements for all the input tables you need, copy those statements into a new workspace source member (a member in your UKANWENU PDS).

Query statements in a workspace look something like this:

```

QUERY="SELECT LPARCAPLIM,LPARGRPNAM,ORIGINNODE,PCTMSUCP,PCTTIMECAP,
ROLLAVG,TIMEPERIOD
FROM KMS.KM5MSUCAP
WHERE SYSTEM.PARMA('NODELIST','*MVS_SYSTEM',11)
AND RECTYPE = 1
ORDER BY PCTMSUCP DESC"

```

**Note:** The comprehensive list of instructions for joining tables can only be found in the enhanced 3270UI Help Directory.

## Other workspace customization

Learn about other workspace customizations and related workspace definition parameters.

The following information explains some common workspace definition statements that can be used to customize product provided workspaces. For an example of a detailed procedure to customize a workspace, see [“Customizing a workspace” on page 950](#).

### The initial and refresh cursor position for workspaces

The initial (on-entry) workspace cursor position is specified by the `CURSOR=` workspace definition statement. For example, `CURSOR=HOME` specifies that the initial cursor location is in the menu bar command field.

The `CURSOREFRESH=` workspace definition statement determines the cursor position behavior when the workspace is refreshed or when you return to the workspace, for example, after you enter **PF3 (End)**. For example, `CURSOREFRESH=ASIS` specifies that the cursor position remains unchanged when you refresh or return to a workspace.

The possible values for the `CURSOR=` and `CURSOREFRESH=` statements are as follows:

#### HOME

Row 00, Column 1

#### COMMANDLINE

The cursor appears after the command-line prompt, **Command ==>**

#### SUBPANEL

The cursor appears in the first selectable field of the first subpanel.

#### ASIS

The cursor remains on the workspace wherever the user placed it.

### Statically defined columns

Statically defined columns remain static during lateral scroll operations. These columns are usually the primary identification columns for a specific summary subpanel data row. For example, in the case of the `KOBSITEC` workspace, the Status and Situation Name columns are defined as static. The statically defined columns are controlled by the `STATICCOLS=` subpanel definition statement. Thus `STATICCOLS=2` specifies that the two leftmost columns in a subpanel display are defined as static; that is, the first two columns that are specified in the subpanel `DISPLAYCOLS` statement as shown in the following excerpt from the `KOBSITEC` workspace definition:

```
STATICCOLS=2

DISPLAYCOLS='DELTASTAT(CAPTION='Status',WIDTH=7),
SITNAME(CAPTION='Situation_Name',WIDTH=30),
ORIGINNODE(CAPTION='MSN_Event_Source'),
GBLTMSTMP(CAPTION='HUB_Event_Time',DATETIME),
LCLTMSTMP(CAPTION='Agent_Event_Time',DATETIME),
ATOMIZE(WIDTH=30,SCROLL),
TYPE(CAPTION='Type')
```

### Number of columns displayed

The columns that are displayed in a specific workspace are specified by the `DISPLAYCOLS=` workspace definition statement. To remove a column from the workspace display, remove its specification in the `DISPLAYCOLS` definition. To remove the Type column from the `KOBSITEC` workspace, remove the `TYPE(CAPTION='Type')` specification from the `DISPLAYCOLS` definition as shown in the example:

```
STATICCOLS=2

DISPLAYCOLS='DELTASTAT(CAPTION='Status',WIDTH=7),
SITNAME(CAPTION='Situation_Name',WIDTH=30),
ORIGINNODE(CAPTION='MSN_Event_Source'),
GBLTMSTMP(CAPTION='HUB_Event_Time',DATETIME),
LCLTMSTMP(CAPTION='Agent_Event_Time',DATETIME),
ATOMIZE(WIDTH=30,SCROLL)
```

**Important:** The closing quotation mark (') that follows the TYPE column specification is not dropped. It is moved to the end of the ATOMIZE column definition. The closing quotation mark signifies the end of the DISPLAYCOLS definition statement.

### Allotted subpanel row count

For workspaces that provide multiple subpanel displays, there might be cases where it is preferable to adjust the screen space. For example, you might modify the minimum number of rows that are allotted to a specific subpanel. This can be illustrated by using the KOBSITEC workspace as an example. The KOBSITEC workspace provides two subpanels, the first subpanel provides a list of *Open* situations, the second subpanel provides a situation alerts history list. As currently defined, if a user logs on to the interface with the 3270 model 5 emulation mode (27 rows), only the history (second) subpanel headers are displayed when the data rows in the first subpanel exceed five rows. The maximum rows that are allotted to a specific subpanel are defined by the subpanel `LINESnn=` parameter statements as shown in the following excerpt from the KOBSITEC workspace first subpanel definition:

```
LINES24=4  
LINES32=8  
LINES43=12  
LINES62=20  
LINES90=25
```

**Tip:** The *nn* in `LINESnn=` represents the maximum available screen lines for a specific 3270 terminal.

To change the default space that might be allotted to the first workspace subpanel, for example, where most enhanced 3270 user interface users are using low maximum line emulation modes (such as a 3270 model 2 with 24 available lines), you might adjust the `LINES24` definition to `LINES24=2`. This change reduces the screen space that is allotted to the first subpanel and frees up two lines for use by the second subpanel. Alternatively, if the second subpanel is used infrequently and you want more space for the first subpanel, the alternative adjustment might be applied; that is, adjust the `LINES24` definition to `LINES24=8`, allowing up to eight rows of detailed data to be viewed in the first subpanel. This example might be considered extreme. The enhanced 3270 user interface recommended minimum screen size is 43x80, for example, a 3270 model 4 with 43 available lines.

### Workspace sort columns

The workspace subpanel sortable columns are specified by the `SORTCOLS=` definition statement. Given that the sort indexes are constructed after row data is retrieved and before the workspace is rendered, the product provided workspaces employ discretionary use of this definition statement, especially in cases where the anticipated returned row set can produce many rows. The product provided workspaces are designed to anticipate the most common use cases.

If, after you use the enhanced 3270 user interface for some time, you find that more sortable columns will improve the usability of a specific workspace, you might consider expanding the `SORTCOLS=` definition. For example, for the KOBSITEC workspace, if the current `SORTCOLS=` definition is `SORTCOLS='SITNAME'`, to expand the definition to also include other subpanel columns such as, the MSN Event Source and HUB and Agent Event Time columns, you might change the definition to `SORTCOLS='SITNAME, ORIGINNODE, GBLTMSTMP, LCLTMSTMP'`.

The `SORTCOLS` definition statement must be defined with discretion, giving thought to potential loading costs. Although it is possible to define up to 30 `SORTCOLS` columns, or to define `SORTCOLS=ALL` to enable sorting on any subpanel column, this option is best avoided unless there is a certainty that the retrieved data comprises few data rows.

Note that the `SORTCOLS` specification can have limited use when a column display value is derived from an internal enumerated list, that is, where the display value is derived from the translation of an internal value. In this case, the sort index is produced from the internal column value. As a result, the column display values might seem to be grouped, but not necessarily in the expected display order.

### Local or agent filter definitions

The workspace subpanel filterable columns is specified by the `FILTERCOLS=` definition statement. The following considerations are for using the `FILTERCOLS` definition statement:

- `FILTERCOLS` specifications support the data result row set for each workspace subpanel that defines the `FILTERCOLS` statement.

- There might be cases where a workspace provides multiple subpanels that share a retrieved data row set, that is, a *reusable query*. In that case, the filters specification supports all subpanels that share the specific result row set.
- The FILTERCOLS workspace operates in conjunction with the FILTERWHERE= definition statement to specify where the filter is applied, either after the data is collected and returned to the enhanced 3270 user interface, or at the agent, during data collection and before the data is returned to the enhanced 3270 user interface. The default FILTERWHERE= definition is FILTERWHERE=AGENT, that is, filter at the agent.
- When a FILTERCOLS statement is defined along with FILTERWHERE=AGENT (the default), the filters are applied at the agent. As a result, a FILTERCOLS statement with FILTERWHERE=AGENT does affect the load that is incurred for data retrieval. Assuming the filters are effective, they reduce the amount of data that is collected and returned to the enhanced 3270 user interface.
- The FILTERCOLS statement must be used with discretion as they are not always effective. For example, they are most usable with column values that contain text strings. However, their use is limited for a numeric column value or a column value that is derived from an internal enumerated list, that is, where the display value is derived from the translation of an internal value.

For more information about adjusting the filterable columns, see [“Adjusting the filterable columns” on page 957](#).

**Remember:** There are other workspace definition statements, for example, FILTERVIEW(S) and FILTERSTRIP, that are related to filters that can be specified in the product provided workspaces. Filter definition statements can be complex and changes to product-provided workspace filter definitions must be applied with discretion to avoid unintended side-effects.

#### Number and order of workspace subpanels

The workspace subpanel definition *start* is specified by the presence of a subpanel start <SUBPANEL> tag statement. The subpanel definition end is specified in one of the following ways:

1. An implicit end that is defined by a <WORKSPACEEND> tag
2. An explicit end that is defined by a <SUBPANELEND> tag
3. An implicit end that is defined by a subsequent <SUBPANEL> tag that signifies the start of another subpanel

**Remember:** The <WORKSPACEEND> tag signifies the end of the workspace definition.

For more information about removing a subpanel, see [“Removing a subpanel” on page 956](#)

The following considerations are about the subject of removing and or reordering workspace subpanels:

- Given that the subpanel definition boundaries are defined by the <SUBPANEL> and <SUBPANELEND> tag statements or by an implicit end of subpanel, you can make a subpanel order change by moving a block of all lines that define a specific subpanel from one location in the workspace definition to another location.

**Remember:** For product provided workspaces, the order of workspaces can matter. For example, the retrieved data result set for workspace A might be shared by workspace B. Another example is when workspace B depends on a value that is set by workspace A. Another case, is for a *silent* workspace, that is, a workspace that is not displayed but contributes to the navigation scenario. For example, a *silent* workspace can run intermediate steps that are required for a subsequent process. Take these considerations into account when customizing a workspace that for example, removes, adds, or reorders subpanels within a specific workspace.

**Workspace panel definitions - reference** For more information about workspace definition statements that might have content and order implications, see [“Workspace panel definitions” on page 1024](#)

## Customizing status indicators

Columns in the enhanced 3270 user interface workspaces use colors to highlight the status of data based on thresholding criteria. If no criteria are set for a status column, the column is displayed in the default *status unknown* color.

You can change the colors that are associated with a particular status or range in the interface profile, by setting the values for the CUASTATUS keywords.

The CUASTATUS keywords control the color assignments for attributes for which thresholds are defined. When thresholds are defined, one of six states or one of nine range values can be assigned to the item. The state that is assigned to the item when the threshold is reached is reflected in a status indicator. The following colors can be assigned as status indicators: red, white, blue, green, yellow, turquoise, and pink.

The SHOWOKGOOD keyword controls the display of a status indicator for the OKGOOD state. By default, the value for this keyword is NO to minimize the number of colors in the workspace. However, in some workspaces, you might prefer to display the status.

The possible states and ranges, with default values, are listed here:

```
<CUASTATUS>
OKGOOD=GREEN
WARNING=YELLOW
CRITICAL=RED
IDLE=BLUE
HIGHLIGHT=TURQUOISE
UNKNOWN=BLUE

SHOWOKGOOD=NO
RANGE1=GREEN
RANGE2=GREEN
RANGE3=GREEN
RANGE4=YELLOW
RANGE5=YELLOW
RANGE6=YELLOW
RANGE7=RED
RANGE8=RED
RANGE9=RED
```

## Modifying predefined thresholds

Workspaces reflect the status of data on the basis of threshold criteria. Each product that supports the enhanced 3270 user interface provides predefined thresholds. You can modify these thresholds to more accurately reflect your site and user criteria.

## Preparing for threshold member cloning

The OMEGAMON enhanced 3270 user interface provides the capability to clone threshold members. Before you can clone a threshold member, you must prepare by performing administrative steps.

### Before you begin

Threshold cloning can be used to customize the standard threshold members that are delivered with the enhanced 3270 user interface.

The cloning process copies a standard product-provided threshold member from a configuration runtime environment data set to a user threshold member data set. The runtime environment data set is a read-only data set; the user threshold member data set is a writeable data set. The user that wants to clone a threshold member must have the authority to create new members in the user threshold member data set. The default user threshold member data set name is *<hilev>.<rtename>.RKANPARU*.

### About this task

In preparation for threshold member cloning by an enhanced 3270 user interface user, complete the following administrative steps.

### Procedure

1. Ensure that the user who wants to clone a threshold member has the required authority. The user must have the authority to create new members in the user threshold member data set. The default user threshold member data set name is `<hilev>.<rtename>.RKANPARU`.

**Note:** For security reasons, you might not be able to grant users write or update authorization to the `<hilev>.<rtename>.RKANPARU` data set. In that case, complete the following steps:

- a. Create an alternative data set with attributes that match the `<hilev>.<rtename>.RKANPARU` data set attributes.
- b. Change the enhanced 3270 user interface started task JCL to include the alternative data set in the UKANPAR DD statement data set concatenation.
- c. Grant users authorization to this data set.
- d. Create the `user ID` custom threshold members in this data set.

2. Ensure that the user threshold member data set is the first data set that is specified in the RKANPAR DD statement. The user threshold member data set is the data set that is pointed to by the enhanced 3270 user interface started task JCL RKANPAR DD statement. If you ensure that it is the first data set, threshold member testing is facilitated when customization changes are applied.

**Important:** Be sure that you specify the same `<hilev>.<rtename>.RKANPARU` or alternative data set first in both the UKANPAR DD and RKANPAR DD statements.

3. Minimize potential disruptions to other enhanced 3270 user interface users. Because the cloning and customization process modifies product provided thresholds, it must be done in a configuration that is not disruptive to ongoing normal usage of the enhanced 3270 user interface. For example, a separate enhanced 3270 user interface address space with a unique instance of the user threshold member data set might be used during the customization and testing process. After the customization and testing, the changes might be deployed to a shared development or production configuration by copying the customized threshold members into a corresponding data set that is specified in the shared development or production configuration enhanced 3270 user interface started task JCL.

## Cloning thresholds

Use the **Configuration** workspace to make a copy of a threshold member and save it to a user-defined thresholds data set.

## Before you begin

You must complete some administrative steps before a threshold member is cloned. For more information about these steps, see [“Preparing for threshold member cloning” on page 963](#).

## Procedure

1. Identify the threshold member that you want to clone.
2. Go to the **Runtime Environment (Configuration)** workspace to browse the available profiles. There are a number of ways you can go to the **Runtime Environment (Configuration)** workspace:
  - From the menu bar, select **Tools > Runtime Environment**. The workspace opens. Then, move your cursor over the **Thresholds** button and press **Enter**.
  - Move your cursor over the **RTE** icon in the drawer and press **Enter**. The **Runtime Environment** workspace opens. Then, move your cursor over the **Thresholds** button and press **Enter**.

The **Runtime Environment** workspace presents two workspace subpanels that provide directory lists for the user threshold member data set (UKANPAR DD) and the runtime environment profiles data set (RKANPAR DD).

Figure 143: Runtime Environment (Configuration), locating the threshold member.

- On the command line, enter the **Locate** command. Specify the threshold member name that you want to search for as an argument and press **Enter**.  
The directory view is positioned in the context of the threshold member name that you entered. The **Locate** command can be shortened to **L**. For example, if you enter **L KM5THRSH** on the command line and press **Enter**, the view is positioned similarly to “[Figure: Runtime Environment \(Configuration\), locating the threshold member.](#)” on page 965
- Place the cursor in the input field of the profile name that you want to clone and press **Enter**.  
For example, to select the **KM5THRSH** profile, place the cursor in the input field that precedes the profile name and press **Enter**.  
The **Partitioned Dataset Member (KOBPDSD)** view opens showing a view of the **KM5THRSH** profile content.
- To clone the threshold member that is being viewed, select **File > Save As**.  
For example, to clone the **KM5THRSH** profile that is being viewed in the previous step, place the cursor under **File** on the menu bar and press **Enter**. Then, from the **File** menu select option 4, **Save As** by typing a or 4 and pressing **Enter**.

**Fastpath:** You can fast path to **File > Save As** by entering **f . a** in the action line.

Figure 144: Cloning a threshold member by using the File > Save As menu option.

When you press **Enter**, the **Member Save As** dialog box opens:

Figure 145: Cloning a threshold member - the *Member Save As* dialog box.

6. Enter the threshold member name that you want to use for the cloned threshold member. If you are cloning a product-provided threshold member to supersede the product provided instance of the same workspace, the **Save As** name that you enter must be identical to the name of the product provided-threshold member, as shown in “Figure: Cloning a threshold member - the Member Save As dialog box.” on page 966. The saved threshold member is written to the user threshold data set. The original product-provided threshold member is preserved intact in the runtime environment data set. When you press **Enter**, the **Save As** action is confirmed and you are returned to the **Partitioned Dataset Member** (KOBPDSD) view.
7. Press **PF3 (End)** to return to the **Runtime Environment (Configuration) KOBPROFS** workspace.

## Result

The profile directory view for the user profile data set now lists the cloned profile, as shown in the following example:

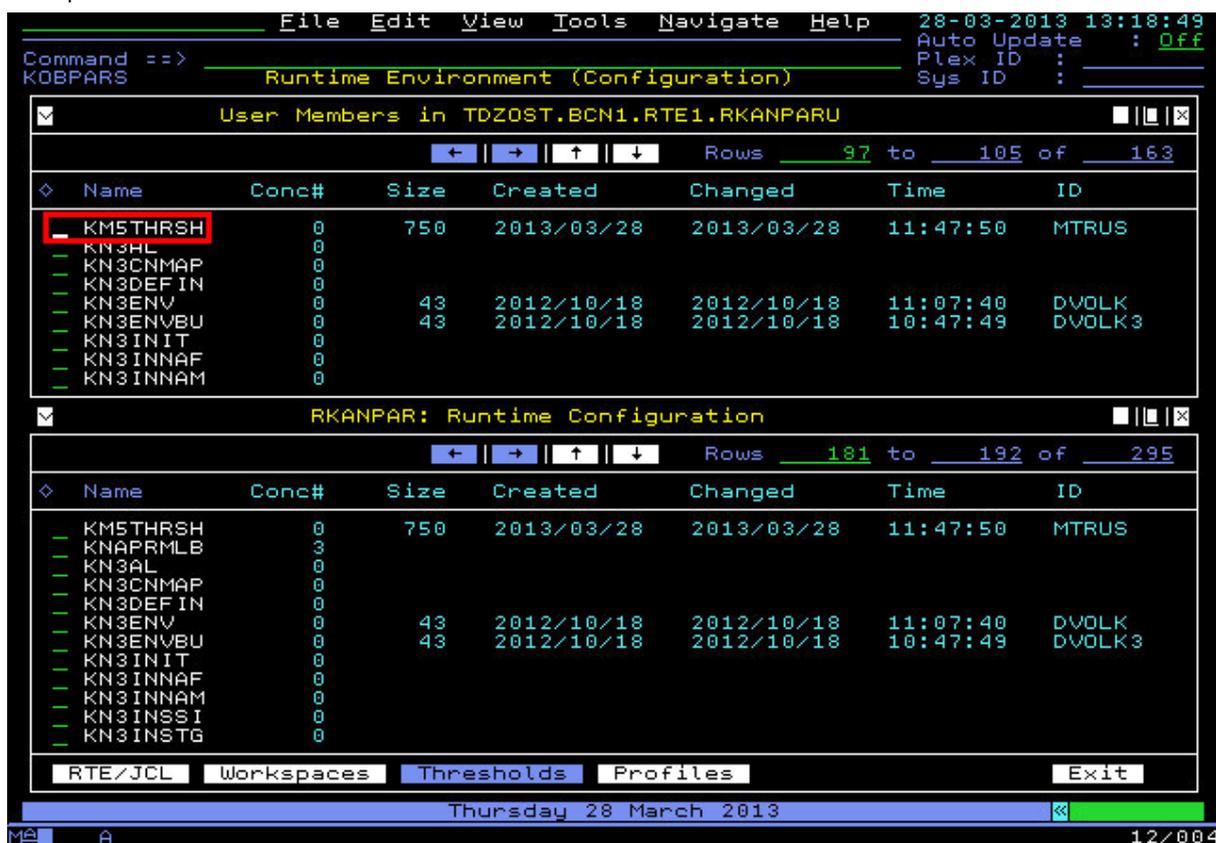

Figure 146: User threshold data set that shows a cloned profile

## What to do next

When the threshold member cloning is complete, edit and test the threshold member, customizing its contents to user requirements. To do this use a file editor such as the ISPF editor.

## Customizing thresholds

You can customize threshold criteria by user, by site, or by product.

### Before you begin

Workspaces reflect the status of data on the basis of threshold criteria. Each product that supports the enhanced 3270 user interface provides predefined thresholds. You can customize these thresholds to more accurately reflect your site and user criteria.

Before you begin customization, review the following topics:

- [“Preparing for threshold member cloning” on page 963](#)
- [“Cloning thresholds” on page 964](#)
- [“Syntax for threshold specification” on page 969](#)

### About this task

This task describes how to create and refresh customized threshold definitions using the enhanced 3270 user interface.

Threshold definitions are categorized as follows:

#### User-specific

User-specific thresholds affect only a single user. The customized user-specific thresholds are defined in a member named *user\_id*, which is the TSO or SAF user ID of the user.

To customize user-specific thresholds, you must create the *user\_id* member and include only the changes that you want to make. Ideally, member *user\_id* contains only the threshold overrides that are specific to the user and is not intended to include all threshold definitions.

If you use member *user\_id* for custom thresholds, you must have a user profile for the same ID in the UKOBDATF data set.

#### Site-wide

Site-wide thresholds affect all users and all products in the environment. The customized site-wide thresholds are defined in a member named CUASITE.

To customize site-wide thresholds, you must create the CUASITE member and include only the changes that you want to make. Ideally, member CUASITE contains only the site-wide threshold overrides and is not intended to include all threshold definitions.

**Note:** Member IBMSITE contains site-wide, product-provided threshold definitions. Member IBMSITE is used only if member CUASITE is not found.

#### Product-specific

Product-specific thresholds affect all users of a specific product. Each product provides predefined threshold definitions in member *Kpp*THRSH of data set TKANPAR, where *pp* is the product code. For example, OMEGAMON for CICS has member KCPTHRS, and OMEGAMON for z/OS has member KM5THRSH.

To customize product-specific thresholds, you must create a copy of member *Kpp*THRSH that is a complete copy of the original predefined threshold member. You then update this copy with your changes, and it is used in place of the original predefined threshold member.

Thresholds are applied in the following order: *user\_id*, CUASITE (or IBMSITE), *Kpp*THRSH.

**Note:** The customization of user-specific and site-wide thresholds requires the use of members named *user\_id* and CUASITE, respectively; the default user-threshold data set is `<hilev>.<rtename>.RKANPARU`. The enhanced 3270 user interface user profiles and site-customized profiles also use members named *user\_id* and CUASITE, respectively; the profile members exist in the default user-profile data set `<hilev>.<rtename>.UKOBDATF`.

To determine the threshold or thresholds that apply to each workspace and subpanel, for each product with thresholds that you want to change, check the *Kpp*THRSH member for comments similar to those in the following screen capture:

```

000009 *****
000010 * TABLE      : KCPPLX                               *
000011 *  *
000012 * PANEL ID: KCPPLXS - ENTERPRISE CICSplex SUMMARY *
000013 * SUBPANEL: 1 - ALL ACTIVE CICSplexES             *
000014 *****

```

**Note:** There is no runtime validation of threshold syntax. If you customize thresholds and they are failing, check the enhanced 3270 user interface address space SYSPRINT log for errors.

After you have completed your customizations, you must refresh the threshold definitions in your environment. An administrator can dynamically refresh the site-wide and product-specific thresholds for all users using the MVS MODIFY command **THRESHREFRESH**; for any users that are logged on to the enhanced 3270 user interface, these changes take effect immediately and automatically. If you make any user-specific threshold customizations and are logged on to the enhanced 3270 user interface, you must use the **Threshold Refresh** option in the interface for the changes to take effect; this option also refreshes the site-wide and product-specific thresholds.

Complete the steps in the following procedure to customize and refresh your threshold definitions.

### Procedure

1. Locate and clone the threshold member or members that contain the threshold or thresholds that you want to modify. Product-specific threshold members containing predefined thresholds are named *Kpp*THRSH, where *pp* is the product code, in data set TKANPAR.

**Note:** For details about cloning members in the enhanced 3270 user interface, see [“Cloning thresholds” on page 964](#).

Use one or more of the following choices when creating cloned threshold members:

- Create a cloned member named *user\_id* for user-level thresholds. The *user\_id* member must include only the subset of thresholds that you want to modify for a specific user. If you use *user\_id* for the custom thresholds, you must have a user profile for the same ID in the UKOBDATF data set.
  - Create a cloned member named CUASITE for site-wide thresholds. The CUASITE member must include only the thresholds that you want to modify on a site-wide basis.
  - Create a cloned member named *Kpp*THRSH to modify product-specific thresholds. This *Kpp*THRSH member must be a complete copy of the original predefined threshold of the same name.
2. Edit the new threshold member to change threshold definitions. Use a file editor such as the ISPF editor to do this.

**Note:** For details about threshold syntax, see [“Syntax for threshold specification” on page 969](#).

3. Refresh the threshold definitions using the following options:
  - To refresh all threshold definitions (including user-specific thresholds), from the **Tools** menu in the enhanced 3270 user interface, select option 4, **Threshold Refresh**. All threshold definitions (customized and predefined) take effect immediately.

- To refresh site-wide and product-specific thresholds for all users, you can issue the following operator command:

```
/F ui_stc_name,THRESHREFRESH
```

where *ui\_stc\_name* is the name of the enhanced 3270 user interface started task. The site-wide and product-specific threshold changes take effect immediately and automatically for all users.

**Note:** The MVS MODIFY command **THRESHREFRESH** does not refresh user-specific thresholds. To refresh user-specific thresholds, you must use the **Threshold Refresh** option if you are logged on to enhanced 3270 user interface, or log off and log on.

## Disabling thresholds

Disable threshold specifications to eliminate status indicators but leave the unmodified threshold specification in place.

## Procedure

- To disable a threshold, edit the definition to specify STATUS(NOSTATE NORANGE). The evaluation still takes place but no data is highlighted in the workspace if the threshold criteria are met.

## Syntax for threshold specification

Use the syntax, values, and parameters described here to modify predefined thresholds.

Specification of thresholds uses the following syntax:

```
IF ( APPL.TABLE.COLUMN [EQ] [(+/-) num_value
                        =
                        NE
                        !=
                        GT
                        >
                        LT
                        <
                        GE
                        >=
                        LE
                        <=] ) [AND
                        OR] .....

THEN DO
    STATUS ( [GOOD
            WARNING
            CRITICAL
            IDLE
            HIGHLIGHT
            NOSTATE]
           [numeric value 0 – 9
            NORANGE] )

ENDDO
```

**Parameters** Each threshold specification consists of six required elements and three optional elements that are used when a complex threshold is specified:

### IF keyword

This keyword indicates the beginning of the threshold specification. Internal parsing considers all text between IF statements as a threshold specification. Only the first column in the IF statement is statused if it evaluates positively.

### Left parenthesis – (

An optional left parenthesis is used to help group connected thresholds in a complex threshold specification. Specification of the left parenthesis is optional, but if specified it is treated based on the

normal rules of operator precedence. That is, the highest level of precedence among parentheses and AND and OR operators. Each left parenthesis must be matched in the complex threshold specification by a corresponding right parenthesis or errors will be flagged during parsing.

**Note:** This parenthesis MUST be preceded and succeeded by at least one blank.

#### **application\_name.table\_name.column\_name**

This triplet must follow the IF keyword with each of the three components delimited by a period. The triplet must be contiguous, that is, must contain no embedded blanks.

#### **Comparator**

This 1-2 byte specification must follow the *application.table\_name.column.name* triplet. Valid comparators are:

**EQ**

compare equal

=

compare equal

**NE**

compare not equal

!=

compare not equal

**GT**

compare greater than

>

compare greater than

**LT**

compare less than

<

compare less than

**GE**

compare greater than or equal

>=

compare greater than or equal

**LE**

compare less than or equal

<=

compare less than or equal

#### **Comparison value or range of values**

This value must follow the comparator with the following formats supported:

- The value is considered a string if enclosed by double-quotes. Up to 70 characters may be specified.

**Note:** If a comparator other than EQ or “=” is used against a string the assumption is that a numeric string value is being thresholded. Currently, the UI data value and the threshold value are right-justified before comparison in these situations. This will provide expected threshold comparison results for numeric values that are specified with the same number of decimal places, scaling units but no parsing of the string is attempted in the evaluation to “normalize” the strings.

- Decimal integer, preceded by an optional sign character (+ or -), in the range  $-2^{63} + 1$  through  $2^{63} - 1$ , that is, -9,223,372,036,854,775,807 to +9,223,372,036,854,775,807. A decimal point may be inserted in any position, including as first or last in the value: that is, 1234. and .1234 are valid.
- Hexadecimal value in the range 0x8000000000000000 through 0x7FFFFFFFFFFFFFFF. After the 0x prefix, 1 – 16 hexadecimal digits can be specified; for example, 0x3F is valid.
- Optionally, a range of values may be specified using a <> symbol immediately after and contiguous to the 1st decimal or hexadecimal value. The second, upper value in the range must follow the same specification rules as the first value in the range though a mixture of decimal and hexadecimal values can be specified if desired. The second value must immediately and contiguously follow the range symbol.

**Note:** The use of the <> symbol may be replaced by a compound IF statement such as IF (a.b.c >= value1 AND a.b.c <= value2).

- A suffix specifying the units that apply to the numeric value(s) can optionally be specified. The unit characters must immediately follow, and be contiguous with, the numeric value they apply to. Valid unit specifications are:

**K**

scales the numeric value by a factor of 1024

**M**

scales the numeric value by a factor of 1024\*1024

**G**

scales the numeric value by a factor of 1024\*1024\*1024

**T**

scales the numeric value by a factor of 1024\*1024\*1024\*1024

**P**

scales the numeric value by a factor of 1024\*1024\*1024\*1024\*1024

**E**

scales the numeric value by a factor of 1024\*1024\*1024\*1024\*1024\*1024

**ms**

milliseconds, scales the numeric value to seconds by a factor of 1000

**csec**

centiseconds, scales the numeric value to seconds by a factor of 100

**sec**

seconds, no scaling

**/sec**

units per second, scales to rate per hour internally (\*3600)

**/min**

units per minute, scales to rate per hour internally (\*60)

**/hr**

units per hour, no scaling

**%**

percentage, no scaling

**Right parenthesis – )**

An optional right parenthesis is used to help group connected thresholds in a complex threshold specification. Specification of the right parenthesis is optional but if specified will be treated based on the normal rules of operator precedence. That is, the highest level of precedence amongst parentheses and AND and OR operators. Each right parenthesis must be matched in the complex threshold specification by a corresponding left parenthesis or errors will be flagged during parsing.

**Note:** This parenthesis MUST be preceded and succeeded by at least one blank.

### Connector AND and OR keywords

The connector between any two individual thresholds, or parenthesized groups of thresholds, must be an AND or an OR keyword. If both are used in a complex threshold, normal rules of precedence and associativity apply. That is, AND has higher precedence than OR if no parentheses are used or both connectors are contained within a single left and right parentheses pair. Associativity is left to right.

### THEN DO keywords

THEN DO must be specified after the threshold IF statements with a corresponding terminating ENDDO keyword. The THEN DO and ENDDO keywords are specified before and after one or more of the STATUS, ZOOMDEST or HELPDEST keywords and keyword values.

### STATUS keyword

STATUS is an optional keyword that can follow the comparison DO THEN keywords.

### (status\_state, status\_range)

This is a parenthesized, space-delimited pair of two keyword parameters that designate one or two statuses for interpretation by the user interface. Both designation types must be specified. Specific keywords indicating that one or more of the status designations does not apply to the current threshold (NOSTATE or NORANGE) are used in place of an actual value. At least one blank must be specified between the STATUS keyword and the left parenthesis.

**Note:** The status\_state value takes precedence over the status\_range specified if both are specified.

- status\_state sets the state to be interpreted by the user interface. Valid specifications are:
  - GOOD
  - WARNING
  - CRITICAL
  - IDLE
  - NOSTATE
- status\_range sets a value in the range 0 through 9 (0 is equivalent to the NORANGE keyword) to augment the column data in the user interface subpanel. Valid specifications are:
  - Numeric value in the range 0 through 9
  - NORANGE

### ENDDO keywords

ENDDO must be specified after the threshold STATUS statements with a corresponding initiating THEN DO keyword pair.

### Acceptable formats

#### Hexadecimal

0xH - 0xHHHHHHHHHHHHHHHHHH

0XH - 0XHHHHHHHHHHHHHHHHHH

1-16 hexadecimal digits

#### Decimal

(+/-)(.)nnnnnnnnnnnnnnnnnn - (+/-)nnnnnnnnnnnnnnnnnn(.)

1-19 decimal digits with decimal point in any position including 1st or last character position

**Scaling suffix**

(1024) K (kilobytes), M (megabytes), G (gigabytes), T (terabytes), P (petabytes), E (exabytes)

**Percentage**

%

**Time suffix**

ms, csec, sec

**Rate**

/sec, /min, /hr

**String**

1-70 characters enclosed by double quotes

## Administration

The OMEGAMON enhanced 3270 user interface provides workspaces to help administrators to view and customize the interface and to validate hub monitoring server connections.

The following workspaces assist administrators:

- Runtime Environment (RTE) viewing
- Workspace source viewing
- Profile customization
- Hub connectivity administration

### Runtime environment viewing

Use the **Runtime Environment** workspace to view the Runtime environment and its partitioned data set members.

#### Procedure

1. Go to the **Runtime Environment** workspace to view the Runtime environment.  
There are a number of ways you can go to the **Runtime Environment** workspace:
  - Select **Tools > Runtime Environment**. Do this action by placing the cursor under **Tools** on the menu bar and pressing **Enter**. Then, from the **File** menu select option 8.
  - Move your cursor over the **RTE** icon in the drawer and press **Enter**.

The **Runtime Environment KOBJCLS** workspace opens. The workspace presents a lists of data sets in the Runtime JCL.

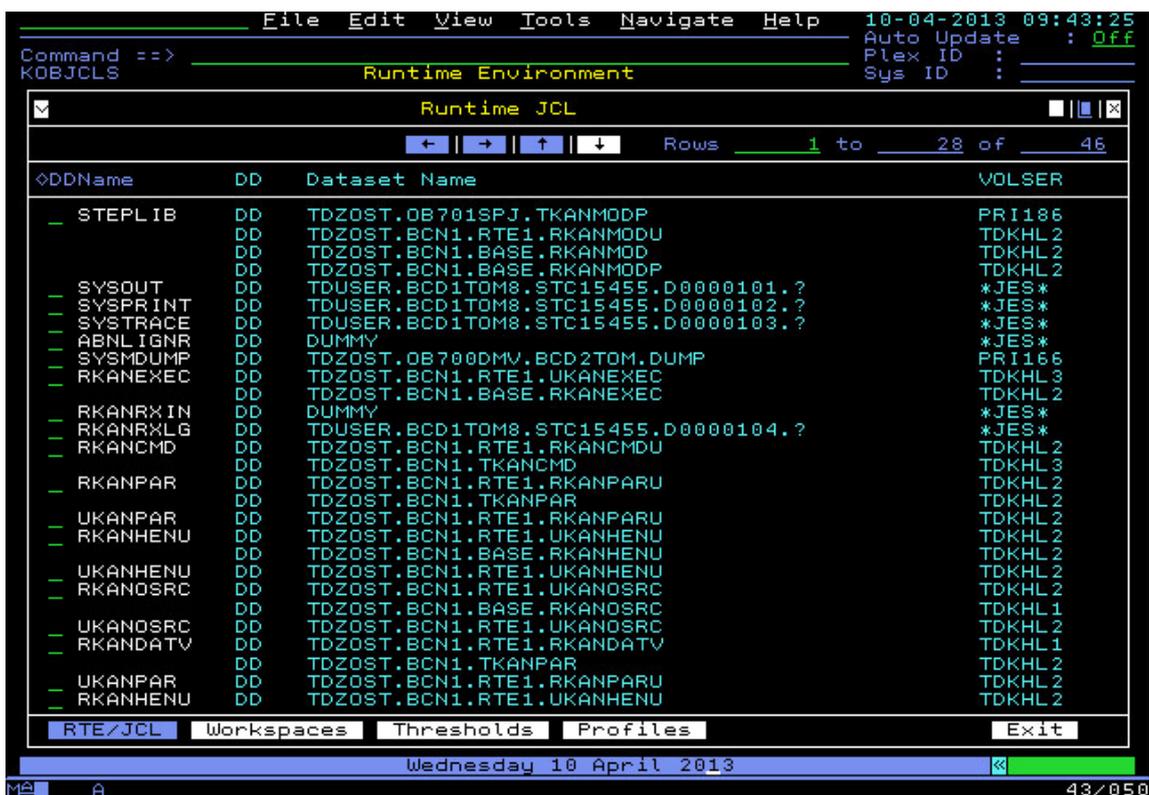

Figure 147: Runtime Environment workspace

Use the scrolling arrows or the PF7 and PF8 keys to scroll through the list of available data sets.

- Optional: Place your cursor on the input field before a data set, type **i** and press **Enter** to see more information about a data set.

The **Data Set Information** workspace opens and shows you information about the data set, as shown in the following example:

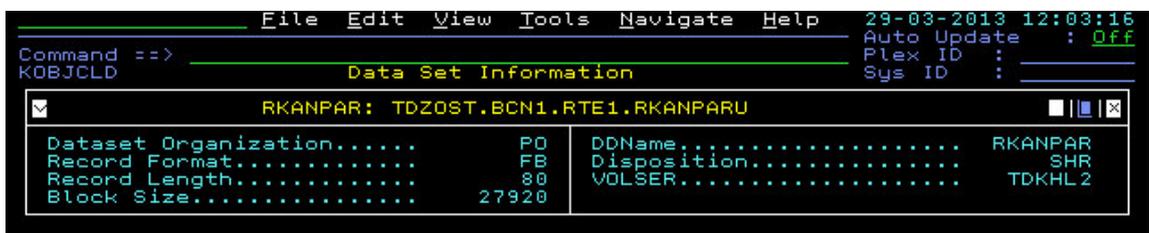

Figure 148: Data Set Information workspace

- Optional: Place your cursor on the input field before a data set name and press **Enter** to browse the members of a data set.

The **Partitioned Dataset Summary** workspace opens, as shown in the following example:

Figure 149: Partitioned Dataset Summary workspace

**Restriction:** JES data sets are listed in the **Runtime Environment** workspace but cannot be browsed.

- Optional: Place your cursor on the input field before a data set member name and press **Enter** to view the data set source.
- Press **PF3 (End)** until you return to the **Runtime Environment** workspace.
- Use the lateral navigation buttons on the **Runtime Environment** workspace to go to workspaces that show views of both user and runtime data sets for workspaces, profiles, and thresholds.

Figure 150: Lateral navigation push-buttons.

**Tip:** The **Exit** button returns you to your logon workspace.

## Viewing a workspace source

Use a menu selection to view the source for a workspace.

### Procedure

- Go to the workspace whose source you want to view.
- Select **View > Workspace Source**  
The **Partitioned Dataset Member (K0BPDSD)** view opens showing a view of the workspace source. Use the function keys or the cursor sensitive arrow controls to scroll through the source view.

### What to do next

If you want to modify the workspace source, you can first clone (make a copy) the workspace and then use a file editor such as the ISPF editor to edit the cloned workspace. For more information about cloning and customization of workspaces, see [“Workspace viewing and cloning” on page 943](#) and [“Customization of product provided workspaces” on page 947](#).

## Customizing the interface

The appearance of various components of the interface are controlled by an *interface profile*. The interface profile controls the color assigned to various elements of the interface, the actions assigned to PFKEYs, the language in which information is present, and the initial workspace displayed after you log on. IBM supplies a default profile named KOBCUA. You can create site-specific or individual user profiles by copying and renaming the default profiles and changing the default values to suit your preferences. You can also create site-specific locale profiles for users at different locations.

For more information about locale profiles, see [“Locale profiles” on page 980](#).

## Interface profiles

Interface profiles, also referred to as logon profiles, control the appearance of workspaces and the source from which data is collected. There are three types of interface profiles: IBM default, site, and user.

Interface profiles specify session configuration values for the following workspace properties:

- Locale (which controls display formats for date and time, monetary values, and separators)
- The color of workspace elements such as headers, borders, and text
- The color of status indicators
- The initial workspace a user sees
- The hub monitoring server from which data is collected
- The number of cycles before the auto update is suspended.

The default KOBCUA profile contains session configuration defaults.

You can create a *site-defined profile* to define settings that are different from the IBM-supplied defaults. This customized profile becomes the default for all enhanced 3270 interface sessions at the installation. It takes precedence over the IBM-supplied profile. The installation-defined profile must be named CUASITE.

You can create a *user profile* to customize users' individual sessions. The user-defined profile takes precedence over the installation- and IBM-supplied profiles. Name the user profile with the user ID that will be used to log on to the interface. Users can use the **User Profile Member** workspace to customize their profiles. For more information about customizing a user profile, see [“Customizing a user profile” on page 937](#).

The IBM-supplied profile is always available and cannot be changed. You must create one or more custom profiles based on the IBM-supplied profile and use them to specify the hub monitoring server from which data is to be collected for display in the enhanced 3270 user interface.

To create custom site and user interface profiles, copy the IBM-supplied KOBCUA profile to a private read/write data set. For more information about creating a custom profile, see [“Creating a custom interface profile” on page 976](#).

## Creating a custom interface profile

Create custom interface profiles to specify site or individual preferences for display colors, the initial workspace, and the source for the data that is displayed.

Custom profiles are stored in the `&hilev.&midlev.UKOBDATF` data set, which is created during configuration of the interface.

**Note:** This process can also be completed by using the [“Profile viewing and cloning” on page 977](#) procedure.

## Procedure

1. In the UKOBDATF data set, create a member with the name CUASITE (for a site profile) or with the user ID that will be used to log on to the enhanced 3270 user interface with the profile (for a user profile). This is usually a TSO user ID.  
Use the profile viewing and cloning feature to create the member. For more information about profile viewing and cloning, see “Profile viewing and cloning” on page 977.
2. Edit the member and modify it to reflect the site or user preferences.
3. To activate the changes log off the interface and then log back on again.

## Profile viewing and cloning

You can use the OMEGAMON enhanced 3270 user interface to view and clone user profiles.

Use Profile viewing and cloning to customize the standard user profiles that are delivered with the enhanced 3270 user interface.

### Preparing for profile cloning

In preparation for profile cloning by a user complete the following administrative steps:

1. Ensure that the user has the required authority.  
The cloning process copies a standard product-provided profile from a configuration runtime environment data set to a user profile data set. The runtime environment data set is a read only data set, the user profile data set is a writeable data set. The user that wants to clone a profile must have the authority to create new members in the user profile data set. The default user profile name is `<hilev>.<rtename>.UKOBDATF`.
2. Ensure that the user profile data set is the first data set that is specified in the RKOBPROF DD statement. The user profile data set is the data set that is pointed to by the enhanced 3270 user interface started task JCL UKOBDATF DD statement.  
If you ensure that it is the first data set, it facilitates profile testing when customization changes are applied.

**Important:** Be sure that you specify the same `<hilev>.<rtename>.UKOBDATF` data set in both the UKOBDATF DD and RKOBPROF DD statements.

3. Minimize potential disruptions to other enhanced 3270 user interface users.  
Because the cloning and customization process modifies product provided profiles, it must be done in a configuration that is not disruptive to ongoing normal usage of the enhanced 3270 user interface. For example, a separate enhanced 3270 user interface address space with a unique instance of the user profile data set might be used during the customization and testing process. After the customization and testing, the changes might be deployed to a shared development or production configuration by copying the customized profiles into a corresponding data set that is specified in the shared development or production configuration enhanced 3270 user interface started task JCL.

## Related information

### Cloning a Profile

#### Cloning a Profile

Use the **Profiles** workspace to make a copy of a profile and save it to the user profiles data set.

### Before you begin

You must complete some administrative steps before a profile is cloned. For more information about these steps, see “Profile viewing and cloning” on page 977.

### Procedure

1. Identify the profile to be cloned.
2. Go to the **Runtime Environment (Profiles)** workspace to browse the available profiles.  
There are a number of ways you can go to **Runtime Environment (Profiles)** workspace:
  - From the menu bar, select **Tools > Runtime Environment**. The **Runtime Environment** workspace opens. Then move your cursor over the **Profiles** button and press **Enter**.

- Move your cursor over the **RTE** icon in the drawer and press **Enter**. The **Runtime Environment** workspace opens. Then move your cursor over the **Profiles** button and press **Enter**.

The **Runtime Environment (Profiles) KOBPROFS** workspace opens. This workspace presents two workspace subpanels that provide directory lists for the user profile data set (UKOBDATF DD) and the runtime environment profiles data set (RKOBPROF DD).

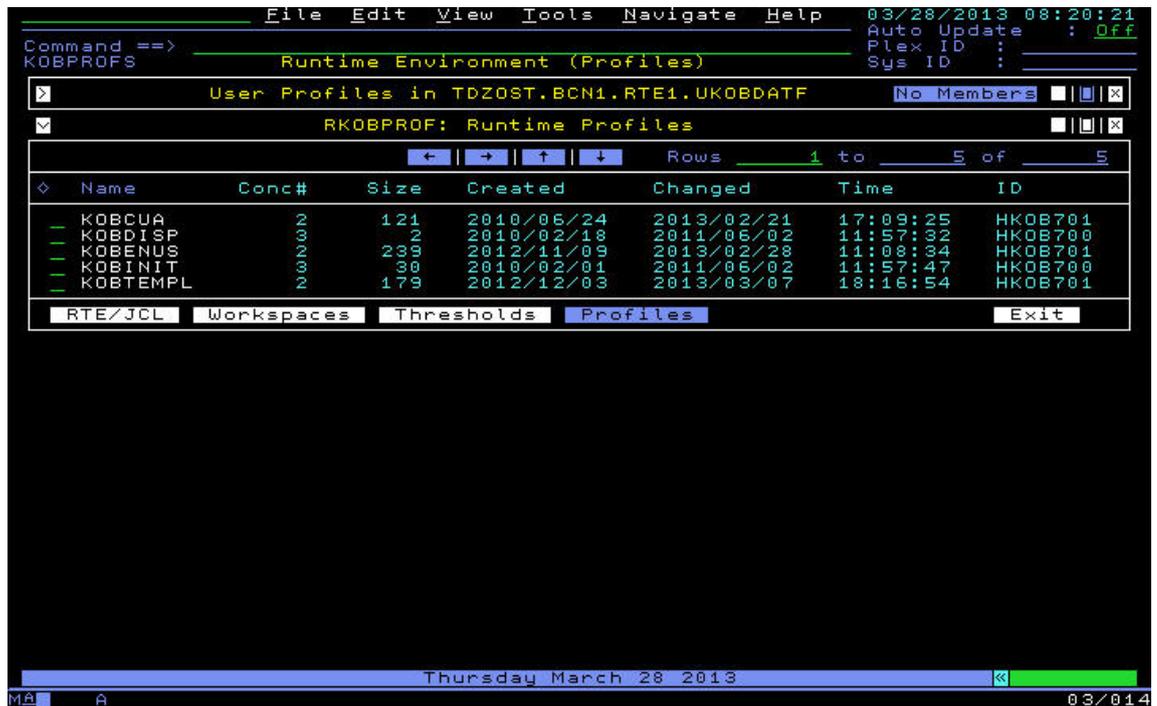

Figure 151: Runtime Environment (Profiles), locating the profile member

3. Place the cursor in the input field of the profile name that you want to clone and press **Enter**. For example, to select the KOBCUA profile, place the cursor in the input field that precedes the profile name and press **Enter**. The **Partitioned Dataset Member (KOBPDSD)** view opens showing a view of the KOBCUA profile content.
4. To clone the profile that is being viewed, select **File > Save As**. For example, to clone the KOBCUA profile, place the cursor under **File** on the menu bar and press **Enter**. Then, from the **File** menu select option 4, **Save As** by typing a or 4 and pressing **Enter**.

**Fastpath:** You can fast path to **File > Save As** by entering f . a in the action line.

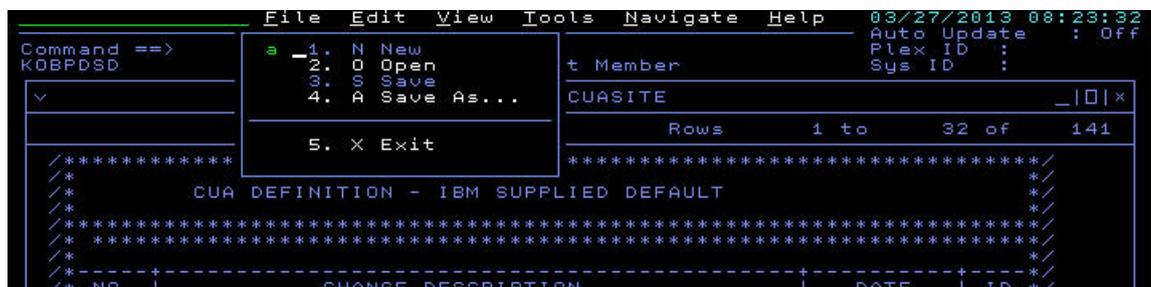

Figure 152: Cloning a profile by using the File > Save As menu option

When you press **Enter**, the **Member Save As** dialog box opens:

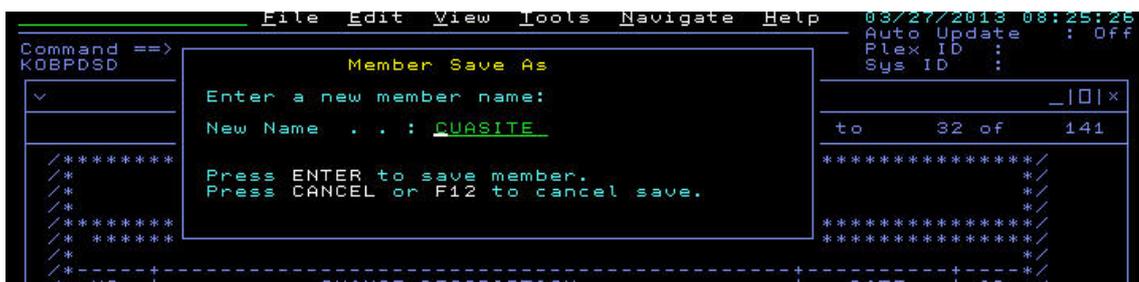

Figure 153: Cloning a profile - the **Member Save As** dialog box

- Enter the profile name that you want to use for the cloned profile.  
 A typical site administration task is to clone the KOBBCUA profile to create a site-defined profile that must be named CUASITE. In this example CUASITE is entered in the New Name field.  
 The saved CUASITE profile is written to the user profile data set. The original IBM-provided KOBBCUA profile is preserved intact in the runtime environment data set. Because the CUASITE profile is a special case, it is also written to the runtime environment data set and it takes precedence over the IBM-provided KOBBCUA profile for all users of the installation. If a name other than CUASITE is entered in the New Name field, the saved profile is written only to the user profile data set. To take precedence over the IBM-provided KOBBCUA profile and the site CUASITE profile for a specific user, name the profile with the user ID of the specific user.  
 When you press **Enter**, the **Save As** action is confirmed and you are returned to the **Partitioned Dataset Member (KOBPDSD)** view.
- Press **PF3 (End)** to return to the **Runtime Environment (Profiles) KOBPROFS** workspace.

## Result

The profile directory view for the user profile data set now lists the cloned profile, as shown in the following example:

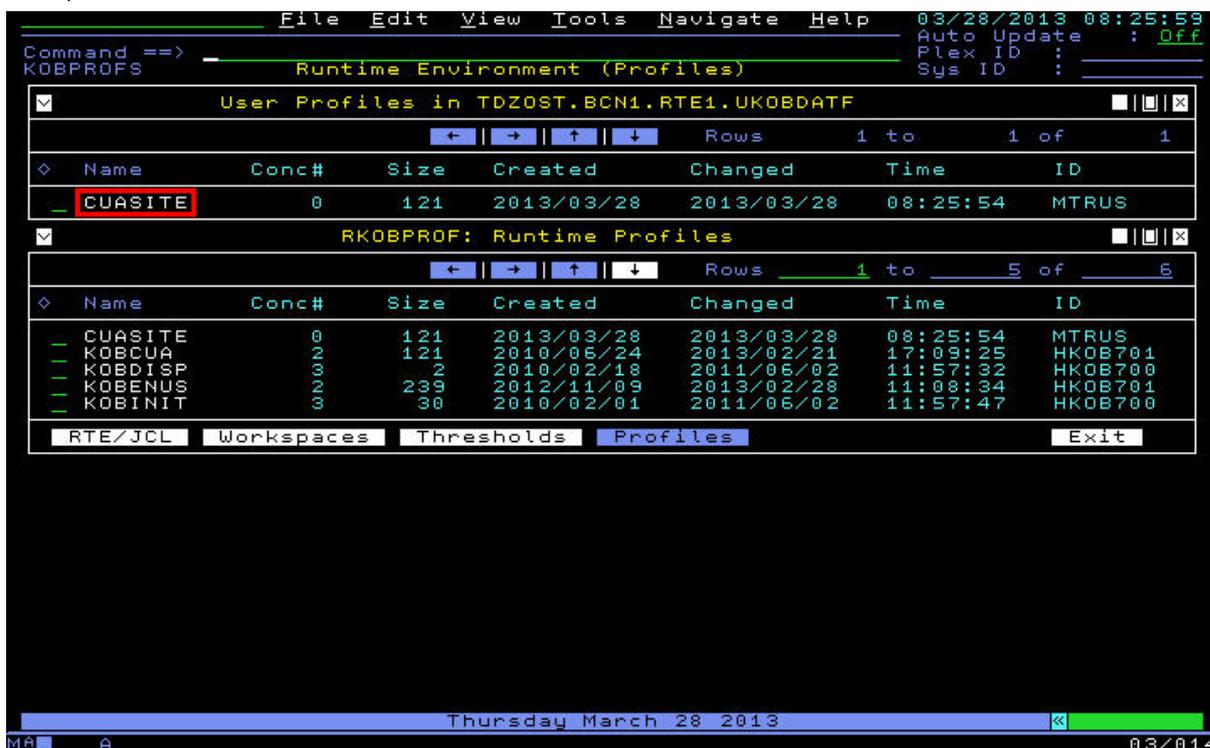

Figure 154: User profile data set that shows a cloned profile

## What to do next

When the profile cloning is complete, edit and test the profile, customizing its contents to user requirements. Use a file editor such as the ISPF editor to edit the profile.

**Remember:** Your users can use the **User Profile Member** workspace to set many of their profile settings directly. For more information about this workspace, see [“Customizing a user profile” on page 937](#).

## Locale profiles

The locale profile controls the display of date, time, currency symbol, and thousandth separator. IBM supplies a default profile, KOBENUS, that defines display characteristics that are based on United States English. You can create profiles that specify different display characteristics.

A locale profile is a member of the data set allocated to the RKOBPROF DD statement. The name of the member must be KOB*locale\_id*, where *locale\_id* is the 4-character identifier that is specified in the interface profile for the session, for example, in the member KOBENUS, ENUS is the identifier that denotes an English (United States) profile.

## Creating a custom locale profile

Create custom locale profiles to specify your preferences for the date and time format, the currency symbol, and the thousands separators.

Custom profiles are stored in the *&hilev.&midlev.UKOBDATF* data set.

## Procedure

1. In the UKOBDATF data set, create a member with the name KOB*cccc*, where *cccc* is the 4-character locale ID, for example KOBEURO for a profile with European formats.  
Use the profile viewing and cloning feature of the interface to complete this step. For more information about profile viewing and cloning, see [“Profile viewing and cloning” on page 977](#).
2. Edit the member and modify it to reflect the user preferences.  
See [“Locale profile keywords” on page 980](#) for keyword descriptions and possible values.
3. To activate the changes, log off and back on to the interface .

**Remember:** If you add a new DD statement for the profile definitions, you must recycle the interface to activate the changes.

## What to do next

After you create the custom profile, update any site or user profiles that you want to reference the new profile. For this example, you specify LOCALEID=EURO in the site or user profiles. Code RKANWEUR DD in your procedure and concatenate the data sets with the workspaces to it.

## Locale profile keywords

Settings in the locale profile are configured using *keyword=value* pairs. The keywords are grouped into two stanzas: LOCALE and ACTIONBAR.

The <LOCALE> stanza contains the following keywords:

### LOCALEDESC

A description of the profile.

### DATEFORMAT

Three date formats are supported:

- MM/DD/YYYY (the default)
- DD/MM/YYYY (European)
- YYYY/MM/DD (global)

### TIMEFORMAT

Time format can be 12 (default) or 24

## CURRENCY

Not currently implemented.

## THOUSANDPOS

Not currently implemented.

## SCALING

Not currently implemented.

## MICROSECOND

Not currently implemented.

The locale profile also contains an <ACTIONBAR> stanza that define the menus and menu options in the action bar that appears at the top of workspaces. These definitions cannot be changed.

## Hub connectivity administration

Hub connectivity administration is used to validate that a requested hub Tivoli Enterprise Monitoring Server can be reached through a TCP/IP connection during the operation of the OMEGAMON enhanced 3270 user interface.

Hub connectivity administration provides information about the user interface address space that you are running in, on what LPAR, and, in what Sysplex. If your current profile does not specify a hub monitoring server for your user interface address space, hub connectivity administration assists you in locating all the available hub monitoring servers in your Sysplex. When you locate the available hub monitoring servers, hub connectivity administration then helps you to select and make a good connection to the hub. When you establish a good hub connection, the connection produces useful data on the user interface.

Hub connectivity administration also provides you with the following information:

- A status overview of every hub monitoring server that is known to the user interface
- The Managed System Names and Managed System Lists that are known for each hub monitoring server
- The starting point for access to the IBM Tivoli Monitoring Service Index, Tivoli Monitoring Service Consoles, and Tivoli Monitoring SOAP servers that are known for each hub monitoring server.

## Multi-hub support

You can use the multi-hub support feature to select a secondary hub monitoring server connection. When you select a secondary hub connection, you can switch between your primary and secondary hub connections. For example, if your site runs multiple hub monitoring configurations, you can use this feature to quickly switch between configurations. You can switch connections manually, or automatically, for example in the event of an unavailable hub connection.

### Secondary Hub Connection

Multi-hub support does not provide a mechanism to make your secondary hub connection a backup or failover of your primary hub connection. Unless you have other mechanisms in place to provide a backup or failover hub monitoring server, it is more likely that your secondary hub connection is monitoring another configuration. For example, your primary hub might be monitoring the *production systems* configuration, while your secondary hub might be monitoring the *test systems* configuration.

**Note:** For more information about selecting a secondary hub connection, see [“Selecting a secondary hub connection” on page 996](#).

## Validate a requested hub Tivoli Enterprise Monitoring Server

While you are interacting with the OMEGAMON enhanced 3270 user interface, a hub Tivoli Enterprise Monitoring Server data source is needed to handle SQL queries that are issued by the user interface workspaces that you want to display.

During the installation of the enhanced 3270 user interface, part of the configuration process is to specify the hub monitoring server, which includes the name of the monitoring server, the IP address, and port number that the SQL queries are sent. For example, as shown in the following screen capture:

```

File Edit Edit_Settings Menu Build SCLM Utilities Test Help
VIEW TDZOS.OB701MNT.DATF (KOBQUA) - 01.28 Columns 00001 00072

Figure 155: CUADATA profile definition shown during the configuration process at installation time

When you log on to the user interface, the hub monitoring server specifications are retrieved from your profile, and an attempt is made to connect to that hub. If the connection attempt is successful, the initial workspace panel for your profile is displayed, for example, the **Enterprise Summary (KOBSTART)** workspace.

If the hub monitoring server connection attempt fails, the **Hub Connectivity Administration** workspace is displayed, as shown in “[Figure: Hub Connectivity Administration workspace that shows a connectivity failure](#)” on page 985. This workspace notifies you that a failure occurred and the possible reason for the connection failure.

These are some of the reasons for failed connections to a requested hub monitoring server:

- The name of the hub monitoring server is incorrect (names are case-sensitive).
- The hub monitoring server IP address is incorrect.
- The hub monitoring server TCP/IP port number is incorrect.
- The hub monitoring server is not operational (not started or is having communications problems).
- TCP/IP or z/OS® UNIX® System Services on the z/OS system that is running the user interface address space is not configured to allow TCP/IP communications between the interface and the hub monitoring server.
- A TCP/IP firewall is preventing successful communications between the interface and the hub monitoring server.

## Logon administration and customization

When you log on to the enhanced 3270 user interface (enhanced 3270UI) for the first time, **Hub Connectivity Administration** can assist you to specify a hub Tivoli® Enterprise Monitoring Server connection.

### Procedure

1. Log on to the user interface in the standard way.  
For more information about logging on, see “[Logging on](#)” on page 900.  
If a hub monitoring server is specified in your profile, and that hub is available, a connection is made to the hub and your initial workspace is displayed. By default, the initial workspace is the **Enterprise Summary (KOBSTART)** workspace. If a hub monitoring server is not specified in your profile, the **Hub Connectivity Administration** workspace is displayed.

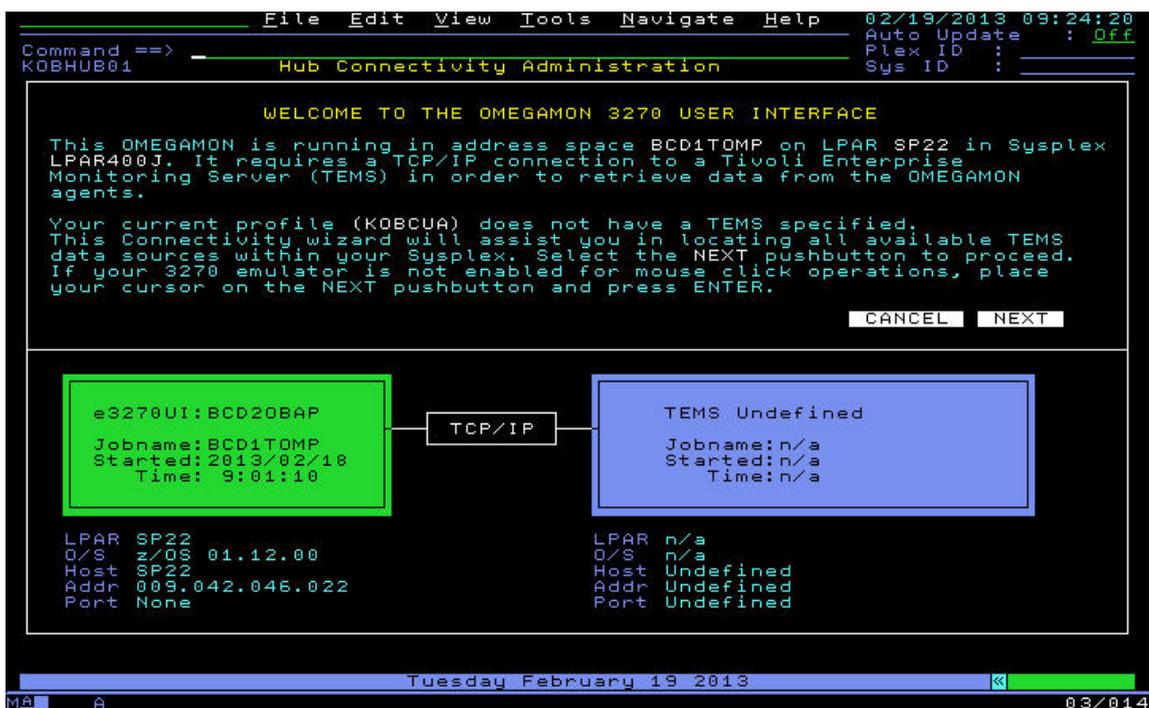

Figure 156: Hub Connectivity Administration workspace that shows a hub connection is not specified for the current profile

- To select the **NEXT** icon on the **Hub Connectivity Administration** workspace, move your cursor to the icon and press **Enter** or double-click the icon. The **All Known Hubs (KOBHUBS)** workspace is displayed showing all of the available hubs that are known to the enhanced 3270UI.

Figure 157: Hub Connectivity Administration All Known Hubs (KOBHUBS) workspace

**Tip:** You can browse overview status information about each hub from this workspace. For more information about the **All Known Hubs (KOBHUBS)** workspace, see [“The All Known Hubs workspace”](#) on page 992.

3. On the **All Known Hubs (KOBHUBS)** workspace, place your cursor next to a hub monitoring server name and press **Enter**.  
The **Action Confirmation** panel is displayed. The panel lists information about the hub monitoring server to be used for your workspace queries. On the **Action Confirmation** panel, you can enter Y to confirm the action or N to cancel the action.
4. Enter Y to confirm the action. The **Hub Verification Complete (KOBHUB04)** workspace is displayed and shows two green information boxes that indicate a successful TCP/IP connection.

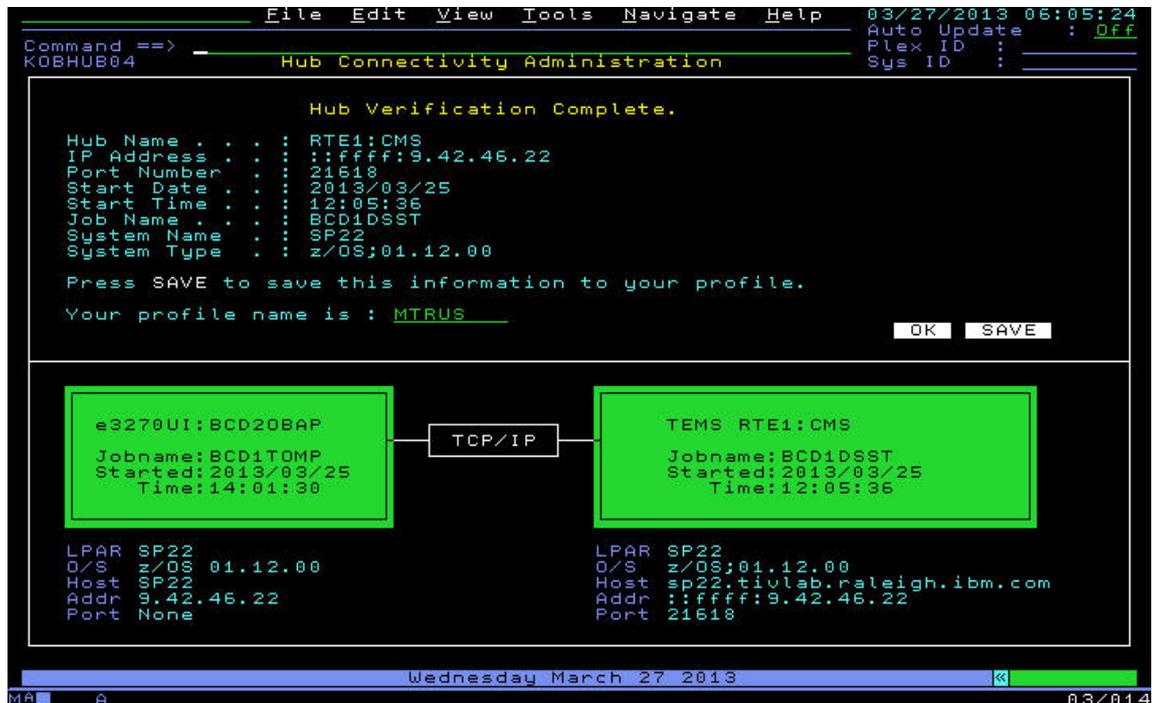

Figure 158: **Hub Verification Complete (KOBHUB04)** workspace that shows a successful hub connection

- a. To save the hub monitoring server name to your user profile, select **SAVE**.
- b. To use the selection for your current enhanced 3270UI session, select **OK**.

## Result

Your session goes to the first workspace name specified in your logon profile, by default the **Enterprise Summary (KOBSTART)** workspace.

## Correcting a failed hub server connection

Use **Hub Connectivity Administration** to assist you in locating all of the available Tivoli Enterprise Monitoring Server data sources. **Hub Connectivity Administration** helps you to correct any failed connection situations that prevent you from accessing the OMEGAMON enhanced 3270 user interface and your subsequent product workspaces.

## About this task

When you log on to the user interface, if the hub monitoring server connection attempt fails, the **Hub Connectivity Administration** workspace is displayed and notifies you that a failure occurred and the possible reason for the connection failure. The workspace helps you to correct the connection failure and to save a corrected profile to prevent future failures.

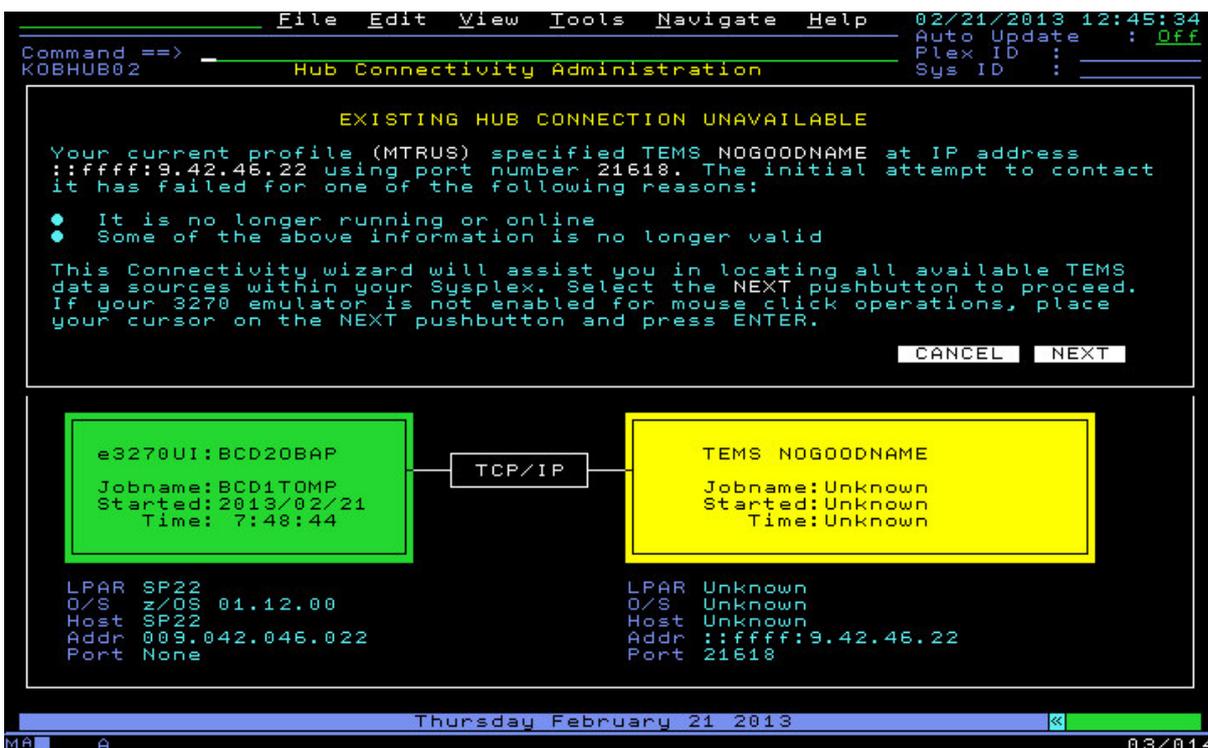

Figure 159: Hub Connectivity Administration workspace that shows a connectivity failure

**Tip:** If this is your first time logging on to the user interface and a hub monitoring server is not specified in your profile, you see the **Hub Connectivity Administration** workspace but with a different message that states the reason for the failure. If the message indicates that your current profile does not have a hub specified, see [“Logon administration and customization” on page 940](#).

## Procedure

1. On the **Hub Connectivity Administration** workspace that shows the connectivity failure, select the **NEXT** icon by moving your cursor to the icon and pressing **Enter** or moving your mouse to the icon and selecting it. The **All Known Hubs (KOBHUBS)** workspace is displayed showing all of the available hubs that are known to the user interface.

Figure 160: Hub Connectivity Administration All Known Hubs (KOBHUBS) workspace

**Tip:** You can browse overview status information about each hub from this workspace. For more detailed information about the **All Known Hubs (KOBHUBS)** workspace, see “[The All Known Hubs workspace](#)” on page 992.

- On the **All Known Hubs (KOBHUBS)** workspace, place your cursor next to a hub monitoring server name and press **Enter**.  
The **Action Confirmation** panel is displayed. The panel lists information about the hub monitoring server to be used for your workspace queries. On the **Action Confirmation** panel, you can enter Y to confirm the action or N to cancel the action.
- Enter Y to confirm the action. The **Hub Verification Complete (KOBHUB04)** workspace is displayed and shows two green information boxes that indicate a successful TCP/IP connection.

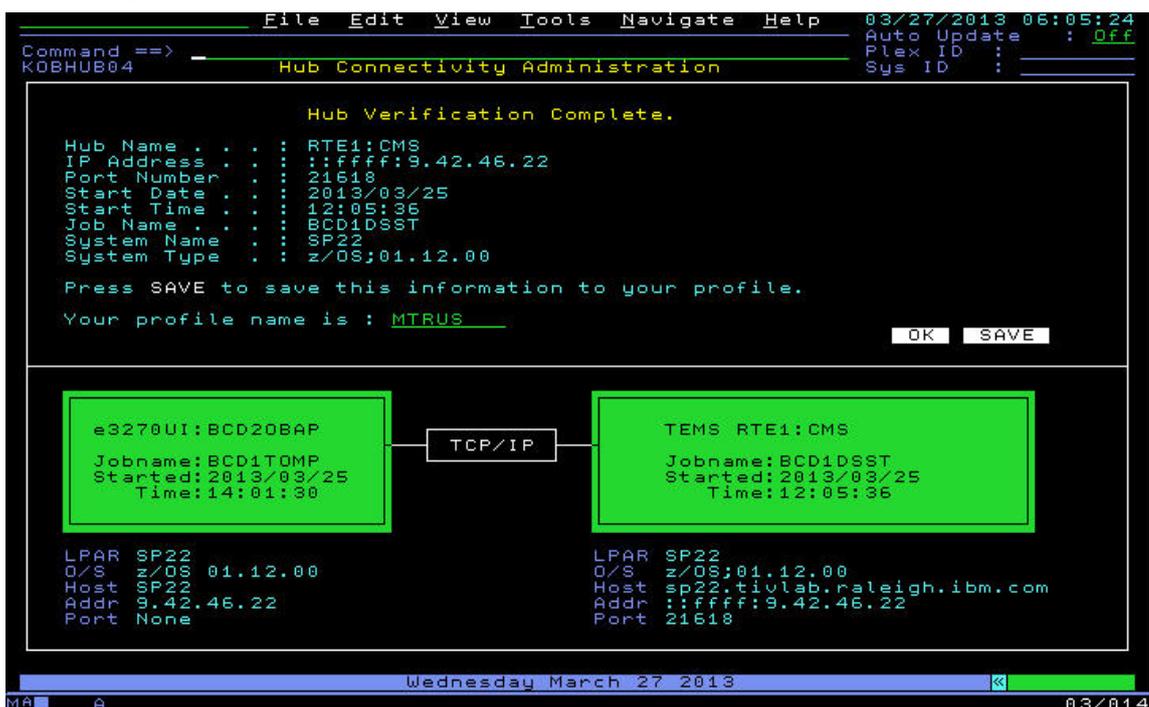

Figure 161: Hub Verification Complete (KOBHUB04) workspace that shows a successful hub connection

- a. To save the hub monitoring server name to your user profile, select the **SAVE** icon.
- b. To use the selection for your current user interface session, select the **OK** icon.

## Result

Your session goes to the first workspace name specified in your logon profile, by default the **Enterprise Summary (KOBSTART)** workspace.

## Changing a hub server connection

Use **Hub Connectivity Administration** to change your existing hub connection.

### Before you begin

If you have not yet successfully connected to a hub monitoring server, see [“Correcting a failed hub server connection” on page 984](#).

### About this task

When you are logged on to the user interface, and are successfully connected to a hub monitoring server, you can use **Hub Connectivity Administration** to browse other hub connections that are available. While browsing the available hubs, you can select and connect to a different hub. Finally you can use the workspace to save the newly specified hub connection to your profile, either for the current session only, or to your profile for future sessions.

### Procedure

1. Go to the **Hub Connectivity Administration** workspace.  
To go to **Hub Connectivity Administration** workspace, enter the HUB command, select **Tools > Current Hub Information** from the menu bar or move your cursor over **HUB** in the drawer and press **Enter**.  
The **Hub Connectivity Administration** workspace is displayed.

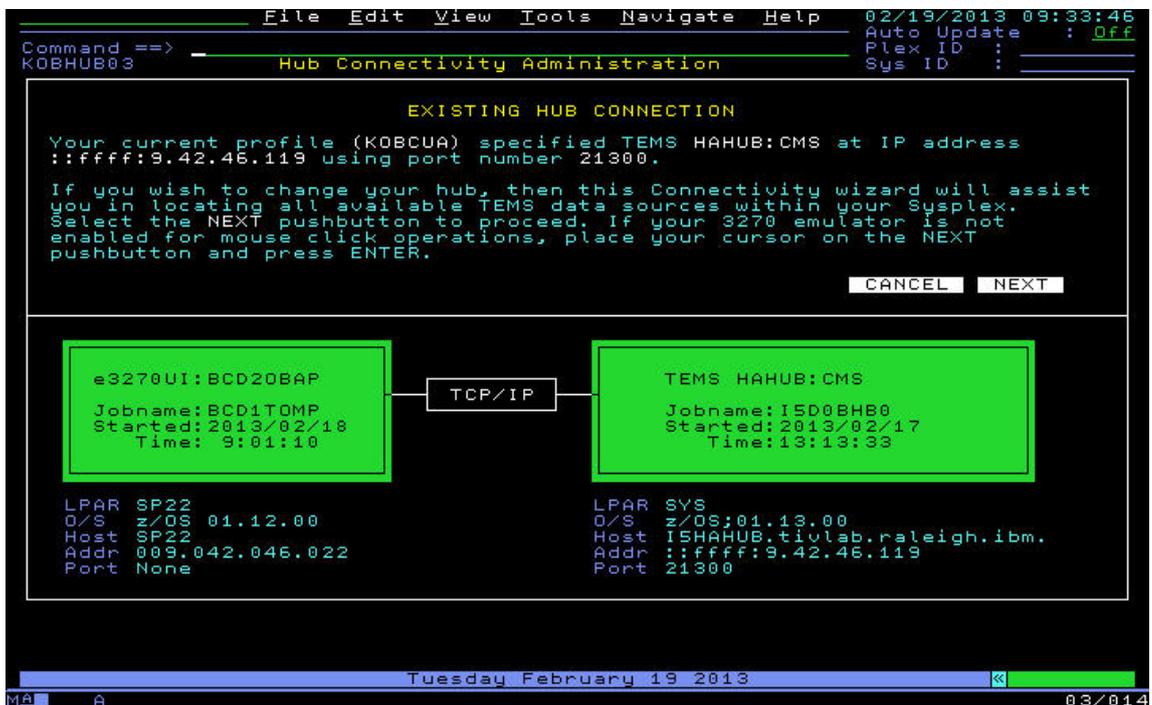

Figure 162: Hub Connectivity Administration workspace that shows an existing hub connection

**Tip:** If you previously selected a secondary hub connection, you see more information in the **Hub Connectivity Administration** workspace. For more information about selecting a secondary hub connection, see [“Selecting a secondary hub connection” on page 996](#).

- On the **Hub Connectivity Administration** workspace, select the **NEXT** icon by moving your cursor to the icon and pressing **Enter** or moving your mouse to the icon and selecting it. The **All Known Hubs (KOBHUBS)** workspace is displayed showing all of the available hubs that are known to the user interface.

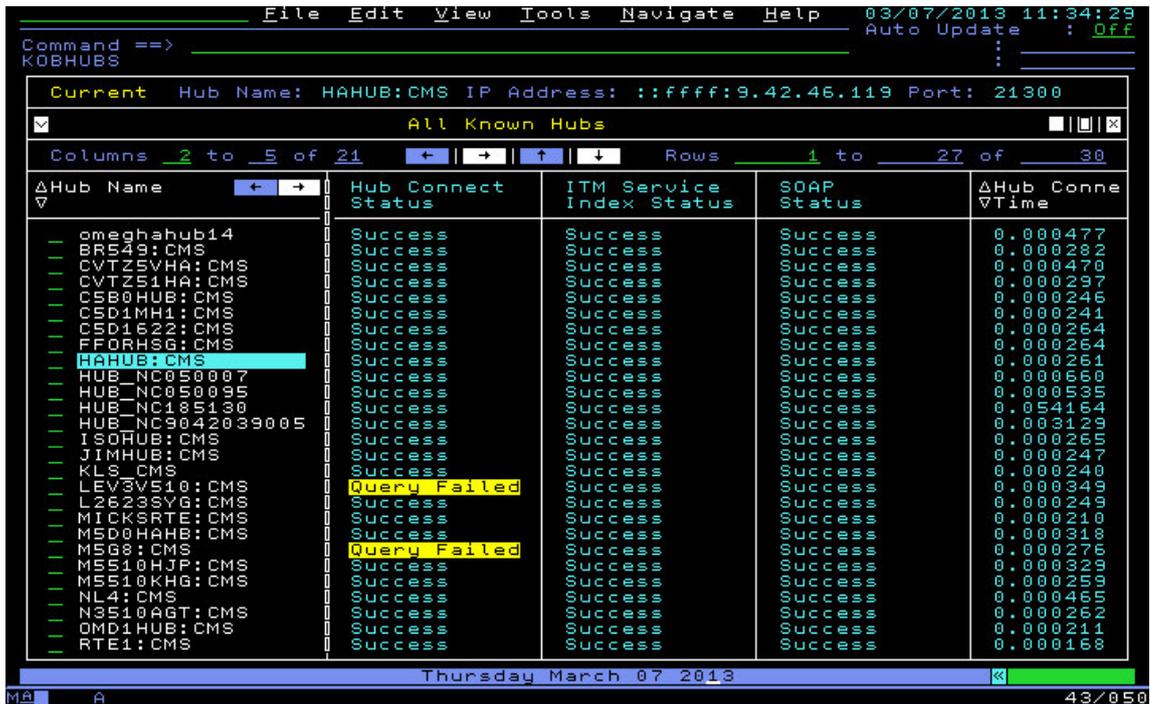

Figure 163: Hub Connectivity Administration All Known Hubs (KOBHUBS) workspace

The existing hub connection is highlighted as shown in the screen capture.

**Tip:** You can browse overview status information about each hub from this workspace. For more detailed information about the **All Known Hubs (KOBHUBS)** workspace, see [“The All Known Hubs workspace” on page 992](#).

- On the **All Known Hubs (KOBHUBS)** workspace, select a different hub by placing your cursor next to a hub monitoring server name and press **Enter**. The **Action Confirmation** panel is displayed. The panel lists information about the new hub monitoring server to be used for your workspace queries. On the **Action Confirmation** panel, you can enter Y to confirm the action or N to cancel the action.
- Enter Y to confirm the action. The **Hub Verification Complete (KOBHUB04)** workspace is displayed and shows two green information boxes that indicate a successful TCP/IP connection.

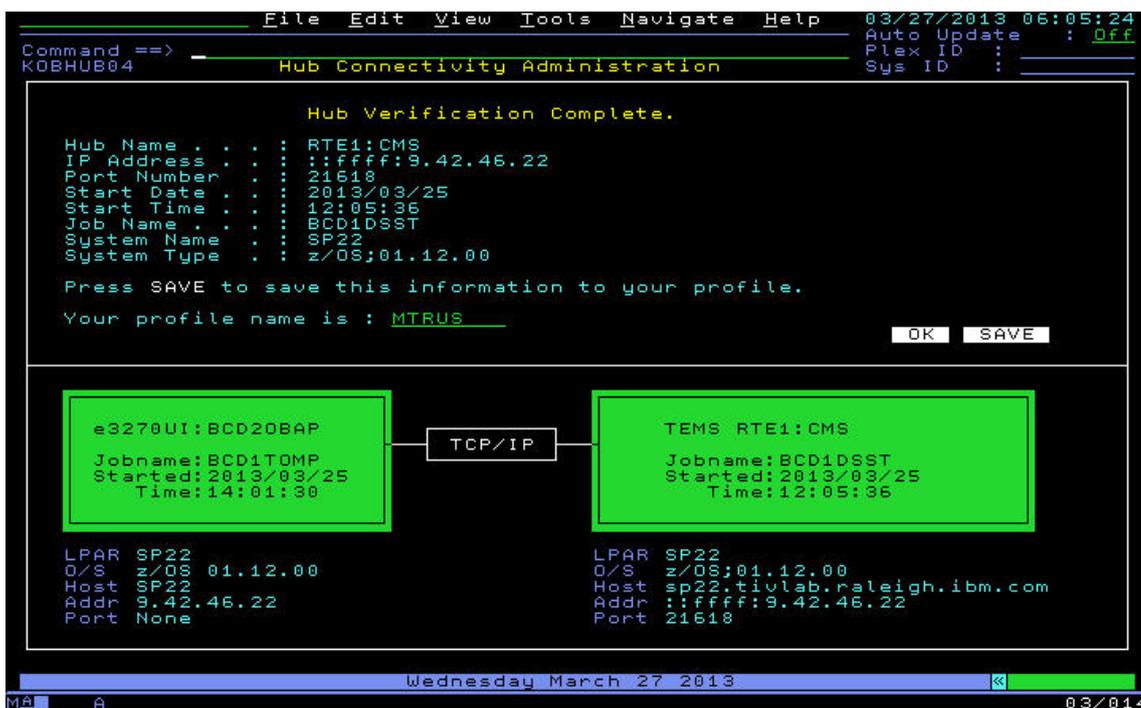

Figure 164: Hub Verification Complete (KOBHUB04) workspace that shows a successful hub connection

- To save the hub monitoring server name to your user profile, select the **SAVE** icon.
- To use the selection for your current user interface session, select the **OK** icon.

## Result

Your session goes to the first workspace name specified in your logon profile, by default the **Enterprise Summary (KOBSTART)** workspace.

## What to do next

You can optionally select a secondary hub connection. For more information about selecting a secondary hub connection, see [“Selecting a secondary hub connection” on page 996](#).

## Switching hub connections

When you select a secondary hub connection, you can switch between your primary and secondary hub connections.

## Before you begin

To select a secondary hub connection, see [“Selecting a secondary hub connection” on page 996](#).

## About this task

You can manually switch between your primary and secondary hub connection, which is described in the following procedure.

In the event of one of the connections being unavailable, you can automatically switch between primary and secondary hub connections. A hub connectivity check runs when the **Hub Check** option is enabled in your User Preferences. The **Hub Check** option is enabled by default. If the hub connectivity check fails, an attempt is made to auto-switch your hub connection to your chosen secondary connection. If the switch is successful you see a notification similar to the one shown in [“Figure: Hub Connectivity Alert Multi-Hub Switch Notification workspace” on page 991](#). For more information about the **Hub Check** option, see [“User Preferences” on page 936](#).

**Note:** Mechanisms are not provided to make your secondary hub connection a backup or failover of your primary hub connection. For more information about multi-hub support, see [“Multi-hub support” on page 981](#).

## Procedure

1. Use one of the following methods to switch hub connections.
  - Go to the **Hub Connectivity Administration** workspace and select the **SWITCH** icon.

**Tip:** To go to **Hub Connectivity Administration** workspace, select **Tools > Current Hub Information** from the menu bar or move your cursor over **HUB** in the drawer and press **Enter**.

```

Figure 165: Hub Connectivity Administration Existing Multi-Hub Configuration workspace.

- Select **Tools > Switch between hubs** from the menu bar.
- From the action or command line, enter the **SWITCH** command.

**Tip:** The **Existing Multi-Hub Configuration** panel and the **Tools > Switch between hubs** options are only available if you previously selected a secondary hub connection.

If the switch is successful, the **Hub Connectivity Alert** workspace displays a **Multi-Hub Switch Notification** to confirm that your hub connections are switched.

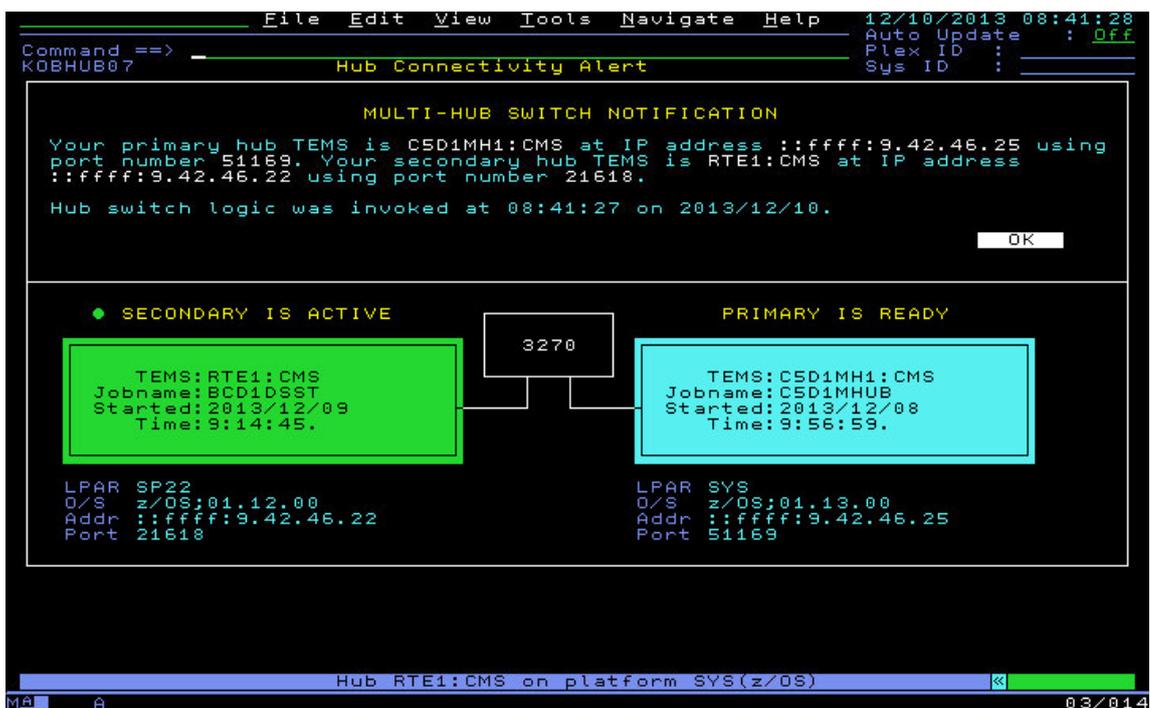

Figure 166: Hub Connectivity Alert Multi-Hub Switch Notification workspace

2. Select **OK**.  
Your session goes to the first workspace name specified in your logon profile, by default the **Enterprise Summary (KOBSTART)** workspace.

**Tip:**

If you attempt to switch to a hub connection that is not available, you see a **Hub Connectivity Alert Multi-Hub Switch Warning** and the switch does not occur.

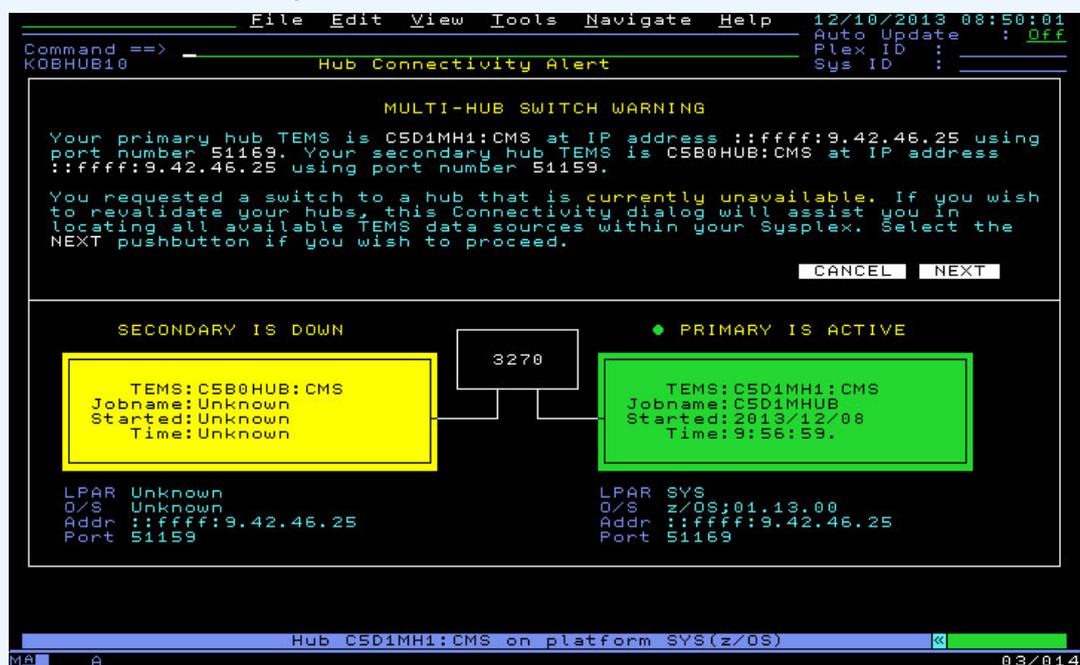

Figure 167: Hub Connectivity Alert Multi-Hub Switch Warning workspace.

If either your primary or secondary hub connections are unavailable, select **NEXT** on the **Hub Connectivity Alert** workspace to view other possible hub connections that may be available.

## Discarding a secondary hub connection

If you previously selected a secondary hub connection, but later decide that you no longer need a secondary hub connection, you can discard it.

### About this task

The option to discard a secondary hub connection is only available when you previously selected a secondary hub connection. For more information about selecting a secondary hub connection, see [“Selecting a secondary hub connection” on page 996](#).

### Procedure

1. Use one of the following methods to discard a secondary hub connection.

- Select **Tools > Discard the secondary hub** from the menu bar.
- From the action or command line, enter the DISCARD command.

The **Discard Confirmation** pop-up window opens.

2. Choose from the following options on the pop-up window.

- Select **OK** to discard your secondary hub connection only for the current session.
- Select **SAVE** to update your profile and discard your secondary hub connection permanently.
- Select **CANCEL** to do nothing, your secondary hub connection is not discarded.

## The All Known Hubs workspace

You can use the **All Known Hubs** workspace to view status information about each of the available hub Tivoli Enterprise Monitoring Servers in your Sysplex.

Use the **All Known Hubs** workspace to select and connect to an available hub monitoring server. The connection procedure is detailed in other topics. For more information about the connection procedure, see [“Changing a hub server connection” on page 987](#), [“Correcting a failed hub server connection” on page 984](#), and [“Logon administration and customization” on page 940](#).

You can use the **All Known Hubs** workspace to view valuable status information about each hub monitoring server that can help you decide the hub to use for your monitoring activities.

The workspace can be scrolled vertically and horizontally to view all of the available hubs and their status information. You can use **PF10** and **PF11** keys to scroll horizontally and **PF7** and **PF8** keys to scroll vertically. The workspace also contains vertical and horizontal arrow keys that you can use for scrolling. Select an arrow and press **Enter** to scroll in this way.

Figure 168: Hub Connectivity Administration All Known Hubs (KOBHUBS) workspace

### Hub status information

The following fields are displayed for every hub in the **All Known Hubs** workspace

#### Hub Name

The name that is given to a hub monitoring server during IBM Tivoli Monitoring configuration of a runtime environment (RTE).

#### Hub Connect Status

A text value that indicates whether a TCP connection can be established between the enhanced 3270 user interface address space and the specific hub monitoring server and whether an SQL query can be issued to the hub monitoring server. This TCP connection is attempted and then immediately closed. The TCP port number that is used is the port number that is assigned to this hub monitoring server during Tivoli Monitoring configuration of an RTE (typically port number 1918). Check the user interface REXX log (RKANRXLG DD name) for more details if the status is not **Success**.

The text values in the **Hub Connect Status** field can be as follows:

#### Success

The TCP connect and a query completed at the Hub.

#### Data Failure

A TCP send or receive failed with the Hub.

#### Timed Out

A TCP connect cannot complete in the allotted time.

#### Connect Fail

The TCP connect cannot complete.

#### TCP Failure

TCP cannot connect because of a failure with a TCP socket or select call.

#### Query Failed

A TCP connect was successful, but an SQL query to the Hub did not complete.

#### CannotAccess

The TCP port number to access the Hub cannot be determined.

#### SAF Denied

The status cannot be determined because the user does not have security authorization to connect to the specified Hub.

### **ITM Service Index Status**

A text value that indicates whether a TCP connection can be established between the enhanced 3270 user interface address space and the IBM Tivoli Monitoring Service Index component that is running at the specific hub monitoring server and whether the Tivoli Monitoring Service Index data can be retrieved. The TCP port number that is used is the HTTP port number that is assigned to this hub monitoring server during Tivoli Monitoring configuration of an RTE (typically port number 1920). Check the user interface REXX log (RKANRXLG DD name) for further details if the status is not **Success**.

The text values in the **ITM Service Index Status** field can be as follows:

#### **Success**

The TCP connect and Service Index retrieval completed at the Hub.

#### **Data Failure**

A TCP send or receive failed with the Hub.

#### **Timed Out**

A TCP connect and data retrieval did not complete in the allotted time.

#### **Connect Fail**

The TCP connect cannot complete.

#### **TCP Failure**

TCP cannot connect because of a failure with a TCP socket or select call.

#### **No HTTP Port**

The TCP port number that is needed to access the HTTP Server at the Hub cannot be determined.

#### **Did Not Try**

Because of previous connectivity failures an attempt is not made to find the value.

#### **SAF Denied**

The status cannot be determined because the user does not have security authorization to connect to the specified Hub.

### **SOAP Status**

A text value that indicates whether a TCP connection can be established between the enhanced 3270 user interface address space and the IBM Tivoli Monitoring SOAP server component that is running at the specific hub monitoring server and whether sample SQL query data can be retrieved. The TCP port number that is used is the HTTP port number that is assigned to this hub monitoring server during Tivoli Monitoring configuration of an RTE (typically port number 1920). Check the user interface REXX log (RKANRXLG DD name) for further details if the status is not **Success**.

The text values in the **SOAP Status** field can be as follows:

#### **Success**

The TCP connect and SOAP query completed at the Hub.

#### **Data Failure**

A TCP send or receive failed with the Hub.

#### **Timed Out**

A TCP connect and data retrieval did not complete in the allotted time.

#### **Connect Fail**

The TCP connect cannot complete.

#### **TCP Failure**

TCP cannot connect because a failure with a TCP socket or select call.

#### **No HTTP Port**

The TCP port number that is needed to access the HTTP Server at the Hub cannot be determined.

#### **Did Not Try**

Because of previous connectivity failures an attempt is not made to find the value.

**SAF Denied**

The status cannot be determined because the user does not have security authorization to connect to the specified Hub.

**Hub Connect Time**

The number of seconds it took to complete the TCP connection to the hub monitoring server. A value of n/a indicates the TCP connect cannot be attempted.

**Hub Time (bar graph)**

A small horizontal bar graph that shows the Hub Connect Time. This field is highlighted by colors that depend on the threshold settings for the KOBHUBS table, which you can adjust.

**ITM Service Index Time**

The number of seconds it took to retrieve the IBM Tivoli Monitoring Service Index from the hub monitoring server. A value of n/a indicates the TCP connect cannot be attempted.

**Srvc Time (bar graph)**

A small horizontal bar graph that shows the Tivoli Monitoring Service Index Time. This field is highlighted by colors that depend on the threshold settings for the KOBHUBS table, which you can adjust.

**SOAP Time**

The number of seconds it took to run a simple SOAP SQL query at the hub monitoring server. A value of n/a indicates the TCP connect cannot be attempted.

**SOAP Time (bar graph)**

A small horizontal bar graph that shows the SOAP Time. This field is highlighted by colors that depend on the threshold settings for the KOBHUBS table, which you can adjust.

**HTTP Port**

The TCP port number that is used with HTTP to access the IBM Tivoli Monitoring Service Index and the SOAP server. If there is no port number configured, the text value *Missing* is shown.

**HTTPS Port**

The TCP port number that is used with HTTPS to access the Tivoli Monitoring Service Index and the SOAP server. If there is no port number configured, the text value *Missing* is shown. HTTPS is a version of HTTP that supports authentication and encryption.

**Hub DRA Count**

The number of Data Retrieval Agents (DRAs) used by the enhanced 3270 user interface for this particular hub monitoring server.

**Hub TCP/IP Host Name**

The host name of the TCP/IP interface in use by the hub monitoring server.

**Hub IP Address**

The IP address in use by the hub monitoring server to which all user interface requests are directed.

**Hub Port**

The TCP port number in use by the hub monitoring server to which all user interface requests are directed. The port number is typically 1918.

**Hub Start Date**

The date that the hub monitoring server job was started.

**Hub Start Time**

The time of day that the hub monitoring server job was started.

**Hub Job Name**

The job name (z/OS system) or task name (Windows, UNIX, or Linux systems) under which the hub monitoring server is running.

**Hub System Name**

The operating system name under which the hub monitoring server is running.

**Hub System Type**

The operating system type under which the hub monitoring server is running. Typical values: z/OS; 01.13.00, Linux; 2.6.9-67.EL or Win2008; 6.0-SP2.

## Selecting a secondary hub connection

Use the multi-hub feature to select a secondary hub connection.

### Before you begin

If you are not yet successfully connected to a hub monitoring server, see [“Correcting a failed hub server connection” on page 984](#).

### About this task

When you are logged on to the user interface, and are successfully connected to a hub monitoring server, you can use **Hub Connectivity Administration** to browse other hub connections that are available. While you are browsing the available hub connections, you can use the multi-hub feature to select a secondary hub connection.

When you select a secondary hub connection, you can save the connection to your profile, either for the current session only, or to your profile for the current and future sessions.

For more information about multi-hub support, see [“Multi-hub support” on page 981](#)

### Procedure

- From the **All Known Hubs (KOBHUBS)** workspace use one of the following methods to select a secondary hub connection.
  - Place your cursor next to the hub monitoring server name that you are interested in, type / and press **Enter**, then select **Select this hub as Secondary** from the **Options Menu**.
  - Place your cursor next to the hub monitoring server name that you are interested in, type B and press **Enter**.

The **Secondary Hub Verification** workspace is displayed. A diagram shows two colored information boxes that represent your hub connections. Under conditions where your primary hub connection is available, a green box represents the primary hub connection with an indication that it is ACTIVE. Under conditions where your secondary hub connection is available, a light blue box represents the secondary hub connection with an indication that it is READY.

**Tip:** Under conditions when your primary or secondary hub connections are unavailable when you select your secondary hub connection, you see variations of [“Figure: Secondary Hub Verification workspace” on page 997](#). Unavailable connections are indicated by yellow colored boxes on the workspace. In such conditions, the workspace assists you to locate available hub connections.

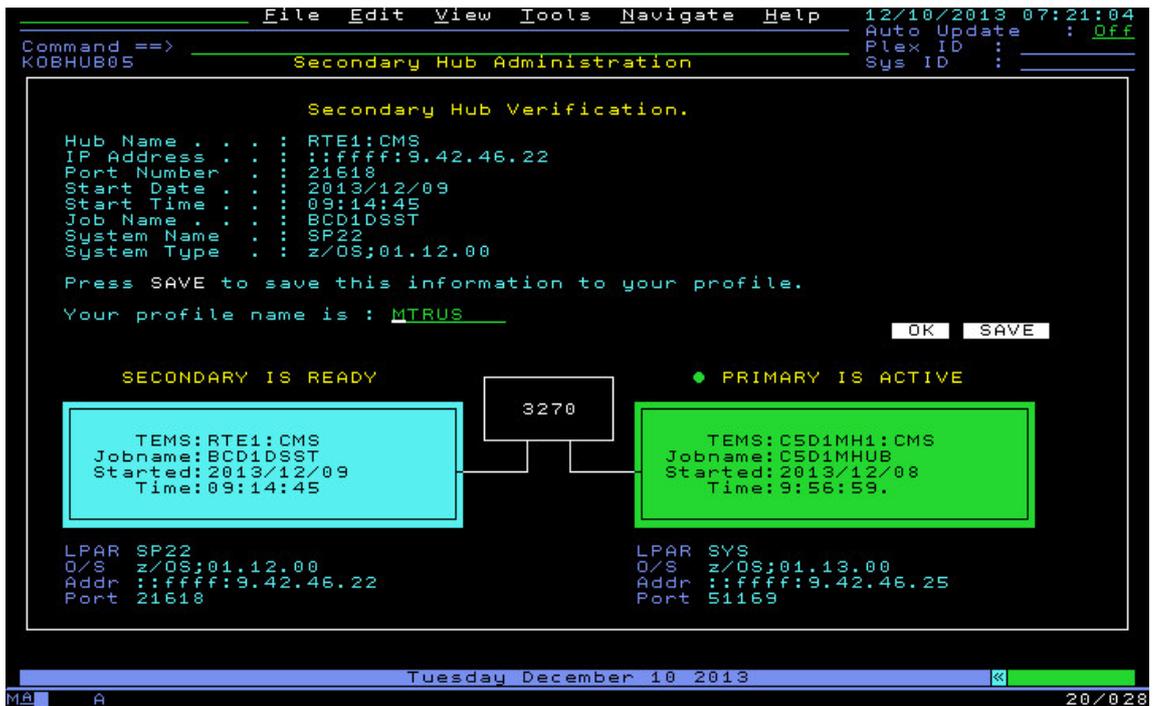

Figure 169: Secondary Hub Verification workspace

- To use the secondary hub selection for your current user interface session, select the **OK** icon.
- To use the secondary hub selection for your current user interface session and to save the secondary hub monitoring server name to your user profile, select the **SAVE** icon.

## Result

- Your session goes to the first workspace name specified in your logon profile, by default the **Enterprise Summary (KOBSTART)** workspace.
- The name of the currently active hub connection is displayed in the footer area of the workspace.

## What to do next

For more information about switching between your primary and secondary hub connections, see [“Switching hub connections”](#) on page 989.

## Displaying hub overview status

You can use the **Hub Overview** workspace to see overview status about a specific hub Tivoli Enterprise Monitoring Server.

## About this task

This procedure shows you how to view status information about a specific hub monitoring server.

For more information about the **All Known Hubs** workspace, see [“The All Known Hubs workspace”](#) on page 992.

## Procedure

- From the **All Known Hubs (KOBHUBS)** workspace use one of the following methods to go to the **Hub Overview (KOBHBSTO)** workspace:
  - Place your cursor next to the hub monitoring server name that you are interested in, type / and press **Enter**, then select **Status Overview for Hub** from the **Options** menu.
  - Place your cursor next to the hub monitoring server name that you are interested in, type 0 and press **Enter**.

The **Hub Overview** workspace is displayed.

Figure 170: Hub Overview (KOBHBSTO) workspace

## Displaying products installed on a hub

You can use the **Installed TEMS Applications** workspace to see the products that are installed on a specific hub Tivoli Enterprise Monitoring Server.

### About this task

This procedure shows you how to view all of the installed products on a specific hub that is available from this workspace.

For more information about the **All Known Hubs** workspace, see [“The All Known Hubs workspace” on page 992](#).

### Procedure

- From the **All Known Hubs** (KOBHUBS) workspace use one of the following methods to go to the **Installed TEMS Applications** (KOBAPPS) workspace:
  - Place your cursor next to the hub monitoring server name that you are interested in, type / and press **Enter**, then select **Products installed in this Hub** from the **Options Menu**.
  - Place your cursor next to the hub monitoring server name that you are interested in, type P and press **Enter**.

The **Installed TEMS Applications** workspace is displayed.

Figure 171: Installed TEMS Applications (KOBAPPS) workspace

## Displaying Data Retrieval Agents (DRA) for a hub

You can use the **Data Retrieval Agents (DRA)** workspace to see the data retrieval agents for a specific hub Tivoli Enterprise Monitoring Server.

### About this task

Data Retrieval Agents (DRA) are enhanced 3270 user interface components that manage the SQL queries sent from the user interface address space to a hub monitoring server. The DRA components do not gather performance data from Managed Systems: They manage the interactions between the user interface and the hub monitoring server address spaces. DRA components run within the hub monitoring server, Remote Tivoli Enterprise Monitoring Servers, and Tivoli Enterprise Monitoring Agents. DRA components are only on z/OS systems.

For more information about the **All Known Hubs** workspace, see [“The All Known Hubs workspace” on page 992](#).

### Procedure

- From the **All Known Hubs (KOBHUBS)** workspace use one of the following methods to go to the **Data Retrieval Agents (KOBHBDRA)** workspace:
  - Place your cursor next to the hub monitoring server name that you are interested in, type / and press **Enter**, then select **DRAs connected to Hub** from the **Options Menu**.
  - Place your cursor next to the hub monitoring server name that you are interested in, type A and press **Enter**.

The **Data Retrieval Agents (DRA)** workspace is displayed.

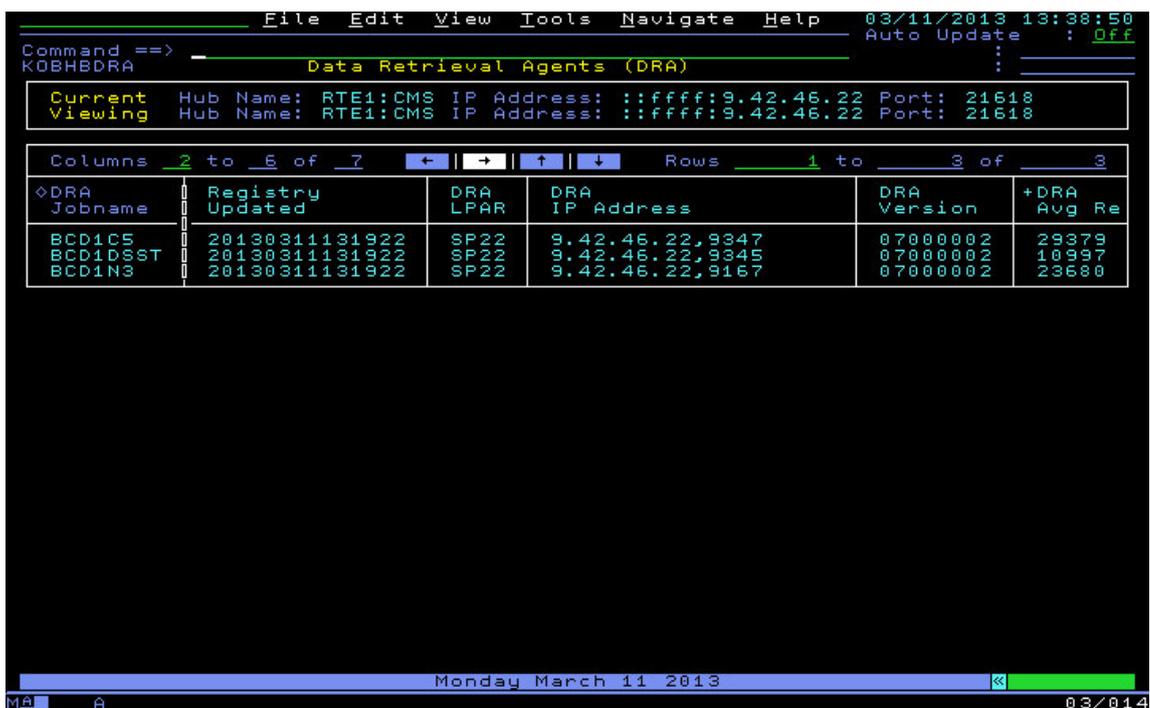

Figure 172: Data Retrieval Agents (KOBHEDRA) workspace

## Displaying Managed System Lists (MSL) for a hub

You can use the **Managed Systems** workspace to see Managed System Lists for a specific hub Tivoli Enterprise Monitoring Server.

### About this task

This procedure shows you how to view all of the Managed System Lists (MSLs) for a specific hub that is available from this workspace.

For more information about the **All Known Hubs** workspace, see [“The All Known Hubs workspace” on page 992](#).

### Procedure

- From the **All Known Hubs** (KOBHUBS) workspace use one of the following methods to go to the **Managed System Lists** (KOBHBMSL) workspace:
  - Place your cursor next to the hub monitoring server name that you are interested in, type / and press **Enter**, then select **MSLs known by Hub (Managed System Lists)** from the **Options Menu**.
  - Place your cursor next to the hub monitoring server name that you are interested in, type L and press **Enter**.

The **Managed System Lists** workspace is displayed.

Figure 173: Managed System Lists (KOBHMSL) workspace

## Displaying Managed System Names (MSN) for a hub

You can use the **Managed Systems** workspace to see Managed System Names for a specific hub Tivoli Enterprise Monitoring Server.

### About this task

An important characteristic of a hub monitoring server is the Managed System Names (MSNs) that are managed by that hub. These Managed Systems are the entities that are being monitored by Tivoli Monitoring *agents*. This procedure shows you how to view the Managed System Names (MSNs) that are managed by a specific hub.

For more information about the **All Known Hubs** workspace, see [“The All Known Hubs workspace” on page 992](#).

### Procedure

- From the **All Known Hubs** (KOBHUBS) workspace use one of the following methods to go to the **Managed Systems** (KOBHMSN) workspace:
  - Place your cursor next to the hub monitoring server name that you are interested in, type / and press **Enter**, then select **MSNs known by Hub (Managed System Names)** from the **Options Menu**.
  - Place your cursor next to the hub monitoring server name that you are interested in, type N and press **Enter**.

The **Managed Systems** workspace is displayed:

Figure 174: Managed Systems (KOBHMSN) workspace

## IBM Tivoli Monitoring (ITM) Service Index

You can use the **ITM Service Index** workspace to see, and interact, with a list of IBM Tivoli Monitoring *Service Points* for a specific hub Tivoli Enterprise Monitoring Server.

### Before you begin

Go to the **All Known Hubs** (KOBHUBS) workspace. For more information, see [“Changing a hub server connection”](#) on page 987.

### About this task

The IBM Tivoli Monitoring (ITM) Service Index is a feature that displays a list of IBM Tivoli Monitoring *Service Points*. A user can interact with these IBM Tivoli Monitoring *Service Points*. The **ITM Service Index** is normally accessed from a Web Browser running under Microsoft Windows, Linux, or UNIX, but can now be accessed directly from the enhanced 3270 user interface.

For more information about the **All Known Hubs** workspace, see [“The All Known Hubs workspace”](#) on page 992.

### Procedure

- From the **All Known Hubs** (KOBHUBS) workspace go to the **ITM Service Index** (KOBHNDX) workspace by using one of the following methods:
  - Place your cursor next to the hub Tivoli Enterprise Monitoring Server name that you are interested in, type / and press **Enter**, then select **ITM Service Index for Hub** from the **Options Menu**.
  - Place your cursor next to the hub Tivoli Enterprise Monitoring Server name that you are interested in, type I and press **Enter**

The **ITM Service Index** workspace is displayed.

Figure 175: ITM Service Index (KOBHBNDX) workspace.

## IBM Tivoli Monitoring (ITM) Service Index (secure HTTPS)

You can use the **ITM Service Index** workspace (secure HTTPS) to see, and interact, with a list of IBM® Tivoli® Monitoring *Service Points* for a specific hub Tivoli Enterprise Monitoring Server.

### Before you begin

Go to the **All Known Hubs** (KOBHUBS) workspace. For more information, see [“Changing a hub server connection”](#) on page 987

### About this task

When you use the IBM® Tivoli® Monitoring Service Console and IBM® Tivoli® Monitoring SOAP Server workspaces within the Tivoli® OMEGAMON® Manager, you must supply a **user ID** and **password**. This information is sent to a Tivoli Enterprise Monitoring Server. The **user ID** and **password** (and the Service Console or SOAP commands and their results) are normally sent in "clear text" using TCP/IP and the HTTP protocol. HTTP is normally used by web browsers and servers. For the Tivoli® OMEGAMON® Manager, the Tivoli® OMEGAMON® Manager is acting as an HTTP client, like a web browser, while the monitoring server is the HTTP server.

If you want these values (especially the **password**) to be sent in encrypted form instead of clear text, you must use the secure version of these Tivoli® OMEGAMON® Manager workspaces. To be able to use the secure versions of these Tivoli® OMEGAMON® Manager workspaces, your Tivoli® OMEGAMON® Manager address space must be able to use the Hypertext Transfer Protocol Secure (HTTPS) communications protocol. HTTPS is the normal HTTP protocol, but uses SSL/TLS (Secure Sockets Layer and Transport Layer Security) to send information. The Tivoli® OMEGAMON® Manager address becomes enabled to use HTTPS by identifying the Tivoli® OMEGAMON® Manager address space to TCP/IP as a user of AT-TLS (Application Transparent-Transport Layer Security).

You identify your Tivoli® OMEGAMON® Manager address spaces as valid users of AT-TLS by creating or modifying an AT-TLS policy file and then refreshing a z/OS component that is known as the Policy Agent, which reads the updated policy file.

For more information about AT-TLS configuration, see *IBM Tivoli OMEGAMON for z/OS: Planning and Configuration Guide*.

### Procedure

- From the **All Known Hubs** (KOBHUBS) workspace, use one of the following methods to go to the **ITM Service Index** (KOBHBNDX) workspace:

- Place your cursor next to the hub Tivoli Enterprise Monitoring Server name that you are interested in, type / and press **Enter**, then select **ITM Service Index for Hub (secure HTTPS)** from the **Options Menu**.
- Place your cursor next to the hub Tivoli Enterprise Monitoring Server name that you are interested in, type J and press **Enter**

The **ITM Service Index** workspace is displayed.

## Displaying hub topology

You can use the **Hub Topology** workspace to see information about nodes that are known to the hub monitoring server.

## About this task

This procedure shows you how to view and filter information about nodes that are known to the hub monitoring server

For more information about the **All Known Hubs** workspace, see [“The All Known Hubs workspace” on page 992](#).

## Procedure

1. From the **All Known Hubs (KOBHUBS)** workspace use one of the following methods to go to the **Hub Topology (KOBHTPO)** workspace:
  - Place your cursor next to the hub monitoring server name that you are interested in, type / and press **Enter**, then select **Topology: Nodes known to this Hub** from the **Options Menu**.
  - Place your cursor next to the hub monitoring server name that you are interested in, type T and press **Enter**.

The **Hub Topology** workspace is displayed.

Figure 176: **Hub Topology** workspace

2. Optional: To see only online nodes, type a non-blank character in the **Online** field and leave the **Offline** field empty.
3. Optional: To see only offline nodes, type a non-blank character in the **Offline** field and leave the **Online** field empty.
4. Optional: To see both online and offline nodes, type a non-blank character in both the **Offline** and **Online** fields.

**Tip:** You can clear the **Online** and **Offline** fields by typing a space in them.

5. Optional: To limit the rows that are displayed, type `include=value`, `exclude=value`, or both in the **Options** field.  
The *value* string must match part of a row value for the row to be included or excluded from the workspace display. If you want to use embedded blanks as part of the *value* string, you must enclose the entire *value* string in single or double quotations. The case of the *value* string (uppercase or lowercase) must match the row data exactly. The `include` and `exclude` keywords can be in lowercase or uppercase. Empty spaces are not allowed on either side of the equal sign.  
The following table contains some example **Options** entries:

Example filter entries in the **Options** field.

Filter condition	Options
Show only rows that contain <i>DB2</i> .	<code>include=DB2</code>
Show only rows that contain <i>M5</i> preceded and followed by an empty space. For example, the <b>Prd</b> (Product) column entries in the workspace for the <i>M5</i> product.	<code>include=' M5 '</code>
Show only Hub or remote monitoring servers but exclude any at version=06.23.03	<code>include=' EM ' exclude=06.23.03</code>
Show only nodes on Windows™ systems.	<code>include=' Win'</code>

## Troubleshooting

The troubleshooting section provides problem determination and resolution for the issues that are most commonly encountered with the OMEGAMON® Enhanced 3270 user interface. Review the troubleshooting topics for a description of a problem you might experience with rendering OMEGAMON® monitoring agent data on the enhanced 3270UI. For issues encountered with specific OMEGAMON® monitoring agents, consult the troubleshooting guide for that product.

### Use of DBCS characters in near term history situation names

Exercise caution when you are working with history situation names that use a double-byte character set (DBCS).

#### Problem description

Situation names for near term history collections can be created and edited both on the enhanced 3270UI and the Tivoli Enterprise Portal Server. The portal server supports the use of double-byte character set (DBCS) characters, however, the enhanced 3270UI does not.

A DBCS supports national languages that contain many unique characters or symbols. Examples of such languages include Japanese, Korean, and Chinese.

Near term history situation names that are created with DBCS characters on a portal server appear garbled on the enhanced 3270UI. For example, the name displays control and other characters that do not make sense. You can edit the situation names on the enhanced 3270UI, however, do not attempt to do this as the original name is then corrupted on the portal server.

Symptoms of this problem are that historical collection situation names that use DBCS characters become corrupted on the Tivoli Enterprise Portal Server when they are edited with the enhanced 3270UI.

#### Solution

Use one of the following workarounds:

1. Use only the Tivoli Enterprise Portal Server to change history collection names that use DBCS characters.

2. Change the history collection name to one that does not use DBCS characters.

## No data condition on the OMEGAMON® Enhanced 3270 user interface

The OMEGAMON® Enhanced 3270 user interface (enhanced 3270UI) is installed and configured. The enhanced 3270UI address space is started and you are able to log on. However, your enhanced 3270UI is showing an empty workspace.

### Possible causes for the no data condition

There are a few causes for the no data condition after the initial log on to the OMEGAMON Enhanced 3270 user interface.

The following figure provides an example of the OMEGAMON Enhanced 3270 user interface initial workspace, KOBSTART, depicting a case of no data after the initial log on:

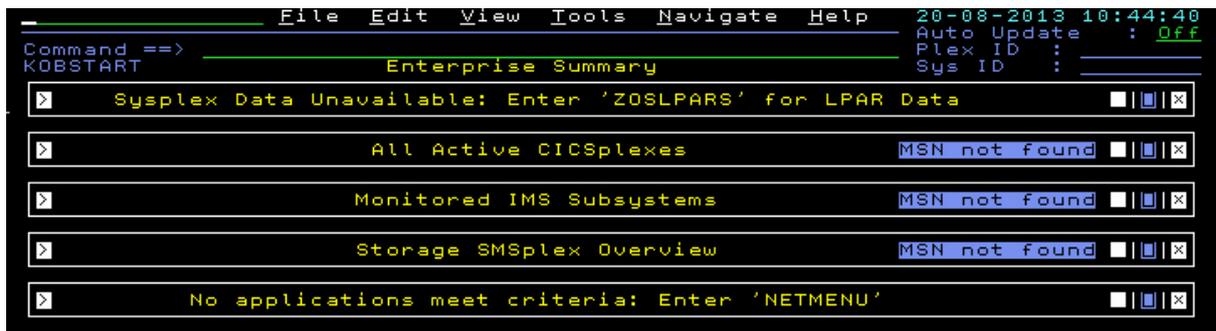

Figure 177: OMEGAMON Enhanced 3270 user interface workspace depicting a case of no data after the initial log on

**Note:** The initial workspace parameter setting is specified in the log on profile with the **FIRSTWS** parameter.

You can use the capability in the OMEGAMON Enhanced 3270 user interface for investigating the root cause of the no data condition.

## Custom log on profiles have not been created or the hub monitoring server settings have not been configured

Depending on the version of the enhanced 3270UI that you are using there are different procedures that you can use to troubleshoot this issue.

### Tivoli Management Services V6.3.2 (APAR OA42127) or later

Hub Connectivity Administration assists you to specify and save a hub Tivoli Enterprise Monitoring Server connection.

#### About this task

When you log on to the enhanced 3270 user interface for the first time, Hub Connectivity Administration can assist you to specify a hub Tivoli Enterprise Monitoring Server connection.

#### Procedure

1. Log on to the user interface in the standard way.  
If a hub monitoring server is specified in your profile, and that hub is available, a connection is made to the hub and your initial workspace is displayed. By default, the initial workspace is the **Enterprise Summary (KOBSTART)** workspace. If a hub monitoring server is not specified in your profile, the **Hub Connectivity Administration** workspace is displayed.

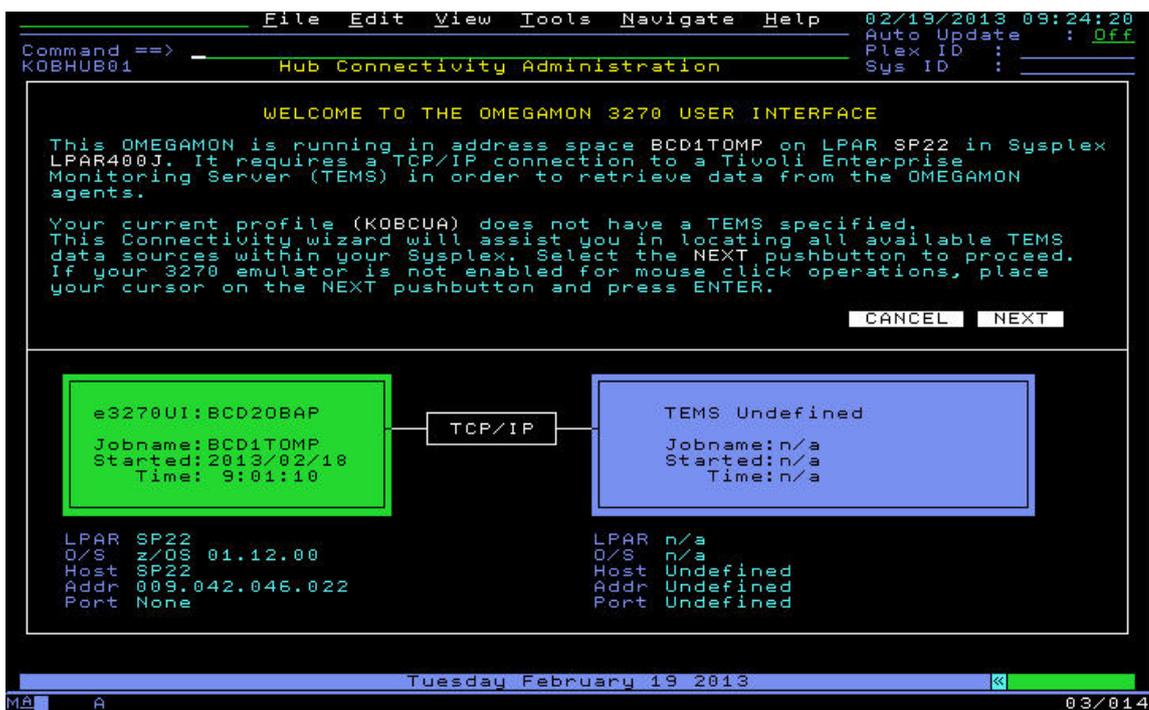

Figure 178: Hub Connectivity Administration workspace that shows a hub connection is not specified for the current profile

- To select the **NEXT** icon on the **Hub Connectivity Administration** workspace, move your cursor to the icon and press **Enter** or double-click the icon. The **All Known Hubs (KOBHUBS)** workspace is displayed showing all of the available hubs that are known to the enhanced 3270 user interface.

Figure 179: Hub Connectivity Administration All Known Hubs (KOBHUBS) workspace

**Tip:** You can browse overview status information about each hub from this workspace. For more information about the **All Known Hubs (KOBHUBS)** workspace, see [“The All Known Hubs workspace”](#) on page 992.

3. On the **All Known Hubs (KOBHUBS)** workspace, place your cursor next to a hub monitoring server name and press **Enter**.  
The **Action Confirmation** panel is displayed. The panel lists information about the hub monitoring server to be used for your workspace queries. On the **Action Confirmation** panel, you can enter Y to confirm the action or N to cancel the action.
4. Enter Y to confirm the action. The **Hub Verification Complete (KOBHUB04)** workspace is displayed and shows two green information boxes that indicate a successful TCP/IP connection.

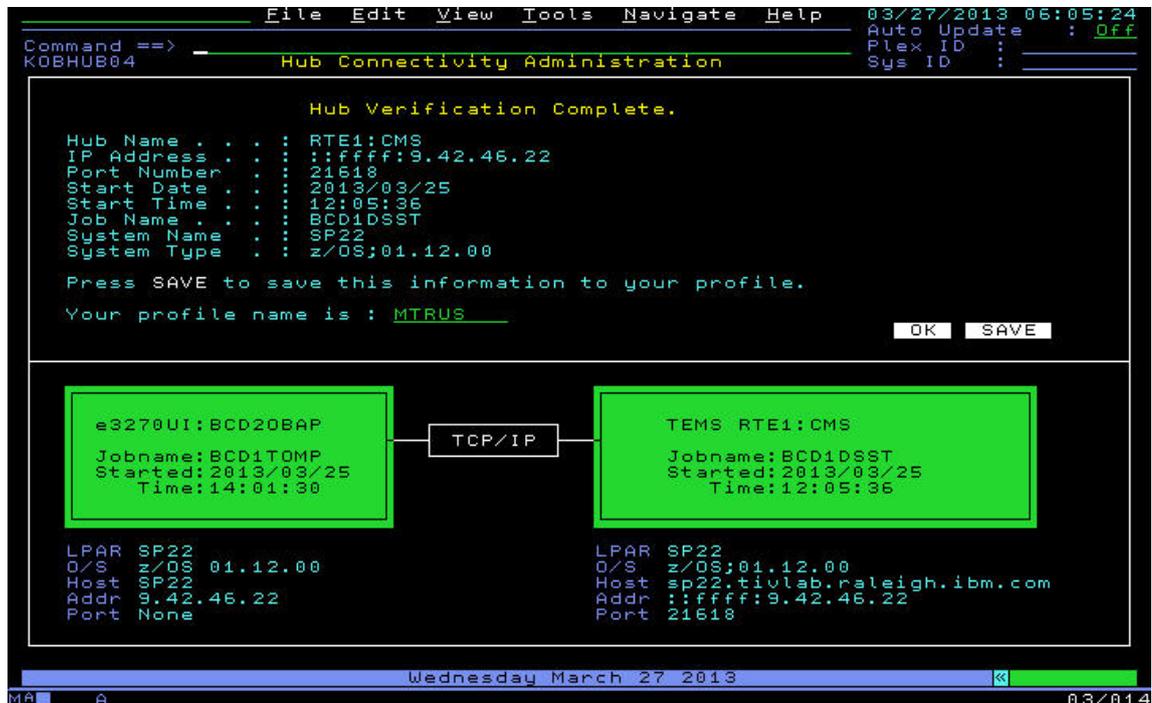

Figure 180: **Hub Verification Complete (KOBHUB04)** workspace that shows a successful hub connection

- a. To save the hub monitoring server name to your user profile, select **SAVE**.
- b. To use the selection for your current enhanced 3270 user interface session, select **OK**.

## Result

Your session goes to the first workspace name specified in your logon profile, by default the **Enterprise Summary (KOBSTART)** workspace.

## Tivoli Management Services V6.3 or earlier (pre-APAR OA42127)

Verify that you created your site and or user\_ID named logon profile members.

## About this task

Use the OMEGAMON Enhanced 3270 user interface to assign values for your site and or user ID named logon profile.

## Procedure

1. From the OMEGAMON Enhanced 3270 user interface, select **View > 2. Hub Information**. The **Current Hub TEMS Information** panel is displayed.  
If you see a panel similar to the following panel that indicates no values are assigned, either no site and or user ID-named logon profile is created, or the profile for this session is not customized to specify hub monitoring server settings.

```

File Edit View Tools Options Help 08/2
Auto
Plex
Sys
Data

Command ==>
KOBSTART

> Syspl Name . . . : Unassigned
IP Address. : Unassigned
IP Port . . : None

>

```

Figure 181: Tivoli Enterprise Monitoring Server information with no settings specified

- a. Verify that a site (CUASITE) or user\_ID named data set member exists in rte.UKOBDATF.
  - b. Verify that the hub monitoring server settings in the profile for the current session is customized to specify the hub monitoring server configured values.  
For example, see “Figure: Current hub Tivoli Enterprise Monitoring Server settings” on page 1009.
2. After you customize the logon profile member, log off the OMEGAMON Enhanced 3270 user interface and log on to pick up the profile changes.

## Result

If you repeat Step 1, you see the hub settings that you specified as shown in the following panel.

```

File Edit View Tools Options Help 08/21/2
Auto Up
Plex ID
Sys ID
Data
No

Command ==>
KOBSTART

> Syspl Name . . . : RTE1.CMS
IP Address. : ::ffff:9.42.46.22
IP Port . . : 21618

>

```

Figure 182: Current hub Tivoli Enterprise Monitoring Server settings

## The hub monitoring server settings in the log on profile do not match the hub monitoring server configured values

Depending on the version of the enhanced 3270UI that you are using there are different procedures that you can use to troubleshoot this issue.

### Tivoli Management Services V6.3.2 (APAR OA42127) or later

**Hub Connectivity Administration** helps you to correct any failed connection situations that prevent you from accessing the OMEGAMON enhanced 3270 user interface and your subsequent product workspaces.

### About this task

When you log on to the user interface, if the hub monitoring server connection attempt fails, the **Hub Connectivity Administration** workspace is displayed and notifies you that a failure occurred and the possible reason for the connection failure. The workspace helps you to correct the connection failure and to save a corrected profile to prevent future failures.

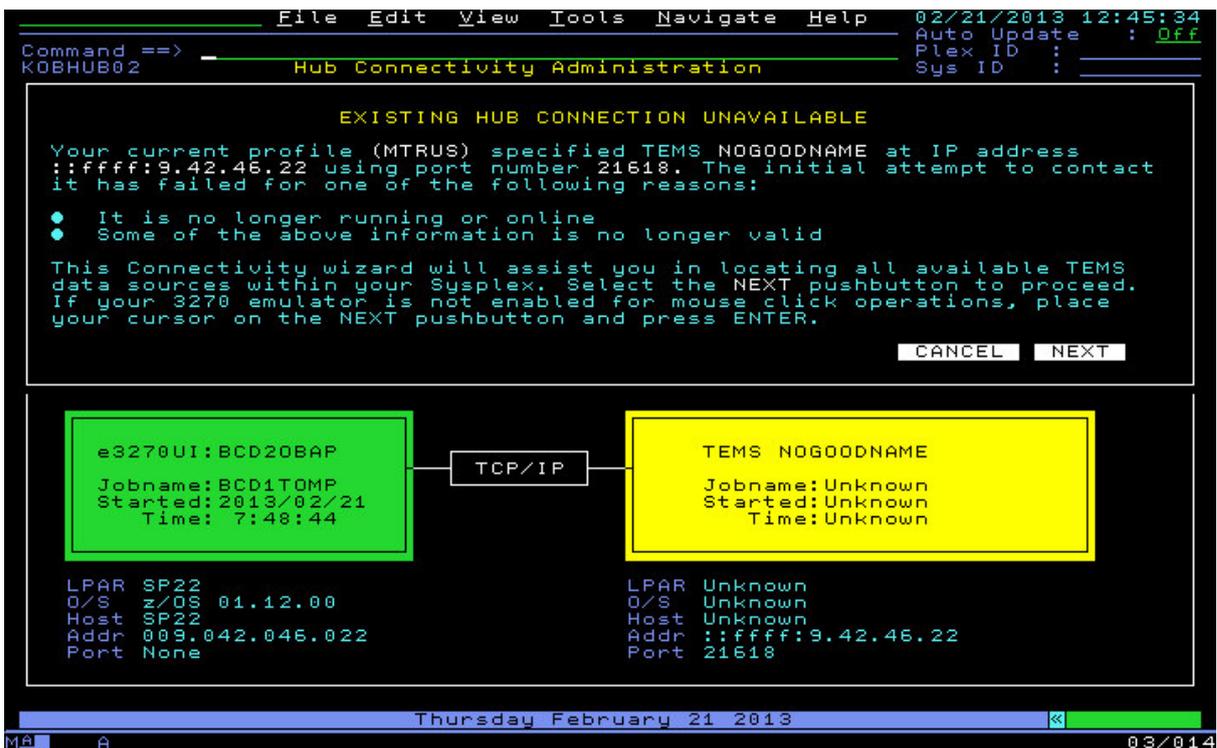

Figure 183: Hub Connectivity Administration workspace that shows a connectivity failure

**Tip:** If this is your first time logging on to the user interface and a hub monitoring server is not specified in your profile, you see the **Hub Connectivity Administration** workspace but with a different message that states the reason for the failure. If the message indicates that your current profile does not have a hub specified, see [“The hub monitoring server settings in the log on profile do not match the hub monitoring server configured values”](#) on page 1009.

## Procedure

1. On the **Hub Connectivity Administration** workspace that shows the connectivity failure, select the **NEXT** icon by moving your cursor to the icon and pressing **Enter** or moving your mouse to the icon and selecting it.  
The **All Known Hubs (KOBHUBS)** workspace is displayed showing all of the available hubs that are known to the user interface.

Figure 184: Hub Connectivity Administration All Known Hubs (KOBHUBS) workspace

**Tip:** You can browse overview status information about each hub from this workspace. For more information about the **All Known Hubs (KOBHUBS)** workspace, see “The All Known Hubs workspace” on page 992.

- On the **All Known Hubs (KOBHUBS)** workspace, place your cursor next to a hub monitoring server name and press **Enter**.  
The **Action Confirmation** panel is displayed. The panel lists information about the hub monitoring server to be used for your workspace queries. On the **Action Confirmation** panel, you can enter Y to confirm the action or N to cancel the action.
- Enter Y to confirm the action. The **Hub Verification Complete (KOBHUB04)** workspace is displayed and shows two green information boxes that indicate a successful TCP/IP connection.

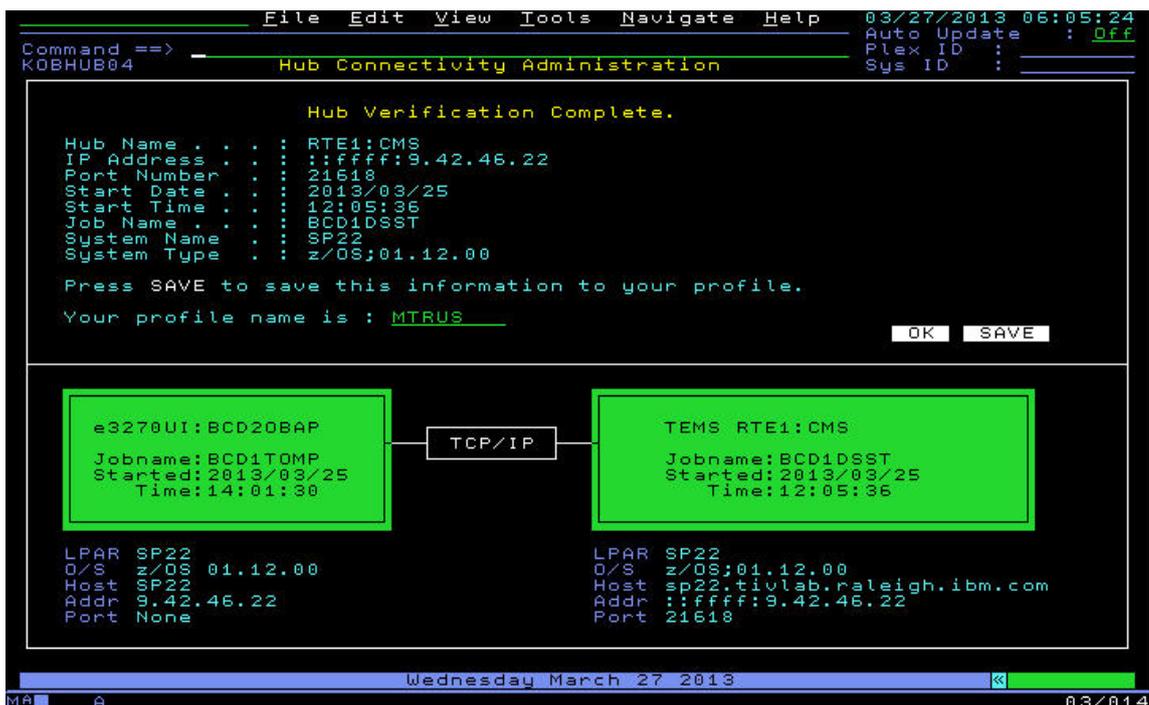

Figure 185: Hub Verification Complete (KOBHUB04) workspace that shows a successful hub connection

- a. To save the hub monitoring server name to your user profile, select the **SAVE** icon.
- b. To use the selection for your current user interface session, select the **OK** icon.

## Result

Your session goes to the first workspace name specified in your logon profile, by default the **Enterprise Summary (KOBSTART)** workspace.

### Tivoli Management Services V6.3 or earlier (pre-APAR OA42127)

Verify that the `rte.UK0BDATF` profile members specify the configured hub monitoring server settings and that these settings match the hub monitoring server configured values.

The settings that are shown in the **Current Hub TEMS Information** panel in “[Figure: Current hub Tivoli Enterprise Monitoring Server settings](#)” on page 1009 indicate that a custom profile member is created and customized; however, the no data condition persists. Inspect the profile for the current session to determine if the specified settings match the configured hub monitoring server settings.

For example, “[Figure: Current hub Tivoli Enterprise Monitoring Server settings](#)” on page 1009 shows that the server name is set to `RTE1.CMS`, with a period. However, the actual configured hub monitoring server name is `RTE1:CMS`, with a colon.

Correct the settings in the `rte.UK0BDATF` profile member, then log off and log on to the OMEGAMON Enhanced 3270 user interface to pick up the profile changes.

The **Current Hub TEMS Information** panel displays the correct settings as shown in the following example:

Systemplex Name	CPU Percent	LPAR Name	LPAR CPU%	VMSU Capacity	LPAR Group Name
_ RTE1PLEX	7	CANSP22	7	17.0	CANDLE

ΔCICSplex Name	ΔNumber of Regions	ΔTransaction Rate	ΔCPU Utilization	Any SOS Regions	SOS Region
_ OMEGPlex	2	0/m	0.0%	No	n/a

Figure 186: The current hub Tivoli Enterprise Monitoring Server information with the correct server name

### There are no OMEGAMON Enhanced 3270 user interface data retrieval agents registered

Verify that there are registered OMEGAMON Enhanced 3270 user interface data retrieval agents online.

The OMEGAMON Enhanced 3270 user interface startup process discovers WLM-registered data retrieval agents and connects to the data retrieval agents to retrieve hub monitoring server information about OMEGAMON agent data sources. This information is stored in the OMEGAMON Enhanced 3270 user interface local registry. By default, the registry information is refreshed every 5 minutes.

If you verified the existence of a custom profile, in which the hub monitoring server settings are correctly specified, but the no data condition persists, you need to verify that there are registered data retrieval agents.

From the OMEGAMON Enhanced 3270 user interface, you can open a workspace that displays DRA information. Use the following procedure to open the workspace.

## Procedure

From the **All Known Hubs** (KOBHUBS) workspace, place your cursor next to the hub monitoring server name that you are interested in, type A and press **Enter**.

The **Data Retrieval Agents (DRA)** workspace is displayed.

DRA Jobname	Registry Updated	DRA LPAR	DRA IP Address	DRA Version	+DRA Avg Re
BCD1C5	20130311131922	SP22	9.42.46.22,9347	07000002	29379
BCD1DSST	20130311131922	SP22	9.42.46.22,9345	07000002	10997
BCD1N3	20130311131922	SP22	9.42.46.22,9167	07000002	23680

Figure 187: Data Retrieval Agents (KOBHBDRA) workspace.

The three rows that are shown in the **Data Retrieval Agents (DRA)** workspace indicate that there are three registered data retrieval agents for the hub monitoring server as RTE1:CMS running in the *same* Sysplex as the OMEGAMON Enhanced 3270 user interface address space. Assuming that there are no problems with agent data collection, the OMEGAMON Enhanced 3270 user interface is able to connect to any one of these data retrieval agents to retrieve OMEGAMON data from a V5.1.0 or later monitoring agent that is connected to the RTE1:CMS hub monitoring server.

If data retrieval agents are not registered for a specific hub monitoring server, the KOBHBDRA workspace is empty.

If the **All Known Hubs** (KOBHUBS) workspace list does *not* contain the hub monitoring server that is specified in the OMEGAMON Enhanced 3270 user interface logon profile, a high probability exists that the OMEGAMON for z/OS agents and or related monitoring server address space are offline.

## The hub monitoring server is off line; verify initialization and data request reception

Verify the hub monitoring server is started, initialized, and prepared to receive data requests; listening on the configured TCP/IP port.

Your hub monitoring server might be running on either a z/OS LPAR or on a distributed system. Verify that the monitoring server has been started and has successfully completed initialization.

The following monitoring server log messages are a good indication regarding the health of hub monitoring server operations:

```

..
KDSMA001 Tivoli Enterprise Monitoring Server (TEMS) data collection server started
...
K04SRV032 Tivoli Enterprise Monitoring Server (TEMS) startup complete
..

```

If you cannot find these messages in the hub monitoring server log, examine the log for indications of potential problems. For example:

- The monitoring server startup is in progress and initialization has not completed
- The monitoring server initialization failed; for example, the monitoring server was not able to bind to its configured TCP/IP port
- The monitoring server is not properly configured
- Unexpected messages in the monitoring server log

See the “Monitoring server troubleshooting” section of this book for more information.

## Application product support (seed data) has not been added to the hub monitoring server

Verify the hub monitoring server has the product version (for example, V5.1.0) application support (seed data) loaded.

If you did not complete this configuration step, your OMEGAMON Enhanced 3270 user interface might be missing data for one or more OMEGAMON products.

For a hub monitoring server on a z/OS system, see the “Adding application support to a monitor server on z/OS” section in the *IBM Tivoli Monitoring Installation and Setup Guide*.

For a hub monitoring server on a distributed system, see the “Installing application support on monitoring server” section in the *IBM Tivoli Monitoring Installation and Setup Guide*.

**Note:** The following message, which shows an example of the OMEGAMON for CICS log, might appear in the OMEGAMON Enhanced 3270 user interface when the add application support configuration step has not been completed; this might also be true when the add application support step was completed after the initial startup of the product agent. For the later case, the hub Tivoli Enterprise Monitoring Server and agent should be recycled after performing the add application support step.

```
...  
RRUIA-DMSL: MSL "KCP_CICSplex_CICSPLXS" does not exist or contains no online  
accessible MSNs.  
...
```

**Note:** The V5.1.0 product application support files must also be loaded in the run time environment libraries that are associated with the OMEGAMON Enhanced 3270 user interface started task. For a new or upgraded run time environment, the run time environment load configuration step updates the application support.

You will see the following messages in the OMEGAMON Enhanced 3270 user interface log file when the application support files are back-leveled or missing:

```
...  
KOBUIGP1I Source ODI does not contain table Kppxxxxx ...  
KOBUIGP9I ERROR: No ODI will cause an erroneous display ...  
KOBUIGP1W ODI Failure ignoring SORTCOLS='...'  
...
```

Also, see “[The OMEGAMON Enhanced 3270 user interface local registry does not contain required agent information](#)” on page 1016.

## The OMEGAMON monitoring agent is offline or is not started

You can employ multiple methods to investigate the online status of an OMEGAMON agent.

One method is to examine the content of the local registry.

**Tivoli Management Services 6.3.1 (APAR OA42127) or later**

From the **All Known Hubs (KOBHUBS)** workspace, place your cursor next to the hub monitoring server name that you are interested in, type N and press **Enter**. The **Managed Systems** workspace is displayed and lists the available names of the local registry managed systems. The information that is displayed is similar to that shown in “[Figure: Only Managed Systems panel that lists the available names of the local registry.](#)” on page 1015.

#### Tivoli Management Services 6.3 or earlier (pre-APAR OA42127)

From the OMEGAMON Enhanced 3270 user interface, select **View > 4. Managed Systems**. The **Only Managed Systems** panel is displayed and lists the available names of the local registry managed systems.

Figure 188: **Only Managed Systems** panel that lists the available names of the local registry.

The various OMEGAMON monitoring agents employ unique conventions to identify agents and managed systems. For example, in the previous figure, the rows that display names that end in **:MVSSYS** and **:SYSPLEX** along with a **Y** in the **MS Online Status** column are an indication that OMEGAMON for z/OS agents are online, which means the interface can retrieve data for the product.

The following table lists the conventions that are used by individual OMEGAMON products to compose managed system names.

Table 76: Managed System naming conventions for OMEGAMON products	
Product name	Managed System naming convention
OMEGAMON for z/OS	<ul style="list-style-type: none"> <li>SYSPLEX:SYSPLEX:PLEXVIEW</li> <li>sysplex_name:MVS:SYSPLEX</li> <li>sysplex_name:lpar_smfID:MVSSYS</li> </ul>
OMEGAMON for CICS	<ul style="list-style-type: none"> <li>cics_region_name:lpar_smfID:CPIRA</li> <li>cics_region_name:lpar_smfID:CEIRA</li> <li>cics_tg_ID:lpar_smfID:CICSTG</li> </ul>
OMEGAMON for Db2 PE	<ul style="list-style-type: none"> <li>DB2plex:DB2plex:Plexview</li> <li>db2_ID:lpar_smfid:DB2</li> <li>XEDB2:lpar_smfid</li> </ul>

Product name	Managed System naming convention
OMEGAMON for IMS on z/OS	<ul style="list-style-type: none"> <li>• IMSplex:IMSplex:Plexview</li> <li>• ims_ID:lpar_smfid:CONNECT</li> <li>• ims_ID:sysplex_name:SQGROUP</li> <li>• ims_ID:lpar_smfid:IMS</li> <li>• XEIMS:lpar_smfid:MVS</li> </ul>
OMEGAMON for Networks	<ul style="list-style-type: none"> <li>• agent_jobname:lpar_smfid:KN3AGENT</li> <li>• tcpip_ID:lpar_smfid</li> <li>• vtam_ID:lpar_smfid</li> </ul>
OMEGAMON for Messaging	<ul style="list-style-type: none"> <li>• mq_ID:lpar_smfid:MQESA</li> </ul>
OMEGAMON for Storage on z/OS	<ul style="list-style-type: none"> <li>• agent_jobname:lpar_smfid:STORAGE</li> </ul>

When you examine the **Managed Systems** (KOBHBMSN) workspace or the **Only Managed Systems** (KOBMSNS) workspace content and it indicates that there are no online agents for a specific product, examine the agent address space to verify that it is started and it is successfully initialized online. In some cases, it might be necessary to verify that the corresponding monitored systems or subsystems (for example, CICS regions) are also running.

### The OMEGAMON Enhanced 3270 user interface local registry does not contain required agent information

The OMEGAMON Enhanced 3270 user interface local registry must have accurate information about the configuration of the environment to enable the composition and routing of data queries to appropriate OMEGAMON agent managed systems.

The registry is initially populated during the address space initialization process and thereafter, by default, at 5-minute intervals.

Given the startup considerations for OMEGAMON monitoring components and monitored systems and or subsystem, it is possible for the local registry content to take up to 10 minutes to stabilize; assuming you have fairly stable configuration.

Use the **Options** menu of the enhanced 3270UI to examine the local registry.

Examine the following items:

- Verify the existence of online registered enhanced 3270UI data retrieval agents. From the **All Known Hubs** (KOBHUBS) workspace, place your cursor next to the hub monitoring server name that you are interested in, type A and press **Enter**. The **Data Retrieval Agents** workspace must contain a minimum of one data retrieval agent row to enable data retrieval.

- Verify the existence of the OMEGAMON agent list for managed systems:

#### **Tivoli Management services 6.3.1 (APAR OA42127) or later**

From the **All Known Hubs** (KOBHUBS) workspace, place your cursor next to the hub monitoring server name that you are interested in, type L and press **Enter**. The **Managed System Lists** workspace lists the rows with managed system list names. The information that is displayed is similar to that shown in [“Figure: Online Managed Systems Lists panel of the local registry” on page 1017](#)

#### **Tivoli Management services 6.3 or earlier (pre-APAR OA42127)**

Select **View > 5. Managed Systems Lists**. For example:

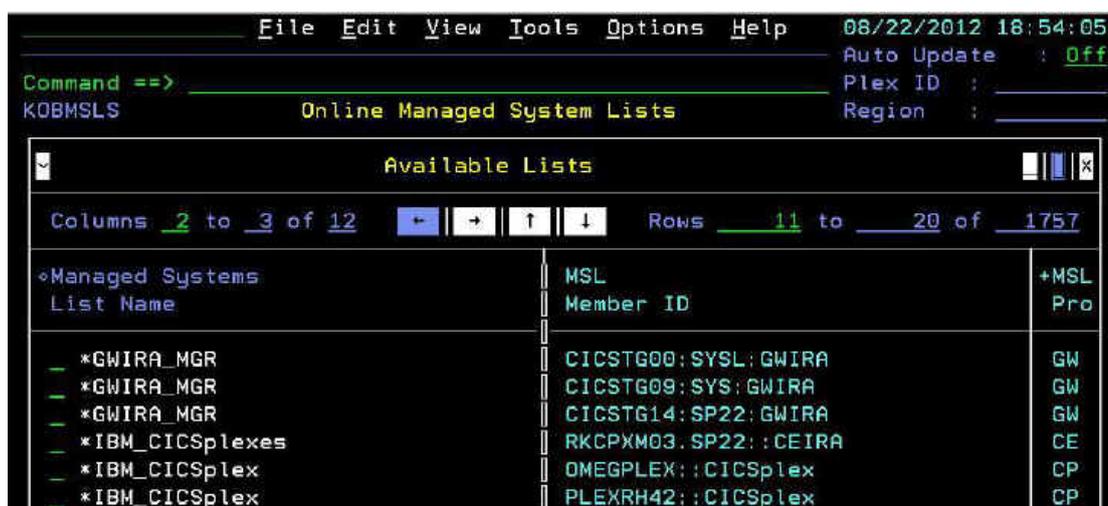

Figure 189: Online Managed Systems Lists panel of the local registry

The Online Managed Systems Lists workspace lists the rows with managed system list names.

The following table lists the naming conventions for the OMEGAMON products of the managed systems list names:

Product	Managed System List naming convention
OMEGAMON for z/OS	<ul style="list-style-type: none"> <li>*MVS_SYSPLEX</li> <li>*MVS_SYSTEM</li> </ul>
OMEGAMON for CICS	<ul style="list-style-type: none"> <li>*CPIRA_MGR *GWIRA_MGR</li> <li>*IBM_CICSplexes</li> <li>*IBM_CICSplex</li> <li>*MVS_CICSTG</li> <li>*MVS_CICS</li> <li>KCP_CICSplex_plex_name</li> </ul>
OMEGAMON for Db2 PE	*MVS_DB2
OMEGAMON for IMS on z/OS	<ul style="list-style-type: none"> <li>*MVS_IMSPLEX</li> <li>KIP_ims_system_IMS</li> </ul>
OMEGAMON for Networks	<ul style="list-style-type: none"> <li>*OMEGAMONXE_MAINFRAME_NTWK_TCP</li> <li>*OMEGAMONXE_MAINFRAME_NTWK_VTAM</li> <li>*OMEGAMONXE_MAINFRAME_NTWK</li> </ul>
OMEGAMON for Messaging	mq_ID:lpar_smfid:MQESA
OMEGAMON for Storage on z/OS	agent_jobname:lpar_smfid:STORAGE

- Verify the existence of online OMEGAMON agents managed systems:

**Tivoli Management services 6.3.1 (APAR OA42127) or later**

From the **All Known Hubs** (KOBHUBS) workspace, place your cursor next to the hub monitoring server name that you are interested in, type N and press **Enter**. The **Managed Systems** workspace is displayed and lists the available names of the local registry managed systems.

**Tivoli Management services 6.3 or earlier (pre-APAR OA42127)**

Select **View > 4. Managed Systems**. The Only Managed Systems workspace (KOBMSNS) shows rows with managed system names.

See “The OMEGAMON monitoring agent is offline or is not started” on page 1014.

**Note:** In a case where the configuration is running multiple versions of the OMEGAMON for z/OS agents (V4.2.0 and V5.1.0), only remote server address spaces that are upgraded to the latest version can be configured as Sysplex-proxy-eligible. You might get a workspace notice that says, Sysplex Data Unavailable: Enter 'ZOSLPARS' for LPAR Data for the case where the Sysplex proxy is started in a back-leveled remote server address space. The result is that the OMEGAMON Enhanced 3270 user interface is unable to render Sysplex data.

**Note:** In the case where multiple instances of IBM Tivoli Monitoring configurations are running in a common Sysplex, the configurations must be configured with unique names; at least one of the configurations must provide an override Sysplex name (pseudo name) so that both configurations are able to start a Sysplex proxy (and agent). The workspace notice, Sysplex Data Unavailable: Enter 'ZOSLPARS' for LPAR Data can depict the case where these conditions are not satisfied and the Sysplex proxy is unable to start in one of the configurations; the result is that the OMEGAMON Enhanced 3270 user interface is unable to render Sysplex data for that Sysplex.

### Data retrieval delays/timeouts causing no data conditions

OMEGAMON enhanced 3270 user interface logs are written to the address space SYSPRINT DD statement.

By default, the OMEGAMON enhanced 3270 user interface is configured with the request timeout parameters shown in the following table:

Table 78: OMEGAMON enhanced 3270UI request timeout parameters		
Parameter name	Description	Defaults and overrides
QUERYTIMEOUT	User interface workspace query timeout	10 seconds  <div style="border: 1px solid black; padding: 5px;"><b>Note:</b> Some workspace queries are delivered with a timeout override; where the composition of data requests anticipates an elongated response.</div>
PNG_TIMEOUT	DRA ping health check (endpoint ping) timeout	One second
SO_TIMEOUT	DRA data request (socket) timeout	15 seconds
DIS_TIMEOUT	Registry refresh (discovery data request) timeout	Two seconds
CON_TIMEOUT	Conduit manager connect to a DRA socket timeout	If parameter <b>PNG_TIMEOUT</b> is specified, the <b>CON_TIMEOUT</b> parameter defaults to the value specified in <b>PNG_TIMEOUT</b> . If parameter <b>PNG_TIMEOUT</b> is not specified, the default value is one second.

These parameter defaults have been established for reasonable or normal operational conditions. There might be unique operational conditions in your environment where the defaults are not optimal. In that case, you can modify the defaults by creating customized OMEGAMON Enhanced 3270 user interface workspaces or specifying parameter overrides in the OMEGAMON Enhanced 3270 user interface environment parameters file (*rte*.RKANPARU (KOBENV)) that is referenced by the address space RKANPAR DD statement. It is recommended

that you use embed members so that your override settings persist. For more information, see [Enhanced 3270 user interface \(KOB\) parameters](#) .

Elongated response times when interacting with the OMEGAMON Enhanced 3270 user interface might be a symptom of timeout conditions. For example, during log on, the initial Enterprise Summary (KOBSTART) workspace might take a significant amount of time (more than a few seconds) to render and or the workspace is rendered with partial or no data.

**Note:** The following message is written to the SYSPRINT log files when request timeouts occur:

```
KOBCM0010E: conduit manager Recv Error, rc = -1, microseconds = nnnnnnnn
```

The following items identify the common causes for delay and or timeout conditions. Investigation of these conditions might be complex, this information provides you with some hints for further investigation:

- The hub monitoring server is running under degraded system conditions (heavy system workload or an under-capacity system) and is being delayed when attempting to service OMEGAMON Enhanced 3270 user interface data requests. In this example, examine the availability and priority of the system resources provided to the hub monitoring server.
- The OMEGAMON agent is running under degraded system conditions (heavy system workload or an under-capacity system) and is being delayed when attempting to service OMEGAMON Enhanced 3270 user interface data requests. In this example, examine the availability and priority of the system resources provided to the OMEGAMON agent.
- Data requests submitted from the OMEGAMON Enhanced 3270 user interface to a given Data Retrieval Agent, thorough a TCP/IP conduit, are being impacted by degraded network conditions. In this case, the availability, priority, and configuration of network resources and paths associated with communications between the OMEGAMON Enhanced 3270 user interface and the hub monitoring server and OMEGAMON agents should be examined.
- An OMEGAMON component (monitoring server or agent) that played a role in a given data request path has gone off-line; the LPAR was terminated, or the address space was terminated. In this case, "[The OMEGAMON Enhanced 3270 user interface local registry does not contain required agent information](#)" on [page 1016](#) to investigate the status of OMEGAMON components, (Managed Systems: on line or off line).
- The hub and or a remote monitoring server is experiencing operational issues and is being delayed when attempting to service OMEGAMON Enhanced 3270 user interface data requests. A misconfiguration or a special site or environmental configuration requirements might lead to operational issues. For example:
  - Operational issues might arise if a monitoring server running on a z/OS operating system is experiencing problems writing to its' Historical Persistent Datastore files.
  - Operational issues might occur if a monitoring server is unable to bind to its configured TCP/IP port number.
- The IP domain name resolution is not fully configured on the z/OS operating system where the OMEGAMON Enhanced 3270 user interface, Tivoli Enterprise Monitoring Server and or agent address spaces are running. Also, there might be more than one TCP/IP task running on the z/OS operating system; for these cases, the OMEGAMON address spaces, the OMEGAMON Enhanced 3270 user interface, Tivoli Enterprise Monitoring Server and or agent started task JCL procedures must specify the IP name resolution configuration data set to be specified through the SYSTCPD DDNAME statement.
- The hub Tivoli Enterprise Monitoring Server is running on a system that has multiple network interfaces and perhaps the preferred and or universally known interface is not being employed; this results in IP connection issues that manifest on the interface as a possible sporadic, no data condition. For more information related to this type of configuration, including the use of the **KDEB\_INTERFACELIST** parameter, see technote [KDEB\\_INTERFACELIST and it variants \("\\*" and "!\\*"\) are misunderstood](https://www.ibm.com/support/docview.wss?uid=swg21282474) (<https://www.ibm.com/support/docview.wss?uid=swg21282474>) .

## RAS1 Tracing

The following topics describe how to enable RAS1 tracing.

## Enabling RAS1 Tracing for the enhanced 3270UI

You can choose from several different types of tracing that can be enabled to debug the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) and Tivoli OMEGAMON Manager Address Space.

Tracing can be enabled at Tivoli OMEGAMON Manager startup, at user start, or dynamically turned on and off for either the Address Space or a particular user. Trace messages are produced in the Tivoli OMEGAMON Manager's SYSPRINT location, SYSTRACE DD location, or both.

**Note:** Tracing can cause excessive output to the Tivoli OMEGAMON Manager job log. Consult IBM Service Personnel for advice before you enable tracing.

An enhanced 3270UI user can use **TRACE** commands or pull-down menus to enable UI tracing. Both of these methods enable UI tracing for actions that are initiated only by that particular user. To enable tracing for the entire Tivoli OMEGAMON Manager Address Space, use modify commands to the Tivoli OMEGAMON Manager Address Space, or use enhanced 3270UI **TRACE** commands or pull-down menus.

The pull-down method is initiated by clicking (or positioning the cursor and pressing Enter) on the **Tools** pull-down. A pull-down menu appears where you can select either UI tracing or Address Space tracing.

After you select one of the tracing options, a **Trace** menu pop-up will display all of the components that can be selected for tracing.

The command method is initiated by entering a **TRACE** command on the command line, or the action line, on the enhanced 3270UI.

LPAR Name	ΔAverage ∇CPU Percent	Percent LPAR MSU Capacity	System Page Rate	Page Fault Rate	+CSA In U Percent
CANSP22	10	5.6	12.4	0.0	12.6

After you initiate tracing, a **TRACE** indicator is displayed in the drawer section of the footer.

Clicking (or positioning the cursor and pressing Enter) on the **TRACE** box displays the **Trace** menu where more tracing can be initiated, or turned off altogether.

Additionally, the **Modify** system command can be used to directly communicate with the Tivoli OMEGAMON Manager started task to start and stop address space level tracing. The syntax of the modify command is: /F tomjobname, TRACE KOBcomp n, where - tomjobname is the Tivoli OMEGAMON Manager started task name. *IBMTOM* is the default started task name. - comp is the component for which you want to start/stop tracing, and - n is the trace level, which can have the value 0 - 4. A trace level of 0 indicates that no tracing takes place, and disables tracing if it was already enabled. A trace level of 1 - 4 enables tracing; 1 generates the least number of trace messages, while 4 generates the most trace messages.

This table lists the pull-down options that are available to the user, and the corresponding **TRACE** and **modify** commands:

Options for UI tracing and Address Space tracing

<i>Table 79: Options for UI tracing and Address Space tracing</i>		
<b>UI trace pulldown options:</b>	<b>Corresponding TRACE command:</b>	<b>Corresponding modify command: (that is, /F IBMTOM, TRACE KOBcomp where n is the level of tracing)</b>
1. B Basic UI Flow of Control	TRACE BASIC	(not applicable)
2. V VTAM Data Stream Analysis	TRACE VTAM	(not applicable)
3. I Input Field Processing	TRACE INPUT	(not applicable)
4. P 3270 Presentation Services	TRACE 3270	(not applicable)
5. O Source ODI Interchange	TRACE ODI	(not applicable)
6. Q SQL and Live Data Analysis	TRACE DATA	(not applicable)
7. U Screen Popups	TRACE POPUP	(not applicable)
8. S Screen Scrolling	TRACE SCROLL	(not applicable)
9. R REXX Processing	TRACE REXX	(not applicable)
10. X Turn All UI Trace Off	TRACE OFF	(not applicable)
<b>Address Space pulldown options:</b>		
1. R Request Router	TRACE RR	TRACE KOBRRWKR 1, KOBRRUIA 1
2. C Conduit Manager	TRACE CM	TRACE KOBGWCND 1
3. G Registry	TRACE RG	TRACE KOBGWREG 1
4. T Status and Thresholding	TRACE ST	TRACE KOBTHRMT 1, KOBTHRSH 2
5. S Session Control	TRACE SC	TRACE KOBBOVAP 1, KOBGWOBV 2
6. W OMEGAMON Gateway	TRACE GW	TRACE KOBGATW0 1
7. O Binary ODI	TRACE BO	TRACE KOBODUTL 1, KOBODILD 1
8. A SAF Authorization	TRACE SAF	TRACE KOBACRAF 1
9. X Turn All Component Trace Off	TRACE MOFF	TRACE KOBcomp 0

## Enabling RAS1 Tracing at startup for an enhanced 3270UI user

You can initiate UI tracing at session startup for an enhanced 3270UI user by updating the TRACE statement in the user's UI profile.

### Procedure

1. Select **Edit > Preferences**
2. Click the **Session/Logon** tab. Alternatively, position the cursor over the **Session/Logon** tab and press Enter.
3. Change the **Engage Trace at session start** setting from *N* to *Y*.
4. Save the profile.
5. The user must re-login to the enhanced 3270UI.

### Result

Trace data is now collected during session startup.

**Note:** Be sure to change the **Engage Trace at session start** setting back to *N* when you finish debugging

## Enabling Address Space tracing at startup

You can initiate Address Space tracing for one or more components at startup.

To initiate Address Space tracing for one or more components at startup, add a TRACEV1 statement in the Tivoli OMEGAMON Manager's RKANPARU(KOBENV) member and specify the component (or components) and level of tracing.

For example:

```
TRACEV1=TRACE KOBxxxxx n
```

where:

- The variable *n* is the trace level and has a value of 0 - 4, where 0 indicates no tracing, 1 is the minimum amount of tracing and 4 is the most tracing.
- The value of KOBxxxxx is as follows:

```
KOBRRUIA KOBRRWKR KOB SOCK KOBTHRSR KOBTHRMT KOBODUTL KOBODISC KOBODILD KOB OBVAP
KOBGWREG
KOBGWOBV KOBGWLPA KOBGWCVA KOBGWCND KOBGATW0 KBCZDIO KBCWTOL KBCVSTG KBCUXIO
KOBCTREE
KOBCTHRD KOBCTRNR KOB CSTLB KOB CSTIO KOB CMAPI KOB CLOCK KOB CIOST KOB CIOBE KOB CENVV
KOB CENVG
KOB CDYNA KOB CDSIO KOB CMSG KOB CBLKQ KOB LISTN KOB CRACF KOB CUNIS KOB FLG01 KOB FLG02
KOB FLG03
KOB FLG04
```

**Note:** Tracing can be dynamically turned off by issuing a **Modify** command with a value of 0 for the trace level. For example:

```
/F IBMTOM, TRACE KOBRRWKR 0
```

Multiple components can be specified on the TRACEV1 statement. For example:

```
/F IBMTOM, TRACE KOBRRWKR 1, KOB SOCK 2
```

Be sure to comment or remove the TRACEV1 statement in the KOBENV member when debug messages are no longer needed.

## RAS1 Tracing for the OMEGAMON Subsystem

You can start and stop tracing for the OMEGAMON Subsystem.

**Note:** Tracing can cause excessive output to the Tivoli OMEGAMON Manager job log. Consult IBM Software Support for advice before you enable tracing.

Tracing for the OMEGAMON Subsystem is dynamically started and stopped using modify commands. Trace messages are produced in the OMEGAMON Subsystem's SYSPRINT location, the SYSTRACE DD location, or both. For example:

```
/F IBM CN,TRACE KOBHTTPW 1
```

You can initiate tracing for one or more components at startup by adding a TRACEV1 statement in the OMEGAMON Subsystem's RKANPARU(KOBENV) member and specifying a component (or components) and level of tracing.

For example:

```
TRACEV1=TRACE KOBxxxxx n
```

where:

- The variable *n* is the trace level, and has a value of 0 - 4. A trace level of 0 indicates that no tracing takes place and disables tracing if it was already enabled. A trace level of 1 - 4 enables tracing; 1 generates the least number of trace messages, while 4 generates the most trace messages.
- The value of KOBxxxxxx is as follows:

```
KOBHTTPS KOBHTTPL KOBHTTPW KOBHTTP$ KOBHTTP@ KOBHTTP# KM5JLFRD
```

**Note:** Tracing can be dynamically turned off by issuing a modify command with a value of 0 for the trace level. For example:

```
/F IBMTOM,TRACE KOBHTTPW 0
```

Multiple components can be specified on the TRACEV1 statement. For example:

```
/F IBMTOM,TRACE KOBHTTPW 1, KOBHTTPS 2
```

Be sure to comment or remove the TRACEV1 statement in the KOBENV member when debug messages are no longer needed.

## KOB messages

Messages that begin with the KOB prefix are associated with the OMEGAMON Enhanced 3270 User Interface, which is part of the OMEGAMON Base component. By default, trace and error logs are created in SYSPRINT. (An alternate log location may have been specified, using standard JCL services.) Most of the messages are prefixed by a timestamp and thread ID.

For the complete list of messages, see [KOB messages](#).

## Reference

The keywords that are used in the definitions of panels and profiles. The commands you can use to start and stop the interface address space or refresh the local registry.

## About panels

Workspaces are composed of two types of panels: workspace panels and popup panels.

*Workspace* panels are typically used to present data. A workspace panel can contain up to 15 subpanels. Each subpanel in a workspace can contain data from a different attribute group or even a different application. Subpanels can be linked to other workspace panels using context-sensitive links, so that the data displayed in the target workspace reflects values in the linked-from workspace (see [“Figure: A workspace with several subpanels” on page 1024](#)).

Figure 190: A workspace with several subpanels

Popup panels overlay workspace panels and are typically used to provide navigation, action options, or help for a particular field, or additional information about actions (see “Figure: Workspace with popup panel” on page 1024). Popup panels are also used to confirm an action.

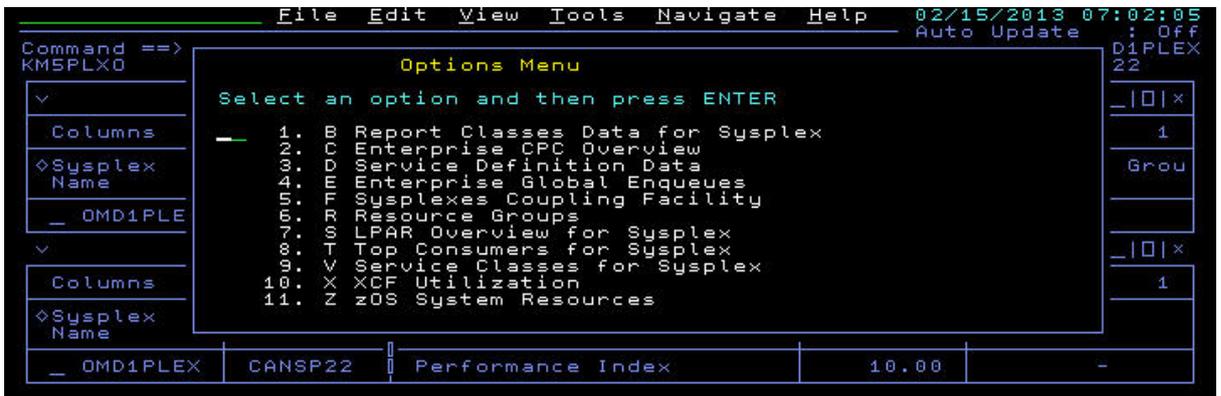

Figure 191: Workspace with popup panel

Workspace and popup panels are created using panel definitions. Panel definitions are members of a data set allocated to RKANWENU (the default for English; the ddname is dependent upon the locale ID). The name of a data set member is the name of the panel it defines.

A panel definition consists of one or more stanzas that specify the panel type or elements and keyword = value pairs that specify the appearance and content of the panel.

## Workspace panel definitions

Workspaces panel definitions consist of an opening and closing stanza tag and a set of keywords that specify the global properties and content of the workspace. A workspace panel definition can contain up to 15 subpanel definitions. Subpanel definitions specify navigation and display options for the subpanel and the data query. Subpanels can be linked to other workspace panels using links, so that the data displayed in the target workspace reflects values in the linked-from workspace.

A workspace panel definition begins with a <WORKSPACE> tag as the first noncomment line and ends with a <WORKSPACEEND> tag. In addition to a set of supported keywords that specify global settings for the workspace, a workspace definition can contain the following stanzas:

## ALIASCOMMANDS

<ALIASCOMMANDS><ALIASEND>

In an ALIASCOMMANDS stanza, the aliases for workspace panel IDs to be used in fastpath navigation are defined with SET statements. By default, alias commands apply only to the current panel. For the aliases to persist, the scope must be set to GLOBAL. If the scope is global, after an alias has been set, it is available to every subsequent panel until the alias is either updated or deleted. The SET statement for the alias can also specify whether the resulting workspace is always presented in realtime mode, even if the user is in history mode when issuing the alias command.

The use of <ALIASEND> it prevents subsequent SET statements from generating alias variables instead of normal variables.

For example:

```
<ALIASCOMMANDS>
SET HEALTH=KPPASTO SCOPE=LOCAL REALTIME
<ALIASEND>
```

## ONENTRY

<ONENTRY><ONENTRYEND>

An ONENTRY stanza contains SET statements that are executed only once, when the workspace is loaded during "forward" navigation. This prevents the statements from being redriven, for example, when a filter is invoked.

## SUBPANEL

<SUBPANEL>

Subpanel definitions are introduced by a <SUBPANEL> statement. Subpanels do not require a corresponding <SUBPANELEND> statement. The occurrence of a new <SUBPANEL> tag or a <WORKSPACEEND> tag functions as an indication of the end of the preceding subpanel.

In each subpanel, you can control the type of subpanel (summary, detail, text, action), the number of lines and rows that are displayed, the data that is queried, and the columns that are displayed. You can specify what controls are available (such as scrolling and minimizing and maximizing subpanels) and define navigation options for drilldown to other workspace or popup panels. The order of some keywords is restricted.

Subpanels may contain several types of stanzas:

### ISPF

<ISPFANEL><ISPFANELEND>

ISPF stanzas support a subset of the standard ISPF statements. See "[Supported ISPF statements](#)" on [page 1058](#).

### PROLOG and EPILOG

<PROLOG><PROLOGEND> and <EPILOG><EPILOGEND>

PROLOG and EPILOG stanzas optionally bracket a QUERY keyword and allow for the definition of local variables and for pre- and post-processing of the queried data using REXX EXECs. PROLOG and EPILOG stanzas can contain the following elements:

- SET commands
- REXX EXEC commands
- ZOOMCOLS=&varname statements

### ONACTION

<ONACTION><ONACTIONEND>

This stanza is executed once when the workspace is first displayed during forward navigation.

ONACTION stanzas can contain the following elements:

- SET commands.  
SET commands coded in an ONACTION stanza are executed directly after key column assignment when an action is driven from the subpanel (see "[KEYCOLS](#)" on [page 1040](#)).

Used with the system variable ZFILTERnn, SET commands in the ONACTION stanza can be used to created filters for columns that have been designated as eligible using the FILTERCOLS keyword.

For example:

```

<ONACTION>
SET ZFILTER01=CICSNAME=C*
SET ZFILTER02=SOS=1
SET ZFILTER03=TASKS>100
<ONACTIONEND>

```

- REXX exec calls. For example:

```

<ONACTION>
CALL MYREXX
<ONACTIONEND>

```

## Example

Here is an example of a simple workspace panel definition:

```

<WORKSPACE>
HEADER='Address Spaces for Service Class'
NAV1TEXT='Plex ID'
NAV2TEXT='SMF ID'
SET ZOMEGNAV2=''
SET ZOMEGLOCK1=NO
SET ZOMEGLOCK2=YES
IMBED=KM5NAV1

/*****/
/*                                     */
/* SUBPANEL 1 - Address Spaces for Service Class */
/*                                     */
/*****/

<SUBPANEL>
HEADER='Service Class &CLSNAME'
TYPE=SUMMARY
/*****/
/*           Data Query */
/*****/
QUERYTYPE=ROUTER
QUERYMODE=LIVE
QUERYREGTYPE=DRA
QUERY='SELECT MADDSPC.ORIGINNODE,MADDSPC.ASNAME,
MADDSPC.VSYSTEMNAM,MADDSPC.ASID,MADDSPC.ASRCNAME,
MADDSPC.VELOCITY,MADDSPC.PAGERATE,MADDSPC.ASCSTOR,
MADDSPC.ASESTOR,MADDSPC.IORATE,MADDSPC.CPUPCNT,
MADDSPC.IFAPCNT,MADDSPC.IFCPCNT,MADDSPC.SUPPCNT,
MADDSPC.SUCPCNT,MADDSPC.CLSNAME,
FROM KM5.MADDSPC,
WHERE ORIGINNODE='&PLEXORIG',
AND MADDSPC.CLSNAME='&CLSNAME',
ORDER BY VELOCITY DESC;'
/*****/
/*           Data Status */
/*****/
/*****/
/*           Session Data Row Key Fields */

DISPLAYCOLS='ASNAME,ASID(HEXDISP),VSYSTEMNAM(W=4),
ASRCNAME,CPUPCNT,VELOCITY,ASCSTOR,ASESTOR,IORATE,
PAGERATE,IFAPCNT,IFCPCNT,SUPPCNT,SUCPCNT'
/*****/
/*           Navigation Options */
/*****/
/* ACTION=ASNAME(?,"Help Assistance",KOHELP1) */
/*****/
/* SUBPANEL 1 END */
/*****/
<WORKSPACEEND>

```

## Popup panel definitions

Popup panels overlies a portion of a workspace panel. Popup panels are typically used to display navigation or action options, to supply information for a particular field, or to provide additional information about actions. Popup panels are also used to confirm actions. Popup panels are linked to a subpanel through an ACTION setting in a subpanel definition.

Popup panel definitions begin with <POPUP> and end with <POPUPEND>. Popup panels may contain a header, free-form text, and a subpanel.

Popup panels suspend Auto update in the parent workspace: until the popup panel is dismissed, the **Auto update** field in the workspace displays SUS instead of Off or Interval.)

Popup panels can contain variables. The variables must be set in the parent workspace or in a previously accessed workspace.

As in workspace definitions, stanzas that define subpanels are introduced by a <SUBPANEL> statement. A corresponding <SUBPANELEND> statement is not required. Unlike workspace panels, which may contain up to 15 subpanels, popup panels can contain only one subpanel. Moreover, subpanels in popup panels cannot contain the QUERY keyword or PROLOG and EPILOG stanzas. Subpanels may contain ONACTION and ISPF stanzas. As in subpanels, ONACTION stanzas may contain SET commands and REXX exec calls. See [“Supported ISPF statements” on page 1058](#) for more information allowable ISPF statements.

### Example 1

The following example shows the use of a subpanel with actions defined, an ISPF )LIST statement with the POPUPACTIONS argument, with the width of the popup panel specified. The POPUPACTIONS argument displays the actions defined in the popup panel in a numbered list, in a popup panel with a width of 50 characters.

Figure 192: Example of a popup panel definition

```
/*
/*
/*          OMEGAMON BASE EXIT CONFIRMATION          */
/*
/*
/*
/*
<POPUP>
<SUBPANEL>
ACTION=(X,"Exit and terminate the session (X)",=LOGOFF)
ACTION=(R,"Resume (R)",=END)
<ISPFANEL>
)LIST POPUPACTIONS
)BODY WIDTH(50)
           Exit Menu

Type a selection number, enter X to exit,
enter R to resume, or press PF3 to return.

)INIT
)PROC
)END
<ISPFANELEND>
<POPUPEND>
```

### Example 2

This is a sample popup panel action, which takes the actions defined in the subpanel from which the popup panel is invoked and inserts them after the text in the )BODY statement. A color variable is used to apply color to text .:

Figure 193: Example of action popup that inserts actions from the subpanel definition

```
/*
/*
/*          OMEGAMON ACTION CHARACTER LIST          */
/*
/*
/*
/*
<POPUP>
<SUBPANEL>
<ISPFANEL>
)ATTR
@ TYPE(TEXT) SKIP(ON) COLOR(&ZCLRTEXT)
)LIST PANELACTIONS

## Guidelines for constructing panel definitions

Panel definitions are constructed according to specific guidelines. You should be aware of these guidelines if you are constructing a panel definition from scratch, instead of copying and modifying an existing definitions

- The first non-comment line of a workspace panel definition must contain a <WORKSPACE> tag. The first noncomment line of a popup panel must contain a <POPUP> tag.
- The end of a workspace panel definition must be marked by a corresponding <WORKSPACEEND> tag. The end of a popup panel definition must be marked by a corresponding <POPUPEND> tag. Anything after this tag is ignored.

**Note:** If you do not specify an end tag, the end of the file is the interpreted as the end of panel definition. Since the rest of the file is ignored, using an explicit end tag allows you to ignore part of the file, for example if you are testing a panel definition.

- Any text values that contain a space must be enclosed in single or double quotation marks. If text contains a single quotation mark, it must be enclosed in double quotation marks. Any comma-delimited list (for example, DISPLAYCOLS= ' CICSplex , PLEXRATE , PLEXCPUP ') must also be enclosed in quotation marks.
- Some keywords must be specified in a particular order (see [“Panel definition keywords” on page 1028](#)). Comments (/\*) are allowed anywhere in the definition.
- Comment lines and blank lines are ignored.

## Panel definition keywords

Keyword/value pairs are used to define the properties of panels. There are keywords that affect the workspace as a whole, and subpanel keywords that apply only to specific subpanels.

### Workspace keywords

The keywords in this section define global properties for workspace panels.

#### CURSOR

Defines the default cursor position on an initial workspace.

CURSOR=[HOME | COMMANDLINE | SUBPANEL | ASIS]

#### Possible values

##### HOME

Row 00, Column 1

##### COMMANDLINE

Cursor appears after **Command ==>**.

##### SUBPANEL

Cursor appears in first selectable field of the first subpanel.

##### ASIS

The cursor remains on the workspace wherever the user placed it.

**Default value**

HOME

**Example**

CURSOR=COMMANDLINE  
 CURSORREFRESH

Defines where the cursor position is after a workspace has been refreshed.

**Possible values****HOME**

Row 00, Column 1

**COMMANDLINE**Cursor appears after **Command ==>****SUBPANEL**

Cursor appears in first selectable field of the first subpanel.

**ASIS**

The cursor remains on the workspace wherever the user placed it.

**Default value**

ASIS

**Example**

CURSORREFRESH=SUBPANEL  
 HEADER (workspace)

The text to be displayed at the top of the workspace.

**Possible values**

Any text up to 46 characters. Any characters that exceed the maximum length are truncated. The text is case-sensitive.

**Default value**

No header is displayed.

**Example**

The following example illustrates the use of the HEADER keyword to define text “Enterprise Overview” as the workspace header.

```
HEADER='Enterprise Overview'
```

shows

```
Command ==> _____
PANELID           Enterprise Overview
```

**IMBED**

Specifies a subpanel definition to be imbedded. Can be used to reuse a subpanel in several workspaces, or to imbed a subpanel definition provided by another product. If an imbed subpanel for another product allows for take actions (like cancelling a CICS task), then security for those actions is governed by the resource rules for the product providing the imbed.

IMBED =[subpanelid|&panelid]

This keyword is placed at the location where the imbedded subpanel will appear, if available. This keyword requires a standalone subpanel definition in a separate PDS member. The member must consist of only the <SUBPANEL> stanza containing the subpanel definition. You can imbed multiple subpanel members.

**Possible values**

- *subpanelid*: the name of the PDS member that contains the subpanel definition
- *&panelid*: a variable set to the member name

**Default value**

None

## Example

```
IMBED=&imbwait
```

### MODE (workspace)

Specifies that the workspace should not be displayed. This keyword is used to "hide" a workspace that is used to collect data for a workspace that is displayed subsequently or to silently perform an action.

Use of MODE=SILENT disables any other display-oriented keywords in the workspace definition, such as DISPLAYCOLS, SCROLLBAR, and MINMAX. A workspace that is specified as SILENT must create a new variable called ZDESTID which contains the panel ID of the destination workspace. This can be accomplished either in a REXX EXEC, or in a workspace definition by specifying SET ZDESTID=*panelid*. Although MODE is a <WORKSPACE> setting, SET ZDESTID is a <SUBPANEL> setting.

#### Possible values

SILENT

#### Default value

None

## Example

```
<WORKSPACE>  
MODE=SILENT  
<SUBPANEL>  
SET ZDESTID=KCPPRGD  
<WORKSPACEEND>
```

### NAV1TEXT

Specifies the text used to label the field that filters for data from a specific plex.

#### Valid values

Any text up to 8 characters. Any additional characters are truncated.

#### Default value

Plex ID

See also: "[NAV2TEXT](#)" on page 1030

## Example

```
NAV1TEXT='CICSPLEX'
```

### NAV2TEXT

Specifies the text used to label the field that allows a subsystem filter (such as a region or LPAR) to be placed on the data.

#### Possible values

Any text up to 8 characters. Additional characters are truncated.

#### Default value

Sys ID

See also: "[NAV1TEXT](#)" on page 1030.

## Example

```
NAV2TEXT='Region'
```

### QUERYWHEN (workspace)

Forces data collection for all subpanels within the workspace when the workspace is returned to using backwards navigation.

QUERYWHEN= RETURN

By default, data collection is driven only when the Enter key is pressed and no screen operations are requested. Screen operations include pulldown or popup panels, collapsing and expanding, minimizing and maximizing, scrolling, or backwards navigation.

### WHENNOHEADER

Replaces the entire subpanel header with the specified text when rows are empty and the subpanel is collapsed.

WHENNOHEADER="text"

If there is no data returned in a subpanel, the subpanel is automatically collapsed and the header displays the text "No data." You can override the header with alternative text, up to a maximum of 64 characters.

### Example

```
WHENNOHEADER="No data is available because the task has ended"
```

### WHENNOTEXT

Replaces the text "No data" when there is no data in the rows and a subpanel is collapsed.

WHENNOTEXT="text"

If there is no data returned in a subpanel, the subpanel is automatically collapsed and the header displays the text "No data." You can replace "No data" with alternative text, up to a maximum of 15 characters.

### Example

```
WHENNOTEXT="task has ended"
```

## Subpanel keywords

The keywords in this section define the properties of a subpanel. The keywords must be preceded by the <SUBPANEL> tag. A <SUBPANELEND> tag is optional. The occurrence of another <SUBPANEL> or a <WORKSPACEEND> tag is taken as the close of the subpanel definition.

### ACTION

In a summary subpanel, defines a list of navigation and action options from which a user can select. You can define up to 16 actions for a selectable field for a subpanel. A popup panel with a list of all possible options is dynamically defined. A default action can be defined. These options are displayed in a popup when a user enters a slash ("/") on the selectable row associated with the actions.

ACTION=columnname(action\_character,"action\_text\_description",destination\_panelid[,DEFAULT][,CONFIRM][,REALTIME])

where:

#### **columnname**

The name of the column with which the action is associated.

#### **action\_character**

The character associated with the action.

#### **action\_text\_description**

A description of the action to be taken, enclosed in single or double quotation marks.

#### **destination\_panelid**

The panel ID of the workspace to which users are taken. Specify NULLDEST for no navigation.

#### **DEFAULT**

Defines the action as the implicit navigation behavior. If only one action is specified, it is taken as the default. If multiple actions are defined for a subpanel, one must be defined as the default.

#### **CONFIRM**

Invokes a confirmation popup panel (KOBCONFM) before proceeding to the specified panel ID.

#### **REALTIME**

Renders the destination workspace in realtime mode, even if the user is in history mode when selecting this action.

#### **ENTER**

ENTER can be used instead of an action character. Using ENTER changes the behavior of a popup panel so that the Enter key can implement navigation instead of data collection and redisplay. The destination panel ID can be any workspace or popup panel or the special keyword END. END indicates navigate backwards (save and PF3). If a REXX EXEC sets the ZDESTID in an ONACTION stanza, the ENTER key options are ignored, and the popup panel is redisplayed with any updates that the REXX EXEC may have made.

### Example 1

This example illustrates an action selection menu:

```
ACTION=HUBNAME(?,"Help Assistance",KOCHHELP1,DEFAULT)
ACTION=HUBNAME(S,"Select a hub",KOBPANE1)
ACTION=HUBNAME(K,"Kill a hub",KOBPANE2,CONFIRM)
```

## Example 2

These examples illustrate the use of the ENTER and END keywords:

```
ACTION=(ENTER, ,MYNEXTWS)
```

or

```
ACTION=(ENTER, ,END)
```

These two examples are mutually exclusive.

### AUTOSELECT

For subpanels with MODE=SILENT that contain a query, automatically selects the first data record returned from the query. If you specify AUTOSELECT, you do not need to specify MODE=SILENT.

### BOXTOP

Determines whether a top border is displayed for a subpanel.

#### Possible values

NO, YES

#### Default value

YES

#### Example

```
BOXTOP=NO
```

### BOXBOTTOM

Determines whether a bottom border is displayed for a subpanel.

#### Possible values

NO, YES

#### Default value

YES

#### Example

```
BOXBOTTOM=NO
```

### COLHEADERS

Determines whether column headings are displayed. This setting applies only to SUMMARY displays.

#### Possible values

N, Y, n, where N means that no column headings are displayed, Y means that column headings are displayed, and n is 1, 2, or 3 indicating how many lines are allowed for the column header.

#### Default value

Y, 2

#### Example

```
COLHEADERS=Y, 3
```

### COLUMNS

Determines how many columns are displayed. A maximum of 100 columns can be displayed on a subpanel.

#### Possible values

##### DYNAMIC

The width of an individual column, and therefore the number of columns displayed, is determined by the width of the column header or the data, whichever is larger. If the column is defined in DISPLAYCOLS with the BAR option, the width may be also be controlled.

##### MAX(IMUM)

The maximum number of columns available for your screen size:

7 for a screen size of 80

10 for a screen size of 132

14 for a screen size of 160  
Optionally, you can specify a number of columns fewer than the maximum, by specifying MAX-*n*.

## ***N***

An integer in the range 1 through *x*, where *x* is the maximum number of columns for the screen size.

### **Default value**

DYNAMIC

### **Example**

COLUMNS=6  
COLUMNS132

Specifies how many columns should appear on screen if the screen is 27x132. Use this keyword to adjust for screen size if you have specified a specific number of columns using the COLUMNS keyword.

COLUMNS132=*nn*

### **Maximum value**

10

### **Example**

To limit the number of columns displayed in a 27x132 screen to 5:

```
COLUMNS132=5
```

COLUMNS160

Specifies how many columns should appear on-screen if the screen is 62x160. Use this keyword if you have indicated a specific number of columns using the COLUMN keyword.

COLUMNS160=*nn*

### **Maximum value**

14

### **Example**

To specify 10 columns:

```
COLUMNS160=10
```

DISPLAYCOLS

Lists the columns that are returned from the QUERY command that are to be displayed on the subpanel. Columns containing integers or percentages can be displayed in either numeric or analog (bar graph) form.

This setting must be specified *after* the QUERY statement for the subpanel.

### **Possible values**

- ALL displays all columns specified in the query
- A comma-separated list of column names specified in the query, enclosed in single quotes.

```
column_name
```

If the column width is dynamic (COLUMN=DYNAMIC) and the data is an integer or a timestamp, you can optionally specify a display format:

```
column_name(options),column_name(options),column_name(options)
```

The display options available depend upon the data type of the column:

- The following options can be used for columns of any data type:

#### **Width=*nnnn* or Width=*nnn*%**

Specifies the width of the column of data in number of characters or as a percentage of the number of characters that can appear on the screen. For example, W=16 or W=25%.

#### **CAPTION=&*varname* or '*textstring*'**

Specifies the column caption that overrides the column caption for the attribute being graphed. Use the SET command to specify the value for the variable name.

#### **INDENT**

Indents a caption in a detail subpanel. For example:

```
DISPLAYCOLS=' SYSTEMID, CICSNAME(ASCII), WSERVCLAS,
WPERFINDX(CAPTION="Region's_Worst_Perf._Index"),
CPUUTIL(INDENT), TODUPDT, TRANRATE, PCNTMXT,
ENQWAIT(INDENT), REMQUEUE, SOS(INDENT),
STGVIOL(CAPTION="Stg._Violations_last_hour"),
AIDS, ICES(INDENT),
CSTRINGW, CBUFFW, WSFAULT, WSTIMOUT,
CICSTODB(TIME), VERSION(INDENT)'
```

results in the following subpanel:

CICS Region Overview		CICS Region Name	
System ID	SYS	CICS Region Name	
Worst Region Service Class	n/a	Region's Worst Perf. Index	0.00%
CPU Utilization	0.0%	CICS TOD Updated	Yes
Transaction Rate	0/m	Maximum Tasks Percent	7%
Enqueue Waits	0	Queued Remote Requests	0
SOS	No	Stg. Violations last hour	0
AIDS	No	ICES	4
Current VSAM String Waits	0	Current VSAM Buffer Waits	0
Any Current WS Faults	No	Any Current WS Timeouts	No
CICS TOD Clock	13:11:11	CICS Version	6.7.0

- If the column contains Date/Time (T,16) data, you can use the following format options for the display:

**DATETIME**

Displays YY/MM/DD HH:MM:SS

**DATE**

Displays as YY/MM/DD

**TIME**

Displays as HH:MM:SS

**None**

Data is shown in any of the following formats, based on the value:

- 12m 31d
- 31d 23h
- 23h 59m
- 59m 59s
- 59.1234s
- 1.12345s

For example:

```
DISPLAYCOLS=' CICSPLEX, PLEXRATE, EIBTIME(DATETIME), PLEXMAXT'
```

- If the column is an IPV6 address, then the options are:

**None**

Displays the IPV6 according to normal rules

**IPV6**

Displays an IP address with the ::ffff: stripped off

Example: DISPLAYCOLS=HUBIPADDRESS(IPV6)

- If the column contains integer data, you can use the following options:

**BAR**

Displays an integer as an analog horizontal bar. The bar is green if the value is 33% or less of the column width; yellow up between 33% and 66% of the column width; and red if the value is over 66% of the column width.

Control the bar display with the following options:

**THRESH=NO**

Suppresses color indicators for thresholds.

**UNIT=nnn**

Specifies how many integers a single character represents. The default is 1. Decimal places are not supported.

For example:

```
SET KOB_HEADER="Graphical Display"  
DISPLAYCOLS=' CICSplex, PLEXRATE, PLEXCPUP, PLEXCPUP (W=22%, BAR, UNIT=20,  
CAPTION=&KOB_HEADER), PLESOS, PLEXMAXT, PLEXENQW, PLEXHSCI'
```

## HEXDISP

Converts values to hexadecimal for display. HEXDISP supports an offset. For example, if you have an integer field column containing the decimal value 254:

```
(HEXDISP)          displays 000000FE  
(HEXDISP+1)        displays 0000FE  
(HEXDISP+2)        displays 00FE  
(HEXDISP+3)        displays FE
```

## HEXVAR

Converts values being passed in variables set by KEYCOLS to hexadecimal. For example,

```
column_name(HEXVAR)
```

## BKMG (Bytes to Kilo to Mega to Giga).

Converts values expressed in bytes to kilobytes, megabytes, or gigabytes, as appropriate. For example, *column\_name*(BKMG).

## KMG T

Converts values expressed in kilobytes to megabytes, gigabytes, or terabytes, as appropriate. For example, *column\_name*(KMG T).

## NOUNIT

No units are displayed. For example, *column\_name*(NOUNIT).

## PERCENT

Appends a percent symbol (%) after the value on the screen.

- If the column contains strings or enumerations:

### ALIGNRIGHT

Align text to the right hand side of the column.

- If the column contains just text strings:

### ASCII

Forces an ASCII translation of a field prior to display.

## SCROLL

Enables cursor-sensitive lateral scrolling for up to 10 columns on a subpanel. Supported only for strings, where WIDTH= (or W=) is specified. Places left and right arrows in the column heading. Pressing PF10 or PF11 in the data area of a lateral data scroll column also performs lateral data scrolling for just that column. For example, the following subpanel definition:

```
DISPLAYCOLS=' HUBNAME (W=20, SCROLL.)  
DRAIPAD (IPV6, W=16, SCROLL),  
HUBIPAD (IPV6, W=16, SCROLL),  
HUBPORT (ALIGNRIGHT)
```

produces the following subpanel:

Hub-TEMS Name	DRA IP Address	Hub-TEMS IP Address	Hub-TEMS Port Number
omeghahub14	9.42.46.22,19939	9.37.37.197	25104
omeghahub14	9.42.46.22,20444	9.37.37.197	25104
omeghahub14	9.42.46.22,19950	9.37.37.197	25104
omeghahub14	9.42.46.114,3185	9.37.37.197	25104
CVTZSVH0-CMS	9.42.46.114,2974	9.42.46.113	36999

- For columns that consist of multiple sub-columns:

**VALUE='X'**

Display the specified character instead of the actual data value. For example X may be a blank, underscore, and so on.

**SUBWIDTH=n**

For an RLE-Composite column, this specifies the display width of a single sub-column.

**SUBGROUP=n**

For an RLE-Composite column, this specifies the number of sub-columns to concatenate together.

**SUBGAP=n**

For an RLE-Composite column, this specifies the number of blanks between sub-groups.

**Default value**

ALL

**DISPLAYOPTION**

Removes all units from every column in DISPLAYCOLS.

**Note:** DISPLAYCOLS *column*(KMG T) overrides a DISPLAYOPTION=NOUNIT statement.

**Default value**

NOUNIT

**Possible values**

NOUNIT

**Example**

DISPLAYOPTION=NOUNIT

**EXPANDCOLAPS**

Determines whether or not the subpanel can be collapsed and expanded. If a subpanel is collapsed, only the subpanel heading is displayed.

A value of YES causes a down arrow  to appear in the left corner of the subpanel header. Placing a cursor on the down arrow and pressing **Enter** collapses the panel so only the subpanel heading line is visible, and turns the down arrow into a right arrow . Placing the cursor on the right arrow expands the subpanel again.

**Possible values**

YES, NO

**Default values**

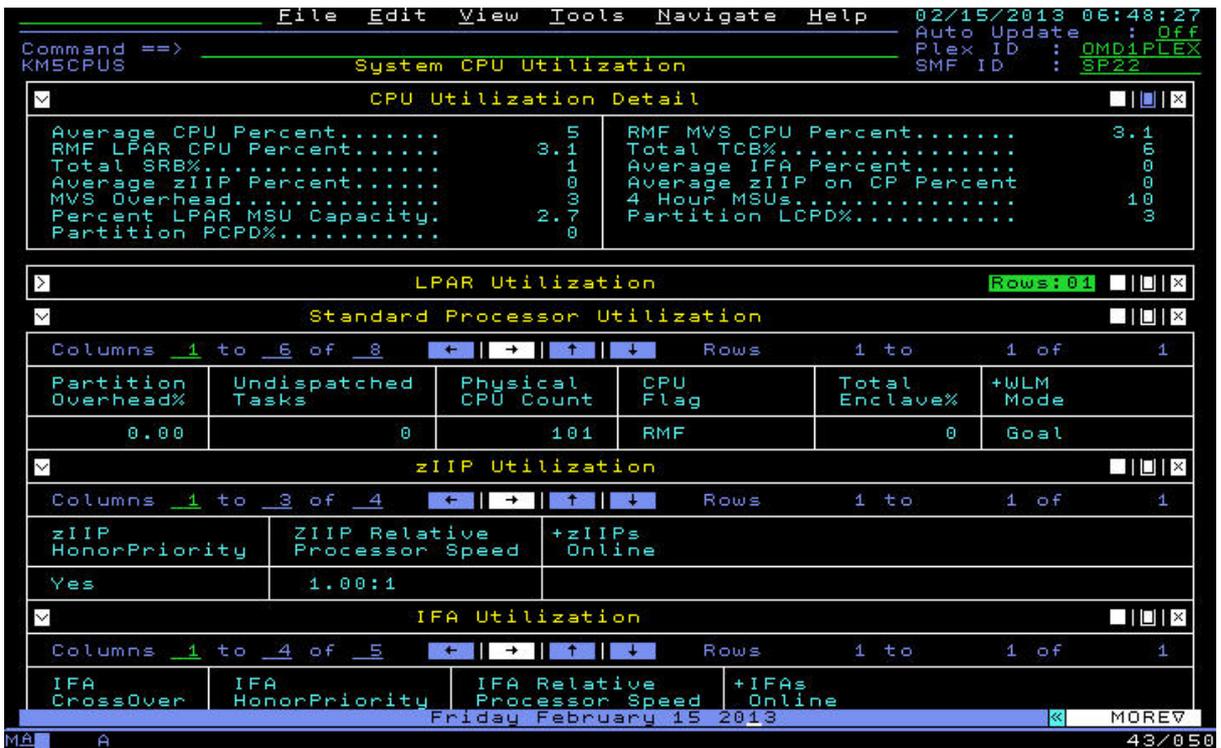

YES

If Yes is specified, you must specify a subpanel HEADER, so that the expand and collapse icons are available.

**Example**

EXPANDCOLAPS=YES

enables a subpanel to be collapsed so only the header is displayed, as in the following example where the LPAR Utilization subpanel is collapsed:

**FILECOMMENTS**

Specifies whether to remove comment lines from the auxiliary file.

FILECOMMENTS=KEEP | REMOVE

**Possible values**

**KEEP**

Do not remove comment lines from the auxiliary file.

**REMOVE**

Remove comment lines from the auxiliary file.

**Default value**

REMOVE

**Example**

```
FILECOMMENTS=REMOVE
```

**FILEDD**

This is the Job Control Language (JCL) Data Definition (DD) name of the PDS from which the 'FILENAME' should be read. The value must match one of the DD statements in your enhanced 3270UI address space's start up JCL.

FILEDD=DDNAME | &NAME

**Possible values**

**DDNAME**

Load an auxiliary file from this PDS concatenation.

**&NAME**

File DDname can be a variable.

**Example**

```
FILEDD=RKANWENU
```

**FILENAME**

This is the Partitioned Data Set (PDS) member name containing information needed within the subpanel. That member can contain things such as a JSON definition of a Status Tree or Help text.

FILENAME=JSONFILE | &NAME

## Possible values

### JSONFILE

Load an auxiliary file to be used by the REXX EXECs associated with this tree.

### &NAME

Filename can be a variable.

## Example

```
FILENAME=KOBSTIT01
```

## FILTERCOLS

Specifies columns to which filtering has been or can be applied.

This keyword must be specified *after* the QUERY statement for the subpanel. Filters are set in the ONENTRY stanza of the workspace panel definition, using SET ZFILTER $nn$  commands.  
FILTERCOLS='columnname,columnname'

### Possible values

A comma-delimited list of column names, with a maximum of 10 columns.

### Default value

None

## Example

```
FILTERCOLS= ' CICSNAME , SOS , TRANRATE , AIDS , WORKSET , CPUUTIL '
```

## FILTERNULLVAL

Specifies whether or not predicates in a query should be removed if their values are unresolved variables.

FILTERNULLVAL=KEEP | REMOVE

### Possible values

#### KEEP

Keeps all predicates in a query even if the values of the predicates are unresolved variables.

#### REMOVE

Removes all predicates in a query if the values of the predicates are unresolved variables.

### Default value

KEEP

## Example

```
FILTERNULLVAL=REMOVE
```

## FILTERSTRIP

Specifies whether or not filtering removes all predicates from the existing query.

FILTERSTRIP=YES | NO

### Possible values

#### YES

Filtering removes all predicates except for SYSTEM.PARMA and ORIGINNODE from the existing query.

#### NO

Filtering retains all existing predicates and dynamically appends the filter predicates.

### Default value

NO

## Example

```
FILTERSTRIP=YES
```

## FILTERVIEW

In subpanels that are reusing data from another subpanel, indicates which ZVIEW $nn$  filter definition, or "view", to use.

FILTERVIEW= $n$

**Parameters**

**Possible values**

1 to maximum number of possible reuses

**Default value**

None

See also [“FILTERVIEWS” on page 1039](#).

**Example**

The following subpanel definition describes a subpanel that has 2 filtered views of a single query. The subpanel definition uses the FILTERVIEW keyword to indicate what view the subpanel is associated with.

```
<SUBPANEL>          Subpanel containing the live query
NAME=SUBPANEL1
QUERY='SELECT A,B,C FROM APP.TABLENAME'
/*****/
FILTERVIEWS=2      Number of filtered views of this query in this workspace
/*****/

<SUBPANEL>          Next subpanel
QUERY=REUSE(SUBPANEL1)      This reaccesses data collected by SUBPANEL1
/*****/
FILTERWHERE=LOCAL
FILTERVIEW=1      ZVIEW $nn$  system variable containing filter predicates
<ONENTRY>
SET ZVIEW01=AIDS=1,SOS<>NO          Can be set/alterd programmatically

<ONENTRYEND>
/*****/

<SUBPANEL>          Next subpanel
QUERY=REUSE(SUBPANEL1)      This reaccesses data collected by SUBPANEL1
/*****/
FILTERWHERE=LOCAL
FILTERVIEW=2      ZVIEW $nn$  system variable containing filter predicates
<ONENTRY>
SET ZVIEW02=CICSNAME=>CICSABCD,MAXOSCOR<=999      Can be set/alterd programmatically

/*****/
```

**FILTERVIEWS**

Indicates the number of filtered re-uses of the data in this subpanel by other subpanels in this workspace.

FILTERVIEWS= $n$

**Possible values**

1 to maximum number of subpanels

**Default value**

None

See also [“FILTERVIEW” on page 1038](#).

**Example**

See example for [“FILTERVIEW” on page 1038](#).

**FILTERWHERE**

Specifies where filtering is applied.

FILTERWHERE=AGENT | LOCAL

**Parameters**

**Possible values**

**AGENT**

Filtering dynamically modifies the SQL to include filter predicates and drives collection.

**LOCAL**

Filtering applies filter predicates to an existing row-set.

**Default value**

AGENT

### Example

```
FILTERWHERE=LOCAL
```

#### FOOTER

Specifies that a footer is displayed at the bottom of a subpanel.

#### Possible values

A text string of up to 68 characters, enclosed in quotation marks. You can use variables in the string. The value is case-sensitive.

#### Default value

None

### Example

```
FOOTER='welcome to &ZSYSID'
```

HEADER (subpanel)

The text to be displayed at the top of the subpanel.

#### Possible values

Any text up to 63 characters. Any characters that exceed the maximum length are truncated. The text is case-sensitive.

#### Default value

No header is displayed.

### Example

```
HEADER='Details for Address Space'
```

#### JOINPREV

Determines whether to adjoin a subpanel to the previous subpanel.

#### Possible values

YES, NO

#### Default value

NO

### Example

```
JOINPREV=YES
```

#### KEYCOLS

Creates a variable of the same name for any columns in a query and assigns the value of the variable to this name. Creating a variable allows fields that uniquely identify a row of data to be saved for a subsequent query (drilldown) using that row of data. KEYCOLS is invoked only after a row of data is selected. This setting must be specified after the subpanel's QUERY statement.

#### Possible values

ALL  
displays all the columns specified in the query.

One or more column names specified in the query  
Use a comma-delimited list to specify more than one column name. Enclose the list in quotation marks.

**Note:** Using ALL results in increased overhead.

#### Default value

None

## Example

```
KEYCOLS='HUBNAME, LPAR, TRANSID'
```

allows these variables to be used in a future query such as:

```
SELECT ... WHERE HUBNAME=&HUBNAME AND LPAR=&LPAR AND TRANSID=&TRANSID
```

## LINES

Determines the number of data rows displayed in a subpanel. The value can be expressed as an absolute number or as percentage of the available workspace, or can be set to adjust dynamically to the data and space available.

### Possible values

#### An integer in the range 1 - 56

The number of rows of data requested. Six lines are dedicated to the workspace header, including subpanel header, column headings, and separator lines.

#### A percentage in the range 1% - 100%

#### DYNAMIC

The subpanel uses the available space of the 3270 session.

The first subpanel is allocated as many rows as it has data. Each subsequent panel is allocated as many of the remaining lines as are available.

### Default value

DYNAMIC

## Examples

LINES=33% or LINES=10

## MINMAX

Determines whether or not the subpanel can be minimized, maximized, and closed.

**Note:** Maximize is currently disabled.

### Possible values

YES, NO

### Default value

YES

If Yes is specified, you must specify a subpanel HEADER, so that the minimize and maximize icons are available.

## Example

MINMAX=YES displays the minimize, maximize, and close boxes in the upper right corner of the subpanel.

## MODE (subpanel)

Indicates that a subpanel should not be displayed. This keyword is used to "hide" a subpanel that is used to run a query, establish variables, or perform an action required by a subsequent panel.

MODE=SILENT

## NAME

Assigns a unique name to a subpanel. Naming a panel allows you to reuse its query.

A subpanel name is 3 to 8 characters, beginning with an uppercase alphabetical character.

## Example

The following example shows four subpanel definitions with each panel assigned a distinct name (ALPHA, BETA, GAMMA, and DELTA).

```

<SUBPANEL>          This is subpanel #1 with a query
NAME=ALPHA          This is its name
QUERY="SELECT .....

<SUBPANEL>          This is subpanel #2 with a query
NAME=BETA           This is its name
QUERY="SELECT .....

<SUBPANEL>          This is subpanel #3 with no query
NAME=GAMMA          This is its name
QUERY=REUSE(ALPHA) Re-using first query

<SUBPANEL>          This is sub-panel #4 with no query
NAME=DELTA          This is its name
QUERY=REUSE(BETA)  Re-using second query

```

## PARTIALCOLS

The dynamic columns feature attempts to put as much information on the screen as possible, which can result in the rightmost column being displayed as only a partial column. Use the scroll bar to see the rest of the column. If you would rather not see a partial column, code PARTIALCOLS=NO .

### Possible values

YES, NO

### Default value

YES

### Example

```
PARTIALCOLS=NO
```

## QUERY

The SQL query that will be used to collect data from the application.

### Possible values

- A valid SQL SELECT statement
- REUSE(*subpanel\_name*)  
uses the data retrieved by the query in the specified subpanel.

All columns (attributes) in a query must be from the same table (attribute group), with a maximum of 100 columns specified on the query. Variables can be used anywhere in the QUERY statement, but only columns specified in a preceding panel can be used as variables.

**Note:** Variables can be used anywhere in the QUERY statement. Column names do not need to be preceded by table names.

### Default value

None

### Example 1: Queries with SELECT statement

```
QUERY='SELECT CICSPLEX, PLEXCPU, PLEXSOS, PLEXRATE, PLEXMAXT,
PLEXENQW, PLEXHSCI, FROM OMCICS.PLEX'
```

```
QUERY='SELECT TRANID, TASKNO, RTYPE, RNAME, STATE, CPUTIME, SUSPTIME,
ELAPTIME, USED16, USED16, ATCHTIME, TIMEOFSU, SUSPDUE, FACTYPE,
FACID, ORIGTRID, UMBTRID, QUEUE, FIRSTPGM, CURRPGM, USERID, EXECCMD,
PURGEABL, PURGSTAT, SUSPTYPE, UOWSTATE,
FROM OMCICS.CICSTRD,
WHERE ORIGINNODE = "&SYSTEMID.&CICSNAME"
AND CICSTRD.TRANID = "&TRANID"
AND CICSTRD.TASKNO = "&TASKNO"'
```

### Example 2: Reused query

```

<SUBPANEL>          This is subpanel #1 with a query
NAME=ALPHA          This is its name
QUERY="SELECT .....

<SUBPANEL>          This is subpanel #2 with a query
NAME=BETA           This is its name
QUERY="SELECT .....

<SUBPANEL>          This is subpanel #3 with no query
NAME=GAMMA          This is its name
QUERY=REUSE(ALPHA) Re-using first query

```

**QUERYLOGIC**  
Special logic rules needed to generate the result rows of the associated QUERY statement.

**Example**

The QUERYLOGIC contents are used only for QUERYTYPE=REXX. The QUERYLOGIC='...' statement controls how data columns and rows are combined from the earlier input queries. The QUERYLOGIC references earlier query results by specifying the subpanel 'name' of the earlier queries. This means you should supply the NAME=xxx statement in each subpanel in your workspace and then reference those NAME values in your final SQL query. See the examples below.

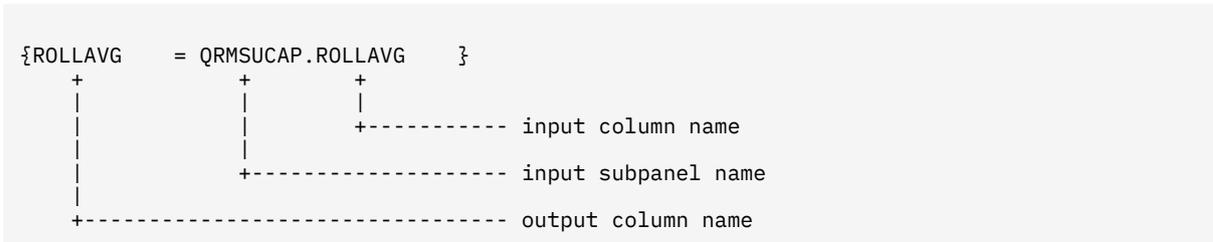

The QUERYLOGIC section is interpreted by a program named KOBQRYEX, which is named in the QUERY='...AT(KOBQRYEX)...' statement for your output table.

The QUERYLOGIC contains sections marked by left and right braces for every column in your output table. The QUERYLOGIC statements must contain the same number of {...} sections as there are columns in the SELECT clause of your QUERY statement.

Within each {...} section, there is an 'assignment' statement that contains an output column name, an equal sign (=), and then the value to be assigned to the column. For example:

```
{ROLLAVG=QRMSUCAP.ROLLAVG}
```

This assignment statement says that the ROLLAVG column in your output table is to get its data from the ROLLAVG column in an earlier <SUBPANEL> query. That earlier query is the one contained in the <SUBPANEL> that contains a NAME=QRMSUCAP statement.

The earlier subpanel would look like this:

```

<SUBPANEL>
NAME=QRMSUCAP
...
QUERY="SELECT ROLLAVG, ...
FROM KM5.KM5MSUCAP WHERE SYSTEM.PARMA('NODELIST', '*MVS_SYSTEM', 11)
AND RECTYPE = 1 ORDER BY PCTMSUCP DESC"
...
<SUBPANELEND>

```

That assignment statement in the QUERYLOGIC is simply copying a column value from one of the input tables into a column of your output table.

**Possible Values**

See examples below and the online Help information within the Enhanced 3270 User Interface.

**Default Value**

None

## Example:

```
QUERYLOGIC="
{ROLLAVG      = QRMSUCAP.ROLLAVG      }
{LPARCAPLIM   = QRMSUCAP.LPARCAPLIM   }
{PCTMSUCP     = QRMSUCAP.PCTMSUCP     }
{SMFID        = QRSYSCFG.SMFID[ORIGINNODE=QRMSUCAP.ORIGINNODE] }
{LPARNAME     = QRSYSCFG.LPARNAME[ORIGINNODE=QRMSUCAP.ORIGINNODE] }
{PLXNAME      = QRSYSCFG.PLXNAME[ORIGINNODE=QRMSUCAP.ORIGINNODE] }
"
```

## QUERYTIMEOUT

Specifies the amount of time, in seconds, that can elapse before a query expires if no data is returned. The default is 10 seconds.

### Possible values

1 - 99

### Default value

10

## Example

```
QUERYTIMEOUT=30
```

## QUERYTYPE

The type of query to be used. This setting is valid only if QUERYMODE=LIVE.

### Possible values

REGISTRY

ROUTER

INTERNAL

PDS

REXX

### Default value

ROUTER

## Example

```
QUERYTYPE=ROUTER
```

## QUERYWHEN (subpanel)

Forces data collection when the default behavior is to not drive data collection, or surpresses collection until user types in information.

QUERYWHEN= [ENTER | RETURN | MIN | COLLAPSE | ZQUERY]

### Possible values

- ENTER  
Drives query when Enter key is pressed
- RETURN  
Drives query when user returns to the workspace.
- MIN  
Drives query when subpanel is minimized.
- COLLAPSE  
Drives query when subpanel is collapsed.
- ZQUERY  
Suppresses a query until the user types something in, even when the Enter key has been pressed. For example, you might want to suppress a Take Action command or Get Response query until the user has actually entered some kind of command. So, the REXX EXEC that builds the data field used in the query will also set the variable ZQUERY=YES. The subpanel in question is be coded with

QUERYWHEN=ZQUERY, so it will only be driven when the variable is set (that is, a positive value like YES). If ZQUERY is null, the query is not driven.

#### Default value

By default, no data collection is driven when subpanels are scrolled, expanded, collapsed, or minimized. No collection is driven during when pulldown or popup panels are being displayed, and no collection is driven during backward navigation.

#### Example

```
QUERYWHEN=COLLAPSE
```

#### SCROLLBAR

Determines whether the subpanel displays the right, left, up, and down arrows for scrolling. This setting applies only to SUMMARY type displays.

#### Possible values

YES, NO

#### Default value

YES

#### Example

SCROLLBAR=YES displays

#### SCROLLCOLS

Suppresses column FROM TO indicators if only one column is displayed and no scrolling is required.

SCROLLCOLS=NO

#### SCROLLROWS

Suppresses row FROM TO indicators if only one row is displayed and no scrolling is required.

SCROLLROWS=NO

#### SELECTROW

This is a formula that controls the selectability of each row in the subpanel (whether an action command is allowed for the row, as indicated by an underscore character). For each row of data in the subpanel, the value of the specified column is compared against a constant value you supply. If the comparison between the column's value and the constant value is true, then the row is selectable. The value may be a string enclosed in single or double quotes or a decimal integer value.

For TYPE=TREE subpanels, the allowed formats are:

- SELECTROW=column\_name>value
- SELECTROW=column\_name<value
- SELECTROW=column\_name>=value
- SELECTROW=column\_name<=value
- SELECTROW=column\_name=value
- SELECTROW=column\_name<>value
- SELECTROW=column\_name\=value

#### SKIP

The number of rows to skip before the first data row.

#### Possible values

0 - 2

#### Default value

0

#### Example

SKIP=1

#### SORTCOLS

Lists the columns that are returned from the QUERY command that are eligible to be sorted. This value must be specified after the subpanel's QUERY statement.

**Note:** The number of columns to be sorted can have performance implications for loading a workspace. See [“Workspace sort columns” on page 961](#) for considerations related to the SORTCOLS keyword.

#### Possible values

- ALL (displays all columns specified in the query)
- A comma-separated list of column names specified in the query, enclosed in single quotes. Up to 30 column names can be specified.
- None

#### Default value

None

#### Example

```
SORTCOLS= 'CICSPLEX, PLEXRATE, PLEXCPUP'
```

#### SPACE

The number of blank lines between rows of data.

#### Possible values

0-2, optionally followed by the ONBREAK control (`ONBREAK=columnname`). The ONBREAK control indicates that a space should be inserted only when the value in a particular column changes in the following row.

#### Default value

0

#### Example

```
SPACE=1, ONBREAK=UOWID
```

#### STARTCOLAPS

Determines whether or not the subpanel is collapsed when the workspace is initialized.

#### Possible values

YES, NO

#### Default value

NO

#### Example

```
STARTCOLAPS=YES
```

#### STARTMIN

Determines whether or not the subpanel is minimized when the workspace is initialized.

#### Possible values

YES, NO

#### Default value

NO

#### Sample

```
STARTMIN=YES
```

#### STATICCOLS

Specifies the number of static columns of a subpanel. These columns stay in place while a user scrolls right or left. This setting applies only to SUMMARY type subpanels and must be specified after the subpanel's QUERY statement. Applies to the column order indicated in the DISPLAYCOLS statement, unless DISPLAYCOLS is ALL, in which case the order of the columns is the same as specified in the query.

### Possible values

A number in the range 0– $n$ , where  $n$  is the maximum number of columns that will fit on the screen, minus 1. If the number of static columns exceeds the screen capacity, scrolling is disabled.

### Default value

0

### Example

```
STATICCOLS=2
```

### STATUSCOLS

Specifies which columns in a summary are assessed for status. This setting must be specified after the subpanel's QUERY statement.

### Possible values

ALL

Names of one or more columns returned by the QUERY command. Use a comma-delimited list for more than one name, enclosed in quotation marks.

**Important:** Using ALL results in increased overhead. Use ALL only for Overview-type subpanels, if at all.

NO

**Tip:** Using NO bypasses assessing status for the subpanel, reducing overhead.

### Default value

None

### Sample

```
STATUSCOLS=' PAGERATE , CPUUTIL '
```

### TEXT

Specify the content of subpanels of TYPE=TEXT.

The text that follows TEXT= can include a small set of HTML and proprietary markup tags (see [“Tags for formatting text” on page 1059](#)). If the text consists of more than one word, it must be enclosed in single quotation marks. Variables can be used in the text.

### Example

The following definition illustrates the use of HTML and proprietary tags in the definition of a subpanel:

```
<SUBPANEL>
TYPE=TEXT
MINMAX=NO
EXPANDCOLAPS=N
BOXBOTTOM=NO
TEXT='<color=yellow
<H1><center>Existing Hub Connection Unavailable</H1></color>
<br>
Your current profile
<color=white>(&ZPROFILE)</color>
specified TEMS
<color=white>&ZHUBNAME</color>
using port number
<color=white>&ZHUBPORT.</color>
The initial attempt to contact it has failed
for one of the following reasons:
<ul>
<li>It is no longer running or online </li>
<li>Some of the above information is no longer valid</li>
</ul>
```

```

<p>
This Connectivity dialog will assist you in locating all available
TEMS data sources within your Sysplex.
Select the
<color=white>NEXT</color>
pushbutton to proceed. If your 3270 emulator is not
enabled for mouse click operations,
place your cursor on the NEXT pushbutton and press ENTER.
<br>'

```

produces the following subpanel:

```

                EXISTING HUB CONNECTION UNAVAILABLE

Your current profile (MCRUM) specified TEMS MSD0HAHB:CMS at IP address
::ffff:9.42.46.125 using port number 11757. The initial attempt to contact
it has failed for one of the following reasons:

● It is no longer running or online
● Some of the above information is no longer valid

This Connectivity dialog will assist you in locating all available TEMS
data sources within your Sysplex. Select the NEXT pushbutton to proceed.
If your 3270 emulator is not enabled for mouse click operations, place
your cursor on the NEXT pushbutton and press ENTER.

```

#### TOFROMHEADER

Determines whether to display a header that indicates how many rows and columns the subpanel is displaying, out of the total number of rows and columns. Applicable only to SUMMARY type displays.

#### Possible values

YES, NO

#### Default value

YES

#### Example

TOFROMHEADER=YES shows

#### TREEBRANCHES

Indicates whether or not to display branches of tree.

#### Possible values

VISIBLE, INVISIBLE

#### Default value

VISIBLE

#### Example

TREEBRANCHES=VISIBLE

#### TREEBUTTONS

Specifies whether or not the Expand/Collapse push-buttons should be displayed.

TREEBUTTONS=YES | NO

#### Possible values

YES

Keeps the Expand/Collapse buttons displayed.

NO

Removes the Expand/Collapse buttons.

#### Default value

YES

#### Example

```
TREEBUTTONS=YES
```

#### TREECOLLAPSE

Determines whether tree is collapsed or open; and if open, to what level.

**Possible values**

ALL, NONE, *n*, where ALL means that the tree is totally collapsed, NONE means that the tree is totally open, and *n* is an integer that specifies the collapsed tree level on entry into the workspace. A value of 0 indicates that the tree is totally open.

**Default value**

NONE or 0

**Example**

TREECOLLAPSE=NONE

TREEHSEP1

Specifies the number of blanks between tree widget and the node icon.

TREEHSEP1=*n*

**Default value**

1

**Example**

```
TREEHSEP1=1
```

TREEHSEP2

Specifies the number of blanks between tree icon and node name.

TREEHSEP2=*n*

**Default value**

2

**Example**

```
TREEHSEP2=2
```

TREEICON

Specifies whether or not to display an icon associated with this tree node.

TREEICON=YES | NO

**Possible values**

**YES**

Display an icon to be associated with this tree node.

**NO**

Do not display an icon to be associated with this tree node.

**Default value**

NO

**Example**

```
TREEICON=NO
```

TREELEVEL

This is the name of one of the columns within the QUERY="..." statement that contains an integer value that defines the 'tree level' for a Status Tree or a Help Tree. The TREELEVEL column you select controls the visual hierarchy of the branches (their indentation level).

TREELEVEL=column\_name

**Example**

TREELEVEL=LEVEL

TREEROOT

Indicates which tree level represents the root level.

**Possible values**

0, 1

**Default value**

0

**Example**

TREEROWTYPE  
TREEROWTYPE=0

This is the name of one of the columns within the QUERY=" . . ." statement that contains an integer value that defines the 'row type' for a Status Tree or a Help Tree. The TREEROWTYPE column you select controls the types of actions that are allowed for particular rows in a Tree.

TREEROWTYPE=column\_name

**Example**

TREESTATE  
TREESTATE=ROWTYPE

This is the name of one of the columns within the QUERY=" . . ." statement whose value is used to color an optional icon that appears near the left edge of the tree.

TREESTATE=column\_name

**Example**

TREEWIDGET  
TREEWIDGET=REALTIME

Specifies whether to color code the tree widgets in reverse video white.

**Possible values**

HIGHLIGHT, NOHIGHLIGHT, where NOHIGHLIGHT specifies to color code the tree widgets in reverse video white.

**Default value**

HIGHLIGHT

**Example**

TYPE  
TYPE=HIGHLIGHT

Determines the formatting of the subpanel.

TYPE=[SUMMARY | DETAIL | TEXT | ACTION | PUSHBUTTON | TABDIALOG | TREE]

**Possible values**

**SUMMARY**

Displays queried data for multiple targets (such as plexes, LPARs, and address spaces) in tabular form, with each column displaying the values for a particular property, or attribute, for each target (["Figure: Example of a SUMMARY subpanel" on page 1051](#)).

**DETAIL**

Displays queried data for a selected target in columns of attribute/value pairs (["Figure: Example of a DETAIL subpanel" on page 1051](#)). In detail subpanels, all data is right-aligned.

**TEXT**

Allows use of freeform text and a subset of HTML formatting tags. Text is entered using the TEXT= keyword. No QUERY or QUERY-related keywords can be used with subpanels of this type.

**ACTION**

For use with workspaces specified MODE=SILENT. Allows actions, like queries, to be executed from the panel, without the users seeing the panel. The panel is invoked as many times as selections are passed to it.

**PUSHBUTTON**

Use this type to code one or more reverse video push-buttons. This type is a special version of <ISPPANEL> that supports the PS (Point and Shoot) field type.

**TABDIALOG**

Use this type value to implement subpanel tabs. This type requires the special keyword TAB. An example is shown in “Figure: Example of a TABDIALOG subpanel definition and the resulting subpanel” on page 1052.

**TREE**

Sub-panel will render display column #1 as a tree structure.

**Default value**

SUMMARY

**Example 1: TYPE=SUMMARY**

Specifying TYPE=SUMMARY results in a subpanel like the one in “Figure: Example of a SUMMARY subpanel” on page 1051:

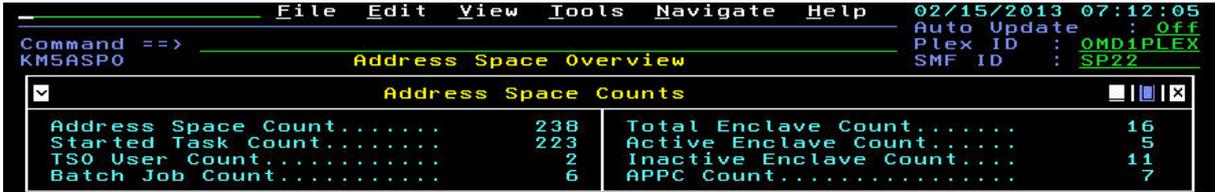

Figure 194: Example of a SUMMARY subpanel

**Example 2: TYPE=DETAIL**

Specifying TYPE=DETAIL results in a subpanel like the one in “Figure: Example of a DETAIL subpanel” on page 1051.

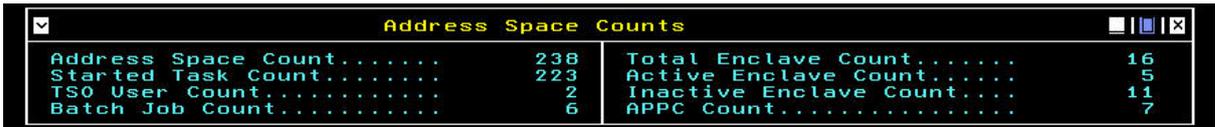

Figure 195: Example of a DETAIL subpanel

**Example 3: TYPE=TEXT**

Specifying TYPE=TEXT results in a subpanel like the one shown in “Figure: Example of a TEXT subpanel” on page 1051.

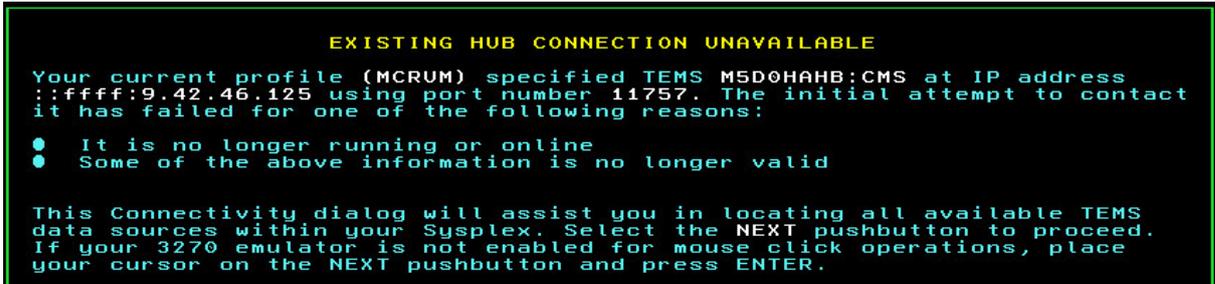

Figure 196: Example of a TEXT subpanel

**Example 4: TYPE=ACTION**

**Example 5: TYPE=PUSHBUTTON**

Specifying TYPE=PUSHBUTTON results in a subpanel like the one shown in “Figure: Example of a PUSHBUTTON subpanel” on page 1051.

Figure 197: Example of a PUSHBUTTON subpanel

**Example 6: TYPE=TABDIALOG**

“Figure: Example of a TABDIALOG subpanel definition and the resulting subpanel” on page 1052 specified by using TYPE=TABDIALOG.

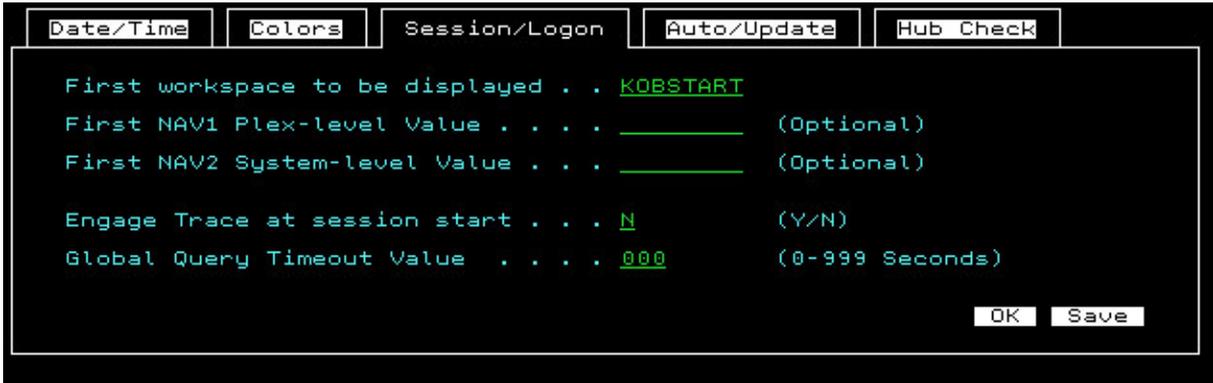

Figure 198: Example of a TABDIALOG subpanel definition and the resulting subpanel

```
<SUBPANEL>
TYPE=TABDIALOG
TAB="Date/Time",KOBPRFDT
TAB="Colors",KOBPRFCL
TAB="Session/Logon",KOBPRFSS
TAB="Auto/Update",KOBPRFAU
TAB="Hub Check",KOBPRFHB
<SUBPANELEND>
```

### Example 7: TYPE=TREE

Specifying TYPE=TREE results in a subpanel like the one shown in Example of a TREE subpanel.

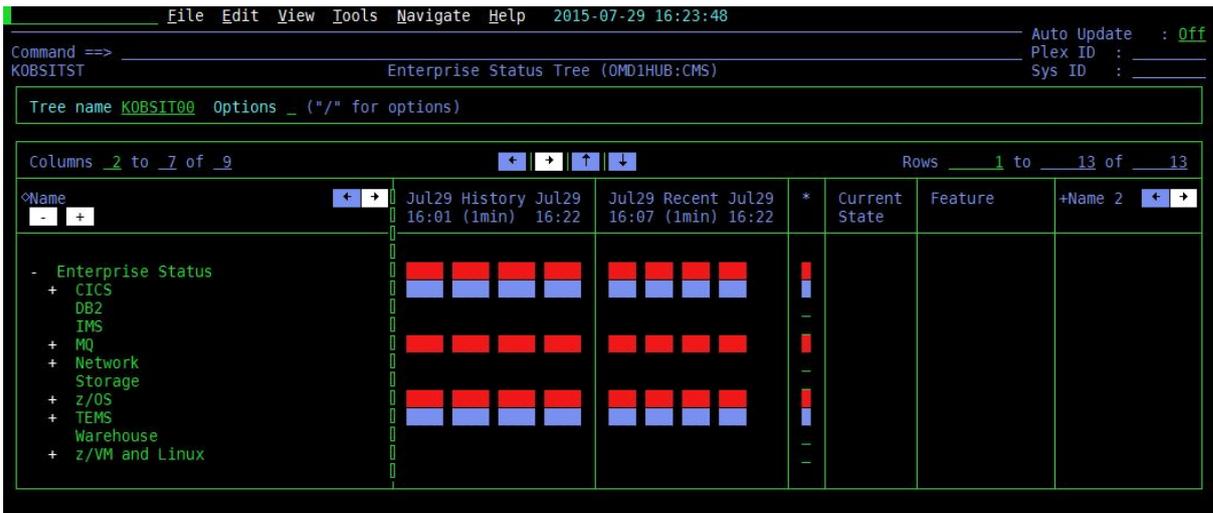

Figure 199: Example of a TREE subpanel

#### VSEPARATORS

Determines whether or not a subpanel displays vertical separators between columns .

#### Possible values

YES, NO

#### Default value

YES

#### Example

VSEPARATORS=NO

#### WHENDATA

Determines whether to expand, maximize, or shrink a subpanel when the subpanel has data to display.

#### Possible values

- Expand

- **Maximize**
- **Shrink.** The row count of the subpanel is dynamically decreased to the number of rows of collected data and subpanel is automatically expanded if collapsed, or maximized if minimized.

**Default value**

Shrink

**Note:** If Expand is specified, code EXPANDCOLLAPSE=Y, so users can collapse the subpanel.

**Example**

WHENDATA=M

**WHENNODATA**

Determines whether to collapse, minimize, or shrink a subpanel when the subpanel has no data to display.

**Possible values**

- **Collapse**
- **Minimize**
- **End (close)**  
If no data is retrieved on the initial query or entry to the workspace, the subpanel is "deleted" and any query it contains is not run again on a refresh until the panel is reentered.
- **Shrink** (the number of rows in the subpanel is dynamically decreased to null when there is no data).
- **Hide.** Use instead of End if you want the subpanel to reappear when data is available again.

**Default value**

Collapse

**Note:** If Collapse is specified, code EXPANDCOLLAPSE=Y so users can expand the subpanel.

**Example**

WHENNODATA=COLLAPSE

**ZOOMCOLS**

Specifies the columns that can be selected for cursor-sensitive navigation (zooming) to another panel. The target panel ID for each column is specified immediately after the column name. In columns that are zoomable, the text is white. This setting must be specified after the subpanel's QUERY statement.

When the cursor is placed on the field for which zooming is defined and user presses ENTER, forward navigation occurs, except when column 1 in a summary panel is selectable. In this case, the subpanel ACTION statements define the destination. By default, S and its associated panel ID are used when column 1 is implicitly selected, but a workspace developer can indicate DEFAULT on any action statement.

**Possible values**

- None
- A comma-delimited list of names of one or more columns specified in DISPLAYCOLS, followed by the name of a target workspace in parentheses
- In a PROLOG or EPILOG stanza, a variable

**Default value**

None

**Example 1: multiple columns with multiple destinations**

In this example, multiple columns are assigned multiple destinations:

<i>Table 80: ISPF variables supported by the enhanced 3270 interface</i>	
<b>Variable Name</b>	<b>Description</b>
ZUSER	User ID
ZSYSID	LPAR name
ZSYSPLEX	Sysplex name
ZAPPLID	Applid of application
ZIPADDR	IP address
ZIPPORT	IP port
ZSPLIT	Split-screen mode in effect (YES or NO)
ZTS	Multicultural support time separator character (:)
ZSCREENW	Screen width
ZSCREEND	Screen length
ZDATEF	Date MM/DD/YYYY
ZSTDYEAR	4-digit year YYYY
ZYEAR	2-digit year YY
ZMONTH	2-digit month MM
ZDAY	2-digit day DD
ZDAYOFWK	Full word day of week
ZJDATE	Julian date YY.DDD
ZJ4DATE	Julian date with 4 digit year YYYY.DDD
ZCS	Currency symbol
ZTHS	Thousands separator
ZTIME	5-digit time HH:MMM
ZCMDLINE	Contains whatever is entered on the command line, in all upper case.
ZCMDLINEMC	Contains whatever is entered on the command line, in mixed case.

“Supported OMEGAMON variables” on page 1055 lists the OMEGAMON-specific variables that are supported by the enhanced 3270 user interface.

<i>Table 81: Supported OMEGAMON variables</i>	
<b>Variable name</b>	<b>Description</b>
ZJOBNAME	Started task name
ZVTAMNETID	VTAM net ID
ZVTAMSSCP	VTAM subsystem control point
ZIPHOSTNAME	IP host name
ZOMEGVRM	OMEGAMON version level
ZOMEGLVL	OMEGAMON build level
ZDOW	3-letter day of week
ZACTIONFILTER	Optionally set by a REXX EXEC to an array of one or more alphanumeric characters that map to the ACTION command characters.

Variable name	Description
ZFILTER $nn$	<p>Specifies the filter for filtering at the agent (where FILTERWHERE=AGENT). <math>nn</math> is a 2-digit number from 01 to 10. The value of the variable must be a column name followed by a comparator, followed by a value. Column names can be 1 to 10 characters, with no trailing blanks. Comparators can be one of the following four symbols: =, &lt;, &gt;, or &lt;&gt;, with no trailing blanks. Values can be alphanumeric and can currently support a trailing asterisk.</p> <p>For example:</p> <pre>SET ZFILTER01=CICSNAME=C* SET ZFILTER02=SOS=1 SET ZFILTER03=TASKS&gt;100</pre>
ZHEADER	For header in message popup panels. Supports up to 46 bytes. For use with ZMESSAGE.
ZMESSAGE	General purpose message service for display on screen. Supports up to 256 bytes. For use with ZHEADER.
ZOMEGLOCK1	If the value is set to N, unlocks the plex field in the workspace so the value can be overtyped. As you navigate forward, the new value is perpetuated and the field is locked again.
ZOMEGLOCK2	If the value is set to N, unlocks the system field in the workspace so the value can be overtyped. As you navigate forward, the new value is perpetuated and the field is locked again.
ZOMEGNAV1	The plex for which data is being displayed.
ZOMEGNAV2	The system, region, or subsystem for which data is being displayed.
ZQUERY	Engages or disengages a query being driven. The REXX EXEC that builds the data field used in the query also sets ZQUERY=YES. The subpanel is coded with QUERYWHEN=ZQUERY so it is driven only when the variable is set (that is, with a positive value like YES). If ZQUERY is null, the query is not driven.
ZSELECTION	Passed into a REXX EXEC in an ONACTION stanza, contains the single character entered by the user. (May be null if user pressed PF3.)
ZVIEWS $nn$	<p>Specifies the filter for filtering existing data (where FILTERWHERE=LOCAL). <math>nn</math> is a 2-digit number from 01 to 10. The value of the variable must be a column name followed by a comparator, followed by a value. Column names can be 1 to 10 characters, with no trailing blanks. Comparators can be one of the following four symbols: =, &lt;, &gt;, or &lt;&gt;, with no trailing blanks. Values can be alphanumeric.</p> <p>For example:</p> <pre>SET ZVIEW01=CICSNAME=CICSABCD SET ZVIEWS02=SOS=1 SET ZVIEWS03=TASKS&gt;100</pre>
ZCLRBOXL	Color variable for box lines.
ZCLRABAR	Color variable for the action bar.
ZCLRCMDL	Color variable for command line

Variable name	Description
ZCLRABKW	Color variable for action bar keywords
ZCLRPANH	Color variable for panel header
ZCLRPKEY	Color variable for panel keywords
ZCLRPID	Color variable for panel ID
ZCLRPANT	Color variable for panel trailer
ZCLRSUBH	Color variable for subpanel header
ZCLRTEXT	Color variable for standard text
ZCLRCOLH	Color variable for column headers
ZCLRPB	Color variable for push buttons
ZCLRGOOD	Color variable for status OK/Good
ZCLRWARN	Color variable for status Warning/caution
ZCLRERRC	Color variable for status Error/Critical

**Note:** Use color variables instead of hard coding a color in an ISPF attribute

### User-defined variables

The enhanced 3270 user interface supports the use of user-defined variables. Variables can be created and set anywhere in a workspace definition using a SET statement. In addition, columns names specified using the KEYCOLS keyword in a previously invoked workspace can be used as variables in subsequent panels, without using a SET statement.

Variables can be set anywhere in a definition, but they are processed differently depending upon where the SET statement appears.

- Variables set in an ALIASCOMMANDS stanza can be used in fastpath commands from that workspace, if SCOPE=LOCAL, or from any workspace after they have been defined until they are deleted, if SCOPE=GLOBAL.
- Variables set in PROLOG stanzas are assigned during PROLOG execution. Assignment occurs after any imbeds and before data collection. If a REXX exec is also present, the SET commands are evaluated according to their placement, before, or after, the REXX EXEC call.
- Variables set in EPILOG stanzas are assigned during EPILOG execution. Assignment occurs after data collection or status assessment and before the screen is constructed. If a REXX exec is also present, the SET commands are evaluated according to their placement, before, or after, the REXX EXEC call.
- Variables set in an ONACTION stanza are executed directly after key column assignment, and just before any navigation that results from an action command. (Key columns are assigned before navigating forward if any action command is driven from a particular subpanel.)
- Variables set anywhere else are processed when the workspace is loaded.

Variable names may consist of up to 16 characters.

**Note:** Do not create variables that begin with Z (or z). That letter is reserved for system variables.

Variable data may consist of up to 64 characters and can be set to specified values or to other variables. For example:

```
SET &var1=mytext
SET &var2=&colname
```

There is a limit of 20 deferred SET commands for a workspace. (Deferred SET commands are those in PROLOG, EPILOG, and ONACTION stanzas.)

### Example: column names as variables

Column names specified using the KEYCOLS keyword in a previously invoked panel can be used as variables in subsequent panel definitions, without using a SET statement. For example, if the following column names have been set in a previous panel:

```
KEYCOLS='TRANID,USERID,TASKNO,TERMID,CICSNAME,SYSTEMID,ORIGINNODE'
```

one or more of these names can be used as variables in a header, query, or any text in a panel navigated to from the first panel. For example:

```
HEADER='Details for Transaction &TRANID Task &TASKNO'  
QUERY='SELECT TRANID, TASKNO, RTYPE, RNAME, STATE, CPUTIME, .SUSPTIME,  
ELAPTIME, CICSTRD.USEDA16, USEDB16,  
ATCHTIME, TIMEOFSU, SUSPDUE, FACTYPE, FACID, ORIGTRID, UMBTRID,  
QUEUE, FIRSTPGM, CURRPGM, USERID, EXECCMD, PURGEABL, PURGSTAT,  
SUSPTYPE, UOWSTATE,  
FROM OMCICS.CICSTRD,  
WHERE ORIGINNODE = "&SYSTEMID.&CICSNAME"  
AND CICSTRD.TRANID = "&TRANID"  
AND CICSTRD.TASKNO = "&TASKNO"'.
```

## Supported ISPF statements

The enhanced 3270 user interface supports a subset of ISPF statements.

The following statements are supported in an ISPF stanza in a subpanel or popup panel:

```
)LIST  
)BODY  
)INIT  
)ATTR  
)PROC  
)PNTS  
)END
```

LIST supports the following arguments:

### POPUACTION

Lists the actions in a subpanel in the popup panel definition.

### PANELACTION

Lists the actions in the subpanel from which the popup panel was invoked.

### DYNAMIC

Lists actions from dynamically generated list, such as a list generated by a REXX exec.

### TRACETABLE

### STACK

BODY supports the following arguments:

#### WIDTH (*n*)

#### WINDOW (DYNAMIC|*width,depth*)

)ATTR supports the following field types:

- INPUT
- OUTPUT
- TEXT
- PS (Point-and-Shoot)

)ATTR supports the following keywords:

- CAPS
- COLOR

- HILITE
- JUST
- INTENS
- SKIP

)INIT supports up to 32 system (Z) variables.

## Tags for formatting text

The enhanced 3270 user interface supports the use of a small subset of HTML tags and some proprietary tags that can be used to format the text specified using the TEXT keyword in a subpanel of TYPE=TEXT.

Note that formatting is not required. Freeform text is supported in these subpanels.

### HTML tags

The enhanced 3270 user interface supports use of the HTML tags shown in “Supported HTML tags” on page 1059.

Table 82: Supported HTML tags		
Type	Tagging	Description
Heading	<h1></h1>	Text enclosed by h1 tags is displayed in all capitals and is followed by a line break. The text can be centered using a <center> tag. For example: <h1><center>TEXT IN CAPS</h1>
Paragraph	<p></p>	Inserts two line breaks (that is, an empty line) before the text.
Unordered list	<ul></ul>	Displays the list items between the tags in a bulleted list.
Ordered list	<ol></ol>	Displays the list items between the tags in a sequentially numbered list.
List items	<li></li>	Contains the text for an entry in a bulleted or numbered list.
Line break	 	Forces a line break. Can be used to create an empty line.
Hypertext link	<a href="panelid"></a>	Text enclosed by the <a></a> (anchor) tags is white (selectable) and underlined. Cursoring over the text and pressing Enter displays the workspace referenced. Only links to other workspace panels are supported.
Emphasis	<em></em>	Text enclosed by the tags is underlined.
Comment	<!-- -->	Text is not displayed.

Spaces between words within tags are preserved, so spaces can be used to align text.

### Additional tags

The enhanced 3270 user interface supports the proprietary formatting tags shown in “Non-HTML formatting tags” on page 1059.

Table 83: Non-HTML formatting tags		
Type	Tagging	Description
Color	<color=color></color>	Can be placed around any word or element. The color is in effect until the end tag or the end of the subpanel if there is no end tag. Any color name supported by the 3270 interface is supported.
Alignment	<center>	Centers text. The center alignment is in effect until the end tag for the element.

## Example

The following example shows the use of the TEXT keyword to specify the text to appear in the subpanel.

```
/*
/*          TEXT SUBPANEL
/*
/*
/*
<WORKSPACE>

<SUBPANEL>
TYPE=TEXT

HEADER='Help for &INSPECT'

TEXT='<h1><center>This is a centered H1 Header</h1>
<br>
Welcome to SYSPLEX <color=yellow>&ZSYSPLEX</color>.
<WORKSPACEEND>
```

## Associating a mouse click with the Enter key

Many 3270 emulators support an option to associate a mouse click with the Enter key.

### About this task

You might prefer to associate a mouse click with the Enter key in your 3270 emulator session. After you make this association, in contexts where you normally “click and enter”, you can instead “double click.”

### Procedure

- Locatepoint and selectormouse clickconfiguration options for your emulator. For example, in an IBM Personal Communications emulator window, select **Edit > Preferences > Hotspots**. The **Hotspots Setup** window opens. Select **ENTER at cursor position** and click **OK**.

### Result

You can now “double click” with your mouse in place of clicking and pressing Enter for your 3270 emulator session.

## Accessibility features for OMEGAMON® Enhanced 3270 user interface

Accessibility features help users who have a disability, such as restricted mobility or limited vision, to use information technology products successfully.

The major accessibility features in this product enable users in the following ways:

- Use assistive technologies, such as screen-reader software and digital speech synthesizer, to hear what is displayed on the screen. Consult the product documentation of the assistive technology for details on using those technologies with this product.
- Operate specific or equivalent features using only the keyboard.
- Magnify what is displayed on the screen.

In addition, the product documentation was modified to include the following features to aid accessibility:

- All documentation is available in both HTML and convertible PDF formats to give the maximum opportunity for users to apply screen-reader software.
- All images in the documentation are provided with alternative text so that users with vision impairments can understand the contents of the images.

### Accessibility features

The following list includes the major accessibility features supported by the OMEGAMON® Enhanced 3270 user interface:

- Keyboard-only operation
- Interfaces that are commonly used by screen readers

- Keys that are discernible by touch but do not activate just by touching them
- Industry-standard devices for ports and connectors
- The attachment of alternative input and output devices

The OMEGAMON® Enhanced 3270 user interface guide and its related publications are accessibility-enabled.

### **Navigating the interface using the keyboard**

Standard shortcut and accelerator keys are used by the product and are documented by the terminal emulator product. See the documentation provided by your terminal emulator for more information.

### **Magnifying what is displayed on the screen**

The Enhanced 3270 user interface can be used with any 3270 emulator that supports the APL character set. The interface supports screen sizes of 24 x 80, 32 x 80, 43 x 80, 27 x 132, and 62 x 160. Choose the resolution that best suits your requirements. PTF UA76751 enables some 3270 emulators that do not support all APF characters to be used for the Enhanced 3270 user interface.

### **Interface information**

The OMEGAMON® Enhanced 3270 user interface supports all the accessibility features supported by your emulator. If you are using IBM® Personal Communications, for information on its accessibility features, see [Using Emulator Sessions](#). If you are using a third-party emulator, see the documentation for that product for accessibility information.

### **IBM® and accessibility**

See the [IBM® Human Ability and Accessibility Center](#) for more information about the commitment that IBM® has to accessibility.

## **OMEGAMON multi-tenancy**

---

OMEGAMON multi-tenancy mode is a feature in the OMEGAMON enhanced 3270 user interface that allows the monitoring of distinctly separate sets of resources. In multi-tenancy mode, users can access information for resources assigned to their tenant only and cannot access information about the resources of another tenant.

### **Overview of OMEGAMON multi-tenancy**

The OMEGAMON multi-tenancy solution allows the monitoring of distinctly separate sets of resources. With OMEGAMON multi-tenancy, general users can access information for resources assigned to their tenant only and cannot access information about the resources of another tenant. For example, an IT service provider or data center might provide services to multiple, unrelated customers and the services might need to be tracked separately by customer. In the OMEGAMON multi-tenancy solution, each customer would be considered a tenant. The OMEGAMON administrator or system programmer would configure the multi-tenancy feature, and the general end user would have access to only those OMEGAMON products and resources that are assigned to the customer with which the user is associated.

### **OMEGAMON multi-tenancy concepts and architecture**

Use this topic to familiarize yourself with the concepts and architecture upon which the OMEGAMON multi-tenancy feature is based.

#### **Monitoring environment**

The monitoring environment for an OMEGAMON multi-tenancy scenario has the following components:

- Tivoli Enterprise Monitoring Server (TEMS). The OMEGAMON multi-tenancy solution allows data collection from multiple LPARs using a single TEMS.
- Tivoli Enterprise Monitoring Agents (TEMA)
- Enhanced 3270 user interface (enhanced 3270UI)
- Tivoli Enterprise Portal (TEP). The TEP is used for configuration.
- User-defined Managed Systems Lists (MSLs)

- User-defined tenant (customer) definitions

## Managed systems lists (MSLs)

The OMEGAMON multi-tenancy feature uses *Managed Systems Lists (MSLs)*, which are defined sets of resources, to restrict access to resources by tenant. The following explanation describes how the MSLs are used.

In general, for data collection, an OMEGAMON client issues an SQL query to a TEMS, which in turn is passed to one or more agents. The SQL query requests one or more columns from one or more tables. The key element in the query is the information that tells the TEMS which agent to invoke. This element is called an *origin node* and is a unique token that the agent registers with the TEMS when the agent starts up.

The following example requests information for a CICS region on an LPAR:

```
SELECT COLUMN1, COLUMN2, COLUMN3, FROM PRODUCT.CICSTABLE,
WHERE (ORIGINNODE = 'LPAR.CICSNAME' )
```

The origin node is referred to as a *Managed System Name (MSN)* and identifies one agent monitoring one system or subsystem. However, many requests need to target multiple agents monitoring multiple systems, and so instead of an origin node, a *Managed Systems List (MSL)* is used. An MSL is a list of MSNs, or origin nodes.

The following example requests information using an MSL:

```
SELECT COLUMN1, COLUMN2, COLUMN3, FROM PRODUCT.PLEXTABLE,
WHERE SYSTEM.PARMA=( 'NODELIST' , "OMEGAMON-CICS-LIST" ,18)
```

In this example, the OMEGAMON-CICS-LIST is an MSL that contains one MSN for every CICS region that belongs in the same CICSplex.

Each OMEGAMON product provides an out-of-the-box MSL that is used to contain all discovered systems or subsystems that belong to it. In an OMEGAMON single-tenant configuration, the product-provided MSLs are used for data collection, allowing inclusion of all discovered resources. In an OMEGAMON multi-tenancy configuration, for each tenant, you must define one or more MSLs (one MSL for each *managed system type*) and include only those systems that belong to that tenant. The user-defined MSLs are then used in the system-generated SQL queries for data collection and limit the scope of collection to only those resources that have been included.

OMEGAMON products that generate queries using the following format are supported in multi-tenancy mode:

```
SYSTEM.PARMA=( 'NODELIST' , "msl" , nn)
```

Where *msl* is the product-provided MSL name and *nn* is the length of the name in characters.

**Note:** A *managed systems list* is also referred to as a *managed system list* and a *managed system group*.

## Silent first workspace

The OMEGAMON multi-tenancy solution uses a silent workspace (KOBLOGON) as the first workspace. The silent first workspace retrieves the multi-tenancy information for the user ID that is logging on, and then calls the designated first workspace to display.

## OMEGAMON multi-tenancy user types

This topic describes the available multi-tenancy user roles and the differences between them.

In a multi-tenancy environment, there are three types of users: a regular user, a power user and a super user. Each user type has a different level of access to resources and features. The regular user and the power user have access only to the tenant (customer) to which the user is defined, whereas the super user has access to all tenants in the environment. Additionally, the regular user and the power user have limited access to some of the enhanced 3270 user interface features, whereas the super user has access to all features. The following list describes access by user type.

### user

The regular tenant user has access to resources only for the tenant (customer) to which the user is defined, with limited access to some enhanced 3270 user interface features. The following list describes the available access for the regular tenant user:

- Access to data for the customer to which user ID is defined
- Access to products (product tabs) to which user ID is defined

**Note:** The PF9 key, used for lateral navigation between products, is disabled.

- Access to a subset of menu options
- All icons are disabled
- Access to a subset of commands
- The **=panelid** navigation command is disabled
- The Plex ID (NAV1) field is read-only
- The Sys ID (NAV2) field is unlocked, or is as set by the individual OMEGAMON product
- The name of the customer is displayed in the footer

#### power user

The power user has access to resources only for the tenant (customer) to which the user is defined, with access to more enhanced 3270 user interface features than the regular tenant user. The following list describes the available access for the power user:

- Access to data for the customer to which user ID is defined
- Access to all products for the customer

**Note:** The PF9 key, used for lateral navigation between products, is enabled.

- Access to all menu options
- Access to all icons
- Access to all commands
- The **=panelid** navigation command is enabled.
- The Plex ID (NAV1) field is read-only
- The Sys ID (NAV2) field is unlocked, or is as set by the individual OMEGAMON product
- The name of the customer is displayed in the footer

#### super user

The super user has access to all resources for all customers and can access all enhanced 3270 user interface features. The super user has the same abilities as an OMEGAMON user in an environment without multi-tenancy enabled. A super user designation allows the user ID to log on to the enhanced 3270 user interface address space, running in multi-tenancy mode, and not be restricted by any multi-tenancy rules. This capability allows an OMEGAMON system programmer to log on to a multi-tenancy address space and access data from all sources, while regular users are restricted to their own customer views. The following list describes the access for the super user:

- Access to data for all customers
- Access to all products for all customers

**Note:** The PF9 key, used for lateral navigation between products, is enabled.

- Access to all menu options
- Access to all icons
- Access to all commands
- The **=panelid** navigation command is enabled.

- The Plex ID (NAV1) field is unlocked
- The Sys ID (NAV2) field is unlocked, or is as set by the individual OMEGAMON product
- The name of the HUB to which the user is connected is displayed in the footer

For more information about some of the enhanced 3270 user interface features that are unique to operating in multi-tenancy mode, see [“Tenant workspaces” on page 1077](#).

## OMEGAMON multi-tenancy terminology

This topic describes terms as they apply to the OMEGAMON multi-tenancy feature.

### customer

A tenant in an OMEGAMON multi-tenancy configuration. For each customer, a distinct set of resources (defined with MSLs), users, and groups are defined. A user for a particular customer can only access the resources defined to that customer. Multiple customers can exist in multi-tenancy mode.

### group

A tenant definition that logically associates one or more users with the same logon experience and working environment. A group defines the first workspace and the product tabs to display when a user logs on.

### managed system group

See *Managed Systems List*.

### Managed Systems List (MSL)

A defined set of resources. Specifically, an MSL is a list of *Managed Systems Nodes (MSNs)*. The MSL is used to control the scope of data collection. Each OMEGAMON product provides an out-of-the-box MSL that contains all discovered systems or subsystems that belong to it. In a multi-tenancy configuration, one or more MSLs are defined for each tenant to limit the scope of collection. Also referred to as a *managed system list* and a *managed system group*.

### Managed System Node (MSN)

A unique token used for agent identification. An MSN is used in data collection to identify one agent monitoring one system or subsystem. Also referred to as an *origin node*.

### multi-tenancy mode

A feature in the OMEGAMON enhanced 3270 user interface that allows the monitoring of distinctly separate sets of resources.

### managed system type

In OMEGAMON multi-tenancy, the managed system type is a pre-defined value used to identify the OMEGAMON agent or type of managed system when specifying user-defined MSLs in customer definitions. For more information, see [“Creating tenant definitions” on page 1067](#).

### Origin node

See *Managed System Name (MSN)*.

### power user

A designation for a user ID that allows the user access to resources only for the tenant (customer) to which the user is defined, with access to more enhanced 3270 user interface features than the regular tenant user, such as access to all menu options, icons and commands.

### super user

A designation for a user ID that allows the user to log on to the enhanced 3270 user interface address space, running in multi-tenancy mode, and not be restricted by any multi-tenancy rules. This setting allows an OMEGAMON System Programmer to log on to a multi-tenancy address space and access data from all sources while tenants are restricted to their own customer views.

### tenant

A monitoring environment consisting of a distinct set of resources for data collection. See also *customer*.

### tenant user

A defined user in a multi-tenancy environment. The regular tenant user has access to resources only for the tenant (customer) to which the user is defined and has limited access to some enhanced 3270 user interface features.

### user

A tenant definition that establishes the group and customer to which a user ID belongs and indicates if the user ID is designated as a *power user* or a *super user*. Unless the user is designated as a super user, a user can access only those resources that are assigned to the customer to which the user ID belongs.

## Installation

Review information about installing OMEGAMON multi-tenancy support.

OMEGAMON multi-tenancy support is installed as part of OMNIMON Base V7.5.0. For information about installing the framework, see the *Program Directory*.

## Configuration

Perform the necessary steps to configure the OMEGAMON enhanced 3270 user interface to operate in multi-tenancy mode.

### About this task

To configure the OMEGAMON enhanced 3270 user interface for operation in multi-tenancy mode, you must define information about the tenant and the systems to be managed, and you must enable the feature.

Perform the following procedure for each tenant.

### Procedure

1. Define the Managed Systems Lists. See [“Defining a Managed Systems List \(MSL\)” on page 1065](#).
2. Define the customer (tenant) and the relationships between the customer and the MSLs. The required definitions can be made in PDS members or in RACF. See [“Creating tenant definitions” on page 1067](#).
3. Enable multi-tenancy mode. See [“Enabling multi-tenancy mode” on page 1076](#).

## Defining a Managed Systems List (MSL)

Define the MSLs for a tenant.

The Managed Systems List (MSL) is a list of Managed System Name (MSN) entries (or, origin nodes).

Each OMEGAMON provides an out-of-the-box MSL that contains all discovered systems or subsystems that belong to it. This MSL is all that is needed for an environment consisting of only a single tenant.

For an environment that has multiple tenants, one or more MSLs must be defined for each tenant to limit the scope of collection to that of the tenant.

It is recommended that you use the TEP to create your MSLs.

#### Notes:

- A *managed systems list* is also referred to as a *managed system list* and a *managed system group*.
- The TEP **Object Group Editor** stores MSL and MSN data in the Hub TEMS to which it is connected. If the enhanced 3270 user interface is connected to the same Hub TEMS, it has access to that same stored data. Equally true, if the enhanced 3270 user interface **Object Editor** stores data into the TEMS, the TEP will have access to that same stored data.

Before you create your MSLs for your multi-tenant implementation, review the following considerations:

- Naming convention. See [“Naming convention” on page 1065](#).
- Scope of resources to include in the MSL. See [“Scope of resources” on page 1066](#).

### Naming convention

When creating managed systems lists, it is important to choose a naming convention that is meaningful. Although there are not any requirements or validation for the name, the following suggested format is recommended:

`env_OMcode_customer`

Where:

- `env` is the environment, such as T for Test, P for Production, or D for Development
- `OMcode` is the OMEGAMON product code, such as C5 for CICS or I5 for IMS
- `customer` is the customer ID (up to 10 characters)

Additionally, the use of uppercase letters is recommended.

For example, T\_C5\_ACMECORP would be the MSL for CICS test regions for the ACME Corporation.

**Note:** A benefit of using this naming convention is that in the required Customer definition (described in [“Creating tenant definitions” on page 1067](#)), if the MSL name ends with ?, then the customer ID will be substituted.

### Scope of resources

Before you create your MSL, plan what managed system nodes to include; for example, you can create an MSL containing a single CICS region. One MSL must be created for each managed system type.

The following conditions apply when creating your MSL:

- In IBM Z® OMEGAMON® for CICS, if you want to have a CICSplex per LPAR, you must define each one.
- The IBM OMEGAMON for Networks on z/OS agent and the IBM Z® OMEGAMON® Network Monitor agent each require an MSL containing three types of managed systems. Each managed system name will include an LPAR name. The three managed systems can be described as follows:
  - `AgentID:LPAR:KN3AGENT`
  - `TCPIP:LPAR`
  - `VTAM:LPAR`

### Procedure

To create your MSL in TEP, see [“Creating an MSL using TEP” on page 1066](#).

### Creating an MSL using TEP

Use the Tivoli Enterprise Portal (TEP) to create a managed systems list (MSL) for the tenant.

### Before you begin

Review the content in [“Defining a Managed Systems List \(MSL\)” on page 1065](#).

### About this task

Use the **Object Group Editor** in the Tivoli Enterprise Portal (TEP) to create one or more MSLs for each tenant. One MSL must be created for each managed system type.

Perform the following steps for each MSL to create.

#### Notes:

- A *managed systems list* is referred to as a *managed system group* in the TEP.
- For more information about using the **Object Group Editor**, see the [IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide](#).

### Procedure

1. Click the **Object Group Editor** icon in the Tivoli Enterprise Portal.

2. Under **Groups**, if the **Managed system** node is collapsed, expand it.
3. Click one of the available managed system types, then click **Create new group**.
4. Type a descriptive name for the managed system group and click **OK**.  
The new managed system group is displayed in the managed system folder.
5. Select a managed system from the **Available Managed Systems** list and move it to the **Assigned** list. You can select multiple managed systems by holding down Ctrl while clicking each managed system. You can also, after selecting a managed system, use Shift+click to select all managed systems between this selection and the first selection.
6. Save your changes and either keep the editor open with **Apply** or exit with **OK**. The managed system group is now available.

## What to do next

Create customer, group, and user definitions for the tenant. See [“Creating tenant definitions” on page 1067](#).

## Creating tenant definitions

Create the customer, group, and user definitions for an OMEGAMON multi-tenancy environment.

### About this task

For each tenant, you must define the customer and the relationships between the customer and the MSLs. This process requires the definition of the following components:

- **Customer.** A customer definition contains a customer ID (up to 10 characters), a descriptive customer name (up to 50 characters), and the list of MSLs for the customer. Each managed system type requires a unique MSL. One customer definition is created for each tenant.
- **Group.** A group definition defines the group to which a user will belong. For each group, you also specify the first workspace to display at logon and the OMEGAMON tabs to display in the workspace. Multiple groups can be defined and can be used by multiple tenants.
- **User.** A user definition specifies information for an individual z/OS TSO user ID. This information includes the group and the customer to which the user belongs; a user can belong to one group and one customer only. A user can also be defined as a *power user* or a *super user*. The differences between the multi-tenancy user types are as follows:
  - A regular tenant user has access to resources only for the tenant (customer) to which the user is defined and has limited access to some enhanced 3270 user interface features.
  - A *power user* has access to resources only for the tenant (customer) to which the user is defined, with access to more enhanced 3270 user interface features than the regular tenant user, such as access to all menu options, icons and commands.
  - A *super user* has access to all resources for all customers and can access all enhanced 3270 user interface features.

For more information, see [“OMEGAMON multi-tenancy user types” on page 1062](#).

You can create the tenant definitions in PDS members or in RACF, which can provide greater security. Because the RACF implementation typically requires the involvement of your RACF administrator, it is recommended that you test your tenant definitions using PDS members and then, when satisfied, transfer the definitions to RACF.

### Procedure

1. Use one of the following procedures to create your tenant definitions:
  - [“Creating tenant definitions in PDS members” on page 1068](#)
  - [“Creating tenant definitions in RACF” on page 1070](#)
2. Indicate if the tenant definitions are to be used in the PDS members or in RACF. See [“Setting the location of the tenant definitions” on page 1074](#).

## Creating tenant definitions in PDS members

Define the customer and the relationships between the customer and the MSLs using PDS members.

### About this task

For each tenant, you must define the customer and the relationships between the customer and the MSLs. This process requires the definition of the following components: customer, group, users. Each of these components is defined in a PDS member. By default, the PDS members are located in the UKOBDATF data set that is allocated to the enhanced 3270 user interface address space (allocated to the RKOBPROF DD name). Template members are provided in data set RKOBDATF and must be copied to data set UKOBDATF for customization.

**Note:** You can change the location of the PDS members using override embed member **MULTI\_TENANCY\_DDNAME**.

The following list describes the definitions to be made.

**Note:** The definitions described in this topic can also be made in RACF for greater security. For more information, see [“Creating tenant definitions in RACF” on page 1070](#).

- **Customer.** Customers definitions are in member KOBCUST. Each customer entry defines the customer ID, title, and associated MSLs for the customer. The following example shows the format for the customer definition:

```
CUSTOMER:customerID,  
CUSTNAME:"customerTitle",  
msType="msl",  
msType="msl",  
msType="msl"
```

Where:

- *customerID* is the customer ID, which can be up to 10 characters.
- *customerTitle* is the unique customer descriptive title, which can be up to 50 characters.
- *msType* is the managed system type. A separate definition is made for each type. Valid values: ZOS, CICS, IMS, DB2, CTG, MQ, QSG, IIB, STOR, MFN, TCP, VTAM, MFAD, JAVA.

**Note:** With APAR OA59694, managed system type MFN has been replaced with the following managed system types for IBM OMEGAMON for Networks for z/OS: TCP, VTAM, and MFAD (Administration). It is recommended that you use TCP, VTAM, and MFAD instead of MFN.

- *msl* is the name of the managed system list (group) for the respective managed system type. A unique MSL must be specified for each managed system type. If the MSL name ends with ?, then the customer ID will be substituted. See [“Naming convention” on page 1065](#) for the recommended MSL name format.

The following example shows a customer definition. For each MSL name ending with ?, the ? is replaced by ACMECORP. For example, CICS="T\_C5\_?" is converted to CICS="T\_C5\_ACMECORP".

```
CUSTOMER:ACMECORP,  
CUSTNAME:"UNIQUE CUSTOMER TITLE",  
ZOS="T_M5_ACMECORP",  
CICS="T_C5_?",  
IMS="T_I5_ACMECORP",  
DB2="T_D5_?",  
CTG="T_GW_?",  
MQ="T_MQ_ACMECORP",  
QSG="T_QSG_ACMECORP",  
IIB="T_IIB_ACMECORP",
```

```

STOR="T_S3_?",
MFN="T_N3_ACMECORP",
TCP="T_N3_TCP_ACMECORP"
VTAM="T_N3_VTAM_ACMECORP"
MFAD="T_N3_ADMIN_ACMECORP"
JAVA="T_JJ_?"

```

- **Group.** Group definitions are in member KOBGROUP. This member defines the groups to which a user will belong. In each group entry, you also specify the first workspace to be displayed at logon and the OMEGAMON tabs to be displayed in the workspace for the group. The following example shows the format for a group definition:

```

GROUP:group, FIRSTWS=workspace,
SHOWEVT=n, SHOWZOS=n, SHOWCICS=n, SHOWCTG=n, SHOWIMS=n,
SHOWDB2=n, SHOWMQ=n, SHOWIIB=n, SHOWMFN=n, SHOWSTOR=n, SHOWJAVA=n

```

Where:

- *group* is the group name, which can be up to 10 characters.
- *workspace* is the workspace to display at logon, which is an 8-character panel ID.
- *n* specifies whether the respective tab is displayed in the first workspace. Valid values are Y and N. The variables and corresponding tabs are as follows:

Table 84: OMEGAMON tab options in first workspace	
Option	Tab
SHOWEVT	<b>Events</b> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> Multi-tenancy mode is not supported for the Events tab. The user will see all available resources and will not be restricted to only those resources in the user-defined MSLs for the tenant.</p> </div>
SHOWZOS	<b>z/OS</b>
SHOWCICS	<b>CICS</b>
SHOWCTG	<b>C/TG</b>
SHOWIMS	<b>IMS</b>
SHOWDB2	<b>DB2</b>
SHOWMQ	<b>MQ</b> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> The MQ tab displays the queue-sharing group (QSG) information. To include QSG information, you must define an MSL for the QSG managed system type for the customer.</p> </div>
SHOWIIB	n/a <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> There is not a corresponding tab for the Integration Bus (IIB) agent. To view IIB information, use the <b>Integration Bus</b> option on the <b>Navigate</b> menu.</p> </div>
SHOWMFN	<b>MFN</b> (Mainframe Networks)
SHOWSTOR	<b>STOR</b> (Storage)

Option	Tab
SHOWJAVA	JVM

The following example shows a group definition.

```
GROUP:OMEGCICS,FIRSTWS=KOBSCICS,
SHOWEVT=N,SHOWZOS=Y,SHOWCICS=Y,SHOWCTG=Y,SHOWIMS=N,
SHOWDB2=N,SHOWMQ=Y,SHOWIIB=Y,SHOWMFN=N,SHOWSTOR=N,SHOWJAVA=Y
```

- **User.** User definitions are in member KOBUSER. This member defines information about individual user IDs. A user can also be defined as a *power user* or a *super user*.

**Note:** For more information, see [“OMEGAMON multi-tenancy user types” on page 1062](#).

The following example shows the format for the definition of a user:

```
USERID:user GROUP:group POWER:Y|N SUPER:Y|N CUSTOMER=customerID
```

Where:

- *user* is the z/OS TSO user ID, which can be up to 8 characters. A trailing asterisk wildcard is supported (for example, TD\*).
- *group* is the associated group name, which can be up to 10 characters.
- *customerID* is the associated customer ID, which can be up to 10 characters. This parameter is omitted for super users.

The following example shows definitions for the different types of users:

```
USERID:TSUSERA GROUP:OMEGALL SUPER:Y
USERID:TSUSERB GROUP:OMEGCICS POWER:Y CUSTOMER=ACMECORP
USERID:TSUSERC GROUP:OMEGCICS CUSTOMER=ACMECORP
USERID:TD* GROUP:OMEGCICS CUSTOMER=ACMECORP
```

Use the following procedure to create the customer, group and user definitions in PDS members.

## Procedure

1. Locate and copy the KOBUCUST, KOBUSER and KOBGROUP members from the RKOBDATF data set to the UKOBDATF data set.
2. Edit the new KOBUCUST, KOBGROUP, and KOBUSER members in the UKOBDATF data set to define information about the customer, groups and users. Use a file editor such as the ISPF editor to do this. For details about the definitions, see [About this task](#).

## What to do next

Because tenant definitions can exist in either PDS members or an external security system, you must indicate the location of the tenant definitions that you want to use. For more information, see [“Setting the location of the tenant definitions” on page 1074](#).

## Creating tenant definitions in RACF

Secure your OMEGAMON enhanced 3270 user interface multi-tenancy environment using RACF. This topic describes the profiles that must be created.

## Before you begin

Because of the authority that is required, some of the steps in this task must be performed by the RACF administrator. It is recommended that you test your tenant definitions using PDS members and then, when satisfied, transfer the definitions to RACF.

**Note:** The definitions described in this topic can also be made in PDS members. For more information, see [“Creating tenant definitions in PDS members” on page 1068](#).

Additionally, if RACF is used, the OMEGAMON enhanced 3270 user interface started task needs to be authorized to issue RACROUTE EXTRACT requests for CSDATA fields for any user ID that logs in to the enhanced 3270 user interface.

## About this task

To secure your multi-tenancy environment using RACF, you must create profiles for the tenant. You create the customer, group, and user definitions for the tenant in RACF using the following profiles:

- To create customer and group definitions, use RACF general resource profiles in the following naming patterns, respectively:

```
KOBUI.MULTI.CUST.customerID
```

```
KOBUI.MULTI.GROUP.group
```

You must create a resource for each customer and group within the security class specified in parameter **RTE\_SECURITY\_CLASS**.

Customer and group details are defined by setting parameters in the installation data field and, if additional space is needed, in the application data field. A parameter and its value must be defined entirely in either field; and, if a parameter is specified in both places, the definition in the application data field is used.

**Note:** Installation data (INSTDATA) and application data (APPLDATA) are limited to 255 characters each.

- To create user definitions, use RACF user profiles.

The following list describes the definitions:

- Customer.** A resource is created for each customer. The customer ID is defined as a resource using the naming pattern `KOBUI.MULTI.CUST.customerID`. The customer details are defined as installation data (and, if additional space is needed, application data) for the resource. The following example shows a customer definition:

```
CLASS      NAME
-----
class      KOBUI.MULTI.CUST.customerID

LEVEL  OWNER      UNIVERSAL ACCESS  YOUR ACCESS  WARNING
-----
 00    ownerid          NONE              NONE         NO

INSTALLATION DATA
-----
msType="msl" CUSTNAME="customerTitle"

APPLICATION DATA
-----
NONE

AUDITING
-----
FAILURES(READ)

NOTIFY
-----
NO USER TO BE NOTIFIED
```

Where:

- `class` is the name of the RACF security class specified in parameter **RTE\_SECURITY\_CLASS**.
- `customerID` is the customer ID.

- *customerTitle* is the unique customer descriptive title, which can be up to 50 characters.

**Tip:** If the entire customer name cannot be specified in the installation data due to the 255-character limit, it can be specified in the application data, as follows:

```
INSTALLATION DATA
-----
msType="msl"

APPLICATION DATA
-----
CUSTNAME="customerTitle"
```

- *msType* is the managed system type. A separate definition is made for each type. Valid values: ZOS, CICS, IMS, DB2, CTG, MQ, QSG, IIB, STOR, MFN, TCP, VTAM, MFAD, JAVA.

**Note:** With APAR OA59694, managed system type MFN has been replaced with the following managed system types for IBM OMEGAMON for Networks for z/OS: TCP, VTAM, and MFAD (Administration). It is recommended that you use TCP, VTAM, and MFAD instead of MFN.

- *msl* is the name of the managed system list (group) for the respective managed system type. A unique MSL must be specified for each managed system type. If the MSL name ends with ?, then the customer ID will be substituted. See [“Naming convention” on page 1065](#) for the recommended MSL name format.
- **Group.** A resource is created for each group. The group name is defined as a resource using the naming pattern `KOBUI.MULTI.GROUP.group`. The group details are defined as installation data (and, if additional space is needed, application data) for the resource. The following example shows a group definition:

```
CLASS      NAME
-----
class      KOBUI.MULTI.GROUP.group

LEVEL  OWNER      UNIVERSAL ACCESS  YOUR ACCESS  WARNING
-----
  00   ownerid      READ              READ          YES

INSTALLATION DATA
-----
FIRSTWS=workspace, SHOWEVT=n, SHOWZOS=n, SHOWCICS=n, SHOWCTG=n, SHOWIMS=n, SHOWDB2=n,
SHOWMQ=n, SHOWIIB=n, SHOWMFN=n, SHOWSTOR=n, SHOWJAVA=n

APPLICATION DATA
-----
NONE

AUDITING
-----
FAILURES(READ)

NOTIFY
-----
NO USER TO BE NOTIFIED
```

Where:

- *class* is the name of the RACF security class specified in parameter `RTE_SECURITY_CLASS`.
- *group* is the group name.
- *workspace* is the workspace to display at logon, which is an 8-character panel ID.
- *n* specifies whether the respective tab is displayed in the first workspace. Valid values are Y and N. The variables and corresponding tabs are as follows:

Table 85: OMEGAMON tab options in first workspace	
Option	Tab
SHOWEVT	<b>Events</b> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> Multi-tenancy mode is not supported for the Events tab. The user will see all available resources and will not be restricted to only those resources in the user-defined MSLs for the tenant.</p> </div>
SHOWZOS	<b>z/OS</b>
SHOWCICS	<b>CICS</b>
SHOWCTG	<b>C/TG</b>
SHOWIMS	<b>IMS</b>
SHOWDB2	<b>DB2</b>
SHOWMQ	<b>MQ</b> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> The MQ tab displays the queue-sharing group (QSG) information. To include QSG information, you must define an MSL for the QSG managed system type for the customer.</p> </div>
SHOWIIB	n/a <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> There is not a corresponding tab for the Integration Bus (IIB) agent. To view IIB information, use the <b>Integration Bus</b> option on the <b>Navigate</b> menu.</p> </div>
SHOWMFN	<b>MFN</b> (Mainframe Networks)
SHOWSTOR	<b>STOR</b> (Storage)
SHOWJAVA	<b>JVM</b>

- **Users.** Definitions for user IDs are contained within RACF custom data fields, which are contained in a CSDATA segment. For each user ID, the following RACF CSDATA fields are used:
  - OMGROUP. This field has a maximum length of 10 and typically contains an 8-character value like OMEGCICS.
  - OMPOWER. This field has a maximum length of 8. Valid values are YES and NO.
  - OMSUPER. This field has a maximum length of 8. Valid values are YES and NO.
  - OMCUST. This field has a maximum length of 10 and typically contains a 6 to 8-character value like CUSTID.

The following example shows the CSDATA fields for a user:

```
SECURITY-LEVEL=NONE SPECIFIED
CATEGORY-AUTHORIZATION
  NONE SPECIFIED
SECURITY-LABEL=NONE SPECIFIED

CSDATA INFORMATION
-----
OMEG GROUP group
OMEG POWER Y|N
OMEG SUPER Y|N
OMEG CUSTOMER customerID
```

Where:

- *group* is the associated group name, which can be up to 10 characters.
- *customerID* is the associated customer ID, which can be up to 10 characters. This parameter is omitted for super users.

For more information about CSDATA fields, see the *z/OS Security Server RACF Security Administrator's Guide*.

**Note:** To display, add, or modify information in the CSDATA segment, you must have the appropriate authorization. These tasks are typically performed by the RACF administrator. Additionally, the OMEGAMON started task needs to be authorized to issue RACROUTE EXTRACT requests for CSDATA fields for any user ID that logs in to the enhanced 3270 user interface.

Use the following procedure to create the customer, group and user definitions in RACF. Refer to the *z/OS Security Server RACF* documentation for details.

## Procedure

1. Create your customer definitions using RACF General Resource Profiles (Option 2 on the RACF - Services Option Menu).
2. Create your group definitions using RACF General Resource Profiles (Option 2 on the RACF - Services Option Menu).
3. Create your user definitions using RACF User Profiles (Option 4 on the RACF - Services Option Menu).
4. Authorize the OMEGAMON started task to issue RACROUTE EXTRACT requests for CSDATA fields for any user ID that logs in to the enhanced 3270 user interface.

## What to do next

Because tenant definitions can exist in either PDS members or an external security system, you must indicate the location of the tenant definitions that you want to use. For more information, see [“Setting the location of the tenant definitions” on page 1074](#).

## Setting the location of the tenant definitions

Set the location of the tenant definitions.

## Before you begin

Setting the location of the tenant definitions requires the use of override embed members. For more information about using override embed members, see the following topics:

- Using Configuration Manager: [Using override embed members](#)
- Using PARMGEN: [Override embed members](#), [Customizing the override embed members](#)

## About this task

The customer, group, and user definitions for the tenant can exist in either PDS members or an external security system, such as RACF. It is recommended that you test your tenant definitions using PDS members and then, when satisfied, transfer the definitions to an external security system.

You control the location of the tenant definitions to use with the following override embed parameters:

## MULTI\_TENANCY\_DEFS

Specifies the location of the tenant definitions to use. Valid values are as follows:

### PDS

(Default) Definitions are in PDS members located in the data set specified in the DD statement named in the **MULTI\_TENANCY\_DDNAME** parameter.

### SAF

Definitions are made using the System Authorization Facility (SAF) interface for use with an external security system, such as RACF.

## MULTI\_TENANCY\_DDNAME

Specifies the DD name of the data set containing the tenant definitions when defined in PDS members. The default value is RKOBPROF, which uses the UKOBDATF data set.

These parameters are defined in override embed member KOB\$PENV. Following a standard override embed procedure places the parameters into member RKANPARU (KOBENV) for Configuration Manager or WCONFIG (KOBENV) for PARMGEN.

Use the following steps to set the location of the tenant definitions to use.

## Procedure

- Using Configuration Manager:
  - a. Locate your embeds data set. If you do not have an embeds data set, you must enable override embed members for your runtime environment by running a **CREATE** action with **KFJ\_USE\_EMBEDS** set to **Y**. For more information, see [Enable override embed members for an existing RTE](#).
  - b. In the override embed member KOB\$PENV in the embeds data set, specify the location of the tenant definitions as follows:

- To use tenant definitions in PDS members, include the following statement:

```
MULTI_TENANCY_DEFS=PDS
```

You can also use a DD name other than the default value of RKOBPROF by including the following statement:

```
MULTI_TENANCY_DDNAME=<ddname>
```

- To use tenant definitions in an external security system, such as RACF, include the following statement:

```
MULTI_TENANCY_DEFS=SAF
```

- c. Run the **GENERATE** action.

- Using PARMGEN:

- a. Update the override embed member KOB\$PENV, as follows:
  - a. From the **Workflow - Primary Option Menu**, select option 2, **Customize PARMGEN configuration profiles**. The **Customize PARMGEN Configuration Profile Members** (KCIP@PG6) panel is displayed.
  - b. Select **WCONFIG**.
  - c. Select and edit the **KOB\$PENV** member.
  - d. Specify the location of the tenant definitions, as follows:  
To use tenant definitions in PDS members, include the following statement:

```
MULTI_TENANCY_DEFS=PDS
```

You can also use a DD name other than the default value of RKOBPROF for the location of the PDS members by including the following statement:

```
MULTI_TENANCY_DDNAME=<ddname>
```

To use tenant definitions in an external security system, such as RACF, include the following statement:

```
MULTI_TENANCY_DEFS=SAF
```

- e. Save the changes and return to the **Workflow - Primary Options Menu** panel.
- b. Regenerate the runtime members and jobs, as follows:
  - a. Select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** (KCIP@PR1) panel is displayed.
  - b. Select option 1 to submit the \$PARSE job (or the \$PARSESV job, if variables are enabled).
  - c. Return to the **Workflow - Primary Options Menu** panel.
- c. Copy the runtime members from the work libraries to the production libraries, as follows:
  - a. Select **Submit batch jobs to complete PARMGEN setup** from the menu.  
The **Submit Batch Jobs To Complete PARMGEN Setup** (KCIP@SUB) panel is displayed.
  - b. Optional: Select option 11 and submit the KCIJPCPR job to back up the production libraries.
  - c. Select option 12 and submit the KCIJPW2R job (or the KCIJPW1R job) to copy the work libraries to the production libraries.

## Enabling multi-tenancy mode

Enable multi-tenancy mode in the enhanced 3270 user interface.

### About this task

To operate the enhanced 3270 user interface in multi-tenancy mode, you must enable the feature using the **KOB\_MT\_ENABLE** parameter. By setting the **KOB\_MT\_ENABLE** parameter to Y, the **MULTI** parameter is changed from the default value of N to Y in the job step of the started task JCL for the enhanced 3270 user interface, as shown in the following example:

```
//*  
//E3270UI EXEC PGM=KOBGATW0,  
//      REGION=&RGN,TIME=&TIM,MEMLIMIT=&MEMLIM,  
//      PARM=( 'MODE=&MODE,APPL=&APPL,FOLD=&FOLD,UMAX=&UMAX',  
//      'TIMEOUT=&TIMEOUT',  
//      'MULTI=Y',  
//      'PROD=&PROD,FSCR=&FSCR,OM=&OM' )
```

After you start or restart the address space, the following message in the JES system log indicates that multi-tenancy mode is enabled:

```
OMV020I e3270UI is running in Multi-Tenancy Mode
```

Use the following procedure to enable multi-tenancy mode in the enhanced 3270 user interface.

### Procedure

1. Perform the following steps using either of the following methods:
  - Using PARMGEN:
    - a. Set parameter **KOB\_MT\_ENABLE** to Y.
    - b. Run \$PARSE.
  - Using Configuration Manager:
    - a. Add parameter **KOB\_MT\_ENABLE** set to Y to the RTEDEF (KOB\$PARM) or RTEDEF (KOB\$*lpar*) member. (Create the member if it is not present.)
    - b. Run the **GENERATE** action.

2. Refresh your PROCLIB entries.
3. Start or restart the address space. When the enhanced 3270 user interface address space is up, verify that the following message appears in the JES system log:

```
OMV020I e3270UI is running in Multi-Tenancy Mode
```

## What to do next

Log on to the OMEGAMON enhanced 3270 user interface, running in multi-tenancy mode. See [“Working in multi-tenancy mode” on page 1077](#).

## Working in multi-tenancy mode

Operate your enhanced 3270 user interface in multi-tenancy mode.

After you have completed the necessary configuration steps to operate in multi-tenancy mode, log on to your enhanced 3270 user interface.

**Note:** If you have issues when logging on, see [“Troubleshooting” on page 1078](#).

## Tenant workspaces

Review characteristics of the enhanced 3270 user interface that are unique to operating in multi-tenancy mode.

The following list describes characteristics of the workspace that are unique to operating in multi-tenancy mode:

- **Menus.** The workspace action bar provides a set of menus: File, Edit, View, Tools Navigate, and Help. For a regular user operating in multi-tenancy mode, only a subset of the menu options is enabled. All options are enabled for users defined as power users or super users.
- **Commands.** Regular tenant users have access to only a subset of commands. The `=panelid` command, which is used for out-of-context navigation, is not functional for regular tenant users. All commands are available to power users and super users.
- **Plex ID, Sys ID.** The following characteristics apply for regular tenant users and power users:
  - The Plex ID (NAV1) field is read-only. You cannot switch to a different system outside the scope of your multi-tenancy definition. Instead, you must go back to the home workspace (PF3 or the HOME command) to select a different plex.
  - The Sys ID (NAV2) field is unlocked, or is as set by the individual OMEGAMON product. Many OMEGAMON products use validation of the Plex ID and Sys ID values together to ensure that an overwritten Sys ID value is within the scope of the Plex ID value. This validation is a registry lookup, and if not found an error message is displayed explaining that the combination of the Plex ID value (locked or not) and the Sys ID value is invalid.

These restrictions do not apply for users defined as super users.

- **Icons.** For regular tenant users, icons are disabled. All icons are available to power users and super users.
- **Tabs.** For regular tenant users, only those tabs that have been designated for inclusion are displayed in the workspace. This setting is made in the group definition, which is described in [“Creating tenant definitions” on page 1067](#).
- **Footer.** For regular tenant users and power users, the name of the customer associated with the logged-on user is displayed in the minimize bar. This value is set in the customer definition, which is described in [“Creating tenant definitions” on page 1067](#). For super users, the name of the HUB to which the user is connected is displayed.

The following figure highlights items described in the list:

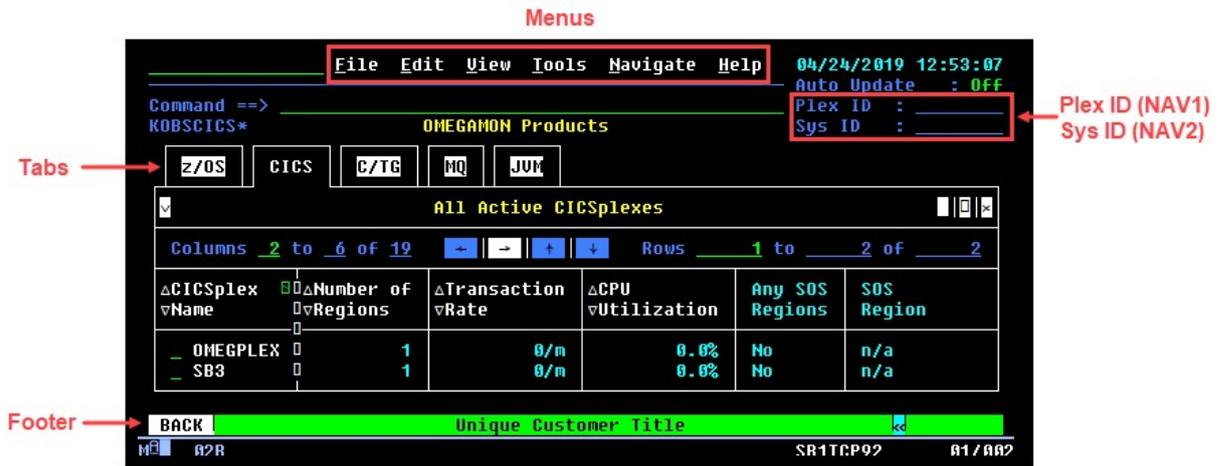

Figure 200: Workspace in multi-tenancy mode

## Troubleshooting

The troubleshooting section provides problem determination and resolution for the issues that are most commonly encountered with the OMEGAMON multi-tenancy feature.

### First workspace does not load

When you log on in multi-tenancy mode, the first workspace does not load.

#### Symptom

The following error message is displayed:

```

First Workspace Error
The Initial workspace KOBLOGON is invalid. It is marked as a silent
workspace, but it did not set the ZDESTID variable. All silent
workspaces must set ZDESTID to enable forward navigation.

You should alter KOBLOGON to include the following statement:

SET ZDESTID=panelid

where panelid is your desired displayable first workspace.

```

#### Explanation

The OMEGAMON multi-tenancy solution uses a silent workspace, KOBLOGON, as the first workspace.

When you log on in multi-tenancy mode, the KOBLOGON workspace is invoked. This workspace retrieves multi-tenancy-related information for the user ID that is logging on, and then calls the first workspace to display, as defined for the group to which the user belongs.

In the silent KOBLOGON workspace, the first workspace to display is specified in the ZDESTID parameter, as shown in the following figure:

```

/*****
/*          NAVIGATE FORWARD TO FIRST WORKSPACE          */
/*****

<SUBPANEL>

<EPILOG>
SET ZDESTID=&FIRSTWS
<EPILOGEND>

<SUBPANELEND>

```

The ZDESTID parameter by default should be set to the value in the FIRSTWS variable.

The FIRSTWS variable is defined in the group definition, which is shown in the following example:

```
GROUP:group, FIRSTWS=workspace,  
SHOWEVT=value, SHOWZOS=value, SHOWCICS=value, SHOWCTG=value, SHOWIMS=value,  
SHOWDB2=value, SHOWMQ=value, SHOWIIB=value, SHOWMFN=value, SHOWSTOR=value, SHOWJAVA=value
```

## Procedure

1. In the KOBLOGON workspace definition, check that the ZDESTID variable is defined correctly.
2. In the group definition in the KOBGROUP member or in RACF, as appropriate for your setup, check that the FIRSTWS variable is set correctly.

## No data condition

When you log on in multi-tenancy mode, the workspace loads but does not display any data.

## Symptom

Multi-tenancy mode has been configured for the OMEGAMON enhanced 3270 user interface. The enhanced 3270 user interface address space has been started and you are able to log on, but your enhanced 3270 user interface is displaying an empty workspace.

## Explanation

As described in [“OMEGAMON multi-tenancy concepts and architecture” on page 1061](#), in a single-tenant configuration, product-provided MSLs are used in the system-generated SQL queries for data collection while in a multi-tenancy configuration, user-defined MSLs are used, limiting the scope of collection to only those resources assigned to the tenant. If the user-defined MSLs are not set up correctly, it is possible that unexpected or no results will display.

To resolve the problem, you can analyze the system-generated SQL using trace. The following examples show how the queries appear in trace for single and multi-tenant configurations.

### Single-tenant configuration

In a single-tenant configuration, a product-provided MSL name is used in the system-generated SQL query. The following example is of a standard trace of the enhanced 3270 user interface in a single-tenant configuration. The user is logging on to the CICS first workspace KOBSCICS. This example shows a typical workspace query that displays the CICS plexes defined to OMEGAMON:

```
KOBUIFD1I SQL1 Query Length : 00284  
..SELECT CICSPLEX, NREGIONS, TRANRATE, CPUUTIL, AN+  
YSOS, CBUFFW, CSTRINGW, ENQWAIT, IORATE, PAGERATE,+  
STGVIOL, AIDS, ICES, HIMAXTP, HIMAXTR, ALLACB, WP+  
ERFINDX, WSERVCLAS, SOSREGION, ORIGINNODE FROM OM+  
CICS.KCPPLX WHERE SYSTEM.PARMA('NODELIST', '*IBM_C+  
ICSpIex',13) ORDER BY CICSPLEX ASC
```

In this example, the query specifies a SYSTEM.PARMA value of NODELIST and "\*IBM\_CICSpIex". "\*IBM\_CICSpIex" is the product-provided MSL for the OMEGAMON for CICS product and will retrieve data from all Managed System Nodes (MSNs) defined within that MSL.

### Multi-tenancy configuration

In multi-tenancy mode, the user-defined MSL name is substituted into the system-generated query. The substitution is reflected in the trace, as shown in the following standard trace excerpt:

```
===== MULTI-TENANCY MODIFY SQL =====  
SYSTEM.PARMA('NODELIST', '*IBM_CICSpIex',13) ORDER+  
SYSTEM.PARMA('NODELIST', '&CICSMSL',nn) ORDER+  
SYSTEM.PARMA('NODELIST', 'T_C5_TENANT_MSL',nn) +  
SYSTEM.PARMA('NODELIST', 'T_C5_TENANT_MSL',15) +  
=====
```

-----

```
KOBUIGD1I SQL1 Query Length : 00291  
SELECT CICSPLEX, NREGIONS, TRANRATE, CPUUTIL, ANYS+  
OS, CBUFFW, CSTRINGW, ENQWAIT, IORATE, PAGERATE, S+  
TGVIOL, AIDS, ICES, HIMAXTP, HIMAXTR, ALLACB, WPER+  
FINDX, WSERVCLAS, SOSREGION, ORIGINNODE FROM OMCI+  
CS.KCPPLX WHERE SYSTEM.PARMA('NODELIST', 'T_C5_TEN+
```

```
ANT_MSL',15          ORDER BY CICSplex ASC <ENDSQL><<+
```

In this example, the multi-tenant customer was defined as having a CICS MSL of "T\_C5\_TENANT\_MSL". The trace shows the step-by-step substitution process and the final SQL that will be sent to the TEMS.

**Note:** Only the OMEGAMON products that generate queries that use the following format are supported in multi-tenancy mode:

```
SYSTEM.PARMA=( 'NODELIST' , "msl" , nn)
```

Where *msl* is the product-provided MSL name and *nn* is the length of the name in characters.

### Procedure

1. Initiate a trace.
2. Locate the following text: MULTI-TENANCY MODIFY SQL
3. Examine the details of the MSL substitution process and correct any errors.

## IBM Z® OMEGAMON® Web UI

IBM Z OMEGAMON Web UI is a browser-based graphical user interface for monitoring and managing z/OS systems using data from OMEGAMON monitoring agents. IBM Z OMEGAMON Web UI requires IBM Z OMEGAMON Data Requester, a Grafana® application plug-in.

IBM Z OMEGAMON Web UI uses Grafana dashboards to provide visualization and analysis of performance data gathered by OMEGAMON monitoring agents. IBM Z OMEGAMON Web UI provides the following key capabilities:

- Web-based monitoring: Provides access to OMEGAMON performance data from any supported web browser.
- Situations management: Allows you to create, view, and manage alert conditions to identify and respond to critical issues.
- Role-based access control: Allows you to secure dashboards and situations through role-specific permissions.
- Customizable dashboards: Allows you to design and share personalized views tailored to specific monitoring needs.
- Integrated architecture: Enables communication between the Tivoli Enterprise Monitoring Server and Grafana using the OMEGAMON Gateway.
- Administrative user interface: Simplifies configuration and automation of monitored environments.
- OMEGAMON Data Requester: Retrieves and filters real-time and historical data.
- Dashboards: Provide real-time and historical visualization of performance metrics of all OMEGAMON monitoring agents.

For more information, including system requirements and installation steps, see [IBM Z OMEGAMON Web UI](#).

**Note:** Starting with Tivoli® Management Services on z/OS® 6.4, IBM Z OMEGAMON Web UI and Grafana are included as components.

## Tivoli Enterprise Monitoring Server REST services

Tivoli Enterprise Monitoring Server (TEMS) REST services provide access to OMEGAMON data using HTTP REST calls.

# Accessing data using Tivoli Enterprise Monitoring Server REST services

You can access OMEGAMON data by using HTTP REST calls.

## TEMS REST services overview

Tivoli Enterprise Monitoring Server (TEMS) REST services provide access to OMEGAMON data using HTTP REST calls. Using the TEMS REST services, you can retrieve real-time and historical data collected by the monitoring agents, the configurations used for collecting the historical data, select managed system information, and information about situations. You can also perform activities such as starting, stopping, creating, editing, and deleting situations; executing or deleting a Take Action; and deleting a history collection configuration.

Version v1 of TEMS REST services provides endpoints using the **GET**, **POST**, **PATCH**, **PUT**, and **DELETE** methods.

Using TEMS REST services, you can integrate OMEGAMON data into your custom applications, including dashboards and automation, or third-party analytical tools (such as Splunk, Elastic, and Grafana).

TEMS REST services are implemented with the OpenAPI Specification 3.0.3.

## Implementation details

Review the following implementation details:

- TEMS REST services are available on the Tivoli Enterprise Monitoring Server on z/OS® only, for both the hub monitoring server and the remote monitoring server.

**Note:** TEMS REST services are not available for monitoring servers on distributed platforms.

- The endpoints are located at the well-known HTTP or HTTPS port for Tivoli® Management Services on z/OS®, as defined at your site. No additional installation or configuration is needed to use TEMS REST services.
- For secure data transmission, TEMS REST services supports HTTPS. It is recommended that you use HTTPS.
- For authorization and authentication, TEMS REST services provides Basic authentication and bearer (token) security methods. For more information, see [“Securing TEMS REST services” on page 1081](#).

**Note:** If you use mixed-case passwords or password phrases (passphrases) for authentication, parameter **RTE\_SECURITY\_FOLD\_PASSWORD\_FLAG** must be set to N.

## Access verification

To verify that you can access the TEMS REST services at your site and that the services are available, you can use the GET /timenow endpoint, which retrieves the TEMS local time and requires no additional parameters, as follows:

```
https://host:port/api/v1/timenow
```

A successful response verifies access.

## Securing TEMS REST services

Enable authentication and authorization for users of TEMS REST services.

TEMS REST services uses the following methods to secure access to OMEGAMON data:

- **Authentication.** Each TEMS REST services request must contain information that identifies the requester as a trusted user.
- **Authorization.** Authorization determines what OMEGAMON data and functions a user has access to.

## TEMS REST services authentication

TEMS REST services provides basic authentication and bearer token security methods for authentication.

Each TEMS REST services request must contain information that identifies the requester as a trusted user; otherwise, the request returns status code 400 (Bad Request) in the response.

TEMS REST services supports two types of authentication:

- [Basic authentication \(username:password\)](#)
- [Bearer token authentication](#)

**Note:** If you use mixed-case passwords or password phrases (passphrases) for authentication, parameter `RTE_SECURITY_FOLD_PASSWORD_FLAG` must be set to N.

### Basic authentication (username:password)

For basic authentication, you provide user credentials in your TEMS REST services request. Typically, the user credentials are a mainframe user ID and a password (or passphrase). TEMS REST services also supports PassTickets and multi-factor authentication (MFA).

To use basic authentication, you must include in the request the Authorization header containing the word Basic, and the username:password string encoded in Base64, as follows:

```
Authorization: Basic credentials
```

where *credentials* is the username:password string encoded in Base64.

If you do not include the Authorization header in the request, the request responds with status code 400 (Bad Request).

The following example shows how you can use basic authentication in a request using a `curl` command:

```
curl -X 'GET' \  
  'https://host:port/api/v1/timenow' \  
  -H 'accept: application/json' \  
  -H 'Authorization: Basic dXN1cm5hbWU6cGFzc3dvcnQ='
```

where `dXN1cm5hbWU6cGFzc3dvcnQ=` is the username:password string encoded in Base64.

**Note:** Implementation of the authorization header varies depending on the REST API tool used for the request.

### Bearer token authentication

TEMS REST services provides the ability to generate a session ID (bearer token) that uniquely identifies a session and can be used for multiple requests during the session. This security method can improve response time and reduce the number of times user credentials are transferred between the client and the monitoring server. The default token expiration time is 86,400 seconds (24 hours).

You can use the GET /token endpoint to generate the bearer token.

To use bearer token authentication in a request, you must include the Authorization header containing the word Bearer and the generated token, as follows:

```
Authorization: Bearer token
```

where *token* is the generated token value.

If you do not include the Authorization header in the request, the request responds with status code 400 (Bad Request).

The following `curl` commands provide an example of how you can generate and use a bearer token:

```
curl -u user:password https://host:port/api/v1/token
```

```
curl -H "Authorization: Bearer token" https://host:port/api/v1/timenow
```

where *token* is the value of the token returned by the `/token` request in the first command.

**Note:** Implementation of the authorization header varies depending on the REST API tool used for the request.

## TEMS REST services authorization

TEMS REST services uses the system authorization facility (SAF) interface for user authorization.

Authorization determines what data and functions a user has access to. To retrieve or manipulate OMEGAMON® data using TEMS REST services, the user must have authorization to access the OMEGAMON data or to perform a specific activity, such as starting or stopping a situation or executing a Take Action. You can control access by defining SAF resource profiles that are unique to TEMS REST services.

The following list provides details about using the SAF interface for authorizing the use of TEMS REST services:

- TEMS REST services uses the SAF interface in a similar manner as the OMEGAMON® enhanced 3270 user interface (enhanced 3270UI). If you use \$KOBSEC as the SAF general resource class for your enhanced 3270UI security, you can use some of the same authorizations that have been defined for the enhanced 3270UI for TEMS REST services. For information about how the enhanced 3270UI implements authorizations, see [“Enable security for the OMEGAMON enhanced 3270 user interface” on page 564](#).
- TEMS REST services requires a SAF general resource class named \$KOBSEC. If resource class \$KOBSEC does not exist, it must be defined. For more information, see [“Define a SAF general resource class for securing access to OMEGAMON resources” on page 566](#).

**Important:** Although TEMS REST services uses the SAF interface in a similar manner as the enhanced 3270UI, the SAF general resource class name is a notable difference. For the enhanced 3270UI, the SAF general resource class name is customizable and specified in parameter `RTE_SECURITY_CLASS`. For TEMS REST services, the class name must be \$KOBSEC.

- TEMS REST services uses parameter `RTE_SECURITY_USER_LOGON` to determine which security system is used for validation. You must set parameter `KDS_TEMS_SECURITY_KDS_VALIDATE` to Y to enable validation.
- You can restrict access to some TEMS REST services by defining SAF resource profiles that are unique to TEMS REST services. For more information, see the following sections about creating SAF profiles for TEMS REST services.

**Note:** TEMS REST services also supports the user ID mapping capability. For more information, see [“Setting up the user ID mapping capability” on page 548](#).

## Define SAF profiles to control access to collection data

Create SAF resource profiles to control access to real-time or historical collection data when using TEMS REST services.

### Before you begin

TEMS REST services endpoint `GET /data` allows you to request collection data. For an example, see [“Requesting collection data” on page 1095](#).

Security for TEMS REST services requires a SAF general resource class named \$KOBSEC. For more information, review [“Securing TEMS REST services” on page 1081](#).

By default, all requests to retrieve collection data are allowed unless SAF profiles are defined that restrict access.

**Note:** If you use \$KOBSEC as the SAF general resource class for your OMEGAMON® enhanced 3270 user interface (enhanced 3270UI) security, the same authorizations that have been defined for query access to data sources in the enhanced 3270UI apply when retrieving collection data using TEMS REST services. The enhanced 3270UI uses the same naming structure for its query profiles as TEMS REST services uses for its collection data profiles (which are described in this topic). For information about the enhanced 3270UI query profiles, see [“Define query profiles to control access to data sources” on page 570](#).

## About this task

The authority to request collection data using TEMS REST services endpoint GET /data is verified by checking for access to a SAF resource named in the following pattern:

```
Kpp.node_name.table_name
```

where

### **Kpp**

Is the product code of the agent instance. For example, for OMEGAMON® for z/OS®, the product code is KM5. See [Product codes](#) for other products.

**Important:** For OMEGAMON® for CICS, you must use value OMCICS instead of the typical product code KCP.

### **node\_name**

Is the name of the node, which is a managed system name. A managed system name typically identifies a unique Tivoli Enterprise Monitoring Server agent instance. Note that the form of managed system names differs from product to product. Check the agent-specific documentation for information about the form used for managed system names.

### **table\_name**

Is the name of the table defined within the product agent.

You must create a SAF profile to match the resource. If a matching SAF profile does not exist to protect a given resource, the request is allowed.

As an example, suppose you want to control the ability to issue a request to an OMEGAMON® for z/OS® agent running on Sysplex IBMTEST on Sysplex member TSTA, for table LPCLUST. You would define a profile named KM5.IBMTEST:TSTA:MVSSYS.LPCLUST by entering the following command, which restricts all access to the resource for all users:

```
RDEFINE $KOBSEC KM5.IBMTEST:TSTA:MVSSYS.LPCLUST UACC(NONE)
```

More generally, you could define the profile using the asterisk (\*) wildcard to restrict all collection data requests for a specific product on a specific node:

```
RDEFINE $KOBSEC KM5.node_name.* UACC(NONE)
```

You can then give access to the profiles for individual users or user groups.

## Procedure

1. For each resource to protect, enter the following commands in RACF:

```
RDEFINE $KOBSEC Kpp.node_name.table_name UACC(NONE)  
SETROPTS RACLIST($KOBSEC) REFRESH
```

These commands restrict access to all users.

2. To permit access to individual users, enter the following command in RACF:

```
PERMIT Kpp.node_name.table_name ID(userid) ACCESS(READ) CLASS($KOBSEC)
```

## Define SAF profiles to control permissions for history collection configurations

Create SAF resource profiles to control permissions for history collection configurations when using TEMS REST services.

### Before you begin

TEMS REST services allows you to retrieve and delete information about history collection configurations. By default, all requests are allowed unless SAF resource profiles that restrict access are defined.

Security for TEMS REST services requires a SAF general resource class named \$KOBSEC. For more information, review [“Securing TEMS REST services” on page 1081](#).

### About this task

A *history collection configuration* defines what historical data is collected for particular attribute groups and provides other collection-related settings.

History collection configurations are stored as internal UADVISOR situations. A UADVISOR situation is a special form of situation that is created for internal product use. The name of a UADVISOR situation is in the format UADVISOR\_XXXXX.

**Note:** For information about securing access to user-defined situations or predefined product-provided situations, see [“Define SAF profiles to control permissions for situations” on page 1086](#).

TEMS REST services verifies the authority to interact with history collection configurations by checking for access to the SAF resources, as follows:

Description of request	Method	Endpoint	Resource pattern	Access required
<a href="#">Retrieve history collection configurations</a>	GET	/data/historycollections	04SRV.HISTORYCOLLECTIONS.uadvisor_name	READ
<a href="#">Delete a history collection configuration</a>	DELETE	/data/historycollections	04SRV.HISTORYCOLLECTIONS.uadvisor_name	ALTER

where:

#### **04SRV**

Is a literal qualifier value. 04SRV is a qualifier for monitoring server tables.

#### **HISTORYCOLLECTIONS**

Is a literal qualifier value. Use this qualifier for controlling permissions to history collection configurations.

#### **uadvisor\_name**

Is the unique name of the history collection configuration in the format UADVISOR\_XXXXX. Commonly, *Kpp* and *tablename* appear in the name.

You must create a SAF profile to match the resource. If a matching SAF profile does not exist to protect a given resource, the request is allowed.

As an example, to control the ability to retrieve a history collection configuration named UADVISOR\_KDP\_ANOMALY for all users, enter the following command:

```
RDEFINE $KOBSEC 04SRV.HISTORYCOLLECTIONS.UADVISOR_KDP_ANOMALY UACC(NONE)
```

More generally, you can define the profile using the asterisk (\*) wildcard to restrict requests for all history collection configurations:

```
RDEFINE $KOBSEC 04SRV.HISTORYCOLLECTIONS.* UACC(NONE)
```

You can then give access to the profiles for individual users or user groups.

**Important:** When enabling security for the OMEGAMON enhanced 3270 user interface, you might define resource profile 04SRV.\*\* with UACC(NONE) to secure near-term history. If this profile exists in your \$KOBSEC resource class, it would overrule the profiles for your history collection configurations using TEMS REST services. If this is the case, define the following profile to allow the use of TEMS REST services to retrieve all history collection configurations before restricting access to specific resources:

```
RDEFINE $KOBSEC 04SRV.HISTORYCOLLECTIONS.* UACC(READ)
```

**Note:** To allow users to delete history collection configurations, you must provide ALTER access.

## Procedure

1. For each history collection configuration to protect, enter the following commands in RACF:

```
RDEFINE $KOBSEC 04SRV.HISTORYCOLLECTIONS.uadvisor_name UACC(NONE)
SETROPTS RACLIST($KOBSEC) REFRESH
```

These commands refuse access to all users.

2. To permit access to individual users, enter the following commands in RACF:

- To permit retrieval of a history collection configuration:

```
PERMIT 04SRV.HISTORYCOLLECTIONS.uadvisor_name ID(userid) ACCESS(READ)
CLASS($KOBSEC)
```

- To permit deleting a history collection configuration:

```
PERMIT 04SRV.HISTORYCOLLECTIONS.uadvisor_name ID(userid) ACCESS(ALTER)
CLASS($KOBSEC)
```

## Define SAF profiles to control permissions for situations

Create SAF resource profiles to control permissions for situations when using TEMS REST services.

### Before you begin

TEMS REST services allows you to interact with user-defined situations and predefined product-provided situations. By default, all requests related to situations are allowed unless SAF resource profiles that restrict access are defined.

Security for TEMS REST services requires a SAF general resource class named \$KOBSEC. For more information, review [“Securing TEMS REST services” on page 1081](#).

**Note:** For information about securing access to history collection configurations (which are stored as UADVISOR situations), see [“Define SAF profiles to control permissions for history collection configurations” on page 1085](#).

### About this task

TEMS REST services verifies the authority to interact with user-defined situations and predefined situations by checking for access to the SAF resources, as follows:

Description of request	Method	Endpoint	Resource pattern	Access required
<a href="#">Retrieve defined situations</a>	GET	/situations	04SRV.SITUATIONS.situation_name	READ

Description of request	Method	Endpoint	Resource pattern	Access required
<a href="#">Edit a situation</a>	PATCH	/situations	04SRV.SITUATIONS. <i>situation_name</i>	UPDATE
<a href="#">Create a situation</a>	PUT	/situations	04SRV.SITUATIONS. <i>situation_name</i>	UPDATE
<a href="#">Delete a situation</a>	DELETE	/situations	04SRV.SITUATIONS. <i>situation_name</i>	ALTER
<a href="#">Retrieve current situation status information</a>	GET	/situations/status	04SRV.SITUATIONS.STATUS. <i>situation_name</i>	READ
<a href="#">Retrieve situation status history</a>	GET	/situations/status/history	04SRV.SITUATIONS.STATUS. <i>situation_name</i>	READ
<a href="#">Start a situation</a>	POST	/situations/start	04SRV.SITUATIONS.STARTSTOP. <i>situation_name</i>	READ
<a href="#">Stop a situation</a>	POST	/situations/stop	04SRV.SITUATIONS.STARTSTOP. <i>situation_name</i>	READ

where:

### **04SRV**

Is a literal qualifier value. 04SRV is a qualifier for monitoring server tables.

### **SITUATIONS**

Is a literal qualifier value. Use this qualifier for controlling permissions to user-defined and product-provided situations.

### **STATUS | STARTSTOP**

Are literal qualifier values. Use STATUS for controlling permissions when retrieving situation status information. Use STARTSTOP for controlling permissions when starting or stopping a situation.

### ***situation\_name***

Is the unique name of the situation or policy.

You must create a SAF profile to match the resource. If a matching SAF profile does not exist to protect a given resource, the request is allowed.

As an example, to control the ability to interact with a user-defined situation named MQ\_Queue\_Depth\_High, you can define the following profiles to restrict all access to the resource for all users:

- To restrict retrieving, editing, creating, and deleting a specific situation:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.MQ_Queue_Depth_High UACC(NONE)
```

- To restrict retrieving the situation status for a specific situation:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.STATUS.MQ_Queue_Depth_High UACC(NONE)
```

- To restrict starting and stopping a specific situation:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.STARTSTOP.MQ_Queue_Depth_High UACC(NONE)
```

More generally, you can define the profiles using the asterisk (\*) wildcard to restrict interaction with all situations:

- To restrict retrieving, editing, creating, and deleting of all situations:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.* UACC(NONE)
```

- To restrict retrieving the situation status for all situations:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.STATUS.* UACC(NONE)
```

- To restrict starting and stopping all situations:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.STARTSTOP.* UACC(NONE)
```

- To restrict all interactions with all situations:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.** UACC(NONE)
```

You can then give access to the profiles for individual users or user groups.

**Important:** When enabling security for the OMEGAMON enhanced 3270 user interface, you might define resource profile 04SRV.\*\* with UACC(NONE) to secure near-term history. If this profile exists in your \$KOBSEC resource class, it would overrule the profiles for your situations using TEMS REST services. If this is the case, define the following profiles to allow the use of TEMS REST services to interact with all situations and situation statuses before restricting access to specific resources:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.* UACC(READ)
```

**Note:** To allow users to edit or create situations, you must provide UPDATE access. To allow users to delete situations, you must provide ALTER access.

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.STATUS.* UACC(READ)
```

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.STARTSTOP.* UACC(READ)
```

## Procedure

1. For each resource to protect, enter the following commands in RACF:

- To restrict retrieving, editing, creating, and deleting a specific situation:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.situation_name UACC(NONE)  
SETROPTS RACLIST($KOBSEC) REFRESH
```

- To restrict retrieving the situation status for a specific situation:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.STATUS.situation_name UACC(NONE)  
SETROPTS RACLIST($KOBSEC) REFRESH
```

- To restrict starting and stopping a specific situation:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.STARTSTOP.situation_name UACC(NONE)  
SETROPTS RACLIST($KOBSEC) REFRESH
```

These commands refuse access to all users.

2. To permit access to individual users, enter the following commands in RACF:

- To permit retrieving a specific situation:

```
PERMIT 04SRV.SITUATIONS.situation_name ID(userid) ACCESS(READ) CLASS($KOBSEC)
```

- To permit editing and creating a specific situation:

```
PERMIT 04SRV.SITUATIONS.situation_name ID(userid) ACCESS(UPDATE) CLASS($KOBSEC)
```

- To permit deleting a specific situation:

```
PERMIT 04SRV.SITUATIONS.situation_name ID(userid) ACCESS(ALTER) CLASS($KOBSEC)
```

- To permit retrieving the situation status for a specific situation:

```
PERMIT 04SRV.SITUATIONS.STATUS.situation_name ID(userid) ACCESS(READ)  
CLASS($KOBSEC)
```

- To permit starting and stopping a specific situation:

```
PERMIT 04SRV.SITUATIONS.STARTSTOP.situation_name ID(userid) ACCESS(READ)
CLASS($KOBSEC)
```

## Define SAF profiles to control Take Action permissions

Create SAF resource profiles to control Take Action permissions when using TEMS REST services.

### Before you begin

TEMS REST services allows you to interact with Take Action command definitions. By default, all requests to interact with Take Action commands are allowed unless SAF profiles that restrict access are defined.

Security for TEMS REST services requires a SAF general resource class named \$KOBSEC. For more information, review [“Securing TEMS REST services” on page 1081](#).

### About this task

TEMS REST services verifies the authority to interact with Take Action command definitions by checking for access to the SAF resources, as follows:

*Table 88: TEMS REST services endpoints and SAF resources for Take Action command definitions*

Description of request	Method	Endpoint	Resource pattern	Access required
<a href="#">Retrieve Take Action command definitions</a>	GET	/system/actions	04SRV.ACTIONS.Kpp.name	READ
<a href="#">Edit Take Action command definitions</a>	PATCH	/system/actions	04SRV.ACTIONS.Kpp.name	UPDATE
<a href="#">Create Take Action command definitions</a>	PUT	/system/actions	04SRV.ACTIONS.Kpp.name	UPDATE
<a href="#">Delete Take Action command definitions</a>	DELETE	/system/actions	04SRV.ACTIONS.Kpp.name	ALTER
<a href="#">Execute a Take Action</a>	POST	/system/actions/execute	04SRV.ACTIONS.EXECUTE.Kpp.name	READ

where:

#### **04SRV**

Is a literal. 04SRV is a qualifier for monitoring server tables.

#### **ACTIONS**

Is a literal. Use ACTIONS for controlling permissions to interact with Take Action definitions.

#### **EXECUTE**

Is a literal qualifier value. Use EXECUTE for controlling permissions when executing a Take Action.

#### **Kpp**

Is the product code of the agent instance, or KCN for user-defined Take Action commands. For example, for OMEGAMON® for z/OS®, the product code is KM5. See [Product codes](#) for other products.

**Note:** CN is a product code for OMNIMON Base (which includes the OMEGAMON® enhanced 3270 user interface and OMEGAMON Subsystem). This code is also used for user-defined Take Action commands and might be present (if applicable) in the NAME field of a GET /system/actions response.

*name*

```
RDEFINE $KOBSEC 04SRV.ACTIONS.** UACC(UPDATE)
```

- To restrict executing this Take Action:

```
RDEFINE $KOBSEC 04SRV.ACTIONS.EXECUTE.KCN.CNP_1211927952798 UACC(NONE)
```

More generally, you could define the profile using the asterisk (\*) wildcard to refuse permission to execute any Take Action:

```
RDEFINE $KOBSEC 04SRV.ACTIONS.EXECUTE.** UACC(NONE)
```

**Important:** If you [enable security for the OMEGAMON enhanced 3270 user interface](#) using SAF profiles in the \$KOBSEC resource class, consider the following cases:

- You might define resource profile 04SRV.\*\* with UACC(NONE) to secure near-term history in the enhanced 3270UI. If this profile exists in your \$KOBSEC resource class, it would overrule the profiles for accessing your Take Action command definitions using TEMS REST services. If this is the case, define the following profiles to allow the use of TEMS REST services to interact with all Take Action command definitions before restricting access to specific resources:

```
RDEFINE $KOBSEC 04SRV.ACTIONS.** UACC(ALTER)
```

```
RDEFINE $KOBSEC 04SRV.ACTIONS.EXECUTE.** UACC(READ)
```

- If you use resource profile *Kpp.msn*.TAKEACTION to secure the use of Take Action commands in the enhanced 3270UI, this profile also applies when executing a Take Action in TEMS REST services.

## Procedure

1. For each resource to protect, enter the following commands in RACF:

- To restrict retrieving, editing, and deleting a Take Action command definition:

```
RDEFINE $KOBSEC 04SRV.ACTIONS.Kpp.name UACC(NONE)  
SETROPTS RACLIST($KOBSEC) REFRESH
```

**Note:** To restrict editing and deleting but allow retrieving a Take Action command definition, use access READ.

- To restrict executing a Take Action:

```
RDEFINE $KOBSEC 04SRV.ACTIONS.EXECUTE.Kpp.name UACC(NONE)  
SETROPTS RACLIST($KOBSEC) REFRESH
```

These commands refuse access to all users.

2. To permit access to individual users, enter the following commands in RACF:

- To permit retrieving a Take Action command definition:

```
PERMIT 04SRV.ACTIONS.Kpp.name ID(userid) ACCESS(READ) CLASS($KOBSEC)
```

- To permit editing a Take Action command definition:

```
PERMIT 04SRV.ACTIONS.Kpp.name ID(userid) ACCESS(UPDATE) CLASS($KOBSEC)
```

- To permit creating a Take Action command definition:

```
PERMIT 04SRV.ACTIONS.Kpp.name ID(userid) ACCESS(UPDATE) CLASS($KOBSEC)
```

- To permit deleting a Take Action command definition:

```
PERMIT 04SRV.ACTIONS.Kpp.name ID(userid) ACCESS(ALTER) CLASS($KOBSEC)
```

- To permit executing a Take Action:

```
PERMIT 04SRV.ACTIONS.EXECUTE.Kpp.name ID(userid) ACCESS(READ) CLASS($KOBSEC)
```

## Accessing TEMS REST services OpenAPI document

Access all available request paths, parameters, and responses in the OpenAPI document.

To access the OpenAPI document for the Tivoli Enterprise Monitoring Server (TEMS) REST services, you can use the GET `/spec` endpoint.

```
https://host:port/api/v1/spec
```

The response is the OpenAPI document in YAML format, which provides all the possible HTTP requests, including request paths, associated query parameters, and possible responses.

## How to specify requests to the TEMS REST services

Get started with the TEMS REST services.

Callers interact with the Tivoli Enterprise Monitoring Server (TEMS) REST services by using HTTP REST calls. Possible callers are command-line based (such as `curl`), web browser applications, front-end applications, or programmatic callers created using the OpenAPI Generator. The base path for the TEMS REST services is as follows:

```
https://host:port/api/version
```

Where `port` is the well-known HTTP or HTTPS port for Tivoli® Management Services on z/OS®, as defined at your site.

Version v1 of TEMS REST services provides the following types of endpoints:

- **GET** endpoints that allow read-only access to the OMEGAMON data. You can access the following types of information using available endpoints:
    - Collection data: real-time data, and near-term history from the persistent data store
- Note:** TEMS REST services does not support retrieving data from the Tivoli Data Warehouse.
- History collection configurations, which define what historical data is collected
  - Managed system data: applications, groups, nodes, tables, self-describing agent records, and Take Action command definitions. Paths for managed system data endpoints include `/system` in the address.
  - Situation definitions and statuses
  - **POST** endpoints that allow you to perform an activity. You can perform the following activities using available endpoints:
    - Start and stop a situation
    - Execute a Take Action
  - **PATCH** endpoint that allows you to edit situations and Take Action definitions
  - **PUT** endpoint that allows you to create situations and Take Action definitions
  - **DELETE** endpoints that allow you to delete situations, Take Action definitions, and history collection configurations

All available request paths and responses can be found in the [OpenAPI document](#).

## TEMS REST services terminology

An understanding of the following terms and how they relate to OMEGAMON and the monitoring server will help expedite your getting starting with the TEMS REST services.

### application

The application is the agent product code.

### affinity

The agent affinity is a Tivoli Monitoring internal identifier that associates workspaces, queries, and other items, with the agent. It must be unique in the Tivoli Monitoring installation.

### group

A defined set of resources (nodes) that is used to control the scope of data collection.

### node

A unique token used for agent identification, which is used in data collection to identify one agent monitoring one system or subsystem.

### table

A data structure consisting of rows and columns that is used by the monitoring server and monitoring agents to store collection data.

## Using time values for requests

You can use time values when making requests for collection data or situation statuses:

### Collection data

When requesting collection data using the GET /data endpoint, two types of collection data are available: real-time data, and near-term history from the persistent data store. To request near-term historical data, you must specify time values as part of the GET /data request. If you do not specify time values, the request returns real-time data.

For the GET /data endpoint, the time values are specified using the parameters **timeFrom** and **timeTill**. When requesting historical data, a start and end time must be provided for the request. If you specify the **timeFrom** parameter alone, then the **timeTill** parameter defaults to the current time. If you specify a value for the **timeTill** parameter, then you must also specify a value for the **timeFrom** parameter.

### Situation status history

When requesting situation status history using the GET /situations/status/history endpoint, you must specify a start time from when to retrieve situation status history using the **timeFrom** parameter. You can also specify an end time using the **timeTill** parameter.

The format for the time values consists of 16 digits as follows: `YYMMDDHHMMSS000`

Where:

- `YYY` is the number of years since the year 1900.
- `MMDDHHMMSS` is months, days, hours, minutes, and seconds, respectively.
- The last three digits are zeros.

For example, 2023 July 17, 06:34:37 would be represented as follows: `1230717063437000`

You can use the GET /timenow endpoint to retrieve the TEMS local time. The response returns the time value in the required format for use in the **timeFrom** and **timeTill** parameters.

### Request:

```
https://host:port/api/v1/timenow
```

### Response:

```
{
  "timenow": "1230717063437000"
}
```

## Requesting a session token

This example shows how to generate a session ID (bearer token).

Generate a unique session ID using the GET `/token` endpoint. This operation authenticates the session and creates a token that can be used on subsequent requests, improving the response time and reducing the number of times the user credentials are transferred between the client and the monitoring server.

```
https://host:port/api/v1/token
```

The response is a JSON document that returns information about the token using the SSSToken schema. You can use the token on subsequent requests.

## Requesting managed system data

This example shows how to request managed system data, which includes information about applications, groups, nodes, tables, self-describing agent (SDA) records, and Take Action command definitions.

Paths for managed system data endpoints include `/system` in the address.

When requesting managed system data, you can request information about all items, or you can use parameters to filter the results. The parameters that are available vary by endpoint and include **name**, affinity ID (**id**) and **product**.

1. You can use the following paths to request all applications, groups, nodes, SDA records, or Take Action definitions respectively:

```
https://host:port/api/v1/system/applications
```

```
https://host:port/api/v1/system/groups
```

```
https://host:port/api/v1/system/nodes
```

```
https://host:port/api/v1/system/sda
```

```
https://host:port/api/v1/system/actions
```

**Note:** Requesting all tables using the GET `/system/tables` endpoint is not supported.

2. Using information returned in the responses from the previous requests, you can then refine each request to be more specific, as shown in the following examples:

```
https://host:port/api/v1/system/applications?name=name&id=affinity_id
```

```
https://host:port/api/v1/system/groups?name=name&id=affinity_id
```

```
https://host:port/api/v1/system/nodes?name=name&id=affinity_id
```

```
https://host:port/api/v1/system/tables?name=name
```

```
https://host:port/api/v1/system/sda?node=node&product=product
```

```
https://host:port/api/v1/system/actions?name=name&id=affinity_id
```

**Note:** The **name** parameter is required for the GET /system/tables endpoint.

The response for each of these endpoints is a JSON document that contains an array of objects that represent the records returned. Using the returned data, you can refine your requests for retrieving collection data, as shown in [“Requesting collection data” on page 1095](#).

## History collection data requests

Using TEMS REST services, you can retrieve history collection data. You can also retrieve and delete the history collection configurations used for collecting the data.

## Requesting collection data

This example shows how to request collection data using the GET /data endpoint and how to interpret the response.

### Requesting data

When requesting collection data using the GET /data endpoint, you can filter the response using available query parameters.

Parameters **application**, **table**, and **cols** are required with each request, and either the **nodes** or **groups** parameter must also be specified.

Additionally, you can specify the time value parameters **timeFrom** and **timeTill**. The specification of these time value parameters indicates the request is for historical data, not real-time data. For more information about using the time value parameters, see [“Using time values for requests” on page 1093](#).

The following example includes some of the available query parameters; other optional parameters are also available.

**Note:** The examples show each parameter on a new line for better visibility.

```
https://host:port/api/v1/data
?application=application
&table=table
&cols=column_1,column_2,column_n
&nodes=nodes
&timeFrom=YYYYMMDDHHMMSS
&timeTill=YYYYMMDDHHMMSS
```

To request historical data, include the **timeFrom** and **timeTill** parameters in the request, as shown in the following example:

```
https://host:port/api/v1/data
?application=KM5
&table=ASCPUTIL
&cols=JOBNAME,JESJOBID,CPUPCT
&nodes=RSPLEXL4:RSD3:MVSSYS
&timeFrom=1230615073300000
&timeTill=1230615073540000
```

To request real-time data, do not include the time value parameters, as shown in the following example:

```
https://host:port/api/v1/data
?application=KM5
&table=ASCPUTIL
&cols=JOBNAME,JESJOBID,CPUPCT
&nodes=RSPLEXL4:RSD3:MVSSYS
```

**Tip:** You can use an asterisk (\*) for the `cols` parameter to select all columns.

## Interpreting the response

The response to a GET `/data` request is a JSON document that contains an array of objects that represent the records returned, as shown in the following example:

```
[
  {
    "JOBNAME": "CXPLEXL4",
    "JESJOBID": "STC05528",
    "CPUPCT": 70
  },
  {
    "JOBNAME": "RMFGAT",
    "JESJOBID": "STC06480",
    "CPUPCT": 9
  }
]
```

In this example, the response returns the requested columns in each record: JOBNAME, JESJOBID, CPUPCT.

For some columns, the meaning of the returned value is not intuitive, such as the value for column CPUPCT in this example. To interpret the value, you can look up the description of the column using the GET `/system/tables` endpoint. For this example, enter the following request:

```
https://host:port/api/v1/system/tables?name=ASCPUUTIL
```

The response includes all columns in the table. For this example, the response returns the properties for all columns in table ASCPUUTIL, which includes the CPUPCT column, as follows:

```
{
  "NAME": "CPUPCT",
  "ATTRNAME": "CPU_Percent",
  "ATOMIZE": false,
  "VERSION": 1,
  "TYPE": "integer"
  "SCALE": 1
  "PRECISION": 4
},
```

Columns that are defined as integers include the following properties to describe the value:

- SCALE is the number of digits to the right of the decimal point in the number
- PRECISION is the maximum number of digits in the number

By applying these properties, you can convert the returned values to meaningful, formatted data.

For example, applying a scale of 1 and a precision of 4 (as defined in the properties for column CPUPCT), translates the raw values to the following meaningful data:

- `"CPUPCT": 70`

represents 7.0, or 7% of CPU use

- `"CPUPCT": 9`

represents .9, or 0.9% of CPU use

## Retrieving history collection configurations

This example shows how to request history collection configurations.

A *history collection configuration* defines what historical data is collected for individual attribute groups and specifies from which managed systems to collect, how frequently to collect the data, where to store it for the

short-term, and whether to save data long-term to a data warehouse. History collection configurations determine what historical data is returned using the GET /data endpoint.

**Note:** In the Tivoli Enterprise Portal, you use the History Collection Configuration window to access history collection configuration definitions.

**Note:** History collection configurations are stored as internal UADVISOR situations. A UADVISOR situation is a special form of situation that is created for internal product use and is not visible in the Tivoli Enterprise Portal. The name of a UADVISOR situation is in the format UADVISOR\_XXXXX. Commonly, *Kpp* and *tablename* appear in the name.

To request a list of history collection configurations or information for a single history collection configuration, use the GET /data/historycollections endpoint, as follows:

- Use the following path to request a list of all history collection configurations:

```
https://host:port/api/v1/data/historycollections
```

- Use the following path to request data collected for a specific history collection configuration by including the **name** parameter set to the UADVISOR situation name:

```
https://host:port/api/v1/data/historycollections?name=uadvisor_name
```

where *uadvisor\_name* is the unique name of the history collection configuration in the format UADVISOR\_XXXXX. Commonly, *Kpp* and *tablename* appear in the name.

- Use the **id** parameter to return history collection configurations by affinity:

```
https://host:port/api/v1/data/historycollections?id=affinity_id
```

## Deleting a history collection configuration

This example describes how to use the DELETE /data/historycollections endpoint to delete a history collection configuration.

A *history collection configuration* defines what historical data is collected for individual attribute groups and specifies from which managed systems to collect, how frequently to collect the data, where to store it for the short-term, and whether to save data long-term to a data warehouse. History collection configurations determine what historical data is returned using the GET /data endpoint.

**Note:** In the Tivoli Enterprise Portal, you use the History Collection Configuration window to access history collection configuration definitions.

**Note:** History collection configurations are stored as internal UADVISOR situations. A UADVISOR situation is a special form of situation that is created for internal product use and is not visible in the Tivoli Enterprise Portal. The name of a UADVISOR situation is in the format UADVISOR\_XXXXX. Commonly, *Kpp* and *tablename* appear in the name.

The format of the path is as follows:

```
https://host:port/api/v1/data/historycollections?  
name=uadvisor_name&lstdate=YYYYMMDDHHMMSS000
```

Where:

- *uadvisor\_name* is the unique name of the history collection configuration in the format UADVISOR\_XXXXX. Commonly, *Kpp* and *tablename* appear in the name.

- `YYMMDDHHMMSS000` is the timestamp when the history collection configuration was last modified.

**Note:** This timestamp value is used as a locking mechanism to prevent multiple requests aimed at the same history collection configuration. For information about the format of the timestamp, see [“Using time values for requests” on page 1093](#).

**Tip:** You can obtain this value by using the GET `/data/historycollections` endpoint; the `lstdate` parameter is returned as part of the response.

## Situation requests

You can use TEMS REST services to interact with situations.

### Retrieving defined situations

This example shows how to request information about defined situations for event monitoring.

Use the GET `/situations` endpoint to request a list of defined situations or information for a single situation, as follows:

- Use the following path to request all defined situations:

```
https://host:port/api/v1/situations
```

- Use the following path to request information for a specific situation, by including the `name` parameter set to the unique identifier given to the situation or policy:

```
https://host:port/api/v1/situations?name=situation_name
```

- Use the `id` parameter to return situations by affinity:

```
https://host:port/api/v1/situations?id=affinity_id
```

### Editing situations

This example describes how to use the PATCH `/situations` endpoint to edit situations.

When using this endpoint, you must provide a request body that specifies the following information for each situation to update:

- The name of the defined situation (the **NAME** property).
- The date when the situation was last modified (the **LSTDATE** property). Specify this information as a timestamp value. Because this value is updated each time the situation is edited, you must update the value with each PATCH `/situations` request.

**Note:** This timestamp value is used as a locking mechanism to prevent multiple requests from updating the situation at the same time. For information about the format of the timestamp, see [“Using time values for requests” on page 1093](#).

**Tip:** You can obtain this value by using the GET `/situations` endpoint; the `lstdate` parameter is returned as part of the response.

- The situation information to modify. The properties that can be updated are described in [“Request body for situation editing” on page 1099](#).

The format of the request slightly differs depending on if you are editing a single situation or multiple situations in your request, as described in the following sections.

### Editing one situation per request

When using the PATCH /situations endpoint to edit a single situation, include in the request body the **NAME** property, the **LSTDATE** property, and the situation information to modify.

The format of the path is as follows:

```
https://host:port/api/v1/situations
```

The properties that can be updated are described in [“Request body for situation editing” on page 1099](#).

### Editing multiple situations in a request

When using the PATCH /situations endpoint to edit multiple situations in a single request, you must use the **NAME** and **LSTDATE** properties in the request body for each situation to update.

The format of the path is as follows:

```
https://host:port/api/v1/situations
```

Include in the request body the information to modify for each situation, specified as a separate object for each situation. For example:

```
[
  {
    "NAME" : "sit1",
    "REEV_DAYS": "1",
    "LSTDATE" : "01293012930293"
  },
  {
    "NAME" : "sit2",
    "REEV_DAYS": "1",
    "LSTDATE" : "01293012930293"
  }
]
```

The properties that can be updated are described in [“Request body for situation editing” on page 1099](#).

### Request body for situation editing

The following example shows the format of the request body for situation editing requests and includes all supported properties:

```
{
  "NAME": "string",
  "LSTDATE": "string",
  "ADVISE": "string",
  "AUTOSTART": "string",
  "CMD": "string",
  "FULLNAME": "string",
  "PDT": "string",
  "REEV_DAYS": "string",
  "REEV_TIME": "string",
  "SITINFO": {
    "TFWD": "string",
    "SEV": "string",
    "TDST": "string",
    "ATOM": "string",
    "COUNT": "string"
  },
  "TEXT": "string",
  "REFLEXACTION_OPTIONS": {
    "EACH_ROW": "string",
    "EACH_INTERVAL": "string",
    "WHERE": "string"
  },
  "DISTRIBUTION": [
    "string"
  ]
}
```

Always include in the request body the **NAME** and the **LSTDATE** properties. For the remainder of the properties, include only those properties that you want to update for the respective situation.

The following table describes the supported properties and provides the relevant location in the Tivoli Enterprise Portal (TEP).

<i>Table 89: Request body properties for situation editing</i>		
<b>Property</b>	<b>Description</b>	<b>Location in TEP Situation Editor</b>
NAME	<p>The name of the defined situation. The <b>NAME</b> value is 31 characters or less, does not start with a number, and contains only alphanumeric characters or the underscore character.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> This parameter is required.</p> </div>	Formula tab, <b>Name</b> field
LSTDATE	<p>The timestamp when the situation was last modified. Because this value is updated each time the situation is edited, you must update the value with each PATCH /situations request.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> This parameter is required.</p> </div>	
FULLNAME	<p>The <i>name</i> value of the defined situation when the value does not meet the <b>NAME</b> criteria. The name of the defined situation is stored as the <b>FULLNAME</b> attribute if it is longer than 31 characters, starts with a number, or contains symbols other than alphanumeric or the underscore character (for example, whitespace characters, question mark, exclamation mark).</p>	Formula tab, <b>Name</b> field
TEXT	<p>Situation description. Valid values: character string, max length 64 bytes</p>	Formula tab, <b>Description</b> field

Property	Description	Location in TEP Situation Editor
PDT	<p>Formula containing the thresholds to be tested by the situation. Valid values: character string, max length 1022 characters</p> <p>PDT examples for the supported situation types:</p> <ul style="list-style-type: none"> <li>Standard situation: <pre data-bbox="632 461 1098 584">"PDT": "*IF *VALUE ALL_THREADS.Plan *EQ K06PLAN *AND *VALUE ALL_THREADS.Plan *EQ K07PLAN"</pre> </li> <li>Correlated situation: <pre data-bbox="632 663 1098 913">PDT": "*IF *VALUE *HSITNAME *EQ SituationToMonitor *AND *VALUE *HNODE *EQ PLEXA:SYSTEM1:MVSSYS *AND *VALUE *HDELTASTAT *EQ Y *AND *VALUE *HSITNAME *EQ SituationToMonitor2 *AND *VALUE *HNODE *EQ PLEXA:SYSTEM2:MVSSYS *AND *VALUE *HDELTASTAT *EQ Y"</pre> <div data-bbox="632 947 1098 1193" style="border: 1px solid blue; padding: 5px;"> <p><b>Note:</b> To be valid, PDT must contain at least two existing situations. The statement <code>*HDELTASTAT *EQ Y</code> means that the situation is 'true'. Thus, Y is the only valid <code>*HDELTASTAT</code> value.</p> </div> </li> <li>Embedded situation: <pre data-bbox="632 1267 1098 1384">"PDT": "*IF *SIT SituationToMonitor *EQ *TRUE *AND *VALUE TableA.ColumnE *GT 90.0"</pre> <div data-bbox="632 1417 1098 1720" style="border: 1px solid blue; padding: 5px;"> <p><b>Note:</b> To be valid, PDT must contain at least one existing situation and at least one other clause, which can be another existing situation or an attribute comparison. When including multiple situations, ensure the situations are from the same agent or All Managed Systems.</p> </div> </li> </ul>	Formula tab, Formula fields

Property	Description	Location in TEP Situation Editor
SITINFO	<p>Situation definitions that are eligible for editing. The SITINFO object includes various properties in JSON object format, as follows:</p> <pre data-bbox="576 338 1098 539">"SITINFO": {   "TFWD": "string",   "SEV": "string",   "TDST": "string",   "ATOM": "string",   "COUNT": "string" }</pre> <p>When making updates to these properties, you must include all the SITINFO properties that are defined for the situation. You can obtain the SITINFO definitions by using the GET / situations endpoint. For example, consider a situation with the following definitions:</p> <pre data-bbox="576 752 1098 902">"SITINFO": {   "SEV": "Harmless",   "TDST": "0",   "COUNT": "1" }</pre> <p>To change the value of the COUNT property from 1 to 2, you must include all of the defined properties, as follows:</p> <pre data-bbox="576 1032 1098 1182">"SITINFO": {   "SEV": "Harmless",   "TDST": "0",   "COUNT": "2" }</pre> <p>For a description of each of the SITINFO properties, see <a href="#">"SITINFO properties" on page 1105</a>.</p>	Formula and EIF tabs
REEV_DAYS REEV_TIME	<p>Sampling interval. You can change it to as seldom as once in 999 days or as often as 30 seconds.</p> <p>Valid values:</p> <ul data-bbox="576 1458 1098 1682" style="list-style-type: none"> <li>• For <b>REEV_DAYS</b>, in <i>ddd</i> format, specify 0 - 999 days.</li> <li>• For <b>REEV_TIME</b>, in <i>hhmmss</i> format, you can specify a minimum value of 30 seconds (000030) and a maximum value of 23 hours, 59 minutes, and 59 seconds (235959).</li> </ul> <p>For example, the following definitions create a sampling interval of 24 hours and 5 minutes:</p> <pre data-bbox="576 1783 1098 1854">"REEV_DAYS": "1", "REEV_TIME": "000500"</pre>	Formula tab, Sampling interval fields

Property	Description	Location in TEP Situation Editor
AUTOSTART	<p>Run at startup. Valid values: *YES, *NO</p> <p>Specify *YES if you want monitoring to start as soon as the situation is saved. If a monitoring agent to which the situation is distributed goes offline, the situation will start automatically when the agent starts again.</p> <p>Specify *NO if you want to start the situation manually.</p>	Formula tab, Run at startup option
DISTRIBUTION	<p>Managed systems where to run the situation. Use the following format:</p> <pre data-bbox="576 645 1098 696">"DISTRIBUTION": ["node_1", "node_2"]</pre> <p>where <i>node_n</i> is one or more nodes (managed systems), listed in JSON array format, where to run the situation.</p> <p>For example:</p> <pre data-bbox="576 869 1098 1016">"DISTRIBUTION": [   "*MVS_DB2",   "DB2plex:DB2plex:Plexview",   "TDB2:SYS1:DB2" ]</pre> <p>When making updates to the DISTRIBUTION values, you must include in the request all the node values that are currently defined for the situation. You can obtain the defined values using the GET /situations endpoint. If you omit an entry, the node is removed from distribution. You can also add nodes to distribution.</p> <div data-bbox="576 1308 1098 1921" style="border: 1px solid orange; padding: 10px;"> <p><b>Important:</b></p> <ul style="list-style-type: none"> <li>For all situation types, including an empty array in your request removes all definitions.</li> <li>For correlated situations, the only valid DISTRIBUTION value is *HUB. <pre data-bbox="667 1570 1066 1666">"DISTRIBUTION": [   "*HUB" ]</pre> </li> <li>For embedded situations, both the embedding situation and the embedded situation must have at least one matching DISTRIBUTION value, otherwise the request is invalid.</li> </ul> </div>	Distribution tab, Assigned field
ADVISE	Expert advice. You can enter text that describes instructions for the user, or provide the URL of a page to display.	Expert Advice tab, Text or Advice Location field

Property	Description	Location in TEP Situation Editor
CMD	<p>Action to perform when the situation becomes true.</p> <p>To run a system command, use the following format:</p> <pre data-bbox="576 371 1098 421">"CMD": "system_command"</pre> <p>where <i>system_command</i> is the command to issue at the system.</p> <p>To issue a universal message, use the following format:</p> <pre data-bbox="576 600 1098 696">"CMD" : "message:category;severity; universal_msg"</pre> <p>where:</p> <ul data-bbox="576 770 1078 1061" style="list-style-type: none"> <li>• <i>message</i> is a literal value</li> <li>• <i>category</i> is a one-word term of up to 16 characters</li> <li>• <i>severity</i> is a one-word term of up to 8 characters</li> <li>• <i>universal_msg</i> is the text (up to 245 characters) to display when the situation occurs.</li> </ul>	<p>On the <b>Action</b> tab:</p> <ul data-bbox="1126 277 1398 712" style="list-style-type: none"> <li>• For system commands: the <b>System Command Selection</b>, and the <b>System Command</b> field.</li> <li>• For universal messages: the <b>Universal Message Selection</b>, and the <b>Category, Severity, and Message</b> fields.</li> </ul>

Property	Description	Location in TEP Situation Editor
REFLEXACTION_OPTIONS	<p>Indicate the reflex action options to take when the situation becomes true. The REFLEXACTION_OPTIONS object includes the following properties in JSON object format:</p> <pre>"REFLEXACTION_OPTIONS": {   "EACH_ROW" : "Y N",   "EACH_INTERVAL" : "Y N",   "WHERE" : "TEMS TEMA" }</pre> <p><b>EACH_ROW</b> If the condition is true for more than one monitored item, specify Y to take action on each item, or specify N to only take action on the first item. The default value is N.</p> <p><b>EACH_INTERVAL</b> If the condition stays true over multiple intervals, specify Y to take action in each interval, or specify N to not take action twice in a row. The default value is N.</p> <p><b>WHERE</b> When the action is executed, specify TEMS to perform the action at the Managing System (TEMS), or specify TEMA to perform the action at the Managed System (agent). The default value is TEMA.</p> <p>When making updates to the REFLEXACTION_OPTIONS properties, if a property and its value are not specified, the default value is used.</p>	<p>Options on the <b>Action</b> tab: If the condition is true for more than one monitored item:</p> <ul style="list-style-type: none"> <li>Only take action on first item</li> <li>Take action on each item</li> </ul> <p>Where should the Action be executed:</p> <ul style="list-style-type: none"> <li>Execute the Action at the Managed System (Agent)</li> <li>Execute the Action at the Managing System (TEMS)</li> </ul> <p>If the condition stays true over multiple intervals:</p> <ul style="list-style-type: none"> <li>Don't take action twice in a row (wait until situation goes false then true again)</li> <li>Take action in each interval</li> </ul>

The following table describes the situation information properties that are defined in the SITINFO object:

<i>Table 90: SITINFO properties</i>		
Property	Description	Location in TEP Situation Editor
TFWD	<p>Event Integration Facility (EIF) forwarding, which forwards situation events to one or more EIF receivers. Specify Y to forward situation events to one or more EIF receivers. An EIF event is sent for each situation event.</p> <p>Valid values: Y, N</p>	<b>EIF</b> tab, <b>Forward Events to an EIF Receiver</b> option
SEV	The severity for forwarded situation events.	<b>EIF</b> tab, <b>EIF Severity</b> field

Property	Description	Location in TEP Situation Editor
TDST	<p>Event Integration Facility (EIF) destinations for the forwarded events. Each destination represents one or more EIF receivers. Use the following format:</p> <pre>"TDST": ["destination_1","destination_2"]</pre> <p>where <i>destination_n</i> is one or more destinations, listed in JSON array format, to which forwarded events will be sent.</p>	EIF tab, <b>Assigned EIF Receivers</b> field
ATOM	<p>For multiple-row attribute groups, you can enable the situation to continue to test all rows in the data sampling and open events. Only columns from tables that are specified in the main formula and are eligible for ATOMIZE are processed.</p> <p>For example, the following definition indicates that only the columns from table REALTHDA that are eligible for ATOMIZE are processed:</p> <pre>"ATOM": "REALTHDA.TDIDPLAN"</pre> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Tip:</b> You can use the GET <code>/system/tables?name=REALTHDA</code> endpoint to identify columns that are eligible for ATOMIZE, as indicated by "ATOMIZE" : <code>true</code>.</p> </div>	On <b>Formula</b> tab, select <b>Advanced</b> settings. On <b>Advanced Situation Options</b> window, <b>Display Item</b> tab, <b>Item</b> field.
COUNT	<p>Consecutive true samples, which is the number of times the situation remains true before an event is opened. Use the following format:</p> <pre>"COUNT": "number"</pre> <p>where <i>number</i> is an integer.</p>	On <b>Formula</b> tab, select <b>Advanced</b> settings. On <b>Advanced Situation Options</b> window, <b>Situation Persistence</b> tab, <b>Consecutive true samples</b> field.

## Creating situations

This example describes how to use the PUT `/situations` endpoint to create situations.

When using this endpoint, you must provide the following information in the request body:

- The situation name. Specify a unique name to create a new situation. For more information about the situation name, see [“Situation name” on page 1107](#).
- The **PDT** property specifying the formula for the situation.

You can also specify other optional properties. For more information about the request body properties, see [“Request body for creating situations” on page 1108](#).

The format of the request slightly differs depending on if you are [creating a single situation](#) or [multiple situations](#) in your request, as described in the following sections.

With the PUT `/situations` endpoint, you can also import multiple existing situations from one runtime environment into a different runtime environment. Thus, you can recreate multiple situations in a new runtime

environment in a single request. For more information about importing situations, see [“Importing multiple situations” on page 1115](#).

### Creating one situation per request

When using the PUT /situations endpoint to create a single situation, include in the request body the **NAME** and **PDT** properties.

The format of the path is as follows:

```
https://host:port/api/v1/situations
```

For example:

```
{
  "NAME": "Situation_1",
  "PDT": "*IF *VALUE Active_Server_Pages.Allocated_Memory *EQ 1",
  "DISTRIBUTION": [
    "string",
    "string"
  ]
}
```

You can also specify other optional properties. For more information about the request body properties, see [“Request body for creating situations” on page 1108](#).

### Creating multiple situations in a request

When using the PUT /situations endpoint to create multiple situations, include in the request body the **NAME** property and the **PDT** property for each situation you want to create.

The format of the path is as follows:

```
https://host:port/api/v1/situations
```

In the request body, for each situation you want to create, specify the information as a separate object. For example:

```
[
  {
    "NAME" : "Situation_1",
    "PDT": "*IF *VALUE Active_Server_Pages.Allocated_Memory *EQ 1"
  },
  {
    "NAME" : "Situation_2",
    "PDT": "*IF *VALUE Active_Server_Pages.Allocated_Memory *EQ 1",
    "FULLNAME": "124 Situation name"
  }
]
```

You can also specify other optional properties. For more information about the request body properties, see [“Request body for creating situations” on page 1108](#).

### Situation name

You must specify a unique name (the **NAME** property) in the request body to create a new situation.

The specified value is stored in the situation definition as follows:

#### NAME

If the value is 31 characters or less, does not start with a number, and contains only alphanumeric characters or the underscore character, the value is stored as the **NAME** attribute for the situation.

#### FULLNAME

If any of the following conditions exist, the specified value is stored as the **FULLNAME** attribute for the situation:

- The specified value is longer than 31 characters
- The specified value starts with a number

- The specified value contains symbols other than alphanumeric or the underscore character (for example, whitespace characters, question mark, exclamation mark)

When the provided value for the situation name is stored as the **FULLNAME** attribute due to any of these conditions, then the value of the **NAME** attribute is generated automatically and returned in the response body.

**Note:** Both the **NAME** attribute value and the **FULLNAME** attribute value must be unique.

### Request body for creating situations

The following example shows the format of the request body and includes all properties that can be specified.

```

{
  "NAME": "string",
  "ADVISE": "string",
  "AUTOSTART": "string",
  "CMD": "string",
  "FULLNAME": "string",
  "PDT": "string",
  "REEV_DAYS": "string",
  "REEV_TIME": "string",
  "SITINFO": {
    "COUNT": "string",
    "ATOM": "string",
    "TFWD": "string",
    "TDST": "string",
    "SEV": "string"
  },
  "TEXT": "string",
  "REFLEXACTION_OPTIONS": {
    "EACH_ROW": "string",
    "EACH_INTERVAL": "string",
    "WHERE": "string"
  },
  "DISTRIBUTION": [
    "string"
  ]
}

```

In addition to the required properties, include only the properties that you want to define. For properties that are not specified, default values are used.

The following table describes the properties that can be used when creating a situation and also provides the relevant location in the Tivoli Enterprise Portal (TEP).

**Note:** Properties **NAME** and **PDT** are required.

Table 91: Situation elements eligible when creating a situation		
Property	Description	Location in TEP Situation Editor
NAME	<p>The name of the defined situation. The <b>NAME</b> value is 31 characters or less, does not start with a number, and contains only alphanumeric characters or the underscore character.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> This parameter is required.</p> </div>	Formula tab, Name field

Property	Description	Location in TEP Situation Editor
FULLNAME	The <i>name</i> value of the defined situation when the value does not meet the <b>NAME</b> criteria. You can specify the <b>FULLNAME</b> attribute together with the <b>NAME</b> attribute.	<b>Formula</b> tab, <b>Name</b> field
TEXT	Situation description. Valid values: character string, max length 64 bytes  Default value: none (empty field)	<b>Formula</b> tab, <b>Description</b> field

Property	Description	Location in TEP Situation Editor
PDT	<p>Formula containing the thresholds to be tested by the situation. Valid values: character string, max length 1022 characters</p> <div data-bbox="576 383 1098 479" style="border: 1px solid #add8e6; padding: 5px; margin: 10px 0;"> <p><b>Note:</b> This parameter is required.</p> </div> <p>PDT examples for the supported situation types:</p> <ul style="list-style-type: none"> <li>• Standard situation: <div data-bbox="628 595 1098 719" style="border: 1px solid #add8e6; padding: 5px; margin: 5px 0;"> <pre>"PDT": "*IF *VALUE ALL_THREADS.Plan *EQ K06PLAN *AND *VALUE ALL_THREADS.Plan *EQ K07PLAN"</pre> </div> </li> <li>• Correlated situation: <div data-bbox="628 790 1098 1050" style="border: 1px solid #add8e6; padding: 5px; margin: 5px 0;"> <pre>PDT": "*IF *VALUE *HSITNAME *EQ SituationToMonitor *AND *VALUE *HNODE *EQ PLEXA:SYSTEM1:MVSSYS *AND *VALUE *HDELTASTAT *EQ Y *AND *VALUE *HSITNAME *EQ SituationToMonitor2 *AND *VALUE *HNODE *EQ PLEXA:SYSTEM2:MVSSYS *AND *VALUE *HDELTASTAT *EQ Y"</pre> </div> <p>A correlated situation in TEMS REST services corresponds to the <b>Correlated Situation</b> type when creating a situation in TEP.</p> <div data-bbox="628 1227 1098 1471" style="border: 1px solid #add8e6; padding: 5px; margin: 10px 0;"> <p><b>Note:</b> To be valid, PDT must contain at least two existing situations. The statement <code>*HDELTASTAT *EQ Y</code> means that the situation is 'true'. Thus, Y is the only valid <code>*HDELTASTAT</code> value.</p> </div> </li> <li>• Embedded situation: <div data-bbox="628 1543 1098 1666" style="border: 1px solid #add8e6; padding: 5px; margin: 5px 0;"> <pre>"PDT": "*IF *SIT SituationToMonitor *EQ *TRUE *AND *VALUE TableA.ColumnE *GT 90.0"</pre> </div> <p>An embedded situation in TEMS REST services corresponds to the <b>Situation Comparison</b> option when selecting conditions for a situation in TEP.</p> </li> </ul>	Formula tab, Formula fields

Property	Description	Location in TEP Situation Editor
	<div style="border: 1px solid blue; padding: 10px; background-color: #e6f2ff;"> <p><b>Note:</b> To be valid, PDT must contain at least one existing situation and at least one other clause, which can be another existing situation or an attribute comparison. When including multiple situations, ensure the situations are from the same agent or All Managed Systems.</p> </div>	
SITINFO	<p>Situation definitions that are eligible when creating a situation.</p> <p>The SITINFO object includes various properties in JSON object format, as follows:</p> <pre style="background-color: #f0f0f0; padding: 10px;"> "SitInfo": {   "TFWD": "string",   "SEV": "string",   "TDST": "string",   "ATOM": "string",   "COUNT": "string" } </pre> <p>When specifying the SITINFO object in your request to create a situation, you must include all of these properties.</p> <p>For a description of each of the SITINFO properties, see <a href="#">“SITINFO properties” on page 1114</a>.</p>	Formula and EIF tabs
REEV_DAYS REEV_TIME	<p>Sampling interval. You can change it to as seldom as once in 999 days or as often as 30 seconds.</p> <p>Valid values:</p> <ul style="list-style-type: none"> <li>For <b>REEV_DAYS</b>, in <i>ddd</i> format, specify 0 - 999 days. The default value is 0.</li> <li>For <b>REEV_TIME</b>, in <i>hhmmss</i> format, you can specify a minimum value of 30 seconds (000030) and a maximum value of 23 hours, 59 minutes, and 59 seconds (235959). The default value is 001500.</li> </ul> <p>For example, the following definitions create a sampling interval of 24 hours and 5 minutes:</p> <pre style="background-color: #f0f0f0; padding: 10px;"> "REEV_DAYS": "1", "REEV_TIME": "000500" </pre>	Formula tab, Sampling interval fields

Property	Description	Location in TEP Situation Editor
AUTOSTART	<p>Run at startup. Specify *YES if you want monitoring to start as soon as the situation is created. If a monitoring agent to which the situation is distributed goes offline, the situation will start automatically when the agent starts again.</p> <p>Specify *NO if you want to start the situation manually.</p> <p>Valid values: *YES, *NO</p> <p>Default value: *YES</p>	Formula tab, Run at startup option
DISTRIBUTION	<p>Managed systems where to run the situation. Use the following format:</p> <pre data-bbox="576 689 1098 741">"DISTRIBUTION": ["node_1", "node_2"]</pre> <p>where <i>node_n</i> is one or more nodes (managed systems), listed in JSON array format, where to run the situation.</p> <p>For example:</p> <pre data-bbox="576 913 1098 1061">"DISTRIBUTION": [   "*MVS_DB2",   "DB2plex:DB2plex:Plexview",   "TDB2:SYS1:DB2" ]</pre> <p>When defining the DISTRIBUTION values, you must include in the request all the node values to define for the situation.</p> <div data-bbox="576 1205 1098 1742" style="border: 1px solid blue; padding: 10px;"> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>When correlating situations, ensure that the DISTRIBUTION value is specified as *HUB, which is the only valid value.</li> </ul> <pre data-bbox="671 1413 1066 1509">"DISTRIBUTION": [   "*HUB" ]</pre> <ul style="list-style-type: none"> <li>When embedding situations, ensure that DISTRIBUTION is specified and the situations have at least one matching DISTRIBUTION value, otherwise the request is invalid.</li> </ul> </div>	Distribution tab, Assigned field
ADVISE	<p>Expert advice. You can enter text that describes instructions for the user, or provide the URL of a page to display.</p> <p>Default value: none (empty field)</p>	Expert Advice tab, Text or Advice Location field

Property	Description	Location in TEP Situation Editor
CMD	<p>Action to perform when the situation becomes true.</p> <p>To run a system command, use the following format:</p> <pre data-bbox="576 371 1098 421">"CMD": "system_command"</pre> <p>where <i>system_command</i> is the command to issue at the system.</p> <p>To issue a universal message, use the following format:</p> <pre data-bbox="576 600 1098 696">"CMD" : "message:category;severity; universal_msg"</pre> <p>where:</p> <ul data-bbox="576 770 1078 1061" style="list-style-type: none"> <li>• <i>message</i> is a literal value</li> <li>• <i>category</i> is a one-word term of up to 16 characters</li> <li>• <i>severity</i> is a one-word term of up to 8 characters</li> <li>• <i>universal_msg</i> is the text (up to 245 characters) to display when the situation occurs.</li> </ul> <p>Default value: none</p>	<p>On the <b>Action</b> tab:</p> <ul data-bbox="1126 282 1398 712" style="list-style-type: none"> <li>• For system commands: the <b>System Command Selection</b>, and the <b>System Command</b> field.</li> <li>• For universal messages: the <b>Universal Message</b> option under <b>Action Selection</b>, and the <b>Category</b>, <b>Severity</b>, and <b>Message</b> fields.</li> </ul>

Property	Description	Location in TEP Situation Editor
REFLEXACTION_OPTIONS	<p>Indicate the reflex action options to take when the situation becomes true. The REFLEXACTION_OPTIONS object includes the following properties in JSON object format:</p> <pre>"REFLEXACTION_OPTIONS": {   "EACH_ROW" : "Y N",   "EACH_INTERVAL" : "Y N",   "WHERE" : "TEMS TEMA" }</pre> <p><b>EACH_ROW</b></p> <p>If the condition is true for more than one monitored item, specify Y to take action on each item, or specify N to only take action on the first item. The default value is N.</p> <p><b>EACH_INTERVAL</b></p> <p>If the condition stays true over multiple intervals, specify Y to take action in each interval, or specify N to not take action twice in a row. The default value is N.</p> <p><b>WHERE</b></p> <p>When the action is executed, specify TEMS to perform the action at the Managing System (TEMS), or specify TEMA to perform the action at the Managed System (agent). The default value is TEMA.</p> <p>When specifying the REFLEXACTION_OPTIONS object in your request to create a situation, if a property and its value are not specified, the default value is used.</p>	<p>Options on the <b>Action</b> tab: If the condition is true for more than one monitored item:</p> <ul style="list-style-type: none"> <li>Only take action on first item</li> <li>Take action on each item</li> </ul> <p>Where should the Action be executed:</p> <ul style="list-style-type: none"> <li>Execute the Action at the Managed System (Agent)</li> <li>Execute the Action at the Managing System (TEMS)</li> </ul> <p>If the condition stays true over multiple intervals:</p> <ul style="list-style-type: none"> <li>Don't take action twice in a row (wait until situation goes false then true again)</li> <li>Take action in each interval</li> </ul>

The following table describes the situation information properties that are defined in the SITINFO object:

<i>Table 92: SITINFO properties</i>		
Property	Description	Location in TEP Situation Editor
TFWD	<p>Event Integration Facility (EIF) forwarding, which forwards situation events to one or more EIF receivers. Specify Y to forward situation events to one or more EIF receivers. An EIF event is sent for each situation event.</p> <p>Valid values: Y, N</p> <p>Default value: N</p>	<b>EIF</b> tab, <b>Forward Events to an EIF Receiver</b> option
SEV	The severity for forwarded situation events.	<b>EIF</b> tab, <b>EIF Severity</b> field

Property	Description	Location in TEP Situation Editor
TDST	<p>Event Integration Facility (EIF) destinations for the forwarded events. Each destination represents one or more EIF receivers. Use the following format:</p> <pre>"TDST": ["destination_1","destination_2"]</pre> <p>where <i>destination_n</i> is one or more destinations, listed in JSON array format, to which forwarded events will be sent.</p>	<b>EIF</b> tab, <b>Assigned EIF Receivers</b> field
ATOM	<p>For multiple-row attribute groups, you can enable the situation to continue to test all rows in the data sampling and open events. Only columns from tables that are specified in the main formula and are eligible for ATOMIZE are processed.</p> <p>For example, the following definition indicates that only the columns from table REALTHDA that are eligible for ATOMIZE are processed:</p> <pre>"ATOM": "REALTHDA.TDIDPLAN"</pre> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Tip:</b> You can use the GET <code>/system/tables?name=REALTHDA</code> endpoint to identify columns that are eligible for ATOMIZE, as indicated by "ATOMIZE" : <code>true</code>.</p> </div>	On <b>Formula</b> tab, select <b>Advanced</b> settings. On <b>Advanced Situation Options</b> window, <b>Display Item</b> tab, <b>Item</b> field.
COUNT	<p>Consecutive true samples, which is the number of times the situation remains true before an event is opened. Use the following format:</p> <pre>"COUNT": "number"</pre> <p>where <i>number</i> is an integer.</p>	On <b>Formula</b> tab, select <b>Advanced</b> settings. On <b>Advanced Situation Options</b> window, <b>Situation Persistence</b> tab, <b>Consecutive true samples</b> field.

### Importing multiple situations

With the PUT `/situations` endpoint, you can import multiple situations from one runtime environment into a different runtime environment by completing the following steps:

1. In the runtime environment with the existing situations, use the GET `/situations` endpoint to retrieve the situations that you want to be imported into a different runtime environment.
2. Copy the response.
3. Switch to the runtime environment into which you want to import the situations and select the PUT `/situations` endpoint.
4. Insert the copied situations' data into request body and submit the request.

In the response body, you will find the information for each processed situation.

**Important:** The original runtime environment might differ from the destination runtime environment into which you import the situations. So, for all the situations to be imported successfully, make sure you observe the following recommendations before submitting the PUT /situations request:

- If the original runtime environment and the destination runtime environment include nodes (managed systems) with different names, the situations that are distributed to the nodes that do not exist in the destination runtime environment will not be created. This scenario also applies to correlated situations that have node names in the formula. To avoid this scenario, update the node names in DISTRIBUTION or in PDT (for correlated situations) accordingly.
- If you have custom managed system groups in the original runtime environment and want to keep them in the destination runtime environment, you should either create them in the destination runtime environment or rename them accordingly.
- If the situations that you want to import include correlated or embedded situations in them, mind the order of the situations in request body; so that the situations that are included in embedded or correlated situations are defined before the situations that include them. For example, the correlated situation with the name SituationThatMonitors includes SituationToMonitor1 and SituationToMonitor2. In request body, SituationToMonitor1 and SituationToMonitor2 should be placed before SituationThatMonitors, as shown in the following example:

```
[
  {
    "NAME" : "SituationToMonitor1",
    "PDT" : "*IF *VALUE Active_Server_Pages.Allocated_Memory *EQ 1",
    "FULLNAME" : "123 Situation name 1"
  },
  {
    "NAME" : "SituationToMonitor2",
    "PDT" : "*IF *VALUE Active_Server_Pages.Allocated_Memory *EQ 1",
    "FULLNAME" : "124 Situation name 2"
  },
  {
    "NAME" : "SituationThatMonitors",
    "PDT" : "*IF *VALUE *HSITNAME *EQ SituationToMonitor1 *AND *VALUE *HNODE
*EQ PLEXA:SYSTEM1:MVSSYS *AND *VALUE *HDELTASTAT *EQ Y *AND *VALUE
*HSITNAME
*EQ SituationToMonitor2 *AND *VALUE *HNODE *EQ PLEXA:SYSTEM2:MVSSYS *AND
*VALUE *HDELTASTAT *EQ Y",
    "FULLNAME" : "124 Situation name 2"
  }
]
```

## Deleting a situation

This example describes how to use the DELETE /situations endpoint to delete a situation.

The format of the path is as follows:

```
https://host:port/api/v1/situations?name=situation_name&lstdate=YYMMDDHHMMSS000
```

Where:

- *situation\_name* is the name of the situation to delete.
- *YYMMDDHHMMSS000* is the timestamp when the situation was last modified.

**Note:** This timestamp value is used as a locking mechanism to prevent multiple requests aimed at the same situation. For information about the format of the timestamp, see [“Using time values for requests” on page 1093](#).

**Tip:** You can obtain this value by using the GET `/situations` endpoint; the `lstdate` parameter is returned as part of the response.

## Retrieving situation status information

These examples show how to retrieve situation status information. You can retrieve information about current statuses, or you can retrieve a history of the statuses.

- To retrieve current situation status information, use the GET `/situations/status` endpoint. For details, see [“Request current situation statuses” on page 1117](#).
- To retrieve situation status history, use the GET `/situations/status/history` endpoint. For details, see [“Request situation status history” on page 1118](#).

You can filter your results by including certain situation status attributes in the request. For more information, see [“Filter results by attributes” on page 1118](#).

**Note:** A request to a remote monitoring server (RTEMS) returns information about situation statuses from the remote monitoring server. When a query is sent to the hub monitoring server (hub TEMS), it returns information about both the hub TEMS and the RTEMS.

## Request current situation statuses

Current situation status attributes collect status information on situations and policies that are running.

To retrieve current situation status information, use the GET `/situations/status` endpoint, as follows:

- Use the following path to request the current status of all defined situations:

```
https://host:port/api/v1/situations/status
```

The result of this request is a list of current statuses for all defined situations.

- To request the status of a specific situation, include the `name` parameter, set to the unique identifier given to the situation or policy:

```
https://host:port/api/v1/situations/status?name=situation_name
```

The result of this request is only the status for the specified situation. By default, the results for the situation are not included in the response.

To retrieve the results for a situation status, include the `includeResults` parameter, set to `true`:

```
https://host:port/api/v1/situations/status?name=situation_name&includeResults=true
```

**Note:** To use the `includeResults` parameter set to `true`, you must also specify either the `name` or `originnode` parameter in the request.

- You can also filter the results by various attributes, as shown in the following examples:

```
https://host:port/api/v1/situations/status?node=node_name
```

```
https://host:port/api/v1/situations/status?originnode=origin_node_name
```

```
https://host:port/api/v1/situations/status?atomize=display_item
```

```
https://host:port/api/v1/situations/status?deltastat=situation_status
```

You can combine the attribute query parameters in a single request as needed. For more information, see [Filter results by attributes](#).

## Request situation status history

To retrieve situation status history, use the GET `/situations/status/history` endpoint.

When using this endpoint, you must specify the time from when to retrieve the history by including the required time value query parameter **timeFrom** and the optional parameter **timeTill**. For more information about using the time value parameters, see [“Using time values for requests” on page 1093](#).

The following examples show how to retrieve situation status history:

- Use the following path to request the status history of all defined situations since a certain time:

```
https://host:port/api/v1/situations/status/history?timeFrom=YYMMDDHHMMSS
```

The result of this request is a list of status history for all defined situations from the time specified.

To include an end time, also include the **timeTill** parameter in the request:

```
https://host:port/api/v1/situations/status/history?
timeFrom=YYMMDDHHMMSS&timeTill=YYMMDDHHMMSS
```

- To request the status history for a specific situation, include the **name** parameter, set to the unique identifier given to the situation or policy:

```
https://host:port/api/v1/situations/status/history?
name=situation_name&timeFrom=YYMMDDHHMMSS
```

The result of this request is the status history for the specified situation. By default, the results for the situation are not included in the response.

To retrieve the results for a situation status, include the **includeResults** parameter, set to `true`:

```
https://host:port/api/v1/situations/status/history?
name=situation_name&timeFrom=YYMMDDHHMMSS&includeResults=true
```

**Note:** To use the **includeResults** parameter set to `true`, you must also specify either the **name** or **originnode** parameter in the request.

- You can also filter the results by various attributes, as shown in the following examples:

```
https://host:port/api/v1/situations/status/history?
timeFrom=YYMMDDHHMMSS&node=node_name
```

```
https://host:port/api/v1/situations/status/history?
timeFrom=YYMMDDHHMMSS&originnode=origin_node_name
```

```
https://host:port/api/v1/situations/status/history?
timeFrom=YYMMDDHHMMSS&atomize=display_item
```

```
https://host:port/api/v1/situations/status/history?
timeFrom=YYMMDDHHMMSS&deltastat=situation_status
```

You can combine the attribute query parameters in a single request as needed. For more information, see [Filter results by attributes](#).

## Filter results by attributes

When requesting situation status information using GET `/situations/status` or GET `/situations/status/history`, you can filter the results by available attributes that you specify using query parameters.

The following table describes the query parameters for the attributes that you can use to filter your request and also provides a relevant location for the attribute in the Tivoli Enterprise Portal (TEP):

<i>Table 93: Attributes eligible for situation status filtering</i>		
<b>Parameter</b>	<b>Description</b>	<b>Location in TEP</b>
<b>name</b>	Situation name. The unique identifier given to the situation or policy.	<b>Message Log view, Name field</b>
<b>node</b>	Node. The name of the managed system where the situation is distributed and monitored. Use <code>/system/nodes</code> to get information about all nodes on the system.	<b>Message Log view, Node field</b>
<b>originnode</b>	Origin node. The name of the managed system where the situation was triggered. Use <code>/system/nodes</code> to get information about all nodes on the system.	<b>Message Log view, Origin Node field</b>
<b>atomize</b>	<p>Display Item. For multiple-row attribute groups, this attribute enables the situation to continue to test all rows in the data sampling and open events. Only columns from tables that are specified in the main formula and are eligible for ATOMIZE are processed.</p> <p>For example, the following specification requests that only the columns from table REALTHDA that are eligible for ATOMIZE are included in the results:</p> <pre>atomize="REALTHDA.TDIDPLAN"</pre> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Tip:</b> You can use the <code>GET /system/tables?name=REALTHDA</code> endpoint to identify columns that are eligible for ATOMIZE, as indicated by <code>"ATOMIZE": true</code>.</p> </div>	<b>Message Log view, Display Item field</b>

Parameter	Description	Location in TEP
<b>deltastat</b>	<p>Situation status. The possible values are as follows:</p> <p><b>A</b> Acknowledged. The situation event has been acknowledged.</p> <p><b>D</b> Deleted. The situation has been deleted.</p> <p><b>X</b> Problem. The situation is in a problem state.</p> <p><b>F</b> Expired. The acknowledgment has expired and the situation is still true.</p> <p><b>Y</b> Open. The situation is running and is true.</p> <p><b>N</b> Closed. The situation is running, has been true, and is now false.</p> <p><b>E</b> Reopened. The acknowledgment was removed before it had expired and the situation is still true.</p> <p><b>L</b> (Current situation status only) Started. The situation has been started.</p> <p><b>S</b> (Situation status history only) Started. The situation was started.</p> <p><b>P</b> Stopped. The situation has been stopped.</p>	<b>Message Log</b> view, <b>Status</b> field

## Starting and stopping a situation

This example shows how to start or stop a situation.

- Use the following path to start a specific situation, by including the **name** parameter, set to the situation name:

```
https://host:port/api/v1/situations/start?name=situation_name
```

- Use the following path to stop a specific situation, by including the **name** parameter, set to the situation name:

```
https://host:port/api/v1/situations/stop?name=situation_name
```

## Take Action requests

Using TEMS REST services, you can execute a Take Action. You can also retrieve, edit, create, and delete Take Action command definitions.

## Retrieving Take Action definitions

This example shows how to retrieve Take Action definitions.

Retrieving Take Action definitions uses the GET `/system/actions` endpoint.

**Note:** Take Action definitions are just one type of managed system data that you can retrieve using the TEMS REST API. All managed system data requests use the `/system` resource. For information about retrieving other types of managed system data (such as applications, groups, nodes, and SDA records), see [“Requesting managed system data” on page 1094](#).

Use the GET `/system/actions` endpoint to retrieve a list of Take Action definitions or information for a single Take Action definition, as follows:

- Use the following path to retrieve all Take Action definitions:

```
https://host:port/api/v1/system/actions
```

- Use the following path to retrieve information for a specific Take Action definition, by including the **name** parameter set to the unique identifier given to the Take Action definition:

```
https://host:port/api/v1/system/actions?name=name
```

- Use the **id** parameter to retrieve Take Action definitions by affinity:

```
https://host:port/api/v1/system/actions?id=affinity_id
```

The response for each of these endpoints is a JSON document that contains an array of objects that represent the records returned.

## Editing Take Action definitions

This example describes how to use the PATCH `/system/actions` endpoint to edit existing Take Action definitions.

When using this endpoint, you must provide a request body that specifies the following information for the Take Action to update:

- The name of the Take Action to edit (the **NAME** parameter).
- The date when the Take Action definition was last modified (the **LSTDATE** parameter). Specify this information as a timestamp value. Because this value is updated each time the Take Action definition is edited, you must update the value with each PATCH `/system/actions` request.

**Note:** This timestamp value is used as a locking mechanism to prevent multiple requests from updating the Take Action definition at the same time. For information about the format of the timestamp, see [“Using time values for requests” on page 1093](#).

**Tip:** You can obtain this value by using the GET `/system/actions` endpoint; the **lstdate** parameter is returned as part of the response.

- The Take Action information to modify. The properties that can be updated are described in [“Request body for editing Take Action definitions” on page 1122](#).

The format of the request slightly differs depending on if you are editing a single Take Action definition or multiple Take Action definitions in your request, as described in the following sections.

## Editing one Take Action definition per request

When using the PATCH /system/actions endpoint to edit a single Take Action definition, include in the request body the **NAME** property, the **LSTDATE** property, and the Take Action information to modify.

The format of the path is as follows:

```
https://host:port/api/v1/system/actions
```

For example:

```
{
  "NAME" : "TakeAction_1",
  "CMD" : "NT:AMS_Start_Manage
&KCA_Agent_Availability_Management_Status.PAS_Agent_Name",
  "LSTDATE" : "1230524072538000"
}
```

The properties that can be updated are described in [“Request body for editing Take Action definitions” on page 1122](#).

## Editing multiple Take Action definitions in a request

When using the PATCH /system/actions endpoint to edit multiple Take Action definitions in a single request, you must use the **NAME** and **LSTDATE** properties for each Take Action definition to update.

The format of the path is as follows:

```
https://host:port/api/v1/system/actions
```

In the request body, specify the information to modify for each Take Action definition as a separate object. For example:

```
[
  {
    "NAME" : "TakeAction_1",
    "CMD" : "NT:AMS_Start_Manage
&KCA_Agent_Availability_Management_Status.PAS_Agent_Name",
    "LSTDATE" : "1230524072538000"
  },
  {
    "NAME" : "TakeAction_2",
    "CMD" : "NT:AMS_Start_Manage
&KCA_Agent_Availability_Management_Status.PAS_Agent_Name",
    "LSTDATE" : "1230524072538000"
  }
]
```

The properties that can be updated are described in [“Request body for editing Take Action definitions” on page 1122](#).

## Request body for editing Take Action definitions

The following example shows the format of the request body for Take Action editing requests and includes all supported properties:

```
{
  "NAME": "string",
  "LSTDATE": "string",
  "DESC": "string",
  "CMD": "string",
  "FULLNAME": "string"
}
```

Always include in the request body the **NAME** and the **LSTDATE** properties. For the remainder of the properties, include only those properties that you want to update for the respective Take Action definition.

The following table describes the supported properties.

Table 94: Request body properties for editing Take Action definitions	
Property	Description
NAME	<p>The generated name of the Take Action definition. The <b>NAME</b> value is automatically generated when the Take Action definition is created; this value is provided in the PUT /system/actions response body.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin: 10px 0;"> <p><b>Note:</b> This parameter is required.</p> </div> <div style="border: 1px solid #0070C0; padding: 5px; margin: 10px 0;"> <p><b>Tip:</b> Use the GET /system/actions endpoint to retrieve <b>NAME</b> value for the Take Action definition that you want to update.</p> </div>
LSTDATE	<p>The timestamp when the Take Action definition was last modified. Because this value is updated each time the Take Action definition is edited, you must update the value with each PATCH /system/actions request.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin: 10px 0;"> <p><b>Note:</b> This parameter is required.</p> </div>
FULLNAME	<p>The name of the Take Action definition that you define when creating a Take Action definition. Valid values: character string, max length 31 characters.</p>
CMD	<p>The system command to run by the corresponding Take Action. Valid values: character string, max length 512 characters</p> <p>To run a system command, use the following format:</p> <pre style="background-color: #f0f0f0; padding: 5px; margin: 10px 0;">"CMD": "system_command"</pre> <p>where <i>system_command</i> is the command to issue at the system.</p>
DESC	<p>An optional description of a Take Action definition.</p>

## Creating Take Action definitions

This example describes how to use the PUT /system/actions endpoint to create new Take Action definitions.

When using this endpoint, you must provide the following information in the request body:

- The Take Action **FULLNAME**. Specify a unique name to create a new Take Action definition.
- The system command (the **CMD** parameter).
- The affinity ID of the managed system on which to run the command (the **ID** parameter).

You can also specify an optional description for the Take Action definition.

The format of the request slightly differs depending on if you are creating a single Take Action definition or multiple Take Action definitions in your request, as described in the following sections.

### Creating one Take Action definition per request

When using the PUT /system/actions endpoint to create a single Take Action definition, include in the request body the **FULLNAME**, **ID**, and **CMD** properties.

The format of the path is as follows:

```
https://host:port/api/v1/system/actions
```

For example:

```
{
  "FULLNAME" : "TakeAction_1",
  "CMD" : "NT:AMS_Start_Manage
&KCA_Agent_Availability_Management_Status.PAS_Agent_Name",
  "ID" : "ManagedSystemAffinityID_1"
}
```

### Creating multiple Take Action definitions in a request

When using the PUT /system/actions endpoint to create multiple Take Action definitions in a single request, include in the request body the **FULLNAME**, **ID**, and **CMD** properties for each Take Action definition to create.

The format of the path is as follows:

```
https://host:port/api/v1/system/actions
```

In the request body, for each Take Action definition you want to create, specify the information as a separate object. For example:

```
[
  {
    "FULLNAME" : "TakeAction_1",
    "CMD" : "NT:AMS_Start_Manage
&KCA_Agent_Availability_Management_Status.PAS_Agent_Name",
    "ID" : "ManagedSystemAffinityID_1"
  },
  {
    "FULLNAME" : "TakeAction_2",
    "CMD" : "NT:AMS_Start_Manage
&KCA_Agent_Availability_Management_Status.PAS_Agent_Name",
    "ID" : "ManagedSystemAffinityID_2"
  }
]
```

### Request body for creating Take Action definitions

The following example shows the format of the request body and includes all properties that can be specified.

```
{
  "FULLNAME": "string",
  "ID": "string",
  "CMD": "string",
  "DESC": "string"
}
```

Always include in the request body the **FULLNAME**, **ID**, and **CMD** properties.

The following table describes the supported properties.

Table 95: Request body properties for creating Take Action definitions	
Property	Description
ID	The affinity ID of the managed system where the Take Action can be executed.  <b>Note:</b> This parameter is required.

Property	Description
FULLNAME	<p>The unique name of the Take Action that you define when creating a Take Action definition. Valid values: character string, max length 31 characters.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> This parameter is required.</p> </div>
CMD	<p>The system command to run by the corresponding Take Action. Valid values: character string, max length 512 characters.</p> <p>To run a system command, use the following format:</p> <pre style="background-color: #F0F0F0; padding: 5px; margin: 10px 0;">"CMD": "system_command"</pre> <p>where <i>system_command</i> is the command to issue at the system.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> This parameter is required.</p> </div>
DESC	An optional description of the Take Action definition.

When the request is successfully completed, the response body will display an information message with the generated **NAME** value.

## Executing a Take Action

This example describes how to use the POST `/system/actions/execute` endpoint to execute a Take Action.

When using this endpoint:

- You must specify the name of a defined Take Action using the **name** query parameter.
- You must provide a request body that includes the **destination** property that lists the nodes (managed systems) where to execute the Take Action.
- If variables are used in the Take Action, you can specify the variable and value pairs in the **arguments** property in the request body.

The format of the path is as follows:

```
https://host:port/api/v1/system/actions/execute?name=action_name
```

where *action\_name* is the name of a defined Take Action.

The format of the request body is as follows:

```
{
  "destination": ["node_1", "node_2"]
  "arguments":
    {
      "variable_1": "value_1",
      "variable_2": "value_2"
    }
}
```

where:

- *node\_n* is one or more nodes (managed systems), listed in JSON array format, where to execute the Take Action
- *variable\_n* and *value\_n* are the names and values for variables in the Take Action

## Deleting a Take Action definition

This example describes how to use the DELETE `/system/actions` endpoint to delete a Take Action definition.

The format of the path is as follows:

```
https://host:port/api/v1/system/actions?name=action_name&lstdate=YYMMDDHHMMSS000
```

Where:

- `action_name` is the name of a defined Take Action.
- `YYMMDDHHMMSS000` is the timestamp when the Take Action definition was last modified.

**Note:** This timestamp value is used as a locking mechanism to prevent multiple requests aimed at the same Take Action definition. For information about the format of the timestamp, see [“Using time values for requests” on page 1093](#).

**Tip:** You can obtain this value by using the GET `/system/actions` endpoint; the `lstdate` parameter is returned as part of the response.

## IBM Z® OMEGAMON® Data Provider

IBM Z OMEGAMON Data Provider makes data from z/OS available to various destinations.

Typically, the data consists of metrics or events from z/OS subsystems or applications, and the destinations are analytics platforms that analyze that data.

Data sources for OMEGAMON Data Provider include the following OMEGAMON products or components:

- OMEGAMON monitoring agents on z/OS
- Tivoli Enterprise Monitoring Server

For more information, see the following content:

- In [IBM Z OMEGAMON Data Provider](#) documentation:
  - [Configuring OMEGAMON monitoring agents as a data source](#)
  - [Characteristics of output from OMEGAMON monitoring agents](#)
  - [Configuration Manager parameters for OMEGAMON Data Provider](#)
- In [OMEGAMON shared documentation](#):
  - [“How to: Add OMEGAMON Data Provider to a runtime environment” on page 357](#)
  - [“\(Optional\) Configure situation status streaming” on page 577](#)
  - [“Stream situation status updates to OMEGAMON Data Provider” on page 1126](#)

### Stream situation status updates to OMEGAMON Data Provider

Using the Tivoli Enterprise Monitoring Server and OMEGAMON Data Provider, you can stream situation status updates from your OMEGAMON® monitoring agents to third-party analytics platforms, such as Instana, Splunk, Elastic Stack, Apache Kafka, OpenTelemetry, Prometheus and Grafana. This feature is also referred to as *situation status streaming*.

When a situation status changes (the situation starts, stops, becomes true, or becomes no longer true), the Tivoli Enterprise Monitoring Server forwards the activity to OMEGAMON Data Provider. Then, OMEGAMON Data Provider forwards the data to the integrated third-party analytics platform. The transferred data is in JSON format.

To enable situation status streaming, see [“\(Optional\) Configure situation status streaming” on page 577](#).

**Note:** When situation status streaming is enabled (**KDS\_STREAM\_SITUATION\_STATUS** set to Y), it is enabled for all situations; you cannot enable situation status streaming for only specific situations. To disable situation status streaming for all situations, set the value of parameter **KDS\_STREAM\_SITUATION\_STATUS** to N. If you change the **KDS\_STREAM\_SITUATION\_STATUS** parameter value, you must restart the monitoring server.

The following table describes the situation properties that are forwarded (in JSON format) from the monitoring server to OMEGAMON Data Provider, and subsequently to the integrated analytics platforms.

<i>Table 96: Situation properties forwarded to the integrated analytics platform</i>	
<b>Property</b>	<b>Description</b>
product_code	The three-character <i>kpp</i> product code of the monitoring agent that owns the table. The value for situation status streaming is <i>ksm</i> .
table_name	Name of the table that is mapped for situation statuses.
table_version	An integer representing the table schema version.
situation_name	Name of the situation with a status change.
predicate	Situation formula.
type	The type of situation event. The possible types are as follows: <ul style="list-style-type: none"> <li>• Pure. The situation has no sampling interval; it is not re-evaluated with a specified frequency.</li> <li>• Sampled. The situation formula has a specified sampling interval and gets reevaluated based on that interval.</li> <li>• Error. The situation formula is incorrect; for example, it fails to properly start.</li> </ul>
write_time	Date and time when the status change was sent.
system_name	Name of the system from which the status change was sent.
sysplex_name	Name of the z/OS sysplex from which the status update was sent.
smf_id	The SMF ID of the z/OS LPAR from which the status change was sent.
local_timestamp	Timestamp value from the Tivoli Enterprise Monitoring Server. The format for the time values consists of 16 digits as follows: <i>YYMMDDHHMMSS000</i>  Where: <ul style="list-style-type: none"> <li>• <i>YYY</i> is the number of years since the year 1900.</li> <li>• <i>MMDDHHMMSS</i> is months, days, hours, minutes, and seconds, respectively.</li> <li>• The last three digits are zeros.</li> </ul>
deltastat	Situation status. The possible values are as follows: <ul style="list-style-type: none"> <li>• Started. The situation started.</li> <li>• Stopped. The situation stopped.</li> <li>• True. The situation rule is triggered.</li> <li>• No longer true. The situation was true but the next time the condition is reevaluated, the situation is not true anymore.</li> <li>• Situation in error. This value is returned when something is wrong with the situation formula.</li> </ul>

Property	Description
situation_results	Object with the data on the situation with a status change. This data is included only when the <b>del<del>ta</del>stat</b> value is <b>True</b> .
originnode	Origin node. The name of the managed system where the situation was triggered. This data is included when the <b>del<del>ta</del>stat</b> value is <b>True</b> or <b>No longer true</b> .

## IBM Z Service Management Explorer

*IBM Z Service Management Explorer (IZSME)* is an OMEGAMON user interface, similar in appearance and function to the Java-based Tivoli Enterprise Portal. IZSME is a Web application running as a Zowe desktop plug-in.

### Introduction to IBM Z Service Management Explorer

IBM Z Service Management Explorer (IZSME®) is a web-based replacement for the Tivoli Enterprise Portal (TEP), with the same layout, so users will be immediately familiar with the interface and workflow. The difference is that while TEP is a Java client, IZSME® is a web application running as a Zowe™ desktop plug-in, eliminating the need for users to install and maintain desktop Java and TEP software.

Because the IZSME® interface is a Zowe desktop plug-in, one or more IZSME® windows may be open on the Zowe desktop alongside other Zowe plug-in windows, all within a single web browser tab or on multiple tabs. The Zowe plug-in for IZSME® connects directly to an existing Tivoli Enterprise Portal Server (TEPS) or Tivoli Enterprise Monitoring Server (TEMS), so no change is required to the TEPS or TEMS infrastructure, and all custom workspaces defined by the user will be visible in IZSME®. IZSME® can fully coexist with TEP, meaning that edits to workspaces by TEP are immediately visible in IZSME®. The TEPS server must be running in order to use IZSME®.

IZSME® supports Chrome, Firefox, and Microsoft Edge. The TEPS, LDAP, and Zowe authentication types are supported for user logins.

### Supported products

IBM Z Service Management Explorer (IZSME) can be used with a variety of IBM products. This interface is customizable and provides many menus, options, and types of reports that allow customers to more easily view data and perform actions that would normally require many more steps.

IZSME currently supports the following IBM products:

- IBM Tivoli Advanced Allocation Management for z/OS
- IBM Tivoli Advanced Audit for DFSMSHsm
- IBM Tivoli Advanced Backup and Recovery
- IBM Tivoli Advanced Catalog Management for z/OS
- IBM Tivoli Advanced Reporting and Management for DFSMSHsm
- IBM Tivoli Allocation Optimizer for z/OS
- IBM Tivoli Automated Tape Allocation Manager
- IBM Tivoli Composite Application Manager (ITCAM) for Application Diagnostics
- IBM Tivoli Tape Optimizer for z/OS
- IBM Z® OMEGAMON® for CICS®
- IBM Z® OMEGAMON® for CICS® TG
- IBM Z® OMEGAMON® AI for Db2
- IBM OMEGAMON for IMS on z/OS

- IBM OMEGAMON for Messaging on z/OS
- IBM MQ Monitoring Agent
- IBM Integration Bus Monitoring Agent
- IBM OMEGAMON for Storage on z/OS
- IBM Z OMEGAMON for JVM
- IBM Z OMEGAMON Monitor for z/OS
- IBM Z OMEGAMON Network Monitor

## What's new in IZSME®

These new features are available in IZSME® v1.1.8.

### Version 1.1.8

This version of IBM Z Service Management Explorer contains the following enhancements and changes:

- Take Action is now available from the Navigator, the Situation Event Console, and workspace views. This allows you to respond quickly when predefined situations become true. See [Take Action from the Navigator, Situations and Workspaces](#)
- You can now purge CICS transactions from IZSME®. See [“Purging CICS tasks” on page 1154](#). **Required OMEGAMON for CICS PTF: UJ07731.**
- IZSME® has improved management of agent status information. To achieve better performance and more accurate display of agent status, INODESTS tables are now updated every 30 seconds, regardless of whether the browser requested an update. To reduce resource costs, updates are incremental; changes only, not the entire table, and tables that have not been used in at least 600 seconds are not updated.

### IMPORTANT: Securing communications with mutual auth TLS

IZSME® must be configured to use mutual authentication to secure communications between Java Sidecar and the Zowe® Node server. Sites that have previously configured AT-TLS for a previous version of IZSME® will need to configure AT-TLS again, to enable mutual authentication TLS with version 1.1.8. See [“Configuring mutual auth TLS to secure Node - JavaSidecar communications” on page 1145](#) for details.

## IZSME® Environment Requirements

IBM Z Service Management Explorer (IZSME®) requires several products and tools to be installed in your environment:

### z/OS

IZSME® will run on z/OS V02.02.00 or later.

Make sure you have the following minimum disk space and memory available:

- Disk (DASD): 550 MB of file systems storage, either HFS or zFS
- Memory: 1.5 GB of Central Storage

### Other operating systems

The Tivoli Enterprise Monitoring Server (TEMS) can be used with zLinux, Linux, UNIX and Windows.

### Zowe®

IZSME® requires Zowe® version 1.20 or later. Applying PTFs U001969 and U001980 will upgrade Zowe to version 1.20.1.

You can download Zowe here:

[IBM Z Distribution for Zowe](#)

## Java

IZSME® requires Java version 8.

## Node

IZSME® requires Node.js version from 12 to 18 (inclusive).

## Web Browser

IZSME® works with three of the web browsers supported by Zowe: Chrome, Firefox, and Microsoft Edge. Safari is not supported. For more information, see [Zowe Desktop requirements \(client\)](#).

## Supported TEPS Databases

IZSME® requires that the database used by the TEPS for managing workspaces/users must be Db2. There are currently no plans to support other databases, particularly the embedded Derby database.

# Installation and Configuration

Use the topics in this section to install and configure IBM Z Service Management Explorer (IZSME®).

## Installing IZSME® on z/OS® systems

Perform the necessary steps to install, maintain, configure, and start IBM Z Service Management Explorer (IZSME®) on a z/OS system.

### About this task

Installing IZSME® on z/OS involves installing Zowe® on z/OS, installing IZSME® on z/OS, and then installing IZSME® as a plug-in in the Zowe® instance. Additional configuration options are also available for customizing the Zowe® instance for IZSME®.

The following procedure provides a high-level overview of this process with links to individual tasks.

### Procedure

1. If not already installed, install Zowe® on z/OS®. For details about installing Zowe®, see [Installing Zowe® z/OS components](#).

**Important:** IZSME® requires Zowe® 1.20 or later. Zowe® 2.0 and 2.1 are not supported; Zowe® 2.2 and later are supported.

2. Using SMP/E, install IZSME® on z/OS as described in the [Program Directory for IBM Z Service Management Explorer 6.3.4](#). The SMP/E package provides a number of sample jobs in the #tgeth1q.SIUWSAMP data set that are used in subsequent steps.
3. (Optional) If you have enabled role-based access control (RBAC), make sure to provide access to the IZSME® plug-in for all roles that need access by editing the `allowedPlugins.json` file. For more information, see [“Role-based access control \(RBAC\)” on page 1146](#).
4. Depending on the Zowe® version you have installed, install IZSME® into your Zowe® instance using one of the following procedures:
  - [“Install IZSME in Zowe 2” on page 1132](#).
  - [“Install IZSME in Zowe 1” on page 1133](#).

**Note:** If you are migrating from Zowe® 1 to Zowe® 2, you can move your IZSME® data from Zowe® 1 to Zowe® 2. For details, see [“Migrate IZSME data from Zowe 1 to Zowe 2” on page 1134](#).

5. [“Apply maintenance to an existing IZSME installation” on page 1135.](#)
6. (Optional) [“Configure the Zowe instance for IZSME” on page 1136.](#)
7. [“Start IZSME” on page 1137.](#)

## Install IZSME® in Zowe® 3

You can install IZSME® into a Zowe® 3 instance to effectively monitor and manage IBM® Z systems.

### Before you begin

The following requirements apply:

- You can install IZSME® in Zowe® 3.1 and later.
- The minimum required IZSME® PTF level is OA65763.

### About this task

This task uses the following sample jobs that are provided in the #tgthlq.SIUWSAMP data set:

- IUWMUNPX
- IUWMUPPT

In each job, the JCL provides instructions about how to customize the job before running it.

### Procedure

1. Install IZSME® base by running the IUWMUNPX job, which extracts the base IZSME® runtime files into the IZSME® installation directory.

**Note:** You can follow the instructions inside the script to learn how you can customize your environment.

2. Update IZSME® runtime files by running the IUWMUPPT job, which extracts an IZSME® PTF.

**Note:** You can follow the instructions inside the script to learn how you can customize your environment.

3. Add the **"javaHome"**: <PATH\_TO\_JAVA\_V8\_DIRECTORY> parameter into the pluginConfig.json file located in <IZSME\_HOME>/ctds/teps\_utils/config. The following example illustrates how the contents of pluginConfig.json appear after making the necessary edits:

```
{
  "javaHome": /rsusr/java/IBM/J8.0_64
}
```

Where:

- PATH\_TO\_JAVA\_V8\_DIRECTORY is the absolute path to Java v8 runtime directory.
- IZSME\_HOME is the absolute path to the IZSME® directory.

**Remember:** If pluginConfig.json does not exist in <IZSME\_HOME>/ctds/teps\_utils/config directory, it must be created at the location specified—this pluginConfig.json file is used only during an installation or update of IZSME®, not for run.

4. Install the IZSME® components into Zowe® by running the following command:

```
<ZOWE_RUNTIME_DIRECTORY>/bin/zwe components install -c <ZOWE_YAML> -o <IZSME_HOME>
```

Where:

- ZOWE\_RUNTIME\_DIRECTORY is the absolute path to the Zowe® runtime directory.
  - ZOWE\_YAML is the absolute path to the Zowe® YAML file for an instance.
  - IZSME\_HOME is the absolute path to the IZSME® directory.
5. Add the "javaHome": <PATH\_TO\_JAVA\_V8\_DIRECTORY> parameter into the pluginConfig.json file located in the <ZOWE\_HOME>/workspace/app-server/ZLUX/pluginStorage/com.rs.tep.queryhandler/pluginConfiguration directory. The following example illustrates how the contents of pluginConfig.json appear after making the necessary edits:

```
{  
  "javaHome": /rsusr/java/IBM/J8.0_64  
}
```

Where:

- PATH\_TO\_JAVA\_V8\_DIRECTORY is the absolute path to Java v8 runtime directory.
- IZSME\_HOME is the absolute path to the IZSME® directory.

**Remember:** If pluginConfig.json does not exist in <ZOWE\_HOME>/workspace/app-server/ZLUX/pluginStorage/com.rs.tep.queryhandler/pluginConfiguration directory, it must be created at the location specified—this pluginConfig.json file is used only during IZSME® run, not for installation or update.

6. Disable node clustering in the Zowe® instance by adding the following line to the zowe.yaml configuration file, as IZSME® does not support node clustering:

```
zowe.environments.ZLUX.NO_CLUSTER: 1  
zowe.configmgr.validation: "COMPONENT-COMPAT"  
components.zss.agent.64bit: false
```

7. Restart the Zowe® server.

## Install IZSME® in Zowe® 2

You can install IZSME® into a Zowe® 2 instance to effectively monitor and manage IBM® Z systems.

### Before you begin

The following requirements apply:

- You can install IZSME® in Zowe® 2.2 and later. However, Zowe® 2.0 and 2.1 are not supported.
- The minimum required IZSME® PTF level is OA64754.
- If you are using Zowe® 2.3 through 2.7, you must disable Zowe® Configuration Manager by adding the following line to the zowe.yaml configuration file:

```
zowe.useConfigmgr: false
```

For more information about zowe.useConfigmgr, refer to the [Zowe®](#) documentation.

### About this task

This task uses the following sample jobs that are provided in the #tgeth1q.SIUWSAMP data set:

```
IUWMUNPX  
IUWMUPPT
```

In each job, the JCL provides instructions about how to customize the job before running it.

The following instructions explain how to install IZSME® in Zowe® 2.

## Procedure

1. Install the IZSME® base by running the IUWMUNPX job, which extracts the base IZSME® runtime files into the IZSME® installation directory.

**Note:** You can follow the instructions inside the script to learn how you can customize your environment.

2. Update the IZSME® runtime files by running the IUWMUPPT job, which extracts an IZSME® PTF.

**Note:** You can follow the instructions inside the script to learn how you can customize your environment.

3. Install the IZSME® components into Zowe® by running the following command:

```
<ZOWE_RUNTIME_DIRECTORY>/bin/zwe components install -c <ZOWE_YAML> -o <IZSME_HOME>
```

Where:

- ZOWE\_RUNTIME\_DIRECTORY is the absolute path to the Zowe® runtime directory.
  - ZOWE\_YAML is the absolute path to the Zowe® YAML file for an instance.
  - IZSME\_HOME is the absolute path to the IZSME® directory.
4. Disable node clustering in the Zowe® instance by adding the following line to the `zowe.yaml` configuration file, as IZSME® does not support node clustering:

```
zowe.environments.ZLUX_NO_CLUSTER: 1
```

5. Restart the Zowe® server.

## Install IZSME® in Zowe® 1

You can install IZSME® into a Zowe® 1 instance to effectively monitor and manage IBM® Z systems.

### Before you begin

IZSME® requires Zowe® 1.20 or later.

### About this task

This task uses the following sample jobs that are provided in the `#tqthlq.SIUWSAMP` data set:

```
IUWMUNPX  
IUWMINST  
IUWMUPPT
```

In each job, the JCL provides instructions about how to customize the job before running it.

## Procedure

1. Install the IZSME® base by running the IUWMUNPX job, which extracts the base IZSME® runtime files into the IZSME® installation directory.

**Note:** You can follow the instructions inside the script to learn how you can customize your environment.

2. Deploy IZSME® into a pre-installed Zowe® instance by running the IUWMINST job.

**Note:** You can follow the instructions inside the script to learn how you can customize your environment.

**Important:** You can deploy the same IZSME® installation into multiple Zowe® instances. If you do so, all Zowe® instances will have their IZSME® upgraded every time you apply maintenance to the IZSME® installation.

**Tip:** After you have run this script for the first time, you can set the IZSME® installation directory to read-only (that is, it can be mounted read-only).

3. Update the IZSME® runtime files by running the IUWMUPPT job, which extracts an IZSME® PTF.

**Note:** You can follow the instructions inside the script to learn how you can customize your environment.

4. Disable node clustering in the Zowe® instance by adding the following line to the `instance.env` file, as IZSME® does not support node clustering:

```
ZLUX_NO_CLUSTER=1
```

5. Restart the Zowe® server.

## Migrate IZSME® data from Zowe® 1 to Zowe® 2

Use this procedure to migrate your IZSME® data from Zowe® 1 to Zowe® 2.

### Before you begin

You must have IZSME® installed in Zowe® 2. For more information, see [“Install IZSME in Zowe 2” on page 1132](#).

### About this task

You can use an IZSME® instance from Zowe® 1 in Zowe® 2. By migrating the IZSME® data, all configured connections, downloaded SDA files, and settings will be available in Zowe® 2. The minimum required PTF level is OA64754.

Use the following steps to migrate your IZSME® data from Zowe® 1 to Zowe® 2.

### Procedure

1. Copy IZSME® data from Zowe® 1 to Zowe® 2 by issuing the following z/OS® UNIX® System Services commands:

```
cp -R <ZOWE_V1_INSTANCE_DIRECTORY>/workspace/app-server/ZLUX/pluginStorage/com.rs.om.webportal <ZOWE_V2_INSTANCE_DIRECTORY>/workspace/app-server/ZLUX/pluginStorage/com.rs.om.webportal

cp -R <ZOWE_V1_INSTANCE_DIRECTORY>/workspace/app-server/ZLUX/pluginStorage/com.rs.tep.queryhandler <ZOWE_V2_INSTANCE_DIRECTORY>/workspace/app-server/ZLUX/pluginStorage/com.rs.tep.queryhandler
```

where:

ZOWE\_V1\_INSTANCE\_DIRECTORY is the path to the Zowe® 1 instance  
ZOWE\_V2\_INSTANCE\_DIRECTORY is the path to the Zowe® 2 instance

2. (Optional) If you plan to continue to use your Zowe® 1 instance, you must provide a new value for the Java Sidecar listener port range for the Zowe® 2 instance; the value for Zowe® 2 must be different from the

value in Zowe® 1. To update the port range, change the value for the `javaListenerPort` property in the `pluginConfig.json` configuration file, which exists in the following location:

```
<ZOWE_V2_INSTANCE_DIRECTORY>/workspace/app-server/ZLUX/pluginStorage/  
com.rs.tep.queryhandler/pluginConfiguration/pluginConfig.json
```

where:

`ZOWE_V2_INSTANCE_DIRECTORY` is the path to the Zowe® 2 instance  
For more information about the port value, see [“Configuring Java Sidecar” on page 1139](#).

## Apply maintenance to an existing IZSME® installation

Use this procedure to apply maintenance to an existing IZSME® installation.

### Before you begin

Locate the latest IZSME® maintenance and use SMP/E to apply the PTF to your IZSME® libraries.

### About this task

This task uses the following sample jobs that are provided in data set `#tqth1q.SIUWSAMP`:

`IUWMUPPT`

`IUWMPPT` (for Zowe® 1 environments only)

In each job, the JCL provides instructions about how to customize the job before running it.

The following instructions explain how to apply maintenance or upgrades to your IZSME® installation.

### Procedure

The process for applying IZSME® maintenance depends on your Zowe® version, as follows:

#### For Zowe® 2 environments

1. Update the IZSME® runtime files by running job `IUWMUPPT`, which extracts an IZSME® PTF. Follow the customization instructions inside the script.

**Note:** This job (`IUWMUPPT`) upgrades the target IZSME® installation directory. If you have installed the same IZSME® installation directory into multiple Zowe® instances, running this job upgrades the IZSME® plug-in for all Zowe® instances.

2. Check if the specific maintenance level has additional instructions and perform further steps if applicable.
3. Restart each Zowe® instance to pick up the changes.

#### For Zowe® 1 environments

1. Update the IZSME® runtime files by running job `IUWMUPPT`, which extracts an IZSME® PTF. Follow the customization instructions inside the script.

**Note:** This job (`IUWMUPPT`) upgrades the target IZSME® installation directory. If you have installed the same IZSME® installation directory into multiple Zowe® instances, running this job upgrades the IZSME® plug-in for all Zowe® instances.

2. Complete the application of maintenance for Zowe® 1 environments by running job `IUWMPPT`.
3. Check if the specific maintenance level has additional instructions and perform further steps if applicable.

**Important:** When you apply PTF `OA64754` in a Zowe® 1 environment, you must perform the following steps after completing the PTF installation:

- a. Delete the following file:

```
<ZOWE_HOME>/workspace/app-server/plugins/com.rs.ctds_common.json
```

- b. Run the following command to install IZSME® into the Zowe® instance:

```
<ZOWE_HOME>/bin/install-app.sh <IZSME_HOME>/ctds_common
```

where:

IZSME\_HOME is the path to the IZSME® directory

ZOWE\_HOME is the path to the Zowe® instance directory

4. Restart each Zowe® instance to pick up the changes.

## Configure the Zowe® instance for IZSME®

Configure your Zowe® instance for IZSME®. Configuration varies depending on your Zowe® version.

### Configuring Zowe® 2 environments

The following list provides options for configuring your Zowe® 2 instance:

#### Disable node clustering

(Required) IZSME® does not support node clustering. You must disable clustering in the Zowe® instance by adding the following line to the `zowe.yaml1` configuration file:

```
zowe.environments.ZLUX_NO_CLUSTER: 1
```

**Note:** If node clustering is not disabled, IZSME® will not connect to the database.

#### Reduce Zowe® footprint

(Optional) IZSME® depends on only the Zowe® Desktop component. For the most lightweight instance, set the following parameter in the `zowe.yaml1` configuration file, as follows:

```
zowe.components.gateway: FALSE
```

#### Disable Zowe® Configuration Manager

(Required for Zowe® 2.3 through 2.7) If you are using Zowe® 2.3 through 2.7, you must disable Zowe® Configuration Manager by adding the following line to the `zowe.yaml1` configuration file before IZSME® installation:

```
zowe.useConfigmgr: false
```

**Note:** For more information about `zowe.useConfigmgr`, see [Zowe release notes for version 2.8.0](#).

#### Use custom background graphics

(Optional) IZSME® allows you to add your own custom background images. JPG and PNG formats are supported. Put your graphics files in the `backgrounds` folder, which exists in the following location:

```
\instance\users\ZLUX\plugins\com.rs.om.webportal\web\assets\graphics-background-images\backgrounds
```

### Configuring Zowe® 1 environments

The following list provides options for configuring your Zowe® 1 instance:

## Disable node clustering

(Required) IZSME® does not support node clustering. You must disable clustering in the Zowe® instance by adding the following line to the `instance.env` file:

```
ZLUX_NO_CLUSTER=1
```

**Note:** If node clustering is not disabled, IZSME® will not connect to the database.

## Reduce Zowe® footprint

(Optional) IZSME® depends on only the Zowe® Desktop component. For the most lightweight instance, add (or modify) the `LAUNCH_COMPONENT_GROUPS` setting in the `instance.env` configuration file, as follows:

```
DESKTOP: LAUNCH_COMPONENT_GROUPS=DESKTOP
```

## Use custom background graphics

(Optional) IZSME® allows you to add your own custom background images. JPG and PNG formats are supported. Put your graphics files in the `backgrounds` folder, which exists in the following location:

```
\instance\users\ZLUX\plugins\com.rs.om.webportal\web\assets\graphics-background-images\backgrounds
```

## Start IZSME®

After you have completed the installation steps, you are ready to start using Zowe® and IZSME®. The next time you start Zowe®, the new **IBM Z Service Management Explorer** plug-in will be displayed on the **Zowe®** applications menu.

## Configuring IZSME®

After installing *IBM Z Service Management Explorer*, the next step is to configure it for your environment. You can add, edit, or delete a Tivoli Enterprise Portal Server (TEPS) for IZSME®.

When you open IZSME® for the first time, a window displays with a message that there is no Tivoli Enterprise Portal Server (TEPS) defined as the default server. You must configure at least one TEPS to use as the default server, and the TEPS must be running in order to use IZSME®.

### Adding a new TEPS to the list

To configure a new TEPS for use, follow the steps below.

1. From the window that displays the **No default TEPS is configured** message, click on the **Settings** gear icon in the top right corner. The **Settings** screen will be displayed.
2. Click the **Add new** button at the top of the screen. The **Add Connection** window is displayed.
3. Specify values for the following fields.

**Note:** Chinese characters are not supported in any of the fields in the configuration user interface. To connect IZSME® to TEPS databases, Tivoli Data Warehouse, and LDAP servers, you will not be able to use Chinese characters for the following fields:

- Database schema name
- Administrator username and password for connecting to databases and LDAP servers
- DNS names for TEMS and other servers configured here

## Zowe® authentication

Specify whether or not Zowe authentication should be enabled. When Zowe authentication is enabled (the default), users will be authenticated against Zowe when they choose this configuration upon launching IZSME®.

#### TEMS properties – Host

Specify the host name or IP address for this Tivoli Enterprise Monitoring Server (TEMS). This setting is the host name or IP address of the machine where the hub TEMS is installed.

#### TEMS properties – Port

Specify a numeric value for the port. The standard port value is 1918.

#### Hot Standby TEMS Host (optional)

This optional field allows you to specify a secondary High Availability TEMS host in case the primary TEMS is not available. If you wish to specify a secondary TEMS, specify the host name or IP address of the machine where the secondary TEMS is installed. If you do not want to specify a secondary High Availability TEMS, leave this field blank.

#### Database properties – Host

Specify the host name for this TEPS database.

#### Database properties – Port

Specify a numeric value for the port. The standard port value is 50000.

#### Database properties – Username

Specify the user ID of the person who has access to this database.

#### Database properties – Password

Specify the password associated with the Username.

#### JDBC URL

This URL is built for you automatically based on the values you specify in the other fields on this screen. If you are using the default database name (TEPS), you do not need to change the URL. However, if you are not using the default database name, you can change the URL to suit your environment. Any changes made to the URL will be changed in the fields above vice versa. Also, you may need to specify the *currentSchema* special register. For example, if the schema for TEPS tables is ITMUSER (and that is not the database username you entered), you would edit the JDBC URL as shown in this example:

```
jdbc:db2://myhost:50000/TEPS
```

Change to:

```
jdbc://myhost:50000/TEPS:currentSchema=ITMUSER;
```

**Note:** The JDBC URL must end with a semi-colon (;) or an error message will display.

#### TEPS properties – Host

Specify the host name or IP address for this Tivoli Enterprise Portal Server (TEPS). This setting is the host name or IP address of the machine where the TEPS is installed.

#### TEPS properties – Port

Specify a numeric value for the port.

4. Click **Test**, on the right side of the **Database properties** section, to verify that these values are acceptable. If not, try a different value.
5. Click **Save** to add this TEPS to the list.

## Editing a TEPS configuration

To edit a TEPS configuration:

1. Click the **Settings** gear icon in the top right corner.
2. On the **Settings** window, highlight the line you want to change.
3. Click the **kabob menu** (three vertical dots) in the header bar. (You may need to page right to see the rest of the screen.)
4. Click **Edit**.
5. The **Edit Connection** window displays the current settings for this highlighted line.
6. Change the values you need to adjust and click **Save**. If you do not want to make any changes, click **Cancel**.

## Viewing a list of existing Tivoli Enterprise Portal Servers (TEPS)

To view a list of TEPS servers that have already been defined for IZSME®, click the **Settings** gear icon in the top right corner. A **star** appears next to the first item on the list, indicating that this TEPS is the default server. All of the information in this window was provided when each of the TEPS was added to the list.

The **DB Status** column shows the status of the TEPS database:

- Available – The connection is good.
- Error – No connection was made.
- Unknown – No connection has been attempted yet.

The **TEMS Status** column shows the status of the Tivoli Enterprise Monitoring Server. The status can be one of the following:

- Available – The connection is good.
- Error – No connection was made.
- Unknown – No connection has been attempted yet.

## Configuring an LDAP connection

IZSME® uses Lightweight Directory Access Protocol (LDAP) to connect to various directories. You can specify one LDAP connection for each TEPS:

1. Click the **Settings** gear icon in the top right corner. You will see the **Settings** screen with several columns of data and the **LDAP** column on the far right side.
2. Right-click anywhere in the LDAP column to see a list of options. Choose **Configure LDAP**.
3. Turn on LDAP authentication by moving the slide to "On".
4. Specify the **LDAP Host**.
5. Specify a number for the **LDAP Port**. An example of the port number is 389.
6. Specify the **Username** and **Password** for the Root directory.
7. The **Repository base entry distinguished name** field is where all the values you have previously specified are listed as one long name. An example is listed under the entry field.
8. Click **Save**. The **Settings** screen will indicate **On** for LDAP in the default TEPS database.

## Configuring Java Sidecar

Java Sidecar is a Java process that must be running in order to start IZSME®. Java Sidecar listens on a port. The default port is 20202; if this port is not available, Java Sidecar will attempt to use the next 19 ports in succession until it finds an available port, going as far as 20221. You can specify a different range of ports by specifying the `javaListenerPort` property in the `pluginConfig.json` configuration file:

```
{  
  "javaListenerPort": "20202",  
  "javaVMArguments": [],  
}
```

```
"classPath": "../lib/jar/*",
"cache": {
[etc.]
```

The `javaListenerPort` property specifies "the first of 20 ports the Java Sidecar will try to listen on." So in the above example, the Java Sidecar will start with port 20202, and if that port is not available, will continue with the next port, until it finds an available port, if there is one in that group of 20 ports.

The `pluginConfig.json` file is located in `[zowe_instance_dir]/workspace/app-server/ZLUX/pluginStorage/com.rs.tep.queryhandler/pluginConfiguration/`. If you do not currently have a `pluginConfig.json` file, you will need to create it, as well as the directories leading to the file. Make sure that the App Server process has read access to this file.

**Note:** It is possible that two instances of Java Sidecar can be briefly running at the same time. As a result, there must be at least two ports available, within the 20-port range specified by `javaListenerPort`.

### Address space naming

By default, Java Sidecar will start with the same address space name as the App Server (Node.js process). For example, if you accept the default `ZOWE_PREFIX` (ZWE), both the App Server and the Java sidecar would have the name `ZWE1DS1` (for `ZOWE_INSTANCE=1`).

The Java Sidecar is started by the App Server process, so its name will always relate to the name of the App Server. If there are different values for `ZOWE_PREFIX` and `ZOWE_INSTANCE`, then App Server and Java Sidecar will have slightly different names. However, the root of the names will be the same (starting with `{ZOWE_PREFIX}{ZOWE_INSTANCE}`). See [Creating and configuring the Zowe instance directory](#) for more information about Zowe naming.

### Normal Login to IZSME®

After you have configured a default TEPS, the login screen will appear the next time you start IZSME®. The default database is listed under the **Log in to IZSME®** heading. This is the TEPS database that you specified when configuring LDAP.

You will need to provide the following information on the login screen:

#### Logon ID

Type the logon ID, such as a user ID, that was assigned to you to access IZSME®.

#### Password

If a password is required for this logon ID, type the password here.

### Performance tuning: number of rows per page

Adjusting IZSME® settings can improve performance, when reading large tables. The `maxRowsInPageRequest` setting lets you paginate the results of a query for faster response.

When IZSME® is reading a large table, a user may experience slow performance because of the large number of rows displayed per page. To reduce the delay, you can limit the number of rows that are displayed at any one time, by paginating the display. When IZSME® displays the results of a query, the status line at the bottom of the panel will indicate how many lines are displayed per page, and how many pages the entire search set contains. For example, it might say **Items per page 200** and **1 of 13 pages**, with an arrow button to retrieve the next 200 results.

### Changing the default page size

The default setting is 200 items per page. If you want to change the setting, ask your system administrator to do so, following these instructions.

The default setting of 200 rows per page overrides the number of rows specified in the view definition in Tivoli Enterprise Portal. Because IZSME® sorting and filtering is done on the server, large page sizes are much less necessary than in the Tivoli Enterprise Portal, where sorting and filtering are performed in the client, which can make it hard to find the data you need when the page size is smaller than the result set.

You can change this value by editing the `pluginConfig.json` file, which resides in `<IZSME_HOME>/ctds/teps_utils/config`. The file looks like this:

```
{
  "javaListenerPort": "20202",
  "javaVMArguments": [],
  "classPath": "../lib/jar/*",
  "cache": {
    "navigatorTree": {
      "cacheTimeoutSec": 300,
      "cacheCount": 15
    },
    "physicalTree": {
      "cacheTimeoutSec": 86400,
      "cacheCount": 15
    },
    "customTree": {
      "cacheTimeoutSec": 86400,
      "cacheCount": 15
    },
    "situationTemplates": {
      "validFor": 300000
    }
  },
  "memoryUsageDumpIntervalSec": 900,
  "resourceUsageDumpIntervalSec": 3600,
  "maxRowsInPageRequest": 200
}
```

The `maxRowsInPageRequest` setting specifies the maximum number of rows to be displayed per page. A value greater than zero (0) will limit the maximum displayed rows. If you want to display the entire result set in one page instead of limiting the number of rows displayed, specify a value of **-1**.

## Enabling a concise user activity log

You can configure IZSME® to generate a concise user activity log, with only the minimal information you need in order to diagnose problems quickly.

With concise user activity logging, you can tell what workspace a user visited; and which users have logged on. The resulting log presents the minimum necessary information so that the logs don't get too large. The user activity log can be controlled separately from other IZSME® logging.

The user activity log is configured in the `server.json` file:

```
<ZOWE_INSTANCE>/workspace/app-server/serverConfig/server.json
```

For security purposes, write access to this file should be limited to an administrator. For more information on the `server.json` file itself, see this [example server.json file](#).

To specify the level of severity or debugging verbosity, add the following lines:

```
"logLevels": {
  "com.rs.tep.queryhandler.logonattempts": 3,
  "com.rs.tep.queryhandler.useractivity": 3,
}
```

The minimum logging level for the user activity log is 3.

The following are examples of log entries for `logonattempts` and `useractivity`.

### Logger: `com.rs.tep.queryhandler.logonattempts`

Log level used: 3

Log message:

```
2021-05-05 23:29:55.969 <ZWED:22328> mshelby DEBUG
(com.rs.tep.queryhandler.logonattempts,logonAttemptsLogger.js:25) Logon attempt {
  user: 'sysadmin',
  izSMEInstanceId: 'hUE51Yghwfb0tBKnaSrw',
  tepsConfigurationId: '0904fd16-655a-4ec3-8ac2-e6c3ea8b70af',
  status: 'SUCCESS'
}
```

The message status can be SUCCESS, FAILED, or ERROR.

**Logger:** com.rs.tep.queryhandler:useractivity

Log levels used: 3 (first example), 4 (second example)

Log messages:

```
2021-05-05 23:33:13.311 <ZWED:7460> mshelby DEBUG
(com.rs.tep.queryhandler:useractivity,log-utils.js:99) User visits workspace {
  workspaceId: 'deec9cbb19',
  izSMEInstanceId: 'sV0v8001lsln1Y4wn1M0',
  navigatorPathString: 'Enterprise | z/OS Systems'
} 1620257593311.9
```

```
2021-05-05 23:33:13.312 <ZWED:7460> mshelby FINER
(com.rs.tep.queryhandler:useractivity,log-utils-impl.js:15) User visits workspace with

  { id: 'PHYSICAL_ENTERPRISE', type: 'ROOT', name: 'Enterprise' },
  { id: 'ed8cf67d@MVS', type: 'SYSTEMS', name: 'z/OS Systems' }
] 1620257593311.9
```

For more information on the log levels in Zowe, see [Log levels](#).

## Configuring security for IZSME®

IZSME® is often used to manage sensitive data. You should encrypt all of the communication channels IZSME® uses.

You should configure AT-TLS to provide security for communication channels between IZSME® and other entities including the Zowe® Node server and zssServer, and the Hub TEMS.

**Note:** The Node - JavaSidecar communication channel must be secured using mutual authentication AT-TLS, as described in [“Configuring mutual auth TLS to secure Node - JavaSidecar communications” on page 1145](#).

You can use RACF and role-based access control (RBAC) to set the authorization levels for groups of users (such as administrators and business users).

To secure communication between the Zowe Node Server and the zssServer, see the Zowe documentation under [Configuring ZSS for HTTPS](#). Secure communications between the Live CT/DB Adapter and your TEPS database(s) will use secure JDBC.

## Secure communications with IZSME

The following topics include details about creating specific AT-TLS rules to achieve secure communication, as well as using RACF to create groups with different levels of authorization, as a way of implementing RBAC. The examples are intended as a guide; you can organize your AT-TLS rules differently, depending on the requirements of your site. For more information on using AT-TLS with z/OS, see these topics:

- [Application Transparent Transport Layer Security](#) (diagram illustrating how AT-TLS works)
- [Application Transparent Transport Layer Security \(AT-TLS\)](#) (discussion of AT-TLS and applications)
- [Setting up AT-TLS](#)
- [Configuring and activating the policy agent \(PAGENT\)](#)

## Variables required for configuring security

These are the variables used to configure RACF, register certificates, and configure AT-TLS rules, which are described in the topics that follow.

Table 97: Variables	
Variable	Description
<ca_cert_label>	CA certificate label
<ca_cert_name>	Certificate name
<cert_label>	Internal certificate label
<country_code>	Two character alphabetic ISO country code
<htems_certificate_dataset>	Dataset with certificate, extracted from HTEMS
<htems_cert_label>	HTEMS certificate label
<htems_ip_address>	IP address of HTEMS
<htems_label>	HTEMS label, added to configuration items name to define the item's target
<htems_spipe_port>	HTEMS SPIPE port
<java_sidecar_port>	Value, specified as javaListenerPort in product environment
<location>	Location name
<organization>	Organization name
<organization_unit>	Organization unit name
<ring_name>	RACF Key Ring name
<server_owner_id>	User ID that runs Zowe®/IZSME
<state>	State or province
<yyyy/mm/dd>	Date (with format)

## Managing certificates for AT-TLS

Internal security requires creating or obtaining an X.509 certificate and connecting it to a keyring. You can customize these command templates and use them to create the certificates. For background, see [Configuring RACF](#) and [Authentication via client digital certificates](#).

### Creating a CA certificate

```
RACDCERT CERTAUTH GENCERT +
SUBJECTSDN(CN(<ca_cert_name>) +
OU(<organization_unit>) +
O(<organization>) +
L(<location>) SP(<state>) C(<country_code>)) +
KEYUSAGE(CERTSIGN) +
WITHLABEL(<ca_cert_label>) +
NOTAFTER(DATE(<yyyy/mm/dd>)) +
SIZE(2048)
```

### Creating a certificate signed by certificate authority

```
RACDCERT ID(<server_owner_id>) GENCERT +
SUBJECTSDN(CN(<cert_name>) +
OU(<organization_unit>) +
O(<organization>) +
L(<location>) SP(<state>) C(<country_code>)) +
KEYUSAGE(HANDSHAKE) +
WITHLABEL(<cert_label>) +
NOTAFTER(DATE(<yyyy/mm/dd>)) +
SIZE(2048) +
SIGNWITH(CERTAUTH LABEL(<ca_cert_label>))
```

### Creating a keyring

```
RACDCERT ID(<server_owner_id>) ADDRING(<ring_name>)
```

### Connecting certificates to the keyring

```
RACDCERT ID(<server_owner_id>) CONNECT(ID(<server_owner_id>) LABEL(<cert_label>)
RING(<ring_name>) DEFAULT)

RACDCERT ID(<server_owner_id>) CONNECT(CERTAUTH LABEL(<ca_cert_label>) RING(<ring_name>))
```

### Refreshing profiles

The changes take effect when you refresh the certificate profiles.

```
SETOPTS RACLIST(DIGTRING,DIGTCERT) REFRESH
```

### Configuring and registering certificates

For each TEMS that will be using SPIPE and AT-TLS to communicate with IZSME, you must extract the certificate from TEMS, place it into a dataset, register the certificate in RACF, and attach it to the keyring.

The certificate should be extracted in a binary format such as Distinguished Encoding Rules (DER, with the .der file extension) and transferred to a dataset for registration in RACF. See [Securing communications](#) and [Secure communication between components](#).

#### Attach certificate to RACF and to keyring

Customize this template to register the certificate in RACF and attach it to the keyring, so it can be used for AT-TLS communication.

```
RACDCERT CERTAUTH ID(<server_owner_id>) ADD(<htems_certificate_dataset>) TRUST
WITHLABEL(<htems_cert_label>)

RACDCERT ID(<server_owner_id>) CONNECT(CERTAUTH LABEL(<htems_cert_label>)
RING(<ring_name>))
```

Repeat this procedure for each TEMS that will be using SPIPE and AT-TLS with IZSME.

Finally, refresh the certificate profiles so that the changes will take effect.

```
SETOPTS RACLIST(DIGTRING,DIGTCERT) REFRESH
```

### Securing TEMS-to-IZSME communication

IZSME communicates with TEMS in two ways:

- Using ZSS, to extract TEMS data
- Using Java Sidecar, to extract SDA data

Both of these connections are covered by one rule, securing connection to a specific TEMS using an SPIPE port.

**Note:** This section must be repeated for each HTEMS that will be using SPIPE and AT-TLS to communicate with IZSME.

#### Configure the SPIPE port on HTEMS

The SPIPE port should be configured on HTEMS for external communications to make IZSME-TEMS connections with AT-TLS security enabled possible. For background, see [Communication between components](#).

#### Configure AT-TLS rules for TEMS-IZSME communication

Customize this configuration template and add it to your environment's TLS policy file. Add these rules to the rules you created previously for securing IZSME internal communications; these TEMS rules will use some of the same configuration items that were created in the internal rules.

```
TTLRule IUW_WTEP_AS_HT_CLIENT_<htems_label>
{
  RemoteAddrRef IUW_ADDR_HT_<htems_label>
  RemotePortRangeRef IUW_PORT_HT_<htems_label>
  Userid <server_owner_id>
  Direction Outbound
  Priority 4
  TLSGroupActionRef gAct1~IUW
```

```

    TTLSEnvironmentActionRef eAct1~IUW_AS_CLIENT
    TLSConnectionActionRef cAct1~IUW_AS_CLIENT_HT_<htems_label>
  }
  IpAddr IUW_ADDR_HT_<htems_label>
  {
    Addr <htems_ip_address>
  }
  PortRange IUW_PORT_HT_<htems_label>
  {
    Port <htems_spipe_port>
  }
  TLSConnectionAction cAct1~IUW_AS_CLIENT_HT_<htems_label>
  {
    HandshakeRole Client
    TLSCipherParmsRef cipher-IUW
    TLSConnectionAdvancedParmsRef cAdv1~IUW_HT_<htems_label>
    CtraceClearText On
    Trace 4
  }
  TLSConnectionAdvancedParms cAdv1~IUW_HT_<htems_label>
  {
    ResetCipherTimer 0
    SecondaryMap Off
    CertificateLabel <htems_cert_label>
  }
}

```

## Configuring mutual auth TLS to secure Node - JavaSidecar communications

Mutual authentication TLS must be configured using AT-TLS.

**Note:** Sites that have previously configured AT-TLS for a previous version of IZSME® will need to configure AT-TLS again, to enable mutual authentication TLS with version 1.1.8.

You can configure AT-TLS rules by customizing the following template and adding it to the environment's TLS policy file. Using one keyring for all of the AT-TLS rules will simplify the task of setting up secure communications:

```

TTLSRule IUW_JAVA_AS_SRV
{
  LocalAddr 127.0.0.1
  LocalPortRangeRef IUW_PORT_JAVA
  Userid <server_owner_id>
  Direction Inbound
  Priority 4
  TTLSGroupActionRef gAct1~IUW
  TTLSEnvironmentActionRef eAct1~IUW_AS_SRV
  TLSConnectionActionRef cAct1~IUW_AS_SRV
}
TTLSRule IUW_JAVA_AS_CLIENT
{
  RemoteAddr 127.0.0.1
  RemotePortRangeRef IUW_PORT_JAVA
  Userid <server_owner_id>
  Direction Outbound
  Priority 4
  TTLSGroupActionRef gAct1~IUW
  TTLSEnvironmentActionRef eAct1~IUW_AS_CLIENT
  TLSConnectionActionRef cAct1~IUW_AS_CLIENT
}
PortRange IUW_PORT_JAVA
{
  Port <java_sidecar_port>
}
TTLSGroupAction gAct1~IUW
{
  TTLS-enabled On
  Trace 4
  GroupUserInstance 1
}
TTLSEnvironmentAction eAct1~IUW_AS_CLIENT
{
  HandshakeRole Client
}

```

```

EnvironmentUserInstance 0
TTLSEnvironmentAdvancedParmsRef eAdv1~IUW
TTLSEnvironmentAdvancedParmsRef keyring~IUW
Trace 4
}
TTLSEnvironmentAction eAct1~IUW_AS_SRV
{
HandshakeRole ServerWithClientAuth
EnvironmentUserInstance 0
TTLSEnvironmentAdvancedParmsRef eAdv1~IUW
TTLSEnvironmentAdvancedParmsRef keyring~IUW
Trace 4
}
TTLSEnvironmentAction eAct1~IUW_AS_SRV
{
TTLSCipherParmsRef cipher-IUW
TTLSEnvironmentAdvancedParmsRef eAdv1~IUW
TraceClearText On
Trace 4
}
TTLSEnvironmentAction eAct1~IUW_AS_SRV
{
HandshakeRole Client
TTLSCipherParmsRef cipher-IUW
TTLSEnvironmentAdvancedParmsRef eAdv1~IUW
TraceClearText On
Trace 4
}
TTLSEnvironmentAdvancedParms eAdv1~IUW
{
ResetCipherTimer 0
SecondaryMap Off
CertificateLabel <cert_label>
}
TTLSEnvironmentAdvancedParms keyring~IUW
{

## Role-based access control (RBAC)

Creating RACF user profiles and groups with different levels of authorization is a simple way of implementing RBAC for your IZSME® users.

**Note:** When you enable RBAC, make sure to provide access to the IZSME® plug-in for all roles that need access by editing the `allowedPlugins.json` file. For details on how to do this, see [Controlling app access for all users](#) in the Zowe® documentation.

In IZSME®, a **configuration** is a combination of a specific TEPS and HTEMS. After you start IZSME®, you can display the current configurations, which are displayed on the **Settings** panel, by clicking the gear icon:

## Settings

✔ Success! Connections to database and TEMS succeeded. ✕

🔍 Search Add new +

TEPS Database host	Primary TEMS Origin node	DB Username	DB Password	DB Port	DB Status	TEMS Status	ZOWE auth	LDAP
--------------------	--------------------------	-------------	-------------	---------	-----------	-------------	-----------	------

Under this heading, the panel lists all the configurations currently set up in your environment, with the specific TEPS database host, primary TEMS origin node, and other specifications.

The following example shows how IZSME® RACF groups can be set up for different roles:

- **IZSMEADM** - group for application administrators
- **IZSMEUSR** - group for application users

These groups represent the "roles" in Role Based Access Control. If you have two TSO IDs set up for yourself, add your "administrator" TSO ID to **IZSMEADM** and your "general user" ID to **IZSMEUSR**.

These are the general application profiles for all users (user IDs that are in both the **IZSMEUSR** and **IZSMEADM** groups):

- **ZLUX.\*.COM\_RS\_CTDS\_COMMON.\*\***
- **ZLUX.\*.COM\_RS\_MVD\_CTDS.\*\***
- **ZLUX.\*.COM\_RS\_DISCOVERY\_BASE.\*\***
- **ZLUX.\*.COM\_RS\_TEP\_QUERYHANDLER.\*\***
- **ZLUX.\*.COM\_RS\_OM\_WEBPORTAL.\*\***

These profiles are for application administrators only (**IZSMEADM** group):

- **ZLUX.\*.SVC.COM\_RS\_OM\_WEBPORTAL.CONFIG.PUT.\*\*** - API for changing configuration file
- **ZLUX.\*.SVC.COM\_RS\_TEP\_QUERYHANDLER.SECURECONFIG.PUT.\*\*** - API for changing configuration file
- **ZLUX.\*.SVC.COM\_RS\_OM\_WEBPORTAL.QUERYHANDLER.POST.JAVALOGLEVEL** - API for changing log level for JavaSidecar
- **ZLUX.\*.COR.\*\*** - Zowe API for administrators

## Enabling non-expiring sessions

You can set up a user ID to run IZSME® with a session that does not expire, or with a different timeout period from the default. This is useful, for example, if you want to have an overhead monitor in your data center that always shows IZSME® a high-level "data center health" display.

You can create a group of user IDs with a session timeout value different from the default. These IDs are specified by creating a file called `timeout.json` in the `serverConfig` folder in the Zowe™ instance:

```
<ZOWE_INSTANCE>\workspace\app-server\serverConfig\timeouts.json
```

For security purposes, write access to this file should be limited to an administrator. For for information, see an example `server.json` file.

This example illustrates the file format:

```
{
  "users": {
    "ab1234": 400,
    "abxyz": -1
  },
  "groups": {
    "ZOWEUSERS": 200
  }
}
```

When one of the specified user IDs logs in, the user's expiration time will be the value specified in the configuration file.

The values specified for users set the timeout period, in seconds; in the example above, the timeout period for user ab1234 would be 400 seconds. To set an unlimited (non-expiring) session, specify a value of **-1**. In the example, user abxyz will have a non-expiring session.

For more information on configuring Zowe, see [Configuring Zowe Application Framework](#).

## Getting started using IZSME

IBM Z Service Management Explorer is a web portal into your monitored environment.

### Architecture

#### Client

IBM Z Service Management Explorer is a browser-based user interface for viewing and monitoring your enterprise network.

#### Server

IZSME® connects to its application server, the Tivoli® Enterprise Portal Server (TEPS), which is a collection of software services that enable retrieval, manipulation and analysis of data from the monitoring agents on your enterprise. The TEPS connects to the Tivoli® Enterprise Monitoring Server (TEMS), which acts as a collection and control point for alerts received from the monitoring agents, and collects performance and availability data. The main, or hub, TEMS (HTEMS) correlates the monitoring data collected by agents and remote servers and passes it to the TEPS for presentation and evaluation.

#### Agent

Tivoli® Enterprise Monitoring Agents (TEMAs) are installed on the systems whose applications or resources you want to monitor. The monitoring agent collects the monitored data, and passes it to the TEMS to which it is connected. The client gathers the current values of the monitored properties, or attributes, and displays them in views. It can also test the values against a threshold and display an event indicator when that threshold is exceeded.

### Predefined tools

IBM Z Service Management Explorer comes with some predefined tools designed to help you get up to speed quickly.

Use these tools to begin monitoring and visualizing data immediately. Some definitions are ready to use; others are turned off until you activate them:

#### Workspaces

The Navigator is the panel that appears at top-left when you enter IZSME®. The workspaces that open when you click a Navigator item are predefined. They provide real-time visual data from managed systems, and they provide historical values when historical data collection has been configured. The predefined workspaces also provide a starting point for designing your own workspaces.

#### Queries

The predefined workspaces are populated with data from predefined queries. Creating your own queries from these predefined queries enables you to add or remove attributes, apply a sort order, and pre-filter the data.

#### Situations

The tests for conditions that you want to be alerted for are available in the predefined situations.

#### Managed system groups

The Tivoli® Enterprise Monitoring Server and every IBM® Tivoli® Monitoring product has at least one predefined managed system group, indicated by an asterisk at the beginning of the list name, such as \*NT\_SYSTEM for the Windows™ OS agent. When you assign one of these managed system groups to a situation, policy, historical collection configuration, or custom Navigator, all managed systems with that agent installed are selected.

## IZSME tour

This topic briefly introduces the Navigator, workspaces, and situations.

### Navigator

The Navigator shows the hierarchy of your network, with *enterprise* at the top, followed by the *operating platform*, etc.:

1. Open a operating platform level (for example, Linux™, UNIX™, Windows™, or z/OS® Systems) by clicking the right-arrow icon for the level you want to look at.  
Opening a level in the Navigator reveals the next level in that branch.
2. Open the next operating platform level to see the names for the systems running on that platform.
3. Open any system to see the monitoring agents installed on that system for monitoring applications and resources; and, below agents, the elements, or attributes, for which the agent can collect data.

**Tip:** You can close the tree entirely by clicking the arrow icon to the left of the Enterprise item.

### Workspaces

Every item in the Navigator has a default workspace that opens when you select it. Multiple workspaces can also be accessed from a single navigator item. When you start IZSME, the top item in the Navigator, Enterprise, is selected and the Situation Event Console is displayed.

Select another Navigator item by clicking the icon for the operating platform, or the name of the platform itself.

The workspace for the operating platform you selected replaces the one previously displayed.

The Navigator and workspaces allow you to examine your managed enterprise from the highest level to the most detailed.

### Situations

In addition to providing a map of your enterprise, the Navigator can alert you to changing conditions. When a condition changes, the associated item is marked with an icon representing each condition: Fatal, Critical, Minor, Warning, Harmless, Informational, or Unknown. The Navigator places one of these icons, called an *alert indicator* or *event indicator*, at each level of the hierarchy, so you can see an alert even if a Navigator branch is closed.

IZSME runs tests called *situations* on systems where monitoring agents are installed. When the conditions of a situation have been met, an event occurs and an event indicator is displayed over the applicable items in the Navigator.

## Using the Navigator

The Navigator provides a hierarchical, high-level overview of the status of your monitored environment. The Situation Event Console is a view that serves as the starting point for taking action to address situations on your managed systems.

### Navigator overview

The Navigator is the top-left pane in IZSME®, which allows you to drill down and display information on the parts of your environment you want to examine. Initially, the Navigator shows your entire enterprise, with the Situation Event Console to the right.

### Types of Navigator views

#### Physical view

The default Navigator view is Physical and shows the hierarchy of your monitored enterprise. As new managed systems come on- or offline, the Physical view changes accordingly.

### Custom views

Your configuration may also have custom views. These views are selectable from the Navigator toolbar. They display event indicators (described below), but unlike the Physical view, custom views can be edited.

### Logical view

IZSME® initially has one custom Navigator view called Logical with a single Navigator item for Enterprise.

### Workspaces

A workspace is a working area (pane) of IZSME®. Selecting an item in the Navigator opens its default workspace.

## Situation event indicators

When a situation becomes "true," an event indicator (a small colored icon) appears next to the corresponding Navigator icon.

Event indicators are classified by severity, from highest to lowest: Fatal, Critical, Minor, Warning, Harmless, Informational, or Unknown. As you move up the Navigator hierarchy, multiple events are consolidated to show only the indicator for the event with the highest severity.

Click on an event indicator to open a listing of the situations that are true for the Navigator item and any branching items. You can display additional columns by clicking on a row, then using the arrow keys to move to the left and right.

Acknowledged	The situation event has been acknowledged.
Expired	The acknowledgement has expired and the situation is still true.
Reopened	The acknowledgement was canceled before it had expired and the situation is still true.
Stopped	The situation has been stopped.
Error	The situation is not functioning properly.
Status Unknown	The monitoring server detects that an agent is offline. The agent might have been taken offline intentionally, there might be a communication problem, or the agent or the system it is running on might have stopped or be failing. The situation flyover listing on this icon shows *STATUS_UNKNOWN, which is not actually a situation, but the notation for a problem on the managed system. Consider recycling the agent.

## Understanding situation events

IZSME® and the products in your environment come with a set of predefined situations. You can use these unmodified or use them as templates to create your own custom situations.

### Situation formula

Situation formulas consist of one or more expressions. For example, a situation that checks for free disk space below 20% has an expression that uses the Logical Disk attribute "Free Megabytes" and reads as `Free Megabytes < 20`. The situation will read data samples taken at the managed system at set intervals, such as once a day for the disk space situation in our example.

Other situations might be more elaborate, such as the predefined situation called Bottleneck Memory. It embeds two situations: one that tests for excessive memory paging activity (>100 pages per second), and one that tests for processor time over 70%. If both of these situations are true at the same time, the Bottleneck Memory situation becomes true and opens an event.

### Situation event indicators

When a situation is associated with a managed system, it also has a state: Fatal, Critical, Minor, Warning, Harmless, Informational, or Unknown. As you move up the Navigator hierarchy, multiple events are consolidated to show only the indicator of the highest severity. Go to the lowest level of the hierarchy in the Navigator and you see the event indicator over the attribute category for which it was written.

### Situation Event Console

The Enterprise Status workspace includes the Situation Event Console view.

When there are more than 100 situations, the Situation Event Console will be paginated, instead of displaying the entire list of situations in one scrollable list. At the bottom of the Situation Event Console, the number of items per page will be displayed, along with an indicator of how many pages of situations are

available; for example, **1 of 2 pages**, with arrow buttons that let you bring up the next or the previous page. You can change the **Items per page** to display 100, 150, or 200 situations; the default is 100. Click the **Items per page** field, then select the number of situations per page. Sorting is unaffected by the number of situations displayed. Regardless of the setting, the entire list of situations will be sorted.

### Event flyover list

In the Navigator, you can click the event indicator icon to the left of a list item (for example, the list item for your managed systems might be **z/OS Systems**), to open a listing of open situations, with this information for each:

- Event state
- Situation name
- Name of the system on which the event occurred
- Event timestamp
- Display item, if one was specified
- Situation status

You can click on an event in the list, then use the right-arrow key to display columns to the right of the ones shown initially.

To display the **Situation Event Results** workspace, right-click on a situation.

### Situation Event Results workspace

The **Situation Event Results** workspace shows the values of the attributes at the time when the situation first became "true" (Initial Situation Values) and at the present time (Current Situation Values). The **Expert Advice** panel at lower-right displays advice for the situation.

Expert advice is currently available only for product-provided situations. The advice is not editable, and when you create a new situation or use a situation created at your site with Tivoli Enterprise Portal, the advice will not be available in the **Expert Advice** panel.

## Using workspaces

The workspace is the working area of IZSME®, divided into panes to show different views.

You can start monitoring activity and system status immediately with the predefined workspaces, or you can create your own workspaces to look at conditions specific to your site.

### Workspace characteristics

Every Navigator item has at least one predefined workspace that you can open. Every workspace characteristics such as editable properties and views.

### Views

A view is a pane, or frame, in the workspace containing a chart or table showing data from one or more monitoring agents. Other types of views such as the topology view and graphic view can give a broader overview of the network. Specialized view such as the browser view and terminal view are also available. You can increase the number of views in a workspace by splitting a view into two separate views.

The data for a table, chart, or relational table-based topology view is chosen by the query it uses. Collectively, they are called *query-based views*. The query specifies the attributes to include in the view. Although each view uses one query, you can add more views to the workspace, and each can use a different query. The queries can be for different monitoring agents, including those for the Tivoli® Enterprise Monitoring Server for showing information that is common to your monitored environment (such as all the managed systems and all the situation events). You can also include queries of JDBC or ODBC data sources by writing custom SQL queries.

### Links

The link feature enables you to define a link from one workspace to another. Then you can quickly jump to a related or more detailed workspace to investigate system conditions.

The simplest type of a link originates from the Navigator item: When you right-click that Navigator item, the pop-up menu shows the defined links for the item. Select one to open the linked workspace.

A more specific link originates from a table or from a chart data point to another workspace. Information from one of the attributes in the selected row, bar, pie segment, or plot point is used to determine the content of the target workspace.

You can also define more complex links and use the predefined links that come with your IBM® Tivoli® Monitoring product.

## Navigator level

The monitoring agents available for reporting in a workspace are those assigned to that branch of the Navigator. If you are not sure which monitoring agents are included, do one of the following:

- Expand the branch of the Navigator
- Right-click the Navigator item and select Properties to see which managed systems are assigned.
- Open one of the workspaces at the enterprise, platform, or system level of the Navigator Physical view

This same principle applies to attribute groups. The lowest level of the Navigator Physical view, for example, is the attribute level. The views you can show for the workspaces at that level can draw only from the attribute groups represented by that level. If you were to build a workspace for the  **Disk** Navigator item, for example, you could create a chart with data from the **Logical Disk** attributes and another with data from the **Physical Disk** attributes.

## Refreshing a workspace

You can refresh the data that is displayed in the workspace on demand or at a set interval.

### About this task

IZSME® receives monitoring data from monitoring agents whenever you open a workspace that includes query-based views. The default setting for most predefined workspaces is *On Demand*, which means retrieved data remains static until you refresh manually.

### Procedure

- To refresh a workspace manually, click the refresh icon . To set a refresh interval, click the menu icon (the three-dot icon at top-right), and select **Refresh Every** and one of the intervals: 30 seconds; 60 seconds; 5 minutes; 15 minutes; 60 minutes; or On Demand. **Note:** You can set the refresh interval, but the setting will be active only for the currently opened IZSME® instance. In addition, be aware that refreshing the workspace creates a certain amount of network traffic. The refresh requests travel to the hub monitoring server and then to the monitoring agent. The information is returned by the same route.

### What to do next

Be aware that the more frequent the automatic refresh, the more network traffic you create. These requests travel from the portal client to the portal server and to the hub monitoring server before reaching the monitoring agent. They might also pass through a remote monitoring server to reach the monitoring agent. The information is returned by the same route.

## Setting a time span to display

IZSME® can display data for a period of hours, days, weeks, months, or years, in addition to showing real time data. If historical data collection has been configured for the managed systems you are using, you can display historical data.

### About this task

If historical data collection has been enabled, the **Specify Time Span for Query** icon  is on the left, just under the title bar in each view (pane) in the current workspace. When you click the icon, you can specify the time span in any of three ways:

- Real time
- Real time plus Last *n* Hours (maximum 48)
- Last *n* Hours/Days/Weeks/Months/Quarters/Years (maximum 32 years)

The **Real time plus Last** option is enabled for the bar chart, plot chart, and area chart. If you are working with tabular data, this option is not available.

The **Cancel** button discards any changes and closes the **Choose the time span** pane.

The **Apply** button applies your settings.

Any changes you have made to the settings will be reset (discarded) when you leave the current workspace.

For more information, see [Overview of historical data collection and reporting](#).

## Using workspace filters

Workspace filters let you narrow down the information displayed in the **Enterprise Networks** view.

### Procedure

1. Log in and open IZSME®.
2. From the **View** menu in the Navigator at top-left, select the **Enterprise\_Networks** navigator tree.
3. From the **Enterprise Networks Navigation** view at the top-left, select any row containing text that ends with **Find**, such as **Enterprise Connections Find**. Click on the icon to the left of the name, or right-click on the name itself and select **Link to > Enterprise Connections Find** (or the name you have selected), to display the **Workspace filters** panel.
4. Fill in at least one filter value. The asterisk (\*) that initially appears allows you to specify a partial search term, with the asterisk serving as a wildcard. For example, if you wanted to search all System IDs beginning with R, you would enter R\*.
5. Submit the dialog by selecting **Apply**. Data will be displayed in the workspace views using the filters you entered.

## Launching directly to a workspace

An application can launch IZSME® and go directly to a workspace you are interested in. This saves time, by allowing you to go directly to a workspace you use frequently, instead of having to navigate to the workspace after you log into IZSME®.

### Procedure

1. Select the link, button, or other control that launches IZSME® from the application.
2. If prompted, log into Zowe with your username and password. IZSME® will open automatically.
3. Depending on the configuration of your site, you may see the following message: **External Launch: There is more than 1 TEPS configuration match found for launch data provided. Choose any configuration to proceed.** Select from the **Server** drop-down menu above the message, choose the TEPS you want to use, and complete the login procedure with your IZSME® username and password. You will be taken directly to the workspace that has been set up to launch from your application, or to a navigation tree from which you can choose the path to the workspace.

## Launching directly to a Situation Event Result workspace

Applications can launch IZSME® and go directly to a Situation Event Result workspace you are interested in, instead of requiring you to navigate there each time.

### About this task

If you have an application outside IZSME®, for example, Service Management Unite, that receives situation event data from OMEGAMON, the application can be coded to launch IZSME® and go straight to that Situation Event Results workspace.

The workflow is similar to right clicking on a situation in the IZSME® situation event console, then selecting a situation from the list that appears.

### Procedure

1. Select the link, button, or other control that launches IZSME® from the application.
2. The direct launch can be set up to go to the Zowe desktop or to go directly to IZSME®. If prompted, log into Zowe with your username and password; IZSME® will start automatically.
3. Depending on the configuration of your site, you may see the following message: **External Launch: There is more than 1 TEPS configuration match found for launch data provided. Choose any configuration to**

**proceed.** Select from the **Server** drop-down list above the message, choose the TEPS you want to use, and complete the login procedure with your username and password for IZSME®. Applications can be configured to launch IZSME® at one specific situation, or to give you choices based on different views (for example, **Physical** or another view defined by your administrator). In the latter case, the **Select situation** panel will be displayed; this lets you navigate to a situation. The panel has columns for Severity, Impact, and other criteria you can use to determine the situation you want to view. Once you have selected the situation, the **Navigator** will show the navigation tree down to the situation displayed, and the **Initial Situation Values**, **Current Situation values**, **Command View**, and **Expert Advice** panels will be displayed.

## Take Action from the Navigator, Situations and Workspaces

**Take Action** lets you enter a predefined command and run it on any system in your managed network, in response to conditions monitored by the OMEGAMON products in your environment.

Predefined actions might include canceling a Db2 thread, purging CICS tasks, starting or stopping an MQ channel, or other maintenance actions frequently taken to keep systems running.

Some monitored applications provide predefined **Take Action** commands. You can customize those commands in Tivoli Enterprise Portal and create command definitions of your own, then invoke them on the system you choose. Customized Take Action commands cannot be created in IZSME®, but any customized Take Action commands you have created in Tivoli Enterprise Portal will be accessible in IZSME®.

You can access **Take Action** from the **Navigator**, the **Situation Event Console**, or a workspace view, by right-clicking an item in the **Navigator**, a situation in the **Situation Event Console**, or a task in a workspace, then selecting **Take Action**.

Choose one of the available predefined actions from the **Action to execute** field. This is the action that will be sent to the destination system(s).

The **Command** field shows the actual command this action will send to the system.

Some actions will have an **Arguments and values** section, with one or more argument fields. These allow you to enter a value, such as a process ID, to be used with the command sent to the destination system(s). For some commands, there will be several argument fields that allow you to specify values for the arguments to be entered along with the command.

In the **Destination systems** field, you can choose one or more of your managed systems, and have the command sent there.

After you submit the action, the **Action status** panel shows the progress and outcome of the action:

- **Destination:** The system(s) to which the command was sent.
- **Status:** The outcome of the command (complete, in progress, failure, etc.)
- **Return code:** The return code. A code of 0 indicates success.
- **Result:** A message describing the outcome, for non-zero (failure) return codes.

If there are no actions available, either predefined or custom created at your site, the **Take Action** panel will be empty.

### Purging CICS tasks

If you are using OMEGAMON for CICS, you can navigate to the Transaction Analysis workspace view and purge (including force purge) one or more CICS tasks.

From the Navigator, open a CICS region, then select **Transaction Analysis**. A list of tasks appears in the workspace view.

#### Using Purge selected tasks

You can select one or more tasks, right-click, then choose **Purge selected task(s)**. A confirmation box will appear, from which you can proceed with the purge (PURGE TASK) and, optionally, specify that you want to perform a force purge. Keep in mind that forcing the purge will purge the tasks even if data integrity cannot be maintained. Normally, it's best to try a PURGE, which will only purge if data integrity can be maintained, before performing a force purge.

#### Using Take Action to purge tasks

You can also use **Take Action** to purge CICS tasks. From **Transaction Analysis**, select a task (**Take Action** can only be used with one task), right-click, then choose **Take Action**. The **Take Action** panel will appear; in the **Action to execute** field, select **Purge Task**.

## Troubleshooting

This section contains information on common problems and solutions related to installing and configuring IBM Z Service Management Explorer.

### Issue with plug-ins

The information below describes what to do when a plug-in cannot be found.

### Issue with nodeServer.sh

The information below describes an issue with the nodeServer.sh shell.

#### Node: not found

You may receive this message while running `./nodeServer.sh`.

**Solution:** Add `NODE_HOME` to your `.profile` or in your environment.

### Issues with Zowe Login

The topics below describe issues that may occur when logging into Zowe.

#### Authentication failed for 1 types. Types: ['zss']

Possible causes include the following:

- Wrong username/password
- zssServer is not running. Contact your Zowe administrator.
- ZIS server is not running. Contact your Zowe administrator.
- Configuration/security problems relating to zssServer and ZIS server. Contact your Zowe administrator.

#### Login fails with no error message, original login reappears.

This is unlikely to happen when you first point your browser at the Zowe web server, but can happen if your Zowe desktop has been up for a while and the session timed out.

It can also happen if your Zowe server is using a certificate that is not considered secure by your browser. Some browsers will periodically force you to re-approve certificates that the browser considers insecure. Check that the Zowe web server is running and that your browser is accepting the Zowe certificate. The easiest way to do this is to "hard" reload the page (Ctrl-Shift-R), so it will not use the browser cache. If the page fails to reload, that means your web server is not available to your browser.

### Gathering other log and output data

The JavaScript console and Zowe application server logs are useful sources of diagnostic information.

JavaScript output is accessed differently in each of the supported browsers:

- For Chrome, see [How to Open Google Chrome's JavaScript Console](#).
- For Firefox, see [Debugging JavaScript](#).
- For Microsoft Edge, see [Console](#).
- For Safari, see [Safari Developer Tools](#).

The Zowe log verbosity determines how much detail is shown in the logs. Verbose logging creates large log files and may slow down performance, but provides more information that can help you troubleshoot a problem.

For information about the Zowe logs, see [Log output from the Zowe Application Server](#). For information on setting the log verbosity, see [Logging verbosity](#).

#### “Items per page” may differ from the number of bars in Bar chart

"Items per page" reflects the number of rows returned. The number of bars displayed reflects the number of unique "formatted category axis values" were in the returned result. If the "items per page" differs from the

number of bars in the chart, consider adding filtering, or using a plot chart with Attribute(s) across multiple rows.

In some cases, maximizing your IZSME view, or zooming out (Ctrl-minus), the “items per page” indicator will not appear, when all the bars fit in the chart view.

## IZSME® Messages

All messages have a severity code printed as the last character of the message ID.

Severity Code	Description
I	Information message. No user action required.
W	Warning message. Results may not be as expected.
E	Error message. Some may be user-correctable, read the User Response to determine the course of action.

**IUWA001E: Could not parse `queryhandler.data (/tepUser?userId=<username>)` response. `HttpReturnCode: <code>`. `Response: <body>`**

### Explanation

An unexpected error occurred during parsing response.

### User response

Contact your system administrator.

**IUWA002E: Error occurred while checking that userID `<username>` exists in CT/DB. `HttpReturnCode: <code>`. `Response: <body>`**

### Explanation

An unexpected error occurred during parsing response.

### User response

Contact your system administrator.

**IUWA003E: Incorrect username or password**

### Explanation

An incorrect username or password was provided when attempting to logon to IZSME.

### User response

Provide correct username and password.

**IUWA004E: User ZOWE user id: `<zowe_user_id>`, IZSME user id: `<izsme_user_id>`, `tepsConfigurationId: <teps_configuration_id>` failed to run SQL1 query `<sql1_query>` to get data from table `<table_name>`. Table requires one of the following affinities: `<table_affinities>`, but affinities allowed for user are `<user_affinities>`**

### Explanation

User cannot run SQL1 query for a certain table, because the table's application is not in the list of allowed applications for `userProblem` requesting allowed affinities for the user.

### User response

Contact your system administrator to change the allowed applications list for this user.

## IUWA004W: RBAC error. You have no permissions

### Explanation

RBAC is enabled. You have no permissions to execute an action or view data.

### User response

Contact your system administrator or check your RBAC profile settings.

## IUWA005E: Failed to retrieve configuration. Reason: <reason>

### Explanation

Problem retrieving TEPS configuration from JSON. Possible reason: Failed to decrypt password with the given key set.

### User response

Contact IBM software support.

## IUWA009I: Logon attempt { user, izSMEInstanceId, sessionID, tepsConfigurationId, status, userToken }

### Explanation

Information about logon attempts. Valid status values: SUCCESS, FAILED, ERROR. The following is an example of the message:

```
2021-11-10 14:01:04.504 <ZWED:42144> juser INFO
(com.rs.tep.queryhandler:logonattempts,logonAttemptsLogger.js:19) IUWA009I Logon attempt {
  user: 'sysadmin',

### User response

None required.

## IUWAF001E: Fail while requesting user affinities from service "queryHandler.data"

### Explanation

Problem requesting allowed affinities for user from queryHandler dataservice.

### User response

Contact IBM software support.

## IUWAF001W: Not found affinities for product <product>

### Explanation

Problem requesting corresponding affinities for product.

### User response

Contact your system administrator.

## **IUWAF002W: Failed to get user affinities**

### **Explanation**

Problem requesting allowed affinities for user.

### **User response**

Contact IBM software support.

## **IUWC001E: Cannot connect to database. Check configuration and try again later.**

### **Explanation**

An incorrect database address, port, username or password was provided in configuration. This message appears during login.

### **User response**

Ensure that you have provided a valid database address, port, username and password.

## **IUWC001W: Wrong configuration for 'ctds' dataservice**

### **Explanation**

An incorrect database address, port, username or password was provided in configuration. This message appears during login to IZSME.

### **User response**

Ensure that you have provided a valid database address, port, username and password.

## **IUWC002E: Data for TEMS testing not correct**

### **Explanation**

An incorrect Tivoli Enterprise Monitoring Server (TEMS) address or port was provided in the configuration.

### **User response**

Ensure that the TEMS address and port are valid.

## **IUWC002W: Error occurred while parsing ctds response body. Body: <body>**

### **Explanation**

Unexpected error during parsing response.

### **User response**

Contact your system administrator.

## **IUWC003E: Check the data, username and password for the database.**

### **Explanation**

An incorrect database address, port, username or password was provided in configuration. This message appears during a test of the Db2 connection.

### **User response**

Ensure that the database address, port, username and password are valid.

**IUWC003W: CTDS respond with error: <error>****Explanation**

Unexpected error during parsing response.

**User response**

Contact your system administrator.

**IUWC004E: CTDS dataservice is configured wrong. Check it and try again.****Explanation**

Incorrect TEMS address or port was provided in configuration.

**User response**

Ensure that you have provided a valid TEMS address and port.

**IUWC005E: Could not connect to database. Reason: <reason>****Explanation**

An incorrect database address, port, username or password was provided in configuration. Key set (public-private pair and AES-256) is not generated or was modified.

**User response**

Ensure that the database address, port, username and password are valid.

**IUWC005W: Error saving configuration <err>****Explanation**

Configuration was not saved successfully.

**User response**

Contact your system administrator.

**IUWC006I: Current log level is <response>****Explanation**

System shows the configured log level.

**User response**

None required.

**IUWC007E: Cannot get log level message <error>****Explanation**

Incorrect call getLogLevel method or cannot get log level message.

**User response**

Ensure that RBAC is set to **true**.

**IUWC007W: Error parsing request body to TepsConfiguration****Explanation**

Configuration was not parsed successfully.

**User response**

Contact your system administrator.

**IUWC008E: Cannot set log level message****Explanation**

Incorrect call setLogLevel method or cannot set log level message.

**User response**

Check parameters and ensure that RBAC is set to **true**.

**IUWC009I: Set log level successfully <response>****Explanation**

Set new log level and show result.

**User response**

None required.

**IUWC009W: Error retrieving configuration <err>****Explanation**

The configuration was not retrieved successfully.

**User response**

Contact your system administrator.

**IUWC010W: Configuration path is not set****Explanation**

The configuration path has not been specified.

**User response**

Contact your system administrator.

**IUWC011W: Configuration file does not exist****Explanation**

The configuration file has not been created.

**User response**

Contact your system administrator.

**IUWC012W: Problem parsing configuration file <parseError>****Explanation**

An error occurred parsing the configuration file.

**User response**

Contact your system administrator.

**IUWC013W: TEPS configuration with id: <id> not found****Explanation**

The configuration has not been specified.

**User response**

Contact your system administrator.

**IUWC015W: Database type <dbType> is not supported****Explanation**

The specified database type is not supported.

**User response**

Contact your system administrator.

**IUWC016W: <dbType> database is not configured properly. Configuration id <tepsConfigurationId>****Explanation**

The database is not configured properly.

**User response**

Contact your system administrator.

**IUWC017E: Failed to prepare decrypted AES-256 key. Reason: <error>****Explanation**

An error occurred generating keys during installation, or the private key file was replaced.

**User response**

Contact your system administrator.

**IUWD001E: Error on getting SQL queries. No queries for execution.****Explanation**

There are no queries that can be executed.

**User response**

Check to see if there are queries assigned to the table.

**IUWD002E: Error occurred while getting SQL queries. Omit this error and continue with other requests. Error message: <error>.****Explanation**

Error occurred getting SQL queries.

**User response**

None required.

**IUWD003E: Error occurred while fetching the table data. Omit this error and continue with other requests. Error message: <error>.**

**Explanation**

Error occurred fetching data.

**User response**

None required.

**IUWD004W: Empty REQUEST.KFWQUERY.app1, <productCode> product is used instead.**

**Explanation**

Application for current request is empty, other suitable product code will be used.

**User response**

None required.

**IUWE001E: TOKEN function call failed: tokens = <tokens>, delims = <delims>, token=<token>.**

**Explanation**

Token string contains fewer tokens than token index.

**User response**

If you recently changed an expression manually, review the expression to check for accuracy. Otherwise, contact your system administrator.

**IUWE002E: Check this TOSTR function call: value= <value>, radixAttr = <radixAttr>.**

**Explanation**

Function TOSTR is used for converting numbers to strings. Value type is not a number.

**User response**

If you recently changed an expression manually, review the expression to check for accuracy. Otherwise, contact your system administrator.

**IUWE003E: Non-string argument of TOINT function: <value>**

**Explanation**

Function TOINT is used for converting strings to numbers. Value type is not a string.

**User response**

If you recently changed an expression manually, review the expression to check for accuracy. Otherwise, contact your system administrator.

**IUWE004E: No type defined for node. id: <id>, name: <name>**

**Explanation**

Missing NODE type in tree path. Problem in tree topology.

**User response**

Contact your system administrator.

**IUWE006E: ReplaceVars: Cannot replace variable <varName> in string: <str>****Explanation**

Variable from expression is not found.

**User response**

If you recently changed an expression manually, review the expression to check for accuracy. Otherwise, contact your system administrator.

**IUWE007E: <Expression> <EvalResult> <EvalError>****Explanation**

Unexpected error during expression evaluation.

**User response**

If you recently changed an expression manually, review the expression to check for accuracy. Otherwise, contact your system administrator.

**IUWE008E: Error checking link availability: <error>****Explanation**

Unexpected error during link availability check.

**User response**

If you recently changed an expression manually, review the expression to check for accuracy. Otherwise, contact your system administrator.

**IUWI001E: Required installation parameter not found: <Parameter\_Name>****Explanation**

Required parameter was not set while calling installation jobs.

**User response**

Provide requested parameter <Parameter\_Name>.

**IUWI002E: Installation folder does not exist: <Folder\_Name>****Explanation**

The folder that was passed as the parameter for installation does not exist.

**User response**

Check the path and provide the correct value, or create the folder shown in the error message text.

**IUWI003W: Optional parameter '<Parameter\_Name>' not set, using default value '<Value>'****Explanation**

An optional parameter was not provided; the default value is being used.

**User response**

None required, but check to see if this parameter should be specified instead of the default value.

**IUWI004E: Wrong parameter format. Correct format: <Format>****Explanation**

The installation parameter failed a format check.

**User response**

Review the parameter's format and correct so that it uses the format shown in the message.

**IUWI005E: Errors found during installation configuration. Exiting****Explanation**

Errors occurred during configuration verification.

**User response**

Review the log and address installation errors.

**IUWI006E: Unknown/Unsupported version of ZOWE: <ZOWE\_Version>****Explanation**

The ZOWE version number provided is not currently supported, or was not registered at installation.

**User response**

Review the version number and contact IBM software support if necessary.

**IUWI007E: Target folder already contain unpxed IZSME files. Actions: <Actions\_Description>.****Explanation**

The target folder for unpax already contains IZSME® files.

**User response**

Follow the actions description provided in the message, or delete old IZSME® files from the previous installation.

**IUWI008E: Found old Zowe version, major <IUW\_SERV\_ZOWE\_H\_VER> , minor <IUW\_SERV\_ZOWE\_M\_VER>. Supported versions: Zowe <ZOWE\_VER> and above. If you wish to use an earlier version, results will be unpredictable.****Explanation**

The indicated Zowe version is not supported.

**User response**

Review the provided version number. Contact IBM Software Support if necessary.

**IUWI009I: Found javaHome property in pluginConfig.json. Checking Java executable <PLUGIN\_JAVA\_HOME\_EXECUTABLE>.****Explanation**

Displays java home property.

**User response**

None required.

**IUWI010W:** javaHome property isn't specified in pluginConfig.json.

**Explanation**

The javaHome property is missing.

**User response**

Add this property to the pluginConfig.json.

**IUWI011I:** ZOWE\_JAVA\_HOME environment variable is specified. Checking Java executable <ZOWE\_JAVA\_HOME\_EXECUTABLE>.

**Explanation**

Informational message.

**User response**

None required.

**IUWI012W:** ZOWE\_JAVA\_HOME environment variable isn't specified..

**Explanation**

This variable is missing.

**User response**

None required. For more information on the Zowe environment, see [Installing Zowe on z/OS](#).

**IUWI013I:** JAVA\_HOME environment variable is specified. Checking Java executable <ZOWE\_JAVA\_HOME\_EXECUTABLE>.

**Explanation**

Informational message.

**User response**

None required.

**IUWI014W:** JAVA\_HOME environment variable isn't specified..

**Explanation**

This variable is missing.

**User response**

None required. For more information on the Zowe environment, see [Installing Zowe on z/OS](#).

**IUWI015I:** Checking 'java' in PATH.

**Explanation**

Informational message.

**User response**

None required.

**IUWI016E: Failed to find Java.**

**Explanation**

Failed to find Java in PATH.

**User response**

Check to verify that Java exists in PATH.

**IUWI017I: Java information: \$(<\$JAVA\_EXECUTABLE\_TO\_CHECK\_VERSION> version).**

**Explanation**

Java version information is displayed.

**User response**

None required.

**IUWI018W: Version for Java <JAVA\_EXECUTABLE\_TO\_CHECK> is not supported. Required version 1.8 and higher.**

**Explanation**

The current Java version is not supported.

**User response**

Install Java 1.8 or later.

**IUWI019I: Java version \$(<\$JAVA\_EXECUTABLE\_TO\_CHECK\_VERSION> version) is supported.**

**Explanation**

Java version information is displayed.

**User response**

None required.

**IUWI020W: Unable to find java executable at \$(<\$JAVA\_EXECUTABLE\_TO\_CHECK\_VERSION> version).**

**Explanation**

Java executable is missing.

**User response**

Contact your system administrator.

**IUWI021I: Starting generate security keys**

**Explanation**

Security keys are being generated.

**User response**

None required.

## **IUWI022E: Specified path <path\_value> is incorrect**

### **Explanation**

Install process cannot be run with incorrect <path\_value>.

### **User response**

Correct the installation path and run the install process again.

## **IUWI023E: Error occurred while trying to create subdirectories for <key\_path>**

### **Explanation**

Install process could not create subdirectories for <key\_path>.

### **User response**

Make sure the installing user ID has permissions to create the subdirectories for key\_path.

## **IUWI024E: Could not generate key string. Key was not initialized.**

### **Explanation**

Install process could not generate key string..

### **User response**

Correct the key\_path and run the install process again.

## **IUWI025E: Error occurred while writing key into the <key\_path>**

### **Explanation**

Install process could not generate key string..

### **User response**

Check that the installing user ID has write permission for the file and path and that the file has not been opened by another process.

## **IUWI026E: Error occurred while encrypting AES-256 key using public key.**

**<error> <error>**

### **Explanation**

AES-256 key could not be encrypted using public key.

### **User response**

Contact your system administrator.

## **IUWI027I: Key generation completed successfully!**

### **Explanation**

Information message.

### **User response**

None required.

### **IUWI027W: Unknown option: <option>**

#### **Explanation**

The option supplied is unknown for install script.

#### **User response**

Check the installation instructions for the valid options.

### **IUWI028I: Start setting permissions <CHMOD\_ACCESS\_PERMISSIONS> for key files.**

#### **Explanation**

Access permissions will be changed for key files.

#### **User response**

None required.

### **IUWI029I: Finish setting permissions.**

#### **Explanation**

Access permissions have been changed for key files.

#### **User response**

None required.

### **IUWI030E: Error occurred while generating security keys.**

#### **Explanation**

An error occurred during security key generation.

#### **User response**

Contact your system administrator.

### **IUWI031I: Option – `forceGenerateKeys` specified. Key files will be overwritten.**

#### **Explanation**

Current key files will be overwritten.

#### **User response**

None required.

### **IUWI032E: Some keys already exist. Changing keys will mean all already encrypted passwords cannot be decrypted. If you want to overwrite keys use -- `forceGenerateKeys` option..**

#### **Explanation**

Conflicts exist with current key files.

#### **User response**

If you want to overwrite keys, run install process with --`forceGenerateKeys`. Otherwise, contact your system administrator.

**IUWI033E: Option --izsmeUnpaxLocation is required.**

**Explanation**

The install process requires this option.

**User response**

Rerun install process with all required options.

**IUWI034E: Directory <IZSME\_UNPAX\_LOCATION> specified in --izsmeUnpaxLocation doesn't exist.**

**Explanation**

The install process cannot unpack ISME into the passed directory.

**User response**

Check to make sure the directory exists, then check the value passed to the install script.

**IUWI036I: Backup permission for <PUBLIC\_KEY\_PATH> to <PUBLIC\_KEY\_PERMISSION\_BACKUP>.**

**Explanation**

Informational message.

**User response**

None required.

**IUWI037I: Backup permission for <PRIVATE\_KEY\_PATH> to <PRIVATE\_KEY\_PERMISSION\_BACKUP>.**

**Explanation**

Informational message.

**User response**

None required.

**IUWI038I: Backup permission for <AES256\_KEY\_PATH> to <AES256\_KEY\_PERMISSION\_BACKUP>.**

**Explanation**

Informational message.

**User response**

None required.

**IUWI039I: Option --forceLessSecureCrypto specified. Key files permissions would be set to 440.**

**Explanation**

Key files permissions will be set to 440.

**User response**

None required.

## **IUWI040W: Could not find Java executable in PATH**

### **Explanation**

The Java executable was not found.

### **User response**

Contact your system administrator.

## **IUWJ001E: Live CT/DB Adapter has failed <attempts count> times since in the last <time range> minutes. To prevent excess resource consumption it will not be auto-restarted until Zowe is restarted.**

### **Explanation**

Java Sidecar was unavailable for external reasons, and the limit on auto-restart attempts was exceeded.

### **User response**

Contact your system administrator. There may be issues with the server environment; Java Sidecar may not have enough RAM available.

**Module:** Java Sidecar

## **IUWJ002E: Failed to read plugin configuration file in <configFolder> directory. Use default parameters.**

### **Explanation**

The plug-in configuration file cannot be read in the current configuration folder.

### **User response**

Check to make sure the configuration file exists and is in the configuration folder.

## **IUWJ002W: Java Sidecar is down. Going to start it again...**

### **Explanation**

Java Sidecar was unavailable. It will be re-started automatically.

### **User response**

None required.

**Module:** Java Sidecar

## **IUWJ004W: Could not find executable via config file, ZOWE\_JAVA\_HOME, or JAVA\_HOME, will use Java from PATH/path if possible.**

### **Explanation**

Java home variable cannot be found in current config file, will use Java from PATH/path.

### **User response**

None required.

## **IUWJ005I: PATH= '<PATH>' ; path= '<path>' ;**

### **Explanation**

The Java Sidecar path is displayed..

**User response**

None required.

**IUWJ006I: About to spawn java CT/DB Adapter with class = <javaClassname>, with classpath = <javaClasspath>, and with port = <javaListenerInitialPort>, at address <javaListenerAddress> using executable <javaExecutable>**

**Explanation**

This message provides information about Java Sidecar.

**User response**

None required.

**IUWL001E: Error on filter assigns clone <error>**

**Explanation**

Object cannot be cloned.

**User response**

Contact your system administrator.

**IUWL002E: Error on expression augmentation <error>**

**Explanation**

Expression cannot be parsed.

**User response**

Contact your system administrator.

**IUWN001E: Unable to parse response while getting information for origin nodes.  
Inner message: <error>**

**Explanation**

Error parsing response.

**User response**

Contact your system administrator.

**IUWN001W: Failed to get applications which are allowed for user <username>.  
Inner error: <error>**

**Explanation**

Failed to get applications.

**User response**

Contact your system administrator.

**IUWN002E: Failed to get info for origin nodes. Inner error: <error>**

**Explanation**

Error parsing information.

**User response**

Contact your system administrator.

**IUWQ001E: Request to CT/DB Adapter failed. This service may not be properly configured, or servers that it depends on are not running.**

**Explanation**

Request failed.

**User response**

Contact your system administrator.

**IUWQ002E: Request failed. "level" parameter is required (number between 0 and 5)**

**Explanation**

Incorrect log level value.

**User response**

Change the log level to the correct value.

**IUWQ003E: handleJavaLogLevelRequest failed. Error: RBAC is disabled.**

**Explanation**

Could not change log level.

**User response**

Enable Role Based Access Control.

**IUWQ004E: handleJavaLogLevelRequest method <method> not implemented.**

**Explanation**

Log level request method is not implemented.

**User response**

Contact your system administrator.

**IUWQ005E: Failed to launch java CT/DB Adapter. Check that java 8 or higher is in the path of userid of the Zowe Application Server (currently <username>). Error=<error>.**

**Explanation**

The current version of Java is not correct.

**User response**

Check to ensure that Java 8 or later is in the path. If the error persists, contact your system administrator.

**IUWQ005W: QueryHandler instance <instanceId>. Socket encountered error: <error.message>.**

**Explanation**

The Query Handler encountered an error.

**User response**

Contact your system administrator.

**IUWQ006W: Failed to create query handler with new resources. Error: <error>**

**Explanation**

Failed to use new SDA jars. There may be a problem copying jars, or a failure to configure or start the Java process.

**User response**

Check to ensure that enough disk space is available and that environment variables are set correctly.

**Module:** SDA

**IUWQ007I: Query handler is going to use existing resources folder ' jars/ classpath.<id> '**

**Explanation**

The necessary SDA jars were prepared and will be used in the Java classpath.

**User response**

None required.

**Module:** SDA

**IUWC008E: Cannot set log level message**

**Explanation**

Incorrect call setLogLevel method or cannot set log level message.

**User response**

Check parameters and ensure that RBAC is set to **true**.

**IUWQ008I: Started new queryHandler with id=<id>**

**Explanation**

New query handler has started.

**User response**

None required.

**Module:** SDA

**IUWC008W: Error retrieving configuration before saving <err>**

**Explanation**

Configuration was not retrieved successfully.

**User response**

Contact your system administrator.

## **IUWQ010E: Cannot get config instance**

### **Explanation**

IZSME is not able to access configuration settings.

### **User response**

Contact IBM software support.

**Module:** Query Generator

## **IUWQ020E: queryHandler starting is not finished, id=<id>, status <status>, detail status <detail status>**

### **Explanation**

Query handler is starting and is not ready to process requests to TEMS.

### **User response**

If this problem occurs regularly, contact IBM software support and provide IZSME logs.

## **IUWQ021E: queryHandler is shutdown, id=<id>, status <status>, detail status <detail status>**

### **Explanation**

Query handler is shut down. IZSME cannot communicate with TEMS.

### **User response**

Contact customer support and provide IZSME logs.

## **IUWQ022E: Unknown queryHandler status, id=<id>, status <status>, detail status <detail status>**

### **Explanation**

Query handler status is not recognized. This is an error in IZSME internals and should not normally occur.

### **User response**

Contact customer support and provide IZSME logs.

## **IUWQ023E: Unexpected query handler detail status, query handler id=<id>, detail status <detail status>**

### **Explanation**

Query handler detail status is not recognized. This is an error in IZSME internals and should not normally occur.

### **User response**

Contact customer support and provide IZSME logs.

## **IUWQ024I: Query handler detail status update, id=<id>, detail status <detail status>**

### **Explanation**

Query handler changed status.

**User response**

None required.

**IUWQ101E: Cannot load table definitions for table \$<tableName>****Explanation**

Query Generator failed to retrieve table definitions. Currently, node server tries to take it from SDA directory and uses ctds\_common tables directory as fallback. Possible reasons:

- broken SDA
- broken query definition in workspace definition

**User response**

None required.

**Module:** Query Generator

**IUWQ102E: Cannot find column metadata in table definitions****Explanation**

Query Generator failed to find column metadata in table definitions. Possible reason: invalid query definition in workspace definition..

**User response**

Correct the query definition.

**Module:** Query Generator

**IUWQ103E: Cannot find TDW Warehouse column name for column \$<colName>****Explanation**

Column metadata in table definitions does not contain information about TDW alias for the column listed.

**User response**

Contact your system administrator.

**Module:** Query Generator

**IUWQ104E: Multi-table queries are not supported****Explanation**

Multi-table queries are not supported by the application.

**User response**

Limit your query to a single table.

**Module:** Query Generator

**IUWQ105E: HUB timestamp is expected but not provided****Explanation**

Caller of QueryGenerator did not provide it with hubTemsTimestamp.

**User response**

Contact IBM Software support.

**Module:** Query Generator

**IUWS0001E: Could not read file: <path> Internal error message: <error>**

**Explanation**

Problem reading metadata.json.

**User response**

Contact IBM software support.

**Module:** SDA

**IUWS0002E: Could not parse metadata file: <path>**

**Explanation**

Problem reading metadata.json.

**User response**

Contact IBM software support.

**Module:** SDA

**IUWS0003E: Could not get files from directory: <path>. Internal error <error>**

**Explanation**

Problem reading products directory.

**User response**

Contact your system administrator.

**Module:** SDA

**IUWS0004E: Could not get information for file: <path>.**

**Explanation**

Failed to read information about file in products directory.

**User response**

Contact your system administrator.

**Module:** SDA

**IUWS0040W: Could not find TPS resource for product <product>. Filter agent: ORIGINNODE - <originnode>, agent version - <version>, local version - <version>.**

**Explanation**

Failed to find the TPS resources listed.

**User response**

Contact IBM software support.

**Module:** SDA

**IUWS001W: Could not get metadata of existing SDA files. Internal error: <error>.**

**Explanation**

Problem reading some files from filesystem.

**User response**

None required. The SDA process will try to download the files automatically as if they were missing.

**Module:** SDA

**IUWS005I: Downloaded SDA files metadata <products>.****Explanation**

The list of successfully downloaded products.

**User response**

None required.

**Module:** SDA

**IUWS006W: Could not get configuration list. Internal error: <error>****Explanation**

Problem reading tepsConfigurations.json file.

**User response**

Contact your system administrator.

**Module:** SDA

**IUWS007I: Unpacked SDA files <products>****Explanation**

The list of successfully unpacked products.

**User response**

None required.

**Module:** SDA

**IUWS008W: Error occurred while getting SDA metadata. Host: <host>. Port: <port>. Internal error: <error>****Explanation**

An error occurred while retrieving SDA metadata.

**User response**

Contact your system administrator.

**Module:** SDA

**IUWS010W: Failed to download SDA files <java response>****Explanation**

An error occurred downloading the products. The response code is not equal to 200.

**User response**

Contact your system administrator.

**Module:** SDA

## **IUWS011I: Request download for <products>**

### **Explanation**

If the product is new, or there is a newer version available, a new download request is sent.

### **User response**

None required.

**Module:** SDA

## **IUWS012W: Failed to unpack SDA files <java response>**

### **Explanation**

An error occurred unpacking the products. The response code is not equal to 200.

### **User response**

Contact your system administrator.

**Module:** SDA

## **IUWS013W: Downloaded SDA files failed! Internal error: <error>**

### **Explanation**

An error occurred completing an HTTP request to the Java process.

### **User response**

Contact your system administrator.

**Module:** SDA

## **IUWS014I: Unpack SDA files done**

### **Explanation**

Unpack process is complete. Errors and unpacked products are cached.

### **User response**

None required.

**Module:** SDA

## **IUWS015W: Unpack SDA files failed! Internal error: <error>**

### **Explanation**

Problem completing HTTP request to the Java process.

### **User response**

Contact your system administrator.

**Module:** SDA

## **IUWS016I: Request unpack for <products>**

### **Explanation**

Downloaded products should be unpacked.

### **User response**

None required.

**Module:** SDA

## **IUWS017I: Downloaded list is empty**

### **Explanation**

No products have been downloaded.

### **User response**

None required.

**Module:** SDA

## **IUWS018I: Unpacked list is empty. No need to replace query handler**

### **Explanation**

The query handler should be replaced only if at least one product is unpacked (is new or has a higher version).

### **User response**

None required.

**Module:** SDA

## **IUWS019W: No configurations were retrieved**

### **Explanation**

No configurations are retrieved from `tepsConfigurations.json` file.

### **User response**

Set up at least one entry in the configuration file.

**Module:** SDA

## **IUWS020I: Nothing found to unpack**

### **Explanation**

No products were unpacked in the Java process.

### **User response**

None required.

**Module:** SDA

## **IUWS021W: getResourceJarsPathList: Couldn't read directory <directory>. Error: <error>**

### **Explanation**

Problem reading jars directory.

### **User response**

Contact your system administrator.

**Module:** SDA

## **IUWS022W: copyDirectory: Couldn't read directory <directory>. Error: <error>**

### **Explanation**

Problem reading source directory for copying.

**User response**

Contact your system administrator.

**Module:** SDA

**IUWS023W: removedDirectory: Couldn't read directory <directory>. Error: <error>**

**Explanation**

Problem reading directory for removal.

**User response**

Contact your system administrator.

**Module:** SDA

**IUWS024W: getResourcesClasspath: Cannot load product resources: <error>**

**Explanation**

Problem accessing product resource jars. Fallback jars will be used. Possible reasons: No SDA downloaded, or not enough disk space for copying.

**User response**

None required. If the problem recurs consistently, contact your system administrator.

**Module:** SDA

**IUWS025W: updateSdaMetadata: failed to write SDA-metadata file. Error: <error>**

**Explanation**

Problem writing to the SDA metadata file.

**User response**

Contact your system administrator.

**Module:** SDA

**IUWS026I: Classpath directory <dir> doesn't exist. Starting to copy JARs from 'current'.**

**Explanation**

Copying downloaded SDA jars to a new classpath directory.

**User response**

**IUWW003E: Error retrieving workspaces <...>**

**Explanation**

There was an issue retrieving data from the workspaces indicated.

**User response**

None required.

# Tivoli Enterprise Portal

Tivoli Enterprise Portal (also called the *portal* or the *portal client*) is the distributed user interface for products using Tivoli Management Services. The Tivoli Enterprise Portal is a thin Java™ client application. It has its own server, the Tivoli® Enterprise Portal Server, that communicates with the hub monitoring server to send requests to and retrieve data from monitoring agents on managed systems. Tivoli® Enterprise Portal Server (the *portal server*) builds and formats the portal workspaces that display real-time and historical data collected by the monitoring agents. The portal server can run on Windows™, AIX®, or Linux™ systems.

You can access the portal client in any of the following ways:

- Browser client (Internet Explorer or Mozilla Firefox on Windows™, Linux™, or AIX®) connected to a web server embedded in the portal server
- Desktop client
- Java-based desktop client that is updated at every startup. IBM Tivoli Monitoring supports IBM Java 8 and Oracle Java 8.

**Note:** You can use open-source Java Web Start replacements, such as [OpenWebStart](#) or [Open Web Launch](#) (Windows only), to run your Tivoli Enterprise Portal client. For more information, see the following topics.

For setup information about the portal server and client, see the [IBM Tivoli Monitoring: Installation and Setup Guide](#).

For information about using the client, see [IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide](#)

## OpenWebStart

You can use OpenWebStart, an open-source Java Web Start replacement, to run your Tivoli Enterprise Portal client.

You can download OpenWebStart at <https://openwebstart.com/>.

If you are moving from Open Web Launch to OpenWebStart, configure OpenWebStart to use the same JRE that was used with Open Web Launch.

**Note:** Java Web Start by Oracle Corporation has been deprecated as of Java 9 and removed completely in Java 11.

## Open Web Launch

You can use Open Web Launch, an open-source Java Web Start replacement, to run your Tivoli Enterprise Portal client.

Open Web Launch is included in IBM Tivoli Management Services on z/OS for running the Tivoli Enterprise Portal client, which can be run as a Java-based desktop application. Open Web Launch is supported for the Windows platform only.

**Note:** Java Web Start by Oracle Corporation has been deprecated as of Java 9 and removed completely in Java 11.

## Installing Open Web Launch

Install Open Web Launch on your Windows system.

You can install Open Web Launch using a setup program, which assists with defining configuration options, or you can use a portable version.

When deploying Open Web Launch in a large Tivoli Enterprise Portal environment, you can [install using the setup silently](#) or [use the portable version](#).

## Prerequisites

To use Open Web Launch with your Tivoli Enterprise Portal client, the following requirements apply:

- Windows system (32 or 64-bit). Open Web Launch is supported for the Windows platform only.
- The Tivoli Enterprise Portal client must be installed on your Windows system. For more information, see [Using Web Start to download and run the desktop client](#).
- IBM Tivoli Monitoring 6.3.0 Fix Pack 7 Service Pack 7 (6.3.0.7-TIV-ITM-SP0007)
- An appropriate Java version must be installed on the system.
- Certificates required by a Java application must be imported.

## Transfer files from a z/OS system to a Windows workstation

Transfer Open Web Launch program files from the mainframe to your workstation.

### About this task

The Open Web Launch program files are located in the z/OS data set TKANDATV. Before you can install Open Web Launch, you must download the files from the mainframe to your workstation and rename them.

**Note:** Although you can also download the Open Web Launch open source version directly from the internet, IBM fully supports only the version provided in z/OS data set TKANDATV.

### Procedure

- From the z/OS system, transfer the members listed in the following table, which are located in data set TKANDATV, to your workstation in binary mode and rename them accordingly.

<b>TKANDATV(member)</b>	<b>File name on workstation</b>	<b>Description</b>
KDSOSA	open-web-launch-setup-admin.exe	Administrator setup program
KDSOSU	open-web-launch-setup-user.exe	User setup program
KDSO32	openweblaunch32.exe	32-bit portable version
KDSO64	openweblaunch64.exe	64-bit portable version
KDSOLIC	OWL License (TMSz).zip	License file

### What to do next

Install Open Web Launch using any of the following methods:

- [“Install Open Web Launch using the setup program” on page 1187](#)
- [“Install Open Web Launch silently” on page 1189](#)
- [“Use the portable version of Open Web Launch” on page 1190](#)

## Install Open Web Launch using the setup program

Install Open Web Launch using the setup program to configure options during installation.

### Before you begin

The following requirements apply:

- IBM Tivoli Monitoring 6.3.0 Fix Pack 7 Service Pack 7 (6.3.0.7-TIV-ITM-SP0007)

- Windows system (32 or 64-bit)
- An appropriate Java version must be installed on the system.
- Certificates required by a Java application must be imported.

## About this task

Using the Open Web Launch setup program, you can specify configuration options during installation.

There are two versions of the setup program:

- `open-web-launch-setup-admin.exe` allows you to install Open Web Launch so that all users on the system have access to it and use the same settings. Administrator privileges are required.
- `open-web-launch-setup-user.exe` allows you to install Open Web Launch for the current user only.

**Note:** You can also run the setup silently, which can be useful when deploying Open Web Launch in a large Tivoli Enterprise Portal environment. See [“Install Open Web Launch silently”](#) on page 1189.

To install Open Web Launch using the setup program, perform the following procedure.

## Procedure

1. Run the appropriate Open Web Launch setup program:
  - `open-web-launch-setup-admin.exe` (Administrator privileges are required.)
  - `open-web-launch-setup-user.exe`
2. Use the setup program to complete the installation, which includes performing the following configuration steps:
  - a. Choose components to install. Because **Browser Extensions** are not needed for the Tivoli Enterprise Portal client, installing this component is not necessary.
  - b. Select any of the following configuration options:

<i>Table 101: Open Web Launch configuration options</i>	
Option	Description
<b>JNLP support</b>	Select this option to support the Java Network Launch Protocol (JNLP).
<b>Make default on JNLP files</b>	Select this option to make Open Web Launch the default action when opening JNLP files in <b>File Explorer</b> .
<b>Register JNLP/JNLPS protocol</b>	Select this option to register the JNLP and JNLPS protocol for Open Web Launch.
<b>Show Java Console</b>	Select this option to display the Java console when a Java Web Start application is running.
<b>Add downloaded applications to control panel</b>	Select this option to add applications to the <b>Control Panel</b> .
<b>Verify jar signatures</b>	Select this option to verify JAR file certificates.
<b>Verify all jars have the same signature</b>	Select this option to verify that all downloaded JAR files of the same origin have the same signatures.
<b>Use environment variables HTTP_PROXY and HTTPS_PROXY for proxy settings</b>	Select this option to use the HTTP_PROXY and HTTPS_PROXY variables for proxy settings.

- c. Specify the Java location to use:

Table 102: Open Web Launch Java location settings	
Option	Description
<b>Use a specific Java version</b>	Select this option to use a specific Java location. You must provide the folder where Java is installed.
<b>Use registry settings to determine Java version</b>	Select this option to read the Oracle Java location from the registry.
<b>Use system environment variable JAVA_HOME</b>	Select this option to read the Java location from the JAVA_HOME environment variable.

As a result of the setup program, the `openweblaunch.exe` file is created.

3. (Optional) To modify settings after installation, select **Rocket Software > Configure Open Web Launch** from the **Start** menu.
4. (Optional) To uninstall Open Web Launch, use the **Control Panel**.

## Install Open Web Launch silently

Install Open Web Launch using the setup program silently, which can be useful when deploying in large environments.

### Before you begin

The following requirements apply:

- IBM Tivoli Monitoring 6.3.0 Fix Pack 7 Service Pack 7 (6.3.0.7-TIV-ITM-SP0007)
- Windows system (32 or 64-bit)
- An appropriate Java version must be installed on the system.
- Certificates required by a Java application must be imported.

### About this task

You can run the Open Web Launch setup program using an option to run the program silently, which uses default configuration options. This installation method can be useful when deploying Open Web Launch in a large Tivoli Enterprise Portal environment.

There are two versions of the setup program:

- `open-web-launch-setup-admin.exe` allows you to install Open Web Launch so that all users on the system have access to it and use the same settings. Administrator privileges are required.
- `open-web-launch-setup-user.exe` allows you to install Open Web Launch for the current user only.

The `/S` option (which must be upper case) causes default configuration options to be used, bypassing the configuration option setting process and allowing the setup program to run silently.

### Procedure

1. Run the appropriate Open Web Launch setup program:
  - `open-web-launch-setup-admin.exe /S` (Administrator privileges are required.)
  - `open-web-launch-setup-user.exe /S`

**Note:** The `/S` option must be upper case.

As a result of the setup program, the `openweblaunch.exe` file is created.

2. (Optional) To modify settings after installation, select **Rocket Software > Configure Open Web Launch** from the **Start** menu.
3. (Optional) To uninstall Open Web Launch, use the **Control Panel**.

## Use the portable version of Open Web Launch

Use the portable version of Open Web Launch without running a setup program.

### Before you begin

The following requirements apply:

- IBM Tivoli Monitoring 6.3.0 Fix Pack 7 Service Pack 7 (6.3.0.7-TIV-ITM-SP0007)
- Windows system (32 or 64-bit)
- An appropriate Java version must be installed on the system.
- Certificates required by a Java application must be imported.

### About this task

The Open Web Launch executable is completely self-contained and can be used without running a setup.

There are two versions of the executable:

- `openweblaunch32.exe`: 32-bit portable version
- `openweblaunch64.exe`: 64-bit portable version

To use the portable version of Open Web Launch, perform the following procedure.

### Procedure

1. Define a shortcut to the appropriate Open Web Launch executable:
  - `openweblaunch32.exe`
  - `openweblaunch64.exe`
2. (Optional) To modify configuration options, see [“Command line options” on page 1190](#) and [“Registry settings” on page 1191](#).
3. (Optional) To uninstall Open Web Launch, use the **Control Panel**.

## Usage scenarios

Review scenarios for using Open Web Launch with your application.

### JNLP files

If you enabled **Make default on JNLP files** in the setup, double-clicking a JNLP file in File Explorer will open the file, download the required resources, and start the application as instructed in the JNLP file.

If you do not want this option, you can create a shortcut on the workstation using the following syntax:

```
<path-to-open-weblaunch>\openweblaunch [options] <jnlp-file>
```

### JNLP URL

Open Web Launch can run Java Web Start applications from a URL pointing to a JNLP file.

Create a shortcut on the workstation using the following syntax:

```
<path-to-open-weblaunch>\openweblaunch [options] <jnlp-url>
```

## Command line options

Command line options are available when using Open Web Launch.

When double-clicking a JNLP file, the following command is the default command that is executed:

```
openweblaunch.exe <jnlp_reference>
```

**Note:** The `openweblaunch.exe` file is created by the setup program.

The following command line options are available:

**-disableVerification**

This command option skips signature verification in jar files:

```
openweblaunch.exe -disableVerification <jnlp_reference>
```

**-disableVerificationSameOrigin**

This command option skips verification that all jars have the same signature:

```
openweblaunch.exe -disableVerificationSameOrigin <jnlp_reference>
```

**-help**

This command option displays usage information:

```
openweblaunch.exe -help
```

**-javaDir**

This command option passes a specific Java location to use when starting a Java Web Start application:

```
openweblaunch.exe -javaDir <java_folder> <jnlp_reference>
```

**-showConsole**

This command option causes the Java console to be displayed when a Java Web Start application is running:

```
openweblaunch.exe -showConsole <jnlp_reference>
```

**-uninstall**

This command option uninstalls a specific Java Web Start application:

```
openweblaunch.exe -uninstall <jnlp_reference>
```

The `-gui` option together with `-uninstall` shows the GUI during the uninstall process:

```
openweblaunch.exe -uninstall -gui <jnlp_reference>
```

## Registry settings

Review Open Web Launch settings that are stored in the registry.

Registry settings that control the Open Web Launch behavior are set through the setup program and can also be set manually, as follows:

- By an administrator under `HKEY_CURRENT_USER\SOFTWARE\Rocket Software\Open Web Launch` for per-user settings
- Under `HKEY_LOCAL_MACHINE\SOFTWARE\Rocket Software\Open Web Launch` for per-machine settings.

The following table lists the registry settings:

<i>Table 103: Open Web Launch registry settings</i>		
<b>Setting</b>	<b>Description</b>	<b>Value</b>
ShowConsole	Controls if the Java console is displayed while running the application	<b>0</b> Do not show <b>1</b> Show
JavaDetection	Determines how Open Web Launch determines the Java that it uses	<b>Registry</b> Read the Oracle Java location from the registry  <b>JavaDir</b> Use the path specified during setup  <b>JavaHome</b> Read the Java location from the JAVA_HOME environment variable
JavaDir	Contains the Java location as specified during setup. This setting is used when JavaDetection is set to <b>JavaDir</b> .	
MakeDefault	Specifies if Open Web Launch is the default action for JNLP files in File Explorer	<b>0</b> Open Web Launch is not the default <b>1</b> Open Web Launch is the default
AddToControlPanel	Indicates if applications are added to the Control Panel	<b>0</b> Add applications to the Control Panel <b>1</b> Do not add applications to the Control Panel
DisableVerification	Specifies if verification of certificates is disabled	<b>0</b> Do not disable verification <b>1</b> Disable verification
DisableVerificationSameOrigin	Specifies if verification of downloaded JAR files having the same origin is disabled	<b>0</b> Do not disable verification <b>1</b> Disable verification

Setting	Description	Value
UseHttpProxyEnvironmentVariable	Indicates if HTTP_PROXY and HTTPS_PROXY variables are used	<b>0</b> Do not use  <b>1</b> Use

## JNLP keywords

This section provides the JNLP keywords that Open Web Launch supports.

The following table lists the Java Network Launch Protocol (JNLP) keywords that Open Web Launch supports.

*Table 104: JNLP keywords implemented by Open Web Launch*

Element	Attribute	Attribute	Values
information			
	icon		
	shortcut		
	title		
	vendor		
	homepage		
	description		
	version		App version like 1.0.1. The tag is Open Web Launch extension
application-desc			
resources			
		os	windows, darwin, linux
		arch	amd64, x86
	j2se or java		
		version	
		java-vm-args	
	jar		
		href	
	nativelib		
		href	
		name	
	extension		
		href	
		name	
		version	

For more information, see [Java Network Launch Protocol \(https://docs.oracle.com/javase/tutorial/deployment/deploymentInDepth/jnlp.html\)](https://docs.oracle.com/javase/tutorial/deployment/deploymentInDepth/jnlp.html).

## Frequently asked questions (FAQs)

Review common questions and answers about Open Web Launch.

## Are there 32 and 64-bit versions available?

Both versions are installed by default (openweblaunch32.exe and openweblaunch64.exe). Based on the Java Virtual Machine selected, the setup will make the 32 or 64-bit version of Open Web Launch the default (openweblaunch.exe).

## What happens if a JNLP file on the host changes?

Open Web Launch will check for changes between remote and local JNLP files and will refresh where needed.

## How does Open Web Launch determine the Java it should use?

Open Web Launch uses the following order when determining what Java executable it will use to run a Java Web Start application:

1. **Command line options.** When `-javaDir <java_folder>` is specified, Java installation from `<java_folder>` will be used.
2. **JAVA\_HOME.** Open Web Launch will use the JAVA\_HOME environment variable to locate the version of Java it should use if this option was selected during setup.
3. **Registry.** Open Web Launch will use a specific version of Java if this option was indicated during setup.
4. **Path.** If none of the other options result in a Java version that it can use, Open Web Launch will try to locate Java on the PATH.

## Troubleshooting

Review how to troubleshoot common issues when using Open Web Launch.

### How to debug an Open Web Launch issue

To monitor Open Web Launch activity or to troubleshoot a problem, you can review the log file. The log file contains information such as details about actions that have been taken, JARs that have been downloaded, and messages about any errors that might have occurred.

The openweblaunch.log file can be found under `%APPDATA%\Rocket Software\Open Web Launch\log`, which usually resolves to `c:\users\<username>\AppData\Roaming\Rocket Software\Open Web Launch\log`.

### How to clear the cache

If you are experiencing performance issues or to assist with troubleshooting, you can clear the cache for Open Web Launch.

The Open Web Launch cache can be found under `%APPDATA%\Rocket Software\Open Web Launch\cache`, which usually resolves to `c:\users\<username>\AppData\Roaming\Rocket Software\Open Web Launch\cache`. To clear the cache, delete the contents of this folder.

### How to determine if the console command is working

The Open Web Launch console uses the same console functionality as in regular Java. In the **Java Control Panel** on the **Advanced** tab, you can use the **Java console** option to control the console.

---

## Reference

Reference material supplements the information provided in the configuration documentation.

---

### Persistent data store

Review information about the persistent data store, which is used for storing historical data.

The *persistent data store* (PDS) is a set of files used for storing and retrieving near-term historical data.

**Important:** Two versions of the persistent data store, PDS V1 and PDS V2, are currently supported. The change from PDS V1 to PDS V2 occurs automatically for the monitoring agents with the initial startup of a Tivoli Enterprise Monitoring Server or a Tivoli Enterprise Monitoring Agent after the application of PDS V2 maintenance. Moving to PDS V2 is recommended. For more information, see [“PDS V2 activation” on page 1228](#).

**Note:** The abbreviation for the OMEGAMON persistent data store (PDS) is distinct from and should not be confused with the abbreviation for the z/OS partitioned data set (PDS).

#### Topics:

- [“Persistent data store V1 \(PDS V1\)” on page 1195](#)
- [“Persistent data store V2 \(PDS V2\)” on page 1222](#)

### Persistent data store V1 (PDS V1)

The *persistent data store* (PDS) is a set of files used for storing and retrieving near-term historical data. The content in this section applies to PDS V1.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

If you intend to collect historical data, you must make provisions to manage the collected data. Without additional action, on distributed computers, the history data files grow unchecked, using up valuable disk space. On z/OS®, the data sets allocated to store historical data are maintained by the persistent data store, which empties and reuses the data set with the oldest data. As you collect and use the historical data, you might want to adjust the size of the data sets allocated.

The topics in this section explain how the persistent data store works, document the maintenance procedure and options, and provide instructions for setting up tracing for troubleshooting problems with the persistent data store.

For more information about using and configuring the persistent data store, see the following topics:

- [Decision 8: Whether to collect historical data and how to manage it](#)
- [Allocate data sets and configure maintenance for historical data](#)
- [How to: Change PDS file count and file size](#)
- [How to: Reallocate PDS files](#)
- [\(Optional\) Enable maintenance of the historical data store](#)
- [\(Optional\) Configure historical data collection](#)

## Overview of PDS V1

The persistent data store is used for writing and retrieving historical data. The data written to the persistent data store is organized by tables (attribute groups), groups, and data sets. Each table is assigned to a group. Multiple tables can be assigned to each group, and each group can have one or more data sets assigned to it. By default, six data sets are assigned to a group.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

One of the data sets in each collection group is kept empty so that it can be quickly switched to if the active data set fills up. After this switch is made, the persistent data store looks to see if there are any empty data sets in the group. If not, the automatic maintenance process empties the data set with the oldest data.

During configuration, you allocate space for the data sets and specify what is to be done with historical data that is sitting in a data set that is being emptied. The default is to delete the data. Alternatively, you can configure maintenance to back up the data to tape or DASD, export the data to an external program for processing, or extract the data and write it in a viewable format.

Note that if the Tivoli Data Warehouse is used, especially with a 1-hour warehousing interval, there is little or no advantage to invoking the BACKUP, EXPORT, or EXTRACT functions for data collected by an OMEGAMON monitoring agent. These functions are more relevant if warehousing is not enabled, or if you are maintaining historical data for OMEGAMON agents whose data is not displayed by the Tivoli Enterprise Portal.

No historical data collection takes place until collection is configured and started through the OMEGAMON enhanced 3270 user interface or the History Collection Configuration window of the Tivoli Enterprise Portal. In the window, you specify the attribute groups for which you want data to be collected, the interval for data collection, and the location where you want the collected data to be stored (at the monitoring server or at the agent). In the Tivoli Enterprise Portal, you can also specify whether you want to store the data in the Tivoli® Data Warehouse so it will be available for long-term history data reporting.

## Automatic maintenance process

When a data set becomes full, the persistent data store selects an empty data set to make active. When the data set is active, the persistent data store checks to see if there are any more empty data sets. If there are no more empty data sets, maintenance is started on the oldest data set.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The maintenance process consists of two files that are generated and tailored by the configuration process and invoked by the persistent data store.

- `&STC_HILEV.PD1`  
`&STC_HILEV.PD1` is a procedure that is started by the automatic maintenance processing if one of the three maintenance functions is configured. Limited information is passed to this started task to drive a CLIST in a TSO environment. The configuration software creates this file and puts it into the RKANSAMU library for each runtime environment that has a persistent data store component. This procedure must be copied to a system level procedure library so the command issued to start it can be found.

The parameters passed to `&STC_HILEV.PD1` vary based on the version of the configuration software and the persistent data store. This document assumes the latest version is installed. Three parameters are passed to the started task:

- `HILEV`  
High-level qualifier for the runtime environment that configured this version of the persistent data store. It is obtained by extracting information from the DD statement that points to the persistent data store control files.

- LOWLEV  
Low-level qualifier for the sample library. It currently contains the RKANSAMU field name.
- data set  
Fully qualified name of the data set being maintained. It is possible to have a data set name that does not match the high-level qualifier specified in the first parameter.
- &STC\_HILEV.PDC  
&STC\_HILEV.PDC is the CLIST that is executed by the &STC\_HILEV.PD1 procedure. The CLIST has the task of obtaining all of the information required to perform the maintenance, saving the data, and initialize the data set so it can be used again. This procedure performs the following actions:
  - Checks the flags for BACKUP, EXTRACT, and EXPORT. If any of the flags is set, the CLIST performs the appropriate actions.
  - Deletes the data set
  - Allocates a new data set based upon the parameters in *KppAL* in RKANPARU
  - Makes the new data set available for reading and writing

Before launching the &STC\_HILEV.PD1 process, the persistent data store checks to see if BACKUP, EXPORT, or EXTRACT function has been specified. If no function has been specified, then the data set is initialized in the persistent data store started task and &STC\_HILEV.PD1 is not executed.

PARMGEN configuration uses the high-level qualifier for started tasks and appends PD1 for the procedure and PDC for the CLIST. If you changed KPDPROC to some other than the default during configuration, the suffixes remain 1 and C. The procedure runs with the ID assigned to the procedure or your system default ID.

## The part of maintenance you control

Most of the persistent data store maintenance procedure is automatic and does not require your attention. However, there are a few options you must decide upon.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

In the PARMGEN configuration method, you use the following parameters to select the options of BACKUP, EXPORT, and EXTRACT:

- **RTE\_PDS\_BACKUP\_FLAG**
- **RTE\_PDS\_EXPORT\_FLAG**
- **RTE\_PDS\_EXTRACT\_FLAG**

By default, these are all set to N. You can also set the parameter **RTE\_PDS\_BATCHINT\_FLAG**, which has a default of N. If the BACKUP, EXPORT, EXTRACT, and BATCHINT flags are set to N, then the data set is re-initialized within the address space without reallocating the data set. If any of these flags is set to Y, then the Persistent Datastore maintenance procedure is run to empty a data set. See [“Command interface” on page 1210](#) for descriptions of additional commands that are used primarily for maintenance.

- BACKUP makes an exact copy of the data set being maintained.  
You can indicate one of these backup options:
  - Back up the data for each data set group.
  - Back up the data to tape or to DASD for all data set groups.
- EXPORT writes the data to a flat file in an internal format that can be used by external programs to post process the data. This file is also used for recovery purposes when the persistent data store detects potential problems with the data.
- EXTRACT writes the data to a flat file in human-readable form, which is suitable for loading into other DBMS systems. The EXTRACT option is not strictly considered a way to maintain the data. If EXTRACT is specified, the data is pulled out and externalized in EBCDIC form, but the extraction does not empty the data set. If EXTRACT is specified, the data is extracted immediately from a data set that is switched from

an active state to a full state. The data set is not initialized until it becomes a candidate for being emptied, so the most current data becomes available in an extracted form without that data being lost.

If none of the options is specified, the data in the data set being maintained is erased.

For more information about configuring maintenance, see [“Allocate data sets and configure maintenance for historical data” on page 456](#).

## Indicating data set backup to tape or to DASD

For all data set groups that you selected to back up, you must indicate whether you want to back up the data to tape or to DASD. This decision applies to all data sets.

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

**Tip:** If you edit the &STC\_HILEV.PDC member of the *rhilev.rte.RKANSAMU* data set and then upgrade or reconfigure the runtime environment, your modifications might be overwritten.

### Procedure

- Complete on of the following steps to indicate where data should be backed up.
  - If you are backing up data sets to tape, use &STC\_HILEV.PDC as included in the product.
  - If you are backing up data sets to DASD, follow this procedure to modify &STC\_HILEV.PDC:
    - a. With any editor, open the procedure in the *rhilev.rte.RKANSAMU(KPDPROCC)* member.
    - b. Find the statement

```
TAPE = N
```

and change the N to Y.
    - c. Save the procedure.
    - d. Copy the &STC\_HILEV.PDC procedure to your system procedure library.

## Names of exported data sets

If you choose to export data, you are requesting that the data be written to a sequential data set. The names of all exported data sets follow a specific format.

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The names of all exported data sets follow this format:

```
rhilev.rte.Annnnnnn
```

where:

- *rhilev* is the high-level qualifier of all data sets in the persistent data store.

- *rte* is the mid-level qualifier of all data sets in the persistent data store, as you specified during configuration.
- A is a required character
- *nnnnnn* is a sequential number

## Persistent data store recovery

When an address space is started, a file check is performed against each of the persistent data stores. If a data store was not properly closed when the address space was brought down, a reset is performed. If the reset cannot be performed, a recovery process is issued against the file.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

If the recovery process fails, you might need to export the data from the file, and then recreate the file and import the exported data (see [“Exporting and restoring persistent data” on page 1201](#) for more information).

The results of the file check, the reset, and the recovery process are displayed in the RKPLOG.

## Making backed up data available

After data has been backed up to DASD or to tape, it can be made available to those products that use it.

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

When the automatic maintenance facility backs up a data set in the persistent data store, it performs the following actions:

- Disconnects the data set from the monitoring server
- Copies the data set to tape or DASD in a format readable by the monitoring server
- Deletes and reallocates the data set
- Reconnects the empty data set to the monitoring server

To view backed up data from the product, you must ensure that the data set is stored on an accessible DASD volume and reconnect the data set to the monitoring server. The following steps outline the procedure for reconnecting a backed up data set.

- Understand the naming convention for backed up data sets.
- Determine whether data collection is taking place in the Tivoli Enterprise Monitoring Server or agent address space.
- Find the data set you want to reconnect.
- Connect the data set to the collector address space.
- Disconnect the data set from the collector address space.

## Naming conventions for backed up data sets

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The maintenance facility uses the following format to name the data sets it creates when it backs up data:

```
rhilev.rte.Bnnnnnnn
```

where:

- *rhilev* is the high-level qualifier of all data sets in the persistent data store, as you specified during configuration
- *rte* is the mid-level qualifier of all data sets in the persistent data store, as you specified during configuration
- B is a required character
- *nnnnnnn* is a sequential number

## Finding backed up data

To make backed up data available, you need to know the name of the data set and the persistent data store group to which the data set belongs.

## About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

To find the name of the data sets and the group to which they belong, see the *rte\_hilev.rte\_name.RKANPARU(KppPG)* members in each RTE.

## Connecting the data set to the collector address space

To view backed up historical data from the product, the backed up data set must be connected to the collector address space.

## About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

Use the following procedure to connect the backed up data set to the collector address space.

## Procedure

1. If the data set is located on tape, use a utility such as IEBGENR to copy the data set to a DASD volume that is accessible by the collector address space.
2. Use the command interface to do an [“ADDFILE command” on page 1211](#). The ADDFILE command requires the group name and data set name. Make sure you use the RO option on the command. Otherwise, the data set is included in the PDS maintenance routines and is eventually over written.

## Disconnecting the data set

The data set that you connected to the monitoring server is not permanently connected. The connection is removed automatically the next time the monitoring server stops. You can also remove the data set from the persistent data store immediately after you view the data.

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

To disconnect the data set after viewing the data, use the command interface to do a [“DELFILE command”](#) on page 1212. The DELFILE command requires the only the name of the data set.

## Exporting and restoring persistent data

In addition to the standard maintenance jobs used by the persistent data store, there are sample jobs distributed with the monitoring server that you can use to export data to a sequential file and then restore the data to the original indexed format.

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

These jobs are not tailored by the configuration software at installation time and must be modified to add pertinent information.

## Exporting persistent data

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

Follow this procedure to export persistent data to a sequential file:

### Procedure

1. Stop the monitoring server if it is running.
2. Copy *rhilev.rte.RKANSAMU(KPDEXPTJ)*.
3. Update the JCL with the following values:
  - rhilev*  
high-level qualifier of the runtime environment where the persistent data store resides.
  - &pdsn*  
fully qualified name of the persistent data store data set to be exported
  - &expdsn*  
fully qualified name of the export file you are creating

**&unit2**

DASD unit identifier for *expdsn*

**&ssz**

record length of output file (You can use the same record length as defined for *pdsn*.)

**&sct**

count of blocks to allocate (You can use the same size as the blocks allocated for *pdsn*.)

**bsz**

&ssz value plus eight

With the exception of *&pdsn*, these values can be found in the PDSLOG SYSOUT of the monitoring server started task.

4. Submit the job.

## Restoring exported data

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

Follow this procedure to restore a previously exported persistent data store data set.

### Procedure

1. Copy *rhilev.rte.RKANSAMU(KPDRESTJ)*.
2. Update the JCL with the following values:

***rhilev***

high-level qualifier of the runtime environment where the persistent data store resides

***pdsn***

fully qualified name of the persistent data store data set to be restored

***expdsn***

fully qualified name of the file you are creating

***unit2***

DASD unit identifier for *expdsn*

***group***

identifier for the group that the data set will belong to

***siz***

size of the data set to be allocated, in megabytes

With the exception of *pdsn*, these values can be found in the PDSLOG SYSOUT of the monitoring server started task.

3. Submit the job.

## Format of exported data records

Exported data records share a common format, but the content of the tables and columns is product-specific. The topics in this section describe the format of the dictionary entries.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

A single dictionary data set contains a description and mapping information for every table recorded in the original data set. In many cases, the tables have variable-length columns and some rows of data where columns are not available. The information about missing columns and lengths for variable columns is embedded in the data records. Some tables have columns that physically overlay each other. This must be taken into account when trying to obtain data for these overlays.

Data in the exported file is kept in internal format, and many of the fields are binary. The output file is made up of three sections with one or more data rows in each.

- Section 1 describes general information about the data source used to create the exported data.
- Section 2 contains a dictionary required for mapping the data.
- Section 3 contains the actual data rows.

The historical data is maintained in relational tables. Therefore, the dictionary mappings provide table and column information for every table that had data recorded for it in the persistent data store.

## Section 2 records

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

Section 2 provides information about the tables and columns that are represented in Section 3. This section has a header record followed by a number of table and column description records.

### Dictionary header record

The dictionary header is the first Section 2 record (and therefore the second record in the data set). It provides general information about the format of the dictionary records that follow. It is used to describe how many tables are defined in the dictionary section.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The data layout for the dictionary header record follows.

Provides description, offset, length, and type for each field in the Section 2 dictionary header record.

<i>Table 105: Section 2 data record format, exported persistent data</i>				
Field	Offset	Length	Type	Description
RecID	0	4	Char	Record ID. Contains DD10 for header record 2.
Dictionary Len	4	4	Binary	Contains the length of the entire dictionary.
Header Len	8	4	Binary	Length of the header record.
Table Count	12	4	Binary	Number of tables in dictionary (1 record per table).
Column Count	16	4	Binary	Total number of columns described.
Table Row Len	20	4	Binary	Size of table row.

Field	Offset	Length	Type	Description
Col Row Len	24	4	Binary	Size of column row.
Expansion	28	28	---	Unused area.

#### Table description record

Each table in the exported data set has a table record that provides its name and identifier, and additional information about the columns. All table records are provided before the first column record. The column records and all of the data records in section 3 use the identifier number to associate it with the appropriate table.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The map length and variable column count fields can be used to determine exactly where the data for each column starts and to determine if the column exists in a record. The format of the table description record is described in the table that follows.

Provides description, offset, length, and type for each field in the Section 2 table record.

*Table 106: Section 2 table description record, exported persistent data*

Field	Offset	Length	Type	Description
RecID	0	4	Char	Record ID. Contains DD20 for table record.
Identifier Num	4	4	Binary	Unique number for this table.
Application	8	8	Char	Application name table belongs to.
Table Name	16	10	Char	Table name.
Table Version	26	8	Char	Table version.
Map Length	34	2	Binary	Length of the mapping area.
Column Count	16	4	Binary	Count of columns in the table.
Variable Cols	36	4	Binary	Count of variable name columns.
Row Count	40	4	Binary	Number of rows in exported file for this table.
Oldest Row	44	16	Char	Timestamp for oldest row written for this table.
Newest Row	64	16	Char	Timestamp for newest row written for this table.
Expansion	80	16	---	Unused area.

#### Column description record

One record exists for every column in the associated table record. Each record provides the column name, type, and other characteristics. The order of the column rows is the same order in which the columns are displayed in the output row. However, some columns might be missing on any given row. Use the mapping structure defined under section 3 to determine whether a column is present.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The format of the column records is described in the following table.  
Provides description, offset, length, and type for each field in a Section 2 column description record.

<i>Table 107: Section 2 column description record, exported persistent data</i>				
Field	Offset	Length	Type	Description
RecID	0	4	Char	Record ID. Contains DD30 for table record.
Table Ident	4	4	Binary	Identifier for the table this column belongs to.
Column Name	8	10	Char	Column name.
SQL Type	18	2	Char	SQL type for column.
Column Length	20	4	Binary	Maximum length of this column's data.
Flag	24	1	Binary	Flag byte.
Spare	25	1	---	Unused.
Overlay Col ID	26	2	Char	Column number if this is an overlay.
Overlay Col Off	28	2	Char	Offset into row for start of overlay column.
Alignment	30	2	---	Unused.
Spare 1	32	8	---	Unused.

### Section 1 record

The Section 1 record is not required for mapping the data in the exported file. However, it is useful for determining how to reallocate a data set when a persistent data store file must be reconstructed.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

Section 1 contains a single data row used to describe information about the source of the data recorded in the export file. The data layout for the record follows.

Provides description, offset, length, and type for all fields in Section 1 of exported data records

<i>Table 108: Section 1 data record format, exported persistent data</i>				
Field	Offset	Length	Type	Description
RecID	0	4	Char	Record ID. Contains AA10 for header record 1.
Length	4	4	Binary	Contains the record length of the header record.
Timestamp	8	16	Char	Timestamp of export. Format: CYMMDDHHMMSSMMM
Group	24	8	Char	Group name to which the data belongs.
Data Store Ver	32	8	Char	Version of KPDMANE used to record original data.
Export Version	40	8	Char	Version of KPDARCH used to create exported file.
Total Slots	48	4	Binary	Number of blocks allocated in original data set.

Field	Offset	Length	Type	Description
Used Slots	52	4	Binary	Number of used blocks at time of export.
Slot Size	56	4	Binary	Block size of original data set.
Expansion Area	60	20	---	Unused area.
Data Store Path	80	256	Char	Name of originating data set.
Export Path	336	256	Char	Name of exported data set.

### Section 3 records

Section 3 has one record for every row of every table that was in the original persistent data store data set being exported. Each row starts with a fixed portion, followed by the actual data associated with the row. The length of the column map can be obtained from the table record (DD20). Each bit in the map represents one column. A **0** for the bit position indicates that the column data is not present, while a **1** indicates that data exists in this row for the column. Immediately following the column map field is an unaligned set of 2-byte-length fields. One of these length fields exists for every variable-length column in the table. This mapping information must be used to find the starting location for any given column in the data structure. The actual data starts immediately after the last length field.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

If you are dealing with overlay columns, use the column offset defined in the DD30 records to determine the starting location for this type of column. Do not worry about overlaid columns with extracted data. If you want to look at the actual content of an overlaid column, you can expand the data by reinserting any missing columns and expanding all variable length columns to the maximum length before doing the mapping.

The table that follows maps the fixed portion of the data.

Provides description, offset, length, and type for each field in the fixed portion of Section 3 records.

<i>Table 109: Section 3 record format, exported persistent data</i>				
Field	Offset	Length	Type	Description
RecID	0	4	Char	Record ID. Contains ROW1 for column record.
Table Ident	4	4	Binary	Identifier for the table this record belongs to.
Row Length	8	4	Binary	Total length of this row.
Data Offset	12	4	Binary	Offset to start of data.
Data Length	16	4	Binary	Length of data portion of row.
Column Map	20	Varies	Binary	Column available map plus variable length fields.

### Extracting persistent data store data to flat files

Historical data can be exported to a flat file in EBCDIC format. The data can then be loaded into spreadsheets or databases for reporting and analysis.

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The format of the data is converted to tab-delimited columns. The data is written to separate files for each table; therefore, the data format for all rows in each data set is consistent. The program also generates a separate file. This file contains a single row that provides the column names in the order in which the data is organized. This file is also delimited for ease of use. An option (NOFF) on the KPDXTTRA program bypasses creating the separate file and places the column information as the first record of the data file.

This file is not tailored by the PARMGEN or Configuration Manager at installation time and must be modified to add pertinent information.

The output from this job is written to files with the following naming standard:

```
&hilev.&rte.tablename.D  
&hilev.&rte.tablename.H
```

The *tablename* is the first eight bytes of the actual table with any invalid characters changed to "#". The "D" suffix is for the data file and the "H" suffix is for the header file. Note that the NOFF parameter can be passed to the KPDXTTRA program to merge the data from the header file into the data file and therefore not create a unique header file. The high level and mid level qualifiers are passed as a parameter to the KPDXTTRA program (PREF=xxxx) and are therefore controlled by the KPDPROCC member in the RKANSAMU data set.

All data sets are kept in read/write state even if they are not active. This makes the data sets unavailable if the monitoring server is running. Jobs cannot be run against the active data sets and the inactive data sets must be taken offline.

You can remove a data set from the monitoring server by issuing the modify command:

```
F stcname,KPDCMD QUIESCE FILE=DSN:data set
```

If you must run a utility program against an active data store, issue a SWITCH command prior to issuing this QUIESCE command.

## Extracting persistent data store data to EBCDIC files

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

Use this job to extract persistent data store data to EBCDIC files.

1. Copy *rhilev.rte.RKANSAMU(KPDXTTRAJ)*.
2. Update the JCL with the following values:

***rhilev***

High-level qualifier of the runtime environment where the persistent data store resides.

***pdsn***

Fully qualified name of the persistent data store data set to be extracted

***pref***

High-level qualifier for the extracted data

3. Add the parameters you want to use for this job

**PREF=**

Identifies the high-level qualifier for the output file. This field is required.

**DELIM=nn**

Identifies the separator character to be placed between columns. The default is 05.

**NOFF=**

If used, causes the format file not to be generated. The column names are placed into the data file as the first record.

**QUOTES**

Places quotation marks around character type of data

4. Submit the job.

**Format of extracted header and data file records**

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

**Header record**

The following example shows an extracted header file record:

```
TMZDIFF(int,0,4) WRITETIME(char,1,16) ORIGINNODE(char,2,128) QMNAME(char,3,48)
APPLID(char,4,12)
APPLTYPE(int,5,4) SDATE_TIME(char,6,16) HOST_NAME(char,7,48) CNTTRANPGM(int,8,4)
MSGSPUT(int,9,4)
MSGSREAD(int,10,4) MSGSBROWSD(int,11,4) INSIZEAVG(int,12,4) OUTSIZEAVG(int,13,4)
AVGMQTIME(int,14,4)
AVGAPPTIME(int,15,4) COUNTOFQS(int,16,4) AVGMQGTIME(int,17,4) AVGMQPTIME(int,18,4)
DEFSTATE(int,19,4)
INT_TIME(int,20,4) INT_TIMEC(char,21,8) CNTTASKID(int,22,4) SAMPLES(int,23,4)
INTERVAL(int,24,4)
```

Each field is separated by a tab character (by default). The data consists of the column name with a type, column number, and column length field within the parentheses for each column. The information within parentheses is used primarily to describe the internal formatting information, and therefore can be ignored.

**Data record**

The following example shows an extracted data file record for the preceding header file record:

```
0 "1000104003057000" "MQM7:SYSG:MQESA" "MQM7" "XCXS2DPL" 2 "1000104003057434"
"SYSG" 1 0 0 0 0 2 90007 0 2 0 1 96056 "016: 01" 1 1 900
```

The header file and the data file match up as follows:

Displays the field name, data, and data type.

<i>Table 110: Extracted data</i>		
Field name	Data	Data type
TMZDIFF	0	Integer
WRITETIME	"1000104003057000"	"Character"
ORIGINNODE	"MQM7:SYSG:MQESA"	"Character"
QMNAME	"MQM7"	"Character"
...	...	...
SAMPLES	1	Integer
INTERVAL	900	Integer

## Components of the persistent data store

The persistent data store consists of a set of components used for writing and retrieving historical data.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

### KPDMANE

KPDMANE is the primary executable program. It is a server for other applications running in the same address space. This program is designed to run inside the TMS:Engine address space as a separate subtask. Although it is capable of running inside the TMS:Engine, the program does not make any use of TMS:Engine services. This is because the KPDMAN program is also used in other utility programs that are intended to run in batch mode. KPDMANE is the program that eventually starts the maintenance task when it does a switch and determines that no empty data sets are available.

### KPDUTIL

This program is used primarily to initialize one or more data sets for persistent data store use. The program attaches a subtask and starts the KPDMANE program in it. The DD statements used when this program is run dictate what control files are executed by the KPDMANE program.

### KPDARCH

This client program pulls data from the specified data set and writes it out to a flat file. The program attaches a subtask and starts up the KPDMANE program in it. The output data is still in an internal format, with index information excluded.

### KPDREST

This client program reads data created by the KPDARCH program, inserts it into a data set in the correct format for use by the persistent data store, and rebuilds the index information. The program attaches a subtask and starts the KPDMANE program in it.

### KPDXTRA

This client program pulls data from a data set and writes it to one or more flat files, with all column data converted to EBCDIC and separated by tabs. This extracted data can be loaded into a database management system or into spreadsheet programs such as Excel. The program attaches a subtask and starts the KPDMANE program in it.

### KPDDSCO

This program communicates with the started task that is running the persistent data store and sends it commands. The typical command is RESUME, which tells the persistent data store that it can resume using a data set. The program can use two forms of communication:

- SNA protocol to connect to the monitoring server and submit command requests.
- SVC 34 to issue a modify command to the started task.

This program also logs information in a general log maintained in the persistent data store tables.

## Operation of the persistent data store

Maintenance is invoked automatically by the KPDMANE program.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The KPDMANE program invokes maintenance in two places:

- On startup, while reading and processing data sets, KPDMANE examines internal data to determine whether each data set is in a known and stable state. If not, KPDMANE issues a RECOVER command.
- When KPDMANE is recording information from applications onto an active data set for a group, if it detects that it is running out of room, it executes the SWITCH command internally.

## Command interface

The persistent data store uses a command interface to perform many of the tasks required for maintaining the data sets used for historical data. Most of these commands can be invoked externally through a command interface supported in the Engine environment.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

These maintenance commands can be executed by using the standard z/OS® MODIFY interface with the following format:

```
F stcname,KPDCMD command arguments
```

where

### ***stcname***

Is the started task name of address space where the persistent data store is running.

### ***command***

Is one of the supported dynamic commands.

### ***arguments***

Are valid arguments to the specified command.

## Maintenance commands

The persistent data store supports a number of commands used primarily for maintenance.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

### SWITCH command

This dynamic command causes a data store file switch for a specific file group. At any given time, update-type operations against tables in a particular group are directed to one and only one of the files in the group. That one file is called the active file. A file switch changes the active file for a group. In other words, the switch causes a file other than the currently active one to become the new active file.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

If the group specified by this command has only one file, or the group currently has no inactive file that is eligible for output, the switch is not performed.

At the conclusion of a switch, persistent data store starts the maintenance process for a file in the group if no empty files remain in the group.

The [NO]EXTRACT keyword can be used to force or suppress an extract job for the data store file deactivated by the switch.

### Syntax

```
SWITCH          GROUP=groupid [ EXTRACT | NOEXTRACT ]
```

where

#### *groupid*

Specifies the ID of the file group that is to be switched. The group must have multiple files assigned to it.

#### EXTRACT

Specifies that the deactivated data store file is to be extracted, even if the file's GROUP statement did not request extraction.

#### NOEXTRACT

Specifies that extraction is not to be performed for the deactivated data store file. This option overrides the EXTRACT keyword of the GROUP statement.

Note that if neither EXTRACT nor NOEXTRACT is specified, the presence or absence of the EXTRACT keyword on the file's GROUP statement determines whether extraction is performed as part of the switch.

**SWITCH logic**The SWITCH command looks at all data sets assigned to the group and attempts to find an empty one. If no empty data sets are available, future attempts to write data to any data set in the group will fail. Normally, an empty data set is found and is marked as the active data set.

When a data set is deactivated because it is full, it is tested to see whether the EXTRACT option was specified. If so, the EXTRACT command for the data set is executed.

The next test is to check whether there are any empty data sets in the current group. If not, the code finds the data set with the oldest data and marks it for maintenance. With the latest release of the persistent data store, the code checks to see whether any of the maintenance options BACKUP, EXPORT, or EXTRACT were specified for this data set. If not, the INITDS command is executed. Otherwise, the BACKUP command is executed.

### BACKUP command

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

This command causes a maintenance task to be started for the data store file named on the command. The maintenance task typically deletes, allocates and initializes a data store file, optionally backing up or exporting the file before deleting it. (The optional export and backup steps are requested through parameters on the data store file's GROUP command in the RKPDI file.)

### Syntax

```
BACKUP FILE=DSN:dsname
```

where

#### *dsname*

Specifies the physical data set name of the file that is to be maintained.

**BACKUP logic**This code quiesces and closes the data set. A test is made to see whether either BACKUP or EXPORT is specified for the data set and appropriate options are set for the started task. The options always include a request to initialize the data set. An SVC 34 is issued to start the KPDPROC1 procedure. The code returns to the caller, and the data set is unavailable until the RESUME command is executed.

### ADDFILE command

The ADDFILE command is used to dynamically assign a new physical data store file to an existing file group. The command can be issued any time after the persistent data store initialization has completed in the Tivoli

Enterprise Monitoring Server. It can be used to increase the number of files assigned to a group or to bring old data back online. It cannot, however, be used to define a new file group ID. It can be used to add files only to groups that already exist as the result of GROUP commands in the RKPDIIN input file.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

### Syntax

```
ADDFILE  GROUP=groupid  FILE=DSN:dsname  [ RO ]  [ BACKUP ]  
  [ ARCHIVE ]
```

where

#### *groupid*

Specifies the unique group ID of the file group to which a file is to be added.

#### *dsname*

Specifies the fully qualified name (no quotation marks) of the physical data set that is to be added to the group specified by *groupid*.

#### RO

Specifies that the file is to be read-only (that is, that no new data can be recorded to it). By default, files are not read-only (that is, they are modifiable). This parameter can also be specified as READONLY.

#### BACKUP

Specifies that the file is to be copied to disk or tape before being reallocated by the automatic maintenance task. (Whether the copy is to disk or tape is a maintenance process customization option.) By default, files are not backed up during maintenance.

#### ARCHIVE

Specifies that the file is to be exported before being reallocated by the automatic maintenance task. By default, files are not exported during maintenance.

### DELFILE command

The DELFILE command is used to drop one physical data store file from a file group's queue of files. It can be issued any time after persistent data store initialization has completed in the Tivoli Enterprise Monitoring Server.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The file to be dropped must be full, partially full, or empty; it cannot be the “active” (output) file for its group (if it is, the DELFILE command is rejected).

The DELFILE command is conceptually the opposite of the ADDFILE command, and is intended to be used to manually drop a file that was originally introduced by a GROUP or ADDFILE command. After a file has been dropped by DELFILE, it is no longer allocated to the Tivoli Enterprise Monitoring Server task and can be allocated by other tasks. Note that DELFILE does not physically delete a file or alter it in any way. To physically delete and uncatalog a file, use the REMOVE command.

### Syntax

```
DELFILE      FILE=DSN:dsname
```

where

#### *dsname*

Specifies the fully qualified (without quotation marks) name of the file that is to be dropped.

## EXTRACT command

The EXTRACT command causes an extract job to be started for the data store file named on the command. The job converts the table data in the data store file to delimited text format in new files, and then signals the originating Tivoli Enterprise Monitoring Server to resume use of the data store file.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

For each table extracted from the data store file, two new files are created. One file contains the converted data and one file contains a record describing the format of each row in the first file.

### Syntax

```
EXTRACT      FILE=DSN:dsname
```

where

#### *dsname*

Specifies the physical data set name of the file to have its data extracted.

**EXTRACT logic** The logic for this command is similar to the BACKUP logic, except that the only option specified is an EXTRACT run with no initialization performed on the data set.

## INITDS command

The INITDS command forces a data store file to be initialized in the address space where the persistent data store is running.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

### Syntax

```
INITDS      FILE DSN:dsname
```

where

#### *dsname*

Identifies the data set name of the data store file to be initialized.

## RECOVER command

The RECOVER command causes a recovery task to be started for the data store file named on the command. The recovery task attempts to repair a corrupted data store file by exporting it, reallocating and initializing it, and restoring it. The restore operation rebuilds the index information, the data most likely to be corrupted in a damaged file. The recovery is not guaranteed to be successful, however; some severe forms of data corruption are unrecoverable.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

## Syntax

```
RECOVER      FILE=DSN: dsname
```

where

### *dsname*

Specifies the physical name of the data set to be recovered.

**RECOVER logic**This code quiesces the data set and closes the file. Information is set up to request an ARCHIVE, INIT, and RESTORE operation to be performed by the maintenance procedures. An SVC 34 is issued for a START command on KPDPROC1 (or its overridden name). The command exits to the caller, and the data set is unusable until a RESUME command is executed.

## RESUME command

The RESUME command is used to notify the persistent data store that it can once again make use of the data set specified in the arguments. The file identified must be one that was taken offline by the backup, recover, or extract commands.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

## Syntax

```
RESUME      FILE=DSN: dsname
```

where

### *dsname*

Specifies the physical name of the data set to be brought online.

**RESUME logic**This code opens the specified data set name and verifies that it is valid. The data set is taken out of the quiesce state and made available for activation during the next SWITCH operation.

## Other useful commands

The commands in this section can be used to obtain information about the persistent data store and the data sets in the store, and to flush buffered data to disk.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The commands are described in the following sections.

## QUERY CONNECT command

The QUERY CONNECT command displays a list of applications and tables that are currently defined in the persistent data store. The output of this command shows the application names, table names, total number of rows recorded for each table, the group the table belongs to, and the current data set that the data is being written to.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

## Syntax

```
QUERY CONNECT <ACTIVE>
```

where

### ACTIVE

Is an optional parameter that displays only those tables that are active. An active table is one that has been defined and assigned to an existing group, and the group has data sets assigned to it.

## QUERY DATASTORE command

The QUERY DATASTORE command displays a list of data sets known to the persistent data store. For each data set, the total number of allocated blocks, the number of used blocks, the number of tables that have data recorded, the block size, and status are displayed.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

## Syntax

```
QUERY DATASTORE <FILE=DSN:datasetname>
```

where

### FILE

Optional parameter that allows you to specify that you are only interested in the details for a single data set. When this option is used, the resulting display is changed to show information that is specific to the tables being recorded in the data set.

## COMMIT command

This dynamic command flushes to disk all pending buffered data. For performance reasons, the persistent data store does not immediately write to disk every update to a persistent table. Updates are buffered in virtual storage. Eventually the buffered updates are flushed (written to disk) at an optimal time. However, this architecture makes it possible for persistent data store files to become corrupted (not valid) if the files are closed prematurely, before pending buffered updates have been flushed. Such premature closings might leave inconsistent information in the files. The COMMIT command is intended to limit the exposure to data store file corruption. Some applications automatically issue this command after inserting data.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The following known circumstances might cause corrupted files:

- Severe abnormal monitoring server terminations that prevent the persistent data store recovery routines from executing
- IPLs performed without first stopping the monitoring server

## Syntax

```
COMMIT
```

## Setting up RAS1 tracing for persistent data store activity

RAS1 tracing is the primary diagnostic tool for product and infrastructure components. For tracing persistent data store activity, the RAS1 trace needs to be set where the collection takes place, that is, in either the agent or the monitoring server address space. RAS1 tracing can be set dynamically in the IBM® Tivoli® Monitoring Service Console interface or by a more direct method of modifying the KBB\_RAS1 parameter.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

For agents that run in their own address space, the KBB\_RAS1 parameter is located in *hilev.rte.RKANPARU(KppENV)* member, where *pp* is the two-letter product code. For agents that run in the monitoring server address space, like OMEGAMON for z/OS or OMEGAMON for Storage, the KBB\_RAS1 parameter is located in *hilev.rte.RKANPARU(KppENV)*. If you modify the KBB\_RAS1 parameter by directly editing the ENV file, you must stop and restart the monitoring server. To change the trace settings without having to recycle the monitoring server, use the Service Console interface **ras1** command.

RAS1 messages are sent to STDOUT and redirected to the files shown in [“Locations of log and trace information for z/OS® components” on page 1216](#).

Location of logs for z/OS components.

Component	Component description and location
Monitoring agents	<p>The RKLVLLOG for the monitoring agent started task is the single most helpful piece of service information for an agent. The RKL (R = runtime, KLV = the prefix associated with IBM® Tivoli® Monitoring Services:Engine or TMS:Engine) is the sysout data set or spool file that contains log and trace messages.</p> <p>These additional zSeries® log files (if available) are also useful:</p> <ul style="list-style-type: none"> <li>• The RKLVSnap sysout data set or spool file contains formatted dump output.</li> <li>• The RKPDLLOG sysout data set or spool file contains the information and error messages related to the handling of persistent datastores.</li> <li>• Some agents have other files defined to collect log and trace messages.</li> </ul> <p>Refer to your started procedures for the locations of these serviceability log files.</p>
Tivoli Enterprise Monitoring Server on z/OS®	The Tivoli Enterprise Monitoring Server runs under TMS:Engine just as an agent does, and the logging is handled in the same way: log and trace data are written to RKLVLLOGs and RKPDLLOGs.
End-to-End Response Time Feature	The End-to-End Response Time Features is a base component and does not have its own RKLVLLOG file. This component writes messages to the IBM® System Display and Search Facility (SDSF) Job Log.
IBM® Tivoli® Management Services:Engine (TMS:Engine)	<p>TMS:Engine is a collection of basic operating system and communication service routines built specifically for z/OS®. All address spaces used by monitoring agents load and use the services of TMS:Engine.</p> <p>TMS:Engine writes messages to the same RKLVLLOG file as the product it is running. In the RKLVLLOG file, product-specific messages start with the product code (for example, KM5 or KM2 for OMEGAMON for z/OS monitoring agent). The messages for the Tivoli Enterprise Monitoring Server start with KDS. The messages for the TMS:Engine itself start with that component prefix, KLV.</p>

Component	Component description and location
OMEGAMON® Subsystem	The OMEGAMON® Subsystem does not allocate an RKLVLOG. This component issues messages directly to either the SYSPRINT or the SYSTRACE output allocation of the Subsystem procedure.
Persistent data store	The RKPLOG SYSOUT data set or spool file contains the information and error messages related to the handling of persistent data stores.

RAS1 trace log files can grow very large with the wrong amount of filtering. Be careful with the levels of tracing that you specify.

## Setting trace levels by editing RKANPARU(KppENV)

One of the simplest ways to set trace levels for an agent or monitoring server is to edit the *rhilev.rte.RKANPARU(KppENV)* member.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

For RAS1 tracing of persistent datastore activity in an agent collector address space, add (UNIT:kraahbin ST) to the default KBB\_RAS1=ERROR setting as shown in the following example:

```
KBB_RAS1=ERROR (UNIT:kraahbin ST)
```

For RAS1 tracing in the monitoring server collector address space, add (UNIT:KFASPHST ST) to the default KBB\_RAS1=ERROR setting as shown in the following example:

```
KBB_RAS1=ERROR (UNIT:KFASPHST ST)
```

These commands trace all write activity with the count of records written during the write.

After you add the command, you must stop and restart the address space for the command to take effect. After that, the setting remains in effect for the life of the address space. To end the trace, you must edit the file again to reset the trace level, and stop and restart the address space.

## Setting trace levels dynamically from the IBM® Tivoli® Monitoring Service Console

You can use the IBM® Tivoli® Monitoring Service Console to set trace levels for monitoring agents on z/OS®, as well as for a Tivoli® Enterprise Monitoring Server on z/OS® or for distributed components. Using the service console, you can read logs and turn on traces for remote product diagnostics and configuration. If you use the Service Console, you can change trace levels without recycling the monitoring server or other components.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The Service Console is uniquely identified by its service point name. All Service Consoles for a host are linked and presented on the IBM® Tivoli® Monitoring Service Index for that host. You can perform operations on a specific component process by selecting the service console associated with the service point name of the component.

**Note:** Enabling tracing may cause large amounts of trace data and degrade performance, so only turn on tracing for the minimal amount of time as required to do problem determination.

## Accessing the Service Console from a browser

You can access the Service Console from a browser window.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

Use the following procedure to start the service console:

1. Start the browser.
2. In the **Address** field, type the URL for the IBM Tivoli Monitoring browser client:

```
http://hostname:1920
```

where hostname specifies the system where the process (monitoring server, portal server, Warehouse Proxy Agent, Tivoli® Data Warehouse, or monitoring agent) is installed. (1920 is the IBM default port, which may be reconfigured by the system administrator.) If the service console is not displayed, a system administrator might have blocked access to it.

3. On the IBM® Tivoli® Monitoring Service Console window, select the desired component process (service point name). A popup window appears, asking for the user ID and password.
4. Supply the required information, then click **OK**.

The IBM® Tivoli® Monitoring Service Console performs user authentication using the native OS security facility. If you use the IBM® Tivoli® Monitoring Service Console on z/OS® systems, your user ID and password are checked by the z/OS® security facility. If you use the IBM® Tivoli® Monitoring Service Console on Windows™ systems, then you must pass the Windows™ workstation user ID and password prompt. This is the rule except for instances of a NULL or blank password. The IBM® Tivoli® Monitoring Service Console never accepts a NULL or BLANK password.

A password is always required to access the service console. Blank passwords, even if correct, cannot access the service console. Even if a user ID is allowed to login to the operating system without a password, access to the service console is denied. Create a password for the user ID that is being used to login to the service console.

You can issue service console commands in the command input area. For a list of available commands, type a question mark (?) and click **Submit**.

## Accessing the Service Console through the Enhanced 3270 user interface

You can access the Service Console from the ITM Service Index workspace in the Enhanced 3270 user interface.

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

To use the ITM Service Console workspace, you must supply a user ID and password. This information is sent to a Tivoli® Enterprise Monitoring Server. The user ID and password (and the Service Console or SOAP commands and their results) are normally sent in clear text using TCP/IP and the HTTP protocol. If you want the password and ID to be sent in encrypted form instead of clear text, you must use the secure version of this workspace. To use the secure versions of these workspaces, the address space must be enabled to use the Hypertext Transfer Protocol Secure (HTTPS) communications protocol.

To access the ITM Service Index (KOBHNDX) workspace, use one of the following methods:

### Procedure

1. Navigate to the KOBHUBS workspace by entering =KOBHUBS on the command line.
2. Use either of the following options.
  - Place your cursor next to the name of the hub Tivoli® Enterprise Monitoring Server that you are interested in, type / and press **Enter**, then select either ITM Service Index for Hub or ITM Service Index for Hub (secure HTTPS) from the Options Menu.
  - Place your cursor next to the name of the hub Tivoli® Enterprise Monitoring Server that you are interested in, and enter I for HTTP connection to the ITM Service Index or J for HTTPS connection to service index, if enabled.

## Result

The ITM Service Index workspace is displayed.

## Service Console commands

The Service Console supports the **ras1** command, which is especially useful for dynamically enabling and disabling RAS1 traces. The documentation requests from IBM® Software Support may conflict with your availability requirements. The **ras1** command can be used to alter KBB\_RAS1 tracing parameters dynamically without the need to recycle the product. The Service Console also supports the **bss1** command, which is also useful for troubleshooting.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

For example, you can issue the following **ras1** command from the Service Console to enable the kpx trace, :

```
ras1 set (UNIT:kpx ALL)
```

After you capture this trace, you can disable it with the following service console command:

```
ras1 set (UNIT:kpx ANY)
```

The **ras1** command is paired with one of the following subcommands:

### **log**

Display RAS1 log capture buffer.

### **list**

List the RAS1 filters in effect.

### **set serviceunit**

Control traces and filters for *serviceunit*

To see what tracing is already in effect, submit the following command:

```
ras1 list
```

### **Note:**

1. The information inside the parentheses may be case-sensitive. Use the values provided by IBM® Software Support.
2. The settings set by Service Console commands remain in effect for the current activation of the product. After the product is recycled, the original trace settings are restored.

The **bss1** command manages BSS1 (Basic System Services). The command is paired with one of the following subcommands:

## listenv

Display the resident TMS:Engine variables.

## getenv envvar

Display environment variable, where *envvar* is any variable that can be returned from **listenv**.

## setenv envvar

Assign an environment variable where *envvar* is any variable that can be returned from **listenv**.

## info

Display BSS1\_Info() data

## config debugenv

Modifies the settings of the TMS:Engine debug environment variables: RES1\_DEBUG, KDH\_DEBUG, KDC\_DEBUG, and KDE\_DEBUG. The possible values, from most to least tracing messages, are: M (Max), D (Detail), Y (Yes) and N (Nominal). For example, the following **config** command alters the setting of KDC\_DEBUG:

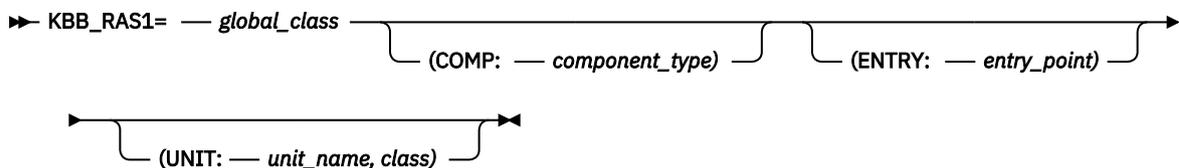

```
BSS1 CONFIG KDC_DEBUG=Y
```

## Syntax for RAS1 traces

This syntax is used to specify a RAS1 trace in the *rhilev.rte.RKANPARU(KppENV)* file. An IBM Software Support representative can tell you the values to set for the RAS1 trace parameters.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The basic syntax of the RAS1 trace command is:

where:

### global\_class

Indicates the level of tracing that you want. This is a global setting that applies to all RAS1 filters in the process. If you set this global class by itself, it is global in scope and the trace cannot filter on any of the other keywords. Separate combined classes with a space. The following values are possible. Valid abbreviations are in parentheses.

- **ERROR (ER):** returns severe error messages only (this is the default for most applications).
- **STATE (ST):** records the condition or current setting of flags and variables in the process. If state tracing is enabled, you can see the current state of particular variables or flags as the process is running.
- **FLOW (FL):** causes a message to be generated at an entry or exit point of a function.
- **DETAIL (DE):** produces a detailed level of tracing.
- **INPUT (IN):** records data created by a particular API, function, or process.
- **ALL:** causes all available messages to be recorded. This setting combines all the other forms of tracing.

### COMP

Indicates that the trace includes a component type. The COMP keyword is used to trace groups of routines related by function (or component). Use this keyword only at the explicit request of an IBM Software Support representative.

#### **component\_type**

Identifies a component type. An IBM Software Support representative can tell you what value to specify.

#### **ENTRY**

Narrows a filtering routine to specify a specific ENTRY POINT. Since multiple entry points for a single routine are rare, use this keyword only at the explicit request of an IBM Software Support representative.

#### **entry\_point**

Represents the name of the entry point. An IBM Software Support representative can tell you what value to specify.

#### **UNIT**

Indicates that the trace is to look for a match between the compilation unit dispatched and the fully or partially qualified compilation unit specified on the RAS1 statement. A match results in a trace entry.

#### **unit\_name**

Represents the name of the compilation unit. In most instances, this name defines the component that is being traced. The value is likely to be the three-character component identifier for the monitoring agent (*Kpp*).

#### **class**

One of the same values specified for *global\_class*, but, because of its position inside the parentheses, narrowed in scope to apply only to the *unit\_name* specified.

**Note:** The default setting for monitoring agents on z/OS® is KBB\_RAS1=ERROR, meaning that only error tracing is enabled. You can specify any combination of UNIT, COMP, and ENTRY keywords. No keyword is required. However, the RAS1 value you set with the global class applies to all components.

## **Redirecting output of RAS1 tracing**

Nearly all diagnostic information for the z/OS® components is delivered by the RAS1 component. This component is configured by the KBB\_RAS1 environment variable in member KBBENV of RKANPARU. You can redirect the initialization member using the TMS:Engine INITLIST processing. INITLIST processing is always echoed to the RKLVLLOG with the KLVIN411 message.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

This example shows a typical KBBENV override to a different member, KDSENV:

```
KLVIN410 INITLIST MEMBER KDSINIT BEING PROCESSED
KLVIN411 KLVINNAM=KDSINNAM
KLVIN411 KLVINTB=KDSINTB
KLVIN411 KLVINVLG=KDSINVLG
KLVIN411 KLVINNAF=KDSINNAF
KLVIN411 KLVINVPO=KDSINVPO
KLVIN411 KLVINSTG=KDSINSTG
KLVIN411 KLVINVAM=KDSINVAM
KLVIN411 KBBENV=KDSENV
```

In this example, configuration of KBB\_RAS1 is recorded in member KDSENV of RKANPARU.

## Resizing persistent data store files

After you have used historical data collection for a while, you might determine that the amount of space allocated initially is not sufficient. In this case, you can change the size of the file allocation.

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

There are two ways to increase the amount of space allocated to historical data collection files:

- Change the total amount of space allocated for the persistent data store libraries and overhead information
- Add additional files to the data set

You change the amount of space allocated to the persistent data store by editing the **Kpp\_PD\_CYL** parameter in the RTE configuration profile. However, editing the parameter does not necessarily mean that the files are automatically resized based upon the new allocation.

There are two processes that re-initialize the persistent data stores. One process runs inside the address space and does not redefine the files, so their size does not change. The other process is a batch process that deletes and redefines the files. The following parameter flags in the RTE configuration profile force the batch process:

#### RTE\_PDS\_BATCHINT\_FLAG

The default is N. If this flag is set to Y, the batch process is run and the files are deleted and redefined.

#### RTE\_PDS\_BACKUP\_FLAG

The default is N. If this flag is set to Y, the batch process is run so a backup of the data in the persistent data store can be made.

#### RTE\_PDS\_EXPORT\_FLAG

The default is N. If this flag is set to Y, the batch process is run so an archive of the data in the persistent data store can be made.

If all these flags are set to N, you have to delete the data sets and recreate them by using Submit batch jobs to complete the PARMGEN reconfiguration process.

Another way to add more space is to increase the value of the product-specific parameter **Kpp\_PDS\_FILE\_COUNT**. To determine the allocation size for each file, the configuration software divides the total **Kpp\_PD\_CYL** allocation by the file count. If you decide to use this method, then after you run the Submit job and everything completes successfully you add one or more files by issuing a modify command against the address space:

```
/F stc_name,KPDCMD ADDFILE GROUP=groupid FILE=DSN:dsname
```

Where:

#### **groupid**

Specifies the unique group ID of the file group to which a file is to be added.

#### **dsname**

Specifies the fully-qualified name (no quotation marks) of the physical data set that is to be added to the group specified by *groupid*.

## Persistent data store V2 (PDS V2)

The *persistent data store* (PDS) is a set of files used for storing and retrieving near-term historical data. The content in this section applies to the new persistent data store, referred to as PDS V2.

**Note:** PDS V2 replaces PDS V1, and certain behaviors differ significantly from PDS V1. If you have used PDS V1, it is recommended that you review [“Differences between PDS V1 and PDS V2” on page 1224](#).

With PDS V2, when collecting historical data, you have the option to manage the data sets by space or by time. With space-based management mode, the amount of historical data in each data set depends on the size of the data set. With time-based management mode, each data set contains data for a single day. The specification of the mode depends on the Extent Constraint Removal (ECR) attribute of the SMS data class used when allocating the data sets. For more information, see [“Data set management modes” on page 1237](#).

PDS V2 activation and data set allocation settings (including the use of encryption) are managed through runtime environment and agent-specific parameters using Configuration Manager or PARMGEN. For more information, see [“Configuring PDS V2” on page 1237](#).

## About PDS V2 data sets and statuses

Review information about how the PDS V2 data sets function and related terminology.

In persistent data store V2 (PDS V2), the data sets are defined dynamically from within the Tivoli Enterprise Monitoring Server (the *monitoring server*) or the Tivoli Enterprise Monitoring Agent (the *monitoring agent*). The number and size of data sets per application is user-configurable, and a wraparound process is used to allocate and delete the data sets when switching from one data set to the next. PDS V2 data sets also support z/OS® data set encryption.

A history data set is *active* if it is currently being written to by a monitoring server or a monitoring agent. At any given time, update-type operations against tables in a particular application are directed to only one of the data sets available to the data store; this data set is the *active* data set. All other data sets defined to the data store for the application are referred as being *inactive*.

**Note:** In order for any maintenance (such as making a backup copy) to be performed on a data set, the data set must be inactive.

When the active data set runs out of space or at local midnight (depending on your configuration), an automatic data set *switch* occurs. The data set switch changes the active data set for an application to the *reserved* data set, which is a data set that has been designated by PDS V2 as the next available data set for the application.

After the switch occurs, in preparation for the next switch, PDS V2 allocates the next reserved data set. If the user-configurable number of data sets for the data store has been allocated and the data sets are full, the oldest data set is removed and replaced with a newly-allocated, empty data set with the same name of the deleted data set. This process of designating a reserved data set in advance allows the opportunity to address problems that might occur when allocating the data set.

**Note:** If a reserved data set is not available and cannot be allocated, the oldest data set is reused.

### PDS V2 data set statuses

A number of terms are used to describe the status of the PDS V2 data sets at any given time. The following list summarizes these terms.

#### active/inactive

A history data set is *active* if it is currently being written to by a monitoring server or monitoring agent. All other data sets defined to the data store for the application are referred as being *inactive*.

#### empty/partial/full

A data set is *empty* if no historical data has been written to it. A data set is *partial* if some historical data has been written to it and there is still space available. A data set is *full* when there is not enough space for additional historical data to be written to it.

#### read/write

A data set is in *read* mode typically when it is allocated to the data store but is inactive. A data set is typically in *write* mode when it is the active data set.

#### reserved

A *reserved* data set is an empty data set that is the target data set when a switch occurs. There is usually one reserved data set for an application, but there could be more when PDS V2 starts for the first time. The

purpose of the reserved data set is so that the next switch is successful; if there are issues when allocating the data set, the problem can be addressed before the data set is needed, avoiding possible write failures.

## Differences between PDS V1 and PDS V2

Version 2 of the persistent data store (PDS V2) replaces the original persistent data store (PDS V1). This topic outlines some of the differences between PDS V1 and PDS V2.

PDS V2 provides enhancements for near-term history collection in the OMEGAMON® products. For example, PDS V2 uses significantly less 31-bit virtual storage and less CPU usage than PDS V1, and has resulted in improved performance. In addition, PDS V2 uses VSAM linear data sets, whereas PDS V1 uses BSAM data sets.

If the Tivoli Enterprise Monitoring Server or the Tivoli Enterprise Monitoring Agent is running on z/OS® 2.2 with APAR OA50569 or later, then PDS V2 is automatically used instead of the original PDS V1.

The following table summarizes differences between PDS V2 and the original PDS V1:

Characteristic	PDS V1	PDS V2
<b>Underlying data set type</b>	BSAM	VSAM Linear Data Sets (LDSs)
<b>Supported z/OS® version</b>	Any z/OS® version	Requires z/OS® 2.2 with APAR OA50569 or later
<b>How data sets are allocated</b>	The user runs a batch job.	The data sets are defined dynamically from within the monitoring server or the monitoring agent. For more information, see <a href="#">“About PDS V2 data sets and statuses” on page 1223</a> .
<b>Action when a data set is full</b>	Recording rolls over to the next data set. A batch job is generated automatically to allocate a new data set.	For space-based mode (ECR=NO), the switch to the next empty data set occurs when the current data set runs out of space. No extents are taken when the current data set is full. For time-based mode (ECR=YES), each LDS contains data for a single 24-hour period. When an LDS is full and cannot be extended, recording rolls over to the next data set and less than 24 hours of data may be present in the data set.
<b>Virtual storage usage</b>	Uses 31-bit virtual storage heavily	The monitoring server and the monitoring agent use 64-bit virtual storage above the bar.
<b>Data set name low-level qualifier</b>	For the monitoring server: RppSGRPn RPDSGRPn RGENHISn  For monitoring agents: RKppaaan  where: <ul style="list-style-type: none"> <li>pp is the two-character OMEGAMON product or component code</li> <li>aaa varies by product</li> <li>n is a sequential identifier number (0-9, A-Z)</li> </ul> See <a href="#">“PDS data set names” on page 1225</a> for more information.	Gppmnnnn, Hppmnnnn where: <ul style="list-style-type: none"> <li>pp is the two-character OMEGAMON product or component code</li> <li>m is the granularity level (0-4). This information is for internal use.</li> <li>nnnn is a sequential, rotating number (0-9, A-Z), or CONF for the configuration file</li> </ul> See <a href="#">“PDS data set names” on page 1225</a> for more information.

Characteristic	PDS V1	PDS V2
<b>Attribute groups</b>	The data written to the persistent data store is organized by tables (attribute groups), groups, and data sets. Each table is assigned to a group. Multiple tables can be assigned to each group, and each group can have one or more data sets assigned to it. By default, six data sets are assigned to a group.	Attribute groups are no longer organized into separate groups, and data sets are no longer assigned to groups. Instead, all attribute groups for an application are effectively in a single data store group.
<b>Extended address volume (EAV) support</b>	Does not support EAV	Supports EAV
<b>z/OS® data set encryption support</b>	Does not support z/OS® data set encryption	Supports z/OS® data set encryption
<b>Management and maintenance</b>	Manual process	Self-managed

## PDS V2 restrictions

This topic identifies some features that are not available in PDS V2.

Some features that are provided in PDS V1 are not available in PDS V2, as follows:

- Some PDS maintenance features available with PDS V1 do not apply or are not available with PDS V2. For example, you cannot extract persistent data store data to a flat file with PDS V2, as provided with the PDS V1 EXTRACT function.
- PDS V2 does not have an equivalent operator command for the PDS V1 KPDCMD **QUERY CONNECT** command.

## PDS data set names

This topic lists the data set names for both PDS V1 and PDS V2.

The naming conventions for the persistent data store (PDS) data sets are different between PDS V1 and PDS V2. The following tables provide the PDS V1 and PDS V2 file naming conventions for collections running in the Tivoli Enterprise Monitoring Server address space (see [“PDS data set names for the monitoring server” on page 1226](#)) and in the Tivoli Enterprise Monitoring Agent address space (see [“PDS data set names for monitoring agents” on page 1226](#)).

Table 113: PDS data set names for the monitoring server			
Product or component	Earliest version supports PDS V2	PDS V1 data set name	PDS V2 data set name
IBM Tivoli Monitoring on z/OS	6.3.0	<p>Data sets used for collection on the monitoring server:</p> <ul style="list-style-type: none"> <li>RppSGRPn</li> <li>RPDSGRPn</li> <li>RGENHISn</li> </ul> <p>where:</p> <ul style="list-style-type: none"> <li>pp is the two-character OMEGAMON product or component code</li> <li>n is a sequential identifier number (0-9, A-Z). The default values set by PARMGEN are 1-6.</li> </ul>	<p>Data sets used for collection on the monitoring server:</p> <ul style="list-style-type: none"> <li>Gppmnnnn (for monitoring agent collection running in the monitoring server address space)</li> <li>HPDmnnnn</li> </ul> <p>where:</p> <ul style="list-style-type: none"> <li>pp is the two-character OMEGAMON product or component code</li> <li>m is the granularity level (0-4). This information is for internal use.</li> <li>nnnn is a sequential, rotating number (0-9, A-Z), or CONF for the configuration file</li> </ul>

Table 114: PDS data set names for monitoring agents			
Product or component	Earliest version supports PDS V2	PDS V1 data set name	PDS V2 data set name
For reference: PDS data set naming conventions for monitoring agents		<p>Data sets used for collection in the monitoring agent address space:</p> <ul style="list-style-type: none"> <li>RKppaaan</li> </ul> <p>where:</p> <ul style="list-style-type: none"> <li>pp is the two-character OMEGAMON product or component code</li> <li>aaa varies by product</li> <li>n is a sequential identifier number (0-9, A-Z). The default values set by PARMGEN are 1-6.</li> </ul>	<p>Data sets used for collection in the monitoring agent address space:</p> <ul style="list-style-type: none"> <li>Hppmnnnn</li> </ul> <p>where:</p> <ul style="list-style-type: none"> <li>pp is the two-character OMEGAMON product or component code</li> <li>m is the granularity level (0-4). IBM Tivoli Composite Application Manager (ITCAM) for Application Diagnostics Agent	7.1.1	RKYNPDSn	HYNmnnnn

**Note:** After you have switched to PDS V2, PDS V1 data sets are no longer needed and can be deleted. For more information, see [“Removing PDS V1 data sets” on page 1237](#).

## PDS V2 activation

Review information about installing and activating PDS V2 for your historical collection.

PDS V2 is installed as part of OMNIMON Base V7.5.0. Additional maintenance is required for Configuration Manager, PARMGEN, and some individual OMEGAMON products.

**Note:** If you are setting up collection of your historical data for the first time, see [“PDS V2 for the first-time OMEGAMON user” on page 1235](#).

PDS V2 is fully activated by default. Unless steps are taken to postpone PDS V2 activation, all supported components will switch to PDS V2 when the runtime environment is refreshed.

If you are using PDS V1 and you need to delay your transition to PDS V2, you can [disable activation](#) and [enable it](#) when you are ready. If you have products in your environment that do not support PDS V2, you must disable PDS V2 activation for those products. You can implement an incremental rollout by activating PDS V2 for specific monitoring agents and then the monitoring server; it is recommended that the monitoring server be the last component activated for PDS V2.

**Warning:** When you switch from PDS V1 to PDS V2, near-term historical data that is in your PDS V1 is not migrated to PDS V2. It is possible that a day or two of data will be lost. You might consider the timing of your switch to PDS V2. For more information, see [“Considerations when switching from PDS V1 to PDS V2” on page 1235](#).

Activating the use of PDS V2 for historical collection occurs automatically after the initial startup of the monitoring server or monitoring agent after PDS V2 maintenance is applied.

**Important:** You can control the activation of PDS V2 for the monitoring server and each monitoring agent separately. Unless manual steps are taken to postpone PDS V2 activation, the switch from PDS V1 to PDS V2 occurs automatically.

If you currently use PDS V1 and choose to temporarily opt out of using PDS V2, see the following procedures:

- [“How to: Postpone PDS V2 activation” on page 1229](#)
- [“How to: Activate PDS V2” on page 1232](#)

Before proceeding, make sure to review [“Differences between PDS V1 and PDS V2” on page 1224](#).

**Warning:** You must opt out of PDS V2 activation before the initial startup of the monitoring server or monitoring agent. After switching to PDS V2, you cannot revert to PDS V1 without data loss.

## PDS V2 support

Review the earliest product versions that support PDS V2.

The following table provides the earliest version of the product or component that supports PDS V2.

<i>Table 115: Earliest product versions supporting PDS V2</i>	
Product or component	Earliest version that supports PDS V2
OMNIMON Base	7.5.0
IBM Tivoli Monitoring on z/OS	6.3.0
IBM Tivoli Management Server for Distributed Systems on z/OS	6.3.0
IBM Z® OMEGAMON® for CICS®	5.5.0
IBM OMEGAMON for Db2 Performance Expert	5.4.0
IBM OMEGAMON for IMS on z/OS	5.5.0
IBM Z OMEGAMON AI for JVM	5.5.0
IBM OMEGAMON for Messaging on z/OS	7.5.0
IBM Z OMEGAMON AI for Networks	5.5.0
IBM OMEGAMON for Storage on z/OS	5.5.0
IBM Z OMEGAMON AI for z/OS	5.5.0
IBM Z NetView Enterprise Management Agent	6.4.0
IBM Tivoli Advanced Allocation Management for z/OS	3.3.0
IBM Tivoli Advanced Audit for DFSMSshm	2.6.0
IBM Tivoli Advanced Backup and Recovery for z/OS	2.4.0
IBM Tivoli Advanced Catalog Management for z/OS	2.6.0
IBM Tivoli Advanced Reporting and Management for DFSMSshm	2.6.0
IBM Tivoli Automated Tape Allocation Manager for z/OS	3.3.0
IBM Tivoli Composite Application Manager (ITCAM) for Application Diagnostics Agent	7.1.1

## How to: Postpone PDS V2 activation

This topic describes how to disable PDS V2 activation. By disabling PDS V2 activation, you can postpone the use of PDS V2.

### Before you begin

This task applies to environments where historical data is collected using the original persistent data store, PDS V1.

If you have products in your environment that do not support PDS V2, you must postpone PDS V2 activation for those products. For more information about products that support PDS V2, see [“PDS data set names” on page 1225](#) and [“PDS V2 support” on page 1229](#).

**Warning:** When you switch from PDS V1 to PDS V2, near-term historical data that is in your PDS V1 is not migrated to PDS V2. It is possible that some data will be lost.

It is recommended that you review the appropriate topic:

- [“PDS V2 for the first-time OMEGAMON user” on page 1235](#)
- [“Considerations when switching from PDS V1 to PDS V2” on page 1235](#)

## About this task

With the application of the PDS V2 maintenance, PDS V2 is enabled by default for the monitoring server and the monitoring agents.

If you want to opt out of PDS V2 activation until you are ready to use it, or if you have products that do not support PDS V2, you must disable PDS V2 activation for the monitoring server or the respective monitoring agents by performing the following procedure before starting the monitoring server or monitoring agent.

**Warning:** You must opt out of PDS V2 activation for the monitoring server or a monitoring agent before the initial startup of the monitoring server or monitoring agent. After switching to PDS V2, you cannot revert to PDS V1 without data loss.

You can postpone PDS V2 activation for the monitoring server, all agents in the runtime environment (RTE), or for specific agents only, allowing for an incremental rollout of PDS V2.

**Note:** It is recommended that the monitoring server be the last component activated for PDS V2.

The following parameters control PDS V2 activation:

### **RTE\_PDS2\_ACTIVATION**

Controls PDS V2 support for the runtime environment.

If **RTE\_PDS2\_ACTIVATION** is set to Y, PDS V2 support is enabled for the runtime environment. By default, the monitoring server and all monitoring agents are activated to use PDS V2. You can control PDS V2 activation for a specific agent using the *Kpp\_PDS2\_ACTIVATION* parameter, and you can control PDS V2 activation for the monitoring server using the *KDS\_PDS2\_ACTIVATION* parameter.

If **RTE\_PDS2\_ACTIVATION** is set to N, PDS V2 activation is disabled for the runtime environment. In this case, parameters *Kpp\_PDS2\_ACTIVATION* and *KDS\_PDS2\_ACTIVATION* are ignored.

### **Kpp\_PDS2\_ACTIVATION**

Controls PDS V2 activation for a specific agent.

### **KDS\_PDS2\_ACTIVATION**

Controls PDS V2 activation for the monitoring server.

**Important:** For IBM OMEGAMON for Storage on z/OS, you cannot postpone PDS V2 activation. You must switch to the latest OMNIMON Base version of PDS V2. For more information, see [“Considerations for OMEGAMON for Storage users” on page 1236](#).

## Procedure

Postpone PDS V2 activation for either of the following scenarios:

- To postpone PDS V2 activation for the monitoring server and all agents in the runtime environment, disable PDS V2 globally for the runtime environment, as follows:
  - Using Configuration Manager:
    - a. Add **RTE\_PDS2\_ACTIVATION N** to `RTEDEF(rte_name)`.

- b. Run the **GENERATE** action.
  - c. Start the monitoring server or monitoring agent.
- Using PARMGEN:

**Note:** For details about performing each of the following steps, see [“Scenario SMPE03: Applying SMP/E maintenance with new configuration changes to an existing RTE and overriding the IBM-supplied configuration defaults” on page 823.](#)

- a. Edit the configuration profile, as follows:
    - a. From the **Workflow - Primary Option Menu**, select option 2, **Customize PARMGEN configuration profiles**.  
The **Customize PARMGEN Configuration Profile Members** (KCIP@PG6) panel is displayed.
    - b. Select option 1 to edit the RTE profile.
    - c. Set **RTE\_PDS2\_ACTIVATION** to N.
    - d. Save the changes and return to the **Workflow - Primary Options Menu** panel.
  - b. Regenerate the runtime members and jobs, as follows:
    - a. Select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** (KCIP@PR1) panel is displayed.
    - b. Select option 1 to submit the \$PARSE job (or the \$PARSESV job, if variables are enabled).
    - c. Return to the **Workflow - Primary Options Menu** panel.
  - c. Copy the runtime members from the work libraries to the production libraries, as follows:
    - a. Select **Submit batch jobs to complete PARMGEN setup** from the menu.  
The **Submit Batch Jobs To Complete PARMGEN Setup** (KCIP@SUB) panel is displayed.
    - b. Optional: Select option 11 and submit the KCIJPCPR job to back up the production libraries.
    - c. Select option 12 and submit the KCIJPW2R job (or the KCIJPW1R job) to copy the work libraries to the production libraries.
  - d. Start the monitoring server or monitoring agent.
- To postpone PDS V2 activation for the monitoring server or one or more specific agents, disable PDS V2 for the server or agent, as follows:
    - Using Configuration Manager:
      - a. Add **RTE\_PDS2\_ACTIVATION Y** to RTEDEF (*rte\_name*).
      - b. To postpone activation for the monitoring server, add **KDS\_PDS2\_ACTIVATION N** to RTEDEF (KDS\$PARM) or RTEDEF (KDS\$lpar).
      - c. For each agent for which to postpone activation, add the corresponding **Kpp\_PDS2\_ACTIVATION N** to RTEDEF (Kpp\$PARM) or RTEDEF (Kpp\$lpar).
      - d. Run the **GENERATE** action.
      - e. Start the monitoring server or monitoring agent.

The following messages appear in KCIPRINT and reflect the status of your PDS configuration:

```
KFJ00223I Global RTE PDS V1 setting is ON
KFJ00224I Global RTE PDS V2 setting is ON
```

- Using PARMGEN:

**Note:** For details about performing each of the following steps, see [“Scenario SMPE03: Applying SMP/E maintenance with new configuration changes to an existing RTE and overriding the IBM-supplied configuration defaults” on page 823.](#)

- a. Edit the configuration profile, as follows:
  - a. From the **Workflow - Primary Option Menu**, select option 2, **Customize PARMGEN configuration profiles**.  
The **Customize PARMGEN Configuration Profile Members (KCIP@PG6)** panel is displayed.
  - b. Select option 1 to edit the RTE profile.
  - c. Set **RTE\_PDS2\_ACTIVATION** to Y.
  - d. To postpone activation for the monitoring server, add parameter **KDS\_PDS2\_ACTIVATION** set to N.
  - e. For each agent for which to postpone activation, set the corresponding **Kpp\_PDS2\_ACTIVATION** value to N.
  - f. Save the changes and return to the **Workflow - Primary Options Menu** panel.
- b. Regenerate the runtime members and jobs, as follows:
  - a. Select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs (KCIP@PR1)** panel is displayed.
  - b. Select option 1 to submit the \$PARSE job (or the \$PARSESV job, if variables are enabled).
  - c. Return to the **Workflow - Primary Options Menu** panel.
- c. Copy the runtime members from the work libraries to the production libraries, as follows:
  - a. Select **Submit batch jobs to complete PARMGEN setup** from the menu.  
The **Submit Batch Jobs To Complete PARMGEN Setup (KCIP@SUB)** panel is displayed.
  - b. Optional: Select option 11 and submit the KCIJPCPR job to back up the production libraries.
  - c. Select option 12 and submit the KCIJPW2R job (or the KCIJPW1R job) to copy the work libraries to the production libraries.
- d. Start the monitoring server or monitoring agent.

## How to: Activate PDS V2

This topic describes how to activate PDS V2. By activating PDS V2, you can start using the latest version of persistent data store. After PDS V2 is activated for all components, PDS V1 is disabled.

### Before you begin

**Important:** By default, PDS V2 is activated for the runtime environment, the monitoring server, and all monitoring agents. If you have not manually postponed PDS V2 activation for the runtime environment, monitoring server, or any of the monitoring agents, no additional action is required.

This task applies to environments where historical data is collected using the original persistent data store, PDS V1. Use this task if you have manually postponed PDS V2 activation for the runtime environment, monitoring server, or any of the monitoring agents.

Review the following important information before you attempt to activate PDS V2:

- Review the content in [“PDS V2 activation” on page 1228.](#)

- If you have products in your environment that do not support PDS V2, do not attempt to activate PDS V2 for those products. You must continue to use PDS V1 for products that do not support PDS V2. For more information about products that support PDS V2, see [“PDS data set names” on page 1225](#) and [“PDS V2 support” on page 1229](#).
- When you switch from PDS V1 to PDS V2, near-term historical data that is in your PDS V1 is not migrated to PDS V2. It is possible that some data will be lost.
- You must use PARMGEN or Configuration Manager to properly configure PDS V2; do not attempt to manually update your runtime environment settings to activate PDS V2. If you have manually configured any settings in your runtime environment prior to activating PDS V2, these settings will be lost when you refresh your runtime environment using PARMGEN or Configuration Manager.

**Important:** If you have manually updated any settings without using PARMGEN or Configuration Manager, it is recommended that you reconcile any discrepancies before continuing. If you are using PARMGEN, see [“Rectifying your PARMGEN configuration” on page 516](#) for more information.

If you are using PARMGEN, review the following scenarios:

- [“Scenario SMPE02: Applying SMP/E maintenance with configuration changes to an existing RTE and using IBM-supplied configuration defaults for new features” on page 820](#)
- [“Scenario SMPE03: Applying SMP/E maintenance with new configuration changes to an existing RTE and overriding the IBM-supplied configuration defaults” on page 823](#)

**Note:** If you are using PARMGEN as your configuration tool, consider migrating to Configuration Manager, which provides a simplified configuration process. For more information, see [“Introduction to Configuration Manager” on page 215](#).

- It is recommended that you review the appropriate topic:
  - [“PDS V2 for the first-time OMEGAMON user” on page 1235](#)
  - [“Considerations when switching from PDS V1 to PDS V2” on page 1235](#)

## About this task

Activating the use of PDS V2 for historical collection is managed separately for the data collected on the monitoring server and data collected on monitoring agents. To use PDS V2 exclusively, PDS V2 must be activated for the runtime environment, all monitoring agents, and the monitoring server.

Although the use of PDS V2 is activated by default, activation for the runtime environment, the monitoring server, or one or more agents might have been [postponed](#).

The following parameters control PDS V2 activation:

### **RTE\_PDS2\_ACTIVATION**

Controls PDS V2 support for the runtime environment.

If **RTE\_PDS2\_ACTIVATION** is set to Y, PDS V2 support is enabled for the runtime environment. By default, the monitoring server and all monitoring agents are activated to use PDS V2. You can control PDS V2 activation for a specific agent using the **Kpp\_PDS2\_ACTIVATION** parameter, and you can control PDS V2 activation for the monitoring server using the **KDS\_PDS2\_ACTIVATION** parameter.

If **RTE\_PDS2\_ACTIVATION** is set to N, PDS V2 support is disabled for the runtime environment. In this case, parameters **Kpp\_PDS2\_ACTIVATION** and **KDS\_PDS2\_ACTIVATION** are ignored.

### **Kpp\_PDS2\_ACTIVATION**

Controls PDS V2 activation for a specific agent.

**Note:** If PDS V2 is activated for an agent, the PDS V1 data sets will not be allocated by default in the Configuration Manager **GENERATE** action or the respective PARMGEN allocation jobs.

## **KDS\_PDS2\_ACTIVATION**

Controls PDS V2 activation for the monitoring server.

**Important:** For PDS V2 to be activated for all components, all of these parameters (**RTE\_PDS2\_ACTIVATION**, **Kpp\_PDS2\_ACTIVATION**, and **KDS\_PDS2\_ACTIVATION**) must be set to Y. After PDS V2 is activated for all components, PDS V1 is disabled automatically, and the following message appears in RKLVLLOG:

```
KPQS237I KPQHINIT: PDS V2 IS RUNNING STAND-ALONE, PDS V1 IS DISABLED
```

With PDS V1 disabled, PDS V1 data sets are no longer used and can optionally be deleted. For more information, see [“Removing PDS V1 data sets” on page 1237](#).

Use the following procedure to activate the use of PDS V2 for monitoring agents or the monitoring server. It is recommended that the monitoring server be the last component activated for PDS V2.

### **Procedure**

Activate PDS V2 using one of the following methods:

- Using Configuration Manager:
  - a. In RTEDEF(*rte\_name*), add (or update, as appropriate) parameter **RTE\_PDS2\_ACTIVATION**, and set the value to Y. This will enable PDS V2 activation for the runtime environment.
  - b. If PDS V2 was previously deactivated for a supported monitoring agent, set the corresponding **Kpp\_PDS2\_ACTIVATION** value to Y in RTEDEF(*Kpp\$PARM*) or RTEDEF(*Kpp\$lpar*).
  - c. If PDS V2 was previously deactivated for the monitoring server, add parameter **KDS\_PDS2\_ACTIVATION** set to Y to RTEDEF(*KDS\$PARM*) or RTEDEF(*KDS\$lpar*).
  - d. Run the **GENERATE** action.  
The following messages appear in KCIPRINT and reflect the status of your PDS configuration:

```
KFJ00223I Global RTE PDS V1 setting is OFF  
KFJ00224I Global RTE PDS V2 setting is ON
```

- e. Start the monitoring server or monitoring agent.
- Using PARMGEN:

**Note:** For details about performing each of the following steps, see [“Scenario SMPE03: Applying SMP/E maintenance with new configuration changes to an existing RTE and overriding the IBM-supplied configuration defaults” on page 823](#).

- a. Edit the configuration profile, as follows:
  - a. From the **Workflow - Primary Option Menu**, select option 2, **Customize PARMGEN configuration profiles**.  
The **Customize PARMGEN Configuration Profile Members** (KCIP@PG6) panel is displayed.
  - b. Select option 1 to edit the RTE profile.
  - c. Set **RTE\_PDS2\_ACTIVATION** to Y, which will activate PDS V2 for the runtime environment.
  - d. If PDS V2 was previously deactivated for a supported monitoring agent, set the corresponding **Kpp\_PDS2\_ACTIVATION** value to Y.
  - e. If PDS V2 was previously deactivated for the monitoring server, add parameter **KDS\_PDS2\_ACTIVATION** set to Y.
  - f. Save the changes and return to the **Workflow - Primary Options Menu** panel.
- b. Regenerate the runtime members and jobs, as follows:
  - a. Select **Create the RTE members and jobs**.

- The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** (KCIP@PR1) panel is displayed.
- b. Select option 1 to submit the \$PARSE job (or the \$PARSESV job, if variables are enabled).
  - c. Return to the **Workflow - Primary Options Menu** panel.
  - c. Copy the runtime members from the work libraries to the production libraries, as follows:
    - a. Select **Submit batch jobs to complete PARMGEN setup** from the menu. The **Submit Batch Jobs To Complete PARMGEN Setup** (KCIP@SUB) panel is displayed.
    - b. Optional: Select option 11 and submit the KCIJPCPR job to back up the production libraries.
    - c. Select option 12 and submit the KCIJPW2R job (or the KCIJPW1R job) to copy the work libraries to the production libraries.
  - d. Start the monitoring server or monitoring agent.

## Result

If PDS V2 has been successfully activated for all components, PDS V1 is disabled automatically, and the following message appears in RKLVL0G:

```
KPQS237I KPQHINIT: PDS V2 IS RUNNING STAND-ALONE, PDS V1 IS DISABLED
```

With PDS V1 disabled, PDS V1 data sets are no longer used and can optionally be deleted. For more information, see [“Removing PDS V1 data sets” on page 1237](#).

**Important:** If you encounter problems when activating PDS V2 (such as receiving message [KPQS235E](#)), review your RKANPARU (KPQHINIT) member. If you have activated PDS V2 for all components, you should see the following settings:

```
PDSV1=OFF  
PDSV2=ON
```

If this is not the case, it is possible that you are attempting to use PDS V2 for a product that does not support PDS V2, or there is some other incorrect configuration. If not all of your products support PDS V2, you must continue to use PDS V1 for products that do not support PDS V2. To correct the problem, do not attempt to manually update this member. Instead, make sure that all of your products support PDS V2, and then use PARMGEN or Configuration Manager to configure PDS V2 again. If this does not resolve the problem, contact IBM® Software Support.

## PDS V2 for the first-time OMEGAMON user

Review this topic if you are a first-time OMEGAMON user.

PDS V2 is installed as part of OMNIMON Base V7.5.0. If you are setting up historical collection for your monitoring agents for the first time, you will only use PDS V2. PDS V2 is activated by default for the runtime environment, monitoring server, and the monitoring agents.

For PDS data set allocation settings, you can define the data set allocation parameters initially or simply use the default settings. For more information about supported customization, see [“PDS V2 parameters and members” on page 1238](#).

## Considerations when switching from PDS V1 to PDS V2

Review these considerations when switching from PDS V1 to PDS V2.

### Minimize data loss

**Warning:** When you switch to from PDS V1 to PDS V2, near-term historical data that is in your PDS V1 is not migrated to PDS V2. It is possible that a day or two of data will be lost.

When you switch to from PDS V1 to PDS V2, near-term historical data that is in your PDS V1 is not migrated to PDS V2. It is possible that a day or two of data will be lost. Because of this, consider the timing of your switch to PDS V2. For example, you could plan to switch to PDS V2 over the weekend so that your near-term data is available on Monday for the week.

### Initial configuration settings

With the application of the latest PDS V2 maintenance, PDS V2 is activated by default for the runtime environment, the monitoring server, and the monitoring agents. Unless manual steps are taken to postpone PDS V2 activation, all components will switch to PDS V2 when the runtime environment is refreshed.

The initial PDS V2 parameter values are taken from PDS V1 settings in your configuration, so you might want to review them:

#### RTE\_PDS2\_HILEV

If the value for this parameter does not match your current PDS V2 high-level qualifier, you will not be able to see old data and old data sets will no longer be used.

#### Kpp\_PDS2\_FILE\_COUNT

Adjust the value of this parameter to use 8 (eight); otherwise, the historical data storage capacity will be different from the one currently used.

#### Kpp\_PDS2\_STORE\_SIZE

Adjust this value according to your current settings, otherwise historical data storage capacity will be different from the current one.

If you want to make customizations, you need to change the PDS V2 parameters, as any change to PDS V1 parameters will not be honored after switching to PDS V2. If you need to customize PDS V2 parameters in Configuration Manager, you will need to add these parameters with the required values to the following members:

- For the monitoring agents: RTEDEF(Kpp\$PARM) or RTEDEF(Kpp\$lpar)
- For the monitoring server: RTEDEF(KDS\$PARM) or RTEDEF(KDS\$lpar)

Products that had two PDS V1 data stores will only have one consolidated PDS V2 data store with a size equal to the sum of the existing PDS V1 data stores (for example, KM5, KS3/KDF).

For more information about PDS V2 parameters, see [“PDS V2 parameters and members” on page 1238](#).

### Phased rollout

To do an incremental PDS V2 rollout, you would leave **RTE\_PDS2\_ACTIVATION** set to Y but set **Kpp\_PDS2\_ACTIVATION** to Y only for the specific agents you want to switch to PDS V2. For the agents that should remain using PDS V1, set the corresponding **Kpp\_PDS2\_ACTIVATION** parameter value to N.

PDS V2 for the monitoring server is also activated by default. It is recommended that the monitoring server be the last component switched to PDS V2. You can control PDS V2 activation for the monitoring server using the parameter **KDS\_PDS2\_ACTIVATION**.

**Important:** For IBM OMEGAMON for Storage on z/OS, you cannot postpone PDS V2 activation. You must switch to the latest OMNIMON Base version of PDS V2. For more information, see [“Considerations for OMEGAMON for Storage users” on page 1236](#).

If PDS V2 is enabled for an agent, the PDS V1 data sets will not be allocated by default in the Configuration Manager **GENERATE** action or the respective PARMGEN allocation jobs.

### Considerations for OMEGAMON for Storage users

For IBM OMEGAMON for Storage on z/OS, the IBM OMEGAMON for Storage internal version of PDS V2 and the use of PDS V1 are no longer available. IBM OMEGAMON for Storage users must use the OMNIMON Base version of PDS V2.

## After switching to PDS V2

- If you want to customize PDS V2, you need to change the PDS V2 parameters, as any PDS V1 parameters will not be honored after switching to PDS V2 (that is, the first Configuration Manager **GENERATE** run after the PTF installation or the first refresh of the PARMGEN work environment).
- After successfully switching to PDS V2 (including the monitoring server), you can remove all PDS V1 data sets. For more information, see [“Removing PDS V1 data sets” on page 1237](#).

**Note:** After successfully switching to PDS V2, the PDS V1 data sets will no longer be allocated by the Configuration Manager **GENERATE** action or in the respective PARMGEN allocation jobs.

## Removing PDS V1 data sets

This topic describes how to remove PDS V1 data sets after switching to PDS V2.

After a successful switch to PDS V2 (including the monitoring server), PDS V1 data sets are no longer needed and can be deleted.

A utility has been provided in TKANSAM (KFJMAINT) with action **DELPDSV1** to remove the PDS V1 data sets in a runtime environment. If you run this utility with CONFIRM N, it will only print the list of data sets to be deleted in the KCI PRINT DD. Specify CONFIRM Y to delete the data sets.

For a list of PDS V1 data set names, see [“PDS data set names” on page 1225](#).

## Configuring PDS V2

The information in this section describes how you can configure PDS V2, including data set management modes, PDS V2 activation, and data set allocation settings.

### Data set management modes

Review the data set management modes available for PDS V2.

When collecting historical data using PDS V2, you have the option to manage the data sets by space or by time. The specification of the mode depends on the Extent Constraint Removal (ECR) attribute of the SMS data class used when allocating the data sets.

#### Space-based (Extent Constraint Removal = NO)

The amount of historical data in each data set depends on the size of the data set. The number and size of the data sets allocated are defined using parameters *Kpp\_PDS2\_FILE\_COUNT* and *Kpp\_PDS2\_STORE\_SIZE*. These data sets are online at all times. All the allocated data sets except for one are used for writing data, while one data set remains empty for future switches. The switch to the next data set occurs when the current data set runs out of space; no extents are taken when the current data set is full.

To use this mode, allocate the data set using an SMS data class that has the Extent Constraint Removal (ECR) parameter set to a value of NO. The data class can be assigned using the SMS data class ACS routine.

**Note:** It is recommended that you periodically review the data set sizes and [change the size](#) to fit your needs.

#### Time-based (Extent Constraint Removal = YES)

Each data set contains 24 hours of historical data. The number and size of the data sets allocated are defined using parameters *Kpp\_PDS2\_FILE\_COUNT*, *Kpp\_PDS2\_STORE\_SIZE* and *Kpp\_PDS2\_SEC\_SIZE*. These data sets are online at all times. All the allocated data sets except for one are used for writing data, while one data set remains empty for future switches. The switch to the next data set occurs around local midnight.

When the current data set fills up and cannot be extended, recording rolls over to the next data set and less than 24 hours of data may be present in the data set. It is important that each PDS V2 data set be large enough to contain historical data for a full 24-hour period.

To use this mode, allocate the data set using an SMS data class that has the Extent Constraint Removal (ECR) parameter set to a value of YES. The data class can be assigned using the SMS data class ACS routine.

**Note:** With ECR=YES, it is possible that the data sets might grow significantly beyond their initial size. For this reason, it is recommended that time-based mode be used only when you need historical data for a fixed number of days.

For both time-based and space-based modes, a wraparound process is used to allocate and delete the data sets. When a switch occurs, the switch is made to the next empty data set. Then, in preparation for a future switch, the oldest data set is removed and replaced with a newly allocated, empty data set with the same name of the deleted data set. This process allows the opportunity to address problems that might occur when allocating the data set.

The number of PDS V2 data sets for historical data for a given agent at one time will never exceed the value defined in `Kpp_PDS2_FILE_COUNT`. In addition to the data sets for historical data, there is also a configuration data set that is allocated and online at all times for each agent.

## PDS V2 parameters and members

This topic lists the parameters and RKANPARU members related to persistent data store V2.

### PDS V2 parameters

Runtime environment, monitoring server, and agent-specific parameters can be used to control the activation of PDS V2 and to define PDS V2 data set allocation settings. These parameters are supported by Configuration Manager and PARMGEN.

#### Runtime environment (RTE)

The following runtime environment parameters control PDS V2 settings for an individual runtime environment and provide default settings for the OMEGAMON monitoring agents and the monitoring server configured in that environment. These parameters control whether PDS V2 is activated for the runtime environment and define default data set allocation settings.

- [RTE\\_PDS2\\_ACTIVATION](#)
- [RTE\\_PDS2\\_ALLOC\\_TYPE](#)
- [RTE\\_PDS2\\_HILEV](#)
- [RTE\\_PDS2\\_SMS\\_DATACLAS](#)
- [RTE\\_PDS2\\_SMS\\_MGMTCLAS](#)
- [RTE\\_PDS2\\_SMS\\_STORCLAS](#)
- [RTE\\_PDS2\\_VOLUME](#)

#### Monitoring server (KDS)

The following parameters provide PDS V2 settings for the Tivoli Enterprise Monitoring Server (monitoring server). These parameters control whether PDS V2 is activated for the monitoring server and define data set allocation settings.

- [KDS\\_PDS2\\_ACTIVATION](#)
- [KDS\\_PDS2\\_FILE\\_COUNT](#)
- [KDS\\_PDS2\\_SEC\\_SIZE](#)
- [KDS\\_PDS2\\_STORE\\_SIZE](#)
- [KDS\\_PDS2\\_VOLUME](#)

#### Monitoring agents (Kpp)

The following parameters provide agent-specific settings for PDS V2. These parameters control whether PDS V2 is activated for the agent and define data set allocation settings.

- [Kpp\\_PDS2\\_ACTIVATION](#)
- [Kpp\\_PDS2\\_FILE\\_COUNT](#)
- [Kpp\\_PDS2\\_SEC\\_SIZE](#)
- [Kpp\\_PDS2\\_STORE\\_SIZE](#)
- [Kpp\\_PDS2\\_VOLUME](#)

**Note:** The data set management mode (whether to manage the data sets by space or by time) depends on the Extent Constraint Removal (ECR) attribute of the SMS data class used when allocating the data sets. For more information, see [“Data set management modes” on page 1237](#).

## PDS V2 members

PDS V2 uses the following members in *&rhilev*.RKANPARU.

**Important:** These members are generated by Configuration Manager or PARMGEN and should not be modified manually as they would be overwritten by the next **GENERATE** or **\$PARSE** run.

### KPQHINIT

Runtime environment settings for PDS V2 parameters, like the high-level qualifier for the data sets allocated by PDS V2 (for example, **RTE\_PDS2\_HILEV**)

### KPDKPQIN

Member for the Tivoli Enterprise Monitoring Server (*monitoring server*) that allows you to tailor parameters like PDS V2 file counts (for example, **KDS\_PDS2\_FILE\_COUNT**).

### KppKPQIN

Agent-specific member (for example, **KD5KPQIN** for OMEGAMON for Db2), that allows you to tailor agent-specific parameters like PDS V2 file counts (for example, **Kpp\_PDS2\_FILE\_COUNT**).

## How to: Use encryption for your PDS V2 data sets

Learn how to use z/OS® data set encryption for your PDS V2 data sets.

### Before you begin

Use of z/OS data set encryption for your PDS V2 data sets requires z/OS 2.2 with APAR OA50569 or later.

**Attention:** PTF UJ08510 for APAR OA62995 introduces support for z/OS® data set encryption for PDS V2. With the installation of PTF UJ08510, PDS V2 in general (regardless of the use of z/OS data set encryption) also requires z/OS 2.2 with OA50569 or later. After PTF UJ08510 is installed, if your system is not running z/OS 2.2 with OA50569 or later and you attempt to start the monitoring server or monitoring agent, PDS V2 initialization will fail and history data will be lost.

**Note:** The OMEGAMON® persistent data store V2 (PDS V2) component does not perform any encryption or decryption of data. All encryption and decryption of data is done by z/OS. For more information, see [z/OS® data set encryption](#).

## About this task

You can protect your sensitive historical data by using encrypted data sets for PDS V2. In general, to create an encrypted data set, a key label must be assigned to the data set when it is newly allocated. For PDS V2, the data sets are allocated automatically from within the monitoring server or monitoring agent by using the SMS data class that is specified in parameter **RTE\_PDS2\_SMS\_DATACLAS**.

To use encryption for PDS V2, choose an SMS data class that has a key label (KEYLABEL) in its definition, and specify this class name in the **RTE\_PDS2\_SMS\_DATACLAS** parameter.

After the monitoring server or monitoring agent is recycled, it will allocate new PDS V2 data sets if they do not exist and make them encrypted. If the PDS V2 data sets already exist, the monitoring server or monitoring agent will gradually make them encrypted, one by one (that is, one data set for each subsequent data set switch). Each time a data set switch occurs and a new reserved data set is allocated, the newly allocated data set will be created as encrypted.

## Procedure

1. Create an SMS data class that contains a key label (KEYLABEL). You can do this using the **Data Set Key Label** field on the **ISMF DEFINE/ALTER** panel.  
For more information, see *Create an encrypted data set* in [Setting up z/OS data set encryption](#).
2. Update your PDS V2 configuration, as follows:
  - Using PARMGEN: Set the **RTE\_PDS2\_SMS\_DATACLAS** parameter value to an SMS data class that contains a key label (as defined in step 1), and then run \$PARSE.
  - Using Configuration Manager: Set the **RTE\_PDS2\_SMS\_DATACLAS** parameter value to an SMS data class that contains a key label (as defined in step 1), and then run the **GENERATE** action.
3. Recycle the monitoring server or monitoring agent started task.

## How to: Change PDS V2 file count, size, and location

After you have been collecting and displaying historical data for a while, you might find that you need to adjust the amount of data that you store. To change the amount of data, you adjust the number and size of files used by PDS V2. You can also change the volume where the data sets are allocated.

## Before you begin

Initially, you should accept the default number of cylinders (or megabytes) provided by each product (*Kpp\_PDS2\_STORE\_SIZE*, *Kpp\_PDS2\_SEC\_SIZE*).

Eventually, you can determine the correct amount of space by observing the activity, as follows:

- For [space-based mode](#), how often the data set switch occurs.
- For [time-based mode](#), the usage of the primary extent (if a secondary extent is not taken) or how many secondary extents are taken for the data sets.

Using this information, you can adjust the space accordingly.

**Note:** This task describes how to modify the data sets for the monitoring agents using *Kpp\_PDS2\_\** parameters. You can also make these changes for the runtime environment (using *RTE\_PDS2\_\** parameters) and for the monitoring server (using *KDS\_PDS2\_\** parameters).

## About this task

You can modify persistent data store data sets as follows:

- To increase or decrease the file count, edit the *Kpp\_PDS2\_FILE\_COUNT* parameter. The default value of *Kpp\_PDS2\_FILE\_COUNT* is 6, with a range of permissible values from 2 to 36.
- To change the size of the data sets, edit the *Kpp\_PDS2\_STORE\_SIZE* parameter (and optionally the *Kpp\_PDS2\_SEC\_SIZE* parameter). The default value of *Kpp\_PDS2\_STORE\_SIZE* is different for different agents. (The *Kpp\_PDS2\_SEC\_SIZE* parameter does not have a default value.)
- To change the volume where the data sets are allocated, edit the *Kpp\_PDS2\_VOLUME* parameter. If a value is not specified, parameter *Kpp\_PDS2\_VOLUME* uses the value from parameter *RTE\_PDS2\_VOLUME*.

**Note:** When allocating data sets, PDS V2 passes the `Kpp_PDS2_VOLUME` parameter value as the **VOLUMES** parameter in the z/OS IDCAMS utility **DEFINE CLUSTER** command. For SMS-managed data sets, the volume specified might not be used. For more information, see [SMS volume selection for data set allocation](#).

The configuration changes take effect after the monitoring server or monitoring agent is recycled. After the monitoring server or monitoring agent is recycled, it allocates new PDS V2 data sets if they do not exist, with the updated sizing and volume specifications. If the PDS V2 data sets exist, the monitoring server or monitoring agent will gradually make the updates, one by one (that is, one data set per each subsequent data set switch). Each time a data set switch occurs and a new reserved data set is allocated, the newly allocated data set will follow the new sizing and volume specifications.

## Procedure

Use either of the following methods:

- Using PARMGEN:
  - a. In the RTE configuration profile, edit any of the following parameters:
    - `Kpp_PDS2_FILE_COUNT` to specify the number of files
    - `Kpp_PDS2_STORE_SIZE` to change the primary allocation size of each file
    - `Kpp_PDS2_SEC_SIZE` to change the secondary allocation size of each file
    - `Kpp_PDS2_VOLUME` to change the volume where the data sets are allocated
  - b. Submit the \$PARSE job to refresh the profile.

Recycle the monitoring server or monitoring agent started task for the configuration changes to take effect.

- Using Configuration Manager:
  - a. In RTEDEF(`Kpp$PARM`) or RTEDEF(`Kpp$lpar`), update any of the following parameters:
    - `Kpp_PDS2_FILE_COUNT` to specify the number of files
    - `Kpp_PDS2_STORE_SIZE` to change the primary allocation size of each file
    - `Kpp_PDS2_SEC_SIZE` to change the secondary allocation size of each file
    - `Kpp_PDS2_VOLUME` to change the volume where the data sets are allocated
  - b. Run the **GENERATE** action.

Recycle the monitoring server or monitoring agent started task for the configuration changes to take effect.

## Changing the default value for short-term history

This topic explains how to retrieve more than 24 hours of data from short-term history in the Tivoli Enterprise Portal.

By default, in the Tivoli Enterprise Portal, historical data from the previous 24 hours is retrieved from the persistent data store, and historical data from earlier time periods is retrieved from Tivoli Data Warehouse. With PDS V2, depending on your configuration, OMEGAMON can keep more than 24 hours of history that you can display as short-term history in the Tivoli Enterprise Portal.

To retrieve more than 24 hours from short-term history in the Tivoli Enterprise Portal, you can modify the value of the Tivoli Enterprise Portal Server environment variable `KFW_REPORT_TERM_BREAK_POINT`. The value of this variable is specified in seconds. The default value is 86400 (the number of seconds in a 24-hour period). For example, to retrieve seven days of data from the persistent data store, use the following setting:

```
KFW_REPORT_TERM_BREAK_POINT=604800
```

This change needs to be made in the Tivoli Enterprise Portal Server `cq.config` and `cq.ini` files.

**Important:** To avoid excessive response times and exceeding limits on the numbers of rows returned, it is recommended that you follow these guidelines when using the time span feature in the Tivoli Enterprise Portal:

- Request a time range that is specific and small (for example a two-hour period), even when querying data older than 24 hours.
- Avoid requesting a large time frame of data to be returned on the Tivoli Enterprise Portal workspace.

## Monitoring PDS V2 activity

Monitor PDS V2 activity by reviewing related messages in the log.

Messages related to persistent data store activity begin with the KPQ prefix and are written to your monitoring server or monitoring agent RKLVLOG. It is recommended that you review these messages.

For example:

```
KPQH003I KPQSPINI: MODULE STARTED, BUILD NUMBER IS build_number
KPQH016I KPQHSMGR: PERFORMING [OUT-OF-SPACE | SCHEDULED] DATASET SWITCH FOR application
KPQH017I KPQHSMGR: SWITCH SUCCESSFUL FOR application, WRITING TO data_set_name
```

For the complete list of messages, see [KPQ messages](#).

## Displaying PDS V2 data set information

Use the **QUERY DATASTORE** command to display information about data sets known to the PDS V2 engine for a particular product.

**Important:** The content in this section was created for and applies to persistent data store V2 (PDS V2).

To display PDS V2 data set information, enter the following **MODIFY** command:

```
F stcname,KPQ QUERY DATASTORE APPL=application
```

where:

- *stcname* is the started task name of the address space where the persistent data store is running.
- *application* is the code of the component (for example, KC5 for OMEGAMON for CICS).

The command output is written to RKLVLOG. To review the output, locate messages KLVOP191 and KPQH043I.

For each data set, the total number of allocated bytes, the number of used bytes, and the status are displayed. For information about possible statuses of the PDS V2 data sets, see [“About PDS V2 data sets and statuses” on page 1223](#).

**Tip:** If there is a delay when writing records to RKLVLOG, you can use the following command to see the output immediately: F *stcname*,FLUSH RKLVLOG

### Example

Command entered:

```
F TEMSSTC,KPQ QUERY DATASTORE APPL=KM5
```

Sample output:

```

KLVOP191      'KPQ QUERY DATASTORE APPL=KM5'
KPQH043I KPQHSMGR: DATASTORE INFORMATION:
-----
DSN
-----
App1      Allocated      Used
Name      Bytes            Bytes      Status
-----
TDUSER.TS1234.PDSPRSB1.HM520001      KM5      107642880      107619936      Partial      Read
TDUSER.TS1234.PDSPRSB1.HM520002      KM5      107642880      107611380      Partial      Read

```

### Switching the active data set

Use the **SWITCH** command to switch the recording data set for the persistent data store to the next available data set.

**Important:** The content in this section was created for and applies to persistent data store V2 (PDS V2).

To switch the currently active data set to the next available data set, enter the following **MODIFY** command:

```
F stcname,KPQ SWITCH APPL=application
```

where:

- *stcname* is the started task name of the address space where the persistent data store is running.
- *application* is the code of the component (for example, KC5 for OMEGAMON for CICS).

The command output is written to RKLVLLOG. After the switch occurs, details about the status of each data set in the persistent data store is also written to the log. To review this information, locate messages KLVOP191, KPQH017I, KPQH021I, and KPQH022I.

**Tip:** You can review the status of each data set in the persistent data store at any time using the **QUERY DATASTORE** command. For more information, see [“Displaying PDS V2 data set information” on page 1242](#).

**Tip:** If there is a delay when writing records to RKLVLLOG, you can use the following command to see the output immediately:

```
F stcname,FLUSH RKLVLLOG
```

### Example

Command entered:

```
F TEMSSTC,KPQ SWITCH APPL=application
```

Sample output:

```

KLVOP191      'KPQ SWITCH APPL=KM5'
KPQH017I KPQHSMGR: SWITCH SUCCESSFUL FOR KM5, WRITING TO TDUSER.TS1234.PDSPRSB1.HM520007

```

## Using tracing for PDS V2

Under the guidance of IBM® Software Support, you can use a tracing facility specific to PDS V2 events to display detailed diagnostic messages in the log.

You can use either of the following methods to trace PDS V2 events:

- [“Tracing by editing RKANPARU\(KPQHINIT\)” on page 1244](#)
- [“Tracing using the MODIFY command” on page 1244](#)

### Tracing by editing RKANPARU(KPQHINIT)

Use this procedure to set up tracing for PDS V2 events by editing the RKANPARU(KPQHINIT) member.

#### About this task

With this method, tracing takes effect at startup.

**Note:** It is recommended that you use the PDS V2 tracing facility only under the guidance of IBM® Software Support.

### Procedure

1. Edit member RKANPARU(KPQHINIT) and add the following record:

```
DEBUG=trace_level
```

Where *trace\_level* specifies the area or component to trace, as follows:

#### HST1

PDS V2 level 1

#### HST2

PDS V2 level 2

#### MTLI

MTLI - Metal C components

#### PDSH

PDS V2 hook

2. Optional: For multiple traces, specify multiple control cards.
3. Review the trace content in the log.

### Tracing using the MODIFY command

Use this procedure to trace PDS V2 events using the standard z/OS® MODIFY interface.

#### About this task

With this method, tracing is dynamic and can be turned on and off as needed.

**Note:** It is recommended that you use the PDS V2 tracing facility only under the guidance of IBM® Software Support.

## Procedure

1. Use the following command in the MODIFY interface:

```
F stcname,PQDBUG [START|ON] | [STOP|OFF] trace_level
```

Where

***stcname***

Is the started task name of address space where the persistent data store is running.

**START|ON**

Specifies to start debug tracing.

**STOP|OFF**

Specifies to stop debug tracing.

***trace\_level***

Specifies the area or component to trace, as follows:

**HST1**

PDS V2 level 1

**HST2**

PDS V2 level 2

**MTLI**

MTLI - Metal C components

**PDSH**

PDS V2 hook

2. Review the trace content in the log.

## Variables in PARMGEN configuration

Using variables in parameter definitions allows systems to share those definitions but retain unique values for the parameters. A variable acts as a placeholder. Each system that shares the definition replaces the variable with a unique value during product initialization. Most of parameters in the RTE configuration profile can be customized to use variables as values.

If you use symbolic values, configured components and products inherit the values of the system on which they are started (the host z/OS® system). Started tasks contain a preprocessing step that resolves all variable specifications in the product parameter members. These system-specific values are then automatically loaded into temporary data sets that exist only while the component runs. The result is that the software runs correctly by using the system-specific parameter values for the host z/OS® system.

Using variables helps you avoid many disruptive reconfiguration tasks if configuration values change. Using variables, you can also configure runtime environments on one LPAR that are intended to run on other LPARs.

Because variables are resolved at startup, you can share procedures and VTAM® elements across runtime environments. User-defined variables allow for the flexibility of not having to reconfigure the runtime environment when values change.

Support for variables must be enabled by setting the **RTE\_SYSV\_SYSVAR\_FLAG** parameter in the LPAR's WCONFIG(%RTE\_NAME%) configuration profile to Y. Variables cannot be used in the runtime environment of a high-availability hub monitoring server.

## Types of variables supported

Parameter Generator (PARMGEN) configuration supports three types of variables: system variables, KCIPARSE extracted variables, and user-defined variables.

- Typical static system variables

Typical static system variables are those defined in SYS1.IPLPARM, such as &SYSNAME and &SYSCLONE. You can use these variables as parameter values in the configuration profile so long as you specify their values using the following syntax:

```
& || VARNAME || .
```

For example, to use a static variable such as &SYSNAME for the RTE\_NAME parameter, specify &SYSNAME . , as shown in the following example:

```
000002 ** =====
000003 ** PARMGEN CONFIG Parameter   PARMGEN CONFIG Value
000004 ** =====
000005 RTE_NAME                       "&SYSNAME . "
```

- KCIPARSE-extracted variables

The PARMGEN process has built-in application program interfaces (APIs) to extract system-related information such as IP network address, IP address, VTAM network ID, and so forth. Review and submit the \$PARSEDV job to get a list of variables that you can use as PARMGEN configuration values.

For example, to use a KCIPARSE-extracted variable such as &SYSIPHOSTNAME for the RTE\_TCP\_HOST parameter, specify &SYSIPHOSTNAME . , as shown in the following example:

```
000012 ** =====
000013 ** PARMGEN CONFIG Parameter   PARMGEN CONFIG Value
000014 ** =====
000015 RTE_TCP_HOST                   "&SYSIPHOSTNAME . "
```

See the z/OS *MVS™ Initialization and Tuning Reference (SA22-7592)* for basic information on system variables.

- User-defined variables

You may reference any variables that your site defines as long as the PARMGEN configuration profile parameter value is not used as any PROC symbol in a started task.

For example, to use a generic user variable such as &HUB\_HOST. for the KDS\_HUB\_TCP\_HOST parameter, specify &HUB\_HOST . , as shown in the following example:

```
000021 KDS$      BEGIN *-- TIVOLI ENTERPRISE MONITORING SERVER
000022 ** =====
000023 ** PARMGEN CONFIG Parameter   PARMGEN CONFIG Value
000024 ** =====
000025 KDS_HUB_TCP_HOST             "&HUB_HOST . "
```

The \$PARSEDV job generates a \$SYSVAR1 output member and stores it in the WCONFIG library. The \$SYSVAR1 report provides a listing of the three types of symbols autodiscovered by PARMGEN processing. When executing any KCIPARSE job, (the KCIJPCFG, KCIJPUP1, and \$PARSE\* jobs, for example), review the SYSVROUT DDNAME output for a full listing.

## Runtime parts in variables mode

If variables support is enabled in a runtime environment, a number of elements are involved during runtime processing.

### Runtime members

When the \$PARSESV job creates the runtime members and KCIJV\* and KCIJP\* jobs in the runtime environment's WK\* work libraries, the runtime members are created with a reference to the variables, where applicable.

### KCIJV\* PARMGEN jobs

After the \$PARSESV job creates the runtime members and KCIJV\* and KCIJP\* jobs in the runtime environment's WK\* work libraries, the KCIJV\* jobs are ready for submission.

For example, the KCIJPALO RTE Build/Allocation job has an equivalent KCIJVALO job, which simply submits KCIJPALO after a KCIPARSE step is performed between KCIJPALO submissions. This processing is required because references in the KCIJPALO job may be using variables that need to be resolved before submitting the subsequent job. Otherwise, if variables are used for the RTE\_HILEV or RTE\_NAME parameters, the job will encounter a JCL error as these parameter values are used directly in the KCIJP\* jobs. Thus, a preprocessor job that resolves all variables the job may contain is needed. The KCIJVALO equivalent job performs the variables substitution prior to submitting the processed KCIJPALO from a temporary dataset to the internal reader.

### Product started tasks

The \$PARSESV job generates the product started tasks in the WKANSAMU library with additional imbeds added to a typical product started task:

- The KCIPARSE step imbed performs the variables substitution step.
- The RKANPAR/RKANCMD DDNAME imbed concatenates either the physical runtime libraries (*x*KANCMDU, *x*KANPARU) when the runtime environment is not in variables mode, or the temporary libraries where the KCIPARSE step has resolved the variables referenced in the physical runtime libraries.
- The RKPDIIN DDNAME imbed concatenates either the physical *x*KANPARU Persistent Data Store command files (*Kpp*PG, *Kpp*PCTL) when the runtime environment is not in variables mode or the temporary libraries where the Persistent Data Store command files (*Kpp*PG, *Kpp*PCTL) have been processed for symbolics.

### Post-KCIPARSE processing in the running started task

The RKLVLG DDNAME of the started task gets passed the resolved values of the variables specified, whether this is a typical static variable, a KCIPARSE-extracted variable, or a user-defined variable.

## Parameters eligible to use variables

Only a subset of parameters support variables as their parameter values.

Only the following PARMGEN profile parameters support variables as their parameter values. These parameter values are referenced in the started task PROC variables:

#### RTE\_NAME

Used as the STC PROC SYS=*symbol* parameter.

#### RTE\_HILEV

Used as the STC PROC RHILEV=*symbol* parameter.

#### RTE\_VSAM\_HILEV

Used as the STC PROC RVHILEV=*symbol* parameter.

#### RTE\_X\_HILEV\_SHARING

Used as part of the STC PROC BASEHLEV=*symbol* parameter.

#### RTE\_SHARE

Used as part of the STC PROC BASEHLEV=*symbol* parameter.

Any PARMGEN profile parameters that have VTAM® APPLIDs (*Kpp*\_\*\_VTAM\_APPL\_\*) are applicable to &stc\_prefix.M2RC and &stc\_prefix.TOM, as well as the STC PROC APPL=*symbol* parameter.

**Note:** Use caution when specifying user-defined variables (as opposed to static variables) for any of these configuration profile parameters. JCL rules that govern the use of system variables state that most system variables cannot be used in batch JCL. In started-task procedures, you will generate a startup JCL error if you issue the /START &stc command, as user variables referenced as part of the STC PROC statement are not recognized by the system. (Static variables like &SYSNAME. or &SYSCON. are defined system-wide).

There are ways to get around this JCL rule by overriding the value of these variables using the startup command or by using the PARMGEN sample composite STC startup member (IBMAPF, by default) and then defining your own PROC symbol overrides. For VTAM\_APPL-related parameters, there are no

exceptions; these *must not* use user-defined variables, as both the started tasks and the VTAM® major node members will not work.

## Parameters ineligible to use variables

Several parameters in the LPAR configuration profile currently do not support variables or should not be used with variable values due to either products' architecture requirements or z/OS® rules governing variables. System variables may be used in started task JCL (for both jobs and procedures) and in TSO logon procedures, but most may not be used in a batch JCL.

There are ways to get around this JCL rule by overriding the value of these variables using the startup command or by using the PARMGEN sample composite STC startup member (IBMAPF, by default) and then defining your own PROC variable overrides. For VTAM\_APPL-related parameters, there are no exceptions; both the started tasks and the VTAM® major node members will get JCL errors at startup if variables are used.

- Common parameters (RTE\_\*) not eligible to specify a variable value on the PARMGEN panels or RTE configuration profile:

### **RTE\_SMS\_\***

Any variation of the VOLUME, UNIT, STORCLAS, and MGMTCLAS parameters.

### **RTE\_STC\_PREFIX**

Global runtime environment product started task prefix. (See [“Post-configuration steps for variables in started tasks” on page 1249](#) if you choose to use variables for this parameter).

### **RTE\_NAMESV**

For use in the KCIJV\* jobs in WKANSAMU when system variables mode is enabled (RTE\_SYSV\_SYSVAR\_FLAG=Y).

### **RTE\_PLIB\_HILEV**

High level qualifier for the PARMGEN work library specified on the “Parameter Generator (PARMGEN) Workflow” panel (KCIP@PGO).

- Product-specific parameters not eligible to specify a variable value in the LPAR profile:

### **Kpp\_\*\_STC**

Any variation of the product started task prefixes. (See [“Post-configuration steps for variables in started tasks” on page 1249](#) if you choose to use variables for these parameters).

### **OMEGAMON® for CICS®**

KC2\_CCnn\_CLASSIC\_STC  
KC2\_CCnn\_CUA\_STC

### **OMEGAMON® AI for Db2**

KD2\_DBnn\_DB2\_SSID  
KD2\_DBnn\_DB2\_PROFID  
KD2\_PFnn\_PROFID  
KD2\_CLASSIC\_DB2ID\_DEFAULT

### **OMEGAMON® for IMS™ on z/OS®**

KI2\_I1nn\_CLASSIC\_STC  
KI2\_I1nn\_CLASSIC\_MPREFIX

**Note:** Use caution when specifying user-defined variables (as opposed to static variables) for any of these configuration profile parameters. JCL rules that govern the use of system variables state that most system variables cannot be used in batch JCL. In started-task procedures, you will generate a startup JCL error if you issue the /START &stc command, as user variables (&OMXESYM., for example) referenced as part of the STC PROC statement are not recognized by the system.

## Post-configuration steps for variables in started tasks

There are MVS restrictions on starting up STC procedures when variables are used. If you use variables for the RTE\_STC\_PREFIX parameter or any of the product-specific Kpp\_\*\_STC parameters, you must customize the started tasks outside the configuration software.

RTE\_STC\_PREFIX and \*\_STC-related parameter values are referenced inside PARMGEN-created product started tasks in the runtime environment's WKANSAMU library. The started task names are referenced in the started task members in two places as shown in the following Tivoli Enterprise Monitoring Server started task example.

“Symbolic parameter values in LPAR profile” on page 1249 shows the LPAR profile for a sharing-with-base runtime environment named PLB1SYSG.

Displays parameters, symbolic values, and resolved values for LPAR profile

Table 116: Symbolic parameter values in LPAR profile		
Parameter in WCONFIG(PLB3SYSG)	Symbolic Value	Resolved Value (system or user defined)
RTE_NAME	PLB&LEV.&SYSNAME.	PLB1SYSG
RTE_STC_PREFIX	TSS&SYSALVL.	TSS1
RTE_HILEV	&RHILEV.	TSTEST.LPAR
RTE_VSAM_HILEV	&RVHILEV.	TSTEST.LPAR
RTE_X_HILEV_SHARING	&BASEHLQ.	TSTEST
RTE_SHARE	BASE&SYSALVL.	BASE1

“User-defined symbol in system variable member” on page 1249 shows the user-defined symbol in the variable configuration profile member PLB3SYSG in %GBL\_USER\_JCL%.

Displays user-defined variable in the system variables member and resolved value at startup

Table 117: User-defined symbol in system variable member	
User-defined symbol	Resolved value at STC startup
LEV	1

The \$PARSESV and KCIJVUPV jobs use the variable values in the started task for the monitoring server as shown in the following example:

```

PROC section:
000045 //TSS&SYSALVL.DSST PROC RGN=0M,TIM=1440,
000046 //          SYS=PLB&LEV.&SYSNAME.,
000047 //          RHILEV=&RHILEV.,
000048 //          BASEHLEV=&BASEHLQ.&SYSALVL..R,
000049 //          USERCMDU=&RHILEV..PLB&LEV.&SYSNAME..RKANCMDU,
000050 //          USERPARU=&RHILEV..PLB&LEV.&SYSNAME..RKANPARU,
000051 //          USERSAMU=&RHILEV..PLB&LEV.&SYSNAME..RKANSAMU,
000052 //          DOUT=X,          DEBUGGING OUTPUT CLASS
000054 //          RVHILEV=&RVHILEV.,
000055 //          STARTUP=KDSSYSIN

EXEC section:
000155 //TSS&SYSALVL.DSST EXEC PGM=KLV,REGION=&RGN,TIME=&TIM
000156 //STEPLIB DD DISP=SHR,
000157 //          DSN=&RHILEV..&SYS..RKANMODU
000158 //          DD DISP=SHR,
000159 //          DSN=&BASEHLEV.KANMODL
000160 //          DD DISP=SHR,
000161 //          DSN=&BASEHLEV.KANMOD

```

When the \$PARSESV and KCIJVUPV jobs build the STCs and VTAM major nodes in the environment's WKANSAMU library, PARMGEN system variables processing retains the variables inside the STC and VTAM members. Retaining the variables makes the procedures and nodes shareable: they can be started on any LPAR without change. However, the reference to “//TSS&SYSALVL.DSST” on lines #45 and #155 in the preceding example started task does not work with MVS startup rules. MVS rules require these to be static values.

The workaround for this limitation is to change the two references to static values after PARMGEN copies the started tasks from WKANSAMU to the system procedure library (GBL\_DSN\_SYS1\_PROCLIB value you supplied in WCONFIG profiles), by using the PARMGEN KCIJPSYS job. The following example shows a sample edit with the variable values changed to static values:

```

EDIT      SYS1.PROCLIB(TSS1DSST)
Command ==>
PROC section:
000045 //TSS1DSST PROC RGN=0M,TIM=1440,
EXEC section:
000155 //TSS1DSST EXEC PGM=KLV,REGION=&RGN,TIME=&TIM

```

## Use of variables with jobcards

Variables such as %SYSJOBNAME% and %SYSTEMEMBER% extracted by the KCIIPARSE program are generated for reference only. For the KCIJPCFG job, these variables are intentionally not resolved, as the KCIJPCFG job must copy the resulting \$JOB CARD member from the GBL\_USER\_JCL library to WCONFIG. The variables must be preserved, so jobs run after the initial KCIJPCFG job can take advantage of the resolved values.

The following example shows the default jobcard in the %GBL\_TARGET\_HILEV%.TKANSAM library:

```

//*&userid.A JOB (ACCT),'%SYSTEMEMBER% - NAME',CLASS=A,
//* MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=,REGION=0M
//** RTE_NAME=%RTE_NAME%
//** SYSJOBNAME=%SYSJOBNAME% SYSTEMEMBER=%SYSTEMEMBER%
//* Begin - Sample Jobcard: -----
//* *****
//* Primary Source: TKANSAM(KCI$JCRD) User Copy: WCONFIG($JOB CARD)
//* Execute JOB CARD macro and/or customize the sample above.
//* Notes: 1. The jobcard statements above are commented out by default.
//*        2. REGION=0M is recommended.
//*        3. SYSJOBNAME/SYSTEMEMBER values are generated for reference.
//*           For the first job (KCIJPCFG), these symbolics are not
//*           resolved on purpose. See KCIJPCFG help panel for more
//*           information.
//*        4. RTE_NAME value is generated for reference.
//* *****
//* End - Sample Jobcard: -----

```

In the file-tailored KCIJPUP1 job, generated by the KCIJPUP1 job, the jobcard is generated as follows (based on the IBM-supplied jobcard):

```

//&userid.A JOB (ACCT),'KCIJPUP1 - NAME',CLASS=A,
// MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M
//* RTE_NAME=TESTSP23
//* SYSJOBNAME=&userid.A SYSTEMEMBER=KCIJPUP1

```

## Submission of PARMGEN batch jobs if system variables are enabled

If system variables are enabled for a runtime environment, there are planning considerations for submitting the batch jobs to complete the PARMGEN setup.

Submitting jobs generated by the \$PARSE\* job in WKANSAMU (option 11 on the Parameter Generator (PARMGEN) Workflow - Welcome menu) is a follow-on step to customizing the configuration profile members. Whether the PARMGEN jobs are submitted in the target LPAR where the symbolics are resolved or submitted in the local LPAR where the PARMGEN runtime environment work is being set up depends on how the runtime environment is configured for system variables.

If the runtime environment is enabled for system variables and you are using symbolics in data set names (RTE\_NAME, RTE\_HILEV, etc.) in an environment where the PARMGEN work is all done on one LPAR whereas the production runtime environment runs on a different LPAR:

- If you are on the LPAR where the symbolics resolve, submit the jobs as usual.
- If you are not on the LPAR where the symbolics resolve, you have two options:
  - *Option 1: Use the RTE\_X\_SYSV\_OVERRIDE\_SYMBOLS parameter.*  
Setting the RTE\_X\_SYSV\_OVERRIDE\_SYMBOLS to Y and defining the symbols and their resolved values in the GBL\_USER\_JCL(&rte) system variables profile enables you to submit the PARMGEN jobs in the system where the PARMGEN runtime environment work is being done (allocating RTE product execution RK\* runtime libraries, loading TK\* to RK\* runtime libraries, and so on).
  - *Option 2: Specify a /\*JOBPARM SYSAFF=xxxx card in your WKANSAMU(KCIJV\*) jobcard (where xxxx is the LPAR system name where you want the submitted jobs to execute).*  
Specifying a job card allows you to submit LPAR specific jobs while on a different LPAR.

JES3 users: Specify the SCHENV=*-name* parameter to define the name of the Workload Manager (WLM) scheduling environment to associate with the KCIJV\* jobs.

**Tip:** Add the /\*JOBPARM SYSAFF=*xxxx* card to your WCONFIG(\$JOB CARD) member prior to submitting the WCONFIG(\$PARSESV) job. In this way, the WKANSAMU(KCIJV\*) jobs that \$PARSESV creates will already contain the JOBPARM card.

**Note:** Certain sites pose JOBPARM restrictions when directing jobs to execute on production LPARs. Consult your site's system programmers for more information.

## Enabling variable support

Support for variables must be enabled in each runtime environment in which variables are used. To enable variable support, the RTE\_SYSV\_SYSVAR\_FLAG parameter in the LPAR configuration profile for each runtime environment must be set to Y. If user-defined variables are referenced, those variables and their resolved values for the target system must be defined in the system variables profile, GBL\_USER\_JCL(%RTE\_NAME%) .

### About this task

Enabling variable support involves the following steps:

1. Enabling variable support in the RTE by setting the RTE\_SYSV\_SYSVAR\_FLAG to Y.
2. Defining user variables, if any, and specifying resolution values for system and KCIPARSE-extracted variables if these values cannot be determined automatically from the IPL PARMLIB.

If you are using the PARMGEN Workflow interface, you can set the RTE\_SYSV\_SYSVAR\_FLAG on the third panel of the "Set up PARMGEN work environment for an RTE" option ( KCIP@PG3), or in the RTE configuration profile itself.

After you have enabled variable support, you can customize other parameters within the profile to use the system and user-defined variables. For example, you can modify the runtime environment name by using a system variable:

```
RTE_NAME          OMXE&SYSNAME .
```

You can also customize parameters to employ user-defined variables. In the following example, the z/OS® UNIX® System Services directory used can be represented by a variable:

```
RTE_USS_RTEDIR    "&RTE_USS_DIR . "
```

If you are referencing user-defined symbols, you must also customize the GBL\_USER\_JCL(%RTE\_NAME%) variables resolution profile to define the variables and their resolved values for this runtime environment. You can edit the member directly, or access it from the "Customize PARMGEN Configuration Profile Members" panel (KCIP@PG6), by selecting option 8 on the PARMGEN Workflow main menu. "[Figure: Pre-defined and user-defined symbolics](#)" on [page 1252](#) shows an example of the member where the resolved symbols are defined.

Figure 201: Pre-defined and user-defined symbolics

## What to do next

After you enable variable support, run the jobs appropriate to the configuration scenario you are enacting.

## Predefining and managing OMEGAMON® started tasks

If you are using System Automation for z/OS®, make sure the automation rules are defined to start and manage the OMEGAMON® started tasks. System Automation comes with an OMEGAMON® policy that predefines these rules.

See the [System Automation publications \(https://www.ibm.com/docs/en/SSWRCJ\\_4.1.0/com.ibm.safos.doc\\_4.1/ProdAuto/omegamon\\_part.html\)](https://www.ibm.com/docs/en/SSWRCJ_4.1.0/com.ibm.safos.doc_4.1/ProdAuto/omegamon_part.html) for information about the OMEGAMON policy.

The following table lists the OMEGAMON® started tasks (default names have been used) and associated automation dependencies.

**Note:** The CUA-related started tasks are applicable to only OMEGAMON family V5.3.0 and earlier versions. PARMGEN 3Q17 IF PTF will no longer generate these started tasks if later versions are installed in the CSI that the PARMGEN environment points to.

This table summarizes the steps necessary to integrate the management of OMEGAMON Monitoring Agents into your site's System Automation for z/OS rules.

<i>Table 118: OMEGAMON® started tasks and automation dependencies</i>		
<b>PARMGEN Configuration Parameter</b>	<b>Default started task name</b>	<b>Description</b>
<b>Dependency on VTAM</b> VTAM must be running and the major node must be active.		
KM2_CLASSIC_STC	IBMM2RC	IBM® OMEGAMON for z/OS® (3270)

KN3_AGT_STC	IBMN3	IBM® OMEGAMON for Networks on z/OS® (Agent)
KOB_TOM_STC	IBMTOM	IBM® OMEGAMON® enhanced 3270 user interface
KGW_AGT_STC	IBMGW	IBM Z® OMEGAMON® for CICS® TG (Agent)
<b>No dependencies</b>		
RTE_CANSCN_STC	IBMCN	OMEGAMON Subsystem
KM2_CSA_ANALYZER_STC	IBMM2CS	IBM® OMEGAMON for z/OS® (3270) Common Storage Area Analyzer

**Note:** IBMOCx must come up before the CICS regions, or the OMEG INIT fails.

## Workload Manager (WLM) settings for the OMEGAMON® tasks

The various started tasks created during the configuration process have varying levels of priority. Some started tasks, typically the data collecting monitoring agents, require a high priority to enable the ability to make requests for data.

The following table lists the OMEGAMON® started tasks (default names have been used) and indicates the priority level to use to allocate these tasks:

This table summarizes the integration of the OMEGAMON Monitoring Agents into your site's Workload Manager settings.

<i>Table 119: OMEGAMON® started tasks by priority group</i>		
PARMGEN Configuration Parameter	Default started task name	Description
<b>Group 1: Collector tasks</b> This group of tasks need high priority. For example, the priority of IBMOCx must be at least as high as that of CICS, and IBMM2RC is typically at the same level as JES2/3. SYSSTC is the most suitable priority level for this group of tasks.		
RTE_CANSCN_STC	IBMCN	OMEGAMON Subsystem

<sup>4</sup> IBM has discontinued support for Tivoli OMEGAMON for Messaging for z/OS 7.3.x, which uses product codes CF and MC.

PARMGEN Configuration Parameter	Default started task name	Description
KD2_CLASSIC_STC (or GBL_DB2_KD2_CLASSIC_STC)	IBMO2	IBM Z® OMEGAMON® AI for Db2 (3270)
KM2_CUA_STC	IBMOCx	IBM Z® OMEGAMON® for CICS® (where n = 1 per 3270 pair)
KC2_CCnn_CLASSIC_STC	IBMOIx	IBM® OMEGAMON for IMS on z/OS® (where n = 1 per 3270 pair)
KON_CUA_STC	IBMON	IBM® Tivoli® OMEGAMON for Networks on z/OS® (3270)
KM2_EPILOG_COLLECTOR_STC	IBMM2HI	IBM® OMEGAMON on z/OS® (3270) Historical Collector (Epilog)
KM2_CLASSIC_STC	IBMM2RC	IBM® OMEGAMON for z/OS® (3270)
KM2_CUA_STC	IBMM2	IBM® OMEGAMON for z/OS® (3270)
KM2_CSA_ANALYZER_STC	IBMM2CS	IBM® OMEGAMON for z/OS® (3270) Common Storage Area Analyzer
RTE_CANSETE_STC	IBMETE	OMEGAMON End-to-End
KDF_CUA_STC	IBMDF	IBM® OMEGAMON for Storage on z/OS® (3270)
KC2_CCnn_CLASSIC_STC	IBMOIx (one for each IMS subsystem)	IBM® OMEGAMON for IMS on z/OS® (where n = 1 per 3270 pair)
<b>Group 2: OMEGAMON® tasks</b> This group of tasks also need high priority. SYSSTC or STCHIGH are suitable priority levels for this group of tasks.		
KDS_TEMS_STC	IBMDSST	Tivoli Enterprise Monitoring Server
KC5_AGT_STC	IBMC5	IBM Z® OMEGAMON® for CICS® (Agent)
KD5_AGT_STC	IBMD5	IBM Z® OMEGAMON® AI for Db2 (Agent)
KI5_AGT_STC	IBMI5	IBM® OMEGAMON for IMS on z/OS® (Agent)
KN3_AGT_STC	IBMN3	IBM® OMEGAMON for Networks on z/OS® (Agent)
KMQ_AGT_STC	IBMMQ	IBM® OMEGAMON for Messaging- MQ (Agent)
KQI_AGT_STC	IBMQI	IBM® OMEGAMON for Messaging-Integration Bus (Agent)
KYN_AGT_STC	IBMYN	ITCAM for Application Diagnostics on z/OS® (Agent)
KMC_AGT_STC	IBMMC	IBM® Tivoli® OMEGAMON for Messaging- MQ Configuration (Agent) <sup>5</sup>
KOB_TOM_STC	IBMTOM	IBM® OMEGAMON® enhanced 3270 user interface
KGW_AGT_STC	IBMGW	IBM Z® OMEGAMON® for CICS® TG (Agent)
<b>Group 3: OMEGAMON® II presentation tasks</b> This group of tasks need lower priority because they display data but do not collect it.		
KI2_CUA_STC	IBMI2	IBM® OMEGAMON for IMS on z/OS® (3270)
KC2_CCnn_CUA_STC	IBMC2n	IBM Z® OMEGAMON® for CICS® (where n = 1 per 3270 pair)
KMV_CUA_STC	IBMMV	IBM® OMEGAMON® DE on z/OS® OMEGAVIEW (Agent)

<sup>5</sup> IBM has discontinued support for Tivoli OMEGAMON for Messaging for z/OS 7.3.x, which uses product codes CF and MC.

PARMGEN Configuration Parameter	Default started task name	Description
KM2_HIST_DATA_INTERFACE_STC	IBMM2HD	IBM® OMEGAMON for z/OS® (3270) Historical data interface
KM2_EPILOG_ZOOM_STC	IBMM2EZ	IBM® OMEGAMON for z/OS® (3270) Epilog Zoom
<b>Group 4: Maintenance tasks for historical data sets</b>		
This group of tasks can be low-priority because they are started only when needed and they run for a short time.		
KM2_HIST_PROC_PRIMARY_STC	IBMM2HP	IBM® OMEGAMON for z/OS® (3270) Historical maintenance (primary)
KM2_HIST_PROC_SECONDARY_STC	IBMM2HS	IBM® OMEGAMON for z/OS® (3270) Historical maintenance (secondary)
RTE_PDS_KPDPROC_PREFIX	KPDPROCn	Common IBM® Tivoli® Monitoring Persistent Datastore high-level qualifier prefix historical maintenance procedure (where n = 1)
KM2_HIST_BATCH_REPORTER_STC	IBMM2BA	IBM® OMEGAMON for z/OS® (3270) Historical maintenance (batch reporter)

## Product codes

The following table lists many of the product codes associated with the Tivoli Management Services components and OMEGAMON® products. Where a component or product has more than one code, the principal configuration code is shown in **bold print**. Throughout this publication, the variable *pp* represents the product code.

Lists the two-character product codes associated with Tivoli Management Services components and OMEGAMON® products.

Product or component	Codes
Advanced Audit for DFSMSHsm Agent	RG
Advanced Reporting and Management for DFSMSHsm Agent	RH
Advanced Allocation Management Agent	RJ
Automated Tape Allocation Manager for z/OS Agent	RK
Advanced Catalog Management Agent	RN
Advanced Backup and Recovery for z/OS Agent	RV
Configuration software (Configuration Manager/PARMGEN)	<b>CI</b> , RT
End-to-End response time component	ET
EPILOG®	ED, EI, EP
Monitoring agent on z/OS® (common to all monitoring agents)	AG
IBM Z® NetView	NA
OMNIMON Base (includes the IBM® Tivoli® OMEGAMON® enhanced 3270 user interface and OMEGAMON® Subsystem)	CA, CC, CN, EB, IA®, JI, <b>OB</b>

IBM Z® OMEGAMON® for CICS® TG	GW
IBM Z® OMEGAMON® AI for Db2	<b>D5</b> , D2, O2, DP
IBM OMEGAMON® for IMS™ on z/OS®	AT®, DF, I2, <b>I5</b> , IA®, IN, IP, ML, OI, OS, RI
IBM OMEGAMON® for Networks on z/OS®	<b>N3</b> , ON

Product or component	Codes
IBM Tivoli Composite Application Manager for SOA on z/OS	D4
ITCAM for Application Diagnostics	YN
OMEGAMON® for Messaging on z/OS®	CF <sup>6</sup> , MC <sup>6</sup> , <b>MQ</b> , QI,
OMEGAMON® for Storage on z/OS®	DF, RC, <b>S3</b>
OMEGAMON® for z/OS®	CG, CS, EA, IA®, IN, M2, <b>M5</b> , MH, MR, OE, OM, OS, PM, RA, WD, XD, XO
OMEGAMON® for JVM on z/OS®	<b>JJ</b> , JT
OMEGAMON® on z/VM® and Linux™	VL
OMEGAVIEW®	<b>MV</b> , SD, WO
Shared probes	<b>SB</b>
Summarization and Pruning agent	SY
System Automation Monitoring Agent	AH
Tape Optimizer for z/OS Agent	RW
Tivoli Enterprise Monitoring Server	AG, CO, <b>DS</b> , EF, FA, FW, GL, IB, IH, LC, LG, LI, LS, MA, MS, NS, NV, O4, OU, OX, PD, PS, PT, QM, SH, SM, SS, TN, TR, UI, UT, VI, VT
Tivoli Enterprise Portal desktop client	CJ
Tivoli Enterprise™ Portal Server	CQ, FW
Tivoli Enterprise™ Portal browser client	CW
TMS:Engine	BB, DC, DE, DF, DH, LB, LC, LD, LE, LF, LG, LH, LI, LS, LT, LU, LV, LX, SB
Warehouse Proxy agent	HD

## Common parameters

Common parameters are those used for setting and storing configuration values for the runtime environments (RTEs) in which the IBM® OMEGAMON® monitoring agents are configured (RTE, GBL) and for the common components of IBM® Tivoli® Management Services on z/OS®, such as the Tivoli Enterprise Monitoring Server (KDS) and the Tivoli Enhanced 3270 user interface (KOB). Common parameters also include common agent parameters (KAG and KPP). Common agent parameters are those parameters that are common to agents that can be configured stand-alone in an RTE without a Tivoli Enterprise Monitoring Server.

For information about agent-specific parameters, see the documentation for each product.

## Overview

Configuration of OMEGAMON® monitoring products and the components of the shared Tivoli® Management Services infrastructure uses parameters for setting and storing configuration values. With the Parameter Generator (PARMGEN) configuration method, you edit the parameters in a set of configuration profiles to configure all the installed products and components in a runtime environment. Then you submit a series of jobs to create the runtime environment with the parameter values you specified. Most parameters are provided with default values that you can accept or change. Some parameters are included in the runtime libraries by default, and others are excluded by default.

The PARMGEN method can be used for creating new runtime environments and for upgrading existing ones that were created from product versions for which the PARMGEN configuration method was enabled.

This reference contains information about the parameters common to all agents and components in a runtime environment. For agent-specific parameter information, see the documentation for each product.

<sup>6</sup> IBM has discontinued support for Tivoli OMEGAMON for Messaging for z/OS 7.3.x, which uses product codes CF and MC.

## Where configured parameters are stored

Most configuration parameters and their configured values are stored in the *KppENV* or *KppSYSIN* members of the *rhilev.rte.RKANPARU* data set for each runtime environment.

Where:

*pp*

is the 2-character product or component code

*rhilev*

is the high-level qualifier for the runtime environment data sets

*rte*

is the runtime environment name, which is used as the mid-level qualifier for the runtime environment data sets

The parameters stored in the *KppENV* member are *environment variables*, which determine the operating characteristics of the runtime environment in which products and components are configured. The parameters stored in the *KppSYSIN* member are *startup parameters*, which determine the default startup values for each product or component.

## Default values

Some parameters have only one default value, and some have more than one.

For example, TMS:Engine sets this global default value for the “[KDS\\_TEMS\\_STORAGE\\_LIMIT\\_EXTEND](#)” on page [1410](#) parameter:

```
LIMIT(16,X)
```

However, the PARMGEN files override the TMS:Engine default and show a different default value for the Tivoli® Enterprise Monitoring Server:

```
LIMIT(23,X)
```

When you edit a default value in a PARMGEN file, your edited value overrides the default value, which has already overridden the TMS:Engine default value (if one exists).

The default values provided by an individual monitoring agent product often differ from the TMS:Engine default values, the Tivoli Enterprise Monitoring Server default values, and the default values of other monitoring agents. Default values are shown in PARMGEN configuration profiles. These values are also included in the documentation for each monitoring agent product. The information in this section includes information about the default values for runtime environment and Tivoli Enterprise Monitoring Server parameters.

## Parameter names

Information on parameter names and how they are used is provided in this section.

### Stored parameter name

Name of the parameter as stored in a runtime library. Example: LIMIT

### PARMGEN name

Name of the parameter in the PARMGEN parameter list. Example: KDS\_TEMS\_STORAGE\_LIMIT\_EXTEND

In this guide, the parameters in each chapter are documented in alphabetical order by PARMGEN name, and all other applicable names for each parameter are shown. You can use the Index to look up a parameter by one of the names other than the PARMGEN name.

### Parameters with *n* or *nn* in their names

Some parameters include *n* or *nn* in their names. These are not the actual names of these commands as you will see them in the configuration profile. The *n* or *nn* means that you can have multiple instances of this parameter in your configuration profile. For example, you will most likely have multiple instances of the set of monitoring agent component override commands (for example, KN3\_TCPX*nn*\_OVRD\_CONN or KN3\_TCPX*nn*\_OVRD\_FTP)

because you have one set of values for every instance in which you override the global (all stacks) collection values for a specific stack. Likewise, you would have multiple instances of the KN3\_AGT\_NONSTD $n$ \_DSN, KN3\_AGT\_NONSTD $n$ \_MBR, KN3\_AGT\_NONSTD $n$ \_PARAM values if you defined several nonstandard parameters. If you cannot find a parameter by searching on its full name, try searching on a part of the name, omitting the numbers that define instance.

### Parameters designated N/A

Some parameters have "N/A" (not applicable) designated in the field description. This designation means that these parameter cannot be set using the mode being described.

There is a difference in how PARMGEN designates multiple instances of sets of parameters for stack-specific configuration (as opposed to global values) in the configuration profile file and how batch mode handles these same parameters. As noted previously, override commands in PARMGEN have a two-digit number (represented as  $nn$ ) appended to the middle of the parameter name (for example, KN3\_TCPX $nn$ ) indicating a stack-specific override of a global value (for example, KN3\_TCPX01\_OVRD\_CONN or KN3\_TCPX02\_OVRD\_CONN to override the global value KN3\_TCP\_CON). Batch mode does not append the two-digit number to indicate a stack-specific override. Instead, Batch overrides are indicated with a KN3\_TCPX BEGIN or KON\_TCPX BEGIN statement and concluded with a KN3\_TCPX END or KON\_TCPX END statement, as shows in the following sample Batch mode file:

```

** TCP/IP Information:
KN3_TCP_DATA          SYS1.TCPPARMS(TCPDATA)
KN3_TCP_SAMP_INTERVAL 1
KN3_TCP_STACK        Y
KN3_TCP_CON          Y          <-- global default
.
.
** Define TCP monitoring systems member:
KN3_TCPX             BEGIN          * Table begin
KN3_TCPX_ROW
KN3_TCPX_SYS_NAME    $$$$
KN3_TCPX_ADDR_SPACE  $$$$$$$$
KN3_TCPX_PROF_DATASET TCPIP.PROFILE.TCPIP
KN3_TCPX_OGBL        N
KN3_TCPX_OSTACK      Y
KN3_TCPX_OTCPC       Y  <-- stack specific-default (this is also global)
.
.
**KN3_TCPX_PROF_MEMBER
KN3_TCPX_ROW
KN3_TCPX_SYS_NAME    $$$$
KN3_TCPX_ADDR_SPACE  SAMPLESTACK
KN3_TCPX_PROF_DATASET USER.PARMLIB
KN3_TCPX_OGBL        Y
KN3_TCPX_OSTACK      Y
KN3_TCPX_OTCPC       Y  <-- stack specific for SAMPLESTACK
.
.
KN3_TCPX_PROF_MEMBER SAMPLESTACK  <-- End of SAMPLESTACK parameters
.
.
KN3_TCPX             END  <--End of all overrides for all stacks

```

### Determining what products are configured in each runtime environment

One of the first sections in the configuration profile is the set of flags that define the set of monitoring agents running in this runtime environment.

These configuration flag statements are in the following format:

```

* Tivoli Enterprise Monitoring Server: KDS flag
CONFIGURE_TEMS_KDS      "Y"

```

Where the first line, which is commented out, identifies the product or component to be configured and the second statement is the PARMGEN command to configure the specified product. Specify **Y** if the product-specific configuration flag if the product is to be configured in this runtime environment. Specify **N** if you do not plan to configure the specified product in this runtime environment. The full set of configuration flags are found in the table that follows.

<i>Table 121: Flags from CONFIGURE_PRODUCTS USER SECTION</i>	
<b>Product</b>	<b>Configuration statement (Y or N)</b>
Tivoli Enterprise Monitoring Server	CONFIGURE_TEMS_KDS
IBM Z® OMEGAMON® for CICS®	CONFIGURE_CICS_KC5
IBM Z® OMEGAMON® for CICS® TG	CONFIGURE_CICS_TG_KGW
IBM Z® OMEGAMON® AI for Db2	CONFIGURE_DB2_AGENT_KD5

## Parameters covered in this guide

This guide documents several types of parameters.

- [“Common agent parameters \(Kpp and KAG\)” on page 1261](#)  
The parameters common to all agents had been documented in the OMEGAMON for Networks parameter reference guide. The definitions of these parameters have been broadened and moved to this common location since the parameters are common to all agents configured with PARMGEN.
- [“Global \(GBL\) parameters” on page 1312](#)  
The global parameters provide default settings for installation and common system library names.
- [“Runtime environment \(RTE\) parameters” on page 1332](#)  
The runtime environment parameters provide configuration settings for an individual runtime environment and default settings for the components and products configured in the runtime environment.
- [“Tivoli Enterprise Monitoring Server \(KDS\) parameters” on page 1372](#)  
The Tivoli Enterprise Monitoring Server parameters provide configuration settings for hub and remote monitoring servers on z/OS®.

<sup>7</sup> IBM has discontinued support for Tivoli OMEGAMON for Messaging for z/OS 7.3.x, which uses product codes CF and MC.

- “Enhanced 3270 user interface parameters” on page 1437  
The OMEGAMON enhanced 3270 user interface has its own set of common configuration parameters, each of which begins with "KOB".

## Common agent parameters (Kpp and KAG)

Common agents are those agents that can be configured stand-alone in a runtime environment without a Tivoli Enterprise Monitoring Server. The parameters for these agents use *Kpp* and *KAG* prefixes.

The prefixes that can appear for the *pp* variable are found in the following table.

Table lists the three-letter product code for each product that uses Tivoli Management Services on z/OS.

<i>Table 122: Common agent parameter prefixes</i>	
<b>Agent name</b>	<b>Agent prefixes</b>
IBM System Automation for z/OS	KAH
IBM Z® OMEGAMON® for CICS®	KC5
IBM Z® OMEGAMON® for CICS® TG	KGW
IBM Tivoli Decision Support for z/OS	KDO
IBM Tivoli Composite Application Manager for SOA	KD4
IBM Z® OMEGAMON® AI for Db2	KD5
IBM OMEGAMON z/OS Management Console	KHL
IBM OMEGAMON for IMS on z/OS	KI5
IBM OMEGAMON for JVM on z/OS	KJJ
IBM OMEGAMON for Messaging - MQ Configuration	KMC <sup>8</sup>
IBM OMEGAMON for Messaging - MQ	KMQ
IBM OMEGAMON for Messaging - Integration Bus	KQI
OMEGAVIEW and OMEGAVIEW II	KMV, KWO
IBM Z® NetView Enterprise Management Agent	KNA
IBM OMEGAMON for Networks	KN3
IBM Tivoli Advanced Audit for DFSMSHsm	KRG
IBM Tivoli Advanced Reporting for DFSMSHsm	KRH
IBM Tivoli Advanced Allocation Management for z/OS	KRJ
IBM Tivoli Automated Tape Allocation Manager for z/OS	KRK
IBM Tivoli Advanced Catalog Management for z/OS	KRN
IBM Tivoli Advanced Backup and Recovery for z/OS	KRV
IBM Tivoli Tape Optimizer for z/OS	KRW
ITCAM for Application Diagnostics on z/OS	KYN

### KAG\_X\_STC\_SYSTCPD\_INCLUDE\_FLAG

This parameter specifies whether to include the SYSTCPD DD statement in the Agent started task.

#### Required or optional

Required

#### Location where the parameter value is stored

N/A

<sup>8</sup> IBM has discontinued support for Tivoli OMEGAMON for Messaging for z/OS 7.3.x, which uses product codes CF and MC.

**Parameter name and syntax**

N/A

**Default value**

Y

**Permissible values**

Y or N

**Description**

This flag is for the SYSTCPD DD: TCPDATA override. Override this DD card to explicitly identify which dataset to use to obtain the parameters defined by TCPIP.DATA when no GLOBALTCPIPDATA statement is configured. Refer to the *IBM z/OS Communications Server: IP Configuration Guide* for information on the TCPIP.DATA search order. TCPIP.SEZAINST(TCPDATA) is the default sample file. TCPIP.TCPPARMS(TCPDATA) is another sample and is created as part of the Installation Verification Program (IVP) for TCP/IP. To customize this value in PARMGEN mode, override this parameter in the CONFIG profile member in WCONFIG (\$CFG\$USR or the user-specified) prior to running the \$PARSE job and specify the GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA library accordingly.

**Related parameters**

- [“GBL\\_DSN\\_TCP\\_SYSTCPD\\_TCPDATA” on page 1327](#)

## Kpp\_AGT\_AUDIT\_ITM\_DOMAIN

This parameter is the audit domain name.

**Required or optional**

Optional

**Location where the parameter value is stored**

KppENV member of the *rhilev.rte*.RKANPARU library for the agent's runtime environment

**Parameter name and syntax**

ITM\_DOMAIN=%Kpp\_AGT\_AUDIT\_ITM\_DOMAIN%

**Default value**

None

**Permissible values**

Character string, maximum length 32.

**PARMGEN name**

Kpp\_AGT\_AUDIT\_ITM\_DOMAIN

**Description**

This field specifies an identifier that may be used to associate audit records. It is suited for commonly identifying agents that are associated with each other. An example use may be for sorting records by a particular customer. This field will also be used to create unique namespaces for RBAC.

**Related parameters**

- [“Kpp\\_AGT\\_AUDIT\\_TRACE” on page 1263](#)
- [“Kpp\\_AGT\\_AUDIT\\_MAX\\_HIST” on page 1262](#)
- [“KDS\\_AUDIT\\_TRACE” on page 1373](#)
- [“KDS\\_AUDIT\\_MAX\\_HIST” on page 1373](#)
- [“KDS\\_AUDIT\\_ITM\\_DOMAIN” on page 1372](#)

## Kpp\_AGT\_AUDIT\_MAX\_HIST

This parameter specifies the maximum in-memory cache entries; it is the maximum number of records kept in short-term memory for direct queries.

**Required or optional**

Optional

**Location where the parameter value is stored**

The AUDIT\_MAX\_HIST parameter in the RKANPARU data set, member KPPENV for the agent's runtime environment.

**Parameter name and syntax**

AUDIT\_MAX\_HIST=%Kpp\_AGT\_AUDIT\_MAX\_HIST%

**Default value**

None

**Permissible values**

10–1000

**PARMGEN name**

Kpp\_AGT\_AUDIT\_MAX\_HIST

**Description**

The maximum number of records kept in short-term memory for direct queries.

**Related parameters**

- [“Kpp\\_AGT\\_AUDIT\\_TRACE” on page 1263](#)
- [“Kpp\\_AGT\\_AUDIT\\_ITM\\_DOMAIN” on page 1262](#)
- [“KDS\\_AUDIT\\_TRACE” on page 1373](#)
- [“KDS\\_AUDIT\\_MAX\\_HIST” on page 1373](#)
- [“KDS\\_AUDIT\\_ITM\\_DOMAIN” on page 1372](#)

## **Kpp\_AGT\_AUDIT\_TRACE**

This parameter indicates the trace level to pass messages.

**Required or optional**

Optional

**Location where the parameter value is stored**

KppENV member of the *rhldev.rte*.RKANPARU library for the agent's runtime environment.

**Parameter name and syntax**

AUDIT\_TRACE=%Kpp\_AGT\_AUDIT\_TRACE%

**Default value**

None

**Permissible values**

M, B, D, X

**PARMGEN name**

Kpp\_AGT\_AUDIT\_TRACE

**Description**

This indicates the trace level to pass messages. Message trace levels, from low to high, are:

**X**

disabled

**M**

minimum

**B**

basic

**D**

detail

Higher levels imply all lower levels.

## Kpp\_AGT\_CONFIGURATION\_MODE

Use the `KPP_AGT_CONFIGURATION_MODE` parameter to specify how you want to run the monitoring agent you are defining, in the agent address space or the server address space.

#### Required or optional

Required

#### Location where parameter value is stored

The parameter value is not stored, but is used for internal processing.

#### Parameter name

N/A

#### Default value

STANDALONE

#### Permissible values

One of the following:

- STANDALONE
- CMS

#### PARMGEN name

`KPP_AGT_CONFIGURATION_MODE`

#### PARMGEN classification

Values that describe the address space

#### Description

Agent configuration option

This parameter specifies how you want to run the monitoring agent you are defining.

When defining an agent, you have the option to run the agent in an agent address space or in the server address space. For performance reasons, you should run the agent in an agent address space. If you plan to run the agent in the server address space, the runtime environment must contain a server.

To run the agent in an agent address space, choose Option 3 (AGTCMS) in the Configuration software, which is the preferred configuration or specify STANDALONE in PARMGEN. Otherwise, use TEMS in PARMGEN to run the agent in the server. The procedures outlined in the product-specific planning and configuration guide assumes that you are running the recommended configuration for this agent, which is running in the agent address space.

#### Related parameters

None

## Kpp\_AGT\_COMM\_PROTOCOLn

This parameter specifies the communication protocol for the connection between the monitoring agent and the Tivoli Enterprise Monitoring Server.

## Description

This parameter specifies the communication protocol to be supported by the monitoring agent, where *n* corresponds to a number between 1 and 7 to indicate the priority sequence for the communication protocols.

When communicating with the monitoring server, the agent first tries protocol 1, and then, in the case of failure, tries protocol 2 and so on.

The following IP-related protocols are available:

- IP.PIPE (IPPIPE): Non-secure TCP over IPv4
- IP.UDP (IP): Non-secure UDP over IPv4
- IP6.PIPE (IP6PIPE): Non-secure TCP over IPv6
- IP6.UDP (IP6): Non-secure UDP over IPv6
- IP.SPIPE (IPSPIPE): Secure (SSL/TLS) TCP over IPv4
- IP6.SPIPE (IP6SPIPE): Secure (SSL/TLS) TCP over IPv6

The following SNA protocol is available:

- SNA.PIPE (SNA): Systems Network Architecture (SNA) implementation of the Network Computing System (NCS) Remote Procedure Call (RPC) API

## Default value

*Kpp\_AGT\_COMM\_PROTOCOL1*: IPPIPE

*Kpp\_AGT\_COMM\_PROTOCOL2*: SNA

*Kpp\_AGT\_COMM\_PROTOCOL3* - *KDS\_TEMS\_COMM\_PROTOCOL7*: empty (no value)

## Permissible values

IPPIPE, IP, IP6PIPE, IP6, IPSPIPE, IP6SPIPE, SNA

## Related parameters

## **Kpp\_AGT\_FLUSH\_LSR\_BUFR\_INT\_HR**

Use the *KPP\_AGT\_FLUSH\_LSR\_BUFR\_INT\_HR* parameter to specify the interval to force all deferred VSAM writes to DASD.

## Required or optional

Required

## Location where the parameter value is stored

In the *KPPAGST* member in the *rhilev.midlev.rtename.RKANCMDDU* library

### Parameter name

EVERY *HH*:*MM*:*SS* FLUSH (Flush VSAM buffers interval - hours)

### Default value

0 hours, 30 minutes

### Permissible values

0 - 24

## PARMGEN name

*KPP\_AGT\_FLUSH\_LSR\_BUFR\_INT\_HR*

## PARMGEN classification

Advanced Agent configuration values

## Description

Flush VSAM buffers interval - hours

This parameter specifies the interval to force all deferred VSAM writes to DASD. The interval values are written as part of the third EVERY command in the KPPAGST member in the *rhilev.midlev.rtename*.RKANCMDDU library. The default is 0 hours (hh) and 30 minutes (mm).

## Related parameters

None

## Kpp\_AGT\_FLUSH\_LSR\_BUFR\_INT\_MIN

Use the KPP\_AGT\_FLUSH\_LSR\_BUFR\_INT\_MIN parameter to specify the interval to force all deferred VSAM writes to DASD.

## Required or optional

Required

## Location where the parameter value is stored

In the KPPAGST member in the *rhilev.midlev.rtename*.RKANCMDDU library

### Parameter name

EVERY HH:MM:SS FLUSH (Flush VSAM buffers interval - mins)

### Default value

0 hours 30 minutes

### Permissible values

0 - 60

## PARMGEN name

KPP\_AGT\_FLUSH\_LSR\_BUFR\_INT\_MIN

## Description

Flush VSAM buffers interval - mins

This parameter specifies the interval to force all deferred VSAM writes to DASD. The interval values are written as part of the third EVERY command in: *rhilev.midlev.rtename*.RKANCMDDU(KPPAGST) The default is 0 hours (hh) and 30 minutes (mm).

## Related parameters

None

## Kpp\_AGT\_DRA\_FLAG

The Kpp\_AGT\_DRA\_FLAG parameter controls the generation of the KOBAGENT startup command in the xKANCMDDU(KppAGST) member. KOBAGENT is the data retrieval agent (DRA) for the OMEGAMON Enhanced 3270 user interface.

## Required or optional

Required if you configure the OMEGAMON enhanced 3270 user interface component.

## Location where parameter value is stored

If the flag is set to Y, the AT ADD ID=KOB DELAY=00:00:10 CMD='IRAMAN KOBAGENT START' startup parameter is added to the KppAGST member of the *rhilev.rtename*.RKANCMDDU library.

### Default value

Y

### Permissible values

Y, N

## Description

This parameter allows you to control on an agent-by-agent basis whether or not to start up the DRA automatically. This flag is applicable to the following stand-alone agents:

- IBM Z® OMEGAMON® for CICS® (KC5)
- IBM Z® OMEGAMON® for CICS® TG (KGW)
- OMEGAMON® AI for Db2 (KD5)
- OMEGAMON for IMS on z/OS (KI5)
- OMEGAMON for JVM (KJJ)
- OMEGAMON for Messaging on z/OS (KMQ)
- OMEGAMON for Networks (KN3)

## Related parameters

[“KDS\\_TEMS\\_DRA\\_FLAG” on page 1397](#)

## Kpp\_AGT\_ICU\_LANGUAGE\_LOCALE

This parameter contains the language and code page (system locale) that you want the monitoring agent to use.

## Description

Language and region for the z/OS® system.

This parameter specifies the language and code page (system locale) that you want the monitoring agent to use. The language locale value is used for National Language Support.

The following table lists the acceptable languages:

Language locale	Code page	National language and region
1a or 1A	en_US.ibm-1047	English - United States (z/OS® UNIX® System Services)
1	en_US.ibm-037	English - United States
2	en_UK.ibm-285	English - United Kingdom
3	de_DE.ibm-273	German - Germany
4	de_CH.ibm-500	German - Switzerland
5	fr_BE.ibm-500	French - Belgium
6	fr_FR.ibm-297	French - France
7	fr_CH.ibm-500	French - Switzerland
8	es_ES.ibm-284	Spanish - Spain
9	it_IT.ibm-280	Italian - Italy
10	pt_PT.ibm-037	Portuguese - Portugal
11	pt_BR.ibm-037	Portuguese - Brazil
12	no_NO.ibm-277	Norwegian - Norway
13	sv_SE.ibm-278	Swedish - Sweden
14	da_DK.ibm-277	Danish - Denmark
15	fi_FI.ibm-278	Finnish - Finland
16	ja_JP.ibm-290	Japanese - Japan
17	fr_CA.ibm-500	French - Canada
18	zh_TW.ibm-937	Traditional Chinese - Taiwan
19	zh_CN.ibm-935	Simplified Chinese - China
20	sq_AL.ibm-500	Albanian - Albania

Language locale	Code page	National language and region
21	bg_BG.ibm-500	Bulgarian - Bulgaria
22	cs_CZ.ibm-870	Czech - Slovenia
23	nl_BE.ibm-500	Dutch - Belgium
24	nl_NL.ibm-037	Dutch - Netherlands
25	el_GR.ibm-87	Greek - Greece
26	iw_IL.ibm-424	Hebrew - Israel
27	ko_KR.ibm-933	Korean - Korea
28	lt_LT.ibm-1112	Lithuanian - Lithuania
29	mk_MK.ibm-1025	Macedonian - Macedonia
30	ro_RO.ibm-870	Romanian - Romania
31	ru_RU.ibm-1025	Russian - Russia
32	sr_SP.ibm-1025	Serbian - Serbia
33	sr_SP.ibm-870	Slovak - Slovakia
34	sk_SK.ibm-870	Slovenian - Slovenia
35	th_TH.ibm-838	Thai - Thailand
36	tr_TR.ibm-1026	Turkish - Turkey

#### Permissible values

Using code page: *lang.ibm-nnn*

Using language locale: 1a, 1A, 1-36

#### Default value

en\_US.ibm-1047

#### Related parameters

[“KDS\\_TEMS\\_ICU\\_LANGUAGE\\_LOCALE” on page 1403](#)

## Kpp\_AGT\_KGL\_WTO

Use the *KPP\_AGT\_KGL\_WTO* parameter to activate write-to-operator messages for a particular agent.

#### Required or optional

Required

#### Location where the parameter value is stored

In the *KPPENV* member of the *rhilev.midlev.rtename.RKANPARU* library

#### Parameter name

KGL\_WTO= (Enable agent WTO messages)

#### Default value

YES

#### Permissible values

YES or NO

#### PARMGEN name

*KPP\_AGT\_KGL\_WTO*

#### PARMGEN classification

Advanced Agent configuration values

#### Description

Enable agent WTO messages

Specify **Y** to this parameter if you want a SYSLOG message on the console to indicate when the monitoring agent finishes initializing. You can use this message in an automation script. See the automation package for your site for further instructions on how to capture the monitoring agent startup automation message IDs. If you specify **Y**, the KGL\_WTO=YES parameter is added to the *rhilev.midlev.rtename.RKANPARU(KPPENV)* member. The default is **N** for the Configuration Tool and **YES** for PARMGEN.

**Note:** The existence of the KGL\_WTO= parameter triggers the startup console messages. Therefore this parameter must not be present in the KPPENV member if you do not want this feature enabled. When it is enabled after configuration, the parameter is added to the KPPENV member. If you want to turn it off again, you can edit the configuration profile (PARMGEN) or RTEDEF(Kpp\$PARM(par)) for Configuration Manager and recycle the monitoring agent.

#### Related parameters

None

### Kpp\_AGT\_KLX\_TCP\_TOLERATERECYCLE

Use the KPP\_AGT\_KLX\_TCP\_TOLERATERECYCLE parameter to determine whether the monitoring agent address space reconnects to its TCP/IP stack without being recycled after the stack is recycled.

#### Required or optional

Optional

#### Location where the parameter value is stored

In the KPPINTCP member of the *rhilev.midlev.rtename.RKANPARU* library

#### Parameter name

```
TCP/IP_USERID='&tcpip_stc' TOLERATERECYCLE
```

#### Default value

Y

#### Permissible values

Y, N

#### PARMGEN name

```
KPP_AGT_KLX_TCP_TOLERATERECYCLE
```

#### PARMGEN classification

Advanced Agent configuration values

#### Description

Reconnect after TCP/IP recycle

The parameter determines whether the monitoring agent address space reconnects to its TCP/IP stack without being recycled after the stack is recycled. Set this parameter to **Y** to allow the monitoring agent address space to reconnect to the z/OS® Communications Server without having to subsequently recycle the address space. When this parameter is set to **Y**, the "TOLERATERECYCLE" keyword is added in the KPPINTCP member of the RKANPARU library. The parameter line is generated as: TCP/IP\_USERID=&tcp\_userid TOLERATERECYCLE.

If this parameter is set to **N**, when the z/OS® Communications Server is recycled, the monitoring agent address space must also be recycled to establish connectivity to TCP/IP. The default is **N**. Specify a value of **Y** to use **TOLERATERECYCLE** for PARMGEN.

**Note:** This parameter may be specified only when the monitoring agent is reporting to Tivoli® Enterprise Monitoring Server V6.2.0 and later versions.

#### Related parameters

None

## Kpp\_AGT\_PARTITION\_NAME

The *KPP\_AGT\_PARTITION\_NAME* parameter specifies the partition name that identifies the location of this monitoring server (TEMS namespace) relative to the firewalls used for address translation.

### Required or optional

Optional

### Location where the parameter value is stored

In the *KPPENV* member of the *rhilev.midlev.rtename.RKANPARU* library

#### Parameter name

*KDC\_PARTITION*= (Agent IP.PIPE partition name)

#### Default value

None

#### Permissible values

Character string, maximum length 32

### PARMGEN name

*KPP\_AGT\_PARTITION\_NAME*

### PARMGEN classification

If the Agent requires address translation support

### Description

Agent IP.PIPE partition name

This parameter specifies the partition name that identifies the location of this monitoring server (TEMS namespace) relative to the firewalls used for address translation.

**Note:** The Tivoli® Enterprise Monitoring Server that this monitoring agent connects to must have a corresponding partition reference entry.

This parameter is put into the partition table that contains labels and associated socket addresses that are provided by the firewall administrator.

The labels in the partition table are configured into and used by IBM® products on an external network, outside a firewall, during the Tivoli® Enterprise Monitoring Server (TEMS) connection establishment phase. The first part of this connection establishment is the lb lookup, which requires that the location brokers return the socket address of the monitoring agent.

The partition table is used by the brokers, matching a partition name for a client to the labels in the partition table. On a match, the associated socket address in the partition table is returned to the client outside the firewall. This socket address is used by the IBM® products to traverse the firewall and connect to the monitoring server.

Each entry consists of a label or partition name, a protocol (IP for UDP or IP.PIPE for TCP), and a host name or dotted-decimal IP address. The well-known port (Hub port) must be authorized by the firewall administrator.

- If UDP is the protocol configured in the partition table, then a range of (UDP) ports must be authorized by the firewall administrator (in addition to the well-known port).
- If TCP is the protocol, no additional ports other than the well-known TEMS port need be authorized.

### Related parameters

None

## Kpp\_AGT\_PPI\_RECEIVER

The `KPP_AGT_PPI_RECEIVER` parameter specifies the Program-to-Program Interface (PPI) values that enable the monitoring agent to forward Take Action commands to IBM Z® NetView.

### Required or optional

Required if the monitoring agent will be forwarding Take Action commands to the IBM Z® NetView Program-to-Program Interface (PPI).

### Location where the parameter value is stored

In the `KPPENV` member of the `rhilev.midlev.rtename.RKANPARU` library

#### Parameter name

`KGLHC_PPI_RECEIVER= (NetView® PPI receiver)`

#### Default value

This value defaults to the IBM Z® NetView PPI receiver used by the server if one is configured in this RTE. Otherwise, specify the default of **CNMPCMDR**.

#### Permissible values

Character string, maximum length 8

### PARMGEN name

`KPP_AGT_PPI_RECEIVER`

### PARMGEN classification

Take Action commands security settings

### Description

IBM Z® NetView PPI receiver.

The parameter specifies the Program to Program Interface (PPI) values that enable the monitoring agent to forward Take Action commands to IBM Z® NetView. The Tivoli® Enterprise Portal user ID is passed to IBM Z® NetView.

Specify the name of the PPI receiver on IBM Z® NetView that will receive Take Action commands. If the specified name is invalid or the receiver is not active on IBM Z® NetView, default (MGCR) command routing is performed. The value should be a 1-8 character, unique identifier for the receiver program. It can contain alphabetic characters A-Z or a-z, numeric characters 0-9, and the following special characters:

- dollar sign (\$)
- percent sign (%)
- ampersand (&)
- number sign (#)

This value must match the `xyz` value coded on statement `AUTOTASK.?APSERV.InitCmd = APSERV xyz` in the IBM Z® NetView DSIPARM initialization member, `CNMSTYLE`. The Configuration Software generates the `KGLHC_PPI_RECEIVER` parameter in the `KPPENV` member of the `rhilev.midlev.rtename.RKANPARU` library. This value defaults to the IBM Z® NetView PPI receiver used by the Server if one is configured in this RTE. Otherwise, specify the default of `CNMPCMDR`. See the IBM Z® NetView online help for command `APSERV` for more details.

To enable this function, specify a value on the `KPP_AGT_PPI_RECEIVER` parameter. Ensure that the parameter is not commented out and the value is enclosed in double quotation marks ("). To disable this function, simply comment out the parameter with asterisks (\*).

For complete instructions, see [“Configuring IBM Z NetView authorization of z/OS commands” on page 544](#).

### Related parameters

None

## Kpp\_AGT\_PPI\_SENDER

The `KPP_AGT_PPI_SENDER` parameter specifies the Program-to-Program Interface (PPI) values that enable the monitoring agent to forward Take Action commands to IBM Z® NetView.

**Required or optional**

Required if the monitoring agent will be forwarding Take Action commands to the IBM Z® NetView Program-to-Program Interface (PPI).

**Location where the parameter value is stored**

In the *KPPENV* member of the *rhilev.midlev.rtename.RKANPARU* library

**Parameter name**

KGLHC\_PPI\_SENDER (Agent PPI sender)

**Default value**

None

**Permissible values**

Character string, maximum length 8

**PARMGEN name**

KPP\_AGT\_PPI\_SENDER

**PARMGEN classification**

Take Action commands security settings

**Description**

Agent PPI sender.

The parameter specifies the Program to Program Interface (PPI) values that enable the monitoring agent to forward Take Action commands to IBM Z® NetView. The Tivoli® Enterprise Portal user ID gets passed to IBM Z® NetView.

Specify the optional name of the PPI sender. The value should be a 1-8 character, unique identifier for the sender program. It can contain alphabetic characters A-Z or a-z, numeric characters 0-9, and the following special characters: dollar sign ('\$'), percent sign ('%'), ampersand ('&'), at sign ('@'), and number sign ('#'). This name should not conflict with any IBM Z® NetView domain name, as it is used in logging the command and command response in the IBM Z® NetView log. If a value is specified on this field, the Configuration Software generates the KGLHC\_PPI\_SENDER parameter in the *KPPENV* member of the *rhilev.midlev.rtename.RKANPARU* library. If a value is not specified on this field, the default is the current monitoring agent *jobname* that is the source of the command.

For complete instructions, see [“Configuring IBM Z NetView authorization of z/OS commands” on page 544](#).

**Related parameters**

None

**Kpp\_AGT\_STC**

Use the *KPP\_AGT\_STC* parameter to specify the started task name for the agent.

**Required or optional**

Required if you configure the monitoring agent in its own address space

**Location where the parameter value is stored**

Value becomes the name of the monitoring agent started task procedure member in the *rhilev.midlev.rtename.RKANSAMU* library for stand-alone agents.

**Parameter name**

N/A

**Default value**

IBMpp (PARMGEN)

**Permissible values**

Character string, maximum length 8

**Batch parameter name**

KPP\_AGT\_STC

**PARMGEN name**

KPP\_AGT\_STC

#### PARMGEN classification

Values that describe the address space

#### Description

Agent started task name

This parameter specifies the started task name for the agent. This started task must be copied to your system procedure library. The default in PARMGEN is *IBMpp*.

The configuration software created started task procedures in *rhilev.midlev.rtename.RKANSAMU* that you must copy to your started task library. If you have configured an agent address space, copy the monitoring agent started task from *rhilev.midlev.rtename.RKANSAMU* to your started task library (PROCLIB). If you have configured the agent in the TEMS address space, then the TEMS started task procedure will be updated in *rhilev.midlev.rtename.RKANSAMU* (the default name for PARMGEN is *IBMDS*) and this started task must be copied to your started task library (PROCLIB).

**Note:** You might also use the sample system copy JCL to copy the system procedures and the VTAM major node members from the *rhilev.midlev.rtename.RKANSAMU* library to the system libraries (if applicable). The sample JCL can be generated from the RTE Utility option using the Configuration Software. In PARMGEN, the JCL is copied by the *KCIJcSYS* job. This job is not submitted automatically by the composite submit job because it requires write access to the system libraries. You must uncomment the *KCIJcSYS* in the *KCIJcSUB* job to submit it.

#### Related parameters

None

## Kpp\_AGT\_STORAGE\_DETAIL\_INT\_HR

Use the *KPP\_AGT\_STORAGE\_DETAIL\_INT\_HR* parameter to set the interval to monitor storage.

#### Required or optional

Required

#### Location where the parameter value is stored

Part of the second EVERY command in the *KPPAGST* member of the *rhilev.midlev.rtename.RKANCMDU* library

#### Parameter name

EVERY HH:MM:SS STORAGE D (Storage detail logging interval - hours)

#### Default value

0

#### Permissible values

0 - 24

#### PARMGEN name

*KPP\_AGT\_STORAGE\_DETAIL\_INT\_HR*

#### PARMGEN classification

Advanced Agent configuration values

#### Description

Storage detail logging interval - hours

This parameters sets the interval to monitor storage. The interval values are written as part of the second EVERY command in: *rhilev.midlev.rtename.RKANCMDU(KPPAGST)* The default is **0** hours (hh) and **60** minutes (mm).

#### Related parameters

None

## Kpp\_AGT\_STORAGE\_DETAIL\_INT\_MIN

Use the `KPP_AGT_STORAGE_DETAIL_INT_MIN` parameter to set the interval to monitor storage.

### Required or optional

Required

### Location where the parameter value is stored

Part of the second EVERY command in the `KPPAGST` member of the `rhilev.midlev.rtename.RKANCMDU` library

### Parameter name

EVERY HH:MM:SS STORAGE D (Storage detail logging interval - minutes)

### Default value

60

### Permissible values

0 - 60

### PARMGEN name

`KPP_AGT_STORAGE_DETAIL_INT_MIN`

### PARMGEN classification

Advanced Agent configuration values

### Description

Storage detail logging interval - minutes

This parameters sets the interval to monitor storage. The interval values are written as part of the second EVERY command in: `rhilev.midlev.rtename.RKANCMDU(KPPAGST)` The default is **0** hours (hh) and **60** minutes (mm).

### Related parameters

None

## Kpp\_AGT\_STORAGE\_MINIMUM\_EXTEND

Use the `KPP_AGT_STORAGE_MINIMUM_EXTEND` parameter to specify the amount of virtual storage the monitoring agent must acquire to run at your site.

### Required or optional

Required

### Location where the parameter value is stored

In the `KPPSYSIN` member of the `rhilev.midlev.rtename.RKANPARU` library

### Parameter name

MINIMUM (nnnnnn,X) (Minimum extended storage)

### Default value

Differs by product

### Permissible values

0 - 9999999

### PARMGEN name

`KPP_AGT_STORAGE_MINIMUM_EXTEND`

### PARMGEN classification

Advanced Agent configuration values

### Description

Minimum extended storage

This parameter specifies the amount of virtual storage the monitoring agent must acquire to run at your site. The default differs by product. Check the documentation for each product to determine the default.

#### Related parameters

None

## Kpp\_AGT\_TCP\_HOST

This parameter specifies the host name of the system that the agent is running on.

#### Description

Agent TCP/IP host name.

This parameter specifies the host name of the system that the agent is running on. This value is the TCP/IP host name or dotted decimal IP address of the z/OS® system where the hub monitoring server is installed.

To obtain the host name or IP address, enter `TSO HOMETEST` at the command line. If the z/OS® domain name resolver configuration specifies a search path that includes the target domain suffix, specify only the first qualifier of the host name. (Example: `sys` is the first qualifier of the fully qualified host name `sys.ibm.com`.) Otherwise, specify the fully qualified host name.

This field is required if you plan to have this agent communicate with the Tivoli® Enterprise Monitoring Server using TCP/IP.

#### Default value

Value set for the `RTE_TCP_HOST` parameter for the runtime environment

#### Permissible values

Character string, maximum length 32

#### Related parameters

None

## Kpp\_AGT\_TCP\_KDEB\_INTERFACELIST

This parameter specifies a list of network interfaces for the monitoring agent to use for IPv4 communication.

#### Description

This parameter specifies one or more network interfaces for the monitoring agent to use for IPv4 communication.

**Note:** To modify this parameter value using Configuration Manager, use parameter `"RTE_TCP_KDEB_INTERFACELIST"` on page 295, which sets the same value for the monitoring server and the monitoring agents.

If the agent requires network interface list support and your site runs more than one TCP/IP interface or network adapter on the same z/OS image, you can specify network interfaces to be used by monitoring servers and monitoring agents running on a z/OS system. You specify the network interfaces in the IP communication protocol parameters for each component.

This parameter is required for sites that are running multiple TCP/IP interfaces or network adapters on the same z/OS® image.

Setting this parameter allows you to direct the monitoring agent to connect to a specific TCP/IP local interface. Specify the network adapters as one or more of the following values:

- A fully-qualified hostname, for example `sys.ibm.com`
- The first qualifier of the fully-qualified hostname, for example `sys` from `sys.ibm.com`
- An IPv4 address in dotted-decimal notation, for example `9.67.1.100`

If your site supports DNS, you can enter the short hostname or an IP address. If your site does not support DNS, you must enter the fully-qualified hostname. This field is only applicable for networks with multiple interface cards for which a specific output network interface list is required.

Specify !\* as the value if this agent runs on the same candidate z/OS image where a high-availability (HA) hub TEMS is running.

Special considerations apply when specifying !*hostname* or \* for this field.

- Use !*hostname* to specify a value for the interface address.
- Use an asterisk (\*) to indicate all values are allowed for the interface address.

Separate the entries using a blank (space) between interface addresses. For example:

```
==> 129.0.131.214 SYS1 SYS.IBM.COM
```

#### Default value

##### For Configuration Manager:

Value set for parameter "RTE\_TCP\_KDEB\_INTERFACELIST" on page 295, which defaults to !\*

##### For PARMGEN:

None

#### Permissible values

Character string, maximum length 44

#### Related parameters

- "KDS\_TEMS\_TYPE" on page 1417
- "KDS\_TEMS\_HA\_TYPE" on page 1402
- "KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST" on page 1412
- "RTE\_TCP\_KDEB\_INTERFACELIST" on page 295

## Kpp\_AGT\_TCP\_STC

Use the *KPP\_AGT\_TCP\_STC* parameter to specify the name of the TCP/IP started task running on the monitoring agent host.

#### Required or optional

Optional. Required if you plan to have this agent communicate with Tivoli® Enterprise Monitoring Server using TCP/IP.

#### Location where the parameter value is stored

In the *KppINTCP* member of the *rhilev.midlev.rtename.RKANPARU* library

##### Parameter name

TCP/IP\_USERID='\*' (TCP/IP started task)

##### Default value

#

##### Permissible values

Character string, maximum length 8

#### PARMGEN name

*KPP\_AGT\_TCP\_STC*

#### PARMGEN classification

Agent's local TCP/IP information

#### Description

TCP/IP started task

This parameter specifies the name of the TCP/IP started task running on the monitoring agent host. This a required field if you plan to have this agent communicate with the server using TCP/IP.

This parameter identifies the TCP/IP stack to be used. If the LPAR contains more than one TCP/IP stack, specify the started task name of the TCP/IP stack you want to use.

Alternatively, you can specify the number sign (#), which is translated to a blank and allows the TCP/IP environment to choose the stack to use, either through TCP/IP definitions or through the use of the SYSTCPD DD statement.

Whichever method is used to select a TCP/IP stack in a multi-stack environment, the Tivoli® Management Services components continue to use that stack, even if a different stack becomes the primary stack. Therefore, in a multi-stack environment, it is best to specify the started task name of the TCP/IP stack to be used, rather than specifying a wildcard or a blank.

## Kpp\_AGT\_TEMA\_SDA

This parameter indicates whether the agent has enabled the self-describing agent (SDA) function in the agent address space.

#### Required or optional

Required

#### Location where the parameter value is stored

KppENV member of the *rhilev.rte.RKANPARU* library for the agent’s runtime environment.

#### Parameter name and syntax

TEMA\_SDA=%Kpp\_AGT\_TEMA\_SDA%

#### Default value

Y

#### Permissible values

Y, N

#### PARMGEN name

Kpp\_AGT\_TEMA\_SDA

#### Description

This parameter indicates whether the agent has enabled the self-describing agent (SDA) function in the agent address space.

## Kpp\_AGT\_TEMS\_NAME\_NODEID

Use the KPP\_AGT\_TEMS\_NAME\_NODEID parameter to specify the primary Tivoli® Enterprise Monitoring Server values for configuring an agent in its own address space.

#### Required or optional

Optional

#### Location where the parameter value is stored

In the KPPENV member in the *rhilev.midlev.rtename.RKANPARU* library

#### Parameter name and syntax

CT\_CMSLIST=%KPP\_AGT\_TEMS\_NAME\_NODEID

**Default value**

*&rtename*:CMS

**Permissible values**

A string of up to 8 case-sensitive characters defining the node ID of the Tivoli Enterprise Monitoring Server to which you are connecting the agent.

**PARMGEN name**

*KPP\_AGT\_TEMS\_NAME\_NODEID*

**PARMGEN classification**

Values that describe the primary TEMS this agent will connect to: specify the primary TEMS (*Kpp\_TEMS\_TCP\_\** and *Kpp\_TEMS\_VTAM\_\**) parameter values that the agent will connect to.

**Related parameters**

- [“Kpp\\_TEMS\\_NAME\\_NODEID” on page 1293](#)

**Related PARMGEN CONFIG profile parameters*****Kpp\_TEMS\_BKUP1\_\****

Agent's backup TEMS parameter values. The agent's primary and backup TEMS parameter values are used in the CT\_CMSLIST parameter in the agent's *xKANPARU(KppENV)* member.

***Kpp\_AGT\_VIRTUAL\_IP\_ADDRESS***

Use the *KPP\_AGT\_VIRTUAL\_IP\_ADDRESS* parameter to set this parameter to the type of VIPA defined for this z/OS® system.

**Required or optional**

Required

**Location where the parameter value is stored**

The parameter value is not stored, but is used for internal processing.

**Parameter name**

AGVIPA (VIPA type for the z/OS® system)

**Default value**

N

**Permissible values**

S (static), D (dynamic), or N (none)

**PARMGEN name**

*KPP\_AGT\_VIRTUAL\_IP\_ADDRESS*

**PARMGEN classification**

Advanced Agent configuration values

**Description**

VIPA type for the z/OS® system

Set this parameter to the type of VIPA defined for this z/OS® system. If the monitoring agent address space is a VIPA-defined application, specify if the VIPA definition is Static or Dynamic. If VIPA is in use, the VIPA name is resolvable through the Domain Name Server (DNS).

**Note:** The IP.PIPE protocol is required when dynamic VIPA is in use.

**Related parameters**

None

## **Kpp\_AGT\_VTAM\_APPL\_AA**

Use the *KPP\_AGT\_VTAM\_APPL\_AA* parameter to specify the Alert Adapter application identifier for the agent address space.

### **Required or optional**

Required

### **Location where the parameter value is stored**

In the VTAM® major node (CTDPPN is the default) member of the of the *rhilev.midlev.rtename.RKANSAMU* library

#### **Parameter name**

N/A

#### **Default value**

CTDPPAA

#### **Permissible values**

A valid applid name no longer than 8 characters in length

### **PARMGEN name**

*KPP\_AGT\_VTAM\_APPL\_AA*

### **Description**

VTAM® applid for Alert Adapter

This parameter specifies the Alert Adapter application identifier for the agent address space. This value is normally specified in “*Kpp\_AGT\_VTAM\_APPL\_PREFIX*” on page 1281, with the characters **AA** appended to it.

### **Related parameters**

None

## **Kpp\_AGT\_VTAM\_APPL\_KPPINVPO**

Use the *KPP\_AGT\_VTAM\_APPL\_KPPINVPO* parameter to specify the VPO VTAM® application identifier for the agent address space.

### **Required or optional**

Required

### **Location where the parameter value is stored**

In the CTDPPN member of the of the *rhilev.midlev.rtename.RKANSAMU* library

#### **Parameter name**

N/A

#### **Default value**

CTDPPVP

#### **Permissible values**

A valid applid name no longer than 8 characters in length

### **PARMGEN name**

*KPP\_AGT\_VTAM\_APPL\_KPPINVPO*

### **PARMGEN classification**

Agent applids

### **Description**

VTAM® applid for VPO interface

This parameter specifies the VPO VTAM® application identifier for the agent address space. This value is normally specified in “[Kpp\\_AGT\\_VTAM\\_APPL\\_PREFIX](#)” on [page 1281](#), with the characters VP appended to it.

#### Related parameters

None

## Kpp\_AGT\_VTAM\_APPL\_NCS

Use the *KPP\_AGT\_VTAM\_APPL\_NCS* parameter to specify the Network Computing System (NCS) application identifier for the agent address space.

#### Required or optional

Required

#### Location where the parameter value is stored

In the CTDPN member of the of the *rhilev.midlev.rtename.RKANSAMU* library

##### Parameter name

N/A

##### Default value

CTDPPNC

##### Permissible values

A valid node name no more than 8 characters in length

#### PARMGEN name

*KPP\_AGT\_VTAM\_APPL\_NCS*

#### PARMGEN classification

Agent applids

#### Description

Agent to server connection applid

This parameter specifies the Network Computing System (NCS) application identifier for the agent address space. This value is normally specified in “[Kpp\\_AGT\\_VTAM\\_APPL\\_PREFIX](#)” on [page 1281](#), with the characters **NC** appended to it.

#### Related parameters

- “[Kpp\\_AGT\\_VTAM\\_APPL\\_PREFIX](#)” on [page 1281](#)

## Kpp\_AGT\_VTAM\_APPL\_OPERATOR

Use the *KPP\_AGT\_VTAM\_APPL\_OPERATOR* parameter to specify the operator VTAM® application identifier for the agent address space.

#### Required or optional

Required

#### Location where the parameter value is stored

In the CTDPN member of the of the *rhilev.midlev.rtename.RKANSAMU* library

##### Parameter name

N/A

##### Default value

CTDPPOR

##### Permissible values

A valid applid name no longer than 8 characters in length

#### PARMGEN name

KPP\_AGT\_VTAM\_APPL\_OPERATOR

**PARMGEN classification**

Agent applids

**Description**

VTAM® applid for the non-CUA operator

This parameter specifies the operator VTAM® application identifier for the agent address space. This is normally the value specified in “[Kpp\\_AGT\\_VTAM\\_APPL\\_PREFIX](#)” on page 1281, with the characters OR appended to it.

**Related parameters**

None

## Kpp\_AGT\_VTAM\_APPL\_PREFIX

Use the KPP\_AGT\_VTAM\_APPL\_PREFIX parameter to build the VTAM® applids for the agent.

**Required or optional**

Required for SNA communications

**Location where the parameter value is stored**

The VTAMLST definition is created in the *rhilev.midlev.rtename*.RKANSAMU library. Copy this definition to your SYS1.VTAMLST library.

**Parameter name**

VTAMLST

**Default value**

CTDPP

**Permissible values**

A character string of up to 6 characters

**PARMGEN name**

KPP\_AGT\_VTAM\_APPL\_PREFIX

**PARMGEN classification**

Agent applids

**Description**

Agent Applid prefix

This parameter is a prefix that is used to build the VTAM® applids for the agent. This is a required field if you plan to have the monitoring agent communicate with the server using VTAM®.

This parameter specifies the applid prefix to establish the VTAM® node and applid list. The product creates a customized VTAMLST definition in the *rhilev.midlev.rtename*.RKANSAMU library, which you then copy to your SYS1.VTAMLST library after the Configuration Software work is complete. The default is **CTDPP**.

**Note:**

1. Each product requires its own set of IDs. Make sure that the product identifiers are unique.
2. Do not confuse this value with “[Kpp\\_AGT\\_VTAM\\_NODE](#)” on page 1282, the value for specifying the VTAM® major node.

**Related parameters**

None

## Kpp\_AGT\_VTAM\_NODE

Use the *KPP\_AGT\_VTAM\_NODE* parameter to specify the name that will be used to build the VTAM® node entry for the agent.

### Required or optional

Required for SNA communications

### Location where the parameter value is stored

In the *CTDPPN* member of the *rhilev.midlev.rtename.RKANSAMU* library

#### Parameter name

*XPPAPLN*

#### Default value

*CTDPPN*

#### Permissible values

A valid node name no more than 8 characters in length

### PARMGEN name

*KPP\_AGT\_VTAM\_NODE*

### PARMGEN classification

Agent's local VTAM® and logon information

### Description

Agent node name

This parameter specifies the name that will be used to build the VTAM® node entry for the agent. This is a required field if you plan to have the agent communicate with the server using VTAM®.

Specify the name of the VTAM® major node name that contains all the VTAM® APPLID definitions for OMEGAMON® for Networks. This member must be moved to your VTAMLST concatenation. The name of this major node is also the name used to activate the VTAM® APPLIDs. The default is **CTDPPN**.

### Related parameters

- [“RTE\\_VTAM\\_GBL\\_MAJOR\\_NODE” on page 1362](#)

## Kpp\_AGT\_WTO\_MSG

Use the *KPP\_AGT\_WTO\_MSG* parameter to specify whether you want the monitoring agent address space to issue Write To Operator (WTO) messages.

### Required or optional

Required

### Location where the parameter value is stored

In the *KPPSYSIN* member of the *rhilev.midlev.rtename.RKANPARU* library

#### Parameter name

*WTO(N)* (Enable WTO messages)

#### Default value

N

#### Permissible values

Y, N

### PARMGEN name

*KPP\_AGT\_WTO\_MSG*

### PARMGEN classification

Advanced Agent configuration values

## Description

Enable WTO messages

Specify **Y** as the value for this parameter if you want the monitoring agent address space to issue Write To Operator (WTO) messages. WTOs write information and exception condition messages to the operator consoles. Alert messages are always written to the consoles. The default is **N**.

## Related parameters

None

## Kpp\_CLASSIC\_PASSPHRASE

This parameter specifies the passphrase support setting for the OMEGAMON 3270 Classic interface.

This parameter is supported for the following products, each listed with its product code (*pp*):

- OMEGAMON for CICS (C2)
- OMEGAMON® AI for Db2 (D2)
- OMEGAMON for IMS (I2)
- OMEGAMON for z/OS (M2)
- IBM Z OMEGAMON Monitor for z/OS (M2)

## Description

This parameter controls if passphrase support is enabled, and, if so, the layout of the password fields on the OMEGAMON 3270 Classic interface logon screen. Multiple configuration options are provided.

**Note:** It is recommended that you review the available configuration options, especially if you use programs to automate the logon process to the OMEGAMON 3270 Classic interface that rely on static placement of keywords and input fields.

When passphrase support is enabled, use parameter **Kpp\_CLASSIC\_SECCLASS** to set the SAF security class that is used to permit or deny user access during logon to the OMEGAMON 3270 Classic interface, and use **Kpp\_CLASSIC\_SAFAPPL** to set the SAF application ID. If passphrase support is not enabled, you can use a security exit where you can specify the SAF class name and SAF application ID.

## Required or optional

Optional

## Default value

NO

## Valid values

### PARTIAL

Passphrase support is enabled with the **PASSWORD** and **NEW PASSWORD** fields each consisting of a single line. The minimum length of each of these fields is 34 bytes, and the maximum length (which can be up to 100 bytes) depends on the screen width. The fields are aligned in the center of the screen.

### MAX62

Passphrase support is enabled with the **PASSWORD** and **NEW PASSWORD** fields each consisting of a single line. The minimum length of each of these fields is 62 bytes, and the maximum length (which can be up to 100 bytes) depends on the screen width. The fields are aligned at the left of the screen.

### FULL

Passphrase support is enabled with the **PASSWORD** and **NEW PASSWORD** fields each consisting of two lines. The value in the second line is concatenated onto the end of the value in the first line. The length of the first line is 34 bytes and the length of the second line is 66 bytes, allowing the maximum passphrase value of 100 bytes to be entered. The fields are aligned in the center of the screen.

### NO or NONE

Passphrase support is not enabled. The lengths of the **PASSWORD** and **NEW PASSWORD** fields are eight bytes each. If you have external security defined using a security exit, the fields are aligned in the

center of the screen. If you do not have external security defined, none of the fields for credentials appear on the logon screen.

#### Related parameters

- [Kpp\\_CLASSIC\\_SAFAPPL](#)
- [Kpp\\_CLASSIC\\_SECCLASS](#)

### **Kpp\_CLASSIC\_SAFAPPL**

This parameter specifies the name of the SAF application ID for OMEGAMON 3270 Classic interface security.

This parameter is supported for the following products, each listed with its product code (*pp*):

- OMEGAMON for CICS (C2)
- OMEGAMON® AI for Db2 (D2)
- OMEGAMON for IMS (I2)
- OMEGAMON for z/OS (M2)
- IBM Z OMEGAMON Monitor for z/OS (M2)

#### Description

When passphrase support is enabled, this parameter specifies the name of the SAF application ID (APPL=) for OMEGAMON 3270 Classic interface security. This value is used by the primary OMEGAMON logon program, KOBVTAM, when calling the SAF security system, such as in the following example:

```
RACROUTE . . ,APPL=
```

**Important:** When passphrase support is enabled, security exits are not used.

#### Required or optional

Optional

#### Default value

CANDLE

#### Related parameters

- [Kpp\\_CLASSIC\\_PASSPHRASE](#)
- [Kpp\\_CLASSIC\\_SECCLASS](#)

### **Kpp\_CLASSIC\_SECCLASS**

This parameter specifies the name of the SAF security class for OMEGAMON 3270 Classic interface security.

This parameter is supported for the following products, each listed with its product code (*pp*):

- OMEGAMON for CICS (C2)
- OMEGAMON® AI for Db2 (D2)
- OMEGAMON for IMS (I2)
- OMEGAMON for z/OS (M2)
- IBM Z OMEGAMON Monitor for z/OS (M2)

#### Description

When passphrase support is enabled, this parameter specifies the name of the SAF security class that is used to permit or deny user access during logon to the OMEGAMON 3270 Classic interface. This value is used by the primary OMEGAMON logon program, KOBVTAM.

**Note:** When passphrase support is enabled, security exits are not used.

**Required or optional**

Optional

**Default value**

OMCANDLE

**Related parameters**

- Kpp\_CLASSIC\_PASSPHRASE
- Kpp\_CLASSIC\_SAFAPPL

## **Kpp\_CLASSIC\_TIMEOUT**

This parameter specifies the OMEGAMON 3270 Classic interface idle session timeout value.

This parameter is supported for the following products, each listed with its product code (*pp*):

- OMEGAMON for CICS (C2)
- OMEGAMON® AI for Db2 (D2)
- OMEGAMON for IMS (I2)
- OMEGAMON for z/OS (M2)
- IBM Z OMEGAMON Monitor for z/OS (M2)

**Description**

This parameter controls the maximum number of minutes that a user session of the OMEGAMON 3270 Classic interface can be idle before the session is canceled.  
The timeout value is in minutes, and 0 indicates that the session will not be timed out.

**Default value**

0

**Valid values**

0 - 99

## **Kpp\_PD\_CYL**

Use the *KPP\_PD\_CYL* parameter to specify the space allocation for the persistent data store libraries and for overhead information such as the product dictionary, table records, index records, and buffers to hold overflow data when the libraries are full.

**Required or optional**

Optional

**Location where the parameter value is stored**

The *KPPAL* member of the *rhilev.midlev.rtename.RKANPARU* library

**Parameter name**

DSG3390 (Datastore group space)

**Default value**

The configuration software computes this value using a formula using the *SIZE*, *WINDOW*, and *UNIT TYPE* values. The default differs by product.

**Permissible values**

1 - 9999

**PARMGEN name**

*KPP\_PD\_CYL*

## PARMGEN classification

Persistent datastore table space allocation overrides

## Description

Datastore group space

The parameter specifies the space allocation for the persistent data store libraries and for overhead information such as the product dictionary, table records, index records, and buffers to hold overflow data when the libraries are full. Allocate enough storage so that maintenance procedures are run only once a day. For more information about the persistent data store, see the [“Persistent data store V1 \(PDS V1\)”](#) on page 1195.

## Kpp\_PDS\_FILE\_COUNT

This parameter contains the number of historical data sets in the group.

### Required or optional

Optional

### PARMGEN name

Kpp\_PDS\_FILE\_COUNT

### Description

Number of historical data sets in the group defined by the Kpp\_PD\_GRP parameter. The value specified for this parameter is applied to the corresponding Kpp product configured in the runtime environment. The possible values range from 3 to 36. The default value is 6, but the best value for the following products is 7:

- IBM Z® OMEGAMON® for CICS®
- IBM® OMEGAMON® for Networks
- IBM® OMEGAMON® for z/OS®

Therefore, set a value of 7 if OMEGAMON® for CICS®, OMEGAMON® for Networks, or OMEGAMON® for z/OS® is to be configured in the runtime environment.

### Related parameters

- N/A

## Kpp\_PDS2\_ACTIVATION

Agent-specific activation switch

### Description

This parameter indicates whether to activate persistent data store V2 support for a specific agent.

**Y**

If global switch RTE\_PDS2\_ACTIVATION parameter is set to Y, persistent data store V2 will be used; otherwise, this parameter is ignored.

**N**

If global switch RTE\_PDS2\_ACTIVATION parameter is set to Y, you can switch off the persistent data store V2 feature for a specific agent by setting this parameter value to N. In this case, persistent data store V1 will be used.

### Default value

Y

### Permissible values

Y, N

### Related parameters

RTE\_PDS2\_ACTIVATION

KDS\_PDS2\_ACTIVATION

## Kpp\_PDS2\_FILE\_COUNT

Number of data sets for each product

### Description

This value specifies the default number of data sets that will be allocated for the persistent data store V2 for each product.

### Default value

6

**Minimum**

2

**Maximum**

36

## **Kpp\_PDS2\_SEC\_SIZE**

Data store secondary space allocation

**Description**

The number of secondary cylinders or megabytes that will be used to allocate the persistent data store V2 data sets. This value represents the number of cylinders or megabytes allocated for each data set. The allocation unit for PDS V2 is specified in parameter RTE\_PDS2\_ALLOC\_TYPE.

**blank**

The number of secondary cylinders or megabytes will be automatically calculated by an agent. The agent will use 10% of the Kpp\_PDS2\_STORE\_SIZE parameter value divided by the number of files set in Kpp\_PDS2\_FILE\_COUNT.

**0**

Only the primary allocation size will be used.

**value**

Number of secondary cylinders or megabytes that will be used for each persistent data store V2 data set as a secondary allocation size.

**Default value**

None

**Minimum**

0

**Maximum**

9999

**Related parameters**

RTE\_PDS2\_ALLOC\_TYPE

## **Kpp\_PDS2\_STORE\_SIZE**

Data store primary space allocation

**Description**

The number of primary cylinders or megabytes that will be used to allocate the persistent data store V2 data sets. To calculate the primary cylinders or megabytes for a single data set, the Kpp\_PDS2\_STORE\_SIZE value is divided by the Kpp\_PDS2\_FILE\_COUNT value. The allocation unit for PDS V2 is specified in parameter RTE\_PDS2\_ALLOC\_TYPE.

**Default value**

agent specific

**Minimum**

1

**Maximum**

9999

**Related parameters**

RTE\_PDS2\_ALLOC\_TYPE

## Kpp\_PDS2\_VOLUME

Volume for PDS V2 data set allocation for the agent

### Description

This parameter specifies the volume serial number for persistent data store V2 (PDS V2) data set allocation for the specific agent.

### Default value

%RTE\_PDS2\_VOLUME%

### Permissible values

Character string, maximum length 6

## Kpp\_TEMS\_BKUP1\_NAME\_NODEID

This parameter specifies the backup monitoring server values for configuring an agent for your site.

### Description

Server that the monitoring agent will connect to if the primary Tivoli® Enterprise Monitoring Server (monitoring server) fails.

This parameter specifies backup monitoring server values for configuring an agent for your site. This name must match the name of a non-z/OS monitoring server or the CMS\_NODEID parameter value for a z/OS® TEMS. If the parameter value contains the SMFID, you must enter the z/OS® system's SMFID in place of this literal.

**Note:** The value of this field is case-sensitive for both z/OS® and non-z/OS monitoring server names.

### Default value

No default

### Permissible values

A string of up to 32 case-sensitive characters

### Related parameters

None

## Kpp\_TEMS\_BKUP1\_TCP\_HOST

This parameter specifies the TCP/IP host name or IP address for the non-z/OS backup hub TEMS that this monitoring agent connects to if the primary hub TEMS is unavailable.

### Description

This parameter is used for configuring this agent to participate in a *hot standby* configuration with a non-z/OS (distributed) hub TEMS that has been enabled for Fault Tolerant Option (FTO). Specify the TCP/IP host name or IP address where the non-z/OS backup (standby) hub TEMS is running.

This parameter is required if you plan to have this monitoring agent communicate with the non-z/OS backup hub TEMS using TCP/IP. An IP-related protocol must be enabled.

### Default value

None

### Permissible values

Character string, maximum length 32

### Related parameters

None

## Kpp\_TEMS\_BKUP1\_VTAM\_APPL\_LLB\_BKR

### Required or optional

Optional. This is a required field if this monitoring agent needs to communicate with the backup server using VTAM® protocol.

### Location where the parameter value is stored

In the *KPPENV* member in the *rhilev.midlev.rtename.RKANPARU* library if you use SNA to communicate with the backup Tivoli® Enterprise Monitoring Server

#### Parameter name

N/A

#### Default value

No default

#### Permissible values

A string of up to 8 characters

### PARMGEN name

*KPP\_TEMS\_BKUP1\_VTAM\_APPL\_LLB\_BKR*

### PARMGEN classification

Secondary TEMS VTAM® information

### Description

Backup Server Location Broker applid

This parameter identifies the Local Location Broker that is to be used for VTAM®-type communication to the backup server. Enter the Local Location Broker applid of the secondary Tivoli® Enterprise Monitoring Server that this agent communicates with. This is a required field if this agent needs to communicate with the backup server using SNA protocol. This field is not required if you use TCP/IP for communication with the backup monitoring server.

### Related parameters

None

## Kpp\_TEMS\_BKUP1\_VTAM\_LU62\_DLOGMOD

Use the *KPP\_TEMS\_BKUP1\_VTAM\_LU62\_DLOGMOD* parameter to specify the name of the LU6.2 LOGMODE that was defined for the backup server.

### Required or optional

Optional. This is a required field if you plan to have the backup server communicate with monitoring agents using VTAM®.

### Location where the parameter value is stored

In the *KPPENV* member in the *rhilev.midlev.rtename.RKANPARU* library if you use SNA to communicate with the backup Tivoli® Enterprise Monitoring Server

#### Parameter name

N/A

#### Default value

CANCTDCS

#### Permissible values

A string of up to 8 characters

### PARMGEN name

*KPP\_TEMS\_BKUP1\_VTAM\_LU62\_DLOGMOD*

### PARMGEN classification

Secondary TEMS VTAM® information

### Description

Agent backup Server LU6.2 logmode

This parameter specifies the name of the LU6.2 LOGMODE that was defined for the backup server. The default is CANCTDCS. This is a required field if you plan to have the backup server communicate with agents using SNA. This field is not needed if you use TCP/IP for communication with the backup monitoring server.

### Related parameters

None

## Kpp\_TEMS\_BKUP1\_VTAM\_NETID

Use the `KPP_TEMS_BKUP1_VTAM_NETID` parameter to identify your SNA network.

### Required or optional

Optional. This is a required field if you plan to have the backup server communicate with monitoring agents using VTAM®.

### Location where the parameter value is stored

In the `PPENV` member in the `rhilev.midlev.rtename.RKANPARU` library if you use SNA to communicate with the backup Tivoli® Enterprise Monitoring Server

#### Parameter name

N/A

#### Default value

No default

#### Permissible values

A string of up to 8 characters

### PARMGEN name

`KPP_TEMS_BKUP1_VTAM_NETID`

### PARMGEN classification

Secondary TEMS VTAM® information

### Description

Agent backup Sever Network ID

This parameter identifies your SNA network. You can locate this value on the NETID parameter within the VTAMLST startup member, `ATCSTRnn`. This is a required field if you plan to have the backup server communicate with monitoring agents using SNA. This field is not needed if you use TCP/IP for communication with the backup monitoring server.

### Related parameters

None

## Kpp\_TEMS\_LOCAL\_CONNECT\_FLAG

Use the `KPP_TEMS_LOCAL_CONNECT_FLAG` parameter to specify values that describe the primary TEMS the agent will connect to.

**Note:** Specify the `Kpp_TEMS_TCP_*` or `Kpp_TEMS_VTAM_*` parameter values for the primary TEMS that the agent will connect to.

### Required or optional

Optional

### Location where the parameter value is stored

The parameter value is not stored, but is used for internal processing.

**Parameter name**

AGLOCCN (Connect agent to local TEMS)

**Default value**

Y

**Permissible values**

Y, N

**PARMGEN name**

KPP\_TEMS\_LOCAL\_CONNECT\_FLAG

**PARMGEN classification**

Values that describe the Primary TEMS the Agent will connect to

**Description**

Connect agent to local TEMS

This parameter specifies how you want to connect the agent you are defining. When defining an agent, you have the option to connect the agent to a local server or a remote server. When connecting to a local server you are connecting the agent to the server in this runtime environment.

Specify **Y** to connect the agent to the server in this RTE. Otherwise, specify **N** to have the agent connect to a remote server.

**Related PARMGEN CONFIG profile parameter****Kpp\_TEMS\_BKUP1\_\***

Agent's backup TEMS parameter values

The agent's primary and backup TEMS parameter values are used in the CT\_CMSLIST parameter in the agent's xKANPARU(KppENV) member.

**Kpp\_TEMS\_NAME\_NODEID**

This parameter defines the primary Tivoli® Enterprise Monitoring Server values for configuring an agent for your site.

**Description**

Primary monitoring server that this monitoring agent connects to.

This parameter specifies the primary Tivoli® Enterprise Monitoring Server values for configuring an agent for your site. This name must match the name of a non-z/OS monitoring server, or the CMS\_NODEID parameter value, in the KDSENV member of the *rhilev.midlev.rtename*.RKANPARU library for a z/OS® TEMS. If the parameter value contains the SMFID, you must enter the z/OS® system's SMFID in place of this literal.

**Note:** The value of this field is case-sensitive for both z/OS® and non-z/OS monitoring server names.

**Default value**

No default

**Permissible values**

A string of up to 8 case-sensitive characters defining the nodeid of the server to which you are connecting the agent

**Related parameters**

None

**Kpp\_TEMS\_TCP\_HOST**

Use this parameter to specify the agent's primary Tivoli Enterprise Monitoring Server TCP/IP information.

**Description**

This parameter specifies the server hostname or IP address.

**Note:** To modify this parameter value using Configuration Manager, use parameter “[RTE\\_TCP\\_HOST](#)” on [page 288](#), which sets the same value for the monitoring server and the monitoring agents.

If the primary Tivoli Enterprise Monitoring Server is on z/OS, to obtain the hostname or IP address, enter **TSO HOMETEST** at the command line. If the z/OS domain name resolver configuration specifies a search path that includes the target domain suffix, specify only the first qualifier of the hostname. (Example: sys is the first qualifier of the fully-qualified hostname sys.ibm.com) Otherwise, specify the fully-qualified hostname.

This parameter is required for this server to communicate with agents using TCP/IP.

#### Default value

##### For Configuration Manager:

Value set for parameter “[RTE\\_TCP\\_HOST](#)” on [page 288](#), which defaults to %SYSIPHOSTNAME%

##### For PARMGEN:

%SYSIPHOSTNAME%

#### Permissible values

Character string, maximum length 39

#### Related parameters

- “[RTE\\_TCP\\_HOST](#)” on [page 288](#)
- “[KDS\\_TEMS\\_TCP\\_HOST](#)” on [page 1412](#)
- “[Kpp\\_TEMS\\_LOCAL\\_CONNECT\\_FLAG](#)” on [page 1292](#)

## Kpp\_TEMS\_TCP\_PIPE\_PORT\_NUM

This parameter specifies the port number that you want to use for the IP.PIPE communication protocol (the TCP/IP protocol that supports IPv4).

#### Description

Agent IP.PIPE port number

This parameter specifies the IP.PIPE port number that you want to use. This port number is used by the non-secure Network Computing System (NCS) IP.PIPE protocol.

**Note:** Port numbers for non-secure IP.PIPE protocol and IP.UDP protocol must match.

This parameter is required if you specified a value of IPPPIPE as one of the “[Kpp\\_AGT\\_COMM\\_PROTOCOLn](#)” on [page 1264](#) protocol parameters.

#### Default value

The value set in [RTE\\_TCP\\_PORT\\_NUM](#). If no value is provided in [RTE\\_TCP\\_PORT\\_NUM](#), 1918 is used.

#### Permissible values

1 - 65535

#### Related parameters

- “[Kpp\\_AGT\\_COMM\\_PROTOCOLn](#)” on [page 1264](#)
- [RTE\\_TCP\\_PORT\\_NUM](#)

## Kpp\_TEMS\_TCP\_PIPE6\_PORT\_NUM

This parameter specifies the port number that you want to use for the IP6.PIPE communication protocol (the TCP/IP protocol that supports IPv6).

### Description

Agent IP6.PIPE port number

This parameter specifies the IP6.PIPE port number that you want to use. This port number is used by the non-secure Network Computing System (NCS) IP.PIPE protocol.

**Note:** Port numbers for non-secure IP6.PIPE and IP.UDP protocols must match.

This parameter is required if you specified a value of IP6PIPE in one of the [“Kpp\\_AGT\\_COMM\\_PROTOCOLn” on page 1264](#) protocol parameters.

### Default value

The value set in [Kpp\\_TEMS\\_TCP\\_PIPE\\_PORT\\_NUM](#). If no value is provided in [Kpp\\_TEMS\\_TCP\\_PIPE\\_PORT\\_NUM](#), 1918 is used.

### Permissible values

1 - 65535

### Related parameters

- [“Kpp\\_AGT\\_COMM\\_PROTOCOLn” on page 1264](#)
- [Kpp\\_TEMS\\_TCP\\_PIPE\\_PORT\\_NUM](#)

## Kpp\_TEMS\_TCP\_PIPE6S\_PORT\_NUM

This parameter specifies the port number that you want to use for the IP6.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv6).

### Description

Agent IP6.SPIPE port number

This parameter specifies the IP6.SPIPE port number that you want to use. This port number is used by the secure Network Computing System (NCS) IP.PIPE protocol.

**Note:** Port numbers for non-secure IP.PIPE and IP.UDP protocols must match.

This parameter is required if you specified a value of IP6SPIPE in one of the [“Kpp\\_AGT\\_COMM\\_PROTOCOLn” on page 1264](#) protocol parameters.

### Default value

3660

### Permissible values

1 - 65535

### Related parameters

- [“Kpp\\_AGT\\_COMM\\_PROTOCOLn” on page 1264](#)

## Kpp\_TEMS\_TCP\_PIPE4\_PORT\_NUM

This parameter specifies the port number that you want to use for the IP.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv4).

### Description

Agent IP.SPIPE port number

This parameter specifies the IP.SPIPE port number that you want to use. This port number is used by the secure Network Computing System (NCS) IP.PIPE protocol.

**Note:** Port numbers for non-secure IP.SPIPE protocols must match.

This parameter is required if you specified a value of IP.SPIPE in one of the “[Kpp\\_AGT\\_COMM\\_PROTOCOLn](#)” on [page 1264](#) protocol parameters.

**Default value**

3660

**Permissible values**

1 - 65535

**Related parameters**

- “[Kpp\\_AGT\\_COMM\\_PROTOCOLn](#)” on [page 1264](#)

## Kpp\_TEMS\_TCP\_UDP\_PORT\_NUM

This parameter specifies the port number that you want to use for the IP.UDP communication protocol (the TCP/IP protocol that uses the packet-based, connectionless User Datagram Protocol under IPv4).

**Description**

Agent IP.UDP port number

This parameter specifies the IP.UDP port number that you want to use. This port number is used by the non-secure Network Computing System (NCS) IP (UDP) protocol.

**Note:** Port numbers for non-secure IP.PIPE protocol and IP.UDP protocol must match.

This parameter is required if you specified a value of IP in one of the “[Kpp\\_AGT\\_COMM\\_PROTOCOLn](#)” on [page 1264](#) protocol parameters.

**Default value**

1918

**Permissible values**

1 - 65535

**Related parameters**

- “[Kpp\\_AGT\\_COMM\\_PROTOCOLn](#)” on [page 1264](#)

## Kpp\_TEMS\_TCP\_UDP6\_PORT\_NUM

This parameter specifies the port number that you want to use for the IP6.UDP communication protocol (the packet-based, connectionless User Datagram Protocol that supports IPv6).

**Description**

Agent IP6.UDP port number for IPv6

This parameter specifies the IP6.UDP port number that you want to use. This port number is used by the non-secure Network Computing System (NCS) IP (UDP) protocol.

**Note:** Port numbers for non-secure IP.PIPE protocols must match.

This parameter is required if you specified a value of IP6 in one of the “[Kpp\\_AGT\\_COMM\\_PROTOCOLn](#)” on [page 1264](#) protocol parameters.

**Default value**

The value set in [Kpp\\_TEMS\\_TCP\\_UDP\\_PORT\\_NUM](#). If no value is provided in [Kpp\\_TEMS\\_TCP\\_UDP\\_PORT\\_NUM](#), 1918 is used.

**Permissible values**

1 - 65535

**Related parameters**

- [“Kpp\\_AGT\\_COMM\\_PROTOCOLn” on page 1264](#)

## **Kpp\_TEMS\_VTAM\_APPL\_LL\_BROKER**

Use the [KPP\\_TEMS\\_VTAM\\_APPL\\_LL\\_BROKER](#) parameter to identify which Local Location Broker is to be used for VTAM®-type communication.

**Description**

Local Location Broker *applid*

This parameter identifies which Local Location Broker is to be used for VTAM®-type communication.

This is a required field if you use SNA to communicate with the Tivoli® Enterprise Monitoring Server.

**Required or optional**

Required if you use SNA to communicate with the Tivoli® Enterprise Monitoring Server

**Default value**

CTDDSLB

**Permissible values**

A string of up to 8 characters

**Related parameters**

None

## **Kpp\_TEMS\_VTAM\_LU62\_DLOGMOD**

Use the [KPP\\_TEMS\\_VTAM\\_LU62\\_DLOGMOD](#) parameter to specify the name of the LU6.2 LOGMODE that was defined for the server.

**Description**

LU6.2 LOGMODE

This parameter specifies the name of the LU6.2 LOGMODE that was defined for the server. This is a required field if you plan to have the server communicate with agents using VTAM®. The IBM® default is **CANCTDCS**.

**Required or optional**

Required if you use SNA to communicate with the Tivoli® Enterprise Monitoring Server

**Default value**

CANCTDCS

**Permissible values**

Character string, maximum length 8

**Related parameters**

None

## Kpp\_TEMS\_VTAM\_LU62\_MODETAB

Use the `KPP_TEMS_VTAM_LU62_MODETAB` parameter to specify the name of the LOGMODE table containing the LU6.2 LOGMODE definition.

### Required or optional

Required if you use SNA to communicate with the Tivoli® Enterprise Monitoring Server

### Location where the parameter value is stored

The CTDPN member of the *rhilev.midlev.rtename.RKANSAMU* library

### Parameter name and syntax

```
CT_CMSLIST=%KPP_TEMS_VTAM_LU62_MODETAB
```

### Default value

KDSMTAB1

### Permissible values

Character string, maximum length 8

### PARMGEN name

`KPP_TEMS_VTAM_LU62_MODETAB`

### PARMGEN classification

Agent's Primary TEMS VTAM® information

### Description

LOGMODE table name

This parameter specifies the name of the LOGMODE table containing the LU6.2 LOGMODE definition. This is a required field if you plan to have the server communicate with agents using SNA.

### Related parameters

None

## Kpp\_TEMS\_VTAM\_NETID

Use the `KPP_TEMS_VTAM_NETID` parameter to specify the identifier of your VTAM® network.

### Required or optional

Required if you use SNA to communicate with the Tivoli® Enterprise Monitoring Server

### Location where the parameter value is stored

The KPPENV member of the *rhilev.midlev.rtename.RKANPARU* library

### Parameter name and syntax

```
CT_CMSLIST=%KPP_TEMS_VTAM_NETID
```

### Default value

Value set for the RTE\_VTAM\_NETID or RTE\_SYSV\_VTAM\_NETID parameter

### Permissible values

Character string, maximum length 8

### PARMGEN name

`KPP_TEMS_VTAM_NETID`

### PARMGEN classification

Agent's Primary TEMS VTAM® information

### Description

Network ID

This parameter specifies the identifier of your VTAM® network. You can locate this value on the NETID parameter within the VTAMLST startup member (ATCSTRnn). This is a required field if you plan to have this server communicate to agents using VTAM®.

### Related parameters

None

## Kpp\_X\_AGT\_CONFIRM\_SHUTDOWN

Use this parameter to specify the maximum number of seconds between two successive SHUTDOWN commands or MVS STOP (P) commands to terminate the monitoring agent address space.

### Required or optional

Required

### Location where parameter value is stored

In the KPPSYSIN member of the *rhilev.midlev.rtename*.RKANPARU library

#### Parameter name

CONFIRM(&XPPFIRM) (Confirm shutdown option)

#### Default value

0

#### Permissible values

0 to 15

### PARMGEN name

KPP\_X\_AGT\_CONFIRM\_SHUTDOWN

### PARMGEN classification

Additional agent settings

### Description

Confirm shutdown option

This parameter sets the maximum number of seconds between two successive SHUTDOWN commands or MVS STOP (P) commands to terminate the monitoring agent address space.

**CONFIRM(0)** allows TMS:Engine shutdown to begin immediately without an additional, confirming SHUTDOWN command.

**CONFIRM(n)** prevents accidental shutdowns by requiring you to confirm the command by entering it a second time within the specified number of seconds.

For example, CONFIRM(15) requires you enter SHUTDOWN twice within 15 seconds to terminate the address space.

The default for the monitoring agent CONFIRM is 0, which is also the Tivoli® Enterprise Monitoring Server default.

### Related parameters

None

## Kpp\_X\_AGT\_DEBUG\_TRACE

Use this parameter to specify whether TMS:Engine debugging services are to be activated.

### Required or optional

Optional

### Location where parameter value is stored

In the KPPSYSIN member of the *rhilev.midlev.rtename*.RKANPARU library

#### Parameter name

DEBUG(&XPPDEBG) (TMS:Engine Debugging Services)

#### Default value

N

**Permissible values**

Y, N

**PARMGEN name**

KPP\_X\_AGT\_DEBUG\_TRACE

**PARMGEN classification**

Additional agent settings

**Description**

TMS:Engine Debugging Services

**Attention:** Do not modify this parameter except under the guidance of IBM® Software Support.

This parameter specifies whether TMS:Engine debugging services are to be activated.

**N** means that basic debugging information will not be recorded.

**Y** means that basic debugging information will be recorded.

DEBUG and STGDEBUG may affect each other. If DEBUG(Y) is specified and STGDEBUG is omitted, basic storage debugging is turned on, causing an increase in storage use.

STGDEBUG must also be specified after DEBUG in the initialization deck for proper functioning of these turned on, causing an increase in storage use. DEBUG will override STGDEBUG if it follows STGDEBUG.

The default for the monitoring agent DEBUG is **N**.

**Related parameters**

None

**Kpp\_X\_AGT\_KDC\_DEBUG**

Use this parameter to instruct the data communications layer to report communications problems using a minimal, summary format.

**Required or optional**

Optional

**Location where parameter value is stored**

In the KPPENV member in the *rhilev.midlev.rtename*.RKANPARU library

**Parameter name**

KBS\_DEBUG=(&amp;XPPDEBUG) (TCP/IP communication trace debug)

**Default value**

N

**Permissible values**

Y, N, D, M, A

**PARMGEN name**

KPP\_X\_AGT\_KDC\_DEBUG

**PARMGEN classification**

Additional agent settings

**Description**

TCP/IP communication trace debug

**Attention:** Do not modify this parameter except under the guidance of IBM® Software Support.

## TCP/IP communication trace debug

Set this parameter to **Y** if you want KDC\_DEBUG=Y as the override setting in RKANPARU(KPPENV) member. Otherwise, the default setting of KDC\_DEBUG=N is used. This default parameter instructs the data communications layer to report communications problems using a minimal, summary format. This parameter is intended for stable applications in production.

Note that the default KDC\_DEBUG=N generates standard RAS1 trace data in the Agent RKLVLLOG, in addition to the summary information diagnosing possible timeout conditions.

The following settings report on data communications problems:

- KDC\_DEBUG=N: minimal tracing (default)
- KDC\_DEBUG=Y: full-packet tracing
- KDC\_DEBUG=D: KDC\_DEBUG=Y plus STATE & FLOW tracing
- KDC\_DEBUG=M: KDC\_DEBUG=D plus INPUT & OUTPUT HELPs tracing
- KDC\_DEBUG=A: KDC\_DEBUG=M plus all format tracing

**Note:** Do not set KDC\_DEBUG=A unless directed to by IBM® Software Support. Higher trace levels increase the size of RKLVLLOG and could eventually fill the JES spool over time.

## Related parameters

None

## Kpp\_X\_AGT\_LGSA\_VERIFY

Use this parameter to specify whether TMS:Engine checks that the \$GSA address is available.

## Required or optional

Required

## Location where parameter value is stored

In the KPPSYSIN member of the *rhilev.midlev.rtename*.RKANPAU library

## Parameter name

LGSA(&XPPLGSA) (Verify \$GSA address availability)

## Default value

Y

## Permissible values

Y, N

## PARMGEN name

KPP\_X\_AGT\_LGSA\_VERIFY

## PARMGEN classification

Additional agent settings

## Description

Verify \$GSA address availability

**Attention:** Do not modify this parameter except under the guidance of IBM® Software Support.

This parameter determines whether TMS:Engine checks that the \$GSA address is available. Y, N are the only options.

**Y** means you want to check if available.

**N** means you do not want to check if available.

The default for the monitoring agent LGSA is Y, which is also the Tivoli® Enterprise Monitoring Server default value.

#### Related parameters

None

## Kpp\_X\_AGT\_LSRPOOL\_BUFFER\_NUM

Use this parameter to specify the number of virtual storage buffers to be allocated for the specified buffer pool in the VSAM resource pool.

#### Required or optional

Required

#### Location where parameter value is stored

In the KPPSYSIN member of the *rhilev.midlev.rtename*.RKANPARU library

#### Parameter name

LSRPOOL(*&XPPBNUM, number*) (Number of buffers)

#### Default value

32

#### Permissible values

3 - 65535 (to the maximum amount of available virtual storage in the monitoring agent address space)

#### PARMGEN name

KPP\_X\_AGT\_LSRPOOL\_BUFFER\_NUM

#### PARMGEN classification

Additional agent settings

#### Description

Number of buffers

This parameter specifies the number of virtual storage buffers to be allocated for buffer pool "n" in the VSAM resource pool. You must specify a size for each buffer pool individually. You cannot string the definitions because they must be specified individually.

Permissible values: 3-65535.

This parameter has size of buffers and number of buffer and is specified as LSRPOOL(32768,32).

The default for the monitoring agent LSRPOOL buffer number is 32.

#### Related parameters

None

## Kpp\_X\_AGT\_LSRPOOL\_BUFSIZE

Use this parameter to specify the size in bytes of each virtual storage buffer in the specified buffer pool in the VSAM resource pool.

#### Required or optional

Required

#### Location where parameter value is stored

In the KPPSYSIN member of the *rhilev.midlev.rtename*.RKANPARU library

#### Parameter name

LSRPOOL(*&XPPBSIZ, number*) (Size of virtual storage buffer in pool)

#### Default value

32768

#### Permissible values

512, 1024, 2048, 8192, 12288, 16384, 20480, 24576, 28672, or 32768

**PARMGEN name**

KPP\_X\_AGT\_LSRPOOL\_BUFSIZE

**PARMGEN classification**

Additional agent settings

**Description**

Size of virtual storage buffer in pool

This parameter specifies the size in bytes of each virtual storage buffer in buffer pool "n" in the VSAM resource pool. You must specify a size for each buffer pool individually. You cannot string the definitions because they must be specified individually.

Permissible values are one of the following: 512, 1024, 2048, 8192, 12288, 16384, 20480, 24576, 28672, or 32768.

This parameter has size of buffers and number of buffer and specified as LSRPOOL(32768,32).

The default for the monitoring agent LSRPOOL buffer size is 32768.

**Related parameters**

None

## Kpp\_X\_AGT\_SDUMP\_SVC\_SYS1\_DUMP

Use this parameter to specify whether SVC dumps are generated.

**Required or optional**

Required

**Location where parameter value is stored**

In the KPPSYSIN member of the *rhilev.midlev.rtename*.RKANPARU library

**Parameter name**

SDUMP(&XPPDSVC) (Generate SVC dump)

**Default value**

Y

**Permissible values**

Y, N, S, M

**PARMGEN name**

KPP\_X\_AGT\_SDUMP\_SVC\_SYS1\_DUMP

**PARMGEN classification**

Additional agent settings

**Description**

Generate SVC dump

This parameter determines whether SVC dumps are generated.

**Y** directs the SVC dump to a system dump data set (SYS1.DUMPxx). Before you specify Y as the value of this parameter, ensure that the TMS:Engine job step is APF-authorized and that the SYS1.DUMPxx data sets are large enough to hold the contents of the TMS:Engine address space.

**N** directs formatted dumps to the RKLVSnap data set. Avoid formatted dumps if possible because they disable the TMS:Engine address space for a longer time than either SVC dumps or SYSDUMPs, and are more difficult to analyze.

**S** directs summary dumps to the RKLVSnap data set. A summary dump consists of an ABEND summary and dispatcher summary and does not provide enough information for reliable problem analysis. Use this setting for specific testing purposes only.

**M** directs ABEND dumps to the data set with the SYSMDUMP DD name. This type of dump is not formatted by the operating system and must be analyzed with IPCS. Only the first dump taken is captured in the SYSMDUMP data set unless JCL specifies DISP=MOD. TMS:Engine automatically initializes the SYSMDUMP data set with an end-of-file mark.

The default for the monitoring agent SDUMP is **Y**.

#### Related parameters

None

## **Kpp\_X\_AGT\_STORAGE\_LIMIT\_EXTEND**

This parameter specifies the maximum size for TMS:Engine primary storage (above-the-line) requests.

#### Required or optional

Required

#### Location where parameter value is stored

In the KPPSYSIN data set of the *rhilev.midlev.rtename*.RKANPARU library

##### Parameter name

LIMIT(&XPPELIM,X)

##### Default value

Varies by product

##### Permissible values

A power of 2 between 16 and 30.

#### PARMGEN name

KPP\_X\_AGT\_STORAGE\_LIMIT\_EXTEND

#### PARMGEN classification

Additional agent settings

#### Description

Extended maximum storage request

This parameter specifies the maximum size for the TMS:Engine primary storage (above-the-line) request. The maximum extended storage request size is specified as a power of 2. The minimum extended storage size is 16, which specifies a limit of 64K. The maximum is 25, which specifies a limit of 32 MB.

The default for the monitoring agent extended storage is 22, which specifies a limit of 4 MB.

#### Related parameters

None

## **Kpp\_X\_AGT\_STORAGE\_LIMIT\_PRIMARY**

Use this parameter to specify the maximum size for the TMS:Engine primary storage request.

#### Required or optional

Required

#### Location where parameter value is stored

In the KPPSYSIN member of the *rhilev.midlev.rtename*.RKANPARU library

##### Parameter name

LIMIT(&XPPPLIM,P) (Primary maximum storage request)

##### Default value

Differs by product

##### Permissible values

A power of two between 16 and 30

**PARMGEN name**

KPP\_X\_AGT\_STORAGE\_LIMIT\_PRIMARY

**PARMGEN classification**

Additional agent settings

**Description**

Primary maximum storage request

This parameter specifies the maximum size for the TMS:Engine primary storage request. The maximum primary storage request size is specified as a power of 2. The minimum primary storage size is 16, which specifies a limit of 64K. The maximum is 25, which specifies a limit of 32 MB

The default for the monitoring agent primary storage is **20**, which specifies a limit of 1 MB.

**Related parameters**

None

**Kpp\_X\_AGT\_STORAGE\_RESERVE\_EXT**

Use this parameter to specify the number of kilobytes of extended (above-the-line) storage to set aside for other routines that might perform their own GETMAINS in this address space.

**Required or optional**

Required

**Location where parameter value is stored**

In the KPPSYSIN member of the *rhilev.midlev.rtename.RKANPARU* library

**Parameter name**

RESERVE(&XAGERES, X) (Extended 31-bit region reserve)

**Default value**

2048

**Permissible values**

0 to 9999

**PARMGEN name**

KPP\_X\_AGT\_STORAGE\_RESERVE\_EXT

**PARMGEN classification**

Additional agent settings

**Description**

Extended 31-bit region reserve

This parameter specifies the number of kilobytes of extended (above-the-line) storage to set aside for other routines that might perform their own GETMAINS in this address space. If your RESERVE value is too small, you might encounter IST566I messages from VTAM® or S80A, S878, S066, S40D, or S0F9 abends.

The default for the monitoring agent primary storage reserve is **2048** KB.

**Related parameters**

None

**Kpp\_X\_AGT\_STORAGE\_RESERVE\_PRI**

Use this parameter to specify the number of KB of primary (below-the-line) storage to set aside for other routines (for example, ACF2 and RACF®) that might perform their own GETMAINS in this address space.

**Required or optional**

Required

**Location where parameter value is stored**

In the *KPPSYSIN* member of the *rhilev.midlev.rtename.RKANPARU* library

**Parameter name**

RESERVE(&XPPPRES,P) (Primary 24-bit region reserve)

**Default value**

2048

**Permissible values**

0 to 9999

**PARMGEN name**

KPP\_X\_AGT\_STORAGE\_RESERVE\_PRI

**PARMGEN classification**

Additional agent settings

**Description**

Primary 24-bit region reserve

This parameter specifies the number of KB of primary (below-the-line) storage to set aside for other routines (for example, ACF2 and RACF®) that might perform their own GETMAINS in this address space. ACF2 and RACF® use approximately 1 KB of primary storage per logged-on user. If your RESERVE value is too small, you might encounter IST566I messages from VTAM® or S80A, S878, S066, S40D, or S0F9 abends.

The default for the monitoring agent primary storage reserve is **2048** KB.

**Related parameters**

None

## **Kpp\_X\_AGT\_STORAGE\_STGDEBUG**

Use this parameter to specify whether TMS:Engine storage debugging services are to be activated.

**Required or optional**

Optional

**Location where parameter value is stored**

The *KPPSYSIN* member of the *rhilev.midlev.rtename.RKANPARU* library

**Parameter name**

STGDEBUG(&XPPSTDB) (Storage Debugging Services)

**Default value**

N

**Permissible values**

Y, N, X

**PARMGEN name**

KPP\_X\_AGT\_STORAGE\_STGDEBUG

**PARMGEN classification**

Additional agent settings

**Description**

Storage Debugging Services

This parameter specifies whether TMS:Engine storage debugging services are to be activated.

**N** means that storage debugging information will not be recorded.

**Y** means that basic storage debugging information will be recorded.

**X** means that extended storage debugging information will be recorded.

DEBUG and STGDEBUG can affect each other. If DEBUG(Y) is specified and STGDEBUG is omitted, basic storage debugging is turned on, causing an increase in storage use.

STGDEBUG must also be specified after DEBUG in the initialization deck for proper functioning of these turned on, causing an increase in storage use. DEBUG will override STGDEBUG if it follows STGDEBUG.

The default for the monitoring agent STGDEBUG is **N**. This parameter is usually omitted from the KPPSYSIN member.

#### Related parameters

None

## Kpp\_X\_AGT\_TASKS\_ATTACHED\_NUM

Use this parameter to specify the number of general-purpose subtasks to be attached in the TMS:Engine address space.

#### Required or optional

Required

#### Location where parameter value is stored

In the KPPSYSIN member of the *rhilev.midlev.rtename*.RKANPARU library

#### Parameter name

TASKS(&XPPTASK) (Default number of available processors)

#### Default value

1

#### Permissible values

Do not modify this parameter except under the guidance of IBM® Software Support.

#### PARMGEN name

KPP\_X\_AGT\_TASKS\_ATTACHED\_NUM

#### PARMGEN classification

Additional agent settings

#### Description

Default number of available processors

**Attention:** Do not modify this parameter except under the guidance of IBM® Software Support.

This parameter specifies the number of general-purpose subtasks to be attached in the TMS:Engine address space. If TMS:Engine is running on a multiprocessor, the TASKS default increases both throughput and CPU usage. Reducing the number of tasks decreases both throughput and CPU usage.

The default for the monitoring agent TASKS is **1**.

#### Related parameters

None

## Kpp\_X\_HUB\_BKUP1\_TEMS\_VTAM\_NETID

Use this parameter to identify the SNA.PIPE protocol for communications with the secondary hub Tivoli Enterprise Monitoring Server.

#### Required or optional

Required, if you plan to have the backup server communicate with monitoring agents using VTAM®.

#### Location where the parameter value is stored

In the KPPENV member in the *rhilev.midlev.rtename*.RKANPARU library if you use SNA to communicate with the backup Tivoli® Enterprise Monitoring Server.

**Batch parameter name**

KPP\_X\_HUB\_BKUP1\_TEMS\_VTAM\_NETID

**Related parameters**

None

**Kpp\_X\_HUB\_BKUP1\_VTAM\_APPL\_GLBK**

Use this parameter to identify the global hub backup server location broker APPLID.

Enter the Global Location Broker APPLID of the hub Tivoli® Enterprise Monitoring Server that this agent uses for communication. This is a required field, if this agent needs to communicate with the backup server using SNA protocol. This field is not required, if you use TCP/IP for communication with the backup monitoring server.

**Required or optional**

Required if this monitoring agent needs to communicate with the backup server using VTAM® protocol.

**Location where the parameter value is stored**

In the KPPENV member in the *rhilev.midlev.rtename.RKANPARU* library if you use SNA to communicate with the backup Tivoli® Enterprise Monitoring Server

**Batch parameter name**

KPP\_X\_HUB\_BKUP1\_VTAM\_APPL\_GLBK

**Related parameters**

None

**Kpp\_X\_HUB\_TEMS\_VTAM\_NETID**

Use this parameter to specify the VTAM identifier associated with the hub monitoring server.

**Required or optional**

Required if you use SNA to communicate with the hub Tivoli® Enterprise Monitoring Server.

**Location where the parameter value is stored**

The KPPENV member of the *rhilev.midlev.rtename.RKANPARU* library

**Permissible values**

Character string, maximum length of eight

**Batch parameter name**

KPP\_X\_HUB\_TEMS\_VTAM\_NETID

**Related parameters**

None

**Kpp\_X\_HUB\_VTAM\_APPL\_GLBK**

Use the KPP\_X\_HUB\_VTAM\_APPL\_GLBK parameter to identify the global hub server location broker APPLID.

Enter the Global Location Broker APPLID of the hub Tivoli® Enterprise Monitoring Server that this agent uses for communication. This is a required field, if this agent needs to communicate with the backup server using SNA protocol. This field is not required, if you use TCP/IP for communication with the backup monitoring server.

**Required or optional**

Required if this monitoring agent needs to communicate with the hub monitoring server using the VTAM applid for the global location broker.

**Location where the parameter value is stored**

In the KPPENV member in the *rhilev.midlev.rtename.RKANPARU* library if you use SNA to communicate with the hub Tivoli® Enterprise Monitoring Server.

**Default value**

No default

### Permissible values

A string of up to 8 characters

### Batch parameter name

KPP\_X\_HUB\_VTAM\_APPL\_GLBKBR

### Related parameters

None

## Kpp\_X\_KDE\_TRANSPORT\_GBL\_OPTIONS

This parameter allows you to limit connections to a specific range of port numbers.

### Description

This parameter specifies a range of pool numbers. After the port allocation algorithm assigns a well-known port to each process, all subsequent ports that are allocated for connections between components are opaque ports; that is, any available port can be allocated for a connection. You can limit opaque port allocations to a specific range of ports by using this parameter for Tivoli Enterprise Monitoring Server (TEMS) and monitoring agents. The existing agent prefixes (*pp* variable values) are listed in [“Common agent parameters \(Kpp and KAG\)” on page 1261](#).

You can use the POOL option, as described in [“Using the POOL option to set a range of port numbers” on page 152](#), with this parameter too.

### Permissible values

The POOL option must specify a range of ports no smaller than 2 and no larger than 1024 in the format *nnnn-nnnn*.

#### Example:

POOL:1000-2023 is valid; POOL:1000-2024 is not.

If more than 1024 ports are needed in a pool for a specific protocol, you can specify more than one POOL option, as in POOL:1000-2023 POOL:3000-4023.

### Default value

None

### Related parameters

- [“KDS\\_X\\_KDE\\_TRANSPORT\\_GBL\\_OPTIONS” on page 1423](#)
- [“RTE\\_TEMS\\_TRANSPORT\\_MODE” on page 290](#)

## Kpp\_X\_KDE\_TRANSPORT\_HTTP\_OPTIONS

This parameter redefines the ports to be used by the HTTP and HTTPS daemons.

### Description

The following special settings are supported:

#### HTTPS:0

This setting eliminates error messages when the HTTPS daemon server is active and failing to obtain or bind to family ip.ssl (ip.ssl.https:3661).

#### HTTP:0, HTTPS:0

These settings disable port allocation and port bind errors for the HTTP (1920) and HTTPS (3661) default ports.

#### HTTP\_SERVER:n

This variable keyword disables HTTP and HTTPS daemon services. Do not specify this for a hub monitoring server or for the portal server.

#### HTTP\_CONSOLE:n

This variable keyword disables the TMS/Service Console facility of the HTTP daemon service.

#### HTTP\_CONSOLE:M

This variable keyword removes the process from the published Tivoli service index; this makes the process inaccessible from the TMS/Service Console.

**Default value**

None

**Related parameters**

- [“KDS\\_X\\_KDE\\_TRANSPORT\\_HTTP\\_OPTIONS” on page 1424](#)
- [“RTE\\_TEMS\\_TRANSPORT\\_MODE” on page 290](#)

## **Kpp\_X\_KDE\_TRANSPORT\_OPTIONS**

This parameter allows you to specify various options for Tivoli Enterprise Monitoring Server (TEMS) and monitoring agents.

**Description**

With this parameter you can specify various options for TEMS and monitoring agents, in addition to HTTP-related and POOL-related options.

For example, you can specify the [SKIP and COUNT options](#) to control the way port numbers are assigned to components.

See [“Kpp\\_X\\_KDE\\_TRANSPORT\\_HTTP\\_OPTIONS” on page 1309](#) for HTTP-related options and [“Kpp\\_X\\_KDE\\_TRANSPORT\\_POOL\\_OPTIONS” on page 1310](#) for POOL-related options.

**Required or optional**

Optional

**Default value**

None

**Permissible values**

A string of up to 30 characters

**Related parameters**

- [“Kpp\\_X\\_KDE\\_TRANSPORT\\_HTTP\\_OPTIONS” on page 1309](#)
- [“Kpp\\_X\\_KDE\\_TRANSPORT\\_POOL\\_OPTIONS” on page 1310](#)

## **Kpp\_X\_KDE\_TRANSPORT\_POOL\_OPTIONS**

This parameter allows you to limit connections to a specific range of port numbers.

**Description**

This parameter specifies a range of pool numbers.

After the port allocation algorithm assigns a well-known port to each process, all subsequent ports allocated for connections between components are opaque ports; that is, any available port can be allocated for a connection. You can limit opaque port allocations to a specific range of ports by using this parameter for Tivoli Enterprise Monitoring Server (TEMS) and monitoring agents. The existing agent prefixes (*pp* variable values) are listed in [“Common agent parameters \(Kpp and KAG\)” on page 1261](#).

With this parameter, you can use the POOL option, as described in [“Using the POOL option to set a range of port numbers” on page 152](#).

**Required or optional**

Optional

**Default value**

None

**Permissible values**

The POOL option must specify a range of ports no smaller than 2 and no larger than 1024 in the format *nnnn-nnnn*.

**Example:**

POOL:1000-2023 is valid; POOL:1000-2024 is not.

If more than 1024 ports are needed in a pool for a specific protocol, you can specify more than one POOL option, as in POOL:1000-2023 POOL:3000-4023.

## Kpp\_X\_PD\_HISTCOLL\_DATA\_AGT\_STC

Use the `KPP_X_PD_HISTCOLL_DATA_AGT_STC` parameter to specify historical collection is being performed by the monitoring agent address space.

#### Required or optional

Optional

#### Location where parameter value is stored

This parameter is used for internal processing to enable a flag to be set if persistent datastore configuration is being set for the product. When this flag is set, the `KPPPG`, `KPPAL`, `KPPPCTL`, `KPPPCTL2` and `KPPDEFIN` members are created in `rhilev.midlev.rtename.RKANPARU` library.

#### Parameter name

N/A

#### Default value

Y

#### Permissible values

Y, N

#### PARMGEN name

`KPP_X_PD_HISTCOLL_DATA_AGT_STC`

#### PARMGEN classification

Persistent datastore

#### Description

This parameter indicates whether historical collection is being performed by the monitoring agent address space. **Y** means that this agent address space is collecting historical data. **N** means that the agent address space is not collecting historical data. The default is **N**.

This parameter determines whether historical data collection takes place on the Tivoli® Enterprise Monitoring Server or on the monitoring agents where the monitoring agent is running in the monitoring server address space (which is the recommended configuration for this monitoring agent). The `KPDPG`, `KPDPCTL`, `KPDPCTL2`, and `KPDDEFIN` members of the `rhilev.midlev.rtename.RKANPARU` library are updated with `KPP*`-specific parameters when this flag is set.

#### Related parameters

None

## Kpp\_X\_PD\_HISTCOLL\_DATA\_TEMS\_STC

Use the `KPP_X_PD_HISTCOLL_DATA_TEMS_STC` parameter to specify whether historical collection is being performed by the Tivoli® Enterprise Monitoring Server address space.

#### Required or optional

Optional

#### Location where parameter value is stored

The parameter value is not stored, but is used for internal processing.

#### Parameter name

N/A

#### Default value

N

**Permissible values**

Y, N

**PARMGEN name**

KPP\_X\_PD\_HISTCOLL\_DATA\_TEMS\_STC

**PARMGEN classification**

Persistent datastore

**Description**

This parameter indicates whether historical collection is being performed by the Tivoli® Enterprise Monitoring Server address space. **Y** means that the monitoring server address space is collecting historical data. **N** means that the monitoring server address space is not collecting historical data. The default is **N**.

This parameter defines the started task name for historical data collection when this collection takes place on the Tivoli® Enterprise Monitoring Server and the monitoring agent is running in the monitoring server address space (which is the recommended configuration for this monitoring agent). **Y** means that the monitoring server is collecting historical data. The KPDPG, KP3AL, KPPPCTL, KPDPCTL2, and KPDEFIN members of the *rhilev.midlev.rtename.RKANPARU* library are created when this flag is set.

**Related parameters**

None

## Global (GBL) parameters

The global parameters are explained in this chapter.

### GBL\_DSN\_ACF2\_MACLIBn

This parameter contains the name of an ACF2 macro library.

**Description**

Name of an ACF2 macro library. Parameter **GBL\_DSN\_ACF2\_MACLIB** is required if the value specified for the **RTE\_SECURITY\_USER\_LOGON** parameter is ACF2. To specify an additional ACF2 macro library, use parameter **GBL\_DSN\_ACF2\_MACLIB1**.

**Permissible values**

A valid data set name

**Related parameters**

[“RTE\\_SECURITY\\_USER\\_LOGON” on page 1348](#)

### GBL\_DSN\_CBC\_SCCNOBJ

This parameter contains the name of the XL C Compiler object library

**Required or optional**

Optional

**Default value**

CBC.SCCNOBJ

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_CBC\_SCCNOBJ

**Description**

This is the name of the XL C Compiler object library.

**Related parameters**

None

## **GBL\_DSN\_CBC\_SCLBSID**

This parameter contains the name of the XL C/C++ side-deck library.

### **Required or optional**

Optional

### **Default value**

CBC.SCCNOBJ

### **Permissible values**

Character string, maximum length 44.

### **PARMGEN name**

GBL\_DSN\_CBC\_SCLBSID

### **Description**

This is the name of the XL C/C++ side-deck library.

### **Related parameters**

None

## **GBL\_DSN\_CEE\_SCEEBIND**

This parameter contains the location of the LE/370 C XPLINK resident routines.

### **Required or optional**

Optional

### **Default value**

CEE.SCEEBIND

### **Permissible values**

Character string, maximum length 44.

### **PARMGEN name**

GBL\_DSN\_CEE\_SCEEBIND

### **Description**

This is the name of the library containing LE/370 C XPLINK resident routines.

### **Related parameters**

None

## **GBL\_DSN\_CEE\_SCEEBND2**

This parameter contains the location of the LE/370 C XPLINK LP64 library.

### **Required or optional**

Optional

### **Default value**

CEE.SCEEBND2

### **Permissible values**

CEE.SCEEBND2

### **PARMGEN name**

GBL\_DSN\_CEE\_SCEEBND2

### **Description**

This is the name of the LE/370 C XPLINK LP64 library.

**Related parameters**

None

**GBL\_DSN\_CEE\_SCEECPP**

This parameter contains the name of the LE/370 C++ class library.

**Required or optional**

Optional

**Default value**

CEE.SCEECPP

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_CEE\_SCEECPP

**Description**

This is the name of the LE/370 C++ class library.

**Related parameters**

None

**GBL\_DSN\_CEE\_SCEELIB**

This parameter contains the name of the LE/370 C side-deck library.

**Required or optional**

Optional

**Default value**

CEE.SCEELIB

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_CEE\_SCEELIB

**Description**

This is the name of the LE/370 C side-deck library.

**Related parameters**

None

**GBL\_DSN\_CEE\_SCEELKED**

This parameter contains the name of the LE/370 C link-edit library.

**Required or optional**

Required

**Default value**

CEE.SCEELKED

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_CEE\_SCEELKED

**Description**

This is the LE/370 C link-edit library that contains the link-edit stubs for C/C++, PL/I, COBOL, and Fortran languages and Language Environment-provided routines.

**Related parameters**

None

**GBL\_DSN\_CEE\_SCEELKEX**

This parameter contains the location of the LE/370 C non-XPLINK long names.

**Required or optional**

Optional

**Default value**

CEE.SCEELKEX

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_CEE\_SCEELKEX

**Description**

This is the location of the LE/370 C non-XPLINK long names.

**Related parameters**

None

**GBL\_DSN\_CEE\_SCEEMSGP**

This parameter contains the name of the library containing the LE/370 C prelinker messages.

**Required or optional**

Optional

**Default value**

CEE.SCEEMSGP

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_CEE\_SCEEMSGP

**Description**

This is the name of the library containing the LE/370 C prelinker messages.

**Related parameters**

None

**GBL\_DSN\_CEE\_SCEERUN**

This parameter contains the name of the LE/370 C Runtime Library.

**Required or optional**

Required

**PARMGEN name**

GBL\_DSN\_CEE\_SCEERUN

**Description**

This is the LE/370 C runtime library that contains the routines needed during execution of applications written in C/C++, PL/I, COBOL and Fortran.

**Related parameters**

None

**GBL\_DSN\_CEE\_SCEESPC**

This parameter contains the name of the LE/370 system programmer's C facility.

**Required or optional**

Optional

**Default value**

CEE.SCEESPC

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_CEE\_SCEESPC

**Description**

This is the name of the LE/370 system programmer's C facility.

**Related parameters**

None

**GBL\_DSN\_CICS\_CTG\_DLL**

This parameter is the name of the CICS TG Dynamic Link Library.

**Required or optional**

Required

**PARMGEN name**

GBL\_DSN\_CICS\_CTG\_DLL

**Description**

This is the name of the CICS TG Dynamic Link Library.

**Related parameters**

None

**GBL\_DSN\_CICS\_SCTGSID**

This parameter contains the name of the CICS TG side-deck library.

**Required or optional**

Optional

**Default value**

CTG.V8ROM0.SCTGSID

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_CICS\_SCTGSID

**Description**

This is the name of the CICS TG side-deck library.

**Related parameters**

None

## **GBL\_DSN\_CICS\_SDFHC370**

This parameter contains the name of the CICS load libraries for C support.

**Required or optional**

Optional

**Default value**

DFH.V4R2M5P.SDFHC370

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_CICS\_SDFHC370

**Description**

This is the name of the CICS load libraries for C support.

**Related parameters**

None

## **GBL\_DSN\_CICS\_SDFHLOAD**

This parameter contains the name of the CICS load libraries.

**Required or optional**

Optional

**Default value**

DFH.V4R2M5P.SDFHLOAD

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_CICS\_SDFHLOAD

**Description**

This is the CICS load library, as described by the SDFHLOAD low-level qualifier in the IBM CICS documentation.

**Related parameters**

None

## **GBL\_DSN\_CSF\_SCSFMODE**

This parameter contains the Integrated Cryptographic Service Facility (ICSF) load library that contains the CSNB\* modules used for password encryption.

**Description**

This parameter is valid in both Configuration Manager and PARMGEN if ICSF is installed and configured on the z/OS® system.

**In Configuration Manager:**

This parameter is explicitly added in the GBL\$PARM member that is generated after the **CREATE** or **MIGRATE** action, as it is relevant for several security-related aspects of the product configuration (such as password encryption).

If your installation does not use the ICSF, you can remove or comment out this parameter in your RTEDEF (GBL\$PARM) or RTEDEF (GBL\$*lpar*).

**In PARMGEN:**

By default, this parameter is commented out in the WCONFIG (\$GBL\$USR) member.

**Required or optional**

This parameter is required if any of the following conditions are in effect:

- Password encryption is enabled for any components.
- A SOAP server is enabled on a remote Tivoli® Enterprise Monitoring Server.
- Granular control of command requests is enabled (compatibility mode is *disabled*): the **KDS\_KMS\_SECURITY\_COMPATMD** parameter is set to N.
- zAware feature is enabled for OMEGAMON® on z/OS®.

**Default value**

CSF.SCSFMODE0

**Permissible values**

An MVS™ data set name, maximum length 44

**Related parameters**

- RTE\_SECURITY\_KAES256\_KEY
- KDS\_KMS\_SECURITY\_COMPATMD

## **GBL\_DSN\_DB2\_DSNEXT**

This parameter contains the name of the Db2 exit library.

**Required or optional**

Optional

**PARMGEN name**

GBL\_DSN\_DB2\_DSNEXT

**Description**

The name of the data set in which the Db2 exit load modules reside that should be used by the OMEGAMON collector.

**Related parameters**

- “GBL\_DSN\_DB2\_LOADLIB\_Vn” on page 1318
- “GBL\_DSN\_DB2\_RUNLIB\_Vn” on page 1319

## **GBL\_DSN\_DB2\_LOADLIB\_Vn**

This parameter contains the name of the load library for the version of Db2 your site is running.

**Required or optional**

Required

**PARMGEN name**

GBL\_DSN\_DB2\_LOADLIB\_Vn

**Description**

The name of the data set in which the Db2 load modules reside. Specify one Db2 load library for each Db2 subsystem version that you want to monitor.

**Related parameters**

- “GBL\_DSN\_DB2\_DSNEXT” on page 1318

- [“GBL\\_DSN\\_DB2\\_RUNLIB\\_Vn” on page 1319](#)

## **GBL\_DSN\_DB2\_RUNLIB\_Vn**

This parameter contains the name of the run library for the version of Db2 your site is running.

### **Required or optional**

Required

### **PARMGEN name**

GBL\_DSN\_DB2\_RUNLIB\_Vn

### **Description**

The name of the dataset in which the Db2 RUNLIB load modules reside. Specify one Db2 run library for each Db2 subsystem version that you want to monitor. This library should contain the modules DSNTIAD and DSNTIAUL to be used to run in batch. The run library is used to generate GRANT and BIND jobs that prepare the Db2 subsystems for monitoring.

### **Related parameters**

- [“GBL\\_DSN\\_DB2\\_DSNEEXIT” on page 1318](#)
- [“GBL\\_DSN\\_DB2\\_LOADLIB\\_Vn” on page 1318](#)

## **GBL\_DSN\_DB2\_SDSNLOAD**

This parameter contains the name of the Db2 load library.

### **Required or optional**

N/A

### **PARMGEN name**

GBL\_DSN\_DB2\_SDSNLOAD

### **Description**

The name of the data set in which the Db2 load modules reside.

## **GBL\_DSN\_GLOBAL\_SOURCE\_LIB**

This parameter provides a common data set that is allocated to house global parameters from products that support these data members.

### **Description**

This parameter provides a common product source library for global parameters.

### **Default value**

*rte\_hilev.rte\_name*.RKANPARU

### **Permissible values**

Character string, maximum length 44

### **Related parameters**

KI2\_I1nn\_CLASSIC\_STC  
 KI2\_I1nn\_CLASSIC\_GLOBAL  
 KC2\_CCnn\_CLASSIC\_STC  
 KC2\_CLASSIC\_KC2GLB\_SRCLIB

## **GBL\_DSN\_IMS\_RESLIB**

The IMS SDFSRESL library.

### **Description**

The IMS SDFSRESL library contains the CQSREG00 action module required to enable the Common Queue Server (CQS). The CQS and shared queues allow users to take advantage of the Parallel Sysplex® environment.

**Note:** The DISCOVER action of IBM Z® Monitoring Configuration Manager discovers the value of the KI2\_I1nn\_CLASSIC\_IMS\_RESLIB parameter, which also specifies an IMS SDFSRESL library. Depending on how IMS is configured at your site, the same value might be appropriate for GBL\_DSN\_IMS\_RESLIB.

**Required or optional**

Required if the runtime environment configures the IMS monitoring agent.

**Default value**

IMS.SDFSRESL

## **GBL\_DSN\_IMS\_SCEXLINK**

This parameter contains the name of the IMS Connect product load library.

**Required or optional**

Optional

**PARMGEN name**

GBL\_DSN\_IMS\_SCEXLINK

**Description**

This specifies the IMS.SCEXLINK library. OMEGAMON for IMS on z/OS uses the IMS Connect Extensions Publisher API. The IMS Connect Extensions product and functional support libraries are required for the OMEGAMON for IMS agent to connect to and collect performance and statistics data from the IMS Connect address space.

**Related parameters**

None

## **GBL\_DSN\_IMS\_SFUNLINK**

This parameter contains the name of the IMS Connect functional load library.

**Required or optional**

Optional

**PARMGEN name**

GBL\_DSN\_IMS\_SFUNLINK

**Description**

OMEGAMON for IMS on z/OS uses the IMS Connect Extensions Publisher API. The IMS Connect Extensions product and functional support libraries are required for the OMEGAMON for IMS agent to connect to and collect performance and statistics data from the IMS Connect address space.

**Related parameters**

None

## **GBL\_DSN\_ISP\_SISPLOAD**

This parameter contains the name of the library that contains ISPLINK (SISPLOAD for ISPF Version 4 and higher, or ISPLOAD for ISPF version 3 and below).

**Required or optional**

Optional

**Default value**

ISP.SISPLOAD

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_ISP\_SISPLOAD

**Description**

This gives the name of the ISPF load library.

**Related parameters**

None

## GBL\_DSN\_NETVIEW\_CNMLINK

This parameter contains the name of the IBM Z® NetView CNMLINK load library, required for NetView authorization of Take Action commands.

**Required or optional**

Optional

**Batch parameter name**

KNA\_NETV\_LNKLIB

**PARMGEN name**

GBL\_DSN\_NETVIEW\_CNMLINK

**Default value**

NETVIEW.VnRnMn.CNMLINK

**Description**

Name of the IBM Z® NetView CNMLINK load library, required for NetView authorization of Take Action commands. Contact your NetView system programmer for the CNMLINK link library name, if necessary. The CNMLINK library must be APF-authorized.

**Related parameters**

- [“KDS\\_PPI\\_RECEIVER” on page 1391](#)
- [“KDS\\_PPI\\_SENDER” on page 1391](#)

## GBL\_DSN\_SYS1\_BROADCAST

This parameter contains the name of the TSO broadcast data set name.

**Required or optional**

Optional

**Default value**

SYS1.BROADCAST

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_SYS1\_BROADCAST

**Description**

SEND stores messages in the broadcast data set, and LISTBC retrieves them from the broadcast data set.

## GBL\_DSN\_SYS1\_CSSLIB

This parameter contains the name of the z/OS® UNIX® System Services library.

**Required or optional**

Optional

**Default value**

SYS1.CSSLIB

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_SYS1\_CSSLIB

**Description**

This library contains Assembler Callable Services.

**Related parameters**

None

**GBL\_DSN\_SYS1\_HSMLOGY**

This parameter contains the name of the HSM LOGY dataset.

**Required or optional**

Optional

**PARMGEN name**

GBL\_DSN\_SYS1\_HSMLOGY

**Description**

HSM log analysis periodically scans the HSM LOGY data set for new messages.

**Related parameters**

None

**GBL\_DSN\_SYS1\_LINKLIB**

This parameter contains the name of the SYSLIB link library.

**Required or optional**

Optional

**Default value**

SYS1.LINKLIB

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_SYS1\_LINKLIB

**Description**

This is typically the SYS1.LINKLIB library in the OMEGAMON Classic security jobs.

**Related parameters**

None

**GBL\_DSN\_SYS1\_MACLIB**

This parameter contains the name of a system macro library for installed components and products.

**Description**

Name of a system macro library for installed components and products.

**Permissible values**

A valid data set name

**Default value**

SYS1.MACLIB

**Related parameters**

None

**GBL\_DSN\_SYS1\_MODGEN**

This parameter contains the name of the System Macro Library.

**Required or optional**

Optional

**Default value**

SYS1.MODGEN

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_SYS1\_MODGEN

**Description**

This is the name of the system macro library.

**Related parameters**

None

**GBL\_DSN\_SYS1\_PARMLIB**

This parameter contains the name of the system parameter library for installed components and products.

**Required or optional**

Required

**Batch parameter name**

KPP\_ICS\_DATASET

**PARMGEN name**

GBL\_DSN\_SYS1\_PARMLIB

**Default value**

SYS1.PARMLIB

**Description**

Name of the system parameter library for installed components and products.

**Related parameters**

None

**GBL\_DSN\_SYS1\_PROCLIB**

This parameter contains the name of the system procedure library that is to contain the started tasks and procedures.

**Description**

Name of the system procedure library that is to contain the started tasks and procedures. You can specify any system library if you do not want to update your PROCLIB library directly.

**Default value**

SYS1.PROCLIB

**Permissible values**

An MVS data set name

**Related parameters**

None

**GBL\_DSN\_SYS1\_SBLSCLI0**

This parameter contains the name of the system library that contains interactive problem control system (IPCS) CLISTs and REXX execs.

**Required or optional**

Optional

**PARMGEN name**

GBL\_DSN\_SYS1\_SBLSCLI0

**Default value**

SYS1.SBLSCLI0

**Description**

Name of the system library that contains interactive problem control system (IPCS) CLISTs and REXX execs.

**Related parameters**

None

**GBL\_DSN\_SYS1\_SBPXEXEC**

This parameter is the z/OS® UNIX® System Services CLIST/EXEC library name.

**Required or optional**

Required

**Location where the parameter value is stored**

N/A

**PARMGEN name**

GBL\_DSN\_SYS1\_SBPXEXEC

**Description**

This is the z/OS UNIX CLIST/EXEC library that contains the oshe11 command to perform the symbolic link. These are described by the SBPXEXEC low-level qualifier in the IBM z/OS® UNIX® System Services documentation.

**Related parameters**

- [“RTE\\_USS\\_RTEDIR” on page 1360](#)
- [“KDS\\_KMS\\_SDA” on page 1378](#)
- [“KDS\\_TEMA\\_SDA” on page 1394](#)
- [“Kpp\\_AGT\\_TEMA\\_SDA” on page 1277](#)
- [“GBL\\_HFS\\_JAVA\\_DIRn” on page 1328](#)

**GBL\_DSN\_SYS1\_SISTMAC1**

This parameter contains the name of the system library that contains the VTAM® macros.

**Required or optional**

Optional

**PARMGEN name**

GBL\_DSN\_SYS1\_SISTMAC1

**Description**

Name of the system library that contains the VTAM® macros. The default is SYS1\_SISTMAC1.

**Related parameters**

None

**GBL\_DSN\_SYS1\_VTAMLIB**

This parameter contains the name of the system library that contains the VTAM® logmode tables.

**Description**

Name of the system library that contains the VTAM® logmode tables. You can specify any system library if you do not want to update your VTAMLIB library directly.

**Default value**

SYS1.VTAMLIB

**Permissible values**

An MVS data set name

**Related parameters**

- [“RTE\\_VTAM\\_LU62\\_MODETAB” on page 1363](#)

**GBL\_DSN\_SYS1\_VTAMLST**

This parameter contains the name of the system VTAMLST library.

**Description**

Name of the system VTAMLST library. You can specify any system library if you do not want to update your VTAMLST library directly.

**Default value**

SYS1.VTAMLST

**Permissible values**

An MVS data set name

**Related parameters**

- [“RTE\\_VTAM\\_NETID” on page 1363](#)

**GBL\_DSN\_TCP\_ETC\_SERVICES**

This parameter contains the name of the TCP/IP network services.

**Required or optional**

Optional

**Default value**

TCPIP.ETC.SERVICES

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_TCP\_ETC\_SERVICES

**Description**

TCP/IP network services such as NIS, DNS, and the /etc/hosts file.

**Related parameters**

None

**GBL\_DSN\_TCP\_SEZACMTX**

This parameter contains the name of the TCP/IP load libraries.

**Required or optional**

Optional

**Default value**

EZA.SEZACMTX

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_TCP\_SEZACMTX

**Description**

This is the TCP/IP load library for linking user modules and programs, as described for the SEZACMTX low-level qualifier in the IBM TCP/IP for z/OS documentation. This is a required field if any of the directory services use TCP/IP communications, such as a directory service that has been configured as a directory server.

**Related parameters**

None

**GBL\_DSN\_TCP\_SEZARNT1**

This parameter contains the name of the TCP/IP Reentrant Object Module Library.

**Required or optional**

Optional

**Default value**

EZA.SEZARNT1

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_TCP\_SEZARNT1

**Description**

This is the TCP/IP Reentrant object module library for linking user modules and programs, as described for the SEZARNT1 low-level qualifier in the IBM TCP/IP for MVS documentation. This is a required field if any of the directory services use TCP/IP communications, such as a directory service that has been configured as a directory server.

**Related parameters**

None

**GBL\_DSN\_TCP\_SEZATCP**

This parameter contains the name of the TCP/IP executable libraries.

**Required or optional**

Optional

**Default value**

EZA.SEZATCP

**Permissible values**

Character string, maximum length 44.

**PARMGEN name**

GBL\_DSN\_TCP\_SEZATCP

**Description**

This is the TCP/IP executable load library used for STEPLIB or LINKLIB concatenation, as described for the SEZATCP low-level qualifier in the IBM TCP/IP for MVS documentation. This is a required field if any of the directory services use TCP/IP communications, such as a directory service that has been configured as a directory server.

**Related parameters**

None

**GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA**

This parameter contains the name of the system library to use in obtaining the parameters defined by TCPIP.DATA when no GLOBALTCPIPDATA statement is configured.

**Required or optional**

Optional

**Default value**

TCPIP.SEZAINST(TCPDATA)

**Batch parameter name**

Kpp\_TCP\_DATA

**PARMGEN name**

GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA

**Description**

Name of the system library to use in obtaining the parameters defined by TCPIP.DATA when no GLOBALTCPIPDATA statement is configured. If IP domain name resolution is not fully configured on the z/OS® system, SYSTCPD must be supported by the monitoring server and monitoring agents on z/OS®.

**Related parameters**

None

**GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA\_MFN**

This parameter contains the name of the TCP/IP data file.

**Required or optional**

Required

**PARMGEN name**

GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA\_MFN

**Description**

This specifies the data set name of the library described in the *z/OS Communications Server IP Configuration Reference*, section “Configuration Datasets”, which provides parameters for TCP/IP client programs. Specify this dsname if your site is running z/OS V1R4 or higher.

**Related parameters**

None

**GBL\_DSN\_WMQ\_SCSQANLE**

This parameter contains the name of the IBM MQ language library.

**Required or optional**

Optional

**PARMGEN name**

GBL\_DSN\_WMQ\_SCSQANLE

**Description**

This is the IBM-supplied library that provides national language support.

**Related parameters**

None

## GBL\_DSN\_WMQ\_SCSQAUTH

This parameter contains the name of the IBM MQ authorized load library.

**Required or optional**

Required

**PARMGEN name**

GBL\_DSN\_WMQ\_SCSQAUTH

**Description**

This is the IBM-supplied library that contains the IBM MQ API modules required to execute OMEGAMON for Messaging. The data set name you specify here will be added to the started task JCL.

**Related parameters**

- [“GBL\\_DSN\\_WMQ\\_SCSQANLE” on page 1327](#)
- [“GBL\\_DSN\\_WMQ\\_SCSQLOAD” on page 1328](#)

## GBL\_DSN\_WMQ\_SCSQLOAD

This parameter contains the name of the IBM MQ load library.

**Required or optional**

Required

**PARMGEN name**

GBL\_DSN\_WMQ\_SCSQLOAD

**Description**

This is the IBM MQ load library that contains load modules for non-APF code, user exits, utilities, samples, installation verification programs, and adapter stubs.

**Related parameters**

- [“GBL\\_DSN\\_WMQ\\_SCSQAUTH” on page 1328](#)

## GBL\_HFS\_JAVA\_DIRn

This parameter contains the name of the Java home directory.

**Required or optional**

Required if you are enabling the Self-Describing Agent (SDA) functionality in the z/OS TEMS and Agents.

**Location where the parameter value is stored**

The TEMS\_JAVA\_BINPATH parameter in the RKANDATV data set, member KSDPROF.

**PARMGEN name**

GBL\_HFS\_JAVA\_DIRn

**Description**

The name of the Java home directory. The default is /usr1/pp/java/J7.1. This directory must begin with a "/". This parameter is required if you are enabling the Self-Describing Agent (SDA) functionality in the z/OS

TEMS and Agents. This value becomes part of the TEMS\_JAVA\_BINPATH parameter in the RKANDATV(KSDPROF) member that is created by the WKANSAMU(KCIJPUSP) z/OS® UNIX® System Services preparation job. "/bin" is added to the "GBL\_HFS\_JAVA\_DIRn" Java home directory value automatically.

#### Related parameters

- [“GBL\\_DSN\\_SYS1\\_SBPXEXEC” on page 1324](#) (typically in WCONFIG(\$GBL\$USR))

## GBL\_INST\_HILEV

This parameter contains the high-level qualifier (*shilev*) of the installation libraries (INSTJOBS, INSTDATA, and so on).

#### Required or optional

Required

#### PARMGEN name

GBL\_INST\_HILEV

#### Description

High-level qualifier (*shilev*) of the installation libraries (INSTJOBS, INSTDATA, and so on).

#### Related parameters

- [“GBL\\_TARGET\\_HILEV” on page 1330](#)

## GBL\_JOBGEN\_WORKFILE

This PARMGEN-only parameter contains the JOBGEN output library (workfile repository).

#### Description

**Note:** This parameter is valid in PARMGEN only. It is not valid in Configuration Manager.

This parameter is used to integrate the Install Job Generator (JOBGEN) tool with PARMGEN. This parameter contains the JOBGEN output library (workfile repository) specified during the PARMGEN **Set up/Refresh PARMGEN work environment KCIJPCFG** step.

#### Permissible values

A valid data set name

## GBL\_REGION

This parameter contains the global JCL REGION value.

#### Description

The required storage value in kilobytes (K) or in megabytes (M) for applicable batch jobs or started tasks. The jobs contain the REGION= parameter on the EXEC statement. Change this value as required by your installation.

#### Permissible values

Character string (maximum length 8) in format *valueK* or *valueM*. You must specify the K or M suffix (for example: 4096K, 0M).

#### Default value

OM

## GBL\_SYSDA\_UNIT

This parameter contains the SYSDA unit name.

### Description

The device type for temporary data sets that are to be dynamically allocated.

### Permissible values

Character string, maximum length 8

### Default value

SYSDA

## GBL\_TARGET\_HILEV

This parameter contains the high-level qualifier (*thilev*) of the target libraries that were installed by SMP/E (for example, TKANDATV and TKANMOD).

### Required or optional

Required

### PARMGEN name

GBL\_TARGET\_HILEV

### Description

High-level qualifier (*thilev*) of the target libraries that were installed by SMP/E (for example, TKANDATV and TKANMOD).

### Related parameters

- [“GBL\\_INST\\_HILEV” on page 1329](#)

## GBL\_USER\_JCL

This parameter specifies the global user library. For PARMGEN, this library contains common JCL and variable definitions. For Configuration Manager, this library contains global parameters.

### Description

#### For PARMGEN:

Specifies the data set name of the PARMGEN global (common) user JCL library, where the KCIJPCFG PARMGEN configuration job is to be customized.

The specified data set stores definitions for every RTE you might create on the LPAR.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile and stores variables.

#### For Configuration Manager:

Specifies the library for global parameters.

### Required or optional

Required

### Related parameters

None

## GBL\_USS\_TKANJAR\_PATH

The path of the z/OS® UNIX® System Services directory that the SMP/E installation jobs define using the ddname TKANJAR.

Depending on your local site practices, this path might refer to a copy, rather than the original SMP/E-managed directory.

#### Required or optional

Required if the runtime environment configures either of the following monitoring agents:

- CICS® Transaction Gateway (TG). The corresponding configuration parameter is **CONFIGURE\_CICS\_TG\_KGW**.
- Java™ Virtual Machine (JVM). The corresponding configuration parameter is **CONFIGURE\_JVM\_KJJ**.

#### Default value

/usr/lpp/kan/bin/IBM

#### Permissible values

z/OS® UNIX® directory path. Must begin with a forward slash (/).

#### Related parameters

GBL\_DSN\_SYS1\_SBPXEXEC  
RTE\_USS\_RTEDIR  
RTE\_USS\_MKDIR\_MODE

## GBL\_USS\_TKAYHFS\_PATH

This Configuration Manager-only parameter specifies the SMP/E TKAYHFS ddname install directory.

For more information, see [“GBL\\_USS\\_TKAYHFS\\_PATH” on page 284](#).

**Note:** Parameter **GBL\_USS\_TKAYHFS\_PATH** is valid in Configuration Manager only. It is not valid in PARMGEN.

## GBL\_USS\_TKAYHFS\_PATH

This parameter specifies the SMP/E TKAYHFS ddname installation directory.

#### Description

This parameter specifies the path of the z/OS UNIX directory that the SMP/E installation jobs for IBM Z OMEGAMON Data Provider define using the ddname TKAYHFS.

Depending on your local site practices, this path might refer to a copy of the SMP/E-managed directory rather than the original.

This directory is read-only for Monitoring Configuration Manager; Monitoring Configuration Manager does not write to this directory.

#### Default value

/usr/lpp/omdp

#### Permissible values

Character string, maximum length 44

## GBL\_UTIL\_BINDER

This Configuration Manager-only parameter allows you to override the default binder program name.

For more information, see [“GBL\\_UTIL\\_BINDER” on page 294](#).

**Note:** Parameter **GBL\_UTIL\_BINDER** is valid in Configuration Manager only. It is not valid in PARMGEN.

## Runtime environment (RTE) parameters

The runtime environment parameters provide configuration settings for an individual runtime environment and default settings for the OMEGAMON components and products configured in that runtime environment, including the end-to-end response-time analysis feature.

The runtime environment parameters are explained in this section.

### RTE\_BASE\_NAME

This parameter contains the mid-level qualifier for base runtime library allocations.

#### Required or optional

Optional

#### PARMGEN name

RTE\_BASE\_NAME

#### Description

Mid-level qualifier for base runtime library allocations. Accept the default value (the base runtime environment name), even though this parameter is modifiable for a base runtime environment. For a full and sharing runtime environment, the mid-level qualifier is set to the runtime environment name (RTE\_NAME parameter value) and cannot be changed.

#### Related parameters

- [“RTE\\_NAME” on page 1340](#)
- [“RTE\\_TYPE” on page 1358](#)
- [“RTE\\_HILEV” on page 1334](#)
- [“RTE\\_VSAM\\_HILEV” on page 1362](#)

### RTE\_CANSCN\_STC

This parameter gives the name of the OMEGAMON subsystem started task.

#### Required or optional

Optional

#### PARMGEN name

RTE\_CANSCN\_STC

#### Description

This is the name of the started task that will be constructed for the OMEGAMON subsystem. The default in PARMGEN is IBMCN.

#### Related parameters

- [“RTE\\_KCNSTR00\\_SSID” on page 1337](#)
- [“RTE\\_KCNSTR00\\_XCFGROUP” on page 1338](#)
- [“RTE\\_KCNSTR00\\_WTO” on page 1337](#)

- [“RTE\\_X\\_KCNDLSSI\\_INITPARAM\\_FLAG” on page 1364](#)

### RTE\_CANSETE\_STC

This parameter contains the name of the started task that measures end-to-end response-time performance.

**Required or optional**

Optional

**PARMGEN name**

RTE\_CANSETE\_STC

**Description**

The started task name for the end-to-end server. The default value in PARMGEN is IBMETE.

**Related parameters**

None

**RTE\_CLONE\_FROM\_HLQRTE**

Specifies the high-level qualifier of the non-VSAM libraries for the runtime environment (RTE) from which custom data is to be copied.

**Required or optional**

Optional.

**Location where the parameter value is stored**

⌘KANSAMU(KCIJPCLN) job

**Parameter name and syntax**

High-level qualifier of the non-VSAM data set + the RTE name of the data sets to be cloned

**Default value**

%RTE\_HILEV%.SYSA

**Permissible values**

Any valid data set high-level qualifier

**Description**

High-level qualifier of the RTE from which the KCIJPCLN job copies the non-VSAM data sets containing custom data, such as profiles, workspaces, or screenspaces. This parameter must be uncommented in the RTE configuration profile and set to a valid value before the KCIJPCLN job is run.

**Related parameters**

- [“RTE\\_CLONE\\_FROM\\_VSAM\\_HLQRTE” on page 1333](#)

**RTE\_CLONE\_FROM\_VSAM\_HLQRTE**

Specifies the high-level qualifier of the VSAM libraries for the runtime environment (RTE) from which the custom data is to be copied.

**Required or optional**

Optional.

**Location where the parameter value is stored**

⌘KANSAMU(KCIJPCLN) job

**Parameter name and syntax**

High-level qualifier of the VSAM data set + the RTE name of the data sets to be cloned

**Default value**

%RTE\_VSAM\_HILEV%.SYSA

**Permissible values**

Any valid data set high-level qualifier

**Description**

High-level qualifier of the RTE from which the KCIJPCLN job copies the VSAM data sets containing custom data, such as situations, self-describing agent status data, and managed objects. This parameter must be uncommented in the RTE configuration profile and set to a valid value before the KCIJPCLN job is run.

#### Related parameters

- [“RTE\\_CLONE\\_FROM\\_HLORTE” on page 1333](#)

## RTE\_DEBUG\_SYSOUT

This parameter contains the SYSOUT class for diagnostic output DDNAMEs, such as SYSUDUMP and SYSABEND, in generated JCL.

#### Required or optional

Required

#### PARMGEN name

RTE\_DEBUG\_SYSOUT

#### Description

SYSOUT class for diagnostic output DDNAMEs, such as SYSUDUMP and SYSABEND, in generated JCL.

#### Related parameters

- [“RTE\\_LOG\\_SYSOUT” on page 1339](#)

## RTE\_DESCRIPTION

This parameter contains the description of the runtime environment.

#### Required or optional

Optional

#### PARMGEN name

RTE\_DESCRIPTION

#### Description

Description of the runtime environment.

#### Related parameters

- [“RTE\\_NAME” on page 1340](#)
- [“RTE\\_TYPE” on page 1358](#)
- [“RTE\\_SHARE” on page 1349](#)

## RTE\_HILEV

This parameters contains the non-VSAM high-level qualifier to be used for allocating the runtime data sets.

#### Required or optional

Required

#### PARMGEN name

RTE\_HILEV

#### Description

Non-VSAM high-level qualifier to be used for allocating the runtime data sets. If you plan to allocate SMS-managed data sets for the runtime environment, the high-level qualifier that you specify must be eligible for SMS-managed volumes.

For PARMGEN configuration, the value of this parameter for a sharing runtime environment must be the same as the value for the shared runtime environment.

#### Related parameters

- [“RTE\\_VSAM\\_HILEV” on page 1362](#)
- [“RTE\\_BASE\\_NAME” on page 1332](#)
- [“RTE\\_TYPE” on page 1358](#)

## RTE\_JCL\_SUFFIX

This parameter contains the unique JCL suffix to identify the batch job members created by the Configuration Software for this runtime environment in the *shilev*.INSTJOBS data set.

### Required or optional

Required

### PARMGEN name

RTE\_JCL\_SUFFIX

### Description

Unique JCL suffix to identify the batch job members created by the Configuration Software for this runtime environment in the *shilev*.INSTJOBS data set.

If possible, specify the runtime environment name (or an abbreviated version of the runtime environment name) as the JCL suffix. This setup makes it easy to identify the runtime environment associated with each job generated by the Configuration Software and stored in the INSTJOBS data set.

### Related parameters

None

## RTE\_KCN\_CACHE\_KM5\_RMF\_DDS

This parameter specifies the preferred RMF Distributed Data Server (DDS) from which to retrieve data for OMEGAMON for z/OS agents.

### Description

This parameter specifies the network address (IP host name or IP address format) and port number for the RMF DDS that you want the OMEGAMON for z/OS agents running in the Tivoli Enterprise Management Server to retrieve data from, rather than the auto-discovered RMF DDS.

### Required or optional

Optional

### Permissible values

Host name or IP address, and port number in the following format:

```
host_name/IP_address:port
```

Character string, maximum length 50

### Default value

null

### Related parameters

- [“RTE\\_KM5\\_NTH” on page 1338](#)

## RTE\_KCN\_VTAM\_APPL\_LOGON

This parameter specifies the VTAM APPLID for logging on to the OMEGAMON Subsystem for purposes of diagnostics.

### Description

**Note:** Previously, this parameter was used for configuring diagnostics related to RMF DDS data caching in the OMEGAMON Subsystem. Use of this function has been deprecated. This parameter has been retained to minimize configuration and administration disruption.

This parameter defines an APPLID that allows you to log on to a diagnostic interface for the OMEGAMON Subsystem. This APPLID is created in the node definition in either an OMEGAMON Subsystem major node, or in the global VTAM major node (CTDNODE, by default) in the RKANSAMU data set.

**Required or optional**

Required

**Permissible values**

Up to 8 alphanumeric characters in the following format:

```
rte_vtam_applid_prefixCNAP
```

**Default value**

CTDCNAP

**Related parameters**

- [“RTE\\_KCN\\_VTAM\\_NODE” on page 1336](#)
- [“RTE\\_VTAM\\_GBL\\_MAJOR\\_NODE” on page 1362](#)

**RTE\_KCN\_VTAM\_NODE**

This parameter specifies the VTAM® major node that contains the VTAM® APPLID definitions for the OMEGAMON® Subsystem.

**Description**

**Note:** Previously, this parameter was used for configuring diagnostics related to RMF DDS data caching in the OMEGAMON Subsystem. Use of this function has been deprecated. This parameter has been retained to minimize configuration and administration disruption.

This parameter defines the name of the VTAM® major node that contains the VTAM® APPLID definitions for the OMEGAMON® Subsystem.

**Required or optional**

Required

**Permissible values**

Up to 8 alphanumeric characters in the following format:

```
rte_vtam_applid_prefixCNN
```

**Default value**

CTDCNN

**Related parameters**

- [“RTE\\_KCN\\_VTAM\\_APPL\\_LOGON” on page 1335](#)
- [“RTE\\_VTAM\\_GBL\\_MAJOR\\_NODE” on page 1362](#)

**RTE\_KCNDLSSI\_IEFSSN00\_FORMAT**

This parameter contains the IEFSSN00 format.

**Required or optional**

Optional

**PARMGEN name**

RTE\_KCNDLSSI\_IEFSSN00\_FORMAT

**Description**

This field specifies the format found in the IEFSSN00 member in the PARMLIB dataset. This member can have one of two formats:

**Keyword**

format allows for dynamic subsystem processing. This is the preferred format for this member when your version of z/OS allows it. Specify K for this field if the member is in Keyword format.

#### Positional

format is for compatibility. Specify P for this field if the member appears as follows:

```
CNDL , KCNDLINT , 'SSPROC=CANSCN'
```

Although both formats can be used, z/OS requires that all the commands in a single concatenation member follow the same format.

#### Related parameters

- [“RTE\\_KCNSTR00\\_SSID” on page 1337](#)
- [“RTE\\_KCNSTR00\\_WTO” on page 1337](#)
- [“RTE\\_KCNSTR00\\_XCFGROUP” on page 1338](#)

## RTE\_KCNSTR00\_SSID

This parameter contains the OMEGAMON subsystem ID.

#### Required or optional

Optional

#### PARMGEN name

RTE\_KCNSTR00\_SSID

#### Description

This field specifies the four-character identifier of the OMEGAMON subsystem. The OMEGAMON subsystem is shipped with a predefined ID set to CNDL. If you change this value, be sure that all references to the subsystem ID in other products configured in this runtime environment are consistent with this value.

#### Related parameters

- [“RTE\\_KCNSTR00\\_XCFGROUP” on page 1338](#)

## RTE\_KCNSTR00\_WTO

This parameter writes the IXCQUERY message to the z/OS console.

#### Required or optional

Optional

#### PARMGEN name

RTE\_KCNSTR00\_WTO

#### Description

This field specifies the IXCQUERY WTO messaging mode to determine if warning and error messages will be written to the z/OS operator console. It allows error, warnings, and key informational messages from the OMEGAMON subsystem that are associated with the Coupling Facility Collection enhancement. It also allows automation to take action for problem conditions. All OMEGAMON subsystems within a sysplex must have the same value for this parameter.

#### Error

is the default.

#### All

allows warning, error, and full diagnostic processing messages that are associated with the Coupling Facility Collection enhancement.

#### No

prevents all messages from the OMEGAMON subsystem that are associated with the Coupling Facility Collection enhancement from being written to the z/OS operator console.

#### Related parameters

- [“RTE\\_CANSCN\\_STC” on page 1332](#)

- [“RTE\\_KCNSTR00\\_XCFGROUP” on page 1338](#)

## RTE\_KCNSTR00\_XCFGROUP

This parameter contains the OMEGAMON subsystem XCF group name.

#### Required or optional

Optional

#### PARMGEN name

RTE\_KCNSTR00\_XCFGROUP

#### Description

This is the XCF group name to be used by the OMEGAMON subsystems to share collected data within a sysplex. This value must be a unique name for this sysplex conforming to the naming rules for XCF groups (characters comprising alphabetic, numerals, and national characters). Every OMEGAMON subsystem configured within a sysplex must use the same value.

#### Related parameters

- [“RTE\\_CANSCN\\_STC” on page 1332](#)

## RTE\_KM5\_NTH

This parameter controls whether the OMEGAMON® for z/OS® agent is eligible to retrieve near-term historical data.

#### Description

This parameter controls whether the OMEGAMON® for z/OS® agent is eligible to retrieve near-term historical data.

#### Required or optional

Optional

#### Permissible values

Y, N, YES, NO

#### Default value

Y

#### Related parameters

- [“RTE\\_KCN\\_CACHE\\_KM5\\_RMF\\_DDS” on page 1335](#)

## RTE\_LOAD\_OPTIMIZE

The parameter determines whether to optimize the loading of the runtime environment after maintenance is applied or products are reconfigured.

#### Required or optional

Required

**PARMGEN name**

RTE\_LOAD\_OPTIMIZE

**Description**

Determines whether to optimize the loading of the runtime environment after maintenance is applied or products are reconfigured. (Load optimization takes effect on the second and subsequent load operations but not on the initial loading.)

If you specify Y, the load job has the following characteristics:

- Copies only modified modules from target to runtime libraries.
- Requires access to IBM's SuperC (ISRSUPC) utility.
- Uses less DASD space.
- Performs additional analysis, which uses more CPU processing and file I/O.

If you specify N (the default), the load job has the following characteristics:

- Copies all members from target to runtime libraries, whether or not they were modified.
- Requires more DASD space.
- Uses less CPU time.

**Related parameters**

None

**RTE\_LOAD\_SHARED\_LIBS**

This parameter determines whether to include the shared libraries of a base or full runtime environment in the Load job of a sharing-with-base or sharing-with-full runtime environment.

**Required or optional**

Required

**PARMGEN name**

RTE\_LOAD\_SHARED\_LIBS

**Description**

Determines whether to include the shared libraries of a base or full runtime environment in the Load job of a sharing-with-base or sharing-with-full runtime environment. Accept the default value (Y) to ensure that all maintenance is loaded properly into the runtime environment.

If you have multiple runtime environments that share the same read-only data sets, one of the environments should be configured to load the common shared base libraries

(RTE\_LOAD\_SHARED\_LIBS=Y). All the other sharing environments should be set to N. This prevents the same libraries from being loaded every time you run the KCIJPLOD load job for each sharing environment.

**Related parameters**

- [“RTE\\_TYPE” on page 1358](#)
- [“RTE\\_SHARE” on page 1349](#)

**RTE\_LOG\_SYSOUT**

This parameter contains the SYSOUT class for non-diagnostic output DDNAMEs, such as RKPLOG, in generated JCL.

**Required or optional**

Required

**PARMGEN name**

RTE\_LOG\_SYSOUT

**Description**

SYSOUT class for non-diagnostic output DDNAMEs, such as RKPLOG, in generated JCL.

### Related parameters

- [“RTE\\_DEBUG\\_SYSOUT” on page 1334](#)

## RTE\_NAME

This parameter contains the unique name that identifies the runtime environment.

### Required or optional

Required

### PARMGEN name

RTE\_NAME

### Description

Unique name that identifies the runtime environment. This name is appended to the high-level qualifiers specified in the [“RTE\\_HILEV” on page 1334](#) and [“RTE\\_VSAM\\_HILEV” on page 1362](#) parameters, to make each set of runtime libraries unique.

### Related parameters

- [“RTE\\_HILEV” on page 1334](#)
- [“RTE\\_VSAM\\_HILEV” on page 1362](#)

## RTE\_PDS\_BACKUP\_FLAG

This parameter determines whether to perform backup operations on data sets used by the persistent data store.

### Required or optional

Optional

### PARMGEN name

RTE\_PDS\_BACKUP\_FLAG

### Description

Determines whether to perform backup operations on data sets used by the persistent data store. Backups enable you to keep a copy of the data sets on either tape or DASD. You can then make the data available to the persistent data store again whenever you want.

### Related parameters

- [“RTE\\_PDS\\_KPDPROC\\_PREFIX” on page 1342](#)
- [“RTE\\_PDS\\_EXPORT\\_FLAG” on page 1341](#)
- [“RTE\\_PDS\\_EXTRACT\\_FLAG” on page 1342](#)

## RTE\_PDS\_BATCHINIT\_FLAG

This parameter determines if the BATCHINIT parameter is generated in the *&rhilev.&rte.RKANSAMU(KppPCTL)* Persistent Datastore RKPDI DD command EXEC startup member.

rte\_pds\_batchinit\_flag

### Required or optional

Optional

### Location where the parameter value is stored

Value determines if the BATCHINIT parameter is generated in the *&rhilev.&rte.RKANSAMU(KppPCTL)* Persistent Datastore RKPDI DD command EXEC startup member.

### Parameter name and syntax

BATCHINIT if the flag is Y. Syntax is: MAINTPRC PROC=KPDPROC1 GENPROC BATCHINIT

### Default value

N

### Permissible values

Y, N

### PARMGEN name

RTE\_PDS\_BATCHINIT\_FLAG

### Description

This parameter determines if the BATCHINIT parameter is generated in the *&rhilev.&rte*.RKANSAMU(KppPCTL) Persistent Datastore RKPDI DD command EXEC startup member. Determines the Persistent Datastore (PDS) settings for *x*KANPARU(KppPCTL), *x*KANPARU(KppPG), *x*KANPARU(KppDEFIN) and *x*KANPARU(KppAL) Persistent Datastore control member options.

- [“RTE\\_PDS\\_SMS\\_VOLUME” on page 1343](#)

## RTE\_PDS\_EXPORT\_FLAG

This parameter determines whether to export data sets used by the persistent data store.

### Required or optional

Optional

### PARMGEN name

RTE\_PDS\_EXPORT\_FLAG

### Description

Determines whether to export data sets used by the persistent data store. The Export option converts the data sets to flat (ASCII) files in an internal format that can be used by other applications. The exported data can also be used for recovery when the persistent data store detects potential problems with its data. To make the exported file available to the persistent data store program again requires the restore program, KPDPREST, to be run against the exported data.

### Related parameters

- [“RTE\\_PDS\\_KPDPROC\\_PREFIX” on page 1342](#)
- [“RTE\\_PDS\\_BACKUP\\_FLAG” on page 1340](#)
- [“RTE\\_PDS\\_EXTRACT\\_FLAG” on page 1342](#)

## RTE\_PDS\_EXTRACT\_FLAG

This parameters determines whether to write the data to a flat file in human-readable form, which is suitable for loading into other database management systems.

### Required or optional

Optional

### PARMGEN name

RTE\_PDS\_EXTRACT\_FLAG

### Description

Determines whether to write the data to a flat file in human-readable form, which is suitable for loading into other database management systems. The data is extracted from a full data set in EBCDIC form, but the extraction does not empty the data set. The data set is not initialized until it becomes a candidate for being emptied, so the most current data becomes available in an extracted form without that data being lost.

### Related parameters

## RTE\_PDS\_HILEV

This parameter contains the high-level qualifier for the persistent data store libraries.

### Required or optional

Required

### PARMGEN name

RTE\_PDS\_HILEV

### Description

High-level qualifier for the persistent data store libraries.

### Related parameters

None

## RTE\_PDS\_KPDPROC\_PREFIX

This parameter contains the prefix of the started task name that will be used to perform maintenance on the data sets written by the persistent data store.

### Required or optional

Required

### PARMGEN name

RTE\_PDS\_KPDPROC\_PREFIX

### Description

Prefix of the started task name that will be used to perform maintenance on the data sets written by the persistent data store. For detailed information on the persistent data store, see [“Persistent data store V1 \(PDS V1\)” on page 1195](#).

### Related parameters

- [“RTE\\_PDS\\_BACKUP\\_FLAG” on page 1340](#)
- [“RTE\\_PDS\\_EXPORT\\_FLAG” on page 1341](#)

## RTE\_PDS\_SMS\_MGMTCLAS

This parameter contains the SMS management class to be used for data set allocation for the persistent data store.

### Required or optional

Optional

### PARMGEN name

RTE\_PDS\_SMS\_MGMTCLAS

### Description

SMS management class to be used for data set allocation for the persistent data store.

### Related parameters

- [“RTE\\_PDS\\_SMS\\_STORCLAS” on page 1343](#)

## RTE\_PDS\_SMS\_STORCLAS

This parameters contains the SMS storage class to be used for data set allocation for the persistent data store.

### Required or optional

Optional

### PARMGEN name

RTE\_PDS\_SMS\_STORCLAS

### Description

SMS storage class to be used for data set allocation for the persistent data store.

### Related parameters

- [“RTE\\_PDS\\_SMS\\_MGMTCLAS” on page 1343](#)

## RTE\_PDS\_SMS\_UNIT

This parameter contains the default unit for non-SMS data set allocation for the persistent data store.

### Required or optional

Required if the runtime data sets are not to be managed by SMS; optional otherwise.

### PARMGEN name

RTE\_PDS\_SMS\_UNIT

### Description

Default unit for non-SMS data set allocation for the persistent data store.

### Related parameters

- [“RTE\\_PDS\\_SMS\\_VOLUME” on page 1343](#)

## RTE\_PDS\_SMS\_VOLUME

This parameter contains the default volume serial number for non-SMS data set allocation for the persistent data store.

### Required or optional

Required if the runtime data sets are not to be managed by SMS; optional otherwise.

### PARMGEN name

RTE\_PDS\_SMS\_VOLUME

### Description

Default volume serial number for non-SMS data set allocation for the persistent data store.

**Related parameters**

- [“RTE\\_PDS\\_SMS\\_UNIT” on page 1343](#)

## RTE\_PDS2\_ACTIVATION

PDS V2 activation switch

**Description**

This parameter indicates whether to activate persistent data store V2 (PDS V2) support for all monitoring agents and the monitoring server.

**Y**

PDS V2 support is enabled for the runtime environment. By default, the monitoring server and all monitoring agents are activated to use PDS V2. You can control PDS V2 activation for a specific agent using the `Kpp_PDS2_ACTIVATION` parameter, and you can control PDS V2 activation for the monitoring server using the `KDS_PDS2_ACTIVATION` parameter.

**N**

PDS V2 support is disabled for the runtime environment; persistent data store V1 will be used instead. By setting this value to N, you will deactivate persistent data store V2 support for all monitoring agents and the monitoring server.

**Default value**

Y

**Permissible values**

Y, N

**Related parameters**

[KDS\\_PDS2\\_ACTIVATION](#)

[Kpp\\_PDS2\\_ACTIVATION](#)

## RTE\_PDS2\_ALLOC\_TYPE

Allocation unit for persistent data store V2

**Description**

This parameter specifies the default allocation unit for PDS V2 data set allocation.

**CYL**

Data sets will be allocated in cylinders.

**MB**

Data sets will be allocated in megabytes.

**Default value**

CYL

**Permissible values**

CYL, MB

**Related parameters**

[KDS\\_PDS2\\_SEC\\_SIZE](#)

[KDS\\_PDS2\\_STORE\\_SIZE](#)

[Kpp\\_PDS2\\_SEC\\_SIZE](#)

[Kpp\\_PDS2\\_STORE\\_SIZE](#)

## **RTE\_PDS2\_HILEV**

High-level qualifier for PDS V2 data sets

### **Description**

This parameter specifies the high-level qualifier for the persistent data store version 2 data sets that will contain historical data.

### **Default value**

%RTE\_VSAM\_HILEV%.%RTE\_NAME%

## **RTE\_PDS2\_SMS\_DATACLAS**

SMS DATACLAS for PDS V2 data set allocation

### **Description**

This parameter specifies the default SMS data class for PDS V2 data set allocation.

To use z/OS® data set encryption for your PDS V2 data sets, specify an SMS data class that has a key label in its definition.

### **Default value**

None

## **RTE\_PDS2\_SMS\_MGMTCLAS**

SMS MGMTCLAS for PDS V2 data set allocation

### **Description**

This parameter specifies the default SMS management class for PDS V2 data set allocation.

### **Default value**

%RTE\_SMS\_VSAM\_MGMTCLAS%

## **RTE\_PDS2\_SMS\_STORCLAS**

SMS STORCLAS for PDS V2 data set allocation

### **Description**

This parameter specifies the default SMS storage class for PDS V2 data set allocation.

### **Default value**

%RTE\_SMS\_VSAM\_STORCLAS%

## **RTE\_PDS2\_VOLUME**

Volume for PDS V2 data set allocation

### **Description**

This parameter specifies the default volume serial number for PDS V2 data set allocation.

### **Default value**

%RTE\_SMS\_VSAM\_VOLUME%

### **Permissible values**

Character string, maximum length 6

## **RTE\_PLIB\_HILEV**

This parameter specifies the high-level qualifier for the runtime environment (RTE).

## Description

This parameter provides the default value for the high-level qualifier of the runtime environment (RTE).

This parameter value is used for the following PARMGEN set-up libraries:

- PARMGEN WCONFIG control library (WCONFIG)
- PARMGEN interim staging (IK\*)
- PARMGEN work output (WK\*)

It is also used in the final PARMGEN or Configuration Manager runtime libraries, including the following libraries:

- Configuration Manager RTE definition library (RTEDEF)
- SYS1 libraries (PROCLIB, VTAMLIB, VTAMLST)
- Runtime environment libraries (RK\*)
- Security exit library (SECEXITS)

**Note:** For the KCIJPCFG job, the RTE\_PLIB\_HILEV parameter is customized to the value supplied during PRPKCIJP step.

## Required or optional

Required

## Default value

%RTE\_PLIB\_HILEV%

## PARMGEN name

RTE\_PLIB\_HILEV

## Related parameters

- [RTE\\_HILEV](#)
- [RTE\\_VSAM\\_HILEV](#)
- [RTE\\_PDS\\_HILEV](#)
- [RTE\\_PDS2\\_HILEV](#)

## RTE\_REMOTE\_LPAR\_FLAG

This parameter determines whether this runtime environment will be run on the local system (N, the default) or transported to other systems (Y).

## Required or optional

Required

## PARMGEN name

RTE\_REMOTE\_LPAR\_FLAG

## Description

Determines whether this runtime environment will be run on the local system (N, the default) or transported to other systems (Y). If the value of this parameter is Y, the value of the [“RTE\\_USERMODS\\_FLAG” on page 1359](#) parameter must be N, and vice versa.

## Related parameters

- [“RTE\\_USERMODS\\_FLAG” on page 1359](#)

## RTE\_SECURITY\_CLASS

This parameter specifies a System Authorization Facility (SAF) security class name for OMEGAMON enhanced 3270 user interface security controls.

### Description

Use this parameter to specify the SAF security class for OMEGAMON enhanced 3270 user interface (enhanced 3270UI) security controls. The enhanced 3270UI performs security validation processing by authenticating the user identity using the SAF interface. The existence of the SAF user and its validity (that is, whether it is suspended) are always checked.

This parameter applies to the OMEGAMON enhanced 3270 user interface and the OMEGAMON monitoring agents that use the enhanced 3270UI. Individual products have additional SAF security settings that are specific to the respective product (for example, how to secure product-specific Take Action requests). To secure other products, see the product-specific documentation for information.

**Important (for Configuration Manager users only):** If a value is not specified for override parameter `Kpp_SECURITY_ACTION_CLASS` (where *pp* is C5, M5, or N3), then the `RTE_SECURITY_CLASS` parameter value will be assigned as the default value.

### Required or optional

Optional

### Default value

None

### Permissible values

A valid SAF class name, which can be a string of up to 8 characters. If you are using ACF2 as your external security resource manager, specify a maximum of 3 characters.

### Related parameters

- [KOB\\_SAF\\_ACTION\\_CLASS\\_NAME](#)
- [KC5\\_SECURITY\\_ACTION\\_CLASS](#)
- [KM5\\_SECURITY\\_ACTION\\_CLASS](#)
- [KN3\\_SECURITY\\_ACTION\\_CLASS](#)

## RTE\_SECURITY\_FOLD\_PASSWORD\_FLAG

This parameter controls if password and password phrase (passphrase) values are folded to uppercase.

### Description

By default, the TMS:Engine folds logon password and password phrase (passphrase) values to uppercase (parameter default value Y).

If you want to use mixed-case password or passphrase values, set this parameter to N so that the characters do not fold to uppercase, allowing mixed-case values to persist.

**Note:** Support for mixed-case passwords on your system requires activation of the SETROPTS PASSWORD(MIXEDCASE) option in RACF®.

### Default value

Y

### Permissible values

Y, N

### Related parameters

RTE\_SECURITY\_USER\_LOGON

## RTE\_SECURITY\_KAES256\_KEY

This parameter contains unique 32-byte password encryption key.

### Required or optional

This parameter is required if any of the following conditions are in effect:

- Password encryption is enabled for any components.
- A SOAP server is enabled on a remote Tivoli® Enterprise Monitoring Server.
- Strict security for command requests is enabled (security compatibility mode is *disabled*).

### Location where the parameter value is stored

KAES256 member of the &rhilev.&rte.RKANPARU library. The stored value is encrypted.

### Default value

IBMTivoliMonitoringEncryptionKey

### Permissible values

A character string, with a maximum length of 32 and no ampersand (&) character.

### Description

A unique 32-byte password encryption key. The value is case-sensitive. You must use the same key during the installation of any components that communicate with the monitoring server. This parameter allows stand-alone agents as well as monitoring servers to customize the TMS:Engine password encryption key. This parameter replaces the KDS\_TEMS\_SECURITY\_KAES256\_ENCKEY.

### Related parameters

[“GBL\\_DSN\\_CSF\\_SCSFMODE0” on page 280](#)

[“KDS\\_KMS\\_SECURITY\\_COMPATMD” on page 1379](#)

## RTE\_SECURITY\_USER\_LOGON

This parameters contains the security system to be used for the runtime environment.

### Required or optional

Required

### Location where the parameter value is stored

N/A

### Parameter name and syntax

Various

### Default value

None

### Permissible values

RACF, ACF2, TSS (Top Secret), NAM, SAF, or None

### PARMGEN name

RTE\_SECURITY\_USER\_LOGON

### Description

Security system to be used for the runtime environment. If you specify a security system, verify that it is installed and configured correctly for your site. If you specify ACF2, you must also provide the name of the ACF2 macro library as the value of the GBL\_DSN\_ACF2\_MACLIB parameter.

The PARMGEN configuration method supports one additional permissible value: SAF. The System Authorization Facility (SAF) provides a generic API to interface to z/OS® security software. Specifying a security system here indicates which system will be used for security validation of users signing on to the Tivoli Enterprise Portal, but it does not enable validation. Security validation of users is enabled by the KDS\_TEMS\_SECURITY\_KDS\_VALIDATE parameter.

In addition, the security-related parameters are used in the PARMGEN WKANSAMU(KCIJPSEC) composite security job and product-specific, stand-alone versions of these security jobs. They are also used in several xKANPARU runtime members such as:

**xKANPARU(KppINNAM)**

for the TMS:Engine security member

**xKANPARU(KDSENV)**

for the KDS\_TEMS\_SECURITY\_KDS\_VALIDATE parameter

**xKANPARU(KppENV)**

for the RTE\_SECURITY\_CLASS parameter

**xKANMODU(&module)**

for product-specific security exits

## RTE\_SHARE

This parameter specifies the source of the libraries that are shared with a sharing runtime environment.

**Note:** This parameter is valid in both Configuration Manager and PARMGEN; however, the permissible values are different depending on the tool.

**Description**

This parameter applies to sharing runtime environments only.

**In Configuration Manager**

This parameter value must be SMP, to indicate sharing with an SMP/E target installation library. This is the only permissible value for Configuration Manager.

**In PARMGEN**

Name of the base or full runtime environment from which the sharing runtime environment obtains its base library information.

If target libraries that were installed by SMP/E are to be shared, provide the value SMP.

**Required or optional**

Required for a sharing runtime environment definition

**Default value**

**In Configuration Manager**

SMP

**In PARMGEN**

None

**Related parameters**

- [“RTE\\_X\\_HILEV\\_SHARING” on page 1364](#)

## RTE\_SMS\_MGMTCLAS

This parameter specifies whether the runtime data sets are to be managed by SMS.

### Required or optional

Optional

### PARMGEN name

RTE\_SMS\_MGMTCLAS

### Description

If the runtime data sets are to be managed by SMS, specify the SMS management class to be used for the allocation of non-VSAM data sets. If your site does not require the SMS MGMTCLAS parameter, you can leave this field blank.

### Related parameters

- [“RTE\\_SMS\\_VSAM\\_MGMTCLAS” on page 1351](#)
- [“RTE\\_SMS\\_STORCLAS” on page 1350](#)

## RTE\_SMS\_PDSE\_FLAG

This parameter specifies whether the non-VSAM data sets are to be managed by SMS, and therefore you want to allocate PDSE data sets instead of PDS data set

### Required or optional

Required

### PARMGEN name

RTE\_SMS\_PDSE\_FLAG

### Description

If the non-VSAM data sets are to be managed by SMS, you can specify Y to allocate PDSE data sets instead of PDS data sets. PDSE data sets do not require compression and are not limited by a predefined number of directory entries.

Even if you specify Y, most load module libraries (RKANMOD, RKANMODL, RKANMODR, and RKANMODU) are not allocated as PDSE data sets. The main exception is RKANMODP, a load module library used for the SMP/E CALLLIBS facility.

### Related parameters

None

## RTE\_SMS\_STORCLAS

This parameter specifies whether the runtime data sets are to be managed by SMS and therefore it is necessary to specify the SMS storage class to be used for the allocation of non-VSAM data sets.

### Required or optional

Optional

### PARMGEN name

RTE\_SMS\_STORCLAS

### Description

If the runtime data sets are to be managed by SMS, specify the SMS storage class to be used for the allocation of non-VSAM data sets. If your site does not require the SMS STORCLAS parameter, you can leave this parameter value blank.

### Related parameters

- [“RTE\\_SMS\\_VSAM\\_STORCLAS” on page 1351](#)
- [“RTE\\_SMS\\_MGMTCLAS” on page 1350](#)

## RTE\_SMS\_UNIT

This parameter specifies the unit name to be used for allocating the non-VSAM runtime data sets, if the data sets are not managed by SMS.

### Required or optional

Required if the runtime data sets are not to be managed by SMS; optional otherwise.

### PARMGEN name

RTE\_SMS\_UNIT

### Description

If the runtime data sets are not to be managed by SMS, specify the unit name to be used for allocating the non-VSAM runtime data sets. Otherwise, leave the parameter value blank.

### Related parameters

- [“RTE\\_SMS\\_VOLUME” on page 1351](#)

## RTE\_SMS\_VOLUME

This parameter specifies the volume serial number to be used for allocating the non-VSAM runtime data sets if the runtime data sets are not to be managed by SMS.

### Description

If the runtime data sets are not to be managed by SMS, specify the volume serial number to be used for allocating the non-VSAM runtime data sets. Otherwise, leave the parameter value blank.

### Permissible values

Character string, maximum length 6

### Related parameters

- [“RTE\\_SMS\\_UNIT” on page 1351](#)
- [“RTE\\_SMS\\_VSAM\\_VOLUME” on page 1352](#)

## RTE\_SMS\_VSAM\_MGMTCLAS

This parameter specifies the SMS management class to be used for the allocation of VSAM data sets, if the runtime data sets are to be managed by SMS.

### Required or optional

Optional

### PARMGEN name

RTE\_SMS\_VSAM\_MGMTCLAS

### Description

If the runtime data sets are to be managed by SMS, specify the SMS management class to be used for the allocation of VSAM data sets. If your site does not require the SMS MGMTCLAS parameter, you can leave this field blank.

### Related parameters

- [“RTE\\_SMS\\_MGMTCLAS” on page 1350](#)
- [“RTE\\_SMS\\_VSAM\\_STORCLAS” on page 1351](#)

## RTE\_SMS\_VSAM\_STORCLAS

This parameter specifies the SMS storage class to be used for the allocation of VSAM data sets if the runtime data sets are to be managed by SMS.

### Required or optional

Optional

**PARMGEN name**

RTE\_SMS\_VSAM\_STORCLAS

**Description**

If the runtime data sets are to be managed by SMS, specify the SMS storage class to be used for the allocation of VSAM data sets. If your site does not require the SMS STORCLAS parameter, you can leave this field blank.

**Related parameters**

- [“RTE\\_SMS\\_STORCLAS” on page 1350](#)
- [“RTE\\_SMS\\_VSAM\\_MGMTCLAS” on page 1351](#)

**RTE\_SMS\_VSAM\_VOLUME**

This parameter specifies the volume serial number to be used for allocating the VSAM runtime data sets, if the runtime data sets are not managed by SMS.

**Description**

Volume serial number to be used for allocating the VSAM runtime data sets. This value is required if the runtime data sets are not to be managed by SMS. Otherwise, leave this parameter value blank.

**Permissible values**

Character string, maximum length 6

**Related parameters**

- [“RTE\\_SMS\\_VOLUME” on page 1351](#)

**RTE\_STC\_PREFIX**

This parameter specifies a prefix to be used when generating started task procedures for products configured in the runtime environment.

**Required or optional**

Required for full and sharing runtime environments; does not apply to base runtime environments.

**PARMGEN name**

RTE\_STC\_PREFIX

**Description**

For full and sharing runtime environments, specify a prefix to be used when generating started task procedures for products configured in the runtime environment. The default value of CANS (Configuration Tool) or IBM (PARMGEN) is provided, but specifying your own prefix prevents confusion with jobs generated by other runtime environments on the same system.

The started task names and VTAM-related members must specify unique names to not collide with other products' members.

**Related parameters**

- 

**RTE\_SYSV\_BASE\_ALIAS**

This parameter specifies a system variable for the base runtime environment for a sharing-with-base runtime environments with system variables enabled.

**Required or optional**

Required for full and sharing runtime environments with system variables enabled; does not apply to base runtime environments

**PARMGEN name**

RTE\_SYSV\_BASE\_ALIAS

**Description**

For a sharing-with-base runtime environment with system variables enabled (RTE\_SYSV\_SYSVAR\_FLAG = Y), specify a system variable for the base runtime environment. This value is then inserted into the base runtime environment data set references in all started tasks. The resolved name must be a valid data set name qualifier.

For other types of runtime environments, the label n/a is displayed with this field.

**Related parameters**

- [“RTE\\_SYSV\\_SYSVAR\\_FLAG” on page 1353](#)
- [“RTE\\_BASE\\_NAME” on page 1332](#)

## RTE\_SYSV\_NAME

This parameter contains the system variable for the name of the runtime environment.

**Required or optional**

Required for full and sharing runtime environments with system variables enabled; does not apply to base runtime environments

**PARMGEN name**

RTE\_SYSV\_NAME

**Description**

System variable for the name of the runtime environment. The resolved name must be a single valid JCL symbol, as defined in the *z/OS® MVS™ JCL Reference*. This field becomes the value of the SYS= parameter (for example, SYS='SYSNAME') in all started task members. This field can contain both literals and symbolics. For example, if you specify a value of OMXSYSNAME, the value resolves to a runtime environment name of OMXSYSA when SYSNAME = SYSA.

**Related parameters**

- [“RTE\\_SYSV\\_SYSVAR\\_FLAG” on page 1353](#)
- [“RTE\\_NAME” on page 1340](#)

## RTE\_SYSV\_SYSVAR\_FLAG

This parameter determines whether to enable z/OS® system variables, which are elements that allow systems to share PARMGEN definitions while retaining unique values in those definitions.

**Required or optional**

Required for full and sharing runtime environments; does not apply to base runtime environments.

**PARMGEN name**

RTE\_SYSV\_SYSVAR\_FLAG

**Description**

Determines whether to enable z/OS® system variables, which are elements that allow systems to share PARMGEN definitions while retaining unique values in those definitions. Each system that shares a definition replaces the system variable with a unique value during initialization.

If you use system variables, the components inherit the system values for the system on which they are started (the host z/OS® system). These system-specific values are then automatically loaded into dynamic in-memory parameter members that exist only while the component runs. The result is that the software runs correctly by using the system-specific parameter values for the host z/OS® system.

**Note:** You cannot use system variables in the runtime environment of a high-availability hub.

### Related parameters

- [“RTE\\_SYSV\\_NAME” on page 1353](#)
- [“RTE\\_SYSV\\_BASE\\_ALIAS” on page 1352](#)

## RTE\_SYSV\_VTAM\_NETID

This parameter specifies a system variable for the VTAM® network identifier, if system variables are enabled and you intend to use SNA communications.

### Required or optional

Required for SNA communications if system variables are enabled

### PARMGEN name

RTE\_SYSV\_VTAM\_NETID

### Description

If system variables are enabled (RTE\_SYSV\_SYSVAR\_FLAG = Y) and if you intend to use SNA communications, supply a system variable for the VTAM® network identifier, as defined in the NETID parameter of the VTAMLST startup member ATCSTRnn. The resolved value can have a maximum of 8 characters. This value is required for SNA communications. If none of the products or components you intend to configure in this runtime environment require SNA communications, leave this parameter value blank.

### Related parameters

- [“RTE\\_SYSV\\_SYSVAR\\_FLAG” on page 1353](#)
- [“RTE\\_VTAM\\_NETID” on page 1363](#)

## RTE\_TCP\_HOST

This parameter contains the TCP/IP hostname or IP address of the z/OS® system where the runtime environment is being defined.

### Description

This parameter contains the TCP/IP hostname or IP address of the z/OS® system where the runtime environment is being defined. To obtain the hostname and IP address, you can enter **TSO HOMETEST** at a command line.

For a high-availability hub monitoring server, this parameter value must be set to the dynamic virtual IP address (DVIPA) and must match the value in parameter **KDS\_TEMS\_TCP\_HOST**.

#### For Configuration Manager:

To ensure consistent settings for the agents and components in the runtime environment, this parameter provides the default value for some other parameters that specify the hostname.

If you configure a monitoring server as part of your runtime environment, this parameter value is used as the default **KDS\_TEMS\_TCP\_HOST** parameter value. Depending on other settings in the runtime environment, this parameter value might also be used as the default value for the **Kpp\_TEMS\_TCP\_HOST** parameters.

If you do not configure a monitoring server as part of the runtime environment, this parameter value is used as the default value for the **Kpp\_TEMS\_TCP\_HOST** parameters.

#### For PARMGEN:

This parameter does not impact the default setting of any other parameter value.

### Default value

%SYSIPHOSTNAME%

### Permissible values

Character string, maximum length 39

### Related parameters

- [RTE\\_TCP\\_PORT\\_NUM](#)

- KDS\_TEMS\_TCP\_HOST
- KDS\_HUB\_TCP\_HOST
- Kpp\_TEMS\_TCP\_HOST

## RTE\_TCP\_PORT\_NUM

This parameter contains the well-known port for the IP.PIPE communication protocol (the TCP/IP protocol that supports IPv4).

### Description

Well-known port for the IP.PIPE communication protocol (the TCP/IP protocol that supports IPv4).

#### For Configuration Manager:

This parameter sets the default values of several parameters that specify port numbers, including:

**KDS\_TEMS\_TCP\_PIPE\_PORT\_NUM**  
**Kpp\_TEMS\_TCP\_PIPE\_PORT\_NUM**

#### For PARMGEN:

This parameter does not impact the default setting of any other parameter value.

### Default value

1918

### Permissible values

1 - 65535

### Related parameters

- RTE\_TCP\_HOST
- KDS\_TEMS\_TCP\_PIPE\_PORT\_NUM

## RTE\_TEMS\_CONFIGURED\_FLAG

This parameter specifies whether a Tivoli Enterprise Monitoring Server is to be configured in this runtime environment.

### Required or optional

Required for full and sharing runtime environments; does not apply to base runtime environments.

### PARMGEN name

RTE\_TEMS\_CONFIGURED\_FLAG

### Description

Determines whether a Tivoli Enterprise Monitoring Server is to be configured in this runtime environment. If you are creating a runtime environment for stand-alone monitoring agents without a monitoring server, specify N. Otherwise, specify Y (the default) to allocate libraries for the monitoring server. If Y is specified, the managed system name of the local monitoring server must be specified as the RTE\_TEMS\_NAME\_NODEID. A remote server connecting to a hub uses the hub's RTE\_TEMS\_NAME\_NODEID as its KDS\_HUB\_TEMS\_NAME\_NODEID.

### Related parameters

- "RTE\_TEMS\_NAME\_NODEID" on page 1355
- KDS\_HUB\_TEMS\_NAME\_NODEID

## RTE\_TEMS\_NAME\_NODEID

This parameter specifies the unique name that identifies the monitoring server for internal processing.

### Description

Unique name that identifies the monitoring server for internal processing. In general, it is best to accept the default TEMS name (the runtime environment name followed by :CMS). If you want to specify a different name, follow these guidelines:

- The TEMS name must be unique.
- The name is alphanumeric and must begin with an alphabetic character.
- The length of the name must be at least 2 characters and no more than 32 characters.
- The name cannot contain blanks or special characters (\$#@). An underscore ( ) is permitted and conforms to ISO 9660 standards. A period (.) is also valid.
- The TEMS name is case-sensitive on all platforms. If you use a mixed-case name, you must supply the same mixed-case name when you configure all components and monitoring agents that will connect to the monitoring server.

Be sure to make a note of the TEMS name. You will have to specify it when you configure components and products in the runtime environment, and when you set up communications with the distributed components of Tivoli Management Services (IBM Tivoli Monitoring).

This parameter is required for a full or sharing runtime environment that contains a Tivoli Enterprise Monitoring Server.

#### Permissible values

Character string, maximum length 32

#### Related parameters

- [“RTE\\_TEMS\\_CONFIGURED\\_FLAG” on page 1355](#)

## RTE\_TEMS\_TRANSPORT\_MODE

Use this parameter to specify the Hypertext Transfer Protocol to use for communication with the Tivoli Enterprise Monitoring Server.

#### Description

This parameter specifies the Hypertext Transfer Protocol to use for communication between the Tivoli Enterprise Monitoring Server (TEMS) and other components.

**Note:** HTTP and HTTPS communication protocol configuration specified in **Kpp\_X\_KDE\_TRANSPORT\_HTTP\_OPTIONS** and **Kpp\_X\_KDE\_TRANSPORT\_GBL\_OPTIONS** can potentially override **RTE\_TEMS\_TRANSPORT\_MODE** parameter output in the *KppENV* members.

#### Permissible values

##### HTTPS

Enables the HTTPS communication protocol for the Tivoli Enterprise Monitoring Server, and disables the HTTP communication protocol for all agents. Use parameter **KDS\_TEMS\_HTTPS\_PORT\_NUM** to specify the HTTPS port.

##### HTTP

Enables HTTP communication protocol for the Tivoli Enterprise Monitoring Server, and disables the HTTPS communication protocol. Use parameter **KDS\_TEMS\_HTTP\_PORT\_NUM** to specify the HTTP port.

##### NONE

Disables HTTP and HTTPS communication protocols for all agents.

#### Default value

HTTPS

#### Related parameters

- [KDS\\_TEMS\\_HTTPS\\_PORT\\_NUM](#)
- [Kpp\\_X\\_KDE\\_TRANSPORT\\_HTTP\\_OPTIONS](#)

- [Kpp\\_X\\_KDE\\_TRANSPORT\\_GBL\\_OPTIONS](#)

## RTE\_TN3270\_DXL\_HOSTADDRESS

This parameter specifies the network address of an LPAR that does have an active Telnet listener, if you are configuring products that support the Dynamic XE to 3270 (Classic) linking feature and if the LPAR in which you are defining a runtime environment does not have an active Telnet listener.

### Description

If you are configuring products that support the Dynamic XE to 3270 (Classic) linking feature and if the LPAR in which you are defining a runtime environment does not have an active Telnet listener, specify the network address of an LPAR that does have an active Telnet listener. A network address can be specified as one of the following values:

- Fully qualified hostname (for example, `sys.ibm.com`)
- First qualifier of the fully qualified hostname (for example, `sys` for `sys.ibm.com`)
- 32-bit IPv4 address in dotted decimal notation (for example, `9.67.1.100`)

To get this value, issue the `TSO HOMETEST` command on the LPAR of the Telnet listener. The values you specify on this panel are displayed during TN3270 logon and can be modified then for an individual TN3270 session.

### Default value

`%SYSIPHOSTNAME%`

### Permissible values

Character string, maximum length 44

### Related parameters

- [“RTE\\_TN3270\\_DXL\\_TN3270PORT” on page 1357](#)

## RTE\_TN3270\_DXL\_LUGROUP

This parameter specifies the name of a Logical Unit (LU) group if the default Telnet USS screen does not accept the `LOGON APPLID() DATA()` command required by the Dynamic XE to 3270 (Classic) linking feature.

### Required or optional

Required

### PARMGEN name

`RTE_TN3270_DXL_LUGROUP`

### Description

The Dynamic XE to 3270 (Classic) linking feature requires the VTAM® Unformatted System Services (USS) screen to accept a `LOGON APPLID() DATA()` command. If the default Telnet USS screen does not accept this command, supply the name of a Logical Unit (LU) group that does accept it. The TN3270 session will be joined to that LU group.

### Related parameters

None

## RTE\_TN3270\_DXL\_TN3270PORT

This parameter contains the port number on which the TN3270 server is listening.

### Required or optional

Optional

### PARMGEN name

`RTE_TN3270_DXL_TN3270PORT`

### Description

Port number on which the TN3270 server is listening.

## Related parameters

- [“RTE\\_TN3270\\_DXL\\_HOSTADDRESS” on page 1357](#)

## RTE\_TYPE

This parameter specifies the type of runtime environment being created.

**Note:** This parameter is valid in both Configuration Manager and PARMGEN; however, the default value is different depending on the tool.

### Description

#### In Configuration Manager

This parameter determines whether runtime members are a full stand-alone set or shared with SMP/E target installation libraries. The following types are valid:

##### FULL

Stand-alone runtime members. Runtime members have no dependency on target libraries.

##### SHARING

Some runtime members refer to the target libraries.

The high-level qualifiers of the target libraries are specified by the **GBL\_TARGET\_HILEV** parameter.

SHARING reduces the storage requirement for each runtime environment.

If **RTE\_TYPE** is SHARING, then the value of the **RTE\_SHARE** parameter must be SMP.

#### In PARMGEN

This parameter specifies the type of runtime environment being created. The following types are valid:

##### FULL

Allocates both private and base libraries. Use this if you only need one runtime environment or if you need a runtime environment for a unique set of products.

##### SHARING

Allocates private libraries only. This type can either share base libraries with a base or full runtime environment, or use target libraries that were installed by SMP/E for its base libraries. Define one sharing runtime environment for each z/OS® image.

**Note:** Base libraries are created automatically as part of creating the first runtime environment that shares the base runtime environment. Runtime environments created after this one can point to the existing base using the **RTE\_SHARE** parameter.

For more information about the types of runtime environments, see [What types of runtime environments to set up](#).

### Default value

#### In Configuration Manager

SHARING

#### In PARMGEN

FULL

### Related parameters

- [“RTE\\_SHARE” on page 1349](#)
- [“RTE\\_BASE\\_NAME” on page 1332](#)

## RTE\_USERMODS\_FLAG

This parameter determines whether the Configuration Tool will identify user-modified data set members that each configuration batch job will affect.

### Required or optional

Required

### PARMGEN name

RTE\_USERMODS\_FLAG

### Description

Determines whether PARMGEN will identify user-modified data set members that each configuration batch job will affect. If runtime members analysis is enabled, a report of user-modified members is displayed. If the value of this parameter is Y, the value of the [“RTE\\_REMOTE\\_LPAR\\_FLAG” on page 1346](#) parameter must be N, and vice versa.

### Related parameters

- [“RTE\\_REMOTE\\_LPAR\\_FLAG” on page 1346](#)

## RTE\_USS\_MKDIR\_MODE

This parameter allows the z/OS® UNIX® System Services access mode that is used in the PARMGEN and Configuration Manager jobs to be customized to a site's security audit requirements.

### Description

This parameter allows customization of the access mode that is used in the following configuration jobs:

- In PARMGEN:
  - KCIJPUSP, which creates the z/OS UNIX-related members in the RKANDATV runtime library for use in the composite KCIJPUSS job. For example, this includes the creation of the RTE RKANDATV(KDSRMKDB) TEMS self-describing agent (SDA) member that contains the **mkdir** commands for the SDA z/OS UNIX runtime environment directories.
  - KCIJPUSS, which creates the z/OS UNIX directories (using commands prepared by the KCIJPUSP job) and copies the z/OS UNIX files.
- In Configuration Manager:
  - KYNJSUSU, which is used by the **GENERATE** action.

The TEMS SDA directories are created with the default access mode value of 775, which generates MODE(7,7,5) in the **mkdir** commands.

**Note:** This parameter is only for creating z/OS UNIX directories. If you want to change the access mode for existing directories and files, use the **chmod** command or delete the old directories before you regenerate and rerun the KCIJPUSP and KCIJPUSS jobs or the **GENERATE** action.

### Required or optional

Required

### Default value

775

### Permissible values

Octal values (0-7) for each digit

### Related parameters

[“GBL\\_HFS\\_JAVA\\_DIRn” on page 1328](#) (typically in WCONFIG(\$GBL\$USR))

[“GBL\\_DSN\\_SYS1\\_SBPXEXEC” on page 1324](#) (typically in WCONFIG(\$GBL\$USR))

[“KDS\\_KMS\\_SDA” on page 1378](#)

[“KDS\\_TEMA\\_SDA” on page 1394](#)

[“Kpp\\_AGT\\_TEMA\\_SDA” on page 1277](#) (per Kpp agent exploiting SDA)

[“RTE\\_USS\\_RTEDIR” on page 1360](#)

## RTE\_USS\_RTEDIR

This parameter specifies the main Hierarchical File System/zSeries File System (HFS/zFS) directory name for the runtime environment, if a product to be configured in the runtime environment requires that z/OS® UNIX® System Services directories be created.

### Required or optional

Optional

### Location where the parameter value is stored

The KDSENV member of the *rhllev.middlev.rtename*.RKANPARU library

### Parameter name and syntax

TEMS\_MANIFEST\_PATH=#rtedir/LPARRTE/kds/support/TEMS

### Default value

/rtehome

### Permissible values

See description.

### PARMGEN name

RTE\_USS\_RTEDIR

### Description

This parameter is conditional. If any products in this runtime environment require that z/OS UNIX directories be created, specify the RTE HFS/zFS home directory (*#rtedir*).

#### Note:

1. Specify the main RTE HFS/zFS home directory name if you are enabling the Self-Describing Agent (SDA) function in the z/OS TEMS and Agents. SDA applies to Tivoli Management Services V6.2.3 or later.
2. Set up required authorizations and files for SDA.
  - Create a user ID with superuser authority (a TSO ID with an OMVS segment defined to it) if you do not already have one. Product configuration z/OS UNIX jobs (KCIJ%USP/KCIJ%USS) that use the RTE\_USS\_RTEDIR home directory parameter must be run by a user ID that has superuser authority (UID=0), or a user ID with read access to resource BPX.SUPERUSER under the FACILITY profile with superuser authority activated. Both the user ID of the KCIJPUS\* z/OS UNIX job submitter and the %KDS\_TEMS\_STC% TEMS started task name must have superuser authority. For more information about assigning superuser authority, see [Superusers in z/OS UNIX](#).
  - Choose an existing file system or create a new one for products that use the RTE\_USS\_RTEDIR home directory parameter. This file system must be created, mounted, and in read/write mode before the z/OS UNIX jobs that define the file system paths are submitted. Select a name for your RTE that establishes or fits a naming convention that can be used as you install additional RTEs.
  - In the MOUNT FILESYSTEM command, the MOUNTPOINT() parameter equates to the value you specify for the RTE\_USS\_RTEDIR. For example:

```
MOUNT FILESYSTEM('&hlq_rte_home') TYPE(ZFS) MODE(RDWR) MOUNTPOINT('/  
rtehome') PARM('AGGRGROW')
```

An example of this using RTE name TSTEST might be

```
MOUNT FILESYSTEM('OMVS.TSTEST.ZFS') TYPE(ZFS) MODE(RDWR) MOUNTPPOINT('/tstest') PARM('AGGRGROW')
```

3. The RTE\_USS\_RTEDIR value (*#rtedir*) is used in this TEMS parameter in the *xKANPARU* library:

```
TEMS_MANIFEST_PATH=\
#rtedir/%RTE_NAME%/kds/support/TEMS
```

The TEMS\_MANIFEST\_PATH parameter is the name of the z/OS UNIX home directory where agent-uploaded jar files and other application support files will be stored by the TEMS. The *#rtedir* value is also used in the KDS\* members in RKANDATV. These members contain the commands that create the z/OS UNIX directories and send files to the z/OS UNIX subdirectories.

4. Customize RTE\_USS\_MKDIR\_MODE parameter if you must secure access mode to be used in the PARMGEN composite z/OS UNIX-related jobs (KCIJPUSP/KCIJPUSS). The default is "755" which generates "MODE(7,5,5)" in the mkdir commands to create the new TEMS SDA directories. PARMGEN KCIJPUSP z/OS UNIX preparation job creates the RTE RKANDATV(KDSRMKDB) TEMS Self-Describing Agent (SDA) member that contains the SDA z/OS UNIX RTEDIR mkdir commands. MODE() is customized to site's security audit requirements based on the value supplied in the RTE\_USS\_MKDIR\_MODE parameter. The RTE\_USS\_MKDIR\_MODE parameter is used only to creating new z/OS UNIX directories. If the z/OS UNIX directories already exist and you want a different access mode for the directories and files, use the CHMOD command or delete the old directories before regenerating and rerunning the KCIJPUSP/KCIJPUSP jobs. For additional security considerations, see "Checklist: Prepare the system" on-line README topic on the "Welcome to the z/OS Installation and Configuration Tools for IBM Tivoli Management Services (TMS) dependent products" KCIP@PGW panel.

## RTE\_VALIDATION\_LEVEL

This parameter specifies the level of checking that is performed during parameter validation.

### Description

This parameter specifies the level of checking that is performed during parameter validation.

In Configuration Manager, parameter validation occurs during the **GENERATE** action and the **GENERATE** action with **OPTION VALIDATE**.

In PARMGEN, parameter validation occurs during the WCONFIG(KCIJPVAL) validation job or the VALIDATE step of the WCONFIG(\$PARSE\*) job.

### Default value

W

## Permissible values

### I (Informational)

The least restrictive level.

### W (Warning)

The default. This is basically the toleration mode level.

### E (Error)

The most restrictive validation level. Each invalid parameter value is reported as an error and stops further validation processing.

## RTE\_VSAM\_HILEV

This parameter specifies the VSAM high-level qualifier to be used for allocating the runtime data sets

### Required or optional

Required

### PARMGEN name

RTE\_VSAM\_HILEV

### Description

VSAM high-level qualifier to be used for allocating the runtime data sets. If you plan to allocate SMS-managed data sets for the runtime environment, the high-level qualifier that you specify must be eligible for SMS-managed volumes.

For PARMGEN configuration, the value of this parameter for a sharing runtime environment must be the same as the value for the shared runtime environment.

### Related parameters

- [“RTE\\_TYPE” on page 1358](#)

## RTE\_VTAM\_APPLID\_PREFIX

This parameter specifies the global VTAM® applid prefix to be used to build the VTAM® applids for products in this runtime environment.

### Required or optional

Optional

### PARMGEN name

RTE\_VTAM\_APPLID\_PREFIX

### Description

Global VTAM® applid prefix to be used when building the VTAM® applids for products in this runtime environment. If none of the products or components you intend to configure in this runtime environment require SNA communications, delete the default value and leave this parameter value blank.

### Related parameters

- [“RTE\\_VTAM\\_NETID” on page 1363](#)

## RTE\_VTAM\_GBL\_MAJOR\_NODE

This parameter specifies the name of the global VTAM® major node in the RKANSAMU member with the same name.

### Required or optional

Required

### PARMGEN name

RTE\_VTAM\_GBL\_MAJOR\_NODE

#### Description

Name of the global VTAM® major node in the RKANSAMU member with the same name. This major node contains all applid definitions required for the runtime environment.

#### Related parameters

None

## RTE\_VTAM\_LU62\_DLOGMOD

This parameter specifies the LU6.2 logmode for this runtime environment.

#### Required or optional

Required for SNA communications

#### PARMGEN name

RTE\_VTAM\_LU62\_DLOGMOD

#### Description

LU6.2 logmode for this runtime environment. The default is CANCTDCS. If none of the products or components you intend to configure in this runtime environment require SNA communications, delete the default value and leave this parameter value blank.

#### Related parameters

- [“RTE\\_VTAM\\_LU62\\_MODETAB” on page 1363](#)

## RTE\_VTAM\_LU62\_MODETAB

This parameter specifies the logmode table name for LU6.2 logmode entries

#### Required or optional

Optional

#### PARMGEN name

RTE\_VTAM\_LU62\_MODETAB

#### Description

Logmode table name for LU6.2 logmode entries. The default is KDSMTAB1. If none of the products or components you intend to configure in this runtime environment require SNA communications, delete the default value and leave this parameter value blank.

This table is assembled into the system library (usually SYS1.VTAMLIB) that contains VTAM® logmode tables.

#### Related parameters

- [“RTE\\_VTAM\\_LU62\\_DLOGMOD” on page 1363](#)
- [“GBL\\_DSN\\_SYS1\\_VTAMLIB” on page 1325](#)

## RTE\_VTAM\_NETID

This parameter specifies the VTAM® network identifier, as defined in the NETID parameter of the VTAMLST startup member.

**Note:** This parameter is valid in both PARMGEN and Configuration Manager; however, its function differs slightly. This topic describes this parameter as it applies to PARMGEN.

#### Required or optional

Required for SNA communications

#### PARMGEN name

RTE\_VTAM\_NETID

### Description

VTAM® network identifier, as defined in the NETID parameter of the VTAMLST startup member (ATCSTRnn). If none of the products or components you intend to configure in this runtime environment require SNA communications, leave this parameter value blank. If system variables are enabled, the value supplied for [“RTE\\_SYSV\\_VTAM\\_NETID” on page 1354](#) is used.

### Related parameters

- [“RTE\\_SYSV\\_VTAM\\_NETID” on page 1354](#)
- [“RTE\\_VTAM\\_APPLID\\_PREFIX” on page 1362](#)
- [“GBL\\_DSN\\_SYS1\\_VTAMLST” on page 1325](#)

## RTE\_X\_HILEV\_SHARING

This parameter specifies the value of the non-VSAM high level qualifier of the base or full runtime environment being shared by this environment.

### Required or optional

Required if RTE\_TYPE is SHARING and RTE\_SHARE is not SMP.

### Location where the parameter values is stored

N/A

### PARMGEN name

RTE\_X\_HILEV\_SHARING

### Description

This parameter specifies the non-VSAM value of the high level qualifier of the runtime environment from which the sharing runtime environment obtains its base library information, if RTE\_TYPE is customized to be SHARING, and the RTE\_SHARE is full or base.

### Related parameters

- [“RTE\\_SHARE” on page 1349](#)
- [“RTE\\_TYPE” on page 1358](#)

## RTE\_X\_KCNDLSSI\_INITPARAM\_FLAG

This parameter determines if the INITPARAM( 'SSPROC=%RTE\_CANSCN\_STC%' ) parameter is generated in the *&rhilev.&rte.RKANSAMU(KCNDLSSI)* OMEGAMON subsystem member.

### Required or optional

Optional

### Location where the parameter value is stored

Value determines if the INITPARAM( 'SSPROC=%RTE\_CANSCN\_STC%' ) parameter should be generated in the *&rhilev.&rte.RKANSAMU(KCNDLSSI)* member.

### Parameter name and syntax

N/A

### Default value

Y

### Permissible values

Y, N

### PARMGEN name

RTE\_X\_KCNDLSSI\_INITPARAM\_FLAG

### Description

This is the flag that generates the INITPARAM( 'SSPROC=%RTE\_CANSCN\_STC%' ) parameter in the KCNDLSSI member in RKANSAMU. A value of Y generates the INITPARAM(). Member KCNDLSSI contains a sample

IEFSSNcc update. In addition to identifying the subsystem to z/OS, this sample causes an automatic start of the subsystem address space.

#### Related parameters

- [“RTE\\_X\\_KCNSTR00\\_PLEXCOLLECT” on page 1365](#)

## RTE\_X\_KCNSTR00\_PLEXCOLLECT

This parameter specifies whether or not the OMEGAMON subsystem address space may become the collector for this sysplex.

#### Required or optional

Optional

#### Location where the parameter value is stored

KCNSTR00 OMEGAMON subsystem startup member in the *&rhilev.&rte*.RKANPARU library.

#### Parameter name and syntax

PLEXCOLLECT=%RTE\_X\_KCNSTR00\_PLEXCOLLECT%

#### Default value

YES

#### Permissible values

YES, NO

#### PARMGEN name

RTE\_X\_KCNSTR00\_PLEXCOLLECT

#### Description

This parameter specifies whether or not the OMEGAMON subsystem address space may become the collector for this Sysplex. There are two values:

##### YES

This OMEGAMON subsystem may become the Coupling Facility data collector for this sysplex. Only one OMEGAMON subsystem at a time is the collector, but OMEGAMON subsystems with this value may take over collection should the current collector fail or be terminated. YES is the default.

##### NO

This OMEGAMON subsystem may not become the collector for this sysplex. This OMEGAMON subsystem may initiate local collection if the sysplex collector cannot be located.

- [“RTE\\_X\\_KCNSTR00\\_REFRESH” on page 1366](#)

## RTE\_X\_KCNSTR00\_REFRESH

This parameter specifies the interval at which the OMEGAMON subsystem refreshes Coupling Facility data in the address space.

### Required or optional

Optional

### Location where the parameter value is stored

KCNSTR00 OMEGAMON subsystem startup member in the *&rhilev.&rte*.RKANPARU library.

### Parameter name and syntax

REFRESH=%RTE\_X\_KCNSTR00\_REFRESH%

### Default value

60 (in seconds)

### Permissible values

Numeric range 1–300

### PARMGEN name

RTE\_X\_KCNSTR00\_REFRESH

### Description

This parameter shows the refresh interval in effect. The value is in seconds. This interval determines how frequently Coupling Facility data gets refreshed in this address space. All OMEGAMON subsystems that are part of the same XCF group should have the same refresh interval. The smaller this number, the higher the overhead incurred.

### Related parameters

## RTE\_X\_OVERRIDE\_EMBEDS\_LIB

This Configuration Manager-only parameter specifies the name of the source library for override embed members.

For more information, see the following topics:

- [“Using override embed members in Configuration Manager” on page 337](#)
- [“RTE\\_X\\_OVERRIDE\\_EMBEDS\\_LIB” on page 298](#)

## RTE\_X\_SECURITY\_DATA\_ABOVE

This parameter determines if the DATA=ABOVE parameter or the DATA=BELOW parameter is generated in the *&rhilev.&rte*.RKANPARU(*KppINNAM*) security member for TMS:Engine to control the allocation of security control blocks.

### Required or optional

Optional

### Location where the parameter value is stored

- *KppINNAM* member in *&rhilev.&rte*.RKANPARU for the TEMS, the agents, and most of the agent CUA interfaces

- KC2NAM $nn$  in  $\&rhilev.\&rte.RKANPARU$  for OMEGAMON II for CICS and OMEGAMON for CICS, where  $nn=00..15$  (one pair per Classic 3270 or CUA started tasks)
- KD2INNAM in  $\&rhilev.\&rte.RKD2PAR$  for OMEGAMON® AI for Db2 (Classic 3270 started task)

**Parameter name and syntax**

DATA=ABOVE|BELOW

**Default value**

Y

**Permissible values**

Y, N

**PARMGEN name**

RTE\_X\_SECURITY\_DATA\_ABOVE

**Description**

Controls where the security control blocks are allocated by the TMS:Engine NAM routines, as follows:

**BELOW**

Control blocks are allocated in 24-bit storage (RMODE 24).

**ABOVE**

Control blocks are allocated in 31-bit storage (RMODE 31).

If RTE\_X\_SECURITY\_DATA\_ABOVE is set to Y, then a DATA=ABOVE parameter is written to the  $KppINNAM$  member in the  $RKANPARU$  library. If RTE\_X\_SECURITY\_DATA\_ABOVE is set to N, then a DATA=BELOW parameter is written out to the  $KppINNAM$  member in the  $RKANPARU$  library.

**Related parameters**

- [“RTE\\_SECURITY\\_USER\\_LOGON” on page 1348](#)
- [“RTE\\_SECURITY\\_FOLD\\_PASSWORD\\_FLAG” on page 287](#)

## RTE\_X\_SECURITY\_EXIT\_LIB

This parameter specifies the name of the global runtime environment library that houses all the OMEGAMON and IBM Tivoli Monitoring-related product security exits (KOBSPDPT OMEGAMON  $KppSUPDI$  exits, TMS:Engine security exits, external security exits, etc.).

**Note:** This parameter is valid in both PARMGEN and Configuration Manager; however, its function differs slightly. This topic describes this parameter as it applies to PARMGEN.

**Required or optional**

Required

**Location where the parameter value is stored**

N/A

**Parameter name and syntax**

N/A

**Default value**

$\&rte\_hilev.\&rte\_name.RKANSAMU$

**Permissible values**

Character string, maximum length 44

**PARMGEN name**

RTE\_X\_SECURITY\_EXIT\_LIB

**Description**

Library where user security exits are located. Overrides the SYSIN DD statement where the user exits may have been customized (if other than the default RKANSAM location). The KppJPSC3 input members to the composite KCIJPSEC security job point the SYSIN DD statement to RKANSAM by default. If you need to make further changes to the sample exit, copy the user exit to the xKANSAMU library, and make your changes accordingly. Then modify the RTE\_X\_SECURITY\_EXIT\_LIB parameter and change the value to RKANSAMU instead.

## RTE\_X\_SMS\_MGMTCLAS\_SHARE

This parameter specifies whether the shared data sets are to be managed by SMS and therefore it is necessary to specify the SMS storage class to be used for the allocation of VSAM data sets.

#### Required or optional

Optional

#### Location where the parameter values is stored

N/A

#### PARMGEN name

RTE\_X\_SMS\_MGMTCLAS\_SHARE

#### Description

For shared data sets owned by the RTE\_SHARE set of read-only libraries and managed by SMS, specify the SMS management class to be used for allocating the non-VSAM shared data sets. If your site does not require the SMS MGMTCLAS parameter, leave the parameter value blank.

#### Related parameters

## RTE\_X\_SMS\_PDSE\_FLAG\_SHARE

This parameter specifies whether the shared data sets are to be managed by SMS and therefore it is necessary to specify the SMS storage class to be used for the allocation of VSAM data sets.

#### Required or optional

Optional

#### Location where the parameter values is stored

N/A

#### PARMGEN name

RTE\_X\_SMS\_PDSE\_FLAG\_SHARE

#### Description

For shared data sets owned by the RTE\_SHARE set of read-only libraries and managed by SMS, specify Y to allocate the non-VSAM data sets as PDSE instead of PDS.

#### Related parameters

## RTE\_X\_SMS\_STORCLAS\_SHARE

This parameter specifies whether the shared data sets are to be managed by SMS and therefore it is necessary to specify the SMS storage class to be used for the allocation of non-VSAM data sets

#### Required or optional

Optional

#### Location where the parameter values is stored

N/A

#### PARMGEN name

RTE\_X\_SMS\_STORCLAS\_SHARE

#### Description

For shared data sets owned by the RTE\_SHARE set of read-only libraries and managed by SMS, specify the SMS storage class to be used for allocating the non-VSAM shared data sets. If your site does not require the SMS STORCLAS parameter, leave the parameter value blank.

#### Related parameters

[“RTE\\_X\\_SMS\\_VSAM\\_VOLUME\\_SHARE” on page 1371](#)

## RTE\_X\_SMS\_UNIT\_SHARE

This parameter specifies the unit name to be used for allocating the non-VSAM shared data sets if the shared data sets are not to be managed by SMS.

#### Required or optional

Required if the shared data sets are not to be managed by SMS; otherwise optional.

#### Location where the parameter values is stored

N/A

#### PARMGEN name

RTE\_X\_SMS\_UNIT\_SHARE

#### Description

For shared data sets owned by the RTE\_SHARE set of read-only libraries, and using non-SMS-managed RTE\_X\_HILEV\_SHARING HLQ, specify the unit name to be used for allocating the non-VSAM shared data sets. Otherwise, leave the parameter value blank.

## RTE\_X\_SMS\_VOLUME\_SHARE

This parameter specifies the volume serial numbers to be used for allocating the non-VSAM shared data sets if the shared data sets are not to be managed by SMS.

#### Required or optional

Required if the shared data sets are not to be managed by SMS; otherwise optional.

#### Location where the parameter values is stored

N/A

#### PARMGEN name

RTE\_X\_SMS\_VOLUME\_SHARING

#### Description

For shared data sets owned by the RTE\_SHARE set of read-only libraries and using a non-SMS-managed RTE\_X\_HILEV\_SHARING high-level qualifier, specify the volume serial numbers to be used for allocating the non-VSAM shared data sets. Otherwise, leave the parameter value blank.

**RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG**

Generates an uncommented INAPF INCLUDE statement in product started tasks (STCs).

**Required or optional**

Optional

**Default value**

N

**Permissible values**

Y, N

**PARMGEN name**

RTE\_STC\_PREFIX

**Description**

The generated INCLUDE statement imbeds a member in all product STCs which contains APF-authorization commands for libraries concatenated in the STC STEPLIB and RKANMODL DDNAMEs. This member also contains the VARY activate command pointing to the %RTE\_VTAM\_GBL\_MAJOR\_NODE% VTAM major node.

**Tivoli Enterprise Monitoring Server (KDS) parameters**

The Tivoli Enterprise Monitoring Server parameters provide configuration settings for hub and remote monitoring servers on z/OS®.

The Tivoli Enterprise Monitoring Server parameters are explained in this section.

**KDS\_AUDIT\_ITM\_DOMAIN**

This parameter specifies an identifier that may be used to associate audit records.

**Required or optional**

Optional

**Location where the parameter value is stored**

The value you specify on the KDS\_AUDIT\_ITM\_DOMAIN parameter generates an ITM\_DOMAIN parameter in KDSENV.

**PARMGEN name**

KDS\_AUDIT\_ITM\_DOMAIN

**Description**

Audit domain name

This field is used to specify an identifier that may be used to associate audit records. It is suited for commonly identifying agents that are associated with each other. An example use may be for sorting records by a particular customer.

This field will also be used to create unique namespaces for RBAC. The value you specify generates an ITM\_DOMAIN parameter in KDSENV.

**Related parameters**

None

## KDS\_AUDIT\_MAX\_HIST

This parameter specifies the maximum number of entries kept in the in-memory cache for direct queries.

**Required or optional**

Optional

**Location where the parameter value is stored**

AUDIT\_MAX\_HIST parameter in the RKANPARU data set, member KDSENV.

**PARMGEN name**

KDS\_AUDIT\_MAX\_HIST

**Description**

The maximum number of records kept in short term memory for direct queries.

**Related parameters**

None

## KDS\_AUDIT\_TRACE

This parameter is used to enable or disable auditing collection in SMF.

**Required or optional**

Optional

**Location where the parameter value is stored**

AUDIT\_TRACE parameter in the RKANPARU data set, member KDSENV.

**PARMGEN name**

KDS\_AUDIT\_TRACE

**Description**

This indicates the trace level to pass messages. Message trace levels (from low to high) are X (Disabled), M (Minimum), B (Basic), and D(Detail). Higher levels imply all lower levels.

**Related parameters**

KDS\_AUDIT\_MAX\_HIST

KDS\_AUDIT\_ITM\_DOMAIN

## KDS\_HUB\_TCP\_HOST

This parameter specifies the TCP/IP hostname or the IP address of the system where the hub monitoring server is installed.

### Description

The TCP/IP hostname or the IP address of the system where the hub monitoring server is installed. This parameter applies only to a remote monitoring server that uses TCP/IP for communication. The value specified for this parameter must match the value set for the [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#) parameter in the runtime environment where the hub is configured, or the value set for an equivalent parameter of a distributed hub.

This parameter is required for remote Tivoli Enterprise Monitoring Servers that use TCP/IP for communication with the hub.

### Default value

None

### Permissible values

Character string, maximum length 38

### Related parameters

- [“RTE\\_TCP\\_HOST” on page 288](#)
- [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

## KDS\_HUB\_TCP\_PIPE\_PORT\_NUM

This parameter contains the well-known port for the hub monitoring server for the IP.PIPE communication protocol (the TCP/IP protocol that supports IPv4), specified during configuration of a remote monitoring server.

### Description

Well-known port for the hub monitoring server for the IP.PIPE communication protocol (the TCP/IP protocol that supports IPv4), specified during configuration of a remote monitoring server.

The value specified for this parameter must match the value set for the [“KDS\\_TEMS\\_TCP\\_PIPE\\_PORT\\_NUM” on page 1413](#) parameter in the runtime environment where the hub is configured, or the value set for an equivalent parameter of a distributed hub.

This parameter is required for remote Tivoli Enterprise Monitoring Servers that use the IP.PIPE protocol for communications with the hub.

### Default value

1918

### Permissible values

1 - 65535

### Related parameters

- [“KDS\\_TEMS\\_TCP\\_PIPE\\_PORT\\_NUM” on page 1413](#)

## KDS\_HUB\_TCP\_PIPE6\_PORT\_NUM

This parameter contains the well-known port for the hub monitoring server for the IP6.PIPE communication protocol (the TCP/IP protocol that supports IPv6), specified during configuration of a remote monitoring server.

### Description

Well-known port for the hub monitoring server for the IP6.PIPE communication protocol (the TCP/IP protocol that supports IPv6), specified during configuration of a remote monitoring server.

The value specified for this parameter must match the value set for the [“KDS\\_TEMS\\_TCP\\_PIPE6\\_PORT\\_NUM” on page 1414](#) parameter in the runtime environment where the hub is configured, or the value set for an equivalent parameter of a distributed hub.

This parameter is required for remote Tivoli Enterprise Monitoring Servers that use the IP6.PIPE protocol for communications with the hub.

**Default value**

1918

**Permissible values**

1 - 65535

**Related parameters**

- [“KDS\\_TEMS\\_TCP\\_PIPE6\\_PORT\\_NUM” on page 1414](#)
- [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#)
- [“KDS\\_TEMS\\_COMM\\_PROTOCOLn” on page 1395](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

## KDS\_HUB\_TCP\_PIPE6S\_PORT\_NUM

This parameter contains the well-known port for the hub monitoring server for the IP6.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv6), specified during configuration of a remote monitoring server.

**Description**

Well-known port for the hub monitoring server for the IP6.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv6), specified during configuration of a remote monitoring server.

The value specified for this parameter must match the value set for the [“KDS\\_TEMS\\_TCP\\_PIPE6S\\_PORT\\_NUM” on page 1414](#) parameter in the runtime environment where the hub is configured, or the value set for an equivalent parameter of a distributed hub.

This parameter is required for remote Tivoli Enterprise Monitoring Servers that use the IP6.SPIPE protocol for communications with the hub.

**Default value**

3660

**Permissible values**

1 - 65535

**Related parameters**

- [“KDS\\_TEMS\\_TCP\\_PIPE6S\\_PORT\\_NUM” on page 1414](#)
- [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#)
- [“KDS\\_TEMS\\_COMM\\_PROTOCOLn” on page 1395](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

## KDS\_HUB\_TCP\_PIPES\_PORT\_NUM

This parameter contains the well-known port for the hub monitoring server for the IP.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv4), specified during configuration of a remote monitoring server

**Description**

Well-known port for the hub monitoring server for the IP.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv4), specified during configuration of a remote monitoring server.

The value specified for this parameter must match the value set for the [“KDS\\_TEMS\\_TCP\\_PIPES\\_PORT\\_NUM” on page 1415](#) parameter in the runtime environment where the hub is configured, or the value set for an equivalent parameter of a distributed hub.

This parameter is required for remote Tivoli Enterprise Monitoring Servers that use the IP.SPIPE protocol for communications with the hub.

**Default value**

3660

**Permissible values**

1 - 65535

**Related parameters**

- [“KDS\\_TEMS\\_TCP\\_PIPES\\_PORT\\_NUM” on page 1415](#)
- [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#)
- [“KDS\\_TEMS\\_COMM\\_PROTOCOLn” on page 1395](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

## KDS\_HUB\_TCP\_UDP\_PORT\_NUM

This parameter contains the well-known port for the hub monitoring server for the IP.UDP communication protocol (the TCP/IP protocol that uses the packet-based, connectionless User Datagram Protocol under IPv4), specified during configuration of a remote monitoring server.

**Description**

Well-known port for the hub monitoring server for the IP.UDP communication protocol (the TCP/IP protocol that uses the packet-based, connectionless User Datagram Protocol under IPv4), specified during configuration of a remote monitoring server.

The value specified for this parameter must match the value set for the [“KDS\\_TEMS\\_TCP\\_UDP\\_PORT\\_NUM” on page 1416](#) parameter in the runtime environment where the hub is configured, or the value set for an equivalent parameter of a distributed hub.

This parameter is required for remote Tivoli Enterprise Monitoring Servers that use the IP.UDP protocol for communications with the hub.

**Default value**

1918

**Permissible values**

1 - 65535

**Related parameters**

- [“KDS\\_TEMS\\_TCP\\_UDP\\_PORT\\_NUM” on page 1416](#)
- [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#)
- [“KDS\\_TEMS\\_COMM\\_PROTOCOLn” on page 1395](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

## KDS\_HUB\_TCP\_UDP6\_PORT\_NUM

This parameter specifies the well-known port for the hub monitoring server for the IP6.UDP communication protocol (the packet-based, connectionless User Datagram Protocol that supports IPv6), specified during configuration of a remote monitoring server.

**Description**

Well-known port for the hub monitoring server for the IP6.UDP communication protocol (the packet-based, connectionless User Datagram Protocol that supports IPv6), specified during configuration of a remote monitoring server.

The value specified for this parameter must match the value set for the [“KDS\\_TEMS\\_TCP\\_UDP6\\_PORT\\_NUM” on page 1417](#) parameter in the runtime environment where the hub is configured, or the value set for an equivalent parameter of a distributed hub.

This parameter is required for remote Tivoli Enterprise Monitoring Servers that use the IP6.UDP protocol for communications with the hub.

**Default value**

1918

**Permissible values**

1 - 65535

**Related parameters**

- [“KDS\\_TEMS\\_TCP\\_UDP6\\_PORT\\_NUM” on page 1417](#)
- [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#)
- [“KDS\\_TEMS\\_COMM\\_PROTOCOLn” on page 1395](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

**KDS\_HUB\_TEMS\_HA\_TYPE**

This parameter specifies whether the hub with which a remote Tivoli Enterprise Monitoring Server communicates is a high-availability hub.

**Required or optional**

Required for a remote Tivoli Enterprise Monitoring Server

**Location where the parameter value is stored**

The parameter value is not stored, but is used for internal processing.

**PARMGEN name**

KDS\_HUB\_TEMS\_HA\_TYPE

**Description**

Specifies whether the hub with which a remote Tivoli Enterprise Monitoring Server communicates is a high-availability hub.

**Related parameters**

- [“KDS\\_TEMS\\_HA\\_TYPE” on page 1402](#)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

**KDS\_HUB\_TEMS\_NAME\_NODEID**

This parameter identifies the name of the hub server to which the remote server connects.

**Description**

This is a case-sensitive field used to identify the name of the hub monitoring server to which this remote server connects. This name is the domain name of a non-z/OS hub server or the CMS\_NODEID parameter value of the z/OS hub server. The value of this field is case-sensitive for both z/OS and non-z/OS server names. This parameter is applicable to a remote monitoring server only.

This parameter is required for a remote Tivoli Enterprise Monitoring Server.

**Related parameters**

- [“KDS\\_TEMS\\_HA\\_TYPE” on page 1402](#)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

**KDS\_HUB\_VTAM\_APPL\_GLB\_BROKER**

This parameter specifies the VTAM® applid for the global location broker of the hub monitoring server.

**Required or optional**

Required for remote Tivoli Enterprise Monitoring Servers that use the SNA.PIPE protocol for communications with the hub

#### Location where the parameter value is stored

- KDCSSITE member of the *rhilev.rte*.RKANPARU library for the runtime environment of the remote monitoring server
- XCF\_PLEXGROUP parameter in the KDSENV member of the *rhilev.rte*.RKANPARU library for the runtime environment of the remote monitoring server

#### PARMGEN name

KDS\_HUB\_VTAM\_APPL\_GLB\_BROKER

#### Description

VTAM® applid for the global location broker of the hub monitoring server. You can find this applid in the VTAM® major node definition in SYS1.VTAMLST for the hub.

#### Related parameters

- [“KDS\\_TEMS\\_VTAM\\_APPL\\_GLB\\_BROKER” on page 1418](#)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

### KDS\_HUB\_VTAM\_NETID

This parameter specifies the VTAM® network identifier associated with the hub monitoring server.

#### Required or optional

Required for remote Tivoli Enterprise Monitoring Servers that use the SNA.PIPE protocol for communications with the hub

#### Location where the parameter value is stored

KDCSSITE member of the *rhilev.rte*.RKANPARU library for the runtime environment of the remote monitoring server

#### PARMGEN name

KDS\_HUB\_VTAM\_NETID

#### Description

VTAM® network identifier associated with the hub monitoring server.

#### Related parameters

- [“KDS\\_TEMS\\_VTAM\\_NETID” on page 1420](#)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

### KDS\_KMS\_SDA

This parameter indicates whether the server supports self-describing agents.

#### Required or optional

Required if you want to enable the Self-Describing Agent (SDA) Function.

#### Location where the parameter value is stored

The KMS\_SDA parameter in the xKANPARU data set, member KDSENV.

#### PARMGEN name

KDS\_KMS\_SDA

#### Description

This field indicates whether the server supports and runs the self-description feature.

#### Related parameters

- [“GBL\\_HFS\\_JAVA\\_DIRn” on page 1328](#) (typically in WCONFIG(\$GBL\$USR))
- [“GBL\\_DSN\\_SYS1\\_SBPXEXEC” on page 1324](#) (typically in WCONFIG(\$GBL\$USR))
- [“RTE\\_USS\\_RTEDIR” on page 1360](#)

- [“RTE\\_USS\\_MKDIR\\_MODE” on page 1359](#)
- [“KDS\\_KMS\\_SDA\\_NO\\_GRANULAR” on page 1379](#) (post V6.3.0 only)
- [“KDS\\_TEMA\\_SDA” on page 1394](#)
- [“Kpp\\_AGT\\_TEMA\\_SDA” on page 1277](#) (per *Kpp* agent exploiting SDA)

## KDS\_KMS\_SDA\_NO\_GRANULAR

This parameter indicates whether to retain the current behavior of no granular controls for self-describing agents during an upgrade from V6.2.3 to V6.3.0 of a hub monitoring server with self-describing agent feature enabled.

### Required or optional

Optional

### Location where the parameter values is stored

The parameter value is not stored, but is used for internal processing.

### PARMGEN name

KDS\_KMS\_SDA\_NO\_GRANULAR

### Description

Tivoli Management Services on z/OS version 6.3 introduced granular control of self-describing agent data. Granular control blocks installation of all self-describing agent application data until the Tivoli administrative commands (tacmd) Command Line Interface (CLI) is used to either specify the agents and versions to be installed, or to enable installation of all products and versions. On a new V6.3 z/OS hub monitoring server, the granular control feature is disabled by default, so if SDA is enabled, all SDA data is installed. To enable granular control, you must use the tacmd CLI. If you are upgrading from Tivoli Management Services V6.2.3 to V6.3.0, and SDA was already enabled on the hub monitoring server, the KDS\_KMS\_SDA\_NO\_GRANULAR parameter can be set to Y to retain the current behavior (all products and versions updated) or to N to enable granular control. Then you must use the tacmd CLI to specify what data to install.

### Related parameters

None

## KDS\_KMS\_SECURITY\_COMPATMD

This parameter allows customization of the KMS\_SECURITY\_COMPATIBILITY\_MODE parameter in a runtime environment's RKANPARU(KDSENV) member. Applicable only in Tivoli® Management Services V6.3.0 and higher.

### Required or optional

Optional

### Location where the parameter value is stored

KDSENV member of the &rhilev.&rte.RKANPARU library.

### Parameter name and syntax (See Description)

KMS\_SECURITY\_COMPATIBILITY\_MODE=&value

### Default value

Y

### Permissible values

Y, N

### Description

By default, command requests (Take Action commands, situation actions, workflow policy actions, and so forth) are required to include an encrypted security token. To assist in migration, a security compatibility mode is provided. If compatibility mode is enabled (KMS\_SECURITY\_COMPATIBILITY\_MODE=Y), the monitoring server generates a default security token if the component does not issue one and checking for encrypted command tokens is automatically disabled.

On z/OS®, compatibility mode is enabled by default. If compatibility mode is disabled, Integrated Cryptographic Service Facility encryption must be enabled for the component (monitoring server or monitoring agent) issuing the request.

- The ICSF started task must be running.
- The ICSF load library must be concatenated in the RKANMODL DD statement in the started task JCL of the z/OS® monitoring server and z/OS® monitoring agents.
- The KAES256 member that contains the encrypted private key must be present in the RKANPARU data set.

[“RTE\\_SECURITY\\_KAES256\\_KEY” on page 1348](#)

## KDS\_MIG\_TAPE\_HILEV

This parameter specifies the high-level qualifier (with DISP=NEW) for the backup VSAM clusters on tape.

#### Required or optional

Required for migrating customized objects (for example, modified situations, templates, and managed objects) from a previous version to a later version of the Tivoli Enterprise Monitoring Server

#### Location where the parameter value is stored

KDSDMG4B member of the *rhilev.rte*.RKANSAMU library for the runtime environment of the monitoring server

#### PARMGEN name

KDS\_MIG\_TAPE\_HILEV

#### Description

High-level qualifier (with DISP=NEW) for the backup VSAM clusters on tape.

#### Related parameters

- [“KDS\\_MIG\\_TAPE\\_UNIT” on page 1380](#)
- [“KDS\\_MIG\\_TAPE\\_VOL” on page 1381](#)
- [“KDS\\_MIG\\_VSAM\\_HILEV” on page 1381](#)

## KDS\_MIG\_TAPE\_UNIT

This parameter specifies the unit device name for the backup VSAM clusters on tape.

#### Required or optional

Optional

#### Location where the parameter value is stored

KDSDMG4B member of the *rhilev.rte*.RKANSAMU library for the runtime environment of the monitoring server

#### PARMGEN name

KDS\_MIG\_TAPE\_UNIT

#### Description

Unit device name for the backup VSAM clusters on tape. Leave this field blank if your environment does not require the unit name.

#### Related parameters

- [“KDS\\_MIG\\_TAPE\\_VOL” on page 1381](#)

## KDS\_MIG\_TAPE\_VOL

This parameter specifies the volume serial for the backup VSAM clusters on tape.

### Required or optional

Optional

### Location where the parameter value is stored

KDSDMG4B member of the *rhilev.rte*.RKANSAMU library for the runtime environment of the monitoring server

### PARMGEN name

KDS\_MIG\_TAPE\_VOL

### Description

Volume serial for the backup VSAM clusters on tape. Leave this field blank if your environment does not require the volume serial number.

### Related parameters

- [“KDS\\_MIG\\_TAPE\\_UNIT” on page 1380](#)

## KDS\_MIG\_VSAM\_HILEV

This parameter specifies complete high-level qualifier (*rvhilev.rte*) of the VSAM runtime libraries from which you want to migrate customized objects.

### Required or optional

Required for migrating customized objects (for example, modified situations, templates, and managed objects) from a previous version to a later version of the Tivoli Enterprise Monitoring Server

### Location where the parameter value is stored

KDSDMG4B member of the *rhilev.rte*.RKANSAMU library for the runtime environment of the monitoring server

### PARMGEN name

KDS\_MIG\_VSAM\_HILEV

### Description

Complete high-level qualifier (*rvhilev.rte*) of the VSAM runtime libraries from which you want to migrate customized objects.

### Related parameters

- [“KDS\\_MIG\\_TAPE\\_HILEV” on page 1380](#)

## KDS\_PA

This parameter indicates the beginning or end of the partition reference table for address translation.

### Required or optional

Required for broker partitioning

### Location where the parameter value is stored

KDCPART member of the *rhilev.rte*.RKANPARU library for the runtime environment of the Tivoli Enterprise Monitoring Server

### Batch parameter name

KDS\_PA

### PARMGEN name

KDS\_PA

### Description

Indicates the beginning or end of the partition reference table for address translation. The partition table contains labels and associated socket addresses provided by the firewall administrator. This parameter is for IBM® internal use only.

#### Related parameters

- [“KDS\\_TEMS\\_COMM\\_ADDRESS\\_XLAT” on page 1395](#)
- [“KDS\\_PA\\_PARTITION\\_ADDRESS” on page 1382](#)
- [“KDS\\_PA\\_PARTITION\\_NAME” on page 1382](#)
- [“KDS\\_TEMS\\_PARTITION\\_NAME” on page 1406](#)

## KDS\_PA\_PARTITION\_ADDRESS

This parameter contains the IP address or SNA reference assigned to the Tivoli Enterprise Monitoring Server from a location on the other side of the firewall.

#### Required or optional

Required for broker partitioning

#### Location where the parameter value is stored

KDCPART member of the *rhilev.rte*.RKANPARU library for the runtime environment of the Tivoli Enterprise Monitoring Server

#### PARMGEN name

KDS\_PA\_PARTITION\_ADDRESS

#### Description

IP address or SNA reference assigned to the Tivoli Enterprise Monitoring Server from a location on the other side of the firewall. The partition address that you supply is added to the partition table identified by the [“KDS\\_PA” on page 1381](#) parameter. The partition table contains labels and associated socket addresses provided by the firewall administrator.

If the value of the [“KDS\\_TEMS\\_COMM\\_ADDRESS\\_XLAT” on page 1395](#) parameter is Y, this parameter must have a value assigned to it, or the Tivoli Enterprise Monitoring Server and its communications will fail.

#### Related parameters

- [“KDS\\_TEMS\\_COMM\\_ADDRESS\\_XLAT” on page 1395](#)
- [“KDS\\_PA” on page 1381](#)
- [“KDS\\_PA\\_PARTITION\\_NAME” on page 1382](#)

## KDS\_PA\_PARTITION\_NAME

This parameter contains the partition name (label) that identifies the location of the Tivoli Enterprise Monitoring Server relative to the firewall or firewalls used for address translation.

#### Required or optional

Required for broker partitioning

#### Location where the parameter value is stored

KDCPART member of the *rhilev.rte*.RKANPARU library for the runtime environment of the Tivoli Enterprise Monitoring Server

#### PARMGEN name

KDS\_PA\_PARTITION\_NAME

#### Description

Partition name (label) that identifies the location of the Tivoli Enterprise Monitoring Server relative to the firewall or firewalls used for address translation. The partition name that you supply is added to the partition table identified by the [“KDS\\_PA” on page 1381](#) parameter. The partition table contains labels and associated socket addresses provided by the firewall administrator. The label is used outside the firewall to establish monitoring server connections. The well-known port for the hub monitoring server must be authorized by the firewall administrator. For the IP\*.PIPE protocols, no additional ports be authorized.

If the value of the [“KDS\\_TEMS\\_COMM\\_ADDRESS\\_XLAT” on page 1395](#) parameter is Y, this parameter must have a value assigned to it, or the Tivoli Enterprise Monitoring Server and its communications will fail.

### Related parameters

- [“KDS\\_TEMS\\_COMM\\_ADDRESS\\_XLAT” on page 1395](#)
- [“KDS\\_PA” on page 1381](#)
- [“KDS\\_PA\\_PARTITION\\_ADDRESS” on page 1382](#)

## KDS\_PA\_ROW

This parameter indicates the beginning or end of a row in the partition reference table for address translation.

### Required or optional

Required for broker partitioning

### Location where the parameter value is stored

KDCPART member of the *rhilev.rte*.RKANPARU library for the runtime environment of the Tivoli Enterprise Monitoring Server

### Batch parameter name

KDS\_PA\_ROW

### PARMGEN name

KDS\_PA\_ROW

### Description

Indicates the beginning or end of a row in the partition reference table for address translation. This parameter is for IBM® internal use only.

### Related parameters

- [“KDS\\_TEMS\\_COMM\\_ADDRESS\\_XLAT” on page 1395](#)
- [“KDS\\_PA” on page 1381](#)

## KDS\_PD\_CYL

This parameter contains the space allocation for the persistent data store libraries and for overhead information such as the product dictionary, table records, index records, and buffers to hold overflow data when the libraries are full.

### Required or optional

Optional

### Location where the parameter value is stored

KPDAL member of the *rhilev.rte*.RKANPARU library for the runtime environment of the Tivoli Enterprise Monitoring Server

### PARMGEN name

KDS\_PD\_CYL

### Description

Space allocation for the persistent data store libraries and for overhead information such as the product dictionary, table records, index records, and buffers to hold overflow data when the libraries are full. By default, the Tivoli Enterprise Portal Server retrieves historical data for reports once every 24 hours. Unless the Tivoli Enterprise Portal Server KFW\_REPORT\_TERM\_BREAK\_POINT parameter is set to a value other than the default, allocate enough space ( $n$  data sets) for the persistent data store to permit  $n-1$  data sets to hold 24 hours of data.

### Related parameters

None

## KDS\_PDS2\_ACTIVATION

Activation switch for PDS V2 for the monitoring server

### Description

This parameter indicates whether to activate persistent data store V2 (PDS V2) support for the Tivoli Enterprise Monitoring Server (monitoring server).

**Y**

If global switch RTE\_PDS2\_ACTIVATION parameter is set to Y, PDS V2 will be used for the monitoring server; otherwise, this parameter is ignored.

**N**

If global switch RTE\_PDS2\_ACTIVATION parameter is set to Y, you can switch off the PDS V2 feature for the monitoring server by setting this parameter value to N. In this case, the original persistent data store (PDS V1) will be used for the monitoring server.

### Default value

Y

### Permissible values

Y, N

### Related parameters

RTE\_PDS2\_ACTIVATION

Kpp\_PDS2\_ACTIVATION

## KDS\_PDS2\_FILE\_COUNT

Number of PDS V2 data sets for the monitoring server

### Description

This value specifies the default number of data sets that will be allocated for the persistent data store V2 (PDS V2) for the Tivoli Enterprise Monitoring Server (monitoring server).

### Default value

6

### Minimum

2

### Maximum

36

## KDS\_PDS2\_SEC\_SIZE

Secondary space allocation for PDS V2 data sets for the monitoring server

### Description

The number of secondary cylinders or megabytes that will be used to allocate the persistent data store V2 (PDS V2) data sets for the Tivoli Enterprise Monitoring Server (monitoring server). This value represents the number of cylinders or megabytes allocated for each data set. The allocation unit for PDS V2 is specified in parameter RTE\_PDS2\_ALLOC\_TYPE.

### blank

The number of secondary cylinders or megabytes will be automatically calculated, using 10% of the KDS\_PDS2\_STORE\_SIZE parameter value divided by the number of files set in KDS\_PDS2\_FILE\_COUNT.

**0**

Only the primary allocation size will be used.

### value

Number of secondary cylinders or megabytes that will be used for each PDS V2 data set as a secondary allocation size.

**Default value**

None

**Minimum**

0

**Maximum**

9999

**Related parameters**

RTE\_PDS2\_ALLOC\_TYPE

**KDS\_PDS2\_STORE\_SIZE**

Primary space allocation for PDS V2 data sets for the monitoring server

**Description**

The number of primary cylinders or megabytes that will be used to allocate the persistent data store V2 (PDS V2) data sets for the Tivoli Enterprise Monitoring Server (monitoring server). To calculate the primary cylinders or megabytes for a single data set, the KDS\_PDS2\_STORE\_SIZE value is divided by the KDS\_PDS2\_FILE\_COUNT value. The allocation unit for PDS V2 is specified in parameter RTE\_PDS2\_ALLOC\_TYPE.

**Default value**

agent specific

**Minimum**

1

**Maximum**

9999

**Related parameters**

RTE\_PDS2\_ALLOC\_TYPE

**KDS\_PDS2\_VOLUME**

Volume for PDS V2 data set allocation for the monitoring server

**Description**

This parameter specifies the volume serial number for persistent data store V2 (PDS V2) data set allocation for the monitoring server.

**Default value**

%RTE\_PDS2\_VOLUME%

**Permissible values**

Character string, maximum length 6

**KDS\_PH**

This parameter indicates the beginning or end of the table that lists the hub monitoring servers that are eligible for SOAP server access.

**Required or optional**

Required for a hub Tivoli Enterprise Monitoring Server

**Location where the parameter value is stored**

KSHXHUBS member of the *rhilev.rte.RKANPARU* library for the runtime environment of the hub

**Batch parameter name**

KDS\_PH

**PARMGEN name**

KDS\_PH

**Description**

Indicates the beginning or end of the table that lists the hub monitoring servers that are eligible for SOAP server access. This parameter is for IBM® internal use only.

**Related parameters**

- [“KDS\\_TEMS\\_SOAP\\_SERVER\\_FLAG” on page 1408](#)
- [“KDS\\_PH\\_ROW” on page 1386](#)

**KDS\_PH\_ROW**

This parameter indicates the beginning or end of a single hub monitoring server entry in the SOAP server list.

**Required or optional**

Required for a hub Tivoli Enterprise Monitoring Server

**Location where the parameter value is stored**

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

**Batch parameter name**

KDS\_PH\_ROW

**PARMGEN name**

KDS\_PH\_ROW

**Description**

Indicates the beginning or end of a single hub monitoring server entry in the SOAP server list. This parameter is for IBM® internal use only.

**Related parameters**

- [“KDS\\_TEMS\\_SOAP\\_SERVER\\_FLAG” on page 1408](#)
- [“KDS\\_PH” on page 1385](#)

**KDS\_PH\_TEMS\_ALIAS\_NAME**

This parameter contains the TEMS name (node ID) that identifies a non-local hub monitoring server to the SOAP server. For best results, accept the default name.

**Required or optional**

Required for a non-local hub Tivoli Enterprise Monitoring Server

**Location where the parameter value is stored**

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the local monitoring server

Example:

```
Aliasrte_name:CMS/Alias
```

**PARMGEN name**

KDS\_PH\_TEMS\_ALIAS\_NAME

**Description**

TEMS name (node ID) that identifies a non-local hub monitoring server to the SOAP server. For best results, accept the default name.

**Related parameters**

- [“RTE\\_TEMS\\_NAME\\_NODEID” on page 1355](#)
- [“KDS\\_TEMS\\_SOAP\\_SERVER\\_FLAG” on page 1408](#)

## KDS\_PH\_TEMS\_COMM\_PROTOCOL1

This parameter contains the communication protocol to be used by the SOAP server.

### Required or optional

Required for a hub Tivoli Enterprise Monitoring Server

### Location where the parameter value is stored

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub  
Example:

```
CMS_NameIP.PIPE:SYS1[1918]/CMS_Name
```

### PARMGEN name

KDS\_PH\_TEMS\_COMM\_PROTOCOL1

### Description

Communication protocol to be used by the SOAP server. The value of this parameter is included in the entry for this hub in the KSHXHUBS member of the *rhilev.rte*.RKANPARU library.

### Related parameters

- [“KDS\\_TEMS\\_COMM\\_PROTOCOLn” on page 1395](#)

## KDS\_PH\_TEMS\_KSH\_SECURE

This parameter defines the security status of the SOAP server.

### Required or optional

Required for a hub Tivoli Enterprise Monitoring Server

### Location where the parameter value is stored

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

### PARMGEN name

KDS\_PH\_TEMS\_KSH\_SECURE

### Description

Security status of the SOAP server. If no user access list is defined, the value of this parameter is set to N and the SOAP server honors requests from any user ID that passes logon validation. If user IDs with query or update access are listed, the parameter value is set to Y. If user IDs are listed and given global security access, the parameter value is reset to N.

### Related parameters

- [“KDS\\_PU\\_TEMS\\_USER\\_QUERY” on page 1393](#)
- [“KDS\\_PU\\_TEMS\\_USER\\_UPDATE” on page 1393](#)

## KDS\_PH\_TEMS\_RTE

This parameter contains the name of the runtime environment where the hub is configured.

### Required or optional

Required for the hub Tivoli Enterprise Monitoring Server SOAP server

### Location where the parameter value is stored

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub  
Example:

```
Service_Namerte_name:CMS/Service_Name
```

### PARMGEN name

KDS\_PH\_TEMS\_RTE

**Description**

Name of the runtime environment where the hub is configured. Accept the default value.

**Related parameters**

- [“RTE\\_NAME” on page 1340](#)

**KDS\_PH\_TEMS\_SYSV\_FLAG**

This parameter determines whether system variables are to be enabled for the SOAP server.

**Required or optional**

Required

**Location where the parameter value is stored**

KSHXHUBS member of the *rhilev.rte.RKANPARU* library for the runtime environment of the hub

**Batch parameter name**

KDS\_PH\_CMS\_SYSV

**PARMGEN name**

KDS\_PH\_TEMS\_SYSV\_FLAG

**Description**

Determines whether system variables are to be enabled for the SOAP server. The value of this parameter is always set to match the value of the [“RTE\\_SYSV\\_SYSVAR\\_FLAG” on page 1353](#) parameter. If system variables are enabled for the runtime environment, the server list that is maintained in the KSHXHUBS member of the *rhilev.rte.RKANPARU* library is restricted to hub monitoring servers that support z/OS® system symbols.

**Related parameters**

- [“RTE\\_SYSV\\_SYSVAR\\_FLAG” on page 1353](#)

**KDS\_PHnn\_TEMS\_TCP\_HOST**

This parameter contains the hostname or IP address of the SOAP server.

**Description**

This parameter contains the TCP/IP hostname or IP address of the SOAP server. For best results, accept the default value.

This parameter is required for a hub monitoring server if Protocol 1 (the highest-priority protocol) for the SOAP server is one of the TCP/IP protocols.

If this is a high-availability hub monitoring server, this parameter must be set to the dynamic virtual IP address (DVIPA).

**Default value**

%SYSIPHOSTNAME%

**Permissible values**

Character string, maximum length 39

**Related parameters**

- [“KDS\\_PH\\_TEMS\\_COMM\\_PROTOCOL1” on page 1387](#)
- [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#)

**KDS\_PH\_TEMS\_TCP\_PORT\_NUM**

This parameter defines the TCP port number of the SOAP server.

**Required or optional**

Required for a hub Tivoli Enterprise Monitoring Server if Protocol 1 (the highest-priority protocol) for the SOAP server is one of the TCP/IP protocols

#### Location where the parameter value is stored

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub  
Example:

```
CMS_NameIP.PIPE:SYS1[1918]/CMS_Name
```

#### PARMGEN name

KDS\_PH\_TEMS\_TCP\_PORT\_NUM

#### Description

TCP port number of the SOAP server. For best results, accept the default value.

#### Related parameters

- [“KDS\\_PH\\_TEMS\\_COMM\\_PROTOCOL1” on page 1387](#)
- [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#)
- [“KDS\\_TEMS\\_COMM\\_PROTOCOLn” on page 1395](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

## KDS\_PH\_TEMS\_USER\_QUERY

This parameter defines the user ID with query access to the SOAP server.

#### Required or optional

Optional

#### Location where the parameter value is stored

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

#### PARMGEN name

KDS\_PH\_TEMS\_USER\_QUERY

#### Description

User ID with query access to the SOAP server. To add more users, use the **KDS\_PU\_TEMS\_USER\_\*** parameters.

#### Related parameters

- [“KDS\\_PU\\_TEMS\\_USER\\_QUERY” on page 1393](#)
- [“KDS\\_PU\\_TEMS\\_USER\\_ID” on page 1393](#)

## KDS\_PH\_TEMS\_USER\_UPDATE

This parameter defines the user ID with update access to the SOAP server.

#### Required or optional

Optional

#### Location where the parameter value is stored

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

#### PARMGEN name

KDS\_PH\_TEMS\_USER\_UPDATE

#### Description

User ID with update access to the SOAP server. To add more users, use the **KDS\_PU\_TEMS\_USER\_\*** parameters.

#### Related parameters

- [“KDS\\_PU\\_TEMS\\_USER\\_UPDATE” on page 1393](#)
- [“KDS\\_PU\\_TEMS\\_USER\\_ID” on page 1393](#)

### KDS\_PH\_TEMS\_VTAM\_APPL\_GLB\_BROKER

This parameter defines the VTAM® applid for the global location broker of the SOAP server.

#### Required or optional

Required for a hub Tivoli Enterprise Monitoring Server if Protocol 1 (the highest-priority protocol) for the SOAP server is SNA

#### Location where the parameter value is stored

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

#### PARMGEN name

KDS\_PH\_TEMS\_VTAM\_APPL\_GLB\_BROKER

#### Description

VTAM® applid for the global location broker of the SOAP server.

#### Related parameters

- [“KDS\\_PH\\_TEMS\\_COMM\\_PROTOCOL1” on page 1387](#)
- [“KDS\\_TEMS\\_VTAM\\_APPL\\_GLB\\_BROKER” on page 1418](#)

### KDS\_PH\_TEMS\_VTAM\_LU62\_DLOGMOD

This parameter defines the LU6.2 logmode entry required by the SOAP server for SNA communications.

#### Required or optional

Required for a hub Tivoli Enterprise Monitoring Server if Protocol 1 (the highest-priority protocol) for the SOAP server is SNA

#### Location where the parameter value is stored

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

#### PARMGEN name

KDS\_PH\_TEMS\_VTAM\_LU62\_DLOGMOD

#### Description

LU6.2 logmode entry required by the SOAP server for SNA communications.

#### Related parameters

- [“KDS\\_PH\\_TEMS\\_COMM\\_PROTOCOL1” on page 1387](#)
- [“KDS\\_TEMS\\_VTAM\\_LU62\\_DLOGMOD” on page 1419](#)

### KDS\_PH\_TEMS\_VTAM\_NETID

This parameter defines the VTAM® network identifier for the SOAP server.

#### Required or optional

Required for a hub Tivoli Enterprise Monitoring Server if Protocol 1 (the highest-priority protocol) for the SOAP server is SNA

#### Location where the parameter value is stored

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

#### PARMGEN name

KDS\_PH\_TEMS\_VTAM\_NETID

**Description**

VTAM® network identifier for the SOAP server.

**Related parameters**

- [“KDS\\_PH\\_TEMS\\_COMM\\_PROTOCOL1” on page 1387](#)
- [“KDS\\_TEMS\\_VTAM\\_NETID” on page 1420](#)

**KDS\_PPI\_RECEIVER**

This parameter specifies the name of the IBM Z® NetView PPI receiver that is to receive Take Action commands.

**Required or optional**

Optional

**Location where the parameter value is stored**

KDSENV member of the *rhilev.rte*.RKANPARU library for the runtime environment of the Tivoli Enterprise Monitoring Server

**Parameter name**

KGLHC\_PPI\_RECEIVER

**Default value**

CNMPCMDR

**Permissible values**

Character string, maximum length 8

**PARMGEN name**

KDS\_PPI\_RECEIVER

**Description**

Name of the IBM Z® NetView PPI receiver that is to receive Take Action commands. This name must match the receiver name specified on the NetView APSERV command.

The value must be a 1- through 8-character unique identifier for the receiver program. It can contain alphabetic characters A-Z and a-z, numeric characters 0-9, and the following special characters: dollar sign (\$), percent sign (%), ampersand (&), at sign (@), and number sign (#). This value must match the value specified in the NetView DSIPARM initialization member, CNMSTYLE.

If a value is specified for this parameter and either the specified name is incorrect or the receiver is not active on NetView, the command fails. If no value is specified, default (MGCR) command routing is performed.

For complete instructions, see [“Configuring IBM Z NetView authorization of z/OS commands” on page 544](#).

**Related parameters**

- [“GBL\\_DSN\\_NETVIEW\\_CNMLINK” on page 1321](#)
- [“KDS\\_PPI\\_SENDER” on page 1391](#)

**KDS\_PPI\_SENDER**

This parameter specifies the name of the IBM Z® NetView PPI sender.

**Required or optional**

Optional

**Location where the parameter value is stored**

KDSENV member of the *rhilev.rte*.RKANPARU library for the runtime environment of the Tivoli Enterprise Monitoring Server

**Parameter name**

KGLHC\_PPI\_SENDER

**Default value**

None

**Permissible values**

Character string, maximum length 8

**PARMGEN name**

KDS\_PPI\_SENDER

**Description**

Name of the IBM Z® NetView PPI sender. This name is used in logging the command and command response in the NetView log and therefore must not conflict with any NetView domain name. This parameter has no default value in the KDSENV member, but the internal default is the value of the [“KDS\\_PPI\\_RECEIVER” on page 1391](#) parameter.

For complete instructions, see [“Configuring IBM Z NetView authorization of z/OS commands” on page 544](#).

**Related parameters**

- [“GBL\\_DSN\\_NETVIEW\\_CNMLINK” on page 1321](#)
- [“KDS\\_PPI\\_RECEIVER” on page 1391](#)

## KDS\_PU

This parameter indicates the beginning or end of the SOAP server user access table.

**Required or optional**

Optional

**Location where the parameter value is stored**

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

**Batch parameter name**

KDS\_PU

**PARMGEN name**

KDS\_PU

**Description**

Indicates the beginning or end of the SOAP server user access table. This parameter is for IBM® internal use only.

**Related parameters**

- [“KDS\\_PH\\_TEMS\\_KSH\\_SECURE” on page 1387](#)

## KDS\_PU\_ROW

This parameter indicates the beginning or end of a single user access record in the SOAP server user access table.

**Required or optional**

Optional

**Location where the parameter value is stored**

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

**Batch parameter name**

KDS\_PU\_ROW

**PARMGEN name**

KDS\_PU\_ROW

**Description**

Indicates the beginning or end of a single user access record in the SOAP server user access table. This parameter is for IBM® internal use only.

**Related parameters**

- [“KDS\\_PH\\_TEMS\\_KSH\\_SECURE” on page 1387](#)
- [“KDS\\_PU” on page 1392](#)

**KDS\_PU\_TEMS\_USER\_ID**

This parameter contains the user ID defined to have access to the SOAP server.

**Required or optional**

Optional

**Location where the parameter value is stored**

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

**PARMGEN name**

KDS\_PU\_TEMS\_USER\_ID

**Description**

User ID defined to have access to the SOAP server. A user ID can have both query and update access.

**Related parameters**

- [“KDS\\_PU\\_TEMS\\_USER\\_QUERY” on page 1393](#)
- [“KDS\\_PU\\_TEMS\\_USER\\_UPDATE” on page 1393](#)

**KDS\_PU\_TEMS\_USER\_QUERY**

This parameter determines query access of a user ID to the SOAP server.

**Required or optional**

Optional

**Location where the parameter value is stored**

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

**PARMGEN name**

KDS\_PU\_TEMS\_USER\_QUERY

**Description**

Determines query access of a user ID to the SOAP server. A user ID can have both query and update access.

**Related parameters**

- [“KDS\\_PH\\_TEMS\\_KSH\\_SECURE” on page 1387](#)
- [“KDS\\_PU\\_TEMS\\_USER\\_UPDATE” on page 1393](#)
- [“KDS\\_PU\\_TEMS\\_USER\\_ID” on page 1393](#)

**KDS\_PU\_TEMS\_USER\_UPDATE**

This parameter determines update access of a user ID to the SOAP server.

**Required or optional**

Optional

**Location where the parameter value is stored**

KSHXHUBS member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub

**PARMGEN name**

KDS\_PU\_TEMS\_USER\_UPDATE

**Description**

Determines update access of a user ID to the SOAP server. A user ID can have both update and query access.

#### Related parameters

- [“KDS\\_PH\\_TEMS\\_KSH\\_SECURE” on page 1387](#)
- [“KDS\\_PU\\_TEMS\\_USER\\_QUERY” on page 1393](#)
- [“KDS\\_PU\\_TEMS\\_USER\\_ID” on page 1393](#)

## KDS\_SAFAPPL

This parameter contains the control point name and the SAF application ID for the Tivoli Enterprise Monitoring Server (TEMS).

#### Description

This parameter is the TEMS control point name and SAF application ID (APPL value) used by the TEMS SAF calls. The control point name is currently unused.

#### Required or optional

Optional. May be used to support MFA.

#### Location where the parameter value is stored

Stored in the KDSINNAM/KLVINNAM member of the `zhldev.ite.RKANPARU` library for the runtime environment of the Tivoli Enterprise Monitoring Server (TEMS).

#### Default value

CANDLE

#### Related parameters

None

## KDS\_STREAM\_SITUATION\_STATUS

This parameter controls if situation status streaming is enabled.

#### Description

This parameter controls if situation status streaming from the Tivoli Enterprise Monitoring Server to IBM Z OMEGAMON Data Provider is enabled. Setting this parameter to Y enables situation status streaming for all situations.

#### Default value

N

#### Permissible values

Y, N

## KDS\_TEMA\_SDA

This parameter indicates whether the agent uses the self-description feature.

#### Required or optional

Required

#### Location where the parameter value is stored

The TEMA\_SDA parameter in the RKANPARU data set, member KDSENV.

#### PARMGEN name

KDS\_TEMA\_SDA

#### Description

This field indicates whether one or more agents will use the self-description feature in the TEMS address space.

### Related parameters

- [“GBL\\_HFS\\_JAVA\\_DIRn” on page 1328](#)
- [“GBL\\_DSN\\_SYS1\\_SBPXEXEC” on page 1324](#)

## KDS\_TEMS\_COMM\_ADDRESS\_XLAT

This parameter points to the file that enables broker partitioning.

### Required or optional

Required

### Location where the parameter value is stored

KDSENV member of the *rhilev.rte.RKANPARU* library for the runtime environment of the Tivoli Enterprise Monitoring Server

#### Parameter name

KDC\_PARTITIONFILE

#### Default value

None

#### Permissible values

KDCPART or none

### PARMGEN name

KDS\_TEMS\_COMM\_ADDRESS\_XLAT

### Description

Points to the file that enables broker partitioning. For more information about broker partitioning, see [“Firewall support” on page 148](#).

### Related parameters

- [“KDS\\_PA” on page 1381](#)
- [“KDS\\_TEMS\\_PARTITION\\_NAME” on page 1406](#)

## KDS\_TEMS\_COMM\_PROTOCOLn

This parameter specifies the communication protocol for the Tivoli Enterprise Monitoring Server.

### Description

This parameter specifies the communication protocol to be supported by the Tivoli Enterprise Monitoring Server, where *n* corresponds to a number between 1 and 7 to indicate the priority sequence for the communication protocols.

When communicating with other components, the monitoring server first tries protocol 1, and then, in the case of failure, tries protocol 2 and so on.

At least one IP-related protocol must be specified when parameter KDS\_TEMS\_DRA\_FLAG is set to Y.

The following IP-related protocols are available:

- IP.PIPE (IPPIPE): Non-secure TCP over IPv4
- IP.UDP (IP): Non-secure UDP over IPv4
- IP6.PIPE (IP6PIPE): Non-secure TCP over IPv6
- IP6.UDP (IP6): Non-secure UDP over IPv6
- IP.SPIPE (IPSPIPE): Secure (SSL/TLS) TCP over IPv4
- IP6.SPIPE (IP6SPIPE): Secure (SSL/TLS) TCP over IPv6

The following SNA protocol is available:

SNA.PIPE (SNA): Systems Network Architecture (SNA) implementation of the Network Computing System (NCS) Remote Procedure Call (RPC) API

#### Default values

KDS\_TEMS\_COMM\_PROTOCOL1: IPPIPE

KDS\_TEMS\_COMM\_PROTOCOL2: SNA

KDS\_TEMS\_COMM\_PROTOCOL3 - KDS\_TEMS\_COMM\_PROTOCOL7: empty (no value)

#### Permissible values

IPPIPE, IP, IP6PIPE, IP6, IPSPIPE, IP6SPIPE, SNA

#### Related parameters

## KDS\_TEMS\_DRA\_FLAG

The KDS\_TEMS\_DRA\_FLAG parameter controls the generation of the KOBAGENT startup command in `⌘KANCMDU(KDSSTR1)`. KOBAGENT is the data-retrieval agent (DRA) for the OMEGAMON enhanced 3270 user interface (if installed in this SMP/E environment). If not installed in this CSI, then KOBAGENT startup is simply ignored at monitoring server startup.

### Required or optional

Required if you configure the OMEGAMON enhanced 3270 user interface component. If the value of this parameter is set to Y, at least one IP-related protocol, for example IPPIPE, must be specified for parameter [“KDS\\_TEMS\\_COMM\\_PROTOCOLn” on page 1395](#)

### Location where the parameter value is stored

If the flag is set to Y, the AT `ADD ID=KOB DELAY=00:00:10 CMD='IRAMAN KOBAGENT START'` startup parameter is added to the KDSSTR1 member of the `rhilev.rtename.RKANCMDU` library.

### Parameter name and syntax

```
AT ADD ID=KOB DELAY=00:00:10 CMD='IRAMAN KOBAGENT START'
```

### Default value

Y

### Permissible values

Y, N

### PARMGEN name

KDS\_TEMS\_DRA\_FLAG

### Description

The KDS\_TEMS\_DRA\_FLAG parameter controls the generation of the KOBAGENT startup command in `⌘KANCMDU(KDSSTR1)`. KOBAGENT is the OMEGAMON enhanced 3270 user interface’s data retrieval agent (DRA) (if installed in the SMP/E environment). If not installed in this CSI, then KOBAGENT startup is ignored when the TEMS starts up.

### Related parameters

- [“KOB\\_TOM\\_VTAM\\_NODE” on page 1439](#)

## KDS\_TEMS{EIF\_BUFFER\_EVENT\_MAXSIZE

This parameter specifies the maximum size, in KB, of the adapter cache file.

### Required or optional

Required for the hub Tivoli Enterprise Monitoring Server if event forwarding is enabled; does not apply to a remote monitoring server

### Location where the parameter value is stored

KMSOMTEC member of the `rhilev.rte.RKANPARU` library for the runtime environment of the hub monitoring server

### Parameter name

BufEvtMaxSize

### Default value

4096

### Permissible values

**PARMGEN name**

KDS\_TEMS{EIF\_BUFFER\_EVENT\_MAXSIZE

**Description**

Maximum size, in KB, of the adapter cache file. The cache file stores events on disk when they cannot be sent to the event server.

**Related parameters**

- [“KDS\\_TEMS{EIF\\_EVENT\\_LISTENER” on page 1398](#)
- [“KDS\\_TEMS{EIF\\_FLAG” on page 1399](#)

**KDS\_TEMS{EIF\_DISABLE\_TEC\_EMITTER**

This parameter specifies whether to deactivate the EIF emitter activities in your policies to prevent workflow policies containing emitter activities that send events to the Tivoli Enterprise Console® from generating duplicate events.

**Required or optional**

Optional for the hub Tivoli Enterprise Monitoring Server if event forwarding is enabled and if the IBM® Tivoli Enterprise Console® is defined as the event server; does not apply to a remote monitoring server

**Location where the parameter value is stored**

KMSOMTEC member of the *rhilev.rte.RKANPARU* library for the runtime environment of the hub monitoring server

**Parameter name**

KMS\_DISABLE\_TEC\_EMITTER

**Default value**

None

**Permissible values**

Y or none

**PARMGEN name**

KDS\_TEMS{EIF\_DISABLE\_TEC\_EMITTER

**Description**

If you already have workflow policies containing emitter activities that send events to the Tivoli Enterprise Console®, turning on EIF event-forwarding causes duplicate events. You can specify Y in this field to deactivate the emitter activities in your policies.

Policies give you more control over which events are sent, and you might want to keep some policies active. Moreover, policies that contain the Tivoli Enterprise Console® emitter activities generally do little else. If you deactivate these activities, there is no point in running the policies. Therefore, you might want to delete the policies that are no longer required, instead of disabling them.

**Related parameters**

- [“KDS\\_TEMS{EIF\\_EVENT\\_LISTENER” on page 1398](#)
- [“KDS\\_TEMS{EIF\\_FLAG” on page 1399](#)

**KDS\_TEMS{EIF\_EVENT\_LISTENER**

This parameter specifies the type of event server.

**Required or optional**

Required for the hub Tivoli Enterprise Monitoring Server if event forwarding is enabled; does not apply to a remote monitoring server

**Location where the parameter value is stored**

KMSOMTEC member of the *rhilev.rte.RKANPARU* library for the runtime environment of the hub monitoring server

**Parameter name**

EventListenerType

**Default value**

T

**Permissible values**

T or M

**PARMGEN name**

KDS\_TEMS{EIF\_EVENT\_LISTENER

**Description**

Type of event server: T (the default) for Tivoli Enterprise Console®, or M for OMNIbus.

**Related parameters**

- [“KDS\\_TEMS{EIF\\_FLAG” on page 1399](#)
- [“KDS\\_TEMS{EIF\\_DISABLE\\_TEC\\_EMITTER” on page 1398](#)

## KDS\_TEMS{EIF\_FLAG

This parameter determines whether to enable event forwarding from the hub.

**Required or optional**

Optional for the hub Tivoli Enterprise Monitoring Server; does not apply to a remote monitoring server

**Location where the parameter value is stored**

KDSENV member of the *rhilev.rte.RKANPARU* library for the runtime environment of the hub monitoring server

**Parameter name**

KMS\_OMTEC\_INTEGRATION

**Default value**

None

**Permissible values**

YES or none

**PARMGEN name**

KDS\_TEMS{EIF\_FLAG

**Description**

Determines whether to enable event forwarding from the hub. If the value of this parameter is Y, the KMS\_OMTEC\_INTEGRATION parameter is created in the KDSENV member.

**Related parameters**

None

## KDS\_TEMS{EIF\_HOST

This parameter contains the fully-qualified hostname or dotted-decimal IPv4 address of the primary event server and of up to seven backup event servers.

**Description**

Fully-qualified hostname or dotted-decimal IPv4 address of the primary event server and of up to seven backup event servers. If you specify more than one event server, use commas to separate the hostnames or IP addresses. If an event cannot be sent to the first server on the list, the next one is tried, and so on. This parameter is required for the hub Tivoli Enterprise Monitoring Server if event forwarding is enabled; this does not apply to a remote monitoring server.

**Note:** IPv6 is not supported for sending EIF events from the hub monitoring server or from monitoring agents.

**Default value**

None

**Permissible values**

Character string, maximum length 44

**Related parameters**

- [“KDS\\_TEMS{EIF\\_PORT\\_NUM” on page 1400](#)
- [“KDS\\_TEMS{EIF\\_FLAG” on page 1399](#)

## KDS\_TEMS{EIF\_PORT\_NUM

This parameter contains the port number on which the Tivoli Enterprise Console® event server or OMNIBus EIF probe listens for events.

**Required or optional**

Required for the hub Tivoli Enterprise Monitoring Server if event forwarding is enabled; does not apply to a remote monitoring server

**Location where the parameter value is stored**

KMSOMTEC member of the *rhilev.rte.RKANPARU* library for the runtime environment of the hub monitoring server

**Parameter name**

ServerPort

**Default value**

5529

**Permissible values**

Character string, maximum length 44

**PARMGEN name**

KDS\_TEMS{EIF\_PORT\_NUM

**Description**

Port number on which the Tivoli Enterprise Console® event server or OMNIBus EIF probe listens for events. If you specify more than one event server, use commas to separate the port numbers. List the port numbers in an order corresponding to the list of event server locations specified in the [“KDS\\_TEMS{EIF\\_HOST” on page 1399](#) parameter.

**Related parameters**

- [“KDS\\_TEMS{EIF\\_HOST” on page 1399](#)
- [“KDS\\_TEMS{EIF\\_FLAG” on page 1399](#)
- [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#)

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

## KDS\_TEMS\_FLUSH\_LSR\_BUFR\_INT\_HR

This parameter specifies in hours how often you want to force all deferred VSAM writes to DASD.

**Required or optional**

Optional

**Location where the parameter value is stored**

Part of the third EVERY command in the KDSSTART member of the *rhilev.rte.RKANCMDU* data set  
Example:

```
EVERY 00:30:00 FLUSH
```

**Default value**

00

**Permissible values**

00 - 24

**PARMGEN name**

KDS\_TEMS\_FLUSH\_LSR\_BUFR\_INT\_HR

**Description**

Specifies in hours how often you want to force all deferred VSAM writes to DASD.

**Related parameters**

- [“KDS\\_TEMS\\_STORAGE\\_DETAIL\\_LOG\\_FLAG” on page 1409](#)
- [“KDS\\_TEMS\\_FLUSH\\_LSR\\_BUFR\\_INT\\_MIN” on page 1401](#)

**KDS\_TEMS\_FLUSH\_LSR\_BUFR\_INT\_MIN**

This parameter specifies in minutes how often you want to force all deferred VSAM writes to DASD.

**Required or optional**

Optional

**Location where the parameter value is stored**

Part of the third EVERY command in the KDSSTART member of the *rhilev.rte.RKANCMDU* data set  
Example:

```
EVERY 00:30:00 FLUSH
```

**Default value**

30

**Permissible values**

00 - 60

**PARMGEN name**

KDS\_TEMS\_FLUSH\_LSR\_BUFR\_INT\_MIN

**Description**

Specifies in minutes how often you want to force all deferred VSAM writes to DASD.

**Related parameters**

- [“KDS\\_TEMS\\_STORAGE\\_DETAIL\\_LOG\\_FLAG” on page 1409](#)
- [“KDS\\_TEMS\\_FLUSH\\_LSR\\_BUFR\\_INT\\_HR” on page 1400](#)

**KDS\_TEMS\_HA\_EXCL\_LIST**

This parameter specifies an eligible product or products to be excluded from reporting to the high-availability hub.

**Required or optional**

Optional

**Location where the parameter value is stored**

The parameter value is not stored, but is used for internal processing.

#### **PARMGEN name**

KDS\_TEMS\_HA\_EXCL\_LIST

#### **Description**

Specifies an eligible product or products to be excluded from reporting to the high-availability hub. You can exclude products by specifying the 2-character product code of each product that you want to exclude. Use a single blank space to separate product codes. The list can have a maximum length of 50 characters. To exclude more products than can be accommodated by the KDS\_CMS\_HA\_EXCL\_LIST or KDS\_TEMS\_HA\_EXCL\_LIST parameter, specify more than one KDS\_CMS\_HA\_EXCL\_LIST $n$  or KDS\_TEMS\_HA\_EXCL\_LIST $n$  parameter, where  $n$  is a number from 1 to 5.

#### **Related parameters**

- [“KDS\\_TEMS\\_HA\\_TYPE” on page 1402](#)

## **KDS\_TEMS\_HA\_TYPE**

This parameter determines whether to configure the Tivoli Enterprise Monitoring Server as a high-availability hub.

#### **Description**

This parameter determines whether to configure the Tivoli Enterprise Monitoring Server as a high-availability hub. This configuration requires a sysplex environment with dynamic virtual IP addressing (DVIPA) and shared DASD. A high-availability hub is configured in its own runtime environment, without monitoring agents, and can be configured on the same LPAR with a remote monitoring server. This configuration allows the hub to be relocated to any suitable LPAR in the sysplex with no changes, and with minimal disruption to the components connecting to the hub.

#### **Default value**

None

#### **Permissible values**

HA

#### **Related parameters**

- [“KDS\\_TEMS\\_TYPE” on page 1417](#)
- [“KDS\\_HUB\\_TEMS\\_HA\\_TYPE” on page 1377](#)
- [“KDS\\_TEMS\\_HA\\_EXCL\\_LIST” on page 1401](#)
- [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#)

## **KDS\_TEMS\_HTTP\_PORT\_NUM**

Use this parameter to specify the port number for HTTP communications with the Tivoli Enterprise Monitoring Server.

#### **Description**

This parameter specifies the port number for HTTP communications between the Tivoli Enterprise Monitoring Server (TEMS) and other components. If the specified port is in use when the hub monitoring server is started, another port is assigned. For more information about assigning port numbers, see [Port number assignments](#).

#### **Permissible values**

1 – 65535

#### **Default value**

1920

#### **Related parameters**

- [“RTE\\_TEMS\\_TRANSPORT\\_MODE” on page 290](#)
- [“KDS\\_TEMS\\_SOAP\\_SERVER\\_FLAG” on page 1408](#)
- [“KDS\\_TEMS\\_TCP\\_HOST” on page 1412](#)

- “KDS\_TEMS\_COMM\_PROTOCOLn” on page 1395
- KDS\_HUB\_\* parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)
- KDS\_X\_HUB\_\* parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

## KDS\_TEMS\_HTTPS\_PORT\_NUM

Use this parameter to specify the port number for HTTPS communications with the Tivoli Enterprise Monitoring Server.

### Description

This parameter specifies the port number for HTTPS communications between the Tivoli Enterprise Monitoring Server (TEMS) and other components. If the specified port is in use when the hub monitoring server is started, another port is assigned. For more information about assigning port numbers, see [Port number assignments](#).

### Permissible values

1 – 65535

### Default value

3661

### Related parameters

- “RTE\_TEMS\_TRANSPORT\_MODE” on page 290

## KDS\_TEMS\_ICU\_LANGUAGE\_LOCALE

This parameter contains the language and region for the z/OS® system.

### Description

Language and region for the z/OS® system.

If the z/OS® UNIX® System Services code page (en\_US.ibm-1047) is required, you can specify either of these values for the z/OS UNIX code page:

```
KDS_TEMS_ICU_LANGUAGE_LOCALE    en_US.ibm-1047
KDS_TEMS_ICU_LANGUAGE_LOCALE    1A
```

The z/OS UNIX code page (en\_US.ibm-1047) is required for agent autonomy and for private situation XML files.

The following table lists the acceptable languages:

<i>Table 124: Language locales and corresponding code pages</i>		
Language locale	Code page	National language and region
1a or 1A	en_US.ibm-1047	English - United States (z/OS® UNIX® System Services)
1	en_US.ibm-037	English - United States
2	en_UK.ibm-285	English - United Kingdom
3	de_DE.ibm-273	German - Germany
4	de_CH.ibm-500	German - Switzerland
5	fr_BE.ibm-500	French - Belgium
6	fr_FR.ibm-297	French - France
7	fr_CH.ibm-500	French - Switzerland
8	es_ES.ibm-284	Spanish - Spain
9	it_IT.ibm-280	Italian - Italy
10	pt_PT.ibm-037	Portuguese - Portugal
11	pt_BR.ibm-037	Portuguese - Brazil
12	no_NO.ibm-277	Norwegian - Norway

Language locale	Code page	National language and region
13	sv_SE.ibm-278	Swedish - Sweden
14	da_DK.ibm-277	Danish - Denmark
15	fi_FI.ibm-278	Finnish - Finland
16	ja_JP.ibm-290	Japanese - Japan
17	fr_CA.ibm-500	French - Canada
18	zh_TW.ibm-937	Traditional Chinese - Taiwan
19	zh_CN.ibm-935	Simplified Chinese - China
20	sq_AL.ibm-500	Albanian - Albania
21	bg_BG.ibm-500	Bulgarian - Bulgaria
22	cs_CZ.ibm-870	Czech - Slovenia
23	nl_BE.ibm-500	Dutch - Belgium
24	nl_NL.ibm-037	Dutch - Netherlands
25	el_GR.ibm-87	Greek - Greece
26	iw_IL.ibm-424	Hebrew - Israel
27	ko_KR.ibm-933	Korean - Korea
28	lt_LT.ibm-1112	Lithuanian - Lithuania
29	mk_MK.ibm-1025	Macedonian - Macedonia
30	ro_RO.ibm-870	Romanian - Romania
31	ru_RU.ibm-1025	Russian - Russia
32	sr_SP.ibm-1025	Serbian - Serbia
33	sr_SP.ibm-870	Slovak - Slovakia
34	sk_SK.ibm-870	Slovenian - Slovenia
35	th_TH.ibm-838	Thai - Thailand
36	tr_TR.ibm-1026	Turkish - Turkey

#### Permissible values

Using code page: *lang.ibm-*nnn**

Using language locale: 1a, 1A, 1-36

#### Default value

en\_US.ibm-1047

#### Related parameters

[“Kpp\\_AGT\\_ICU\\_LANGUAGE\\_LOCALE” on page 1267](#)

## KDS\_TEMS\_KDC\_DEBUG

This parameter determines the trace option.

#### Required or optional

Optional

#### Location where the parameter value is stored

KDSENV member of the *rhilev.rte.RKANPARU* library for the runtime environment of the Tivoli Enterprise Monitoring Server

#### Parameter name

KBS\_DEBUG

#### Default value

N

**Permissible values**

N, Y, D, M, or A

**PARMGEN name**

KDS\_TEMS\_KDC\_DEBUG

**Description**

Determines the trace option. The default setting of N instructs the data communications layer to summarize communications problems, and is intended for stable applications in production. The default setting generates standard RAS1 trace data in the RKLVLLOG, in addition to the summary information diagnosing possible timeout conditions. The following settings report on data communications problems:

**N**

Minimal tracing (the default)

**Y**

Full-packet tracing

**Note:** The Y setting causes a great many records to be written to the log files. Use this setting only for testing or problem diagnosis.

**D**

Y, plus state and flow tracing

**M**

D, plus input and output help tracing

**A**

M, plus all-format tracing

**Note:** Do not use the A setting unless directed by IBM® Software Support personnel.

**Related parameters**

None

**KDS\_TEMS\_KGL\_WTO**

This parameter determines whether a SYSLOG message is written to the console to indicate that the monitoring server has completed initialization.

**Required or optional**

Required

**Location where the parameter value is stored**

KDSENV member of the *rhilev.rte*.RKANPARU library for the runtime environment of the Tivoli Enterprise Monitoring Server

**Parameter name**

KGL\_WTO

**Default value**

YES

**Permissible values**

YES or none

**PARMGEN name**

KDS\_TEMS\_KGL\_WTO

**Description**

Determines whether a SYSLOG message is written to the console to indicate that the monitoring server has completed initialization. You can use this message as an UP status message in your automation package (for example, IBM® System Automation for z/OS®). See the documentation for your automation package for instructions on capturing the monitoring server automation message IDs (KO4SRV032 and KDSMA001).

#### Related parameters

None

## KDS\_TEMS\_KLX\_TCP\_TOLERATERECYCLE

This parameter determines whether the monitoring server address space reconnects to its TCP/IP stack without being recycled after the stack is recycled.

#### Required or optional

Required

#### Location where the parameter value is stored

KLXINTCP member of the *rhilev.rte.RKANPARU* library for the runtime environment of the Tivoli Enterprise Monitoring Server

#### Parameter name

TCP/IP\_USERID (TOLERATERECYCLE option)

Example:

```
TCP/IP_USERID='*' TOLERATERECYCLE
```

#### Default value

None

#### Permissible values

TOLERATERECYCLE or None

#### PARMGEN name

KDS\_TEMS\_KLX\_TCP\_TOLERATERECYCLE

#### Description

Determines whether the monitoring server address space reconnects to its TCP/IP stack without being recycled after the stack is recycled. If this parameter is set to N (the default), then if the TCP/IP stack used by the monitoring server is recycled, the monitoring server address space must also be recycled to re-establish TCP/IP connectivity. If this parameter is set to Y, the TOLERATERECYCLE option is added to the TCP/IP\_USERID parameter in KLXINTCP.

#### Related parameters

None

## KDS\_TEMS\_PARTITION\_NAME

This parameter contains the partition name (label) that identifies the location of the monitoring server relative to the firewall or firewalls used for address translation.

#### Required or optional

Required if you specified Y for the “[KDS\\_TEMS\\_COMM\\_ADDRESS\\_XLAT](#)” on [page 1395](#) parameter

#### Location where the parameter value is stored

KDCPART member of the *rhilev.rte.RKANPARU* library for the runtime environment of the Tivoli Enterprise Monitoring Server

#### PARMGEN name

KDS\_TEMS\_PARTITION\_NAME

#### Description

Partition name (label) that identifies the location of the monitoring server relative to the firewall or firewalls used for address translation. The partition name that you supply is added to the partition table, which contains labels and associated socket addresses provided by the firewall administrator. The label is used outside the firewall to establish monitoring server connections. The well-known port for the hub monitoring

server must be authorized by the firewall administrator. For the IP\*.PIPE protocols, no additional ports require authorization.

#### Related parameters

- [“KDS\\_TEMS\\_COMM\\_ADDRESS\\_XLAT” on page 1395](#)
- [“KDS\\_PA” on page 1381](#)
- [“KDS\\_PA\\_PARTITION\\_NAME” on page 1382](#)

## KDS\_TEMS\_PROC\_SHARED

This parameter indicates if the monitoring server procedure can be shared.

#### Description

This flag specifies if the monitoring server procedure can be shared among different systems in the sysplex. When the flag is set to Y, the same procedure is generated for a hub monitoring server or a remote monitoring server, and the procedure can be copied to a shared SYS1.PROCLIB.

#### Default value

N

#### Permissible values

Y, N

## KDS\_TEMS\_SECURITY\_KAES256\_ENCKEY (deprecated)

This parameter contains unique 32-byte password encryption key. Starting with APAR OA41710, this parameter has been deprecated in favor of the global runtime environment parameter RTE\_SECURITY\_KAES256\_KEY.

#### Required or optional

Required if ICSF is installed and configured on the z/OS® system

#### Location where the parameter value is stored

KAES256 member of the *rhilev.rte.RKANPARU* library for the runtime environment of the Tivoli Enterprise Monitoring Server. The stored value is encrypted.

#### Default value

IBMTivoliMonitoringEncryptionKey

#### Permissible values

Character string, maximum length 32, no ampersand (&) character

#### PARMGEN name

KDS\_TEMS\_SECURITY\_KAES256\_ENCKEY

#### Description

Unique 32-byte password encryption key. The value is case-sensitive. You must use the same key during the installation of any components that communicate with the monitoring server. For further information, see [“Configuring security on a monitoring server on z/OS” on page 538](#).

#### Related parameters

- [“GBL\\_DSN\\_CSF\\_SCSFMOD0” on page 280](#)

## KDS\_TEMS\_SECURITY\_KDS\_VALIDATE

This parameter determines whether the hub monitoring server validates user IDs and passwords.

#### Description

This parameter determines whether the hub monitoring server validates user IDs and passwords. If this parameter is set to Y, validation of users is handled by the security system specified for the runtime environment.

#### Default value

Y

**Permissible values**

Y, N

**Related parameters**

- [“RTE\\_SECURITY\\_USER\\_LOGON” on page 1348](#)

## **KDS\_TEMS\_SOAP\_SERVER\_FLAG**

This parameter determines whether to enable the Web Services Simple Object Access Protocol (SOAP) server.

**Required or optional**

Required for a hub Tivoli Enterprise Monitoring Server. This parameter can be set to Y only when an IP-related protocol is specified in [“KDS\\_TEMS\\_COMM\\_PROTOCOLn” on page 1395](#).

**Location where the parameter value is stored**

The parameter value is not stored, but is used for internal processing.

**PARMGEN name**

KDS\_TEMS\_SOAP\_SERVER\_FLAG

**Description**

Determines whether to enable the Web Services Simple Object Access Protocol (SOAP) server. The SOAP server is an application server plug-in that receives and sends XML data, and provides XML SOAP interfaces into the Tivoli® Management Services components and the monitoring agents. This feature requires a TCP communication protocol.

**Related parameters**

N

- [“KDS\\_TEMS\\_COMM\\_PROTOCOLn” on page 1395](#) (IP-related protocol required if KDS\_TEMS\_SOAP\_SERVER\_FLAG=Y)

one

## **KDS\_TEMS\_STC**

This parameter contains the unique name of the started task JCL procedure for the monitoring server.

**Required or optional**

Required

**Location where the parameter value is stored**

Value becomes the name of the Tivoli Enterprise Monitoring Server started task procedure member in the *rhilev.rte.RKANSAMU* library

**PARMGEN name**

KDS\_TEMS\_STC

**Description**

Unique name of the started task JCL procedure for the monitoring server. Make a note of the name, because you will to copy this started task procedure to your system procedure library. The default started task name for a monitoring server is IBMDS in PARMGEN.

**Related parameters**

- [“RTE\\_STC\\_PREFIX” on page 1352](#)

## **KDS\_TEMS\_STORAGE\_DETAIL\_INT\_HR**

This parameter specifies in hours how often you want storage allocation detail to be logged.

**Required or optional**

Required if the value of the [“KDS\\_TEMS\\_STORAGE\\_DETAIL\\_LOG\\_FLAG” on page 1409](#) parameter is Y

**Location where the parameter value is stored**

Part of the second EVERY command in the KDSSTART member of the *rhilev.rte.RKANCMDU* library  
Example:

```
EVERY 00:60:00 STORAGE D
```

**Default value**

00

**Permissible values**

00 - 24

**PARMGEN name**

KDS\_TEMS\_STORAGE\_DETAIL\_INT\_HR

**Description**

Specifies in hours how often you want storage allocation detail to be logged.

**Related parameters**

- [“KDS\\_TEMS\\_STORAGE\\_DETAIL\\_INT\\_MIN” on page 1409](#)
- [“KDS\\_TEMS\\_STORAGE\\_DETAIL\\_LOG\\_FLAG” on page 1409](#)

**KDS\_TEMS\_STORAGE\_DETAIL\_INT\_MIN**

This parameter specifies in minutes how often you want storage allocation detail to be logged.

**Required or optional**

Required if the value of the [“KDS\\_TEMS\\_STORAGE\\_DETAIL\\_LOG\\_FLAG” on page 1409](#) parameter is Y

**Location where the parameter value is stored**

Part of the second EVERY command in the KDSSTART member of the *rhilev.rte.RKANCMDU* library  
Example:

```
EVERY 00:60:00 STORAGE D
```

**Default value**

60

**Permissible values**

00 - 60

**PARMGEN name**

KDS\_TEMS\_STORAGE\_DETAIL\_INT\_MIN

**Description**

Specifies in minutes how often you want storage allocation detail to be logged.

**Related parameters**

- [“KDS\\_TEMS\\_STORAGE\\_DETAIL\\_INT\\_HR” on page 1408](#)
- [“KDS\\_TEMS\\_STORAGE\\_DETAIL\\_LOG\\_FLAG” on page 1409](#)

**KDS\_TEMS\_STORAGE\_DETAIL\_LOG\_FLAG**

This parameter determines whether to enable storage allocation detail logging.

**Required or optional**

Optional

**Location where the parameter value is stored**

Generates the second EVERY command in the KDSSTART member of the *rhilev.rte.RKANCMDU* library

## PARMGEN name

KDS\_TEMS\_STORAGE\_DETAIL\_LOG\_FLAG

## Description

Determines whether to enable storage allocation detail logging. You can use the storage detail command output to analyze storage allocated by the monitoring server address space. To disable storage detail logging, set this parameter to N. The second EVERY command is then written as a comment in *rhilev.rte.RKANCMU(KDSSTART)*.

If you disable storage logging and then want to activate it after the monitoring server is configured and running, you can issue the following modify command to the monitoring server started task:

```
/F started_task,EVERY hh:mm:ss STORAGE D
```

Issuing this modify command activates storage detail logging without a requirement to recycle the monitoring server.

## Related parameters

- [“KDS\\_TEMS\\_STORAGE\\_DETAIL\\_INT\\_HR” on page 1408](#)
- [“KDS\\_TEMS\\_STORAGE\\_DETAIL\\_INT\\_MIN” on page 1409](#)

## KDS\_TEMS\_STORAGE\_LIMIT\_EXTEND

This parameter contains the maximum extended (above-the-line) storage request size, as a power of 2.

## Required or optional

Required

## Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte.RKANPARU* library for the runtime environment of the monitoring server

## Parameter name and syntax

LIMIT(*n*,*X*)

## Default value

- Default for PARMGEN: LIMIT(23,*X*)
- Default in TMS:Engine: LIMIT(16,*X*)

## Permissible values

No higher than 25 (see Description)

## PARMGEN name

KDS\_TEMS\_STORAGE\_LIMIT\_EXTEND

## Description

Maximum extended (above-the-line) storage request size, as a power of 2. The value can be no higher than 25 (32768 KB).

This value is used in building storage access tables to speed memory allocation. If a process in TMS:Engine attempts to allocate a block of storage larger than the value set, program interruption U0100 or U0200 results. Too small a value causes components to fail. Too large a value wastes storage and increases processing overhead. You might to specify a large value if any monitoring agent reporting to the monitoring server builds large VTAM® request/response units (RUs) and data streams.

## Related parameters

- [“KDS\\_TEMS\\_STORAGE\\_LIMIT\\_PRIMARY” on page 1410](#)
- [“KDS\\_TEMS\\_STORAGE\\_MINIMUM\\_EXTEND” on page 1411](#)

## KDS\_TEMS\_STORAGE\_LIMIT\_PRIMARY

This parameter contains the maximum primary (below-the-line) storage request size, as a power of 2.

**Required or optional**

Required

**Location where the parameter value is stored**KDSSYSIN member of the *rhilev.rte*.RKANPARU library for the runtime environment of the monitoring server**Parameter name and syntax**LIMIT(*n*,*P*)**Default value**LIMIT(20,*P*)**Permissible values**

No higher than 25 (see Description)

**PARMGEN name**

KDS\_TEMS\_STORAGE\_LIMIT\_PRIMARY

**Description**

Maximum primary (below-the-line) storage request size, as a power of 2. The value can be no higher than 25 (32768 KB). The default maximum for primary storage is 20 (64 KB). However, some monitoring agents configured to run in the monitoring server address space require a maximum primary storage request size of 20 (1 MB).

This value is used in building storage access tables to speed memory allocation. If a process in TMS:Engine attempts to allocate a block of storage larger than the value set, program interruption U0100 or U0200 results. Too small a value causes components to fail. Too large a value wastes storage and increases processing overhead. You might to specify a large value if any monitoring agent reporting to the monitoring server builds large VTAM® request/response units (RUs) and data streams.

**Related parameters**

- [“KDS\\_TEMS\\_STORAGE\\_LIMIT\\_EXTEND” on page 1410](#)
- [“KDS\\_TEMS\\_STORAGE\\_MINIMUM\\_EXTEND” on page 1411](#)

**KDS\_TEMS\_STORAGE\_MINIMUM\_EXTEND**

This parameter specifies the minimum number of kilobytes of extended (above-the-line) storage to be made available to the monitoring agents and other components that are communicating with the monitoring server.

**Required or optional**

Required

**Location where the parameter value is stored**KDSSYSIN member of the *rhilev.rte*.RKANPARU library for the runtime environment of the monitoring server**Parameter name and syntax**MINIMUM(*n*,*X*)**Default value**MINIMUM(768000,*X*)**Permissible values**

1 - 9999999

**PARMGEN name**

KDS\_TEMS\_STORAGE\_MINIMUM\_EXTEND

**Description**

Minimum number of kilobytes of extended (above-the-line) storage to be made available to the monitoring agents and other components that are communicating with the monitoring server. The default value is 768000 KB. If you do not have many IBM® components reporting to the monitoring server and you want to conserve storage, you can lower the value.

**Related parameters**

- [“KDS\\_TEMS\\_STORAGE\\_LIMIT\\_EXTEND” on page 1410](#)

- [“KDS\\_TEMS\\_STORAGE\\_LIMIT\\_PRIMARY” on page 1410](#)

## KDS\_TEMS\_TCP\_HOST

This parameter specifies the TCP/IP hostname or IP address of the z/OS® system where the monitoring server is installed.

### Description

TCP/IP hostname or IP address of the z/OS® system where the monitoring server is installed.

**Note:** To modify this parameter value using Configuration Manager, use parameter [“RTE\\_TCP\\_HOST” on page 288](#), which sets the same value for the monitoring server and the monitoring agents.

To obtain the hostname or IP address, enter `TSO HOMETEST` at the command line. If the z/OS® domain name resolver configuration specifies a search path that includes the target domain suffix, specify only the first qualifier of the hostname. (Example: `sys` is the first qualifier of the fully qualified hostname `sys.ibm.com`.) Otherwise, specify the fully-qualified hostname.

For a high-availability hub, the hostname is the application-instance-specific (private) dynamic virtual IP address you have defined to the Domain Name Server (DNS).

### Default value

#### For Configuration Manager:

Value set for parameter [“RTE\\_TCP\\_HOST” on page 288](#), which defaults to `%SYSIPHOSTNAME%`

#### For PARMGEN:

`%SYSIPHOSTNAME%`

### Permissible values

Character string, maximum length 39

### Related parameters

- [“RTE\\_TCP\\_HOST” on page 288](#)

## KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST

This parameter specifies a list of network interfaces for the monitoring server to use for IPv4 communication.

### Description

This parameter specifies one or more network interfaces for the monitoring server to use for IPv4 communication.

**Note:** To modify this parameter value using Configuration Manager, use parameter [“RTE\\_TCP\\_KDEB\\_INTERFACELIST” on page 295](#), which sets the same value for the monitoring server and the monitoring agents.

If the z/OS® image has more than one TCP/IP interface or network adapter, you can use this parameter to direct the monitoring server to connect to a specific TCP/IP local interface.

To set a network interface list, supply one of the following values:

- The hostname or dotted-decimal IPv4 address of the preferred interface.
- A list of hostnames or dotted-decimal IPv4 addresses, in descending order of preference. Use a blank (space) to separate the entries.
- An asterisk (\*) to prefer the interface associated with the default hostname for the z/OS® image. To display this value, enter `TSO HOMETEST` at the command line.
- An exclamation point followed by an asterisk (!\*) to use only the interface associated with the default hostname for the z/OS® image.
- An exclamation point followed by a hostname or dotted-decimal IPv4 address (!*hostname*) to use only the interface associated with *hostname*.  
If you set the value of this parameter to !\* or !*hostname*, you must specify the same value for every component and product configured in all runtime environments on the same z/OS® image.  
For a high-availability hub, specify the value of this parameter as !*dvipa*, where *dvipa* is the private dynamic virtual IP address (DVIPA) set for the `"KDS_TEMS_TCP_HOST"` on page 1412 parameter.

**Note:** In the default character set (LANG=en\_US.ibm-037), the code for an exclamation point is x'5A'. If you are using a character set other than the default, a different character might map to that code. To require a specific network interface, use the character that maps to x'5A' in your character set.

#### Default value

##### For Configuration Manager:

Value set for parameter `"RTE_TCP_KDEB_INTERFACELIST"` on page 295, which defaults to !\*

##### For PARMGEN:

None

#### Permissible values

Character string, maximum length 44

#### Related parameters

- `"KDS_TEMS_TCP_HOST"` on page 1412
- `"RTE_TCP_KDEB_INTERFACELIST"` on page 295

## KDS\_TEMS\_TCP\_PIPE\_PORT\_NUM

This parameter specifies the well-known port for the monitoring server for the IP.PIPE communication protocol (the TCP/IP protocol that supports IPv4). Tivoli® Management Services reserves a default well-known port for the first process started on a system (normally, the monitoring server).

#### Description

Well-known port for the monitoring server for the IP.PIPE communication protocol (the TCP/IP protocol that supports IPv4). Tivoli® Management Services reserves a default well-known port for the first process started on a system (normally, the monitoring server). For monitoring agents and other components, an algorithm based on the port number assigned to the monitoring server calculates the listening port to reserve. A port number cannot be assigned to a component if it is already reserved for another component or application.

The default listening port number for the monitoring server for IP.PIPE is 1918 or the value set for the `"RTE_TCP_PORT_NUM"` on page 289 parameter. You might find it necessary to change the setting under some conditions; for example, when the port assigned to a component by the algorithm is already reserved by another application or component. For a remote Tivoli Enterprise Monitoring Server, the port number must be the same as that of the hub.

For detailed information about assigning port numbers, see `"Port number assignments"` on page 150.

This parameter is required if you specified IP.PIPE as a communication protocol for the Tivoli Enterprise Monitoring Server.

#### Default value

1918 or the value set for the `"RTE_TCP_PORT_NUM"` on page 289 parameter

### Permissible values

1 - 65535

### Related parameters

- [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#)

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)
- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

## KDS\_TEMS\_TCP\_PIPE6\_PORT\_NUM

This parameter specifies the well-known port for the monitoring server for the IP6.PIPE communication protocol (the TCP/IP protocol that supports IPv6).

### Description

Well-known port for the monitoring server for the IP6.PIPE communication protocol (the TCP/IP protocol that supports IPv6).

Tivoli® Management Services reserves a default well-known port for the first process started on a system (normally, the monitoring server). For monitoring agents and other components, an algorithm based on the port number assigned to the monitoring server calculates the listening port to reserve. A port number cannot be assigned to a component if it is already reserved for another component or application.

The default listening port number for the monitoring server for IP6.PIPE is 1918 or the value set for the [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#) parameter. You might find it necessary to change the setting under some conditions; for example, when the port assigned to a component by the algorithm is already reserved by another application or component. For a remote Tivoli Enterprise Monitoring Server, the port number must be the same as that of the hub.

For detailed information about assigning port numbers, see [“Port number assignments” on page 150](#).

This parameter is required if you specified IP6.PIPE as a communication protocol for the Tivoli Enterprise Monitoring Server.

### Default value

1918 or the value set for the [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#) parameter

### Permissible values

1 - 65535

### Related parameters

- [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#)

## KDS\_TEMS\_TCP\_PIPE6S\_PORT\_NUM

This parameter specifies the well-known port for the monitoring server for the IP6.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv6).

### Description

Well-known port for the monitoring server for the IP6S.PIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv6).

Tivoli® Management Services reserves a default well-known port for the first process started on a system (normally, the monitoring server). For monitoring agents and other components, an algorithm based on the

port number assigned to the monitoring server calculates the listening port to reserve. A port number cannot be assigned to a component if it is already reserved for another component or application.

The default listening port number for the monitoring server for IP6.SPIPE is 3660 or the value set for the [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#) parameter. You might find it necessary to change the setting under some conditions; for example, when the port assigned to a component by the algorithm is already reserved by another application or component. For a remote Tivoli Enterprise Monitoring Server, the port number must be the same as that of the hub.

For detailed information about assigning port numbers, see [“Port number assignments” on page 150](#).

This parameter is required if you specified IP6.SPIPE as a communication protocol for the Tivoli Enterprise Monitoring Server.

#### **Default value**

3660 or the value set for the [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#) parameter

#### **Permissible values**

1 - 65535

#### **Related parameters**

- [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#)

- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

## **KDS\_TEMS\_TCP\_PIPES\_PORT\_NUM**

This parameter specifies the well-known port for the monitoring server for the IP.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv4).

#### **Description**

Well-known port for the monitoring server for the IP.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv4).

Tivoli® Management Services reserves a default well-known port for the first process started on a system (normally, the monitoring server). For monitoring agents and other components, an algorithm based on the port number assigned to the monitoring server calculates the listening port to reserve. A port number cannot be assigned to a component if it is already reserved for another component or application.

The default listening port number for the monitoring server for IP.SPIPE is 3660 or the value set for the [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#) parameter. You might find it necessary to change the setting under some conditions; for example, when the port assigned to a component by the algorithm is already reserved by another application or component. For a remote Tivoli Enterprise Monitoring Server, the port number must be the same as that of the hub.

For detailed information about assigning port numbers, see [“Port number assignments” on page 150](#).

This parameter is required if you specified IP.SPIPE as a communication protocol for the Tivoli Enterprise Monitoring Server.

#### **Default value**

3660 or the value set for the [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#) parameter

#### **Permissible values**

1 - 65535

#### **Related parameters**

- [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#)

- **KDS\_X\_HUB\_\*** parameters (values for the Standby HUB TEMS that the z/OS Remote TEMS connects to)

## KDS\_TEMS\_TCP\_STC

This parameter identifies the TCP/IP stack to be used. If the LPAR contains a single TCP/IP stack, accept the default value of an hash or pound sign (#), which uses the first TCP/IP stack that was started.

### Description

Identifies the TCP/IP stack to be used.

If the LPAR contains more than one TCP/IP stack, specify the started task name of the TCP/IP stack you want to use. Alternatively, you can specify the pound or hash sign (#), which is translated to a blank and allows the TCP/IP environment to choose the stack to use, either through TCP/IP definitions or through the use of the SYSTCPD DD statement.

Whichever method is used to select a TCP/IP stack in a multi-stack environment, the Tivoli® Management Services components continue to use that stack, even if a different stack becomes the primary stack. Therefore, in a multi-stack environment, it is best to specify the started task name of the TCP/IP stack to be used, rather than specifying a wildcard or a blank.

### Required or optional

Required

### Default value

#

### Permissible values

Character string, maximum length 8

### Related parameters

None

## KDS\_TEMS\_TCP\_UDP\_PORT\_NUM

This parameter specifies the well-known port for the monitoring server for the IP.UDP communication protocol (the TCP/IP protocol that uses the packet-based, connectionless User Datagram Protocol under IPv4).

### Description

Well-known port for the monitoring server for the IP.UDP communication protocol (the TCP/IP protocol that uses the packet-based, connectionless User Datagram Protocol under IPv4).

Tivoli® Management Services reserves a default well-known port for the first process started on a system (normally, the monitoring server). For monitoring agents and other components, an algorithm based on the port number assigned to the monitoring server calculates the listening port to reserve. A port number cannot be assigned to a component if it is already reserved for another component or application.

The default listening port number for the monitoring server for IP.UDP is 1918 or the value set for the [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#) parameter. You might find it necessary to change the setting under some conditions; for example, when the port assigned to a component by the algorithm is already reserved by another application or component. For a remote Tivoli Enterprise Monitoring Server, the port number must be the same as that of the hub.

For detailed information about assigning port numbers, see [“Port number assignments” on page 150](#).

This parameter is required if you specified IP.UDP as a communication protocol for the Tivoli Enterprise Monitoring Server.

### Default value

1918 or the value set for the [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#) parameter

### Permissible values

1 - 65535

### Related parameters

## KDS\_TEMS\_TCP\_UDP6\_PORT\_NUM

This parameter specifies the well-known port for the monitoring server for the IP6.UDP communication protocol (the packet-based, connectionless User Datagram Protocol that supports IPv6).

### Description

This parameter specifies the well-known port for the monitoring server for the IP6.UDP communication protocol (the packet-based, connectionless User Datagram Protocol that supports IPv6). Tivoli® Management Services reserves a default well-known port for the first process started on a system (normally, the monitoring server). For monitoring agents and other components, an algorithm based on the port number assigned to the monitoring server calculates the listening port to reserve. A port number cannot be assigned to a component if it is already reserved for another component or application.

The default listening port number for the monitoring server for IP6.UDP is 1918 or the value set for the [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#) parameter. You might find it necessary to change the setting under some conditions; for example, when the port assigned to a component by the algorithm is already reserved by another application or component. For a remote Tivoli Enterprise Monitoring Server, the port number must be the same as that of the hub.

For detailed information about assigning port numbers, see [“Port number assignments” on page 150](#).

This parameter is required if you specified IP6.UDP as a communication protocol for the Tivoli Enterprise Monitoring Server.

### Default value

1918 or the value set for the [“RTE\\_TCP\\_PORT\\_NUM” on page 289](#) parameter

### Permissible values

1 - 65535

### Related parameters

## KDS\_TEMS\_TYPE

This parameter specifies whether to configure a Tivoli Enterprise Monitoring Server as a hub monitoring server or a remote monitoring server.

### Description

This parameter specifies whether to configure a monitoring server as a hub monitoring server or a remote monitoring server

The hub monitoring server is the focal point for the entire monitoring environment. This server is under a significant load. Work on the hub includes communicating with remote monitoring servers, with the Tivoli® Enterprise Portal Server, and with local monitoring agents; authenticating users; consolidating and distributing data; storing and tracking situations and policies; and initiating and tracking all generated Take Action commands.

Remote monitoring servers communicate only with the monitoring agents that report to them and with the hub monitoring server to which they report. Note that a remote monitoring server is remote with respect to the hub monitoring server, not necessarily with respect to the monitoring agents. If monitoring agents are installed on the same system as a remote monitoring server, that monitoring server is local to the monitoring agents but remote to the hub.

The load on remote monitoring servers is typically low. Load is driven higher if historical data collection is performed on the monitoring servers instead of on the monitoring agents.

**Default value**

HUB

**Permissible values**

HUB, REMOTE

**Related parameters**

- [“KDS\\_TEMS\\_HA\\_TYPE” on page 1402](#)

## KDS\_TEMS\_VTAM\_APPL\_GLB\_BROKER

This parameter contains the VTAM® applid for the global location broker.

**Required or optional**

Required for the hub if SNA is one of the selected communication protocols

**Location where the parameter value is stored**

CTDDSN member of the *rhilev.rte*.RKANSAMU library for the runtime environment of the hub

**PARMGEN name**

KDS\_TEMS\_VTAM\_APPL\_GLB\_BROKER

**Description**

VTAM® applid for the global location broker. The value is recorded in the VTAM® major node created for the hub.

**Related parameters**

- [“KDS\\_HUB\\_VTAM\\_APPL\\_GLB\\_BROKER” on page 1377](#)
- [“KDS\\_PH\\_TEMS\\_VTAM\\_APPL\\_GLB\\_BROKER” on page 1390](#)

## KDS\_TEMS\_VTAM\_APPL\_KDS\_VTAMID

This parameter contains the primary VTAM® applid for the Tivoli® Enterprise Monitoring Server.

**Required or optional**

Required for SNA communications

**Location where the parameter value is stored**

KDSENV member of the *rhilev.rte*.RKANPARU library for the runtime environment of the Tivoli Enterprise Monitoring Server

**Parameter name**

KDS\_VTAMID

**Default value**

CTDDSDS

**Permissible values**

Character string, maximum length 8

**PARMGEN name**

KDS\_TEMS\_VTAM\_APPL\_KDS\_VTAMID

**Description**

Primary VTAM® **applid** for the Tivoli Enterprise Monitoring Server.

**Related parameters**

None

## KDS\_TEMS\_VTAM\_APPL\_LL\_BROKER

This parameter contains the VTAM® applid for the local location broker.

### Required or optional

Required for SNA communications

### Location where the parameter value is stored

KDSENV member of the *rhilev.rte*.RKANPARU library for the runtime environment of the Tivoli Enterprise Monitoring Server

### Parameter name

KDCFC\_ALIAS

### Default value

CTDDSLB

### Permissible values

Character string, maximum length 8

### PARMGEN name

KDS\_TEMS\_VTAM\_APPL\_LL\_BROKER

### Description

VTAM® applid for the local location broker.

### Related parameters

- [“KDS\\_TEMS\\_VTAM\\_APPL\\_PREFIX” on page 1419](#)

## KDS\_TEMS\_VTAM\_APPL\_PREFIX

This parameter defines a prefix for VTAM® application names that are used for communication with the monitoring server.

### Required or optional

Required for SNA communications

### Location where the parameter value is stored

The parameter value is not stored, but is used for internal processing.

### PARMGEN name

KDS\_TEMS\_VTAM\_APPL\_PREFIX

### Description

This value defines a prefix for VTAM® application names that are used for communication with the monitoring server. These application names begin with the prefix, and end with a specific value that makes each applid unique. The names (applids) are contained in the VTAM® major node.

### Related parameters

- [“RTE\\_VTAM\\_APPLID\\_PREFIX” on page 1362](#)

## KDS\_TEMS\_VTAM\_LU62\_DLOGMOD

This parameter defines LU6.2 logmode for the Tivoli® Enterprise Monitoring Server.

### Required or optional

Required for SNA communications

### Location where the parameter value is stored

CTDDSN member of the *rhilev.rte*.RKANSAMU library for the runtime environment of the Tivoli Enterprise Monitoring Server

### PARMGEN name

KDS\_TEMS\_VTAM\_LU62\_DLOGMOD

**Description**

LU6.2 logmode for the Tivoli Enterprise Monitoring Server.

**Related parameters**

- [“RTE\\_VTAM\\_LU62\\_DLOGMOD” on page 1363](#)
- [“KDS\\_PH\\_TEMS\\_VTAM\\_LU62\\_DLOGMOD” on page 1390](#)

**KDS\_TEMS\_VTAM\_LU62\_MODETAB**

This parameter contains the name of the logmode table containing the LU6.2 logmode entry for the Tivoli® Enterprise Monitoring Server.

**Required or optional**

Required for SNA communications

**Location where the parameter value is stored**

CTDDSN member of the *rhilev.rte.RKANSAMU* library for the runtime environment of the Tivoli Enterprise Monitoring Server

**PARMGEN name**

KDS\_TEMS\_VTAM\_LU62\_MODETAB

**Description**

Name of the logmode table containing the LU6.2 logmode entry for the Tivoli® Enterprise Monitoring Server.

**Related parameters**

- [“RTE\\_VTAM\\_LU62\\_MODETAB” on page 1363](#)

**KDS\_TEMS\_VTAM\_NETID**

This parameter contains the VTAM® network identifier, as defined in the NETID parameter of the VTAMLST startup member (ATCSTR*nn*).

**Required or optional**

Required for SNA communications

**Location where the parameter value is stored**

CTDDSN member of the *rhilev.rte.RKANSAMU* library for the runtime environment of the Tivoli Enterprise Monitoring Server

**PARMGEN name**

KDS\_TEMS\_VTAM\_NETID

**Description**

VTAM® network identifier, as defined in the NETID parameter of the VTAMLST startup member (ATCSTR*nn*).

**Related parameters**

- [“RTE\\_VTAM\\_NETID” on page 1363](#)
- [“RTE\\_SYSV\\_VTAM\\_NETID” on page 1354](#)
- [“KDS\\_PH\\_TEMS\\_VTAM\\_NETID” on page 1390](#)

**KDS\_TEMS\_VTAM\_NODE**

This parameter contains the name of the VTAM® major node for the Tivoli Enterprise Monitoring Server.

**Required or optional**

Required for SNA communications

**Location where the parameter value is stored**

CTDDSN member of the *rhilev.rte*.RKANSAMU library for the runtime environment of the Tivoli Enterprise Monitoring Server

**PARMGEN name**

KDS\_TEMS\_VTAM\_NODE

**Description**

Name of the VTAM® major node for the Tivoli Enterprise Monitoring Server.

**Related parameters**

- [“RTE\\_VTAM\\_GBL\\_MAJOR\\_NODE” on page 1362](#)

## KDS\_X\_HUB\_BKUP1\_TCP\_HOST

This parameter specifies the TCP/IP host name or IP address of the non-z/OS backup hub TEMS that the z/OS remote TEMS connects to if the primary hub TEMS is unavailable.

**Description**

This parameter is used for configuring the z/OS remote TEMS to participate in a *hot standby* configuration with a non-z/OS (distributed) hub TEMS that has been enabled for Fault Tolerant Option (FTO). Specify the TCP/IP host name or IP address where the non-z/OS backup (standby) hub TEMS is running.

This parameter is required if you plan to have the z/OS remote TEMS communicate with the non-z/OS backup hub TEMS using TCP/IP. An IP-related protocol must be enabled.

**Default value**

None

**Permissible values**

Character string, maximum length 32

**Related parameters**

- **KDS\_HUB\_\*** parameters (values for the primary hub TEMS that the z/OS remote TEMS reports to)

## KDS\_X\_HUB\_BKUP1\_TEMS\_VTAM\_NETID

This parameter specifies the identifier of your VTAM network.

**Required or optional**

Required only if you plan to have the Remote TEMS communicate with the backup Hub TEMS using VTAM

**Location where the parameter value is stored**

In the VTAMLST startup member, ATCSTRnn for the backup Hub monitoring server

**Parameter name and syntax**

SNA.PIPE:&XDSBNETD

**Default value**

No default

**Permissible values**

A string of up to 8 characters

**PARMGEN name**

KDS\_X\_HUB\_BKUP1\_TEMS\_VTAM\_NETID

**Description**

TEMS backup Sever Network ID

This parameter specifies the identifier of your VTAM network. You can locate this value on the NETID parameter within the VTAMLST startup member, ATCSTRnn. This is a required field if you plan to have the Remote TEMS communicate with the backup Hub TEMS using VTAM.

**Related parameters**

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_HUB\_BKUP1\_VTAM\_APPL\_GLBBKR

This parameter identifies the global location broker that is to be used for VTAM communication to the backup monitoring server.

### Required or optional

Required if the remote TEMS needs to communicate with the backup Hub TEMS using the VTAM protocol

### Location where the parameter value is stored

The KDCSSITE member of the RKANPARU library.

### Parameter name and syntax

SNA.PIPE:

### Default value

No default

### Permissible values

A character string of up to 8 characters

### PARMGEN name

KDS\_X\_HUB\_BKUP1\_VTAM\_APPL\_GLBBKR

### Description

TEMS backup VTAM applid for the global location broker.

This parameter identifies the global location broker that is to be used for VTAM communication to the backup monitoring server. This is a required field if the remote TEMS needs to communicate with the backup Hub TEMS using the VTAM protocol.

### Related parameters

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_HUB\_CMS\_FTO\_FLAG

This is the Hot Standby flag if the z/OS Remote TEMS will participate in Hot Standby configuration between distributed Hub TEMS enabled for FTO (Fault Tolerant Option).

### Required or optional

Optional

### Location where the parameter value is stored

The KDSENV member of the xKANPARU library.

### Parameter name and syntax

CMS\_FTO=&XDSBFTO

### Default value

No

### Permissible values

YES, NO

### PARMGEN name

KDS\_X\_HUB\_CMS\_FTO\_FLAG

### Description

This parameter is applicable to a z/OS Remote TEMS based on these scenarios:

- z/OS Remote TEMS connecting to a non-z/OS Hub TEMS with the Hot Standby (FTO) feature enabled.
- z/OS Remote TEMS connecting to a z/OS High Availability (HA) Hub TEMS (Primary TEMS) and a z/OS HA Hub TEMS (Standby TEMS).

If KDS\_X\_HUB\_CMS\_FTO\_FLAG is enabled to "YES" value, it generates CMS\_FTO=YES value in the xKANPARU(KDSENV) TEMS runtime member.

### Related parameters

## KDS\_X\_KDCFC\_RXLIMIT

This parameter defines the size (in KB) of the buffer used for return queries.

### Required or optional

Required

### Location where the parameter value is stored

KDSENV member of the *rhilev.rte*.RKANPARU library for the runtime environment of the hub monitoring server.

### Parameter name and syntax

KDCFC\_RXLIMIT=8192

### Default value

8192

### Permissible values

1024–65536

### PARMGEN name

KDS\_X\_KDCFC\_RXLIMIT

### Description

RPC request size

This parameter defines the size (in KB) of the buffer used for return queries.

### Related parameters

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_KDE\_TRANSPORT\_GBL\_OPTIONS

This parameter allows you to limit connections to a specific range of port numbers.

### Description

This parameter specifies a range of pool numbers. After the port allocation algorithm assigns a well-known port to each process, all subsequent ports that are allocated for connections between components are opaque ports; that is, any available port can be allocated for a connection. You can limit opaque port allocations to a specific range of ports by using this parameter for Tivoli Enterprise Monitoring Server (TEMS).

You can use the POOL option, as described in [“Using the POOL option to set a range of port numbers” on page 152](#), with this parameter too.

### Required or optional

Optional

### Default value

None

### Permissible values

The POOL option must specify a range of ports no smaller than 2 and no larger than 1024 in the format *nnnn-nnnn*.

### Example:

POOL:1000-2023 is valid; POOL:1000-2024 is not.

If more than 1024 ports are needed in a pool for a specific protocol, you can specify more than one POOL option, as in POOL:1000-2023 POOL:3000-4023.

#### Related parameters

- [“KDS\\_X\\_KDE\\_TRANSPORT\\_POOL\\_OPTIONS” on page 1425](#)
- [“Kpp\\_X\\_KDE\\_TRANSPORT\\_GBL\\_OPTIONS” on page 1309](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_KDE\_TRANSPORT\_HTTP\_OPTIONS

This parameter redefines the ports to be used by the HTTP and HTTPS daemons.

#### Description

This parameter redefines the ports to be used by the HTTP and HTTPS daemons. A portal server on Windows, Linux, or UNIX uses port 1920 for HTTP connections and 3661 for HTTPS connections from portal browser clients.

Default port settings should not be changed, especially on multifunction UNIX and Linux systems, since many components might be located on the same system and some of these components might depend on the default values being used for HTTP and HTTPS ports.

The following special settings are supported:

#### HTTPS:0

This setting eliminates error messages when the HTTPS daemon server is active and failing to obtain or bind to family ip.ssl (ip.ssl.https:3661).

#### HTTP:0, HTTPS:0

These settings disable port allocation and port bind errors for the HTTP (1920) and HTTPS (3661) default ports.

#### HTTP\_SERVER:n

This variable keyword disables HTTP and HTTPS daemon services. Do not specify this for a hub monitoring server or for the portal server.

#### HTTP\_CONSOLE:n

This variable keyword disables the TMS/Service Console facility of the HTTP daemon service.

#### HTTP\_CONSOLE:N

This variable keyword removes the process from the published Tivoli service index; this makes the process inaccessible from the TMS/Service Console.

#### Required or optional

Optional

#### Default value

None

#### Related parameters

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_KDE\_TRANSPORT\_OPTIONS

This parameter allows you to specify various options for Tivoli Enterprise Monitoring Server (TEMS).

#### Description

With this parameter you can specify various options for TEMS, in addition to HTTP-related and POOL-related options.

For example, you can specify the [SKIP and COUNT options](#) to control the way port numbers are assigned to components.

See [“KDS\\_X\\_KDE\\_TRANSPORT\\_HTTP\\_OPTIONS” on page 1424](#) for HTTP-related options and [“KDS\\_X\\_KDE\\_TRANSPORT\\_POOL\\_OPTIONS” on page 1425](#) for POOL-related options.

**Required or optional**

Optional

**Default value**

None

**Permissible values**

A string of up to 50 characters

**Related parameters**

- [“KDS\\_X\\_KDE\\_TRANSPORT\\_HTTP\\_OPTIONS” on page 1424](#)
- [“KDS\\_X\\_KDE\\_TRANSPORT\\_POOL\\_OPTIONS” on page 1425](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

**KDS\_X\_KDE\_TRANSPORT\_POOL\_OPTIONS**

This parameter allows you to limit connections to a specific range of port numbers.

**Description**

This parameter specifies a range of pool numbers.

After the port allocation algorithm assigns a well-known port to each process, all subsequent ports allocated for connections between components are opaque ports; that is, any available port can be allocated for a connection. You can limit opaque port allocations to a specific range of ports by using this parameter for Tivoli Enterprise Monitoring Server (TEMS).

With this parameter, you can use the POOL option, as described in [“Using the POOL option to set a range of port numbers” on page 152](#).

**Required or optional**

Optional

**Default value**

None

**Permissible values**

The POOL option must specify a range of ports no smaller than 2 and no larger than 1024 in the format *nnnn-nnnn*.

**Example:**

POOL:1000-2023 is valid; POOL:1000-2024 is not.

If more than 1024 ports are needed in a pool for a specific protocol, you can specify more than one POOL option, as in POOL:1000-2023 POOL:3000-4023.

**Related parameters**

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

**KDS\_X\_STC\_SYSTCPD\_INCLUDE\_FLAG**

This parameter is used to specify whether to include the SYSTCPD DD statement in the monitoring server started task.

**Required or optional**

Required

**Location where the parameter value is stored**

N/A

**Parameter name and syntax**

N/A

**Default value**

Y

**Permissible values**

Y or N

**PARMGEN name**

KDS\_X\_STC\_SYSTCPD\_INCLUDE\_FLAG

**Description**

This flag is for the SYSTCPD DD: TCPDATA override. Override this DD card to explicitly identify which dataset to use to obtain the parameters defined by TCPIP.DATA when no GLOBALTCPDATA statement is configured. Refer to the *IBM z/OS Communications Server: IP Configuration Guide* for information on the TCPIP.DATA search order. TCPIP.SEZAINST(TCPDATA) is the default sample file. TCPIP.TCPPARMS(TCPDATA) is another sample and is created as part of the Installation Verification Program (IVP) for TCP/IP. To customize this value in PARMGEN mode, override this parameter in the CONFIG profile member in WCONFIG (\$CFG\$USR or the user-specified) prior to running the \$PARSE job and specify the GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA library accordingly.

**Related parameters**

- [“GBL\\_DSN\\_TCP\\_SYSTCPD\\_TCPDATA” on page 1327](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS\_CONFIRM\_SHUTDOWN

This parameter specifies the maximum number of seconds between two successive SHUTDOWN commands or MVS™ STOP (P) commands to terminate the monitoring server address space.

**Required or optional**

Required

**Location where the parameter value is stored**

KDSSYSIN member of the *rhilev.rte*.RKANPARU library for the runtime environment of the monitoring server

**Parameter name and syntax**

CONFIRM(*n*)

**Default value**

- Default for PARMGEN: CONFIRM(0)
- Default in TMS:Engine: CONFIRM(15)

**Permissible values**

0 - 2000000000

**PARMGEN name**

KDS\_X\_TEMS\_CONFIRM\_SHUTDOWN

**Description**

Maximum number of seconds between two successive SHUTDOWN commands or MVS™ STOP (P) commands to terminate the monitoring server address space. CONFIRM(0) allows shutdown to begin immediately, without an additional, confirming SHUTDOWN command. CONFIRM(*n*), where *n* is a number greater than zero, prevents accidental shutdowns by requiring confirmation of the command by entering it a second time within the specified number of seconds. For example, the value 15 requires that the SHUTDOWN command be entered twice within 15 seconds to terminate the monitoring server address space.

**Related parameters**

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS\_DEBUG\_TRACE

This parameter determines whether to activate TMS:Engine debugging services.

**Required or optional**

Optional

### Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte.RKANPARU* library for the runtime environment of the monitoring server

### Parameter name and syntax

DEBUG(N|Y)

### Default value

DEBUG(N)

### Permissible values

DEBUG(N) or DEBUG(Y)

### PARMGEN name

KDS\_X\_TEMS\_DEBUG\_TRACE

### Description

Determines whether to activate TMS:Engine debugging services. A setting of Y automatically turns on the internal trace with the default number of entries (1024), resulting in an increase in CPU use, storage use, and number of messages issued. The amount of increase depends on the activity in the Tivoli Enterprise Monitoring Server address space.

The setting for this parameter and the setting for the [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#) parameter interact.

- If the [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#) parameter is included (not commented out and not deleted), the [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) parameter must precede it. Otherwise, [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) overrides [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#).
- If the [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#) parameter is commented out or omitted, and the setting for [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) is Y, basic storage debugging is turned on, causing an increase in storage use.
- If the setting for the [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#) parameter is N, and the setting for [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) is Y, no storage debugging is performed.
- If the setting for the [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#) parameter is Y or X, and the setting for [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) is N, storage debugging is performed, but no other debugging is performed.

### Related parameters

- [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS\_EIF\_BUFFEREVENTS

This parameter determines whether event buffering is enabled.

### Description

This parameter determines whether event buffering is enabled. A value of YES stores events in the library specified by the [“KDS\\_X\\_TEMS\\_EIF\\_BUFVTPATH” on page 1428](#) parameter. A value of NO does not store or buffer events.

### Default value

YES

### Permissible values

YES, NO

### Related parameters

- [“KDS\\_X\\_TEMS\\_EIF\\_BUFVTPATH” on page 1428](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS{EIF\_BUFEVTPATH

This parameter contains the path name of the adapter cache file.

### Description

Specify the path name of the adapter cache file. The format is similar to a data set name that is limited to 5 levels with no more than 8 characters per level, separated by periods (for example, LEVEL001.LEVEL002.LEVEL003.LEVEL004.LEVEL005).

### Default value

./TECLIB/om\_tec.cache

### Permissible values

Character string, maximum length 44

### Related parameters

- [“KDS\\_X\\_TEMS{EIF\\_BUFFEREVENTS” on page 1427](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS{EIF\_FILTER\_ATTR1

This parameter contains the name of a filter attribute.

### Description

Specify a filter attribute for the class. An event matches a filter statement when each attribute=value pair in the filter statement is identical to the corresponding attribute=value pair in the event. A filter statement must contain the event class, and optionally can include any other attribute=value pair that is defined for the event class.

The format of a filtering statement is as follows:

```
Filter:Class=class_name;attribute=value;..;attribute=value
```

Each statement must be on a single line. The attribute=value pair is case-sensitive.

### Default value

master\_reset\_flag=''

### Permissible values

Character string, maximum length 27

### Related parameters

- [“KDS\\_X\\_TEMS{EIF\\_FILTER\\_CLASS1” on page 1428](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS{EIF\_FILTER\_CLASS1

This parameter contains the name of the event class for a filter.

### Description

Specify the event class for the filter. A filter statement must contain the event class.

The format of a filter statement is as follows:

```
Filter:Class=class_name;attribute=value;..;attribute=value
```

Each statement must be on a single line.

### Default value

ITM\_Generic

### Permissible values

Character string, maximum length 27

### Related parameters

- “KDS\_X\_TEMS\_EIF\_FILTER\_ATTR1” on page 1428
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS\_EIF\_FILTERMODE

This parameter determines whether events that match a Filter or FilterCache statement are sent to the event server (`FilterMode=IN`) or discarded (`FilterMode=OUT`).

### Required or optional

Optional

### Location where the parameter value is stored

KMSOMTEC member of the *rhilev.rte*.RKANPARU library for the runtime environment of the Tivoli Enterprise Monitoring Server

#### Parameter name

FilterMode

#### Default value

OUT

#### Permissible values

IN or OUT

### Batch parameter name

KDS\_CMS\_EIF\_FLT\_MODE

### PARMGEN name

KDS\_X\_TEMS\_EIF\_FILTERMODE

### Description

Determines whether events that match a Filter or FilterCache statement are sent to the event server (`FilterMode=IN`) or discarded (`FilterMode=OUT`). If you set `FilterMode=IN`, you must have one or more Filter and FilterCache statements defined.

### Related parameters

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS\_FRAME\_STACK\_SIZE

This parameter defines the size (in bytes) of the initial save area stack that TMS:Engine allocates for each of its tasks.

### Required or optional

Required

### Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte*.RKANPARU library for the runtime environment of the monitoring server

#### Parameter name and syntax

FRAME(*n*)

#### Default value

- Default for PARMGEN: FRAME(1025)
- Default in TMS:Engine: FRAME(512)

#### Permissible values

Do not change the value from the default except under the guidance of IBM® Software Support.

### PARMGEN name

KDS\_X\_TEMS\_FRAME\_STACK\_SIZE

**Description**

Size (in bytes) of the initial save area stack that TMS:Engine allocates for each of its tasks.

**Related parameters**

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

**KDS\_X\_TEMS\_KDSSTRT1\_DELAY\_INT**

This parameter controls the delay before the Tivoli Enterprise Monitoring Server issues the IRAMAN commands included in the `xKANCMDU(KDSSTRT1)` member after it starts up.

**Description**

This parameter is used to control the amount of time the monitoring server delays before issuing the startup commands for agents, including the OMEGAMON enhanced 3270 user interface Data Retrieval Agent (DRA), that are included in the `xKANCMDU(KDSSTRT1)` member. The following KDSSTART command is issued based on the delay you specify:

```
"AT ADD ID=DELAYAPP DELAY=&seconds CMD='KDSSTRT1' "
```

**Default value**

180 seconds

**Permissible values**

Number, maximum length 5

**Related parameters**

- **KDS\_HUB\_\*** parameters (values for the primary hub TEMS that the z/OS remote TEMS reports to)

**KDS\_X\_TEMS\_LGSA\_VERIFY**

This parameter determines whether TMS:Engine checks that the \$GSA address is available.

**Required or optional**

Required

**Location where the parameter value is stored**

KDSSYSIN member of the *rhilev.rte.RKANPARU* library for the runtime environment of the monitoring server

**Parameter name and syntax**

LGSA(Y|N)

**Default value**

LGSA(Y)

**Permissible values**

Do not change the value from the default except under the guidance of IBM® Software Support.

**PARMGEN name**

KDS\_X\_TEMS\_LGSA\_VERIFY

**Description**

Determines whether TMS:Engine checks that the \$GSA address is available.

**Related parameters**

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

**KDS\_X\_TEMS\_LOGBLOCK\_RKLVLOG\_SIZE**

This parameter defines the block size, in bytes, of the RKLVLOG file.

**Required or optional**

Required

### Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte*.RKANPARU library for the runtime environment of the monitoring server

#### Parameter name and syntax

LOGBLOCK(*n*)

#### Default value

- Default for PARMGEN: LOGBLOCK(12480)
- Default in TMS:Engine: LOGBLOCK(3120)

#### Permissible values

Do not change the value from the default except under the guidance of IBM® Software Support.

### PARMGEN name

KDS\_X\_TEMS\_LOGBLOCK\_RKLVLOG\_SIZE

### Description

Block size, in bytes, of the RKLVLOG file.

### Related parameters

- [“KDS\\_X\\_TEMS\\_LOGBUFS\\_RKLVLOG\\_BUFSZ” on page 1431](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS\_LOGBUFS\_RKLVLOG\_BUFSZ

This parameter defines the number of buffers to allocate for the RKLVLOG file.

### Required or optional

Required

### Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte*.RKANPARU library for the runtime environment of the monitoring server

#### Parameter name and syntax

LOGBUFS(*n*)

#### Default value

- Default for PARMGEN: LOGBUFS(5)
- Default in TMS:Engine: LOGBUFS(2)

#### Permissible values

Do not change the value from the default except under the guidance of IBM® Software Support.

### PARMGEN name

KDS\_X\_TEMS\_LOGBUFS\_RKLVLOG\_BUFSZ

### Description

Number of buffers to allocate for the RKLVLOG file. If the value of LOGBUFS is too small and extensive logging is performed (for example, during debugging), excessive physical I/O can increase response time. If the value of LOGBUFS is too large, storage shortages can occur.

### Related parameters

- [“KDS\\_X\\_TEMS\\_LOGBLOCK\\_RKLVLOG\\_SIZE” on page 1430](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS\_LSRPOOL\_BUFFER\_NUM*n*

This parameter specifies the number of virtual storage buffers, of the size specified in the KDS\_X\_TEMS\_LSRPOOL\_BUFSIZE*n* parameter, to be allocated for buffer pool *n* in the VSAM resource pool.

## Required or optional

Required

## Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte*.RKANPARU library for the runtime environment of the monitoring server

## Parameter name and syntax

LSRPOOL(*size, number*)

## Default value

- Default for PARMGEN: See the example in the Description section.
- Default in TMS:Engine: No default value, but starting TMS:Engine requires at least one LSRPOOL parameter.

## Permissible values

3 - 65535 (to the maximum amount of available virtual storage in the monitoring server address space)

## PARMGEN name

KDS\_X\_TEMMS\_LSRPOOL\_BUFFER\_NUM*n*

## Description

Number of virtual storage buffers, of the size specified in the KDS\_X\_TEMMS\_LSRPOOL\_BUFSIZE*n* parameter, to be allocated for buffer pool *n* in the VSAM resource pool. You must specify a number for each buffer pool individually; you cannot string the definitions together.

Example:

```
KDS_X_TEMMS_LSRPOOL_BUFSIZE1      32768
KDS_X_TEMMS_LSRPOOL_BUFFER_NUM1    12
KDS_X_TEMMS_LSRPOOL_BUFSIZE2      8192
KDS_X_TEMMS_LSRPOOL_BUFFER_NUM2    21
KDS_X_TEMMS_LSRPOOL_BUFSIZE3      4096
KDS_X_TEMMS_LSRPOOL_BUFFER_NUM3    400
KDS_X_TEMMS_LSRPOOL_BUFSIZE4      1024
KDS_X_TEMMS_LSRPOOL_BUFFER_NUM4     6
```

If you receive KLVVS026 messages identifying buffer contention, increase the number of buffers allocated to the data set identified in the associated KLVVS021 messages.

## Related parameters

- [“KDS\\_X\\_TEMMS\\_LSRPOOL\\_BUFSIZE\*n\*” on page 1432](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMMS that the z/OS Remote TEMMS reports to)

## KDS\_X\_TEMMS\_LSRPOOL\_BUFSIZE*n*

This parameter specifies the size (in bytes) of each virtual storage buffer in buffer pool *n* in the VSAM resource pool.

## Required or optional

Required

## Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte*.RKANPARU library for the runtime environment of the monitoring server

## Parameter name and syntax

LSRPOOL(*size, number*)

## Default value

- Default for the Configuration Manager and PARMGEN: See the example in the Description section.
- Default in TMS:Engine: No default value, but starting TMS:Engine requires at least one LSRPOOL parameter.

## Permissible values

512, 1024, 2048, 4096, 8192, 12288, 16384, 20480, 24576, 28672, or 32768

### PARMGEN name

KDS\_X\_TEMS\_LSRPOOL\_BUFSIZE $n$

### Description

Size (in bytes) of each virtual storage buffer in buffer pool  $n$  in the VSAM resource pool. You must specify a size for each buffer pool individually; you cannot string the definitions together.

Example:

```
KDS_X_TEMS_LSRPOOL_BUFSIZE1      32768
KDS_X_TEMS_LSRPOOL_BUFFER_NUM1    12
KDS_X_TEMS_LSRPOOL_BUFSIZE2      8192
KDS_X_TEMS_LSRPOOL_BUFFER_NUM2    21
KDS_X_TEMS_LSRPOOL_BUFSIZE3      4096
KDS_X_TEMS_LSRPOOL_BUFFER_NUM3    400
KDS_X_TEMS_LSRPOOL_BUFSIZE4      1024
KDS_X_TEMS_LSRPOOL_BUFFER_NUM4    6
```

### Related parameters

- [“KDS\\_X\\_TEMS\\_LSRPOOL\\_BUFFER\\_NUM \$n\$ ” on page 1431](#)
- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS\_LSRSTRNO\_CONCURRENT

This parameter specifies the maximum number of concurrent VSAM requests that TMS:Engine can process against all the VSAM data sets allocated to it.

### Required or optional

Required

### Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte*.RKANPARU library for the runtime environment of the monitoring server

### Parameter name and syntax

LSRSTRNO( $n$ )

### Default value

- Default for the Configuration Manager and PARMGEN: LSTSTRNO(255)
- Default in TMS:Engine: LSTSTRNO(32)

### Permissible values

3 - 255

### PARMGEN name

KDS\_X\_TEMS\_LSRSTRNO\_CONCURRENT

### Description

Maximum number of concurrent VSAM requests that TMS:Engine can process against all the VSAM data sets allocated to it.

If you receive KLVVS026 messages identifying string contention and if the LSRSTRNO value is less than 255, increase the value.

### Related parameters

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS\_SDUMP\_SVC\_SYS1\_DUMP

This parameter determines whether SVC dumps are generated.

### Required or optional

Required

### Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte.RKANPARU* library for the runtime environment of the monitoring server

**Parameter name and syntax**

SDUMP(Y|N)

**Default value**

SDUMP(Y) if the TMS:Engine job step is APF-authorized; SDUMP(N) otherwise.

**Permissible values**

Y, N, S, or M (see Description)

**PARMGEN name**

KDS\_X\_TEMS\_SDUMP\_SVC\_SYS1\_DUMP

**Description**

Determines whether SVC dumps are generated.

- Y directs SVC dumps to a system dump data set (SYS1.DUMPxx). Before you specify Y as the value of this parameter, ensure that the TMS:Engine job step is APF-authorized and that the SYS1.DUMPxx data sets are large enough to hold the contents of the TMS:Engine address space.
- N directs formatted dumps to the RKLVSnap data set. Avoid formatted dumps if possible, because they disable the TMS:Engine address space for a longer time than either SVC dumps or SYSMDUMPs, and are more difficult to analyze.
- S directs summary dumps to the RKLVSnap data set. A summary dump consists of an ABEND summary and a dispatcher summary, and does not provide enough information for reliable problem analysis. Use this setting for specific testing purposes only.
- M directs ABEND dumps to a data set with the SYSMDUMP DD name. This type of dump is not formatted by the operating system and must be analyzed with IPCS. Only the first dump taken is captured in the SYSMDUMP data set unless the JCL specifies DISP=MOD. TMS:Engine automatically initializes the SYSMDUMP data set with an end-of-file mark.

**Related parameters**

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

**KDS\_X\_TEMS\_STORAGE\_RESERVE\_PRI**

This parameter specifies the number of kilobytes of primary (below-the-line) storage to set aside for other routines (for example, RACF®) that might perform their own GETMAINS in the monitoring server address space.

**Required or optional**

Required

**Location where the parameter value is stored**

KDSSYSIN member of the *rhilev.rte.RKANPARU* library for the runtime environment of the monitoring server

**Parameter name**

RESERVE(n,P)

**Default value**

- Default for the Configuration Manager and PARMGEN:
  - High-availability hub: RESERVE(4096,P)
  - Other monitoring servers: RESERVE(2048,P)
- Default in TMS:Engine: RESERVE(512,P)

**Permissible values**

See Description.

**PARMGEN name**

KDS\_X\_TEMS\_STORAGE\_RESERVE\_PRI

**Description**

The number of kilobytes of primary (below-the-line) storage to set aside for other routines (for example, RACF®) that might perform their own GETMAINS in the monitoring server address space. If your RESERVE value is too small, you might encounter IST566I messages from VTAM® or S80A, S878, S066, S40D, or S0F9 abends.

#### Related parameters

## KDS\_X\_TEMS\_STORAGE\_STGDEBUG

This parameter determines whether to disable (N) TMS:Engine storage debugging services, or to activate basic (Y) or extended (X) storage debugging services.

#### Required or optional

Optional

#### Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte*.RKANPARU library for the runtime environment of the monitoring server

#### Parameter name and syntax

STGDEBUG(N|Y|X)

#### Default value

STGDEBUG(N)

#### Permissible values

STGDEBUG(N), STGDEBUG(Y), or STGDEBUG(X)

#### PARMGEN name

KDS\_X\_TEMS\_STORAGE\_STGDEBUG

#### Description

Determines whether to disable (N) TMS:Engine storage debugging services, or to activate basic (Y) or extended (X) storage debugging services. A setting of Y or X increases storage use; X causes a larger increase than Y.

The setting for this parameter and the setting for the [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) parameter interact.

- If the [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#) parameter is included (not commented out and not deleted), the [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) parameter must precede it. Otherwise, [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) overrides [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#).
- The default setting for the [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#) parameter is N if the [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) parameter is commented out or omitted, or if the value of the [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) parameter is N; and Y if the value of [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) is Y.
- If the [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#) parameter is commented out or omitted, and the setting for [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) is Y, basic storage debugging is turned on, causing an increase in storage use.
- If the setting for the [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#) parameter is N, and the setting for [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) is Y, no storage debugging is performed.
- If the setting for the [“KDS\\_X\\_TEMS\\_STORAGE\\_STGDEBUG” on page 1435](#) parameter is Y or X, and the setting for [“KDS\\_X\\_TEMS\\_DEBUG\\_TRACE” on page 1426](#) is N, storage debugging is performed, but no other debugging is performed.

#### Related parameters

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS\_TASKS\_ATTACHED\_NUM

This parameter specifies the number of general-purpose subtasks to be attached in the monitoring server address space.

### Required or optional

Required

### Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte.RKANPARU* library for the runtime environment of the monitoring server

### Parameter name and syntax

TASKS(*n*)

### Default value

The number of available processors.

### Permissible values

Do not change the value from the default except under the guidance of IBM® Software Support.

### PARMGEN name

KDS\_X\_TEMS\_TASKS\_ATTACHED\_NUM

### Description

Number of general-purpose subtasks to be attached in the monitoring server address space. If the monitoring server is running on a multiprocessor, the TASKS default increases both throughput and CPU usage.

### Related parameters

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## KDS\_X\_TEMS\_WTO

This parameter determines whether the monitoring server address space issues Write To Operator (WTO) messages.

### Required or optional

Required

### Location where the parameter value is stored

KDSSYSIN member of the *rhilev.rte.RKANPARU* library for the runtime environment of the monitoring server

### Parameter name and syntax

WTO(Y|N)

### Default value

WTO(N)

### Permissible values

Y or N

### PARMGEN name

KDS\_X\_TEMS\_WTO

### Description

Determines whether the monitoring server address space issues Write To Operator (WTO) messages. WTOs write information and exception condition messages to the operator consoles. Alert messages are always written to the consoles.

### Related parameters

- **KDS\_HUB\_\*** parameters (values for the Primary HUB TEMS that the z/OS Remote TEMS reports to)

## Enhanced 3270 user interface parameters

The OMEGAMON enhanced 3270 user interface has its own set of common configuration parameters, each of which begins with "KOB".

The KOB parameters are related to the following parameters, described elsewhere in this reference:

- [“KDS\\_TEMS\\_DRA\\_FLAG” on page 1397](#)
- [“RTE\\_SECURITY\\_CLASS” on page 286](#)

### KOB\_MT\_ENABLE

This parameter is used to enable multi-tenancy mode in the enhanced 3270 user interface.

#### Description

This parameter controls if multi-tenancy mode is enabled in the enhanced 3270 user interface. Set this parameter to Y to enable multi-tenancy mode.

This parameter sets the value of the **MULTI** parameter in the job step of the started task JCL for the enhanced 3270 user interface.

#### Required or optional

Optional

#### Default value

N

#### Permissible values

Y, N

### KOB\_TIMEOUT

This parameter controls the OMEGAMON enhanced 3270 user interface user session timeout value.

#### Description

This parameter controls the maximum number of minutes that a user session of the OMEGAMON enhanced 3270 user interface can be idle before the session is canceled.

The timeout value is in minutes, and 0 indicates that the session will not be timed out.

#### Required or optional

Optional

#### Default value

0

#### Minimum

0

#### Maximum

999

### KOB\_TOM\_STC

This parameter is the name of the started task for the OMEGAMON enhanced 3270 user interface.

#### Required or optional

Required if you configure the OMEGAMON enhanced 3270 user interface component.

#### Location where the parameter value is stored

Value becomes the name of the started task procedure member in the *rhilev.rtename*.RKANSAMU library.

#### Parameter name and syntax

N/A

**Default value**

IBMTOM

**Permissible values**

Character string, maximum length 8.

**PARMGEN name**

KOB\_TOM\_STC

**Description**

This parameter is the name of the started task that starts the OMEGAMON enhanced 3270 user interface's Tivoli OMEGAMON Manager (TOM). The default in PARMGEN is IBMTOM.

**Related parameters**

- [“KDS\\_TEMS\\_DRA\\_FLAG” on page 1397](#)
- [“RTE\\_SECURITY\\_CLASS” on page 286](#)
- [“KOB\\_TOM\\_VTAM\\_APPL\\_LOGON” on page 1438](#)
- [“KOB\\_TOM\\_VTAM\\_NODE” on page 1439](#)

## KOB\_TOM\_VTAM\_APPL\_LOGON

This parameter specifies the name that will be used to build the VTAM logon APPLID for the OMEGAMON enhanced 3270 user interface's Tivoli OMEGAMON Manager (CTDOBN).

**Required or optional**

Required if you configure the OMEGAMON enhanced 3270 user interface component.

**Location where the parameter value is stored**

Value is included in the VTAM major node member in the *rhilev.rtename*.RKANSAMU library or in the RTE\_VTAM\_GBL\_MAJOR\_NODE member in RKANSAMU.

**Parameter name and syntax**

N/A

**Default value**

CTDOBAP

**Permissible values**

Character string, maximum length 8.

**PARMGEN name**

KOB\_TOM\_VTAM\_APPL\_LOGON

**Description**

This parameter specifies the VTAM logon APPLID for the OMEGAMON enhanced 3270 user interface address space.

**Note:** If you use the global VTAM major node member specified on the RTE\_VTAM\_GBL\_MAJOR\_NODE parameter, the VTAM APPLID associated with CTDOBN is automatically included in the RTE\_VTAM\_GBL\_MAJOR\_NODE member in RKANSAMU.

**Related parameters**

- [“KDS\\_TEMS\\_DRA\\_FLAG” on page 1397](#)
- [“RTE\\_SECURITY\\_CLASS” on page 286](#)
- [“RTE\\_VTAM\\_GBL\\_MAJOR\\_NODE” on page 1362](#)
- [“KOB\\_TOM\\_STC” on page 1437](#)

- [“KOB\\_TOM\\_VTAM\\_NODE” on page 1439](#)

## KOB\_TOM\_VTAM\_NODE

This parameter specifies the name used to build the VTAM node entry for the OMEGAMON enhanced 3270 user interface.

### Required or optional

Required if you configure the OMEGAMON enhanced 3270 user interface component.

### Location where the parameter value is stored

Value specified becomes the name of the TOM VTAM major node member in the *rhilev.rtename*.RKANSAMU library.

### Parameter name and syntax

N/A

### Default value

CTDOBN

### Permissible values

Character string, maximum length 8.

### PARMGEN name

KOB\_TOM\_VTAM\_NODE

### Description

This parameter specifies the name used to build the VTAM node entry for the OMEGAMON enhanced 3270 user interface's Tivoli OMEGAMON Manager (CTDOBN).

**Note:** If you use the global VTAM major node member specified on the RTE\_VTAM\_GBL\_MAJOR\_NODE parameter, the VTAM APPLID associated with CTDOBN is automatically included in the RTE\_VTAM\_GBL\_MAJOR\_NODE member in RKANSAMU.

### Related parameters

- [“KDS\\_TEMS\\_DRA\\_FLAG” on page 1397](#)
- [“RTE\\_SECURITY\\_CLASS” on page 286](#)
- [“RTE\\_VTAM\\_GBL\\_MAJOR\\_NODE” on page 1362](#)
- [“KOB\\_TOM\\_STC” on page 1437](#)
- [“KOB\\_TOM\\_VTAM\\_APPL\\_LOGON” on page 1438](#)

## Enhanced 3270 user interface override embed parameters

In addition to standard parameters, the enhanced 3270 user interface also uses override embed parameters.

OMEGAMON enhanced 3270 user interface override embed parameters are located in the EMBEDS (KOB\$PENV) member (Configuration Manager) or the WCONFIG (KOB\$PENV) member (PARMGEN). You must follow a standard override embed procedure to ensure the parameters are set properly in RKANPARU (KOBENV).

### Using Configuration Manager

For information about using override embed parameters in Configuration Manager, see the following topics:

- [“Using override embed members in Configuration Manager” on page 337](#)
  - [“Enable override embed members when creating an RTE” on page 338](#)
  - [“Enable override embed members for an existing RTE” on page 339](#)
  - [“Update override embed members for an existing RTE after maintenance” on page 340](#)

## Using PARMGEN

Perform the steps in the following procedures, as appropriate:

- For an existing runtime environment (RTE):
    - a. Edit `%RTE_PLIB_HILEV%.%RTE_NAME%.WCONFIG(&imbed_name)` referenced by the enabling product PTF or new product version. Modify the parameter accordingly before rerunning the `WCONFIG($PARSE)` job.
- Note:** The new default parameter is typically introduced in a PARMGEN APAR maintenance. For existing runtime environments created before the PARMGEN APAR that introduced the new parameter, the `WCONFIG(&imbed_name)` already exists. To enable the function, add the new override parameter to `WCONFIG(&imbed_name)`.
- b. Submit `WCONFIG($PARSEPR)` job to recreate the RTE's `%RTE_PLIB_HILEV%.%RTE_NAME%.WKANPARU(&runtime_member)` where the `&imbed_name` is imbedded.
    - c. Submit `WKANSAMU(KCIJPW2R)` job to refresh the `&runtime_member` from the PARMGEN work data set (`WKANPARU`, for example) to the corresponding product execution user library (`RKANPARU`, for example) when you are ready to stage your runtime member updates.
    - d. Recycle the product started task.
    - e. Repeat step 1 to step 4 for additional RTEs that will enable the function.
  - For a new runtime environment (RTE):
    - a. Follow the preferred RTE Implementation Scenario documented in [Implementation scenarios](#).
    - b. As part of the "Customizing the configuration profiles" step, edit `%RTE_PLIB_HILEV%.%RTE_NAME%.WCONFIG(&imbed_name)` that will override the `WKANPARU(&runtime_member)`. Modify the parameter accordingly before rerunning the `WCONFIG($PARSE)` job.
    - c. Complete the remaining steps as documented in the RTE Implementation Scenario.

For more information about using embed members in PARMGEN, see ["Override embed members" on page 417](#) and [Customizing the override embed members](#)

## FFDC\_DDNAME

This override embed parameter specifies the DD name of the data set containing the First-Failure Data Capture error code definitions.

### Description

This parameter specifies the DD name of the data set containing the First-Failure Data Capture (FFDC) repository of error code definitions. FFDC is a feature in the OMEGAMON enhanced 3270 user interface.

This parameter is in the `EMBEDS(KOB$PENV)` member (Configuration Manager) or the `WCONFIG(KOB$PENV)` member (PARMGEN). You must follow a standard override embed procedure to ensure the parameter is set properly in `RKANPARU(KOBENV)`.

### Default value

`RKOBPROF` (uses the `UKOBDATF` data set)

## FFDC\_ERROR\_CODES

This override embed parameter specifies the name of the member containing the First-Failure Data Capture error code definitions.

### Description

This parameter specifies the name of the member containing the First-Failure Data Capture (FFDC) repository for error code definitions. FFDC is a feature in the OMEGAMON enhanced 3270 user interface.

This parameter is in the EMBEDS(KOB\$PENV) member (Configuration Manager) or the WCONFIG(KOB\$PENV) member (PARMGEN). You must follow a standard override embed procedure to ensure the parameter is set properly in RKANPARU(KOBENV).

**Default value**

KOBFFDC

## KOB\_DRA\_BACKLOG

This parameter specifies the maximum number of queued connections for the OMEGAMON enhanced 3270 user interface data retrieval agent (DRA). This parameter must be added to the EMBEDS(Kpp\$PENV) member (Configuration Manager) or to the WCONFIG(Kpp\$PENV) member (PARMGEN) for the agent in the DRA. You must enable the parameter after adding it in the imbed.

**Description**

This parameter controls the number of incoming connections that can be queued for acceptance for the OMEGAMON enhanced 3270 user interface DRA. The parameter value is picked up after the DRA is restarted.

**Note:** The **KOB\_DRA\_BACKLOG** parameter value can be capped by the global TCP/IP profile configuration parameter **SOMAXCONN**. If the **KOB\_DRA\_BACKLOG** value exceeds the **SOMAXCONN** value, the **SOMAXCONN** value will be used instead.

**Required or optional**

Optional

**Default value**

30

**Permissible values**

10 - 250 (integer values)

## KOB\_SAF\_ACTION\_CLASS\_NAME

This parameter specifies a specific security class name that is to be employed for authorization of Take Action commands issued from the OMEGAMON enhanced 3270 user interface. This parameter must be added to the EMBEDS(KOB\$PENV) member (Configuration Manager) or to the WCONFIG(KOB\$PENV) member (PARMGEN). You must enable the parameter after adding it in the imbed.

**Required or optional**

Optional

**Location where the parameter value is stored**

The KOBENV member of RKANPARU.

**PARMGEN name**

KOB\_SAF\_ACTION\_CLASS\_NAME

**Description**

This parameter defaults to the RTE\_SECURITY\_CLASS parameter value. This parameter should only be specified if a unique security class name is required for Take Action authorization.

**Related parameters**

- [“RTE\\_SECURITY\\_CLASS” on page 286](#)
- [“KOB\\_TOM\\_VTAM\\_APPL\\_LOGON” on page 1438](#)
- [“KOB\\_TOM\\_VTAM\\_NODE” on page 1439](#)
- [“KOB\\_SAF\\_LOGON\\_CLASS\\_NAME” on page 1442](#)
- [“KOB\\_SAF\\_QUERY\\_CLASS\\_NAME” on page 1443](#)

- [“KOB\\_SAF\\_LOGON\\_RESOURCE\\_PREFIX” on page 1443](#)

## KOB\_SAF\_APPLID

This parameter specifies the name of the optional SAF application ID for OMEGAMON enhanced 3270 user interface security.

### Description

This parameter specifies the name of the optional SAF application ID for OMEGAMON enhanced 3270 user interface security.

### Required or optional

Optional

### Location where the parameter value is stored

The KOBENV member of `rhilev.rte.RKANPARU`

### Default value

CANDLE

### Related parameters

- [RTE\\_SECURITY\\_CLASS](#)

## KOB\_SAF\_FAILURE

This parameter determines whether to echo security-related messages from the security product to the OMEGAMON enhanced 3270 user interface and SYSPRINT, as well as SYSLOG. You must use the respective configuration tool to enable (uncomment) the parameter in the EMBEDS(KOB\$PENV) member (Configuration Manager) or the WCONFIG(KOB\$PENV) member (PARMGEN).

### Description

This parameter determines whether to echo security-related messages from the security product to the OMEGAMON enhanced 3270 user interface and SYSPRINT, as well as SYSLOG.

### Permissible value

CONSOLE

## KOB\_SAF\_LOGON\_CLASS\_NAME

This parameter specifies a specific security class name that is to be employed for log-on authentication for the OMEGAMON enhanced 3270 user interface. This parameter must be added to the EMBEDS(KOB\$PENV) member (Configuration Manager) or to the WCONFIG(KOB\$PENV) member (PARMGEN). You must enable the parameter after adding it in the imbed.

### Required or optional

Optional

### Location where the parameter value is stored

The KOBENV member of `RKANPARU`.

### PARMGEN name

KOB\_SAF\_LOGON\_CLASS\_NAME

### Description

This parameter defaults to the `RTE_SECURITY_CLASS` parameter value. This parameter should only be specified if the `RTE_SECURITY_CLASS` is not being specified or a unique security class name is required for log-on authorization.

### Related parameters

- [“RTE\\_SECURITY\\_CLASS” on page 286](#)
- [“KOB\\_TOM\\_VTAM\\_APPL\\_LOGON” on page 1438](#)
- [“KOB\\_TOM\\_VTAM\\_NODE” on page 1439](#)

- KOB\_SAF\_QUERY\_CLASS\_NAME
- KOB\_SAF\_ACTION\_CLASS\_NAME
- KOB\_SAF\_LOGON\_RESOURCE\_PREFIX

## KOB\_SAF\_LOGON\_RESOURCE\_PREFIX

This parameter specifies the prefix used with the SAF resource class. This parameter must be added to the EMBEDS(KOB\$PENV) member (Configuration Manager) or to the WCONFIG(KOB\$PENV) member (PARMGEN). You must enable the parameter after adding it in the imbed.

### Required or optional

Optional

### Location where the parameter value is stored

The KOBENV member of RKANPARU.

### PARMGEN name

KOB\_SAF\_LOGON\_RESOURCE\_PREFIX

### Description

Authorization to log on to the enhanced 3270 user interface is verified by checking for access to an SAF resource named in the following pattern: KOB.LOGON.*plexname.smfid.stcname* where KOB.LOGON is the logon resource prefix. This prefix can be changed by setting this parameter to another value.

### Related parameters

- [“RTE\\_SECURITY\\_CLASS” on page 286](#)
- [“KOB\\_TOM\\_VTAM\\_APPL\\_LOGON” on page 1438](#)
- [“KOB\\_TOM\\_VTAM\\_NODE” on page 1439](#)

- [“KOB\\_SAF\\_QUERY\\_CLASS\\_NAME” on page 1443](#)
- [“KOB\\_SAF\\_ACTION\\_CLASS\\_NAME” on page 1441](#)

## KOB\_SAF\_LOGON\_TRACE

This parameter allows the OMEGAMON enhanced 3270 user interface to trace the session logon process. You must use the respective configuration tool to enable (uncomment) the parameter in the EMBEDS(KOB\$PENV) member (Configuration Manager) or the WCONFIG(KOB\$PENV) member (PARMGEN).

### Description

This parameter allows the OMEGAMON enhanced 3270 user interface to trace the session logon process, even if the logon did not succeed.

### Permissible value

YES

## KOB\_SAF\_QUERY\_CLASS\_NAME

This parameter specifies a specific security class name that is to be employed for authorization of a query (data retrieval) from the OMEGAMON enhanced 3270 user interface. This parameter must be added to the EMBEDS(KOB\$PENV) member (Configuration Manager) or to the WCONFIG(KOB\$PENV) member (PARMGEN). You must enable the parameter after adding it in the imbed.

### Required or optional

Optional

### Location where the parameter value is stored

The KOBENV member of RKANPARU.

**PARMGEN name**

KOB\_SAF\_QUERY\_CLASS\_NAME

**Description**

This parameter defaults to the RTE\_SECURITY\_CLASS parameter value. This parameter should only be specified if the RTE\_SECURITY\_CLASS is not being specified or a unique security class name is required for data retrieval authorization.

**Related parameters**

- [“RTE\\_SECURITY\\_CLASS” on page 286](#)
- [“KOB\\_TOM\\_VTAM\\_APPL\\_LOGON” on page 1438](#)
- [“KOB\\_TOM\\_VTAM\\_NODE” on page 1439](#)

- [“KOB\\_SAF\\_LOGON\\_RESOURCE\\_PREFIX” on page 1443](#)

**KOB\_SITST\_EXCLUDE\_HUBS**

This parameter is used to explicitly exclude one or more hub TEMS from periodic Situation data collection. This parameter must be added to the EMBEDS(KOB\$PENV) member (Configuration Manager) or to the WCONFIG(KOB\$PENV) member (PARMGEN). You must enable the parameter after adding it in the imbed.

**Required or optional**

Optional

**Location where the parameter value is stored**

The KOBENV member of RKANPARU.

**PARMGEN name**

KOB\_SITST\_EXCLUDE\_HUBS

**Description**

User supplies a comma-separated list of hub TEMS names (CMS\_NODEID). If both KOB\_SITST\_INCLUDE\_HUBS and KOB\_SITST\_EXCLUDE\_HUBS parameters are specified, the values specified in the KOB\_SITST\_INCLUDE\_HUBS parameter are ignored, and only the values for KOB\_SITST\_EXCLUDE\_HUBS are applied. If neither parameter is implemented, then all discovered Hub TEMS are sampled for situation data. For example: To exclude three test Hub TEMS running on z/OS, zLinux, and Windows, uncomment the parameter and customize the parameter value as follows:

```
000126 ** =COLS>----+----1----+----2----+----3----+----4----+----5----+----6--
000127 **          KOB_SITST_EXCLUDE_HUBS=%RTE_TEMS_NAME_NODEID%,HUB_zlnx,HUB_win
000128 **          ****
```

**Related parameters**

- [“KOB\\_SITST\\_SAMPLE\\_MINUTES” on page 1446](#)
- [“KOB\\_SITST\\_RECENT\\_SLOTS” on page 1446](#)
- [“KOB\\_SITST\\_HISTORY\\_SLOTS” on page 1445](#)
- [“KOB\\_SITST\\_HISTORY\\_RANGE” on page 1444](#)
- [“KOB\\_SITST\\_INCLUDE\\_HUBS” on page 1445](#)

**KOB\_SITST\_HISTORY\_RANGE**

This parameter is the total length of time (in Minutes, Hours, or Days) the historical summary of situation data will be kept for and displayed within the Situation Status Tree. This parameter must be added to the EMBEDS(KOB\$PENV) member (Configuration Manager) or to the WCONFIG(KOB\$PENV) member (PARMGEN). You must enable the parameter after adding it in the imbed.

**Required or optional**

Optional

**Location where the parameter value is stored**

The KOBENV member of RKANPARU.

**PARMGEN name**

KOB\_SITST\_HISTORY\_RANGE

**Description**

Valid ranges for this parameter are: 1M - 2<sup>32</sup>M (Minutes) or 1H - 2<sup>32</sup>H (Hours) or 1D - 2<sup>32</sup>D (Days). The default value is 4H. After supplying a numeric value, follow it immediately by one of the letters M, H, or D to indicate Minutes, Hours, or Days.

**Examples**

KOB\_SITST\_HISTORY\_RANGE=4H

KOB\_SITST\_HISTORY\_RANGE=45M

KOB\_SITST\_HISTORY\_RANGE=14D

**Related parameters**

- [“KOB\\_SITST\\_SAMPLE\\_MINUTES” on page 1446](#)
- [“KOB\\_SITST\\_RECENT\\_SLOTS” on page 1446](#)
- [“KOB\\_SITST\\_HISTORY\\_SLOTS” on page 1445](#)
- [“KOB\\_SITST\\_EXCLUDE\\_HUBS” on page 1444](#)
- [“KOB\\_SITST\\_INCLUDE\\_HUBS” on page 1445](#)

## KOB\_SITST\_HISTORY\_SLOTS

This parameter is the number of slots, or samples, of situation data that you want the OMEGAMON Enhanced 3270UI to keep as a historical summary and display within the Situation Status Tree. This parameter must be added to the EMBEDS(KOB\$PENV) member (Configuration Manager) or to the WCONFIG(KOB\$PENV) member (PARMGEN). You must enable the parameter after adding it in the imbed.

**Required or optional**

Optional

**Location where the parameter value is stored**

The KOBENV member of RKANPARU.

**PARMGEN name**

KOB\_SITST\_HISTORY\_SLOTS

**Description**

Values for this parameter are between 1 - 128 slots. The default value is 16 slots.

**Related parameters**

- [“KOB\\_SITST\\_SAMPLE\\_MINUTES” on page 1446](#)
- [“KOB\\_SITST\\_RECENT\\_SLOTS” on page 1446](#)
- [“KOB\\_SITST\\_HISTORY\\_RANGE” on page 1444](#)
- [“KOB\\_SITST\\_EXCLUDE\\_HUBS” on page 1444](#)
- [“KOB\\_SITST\\_INCLUDE\\_HUBS” on page 1445](#)

## KOB\_SITST\_INCLUDE\_HUBS

This parameter is used to explicitly include one or more hub TEMS for periodic situation data collection. This parameter must be added to the EMBEDS(KOB\$PENV) member (Configuration Manager) or to the WCONFIG(KOB\$PENV) member (PARMGEN). You must enable the parameter after adding it in the imbed.

### Required or optional

Optional

### Location where the parameter value is stored

The KOBENV member of RKANPARU.

### PARMGEN name

KOB\_SITST\_INCLUDE\_HUBS

### Description

User supplies a comma-separated list of hub TEMS names (CMS\_NODEID). If both KOB\_SITST\_INCLUDE\_HUBS and KOB\_SITST\_EXCLUDE\_HUBS parameters are specified, the values specified in the KOB\_SITST\_INCLUDE\_HUBS parameter are ignored, and only the values for KOB\_SITST\_EXCLUDE\_HUBS are applied. If neither parameter is implemented, then all discovered Hub TEMS are sampled for situation data. For example: To include three test Hub TEMS running on z/OS, zLinux, and Windows, uncomment the parameter and customize the parameter value as follows:

```
000126 ** =COLS>-----1-----2-----3-----4-----5-----6---
000127 **      KOB_SITST_INCLUDE_HUBS=%RTE_TEMS_NAME_NODEID%,HUB_zlnx,HUB_win
```

### Related parameters

- [“KOB\\_SITST\\_HISTORY\\_RANGE” on page 1444](#)
- [“KOB\\_SITST\\_EXCLUDE\\_HUBS” on page 1444](#)

## KOB\_SITST\_RECENT\_SLOTS

This parameter is the number of slots, or samples, of situation data that you want the OMEGAMON Enhanced 3270UI to keep as a record of recent situation status and display within the Situation Status Tree. This parameter must be added to the EMBEDS(KOB\$PENV) member (Configuration Manager) or to the WCONFIG(KOB\$PENV) member (PARMGEN). You must enable the parameter after adding it in the imbed.

### Required or optional

Optional

### Location where the parameter value is stored

The KOBENV member of RKANPARU.

### PARMGEN name

KOB\_SITST\_RECENT\_SLOTS

### Description

Values for this parameter are between 1 - 128 slots. For example, if you specify 12 slots and your sampling interval is 5 minutes (KOB\_SITST\_SAMPLE\_MINUTES=5), you will have one hour of recent data, shown across 12 different slots. The default value is 12 slots.

### Related parameters

- [“KOB\\_SITST\\_SAMPLE\\_MINUTES” on page 1446](#)
- [“KOB\\_SITST\\_HISTORY\\_SLOTS” on page 1445](#)

- [“KOB\\_SITST\\_EXCLUDE\\_HUBS” on page 1444](#)
- [“KOB\\_SITST\\_INCLUDE\\_HUBS” on page 1445](#)

## KOB\_SITST\_SAMPLE\_MINUTES

This parameter is the sampling interval (in minutes) that you want the OMEGAMON Enhanced 3270UI to periodically gather current data about situation status from every active, and included, hub TEMS. This

parameter must be added to the EMBEDS(KOB\$PENV) member (Configuration Manager) or to the WCONFIG(KOB\$PENV) member (PARMGEN). You must enable the parameter after adding it in the imbed.

**Required or optional**

Optional

**Location where the parameter value is stored**

The KOBENV member of RKANPARU.

**PARMGEN name**

KOB\_SITST\_SAMPLE\_MINUTES

**Description**

Values for this parameter are between 1 - 2<sup>32</sup> minutes. Specify '0' to disable all Situation Data Collection at this OMEGAMON enhanced 3270UI. The default value is 5 minutes.

**Related parameters**

- [“KOB\\_SITST\\_RECENT\\_SLOTS” on page 1446](#)
- [“KOB\\_SITST\\_HISTORY\\_SLOTS” on page 1445](#)
- [“KOB\\_SITST\\_HISTORY\\_RANGE” on page 1444](#)

- [“KOB\\_SITST\\_INCLUDE\\_HUBS” on page 1445](#)

## **MULTI\_TENANCY\_DDNAME**

This override embed parameter specifies the DD name of the data set containing the tenant definitions.

**Description**

This parameter specifies the DD name of the data set containing the tenant definitions when defined in PDS members. Tenant definitions are used in OMEGAMON enhanced 3270 user interface multi-tenancy mode.

This parameter is in the EMBEDS (KOB\$PENV) member (Configuration Manager) or the WCONFIG (KOB\$PENV) member (PARMGEN). You must follow a standard override embed procedure to ensure the parameter is set properly in RKANPARU (KOBENV).

**Default value**

RKOBPROF (uses the UKOBDATF data set)

## **MULTI\_TENANCY\_DEFS**

This override embed parameter specifies the location of the tenant definitions.

This parameter specifies the location of the tenant definitions, which are used in OMEGAMON enhanced 3270 user interface multi-tenancy mode.

**Description**

This parameter specifies the location of the tenant definitions, which are used in OMEGAMON enhanced 3270 user interface multi-tenancy mode.

This parameter is in the EMBEDS (KOB\$PENV) member (Configuration Manager) or the WCONFIG (KOB\$PENV) member (PARMGEN). You must follow a standard override embed procedure to ensure the parameter is set properly in RKANPARU (KOBENV).

**Permissible values**

**PDS**

Definitions are in PDS members located in the data set specified in the DD statement named in the **MULTI\_TENANCY\_DDNAME** parameter.

**SAF**

Definitions are made using the System Authorization Facility (SAF) interface for use with an external security system, such as RACF.

## Default value

PDS

## What's new (previous updates)

---

The topics in this section describe previous updates to the OMEGAMON configuration tools, products, and components.

## What's new in Monitoring Configuration Manager (previous updates)

This history summarizes the previous changes in Monitoring Configuration Manager documentation.

**Note:** For information about the most recent updates, see [“What's new in Tivoli Management Services on z/OS configuration software” on page 22](#).

Edition date	Description
October 2021	<p>With APAR OA62230, the following new features or changes are provided:</p> <ul style="list-style-type: none"><li>• The DELETE action provides an additional parameter of CONFIRM Y/N when the KCIVARS data set is affected. A value of "N" creates a list of potential data sets that could be deleted. See <a href="#">“DELETE” on page 258</a> for more information.</li><li>• A new PDCOLLECT utility collects diagnostic information. See <a href="#">“Troubleshooting” on page 365</a> for more details. Also new parameters have been added for the PDCOLLECT utility, which are:<ul style="list-style-type: none"><li>◦ <a href="#">“KFJ_PDCOL_HLQ” on page 310</a></li><li>◦ <a href="#">“KFJ_PDCOL_JOB_ID” on page 311</a></li><li>◦ <a href="#">“KFJ_PDCOL_JOB_NAME” on page 311</a></li><li>◦ <a href="#">“KFJ_PDCOL_JOB_OUTPUT” on page 312</a></li></ul></li><li>• An issue has been discovered when attempting to use batch optimization tools. See <a href="#">“Preparing to use Configuration Manager” on page 220</a> for more information.</li></ul>
September 2021	<p>With APAR OA61601 the following new features are introduced:</p> <ul style="list-style-type: none"><li>• Centralized configuration capability – Monitoring Configuration Manager can be used to generate runtime environments for remote systems from a single configuration LPAR.</li><li>• New PACKAGE and DEPLOY actions – These new actions are used to allow packaging runtime environments and to deploy the packages on a remote system. For more details, see <a href="#">“PACKAGE” on page 265</a> and <a href="#">“DEPLOY” on page 268</a>. See also <a href="#">“Remote deployment scenario” on page 341</a> for more details.</li></ul>
July 2021	<p>With APAR OA61383, all references to <i>super user</i> have been removed.</p>

Edition date	Description
December 2020	<p>With APAR OA60562, the following products can now be configured using Monitoring Configuration Manager, regardless of them being part of a Suite or Pack offering or purchased as a standalone point product:</p> <ul style="list-style-type: none"> <li>• Tivoli Enterprise Monitoring Server 6.3.0</li> <li>• OMEGAMON Enhanced 3270 User Interface 7.5.0</li> <li>• IBM Z OMEGAMON Monitor for z/OS 5.6.0</li> <li>• IBM OMEGAMON for z/OS 5.5.0</li> <li>• IBM Z OMEGAMON Network Monitor 5.6.0</li> <li>• IBM OMEGAMON for Networks on z/OS 5.5.0</li> <li>• IBM Z OMEGAMON Integration Monitor 5.6.0</li> <li>• IBM Tivoli OMEGAMON XE for Db2 Performance Expert on z/OS 5.4.0</li> <li>• IBM Tivoli OMEGAMON XE for Db2 Performance Monitor on z/OS 5.4.0</li> <li>• IBM OMEGAMON for CICS on z/OS 5.5.0</li> <li>• IBM OMEGAMON for IMS on z/OS 5.5.0</li> <li>• IBM OMEGAMON for Messaging on z/OS 7.5.0</li> <li>• IBM Z OMEGAMON for JVM 5.5.0</li> <li>• IBM Z OMEGAMON Runtime Edition for JVM 5.5.0</li> <li>• IBM OMEGAMON for Storage on z/OS 5.5.0</li> <li>• IBM Z NetView Agent 6.3.0</li> <li>• ITCAM for Application Diagnostics Agent 7.1.0</li> <li>• IBM OMEGAMON Dashboard Edition on z/OS 5.5.0</li> </ul>
November 2020	<p>Monitoring Configuration Manager updates include the following new features:</p> <ul style="list-style-type: none"> <li>• MIGRATE action as described in <a href="#">“MIGRATE” on page 261</a>.</li> <li>• Embed overrides as described in <a href="#">“Using override embed members in Configuration Manager” on page 337</a>.</li> <li>• Security exits as described in <a href="#">“Setting up security exits in your runtime environment” on page 336</a>.</li> </ul>
July 2020	<p>First public edition, coinciding with the general availability (GA) of the fix for APAR OA59463, PTF UJ03556 (new function: Monitoring Configuration Manager).</p>

## What's new in PARMGEN (previous updates)

The topics in this section describe previous updates to the Parameter Generator (PARMGEN) configuration method.

**Note:** For information about the most recent updates, see [“What's new in Tivoli Management Services on z/OS configuration software” on page 22](#).

### PARMGEN PTF UJ07400 for APAR OA62486 (4Q21)

The PARMGEN PTF UJ07400 (4Q21) includes updates to OMEGAMON for Messaging and OMEGAMON for JVM agents, and the IBM runtime exclude member list.

## PARMGEN configuration framework enhancements and updates

The following statement is now included in the RKANSAMU(KCI\$IW2R) IBM runtime exclude member list:

```
EXCLUDEI K*THRS
```

This statement prevents *Kpp*THRS members from being removed from RK\* libraries when (in PARMGEN) jobs KCIJPW2R and KCIJPW1R, which copy WK\* files to RK\*, are run, or (in Configuration Manager) the **GENERATE** action is run.

## Product-specific enhancements

### OMEGAMON for Messaging

The following updates have been made for OMEGAMON for Messaging:

- The following parameters have been added for monitoring IBM App Connect Enterprise (ACE) on z/OS Container Extensions (zCX):
  - **KQI\_XML\_JAVA\_HOME1**
  - **KQI\_XML\_JAVA\_HOME2**
- The following parameters have been changed to be optional with no default value:
  - **KQI\_XML\_XIMBDIR1**
  - **KQI\_XML\_XIMBNAME\_MON\_BRKR\_NAME**
- The default value has been changed to 0 for the following parameter:
  - **KQI\_XML\_XISSRET\_SNAPSHOT\_SAMPLE**
- Embed file KQIXML has been updated.

### OMEGAMON for JVM

Override members KJT\$SST1 and KJT\$SST3 have been added to the OMEGAMON for JVM Collector started task.

## PARMGEN PTF UJ06932 for APAR OA62358 (3Q21)

The PARMGEN PTF UJ06932 (3Q21) includes fixes for the APF authorization procedure and several OMEGAMON for Db2 parameter default values.

## PARMGEN configuration framework enhancements and updates

The generated APF authorization procedure contained SMP/E data sets (\*KANMODR, \*KANMODP) that did not always exist. A check was added to only include those data sets if certain products are installed.

## Product-specific enhancements

### OMEGAMON for Db2

OMEGAMON for Db2 threshold, exception log, and exception file data sets used incorrect default values in the following parameters:

- **KD2\_PFO1\_AEXCP\_D2TPVL**
- **KD2\_PFO1\_AEXCP\_D2TPTFSC**
- **KD2\_PFO1\_AEXCP\_D2TPTFMC**

The default values were taken from VSAM parameters instead of non-VSAM parameters.

## PARMGEN PTF UJ06753 for APAR OA62125 (3Q21)

The PARMGEN PTF UJ06753 (3Q21) includes a fix for z/OS® UNIX® System Services-related JCL jobs.

## PARMGEN configuration framework enhancements and updates

After the super user requirement was removed in a previous PARMGEN update, the JCL jobs related to z/OS UNIX produced an error (RC=256), as they were unable to change the permission for files if the JCL jobs were run using different user IDs. This problem has been corrected.

## PARMGEN PTF UJ06604 for APAR OA62001 (3Q21)

The PARMGEN PTF UJ06604 for APAR OA62001 (3Q21) provides an enhancement for the problem determination data collection tool KCIPDCOL.

## PARMGEN configuration framework enhancements and updates

The PARMGEN problem determination data collection tool, which is exposed on the Utilities panel (KCIPQPGU) as **32. Collect diagnostic information for this RTE**, and uses the tailored job KCIJPCOL, has been enhanced to collect diagnostic information about the Self-Describing Agent (SDA) functionality.

Also, the option PMR has been removed from the KCIJPCOL job and the respective changes have been made to KCIJPCOL.

For more information about using the tool, see [“How to: Collect diagnostic information using PDCOLLECT” on page 508](#).

## PARMGEN PTF UJ05702 for APAR OA61383 (2Q21)

The PARMGEN PTF UJ05702 for APAR OA61383 (2Q21) updates include several JCL job fixes.

## PARMGEN configuration framework enhancements and updates

This PTF removes the requirement for the submitting user to either have UID (0) or superuser privileges to perform various z/OS® UNIX® System Services functions to configure OMEGAMON products. The submitting user must have read/write permission to the **RTE\_USS\_RTEDIR** path.

## Product-specific enhancements

The following product-specific enhancements are provided in this release:

### IBM OMEGAMON for JVM

The default location of the Health Center Agent (HCA) files has changed.

- Previous location, which is two levels above **GBL\_USS\_TKANJAR\_PATH**:

```
/usr/lpp/kan/
```

- New location, where the path consists of two parameters, **RTE\_USS\_RTEDIR** and **RTE\_NAME**, for all RTE types (FULL, SHARING with base libraries, or SHARING with SMP/E libraries).

```
/rtehome/rte_name/kan/
```

## PARMGEN PTF UJ05411 for APAR OA60244 (1Q21)

The PARMGEN PTF UJ05411 for APAR OA60244 (1Q21) introduces a new set of parameters that can be used by PARMGEN to configure PDS V2 data sets properly for supported products.

The intent of the PTF is to provide a smooth transition from an existing PDS V1 implementation to PDS V2, allowing improved customization of some of the basic information for PDS V2, such as high-level qualifiers or allocation sizes for the PDS V2 data sets.

The following RTE parameters control PDS V2 settings for an individual runtime environment and provide default settings for the OMEGAMON agents configured in that environment. These parameters control whether PDS V2 is activated for the RTE and define default data set allocation settings.

```
RTE_PDS2_ACTIVATION
RTE_PDS2_ALLOC_TYPE
RTE_PDS2_HILEV
RTE_PDS2_SMS_DATACLAS
RTE_PDS2_SMS_MGMTCLAS
```

RTE\_PDS2\_SMS\_STORCLAS  
RTE\_PDS2\_VOLUME

The following parameters provide agent-specific settings for PDS V2, where *pp* identifies the agent. These parameters control whether PDS V2 is activated for the agent and define data set allocation settings.

Kpp\_PDS2\_ACTIVATION  
Kpp\_PDS2\_FILE\_COUNT  
Kpp\_PDS2\_SEC\_SIZE  
Kpp\_PDS2\_STORE\_SIZE

For more information, see [PDS V2 parameters](#).

## PARMGEN PTF UJ05166 for APAR OA60209 (1Q21)

The PARMGEN PTF UJ05166 for APAR OA60209 (1Q21) updates include support for OMEGAMON for Db2 Thread Level Anomaly Detection parameters and their handling.

### Product-specific enhancements

The following product-specific enhancements are provided in this release:

#### IBM OMEGAMON for Db2

The following new parameters are introduced:

KD2\_PFn\_HIS\_AD\_ALPHA  
KD2\_PFn\_HIS\_AD\_CPU\_DSC\_TOL  
KD2\_PFn\_HIS\_AD\_CPU\_TOL  
KD2\_PFn\_HIS\_AD\_ELP\_DSC\_TOL  
KD2\_PFn\_HIS\_AD\_ELP\_TOL  
KD2\_PFn\_HIS\_AD\_ENABLED  
KD2\_PFn\_HIS\_AD\_GP\_DLT  
KD2\_PFn\_HIS\_AD\_GPG\_DSC\_TOL  
KD2\_PFn\_HIS\_AD\_GPG\_TOL  
KD2\_PFn\_HIS\_AD\_MEMORY\_SIZE  
KD2\_PFn\_HIS\_AD\_MIN\_COUNT  
KD2\_PFn\_HIS\_AD\_USE\_AUTH  
KD2\_PFn\_HIS\_AD\_USE\_CONNECT  
KD2\_PFn\_HIS\_AD\_USE\_CONNM  
KD2\_PFn\_HIS\_AD\_USE\_CORRID  
KD2\_PFn\_HIS\_AD\_USE\_ENDUSER  
KD2\_PFn\_HIS\_AD\_USE\_PLAN  
KD2\_PFn\_HIS\_AD\_USE\_TRANSAC  
KD2\_PFn\_HIS\_AD\_USE\_WSNAME

For more information, see [KD2\\_PFn\\_HIS\\_AD - Anomaly detection](#).

## PARMGEN PTF UJ04817 for APAR OA60708 (1Q21)

The PARMGEN PTF UJ04817 for APAR OA60708 (1Q21) updates include minor changes to two parameters, as well as JCL and job fixes.

### PARMGEN configuration framework enhancements and updates

The configuration software includes an update to the processing of the PARMGEN panels. The PARMGEN panels now correctly display any errors from the JCL jobs and ignore system or user job abends that are associated with fix \*ABN=xxx.

### Product-specific enhancements

The following product-specific enhancements are provided in this release:

#### IBM Tivoli OMEGAMON Manager (TOM)

The VTAM and started task (STC) definitions for TOM are no longer created if they are not clearly specified to be configured.

#### IBM OMEGAMON for Db2

The following changes have been made:

- The default value for the **KD2\_PFn\_DCM\_D2SHDCST** parameter has changed from Y to N.
- The following JCL error, which occurred when near-term historical archive jobs were run, has been fixed:

### **IBM OMEGAMON for Storage**

The description of the **KS3\_AS\_LISTENER\_ADDR** parameter has been improved to clarify the term loopback address.

## **PARMGEN PTF UJ04560 for APAR OA60460 (4Q20)**

The PARMGEN PTF UJ04560 for APAR OA60460 (4Q20) updates include a fix for unresolved variables, a fix for a syntax error, and a change in JCL used in a PROCLIB fix.

### **Product-specific enhancements**

The following product-specific enhancements are provided in this release:

#### **IBM OMEGAMON XE for z/OS Version 5.4.0**

- A fix for unresolved variables.
- A fix for a syntax error that may be generated when using the **KD5\_AGT\_STC** JCL parameter.

#### **IBM OMEGAMON for CICS**

Previously, only the first started task (Classic STC) JCL was sent to the PROCLIB. This has been changed to include all available Classic STCs.

## **PARMGEN PTF UJ04273 for APAR OA60210 (3Q20)**

The PARMGEN PTF UJ04273 for APAR OA60210 (3Q20) updates include a new MFA parameter, a parameter setting for started tasks, and a version correction.

### **PARMGEN configuration framework enhancements and updates**

The configuration software includes the following updates:

- Introduces the new parameter **KDS\_SAFAPPL** to define APPL support for MFA.
- Adds **MEMLIMIT=NOLIMIT** to generated started tasks for monitoring agents and servers.
- Corrects the PTF number in PARMGEN jobs.

## **PARMGEN PTF UJ03989 for APAR OA60163 (3Q20)**

The PARMGEN PTF UJ03989 for APAR OA60163 (3Q20) updates include a change for OMEGAMON for Networks and a new message.

### **PARMGEN configuration framework enhancements and updates**

The configuration software generates a message when the value of the **GBL\_DSN\_SYS1\_VTAMLIB** parameter is **SYS1.VTAMLIB**.

## **PARMGEN PTF UJ03737 for APAR OA60006 (3Q20)**

The PARMGEN PTF UJ03737 for APAR OA60006 (3Q20) updates include validation improvements, a CALDFLT update, and a change in anomaly detection.

### **PARMGEN configuration framework enhancements and updates**

The configuration software includes the following updates:

- Improvements in validation of empty table definitions.
- A change in the possible CALDFLT values for the **GBL\_DSN\_WMQ\_SCSQLOAD** parameter.

## **PARMGEN PTF UJ03556 for APAR OA59910 (3Q20)**

The PARMGEN PTF UJ03556 for APAR OA59910 (3Q20) update includes new optimizations to the KCIPARSE program.

### **PARMGEN configuration framework enhancements and updates**

Optimizations to the KCIPARSE program have been implemented that reduce the CPU usage.

## **PARMGEN PTF UJ03536 for APAR OA59848 (3Q20)**

The PARMGEN PTF UJ03536 for APAR OA59848 (3Q20) updates include enhanced reporting, and restrictions for a template, for collector libraries, and for a sample file.

### **PARMGEN configuration framework enhancements and updates**

The configuration software includes the following updates:

- Previously in the CUA VTAM major node definition, the KMVNODE@ template was not imbedded. This has been corrected.
- Previously the sample RKANSAMU(KEPTSO) contained an incorrect default for the \*PAR dataset. This has been corrected.

### **Product-specific enhancements**

The following product-specific enhancements are provided in this release:

#### **IBM OMEGAMON for Storage**

Enhanced reporting is now provided for the Storage Toolkit.

#### **IBM OMEGAMON for z/OS**

For a full runtime environment (RTE), the KM2 Epilog Collector libraries are not loaded correctly. To address this issue, you must apply the PTF and reload your runtime environment.

## **PARMGEN PTF UJ03239 for APAR OA59623 (3Q20)**

PARMGEN PTF UJ03239 for APAR OA59623 (3Q20) updates include support for security updates, improved assessment of "I" validation errors, and information on detection parameters for OMEGAMON for Db2 V5.4.

### **PARMGEN configuration framework enhancements and updates**

The configuration software includes an update. The `RTE_VALIDATION_LEVEL` parameter with a setting of "I" has been fixed to ensure it recognizes validation errors.

### **Product-specific enhancements**

The following product-specific enhancement is provided in this release:

#### **IBM OMEGAMON for Storage**

The `RTE_USS_RTEDIR` parameter is used to define the path where runtime members are stored in z/OS® UNIX® System Services. This parameter is not available for use in OMEGAMON for Storage started tasks with Realtime Dataset Metrics (RDM).

## **PARMGEN PTF UJ02903 for APAR OA59433 (2Q20)**

PARMGEN PTF UJ02903 for APAR OA59433 (2Q20) includes additional parameter checks for OMEGAMON for Storage and several fixes for maintenance issues.

### **PARMGEN configuration framework enhancements and updates**

The configuration software includes the fix of a potential problem with the PARMGEN maintenance procedures.

### **Product-specific enhancements**

The following product-specific enhancements are provided in this release:

#### **IBM OMEGAMON for z/OS**

Provides a list of updates for the procedures.

### **IBM OMEGAMON for Storage**

Check of additional parameters used in IBM OMEGAMON for Storage on z/OS.

## **PARMGEN PTF UJ01973 for APAR OA59012 (1Q20)**

The PARMGEN PTF UJ01973 for APAR OA59012 (1Q20) provides configuration support for new products, a new parameter for multi-tenancy enablement, and the removal of hardware-related informational messages.

### **PARMGEN configuration framework enhancements and updates**

The configuration software includes the following updates:

- The following products can now be configured with PARMGEN:
  - IBM Z OMEGAMON for JVM, V5.5.0
  - IBM Z OMEGAMON Runtime Edition for JVM, V5.5.0
- Post-configuration information for OMEGAMON for JVM has been removed from PARMGEN. For information about the steps to complete after using PARMGEN, see [Completing the configuration - IBM Z OMEGAMON for JVM](#).
- Informational messages about CPU or other hardware that appeared when starting PARMGEN have been removed.

### **Component-specific enhancement**

This release provides the following component-specific enhancement:

#### **OMEGAMON enhanced 3270 user interface**

New parameter **KOB\_MT\_ENABLE** has been introduced to control whether multi-tenancy is enabled. This parameter allows you to modify the **MULTI** parameter in the OMEGAMON enhanced 3270 user interface started task JCL using PARMGEN.

## **PARMGEN PTF UJ02038 for APAR OA58817 (1Q20)**

The PARMGEN PTF UJ02038 for APAR OA58817 (1Q20) provides performance improvements for the KCIPARSE program.

## **PARMGEN PTF UJ02017 for APAR OA58861 (1Q20)**

The PARMGEN PTF UJ02017 for APAR OA58861 (1Q20) provides configuration support for OMEGAMON enhanced 3270 user interface enhancements including multi-tenancy, cryptography, and improved messaging for security and logon events. Configuration support is also provided for enhancements in OMEGAMON for Networks for VTAM applications (VAPP) and for z/OS Encryption Readiness Technology (zERT). A syntax error has been corrected for IBM Z OMEGAMON Integration Monitor.

This PTF provides the following updates, listed by product or component:

#### **OMEGAMON enhanced 3270 user interface**

- Configuration support for the multi-tenancy feature. The parameter **MULTI=N** has been added to the OMEGAMON enhanced 3270 user interface started task JCL. To enable multi-tenancy in your environment, you must change this setting to **MULTI=Y**.
- Configuration support for improved messaging for security and logon events. The following parameters have been introduced:
  - KOB\_SAF\_FAILURE=CONSOLE**

This parameter determines whether to echo security-related messages from the security product to the OMEGAMON enhanced 3270 user interface and SYSPRINT, as well as SYSLOG.
  - KOB\_SAF\_LOGON\_TRACE=YES**

This parameter allows the OMEGAMON enhanced 3270 user interface to trace the session logon process.
- Cryptography support

## OMEGAMON for Networks

Configuration support for enhancements around VTAM applications (VAPP) and for z/OS Encryption Readiness Technology (zERT). The following parameters have been introduced:

### **KN3\_SNA\_VTAM\_APPS**

This parameter determines whether to collect data for VTAM applications and sessions.

### **KN3\_TCP\_ZERT**

This parameter determines whether to collect z/OS Encryption Readiness Technology (zERT) data for the system. This global parameter is for the entire system.

### **KN3\_TCPXnn\_OVRD\_ZERT**

This parameter determines whether to override the global collection setting for z/OS Encryption Readiness Technology (zERT) for this TCP/IP address space.

## IBM Z OMEGAMON Integration Monitor

Resolve a syntax error generated in \*NODE APPL definitions

## PARMGEN PTF UJ01311 for APAR OA58363 (4Q19)

PARMGEN PTF UJ01311 for APAR OA58363 (4Q19) provides configuration support for passphrase and MFA, EAV, and the IBM Z NetView release.

## PARMGEN configuration framework enhancements and updates

The configuration software includes the following enhancements and updates:

- Provides configuration support for passphrase and multi-factor authorization (MFA) in OMEGAMON enhanced 3270 user interface and OMEGAMON Classic User Interface
- Provides configuration support for the IBM Z NetView V6.3 release

**Note:** IBM Tivoli NetView for z/OS is now IBM Z NetView. IBM Tivoli NetView for z/OS Enterprise Management Agent is now IBM Z NetView Enterprise Management Agent.

- Provides Extended Address Volume (EAV) support, including updates to the KCIJPSEC job

## Product-specific enhancements

This release provides the following product-specific enhancements:

### OMEGAMON for z/OS

New parameters for passphrase and MFA support:

**KM2\_CLASSIC\_PASSPHRASE**

**KM2\_CLASSIC\_SECCLASS**

**KM2\_CLASSIC\_SAFAPPL**

**Note:** Parameters PRTCT and PSWD are being deprecated.

### OMEGAMON for CICS

New parameters for passphrase and MFA support:

**KC2\_CLASSIC\_PASSPHRASE**

**KC2\_CLASSIC\_SECCLASS**

**KC2\_CLASSIC\_SAFAPPL**

### OMEGAMON for Db2

New parameters for passphrase and MFA support:

**KD2\_CLASSIC\_PASSPHRASE**

**KD2\_CLASSIC\_SECCLASS**

**KD2\_CLASSIC\_SAFAPPL**

## **OMEGAMON for IMS**

New parameters for passphrase and MFA support:

**KI2\_CLASSIC\_PASSPHRASE**

**KI2\_CLASSIC\_SECCLASS**

**KI2\_CLASSIC\_SAFAPPL**

## **OMEGAMON enhanced 3270 user interface**

New parameter for passphrase and MFA support:

**KOB\_SAF\_APPLID**

## **PARMGEN PTF UJ01287 for APAR OA58439 (4Q19)**

The PARMGEN PTF UJ01287 for APAR OA58439 (4Q19) provides updates to the PARMGEN configuration framework.

### **PARMGEN configuration framework enhancements and updates**

The configuration software includes the following update:

- Resolves a PARMGEN program loop when using code page 1141

### **Product-specific update**

This PTF provides the following product-specific update:

#### **OMEGAMON for Storage**

Corrects an issue where the wrong member is copied in job KCIJPSYS for OMEGAMON XE for Storage 5.4.0

## **PARMGEN PTF UJ01126 for APAR OA58518 (4Q19)**

The PARMGEN PTF UJ01126 for APAR OA58518 (4Q19) provides configuration support for new products.

### **PARMGEN configuration framework enhancements**

The following products can now be configured with PARMGEN:

- IBM Z OMEGAMON Monitor for z/OS V5.6.0
- IBM Z OMEGAMON Network Monitor V5.6.0
- IBM Z OMEGAMON Integration Monitor V5.6.0

## **PARMGEN PTF UJ00100 for APAR OA56017 (3Q19)**

The PARMGEN PTF UJ00100 for cumulative APAR OA56017 (3Q19) provides several updates to the PARMGEN configuration framework.

### **PARMGEN configuration framework updates**

The configuration software includes the following updates:

- Provides an update to allow the **KDS\_CMS\_NODE\_VALIDATION** parameter to be set to N0 (APAR OA57554)
- Updates module KCIR@PG1 to recognize machine type 3907 (APAR OA57047)

### **Product-specific updates**

This PTF provides the following product-specific updates:

#### **OMEGAMON for Messaging**

Corrects an issue where changing the **RTE\_USS\_MKDIR\_MODE** value does not update the access mode in the OMEGAMON for Messaging KQIMKDIR and KQIUSS jobs

#### **OMEGAMON for Networks**

Updates SNMP configuration instructions (KNSNMP) for OMEGAMON for Networks v5.5.0

#### **OMEGAMON for Storage**

Resolves KCIJPSYS job errors when OMEGAMON for Storage (KS3) is not installed (APAR OA57357)

### **OMEGAMON XE for z/OS**

Updates EPILOG use for OMEGAMON XE for z/OS V5.3.0

### **IBM Tivoli Composite Application Manager**

Corrects syntax for z/OS® UNIX® System Services command in IBM Tivoli Composite Application Manager (ITCAM) RTE job

## **PARMGEN PTF UA98449 for APAR OA56325 (4Q18)**

PARMGEN PTF UA98449 for cumulative APAR OA56325 (4Q18 Update) introduces support to configure IBM OMEGAMON for Storage V5.5.0 together with several fixes to the PARMGEN configuration framework.

### **PARMGEN configuration framework enhancements and updates**

The configuration software includes the following enhancements:

- Resolve a hang when exiting from editing a parameter member when the PARMGEN dialog is invoked from a REXX program under TSO. (APAR OA55793)
- Fix a potential space problem with the PDS procedure (CANSPD1) with the allocation of TMPPARU. (APAR OA55119)
- Correct erroneous data set names produced as a result of the zDLA processing. (APAR OA55501)
- Improve the error handling of KCIJPUS to more accurately reflect the success of the job.

### **Product-specific enhancements**

The following product-specific enhancements are provided in this release:

#### **IBM OMEGAMON for Storage**

Support has been added for configuring Version 5.5.0 of IBM OMEGAMON for Storage on z/OS. This includes the configuration of the Realtime Data Metrics (RDM) server.

There are two new basic parameters. **KS3\_NODEJS\_HOME** and **KS3\_RDM\_SERVICE\_ADDR**. The **KS3\_NODEJS\_HOME** parameter defines the location where Node.js is installed on z/OS. It is the equivalent of the `node.js_home` directory. The **KS3\_RDM\_SERVICE\_ADDR** parameter is the IP address of the z/OS host that is known to the users of the TEP.

See [Realtime Dataset Metrics Web user interface](#) in the *IBM OMEGAMON for Storage on z/OS 5.5.0 Planning and Configuring* guide for more information on configuring the RDM server.

## **PARMGEN PTF UA95719 for APAR OA54925 (1Q18)**

PARMGEN PTF UA95719 for APAR OA54925 (1Q18) introduces several enhancements to PARMGEN Workflow User Interface applicable to all products that the PARMGEN configuration tool deploys.

Note that this PTF applies to all product versions. You do not have to upgrade to Tivoli® Management Services on z/OS® V6.3.0 Fix Pack 6 or later to take advantage of these features, but Tivoli® Management Services V6.3.0 Fix Pack 6 or later is a prerequisite for the OMEGAMON® XE version 5.3.0 family of products on the distributed platform. Starting from OMEGAMON version 5.5.0 family products, Tivoli Management Services V6.3.0 Fix Pack 6 or later is a prerequisite on both distributed and z/OS platforms because the OMEGAMON V5.5.0 products are built on z/OS ITM 6.3.0 FP6 level of maintenance.

If you upgrade a monitoring agent and Tivoli Management Services, always review the topic [“Basic upgrade requirements” on page 167](#). In this topic you can find information about any new PARMGEN profile parameters that you might need to add to your existing \$GBL\$USR global user profile for a product feature.

### **PARMGEN configuration framework enhancements and updates**

The configuration software includes the following enhancements:

- Some global parameters are now product-specific parameters for more flexible configuration.
  - The following global parameters are now product-specific parameters to allow each product to have its own IP and port for connecting to the HUB TEMS:
    - **KAG\_X\_KDE\_TRANSPORT\_GBL\_OPTIONS** is now **Kpp\_X\_KDE\_TRANSPORT\_GBL\_OPTIONS**.

- **KAG\_X\_KDE\_TRANSPORT\_HTTP\_OPTIONS** is now **Kpp\_X\_KDE\_TRANSPORT\_HTTP\_OPTIONS**.
  - **KAG\_X\_KDE\_TRANSPORT\_POOL\_OPTIONS** is now **Kpp\_X\_KDE\_TRANSPORT\_POOL\_OPTIONS**.
  - **KAG\_X\_KDE\_TRANSPORT\_OPTIONS** is now **Kpp\_X\_KDE\_TRANSPORT\_OPTIONS**.
  - The parameter **RTE\_PDS\_FILE\_COUNT** is now **Kpp\_PDS\_FILE\_COUNT** to allow each product to define its own number of PDS files for near term history data.
- In the CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS (KCIP@PG6) panel, DLAJOB is added as a new option 0 for the auto-discovery job.

```

KCIP@PG6 ----- CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS -----
Command ==>                                     Scroll ==> PAGE
  More:      +

(Required) Customize the RTE profile and the $GBL$USR user profiles:
  0. DLAJOB    z/OS Automatic Resource Discovery Job
  1. RTE      RTE LPAR-specific CONFIG profile in WCONFIG (User copy)
  2. $GBL$USR Global parameters CONFIG profile in WCONFIG (User copy)

(Not Required) Customize the RTE Variables profile if RTE_SYSV_SYSVAR_FLAG=Y:
  3. RTE      Variables (system, user) CONFIG profile in GBL_USER_JCL PARMGEN
              global library (TDITNT.IDTST.PARMGEN.JCL).
              Add or override system or user-defined symbols and their
              resolution values for symbols used in the user profiles.

(Tip) Review/Customize WCONFIG Kpp$C*/Kpp$P*/Kpp$S* user imbeds:
(Cloning Tip) Review KCIJPCCF job in Utility menu prior to customization.
  4. WCONFIG  TDITNT.IDTST.JVM.WCONFIG

(Tip) Review if you want to compare with IBM-supplied default profile values:
  5. $CFG$IBM RTE LPAR-specific CONFIG profile in WCONFIG (IBM copy)
  6. $GBL$IBM Global parameters CONFIG profile in WCONFIG (IBM copy)

(Optional) Override SYSIN member to supply additional (User) profiles:
  7. $SYSIN  $PARSE/$PARSESV SYSIN controls (CONFIG/SELECT MEMBER)

```

- A user-defined exclude list **WCONFIG (KCI\$XW2R)** is provided to retain customized members in the RK\* user libraries during maintenance. When you run the WKANSAMU(KCIJPW1R) job, the members that are listed in the user-defined exclude list **WCONFIG (KCI\$XW2R)** and the IBM provided exclude list **WKANSAMU (KCI\$IW2R)** are retained.

## Product-specific enhancements

This release provides the following product-specific enhancements:

### OMEGAMON for DB2

When you configure DB2 subsystems, the validation of the parameter **KD2\_DBnn\_DB2\_PORT\_NUM** now involves the parameter **KD2\_DBnn\_DB2\_SYSNAME**. If the port numbers are the same, PARMGEN checks the system names of the corresponding DB2 subsystems. If the system names are also the same, the parameter is flagged as invalid.

## PARMGEN PTF UA94193 for APAR OA53974 (4Q17 Interim Feature)

PARMGEN PTF UA94193 for APAR OA53974 (4Q17 Interim Feature) introduces several enhancements to PARMGEN Workflow User Interface applicable to all products that the PARMGEN configuration tool deploys.

Note that this APAR applies to all product versions. You do not have to upgrade to Tivoli® Management Services on z/OS® V6.3.0 Fix Pack 6 or later to take advantage of these features, but Tivoli® Management Services V6.3.0 Fix Pack 6 or later is a prerequisite for the OMEGAMON® XE version 5.3.0 family of products on the distributed platform. Starting from OMEGAMON version 5.5.0 family products, Tivoli Management Services V6.3.0 Fix Pack 6 or later is a prerequisite on both distributed and z/OS platforms because the OMEGAMON V5.5.0 products are built on z/OS ITM 6.3.0 FP6 level of maintenance.

If you upgrade a monitoring agent and Tivoli Management Services, always review the topic [“Basic upgrade requirements” on page 167](#). In this topic you can find information about any new PARMGEN profile parameters that you might need to add to your existing \$GBL\$USR global user profile for a product feature.

## PARMGEN configuration framework enhancements and updates

The configuration software includes the following enhancements:

- CUA-related best practice comments are added to the variables profile in GBL\_USER\_JCL. The comments indicate that CUA-related user symbols apply to OMEGAMON family products version 5.3.0 and earlier versions. Comments can be found in KCI\$RTEV during RTE configuration.
- KCIPDCOL no longer creates libraries with LRCL larger than BLKSIZE so that internal libraries that are created during temporary file allocation do not cause space issues.
- Benign return code RC=20 is removed. The benign return code RC=20 was returned by job KCIJPDEL when the \$LAST member is not in the GBL\_USER\_JCL dataset, or the first RTE created in the GBL\_USER\_JCL dataset is deleted.
- BPX.SUPERUSER read access provides enough authority to run the KCIJPUSS job, batch job 7.
- Additional checks are added in optional KCIJPSYS job to detect if RTE has OMEGAMON for IMS V530 installed but not configured. If so, the IEBCOPY step in COPYNODE/COPYPROC of KCIJPSYS generates the IEBCOPY control statement as a comment.
- Product template for KOB\$PENV in IKANPARU is enhanced to split lines and avoid KOB delimiter error message.

### Product-specific enhancements

This release provides the following product-specific enhancements:

#### OMEGAMON for IMS

The following enhancements are added:

- OMIMS CUA IEBCOPY is no longer generated by KCIJPSYS job for RTE that has no OMEGAMON for IMS.
- IMS V15 support is added for BMP function in OMEGAMON for IMS V5.3.0 and V5.1.0 in OMEGAMON IMS KI2BLDLI stand-alone BMP link job. This enhancement does not apply to OMEGAMON for IMS V5.5.0 where the BMP function is dropped.

#### OMEGAMON for Storage

KDF and KS3 PDS V1 data sets are only needed for OMEGAMON for Storage v540 and earlier versions. After you apply the PTF, KDF and KS3 PDS V1 datasets will no longer be created for OMEGAMON for Storage V550. KxxAL and KxxPDICT members will still be generated in parameter dataset, and EXECs will be run at TEMS start-up.

#### OMEGAMON for DB2

The default values of OMEGAMON for DB2 parameters **KD2\_PFO1\_HIS\_SEQ\_TYP** and **KD2\_PFO1\_HIS\_SEQ\_ARC\_TYP** are changed to dynamic.

## PARMGEN PTF UA91953 for APAR OA52888 (3Q17 Interim Feature)

PARMGEN PTF UA91953 for APAR OA52888 (3Q17 Interim Feature) introduces several enhancements that benefit many of the products in the z Systems Management Suites that PARMGEN helps deploy, for example, the PARMGEN z/OS Discovery Library Adapter (DLA) integration enhancement.

Note that this APAR applies to all product versions. You do not have to upgrade to Tivoli® Management Services on z/OS® V6.3.0 Fix Pack 6 or later to take advantage of these features, but Tivoli® Management Services V6.3.0 Fix Pack 6 or later is a prerequisite for the OMEGAMON® XE version 5.3.0 family of products on the distributed platform. Starting from OMEGAMON version 5.5.0 family products, Tivoli Management Services V6.3.0 Fix Pack 6 or later is a prerequisite on both distributed and z/OS platforms because the OMEGAMON V5.5.0 products are built on z/OS ITM 6.3.0 FP6 level of maintenance.

For product-specific enhancements, see the *New in this release* information for each OMEGAMON® product. For a composite list of all the product-specific "What's New?" documentation, refer to ["OMEGAMON version 5.5.0 family products \(3Q17 release\)" on page 1508](#).

If you upgrade a monitoring Agent and Tivoli Management Services, always review this topic related to any new PARMGEN profile parameters that you may need to add to your existing \$GBL\$USR global user profile if exploiting a product feature: Basic upgrade requirements

### PARMGEN configuration framework enhancements and updates

The configuration software includes the following enhancements:

- Updated the "Welcome to the z/OS Installation and Configuration Tools for IBM Tivoli Management Services (TMS) dependent products" preparation topics such as "IBM z Systems Management Suites that

JOBGEN/PARMGEN help deploy - Overview", "Components in the Product Suites Matrix by Suite Code", "Components in the Product Suites Matrix by JOBGEN Exploitation" and "Components in the Product Suites Matrix by PARMGEN Exploitation". An thus you will know the following information ahead of time:

- How to deploy the SMP/E and configuration requirements of the various components included in the suites.
- Where to go next after the SMP/E and PARMGEN configuration phase of product deployment (especially components that use their own installation and configuration processes outside JOBGEN/PARMGEN controls).
- Which components need further post-configuration work.

This information can lead to a smoother deployment of the product suites. A well-planned ordering, system preparation, installation, configuration and post-configuration of the products mean a better time-to-value using the products quicker.

- Updated additional JOBGEN and PARMGEN on-line help to support the following changes:
  - New version of IBM Service Management Suite for z/OS V1.5.0. Suite is refreshed to include new versions of the following products:
    - IBM OMEGAMON Enhanced 3270 User Interface V7.5.0
    - IBM OMEGAMON Subsystem V7.5.0
    - IBM OMEGAMON for CICS on z/OS V5.5.0
    - IBM OMEGAMON for CICS TG on z/OS V5.5.0
    - IBM OMEGAMON for IMS on z/OS V5.5.0
    - IBM OMEGAMON for Messaging on z/OS - MQ V7.5.0
    - IBM OMEGAMON for Messaging on z/OS - Integration Bus V7.5.0
    - IBM OMEGAMON for Networks on z/OS V5.5.0
    - IBM OMEGAMON for z/OS V5.5.0
    - IBM OMEGAMON Dashboard Edition on z/OS V5.5.0
    - IBM Tivoli Discovery Library Adapter V3.1.0 (JOBGEN support; now packaged in each OMEGAMON Family V5.5.0 standalone product package for PARMGEN use only)
  - New version of IBM OMEGAMON Performance Management Suite for z/OS V5.5.0. Suite is refreshed to include new versions products refreshed in the IBM Service Management Suite for z/OS of applicable V1.5.0.
  - New version of IBM OMEGAMON for z/OS Management Suite V5.5.0. Suite is refreshed to include new versions of applicable products refreshed in the IBM OMEGAMON Performance Management Suite for z/OS V5.5.0.
  - Updated helps to include new version of IBM Advanced Storage Management Suite V2.2 which includes support for the following products:
    - IBM Cloud Tape Connector for z/OS V1.1.0 (JOBGEN support)
    - IBM Advanced VSAM Manager for z/OS V2.6.0 (JOBGEN support)
    - IBM Advanced Archive for DFSMSHsm V1.1.0 (JOBGEN support)
  - Updated helps to include new version of IBM DB2 Query Monitor for z/OS V3.3.
  - Updated helps to remove the IBM OMEGAMON Serviceability Log Analysis references as this is now dropped from the Suites.
- Provided "Display a consolidated list of 'What's New' component READMEs" in PARMGEN UTILITIES panel to document the new IBM Knowledge Center URL Keys for the new 3Q17 product versions:

PRODUCT FAMILIES AND SUITES:	KEY:

- Provided currency and toleration support for the following updates:
  - Add z/OS 2.3
  - Add CICS TS V5.4
  - Drop DB2 V9.1 support in OMEGAMON for DB2 V5.4.0+
  - Drop IMS V9.1, IMS V10.1, IMS V11.1 support in OMEGAMON for IMS V5.5.0+

This also includes product rebranding support for the following products:

- OMEGAMON Family V5.5.0 products have removed "Tivoli" and "XE" as part of their official full product names.
- OMEGAMON Family V5.5.0 components have removed "on z/OS" as part of their official short product names similar to OMEGAMON Family V5.4.0 components such as OMEGAMON for JVM and OMEGAMON for Storage.
- OMEGAMON for CICS (formerly called OMEGAMON for CICS on z/OS)
- OMEGAMON for IMS (formerly called OMEGAMON for IMS on z/OS)
- OMEGAMON for Messaging - MQ (formerly called OMEGAMON for WebSphere MQ Monitoring)
- OMEGAMON for Messaging - Integration Bus (formerly called OMEGAMON for WebSphere MQ Broker)
- OMEGAMON for Networks (formerly called OMEGAMON for Mainframe Networks)
- OMEGAMON for z/OS (formerly called OMEGAMON on z/OS)

- Enhanced "Customize PARMGEN configuration profiles" processing by providing additional PARMGEN KCIJPDLA autodiscovery functions for the following members in the RTE's WCONFIG dataset:
  - WCONFIG(%RTE\_NAME%) LPAR RTE user profile:
    - Provided CICS TS V5.4 currency support. Autodiscover LPAR RTE user profile parameter for each CICS region to make it easier to set-up the On-line Data Viewer (ONDV) VSAM LDS RKC2HIST datasets for application history.
    - **KC2\_HSnn\_CLASSIC\_CICS\_REGION.**

**Note:** If z/OS Discovery Library Adapter FMID HIZD310's CICS TS V5.4 currency PTF UA92023 is applied, **KC2\_HSnn\_CLASSIC\_CICS\_REGION** LPAR RTE profile parameter is autodiscovered by the PARMGEN KCIJPDLA or KCIJPD3 job if there are CICS TS V5.4 regions online.

- WCONFIG(\$GBL\$USR) global RTE user profile:
    - New **GBL\_DSN\_CEE\_SCEERUN2** parameter (autodiscovered value can be used for monitoring Agents that require the LE/370 "C" runtime library to be concatenated in the STC's STEPLIB DD).
    - **GBL\_DSN\_CICS\_CTG\_DLL** parameter (autodiscovered value is concatenated in the OMEGAMON for CICS TG Agent started task's STEPLIB DD). In PARMGEN 3Q17 IF PTF UA91953, this value is prepopulated with the autodiscovered SCTGDLL dataset as the preferred library over the previous settings of SCTGLINK.
    - **GBL\_DSN\_NETVIEW\_CNMLINK** parameter (autodiscovered value is concatenated in the z/OS TEMS and Agent STCs' respective RKANMODL DD if you are enabling the ITM Forward Take Action commands to NetView for z/OS).
    - **GBL\_DSN\_IMS\_SCEXLINK** and **GBL\_DSN\_IMS\_SFUNLINK** parameters (autodiscovered value is concatenated in the OMEGAMON for IMS Agent started task's STEPLIB DD to exploit the IMS Connect Extensions Publisher API).
  - Updated WCONFIG(KJJ\$SDL4) post-configuration imbed to OMEGAMON for JVM Agent's xKANSAMU(KJJDFINL) "Complete the configuration" tailored on-line README (autodiscovered z/OS Connect JVM started tasks and their respective STDENV data). This autodiscovery is further enhanced in 3Q17 IF to detect in-stream "STDENV DD \*". The values are tailored into the OMEGAMON for JVM's post-configuration detailed monitoring enablement steps in the xKANSAMU(KJJDFINL) PARMGEN KJJ post-configuration tailored README).
  - New WCONFIG(KJJ\$SDL5) post-configuration imbed to OMEGAMON for JVM Agent's xKANSAMU(KJJDFINL) "Complete the configuration" tailored on-line README (autodiscovered IBM Operational Decision Manager (ODM) JVMs' HBRMSTR files).
- Provided additional PARMGEN z/OS DLA reports that aid staged maintenance and upgrades. With the function-specific PARMGEN KCIJPD1, KCIJPD2 and KCIJPD3 jobs, when to run these jobs provide the flexibility for customers to stage maintenance and upgrades to control when to refresh the following files:
    - IDML books
    - \$DLARPT report
    - LPAR RTE and \$GBL\$USR user profiles

In addition to the current \$DLARPT DLA report generated by either the KCIJPDLA "Composite PARMGEN z/OS Discovery Library Adapter (DLA) job" or the KCIJPD2 "Generate PARMGEN \$DLARPT report from DLA IDML books dataset" job, starting in PARMGEN 3Q17 IF, two new additional DLA reports are supported. The PARMGEN Utilities panel and a new PARMGEN DLA Menu (KCIQDLA) provides additional handy DLA shortcut commands to support these new reports, as shown below:

```

=====
DLA      DLA
Cmds.    Member/Report Displayed and Function
=====
-----
DLAMENU  Starting in PARMGEN 3Q17 Interim Feature (IF) PTF UA91953,
         the various PARMGEN KCIJPD* jobs, $DLA* reports and DLA*
         shortcut commands are provided in a menu format to make it
         easier to access key PARMGEN DLA autodiscovery tasks. You
         can access the PARMGEN DLA Menu (KCIQDLA panel) by typing
         the 'DLAMENU' command from the UTILITIES (KCIQPGU panel).
         The DLA artifacts are also still accessible via the
         UTILITIES panel.
-----
DLADLTA  Review the RTE's WCONFIG($DLADLTA) DLA delta report. This
         report is created by submitting the KCIJPDLA composite job
         or the KCIJPD2 "Generate PARMGEN $DLARPT report from DLA
         IDML books dataset" if both $DLARPT and $DLAMAP reports
         already exist in the RTE's WCONFIG dataset. 'DLADLTA'
         command displays the $DLADLTA delta report. This $DLADLTA
         delta report compares the previous $DLARPT report with the
         latest $DLARPT report run. The delta report highlights
         the changes in the %RTE_NAME% LPAR RTE user profile and
         the $GBL$USR global user profile.
-----
DLAMAP   Review the RTE's WCONFIG($DLAMAP) parameter DLA map
         report. This report is created by submitting the KCIJPDLA
         composite job or the KCIJPD3 "Refresh %RTE_NAME% /
         $GBL$USR user profiles with $DLARPT data" job. DLAMAP
         command displays the $DLAMAP report that maps what $DLARPT
         parameters equate to the equivalent PARMGEN %RTE_NAME% and
         $GBL$USR user profile parameters.
-----
Note:    The PARMGEN KCIJPD* jobs' comments and PARMGEN Utilities
         on-line help panel topics below also provide details on
         the new $DLAMAP and $DLADLTA reports:
         o From PARMGEN Utilities menu:
           "4  PARMGEN z/OS Discovery Library Adapter (DLA) support"
           "6  Additional Utility options/shortcut commands"
         o From the new PARMGEN DLA menu:
           "1  DLAMENU - PARMGEN DLA Menu - Overview"
           "2  PARMGEN z/OS Discovery Library Adapter (DLA) support"
           "3  DLA shortcut commands"

```

- Enhanced "Customize PARMGEN configuration profiles" processing by reducing product-specific LPAR RTE profile parameters that are coupled with automatic discovery of system properties. Continuous simplification of the deployment process is the key goal. With PARMGEN z/OS DLA autodiscovery functions, the need to customize product parameter values are greatly reduced. With mostly discovered data, streamlining how the product parameters are presented to the customers, is simplified further in PARMGEN 3Q17 IF PTF UA91953 with useful parameter PF Key macros:

```

o F23=BASIC   to display only required product parameters or
              parameters with best-practice IBM defaults but may
              need to be overridden based on your site deployment
              needs.
o F24=ADVANCED to display only advanced (optional and/or conditional)
              product parameters with best-practice IBM defaults but
              may need to be overridden based on your site
              deployment needs.
o F22=SEARCH  to search parameters in PARMGEN IK*/W*/RK* libs.

```

Basic (F23=BASIC PF Key) and Advanced (F24=ADVANCED PF Key) LPAR RTE profile parameter handling and ease-of-use grouping help a great deal especially for first-time-users.

All products that PARMGEN configures in the various product suites benefit from this enhancement. When an LPAR RTE profile is created in a new RTE, or is refreshed in an existing RTE that is being maintained or upgraded the WCONFIG dataset, the various product parameters will be grouped with these helpful sections:

```

** ($$BEGIN - BASIC SECTION (&ppp - &component name)
** ($$END   - BASIC SECTION (&ppp - &component name)
** ($$BEGIN - ADVANCED SECTION (&ppp - &component name)
** ($$END   - ADVANCED SECTION (&ppp - &component name)

```

The following products can take advantage of this streamlined Basic and Advanced LPAR RTE profile parameter grouping. The GA versions as well as any supported earlier versions benefit from this enhancement with PARMGEN 3Q17 IF PTF UA91953 applied:

```

-----
Kpp Component Name and GA Version
-----
KAH System Automation Monitoring Agent V3.5.0
KCN OMEGAMON Subsystem V7.5.0
KC5 OMEGAMON for CICS V5.5.0
KDO Tivoli Decision Support for z/OS Agent V1.8.1
KDS Tivoli Enterprise Monitoring Server V6.3.0
KD4 ITCAM for SOA Agent V7.1.1
KD5 OMEGAMON for DB2 PE/PM V5.4.0
KGW OMEGAMON for CICS TG V5.5.0
KI5 OMEGAMON for IMS V5.5.0
KJJ OMEGAMON for JVM V5.4.0
KMC OMEGAMON for Messaging - WebSphere MQ Configuration V7.3.0
KMQ OMEGAMON for Messaging - MQ V7.5.0
KM5 OMEGAMON for z/OS V5.5.0
KNA NetView for z/OS Agent V6.2.1
KN3 OMEGAMON for Networks V5.5.0
KOB OMEGAMON Enhanced 3270 User Interface V7.5.0
KQI OMEGAMON for Messaging - Integration Bus V7.5.0
KRG Advanced Audit for DFSMSHsm Agent V2.6.0
KRH Advanced Reporting and Management for DFSMSHsm Agent V2.6.0
KRJ Advanced Allocation Management Agent V3.3.0
KRK Automated Tape Allocation Manager for z/OS Agent V3.3.0
KRN Advanced Catalog Management Agent V2.6.0
KRV Advanced Backup and Recovery for z/OS Agent V2.4.0
KRW Tape Optimizer for z/OS Agent V2.2.0
KS3 OMEGAMON for Storage V5.4.0
KWO OMEGAMON Dashboard Edition - OMEGAVIEW V5.3.0
KYN ITCAM for Application Diagnostics, TEMA V7.1.0.03

```

- Enhanced "Customize PARMGEN configuration profiles" processing by reducing over 575 total product-specific LPAR RTE profile parameters for removed product features documented in the OMEGAMON Family V5.5.0's respective product documentation. Refer to the "What's new in the OMEGAMON version 5.5.0 family products (3Q17 release)" topic in the OMEGAMON shared documentation, which has a composite table that lists the products' "What's New" KC links. A number of these removed features are as follows:
  - For all OMEGAMON products:
    - Removed the Common User Access (CUA) interface (also referred to as "OMEGAMON II") to reduce complexity and cost of ownership in the monitoring environment. SMEs experience improved ease of use since all key workspaces are now represented in the enhanced 3270 user interface (enhanced 3270UI) for additional problem solving capability. CUA is eliminated in Version 5.4 and Version 5.5 since functions which could be accomplished with CUA in previous releases, can now be accomplished with enhanced 3270UI.
    - For staged upgrade planning, use the KCIJPW1R job to delete any obsolete runtime members that are no longer generated by the PARMGEN \$PARSE\* job for the product-specific deprecated functions (CUA-related product runtime members, Epilog-related product runtime members, and other obsolete functions) from the product-execution user libraries for each RTE to upgrade (RKANCMDU, RKANPARU, RKANSAMU, RKD2PAR, RKD2PRF and RKD2SAM), when the product started tasks are not in use. The PARMGEN \$PARSE "(Re)create runtime members and jobs" will not generate these members in the PARMGEN WK\* staging work user libraries (WKANCMDU, WKANPARU, WKANSAMU, WKD2PAR, WKD2PRF and WKD2SAM), once PARMGEN detects that the versions of the products installed in the %GBL\_TARGET\_HILEV%.TK\*/CSI are at the latest V5.4/V5.5/V7.5 FMIDs. PARMGEN also has logic added to no longer generate over 575 product-specific LPAR RTE profile parameters in the WCONFIG(%RTE\_NAME%) LPAR RTE user profile once you refresh the RTE supported by the "1. Set up/Refresh PARMGEN work environment" processing on the "PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU".
    - PARMGEN KCIJPALO processing changes:
      - If the minimum OMEGAMON version is V5.5.0, increase space allocation for the following datasets to accommodate the V5.5 SMP/E requirements:
        - read-only %RTE\_X\_HILEV\_SHARING%.%RTE\_SHARE%.RKANWENU shared dataset.
        - RTE-specific %RTE\_HILEV%.%RTE\_NAME%.RKANDATV dataset

- If the minimum OMEGAMON for Networks FMID HKN3vuv version is V5.5.0, add logic in PARMGEN to no longer allocate the read-only %RTE\_X\_HILEV\_SHARING%. %RTE\_SHARE%.RKANSAS shared dataset.
- PARMGEN KCIJPLOD/KCIJPW1R/KCIJPW2R dependencies and changes:
  - If the minimum OMEGAMON for Networks FMID HKN3vuv version is V5.5.0, add logic in PARMGEN to no longer load the read-only %RTE\_X\_HILEV\_SHARING%. %RTE\_SHARE%.RKANSAS shared dataset as the SMP/E target dataset %GBL\_TARGET\_HILEV%.TKANSAS is no longer shipped starting in HKN3550 FMID. The KCIJPLOD job is updated to no longer generate the KANSAS IEBCOPY step in this scenario.
  - New DELRUN2 step is added to delete obsolete modules from the xKANMOD\* load libraries, obsolete Object Definition Information (ODI) files from the RTE's RKANDATV, obsolete panels from the read-only RKANWENU, and obsolete screenspace from the read-only RKppPROC profile dataset, once PARMGEN detects that the minimum OMEGAMON version installed is V5.5.0/V7.5.0.
  - New handy standalone KCIDELJB job is available for staged upgrades. This standalone job is the equivalent of the BUILDEX\*/DELRUN\* steps of the composite KCIJPLOD job. Submit the composite KCIDELJB standalone job, which deletes obsolete elements in read-only runtime dataset copies of the %GBL\_TARGET\_HILEV%. TK\* SMP/E target datasets. Run this job when the started tasks are not running in order to do the clean-up.

**Tip:** Related to using the KCIJPLOD job's new DELRUN2 step to clean-up these obsolete read-only elements from the read-only product execution datasets (RKANMOD\* load libraries, RKANDATV ODI library, RKANWENU enhanced 3270UI workspace library, etc.), use the KCIJPW1R job to clean-up obsolete PARMGEN tailored runtime members from the product execution user libraries when the product started tasks are not running.

- PARMGEN KCIJPW1R/KCIJPW2R dependencies and changes:  
For staged upgrade planning, use the KCIJPW1R job to delete any obsolete runtime members that are no longer generated by the PARMGEN \$PARSE\* job for the product-specific deprecated functions (CUA-related product runtime members, Epilog-related product runtime members, and other obsolete functions) from the product-execution user libraries for each RTE to upgrade (RKANCMDU, RKANPARU, RKANSAMU, RKD2PAR, RKD2PRF and RKD2SAM), when the product started tasks are not in use.

**Tip:** You do not have to delete these obsolete runtime members from the product execution user libraries (RK\* user) immediately after SMP/E upgrade and reconfiguration of the RTEs pointing to the upgraded SMP/E target datasets. The product started tasks upgraded and loaded with the latest OMEGAMON V5.5 code will continue to run and tolerate the obsolete runtime members. You can continue to use the KCIJPW2R "Copy runtime mbrs from WK\*->RK\* RW libraries" to refresh the RK\* user libraries after an upgrade following either the [SMPE04](#), [SMPE05](#), or [SMPE06](#) upgrade scenario.

- PARMGEN KCIJPSEC processing changes:  
If the minimum OMEGAMON for IMS FMID HKI5vuv version is V5.5.0, add logic in PARMGEN to:  
remove IMS V9.1-related module (KOICTJQ), IMS V10.1-related module (KOICTKQ) and IMS V11.1-related module (KOICTLQ) from COPYKOIM step and KOISUPDI PROC in the composite job and in the xKANSAMU(KOISUPD) standalone OMEGAMON for IMS security tailored job.

**Tip:** Before you rerun KCIJPSEC job, you must take steps to disable/enable IMS related modules no longer shipped/newly shipped in the version of OMEGAMON for IMS installed by FMID HKI5vuv. For detailed information, see "Enabling the IMS version-related modules" topic in the [OMEGAMON for IMS documentation](#). In summary, customize the

WCONFIG(KI2\$SSC\*) override imbeds prior to rerunning the \$PARSE\* job, which refreshes the upgraded KCIJPSEC job.

- PARMGEN KCIJPLNK processing changes:
  - LKEDppp steps are no longer generated for OMEGAMON for IMS and OMEGAMON for Networks. Their corresponding standalone version of these link jobs (KI2BLDLI for OMEGAMON for IMS, and KONLINK for OMEGAMON for Networks) are also removed starting in V5.5.0.
- For OMEGAMON for IMS:
  - IMS Console Facility (I/CF) is no longer supported, so the relevant messages, PARMGEN product parameters, runtime members, jobs and commands are removed. Use the new feature of IMS Commander, which is implemented within the OMEGAMON enhanced 3270 user interface.
  - Individual settings as a configuration choice for the **KI5\_IInn\_★ KIPCNFG** XE collectors are removed to simplify configuration. Instead, unless otherwise specified in PARMGEN, IMS Connect AUTODISCOVER is set to YES by default. PARMGEN logic is in place to continue to support the advanced KIPCNFG XE granular collectors in earlier versions of OMEGAMON for IMS, but it is recommended to take the PARMGEN LPAR RTE default settings.
  - IMS Command Batch Message Processing interface (known as the BMP interface) that is designed to supplement the Write-to-Operator with Reply (WTOR) interface is no longer supported, so the PARMGEN product parameters, runtime members, jobs and commands are removed. Use the ICMD feature in the KIPCMD workspace from the OMEGAMON enhanced 3270 user interface.
  - ATF Detail Exception Data DETXLOGR=%KI2\_LOGR\_LS\_PREFIX%.&imsid.DX VSAM dataset is no longer allocated or processed in the KI2ATFmp runtime members.
- For OMEGAMON for z/OS:
  - Epilog is no longer supported, so the relevant messages, PARMGEN product parameters, runtime members, jobs and commands are removed. Use the product's replacement feature, which is implemented within the OMEGAMON enhanced 3270 user interface.
- For OMEGAVIEW/OMEGAVIEW II for the Enterprise:
  - Starting in OMEGAMON Dashboard Edition on z/OS V5.5.0, OMEGAVIEW Agent configuration is removed. Use the product's replacement feature, which is implemented within the OMEGAMON enhanced 3270 user interface.
- For End-to-End Response Time Monitor started task, this common component is applicable to the following products only. ETE is no longer supported in the V5.5.0 Family:
  - OMEGAMON for CICS V5.3.0 and earlier versions only
  - OMEGAMON for IMS V5.1.0 and earlier versions only
  - OMEGAMON for Networks V5.3.0 and earlier versions only
  - OMEGAMON for z/OS V5.3.0 and earlier versions only
  - PARMGEN KCIJPLOD processing changes:

If HKET620 End-to-End FMID is not installed, adjust the logic in PARMGEN when to generate the KANMODR IEBCOPY step from SMP/E %GBL\_TARGET\_HILEV%.TKANMODR target dataset to the read-only RKANMODR base dataset. TKANMODR is only SMP/E packaged by the HKET620 End-to-End FMID, the OMEGAMON for CICS FMID HKC5vvv and the OMEGAMON for IMS FMID HKI5vvv.
  - PARMGEN KCIJPSYS processing changes:

With similar SMP/E requirements noted above, add logic in PARMGEN to no longer generate the ETE started task nor copy it to the system PROCLIB dataset (%GBL\_DSN\_SYS1\_PROCLIB%), nor generate its START/STOP %RTE\_CANSETE\_STC% commands in the composite xxxxSTRT/xxxxSTOP tailored PROCs.
- Provided additional IVP advanced validation checks:

- Detect an error condition when customer executes the "DLAJOB" shortcut command on the "Customize PARMGEN configuration profiles" KCIP@PG6 panel but the z/OS DLA SMP/E SIZD\* target datasets do not exist or customer has a different zDLA high level qualifier (IZDHLQ parameter) in the DLADISC step of KCIJPDLA job.
- Detect an error condition when customer executes the "DLAJOB" shortcut command on the "Customize PARMGEN configuration profiles" KCIP@PG6 panel but the z/OS DLA FMID HIZD310 is not installed. Provide a warning that IZDHLQ must point to the SMP/E HLQ where you installed FMID HIZD310. UA78769 also introduced the SMPTLOAD requirement. See sample KCIDDFJB SMPTLOAD DDDEF job in %GBL\_TARGET\_HILEV%.TKANSAM(KCIDDFJB) for more information.
- Detect a warning condition when specifying a new **GBL\_USER\_JCL** PARMGEN JCL library using a NONSMS-managed HLQ, but no required VOLUME and UNIT values were supplied on the KCIP@TLV panel. In this case, provide a warning message to re-invoke PARMGEN using the INIT invocation option:

```
%GBL_USER_JCL% ALLOC failed!
If using NONSMS HLQ, use %GBL_TARGET_HILEV%.TKANSAM(KCIALOJB).
Or re-invoke PARMGEN and pass on the 'INIT' option. For example
Command ==> EX '%GBL_TARGET_HILEV%.TKANCUS' 'INIT' "
```

- Enhanced the PARMGEN KCIJPDLA\* processing to generate helpful "\*" zDLA \$DLARPT job no DB2 auth" in the autodiscovered "KD2\_DBnn\_DB2\_VER" OMEGAMON for DB2 LPAR RTE profile parameter alerting customers when DB2 Authorizations have not been performed prior to using the KCIJPDLA function. The KCIJPDLA\* jobs have been updated to list the DB2 specific SQL GRANT commands.

#### Note:

Technote [Preinstallation Requirements and Instructions](https://www.ibm.com/support/docview.wss?uid=swg21318692) (<https://www.ibm.com/support/docview.wss?uid=swg21318692>) has been updated with "Important System Requirements:" zDLA requirements.

- Provided JOBGEN support for IBM Tivoli Discovery Library Adapter FMID HIZD310.

**Tip:** JOBGEN file-tailors SMP/E jobs that accommodate the SMP/E requirements of FMID HIZD310, ideally installed in an existing or new OMEGAMON/ITM CSI, where one can take advantage of using the PARMGEN z/OS DLA integration autodiscovery jobs (KCIJPDLA). Each OMEGAMON Family V5.5.0 standalone product package will now ship the z/OS DLA FMID HIZD310 by default (for PARMGEN use only).

- Provided a new "R" option to make it easier to (R)efresh the product templates and IBM-supplied default profiles prior to recreating the product runtime members. This is applicable to [SMPE02](#) or [SMPE03](#) maintenance scenario.

Description	Job Name
R Refresh IK* templates/WCONFIG *\$IBM profiles.	KCIJPUP1
1. Create runtime members/jobs in all WK* libs.	\$PARSE

## Product-specific enhancements

The following product-specific enhancements are provided in this release:

### Tivoli Management Services: Engine infrastructure common to all z/OS TEMS and Agents

The following features are added:

- (Common to all z/OS TEMS and z/OS Agents) Enhanced configuration to auto-discover the following parameter values by the PARMGEN z/OS DLA integration:
  - Auto-discover new \$GBL\$USR global user profile parameter **GBL\_DSN\_CEE\_SCEERUN2**. The auto-discovered value can be used for monitoring Agents that require the LE/370 "C" runtime library to be concatenated in the STC's STEPLIB DD.

- Auto-discover \$GBL\$USR global user profile parameter **GBL\_DSN\_NETVIEW\_CNMLINK**. The auto-discovered value is concatenated in the z/OS TEMS and Agent STCs' respective RKANMODL DD if you are enabling the ITM Forward Take Action commands to NetView for z/OS.

**Tip:** It is ideal to customize this library as part of initial RTE deployment even if the respective ITM features that require the CNMLINK dataset is not yet enabled. Auto-discovering this load library value ensures that PARMGEN sets up the product started tasks' STEPLIB DD to concatenate this dataset to avoid recycling the TEMS and Agent started tasks later.

- Auto-discover \$GBL\$USR global user profile parameter **GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA** for SYSTCPD DD that is required for a number of ITM features if enabled (for example, if LPAR contains more than one TCP/IP stack).
- Provide a new handy RTE RKANSQULU(KDSSQLD) Sample SPUFIL Delete SQL statements member, to remove obsolete product entries in the O4SRV.T\* z/OS TEMS Enterprise Information Base (EIB) tables (%RTE\_VSAM\_HILEV%.%RTE\_NAME%.RKDS\* VSAM datasets). PARMGEN KCIJPLOD job is updated to provide a new SSQLIBCP IEBCOPY step to copy this new KDSSQLD member (along with the handy new KDSSQL1 SDA TAPPLPROPS RKDSAPPL TEMS VSAM member introduced in PARMGEN 4Q16 IF), from the PARMGEN WKANSAMU work staging dataset to the product-execution RTE RKANSQULU dataset. PARMGEN automatically concatenates the RKANSQULU dataset in the TEMS' SSQLIB DD, where the TEMS SPUFIL processing is operationally performed during TEMS CTDS SPUFIL invocation.

**Tip:** On distributed platforms, performing this SPUFIL equates to the tacmd deleteappinstallrecs function. Having a handy KDSSQL\* members supplied by PARMGEN provides an alternative to perform the function on the readily-available z/OS platform, if the distributed TEPS is not available or is not yet set-up.

- Enhance RKANSAMU(KCIODIJB) standalone RKANDATV refresh job and the new cross-RTE %GBL\_USER\_JCL%(KCIJ@ODI) RKANDATV refresh job to also generate a useful VVRRMMFF table which helps with the distributed TACMD execution planning \*PRIOR\* to the various Agents' product startup:

```
Example KCIODIJB output:
KCIRDATV - I (Reference) List of Product Code and Version for TACMD
KCIRDATV - I TKANDATV pp VRMF = vvrrmmff
KCIRDATV - I ===== == =====
KCIRDATV - I KAHVRTMS AH VRMF = 03500000
KCIRDATV - I KCPVRTMS CP VRMF = 05500000
KCIRDATV - I KDPVRTMS DP VRMF = 05400000
KCIRDATV - I KGWVRTMS GW VRMF = 05500000
KCIRDATV - I KIPVRTMS IP VRMF = 05500000
KCIRDATV - I KJJVRTMS JJ VRMF = 05400200
KCIRDATV - I KM5VRTMS M5 VRMF = 05500000
KCIRDATV - I KNAVRTMS NA VRMF = 06210000
KCIRDATV - I KN3VRTMS N3 VRMF = 05500000
KCIRDATV - I KQQVRTMS QQ VRMF = 03200000
KCIRDATV - I KRGVRTMS RG VRMF = 02600000
KCIRDATV - I KRHVRTMS RH VRMF = 02600000
KCIRDATV - I KRJVRTMS RJ VRMF = 03300002
KCIRDATV - I KRKVRTMS RK VRMF = 03300001
KCIRDATV - I KRNVRTMS RN VRMF = 02600000
KCIRDATV - I KRVRTMS RV VRMF = 02400001
KCIRDATV - I KS3VRTMS S3 VRMF = 05400001
```

To generate the new cross-RTE %GBL\_USER\_JCL%(KCIJ@ODI) RKANDATV refresh job, type the LOADDATV command on the Runtime Environments (RTEs) panel (KCIP@RTE). Get to the Runtime Environments (RTEs) panel (KCIP@RTE) via one of the following ways:

- Option **0** from the PARMGEN UTILITIES menu.
- Type a ? on the RTE\_NAME field of the **KCIPQPGA "PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU**.
- Add placeholder parameter support for the following parameters in the WCONFIG(KDS\$PENV) imbed to the TEMS xKANPARU(KDSENV) environmental file, which is read at TEMS STC startup.

```

** o CMS_NODE_VALIDATION parameter enables the rejection of
**   incorrect managed system names.
- *CMS_NODE_VALIDATION=YES
- *CMS_NODE_VALIDATION=&KDS_CMS_NODE_VALIDATION.

```

- Add best-practice user symbols for WCONFIG(KDS\$PENV) placeholder parameters so they are ready for the KCIPARSE step during variables substitution step at TEMS startup. IBM default variables profile %GBL\_USER\_JCL%(KCI\$RTEV) adds the following user symbol definition:

```
KDS_CMS_NODE_VALIDATION  YES          *default if used
```

- Enhance KCIJPUSP job's KDSUSSDV step to use **RTE\_USS\_MKDIR\_MODE** parameter value (default=775) to customize the oshell chmod %RTE\_USS\_MKDIR\_MODE% z/OS® UNIX® System Services command in the RKANDATV(KDSUSS) member. This member copies the RKANDATV(KDSDPROF) TEMS\_JAVA\_BINPATH member to z/OS UNIX.

**Tip:** The ability to customize the permission bits in the z/OS UNIX command caters to sites that implement the new UMASK() override permissions at the system level (for example, UMASK override of 0007 means no permissions altogether for the OTHER bit regardless what the PARMGEN mkdir commands created the directories in the KCIJPUSP job).

- Update xKANSAMU(KDSDFINL) post-configuration step "Step 4 - Copy procedures to %GBL\_DSN\_SYS1\_PROCLIB%" to add this refresh note when adding products to an existing TEMS after initial configuration:

Note:

- Certain products add special product-specific DDNAMEs to the %KDS\_TEMS\_STC% TEMS started task when the respective products are configured in the RTE. These products are as follows:

- o OMEGAMON for Messaging - MQ Configuration (KMC) Agent adds RKCF\* DDNAMEs to the TEMS started task:

Example:

```

//RKCFDLOG DD DISP=SHR,
//          DSN=&RHILEV..&SYS..RKCFDLOG
//RKCFAPLT DD DISP=SHR,
//          DSN=&RVHILEV..&SYS..RKCFAPLT
//RKCFAPLA DD DISP=SHR,
//          DSN=&RVHILEV..&SYS..RKCFAPLA
//RKCFAPLN DD DISP=SHR,
//          DSN=&RVHILEV..&SYS..RKCFAPLN
//*DSNAOINI DD DISP=SHR,
//*          DSN=&RHILEV..&SYS..RKANPARU(KCFDBINI)

```

- o OMEGAMON for Storage (KS3) Agent adds SYSTSPRT and RKS3I\* DDNAMEs to the TEMS started task:

Example:

```

//SYSTSPRT DD SYSOUT=&SOUT
//RKS3IRDR DD SYSOUT=(,INTRDR)
//RKS3IDCO DD DUMMY

```

- Update the PARMGEN F1=Help Parameter On-line Help text for the TEMS' **KDS\_TEMS\_STORAGE\_MINIMUM\_EXTEND** LPAR RTE profile parameter in the WCONFIG(%RTE\_NAME%):

"Tip: The default values should work for most cases, but if you have a large shop and numerous ITM components (other TEMS, Agents) communicating to this TEMS running on this LPAR, or z/OS Agents running in this local TEMS address space, please review this documentation for best practice storage deployment considerations:  
<http://www.ibm.com/support/docview.wss?uid=swg21501180>"

**KDS\_TEMS\_STORAGE\_MINIMUM\_EXTEND** LPAR RTE profile parameter value populates the **MINIMUM(%KDS\_TEMS\_STORAGE\_MINIMUM\_EXTEND%,X)** parameter in the TEMS' RKANPARU(KDSSYSIN) runtime member. Default is **MINIMUM(768000,X)** parameter.

This is JOBGEN SMP/E installation and PARMGEN application configuration support for a new version of IBM OMEGAMON Enhanced 3270 User Interface V7.5.0 and OMEGAMON Subsystem V7.5.0, which are OMNIMON base features delivered in the HKOB750 FMID. The following configuration enhancements are provided to support new features in this new version.

- Add placeholder parameter support for the following parameters in the WCONFIG(KOB\$PENV) imbed to the TOM xKANPARU(KOBENV) environmental file, which is read at OMEGAMON enhanced 3270UI (%KOB\_TOM\_STC%) TOM STC startup.
  - **PNG\_TIMEOUT=&KOB\_PNG\_TIMEOUT**
  - **SO\_TIMEOUT=&KOB\_SO\_TIMEOUT**
  - **DIS\_TIMEOUT=&KOB\_DIS\_TIMEOUT**
- Add best-practice user symbols for WCONFIG(KOB\$PENV) placeholder parameters so they are ready for the KCIPARSE step during variables substitution step at TOM startup. IBM default variables profile %GBL\_USER\_JCL%(KCI\$RTEV) adds the following user symbol definitions:

- KOB_PNG_TIMEOUT	1	*default if used
- KOB_SO_TIMEOUT	15	*default if used
- KOB_DIS_TIMEOUT	30	*default if used

- Update xKANSAMU(KOBDINL) post-configuration step "(Optional) Complete enablement of alternate XKAN\* Tivoli OMEGAMON (TOM) datasets for other integration products that deliver workspaces and other OMEGAMON enhanced 3270UI support elements" to document new version KQQ IBM DB2 Query Monitor for z/OS V3.3.
- Change default values of the following parameters in the WCONFIG(KOB\$PENV) imbed to xKANPARU(KOBENV):
  - **PNG\_TIMEOUT=2 to PNG\_TIMEOUT=1**
  - **DIS\_TIMEOUT=2 to DIS\_TIMEOUT=30**

#### OMEGAMON for CICS V5.3.0 and V5.5.0

This is JOBGEN SMP/E installation and PARMGEN application configuration support for a new version of IBM OMEGAMON for CICS on z/OS V5.5.0 (HKC5550 FMID). The following configuration enhancements are provided to support new features in this new version.

- Enhance configuration of KC2GLB globals customization in PARMGEN UTILITIES panel option **10**. **GBL\_DSN\_GLOBAL\_SOURCE\_LIB** navigation by clarifying the usage of these KC2GLB globals ONDV parameters:

```
<ONLINE_VIEWER>
DATA_STORE_TYPE=
DATA_STORE_FILE_NAME=
```

For customers enabling usage of the On-line Data Viewer (ONDV) task history RKC2HIST VSAM LDS as the storage type (**DATA\_STORE\_TYPE=FILEOCMP** or **DATA\_STORE\_TYPE=AUTO**), enablement instructions are needed in the OMEGAMON for CICS KC2GLB manage global documentation that customers must add the key **DATA\_STORE\_FILE\_NAME** parameter in the KC2GLB global in use by the OMEGAMON for CICS Classic started task's RKC2GLBL DDNAME. The **DATA\_STORE\_FILE\_NAME** parameter is not supplied by the OMEGAMON for CICS product by default, because its default ONDV task history storage is dataspace.

Enablement instructions are added to the PARMGEN globals in-context help. Syntax examples of **DATA\_STORE\_FILE\_NAME** are also provided.

-----  
KCIPGLH2 Product Global Data Area EDIT Help Panel  
-----

Cursor: <ONLINE\_VIEWER> \*  
DATA\_STORE\_TYPE  
-----

DATA\_STORE\_TYPE=DSPACE

If this parameter is omitted, the default is DSPACE.

#### DSPACE

DSPACE indicates that data for task history collection is saved in a dataspace owned by the OMEGAMON for CICS (3270) interface. This data is saved until the task history collector terminates.

#### FILEOCMP

FILEOCMP indicates that task history data is saved in a VSAM linear dataset. No z/OS dataspace is used. FILEOCMP is required if you have a very large number of CICS transaction records that you wish to access through the ONDV command in OMEGAMON for CICS (3270) interface.

The size of the VSAM file does not have an impact on the amount of virtual storage used in the OMEGAMON for CICS or CICS address spaces. FILEOCMP causes data to be compressed before it is written to the data store.

The file should be allocated prior to restarting the CICS address space using this FILEOCMP monitoring option. Refer to the planning and configuration guide for further information.

Note: You must add the DATA\_STORE\_FILE\_NAME parameter if you are using DATA\_STORE\_TYPE=FILEOCMP or DATA\_STORE\_TYPE=AUTO.

#### AUTO

AUTO indicates that the value of DATA\_STORE\_TYPE could automatically be switched between DSPACE and FILEOCMP. The value FILEOCMP is used if the file which is specified for a CICS region exists. If no file matches the definition then the value DSPACE is used.

Notes: This parameter is applicable to OMEGAMON for CICS V5.5.0 and higher versions only.

You must add the DATA\_STORE\_FILE\_NAME parameter if you are using DATA\_STORE\_TYPE=FILEOCMP or DATA\_STORE\_TYPE=AUTO.

Whether you use a dataspace or linear dataset, the task history collector writes records using a wraparound format. Once the dataspace or dataset is full, the task history collector resumes writing records from the beginning, overlaying the previous data.

```
Cursor: <ONLINE_VIEWER> *
      DATA_STORE_FILE_NAME
```

```
-----
DATA_STORE_FILE_NAME=
```

Specifies the name of a VSAM linear dataset when the DATA\_STORE\_TYPE=FILEOCMP or DATA\_STORE\_TYPE=AUTO is specified.

You can share global data area modules (but not VSAM datasets) across different CICS regions even though a dataset name is specified in the global data area module. To do this, you must insert one wildcard character (\*) somewhere in the VSAM dataset name on this operand. When the task history collector is running, the wildcard character is replaced by the job name of the CICS region being monitored. The wildcard character may appear anywhere in the dataset name and should occur only once.

Syntax example:

```
o DATA_STORE_FILE_NAME=&rtevh1q.&rte.*.RKC2HIST
```

(where:

- &rtevh1q = Your RTE\_VSAM\_HILEV VSAM HLQ value you specified during PARMGEN RTE configuration in the RTE's WCONFIG(%RTE\_NAME%) LPAR RTE profile).
- &rte = Your RTE\_NAME LPAR RTE name)

Note:

In PARMGEN, review the KC2\_HS\* table parameter rows in the RTE's WCONFIG(%RTE\_NAME%) LPAR RTE profile to enable the allocation of the ONDV task history VSAM LDS %RTE\_VSAM\_HILEV.%RTE\_NAME%.%KC2\_HSnn\_CICS\_REGION%.RKC2HIST in the PARMGEN-tailored xKANSAMU(KC2HISJB) standalone OMEGAMON for CICS task history VSAM allocation job or in the xKANSAMU(KCIJPALO) composite dataset allocation job.

- Add new **Step 8 - (Optional) Start/stop product functions dynamically** step in xKANSAMU(KC5DFINL) post-configuration on-line README to provide a quick way to increase the OMEGAMON for CICS Agent's WLM BLOCKS parameter dynamically and thereby avoid recycling the OMEGAMON for CICS Agent.
- OMEGAMON CUA, Epilog and End-to-End features are no longer supported, so the relevant messages, PARMGEN product parameters, runtime members, jobs and commands are removed. Use the product-specific replacement features, which are implemented within the OMEGAMON enhanced 3270 user interface.

### OMEGAMON for CICS TG V5.3.0 and V5.5.0

This is JOBGEN SMP/E installation and PARMGEN application configuration support for a new version of OMEGAMON for CICS TG V5.5.0 (HKGW550 FMID), which is part of the IBM OMEGAMON for CICS on z/OS product package. The following configuration enhancements are provided to support new features in this new version.

- Enhance configuration to autodiscovery the following parameter values by the PARMGEN KCIJPDLA discovery job:
  - Auto-discover LPAR RTE user profile parameter for each CICS TG Gateway Daemon STC name or the WebSphere region: **KGW\_SAnn\_CTG\_DAEMON\_STC**.
  - Auto-discover \$GBL\$USR global user profile parameters **GBL\_DSN\_CICS\_CTG\_DLL** CICS TG Dynamic Link Library. Auto-discovered value is concatenated in the OMEGAMON for CICS TG Agent started task's STEPLIB DD. In PARMGEN 3Q17 IF PTF UA91953, this value is pre-populated with the auto-discovered SCTGDLL dataset as the preferred library over the previous settings of SCTGLINK.

### OMEGAMON for IMS V5.3.0 and V5.5.0

This is JOBGEN SMP/E installation and PARMGEN application configuration support for a new version of IBM OMEGAMON for IMS on z/OS V5.5.0 (HKI5550 FMID). The following configuration enhancements are provided to support new features in this new version.

- Enhance configuration to auto-discover the following parameter values by the PARMGEN KCIJPDLA discovery job:
  - Auto-discover \$GBL\$USR global user profile parameters:

- **GBL\_DSN\_IMS\_SCEXLINK** IMS Connect load library
- **GBL\_DSN\_IMS\_SFUNLINK** IMS Connect load library
- **GBL\_DSN\_IMS\_RESLIB** IMS RESLIB load library
- Auto-discover LPAR RTE user profile parameter for each IMS subsystem monitored:
  - **KI2\_I1nn\_CLASSIC\_IMSID**
  - **KI2\_I1nn\_CLASSIC\_IMS\_RESLIB**
- Automatically instantiate each IMS-subsystem specific parameter value for each IMS subsystem discovered to ensure uniqueness as the product requires that each IMS subsystem is monitored by a unique OMEGAMON for IMS MPREFIX, Classic started task, Classic VTAM major node, and Classic VTAM APPLID, as shown in the example of 2 IMS subsystem rows auto-discovered:

```

Example:
- KI2_I101_CLASSIC_MPREFIX      M0
- KI2_I101_CLASSIC_STC          IBM0I0
- KI2_I101_CLASSIC_VTAM_NODE    CTDOI0N
- KI2_I101_CLASSIC_VTAM_APPL    CTDOI0
- KI2_I102_CLASSIC_MPREFIX      M1
- KI2_I102_CLASSIC_STC          IBM0I1
- KI2_I102_CLASSIC_VTAM_NODE    CTDOI1N
- KI2_I102_CLASSIC_VTAM_APPL    CTDOI1

```

- Change **KI2\_I1nn\_CLASSIC\_LROWS** default value from 255 to 9999. Existing RTEs are not impacted. The new default value takes effect for new RTEs created after you apply PARMGEN 3Q17 IF PTF.
- Change LPAR RTE profile parameter **KI5\_X\_AGT\_STORAGE\_LIMIT\_EXTEND** default value from 23 to 24.  
**KI5\_X\_AGT\_STORAGE\_LIMIT\_EXTEND** LPAR RTE profile parameter value populates the **LIMIT(%KI5\_X\_AGT\_STORAGE\_LIMIT\_EXTEND%,X)** parameter in the Agent's RKANPARU(KI5SYSIN) runtime member. New default is **LIMIT(24,X)** parameter (applicable to new RTEs created with PTF UA91953 applied).
- OMEGAMON CUA and End-to-End features are no longer supported, so the relevant messages, PARMGEN product parameters, runtime members, jobs and commands are removed. Use the product-specific replacement features, which are implemented within the OMEGAMON enhanced 3270 user interface.

### OMEGAMON for Messaging (WebSphere MQ, a.k.a. MQ Monitoring) V7.3.0 and V7.5.0

This is JOBGEN SMP/E installation and PARMGEN application configuration support for a new version of IBM OMEGAMON for Messaging on z/OS - MQ V7.5.0 (HKMQ750 FMID). The following configuration enhancements are provided to support new features in this new version.

- Enhance configuration to auto-discover the following parameter values by the PARMGEN KCIJPDLA discovery job:
  - Auto-discover \$GBL\$USR global user profile parameters for WebSphere MQ load libraries:
    - **GBL\_DSN\_WMQ\_SCSQANLE**
    - **GBL\_DSN\_WMQ\_SCSQAUTH**
    - **GBL\_DSN\_WMQ\_SCSQLOAD**
  - Auto-discover WCONFIG(KMQ\$CUR) RKANCMU(KMQUSER) imbed to add placeholder entries for discovered MQ Queue managers.
- Update the RTE xKANSAMU(KCIDFINL) post-configuration on-line README step "7c) Add the following modules to the IPL linklist" to add KMQAMHSE module introduced by HKMQ730 PTF UA82781. It reads: "KMQASSIN, KMQAMHST, KMQAMHSD, KMQAMHSE modules (OMEGAMON for Messaging) in load library (TKANMOD SMP/E target or read-only RTE RKANMOD dataset), if Application Statistics feature (MQI Monitoring), will be enabled".
- Change LPAR RTE profile parameter **KMQ\_X\_AGT\_STORAGE\_LIMIT\_EXTEND** default value from 23 to 24.  
**KMQ\_X\_AGT\_STORAGE\_LIMIT\_EXTEND** LPAR RTE profile parameter value populates the **LIMIT(%KMQ\_X\_AGT\_STORAGE\_LIMIT\_EXTEND%,X)** parameter in the Agent's

RKANPARU(KMQSYSIN) runtime member. New default is **LIMIT(24,X)** parameter (applicable to new RTEs created with PTF UA91953 applied).

- Remove the MQ3270 function in the RTE's RKANCMU(KDSSTR1) TEMS startup and in the RKANPARU (KDSSYSIN) TEMS loadlist startup runtime members. The following statements are now removed once OMEGAMON for Messaging - MQ V7.5.0 is configured or upgraded in the RTE where the TEMS is configured:
  - From RKANCMU(KDSSTR1) TEMS startup:
    - DIALOG %KDS\_TEMS\_VTAM\_APPL\_MQ% KMQDSTR
    - NTD KMQDPINI
  - From RKANPARU(KDSSYSIN) TEMS startup:
    - LOADLIST(KMQLLIST)

This removal also helps in reducing CPU overhead at the TEMS address space.

### **OMEGAMON for Messaging (WebSphere Message Broker, a.k.a. IBM Integration Bus, Monitoring) V7.3.0 and V7.5.0**

This is JOBGEN SMP/E installation and PARMGGEN application configuration support for a new version of IBM OMEGAMON for Messaging on z/OS - Integration Bus V7.5.0 (HKQI750 FMID). The following configuration enhancements are provided to support new features in this new version.

- Enhance configuration to auto-discover the following parameter values by the PARMGGEN KCIJPDLA discovery job:
  - Auto-discover \$GBL\$USR global user profile parameter **GBL\_DSN\_CEE\_SCEERUN** LE load library.
  - Auto-discover LPAR RTE user profile parameter **KQI\_XML\_XIMBNAME\_MON\_BRKR\_NAME** giving the name of the broker to be monitored.
  - Auto-discover LPAR RTE user profile parameter **KQI\_XML\_XIMBDIR1** giving the broker's ENVFILE z/OS UNIX path.
  - Auto-discover WCONFIG(KQI\$XML) RKANDATV(KQIXML) imbed to add XML entries for additional brokers to monitor.
  - Auto-discover monitored brokers and list each discovered broker's STDENV z/OS UNIX directory in the xKANSAMU(KQIDFINL) post-configuration tailored on-line README for KqiAgent.
- Modify the KQIXML product parameter default values as follows:
  - **KQI\_XML\_XIREQMDL\_REPLY\_QUE\_MDL** KQIXML's defaultReplyQueueModel default changed from SYSTEM.DEFAULT.MODEL.QUEUE to SYSTEM.BROKER.MODEL.QUEUE. This attribute specifies the name of the queue that will be used as a model for creation of the Agent reply queue for any queue manager to which the Agent connects. The PARMGGEN KCIJPUSP job uses this value to build the RTE's RKANDATV(KQIXML).
  - **KQI\_XML\_XISSRET\_SNAPSHOT\_SAMPLE** KQIXML's defaultRetainRecentSnapshotSamples default changed from 15 to 0 if you apply the HKQI730 FP2 PTF tracked in APAR OA51396 (and higher versions). Starting PARMGGEN 3Q17 IF PTF UA91953, PARMGGEN default will also support a null default setting (**KQI\_XML\_XISSRET\_SNAPSHOT\_SAMPLE ""**) resulting in KCIJPUSP/ KCIJPUS job to generate defaultRetainRecentSnapshotSamples="" value. This setting takes advantage of using the internal product code KQIXML default of "0" in the event that the HKQIvsv support is not applied. This attribute gives the minimum number of Snapshot Message Flow Accounting and Statistics samples that will be retained by the Agent for viewing in reports. This is a minimum, more may be retained at any given time. Note that this value should be set to 0 if you do not want the Agent to process Snapshot data from the broker at all. The PARMGGEN KCIJPUSP job uses this value to build the RTE's RKANDATV(KQIXML).

### **OMEGAMON for Messaging (WebSphere MQ Configuration) V7.3.0**

The following enhancements are added

- Enhance configuration to remove starting up the RKPDI DD EXEC for KMCPDICT persistent datastore processing in a z/OS Remote TEMS. To save TEMS and Agent STC CPU overhead, PARMGGEN logic checks are added to not start the KCFAUDIT history processing in the TEMS KPDPCTL, KPDPCTL2, and KPDDFIN ITM persistent datastore runtime members in the RTE's RKANPARU dataset.

- Enhance configuration to auto-discover the following parameter values by the PARMGEN KCIJPDLA discovery job:
  - Auto-discover \$GBL\$USR global user profile parameters for WebSphere MQ load libraries:
    - **GBL\_DSN\_WMQ\_SCSQANLE**
    - **GBL\_DSN\_WMQ\_SCSQAUTH**

#### **OMEGAMON for z/OS V5.3.0 and V5.5.0**

This is JOBGEN SMP/E installation and PARMGEN application configuration support for a new version of IBM OMEGAMON for z/OS V5.5.0 (HKM5550 FMID). The following configuration enhancements are provided to support new features in this new version.

- OMEGAMON CUA, Epilog and End-to-End features are no longer supported, so the relevant messages, PARMGEN product parameters, runtime members, jobs and commands are removed. Use the product-specific replacement features, which are implemented within the OMEGAMON enhanced 3270 user interface.

#### **OMEGAMON for Networks V5.3.0 and V5.5.0**

This is JOBGEN SMP/E installation and PARMGEN application configuration support for a new version of IBM OMEGAMON for Networks on z/OS V5.5.0 (HKN3550 FMID). The following configuration enhancements are provided to support new features in this new version.

- Enhance configuration to auto-discover the following parameter values by the PARMGEN KCIJPDLA discovery job:
  - Auto-discover LPAR RTE user profile parameters for each TCP/IP stack monitored:
    - **KN3\_TCPXnn\_TCPIP\_PROFILES\_DSN**
    - **KN3\_TCPXnn\_TCPIP\_PROFILES\_MBR**
- OMEGAMON CUA and End-to-End features are no longer supported, so the relevant messages, PARMGEN product parameters, runtime members, jobs and commands are removed. Use the product-specific replacement features, which are implemented within the OMEGAMON enhanced 3270 user interface.

#### **OMEGAMON for JVM V5.4.0**

Enhance configuration to auto-discover the following parameter values by the PARMGEN KCIJPDLA discovery job:

- Auto-discover the various JVM subsystem and application types running that are eligible for monitoring, and their respective z/OS UNIX directories to make it easier for customer to add the OMEGAMON for JVM monitoring Agent's (-javaagent) and IBM Java Health Center Agent's (-Xbootclasspath, -agentpath) respective enablement options. List each discovered z/OS UNIX directory or file location for these parameters in the xKANSAMU(KJJDFINL) post-configuration tailored on-line README for KJJ Agent:
  - JVMPROFILEDIR / USSHOME from CICS SIT for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in CICS JVMs.
  - STDENV for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in CICS Transaction Gateway (CTG) JVMs.
  - JVMOPMAS PROCLIB for IMS JMP for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in IMS JVMs.
  - STDENV for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in WebSphere Liberty z/OS Connect EE JVMs.
  - JVM\_OPTIONS in HBRMSTR file for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in ODM.

#### **OMEGAMON for DB2 PE/PM V5.3.0 and V5.4.0**

The following enhancements are added:

- Enhance configuration to auto-discover the following parameter values by the PARMGEN KCIJPDLA discovery job:
  - Auto-discover LPAR RTE user profile parameter for each DB2 subsystem to make it easier to concatenate these DB2-subsystem-specific load libraries in the various OMEGAMON for DB2 BIND and GRANT jobs per subsystem:

- **KD2\_DBnn\_DB2\_SSID**
- **KD2\_DBnn\_DB2\_VER**
- **KD2\_DBnn\_DB2\_LOADLIB**
- **KD2\_DBnn\_DB2\_RUNLIB**
- **KD2\_DBnn\_PWH\_LOADLIB**
- **KD2\_DBnn\_PWH\_EXITLIB**
- **KD2\_DBnn\_DB2\_SYSNAME**
- Auto-discover \$GBL\$USR global user profile parameters to make it easier to concatenate these DB2 subsystem load libraries in the STEPLIB DDNAME of the OMEGAMON for DB2 Classic started task (GBL\_DB2\_KD2\_CLASSIC\_STC) and other various OMEGAMON DB2 jobs:
  - **GBL\_DSN\_DB2\_LOADLIB\_V10**
  - **GBL\_DSN\_DB2\_RUNLIB\_V10**
  - **GBL\_DSN\_DB2\_LOADLIB\_V11**
  - **GBL\_DSN\_DB2\_RUNLIB\_V11**
  - **GBL\_DSN\_DB2\_LOADLIB\_V12**
  - **GBL\_DSN\_DB2\_RUNLIB\_V12**
  - **GBL\_DSN\_DB2\_SDSNLOAD**
  - **GBL\_DSN\_DB2\_DSNEEXIT**

- Generate helpful "\*" zDLA \$DLARPT job no DB2 auth" in the autodiscovered "**KD2\_DBnn\_DB2\_VER**" LPAR RTE profile parameter alerting customers when DB2 Authorizations have not been performed for the KCIJPDLA job or KCIJPD1 job. The KCIJPD1\* jobs have been updated to list the DB2 specific SQL GRANT commands to execute:  
If RACF is used to protect DB2 resources, then authority is required to issue DB2 DISPLAY commands and to access (READ) SYSIBM resources using dynamic SQL. In addition, for the DB2 version autodiscovery, the z/OS DLA extracts the DB2 version via the Instrumentation Facility Interface (IFI).

The IZDPDISC PROC and the auth. ID that runs the KCIJPDLA or KCIJPD1 job must have the appropriate authorization to issue the DB2 commands for each DB2 subsystem.

DB2 Authorities for each DB2 subsystem: Take SQL statements to authorize &user="IZDPDISC" as an example:

```
GRANT DISPLAY,MONITOR1,MONITOR2      TO "IZDPDISC";
GRANT SELECT ON SYSIBM.SYSDATABASE   TO "IZDPDISC";
GRANT SELECT ON SYSIBM.SYSTABLESPACE TO "IZDPDISC";
GRANT SELECT ON SYSIBM.SYSTABLES     TO "IZDPDISC";
GRANT SELECT ON SYSIBM.SYSINDEXES    TO "IZDPDISC";
GRANT SELECT ON SYSIBM.SYSCOLUMNS   TO "IZDPDISC";
GRANT EXECUTE ON PROCEDURE SYSPROC.DSNWZP TO "IZDPDISC";"
```

- Update xKANSAMU(KD5DFINL) post-configuration step "(Optional) Complete enablement of alternate XKAN\* Tivoli OMEGAMON (TOM) datasets for other integration products that deliver workspaces and other OMEGAMON enhanced 3270UI support elements" to document new version KQQ IBM DB2 Query Monitor for z/OS V3.3.

### OMEGAMON for Storage V5.3.0 and V5.4.0

Add xKANSAMU(KS3DFINL) post-configuration step "Step 1 - Refresh procedures to %GBL\_DSN\_SYS1\_PROCLIB%".

```
a) Refresh the TEMS started task (%KDS_TEMS_STC%) from RKANSAMU to %GBL_DSN_SYS1_PROCLIB%.
Notes:
- Certain products add special product-specific DDNAMEs to the %KDS_TEMS_STC% TEMS started task when the respective products are configured in the RTE. These products are as follows:
  o OMEGAMON for Storage (KS3) Agent adds SYSTSPRT and RKS3I*
```

```
DDNAMEs to the TEMS started task:  
Example:  
//SYSTSPRT DD SYSOUT=&SOUT  
//RKS3IRDR DD SYSOUT=(,INTRDR)  
//RKS3IDCO DD DUMMY"
```

## PARMGEN PTF UA91952 for APAR OA51755 (2Q17 Interim Feature)

PARMGEN PTF UA91952 for APAR OA51755 (2Q17 Interim Feature) introduces several enhancements, which are described in this section.

### PARMGEN configuration framework enhancements and updates

The configuration software includes the following enhancements:

- Provide \$JOB CARD-related processing updates to the KCIJRCD jobcard macro and the sample jobcard for the first-time PARMGEN users in support of z/OS 2.3 currency with users that have 8-character TSO user IDs. The TSO user ID will be used as the preferred jobname.
- Provide additional IVP advanced validation check during the VALIDATE step of PARMGEN \$PARSE\*-related jobs, or PARMGEN KCIJPVAL standalone validation job:
  - Detect a warning condition when the parameter **KDS\_TEMS\_HTTP\_PORT\_NUM** (representing the TEMS HTTP port number) is nulled out or blanked out. **KDS\_TEMS\_HTTP\_PORT\_NUM** is required when OMEGAMON for z/OS product is configured for RMF DDS communication.
  - Detect a warning condition when all the TEMS **KDS\_TEMS\_DRA\_FLAG** and Agent-specific **Kpp\_AGT\_DRA\_FLAG** OMEGAMON enhanced 3270UI's KOBAGENT Data Retrieval Agents (DRA) are all enabled in a given LPAR RTE. Provide a best practice tip that typically one or two OMEGAMON enhanced 3270UI (TOM) KOBAGENT DRAs are required to be started in the TEMS and Agent STCs. You can disable some of the DRA flags, but leave two DRAs enabled in an LPAR for backup purpose.

**Tip:** In a given Sysplex, 1 or 2 TOMs are required and having one or two DRAs in the STCs is typically sufficient. Avoid enabling the DRA in the z/OS Hub TEMS STC.

- For OMEGAMON for Storage Agent: Detect a warning condition when **KDF\_FM01\_MON\_STAT = 'MSR'** and **KDF\_FM01\_SAM\_CNT = '1'** values are specified. MSR=1 may cause performance issues when monitoring a large number of volumes or during heavy I/O traffic. MSR parameter values populate the xKANPARU(KDFDSCIN) runtime member.

### Product-specific enhancements

The following product-specific enhancements are provided in this release:

#### Tivoli Management Services: Engine infrastructure common to TEMS and Agents

The following features are added:

- (TEMS) Enable **KDS\_VALIDATE=YES** parameter for a TEMS configured in a new RTE. The LPAR RTE profile parameter **KDS\_TEMS\_SECURITY\_KDS\_VALIDATE** now has a default value of Y that writes out **KDS\_VALIDATE=YES** in the TEMS' %RTE\_HILEV%.%RTE\_NAME%.RKANPARU(KDSENV) runtime member. This parameter validates user ID access to the TEMS. Setting **KDS\_VALIDATE=NO** means that the application userid is authorized, or the TEMS does not have a security requirement.
- (TEMS) Provide flexibility to set the z/OS® UNIX® System Services permission for the %RTE\_USS\_RTEDIR%/RTE\_NAME%/kds/support/TEMS/KDSDPROF file that contains TEMS\_JAVA\_BINPATH parameter for SDA processing. KCIJPUSP job now provides support for using the RTE\_USS\_MKDIR\_MODE parameter for the chmod z/OS UNIX command. The default permission bits are set to 775. Providing this flexibility accommodates sites that have UMASK() overrides.

#### IBM Tivoli OMEGAMON XE for DB2 PE/PM V5.3.0 and later

The following enhancements are added:

- Enable the configuration of thread history in the OMEGAMON Enhanced 3270 User Interface (enhanced 3270UI). OMEGAMON for DB2 "Thread history" on the enhanced 3270UI is the same capability as what's known as 'near-term history' in the OMEGAMON for DB2 Classic interface. PI82090 delivers this same capability to the enhanced 3270UI for OMEGAMON for DB2. Both Near-

Term History (Classic) and Thread History (enhanced 3270) data is stored in VSAM. The following parameters represent the valid values for storage type:

- (New) THVSAM - Store the data to VSAM datasets for enhanced 3270UI Thread history support.
- (New) VSAMSEQTHVSAM - Store the data to VSAM datasets, sequential files for OMEGAMON DB2 Classic NTH support and VSAM datasets for enhanced 3270UI Thread history support.
- (New) SEQTHVSAM - Store the data to sequential files for OMEGAMON for DB2 Classic NTH support and VSAM datasets for enhanced 3270UI Thread history support.
- (New) VSAMTHVSAM - Store the data to VSAM datasets for OMEGAMON DB2 Classic NTH support and VSAM datasets for enhanced 3270UI Thread history support.

Summary of near-term-history related configuration enhancements (applicable to both TOM thread history and Classic history):

- New PARMGEN parameters enable configuration of thread history. The following new parameters allow you to specify how thread history will be collected:

```

THRDLG (PARMGEN parameter KD2_PFn_THRDHIS_LOG_NUM)
THRDSQL (PARMGEN parameter KD2_PFn_THRDHIS_DYN_SQL)
THRDSKAN (PARMGEN parameter KD2_PFn_THRDHIS_SCAN_SUMM)
THRDSORT (PARMGEN parameter KD2_PFn_THRDHIS_SORT_SUMM)
THRDSUSP (PARMGEN parameter KD2_PFn_THRDHIS_LOCK_SUSP)
THRDCONT (PARMGEN parameter KD2_PFn_THRDHIS_LOCK_CNTN)

```

- To support thread history in the OMEGAMON Enhanced 3270UI, new COPT&dbid parameter values that are THVSAM-related have been added to the WRITEOPTION parameter of the %RTE\_HILEV%.%RTE\_NAME%.RKD2PAR(COPT&dbid) runtime member. In addition, several new parameters, THRDSQL, THRDCONT, THRDSUSP, THRDSKAN, and THRDSORT, have been added for data collection.
- Two new COPT&dbid parameters, THRDLG and THRDDATASET, can be used to control VSAM datasets. The maximum number of VSAM datasets is 60 for Enhanced 3270UI thread history. The PARMGEN LPAR RTE profile parameters supporting the new COPT&dbid parameters are:

```

- THRDLG(%KD2_PFn_THRDHIS_LOG_NUM%)
- THRDDATASET(%KD2_OMPE_VSAM_DSHLQ%.%DB%.RKTH*)

```

- New VSAM dataset allocation logic: The general logic of allocating VSAM data sets for Near Term History has changed. Now, the selected types of datasets are allocated only if the thread history flag (%KD2\_PFn\_HIS\_START%) is set to Y. If this flag is set to N, no data sets are allocated and WRITEOPTION() is changed to NONE. For staging purposes, new standalone VSAM allocation jobs are provided in %RTE\_HILEV%.%RTE\_NAME%.RKD2SAM dataset as follows:

```

* Standalone Job Versions: Applicable if KD2_PFn_HIS_START = "Y":
- RKD2SAM(TCRV&dbid) for OMEGAMON enhanced 3270UI thread history
  o THRDDATASET(%KD2_OMPE_VSAM_DSHLQ%.%DB%.RKTH*) VSAM LDS
- RKD2SAM(HCRV&dbid) for Classic NTH:
  o H2DATASET(%KD2_PF_HIS_LOGn%) VSAM LDS

```

- New imbed increases allowable VSAM datasets: A new WCONFIG(KD2\$PCOP) imbed has been added to the H2DATASET() parameter in the COPT&dbid member. This allows you to enable more than seven Classic RKD2VSnn thread history VSAM data sets. The limit for the VSAM data sets number for thread history is now 1024. Only seven data sets can be set via PARMGEN. The others should be specified in WCONFIG(KD2\$PCOP) prior to submitting the WCONFIG(\$PARSE\*)-related "Create runtime members" and WKANSAMU(KCIJPW2R) "Copy runtime mbrs from WK\*->RK\* RW libs" jobs.
- New default sizes and units for memory: The default size and memory measurement units are changed from 10 Cylinders to 900 MegaBytes (MB) when allocating the thread history datasets. The value is controlled via two profile parameters:

```

- KD2_PFn_HIS_VSAM_SU
- KD2_PFn_HIS_VSAM_MB

```

Existing RTEs are not impacted; new defaults take effect for new RTEs. OMEGAMON for DB2-related allocation jobs such as RKD2SAM(ALLOCDS) composite OMEGAMON for DB2 NTH

allocation job, new RKD2SAM(TCRV&dbid) standalone RKTH\* enhanced 3270UI thread history dataset allocation job, existing RKD2SAM(HCRV&dbid) standalone RKD2VS\* Classic NTH VSAM dataset allocation job, are all modified to support the new MEGABYTES(%KD2\_PFn\_HIS\_VSAM\_MB%) parameter value.

- Add support for a new GRANT command for the SYSIBM.SYSCOLUMNS table in the %RTE\_HILEV%. %RTE\_NAME%.RKD2PAR(OMGR&dbid) member:

```
GRANT SELECT ON SYSIBM.SYSCOLUMNS to
%KD2_CLASSIC_DB2PM_PLANPKG_OWNER%;
```

- Change the default values of DB2RTCPU and DB2REMIO parameters to YES in the %RTE\_HILEV%. %RTE\_NAME%.RKD2PAR(OMPEOPTS) runtime member applicable to new runtime environments (RTEs) that configure OMEGAMON for DB2. Existing RTEs are not impacted.

#### IBM OMEGAMON for JVM on z/OS V5.4.0

Enhance configuration that supports IBM Java Health Center Agent packaging in the following jobs:

```
- KCIJPUSP "(Re)Create USS runtime members in RKANDATV" USS
  preparation job
- KCIJPUSS "Create USS directories/(Re)Copy USS files" job
```

Logic is added to KCIJARPX step in the KCIJPUSS job to accommodate bpxbatch requirements in later versions of z/OS for the "cd" and "pax" commands. In later z/OS versions, the commands get executed independently, so that the current working directory for the pax command is the user's home directory rather than the TKANJAR SMP/E install z/OS UNIX source directory. The enhancements being made to the PARMGEN KCIJPUSS job's KCIJARPX step is to accommodate all possible scenarios.

#### IBM OMEGAMON for CICS TG on z/OS V5.3.0:

Logic is added to KCIJARPX step in the KCIJPUSS job to accommodate bpxbatch requirements in later versions of z/OS for the "cd" and "pax" commands. In later z/OS versions, the commands get executed independently, so that the current working directory for the pax command is the user's home directory rather than the TKANJAR SMP/E install z/OS UNIX source directory. The enhancements being made to the PARMGEN KCIJPUSS job's KCIJARPX step is to accommodate all possible scenarios.

#### IBM OMEGAMON for IMS on z/OS V5.3.0:

Address the \$PARSE "Create runtime members and jobs" code to generate the KIPICPT dataset when KI5\_X\_ICT\_IMS\_CONNECT\_FLAG=Y is enabled.

### PARMGEN PTF UA83283 for APAR OA51503 (4Q16B Interim Feature)

PARMGEN PTF UA83283 for APAR OA51503 (4Q16B Interim Feature) introduces several enhancements that benefit **IBM OMEGAMON for JVM on z/OS**.

#### PARMGEN configuration framework enhancements and updates

The configuration software includes the following enhancements:

- Updated the Suites Code legend in the detailed discussion on system preparation topics such as **IBM Management Suites that JOBGEN/PARMGEN help deploy – Overview, Components in the Product Suites Matrix by Suite Code, Components in the Product Suites Matrix by JOBGEN Exploitation, and Components in the Product Suites Matrix by PARMGEN Exploitation**. You can find the topics on the **Welcome to the z/OS Installation and Configuration Tools for IBM Tivoli Management Services (TMS) dependent products (KCIPQPGW panel / KCIHPGW help panel)**. Additional JOBGEN and PARMGEN on-line help updates are added to support the new version of the following suites:
  - New version of IBM Service Management Suite for z/OS V1.4.1. Suite is refreshed to include new versions of the following products:
    - IBM OMEGAMON for DB2 Performance Experts on z/OS V5.4.0
    - IBM OMEGAMON for JVM on z/OS V5.4.0
    - IBM OMEGAMON for Storage on z/OS V5.4.0
  - New version of IBM OMEGAMON Performance Management Suite for z/OS V5.4.1. Suite is refreshed to include new versions of the following products:
    - IBM OMEGAMON for DB2 Performance Experts on z/OS V5.4.0

- IBM OMEGAMON for JVM on z/OS V5.4.0
- IBM OMEGAMON for Storage on z/OS V5.4.0
- New version of IBM Advanced Storage Management Suite for z/OS V2.2.1. Suite is refreshed to include new versions of the following products:
  - IBM OMEGAMON for Storage on z/OS V5.4.0
  - IBM Advanced Audit for DFSMSHsm Agent V2.6.0
  - IBM Advanced Reporting and Management for DFSMSHsm Agent V2.6.0
  - IBM Advanced Archive for DFSMSHsm V1.1.0
  - IBM Cloud Tape Connector for z/OS V1.1.0
- Updated the PARMGEN KCIJPALO job to accommodate PDSE V1 requirement for additional TMS: Engine datasets (UKANDATV/RKANDATV) when the RTE is enabled for PDSE support (RTE\_SMS\_PDSE\_FLAG=Y). PDSE V2 format requires DFP FMID HZD2vvv PTF UA81278/UA81279/UA81280 tracked in DFP APAR OA45431. For more information, see technote [ABENDOF4 RKANDATV RKNSLOCL KLVPA001 KLVPA007 KLVPA002 KLVPA003](https://www.ibm.com/support/docview.wss?uid=swg21984143) (<https://www.ibm.com/support/docview.wss?uid=swg21984143>).
- Enhanced the PARMGEN KCIJPUSS job to change the OMEGAMON for JVM-related KCIJARPX step handling the new **IBM Java Health Center Agent** hca\_31.pax and hca\_64.pax files packaged with **OMEGAMON for JVM V5.4.0** to dynamically switch to UID(0) if the TSO user ID submitting the KCIJPUSS job only has read access to the RACF class=facility / profile=bpj.superuser.
- Added new user symbols in the predefined RTE models:

```
- RTE_KCN_CACHE_KM5_RMF_DDS      "&KM5_NTH_DDS."
```

Added new user symbol in the %GBL\_USER\_JCL%(KCI\$RTEV) IBM default variables profile and %GBL\_USER\_JCL%(%RTE\_NAME%) LPAR RTE user variables profile:

```
- KM5_NTH_DDS                    ""
```

## Product-specific enhancements

The following product-specific enhancements are provided in this release:

### IBM OMEGAMON for JVM on z/OS V5.4.0

- Enhanced configuration that supports **IBM Java Health Center Agent** packaging in the following jobs:
  - KCIJPUSP z/OS® UNIX® System Services preparation job
  - KCIJPUSS job

Logic is added to generate the new KCIJARPX step in the KCIJPUSS job for **OMEGAMON for JVM V5.4.0** and higher versions only. The packaging of the hca\_31.pax and hca\_64.pax Health Center Agent binaries are only made available starting in **OMEGAMON for JVM V5.4.0**. The KCIJARPX-related step that expands the pax files is generated commented out in an **OMEGAMON for JVM V5.3.0** configuration. The bpxbatch pax steps that expand the hca\_31.pax and hca\_64.pax Health Center Agent binaries are also enhanced to switch dynamically to superuser (su) if the user ID submitting the KCIJPUSS job does not have a z/OS UNIX UID of 0.

- Enhanced OMEGAMON for JVM Agent post-configuration:
  - Add the 31-bit JVM requirement for IMS JVMs if the IMS version is V13 and earlier, or if the IMS version is V14 and higher, but does not have IMS APAR PI64142 maintenance applied. The following text is added to the **PARMGEN KJJDFINL Complete the configuration on-line README**:

```
"Important:
IMS supports 64-bit Java starting with IMS V14 with PI64142
maintenance. See "New function APAR that provides JVM 64 bit
support" currency technote for more information (URL:
http://www.ibm.com/support/docview.wss?crawler=1&uid=isg1PI64142
)."
```

- Add additional considerations in the methods to configure JVMs in the different subsystems based on the copy of the Health Center Agent being used and what version of OMEGAMON for JVM Agent (KJJ) is running (FMID HKJJ530 GA-1 or the latest GA version FMID HKJJ540).
- Add additional considerations in the **Refresh jar files after SMP/E maintenance and recycle the components** step:

```

*** Important recycle considerations ***
In certain cases, you would also be required to recycle the following
components:
- OMEGAMON for JVM Agent (by default, IBMJJ Agent started task)
* Your KJJ_AGT_STC = %KJJ_AGT_STC%
OMEGAMON for JVM Collector (by default, IBMJT Collector started task)
* Your KJJ_COLLECTOR_STC = %KJJ_COLLECTOR_STC%

- each monitored JVM you may have enabled for detailed monitoring in the
PARMGEN KJJDFINL post-configuration step 1 above.
Refer to the HKJJvvv PTF maintenance HOLDDATA information for required
enablement instructions.

```

## PARMGEN PTF UA82508 for APAR OA50912 (4Q16 Interim Feature)

PARMGEN PTF UA82508 for APAR OA50912 (4Q16 Interim Feature) introduces several enhancements that benefit all products that use the configuration software.

### PARMGEN configuration framework enhancements and updates

The configuration software includes the following enhancements:

- Enhanced **Customize PARMGEN configuration profiles** processing by using the autodiscovery functions of z/OS Discovery Library Adapter (DLA) (FMID HIZD310). The PARMGEN z/OS DLA integration enhancement enables self-discovery of product parameter values during the PARMGEN configuration phase of z Management Suites deployment, thus increasing customer TTV (Time-to-Value) and ease of use. You can customize the LPAR RTE user profile and the \$GBL\$USR global user profile in the RTE's WCONFIG dataset via one of two methods:
  - For the parameters that do not have default values or the IBM-supplied values that need further customization at your site, but are required by the products during configuration phase for PARMGEN to create the runtime members read by the respective product started tasks at startup, supply those configuration settings during the **Customize PARMGEN configuration profiles** step by selecting this option on the **PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU KCIQPGB** panel. Then customize those required parameters, especially for those product parameters that are in a table row format that contain subsystems, etc. For ease-of-use, you can instantiate each table parameter row via the F16=CLNESECT (Clone Section) PF Key macro.
  - (New in PARMGEN 4Q16 IF PTF UA82508) If you have the z/OS Discovery Library Adapter (DLA) FMID (HKIZD310) installed in an LPAR that the PARMGEN configuration jobs have access to, you can use the KCIJPDLA PARMGEN z/OS Discovery Library Adapter (zDLA) autodiscovery job for the following functions:
    - (KCIJPD1 job function) Create a zDLA IDML dataset and drive FMID HZID310 zDLA code to auto-discover active running subsystems in the monitored LPAR.
    - (KCIJPD2 job function) Generate a handy PARMGEN \$DLARPT DLA RTE report in the RTE's WCONFIG dataset from the zDLA IDML extracted data.
    - (KCIJPD3 job function) Refresh the LPAR RTE user profile, the \$GBL\$USR global user profile, certain WCONFIG user imbeds (KMQ\$CUSR, KQI\$XML), and applicable post-configuration READMEs (KJJDFINL, KQIDFINL) with PARMGEN \$DLARPT DLA extracted data.

**Note:** This key integration is especially useful in large environments with multiple subsystems. Customers don't have to manually specify parameter values that are related to monitored subsystems. The PARMGEN enhancement allows you to submit a new KCIJPDLA composite job, or the standalone, function-specific KCIJPD1, KCIJPD2, and KCIJPD3 equivalent jobs.

The goal is to auto-discover subsystems monitored by the PARMGEN z/OS DLA integration so the PARMGEN configuration tool is able to automatically pre-populate the LPAR RTE user profiles with actual customer system data for the remaining required product parameters customized in the user profiles (PARMGEN supplies around 90% IBM configuration defaults out-of-the-box). For more information, refer to **Customize configuration profiles via KCIJPDLA z/OS DLA job** discussion in the PARMGEN on-line helps associated with these three panels:

- PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU
- CUSTOMIZE PARMGEN CONFIGURATION USER PROFILES
- UTILITIES

For more information about how to run the KCIJPDn jobs, see [“Preparing the configuration profiles by running the KCIJPDn jobs”](#) on page 440 and [“PARMGEN z/OS DLA utility jobs and commands”](#) on page 442.

- Enhanced the access to the what's new information of quarterly IFs by adding a new option **I** for **What's New in PARMGEN** in the first PARMGEN welcome screen. A **Revised** flag is displayed next to this option if a new PTF is installed but the what's new topic is not reviewed.
- Enhanced JOBGEN and PARMGEN integration for **GBL\_USS\_TKANJAR\_PATH** and **GBL\_JOBGEN\_WORKFILE JOBGEN** repository autodiscovery. If you used the Install Job Generator (**JOBGEN**) tool to perform the SMP/E work for these products and you specified the JOBGEN output library (workfile repository) during the PARMGEN Set up/Refresh PARMGEN work environment KCIJPCFG step, then PARMGEN extracted the z/OS® UNIX® System Services install root directory value of the **TKANJAR DDDEF** you customized on the "Job Generator - USS Install Path" (KCIJG04 panel). The "USS Install root directory" value is appended to the TKANJAR z/OS UNIX path name and this composite value becomes the PARMGEN-supplied default for this **GBL\_USS\_TKANJAR\_PATH** parameter.
- Provided additional IVP advanced validation checks during the **Create runtime members and jobs VALIDATE** step for \$PARSE\*-related jobs, or PARMGEN **KCIJPVAL** standalone validation job:
  - Detect an error condition when OMEGAMON XE for DB2 PE/PM DB2 subsystem specific LPAR RTE profile parameter **KD2\_DBnn\_DB2\_VER** is missing a required value. As part of the PARMGEN z/OS DLA integration feature, if the new PARMGEN KCIJPDLA job is not authorized to auto-discover the DB2 subsystem version, then the new PARMGEN WCONFIG(\$DLARPT) DLA report will not be able to extract the VERSION row for this DB2\_&dbid subsystem rows. PARMGEN's validation code in the VALIDATE step of \$PARSE jobs as well as in the PARMGEN KCIJPVAL standalone profile validation step, will provide the protective code to alert users that KD2\_DBnn\_DB2\_VER was not automatically populated with discovered data by the new PARMGEN **KCIJPDLA** composite job, or the new PARMGEN **KCIJPD2 Generate \$DLARPT DLA report from IDML dataset** job.
  - Detect an error condition when OMEGAMON XE for DB2 and OMEGAMON XE for IMS LPAR RTE profile table row parameters (**KD2\_DB\***, **KD2\_PF\***, **KI2\_I1\*** product table &Kpp-table row indicators) for &Kpp-table\_ROW numbers are out of sequence. These row parameters are used in instantiating subsystem-specific runtime members that are unique to these products. As part of the PARMGEN z/OS DLA integration feature, the new PARMGEN KCIJPDLA job will ensure that each instantiated set of parameters for applicable table rows is incremented with unique values. If customer is manually customizing the table rows instead of using the PARMGEN KCIJPDLA job, then the validation code in the VALIDATE step of \$PARSE jobs as well as in the PARMGEN KCIJPVAL standalone profile validation step, will provide the protective code to alert users that the values must be unique.
  - Detect an error condition when OMEGAMON XE for DB2 profile parameter **KD2\_DBnn\_DB2\_PORT\_NUM** port number is not unique per DB2 subsystem and one of the functions that require this parameter is enabled. These product functions are as follows:
    - **KD2\_OMPE\_PE\_SUPPORT** - Enable Performance Expert (PE) Client support
    - **KD2\_OMPE\_E2E\_MON\_SPRT** - Enable end-to-end SQL monitoring support
  - Detect an error condition when OMEGAMON XE for IMS LPAR RTE profile table parameters (**KI2\_I1\***) for **CLASSIC\_STC**, **CLASSIC\_MPREFIX**, **CLASSIC\_IMSID**, **CLASSIC\_VTAM\_NODE**, and **CLASSIC\_VTAM\_LOGON\_APPL** parameter values are not unique to each IMS subsystem row. As part of the PARMGEN z/OS DLA integration feature, the new PARMGEN KCIJPDLA job will ensure that each instantiated **KI2\_I1\*** set of parameters for each IMS subsystem discovered, is incremented with unique values. If customer is manually customizing the **KI2\_I1\*** table rows instead of using the PARMGEN KCIJPDLA job, then the validation code in the VALIDATE step of \$PARSE jobs as well as in

the PARMGEN KCIJPVAL standalone profile validation step, will provide the protective code to alert users that the values must be unique.

- Detect an error condition when required parameters are not supplied for OMEGAMON XE for Messaging: WebSphere Message Broker Monitoring Agent (KqiAgent). These parameter value errors are as follows:
    - If **KQI\_XML\_XIMBNAME\_MON\_BRKR\_NAME** giving the name of the broker to be monitored is missing
    - If **KQI\_XML\_XIMBDIR1** giving the broker's ENVFILE z/OS UNIX path is missing
    - If **KQI\_HFS\_HFSROOT\_DIR1** giving the KqiAgent z/OS UNIX path for bin files and logs is missing
- New PARMGEN z/OS DLA KCIJPDLA job can auto-discover these values in the LPAR where WebSphere Message Brokers or IBM Integration Bus brokers are deployed for setting KqiAgent parameter values.
- Detect an error condition when **GBL\_USS\_TKANJAR\_PATH** TKANJAR install z/OS® UNIX® System Services directory is not specified. In WCONFIG(\$GBL\$USR), specify the TKANJAR DDEF install directory for KJJ (OMEGAMON for JVM) and KGW (OMEGAMON for CICS TG) Agent jars and Health Center Agent pax files. PARMGEN KCIJPUSP and KCIJPUSS jobs require the z/OS UNIX directory to expand the **hca\_\* pax** files. **GBL\_USS\_TKANJAR\_PATH** is required when OMEGAMON for JVM (KJJ) Agent is configured, or when OMEGAMON for CICS TG (KGW) Agent is configured in a non-SMP sharing RTE to copy the SMP/E TKANJAR files from **GBL\_USS\_TKANJAR\_PATH** to the runtime z/OS versions.
- Enhanced panel and on-line help panel updates for deployment.
    - Enhanced the main PARMGEN **Welcome to the z/OS Installation and Configuration Tools for z Systems Management Suites** by streamlining the configuration workflow option to display a **Configuration Workflow (Post-installation): Configure z/OS products with Parameter Generator Workflow (PARMGEN)** selection only, rather than providing 2 modes (recommended Quick Configuration mode and the alternate Standard Configuration mode). The welcome menu now only features the recommended Quick Configuration for simplicity. Press F1=Help for more information about the streamlining of the panel options.
    - Added F1=HELP profile parameter on-line help text support for additional parameters in these prefixes so detailed helps are provided when a user places the cursor on the parameter name and presses the PF Key F1=HELP while in edit mode of the LPAR RTE user profile or \$GBL\$USR global user profile:
      - GBL\_\* global profile parameters in WCONFIG(\$GBL\*)
      - RTE\_\* common LPAR profile parameters in WCONFIG(%RTE\_NAME%)
      - KDS\_X\_\* TEMS profile parameters in WCONFIG(%RTE\_NAME%)
      - Kpp\_X\_\* common Agent profile parameters in WCONFIG(%RTE\_NAME%)
    - Updated existing help topics focusing on additional system preparation requirements for the following products:
      - Products that have z/OS UNIX SMP/E and configuration deployment requirements when SDA is enabled.
      - Products that update their TKANJAR DD jar files.
    - Updated panels and associated help panels to add support for Type U or UTIL to access utility menu. Shortcut commands to make it easier to access the Utilities panels where the new PARMGEN z/OS DLA integration jobs are available.
  - Enhanced **Welcome to the z/OS Installation and Configuration Tools for IBM Tivoli Management Services (TMS) dependent products (KCIPQPGW panel / KCIHPGW help panel)** by further enhancing the recently added detailed discussion on system preparation topics such as **IBM Management Suites that JOBGEN/PARMGEN help deploy – Overview, Components in the Product Suites Matrix by Suite Code, Components in the Product Suites Matrix by JOBGEN Exploitation, and Components in the Product Suites Matrix by PARMGEN Exploitation**. You will know the following information before the deployment.
    - How to deploy the SMP/E and configuration requirements of the various components included in the suites.
    - Where to go next after the SMP/E and PARMGEN configuration phase of product deployment (especially components that use their own installation and configuration processes outside JOBGEN/PARMGEN controls).

- Which components need further post-configuration work.

With this information you can have a smoother deployment of the product suites. A well-planned ordering, system preparation, installation, configuration, and post-configuration of the products mean a better time-to-value using the products quicker.

- Provide a new **KCIS\$APF** WCONFIG common user imbed to all product started tasks. KCIS\$APF is a sample composite APF authorized list of datasets:
  - USER SECTION: VARY NODE SECTION
  - USER SECTION: SETPROG APF SECTION
  - USER SECTION: SET SPECIAL VARIABLES SECTION
- Provided update to product configuration assembly/link jobs that need //SYSTEM DD SYSOUT=\* statement to provide a way to define a dataset for binder messages that supplements the SYSPRINT DD.

## Product-specific enhancements

The following product-specific enhancements are provided in this release:

### Tivoli Management Services: Engine infrastructure common to TEMS and Agents

(Common to all z/OS TEMS and z/OS Agents) Enhanced configuration to auto-discover the following parameter values by the PARMGEN z/OS DLA integration:

- Auto-discover \$GBL\$USR global user profile parameter **GBL\_DSN\_CSF\_SCSFMODO** for ICSF load library required for a number of ITM features if enabled:
  - The ITM Password Encryption (KAES256 key) across the ITM enterprise
  - The SOAP server for a TEMS
  - OMEGAMON on z/OS zAware exploitation
  - Take Action commands

It is ideal to customize this library when you create an RTE even if the ITM features that require the ICSF load library are not yet enabled. Auto-discovering this load library value ensures that PARMGEN sets up the STEPLIB DD of the product started tasks to concatenate this dataset to avoid recycling the TEMS and Agent started tasks later.

- Auto-discover \$GBL\$USR global user profile parameter **GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA** for SYSTCPD DD required for a number of ITM features if enabled (if the LPAR contains more than one TCP/IP stack).
- Auto-discover \$GBL\$USR global user profile parameter **GBL\_DSN\_TCP\_PROFILES** dataset for the TCP/IP requirements of various products.
- Provided configuration support for **Autonomous Agent** parameters for **SNMP** support. Placeholder **Central Configuration Server (CCS)** parameters such as **IRA\_CONFIG\_SERVER\_\*** were also provided in the PARMGEN **KAG\$PENV** common Agent user imbed to the RTE's xKANPARU(KppENV) Agent ENV file. For more information, review the topic **How to: Configure an autonomous agent to send SNMP events.**
- Provided a new handy **KDSSQL1** Sample SPUFIL Delete SQL statement to remove Self Describing Agent (SDA) corrupted product entries in the **04SRV.TAPPLPROPS SDA** table (TEMS **RKDSAPPL VSAM** dataset). This member can be used to run the **SQL Processing Using File Input (SPUFI)** to issue an MVS Modify command to the **KDS\_TEMS\_STC** TEMS started task to drive the SQL. On distributed platforms, performing this SPUFIL equates to the **tacmd deleteappinstallrecs** function. Having a handy **KDSSQL1** member supplied by PARMGEN provides an alternative to perform the function on z/OS if the distributed TEPS server is not available or is not yet set up.

### IBM OMEGAMON for JVM on z/OS V5.4.0

- This is JOBGEN SMP/E installation and PARMGEN application configuration support for a new version of IBM OMEGAMON for JVM on z/OS V5.4.0 Agent (HKJJ540 FMID).
- The following configuration enhancements are provided to support new features in this new version. For more information, refer to **What's new in IBM OMEGAMON for JVM on z/OS V5.4.0.**
  - Enhanced installation with support for **JOBGEN TKCIINST(KCIDJG00)** table updates to support SMP/E installation requirements for **new HKJJ540 OMEGAMON for JVM FMID** (if JOBGEN tool will be used to front-end SMP/E).

- Enhanced JOBGEN and PARMGEN integration for **GBL\_USS\_TKANJAR\_PATH** and **GBL\_JOBGEN\_WORKFILE** JOBGEN repository autodiscovery. If you used the Install Job Generator (JOBGEN) tool to perform the SMP/E work for these products and you specified the JOBGEN output library (workfile repository) during the PARMGEN "Setup/ Refresh PARMGEN work environment" KCIJPCFG step, then PARMGEN extracted the **TKANJAR** DDDEF's "USS Install root directory" value you customized on the "Job Generator - USS Install Path" (KCIJG04 panel). The "USS Install root directory" value is appended to the TKANJAR z/OS UNIX path name and this composite value becomes the PARMGEN-supplied default for this GBL\_USS\_TKANJAR\_PATH parameter
- Enhanced configuration that supports **IBM Java Health Center Agent** packaging. IBM Java Health Center Agent is packaged with OMEGAMON for JVM. The following PARMGEN jobs were modified to generate tailored **bpxbatch** commands depending on RTE type:
  - PARMGEN **KCIJPUSP** creates or re-creates z/OS® UNIX® System Services runtime members in RKANDATV z/OS UNIX preparation job.
  - PARMGEN **KCIJPUSS** creates z/OS UNIX directories, and copies or recopies z/OS UNIX files job.
- Added SMP/E target **TKANSAM KJJUSSJB sample job** that expands the shipped Java Health Center Agent **hca\_\* pax** files starting in **IBM OMEGAMON for JVM on z/OS V5.4.0 Agent (HKJJ540 FMID)**.  
For customers who have an SMP/E-sharing RTE deployment but not yet upgraded the RTE to OMEGAMON for JVM V5.4.0 to refresh the KCIJPUSS tailored job, the handy sample KJJUSSJB that is provided in the SMP/E TKANSAM target dataset allows customers to expand the required Health Center Agent **hca\_\* pax** files into the SMP/E **TKANJAR** install z/OS UNIX directory which the OMEGAMON for JVM jar and binary files are executed from.
- Enhanced configuration that adds TEMS application support on z/OS via **PARMGEN KCIJPLOD job's new REPROKJJ** step and a new **KJJRPOJB REPROKJJ standalone job**, which are alternatives to distributed means. TEMS application support seeding is **required** if the Self-Describing Agent (SDA) feature is not enabled at the TEMS.
- Enhanced post-configuration with support for:
  - adding new JVMs monitored by the OMEGAMON for JVM monitoring Agent – tailored post-configuration instructions for the new subsystems or application type such as **IBM Operational Decision Manager (ODM)**, **IBM WebSphere Liberty z/OS Connect** application, and other types being monitored are updated in the modified **PARMGEN KJJDFINL post-configuration on-line README**. For IBM z/OS Connect Enterprise Edition (EE), this application provides a model to enable new cloud-based workloads to securely access z/OS based assets through RESTful API calls. OMEGAMON for JVM supports organizations deploying z/OS Connect EE by providing key metrics that help identify the performance of their available services.
  - auto-discovering the CICS JVM, CICS TG JVM, and IMS Java Dependent Regions and z/OS Connect Enterprise Edition (EE) JVM various locations (STDENV file or applicable z/OS UNIX directories) where the OMEGAMON for JVM and IBM Health Center Agent enablement options need to be added to enable detailed JVM monitoring of various JVM subsystems and application types.
- Enhanced configuration to auto-discover the following parameter values by the **PARMGEN z/OS DLA integration**.  
Auto-discover the various JVM subsystem and application types running that are eligible for monitoring, and their respective z/OS UNIX directories to make it easier for customer to add the **OMEGAMON for JVM monitoring Agent's (-javaagent)** and **IBM Java Health Center Agent's (-Xbootclasspath, -agentpath)** respective enablement options. List each discovered z/OS UNIX directory or file location for these parameters in the KJJDFINL "Post-configuration" tailored on-line **README** for KJJ Agent:
  - **JVMPROFILEDIR/USSHOME** from CICS SIT for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in **CICS JVMs**.
  - **STDENV** for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in **CICS Transaction Gateway (CTG) JVMs**.
  - **JVMOPSMAS PROCLIB** for IMS JMP for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in **IMS JVMs**.

- **STDENV** for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in **WebSphere Liberty z/OS Connect EE JVMs**.

### OMEGAMON Enhanced 3270 User Interface V7.3.0

Enhanced configuration support for preferred RMF Server by supporting a new **RTE\_KCN\_CACHE\_KM5\_RMF\_DDS** LPAR RTE profile parameter. Its value can contain your preferred RMF DDS network address (IP address or IP hostname format) and RMF DDS port number that you want the OMEGAMON Subsystem RMF cache to retrieve the data from, rather than the autodiscovered RMF DDS. **RTE\_KCN\_CACHE\_KM5\_RMF\_DDS** Enablement Support: Refer to **OMEGAMON on z/OS HKM5530 PTF UA82561** (or later maintenance) for the **RTE\_KCN\_CACHE\_KM5\_RMF\_DDS** enablement support if you exploit this feature.

### OMEGAMON Subsystem V7.3.0

- Enhanced configuration support for preferred RMF Server by supporting a new **RTE\_KCN\_CACHE\_KM5\_RMF\_DDS** LPAR RTE profile parameter. Its value can contain your preferred RMF DDS network address (IP address or IP hostname format) and RMF DDS port number that you want the OMEGAMON Subsystem RMF cache to retrieve the data from, rather than the auto-discovered RMF DDS.
- **RTE\_KCN\_CACHE\_KM5\_RMF\_DDS** Enablement Support: Refer to **OMEGAMON on z/OS HKM5530 PTF UA82561** (or later maintenance) for the **RTE\_KCN\_CACHE\_KM5\_RMF\_DDS** enablement support if you exploit this feature.

### OMEGAMON XE on z/OS V5.3.0

- Enhanced configuration support for preferred RMF Server by supporting a new **RTE\_KCN\_CACHE\_KM5\_RMF\_DDS** LPAR RTE profile parameter. Its value can contain your preferred RMF DDS network address (IP address or IP hostname format) and RMF DDS port number that you want the OMEGAMON Subsystem RMF cache to retrieve the data from, rather than the auto-discovered RMF DDS.
- **RTE\_KCN\_CACHE\_KM5\_RMF\_DDS** Enablement Support: Refer to **OMEGAMON on z/OS HKM5530 PTF UA82561** (or later maintenance) for the **RTE\_KCN\_CACHE\_KM5\_RMF\_DDS** enablement support if you exploit this feature. Corresponding **KM5\_RMF\_DDS\_COLLECTION** LPAR RTE profile parameter also is updated to accommodate the changes to the TEMS RTE's **xKANPARU(KDSENV)** parameter called **KDS\_KM5\_DDS=%RTE\_KCN\_CACHE\_KM5\_RMF\_DDS%,%KM5\_RMF\_DDS\_COLLECTION%**.

### OMEGAMON XE for DB2 PE/PM V5.4.0

- This is **JOBGEN SMP/E** installation and **PARMGEN** application configuration support for a new version of **IBM OMEGAMON XE for DB2 Performance Expert (PE) / Performance Monitor (PM) V5.4.0 Agent (HKDB540 FMID)**.
- The following configuration enhancements are provided in support of new features delivered in this new version. For more information, see [What's new in OMEGAMON for Db2 Performance Expert](#).
  - Enhanced installation with support for **JOBGEN TKCIINST(KCIDJG00)** table updates to support SMP/E installation requirements for new **HKDB540 OMEGAMON for DB2 PE/PM FMID** (if **JOBGEN** tool will be used to front-end SMP/E).
  - Added configuration support for Near-term history (NTH) **KD2\_PFn\_HIS\_ACCTG\_CLAS** **PARMGEN** LPAR RTE profile parameter **Accounting Class 11** for monitoring trace data.
  - Added validation check enforcing that the OMEGAMON DB2 port number **KD2\_DBnn\_DB2\_PORT\_NUM** is made unique per DB2 subsystem if PE Client function or E2E SQL monitoring function is enabled. This value must be unique not just per monitored DB2 subsystem, but also from the DB2 port number itself.
  - Added logic checks to only generate certain jobs for DB EXPLAIN based on the OMEGAMON for DB2 version that supports that DB2 version:  
CURRENCY NOTES:
    - DB2 V9.1 is applicable to OMEGAMON for DB2 PE/PM V5.2.0- ("- denotes "and lower versions included").
    - DB2 V10 is applicable to OMEGAMON for DB2 PE/PM V5.1.0+ ("+" denotes "and higher versions included").
    - DB2 V11 is applicable to OMEGAMON for DB2 PE/PM V5.2.0+.
    - DB2 V12 is applicable to OMEGAMON for DB2 PE/PM V5.4.0+.

Profile Parameter Notes:

- KD2\_DBnn\_DB2\_VER = 91 is valid for OMEGAMON for DB2 V5.2.0-.
- KD2\_DBnn\_DB2\_VER = 10 is valid for OMEGAMON for DB2 V5.1.0+.
- KD2\_DBnn\_DB2\_VER = 11 is valid for OMEGAMON for DB2 V5.2.0+.
- KD2\_DBnn\_DB2\_VER = 12 is valid for OMEGAMON for DB2 V5.4.0+.
- Enhanced configuration with DB2 V12 support, including key DB2 features like LOB compression, dynamic plan stability, lifted partition limits, and so on:
  - New **GBL\_DSN\_DB2\_LOADLIB\_V12** and **GBL\_DSN\_DB2\_RUNLIB\_V12 \$GBL\$\*** global profile parameters for runtime members and jobs that support DB2 V12 such as the **GBL\_DB2\_KD2\_CLASSIC\_STC** Classic started task's STEPLIB DDNAME.
  - New **KO2OM540** DB2 package and FPEV\* DBRMs in support of V540 for DB2-subsystem-specific **OMBD&dbid Bind OMEGAMON Server Packages (KO2OMvvv)** job, **OMBP&dbid Bind OMEGAMON Server DB2 Plan (KO2PLAN)** job, **OMGR&dbid Grant DB2 privileges to OMEGAMON Collector Plan/Package OWNER()**
  - New EXC4&dbid DB2 EXPLAIN (New Function Mode) and EXC5&dbid DB2 EXPLAIN (Compatibility Mode) jobs for DB2 V12.
  - Modified DBRM names **DGOY\*** in **EXBD&dbid** Explain bind jobs and DBRM names **BPOM\***, **DGOV\***, **FPEV\*** in **OMBD&dbid** bind jobs for DB2 V12.
- Enhanced configuration to auto-discover the following parameter values by the PARMGEN z/OS DLA integration:
  - Auto-discover LPAR RTE user profile parameter for each DB2 subsystem to make it easier to concatenate these DB2-subsystem-specific load libraries in the various OMEGAMON DB2 BIND and GRANT jobs per subsystem:
    - **KD2\_DBnn\_DB2\_SSID**
    - **KD2\_DBnn\_DB2\_VER**
    - **KD2\_DBnn\_DB2\_LOADLIB**
    - **KD2\_DBnn\_DB2\_RUNLIB**
    - **KD2\_DBnn\_PWH\_LOADLIB**
    - **KD2\_DBnn\_PWH\_EXITLIB**
    - **KD2\_DBnn\_DB2\_SYSNAME**
  - Auto-discover \$GBL\$USR global user profile parameters to make it easier to concatenate these DB2 subsystem load libraries in the STEPLIB DDNAME of the OMEGAMON DB2 Classic started task (**GBL\_DB2\_KD2\_CLASSIC\_STC**) and other various OMEGAMON DB2 jobs:
    - **GBL\_DSN\_DB2\_LOADLIB\_V10**
    - **GBL\_DSN\_DB2\_RUNLIB\_V10**
    - **GBL\_DSN\_DB2\_LOADLIB\_V11**
    - **GBL\_DSN\_DB2\_RUNLIB\_V11**
    - **GBL\_DSN\_DB2\_LOADLIB\_V12**
    - **GBL\_DSN\_DB2\_RUNLIB\_V12**
    - **GBL\_DSN\_DB2\_SDSNLOAD**
    - **GBL\_DSN\_DB2\_DSNEEXIT**
- **Removal of the Common User Access (CUA) interface** to reduce complexity and cost of ownership in the monitoring environment. SMEs experience improved ease of use since all key workspaces are now represented in the enhanced 3270 user interface (enhanced 3270UI) for additional problem solving capability. CUA is eliminated in Version 5.4 since functions which could be accomplished with CUA in previous releases, can now be accomplished with enhanced 3270UI.

### OMEGAMON for Storage V5.4.0

- This is JOBGEN SMP/E installation and PARMGEN application configuration support for a new version of **OMEGAMON for Storage on z/OS V5.4.0 Agent (HKS3540 FMID)**.
- The following configuration enhancements are provided in support of new features delivered in this new version such as:
  - A new history store providing improved performance and resource consumption for near term historical data.
  - Real and historical monitoring of FICON Directors performance bottlenecks.
  - Improvements to the E3270UI allow storage administrator access to critical reports and controls.

For more information, see [New in OMEGAMON for Storage on z/OS 5.4.0](#)

- Enhanced installation with support for **JOBGEN TKCIINST(KCIDJG00)** table updates to support SMP/E installation requirements for new **HKS3540 OMEGAMON for Storage FMID** (if JOBGEN tool will be used to front-end SMP/E).
- **Removal of the Common User Access (CUA) interface** to reduce complexity and cost of ownership in the monitoring environment. SMEs experience improved ease of use since all key workspaces are now represented in the enhanced 3270 user interface (enhanced 3270UI) for additional problem solving capability. CUA is eliminated in Version 5.4 since functions which could be accomplished with CUA in previous releases, can now be accomplished with enhanced 3270UI.

### OMEGAMON XE for CICS on z/OS V5.3.0

- Auto-discover LPAR RTE user profile parameter for each CICS region to make it easier to setup the On-line Data Viewer (ONDV) VSAM LDS RKC2HIST datasets for application history:  
**KC2\_HSnn\_CLASSIC\_CICS\_REGION.**
- Provided a tailored placeholder **RKCPXMxx DD DUMMY** statement in the RTE's WCONFIG(KC5\$SST3) OMEGAMON for CICS Agent started task user imbed (%KC5\_AGT\_STC% IBMC5 by default) to make it easier to enable the same XMIT DDNAME used in the OMEGAMON for CICS Classic 3270 STC.

```
//*****  
//* Multiple RKCPXMnn XMIT linkage parameter  
//* Note: Review the PARMGEN "Perform post configuration steps"  
//*       for KC5 component to review any set-up needed for  
//*       RKCPXMnn DD in the %KC5_AGT_STC% Agent started task.  
//*****  
//*RKCPXM%KC2_CC_CLASSIC_XMIT% DD DUMMY  
//* ----- END - USER SECTION: OVERRIDE -----.
```

### OMEGAMON XE for CICS TG on z/OS V5.3.0

- Enhanced configuration to autodiscover the following parameter values by the PARMGEN z/OS DLA integration:
  - Auto-discover LPAR RTE user profile parameter for each CICS TG Gateway Daemon STC name or the WebSphere region: **KGW\_SAnn\_CTG\_DAEMON\_STC.**
  - Auto-discover \$GBL\$USR global user profile parameters **GBL\_DSN\_CICS\_CTG\_DLL** CICS TG Dynamic Link Library
- Modified the placeholder **KGW\_SAnn\_CTG\_DAEMON\_HOST** Gateway Daemon STC name or the WebSphere region LPAR RTE profile parameter from null value (blank) to the better default of **LOCALHOST** so the running product defaults it to the local IP host name or IP address.
- Provided a tailored **RKGWXMxx DD DUMMY** statement in the OMEGAMON for CICS TG Agent started task (%KGW\_AGT\_STC% IBMGW by default) to make it easier to enable the XMIT DDNAME if the XMIT value is other than the default "00" value.

```
//*****  
//* Multiple RKGWXMnn XMIT linkage parameter  
//*****  
//%CMTGWS21%RKGWXM%KGW_AGT_XMIT% DD DUMMY
```

The KGW LPAR RTE profile parameter KGW\_AGT\_XMIT is also modified accordingly in the LPAR RTE profiles:

```

** (Optional) CICS TG Agent XMIT number:
** If the KGW_AGT_XMIT is other than the default "00" Agent XMIT
** number, the RKGWXM%KGW_AGT_XMIT% DD DUMMY is generated in the
** KGW Agent started task as enabled.
**
** The value is also used in the "GW START ID=XMI, XM=%KGW_AGT_XMIT%"
** KGW Agent startup parameter in the xKANCMDU(KGWAGST) startup
** member.

```

### OMEGAMON XE for IMS on z/OS V5.3.0

- Enhanced configuration to auto-discover the following parameter values by the PARMGEN z/OS DLA integration:
  - Auto-discover LPAR RTE user profile parameter for each IMS subsystem monitored:
    - KI2\_I1nn\_CLASSIC\_IMSID**
    - KI2\_I1nn\_CLASSIC\_IMS\_RESLIB**
  - Auto-discover \$GBL\$USR global user profile parameters **GBL\_DSN\_IMS\_RESLIB** IMS RESLIB load library.
  - Automatically instantiate each IMS-subsystem specific parameter value for each IMS subsystem discovered to ensure uniqueness as the product requires that each IMS subsystem is monitored by a unique OMEGAMON for IMS MPREFIX, Classic started task, Classic VTAM major node, and Classic VTAM APPLID, as shown in the example of 2 IMS subsystem rows auto-discovered.

```

KI2_I101_CLASSIC_MPREFIX      "M0"
KI2_I101_CLASSIC_STC         "IBMOI0"
KI2_I101_CLASSIC_VTAM_NODE   "CTDOI0N"
KI2_I101_CLASSIC_VTAM_APPL   ""CTDOI0"
KI2_I102_CLASSIC_MPREFIX      "M1"
KI2_I102_CLASSIC_STC         "IBMOI1"
KI2_I102_CLASSIC_VTAM_NODE   "CTDOI1N"
KI2_I102_CLASSIC_VTAM_APPL   ""CTDOI1"

```

- Enhanced the default security module for **RACF (KOIRACFX)** and **ACF2 (KOIACF2X)** reference in the **PARMGEN KCIJPSEC** composite security job or the **KOISUPD OMEGAMON for IMS command table security job**, to match the **MODULE=KOIRACFX / MODULE=KOIACF2X** load module names as referenced in the **KOISUPDI** default security exit that PARMGEN KCIJPLOD job uses to copy from the SMP/E target TKANSAM dataset to the **RTE\_X\_SECURITY\_EXIT\_LIB** dataset. PARMGEN KCIJPSEC job processing presents the security exits for further customization and programmatically generates the KCIJPSEC composite security job to process the product security user modules into the RTE's RKANMODU user load library. Starting in PARMGEN 4Q16 IF, the tailored KCIJPSEC job or the standalone KOISUPD security job will use the KOIRACFX and KOIACF2X names.

### OMEGAMON XE for Messaging (WebSphere MQ, a.k.a. IBM MQ, Monitoring) V7.3.0

- Enhanced configuration to auto-discover the following parameter values by the PARMGEN z/OS DLA integration:
  - Auto-discover \$GBL\$USR global user profile parameters **GBL\_DSN\_WMQ\_SCSQANLE**, **GBL\_DSN\_WMQ\_SCSQAUTH**, and **GBL\_DSN\_WMQ\_SCSQLOAD** WebSphere MQ load libraries.
  - Auto-discover **WCONFIG(KMQ\$CURS) RKANCMU(KMQUSER) imbed** to add placeholder entries for discovered MQ Queue managers.
- Provided configuration support for message monitoring summary enhancement in order to support the security checking for situations. Refer to **HKMQ730 Fix pack 2 (FP2) APAR OA50601** for more information.

```

KMQ_MSG_GROUP_MSGSITMON      ""      * YES, NO, STATONLY
KMQ_MSG_GROUP_MSGSITACCOUNT  ""      * MQAGENT, USER=<userid>
KMQ_MSG_QACCESS_MSGSITMON    ""      * YES, NO, STATONLY
KMQ_MSG_QACCESS_MSGSITACCOUNT ""      * MQAGENT, USER=<userid>
KMQ_MSG_QACCESS_IS_DEFAULT   NO      * YES, NO

```

### OMEGAMON XE for Messaging (WebSphere Message Broker Monitoring, a.k.a. IBM Integration Bus, Monitoring) V7.3.0

- Enhanced configuration to autodiscover the following parameter values by the PARMGEN z/OS DLA integration:
  - Auto-discover LPAR RTE user profile parameter **KQI\_XML\_XIMBNAME\_MON\_BRKR\_NAME** giving the name of the broker to be monitored.
  - Auto-discover LPAR RTE user profile parameter **KQI\_XML\_XIMBDIR1** giving the broker's ENVFILE z/OS UNIX path.
  - Auto-discover \$GBL\$USR global user profile parameter **GBL\_DSN\_CEE\_SCEERUN** LE load library.
  - Auto-discover **WCONFIG(KQI\$XML) RKANDATV(KQIXML) imbed** to add XML entries for additional brokers to monitor.
  - Auto-discover monitored brokers and list each discovered broker's **STDENV USS directory** in the on-line "Post-configuration" README **KQIDFINL** that is tailored for KQI Agent.
- Added support in KQIXML for KqiAgent parameter. Supports **KQIXML's defaultRetainRecentResourceSamples** parameter **KQI\_XML\_XIRSRET\_RESOURCE\_SAMPLE**. This attribute specifies whether to collect resource statistics records from the broker. This attribute value can be either 1 or 0. When this attribute is set to 0, the Agent does not subscribe to the resource statistics that are emitted by the broker, and the Resource Statistics workspaces are empty. The default is 1. The PARMGEN KCIJPUSP job uses this value to build the RTE's RKANDATV(KQIXML). The PARMGEN KCIJPUSP job will start generating the **defaultRetainRecentResourceSamples=1** parameter in the RTE's RKANDATV(KQIXML) once PARMGEN detects that you have applied the HKQI730 PTF that ships the SMP/E target **TKANDATV(KQIXML)** product template that adds support for the **defaultRetainRecentResourceSamples="|XIRSRET|"** template.

#### OMEGAMON XE for Mainframe Networks V5.3.0

Enhanced configuration to auto-discover the following parameter values by the PARMGEN z/OS DLA integration. Auto-discover LPAR RTE user profile parameters for each TCP/IP stack monitored:

- **KN3\_TCPXnn\_TCPIP\_PROFILES\_DSN**
- **KN3\_TCPXnn\_TCPIP\_PROFILES\_MBR**

### PARMGEN PTF UA81228 for APAR OA49893 (2Q16 Interim Feature)

PARMGEN PTF UA81228 for APAR OA49893 (2Q16 Interim Feature) introduces several enhancements affecting all products that use the configuration software.

The configuration software includes the following enhancements:

- Enhanced the \$PARSE composite batch job run elapsed time-to-value savings. \$PARSE jobs have better performance.
- Enhanced the following help topics in **Welcome to the z/OS Installation and Configuration Tools for z Systems Management Suites** panel (KCIPQPGW panel / KCIHPGW help panel):
  - IBM z Systems Management Suites that PARMGEN helps deploy - Overview
  - Components in the Product Suites Matrix by Suite Code
  - Components in the Product Suites Matrix by JOBGEN Exploitation
  - Components in the Product Suites Matrix by PARMGEN Exploitation

You can have a smoother deployment of the products suites with better planning, system preparation, installation, configuration and post-configuration.

- Provided currency support:
  - Updated PARMGEN SYSCPUS pop-up panel that displays informational message about the number of CPU(s) and system hardware on the LPAR that PARMGEN is running on. Added support for new z13s (CPC Type=2965 Hardware=IBM z13s).
  - Updated the PARMGEN job KCIJPALO "Allocate runtime read-only (RO) and read-write (RW) user datasets" to accommodate PDSE V1 requirement when the RTE is enabled for PDSE support (RTE\_SMS\_PDSE\_FLAG=Y). PDSE V2 format requires DFP FMID HZD2vvv PTF UA81278/UA81279/UA81280 tracked in DFP APAR OA45431. For more information, see technote [ABENDQF4 RKANDATV](#)

[RKNSLOCL KLVPA001 KLVPA007 KLVPA002 KLVPA003](https://www.ibm.com/support/docview.wss?uid=swg21984143) (<https://www.ibm.com/support/docview.wss?uid=swg21984143>).

- Updated the default value of parameter GBL\_HFS\_JAVA\_DIR1 (for global Java bin path) from /usr/lpp/java/J6.0 to /usr/lpp/java/J7.1 for new RTE deployments.
- Enhanced the RTE\_USS\_RTEDIR and TKANJAR DDEF processing by providing a runtime version of the installation z/OS® UNIX® System Services directory. If you have copies of the SMP/E targets on z/OS and z/OS UNIX directories, you can deploy the new maintenance to the runtime copies based on their maintenance rollout schedule.
- Additional IVP advanced validation checks during PARMGEN \$PARSE VALIDATE step or PARMGEN KCIJVAL standalone validation job:
  - Detect an warning if the RTE is enabled for variables to review RTE\_USS\_RTEDIR parameter for more information. If the RTE has variables enabled, the corresponding KDS\_KMS\_SDA user symbol resolution value is set to Y in the GBL\_USER\_JCL RTE variables profile.
  - Detect an error condition when OMEGAMON XE for DB2 profile parameter KD2\_DBnn\_DB2\_PORT\_NUM port number is not unique per DB2 subsystem.
  - Detect an error condition when required KI2\_I1nn\_CLASSIC\_IMS\_RESLIB profile table parameter is not supplied for configuring OMEGAMON XE for IMS product.
- Enhanced %GBL\_USER\_JCL%(RTE\_NAME%) LPAR RTE variables and %GBL\_USER\_JCL%(KCI\$RTEV) LPAR RTE IBM default variables profile to provide best-practice user symbols used in the WCONFIG(RTE\_NAME%) LPAR RTE profile and in the WCONFIG(Kpp\$\*) override imbeds. Provide tailored or predefined model user symbols for quicker deployment of operational changes.
  - From %GBL\_USER\_JCL%(KCI\$RTEV) IBM default variables profile and %GBL\_USER\_JCL%(RTE\_NAME%) LPAR RTE user variables profile:

```

- KDS_USERS_NO_MSGLOG "SRVR01,sysadmin,KOB101,Kpp" *example usage syntax
- KOE_ALLOW_ANY_UID 1 *default if used
- KOE_ALLOW_UNDEFINED 1 *default if used
- KM5_KM5ZIIPOFFLOAD NO *if parameter is enabled
- KM5_RMF_DDS "NO" *default if used
- *KM5_RMF_DDS "%KM5_RMF_DDS_COLLECTION%" *Your WCONFIG

```

- From WCONFIG(KDS\$PENV) TEMS KDSENV imbed:
 

```

KDS_USERS_NO_MSGLOG "SRVR01,sysadmin"
*KDS_USERS_NO_MSGLOG=&KDS_USERS_NO_MSGLOG.
*KOE_ALLOW_ANY_UID=1
*KOE_ALLOW_ANY_UID=&KOE_ALLOW_ANY_UID.
*KOE_ALLOW_UNDEFINED=1
*KOE_ALLOW_UNDEFINED=&KOE_ALLOW_UNDEFINED.
*KM5ZIIPOFFLOAD=NO
*KM5ZIIPOFFLOAD=&KM5_KM5ZIIPOFFLOAD.

```
- Provided default placeholder parameter support in various WCONFIG(Kpp\$PENV) imbeds to the xKANPARU(KppENV) environment runtime members.
  - KDS\_USERS\_NO\_MSGLOG=SRVR01,sysadmin in TEMS KDS\$PENV
  - \*KDS\_USERS\_NO\_MSGLOG=&KDS\_USERS\_NO\_MSGLOG. in TEMS KDS\$PENV
  - \*KOE\_ALLOW\_ANY\_UID=1 in TEMS KDS\$PENV
  - \*KOE\_ALLOW\_ANY\_UID=&KOE\_ALLOW\_ANY\_UID. in TEMS KDS\$PENV
  - \*KOE\_ALLOW\_UNDEFINED=1 in TEMS KDS\$PENV
  - \*KOE\_ALLOW\_UNDEFINED=&KOE\_ALLOW\_UNDEFINED. in TEMS KDS\$PENV
  - \*KM5ZIIPOFFLOAD=NO in TEMS KDS\$PENV
  - \*KM5ZIIPOFFLOAD=&KM5\_KM5ZIIPOFFLOAD. in TEMS KDS\$PENV
- Provided new &gbl\_target\_hilev.TKANSAM(\*MDL\*) predefined RTE models to quickly deploy other types of RTEs and product combination.

Table 126: New predefined RTE models

Scenario	Template name	RTE type	Monitoring server type	System variables	Description
QCF21	\$MDLHSBV	Sharing-with-base	Hub	Yes	Predefined RTE models include a z/OS Tivoli Enterprise Monitoring Server (TEMS, whether this is a Hub TEMS or a Remote TEMS), an OMEGAMON enhanced 3270 user interface (TOM) and both types of z/OS monitoring Agents (Agents that run in the z/OS TEMS address space and Agents that run in their own standalone Agent address spaces).
QCF22	@MDLHSSV	Sharing-with-SMP/E	Hub	Yes	Predefined RTE models include a z/OS Tivoli Enterprise Monitoring Server (TEMS, whether this is a Hub TEMS or a Remote TEMS), an OMEGAMON enhanced 3270 user interface (TOM) and both types of z/OS monitoring Agents (Agents that run in the z/OS TEMS address space and Agents that run in their own standalone Agent address spaces).

- Enhanced “Set up/Refresh PARMGEN work environment” KCIJPCFG processing for brand new user of PARMGEN in a new LPAR by including the user’s accounting information (ZACCTNUM) in the IBM-supplied jobcard.
- Enhanced “Set up/Refresh PARMGEN work environment” KCIJPCFG processing discussed in the [“SMP/E maintenance and upgrade scenarios” on page 818](#) by automatically defaulting a backup RTE profile member name on the “KCIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES” panel. The KCIJPPRF profile refresh job is submitted automatically by the KCIJPCFG job to simplify the following processes:
  - The refreshing of product templates in IK\* datasets.
  - The rebuilding of the LPAR RTE and global profiles (IBM-supplied) with the new values.
  - The merging of the customized profile values from the backed-up LPAR RTE user profile into the refreshed WCONFIG RTE profile.
  - The generating of a delta report.
- Enhanced panel and on-line help panel updates to aid in deployment.
  - Enhanced the main PARMGEN “Welcome to the z/OS Installation and Configuration Tools for z Systems Management Suites” by streamlining the configuration workflow option to display a streamlined “Configuration Workflow (Post-installation): Configure z/OS products with Parameter Generator Workflow (PARMGEN)” selection only, rather than providing recommended Quick Configuration mode and the alternate Standard Configuration mode.
  - Enhanced the “R” option on the “KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU” panel by clarifying the option name as “R Create next RTE - Reset fields” and navigating the user automatically to the “KCIPQPGA PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU” panel to supply the RTE name of the next RTE to create or clone from an existing RTE.
  - Added profile parameter on-line help text in F1=HELP for the following parameters:
    - Global profile parameters in WCONFIG(\$GBL\*) prefixed by GBL\_.
    - Common LPAR profile parameters in WCONFIG(%RTE\_NAME%) prefixed by RTE\_.
    - TEMS profile parameters in WCONFIG(%RTE\_NAME%) prefixed by KDS\_X\_.
    - Common Agent profile parameters in WCONFIG(%RTE\_NAME%) prefixed by Kpp\_X\_.
  - Enhanced the “F16=CLNESECT CLONE SECTION” KCIP@PM2 panel to provide better examples and a complete list of Kpp product table profile parameters that can be cloned.
  - Enhanced the “IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES” KCIP@BAK panel to provide a default backup LPAR RTE profile name to the “%RTE\_NAME% Backup member name” field.
  - Updated existing help topics focusing on additional system preparation requirements for products that have z/OS UNIX SMP/E and configuration deployment requirements when SDA is enabled, and for products that update their TKANJAR DD jar files.
  - Added help topics focusing on PARMGEN utilities such as PF Keys and macros.
  - Added help topics focusing on PARMGEN Transport scenarios.

## Product-specific enhancements

The following product-specific enhancements are provided in this release:

### Tivoli Management Services: Engine infrastructure common to TEMS and Agents

The following features are added:

- (For TEMS) Provided configuration support for a new KDS\_X\_HUB\_CMS\_FTO\_FLAG profile parameter which generates the CMS\_FTO=%KDS\_X\_HUB\_CMS\_FTO\_FLAG% parameter in the TEMS xKANPARU(KDSENV) runtime member. KDS\_X\_HUB\_\* parameters are applicable to a z/OS Remote TEMS based on these scenarios:
  - z/OS Remote TEMS connecting to a non-z/OS Hub TEMS enabled with the Hot Standby (FTO) feature.

- z/OS Remote TEMS connecting to a z/OS High Availability (HA) Hub TEMS (Primary TEMS) and a z/OS HA Hub TEMS (Standby TEMS).
- (For TEMS) Enabled “KDS\_USERS\_NO\_MSGLOG=SRVR01,sysadmin” parameter by default in the TEMS WCONFIG(KDS\$PENV) imbed to xKANPARU(KDSENV) TEMS environmental runtime member. The KDS\_USERS\_NO\_MSGLOG=&userid parameter is used to suppress the z/OS TEMS RKLVLLOG DD messages if the &userid TMS component is contained in a list. The list is provided by KDS\_USERS\_NO\_MSGLOG KDSENV variable that the customer can modify as needed.
- (For TEMS) Enhanced the existing WCONFIG(KDS\$SDMP) for the TEMS SYS%DUMP DD imbed to the started task to default the DDNAME to an enabled SYSDUMP DD instead of SYSUDUMP DD. KCIJPALO job now allocates the SYSDUMP dataset by default.
- Enhanced persistent datastore processing by ensuring that the %RTE\_PDS\_HILEV%.KPDCTLL sequential file is allocated as DISP=OLD.

### **IBM OMEGAMON for JVM on z/OS V5.3.0**

The following features are added:

- Updated the product’s post-configuration README:
  - Add a step documenting how to monitor a JVM running in a DB2 stored procedure.
  - Add a step to refresh jar files after SMP/E maintenance by rerunning the KCIJPUSS job.
  - Add an optional step to enable %KJJ\_COLLECTOR\_STC% JTCOLL Collector trace options.
- Added a new WCONFIG(KJJ\$SDMP) SYS%DUMP DD imbed to the OMEGAMON for JVM Agent’s started task. A placeholder SYSUDUMP DD pointing to spool datasets is also provided as an example, if you prefer to store the data in the spool, instead of the default SYSDUMP sequential dataset. If you want to have a SYSUDUMP DD instead of SYSDUMP DD, modify the DDs accordingly.

### **OMEGAMON Enhanced 3270 User Interface V7.3.0**

The following feature is added:

- Added a new WCONFIG(KJJ\$SDMP) SYS%DUMP DD imbed to the OMEGAMON for JVM Agent’s started task. A placeholder SYSUDUMP DD pointing to spool datasets is also provided as an example, if you prefer to store the data in the spool, instead of the default SYSDUMP sequential dataset. If you want to have a SYSUDUMP DD instead of SYSDUMP DD, modify the DDs accordingly.

### **OMEGAMON Subsystem V7.3.0**

The following features are added:

- Added a new WCONFIG(KCN\$SDMP) for OMEGAMON Subsystem SYS%DUMP DD imbed to the started task. KCIJPALO job allocates the SYSDUMP dataset by default.
- Modified the OMEGAMON Subsystem default STC PROC symbols to better accommodate enablement of the optional RST=',RESTART=FORCE' keyword. STC PROC symbols UMAX and FSCR are now enabled via internal code by default, which is sufficient for OMEGAMON Subsystem usage.

### **OMEGAMON XE on z/OS V5.3.0**

The following features are added:

- Updated dynamic ICSF configuration support for new KM5CSFSX ICSF monitoring module in stead of KM5EXIT4 module to support FMID HKM5530 APAR OA50548 IF changes.
- Added placeholder parameter support for the following parameters in the WCONFIG(KDS\$PENV) imbed to the TEMS xKANPARU(KDSENV) environmental file, which is read at TEMS STC startup (OMXE on z/OS Agent runs in the TEMS address space):
  - \*KOE\_ALLOW\_ANY\_UID=1
  - \*KOE\_ALLOW\_ANY\_UID=&KOE\_ALLOW\_ANY\_UID.
  - \*KOE\_ALLOW\_UNDEFINED=1
  - \*KOE\_ALLOW\_UNDEFINED=&KOE\_ALLOW\_UNDEFINED.
  - \*KM5ZIIPOFFLOAD=NO
  - \*KM5ZIIPOFFLOAD=&KM5\_KM5ZIIPOFFLOAD.

### **OMEGAMON XE for DB2 PE/PM V5.3.0**

The following feature is added:

- Removed obsolete profile parameters as their value are not used in PARMGEN when generating the KD2VTP virtual terminal pool startup runtime member in the RTE's RKANCMU dataset. Standard KD2\_CUA\_VTAM\_VTPOOL\_PREFIX is used instead to simplify the VTPOOL APPLID generation starting in 01 range through %KD2\_CUA\_VTAM\_VTPOOL\_NUM% number:
  - KD2\_CUA\_VTAM\_VTRM\_APPL\_LENGTH
  - KD2\_CUA\_VTAM\_VTRM\_SUFFIX

### **OMEGAMON XE for Messaging (WebSphere MQ Monitoring) V7.3.0**

The following features are added:

- Increased the default KMQ\_PD\_CYL persistent datastore cylinder size profile parameter from 120 to 300 cylinders so the composite PARMGEN KCIJPALO "Allocate runtime RO and RW datasets" job or the KMQJPALP KMQ Agent's standalone PDS allocation job allocates enough space for the default 6 %RTE\_PDS\_HILEV%.RKMQPDSn persistent datastore sequential files for history storage (for both the TEPS ITM PDS history collection and for OMEGAMON enhanced 3270UI near-term history).
- Provided configuration support for message monitoring summary enhancement in order to support the security checking for situations.
- Updated the KMQDFINL post-configuration on-line README to add a new "Grant authorities to WebSphere MQ Monitoring and WebSphere MQ Configuration Agents" post-configuration step.

### **OMEGAMON XE for Messaging (WebSphere Message Broker Monitoring a.k.a. IBM Integration Bus [IIB])**

#### **V7.3.0**

The following features are added:

- Increased the default KQI\_PD\_CYL persistent datastore cylinder size profile parameter from 178 to 250 cylinders so the composite PARMGEN KCIJPALO "Allocate runtime RO and RW datasets" job or the KQIJPALP KQI Agent's standalone PDS allocation job allocates enough space for the default 6 %RTE\_PDS\_HILEV%.RKQIPDSn persistent datastore sequential files for history storage (for both the TEPS ITM PDS history collection and for future OMEGAMON enhanced 3270UI IIB near-term history exploitation).
- Updated the KQIDFINL post-configuration on-line README to add a new "Authorize WebSphere Message Broker Monitoring Agent and set WebSphere Message Broker Monitoring Agent parameters" post-configuration step

### **IBM Advanced Audit for DFSMSHsm V2.6.0**

The following features are added:

- This is JOBGEN SMP/E installation and PARMGEN application configuration support for IBM Advanced Audit for DFSMSHsm V2.6.0 (HKRG260 FMID) Agent.
- The following configuration enhancements are provided in support of new features delivered in this new version.
  - Added JOBGEN TKCIINST(KCIDJG00) new product SMP/E installation support for new HKRG260 FMID.
  - Added full standalone Agent configuration support for this new version of the Agent.

### **IBM Advanced Reporting and Management-HSM V2.6.0**

The following features are added:

- This is JOBGEN SMP/E installation and PARMGEN application configuration support for IBM Advanced Reporting and Management-HSM V2.6.0 (HKRH260 FMID) Agent.
- The following configuration enhancements are provided in support of new features delivered in this new version.
  - Added JOBGEN TKCIINST(KCIDJG00) new product SMP/E installation support for new HKRH260 FMID.
  - Added full standalone Agent configuration support for this new version of the Agent.

## PARMGEN PTF UA80256 for APAR OA48678 (1Q16 Interim Feature)

PARMGEN PTF UA80256 for APAR OA48678 (1Q16 Interim Feature) introduces several enhancements affecting all products that use the configuration software.

The configuration software includes the following enhancements:

- New IBM Tivoli OMEGAMON XE on z/OS Monitoring Feature for JVM (HKJJ530 FMID)
- New cross-RTE command “LOADDATV” to submit a new KCIJ@ODI multi-load RKANDATV runtime libraries composite job for all listed RTEs
- New global parameter GBL\_USS\_TKANJAR\_PATH
- Ongoing PARMGEN \$PARSE/\$PARSESV performance improvements involving streamlining PARMGEN runtime members logic processing
- Additional IVP advanced validation checks during PARMGEN \$PARSE “Create runtime members and jobs” VALIDATE step or PARMGEN KCIJPVAL standalone validation job
- Updated “KCIP@TLV – SPECIFY GBL\_TARGET\_HILEV PARAMETER” processing to programmatically detect the two conditions as to why PARMGEN presents the panel
- New PARMGEN INIT invocation command to redrive the updated “KCIP@TLV - SPECIFY GBL\_TARGET\_HILEV PARAMETER” panel, in cases where you need to refresh GBL\_TARGET\_HILEV-related values appropriate for your deployment.
- New PARMGEN LOCATE/LOC/L commands on the Runtime Environments (RTEs) panel (KCIP@RTE) to make it easier to locate an RTE for further processing
- PARMGEN SYSCPUS informational messages to display the number of CPUs and the system hardware on which PARMGEN is being executed
- New PARMGEN KCIRMVCP utility macro: KCIRMVCP move/copy/allocate exec and KCIPCPY\* panels. For more information about how to activate the utility macro, see new help topics on the “KCIH@PG5 CUSTOMIZE PARMGEN CONFIGURATION PROFILES” help panel: “3 XF “Exclude Find” and KCIRMVCP move/copy/allocate macro”
- Enhanced PARMGEN system and user variables handling:
  - New optional global variables profile called %GBL\_USER\_JCL%(KCI\$GBLV) applicable to all RTEs
  - Tailored IBM default variables profile (%GBL\_USER\_JCL%(KCI\$RTEV)) based on customer's existing LPAR RTE profile customization values
  - Enhanced %GBL\_USER\_JCL%(RTE\_NAME%) LPAR RTE variables user profile to provide handy placeholder examples of typical types of system variables used during PARMGEN System Variables RTE configuration such as:
    - Type 1: Static system symbols
    - Type 2: PARMGEN KCIPARSE-extracted symbols
    - Type 3: User-defined symbols
  - Enhanced %GBL\_USER\_JCL%(KCI\$RTEV) IBM default variables profile to provide additional handy system and user-defined symbols; pre-defined TKANSAM(\$MDLVARS) model introduced in 3Q14 PARMGEN IF is available for merging via KCIJPMCF merge profile job
- Updated KCIJPCOL PDCOLLECT tailored job to add SDSF considerations and to default the NO() job number parameter to NO(S\*) instead of NO(STC\*)
- New on-line help panels focusing on PARMGEN utilities and PARMGEN Transport scenarios to aid in deployment:
  - Added help topics on PARMGEN utilities such as PF Keys and macros such as XF “EXCLUDE FIND” and KCIRMVCP MOVE/COPY/ALLOCATE dataset/members macros, and PF Keys such as F1=PARMHELP / F15=HIDECMNT / F16=CLNESECT (F1 to view parameter on-line help, F15 to hide profile comments, and F16 to clone parameter section for a table row)
  - Added help topics on PARMGEN Transport scenarios

- New detailed discussion on system preparation topics such as "IBM Management Suites that JOBGEN/ PARMGEN help deploy – Overview," "Components in the Product Suites Matrix by Suite Code," "Components in the Product Suites Matrix by JOBGEN Exploitation," and "Components in the Product Suites Matrix by PARMGEN Exploitation"
- New predefined &gbl\_target\_hilev.TKANSAM(\*MDL\*) predefined RTE models to quickly deploy other types of RTEs and product combination  
This table summarizes the new RTE models.

<i>Table 127: Summary of new RTE models</i>					
Scenario	Template name	RTE type	Monitoring server type	System variables	Description
QCF13	\$MDLAFV	Full	Remote	Yes	RTE configuration template for full, stand-alone RTE (Agents only with variables enabled connecting to a z/OS TEMS in another RTE)
QCF14	@MDLAF	Full	Remote	No	IBM-provided RTE configuration template for full, standalone RTE (Agents only connecting to a z/OS TEMS in another RTE)
QCF15	\$MDLASBV	Sharing-with-base	Remote	Yes	RTE configuration template for sharing-with-base read-only libraries RTE (Agents only with variables enabled connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)
QCF16	@MDLASB	Sharing-with-base	Remote	No	RTE configuration template for sharing-with-base read-only libraries RTE (Agents only connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)
QCF17	@MDLASSV	Sharing-with-SMP/E	Remote	Yes	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Agents only with variables enabled connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)

Scenario	Template name	RTE type	Monitoring server type	System variables	Description
QCF18	@MDLASS	Sharing-with-SMP/E	Remote	No	RTE configuration template for sharing-with-SMP/E datasets RTE (Agents only connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)
QCF19	\$MDLHSSV	Sharing-with-SMP/E	Hub	Yes	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Static Hub TEMS, enhanced 3270 user interface (TOM) and OMEGAMON Monitoring for JVM (KJJ) Agent only with variables enabled)
QCF20	\$MDLHSS	Sharing-with-SMP/E	Hub	No	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Static Hub TEMS, enhanced 3270 user interface (TOM) and OMEGAMON Monitoring for JVM (KJJ) Agent only)

- Enhanced on-line parameter help information for various Kpp\_AGT\_\* common Agent parameters when placing the cursor on the parameter and pressing the F1=Help key while customizing the WCONFIG profiles (LPAR RTE %RTE\_NAME% and \$GBL\$USR global user profiles)
- Enhanced xKANSAMU(KCIJPDEL) composite RTE Delete job to use DELETE MASK IDCAMS function
- Sample SMP/E versions of sample KCIJPBSA RTE allocation job for shared base, read-only datasets, and sample KCIJPBSL RTE load job for shared base, read-only datasets
- Default placeholder parameter support for KMS\_EXPAND\_EMBEDDED\_SIT=N in the TEMS WCONFIG(KDS\$PENV) imbed to xKANPARU(KDSENV) TEMS environment runtime member
- Enhanced KCIJPLOD job and product-specific REPRO jobs and KppJPLDB input to the composite xKANSAMU(KCIJPLOD) RTE load job's REPROKpp steps in support of products with REPRO seeding requirements to the Hub TEMS' RKDSRULD VSAM dataset (QA1CRULD DD in the TEMS started task)
- New xKANSAMU(KDSDELRM) tailored job to delete the Hub TEMS VSAM dataset if the TEMS in RTE is configured to be a Remote TEMS
- Updated WCONFIG(\$JOBINDEX) PARMGEN job index with all TEMS-related utility jobs

### Product-specific enhancements

The following product-specific enhancements are provided in this release:

#### OMEGAMON® XE on z/OS Monitoring Feature for JVM

The following JOBGEN SMP/E installation and PARMGEN application configuration support is provided:

- JOBGEN TKCIINST(KCIDJG00) new product SMP/E installation support
- Full Agent configuration support

### OMEGAMON® enhanced 3270 user interface V7.3.0

The following support has been added:

- KOB Registry Query SQL support with new KOB\_REGQUERY\_\* parameters in WCONFIG(KOB\$PENV) imbed to xKANPARU(KOBENV)
- EIF tab toleration support for the KOB\_SITST\_\* situation status tree function

### OMEGAMON® XE for CICS® on z/OS® V5.1.0 and later versions

The following support is provided:

- Enhanced TKANJAR SMP/E DDDEF maintenance processing with a runtime version of the jar install directory housing the kgw\_monitor.jar file
- Support of the new KCIMKXDV step in the KCIPUSP z/OS® UNIX® System Services system preparation job and new KCIMKDRB and KCIJARPX steps in the KCIJPUSJ job for kgw\_monitor.jar maintenance for Full RTEs and non-SMP/E-sharing RTEs with the new tailored "Step 6 - Refresh jar files after SMP/E maintenance" in the post-configuration online README file
- New standalone KCIUSPJB/KCIUSSJB standalone jobs for KGW\*-related steps to maintain kgw\_monitor.jar

### OMEGAMON® XE for DB2 PE/PM V5.3.0

The following support is provided:

- Added SQLPA V5.1 support in KD2\_PFn\_SQLPA\_VERSION

### OMEGAMON® XE on z/OS® V5.3.0

The following support has been added:

- Dynamic ICSF configuration support for new ICSF exit KM5CSFSX dynamic ICSF monitoring module to support FMID HKM5530 APAR OA49689.
- New post-configuration "(Optional) If you want OMEGAMON XE on z/OS to connect to an IBM z Aware server to monitor z Aware data, review the 'Configuration for connection to an IBM z Aware server'" topic.

### OMEGAMON® XE for Storage on z/OS® V5.1.0 and later versions

The following support has been added:

- Modified "JOBPARM SYSAFF=\*" instead of original default "JOBPARM SYSAFF=%KS3TK\_SYST\_NAME%" in the RTE's xKANPARU(KS3CA1J) and xKANPARU(KS3EXTJ) runtime members.

### Various products

PARMGEN configuration support is removed for the following components at the end of its life cycle:

<i>Table 128: Components no longer supported in PARMGEN</i>	
<b>Kpp</b>	<b>Product Name and Version</b>
KHL	OMEGAMON® z/OS® Management Console Agent V4.1.0 (KHL functions merged with OMEGAMON® XE on z/OS® V5.1.0 and later versions of the KM5 Agent)
KRG	Advanced Audit for DFSMSHsm pre-V2.5.0
KRH	Advanced Reporting and Management-HSM pre-V2.5.0
KRJ	Advanced Allocation Management pre-V3.3.0
KRK	Automated Tape Allocation Manager pre-V3.3.0
KRN	Advanced Catalog Management pre-V2.5.0
KRV	Advanced Backup and Recovery pre-V2.4.0

## PARMGEN PTF UA77851 for APAR OA47937 (3Q15 Interim Feature)

PARMGEN PTF UA77851 for APAR OA47937 (PARMGEN 3Q15 Interim Feature) introduces significant enhancements to the PARMGEN Workflow interface and new and modified parameters, embed files and batch jobs. The enhancements discussed here affect all products that use the configuration software.

The configuration software includes the following enhancements:

- New parameters for customizing the Situation Status Tree in OMEGAMON® Dashboard Edition for z/OS®.
- New global variable source library GBL\_DSN\_GLOBAL\_SOURCE\_LIB for KppGLB\* global data members (OMEGAMON® XE for CICS® and OMEGAMON® XE for IMS™ V5.3.0, and later versions).
- Enhanced PARMGEN system and user variables handling:
  - New default variables %GBL\_USER\_JCL%(KCI\$RTEV) profile based on existing LPAR RTE profile customization values.
  - Enhanced %GBL\_USER\_JCL%(RTE\_NAME%) LPAR RTE variables user profile including examples of typical PARMGEN system variables.
  - Enhanced %GBL\_USER\_JCL%(KCI\$RTEV) default variables profile including new system and user-defined symbols.
- Enhanced PARMGEN Quick Configuration mode including new and updated WCONFIG override imbeds, deployment parameters, user variables, IVP advanced validation checks and online POSTCFG README steps.
- Capability to override the JCL REGION value in additional PARMGEN jobs.

### Product-specific enhancements

The following OMEGAMON® product-specific enhancements are provided in this release:

#### OMEGAMON® enhanced 3270 user interface V7.3.0

The following support has been added:

- KOB\_SITST\_\* situation data collection parameters in the WCONFIG(KOB\$PENV) imbed for the RKANPARU(KOBENV) environmental runtime member.
- FB-to-VB conversion support for the xKANSAMU(KOBXKNCP) copy job.
- Modified post-configuration online printable README steps.

#### OMEGAMON® XE for IMS™ V5.3.0

The following JOBGEN SMP/E installation and PARMGEN application configuration support is provided:

- JOBGEN TKCIINST(KCIDJG00) new version SMP/E installation support.
- IMS™ V14.1 KOICTOQ module support in the composite KCIJPSEC job and OMXE IMS-specific equivalent job (KOISUPD).
- IMS™ V14.1 KI2BMPO0 module support in the composite KCIJPLNK job and OMXE IMS-specific equivalent job (KI2BLDLI).
- Near-term history support in the OMEGAMON® enhanced 3270 user interface.
- KIPGLB Global data (text format).
- z/OS® System Logger support for the Application Trace Facility (ATF) function.
- New post-configuration online printable README steps.

#### OMEGAMON® XE for Mainframe Networks V5.3.0

The following JOBGEN SMP/E installation and PARMGEN application configuration support is provided:

- JOBGEN TKCIINST(KCIDJG00) new version SMP/E installation support.
- Near-term history support in the OMEGAMON® enhanced 3270 user interface.
- New post-configuration online printable README steps to aid in deployment.

#### OMEGAMON® XE for CICS® on z/OS® V5.1.0 and later versions

Support has been added for the new GBL\_DSN\_GLOBAL\_SOURCE\_LIB common product global variables source library for managing KC2GLB\* global variables via PARMGEN online support.

### **OMEGAMON® XE on z/OS® V5.1.0 and later versions**

The following support has been added:

- New KOE\_MFSB\_WUI=600, KOE\_MFSB\_MDI=18000 and KOE\_MFSB\_TBI=18000 parameters in the WCONFIG(KDS\$PENV) TEMS imbed to the RKANPARU(KDSENV) TEMS environmental runtime member.
- Enhanced KM5\_SYSPLEX\_PROXY\_POSITION LPAR RTE profile comments for using the z/OS® display XCF command to identify the primary sysplex proxy.

### **New enhanced 3270 user interface (KOB) parameters**

For more information about these new enhanced 3270 user interface (KOB) parameters, see the corresponding topic in [“Common parameters” on page 1257](#).

**Note:** To view and customize a Situation Status Tree, you must have OMEGAMON® Dashboard Edition on z/OS® installed.

#### **KOB\_SITST\_EXCLUDE\_HUBS**

This parameter excludes one or more Hub TEMS from periodic data collection. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or added using the Nonstandard Parameter Editor (Configuration Tool).

#### **KOB\_SITST\_HISTORY\_RANGE**

This parameter specifies the total length of time (in minutes, hours, or days) for the historical summary of situation data to keep and display data for. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or added using the Nonstandard Parameter Editor (Configuration Tool).

#### **KOB\_SITST\_HISTORY\_SLOTS**

This parameter specifies the number of slots for the OMEGAMON® Enhanced 3270UI to keep for the historical situation status. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or added using the Nonstandard Parameter Editor (Configuration Tool).

#### **KOB\_SITST\_INCLUDE\_HUBS**

This parameter includes one or more Hub TEMS for periodic data collection. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or added using the Nonstandard Parameter Editor (Configuration Tool).

#### **KOB\_SITST\_RECENT\_SLOTS**

This parameter specifies the number of slots for the OMEGAMON® Enhanced 3270UI to keep for the recent situation status. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or added using the Nonstandard Parameter Editor (Configuration Tool).

#### **KOB\_SITST\_SAMPLE\_MINUTES**

This parameter specifies the sampling interval (in minutes) for OMEGAMON® Enhanced 3270UI to use to gather data about situations. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or added using the Nonstandard Parameter Editor (Configuration Tool).

### **PARMGEN PTF UA76853 for APAR OA46817 (2Q15 Interim Feature)**

PTF UA76853 for APAR OA46817 (2Q15 Interim Feature) bring significant changes to the PARMGEN Workflow interface and introduce new and modified parameters, embed files and batch jobs. The enhancements discussed here affect all products that use the configuration software.

The configuration software includes the following enhancements:

- New parameters to support the customization of the Situation Status Tree on OMEGAMON® Dashboard Edition on z/OS.
- Added support for the z/OS 2.2 release (ZOS0202T/K).
- Additional Quick configuration mode improvements such as a new @MDLHSB QCF12 predefined RTE model to cater to sharing-w/-base RTE w/ Hub TEMS/Agents for First-Time-Users (FTUs).

- Persistent data store enhancements to accommodate the near-term history feature that is introduced by the OMEGAMON® enhanced 3270 user interface.
- New problem determination data collection KCIPDCOL tool, which uses the new PARMGEN KCIJPCOL job (formerly PDCOLLECT).
- New parameters to support the integration between OMEGAMON® XE Agents, Tivoli® Enterprise Portal System, and IBM® Operations Analytics - Log Analysis (formerly IBM SmartCloud® Analytics - Log Analysis).
- Enhanced end-to-end handling (creating, verifying, converting and copying) of global variables through a new user-customizable common global variables source library (GBL\_DSN\_GLOBAL\_SOURCE\_LIB) for products that provide KppGLB\* global data members. This new dataset is automatically created, loaded and concatenated by PARMGEN in the product-specific started task global variable DDNAME (RKppGLBL DD).
- Additional PARMGEN Deployment Time-To-Value Optimization Enhancements:
  - New common global source dataset for simplified management of products with global data members
  - Faster \$PARSE "Create runtime members and jobs" batch job runs, averaging 30-45% time savings
  - Enhanced RTE variables processing by providing additional system and user-defined symbols for quicker deployment of operational changes
  - Advanced configuration verification validation checks
  - New online printable post-configuration important README steps that save deployment and reconfiguration time
  - Automated SUPERF report with each \$PARSE\* job.

### Product-specific enhancements

The following product-specific enhancements are provided in this release:

#### Common TEMS/Agent/CUA TMS:Engine SYSTCPD DD global parameter GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA

Support RFE70755 to allow sequential dataset format for SYSTCPD DD dataset value.

#### OMEGAMON Enhanced 3270 User Interface V7.3.0

Add support for a new xKANSAMU(KOBXKNCP) tailored copy job to copy OMEGAMON Enhanced 3270 User Interface support elements into the alternate %RTE\_XKAN\_HILEV%.XKANWENU/XKANHENU/XKANEXEC Tivoli OMEGAMON (TOM) datasets for other integration products that deliver workspaces and other OMEGAMON enhanced 3270UI support elements.

#### OMEGAMON XE for DB2 PE/PM V5.3.0

This is JOBGEN SMP/E installation and PARMGEN application configuration support for the new version of OMEGAMON XE for DB2 PE/PM product (HKDB53x FMID).

- Add JOBGEN TKCIINST(KCIDJG00) new version SMP/E installation support.
- Add toleration and new version configuration support in KCICRPLC PARMGEN "Create additional DB2 runtime members" processor invoked by \$PARSE\* job.
- Support for new OMDB2 V530 DB2 plan and package names for binds and grants in these tailored jobs:
  - - *OMBD%KD2\_DBnn\_DB2\_SSID% Bind OMEGAMON Server Packages (KO2OM%KD5VER%) job*
  - - *OMBP%KD2\_DBnn\_DB2\_SSID% Bind OMEGAMON Server DB2 Plan (KO2PLAN) job*
  - - *OMGR%KD2\_DBnn\_DB2\_SSID% Grant DB2 privileges to OMEGAMON Collector Plan/Package OWNER()*
- Add Spreadsheet Input-Data Generator TKANSAMF/RKANSAMF PARMGEN processing in KCIJPALO/KCIJPLOD jobs.
- Add DB2 autodiscovery code ("DPDC AUTODISCOVER") support only in xKANCMDU(KDPSTART) OMXE DB2 Agent startup command member.
- Add IBM DB2 Query Monitor for z/OS (KQQ) integration with OMEGAMON enhanced 3270 user interface configuration support.
- Add support for new WCONFIG(KD2\$POMD) imbed which provides the flexibility to add the more advanced type parameters such as additional DB2COMMAND parameters.
- Add new post-configuration on-line, printable README steps to aid in deployment.

- Provide toleration support for the drop of Japanese NLS FMID.

### OMEGAMON XE for CICS on z/OS V5.3.0 and later versions

Add support for exploiting a new “GBL\_DSN\_GLOBAL\_SOURCE\_LIB” common product global source library.

### New Enhanced 3270 user interface (KOB) parameters

For more information about any of these parameters, see the corresponding topic in [“Common parameters” on page 1257](#).

**Note: To view and customize a Situation Status Tree, you must have OMEGAMON® Dashboard Edition on z/OS installed, and APAR OA46867 applied.**

#### KOB\_SITST\_EXCLUDE\_HUBS

This parameter is used to exclude one or more Hub TEMS from periodic data collection. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or to the *rPlibHilev.rte\_name.EMBEDS(KOB\$PENV)* member for Configuration Manager processing.

#### KOB\_SITST\_HISTORY\_RANGE

This parameter is the total length of time (in Minutes, Hours, or Days) the historical summary of situation data will keep and display data for. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or to the *rPlibHilev.rte\_name.EMBEDS(KOB\$PENV)* member for Configuration Manager processing.

#### KOB\_SITST\_HISTORY\_SLOTS

This parameter is the number of slots that you want the OMEGAMON Enhanced 3270UI to keep for the historical situation status. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or to the *rPlibHilev.rte\_name.EMBEDS(KOB\$PENV)* member for Configuration Manager processing.

#### KOB\_SITST\_INCLUDE\_HUBS

This parameter is used to include one or more Hub TEMS from periodic data collection. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or to the *rPlibHilev.rte\_name.EMBEDS(KOB\$PENV)* member for Configuration Manager processing.

#### KOB\_SITST\_RECENT\_SLOTS

This parameter is the number of slots that you want the OMEGAMON Enhanced 3270UI to keep for the recent situation status. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or to the *rPlibHilev.rte\_name.EMBEDS(KOB\$PENV)* member for Configuration Manager processing.

#### KOB\_SITST\_SAMPLE\_MINUTES

This parameter is the sampling interval (in minutes) that you want the OMEGAMON Enhanced 3270UI to gather data about situations. This parameter must be added to the WCONFIG(KOB\$PENV) member (PARMGEN) or to the *rPlibHilev.rte\_name.EMBEDS(KOB\$PENV)* member for Configuration Manager processing.

### PARMGEN PTF UA76016 for APAR OA46184 (1Q15 Interim Feature)

PARMGEN PTF UA76016 for APAR OA46184 (1Q15 Interim Feature) introduces several enhancements affecting all products that use the configuration software.

The configuration software includes the following enhancements:

#### New WCONFIG RTE LPAR profile parameters

- Provide the flexibility to override the JCL REGION value in all PARMGEN jobs, including the KCIJPCFG, KCIJPPRF, KCIJPUP1, and \$PARSE\* related jobs in “Set-up PARMGEN work environment”. KCIP@PG2 panel externalizes the new GBL\_REGION field for customer overrides.
- 3 New global RTE\_\* parameters to support the SmartCloud Analytics - Log Analysis (SCA-LA) and Tivoli Enterprise Portal (TEP) integration parameters.
  - RTE\_SCALA\_ENABLED\_FLAG
  - RTE\_SCALA\_HOST

- RTE\_SMFID
- Parameter RTE\_KCIJPSYS\_INCLUDE\_STEP\_KDS provides the flexibility to exclude generating the ASMKDS KDSMTAB1 LU62 logmode table assembly and link step in the xKANSAMU(KCIJPSYS) system copy and processor job.
- Parameter RTE\_X\_STC\_INAPF\_MEMBER\_NAME defines the optional INAPF name (default is IBMAPF). Override the INAPF member name in the RTE\_X\_STC\_INAPF\_MEMBER\_NAME parameter if the default IBMAPF member needs to cater to multiple versions of the product started tasks in a given LPAR.
- RTE\_X\_STC\_START\_MEMBER\_NAME and RTE\_X\_STC\_STOP\_MEMBER\_NAME parameters define optional composite START/STOP PROC names (default is IBMSTRT/IBMSTOP, respectively). Override the /S, /P composite STCs if the default IBM\* names need to cater to multiple versions of the product started tasks in a given LPAR.
- KI2\_ICnn\_\* parameter is for OMXE for IMS, support new KI2\_IC\* I/CF profile parameters to support I/CF Console Commands or the I/CF Trap Command parameters generated in the OMXE IMS RKANCMU(KI2START) startup member.

### Changed default values for existing WCONFIG RTE LPAR profile parameters

- KDS\_KMS\_SDA for TEMS is set to "N" by default. Prior default was not set to any value (KDS\_KMS\_SDA was commented out in the LPAR RTE profile).
- Kpp\_AGT\_STORAGE\_MINIMUM\_EXTEND for common TEMS and agents increases the new default value to MINIMUM(384000,X) and support QUIESCE(96,X,F) and QUIESCE(99,X,C) xKANPARU(KppSYSIN) TMS:Engine startup parameters for TEMS and all Agents.
- KD2\_PFn\_HIS\_BUFSIZE for OMXE for DB2 changes Thread Near-term History (NTH) buffer size from 1024 to 2048.
- KD2\_DBnn\_PWH\_D2PWSTBP for OMXE for DB2 changes default of Performance Warehouse bufferpool from BP0 to BP32K.
- KD2\_PFn\_HIS\_LOGn for OMXE for DB2 changes default Thread NTH VSAM log datasets from 3 VSAMs to 7 VSAMs (RKD2VSnn).
- Comments updated in the KM5\_\* RTE profile to add note about Non-Sysplex RTEs.
- KMV\_X\_AGT\_STORAGE\_LIMIT\_PRIMARY for OMEGAMON DE on z/OS increases OMEGAVIEW LIMIT() primary storage request from 17,P to 19,P.

### New WCONFIG(Kpp\$\*) override imbeds

- New WCONFIG(KCI\$SLOG) for RKLVSNA/RKLVLOG. TMS:Engine-based product started tasks (TEMS, CUA, Agents) will remove these DDs from the product started tasks, and instead, PARMGEN will replace the DDs with a customer-controlled WCONFIG imbed called WCONFIG(KCI\$SLOG) that gets imbedded during \$PARSE\* job.
- New WCONFIG(Kpp\$SDMP) SYS%DUMP DD - TMS:Engine-based product started tasks (TEMS, CUA, Agents) that currently have a SYSUDUMP DD, will remove it from the product started tasks that currently hardcode a SYSUDUMP DD, and instead, PARMGEN will replace as a customer-controlled WCONFIG imbed called WCONFIG(Kpp\$SDMP) (one per product). Current products that have a hardcoded SYSUDUMP DD are:
  - TEMS (KDS)
  - OMEGAMON XE for Storage CUA (KDF)
  - OMEGAMON XE for IMS (Classic KOI STC per IMS subsystem and CUA KI2)
  - OMEGAVIEW (KMV)
  - OMEGAMON XE on z/OS Classic KOM and CUA KM2
  - OMEGAMON XE for Mainframe Networks CUA (KON).
- New WCONFIG(KDF\$PSCN) imbed for MSR monitoring and dataset monitoring devices options member in xKANPARU(KDFDSCIN).
- New WCONFIG(KR%\$PCON) imbeds for Tivoli Advanced Storage Agents' (KRG KRH KRJ KRK KRN KRV KRW) product-specific imbed to KR%CONFG runtime members (IRAMAN startup members).

## Updated WCONFIG(Kpp\$\*) Override Imbeds

- WCONFIG(KMQ\$CUSR) imbed to W/RKANCMU(KMQUSER) for OMXE for Messaging, updated the KMQUSER imbed comments to highlight the importance of supported dynamic commands.
- WCONFIG(KDS\$PENV/KAG\$PENV/KDF\$PENV/KM2\$PENV) imbed to W/RKANPARU(KppENV) for common KDS TEMS/common KAG\* Agents/OMXE Storage and z/OS CUAs (KDF/KM2), updated the KppENV imbed to add the enabled parameter “KDE\_ALLOWNETIDMISMATCH=1” by default.
- WCONFIG(KDS\$PENV) imbed to W/RKANPARU(KDSENV) for common KDS TEMS, updated the TEMS KDSENV imbed to add the recommended enabled parameters “MAX\_CTIRA\_RECURSIVE\_LOCKS=150” and “KDEP\_SERVICETHREADS=63” by default.
- WCONFIG(KD5\$PENV) imbed to W/RKANPARU(KD5ENV) for OMXE for DB2, updated the KD5ENV imbed to add highlighted comments and placeholder “CTIRA\_SUBSYSTEM\_ID” parameter to feature advanced Agent implementation when there are multiple instances of the OMXE DB2 Agent in a given LPAR reporting to the same TEMS.

## New PARMGEN WK\* Members or Jobs

- WKANSAMU(KCIJPCOL) PDCOLLECT tailored job is a new diagnostic job created by PARMGEN to collect diagnostic information. You can select the new job on the PARMGEN Utilities menu.
- WKANSAMU(KCIJPHRC) HRECALL sample tailored job is a new utility job created by PARMGEN to help recall the RTE datasets.
- xKANPARU(KppCONFIG) is new runtime members file-tailored by PARMGEN for the Tivoli Advanced Storage Agents' (KRG KRH KRJ KRK KRN KRV KRW) IRAMAN startup members. Prior to this enhancement, the product FMIDs delivered default members that required customers to manually copy to RKANPARU dataset and manually add “HLQ=” customization.
- WCONFIG(\$MBDINDX) is a new WCONFIG imbed table listing in \$MBDINDX (extracted from WCONFIG(\$JOBINDX)); both index members accommodate the new KCI\$SLOG and Kpp\$SDMP log-dump-related override imbeds, as well as the new Kpp\$PCON imbeds to the Tivoli Advanced Storage Agents' xKANPARU(KppCONFIG) IRAMAN startup runtime members

## Changed PARMGEN WCONFIG or WK\* Members or Jobs

Changed PARMGEN profiles and jobs:

- IKANSAMU(KCI\$RTEV)/&gbl\_user\_jcl(KCI\$RTEV) &gbl\_user\_jcl(&rte\_name) for all products: updated the Variables profile resolution member with additional best practice user symbols (STGDEBUG\_\*, TCP\_STC, etc). Note that existing &gbl\_user\_jcl(&rte\_name) variables profile is preserved, so compare the IBM-supplied PARMGEN variables profile in IKANSAMU(KCI\$RTEV) or &gbl\_user\_jcl(KCI\$RTEV) with your user customized variables RTE profile in &gbl\_user\_jcl.
- WCONFIG(\$PARSE\*) for all products: new WSUPER step added in all \$PARSE\*-related jobs.
- WCONFIG(\$PARSE\*) for all products: significant batch job run elapsed time improvement.
- WCONFIG(\$PARSE\*) for OMXE for DB2: automate generating the SUBMIT command for the appropriate CRTDB2\* job depending on the KD2\_OMPE\_USE\_MODEL parameter setting.
- WCONFIG(KCIJPVAL) for common TEMS and agent exploiters of ICSF: PARMGEN validation job detects if ICSF load library is not set. This is required starting from ITM630.
  - By default this parameter is commented out. You must customize this parameter in WCONFIG(\$GBL\$USR).
  - Additional WCONFIG(KCIJPVAL) validation checking added:
    - VALIDATE 1: If the default GBL\_DSN\_SYS1\_\* libraries are using default value SYS1.\* dataset names, provide a warning when customer submits the optional KCIJPSYS system copy job.
    - For all PARMGEN jobs, enabled the customizable GBL\_REGION WCONFIG(&rte\_name) and WCONFIG(\$GBL\$USR) profile parameter in all PARMGEN KCIJ\* jobs and all PARMGEN product-specific jobs.
    - For all PARMGEN profiles and jobs, added z/OS and ISPF environment information in PARMGEN jobs and READMEs for reference.

Changed runtime members:

- WKANPARU(KppENV) for common TEMS and agents: added new CTIRA\_SYSTEM\_NAME and CTIRA\_HOSTLOC parameters in the TEMS and agents' xKANPARU(KppENV) runtime members. By default, the parameters are generated commented out by the PARMGEN \$PARSE\* job. If the value of RTE\_SCALA\_ENABLED\_FLAG is changed from N to Y in the WCONFIG(&rte\_name) LPAR RTE profile, the CTIRA\_\* parameters in the KppENV runtime members are generated enabled(uncommented out).
- WKANPARU(KppSYSIN) for common TEMS and agents: added QUIESCE(96,X,F) and QUIESCE(99,X,C) parameters to all TEMS and agent xKANPARU(KppSYSIN).
- WKANPARU(KppSYSIN) for common agents: for any agents that run in their own agent address space that do not currently default its MINIMUM() storage setting to 384000, the PARMGEN configuration default is now MINIMUM(384000,X) in xKANPARU(KppSYSIN).
- xKANPARU(KppPRD00) for Tivoli Advanced Storage agents: these runtime members are no longer generated in the newer versions of the respective KR\* TEMA-based Agents.
- OMEGAMON DE on z/OS: Support MV-only no TEMS/no KWO configuration.
  - WKANPARU(KMVINIT): added checking to detect if related 3 parameters should be generated based on TEMS connect flag.
  - WKANCMDU(KMVSTKMV): added checking to detect if the KMV agent startup should be generated based on TEMS connect flag.
  - WCONFIG(&rte\_name): updated comment section in the 2 key parameters that control these flags: KMV\_TEMS\_LOCAL\_CONNECT\_FLAG and KMV\_OMEGAVIEW\_II\_ENTERPRISE
- OMXE for CICS Classic STC in xKANSAMU: increased the default REGION size from 4096K to 0M, and provided externalization support to customize REGION via GBL\_REGION parameter.
- All product started tasks, KCIJ\* PARMGEN composite jobs, product-specific utility jobs in xKANSAMU: provided externalization support to customize REGION via new GBL\_REGION parameter.
- All product started tasks in xKANSAMU: added "Last \$PARSE\* run refresh: TEMS version @ FMID HKDS630" header.
- All product started tasks in xKANSAMU: modified PROCSTEP with more function-centric names instead of the started task name.
- All product started tasks in xKANSAMU: added support for customizable log and dump-related product started task DDNAMEs.
  - RKLVSNAp/RKLVL0G: TMS:Engine-based product started tasks (TEMS, CUA, Agents) will remove these 2 DDs from the product started tasks, and instead, PARMGEN will replace as a customer-controlled WCONFIG imbed called WCONFIG(KCI\$SLOG).
  - SYS%DUMP DD: TMS:Engine-based product started tasks (TEMS, CUA, Agents), that currently have a SYSUDUMP DD, will remove it from the product started tasks that currently hardcode a SYSUDUMP DD, and instead, PARMGEN will replace as a customer-controlled WCONFIG imbed called WCONFIG(Kpp\$SDMP). There will be one WCONFIG imbed per product.
- WKANSAMU(KppDFINL): updated the "Perform post configuration steps" READMEs.
- WKANSAMU(KCIDFINL) "KCI" step 2 and step 3 for all products: added new tables for the complete list of product started tasks and product VTAM elements (major node and APPLIDs) categorized by product and suite.
- WKANSAMU(KCIDFINL) for all products: added a complete list of all product VTAM node and APPLIDs table in the "POSTCFG" on-line README.
- WKANSAMU(KCIDFINL) for all products: added post-configuration step 12 to highlight the importance of dynamic commands.
- WKANSAMU(KAGDFINL) for common Agent post-configuration README: added new table for the complete list of products that configure the ITM persistent datastore (short-term, NTH).
- WKANSAMU(KD5DFINL) for OMXE for DB2: added new post-configuration step 7 for RRSaF.
- WKANSAMU(KD5DFINL) for OMXE for DB2: added new post-configuration steps 10 and 11 to highlight the importance of dynamic commands.
- WKANSAMU(KI5DFINL) for OMXE for IMS: added new post-configuration step 12 to highlight the importance of dynamic commands.

- WKANSAMU(KMQDFINL) for OMXE for Messaging: added post-configuration step update to step 1b to highlight the importance of dynamic commands.
- WKANSAMU(KOBDFINL) for enhanced 3270UI: added new steps to highlight the enhanced 3270UI NTH post-configuration step.
- WKANSAMU(KM5DFINL) for OMXE on z/OS: added new step to highlight the enhanced 3270UI NTH post-configuration step.
- WKANSAMU(KGWDFINL) for OMXE for CICS TG: added new step to point to the technote (if TxnMonitor Exit (kgw\_monitor.jar) monitoring values need to be changed post-install).
- WKANSAMU(KD5DFINL) for OMXE for DB2: added post-configuration step for dynamic START/STOP of Object Analysis.

### Changed and new PARMGEN workflow UI panels

PARMGEN Workflow UI panel changes:

- KCIPQPGW “ Welcome to the z/OS Installation and Configuration Tools for IBM Tivoli Management Services (TMS) dependent products”: updated SMC panel to add "try" and the new suites (OMEGAMON Performance Management Suite, IBM Service Management Suite for z/OS).
- “PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU”: clarified KCIJPCFG option.
- “SET UP PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3)” KCIP@PG2 panel:
  - Added new GBL\_REGION field.
  - Added logic to only display the GBL\_INST\_HILEV field only if this is an ICAT to PARMGEN conversion.
- "CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS": clarified option labels.
- "SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP": clarified KCIJPUSP/KCIJPUSS options.
- UTILITIES: clarified KCIJPW1R function (equivalent to KCIJPMTY and KCIJPW2R - handy when deleting products from an RTE).
- KCIP@SEC panel: added note about the ICAT to PARMGEN conversion consideration.

## What's new in OMEGAMON products (previous updates)

The topics in this section summarize the enhancements and changes in the OMEGAMON products.

### OMEGAMON version 5.5.0 family products (3Q17 release)

Most products of the OMEGAMON family has gone up to version 5.5.0 or 7.5.0 in this release with new features and enhancements. Find the what's new topics for the products of interest in the following table. The what's new topics for the IBM Service Management Suite for z/OS 1.5.0, IBM OMEGAMON Performance Management Suite for z/OS 5.5.0, IBM OMEGAMON for z/OS Management Suite 5.5.0, NetView for z/OS agent version 6.2.1, and the System Automation Monitoring agent version 3.5.0 are also included in the table for the Service Management Suite users' reference as these products are all configured by PARMGEN.

<b>Product name</b>	<b>What's new topic</b>
IBM® OMEGAMON for CICS on z/OS version 5.5.0	<a href="#">What's New in V5.5.0</a>
Tivoli IBM® OMEGAMON for DB2 Performance Expert on z/OS version 5.4.0	<a href="#">What's new in OMEGAMON for Db2 Performance Expert</a>
Tivoli IBM® OMEGAMON for DB2 Performance Monitoring on z/OS version 5.4.0	<a href="#">What's new &amp; PDFs</a>
IBM® OMEGAMON for IMS on z/OS version 5.5.0	<a href="#">What's new in IBM OMEGAMON for IMS on z/OS 5.5.0</a>

Product name	What's new topic
IBM® OMEGAMON for JVM on z/OS version 5.4.0	<a href="#">What's new in IBM OMEGAMON for JVM on z/OS V5.4.0</a>

System Automation Monitoring Agent version 3.5.0	IBM Tivoli System Automation for z/OS 3.5.0 is no longer published. See <a href="#">IBM Z System Automation documentation</a> .
IBM Service Management Suite for z/OS 1.5.0	<a href="#">What's new in V1.5.0</a>
IBM OMEGAMON Performance Management Suite for z/OS 5.5.0	IBM OMEGAMON Performance Management Suite for z/OS 5.5.0 is no longer published.
IBM OMEGAMON for z/OS Management Suite 5.5.0	IBM OMEGAMON for z/OS Management Suite 5.5.0 is no longer published.

## What's new in the OMNIMON Base (previous updates)

The topics in this section introduce new features and enhancements in OMNIMON Base.

### OMNIMON Base Version 7.5.0 PTF UA98944 for APAR OA57133

APAR OA57133 provides OMNIMON Base Version 7.5.0 password phrase (passphrase) and multi-factor authentication (MFA) enablement support.

This enhancement enables OMEGAMON 3270 (Classic) users to log on using passphrase and MFA credentials. This support is in addition to the existing password logon capability provided in both the OMEGAMON Classic and OMEGAMON enhanced 3270 user interface. Passphrase support also enables the use of MFA. MFA is typically a six-digit volatile numeric token that is paired with a password or passphrase value to facilitate authentication. This enhancement replaces the need for a user-customized assembler module (for example, SAMPLIB security exit) which generally defines the SAF security class for OMEGAMON Classic started tasks.

**Note:** The manual configuration procedures required for this APAR will be superseded by future updates to the PARMGEN configuration tool.

#### Passphrase support in OMEGAMON Classic

A password is eight bytes or less. A passphrase is from nine to 100 bytes long. One problem with supporting a passphrase is the size of a 3270 screen, which is predominantly 80 bytes wide. Therefore, the OMEGAMON logon screen requires a second line of input field to support long passphrase values. The second line value is effectively concatenated onto the end of the first line input field. This is the mechanism in use by the OMEGAMON enhanced 3270 user interface. However, in some cases this is not easily adaptable to the Classic OMEGAMON 3270 logon screens. At any given site, it is possible that multiple programs automate the logon process to the classic products. Often these programs rely on a logon screen that provides static placement of keywords and input fields in order to populate them. The OMNIMON Base passphrase implementation anticipates this by supporting multiple passphrase support settings, as follows:

##### **PARTIAL**

Passphrase PARTIAL means that the passphrase value will occupy one line and input field on the screen, 34 bytes or greater in length. The length of the one field will depend on the screen width setting. In this case, the existing GROUP and NEW PASSWORD fields remain unchanged on the screen. This is to avoid an

incompatibility with programs that might be parsing or populating the logon screen. Equally true, the new password field also occupies one line and input field, 34 bytes or greater in length.

## FULL

Passphrase FULL means that the passphrase value will employ a second line of input on screen, the first line being 34 bytes, and the second line being the remaining 66 bytes. Equally true, the new password field is 34 bytes long, followed by a second line of 66 bytes.

## NO (or NONE)

Passphrase NO (or NONE) means that passphrase support is not enabled.

## SECURITY CLASS in OMEGAMON Classic

Traditionally, there has been an OMEGAMON-supplied sample assembler program, usually ending with a suffix that indicates the security system (SAF) that will be utilized, for example, RACF. It is typically the responsibility of the systems programmer (OMEGAMON administrator) to modify this program, then assemble it and link it. Its purpose is to define the SAF class ID (the default is OMCANDLE), but it also performs the authentication of the user ID and password entered during logon.

Passphrase support implementation choices for this enhancement would have either forced every customer to adopt a new replacement SAMPLIB (security exit) program, or, relocated the Security Class definition to somewhere else. The latter was chosen. For this reason, this enhancement renders the SAMPLIB (security exit) program obsolete. The Security Class definition is now a startup parameter to the primary OMEGAMON logon program, KOBVTAM.

## SAF Application ID in the OMEGAMON Classic

The OMEGAMON Security Exit program defines the SAF Application ID (ApplID) that is used on the various RACROUTE SAF calls. The SAF Application ID field is defined as M\$APPL in the sample security exit program. By default, its value is CANDLE. This enhancement externalizes this value as a parameter. The SAF ApplID is now also a startup parameter to the primary OMEGAMON logon program, KOBVTAM.

## SAF Application ID in the OMEGAMON enhanced 3270 user interface

The CANDLE value continues to be used in the OMEGAMON enhanced 3270 user interface, and there is no mechanism to externalize it. This enhancement updates the OMEGAMON enhanced 3270 user interface to support a new environment variable that can be used to change the default SAF Application ID.

## Configuration changes

The following OMEGAMON components are affected by this enhancement and require manual configuration changes to enable or exploit the passphrase and multi-factor authentication (MFA) capability provided with this enhancement:

- [“OMEGAMON for z/OS Classic V5.5.0” on page 1510](#)
- [“OMEGAMON for CICS Classic V5.5.0” on page 1511](#)
- [“OMEGAMON for IMS Classic V5.5.0” on page 1512](#)
- [“OMEGAMON for Db2 Classic V5.4.0” on page 1513](#)
- [“OMEGAMON enhanced 3270 user interface V7.5.0” on page 1513](#)

Configuration steps for each of these components are provided, as follows.

**Important:** You should back up the results of any manual configuration changes as subsequent PARMGEN configuration activity might remove your changes and require reinstatement. Future PARMGEN support will remove the need for manual backup and configuration procedures.

## OMEGAMON for z/OS Classic V5.5.0

To configure OMEGAMON for z/OS Classic for passphrase support, you must modify the OMEGAMON CLASSIC REALTIME COLLECTOR Started Task JCL and add a new PDS member in your `&rhilev.&rte.RKANPARU` data set.

The OMEGAMON CLASSIC REALTIME COLLECTOR started task JCL is stored in the `&rhilev.&rte.RKANSAMU` data set and subsequently copied into a PROCLIB data set. The started task JCL should look similar to the following excerpts:

```

//*****
//* NAME: xxxxm2rc OMEGAMON CLASSIC REALTIME COLLECTOR
//*
...
//OMCI PROC RGN=OM,
// TIM=1440,
// SYS=sysa,
// RHILEV=MYHILEV1,
// BASEHLEV=MYHILEV2,
// USERPARU=MYHILEV3,
// DOUT=X,
// APPL=OMAPPLID,
// PRTCT=, /* Change required here. See step 1. */
// PSWD=, /* Change required here. See step 2. */
// UMAX=99,
...
//STEPNAME EXEC PGM=KOBVTAM,
// REGION=&RGN,TIME=&TIM,
// PARM=('APPL=&APPL,PRTCT=&PRTCT', /* Change required here. See step 1. */
// 'PSWD=&PSWD,UMAX=&UMAX,OM=&OM', /* Change required here. See step 2. */
// 'PROD=&PROD,FSCR=&FSCR', /* Change required here. See step 3. */
// 'USER=&USR,FOLD=&FOLD',
// 'LROWS=&LROWS')
...

```

## Procedure

1. Remove the PRTCT keyword from both the EXEC PARM string and the PROC string. The PRTCT keyword is being deprecated.
2. Remove the PSWD keyword from both the EXEC PARM string and the PROC string. The PSWD keyword is being deprecated.
3. Add the following keyword to the PARM string: `MEMBER=memname`, where *memname* is the name of the PDS member that you create in the next step. The use of KOBVTAM as the member name is recommended.
4. Create a new member in the `&rhilev.&rte.RKANPARU` data set whose name matches that which is referenced in the PARM string keyword `MEMBER=memname` (for example, KOBVTAM), and add the following three lines:

```

PASSPHRASE=passphrase
SECCLASS=secclass
SAFAPPL=safapplid

```

where:

### ***passphrase***

Specifies the passphrase support setting, as follows:

- PARTIAL - Enable partial passphrase.
- FULL - Enable full passphrase.
- NO - (default) Passphrase support is not enabled.

For more information about this setting, see [“Passphrase support in OMEGAMON Classic” on page 1509](#).

### ***secclass***

Specifies the name of your security class for OMEGAMON. The default value is OMCANDLE and is used to permit or deny user access during OMEGAMON logon. For more information, see [“SECURITY CLASS in OMEGAMON Classic” on page 1510](#).

### ***safappl***

Specifies the name of the optional SAF Application ID for OMEGAMON. The default value is CANDLE. For more information, see [“SAF Application ID in the OMEGAMON Classic” on page 1510](#)

To configure OMEGAMON for CICS Classic for passphrase support, you must modify an existing PDS member in your *&rhilev.&rte*.RKANPARU data set. In the RKANPARU data set, locate the PDS member that starts OBVTAM. The PDS member is typically named KOCVTM*nn*. Its contents should look similar to the following:

```
START OBVTAM APPL=OMAPPLID,  
LROWS=9999,  
UMAX=99,  
FOLD=Y,  
USER=/I,
```

Add the following three lines anywhere in the parameter definition:

```
PASSPHRASE=passphrase,  
SECCLASS=secclass,  
SAFAPPL=safapplid,
```

where:

#### ***passphrase***

Specifies the passphrase support setting, as follows:

- PARTIAL - Enable partial passphrase.
- FULL - Enable full passphrase.
- NO - (default) Passphrase support is not enabled.

For more information about this setting, see [“Passphrase support in OMEGAMON Classic” on page 1509](#).

#### ***secclass***

Specifies the name of your security class for OMEGAMON. The default value is OMCANDLE and is used to permit or deny user access during OMEGAMON logon. For more information, see [“SECURITY CLASS in OMEGAMON Classic” on page 1510](#).

#### ***safappl***

Specifies the name of the optional SAF Application ID for OMEGAMON. The default value is CANDLE. For more information, see [“SAF Application ID in the OMEGAMON Classic” on page 1510](#)

### **OMEGAMON for IMS Classic V5.5.0**

**Important:** Support for passphrase and multi-factor authentication in OMEGAMON for IMS requires PTF UA98947 for APAR OA57125.

To configure OMEGAMON for IMS Classic for passphrase support, you must modify an existing PDS member in your *&rhilev.&rte*.RKANPARU data set. The PDS member is typically named KOIVTM*nn*. Its contents should look similar to the following:

```
START OIVTAM,  
DATA=YES,  
LROWS=9999,  
TIMEOUT=30,  
USER=/C,  
FOLD=Y,  
UMAX=99  
...
```

Add the following three lines anywhere in the parameter definition:

```
PASSPHRASE=passphrase,  
SECCLASS=secclass,  
SAFAPPL=safapplid,
```

where:

#### ***passphrase***

Specifies the passphrase support setting, as follows:

- PARTIAL - Enable partial passphrase.
- FULL - Enable full passphrase.
- NO - (default) Passphrase support is not enabled.

For more information about this setting, see [“Passphrase support in OMEGAMON Classic” on page 1509](#).

#### ***secclass***

Specifies the name of your security class for OMEGAMON. The default value is OMCANDLE and is used to permit or deny user access during OMEGAMON logon. For more information, see [“SECURITY CLASS in OMEGAMON Classic” on page 1510](#).

#### ***safappl***

Specifies the name of the optional SAF Application ID for OMEGAMON. The default value is CANDLE. For more information, see [“SAF Application ID in the OMEGAMON Classic” on page 1510](#)

### **OMEGAMON for Db2 Classic V5.4.0**

To configure OMEGAMON for Db2 Classic for passphrase support, you must modify an existing PDS member in your RKD2PAR data set.

In the RKD2PAR data set, locate the PDS member that starts OBVTAM. The PDS member is typically named RVTMnnnn. Its contents should look similar to the following:

```
START OBVTAM APPL=OMAPPLID,  
LROWS=9999,  
UMAX=99,  
FOLD=Y,  
USER=/I,  
...
```

Add the following three lines anywhere in the parameter definition :

```
PASSPHRASE=passphrase,  
SECCLASS=secclass,  
SAFAPPL=safapplid,
```

where:

#### ***passphrase***

Specifies the passphrase support setting, as follows:

- PARTIAL - Enable partial passphrase.
- FULL - Enable full passphrase.
- NO - (default) Passphrase support is not enabled.

For more information about this setting, see [“Passphrase support in OMEGAMON Classic” on page 1509](#).

#### ***secclass***

Specifies the name of your security class for OMEGAMON. The default value is OMCANDLE and is used to permit or deny user access during OMEGAMON logon. For more information, see [“SECURITY CLASS in OMEGAMON Classic” on page 1510](#).

#### ***safappl***

Specifies the name of the optional SAF Application ID for OMEGAMON. The default value is CANDLE. For more information, see [“SAF Application ID in the OMEGAMON Classic” on page 1510](#)

### **OMEGAMON enhanced 3270 user interface V7.5.0**

The OMEGAMON enhanced 3270 user interface reads the *&rhilev.&rte*.RKANPARU PDS member KOBENV to obtain the SAF security configuration values for authentication and authorization. The new SAF Application ID environment variable will also be read from this file. Following is an example of the environment variables statement that can be added to KOBENV. The default value is CANDLE. As a result, the following statement should only be added to change the default:

```
KOB_SAF_APPLID=safapplid
```

where:

***safapplid***

Specifies the name of the optional SAF Application ID for OMEGAMON. The default value is CANDLE. For more information, see [“SAF Application ID in the OMEGAMON enhanced 3270 user interface” on page 1510](#).

## What's new in the OMEGAMON enhanced 3270 user interface (previous updates)

The topics in this section introduce new features and enhancements to the OMEGAMON enhanced 3270 user interface.

**Tip:** You can also access a list of the latest features and enhancements using the online help in the product, by expanding the **HELP** menu and selecting **W Whats New**.

### OMEGAMON enhanced 3270 user interface V7.5.0 PTF UA93322 (3Q17)

OMEGAMON enhanced 3270 user interface 7.5.0 PTF is UA93322 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) 7.5.0:

#### Situation Editor enhancement

A more user-friendly way of editing the formula of a situation via the Situation Formula workspace (KOBSEDPA). The formula is displayed in the workspace as a set of rows and columns. Each column is the name of a monitoring system attribute or the name of another situation. When you edit the cells by typing the E action character in the cell, a series of pop-up windows will display with the following items to choose from:

- Available tables and columns
- Available functions (VALUE, AVERAGE, etc.)
- Available operators (EQ, NE, etc.)
- Available values (strings, numbers, and ENUM values.)

### OMEGAMON enhanced 3270 user interface PTF UA83356 for APAR OA51564

APAR OA51564 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) with APAR OA51564 (PTF UA83356):

#### Situation Editor

You can use the Situation Editor to create, view, and edit situations (including the formula, distribution, expert advice, action, and until conditions) that can monitor important conditions in your environment. Each situation monitors your environment constantly by testing a formula at time intervals that you set up, for example, every 5 minutes. You can view the overall status of your environment in the Situation Status tree. Type / to select option rows. Move between areas in the Situation Editor by selecting a tab on top.

Some screens contain highlighted push buttons, through which you can access additional Situation Editor features.

#### Object Editor

You can use the Object Editor to organize managed systems and situations into name groups which you can reference in distribution lists.

The tree shows the types of object groups that are available and groups that have been created.

There are 2 types of groups available to be created.

### Managed System
