# Introduction to OMEGAMON shared documentation

The *OMEGAMON shared documentation* contains information that applies to [OMEGAMON® products](#) that use Tivoli® Management Services on z/OS®, or the configuration software that supports it.

This documentation set covers the following information:

- Overview of the Tivoli Management Services components and OMEGAMON shared components. These components include the Tivoli Enterprise Monitoring Server, the Tivoli Enterprise Portal Server, TMS:Engine, and OMNIMON Base.
- Planning, installing, upgrading, and securing Tivoli Management Services components and OMEGAMON shared components
- Configuring OMEGAMON® products and their common framework components on z/OS® using the Tivoli Management Services on z/OS configuration tools:
  - [IBM Z Monitoring Configuration Manager](#) (Monitoring Configuration Manager or Configuration Manager)
  - [Parameter Generator](#) (PARMGEN)
- Configuring and using the product interfaces, including the user guides for the following interfaces:
  - [OMEGAMON® enhanced 3270 user interface](#)
  - [IBM Z Service Management Explorer](#)
  - [“Tivoli Enterprise Monitoring Server REST services” on page 1080](#)
- Messages for the z/OS®-based components of the IBM® OMEGAMON products and Tivoli® Management Services

---

## Downloadable PDFs

This topic provides a list of PDF files that are available for download.

Title	Description
<a href="#"><u>IBM® OMEGAMON Shared Documentation</u></a>	This PDF includes all of the OMEGAMON shared documentation content.  <b>Note:</b> This PDF contains planning, upgrading, deployment, configuration (including parameter reference), troubleshooting, and other reference content and replaces the individual PDFs that were previously available.
<a href="#"><u>IBM Z Monitoring Configuration Manager</u></a>	Read this guide to understand the Configuration Manager configuration method and the steps for configuring products and components on z/OS.
<a href="#"><u>IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide</u></a>	Read this guide to understand the Tivoli Enterprise Portal, a distributed user interface for products using Tivoli Management Services.
<a href="#"><u>IBM® OMEGAMON Monitoring Agents on z/OS Quick Start Guide</u></a>	Read this guide to understand the process for installing an OMEGAMON monitoring agent on z/OS.
<a href="#"><u>IBM® OMEGAMON Enhanced 3270 User Interface Guide</u></a>	Read this guide to understand the OMEGAMON enhanced 3270 user interface, an ISPF-based user interface for the OMEGAMON monitoring products.

Title	Description
<a href="#"><u>OMEGAMON Multi-tenancy Guide</u></a>	Read this guide to understand OMEGAMON multi-tenancy mode, a feature that allows the monitoring of distinctly separate sets of resources in the OMEGAMON enhanced 3270 user interface.
<a href="#"><u>IBM Z Service Management Explorer User Guide</u></a>	Read this guide to understand IBM Z Service Management Explorer (IZSME), a web-based interface for the OMEGAMON monitoring products.
<a href="#"><u>IBM® OMEGAMON Messages</u></a>	Use this guide to review messages for the z/OS®-based components of the IBM® OMEGAMON products and Tivoli® Management Services, such as the Tivoli Enterprise Portal Server, the Tivoli Enterprise Monitoring Server, OMNIMON Base, and the Tivoli Monitoring Services:Engine (TMS:Engine).
<a href="#"><u>Program Directory for IBM Tivoli Management Services on z/OS 6.4.0</u></a>	This program directory is intended for system programmers who are responsible for program installation and maintenance. It contains information about the material and procedures associated with the installation of IBM Tivoli Management Services on z/OS.
<a href="#"><u>Program Directory for IBM Z Service Management Explorer 6.4.0</u></a>	This program directory is intended for system programmers who are responsible for program installation and maintenance. It contains information about the material and procedures associated with the installation of IBM Z Service Management Explorer.

For additional program directories of the OMEGAMON family products and suite products, see [Program Directories](#).

## OMEGAMON products

This topic provides a list of the latest OMEGAMON products, product-extending components, and suites.

The *OMEGAMON shared documentation* contains information that applies to OMEGAMON® products that use IBM® Tivoli® Management Services on z/OS®. OMEGAMON products can be stand-alone or part of a suite.

### Tivoli Management Services on z/OS

The OMEGAMON suite of products use the Tivoli® Management Services on z/OS infrastructure, which provides security, data transfer and storage, notification mechanisms, user interface presentation, and communication services.

The latest version is Tivoli Management Services on z/OS 6.4, which includes the browser-based [IBM Z OMEGAMON Web UI](#) and Grafana OSS Edition 12.1.1. [IBM Z OMEGAMON AI Insights 2.2](#) is also included.

For information about additional components, such as [Tivoli Enterprise Monitoring Server REST services](#), see [“Tivoli Management Services components” on page 54](#).

#### Important:

- Tivoli Management Services on z/OS 6.3.0 Fix Pack 6 (or later) is a prerequisite for the OMEGAMON products and suites listed in this topic.
- Any OMEGAMON product or suite that offers artificial intelligence and machine learning capabilities requires [IBM Z OMEGAMON AI Insights](#).

For more information, see the Program Directory for the respective product or suite.

**Update to License Information for IBM Tivoli Management Services on z/OS 6.4:** In the *License Information* document for this product, *Limited Use Separately Licensed Code* section, the Program below is hereby included in the “Named Program(s) and/or Services(s)” list:  
5698-W37 IBM Z OMEGAMON AI for Db2

## Individual OMEGAMON products

- [IBM Z® OMEGAMON® AI for CICS 6.1](#)
- [IBM Z® OMEGAMON® AI for Db2 6.1](#)
- [IBM OMEGAMON® for IMS™ on z/OS® 5.5](#)
- [IBM Z® OMEGAMON® AI for JVM, 6.1](#)
- [IBM OMEGAMON® for Messaging on z/OS® 7.5](#)
- [IBM OMEGAMON® for Networks on z/OS 5.5](#)
- [IBM Z® OMEGAMON® AI for Networks 6.1](#)
- [IBM Z OMEGAMON® AI for Storage 6.1](#)
- [IBM OMEGAMON® for z/OS® 5.5](#)
- [IBM Z® OMEGAMON® AI for z/OS® 6.1](#)
- [IBM OMEGAMON® Dashboard Edition on z/OS® 5.5](#)
- [IBM Z® OMEGAMON® Integration Monitor 5.6<sup>1</sup>](#)

**Note:** Additional products and agents are also managed under the Tivoli Management Services infrastructure. For more information, see [“Other product/agent codes and documentation” on page 52](#).

## Additional OMEGAMON components

The following components extend the capabilities of the OMEGAMON products:

- [IBM Z OMEGAMON AI Insights 2.2](#). This component provides an artificial intelligence and machine learning model for processing OMEGAMON key performance indicators that can deliver insights into future performance. OMEGAMON AI Insights is required for any product that offers artificial intelligence and machine learning features.  
IBM Z OMEGAMON AI Insights is available as a container image included with IBM Tivoli Management Services on z/OS 6.3.3 and later. IBM Z OMEGAMON AI Insights 2.2 is included in IBM Tivoli Management Services on z/OS 6.4.
- [IBM Z® OMEGAMON® Web UI 2.1](#). This component is a browser-based graphical user interface for monitoring and managing z/OS systems. IBM Z OMEGAMON Web UI uses Grafana dashboards to provide visualization and analysis of performance data gathered by OMEGAMON monitoring agents. This user interface also includes administrative functions that are both stand-alone and integrated with the dashboard experience. IBM Z OMEGAMON Web UI requires the IBM Z OMEGAMON Data Requester component, a Grafana application plug-in that provides customizable starter dashboards.  
IBM Z OMEGAMON Web UI and Grafana OSS Edition 12.1.1 are included with IBM Tivoli Management Services on z/OS 6.4 and later.  
  
IBM Z OMEGAMON Data Requester is included with IBM Tivoli Management Services on z/OS 6.3.4 and later. Use of IBM Z OMEGAMON Data Requester requires Tivoli Management Services on z/OS APAR OA67404 (PTF UJ96676).
- [IBM Z OMEGAMON Data Provider 1.1](#). This component makes data from z/OS available to various destinations. Typically, the data consists of metrics or events from z/OS subsystems or applications, and the destinations are analytics platforms that analyze that data.

<sup>1</sup> This product is available only as a component product in IBM® Z Monitoring Suite; IBM® Z Integration for Observability; or IBM Z® Service Management Suite 2.3 and later.

## Suites

OMEGAMON products are available in or complemented by the following suites. You can view the list of component products for each suite using the provided links.

- [IBM Z Monitoring Suite 2.3.0](#)
- [IBM Z Service Management Suite 3.3.0](#)
- [IBM Z Integration for Observability 6.3.0](#). This suite delivers data integration and user interfaces for use with stand-alone OMEGAMON agents. It does not include stand-alone OMEGAMON products.
- [IBM Z Storage Management Suite 3.1](#)

# What's new in OMEGAMON®

The topics in this section describe recent updates.

**Note:** Previous updates are described in [“What's new \(previous updates\)”](#) on page 14.

## What's new in OMEGAMON shared components

This topic summarizes the recent updates in the OMEGAMON shared documentation for various OMEGAMON shared components.

Description	Related APARs
With situation status streaming, you can forward situation status updates from your OMEGAMON® monitoring agents to third-party analytics platforms, such as Instana, Splunk, Elastic Stack, Prometheus, Grafana, and others. For more information, see <a href="#">(Optional) Configure situation status streaming</a> and <a href="#">“Stream situation status updates to OMEGAMON Data Provider”</a> on page 1126.	OA68099 OA68536
Starting with Tivoli® Management Services on z/OS® 6.4, IBM Z® OMEGAMON® Web UI, a browser-based graphical user interface that uses Grafana® dashboards, is included as a component. Also included is Grafana OSS Edition 12.1.1. For more information about the new interface, see <a href="#">“IBM Z OMEGAMON Web UI”</a> on page 59.	—
Tivoli Enterprise Monitoring Server REST services have been enhanced, as follows: <ul style="list-style-type: none"><li>• With the PUT /situations endpoint, you can now in one request create multiple situations or import multiple existing situations from one runtime environment into a different runtime environment. For more information, see <a href="#">“Creating situations”</a> on page 1106.</li><li>• With the PUT /situations endpoint, you can no longer replace existing situations. If you want to update existing situations, use the PATCH /situations endpoint. For more information, see <a href="#">“Editing situations”</a> on page 1098.</li><li>• When deleting a situation or a history collection configuration, in addition to the required <b>NAME</b> parameter, now you must also provide the timestamp when the situation or history collection configuration was last modified (the <b>LSTDATE</b> parameter). This timestamp value is used as a locking mechanism to prevent multiple requests aimed at the same situation or history collection configuration. For more information, see <a href="#">“Deleting a situation”</a> on page 1116 and <a href="#">“Deleting a history collection configuration”</a> on page 1097.</li></ul>	OA68566

Description	Related APARs
<p>Tivoli Enterprise Monitoring Server REST services have been enhanced, as follows:</p> <ul style="list-style-type: none"> <li>• You can now create new Take Action definitions and edit existing Take Action definitions. To control permissions, you must use SAF resource profiles. For more information, see <a href="#">“Creating Take Action definitions” on page 1123</a>, <a href="#">“Editing Take Action definitions” on page 1121</a>, and <a href="#">“Define SAF profiles to control Take Action permissions” on page 1089</a>.</li> <li>• When using the GET /spec endpoint, the OpenAPI document is returned in YAML format. For more information, see <a href="#">“Accessing TEMS REST services OpenAPI document” on page 1092</a>.</li> <li>• When deleting a Take Action definition, in addition to the required <b>NAME</b> parameter, now you must also provide the timestamp when the Take Action definition was last modified (the <b>LSTDATE</b> parameter). This timestamp value is used as a locking mechanism to prevent multiple requests aimed at the same Take Action definition. For more information, see <a href="#">“Deleting a Take Action definition” on page 1126</a>.</li> <li>• The response body for the /system/actions endpoint has been aligned with the other endpoints. The <b>KEY</b> and the <b>NAME</b> parameter names have been updated. The parameter that was previously displayed as <b>KEY</b> in the response body is now displayed as <b>NAME</b>. And the parameter that was previously displayed as <b>NAME</b> is now displayed as <b>FULLNAME</b>.</li> </ul>	<p>OA68441 OA68455</p>
<p>Tivoli Enterprise Monitoring Server REST services have been enhanced, as follows:</p> <ul style="list-style-type: none"> <li>• The following updates have been made to the PUT /situations endpoint, which you use to create or replace a situation, and the PATCH /situations endpoint, which you use to edit a situation: <ul style="list-style-type: none"> <li>◦ When creating, replacing, or editing a situation, now all parameters must be specified in the request body, including the <b>NAME</b> parameter and the <b>LSTDATE</b> parameter for editing a situation. For more information, see <a href="#">“Creating situations” on page 1106</a> and <a href="#">“Editing situations” on page 1098</a>.</li> <li>◦ You can now create, replace, and edit correlated situations and embedded situations ("Situation Comparison" in Tivoli Enterprise Portal). For more information, see <a href="#">“Creating situations” on page 1106</a> and <a href="#">“Editing situations” on page 1098</a>.</li> </ul> </li> <li>• With the PATCH /situations endpoint, which you use to edit a situation, you can now update the situation FULLNAME property. For more information, see <a href="#">“Editing situations” on page 1098</a>.</li> </ul>	<p>OA68228</p>
<p>Starting with Tivoli® Management Services on z/OS® 6.3.4, IBM Z® OMEGAMON® Data Requester is included as a component. Use of this Grafana application plug-in requires Tivoli Management Services on z/OS APAR OA67404 (PTF UJ96676). For more information, see <a href="#">IBM Z® OMEGAMON® Data Requester</a>.</p>	<p>—</p>

Description	Related APARs
<p>Tivoli Enterprise Monitoring Server REST services have been enhanced, as follows:</p> <ul style="list-style-type: none"> <li>• You can now create and replace situations. To control permissions, you must use SAF resource profiles. For more information, see <a href="#">“Creating situations” on page 1106</a> and <a href="#">“Define SAF profiles to control permissions for situations” on page 1086</a>.</li> <li>• The following updates have been made to the PATCH /situations endpoint, which you use to edit a situation: <ul style="list-style-type: none"> <li>◦ You can now edit multiple situations in a single request. For more information, see <a href="#">“Editing multiple situations in a request” on page 1099</a>.</li> <li>◦ Request body property REFLEXACTION_OPTIONS replaces AUTOSOPT. For more information, see <a href="#">“Request body properties for situation editing” on page 1100</a>.</li> </ul> </li> <li>• When requesting situation status information, to use the <b>includeResults</b> parameter set to true, you must now also specify either the <b>name</b> or <b>originnode</b> parameter in the request. For more information, see <a href="#">“Retrieving situation status information” on page 1117</a>.</li> <li>• When executing a Take Action, you can now pass values for variables used in the Take Action. For more information, see <a href="#">“Executing a Take Action” on page 1125</a>.</li> </ul>	<p>OA67524</p>

Description	Related APARs
<p>Tivoli Enterprise Monitoring Server REST services have been enhanced, as follows:</p> <ul style="list-style-type: none"> <li>• The following updates have been made to the /situations/status resource: <ul style="list-style-type: none"> <li>◦ Endpoint GET /situations/status now returns information for current situation statuses only. Query parameters <b>expand</b> and <b>timeFrom</b> are no longer supported for this endpoint. New parameter <b>includeResults</b>, when set to true, retrieves the results for a current situation status. For more information, see <a href="#">“Request current situation statuses” on page 1117</a>.</li> <li>◦ New endpoint GET /situations/status/history retrieves situation status history. For more information, see <a href="#">“Request situation status history” on page 1118</a>.</li> <li>◦ New query parameter <b>deltastat</b> allows you to filter results by situation status. For more information, see <a href="#">“Filter results by attributes” on page 1118</a>.</li> </ul> </li> <li>• You can now delete history collection configurations. To control permissions, you must use SAF resource profiles. For more information, see <a href="#">“Deleting a history collection configuration” on page 1097</a> and <a href="#">“Define SAF profiles to control permissions for history collection configurations” on page 1085</a>.</li> <li>• You can now delete situations. <p>Tivoli Enterprise Monitoring Server REST services have been enhanced, as follows:</p> <ul style="list-style-type: none"> <li>You can now retrieve information about Take Action command definitions.</li> <li>When retrieving situation status information, you can now filter results by Origin Node (<b>originnode</b>) and Display Item (<b>atomize</b>). When using the <b>expand</b> parameter set to true, the <b>name</b> parameter is now required, you can now specify a start time using the <b>timeFrom</b> parameter, and historical information is included in the response.</li> <li>In addition to being able to restrict access to collection data, you can now use SAF profiles to also restrict access to situations, situation statuses, and Take Action command definitions. For more information, see new section <a href="#">“Securing TEMS REST services” on page 1081</a>.</li> </ul> <p>For more information, see <a href="#">“Tivoli Enterprise Monitoring Server REST services” on page 1080</a>.</p>	OA66384
<p>Tivoli Enterprise Monitoring Server REST services have been enhanced to retrieve information about situations for event monitoring, including situation status. You can also retrieve information about self-describing agent records. Additionally, support for user ID mapping for authorization has been added. For more information see <a href="#">“Tivoli Enterprise Monitoring Server REST services” on page 1080</a>.</p>	OA65553
<p>New Take Action command <b>HTTPrQ</b> (HTTP Request) creates an HTTP request when a situation occurs. For more information, see <a href="#">“How to: Create an HTTP request for a situation” on page 888</a>.</p>	OA65625
<p>You can use OpenWebStart, an open-source Java Web Start replacement, to run your Tivoli Enterprise Portal client. For more information, see <a href="#">“Tivoli Enterprise Portal” on page 1186</a> and <a href="#">“OpenWebStart” on page 1186</a>.</p>	—
<p>A new OMEGAMON enhanced 3270 user interface parameter, <b>CON_TIMEOUT</b>, controls the number of seconds until timeout that the conduit manager uses when connecting to a data retrieval agent (DRA) socket. For more information, see <a href="#">“Data retrieval delays/timeouts causing no data conditions” on page 1018</a>.</p> <p>New parameter <b>KOB_DRA_BACKLOG</b> specifies the maximum number of queued connections for the DRA component of the OMEGAMON enhanced 3270 user interface. For more information, see <a href="#">KOB_DRA_BACKLOG</a>.</p>	OA65475

Description	Related APARs
Tivoli Enterprise Monitoring Server REST services are available for accessing OMEGAMON collection data and select managed system data. For more information, see <a href="#">“Tivoli Enterprise Monitoring Server REST services” on page 1080</a> .	OA64983 OA65203
Starting from IBM Tivoli Monitoring V6.3.0.7, Docker technology is introduced to reduce the time and effort in installing the Tivoli Enterprise Portal Server. You can now run IBM Tivoli Monitoring - Tivoli Enterprise Portal Server Container in a Docker runtime environment on Linux on System z or on z/OS using z/OS Container Extensions. For more information, see <a href="#">Tivoli Enterprise Portal Server Container</a> .	—
<p>The IBM Tivoli Monitoring on z/OS framework now supports persistent data store V2 (PDS V2) for all history data sets. You can now use extended address volumes (EAV) for all history data sets.</p> <p>Using Configuration Manager or PARMGEN, you can configure the use of PDS V2 for the Tivoli Enterprise Monitoring Server using the new <b>KDS_PDS2_*</b> parameters.</p> <p>For more information, see <a href="#">“Persistent data store V2 (PDS V2)” on page 1222</a>.</p> <div data-bbox="247 786 1136 943" style="border: 1px solid blue; padding: 5px;"> <p><b>Note:</b> The IBM OMEGAMON for Storage on z/OS internal version of PDS V2 is no longer supported. IBM OMEGAMON for Storage users must use the OMNIMON Base version of PDS V2.</p> </div>	OA63242 OA63770 OA63966
<p>Configuration Manager and PARMGEN now support PDS V2 parameters for the following IBM Advanced Storage Management agents:</p> <ul style="list-style-type: none"> <li>• IBM Tivoli Advanced Allocation Management for z/OS 3.3</li> <li>• IBM Tivoli Automated Tape Allocation Manager for z/OS 3.3</li> <li>• IBM Tivoli Advanced Backup and Recovery for z/OS 2.4</li> </ul> <p>See <a href="#">“PDS V2 parameters and members” on page 1238</a> and <a href="#">“PDS data set names” on page 1225</a>.</p>	OA64006
<p>Configuration Manager and PARMGEN now support PDS V2 parameters for IBM Tivoli Composite Application Manager for Application Diagnostics Agent 7.1.1. See <a href="#">“PDS V2 parameters and members” on page 1238</a> and <a href="#">“PDS data set names” on page 1225</a>.</p>	OA63790
<p>Configuration Manager and PARMGEN now support PDS V2 parameters for the following IBM Advanced Storage Management agents:</p> <ul style="list-style-type: none"> <li>• IBM Tivoli Advanced Catalog Management for z/OS 2.6</li> <li>• IBM Tivoli Advanced Reporting and Management for DFSMSHsm 2.6</li> <li>• IBM Tivoli Advanced Audit for DFSMSHsm 2.6</li> </ul> <p>See <a href="#">“PDS V2 parameters and members” on page 1238</a> and <a href="#">“PDS data set names” on page 1225</a>.</p>	OA63566
<p>A new configuration option is available for passphrase support for the OMEGAMON 3270 Classic user interface. For parameter <b>Kpp_CLASSIC_PASSPHRASE</b> (where <i>pp</i> is C2, D2, I2, or M2), you can now specify the value MAX62, which allows you to enter up to a 62-byte passphrase value on a single line when the screen width is 80 bytes. With a wider screen size, you can specify a passphrase value up to 100 bytes long. For more information, see <a href="#">“How to: Configure passphrase and MFA support in the OMEGAMON 3270 Classic interface” on page 362</a>.</p>	OA62991
<p>Configuration Manager and PARMGEN now support PDS V2 parameters for IBM Z NetView Enterprise Management Agent. See <a href="#">“PDS data set names” on page 1225</a>.</p>	OA63103

Description	Related APARs
<p>z/OS® data set encryption support has been added for persistent data store V2 (PDS V2). For more information, see <a href="#">“How to: Use encryption for your PDS V2 data sets” on page 1239</a>.</p> <p>With the installation of PTF UJ08510 for APAR OA62995, PDS V2 now requires z/OS 2.2 with OA50569 or later.</p> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Attention:</b> After PTF UJ08510 is installed, if your system is not running z/OS 2.2 with OA50569 or later and you attempt to start the monitoring server or monitoring agent, PDS V2 initialization will fail and history data will be lost.</p> </div>	OA62995
<p>The following commands have been added for managing persistent data store V2 (PDS V2) data sets:</p> <ul style="list-style-type: none"> <li>• <b>QUERY DATASTORE.</b> For more information, see <a href="#">“Displaying PDS V2 data set information” on page 1242</a>.</li> <li>• <b>SWITCH.</b> For more information, see <a href="#">“Switching the active data set” on page 1243</a></li> </ul>	OA62342
<p>Support has been added for using the Tivoli administrative commands (tacmd) Command Line Interface (CLI) when your Tivoli Enterprise Monitoring Server resides on a z/OS system that is using multi-factor authentication (MFA). For more information, see <a href="#">“(If applicable) Installing the tacmd CLI component” on page 524</a>.</p>	OA62146
<p>New messages have been added for support of IBM Z OMEGAMON Data Provider.</p>	OA62052
<p>For the OMEGAMON multi-tenancy solution, wildcard support for multi-tenancy user ID definitions has been added. For more information, see <a href="#">“Creating tenant definitions in PDS members” on page 1068</a>.</p>	OA61889
<p>A new type of user has been defined for the OMEGAMON multi-tenancy solution. <i>Power</i> users can access all menu options, icons and commands for all products assigned to their tenant. Power users also have additional navigational capabilities than the regular tenant user. For more information, see <a href="#">“OMEGAMON multi-tenancy” on page 1061</a>.</p>	OA61210
<p>Take Action command authorization and access settings can now be set using SAF profiles. This option provides centralized control to Take Action command access by a security administrator. For more information, see <a href="#">“Configuring Take Action command access using SAF profiles” on page 549</a>.</p>	OA61138 OA61140
<p>Common parameters have been introduced for configuring PDS V2. RTE and agent-specific parameters can be used to activate the use of PDS V2 and to define data set allocation settings, improving the migration process from PDS V1 to PDS V2. These parameters are supported by PARMGEN and Configuration Manager. A utility is also provided that can be used to remove PDS V1 data sets after successful migration to PDS V2. For more information, see <a href="#">“Persistent data store V2 (PDS V2)” on page 1222</a>.</p>	OA60244 OA61008
<p>Open Web Launch, an open-source Java Web Start replacement, can be used to run your Tivoli Enterprise Portal client. For more information, see <a href="#">“Open Web Launch” on page 1186</a>.</p>	OA60952
<p>Improvements have been made to PDS V2 data set allocation, management and usage. PDS V2 data set allocation and management behavior is now either space-based or time-based and depends on the Extent Constraint Removal (ECR) attribute of the SMS data class used when allocating the data sets. Additionally, the overall size of the PDS V2 data sets for an OMEGAMON product has been decreased and is now approximately equal to the size of the equivalent PDS V1 data sets. For more information, see <a href="#">“Persistent data store V2 (PDS V2)” on page 1222</a>.</p>	OA60782

Description	Related APARs
<p>IBM Z Monitoring Configuration Manager (Monitoring Configuration Manager) is a new tool for configuring runtime environments. Monitoring Configuration Manager evolved from Parameter Generator (PARMGEN). While PARMGEN and Monitoring Configuration Manager use the same parameters, Monitoring Configuration Manager simplifies the process of generating runtime members from those parameters.</p> <p>You can use PARMGEN or Monitoring Configuration Manager to configure, replicate, maintain, and update RTEs. For more information, see <a href="#">“Configuring products and components on z/OS”</a> on page 213.</p>	OA60562
<p>For the OMEGAMON multi-tenancy solution, managed system types TCP, VTAM, and MFAD have been introduced for IBM OMEGAMON for Networks for z/OS. These new types replace managed system type MFN. For more information, see <a href="#">“Creating tenant definitions in PDS members”</a> on page 1068.</p>	OA59694
<p>IBM Z Service Management Explorer (IZSME) is a web-based replacement for the Tivoli Enterprise Portal (TEP). The same layout, workspaces, situations, and data available in the TEP are available in IZSME. IZSME is a web application running as a Zowe desktop plug-in, which eliminates the need to install and maintain Java and TEP software on client workstations as required with the TEP. For more information, see <a href="#">“IBM Z Service Management Explorer”</a> on page 1128.</p> <div data-bbox="247 862 1136 987" style="border: 1px solid black; padding: 5px;"> <p><b>Note:</b> IBM Z Service Management Explorer requires Tivoli Management Services V6.3.1.</p> </div>	OA59394
<p>A new version of the persistent data store (PDS) has been introduced in OMNIMON Base Version 7.5.0. The new version (PDS V2) uses VSAM Linear Data Sets (LDSs) and replaces the original version (PDS V1), which uses BSAM data sets. PDS V2 is used for near-term history in all the OMEGAMON products. PDS V2 uses significantly less 31-bit virtual storage and less CPU usage than PDS V1, and there are no configuration changes required to use PDS V2. For more information, see <a href="#">“Persistent data store V2 (PDS V2)”</a> on page 1222.</p> <p>PDS V2 supports agent history only; PDS V2 for ITM history is not supported.</p> <div data-bbox="247 1294 1136 1420" style="border: 1px solid black; padding: 5px;"> <p><b>Note:</b> PDS V2 was previously available for OMEGAMON for Storage only but is now available for all OMEGAMON products.</p> </div>	Multiple. See <a href="#">“PDS V2 support”</a> on page 1229.
<p>OMEGAMON products support extended address volumes (EAV) for product data sets and agent history PDS data sets. PDS V2 for ITM history is not currently supported.</p>	—
<p>The OMEGAMON multi-tenancy solution allows the monitoring of distinctly separate sets of resources. With OMEGAMON multi-tenancy, general users can access information for resources assigned to their tenant only and cannot access information about the resources of another tenant. For more information, see <a href="#">“OMEGAMON multi-tenancy”</a> on page 1061.</p>	OA57511
<p>OMNIMON Base Version 7.5.0 provides enablement support for passphrase and multi-factor authentication (MFA). This support enables OMEGAMON 3270 (Classic) users to log on using passphrase and MFA credentials. This enhancement replaces the need for a user-customized assembler module (for example, a SAMPLIB Security exit) which generally defines the SAF Security class for OMEGAMON Classic started tasks. For more information, see <a href="#">“OMNIMON Base Version 7.5.0 PTF UA98944 for APAR OA57133”</a> on page 1509.</p>	OA57133

# What's new in Tivoli Management Services on z/OS configuration software

The topics in this section describe recent updates to IBM Z Monitoring Configuration Manager (Monitoring Configuration Manager or Configuration Manager) and Parameter Generator (PARMGEN). These tools are used to configure, replicate, maintain, and update runtime environments.

**Note:** Previous updates are described in [“What's new in Monitoring Configuration Manager \(previous updates\)”](#) on page 1448 and [“What's new in PARMGEN \(previous updates\)”](#) on page 1449.

## PTF UJ98936 for APAR OA68919 (1Q26)

PTF UJ98936 for APAR OA68919 (1Q26) delivers numerous fixes for Configuration Manager and PARMGEN, including updated parameter help.

For the complete list of updates, see [APAR OA68919](#).

### Configuration Manager and PARMGEN updates

The following updates have been made:

- Updates have been made to the parameter dictionaries for the following products. The listed members, which enable the PF1 help panels for the respective product and parameters, have been shipped with this maintenance.

#### OMEGAMON for IMS

KI2AHELP

#### OMEGAMON for z/OS

KM2AHELP

KM5AHELP

**Tip:** To set up PF1 help in Configuration Manager, see the following blog: [How to enable parameter help in IBM Z Monitoring Configuration Manager](#).

- Parameter `KDS_PH_TEMS_NAME_NODEID` is obsolete and has been removed.

## PTF UJ98753 for APAR OA68536 (4Q25)

PTF UJ98753 for APAR OA68536 (4Q25) provides Configuration Manager enhancements by introducing checking for undefined symbols during parameter validation and improving the data set allocation process for agents. New parameters are introduced for situation status streaming, controlling the session timeout value for OMEGAMON 3270 Classic interface, and other product-specific settings.

### Configuration Manager-only updates

The following updates have been made:

- The **GENERATE** action and the **GENERATE** action with **OPTION VALIDATE** now check that any symbol used in a parameter value is properly defined. If an undefined symbol is encountered, new message `KFJ00253E` is issued for each undefined symbol.

Previously, if you had system variables enabled in your runtime environment (that is, parameter `RTE_SYSV_SYSVAR_FLAG` set to Y), and used a symbol for one of your parameter values, Configuration Manager did not verify if the symbol was defined.

Now, when the validation process encounters a symbol as a parameter value, it checks for the definition where the symbols are defined, as follows:

- System symbols defined (as either dynamic or static) in the PARMLIB library

- System symbols defined in member RTEDEF (SYS@*lpar*)
- User variables defined in members RTEDEF (VAR\$GLOB) or RTEDEF (VAR\$*lpar*)

If the symbol definition is not found, the **GENERATE** action issues message [KFJ00253E](#), and the system action depends on the **RTE\_VALIDATION\_LEVEL** parameter setting, as follows:

- If parameter **RTE\_VALIDATION\_LEVEL** is set to W (Warning) or E (Error), the **GENERATE** action stops with a return code of 8. You must correct the parameter value or symbol definition.
- If parameter **RTE\_VALIDATION\_LEVEL** is set to I (Informational), processing continues, allowing you to use the undefined symbol in your parameter settings. This behavior is acceptable in the following scenarios:
  - You have an undefined symbol that becomes defined when the agent starts, as the symbol can be defined in the PARMLIB library and added dynamically.
  - Your runtime environment is being packaged for deployment to another system; during the **GENERATE** action, the validation process does not have access to the remote system symbols.

**Tip:** Optionally, you can discover the system symbols on the target system and send the results back the configuration system for validation.

- Configuration Manager no longer attempts to allocate data sets in the data set allocation stage for an agent if the data sets already exist. This avoids RACF violations if special privileges are needed for updating data set RKANMODU.

## Product-specific updates

### Tivoli Enterprise Monitoring Server

New parameter **KDS\_STREAM\_SITUATION\_STATUS** controls if situation status streaming from the monitoring server to IBM Z OMEGAMON Data Provider is enabled. The default value is N.

### OMEGAMON 3270 Classic interface

New parameter **Kpp\_CLASSIC\_TIMEOUT** (where *pp* is C2, D2, I2, or M2) allows you to control the idle session timeout value for the OMEGAMON 3270 Classic interface for the respective product.

**Note:** New parameter **KI2\_CLASSIC\_TIMEOUT** for OMEGAMON for IMS has the default value of 0. This default value is different from the previously hardcoded value of 30 that was defined in member RKANPARU (KOIVTM\*). If this member is not excluded, the timeout value is updated with the new default.

### IBM Z OMEGAMON AI for z/OS 6.1

New parameter **KM5\_BPX\_SUPERUSER** allows you to bypass SAF or RACF privilege checks when the monitoring server needs superuser authority to perform certain operations. The default value is N. If **KM5\_BPXSUPERUSER** exists in your embeds data set, remove the parameter; Configuration Manager adds it automatically. Otherwise, there will be duplicate definitions.

### OMEGAMON for JVM 6.1.0

New parameter **KJJ\_IMSREQ\_LATENCY** specifies the startup delay between the IMS transaction initialization and the z/OS Connect API request invocation. The value is in seconds, and the default value is 2.

## PTF UJ98473 for APAR OA68534 (4Q25)

PTF UJ98473 for APAR OA68534 (4Q25) enables IBM Z OMEGAMON AI for Db2 6.1.0 in Configuration Manager and PARMGEN, and also provides various enhancements for this latest product version.

## IBM Z OMEGAMON AI for Db2 6.1

### Configuration Manager-only updates

The following updates have been made in Configuration Manager for IBM Z OMEGAMON AI for Db2 6.1:

- The Performance Warehouse parameters have been simplified. You can now use the following new parameters to configure Performance Warehouse default storage groups, 4K buffer pools, and 32K buffer pools:

```
KD2_DBnn_PWH_DEFAULT_STG      SYSDEFLT
KD2_DBnn_PWH_DEFAULT_BP4K     BP0
KD2_DBnn_PWH_DEFAULT_BP32K    BP32K
```

- For configuration of Near-Term History data sets, you can now use the following new parameters for specifying sequential dynamic (DYN) and sequential generation data group (GDG) settings:

```
KD2_PFn_HIS_SEQ_DSNAME
KD2_PFn_HIS_SEQ_GDG_LIM
```

The new parameters can be used with the following existing parameters:

```
KD2_PFn_HIS_SEQ_PRIMARY_CYL
KD2_PFn_HIS_SEQ_SECONDARY_CYL
KD2_PFn_HIS_SEQ_VOLUME
KD2_PFn_HIS_SEQ_UNIT
KD2_PFn_HIS_SEQ_MCLAS
KD2_PFn_HIS_SEQ_SCLAS
```

- New parameter **KD2\_CLASSIC\_STC** has been added and can be used as an alternative to **GBL\_DB2\_KD2\_CLASSIC\_STC** for specifying the name of the OMEGAMON Db2 Collector started task.
- Member KD2\$PC0P is no longer used.

**Note:** This change also applies to OMEGAMON for Db2 5.4 and 5.5.

For more information about the new parameters, see [New parameters](#).

### Configuration Manager and PARMGEN updates

The following updates have been made in Configuration Manager and PARMGEN for IBM Z OMEGAMON AI for Db2 6.1:

- The product has been enabled.
- The product has been renamed to IBM Z OMEGAMON AI for Db2 (OMEGAMON AI for Db2). It was formerly named IBM OMEGAMON for Db2 Performance Expert on z/OS.
- The following changes have been made to the OMEGAMON for Db2 Performance Warehouse PWG1### template:
  - The template now removes duplicate storage group and buffer pool GRANT statements.
  - Missing GRANT statements from parameters **KD2\_DB\_PWH\_D2PWSTTG** and **KD2\_DB\_PWH\_D2PWSTBP** have been added.
- The default value for parameter **KD2\_PFO1\_SQLPA\_VERSION** is now 5.1.
- The default value for parameter **KD2\_OMPE\_OPTS\_NTHDB2I** is now WAIT.
- The OMEGAMON for Db2 template KD5DFINL now includes a link to the *Complete the configuration* content in IBM Documentation.
- The OMEGAMON Db2 Collector started task EXEC has been renamed from O2CI to D5COLL.
- The configured components table printed in the [parameter validation report \(\\$VALRPT\)](#) now supports the KppDINFO field PRODNAME if COMPNAME does not exist.
- The new embed override member **KD2\$PCPT** has been introduced.

### Job generator utility (JOBGEN) updates

Support has been added for IBM Z OMEGAMON AI for Db2 6.1 in the job generator utility (JOBGEN).

## PTF UJ98129 for APAR OA68463 (3Q25)

PTF UJ98129 for APAR OA68463 (3Q25) provides enhancements for the **PDCOLLECT** utility action in Configuration Manager.

### Configuration Manager-only updates

The following enhancements have been made to the Problem Determination Data Collection (**PDCOLLECT**) utility action that is provided in Configuration Manager:

- The **PDCOLLECT** action now creates a configuration data set that you can use to customize the collection of your diagnostic data. During the initial run of the utility, the **PDCOLLECT** action creates the data set PDCLDEF and member \$USER. You can customize the \$USER member with your own settings to use for collecting diagnostic data during subsequent runs of the utility. For more information, see [“PDCLDEF\(\\$USER\)” on page 370](#).

**Note:** The **PDCOLLECT** action also creates members DEFAULTS and KCIVARS. These members are for internal use by the utility and for reference only. Do not update these members.

- The **PDCOLLECT** action now supports multiple formats for the packaged output. If needed, you can produce more than one type of output in a single job. The following additional packaging formats are now available:
  - PAX (.pax) file, created in a specified z/OS® UNIX® System Services directory
  - ADRDSU archive

**Note:** The **PDCOLLECT** action continues to support the terse (.TRS) file format, which is created using the IEBCOPY UNLOAD function and is retained for compatibility.

- Specifying parameters **RTE\_PLIB\_HILEV** and **RTE\_NAME** is now optional. Omitting the runtime environment information provided by these parameters limits the types of diagnostic data that the **PDCOLLECT** action can collect.
- You can now capture several snapshots of SDSF Display Active Users (DA) data for specified started tasks. The default is 10 samples every 10 seconds, and you can customize these settings.
- You can now capture logs and SDSF DA snapshots for multiple started tasks in a single job by using filtering and wildcard characters.
- You can now select the diagnostic data to collect at a detailed level by using collection flags. By collecting only the types of data that you need, you can reduce both the time and storage used by the **PDCOLLECT** action job. For more information, see [“PDCOLLECT collection flags” on page 369](#).
- Enhanced status reporting for the **PDCOLLECT** action now appears in the KCIPRINT output data set. New messages are in the range [KFJ00240I](#) to [KFJ00262I](#).
- Sample job TKANSAM(KFJMAINT) has been updated.

To support these enhancements, the following parameters have been introduced or modified:

<i>Table 3: PDCOLLECT parameters</i>	
Parameter	Description
<a href="#">RTE_PLIB_HILEV</a> <a href="#">RTE_NAME</a>	Runtime environment information
<a href="#">KFJ_PDCOL_COLLECT_data</a>	Diagnostic data collection flags
<a href="#">KFJ_PDCOL_DA_INTERVAL</a> <a href="#">KFJ_PDCOL_DA_SAMPLES</a>	Control the frequency of SDSF Display Active Users (DA) data collection

Parameter	Description
<u>KFJ_PDCOL_HLQ</u>	High-level qualifier for data sets that the <b>PDCOLLECT</b> action uses
<u>KFJ_PDCOL_JOB_NAME</u> <u>KFJ_PDCOL_JOB_ID</u> <u>KFJ_PDCOL_JOB_FILTER</u>	Collect diagnostic data when OMEGAMON started task logs are in the SDSF output queue
<u>KFJ_PDCOL_JOB_OUTPUT</u>	Collect diagnostic data when OMEGAMON address space logs have been copied to a sequential data set
<u>KFJ_PDCOLLECT_COMPATIBILITY</u> <u>KFJ_PDCOLLECT_ADRSSU</u> <u>KFJ_PDCOLLECT_PAX</u> <u>KFJ_PDCOLLECT_PAX_DIR</u>	<b>PDCOLLECT</b> action output package formats
<u>KFJ_PDCOLLECT_RESTORE</u> <u>KFJ_PDCOL_RESTORE_HLQ</u> <u>KFJ_PDCOL_ADR_ARCHIVE</u>	Restore <b>ADRSSU</b> archive  <div style="border: 1px solid blue; padding: 5px;"><b>Note:</b> These parameters are for use by IBM Software Support only.</div>

For more information about using the Configuration Manager **PDCOLLECT** action, see [“Collecting diagnostic data using PDCOLLECT”](#) on page 366.

## PTF UJ97989 for APAR OA68360 (3Q25)

PTF UJ97989 for APAR OA68360 (3Q25) provides support for configuring IBM Z® OMEGAMON Data Provider in Configuration Manager.

### OMEGAMON® Data Provider

You can now configure OMEGAMON® Data Provider in Configuration Manager using the following new parameters:

#### **CONFIGURE\_ODP\_KAY**

Enables or disables OMEGAMON® Data Provider configuration for the runtime environment

#### **GBL\_USS\_TKAYHFS\_PATH**

Sets the path to the z/OS® UNIX® System Services directory that the SMP/E installation jobs define using the ddname TKAYHFS

#### **KFJ\_LOCAL\_USS\_TKAYHFS\_PATH**

Specifies the local z/OS® UNIX® System Services directory that the SMP/E installation jobs define using the ddname TKAYHFS

#### **TRG\_COPY\_TKAYHFS\_PATH**

Specifies the z/OS® UNIX® System Services directory for the SMP/E TKAYHFS installation directory copy

The following product-specific parameters for OMEGAMON® Data Provider (with product prefix **KAY**) have also been introduced:

#### **For OMEGAMON Data Broker:**

##### **KAY\_BROKER\_MEMBER**

Sets the two-character value for the KAYSIP $nn$  member name and the OMEGAMON Data Broker procedure MEM= $nn$  parameter value

##### **KAY\_BROKER\_NAME**

Sets the OMEGAMON Data Broker name, which must match the name specified in the KAYOPEN member

### KAY\_BROKER\_STC

Sets the OMEGAMON Data Broker procedure name

#### For OMEGAMON Data Connect:

### KAY\_CONNECT\_JAVA\_HOME

Sets the path to the Java 17 installation directory

**Note:** Other Java versions are not supported.

### KAY\_CONNECT\_STC

Sets the OMEGAMON Data Connect procedure name

For more information about configuring OMEGAMON® Data Provider, see the following content:

- *Configuration Manager: “How to: Add OMEGAMON Data Provider to a runtime environment” on page 357*
- [IBM Z OMEGAMON Data Provider](#)

**Note:** Configuration of OMEGAMON® Data Provider in Configuration Manager requires IBM Z® OMEGAMON Data Provider (FMID HKOA110) PTF UJ97499.

**Note:** Configuration of OMEGAMON® Data Provider in PARMGEN is not supported.

## PTF UJ97760 for APARs OA67927, OA68134 (3Q25)

PTF UJ97760 for APARs OA67927, OA68134 (3Q25) provides Configuration Manager updates for OMEGAMON for IMS ATF parameters, and introduces a new message that informs you of improved alias processing for SMP/E target libraries. (This PTF also delivers additional updates and fixes; refer to the APAR text for those details.)

### Configuration Manager-only updates

If an alias is used for the SMP/E target data sets for the TKANCUS library, Configuration Manager now resolves the alias before checking if the KCIFLOW DD statement and RTEDEF members point to the same SMP/E target libraries. When an alias is found and resolved, new informational message [KFJ00235I](#) is issued.

### Product-specific updates

#### OMEGAMON for IMS

The following Configuration Manager-only updates have been made related to the Application Trace Facility (ATF) parameters:

- The following parameters, which were converted to table parameters in [PTF UJ97474 for APAR OA67992](#), have been reinstated:
  - KI2\_CLASSIC\_ATFI2**
  - KI2\_CLASSIC\_ATF\_SANDBOX**
  - KI2\_CLASSIC\_ATF\_AUTORESTART**
  - KI2\_CLASSIC\_ATF\_ATFBUFF**

If you have any of these parameters customized in your RTEDEF library, Configuration Manager configuration uses them until you have moved to the **KI2\_I1nn\_CLASSIC\_ATF\*** table parameters. See the PTF HOLD ACTION for various maintenance scenarios.

**Note:** In PARMGEN, the **KI2\_CLASSIC\_ATF\*** parameters have not been reinstated. For information about moving to the **KI2\_I1nn\_CLASSIC\_ATF\*** table parameters, see [PTF UJ97474 for APAR OA67992](#).

- The default values for the **KI2\_I1nn\_CLASSIC\_ATF\*** table parameters are now set automatically.
- The **KI2\_I1nn\_CLASSIC\_ATF\*** table parameters are no longer added to the RTEDEF library during the **DISCOVER** action.

#### OMEGAMON enhanced 3270 user interface

The OMEGAMON enhanced 3270UI started task JCL has been updated: data sets have been moved to different DD names.

**Important:** Because this update modifies the OMEGAMON enhanced 3270UI started task, after applying this maintenance and regenerating your runtime members, you must copy your updated procedure to your system PROCLIB library. The default OMEGAMON enhanced 3270UI started task procedure member is as follows:

- For Configuration Manager: `rte_hilev.SYS1.PROCLIB(OMEGTOM)`
- For PARMGEN: `rte_plib_hilev.rte_name.RKANSAMU(IBMTOM)`

## PTF UJ97474 for APAR OA67992 (2Q25)

PTF UJ97474 for APAR OA67992 (2Q25) provides Configuration Manager enhancements that allow you to omit security exit and assemble-and-link processing during the **GENERATE** action. Additionally, new parameters allow you now to allocate your PDS V2 history data sets on different volumes for the monitoring server and for each monitoring agent. Updates have also been made to the OMEGAMON for IMS ATF parameters.

#### Configuration Manager-only updates

The **GENERATE** action provides the following new action options:

##### **NOSECEXITS**

When **OPTION NOSECEXITS** is specified, the **GENERATE** action does not perform configuration processing for security exits. You can use this option on the initial run of the **GENERATE** action for a new runtime environment, as well as on subsequent runs. You can abbreviate this keyword to **NS**.

##### **NORELINK**

When **OPTION NORELINK** is specified, the **GENERATE** action does not assemble and link the IBM Z OMEGAMON AI for Networks (KN3) or OMEGAMON enhanced 3270 user interface (KOB) modules, even if a relink is required. You can use this option on the initial run of the **GENERATE** action for a new runtime environment, as well as on subsequent runs. You can abbreviate this keyword to **NL**.

Options **NOSECEXITS** and **NORELINK** do not update the RKANMODU load library, a data set that might require more restrictive authorization for updating. You can use these options together while performing the other **GENERATE** configuration steps that do not require additional access.

For more information, see [“GENERATE options” on page 251](#).

#### Configuration Manager and PARMGEN updates

The following persistent data store V2 (PDS V2) parameters have been introduced:

- Common agent parameter **Kpp\_PDS2\_VOLUME** allows PDS V2 history data sets in each monitoring agent to use a different volume for allocation. If a value is not specified, parameter **Kpp\_PDS2\_VOLUME** uses the value from parameter **RTE\_PDS2\_VOLUME**.
- Parameter **KDS\_PDS2\_VOLUME** allows PDS V2 history data sets in the monitoring server to use a custom volume for allocation. If a value is not specified, parameter **KDS\_PDS2\_VOLUME** uses the value from parameter **RTE\_PDS2\_VOLUME**.

#### Product-specific updates

##### OMEGAMON for IMS

New parameters for the Application Trace Facility (ATF) have been introduced that allow you to individually customize each IMS subsystem. The new parameters replace former parameters as described in the following table:

Table 4: Updated OMEGAMON for IMS ATF parameters		
Former parameter name	New parameter name	New default value
KI2_CLASSIC_ATFI2	KI2_I1nn_CLASSIC_ATFI2	N
KI2_CLASSIC_ATF_SANDBOX	KI2_I1nn_CLASSIC_ATF_SANDBOX	OFF
KI2_CLASSIC_ATF_AUTORESTART	KI2_I1nn_CLASSIC_ATF_AUTORSTRT	YES
KI2_CLASSIC_ATF_ATFBUFF	KI2_I1nn_CLASSIC_ATF_ATFBUFF	512

The new parameters must be added between table markers and in the correct row, for example:

```

KI2_I1 BEGIN
KI2_I101_ROW                01
KI2_I101_CLASSIC_ATFI2     N
KI2_I101_CLASSIC_ATF_SANDBOX OFF
KI2_I101_CLASSIC_ATF_AUTORSTRT YES
KI2_I101_CLASSIC_ATF_ATFBUFF 512
...
KI2_I1 END

```

**Note:** For more information about parameter tables in Configuration Manager, see [“Sparse parameter tables: The first row sets the default values for subsequent rows” on page 318.](#)

**Attention:** After applying this maintenance, the former parameters will no longer be used for configuration and in some cases might be lost. Before updating your configuration, make sure to back up the former parameters. See the PTF HOLD TEXT for detailed instructions.

## PTF UJ97076 for APAR OA67703 (2Q25)

PTF UJ97076 for APAR OA67703 (2Q25) provides improved processing in Configuration Manager for z/OS UNIX System Services copy scripts, **GENERATE** action exclude lists, and the **PDCOLLECT** utility action. Configuration validation for OMEGAMON for Db2 has also been improved. In addition, this PTF removes support for some parameters that are now obsolete. (This PTF also delivers some internal updates; refer to the APAR text for those details.)

### Configuration Manager-only updates

The following updates have been made:

- The z/OS UNIX System Services scripts that copy data set members to a z/OS UNIX file system now support MVS data set names that contain the dollar sign (\$) character, which is a special symbol used for variables in shell scripts.
- The **GENERATE** action exclude list processing has been improved.
- The **PDCOLLECT** utility action has been improved.

### Configuration Manager and PARMGEN updates

The following parameters, which are related to the obsolete OMEGAMON health checks for IBM® Health Checker for z/OS®, have been removed:

```

GBL_DSN_HZSPROC_LOADLIB
GBL_DSN_SYS1_SAXREXEC
RTE_HCK_REXX_AXRUSER_HILEV
RTE_HCK_STC_INTERVAL

```

Related topic "Configure the OMEGAMON health checks" has also been removed.

### Product-specific updates

#### OMEGAMON for CICS

OMEGAMON for CICS parameter **KC2\_CLASSIC\_KC2GLB\_SRCLIB** is valid in PARMGEN only. It is not supported by Configuration Manager; instead, you must use parameter **GBL\_DSN\_GLOBAL\_SOURCE\_LIB**.

#### OMEGAMON for Db2

Configuration validation for OMEGAMON for Db2 between the Db2 profile and the Db2 subsystem parameters has been improved.

## PTF UJ96866 for APAR OA67573 (1Q25)

PTF UJ96866 for APAR OA67573 (1Q25) provides a new Configuration Manager report that lists your installed products, and also provides configuration support for the new z/OS Connect API Provider Cluster (*Plex*) view in OMEGAMON for JVM. Additionally, the OMEGAMON enhanced 3270UI started task JCL has been updated, and IPv6 support has been enhanced for parameters **Kpp\_TEMS\_TCP\_HOST** and **KD2\_OMPE\_TCPIP\_ADDRESS**.

### Configuration Manager-only updates

A new report provides information about the installation status and Configuration Manager support of products at your site. The *products installed report* identifies the following products:

- Products that are installed and supported by Configuration Manager
- Products that are installed but not supported by Configuration Manager
- Products that are not installed but supported by Configuration Manager

This report appears automatically in the job output for the **CREATE**, **MIGRATE**, and **GENERATE** actions.

You can also generate the report using the KFJMAINT maintenance workflow by specifying the new **REPORT** action. No other option or parameter is required to run the KFJMAINT job with the **REPORT** action. With this option, you can verify that your product is supported by Configuration Manager before beginning the configuration process.

The report is printed to the job output identified by the new **REPORT** DD statement.

For more information, see [“Products installed report \(REPORT\)” on page 277](#).

### Configuration Manager and PARMGEN updates

Parameter **Kpp\_TEMS\_TCP\_HOST** has been updated to accept a maximum of 39 characters, providing support for IPv6 addresses.

### Product-specific updates

#### OMEGAMON for JVM 6.1

To support the new z/OS Connect API Provider Cluster (*Plex*) view in OMEGAMON for JVM, member **KJJPLNOD** is copied from the TKANSAM library to the global source library defined by parameter **GBL\_DSN\_GLOBAL\_SOURCE\_LIB**. Member **KJJPLNOD** is customizable and automatically excluded from replacement by the **GENERATE** action in Configuration Manager or the **Copy runtime mbrs from WK\*->RK\* RW libs** step (jobs **KCIJPW2R** and **KCIJPW1R**) in PARMGEN.

In addition, new DD name **RKJJGLBL** has been added to the OMEGAMON for JVM started task JCL. This DD name refers to the library where plex node definitions are stored.

**Note:** The plex node functionality requires OMEGAMON for JVM APAR OA67169.

#### OMEGAMON for Db2

The parameter help has been updated for parameter **KD2\_OMPE\_TCPIP\_ADDRESS** to indicate that the maximum length is 39 characters, providing support for IPv6 addresses.

**Note:** The related parameter validation functionality requires OMEGAMON for Db2 APAR PH64397.

### OMEGAMON enhanced 3270 user interface

The enhanced 3270UI started task JCL has been updated: DD names have been reordered, unnecessary DD names have been removed, and new DD names have been added.

## PTF UJ96722 for APAR OA67212 (1Q25)

PTF UJ96722 for APAR OA67212 (1Q25) provides improvements to the Configuration Manager **GENERATE** and **MIGRATE** actions. In addition, this PTF removes PARMGEN and Configuration Manager support for some deprecated features for OMEGAMON for Messaging and OMEGAMON for Storage. (This PTF also delivers additional updates and fixes; refer to the APAR text for those details.)

### Configuration Manager-only updates

The following updates have been made:

- The **GENERATE** action no longer prints the entire RTEDEF library contents to the DSNPROUT output data set by default; only the members used in the configuration are now printed. To print the complete list of members, you must use the **DEBUG** action option.

Related to this change, new message KFJ00237E is now issued when the RTEDEF library does not exist for an action that requires it.

- The **GENERATE** action **VALIDATE** option no longer reads the checkpoint created by the **PREPARE** option. The **VALIDATE** option now deletes the checkpoint member if it exists and continues processing.
- The **MIGRATE** action has been enhanced with improved processing and RTEDEF library formatting.
- Error message KFU00101E has been changed to warning message KFU00101W. Processing continues when this message is encountered.

### Product-specific updates

#### OMEGAMON for Messaging

Parameter **KMQ\_AGT\_STC\_OWNER** has been deprecated. This parameter has been removed from both PARMGEN and Configuration Manager and no longer impacts the creation of the OMEGAMON for Messaging started task. It is recommended that you remove parameter **KMQ\_AGT\_STC\_OWNER** from your runtime environment.

#### OMEGAMON for Storage

Deprecated features of OMEGAMON for Storage have been removed from PARMGEN and Configuration Manager. Directory `/MVD/bin` is no longer referenced, and started tasks that reference this directory (`*S3SO` and `*S3ST`) are no longer created.

## PTF UJ96587 for APAR OA67334 (1Q25)

PTF UJ96587 for APAR OA67334 (1Q25) provides new override embed parameters for the OMEGAMON enhanced 3270 user interface multi-tenancy and First-Failure Data Capture features and adds a new agent startup command for OMEGAMON for JVM. Also, IPv6 support has been enhanced in the Configuration Manager **DISCOVER** action and for the **RTE\_TCP\_HOST** parameter.

### Configuration Manager-only updates

The **DISCOVER** action now supports the discovery of IPv6 addresses. Newly discovered IPv6 addresses are added to the `SYS@lpar` member. IPv6 addresses are added as additional parameters; there is no impact to the existing setup where IPv4 is used.

### Configuration Manager and PARMGEN updates

Parameter **RTE\_TCP\_HOST** has been updated to accept a maximum of 39 characters.

### Product-specific updates

#### OMEGAMON enhanced 3270 user interface

The following new override embed parameters have been added to override embed member `KOB$PENV`:  
**FFDC\_ERROR\_CODES**

Specifies the name of the member containing the First-Failure Data Capture error code definitions. The default value is `KOBFFDC`.

#### **FFDC\_DDNAME**

Specifies the DD name of the data set containing the First-Failure Data Capture error code definitions. The default value is `RKOBPROF`, which uses the `UKOBDATF` data set.

## MULTI\_TENANCY\_DEFS

Specifies the location of the tenant definitions. Valid values are as follows:

### PDS

Definitions are in PDS members located in the data set specified in the DD statement named in the **MULTI\_TENANCY\_DDNAME** parameter.

### SAF

Definitions are made using the System Authorization Facility (SAF) interface for use with an external security system, such as RACF.

## MULTI\_TENANCY\_DDNAME

Specifies the DD name of the data set containing the tenant definitions when defined in PDS members. The default value is RKOBPROF, which uses the UKOBDATF data set.

Following a standard override embed procedure places the new parameters into member RKANPARU (KOBENV).

**Note:** Full enablement of the multi-tenancy and First-Failure Data Capture features requires the OMNIMON BASE APAR OA66898 (PTF UJ96474).

**Note:** During maintenance, if the runtime environment has override embed members enabled, changes to override embed members are not applied automatically by the configuration tool. Instead, you must perform steps manually to apply the updates. This process ensures that any existing settings are not overwritten. If you use Configuration Manager, see new topic "[Update override embed members for an existing RTE after maintenance](#)" on page 340. If you use PARMGEN, see [Override embed members](#).

## OMEGAMON for JVM 6.1.0

New agent startup command **KJJPLEX** has been added to member RKANCMDU (KJJAGST).

**Note:** The **KJJPLEX** functionality requires OMEGAMON for JVM APAR OA67169.

## PTF UJ96496 for APAR OA67208 (4Q24)

PTF UJ96496 for APAR OA67208 (4Q24) provides improved **PDCOLLECT** processing in Configuration Manager and introduces parameters for OMEGAMON for Storage. (This PTF also delivers some internal updates; refer to the APAR text for those details.)

### Configuration Manager-only updates

The **PDCOLLECT** utility action has been improved when gathering network statistics. Related message "[KFJ00236W](#)" on page 385 has been added.

### Product-specific updates

#### OMEGAMON for Storage

The following parameters have been introduced:

- Parameter **KS3\_ZIIP\_OFFLOAD** controls the offloading of some agent workloads to zIIP processing units. The default value is Y.

**Note:** This functionality existed previously in OMEGAMON for Storage agents but was not exposed in Configuration Manager or PARMGEN.

- Parameter **KS3\_TOOLKIT\_DELETE\_AFTER\_DAYS** controls the global retention policy for Storage Toolkit data. The default value is 0.

**Notes:**

- Support for parameter **KS3\_TOOLKIT\_DELETE\_AFTER\_DAYS** requires OMEGAMON for Storage APAR OA67240.
- PF1 help and parameter validation for both parameters also requires OMEGAMON for Storage APAR OA67240.

## PTF UJ96215 for APAR OA67130 (4Q24)

PTF UJ96215 for APAR OA67130 (4Q24) provides support in PARMGEN and Configuration Manager for IBM Z OMEGAMON AI for CICS 6.1 and IBM Z OMEGAMON AI for Storage 6.1. Also, new parameters have been introduced for allocating task history data sets for the OMEGAMON for CICS Classic interface, and the default port value for the Realtime Dataset Metrics feature in OMEGAMON for Storage has changed.

### OMEGAMON for CICS

Updates have been made for the latest release of the product and earlier versions, as follows:

#### IBM Z OMEGAMON AI for CICS 6.1

- The product has been renamed to IBM Z OMEGAMON AI for CICS (OMEGAMON AI for CICS). It was formerly named IBM Z OMEGAMON for CICS.
- Agent startup delay commands have been added.

#### IBM OMEGAMON for CICS 5.5, IBM Z OMEGAMON for CICS 5.6, IBM Z OMEGAMON AI for CICS 6.1

- Initialization of the task history data set (RKC2HIST) for the Classic interface is no longer performed during configuration. The **KOCONV00** program call has been removed.
- For allocating the task history data set (RKC2HIST) for the Classic interface, the following parameters (with respective default values) have been introduced:

KC2_HS01_CLASSIC_VSAM_VOLUME	"%RTE_SMS_VSAM_VOLUME%"
KC2_HS01_CLASSIC_VSAM_STORCLAS	"%RTE_SMS_VSAM_STORCLAS%"
KC2_HS01_CLASSIC_VSAM_MGMTCLAS	"%RTE_SMS_VSAM_MGMTCLAS%"
KC2_HS01_CLASSIC_VSAM_DATACLAS	" "

These parameters define the allocation properties for the Classic interface VSAM data sets, replacing the use of the **RTE\_SMS\_VSAM\_\*** parameters.

To use the new parameters to allocate new data sets in existing runtime environments, you must manually set the parameters, as follows:

#### Using Configuration Manager

Define the new parameters in member **KC5\$PARM** or **KC5\$LPAR** in your runtime environment definition (RTEDEF) library.

#### Using PARMGEN

In new runtime environments, the values for the new parameters are resolved based on existing **RTE\_SMS\_VSAM\_\*** values, and the parameters are commented out.

During the **Set up/Refresh PARMGEN work environment** step (option 1 on the **Workflow - Primary Option Menu**), these new parameters are added with the values set to empty.

### OMEGAMON for Storage

Updates have been made for the latest release of the product and earlier versions, as follows:

#### IBM Z OMEGAMON AI for Storage 6.1

- The product has been renamed to IBM Z OMEGAMON AI for Storage (OMEGAMON AI for Storage). It was formerly named IBM OMEGAMON for Storage on z/OS.
- Member **KS3AINIT** in data set **RKANPARU** now contains only a Realtime Dataset Metrics (RDM) port value.
- Parameter **KDF\_VTS\_VTSHIST** is no longer used.

## IBM OMEGAMON for Storage on z/OS 5.4, IBM OMEGAMON for Storage on z/OS 5.5, IBM Z OMEGAMON AI for Storage 6.1

- The default value for parameter **KS3\_RDM\_PORT** has been changed from 48903 to 0.

### Important:

- For Configuration Manager users: If you previously used the default RDM port value and did not specify parameter **KS3\_RDM\_PORT** in member **KS3\$PARM** or **KS3\$Lpar** in your runtime environment definition (RTEDEF) library, you must explicitly define the parameter and value after applying this maintenance. Otherwise, port 0 is used.
- For PARMGEN users: The value that is in use for parameter **KS3\_RDM\_PORT** in your runtime environment continues to be used after applying this maintenance. No action is required.

### Job generator utility (JOBGEN) updates

Support has been added for IBM Z OMEGAMON AI for CICS 6.1 and IBM Z OMEGAMON AI for Storage 6.1 in the job generator utility (JOBGEN).

## PTF UJ95792 for APAR OA66704 (3Q24)

PTF UJ95792 for APAR OA66704 (3Q24) provides the ability to use the same started task procedure for multiple monitoring servers across different systems in the sysplex. Also, Configuration Manager processing has been improved by not retaining unnecessary members.

### Configuration Manager-only updates

To reduce the amount of DASD space required for your runtime environment and potentially improve the performance of the **KCIPARSE** step in runtime environments where z/OS system variables are enabled, members that do not impact the configuration or agent functionality are no longer included. For new runtime environments, the unnecessary members will not be created. For existing runtime environments, the first time you run the **GENERATE** action after applying this PTF, the unnecessary members are removed from the following libraries:

- RKANPARU
- RKANSAMU
- RKD2PRF
- RKD2PAR
- WKANPARU
- WKANSAMU
- WKD2PRF
- WKD2PAR

### Product-specific updates

#### Tivoli Enterprise Monitoring Server

You can now configure your environment to use the same started task procedure for multiple monitoring servers across different systems in the sysplex. This *shared procedure* can be used for all monitoring server types: hub, high-availability hub, remote. This capability is useful for sites where the SYS1.PROCLIB (or equivalent procedure library) must be shared across all the systems in the sysplex.

To create a shared procedure, you must use system variables and the new flag parameter **"KDS\_TEMS\_PROC\_SHARED"** on page 1407.

For more information, see ["How to: Use a shared procedure for multiple monitoring servers"](#) on page 359.

### IBM OMEGAMON for Messaging on z/OS

Parameter **KMQ\_BACKUP\_STC** has been introduced. For information about using this parameter, see [Optional configuration steps for using the queue manager backup procedure](#).

## PTF UJ95574 for APAR OA66051 (2Q24)

PTF UJ95574 for APAR OA66051 (2Q24) provides several Configuration Manager enhancements, which include the ability to prepare work libraries separately ahead of other steps for staged maintenance, a new report that shows members that are not replaced in runtime libraries due to exclude lists, and a new sample member for setting up PF1 parameter help. Additional enhancements have been made for the allocation of VSAM data sets for history collection in IBM OMEGAMON for Db2 Performance Expert on z/OS 5.5, and dynamic proxy support in IBM Z OMEGAMON AI for z/OS 6.1.

### Configuration Manager-only updates

The following updates have been made:

- The **GENERATE** action now supports **OPTION PREPARE**, a new option that lets you prepare intermediate work libraries for your runtime environment separately from other stages. With this option, you can build the work data sets before other **GENERATE** action stages, in preparation of OMEGAMON® installation or maintenance. You can use this option if you have to perform other related tasks that require the work data sets ahead of time or in parallel, such as preparing members for Db2 binds or copying started task members to PROCLIB libraries. As a result, you can adapt the overall OMEGAMON® maintenance to your site-specific change management process. For more information, see [“PREPARE” on page 255](#).
- The **GENERATE** action job output now shows what members are not replaced when the work (WK\*) libraries are copied to the runtime (RK\*) libraries due to exclude list definitions. The list of members is provided in the new exclude report, which is identified by the EXCLRPT DD statement. For more information, see [“Members excluded during GENERATE action” on page 256](#).
- REXX exec KFJPHelp has been added to sample library TKANSAM, which provides PF1 parameter help in Configuration Manager. To enable this function, see the following article: [How to enable parameter help in IBM Z Monitoring Configuration Manager](#)

### Configuration Manager and PARMGEN updates

The following update has been made:

- Warning messages have been added to RKANPARU members indicating they are read-only and should not be modified.

### Product-specific updates

#### IBM OMEGAMON for Db2 Performance Expert on z/OS 5.5

The following updates have been made:

- Previously, allocation of VSAM data sets for Thread History collection for the OMEGAMON® enhanced 3270 user interface (enhanced 3270UI) used the following parameters for default allocation attributes, which were shared with the Classic Near-Term History feature:  
**KD2\_PFn\_HIS\_VSAM\_VOLUME1**  
**KD2\_PFn\_HIS\_VSAM\_SCLAS1**  
**KD2\_PFn\_HIS\_VSAM\_MCLAS1**  
Now, when allocating VSAM data sets for Thread History collection, use the following new parameters, which are exclusive to allocating the data sets for the enhanced 3270UI:  
**KD2\_PFn\_THRDHIS\_VOLUME**  
**KD2\_PFn\_THRDHIS\_SCLAS**  
**KD2\_PFn\_THRDHIS\_MCLAS**
- New possibilities have been introduced to reuse IBM OMEGAMON for Db2 Performance Expert on z/OS 5.4 Classic Near-Term History parameters to customize the allocation of VSAM data sets in IBM OMEGAMON for Db2 Performance Expert on z/OS 5.5.

To support better customization, Classic Near-Term History VSAM allocation attributes in OMEGAMON for Db2 5.5 can now reuse the following numbered parameters:

**KD2\_PFn\_HIS\_VSAM\_VOLUMEi**  
**KD2\_PFn\_HIS\_VSAM\_SCLASi**  
**KD2\_PFn\_HIS\_VSAM\_MCLASi**

By default, this feature is not enabled, and you do not need to change your existing configuration if you are using parameters **KD2\_PFnn\_HIS\_VSAM\_VOLUME**, **KD2\_PFnn\_HIS\_VSAM\_SCLAS**, and **KD2\_PFnn\_HIS\_VSAM\_MCLAS**.

However, if you are manually editing the ALLOCDS member to customize the allocations of the Classic Near-Term History VSAM data sets, you can now use this new customization feature instead. To enable the customization, set new parameter **KD2\_PFnn\_HIS\_VSAM\_CUSTOMIZE** to Y.

Optionally, you can use related new parameter **KD2\_PFnn\_HIS\_VSAM\_PREFIX**. You can change the prefix value to VS to use the backwards-compatible naming convention used in OMEGAMON for Db2 5.4, and reuse the existing numbered parameters. Using this approach, now you can set different values for the numbered parameters for all 768 VSAM data sets directly in the configuration, if needed.

**Note:** While the new parameters and associated help are delivered in APAR OA66051, the parameter validation logic is delivered in OMEGAMON for Db2 5.5 APAR PH60055.

OMEGAMON for Db2 5.4 is not impacted by these updates.

### IBM OMEGAMON® for z/OS

The following updates have been made:

- IBM Z OMEGAMON AI for z/OS 6.1 parameter **KM5\_SYSPLEX\_PROXY\_POSITION** set to EXCLUDE now supports Dynamic Proxy Assignment, which enables the automatic switching of the plexview proxy. For more information, see [Configuring Dynamic Proxy Assignment](#).
- Support for the following parameters, which are related to RMF caching in the OMEGAMON Subsystem, has been removed from PARMGEN and Configuration Manager:

**RTE\_KCN\_CACHE\_KM5\_NTH**  
**RTE\_KCN\_CACHE\_KM5\_NTH\_RANGE**

This update applies to all versions of OMEGAMON® for z/OS.

## PTF UJ95019 for APAR OA66050 (1Q24)

PTF UJ95019 for APAR OA66050 (1Q24) provides several Configuration Manager enhancements, which include the ability to create members for multiple runtime environments in the same RTEDEF library and to create SMP/E target library copies that you can use with your runtime environments. Additionally, new data sets are now allocated for the new *Developers Reference* in the OMEGAMON enhanced 3270 user interface. Updates have also been made to the JOBGEN tables.

### Configuration Manager-only updates

The following updates have been made:

- The **CREATE** action now supports the creation of multiple runtime environments in the same RTEDEF library. To use this feature, specify **OPTION MULTIPLE** (which you can abbreviate to **OPTION MULTI**) in the KCIIVARS DD. Use the **KFJ\_SYSNAME** parameter to replace *lpar* in the member name *Kpp\$lpar*. By running the **CREATE** action multiple times with different *\$lpar* suffixes, you can create an initial set of members for multiple runtime environments.

**Note:** **KFJ\_SYSNAME** is an internal parameter that automatically assigns the value of **SYSNAME**, but it is possible to specify a different value for **KFJ\_SYSNAME** in the KCIIVARS DD as well.

If **OPTION MULTIPLE** is not specified, the **CREATE** action constructs product members with the extension of \$PARM, as occurred previously.

For more information, see [“CREATE” on page 239](#).

- You can now use Configuration Manager to create one or more copies of your SMP/E target libraries from which you can create or update your runtime environments. New action option **TRGCOPY** has been added to the **CREATE** and **GENERATE** actions for this *target copy* feature. The target library copies that are created depend on the products selected for configuration. The **CREATE** action with **OPTION TRGCOPY** creates the

required member for customizing the SMP/E target copy properties, and the **GENERATE** action with **OPTION TRGCOPY** copies the SMP/E target libraries.

**Note:** If you are moving from PARMGEN to Configuration Manager, the Configuration Manager target copy feature provides an alternative to the PARMGEN base library feature.

For more information, see [“Using SMP/E target library copies” on page 352](#).

- To support the target copy feature, new parameters with prefix TRG have been introduced. For more information, see [“Target copy \(TRG\) parameters” on page 316](#).
- The **CREATE** action options **MULTIPLE** and **TRGCOPY** are not compatible.
- The following messages are new or have been updated: [“KFJ00203E” on page 376](#), [KFJ00227E](#), [KFJ00228W](#) (replaces message KFJ00206W), and [“KFJ00229E” on page 384](#).

## Product-specific updates

### OMEGAMON enhanced 3270 user interface

To support the new *Developers Reference* that is now available in the OMEGAMON enhanced 3270 user interface, the new TKANBENU library definition has been added to the enhanced 3270UI started task. Allocation statements for DKANBENU and TKANBENU libraries have been added in the job generator utility (JOBGEN). After you generate an updated runtime environment, a new user copy data set UKANBENU will also be created. Refer to the APAR text for detailed information.

**Important:** Because this enhancement modifies the OMEGAMON enhanced 3270UI started task, after applying this maintenance and regenerating your runtime members, you must copy your updated procedure to your system PROCLIB library. The default OMEGAMON enhanced 3270UI started task procedure member is as follows:

- For Configuration Manager: `rte_hilev.SYS1.PROCLIB(OMEGTOM)`
- For PARMGEN: `rte_plib_hilev.rte_name.RKANSAMU(IBM TOM)`

### IBM OMEGAMON for Db2 Performance Expert on z/OS

The RKANSAMV library is no longer allocated for OMEGAMON for Db2 versions later than 5.4.0, and RKANSAMF is no longer allocated if OMEGAMON for Db2 is not installed.

### Job generator utility (JOBGEN) updates

In addition to the JOBGEN updates that were made for the [OMEGAMON enhanced 3270 user interface](#), the JOBGEN tables were updated to support OMEGAMON for z/OS 5.5.1 and OMEGAMON for Networks 5.5.1.

## PTF UJ94732 for APAR OA64188 (1Q24)

PTF UJ94732 for APAR OA64188 (1Q24) sets HTTPS as the default communication protocol for Tivoli Management Services on z/OS components, introduces related parameters **RTE\_TEMS\_TRANSPORT\_MODE** and **KDS\_TEMS\_HTTPS\_PORT\_NUM**, and also introduces related message KFJ00226W.

**Important:** The application of this PTF affects the communication protocol that will be used for your runtime environment, regardless of any previous settings. You must proactively review your settings and make any necessary updates as needed, as described in this topic and in the APAR text. If you do not update your configuration, the default communication protocol will be HTTPS.

**Important:** In order to remain on HTTP for an existing runtime environment, you must add (or update) parameter `RTE_TEMS_TRANSPORT_MODE` set to value HTTP in the RTEDEF (`rte_name`) member for Configuration Manager or WCONFIG(`rte_name`) for PARMGEN. Do not refresh your environment until after you set this parameter. For more information, see [“Impact to an existing runtime environment” on page 38](#) or [“Update runtime environment to use HTTP” on page 593](#).

## New parameters

New parameter `RTE_TEMS_TRANSPORT_MODE` lets you specify the communication protocol for your runtime environment. Valid values are HTTPS, HTTP, and NONE. The default value is HTTPS.

New parameter `KDS_TEMS_HTTPS_PORT_NUM` lets you specify the HTTPS port number. The default value is 3661.

These parameters are supported by both Configuration Manager and PARMGEN.

For more information about the parameters, see [RTE\\_TEMS\\_TRANSPORT\\_MODE](#) and [KDS\\_TEMS\\_HTTPS\\_PORT\\_NUM](#).

## Impact to a new runtime environment

The application of this PTF impacts a new runtime environment as follows:

- Using Configuration Manager: On the **CREATE** and **MIGRATE** actions, Configuration Manager exposes parameter `RTE_TEMS_TRANSPORT_MODE` in RTEDEF (`rte_name`) with the default value HTTPS, but it does not expose parameter `KDS_TEMS_HTTPS_PORT_NUM`. To use an HTTPS port other than the default, you must manually add parameter `KDS_TEMS_HTTPS_PORT_NUM` and specify the HTTPS port number.
- Using PARMGEN: PARMGEN lists parameters `RTE_TEMS_TRANSPORT_MODE` and `KDS_TEMS_HTTPS_PORT_NUM` in WCONFIG(`rte_name`). You must manually review both settings and update per your environment setup if necessary; otherwise, the default values will be used.

## Impact to an existing runtime environment

**Important:** After you apply this PTF and before you refresh your runtime environment, you must update your configuration to reflect your HTTP or HTTPS protocol setup. For Configuration Manager, any updates must be made before running the **GENERATE** action. For PARMGEN, any updates must be made before running the \$PARSE job.

**Important:** In order to remain on HTTP for an existing runtime environment, you must add (or update) parameter `RTE_TEMS_TRANSPORT_MODE` set to value HTTP in the RTEDEF (`rte_name`) member for Configuration Manager or WCONFIG(`rte_name`) for PARMGEN. Do not refresh your environment until after you set this parameter.

The application of this PTF impacts existing runtime environments and requires manual configuration updates, as follows:

- Using Configuration Manager: Before you run the **GENERATE** action, add the new `RTE_TEMS_TRANSPORT_MODE` parameter to the RTEDEF (`rte_name`) member and specify one of the acceptable values for this parameter: HTTP, HTTPS or NONE. The default value is HTTPS. If the parameter is not specified in the RTEDEF (`rte_name`) member, the default value will be used. Next, add the new `KDS_TEMS_HTTPS_PORT_NUM` parameter to the RTEDEF (KDS\$PARM) member, the RTEDEF (KDS\$lpar) member, or both, and specify the HTTPS port number. The default value is 3661. If the parameter is not specified in the RTEDEF (KDS\$PARM) or RTEDEF (KDS\$lpar) member, the default value will be used.

If, prior to the application of the PTF, your existing runtime environment was set up to use the default HTTP protocol and specified the port with parameter `KDS_TEMS_HTTP_PORT_NUM`, then, when you apply the PTF and run the **GENERATE** action without doing any manual changes, HTTP will be disabled, the `KDS_TEMS_HTTP_PORT_NUM` value (HTTP:0) will be ignored, and the default setting (HTTPS:3661) will be enabled. To continue using HTTP, you must manually add the following line into the RTEDEF (`rte_name`) member:

```
RTE_TEMS_TRANSPORT_MODE "HTTP"
```

If HTTP is specified for **RTE\_TEMS\_TRANSPORT\_MODE**, new message **KFJ00226W** is issued in the Configuration Manager KCIPRINT output data set, informing you that your runtime environment is using a non-secure communication protocol.

- Using PARMGEN: After you run the PARMGEN Workflow primary option **Set up/Refresh PARMGEN work environment** (option 1), the new parameters appear in WCONFIG (*rte\_name*). You can update the parameters as needed. For example, to continue using the HTTP protocol, change **RTE\_TEMS\_TRANSPORT\_MODE** to HTTP manually before running the \$PARSE job and the subsequent PARMGEN steps; otherwise, the HTTP protocol will be disabled and the HTTPS protocol will be enabled.

For more information about updating the communication protocol for your runtime environment, see the following topics:

- [“Update runtime environment to use HTTPS” on page 591](#)
- [“Update runtime environment to use HTTP” on page 593](#)
- [“Update runtime environment to disable HTTP and HTTPS” on page 594](#)

### Avoiding potential overrides

Existing HTTP and HTTPS communication protocol configuration in the following parameters can potentially override **RTE\_TEMS\_TRANSPORT\_MODE** parameter output in the *KppENV* members:

**Kpp\_X\_KDE\_TRANSPORT\_HTTP\_OPTIONS**  
**Kpp\_X\_KDE\_TRANSPORT\_GBL\_OPTIONS**

- For the Tivoli Enterprise Monitoring Server (product code KDS): If **HTTPS:n** or **HTTP:n** is specified in **KDS\_X\_KDE\_TRANSPORT\_HTTP\_OPTIONS** or **KDS\_X\_KDE\_TRANSPORT\_GBL\_OPTIONS**, consider removing those settings. The configuration tool will automatically update the *KDSENV* member using existing and newly introduced parameters.
- For the agents: If **HTTP:0** is specified in **Kpp\_X\_KDE\_TRANSPORT\_HTTP\_OPTIONS** or **Kpp\_X\_KDE\_TRANSPORT\_GBL\_OPTIONS**, consider removing it from the parameter value. By specifying **RTE\_TEMS\_TRANSPORT\_MODE "HTTPS"**, **HTTP:0** will be added to all *KppENV* members automatically. All HTTPS-related configuration in these parameters can remain unchanged.

## PTF UJ94529 for APAR OA65933 (1Q24)

PTF UJ94529 for APAR OA65933 (1Q24) introduces a new section in the **MIGRATE** action report about additional parameters that are not migrated, and also introduces error message **KFJ00225E** to indicate an incorrectly set embeds library. Additionally, informational message **KFU00003I** was removed from KCIPRINT and now appears in KCITRACE only. (This PTF also delivers additional fixes; refer to the APAR text for those details.)

### Configuration Manager-only updates

The following updates have been made:

- A new section has been added to the report in the **MIGRATE** job output that includes parameters that are not migrated because they match the PARMGEN **RTE\_HILEV** parameter value.
- New error message [“KFJ00225E” on page 382](#) has been added. This message informs you when there is a problem with the specification of your embeds data set.
- Informational message [“KFU00003I” on page 392](#), which is issued by **KCIOMEGA**, now appears only in the KCITRACE sysout data set. Previously, it also appeared in KCIPRINT. Documented examples have been updated accordingly.

## PTF UJ94312 for APAR OA65216 (4Q23)

PTF UJ94312 for APAR OA65216 (4Q23) changes PDS V2 activation for the monitoring server to be enabled by default. In addition, Configuration Manager has been updated to provide enhanced PDS V2 status messaging, improved parameter support for SAF class configuration for product-specific Take Action commands, the ability to override the default binder program, and new Db2-related data set allocation control for remote deployment.

## Configuration Manager and PARMGEN updates

With this PTF, activation of the persistent data store V2 (PDS V2) for the Tivoli Enterprise Monitoring Server (monitoring server) is now enabled by default. Previously, the **KDS\_PDS2\_ACTIVATION** parameter had the default setting of N; now, the default setting is Y. This change impacts new runtime environments created using either PARMGEN or Configuration Manager.

This change also impacts existing Configuration Manager configurations where the **KDS\_PDS2\_ACTIVATION** parameter is not explicitly defined in the RTEDEF library. If there are no other settings preventing PDS V1 from being disabled, the **GENERATE** action will cause the runtime environment to fully switch to using PDS V2, which will occur when you run a full **GENERATE** or a **GENERATE** with options **NOUSS** or **QUICKCONFIG**.

## Configuration Manager-only updates

The following updates have been made:

- New informational messages [KFJ00223I](#) and [KFJ00224I](#) have been added. These messages appear in KCIPRINT to inform you about the global status of PDS V1 and PDS V2 in the runtime environment. If PDS V1 is still enabled, more messages will follow that provide details about the PDS V2 status of individual agents.
- To simplify System Authorization Facility (SAF) class configuration of product-specific Take Action commands, the **RTE\_SECURITY\_CLASS** parameter value is now automatically propagated to the following product parameters as the default value:
  - [KC5\\_SECURITY\\_ACTION\\_CLASS](#)
  - [KM5\\_SECURITY\\_ACTION\\_CLASS](#)
  - [KN3\\_SECURITY\\_ACTION\\_CLASS](#)
- New parameter "[GBL\\_UTIL\\_BINDER](#)" on [page 294](#) is now available. You can use this parameter to override the default binder program IEWL.

**Note:** [GBL\\_UTIL\\_BINDER](#) is incorrectly documented as [KFJ\\_UTIL\\_BINDER](#) in the APAR text. The correct name for this parameter is [GBL\\_UTIL\\_BINDER](#).

- New parameter [KFJ\\_LOCAL\\_KD5\\_RUN\\_ALLOC](#) is now available. This parameter controls if the job for Db2-related data set allocation is submitted. This parameter is used for remote deployment scenarios.

## PTF UJ93992 for APAR OA65613 (4Q23)

PTF UJ93992 for APAR OA65613 (4Q23) provides improved job reporting output for the Configuration Manager **DEPLOY** action. Additionally, PARMGEN now refers to IBM Documentation for information about completing the configuration for some components. (This PTF also delivers additional fixes; refer to the APAR text for those details.)

## Configuration Manager-only updates

The **DEPLOY** action has been enhanced to produce an informative report when running in default mode. The \$REPORT DD has been added to indicate which data sets were deployed, which were intentionally skipped, and which failed; and messages have been improved in KCIPRINT to better summarize this information. In addition, the deployment status of the z/OS UNIX System Services data sets is included in the \$REPORT output. For more information, see "[DEPLOY action output](#)" on [page 272](#).

**Note:** SYSPRINT is no longer used for **DEPLOY** action output. In earlier product versions, SYSPRINT was used for reporting the status of the restore process; however, this information is now provided in the KCIPRINT SYSOUT data set and the \$REPORT DD.

## PARMGEN-only updates

The **Complete the configuration** panels for the Tivoli Enterprise Monitoring Server (KDS) and the OMEGAMON enhanced 3270 user interface (KOB) components have been updated to link to the respective information in IBM Documentation:

- [“Complete the configuration of a Tivoli Enterprise Monitoring Server” on page 523](#)
- [“Complete configuration of the OMEGAMON enhanced 3270 user interface” on page 564](#)

## PTF UJ93804 for APAR OA65222 (3Q23)

PTF UJ93804 for APAR OA65222 (3Q23) provides Configuration Manager enhancements, including new **GENERATE** action options **RELINK** and **QUICKCONFIG**, improvements in job output reporting, support for symbolics in parameter **RTE\_X\_OVERRIDE\_EMBEDS\_LIB**, and support for discovering subsystem aliases. Additional enhancements have also been made for configuring the OMEGAMON enhanced 3270 user interface.

### Configuration Manager-only updates

The following changes have been made:

- The **GENERATE** action has been updated to introduce the following **OPTION** keywords:

#### **RELINK**

This option allows you to rerun only the assembly and link-edit steps for modules shipped by products OMEGAMON for Networks (KN3) and OMEGAMON enhanced 3270 user interface (KOB).

#### **QUICKCONFIG**

This option skips the reloading of SMP/E modules into the runtime environment and provides significant reduction in resources used by the **GENERATE** action. The runtime environments that will benefit the most from this option are full runtime environments (**RTE\_TYPE** parameter is set to FULL).

- Configuration Manager jobs will now print fewer lines of output than previously, resulting in significantly reduced spool usage.

Configuration Manager jobs now delete most of the substep DD outputs from the JES spool. There are some exceptions, such as KCIPRINT, KCITRACE, KCIVARSO, and other similar, important DD outputs. Automatically deleting this output significantly reduces spool usage and should help to successfully run the **GENERATE** action on systems where output line limitations exist. Since the number of output lines still varies, you should check the impact on your individual runtime environment setups and adjust the limits accordingly.

If a Configuration Manager job fails, the DD statement that contains the error message is printed in addition to the regular DD statements. **OPTION DEBUG** has been added to re-enable the printing of the entire output; this option is only needed for troubleshooting.

**Note:** Deletion of DD outputs is not supported in JES3. The debugging option can still be used if required, but its function is limited to printing additional debugging messages.

- In the **GENERATE** and **MIGRATE** actions, you can now see stage completion messages issued to KCIPRINT. These messages give you a better understanding of how far the job has progressed.
- Support for symbolics has been added to the Configuration Manager-only parameter **RTE\_X\_OVERRIDE\_EMBEDS\_LIB**. You can now use system variables, like in the respective security exits parameter (**RTE\_X\_SECURITY\_EXIT\_LIB**).
- The **DISCOVER** action now honors subsystem aliases during discovery, which impacts the following parameters for Db2, IMS, and TCP/IP, respectively: **KD2\_DBnn\_DB2\_LOADLIB**, **KI2\_I1nn\_CLASSIC\_IMS\_RESLIB**, **KN3\_TCPXnn\_TCPIP\_PROFILES\_DSN**

### Product-specific updates

#### OMEGAMON enhanced 3270 user interface

The following changes have been made:

- The default OMEGAMON enhanced 3270 user interface (KOB) UKOBDATF data set allocation size has been increased to 100 directory blocks, and the space allocation has been increased to CYL(1,5). This update impacts both Configuration Manager and PARMGEN.

The UKOBDATF data set is not reallocated automatically by the configuration software. The new allocation size applies only to new runtime environments. If you want to change an existing UKOBDATF data set to use the new recommended size, you must manually reallocate it.

- Parameter **KOB\_TIMEOUT** was added to OMEGAMON enhanced 3270 user interface (KOB) configuration. This parameter can be used to control the TIMEOUT parameter in the IBM OMEGAMON enhanced 3270 user interface started task JCL, in the PARM=( ) section. This update impacts both Configuration Manager and PARMGEN.

## PTF UJ92865 for APAR OA64870 (3Q23)

PTF UJ92865 for APAR OA64870 (3Q23) provides support in PARMGEN and Configuration Manager for IBM Z OMEGAMON AI for JVM, 6.1; IBM Z OMEGAMON AI for z/OS 6.1; and IBM Z OMEGAMON AI for Networks 6.1.

### IBM Z OMEGAMON AI for JVM, 6.1

- The product has been renamed to IBM Z OMEGAMON AI for JVM (OMEGAMON AI for JVM). It was formerly named IBM Z OMEGAMON for JVM.
- Support for Health Center has been removed.

### IBM Z OMEGAMON AI for Networks 6.1

- The product has been renamed to IBM Z OMEGAMON AI for Networks (OMEGAMON AI for Networks). It was formerly named IBM Z OMEGAMON Network Monitor.

### IBM Z OMEGAMON AI for z/OS 6.1

- The product has been renamed to IBM Z OMEGAMON AI for z/OS (OMEGAMON AI for z/OS). It was formerly named IBM Z OMEGAMON Monitor for z/OS.
- Support for EPILOG has been removed.

## PTF UJ93077 for APAR OA64681 (2Q23)

PTF UJ93077 for APAR OA64681 (2Q23) provides several Configuration Manager enhancements, including new **GENERATE** action options for parameter validation and loading read-only configuration members. Added control for z/OS® UNIX® System Services configuration steps has been extended to the **PACKAGE** and **DEPLOY** actions for remote deployment. Additionally, enhancements have been made in support of IBM Z OMEGAMON Data Provider and IBM OMEGAMON for Db2 Performance Expert on z/OS.

### Configuration Manager-only updates

The following changes have been made:

- The **GENERATE** action has been updated to provide the following **OPTION** keywords:

#### **VALIDATE**

Perform initial validation of RTEDEF parameters. The **VALIDATE** option performs only the necessary steps to perform the parameter validation, and produces the validation report, \$VALRPT. The **VALIDATE** option can be used before the full **GENERATE** job is run. It is not compatible with any other **OPTION** value.

#### **QUICKLOAD**

Load the read-only configuration members to the RK\* data sets. The read-only members are those members that are not impacted by customization during configuration. **OPTION QUICKLOAD** is compatible with the **USS** and **SECXITS** values, but is not compatible with the **VALIDATE** and **NOUSS** values.

For more information, see [“GENERATE” on page 248](#).

- The **PACKAGE** action has been updated to provide the following **OPTION** keyword:

#### **NOUSS**

Do not include the files and directories related to z/OS® UNIX® in the **PACKAGE** output.

For more information, see [“PACKAGE” on page 265](#).

- The **DEPLOY** action has been updated to provide the following **OPTION** keywords:

**USS**

Run only the **DEPLOY** workflow stage that deploys the parts related to z/OS® UNIX®.

**NOUSS**

Do not run the z/OS® UNIX® deploy stage in the **DEPLOY** action.

For more information, see [“DEPLOY” on page 268](#).

- The **MIGRATE** action has been updated with a new DD statement, MIGRPT, which adds information about the parameters to the job output. The new report presents parameters in the following groups:
  - Parameters that are migrated to the RTEDEF data set because their values are different from the default values
  - Parameters that are always migrated, regardless of values being default or not
  - Parameters that are not migrated because of having default values

For more information, see [“MIGRATE” on page 261](#).

## Product-specific updates

### IBM Z OMEGAMON Data Provider

An update has been made for handling IBM Z OMEGAMON Data Provider configuration artifacts. Filter RKANPARU (KAY\*) has been added to the EXCLUDE list, and as a result, any user changes in those members (including member KAYOPEN) will be retained during runtime environment regeneration.

### IBM OMEGAMON for Db2 Performance Expert on z/OS

This PTF adds enablement and validation extensions for IBM OMEGAMON for Db2 Performance Expert on z/OS APAR PH53163.

## PTF UJ92421 for APAR OA64052 (1Q23)

PTF UJ92421 for APAR OA64052 (1Q23) provides several Configuration Manager enhancements, including a new parameter that allows more granular control over certain actions. This parameter enables generate options for z/OS® UNIX® System Services and security exits configuration steps and the ability to migrate multiple runtime environments into a single RTEDEF data set. Additionally, support has been added to PARMGEN and JOBGEN for IBM Discovery Library Adapter for z/OS V3.2.

### Configuration Manager-only updates

The following changes have been made:

- A new KCIVARS parameter, **OPTION**, has been introduced. It allows more granular control over certain actions. This parameter is optional. All actions run as previously if **OPTION** is not specified. For more information, see [“Action options” on page 238](#).

- The **GENERATE** action has been updated to provide the following **OPTION** keywords:

**USS | NOUSS**

**OPTION USS** runs only the **GENERATE** workflow stage that deploys the z/OS UNIX related parts.  
**OPTION NOUSS** skips the z/OS UNIX deploy stage in the **GENERATE** action.

**SECEXITS**

**OPTION SECEXITS** rebuilds security exits only.

Some options require a complete run of the **GENERATE** action prior to use. Additionally, some options are not compatible to run with other options during the same job.

For more information, see [“GENERATE” on page 248](#).

- The **MIGRATE** action has been updated as follows:
  - The **MIGRATE** action now supports the migration of multiple runtime environments into the same RTEDEF library. To use this function, the new KCIVARS parameter **OPTION** must be specified with the value **MULTIPLE** (which can be abbreviated to **MULTI**).

The **KFJ\_SYSNAME** parameter value is used to replace *lpar* in the member name *Kpp\$lpar*. Note that **KFJ\_SYSNAME** is an internal parameter that automatically assigns the value of **SYSNAME**, but it is possible to specify a different value for **KFJ\_SYSNAME** in KCIVARS as well.

If **OPTION MULTIPLE** is not specified, the **MIGRATE** action constructs product members with the extension of \$PARM, as occurred previously.

- The **CONFIRM** workflow variable is no longer supported for the **MIGRATE** action. The job issues a list of error messages in KCIPRINT and writes user actions to perform in the case of member duplication. The RTEDEF library, once created, is not overwritten by the **MIGRATE** action.
- The **MIGRATE** action now supports using the same high-level qualifier as PARMGEN-generated runtime environments. This functionality is referred to as *in-place migrate*. The only action required is changing the **RTE\_PLIB\_HILEV** parameter value to match the high-level qualifier as indicated in the **KFJ\_MIGRATE\_WCONFIG** parameter.

**Important:** It is highly recommended that you back up the source PARMGEN runtime environment as subsequent **GENERATE** actions will overwrite data set contents and previous data might be lost.

For more information, see “[MIGRATE](#)” on page 261.

- The high-level qualifier used in Configuration Manager can now be 28 characters (instead of the previous limit of 20 characters).
- Configuration Manager no longer creates data sets WCONTABL and WCONBACK, which are not required.

### PARMGEN-only updates

Support has been added for IBM Discovery Library Adapter for z/OS V3.2 in PARMGEN.

### Job generator utility (JOBGEN) updates

Support has been added for IBM Discovery Library Adapter for z/OS V3.2 in the job generator utility (JOBGEN). FMID HIZD320 was added to the JOBGEN table and it can be used to install or upgrade DLA.

## PTF UJ92101 for APAR OA63966 (1Q23)

PTF UJ92101 for APAR OA63966 (1Q23) adds support for PDS V2 configuration for the Tivoli Enterprise Monitoring Server in the configuration software and modifies PDS V2 support for IBM OMEGAMON for Storage on z/OS.

### Configuration Manager and PARMGEN updates

With this PTF, you can now configure the use of persistent data store V2 (PDS V2) for the monitoring server in both Configuration Manager and PARMGEN using the following parameters:

- KDS\_PDS2\_ACTIVATION
- KDS\_PDS2\_FILE\_COUNT
- KDS\_PDS2\_SEC\_SIZE
- KDS\_PDS2\_STORE\_SIZE

The default value for **KDS\_PDS2\_ACTIVATION** is N, so if it is not manually changed to Y, there is no functional change in the runtime environment.

If **KDS\_PDS2\_ACTIVATION** is set to Y and all agents in the runtime environment also have PDS V2 activated (which is the default setting), then PDS V1 is automatically disabled; PDS V1 modules will not be loaded and PDS V1 data sets are no longer allocated.

Configuration Manager action **DEL PDSV1**, which is used to remove PDS V1 data sets after switching to PDS V2, has been updated with the names of the PDS V1 data sets for the monitoring server (*GENHISn*, *RppSGRPn*, *RPDSGRPn*).

## Product-specific updates

### IBM OMEGAMON for Storage on z/OS

The IBM OMEGAMON for Storage internal version of PDS V2 and the use of PDS V1 are no longer available. IBM OMEGAMON for Storage users must use the OMNIMON Base version of PDS V2.

Configuration Manager and PARMGEN will no longer generate member *&rhilev*.RKANPARU(KDFDINIT), which contained the setting PDS2=F0RC. This setting forced the IBM OMEGAMON for Storage version of PDS V2 to be used when the OMNIMON Base version of PDS V2 was disabled on a runtime environment level (by specifying **RTE\_PDS2\_ACTIVATION** to N). The PDS2=F0RC option is no longer supported, and the IBM OMEGAMON for Storage agent will be moved to the OMNIMON Base version of PDS V2. History data sets cannot be reused.

It is important that the KDFDINIT member is removed from RKANPARU after applying this and related APARs. You must remove KDFDINIT from EXCLUDE rules and verify that is removed from RKANPARU.

## PTF UJ09749 for APAR OA64006 (4Q22)

PTF UJ09749 for APAR OA64006 (4Q22) adds support for IBM Advanced Storage Management agents in the configuration software.

With this PTF, Configuration Manager support is added for the following IBM Advanced Storage Management (ASM) agents:

- IBM Tivoli Advanced Allocation Management for z/OS 3.3
- IBM Tivoli Automated Tape Allocation Manager for z/OS 3.3
- IBM Tivoli Advanced Backup and Recovery for z/OS 2.4

These agents can now be fully configured using Configuration Manager; all actions are supported.

In addition, these agents are enabled for persistent data store V2 (PDS V2) support in both Configuration Manager and PARMGEN.

## PTF UJ09486 for APAR OA63790 (4Q22)

PTF UJ09486 for APAR OA63790 (4Q22) adds support for IBM Tivoli Composite Application Manager (ITCAM) for Application Diagnostics Agent 7.1.1 and also updates the JOBGEN table member to include a new CALLLIBS entry for IBM OMEGAMON for Storage on z/OS.

## Product-specific updates

### ITCAM for Application Diagnostics Agent 7.1.1

Support has been added for ITCAM for Application Diagnostics Agent 7.1.1 in the configuration software and includes the following updates:

- This agent is enabled for persistent data store V2 (PDS V2) support in both Configuration Manager and PARMGEN using the following parameters:
  - KYN\_PDS2\_ACTIVATION
  - KYN\_PDS2\_FILE\_COUNT
  - KYN\_PDS2\_SEC\_SIZE
  - KYN\_PDS2\_STORE\_SIZE

For more information, see [“PDS V2 parameters and members” on page 1238](#).

- The access mode that is used when creating files on z/OS UNIX™ System Services for the ITCAM for Application Diagnostics Agent 7.1.1 is now based on the value in parameter **RTE\_USS\_MKDIR\_MODE**. PARMGEN JCL job KCIJPUSS and Configuration Manager workflows have been updated accordingly.

### IBM OMEGAMON for Storage on z/OS 5.5

The JOBGEN table member has been updated with a new CALLLIBS entry for IBM OMEGAMON for Storage on z/OS 5.5 (HKS3550) for SCSFSTUB, which is used for Integrated Cryptographic Service Facility (ICSF) services.

## PTF UJ09334 for APAR OA63566 (3Q22)

PTF UJ09334 for APAR OA63566 (3Q22) adds support for IBM Advanced Storage Management agents in the configuration software.

With this PTF, Configuration Manager support is added for the following IBM Advanced Storage Management (ASM) agents:

- IBM Tivoli Advanced Catalog Management for z/OS 2.6
- IBM Tivoli Advanced Reporting and Management for DFSMSHsm 2.6
- IBM Tivoli Advanced Audit for DFSMSHsm 2.6

These agents can now be fully configured using Configuration Manager; all actions are supported.

In addition, these agents are enabled for persistent data store V2 (PDS V2) support in both Configuration Manager and PARMGEN.

## PTF UJ09236 for APAR OA63621 (3Q22)

PTF UJ09236 for APAR OA63621 (3Q22) changes the default value for the GBL\_DSN\_IMS\_RESLIB parameter and also addresses various bug fixes.

The default value for parameter `GBL_DSN_IMS_RESLIB` is now `IMS.SDFSRESL`. Previously, the default value for this parameter was `DFS.V12R0M0.SDFSRESL`.

## PTF UJ08884 for APAR OA63423 (3Q22)

PTF UJ08884 (3Q22) for cumulative APAR OA63423 introduces a new configuration option for passphrase support for the OMEGAMON 3270 Classic user interface, increased allocation sizes for Db2-related data sets, and several other enhancements for Configuration Manager and PARMGEN.

### Configuration Manager and PARMGEN updates

A new configuration option is available for passphrase support for the OMEGAMON 3270 Classic user interface. For parameter `Kpp_CLASSIC_PASSPHRASE` (where *pp* is C2, D2, I2, or M2), you can now specify the value `MAX62`, which allows you to enter up to a 62-byte passphrase value on a single line when the screen width is 80 bytes. With a wider screen size, you can specify a passphrase value up to 100 bytes long. This enhancement is a documentation-only change in Configuration Manager and PARMGEN, with the functional support provided in OMNIMON Base APAR OA62991. This update impacts the following products, each listed with its respective product code:

- OMEGAMON for CICS (C2)
- OMEGAMON for Db2 Performance Expert (D2)
- OMEGAMON for IMS (I2)
- OMEGAMON for z/OS (M2)
- IBM Z OMEGAMON Monitor for z/OS (M2)

(APAR OA63423)

### PARMGEN-only updates

Changes have been made regarding how z/OS Unix System Services processing is done in PARMGEN, impacting products IBM OMEGAMON for Messaging on z/OS (KQI) and the Tivoli Enterprise Monitoring Server (KDS). The REXX script `KCIR@USS` is now no longer used, and `KFURSH` is used instead. (APAR OA63310)

### Product-specific updates

#### OMEGAMON for Db2 Performance Expert

The following changes have been made:

- In Configuration Manager, to allow for more Db2 subsystems to be configured, the data set allocation parameter values have been increased. Specifically, the `SPACE` primary and secondary allocation size

values have been increased for the following data sets: RKD2SAM, RKD2PAR, and RKD2PRF. (APAR OA63528)

- The default values for the following parameters have been changed from RTE\_SMS\_VSAM\_\* to RTE\_SMS\_\*:
    - **KD2\_PFn\_HIS\_DYN\_\***
    - **KD2\_PFn\_HIS\_GDG\_\***
- (APAR OA63423)

#### **IBM Z OMEGAMON Network Monitor 5.6**

The following changes have been made:

- Parameters **KN3\_TCP\_ZERT** and **KN3\_TCPXNN\_OVRD\_ZERT** are no longer supported by the product. (APAR OA63423)
- Member RKANPARU(KN3SNMP) was updated to support Simple Network Management Protocol v3 (SNMPv3). It is compatible with existing SNMPv2 entries and allows you to add new entries for SNMPv3. (APAR OA63423)

## **PTF UJ08674 for APAR OA63103 (2Q22)**

The PARMGEN PTF UJ08674 (2Q22) provides support for IBM Z OMEGAMON for CICS 5.6 and IBM Z NetView Enterprise Management Agent 6.4 in Configuration Manager and PARMGEN. Additionally, the name for OMEGAMON Data Provider has been updated.

### **Product-specific updates**

#### **IBM Z OMEGAMON for CICS 5.6**

The following changes have been made:

- IBM Z OMEGAMON for CICS 5.6 was formerly known as IBM OMEGAMON for CICS on z/OS. The new name is reflected in all JCL templates, configuration members, and user interface panels, and is used regardless of the installed version of OMEGAMON for CICS.
- A set of modules has been cleaned up from the \*KANMOD libraries.
- FMID KC5560 has been added to JOBGEN.

#### **IBM Z NetView Enterprise Management Agent 6.4**

The following changes have been made:

- IBM Z NetView Enterprise Management Agent 6.4 was formerly known as IBM Tivoli NetView for z/OS Enterprise Management Agent. The new name is reflected in all JCL templates, configuration members, and user interface panels, and is used regardless of the installed version of IBM Z NetView Enterprise Management Agent.
- PDS V2 has been enabled for IBM Z NetView Enterprise Management Agent v6.4. The following parameters have been introduced:
  - **KNA\_PDS2\_ACTIVATION**
  - **KNA\_PDS2\_FILE\_COUNT**
  - **KNA\_PDS2\_SEC\_SIZE**
  - **KNA\_PDS2\_STORE\_SIZE**

For for information, see “PDS V2 parameters and members” on [page 1238](#).

#### **OMEGAMON Data Provider**

The product name has been changed from **OMNIMON Data Provider** to **OMEGAMON Data Provider** in the JOBGEN product list.

## PTF UJ08515 for APAR OA62832 (2Q22)

The PARMGEN PTF UJ08515 (2Q22) provides support for IBM OMEGAMON® for Db2® Performance Expert on z/OS 5.5 in Configuration Manager and PARMGEN.

### Product-specific updates

#### IBM OMEGAMON® for Db2® Performance Expert on z/OS 5.5

The following changes have been made:

- IBM OMEGAMON for Db2 Performance Expert on z/OS 5.5 was formerly known as IBM Tivoli® OMEGAMON XE for Db2 Performance Expert on z/OS. The new name is reflected in all JCL templates, configuration members, and user interface panels, and is used regardless of the installed version of OMEGAMON for Db2 Performance Expert or OMEGAMON for Db2 Performance Monitor.
- You can now configure an RTE to monitor IBM Db2 13 for z/OS. The following global parameters have been introduced:
  - **GBL\_DSN\_DB2\_LOADLIB\_V13**
  - **GBL\_DSN\_DB2\_RUNLIB\_V13**

In addition, the JOBGEN table has been updated to include HKDB550 SMP/E data set definitions.

**Note:** Several back-level products have been removed from JOBGEN. See the PTF HOLD TEXT for details.

- The JCL templates for Db2 EXPLAIN have been simplified. A single EXPLAIN template, EXCV#####, is now generated for Db2 versions 11, 12, and 13. This feature is enabled only when OMEGAMON for Db2 Performance Expert 5.5.0 is installed.
- Classic and static sequential Near Term History data sets can now be automatically allocated using the following new parameters:
  - **KD2\_PF\_HIS\_LOG\_NUM**
  - **KD2\_PF\_HIS\_SEQ\_LOG\_NUM**
  - **KD2\_PF\_HIS\_SEQ\_MCLAS**
  - **KD2\_PF\_HIS\_SEQ\_SCLAS**
  - **KD2\_PF\_HIS\_SEQ\_UNIT**
  - **KD2\_PF\_HIS\_SEQ\_VOLUME**
  - **KD2\_PF\_HIS\_VSAM\_MCLAS**
  - **KD2\_PF\_HIS\_VSAM\_SCLAS**
  - **KD2\_PF\_HIS\_VSAM\_VOLUME**This feature is enabled only when OMEGAMON for Db2 Performance Expert 5.5.0 is installed. For more information about these parameters, see [KD2\\_PFn\\_HIS - Near-Term History](#).
- You can control the behavior of the Near Term History collection task during startup using the new parameter **KD2\_OMPE\_OPTS\_NTHDB2I**. This parameter value is automatically added to OMPEOPTS. This new parameter can be used only when OMEGAMON for Db2 Performance Expert 5.5.0 is installed.
- The following parameters have been deprecated for all versions of OMEGAMON for Db2 Performance Expert:
  - **KD2\_OMPE\_E2E\_MON\_SPRT**
  - **KD2\_DB\_DB2\_USEFLG**
  - **KD2\_PF\_SH\_D2SHSQLC**
  - **KD2\_PF\_SH\_D2SHSQLI**

- **KD2\_PF\_READA\_SPMON**
- **KD5\_DB\_OPM\_E2ESQLHN\_TCP\_HOST**
- **KD5\_DB\_OPM\_E2ESQLPT\_PORT\_NUM**
- **KD5\_DB\_OPM\_E2ESEQUIRE\_SECURE**

These parameters are ignored by Configuration Manager and PARMGEN.

## PTF UJ08174 for APAR OA63060 (2Q22)

The PARMGEN PTF UJ08174 (2Q22) includes various bug fixes in data set allocations, merge and z/OS® UNIX® System Services-related configuration steps, and the IBM® OMEGAMON® for JVM API Archive Extract Transform utility.

### PARMGEN configuration framework enhancements and updates

The following updates have been made:

- Previously, PARMGEN would allocate extraneous data sets when parameter **KDS\_TEMS\_TYPE** was set to REMOTE. This issue has been addressed by checking the parameter value and applying conditional logic.
- When using PARMGEN, if step MERGEBKA failed in the KCIJPPRF job, WCONFIG(*rte\_name*) member contents were not merged. If you would rerun the job, it would complete successfully, but WCONFIG(*rte\_name*) contents would still remain incorrect. This issue has been corrected by taking existing members in GBL\_USER\_JCL and WCONFIG from the backup.

### Product-specific updates

#### OMEGAMON for JVM

The PARM statement in the RKANSAMU(KJJREPTJ) job template, which supports the OMEGAMON for JVM API Archive Extract Transform utility, changed from PARM= 'JSON' to PARM= ' ', as there was a parameter description in the job comment that did not match the actual statement.

#### OMEGAMON for Storage

In certain conditions, during the extract of TKANDATV(KS3RDMPZ) to the RDM Application Server ZFS Directory (RTE\_USS\_RTEDIR/KS3/*r dm*) z/OS UNIX path, this step would fail with errors indicating that permission is denied (RC=256). The target directories are now removed before re-creating them, which resolves the permission errors.

## PTF UJ08103 for APAR OA62792 (1Q22)

The PARMGEN PTF UJ08103 (1Q22) includes support for the IBM® OMEGAMON® for JVM API Archive Extract Transform utility.

### Product-specific enhancements

#### OMEGAMON for JVM

Support has been added for the IBM® OMEGAMON® for JVM API Archive Extract Transform utility. The following parameters have been introduced:

- **KJJ\_API\_DETAIL\_ARCHIVE\_FLAG**
- **KJJ\_API\_DETAIL\_ARCHIVE\_STC**

## PTF UJ07786 for APAR OA62833 (1Q22)

The PARMGEN PTF UJ07786 (1Q22) includes an update to encryption setup.

### PARMGEN configuration framework enhancements and updates

To generate the KAES256 encryption key, PARMGEN was using the KGLCRYUT module from the TKANMOD library, but this module does not support Extended Address Volumes (EAV). To support KAES256 key

generation on EAV, module KGLCRYWR has been created in library TKANMODP. The respective PARMGEN JCL templates have been updated to use module KGLCRYWR, accordingly.

## PTF UJ07639 for APAR OA62526 (1Q22)

The PARMGEN PTF UJ07639 (1Q22) corrects an error in PDS V1 program logic.

### PARMGEN configuration framework enhancements and updates

There was an issue where PARMGEN produced truncated output in a PDS V1 REXX script if the data set name in parameter `GBL_DSN_SYS1_PARMLIB` was too long. The PDS V1 REXX script in member KDSJPUPD has been modified to fit data set names up to 44 characters.

## What's new in OMEGAMON products and components

Find the what's new topics for the latest OMEGAMON products and components.

# OMEGAMON products and IBM Tivoli Management Services on z/OS

The OMEGAMON® products are a suite of products used to monitor and manage sophisticated mainframe applications and environments. The OMEGAMON products share a common technology, Tivoli® Management Services on z/OS. They also share a set of common components.

## Tivoli Management Services components

The OMEGAMON suite of products uses the Tivoli® Management Services infrastructure, which provides security, data transfer and storage, notification mechanisms, user interface presentation, and communication services for products in the IBM® Tivoli® Monitoring and IBM® OMEGAMON suites.

“Figure: Architecture” on page 54 shows a simple topology of the various principal components that form the Tivoli® Management Services and OMEGAMON monitoring infrastructure, and how they interact with each other.

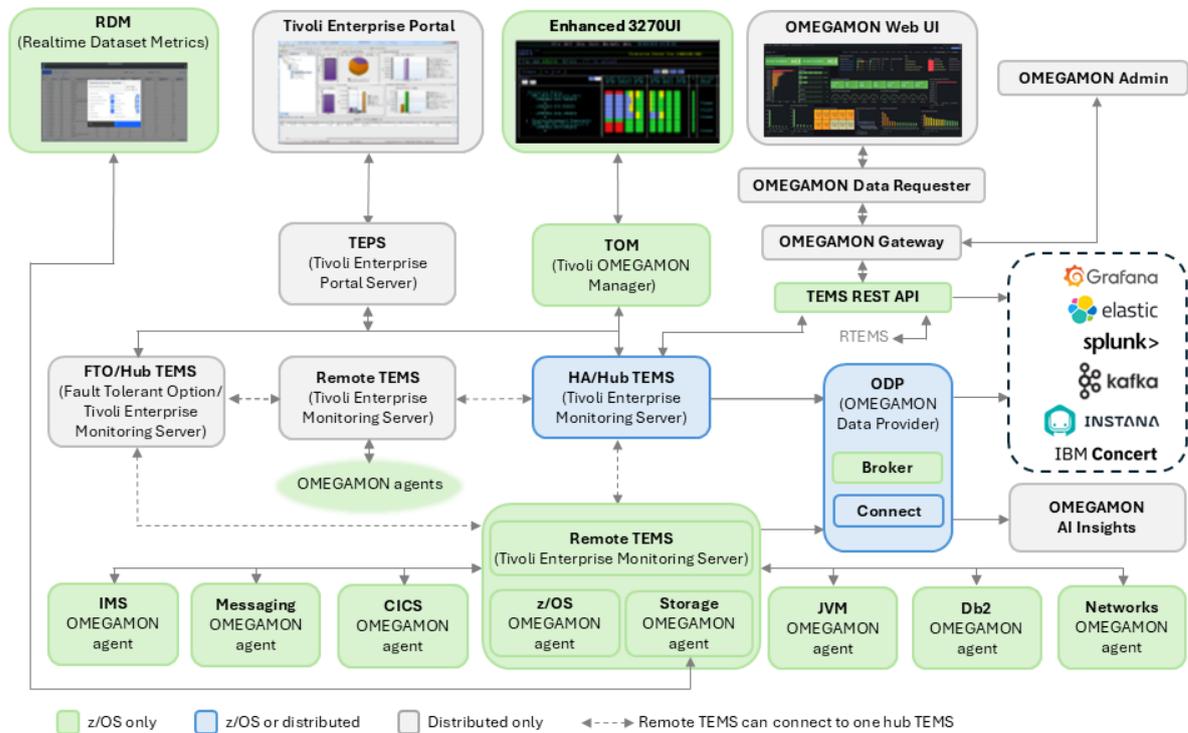

Figure 1: Architecture

**Note:** Not all the Tivoli® Management Services and OMEGAMON components in “Figure: Architecture” on page 54 are required for all customer environments. For example, you do not have to have a Tivoli Enterprise Portal Server installed in your environment to run OMEGAMON on z/OS® and use the OMEGAMON® enhanced 3270 user interface to view data. However, if you enable the self-describing agent feature provided by Tivoli® Management Services, the Tivoli® Enterprise Services user interface extension is required to control the administration of the self-describing agent feature. This component provides the tacmd command-line utility to interact with a monitoring server. This component is available on the IBM® Tivoli® Monitoring DVD image that is referenced in the *IBM® OMEGAMON Monitoring Agents on z/OS Quick Start Guide*.

## Tivoli Enterprise Monitoring Server

Tivoli Enterprise Monitoring Server (also called the *monitoring server*) is the nerve center of Tivoli Management Services.

The monitoring server performs the following tasks:

- Consolidates the data collected by monitoring agents and distributes the data to the connected clients (OMEGAMON® enhanced 3270 user interface and Tivoli Enterprise Portal Server).
- Manages the connection status of the monitoring agents.
- Receives commands from the connected clients and distributes them to the appropriate monitoring agents.
- Sends alerts to the connected clients when specified availability and performance problems are detected.
- Stores historical data and configuration prototypes.

Based on different functions in the monitoring systems, there are two monitoring server types:

- The *hub monitoring server* is the central monitoring server, acting as the focal point for data collection and distribution. It communicates with monitoring agents, with the OMEGAMON® enhanced 3270 user interface, with the Tivoli Enterprise Portal Server, and with the Warehouse Proxy and Summarization and Pruning agents (see [“Tivoli Data Warehouse” on page 56](#)).
- The *remote monitoring server* is remote only with respect to the hub monitoring server, not with respect to the monitoring agents. Remote monitoring servers communicate only with the monitoring agents that report to them and with the hub monitoring server to which the monitoring servers report.

Monitoring servers can run on z/OS®, Windows™, AIX®, Solaris, or Linux™ systems.

## OMEGAMON® Enhanced 3270 user interface

The OMEGAMON® Enhanced 3270 user interface component represents the latest generation of 3270 interfaces for the OMEGAMON® family of monitoring products. The new interface preserves many of the valued features of the earlier 3270-based interfaces, but extends the functionality to include many new features including cross-system, cross-plex, and cross-product reporting.

The OMEGAMON® enhanced 3270 user interface component enables you to monitor the performance of your z/OS systems, applications, and devices in your environment and helps you identify and troubleshoot problems with those monitored resources. In the interface, data is presented in workspaces and subpanels in which the collected data and relevant information is displayed. You can quickly and easily diagnose problems with monitored resources and take action to correct them. You can also customize the workspaces to suit your requirements, and even design and create your own workspaces and navigation.

For more information about the interface, see [“OMEGAMON enhanced 3270 user interface” on page 890](#).

## Tivoli Enterprise Portal Server and clients

The Tivoli Enterprise Portal and the Tivoli Enterprise Portal Server work together to provide access to real-time and historical data collected by the monitoring agents.

Tivoli Enterprise Portal (also called the *portal* or the *portal client*) is the distributed user interface for products using Tivoli Management Services. The Tivoli Enterprise Portal is a thin Java™ client application. It has its own server, the Tivoli® Enterprise Portal Server, that communicates with the hub monitoring server to send requests to and retrieve data from monitoring agents on managed systems. Tivoli® Enterprise Portal Server (the *portal server*) builds and formats the portal workspaces that display real-time and historical data collected by the monitoring agents. The portal server can run on Windows™, AIX®, or Linux™ systems and can also run as a Docker [container](#).

You can access the portal client in any of the following ways:

- Browser client (Internet Explorer or Mozilla Firefox on Windows™, Linux™, or AIX®) connected to a web server embedded in the portal server.
- Desktop client installed on a Windows™ or Linux™ system.
- Desktop client downloaded and run by IBM® Web Start for Java™, and updated at every startup.

**Note:** You can also use Open Web Launch, an open-source Java Web Start replacement, to run your Tivoli Enterprise Portal client. For more information, see [“Open Web Launch” on page 1186](#).

For setup information about the portal server and client, see the *IBM Tivoli Monitoring: Installation and Setup Guide*.

The portal server also includes the optional dashboard data provider which is used by Dashboard Application Services Hub to retrieve read-only monitoring data from the hub monitoring server and monitoring agents. Dashboard Application Services Hub can display this data in monitoring dashboard applications such as the IBM Infrastructure Management Dashboards for Servers or in custom dashboards.

## Monitoring agents

OMEGAMON monitoring agent products are available for systems, database products, and applications.

Monitoring agents are located on monitored, or *managed*, systems. The agents pass the system or application data they collect to a Tivoli Enterprise Monitoring Server, and the data is passed to a connected client user interface (OMEGAMON® enhanced 3270 user interface or the Tivoli Enterprise Portal). Monitoring agents can also sample data at specified intervals and store it for short-term historical collection, which can then be transferred to a Tivoli Data Warehouse. Finally, the monitoring agents can also compare the current values of monitored properties against a set of defined conditions and thresholds, and trigger alerts or actions when the current values match the defined conditions or surpass the thresholds.

See the following topics for the available OMEGAMON monitoring agents and other agents that are managed under the Tivoli Management Services infrastructure:

- [“OMEGAMON products” on page 11](#)
- [“Other product/agent codes and documentation” on page 52](#)

## Tivoli Data Warehouse

Tivoli Data Warehouse, an optional component of Tivoli Management Services, is a long-term data store for the performance and analysis data collected by the monitoring agents. The *Warehouse Proxy agent* periodically receives data from the hub monitoring server or from the monitoring agents and inserts the data into the Tivoli Data Warehouse. On a z/OS® system, short-term history data for monitoring agents is maintained in data sets allocated and initialized during product configuration. The Warehouse Proxy agent receives the short-term history data and delivers it to the warehouse.

Two specialized agents interact with the Tivoli Data Warehouse:

- The Warehouse Proxy agent receives the short-term history data and delivers it to the Tivoli Data Warehouse.
- You can use the Summarization and Pruning agent to customize how long to save (pruning) and how often to aggregate (summarization) the data in the Tivoli Data Warehouse database.

The Tivoli Data Warehouse, the Warehouse Proxy agent, and the Summarization and Pruning agent can run on Windows™, AIX®, Solaris, or Linux™ systems. The Tivoli Data Warehouse can also run on z/OS®. For more information, see [IBM Tivoli Monitoring: Installation and Setup Guide](#) and [IBM Tivoli Monitoring: Administrator's Guide](#).

## TMS:Engine

TMS:Engine provides common functions such as communications, multithreaded runtime services, tracing, and logging for the monitoring server and monitoring agents on z/OS®.

This shared component enables common portable code to make platform-independent system calls. This allows Tivoli Enterprise Monitoring Server code to be compiled for and executed on z/OS®, Windows™, Linux™, and UNIX™ platforms.

## Event synchronization component

The event synchronization component sends updates to situation events that have been forwarded to a Tivoli Enterprise Console® event server or an IBM® Tivoli® Netcool®/OMNIBus ObjectServer back to the monitoring server. In the Tivoli Enterprise Portal, the Situation Event Console, the Common Event Console and the Tivoli Enterprise Console® event views are synchronized with the updated status of the events.

For information about the various configurations of monitoring servers and event servers that you can have in your environment, see the *IBM Tivoli Monitoring: Installation and Setup Guide*.

You can set up stand-alone monitoring agents (those that are configured in their own address spaces) to run in autonomous mode (without communicating directly with a monitoring server). An autonomous agent can emit Simple Network Management Protocol (SNMP) traps and Event Integration Facility (EIF) events directly to a Netcool®/OMNIBus ObjectServer for agent-specific situations (but not for enterprise situations).

The *IBM Tivoli Monitoring: Installation and Setup Guide* provides instructions for configuring Netcool®/OMNIBus ObjectServers to receive the events. For information on specifying which situation events to forward, see the Tivoli Enterprise Portal online help and the *IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide*. For detailed information about configuring and managing autonomous agents, see the “Agent autonomy” topics in the *IBM Tivoli Monitoring: Administrator's Guide*.

## Tivoli Enterprise Portal Server extended services

Tivoli Enterprise Portal Server extended services (TEPS/e) is an embedded, co-located extension of the Tivoli Enterprise Portal Server that provides J2EE-based Application Server integration facilities. TEPS/e provides support for a federated user repository. For more information about TEPS/e, see the *IBM Tivoli Monitoring: Administrator's Guide*.

## Tivoli® Enterprise Monitoring Automation Server, Registry Services, and OSLC clients

The Tivoli® Enterprise Monitoring Automation Server is an optional component that can be installed on the same system as the hub Tivoli® Enterprise Monitoring Server. The automation server is not supported if the hub monitoring server is installed on a z/OS® system.

The automation server includes the Open Services Lifecycle Collaboration Performance Monitoring (OSLC-PM) service provider. The Performance Monitoring service provider registers monitoring resources such as computer systems, software servers, and databases with the Registry Services. Registry Services is a Jazz™ for Service Management integration service that provides a shared data repository for products in an integrated service management environment. Products that discover and manage shared IT resources can register these IT resources and the services they offer with Registry Services. Other products acting as OSLC clients can use linked data interfaces to consume data by querying Registry Services for the managed resources or the associated service providers of interest. In the query responses, Registry Services return links to the service providers that can be queried to retrieve more information about the managed resources.

The Performance Monitoring service provider also supports the OSLC-PM RESTful API for retrieving linked data about monitored resources. It accommodates HTTP GET requests for the RDF/XML, compact XML and HTML content types. When RDF/XML and HTML content is requested, the API returns resource metrics defined by the OSLC-PM domain.

Each agent that supports registration of monitored resources includes an OSLC template in their monitoring server application support. This template is used by the Performance Monitoring service provider to determine which resources to register and what metrics are available for the resources. The IBM® Tivoli® Monitoring distributed OS agents provide templates to register ComputerSystems and IPAddress resources. See the user guide for each of your agents to determine if they also provide an OSLC template.

Install and configure the Tivoli® Monitoring Automation Server if your monitoring environment has agents that provide an OSLC template and you want to integrate IBM® Tivoli® Monitoring with other products using Registry Services and OSLC linked data interfaces. See the *IBM® Tivoli® Monitoring Administrator's Guide* to find more information on the Performance Monitoring service provider and getting started with OSLC integration. The automation server can be installed on Windows™, Linux™, AIX® and Solaris systems.

Registry Services can be installed on Windows™, Linux™, and AIX® systems.

## IBM® Dashboard Application Services Hub, dashboard applications, Tivoli® Authorization Policy Server, and IBM Cognos®

The Dashboard Application Services Hub is a Jazz™ for Service Management component. The Hub is an optional component for your environment that provides a web-based console component for common task navigation for products, aggregation of data from multiple products into a single view, and message passing between views from different products.

The IBM® Tivoli® Monitoring dashboard data provider retrieves monitoring agent data for display in the Dashboard Application Services Hub. The dashboard data provider is optionally enabled during the Tivoli® Enterprise Portal Server configuration. With the dashboard data provider enabled, Dashboard Application Services Hub users can retrieve read-only data from the hub monitoring server and monitoring agent for display in monitoring dashboards such as the IBM® Infrastructure Management Dashboards for Servers or in custom dashboards. The IBM® Tivoli® Monitoring Authorization Policy Server can also be installed into the Dashboard Application Services Hub. The Authorization Policy Server allows you to define roles and permissions, which control the access that dashboard users have to managed systems and managed system groups displayed in monitoring dashboards of the IBM® Dashboard Application Services Hub. The `tivcmd` command line interface for Authorization Policy is used to connect to the Authorization Policy Server and create and work with the policies.

Dashboard Application Services Hub can also be used in conjunction with the IBM Cognos® component of Jazz™ for Service Management to gather, analyze, and report important trends in your managed environment using historical data from the Tivoli® Data Warehouse.

Install and configure IBM® Dashboard Application Services Hub if you will be using monitoring dashboards in your environment. Check the user guides for the monitoring agents in your environment to determine if they provide a monitoring dashboard application. You can also use Dashboard Application Services Hub to create custom dashboard pages showing data from any monitoring agents in your environment. IBM® Dashboard Application Services Hub is supported on 64-bit Windows™, Linux™, and AIX® systems.

## Tivoli Enterprise Monitoring Server REST services

Tivoli Enterprise Monitoring Server (TEMS) REST services provide access to OMEGAMON data using HTTP REST calls.

Tivoli Enterprise Monitoring Server (TEMS) REST services provide access to OMEGAMON data using HTTP REST calls. Using the TEMS REST services, you can retrieve real-time and historical data collected by the monitoring agents, the configurations used for collecting the historical data, select managed system information, and information about situations. You can also perform activities such as starting, stopping, creating, editing, and deleting situations; executing or deleting a Take Action; and deleting a history collection configuration.

Using TEMS REST services, you can integrate OMEGAMON data into your custom applications, including dashboards and automation, or third-party analytical tools (such as Splunk, Elastic, and Grafana).

TEMS REST services are implemented with the OpenAPI Specification 3.0.3.

For more information, see [“Tivoli Enterprise Monitoring Server REST services” on page 1080](#).

## IBM Z® OMEGAMON® AI Insights

IBM Z OMEGAMON AI Insights is designed to detect and visualize performance anomalies within z/OS components and applications. It uses advanced machine learning algorithms embedded in its code to analyze data.

You can analyze data that is collected from any of the following OMEGAMON monitoring agents:

- IBM Z OMEGAMON AI for CICS 6.1
- IBM Z OMEGAMON AI for Db2 6.1
- IBM Z OMEGAMON AI for JVM, 6.1
- IBM Z OMEGAMON AI for Networks 6.1
- IBM Z OMEGAMON AI for Storage 6.1
- IBM Z OMEGAMON AI for z/OS 6.1

These agents monitor the behavior of applications and components by tracking various performance metrics. In the process, they collect enormous amounts of data that are passed to OMEGAMON AI Insights. With this data, OMEGAMON AI Insights can arrive at models that predict the seasonality of various key performance indicators across different types of workloads.

For more information, see [IBM Z OMEGAMON AI Insights](#).

**Note:** Starting with Tivoli® Management Services on z/OS® 6.3.3, IBM Z OMEGAMON AI Insights is included as a component. With IBM Z OMEGAMON AI Insights 2.1, the application is now containerized and deployed as a Docker container.

## IBM Z® OMEGAMON® Web UI

IBM Z OMEGAMON Web UI is a browser-based graphical user interface for monitoring and managing z/OS systems using data from OMEGAMON monitoring agents. IBM Z OMEGAMON Web UI requires IBM Z OMEGAMON Data Requester, a Grafana® application plug-in.

IBM Z OMEGAMON Web UI uses Grafana dashboards to provide visualization and analysis of performance data gathered by OMEGAMON monitoring agents. IBM Z OMEGAMON Web UI provides the following key capabilities:

- Web-based monitoring: Provides access to OMEGAMON performance data from any supported web browser.
- Situations management: Allows you to create, view, and manage alert conditions to identify and respond to critical issues.
- Role-based access control: Allows you to secure dashboards and situations through role-specific permissions.
- Customizable dashboards: Allows you to design and share personalized views tailored to specific monitoring needs.
- Integrated architecture: Enables communication between the Tivoli Enterprise Monitoring Server and Grafana using the OMEGAMON Gateway.
- Administrative user interface: Simplifies configuration and automation of monitored environments.
- OMEGAMON Data Requester: Retrieves and filters real-time and historical data.
- Dashboards: Provide real-time and historical visualization of performance metrics of all OMEGAMON monitoring agents.

For more information, including system requirements and installation steps, see [IBM Z OMEGAMON Web UI](#).

**Note:** Starting with Tivoli® Management Services on z/OS® 6.4, IBM Z OMEGAMON Web UI and Grafana are included as components.

## OMEGAMON shared components

OMEGAMON® monitoring agents on z/OS® share several common components, which are included on the product tape. If you install into an existing environment, with the components at the required level, you might have to delete the FMIDs for these components from the SMP/E installation jobs to avoid errors because the components are already installed. See the *Program Directory* for each product for more information.

“[Common components of OMEGAMON® monitoring agents on z/OS®](#)” on page 60) lists the common z/OS® components.

<i>Table 9: Common components of OMEGAMON® monitoring agents on z/OS®</i>	
<b>Component</b>	<b>Description</b>
OMNIMON Base	<p>A set of common code used by several OMEGAMON® components and the OMEGAMON® enhanced 3270 user interface to control initialization, security, and I/O for all sessions. OMNIMON Base has two components:</p> <ul style="list-style-type: none"> <li>• <b>OMEGAMON® Subsystem</b> The OMEGAMON® Subsystem is a z/OS® subsystem that runs in its own address space. The subsystem enables OMEGAMON® components running in other address spaces to monitor dynamic device activity. A single OMEGAMON® Subsystem can support multiple OMEGAMON® products on a single z/OS® image. Some OMEGAMON® monitoring products, such as OMEGAMON® for Networks, do not use the OMEGAMON® Subsystem.</li> <li>• <b>OMEGAMON® enhanced 3270 user interface</b> An enhanced 3270-based user interface that collects and displays data from the Tivoli Enterprise Monitoring Server and OMEGAMON® monitoring agents on z/OS®. One instance of the interface must be installed in each Sysplex for use by all supporting agents.</li> </ul>
Shared probes	Data probes shared by several OMEGAMON® products.
End-to-End Response Time collector	Provides response time data for several OMEGAMON® products.

## Interoperability and integration with other products

The OMEGAMON® family of monitoring agents are designed to integrate with each other and with other products that use Tivoli Management Services. These products exploit the power of the Tivoli Enterprise Portal to integrate and correlate performance and availability information from a variety of sources.

For example, you can create context-sensitive links between product workspaces to obtain additional information about systems, subsystems, resources, or network components that are being monitored by other monitoring agents. You can also create links from Tivoli Enterprise Portal workspaces to TN3270-based applications. Additionally, if you have purchased IBM® OMEGAMON® Dashboard Edition on z/OS®, you can create custom Tivoli Enterprise Portal workspaces composed of data from a range of Tivoli® monitoring solutions (IBM® Tivoli® Monitoring, IBM® Tivoli® Composite Application Management, IBM Z® NetView, and OMEGAMON® products). You can use OMEGAMON® Dashboard to display metrics from operating systems, middleware, databases, storage, web application servers, and network sources for integrated performance views on a single screen.

After you install OMEGAMON Dashboard Edition, you can set up Tivoli Enterprise Portal workspaces that display data collected by more than one OMEGAMON product or that integrate OMEGAMON data with data from other products that use the Tivoli Enterprise Portal. You can create a consolidated situation for a combination of products. You can also use OMEGAMON Dashboard Edition on z/OS to set up advanced automation policies for notification and resolution of complex problems. For further information about the components and capabilities of OMEGAMON Dashboard Edition on z/OS, see [IBM OMEGAMON Dashboard Edition on z/OS](#).

Additionally, OMEGAMON® products are being integrated with an increasing number of other IBM® products. You can generate reports using IBM Cognos®, which gathers data collected by OMEGAMON® products and presents results in a format allowing the analysis of trends and key metrics in a consistent and integrated manner. Situation events reported by OMEGAMON® monitoring agents can be forwarded to Tivoli® Netcool/OMNIBus™ for event correlation and management. From the Tivoli Enterprise Portal, you can launch into other web-based or web-enabled Tivoli® applications without having to re-enter user credentials, and you can launch in context into the Tivoli Enterprise Portal from other applications, as well.

For more information on product integration, see the user's guides for your products.

---

# Getting started

Getting an overview of the entire process, gathering certain information, and accomplishing certain tasks even before you acquire and install your software can make your deployment go much more quickly and smoothly.

## Quick Start Guide

---

This guide describes the process for installing an OMEGAMON monitoring agent on z/OS.

### OMEGAMON product overview

The IBM® OMEGAMON® monitoring agents on z/OS® are a suite of products that you can run with the commonly shared components of Tivoli® Management Services.

These agents monitor and manage system and network applications to track the availability and performance of systems and resources in your enterprise. You can access the data collected by the agents using the following user interfaces:

- The OMEGAMON enhanced 3270 user interface provides predefined workspaces that you can use to monitor the performance of the z/OS systems, applications, and devices in your environment.
- IBM Z OMEGAMON Web UI uses Grafana dashboards to provide visualization and analysis of performance data gathered by OMEGAMON monitoring agents.
- The Tivoli Enterprise Portal user interface offers expert advice on alerts and corrective actions from one or more designated workstations.

This document describes the procedure for installing a monitoring agent on z/OS® for the following releases:

- IBM Z OMEGAMON AI for CICS 6.1
- IBM Z OMEGAMON AI for Db2 6.1
- IBM OMEGAMON for IMS on z/OS 5.5
- IBM Z OMEGAMON AI for Networks 6.1
- IBM OMEGAMON for Messaging on z/OS 7.5
- IBM Z OMEGAMON AI for Storage 6.1
- IBM Z OMEGAMON AI for z/OS 6.1
- IBM Z OMEGAMON AI for JVM 6.1

You can also install the following OMEGAMON component releases:

- IBM Z OMEGAMON AI Insights 2.2
- IBM Z OMEGAMON Web UI 2.1
- IBM Z OMEGAMON Data Provider 1.1

If you are upgrading a monitoring agent and Tivoli® Management Services, see [Upgrading](#) in the OMEGAMON® shared documentation. If you have not done so already, gather the information described in the [Pre-installation requirements and checklist](#).

Product documentation is available in [IBM Documentation](#). Always refer to the version of the documentation that is consistent with the version of the software that you have installed.

### Step 1: Access the software and documentation

Use this information to access the software and documentation necessary to install OMEGAMON agents.

An OMEGAMON® monitoring agent on z/OS® product package includes the following items:

- z/OS® FMIDs (function modification identifiers) either on tape or in electronic format. Product tapes are in Custom-Built Product Delivery Offering (CBPDO) or ServerPac format and contain product-specific FMIDs
- Physical CDs or DVDs, or electronic CD or DVD images that are required for some core product functions

For each monitoring agent, you receive the following product resources:

- Product-specific license information and the IBM® International Program License Agreement (IPLA)
- Tivoli® Management Services on z/OS® (5698-A79) FMIDs, which are a prerequisite and packaged separately from the agent

**Note:** Tivoli Management Services on z/OS 6.3.0 Fix Pack 6 (or later) is a prerequisite for the OMEGAMON products listed in [“OMEGAMON product overview” on page 61](#). The latest available version of Tivoli® Management Services on z/OS® is 6.4.0, which includes updates and maintenance that you might want or are required for the latest features. Tivoli Management Services on z/OS 6.3.0, 6.3.1, and 6.3.2 have been withdrawn from marketing by IBM.

- Application and language support, which includes the predefined workspaces and situations, online help, expert advice, and other OMEGAMON® data, for the z/OS agents. Application support information, including the latest media levels, is available at [Locating IBM Z Monitoring Suite Application Support Files](#).

**Note:** For earlier OMEGAMON product releases, see [Locating ITM Workspace Application Support Files for z/OS Agents](#).

Program Directories provide information about installing each component. All z/OS® product Program Directories are available as PDF files and can be viewed, downloaded, and printed from [Program Directories](#). Program Directories are also provided in the fulfillment offerings such as CBPDO, ServerPac, and SystemPac®. You can also find links to Program Directories in the documentation for each product.

Each monitoring agent includes the latest level of all product materials. Review the packing list that comes with the product. If you are missing materials or need additional materials, contact IBM® Support.

Distributed fixes and updates for monitoring agents can be found on [Fix Central](#). A registered IBMid is required to download fixes from this site and to enable IBM® to inform you of related updates.

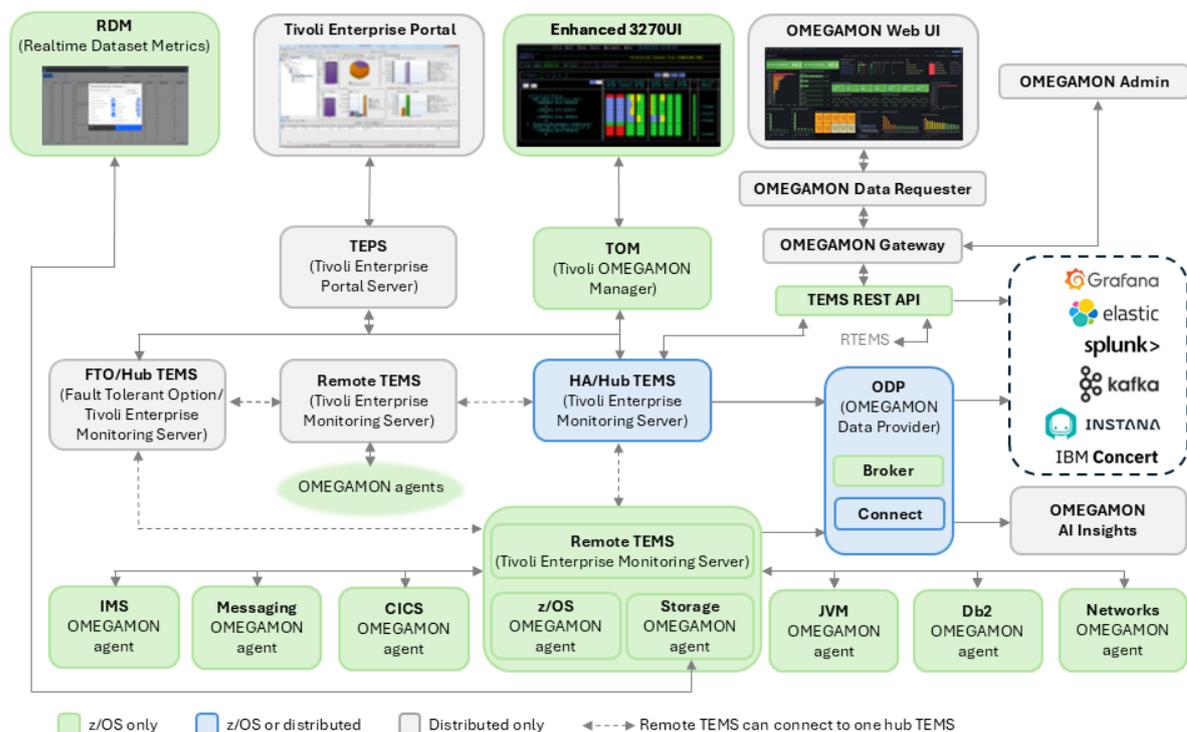

z/OS® fixes are available through [IBM Shopz](#).

Product documentation is available in [IBM Documentation](#). Always refer to the version of the documentation that is consistent with the version of the software that you have installed.

## Step 2: Review the product components and installation steps

Use this information to understand the basic OMEGAMON components and topology.

The following diagram illustrates the basic topology that results from the installation steps you perform.

The installation process follows this order:

1. Plan the locations of the hub and remote Tivoli® Enterprise Monitoring Servers, Tivoli® Enterprise Portal Server (if applicable), and the OMEGAMON® enhanced 3270 user interface, and decide which agents to install.
2. Install and configure the z/OS® components.
3. Install and configure the distributed IBM® Tivoli® Monitoring components: the hub Tivoli® Enterprise Monitoring Server (if not on z/OS®), Tivoli® Enterprise Portal Server, and Tivoli® Enterprise Portal client.
4. For any agent that does not have the self-describing capability enabled, install the application support files that enable the storage and display of data collected by OMEGAMON® monitoring agents on z/OS®.

**Information sources:**

- For a list of supported operating systems and to install distributed components, see the [IBM Tivoli Monitoring Installation and Setup Guide](#).
- For shared components and all monitoring agents on z/OS®, see the [Overview](#) topics of the *OMEGAMON® shared documentation*.
- For the Configuration Manager configuration method, see the following additional sources:
  - *OMEGAMON® shared documentation: Configuration Manager* topics for configuring an OMEGAMON runtime environment from a set of parameters that you specify.
  - *OMEGAMON® shared documentation: Planning and Configuring* topics for general planning and configuration flow.
  - *OMEGAMON® shared documentation: Parameters* for definitions of parameters.
  - Agent-specific parameter reference guides for parameters used by a single agent.
- For OMEGAMON Web UI, see [IBM Z OMEGAMON Web UI](#).
- For OMEGAMON AI Insights, see [IBM Z OMEGAMON AI Insights](#).
- For OMEGAMON Data Provider (ODP), see [IBM Z OMEGAMON Data Provider](#).

## Step 3: Perform the SMP/E installation of the components that run on z/OS

SMP/E is used to install and maintain OMEGAMON software on z/OS® systems.

For information about supported levels of the SMP/E program and other related SMP/E installation requirements, see the product-specific program directories. See Step 1 for information about locating your program directory.

The product media (physical or electronic) includes all the z/OS® components. If you have an earlier version of any of these components installed in the same SMP/E CSI (consolidated software inventory), those components will be automatically replaced by the new version and release provided on the tape. If the CSI already has the same version or a higher-level version of the components, the new version is not installed. The following features and components are part of the monitoring agent package:

- z/OS® Configuration Tool (Configuration Manager)\*
- Tivoli® Enterprise Monitoring Server on z/OS\*
- Tivoli® Management Services: Engine (TMS:Engine)\*
- OMNIMON base, including the OMEGAMON® subsystem and OMEGAMON® enhanced 3270 user interface
- Shared probes (Storage and z/OS® agents only)
- Reporter and Buffer Pool Analyzer (IBM Z® OMEGAMON® AI for Db2)
- The monitoring agents on z/OS®

\* Part of the no-charge IBM® Tivoli® Management Services on z/OS® (5698-A79) mandatory prerequisite.

Perform the SMP/E installation of the monitoring agent before starting the configuration procedures. If recommended maintenance is available, obtain and apply the maintenance.

### Information sources:

See the *IBM® Tivoli® Management Services on z/OS®: Program Directory* and program directories for your monitoring agents on z/OS®.

## Step 4: Configure components and products on z/OS

If you have chosen to run your hub monitoring server on z/OS®, use Configuration Manager to set up your monitoring server.

As you create your hub monitoring server on z/OS®, you also create the required runtime environments and the persistent data store.

If you have chosen to run your hub monitoring server on a distributed system, use Configuration Manager to set up other components on z/OS such as the monitoring agents. You must confirm the IP hostname of the distributed system where the hub monitoring server will be deployed on so that you can specify the value for the **CT\_CMSLIST** parameters (for example the **Kpp\_TEMS\_TCP\_HOST** parameters) of z/OS agents. This parameter establishes connections via enabled protocol between the z/OS agents and their primary TEMS and backup TEMS (if enabled) to report data to.

Initially, you might configure a new runtime environment to be stand-alone, with its own hub monitoring server. Later, you can integrate that runtime environment with the rest of your monitoring topology by converting its hub monitoring server to a remote monitoring server that communicates with a central hub.

As part of the same configuration process, Configuration Manager performs the configuration required for infrastructure components and each monitoring agent on z/OS®.

### Information sources:

- *OMEGAMON® shared documentation: [Configuring products and components on z/OS](#)* for instructions on configuring OMEGAMON products and their common framework components on z/OS.
- *IBM Z Monitoring Configuration Manager: [Creating your first, minimal runtime environment](#)* for the instructions on setting up a simple POC environment.
- *IBM Z Monitoring Configuration Manager: [Creating or updating a runtime environment](#)* for the configuration scenario that matches your requirements.

- *IBM Z Monitoring Configuration Manager: [Converting a hub monitoring server to a remote monitoring server](#)* for instructions on converting a hub monitoring server to a remote monitoring server that communicates with a central hub.

## Step 5: Complete the setup of the z/OS environment

To make the OMEGAMON® monitoring agents on z/OS® and the monitoring server on z/OS® fully operational, you must perform some z/OS® environment setup tasks on each system where any monitoring agent will be running.

You must also complete some product-specific post Configuration Manager steps. These steps must be completed before you start the components.

### Information sources:

- *OMEGAMON® shared documentation: [Completing the configuration outside the configuration software](#)* for additional steps outside the configuration software to complete the configuration of your runtime environment.
- *OMEGAMON® shared documentation: [Complete the configuration of a Tivoli Enterprise Monitoring Server](#)* to configure the z/OS® monitoring server.
- *OMEGAMON® shared documentation: [Complete the configuration for OMEGAMON monitoring agents](#)* for product-specific configuration steps.

## Step 6: Install the distributed components

You must install the distributed components when your hub monitoring server is on a distributed system or when you do not have self-describing agent capability configured.

You need to complete this step under one of the following circumstances:

- Your hub monitoring server is on a distributed system.
- You do not have the self-describing agent (SDA) capability configured regardless of the platform where the hub monitoring server, remote monitoring server, or monitoring agents will be deployed. Review the upgrade documentation to determine whether the level of product you are installing supports the self-describing agent capability. To active the SDA capability on a monitoring suite level, use `tacmd editSdaInstallOptions` or `SPUFIL`.

Add application support (predefined workspaces and situations, online help, expert advice, and OMEGAMON® data for Tivoli® Monitoring) from the appropriate application support media described in Step 2.

If you are installing IBM Z® OMEGAMON® AI for Db2, you can also install product-specific distributed components, such as IBM Z® OMEGAMON® AI for Db2 Agent for Db2 Connect Monitoring.

### Information sources:

- To perform administrative tasks for the distributed components of IBM® Tivoli® Monitoring, see [IBM Tivoli Monitoring Administrator's Guide](#).
- To install and configure the distributed components of IBM Z® OMEGAMON® AI for Db2, see [Installing IBM Z OMEGAMON AI for Db2 Agent for Db2 Connect Monitoring](#).

## Step 7: Set up user security

Use this information to set up user security for Tivoli Enterprise Portal users.

Completing security setup is not mandatory until after step 8. If your hub monitoring server is running on z/OS®, then you need to configure the Resource Access Control Facility (RACF®) or your system authorization facility (SAF) product to authenticate your Tivoli® Enterprise Portal users. Additional RACF® authorization might be described in your product-specific configuration guide.

### Information sources:

- For information on setting up Tivoli® Enterprise Portal user accounts and enabling authentication, see [IBM Tivoli Monitoring Administrator's Guide](#).
- For information about enabling authentication on a z/OS® hub, see [Configure a Tivoli Enterprise Monitoring Server](#).

## Step 8: Start all components and test your installation

Use this information to test your installation.

After completing the previous steps, you will have installed and configured all required components. Use the following steps to start and test your installation for each environment:

1. Start the OMEGAMON® Subsystem.
2. Start the Tivoli® Enterprise Monitoring Server. Check the job log for any errors. (If the hub monitoring server is not configured in this environment, start the hub before you start the local monitoring server.)
3. For agents configured to run in their own address space, start the started task for each monitoring agent on z/OS®. Check the log for errors. If you are using the classic component, start the classic collector before you start the OMEGAMON® monitoring agent.
4. Start the OMEGAMON® enhanced 3270 user interface started task (default OMEGTOM). Check the job logs for errors.
5. Start the Tivoli® Enterprise Portal Server and Tivoli® Enterprise Portal (required if the self-describing agent feature is not enabled).
6. Verify that the monitoring agent is collecting data.

**Information source:** The product-specific configuration documentation or the [Configuring products and components on z/OS](#) topics in the *OMEGAMON® shared documentation*.

## Step 9: Configure historical data collection

Historical data collection is an optional feature that is enabled through the Tivoli® Enterprise Portal or the OMEGAMON® enhanced 3270 user interface.

The tasks required to enable historical reporting can be performed at any time after you have verified your installation. If you enable historical data collection, monitoring agents are instructed to take data samples at a specified interval and store it. The collected data can be displayed in workspaces in the user interfaces, warehoused for in-depth analysis and long-term data reporting, used as a data source for OMEGAMON Data Provider, and exported to third-party tools for reporting and analysis.

OMEGAMON Web UI supports historical visualizations through Tivoli Enterprise Monitoring Server REST services (TEMS REST API). To view historical data in the starter dashboards, you must enable historical data collection using either the Tivoli Enterprise Portal or the enhanced 3270UI. For a complete list of available dashboards for OMEGAMON agents and the corresponding attribute groups that require history collection, refer to the [OMEGAMON Web UI](#) documentation.

### Notes:

- Not all historical data that is displayed in the Tivoli® Enterprise Portal can be displayed in the enhanced 3270UI, and not all the near-term history displayed in the enhanced 3270UI can be displayed in the Tivoli® Enterprise Portal.
- The enhanced 3270UI cannot display data from the Tivoli® Data Warehouse, and you cannot configure the Warehouse Proxy agent or the Summarization and Pruning agent from the enhanced 3270UI.
- Using the Tivoli® Data Warehouse is optional for the IBM Z® OMEGAMON® AI for Db2 monitoring agent. The agent offers other long-term storage options.
- The z/OS® persistent data store data sets, where some of the historical data is stored on z/OS®, should have been configured earlier during Step 4.

### Information sources:

- *OMEGAMON® shared documentation*: [Persistent data store V2 \(PDS V2\)](#) to configure the persistent data store for your monitoring agent.

- [IBM Tivoli Monitoring Installation and Setup Guide](#) to install and configure the Tivoli® Data Warehouse, set up the Warehouse Proxy agent and configure the Summarization and Pruning agent, and configure and enable data collection.
- [OMEGAMON Web UI](#)

## More information

Tivoli® Management Services on z/OS® and the OMEGAMON® products are available in a ServerPac offering that lets you install them without the need to install the z/OS® operating system.

- For application support file information, see [Locating IBM Z Monitoring Suite Application Support Files](#).

**Note:** For earlier OMEGAMON product releases, see [Locating ITM Workspace Application Support Files for z/OS Agents](#).

- For IBM® Support, see [Let's troubleshoot](#).
- If you have problems ordering products or services or understanding how to use a Shop zSeries® Electronic Download page, see [Ordering Products and Maintenance through Shop zSeries](#).

## Prerequisites and packaging

The topics in this section help you prepare to install and configure the OMEGAMON® products and the components of Tivoli Management Services on z/OS® systems.

- [“Software and hardware prerequisites” on page 67](#) directs you to the documentation of requirements that must be completed before you begin installing and configuring the products and components.
- [“Installation packages” on page 67](#) describes the contents of the packages for the Tivoli Management Services and OMEGAMON® products.

## Pre-installation requirements and checklist

See technote [Preinstallation Requirements and Instructions](https://www.ibm.com/support/docview.wss?uid=swg21318692) (<https://www.ibm.com/support/docview.wss?uid=swg21318692>).

## Software and hardware prerequisites

Before you begin installation and configuration, be sure you have identified and addressed any required any software and hardware prerequisites.

The *Program Directory* for each OMEGAMON® product contains a complete list of the software and hardware prerequisites for that product. The [Program Directory for IBM Tivoli Management Services on z/OS 6.4.0](#) provides instructions for the SMP/E installation of these components and information about their z/OS® hardware and software prerequisites. The hardware and software prerequisites for the distributed components of Tivoli Management Services can be found in [IBM Tivoli Monitoring: Installation and Setup Guide](#).

To make sure that you have the latest version of all components, check for any fix packs that might be available.

## Installation packages

If you are installing OMEGAMON products and Tivoli Management Services components for the first time, you will find familiar IBM® fulfillment methods (such as Shopz), installation tools (such as SMP/E or InstallShield), and installation documentation, including a program directory. You should be aware of the contents of your installation packages.

Product tapes (or their electronic representation) are in the standard IBM® refile format that IBM® software manufacturing uses to create the tape images for installation systems such as ServerPac and CBPDO. If you

receive your product through CBPDO, maintenance is included on the media for you to install. If you receive your product as part of a ServerPac or SystemPac®, maintenance is preinstalled.

You can order a ServerPac that includes your mainframe Tivoli products with or without the z/OS® operating system. For a list of the Tivoli products you can include in a ServerPac, see the [Shopz product catalog](#).

**Important:** The shared components of the IBM Tivoli Management Services on z/OS product are not automatically included in the product package for a monitoring agent on z/OS® systems. Be sure to include IBM Tivoli Management Services on z/OS in your order. If you have not ordered any monitoring agents on a z/OS® system but you want to install a monitoring server on a z/OS® system, you can order IBM Tivoli Management Services on z/OS by itself. The IBM Tivoli Management Services on z/OS product includes both mainframe and distributed components of Tivoli Management Services (IBM Tivoli Monitoring).

Contents of a product package for Tivoli Management Services on z/OS.

	<p>The distributed package includes DVDs and CDs:</p> <ul style="list-style-type: none"> <li>• IBM Tivoli Monitoring DVDs include subdirectories and installation procedures for components and tools on supported Windows™, UNIX™, and Linux™ operating systems.</li> <li>• IBM® Db2 Universal Database™ CDs provide database functions to the components on supported Windows™, UNIX™, and Linux™ operating systems.</li> <li>• Language packs provide online help and presentation files in the supported national languages: <ul style="list-style-type: none"> <li>◦ <i>IBM Tivoli Monitoring Language Packs</i> DVD or CDs</li> <li>◦ <i>Db2® National Language Pack</i> CDs</li> </ul> </li> </ul>	

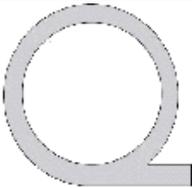

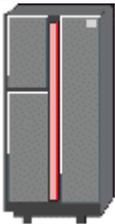

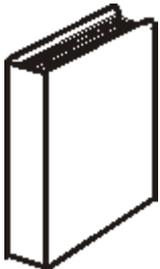

“Product packaging, Tivoli Management Services on z/OS” on page 68 shows the contents of a product package for Tivoli Management Services on z/OS.

IBM Tivoli Monitoring publications are not included as part of the product package. You can find the latest publications in [IBM Documentation](#).

An OMEGAMON® monitoring agent on z/OS® product package includes the following items:

- z/OS® FMIDs either on tape or in electronic format.  
Product tapes are in CBPDO or ServerPac format and contain product-specific FMIDs.
- Physical CDs or DVDs or electronic CD or DVD images that are required for some core product functions.
- Publications on CD or DVD as well as in hardcopy or electronic form.

“Product packaging, OMEGAMON® monitoring agents” on page 69 summarizes the contents of the packages. Contents of a product package for an OMEGAMON Monitoring Agent.

Application support (which contains the predefined workspaces and situations, online help, expert advice, and OMEGAMON® data for the Tivoli® Enterprise Portal) is supplied on multiple DVDs or CDs. For a complete list, see the *IBM® OMEGAMON Monitoring Agents on z/OS Quick Start Guide*. Application support information, including the latest media levels available, can be found online in technote *Locating ITM Workspace Application Support Files for z/OS Agents* (<https://www.ibm.com/support/pages/node/1077603>).

---

## Deployment guides

IBM Tivoli Management Services on z/OS is a complex monitoring system that consists of many components and features. For one who is new to the system, it could be hard to figure out the proper flow to install and configure various components. To help TMS beginners build a better understanding of how the monitoring infrastructure is set up, this section provides several deployment guides that describe different deployment scenarios. These guides are mostly for Proof of Concept purpose, and therefore not all features are introduced. You can follow the scenarios introduced in these guides to learn the deployment process at first, and then exploit additional features based on your needs.

You can find the following guides:

	Hub TEMS	Remote TEMS	TEPS	TEP
First time deployment guide	z/OS	z/OS	N/A	N/A
Cross-platform quick deployment guide	Linux	z/OS	Linux	Linux
Extension guide	Linux	z/OS	Linux	Linux

**Note:** Both First time deployment guide and Cross-platform quick deployment guide help you set up a simple environment with basic monitoring features. The main difference is the location of the Hub TEMS and other components on distributed system. Therefore, if you are setting up an environment across platforms, be sure to take Cross-platform quick deployment guide for reference.

---

## First time deployment guide

The purpose of this guide is to provide step-by-step instructions for a person who is either new to the monitoring system on z/OS® or new to the configuration tool, PARMGEN, which is used to get monitoring running properly at your site.

### About this task

You should use this guide if any of the following items describes you:

- You are installing IBM®'s OMEGAMON monitoring solutions at your site for the first time.
- You are using the PARMGEN configuration tool for the first time.
- You are performing a quick on-premise proof of concept deployment.

If none of these items describes you, then you are an experienced user of the monitoring products and the PARMGEN tool and you are welcome to go directly to the documented configuration scenarios after you've installed the products using SMP/E.

If you are a *first-time user* (FTU), according to any of these criteria, you've found the perfect place to start. As a new user, you cannot be expected to know enough detail about the monitoring components at this point to make the best decisions for your site. Our intent is to lead you through the implementation of the monitoring system without bogging you down in too much documentation. We will tell you what you need to know to get started and accomplish some tasks.

As you follow the configuration steps designed for the first-time user, you will begin to learn about the components that comprise the monitoring system and you will be more confident in the decisions you are making for your enterprise. Rather than overload you with options and advanced features, the FTU approach is to divide the entire scope of configuration into smaller tasks. After completing each task, you will be able to start and use the monitoring products that have been configured. You will see the system working after each configuration task is completed.

The goal of this guide is to keep the reading minimal while building your understanding. Just follow our step-by-step instructions and click on the links which will take you to the exact instructions you need to follow. When you have finished with the activity in each link, return to this document for the next task.

## FTU installation and configuration tasks

The first time user (FTU) configuration tasks are designed to get the monitoring system into real production use as quickly as possible. Some of the FTU tasks along the road to a full production implementation may not seem to be exactly what you think your site needs. But by the time that you finish all of the FTU tasks, you will have modified the initial configuration into the perfect advanced configuration for your site. What is more, you will see the monitoring system running as soon as the fourth task is completed. Just follow the tasks in the order they are presented.

### About this task

By getting monitoring running quickly, you will be able to verify that it is still running after every subsequent task. That way, any problems you encounter can be assumed to be related to the changes that you just completed, which makes it easier to fix any issues that might arise before you make further changes.

Sometimes this staged configuration methodology is referred to as *Crawl-Walk-Run* and that fits in this case. By teaching you what you need to know along the way, you get *crawling* with the monitoring system nearly immediately, and before you know it, you are *walking* along and then *running* with advanced concepts like a true expert. FTU Tasks 1 – 5 complete the *crawl* phase; FTU Tasks 6 – 8 complete the *walk* phase; and you begin to *run* with FTU Task 9.

You can skip the optional tasks if they do not apply to your site, but you must complete the tasks you do perform in the order they are presented. If you are not sure if you need the optional steps, just read the brief description at the beginning of each task.

The FTU process is not just about seeing value quickly although it accomplishes that. It is also about getting your monitoring system fully operational and in production.

Let's get started with some basic concepts and terminology.

### FTU Task 1: Understand the minimum background information needed to get started

There are some terms and topics that you need to understand in order to begin the installation and configuration of the monitoring system. Other terms and concepts will be introduced in the tasks that use them.

#### Monitoring servers

The monitoring system employs a client/server method where various agents collect data on the items you want monitored and they send that data to a central server where the client user interfaces have access to it. The server also takes data from the user interfaces and passes it back to the appropriate agent to effect changes that the user may want.

A single *hub* monitoring server can have up to 20,000 agents reporting to it and many instances of user interfaces connected to it. The agents that report to the hub can reside on z/OS®, Linux™ on Z or distributed systems, Windows™, or UNIX™, which gives you a picture of your entire enterprise, not just z/OS®. Note that when many agents are reporting directly to a single hub, configuring the remote Tivoli® Enterprise Monitoring Server is important for maintaining the performance and availability of your monitoring system.

To avoid those issues, there are also *remote* servers. These servers can be distributed throughout the enterprise and offload work from the hub by having many of the possible 20,000 agents report to the remote servers rather than to the hub. The remote servers then interact with the hub on behalf of the agents that report to the remote. If the hub goes down, the remote servers will continue to collect data from the agents and pass it along to the hub when it comes back on line. The same is generally true for the agents themselves should the server they interact with not be available.

There is only one hub in a monitoring enterprise. If your site has more than 20,000 endpoints to be monitored, then you have set up more than one hub. As a separate system, each hub would have its own distinct group of monitoring agents, remote servers, client user interfaces, and historical data collection.

On z/OS®, there are a couple of monitoring agents that must run inside the address space of the server. In those cases, there must be a server (usually a remote server) configured and running along with the agent. Note that the type of the server is controlled by a mode switch. In other words, the code and programs are the same and whether a server is a hub or remote is controlled by parameters settings.

For z/OS®, all of the remote servers would be configured to run on z/OS®. The hub, however, can run on other systems besides z/OS®, such as Linux™ on Z or distributed systems, Windows™, or UNIX™. The FTU tasks in this guide have you set up a hub server on z/OS® to start with, then you will have an opportunity to change that to another permanent location.

The hub server is clearly a key component in the monitoring system, one that you cannot have going down even for routine maintenance. If the hub is on z/OS®, it can be configured as a high-availability hub (HA hub) using DVIPA (Dynamic Virtual IP Addressing). On the other operating systems, a *hot standby* hub can be configured that mirrors the hub and then takes over when needed.

Monitoring agents must store certain credentials and artifacts on all the servers (hub and remote) so that the servers know how to interact with them. For distributing these agent files and maintaining their currency, use the self-describing agent (SDA). The SDA feature is employed by the FTU configuration tasks, and described in a following section.

For a picture of how the basic components of the monitoring system work together, see [Tivoli Management Services components](#).

## User interfaces

There are several user interfaces available to you. The two user interfaces that this guide will talk about are the OMEGAMON® Enhanced 3270 user interface (Enhanced 3270UI) and the Tivoli® Enterprise Portal.

The Tivoli® Enterprise Portal is run from a browser. It connects to its own server, the Tivoli® Enterprise Portal Server (the portal server). The portal server runs on Linux™ on Z or distributed systems, Windows™, or UNIX™. The portal server interacts with the hub server to display data for your entire enterprise, including data for both distributed and z/OS-based monitoring agents.

The Enhanced 3270UI provides browser-like interaction on a 3270 emulation terminal. The interface interacts with the hub server and displays data for z/OS-based monitoring agents. It is also referred to as the Tivoli® OMEGAMON® Manager.

There are two other z/OS-based user interfaces. The first is the *classic* or menu system interface, which is the interface provided with the original four OMEGAMONs, those for z/OS®, CICS®, IMS™, and Db2®. The other interface is the CUA interface, which employs a basic graphical user interface from which you can drill down to the meaningful data behind status changes. You can use any or all of these user interfaces at the same time. The FTU tasks focus on using the Enhanced 3270UI because it is useful for z/OS-based monitoring tasks.

## SDA

SDA stands for *self-describing agent*. Self-describing agents include all the application support files required to recognize and process data from those agents. At startup, self-describing agents automatically push application support updates to their local monitoring server. The data is then replicated to the hub monitoring server and all other Tivoli® Management Services components that require it (such as the Enhanced 3270UI, the portal server, and the Tivoli® Data Warehouse).

Self-describing monitoring agents eliminate the need to recycle the monitoring server after application support updates and to ensure that application support files are current. If the SDA feature is not enabled, application support must be installed manually from a DVD and can easily get out of sync with the agent.

By default, the SDA feature is enabled for any monitoring agent that provides self-describing support, but the feature is disabled on monitoring servers. If your enterprise includes self-describing agents, you can enable SDA by changing parameter values for the monitoring servers. You can selectively enable or disable SDA for individual agents or monitoring servers. In addition, SDA provides granular control over the products and versions for which application data is automatically installed.

Activating the SDA feature for OMEGAMON® requires that you specify a z/OS® UNIX® System Services file system to store agent artifacts that are used by the monitoring servers. The FTU model RTE used in Task 4 (@MDLHSS) is set up to use SDA, which means that the `KDS_KMS_SDA` parameter in the RTE configuration profile is set to Y. You can always set up another runtime environment that does not use SDA after you better understand all the components and how they interact.

For more information about SDA feature, see [Self-describing agent feature](#).

## Historical data collection

The Tivoli® Data Warehouse, an optional component of Tivoli® Management Services, is the long-term data store for the performance and analysis data collected by the monitoring agents. The data warehouse is stored on a supported database (such as Db2®, Oracle®, or Microsoft® SQL) by the Warehouse Proxy agent (WPA). The WPA periodically receives data (either indirectly from the hub monitoring server or directly from the monitoring agents) and inserts that data into the Tivoli® Data Warehouse.

On z/OS® systems, the monitoring agents' short-term history data is maintained in data sets allocated and initialized during product configuration. The WPA receives this short-term history data from the monitoring server running on z/OS® and delivers it to the warehouse. Two specialized agents interact with the Tivoli® Data Warehouse:

- The Warehouse Proxy agent receives the short-term history data and delivers it to the Tivoli® Data Warehouse for long-term storage.
- The Summarization and Pruning agent allows you to customize how long to save (prune) and how often to aggregate (summarize) the data in the Tivoli® Data Warehouse database, thereby cutting database size and reducing resource requirements.

The Warehouse Proxy agent and the Summarization and Pruning agent run on Linux™ on Z or distributed systems, Windows™, or UNIX™.

## PARMGEN

Parameter Generator, or PARMGEN, is the name of the configuration tool supplied with OMEGAMON® and related products. IBM® supplies everything you need to get the monitoring products running; however, the supplied template files need to be customized for the specific settings used at your site.

You are probably very familiar with modifying JCL, adding a job card, changing data set names and disk characteristics for any product you have ever tried to use on z/OS®. You might have to change product-supplied parameters as well to suit the way you intend to use the supplied product. PARMGEN provides a framework for accomplishing all of those same updates, as well as mechanism to retain and re-implement the same modifications whenever you clone or update your monitoring system.

Each of the products in the monitoring system deals with a different application. The monitored applications clearly have unique needs and methods, so it stands to reason that the agents that monitor applications also have different needs from one another, including unique parameters that must be tuned for the application. PARMGEN helps to manage all of those things.

There are four elements at the heart of the PARMGEN process.

First, there is the PARMGEN ISPF-based menu, called the PARMGEN workflow interface. This interface guides you through the configuration work required to get the monitoring system running as desired for your site. This tool also verifies that data sets exist and that parameter values are within range.

Second, there are configuration profiles (global and RTE-specific) that contain all of the settings for parameters, switches, and variables that control how the monitoring products work at your site. The PARMGEN tool aids you in setting these values correctly for your site and updates the profile. It still may be necessary for you to review the contents of the profile manually to ensure values and switches are all correct.

Third, there are supplied templates (JCL, data, embeds, and SYSIN) used to run the monitoring programs. These templates use the same variables and strings found in the PARMGEN profile as placeholders in the templates.

Fourth, a program called \$PARSE reads the PARMGEN profile and substitutes the values from the profile into the placeholder positions in all the templates. For example, \$PARSE inserts an instance of your job card into all the supplied JCL and substitutes your desired high-level qualifier and disk-related values so that everything matches your data set naming conventions. \$PARSE also makes updates according to all the product-specific parameter changes you have made and modifies data, embeds, and SYSIN accordingly.

In other words, by the time you see and submit JCL, all of your chosen values will already be in place. You just interact with the PARMGEN ISPF interface and PARMGEN updates the PARMGEN profile, makes various string substitutions, and presents updated JCL for you to submit.

A best practice is to implement user and system variables in the configuration of the monitoring system. This greatly aids in cloning to different systems. The cloned runtime environment will then pick up the values of the new system. Implementing system variables is a step in the FTU configuration process. Just follow the tasks in this guide.

For more on PARMGEN, see [The PARMGEN configuration method](#).

## RTE

A *runtime environment*, or RTE, is a logical grouping of runtime libraries that are referenced by started tasks running on a z/OS® image. This grouping is useful because you will not always want to implement every monitoring product that you installed via SMP/E on every system or LPAR. For example, you may have installed OMEGAMON® for IMS™ on z/OS®, but not every LPAR contains an instance of IMS™ to be monitored. Therefore not every RTE should have a configured version of OMEGAMON® for IMS™.

There are different types of RTEs you can configure that control the way SMP/E libraries are used. The initial FTU configuration uses an RTE type that concatenates the actual SMP/E target libraries in the started tasks. Sharing libraries with SMP/E can have some advantages that are appropriate for a test environment, namely that any changes or maintenance that you install are immediately employed in the RTE.

Because the immediate implementation of maintenance and changes is not typically a best practice for non-test systems, the initial SMP/E-sharing RTE created in the FTU process will be changed later to an RTE type that is more appropriate for production, namely one that maintains a static copy of the target libraries so that it is not affected by changes to the target libraries. A static RTE type gives you control over when and how production libraries are updated.

What types of runtime environments to set up contains all the information you will need to understand the concept of an RTE and the types of RTEs available to you. But please follow the FTU process to begin with and set up an RTE that shares with SMP/E. Again, this will be changed to a static type of RTE later in FTU process.

## Exclude Find (XF)

An Exclude Find is a quick way of displaying only the items you want to see when using the ISPF editor. IBM® supplies an XF macro that first does an **Exclude** all of the data followed by a **Find** on the desired string. This is a convenient tool. XF edit macro contains more information on this ISPF macro that is referenced in our documentation.

## FTU Task 2: Install the monitoring product

The monitoring products and shared framework components like the monitoring server are installed via SMP/E. Skip this step if you already completed the SMP/E installation of the monitoring products and SMP/E applied them.

### About this task

**Note:** Before installing any monitoring product, ensure that all prerequisites have been met as described in Pre-installation requirements and checklist.

There are two ways to make this process simpler:

1. Your monitoring products can be ordered on a ServerPac. The ServerPac contains all the products at the latest RSU level with some SMP/E processing already completed. For these reasons, installing a ServerPac is recommended. See Packaging for more information.
2. If you have already ordered CBPDO format (individual images) rather than a ServerPac, you can use the JOBGEN facility provided with the monitoring products to help with installation. If you use CBPDO, you will have to install the latest maintenance in addition to that. It might be worth your while to order an integrated ServerPac right now.  
For more on JOBGEN, see Job Generator Utility.

Because the monitoring products have shared elements, it is highly recommended that you install all of them together into the same consolidated software inventory (CSI). In the rare case where you prefer to install monitoring products into multiple CSI zones because of how they are structured internally, PARMGEN provides the capability for disparate product support group configuration. For more information, see Decision 1: Why to install into a shared CSI.

After you install the products via SMP/E, they must be configured to operate properly at your site. This configuration begins with the next FTU task.

## FTU Task 3: Prepare the system for configuration

Several system preparation tasks must be completed before the RTE is created and monitoring can be started. In this task, you prepare your system for the RTE you are about to configure.

### About this task

Several of these steps involve authorization changes to the security software that manages z/OS® resources. IBM® supplies instructions for the Resource Access Control Facility (RACF). If your sites uses other software, you will have to complete similar steps for that software.

### Procedure

1. Set up required authorizations and files for SDA.
  - a. Create a user ID with superuser authority (a TSO ID with an OMVS segment defined to it) if you do not already have one.  
The %KDS\_TEMS\_STC% TEMS started task name must have superuser authority. For more information, see *z/OS® UNIX® System Services Planning: Superusers in z/OS UNIX*.
  - b. Create a new file system for products that use the **RTE\_USS\_RTEDIR** home directory parameter: for example, `omvs.omegamon.tstest.hfs`.  
This file system must be created, mounted, and in read/write mode before the z/OS® UNIX® System Services jobs that define the file system paths are submitted. Select a name for your RTE that establishes or fits a naming convention that can be used as you install additional RTEs. The KCIUSSJB sample job in the *gbl\_target\_hilev*.TKANSAM SMP/E target library is run in FTU Task 4.  
In the **MOUNT FILESYSTEM** command, the **MOUNTPOINT()** parameter equates to the value you will specify for the **RTE\_USS\_RTEDIR** parameter. For example:

```
"MOUNT FILESYSTEM('&hlq_rte_home') TYPE(ZFS) MODE(RDWR) MOUNTPOINT('/rtehome')  
  PARM('AGGRGROW')"
```

So an example of this using RTE name TSTEST might be:

```
"MOUNT FILESYSTEM('OMVS.TSTEST.HFS') TYPE(ZFS) MODE(RDWR) MOUNTPOINT('/tstest')  
  PARM('AGGRGROW')"
```

2. Optional: To use the auto-discovery functions of IBM® Discovery Library Adapter for z/OS® (DLA), verify that the user ID has the following RACF authorities, which are required to run the KCIJPDLA job:
  - READ access is recommended for all the data sets in the system PARMLIB concatenation used during IPL.
  - READ access is required to profiles in the MQCMDS class (if active) to allow the z/OS DLA to issue MQ DISPLAY commands via the MQ command interface.
  - If RACF is used to protect DB/2 resources, then authority is required to issue DB/2 DISPLAY commands and to access (READ) SYSIBM resources using dynamic SQL.
  - READ access is recommended to WebSphere configuration files.
  - An OMVS segment with authority to issue the netstat, host and home commands.
3. Authorize the monitoring programs.
  - a. IEFSSNxx must be updated to define and start the OMEGAMON® subsystem.  
Create a subsystem ID entry in your system PARMLIB member IEFSSN.xx. The default subsystem name generated by PARMGEN is CNDL in the **RTE\_KCNSTR00\_SSID** parameter. An example of the default SSN entry to bring up the OMEGAMON® subsystem at IPL would therefore be:

```
SUBSYS SUBNAME(CNDL) INITRTN(KCNDLINT) INITPARAM('SSPROC=IBMCN')
```

Be sure that the subsystem proc has been moved to the appropriate system proclib prior to IPL. If you do not want the subsystem started at IPL, the entry would be:

```
SUBSYS SUBNAME(CNDL) INITRTN(KCNDLINT)
```

3. Authorize the product started tasks:

- i. Update RACF® or equivalent security system for the user ID (with OMVS segment) you will use for these started tasks:
  - Hub and remote monitoring servers (the default started task is named IBMDS)
  - Enhanced 3270 user interface (the default started task is named IBMTOM)
  - Agent address spaces (the default z/OS® classic monitor task is named IBMM2RC)

- ii. Use the RDEFINE command to associate the ID with the following started tasks:

- Monitoring server (default started task name: IBMDS):

```
RDEFINE STARTED IBMDS.* STDATA(USER(userID) GROUP(SYS1))
```

- Enhanced 3270 user interface (default started task name: IBMTOM):

```
RDEFINE STARTED IBMTOM.* STDATA(USER(userID) GROUP(SYS1))
```

- z/OS® agent OMEGAMON® component (default started task name: IBMM2RC):

```
RDEFINE STARTED IBMM2RC.* STDATA(USER(userID) GROUP(SYS1))
```

See the *Security Requirements* section in the attachment of the technote that is listed in [Pre-installation requirements and checklist](#) for a complete list of product started tasks.

- iii. After you issue all the RDEFINE commands, issue the refresh command:

```
SETROPTS RACLIST(STARTED) REFRESH
```

For additional information about these RACF® commands, see the [z/OS® Security Server RACF® Security Administrator's Guide](#).

4. Update IKJTSONn with the names of authorized monitoring programs. You might request your site's authorized system programmers to perform this step so it can be scheduled with the LPAR's change control processes.
  - Add programs KPDDSCO, KEPSTCTO, KOBROUTR, and KOBSPFAU to the system PARMLIB member IKJTSONn under the AUTHPGM section.
  - Refresh the IKJTSONn member by issuing the set command (T IKJTSONn).
5. If you installed OMEGAMON® for z/OS®, add the following modules to the IPL linklist:
  - KCNDLINT
  - KM5EXIT3/KM5CSFSX (if ICSF is used). To provide sufficient storage to allow the monitoring exit to run, modify the ICSF subsystem JCL to increase the REGION limit to REGION=0M.

## FTU Task 4: Configure a monitoring system on z/OS® with a hub monitoring server

In this task, you will configure a simple runtime environment (RTE) with a hub monitoring server, one monitoring agent, and the Enhanced 3270 user interface.

### Before you begin

Ensure that you have fully completed the following tasks:

- FTU Task 1 so that you understand the terminology used in this task and subsequent tasks.
- FTU Task 2 so that the monitoring products are applied in SMP/E target libraries.
- FTU Task 3 so that the file system for storing SDA data is available on your z/OS® UNIX® System Services system and OMEGAMON® programs are authorized.

### About this task

The purpose of this first configuration task is to quickly create a working RTE where you can run the monitoring system after finishing this task. To accomplish this task, we will:

- Use a sharing type of RTE in which SMP/E libraries are concatenated directly in the runtime JCL. Do not worry if this is not the RTE type you want to use in production. We will be changing the RTE type in a subsequent FTU task.
- Limit this initial configuration to just one monitoring agent even if you installed many more agents than that into your target libraries. Let's keep it simple for now. We will add more agents to the RTE in a subsequent FTU task.

Follow the step-by-step instructions in [Scenario QCF10: Configuring a sharing-with-SMP/E runtime environment with a hub monitoring server](#) to configure this RTE. Make the following adjustments as you go through the scenario:

#### In the Setting up the work environment step

In the Include Products in this PARMGEN RTE panel, all products that were installed into your target libraries are preselected for configuration. We do not want them all at this time. For this initial configuration, we want only the following components:

KDS Tivoli® Enterprise Monitoring Server V6.3.0

KM5 OMEGAMON® for z/OS® V5.3.0

OMEGAMON® Enhanced 3270 User Interface V7.3.0

Remove the slash in front of all other components to deselect them from the configuration.

Our choice for the one agent to configure first in this RTE is OMEGAMON® for z/OS® (the agent whose product code is KM5). If you did not install KM5 into your SMP/E target libraries, then it will not be listed here as an available selection.

If you do not have KM5, our next recommendation would be OMEGAMON for CICS (KC5). If you did not install either of these agents, then choose any one of the agents you did install and remember your choice.

**Note:** This guide assumes you are configuring KM5 as the agent. If that is not the case, substitute the KM5 product code in the scenarios with the code of the agent you have selected. Be aware that you may have to complete some additional prerequisite steps including program authorization and addition post configuration steps for the agent you choose. If you install a different agent, check technote [Preinstallation Requirements and Instructions](https://www.ibm.com/support/docview.wss?uid=swg21318692) (<https://www.ibm.com/support/docview.wss?uid=swg21318692>), the *Program Directory*, and the *Planning and Configuration Guide* for your agent or agents.

#### In the Customizing the configuration profiles step

You need to make a few adjustments to customize the profiles for your site.

Pre-populate the parameters in the configuration profiles by running the KCIJPDLn jobs. For more information about the KCIJPDLn jobs, see [Preparing the configuration profiles by running the KCIJPDLn jobs, PARMGEN z/OS DLA utility jobs and commands](#), and [The parameters that can be auto-discovered by the KCIJPDLa job](#).

In the RTE configuration profile, at a minimum you must edit the **RTE\_USS\_RTEDIR** parameter to specify the path for the z/OS UNIX directory where the self-describing agent data is stored. Review the [Customizing the runtime environment configuration profile](#) to see if you have to make additional changes.

In the global configuration profile, you must provide a site-appropriate value for the **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library **GBL\_DSN\_CSF\_SCSFMO00** parameter and any of the product-specific parameters listed in [Customizing the global configuration profile](#) as appropriate.

#### In the Completing the setup of the environment step

Several of the jobs that you submit to complete the setup require authorization, including those that APF-authorize the SMP/E target libraries and those that add the VTAM® definitions for the started tasks to VTAMLST. Make sure that you have the proper authorization to submit these jobs, or have someone with the proper authority submit them.

Additional steps may be required that cannot be completed in the PARMGEN workflow tool. That should not be the case for FTU Task 4 if you installed only the monitoring server, the Enhanced 3270 user interface, and OMEGAMON® for z/OS®. Still, you should review the topics in [Completing the configuration outside the configuration software](#).

## FTU Task 5: Start and verify the monitoring system

In FTU task 3, you added security and network definitions to z/OS® for this runtime environment (RTE). In FTU task 4, you configured the RTE to use the names you defined. Now, you are ready to start the tasks needed for this RTE and log on to the Enhanced 3270 to test your installation.

### About this task

The started tasks for the configured components are located in the `rte_hilev.rte_name.RKANSAMU` data set. The name of the started task for the monitoring server is `rte_stc_prefixDS`, where `rte_stc_prefix` is IBM by default, or the prefix you specified when you configured the RTE. This started task also starts the OMEGAMON® for z/OS® monitoring agent, if configured. The started task for the Enhanced 3270 user interface is `rte_stc_prefixTOM`.

**Tip:** If you don't want to start the components individually, the PARMGEN configuration method provides a composite `rte_stc_prefixSTRT` member in the RKANSAMU data set of each RTE. This composite member has the start commands for all configured products in the order in which they should be started. If you used the PARMGEN-supplied KCIJPSYS job, this job also copied the `rte_stc_prefixSTRT` member in the system procedure library (or the data set you might have customized in the `GBL_DSN_SYS1_PROCLIB` global parameter).

To verify that the monitoring system is successfully configured, complete the following steps.

### Procedure

1. Start the hub monitoring server. Check the job log for any errors.  
For more information, see [Verifying that you can start and stop the monitoring server](#).
2. Start agents' started tasks.  
If you installed the OMEGAMON® for z/OS® monitoring agent, start the real time collector component IBMM2RC. If you installed any agent other than OMEGAMON® for z/OS®, start the started task for that agent. For a list of started task names, see [Predefining and managing OMEGAMON started tasks](#). Check the job logs for errors.
3. Start the Enhanced 3270 user interface (Enhanced 3270UI) started task. Check the job logs for errors.
4. Verify that the monitoring agent is collecting data. Use a 3270 emulator to log into the Enhanced 3270UI APPLID (default CTDOBAP).  
For more information about using the Enhanced 3270UI, see [OMEGAMON enhanced 3270 user interface](#).

### What to do next

Hopefully you have seen that the PARMGEN process is easy to use, but with so much going on, it might still take some practice to fully understand and use it for optimum effect at your site. Now that you have created your first RTE, you might find that you have a better understanding and want to do things differently. If so, it is easy to delete your first RTE and create a new one. There is no reason to continue on with something that is not right for your site. However, to continue with the FTU process, you will need to re-create the same type of RTE as you did in FTU Task 4.

### Next steps

Now that you have set up your first, basic runtime environment (RTE), you can begin to modify and expand your monitoring system to meet your specific site requirements.

Complete any or all of the following tasks as you deploy monitoring in your production environment:

#### FTU task 6: (Optional) Set up a hub monitoring server on another OS

FTU task 4 had you set up a hub monitoring server on z/OS®. However, you might prefer to run your hub on a different operating system such as Linux on Z, Windows, UNIX, or Linux. You can set up another hub, then convert the z/OS hub that you previously created to a remote, and configure it to connect to the hub on a distributed system. Skip this task if you intend to run the hub monitoring server on z/OS.

- If you are not sure where you might want the hub server, see [Decision 3: Where to install your monitoring servers](#) for more information.
- To install and configure the IBM® Tivoli® Monitoring distributed components, see the [IBM® Tivoli® Monitoring: Installation and Setup Guide](#).

- To perform administrative tasks for the distributed components of IBM® Tivoli® Monitoring, see the [IBM® Tivoli® Monitoring: Administrator's Guide](#).
- To install and configure the distributed components of OMEGAMON® AI for Db2, see [IBM Z® OMEGAMON® AI for Db2 6.1](#).
- To convert the z/OS® hub monitoring server to a remote, see [Scenario RTE04: Converting a hub monitoring server to a remote](#).

### FTU task 7: Configure additional monitoring agents

You configured an RTE with a single monitoring agent. Now you might want to configure other monitoring agents that you already installed via SMP/E in this particular RTE. For example, you may want to monitor Db2 on this LPAR. If so, configure that monitoring agent. You can configure as many agents as you want all at the same time in this task.

- Verify and complete any prerequisite tasks for the additional agents you are configuring into the RTE. You can find information on product prerequisites in technote [Preinstallation Requirements and Instructions](https://www.ibm.com/support/docview.wss?uid=swg21318692) (<https://www.ibm.com/support/docview.wss?uid=swg21318692>), and in the *Program Directory* for each product.
- Complete the instructions in [Scenario RTE01: Adding a new product to an existing PARMGEN runtime environment](#).
- Run the started tasks for the products and components configured in the RTE and verify that the monitoring system is functioning.

### FTU task 8: Configure historical data collection

Historical data collection is an optional feature that is enabled through the Tivoli® Enterprise Portal or the OMEGAMON® enhanced 3270 user interface. The tasks required to enable historical reporting can be performed at any time after you have verified your installation. If you enable historical data collection, monitoring agents are instructed to take data samples at a specified interval and store it. The collected data can be displayed in workspaces in either interface, warehoused for in-depth analyses and long-term data reporting, and exported to third-party tools for reporting and analysis. (Note that not all historical data that is displayed in the Tivoli® Enterprise Portal can be displayed in the Enhanced 3270UI, and not all the near-term history displayed in the Enhanced 3270UI can be displayed in the Tivoli® Enterprise Portal.)

#### Notes:

- The Enhanced 3270 user interface cannot display data from the Tivoli® Data Warehouse, and you cannot configure the Warehouse Proxy agent or the Summarization and Pruning agent from the enhanced 3270UI.
- Using the Tivoli® Data Warehouse is optional for the IBM Z® OMEGAMON® AI for Db2 monitoring agent. The agent offers other long-term storage options.
- The z/OS® persistent data store data sets, where some of the historical data is stored on z/OS®, should have been configured earlier during *FTU Task 4* and *FTU Task 7*.

For more information on configuring the persistent data store, see [Allocate data sets and configure maintenance for historical data](#), [\(Optional\) Configure historical data collection](#), and the product-specific *Planning and Configuration Guides*.

Note that near-term historical data for OMEGAMON for z/OS for the OMEGAMON enhanced 3270 user interface can be collected from RMF. The RACF ID that is defined for the address spaces where OMEGAMON for z/OS agents run must be authorized to access RMF.

### FTU task 9: (Optional best practice) Implement system and user variables

Implementing system and user variables in the RTE is a best practice because it allows the RTE to be cloned and automatically pick up the values of the new system. Using variables also makes it easier to handle any system changes that might be made along the way.

To quickly implement system and best-practice user symbols in the RTE, complete the instructions in [How to: Merge predefined variables into configuration profiles](#).

### FTU task 10: (Optional best practice) Create a high-availability hub monitoring server

A high-availability (HA) hub monitoring server is available only when the hub resides on z/OS. On distributed systems and Linux on Z, you create a *hot standby* rather than an HA hub. Skip this task if your hub monitoring server does not reside on z/OS.

To create an HA hub and convert the current static hub monitoring server to a remote, follow the instructions in [How to: Convert an existing static hub monitoring environment to a high-availability hub environment](#).

### **FTU task 11: Install maintenance and update the RTE**

At some point, you will need to apply maintenance to your RTEs.

Apply SMP/E maintenance for products and components, then start the configuration procedures. Check the PSP and Upgrade information in the Recommended Maintenance Service Levels for OMEGAMON® products in the [ITM V6.x technote](#) for recommended maintenance. If recommended maintenance is available, obtain and apply the maintenance via SMP/E.

To update the RTE with the recommended maintenance, follow the instructions in [SMP/E maintenance and upgrade scenarios](#). Select the scenario appropriate to what you are trying to achieve and to the actions from the HOLD++ data in the SMP/E maintenance.

### **FTU task 12: Convert the RTE type for production use**

A best practice for a production RTE is to use a set of static base libraries instead of concatenating SMP/E libraries that are updated each time SMP/E maintenance is applied. This approach provides more control and increases stability of your production environment. Rather than create a new sharing-with-base RTE from scratch, you can convert the sharing-with-SMP/E environment that was created in previous steps into a sharing-with-base RTE.

To convert the existing RTE to share with a static base, complete the instructions in [How to: Convert a sharing-with-SMP/E RTE to sharing-with-base](#).

### **FTU task 13: Clone the RTE to other systems**

After you configure an RTE that reflects your requirements and best practices, you can use PARMGEN to replicate that RTE to other z/OS® images. As you replicate, you can remove various applications from the cloned environment or add new applications to the clone, change the RTE type, or change the type of monitoring server.

For instructions on how to clone the RTE to another system or LPAR, see [Cloning an existing PARMGEN runtime environment](#). For background information on cloning and moving an RTE, read [Replicating configured runtime environments](#). This information is particularly important when you are cloning an RTE that will be moved to another system.

### **FTU task 14: Consider security issues**

The monitoring framework (Tivoli® Management Services) and the OMEGAMON® monitoring products offer a number of security options, including logon security for the various interfaces, secure communication between monitoring components, and password encryption. In addition, monitoring components, started tasks, and address spaces require authorization to perform various tasks such as communicating with monitored subsystems, issuing Take Action commands, and accessing certain data.

You have already implemented the minimum security required for the basic RTE you configured (authorization for the Tivoli® Enterprise Monitoring Server to access the z/OS® UNIX® System Services file system to store data for self-describing agents). But before you begin to deploy other RTEs, you need to evaluate other security options and requirements in the light of your site standards. For more information about security options, see [Decision 9: Which security options to enable](#).

## **Cross-platform quick deployment guide for OMEGAMON**

---

The purpose of this guide is to provide step-by-step instructions to set up a POV (Proof-of-value) monitoring system across Linux and z/OS for a person who has a basic understanding of the monitoring system, monitoring components, and either Configuration Manager or PARMGEN as the configuration tool.

### **About the scenario in this guide**

This guide introduces a specific scenario that deploys the monitoring structure across Linux and z/OS, which is different from the basic scenario that is illustrated in the First time deployment guide. Therefore, for a simpler scenario that consists of z/OS only, you can go through the instructions in the First time deployment guide.

To show an overall picture of deploying a monitoring system not only on z/OS, a specific scenario is introduced in this guide:

- Install Hub Tivoli Enterprise Monitoring Server, Tivoli Enterprise Portal Server and Tivoli Enterprise Portal on Linux.
- Install OMEGAMON AI for JVM agent on z/OS.
- No advanced security configurations.

The installation and configuration steps are tailored specifically for this scenario, which might not meet your requirement. However, by the time you finish the tasks in the guide and start the system, you will have a better understanding of how the components are installed, configured, and communicating with each other. You will have the ability to expand the POV environment, or setting up a new environment by performing similar steps.

## Background knowledge

Before you can perform the installation and configuration tasks in this guide, you must have a basic understanding of the following monitoring components:

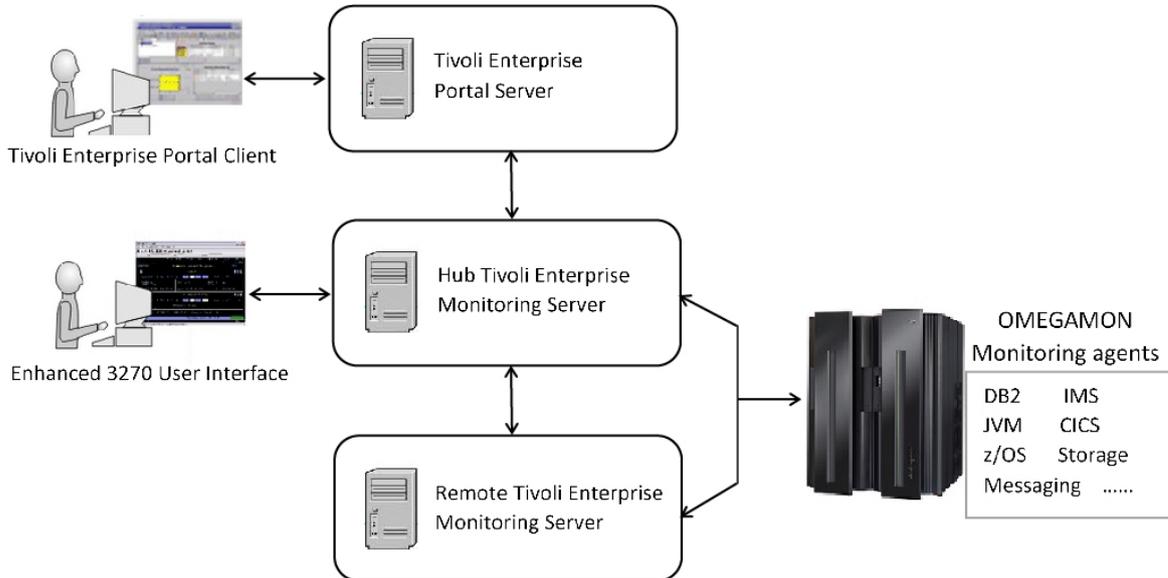

Figure 2: Basic architecture of OMEGAMON monitoring environment

### Tivoli Enterprise Monitoring Server

The nerve center of the monitoring system that consolidates the data collected by monitoring agents and distributes the data to the connected clients. It is referred to as TEMS in this guide.

Based on different functions in the monitoring systems, there are two types of TEMS:

- The *hub monitoring server* is the monitoring server of the monitoring system that acts as the focal point for data collection and distribution. It is referred to as the Hub TEMS in later topics.
- The *remote monitoring server* collects data from the monitoring agents and sends the data to the hub monitoring server for consolidation. In this way, the work on the hub monitoring server can be offloaded. It is referred to as the Remote TEMS in later topics.

### OMEGAMON Enhanced 3270 user interface

The interface on z/OS through which you can view the monitoring data. It is referred to as the enhanced 3270UI in later topics.

### Tivoli Enterprise Portal

The user interface on distributed systems for the monitoring system. It is referred to as the TEP in later topics.

### Tivoli Enterprise Portal Server

The server of TEP that communicates with the hub monitoring server to send requests to and retrieve data from monitoring agents on managed systems. It is referred to as the TEPS in later topics.

### Monitoring agents

Monitoring agents are on monitored, or managed systems. The agents pass the system or application data they collect to a Tivoli Enterprise Monitoring Server, and the data is passed to a connected client user interface.

### Configuration Manager

IBM Z Monitoring Configuration Manager (also referred to as Configuration Manager) is a tool that configures an OMEGAMON runtime environment from a set of parameters that you specify. This process is easier and faster than using the legacy PARMGEN, with its many parameters, for configuration.

### PARMGEN

A legacy configuration tool that can be used for setting up runtime environment (RTE) and monitoring components on z/OS.

### RTE (runtime environment)

An RTE (runtime environment) is a logical grouping of runtime libraries that are referenced by started tasks running on a z/OS image. When you configure monitoring servers and monitoring agents, you begin by defining a runtime environment of a certain type, which determines the number and types of runtime libraries required.

## Topology

Go through this topic to understand the topology of the monitoring system to be deployed in this guide.

The monitoring system consists of the following components:

- A Hub TEMS on a Linux server.
- A TEP on the same Linux server as the Hub TEMS.
- A TEPS on the same Linux server as the Hub TEMS.
- A Remote TEMS on z/OS.
- Enhanced 3270UI on z/OS in the same RTE (runtime environment).
- An OMEGAMON AI for JVM agent on z/OS in the same RTE.

Refer to the following figure for the relationship between the components.

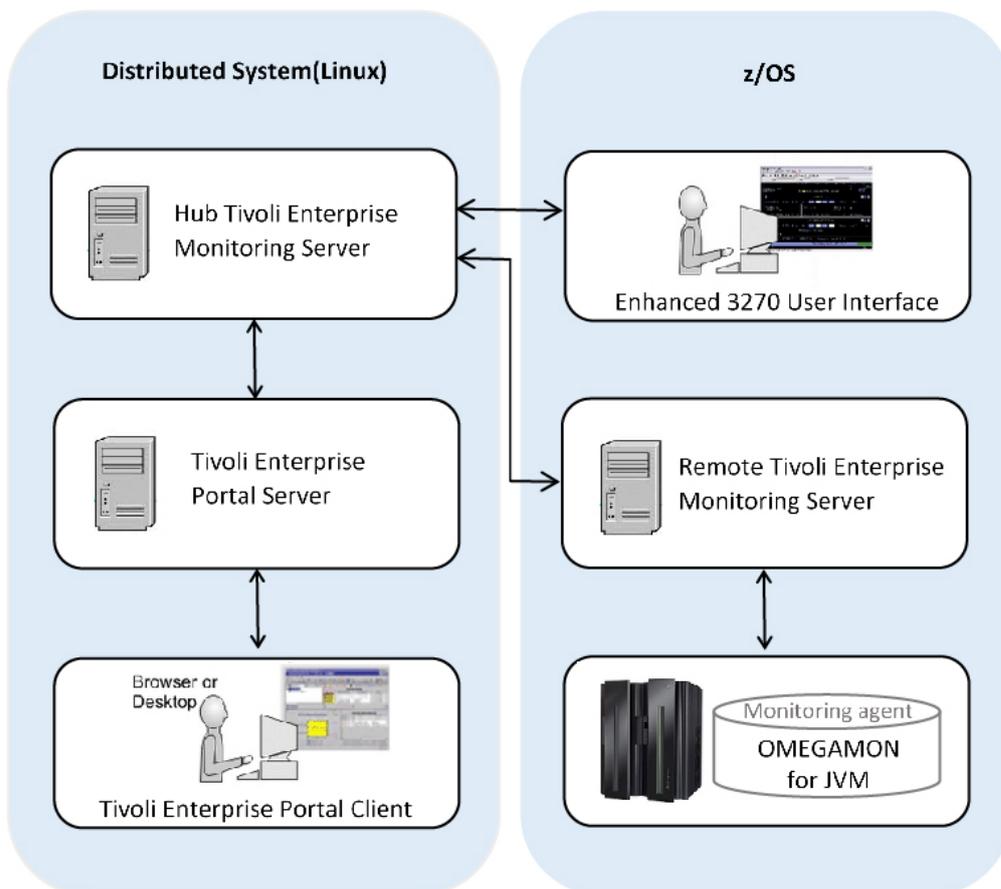

Figure 3: Topology of the monitoring system

There is only one OMEGAMON AI for JVM agent in one RTE on one LPAR as an example. You can repeat the RTE configuration steps later to create more RTEs or to deploy more monitoring components in the RTEs.

## Installation and configuration

For a monitoring environment consisting of both Linux and z/OS, the components are installed and configured on different platforms separately. Follow the instructions in this chapter to first install and configure the Hub TEMS, TEPS, and TEP on a Linux system, and then install and configure the Remote TEMS, enhanced 3270UI, and OMEGAMON AI for JVM agent on z/OS.

The overall deployment roadmap is:

1. Deploy the monitoring components on Linux.
  - a. [Check the hardware and software requirements.](#)
  - b. [Install Hub TEMS, TEPS, TEP and JVM application support.](#)
  - c. [Configuring the monitoring components.](#)
  - d. [Verify the deployment by starting the components.](#)
2. Deploy the monitoring components on z/OS.
  - a. [Order a ServerPac that includes the components and install the components via SMP/E.](#)
  - b. Use [Configuration Manager](#) or [PARMGEN](#) to create a runtime environment.
3. [Start the monitoring system and log in to either TEP or enhanced 3270UI.](#)

## Installing and configuring IBM Tivoli Monitoring components on Linux

IBM Tivoli Monitoring monitors and manages system and network applications on a variety of operating systems, tracks the availability and performance of your enterprise system, and provides reports to track trends and troubleshoot problems.

This section contains information that will assist you with installing and configuring IBM Tivoli Monitoring infrastructure components (including hub TEMS, TEPS and TEP) on Linux.

### Hardware and software requirements

Before you install the components, review the basic hardware and software requirements to make your deployment go more smoothly.

### Hardware prerequisites

The following sections describe the disk, memory, and processor requirements for the IBM Tivoli Monitoring infrastructure components on Linux.

The following list is the IBM® Tivoli® Monitoring components that are covered in this section:

- Hub Tivoli Enterprise Monitoring Server
- Tivoli Enterprise Portal Server
- Tivoli Enterprise Portal desktop client

#### Memory and disk requirements

Review the estimated memory and disk storage for IBM Tivoli Monitoring components on Linux, and make sure that your environment meet the requirements.

To install TEPS, TEP and TEMS on the same server, you need at least 3 GB RAM (2GB for the components and 1 GB for the OS and filesystem caching) and 6.8 GB disk storage available on your system.

#### Processor requirements

Multiprocessor systems are recommended for the IBM® Tivoli® Infrastructure components.

The infrastructure components (monitoring server, portal server, portal client) run as multithreaded processes and are able to run threads concurrently across multiple processors if they are available. CPU utilization for most components can be high for a short moment from time to time, and steady-state CPU utilization is

expected to be low in most cases. For components supporting large environments, using multiprocessor systems can improve throughput.

## Software prerequisites

Software prerequisite must be installed before you install IBM Tivoli Monitoring infrastructure components on Linux.

To install components on Linux, make sure that a Korn shell interpreter is available on your system.

## Installing IBM Tivoli Monitoring

The following sections provide detailed information for installing the IBM Tivoli Monitoring infrastructure components and the JVM application support.

### Installing IBM Tivoli Monitoring components

The basic architecture of IBM Tivoli Monitoring components consists of the Tivoli Enterprise Portal desktop client, the Tivoli Enterprise Portal Server, and the Tivoli Enterprise Monitoring Server. This section provides information about how to install these key components.

### Before you begin

To order IBM Tivoli Monitoring components, visit [Shopz](#).

### Procedure

1. Browse to the directory where you extracted the installation files, run the following command to start the installation:

```
./install.sh
```

2. When prompted for the IBM Tivoli Monitoring installation directory, press Enter to accept the default location /opt/IBM/ITM.
3. If the directory you specified does not exist, type **1** to create this directory.
4. Type **1** to accept to place data in the installation directory, or type **2** to specify a different directory.
5. From the installation list, type **1** and press Enter to install products to the local host.

```
Select one of the following:  
1) Install products to the local host.  
2) Install products to depot for remote deployment (requires TEMS).  
3) Install TEMS support for remote seeding  
4) Exit install.  
Please enter a valid number: 1
```

6. The license agreement is displayed. Press Enter to read through the agreement, and then type **1** to accept the agreement.
7. Press Enter to use the default encryption key. You can also specify a 32-character encryption key and press Enter to continue.
8. Install IBM Tivoli Monitoring products.
  - a. The product packages available for this operating system and component support categories are listed. For a new installation, type **1** (IBM Tivoli Monitoring components for this operating system) and press Enter to confirm your selection.
  - b. On the product list, type **3, 4, 5** and press Enter to install the Tivoli Enterprise Monitoring Server, Tivoli Enterprise Portal Server, Tivoli Enterprise Portal desktop client for your current operating system.

```
The following products are available for installation:
1) Summarization and Pruning Agent
2) Tivoli Enterprise Monitoring Automation Server
3) Tivoli Enterprise Monitoring Server
4) Tivoli Enterprise Portal Desktop Client
5) Tivoli Enterprise Portal Server
6) Tivoli Enterprise Services User Interface Extensions
7) Tivoli Performance Analyzer
8) Warehouse Proxy
9) All of the above
Type your selections here: 3,4,5
```

- c. Type **1** to start to check prerequisites for the components before you install them. After the check, you can view the scan results. Type **1** to continue with the installation.
- d. For first-time installations only, provide a name for your TEMS. For example: *HUB\_hostname*. The default name is **TEMS**.
- e. After all of the components are installed, type **2** to not to continue with the installation of other products.
- f. When you are asked to seed product support on the TEMS, type 2 to not to seed support.

**Note:**

Seeding the monitoring server is the process of enabling application support. When you install the monitoring server, the application support available on the installation media for the monitoring server is installed automatically.

- g. Type **2** to not secure your IBM Tivoli Monitoring environment and press Enter to exit the installation.  
IBM Tivoli Monitoring provides the secureMain utility to help you keep the monitoring environment secure. You can secure your installation now, or manually execute the secureMain utility later. For more information, see [Securing your IBM Tivoli Monitoring installation on Linux or UNIX](#).
9. If the installation fails, check the log files that are created during installation to help diagnose any errors or operational issues. The log files are stored in *ITMinstall\_dir/logs*, where *ITMinstall\_dir* is the directory where you installed the product.
10. To check and verify the product version that you installed, perform as follows:
- a. Change to the directory *ITMinstall\_dir/bin*, where *ITMinstall\_dir* is the directory where you installed the product.
  - b. Issue the following command to view the information menu:  

```
./cinfo
```
  - c. Select option 1 to show products information installed.  
All the products that you installed are displayed, as well as their separate product code and version number.

## Result

The IBM Tivoli Monitoring infrastructure components are installed successfully.

## Installing JVM application support

Before you can view data collected by OMEGAMON AI for JVM, you must install and enable the JVM application support. Application support files provide agent-specific information for workspaces, helps, situations, templates, and other data.

## Before you begin

To obtain JVM application support, visit [Fix Central](#). In the **Product selector**, enter IBM Z OMEGAMON AI for JVM. For **Installed version** and **Platform**, select All and click **Continue**. Download the application support DVD: LCD7-7581-00-IBM\_Z\_OMEGAMON\_AI\_for\_JVM\_V610\_Application\_Support\_DVD.

Before you install the JVM application support, make sure that the IBM Tivoli Monitoring components are stopped.

- To stop TEMS, issue the following command, the default *tems\_name* is **TEMS**:

```
/opt/IBM/ITM/bin/itmcmd server stop tems_name
```

- To stop TEPS, issue the following command:

```
/opt/IBM/ITM/bin/itmcmd agent stop cq
```

- To stop TEP, issue the following command:

```
/opt/IBM/ITM/bin/itmcmd agent stop cj
```

## About this task

OMEGAMON AI for JVM requires that application support be configured on all instances of the following infrastructure components:

- Tivoli Enterprise Monitoring Server
- Tivoli Enterprise Portal Server
- Tivoli Enterprise Portal desktop client

## Procedure

1. Browse to the directory where you extracted the installation files, run the following command to start the installation:

```
./install.sh
```

2. When prompted for the IBM Tivoli Monitoring installation directory, press Enter to accept the default location `/opt/IBM/ITM`.
3. From the installation list, type **1** and press Enter to install products to the local host.

```
Select one of the following:  
1) Install products to the local host.  
2) Install products to depot for remote deployment (requires TEMS).  
3) Install TEMS support for remote seeding  
4) Exit install.  
Please enter a valid number: 1
```

4. The license agreement is displayed. Press Enter to read through the agreement, and then type **1** to accept the agreement.
5. Read through the information displayed and press Enter to continue.
6. Install application support for Tivoli Enterprise Portal desktop client.
  - a. On the product packages list, type **2** and press Enter to select the Tivoli Enterprise Portal Desktop Client support.

```
Product packages are available for the following  
operating systems and component support categories:  
1) Tivoli Enterprise Portal Browser Client support  
2) Tivoli Enterprise Portal Desktop Client support  
3) Tivoli Enterprise Portal Server support  
4) Tivoli Enterprise Monitoring Server support  
Type the number for the OS that you want, or type "q" to quit selection: 2
```

- b. On the application supports list, select IBM Z OMEGAMON AI for JVM.
  - c. When the installation is finished, type **1** to continue install application support for Tivoli Enterprise Portal Server.
7. Install application support for Tivoli Enterprise Portal Server.
    - a. On the product packages list, type **3** and press Enter to select the Tivoli Enterprise Portal Server support.
    - b. On the application supports list, type **1** and press Enter to select IBM Z OMEGAMON AI for JVM.

8. Install application support for Tivoli Enterprise Monitoring Server.
  - a. On the product packages list, type **4** and press Enter to select the Tivoli Enterprise Monitoring Server support.
  - b. On the application supports list, type **2** and press Enter to select IBM Z OMEGAMON AI for JVM.
9. Type **2** to exit the application support installation.
10. Press Enter to seed product support on the Tivoli Enterprise Monitoring Server.
11. Type **1** to add the default managed system groups to all the applicable situations. Or you can type **2** to not to add the default managed system group to any situation.
12. After the application support seeding is completed, type **2** and press Enter exit the installation.
13. To check and verify the product version that you installed, perform as follows:
  - a. Change to the directory `ITMinstall_dir/bin`, where `ITMinstall_dir` is the directory where you installed the product.
  - b. Issue the following command to view the information menu:
 

```
./cinfo
```
  - c. Select option **1** to show products information installed.  
All the products that you installed are displayed, as well as their separate product code and version number.

## Result

The JVM application support is installed successfully.

## Configuring IBM Tivoli Monitoring

The following sections provide detailed information for initially configuring the IBM Tivoli Monitoring infrastructure components.

### Configuring the Tivoli Enterprise Portal Server

Before you start the Tivoli Enterprise portal Server, you need to complete the following tasks to configure the portal server.

#### Procedure

1. Log in to the system where you installed Tivoli Enterprise™ Portal Server.
2. Change to the directory `ITMinstall_dir/bin`, where `ITMinstall_dir` is the directory where you installed the product.
3. Run the following command to start to configure the Tivoli Enterprise™ Portal Server:

```
./itmcmd config -A cq
```

Where `cq` is the product code for the portal server.

4. Keep pressing Enter to accept the default settings until you are asked to select the database for the portal server:

```
Which database would you like to use for TEPS (1=Embedded, 2=DB2) (Default is 2):
1
```

5. In this POV scenario, type **1** to use the embedded Derby database. If you install for a production environment in the future, then consider to use the Db2 database.
6. Type **3** to not to use any database for warehouse.

```
Are you using Db2, Oracle or None for Warehouse?[1=Db2, 2=Oracle, 3=None] (Default is:
1):
3
```

7. In the following configuration steps, keep pressing Enter to use the default settings until the end of configuration.

## Result

The Tivoli Enterprise Portal Server is successfully configured.

## Configuring the Tivoli Enterprise Portal desktop client

Complete the following steps to configure the desktop client from the command line on Linux.

### Procedure

1. Browse to the directory `/opt/IBM/ITM/bin`, or the directory where you installed IBM Tivoli Monitoring.
2. Run the following command to start to configure the Tivoli Enterprise Portal desktop client:

```
./itmcmd config -A cj
```

3. Press Enter to use the default TEP instance name (none), or provide a name for the TEP instance.
4. Type the host name for the portal server and press Enter. The default value is `'localhost'`. Sometimes `localhost` is not mapped with `127.0.0.1`, as a result, you need to manually edit the host file in your system to create the map between `localhost` and `127.0.0.1`. By default, the host file is located in `/etc/hosts`.
5. Press Enter to accept the default browser path `/usr/bin/firefox`.
6. Press Enter to not use HTTP Proxy support.

## Result

The Tivoli Enterprise Portal desktop client is successfully configured.

## Starting IBM Tivoli Monitoring

After you configure the IBM Tivoli Monitoring, you can run the command to start the components.

### Procedure

1. Browse to the directory where you installed the IBM Tivoli Monitoring: `ITMinstall_dir/bin`.
2. Start the monitoring server.  
Run the following command to start the monitoring server:

```
./itmcmd server start tems_name
```

The default name of TEMS is **TEMS**.

3. Start the portal server.  
Run the following command to start the portal server:

```
./itmcmd agent start cq
```

4. Start the portal client.  
Run the following command to start the portal client:

```
./itmcmd agent start cj
```

To log in to the portal client, you can use the default user ID **sysadmin**. No password is required to log on to the portal client unless the hub monitoring server was configured to enable **Security: Validate User**.

## Deploying monitoring components on z/OS

Install the product via a ServerPac that can be ordered on Shopz and create an RTE to configure the monitoring components.

### Installing the monitoring product on z/OS

The monitoring products and shared framework components like the monitoring server are installed via SMP/E. Skip this step if you already completed the SMP/E installation of the monitoring products and SMP/E applied them.

#### Procedure

1. Order the monitoring products in a ServerPac on [Shopz](#). The ServerPac contains all the products at the latest RSU level with some SMP/E processing already completed. For these reasons, installing a ServerPac is recommended.  
See [Packaging](#) for more information. Make sure the following products are included in the ServerPac:
  - Tivoli Management Services: search the keyword IBM Tiv Mgmt Services z/OS in Shopz.
  - IBM Z OMEGAMON AI for JVM (FMID HKJJ610): search the keyword OMEGAMON AI for JVM in Shopz.
  - FMID HKCI310 for Configuration Manager (and PARMGEN Workflow User Interface at PTF UA91953)
  - IBM® Discovery Library Adapter for z/OS®: The PARMGEN configuration tool uses the data that is collected by this component to tailor the configuration profiles and post-configuration README members.

**Note:** IBM® Discovery Library Adapter for z/OS® is part of every product package that is released for the OMEGAMON products.

2. Install all product into the same consolidated software inventory (CSI) because the monitoring products have shared elements.

#### What to do next

After you install the products via SMP/E, they must be configured to operate properly at your site.

### Using Configuration Manager to create a runtime environment

This example consists of a monitoring server, an enhanced 3270 user interface, and an OMEGAMON AI for JVM monitoring agent.

#### Prerequisites

Review the prerequisites and other considerations before you start using Configuration Manager.

Read the [prerequisites](#) for using Configuration Manager.

### Creating the runtime environment

Creates a runtime environment consisting of a monitoring server, and enhanced 3270 user interface, and an OMEGAMON AI for JVM monitoring agent.

#### Procedure

1. Submit a job that performs the **CREATE** action.

Copy and customize the job TKANSAM(KFJJMCM) to perform the **CREATE** action of Configuration Manager, then submit that job. The **CREATE** action creates a runtime environment definition library, *rte\_plib\_hilev*.RTEDEF, and populates it with an initial set of parameters.

Edit the example job statement to match your site's standards for job name, class, and message class. Consider changing the example job name prefix, UID, to your TSO user ID.

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<tlib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<tlib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION CREATE
RTE_NAME <rte_name>
RTE_PLIB_HILEV <rte_plib_hilev>
/*
```

Replace the placeholders in the example JCL with appropriate values:

**<lpar>**

Run Configuration Manager actions on the LPAR where you will start the runtime environment.

**<tlib\_hlq>**

The high-level qualifiers of the target libraries.

**<rte\_name>**

Runtime environment name, 1 - 8 characters.

Configuration Manager uses this name for various purposes, including:

- MVS member names
- MVS data set name qualifiers
- z/OS UNIX System Services directory name, all uppercase

**<rte\_plib\_hilev>**

The high-level qualifiers of the runtime environment definition library:

*rte\_plib\_hilev*.RTEDEF

Configuration Manager uses the values of **RTE\_NAME** and **RTE\_PLIB\_HILEV** to set the default value of other parameters, such as **RTE\_HILEV** and **RTE\_VSAM\_HILEV**, that are used for data set names.

To avoid exceeding the z/OS 44-character limit for data set names, the combined length of **RTE\_NAME** and **RTE\_PLIB\_HILEV** should not exceed 28 characters. For example, if **RTE\_NAME** is 8 characters, then **RTE\_PLIB\_HILEV** should not exceed 20 characters.

After running the job, check the KCIPRINT sysout data set.

2. Edit the parameters in the *rte\_plib\_hilev*.RTEDEF library to configure an OMEGAMON AI for JVM agent.

In the RTEDEF (*rte\_name*) member, set the following parameters to Y:

#### **CONFIGURE\_TEMS\_KDS**

Configures a monitoring server (Tivoli® Enterprise Monitoring Server, or TEMS)

#### **CONFIGURE\_E3270UI\_KOB**

Configures an enhanced 3270 user interface address space

#### **CONFIGURE\_JVM\_KJJ**

Configures an OMEGAMON AI for JVM monitoring agent

Set all of the other parameters to N.

```
RTE_NAME <rte_name>
RTE_PLIB_HILEV <rte_plib_hilev>
RTE_SECURITY_USER_LOGON NONE
RTE_SECURITY_FOLD_PASSWORD_FLAG Y
RTE_SECURITY_CLASS ""
```

```

RTE_X_SECURITY_EXIT_LIB      <rte_plib_hilev>.<rte_name>.SECEXITS
RTE_TEMS_NAME_NODEID        <rte_name>:TEMS
RTE_TEMS_TRANSPORT_MODE     HTTPS
RTE_COMM_PROTOCOLn         IPPIPE
RTE_TCP_HOST                <sysiphostname>
RTE_TCP_PORT_NUM           1918
RTE_VTAM_APPLID_PREFIX     OM<sysclone>
RTE_STC_PREFIX              OMEG
RTE_USS_RTEDIR              "/var/rtehome"
CONFIGURE_TEMS_KDS          Y * TEMS
CONFIGURE_E3270UI_KOB       Y * Enhanced 3270
CONFIGURE_CICS_KC5          N * CICS TS
CONFIGURE_CICS_TG_KGW       N * CICS TG
CONFIGURE_DB2_AGENT_KD5     N * Db2
CONFIGURE_IMS_KI5           N * IMS
CONFIGURE_JVM_KJJ           Y * JVM
CONFIGURE_ZOS_KM5           N * z/OS
CONFIGURE_MESSAGING_KMQ     N * MQ
CONFIGURE_MESSAGING_KQI     N * Integration Bus
CONFIGURE_NETVIEW_KNA       N * Netview
CONFIGURE_MFN_KN3           N * Network
CONFIGURE_STORAGE_KS3       N * Storage
CONFIGURE_OMEGAVIEW_KWO     N * Integration Monitor
CONFIGURE_ITCAMAD_KYN       N * ITCAM for Applications
CONFIGURE_ACM_KRN           N * Advanced Catalog Mgmt
CONFIGURE_ARD_KRH           N * Advanced Rpt and Mgmt
CONFIGURE_AAD_KRG           N * Advanced Audit
CONFIGURE_AAM_KRJ           N * Advanced Alloc Mgmt
CONFIGURE_ATAM_KRK          N * Automated Tape Alloc
CONFIGURE_ABR_KRV           N * Advanced Backup and Rec
CONFIGURE_ODP_KAY           N * Data Provider

```

Also in the RTEDEF (*rte\_name*) member, set the following parameters to match your site-specific standards:

#### RTE\_STC\_PREFIX

1- to 4-character prefix of the started task names for this runtime environment. The value in the initial set of parameters is OMEG.

#### RTE\_VTAM\_APPLID\_PREFIX

Prefix of the VTAM® applids in this runtime environment. For this minimal runtime environment, there is only one VTAM® application: the enhanced 3270 user interface.

Each VTAM® application in a runtime environment has a corresponding parameter for the VTAM® applid. The default values of these parameters are the value of **RTE\_VTAM\_APPLID\_PREFIX** followed by an application-specific suffix.

In the initial set of parameters created by the **CREATE** action, the value of **RTE\_VTAM\_APPLID\_PREFIX** is *OMxx*, where *xx* is the value of the z/OS® static system symbol **SYSCONE**. **SYSCONE** is a 1- or 2-character shorthand notation for the system (LPAR) name. This value is one example of why you need to run Configuration Manager actions on the LPAR where you will start the runtime environment.

If you use these values, then the default VTAM® applid for the enhanced 3270 user interface is *OMxxOBAP*. For example, if the system (LPAR) name is ZOS1, then the VTAM® applid is OMS1OBAP.

#### RTE\_USS\_RTEDIR

The path of the z/OS UNIX directory where you want Configuration Manager to write runtime files required by the started tasks.

The TSO user ID that runs Configuration Manager jobs must have permission to write to this directory, otherwise the **GENERATE** action will fail.

#### RTE\_TCP\_PORT\_NUM

The TCP/IP port number on which the monitoring server will listen.

**Tip:** Later steps in this procedure describe how to activate VTAM® resources and APF-authorize libraries. If you insert the parameter **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** Y in the

RTEDEF (*rte\_name*) member, then the started tasks include a member that performs these steps for you.

In the RTEDEF (GBL\$PARM) member, set the following parameters:

#### **GBL\_USS\_TKANJAR\_PATH**

The z/OS UNIX path that the SMP/E installation jobs define using the ddname TKANJAR. This parameter is required when the runtime environment configures OMEGAMON AI for JVM.

#### **GBL\_HFS\_JAVA\_DIR1**

The z/OS UNIX path of the Java™ home directory.

#### **GBL\_DSN\_CSF\_SCSFMOD0**

This parameter is explicitly added in the GBL\$PARM member that is generated after the **CREATE** action, as it is relevant for several security-related aspects of the product configuration (such as password encryption). If your installation does not use the Integrated Cryptographic Service Facility (ICSF), you can remove or comment out this parameter in your RTEDEF (GBL\$PARM) or RTEDEF (GBL\$lpar).

3. Convert the hub monitoring server to a remote monitoring server.  
Edit the RTEDEF (KDS\$PARM) or RTEDEF (KDS\$lpar) member for the runtime environment.  
Set the following parameters:

#### **KDS\_TEMS\_TYPE**

Change from HUB to REMOTE.

#### **KDS\_HUB\_TEMS\_NAME\_NODEID**

Set to the value of **RTE\_TEMS\_NAME\_NODEID** in the central hub runtime environment.

#### **KDS\_HUB\_TCP\_PIPE\_PORT\_NUM**

Set to the value of **RTE\_TCP\_PORT\_NUM** in the central hub runtime environment.

#### **KDS\_HUB\_TCP\_HOST**

Set to the host name of the LPAR for the central hub runtime environment.

4. Submit a job that performs the **GENERATE** action.  
The **GENERATE** action generates the runtime members for the runtime environment, including the started tasks.

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1      EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<tlib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<tlib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION          GENERATE
RTE_NAME        <rte_name>
RTE_PLIB_HILEV  <rte_plib_hilev>
/*
```

You have completed the steps that involve the configuration software. The remaining steps complete the configuration of the runtime environment *outside* of the configuration software.

## **Completing the runtime environment configuration**

Depending on your user privileges, you might need to ask someone else to perform some or all of the following steps. For example, only z/OS® system administrators are typically allowed to write to system libraries.

### **About this task**

These “complete the configuration” steps depend on your site-specific procedures and the requirements of the components, such as the monitoring agents, that you have chosen to configure in the runtime environment. The requirements of each component are described in the separate product documentation for each component.

Typically, at this point in the procedure for creating a runtime environment, you would need to refer to that separate documentation. However, to help make this “first runtime environment” procedure stand-alone, and because in this procedure we have selected a fixed set of specific components, the “complete the configuration” steps are presented here.

## Procedure

1. Use your site-specific procedures to copy the runtime members for started tasks and VTAM® definitions to your system libraries.  
Copy the members from the following libraries to your corresponding PROCLIB, VTAMLIB, and VTAMLST system libraries:

```
rte_hilev.SYS1.PROCLIB
rte_hilev.SYS1.VTAMLIB
rte_hilev.SYS1.VTAMLST
```

The default value of the RTE\_HILEV parameter is the value of RTE\_PLIB\_HILEV.

2. If you followed the earlier tip to set the **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** parameter to Y, then you can skip this step. However, you should still *read* this information to understand the requirements of the runtime environment for VTAM® resources and APF-authorized libraries.
  - a. Activate the VTAM® resources defined by this runtime environment.  
Issue the following **VARY ACT** MVS™ system command:

```
VARY NET,ACT,ID=rte_vtam_applid_prefixNODE,SCOPE=ALL
```

The **ID** parameter of the **VARY ACT** command must match the value of the runtime environment parameter **RTE\_VTAM\_GBL\_MAJOR\_NODE**.

The default value of **RTE\_VTAM\_GBL\_MAJOR\_NODE** is the value of **RTE\_VTAM\_APPLID\_PREFIX** followed by the string **NODE**. If you use the **RTE\_VTAM\_APPLID\_PREFIX** initial value of **OMxx**, then the default value of **RTE\_VTAM\_GBL\_MAJOR\_NODE** is **OMxxNODE**, where **xx** is the value of the z/OS® static system symbol **SYSCLONE**. For example, if the system (LPAR) name is **ZOS1**, then specify **ID=OMS1NODE**.

- b. APF-authorize libraries.  
Add the following data sets to the authorized program facility (APF) list:

- The following runtime environment library:  
`rte_hilev.rte_name.RKANMODU`
- The following target libraries, under the high-level qualifiers of the STEPLIB of the Configuration Manager job:  
TKANMOD  
TKANMODL  
TKANMODP  
TKANMODR

The runtime member `rte_hilev.SYS1.PROCLIB(rte_stc_prefixAPF)` contains **VARY ACT** and **SETPROG APF** commands for this runtime environment. Different runtime environments require different VTAM® resources and APF-authorized libraries, depending on the configured products.

If you specify the parameter **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** Y in the RTEDEF (`rte_name`) member, and then perform the **GENERATE** action, some started tasks will contain an **INCLUDE** statement to include that member, so that you do not need to issue these commands separately. Whether started tasks are allowed to perform such commands depends on your local site practices.

Setting **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** can be expedient for initial testing. However, typical best practice is to activate VTAM® resources and APF-authorize libraries during system initialization rather than each time you start a task. Use the generated `SYS1.PROCLIB(rte_stc_prefixAPF)` member to identify which libraries you need to add to the APF list at system initialization.

3. Authorize the monitoring programs.
  - a. Authorize the product started tasks:
    - i. Update RACF® or equivalent security system for the user ID (with OMVS segment) you will use for these started tasks:

- Hub and remote monitoring servers (the default started task is named **OMEGDS**)
- Enhanced 3270 user interface (the default started task is named **OMEGTOM**)
- OMEGAMON AI for JVM (the default started task is **OMEGJJ**)

ii. Identify the user ID you created as a Superuser:

```
ALU <user ID> OMVS(UID(0) HOME(/) PROGRAM(/bin/sh))
```

iii. Use the RDEFINE commands to associate the ID with the following started tasks:

- OMEGDS (the started task of the monitoring server)
- OMEGTOM (the started task of the enhanced 3270 user interface)
- OMEGJJ (the started task of the OMEGAMON AI for JVM agent)
- OMEGJT (the started task of the OMEGAMON AI for JVM collector)

```
*/associate the user ID with started tasks
RDEFINE STARTED IBMDS.* STDATA(USER(userID) GROUP(SYS1))
RDEFINE STARTED IBMTOM.* STDATA(USER(userID) GROUP(SYS1))
RDEFINE STARTED IBMJJ.* STDATA(USER(userID) GROUP(SYS1))
RDEFINE STARTED IBMJT.* STDATA(USER(userID) GROUP(SYS1))
```

iv. After you issue all the RDEFINE commands, issue the refresh command:

```
SETROPTS RACLIST(STARTED) REFRESH
```

4. Update IKJTSONn with the names of authorized monitoring programs. You might request your site's authorized system programmers to perform this step so it can be scheduled with the LPAR's change control processes.
  - Add programs KPDDSCO, KOBROUTR, and KOBSPFAU to the system PARMLIB member IKJTSONn under the AUTHPGM section.
  - Refresh the IKJTSONn member by issuing the set command (T IKJTSONn).
5. Start at least the following tasks: *rte\_stc\_prefixCN*, *rte\_stc\_prefixDS*, *rte\_stc\_prefixTOM*, *rte\_stc\_prefixJJ*, and *rte\_stc\_prefixJT*. The user ID that you associate with these started tasks must have z/OS UNIX superuser privileges and access to the runtime member.

#### ***rte\_stc\_prefixCN***

OMEGAMON® subsystem.

The OMEGAMON® subsystem does not belong to a runtime environment. You only need one OMEGAMON® subsystem per LPAR.

If the OMEGAMON® subsystem has already been started, the job for this started task will fail. The JESMSGLG output data set for the failed job will contain the following messages:

```
CNDL018I OMEGAMON SUBSYSTEM ALREADY ACTIVE ...
CNDL002I OMEGAMON SUBSYSTEM Vvrm TERMINATED ...
```

This is not a problem: your runtime environment will use the already-active subsystem.

#### ***rte\_stc\_prefixDS***

Monitoring server.

#### ***rte\_stc\_prefixTOM***

Enhanced 3270 user interface.

#### ***rte\_stc\_prefixJJ***

The default OMEGAMON AI for JVM monitoring agent name is OMEGJJ. OMEGAMON AI for JVM started task names are specified in the RTEDEF(KJJ\$PARM) member or the LPAR-specific RTEDEF(KJJ\$lpar) member.

#### ***rte\_stc\_prefixJT***

The default OMEGAMON AI for JVM collector name is OMEGJT. OMEGAMON AI for JVM started task names are specified in the RTEDEF(KJJ\$PARM) member or the LPAR-specific RTEDEF(KJJ\$*lpar*) member.

## What to do next

Complete the post-configuration steps for OMEGAMON AI for JVM: [“Completing the configuration for the OMEGAMON AI for JVM agent” on page 105.](#)

## Using PARMGEN to create a runtime environment

Use the IBM predefined LPAR runtime model QCF08 to create a sharing-with-SMP/E runtime environment (RTE). A sharing-with-SMP/E RTE contains LPAR-specific libraries and references the read-only target libraries managed by SMP/E or a copy of SMP/e target libraries.

### About this task

The RTE will have the following components configured:

- A Remote Tivoli Monitoring Server (RTEMS)
- Enhanced 3270 user interface (enhanced 3270UI)
- OMEGAMON AI for JVM

You first start the PARMGEN configuration tool and create an RTE and then complete the configuration outside of PARMGEN.

## Preparing the environment for configuration with PARMGEN

System preparation must be completed before you can create and configure an RTE using PARMGEN.

### Procedure

1. Go through the checklist in technote [Preinstallation Requirements and Instructions.](#)

**Note:** You must have an IBM ID to use the checklist. Make sure all items in the checklist are met, and then move to the next step.

2. Create a new file system for OMEGAMON AI for JVM that use the **RTE\_USS\_RTEDIR** home directory parameter.  
This file system must be created, mounted, and in read/write mode before the z/OS® UNIX® System Services jobs that define the file system paths are submitted. Select a name for your RTE that establishes or fits a naming convention that can be used as you install additional RTEs. The KCIUSSJB sample job in the *gbl\_target\_hilev*.TKANSAM SMP/E target library is run in the following RTE configuration task. In the **MOUNT FILESYSTEM** command, the **MOUNTPOINT()** parameter equates to the value you will specify for the **RTE\_USS\_RTEDIR** parameter. For example, run the following TSO command:

```
MOUNT FILESYSTEM('&hlq_rte_home') TYPE(ZFS) MODE(RDWR) MOUNTPOINT('/rtehome') PARM('AGGRGROW')
```

So an example of this using RTE name TSTEST might be:

```
MOUNT FILESYSTEM('OMVS.TSTEST.HFS') TYPE(ZFS) MODE(RDWR) MOUNTPOINT('/tstest') PARM('AGGRGROW')
```

**Note:** Take note of the SMP/E TKANJAR DDDEF location in z/OS UNIX, which is key to the PARMGEN WCONFIG(\$GLB\$USR) GBL\_USS\_TKANJAR\_PATH required parameter when OMEGAMON AI for JVM 6.1 is installed.

3. Authorize the monitoring programs.
  - a. Authorize the product started tasks:

- i. Update RACF® or equivalent security system for the user ID (with OMVS segment) you will use for these started tasks:
  - Hub and remote monitoring servers (the default started task is named **IBMDS**)
  - Enhanced 3270 user interface (the default started task is named **IBMTOM**)
  - OMEGAMON AI for JVM (the default started task is **IBMJJ**)

- ii. Identify the user ID you created as a Superuser:

```
ALU <user ID> OMVS(UID(0) HOME(/) PROGRAM(/bin/sh))
```

- iii. Use the RDEFINE commands to associate the ID with the following started tasks:

- IBMDS (the started task of the monitoring server)
- IBMTOM (the started task of the enhanced 3270 user interface)
- IBMJJ (the started task of the OMEGAMON AI for JVM agent)
- IBMJT (the started task of the OMEGAMON AI for JVM collector)

```
*/associate the user ID with started tasks
RDEFINE STARTED IBMDS.* STDATA(USER(userID) GROUP(SYS1))
RDEFINE STARTED IBMTOM.* STDATA(USER(userID) GROUP(SYS1))
RDEFINE STARTED IBMJJ.* STDATA(USER(userID) GROUP(SYS1))
RDEFINE STARTED IBMJT.* STDATA(USER(userID) GROUP(SYS1))
```

- iv. After you issue all the RDEFINE commands, issue the refresh command:

```
SETROPTS RACLIST(STARTED) REFRESH
```

4. Update IKJTSOnn with the names of authorized monitoring programs. You might request your site's authorized system programmers to perform this step so it can be scheduled with the LPAR's change control processes.
  - Add programs KPDDSCO, KOBROUTR, and KOBSPFAU to the system PARMLIB member IKJTSOnn under the AUTHPGM section.
  - Refresh the IKJTSOnn member by issuing the set command (T IKJTSO=nn).

## What to do next

After you finish the preparation tasks, go to PARMGEN and create an RTE.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, specify the name of the RTE, identify the library where the JCL for all the RTEs that share the same global properties is stored, and provide the high-level qualifier that together with the RTE name uniquely identifies the data sets for this RTE.

## Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```

KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM

```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```

KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your <USERID> TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT      /  STORCLAS /
                                VOLSER   /  MGMTCLAS
GBL_TARGET_HILEV: _____ / _____ /
                                HLQ of SMP/E target (TK*) datasets  -----

Note:
If this is not the first time your <USERID> ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in <USERID>'s ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:

```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, <gbl_target_hilev>.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example:  
MY.RTE.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: MY.RTE.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique:  
%RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu.  
The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the primary options menu. The first **Set up PARMGEN work environment for an RTE** panel is displayed.
2. On panel KCIPQPG1, leave the field blank to create a new RTE.
3. Uncomment out the first two lines of the jobcard and specify values according to your environment.
4. Press Enter to proceed to the next panel. The **Set up PARMGEN Work Environment for an RTE (2 of 3)** panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```
KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                                Quick Configuration Mode
GBL_USER_JCL: MY.RTE.PARMGEN.JCL
RTE_PLIB_HILEV: MY.RTE
RTE_NAME: SYSA

Enter parameter values appropriate for your environment:
                                UNIT / STORCLAS /
                                VOLSER / MGMTCLAS /
GBL_TARGET_HILEV: IBM.TARGET.ITM63055_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets -----
GBL_SYSDA_UNIT: SYSDA___
                   Work datasets UNIT name
GBL_REGION: OM_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel. Type UTIL to access utility menu.
```

5. Review the values on the panel and override them as necessary.

#### **GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

#### **GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

#### **GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=OM value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, OM). The default is OM.

6. Press Enter to proceed to the next panel. The **Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed. The panel contains the values shown in the following figure.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=SYSA.
Press F1=Help for more information.

RTE_DESCRIPTION:      DESCRIPTION_____
More:                +

RTE_TYPE:             SHARING_          (Full, Sharing)
RTE_HILEV:            MY.RTE_____ (ex.: MY.RTE
                        (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      MY.RTE_____ (ex.: MY.RTE
                        (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:     _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:   _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:   _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                        (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE: SMP_____ ("SMP" value or *&rte_share)
                        (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y (Y, N) (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: N (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS: _____
RTE_X_SECURITY_EXIT_LIB: MY.RTE.SYSA.RKANSAMU_____
GBL_DSN_ACF2_MACLIB: _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE: REMOTE__ (Hub, Remote)
KDS_TEMS_HA_TYPE: -- (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM: 1918_____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX: IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Note the **More: +** which indicates that there is additional content on the panel.)

7. Provide values to required fields.
  - If your environment is not SMS-managed, specify the VSAM values.
  - Supply the high-level qualifier and the name for the base libraries:
    - **RTE\_X\_HILEV\_SHARING**
    - **RTE\_SHARE**
8. Press Enter to proceed to the next panel.

The **Include Products in this PARMGEN RTE** panel (KCIP@PGI) is displayed. This panel lists all the products installed in the product library.

```

KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE

Select ("S" or "/" ) products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
  -----
/ KDS Tivoli Enterprise Monitoring Server V630

/ KJJ OMEGAMON Monitoring for JVM V610
/ KOB OMEGAMON Enhanced 3270 User Interface V730
End of data

```

If you have other products in the ServerPac that you installed, they will be shown in the list as well.

9. All products are selected by default in the model. Make sure Tivoli Enterprise Monitoring Server (KDS), OMEGAMON Monitoring for JVM (KJJ), and OMEGAMON Enhanced 3270 User Interface (KOB) selected. Deselect other products if any, then change `Confirm ==> N` to Y, and press Enter. The JCL for the KCIJPCFG job is displayed.
10. Review the JCL to understand what the job is doing, then submit the job by typing `SUBMIT` or `SUB` in the **Command** line and press Enter. The KCIJPCFG jobs submits a second job, KCIJPPRF. Wait for both jobs to complete successfully before proceeding to the next step.
11. Return to the Workflow - Primary Option Menu by pressing F3.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, and populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPIPE and SNA defaults, and the like). You must also enable and configure any features you want to exploit (such as support for self-describing agents).

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Select 1 to review and edit the RTE profile. Review the configuration profile before editing it. Make sure the following parameters are configured, and accept default values for other parameters:
  - For the Remote TEMS, at a minimum you must set the `KDS_HUB_*` parameters to the appropriate values for the Hub TEMS that is installed on Linux system.
    - **KDS\_HUB\_TEMS\_NAME\_NODEID**
    - **KDS\_HUB\_TCP\_HOST**
    - **KDS\_HUB\_TCP\_PIPE\_PORT\_NUM**
  - To specify the z/OS® UNIX® System Services directory that is used for the OMEGAMON AI for JVM, set the following parameters:
    - **RTE\_USS\_RTEDIR**
  - Make sure the following parameter is configured for the network address (IP hostname or IP address) of the Remote TEMS that the Agent will report to. Normally this parameter is auto-discovered. Review its value and make sure it is correct.
    - **KJJ\_TEMS\_TCP\_HOST**

Return to the Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) after you edit the parameters.

3. Select 2 to review and edit the \$GBL\$USR global profile.  
Specify values to the following parameters:
  - **GBL\_DSN\_CSF\_SCSFMODE** for load library. By default, this parameter is commented out in the WCONFIG(\$GBL\$USR) member. Normally this parameter is auto-discovered by the DLA job. Review this parameter to make sure the value is correct.
  - **GBL\_USS\_TKANJAR\_PATH** for the TKANJAR DDDEF file system path

Return to the Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) after you edit the parameters.

4. Return to the Workflow - Primary Option Menu.

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name  Status  Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information.  Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job.
3. (Conditional) If the job failed with the return code 0008, go to the **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1), type 1s and press Enter. The job status window displays. Press Enter to continue to the Parameter Validation Report. Fix the errors detected in the report, and repeat step 1 and step 2.

## Completing the setup of the runtime environment

The final step in setting up the runtime environment (RTE) using the configuration software is submitting the batch jobs that were created in the preceding step. These jobs allocate the necessary data sets.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KICIPQGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL: MY.RTE.PARMGEN.JCL
RTE_PLIB_HILEV: MY.RTE
RTE_NAME: SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5. Perform post configuration steps.         POSTCFG
R Create next RTE - Reset fields.           New RTE

Press F1=Help for more information. Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KICIP@SUB) is displayed.

```

KICIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4. Run product security steps              (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs      (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

More: +

Press F1=Help for more information. Type UTIL to access utility menu.

```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

2. Select option 1 for the **Composite SUBMIT job**, which will run the required jobs altogether. Review the job description and submit the job.  
You can also submit each job individually.
3. If the jobs complete with any errors, review the \$IVPRPT verification report in the WCONFIG library. Correct any errors and rerun any jobs that did not complete successfully. Rerun the KCIJPIVP verification job until all errors have been eliminated.

## What to do next

**Note:** Make sure the following started tasks run in a proper service class in Work Load Manager:

- The started task of TEMS: **IBMDS**. SYSSTC or STCHIGH are suitable priority levels for this started task.
- The started task of enhanced 3270UI: **IBMTOM**. SYSSTC or STCHIGH are suitable priority levels for this started task.

- The started tasks of the OMEGAMON for JVM agent and collector: **IBMJJ** and **IBMJT**. Make sure the service class of these started tasks are equal to or higher than that of the object they are monitoring.

Then complete any configuration required outside of the configuration software.

## Configuring the components outside of PARMGEN

After you complete the configuration steps in PARMGEN, you must take additional steps outside the configuration software to complete the configuration of your monitoring components before you start the product started tasks. Complete the post configuration steps listed in this guide and you will be able to complete the configuration of the Remote TEMS, enhanced 3270UI, and the OEMGAMON AI for JVM agent on z/OS.

### APF-authorize the runtime load libraries

The runtime load libraries created by the configuration software must be added to your list of APF-authorized libraries.

### About this task

This step is applicable only if you did not enable the optional `RTE_X_STC_INAPF_INCLUDE_FLAG` parameter to generate inline APF-authorized statements in the product started tasks.

### Procedure

- Add the following runtime load libraries to your list of APF-authorized libraries.
  - `rhilev.rte.RKANMOD`
  - `rhilev.rte.RKANMODU`
  - `rhilev.rte.RKANMODL`
  - `rhilev.rte.RKANMODP`

You can run the following commands to do this:

```
*/commands to APF the needed libraries
SETPROG APF,ADD,DSNAME=&RHILEV..&SYS..RKANMOD,VOL(xxxxxx)
SETPROG APF,ADD,DSNAME=&RHILEV..&SYS..RKANMODU,VOL(xxxxxx)
SETPROG APF,ADD,DSNAME=&RHILEV..&SYS..RKANMODL,VOL(xxxxxx)
SETPROG APF,ADD,DSNAME=&RHILEV..&SYS..RKANMODP,VOL(xxxxxx)
```

Any other runtime libraries concatenated in the STEPLIB DDNAME or in the RKANMODL DDNAME of started tasks must also be APF-authorized.

If the runtime environment shares target libraries that were installed by SMP/E, you must also APF-authorize the following libraries:

- `thilev.TKANMOD`
- `thilev.TKANMODL`
- `thilev.TKANMODP`

### What to do next

Some monitoring agents require additional target libraries. Check the product-specific planning and configuration guides for a complete list of runtime libraries to include.

## Completing the configuration for the OMEGAMON AI for JVM agent

After you configure OMEGAMON AI for JVM using Configuration Manager or PARMGEN, you must complete several post-configuration steps. The post-configuration steps that you must complete are a combination of required steps and optional steps that depend on your particular configuration and monitoring objectives.

Step	Context
<a href="#">Configuring a JVM for monitoring with the OMEGAMON for JVM Agents</a>	Required for all configurations
<a href="#">Configuring JVMs in CICS</a>	Required to monitor a Java™ virtual machine (JVM) that runs in a CICS® subsystem
<a href="#">Configuring JVMs in a CICS Transaction Gateway subsystem</a>	Required to monitor a Java™ virtual machine (JVM) that runs in a CICS® Transaction Gateway subsystem
<a href="#">Configuring JVMs in an IBM Db2 stored procedure</a>	Required to monitor a JVM that runs in an IBM Db2® stored procedure
<a href="#">Configuring JVMs in IBM Operational Decision Manager</a>	Required to monitor a JVM that runs in IBM Operational Decision Manager (IBM ODM)
<a href="#">Configuring JVMs in an IMS batch or message processing region</a>	Required to monitor a Java™ virtual machine (JVM) that runs in an IMS™ Java Batch Processing (JBP) region or Java Message Processing (JMP)
<a href="#">Configuring JVMs in WebSphere Application Server</a>	Required to monitor a JVM that runs in WebSphere® Application Server
<a href="#">Configuring JVMs in WebSphere Liberty</a>	Required to monitor a Java virtual machine (JVM) that runs in WebSphere Liberty
<a href="#">Configuring JVMs in z/OSMF</a>	Required to monitor a Java™ virtual machine (JVM) that runs in z/OSMF
<a href="#">Configuring z/OS Connect for API monitoring</a>	Required for all configurations
<a href="#">Configuring JVMs that use the JZOS Batch Launcher</a>	Required to monitor a Java™ virtual machine (JVM) that uses the JZOS Batch Launcher
<a href="#">Specifying a non-default collector ID</a>	Required when you don't use the default <code>KJJ_COLLECTOR_ID=KJJ1</code> collector ID
<a href="#">Refreshing jar files after SMP/E maintenance</a>	Required for all configurations
<a href="#">Enabling IBMJT JTCOLL collector trace options</a>	Required to enable debugging in the IBMJT JTCOLL collector started task
<a href="#">Publishing OMEGAMON AI for JVM data to analytic platforms for AI Ops (including OMEGAMON Data Provider)</a>	Required to publish data to OMEGAMON Data Provider

## Starting the monitoring system

All monitoring components are installed and configured. You can start the monitoring system and monitor the application status either on Linux via TEP or on z/OS via enhanced 3270UI.

### About this task

**Note:** To guarantee the monitoring components work properly, start the Hub TEMS, TEPS, and TEP on the Linux server first, and then start the started tasks of the Remote TEMS, enhanced 3270UI, and OMEGAMON AI for JVM agent on z/OS.

### Procedure

1. Start the TEMS, TEP, and TEPS on the Linux server.

- a. On the Linux server, browse to the directory where you installed the IBM Tivoli Monitoring: *ITMinstall\_dir/bin*.
- b. Start the monitoring server.  
Run the following command to start the monitoring server:

```
./itmcmd server start tems_name
```

- c. Start the portal server.  
Run the following command to start the portal server:

```
./itmcmd agent start cq
```

- d. Start the portal client.  
Run the following command to start the portal client:

```
./itmcmd agent start cj
```

2. On z/OS, start the started tasks of the Remote TEMS, enhanced 3270UI, and OMEGAMON AI for JVM agent by running the following commands.

```
S IBMDS
S IBMTOM
S IBMJJ
```

In the RKLVLLOG for the monitoring server address space, look for the following messages to indicate successful startup:

```
KDSMA001 Tivoli Enterprise Monitoring Server (TEMS) data collection server started.
K04SRV032 Tivoli Enterprise Monitoring Server (TEMS) startup complete.
```

Look also for the following messages to indicate successful establishment of a communications path by the local location broker:

```
KDSNC007 Local Location Broker is active
KDSNC004 Bind of local location broker complete= protocol_name:address
```

Also look for the messages that indicate successful connection between the OMEGAMONAI for JVM agent and the local Remote TEMS.

From the Remote TEMS started task IBMDS:

```
Remote node <KJJ:SYSA:JVM> is ON-LINE
```

From the OMEGAMON AI for JVM agent started task IBMJJ:

```
Starting Enterprise situation HEARTBEAT
No action is required., Producer (IRA Constructor)
Timer for owner KPX.RNODESTS started.
Connecting to CMS SYSA:CMS
```

## Result

The monitoring system is started.

## What to do next

You can access the monitoring system through TEP or enhanced 3270UI:

- To log in to the TEP client, you can use the default user ID **sysadmin**. No password is required to log on to the portal client unless the hub monitoring server was configured to enable **Security: Validate User**.
- To log in to the enhanced 3270UI, start a new VTAM 3270 session and run the following command at the VTAM logon panel.

```
LOGON APPLID(applid)
```

where *applid* is the VTAM Applid of the enhanced 3270UI address space. Then enter your user ID and password and press Enter.

## Extension guide for OMEGAMON

The purpose of this guide is to provide instructions for adding a new monitoring agent to an existing monitoring infrastructure.

### About the scenario in this guide

To better illustrate the procedure of adding a new monitoring agent to an existing monitoring infrastructure, the OMEGAMON AI for JVM agent will be used as an example and will be added to a monitoring infrastructure that is similar to the one that is set up in the Cross-platform quick deployment guide. The steps of adding other agents is similar.

Before using this guide, it is expected that you have a basic understanding of the monitoring infrastructure and the relationship between different monitoring components. Otherwise, it is recommended that you start with the First time deployment guide, or the Cross-platform quick deployment guide to set up a functional RTE, then refer to this guide for extension steps.

## Topology

Go through this topic to understand the topology of the monitoring system to be deployed in this guide.

The existing monitoring environment of the scenario in this guide has the following components:

- A Hub TEMS, a TEP, and a TEPS on a Linux server.
- A Remote TEMS, an e3270UI on z/OS in LPARx.
- Multiple monitoring agents like OMEGAMON for CICS and OMEGAMON for IMS running in the same LPAR.

Refer to the following figure for the relationship between the components.

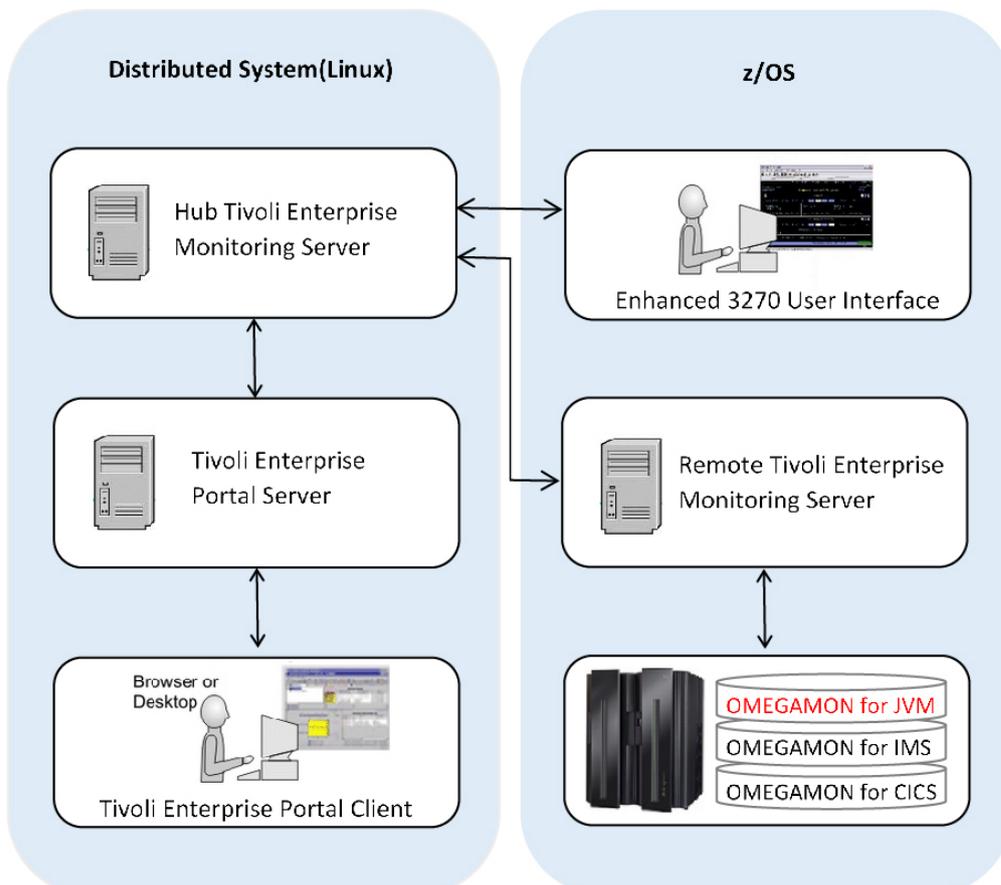

Figure 4: Topology of the monitoring system

**Note:** In this scenario, an OMEGAMON AI for JVM agent is added to the RTE that is running on LPARx. You can repeat the configuration steps in this guide to add the agent to other RTEs in other LPARs.

## RTE configuration

OMEGAMON AI for JVM can use either IBM Z Monitoring Configuration Manager (Configuration Manager) or Parameter Generator (PARMGEN) as its configuration tool. It is recommended to use Configuration Manager, though PARMGEN is also supported.

To use Configuration Manager, follow the steps in [Using Configuration Manager to add OMEGAMON AI for JVM to an existing RTE](#).

To use PARMGEN, follow the steps in [Using PARMGEN to add OMEGAMON AI for JVM to an existing RTE](#).

### Using Configuration Manager to add OMEGAMON AI for JVM to an existing RTE

Use this procedure add an IBM Z OMEGAMON AI for JVM, 6.1 agent to an existing runtime environment (RTE) using IBM Z Monitoring Configuration Manager.

This procedure assumes that you already have an RTE defined in your RTEDEF library and that the agent software (version 6.1) is installed and available. For additional details, see the [IBM Z OMEGAMON AI for JVM](#) and [Configuration Manager](#) documentation. Be sure to review your site's prerequisites, security, and network settings before proceeding.

### Prerequisites

Ensure that the IBM Z OMEGAMON AI for JVM 6.1 agent and its support files are installed in the SMP/E target libraries.

Confirm that you have the following prerequisites:

- Ensure that the IBM Z OMEGAMON AI for JVM, 6.1 agent is installed and its application support files are accessible in your SMP/E target libraries.
- Confirm that you have an existing runtime environment (RTE) defined in your RTEDEF library (for example, *rte\_plib\_hilev*.RTEDEF).
- Verify that you have proper read/write access to the RTEDEF library and that a current backup of the configuration is available.
- Make certain that your user ID has sufficient administrative privileges and that all necessary networking and security settings are correctly configured.

### Update the runtime environment

Edit the parameters in the RTEDEF (*rte\_name*) library to meet your requirements for the runtime environment, and then submit a job that performs the **GENERATE** action to generate runtime members from those parameters.

### About this task

Updating a runtime environment encompasses many scenarios. For example:

- Applying maintenance, after using SMP/E to update target libraries
- Upgrading an agent to a new product release
- Adding or removing agents
- Changing parameter values; for example, to change a hub monitoring server to a remote monitoring server

The procedure for updating the runtime environment is the same for every scenario.

### Procedure

1. Edit the parameters in the `rte_plib_hilev`.RTEDEF library to configure an OMEGAMON AI for JVM agent.

In the RTEDEF (`rte_name`) member, set the following parameter to Y:

### CONFIGURE\_JVM\_KJJ

Configures an OMEGAMON AI for JVM monitoring agent

```
RTE_NAME                <rte_name>
RTE_PLIB_HILEV          <rte_plib_hilev>
RTE_SECURITY_USER_LOGON NONE
RTE_SECURITY_FOLD_PASSWORD_FLAG Y
RTE_SECURITY_CLASS      ""
RTE_X_SECURITY_EXIT_LIB <rte_plib_hilev>.<rte_name>.SECEXITS
RTE_TEMS_NAME_NODEID    <rte_name>:TEMS:RTE_COMM_PROTOCOL1
RTE_COMM_PROTOCOLn     IPPPIPE
RTE_TCP_HOST            <sysiphostname>
RTE_TCP_PORT_NUM       1918
RTE_VTAM_APPLID_PREFIX OM<sysclone>
RTE_STC_PREFIX         OMEG
RTE_USS_RTEDIR         "/var/rtehome"
CONFIGURE_TEMS_KDS      Y * TEMS
CONFIGURE_E3270UI_KOB   Y * Enhanced 3270
CONFIGURE_CICS_KC5      Y * CICS TS
CONFIGURE_CICS_TG_KGW   Y * CICS TG
CONFIGURE_DB2_AGENT_KD5 N * Db2
CONFIGURE_IMS_KI5       Y * IMS
CONFIGURE_JVM_KJJ       Y * JVM
CONFIGURE_ZOS_KM5       N * z/OS
CONFIGURE_MESSAGING_KMQ N * MQ
CONFIGURE_MESSAGING_KQI N * Integration Bus
CONFIGURE_NETVIEW_KNA   N * Netview
CONFIGURE_MFN_KN3       N * Network
CONFIGURE_STORAGE_KS3   N * Storage
CONFIGURE_OMEGAVIEW_KWO N * Integration Monitor
CONFIGURE_ITCAMAD_KYN   N * ITCAM for Applications
CONFIGURE_ACM_KRN       N * Advanced Catalog Mgmt
CONFIGURE_ARD_KRH       N * Advanced Rpt and Mgmt
CONFIGURE_AAD_KRG       N * Advanced Audit
CONFIGURE_AAM_KRJ       N * Advanced Alloc Mgmt
CONFIGURE_ATAM_KRK      N * Automated Tape Alloc
CONFIGURE_ABR_KRV       N * Advanced Backup and Rec
CONFIGURE_ODP_KAY       N * Data Provider
```

2. Submit a job that performs the **GENERATE** action.

The **GENERATE** action generates the runtime members for the runtime environment, including the started tasks.

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<tlib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<tlib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION GENERATE
RTE_NAME <rte_name>
RTE_PLIB_HILEV <rte_plib_hilev>
/*
```

You have completed the steps that involve the configuration software. The remaining steps complete the configuration of the runtime environment *outside* of the configuration software.

## Completing the runtime environment configuration

Depending on your user privileges, you might need to ask someone else to perform some or all of the following steps. For example, only z/OS® system administrators are typically allowed to write to system libraries.

### About this task

These “complete the configuration” steps depend on your site-specific procedures and the requirements of the components, such as the monitoring agents, that you have chosen to configure in the runtime environment. The requirements of each component are described in the separate product documentation for each component.

Typically, at this point in the procedure for creating a runtime environment, you would need to refer to that separate documentation. However, to help make this “first runtime environment” procedure stand-alone, and because in this procedure we have selected a fixed set of specific components, the “complete the configuration” steps are presented here.

## Procedure

1. Use your site-specific procedures to copy the runtime members for started tasks and VTAM® definitions to your system libraries.  
Copy the members from the following libraries to your corresponding PROCLIB, VTAMLIB, and VTAMLST system libraries:

```
rte_hilev.SYS1.PROCLIB
rte_hilev.SYS1.VTAMLIB
rte_hilev.SYS1.VTAMLST
```

The default value of the RTE\_HILEV parameter is the value of RTE\_PLIB\_HILEV.

2. If you followed the earlier tip to set the **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** parameter to Y, then you can skip this step. However, you should still *read* this information to understand the requirements of the runtime environment for VTAM® resources and APF-authorized libraries.
  - a. Activate the VTAM® resources defined by this runtime environment.  
Issue the following **VARY ACT** MVS™ system command:

```
VARY NET,ACT,ID=rte_vtam_applid_prefixNODE,SCOPE=ALL
```

The **ID** parameter of the **VARY ACT** command must match the value of the runtime environment parameter **RTE\_VTAM\_GBL\_MAJOR\_NODE**.

The default value of **RTE\_VTAM\_GBL\_MAJOR\_NODE** is the value of **RTE\_VTAM\_APPLID\_PREFIX** followed by the string **NODE**. If you use the **RTE\_VTAM\_APPLID\_PREFIX** initial value of **OMxx**, then the default value of **RTE\_VTAM\_GBL\_MAJOR\_NODE** is **OMxxNODE**, where **xx** is the value of the z/OS® static system symbol **SYSCLONE**. For example, if the system (LPAR) name is **ZOS1**, then specify **ID=OMS1NODE**.

- b. APF-authorize libraries.  
Add the following data sets to the authorized program facility (APF) list:

- The following runtime environment library:  
`rte_hilev.rte_name.RKANMODU`
- The following target libraries, under the high-level qualifiers of the STEPLIB of the Configuration Manager job:  
TKANMOD  
TKANMODL  
TKANMODP  
TKANMODR

The runtime member `rte_hilev.SYS1.PROCLIB(rte_stc_prefixAPF)` contains **VARY ACT** and **SETPROG APF** commands for this runtime environment. Different runtime environments require different VTAM® resources and APF-authorized libraries, depending on the configured products.

If you specify the parameter **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** Y in the RTEDEF (`rte_name`) member, and then perform the **GENERATE** action, some started tasks will contain an **INCLUDE** statement to include that member, so that you do not need to issue these commands separately. Whether started tasks are allowed to perform such commands depends on your local site practices.

Setting **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** can be expedient for initial testing. However, typical best practice is to activate VTAM® resources and APF-authorize libraries during system initialization rather than each time you start a task. Use the generated `SYS1.PROCLIB(rte_stc_prefixAPF)` member to identify which libraries you need to add to the APF list at system initialization.

3. Authorize the monitoring programs.
  - a. Authorize the product started tasks:
    - i. Update RACF® or equivalent security system for the user ID (with OMVS segment) you will use for these started tasks:

- Hub and remote monitoring servers (the default started task is named **OMEGDS**)
- Enhanced 3270 user interface (the default started task is named **OMEGTOM**)
- OMEGAMON AI for JVM (the default started task is **OMEGJJ**)

ii. Identify the user ID you created as a Superuser:

```
ALU <user ID> OMVS(UID(0) HOME(/) PROGRAM(/bin/sh))
```

iii. Use the RDEFINE commands to associate the ID with the following started tasks:

- OMEGDS (the started task of the monitoring server)
- OMEGTOM (the started task of the enhanced 3270 user interface)
- OMEGJJ (the started task of the OMEGAMON AI for JVM agent)
- OMEGJT (the started task of the OMEGAMON AI for JVM collector)

```
*/associate the user ID with started tasks
RDEFINE STARTED IBMDS.* STDATA(USER(userID) GROUP(SYS1))
RDEFINE STARTED IBMTOM.* STDATA(USER(userID) GROUP(SYS1))
RDEFINE STARTED IBMJJ.* STDATA(USER(userID) GROUP(SYS1))
RDEFINE STARTED IBMJT.* STDATA(USER(userID) GROUP(SYS1))
```

iv. After you issue all the RDEFINE commands, issue the refresh command:

```
SETROPTS RACLIST(STARTED) REFRESH
```

4. Update IKJTSONn with the names of authorized monitoring programs. You might request your site's authorized system programmers to perform this step so it can be scheduled with the LPAR's change control processes.
  - Add programs KPDDSCO, KOBROUTR, and KOBSPFAU to the system PARMLIB member IKJTSONn under the AUTHPGM section.
  - Refresh the IKJTSONn member by issuing the set command (T IKJTSONn).
5. Start at least the following tasks: *rte\_stc\_prefixCN*, *rte\_stc\_prefixDS*, *rte\_stc\_prefixTOM*, *rte\_stc\_prefixJJ*, and *rte\_stc\_prefixJT*. The user ID that you associate with these started tasks must have z/OS UNIX superuser privileges and access to the runtime member.

#### ***rte\_stc\_prefixCN***

OMEGAMON® subsystem.

The OMEGAMON® subsystem does not belong to a runtime environment. You only need one OMEGAMON® subsystem per LPAR.

If the OMEGAMON® subsystem has already been started, the job for this started task will fail. The JESMSGLG output data set for the failed job will contain the following messages:

```
CNDL018I OMEGAMON SUBSYSTEM ALREADY ACTIVE ...
CNDL002I OMEGAMON SUBSYSTEM Vvrm TERMINATED ...
```

This is not a problem: your runtime environment will use the already-active subsystem.

#### ***rte\_stc\_prefixDS***

Monitoring server.

#### ***rte\_stc\_prefixTOM***

Enhanced 3270 user interface.

#### ***rte\_stc\_prefixJJ***

The default OMEGAMON AI for JVM monitoring agent name is OMEGJJ. OMEGAMON AI for JVM started task names are specified in the RTEDEF(KJJ\$PARM) member or the LPAR-specific RTEDEF(KJJ\$*lpar*) member.

#### ***rte\_stc\_prefixJT***

The default OMEGAMON AI for JVM collector name is OMEGJT. OMEGAMON AI for JVM started task names are specified in the RTEDEF(KJJ\$PARM) member or the LPAR-specific RTEDEF(KJJ\$*lpar*) member.

## What to do next

Complete the post-configuration steps for OMEGAMON AI for JVM: [“Completing the configuration for the OMEGAMON AI for JVM agent” on page 105.](#)

## Using PARMGEN to add OMEGAMON AI for JVM to an existing RTE

Describes how to add an IBM Z OMEGAMON AI for JVM, 6.1 agent to an existing runtime environment (RTE) using the PARMGEN configuration tool.

### About this task

The key to adding a new product to an existing RTE is the Include Products in this PARMGEN RTE panel (KCIP@PGI). You regenerate the KCIJPCFG setup job and add the new product by selecting it on the Include Products panel. After you submit the job, the RTE configuration profile is updated with the parameters for that product. Then, you can customize those parameters by editing the profile. You run the \$PARSE job to recreate the runtime members and jobs, and then resubmit the jobs to complete the reconfiguration of the RTE with the new product.

### Preparing the environment for configuration

You must prepare your system before adding the OMEGAMON AI for JVM agent to your RTE.

### Procedure

1. Make sure that **IBM Z OMEGAMON AI for JVM on z/OS** (FMID HKJJ610) is SMP/E installed in the same CSI as other monitoring components.
2. Create a new file system for OMEGAMON AI for JVM that uses the **RTE\_USS\_RTEDIR** home directory parameter. If the RTE already enabled SDA, or has OMEGAMON for CICS TG agent configured, it means the z/OS® UNIX® System Services directory already exists, and you can skip this step. This file system must be created, mounted, and in read/write mode before the z/OS® UNIX® jobs that define the file system paths are submitted. Select a name for your RTE that establishes or fits a naming convention that can be used as you install additional RTEs. The KCIUSSJB sample job in the *gbl\_target\_hilev*.TKANSAM SMP/E target library is run in the following RTE configuration task. In the **MOUNT FILESYSTEM** command, the **MOUNTPOINT()** parameter equates to the value you will specify for the **RTE\_USS\_RTEDIR** parameter. For example:

```
"MOUNT FILESYSTEM('&hlq_rte_home') TYPE(ZFS) MODE(RDWR) MOUNTPOINT('/rtehome') PARM('AGGRGROW')"
```

So an example of this using RTE name TSTEST might be:

```
"MOUNT FILESYSTEM('OMVS.TSTEST.HFS') TYPE(ZFS) MODE(RDWR) MOUNTPOINT('/tstest') PARM('AGGRGROW')"
```

**Note:** Take note of the SMP/E TKANJAR DDDEF location in z/OS UNIX, which is key to the PARMGEN WCONFIG(\$GLB\$USR) GBL\_USS\_TKANJAR\_PATH required parameter when OMEGAMON AI for JVM is installed.

3. To use the autodiscovery function properly, give the user ID proper RACF authorities and make sure the SMPTLOAD DDDEF statement is defined in the CSI:
  - The user ID must have the following authorities:
    - READ access is recommended for all the data sets in the system PARMLIB concatenation used during IPL.
    - An OMVS segment with authority to issue the netstat, host and home commands.

- If you are upgrading from an older version of a product that does not support IBM® Discovery Library Adapter for z/OS®, make sure that SMPTLOAD is defined in the CSI. Use the following sample job to define the SMPTLOAD DDDEF. Change all occurrences of the following lowercase variables to values suitable to your installation before submitting.

```
#globalcsi - The dsname of your global CSI.
#tzone - The name of the SMP/E target zone.
#dzone - The name of the SMP/E distribution zone.
//SMPTLOAD JOB 'ACCOUNT INFORMATION','SMPTLOAD',
// CLASS=A,MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID
//
// D e f i n e D D D E F E n t r i e s
//
//SMPTLOAD EXEC PGM=GIMSMP,REGION=496K
//SMPCSI DD DISP=OLD,DSN=#globalcsi
//SMPCNTL DD
SET BDY(GLOBAL) .
UCLIN .
ADD DDDEF(SMPTLOAD) CYL SPACE(2,1) DIR(1)
UNIT(SYSALLDA) .
ENDUCL .
SET BDY(#tzone) .
UCLIN .
ADD DDDEF(SMPTLOAD) CYL SPACE(2,1) DIR(1)
UNIT(SYSALLDA) .
ENDUCL .
SET BDY(#dzone) .
UCLIN .
ADD DDDEF(SMPTLOAD) CYL SPACE(2,1) DIR(1)
UNIT(SYSALLDA) .
ENDUCL .
/*
```

#### 4. Authorize the monitoring programs.

##### a. Authorize the product started tasks:

- Update RACF® or equivalent security system for the user ID (with OMVS segment) you will use for the started task of OMEGAMON AI for JVM (the default started task is IBMJJ).
- Identify the user ID you created as a Superuser:

```
ALU <user ID> OMVS(UID(0) HOME(/) PROGRAM(/bin/sh))
```

- Use the RDEFINE commands to associate the ID with the started task IBMJJ and IBMJT (the started tasks of the OMEGAMON AI for JVM agent and collector):

```
*/associate the user ID with started tasks
RDEFINE STARTED IBMJJ.* STDATA(USER(userID) GROUP(SYS1))
RDEFINE STARTED IBMJT.* STDATA(USER(userID) GROUP(SYS1))
```

- After you issue all the RDEFINE commands, issue the refresh command:

```
SETROPTS RACLIST(STARTED) REFRESH
```

## Specify the runtime environment

To specify the runtime environment (RTE) you want to configure, specify the name of the RTE, identify the library where the JCL for all the RTEs that share the same global properties is stored, and provide the high-level qualifier that together with the RTE name uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```

KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM

```

2. Select option 3 and press Enter to enter PARMGEN.
3. Provide the requested values to locate the RTE where you want to add the OMEGAMON AI for JVM agent.

#### **GBL\_USER\_JCL**

Specify the data set name of the PARMGEN global user JCL library for the existing RTE. For example: TDITN.IDTST.PARMGEN.JCL.

#### **RTE\_PLIB\_HILEV**

Specify the non-VSAM high-level qualifier of the existing RTE for the PARMGEN work libraries. For example: TDITN.IDTST.

#### **RTE\_NAME**

Specify the name for the existing RTE you created before, for example: SYSA.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL_____
                (for example, TDITNT.DEV.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: TDITN.IDTST_____
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      SYSA_____ (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.
Press F1=Help for more information. Type U or UTIL to access utility menu.

```

4. Press Enter.  
The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----  
Option ==>
```

Quick Configuration Mode

```
GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL  
RTE_PLIB_HILEV: TDITN.IDTST  
RTE_NAME: SYSA
```

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.  
If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.  
Enter n (1-5) to perform tasks.  
Enter ns (1s-5s) for detailed job/task status.

	Description	Job/Label	Status	Date
1.	Set up/Refresh PARMGEN work environment.	KCIJPCFG		
2.	Customize PARMGEN configuration profiles.	SYSA		
3.	Create this RTE's runtime members and jobs.	\$PARSE		
4.	Submit batch jobs to complete PARMGEN setup.	SUBMIT		
5.	Perform post configuration steps.	POSTCFG		
R	Create next RTE - Reset fields.	New RTE		

## Extend the work environment

Accept the settings of the existing RTE, and select the OMEGAMON AI for JVM agent in the KCIP@PGI panel. Then you submit the KCIJPCFG job to update the libraries and the configuration profiles for the RTE.

## Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the primary options menu. The first **Set up PARMGEN work environment for an RTE** panel is displayed.
2. Accept the existing settings in the KCIPQPG1, KCIP@PG2, and KCIP@PG3 panels, and press Enter till you reach the KCIP@PGI panel. The **Include Products in this PARMGEN RTE** panel (KCIP@PGI) is displayed. This panel lists all the products installed in the product library.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE
```

```
Select ("S" or "/" ) products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected
```

```
When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)
```

```
 Kpp Component or Product Name and Version
-----
_ KAH System Automation Monitoring Agent V350
_ KC5 OMEGAMON AI for CICS V610
_ KD0 Tivoli Decision Support for z/OS Agent V181
/ KDS Tivoli Enterprise Monitoring Server V630

End of data
```

If you have other products in the ServerPac that you installed, they will be shown in the list as well.

3. Select the line **KJJ OMEGAMON AI for JVM V6.1.0**.
4. Change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
5. Review the JCL to understand what the job is doing, then submit the job and return to the Workflow - Primary Option Menu.  
The KCIJPCFG jobs submits a second job, KCIJPPRF. Wait for both jobs to complete successfully before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, and populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The OMEGAMON AI for JVM parameters are added in the configuration profile. Set necessary parameters to proper values.

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles).  
The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles and post configuration instructions.  
Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#) and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to review and edit the RTE profile.  
Configure the following parameters and accept default values for other parameters:

- **KJJ\_TEMS\_TCP\_HOST** for the network address (IP hostname or IP address) of the Remote TEMS that the Agent will report to. Normally this parameter is auto-discovered. Review its value and make sure it is correct.
  - **RTE\_USS\_RTEDIR** for the z/OS UNIX System Services™ directory is used for the OMEGAMON AI for JVM.
4. Select 2 to edit the \$GBL\$USR global profile.  
Specify values to the following parameters:
    - **GBL\_DSN\_CSF\_SCSFMOD0** for load library. Normally this parameter is auto-discovered by the DLA job. Review this parameter to make sure the value is correct.
    - **GBL\_USS\_TKANJAR\_PATH** for the TKANJAR DDDEF file system path
  5. Select 4 to review the following imbeds to make sure there are JVM subsystems or types running that can be monitored by the OMEGAMON AI for JVM agent. Otherwise, there will be no data displayed on the interface.
    - KJJ\$SDL1
    - KJJ\$SDL2
    - KJJ\$SDL3
    - KJJ\$SDL4
    - KJJ\$SDL5

## Creating the RTE members and jobs

To update the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

      Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles. KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job.

## Completing the setup of the runtime environment

The final step in setting up the runtime environment (RTE) using the configuration software is submitting the batch jobs that were created in the preceding step. These jobs allocate the necessary data sets.

### Procedure

- From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```
KCIPQPG  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE    Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT    Enter 4 for details.
5. Perform post configuration steps.         POSTCFG
R Create next RTE - Reset fields.           New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.
```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
More: +
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
** OR **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4. Run product security steps              (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information.  Type UTIL to access utility menu.
```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs by using the composite SUBMIT job.

#### TUTORIAL INFORMATION

Before you submit the **Composite SUBMIT job**, review and edit it as necessary. For example, OMEGAMON AI for JVM uses z/OS® UNIX® System Services and the user that submits the job must have SUPERUSER and READ access to BPX.FILEATTR.\* profiles (BPX.FILEATTR.APF, BPX.FILEATTR.PROGCTL) in the FACILITY class. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

**Note:** After you submit the required jobs or the composite job, you still need to copy the product started tasks and the VTAM major node members to the system libraries. You can copy the product started tasks and VTAM major node members by running either your own jobs or the PARMGEN KCIJPSYS job. You can review the KCIJPSYS job overview to get a list of items that you must copy.

- If the jobs complete with any errors, review the \$IVPRPT verification report in the WCONFIG library. Correct any errors and rerun any jobs that did not complete successfully. Rerun the KCIJPIVP verification job until all errors have been eliminated.

## What to do next

**Note:** Make sure the following started task run in a proper service class in Work Load Manager:

- The started task of the OMEGAMON AI for JVM agent and collector: **IBMJJ** and **IBMJT**. Make sure the service class of the started tasks are equal to or higher than that of the object they are monitoring.

Then complete any configuration required outside of the configuration software.

## Completing the configuration for the OMEGAMON AI for JVM agent

After you configure OMEGAMON AI for JVM using Configuration Manager or PARMGEN, you must complete several post-configuration steps. The post-configuration steps that you must complete are a combination of required steps and optional steps that depend on your particular configuration and monitoring objectives.

<i>Table 14: Post-configuration steps</i>	
Step	Context
<a href="#">Configuring a JVM for monitoring with the OMEGAMON for JVM Agents</a>	Required for all configurations
<a href="#">Configuring JVMs in CICS</a>	Required to monitor a Java™ virtual machine (JVM) that runs in a CICS® subsystem
<a href="#">Configuring JVMs in a CICS Transaction Gateway subsystem</a>	Required to monitor a Java™ virtual machine (JVM) that runs in a CICS® Transaction Gateway subsystem
<a href="#">Configuring JVMs in an IBM Db2 stored procedure</a>	Required to monitor a JVM that runs in an IBM Db2® stored procedure
<a href="#">Configuring JVMs in IBM Operational Decision Manager</a>	Required to monitor a JVM that runs in IBM Operational Decision Manager (IBM ODM)
<a href="#">Configuring JVMs in an IMS batch or message processing region</a>	Required to monitor a Java™ virtual machine (JVM) that runs in an IMS™ Java Batch Processing (JBP) region or Java Message Processing (JMP)
<a href="#">Configuring JVMs in WebSphere Application Server</a>	Required to monitor a JVM that runs in WebSphere® Application Server
<a href="#">Configuring JVMs in WebSphere Liberty</a>	Required to monitor a Java virtual machine (JVM) that runs in WebSphere Liberty
<a href="#">Configuring JVMs in z/OSMF</a>	Required to monitor a Java™ virtual machine (JVM) that runs in z/OSMF
<a href="#">Configuring z/OS Connect for API monitoring</a>	Required for all configurations
<a href="#">Configuring JVMs that use the JZOS Batch Launcher</a>	Required to monitor a Java™ virtual machine (JVM) that uses the JZOS Batch Launcher
<a href="#">Specifying a non-default collector ID</a>	Required when you don't use the default <code>KJJ_COLLECTOR_ID=KJJ1</code> collector ID
<a href="#">Refreshing jar files after SMP/E maintenance</a>	Required for all configurations
<a href="#">Enabling IBMJT JTCOLL collector trace options</a>	Required to enable debugging in the IBMJT JTCOLL collector started task
<a href="#">Publishing OMEGAMON AI for JVM data to analytic platforms for AI Ops (including OMEGAMON Data Provider)</a>	Required to publish data to OMEGAMON Data Provider

## Starting the monitoring system

All monitoring components are installed and configured. You can start the monitoring system and monitor the application status either on Linux via TEP or on z/OS via enhanced 3270UI.

### About this task

**Note:** To guarantee the monitoring components work properly, start the Hub TEMS, TEPS, and TEP on the Linux server first, and then start the started tasks of the Remote TEMS, enhanced 3270UI, and OMEGAMON AI for JVM agent on z/OS.

### Procedure

1. Start the TEMS, TEP, and TEPS on the Linux server.
  - a. On the Linux server, browse to the directory where you installed the IBM Tivoli Monitoring: `ITMinstall_dir/bin`.
  - b. Start the monitoring server.  
Run the following command to start the monitoring server:

```
./itmcmd server start tems_name
```

- c. Start the portal server.  
Run the following command to start the portal server:

```
./itmcmd agent start cq
```

- d. Start the portal client.  
Run the following command to start the portal client:

```
./itmcmd agent start cj
```

2. On z/OS, start the started tasks of the Remote TEMS, enhanced 3270UI, and OMEGAMON AI for JVM agent by running the following commands.

```
S IBMDS  
S IBMTOM  
S IBMJJ
```

In the RKLVLLOG for the monitoring server address space, look for the following messages to indicate successful startup:

```
KDSMA001 Tivoli Enterprise Monitoring Server (TEMS) data collection server started.  
K04SRV032 Tivoli Enterprise Monitoring Server (TEMS) startup complete.
```

Look also for the following messages to indicate successful establishment of a communications path by the local location broker:

```
KDSNC007 Local Location Broker is active  
KDSNC004 Bind of local location broker complete= protocol_name:address
```

Also look for the messages that indicate successful connection between the OMEGAMONAI for JVM agent and the local Remote TEMS.

From the Remote TEMS started task IBMDS:

```
Remote node <KJJ:SYSA:JVM> is ON-LINE
```

From the OMEGAMON AI for JVM agent started task IBMJJ:

```
Starting Enterprise situation HEARTBEAT  
No action is required., Producer (IRA Constructor)
```

```
Timer for owner KPX.RNODESTS started.  
Connecting to CMS SYSA:CMS
```

## Result

The monitoring system is started.

## What to do next

You can access the monitoring system through TEP or enhanced 3270UI:

- To log in to the TEP client, you can use the default user ID **sysadmin**. No password is required to log on to the portal client unless the hub monitoring server was configured to enable **Security: Validate User**.
- To log in to the enhanced 3270UI, start a new VTAM 3270 session and run the following command at the VTAM logon panel.

```
LOGON APPLID(applid)
```

where *applid* is the VTAM Applid of the enhanced 3270UI address space. Then enter your user ID and password and press Enter.

---

# Planning

Effective preparation and planning make deployment and upgrades go more quickly and smoothly. To prepare for deployment, review the preinstallation requirements and familiarize yourself with the product components and architecture. Then, review the planning decisions that are covered in the deployment section. To prepare for upgrade, review the requirements and other information in the upgrade section.

To plan deployment of distributed components of Tivoli Management Services, see the topics in the *IBM Tivoli Monitoring Installation and Setup Guide*. For planning information specific to a particular OMEGAMON product, see the planning topics for that product.

---

## Planning a first deployment

If you are planning a first-time deployment, review the pre-installation requirements and familiarize yourself with the product components and architecture. Then, make the planning decisions that are covered in this section.

For information on installing, configuring, and upgrading the distributed components of Tivoli Management Services, see the *IBM Tivoli Monitoring: Installation and Setup Guide*. For product-specific planning, installation, configuration, and upgrade information, see the documentation and technotes for each product.

### Decision 1: Why to install into a shared CSI

To manage a suite of monitoring agent products with a monitoring server on z/OS® systems, install the products into a shared consolidated software inventory (CSI) whenever possible.

A shared CSI has two main advantages:

- A shared CSI eliminates duplication and can reduce space requirements by as much as 75%. The monitoring agents share components that must be duplicated if different target and distribution zones are used.
- In a shared CSI, SMP/E can automatically manage IFREQ situations across product components. Otherwise, the IFREQ situations must be managed by running SMP/E cross-zone reports. For information about cross-zone reports, see the *IBM® SMP/E for z/OS®* documentation.

**Note:** While most of the monitoring agents on a z/OS® system can coexist in a shared CSI, IBM® cannot guarantee that these products can coexist with products from other vendors.

If you install a product or component into an existing CSI that contains a previous version of the same product or component, SMP/E deletes the previous version during the installation process. To maintain more than one version of products or components, you must install them into a separate CSI from the CSI that contains the previous version.

If you decide to install into a shared CSI, follow these guidelines:

- Specify the same high-level qualifier for the target and distribution libraries.
- Make sure you have enough DASD. If you are installing into an existing shared CSI, pay particular attention to the DKAN\* and TKAN\* common libraries. The DKAN\* and TKAN\* libraries were originally allocated with secondary space allocation, to allow them to expand when you install additional products or apply maintenance. However, if these libraries have already gone into multiple extents, you might not have sufficient extents available for any necessary expansion. In that case, you might receive error messages during installation.
- During normal SMP/E processing, VSAM control interval and control area splits can occur. The resulting fragmentation can degrade SMP/E performance and space utilization. To reorganize the CSI, use your site's approved utility and method for managing VSAM files.

If you are not installing into a shared CSI, you must use a different high-level qualifier for the target and distribution libraries.

## Decision 2: What types of runtime environments to set up

A *runtime environment* is a logical grouping of runtime libraries that are referenced by started tasks running on a z/OS® image. When you configure monitoring servers and monitoring agents, you begin by defining a runtime environment of a certain type, which determines the number and types of runtime libraries required. System proximity, available storage space, and product maintenance strategy are all factors used to determine the type of runtime environment you require for a set of products.

“Types of libraries” on page 123 summarizes the types of libraries created during installation and configuration of monitoring servers and monitoring agents on z/OS® systems.

Lists names and descriptions of types of runtime libraries

Type of library	Description
Runtime libraries	General term for libraries referenced by started task procedures.
Target libraries Abbreviated <i>thilev</i> .	SMP/E-maintained target libraries.
Base libraries Abbreviated <i>rhilev</i> or <i>rhilev.rte</i> .	Read-only runtime libraries that the configuration process does not alter and that are shareable between systems. These libraries physically exist in a full or base runtime environment, or as SMP/E target libraries (if a runtime environment shares with SMP/E). The base libraries can contain the actual data sets maintained by SMP/E, or a copy of them. Use a clone or copy of the SMP/E installation libraries for a production environment.
LPAR-specific libraries Abbreviated <i>rhilev.rte</i> .	Runtime libraries that are built during configuration to run on a specific logical partition (LPAR). These libraries contain the unique elements required for a particular LPAR and cannot be shared among z/OS® images.

The distinction among library types helps you to optimize your product environment. For example, by allocating common base libraries to a single runtime environment that can be shared by other runtime environments, you can substantially reduce the amount of disk space required and simplify the application of maintenance across z/OS® images.

The OMEGAMON® products support three types of runtime environments: base, full, and sharing. A sharing environment may share libraries with a base runtime environment, a full runtime environment, or an SMP/E runtime environment. “Types of runtime environments” on page 123 explains the types of runtime environments that you can create during product configuration.

Short descriptions of runtime environment types

Type of runtime environment	Description
Full (self-contained) runtime environment	Runtime environment containing a full set of dedicated libraries, consisting of both LPAR-specific libraries and a copy of the SMP/E installation read-only base libraries eligible for sharing with other runtime environments. See “Example 1. Full (self-contained) runtime environment” on page 125.
Sharing-with-base runtime environment	Runtime environment containing LPAR-specific libraries and referencing the base libraries configured in a base runtime environment. See “Example 2. Sharing-with-base runtime environment” on page 127.
Sharing-with-full runtime environment	Runtime environment containing LPAR-specific libraries and referencing the base libraries configured in a full runtime environment. See “Example 3. Sharing-with-full runtime environment” on page 128.

Type of runtime environment	Description
Sharing-with-SMP/E runtime environment	Runtime environment containing LPAR-specific libraries and referencing the libraries managed by SMP/E. See <a href="#">“Example 4. Sharing-with-SMP/E runtime environment” on page 130.</a>

In deciding which type of runtime environment you want to configure, take into account the following considerations:

- **Number of LPARs**  
A best practice is to have a single runtime environment per LPAR. Based on the workload being monitored in an LPAR, it might make sense to have different runtime environment "templates" based on the commonality of monitoring in the LPARs. For example, if there are LPARs that primarily run transaction workloads (CICS®, WebSphere®), and LPARs that primary run databases (for example, Db2® or IMS™), then two runtime environment templates might be defined, one for monitoring the transaction subsystems, one for monitoring the database subsystems.
- **Shared DASD**  
If shared DASD is in place, runtime environments can be defined and maintained on a single LPAR without having to move the updated data sets to the target system. Without shared DASD, you will either have to maintain separate installation environments on the systems not sharing DASD, or use one system for the installation environment to create and maintain runtime environments, and then have a process to move new or updated runtime environments to the target system.
- **SMP/E CSI environments**  
A single SMP/E CSI (consolidated software inventory) environment for the products is simpler to manage, but is also less flexible when moving to different product levels. Multiple CSI environments provide more flexibility, but require more effort to maintain. Since a runtime environment is associated with a set of SMP/E target libraries, multiple CSIs may mean either more runtime environments, or the need to manage the association of runtime environments with an SMP/E CSI environment (for example, by a physical system or a set of LPARs). For more information, see [“Decision 1: Why to install into a shared CSI” on page 122.](#)
- **Maintenance**  
SMP/E maintenance is added to the product target libraries. When a runtime environment is sharing with the SMP/E target libraries, the runtime environment is updated when the SMP/E maintenance is applied. Base and full runtime environments are updated only after they are loaded after the SMP/E maintenance. This configuration provides additional flexibility, as the SMP/E maintenance can be applied and tested before updating the base or full runtime environments (and any sharing runtime environments that share with the base or full runtime environment).

**Tips:**

See the following suggested strategies for deciding the type of runtime environment to configure based on your requirements:

- If you plan to install monitoring agents on many z/OS® images, you can get good results with a sharing-with-base or sharing-with-SMP/E type of runtime environment. See the following examples for considerations when using any type of sharing environment.
- If you want to test quickly, use a sharing-with-SMP/E type of runtime environment runtime environment .
- If you want to test your configuration on an isolated test system, use a full, self-contained type of runtime environment.

## Naming convention for runtime environment data sets

Before you begin configuring runtime environments, you should understand the convention for naming the data sets in the runtime libraries.

Each data set in a runtime library has a name composed of the following parts:

Table 17: Runtime environment data set naming convention	
Part of the name	Length
High-level qualifier, VSAM or non-VSAM	26 bytes
Mid-level qualifier, which identifies the runtime environment	8 bytes
Low-level qualifier, which identifies the data set and usually matches the DDNAME	8 bytes

You set the high-level qualifiers for VSAM and non-VSAM data sets and the mid-level qualifier when you create a runtime environment. The low-level qualifier for each data set is provided by the configuration software and has the format

```
cKppffff
```

where

- *c* is the data set class:  
D for installation distribution libraries (DLIBs).  
T for target libraries (TLIBs) that were installed by SMP/E.  
R for runtime libraries.
- *pp* is the 2-character code for the product or component.
- *ffff* identifies the function of the data set; U as the final character identifies the data set as a user library. (Examples: CMD or CMDU for a commands data set, PAR or PARU for a parameters data set, and SAM or SAMU for a samples data set.)

For example, the data set IBM.RHILEV1.RTENAME1.RKANPARU has the high-level qualifier IBM.RHILEV1, the mid-level qualifier RTENAME1, and the low-level qualifier RKANPARU (which identifies the data set as a user library containing parameters for the component AN, the conglomerate component for the entire combination of products and components in the runtime environment).

## Naming convention for runtime environment jobs

When you configure a runtime environment, you edit and submit several jobs.

The naming convention for these jobs is

```
KCIJcsss
```

where *c* = V if support for variables is enabled for the RTE or *c* = P if variable support is disabled and *sss* is the job name. For example, the KCIJVALO job allocates the runtime libraries with system variables, and the KCIJPALO job allocates the runtime libraries without system variables.

## Example configurations using different types of runtime environments

The following five examples show different types of runtime environment (RTE) configurations. The way you choose to set up your RTEs depends on your site requirements and maintenance procedures.

**Tip:** The data set name (DSN) is composed of the high-level qualifier (*rhilev*), followed by the mid-level qualifier (*rte*), followed by the low-level qualifier. The field settings and library names shown are for illustrative purposes only.

### Example 1. Full (self-contained) runtime environment

The full runtime environment contains all libraries required by a particular IBM® product and is the easiest runtime environment to create.

This type of runtime environment can be defined in any situation but is most suitable if at least one of the following statements is true:

- Your installation comprises only a single z/OS® image.

- You want each z/OS® image to be independent.
- You are creating a runtime environment for a specific combination of products that does not exist in any other runtime environment.

The following example represents a full runtime environment called RTE1 that is completely self-contained. All base libraries and LPAR-specific libraries are allocated in RTE1. The base libraries in a full runtime environment are a copy of the SMP/E installation libraries.

```
Name: RTE1
Type: Full
Hilev: PROD.CAN
Midlev: RTE1
Shares with: (none)
```

LPAR-specific library DD DSNNAME resolution with concatenated base, read-only libraries:

```
//RKANPAR DD DISP=SHR,
// DSN=PROD.CAN.RTE1.RKANPARU
// DD DISP=SHR,
// DSN=PROD.CAN.RTE1.RKANPAR

//RKANCMD DD DISP=SHR,
// DSN=PROD.CAN.RTE1.RKANCMDU
// DD DISP=SHR,
// DSN=PROD.CAN.RTE1.RKANCMD
//STEPLIB DD DISP=SHR,
// DSN=PROD.CAN.RTE1.RKANMODU
// DD DISP=SHR,
// DSN=PROD.CAN.RTE1.RKANMOD
// DD DISP=SHR,
// DSN=PROD.CAN.RTE1.RKANMODL
// DD DISP=SHR,
// DSN=PROD.CAN.RTE1.RKANMODP
```

In typical product started tasks, the LPAR-specific libraries are concatenated ahead of RTE1 standalone, read-only base libraries (copies of the SMP/E target libraries), as shown below:

```
//&PROCNAME PROC
// SYS=RTE1,
// RHILEV=PROD.CAN,
// BASEHLEV=PROC.CAN.RTE1.R . .
//STEPLIB DD DISP=SHR,
// DSN=&RHILEV..&SYS..RKANMODU
// DD DISP=SHR,
// DSN=&BASEHLEV.KANMODL
// DD DISP=SHR,
// DSN=&BASEHLEV.KANMOD
// DD DISP=SHR,
// DSN=&BASEHLEV.KANMODP
//RKANMODL DD DISP=SHR,
// DSN=&RHILEV..&SYS..RKANMODU
// DD DISP=SHR,
// DSN=&BASEHLEV.KANMODL
```

“Figure: Full runtime environment on a single system” on page 126 illustrates a full runtime environment.

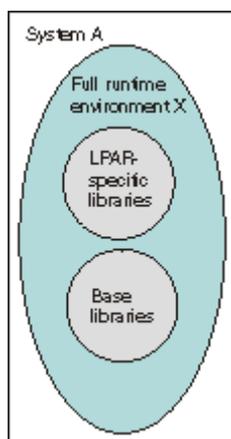

Figure 5: Full runtime environment on a single system

“Figure: Full runtime environments on several systems” on page 127 shows the way a full runtime environment can be expanded to more than one z/OS® image. Each runtime environment is self-contained; the three runtime environments X, Y, and Z on systems A, B, and C do not share any libraries.

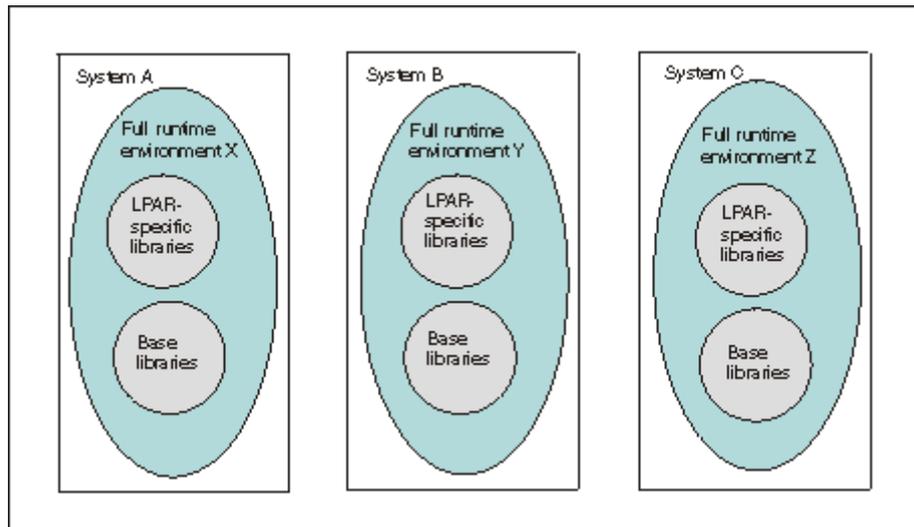

Figure 6: Full runtime environments on several systems

## Example 2. Sharing-with-base runtime environment

The sharing-with-base configuration is a good choice for environments where storage devices are shared. Using the base runtime environment for common data sets, the sharing-with-base runtime environment contains only LPAR-specific libraries. The base runtime environment cannot contain the LPAR-specific libraries required to run the installed products. The sharing-with-base runtime environment must contain the same set or a subset of the products and components in the base runtime environment.

The configuration software resolves product configuration elements to point at the LPAR-specific libraries and the base runtime environment libraries as necessary.

The following example represents a sharing-with-base runtime environment called SHARRTE2, which obtains its base library information from the base runtime environment (RTE2).

```
Name:      SHARRTE2
Type:      Sharing
Hilev:     E.F.G
Midlev:    SHARRTE2
Shares with: Base RTE called "BASELIB". Its read-only base libraries
              (copies of the SMP/E target libraries) are shared by 2
              LPAR RTEs (SHARRTE1 and SHARRTE2). Cited example here is
              for SHARRTE2.

              Read-only Base HLQ (BASELEV PROC symbol) =
              RTE_X_HILEV_SHARING parm. (Value: COMMON) + RTE_SHARE parm.
              (Value: BASELIB)
```

LPAR-specific library DD DSNNAME resolution with concatenated base, read-only libraries:

```
//RKANPAR DD DISP=SHR,
//        DSN=E.F.G.SHARRTE2.RKANPARU
//        DD DISP=SHR,
//        DSN=COMMON.BASELIB.RKANPAR
//RKANCMD DD DISP=SHR,
//        DSN=E.F.G.SHARRTE2.RKANCMDU
//        DD DISP=SHR,
//        DSN=COMMON.BASELIB.RKANCMD
//STEPLIB DD DISP=SHR,
//        DSN=E.F.G.SHARRTE2.RKANMODU
//        DD DISP=SHR,
//        DSN=COMMON.BASELIB.RKANMODL
//        DD DISP=SHR,
//        DSN=COMMON.BASELIB.RKANMOD
//        DD DISP=SHR,
//        DSN=COMMON.BASELIB.RKANMODP
```

In typical product started tasks, the LPAR-specific libraries are concatenated ahead of the base libraries, as shown below:

```

//&PROCNAME  PROC
//           SYS=SHARTE2,
//           RHILEV=X.Y.Z,
//           BASEHLEV=COMMON.BASELIB.R
.
.
//STEPLIB   DD DISP=SHR,
//           DSN=&RHILEV..&SYS..RKANMODU
//           DD DISP=SHR,
//           DSN=&BASEHLEV.KANMODL
//           DD DISP=SHR,
//           DSN=&BASEHLEV.KANMOD
//RKANMODL  DD DISP=SHR,
//           DSN=&RHILEV..&SYS..RKANMODU
//           DD DISP=SHR,
//           DSN=&BASEHLEV.KANMODL

```

“Figure: Sharing-with-base runtime environment” on page 128 illustrates a sharing-with-base runtime environment.

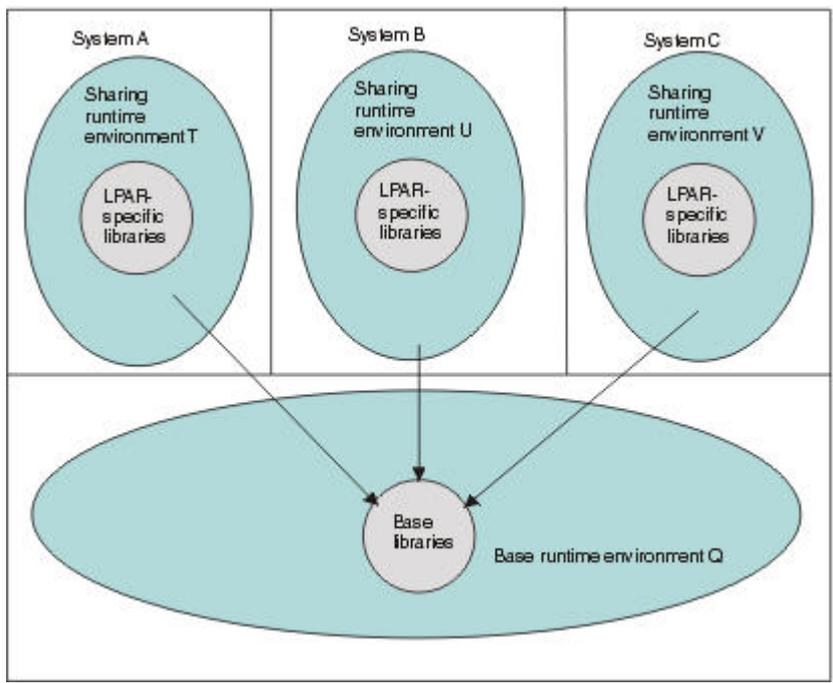

Figure 7: Sharing-with-base runtime environment

### Example 3. Sharing-with-full runtime environment

The sharing-with-full runtime environment allocates LPAR-specific libraries only, and in this example, obtains its base library information from a full runtime environment. The sharing-with-base runtime environment must contain the same set or a subset of the products and components in the base runtime environment.

This configuration can also be used for environments where storage devices are shared, although the sharing-with-base configuration is the preferred approach.

The following example represents a sharing-with-full runtime environment called SHARTE1, which obtains its base library information from the full runtime environment (RTE1).

```

Name:      SHARTE1
Type:     Sharing
Hilev:    E.F.G
Midlev:   SHARTE1
Shares with: Full RTE called "RTE1" in Example 1. Its read-only base libraries
              (copies of RTE1 base libraries) are shared by 2 LPAR RTEs (SHARTE1
              and SHARTE3). Cited example here is for SHARTE1.

              Read-only Base HLQ (BASELEV PROC symbol) = RTE_X_HILEV_SHARING parm.

```

(Value: PROD.CAN) + RTE\_SHARE parm. (Value: RTE1)

LPAR-specific library DD DSNAME resolution with concatenated base, read-only libraries:

```
//RKANPAR DD DISP=SHR,  
//        DSN=E.F.G.SHARRTE1.RKANPARU  
//        DD DISP=SHR,  
//        DSN=PROD.CAN.RTE1.RKANPAR  
//RKANCMD DD DISP=SHR,  
//        DSN=E.F.G.SHARRTE1.RKANCMDU  
//        DD DISP=SHR,  
//        DSN=PROD.CAN.RTE1.RKANCMD  
//STEPLIB DD DISP=SHR,  
//        DSN=E.F.G.SHARRTE1.RKANMODU  
//        DD DISP=SHR,  
//        DSN=PROD.CAN.RTE1.RKANMOD  
//        DD DISP=SHR,  
//        DSN=PROD.CAN.RTE1.RKANMODL  
//        DD DISP=SHR,  
//        DSN=PROD.CAN.RTE1.RKANMODP
```

In typical product started tasks, the LPAR-specific libraries are concatenated ahead of the base libraries (RTE1 read-only base libraries), as shown below:

```
//&PROCNAME PROC  
//        SYS=SHARRTE1,  
//        RHILEV=E.F.G,  
//        BASELEV=PROC.CAN.RTE1.R  
.  
//STEPLIB DD DISP=SHR,  
//        DSN=&RHILEV..&SYS..RKANMODU  
//        DD DISP=SHR,  
//        DSN=&BASELEV.KANMODL  
//        DD DISP=SHR,  
//        DSN=&BASELEV.KANMOD  
//        DD DISP=SHR,  
//        DSN=&BASELEV.KANMODP  
//RKANMODL DD DISP=SHR,  
//        DSN=&RHILEV..&SYS..RKANMODU  
//        DD DISP=SHR,  
//        DSN=&BASELEV.KANMODL
```

“[Figure: Sharing-with-full runtime environment](#)” on page 129 illustrates a sharing-with-full runtime environment.

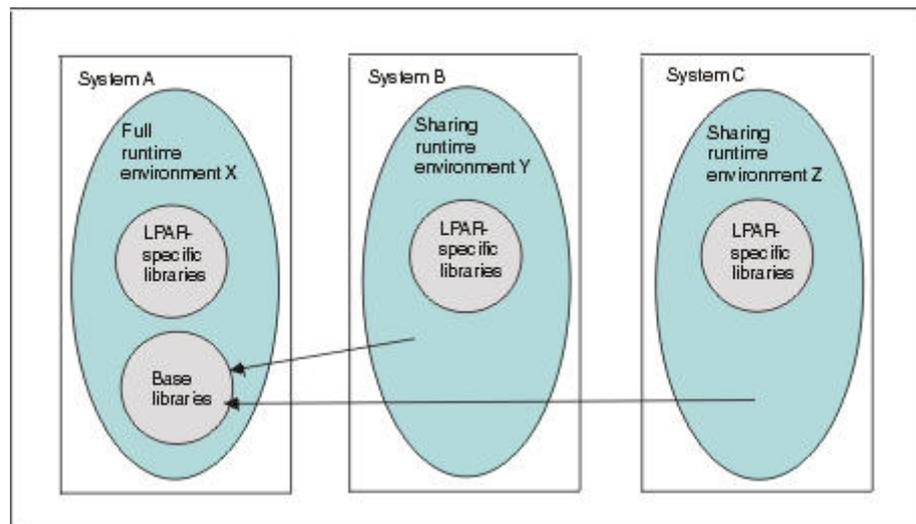

Figure 8: Sharing-with-full runtime environment

## Example 4. Sharing-with-SMP/E runtime environment

The sharing-with-SMP/E runtime environment allocates LPAR-specific libraries only and obtains its base library information from target libraries managed by SMP/E.

Use the sharing-with-SMP/E configuration if at least one of the following statements is true:

- Space is limited on storage devices. This configuration method does not allocate base libraries in the runtime environment, thereby reducing storage requirements.
- You want to activate SMP/E-applied product maintenance immediately.

The following example represents a sharing-with-SMP/E runtime environment called SHARSMP, which obtains its base library information from SMP/E target libraries.

```
Name:      SHARSMP
Type:      Sharing
Hilev:     E.F.G
Midlev:    SHARSMP
Shares with: SMP/E target libraries using target hilev
            (gbl_target_hilev) INSTALL.SMPE
```

LPAR-specific library DD DSNNAME resolution with concatenated base, read-only libraries:

```
//RKANPAR DD DISP=SHR,
//        DSN=E.F.G.SHARSMP.RKANPARU
//        DD DISP=SHR,
//        DSN=INSTALL.SMPE.TKANPAR
//RKANCMD DD DISP=SHR,
//        DSN=E.F.G.SHARSMP.RKANCMDU
//        DD DISP=SHR,
//        DSN=INSTALL.SMPE.TKANCMD
//STEPLIB DD DISP=SHR,
//        DSN=E.F.G.SHARSMP.RKANMODU
//        DD DISP=SHR,
//        DSN=INSTALL.SMPE.TKANMOD
//        DD DISP=SHR,
//        DSN=INSTALL.SMPE.TKANMODL
//        DD DISP=SHR,
//        DSN=INSTALL.SMPE.TKANMODP
```

In typical product started tasks, the LPAR-specific libraries are concatenated ahead of the base libraries (the SMP/E target libraries), as shown below:

```
//&PROCNAME PROC
//          SYS=SHARSMP,
//          RHILEV=X.Y.Z,
//          BASEHLEV=INSTALL.SMPE.T
.
.
//STEPLIB DD DISP=SHR,
//        DSN=&RHILEV..&SYS..RKANMODU
//        DD DISP=SHR,
//        DSN=&BASEHLEV.KANMODL
//        DD DISP=SHR,
//        DSN=&BASEHLEV.KANMOD
//        DD DISP=SHR,
//        DSN=&BASEHLEV.KANMODP
//RKANMODL DD DISP=SHR,
//        DSN=&RHILEV..&SYS..RKANMODU
//        DD DISP=SHR,
//        DSN=&BASEHLEV.KANMODL
```

“Figure: Sharing-with-SMP/E runtime environment” on page 131 illustrates a sharing-with-SMP/E runtime environment.

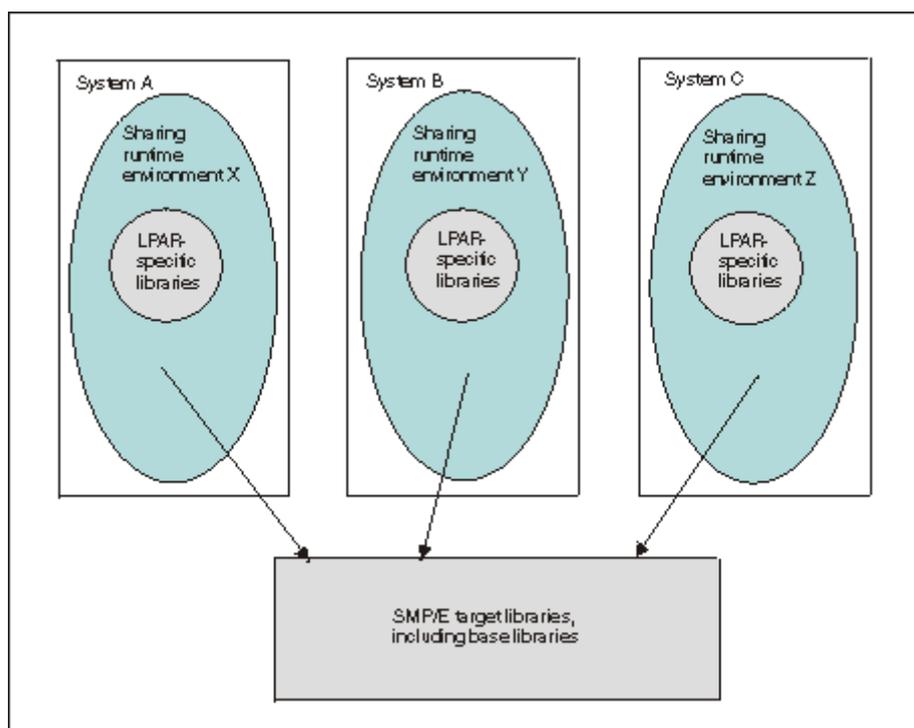

Figure 9: Sharing-with-SMP/E runtime environment

## Decision 3: Where to install your monitoring servers

The Tivoli® Enterprise Monitoring Server (also called the *monitoring server*) is the central component of the commonly-shared Tivoli® Management Services infrastructure. The monitoring server consolidates and distributes data; receives and distributes commands; and sends alerts when specified availability and performance problems are detected in the monitored applications, systems, or networks. You must install and configure at least one monitoring server, called the hub, to support the monitoring products. You may install one or more additional *remote* monitoring servers.

The *hub monitoring server* is the central monitoring server, acting as the focal point for data collection and distribution. It communicates with monitoring agents, with remote monitoring servers, with the Tivoli Enterprise Portal Server, and with the Warehouse Proxy and Summarization and Pruning agents. The load on the hub is typically high.

Remote monitoring servers communicate only with the monitoring agents that report to them and with the hub monitoring servers to which they report. Note that a remote monitoring server is remote with respect to the hub monitoring servers, not necessarily with respect to the monitoring agents. If monitoring agents are installed on the same system as a remote monitoring server, that monitoring server is local to the monitoring agents but remote to the hub.

The load on remote monitoring servers is typically low. Load is driven higher if historical data collection is performed on the monitoring servers instead of on the monitoring agents.

You can install monitoring servers on z/OS®, Windows™, and some UNIX™ and Linux™ systems. See [IBM Tivoli Monitoring: Installation and Setup Guide](#) for a complete list of supported platforms.

### Location of hub monitoring server

On System z®, the hub can be located on either z/OS® or z/Linux. The hub may also be installed on a distributed operating system such as Windows™, UNIX™, or Linux™. A number of factors must be taken into consideration when deciding where to locate the hub monitoring server.

Many organizations prefer the reliability and availability characteristics of the z/OS® platform for the hub monitoring server. If most of your monitoring agents are on a z/OS® system, placing the hub monitoring server on a z/OS® system can shorten the communications path.

Alternatively, if most of your monitoring agents are on distributed systems, you might prefer a distributed platform for your hub monitoring server. If you install the hub monitoring server on a distributed system, such as a Windows™, Linux™, or AIX® system, you have the option of deploying the portal server on the same system

to shorten that communications path. If your hub is not running on a z/OS® system, it may make sense to have a remote monitoring server on your z/OS® LPARs.

The following additional factors should also be taken into consideration in deciding where to locate the hub:

- Security requirements
- Available or required CPU cycles
- Data conversion considerations
- Network topology
- Failover capabilities and requirements

The hub monitoring server is the focal point for the entire monitoring environment. This server is under a significant load.

Place the hub monitoring server inside the data center on a high-performance network. Connectivity between the hub monitoring server and other directly connected components such as the remote monitoring servers must be fast and reliable.

### **Security requirements**

When you are selecting the platform where the hub monitoring server will be deployed, you should consider what your security requirements are.

Access to the Tivoli® Enterprise Portal is controlled by user accounts (IDs) defined to the portal server. Authentication of those IDs can be enabled through either the hub Tivoli® Enterprise Monitoring Server or the Tivoli® Enterprise Portal Server. The hub Tivoli® Enterprise Monitoring Server can be configured to authenticate user IDs by using either the local system registry or an external LDAP-enabled registry. The Tivoli® Enterprise Portal Server can be configured to authenticate through an external LDAP registry. You can provide security for the enhanced 3270 user interface, the 3270 OMEGAMON® (menu system) and OMEGAMON® II® (CUA) interfaces by using a combination of security types and implementations.

For more information on security options, see [Which security options to enable](#). Do not implement user authentication before you complete a basic installation of Tivoli® Management Services components and monitoring agents and test their operation.

### **Available or required CPU cycles**

Place the hub monitoring server on a supported platform that has the required resources available (memory, processor, storage) and where it will not be constrained. In some cases, local organizational standards or requirements might dictate where processing resources for the hub monitoring server must be allocated.

### **Data conversion considerations**

When data is passed between mainframe and distributed platforms, the data must be converted from ASCII (distributed) to EBCDIC (mainframe), or vice versa, for each request. Data conversion is always completed by the receiving component in a Tivoli® Monitoring environment. Because the Tivoli® Enterprise Portal Server can be located only on ASCII-based systems, for environments that contain z/OS® monitored systems, data translation cannot be completely avoided. However, minimizing the amount of data conversion can significantly improve the performance of the environment.

If only z/OS® OMEGAMON® agents are reporting to the infrastructure, a hub monitoring server on a z/OS® system will not affect data conversion. Conversion takes place only once, when the portal server receives its data from the hub monitoring server. If both distributed and z/OS® based agents are reporting to the infrastructure, the data conversion time can be reduced by hosting the hub monitoring server on a distributed system. For distributed agents connecting to a hub monitoring server on a distributed system, no data conversion is required. The z/OS® agents connect to a remote monitoring server on a z/OS® system and data conversion occurs only once, when the hub monitoring server receives data from this z/OS-based remote monitoring server. After the z/OS® data is installed on the hub, no additional conversion is required when it is received by the portal server because the data has already been converted.

Historical data conversion is another area of consideration. Storing history at the agent is recommended, so in this case there is no monitoring server data conversion. However, if you collect history at the monitoring server where your agents are using different data conversion protocols than the monitoring server is using, you must complete the conversion process. This data must also go through yet another conversion when it is offloaded and converted again when it is retrieved from the data warehouse, if one is used.

## Network topology

Connectivity between the hub monitoring server and other directly connected components such as the remote monitoring servers must be fast and reliable. For all successful deployments, you must understand the network infrastructure. When planning your deployment, take into account each of the following important factors:

- **Location of firewalls**  
Tivoli® Management Services supports most common firewall configurations, including those that use address translation (application proxy firewall is a notable exception). To enable this support, use the piped protocols, which open a single port on the firewall for communication by IBM® products. If your environment includes a firewall between any components that must communicate with each other, you must specify at least one piped protocol during configuration.
- **Whether you have NAT (network address translation)**  
Network address translation limits the visibility of resources between different network segments. This issue can affect the monitoring infrastructure if this is not taken into account when configuring the ability for agents and the Tivoli® Enterprise Portal to connect to the hub monitoring server.
- **Network bandwidth between WAN (wide area network) links**  
The amount of bandwidth between the hub monitoring server and the connected infrastructure components can influence where the hub monitoring server is placed. In general, place the hub monitoring server where the most connected components have the fastest bandwidth access to it. For example, if two data center locations are serviced by a single hub, where possible place the hub the data center that will send the most traffic to it.
- **Number of agents that are located across WAN links**  
The amount of bandwidth between the hub monitoring server and the connected agents can influence where the hub monitoring server is placed. In general, place the hub monitoring server where most of the connected agents components have the fastest bandwidth access to it. Where this placement is not possible, the use of remote monitoring servers to act as agent concentrators might be a feasible option.

For more information on setting up communications across firewalls or between components that use NAT, see [How to set up communications between components](#). Also see the section on "Firewalls" in the *IBM® Tivoli® Monitoring: Installation and Setup Guide*.

## Failover capabilities and requirements

The requirement for high availability should dictate the degree of failover required for the hub monitoring server. A manual restart of the hub on another platform is sufficient, or you might need a high-availability hub. The important point is to understand the level of failover required, and then implement the hub monitoring server configuration with this in mind.

## Location of remote monitoring servers

It is a good idea to place a remote monitoring server on every z/OS® system where you are installing monitoring agents. In fact, two monitoring agents (OMEGAMON® for z/OS® and OMEGAMON® for Storage on z/OS®) require that you configure them in the same address space as a hub or remote monitoring server.

For advice about placing remote monitoring servers on distributed systems, see the *IBM Tivoli Monitoring: Installation and Setup Guide*.

### Tips:

- A remote monitoring server can report to a high-availability hub on the same LPAR.
- If the hub is not a high-availability hub, it cannot be on the same LPAR as any of the remote monitoring servers that report to it and that are configured to use any TCP/IP protocol.
- If more than one remote monitoring server is configured in a z/OS® image and if a TCP/IP protocol is being used for communication, the hub to which each remote monitoring server reports must have a unique port number. Otherwise, connectivity problems are likely.
- If more than one hub is configured in a z/OS® image, each hub must have a unique port number for any nonsecure TCP/IP protocols being used and a unique port number for any secure TCP/IP protocols being used.  
For information about port number allocation, see [“Port number assignments” on page 150](#).

- If a remote monitoring server is to communicate with any monitoring agents that require SNA, the remote monitoring server must be configured for SNA communications. Examples of such monitoring agents include OMEGAMON® for z/OS® (for the EPILOG facility of the OMEGAMON II® component) and OMEGAMON® for Messaging on z/OS® (for the 3270 interface component). See the product-specific configuration guides for further information about SNA requirements.

## Monitoring server names

Each monitoring server has a unique name used for internal processing. This name is known as the *TEMS name* or the *CMS name*. You specify the TEMS name for a monitoring server on a z/OS® system when you define the runtime environment in which the monitoring server is to be configured. The default name is *rte:CMS* (where *rte* is the name of the runtime environment). The TEMS name is stored as the value of the CMS\_NODEID environment variable in the KDSENV member of the *rhilev.rte.RKANPARU* data set.

In general, it is best to accept the default TEMS name. If you want to specify a different name, follow these guidelines:

- The TEMS name must be unique.
- The name is alphanumeric and must begin with an alphabetic character.
- The length of the name must be at least 2 characters and no more than 32 characters.
- The name cannot contain blanks or special characters (\$#@). An underscore (\_) is permitted and conforms to ISO 9660 standards. A period (.) is also valid.
- The TEMS name is case-sensitive on all platforms. If you use a mixed-case name, you must supply the same mixed-case name when you configure all components and monitoring agents that will connect to the monitoring server.

## Decision 4: How to configure your monitoring servers

There are number of options for configuring Tivoli Enterprise Monitoring Servers. Hub monitoring servers can be configured as high availability hubs and to forward monitoring events to an event server (Netcool/OMNIbus) for correlation and management. Both hub and remotes can be enabled to support self-describing agents, to provide security on an associated SOAP server, and to audit and record events in the monitoring environment.

### High-availability hub monitoring server

An operational hub monitoring server is essential to a monitoring environment. If the hub monitoring server address space fails, or if the system on which the hub is installed has a planned or unplanned outage, the flow of monitoring data comes to a halt. Therefore, it is important to restart the hub or move it to another system as quickly as possible. You can ensure continuous availability by using a high-availability (HA) hub monitoring server.

You can configure an HA hub monitoring server in any sysplex environment with dynamic virtual IP addressing (DVIPA) and shared DASD. An HA hub is configured in its own runtime environment, without any monitoring agents, and can be configured on the same LPAR with a remote monitoring server. System variables are not enabled on an HA hub. This configuration allows the hub monitoring server to be relocated to any suitable LPAR in the sysplex with no changes, and with minimal disruption to the components connecting to the hub.

**Best practices:** If you are configuring a hub monitoring server on z/OS and the requirements for configuring an HA are met, it is best practice to create one.

[“Figure: High-availability runtime environment” on page 135](#) shows a typical configuration with a high-availability hub runtime environment deployed.

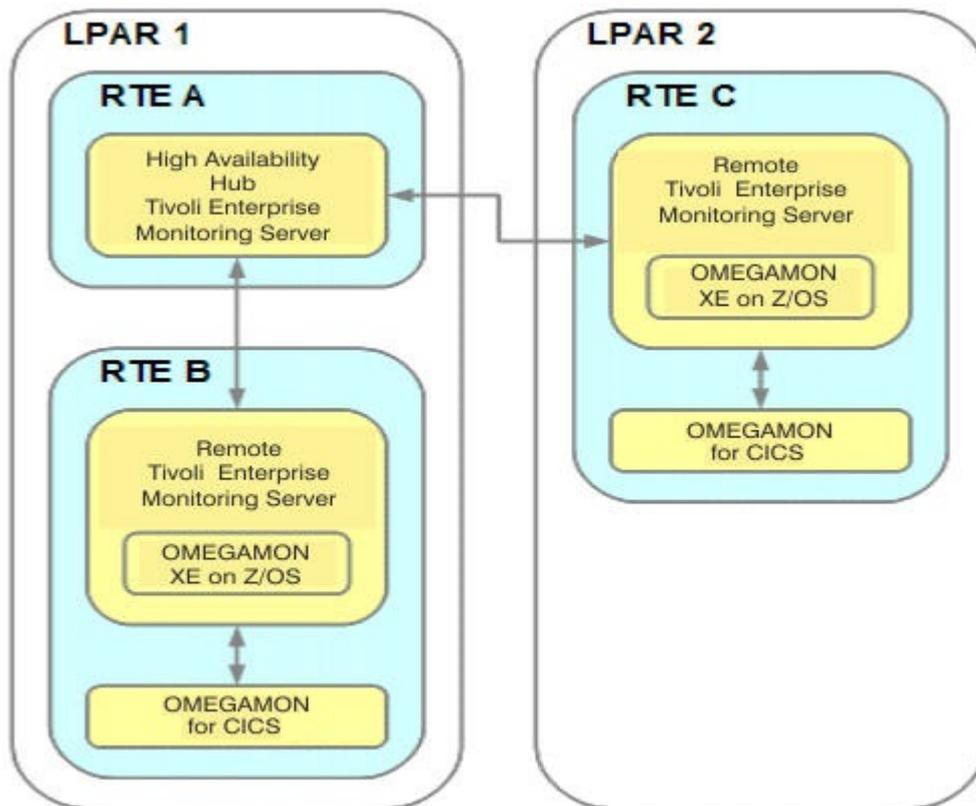

Figure 10: High-availability runtime environment

In this monitoring environment, you have two LPARs: LPAR 1 and LPAR 2. In LPAR 1, a runtime environment (RTE A) has been created containing just the hub monitoring server, which has been defined as a high-availability hub monitoring server with DVIPA. Because you also want to monitor LPAR 1 in addition to the subsystems running on it (in this example, CICS), a second runtime environment (RTE B) is created with a remote monitoring server and any monitoring agents that are needed.

**Note:** The OMEGAMON® for z/OS® monitoring agent shares an address space with the remote monitoring server while the OMEGAMON® for CICS monitoring agent runs within its own address space. On the second LPAR, a runtime environment (RTE C) is created in the same fashion as RTE B to monitor the systems and subsystems on that LPAR. It connects to the high-availability hub monitoring server through the DVIPA address. The advantage of the high-availability configuration is that if anything happens to LPAR 1, either planned or unplanned, the hub can be restarted on LPAR 2 without the need for reconfiguring the existing runtime environments.

For information about configuring a high-availability hub on z/OS® systems, see the following topics:

- Using Configuration Manager: [“How to: Create a high-availability hub monitoring server” on page 360](#)
- Using PARMGEN: [Configuring a high-availability hub, Scenario QCF01: Configuring a full RTE with a high-availability hub monitoring server](#)

For detailed information about the high-availability hub on distributed systems, see [IBM Tivoli Monitoring: High-Availability Guide for Distributed Systems](#).

## Self-describing agent feature

Self-describing agents include all the application support files required to recognize and process data from those agents. At startup, self-describing agents automatically push application support updates to their local monitoring server. The data is then replicated to the hub monitoring server and all other Tivoli® Management Services components that require it (such as the OMEGAMON® Enhanced 3270 user interface, the Tivoli® Enterprise Portal Server, and the Tivoli® Data Warehouse). Self-describing monitoring agents eliminate the need to recycle the monitoring server after application support updates, and to ensure that application support files

are current. If the self-describing features is not enabled, application support must be installed manually from a DVD and can easily get out of sync with the agent.

The self-describing agent feature (SDA) is enabled by default when you use Configuration Manager to create your runtime environment. You can selectively enable or disable SDA for individual agents or monitoring servers. In addition, SDA provides granular control over the products and versions for which application data is automatically installed.

**Note:** If you use PARMGEN to create your runtime environment, SDA is disabled by default. Before you can enable SDA, you must perform z/OS® UNIX® System Services system preparation set-up tasks to create the z/OS UNIX file system. Afterward, if your enterprise includes self-describing agents, you can enable SDA by changing parameter values for the monitoring agents and servers. For more information, see [“Enabling the self-describing agent feature at a monitoring server” on page 461](#).

To administer the self-describing agent feature, including exploiting its granular control of which products and versions are installed, the Tivoli administrative commands (tacmd) Command Line Interface (CLI) is required. The tacmd CLI is a product component that is installed on a distributed system and allows interaction with the monitoring server. For more information about the tacmd CLI, see [“\(If applicable\) Installing the tacmd CLI component” on page 524](#).

If you are planning to configure a hub monitoring server on a z/OS® system and enable the self-describing agent feature, you must create or set aside a z/OS UNIX Hierarchical File System (HFS) or zSeries File System (zFS) where the monitoring server can store the application support files. The file system must have access to a Java™ runtime environment running under IBM®'s 31-bit or 64-bit Java™ SDK Version 5 (or higher) on an HFS or zFS file system.

Ensure that you complete the following steps before starting the configuration of the hub runtime environment:

1. Confirm that you have enough space on the z/OS UNIX file system. The amount required depends on the amount of agents you have deployed in your environment.
2. Confirm that a supported level of Java™ is installed and note the z/OS UNIX path for your Java™ home directory.
3. Determine the data set name of your SBXEXEC library.
4. Determine the z/OS UNIX path prefix where your runtime environment will store self-describing agent packages. These directories do not need to be created in advance; the configuration process will create them if needed.

## Granular control of self describing agent behavior

Granular control of self describing agent (SDA) behavior provides control over the products and versions for which application data is automatically installed.

On distributed systems, granular control of SDA blocks installation of all self-describing data unless a Tivoli administrative command (tacmd) is issued to allow installation of all products and versions, or to specify particular products and versions. On z/OS® hub monitoring servers, granular control is disabled by default. During upgrades of a hub where SDA is enabled, you are asked if you want to retain the current behavior (all products and versions updated) or enable granular control. For new z/OS® hub monitoring server installations, if you enable the granular control feature, you must use the tacmd Command Line Interface (CLI) to set which products and versions can be installed. The tacmd CLI is a product component that is installed on a distributed system and allows interaction with the monitoring server. For more information about the tacmd CLI, see [“\(If applicable\) Installing the tacmd CLI component” on page 524](#).

To implement granular control, issue one of the following commands using the tacmd CLI on a distributed platform, such as Windows™, UNIX™, or Linux™:

- **tacmd addSdaInstallOptions** to specify the products and versions for which the self-describing agent facility is allowed to install data.

OR

- **tacmd editSdaInstallOptions -t DEFAULT -i ON** to allow installations for all products and versions without any blocking. (This setting is essentially the default self-describing agent behavior in V6.2.3 and V6.2.3 FP1.)

## z/OS UNIX System Services and Java requirements

After your site activates self-describing agents on a hub Tivoli Enterprise Monitoring Server, the monitoring server must have access to a Java™ Runtime Environment running under IBM®'s 31-bit or 64-bit Java™ SDK Version 5 (or higher) and an HFS or zFS file system accessed through z/OS UNIX. The self-describing agent function stores the application support packages in the z/OS UNIX file system and then invokes the Java™ **jar** command to extract the files from the application support packages stored there. Since IBM®'s Java™ runs on z/OS® under z/OS UNIX, this also means z/OS UNIX must be available with ~50MB of working space.

If your environment has more than 10 to 15 agent types, see the hardware and software requirements section of the *IBM Tivoli Monitoring: Installation and Setup Guide* for more details on the storage requirements.

If you use the self-describing agents feature on a Tivoli Enterprise Monitoring Server running on z/OS®, you must supply the z/OS UNIX directory where Java™ is installed. Using the PARMGEN configuration method, the directory is specified in the GBL\_HFS\_JAVA\_DIRn parameter. The value you supply gets set as the TEMS\_JAVA\_BINPATH statement in the KSDSDPROF file, which is created in the monitoring server's z/OS UNIX support directory.

When a monitoring server running on z/OS® installs a self-describing agent, it prepends the TEMS\_JAVA\_BINPATH value to the default z/OS UNIX PATH setting so it can locate the Java™ /bin directory where the **jar** utility resides. The **jar** utility is required to extract the files from the application support packages that were uploaded from the agent.

You must ensure that no older or inconsistent version of Java™ remains in the default z/OS UNIX PATH or LIBPATH libraries, because the older Java™ binaries may conflict with the Java™ binaries in the directory you supplied in a previous configuration. For example, the default LIBPATH on most z/OS UNIX systems is **LIBPATH=/lib:/usr/lib:**. Because this specification contains no Java™ binary directories, it will not conflict with the TEMS\_JAVA\_BINPATH setting, and so the jar utility invoked by a monitoring server should run successfully.

But if there is a LIBPATH setting that includes a Java™ directory with a different version of Java™ than you specified during configuration, the self-describing function could fail when it calls the **jar** utility. This failure occurs because the TEMS\_JAVA\_BINPATH value specifying one Java™ version has been prepended to the PATH setting, with a different Java™ version specified in LIBPATH. If these are incompatible Java™ versions, the **jar** utility cannot work correctly.

To resolve this problem, update the default z/OS UNIX LIBPATH setting so that it either omits the Java™ directory or specifies a directory at the same Java™ level. IBM® recommends that, if the **jar** utility invoked by the monitoring server fails to complete successfully, you verify that there isn't an inconsistent level of Java™ specified in the default z/OS UNIX PATH or LIBPATH setting that may be causing a binary incompatibility.

## Disk space requirements

The self-describing agent (SDA) feature requires not only access to a z/OS® UNIX® System Services environment, but also a fairly significant amount of disk space in that environment. The suggested amount of disk space is somewhere in the range of 25 to 50 MB.

The average disk space usage depends upon the type of monitoring server:

- a hub monitoring server requires ~3.25 MB per package
- each remote monitoring server requires approximately ~2 MB per package

The average amount takes into account the following considerations:

- The average amount of storage needed by the monitoring server SDA process to backup the existing product files in the \$TEMS\_MANIFEST\_PATH/SDMBACKUP directory.
- The hub monitoring server SDA process stores all existing SDA package files, including an SDA agent's Tivoli® Enterprise Portal jars, which are the largest jars, often in the 1 to 2 MB range.
- The remote monitoring has to store only an SDA agent's monitoring server jar files, which are typically less than 500K.

The amount of z/OS UNIX disk space required is also influenced by other factors:

- The amount of space will fluctuate depending on how many SDA agents register with the z/OS® monitoring server and whether multiple SDA installs are in progress.

- The jar files are extracted into individual files in subdirectories under the monitoring server z/OS UNIX home directory, and those individual files are copied to the runtime environment's RKANDATV library and then automatically deleted. But there will be a high-water mark at which there must be enough space for both the jars and the extracted contents of those jars. The allocated disk space must be generous enough to handle these spikes in disk usage.

## Group-based security for z/OS® UNIX® System Services directories

By default, the z/OS UNIX directories created by the configuration software for self describing agent (SDA) application support files are created with group and user directory permissions MODE(7,5,5), which sets permission as read-write-execute (7) for the owner, and read-execute (5) for all others (group and others). If you would like to implement a more secure access scheme for the directories, you can do so with group-based security.

The TEMS\_MANIFEST\_PATH parameter in the KDSENV member points to the name of the z/OS UNIX home directory where uploaded agent jar files and other application support files will be stored by the monitoring server. The parameter value consists of the runtime environment directory name followed by &rtename/kds/support/TEMS. By default, the KCIJPUSS job (PARMGEN) creates the RKANDATV(KDS\*) z/OS UNIX members to invoke the **mkdir** commands for the TEMS\_MANIFEST\_PATH directory and subdirectories with owner, group and others in permission MODE(7,5,5). For example, one of the **mkdir** commands processed by the PARMGEN KCIJPUSS job in WKANSAMU is this **mkdir** member in RKANDATV library:

```
VIEW   &rte_hilev.&rte_name.RKANDATV(KDSRMKDB)
%mkdir '/rtehome/ibmuser1/USSRTE1/kds/support/TEMS' MODE(7,5,5) +
```

The last 5 permission bit in the MODE(7,5,5) parameter grants read-execute permission to the z/OS UNIX directories for the runtime environment to *all* users. Note that the TSO user ID of the person running the job is not necessarily the user ID associated with the monitoring server started task. However, both user IDs require write access to the z/OS UNIX directories for the following reasons:

- To support the self describing agent feature, the z/OS® monitoring server must be able to add and remove files from these directories. A more restrictive MODE() parameter would prevent the monitoring server from doing so.
- The TSO user ID of the person running the z/OS UNIX jobs must have write access to these same directories.

To implement a more secure access scheme for the z/OS UNIX directories, use group-based security, as illustrated by the following example:

Assume that the TSO user ID `ibmuser1` is connected to three security groups, GROUP1, GROUP2, and GROUP3. Since GROUP1 is `ibmuser1`'s default group, all of the newly created z/OS UNIX directories are owned by GROUP1 by default. The user ID of the monitoring started task is `CANSDDSST` and it is connected to two security groups, GROUP2 and GROUP4. Since both user IDs have GROUP2 in common, the `ibmuser1` user ID could log on to z/OS UNIX and issue a **chgrp** command to set GROUP2 as the owner of the runtime environment's z/OS UNIX directories. For example:

```
/rtehome/ibmuser1> chgrp -R GROUP2 USSRTE1
```

Next, the `ibmuser1` user ID can issue a **chmod** command to change the original MODE(7,5,5) value, such as:

```
/rtehome/ibmuser1> chmod -R 775 USSRTE1
```

After this **chmod** command is issued, only users who are connected to GROUP2 will have write access to the z/OS UNIX directories for the runtime environment.

If the TSO user ID and monitoring server started task user IDs do not have any security groups in common, you would need to either connect one or both of the user IDs to a common security group, or define a new security group and connect both user IDs to that group. With either option, you still need to perform the **chgrp** and **chmod** actions.

## SOAP server

The *SOAP server* is an application server plug-in that receives and sends XML data, and provides XML SOAP interfaces into the Tivoli Management Services components and the monitoring agent. The SOAP server is installed with each monitoring server and is enabled during configuration of the hub monitoring server. During

configuration, you specify the list of non-local hub monitoring servers with which the local SOAP server can communicate.

SOAP services can add a whole new dimension to your use of the OMEGAMON® monitors. You can invoke SOAP from the Tivoli administrative commands (tacmd) Command Line Interface (CLI) to issue commands to manage the monitoring environment, such as turning situations on or off. SOAP can also enable very sophisticated automation solutions by opening up monitoring data for use by an automation product such as System Automation for z/OS®. For example, an OMEGAMON® situation that triggers an action in the automation product could be followed by a SOAP request to the monitor to get additional data. Automation could then use that data to validate the results or to take further action.

The Simple Object Access Protocol (SOAP) is a communication method that uses the Hypertext Transfer Protocol (HTTP) and Extensible Markup Language (XML) as the mechanisms for information exchange. Because web protocols are installed and available for use by all major operating system platforms, HTTP and XML provide a ready solution to the problem of how programs running under different operating systems in a network can communicate with each other. SOAP specifies exactly how to encode an HTTP header and an XML file so that a program in one computer can call a program in another computer and pass it information. It also specifies how the called program can return a response.

An advantage of SOAP is that program calls are likely to get through firewall servers that screen out requests other than those for known applications (through the designated port mechanism). Because HTTP requests are usually allowed through firewalls, programs using SOAP to communicate can generally communicate with programs anywhere.

## SOAP server terminology

To configure the SOAP server, you must understand certain terms that are used in the configuration.

### Hub monitoring server list

Aliasing mechanism for identifying which non-local hub monitoring servers can be accessed from the local SOAP server.

### KDSTHUBS

Global table used by all SOAP servers enabled in the installation library.

### KSHXHUBS

Member stored in the *rhilev.rte.RKANPARU* library and containing the hub monitoring server list.

### User access list

List of user IDs associated with the hub monitoring server list.

## SOAP server configuration and security

User access to a SOAP server can be secured in one of two ways: by enabling security and creating user accounts for the hub monitoring server, or by adding specific users to the SOAP server definition. If security is not enabled and no users are added to the server definition, the SOAP server honors all requests from any sender. If security is enabled on the hub monitoring server, the SOAP server honors requests only from users defined to the system authorization facility. However, if any users are added to the SOAP server definition, only those users have access to the server, regardless of whether security is enabled on the monitoring server.

SOAP server configuration creates a KSHXHUBS member in the *rhilev.rte.RKANPARU* library. The KSHXHUBS member contains the hub monitoring server list, an aliasing mechanism for identifying the hub monitoring servers with which the local SOAP server can communicate.

When enabling access to a non-local hub monitoring server from the SOAP server, you can choose one of these options:

- Enable global access to all user IDs that pass logon validation.
- Specify a hub monitoring server list and, for each monitoring server on the list, the user IDs that are allowed to query (read) or update (write to) that monitoring server.

You must still use external security to validate user IDs and passwords, after the user IDs pass validation with the KSHXHUBS member.

The hub monitoring server list in a runtime environment is maintained in the KDSTHUBS global table. KDSTHUBS is used by all SOAP servers that are enabled in the installation library. Any changes you make to the

hub monitoring server entries in KDSTHUBS affect KSHXHUBS members used in the different RKANPARU libraries for the runtime environments, when you reconfigure those runtime environments.

**Important:** Do not edit the KSHXHUBS member directly. Its XML tags and values require a specific format and are case-sensitive. If you want to change the contents of the KSHXHUBS member, do so in the PARMGEN configuration profile.

## Communication protocols

If you enable the SOAP server while configuring the hub, at least one of the communication protocols you specify must be either IP\*.PIPE or IP\*.UDP.

The communication protocols for the SOAP server are automatically initialized to the protocol values set for the runtime environment.

## Event forwarding

If you use the Netcool/OMNIBus™ product, in addition to the Tivoli Enterprise Portal, to manage events in your enterprise, you can configure a hub monitoring server to forward situation events to the event servers for correlation and management.

A hub monitoring server contains a Situation Event Forwarder component. The Event Forwarder maps Tivoli Enterprise Portal situation events to Tivoli® Event Integration Facility (EIF) events and uses the EIF interface to send the events to an OMNIBus EIF probe (the *EIF receiver*). The event receiver receives the forwarded events, and expand and format the events for the event servers. On the OMNIBus console, users can view, acknowledge, or reset situation events. The updated situation status is returned to the originating hub monitoring server and reflected in the OMNIBus console on the Tivoli Enterprise Portal.

The EIF is an application programming interface (API) that external applications can use to create, send, or receive events. These events are referred to as either EIF events or TEC/EIF events. For complete information about EIF, see the *IBM® Tivoli Enterprise Console Event Integration Facility Reference*. In the *IBM Tivoli Monitoring: Administrator's Guide*, the section “Customizing event integration with Tivoli Enterprise Console®” discusses the mapping of situation events to Tivoli Enterprise Console events; the section “Customizing event integration with Tivoli® Netcool/OMNIBus™” discusses the mapping of situation events to OMNIBus events.

The hub monitoring server must be configured to enable EIF forwarding and specify the default destination server.

If situation event forwarding is enabled, by default all situation events are forwarded to the EIF destinations defined when you configured the monitoring server. However, you can configure additional EIF receivers and selectively forward situation events to different destinations by using the EIF tab of the Tivoli Enterprise Portal Situation editor. You can also use the EIF tab to assign an OMNIBus severity to a situation.

The severity of EIF events is derived from the situation name. The severity is determined as follows:

- If the suffix of the situation name is either `_Warn` or `_Warning`, the EIF event severity is set to `WARNING`.
- If the suffix is either `_Crit` or `_Critical`, the severity is set to `CRITICAL`.
- If the severity cannot be determined from the suffix, a severity of `UNKNOWN` is assumed. You might have to use the EIF tab to set the severity for situations that display in the OMNIBus console with a severity of `UNKNOWN`. See the *IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide* for instructions on using the Situation editor to assign a situation severity.

## Auditing

The auditing function allows you to capture significant events occurring in your site's monitoring environment and record them in permanent storage for later retrieval and analysis. Each audit record fully describes some event that has changed the state of your monitoring environment: authorization and authentication failures (such as those that allow or disallow the execution of Take Action commands), and major and minor state changes (though they do not reflect the minor service messages stored in the RAS logs). Platforms covered include Windows™, UNIX/Linux, IBM® i, and z/OS®. The records stored are compatible with those created by Tivoli Business Service Manager.

Auditing and logging records can be stored in the Tivoli Data Warehouse. Standard reports are provided by the IBM Cognos® feature. In addition, the Tivoli Enterprise Portal Managed System Lists workspace (within the Enterprise icon) enables you to view auditing and logging records online; for information, see [IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide](#).

Initially, the auditing function is turned off by default on all Tivoli Management Services nodes.

On z/OS®, the auditing facility optionally creates and stores Systems Management Facility (SMF) format type 112 records, coded in UTF-8 and included in a common repository (the SYS1.MANn data sets) with all other z/OS® event data. Note that SMF type 112 records are disabled by default in the SYS1.PARMLIB(SMFPRMxx) member. To display the current SMFPRMxx settings, invoke the z/OS® console command **D SMF**. For complete information on the syntax of this console command, including how you check which records are enabled for recording and how you dynamically change these settings, consult the *z/OS® System Management Facilities* document and the *MVS™ System Commands* reference.

The auditing data written covers the self-describing agents (including their auto-refresh feature), actions of the Warehouse Proxy Agent, successful and failed automation-command actions (for example, the invocation of Take Action commands), and IBM Tivoli Monitoring's integration with Tivoli Application Dependency Discovery Manager.

## Environment variables that control the auditing function

There are two environment variables that affect the auditing function when running on a z/OS®-based Tivoli Enterprise Monitoring Server: AUDIT\_TRACE and AUDIT\_SMF.

Using the PARMGEN method, these values are set using the **KDS\_AUDIT\_TRACE** and **KDS\_AUDIT\_SMF** parameters in the LPAR configuration profile (%RTE\_NAME%). Using the Configuration Tool, these values are set in the **Enable/Disable z/OS audit collection** field of the **Specify Advanced Configuration Values** panel.

### AUDIT\_TRACE

The auditing facility supports three levels of tracing:

#### Minimum

Records major changes to the product state such as authorization failure, new connections to the monitoring server or the portal server, or failed user login attempts.

#### Basic

Records any actions that modify objects or cause an access failure, such as attempts to modify monitoring server entities like situations and Take Action commands.  
This is the default tracing level.

#### Detail

Records all authorization requests, whether successful or failed, such as all successful logins and all modifications to entities such as Take Action commands.

#### Disabled

Disables the auditing function.

### AUDIT\_SMF

z/OS® only.

Controls the writing of auditing records to the System Management Facility.

#### Disabled

Prevents the creation of SMF records while still allowing IBM Tivoli Monitoring audit data to be recorded in the Tivoli Data Warehouse and for reporting purposes.

#### Enabled

Both SMF and warehouse audit records get written.  
This is the default for SMF recording.

Setting the trace level to Basic or Detail might require you to enlarge your SYS1.MANn data sets or to increase the frequency with which you offload Tivoli Monitoring audit data to your SMF archives. If you do not want to record Tivoli Monitoring events, you can disable SMF audit records (**AUDIT\_SMF=Disabled**) and thereby eliminate the storage requirements and I/O overhead necessary when writing SMF records.

## SMF recording of audit records

You can configure the Tivoli Enterprise Monitoring Server running on z/OS® to write audit records to the z/OS® System Management Facility (SMF). This configuration enables you to use SMF to integrate OMEGAMON events with the event data recorded by other products and components that run on your z/OS® system. You can extract OMEGAMON audit record data from SMF data sets (or from the archives of such data sets) for analysis of performance or resource utilization, and for validation of security events (authorization and authentication).

SMF provides facilities that let you suppress recording of SMF records by record types, event types (listed in [“SMF type-112 record subtypes”](#) on page 142 as record subtypes), and product codes (known as subsystem IDs, or SSIs).

SMF record subtypes and associated event type categories

<i>Table 18: SMF type-112 record subtypes</i>	
SMF 112 subtype	Event type category
32 (0x20)	permission checking
33 (0x21)	object maintenance
34 (0x22)	security maintenance
35 (0x23)	system administration
36 (0x24)	authorization validation
37 (0x25)	contextual event
38 – 47 (0x26 through 0x2f)	reserved

SMF record 112 subtypes 32 – 37 (0x20 through 0x25) share a common, fixed header format followed by a variable-length field of up to 8,912 bytes that contains XML-encoded event data, as shown in [“SMF record 112 format”](#) on page 142.

Descriptions of format for type 112 SMF records

<i>Table 19: SMF record 112 format</i>					
Name	Assembler name	Type	Length	Offset	Description
smf112len	SMF112LEN	Binary (unsigned short)	2	0	Record length (RDW1). Maximum size 32756. This field and the next (total of four bytes) form the record descriptor word (RDW). The first two bytes (this field) must contain the logical record length including the RDW1 field. The second two bytes (the following field) are used for variable-block, spanned records. If the record is not spanned, set these two bytes to hexadecimal zeros.
smf112seg	SMF112SEG	Binary (unsigned short)	2	2 (0x02)	Segment descriptor (RDW2); see smf112len field.

Name	Assembler name	Type	Length	Offset	Description
smf112flg# defined constants:  FLGSTY FLGSP4 FLGSP3 FLGSP2 FLGVS2	SMF112FLG predefined EQU constants:  FLGSTY FLGSP4 FLGSP3 FLGSP2 FLGVS2	Binary (unsigned char) predefined values:  0x40 0x10 0x08 0x04 0x02	1	4 (0x04)	Header flag byte. Contains the system indicator bits. <b>Bit</b> <b>Meaning when set</b> <b>0</b> Reserved. <b>1</b> Subtypes are valid. <b>2</b> Reserved. <b>3</b> MVS/SP Version 4 and above. Bits 3, 4, 5, and 6 are on. <div style="border: 1px solid blue; padding: 5px; margin: 10px 0;"> <p><b>Note:</b> IBM® recommends you use record type 30 to obtain the MVS™ product level.</p> </div> <b>4</b> MVS/SP Version 3. Bits 4, 5, and 6 are on. <b>5</b> MVS/SP Version 2. Bits 5 and 6 are on. <b>6</b> VS2. Bit 6 is on. <b>7</b> Reserved. System indicator bits are automatically set when the record is written.
smf112rty# defined constants:  RTY112	SMF112RTY predefined EQU constants:  RTY112	Binary (unsigned char) predefined values:  112 (0x40)	1	5 (0x05)	Record type (hexadecimal values are 0-FF). Record type 112 (0x70) for this record type.
smf112tme	SMF112TME	Binary (unsigned int)	4	6 (0x06)	Time since midnight, in hundredths of a second, that the record was moved into the SMF buffer.

Name	Assembler name	Type	Length	Offset	Description
smf112dte	SMF112DTE	Packed Decimal (char [4])	4	10 (0x0A)	Date when the record was moved into the SMF buffer, in the form 00yydddF or 0cyydddF (where c is 0 for 19xx and 1 for 20xx, yy is the current year (0-99), ddd is the current day (1-366), and F is the sign).
smf112sid	SMF112SID	Char (char [4])	4	14 (0x0E)	System identification (also known as the SMFID).
smf112ssi	SMF112SSI	Char (char [4])	4	18 (0x12)	Subsystem ID(OMEGAMON® product code). This field is a four-byte character value set by the SUBSYS= <b>option</b> keyword specified to SMF. Refer to member RKANSAM(KOLSSI) for a partial list of product codes.
smf112sty #defined constants:  STY_EVENT_CHECKING STY_EVENT_OBJMAINT STY_EVENT_SECMANT STY_EVENT_SYSADMIN STY_EVENT_ACTION STY_EVENT_VALIDATE	SMF112STY predefined EQU constants:  STY_EVENT_CHECKING STY_EVENT_OBJMAINT STY_EVENT_SECMANT STY_EVENT_SYSADMIN STY_EVENT_ACTION STY_EVENT_VALIDATE	Halfword (unsigned short) predefined values:  32 (0x20) 33 (0x21) 34 (0x22) 35 (0x23) 36 (0x24) 37 (0x25)	2	22 (0x16)	Record subtype 32-37 (0x20-0x25):  Permission Checking event Object Maintenance event Security Maintenance event System Administration event Authorization Validation event Contextual event
ai_rev #defined constants:  AICVER	AIVER predefined EQU constants:  AICVER	Fullword (unsigned long) predefined values:  1	4	24 (0x18)	Audit information version. This release is 1.
ai_jname	AIJNAME	Char(char [8])	8	28 (0x1c)	Name of the address space issuing this SMF record.
ai_asid	AIASID	Halfword (unsigned short)	2	36 (0x24)	ID of the address space issuing this SMF record.
ai_event_len	AIEVENTLEN	Halfword (unsigned short)	2	38 (0x26)	Length of the null-terminated string in ai_event_info, including the null terminator. Smallest length is 1 for a null string.

Name	Assembler name	Type	Length	Offset	Description
ai_event_info	AIEVENTINFO	Char (char [8192])	1-8192	40 (0x28)	A null-terminated string containing the audit event data encoded in XML. The maximum length of this field is 8192 bytes, but the actual length is specified by ai_event_len. The contents of the field depend on the record subtype, which is directly associated with the Event Type Category for this record. Refer to <a href="#">“SMF type-112 record subtypes” on page 142</a> for further information.

In addition, your site can write its own exits that programmatically decide which records are suppressed. See the *z/OS® System Management Facilities* reference for details.

The following sample Tivoli Monitoring RKANSAM library members are provided to assist you in extracting data from various subtypes of type-112 records:

**Member**

**Contents**

**KOLSMFA**

Record format as an assembler language DSECT.

**KOLSMFC**

Record format as a C typedef.

**KOLSMFCX**

Sample program to extract and print the contents of IBM Tivoli Monitoring SMF records.

**KOLSMFCC**

Sample JCL to compile RKANSAM(KOLSMFCX).

**KOLSMFS**

Record format as a SAS DATA statement.

**KOLSMFSX**

Sample SAS program to extract and print the contents of Tivoli Monitoring SMF records.

**KOLSMFSC**

Sample JCL to run RKANSAM(KOLSMFSX).

**KOLSSI**

Partial list of product codes (SSIs) mapped to Tivoli® product names.

Additional reference material is provided on the Tools DVD in the XML directory: see either `kolddtd.samp1ib` or the copy in the runtime environment's RKANSAM library, member KOLDDT. This DTD (document type definition) contains XML metadata that describes each XML record's constituent fields and their contents.

## Decision 5: Where to configure your monitoring agents

Two monitoring agents (OMEGAMON® for z/OS® and OMEGAMON® for Storage on z/OS®) require that you configure them in the same address space as a hub or remote monitoring server. For the other monitoring agents, you have the option to configure each monitoring agent as *stand-alone* (in its own address space) or in the same address space with a monitoring server.

**Terminology tip:** The term *stand-alone* can be confusing, because it has one meaning when applied to a monitoring server and another meaning when applied to a monitoring agent. A *stand-alone monitoring server* is one configured in its own runtime environment, without any monitoring agents. A *stand-alone monitoring agent* is one configured in its own address space, rather than in the same address space with a monitoring server. A stand-alone monitoring agent can be in the same runtime environment with a monitoring server, but a stand-alone monitoring server is never in the same runtime environment with monitoring agents.

## Best practices

- Unless you are planning to configure a high-availability hub, configure one runtime environment per logical partition (LPAR). In each runtime environment, configure a monitoring server (hub or remote) and all agents required for monitoring the various workloads on that system. Configure all monitoring agents to report to the monitoring server in their runtime environment.
- Unless a monitoring agent is required to run in the same address space as a monitoring server, it is best to configure each monitoring agent stand-alone (in its own address space). Configuring the monitoring agents stand-alone has several advantages:
  - A stand-alone monitoring agent can be started and stopped independent of the monitoring server.
  - If a monitoring server fails or becomes unresponsive, stand-alone agents that report to it can switch to a secondary monitoring server specified during configuration.
  - You can apply maintenance to a stand-alone monitoring agent without interfering with the operation of other components.
  - Troubleshooting is easier if each monitoring agent is identified in trace logs by its own started task.

Even if you configure a monitoring agent stand-alone, it still might report to the same monitoring server as other monitoring agents. Therefore, make sure that the values you supply when configuring the monitoring server are compatible with the requirements of all the monitoring agents intended to report to that monitoring server. For example, some monitoring agents may require a SNA connection between the agent and the monitoring server.

## Self-describing agents

Self-describing agents include all the application support files required to recognize and process data from those agents. At startup, self-describing agents automatically push application support updates to their local monitoring server. The data is then replicated to the hub monitoring server and all other Tivoli® Management Services components that require it (such as the OMEGAMON® Enhanced 3270 user interface, the Tivoli® Enterprise Portal Server, and the Tivoli® Data Warehouse). Self-describing monitoring agents eliminate the need to recycle the monitoring server after application support updates, and to ensure that application support files are current. If the self-describing features is not enabled, application support must be installed manually from a DVD and can easily get out of sync with the agent.

By default, the self-describing agent feature is enabled within any remote monitoring server and any monitoring agent that provides self-describing support but the feature is disabled at the hub monitoring server. If your enterprise includes self-describing agents, you can enable the self-describing agent feature by changing parameter values for the hub monitoring server.

For more information, see [Enabling the self-describing agent feature at a monitoring server](#).

## Autonomous agents

You can choose to configure stand-alone monitoring agents to run in *autonomous mode* (without communicating directly with a monitoring server). An autonomous agent can emit Simple Network Management Protocol (SNMP) traps and Event Integration Facility (EIF) events directly to a Netcool®/OMNIbus ObjectServer for agent-specific situations (but not for enterprise situations). Autonomous agents can be advantageous in environments where disk space or transmission bandwidth is in short supply.

An autonomous agent requires the DSEVT DDNAME in the monitoring agent started task in the *rhilev.rte.RKANSAMU* data set. This DDNAME points to the *rhilev.rte.RKDSEVT* data set.

The *IBM Tivoli Monitoring: Installation and Setup Guide* provides instructions for configuring Netcool®/OMNIBus ObjectServers to receive the events. For information on specifying which situation events to forward, see the Tivoli Enterprise Portal online help and the *IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide*.

For information about parameters to set for an autonomous agent, see the "Agent autonomy" chapter of the *IBM Tivoli Monitoring: Administrator's Guide*. You can add these parameters for an autonomous agent on a z/OS® system by editing the Kpp\$PENV member of the PARMGEN WCONFIG library.

For instructions on enabling SNMP V3 passwords for autonomous agents, see [Enabling SNMP V3 passwords for autonomous agents](#).

## Decision 6: How to set up communications between components

A number of communication protocols are available for connections between the hub and remote monitoring servers and between each monitoring agent and the monitoring server it reports to. You configure each monitoring server to use one or more of these protocols, and you assign a priority number to each protocol selected. When the monitoring server attempts to communicate with another component, it tries the highest-priority protocol first. In case of failure, it goes on to the second-priority protocol, and so on. Every component configured to communicate with a monitoring server must have at least one communication protocol in common with that monitoring server.

The communication protocols are of two basic types:

### SNA

Because some monitoring agents on z/OS® systems require SNA, it must be one of the protocols selected for a monitoring server communicating directly with those monitoring agents. However, SNA does not have to be the highest-priority protocol.

### TCP/IP

The TCP protocols available are IP.PIPE, IP.SPIPE, IP6.PIPE, IP6.SPIPE, IP.UDP, and IP6.UDP. For the hub monitoring server, at least one of the protocols chosen must be a TCP protocol to support the SOAP server. If you plan to implement long-term historical data collection, communication with the Tivoli Data Warehouse also requires a TCP protocol.

IP.PIPE is the default protocol. All of the piped protocols (IP.PIPE, IP.SPIPE, IP6.PIPE, and IP6.SPIPE) enable the monitoring software to traverse most firewall configurations. If you choose piped protocols for the monitoring server and monitoring agent, be aware of the following limitations:

- The maximum number of piped processes per host is 16.
- The piped protocols use only one physical port per process.

If you are configuring a high-availability hub monitoring server, Dynamic Virtual IP Addressing (DVIPA) is required on the z/OS® system. This allows the high-availability hub to be moved and restarted on, for example a different LPAR, without the need for reconfiguration should problems occur or if you have a planned maintenance outage on the LPAR where it was originally running. DVIPA requires a piped TCP/IP protocol to be used and the address of the monitoring server must be resolvable through the Domain Name Server (DNS).

Your communication protocol settings for a monitoring server on a z/OS system are saved in the KDE\_TRANSPORT environment variable of the KSENV member of the *rhilev.rte.RKANPARU* library for the runtime environment.

## Requirements for TCP/IP communication protocols

The Tivoli Enterprise Monitoring Server and the OMEGAMON enhanced 3270 user interface have special TCP/IP requirements. You must also provide a TCP/IP started task name.

Review the following TCP-related requirements.

### Default OMVS segment

To use the TCP/IP communication protocols, a Tivoli Enterprise Monitoring Server on a z/OS® system requires a default OMVS segment. See the *z/OS® Communications Server IP Configuration Guide* for an explanation of how to provide an OMVS segment. The OMVS segment is also required for the Tivoli OMEGAMON enhanced 3270 user interface.

### UID for the enhanced 3270 user interface started task

The enhanced 3270 user interface uses BPXmmm services, which are part of z/OS® UNIX® System Services, for TCP/IP. So a user ID defined with an OMVS segment must be created for the enhanced 3270 user interface started task.

### TCP/IP stack name

You are prompted for a TCP/IP started task name when you create a runtime environment and when you configure a monitoring server or monitoring agent. In a new runtime environment, the default value for the TCP/IP started task name is an asterisk (\*). This default, which uses the first TCP/IP stack that was started, is suitable if the LPAR contains a single TCP/IP stack.

If the LPAR contains more than one TCP/IP stack, you can specify the started task name of the TCP/IP stack you want to use; or you can specify the number sign (#), which is translated to a blank and allows the TCP/IP environment to choose the stack to use, either through TCP/IP definitions or through the use of the SYSTCPD DD statement.

Whichever method is used to select a TCP/IP stack in a multi-stack environment, the Tivoli Management Services components continue to use that stack, even if a different stack becomes the primary stack.

Therefore, in a multi-stack environment, it is best to specify the started task name of the TCP/IP stack to be used, rather than specifying a wildcard or a blank.

## Firewall support

Tivoli Management Services supports most common firewall configurations, including those that use address translation (application proxy firewall is a notable exception). To enable this support, use the piped protocols, which open a single port on the firewall for communication by IBM® products. If your environment includes a firewall between any components that must communicate with each other, you must specify at least one piped protocol during configuration.

During startup, the monitoring server registers its services and the IP address of these services with a *location broker*. Clients such as monitoring agents send queries to the location broker to request address information for a service, and receive a list of protocols and IP addresses at which these services are available. The client then sends a specific server request to one of the addresses in the list received from the location broker. Service registration with the location broker assumes address continuity.

If the published address of the monitoring server is identical and reachable for either side of the firewall, then nothing further has to be done to achieve communications in this firewall environment. If the same address cannot be reached from either side of the barrier firewall, then either ephemeral pipe support or broker partitioning is required.

For more information about configuring firewall support, see the following publications:

- Instructions for enabling firewall support for the z/OS® components: [Configure a Tivoli Enterprise Monitoring Server](#) and the configuration documentation for each monitoring agent.
- Instructions for enabling firewall support for the distributed components: the "Firewalls" section in the [IBM Tivoli Monitoring: Installation and Setup Guide](#).
- Conceptual information about IBM Tivoli Monitoring firewall support: *IBM Tivoli Monitoring: Implementation and Performance Optimization for Large Scale Environments, SG24-7443*, which you can find at the [IBM Redbooks® website \(https://www.redbooks.ibm.com/\)](https://www.redbooks.ibm.com/).

## Ephemeral pipe support

Ephemeral pipe support allows piped connections to cross a NAT (network address-translating) firewall without a broker partition file. Ephemeral pipe support is enabled when IP\*. \*PIPE connections cross a NAT firewall. If this default does not suit your network, you can disable ephemeral pipe support and use location broker partitioning instead, or you can force ephemeral connections to be used even when piped communications do not cross a NAT firewall.

Ephemeral pipe support and location broker partitioning for address translation are mutually exclusive.

## Disabling ephemeral pipe support

To disable ephemeral pipe support, specify Y as the value of the KDS\_TEMS\_COMM\_ADDRESS\_XLAT parameter in the PARMGEN configuration profile.

See "[Broker partitioning](#)" on [page 149](#) for information about enabling address translation through a broker partition file.

## Forcing ephemeral connections

Under some circumstances, you might want to force ephemeral connections to be used for IP\*. \*PIPE communications, even if they do not cross a NAT firewall. For example, if your configuration requires more than 16 piped processes on a host, ephemeral connections make it possible to exceed the TCP maximum. However, forcing ephemeral connections can have serious drawbacks:

- If an ephemeral connection breaks between a monitoring agent and the monitoring server to which it reports, the monitoring server might not be able to originate a connection back to the monitoring agent.
- The address of a monitoring agent configured for ephemeral connections is randomly assigned in the monitoring server logs. Tracing and troubleshooting are more difficult as a result.
- Extra configuration might be required for enabling communications between the monitoring agents and the Warehouse Proxy agent.

If you want to force ephemeral connections, use the EPHEMERAL option of the KDE\_TRANSPORT environment variable.

- EPHEMERAL : Y or EPHEMERAL : OUTBOUND forces outbound connections to be ephemeral.

**Important:** You can specify EPHEMERAL : Y or EPHEMERAL : OUTBOUND for a monitoring agent or a remote monitoring server, but *not* for a hub.

- EPHEMERAL : INBOUND forces inbound connections to be ephemeral.

You can specify the EPHEMERAL option in the Kpp\_X\_KDE\_TRANSPORT\_OPTIONS parameter in your PARMGEN configuration file .

For information about ephemeral pipe support on distributed components, see [IBM Tivoli Monitoring: Installation and Setup Guide](#).

## Broker partitioning

Address translation is an enhanced security feature of some firewall configurations. With this feature, components that must be reached across the firewall have two unique but corresponding addresses: the *external address* (valid for components outside the firewall) and the *internal address* (valid for components inside the firewall). A component on either side of the firewall knows only about the address that is valid for its *partition* (its own side of the firewall).

You can configure broker partitioning during configuration of the monitoring server on a z/OS® system. To do so, you specify Y as the value of the KDS\_TEMS\_COMM\_ADDRESS\_XLAT parameter in the PARMGEN configuration profile. You also supply the label that identifies the location of the monitoring server relative to the firewalls used for address translation, as the value of the KDS\_TEMS\_PARTITION\_NAME parameter in the PARMGEN configuration profile.

The partition name that you supply is added to the partition table, which contains labels and associated socket addresses provided by the firewall administrator. The label is used outside the firewall to establish monitoring server connections.

Additionally, you supply the IP address of the monitoring server in its own partition, and the partition name and address assigned to the monitoring server from a location on the other side of each firewall being used. These values are saved as the KDC\_PARTITIONFILE environment variable in the KDSENV member of the rhilev.rte.RKANPARU library. KDC\_PARTITIONFILE points to a new member, KDCPART, created in the rhilev.rte.RKANPARU library.

Then, when you configure a monitoring agent that reports to the monitoring server, you specify Y as the value of the address translation parameter, and you supply the partition label of the monitoring server. These values are saved as the KDC\_PARTITION environment variable in the monitoring agent's KppENV member of the rhilev.rte.RKANPARU library.

The well-known port for the hub monitoring server must be authorized by the firewall administrator. For the IP\*. \*PIPE protocols, no additional ports require authorization. For the IP\*.UDP protocols, a range of UDP ports must be authorized.

## Firewall gateway support

A *firewall gateway* provides end-to-end connectivity options for environments with specific TCP/IP connection management policies. The firewall gateway can negotiate numerous firewall hops and supports network address translation. You can use a firewall gateway to configure network traffic so that it is always initiated from the more secure network zone, if two communicating components are in zones with different security levels.

A firewall gateway can be the most advantageous firewall configuration if any of the following conditions apply:

- A single TCP connection cannot span between product components. Example: communication between components requires crossing more than one firewall in an environment with a policy that does not allow a single connection to traverse more than one firewall.
- Connection requirements do not allow the default pattern of connections to the hub monitoring server. Example: agents fail to connect to a monitoring server in a zone with higher security than that of the agents; security policy allows a connection to be established from a more secure zone to a less secure zone, but not the other way around.
- Open firewall ports must be reduced to a single port or connection. The gateway can consolidate the ports into one. Example: agent failover and monitoring server assignment must be managed symbolically at the hub monitoring server end of the connection. Because gateway connections are made between matching service names, an administrator can change the failover and monitoring server assignment of agents by changing the client proxy bindings at the hub monitoring server.

To configure the firewall gateway, you must perform two tasks:

1. Create an XML document that specifies a set of zones, each of which contains at least one server (upstream) interface with one or more embedded client (downstream) interfaces. The XML document must be stored as a member of the *rhilev.rte.RKANPARU* library, and the member name must conform to z/OS® naming standards (no more than 8 characters). Here is an example of a gateway XML document, stored as the ZOSPROXY member of the RKANPARU library:

```
000001 <tep:gateway xmlns:tep="http://xml.schemas.ibm.com/tivoli/tep/kde/"
000002   name="zOSproxy" threads="32">
000003 <zone name="trusted" maxconn="512" error="ignore">
000004 <interface name="zosproxy_upstream" role="proxy">
000005 <bind ipversion="4" localport="pool2K" service="tems_pipe">
000006 <connection remoteport="1920">127.0.0.1</connection>
000007 </bind>
000008 <interface name="zosproxy_downstream" role="listen">
000009 <bind ipversion="4" localport="60902">
000010 </bind>
000011 </interface>
000012 </interface>
000013 </zone>
000014 <portpool name="pool2K">20000-21023 21024-22047</portpool>
000015 </tep:gateway>
```

For reference information about the elements of the gateway XML document, see the “XML document structure” section of the Firewalls appendix to the *IBM Tivoli Monitoring: Installation and Setup Guide*.

2. In the *KppENV* member of the *rhilev.rte.RKANPARU* library, add a KDE\_GATEWAY environment variable that references the XML document.  
Example:

```
KDE_GATEWAY=ZOSPROXY
```

## Port number assignments

Tivoli Management Services reserves a default well-known port for the first process started on a system (normally, the monitoring server). For monitoring agents and other components, an algorithm based on the port number assigned to the monitoring server calculates the listening port to reserve. A port number cannot be assigned to a component if it is already reserved for another component or application.

The default listening port number for the monitoring server is 1918 for IP.PIPE, IP.UDP, IP6.PIPE, and IP6.UDP. For the secure IP protocols (IP.SPIPE and IP6.SPIPE), the default port number is 3660. For SNA, the default is 135. It is generally best to accept the default setting. However, you might find it necessary to change the setting

under some conditions; for example, when the port assigned to a component by the algorithm is already reserved by another application or component.

## Algorithm for allocating port numbers

Tivoli Management Services uses an algorithm to allocate port numbers for monitoring agents and other components to use in communications with the local monitoring server, under any of the TCP protocols.

The algorithm is

$$\text{allocated port} = \text{well-known port} + (N * 4096)$$

where:

- *well-known port* is the port number assigned to the monitoring server (for example, the default, 1918).
- *N* indicates the position of the monitoring agent or other component in the startup sequence.

For example, if there are a monitoring server and two monitoring agents on a system, and the monitoring server uses port 1918, the first monitoring agent in the startup sequence is assigned port 6014 (1918 + 1\*4096), and the second monitoring agent to start is assigned port 10110 (1918 + 2\*4096).

## Controlling port number assignments

You can change the port number assignments in either of two ways.

- Changing a TCP port number assigned to the monitoring server.
- Using the SKIP and COUNT options with the `Kpp_X_KDE_TRANSPORT_OPTIONS` parameter for Tivoli Enterprise Monitoring Server (TEMS) and monitoring agents.

You can also use the POOL option with the `Kpp_X_KDE_TRANSPORT_POOL_OPTIONS` parameter for TEMS and monitoring agents to limit connections to a specific range of port numbers.

## Changing a TCP port number assigned to the monitoring server

If you change a TCP port number assigned to a monitoring server on a z/OS® system, the port numbers allocated for the local monitoring agents also change, because the algorithm starts from the monitoring server's well-known port. You can use this method to avoid conflicts with ports reserved for other applications or components. If you specify a high number, conflicts are less likely than if you use the default or specify a low number for the monitoring server's well-known port.

### Tips:

- Only one remote monitoring server in an LPAR can report to a given hub. If more than one remote monitoring server is configured in an LPAR, the hub to which each remote monitoring server reports must have a unique port number. Otherwise, connectivity problems might occur.
- If you change a port number for a hub monitoring server, you must reconfigure all the components that communicate with it. If you change a port number for a remote monitoring server, you must reconfigure all the agents that report to it. In a large enterprise, this can be a large task.

## Using the SKIP and COUNT options to control port number assignments

For piped protocols (IP\*.PIPE, but not IP\*.UDP or SNA), you can use the SKIP and COUNT options to control the way port numbers are assigned to components.

You can specify these options in `Kpp_X_KDE_TRANSPORT_OPTIONS` parameter (where the *pp* variable is the agent prefix) for Tivoli Enterprise Monitoring Server (TEMS) and monitoring agents.

- The COUNT:*N* option is the mechanism for reserving IP.PIPE ports for components that connect to the monitoring server. *N* is the number of IP.PIPE ports to reserve on the host system, in addition to the well-known port for the monitoring server.

For example, if the well-known port for the monitoring server is 1918, COUNT:3 starts the search at port 6014 (1918 + 1\*4096). If the monitoring agent process cannot bind to port 6014, the algorithm tries port 10110 (1918 + 2\*4096). If port 10110 is not available, the search goes to port 14206 (1918 + 3\*4096).

The monitoring agent is assigned to the first available port encountered in the search. The process fails to start if the search reaches the highest port number without a successful binding (port 14206 in this example).

Use the COUNT option to reserve ports for components that must be accessible from outside a firewall. Because these ports must be permitted at the firewall, the ports must be predictable.

- The SKIP:*N* option specifies the number of ports to skip when starting the search for an available port. For example, if the well-known port for the monitoring server is 1918, SKIP:2 specifies to start the search at port 10110 (1918 + 2\*4096), skipping ports 1918 and 6014 (1918 + 1\*4096). The algorithm continues searching until it finds an available port.

Use the SKIP option for components that do not require access across a firewall.

## Using the POOL option to set a range of port numbers

After the port allocation algorithm assigns a well-known port to each process, all subsequent ports allocated for connections between components are *opaque* ports; that is, any available port can be allocated for a connection. You can limit opaque port allocations to a specific range of ports by using the POOL option.

You can use the POOL option with the `Kpp X KDE_TRANSPORT_POOL_OPTIONS` parameter (where the *pp* variable is the agent prefix) for Tivoli Enterprise Monitoring Server (TEMS) and monitoring agents.

The POOL option must specify a range of ports no smaller than 2 and no larger than 1024. `POOL:1000-2023` is valid; `POOL:1000-2024` is not. If more than 1024 ports are required in a pool for a specific protocol, you can code more than one POOL option, as in `POOL:1000-2023 POOL:3000-4023`.

## Network interfaces

If your site runs more than one TCP/IP interface or network adapter on the same z/OS® image, you can specify network interfaces to be used by monitoring servers and monitoring agents on a z/OS® system. You specify the network interfaces in the IP communication protocol parameters for each component.

Before you begin configuring the monitoring server, decide whether you require a network interface list and, if so, which of the following values to specify for it:

- The host name or IP address of the preferred interface.
- A list of host names or IP addresses, in descending order of preference. Use a blank space to separate the entries.
- An asterisk (\*) to prefer the interface associated with the default host name for the z/OS® image. To display this value, enter `TSO HOMETEST` at the command-line.
- An exclamation point followed by an asterisk (!\*) to use only the interface associated with the default host name for the z/OS® image.
- An exclamation point followed by a host name or IP address (!*hostname*) to use only the interface associated with *hostname*.
- A minus sign followed by a host name or IP address (-*hostname*) to use any interface except the one associated with *hostname*.

If you provide a value for the `KDS_TEMS_TCP_KDEB_INTERFACELIST` parameter in the PARMGEN configuration profile, the `KDEB_INTERFACELIST` environment variable is added to the `KDSENV` member of the `rhilev.rte.RKANPARU` library.

### Important:

- If you set the value of this parameter to !\* or !*hostname*, you must specify the same value for every component and product configured in all runtime environments on the same z/OS® image.

- In the default character set (language locale en\_US.ibm-037), the code for an exclamation point is x'5A'. If you are using a character set other than the default, a different character might map to that code. To require a specific network interface, use the character that maps to x'5A' in your character set.

See [Configuring a high-availability hub](#) for special considerations in specifying the KDEB\_INTERFACELIST environment variable for a high-availability hub.

## Disabling the HTTPS or HTTP server

If your environment uses an HTTP server but not an HTTPS server, or vice versa, you can prevent unnecessary error logging by specifying configuration parameters to disable the unused server. For a monitoring server, the HTTP or HTTPS server is used both for the Service Console and for the SOAP server. For a stand-alone monitoring agent, the HTTP or HTTPS server is used for the Service Console only.

To disable an HTTPS server, the HTTPS option in the KDE\_TRANSPORT environment variable must be set to 0 (zero) in the Kpp ENV member of the *rhilev.rte*.RKANPARU library. To disable an HTTP server, the HTTP option in the KDE\_TRANSPORT environment variable must be set to 0 (zero).

Disable the HTTPS server by setting the value of the *Kpp\_X\_KDE\_TRANSPORT\_HTTP\_OPTIONS* parameter to HTTPS:0 in the PARMGEN LPAR configuration profile. Similarly, you can disable the HTTP server by setting the value of the *Kpp\_X\_KDE\_TRANSPORT\_HTTP\_OPTIONS* parameter to HTTP:0 in the PARMGEN configuration profile.

**Important:** If you disable both the HTTP server and the HTTPS server in the KDSENV member (which contains environment variable definitions for the monitoring server), you disable the SOAP server. The SOAP server is required if you want to use the Tivoli administrative commands (tacmd) Command Line Interface (CLI) to administer the self-describing agent feature.

## Decision 7: Whether and where to use variables

Variables allow systems to share parameter definitions while retaining unique values in those definitions. Variables can take on different values, based on the input to the program. When you specify a variable in a shared parameter definition, the variable acts as a placeholder. Each system that shares the definition replaces the system variable with a unique value during initialization.

If you use variables, the components inherit the system values of the system on which they are started (the host z/OS® system). These system-specific values are then automatically loaded into temporary data sets that exist only while the component runs. The result is that the software runs correctly by using the system-specific parameter values for the host z/OS® system.

Using variable support includes the following benefits:

- You can deploy the same software unit, consisting of any or all TMS:Engine-based products, on any system without modification. LPAR-specific values are automatically resolved and substituted at product startup.
- The number of unique runtime environments required is smaller (although unique physical data sets must still exist.) This feature saves storage space, CPU, and labor.
- The same started task JCL and the same VTAM® node can be used on any system without modification.
- You can choose to use a single VTAM® major node in place of the individual product major nodes. When generated, a single VTAM® major node contains all VTAM® applids for all TMS:Engine-based products you have configured in the runtime environment.

### Tips:

- You cannot use variables in the runtime environment of a high-availability hub. (Because the high-availability hub can be started on any LPAR with DVIPA, parameters such as the monitoring server node ID, name, and VTAM major node must be set to static values.)

- Product started tasks contain a preprocessing step that resolves all variable specifications in the product parameter members.
- If you enable variable support, product parameter members contain many variables whose values are resolved during startup of the started task.

See the *z/OS® MVS™ Initialization and Tuning Reference (SA22-7592)* for basic information on system variables.

See [Variables in PARMGEN configuration](#) for more information about using variables.

## Decision 8: Whether to collect historical data and how to manage it

Historical data collection is an optional feature that is enabled through the Tivoli Enterprise Portal or the OMEGAMON enhanced 3270 user interface. If you enable historical data collection, monitoring agents are instructed to take data samples at a specified interval and store it. The collected data can be displayed in workspaces in the Tivoli Enterprise Portal or the enhanced 3270 interface, warehoused for in-depth analyses and long-term data reporting, and exported to third-party tools for reporting and analysis.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

Historical data collection can be configured through either Tivoli Enterprise Portal or the enhanced 3270 interface. In the Tivoli Enterprise Portal, you configure and start historical data collection through the History Collection Configuration window of the Tivoli Enterprise Portal.

In the enhanced 3270 user interface, you configure historical data collection using the OMEGAMON History Configuration workspace. In both instances, you specify the attribute groups for which you want data to be collected, the interval for data collection, the location where you want the collected data to be stored (at the monitoring server or at the agent). In the Tivoli Enterprise Portal, you can also specify whether you want the data to be migrated to the Tivoli® Data Warehouse. Note that you cannot configure data warehousing through the enhanced 3270UI, nor can you configure summarization and pruning. Only a subset of attributes can be configured and displayed in the enhanced 3270UI.

On z/OS® systems, historical data is stored in data sets maintained by the persistent data store. If you enable historical data collection during configuration, space is allocated for the data sets. Persistent data store maintenance options should also be configured.

**Important:** The Tivoli Enterprise Portal displays only 24 hours of data from the persistent data store data sets (*short-term history*). Data older than 24 hours is taken from the Tivoli Data Warehouse (*long-term history*). So to display more than 24 hours of data in the portal, you must configure data warehousing. The enhanced 3270UI can display as much data as is stored in the persistent data store (near-term history). However, the enhanced 3270UI cannot display data from the Tivoli Data Warehouse and you cannot configure the Warehouse Proxy and Summarization Pruning agents from the enhanced 3270UI.

Historical data collection consumes CPU and storage, so it is important to plan data collection carefully. Consider the following planning decisions before you begin to configure historical data collection and storage:

- [“What data to collect and how often” on page 155.](#)
- [“Where to collect data” on page 155.](#)
- [“How much space to allocate” on page 156.](#)
- [“How to manage collected data” on page 156.](#)

## What data to collect and how often

The impact of historical data collection and warehousing depends on many factors, including collection interval, frequency of roll-off, number and size of historical tables collected, amount of data, number of monitored resources, and system size.

The *IBM Tivoli Monitoring: Administrator's Guide* discusses the impact of historical data collection and warehousing on Tivoli Management Services components. The documentation for many OMEGAMON monitoring agents provides information about the space requirements and size of individual attribute tables, to help you estimate the impact of data collection.

Give careful consideration to what data you actually require. Historical data collection can be specified for individual monitoring servers, products, and attribute tables. Depending on your requirements, you can configure historical data collection for only a subset of attribute tables. Such a configuration can reduce storage and CPU consumption, particularly if you choose not to perform historical data collection for high-volume attribute tables or for attribute tables with many bytes per row (many attributes). Collect only the data that you plan to use in historical reports. Collect that data only as frequently as your enterprise requires.

The collection interval set in the History Collection Configuration window can be as short as a minute or as long as a day. The shorter the interval, the faster and larger the history files grow at the collection location. Short collection intervals also increase CPU consumption and network traffic. Do not set a one-minute collection interval unless your work requires it. If you require frequent collection of historical data, be sure to allocate extra space for the persistent data store. Insufficient allocation of space results in inability to view short-term data and can result in loss of historical data. Allocate enough space for 24 hours of short-term historical data at the location of the persistent data store.

Decisions about what data to collect always involve trade-offs between the usefulness of the data collected and the cost of collecting and managing the data.

## Where to collect data

Historical data can be stored as short-term data either at the monitoring agent or at the monitoring server to which the agent reports. Where you decide to collect the data determines what steps you take to configure the persistent data store.

### Best practices

Two OMEGAMON® monitoring agents (OMEGAMON® for z/OS® and OMEGAMON® for Storage on z/OS®) must be configured within the address space of a monitoring server. Therefore, any historical data collection for these agents must also be stored at the monitoring server. For all other agents, whenever possible configure historical data to be collected and stored at the monitoring agent rather than at the monitoring server.

**Tip:** For best performance, avoid collecting historical data at the hub. See *IBM Tivoli Monitoring: Administrator's Guide* for details.

If an agent is configured to run in the monitoring server address space, like OMEGAMON® for z/OS® and OMEGAMON® for Storage on z/OS®, the persistent data store is configured in two locations:

- During configuration of the monitoring server, the generic persistent data store (RPDSGRP) is configured and the generic data sets (RGENHIS\*) are allocated.
- During configuration of the OMEGAMON® monitoring agent, product-specific historical data sets are allocated.

If a monitoring agent runs in its own address space (stand-alone), and you intend to collect historical data only at the location of the monitoring agent, you can configure the persistent data store during configuration of the agent only. However, to ensure that you have flexibility to collect data at the monitoring server at some later date, configure the persistent data store at the location of the monitoring server as well. If you have no monitoring server in the runtime environment, configuring the persistent data store for the monitoring agent allocates the generic data sets as well as the private data sets.

Data can be uploaded to the Tivoli Data Warehouse for long-term storage and reporting. However, warehoused data can only be viewed using the Tivoli Enterprise Portal. Data warehousing is configured in the Historical Data Collection window of the Tivoli Enterprise Portal. See the *IBM Tivoli Monitoring: Installation and Setup Guide* for

instructions on setting up the Tivoli Data Warehouse and the Warehouse Proxy and Summarization and Pruning agents. See the [IBM Tivoli Monitoring: Administrator's Guide](#) for instructions on configuring data warehousing.

## How much space to allocate

Data written to the persistent data store is organized by tables (attribute groups), groups, and data sets. Each table is assigned to a group; each group can have one or more tables and one or more data sets assigned to it. The size of the persistent data store (spread across the data sets), the groups that are selected, and the activity of the system or subsystem monitored determines how much data is available. By default, one group and six data sets are allocated. When you configure the persistent data store, the persistent data store processing computes how much space is required for the group data store files and how much additional required space is required for overhead information. (Overhead information includes the product dictionary, table records, index records, and spare room for buffers that must be reserved for when the data set is full.) However, you might have to adjust the space allocated.

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

Initially, you should accept the default number of cylinders and groups provided by each product (`Kpp_PD_CYL=`, `Kpp_PD_GRP=`). Eventually, you can determine the correct amount of space by observing how often the maintenance procedures are running and adjusting space according. To help you make more specific calculations, the product documentation for the monitoring agents provides estimated space requirements or information about attribute tables. You might want to make your own calculations, based on site-specific factors: what types of monitoring agents are running, what resources are being monitored, how many resources, and so on. You can also take a trial-and-error approach. If you are not seeing as much data in your reports as you would like, you can override the defaults.

Increasing the group count (number of data sets used to provide the total number of cylinders of persistent data store space) is a way to reduce the total space required, by reducing the percentage of the total space required for the in-use and empty data sets. Increasing the group count to 6 or 8 dramatically reduces the total space required. (The maximum group count value is 36.) Another benefit of increasing the group count is that roll-off to the warehouse as well as short-term history queries perform better when the individual data sets are smaller. The overhead for more frequent data set switches caused by the increased group count (and presumably by executions of the maintenance procedures) is more than offset by the gains in efficiency.

When historical data is collected in generic history data sets at the monitoring server, the same considerations apply, but the data sets must be sized to contain the data from all of the agents that write to them.

For more information on changing the size of the persistent data store, see [Resizing persistent data store files](#) and [How to: Change PDS file count and file size](#).

## How to manage collected data

If you intend to configure historical data collection, you must make provisions for handling the collected data. Without such provision, on distributed computers the history data files grow unchecked, using up valuable disk space. On z/OS® systems, the data sets allocated to the persistent data store are emptied and overwritten.

On distributed systems, if warehousing of the data is configured, the files are automatically pruned after the data is inserted into the Tivoli Data Warehouse by the Warehouse Proxy agent. On z/OS® systems, the persistent data store data sets are not pruned after data is inserted into the Tivoli Data Warehouse by the Warehouse Proxy agent. A record is written in the persistent data store to indicate where to begin exporting data to the Warehouse Proxy agent the next time, and the exported data is kept in the persistent data store until it is overwritten or deleted by other means.

Tivoli Management Services provides automatic maintenance for the data sets in the persistent data store. When a data set becomes full, the persistent data store selects an empty data set to make active. When the data set is active, the persistent data store checks to see whether any data sets are empty. If not, the persistent data store begins maintenance on the oldest data set. However, before it begins processing, it checks to see whether one or more of the following functions have been configured:

- BACKUP makes an exact copy of the data set being maintained.

- EXPORT writes the data to a flat file in an internal format that can be used by external programs to post-process the data. This function is also used for recovery when the persistent data store detects potential problems with the data.
- EXTRACT writes the data to a flat file in human-readable form suitable for loading into other database management systems (DBMS).

If no function has been specified, the data is deleted from the data set.

You specify which maintenance options are implemented when you configure the persistent data store. [Maintaining the persistent data store](#) provides more information about how the persistent data store operates and how maintenance is performed.

## Decision 9: Which security options to enable

The security options you decide to employ can determine tasks you must complete in advance, such as arrangements you must make with security administrators or accounts you must set up. Your security decisions can also dictate certain choices during configuration, such as the selection of secure protocols when configuring communication between components.

Tivoli Management Services and the OMEGAMON monitoring agents offer several security options. The information in the following topics is intended to help you decide which security options you want to enforce and what steps you need to take to enable that security.

### Related topic:

[“Predefining and managing OMEGAMON started tasks” on page 1252](#)

## Secure communication between components

User IDs and passwords sent between Tivoli® Management Services components are encrypted by default. To secure other communications, use SPIPE (IP:SPIPE, IP6:SPIPE) as the protocol when you configure communication between the Tivoli Enterprise Portal Server and the hub Tivoli Enterprise Monitoring Server, between hub and remote monitoring servers, and between agents and monitoring servers.

A secure pipe is an implementation of the Internet Protocol's pipe specification that uses the Secure Sockets Layer (SSL) API. Tivoli Management Services uses two additional protocols for securing communications that also use SSL: HTTPS to retrieve files and Interoperable Object Reference (IOR).

- The integrated browser in the Tivoli Enterprise Portal desktop client provides HTTPS support on the client side; for the server, consider using a web server that supports HTTPS, such as the IBM® HTTP Server. For more information on using web servers, see the [IBM Tivoli Monitoring: Installation and Setup Guide](#). For information about disabling an HTTPS server, see [“Disabling the HTTPS or HTTP server” on page 153](#).
- Internet Inter-ORB Protocol (IIOP) is used to secure the communications between the portal server and client.

SSL uses public key cryptography. Tivoli® Monitoring includes the Global Security Toolkit (GSKit) for SSL processing. GSKit is installed by default with all distributed components, and its utilities are used to create and manage the encryption of data between components through the use of digital certificates.

On z/OS® systems, GSKit is known as the Integrated Cryptographic Service Facility, or ICSF. If ICSF is not installed on the z/OS® system, the monitoring server uses an alternative, less secure encryption scheme. Because both components must be using the same scheme, if the hub system does not use ICSF, you must configure the Tivoli Enterprise Portal to use the less secure scheme (EGG1) as well. For more information, see the [IBM® Tivoli® Monitoring: Installation and Setup Guide](#).

A default certificate and key are provided with GSKit at installation. A stash file provides the database password for unattended operation. You can also use the key management facility (iKeyMan) in GSKit to generate your own certificates.

**Important:** Use of SSL protocols and services on z/OS by the IBM Tivoli Management Services on z/OS requires that an Application Transparent Transport Layer Security (AT-TLS) policy be configured and operational in the runtime environment.

## OMEGAMON enhanced 3270 user interface security

The OMEGAMON® enhanced 3270 user interface uses the system authorization facility (SAF) interface to authorize and authenticate users. Planning for security includes deciding who requires access to the OMEGAMON® enhanced 3270 user interface, what information they may view, and what Take Action commands they should have permission to invoke; choosing or creating an SAF class that will contain the SAF resources; then ensuring that the required IDs are given the appropriate authority to those resources.

The existence of the SAF user ID and its validity are always checked. The enhanced 3270 user interface also runs SAF authorization checks to determine if the user has the authority to perform the following actions:

- Log on to this instance of the user interface.
- View the data from queries for specific types of data (attribute groups) on a specific managed system
- Transmit a Take Action request to a specific managed system
- Perform the following interface activities:
  - List users of the enhanced 3270 user interface.
  - Save a data set member.
  - Start or stop user interface tracing.
  - Start or stop internal tracing.
  - Modify (**Save As**) any PDS member that is named with a user ID different than that of the current user.
  - Change auto-update preferences.
  - Enter a command on the command line.
  - Create and modify a profile member name that is the same as the user's user ID.
  - Use a hub Tivoli® Enterprise Monitoring Server.
  - Configure near-term history

User permissions and the amount of security that is imposed are assigned by site administrators. Authorization works as follows:

- If *no* SAF security class is supplied (value for RTE\_SECURITY\_CLASS is missing or blank), users may log on to the OMEGAMON® enhanced 3270 user interface, may access data through queries, but may not issue Take Action commands.
- If a SAF security class is supplied, but the class is not defined and active in SAF, no one may log on to the OMEGAMON® enhanced 3270 user interface.
- If a SAF security class is supplied, and is defined and active in SAF, but no logon profile is defined, no one may log on to the OMEGAMON® enhanced 3270 user interface.
- If a user is able to log on, and a different security class than the one used for logon is used for queries or for Take Action commands (but is not activated or resources are not defined in that security class), everyone can view data for any managed system and perform other commands and activities, but all Take Action commands are denied.
- If a security class name is configured, resource profiles must be defined to control log on, data access, and Take Actions, and users must be given access to those profiles.

Before security is configured in the environment by providing a resource class name, a security administrator must complete the following setup tasks:

1. Define an SAF general resource class.
2. Define logon profiles to control access to the enhanced 3270 user interface.
3. Define Take Action profiles to control access to enhanced 3270 user interface data actions.
4. Define Query profiles to control access to OMEGAMON® enhanced 3270 user interface data sources.
5. Define profiles to control permissions to additional activities performed using the enhanced 3270 user interface.
6. Permit access to the profiles by appropriate personnel.

See [Enable security for the OMEGAMON enhanced 3270 user interface](#) for information about how to configure security resource profiles.

At a minimum, update the security settings to secure the Take Action function. Failure to correctly secure this powerful function of the OMEGAMON® enhanced 3270 user interface might give all users full control to modify the managed system, including starting and stopping applications.

**Note:** The following activities are separately secured by the Data Facility Storage Management System (DFSMS):

- Display a member list for a data set
- Browse the contents of a data set member
- Save a data set member

## Tivoli Enterprise Portal security

Access to the Tivoli Enterprise Portal (*authorization*) is controlled by user accounts (IDs) defined to the portal server. Authentication of users is controlled through either the hub Tivoli Enterprise Monitoring Server or the Tivoli Enterprise Portal Server.

In addition to defining the user IDs that are authorized to log on to the Tivoli Enterprise Portal, these accounts define the permissions that determine the Tivoli® Enterprise Portal features a user is authorized to see and use, the monitored applications the user is authorized to see, and the Navigator views (and the highest level within a view) the user can access. An initial **sysadmin** user ID with full administrator authority is provided during installation so you can log in to the Tivoli Enterprise™ Portal and add more user accounts. No password is required to log on to the Tivoli Enterprise Portal, unless user authentication is enabled.

The hub Tivoli Enterprise Monitoring Server can be configured to authenticate, or *validate*, user IDs using either the local system registry or an external LDAP-enabled registry. The Tivoli Enterprise Portal Server can be configured to authenticate through an external LDAP registry. If authentication is not enabled through either the monitoring server or the portal server, no authentication is performed and no password is required to log on to the Tivoli Enterprise™ Portal.

User IDs that have to make SOAP Server requests (including user IDs that issue CLI commands that invoke SOAP server methods) can be authenticated only through the hub monitoring server. User IDs that require the ability to share credentials with other web-enabled Tivoli® applications (single sign-on capability, or SSO) must be authenticated through the portal server and mapped to unique user identifiers in an LDAP registry shared by all SSO-eligible Tivoli® applications.

Do not enable user authentication before completing and testing at least a basic installation of Tivoli® Management Services components and monitoring agents. The first time you configure the hub monitoring server, do not enable security. Complete the following steps before you reconfigure the hub to enable security:

1. Configure all products and verify that they are operating correctly.
2. If you choose a third-party security package, verify that it is installed and configured correctly for your site.
3. Create user IDs in the Tivoli Enterprise Portal, and authorize the users to access resources.
4. Create the user IDs and passwords on the system hosting the hub monitoring server.

You do not have to define and authorize additional user IDs before you enable security, but you must define and authorize the **sysadmin** user ID.

As part of your preparation for deployment, determine which users require access to the Tivoli Enterprise Portal and which features, applications, and views the users must access.

Also determine which users you want to authorize to issue Take Action commands from the Tivoli Enterprise Portal. You can have the issuers of z/OS® console commands authorized by IBM Z® NetView (see [Configuring IBM Z NetView authorization of z/OS commands](#)). Monitoring agents can have product-specific requirements for authentication. Consult the documentation for each monitoring agent for more information.

For instructions on enabling authentication on a hub monitoring server on Windows™, UNIX™, and Linux™ operating systems, managing user accounts and permissions, or enabling the Tivoli Enterprise Portal Server for

single sign-on, see the [IBM Tivoli Monitoring: Administrator's Guide](#). For instructions on enabling authentication on a hub monitoring server on a z/OS® system, see [Enabling security validation on a z/OS hub](#).

## OMEGAMON® 3270 Classic interface security

You can provide security for the OMEGAMON® 3270 Classic interface by using a combination of security types and implementations. You must implement security at both the product level and the command level. Product-level security provides user ID and password validation to detect and prevent unauthorized access to the OMEGAMON® product. Command-level security prevents the unauthorized use of sensitive commands from OMEGAMON® 3270 Classic panels and by OMEGAMON® users.

The OMEGAMON® 3270 Classic interface is available for the following OMEGAMON products: OMEGAMON for CICS, OMEGAMON® AI for Db2, OMEGAMON for IMS, and OMEGAMON for z/OS.

You can implement product-level (logon access and authorization) and command-level security using either external or internal security, or a mixture, as follows:

- External security uses another security package (such as IBM RACF®) to control access. External security can be used for securing logon validation and command validation.
- Internal security uses the security included within the product to control access for commands. By default, OMEGAMON command validation is controlled by an internal security table. Internal product security is not available for logon validation.
- A mixed implementation mixes the security used at the product level and the command level. For example, you can use RACF® for logon authentication, and then use internal security at the command level.

If security is enabled on a z/OS hub monitoring server, you must use the same security implementation for the OMEGAMON® 3270 Classic interface as is used for the hub.

### External security and logon validation

The OMEGAMON® 3270 Classic interface uses the System Authorization Facility (SAF) interface to implement external security. SAF provides a system interface to z/OS security software, such as IBM RACF. The method by which you set up the SAF interface depends on the type of authentication that you intend to use when logging on to the OMEGAMON 3270 Classic interface, as follows:

- If you will be using traditional eight-byte mainframe passwords only, you must use an external security exit to implement the SAF interface. The security exit is a user-customized assembler module that generally defines the SAF security class and SAF application ID for OMEGAMON Classic started tasks. A sample SAF exit is provided, which might require modification to conform to installation standards.
- If you will be using passphrase and multi-factor authentication, OMEGAMON implements the SAF interface without the use of external security exits. The SAF security class and SAF application ID are defined as startup parameters to the OMEGAMON logon program. In order for a user ID to use a passphrase, the user ID must be set up in the security system.

**Note:** Passphrase support for the OMEGAMON 3270 Classic interface is introduced with APAR OA57133 (PTF UA98944).

See the configuration documentation for the specific OMEGAMON® monitoring products for instructions on implementing security for the OMEGAMON 3270 Classic interface. If you will be using passphrase and multi-factor authentication, see also [“How to: Configure passphrase and MFA support in the OMEGAMON 3270 Classic interface” on page 362](#).

- Passphrase and multi-factor authentication: “[How to: Configure passphrase and MFA support in the OMEGAMON 3270 Classic interface](#)” on page 362

## SOAP server security

User IDs that require access to the SOAP Server, including user IDs that issue commands that invoke SOAP methods, must be authenticated through the hub monitoring server. If user authentication is *not* enabled on the hub monitoring server, anyone can make requests to the SOAP Server. If user authentication *is* enabled on the hub, the SOAP Server honors requests only from user IDs and passwords authenticated by the local or external registry. If type of access is specified for specific users, requests from only those users for which access is specified are honored.

You can control access to the SOAP server in two ways:

- You can control *who* is permitted to make requests by enabling user authentication on the hub monitoring server.  
If user authentication is *not* enabled, the SOAP server honors all requests regardless of the sender. If user authentication *is* enabled on the hub monitoring server, the SOAP server honors requests only from users defined to the operating system or security authorization facility of the host of the monitoring server.
- You can control *what type of requests* users are permitted to make by configuring the SOAP server.

**Important:** If you specify a specific type of access for any users, the SOAP server honors requests only from those users, regardless of whether or not authentication is enabled.

User authentication is enabled by setting the `KDS_TEMS_SECURITY_KDS_VALIDATE` in the LPAR configuration profile to Y.

## IBM Tivoli Monitoring Service Console security

The Service Console performs user authentication using the native security facility of the host operating system. This means that if you use the Service Console on a z/OS® system, your user ID and password are checked by the z/OS® security facility (such as RACF/SAF). If you use the Service Console on Windows™, the Windows™ workstation user ID and password are required for authentication.

The IBM Tivoli Monitoring Service Console enables you to read logs and turn on traces for remote product diagnostics and configuration. A password is always required to access the Service Console. Even if a user ID is allowed to log in to the operating system without a password, access to the Service Console is denied without a password. If necessary, create a password for the user ID that is being used to log in to the Service Console.

For more information about the Service Console, see [IBM Tivoli Monitoring: Troubleshooting Guide](#).

## Decision 10: Which user interfaces to use

Most OMEGAMON® monitoring products support the available z/OS-based 3270 “green screen” interfaces as well as the graphical interfaces. The interfaces differ in the information they offer, the infrastructure they require, and the security they provide. The capabilities of each interface, as well as the familiarity of a user community with a specific type of interface, should be considered when deciding which interface to provide.

For many products, it is possible to provide multiple user interfaces, allowing users to access the product in the manner more appropriate to their skills and familiarity. Review the following available user interfaces and considerations:

- The IBM® OMEGAMON® enhanced 3270 user interface requires that you install one or more Tivoli Enterprise Monitoring Servers, but it offers plex-level as well as system-level and cross-product data and enhanced functionality.
- The graphical [IBM Z® OMEGAMON® Web UI](#) interface requires you to install Grafana and one or more Tivoli Enterprise Monitoring Servers. For additional requirements depending on platform, see [Installation of OMEGAMON Web UI](#).
- The “[Tivoli Enterprise Monitoring Server REST services](#)” on page 58 interface is a REST API that you can use to integrate OMEGAMON data into your custom applications, including dashboards and automation, or third-party analytical tools (such as Splunk, Elastic, and Grafana).

- The graphical IBM Z Service Management Explorer interface is a web application that runs as a Zowe desktop plug-in. Installing and maintaining Java and TEP software on client workstations is not required.
- The graphical Tivoli Enterprise Portal interface requires that you install one or more Tivoli Enterprise Monitoring Servers and a Tivoli Enterprise Portal Server, which must be installed on a distributed platform.
- The older 3270 user interfaces require less infrastructure, but these interfaces provide more limited information and customization options.

Review the following sections to decide which interfaces to use.

## OMEGAMON® enhanced 3270 user interface

The OMEGAMON® enhanced 3270 user interface retains the virtues of the earlier 3270 interfaces, while offering many of the features of the Tivoli Enterprise Portal in a native 3270 interface.

- The ability to view plex-wide data, data from multiple systems, and data from multiple agents in the same interface or even the same workspace
- The ability to modify product-provided workspaces to create customized views and queries, and or create new workspaces
- The ability to set dynamic filters
- The ability to define or modify thresholds that trigger status indicators
- The ability to view near-term historical data.

One or more enhanced 3270 interface address spaces can be deployed on any given sysplex. A monitoring agent or a remote monitoring server must run in the same sysplex as the interface to enable discovery and communications with the associated hub monitoring server.

The OMEGAMON® enhanced 3270 user interface requires that at least one hub monitoring server be configured. The scope of the data displayed by the interface is determined by the scope of the associated hub monitoring server. If a hub monitoring server configuration connects agents from systems that span multiple sysplexes, the enhanced 3270 interface displays data from multiple sysplexes.

**Important:** The enhanced 3270 user interface uses BPXmmm services, which are part of z/OS® UNIX® System Services, for TCP/IP (connect, send, receive, and so forth). A user ID defined with an OMVS segment must be created for the enhanced 3270 user interface started task.

Self-describing agents (SDA) do not provide all the information that the Enhanced 3270 user interface requires to display its data. If your environment includes a high-availability hub monitoring server with SDA is enabled, consider placing the enhanced 3270 user interface in its own runtime environment (RTE). An e3270UI configured in its own RTE requires more DASD, but it give you more control over maintenance upgrades. If SDA is enabled and you do not want to place the e3270UI in its own RTE, place the e3270UI in an RTE with a remote monitoring server designated as a backup proxy and monitoring agents.

## IBM Z® OMEGAMON® Web UI

IBM Z OMEGAMON Web UI is a browser-based graphical user interface for monitoring and managing z/OS systems using data from OMEGAMON monitoring agents. IBM Z OMEGAMON Web UI requires IBM Z OMEGAMON Data Requester, a Grafana® application plug-in.

IBM Z OMEGAMON Web UI uses Grafana dashboards to provide visualization and analysis of performance data gathered by OMEGAMON monitoring agents. IBM Z OMEGAMON Web UI provides the following key capabilities:

- Web-based monitoring: Provides access to OMEGAMON performance data from any supported web browser.
- Situations management: Allows you to create, view, and manage alert conditions to identify and respond to critical issues.
- Role-based access control: Allows you to secure dashboards and situations through role-specific permissions.

- Customizable dashboards: Allows you to design and share personalized views tailored to specific monitoring needs.
- Integrated architecture: Enables communication between the Tivoli Enterprise Monitoring Server and Grafana using the OMEGAMON Gateway.
- Administrative user interface: Simplifies configuration and automation of monitored environments.
- OMEGAMON Data Requester: Retrieves and filters real-time and historical data.
- Dashboards: Provide real-time and historical visualization of performance metrics of all OMEGAMON monitoring agents.

For more information, including system requirements and installation steps, see [IBM Z OMEGAMON Web UI](#).

**Note:** Starting with Tivoli® Management Services on z/OS® 6.4, IBM Z OMEGAMON Web UI and Grafana are included as components.

## Tivoli Enterprise Monitoring Server REST services

Tivoli Enterprise Monitoring Server (TEMS) REST services provide access to OMEGAMON data using HTTP REST calls.

Tivoli Enterprise Monitoring Server (TEMS) REST services provide access to OMEGAMON data using HTTP REST calls. Using the TEMS REST services, you can retrieve real-time and historical data collected by the monitoring agents, the configurations used for collecting the historical data, select managed system information, and information about situations. You can also perform activities such as starting, stopping, creating, editing, and deleting situations; executing or deleting a Take Action; and deleting a history collection configuration.

Using TEMS REST services, you can integrate OMEGAMON data into your custom applications, including dashboards and automation, or third-party analytical tools (such as Splunk, Elastic, and Grafana).

TEMS REST services are implemented with the OpenAPI Specification 3.0.3.

For more information, see [“Tivoli Enterprise Monitoring Server REST services” on page 1080](#).

## IBM Z Service Management Explorer (IZSME)

This graphical user interface is a web application that runs as a Zowe desktop plug-in.

**Note:** IBM Z Service Management Explorer is a web-based replacement for the Tivoli Enterprise Portal (TEP). The same layout, workspaces, situations, and data available in the TEP are available in IZSME. IZSME is a web application running as a Zowe desktop plug-in, which eliminates the need to install and maintain Java and TEP software on client workstations, as required with the TEP.

IBM Z Service Management Explorer (IZSME) provides the following features:

- The ability to view the data from multiple agents or multiple systems in a single workspace for business views and unit-of-work views
- Graph and table views
- Integral historical data collection, reporting, and warehousing
- Integration with other Tivoli® and IBM® products, including single sign-on

IZSME is a web application, running as a Zowe desktop plug-in, and uses the standard browser interface. Using the IZSME interface requires defining and running the Tivoli Enterprise Portal Server, a hub Tivoli Enterprise Monitoring Server, and potentially one or more remote monitoring servers. The agents that will provide data also have to be configured. For more information, see [“IBM Z Service Management Explorer” on page 1128](#).

## Tivoli Enterprise Portal interface

This graphical user interface may be accessed through a Java™-based desktop client or a supported browser. The Tivoli Enterprise Portal provides the greatest number of features, but requires the most infrastructure.

The Tivoli Enterprise Portal provides the following features:

- The ability to merge the data from multiple agents or multiple systems into a single workspace for business views and unit-of-work views
- The ability to define specific conditions that should be monitored (situations)
- The ability to define colored highlights and sounds to alert operators when events occur
- Proactive automation to respond to situations
- Highly customizable graph and table views
- Integral historical data collection, reporting, and warehousing
- Customizable historical reporting
- Integration with other Tivoli® and IBM® products, including single sign-on
- Event forwarding to event management systems LDAP authentication

The portal uses the standard browser interface and is user-friendly to most users and is often the preferred interface for operation centers, managers, and technical staff. Using the Tivoli Enterprise Portal interface always requires defining and running the Tivoli Enterprise Portal Server, a hub Tivoli Enterprise Monitoring Server, and potentially one or more remote monitoring servers. The agents that will provide data also have to be configured. For more information about the Tivoli Enterprise Portal, see the [\*IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide\*](#).

## OMEGAMON® (3270) and OMEGAMON II® (CUA®) interfaces

The older 3270 interfaces require the least amount of product-specific architecture to support. These interfaces perform well and are user-friendly to systems programmers and administrators that are familiar with an ISPF-based 3270 interface. Standard and custom PF Key settings, menu options, and command-line interface options allow for short cuts to commonly viewed screens. While basic customization options allow for highlights and other eye-catcher techniques to be added to the interface, the customization options are limited. The 3270 interfaces use dedicated connection features and avoid disk I/O. Documentation may be out-of-date or difficult to find.

The OMEGAMON® (3270) and OMEGAMON II® interfaces do not provide plex data, cross-LPAR monitoring, or cross-product views. However, you can get limited multisystem monitoring and cross-system views using OMEGAMON® DE. The following OMEGAMON® products provide older 3270 interfaces:

- IBM® OMEGAMON for z/OS®
- IBM Z® OMEGAMON® for CICS®
- IBM® OMEGAMON for Db2® on z/OS®
- IBM® OMEGAMON for IMS® on z/OS®
- IBM® OMEGAMON for Messaging on z/OS®
- IBM® OMEGAMON for Storage on z/OS®
- IBM® OMEGAMON for Networks on z/OS®

OMEGAMON on z/OS® and OMEGAMON for Storage require more infrastructure than the other agents: a Tivoli Enterprise Monitoring Server must be installed in the same runtime environment as each monitoring agent and the OMEGAMON component to be configured. (While the OMEGAMON on z/OS® agent can be configured to run as a stand-alone system, that is, outside of a monitoring server, such a configuration does not support plex data.)

The other agents do not require either a portal server or a monitoring server, and require only configuration of the OMEGAMON II® component.

## What to do next

After you finish planning your deployment and installing components where desired, you can begin the configuration tasks.

For an overview of the configuration process and an explanation of the configuration steps, the topics in the [Configuring products and components on z/OS](#) section. If you know exactly which RTEs you want to configure, see the appropriate scenarios in [Scenarios](#).

**Note:** If you are planning new started tasks and system automation, see the recommended naming conventions and critical planning information in [Predefining and managing OMEGAMON started tasks](#).

## Planning an upgrade or installation

Before installing or upgrading the components of Tivoli® Management Services and the OMEGAMON® monitoring agent products, consider the basic requirements for an installation or upgrade and the effects of a mixed-version environment on globalization and data presentation. For an upgrade, you must also decide which upgrade path to follow after considering these basic requirements.

The information in this section applies to the components of Tivoli Management Services installed on z/OS and to all the products in the OMEGAMON version 5.3.0 family of products. For an upgrade, this information makes the following assumptions:

- Version 4.2.0 or later of the OMEGAMON® monitoring agents that you want to upgrade are currently installed.
- The Tivoli Management Services components are being upgraded to V6.3.0 Fix Pack 2, or above.

You can find product-specific upgrade information in the following locations:

- Documentation for [IBM Tivoli Monitoring](#)
- Documentation for the OMEGAMON family of products: [OMEGAMON shared documentation](#)
- Technotes for each product on the [IBM® Software Support](#) website

You can use the Shopz website to order mainframe products and maintenance (also known as program temporary fixes or PTFs). The primary product fulfillment mechanism is physical media, but electronic CBPDOs (Custom-Built Product Delivery Offerings) are available. Maintenance is available on physical tape or electronically on the [Shopz](#) website (<https://www.ibm.com/software/shopzseries>).

For information about ordering products and maintenance through the Shopz website, see technote [Ordering Products and Maintenance Through Shop zSeries](#) (<https://www.ibm.com/support/docview.wss?uid=swg21225816>).

## Version requirements

IBM® OMEGAMON® monitoring agents require that IBM® Tivoli® Management Services (the framework) and common components be at a certain minimum version. The minimum level required depends on the version of the monitoring agent that you are installing.

A family is a group of products that have the same minimal FMID requirements and the same cross-product release features. The OMEGAMON® V5.5.0 family includes the following products:

- IBM OMEGAMON® for CICS® on z/OS® V5.5.0
- IBM Tivoli OMEGAMON® XE for Db2 Performance Expert on z/OS V5.4.0
- IBM Tivoli OMEGAMON® XE for Db2 Performance Monitor on z/OS V5.4.0
- IBM OMEGAMON® for Db2 Performance Expert on z/OS V5.5.0
- IBM OMEGAMON® for IMS on z/OS® V5.5.0
- IBM OMEGAMON® for Networks on z/OS V5.5.0
- IBM OMEGAMON® for Messaging on z/OS® V7.5.0
- IBM OMEGAMON® for Storage on z/OS® V5.5.0
- IBM OMEGAMON® for z/OS® V5.5.0
- IBM OMEGAMON® for JVM on z/OS® V5.4.0
- IBM® Z OMEGAMON for JVM on z/OS®, V5.5.0
- IBM OMEGAMON® Dashboard Edition on z/OS® V5.5.0

The following shared components are included in the packages for these agents:

HKOB750: OMNIMON Base

HKSB740: Shared Probes

The cross-product features include support for near-term history and cross-product embedded data in the OMEGAMON® Enhanced 3270 user interface, a minimum requirement for z/OS® V1.13 or higher, and support for PARMGEN configuration method only.

All members of the V5.5.0 family require that Tivoli® Management Services be at a minimum of version 6.3.0 Fix Pack 6 on z/OS.

Monitoring agents and the Tivoli® Enterprise Monitoring Servers that the agents report to must be at the same version and maintenance level of the framework. Upgrade the Tivoli® Data Warehouse components at the same time you upgrade the Tivoli® Enterprise Portal Server. If you are not enabling support for self-describing agents, you must also install application support for the highest level of each monitoring agent at the hub monitoring server, at the Tivoli® Enterprise Portal Server, and at the desktop client. For planning purposes, these upgrade paths require Tivoli® Management Services V6.3.0 Fix Pack 6 starting in April 2016. For more information, see the technote *Recommended Maintenance Service Levels for OMEGAMON and Tivoli Advanced Reporting products on ITM V6.x* (<https://www.ibm.com/support/docview.wss?uid=swg21290883>).

The required minimum version for common components are listed in “Current versions of OMEGAMON® monitoring agents and minimum required level of Tivoli® Management Services and common components” on page 166.

Upgrade requirements and release levels for OMEGAMON® Monitoring Agents.

Current® monitoring agent release	OMNIMON (Enhanced 3270UI - KOB)	End-to-End (KET)	Shared probes (KSB)
IBM OMEGAMON® for CICS® on z/OS® V5.5.0	V7.5.0	n/a	n/a
IBM Z® OMEGAMON® AI for Db2 V6.1.0	V7.5.0	n/a	n/a
IBM® OMEGAMON® for IMS™ on z/OS® V5.5.0	V7.5.0	n/a	n/a
IBM® OMEGAMON® for Networks on z/OS V5.5.0	V7.5.0	n/a	n/a
IBM OMEGAMON® for Messaging on z/OS® V7.5.0	V7.5.0	n/a	n/a
IBM® OMEGAMON® for Storage on z/OS® V5.5.0	V7.3.0	n/a	V7.4.0
IBM OMEGAMON® for z/OS® V5.5.0	V7.5.0	n/a	V7.4.0
IBM® OMEGAMON® Dashboard Edition on z/OS® V5.5.0	n/a	n/a	n/a
IBM® OMEGAMON® for JVM on z/OS® V5.4.0	V7.3.0	n/a	n/a

“Supported OMEGAMON® 550 family features” on page 166 lists the features supported by GA products.

Lists the current release for each agent and the features it supports

Current® Monitoring Agent Release	Enhanced 3270 user interface	Self-describing agents	Configuration method
IBM OMEGAMON® for CICS® on z/OS® V5.5.0	Yes	Yes	PARMGEN
IBM OMEGAMON® for Db2 Performance Expert on z/OS V5.5.0	Yes	Yes	PARMGEN
IBM OMEGAMON® for IMS™ on z/OS® V5.5.0	Yes	Yes	PARMGEN
IBM OMEGAMON® for Networks on z/OS® V5.5.0	Yes	Yes	PARMGEN

Current® Monitoring Agent Release	Enhanced 3270 user interface	Self-describing agents	Configuration method
IBM OMEGAMON® for Messaging on z/OS® V7.5.0	Yes	Yes <sup>1</sup>	PARMGEN
IBM OMEGAMON® for Storage on z/OS® V5.5.0	Yes	Yes	PARMGEN
IBM OMEGAMON® for z/OS® V5.5.0	Yes	Yes	PARMGEN
IBM OMEGAMON® for JVM on z/OS® V5.4.0	Yes	Yes	PARMGEN

All currently GA products support a staged upgrade with SDA, so long as the Tivoli® Management Services framework is at V6.2.3 Fix Pack 1 or higher. However, the OMEGAVIEW II for the Enterprise component of OMEGAMON® Dashboard Edition does not support SDA. If you are using this component, you must install its application support data manually. If you are not using the component, no agent application data is required.

## Basic upgrade requirements

Review the basic upgrade requirements.

Before you begin to upgrade your OMEGAMON products, any Tivoli Enterprise Monitoring Server (hub, remote, backup, and Hot Standby) that a monitoring agent reports to must be running at the prerequisite level. In addition, any agent and the Tivoli Enterprise Monitoring Server that it reports to must be running with the same level of IBM Tivoli Monitoring maintenance. All products in a runtime environment must use the same configuration method. If you are configuring multiple products, some of which require PARMGEN, you must use PARMGEN for all of the products.

Whenever you upgrade an OMEGAMON product or install PTF maintenance, the runtime environment libraries must be loaded to the upgraded maintenance level, at a minimum (which means that the PARMGEN KCIJPLOD load job must be run).

- If you are upgrading to IBM Z® OMEGAMON® AI for Db2 V6.1.0 in an existing PARMGEN runtime environment, to enable support for Db2 V12, you must manually add the following two parameters to the *rte\_plib\_hilev.rte\_name.WCONFIG(\$GBL\$USR)* profile:
  - GBL\_DSN\_DB2\_LOADLIB\_V12
  - GBL\_DSN\_DB2\_RUNLIB\_V12

To enable support for Db2 V13, you must manually add the following two parameters to the *rte\_plib\_hilev.rte\_name.WCONFIG(\$GBL\$USR)* profile:

- GBL\_DSN\_DB2\_LOADLIB\_V13
- GBL\_DSN\_DB2\_RUNLIB\_V13
- If you are upgrading to OMEGAMON for IMS V5.5.0, OMEGAMON for CICS V5.5.0, and OMEGAMON for z/OS V5.5.0, you must rerun the **KCIJPSEC** job as part of the upgrade.

**Note:** Regarding OMEGAMON for IMS, before you rerun **KCIJPSEC** job, you must take steps to enable the IMS related modules. For detailed information, see [Enabling the IMS version-related modules](#).

- New jobs are provided in OMEGAMON family version 5.5.0 to delete obsolete elements and runtime members. Consider running the following jobs based on your requirements.
  - The **KCIJPW1R** job. For staged upgrade planning, use the KCIJPW1R job to delete any obsolete runtime members that are no longer generated by the PARMGEN \$PARSE\* jobs for the product-specific deprecated functions (CUA-related product runtime members, Epilog-related product runtime members, and other obsolete functions) from the product-execution user libraries for each RTE to upgrade (RKANCMDU, RKANPARU, RKANSAMU, RKD2PAR, RKD2PRF and RKD2SAM), when the product started tasks are not in use.

**Note:** You do not have to delete these obsolete runtime members from the product execution user libraries (RK\* user) immediately after SMP/E upgrade and reconfiguration of the RTEs pointing to the upgraded SMP/E target datasets. The product started tasks upgraded and loaded with the latest OMEGAMON V5.5 code will continue to run and tolerate the obsolete runtime members. You can continue to use the KCIJPW2R "Copy runtime mbrs from WK\*->RK\* RW libraries" to refresh the RK\* user libraries after an upgrade following either the [SMPE04](#), [SMPE05](#), or [SMPE06](#) upgrade scenario.

- The standalone **KCIDELJB** job. A new DELRUN2 step is added to delete obsolete modules from the xKANMOD\* load libraries, obsolete Object Definition Information (ODI) files from the RTE's RKANDATV, obsolete panels from the read-only RKANWENU, and obsolete screen space from the read-only RKppPROC profile dataset, once PARMGEN detects that the minimum OMEGAMON version installed is V5.5.0/V7.5.0.  
The new handy standalone KCIDELJB job, which is the equivalent of the BUILDEX\*/DELRUN\* steps of the composite KCIJPLD job, is available for staged upgrades. Submit the KCIDELJB standalone job, which deletes obsolete elements in read-only runtime dataset copies of the %GBL\_TARGET\_HILEV%.TK\* SMP/E target datasets. Run this job when the started tasks are not running in order to do the clean-up.
- Some product components are not SDA enabled:
  - OMEGAVIEW for the Enterprise agents
  - Language packs
  - Tivoli Enterprise Portal desktop client.

Application support for these components must be installed manually.

- The GBL\_DSN\_GLOBAL\_SOURCE\_LIB parameter provides the flexibility in accommodating a common dataset that PARMGEN allocates to house globals from products that support KppGLB\* global data members. IBM recommends that you use the common globals dataset name. The current default is the RTE-specific %RTE\_HILEV%.%RTE\_NAME%.RKANPARU dataset for compatibility with OMEGAMON for CICS and OMEGAMON for IMS globals usage, but best practice is to use a common globals dataset that can be shared across different LPAR RTEs. The GBL\_DSN\_GLOBAL\_SOURCE\_LIB parameter is available for customization by adding the parameter in WCONFIG(\$GBL\$USR), if your \$GBL\$USR member existed prior to PARMGEN 2Q15 Interim Feature (APAR OA46817). Otherwise, the parameter is available in both WCONFIG(\$GBL\$IBM) IBM default global profile and in the WCONFIG(\$GBL\$USR) user global profile. To specify a more common global dataset rather than the default dataset value of the RTE's RKANPARU dataset, override the GBL\_DSN\_GLOBAL\_SOURCE\_LIB parameter value in WCONFIG(\$GBL\$USR).
- The GBL\_USS\_TKANJAR\_PATH parameter is used to change the TKANJAR DDDEF installation z/OS® UNIX® System Services directory. If your \$GBL\$USR member exists before PARMGEN 1Q16 Interim Feature (APAR OA48678), you must add the GBL\_USS\_TKANJAR\_PATH parameter in WCONFIG(\$GBL\$USR) before you can use it. If your \$GBL\$USR member is created after you apply PARMGEN 1Q16 Interim Feature (APAR OA48678) or later PARMGEN PTF maintenance, the parameter is available in both WCONFIG(\$GBL\$IBM) IBM default global profile and in the WCONFIG(\$GBL\$USR) user global profile.

Customize the GBL\_USS\_TKANJAR\_PATH parameter in WCONFIG(\$GBL\$USR), then follow the SMPenn maintenance scenario to reconfigure your RTE. For more information, see the **Maintenance Scenarios (Scenario SMPenn)** on-line help on the **PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU** or [SMP/E maintenance and upgrade scenarios](#).

If the products that have TKANJAR DDDEF requirement such as OMEGAMON for JVM (HKJJvuv FMID) or OMEGAMON for CICS TG (HKGWvuv FMID) is upgraded, or you are applying SMP/E maintenance to these products that updated the elements in the TKANJAR path, make sure that you rerun the PARMGEN KCIJPUSS job in the RTE\_PLIB\_HILEV.RTE\_NAME.WKANSAMU or RTE\_HILEV.RTE\_NAME.RKANSAMU dataset. Or you can submit these jobs from the "SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP" KCIP@SUB panel to refresh RTE\_USS\_RTEDIR/RTE\_NAME/kan/bin/IBM/\*.jar.

For more information about this parameter, see [GBL\\_USS\\_TKANJAR\\_PATH](#).

- The KCIJPLA autodiscovery job integrates with IBM® Discovery Library Adapter for z/OS® (DLA); DLA requires the SMP/E SMPTLOAD DDDEF statement.  
If you are upgrading from an older version of a product that does not support DLA, make sure that SMPTLOAD is defined in the CSI. Use the following sample job to define the SMPTLOAD DDDEF. Change all occurrences of the following lowercase variables to values suitable to your installation before submitting.

```

#globalcsi - The dsname of your global CSI.
#tzone - The name of the SMP/E target zone.
#dzone - The name of the SMP/E distribution zone.
//SMPTLOAD JOB 'ACCOUNT INFORMATION','SMPTLOAD',
// CLASS=A,MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID
//
// D e f i n e D D D E F E n t r i e s
//
//SMPTLOAD EXEC PGM=GIMSMP,REGION=496K
//SMPCSI DD DISP=OLD,DSN=#globalcsi
//SMPCNTL DD
SET BDY(GLOBAL) .
UCLIN .
ADD DDDEF(SMPTLOAD) CYL SPACE(2,1) DIR(1)
UNIT(SYSALLDA) .
ENDUCL .
SET BDY(#tzone) .
UCLIN .
ADD DDDEF(SMPTLOAD) CYL SPACE(2,1) DIR(1)
UNIT(SYSALLDA) .
ENDUCL .
SET BDY(#dzone) .
UCLIN .
ADD DDDEF(SMPTLOAD) CYL SPACE(2,1) DIR(1)
UNIT(SYSALLDA) .
ENDUCL .
/*

```

**Tip:** You can run more than one version of an OMEGAMON® monitoring agent on the same z/OS® system, provided that the different versions of the monitoring agent report to different monitoring servers or have different started task names.

**Note:** Distributed fix packs are available through [IBM Support Fix Central \(https://www.ibm.com/support/fixcentral/\)](https://www.ibm.com/support/fixcentral/). You need an IBM registered ID to download fixes from this site and to enable IBM to update you about critical issues that are associated with fixes that you download. z/OS fixes continue to be available through IBMLINK or Shop zSeries. For OMEGAMON V5.1.0 and V5.3.0 products (with the exception of OMEGAMON for Messaging on z/OS) you no longer need to install the application support DVD before installing the distributed fix packs.

## Before you begin

You can eliminate roadblocks and ensure a smoother upgrade if you make sure that all requirements are met before you begin.

In addition to reviewing the Upgrade checklist, review the following requirements.

### Tivoli® Management Services components

Before you upgrade an OMEGAMON® monitoring agent, determine the current release levels of the Tivoli® Management Services components. To determine the required level, see [“Version requirements” on page 165](#). To determine the current level of components on z/OS®, compare the FMIDs associated with the following components to the FMIDs listed in the product program directory and the FMIDs listed in the SMP/E CSI whose agents you intend to upgrade. This information will help you determine which components must be updated.

- Tivoli® Enterprise Monitoring Server (FMID HKDS630)
- z/OS configuration tools, which are Parameter Generator (PARMGEN) Workflow user interface and Configuration Manager (FMID HKCI310)
- Tivoli® Management Services:Engine (TMS:Engine) (FMID HKLV630)

To find the current release levels of the components running on distributed systems, issue one of the following commands:

- On Windows™

```
\ibm\ITM\KinCInfo -i
```

- On Linux™ or UNIX™:

```
opt/ibm/ITM/BIN/cinfo -i
```

### Shared components

The shared components should be upgraded to the following levels:

- OMNIMON Base (including framework support for OMEGAMON® enhanced 3270 user interface and OMEGAMON® Subsystem): HKOB730
- Shared probes: HKSB730
- End-to-End Response Time Feature: HKET620

### Self-describing agent feature (SDA)

If you are running a Tivoli® Enterprise Monitoring Server on z/OS® and you are planning to enable SDA:

- Create HFS or zFS file system on z/OS® UNIX™ System Services. The file system must be mounted before you upgrade. You will need to provide the path to this directory during configuration. The file system must be large enough to support all the jar files delivered by the z/OS® agents:
  - Hub monitoring server: approximately 3.25 MB per agent
  - Remote monitoring server: approximately 2 MB per agent
- The z/OS UNIX system where you create these files system must have access to a Java™ Runtime Environment running under IBM's 31-bit or 64-bit Java™ SDK Version 6 (or later) and an HFS or zFS file system.
- Ensure proper authorization has been set for the person who will run the jobs that add the subdirectories for the application support files.

To use SDA to upgrade your monitoring agents, SDA must be enabled and successfully started on the hub monitoring server, any remote monitoring server the monitoring agent reports, and the Tivoli® Enterprise Portal, if used. You can check the status of SDA by using tacmd or looking in your monitoring server JESS message log for the following message: KFASD009 Self-Describing Agent feature enabled on local TEMS.

See [Configure a Tivoli Enterprise Monitoring Server](#) for more details on these requirements. For more information on enabling the self-describing agent capability, see “Self-describing agent feature” on page 135 and the [IBM Tivoli Monitoring: Administrator's Guide](#).

The following components do not support SDA. Application support for these components must be installed manually using the application support DVD.

- OMEGAVIEW for the Enterprise agents
- Language Packs
- Tivoli® Enterprise Portal desktop client

### OMEGAMON® enhanced 3270 user interface

If you will be configuring the OMEGAMON® enhanced 3270 user interface, define an OMVS segment for the started task (IBMTOM by default).

**Note:** As of z/OS® V2R1, the ability to use default OMVS segments has been removed. All z/OS® UNIX™ users or groups must now have OMVS segments defined for user and group profiles with unique user IDs (UIDs) and group IDs (GIDs). One solution is the use of RACF® support to automatically generate unique UIDs and GIDs on demand for users and groups that do not have OMVS segments defined. Support for automatic unique UID and GID generation has been available since z/OS® V1R11.

If you want to enable the Memory Display/Zap feature in the OMEGAMON® enhanced 3270 user interface with the OMEGAMON on z/OS product, you must assign a RACF ID to the enhanced 3270 user interface and authorize the ID to be able to generate PassTickets. See the section [Security](#) in the OMEGAMON enhanced 3270 user interface reference guide. Additional security definitions are also required for the OMEGAMON on z/OS product to enable the Memory List/Zap feature. See the OMEGAMON for z/OS Planning and Configuration Guide for more information.

### SDA and enhanced 3270 user interface

Before you begin an upgrade, if your RKANDATV library was not already converted to a PDSE, you must reallocate it as a PDSE. This change accommodates product features that allow the product started tasks to dynamically create or write multiple members into RKANDATV at product startup, and to ensure that the started tasks are allowed to write into RKANDATV. To reallocate the library as a PDSE, delete it, then run the PARMGEN allocation job as part of the upgrade configuration.

If SDA support is enabled and you are configuring a high-availability hub, do not configure the OMEGAMON® enhanced 3270 user interface in the same runtime environment as the hub. Configure the OMEGAMON® enhanced 3270 user interface in its own runtime environment or in a runtime environment that has a remote monitoring server and monitoring agents configuring in it.

If the OMEGAMON® enhanced 3270 user interface is not installed in the same SMP/E CSI as the other OMEGAMON products, you will have to maintain your environment manually by copying the updated application support files from the agent, monitoring server, and portal server libraries into the OMEGAMON® enhanced 3270 user interface environment. You must then recycle the OMEGAMON® enhanced 3270 user interface started task to include the updates.

### **High-availability hub monitoring server**

If you will be configuring a high-availability (HA) hub monitoring server, set up a dedicated dynamic virtual IP address (DVIPA). Allow enough time to reconfigure existing static hub to a remote and reconfigure all remotes to connect to the HA hub.

### **Integrated Cryptographic Security Facility**

If any of the following conditions are in effect, the Integrated Cryptographic Security Facility started task must be running:

- Components will use password encryption.
- The SOAP server will be enabled on a remote monitoring server
- Granular control of command requests will be enabled (**KMS\_SECURITY\_COMPATIBILITY\_MODE=N**)
- The zAware feature will be configured for OMEGAMON® for z/OS®.

### **Persistent data store**

If your persistent data store has not been reconfigured from 3 files to 6, delete your persistent data store files and your RppSGRP\* files prior to the upgrade so that they can be reallocated as part of the upgrade configuration process by rerunning the \$PARSE and KCIJPALO jobs.

### **Variables**

If the runtime environment is enabled for variables, started tasks generate a required symbolic substitution step that allocates temporary data sets to perform the variables resolution processing. If you are enabling variables, ensure that enough space is allocated to your temporary space volume to accommodate the TMP\* DD processing.

## **Products in a mixed environment**

Support for multiple versions of an agent that run in the same environment is provided to support a staged upgrade. However, you should be aware of certain issues while you are working with a mixed environment.

### **Tivoli® Enterprise Portal user interface**

Product information in the Tivoli Enterprise Portal reflects the level of support for applications that are installed on the portal server, not the version of the monitoring agent. After you install support on the portal for V5.3.0 monitoring agents, you will see accurate workspace and attribute information for the monitoring agent. However, for prior versions of the monitoring agents, you might see potentially misleading information in flyovers, full-text help, and information that is provided in the situation editor.

You can use the predefined dynamic workspace links provided by V5.3.0 agents to link to the workspace of a OMEGAMON® at an earlier version if the target workspace exists in that version of the product. If the target workspace does not exist, you receive the KFWITM081E message.

In cases where the target workspace has been modified (for example, to accept link parameters to limit the data that is displayed) you might notice different behavior when you upgrade the target product to V5.3.0.

### **OMEGAMON® enhanced 3270 user interface**

The current release of the enhanced 3270 user interface does not support SDA processing. If the enhanced 3270 user interface is configured in the same runtime environment as the hub address space and you plan to

upgrade with an OMEGAMON® agent that is not configured in this same runtime environment, it is suggested that you run the configuration load processing for both the runtime environment that contains the agent and the runtime environment that contains both the interface and the hub monitoring server and recycle the interface address space.

The OMEGAMON enhanced 3270 user interface does not support releases of OMEGAMON® earlier than V5.1. Although some of the OMEGAMON® V4.2.0 agents return data that is viewable in the new 3270 user interface, only the displayed data that is returned by the OMEGAMON® V5.1.\* and V5.3.0 monitoring agents is supported.

Users of the enhanced 3270 user interface can experience operational limitations when they are running configurations that run multiple versions of OMEGAMON® agents during a staged upgrade period. [“Operation issues for the enhanced 3270 user interface during a staged upgrade” on page 172](#) summarizes related operational considerations by product. For more information about limitations, consult the product configuration and upgrade documentation. Not all new features introduced in V5.3.0 releases will display data for prior agent versions.

Summarizes operations considerations for enhanced 3270 user interface users during a staged upgrade by product.

<i>Table 22: Operation issues for the enhanced 3270 user interface during a staged upgrade</i>	
<b>Product version that provides enhanced 3270 interface support</b>	<b>Operational considerations with multiple agent versions running</b>
OMEGAMON® for CICS® on z/OS® V5.3.0	Only data that is returned from OMEGAMON® for CICS® V5.1.0 and V5.3.0 agents is displayed in the enhanced 3270 user interface. Data that is returned from the V4.2.0 agents can be viewed from one of the other available interfaces: Tivoli Enterprise Portal, OMEGAMON® for CICS®, or OMEGAMON® II for CICS®.
OMEGAMON® XE for Db2® Performance Expert on z/OS® V5.4.0 OMEGAMON® XE for Db2® Performance Monitor on z/OS® V5.4.0	Only data that is returned from OMEGAMON® Db2® V5.1.1, V5.2.0, V5.3.0, and V5.4.0 agents is displayed in the enhanced 3270 user interface. Data that is returned from V5.1.0 and V4.2.0 agents can be viewed from one of the other available interfaces.
OMEGAMON® for IMS™ on z/OS® V5.3.0	Only data that is returned from OMEGAMON® for IMS™ V5.1.0 and V5.3.0 agents is displayed in the enhanced 3270 user interface. Data that is returned from the V4.2.0 agents can be viewed from one of the other available interfaces: Tivoli® Enterprise Portal, OMEGAMON® for IMS™ or OMEGAMON® II for IMS™.
OMEGAMON® for Networks V5.3.0	The enhanced 3270 user interface for OMEGAMON® for Mainframe Networks is designed to display data from V5.1.0 and later agents. Continue to use the Tivoli Enterprise Portal to view data from V4.2.0 agents.
OMEGAMON® for Storage on z/OS® V5.4.0	The enhanced 3270 user interface displays only data from V5.1.0, V5.2.0, V5.3.0, and V5.4.0 Storage agents. Data from prior versions is ignored in the interface.
OMEGAMON® for z/OS® V5.3.0	The product must be configured so that only V5.1.0, V5.1.1, or V5.3.0 agents are eligible to assume the sysplex proxy role. Otherwise, sysplex data is not available in the enhanced 3270 user interface until all OMEGAMON® for z/OS® monitoring agents are upgraded to version 5.3.0.

### **Incompatibility of V4.2.0 agents and native 64-bit monitoring servers**

Tivoli Management Services on z/OS® V6.3.0 and higher supports monitoring servers on native 64-bit Windows™ and xLinux systems. The IBM® Tivoli® OMEGAMON® V5.1.0 (or higher) family (including OMEGAMON® XE for Db2® PE/PM V5.1.1 and OMEGAMON® for Messaging for z/OS V7.1.0) supports the native 64-bit monitoring server. The OMEGAMON® V4.2.0 family (including OMEGAMON® XE for Db2® PE/PM V5.1.0 and OMEGAMON®

for Messaging for z/OS V7.0.1) supports only monitoring servers that run on 64-bit Windows™ and 64-bit Linux™ platforms that use 32-bit compatibility mode with IBM® Tivoli® Monitoring V6.2.3. If you are installing or upgrading a hub monitoring server on native 64-bit Windows™ and xLinux systems, the metaprobes that collect plex data for the following V4.2.0 family products are disabled until the products are upgraded to the V5.1.0 or above family versions:

- OMEGAMON® XE for Db2® Performance Expert V4.2.0, V5.1.0
- OMEGAMON® XE for Db2® Performance Monitoring V4.2.0, V5.1.0
- OMEGAMON® for z/OS® V4.2.0
- OMEGAMON® for Messaging for z/OS® V7.0.x

### Globalization of interfaces

User interfaces for OMEGAMON® V4.2.0 and later monitoring agents are globalized, with the following exceptions:

- z/OS configuration tools, which are the Parameter Generator (PARMGEN) Workflow user interface and also Configuration Manager.
- Installation program
- OMEGAMON enhanced 3270 user interface
- OMEGAMON II (CUA) interface
- OMEGAMON (3270) interface

OMEGAMON® V4.2.0 (or later) workspaces in the Tivoli Enterprise Portal are displayed in the specified language (for example, Spanish or Chinese).

## Autonomous agent support

Tivoli Management Services V6.2.3 (and higher) allows stand-alone monitoring agents (those that are configured in their own address spaces) to run in *autonomous mode* (without communicating directly with a monitoring server). An autonomous agent can emit Simple Network Management Protocol (SNMP) traps and Event Integration Facility (EIF) events directly to an event server for agent-specific situations (but not for enterprise situations). Autonomous agents can be advantageous in environments where disk space or transmission bandwidth is in short supply.

An autonomous agent requires the DSEVT DDNAME in the monitoring agent started task in *rhilev.rte.RKANSAMU*. This DDNAME points to the *rvhilev.rte.RKDSEVT* data set.

The [IBM Tivoli Monitoring: Installation and Setup Guide](#) provides instructions for configuring IBM® Tivoli® Netcool®/OMNIBus ObjectServers to receive the events. For information on specifying which situation events to forward, see the Tivoli Enterprise Portal online help and the [IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide](#). For detailed information about managing autonomous agents, see “Agent autonomy” in the [IBM Tivoli Monitoring: Administrator's Guide](#).

## Tivoli Management Services V6.3.x component interoperability

If you are doing a staged upgrade, it is important to know what framework components are interoperable at different version levels.

For up-to-date statements on interoperability, see [IBM Tivoli Monitoring coexistence and interoperability](#).

---

# Installing

Review information about installing Tivoli Management Services on z/OS.

The *Program Directory for IBM Tivoli Management Services on z/OS* provides information about the material and procedures associated with the installation of the framework shared by the OMEGAMON monitoring products.

Before installing Tivoli Management Services on z/OS, read the *CBPDO Memo To Users* and the *CBPDO Memo To Users Extension* that are supplied with this program in softcopy format and the *Program Directory*; then keep them for future reference.

Tivoli Management Services on z/OS consists of the following FMIDs:

- HKDS630
- HKCI310
- HKLV630

**For more information:**

- See [Program Directory for IBM Tivoli Management Services on z/OS 6.4.0](#).
- For installation instructions for Tivoli Management Services component on distributed systems, see the [IBM Tivoli Monitoring Installation and Setup Guide](#).
- For installation instructions for individual products, see the *Program Directory* for each product being installed. For links to these documents, see [“Program Directories” on page 190](#).

---

## Job Generator (JOBGEN) utility

Job Generator is a job-generation utility that can generate the necessary installation jobs for products that use Tivoli® Management Services on z/OS®.

The OMEGAMON® products share a great deal of base code in common libraries. This shared code makes the suite somewhat unique and more complex than many other IBM® products. For example, you need to go through all the program directories and understand how much DASD each product needs in the common libraries and allocate (or reallocate) them accordingly. The JOBGEN utility is available to generate the necessary installation jobs for products that use Tivoli® Management Services on z/OS®. The JOBGEN utility automatically handles proper data set allocation due to its ability to scan current data sets and analyze them for adequate space to install the selected products. The JOBGEN utility also provides a compiled list of hold data that you can review in one place for all products together.

The JOBGEN utility is delivered in the z/OS Installation and Configuration Tool component of the Tivoli Management Services on z/OS product and is enhanced through the maintenance stream.

**Important:** Before using JOBGEN, ensure that the latest maintenance is installed for FMID HKCI310 to get the latest updates for the JOBGEN product selection table.

If you are installing for the first time into a new environment and do not have an existing environment available to invoke the JOBGEN utility, use the sample jobs for the Tivoli® Management Services on z/OS® product and install it first. This will install the FMID containing the JOBGEN utility and the latest maintenance. Then you can invoke the utility from the target library TKANCUS to install other products in the package.

You can invoke the JOBGEN utility from the SMP/E target library with the low-level qualifier of TKANCUS. After you locate the TKANCUS file, launch the utility by using ISPF option 6 and entering the following command.

```
ex '&gbl_target_hilev.TKANCUS'
```

Select option 2, **Installation Workflow: SMP/E-install z/OS products with Install Job Generator (JOBGEN)**, from the z/OS Installation and Configuration Tool main menu.

You can use the available online help as a tutorial to become familiar with the utility and its processes, and you can also follow the step-by-step case scenarios that are provided in the following topics. These case scenarios

provide guidance on how to use the JOBGEN utility to create a new SMP/E environment with a few products installed, and to install additional products in an existing SMP/E environment.

For more information about using JOBGEN, see [Program Directory for IBM Tivoli Management Services on z/OS 6.4.0](#).

### The JOBGEN utility process

The following figure provides a simplified view and guidance on how the JOBGEN utility can be used to create a new SMP/E environment or install products into an existing SMP/E environment. The cases identified in the boxes marked [1] and [2] will be described in detail in the following topics.

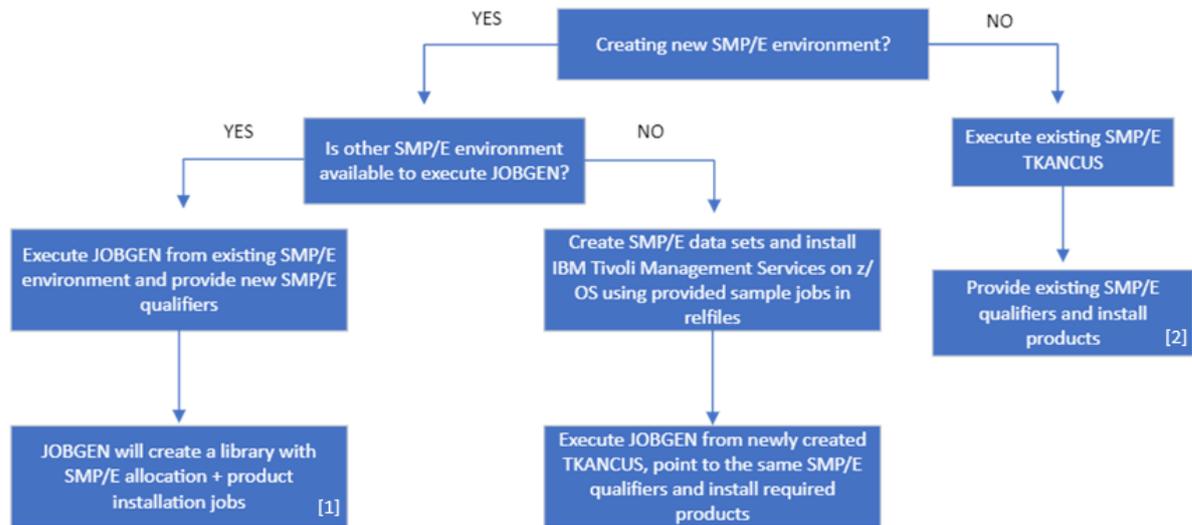

Figure 11: The JOBGEN process

[“Case 1: Create a new SMP/E environment and install products with JOBGEN” on page 175](#)

[“Case 2: Install additional products in an existing SMP/E environment with JOBGEN” on page 181](#)

## Case 1: Create a new SMP/E environment and install products with JOBGEN

Use this step-by-step guide to create a new SMP/E environment and install a couple of products to it using the Job Generator (JOBGEN) utility.

### Before you begin

Review the diagram in [“The JOBGEN utility process” on page 175](#).

This example assumes that there is an existing SMP/E environment available that can be used to launch the JOBGEN utility. If there is no existing SMP/E environment, you must manually install IBM Tivoli Management Services on z/OS first, using sample jobs provided in the product RELFILES. For more information, see [Program Directory for IBM Tivoli Management Services on z/OS 6.4.0](#).

After installing the FMID containing the JOBGEN utility, JOBGEN can be invoked from the target library TKANCUS to install other products.

### About this task

Complete the following steps to create a new SMP/E environment and install products using JOBGEN.

### Procedure

1. Invoke the JOBGEN utility, as follows:
  - a. Enter the following command for the TKANCUS library from the existing SMP/E environment:

```

Menu Options View Utilities Compilers Help
DSLIST - Data Sets Matching TDCI.ZSMS21R.SMPE.TKANCUS Row 1 of 1
Command ==> Scroll ==> CSR
-----
Command - Enter "/" to select action Message Volume
-----
ex TDCI.ZSMS21R.SMPE.TKANCUS DVLK10
***** End of Data Set list *****

```

- b. Select option 2, **Installation Workflow: SMP/E-install z/OS products with Install Job Generator (JOBGEN)**, from the z/OS Installation and Configuration Tool main menu:

```

KCIPQPGW
Welcome to the z/OS Installation and Configuration Tools for
z Systems Management Suites

Option ==> 2
1. Checklist: System preparation checklists
Tip: Read/Print Checklists prior to installation and configuration.
2. Installation Workflow:
SMP/E-install z/OS products with Install Job Generator (JOBGEN)
Conditional: JOBGEN is not required when using SystemPac or ServerPac.
3. Configuration Workflow (Post-installation):
Configure z/OS products with Parameter Generator Workflow (PARMGEN)
I. What's New in PARMGEN? <=== Revised

Maintenance Level: HKCI310 2Q23 OA64598 PTF
©Copyright IBM Corporation 1992-2023
Licensed Material - Program Property of IBM

```

2. Provide the JOBGEN output PDS where you want the jobs to be created:

```

KCIPJG00 ----- INSTALL JOB GENERATOR (JOBGEN) - WELCOME -----
Command ==>

Welcome to the Install Job Generator (JOBGEN). This routine will
generate batch jobs to create and update an SMP/E environment.

Processing will be done in the following steps requiring user input.
(1) Select the products for installation into an SMP/E environment.
(2) Enter values for data set allocation and SMP/E processing.
(3) Enter values for HFS/zFS or CALLLIBS processing when required.

All information will be saved into an output PDS. Restarting the
processor with this PDS will cause the values to be reinstalled on
each panel. For this reason, a positive response will be required
to accept values and selections.

Enter the fully qualified PDS name and output location for the generated jobs.
JOBGEN output library (workfile repository) Volser  STORCLAS  MGMTCLAS
TDCI.JOBGEN.RUN1
Enter=Next F1=Help F3=Back

```

3. Select the products that you want to install. In this example, a new SMP/E environment will be created, so select **IBM Tivoli Management Services on z/OS** as well:

```

KCIPJG02 ----- Job Generator - Product Selection --- Row 1 to 33 of 33
Command ==>

Select (S) the products to be included from the install media. The list
below is the list of all supported products and might have entries for
products that are not available. Be sure to select only products
that exist for this install.

You must select (S) at least one product.
To add additional products, type UPDATE on the command line and hit ENTER.

Verify your selections and change this field to accept ==> Y (Y, N)

_ Clear all product selections (X)

Sel Product Description                                     Version
--
IBM Advanced Archive for DFSMSHsm                          V1.1.0

ITCAM for Application Diagnostics on z/OS                    V7.1.1
Enter=Next F1=Help F3=Back F7=Up F8=Down

```

4. Specify the required information in the panel:

```

KCIPJG01 ----- Job Generator - Parameters -----
Command ==>

Verify your entries and change this field to accept ==> Y (Y, N)

Specify SMP/E CSI and data set information.
1 SMP/E zone names: Target ==> KDSTRG Distribution ==> KDSDLB
SMP/E OPTIONS name ==> DEFOPT SMPTLIB volser ==> TSP100
DSPREFIX value ==> TDCI.NEWSMP.DS

Data set High-Level Qualifier Volser STORCLAS MGMTCLAS
2 SMP/E TDCI.NEWSMP TSP100
Target TDCI.NEWSMP TSP100
DLIB TDCI.NEWSMP TSP100

Specify jobcard and member name information.
Generated name prefix ==> KCIJG
3 //&JGJOBN JOB 'ACCOUNT INFORMATION', '&ZUSER',
CLASS=A,MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID
JOB CARD

Enter=Next F1=Help F3=Back

```

1 – Specify the names of the target and distribution zones and the global zone OPTIONS section, as well as the data set prefix for the SMPTLIB data sets that will be allocated for the RELFILES. You must also supply the SMPTLIB volume serial number, which will be used for the SMPTLIB DDDEF entry.

2 – Specify high-level qualifiers for the SMP/E data sets and the target and distribution zone data sets. You must also specify at least one of the Volser, STORCLAS, or MGMTCLAS entries. If the target or distribution zone entries are left blank, they will be propagated from the prior panel row.

3 – (Optional) Change the generated name prefix (1-5 characters) that will be used to name the generated jobs to install the selected products. You can also specify the jobcard information in the four lines that are available.

5. Provide the input location of the selected products. Only one input media type is allowed at a time. In this example, the DASD input RELFILE hilev is provided. (This is the high-level qualifier preceding IBM, which already exists on the disk):

```

KCIPJG05 ----- Job Generator - Media Informat "UP      " is not active
Command ==>>>

Verify your entries and change this field to accept ==> Y (Y, N)
Specify values for only one input media type.

TAPE:
  unit name ==> _____
  serial numbers ==> _____

DASD:
  Input Relfile hilev ==> TDSHR.PKG _____

Downloaded PAX files:
  Package ID ==> _____ (for the FROMNTS operand)
  SMPNTS Path Root ==> _____

Enter=Next F1=Help F3=Back

```

6. If a z/OS UNIX System Services (z/OS UNIX) install environment is required by any of the selected products, the USS Install Path panel is presented. Provide the z/OS UNIX install root directory. It must start with a forward slash (/) and is case sensitive. This directory will be the mount point of the HFS/zFS file system that will be used for installation:

```

KCIPJG04 ----- Job Generator - USS Install Path -----
Command ==>>>

Verify your entry and change this field to accept ==> Y (Y, N)

Enter the root directory for your USS install environment so the
pathname can be defined in the target zone.

USS Install root directory ==> /proj/tdci2/newsmp_____

Enter=Next F1=Help F3=Back

```

7. Remove the asterisks and/or modify the provided model CALLLIBS data sets according to your shop standards:

```

KCIPJG03 ----- Job Generator - CALLLIBS Selection -- Row 1 to 12
Command ==>>>

Enter the CALLLIBS data set names for SMP/E target zone definitions.
Entries beginning with an asterisk are models. Remove the asterisk
and use or modify the entry to enable the data set name.

Verify your entries and change this field to accept ==> Y (Y, N)

DDname      Description
-----
CSSLIB      MVS callable services
Data set    name ==> SYS1.CSSLIB
SCCNOBJ     XL C Compiler object library
Data set    name ==> CBC.SCCNOBJ
SCEEBND2    LE/370 C spt - XPLINK LP64 library
Data set    name ==> CEE.SCEEBND2
SCEECPP     LE/370 C spt - CPP class library
Data set    name ==> CEE.SCEECPP
SCEELIB     LE/370 C spt - side-deck library
Data set    name ==> CEE.SCEELIB
SCEELKED    LE/370 C spt - non-XPLINK, short names
Data set    name ==> CEE.SCEELKED
SCEELKEX    LE/370 C spt - non-XPLINK, long names
Data set    name ==> CEE.SCEELKEX
SCEERUN     LE/370 C spt - dynamic routines
Data set    name ==> *CEE.SCEERUN
SCEERUN2    LE/370 C spt
Data set    name ==> *CEE.SCEERUN2
SCLBSID     XL C/C++ - side-deck library
Data set    name ==> *CBC.SCLBSID
SCSFSTUB    ICSF services
Data set    name ==> *CSF.SCSFSTUB
SEZACMTX    TCP/IP libraries - Load
Data set    name ==> *EZA.SEZACMTX
Enter=Next F1=Help F3=Back F7=Up F8=Down

```

After you confirm your choice, JOBGEN starts generating installation jobs.

8. Wait for JOBGEN to complete the generation of the installation jobs, and monitor the return codes. A successful JOBGEN run returns RC = 0. If there are any mistakes in the setup process that JOBGEN can recognize, it will issue RC = 8 and errors will be printed in the KCIJGLOG member:

```

KCIRJG01 - I Starting 10 May 2023 08:48:54
KCIRJG01 - I End of EXEC, RC = 0
KCIRJG05 - I
KCIRJG05 - I Installation jobs created successfully in
KCIRJG05 - I TDCI.JOBGEN.RUN1
KCIRJG05 - I Please review the log member, KCIJGLOG.
KCIRJG05 - I
***

```

9. Review the content in log member KCIJGLOG in the JOBGEN output library. It contains all the information about the generated jobs and indicates the order in which they must be submitted. This member also contains a summary of the parameters that were provided in the JOBGEN panels, a list of the products selected and their FMIDs, as well as information about the data sets that will be created, DDDEFs, and so on. In this scenario, a new SMP/E environment is created and new SMP/E qualifiers for CSI, target, and distribution libraries were provided; therefore, jobs KCIJGSMA and KCIJGSMI were created. These members contain JCL to allocate basic SMP/E data sets, and to allocate and initialize CSI and global, target, and distribution zones.

***** Top of Data *****
000001
000002 AFTER REVIEWING THE INFORMATION IN THIS LOG, SUBMIT THE JOBS SHOWN
000003 BELOW IN THE ORDER INDICATED.
000004
000005           B a t c h   J o b s
000006
000007 The following members of
000008 TDCI.JOBGEN.RUN1
000009 should be submitted and executed in the order presented below.
000010
000011 Member
000012 Name      Description
000013 -----
000014 KCIJGSMA  Allocate basic SMP/E data sets
000015           The data sets are required for running SMP/E but they
000016           are not component oriented.
000017
000018 KCIJGSMI  Allocate and initialize the CSI
000019           The CSI is defined using IDCAMS and the basic controls
000020           are added to the GLOBAL, target, and distribution zones.
000021           The JCL will have an SMPPTS pointer to the data set
000022           allocated by the previous step.
000023
000024 KCIJGALO  Allocate required data sets
000025           This job will allocate any new data sets with the
000026           correct space requirements.
000027
000028           Existing data sets are examined by the space analysis
000029           job and a report is produced to alert users about any
000030           additional space requirements requiring action.
000031
000032
000033

```

10. To create a new SMP/E environment and install products into it, submit the jobs in the order presented in KCIJGLOG. Every job contains a comprehensive comment section with the function of the job and additional notes. This section briefly describes all the jobs in the order that they should be submitted:
- a. KCIJGSMA – This job allocates six SMP/E libraries for the new SMP/E environment:

```

VIEW          TDCI .JOBGEN .RUN1(KCIJGSM) - 01.00
Command ==>
000035 //*****
000036 //SMPLOG DD DSN=TDCI .NEWSMP .SMPLOG ,
000037 //        SPACE=(TRK,(15,300)),
000038 //        DISP=(NEW,CATLG,DELETE),
000039 //        UNIT=SYSALLDA,
000040 //        VOL=SER=TSP100,
000041 //        DCB=(LRECL=510,RECFM=VB,BLKSIZE=0)
000042 //SMPPTS DD DSN=TDCI .NEWSMP .SMPPTS,
000043 //        SPACE=(TRK,(15,150,220)),
000044 //        DISP=(NEW,CATLG,DELETE),
000045 //        UNIT=SYSALLDA,
000046 //        VOL=SER=TSP100,
000047 //        DSNTYPE=LIBRARY,
000048 //        DCB=(RECFM=U,BLKSIZE=32760)
000049 //SMPMTS DD DSN=TDCI .NEWSMP .SMPMTS,
000050 //        SPACE=(TRK,(15,150,220)),
000051 //        DISP=(NEW,CATLG,DELETE),
000052 //        UNIT=SYSALLDA,
000053 //        VOL=SER=TSP100,

```

- b. KCIJGSMI – This job defines and initializes the SMP/E CSI as well as the global, target, and distribution zones. The DEFINE statement for the CSI and the DDDEF statement for the SMPDLIB data set include the VOLUME(xxxxxx) parameter that was required to be provided in the JOBGEN panel. If the data sets are SMS-managed, the VOLUME lines can be deleted from the JCL before submitting the job:

```

VIEW          TDCI .JOBGEN .RUN1(KCIJGSMI) - 01.00
Command ==>

```

- f. KCIJGREC – This job is the RECEIVE job, which receives the components for the selected products.
- g. KCIJGAPP – This job is the APPLY job, which applies the components for the selected products.
- h. KCIJGACC – This job is the ACCEPT job, which accepts the components for the selected products.

**Result**

After all the jobs run successfully, you have a new SMP/E environment created and selected products installed.

## Case 2: Install additional products in an existing SMP/E environment with JOBGEN

Use this step-by-step guide to install additional products in an existing SMP/E environment using the Job Generator (JOBGEN) utility.

**Before you begin**

Review the diagram in [“The JOBGEN utility process” on page 175](#).

**About this task**

Complete the following steps to install additional products in an existing SMP/E environment using the JOBGEN utility.

**Procedure**

1. Invoke the JOBGEN utility, as follows:

- a. Enter the following command for the TKANCUS library from the existing SMP/E environment where you want to install additional products:

```

DSLIST - Data Sets Matching TDCI.ZSMSTMS.SMPE.TKANCUS          Row 1 of 1
Command ==>>>                                         Scroll ==>> CSR
-----
Command - Enter "/" to select action                    Message                    Volume
-----
ex      TDCI.ZSMSTMS.SMPE.TKANCUS                      DVLK23
***** End of Data Set list *****

```

- b. Select option 2, **Installation Workflow: SMP/E-install z/OS products with Install Job Generator (JOBGEN)**, from the z/OS Installation and Configuration Tool main menu:

```

KCIPQPGW
Welcome to the z/OS Installation and Configuration Tools for
z Systems Management Suites

Option ==>> 2
1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.
2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.
3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)
I. What's New in PARMGEN? <=== Revised

Maintenance Level: HKCI310 2Q23 OA64598 PTF
                  ©Copyright IBM Corporation 1992-2023
                  Licensed Material - Program Property of IBM

```

2. Provide the JOBGEN output PDS where you want the jobs to be created:

```

KCIPJG00 ----- INSTALL JOB GENERATOR (JOBGEN) - WELCOME -----
Command ==>>>

Welcome to the Install Job Generator (JOBGEN). This routine will
generate batch jobs to create and update an SMP/E environment.

Processing will be done in the following steps requiring user input.
(1) Select the products for installation into an SMP/E environment.
(2) Enter values for data set allocation and SMP/E processing.
(3) Enter values for HFS/zFS or CALLLIBS processing when required.

All information will be saved into an output PDS. Restarting the
processor with this PDS will cause the values to be reinstalled on
each panel. For this reason, a positive response will be required
to accept values and selections.

Enter the fully qualified PDS name and output location for the generated jobs.
JOBGEN_output_library (workfile repository)  Volser  STORCLAS  MGMTCLAS
TDCI.JOBGEN.RUN2
Enter=Next F1=Help F3=Back

```

3. Select the products that you want to install. In this example, additional products will be installed into an existing environment, so **IBM Tivoli Management Services on z/OS** is not selected:

```

KCIPJG02 ----- Job Generator - Product Selection --- Row 1 to 33 of 33
Command ==>

Select (S) the products to be included from the install media. The list
below is the list of all supported products and might have entries for
products that are not available. Be sure to select only products
that exist for this install.

You must select (S) at least one product.
To add additional products, type UPDATE on the command line and hit ENTER.

Verify your selections and change this field to accept ==> Y (Y, N)

_ Clear all product selections (X)

Sel Product Description Version
-- IBM Advanced Archive for DFSMSHsm V1.1.0
-- IBM Cloud Tape Connector for z/OS V1.1.0
-- IBM Discovery Library Adapter for z/OS V3.2.0
-- IBM OMEGAMON for z/OS V5.5.0
-- IBM OMEGAMON for CICS on z/OS V5.5.0
-- IBM OMEGAMON for Db2 Performance Expert on z/OS V5.5.0
-- IBM OMEGAMON for IMS on z/OS V5.5.0
-- IBM OMEGAMON for Messaging on z/OS V7.5.0
-- IBM OMEGAMON for Networks on z/OS V5.5.0
-- IBM OMEGAMON for Storage on z/OS V5.5.0
-- IBM OMEGAMON Dashboard Edition on z/OS V5.5.0
-- IBM Tivoli Advanced Allocation Management for z/OS V3.3.0
-- IBM Tivoli Advanced Audit for DFSMSHsm V2.6.0
-- IBM Tivoli Advanced Backup and Recovery for z/OS V2.4.0
-- IBM Tivoli Advanced Catalog Management for z/OS V2.6.0
-- IBM Tivoli Advanced Reporting and Management for DFSMSHsm V2.6.0
-- IBM Tivoli Advanced VSAM Manager for z/OS V2.6.0
-- IBM Tivoli Automated Tape Allocation Manager for z/OS V3.3.0
-- IBM Tivoli Decision Support for z/OS V1.8.1
-- IBM Tivoli Discovery Library Adapter for z/OS V3.1.0
-- IBM Tivoli Management Services on z/OS V6.3.0
-- IBM Tivoli OMEGAMON Dashboard Edition on z/OS V5.3.0
-- IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS V5.4.0
-- IBM Tivoli OMEGAMON XE for DB2 Performance Monitor on z/OS V5.4.0
-- IBM Tivoli Tape Optimizer for z/OS V2.2.0
-- IBM Z OMEGAMON for CICS V5.6.0
-- IBM Z OMEGAMON for JVM V5.5.0
-- IBM Z OMEGAMON Integration Monitor V5.6.0
-- IBM Z OMEGAMON Monitor for z/OS V5.6.0
-- IBM Z OMEGAMON Network Monitor V5.6.0
-- IBM Z OMEGAMON Runtime Edition for JVM V5.5.0
-- ITCAM for Application Diagnostics on z/OS V7.1.0
-- ITCAM for Application Diagnostics on z/OS V7.1.1
Enter=Next F1=Help F3=Back F7=Up F8=Down

```

- Specify the required information in the panel:

```

KCIPJG01 ----- Job Generator - Parameters -----
Command ==>

Verify your entries and change this field to accept ==> Y (Y, N)

Specify SMP/E CSI and data set information.
SMP/E zone names: Target ==> KDSTRG Distribution ==> KDSDLB
1 SMP/E OPTIONS name ==> DEFOPT SMPTLIB volser ==> TSP100
DSPREFIX value ==> TDCI.ZSMSTMS.DS

Data set High-Level Qualifier Volser STORCLAS MGMTCLAS
2 SMP/E TDCI.ZSMSTMS.SMPE TSP100
Target TDCI.ZSMSTMS.SMPE TSP100
DLIB TDCI.ZSMSTMS.SMPE TSP100

Specify jobcard and member name information.
Generated name prefix ==> KCIJG
3 JOB //&JGJOBN JOB 'ACCOUNT_INFORMATION','&ZUSER',
CARD // CLASS=A,MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID

Enter=Next F1=Help F3=Back

```

1 – Specify the names of the target and distribution zones and the global zone OPTIONS section, as well as the data set prefix for the SMPTLIB data sets that will be allocated for the RELFILES. You must also supply the SMPTLIB volume serial number, which will be used for the SMPTLIB DDEF entry.

2 – Specify high-level qualifiers for the SMP/E data sets and the target and distribution zone data sets. In this example, qualifiers are provided for existing SMP/E data sets where the products will be installed. You must also specify at least one of the Volser, STORCLAS, or MGMTCLAS entries. If the target or distribution zone entries are left blank, they will be propagated from the prior panel row.

3 – (Optional) Change the generated name prefix (1-5 characters) that will be used to name the generated jobs to install the selected products. You can also specify the jobcard information in the four lines that are available.

- Provide the input location of the selected products. Only one input media type is allowed at a time. In this example, the DASD input RELFILE hilev is provided. (This is the high-level qualifier preceding IBM, which already exists on the disk):

```

KCIPJG05 ----- Job Generator - Media Informat "UP      " is not active
Command ==>>

Verify your entries and change this field to accept ==> Y (Y, N)
Specify values for only one input media type.

TAPE:
  unit name ==> _____
  serial numbers ==> _____

DASD:
  Input Relfile hilev ==> TDSHR.PKG

Downloaded PAX files:
  Package ID ==> _____ (for the FROMNTS operand)
  SMPNTS Path Root ==> _____

Enter=Next F1=Help F3=Back

```

6. If a z/OS UNIX System Services (z/OS UNIX) install environment is required by any of the selected products, the USS Install Path panel is presented. Provide the z/OS UNIX install root directory. It must start with a forward slash (/) and is case sensitive. This directory will be the mount point of the HFS/zFS file system that will be used for installation:

```

KCIPJG04 ----- Job Generator - USS Install Path -----
Command ==>>

Verify your entry and change this field to accept ==> Y (Y, N)
Enter the root directory for your USS install environment so the
pathname can be defined in the target zone.

USS Install root directory ==> /proj/tdci2/qat_____

```

In this example, the SMP/E environment did not have anything installed in z/OS UNIX, so a new install root directory will be provided, like in the [Case 1 scenario](#). If there were any products installed already that are using z/OS UNIX, you must provide the install root directory that is already being used. Otherwise, JOBGEN will fail with RC=8 due to mismatching *supplied* and *installed* paths and you would have to rerun JOBGEN and enter the correct z/OS UNIX path in the panel. The following figure shows an example error that would occur when you provide an incorrect path:

```

KCIRJG01 - I Starting 15 May 2023 08:28:12
KCIRJG02 - I Starting 15 May 2023 08:28:12
KCIRJG02 - I Extracting information from:
KCIRJG02 - I      CSI - TDCI.ZSMSTMS.SMPE.CSI
KCIRJG02 - I      TZONE - KDSTRG
KCIRJG02 - I      DZONE - KSDSLB
KCIRJG02 - I End of EXEC, RC = 0
KCIRJG01 - E An error has occurred during the processing
KCIRJG01 - E of your request. Examine the KCIJGLOG
KCIRJG01 - E information and make suitable corrections
KCIRJG01 - I End of EXEC, RC = 8
KCIRJG05 - I
KCIRJG05 - I Install job creation failed.
KCIRJG05 - I
***

```

Data set   name ==> *EZA.SEZACMTX
Enter=Next F1=Help F3=Back F7=Up F8=Down

```

After you confirm your choice, JOBGEN starts generating installation jobs.

- Wait for JOBGEN to complete the generation of the installation jobs, and monitor the return codes. A successful JOBGEN run returns RC = 0. If there are any mistakes in the setup process that JOBGEN can recognize, it will issue RC = 8 and errors will be printed in KCIJGLOG member. In this example, you can also see that the existing CSI was scanned for information:

```

KCIRJG01 - I Starting 15 May 2023 07:24:53
KCIRJG02 - I Starting 15 May 2023 07:24:53
KCIRJG02 - I Extracting information from:

KCIRJG02 - I TZONE - KDSTRG
KCIRJG02 - I DZONE - KDSDLB
KCIRJG02 - I End of EXEC, RC = 0
KCIRJG01 - I End of EXEC, RC = 0
KCIRJG05 - I
KCIRJG05 - I Installation jobs created successfully in
KCIRJG05 - I TDCI.JOBGEN.RUN2
KCIRJG05 - I Please review the log member, KCIJGLOG.
KCIRJG05 - I
***

```

- Review the content in log member KCIJGLOG in the JOBGEN output library. It contains all the information about generated jobs and indicates the order in which they must be submitted. This member also contains a summary of the parameters that were provided in the JOBGEN panels, a list of the products selected and their FMIDs, as well as information about the data sets that will be created, DDDEFS, and so on. In this scenario, an existing SMP/E environment is being used to install additional products and qualifiers for existing SMP/E CSI, target, and distribution libraries were provided; therefore, jobs KCIJGMA and KCIJGSMI were not created. Instead, KCIJGANL and KCIJGREA jobs were created to analyze the existing SMP/E environment for adequate space to install new products.

000001
000002 AFTER REVIEWING THE INFORMATION IN THIS LOG, SUBMIT THE JOBS SHOWN
000003 BELOW IN THE ORDER INDICATED.
000004
000005 B a t c h J o b s
000006
000007 The following members of
000008 TDCI.JOBGEN.RUN2
000009 should be submitted and executed in the order presented below.
000010
000011 Member
000012 Name Description
000013 -----
000014 KCIJGANL Analyze an existing SMP/E environment.
000015 The data sets that are already installed are examined to
000016 determine if the new products will fit into the existing
000017 allocations.
000018
000019 BE SURE TO RUN AND ANALYZE THE OUTPUT OF THIS JOB TO
000020 AVOID INSTALLATION PROBLEMS.
000021
000022 THIS JOB REQUIRES EXCLUSIVE CONTROL OF THE WORK LIBRARY.
000023 AFTER SUBMITTING THIS JOB BE SURE TO RELEASE CONTROL
000024 OF TDCI.JOBGEN.RUN2.
000025
000026 KCIJGREA Reallocate existing SMP/E libraries that were
000027 discovered by KCIJGANL to have insufficient space to
000028 hold additional product elements.
000029
000030 The controls for this job are created by the analysis
000031 routine and placed into the REALLOC member.
000032
000033 KCIJGALO Allocate required data sets
000034 This job will allocate any new data sets with the
000035 correct space requirements.
000036
000037 Existing data sets are examined by the space analysis
000038 job and a report is produced to alert users about any
000039 additional space requirements requiring action.
000040
000041

```

10. To install additional products into an existing SMP/E environment, submit the jobs in the order presented in KCIJGLOG. Every job contains a comprehensive comment section with the function of the job and additional notes. This section briefly describes all the jobs in the order that they should be submitted:
  - a. KCIJGANL – This job analyzes the existing SMP/E environment (target and distribution libraries) and checks if there is enough space to install new products. If some data sets will have to be reallocated, the REALLOC member is created in the same JOBGEN PDS. When you submit this job, the JOBGEN PDS should not be in use (browsed); otherwise, it might hang in execution:

000068 WAITFORDSN
000069 SHR .
000070 ADD DDDEF(SIZDSAMP)

```

- e. KCIJGBDI – This job builds the directory structure for the selected products. Before submitting this job, you must ensure that the z/OS UNIX root directory that was provided in the JOBGEN USS Install Path panel already exists. In this example, this job was created because the SMP/E environment did not have it defined earlier. If such a path already exists and is defined to SMP/E, the KCIJGBDI job will not be created:

```

VIEW          TDCI.JOBGEN.RUN2(KCIJGBDI) - 01.00
Command ==>
000039 //*****
000040 //*
000041 //* Define HFS/zFS directories
000042 //*
000043 //HFS      EXEC PGM=IKJEFT1A,REGION=0M
000044 //SYSTSPRT DD  SYSOUT=*
000045 //SYSTSIN  DD  *
000046 EX 'TDCI.ZSMSTMS.SMPE.TKCIINST(KCIRJGOM)' -
000047 '/proj/tdci2/gat/' -
000048 'usr/lpp/kan/bin/IBM' -
000049 EXEC
000050 //*
000051 //
***** Bottom of Data *****

```

- f. KCIJGREC – This job is the RECEIVE job, which receives the components for the selected products. If any of the components that are shared by the products is already installed, it will be skipped from the job.
- g. KCIJGAPP – This job is the APPLY job, which applies the components for the selected products. If any of the components that are shared by the products is already applied, it will be excluded in the SMPCNTL statement.
- h. KCIJGACC – This job is the ACCEPT job, which accepts the components for the selected products. If any of the components that are shared by the products is already accepted, it will be excluded in the SMPCNTL statement.

### Result

After all the jobs run successfully, you have additional products installed in an existing SMP/E environment.

## Program Directories

Find the Program Directories of the OMEGAMON family products and Suite products in the following table.

Table 23: Program Directories	
Product name	Program Directory
IBM® OMEGAMON for CICS® on z/OS 5.5.0	<a href="#">Program Directory for IBM OMEGAMON for CICS on z/OS V5.5.0</a>

# Upgrading

Before upgrading components of Tivoli® Management Services on z/OS and the OMEGAMON® monitoring agent products, consider the basic requirements for the upgrade and the effects of a staged upgrade.

You can find additional, product-specific upgrade information in the documentation for V5.5.0 monitoring product. Technotes for each product are available on the [IBM® Software Support](https://www.ibm.com/software/support) website (<https://www.ibm.com/software/support>).

This upgrade information make the following assumptions:

- You are already at Tivoli Management Services V6.2.x or higher.
- You are upgrading the Tivoli Management Services components to the V6.3.0 and its Fix Packs, or you are upgrading one or more monitoring agent products to V5.5.0 (or V7.5.0 for OMEGAMON for Messaging on z/OS) or later versions.

You can use the ShopzSeries website to order mainframe products and maintenance (also known as program temporary fixes or PTFs). The primary product fulfillment mechanism is physical media, but electronic CBPDOs (Custom-Built Product Delivery Offerings) are available. Maintenance is available on physical tape or electronically on the ShopzSeries website. For information about ordering products and maintenance through the ShopzSeries website, see technote [Ordering Products and Maintenance Through Shop zSeries](https://www.ibm.com/support/docview.wss?uid=swg21225816) (<https://www.ibm.com/support/docview.wss?uid=swg21225816>).

---

## Upgrade order

The upgrade to a new version of an OMEGAMON agent follows an ordered procedure. The path to follow depends on the version levels of your previously installed components and products. Follow the sequence of steps appropriate for your monitored environment to complete the upgrade.

If you are running at or upgrading to Tivoli Management Services on z/OS version 6.3.0 Fix Pack 2 or later versions, follow the [Required order of upgrade](#) in the "Planning your upgrade" section of the *IBM Tivoli Monitoring Installation and Setup Guide*.

**Important:** If the self-describing agent (SDA) feature is not enabled, you must upgrade the hub monitoring server before you upgrade remote servers and monitoring agents. The order is not optional. If you are using self-describing agents, you can upgrade remote servers and agents before you upgrade the hub, but some new features may not be available until you upgrade the hub.

**Tip:** If you want to migrate your monitoring server or Tivoli Enterprise Portal Server to a different platform (for example, from Windows® to Linux® on zSeries®), you must upgrade it in place first, and then use the export/import capability. For more information, see the [IBM Tivoli Monitoring: Installation and Setup Guide](#).

---

## Backing up your environments

Before you begin your upgrade, you may want to backup up your current environments. That way, you can revert to the original environment if anything goes wrong with the upgrade, or you can continue to maintain your existing environments as you stage your upgrade.

### About this task

On zOS, there are multiple ways to achieve a backup:

- Run full disk backups of the SMPE and runtime environments (RTEs).
- Run DFDSS copy of the SMPE and RTEs (often referred to as "cloning"), then install new versions into the existing environment, keeping the backup around.

- Create a cloned CSI or a cloned target zone, then install into the new cloned CSI or target zone. If you run from target libraries, you modify your runtime procedures to run from the new targets. To reinstate the backup, you restart your runtime process pointing to the old targets. The following JCL symbolics in the runtime process enable you to switch between upgraded and backed up environments:
  - RHILEV--the runtime high-level qualifier
  - BASEHLEV--the high-level qualifier for the SMP/E target libraries, a full RTE, or a base RTE

See [“Cloning an SMP/E environment for a staged upgrade of existing runtime environments” on page 195](#) for complete instructions for a cloned upgrade install.

To back up Tivoli Management Services components on distributed operating systems, see the following references:

- [Backing up IBM Tivoli Monitoring](#)
- [Backing up the Tivoli Enterprise Portal and Tivoli Data Warehouse databases](#)

## SMP/E installation

Using the SMP/E utility, you can install new versions of products and components into a cloned, new, or existing consolidated software inventory (CSI). The SMP/E Modification Control Statements that are delivered with the IBM Tivoli Management Services on z/OS and OMEGAMON product FMIDs delete the previous version of the relevant components. If you want to perform a staged upgrade, install the new versions into a cloned or new SMP/E environment, so you can still maintain and reconfigure runtime environments that contain older versions. If you are performing a complete upgrade, you can install new versions into an existing SMP/E environment (“upgrade in place”).

Consider the benefits of each installation scenario when deciding which of the three is most appropriate for your upgrade: a cloned environment for a staged upgrade, a new environment for a staged upgrade, or an existing environment for an “in place” upgrade.

A staged upgrade makes it possible for you to perform your upgrade gradually, rather than all at once. For a staged upgrade to succeed, you must keep the previous versions of products and components intact so that you can continue to apply maintenance to them until the entire environment has been upgraded. Therefore, the installation scenarios for staged upgrades involve installing the new components into either a cloned copy of the existing libraries or a new CSI. You can then upgrade runtime environments one at a time.

If you are upgrading in place (and not staging your upgrade), you should back up the existing runtime and installation libraries before installing the new version, in case you need to back out the upgrade.

For instructions on planning and performing the SMP/E installation of IBM Tivoli Management Services on z/OS (including Tivoli Enterprise Monitoring Server, TMS:Engine, and the configuration software), see [Program Directory for IBM Tivoli Management Services on z/OS 6.4.0](#). For instructions on planning and performing the SMP/E installation of the OMEGAMON® products, see the program directory for each product.

## Cloning an SMP/E environment for a staged upgrade of existing runtime environments

Cloning an environment and installing new versions into the cloned environment makes it possible for you to stage your upgrade. You can continue to apply maintenance to and reconfigure runtime environments that have not yet been upgraded as you gradually upgrade others.

### About this task

In this scenario, you use JOBGEN to install new versions into a new set of SMP/E libraries. Then, you upgrade runtime environments one by one by pointing them to the updated libraries in the cloned environment and making any configuration changes required to upgrade them.

**Note:** This scenario assumes a PARMGEN to PARMGEN upgrade.

### Procedure

1. Install the products into a new set of SMP/E target libraries using the Install Job Generator (JOBGEN).

- a. Launch the installation and configuration software in an existing installation:
 

```
EX '%GBL_TARGET_HILEV%.TKANCUS'
```
  - b. On the Welcome page, select option 2 (SMP/E-install z/OS® products with Install Job Generator).
  - c. Supply the values as prompted.
  - d. Submit the file-tailored KCIJG\* SMP/E jobs to complete the installation.
  - e. Exit JOBGEN and then exit the software configuration software.
2. Modify each runtime environment in the new CSI to point to the new target libraries and high-level qualifiers.
    - a. Invoke the configuration software from TKANCUS of the new environment and select option 3 (Configuration Workflow).
    - b. Set the GBL\_USER\_JCL and RTE\_PLIB\_HILEV fields to the new values for the cloned GBL\_USER\_JCL. For RTE\_NAME, specify the name of the runtime environment you want to clone and upgrade, then press Enter.  
For RTE\_PLIB\_HILEV, use a different value for the high-level qualifier, not the one in production (for example, change OMEG623.%USER\_ID% to OMEG630.%USER\_ID%), so the new runtime environment uses a different set of PARMGEN IK\*, WCONFIG, and WK\* work libraries.
    - c. Select option 1 (Set up PARMGEN work environment for an RTE).
      - On the first set-up panel, provide the library and LPAR profile member name for the runtime environment you are cloning (for example, OMEG623.%USER\_ID%.PLBLPAR1.WCONFIG(PLBLPAR1)).
      - On the second set-up panel, specify the new GBL\_TARGET\_HILEV.
      - On the third set-up panel, you should not need to make any changes if you want an exact clone of the existing environment. However, any changes you make on this panel will be reflected in the corresponding parameters in the RTE configuration profile.
      - On the fourth set-up panel, all the products installed in the new CSI are selected. The products already configured in the RTE that is being cloned are marked with an asterisk. Deselect any products that you do not want to configure in this RTE, then specify Y in the **Confirm ==>** field and press Enter. The latest versions of the products installed are configured into new runtime environment.
      - When prompted, provide a name for the backed up RTE profile and press Enter.
    - d. Review and submit the KCIJPCFG job, then return to the main Workflow panel.

## What to do next

Complete the remaining steps as appropriate for your upgrade scenario:

- If the new FMIDs introduce no configuration changes, only the KCIJcLOD job is required, to copy the target libraries to the RK\* runtime libraries.  
See [“Scenario SMPE04: Upgrading an existing runtime environment with no configuration changes” on page 197](#) for detailed instructions.
- If the new FMID contain new components or configuration parameters and you want to implement the changes using IBM-supplied configuration defaults, the following jobs must be resubmitted:
  - The \$PARSE or \$PARSESV job to recreate the runtime members and jobs
  - The following jobs, as indicated:
    - KCIJPLOD to copy the target libraries to the RK\* runtime libraries
    - KCIJPSEC (if upgrade introduces changes in security) to create security-related members (load modules, encryption key, and other elements) based on the product security requirements
    - KCIJPUSP and KCIJPUSS (if upgrade introduces changes in z/OS® UNIX® System Services requirements)
    - KCIJPSYS (if upgrade introduces new started tasks or nodes)
    - KCIJPCPR to backup RK\* production user runtime libraries job

- KCIJPW2R to copy the WK\* work libraries to the RK\* production libraries

See [“Scenario SMPE05: Upgrading an existing runtime environment with configuration changes but using IBM-supplied configuration defaults” on page 199](#) for detailed instructions for submitting these jobs.

- To customize new components or parameters, edit the configuration profiles, and then submit the jobs listed in the previous bullet.  
See [“Scenario SMPE06: Upgrading an existing runtime environment and overriding defaults” on page 201](#) for detailed instructions.

## Scenario SMPE04: Upgrading an existing runtime environment with no configuration changes

If you apply maintenance that contains upgraded FMIDs but does not contain features that require configuration changes, you only need to refresh the work libraries (to update the version) and load the read-only files from the SMP/E target libraries to the runtime libraries.

### About this task

If you are upgrading in place (that is using the same target libraries and the same runtime product libraries, follow these instructions. Otherwise, follow [“Scenario SMPE05: Upgrading an existing runtime environment with configuration changes but using IBM-supplied configuration defaults” on page 199](#) and change the high-level qualifiers as appropriate.

**Note:** If you are upgrading it to V6.3.0 Fix Pack 6 and you have a V6.2.3 z/OS hub monitoring server with SDA enabled and you elected to retain the previous behavior (no granular controls), follow the steps in [“Scenario SMPE05: Upgrading an existing runtime environment with configuration changes but using IBM-supplied configuration defaults” on page 199](#). If you are upgrading a monitoring server at a version prior to V6.2.3 to V6.3.0 FP6, you must also follow [“Scenario SMPE06: Upgrading an existing runtime environment and overriding defaults” on page 201](#). In the first case, the load job needs to be refreshed to add the REPROKFA step to the load job. In the second scenario, new VSAM libraries need to be allocated, so the KCIJPALO and KCIJPLOD jobs need to be refreshed as well.

Perform an upgrade with no configuration changes involves the following steps:

1. Refreshing the work libraries.
2. Submitting the jobs that complete the setup of the RTE.

At a minimum, you need to copy the SMP/E target libraries to the read-only runtime libraries (KCIJPLOD) and the updated work libraries to the user libraries (KCIJPCPR and KCIJPW2R). You might need to run additional jobs, depending upon product-specific requirements spelled out in ++HOLD data.

### Procedure

1. Refresh the work libraries.
  - a. From the Workflow main menu, select **Set up PARMGEN work environment for an RTE**. The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

While configuring an existing RTE profile, you have asked to
navigate to the KCIJPCFG option to review or make changes to the
KCIJPCFG job, which was run with highest condition code RC= 00000
on 2017/07/27. In most cases, if you change any KCIJPCFG
parameters, you will have to rerun the KCIJPCFG job and certain
subsequent PARMGEN configuration jobs.

Press ENTER to continue with KCIJPCFG changes.

Press F3 to abort.
```

- b. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.

- c. Step through the presented panels by pressing Enter to accept the current configuration values. (On the **Include Products in this PARMGEN RTE** panel, enter y to confirm the current choices.) After you confirm the current product selection, you are prompted to provide a name for the backup copy of the RTE profile.
  - d. Provide a name for the backup, then press Enter. The KCIJPCFG JCL is displayed.
  - e. Review the notes, then submit the job. The KCIJPCFG job creates new RTE profiles that contains the new parameters, then runs the KCIJPPRF job. The KCIJPPRF job updates the interim libraries and merges the current values from the backed up profile into the new profiles. Return to the main Workflow panel. Wait until both KCIJPCFG and KCIJPPRF have completed before proceeding to the next step. No return code is displayed on the Workflow main panel until both jobs have completed.
2. Submit the jobs to complete the setup of the RTE.
    - a. Select **Submit batch jobs to complete PARMGEN setup**. The Submit Batch Jobs to Complete PARMGEN Setup menu is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.
```

Description	REQ	Job Name	Status	Date
1. Composite SUBMIT job (See JCL comments) ** OR **		KCIJPSUB		
2. Allocate runtime R0 and RW datasets	(Yes)	KCIJPALO		
3. Copy SMP/E mbrs from TK*->RK* R0 libs	(Yes)	KCIJPLOD		
4. Run product security steps	(Yes)	KCIJPSEC		
5. Update variable-named runtime mbrs	(No )	KCIJPUPV		
6. (Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7. Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8. Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9. Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10. Verify the configuration jobs	(Tip)	KCIJPIVP		
11. Back-up RK* product execution user libs	(Tip)	KCIJPCPR		
12. Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

```
Press F1=Help for more information. Type UTIL to access utility menu.
```

- b. Submit the following jobs and any other jobs indicated by a Yes in the REQ column.

**KCIJPLOD**

This required job copies members of the target libraries that were installed by SMP/E to the read-only RK\* libraries.

**KCIJPW2R/KCIJPW1R**

These jobs (Option 12) copies the WK\* work output libraries to the respective production RK\* runtime libraries. If you run either of these jobs, run KCIJPCPR to back up the RK\* production libraries. KCIJPW2R is run by default when the composite submit job KCIJPSUB is run. KCIJPW2R replaces all RK\* members with members from WK\*. It will leave non-PARMGEN managed members in RK\* libraries. KCIJPW1R deletes all RK\* members except for the ones that are added in the IBM provided WKANSAMU(KCI\$IW2R) and user defined WCONFIG(KCI\$XW2R) exclude lists, and then copies WK\* members to RK\* libraries. You must add members they want saved to their RTE WCONFIG(KCI\$XW2R) member.

You might need to submit one or more of the following jobs:

- KCIJPSEC (if upgrade introduces changes in security) to create security-related members (load modules, encryption key, and other elements) based on the product security requirements
- KCIJPALO (if the upgrade introduces new data sets are introduced)
- KCIJPUSP and KCIJcUSS (if upgrade introduces changes in z/OS® UNIX® System Services requirements)

- KCIJPLNK (if OMEGAMON for IMS on z/OS is installed)
- KCIJPSYS (if upgrade introduces new started tasks or nodes)

## Scenario SMPE05: Upgrading an existing runtime environment with configuration changes but using IBM-supplied configuration defaults

Upgraded FMIDs can include new product features that introduce configuration changes (such as new product configuration parameters in RKANPARU(KppENV), or new RK\* runtime members). Typically, these types of configuration changes caused by new product versions are delivered as benign, and IBM-supplied configuration defaults are supplied, so you do not need to customize the configuration profiles to incorporate them. However, you do need to stage the changes by refreshing the work environment and recreating the runtime members and jobs.

### About this task

This scenario involves the following steps:

1. Refreshing the work libraries.
2. Regenerating the RTE members and jobs.
3. Submitting the jobs that complete the setup of the RTE.

At a minimum, you need to copy the SMP/E target libraries to the read-only runtime libraries (KCIJPLOD) and the updated work libraries to the user libraries (KCIJPCPR and KCIJPW2R). You might need to run additional jobs, depending upon product-specific requirements indicated in ++HOLD data.

**Tip:** Each site has different change-control procedures. Certain sites deploy these types of changes by renaming the current production RK\* libraries to a backup set like RK\*.Dyymmdd, then renaming the latest WK\* set to RK\*. Sample deployment and backup jobs WKANSAMU(KCIJcCPY) and WKANSAMU(KCIJcW2R) provide helpful samples.

To stage the new configuration parameters, complete the following procedure.

### Procedure

1. Refresh the PARMGEN work environment.  
This step update interim libraries and recreates the configuration profiles with any new parameters.
  - a. On the main Workflow panel, specify the name of the runtime environment to which you want to apply maintenance.
  - b. From the Workflow - Primary Options Menu, select **Set up PARMGEN work environment for an RTE**.

The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

While configuring an existing RTE profile, you have asked to
navigate to the KCIJPCFG option to review or make changes to the
KCIJPCFG job, which was run with highest condition code RC= 00000
on 2017/07/27. In most cases, if you change any KCIJPCFG
parameters, you will have to rerun the KCIJPCFG job and certain
subsequent PARMGEN configuration jobs.

Press ENTER to continue with KCIJPCFG changes.

Press F3 to abort.
```

- c. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
- d. Press Enter to continue through the following screens.  
TUTORIAL INFORMATIONOn the Include Products in this PARMGEN RTE panel, change the **Confirm ==> N** field to **Confirm ==> Y** to continue.

The following panel is displayed:

```
KCIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES -----
Command ==>

If you changed any JVM RTE configuration values on the
"SET UP/REFRESH PARMGEN WORK ENVIRONMENT" KCIJPCFG navigation
panels, or changed the configured product mix or upgraded product
versions, then you must regenerate/resubmit the KCIJPCFG/KCIJPPRF jobs.
You must also refresh the PARMGEN profiles.

Specify a backup member name for the LPAR RTE to automate the
resubmission and refresh process. A default backup member is provided.
Blank-out the field if you do not want to refresh the profiles.

  DEMO Backup member name  ==>  _____  (Required for KCIJPPRF)

PARMGEN automatically backs up the RTE profile in
TDITN.IDTST.PARMGEN.WCONBACK, refreshes templates in IK* datasets,
rebuilds the profiles with the new values, merges in the profiles values
from the backed-up LPAR RTE user profile, and generates a delta report.

Press F1 for information about the automated process.
```

- e. Enter a name for the profile backup member.  
The modified KCIJPCFG job is displayed.
  - f. Submit the job.  
The KCIJPCFG job creates new RTE profiles that contains the new parameters, then runs the KCIJPPRF job. The KCIJPPRF job updates the interim libraries and merges the current values from the backed up profile into the new profiles. Return to the main Workflow panel. Wait until both KCIJPCFG and KCIJPPRF have completed before proceeding to the next step. No return code is displayed on the Workflow main panel until both jobs have completed.
2. Regenerate the RTE members and jobs.
    - a. Select **Create the RTE members and jobs**.  
The **\$PARSE /\$PARSESV: Create the RTE Members and Jobs** panel is displayed.
    - b. Select option 1 to submit the composite job.  
TUTORIAL INFORMATION If the updates affect only one set of libraries, you can submit the library-specific job instead of the composite job. Press F5 to create runtime members and jobs in an individual library (WKANCMDU, WKANPARU, or WKANSAMU).  
  
The \$PARSE job takes the product templates from the %RTE\_PLIB\_HILEV%.%RTE\_NAME%. IK\* staging libraries, applies the customized values from the configuration profiles, and creates the runtime members in the work libraries (WK\*).
    - c. Return to the main Workflow panel.
  3. Submit the jobs to complete the setup of the RTE.
    - a. Select **Submit batch jobs to complete PARMGEN setup**.  
The Submit Batch Jobs to Complete PARMGEN Setup menu is displayed.

```

KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                                REQ  Job Name  Status  Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4. Run product security steps               (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUVP
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files     (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs      (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps   (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information. Type UTIL to access utility menu.

```

- b. Submit the following jobs and any other jobs indicated by a Yes in the REQ column.

**KCIJPLOD**

This required job copies members of the target libraries that were installed by SMP/E to the read-only RK\* libraries.

**KCIJPW2R/KCIJPW1R**

These jobs (Option 12) copies the WK\* work output libraries to the respective production RK\* runtime libraries. If you run either of these jobs, run KCIJPCPR to back up the RK\* production libraries. KCIJPW2R is run by default when the composite submit job KCIJPSUB is run. KCIJPW2R replaces all RK\* members with members from WK\*. It will leave non-PARMGEN managed members in RK\* libraries. KCIJPW1R deletes all RK\* members except for the ones that are added in the IBM provided WKANSAMU(KCI\$IW2R) and user defined WCONFIG(KCI\$XW2R) exclude lists, and then copies WK\* members to RK\* libraries. You must add members they want saved to their RTE WCONFIG(KCI\$XW2R) member.

You might have to submit one or more of the following jobs:

- KCIJPSEC (if upgrade introduces changes in security) to create security-related members (load modules, encryption key, and other elements) based on the product security requirements
- KCIJPALO (if the upgrade introduces new data sets are introduced)
- KCIJPUSP and KCIJcUSS (if upgrade introduces changes in z/OS® UNIX® System Services requirements)
- KCIJPLNK (if OMEGAMON® for IMS™ on z/OS® is installed)
- KCIJPSYS (if upgrade introduces new started tasks or nodes)

**Result**

The new product features are implemented and the defaults are in effect.

**Scenario SMPE06: Upgrading an existing runtime environment and overriding defaults**

Typically, configuration changes introduced by upgrade FMIDs are delivered as benign, and IBM-supplied configuration defaults are supplied. However, you might need to edit the configuration profiles to exploit a new features or to set custom values for new parameters.

**About this task**

There are four main steps involved in this scenario:

1. Refreshing the work libraries.
2. Editing profiles and overriding embed members, as necessary.
3. Regenerate thing RTE members and jobs.
4. Submitting the jobs that complete the setup of the RTE.

At a minimum, you need to copy the SMP/E target libraries to the read-only runtime libraries (KCIJPLOD) and copy the updated work libraries to the user runtime libraries (KCIJPW2R). You might need to run additional jobs, depending upon product-specific requirements spelled out in ++HOLD data.

**Tip:** Each site has different change-control procedures. Certain sites deploy these types of changes by renaming the current production RK\* libraries to a backup set like RK\*.Dyymdd, then renaming the latest WK\* set to RK\*. Sample backup and deployment jobs WKANSAMU(KCIJPCPR) and WKANSAMU(KCIJPW2R) provide helpful samples.

## Procedure

1. Refresh the work libraries.  
This step backs up (renames) the existing LPAR profile, updates the interim libraries, recreates the configuration profiles with any new parameters, and merges the backup profile with the newly created one.
  - a. Select the runtime environment to which you want to apply maintenance.
  - b. From the Workflow - Primary Options Menu, select Set up PARMGEN work environment for an RTE to regenerate and resubmit the KCIJPCFG job.  
The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
While configuring an existing RTE profile, you have asked to  
navigate to the KCIJPCFG option to review or make changes to the  
KCIJPCFG job, which was run with highest condition code RC= 00000  
on 2017/07/27. In most cases, if you change any KCIJPCFG  
parameters, you will have to rerun the KCIJPCFG job and certain  
subsequent PARMGEN configuration jobs.  
  
Press ENTER to continue with KCIJPCFG changes.  
  
Press F3 to abort.
```

- c. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
- d. Step through the presented panels by pressing Enter to accept the current configuration values.  
(On the Include Products in this PARMGEN RTE panel, enter y to confirm the current choices.)  
After you confirm the current product selection, you are prompted to provide a name for the backup copy of the RTE profile.

```
KCIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES -----  
Command ==>
```

If you changed any JVM RTE configuration values on the "SET UP/REFRESH PARMGEN WORK ENVIRONMENT" KCIJPCFG navigation panels, or changed the configured product mix or upgraded product versions, then you must regenerate/resubmit the KCIJPCFG/KCIJPPRF jobs. You must also refresh the PARMGEN profiles.

Specify a backup member name for the LPAR RTE to automate the resubmission and refresh process. A default backup member is provided. Blank-out the field if you do not want to refresh the profiles.

```
DEMO Backup member name ==> _____ (Required for KCIJPPRF)
```

PARMGEN automatically backs up the RTE profile in TDITN.IDTST.PARMGEN.WCONBACK, refreshes templates in IK\* datasets, rebuilds the profiles with the new values, merges in the profiles values from the backed-up LPAR RTE user profile, and generates a delta report.

Press F1 for information about the automated process.

- e. Enter a name for the profile backup member.  
The KCIJPCFG job is displayed.
  - f. Review the notes, then submit the job.  
The KCIJPCFG job creates new RTE profiles that contains the new parameters, then runs the KCIJPPRF job. The KCIJPPRF job updates the interim libraries and merges the current values from the backed up profile into the new profiles. Return to the main Workflow panel. Wait until both KCIJPCFG and KCIJPPRF have completed before proceeding to the next step. No return code is displayed on the Workflow main panel until both jobs have completed.
2. Edit profiles and override embeds to customize new features or parameters as required.
    - a. Select **Customize PARMGEN configuration profiles**.  
The **Customize PARMGEN Configuration Profile Members** panel is displayed.
    - b. Select the RTE, global, and variables profiles in turn as necessary and make the required customizations. If required, edit the appropriate embed members.

#### Tips:

- In a scenario where you have also added a new product to configure to this runtime environment, ensure that you also customize the new product's *Kpp\_\** PARMGEN profile parameters added into the refreshed RTE configuration profile.
- Compare the updated \$CFG\$IBM and \$GBL\$IBM to your customized profiles to determine what parameters have changed or been added.
- Update or customize any new or modified embed files as desired.

3. Regenerate the RTE members and jobs.
  - a. Select **Create the RTE members and jobs**.  
The **\$PARSE /\$PARSESV: Create the RTE Members and Jobs** panel is displayed.
  - b. Select option 1 to submit the composite job.  
  
TUTORIAL INFORMATION If the updates affect only one set of libraries, you can submit the library-specific job instead of the composite job. Press F5 to create runtime members and jobs in an individual library (WKANCMU, WKANPARU, or WKANSAMU).  
  
The \$PARSE job takes the product templates from the %RTE\_PLIB\_HILEV%.%RTE\_NAME%. IK\* staging libraries, applies the customized values from the configuration profiles, and creates the runtime members in the work libraries (WK\*).
  - c. Return to the main Workflow panel.
4. Submit the batch jobs necessary to complete the set up of the environment:
  - a. Select **Submit batch jobs to complete PARMGEN setup**.  
The Submit Batch Jobs to Complete PARMGEN Setup menu is displayed.

```

KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                                REQ  Job Name  Status  Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs    (Yes) KCIJPLOD
4. Run product security steps                (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUVP
6. (Re)Create USS runtime mbrs in RKANDATV  (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files     (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs      (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps   (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information. Type UTIL to access utility menu.

```

- b. Submit the following jobs and any other jobs indicated by a Yes in the REQ column.

**KCIJPLOD**

This required job copies members of the target libraries that were installed by SMP/E to the read-only RK\* libraries.

**KCIJPW2R/KCIJPW1R**

These jobs (Option 12) copies the WK\* work output libraries to the respective production RK\* runtime libraries. If you run either of these jobs, run KCIJPCPR to back up the RK\* production libraries. KCIJPW2R is run by default when the composite submit job KCIJPSUB is run. KCIJPW2R replaces all RK\* members with members from WK\*. It will leave non-PARMGEN managed members in RK\* libraries. KCIJPW1R deletes all RK\* members except for the ones that are added in the IBM provided WKANSAMU(KCI\$IW2R) and user defined WCONFIG(KCI\$XW2R) exclude lists, and then copies WK\* members to RK\* libraries. You must add members they want saved to their RTE WCONFIG(KCI\$XW2R) member.

You might have to submit one or more of the following jobs:

- KCIJPSEC (if upgrade introduces changes in security) to create security-related members (load modules, encryption key, and other elements) based on the product security requirements
- KCIJPALO (if the upgrade introduces new data sets are introduced)
- KCIJPUSP and KCIJcUSS (if upgrade introduces changes in z/OS® UNIX® System Services requirements)
- KCIJPLNK (if OMEGAMON for IMS on z/OS is installed)
- KCIJPSYS (if upgrade introduces new started tasks or nodes)

**Result**

The runtime environment is upgraded and any values you customized are in effect.

## Creating a new SMP/E environment for a staged upgrade of new or existing runtime environments

Instead of cloning an existing environment to begin your staged upgrade, you can install the new product and component versions into a new SMP/E environment and then configure new or existing runtime environments that contain the new versions.

**Procedure**

1. Install a ServerPac that contains the latest version of the Tivoli® Management Services on z/OS® components and of any OMEGAMON® products you want to upgrade.  
 TUTORIAL INFORMATION Make sure that the ServerPac contains all the products configured in the RTE, or they will not be included in the reconfigured RTE.  
 Follow the instructions in the *Program Directory for IBM® Tivoli® Management Services on z/OS®* and in the *Program Directory* for each OMEGAMON® product being installed.
2. Configure the new runtime environments with the installed components and products.  
 TUTORIAL INFORMATION  
 Follow the instructions in the appropriate [implementation scenario](#).
3. Complete any configuration required outside the configuration software.  
 TUTORIAL INFORMATION  
 You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:
  - [“Completing the configuration outside the configuration software” on page 522](#)
  - [“Completing the upgrade” on page 205](#)
  - The *Planning and Configuration Guide* for each product.

## Completing the upgrade

After you have completed the configuration steps for the appropriate upgrade scenario, there are additional steps you may need to complete.

### OMEGAMON enhanced 3270 user interface

If you are enabling the enhanced 3270 user interface for the first time, the following steps must be completed:

1. Define the new started task user IDs to your STC table. The default name is IBMTOM.
2. Define the new VTAM APPLID for the enhanced user interface. The default name is CTDOBAP.
3. APF-authorize &rte\_hilev.&rte\_name.RKANMODP library, as this load library is included in the STEPLIB DDNAME of all started tasks.
4. Customize the KOB\* parameters as desired.
5. Add the new address space to the system PROCLIB and add its VTAM major node to the system VTAMLST. If you are using a global VTAM major node, refresh the global VTAM major node with the user interface's VTAM LOGON APPLID.  
 In PARMGEN, the KCIJPSYS job is available to perform these steps.

In a PARMGEN upgrade, steps 1-3 are done automatically (and step 5 if the KCIJPSYS job is run).

After you have completed configuration, run the appropriate load job and recycle started tasks in the upgraded runtime environment.

## Upgrade scenarios

You can use the PARMGEN configuration method to upgrade products in a runtime environment that already contains a previous version of the products. Choose the upgrade scenario that fits your existing configuration and your upgrade plans.

The upgrade scenarios are based on the assumption that the new version of the Tivoli Management Services on z/OS components and the OMEGAMON® products have already been installed with SMP/E. (See [“SMP/E installation” on page 195](#).)

### Scenario A: Upgrading the z/OS® monitoring server only

You can upgrade a z/OS Tivoli Enterprise Monitoring Server in an existing PARMGEN runtime environment (RTE).

#### About this task

To upgrade just the monitoring server in a PARMGEN RTE, follow the steps in “Scenario RTE02: Upgrading a single product or component in an existing runtime environment” on page 206. On the Include Products in this PARMGEN RTE panel (KCIP@PGI), deselect all products except for the monitoring server (KDS).

## Scenario RTE02: Upgrading a single product or component in an existing runtime environment

If the runtime environment (RTE) is pointing to the target libraries where the new version is SMP/E installed, the product is automatically upgraded when you refresh the work environment.

### Procedure

1. Refresh the PARMGEN work environment to include the latest installed version of the product. This step updates interim libraries and recreates the configuration profiles with any new parameters introduced by the upgrade.
  - a. Identify the RTE in which you want to upgrade the product by specifying the fully-qualified name of the RTE (**RTE\_PLIB\_HILEV** and **RTE\_NAME**).
  - b. From the Workflow - Primary Options Menu, select **Set up PARMGEN work environment for an RTE**.  
The following message is displayed, notifying you that you need to resubmit the modified KCIJPCFG job:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
While configuring an existing RTE profile, you have asked to  
navigate to the KCIJPCFG option to review or make changes to the  
KCIJPCFG job, which was run with highest condition code RC= 00000  
on 2017/07/27. In most cases, if you change any KCIJPCFG  
parameters, you will have to rerun the KCIJPCFG job and certain  
subsequent PARMGEN configuration jobs.  
  
Press ENTER to continue with KCIJPCFG changes.  
  
Press F3 to abort.
```

- c. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
    - d. Press Enter until the Include Products in this PARMGEN RTE panel (KCIP@PGI) is displayed.  
The products already configured into the environment are indicated by a slash. However, the version currently installed in the target libraries is displayed, not the version currently configured. If the versions are different, the product is upgraded to the version shown when you submit the KCIJPCFG job.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE
```

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.  
Select or deselect products to include or exclude from configuration.  
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)

```
  Kpp Component or Product Name and Version
-----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181
/ KDS Tivoli Enterprise Monitoring Server V630
/ KD4 ITCAM for SOA Agent V711
/ KD5 OMEGAMON for DB2 PE V550
/ KGW OMEGAMON for CICS TG V550
/ KI5 OMEGAMON for IMS V550
/ KJJ OMEGAMON for JVM V540
/ KMQ OMEGAMON for Messaging - MQ V750
/ KM5 OMEGAMON for z/OS V550
/ KNA NetView for z/OS Agent V621
/ KN3 OMEGAMON for Networks V550
/ KOB OMEGAMON Enhanced 3270 User Interface V750
/ KQI OMEGAMON for Messaging - Integration Bus V750
/ KRQ Advanced Audit for DFSMSHsm Agent V260
/ KRH Advanced Reporting and Management for DFSMSHsm Agent V260
/ KRJ Advanced Allocation Management Agent V330
/ KRK Automated Tape Allocation Manager for z/OS Agent V330
/ KRN Advanced Catalog Management Agent V260
/ KRV Advanced Backup and Recovery for z/OS Agent V240
/ KRW Tape Optimizer for z/OS Agent V220
/ KS3 OMEGAMON for Storage V540
/ KYN ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

- e. Specify Y in the **Confirm ==>** field to confirm the current selection of products, then press Enter to continue.

The following panel is displayed:

```
KCIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES -----
Command ==>
```

If you changed any JVM RTE configuration values on the "SET UP/REFRESH PARMGEN WORK ENVIRONMENT" KCIJPCFG navigation panels, or changed the configured product mix or upgraded product versions, then you must regenerate/resubmit the KCIJPCFG/KCIJPPRF jobs. You must also refresh the PARMGEN profiles.

Specify a backup member name for the LPAR RTE to automate the resubmission and refresh process. A default backup member is provided. Blank-out the field if you do not want to refresh the profiles.

DEMO Backup member name ==> \_\_\_\_\_ (Required for KCIJPPRF)

PARMGEN automatically backs up the RTE profile in TDITN.IDTST.PARMGEN.WCONBACK, refreshes templates in IK\* datasets, rebuilds the profiles with the new values, merges in the profiles values from the backed-up LPAR RTE user profile, and generates a delta report.

Press F1 for information about the automated process.

- f. Type a name for the profile backup member and press Enter.  
The modified KCIJPCFG job is displayed.
- g. Submit the job.  
The KCIJPCFG job submits the KCIJPPRF job, which updates the libraries and merges the backed up profile with the newly generated one containing the new version of the product. Wait until both jobs have completed and you receive a successful return code before proceeding to the next step.
2. The next steps depend on whether or not you have configuration changes to make:
- If you do not need to make any further configuration changes (for example, you can use the product defaults and no new features need to be configured), regenerate the RTE members and jobs by submitting the \$PARSE (or \$PARSESV) job and submit the jobs that complete the setup of the RTE.

- If you want to exploit new configuration changes (such as enabling the self-describing agent feature) or override the product-supplied configuration defaults, edit the configuration profiles as necessary. Then regenerate the RTE members and jobs by submitting the \$PARSE (or \$PARSESV) job and submit the jobs that complete the setup of the RTE.
- At a minimum, you need to copy the SMP/E target libraries to the read-only runtime libraries (KCIJPLOD job) and the updated work libraries to the user libraries (KCIJPCPR and KCIJPW2R jobs). You might need to run additional jobs, depending upon product-specific requirements spelled out in ++HOLD data..

## What to do next

Select the **Perform post configuration steps** in the PARMGEN Workflow - Primary Option Menu to the readmes for the installed products. See also the *Planning and Configuration Guide* for the upgraded product for any configuration steps that need to be completed outside the configuration software.

## Scenario B: Upgrading the z/OS monitoring server and monitoring agents

In this scenario, you are upgrading the monitoring server to V6.3.0 Fix Pack 6 and upgrading one monitoring agent or more in the runtime environment to the latest versions installed at the same time.

### Before you begin

If you do not plan to enable the self-describing agent (SDA) capability, you must upgrade the hub monitoring server before you upgrade a remote monitoring server that reports to it. If you intend to use SDA, and the runtime environment of hub monitoring server is already at Tivoli Management Services V6.3.0 FP6, the agent upgrades can start at a remote monitoring server.

### About this task

Upgrade the z/OS monitoring server and one monitoring agent or more in an existing PARMGEN runtime environment. Take the following upgrade path for Scenario B using the PARMGEN configuration method, as described below.

### Procedure

- To upgrade your Tivoli Enterprise Monitoring Server to V6.3.0 Fix Pack 6 and the monitoring agents to the latest version installed, complete one of the following scenarios:
  - [“Scenario SMPE04: Upgrading an existing runtime environment with no configuration changes” on page 197](#)
  - [“Scenario SMPE05: Upgrading an existing runtime environment with configuration changes but using IBM-supplied configuration defaults” on page 199](#)
  - [“Scenario SMPE06: Upgrading an existing runtime environment and overriding defaults” on page 201](#)

## Scenario C: Upgrading a z/OS® monitoring server and adding a new monitoring agent

In this scenario, you are upgrading an existing z/OS® monitoring server to V6.3.0 FP6 and adding a new V5.5.0 monitoring agent monitoring agent to the RTE.

### Before you begin

If you do not plan to enable the self-describing agent (SDA) capability, you must upgrade the hub monitoring server before you upgrade a remote monitoring server that reports to it. If you intend to use SDA, and the runtime environment of hub monitoring server is already at Tivoli Management Services V6.3.0 FP6, the agent upgrades can start at a remote monitoring server.

### About this task

Upgrade the z/OS® monitoring server in an existing PARMGEN RTE and add new monitoring agent. To upgrade your Tivoli Enterprise Monitoring Server to V6.3.0 (or later) and add a new in an existing PARMGEN environment, complete [“Scenario RTE01: Adding a new product to an existing PARMGEN runtime environment” on page 209](#). Products already configured in the environment, including the Tivoli Enterprise Monitoring Server,

are indicated by a slash (/) and are upgraded to the new version installed in the SMP/E target libraries unless they deselected.

## Scenario RTE01: Adding a new product to an existing PARMGEN runtime environment

You have an existing runtime environment (RTE) to which you want to add a new product. The product is SMP/E installed, but it is not yet configured in the RTE.

### About this task

The key to adding a new product to an existing RTE is the Include Products in this PARMGEN RTE panel (KCIP@PGI). You regenerate the KCIJPCFG setup job and add the new product by selecting it on the Include Products panel. After you submit the job, the RTE configuration profile is updated with the parameters for that product. Then, you can customize those parameters by editing the profile. You run the \$PARSE job to recreate the runtime members and jobs, and then resubmit the jobs to complete the reconfiguration of the RTE with the new product.

### Procedure

1. Recreate the work environment.

This step adds the new product, updates interim libraries, and recreates the configuration profiles with any new parameters for the new product.

- a. Select the RTE to which you want to add the product by providing the fully-qualified RTE name (RTE\_PLIB\_HILEV and RTE\_NAME).
- b. From the Workflow - Primary Options Menu, select **Set up PARMGEN work environment for an RTE**.

The following message is displayed, notifying you that you need to resubmit the modified KCIJPCFG job after you make changes:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
While configuring an existing RTE profile, you have asked to  
navigate to the KCIJPCFG option to review or make changes to the  
KCIJPCFG job, which was run with highest condition code RC= 00000  
on 2017/07/27. In most cases, if you change any KCIJPCFG  
parameters, you will have to rerun the KCIJPCFG job and certain  
subsequent PARMGEN configuration jobs.  
  
Press ENTER to continue with KCIJPCFG changes.  
  
Press F3 to abort.
```

- c. Press Enter to continue.  
The first setup panel (KCIP@PG1) is displayed.
- d. Press Enter until the Include Products in this PARMGEN RTE panel (KCIP@PGI) is displayed.  
Any products already configured into the environment are indicated by a slash (/).
- e. Select the new product you want to include by typing a slash (/) next to its product code.  
In the following example, a monitoring server, the OMEGAMON® enhanced 3270 user interface, and all of the OMEGAMON® products except OMEGAMON® for Storage are already configured in the runtime environment. To add OMEGAMON® for Storage, a slash is placed next to KS3.

```

----- INCLUDE PRODUCTS IN THIS PARMGEN RTE - Row 1 to 19 of 26
Command ==> Scroll ==> PAGE

Select (/) product(s) to CONFIGURE those product(s) in RTE=PLB1SP13
Products configured in the model RTE have been preselected (/).
Select or deselect products to include or exclude from configuration.

When finished, change "N" to "Y" to confirm selections. Confirm ==> N (Y, N)

  Kpp Product Name/Version
-----

```

- f. Type Y in the **Confirm ==>** field, then press Enter to continue.  
The following panel is displayed:

```

KCIP@BAK IMPORTANT - REFRESH THE LPAR RTE USER AND IBM PROFILES -----
Command ==>

If you changed any JVM RTE configuration values on the
"SET UP/REFRESH PARMGEN WORK ENVIRONMENT" KCIJPCFG navigation
panels, or changed the configured product mix or upgraded product
versions, then you must regenerate/resubmit the KCIJPCFG/KCIJPPRF jobs.
You must also refresh the PARMGEN profiles.

Specify a backup member name for the LPAR RTE to automate the
resubmission and refresh process. A default backup member is provided.
Blank-out the field if you do not want to refresh the profiles.

  DEMO Backup member name ==> _____ (Required for KCIJPPRF)

PARMGEN automatically backs up the RTE profile in
TDITN.IDTST.PARMGEN.WCONBACK, refreshes templates in IK* datasets,
rebuilds the profiles with the new values, merges in the profiles values
from the backed-up LPAR RTE user profile, and generates a delta report.

Press F1 for information about the automated process.

```

- g. Type a name for the profile backup member and press Enter.  
The modified KCIJPCFG job is displayed.
- h. Submit the job.  
The KCIJPCFG job submits the KCIJPPRF job, which updates the libraries and merges the backed up profile with the newly generated one containing the new product parameters.
- i. Return to the Workflow - Primary Options Menu. Wait until both jobs have completed. No return code is displayed on the Workflow main panel until both jobs have completed.
2. Edit the configuration profiles, as required.

TUTORIAL INFORMATION See the *Planning and Configuration Guide* and *Parameter Reference* for the new product for information on parameters that you might want to customize or features you might want to enable. Note that the new product inherits any global runtime environment parameters specified in the Set up PARMGEN Work Environment for an RTE (3 OF 3) panel (KCIP@PG3), such as started task prefixes.

3. Recreate the RTE members and jobs.
  - a. From the Primary Options Menu, select **Create the RTE members and jobs**.  
The \$PARSE/\$PARSESV: Create the RTE Members and Jobs (KCIP@PRS) panel is displayed.
  - b. Select option 1 to submit the generated \$PARSE or \$PARSESV composite job.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status    Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information.  Type UTIL to access utility menu.
```

Note that you see the second option only if the RTE is enabled for variables.

The \$PARSE or \$PARSESV member is presented.

- c. Review the member for any jobs that need to be submitted manually, then submit the job.  
Return to the Workflow - Primary Options Menu.
4. Submit the batch jobs to complete reconfiguration of the RTE.

- a. From the Primary Options Menu, select **Submit batch jobs to complete PARMGEN setup**.  
The Submit batch jobs to complete PARMGEN setup (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name   Status    Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
** OI **
2. Allocate runtime R0 and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* R0 libs   (Yes) KCIJPLOD
4. Run product security steps              (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSP
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPVIP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information.  Type UTIL to access utility menu.
```

- b. Select option 1 to submit the KCIJPSUB composite submit job, or select the other options to submit each job separately.  
If you select option 1, first review the KCIJPSUB job, and edit the job according to which of the conditional jobs can to be submitted automatically.

- c. Check for good condition codes.

**Note:** The WSUPERC step will encounter an informational condition code of 4 if OMEGAMON® AI for Db2 is not configured in this runtime environment as there are no xKD2\* libraries to compare.

- d. If you do not receive good condition codes, review the resulting output:
  - \$IVPRPT report, which is stored in the WCONFIG library
  - WSUPERC SYSTSPRT report, which is stored in the WSUPERC sequential library

Correct any errors, and rerun any jobs that did not complete successfully.

## What to do next

See the *Planning and Configuration Guide* for the new product to complete any configuration steps required outside the configuration software.

## Scenario D: Upgrading monitoring agents in an existing runtime environment without a z/OS® monitoring server

Use this scenario if you already upgraded the Tivoli Management Services on z/OS components and want to upgrade stand-alone monitoring agents in an existing runtime environment that does not contain a z/OS® monitoring server.

For example, use the scenario for upgrading an OMEGAMON for CICS monitoring agent to V5.5.0 in an existing runtime environment with no monitoring server.

### About this task

Take the following path for Scenario D using the PARMGEN configuration method:

### Procedure

- Upgrade the monitoring agents in an existing runtime environment without a z/OS® monitoring server in an existing PARMGEN RTE.  
To upgrade monitoring agents using the PARMGEN-to-PARMGEN upgrade path, complete [“Scenario RTE02: Upgrading a single product or component in an existing runtime environment”](#) on page 206.  
Make the following adjustments:
  - On the Include Products in this PARMGEN RTE panel (KCIP@PGI), deselect any installed products that you do not want to add or upgrade. Products already configured in the environment are indicated by a slash (/). If newer versions are installed in the target SMP/E libraries, and you do not exclude these products, they are upgraded.

## Scenario E: Upgrading additional products in an upgraded environment

You have already upgraded the monitoring server to V6.3.0 Fix Pack 6 and upgraded the monitoring agents to the most recent version. Now new versions are available for some of the products and you want to upgrade those agents.

### About this task

To upgrade additional products in an already upgraded PARMGEN RTE, complete [“Scenario RTE02: Upgrading a single product or component in an existing runtime environment”](#) on page 206. On the Include Products in this PARMGEN RTE panel (KCIP@PGI), any of the installed products already configured in the RTE are indicated by a slash. The version currently installed in the target libraries is displayed, not the version currently configured. If the versions are different and you do not deselect the product, the product is upgraded to the version shown when you submit the KCIJPCFG job.

---

# Configuring products and components on z/OS

Configure OMEGAMON® products and their common framework components on z/OS®.

Configuration of OMEGAMON® products and their common framework components on z/OS® is based on the concept of a runtime environment, or RTE. An RTE consists of all the parts (data sets, parameters, start task JCL, and so on) required to run the configured products and framework components on a single z/OS® LPAR.

You can use IBM Z Monitoring Configuration Manager (Monitoring Configuration Manager or Configuration Manager) or Parameter Generator (PARMGEN) to configure, replicate, maintain, and update RTEs.

**Important:** To facilitate your configuration experience, make sure to review [“Best practices for configuring OMEGAMON products and components” on page 213](#).

## What's new

For information about recent updates to Configuration Manager and PARMGEN, see [“What's new in Tivoli Management Services on z/OS configuration software” on page 22](#).

**Note:** Previous updates are described in [“What's new in Monitoring Configuration Manager \(previous updates\)” on page 1448](#) and [“What's new in PARMGEN \(previous updates\)” on page 1449](#).

---

## Best practices for configuring OMEGAMON products and components

Follow these guidelines to facilitate your experience when configuring OMEGAMON products and components.

When configuring your OMEGAMON products and components, you can use either of the two available configuration tools: IBM Z Monitoring Configuration Manager (Monitoring Configuration Manager or Configuration Manager) or Parameter Generator (PARMGEN).

### PARMGEN or Configuration Manager?

IBM Z® Monitoring Configuration Manager evolved from PARMGEN.

You can use either Configuration Manager or PARMGEN to configure runtime environments for the supported OMEGAMON products and components, and both tools use mainly the same parameters.

Although you can achieve the same results using either tool, Configuration Manager provides a significantly improved and simplified process of configuring your runtime environments when compared with PARMGEN.

If you are a new user, use Configuration Manager.

If you are a PARMGEN user, consider moving to Configuration Manager, by methodically migrating your runtime environments from PARMGEN to Configuration Manager.

For more information about moving from PARMGEN to Configuration Manager, see the following topics:

- [“Rectifying your PARMGEN configuration” on page 516](#)
- [Configuration Manager: Comparison with PARMGEN](#)
- [Configuration Manager: Parameters with different default values than PARMGEN](#)
- [Configuration Manager: MIGRATE](#)

### Best practices for configuration

Regardless of which configuration tool you are using, Configuration Manager or PARMGEN, there are some basic guidelines that will help you to maintain a clean and problem-free configuration for your runtime environment.

The following best practices apply when using either Configuration Manager or PARMGEN:

- Before any configuration update, review the latest enhancements to the configuration tools. See [“What's new in Tivoli Management Services on z/OS configuration software” on page 22](#).

- Update the configurable parameters for your runtime environment by using the configuration tool only; do not attempt to modify any of the underlying configurable members directly. Such updates can cause problems when applying maintenance or upgrading products within a runtime environment.

**Important:** If you make manual modifications to your runtime libraries (RK\*), you will lose your configuration changes when you run the Configuration Manager **GENERATE** action or the PARMGEN \$PARSE jobs.

**Note:** If you are using PARMGEN to maintain your runtime environments, there are steps you can take to make sure that no manual modifications exist in your configuration. For more information, see [“Rectifying your PARMGEN configuration” on page 516](#).

- Configure your runtime environment parameters only in the supported data sets. For Configuration Manager, use members in the RTEDEF data set; for PARMGEN, use the WCONFIG data set.
- Use override embed members when you cannot apply a setting using a standard parameter. Use of embed members for override parameters prevents parameter settings from being overwritten during maintenance or upgrades. For more information, see the following topics: [“Override embed members” on page 417](#), [“Customizing the override embed members” on page 471](#), [“Using override embed members in Configuration Manager” on page 337](#).

## Configuration Manager

IBM Z® Monitoring Configuration Manager, also known as Monitoring Configuration Manager or Configuration Manager, is a tool that configures an OMEGAMON runtime environment from a set of parameters that you specify.

## Products supported by Configuration Manager

These products and components can be configured using Monitoring Configuration Manager, regardless of the product being part of a suite or pack offering or purchased as a stand-alone point product.

Each product or component is listed with its corresponding code.

<i>Table 24: Products supported by Configuration Manager</i>		
Product or component	Version	Code
Tivoli Enterprise Monitoring Server	6.3	DS
OMEGAMON® Enhanced 3270 User Interface	7.5	OB
IBM® OMEGAMON® Dashboard Edition on z/OS	5.5	WO
IBM Z® OMEGAMON® Integration Monitor	5.6	WO
IBM Z® OMEGAMON Data Provider	1.1	AY
IBM OMEGAMON® for CICS® on z/OS	5.5	C5
IBM Z OMEGAMON for CICS	5.6	CICS TS: C5, CICS TG: GW
IBM Z OMEGAMON AI for CICS	6.1	CICS TS: C5, CICS TG: GW
IBM Tivoli OMEGAMON® XE for Db2 Performance Expert on z/OS	5.4	D5
IBM Tivoli® OMEGAMON® XE for Db2® Performance Monitor on z/OS	5.4	D5
IBM OMEGAMON® for Db2 Performance Expert on z/OS	5.5	D5
IBM Z® OMEGAMON® AI for Db2	6.1	D5
IBM OMEGAMON® for IMS on z/OS	5.5	I5
IBM Z® OMEGAMON® for JVM	5.5	JJ
IBM Z® OMEGAMON® Runtime Edition for JVM	5.5	JJ

Product or component	Version	Code
IBM Z® OMEGAMON® AI for JVM	6.1	JJ
IBM OMEGAMON® for Messaging on z/OS	7.5	MQ: MQ Integration Bus: QI
IBM OMEGAMON® for Networks on z/OS	5.5	N3
IBM Z® OMEGAMON® Network Monitor	5.6	N3
IBM Z® OMEGAMON® AI for Networks	6.1	N3
IBM OMEGAMON® for Storage on z/OS	5.5	S3

## Introduction to Configuration Manager

IBM Z® Monitoring Configuration Manager, also known as Monitoring Configuration Manager or Configuration Manager, is a tool that configures an OMEGAMON runtime environment from a set of parameters that you specify.

A runtime environment (RTE) consists of the started tasks and related members, including MVS™ data sets and z/OS® UNIX® System Services files, that are required to monitor subsystems on a z/OS® LPAR. These started tasks and related members are collectively known as *runtime members*.

To generate the runtime members for a runtime environment, you configure a set of parameters, and then you run a single Monitoring Configuration Manager job. Parameters are name-value pairs stored as plain text. The following figure illustrates this basic concept:

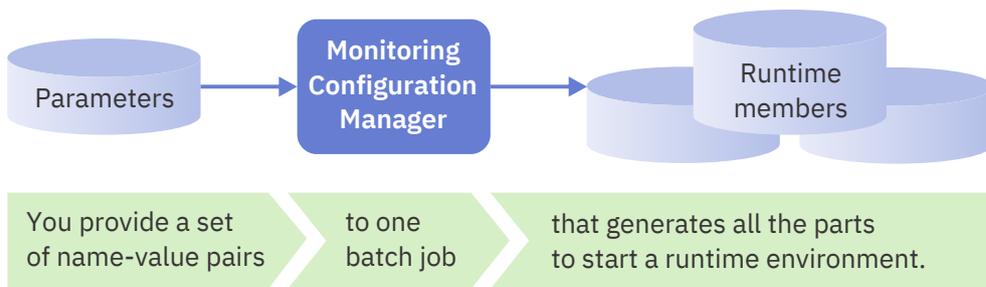

Figure 12: The basic concept: parameters in, one job, runtime members out

Generating runtime members from parameters is the main purpose of Monitoring Configuration Manager. This is known as the **GENERATE** action.

Monitoring Configuration Manager can also perform other actions:

- The **CREATE** action creates an initial set of parameters for a runtime environment.
- The **DISCOVER** action discovers subsystems on an LPAR, and then creates corresponding parameters to configure a runtime environment to monitor those subsystems.
- The **DELETE** action deletes the runtime members for a runtime environment.

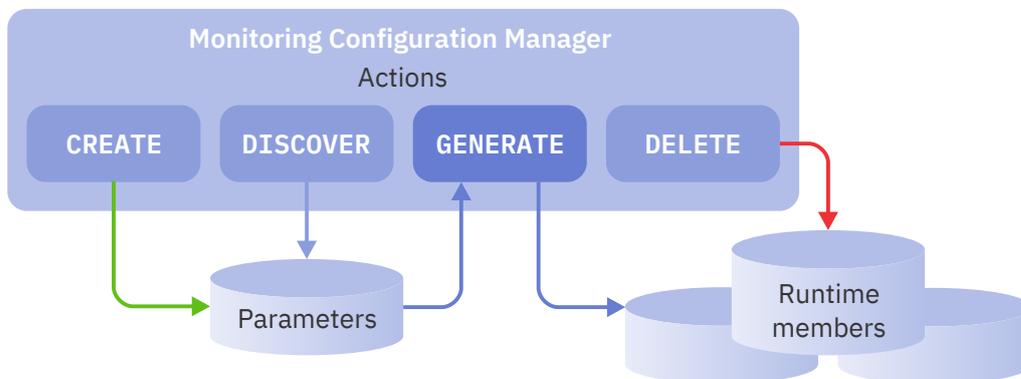

Figure 13: Actions

In addition to the actions shown in the diagram:

- The **MIGRATE** action imports existing PARMGEN RTE configuration settings from a specific WCONFIG member.
- The **PACKAGE** and **DEPLOY** actions support a convenient rollout from a single LPAR to other runtime environments.

## Comparison with PARMGEN

IBM Z® Monitoring Configuration Manager evolved from PARMGEN. If you understand PARMGEN, then a comparison can help you to quickly understand Monitoring Configuration Manager.

You can use either Monitoring Configuration Manager or PARMGEN to configure runtime environments for the supported OMEGAMON agents. Monitoring Configuration Manager and PARMGEN use mainly the same parameters. However, Monitoring Configuration Manager radically simplifies the process of configuring runtime environments from those parameters.

### You must decide whether to use Monitoring Configuration Manager or PARMGEN

You can use Monitoring Configuration Manager to generate runtime members for some runtime environments, PARMGEN for others, and run them in the same monitoring topology, communicating with the same hub monitoring server. In that sense, you can use Monitoring Configuration Manager and PARMGEN alongside each other.

However, you cannot use Monitoring Configuration Manager and PARMGEN interchangeably to generate runtime members for a runtime environment from the same set of parameters. For each runtime environment, you must decide whether to use Monitoring Configuration Manager or PARMGEN.

**Note:** You can move PARMGEN data to Configuration Manager using the **MIGRATE** action.

## Overview

The following table provides an overview of the differences between Monitoring Configuration Manager and PARMGEN.

<i>Table 25: Monitoring Configuration Manager versus PARMGEN: overview</i>	
<b>Monitoring Configuration Manager</b>	<b>PARMGEN</b>
<u>Batch-only interface.</u>	Combination of ISPF user interface and batch. You navigate ISPF panels to select which job to submit.
The same simple, concise JCL for all actions.	Different jobs for different actions. Complex, long JCL. JCL members tailored for each runtime environment must be created, stored, and potentially recreated, depending on the situation.
To generate runtime members from parameters, you submit <b>one job</b> .	To generate runtime members from parameters, you use ISPF panels to submit <b>a series of jobs</b> . Some jobs submit other jobs. You need to check the output from each job, and then return to the ISPF panels to submit the next job in the series.
To generate runtime members, you submit the same job in all situations. Enhancements introduced by Monitoring Configuration Manager, including performance improvements and the streamlining of previously separate stages into a single job, removes the need for users to decide which stages to run in different situations.	You need to understand which job, or series of jobs, to submit in different situations. For example, you need to understand which jobs to run to update a runtime environment after applying SMP/E maintenance to your OMEGAMON agents.
You only need to know about the input parameters and the output runtime members. Monitoring Configuration Manager insulates you from the underlying complexity.	In addition to understanding the inputs and outputs, you also need to understand the details of the process that generates runtime members. For example, you need to understand the difference between interim staging (IK*) libraries, work (WK*) libraries, and the final output runtime (RK*) libraries. You also need to understand which stages of the process, and which jobs, affect each of those libraries.
Sparse configuration profiles containing only the parameters you need. The initial configuration profile members contain only <b>a few dozen parameters</b> . This is all you need to use basic functions if you are content with default parameter values.	Comprehensive configuration profiles containing all parameters for all agents. You edit a configuration profile member containing <b>hundreds of parameters</b> interspersed with multiline comments.
Integrated subsystem discovery.	Requires IBM® Discovery Library Adapter for z/OS® (DLA).

Monitoring Configuration Manager	PARMGEN
<p>Available for all agents of the IBM Z® Monitoring Suite and the IBM Z® NetView Enterprise Management Agent, as well as for IBM® OMEGAMON for z/OS version 5.5.0 or later, IBM® OMEGAMON for Networks on z/OS V5.5.0 or later, and IBM Z® OMEGAMON Integration Monitor V5.5.0 or later.</p> <p>In addition, support is provided for all agents that are part of the IBM Z Service Management Suite. This includes the same list of agents as above, except for Integration Monitor.</p> <p>Point product installations are also supported for the aforementioned agents/products.</p>	<p>Available with IBM Z® Monitoring Suite and other products.</p>

### Details

The following table describes some differences in the implementation details between Monitoring Configuration Manager and PARMGEN.

For a comprehensive list of parameters that have different default values in Monitoring Configuration Manager and PARMGEN, see “Parameters with different default values than PARMGEN” on page 292.

Text in *italics* represents a parameter value. For example, *rte\_plib\_hilev* represents the value of the **RTE\_PLIB\_HILEV** parameter.

Table 26: Monitoring Configuration Manager versus PARMGEN: details

Monitoring Configuration Manager	PARMGEN
<p>Stores <u>parameters</u> and <u>variables</u> in: <i>rte_plib_hilev</i>.RTEDEF</p> <p>Each RTEDEF library can contain definitions for multiple runtime environments, customized to run on multiple LPARs.</p> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> The Configuration Manager <b>GENERATE</b> action creates an <i>rte_plib_hilev.rte_name</i>.WCONFIG(<i>rte_name</i>) member that is similar to the member created by PARMGEN, with one key difference: the member created by Configuration Manager contains default parameter values; it does not reflect the values in your RTEDEF library members. The WCONFIG data sets created by Configuration Manager, as a whole, should be considered a <i>black box</i>.</p> </div>	<p>Stores parameters in: <i>rte_plib_hilev.rte_name</i>.WCONFIG</p> <p>Each WCONFIG library contains the definition for a single runtime environment, with limited flexibility to customize that definition to run on multiple LPARs.</p> <p>Stores variables in: <i>gbl_user_jcl</i></p>
<p>Organizes parameters into members according to their prefix and whether they apply to all LPARs or only to a specific LPAR.</p> <p>Provides a well-defined <u>member naming convention</u> so you know which parameters to store where and which parameters take precedence.</p> <p>Similarly, Monitoring Configuration Manager organizes variables into members that enable different values for each LPAR.</p> <p>You can configure a runtime environment using a combination of parameters that are common to all LPARs and parameters that apply only to a specific LPAR.</p>	<p>Mixes runtime environment (<b>RTE_*</b>) parameters and product-specific (<b>Kpp_*</b>) parameters in a single large member, WCONFIG(<i>rte_name</i>).</p> <p>You can divide this monolithic member into smaller members, but you need to manage this yourself for each runtime environment. You need to define your own member naming convention, and then edit the WCONFIG(\$SYSIN) member to include the members in PARMGEN processing and define their order of precedence.</p> <p>No built-in support for LPAR-specific parameter values beyond using variables, such as SYSNAME, that have LPAR-specific values.</p>

Monitoring Configuration Manager	PARMGEN
Enables you to define LPAR-specific parameter values without using variables.	Uses variables to customize configuration profiles for different LPARs.
Uses the parameters in the first row of a table as the defaults for subsequent rows. If you omit a parameter from a subsequent row, that row uses the value from the first row. This enables you to define more concise “sparse” parameter tables with less duplication of values.	You must specify parameter values for each row in a table of parameters.
By default, writes system library members to the same high-level qualifiers as other non-VSAM runtime members: <i>rte_hilev.SYS1.*</i> where * is the system library low-level qualifier: PROCLIB, VTAMLIB, or VTAMLST	By default, writes system library members directly to: SYS1.*
Writes concise started tasks with minimal comments.  <div style="border: 1px solid #add8e6; padding: 10px; margin: 10px 0;"><b>Tip:</b> Monitoring Configuration Manager writes concise started tasks to: <i>rte_hilev.SYS1.PROCLIB</i> and versions with verbose comments to the same location used by PARMGEN: <i>rte_plib_hilev.rte_name.RKANSAMU</i> <i>rte_plib_hilev.rte_name.RKD2SAM</i> (for Db2®)</div>	Writes started tasks with verbose comments.
Sets the default value of the <b>RTE_USS_DIR</b> parameter to <i>/var/rtehome</i> .	Sets the default value of the <b>RTE_USS_DIR</b> parameter to <i>/rtehome</i> , a subdirectory of the root directory. Creating a new subdirectory of the root directory is bad practice.
In the z/OS® UNIX® System Services file system, by default writes only to <i>rte_uss_dir/rte_name</i>	By default, writes to various z/OS® UNIX® directories.
Sets the default value of the <b>RTE_TYPE</b> parameter to SHARING and <b>RTE_SHARE</b> to SMP. By default, runtime environments refer to some runtime members, such as load modules, in the SMP/E installation target library, rather than creating a full copy of those members in the runtime environment's own runtime libraries.	Sets the default value of the <b>RTE_TYPE</b> parameter to FULL. By default, the runtime environment runtime members include a full copy of all members required from the SMP/E installation target library.
Provides the ability to create one or more copies of SMP/E target libraries from which you can create or update your runtime environments. Sharing with an SMP/E target in reality is sharing with an SMP/E target copy. The Configuration Manager <i>target copy</i> feature copies only the data sets needed for products that are selected for configuration into the target copy libraries.  For <b>RTE_SHARE</b> , you can only specify SMP for a sharing runtime environment. Configuration Manager does not use base runtime environments (as in PARMGEN).	Provides the ability to use a set of static base libraries in a base runtime environment from which a sharing-with-base runtime environment obtains read-only runtime libraries.  For <b>RTE_SHARE</b> , you can specify the name of base or full runtime environment from where a sharing runtime environment obtains its base library information, or you can specify SMP to share SMP/E target libraries.

## Preparing to use Configuration Manager

Review prerequisites and other considerations before you start using Configuration Manager.

This section provides information about the following items, which are prerequisites or should be considered before using Configuration Manager:

- You need to know where your SMP/E installation target library is located. See [Location of SMP/E installation target libraries](#).
- Consider the naming convention for your runtime environments. See [Naming your runtime environment](#).
- The TSO user ID that will be used to run Configuration Manager jobs needs some special access privileges. See [Access privileges for TSO user ID](#).
- Certain Configuration Manager functions require APF authorization or special RACF privileges. See [Authorization for certain Configuration Manager functions](#).
- Review other known issues. See [Issues to be aware of before using Configuration Manager](#).

### Location of SMP/E installation target libraries

You need to know where your target libraries are installed:

- On MVS™: The high-level qualifiers of the SMP/E target libraries, such as TKANMOD.
- On z/OS® UNIX® System Services:
  - For products that require it, such as OMEGAMON for CICS and OMEGAMON for JVM, the path of the SMP/E target directory that is defined in the SMP/E installation jobs by ddname TKANJAR. The default directory path is /usr/lpp/kan/bin/IBM.
  - For OMEGAMON® Data Provider, the path of the SMP/E target directory that is defined in the SMP/E installation jobs by ddname TKAYHFS. The default directory path is /usr/lpp/omdp.

Typical best practice is to make a copy of the original SMP/E-managed locations and refer to the copies. This enables you to manage when to introduce changes in the original SMP/E-managed locations into your environment.

### Naming your runtime environment

When you define your runtime environment, it is recommended to use a naming convention that will not interfere with your system libraries. Consider meaningful names that will easily distinguish and isolate your OMEGAMON runtime environments on your system.

Configuration Manager uses the values of **RTE\_NAME** and **RTE\_PLIB\_HILEV** to set the name of the runtime environment and runtime environment definition library. It is recommended that the combined length of these parameters does not exceed 28 characters. For more information, see [“Creating your first, minimal runtime environment” on page 222](#).

### Access privileges for TSO user ID

The TSO user ID that you plan to run Configuration Manager jobs (for example, your own user ID) must have the following access privileges:

- Read access to the target libraries and the z/OS® UNIX® directory defined by the TKANJAR ddname.
- Read access to the following z/OS® System Authorization Facility (SAF) resources in the FACILITY class:  
BPX.FILEATTR.APF  
BPX.FILEATTR.PROGCTL

You do not need z/OS® UNIX® superuser privileges to run Configuration Manager.

### Authorization for certain Configuration Manager functions

Some Configuration Manager programs and actions require APF authorization or special RACF privileges, as follows:

- To use actions **DISCOVER** (for full discovery), **PACKAGE**, and **DEPLOY**, you must run program **KCIALPHA** from an APF-authorized load library. Make sure the necessary APF authorization of the TKANMOD library is made. For more information about APF authorization, see step [“7” on page 228](#) in [Creating your first, minimal runtime environment](#).

- The **PACKAGE** and **DEPLOY** actions use z/OS DFSMSdss commands to implement remote deployment. You might need authority to run **ADDRSSU**, which is the program that is invoked when using DFSMSdss. For more information, see the authorization requirements in [“PACKAGE” on page 265](#).

### Issues to be aware of before using Configuration Manager

When using Configuration Manager, especially the **GENERATE** action, make sure the job does not use a Batch Optimization tool. These tools are known to exhaust below-the-line storage and fail the job with ABEND878-10.

## Defining the OMEGAMON® subsystem to z/OS®

Some OMEGAMON® monitoring agents depend on the OMEGAMON® subsystem. Before starting a runtime environment that contains any of these monitoring agents, you must define the OMEGAMON® subsystem to z/OS®.

### Before you begin

Check whether the OMEGAMON® subsystem has already been defined to z/OS®.

For example, issue the following **DISPLAY MVS™** system command to list subsystems:

```
D SSI
```

The default name of the OMEGAMON® subsystem is CNDL.

### About this task

IBM Z® Monitoring Configuration Manager does not depend on the OMEGAMON® subsystem. Defining the OMEGAMON® subsystem is not a prerequisite for using Monitoring Configuration Manager.

However, the OMEGAMON® subsystem *is* a prerequisite for starting some of the runtime environments that you create with Monitoring Configuration Manager.

The following OMEGAMON® monitoring agents depend on the OMEGAMON® subsystem:

- CICS® (optional)
- Db2®
- IMS
- Storage
- z/OS®

You must define the OMEGAMON® subsystem on each LPAR where you plan to start runtime environments that contain any of these monitoring agents.

When you create a runtime environment that contains one of these monitoring agents, the generated runtime members include a started task that starts the OMEGAMON® subsystem.

Optionally, you can configure your LPAR to start the OMEGAMON® subsystem whenever z/OS® restarts (IPL).

### Procedure

1. Copy the OMEGAMON® subsystem initialization module KCNDLINT from the target library TKANMOD to a library in the linklist.  
For example, SYS1.LINKLIB.
2. Refresh the library lookaside (LLA) library directory indexes.  
Issue the following **MODIFY MVS™** system command:

```
F LLA,REFRESH
```

3. Dynamically define the OMEGAMON® subsystem to z/OS®.  
Issue the following **SETSSI MVS™** system command:

```
SETSSI ADD,SUBNAME=CNDL,INITRTN=KCNDLINT,INITPARM='SSPROC=OMEGCN'
```

where:

- CNDL is the subsystem name.  
CNDL is the default value of the runtime environment parameter **RTE\_KCNSTR00\_SSID**.  
The values of **SUBNAME** and **RTE\_KCNSTR00\_SSID** must match.
- OMEGCN, the name of the procedure that initializes the subsystem, is the value of the runtime environment parameter **RTE\_CANSCN\_STC**.  
The default value of **RTE\_CANSCN\_STC** consists of the value of the **RTE\_STC\_PREFIX** parameter followed by the suffix CN. The value of **RTE\_STC\_PREFIX** in the initial set of parameters created by Monitoring Configuration Manager is OMEG (an abbreviation of OMEGAMON®).  
The **SSPROC** parameter of the **SETSSI** command and the runtime environment parameter **RTE\_CANSCN\_STC** must match.

If you do not want the subsystem address space to be started immediately, omit **INITPARM**.

4. Define the OMEGAMON® subsystem in the IEFSSNxx member of the SYS1.PARMLIB library.  
For example:

```
SUBSYS SUBNAME(CNDL) INITRTN(KCNDLINT) INITPARM('SSPROC=OMEGCN')
```

The **SETSSI** command in the previous step dynamically defines the subsystem so that it is available immediately. Defining the subsystem in the IEFSSNxx member defines the subsystem during z/OS® initialization (IPL), so that you do not have to reissue the **SETSSI** command after each IPL.

If you do not want the subsystem address space to be started at IPL, omit **INITPARM**.

## Creating your first, minimal runtime environment

If you are a first-time user of IBM Z® Monitoring Configuration Manager, creating a minimal runtime environment is a good place to start. This example consists of a z/OS® agent, a monitoring server, and an enhanced 3270 user interface. You can logon to the enhanced 3270 user interface to view data from the z/OS® agent.

### Before you begin

Read the [prerequisites](#) for using Monitoring Configuration Manager.

The [OMEGAMON® subsystem must be defined to z/OS®](#).

### About this task

Here is a diagram of the minimal runtime environment created by the following procedure:

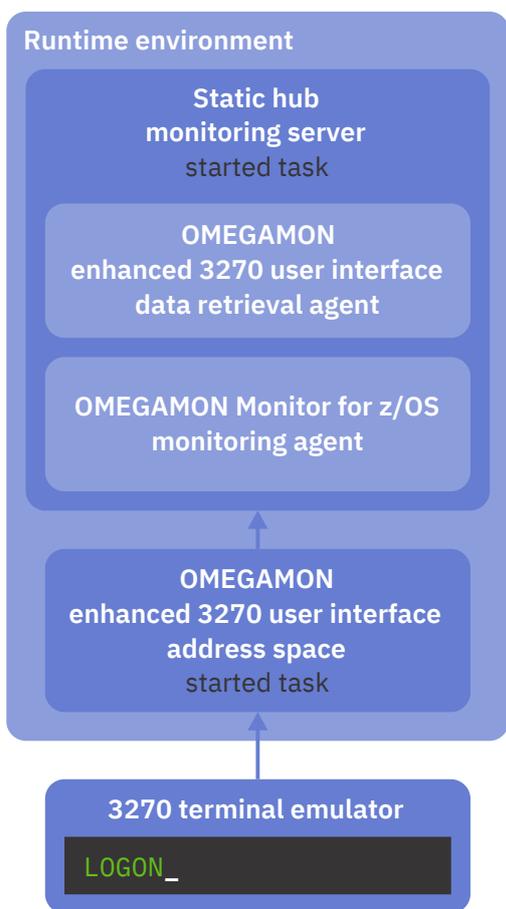

Figure 14: Overview of a minimal runtime environment

To create this minimal runtime environment, you follow the same procedure you would follow to create any runtime environment. The difference is that a minimal runtime environment involves setting fewer parameters, and involves fewer tasks to complete the configuration after running Monitoring Configuration Manager.

## Procedure

1. Submit a job that performs the **CREATE** action of Monitoring Configuration Manager. The **CREATE** action creates a runtime environment definition library, `rte_plib_hilev.RTEDEF`, and populates it with an initial set of parameters.

Example JCL:

Figure 15: Example JCL to perform the **CREATE** action

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<tlib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<tlib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION CREATE
RTE_NAME <rte_name>
RTE_PLIB_HILEV <rte_plib_hilev>
/*
```

Similar JCL is supplied in the KFJJMCM member of the TKANSAM target library.

**Note:** Refer to this sample member, KFJJMCM, for any updates to the parameters. Any new or changed parameters will be listed in this member and can be customized according to the action that you want to run.

Edit the example job statement to match your site's standards. For example, for job name, class, and message class. Consider changing the example job name prefix, UID, to your TSO user ID.

Replace the placeholders in the example JCL with appropriate values:

**<lpar>**

Run Monitoring Configuration Manager actions on the LPAR where you will start the runtime environment.

For example, if your site uses JES2, insert a **SYSAFF** job parameter after the **JOB** statement to ensure that the job runs on that LPAR.

**<tlib\_hlq>**

The high-level qualifiers of the target libraries.

**<rte\_name>**

Runtime environment name, 1 - 8 characters.

Monitoring Configuration Manager uses this name for various purposes, including:

- MVS™ member names
- MVS™ data set name qualifiers
- z/OS® UNIX® System Services directory name, all uppercase

**<rte\_plib\_hilev>**

The high-level qualifiers of the runtime environment definition library:

*rte\_plib\_hilev*.RTEDEF

Monitoring Configuration Manager uses the values of **RTE\_NAME** and **RTE\_PLIB\_HILEV** to set the default value of other parameters, such as **RTE\_HILEV** and **RTE\_VSAM\_HILEV**, that are used for data set names. To avoid exceeding the z/OS 44-character limit for data set names, the combined length of **RTE\_NAME** and **RTE\_PLIB\_HILEV** should not exceed 28 characters. For example, if **RTE\_NAME** is 8 characters, then **RTE\_PLIB\_HILEV** should not exceed 20 characters.

**Tip:** After running a Monitoring Configuration Manager job, check the KCIPRINT sysout data set.

2. Edit the parameters in the *rte\_plib\_hilev*.RTEDEF library to configure a static hub monitoring server, a z/OS® agent, and an enhanced 3270 user interface.

In the RTEDEF (*rte\_name*) member, set the following **CONFIGURE\_\*** parameters to Y:

**CONFIGURE\_TEMS\_KDS**

Configures a monitoring server (Tivoli® Enterprise Monitoring Server, or TEMS)

**CONFIGURE\_ZOS\_KM5**

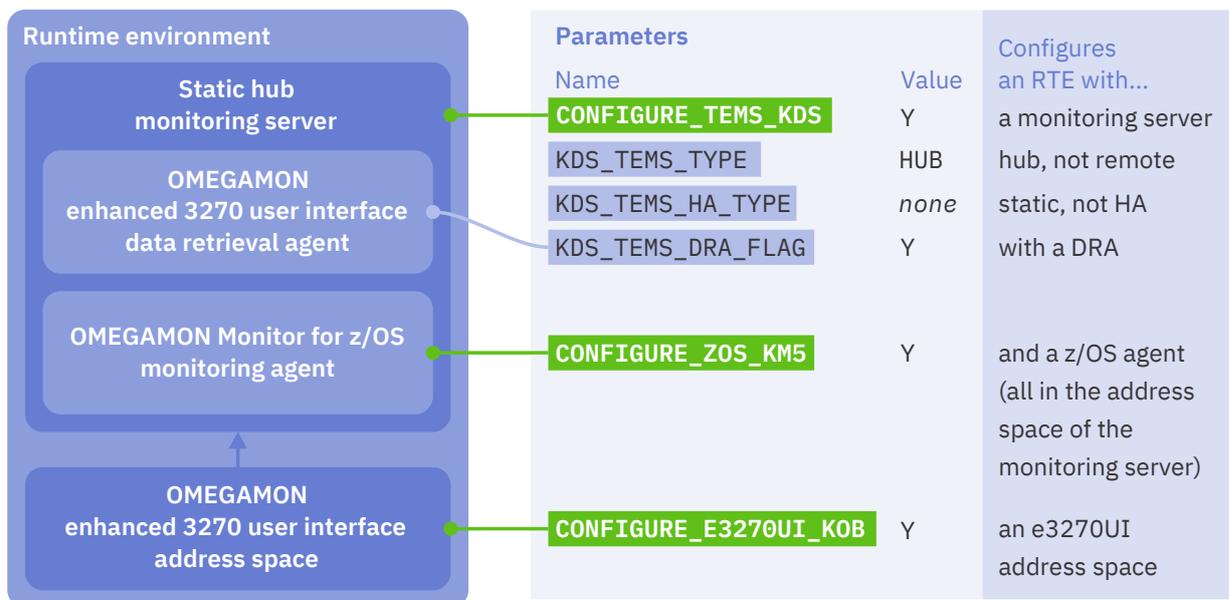

Configures a z/OS® monitoring agent

**CONFIGURE\_E3270UI\_KOB**

Configures an enhanced 3270 user interface address space

Either delete all other **CONFIGURE\_\*** parameters or set them to N.

The following diagram shows how these **CONFIGURE\_\*** parameters, and the default values of related parameters, configure the topology of the runtime environment:

Legend	
PARAMETER	value specified in the RTE configuration profile
PARAMETER	default value, does not need to be specified

Figure 16: CONFIGURE\_\* parameters for a minimal runtime environment

Also in the RTEDEF (*rte\_name*) member, set the following parameters to match your site-specific standards:

#### RTE\_STC\_PREFIX

1- to 4-character prefix of the started task names for this runtime environment. The value in the initial set of parameters is OMEG.

#### RTE\_VTAM\_APPLID\_PREFIX

Prefix of the VTAM® applids in this runtime environment. For this minimal runtime environment, there is only one VTAM® application: the enhanced 3270 user interface.

Each VTAM® application in a runtime environment has a corresponding parameter for the VTAM® applid. The default values of these parameters are the value of **RTE\_VTAM\_APPLID\_PREFIX** followed by an application-specific suffix.

In the initial set of parameters created by the **CREATE** action, the value of **RTE\_VTAM\_APPLID\_PREFIX** is *OMxx*, where *xx* is the value of the z/OS® static system symbol **SYSCONE**. **SYSCONE** is a 1- or 2-character shorthand notation for the system (LPAR) name. This value is one example of why you need to run Monitoring Configuration Manager actions on the LPAR where you will start the runtime environment.

If you use these values, then the default VTAM® applid for the enhanced 3270 user interface is *OMxxOBAP*. For example, if the system (LPAR) name is ZOS1, then the VTAM® applid is *OMS1OBAP*.

#### RTE\_USS\_RTEDIR

The path of the z/OS® UNIX® directory where you want Monitoring Configuration Manager to write runtime files required by the started tasks.

The TSO user ID that runs Monitoring Configuration Manager jobs must have permission to write to this directory, otherwise the **GENERATE** action will fail.

#### RTE\_TCP\_PORT\_NUM

The TCP/IP port number on which the monitoring server will listen.

**Tip:** Later steps in this procedure describe how to activate VTAM® resources and APF-authorize libraries. If you insert the parameter `RTE_X_STC_INAPF_INCLUDE_FLAG` in the RTEDEF (`rte_name`) member, then the started tasks include a member that performs these steps for you.

In the RTEDEF (GBL\$PARM) member, set the following parameter:

#### GBL\_HFS\_JAVA\_DIR1

The z/OS® UNIX® path of the Java™ home directory.

The following diagram shows parameters that configure identifiers and values used by the runtime environment. Notice how the RTE parameters determine the default values of other parameters. For example, the default value of the `KDS_TEMS_STC` parameter is the value of `RTE_STC_PREFIX` followed by the suffix DS.

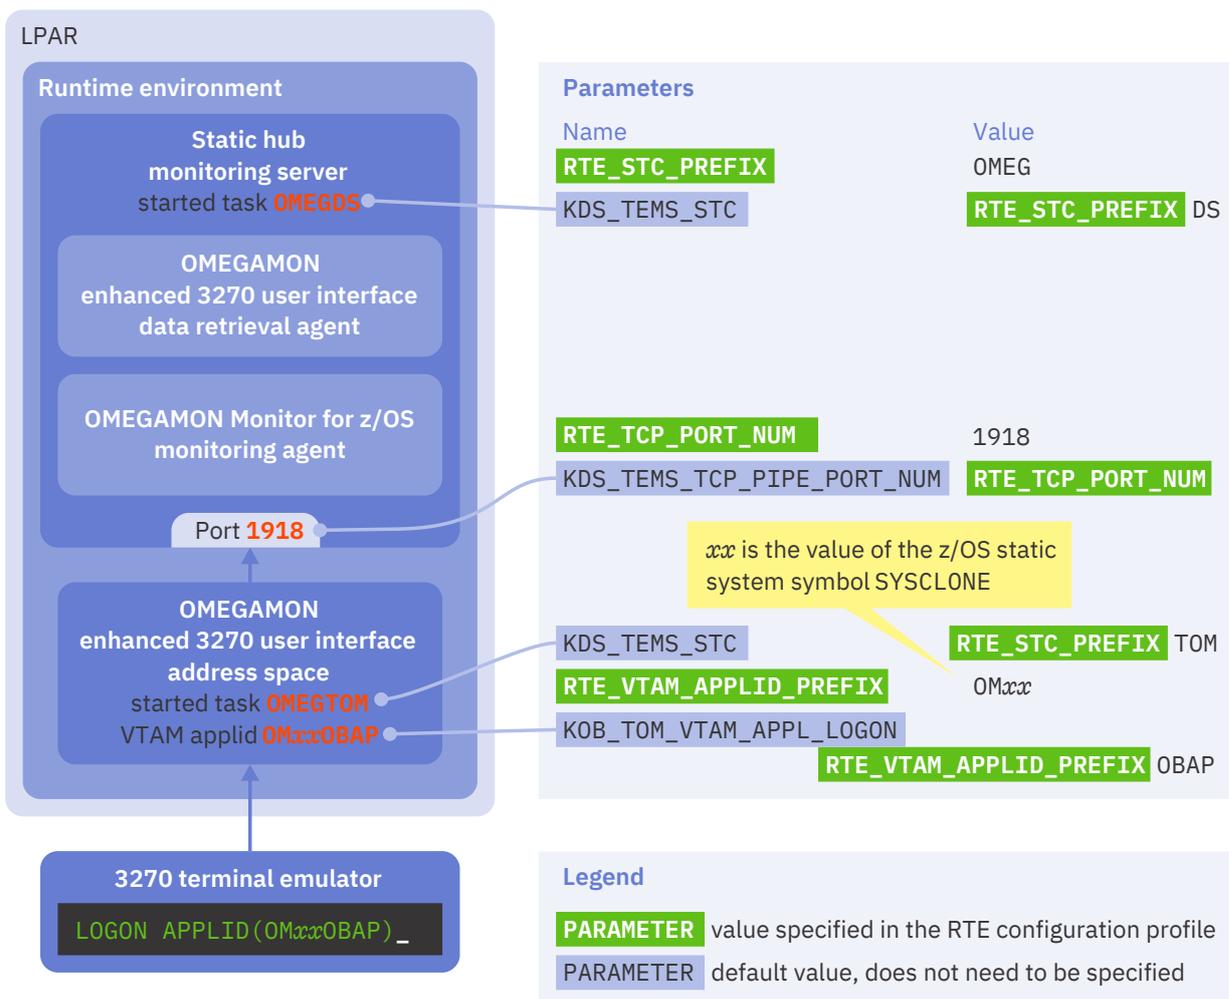

Figure 17: Parameters that specify z/OS®-related identifiers for a minimal runtime environment

- Submit a job that performs the **DISCOVER** action. The **DISCOVER** action discovers CICS® regions, Db2® subsystems, IMS control regions, MQ subsystems, TCP/IP stacks, and System Symbols, and then writes corresponding members to the RTEDEF library.

Strictly speaking, for this minimal runtime environment, you can skip this step, because this runtime environment will run only the z/OS® agent, which does not require any subsystem parameters. However, performing the **DISCOVER** action is still a useful exercise, because it prepares the RTEDEF library for extending the runtime environment to run other agents.

Reuse the same JCL as before, with the following changes:

[1]

Optionally, change the program name in the JCL **EXEC** statement to KCIALPHA.

KCIALPHA is an APF-authorized version of KCIOMEGA. APF-authorization enables the program to discover more subsystem details.

[2]

Change the action to **DISCOVER**.

Example JCL:

Figure 18: Example JCL to perform the **DISCOVER** action

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1 EXEC PGM=KICIALPHA,REGION=0M,DYNAMNBR=256 [1]
//STEPLIB DD DISP=SHR,DSN=<tlib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<tlib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION DISCOVER [2]
RTE_NAME <rte_name>
RTE_PLIB_HILEV <rte_plib_hilev>
/*
```

4. Submit a job that performs the **GENERATE** action.  
Reuse the same JCL as before, with the following changes:

[1]

If you changed the program name to KICIALPHA for the **DISCOVER** action, change it back to KCIOMEGA before performing the **GENERATE** action.

[2]

Change the action to **GENERATE**.

Example JCL:

Figure 19: Example JCL to perform the **GENERATE** action

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256 [1]
//STEPLIB DD DISP=SHR,DSN=<tlib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<tlib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION GENERATE [2]
RTE_NAME <rte_name>
RTE_PLIB_HILEV <rte_plib_hilev>
/*
```

The **GENERATE** action generates the runtime members for the runtime environment, including the started tasks.

You have completed the steps that involve the configuration software, Monitoring Configuration Manager.

The remaining steps complete the configuration of the runtime environment *outside* of the configuration software.

These “complete the configuration” steps depend on your site-specific procedures and the requirements of the components, such as the monitoring agents, that you have chosen to configure in the runtime environment. The requirements of each component are described in the separate product documentation for each component.

Typically, at this point in the procedure for creating a runtime environment, you would need to refer to that separate documentation. However, to help make this “first runtime environment” procedure stand-alone, and because in this procedure we have selected a fixed set of specific components, the “complete the configuration” steps are presented here.

Depending on your user privileges, you might need to ask someone else to perform some or all of the following steps. For example, only z/OS® system administrators are typically allowed to write to system libraries.

5. Use your site-specific procedures to copy the runtime members for started tasks and VTAM® definitions to your system libraries.  
Copy the members from the following libraries to your corresponding PROCLIB, VTAMLIB, and VTAMLST system libraries:

```
rte_hilev.SYS1.PROCLIB
rte_hilev.SYS1.VTAMLIB
rte_hilev.SYS1.VTAMLST
```

The default value of the RTE\_HILEV parameter is the value of RTE\_PLIB\_HILEV.

If you followed the earlier tip to set the **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** parameter to Y, then you can skip the next two steps. However, you should still *read* these steps to understand the requirements of the runtime environment for VTAM® resources and APF-authorized libraries.

6. Activate the VTAM® resources defined by this runtime environment.  
Issue the following **VARY ACT** MVS™ system command:

```
VARY NET,ACT,ID=rte_vtam_applid_prefixNODE,SCOPE=ALL
```

The **ID** parameter of the **VARY ACT** command must match the value of the runtime environment parameter **RTE\_VTAM\_GBL\_MAJOR\_NODE**.

The default value of **RTE\_VTAM\_GBL\_MAJOR\_NODE** is the value of **RTE\_VTAM\_APPLID\_PREFIX** followed by the string **NODE**. If you use the **RTE\_VTAM\_APPLID\_PREFIX** initial value of **OM $xx$** , then the default value of **RTE\_VTAM\_GBL\_MAJOR\_NODE** is **OM $xx$ NODE**, where  $xx$  is the value of the z/OS® static system symbol **SYSCONE**. For example, if the system (LPAR) name is **ZOS1**, then specify **ID=OMS1NODE**.

7. APF-authorize libraries.  
Add the following data sets to the authorized program facility (APF) list:

- The following runtime environment library:  
`rte_hilev.rte_name.RKANMODU`
- The following target libraries, under the high-level qualifiers of the STEPLIB of the Monitoring Configuration Manager job:  
TKANMOD  
TKANMODL  
TKANMODP  
TKANMODR

The runtime member `rte_hilev.SYS1.PROCLIB(rte_stc_prefixAPF)` contains **VARY ACT** and **SETPROG APF** commands for this runtime environment. Different runtime environments require different VTAM® resources and APF-authorized libraries, depending on the configured products.

If you specify the parameter **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** Y in the RTEDEF (`rte_name`) member, and then perform the **GENERATE** action, some started tasks will contain an **INCLUDE** statement to include that member, so that you do not need to issue these commands separately. Whether started tasks are allowed to perform such commands depends on your local site practices.

Setting **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** can be expedient for initial testing. However, typical best practice is to activate VTAM® resources and APF-authorize libraries during system initialization rather than each time you start a task. Use the generated `SYS1.PROCLIB(rte_stc_prefixAPF)` member to identify which libraries you need to add to the APF list at system initialization.

8. Start at least the following tasks: `rte_stc_prefixCN`, `rte_stc_prefixDS`, and `rte_stc_prefixTOM`.

The user ID that you associate with these started tasks must have z/OS® UNIX® superuser privileges and access to the [runtime members](#).

#### **rte\_stc\_prefixCN**

OMEGAMON® subsystem.

The OMEGAMON® subsystem does not belong to a runtime environment. You only need one OMEGAMON® subsystem per LPAR.

If the OMEGAMON® subsystem has already been started, the job for this started task will fail. The JESMSGLG output data set for the failed job will contain the following messages:

```
CNDL018I OMEGAMON SUBSYSTEM ALREADY ACTIVE ...
CNDL002I OMEGAMON SUBSYSTEM Vvrm TERMINATED ...
```

This is not a problem: your runtime environment will use the already-active subsystem.

#### **rte\_stc\_prefixDS**

Monitoring server.

## *rte\_stc\_prefix*TOM

Enhanced 3270 user interface.

### What to do next

[Logon](#) to the enhanced 3270 user interface and view the monitoring data from the z/OS® agent.

## Creating or updating a runtime environment

To create or update a runtime environment, you edit a set of parameters, and then you submit a job that performs the **GENERATE** action to generate runtime members from those parameters.

### Before you begin

Read the [prerequisites](#) for using Monitoring Configuration Manager.

If you are updating a runtime environment after using SMP/E to apply maintenance to the target libraries, and your runtime environment refers to a copy of those libraries, then use your site-specific procedures to refresh that copy.

### About this task

When creating a runtime environment, you can optionally perform the **CREATE** action to create an initial set of parameters.

When creating or updating a runtime environment, you can optionally perform the **DISCOVER** action to create or update subsystem parameters, rather than editing them yourself.

Updating a runtime environment encompasses many scenarios. For example:

- Applying maintenance, after using SMP/E to update target libraries
- Upgrading an agent to a new product release
- Adding or removing agents
- Changing parameter values; for example, to change a hub monitoring server to a remote monitoring server

The procedure for updating the runtime environment is the same for every scenario.

### Procedure

1. Create a runtime environment definition. If you are updating a runtime environment, the definition already exists: skip this step.  
A runtime environment definition consists of one or more plain-text members in a library. These members specify the parameters that define the runtime environment. For details, see [“Runtime environment definition \(RTEDEF\) library”](#) on page 319.

To create a runtime environment definition, submit a job that performs the **CREATE** action of Monitoring Configuration Manager.

Example JCL:

*Figure 20: Example JCL to perform the **CREATE** action*

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1      EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<tlib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<tlib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION    CREATE
RTE_NAME  <rte_name>
RTE_PLIB_HILEV <rte_plib_hilev>
/*
```

Similar JCL is supplied in the KFJJMCM member of the TKANSAM target library.

Edit the example job statement to match your site's standards. For example, for job name, class, and message class.

Replace the placeholders in the example JCL with appropriate values. For details, see [“Batch interface” on page 236](#).

**Tip:** After running a Monitoring Configuration Manager job, check the KCIPRINT sysout data set.

2. Edit the parameters in the RTEDEF library to meet your requirements for the runtime environment.
3. Optionally, submit a job that performs the **DISCOVER** action.  
The **DISCOVER** action discovers CICS®, Db2®, IMS, and MQ subsystems, TCP/IP stacks, and System symbols, and then writes corresponding members to the RTEDEF library.

Use the same JCL as the previous step but change the action to **DISCOVER**.

Optionally, change the program name in the JCL **EXEC** statement to KCIALPHA. KCIALPHA is an APF-authorized version of KCIOMEGA. APF-authorization enables the program to discover more subsystem details.

Check and, if necessary, edit the contents of the [members created by the \*\*DISCOVER\*\* action](#).

For discovered Db2® subsystems, you need to complete some of the parameters: see [“Completing the parameters for discovered Db2 subsystems” on page 231](#).

4. Submit a job that performs the **GENERATE** action.  
Use the same JCL shown in the first step but change the action to **GENERATE**.  
The **GENERATE** action generates the runtime members for the runtime environment, including the started tasks.

**Note:** You have completed the steps that involve the configuration software, Monitoring Configuration Manager.  
The remaining steps complete the configuration of the runtime environment *outside* of the configuration software.

These “complete the configuration” steps depend on your site-specific procedures and the requirements of the components, such as the monitoring agents, that you have chosen to configure in the runtime environment. The requirements of each component are described in the separate product documentation for each component.

Depending on your user privileges, you might need to ask someone else to perform some or all of the following steps. For example, only z/OS® system administrators are typically allowed to write to system libraries.

5. Use your site-specific procedures to copy the runtime members for started tasks and VTAM® definitions to your system libraries.  
Copy the members from the following libraries to your corresponding PROCLIB, VTAMLIB, and VTAMLST system libraries:

```
rte_hilev.SYS1.PROCLIB  
rte_hilev.SYS1.VTAMLIB  
rte_hilev.SYS1.VTAMLST
```

The default value of the RTE\_HILEV parameter is the value of RTE\_PLIB\_HILEV.

6. Follow the instructions in the OMEGAMON® shared documentation to [complete the configuration](#) of the runtime environment.
7. For a newly created runtime environment: start the tasks. For an updated runtime environment: stop and then restart the tasks.

## Sharing runtime members with an SMP/E target installation library or creating a full, stand-alone set of runtime members

Runtime members can be either a full stand-alone set or they can refer to some read-only members, such as load modules, in SMP/E target installation libraries.

## Procedure

1. In the RTEDEF (*rte\_name*) member, specify an **RTE\_TYPE** value.  
Valid values:

### FULL

Stand-alone runtime members. Runtime members have no dependency on target libraries.

### SHARING

Some runtime members refer to the target libraries.

The high-level qualifiers of the target libraries are specified by the **GBL\_TARGET\_HILEV** parameter.

SHARING reduces the storage requirement for each runtime environment.

If **RTE\_TYPE** is SHARING, then the value of the RTE\_SHARE parameter must be SMP.

If you omit **RTE\_TYPE**, the default value is SHARING.

2. Submit a job that performs the **GENERATE** action.

## Completing the parameters for discovered Db2® subsystems

The **DISCOVER** action discovers only some of the parameter values required to monitor Db2® subsystems. You must supply the remaining values.

### Before you begin

You must have performed a **DISCOVER** action that created an RTEDEF (KD5@*lpar*) member containing a table of parameters: one row for each discovered Db2® subsystem.

### About this task

You must supply values for the following parameters:

#### KD2\_DBnn\_DB2\_RUNLIB

The Db2® RUNLIB library.

#### KD2\_DBnn\_DB2\_PORT\_NUM

The port number on which the OMEGAMON® for Db2® Collector (or “server”, default started task suffix 02) listens for requests.

The **DISCOVER** action sets a placeholder value for the port number. Typically, you will need to change this value to match your site-specific standards.

To specify the RUNLIB library for discovered Db2® subsystems, you must either ensure that the global parameters are correct or edit the parameters for each Db2® subsystem.

## Procedure

1. Specify the correct port numbers.  
In the RTEDEF (KD5@*lpar*) member, change the placeholder value of each **KD2\_DBnn\_DB2\_PORT\_NUM** parameter to the actual port number you want to use.
2. Specify Db2® RUNLIB libraries.  
Select one of the following choices:
  - To use global parameter values for Db2® LOADLIB and RUNLIB libraries: in the RTEDEF (GBL\$PARM) member or LPAR-specific RTEDEF (GBL\$*lpar*) member, define **GBL\_DSN\_DB2\_LOADLIB\_Vn** and **GBL\_DSN\_DB2\_RUNLIB\_Vn** parameters for the Db2® versions that your site uses.
  - To set LOADLIB and RUNLIB libraries for each Db2® subsystem: in the RTEDEF (KD5@*lpar*) member, specify a value for **KD2\_DBnn\_DB2\_RUNLIB**.

## Converting a hub monitoring server to a remote monitoring server

Initially, you might configure a new runtime environment to be stand-alone, with its own hub monitoring server. Later, you can integrate that runtime environment with the rest of your monitoring topology by converting its hub monitoring server to a remote monitoring server that communicates with a central hub.

## Before you begin

The following procedure assumes that you have already created the following two runtime environments:

- A runtime environment with a hub monitoring server that you want to convert to a remote monitoring server.
- A runtime environment with the central hub monitoring server that you want the new remote monitoring server to communicate with. We'll call this the **central hub** runtime environment.

## About this task

Converting a hub monitoring server to a remote monitoring server involves changing the **KDS\_TEMS\_TYPE** parameter value from HUB to REMOTE, and setting some other **KDS\_\*** parameters to refer to the central hub.

The following diagram shows a stand-alone runtime environment with a hub:

Figure 21: Before: A stand-alone runtime environment with a hub monitoring server

The following diagram shows the runtime environment after you have converted its hub to a remote monitoring server that communicates with a central hub:

Figure 22: After: A runtime environment with a remote monitoring server

## Procedure

1. Edit the RTEDEF (KDS\$PARG) or RTEDEF (KDS\$Lpar) member for the runtime environment with the hub that you want to convert to a remote monitoring server. Set the following parameters:

### KDS\_TEMS\_TYPE

Change from HUB to REMOTE.

### KDS\_HUB\_TEMS\_NAME\_NODEID

Set to the value of **RTE\_TEMS\_NAME\_NODEID** in the central hub runtime environment.

### KDS\_HUB\_TCP\_PIPE\_PORT\_NUM

Set to the value of RTE\_TCP\_PORT\_NUM in the central hub runtime environment.

### KDS\_HUB\_TCP\_HOST

Set to the host name of the LPAR for the central hub runtime environment.

2. Submit a job that performs the **GENERATE** action for the runtime environment whose parameters you have just edited.

## Defining multiple runtime environments in an RTEDEF library

You can define one runtime environment per RTEDEF library or, as described here, you can define multiple runtime environments in a single RTEDEF library.

### About this task

For each runtime environment that you want to define, you create a corresponding RTEDEF (*rte\_name*) member. To cater for LPAR-specific parameter differences between runtime environments, you create LPAR-specific RTEDEF members.

The simple example presented here defines two runtime environments on different LPARs:

- A runtime environment with a hub monitoring server and an enhanced 3270 user interface, but no monitoring agents.
- A runtime environment with a remote monitoring server and a z/OS® monitoring agent.

The following diagram shows the significant RTEDEF members and their parameters for this example:

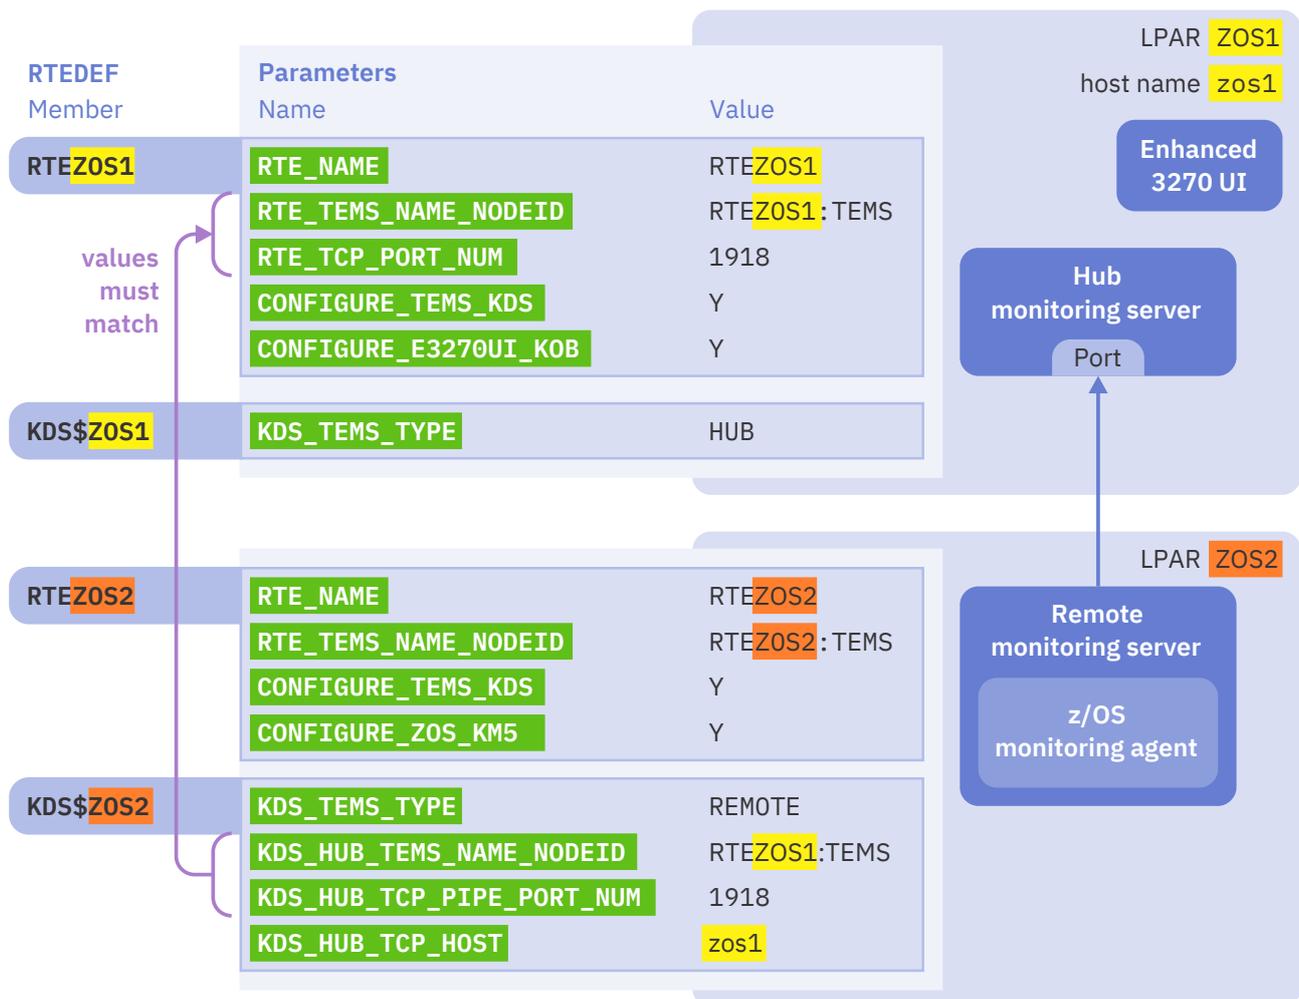

Figure 23: Defining two runtime environments in a single RTEDEF library

In the following procedure, replace the example names with names appropriate for your site:

- Replace the host name `zos1` with the host name of the LPAR where you will run the hub monitoring server.
- Replace the LPAR names `ZOS1` and `ZOS2` with the names of LPARs at your site.
- Use RTE names that match your site naming conventions.

## Procedure

1. Use the **CREATE** action to create an initial set of parameters in a new RTEDEF library.

Example JCL:

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1 [1]
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<tlib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<tlib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION CREATE
RTE_NAME RTEZOS1 [2]
RTE_PLIB_HILEV TSOUID.MONSUITE
/*
```

### [1]

Run this job on the LPAR where you will run the hub monitoring server, `ZOS1`.

### [2]

Specify the **RTE\_NAME** that you want to use for the runtime environment with the hub monitoring server. For example, `RTEZOS1`: the prefix `RTE`, followed by the LPAR name. You are free to use your own naming convention: for example, there is no requirement for the value to begin with `RTE` or to end with the LPAR name.

2. Edit the RTEDEF (`RTEZOS1`) member to configure a monitoring server and an enhanced 3270 user interface.

Set the following parameters to Y:

**CONFIGURE\_TEMS\_KDS** to configure a monitoring server

**CONFIGURE\_E3270UI\_KOB** to configure an enhanced 3270 user interface

Either delete all other **CONFIGURE\_\*** parameters or set them to N.

Review the following parameter values and, if necessary, change them to match your site requirements:

**RTE\_TEMS\_NAME\_NODEID**

**RTE\_TCP\_PORT\_NUM**

3. Create an RTEDEF (`KDS$ZOS1`) member.

Set a single parameter in this member:

**KDS\_TEMS\_TYPE** HUB

Strictly speaking, this member is unnecessary, because `HUB` is the default value of **KDS\_TEMS\_TYPE**.

However, creating this member serves as a reminder that the runtime environment on this LPAR contains a *hub* monitoring server. You will also need this member if you decide later to further configure the hub: for example, to make it a high-availability hub (**KDS\_TEMS\_HA\_TYPE** HA).

You have completed the definition of the runtime environment for the hub.

4. Run another job that performs a **CREATE** action, this time for the LPAR where you will run the remote monitoring server.

Example JCL:

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS2 [1]
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<tlib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<tlib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION CREATE
RTE_NAME RTEZOS2 [2]
RTE_PLIB_HILEV TSOUID.MONSUITE
/*
```

[1]

Run this job on the LPAR where you will run the remote monitoring server, ZOS2.

[2]

Specify the **RTE\_NAME** that you want to use for the runtime environment with the remote monitoring server. For example, RTEZOS2.

5. Edit the new RTEDEF (RTEZOS2) member to configure a monitoring server and a z/OS® monitoring agent. Set the following parameters to Y:

**CONFIGURE\_TEMS\_KDS** to configure a monitoring server  
**CONFIGURE\_ZOS\_KM5** to configure a z/OS® monitoring agent  
Either delete other **CONFIGURE\_\*** parameters or set them to N.

6. Create an RTEDEF (KDS\$ZOS2) member.  
Set the following parameters in the member:

**KDS\_TEMS\_TYPE**

Set to REMOTE.

**KDS\_HUB\_TEMS\_NAME\_NODEID**

Set to the value of **RTE\_TEMS\_NAME\_NODEID** in the hub runtime environment.

**KDS\_HUB\_TCP\_PIPE\_PORT\_NUM**

Set to the value of **RTE\_TCP\_PORT\_NUM** in the hub runtime environment.

**KDS\_HUB\_TCP\_HOST**

Set to the host name of the LPAR for the hub runtime environment.

7. Optionally, delete the RTEDEF (KDS\$PARM) member.  
The KDS\$PARM member created by the **CREATE** action contains only one parameter, **KDS\_TEMS\_TYPE**. The value of **KDS\_TEMS\_TYPE** in the LPAR-specific members takes precedence over the value in KDS\$PARM. So the KDS\$PARM member is, effectively, redundant.

You have completed the definition of the runtime environment for the remote monitoring server.

8. Use the **GENERATE** action to create runtime members for the hub runtime environment.  
Example JCL:

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID  
/*JOBPARM SYSAFF=ZOS1 [1]  
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256  
//STEPLIB DD DISP=SHR,DSN=<plib_hlq>.TKANMOD  
//KCIFLOW DD DISP=SHR,DSN=<plib_hlq>.TKANCUS(KFJOMEGA)  
//KCIVARS DD *  
ACTION GENERATE  
RTE_NAME RTEZOS1 [2]  
RTE_PLIB_HILEV TSOUID.MONSUITE  
/*
```

[1]

Run this job on the LPAR where you will run the hub, ZOS1.

[2]

Specify an **RTE\_NAME** value to match the RTEDEF (RTEZOS1) member for the hub runtime environment.

9. Use the **GENERATE** action to create runtime members for the remote monitoring server runtime environment.  
Reuse the JCL from the previous step, with the following changes:

[1]

Run the job on the LPAR where you will run the remote monitoring server, ZOS2.

[2]

Specify the corresponding **RTE\_NAME** for that runtime environment, RTEZOS2.

## What to do next

For details on completing the configuration of these runtime environments and then starting them, see the corresponding steps in the general procedure for [creating a runtime environment](#).

Extend this example with more LPARs and more monitoring agents. Use the **DISCOVER** action to discover subsystems on each LPAR.

This example assumed that the same global parameter values in RTEDEF (GBL\$PARM) apply to the runtime environments on both LPARs. To specify different values for different LPARs, create LPAR-specific RTEDEF (GBL\$lpar) members.

## Batch interface

The JCL to run IBM Z® Monitoring Configuration Manager is simple and concise. You specify an action, the name of the runtime environment on which you want to perform that action, and the high-level qualifiers of the data sets for that runtime environment.

### JCL

Figure 24: JCL to run Monitoring Configuration Manager

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<tlib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<tlib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
*
*
* <action> SELECT FROM:
* CREATE | DISCOVER | GENERATE | DELETE | MIGRATE | PACKAGE | DEPLOY
*
ACTION          <action>
OPTION          <option>
RTE_NAME       <rte_name>
RTE_PLIB_HILEV <rte_plib_hilev>
/*
```

Similar JCL is supplied in the KFJJMCM member of the TKANSAM target library.

KCIOMEGA is the program that runs Monitoring Configuration Manager. The KCIFLOW data set provides input to KCIOMEGA. That is all you need to know about the KCIOMEGA program and the KCIFLOW data set to run Monitoring Configuration Manager. If you want to know more, see [“KCIOMEGA workflows” on page 274](#).

Replace the placeholders in the JCL with appropriate values:

#### <lpar>

Run Monitoring Configuration Manager actions on the LPAR where you will start the runtime environment. For example, if your site uses JES2, insert a **SYSAFF** job parameter after the **JOB** statement to ensure that the job runs on that LPAR.

#### <tlib\_hlq>

The high-level qualifiers of the target libraries.

#### <action>

One of the Monitoring Configuration Manager [actions](#).

You can abbreviate actions to their first three characters: **CRE**, **DIS**, **GEN**, **DEL**, **MIG**, **PAC**, and **DEP**.

#### <option>

One or more compatible Monitoring Configuration Manager [options](#). Multiple options must be specified by a comma with no spaces.

#### <rte\_name>

Runtime environment name, 1 - 8 characters.

Monitoring Configuration Manager uses this name for various purposes, including:

- MVS™ member names
- MVS™ data set name qualifiers

- z/OS® UNIX® System Services directory name, all uppercase

### <*rte\_plib\_hilev*>

The high-level qualifiers of the runtime environment definition library:  
*rte\_plib\_hilev*.RTEDEF

Monitoring Configuration Manager uses the values of **RTE\_NAME** and **RTE\_PLIB\_HILEV** to set the default value of other parameters, such as **RTE\_HILEV** and **RTE\_VSAM\_HILEV**, that are used for data set names. To avoid exceeding the z/OS 44-character limit for data set names, the combined length of **RTE\_NAME** and **RTE\_PLIB\_HILEV** should not exceed 28 characters. For example, if **RTE\_NAME** is 8 characters, then **RTE\_PLIB\_HILEV** should not exceed 20 characters.

### **RTE\_NAME and RTE\_PLIB\_HILEV parameters versus the values in KCIVARS**

The **CREATE** action uses the **RTE\_NAME** and **RTE\_PLIB\_HILEV** values that you specify in the KCIVARS input data set as the initial values of the **RTE\_NAME** and **RTE\_PLIB\_HILEV** parameters in the *rte\_plib\_hilev*.RTEDEF(*rte\_name*) member. At that point in time, the values of the **RTE\_NAME** and **RTE\_PLIB\_HILEV** parameters in the RTEDEF(*rte\_name*) member match the values that you specified in KCIVARS.

However, you might edit the values of the **RTE\_NAME** and **RTE\_PLIB\_HILEV** parameters in the RTEDEF(*rte\_name*) member so they no longer match the values that you specified in KCIVARS.

For subsequent actions, the **RTE\_NAME** and **RTE\_PLIB\_HILEV** values that you specify in KCIVARS are used only to *locate* the *rte\_plib\_hilev*.RTEDEF(*rte\_name*) member. The action uses the **RTE\_NAME** and **RTE\_PLIB\_HILEV** parameters in that RTEDEF library.

### **Contents of the KCIVARS input data set**

The contents of the KCIVARS data set are **case-sensitive**: you must specify the variable names and their values exactly as described.

KCIVARS can contain comment lines and inline comments:

- Comment lines begin with an asterisk (\*) in column 1.

```
* Comment line
```

- Inline comments begin with an asterisk after a variable value.

```
RTE_NAME MYRTE * Inline comment
```

## **Actions**

IBM Z® Monitoring Configuration Manager can perform several actions. The main action, **GENERATE**, generates runtime members, which is the main purpose of Monitoring Configuration Manager. The other actions are optional, for your convenience.

You typically perform the actions in the following order:

1. **CREATE**
2. **DISCOVER**
3. **GENERATE**
4. **DELETE**

In addition, a **MIGRATE** action can be used to copy the required configuration parameters from PARMGEN for use with Monitoring Configuration Manager. When using **MIGRATE**, you typically perform the actions in the following order:

1. **MIGRATE**
2. **GENERATE**
3. **DELETE**

Finally, to support cross-sysplex rollout scenarios, the **PACKAGE** and **DEPLOY** actions can be used after the **GENERATE** action has completed successfully.

## Action options

The **OPTION** parameter is available for some actions and provides more granular control over certain processing. Use of this parameter is optional.

This topic summarizes the available options for each of the respective actions, as follows. For sample JCL, see [“JCL” on page 236](#).

### CREATE action

The following options are available for the **CREATE** action. For more information, see [“CREATE” on page 239](#).

#### MULTIPLE

Use a single Configuration Manager RTEDEF data set for multiple runtime environments. You can abbreviate this keyword to **MULTI**.

#### TRGCOPIY

Create a target copy member in the RTEDEF library. You can abbreviate this keyword to **TRG**.

### GENERATE action

Some options require a complete run of the **GENERATE** action prior to use. Additionally, some options are not compatible to run with other options during the same job.

To specify more than one option, separate the values with a comma and no spaces. For example: **OPTION USS, SECEXITS**

The following options are available for the **GENERATE** action. For details about using these options, see [“GENERATE” on page 248](#) and [“GENERATE options” on page 251](#).

#### USS | NOUSS

Provides control of the **GENERATE** workflow stage that deploys the parts related to z/OS® UNIX® System Services. You must perform a complete run of the **GENERATE** action before you can use **OPTION USS**.

#### SECEXITS | NOSECEXITS

Provides control of configuration processing for security exits. You must perform a complete run of the **GENERATE** action before you can use **OPTION SECEXITS**. You can abbreviate these keywords to **SEC** and **NS**, respectively.

#### VALIDATE

Performs initial validation of RTEDEF parameters. You can abbreviate this keyword to **VAL**.

#### QUICKLOAD

Loads the read-only configuration members to the RK\* data sets. The read-only members are those members that are not impacted by customization during configuration. You can abbreviate this keyword to **QL**.

#### QUICKCONFIG

Updates the configurable members for the runtime environment (for example, in the RKANPARU, RKANSAMU, and RKANCMU libraries) without refreshing data from SMP/E target libraries. You can abbreviate this keyword to **QC**.

#### RELINK | NORELINK

Provides control of when to assemble and link edit modules for OMEGAMON for Networks (KN3) and OMEGAMON enhanced 3270 user interface (KOB). You must perform a complete run of the **GENERATE** action before you can use **OPTION RELINK**. You can abbreviate these keywords to **LINK** and **NL**, respectively.

#### TRGCOPIY

Copies SMP/E target libraries into target copy data sets. You can abbreviate this keyword to **TRG**.

#### PREPARE

Prepares intermediate work libraries for your runtime environment separately from other **GENERATE** action stages. You can use this option to build the work data sets before other **GENERATE** action stages so that other required tasks dependent on the data sets can be performed ahead of time or in parallel. You can abbreviate this keyword to **PREP**.

### MIGRATE action

The following option is available for the **MIGRATE** action. For more information, see [“MIGRATE” on page 261](#).

## MULTIPLE

Use a single Configuration Manager RTEDEF data set for multiple PARMGEN runtime environments. You can abbreviate this keyword to **MULTI**.

## PACKAGE action

The following option is available for the **PACKAGE** action. For more information, see [“PACKAGE” on page 265](#).

### NOUSS

Do not include the files and directories related to z/OS® UNIX® in the **PACKAGE** output.

## DEPLOY action

The following options are available for the **DEPLOY** action. For more information, see [“DEPLOY” on page 268](#).

### USS

Run only the **DEPLOY** workflow stage that deploys the parts related to z/OS® UNIX®.

### NOUSS

Do not run the z/OS® UNIX® deploy stage in the **DEPLOY** action.

## All actions

The following option is available for all actions.

### DEBUG

This option provides output for troubleshooting purposes and should only be used under the guidance of IBM Software Support. The **DEBUG** keyword can be used with all other **OPTION** keywords. You can abbreviate this keyword to **DBG**.

## CREATE

The **CREATE** action creates an initial runtime environment definition that you can customize to match your requirements.

## Before you begin

Review the following information before you use the **CREATE** action:

- For an overview of how the **CREATE** action fits into the process of creating a runtime environment, see [“Creating your first, minimal runtime environment” on page 222](#).
- For information about the members that the **CREATE** action allocates and populates, see [“Initial runtime environment library members” on page 322](#).
- The **CREATE** action supports creating one or more runtime environments in a single RTEDEF configuration. It is recommended that you decide prior to the creation of your first runtime environment whether you plan to create one or multiple runtime environments in a single RTEDEF.

**Note:** If you are going to set up a High Availability TEMS (HA TEMS), make sure only one runtime environment is defined in the RTEDEF (that is, the one used for the HA TEMS).

**Note:** You can also use the **CREATE** action as part of the process to create a copy of your SMP/E target libraries. For more information, see [“Using SMP/E target library copies” on page 352](#).

## About this task

The **CREATE** action creates an initial runtime environment definition by allocating and populating the necessary data sets, members, and configuration settings.

**Note:** Using the **CREATE** action to create your initial runtime environment definition is optional and provided for convenience; you can perform the same steps manually. Experienced users can skip **CREATE** and copy an existing RTEDEF library. You can allocate the RTEDEF library yourself using a record format of fixed-length, blocked (FB) and a record length of 80. You can also create the members; the only required member is *rte\_name*.

The following list provides details about the **CREATE** action:

- The **CREATE** action allocates the runtime environment definition library, *rte\_plib\_hilev*. RTEDEF, if it does not already exist, and populates it with initial configuration settings. The **CREATE** action does not overwrite members. If the RTEDEF library already exists, the **CREATE** action only writes members that do not yet exist.
- You can create one or more runtime environments in a single RTEDEF configuration. The default behavior of the **CREATE** action is to create only one runtime environment in the RTEDEF data set. Using the **OPTION MULTIPLE** parameter, you can create multiple runtime environments in a single RTEDEF data set. Each runtime environment creation requires a separate **CREATE** action job. If you plan to configure multiple runtime environments in a single RTEDEF data set, make sure to include the **OPTION MULTIPLE** parameter on every **CREATE** action job, including the first one.

**Note:** You can abbreviate **OPTION MULTIPLE** to **OPTION MULTI**. **OPTION MULTIPLE** is not compatible with the other available **CREATE** action option, **TRGCOPY**.

- The **CREATE** action creates the necessary members in the RTEDEF data set, as follows:
  - When using the default behavior of the **CREATE** action to create one runtime environment in a single RTEDEF data set (omitting the **OPTION MULTIPLE** parameter), the **CREATE** action will create members of type *Kpp\$PARM* in the respective created RTEDEF data set, along with the *rte\_name* member for the runtime environment-specific parameters.
  - When creating a runtime environment in a configuration where a single RTEDEF contains multiple runtime environments, use parameter **OPTION MULTIPLE** and **KFJ\_SYSNAME lpar** in the KCIVARS DD. The **CREATE** action will create members of type *Kpp\$lpar* in the RTEDEF data set, along with the *rte\_name* member for the runtime environment-specific parameters.

**Note:** When using **OPTION MULTIPLE**, the **CREATE** action creates the *Kpp\$lpar* members automatically. It is recommended that you create the *Kpp\$lpar* members as well and add the parameter values that are the same for all runtime environments in the given RTEDEF library.

On subsequent runs of the **CREATE** action, reuse the same **RTE\_PLIB\_HILEV** parameter value, but update the values for parameters **RTE\_NAME** and **KFJ\_SYSNAME** to create a new set of runtime environment parameter members. There is no limit on how many runtime environments can be configured in a single RTEDEF data set.

- The **CREATE** action allocates the security exits library with the default name *rte\_plib\_hilev.rte\_name*. SECEXITS (or, optionally, the name specified in the **KFJ\_SECURITY\_EXITS\_LIB** parameter). The **CREATE** action also populates the security exits library with default security exits members and defines the library to the runtime environment using the **RTE\_X\_SECURITY\_EXIT\_LIB** parameter. For more information, see [“Setting up security exits in your runtime environment” on page 336](#).
- If the use of override embed members is enabled by specifying parameter **KFJ\_USE\_EMBEDS** set to Y, the **CREATE** action allocates the embeds data set with the default name *rte\_plib\_hilev.rte\_name*. EMBEDS (or, optionally, the name specified in the **KFJ\_EMBEDS\_LIB** parameter). The **CREATE** action sets up the embeds data set, populates it with supported override embed parameters (if applicable), and defines it to the runtime environment using the **RTE\_X\_OVERRIDE\_EMBEDS\_LIB** parameter. For more information, see [“Using override embed members in Configuration Manager” on page 337](#).
- The **CREATE** action works with the **KFJ\_LOCAL\_PLIB\_HILEV** parameter to allow for local generation of runtime environments for remote systems using different high-level qualifiers.

When the **KFJ\_LOCAL\_PLIB\_HILEV** parameter is specified, the generated *kfj\_local\_plib\_hilev*.RTEDEF data set will contain an additional member: PCK\$PARM for a default (single) **CREATE** action, or member PCK\$*lpar* in a multiple **CREATE** action. This member allows locally generated runtime environments using a different data set high-level qualifier than the one intended to be used on the deployment target (for example, the production system).

For more information about remote deployments, see [“Special considerations for SYSPLEX rollout” on page 323](#), [“RTEDEF\(PCK\\$PARM\)” on page 326](#), and [“Deploying remote runtime environments” on page 341](#).

To create a runtime environment definition using the **CREATE** action, use the following procedure.

## Procedure

1. Modify the KFJJMCM sample job in TKANSAM (see example below) to select a **CREATE** action.
2. Specify values for the required parameters **RTE\_NAME** and **RTE\_PLIB\_HILEV**.
3. (Optional) Specify additional parameters as needed, for example:
  - To create this runtime environment in a RTEDEF data set that does or will contain multiple runtime environment configurations, add the **OPTION MULTIPLE** and **KFJ\_SYSNAME lpar** parameters. If this is a subsequent run of the **CREATE** action, reuse the same **RTE\_PLIB\_HILEV** parameter value, but update the values for parameters **RTE\_NAME** and **KFJ\_SYSNAME**.
  - To specify a different name for the security exits library, add the **KFJ\_SECURITY\_EXITS\_LIB** parameter and value.
  - To enable the use of override embed members, add the **KFJ\_USE\_EMBEDS** parameter set to Y and the **KFJ\_EMBEDS\_LIB** parameter and value.
4. Run the KFJJMCM job to generate and populate the RTEDEF data set and other required data sets. Job messages for the **CREATE** action are written to the KCIPRINT SYSOUT data set.

## Creating runtime environment definition for one LPAR

The following JCL jobs create the runtime environment definition library TSOUID.MONSUITE.RTEDEF and populate it with various members, including the runtime environment configuration profile member RTE1. The first example is for a single runtime environment RTEDEF, and the second example is for a multiple runtime environment RTEDEF. These examples also specify that override embed members are enabled and provide custom data set names for the security exits and embeds libraries.

Figure 25: Example JCL to perform the **CREATE** action (one LPAR) for a single runtime environment RTEDEF

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUIITE.TKANMOD

//KCIIVARS DD *
*
ACTION                CREATE
RTE_NAME              RTE1
RTE_PLIB_HILEV        TSOUID.MONSUITE

KFJ_SECURITY_EXITS_LIB TEST1.TST.DEMO.MYEXITS
KFJ_USE_EMBEDS        Y
KFJ_EMBEDS_LIB        TEST1.TST.DEMO.MYEMBEDS
/*
```

Figure 26: Example JCL to perform the **CREATE** action (one LPAR) for a multiple runtime environment RTEDEF

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUIITE.TKANMOD
//KCIFFLOW DD DISP=SHR,DSN=MONSUIITE.TKANCUS(KFJOMEGA)
//KCIIVARS DD *
*
ACTION                CREATE
OPTION                MULTIPLE
RTE_NAME              RTE1
RTE_PLIB_HILEV        TSOUID.MONSUITE
```

```

KFJ_SECURITY_EXITS_LIB TEST1.TST.DEMO.MYEXITS
KFJ_USE_EMBEDS        Y
KFJ_EMBEDS_LIB        TEST1.TST.DEMO.MYEMBEDS

KFJ_SYSNAME           lpar
/*

```

### Creating a runtime environment definition for remote deployment

The following JCL creates the runtime environment definition library TSOUID.DEV.RTEDEF. In addition to the standard members, it will contain member PCK\$PARM, where you will find all available **KFJ\_LOCAL\_\*** parameters.

Figure 27: Example JCL to perform the **CREATE** action (remote deployment)

```

//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUITE.TKANMOD
//KCIFFLOW DD DISP=SHR,DSN=MONSUITE.TKANCUS(KFJOMEGA)
//KCIIVARS DD *
*
ACTION                CREATE
RTE_NAME              RTE1
RTE_PLIB_HILEV        TSOUID.PROD
KFJ_LOCAL_PLIB_HILEV  TSOUID.DEV
/*

```

**Note:** If **OPTION MULTIPLE** is used, the **CREATE** action creates member PCK\$lpar instead of PCK\$PARM.

## DISCOVER

The **DISCOVER** action discovers CICS® regions, Db2® subsystems, IMS control regions, MQ subsystems, TCP/IP stacks and system symbols on an LPAR, and then creates corresponding members in the runtime environment definition library.

### Before you begin

This documentation uses *subsystem* as an informal collective term for CICS® regions, Db2® subsystems, IMS control regions, MQ subsystems, and TCP/IP stacks.

Discovery is not limited to the products that you have configured using **CONFIGURE\_\*** parameters. The **DISCOVER** action always discovers all the subsystems it can.

It is recommended that you review the following topics, which describe the results of the **DISCOVER** action:

- [“Parameters created by the DISCOVER action” on page 244](#)
- [“Members created by the DISCOVER action” on page 245](#)

**Tip:** Bring up all the subsystems you intend to monitor before you run the **DISCOVER** action. You can re-run the **DISCOVER** action if any subsystems are added or started on your LPAR after your initial discovery run. In this case, you need to consolidate the respective discovery output in your RTEDEF data set (that is, [merge the generated members](#) accordingly).

### About this task

The **DISCOVER** action discovers subsystems and system symbols on an LPAR, and then creates corresponding members in the runtime environment definition library (*rte\_plib\_hilev*.RTEDEF) and populates the members with the discovered data.

The following list provides details about the **DISCOVER** action:

- Run the **DISCOVER** action on the LPAR whose subsystems you want to discover. For example, insert a JES2 **SYSAFF** job parameter after the **JOB** statement to ensure that the job runs on the correct LPAR:

```
/*JOBPARM SYSAFF=<lpar>
```

- Use the KCIALPHA program to discover more details. Optionally, for the **DISCOVER** action only, change the program name in the JCL **EXEC** statement from KCIOMEGA to KCIALPHA. KCIALPHA is an APF-authorized version of KCIOMEGA. APF authorization enables KCIALPHA to discover more subsystem details, which would otherwise need to be entered manually. If KCIALPHA is run from a load library that is not APF authorized, partial discovery will still be completed, but the job will end with return code 8.
- The **DISCOVER** action can run stand-alone, that is, without requiring an existing RTEDEF data set as pointed to by the **RTE\_PLIB\_HILEV** parameter. The resulting RTEDEF will only contain the members produced by discovery and will use the default prefixes for VTAM applids and started task definitions. For more information about this use case, see the example [“Stand-alone discovery using defaults” on page 244](#).
- For some subsystem data sets, if an alias is defined for the data set, the **DISCOVER** action will use the alias name instead of the original data set name. The following parameters will be populated with alias names if they exist: **KD2\_DBnn\_DB2\_LOADLIB**, **KI2\_I1nn\_CLASSIC\_IMS\_RESLIB**, **KN3\_TCPXnn\_TCPIP\_PROFILES\_DSN**.
- After performing a **DISCOVER** action, review the messages about discovery in the KCIPRINT SYSOUT data set.
- The output of the **DISCOVER** action depends on the subsystem. For more information, see the following topics:
  - [“Parameters created by the DISCOVER action” on page 244](#)
  - [“Members created by the DISCOVER action” on page 245](#)
- On the first run, the **DISCOVER** action creates members for each type of subsystem it discovers. On subsequent runs, if the discovery member for a subsystem exists, it will not be overwritten, but instead a comment member (*Kpp#lpar*) will be created. You must then review the members and manually apply the updates that you want to keep. For more information, see [“First-time discovery versus rediscovery” on page 246](#).

To run a discovery using the **DISCOVER** action, use the following procedure.

## Procedure

1. Modify the KFJJMCM sample job in TKANSAM (see example below) to select a **DISCOVER** action.
2. Specify values for the required parameters **RTE\_NAME** and **RTE\_PLIB\_HILEV**.
3. Run the KFJJMCM job to discover the available subsystems.  
The **DISCOVER** action creates the discovery members in the RTEDEF data set and populates the parameters with discovered values. Job messages for the **DISCOVER** action are written to the KCIPRINT SYSOUT data set.
4. Review the content in the discovery members and update as necessary.

## Discovering subsystems

The following JCL discovers subsystems on the LPAR ZOS1 and creates corresponding members in TSQUID.MONSUITE.RTEDEF. For example, if the **DISCOVER** action discovers Db2® subsystems, then it creates the member KD5@ZOS1; or, if that member already exists, KD5#ZOS1.

Figure 28: Example JCL to perform the **DISCOVER** action

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1 EXEC PGM=KCIALPHA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUITE.TKANMOD
//KCIFFLOW DD DISP=SHR,DSN=MONSUITE.TKANCUS(KFJOMEGA)
//KCIIVARS DD *
ACTION DISCOVER
RTE_NAME RTE1
RTE_PLIB_HILEV TSQUID.MONSUITE
/*
```

The JES2 **SYSAFF** job parameter ensures that the job runs, and the **DISCOVER** action discovers subsystems, on LPAR ZOS1.

## Stand-alone discovery using defaults

The following JCL is used to perform a stand-alone discovery that uses default values.

If you want to discover IMS systems using the stand-alone run of the **DISCOVER** action and specify different prefixes for started task and VTAM applids, specify the prefixes of your choice in the **RTE\_VTAM\_APPLID\_PREFIX** and **RTE\_STC\_PREFIX** parameters. This way the VTAM and started task prefixes will be honored accordingly in member RTEDEF (*KI5@lpar*).

Figure 29: Example JCL to perform a stand-alone discovery using the **DISCOVER** action

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1 EXEC PGM=KCIALPHA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUITE.TKANMOD
//KCIFFLOW DD DISP=SHR,DSN=MONSUITE.TKANCUS(KFJOMEGA)
//KCIIVARS DD *
ACTION                DISCOVER
RTE_NAME              RTE1
RTE_PLIB_HILEV        TSUID.MONSUITE

RTE_STC_PREFIX        OMEG
RTE_VTAM_APPLID_PREFIX OM&SYSCLONE.
/*
```

If you do not have any SMP/E target libraries on the system on which you want to run a stand-alone **DISCOVER** action, you can use the utility, TKANSAM (KFJMAINT), with action **BLDREMDS** to build the necessary minimum data sets (TKANSAM, TKANMOD, and TKANCUS libraries) needed to run the action. Make sure you transfer the created data sets to your remote system where the stand-alone **DISCOVER** should run and where the necessary APF authorization of the TKANMOD library is made.

## Parameters created by the DISCOVER action

The **DISCOVER** action creates parameters for each subsystem it discovers.

### Overview of output

The output of the **DISCOVER** action depends on the subsystem:

Table 27: Output of the <b>DISCOVER</b> action	
Subsystem	Output
Db2®, IMS, TCP/IP	Parameters that configure the runtime environment to monitor these subsystems. For Db2®, you need to <a href="#">complete the discovered details</a> .
CICS®	Parameters that specify an historical datastore allocation table for task history file disposition.
MQ	Statements using embed overrides that you can place in the KMQ\$CUSR embed override member:  <pre>SET MANAGER NAME(<i>queue-manager</i>)</pre>

In addition to the subsystem discovery, a member is created that contains the System symbols that can be used by the **GENERATE** action along with the respective **KCIPARSE** extracted variables. For more information, see [“RTEDEF\(SYS@lpar\)” on page 248](#).

### Parameters

The following table lists the parameters created by the **DISCOVER** action.

The parameters created depend on which program performs the action: KCIOMEGA or KCIALPHA.

In general, KCIOMEGA discovers only the subsystem identifier. For detailed discovery, use KCIALPHA.

Table 28: Parameters created by the <b>DISCOVER</b> action			
Subsystem	Parameter ( <i>nn</i> is the 2-digit table row number)	KCIOMEGA	KCIALPHA
CICS®	KC2_HSnn_CLASSIC_CICS_REGION	No	Yes
Db2®	KD2_DBnn_DB2_SSID	Yes	Yes

Subsystem	Parameter ( <i>nn</i> is the 2-digit table row number)	KCIOMEGA	KCIALPHA
Db2®	KD2_DBnn_DB2_VER	No	Yes
Db2®	KD2_DBnn_DB2_DS_GROUP	No	Yes
Db2®	KD2_DBnn_DB2_LOADLIB	No	Yes
IMS	KI2_I1nn_CLASSIC_IMSID	Yes	Yes
IMS	KI2_I1nn_CLASSIC_IMS_RESLIB	No	Yes
MQ	For MQ subsystems, <b>DISCOVER</b> generates <b>SET MANAGER</b> statements, not parameters.	Yes	Yes
TCP/IP	KN3_TCPXnn_TCP_STC	Yes	Yes
TCP/IP	KN3_TCPXnn_TCPIP_PROFILES_DSN	No	Yes
TCP/IP	KN3_TCPXnn_TCPIP_PROFILES_MBR	No	Yes

### Members created by the DISCOVER action

The **DISCOVER** action creates members for each type of subsystem it discovers.

<i>Table 29: Members created by the DISCOVER action</i>	
Subsystem	Member name
CICS®	KC5@ <i>lpar</i> for first-time discovery KC5# <i>lpar</i> for rediscovery
Db2®	KD5@ <i>lpar</i> for first-time discovery KD5# <i>lpar</i> for rediscovery
IMS	KI5@ <i>lpar</i> for first-time discovery KI5# <i>lpar</i> for rediscovery
MQ	KMQ# <i>lpar</i>  <b>Note:</b> For MQ subsystems, only the KMQ# <i>lpar</i> member is created for both first-time discovery and rediscovery. For more information, see “RTEDEF(KMQ# <i>lpar</i> )” on page 247.
TCP/IP	KN3@ <i>lpar</i> for first-time discovery KN3# <i>lpar</i> for rediscovery
Symbols	SYS@ <i>lpar</i> for first-time discovery SYS# <i>lpar</i> for rediscovery

### Member naming convention

For subsystem and symbols discovery, the **DISCOVER** action creates RTEDEF library members with the following naming convention:

#### Prefix

For subsystem type: *Kpp* from the corresponding **CONFIGURE\_\*** parameter.  
For symbols: SYS.

#### Separator

An at sign (@) or a hash (#).  
A hash indicates that the member is a comment: the **GENERATE** action ignores these members.

**Note:** The at sign (@) appears in only some code pages. For example, when using CCSID 1141, it appears as "§" (0x7C).

## Suffix

Identifies the LPAR.

### First-time discovery versus rediscovery

The **DISCOVER** action does not overwrite *Kpp@lpar* or *SYS@lpar* members (“@” members).

If a *Kpp@lpar* or *SYS@lpar* member already exists, the **DISCOVER** action writes a comment member, *Kpp#lpar* or *SYS#lpar*, respectively, and then continues, eventually completing with return code 4. Review the comments about discovery in the KCIPRINT sysout data set, and then review the “#” members. Edit the existing “@” members to apply any preferred updates.

The **DISCOVER** action overwrites comment members.

#### RTEDEF (KC5@lpar)

If the **DISCOVER** action discovers CICS® regions, it creates the RTEDEF (KC5@lpar) member. This member contains parameters that configure the CICS® monitoring agent.

Figure 30: RTEDEF (KC5@lpar) member created by the **DISCOVER** action

```
* CICS regions discovered by KCIOMEGA
* SYSPLEX=<sysplex> LPAR=<lpar> DATE=<date>

KC2_HS                BEGIN                * Table begin *

KC2_HS01_ROW          01
KC2_HS01_CLASSIC_CICS_REGION "<region_name>"
KC2_HS01_CLASSIC_VSAM_CYL  1                                [1]

* More rows (one for each region discovered)...

KC2_HS                END                * Table end *
```

#### [1] KC2\_HS01\_CLASSIC\_VSAM\_CYL

If necessary, replace the initial value of 1 with an appropriate value for your site.

#### RTEDEF (KD5@lpar)

If the **DISCOVER** action discovers Db2® subsystems, it creates the RTEDEF (KD5@lpar) member. This member contains parameters that configure the Db2® monitoring agent.

Figure 31: RTEDEF (KD5@lpar) member created by the **DISCOVER** action

```
* Db2 subsystems discovered by KCIOMEGA
* SYSPLEX=<sysplex> LPAR=<lpar> DATE=<date>

KD2_DB                BEGIN                * Table begin *

KD2_DB01_ROW          01
KD2_DB01_DB2_SSID     "<ssid>"
KD2_DB01_DB2_DESCRIPTION "<ssid> Db2 subsystem"
KD2_DB01_DB2_VER      "<version>"
KD2_DB01_DB2_SYSNAME  "<lpar>"
KD2_DB01_DB2_PROFID   "P001"
KD2_DB01_DB2_DS_GROUP "N"
KD2_DB01_DB2_MONITOR_START "N"
KD2_DB01_DB2_PORT_NUM "2000"
KD2_DB01_DB2_LOADLIB  "<dsname>"                                [1]
KD2_DB01_DB2_DSNTIAD "DSNTIAD"
KD2_DB01_DB2_RUNLIB   ""

* More rows (one for each subsystem discovered)...

KD2_DB                END                * Table end *
```

The **DISCOVER** action only discovers the parameter values shown in the previous figure in *italics*. You must complete or edit the other parameters.

#### [1] KD2\_DBnn\_DB2\_LOADLIB

If an alias is defined for the data set, the alias name will be used for the parameter value instead of the original data set name.

#### RTEDEF (KI5@lpar)

If the **DISCOVER** action discovers IMS control regions, it creates the RTEDEF (KI5@lpar) member. This member contains parameters that configure the IMS monitoring agent.

Figure 32: RTEDEF (KI5@lpar) member created by the **DISCOVER** action

```

* IMS control regions discovered by KCIOMEGA
* SYSPLEX=<sysplex> LPAR=<lpar> DATE=<date>

KI2_I1                                BEGIN                                * Table begin *

KI2_I101_ROW                          01
KI2_I101_CLASSIC_IMSID                "<imsid>"
KI2_I101_CLASSIC_MPREFIX              "M<n>"
KI2_I101_CLASSIC_GLOBAL                ""
KI2_I101_CLASSIC_STC                  "<rte_stc_prefix>0I<n>"
KI2_I101_CLASSIC_VTAM_NODE            "<rte_vtam_applid_prefix>0I<n>N"
KI2_I101_CLASSIC_VTAM_APPL_LOGON     "<rte_vtam_applid_prefix>0I<n>"
KI2_I101_CLASSIC_IMS_RESLIB           "<dsname>"                                [1]
KI2_I101_CLASSIC_LROWS                "255"
KI2_I101_CLASSIC_USER_PROFILE         "/C"
KI2_I101_CLASSIC_CTRL_UNIT_ADDR      "XXXX"

* More rows (one for each control region discovered)...

KI2_I1                                END                                * Table end *

```

The **DISCOVER** action only discovers the values of the **KI2\_I101\_CLASSIC\_IMSID** and **KI2\_I101\_CLASSIC\_IMS\_RESLIB** parameters.

For other parameters, **DISCOVER** generates placeholder values. Review these values and, if necessary, edit them to match your site requirements.

**[1] KI2\_I1nn\_CLASSIC\_IMS\_RESLIB**

If an alias is defined for the data set, the alias name will be used for the parameter value instead of the original data set name.

**RTEDEF (KMQ#lpar)**

If the **DISCOVER** action discovers MQ subsystems, it creates the RTEDEF (KMQ#lpar) member. This member contains **SET MANAGER** statements that you can use in the KMQ\$CUSR embed override member.

Figure 33: RTEDEF (KMQ#lpar) member created by the **DISCOVER** action

```

* MQ subsystems discovered by KCIOMEGA
* SYSPLEX=sysplex LPAR=lpar DATE=date

SET MANAGER NAME(*)

*SET MANAGER NAME(queue-manager)

* More SET MANAGER statements (one for each queue manager discovered)...

```

When discovering MQ subsystems, the **DISCOVER** action creates only a comment member, as indicated by the hash (#) in the member name. This is unlike the discovery of other types of subsystems, where the **DISCOVER** action creates members that contain configuration parameters and have the at sign (@) in the member name. Discovery of MQ subsystems is for informational purposes only.

The IBM OMEGAMON® for Messaging on z/OS, IBM MQ Monitoring agent performs its own discovery and, by default, will monitor any queue manager on the LPAR. The default setting of SET MANAGER NAME(\*) is recommended because it allows you to change your queue manager configuration without having to change agent parameters.

If you want to name particular queue managers, you can specify multiple statements of SET MANAGER NAME(queue-manager).

Because it is a comment member, the information in KMQ#lpar is not used for agent configuration directly. However, you can use the information that was discovered and is provided in the KMQ#lpar member in your KMQ\$CUSR embed override member.

**RTEDEF (KN3@lpar)**

If the **DISCOVER** action discovers TCP/IP stacks, it creates the RTEDEF (KN3@lpar) member. This member contains parameters that configure the networks monitoring agent.

Figure 34: RTEDEF (KN3@lpar) member created by the **DISCOVER** action

```

* TCP/IP stacks discovered by KCIOMEGA
* SYSPLEX=<sysplex> LPAR=<lpar> DATE=<date>

KN3_TCPX          BEGIN          * Table begin *

KN3_TCPX01_ROW    01
KN3_TCPX01_TCP_STC "<task-name>"
KN3_TCPX01_SYS_NAME "<lpar>"
KN3_TCPX01_TCPIP_PROFILES_DSN "<dsname>" [1]

KN3_TCPX01_TCPIP_PROFILES_MBR "<member-name>"

* More rows (one for each stack discovered)...

KN3_TCPX          END            * Table end *

```

### [1] KN3\_TCPXnn\_TCPIP\_PROFILES\_DSN

If an alias is defined for the data set, the alias name will be used for the parameter value instead of the original data set name.

#### RTEDEF(SYS@lpar)

The **DISCOVER** action creates the RTEDEF(SYS@lpar) member. This member contains system symbols and KCIPARSE extracted variables needed by the **GENERATE** action.

The primary use is, in conjunction with parameter **KFJ\_SYSNAME**, to allow you to pre-generate RTEs on a single local system without having to run the **GENERATE** step on the remote system.

```

## GENERATE

The **GENERATE** action generates runtime members for a runtime environment from a set of configured parameters.

### Before you begin

Before performing a **GENERATE** action for an existing runtime environment, stop the started tasks for that runtime environment. Started tasks can lock runtime members, such as persistent data store data sets. Locked runtime members can cause the **GENERATE** action to fail.

**Note:** You can also use the **GENERATE** action to make a copy of your SMP/E target libraries. For more information, see [“Using SMP/E target library copies” on page 352](#).

**If you are familiar with PARMGEN:** PARMGEN uses several scenarios to perform maintenance actions. With Configuration Manager, numerous maintenance scenarios are not needed. The **GENERATE** action performs in one job what previously required multiple steps for the various maintenance scenarios. All of the PARMGEN scenarios are replaced by the **GENERATE** action.

## About this task

With the **GENERATE** action, you can generate the runtime members and started tasks for your runtime environment.

The following list provides details about the **GENERATE** action:

- The **GENERATE** action generates runtime members from the parameters in the runtime environment definition library, *rte\_plib\_hilev*.RTEDEF. The **GENERATE** action builds the set of parameters that is used by concatenating the corresponding RTEDEF library members.
- Run the **GENERATE** action on the LPAR where you will start the runtime environment. For example, if your site uses JES2, insert a **SYSAFF** job parameter after the **JOB** statement to ensure that the job runs on that LPAR.
- If the RTEDEF library contains LPAR-specific members, then the **GENERATE** action uses the LPAR-specific members for the LPAR where the **GENERATE** action is running. For example, consider the RTEDEF library that contains the following members:  
KDS\$PARM  
KDS\$ZOS1  
KDS\$ZOS2  
If you run the **GENERATE** action on LPAR ZOS1, then the **GENERATE** action uses the non-LPAR-specific member KDS\$PARM and the LPAR-specific member KDS\$ZOS1, but not the LPAR-specific member KDS\$ZOS2.
- Specify **KFJ\_LOCAL\_PLIB\_HILEV** in the KCI VARS DD, along with **KFJ\_SYSNAME**, if you are generating a runtime environment that will be deployed using a different local high-level qualifier. For more information about this remote deployment scenario, see [“Remote deployment example using local libraries” on page 343](#).

**Important:** If you are using different settings for the local generation of the runtime environment, there are some limitations regarding the parameters that can be customized. Certain parameters are not allowed in the respective RTEDEF members. If any of these parameters are explicitly specified in the RTEDEF members, message **KFJQ0213E** is returned in KCI PRINT and the workflow stops. To continue, remove these parameters from the RTEDEF data set members and re-run the **GENERATE** action. For the list of parameters, see [“Parameters that cannot be customized for remote deployment” on page 350](#).

- You can use the **OPTION** parameter for the **GENERATE** action to control certain processing. For information about the available options, see [“GENERATE options” on page 251](#).
- After you run the **GENERATE** action, you can review a list of the members that were not replaced when the work (WK\*) libraries were copied to the runtime (RK\*) libraries due to having been defined in an exclude list. The list of members is provided in the exclude report, which is identified by the EXCLRPT DD statement. The exclude report is generated only for the **GENERATE** action without any options specified, or with only **OPTION NOUSS** or **OPTION QUICKCONFIG** specified. For more information, see [“Members excluded during GENERATE action” on page 256](#).

To generate runtime members for a runtime environment using the **GENERATE** action, use the following procedure.

## Procedure

1. Modify the KFJJMCM sample job in TKANSAM (see example below) to select a **GENERATE** action.

2. Specify values for the required parameters **RTE\_NAME** and **RTE\_PLIB\_HILEV**.
3. (Optional) To generate a runtime environment that will be deployed using a different local high-level qualifier, specify **KFJ\_LOCAL\_PLIB\_HILEV** and **KFJ\_SYSNAME**.
4. (Optional) To validate your RTEDEF data set before running the **GENERATE** action, add **OPTION VALIDATE**, then run the KFJJMCM job. Review the job output and correct any identified problem.

**Note:** You cannot use the **VALIDATE** option with any other **OPTION** value.

5. (Optional) To prepare intermediate work libraries, specify **OPTION PREPARE**, then run the KFJJMCM job.

**Note:** You cannot use the **PREPARE** option with any other **OPTION** value.

6. (Optional) To bypass select configuration steps, specify the following options using the **OPTION** parameter, as needed. To specify multiple options, separate the values with a comma and no spaces.
  - To bypass configuration processing for z/OS® UNIX® System Services, specify option **NOUSS**.
  - To bypass configuration processing for security exits, specify option **NOSEEXITS**.
  - To bypass assembling and linking IBM Z OMEGAMON AI for Networks (KN3) or OMEGAMON enhanced 3270 user interface (KOB) modules, specify option **NORELINK**.
7. To run the **GENERATE** action to create the runtime members, remove **OPTION VALIDATE** (if present), and then run the KFJJMCM job.  
Job messages for the **GENERATE** action are written to the KCIPRINT SYSOUT data set.
8. (Optional) On subsequent runs of the **GENERATE** action, you can perform select configuration steps by specifying the following options using the **OPTION** parameter, as needed. To specify multiple options, separate the values with a comma and no spaces.
  - To run only the **GENERATE** workflow stage that deploys the parts related to z/OS® UNIX®, specify option **USS**.
  - To perform configuration processing for security exits only, specify option **SEEXITS**.
  - To perform only the step that loads the read-only configuration members to the RK\* data sets, specify option **QUICKLOAD**.

**Note:** You can use the **QUICKLOAD** option with the **USS** and **SEEXITS** options, but you cannot use it with the **NOUSS** option.

- To update the configurable members for the runtime environment (for example, in the RKANPARU, RKANAMU, and RKANCMU libraries) without refreshing data from SMP/E target libraries, specify option **QUICKCONFIG**.

**Note:** You cannot use the **QUICKCONFIG** option with the **VALIDATE** option or the **NOUSS** option.

- To only assemble and link elements, specify option **RELINK**.

The following JCL generates runtime members for the runtime environment that is defined by members of the TSQUID.MONSUITE.RTEDEF library, including RTE1 and LPAR-specific configuration profile members such as Kpp\$ZOS1.

Figure 36: Example JCL to perform the **GENERATE** action

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUITE.TKANMOD
```

```
//KCIFLOW DD DISP=SHR,DSN=MONSUIE.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION          GENERATE
RTE_NAME        RTE1
RTE_PLIB_HILEV TSQUID.MONSUIE
/*
```

Note the JES2 **SYSAFF** parameter that causes the job to run on LPAR ZOS1.

## GENERATE options

You can use the **OPTION** parameter for the **GENERATE** action to control certain processing. This topic describes the available options for use with the **GENERATE** action.

### Overview of GENERATE options

“Overview of **GENERATE** options” on page 251 provides an overview of the **GENERATE** options that are available. Each of the available options is described in more detail in “**GENERATE** OPTION keywords” on page 252.

OPTION	Abbreviation	Description
<u>USS</u>	–	Run only the <b>GENERATE</b> workflow stage that deploys the parts related to z/OS® UNIX® System Services. This option requires a complete run of the <b>GENERATE</b> action prior to use.
<u>NOUSS</u>	–	Do not run the z/OS® UNIX® deploy stage in the <b>GENERATE</b> action.
<u>SECEXITS</u>	SEC	Perform configuration processing for security exits only. This option requires a complete run of the <b>GENERATE</b> action prior to use.
<u>NOSECEXITS</u>	NS	Do not perform configuration processing for security exits.
<u>VALIDATE</u>	VAL	Perform validation of RTEDEF parameters.
<u>QUICKLOAD</u>	QL	Load the read-only configuration members to the RK* data sets. The read-only members are those members that are not impacted by customization during configuration. This option requires a complete run of the <b>GENERATE</b> action prior to use.
<u>QUICKCONFIG</u>	QC	Update the configurable members for the runtime environment (for example, in the RKANPARU, RKANSAMU, and RKANCMU libraries) without refreshing data from SMP/E target libraries. This option requires a complete run of the <b>GENERATE</b> action prior to use.
<u>RELINK</u>	LINK	Assemble and link edit modules for OMEGAMON for Networks (KN3) and OMEGAMON enhanced 3270 user interface (KOB). This option requires a complete run of the <b>GENERATE</b> action prior to use.
<u>NORELINK</u>	NL	Do not assemble and link edit modules for OMEGAMON for Networks (KN3) and OMEGAMON enhanced 3270 user interface (KOB).
<u>TRGCOPY</u>	TRG	Make a copy of your SMP/E target libraries, from which you can create or update your runtime environments.
<u>PREPARE</u>	PREP	Prepare work data sets for your runtime environment. You can use this option to build the work data sets before other <b>GENERATE</b> action stages, in preparation of OMEGAMON installation or maintenance.

To specify more than one option, separate the values with a comma and no spaces. For example: **OPTION USS, SECEXITS**

### Compatibility of GENERATE options

Some options are not compatible to run with other options during the same job. “Compatibility of **GENERATE** options” on page 251 indicates which options are compatible. **Y** in the table cell indicates that you can specify the two options together in the same job. **N** in the table cell indicates that you cannot specify the two options together in the same job.

	USS	NOUSS	SECEXITS	NOSECEXITS	VALIDATE	QUICKLOAD	QUICKCONFIG	RELINK	NORELINK	TRGCOPY	PREPARE
USS	–	N	Y	N	N	Y	Y	Y	N	N	N

	USS	NOUSS	SECEXITS	NOSECEXITS	VALIDATE	QUICKLOAD	QUICKCONFIG	RELINK	NORELINK	TRGCOPY	PREPARE
NOUSS	N	—	N	Y	N	N	N	N	Y	Y	N
SECEXITS	Y	N	—	N	N	Y	Y	Y	N	N	N
NOSECEXITS	N	Y	N	—	N	N	N	N	Y	N	N
VALIDATE	N	N	N	N	—	N	N	N	N	N	N
QUICKLOAD	Y	N	Y	N	N	—	Y	Y	N	N	N
QUICKCONFIG	Y	N	Y	N	N	Y	—	Y	N	N	N
RELINK	Y	N	Y	N	N	Y	Y	—	N	N	N
NORELINK	N	Y	N	Y	N	N	N	N	—	N	N
TRGCOPY	N	Y	N	N	N	N	N	N	N	—	N
PREPARE	N	N	N	N	N	N	N	N	N	N	—

## GENERATE OPTION keywords

### USS | NOUSS

You can optionally control when to run the **GENERATE** workflow stage that deploys the parts related to z/OS® UNIX®. By default, the **GENERATE** action automatically performs any required z/OS® UNIX® configuration. However, there might be cases where you would want to skip this step (for reasons such as authorization issues), and perform this step at a later time. You can use the **OPTION** parameter to specify the **USS** or **NOUSS** value to control this processing, as follows:

#### USS

When **OPTION USS** is specified, the **GENERATE** action runs only the stage that deploys the parts related to z/OS® UNIX®; no other processing is performed (unless another **OPTION** value is also specified, such as **SECEXITS**). You cannot use this option on the initial run of the **GENERATE** action for a new runtime environment; it can only be used on subsequent runs.

#### Important:

- You must perform a complete run of the **GENERATE** action before you can use **OPTION USS**.
- If you have changed any parameters inside your RTEDEF members that impact z/OS® UNIX® configuration, do not use **OPTION USS**, because it will not capture your parameter changes. Instead, run action **GENERATE** with **OPTION NOUSS** (or without the option) to reconfigure the members related to z/OS® UNIX®. Then, you can use **OPTION USS** to move the updated members to z/OS® UNIX®.

#### NOUSS

When **OPTION NOUSS** is specified, the **GENERATE** action does not run the stage that deploys the parts related to z/OS® UNIX®. You can use this option on the initial run of the **GENERATE** action for a new runtime environment, as well as on subsequent runs.

### SECEXITS | NOSECEXITS

You can optionally control when to perform configuration processing for security exits. By default, the **GENERATE** action automatically performs the required configuration tasks for security exits, which includes rebuilding and relinking the security exits into the RKANMODU load library. By performing these tasks separately from other stages, you can save valuable CPU cycles and isolate when additional authorization is needed, which might be the case when updating the load library.

You can use the **OPTION** parameter to specify the **SECEXITS** or **NOSECEXITS** value to control this processing, as follows:

#### SECEXITS

When **OPTION SECEXITS** is specified, the **GENERATE** action performs configuration for security exits only; no other processing is performed (unless another **OPTION** value is also specified, such as **USS**). You cannot use this option on the initial run of the **GENERATE** action for a new runtime environment; it can only be used on subsequent runs.

**Important:** You must perform a complete run of the **GENERATE** action before you can use the **SECEXITS** option.

## NOSECEXITS

When **OPTION NOSECEXITS** is specified, the **GENERATE** action does not perform configuration processing for security exits. You can use this option on the initial run of the **GENERATE** action for a new runtime environment, as well as on subsequent runs.

**Tip:** This option does not update the RKANMODU load library, a data set that might require more restrictive authorization for updating. If you use this option together with option **NORELINK**, the **GENERATE** action does not update the RKANMODU library, and you can perform the other **GENERATE** configuration steps that do not require additional access.

For more information about creating your security exits library, see [“Setting up security exits in your runtime environment”](#) on page 336.

## VALIDATE

**OPTION VALIDATE** performs a validation of the parameters specified in the RTEDEF data set. Using this option helps you to prepare for running the full **GENERATE** action. You cannot use the **VALIDATE** option with any other **OPTION** value.

To ensure that your configuration is correct, **OPTION VALIDATE** performs the following steps:

- Verifies that all parameters have correct values defined and that no required parameters are missing. If any problems are found, the sysout data sets include the parameter validation report (**\$VALRPT**). If this report is generated, review the report and correct the identified parameters.
- Checks that any symbol used in a parameter value is properly defined. If an undefined symbol is encountered, message **KFJ00253E** is issued for each undefined symbol.
- Re-creates interim and work libraries.

**Attention:** If you previously used PARMGEN for configuration, be aware that using the **GENERATE** action with **OPTION VALIDATE** will re-create the WCONFIG data set, which will invalidate the PARMGEN configuration. This means that if you migrate a runtime environment from PARMGEN to Configuration Manager using the **MIGRATE** action, and then perform the **GENERATE** action with **OPTION VALIDATE**, you can no longer use the PARMGEN configuration.

## QUICKLOAD

Using **OPTION QUICKLOAD**, you can load the read-only configuration members to the RK\* data sets. The read-only members are those members that are not impacted by customization during configuration.

**OPTION QUICKLOAD** is compatible with the **USS** and **SECEXITS** options, but is not compatible with the **VALIDATE** and **NOUSS** options. This option requires a complete run of the **GENERATE** action prior to use.

## QUICKCONFIG

With this option, you can quickly reconfigure your products without reloading the read-only runtime members or refreshing data from SMP/E target libraries. Using this option can improve performance, with the most impact experienced when using a full runtime environment (**RTE\_TYPE** parameter is set to FULL).

When **OPTION QUICKCONFIG** is specified, the **GENERATE** action updates the configurable members for the runtime environment (for example, in the RKANPARU, RKANSAMU, and RKANCMDU libraries) without refreshing data from SMP/E target libraries. The read-only members, which are members that are not impacted by customization during configuration, are not loaded to the RK\* data sets.

More specifically, running the **GENERATE** action with **OPTION QUICKCONFIG** performs the following actions:

- Validates parameters

- Allocates missing data sets
- Updates configurable members for the runtime environment (for example, in the RKANPARU, RKANSAMU, and RKANCMU libraries)
- Updates started tasks, VTAM list, and VTAM node
- Updates z/OS® UNIX®-related members, but does not deploy them to the z/OS® UNIX® directories or files. To deploy prepared members to z/OS® UNIX® files or directories, you must combine the **QUICKCONFIG** option with the **USS** option.

Running the **GENERATE** action with **OPTION QUICKCONFIG** does not perform the following actions:

- Refresh data from SMP/E target libraries
- Update read-only modules from SMP/E target libraries
- Update z/OS® UNIX® files or directories
- Perform any assembly or linking operations related to security exits or other load modules

You cannot use the **QUICKCONFIG** option with the **VALIDATE** option or the **NOUSS** option. The **QUICKCONFIG** option requires a complete run of the **GENERATE** action prior to use.

## RELINK | NORELINK

You can optionally control when to assemble and link elements into the RKANMODU load library when a relink of IBM Z OMEGAMON AI for Networks (KN3) or OMEGAMON enhanced 3270 user interface (KOB) modules is required, such as when applying maintenance. By default, the **GENERATE** action automatically performs these steps. By performing these tasks separately, you can isolate when additional authorization is needed, which might be the case when updating the load library.

You can use the **OPTION** parameter to specify the **RELINK** or **NORELINK** value to control this processing, as follows:

### RELINK

Use **OPTION RELINK** to assemble and link elements into the RKANMODU load library when a relink of IBM Z OMEGAMON AI for Networks (KN3) or OMEGAMON Enhanced 3270 User Interface (KOB) modules is required, such as when applying maintenance. You cannot use this option on the initial run of the **GENERATE** action for a new runtime environment; it can only be used on subsequent runs.

**Important:** You must perform a complete run of the **GENERATE** action before you can use the **RELINK** option.

**Note:** If you are familiar with PARMGEN, the **RELINK** option performs the same function as the PARMGEN KCIJPLNK job (**Run post-SMP/E RKANMODU ASM/LINK steps**).

**Tip:** You can customize the binder program that is used by specifying the program name in parameter `"GBL_UTIL_BINDER"` on page 294.

When using the **GENERATE** action with **OPTION RELINK**, the details differ depending on the environment where the action runs, as follows:

#### On a local system (the *configuration system* in a remote deployment scenario)

You can run the **GENERATE** action with **OPTION RELINK** on a local system to assemble and link elements.

#### On a remote environment with a different z/OS level

You can run the **GENERATE** action with **OPTION RELINK** on a target system that is at a different z/OS level than the configuration system. You do not need to run all the steps in the remote deployment scenario (**GENERATE** action, **PACKAGE** action, transfer data sets, **DEPLOY** action).

Using the **RELINK** option requires the SMP/E library TKANMODS to be present on the target system. The TKANMODS library is not part of the full runtime environment, and it is not created by the **BLDREMDS** action. In other words, you must have an SMP/E environment present to ensure consistency. As a result, you must run Configuration Manager from the same SMP/E libraries.

You can rerun the **GENERATE** action with **OPTION RELINK** as needed.

When you use the **RELINK** option to relink modules on a remote environment at a different z/OS level, you might have different settings in the libraries set by parameters **GBL\_DSN\_SYS1\_MACLIB** and **GBL\_DSN\_CEE\_SCEELKED** than what you would have on your local system. If there are significant differences in the contents of those libraries, which control how modules are being assembled and linked, then you should run the **GENERATE** action with **OPTION RELINK** on the target system.

#### On a remote environment with the same z/OS level

You can run the **GENERATE** action with **OPTION RELINK** on a target system that is at the same z/OS level as the configuration system. In this environment, there is not an SMP/E environment on the target system, and only the minimal set of libraries is transferred to perform the **DEPLOY** action.

You can run the following series of steps:

1. **GENERATE** action with **OPTION RELINK**
2. **PACKAGE** action
3. Transfer of data sets
4. **DEPLOY** action

This implementation saves CPU cycles on the **GENERATE** step.

#### For a full runtime environment

In a full runtime environment, you must run the **GENERATE** action with **OPTION QUICKLOAD, RELINK** to achieve the correct relinking results. (This requirement is due to a dependency on the RKANSAM data set).

#### NORELINK

When **OPTION NORELINK** is specified, the **GENERATE** action does not assemble and link the IBM Z OMEGAMON AI for Networks (KN3) or OMEGAMON enhanced 3270 user interface (KOB) modules, even if a relink is required. You can use this option on the initial run of the **GENERATE** action for a new runtime environment, as well as on subsequent runs.

**Tip:** This option does not update the RKANMODU load library, a data set that might require more restrictive authorization for updating. If you use this option together with option **NOSECEXITS**, the **GENERATE** action does not update the RKANMODU library, and you can perform the other **GENERATE** configuration steps that do not require additional access.

#### TRGCOPY

Use **OPTION TRGCOPY** to make a copy of your SMP/E target libraries, from which you can create or update your runtime environments. You can abbreviate this keyword to **TRG**. For more information, see [“Using SMP/E target library copies” on page 352](#).

#### PREPARE

Use **OPTION PREPARE** to prepare intermediate work libraries for your runtime environment. You can use this option to build the work data sets before other **GENERATE** action workflow stages, in preparation of OMEGAMON installation or maintenance. You might find this option useful if you have to perform other related tasks that require the work data sets ahead of time or in parallel, such as preparing members for Db2 binds or copying started task members to PROCLIB libraries.

With this option, you can run the **GENERATE** action with **OPTION PREPARE** initially to create the work data sets, and then, when you are ready, run the **GENERATE** option again (without the **PREPARE** option) to complete the additional workflow stages. You cannot use the **PREPARE** option with any other **OPTION** value.

**Important:** If you use the **PREPARE** option to create the work data sets, you must be at the same Configuration Manager maintenance level when you run subsequent **GENERATE** action jobs without the **PREPARE** option.

More specifically, running the **GENERATE** action with **OPTION PREPARE** performs the following actions:

- Validates parameter values
- Performs parsing steps
- Allocates and refreshes the interim staging (IK\*) and work (WK\*) libraries. These libraries will be copied to the runtime (RK\*) libraries later.
- Allocates and refreshes PROCLIB, VTAMLST, and VTAMLIB libraries. These libraries contain started tasks, VTAM lists, and VTAM nodes.

**Important:** Data sets specified in parameters **GBL\_DSN\_SYS1\_PROCLIB**, **GBL\_DSN\_SYS1\_VTAMLIB**, and **GBL\_DSN\_SYS1\_VTAMLST** will be impacted.

- Updates the global user library specified in parameter **GBL\_USER\_JCL**, which contains global parameters.

**Important:** Any changes to the following RTEDEF members will impact your existing runtime environment: **VAR\$GLOB**, **VAR\$lpar**, and **SYS@lpar**

- Creates a checkpoint. At the end of the job, the **GENERATE** action with **OPTION PREPARE** creates member **\$PREPARE** in the **WKPANPARU** library and populates it with the checkpoint creation date and time, as follows:

```
***** Top of Data *****  
* Checkpoint created by userID on yyyy-mm-dd hh:mm:ss  
***** Bottom of Data *****
```

If the checkpoint is detected, subsequent **GENERATE** action jobs (without the **PREPARE** option) bypass the workflow stages performed by the **PREPARE** option and resume processing with the remaining workflow stages. The **GENERATE** action then deletes the **\$PREPARE** member at the end of the job.

**Note:** The checkpoint is not removed if any of the following options are used: **USS**, **SECEXITS**, **RELINK**, **QUICKLOAD**

## Members excluded during **GENERATE** action

The Configuration Manager **GENERATE** action intentionally excludes some members when creating or refreshing the runtime (RK\*) libraries. The output from the **GENERATE** action job includes a report that lists the members that were not replaced in the runtime libraries.

### Exclude lists

To retain customized members in the runtime (RK\*) user libraries during maintenance, you can use exclude lists to define the members not to replace.

IBM-provided exclude list definitions are stored in member **KCI\$IW2R**. User-defined exclude list definitions are stored in the embeds data set (EMBEDS) in member **KCI\$XW2R**. You must add any member that you want saved to your EMBEDS (**KCI\$XW2R**) member.

**Note:** For more information about using override embed members and the embeds data set, see [“Using override embed members in Configuration Manager” on page 337](#).

When you run the **GENERATE** action, members that are defined in the exclude lists are not replaced when the work (WK\*) libraries are copied to the runtime (RK\*) libraries.

After you run the **GENERATE** action, you can review a list of the members that were not replaced in the runtime (RK\*) libraries. The list of members is provided in the exclude report, which is identified by the EXCLRPT DD statement.

**Exclude report (EXCLRPT)**

The exclude report (identified by the EXCLRPT DD statement) lists the members that were not replaced in the runtime (RK\*) libraries by the **GENERATE** action job.

The exclude report is included in the job output for the **GENERATE** action only. If the **OPTION** parameter is used, the exclude report is generated only for options **NOUSS** and **QUICKCONFIG**.

**Note:** Both the **NOUSS** and **QUICKCONFIG** options update the configurable members for the runtime environment.

The following figure shows an example of the exclude report:

```

=====
EXCLUDE members not replaced in RK* libraries:
=====

Figure 37: Example exclude report (EXCLRPT)

The following details describe the contents of the exclude report:

- The exclude report provides the status of excluded members for the following libraries:
  - RKANCMDU
  - RKANPARU
  - RKANSAMU
  - RKD2PAR
  - RKD2PRF
  - RKD2SAM

At least one excluded member must be found in the RK\* data set for the respective section to be included in the report. If there are not any members excluded across all runtime libraries, the exclude report is not written.

- The exclude report provides the status for each excluded member as follows:

## default

The member name is defined in the IBM-provided exclude list member KCI\$IW2R.

**Note:** Separate agent exclude rules are concatenated into the KCI\$IW2R member.

## user

The member name is defined in the user-defined exclude list member EMBEDS (KCI\$XW2R).

## duplicate

The member name is defined in both the IBM-provided exclude list member KCI\$IW2R and the user-defined exclude list member EMBEDS (KCI\$XW2R). The report uses an asterisk (\*) to emphasize duplicate members and provide guidance to remove the duplicate definitions.

**Tip:** Because the member is defined in the default IBM-provided exclude list member KCI\$IW2R, you can remove the member name from your user-defined exclude list member EMBEDS (KCI\$XW2R).

- The exclude report includes the global definitions members for the following products:
  - IBM OMEGAMON for CICS ([Overview of the Global Data Area](#))
  - IBM OMEGAMON for IMS ([KIPGLB global definitions members](#))

The report uses two asterisks (\*\*) to identify the global definitions members that are regenerated by Configuration Manager; these members are not affected by the exclude rules.

## DELETE

Use the **DELETE** action to delete the runtime libraries for your runtime environment.

### Before you begin

Review the following information before you use the **DELETE** action:

- The **DELETE** action requires the **RTE\_NAME** and **RTE\_PLIB\_HILEV** parameters and values.
- If you are implementing a [remote deployment scenario](#) and used the **KFJ\_LOCAL\_PLIB\_HILEV** parameter when creating the runtime environment, you can also specify this parameter for the **DELETE** action, depending on your situation. For more information, see [“Deleting libraries used for remote deployment” on page 260](#).
- Review details about the data sets that are deleted by the **DELETE** action and those that are not affected, as follows:

#### Data sets that are deleted by the DELETE action

The **DELETE** action deletes the runtime libraries created by the **GENERATE** action. This includes the PARMGEN libraries that the **GENERATE** action creates: WCONFIG, interim staging, work, and global user JCL.

The following list describes the name patterns of the data sets that are affected by the **DELETE** action:

- Data sets that match the following name patterns:
  - rte\_plib\_hilev.rte\_name.\**
  - rte\_hilev.rte\_name.\**
  - rte\_vsam\_hilev.rte\_name.\**By default, these are all the same pattern, because the default value for *rte\_hilev* and *rte\_vsam\_hilev* is *rte\_plib\_hilev*.
- For the following data sets, the default values for these parameters, when not specified explicitly, include *rte\_name*, but custom values are allowed:
  - rte\_pds\_hilev.\**
  - rte\_pds2\_hilev.\**

- Data sets that match the following product-specific name patterns, if the respective products have been configured:

**IBM Z® OMEGAMON® AI for Db2**

KD2\_OMPE\_DSHLQ.\*  
KD2\_OMPE\_VSAM\_DSHLQ.\*

**IBM OMEGAMON for IMS on z/OS**

KI2\_LOGR\_EHLQ.KI2\_LOGR\_LS\_PREFIX.\*

- For remote deployment scenarios, if you used the **KFJ\_LOCAL\_PLIB\_HILEV** parameter for deploying remote environments, data sets that match the following name patterns:

*kfj\_local\_plib\_hilev.rte\_name.\**  
*kfj\_local\_hilev.rte\_name.\**  
*kfj\_local\_vsam\_hilev.rte\_name.\**  
*kfj\_local\_pds\_hilev.\**

**Note:** When deploying remote environments, the *rte\_\** parameters are for the remote runtime environments and the *kfj\_local\_\** parameters are for the local runtime environments. On a single run of the **DELETE** action, either *rte\_\** parameter values or *kfj\_local\_\** parameter values are used for the high-level qualifier.

**Data sets not affected by the DELETE action**

The **DELETE** action does not affect the following data sets:

- The runtime environment definition library: *rte\_plib\_hilev.RTEDEF*
- The security exits library, defined by **RTE\_X\_SECURITY\_EXIT\_LIB**
- The embed overrides library, defined by **RTE\_X\_OVERRIDE\_EMBEDS\_LIB**
- Any other data sets, such as persistent data store data sets, that have been allocated outside the *rte\_name*-based data set name patterns described previously
- z/OS® UNIX® System Services directories

**About this task**

The following list provides details about the **DELETE** action:

- The **DELETE** action uses the specified information and values in the configuration members to derive the names of the data sets to be deleted.
- You must perform the **DELETE** action on the system where the files to be deleted exist, which is significant in remote deployment scenarios.
- The **DELETE** action requires the **CONFIRM** workflow variable to delete the data sets. You can also use the **CONFIRM** parameter to preview the data sets that will be deleted. Specify the **CONFIRM** parameter in the **KCIVARS DD** statement with one of the following values:

**N**

(Default) List all data sets that will be deleted. The list appears in **KCIPRINT**.

**Important:** It is recommended that you review the list of data sets that will be deleted before performing the delete.

**Y**

Delete the data sets. The **DELETE** action deletes your runtime libraries, as described in [“Data sets that are deleted by the DELETE action”](#) on page 258.

**Procedure**

Perform the following steps on the system where the files to be deleted exist:

1. Modify the KFJJMCM sample job in TKANSAM (see example below) to select a **DELETE** action.
2. Add the **CONFIRM** workflow variable and set to N, which will allow you to review the list of data sets that will be deleted.
3. Specify values for the required parameters **RTE\_NAME** and **RTE\_PLIB\_HILEV**.
4. For remote deployment scenarios: If you are using remote deployment and want to delete data sets on the configuration system, specify the **KFJ\_LOCAL\_PLIB\_HILEV** parameter and value.
5. Run the KFJJMCM job to display the data sets that will be deleted.  
The list appears in the KCIPRINT SYSOUT data set.
6. Review the generated list of data sets that will be deleted.
7. If you are satisfied with the list of data sets that will be deleted, change the **CONFIRM** workflow variable to Y and run the KFJJMCM job.  
The **DELETE** action deletes your runtime libraries.

The following JCL deletes the runtime libraries for the runtime environment that is defined in the member TSOUID.MONSUITE.RTEDEF(RTE1).

Figure 38: Example JCL to perform the **DELETE** action

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUITE.TKANMOD
//KCIFFLOW DD DISP=SHR,DSN=MONSUITE.TKANCUS(KFJOMEGA)
//KCIIVARS DD *
ACTION          DELETE
CONFIRM         Y
RTE_NAME       RTE1
RTE_PLIB_HILEV TSOUID.MONSUITE
/*
```

Note the JES2 **SYSAFF** that causes the job to run on LPAR ZOS1. This is required only if the **RTE\_NAME** parameter in the TSOUID.MONSUITE.RTEDEF(RTE1) member refers to a variable whose value is LPAR-specific.

## Deleting libraries used for remote deployment

You can use the **DELETE** action to delete libraries used for remote deployment.

The process of deploying a remote environment using the Configuration Manager **PACKAGE** and **DEPLOY** actions results in multiple sets of data sets on multiple systems. In a remote deployment scenario, you create a runtime environment on a specific LPAR (the configuration system), package the runtime environment data sets into transferable dump data sets on the configuration system, transfer the packaged data sets to the remote target system (target system), and deploy the packaged runtime environment data sets on the target system. As mentioned previously, many data sets are created; and these data sets can also have different high-level qualifiers. Deleting these data sets manually would be a complex task. Instead, you can delete these data sets easily and accurately using the **DELETE** action.

Using the **DELETE** action, you can remove these data sets on the configuration system or the target system, and you must perform the **DELETE** action on the system where the files to be deleted exist. If you used the **KFJ\_LOCAL\_PLIB\_HILEV** parameter when creating the runtime environment, the **DELETE** action identifies and deletes the runtime environment that was generated for a remote system using different high-level qualifiers.

**Important:** It is recommended that you review the list of data sets that will be deleted by using the **CONFIRM** workflow variable set to N before performing the delete. After you are satisfied with the generated list, run the **DELETE** action using the **CONFIRM** workflow variable set to Y to delete the data sets.

The following examples describe which parameters to use with the **DELETE** action depending on your situation and assumes that you used **KFJ\_LOCAL\_PLIB\_HILEV** when creating your runtime environment.

**Note:** For information about the data sets that are affected, see [“Data sets that are deleted by the DELETE action” on page 258](#).

### Deleting data sets on the configuration system

To delete runtime environment data sets on the configuration system, run the **DELETE** action on the configuration system using the parameters in the following example. To indicate the high-level qualifier, note that both the **RTE\_PLIB\_HILEV** and **KFJ\_LOCAL\_PLIB\_HILEV** parameters are specified.

```
//KCIVARS DD *
ACTION          DELETE
CONFIRM         Y
RTE_NAME       RTE1
RTE_PLIB_HILEV TSOUID.TARG1
KFJ_LOCAL_PLIB_HILEV TSOUID.LOCL1
```

Figure 39: Example to delete data sets on the configuration system

This example will use the `TSOUID.LOCL1.RTEDEF(PCK$*)` members to generate the list of data sets to delete on the configuration system.

**Important:** Make sure to specify the correct values for the **RTE\_PLIB\_HILEV** and **KFJ\_LOCAL\_PLIB\_HILEV** parameters; otherwise, unexpected results might occur. It is important that you review the generated list of data sets to be deleted using the **CONFIRM** workflow variable set to **N**.

### Deleting data sets on the remote system (target system)

To delete runtime environment data sets on the target system, run the **DELETE** action on the target system using the parameters in the following example. To indicate the high-level qualifier, note that only the **RTE\_PLIB\_HILEV** parameter is specified.

```
//KCIVARS DD *
ACTION          DELETE
CONFIRM         Y
RTE_NAME       RTE1
RTE_PLIB_HILEV TSOUID.TARG1
```

Figure 40: Example to delete data sets on the remote system (target system)

This example will delete the data sets for the runtime environment on the target system with high-level qualifier `TSOUID.TARG1`, or as defined in `TSOUID.TARG1.RTEDEF(RTE1)`.

**Important:** Make sure to specify the correct value for the **RTE\_PLIB\_HILEV** parameter. If you inadvertently specify the value that was used for parameter **KFJ\_LOCAL\_PLIB\_HILEV** for parameter **RTE\_PLIB\_HILEV**, unexpected results might occur. It is important that you review the generated list of data sets that will be deleted using the **CONFIRM** workflow variable set to **N**.

## MIGRATE

The **MIGRATE** action imports configuration settings from a runtime environment that is configured with **PARMGEN** to one that is configured with Configuration Manager.

### Before you begin

Review the following information before you use the **MIGRATE** action:

- If you migrate a runtime environment that is configured with **PARMGEN** to one that is configured with Configuration Manager, you can no longer use **PARMGEN** to configure the runtime environment. For more information, see [“Comparison with PARMGEN” on page 216](#).
- In this task, *source* refers to the runtime environment that is configured with **PARMGEN**, and *target* refers to the runtime environment that is configured with Configuration Manager.

- Migration works only for OMEGAMON products that are supported by Configuration Manager. If the migration source contains other products configured by PARMGEN that are not supported by Configuration Manager, error message [KFJ00001E](#) is issued for the **MIGRATE** action in the KCIPRINT output, and the job ends. For the list of supported products, see [“Products supported by Configuration Manager” on page 214](#).
- Consider the naming convention that you will use for your target runtime environment. Source and target runtime environments can share the same high-level qualifier, which is referred to as an *in-place migrate*.

**Note:** Whereas PARMGEN stores parameters in `rte_plib_hilev.rte_name.WCONFIG` for each runtime environment, Configuration Manager stores parameters and variables in `rte_plib_hilev.RTEDEF`, which can contain definitions for multiple runtime environments. For more information about the differences between PARMGEN and Configuration Manager, see [“Comparison with PARMGEN” on page 216](#).

- The **MIGRATE** action supports migrating one or multiple PARMGEN runtime environments into a single Configuration Manager RTEDEF configuration. It is recommended that you decide prior to the migration of your first runtime environment whether you plan to migrate one or multiple runtime environments into a single RTEDEF.

**Note:** If you are going to set up a High Availability TEMS (HA TEMS), make sure only one runtime environment is defined in the RTEDEF (that is, the one used for the HA TEMS).

- For parameters that describe data set qualifiers, the **MIGRATE** action does not migrate parameters that have been customized with hardcoded values that partially match the PARMGEN `RTE_HILEV` parameter value. For example, if in your PARMGEN configuration, you have set parameter `KD2_OMPE_DSHLQ` to use value `TEST.RTE1.HLQ1`, and `RTE_HILEV` is set to `"TEST.RTE1"`, then `KD2_OMPE_DSHLQ` will not be migrated.  
Before migrating from PARMGEN to Configuration Manager, review your customized parameters that describe data set qualifiers. If you have customized data set names that partially match your PARMGEN configuration `RTE_HILEV` value, but use a hardcoded value instead of parameter reference `%RTE_HILEV%`, you must update the value to use `%RTE_HILEV%` in order for the parameter to migrate successfully.
- Before performing a **MIGRATE** action, make sure you have a backup of your source PARMGEN runtime environment. The next step in Configuration Manager after a migration is to generate runtime members using the **GENERATE** action. If you perform an in-place migration, the subsequent **GENERATE** action will overwrite the runtime environment data sets that were used by PARMGEN.

## About this task

With the **MIGRATE** action, you can import existing PARMGEN runtime environment configuration settings from a specific `WCONFIG` member into the Configuration Manager `rte_plib_hilev.RTEDEF`. The **MIGRATE** action reads the `WCONFIG` and other data sets from a PARMGEN installation, from which it creates the [sparse descriptors](#) containing the parameters, hiding every parameter setting that is considered a default or has not been changed. It also copies other files for system variables support, embed overrides, and security exits that are required to support the migration.

The following list provides details about the **MIGRATE** action:

- The **MIGRATE** action supports migrating one PARMGEN runtime environment at a time.
- You can migrate one or more PARMGEN runtime environments into a single Configuration Manager RTEDEF configuration. The default behavior of the **MIGRATE** action is to migrate only one runtime environment into the RTEDEF data set. Using the **OPTION MULTIPLE** parameter, you can migrate multiple runtime environments into a single RTEDEF data set. Each runtime environment migration requires a separate **MIGRATE** action job. If you plan to migrate multiple runtime environments into a single RTEDEF data set, make sure to include the **OPTION MULTIPLE** parameter on every **MIGRATE** action job, including the first one.

**Note:** You can abbreviate **OPTION MULTIPLE** to **OPTION MULTI**.

- The **MIGRATE** action creates the necessary members in the RTEDEF data set, as follows:

- When using the default behavior of the **MIGRATE** action to migrate one runtime environment into a single RTEDEF data set (omitting the **OPTION MULTIPLE** parameter), the **MIGRATE** action will create members of type *Kpp\$PARM* in the respective created RTEDEF data set, along with the *rte\_name* member for the runtime environment-specific parameters.
- When migrating multiple runtime environments into a single RTEDEF configuration, use parameter **OPTION MULTIPLE** and **KFJ\_SYSNAME** *lpar* in `KCIVARS DD`. The **MIGRATE** action will create members of type *Kpp\$lpar* in the RTEDEF data set, along with the *rte\_name* member for the runtime environment-specific parameters.  
On subsequent runs of the **MIGRATE** action, reuse the same **RTE\_PLIB\_HILEV** parameter value, but update the values for parameters **RTE\_NAME**, **KFJ\_MIGRATE\_WCONFIG**, and **KFJ\_SYSNAME** to create a new set of runtime environment parameter members. There is no limit on how many runtime environments can be migrated into a single RTEDEF data set.
- If the **MIGRATE** action detects that a specified target RTEDEF already contains *Kpp\$lpar* and *rte\_name* members, **MIGRATE** issues an error message and stops. Note that **MIGRATE** will detect *Kpp\$PARM* and *VAR\$GLOB* members in RTEDEF as well. Because these members are considered to have a sysplex scope, they can only exist in RTEDEF during the migration process if no additional *Kpp\$lpar* members are intended to be migrated into the same RTEDEF. Depending on the case, any of the following messages might appear: [KFJ00218E](#), [KFJ00219E](#), [KFJ00220E](#)
- The **MIGRATE** action accepts PARMGEN runtime environments with system variables. However, system variables are not copied unless you have chosen to override them in your PARMGEN configuration. Variables are copied to the RTEDEF member *VAR\$GLOB* for a default (single) **MIGRATE** action or member *VAR\$lpar* in a multiple **MIGRATE** action.
- For parameters that use variables as their values, unlike PARMGEN, Configuration Manager does not allow the parameter and the variable to have the same name. If such settings exist in your PARMGEN configuration, the **MIGRATE** action renames the variables automatically. In most cases, the suffix *\_R* is added to the variable name. For more information, see [“Variables migrated from PARMGEN” on page 335](#).
- The **MIGRATE** action allocates the security exits library with the default name *rte\_plib\_hilev.rte\_name*. *SECEXITS* (or, optionally, the name specified in the **KFJ\_SECURITY\_EXITS\_LIB** parameter). The **MIGRATE** action also copies the security exits used by the PARMGEN environment to the specified security exits library, and defines the source security exits library to the runtime environment using the **RTE\_X\_SECURITY\_EXIT\_LIB** parameter. For more information, see [“Setting up security exits in your runtime environment” on page 336](#).

**Important:** The **RTE\_X\_SECURITY\_EXIT\_LIB** parameter will contain the name of the security exits library used by the source PARMGEN environment; you must review this setting and update it if necessary before running the **GENERATE** action.

- If the use of override embed members is enabled by specifying parameter **KFJ\_USE\_EMBEDS** set to *Y*, the **MIGRATE** action allocates the embeds data set with the default name *rte\_plib\_hilev.rte\_name*. *EMBEDS* (or, optionally, the name specified in the **KFJ\_EMBEDS\_LIB** parameter). The **MIGRATE** action sets up the embeds data set, populates it with supported override embed parameters (if applicable), and defines it to the runtime environment using the **RTE\_X\_OVERRIDE\_EMBEDS\_LIB** parameter. For more information, see [“Using override embed members in Configuration Manager” on page 337](#).
- The **MIGRATE** action works with the **KFJ\_LOCAL\_PLIB\_HILEV** parameter to allow for local generation of runtime environments for remote systems using different high-level qualifiers. When the **KFJ\_LOCAL\_PLIB\_HILEV** parameter is specified, the generated *kfj\_local\_plib\_hilev*.RTEDEF data set will contain an additional member: *PCK\$PARM* for a default (single) **MIGRATE** action, or member *PCK\$lpar* in a multiple **MIGRATE** action. This member allows locally generated runtime environments using a different data set high-level qualifier than the one intended to be used on the deployment target (for example, the production system).  
  
For more information about remote deployments, see [“Special considerations for SYSPLEX rollout” on page 323](#), [“RTEDEF\(PCK\\$PARM\)” on page 326](#), and [“Deploying remote runtime environments” on page 341](#).

#### After you run the **MIGRATE** action

After you run the **MIGRATE** action, you must carefully review the generated RTEDEF data set members to verify that the parameters have the expected values. You can use the report provided in the **MIGRATE** job

output identified by the MIGRPT DD statement to review details about the parameters. This report presents parameters in the following groups:

- Parameters that are migrated to the RTEDEF data set because their values are different from the default values
- Parameters that are always migrated, regardless of values being default or not
- Parameters that are not migrated because of having default values
- Parameters that are not migrated because they match the PARMGEN **RTE\_HILEV** parameter value

This report provides each parameter with its resolved value. Note that some parameters use system variables or are dependent on other parameters, and some parameters inherit values from other parameters and might be regarded as having default values. Additionally, some parameters have different default values than PARMGEN, as outlined in “Parameters with different default values than PARMGEN” on page 292.

**Important:** Verify that the data set high-level qualifiers, data set names, and z/OS® UNIX® System Services paths are correct, as a subsequent **GENERATE** action might overwrite existing files.

To migrate a PARMGEN runtime environment to a Configuration Manager runtime environment, use the following procedure.

**Note:** The **CONFIRM** workflow variable is not supported for the **MIGRATE** action.

## Procedure

1. Modify the KFJJMCM sample job in TKANSAM (see example below) to select a **MIGRATE** action.
2. Specify the required parameter values, as follows:
  - a. Specify values for the target environment that is to be configured with Configuration Manager in parameters **RTE\_NAME** and **RTE\_PLIB\_HILEV**.
  - b. Specify the name of the source WCONFIG data set in the **KFJ\_MIGRATE\_WCONFIG** parameter. This is the WCONFIG data set of the PARMGEN-configured runtime environment from which configuration settings are to be imported.
3. (Optional) Specify additional parameters as needed, for example:
  - To migrate this runtime environment into a RTEDEF data set containing multiple runtime environment configurations, add the **OPTION MULTIPLE** and **KFJ\_SYSNAME 1par** parameters. If this is a subsequent run of the **MIGRATE** action, reuse the same **RTE\_PLIB\_HILEV** parameter value, but update the values for parameters **RTE\_NAME**, **KFJ\_MIGRATE\_WCONFIG**, and **KFJ\_SYSNAME**.
  - To specify a different name for the security exits library, add the **KFJ\_SECURITY\_EXITS\_LIB** parameter and value.
  - To enable the use of override embed members, add the **KFJ\_USE\_EMBEDS** parameter set to Y and the **KFJ\_EMBEDS\_LIB** parameter and value.
4. Run the KFJJMCM job to perform the migration and generate the new RTEDEF data set. Job messages for the **MIGRATE** action are written to the KCIPRINT SYSOUT data set.
5. Review the generated RTEDEF data set members to verify that the parameters have the expected values. Verify that the data set high-level qualifiers, data set names, and z/OS® UNIX® paths are correct. You can also use the report provided in the **MIGRATE** job output identified by the MIGRPT DD to review details about the parameters.

The following JCL jobs migrate an existing PARMGEN configuration pointed to by *highlevel.WCONFIG* into an RTEDEF library *TSUID.MONSUITE.RTEDEF*. The first example is for a single runtime environment RTEDEF, and the second example is for a multiple runtime environment RTEDEF. These examples also specify that override embed members are enabled and provide custom data set names for the security exits and embeds libraries.

*Figure 41: Example JCL to perform the **MIGRATE** action for a single runtime environment RTEDEF*

## What to do next

After you have finished migrating your PARMGEN runtime environments into the Configuration Manager RTEDEF library, use the **GENERATE** action to generate runtime members using the configured parameters. See [GENERATE](#).

## PACKAGE

The **PACKAGE** action packages a runtime environment that can then be deployed to a remote system.

## Before you begin

Review the following information before you use the **PACKAGE** action:

- You can run the **PACKAGE** action only after you have successfully generated a runtime environment using the **GENERATE** action. For more information about the complete remote deployment process, see [“Remote deployment scenario” on page 341](#).
- The **PACKAGE** action uses the z/OS DFSMSdss **DUMP** command. You might need authority to run **ADDRSSU**, which is the program that is invoked when using DFSMSdss. Specifically, the **PACKAGE** action uses the **DUMP** command keywords **CONCURRENT** and **TOLERATE(ENQFAILURE)**. The use of these keywords with the **DUMP** command is controlled by the following RACF FACILITY class profiles:

Keyword	Profile Name
CONCURRENT with DUMP	STGADMIN.ADR.DUMP.CNCURRNT
TOLERATE(ENQF) with DUMP	STGADMIN.ADR.DUMP.TOLERATE.ENQF

Make sure that you have the proper RACF authority to use DFSMSdss and these keywords. If authorization is required, DFSMSdss issues error message [ADR707E](#).

For more information, see *z/OS DFSMSdss Storage Administration Guide: [Protecting DFSMSdss functions with RACF FACILITY class profiles](#)*.

- Before you run the **PACKAGE** action, perform the following important steps:
  - For an existing runtime environment, stop the started tasks for that runtime environment. Started tasks can lock runtime members, which can cause the **PACKAGE** action to fail.
  - For the SMS-managed data sets for the runtime environment to be packaged, make sure that any migrated data sets are recalled.

#### Related topics

- [“Remote deployment scenario” on page 341](#)

- [“KFJ\\_PACK\\_HILEV” on page 307](#)
- [“DEPLOY” on page 268](#)

#### About this task

The following list provides details about the **PACKAGE** action:

- The **PACKAGE** action uses the z/OS DFSMSdss **DUMP** command to create a series of data sets that contain the runtime environment. These dump files can be transferred across SYSPLEX boundaries, using methods like FTPS. The **PACKAGE** action is used in conjunction with the **DEPLOY** action.
- The **PACKAGE** action requires the use of the KCIALPHA program. KCIALPHA is an APF-authorized version of KCIOMEGA.
- You must specify high-level qualifier values for locating existing data sets and for allocating the output package data sets. The following parameters are used for specifying high-level qualifiers:

##### **RTE\_PLIB\_HILEV**

(Required) Specifies the high-level qualifiers for the runtime environment definition (RTEDEF) library, as follows:

- If local libraries are not used (that is, parameter **KFJ\_LOCAL\_PLIB\_HILEV** is not specified), **RTE\_PLIB\_HILEV** specifies the high-level qualifier of the RTEDEF library on the configuration system.
- If local libraries are used (that is, parameter **KFJ\_LOCAL\_PLIB\_HILEV** is also specified), **RTE\_PLIB\_HILEV** specifies the high-level qualifier of the RTEDEF library on the remote (target) system.

You must specify the **RTE\_PLIB\_HILEV** parameter and value for the **PACKAGE** action.

##### **KFJ\_LOCAL\_PLIB\_HILEV**

(Optional) Specifies the high-level qualifier for the local libraries. You must specify this parameter and value for the **PACKAGE** action if the parameter was used with the **CREATE** and **GENERATE** actions when building the runtime environment to be packaged. Otherwise, do not specify this parameter for the **PACKAGE** action. For more information on using local libraries for remote deployment, [“Remote deployment example using local libraries” on page 343](#).

**Note:** Parameter **KFJ\_LOCAL\_PLIB\_HILEV** is used when packaging the runtime environment; it is not used when deploying the package.

##### **KFJ\_PACK\_HILEV**

(Optional) Specifies a custom high-level qualifier for the output package data sets, which can be useful to distinguish the package data sets from the many runtime environment data sets in the local

libraries. If this parameter is not specified, the value for parameter **KFJ\_LOCAL\_PLIB\_HILEV** (if specified) or **RTE\_PLIB\_HILEV** is used as the high-level qualifier for the output package data sets.

- The **PACKAGE** action creates the following package data sets:
  - A set of dump data sets using the following naming convention:

```
package_hlq.rte_name.PACKxx.DMP
```

where:

- *package\_hlq* is one of the following values:
  - **KFJ\_PACK\_HILEV** parameter value, if specified
  - **KFJ\_LOCAL\_PLIB\_HILEV** parameter value, if **KFJ\_PACK\_HILEV** is not specified
  - **RTE\_PLIB\_HILEV** parameter value, if neither **KFJ\_PACK\_HILEV** or **KFJ\_LOCAL\_PLIB\_HILEV** is specified

To avoid exceeding the z/OS 44-character limit for data set names, the combined length of *package\_hlq* and *rte\_name* should not exceed 28 characters. For example, if *rte\_name* is 8 characters, then *package\_hlq* should not exceed 20 characters.

- *xx* is one of the following package codes:

**MN**

Main non-VSAM package. Contains data sets from the **RTE\_HILEV** libraries and some from the **RTE\_PLIB\_HILEV** libraries.

**MV**

Main VSAM package. Contains non-history related VSAM data sets from the **RTE\_VSAM\_HILEV** libraries.

**HN**

History non-VSAM package. Contains history-related data sets from the **RTE\_PDS\_HILEV** libraries.

**HV**

History VSAM package. Contains history-related data sets from the **RTE\_VSAM\_HILEV** libraries.

- A metadata file named *package\_hlq.rte\_name.PACKMD*. This flat file is not tersed or dumped and is required for the **DEPLOY** action if local libraries are used for the deployment.
- You can specify the following optional parameters in the **KCIVARS DD** statement when running the **PACKAGE** action:

**KFJ\_ADDRSSU\_ADMIN**

Specifies whether to use the **ADMINISTRATOR** keyword with z/OS **DFSMSdss** commands. Valid values are **Y** and **N**. The default is **N**. This option might be required depending on the security settings at your site.

**KFJ\_PACK\_TERSE**

Specifies if the dump data sets should also be tersed. Valid values are **Y** and **N**. The default is **N**. Specify **Y** if you want to transfer the packages using **FTP**. In this case, the dump files will be tersed and only the tersed copy will be retained.

**Note:** If you are using virtual tapes to transfer your data sets, tersing the dump files is not necessary.

If specified, the following parameters will be used for both the **DMP** and **DMP .TRS** data sets:

**KFJ\_PACK\_DATACLAS**

Specifies the data class for the package. This setting is needed for large package files or tersed files as it allows you to specify multiple volumes.

### KFJ\_PACK\_MGMTCLAS

Specifies the management class for the package.

### KFJ\_PACK\_STORCLAS

Specifies the storage class for the package.

### KFJ\_PACK\_UNIT

Specifies the unit for the package if non-SMS or virtual tape is used.

### KFJ\_PACK\_VOLUME

Specifies the volume for the package if non-SMS or virtual tape is used.

- You can use the **OPTION NOUSS** parameter to bypass the z/OS® UNIX® System Services workflow stage and not include any related files or directories in the produced output data sets.

To run the **PACKAGE** action, complete the following steps.

## Procedure

1. Update the KFJJMCM sample job in TKANSAM as follows (see example below):
  - a. Select a **PACKAGE** action.
  - b. Change the program name in the JCL **EXEC** statement from KCIOMEGA to KCIALPHA.
  - c. Specify values for the required parameters **RTE\_NAME** and **RTE\_PLIB\_HILEV**.
  - d. (Optional) Specify any additional parameters as needed.
2. For an existing runtime environment, stop the started tasks for that runtime environment.
3. Make sure that any migrated SMS-managed data sets to be packaged have been recalled.
4. Run the KFJJMCM job to perform the packaging process and generate the related package files. Job messages for the **PACKAGE** action are written to the KCIPRINT SYSOUT data set.

## Result

The packaging dump data sets and the metadata file are created.

## Example

The following JCL creates DUMP data sets for the runtime environment that is defined by members of the TSOUID.MONSUITE.RTEDEF library.

Figure 43: Example JCL to perform the PACKAGE action

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1 EXEC PGM=KCIALPHA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUITE.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=MONSUITE.TKANCUS(KFJOMEGA)
//KCIIVARS DD *
ACTION          PACKAGE
RTE_NAME        RTE1
RTE_PLIB_HILEV  TSOUID.MONSUITE
/*
```

## What to do next

Transfer the files to the target system using a method like FTPS, and run the **DEPLOY** action.

## DEPLOY

The **DEPLOY** action deploys a packaged runtime environment to a remote system.

## Before you begin

Review the following information before you use the **DEPLOY** action:

- You can run the **DEPLOY** action only after you have successfully packaged a runtime environment using the **PACKAGE** action.
- The **DEPLOY** action uses z/OS DFSMSdss commands. You might need authority to run **ADDRSSU**, which is the program that is invoked when using DFSMSdss. If authorization is required, DFSMSdss issues error message **ADR707E**. For more information, see *z/OS DFSMSdss Storage Administration Guide: Protecting DFSMSdss functions with RACF FACILITY class profiles*.
- If you do not have any SMP/E target libraries on the system on which you want to run a **DEPLOY** action, you can use the utility **TKANSAM**(**KFJMAINT**) with the **BLDREMDS** action to build the necessary minimum data sets (**TKANSAM**, **TKANMOD**, and **TKANCUS** libraries) needed to run the action. Make sure you transfer the created data sets to your remote system where **DEPLOY** should run and where the necessary APF authorization of the **TKANMOD** library is made. These SMP/E target libraries are the minimum required to allow Configuration Manager to run for a full runtime environment. However, for a runtime environment that you are sharing with SMP/E, you will need to copy your entire set of SMP/E target libraries to the system where you run the **DEPLOY** action.

**Important:** When you use the **DEPLOY** action, the target runtime environment data sets will be updated. Verify that these data sets are not in use before you use the **DEPLOY** action.

**Important:** The **PACKAGE** action creates a metadata file named *package\_hlq.rte\_name.PACKMD*. The **DEPLOY** action requires the **PACKMD** metadata file if a data set is renamed, which can occur if the **KFJ\_LOCAL\_\*** parameters (in the **KCIVARS DD** and in the **PCK\$PARM** member) are used when creating the package. If the **PACKMD** file is not available, the **DEPLOY** action restores packages as is, retaining all high-level qualifiers and SMS properties, and you might experience unpredictable results in your deployment. It is recommended that you use the **PACKMD** metadata file when using the **DEPLOY** action.

- [“KFJ\\_LOCAL\\_PLIB\\_HILEV” on page 302](#)
- [“KFJ\\_PACK\\_HILEV” on page 307](#)

#### About this task

The following list provides details about the **DEPLOY** action:

- The **DEPLOY** action deploys a runtime environment by restoring [package data sets](#) generated by the **PACKAGE** action on a target system. The **DEPLOY** action uses DFSMSdss to restore the data sets.
- The **DEPLOY** action requires the use of the **KCIALPHA** program. **KCIALPHA** is an APF-authorized version of **KCIOMEGA**.
- You must specify high-level qualifier values that are used for locating existing data sets. The following parameters are used for specifying high-level qualifiers:

##### **RTE\_PLIB\_HILEV**

(Required) Specifies the high-level qualifiers for locating the runtime environment definition (**RTEDEF**) library. You must specify this parameter and value for the **DEPLOY** action.

##### **KFJ\_PACK\_HILEV**

(Optional) Specifies the high-level qualifier value for the package data sets. If this parameter is not specified, the value for parameter **RTE\_PLIB\_HILEV** is used.

**Important:** You must use parameter **KFJ\_PACK\_HILEV** with the **DEPLOY** action if you transferred your package data sets with a high-level qualifier that is different from **RTE\_PLIB\_HILEV**.

**Note:** It is recommended that you specify the **KFJ\_PACK\_HILEV** parameter when deploying your runtime environment.

**Note:** Parameter **KFJ\_LOCAL\_PLIB\_HILEV** is not supported on the **DEPLOY** action.

- You can optionally control when to run the **DEPLOY** workflow stage that deploys the parts related to z/OS® UNIX® System Services. By default, the **DEPLOY** action automatically deploys files and directories related to z/OS® UNIX®, if they are present in the packaged runtime environment data sets. However, there might be cases where you want to skip this step (for reasons such as authorization issues), and perform this step at a later time. You can use the **OPTION** parameter to specify the **NOUSS** or **USS** value to control this processing, as follows:

#### **NOUSS**

When **OPTION NOUSS** is specified, the **DEPLOY** action does not run the stage that deploys the parts related to z/OS® UNIX®.

With this option, only z/OS data sets are deployed; files and directories related to z/OS® UNIX® are bypassed.

#### **USS**

When **OPTION USS** is specified, the **DEPLOY** action runs only the stage that deploys the parts related to z/OS® UNIX®; no other processing is performed.

This option is useful when you want to refresh files and directories related to z/OS® UNIX® only.

- The **DEPLOY** action performs an unconditional restore for the main VSAM and non-VSAM packages (fully replaces the data sets) and a conditional restore for the history packages (does not replace existing data sets). Note the following behaviors:
  - If the history dump data sets (\*\*.PACKHN or \*\*.PACKHV) are not found or failed to restore, a return code of 4 will be generated.
  - If the main dump data sets (\*\*.PACKMN or \*\*.PACKMV) are not found or failed to restore, a return code of 8 will be generated.

**Note:** The **DEPLOY** action replaces some main package VSAM and non-VSAM files, but does not replace any history-related files. Therefore, it is normal for PACKHN and PACKHV deploy flows to end with RC=8. If you want to avoid this, for example if you roll out maintenance, do not transfer these packages to the target system. While normally a return code of 8 would cause Configuration Manager to stop, in this particular situation (history files), a return code of 8 is considered acceptable and will not prevent Configuration Manager from continuing to function.

- When restoring (and potentially unversing) the packaged runtime environment, the **DEPLOY** action reuses the following parameters that were used with the **PACKAGE** action:
  - **KFJ\_PACK\_HILEV**
  - **KFJ\_ADRDSSU\_ADMIN**
  - **KFJ\_PACK\_TERSE**
  - **KFJ\_PACK\_DATACLAS**
  - **KFJ\_PACK\_UNIT**
  - **KFJ\_PACK\_VOLUME**

See “PACKAGE” on page 265 for information about these parameters.

- If **KFJ\_PACK\_TERSE** is set to Y, the **DEPLOY** action first untermses the package. The untermesed DMP file high-level qualifier and SMS parameters are used as specified in the following parameters:
  - **RTE\_PLIB\_HILEV**
  - **RTE\_SMS\_MGMTCLAS**
  - **RTE\_SMS\_STORCLAS**
  - **RTE\_SMS\_UNIT**
  - **RTE\_SMS\_VOLUME**
- For large packages being untermesed, you should use **KFJ\_PACK\_DATACLAS** accordingly to allow multi-volume data set allocation for the extracted package files.
- If **KFJ\_PACK\_UNIT** or **KFJ\_PACK\_VOLUME** is specified, it applies to all of the packages being untermesed.
- If **RTE\_SMS\_VOLUME** is specified but **RTE\_SMS\_MGMTCLAS** is not, **RTE\_SMS\_MGMTCLAS** defaults to NULLMGMTCLAS. Similarly, **RTE\_SMS\_STORCLAS** defaults to NULLSTORCLAS.

To run the **DEPLOY** action, complete the following steps.

## Procedure

1. Locate the dump (.DMP) data sets and the metadata file (.PACKMD) that were created by the **PACKAGE** action.  
The naming convention of the package data sets is *package\_hlq.rte\_name.PACKMD*, where *package\_hlq* is the value of parameter **KFJ\_PACK\_HILEV** or **RTE\_PLIB\_HILEV**.

**Note:** It is possible that the high-level qualifier value was modified when transferring the package data sets to the remote system.

2. Modify the KFJJMCM sample job in TKANSAM (see example below) to select a **DEPLOY** action.
3. Change the program name in the JCL **EXEC** statement from KCIOMEGA to KCIALPHA.
4. Specify values for the required parameters **RTE\_NAME** and **RTE\_PLIB\_HILEV**.
5. (Optional) Specify any additional parameters as needed.

**Important:** You must use parameter **KFJ\_PACK\_HILEV** if you transferred your package data sets to the remote system with a high-level qualifier that is different from the **RTE\_PLIB\_HILEV** parameter value.

6. Run the KFJJMCM job to perform the deploy process and restore the related package files.  
Job messages for the **DEPLOY** action are written to the KCIPRINT SYSOUT data set and to the \$REPORT DD. If return code 4 or 8 is received, review the \$REPORT DD statement in the JCL job output to ensure that the restore process completed successfully. For more information, see “[DEPLOY action output](#)” on page 272.

The following examples restore (*deploy*) the data sets for a runtime environment that has been packaged by the **PACKAGE** action.

### Using default high-level qualifier with parameter **RTE\_PLIB\_HILEV**

In this example, the package data sets were named using the default high-level qualifier of the runtime definition library and were transferred to the remote system using the same file names.

The packaged data sets contain the runtime environment named RTE1 and the runtime environment definition library TSOUID.MONSUITE.RTEDEF.

The packaged data sets are named TSOUID.MONSUITE.RTE1.PACK\*.

The following **DEPLOY** action job, run on the remote system, deploys (restores) the package data sets on the target LPAR to data sets with the high-level qualifier TSOUID.MONSUITE.

*Figure 44: Example JCL to perform the DEPLOY action using default high-level qualifier*

```

//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1 EXEC PGM=KCIALPHA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUIE.TKANMOD
//KCIFFLOW DD DISP=SHR,DSN=MONSUIE.TKANCUS(KFJOMEGA)
//KCIIVARS DD *
ACTION          DEPLOY
RTE_NAME        RTE1
RTE_PLIB_HILEV  TSOUID.MONSUIE
/*

```

### Using custom high-level qualifier with parameter KFJ\_PACK\_HILEV

You must use parameter **KFJ\_PACK\_HILEV** with the **DEPLOY** action if you transferred your package data sets to the remote system with a high-level qualifier that is different from the **RTE\_PLIB\_HILEV** parameter value.

In this example, the package data sets contain the runtime environment named **RTE1** and the runtime environment definition library **TSOUID.MONSUIE.RTEDEF**. However, the files were transferred to the remote system using the high-level qualifier **TESTSYS**.

As a result, the package data sets on the remote system are named **TESTSYS.MONSUIE.RTE1.PACK\***, requiring the use of parameter **KFJ\_PACK\_HILEV**.

*Figure 45: Example JCL to perform the DEPLOY action using custom high-level qualifier*

```

//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1 EXEC PGM=KCIALPHA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUIE.TKANMOD
//KCIFFLOW DD DISP=SHR,DSN=MONSUIE.TKANCUS(KFJOMEGA)
//KCIIVARS DD *
ACTION          DEPLOY
RTE_NAME        RTE1
RTE_PLIB_HILEV  TSOUID.MONSUIE
KFJ_PACK_HILEV  TESTSYS.MONSUIE
/*

```

### DEPLOY action output

The **DEPLOY** action produces job output that provides information about the deployment of the data sets as a result of the job.

When running in default mode, the **DEPLOY** action writes summarized output and the job return code to the **KCIPRINT** SYSOUT data set and produces a more detailed report in the **\$REPORT** DD. The following sections provide information about these output data sets and their contents, which includes [data set deployment states](#) and [DEPLOY action return codes](#).

#### KCIPRINT

**KCIPRINT** contains a count of the data sets that the **DEPLOY** action processes, summarized by [deployment state](#) (*deployed, skipped, failed*), for each package data set. Looking at **KCIPRINT**, you can see if any data sets failed, but you will not see the exact data set names. This content is a condensed preview of what is included in the **\$REPORT** output. **KCIPRINT** also contains the [return code](#) for the job.

The following figures show example **KCIPRINT** output for the **DEPLOY** action.

The example in “[Figure: DEPLOY action output in KCIPRINT — data set deployment summary](#)” on page 272 shows sample summary counts of the data sets processed by the **DEPLOY** action for each package (dump) data set; the actual number of data sets reported will be unique to the job:

*Figure 46: DEPLOY action output in KCIPRINT — data set deployment summary*

```

IMB Z Monitoring Configuration manager is about to perform DEPLOY action

Processing: PACKMN
- Deployed: .. 30
- Skipped: ... 21
- Failed: .... 0

Processing: PACKHN
- Deployed: .. 0
- Skipped: ... 23

```

```

- Failed: .... 0

Processing: PACKMV
- Deployed: .. 38
- Skipped: ... 41
- Failed: .... 0

Processing: PACKHV
- Deployed: .. 0
- Skipped: ... 14
- Failed: .... 0

```

For more detailed information see \$REPORT DD statement

For more information about the deployment states, see [“Data set deployment states” on page 274](#).

The example in [“Figure: DEPLOY action output in KCIPRINT – return code” on page 273](#) shows a possible return code for the **DEPLOY** action; the actual return code will be unique to the job:

Figure 47: DEPLOY action output in KCIPRINT – return code

```
KFU00004I KCIALPHA is ending; RC=4 SYSPLEX=sysplex LPAR=lpar DATE=...
```

For more information about return codes for the **DEPLOY** action, see [“DEPLOY action return codes” on page 274](#).

For more information about KCIPRINT, see [“Navigating Configuration Manager action output” on page 365](#) and [“Action job output” on page 275](#).

#### \$REPORT

\$REPORT provides details about which data sets were deployed, which were intentionally skipped, and which failed. In addition, the report includes the deployment status of the z/OS UNIX System Services (z/OS UNIX) data sets as a result of the job.

**Note:** If you encounter issues with the **DEPLOY** action and the normal run does not explain what failed, use the **DEPLOY** action with **OPTION DEBUG** to print the complete output.

The following figures shows example \$REPORT output.

The \$REPORT content lists the individual data sets that were skipped, deployed, and failed (if any) for each package (dump) data set. The report sample in [“Figure: DEPLOY action output in \\$REPORT – data set deployment state” on page 273](#) shows a portion of the report for the PACKMN package data set only; the actual number of data sets reported will be unique to the job:

```

Processing data set: PACKMN
Will NOT REPLACE existing data sets
-----
Total deployed data sets: ..... 0
Total skipped data sets: ..... 21
Total failed to deploy data sets: .. 0

Details:
|- Skipped data sets:
||- rte_plib_hilev.rte_name.ims_id.RKOIPCSV
||- rte_plib_hilev.rte_name.ims_id.RKOIPFSV
||- rte_plib_hilev.rte_name.ims_id.RKOIPCSV
...
*****

Processing data set: PACKMN
Will REPLACE existing data sets
-----
Total deployed data sets: ..... 30
Total skipped data sets: ..... 0
Total failed to deploy data sets: .. 0

KS3/rdm/jobs/RDMUNPX  
...
```

Figure 49: DEPLOY action output in \$REPORT – z/OS UNIX data sets

### Data set deployment states

The **DEPLOY** action job output categorizes the processed data sets as follows:

#### Deployed

The **DEPLOY** action has successfully restored these data sets to the target system.

#### Skipped

The **DEPLOY** action skipped these data sets because they contain user data, such as configuration information and history-related files. These data sets should not be overwritten. It is normal to see numerous data sets skipped by the **DEPLOY** action.

#### Failed

The **DEPLOY** action did not restore these data sets to the target system. You should investigate any data sets that failed to deploy.

#### DEPLOY action return codes

The **DEPLOY** action uses the DFSMSdss ADRDSSU program to restore the data sets. It performs an unconditional restore for the main VSAM and non-VSAM packages (fully replaces the data sets) and a conditional restore for the history packages (does not replace existing data sets). Note the following behaviors:

- If history dump data sets (\*\*.PACKHN or \*\*.PACKHV) are not found or failed to restore, a return code of 4 will be generated.
- If the main dump data sets (\*\*.PACKMN or \*\*.PACKMV) are not found or failed to restore, a return code of 8 will be generated.

The **DEPLOY** action replaces all main package VSAM and non-VSAM files, but does not replace any history-related files. Therefore, it is normal for PACKHN and PACKHV deploy flows to end with RC=8. If you want to avoid this, for example if you roll out maintenance, do not transfer these packages to the target system. While normally a return code of 8 would cause Configuration Manager to stop, in this particular situation (history files), a return code of 8 is considered acceptable and will not prevent Configuration Manager from continuing to function.

## KCIOMEGA workflows

The KCIOMEGA program that runs IBM Z® Monitoring Configuration Manager is a general-purpose job template engine. KCIOMEGA performs batch processing based on the job template that you specify. The processing that KCIOMEGA performs is known as a *workflow*.

**Note:** KCIALPHA is an APF-authorized version of KCIOMEGA. APF authorization is required for some actions.

In KCIOMEGA terms, Monitoring Configuration Manager is a workflow.

The KCIOMEGA program has two input data sets:

#### KCIFLOW

Contains a job template written in the KCIOMEGA *skeleton language*. The language is similar to a subset of JCL with additional syntax introduced by KCIOMEGA.  
This job template is also known as a *workflow skeleton* or simply *skeleton*.

KCIOMEGA dynamically interprets the statements in the skeleton and performs the corresponding processing (the workflow).

Skeletons can invoke other skeletons, resulting in composite workflows that run sub-workflows.

The KCIOMEGA skeleton language is unpublished; not intended for users. However, it's human-readable plain text. If you're familiar with JCL syntax, the additional KCIOMEGA syntax is relatively straightforward to understand.

## KCIVARS

Contains name-value pairs that set workflow variables.  
KCIOMEGA replaces variable names in skeletons with the values from this data set.

Skeletons can refer to variable names in various contexts, such as data set names and “if ... then” conditions. Variables can determine the actions that workflows perform and the data sets that workflows use.

In the context of Monitoring Configuration Manager, workflow variables specify which action to perform and the location of the runtime environment definition on which you want to perform that action.

## Action job output

Review the types of output data sets that are produced by the **KCIOMEGA** program.

Configuration Manager writes job output for the **KCIOMEGA** actions to a number of output data sets. Output from invoked utilities is also generated, with each utility writing to its own output data set.

**Note:** **KCIALPHA** is an APF-authorized version of the **KCIOMEGA** program. The information in this topic also applies when using **KCIALPHA**.

The following table lists the output data sets that Configuration Manager generates and retains.

<i>Table 33: Standard sysout data sets</i>	
<b>Output data set</b>	<b>Description</b>
<u>KCIPRINT</u>	<b>KCIOMEGA</b> program messages and messages about Configuration Manager processing
<u>KCITRACE</u>	<b>KCIOMEGA</b> workflow trace output, used primarily by IBM Software Support for troubleshooting
KCIVARSO	KCIVARS input that was used in the JCL
DSNPROUT	Contents of the RTEDEF library used in the configuration. When the <b>DEBUG</b> action option is used, this data set contains the complete list of members in the RTEDEF library.  <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"><b>Note:</b> The <b>DEBUG</b> action option should only be used under the guidance of IBM Software Support.</div>
<u>\$VALRPT</u>	Parameter validation report
<u>MIGRPT</u>	Output for the <b>MIGRATE</b> action
<u>EXCLRPT</u>	List of members excluded (not replaced) in the runtime libraries during the <b>GENERATE</b> action
<u>REPORT</u>	Products installed report. This report appears automatically in the job output for the <b>CREATE</b> , <b>MIGRATE</b> , and <b>GENERATE</b> actions and can also be generated using the KFJMAINT maintenance workflow by specifying <b>ACTION REPORT</b> .

Output data set	Description
\$REPORT	Output for the <b>DEPLOY</b> action
JESMSG LG, JESJCL and JESYSMSG	Standard JES-produced output

In addition to the output data sets listed in “Standard sysout data sets” on page 275, Configuration Manager also generates other output that it does not retain and deletes from the spool automatically.

If a Configuration Manager job fails, the DD statement that contains the error message is retained and printed.

#### Notes:

- JES3 does not allow deleting DD output. If your site uses JES3, you might see additional output, which can be considerable.
- With APAR OA65222, the **DEBUG** action option (**OPTION DEBUG**), is introduced. This option generates additional output that is otherwise suppressed by default. This option should only be used under the guidance of IBM Software Support. Prior to this enhancement, all generated output was retained and printed to the spool, which could result in hundreds of output data sets.

To review the Configuration Manager job output, use a tool such as SDSF to view the JES output data sets.

### KCIPRINT sysout data set

The KCIPRINT output data set contains messages from the KCIOMEGA program interspersed with messages about Configuration Manager processing.

Here is an example KCIPRINT for a successful job:

Figure 50: Example KCIPRINT output data set for a successful Configuration Manager job

```
KFU00001I KCIOMEGA is starting; SYSPLEX=sysplex LPAR=lpar DATE=...
KFU00002I INVOKE processing is about to commence; MEMBER=KFJOMEGA
...
Workflow has completed successfully
KFU00004I KCIOMEGA is ending; RC=rc SYSPLEX=sysplex LPAR=lpar DATE=...
```

### Parameter values used

The KCIPRINT sysout data set from a **GENERATE** action contains an ordered list of the RTEDEF library members that the action uses. For example:

```
01. Using parameters in rte_plib_hilev.RTEDEF(rte_name)
02. Using parameters in rte_plib_hilev.RTEDEF(KDS$PARM)
03. Using parameters in rte_plib_hilev.RTEDEF(GBL$PARM)
```

The corresponding KCITRACE sysout data set contains an alphabetical list of parameters and symbols (such as workflow variables) with their values. The list is preceded by the following heading:

```
>Parameter and symbol values
```

**Note to users with PARMGEN experience:** The **GENERATE** action of Configuration Manager creates an *rte\_plib\_hilev.rte\_name.WCONFIG(rte\_name)* member that is similar to the member created by PARMGEN, with one key difference: the member created by Configuration Manager contains default parameter values; it does not reflect the values in your RTEDEF library members. To see the parameter values used by Configuration Manager, refer to the >Parameter and symbol values heading in the KCITRACE sysout data set. As such, the WCONFIG data sets as a whole should be considered as a *black box*.

## KCITRACE sysout data set

The KCITRACE output data set contains the KCIPRINT contents, and, in addition, also includes the source of each workflow skeleton and additional messages.

KCITRACE records that start with two consecutive plus signs (++) show the previous record after variable substitution. For example:

```
//RTEDEF DD DSN=%RTEDEF_DSN%,PASS=YES  
++RTEDEF DD DSN=MYID.MONITORS.RTEDEF,PASS=YES
```

## Renamed SYSPRINT sysout data sets

The KCIOMEGA program runs a workflow, such as the **GENERATE** action of Configuration Manager, that can invoke many programs, resulting in long job output listings. All of these programs run in the same job step as KCIOMEGA.

Many programs write to the ddname SYSPRINT. To avoid a job output listing with multiple SYSPRINT ddnames for the same step name, KCIOMEGA renames SYSPRINT sysout data sets to match the corresponding step name in the workflow skeleton shown in KCITRACE. This makes it easier to find the SYSPRINT for each step in the skeleton.

## Parameter validation report (\$VALRPT)

If the set of parameters that you specified in the RTEDEF library is invalid (for example, a required parameter is missing or a defined value is incorrect), then the sysout data sets include the parameter validation report (\$VALRPT). If this report is generated, then review the report, correct the parameters, and resubmit the job.

**If you are familiar with PARMGEN:** The Configuration Manager parameter validation report contains the same information as the parameter validation report generated by PARMGEN, with the difference that you do not have to manually navigate to the data set and open it.

## Products installed report (REPORT)

The *products installed report* provides information about the installation status and Configuration Manager support of products at your site. The report identifies the following products:

- Products that are installed and supported by Configuration Manager
- Products that are installed but not supported by Configuration Manager
- Products that are not installed but supported by Configuration Manager

The report appears automatically in the job output for the **CREATE**, **MIGRATE**, and **GENERATE** actions. You can also generate the report using the KFJMAINT maintenance workflow by specifying **ACTION REPORT**. (No other option or parameter is required to run the KFJMAINT job with the **REPORT** action.)

**Tip:** By producing the report using KFJMAINT, you can verify that your product is supported by Configuration Manager before beginning the configuration process. For a complete list of supported products, see [“Products supported by Configuration Manager” on page 214](#).

The report is printed to the job output identified by the **REPORT DD** statement.

The report lists the product code, the product version, and the product name. If the version is not supported in Configuration Manager, then an asterisk appears after the version and the comment (not supported) appears after the name. If the product is not installed, then N/A appears as the version and the comment (not installed) appears after the name.

The following figure shows an example of the products installed report:

Products installed in <data_set_name>		
Code	Version	Product name
KM5	N/A	IBM Z OMEGAMON AI for z/OS (not installed)
KN3	5.1.0*	IBM OMEGAMON for Networks on z/OS (not supported)
KWO	5.6.0	IBM OMEGAMON Dashboard Edition on z/OS
KS3	6.1.0	IBM Z OMEGAMON AI for Storage
KC5	6.1.0	IBM Z OMEGAMON AI for CICS
KGW	6.1.0	IBM Z OMEGAMON AI for CICS Transaction Gateway
KI5	5.5.0	IBM OMEGAMON for IMS on z/OS
KJJ	6.1.0	IBM Z OMEGAMON AI for JVM
KD5	6.1.0	IBM Z OMEGAMON AI for Db2
KQI	7.5.0	IBM OMEGAMON for Messaging Integration Bus
KMQ	7.5.0	IBM OMEGAMON for Messaging on z/OS
KYN	7.1.1	ITCAM for Application Diagnostics Agent
KDS	6.3.0	Tivoli Enterprise Monitoring Server
KOB	7.5.0	OMEGAMON Enhanced 3270 User Interface
KNA	4.4.0*	IBM Z NetView Enterprise Management Agent (not supported)
KRN	2.6.0	IBM Tivoli Advanced Catalog Management for z/OS
KRH	2.6.0	IBM Tivoli Advanced Reporting and Management for KFSMShsm (not supported)
KRG	2.6.0	IBM Tivoli Advanced Audit for DFSMShsm
KRJ	3.3.0	IBM Tivoli Advanced Allocation Management for z/OS
KRK	3.3.0	IBM Tivoli Automated Tape Allocation Manager for z/OS
KRV	2.4.0	IBM Tivoli Advanced Backup and Recovery for z/OS
KAY	1.1.0	IBM Z OMEGAMON Data Provider

Figure 51: Products installed report (REPORT)

## Parameters

In general, IBM Z® Monitoring Configuration Manager and PARMGEN use the same parameters with the same default values. In a few cases, Monitoring Configuration Manager introduces a new parameter or sets a different default value for an existing parameter.

For parameters not described here, see [Where to find information](#).

### Parameters that determine what products are configured

You can control the products that are configured in your runtime environment using the **CONFIGURE\_\*** parameters.

Each product that is configured in the runtime environment has a corresponding parameter with the prefix **CONFIGURE**. The **CONFIGURE\_\*** parameters are defined in the *rte\_name* member in the runtime environment definition library (RTEDEF) and have the permissible values of Y and N.

For example, for a runtime environment that contains a monitoring server, an OMEGAMON for z/OS monitoring agent, the OMEGAMON enhanced 3270 user interface, and OMEGAMON Data Provider, each of the corresponding parameters are set to Y; the parameters for the other products are set to N:

CONFIGURE_TEMS_KDS	Y * TEMS
CONFIGURE_E3270UI_KOB	Y * Enhanced 3270
CONFIGURE_CICS_KC5	N * CICS TS
CONFIGURE_CICS_TG_KGW	N * CICS TG
CONFIGURE_DB2_AGENT_KD5	N * Db2
CONFIGURE_IMS_KI5	N * IMS
CONFIGURE_JVM_KJJ	N * JVM
CONFIGURE_ZOS_KM5	Y * z/OS
CONFIGURE_MESSAGING_KMQ	N * MQ
CONFIGURE_MESSAGING_KQI	N * Integration Bus
CONFIGURE_NETVIEW_KNA	N * Netview
CONFIGURE_MFN_KN3	N * Network
CONFIGURE_STORAGE_KS3	N * Storage
CONFIGURE_OMEGAVIEW_KWO	N * Integration Monitor
CONFIGURE_ITCAMAD_KYN	N * ITCAM for Applications
CONFIGURE_ACM_KRN	N * Advanced Catalog Mgmt
CONFIGURE_AAD_KRH	N * Advanced Rpt and Mgmt
CONFIGURE_AAD_KRG	N * Advanced Audit
CONFIGURE_AAM_KRJ	N * Advanced Alloc Mgmt
CONFIGURE_ATAM_KRK	N * Automated Tape Alloc

CONFIGURE\_ABR\_KRV  
 CONFIGURE\_ODP\_KAY

N \* Advanced Backup and Rec  
 Y \* Data Provider

**Tip:** Explicitly setting the **CONFIGURE\_\*** parameters to N for the products that are not used can result in less CPU and time used as the respective product-specific workflows are bypassed. Otherwise, unspecified configuration flags default to N as early as possible in the workflow.

The following table lists the products and corresponding **CONFIGURE** parameters.

*Table 34: CONFIGURE\_\* parameters*

Product	Parameter
Tivoli Enterprise Monitoring Server	CONFIGURE_TEMS_KDS
OMEGAMON® Enhanced 3270 User Interface	CONFIGURE_E3270UI_KOB
IBM Z OMEGAMON AI for CICS TS	CONFIGURE_CICS_KC5
IBM Z OMEGAMON AI for CICS TG	CONFIGURE_CICS_TG_KGW
IBM Z® OMEGAMON® AI for Db2	CONFIGURE_DB2_AGENT_KD5
IBM OMEGAMON® for IMS on z/OS	CONFIGURE_IMS_KI5
IBM Z® OMEGAMON® AI for JVM	CONFIGURE_JVM_KJJ
IBM Z® OMEGAMON® AI for z/OS®	CONFIGURE_ZOS_KM5
IBM OMEGAMON® for Messaging on z/OS - MQ	CONFIGURE_MESSAGING_KMQ
IBM OMEGAMON® for Messaging on z/OS - Integration Bus	CONFIGURE_MESSAGING_KQI
IBM Z® NetView Enterprise Management Agent	CONFIGURE_NETVIEW_KNA
IBM Z® OMEGAMON® AI for Networks	CONFIGURE_MFN_KN3
IBM Z OMEGAMON® AI for Storage	CONFIGURE_STORAGE_KS3
IBM Z® OMEGAMON® Integration Monitor	CONFIGURE_OMEGAVIEW_KWO
IBM Tivoli Composite Application Manager (ITCAM) for Application Diagnostics Agent	CONFIGURE_ITCAMAD_KYN
IBM Tivoli Advanced Catalog Management for z/OS	CONFIGURE_ACM_KRN
IBM Tivoli Advanced Reporting and Management for DFSMSHsm	CONFIGURE_ARD_KRH
IBM Tivoli Advanced Audit for DFSMSHsm	CONFIGURE_AAD_KRG
IBM Tivoli Advanced Allocation Management for z/OS	CONFIGURE_AAM_KRJ
IBM Tivoli Automated Tape Allocation Manager for z/OS	CONFIGURE_ATAM_KRK
IBM Tivoli Advanced Backup and Recovery for z/OS	CONFIGURE_ABR_KRV
IBM Z® OMEGAMON Data Provider	CONFIGURE_ODP_KAY

**Related topic:**

[“How to: Add a new agent or product to a runtime environment” on page 356](#)

[“How to: Add OMEGAMON Data Provider to a runtime environment” on page 357](#)

## Parameters in the initial runtime environment configuration profile

The **CREATE** action creates an initial set of parameters that define a basic runtime environment. You can edit and add to this initial set to meet your specific requirements.

These parameters are also described in the OMEGAMON® shared documentation or in the documentation for each product. The descriptions provided here include additional information to help you get started.

## GBL\_DSN\_CICS\_CTG\_DLL

The CICS® Transaction Gateway (TG) dynamic link library.

### Description

The CICS® Transaction Gateway (TG) dynamic link library.

### Default value

SYS1.SCTGDLL

### Permissible values

An MVS™ data set name.

## GBL\_DSN\_CSF\_SCSFMODE

This parameter contains the Integrated Cryptographic Service Facility (ICSF) load library that contains the CSNB\* modules used for password encryption.

### Description

This parameter is valid in both Configuration Manager and PARMGEN if ICSF is installed and configured on the z/OS® system.

#### In Configuration Manager:

This parameter is explicitly added in the GBL\$PARM member that is generated after the **CREATE** or **MIGRATE** action, as it is relevant for several security-related aspects of the product configuration (such as password encryption).

If your installation does not use the ICSF, you can remove or comment out this parameter in your RTEDEF (GBL\$PARM) or RTEDEF (GBL\$*lpar*).

#### In PARMGEN:

By default, this parameter is commented out in the WCONFIG (\$GBL\$USR) member.

### Required or optional

This parameter is required if any of the following conditions are in effect:

- Password encryption is enabled for any components.
- A SOAP server is enabled on a remote Tivoli® Enterprise Monitoring Server.
- Granular control of command requests is enabled (compatibility mode is *disabled*): the **KDS\_KMS\_SECURITY\_COMPATMD** parameter is set to N.
- zAware feature is enabled for OMEGAMON® on z/OS®.

### Default value

CSF.SCSFMODE

### Permissible values

An MVS™ data set name, maximum length 44

### Related parameters

- RTE\_SECURITY\_KAES256\_KEY
- KDS\_KMS\_SECURITY\_COMPATMD

## GBL\_DSN\_DB2\_DSNEEXIT

The Db2® exit library.

### Description

The Db2® exit library.

The OMEGAMON® collector uses the Db2® exit load modules in this library.

Example value:

```
DSN.VC10.SDSNEXIT
```

#### Permissible values

An MVS™ data set name.

### GBL\_DSN\_DB2\_LOADLIB\_Vn

The load library for the version of Db2® that your site is running.

#### Description

The load library for the version of Db2® that your site is running.

In the parameter name, **n** is the Db2® version number. For example, **GBL\_DSN\_DB2\_LOADLIB\_V12**.

Specify a **GBL\_DSN\_DB2\_LOADLIB\_Vn** parameter for each Db2® version that you want to monitor.

This parameter is required if the runtime environment contains the Db2® monitoring agent.

Example value:

```
DSN.VC10.SDSNLOAD
```

#### Permissible values

An MVS™ data set name.

### GBL\_DSN\_DB2\_RUNLIB\_Vn

The run library for the version of Db2® that your site is running.

#### Description

The run library for the version of Db2® that your site is running.

In the parameter name, **n** is the Db2® version number. For example, **GBL\_DSN\_DB2\_RUNLIB\_V12**.

Specify a **GBL\_DSN\_DB2\_RUNLIB\_Vn** parameter for each Db2® version that you want to monitor. The library should contain the modules DSNTIAD and DSNTIAUL to be used to run in batch.

IBM Z® Monitoring Configuration Manager uses the library to generate **GRANT** and **BIND** jobs that prepare the Db2® subsystems for monitoring.

This parameter is required if the runtime environment contains the Db2® monitoring agent.

Example value:

```
DSN.VC10.RUNLIB.LOAD
```

#### Permissible values

An MVS™ data set name.

### GBL\_DSN\_IMS\_RESLIB

The IMS SDFSRESL library.

#### Description

The IMS SDFSRESL library contains the CQSREG00 action module required to enable the Common Queue Server (CQS). The CQS and shared queues allow users to take advantage of the Parallel Sysplex® environment.

**Note:** The DISCOVER action of IBM Z® Monitoring Configuration Manager discovers the value of the KI2\_I1nn\_CLASSIC\_IMS\_RESLIB parameter, which also specifies an IMS SDFSRESL library.

Depending on how IMS is configured at your site, the same value might be appropriate for GBL\_DSN\_IMS\_RESLIB.

**Required or optional**

Required if the runtime environment configures the IMS monitoring agent.

**Default value**

IMS.SDFSRESL

**GBL\_DSN\_IMS\_SCEXLINK**

The IMS Connect product load library.

**Description**

The IMS Connect product load library.

The IMS monitoring agent uses the IMS Connect Extensions Publisher API. The agent requires the IMS Connect Extensions product and functional support load libraries to connect to and collect performance and statistics data from the IMS Connect address space.

This parameter is required if the runtime environment configures the IMS monitoring agent.

**Default value**

IMS.SCEXLINK

**Permissible values**

An MVS™ data set name.

**GBL\_DSN\_IMS\_SFUNLINK**

The IMS Connect functional support load library.

**Description**

The IMS Connect functional support load library.

The IMS monitoring agent uses the IMS Connect Extensions Publisher API. The agent requires the IMS Connect Extensions product and functional support load libraries to connect to and collect performance and statistics data from the IMS Connect address space.

This parameter is required if the runtime environment configures the IMS monitoring agent.

**Default value**

IMS.SFUNLINK

**Permissible values**

An MVS™ data set name.

**GBL\_DSN\_WMQ\_SCSQANLE**

The IBM® MQ language library.

**Description**

The IBM® MQ language library.

This parameter is required if the runtime environment configures the MQ monitoring agent.

**Default value**

CSQ.V9R0M0.SCSQANLE

**Permissible values**

An MVS™ data set name.

## GBL\_DSN\_WMQ\_SCSQAUTH

The IBM® MQ authorized load library.

### Description

The IBM® MQ authorized load library.  
This parameter is required if the runtime environment configures the MQ monitoring agent.

### Default value

CSQ.V9R0M0.SCSQAUTH

### Permissible values

An MVS™ data set name.

## GBL\_DSN\_NETVIEW\_CNMLINK

Identifies the IBM Z® NetView CNMLINK library

### Description

This parameter identifies the IBM Z® NetView CNMLINK library .  
It is required only if using an IBM Z® NetView Agent.

### Default value

NETVIEW.VNRNMN.CNMLINK

### Permissible values

An MVS™ data set name.

## GBL\_HFS\_JAVA\_DIRn

The z/OS® UNIX® System Services path of the Java™ home directory.

### Description

The z/OS® UNIX® System Services path of the Java™ home directory.

The path consists of the concatenated values of the **GBL\_HFS\_JAVA\_DIR1** and **GBL\_HFS\_JAVA\_DIR2** parameters.

Typically, you only specify **GBL\_HFS\_JAVA\_DIR1**. **GBL\_HFS\_JAVA\_DIR2** is provided as a convenience to specify the remainder of a long directory path.

This parameter is required if you are enabling the self-describing agent (SDA) functionality in the z/OS® monitoring server (TEMS) and agents.

For the runtime members, see the **TEMS\_JAVA\_BINPATH** parameter in the KSDSPROF member of the RKANDATV library.

As an example, if **GBL\_HFS\_JAVA\_DIR1** is set to `/my/own/copy` and **GBL\_HFS\_JAVA\_DIR2** is set to `/of/java`, then the resulting directory path is a concatenation of these two values: `/my/own/copy/of/java`.

### Default value

For **GBL\_HFS\_JAVA\_DIR1**: `/usr/lpp/java/IBM/J8.0_64`

For **GBL\_HFS\_JAVA\_DIR2**: *none* (empty string)

### Permissible values

A z/OS® UNIX® directory path. Must begin with a forward slash (/).

Do not specify a trailing `/bin` directory in the value. IBM Z® Monitoring Configuration Manager appends `/bin` to the value that you specify.

## GBL\_TARGET\_HILEV

The high-level qualifiers of the target libraries, such as TKANDATV and TKANMOD.

## Description

The high-level qualifiers of the target libraries, such as TKANDATV and TKANMOD.

The **CREATE** action of IBM Z® Monitoring Configuration Manager sets the **GBL\_TARGET\_HILEV** parameter to the high-level qualifiers of the data set name specified by the KCIFLOW DD statement in the job step that performs the **CREATE** action.

This parameter is required.

As an example, if the KCIFLOW DD statement of the job step that performs the **CREATE** action specifies the data set name MONSUIITE .TKANCUS, then the **CREATE** action sets the value of **GBL\_TARGET\_HILEV** to MONSUIITE.

## Permissible values

MVS™ data set high-level qualifiers.

## GBL\_USS\_TKANJAR\_PATH

The path of the z/OS® UNIX® System Services directory that the SMP/E installation jobs define using the ddname TKANJAR.

Depending on your local site practices, this path might refer to a copy, rather than the original SMP/E-managed directory.

## Required or optional

Required if the runtime environment configures either of the following monitoring agents:

- CICS® Transaction Gateway (TG). The corresponding configuration parameter is **CONFIGURE\_CICS\_TG\_KGW**.
- Java™ Virtual Machine (JVM). The corresponding configuration parameter is **CONFIGURE\_JVM\_KJJ**.

## Default value

/usr/lpp/kan/bin/IBM

## Permissible values

z/OS® UNIX® directory path. Must begin with a forward slash (/).

## Related parameters

GBL\_DSN\_SYS1\_SBPXEXEC

RTE\_USS\_RTEDIR

RTE\_USS\_MKDIR\_MODE

## GBL\_USS\_TKAYHFS\_PATH

This parameter specifies the SMP/E TKAYHFS ddname installation directory.

## Description

This parameter specifies the path of the z/OS UNIX directory that the SMP/E installation jobs for IBM Z OMEGAMON Data Provider define using the ddname TKAYHFS.

Depending on your local site practices, this path might refer to a copy of the SMP/E-managed directory rather than the original.

This directory is read-only for Monitoring Configuration Manager; Monitoring Configuration Manager does not write to this directory.

## Default value

/usr/lpp/omdp

## Permissible values

Character string, maximum length 44

## RTE\_COMM\_PROTOCOLn

This parameter sets the communication protocol choices of all components in the runtime environment.

**Note:** This parameter is valid in Configuration Manager only. It is not valid in PARMGEN.

### Description

The **RTE\_COMM\_PROTOCOLn** (n: 1 - 7) parameters set the value of the **KDS\_TEMS\_COMM\_PROTOCOLn** and **Kpp\_AGT\_COMM\_PROTOCOLn** parameters. This parameter offers an easy way to set all components to the same values, rather than setting parameters individually for each component.

### Required or optional

Optional

### Default value

None

### Permissible values

Value	Protocol description	Corresponding protocol-specific parameters
IPPIPE	Non-secure TCP over IPv4	RTE_TCP_HOST RTE_TCP_PORT_NUM
IP	Non-secure UDP over IPv4	RTE_TCP_HOST RTE_TCP_UDP_PORT_NUM
IP6PIPE	Non-secure TCP over IPv6	RTE_TCP_HOST RTE_TCP_PIPE6_PORT_NUM
IP6	Non-secure UDP over IPv6	RTE_TCP_HOST RTE_TCP_UDP6_PORT_NUM
IPSPIPE	Secure (SSL/TLS) TCP over IPv4	RTE_TCP_HOST RTE_TCP_PIPES_PORT_NUM
IPS6PIPE	Secure (SSL/TLS) TCP over IPv6	RTE_TCP_HOST RTE_TCP_PIPE6S_PORT_NUM
SNA	NCS RPC: Systems Network Architecture implementation of the Network Computing System Remote Procedure Call API	Kpp_TEMS_VTAM_APPL_LL_B_BROKER Kpp_TEMS_VTAM_LU62_DLOGMOD Kpp_TEMS_VTAM_LU62_MODETAB RTE_VTAM_NETID

Default values of **KDS\_TEMS\_COMM\_PROTOCOLn** and **Kpp\_AGT\_COMM\_PROTOCOLn**:

n	Value
1	IPPIPE
2	SNA

### Example

Parameter	Value	Description
<b>RTE_COMM_PROTOCOL1</b>	IPSPIPE	First choice: secure TCP over IPv4
<b>RTE_COMM_PROTOCOL2</b>	IPPIPE	Second choice: non-secure TCP over IPv4

## Related parameters

- KDS\_TEMS\_COMM\_PROTOCOLn
- Kpp\_AGT\_COMM\_PROTOCOLn

## RTE\_NAME

The runtime environment name.

### Description

The runtime environment name.

IBM Z® Monitoring Configuration Manager uses this name for various purposes, including:

- MVS™ member names
- MVS™ data set name qualifiers
- z/OS® UNIX® System Services directory name, all uppercase

Example value: RTE1

### Permissible values

1 - 8 characters.

## RTE\_PLIB\_HILEV

This parameter specifies the high-level qualifiers of the runtime environment definition (RTEDEF) library.

### Description

This parameter specifies the high-level qualifiers of the runtime environment definition (RTEDEF) library.

The **RTE\_PLIB\_HILEV** parameter sets the default values of several parameters that specify runtime member locations:

**RTE\_HILEV**  
**RTE\_VSAM\_HILEV**  
**GBL\_DSN\_SYS1\_PROCLIB**  
**GBL\_DSN\_SYS1\_VTAMLIB**  
**GBL\_DSN\_SYS1\_VTAMLST**

### Permissible values

To avoid exceeding the z/OS 44-character limit for data set names, the combined length of **RTE\_NAME** and **RTE\_PLIB\_HILEV** should not exceed 28 characters. For example, if **RTE\_NAME** is 8 characters, then **RTE\_PLIB\_HILEV** should not exceed 20 characters.

## RTE\_SECURITY\_CLASS

This parameter specifies a System Authorization Facility (SAF) security class name for OMEGAMON enhanced 3270 user interface security controls.

### Description

Use this parameter to specify the SAF security class for OMEGAMON enhanced 3270 user interface (enhanced 3270UI) security controls. The enhanced 3270UI performs security validation processing by authenticating the user identity using the SAF interface. The existence of the SAF user and its validity (that is, whether it is suspended) are always checked.

This parameter applies to the OMEGAMON enhanced 3270 user interface and the OMEGAMON monitoring agents that use the enhanced 3270UI. Individual products have additional SAF security settings that are specific to the respective product (for example, how to secure product-specific Take Action requests). To secure other products, see the product-specific documentation for information.

**Important (for Configuration Manager users only):** If a value is not specified for override parameter `Kpp_SECURITY_ACTION_CLASS` (where *pp* is C5, M5, or N3), then the `RTE_SECURITY_CLASS` parameter value will be assigned as the default value.

#### Required or optional

Optional

#### Default value

None

#### Permissible values

A valid SAF class name, which can be a string of up to 8 characters. If you are using ACF2 as your external security resource manager, specify a maximum of 3 characters.

#### Related parameters

- `KOB_SAF_ACTION_CLASS_NAME`
- `KC5_SECURITY_ACTION_CLASS`
- `KM5_SECURITY_ACTION_CLASS`
- `KN3_SECURITY_ACTION_CLASS`

## RTE\_SECURITY\_FOLD\_PASSWORD\_FLAG

This parameter controls if password and password phrase (passphrase) values are folded to uppercase.

#### Description

By default, the TMS:Engine folds logon password and password phrase (passphrase) values to uppercase (parameter default value Y).

If you want to use mixed-case password or passphrase values, set this parameter to N so that the characters do not fold to uppercase, allowing mixed-case values to persist.

**Note:** Support for mixed-case passwords on your system requires activation of the SETROPTS PASSWORD(MIXEDCASE) option in RACF®.

#### Default value

Y

#### Permissible values

Y, N

#### Related parameters

`RTE_SECURITY_USER_LOGON`

## RTE\_SECURITY\_USER\_LOGON

The security system to be used for the runtime environment.

#### Description

The security system to be used for the runtime environment.

If you specify a security system, verify that it is installed and configured correctly for your site.

The `RTE_SECURITY_USER_LOGON` parameter specifies which system will be used to validate users signing on to the Tivoli® Enterprise Portal (TEP), but it does not enable validation. To enable validation of users signing on to TEP, the `KDS_TEMS_SECURITY_KDS_VALIDATE` parameter value must be Y (its default value).

**Default value**

NONE

**Permissible values****NONE**

No security.

**RACF**

IBM® z/OS® Security Server.

**ACF2**

CA ACF2.

If you specify ACF2, you must set the **GBL\_DSN\_ACF2\_MACLIB** parameter to the name of the ACF2 macro library.**TSS**

CA Top Secret.

**NAM**

Network Access Manager.

**SAF**

IBM® z/OS® System Authorization Facility API.

**RTE\_STC\_PREFIX**

The prefix of started task names for this runtime environment.

**Description**

The prefix of started task names for this runtime environment.

The **CREATE** action of IBM Z® Monitoring Configuration Manager sets the following value:

OMEG

(an abbreviation of OMEGAMON®).

**Default value**

IBM

**Permissible values**

1 - 4 characters.

**RTE\_TCP\_HOST**

This parameter contains the TCP/IP hostname or IP address of the z/OS® system where the runtime environment is being defined.

**Description**This parameter contains the TCP/IP hostname or IP address of the z/OS® system where the runtime environment is being defined. To obtain the hostname and IP address, you can enter **TSO HOMETEST** at a command line.For a high-availability hub monitoring server, this parameter value must be set to the dynamic virtual IP address (DVIPA) and must match the value in parameter **KDS\_TEMS\_TCP\_HOST**.**For Configuration Manager:**

To ensure consistent settings for the agents and components in the runtime environment, this parameter provides the default value for some other parameters that specify the hostname.

If you configure a monitoring server as part of your runtime environment, this parameter value is used as the default **KDS\_TEMS\_TCP\_HOST** parameter value. Depending on other settings in the runtime

environment, this parameter value might also be used as the default value for the **Kpp\_TEMS\_TCP\_HOST** parameters.

If you do not configure a monitoring server as part of the runtime environment, this parameter value is used as the default value for the **Kpp\_TEMS\_TCP\_HOST** parameters.

**For PARMGEN:**

This parameter does not impact the default setting of any other parameter value.

**Default value**

%SYSIPHOSTNAME%

**Permissible values**

Character string, maximum length 39

**Related parameters**

- [RTE\\_TCP\\_PORT\\_NUM](#)
- [KDS\\_TEMS\\_TCP\\_HOST](#)
- [KDS\\_HUB\\_TCP\\_HOST](#)
- [Kpp\\_TEMS\\_TCP\\_HOST](#)

## RTE\_TCP\_PORT\_NUM

This parameter contains the well-known port for the IP.PIPE communication protocol (the TCP/IP protocol that supports IPv4).

**Description**

Well-known port for the IP.PIPE communication protocol (the TCP/IP protocol that supports IPv4).

**For Configuration Manager:**

This parameter sets the default values of several parameters that specify port numbers, including:

**KDS\_TEMS\_TCP\_PIPE\_PORT\_NUM**  
**Kpp\_TEMS\_TCP\_PIPE\_PORT\_NUM**

**For PARMGEN:**

This parameter does not impact the default setting of any other parameter value.

**Default value**

1918

**Permissible values**

1 - 65535

**Related parameters**

- [RTE\\_TCP\\_HOST](#)
- [KDS\\_TEMS\\_TCP\\_PIPE\\_PORT\\_NUM](#)

## RTE\_TEMS\_NAME\_NODEID

Identifies the monitoring server for internal processing.

**Description**

Identifies the monitoring server for internal processing.

The **KDS\_HUB\_TEMS\_NAME\_NODEID** parameter of remote monitoring servers must refer to the **RTE\_TEMS\_NAME\_NODEID** of the hub monitoring server. For example, if the hub sets **RTE\_TEMS\_NAME\_NODEID** to HUB:TEMS, then the runtime environments for remote monitoring servers must set **KDS\_HUB\_TEMS\_NAME\_NODEID** to HUB:TEMS.

The **CREATE** action of IBM Z® Monitoring Configuration Manager sets the following value:

*rte\_name*:TEMS

where TEMS stands for Tivoli® Enterprise Monitoring Server, reflecting current terminology.

#### Default value

`rte_name:CMS`

## RTE\_TEMS\_TRANSPORT\_MODE

Use this parameter to specify the Hypertext Transfer Protocol to use for communication with the Tivoli Enterprise Monitoring Server.

#### Description

This parameter specifies the Hypertext Transfer Protocol to use for communication between the Tivoli Enterprise Monitoring Server (TEMS) and other components.

**Note:** HTTP and HTTPS communication protocol configuration specified in `Kpp_X_KDE_TRANSPORT_HTTP_OPTIONS` and `Kpp_X_KDE_TRANSPORT_GBL_OPTIONS` can potentially override `RTE_TEMS_TRANSPORT_MODE` parameter output in the `KppENV` members.

#### Permissible values

##### HTTPS

Enables the HTTPS communication protocol for the Tivoli Enterprise Monitoring Server, and disables the HTTP communication protocol for all agents. Use parameter `KDS_TEMS_HTTPS_PORT_NUM` to specify the HTTPS port.

##### HTTP

Enables HTTP communication protocol for the Tivoli Enterprise Monitoring Server, and disables the HTTPS communication protocol. Use parameter `KDS_TEMS_HTTP_PORT_NUM` to specify the HTTP port.

##### NONE

Disables HTTP and HTTPS communication protocols for all agents.

#### Default value

HTTPS

#### Related parameters

- `KDS_TEMS_HTTP_PORT_NUM`
- `KDS_TEMS_HTTPS_PORT_NUM`
- `Kpp_X_KDE_TRANSPORT_HTTP_OPTIONS`
- `Kpp_X_KDE_TRANSPORT_GBL_OPTIONS`

## RTE\_USS\_RTEDIR

The path where runtime members are stored in z/OS® UNIX® System Services.

#### Description

The path where runtime members are stored in z/OS® UNIX® System Services.

The runtime environment name, parameter `RTE_NAME`, is appended to the value of `RTE_USS_RTEDIR` as a directory name.

The TSO user ID that runs IBM Z® Monitoring Configuration Manager jobs must have permission to write to this directory, otherwise the **GENERATE** action will fail.

As an example, if `RTE_USS_RTEDIR` is `/var/rtehome` and `RTE_NAME` is `RTE1`, then runtime members are stored in:

`/var/rtehome/RTE1/*`

#### Default value

`/var/rtehome`

## RTE\_VTAM\_APPLID\_PREFIX

The global VTAM® applid prefix to be used to build the VTAM® applids for products in this runtime environment.

### Description

The global VTAM® applid prefix to be used to build the VTAM® applids for products in this runtime environment.

The **CREATE** action of IBM Z® Monitoring Configuration Manager sets the following value:

OM $xx$

where  $xx$  is the value of the z/OS® static system symbol **SYSCZONE**. **SYSCZONE** is a 1- or 2-character shorthand notation for the system (LPAR) name.

### Default value

CTD

## RTE\_X\_SECURITY\_EXIT\_LIB

This parameter specifies the library containing the security exits used for the runtime environment.

**Note:** This parameter is valid in both PARMGEN and Configuration Manager; however, its function differs slightly. This topic describes this parameter as it applies to Configuration Manager.

### Description

This parameter specifies the library containing the security exits used for the runtime environment.

The **RTE\_X\_SECURITY\_EXIT\_LIB** parameter specifies the name of the global runtime environment library that contains all of the OMEGAMON and IBM Tivoli Monitoring-related product security exits (such as KOBSPDT OMEGAMON  $Kpp$ SUPDI exits, Tivoli Monitoring Services: Engine security exits, external security exits).

Example value: TEST1.TST.DEMO.SECEXITS

### Default value

$\langle rte\_plib\_hilev \rangle . \langle rte\_name \rangle . SECEXITS$

### Permissible values

A valid data set name.

## Parameters with significant default values

The runtime environment defined by the initial set of parameters is configured not just by the relatively small number of parameters in that set, but also by the default values of many other parameters.

The following parameter is not included in the initial set, but its default value significantly affects the runtime environment.

## RTE\_TYPE

This parameter determines whether runtime members are a full stand-alone set or shared with SMP/E target installation libraries.

### Description

This parameter determines whether runtime members are a full stand-alone set or shared with SMP/E target installation libraries.

### Default value

Configuration Manager: SHARING

PARMGEN: FULL

## Permissible values

The following descriptions apply to Configuration Manager:

### FULL

Stand-alone runtime members. Runtime members have no dependency on target libraries.

### SHARING

Some runtime members refer to the target libraries.

The high-level qualifiers of the target libraries are specified by the **GBL\_TARGET\_HILEV** parameter.

SHARING reduces the storage requirement for each runtime environment.

If **RTE\_TYPE** is SHARING, then the value of the **RTE\_SHARE** parameter must be SMP.

## Parameters with different default values than PARMGEN

IBM Z® Monitoring Configuration Manager sets some different default parameter values than PARMGEN.

In some cases, instead of changing the default value of a parameter, Monitoring Configuration Manager sets a different example value in the [initial set of parameters](#).

Parameter	PARMGEN default value and reason for change	Monitoring Configuration Manager default value
<b>GBL_DSN_CSF_SCSFMODE0</b>	In PARMGEN, this parameter is commented out in the WCONFIG (\$GBL\$USR) member. In Configuration Manager, it is explicitly added in the GBL\$PARM member that is generated after the <b>CREATE</b> or <b>MIGRATE</b> action, as it is relevant for several security-related aspects of the product configuration (such as password encryption). As described in the parameter description, if your installation does not use the Integrated Cryptographic Service Facility (ICSF), you can remove or comment out this parameter in your RTEDEF (GBL\$PARM) or RTEDEF (GBL\$lpar).	CSF . SCSFMODE0
<b>GBL_DSN_SYS1_PROCLIB</b> <b>GBL_DSN_SYS1_VTAMLIB</b> <b>GBL_DSN_SYS1_VTAMLST</b>	SYS1 . PROCLIB SYS1 . VTAMLIB SYS1 . VTAMLST Sites typically have their own procedures for copying members to system libraries, limited to z/OS® system administrators with special permissions.	<i>rte_hilev</i> .SYS1 . PROCLIB <i>rte_hilev</i> .SYS1 . VTAMLIB <i>rte_hilev</i> .SYS1 . VTAMLST
<b>KDS_KMS_SDA</b>	N Using the self-describing agent (SDA) function is best practice.	Y
<b>KDS_TEMS_TCP_KDEB_INTERFACELIST</b> <b>Kpp_AGT_TCP_KDEB_INTERFACELIST</b>	None Specifying a default value is best practice.	!* Inherited from parameter <b>RTE_TCP_KDEB_INTERFACELIST</b>
<b>KMQ_HISTCOLL_DATA_FLAG</b>	N Collecting historical data is best practice.	Y

Parameter	PARMGEN default value and reason for change	Monitoring Configuration Manager default value
KMQ_STARTMON_ACTIVEONLY	NO Only monitoring active queue managers is best practice.	YES
KYN_XAI01_SUBAGENT_JAVAHOME	/usr/lpp/java/J7.1 There is no need for a default value specifically for this subagent. Use the existing global parameters as a default value instead.	Concatenation of the following two parameter values: <i>gbl_hfs_java_dir1</i> <i>gbl_hfs_java_dir2</i>
RTE_TYPE	FULL SHARING reduces the storage requirement for each runtime environment.	SHARING  <b>Note:</b> When <b>RTE_TYPE</b> is SHARING, then the value of the <b>RTE_SHARE</b> parameter must be SMP, which indicates sharing with SMP/E target libraries. Configuration Manager does not use base or sharing-with-base runtime environments (as in PARMGEN).
RTE_USS_RTEDIR	/rtehome Creating a new subdirectory of the root directory is bad practice.	/var/rtehome
RTE_X_SECURITY_EXIT_LIB	<i>rte_hilev.rtename</i> .RKANSAMU Identifies the security exits library currently used in PARMGEN.	<i>rte_hilev.rte_name</i> .SECEXITS

## Parameters introduced by Monitoring Configuration Manager

IBM Z® Monitoring Configuration Manager introduces some parameters that do not exist in PARMGEN.

### Global (GBL) parameter introduced by Configuration Manager

The global parameters provide default settings for installation and common system library names.

The global parameter introduced by IBM Z® Monitoring Configuration Manager is explained in this section.

#### GBL\_USS\_TKAYHFS\_PATH

This parameter specifies the SMP/E TKAYHFS ddname installation directory.

##### Description

This parameter specifies the path of the z/OS UNIX directory that the SMP/E installation jobs for IBM Z OMEGAMON Data Provider define using the ddname TKAYHFS.

Depending on your local site practices, this path might refer to a copy of the SMP/E-managed directory rather than the original.

This directory is read-only for Monitoring Configuration Manager; Monitoring Configuration Manager does not write to this directory.

##### Default value

/usr/lpp/omdp

**Permissible values**

Character string, maximum length 44

**GBL\_UTIL\_BINDER**

This parameter allows you to override the default binder program name.

**Description**

To use a binder program other than the default IEWL, specify the name of the program in this parameter. If the name is in the list of documented IEWL aliases, then KCIOMEGA will rename the SYSPRINT, as it does for IEWL.

**Required or optional**

Required

**Default value**

IEWL

**Permissible values**

A valid MVS program name

**Runtime environment (RTE) parameters introduced by Configuration Manager**

The runtime environment parameters provide configuration settings for an individual runtime environment and default settings for the OMEGAMON components and products configured in that runtime environment.

The runtime environment parameters introduced by IBM Z® Monitoring Configuration Manager are explained in this section. The **RTE\_COMM\_PROTOCOLn**, **RTE\_TCP\_\***, and **RTE\_VTAM\_NETID** parameters offer an easy way to set all components to the same values, rather than setting parameters individually for each component.

**RTE\_COMM\_PROTOCOLn**

This parameter sets the communication protocol choices of all components in the runtime environment.

**Note:** This parameter is valid in Configuration Manager only. It is not valid in PARMGEN.

**Description**

The **RTE\_COMM\_PROTOCOLn** (n: 1 - 7) parameters set the value of the **KDS\_TEMS\_COMM\_PROTOCOLn** and **Kpp\_AGT\_COMM\_PROTOCOLn** parameters. This parameter offers an easy way to set all components to the same values, rather than setting parameters individually for each component.

**Required or optional**

Optional

**Default value**

None

**Permissible values**

*Table 39: RTE\_COMM\_PROTOCOLn permissible values*

Value	Protocol description	Corresponding protocol-specific parameters
IPPIPE	Non-secure TCP over IPv4	RTE_TCP_HOST RTE_TCP_PORT_NUM
IP	Non-secure UDP over IPv4	RTE_TCP_HOST RTE_TCP_UDP_PORT_NUM

Value	Protocol description	Corresponding protocol-specific parameters
IP6PIPE	Non-secure TCP over IPv6	RTE_TCP_HOST RTE_TCP_PIPE6_PORT_NUM
IP6	Non-secure UDP over IPv6	RTE_TCP_HOST RTE_TCP_UDP6_PORT_NUM
IPSPPIPE	Secure (SSL/TLS) TCP over IPv4	RTE_TCP_HOST RTE_TCP_PIPES_PORT_NUM
IPS6PIPE	Secure (SSL/TLS) TCP over IPv6	RTE_TCP_HOST RTE_TCP_PIPE6S_PORT_NUM
SNA	NCS RPC: Systems Network Architecture implementation of the Network Computing System Remote Procedure Call API	Kpp_TEMS_VTAM_APPL_LL_BROKER Kpp_TEMS_VTAM_LU62_DLOGMOD Kpp_TEMS_VTAM_LU62_MODETAB RTE_VTAM_NETID

Default values of **KDS\_TEMS\_COMM\_PROTOCOLn** and **Kpp\_AGT\_COMM\_PROTOCOLn**:

n	Value
1	IPPIPE
2	SNA

#### Example

Parameter	Value	Description
<b>RTE_COMM_PROTOCOL1</b>	IPSPPIPE	First choice: secure TCP over IPv4
<b>RTE_COMM_PROTOCOL2</b>	IPPIPE	Second choice: non-secure TCP over IPv4

#### Related parameters

- [KDS\\_TEMS\\_COMM\\_PROTOCOLn](#)
- [Kpp\\_AGT\\_COMM\\_PROTOCOLn](#)

#### RTE\_TCP\_KDEB\_INTERFACELIST

This Configuration Manager-only parameters directs all components in the runtime environment to connect to a specific TCP/IP local interface.

#### Description

The **RTE\_TCP\_KDEB\_INTERFACELIST** parameter sets the value of the **KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST** and **Kpp\_AGT\_TCP\_KDEB\_INTERFACELIST** parameters.

This parameter offers an easy way to set all components to the same values, rather than setting parameters individually for each component.

If the z/OS® image has more than one TCP/IP interface or network adapter, you can use this parameter to direct components to connect to a specific TCP/IP local interface.

#### Default value

!\* (exclamation point followed by an asterisk)

#### Permissible values

Character string, maximum length 44, specifying one or more network interfaces to use.

To set a network interface list, supply one of the following values:

- The hostname or IP address of the preferred interface.
- A list of hostnames or IP addresses, in descending order of preference. Use a blank (space) to separate the entries.

- An asterisk (\*) to prefer the interface associated with the default hostname for the z/OS® image. To display this value, enter TSO HOMETEST at the command line.
- An exclamation point followed by an asterisk (!\*) to use only the interface associated with the default hostname for the z/OS® image.
- An exclamation point followed by a hostname or IP address (!*hostname*) to use only the interface associated with *hostname*.

**Note:**

- If you set the value of this parameter to !\* or !*hostname*, you must specify the same value for every component and product configured in all runtime environments on the same z/OS® image.
- In the default character set (LANG=en\_US.ibm-037), the code for an exclamation point is x'5A'. If you are using a character set other than the default, a different character might map to that code. To require a specific network interface, use the character that maps to x'5A' in your character set.

For a high-availability hub, specify the value of this parameter as !*dvipa\_hostname*, where *dvipa\_hostname* is the private DVIPA name set for the **KDS\_TEMS\_TCP\_HOST** parameter.

### **RTE\_TCP\_PIPE6\_PORT\_NUM**

Sets the port number for all components in the runtime environment that use the TCP over IPv6 communication protocol.

**Description**

The **RTE\_TCP\_PIPE6\_PORT\_NUM** parameter sets the value of the **KDS\_TEMS\_TCP\_PIPE6\_PORT\_NUM** and **Kpp\_TEMS\_TCP\_PIPE6\_PORT\_NUM** parameters.

This parameter is used only if one of the parameters that sets communication protocol choices, **\*\_COMM\_PROTOCOLn**, specifies the value for this protocol, IP6PIPE.

This parameter offers an easy way to set all components to the same values, rather than setting parameters individually for each component.

**Default value**

*none*

**Permissible values**

A port number.

### **RTE\_TCP\_PIPE6S\_PORT\_NUM**

Sets the port number for all components in the runtime environment that use the secure TCP over IPv6 communication protocol.

**Description**

The **RTE\_TCP\_PIPE6S\_PORT\_NUM** parameter sets the value of the **KDS\_TEMS\_TCP\_PIPE6S\_PORT\_NUM** and **Kpp\_TEMS\_TCP\_PIPE6S\_PORT\_NUM** parameters.

This parameter is used only if one of the parameters that sets communication protocol choices, **\*\_COMM\_PROTOCOLn**, specifies the value for this protocol, IPS6PIPE.

This parameter offers an easy way to set all components to the same values, rather than setting parameters individually for each component.

**Default value**

*none*

**Permissible values**

A port number.

## RTE\_TCP\_PIPES\_PORT\_NUM

Sets the port number for all components in the runtime environment that use the secure TCP over IPv4 communication protocol.

### Description

The **RTE\_TCP\_PIPES\_PORT\_NUM** parameter sets the value of the **KDS\_TEMS\_TCP\_PIPES\_PORT\_NUM** and **Kpp\_TEMS\_TCP\_PIPES\_PORT\_NUM** parameters.

This parameter is used only if one of the parameters that sets communication protocol choices, **\*\_COMM\_PROTOCOLn**, specifies the value for this protocol, IPSPiPE.

This parameter offers an easy way to set all components to the same values, rather than setting parameters individually for each component.

### Default value

*none*

### Permissible values

A port number.

## RTE\_TCP\_STC

Sets the TCP/IP stack for all components in the runtime environment that use the IP communication protocol.

### Description

The **RTE\_TCP\_STC** parameter sets the value of the **KDS\_TEMS\_TCP\_STC** and **Kpp\_AGT\_TCP\_STC** parameters.

This parameter offers an easy way to set all components to the same values, rather than setting parameters individually for each component.

This parameter sets the value of the **TCP/IP\_USERID** parameter in the **KppINTCP** member of the **RKANPARU** library.

Setting **RTE\_TCP\_STC** to **#** (pound or hash sign) sets the value of **TCP/IP\_USERID** to a blank (space), which allows TCP/IP to decide the stack associated with the address space, for better load balancing.

### Default value

**#** (pound or hash sign)

### Permissible values

If the LPAR contains more than one TCP/IP stack, specify the started task name of the TCP/IP stack you want to use. Alternatively, specify a hash sign (**#**), which is translated to a blank and allows the TCP/IP environment to choose the stack to use, either through TCP/IP definitions or through the use of the **SYSTCPD** DD statement.

Whichever method is used to select a TCP/IP stack in a multi-stack environment, the Tivoli® Management Services components continue to use that stack, even if a different stack becomes the primary stack. Therefore, in a multi-stack environment, it is best to specify the started task name of the TCP/IP stack to be used, rather than specifying a wildcard or a blank.

## RTE\_TCP\_UDP\_PORT\_NUM

Sets the port number for all components in the runtime environment that use the UDP over IPv4 communication protocol.

### Description

The **RTE\_TCP\_UDP\_PORT\_NUM** parameter sets the value of the **KDS\_TEMS\_TCP\_UDP\_PORT\_NUM** and **Kpp\_TEMS\_TCP\_UDP\_PORT\_NUM** parameters.

This parameter is used only if one of the parameters that sets communication protocol choices, **\*\_COMM\_PROTOCOLn**, specifies the value for this protocol, IP.

This parameter offers an easy way to set all components to the same values, rather than setting parameters individually for each component.

**Default value**

*none*

**Permissible values**

A port number.

**RTE\_TCP\_UDP6\_PORT\_NUM**

Sets the port number for all components in the runtime environment that use the UDP over IPv6 communication protocol.

**Description**

The **RTE\_TCP\_UDP6\_PORT\_NUM** parameter sets the value of the **KDS\_TEMS\_TCP\_UDP6\_PORT\_NUM** and **Kpp\_TEMS\_TCP\_UDP6\_PORT\_NUM** parameters.

This parameter is used only if one of the parameters that sets communication protocol choices, **\*\_COMM\_PROTOCOLn**, specifies the value for this protocol, IP6.

This parameter offers an easy way to set all components to the same values, rather than setting parameters individually for each component.

**Default value**

*none*

**Permissible values**

A port number.

**RTE\_VTAM\_NETID**

Sets the VTAM® network ID for all components in the runtime environment that use the SNA communication protocol.

**Note:** This parameter is valid in both PARMGEN and Configuration Manager; however, its function differs slightly. This topic describes this parameter as it applies to Configuration Manager.

**Description**

The **RTE\_VTAM\_NETID** parameter sets the value of the **KDS\_TEMS\_VTAM\_NETID** and **Kpp\_TEMS\_VTAM\_NETID** parameters.

This parameter is used only if one of the parameters that sets communication protocol choices, **\*\_COMM\_PROTOCOLn**, specifies the value for this protocol, SNAPPIPE.

This parameter offers an easy way to set all components to the same values, rather than setting parameters individually for each component.

**Default value**

*none*

**Permissible values**

A VTAM® network ID.

**RTE\_X\_OVERRIDE\_EMBEDS\_LIB**

This parameter specifies the name of the source library for override embed members.

**Description**

Override embed files can be used to add user-defined parameters and values that might be overwritten during the **GENERATE** action.

If the **KFJ\_USE\_EMBEDS** parameter is set to Y, this parameter is automatically defined in the *rte\_plib\_hilev.RTEDEF(rte\_name)* member during an initial **CREATE** or **MIGRATE** action when creating an RTE.

**Note:** If the **KFJ\_USE\_EMBEDS** parameter was not set to Y when creating the RTE, you must manually add this parameter to the *rte\_plib\_hilev.RTEDEF(rte\_name)* member to enable the use of override embed members for the RTE.

This library contains all the override embed members for all products installed in the respective CSI.

Example value: TEST1.TST.DEMO.EMBEDS

#### Default value

*<rte\_plib\_hilev>.<rte\_name>.EMBEDS*

#### Permissible values

A valid MVS data set name.

#### Related parameters

KFJ\_USE\_EMBEDS  
KFJ\_EMBEDS\_LIB

### RTE\_X\_SECURITY\_EXIT\_LIB

This parameter specifies the library containing the security exits used for the runtime environment.

**Note:** This parameter is valid in both PARMGEN and Configuration Manager; however, its function differs slightly. This topic describes this parameter as it applies to Configuration Manager.

#### Description

This parameter specifies the library containing the security exits used for the runtime environment.

The **RTE\_X\_SECURITY\_EXIT\_LIB** parameter specifies the name of the global runtime environment library that contains all of the OMEGAMON and IBM Tivoli Monitoring-related product security exits (such as KOBSPDT OMEGAMON *KppSUPDI* exits, Tivoli Monitoring Services: Engine security exits, external security exits).

Example value: TEST1.TST.DEMO.SESEXITS

#### Default value

*<rte\_plib\_hilev>.<rte\_name>.SESEXITS*

#### Permissible values

A valid data set name.

### Configuration Manager (KFJ) parameters

The Configuration Manager parameters have the prefix KFJ.

### KFJ\_ADRDSSU\_ADMIN

This parameter specifies whether to include the ADMINISTRATOR keyword with z/OS DFSMSdss commands.

#### Description

The **PACKAGE** and **DEPLOY** actions use z/OS DFSMSdss commands when creating and restoring dump data sets. The ADMINISTRATOR keyword allows you to act as a DFSMSdss-authorized storage administrator. Specify this value in accordance with security settings at your site.

Y

Include the ADMINISTRATOR keyword

**N**

Do not include the ADMINISTRATOR keyword

**Notes:**

- You might need authority to run **ADDRSSU**, which is the program that is invoked when using DFSMSdss.
- You might need additional authority to use the ADMINISTRATOR keyword. For more information about using the ADMINISTRATOR keyword, see the following topics in the *z/OS DFSMSdss Storage Administration Reference*: [ADMINISTRATOR keyword](#), [FACILITY class profiles for the ADMINISTRATOR keyword](#)

**Default value**

N

**Permissible values**

Y, N

**KFJ\_EMBEDS\_LIB**

This parameter identifies the data set that contains the override embed values for the RTE.

**Description**

Use this parameter to specify the name of the data set (the *embeds data set*) that will contain the override embed values to use for the RTE. The data set must be accessible by Monitoring Configuration Manager. An example of the data set name is *highlevel.CFM.RTEDEF.EMBEDS*.

This parameter is active only if **KFJ\_USE\_EMBEDS** is set to Y.

The default name of the embeds data set is *rte\_plib\_hilev.rte\_name.EMBEDS*, which is intended for a single RTE. By using **KFJ\_EMBEDS\_LIB**, you can customize the name of the embeds data set and use the same override embed parameters and values for multiple RTEs. If you will be using different override values for different RTEs, consider using the *rte\_name* or *sysname* values in the data set name.

If the specified data set does not exist when the **CREATE** or **MIGRATE** action runs, Monitoring Configuration Manager creates the data set and populates it with the override embed parameters and values for the products that are installed in the respective CSI used to build the RTE. For the **MIGRATE** action, this library will contain the override embed parameters and values from the RTE being migrated from.

If the specified data set exists when the **CREATE** or **MIGRATE** action runs, none of the existing members in it are changed or removed; only new members are added, which can occur if the CSI used to build the RTE has changed to add products.

**Required or optional**

Optional

**Default value**

*rte\_plib\_hilev.rte\_name.EMBEDS*

**Permissible values**

A valid MVS data set name

**Example**

TEST1.TST.DEMO.EMBEDS

**Related parameters**

[KFJ\\_USE\\_EMBEDS](#)

["RTE\\_X\\_OVERRIDE\\_EMBEDS\\_LIB" on page 298](#)

## KFJ\_LOCAL\_HILEV

Assigns a local non-VSAM high-level qualifier.

The KFJ\_LOCAL\_HILEV parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$*par*) member, and identifies the non-VSAM high-level qualifier to be used for allocating the local runtime data sets when the GENERATE action is run. The names of the non-VSAM data sets will be generated by appending the appropriate suffix to this parameter.

KFJ\_LOCAL\_HILEV maps to the local value of RTE\_HILEV that is used on the deployment target system.

### Required or optional

Optional

### Default value

%KFJ\_LOCAL\_PLIB\_HILEV%

### Location where the parameter value is stored

This value is not stored in a configuration member.

## KFJ\_LOCAL\_KD5\_RUN\_ALLOC

This parameter controls if the job for Db2-related data set allocation is submitted. This parameter is used for remote deployment scenarios.

### Description

In a remote deployment scenario, you can use this parameter to specify whether to submit the Db2-related data set allocation job. This job allocates all operational data sets required for the enabled functions (for example, to collect data for Thread History). This job does not overwrite existing operational data sets.

Specify one of the following values:

#### GENERATE

Trigger the ALLOCDS JCL job during the GENERATE action. With this option, you cannot customize the KD2 operational data set allocation parameters.

#### DEPLOY

Trigger the ALLOCDS JCL job during the DEPLOY action. With this option, you can customize the KD2 operational data set allocation parameters.

#### NONE

Do not trigger the ALLOCDS JCL job. With this option, you can customize the KD2 operational data set allocation parameters.

**Tip:** For non-remote deployment scenarios (PACKAGE, DEPLOY), you can use parameter KD2\_OMPE\_RUNALLOC to perform the same function.

### Required or optional

Optional

### Default value

GENERATE

### Permissible values

GENERATE, DEPLOY, NONE

### Related parameters

KD2\_OMPE\_RUNALLOC

## KFJ\_LOCAL\_PDS\_HILEV

Specifies the PDS V1 local high-level qualifier.

The KFJ\_LOCAL\_PDS\_HILEV parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$*lpar*) member, and identifies the high-level qualifier for the local Persistent Data Store (PDS) V1 data sets. It maps to the local value of RTE\_PDS\_HILEV that is used on the deployment target system.

**Required or optional**

Optional

**Default value**

%KFJ\_LOCAL\_HILEV%.%RTE\_NAME%

**Location where the parameter value is stored**

This value is not stored in a configuration member.

**KFJ\_LOCAL\_PLIB\_HILEV**

This parameter specifies the high-level qualifiers for local libraries.

**Description**

This parameter allows for local generation of runtime environment data sets RTEDEF, EMBEDS, and SECEXITS.

Specifying this member triggers the generation of member PCK\$PARM (or PCK\$*lpar*) in the RTEDEF data set. This parameter populates the default values for other **KFJ\_LOCAL\_\*** high-level qualifier parameters in the PCK\$\* members, such as **KFJ\_LOCAL\_HILEV** and **KFJ\_LOCAL\_VSAM\_HILEV**.

For remote deployment scenarios, this parameter allows local libraries to be used for creating, configuring, and packaging a runtime environment that can then be deployed to another system that uses different high-level qualifiers from the configuration system. For more information, see [“Remote deployment example using local libraries” on page 343](#).

This parameter can be used with the following actions: **CREATE, MIGRATE, GENERATE, PACKAGE, DELETE**

This parameter is specified in the KCIVARS DD statement in the action job JCL and is not stored in an RTEDEF member.

**Default value**

N/A

**Related parameters**

- [RTE\\_PLIB\\_HILEV](#)
- [KFJ\\_PACK\\_HILEV](#)

**KFJ\_LOCAL\_SMS\_MGMTCLAS**

Identifies the MGMTCLAS for local non-VSAM libraries.

The KFJ\_LOCAL\_SMS\_MGMTCLAS parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$*lpar*) member and indicates the SMS Management Class to be used when allocating the local non-VSAM runtime data sets. KFJ\_LOCAL\_SMS\_MGMTCLAS maps to the local value of RTE\_SMS\_MGMTCLAS that is used on the deployment target system.

**Required or optional**

Optional

**Default value**

None

**Location where the parameter value is stored**

This value is not stored in a configuration member.

**KFJ\_LOCAL\_SMS\_STORCLAS**

Identifies the STORCLAS for local non-VSAM libraries.

This parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$*lpar*) member, and defines the SMS Storage Class to be used when allocating the local non-VSAM runtime data sets. KFJ\_LOCAL\_SMS\_STORCLAS maps to the local value of RTE\_SMS\_STORCLAS that is used on the deployment target system.

**Required or optional**

Optional

**Default value**

None

**Location where the parameter value is stored**

This value is not stored in a configuration member.

**KFJ\_LOCAL\_SMS\_UNIT**

Specifies the Unit name for local non-VSAM libraries.

The KFJ\_LOCAL\_SMS\_UNIT parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$*par*) member, and identifies the unit name to be used when allocating the local non-VSAM runtime data sets.

KFJ\_LOCAL\_SMS\_UNIT maps to the local value of RTE\_SMS\_UNIT that is used on the deployment target system.

This is a required field if the runtime data sets are not to be SMS-managed.

**Required or optional**

Required if the runtime data sets are not to be SMS-managed

**Default value**

None

**Location where the parameter value is stored**

This value is not stored in a configuration member.

**KFJ\_LOCAL\_SMS\_VOLUME**

Specifies the VOLSER for the local non-VSAM libraries.

This parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$*par*) member, and identifies the volume serial number to be used when allocating the local non-VSAM runtime data sets.

KFJ\_LOCAL\_SMS\_VOLUME maps to the local value of RTE\_SMS\_VOLUME that is used on the deployment target system.

This is a required field if the runtime data sets are not to be SMS-managed.

**Required or optional**

Required if the runtime data sets are not to be SMS-managed

**Default value**

None

**Location where the parameter value is stored**

This value is not stored in a configuration member.

**KFJ\_LOCAL\_SMS\_VSAM\_MGMTCLAS**

Specifies the MGMTCLAS for any local VSAM libraries.

This parameter specifies the SMS Management Class to be used when allocating the local VSAM runtime data sets. KFJ\_LOCAL\_SMS\_VSAM\_MGMTCLAS maps to the local value of RTE\_SMS\_VSAM\_MGMTCLAS that is used on the deployment target system.

**Required or optional**

Optional

**Default value**

None

**Location where the parameter value is stored**

This value is not stored in a configuration member.

## **KFJ\_LOCAL\_SMS\_VSAM\_STORCLAS**

Specifies the STORCLAS for local VSAM libraries.

The KFJ\_LOCAL\_SMS\_VSAM\_STORCLAS parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$*par*) member, and identifies the SMS Storage Class to be used when allocating the local VSAM runtime data sets. KFJ\_LOCAL\_SMS\_VSAM\_STORCLAS maps to the local value of RTE\_SMS\_VSAM\_STORCLAS that is used on the deployment target system.

### **Required or optional**

Optional

### **Default value**

None

### **Location where the parameter value is stored**

This value is not stored in a configuration member.

## **KFJ\_LOCAL\_SMS\_VSAM\_VOLUME**

Specifies the VOLSER for local VSAM libraries.

This parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$*par*) member, and identifies the volume serial number to be used when allocating the local VSAM runtime data sets. KFJ\_LOCAL\_SMS\_VSAM\_VOLUME maps to the local value of RTE\_SMS\_VSAM\_VOLUME that is used on the deployment target system.

This is a required field if the runtime data sets are not to be SMS-managed.

### **Required or optional**

Required if the runtime data sets are not to be SMS-managed

### **Default value**

None

### **Location where the parameter value is stored**

This value is not stored in a configuration member.

## **KFJ\_LOCAL\_TARGET\_HILEV**

Assigns the local SMP/E target high-level qualifier.

This parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$*par*) member and identifies the high-level qualifier to be used when referencing the local SMP/E target data sets as part of the GENERATE action. The names of SMP/E target data sets will be generated by appending the appropriate suffix to this parameter.

KFJ\_LOCAL\_TARGET\_HILEV maps to the local value of the GBL\_TARGET\_HILEV parameter, which is used on the deployment target system.

### **Required or optional**

Optional

### **Default value**

None

### **Location where the parameter value is stored**

This value is not stored in a configuration member.

## **KFJ\_LOCAL\_USS\_RTEDIR**

Specify the local RTE HFS/zFS home directory.

This parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$*par*) member. If any products in this RTE require z/OS® UNIX® System Services directories to be created, specify the local RTE HFS/zFS home

directory. KFJ\_LOCAL\_USS\_RTEDIR maps to the local value of RTE\_USS\_RTEDIR that is used on the deployment target system.

#### Required or optional

Required

#### Default value

/var/rtehome

#### Location where the parameter value is stored

This value is not stored in a configuration member.

### KFJ\_LOCAL\_USS\_TKANJAR\_PATH

Specifies the local z/OS® UNIX® System Services directory that the SMP/E installation jobs define using the ddname TKANJAR.

This parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$lpar) member. The **KFJ\_LOCAL\_USS\_TKANJAR\_PATH** parameter maps to the value of the **GBL\_USS\_TKANJAR\_PATH** parameter that is used on the deployment target system.

#### Required or optional

Required if the runtime environment configures either of the following monitoring agents:

- CICS® Transaction Gateway (TG). The corresponding configuration parameter is **CONFIGURE\_CICS\_TG\_KGW**.
- Java™ Virtual Machine (JVM). The corresponding configuration parameter is **CONFIGURE\_JVM\_KJJ**.

#### Default value

/usr/lpp/kan/bin/IBM

#### Location where the parameter value is stored

This value is not stored in a configuration member.

#### Related parameters

[“GBL\\_USS\\_TKANJAR\\_PATH” on page 284](#)

### KFJ\_LOCAL\_USS\_TKAYHFS\_PATH

This parameter specifies the local z/OS UNIX System Services directory that the SMP/E installation jobs define using the ddname TKAYHFS.

#### Description

This parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$lpar) member.

This parameter maps to the value of the **GBL\_USS\_TKAYHFS\_PATH** parameter that is used on the deployment target system.

#### Default value

/usr/lpp/omdp

#### Permissible values

Character string, maximum length 44

### KFJ\_LOCAL\_VSAM\_HILEV

Specifies the local VSAM high-level qualifier.

This parameter is specified in the RTEDEF(PCK\$PARM) or RTEDEF(PCK\$lpar) member, and identifies the VSAM high-level qualifier to be used for allocating the local runtime data sets when the GENERATE action is run. The names of the VSAM data sets will be generated by appending the appropriate suffix to this parameter. KFJ\_LOCAL\_VSAM\_HILEV maps to the local value of RTE\_VSAM\_HILEV that is used on the deployment target system.

**Required or optional**

Optional

**Default value**

%KFJ\_LOCAL\_PLIB\_HILEV%

**Location where the parameter value is stored**

This value is not stored in a configuration member.

**KFJ\_MIGRATE\_WCONFIG**

This parameter identifies the WCONFIG data set of the PARMGEN-configured runtime environment from which configuration settings are to be imported during migration.

**Description**

The **MIGRATE** action imports configuration settings from a runtime environment that is configured with PARMGEN to one that is configured with Configuration Manager. The **KFJ\_MIGRATE\_WCONFIG** parameter is used by the **MIGRATE** action to identify the WCONFIG data set of the source runtime environment (which is configured by PARMGEN).

**Important:** The source WCONFIG data set cannot be the same as the target WCONFIG data set. Make sure that the high-level qualifier specified for the source WCONFIG data set is not the same as the high-level qualifier of the target data sets (specified with the **RTE\_PLIB\_HILEV** parameter on the **MIGRATE** action).

**Required or optional**

Required for the **MIGRATE** action

**Default value**

None

**Permissible values**

*highlevel*.WCONFIG

Where *highlevel* is different from the target high-level qualifier specified in **RTE\_PLIB\_HILEV**

**Example**

TEST1.TST.DEMO.WCONFIG

**Location where the parameter value is stored**

This value is not stored in a configuration member.

**KFJ\_PACK\_DATACLAS**

Specifies the DATACLAS for non-VSAM package data sets.

This parameter is used by the PACKAGE and DEPLOY action, and specifies the SMS Data Class to be used when allocating or reading the non-VSAM package data sets. This parameter is not stored in any RTEDEF member and will be specified in the KCIVARS DD statement of your Configuration Manager batch JCL.

**Required or optional**

Optional

**Default value**

None

**Location where the parameter value is stored**

This value is not stored in a configuration member.

## KFJ\_PACK\_HILEV

This parameter specifies the non-VSAM high-level qualifiers for allocating and reading the package data sets used in remote deployment.

### Description

This parameter specifies the high-level qualifiers for the package data sets that are allocated and populated by the **PACKAGE** action and deployed (restored) by the **DEPLOY** action for remote deployment of runtime environments.

This parameter is required for the **DEPLOY** action if you transfer your package data sets from the configuration system to the remote (target) system with a qualifier that is different from the **RTE\_PLIB\_HILEV** parameter value.

For details about using this parameter, see [“PACKAGE” on page 265](#) and [“DEPLOY” on page 268](#).

This parameter is specified in the KCIVARS DD statement in the action job JCL and is not stored in an RTEDEF member.

### Default value

None

### Related parameters

- [RTE\\_PLIB\\_HILEV](#)
- [KFJ\\_LOCAL\\_PLIB\\_HILEV](#)

## KFJ\_PACK\_MGMTCLAS

Specifies the MGMTCLAS for non-VSAM package data sets.

The KFJ\_PACK\_MGMTCLAS parameter is used by the PACKAGE and DEPLOY action, and specifies the SMS Management Class to be used when allocating or reading the non-VSAM package data sets. This parameter is not stored in any RTEDEF member and will be specified in the KCIVARS DD statement of your Configuration Manager batch JCL.

### Required or optional

Optional

### Default value

None

### Location where the parameter value is stored

This value is not stored in a configuration member.

## KFJ\_PACK\_STORCLAS

Specifies the STORCLAS for non-VSAM package data sets.

The KFJ\_PACK\_STORCLAS parameter is used by the PACKAGE and DEPLOY action, and specifies the SMS Storage Class to be used when allocating or reading the non-VSAM package data sets. This parameter is not stored in any RTEDEF member and will be specified in the KCIVARS DD statement of your Configuration Manager batch JCL.

### Required or optional

Optional

### Default value

None

### Location where the parameter value is stored

This value is not stored in a configuration member.

## **KFJ\_PACK\_TERSE**

Specifies to use the terse data set option.

The KFJ\_PACK\_TERSE parameter works as a switch during PACKAGE and DEPLOY actions:

- **Y** – Terse the packages created during PACKAGE action, that is, append suffix "TRS" to the package data set. Instruct the DEPLOY action to read tersed package data sets. Use KFJ\_PACK\_TERSE Y if you transfer package data sets using FTP.
- **N** – Do not terse the package data sets created by the PACKAGE action. The DEPLOY action will read the DUMP data sets using the documented naming convention. Use KFJ\_PACK\_TERSE N when working with Virtual Tapes.

This parameter is not stored in any RTEDEF member and will be specified in the KCIVARS DD statement of your Configuration Manager batch JCL.

### **Required or optional**

Optional

### **Default value**

N

### **Permissible values**

Y, N

### **Location where the parameter value is stored**

This value is not stored in a configuration member.

## **KFJ\_PACK\_UNIT**

Specifies the Unit value for non-VSAM package data sets.

The KFJ\_PACK\_UNIT parameter is used by the PACKAGE and DEPLOY action, and specifies the UNIT name to be used when allocating or reading the non-VSAM package data sets. This parameter is not stored in any RTEDEF member and will be specified in the KCIVARS DD statement of your Configuration Manager batch JCL.

This parameter is required if the package data sets are not to be SMS-managed.

### **Required or optional**

Required if the package data sets are not to be SMS-managed

### **Default value**

None

### **Location where the parameter value is stored**

This value is not stored in a configuration member.

## **KFJ\_PACK\_VOLUME**

Specifies the volume for the non-VSAM package data set.

The KFJ\_PACK\_VOLUME parameter is used by the PACKAGE and DEPLOY actions, and specifies the volume serial number/name to be used when allocating or reading the non-VSAM package data sets. This parameter is not stored in any RTEDEF member and is specified in the KCIVARS DD statement of the Configuration Manager batch JCL.

This parameter is required if the package data sets are not to be SMS-managed.

### **Required or optional**

Required if the package data sets are not to be SMS-managed

### **Default value**

None

### **Location where the parameter value is stored**

This value is not stored in a configuration member.

## KFJ\_PDCOL\_ADR\_ARCHIVE

This parameter specifies the name of the ADRDSSU archive for the **PDCOLLECT** action to restore.

**Note:** This parameter is for use by IBM Software Support only.

### Description

This parameter specifies the name of the **ADRDSSU** archive for the **PDCOLLECT** action to restore.

### Default value

None

### Permissible values

Character string, maximum length 44

### Related parameters

[“KFJ\\_PDCOLLECT\\_RESTORE” on page 314](#)

[“KFJ\\_PDCOL\\_RESTORE\\_HLQ” on page 312](#)

## KFJ\_PDCOL\_COLLECT\_data

This parameter (with its variations) specifies the diagnostic data items that the **PDCOLLECT** action collects. You can control the collection of each of the items individually.

### Description

This parameter specifies the diagnostic data that the **PDCOLLECT** action collects at a detailed level. The variations of this parameter are referred to as *collection flags*. You can control each of the flags individually.

The following table lists the collection flags that are available and describes the content that each setting collects.

Parameter	Description
KFJ_PDCOL_COLLECT_STC	Collects the started task log
KFJ_PDCOL_COLLECT_NETSTAT	Collects network information using the <b>netstat</b> utility
KFJ_PDCOL_COLLECT_DASTATS	Collects SDSF Display Active Users (DA) statistics
KFJ_PDCOL_COLLECT_RK	Collects libraries RKANSAMU, RKANPARU, RKANCMDU, RKANDATV, RKCPDEFW, RKD2PAR, RKD2SAM
KFJ_PDCOL_COLLECT_TRG	Collects libraries <i>x</i> KANCMD, <i>x</i> KANSAM, <i>x</i> KANPAR, where <i>x</i> is T or R (shared or full RTE)
KFJ_PDCOL_COLLECT_LISTCAT	Collects <b>LISTCAT</b> command output, which lists all the data sets under the runtime environment qualifiers
KFJ_PDCOL_COLLECT_RTEDEF	Collects the runtime environment definition (RTEDEF) library
KFJ_PDCOL_COLLECT_EMBEDS	Collects the EMBEDS data set
KFJ_PDCOL_COLLECT_USERJCL	Collects the data set specified in the GBL_USER_JCL parameter
KFJ_PDCOL_COLLECT_WCONFIG	Collects the WCONFIG data set
KFJ_PDCOL_COLLECT_SNMP	Collects member RKANSAMU (KN3SNMP) or the data set specified in parameter KN3_SNMP_CONFIG_FILE
KFJ_PDCOL_COLLECT_STDENV	Collects the data sets mapped to the SDTENV DD statement
KFJ_PDCOL_COLLECT_SDADIR	Collects various information about the self-describing agent (SDA) directory, permission bits, contents, spawn_cmd.sh contents

Parameter	Description
KFJ_PDCOL_COLLECT_QA1	Collects QA1 files from the Tivoli Enterprise Monitoring Server started task  <div style="border: 1px solid blue; padding: 5px;"> <p><b>Note:</b> When producing output in the PAX (.pax) file format, the <b>PDCOLLECT</b> action writes the QA1 files to the z/OS® UNIX® System Services file system in hexadecimal print format. Additionally, the hex print data is converted to ASCII format and placed in the /converted subdirectory.</p> </div>
KFJ_PDCOL_COLLECT_OPSLOG	Collects data sets mapped to the RKMSLG DD statement
KFJ_PDCOL_COLLECT_MANIFEST	Collects component level information

**Default value**

For all flags except parameter **KFJ\_PDCOL\_COLLECT\_OPSLOG**: Y  
 For parameter **KFJ\_PDCOL\_COLLECT\_OPSLOG**: N

**Permissible values**

Y, N

**KFJ\_PDCOL\_DA\_INTERVAL**

This parameter specifies the interval (in seconds) for SDSF DA panel statistics collection.

**Description**

This parameter specifies the interval (in seconds) for the PDCOLLECT action to use for SDSF Display Active Users (DA) panel statistics collection.

**Default value**

10

**Permissible values**

Integer

**Related parameters**

[“KFJ\\_PDCOL\\_DA\\_SAMPLES” on page 310](#)

**KFJ\_PDCOL\_DA\_SAMPLES**

This parameter specifies the number of samples to take per interval for SDSF DA panel statistics collection.

**Description**

This parameter specifies the number of samples for the PDCOLLECT action to take per interval for SDSF Display Active Users (DA) panel statistics collection.

**Default value**

10

**Permissible values**

Integer

**Related parameters**

[“KFJ\\_PDCOL\\_DA\\_INTERVAL” on page 310](#)

**KFJ\_PDCOL\_HLQ**

This parameter specifies the high-level qualifier for the data sets that the **PDCOLLECT** action uses.

**Description**

This parameter specifies the high-level qualifier for the data sets that the **PDCOLLECT** action uses.

These data sets include the collection configuration data set (PDCLDEF) and generated output files in terse format (PDCOLPDS . TRS).

**Default value**

&SYSUID.KCIPDCOL

**Permissible values**

An MVS data set name, maximum length 31

## **KFJ\_PDCOL\_JOB\_FILTER**

This parameter specifies if job filtering is enabled for the **PDCOLLECT** action.

**Description**

This parameter specifies if job filtering is enabled for the **PDCOLLECT** action.

When job filtering is enabled, you can use the asterisk (\*) and percent sign (%) as wildcard characters in the **KFJ\_PDCOL\_JOB\_NAME** and **KFJ\_PDCOL\_JOB\_ID** parameter values to create the job filters.

**Default value**

Y

**Permissible values**

Y, N

**Related parameters**

[“KFJ\\_PDCOL\\_JOB\\_ID” on page 311](#)

[“KFJ\\_PDCOL\\_JOB\\_NAME” on page 311](#)

## **KFJ\_PDCOL\_JOB\_ID**

This parameter specifies the job ID of the started task for which the **PDCOLLECT** action collects diagnostic data.

**Description**

This parameter specifies the job ID (located in the SDSF job output queue) of the started task for which the **PDCOLLECT** action collects diagnostic data.

This parameter must be specified with parameter **KFJ\_PDCOL\_JOB\_NAME** and should point to the same job output.

**Default value**

When **KFJ\_PDCOL\_JOB\_FILTER** is set to N: JOBJID

When **KFJ\_PDCOL\_JOB\_FILTER** is set to Y: \*

**Permissible values**

Character string, maximum length 8

## **KFJ\_PDCOL\_JOB\_NAME**

This parameter specifies the job name of the started task for which the **PDCOLLECT** action collects diagnostic data.

**Description**

This parameter specifies the job name (located in the SDSF job output queue) of the started task for which the **PDCOLLECT** action collects diagnostic data.

This parameter must be specified with parameter **KFJ\_PDCOL\_JOB\_ID** and should point to the same job output.

**Default value**

JOBNAME

**Permissible values**

Character string, maximum length 8

**KFJ\_PDCOL\_JOB\_OUTPUT**

This parameter specifies the name of the data set containing the job output of the started task for which the **PDCOLLECT** action collects diagnostic data.

**Description**

This parameter specifies the name of the data set containing the job output of the OMEGAMON address space started task for which the **PDCOLLECT** action collects diagnostic data. Use this parameter if your OMEGAMON address space logs have been copied to a sequential data set.

**Note:** If parameters **KFJ\_PDCOL\_JOB\_NAME** and **KFJ\_PDCOL\_JOB\_ID** are specified in the KCIVARS DD statement, parameter **KFJ\_PDCOL\_JOB\_OUTPUT** is ignored.

**Default value**

None

**Permissible values**

An MVS data set name, maximum length 44

**KFJ\_PDCOL\_RESTORE\_HLQ**

This parameter specifies the high-level qualifier for the **PDCOLLECT** action to use for **ADDRSSU** archive restore.

**Note:** This parameter is for use by IBM Software Support only.

**Description**

This parameter specifies the high-level qualifier for the **PDCOLLECT** action to use for **ADDRSSU** archive restore.

The **ADDRSSU** program uses this parameter value as the first qualifier for a rename option.

**Default value**

None

**Permissible values**

An MVS data set name, maximum length 8. The value must be a single qualifier.

**Related parameters**

[“KFJ\\_PDCOL\\_ADR\\_ARCHIVE” on page 309](#)

[“KFJ\\_PDCOLLECT\\_RESTORE” on page 314](#)

**KFJ\_PDCOLLECT\_ADDRSSU**

This parameter specifies that the **PDCOLLECT** action store the collected diagnostic data in an **ADDRSSU** archive.

**Description**

This parameter specifies that the **PDCOLLECT** action store the collected diagnostic data in an **ADDRSSU** archive.

The file **ADR.ARCHIVE** is generated.

This option requires the use of the **KCIALPHA** program.

**Default value**

N

**Permissible values**

Y, N

**KFJ\_PDCOLLECT\_COMPATIBILITY**

This parameter specifies that the **PDCOLLECT** action store the collected diagnostic data in a terse data set.

**Description**

This parameter specifies that the **PDCOLLECT** action store the collected diagnostic data in a terse data set.

With this option, the **PDCOLLECT** action uses the IEBCOPY UNLOAD function to package the diagnostic data.

The file *kfj\_pdcoll\_hlq.PDCOLPDS*.TRS is generated.

**Default value**

Y

**Permissible values**

Y, N

**KFJ\_PDCOLLECT\_PAX**

This parameter specifies that the **PDCOLLECT** action store the collected diagnostic data in a PAX archive.

**Description**

This parameter specifies that the **PDCOLLECT** action store the collected diagnostic data in a PAX archive.

This parameter must be specified with parameter **KFJ\_PDCOLLECT\_PAX\_DIR**.

The file *kcipdcol.pax* is generated.

**Default value**

N

**Permissible values**

Y, N

**Related parameters**

[KFJ\\_PDCOLLECT\\_PAX\\_DIR](#)

**KFJ\_PDCOLLECT\_PAX\_DIR**

This parameter specifies the **PDCOLLECT** action PAX archive path.

**Description**

This parameter specifies the **PDCOLLECT** action PAX archive path.

This value must be a valid z/OS® UNIX® System Services directory and is used as the root to create directory *kcipdcol/*.

This parameter must be specified with parameter **KFJ\_PDCOLLECT\_PAX**.

**Default value**

None

**Permissible values**

Character string, maximum length 50

**Related parameters**

[KFJ\\_PDCOLLECT\\_PAX](#)

## KFJ\_PDCOLLECT\_RESTORE

This parameter specifies that the **PDCOLLECT** action restore diagnostic data from a given archive.

**Note:** This parameter is for use by IBM Software Support only.

### Description

This parameter specifies that the **PDCOLLECT** action restore diagnostic data from a given archive.

### Default value

N

### Permissible values

Y, N

### Related parameters

[“KFJ\\_PDCOL\\_ADR\\_ARCHIVE” on page 309](#)

[“KFJ\\_PDCOL\\_RESTORE\\_HLQ” on page 312](#)

## KFJ\_SECURITY\_EXITS\_LIB

This parameter specifies the name of the security exits library for the runtime environment.

### Description

Use this parameter to specify the name of the data set that will contain the security exits for the runtime environment.

The default name for the security exits data set is *rte\_plib\_hilev.rte\_name*.SECEXITS. By using the **KFJ\_SECURITY\_EXITS\_LIB**, you can customize the name of the security exits data set.

The **KFJ\_SECURITY\_EXITS\_LIB** parameter works with the **CREATE** and **MIGRATE** actions only.

If the specified data set does not exist when the **CREATE** or **MIGRATE** action runs, Configuration Manager allocates the data set and populates it with the default security exit members. For the **MIGRATE** action, this library will contain the security exit members from the source PARMGEN runtime environment.

### Required or optional

Optional

### Default value

*rte\_plib\_hilev.rte\_name*.SECEXITS

### Permissible values

A valid data set name

### Example

TEST1.TST.DEMO.MYEXITS

### Location where the parameter value is stored

This value is not stored in a configuration member.

### Related parameters

[“RTE\\_X\\_SECURITY\\_EXIT\\_LIB” on page 291](#)

## KFJ\_SYSNAME

This parameter defines the system name (SYSNAME), LPAR name, or SYSSMFID to use in runtime environment configuration members.

**Note:** `KFJ_SYSNAME` is an internal parameter that automatically assigns the value of `SYSNAME`, but it is possible to specify a different value for `KFJ_SYSNAME` in the `KCIVARS DD` as well.

### Description

This parameter is specified in the `KCIVARS DD` statement of the JCL that runs the Configuration Manager jobs (for example, the `KFJJMCM` sample job in `TKANSAM`).

This parameter is used for the following purposes:

- Used with **OPTION MULTIPLE** to create (or migrate) multiple runtime environments in a single RTEDEF library. The `KFJ_SYSNAME` parameter value replaces `lpar` in member name `Kpp$lpar` for the generated members. For more information, see [“CREATE” on page 239](#) and [“MIGRATE” on page 261](#).
- Used for remote deployment to generate runtime environments on a single local system that can then be deployed to remote target systems. For more information, see [“Deploying remote runtime environments” on page 341](#).
- Used to assign the system name if you use a `SYSNAME` that is larger than 4 characters (5 - 8 characters) and the `SYSSMFID` is not assigned or the default `SYSSMFID` setting is not acceptable. Normally, a `SYSNAME` is 1 - 4 characters in length; however, if a system has a longer `SYSNAME`, you can use the `KFJ_SYSNAME` parameter to override it. The `KFJ_SYSNAME` parameter value replaces the value assigned to the `&SYSNAME` parameter when generating member names for the **DISCOVER**, **GENERATE**, and **MIGRATE** actions. The following rules apply:
  - If the value for `&SYSNAME` is 4 characters or less, the value for `KFJ_SYSNAME` equals the `&SYSNAME`.
  - If the value for `&SYSNAME` is 5 - 8 characters in length, the value for `KFJ_SYSNAME` equals the `&SYSSMFID` parameter, which is the SMF ID.
  - If the value for `&SYSSMFID` is not set explicitly, the system defaults to the CPU model number.

If the `KFJ_SYSNAME` value has been set for `&SYSSMFID`, warning message `KFJ00205W` is issued in the `KCIPRINT` member. This message states that you can provide (override) a custom `KFJ_SYSNAME` value (in `KCIVARS DD`) when running the Configuration Manager job. This action allows you to avoid duplicate member names in the RTEDEF data set, in case the `&SYSSMFID` is set to default to the CPU model number.

### KFJ\_USE\_EMBEDS

This parameter controls whether override embed members are enabled for the RTE.

### Description

A value of `Y` indicates that override embed members are enabled for the RTE.

For a **CREATE** or **MIGRATE** action, when this parameter is set to `Y`, Monitoring Configuration Manager creates a data set (the *embeds data set*) that contains the override embed parameters and values for the products that are installed in the respective CSI used to build the RTE. For the **MIGRATE** action, this library will contain the override embed parameters and values from the RTE being migrated from.

Unless specified otherwise in parameter `KFJ_EMBEDS_LIB`, the embeds data set name is `rte_plib_hilev.rte_name.EMBEDS`, where `rte_plib_hilev` is the high-level qualifier (HLQ) and `rte_name` is the name of the RTE specified on the action. By using this default naming convention, you can isolate the override embed values into the respective libraries per RTE.

**Note:** If the default or specified embeds data set exists when the **CREATE** or **MIGRATE** action runs, none of the existing members in it are changed or removed; only new members are added, which can occur if the CSI used to build the RTE has changed to add products.

During an initial **CREATE** or **MIGRATE** action when creating an RTE, when this parameter is set to `Y`, Monitoring Configuration Manager also defines the data set to the RTE using the `RTE_X_OVERRIDE_EMBEDS_LIB` parameter.

**Required or optional**

Optional

**Default value**

N

**Permissible values**

Y, N

**Related parameters**

KFJ\_EMBEDS\_LIB

RTE\_X\_OVERRIDE\_EMBEDS\_LIB

**Target copy (TRG) parameters**

The target copy parameters provide configuration settings for managing copies of SMP/E target libraries.

**TRG\_COPY\_HILEV**

Non-VSAM high-level qualifier for SMP/E target library copy

**Description**

This field specifies the high-level qualifier to be used when allocating the SMP/E target copy non-VSAM data sets. The names of these data sets will be generated by appending the appropriate suffix to this field.

**Required or optional**

Optional

**Default value**

%RTE\_PLIB\_HILEV%

**TRG\_COPY\_MGMTCLAS**

MGMTCLAS for non-VSAM libraries for SMP/E target library copy

**Description**

This field specifies the SMS management class to be used when allocating the SMP/E target copy non-VSAM data sets.

This field is required if the data sets are not to be SMS-managed. Leave this field blank if your installation does not use the SMS MGMTCLAS parameter or it is optional.

**Required or optional**

Optional

**Default value**

%RTE\_SMS\_MGMTCLAS%

**TRG\_COPY\_NAME**

SMP/E target library copy name

**Description**

This field specifies the name of the member in the RTEDEF library for SMP/E target copy settings. This member is required when using Configuration Manager to create and maintain an SMP/E target copy.

**Required or optional**

Optional

**Default value**

None

## TRG\_COPY\_STORCLAS

STORCLAS for non-VSAM libraries for SMP/E target library copy

### Description

This field specifies the SMS storage class to be used when allocating the SMP/E target copy non-VSAM data sets.

This field is required if the data sets are not to be SMS-managed. Leave this field blank if your installation does not use the SMS STORCLAS parameter or it is optional.

### Required or optional

Optional

### Default value

%RTE\_SMS\_STORCLAS%

## TRG\_COPY\_TKANJAR\_PATH

z/OS UNIX System Services directory for SMP/E target copy

### Description

This field specifies the z/OS UNIX directory that will be used as a copy for the SMP/E installation jobs.

This field specifies the directory for a copy of SMP/E TKANJAR files, which is needed for OMEGAMON for CICS TG on z/OS (KGW) and OMEGAMON for JVM (KJJ).

## TRG\_COPY\_TKAYHFS\_PATH

This parameter specifies the z/OS UNIX System Services directory for the SMP/E TKAYHFS installation directory copy.

### Description

This field specifies the z/OS UNIX directory that will be used as a copy for the SMP/E TKAYHFS installation directory.

This field specifies the directory for a copy of SMP/E TKAYHFS files, which is needed for OMEGAMON Data Provider (KAY).

### Default value

*/var/rtehome/<trg\_copy\_name>/kay*

### Permissible values

Character string, maximum length 44

## TRG\_COPY\_UNIT

Unit for non-VSAM libraries for SMP/E target library copy

### Description

This field specifies the unit name to be used when allocating the SMP/E target copy non-VSAM data sets.

This field is required if the data sets are not to be SMS-managed. Leave this field blank if your installation does not use the unit name or it is optional.

### Required or optional

Optional

### Default value

%RTE\_SMS\_UNIT%

## TRG\_COPY\_VOLUME

VOLSER for non-VSAM libraries for SMP/E target library copy

### Description

This field specifies the volume serial numbers to be used when allocating the SMP/E target copy non-VSAM data sets.

This field is required if the data sets are not to be SMS-managed. Leave this field blank if your installation does not use the volume serial number or it is optional.

### Required or optional

Optional

### Default value

%RTE\_SMS\_VOLUME%

## Sparse parameter tables: The first row sets the default values for subsequent rows

For parameters that are arranged in tables, IBM Z® Monitoring Configuration Manager uses the first row to set the defaults for subsequent rows.

You can use this behavior to specify “sparse” parameter tables. You only need to specify parameters whose values differ from the first row. Sparse parameter tables are especially useful for configuring the Db2® monitoring agent.

As with PARMGEN, you can also specify complete parameter tables: every parameter in every row.

### Example: Db2® profile configuration

The following example shows a sparse parameter table that configures three Db2® profiles (PROD, TEST, and DEV):

```
KD2_PF          BEGIN
KD2_PF01_ROW    01
KD2_PF01_PROFID "PROD"
* Configure and autostart Near-Term History (NTH)
KD2_PF01_HIS_START Y
* Store NTH data to VSAM data sets for e3270UI thread history
KD2_PF01_HIS_STORE THVSAM
KD2_PF01_THRDHIS_LOG_NUM 10
* Storage units
KD2_PF01_HIS_VSAM_SU  CYLS
KD2_PF01_HIS_VSAM_MB  50

KD2_PF02_ROW    02
KD2_PF02_PROFID "TEST"
* TEST requires fewer resources for NTH than PROD
KD2_PF02_THRDHIS_LOG_NUM 3
KD2_PF02_HIS_VSAM_MB  10

KD2_PF03_ROW    03
KD2_PF03_PROFID "DEV"
* No NTH in DEV
KD2_PF03_HIS_START N

KD2_PF          END
```

The first row configures the PROD profile and sets the default values for subsequent rows (profiles).

The TEST profile omits the following parameters, falling back to the values from the first row:

```
KD2_PFnn_HIS_START
KD2_PFnn_HIS_STORE
KD2_PFnn_HIS_VSAM_SU
```

The TEST profile sets different, lower values than PROD for the following parameters, because TEST requires fewer resources for Near-Term History:

```
KD2_PF02_THRDHIS_LOG_NUM
```

## KD2\_PF02\_HIS\_VSAM\_MB

The DEV profile does not configure Near-Term History.

### Example: Db2® subsystem configuration

The following example shows a sparse parameter table that configures the Db2® monitoring agent to monitor three Db2® subsystems (DB2P, DB2T, and DB2D):

```
KD2_DB          BEGIN

KD2_DB01_ROW    01
KD2_DB01_DB2_SSID "DB2P"
KD2_DB01_DB2_DESCRIPTION "PROD Db2 subsystem"
KD2_DB01_DB2_PROFID "PROD"
KD2_DB01_DB2_VER "12"
KD2_DB01_DB2_SYSNAME "ZOSP"
KD2_DB01_DB2_DS_GROUP "N"
KD2_DB01_DB2_MONITOR_START "Y"
KD2_DB01_DB2_PORT_NUM "2000" * OMEGAMON Db2 PE Server TCP/IP port number
KD2_DB01_DB2_LOADLIB "DSN.VCR1M0.SDSNLOAD"
KD2_DB01_DB2_DSNTIAD "DSNTIAD"
KD2_DB01_DB2_RUNLIB "DSN.VCR1M0.RUNLIB.LOAD"

KD2_DB02_ROW    02
KD2_DB02_DB2_SSID "DB2T"
KD2_DB02_DB2_DESCRIPTION "TEST Db2 subsystem"
KD2_DB02_DB2_PROFID "TEST"
KD2_DB02_DB2_SYSNAME "ZOST"
KD2_DB02_DB2_PORT_NUM "2001"

KD2_DB03_ROW    03
KD2_DB03_DB2_SSID "DB2D"
KD2_DB03_DB2_DESCRIPTION "DEVT Db2 subsystem"
KD2_DB03_DB2_PROFID "DEVT"
KD2_DB03_DB2_SYSNAME "ZOSD"
KD2_DB03_DB2_PORT_NUM "2002"
KD2_DB03_DB2_LOADLIB "DSN.VC10.SDSNLOAD"
KD2_DB03_DB2_RUNLIB "DSN.VC10.RUNLIB.LOAD"

KD2_DB          END
```

The first row configures the agent to monitor the DB2P subsystem and sets the default values for subsequent rows (subsystems).

The second row falls back to the values set by the first row for Db2® version, LOADLIB, and RUNLIB, but sets its own values for the profile, system (LPAR) name, and port number.

The third row specifies its own values for LOADLIB and RUNLIB.

## Runtime environment definition (RTEDEF) library

A runtime environment definition is a set of parameters. Parameters are stored in a runtime environment definition (RTEDEF) library. The set of parameters for each runtime environment is organized into several RTEDEF members.

The data set name of the RTEDEF library consists of the high-level qualifiers that you specify to IBM Z® Monitoring Configuration Manager in the **RTE\_PLIB\_HILEV** workflow variable in the KCIVARS input data set, followed by the fixed low-level qualifier RTEDEF:

```
rte_plib_hilev.RTEDEF
```

You can allocate the RTEDEF library yourself or you can use the **CREATE** action to allocate it and populate it with [initial members](#) for you.

An RTEDEF library can contain multiple runtime environment definitions. A single RTEDEF library can contain all of the runtime environment definitions for a sysplex. Or you can choose to store each runtime environment definition in a separate RTEDEF library.

If you are going to set up a High Availability TEMS (HA TEMS), make sure there is only one runtime environment defined in the RTEDEF (that is, the one used for the HA TEMS).

RTEDEF library members are also known as *configuration profile* members.

## Runtime environment definition library members

RTEDEF library members follow a naming convention that identifies the contents of the member and whether the member applies to a specific LPAR or to all LPARs.

Use the naming convention described in the following table to store parameters in the correct members. In the LPARs column of the following table, *Current* means the LPAR on which the **GENERATE** action is performed.

Table 43: RTEDEF member naming convention			
Member name	Parameters	LPARs	Description
<i>rte_name</i>	<b>RTE_* CONFIGURE_*</b>	All	Runtime environment configuration profile. <i>rte_name</i> matches the value of the <b>RTE_NAME</b> workflow variable in the KCIVARS data set of the job that performs the Monitoring Configuration Manager action.
KC5@ <i>lpar</i> KD5@ <i>lpar</i> KI5@ <i>lpar</i> KN3@ <i>lpar</i>	<b>Kpp_*</b>	Current	LPAR-specific product configuration profile created by the <b>DISCOVER</b> action.  <b>Note:</b> The <b>DISCOVER</b> action writes a comment member, <i>Kpp#lpar</i> , if a <i>Kpp@lpar</i> member already exists. For more information, see <a href="#">“Members created by the DISCOVER action” on page 245.</a>
SYS@ <i>lpar</i>	Symbols	Current	LPAR-specific system symbols and KCIPARSE extracted variables found by the <b>DISCOVER</b> action.  <b>Note:</b> The <b>DISCOVER</b> action writes a comment member, <i>SYS#lpar</i> , if a <i>SYS@lpar</i> member already exists. For more information, see <a href="#">“Members created by the DISCOVER action” on page 245.</a>
Kpp\$PARM	<b>Kpp_*</b>	All	Product configuration profile, where <i>pp</i> is the product code. For the list of supported code values, see <a href="#">“Products supported by Configuration Manager” on page 214.</a>
Kpp\$lpar	<b>Kpp_*</b>	Current	LPAR-specific product configuration profile, where <i>pp</i> is the product code. For the list of supported code values, see <a href="#">“Products supported by Configuration Manager” on page 214.</a>
GBL\$PARM	<b>GBL_*</b>	All	Global configuration profile.
GBL\$lpar	<b>GBL_*</b>	Current	LPAR-specific global configuration profile.
VAR\$GLOB	Variables	All	Variables configuration profile. For more information, see <a href="#">“Variables in parameter values” on page 334.</a>
VAR\$lpar	Variables	Current	LPAR-specific variables configuration profile. For more information, see <a href="#">“Variables in parameter values” on page 334.</a>
PCK\$PARM	<b>KFJ_LOCAL_*</b>	All	Configuration profile created by the <b>PACKAGE</b> action that contains data set high-level qualifiers and other settings for deploying to a target system. For more information, see <a href="#">“Special considerations for SYSPLEX rollout” on page 323.</a>

Member name	Parameters	LPARs	Description
PCK\$ <i>lpar</i>	KFJ_LOCAL_*	Current	LPAR-specific configuration profile created by the <b>PACKAGE</b> action that contains data set high-level qualifiers and other settings for deploying to a target system. For more information, see “ <a href="#">Special considerations for SYSPLEX rollout</a> ” on page 323.
<i>trg_copy_name</i>	TRG_COPY_* GBL_* CONFIGURE_*	All	Target copy configuration profile. <i>trg_copy_name</i> matches the value of the <b>TRG_COPY_NAME</b> workflow variable in the KCIVARS DD statement of the job that performs the Monitoring Configuration Manager action with option <b>TRGCOPY</b> .

The following figure illustrates an example of the RTEDEF library member naming and hierarchy. Depending on your configuration, there might be more or fewer members in your RTEDEF. The complete list of members is provided in the previous [table](#).

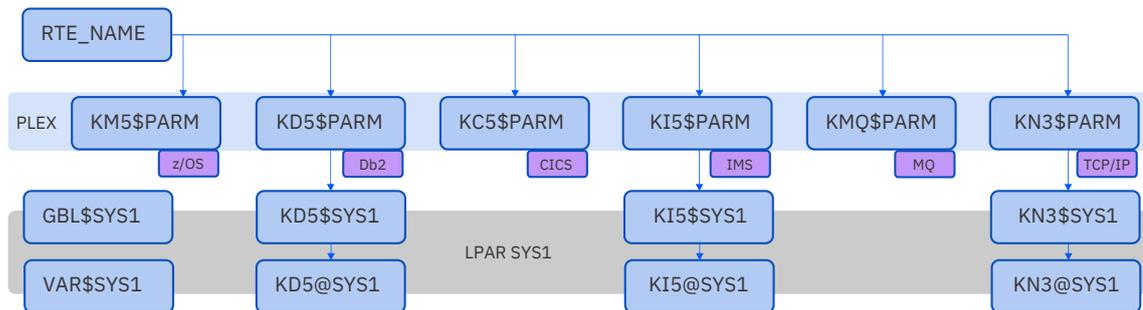

Figure 52: Example runtime environment definition library member naming and hierarchy

**Note:**

If a product has parameters with different prefixes, use the *Kpp* from the corresponding **CONFIGURE\_\*** parameter as the member name prefix for all the parameters. For example:

- Store all Db2® agent parameters, **KD2\_\*** and **KD5\_\***, in KD5\* members, to match the **CONFIGURE\_DB2\_AGENT\_KD5** parameter.
- Store all **KC2\_\*** and **KC5\_\*** parameters in KC5\* members.
- Store all **KI2\_\*** and **KI5\_\*** parameters in KI5\* members.
- Store all **KDF\_\*** and **KS3\_\*** parameters in KS3\* members.

## Concatenation order of runtime environment definition library members

The **GENERATE** action builds the set of parameters for a runtime environment by concatenating RTEDEF members in a well-defined order.

At a high level, the order in which the parameters are read can be categorized as follows:

- System symbols and KCIPARSE-extracted variables found by the **DISCOVER** action
- Target copy (if option **TRGCOPY** is specified)
- [Variables](#) (if system variables are enabled for the runtime environment)
- Runtime environment
- Product
- Global
- Package (if remote deployment applies)

The following table provides the specific order (by RTEDEF member) in which the parameters are read. In this list, parameters that are set in member `SYS@lpar` are read first and parameters that are set in member `PCK$lpar` are read last. In the following table, `lpar` identifies the LPAR on which the **GENERATE** action runs.

**Important:** If a parameter is set more than once, the last value that is read is used.

Table 44: Read order of runtime environment parameters		
Order position	RTEDEF member	Notes
1	<code>SYS@lpar</code>	The <code>SYS@lpar</code> member is always processed first, even if the system variables flag ( <code>RTE_SYSV_SYSVAR_FLAG</code> ) is disabled.
2	<code>trg_copy_name</code>	The <code>trg_copy_name</code> member is processed only if option <b>TRGCOPY</b> is specified.
3	<code>VAR\$GLOB</code>	The <code>VAR\$GLOB</code> member is processed only if the system variables flag ( <code>RTE_SYSV_SYSVAR_FLAG</code> ) is enabled.
4	<code>VAR\$lpar</code>	The <code>VAR\$lpar</code> member is processed only if the system variables flag ( <code>RTE_SYSV_SYSVAR_FLAG</code> ) is enabled.
5	<code>rte_name</code>	
6	<code>Kpp@lpar</code>	For KC5, KI5, KD5, and KN3 only
7	<code>Kpp\$PARM</code>	
8	<code>Kpp\$lpar</code>	
9	<code>GBL\$PARM</code>	
10	<code>GBL\$lpar</code>	
11	<code>PCK\$PARM</code>	The <code>PCK\$PARM</code> member is processed only if the runtime environment is designed for <u>remote deployment</u> and parameter <code>KFJ_LOCAL_PLIB_HILEV</code> is specified in the <code>KCIVARS DD</code> statement.
12	<code>PCK\$lpar</code>	The <code>PCK\$lpar</code> member is processed only if the runtime environment is designed for <u>remote deployment</u> and parameter <code>KFJ_LOCAL_PLIB_HILEV</code> is specified in the <code>KCIVARS DD</code> statement.

**Tip:** After you run the **GENERATE** action, you can view an ordered list of the RTEDEF library members that the action uses. For more information, see [“Parameter values used” on page 276](#).

## Initial runtime environment library members

The **CREATE** action populates the RTEDEF library with an initial set of configuration profile members for a basic runtime environment.

There are hundreds of OMEGAMON parameters. However, to configure a runtime environment that uses basic functions, you only need to specify the few dozen parameters in these initial members. All other parameters use their default values.

Edit the members to specify appropriate parameters for your runtime environment.

### Characteristics of the runtime environment defined by the initial members

The parameters in the initial members define a runtime environment with the following characteristics:

Table 45: Characteristics of the initial runtime environment definition							
Characteristic	Defined by these parameters						
Static hub monitoring server.	<table border="0"> <tr> <td>KDS_TEMS_TYPE</td> <td>HUB</td> </tr> <tr> <td colspan="2">Default parameter value (not specified in the initial set of parameters):</td> </tr> <tr> <td>KDS_TEMS_HA_TYPE</td> <td>none</td> </tr> </table>	KDS_TEMS_TYPE	HUB	Default parameter value (not specified in the initial set of parameters):		KDS_TEMS_HA_TYPE	none
KDS_TEMS_TYPE	HUB						
Default parameter value (not specified in the initial set of parameters):							
KDS_TEMS_HA_TYPE	none						
All <i>installed</i> components configured. The <b>CREATE</b> action detects which component products, such as monitoring agents, are installed and sets the corresponding <b>CONFIGURE_*</b> parameters to Y.	<table border="0"> <tr> <td>CONFIGURE_*</td> <td>Y</td> </tr> </table>	CONFIGURE_*	Y				
CONFIGURE_*	Y						
Runtime members shared with target libraries. Rather than being a full stand-alone set, the runtime members refer to some SMP/E installation target libraries (or, more typically, a copy that you have created of those target libraries).	<p>Default parameter values (not specified in the initial set of parameters):</p> <table border="0"> <tr> <td><u>"RTE_TYPE" on page 291</u></td> <td>SHARING</td> </tr> <tr> <td>RTE_SHARE</td> <td>SMP</td> </tr> </table>	<u>"RTE_TYPE" on page 291</u>	SHARING	RTE_SHARE	SMP		
<u>"RTE_TYPE" on page 291</u>	SHARING						
RTE_SHARE	SMP						

### The initial members include only a few product-specific members

Only a few component products require you to specify parameter values for their basic functions. Most work out-of-the-box using default parameter values.

The **CREATE** action creates *Kpp\$*PARM members only for the following components, and only if they are installed:

- Monitoring server (*KDS\$*PARM)
- CICS® TG monitoring agent (*KGW\$*PARM)

The **CREATE** action creates these members based only on which components are installed. The **CREATE** action is not sensitive to **CONFIGURE\_\*** parameters in an existing RTEDEF (*rte\_name*) member. The **CREATE** action neither reads nor overwrites existing RTEDEF members. For example, if the CICS® TG monitoring agent is installed in the target libraries, then the **CREATE** action creates an RTEDEF (*KGW\$*PARM) member, even if an RTEDEF (*rte\_name*) member already exists and specifies **CONFIGURE\_CICS\_TG\_KGW** N.

To set parameter values for other products, you must create the corresponding product-specific *Kpp\** members.

### Special considerations for SYSPLEX rollout

Specify an additional parameter, **KFJ\_LOCAL\_PLIB\_HILEV**, in your KCIVARS DD statement when running the **CREATE** action to have the RTEDEF created using the value in **KFJ\_LOCAL\_PLIB\_HILEV**.

When this parameter is specified, the generated *kfj\_local\_plib\_hilev*.RTEDEF data set will contain an additional member called *PCK\$*PARM. This member allows locally generated runtime environment data sets to have a different high-level qualifier than the data sets that will be used on the deployment (target) system.

Just like for other members in the RTEDEF, there is a SYSPLEX-wide member called RTEDEF (*PCK\$*PARM) and an LPAR-specific member, RTEDEF (*PCK\$*LPAR), supported. The **CREATE** action will generate the RTEDEF (*PCK\$*PARM) member.

If any of the parameters in *PCK\$*PARM are not defined, Configuration Manager will use the **KFJ\_LOCAL\_PLIB\_HILEV** parameter to generate default values for all of the high-level qualifier parameters. For the remaining parameters, the target runtime environment parameter will be used as the default.

The target runtime environment parameter will be used to allocate the respective data sets.

For more information about the *PCK\$*PARM member, see ["RTEDEF\(PCK\\$PARM\)" on page 326](#).

### Using an SMP/E target copy

Specifying the **CREATE** action with option **TRGCOPY** creates member RTEDEF (*trg\_copy\_name*). This member contains source and destination information used to create and maintain a copy of your SMP/E target libraries.

This member is used only when the **CREATE** or **GENERATE** action is run using option **TRG COPY**. For more information, see “[RTEDEF\(trg\\_copy\\_name\)](#)” on page 328 and “[Using SMP/E target library copies](#)” on page 352.

## RTEDEF(*rte\_name*)

The RTEDEF(*rte\_name*) member is the runtime environment configuration profile. This member contains parameters with the prefixes **RTE** and **CONFIGURE**.

Figure 53: Initial RTEDEF(*rte\_name*) member created by the **CREATE** action

RTE_NAME	<rte_name>
RTE_PLIB_HILEV	<rte_plib_hilev>

CONFIGURE_ODP_KAY	Y * Data Provider

**Note:** RTE\_X\_OVERRIDE\_EMBEDS\_LIB is included if you specify **KFJ\_USE\_EMBEDS** set to Y.

### Non-default values

The values of the following parameters in this initial member are different than the default values:

#### RTE\_TEMS\_NAME\_NODEID

This parameter sets the node ID of the monitoring server that is configured in this runtime environment. The only difference between the value in this initial member and the default value: the default value ends in CMS rather than TEMS. Given the related parameter names, TEMS is a more intuitive value.

#### RTE\_VTAM\_APPLID\_PREFIX

LPARs in a sysplex might have their own instances of the same VTAM® application. The fixed default VTAM® applid prefix, CTD, does not help to identify the LPAR to which each instance belongs. This initial member sets the value to OM<sysclone>, where:

- OM is an abbreviation of OMEGAMON®.
- <sysclone> is the 1- or 2-character value of the z/OS® static system symbol **SYSCLONE**. **SYSCLONE** is shorthand notation for the system (LPAR) name.

#### RTE\_STC\_PREFIX

The default started task prefix is IBM.  
This initial member sets the value to OMEG (an abbreviation of OMEGAMON®).

## Significant default values

Some characteristics of the runtime environment configured using this initial member are determined by the following default parameter values:

```
RTE_TYPE          SHARING
RTE_SHARE         SMP
```

## RTEDEF (KDS\$PARM)

The RTEDEF (KDS\$PARM) member contains parameters that configure the monitoring server. These parameters have the prefix **KDS**.

*Figure 54: Initial RTEDEF (KDS\$PARM) member created by the CREATE action*

```
* Tivoli Enterprise Monitoring Server
KDS_TEMS_TYPE     HUB
```

## RTEDEF (KGW\$PARM)

The RTEDEF (KDS\$PARM) member contains parameters that configure the CICS® Transaction Gateway monitoring agent. These parameters have the prefix **KGW**.

*Figure 55: Initial RTEDEF (KGW\$PARM) member created by the CREATE action*

```
* CICS Transaction Gateway

KGW_SA           BEGIN           * Table begin *
KGW_SA01_ROW     01
KGW_SA01_CTG_DAEMON_STC CTGPROC * Sample CTG Daemon *
KGW_SA01_CTG_DAEMON_PORT_NUM 2980 * 00000-65535
KGW_SA01_CTG_DAEMON_HOST LOCALHOST
KGW_SA01_SAPI_CLIENT_CTGTRACE 0 * 0-4
* END KGW_SA01 row 1 (add more rows as needed!)
KGW_SA           END           * Table end *
```

## RTEDEF (GBL\$PARM)

The RTEDEF (GBL\$PARM) member is the global configuration profile. This member contains global parameters. These parameters have the prefix **GBL**.

The **CREATE** action only populates the RTEDEF (GBL\$PARM) member with parameters that are relevant to the monitoring agents that are installed. For example:

*Figure 56: Initial RTEDEF (GBL\$PARM) member created by the CREATE action*

```
* Global parameters (used by installed products)
* High-level qualifier of SMP/E target libraries
GBL_TARGET_HILEV "<HLQs of KCIFLOW dsname of CREATE action>"
* Java home directory (KYN, KDS)
GBL_HFS_JAVA_DIR1 "/usr/lpp/java/IBM/J8.0_64"
* SMP/E target directory containing TKANJAR files (KGW, KJJ)
GBL_USS_TKANJAR_PATH "/usr/lpp/kan/bin/IBM"
* SMP/E target directory containing TKAYHFS files (KAY)
GBL_USS_TKAYHFS_PATH "/usr/lpp/omdp"
* ICSF load library containing CSNB* modules for password encryption
* (KS3, KI5)
GBL_DSN_CSF_SCSFMODE0 "CSF.SCSFMODE0"
* Db2 libraries (KD5)
GBL_DSN_DB2_RUNLIB_V12 "DSN.VCR1M0.RUNLIB.LOAD"
GBL_DSN_DB2_LOADLIB_V12 "DSN.VCR1M0.SDSNLOAD"
GBL_DSN_DB2_DSNEEXIT "DSN.VCR1M0.DSNEEXIT"
```

```

* CICS Transaction Gateway (KGW)
GBL_DSN_CICS_CTG_DLL "SYS1.SCTGDLL"

* IMS libraries (KI5)
GBL_DSN_IMS_RESLIB "IMS.SDFSRESL"
GBL_DSN_IMS_SCEXLINK "IMS.SCEXLINK"
GBL_DSN_IMS_SFUNLINK "IMS.SFUNLINK"

* MQ and Integration Broker (KMQ, KQI)
GBL_DSN_WMQ_SCSQANLE "CSQ.V9R0M0.SCSQANLE"
GBL_DSN_WMQ_SCSQAUTH "CSQ.V9R0M0.SCSQAUTH"

* Netview CNMLINK library
GBL_DSN_NETVIEW_CNMLINK "NETVIEW.VNRNMN.CNMLINK"

```

## GBL\_TARGET\_HILEV

The **CREATE** action sets the **GBL\_TARGET\_HILEV** parameter to the high-level qualifiers of the data set name specified by the **KCIFLOW DD** statement in the job step that performs the **CREATE** action.

Combined with the default parameter values **RTE\_TYPE** SHARING and **RTE\_SHARE** SMP, this value configures the runtime environment to share the same target library that was used to perform the **CREATE** action.

## RTEDEF (PCK\$PARM)

The RTEDEF (PCK\$PARM) member contains parameters that allow remote deployment of a runtime environment.

This member essentially specifies a mapping. A shadow value is specified that represents the value used to generate the runtime environment data sets on the local system (that is, the configuration LPAR). Note that this is the only place this mapping is done. All other values in the RTEDEF members should be specified using the attributes and high-level qualifiers of the target system (that is, the system that the runtime environment will be deployed to).

The list of **\*\_HILEV** parameters, along with **RTE\_USS\_RTEDIR** and **GBL\_USS\_TKANJAR\_PATH**, are the only parameters supported for this mapping.

**Note:** If the **GENERATE** action detects that non-supported high-level qualifiers are being used in the RTEDEF, an error message will be displayed in KCIPRINT indicating incompatible parameters, and the **GENERATE** action workflow stops.

The RTEDEF (PCK\$PARM) member contains the values described in the following table:

Parameter in member PCK\$PARM or PCK\$lpar	Target runtime environment parameter mapped in RTEDEF (rte_name)	Description
KFJ_LOCAL_PLIB_HILEV	RTE_PLIB_HILEV	
KFJ_LOCAL_HILEV	RTE_HILEV	
KFJ_LOCAL_VSAM_HILEV	RTE_VSAM_HILEV	Default VSAM high-level qualifier to be used when allocating VSAM data sets
KFJ_LOCAL_PDS_HILEV	RTE_PDS_HILEV	Default PDS high-level qualifier to be used to allocate PDS V1 data sets (if needed)
KFJ_LOCAL_TARGET_HILEV	GBL_TARGET_HILEV	SMP/E target high-level qualifier found in RTEDEF (GBL\$PARM/GBL\$lpar)

Parameter in member PCK\$PARM or PCK\$lpar	Target runtime environment parameter mapped in RTEDEF(rte_name)	Description
KFJ_LOCAL_USS_RTEDIR	RTE_USS_RTEDIR	Runtime environment z/OS® UNIX® System Services root path used by Configuration Manager to save all z/OS® UNIX®-related artifacts
KFJ_LOCAL_USS_TKANJAR_PATH	GBL_USS_TKANJAR_PATH	SMP/E target directory containing TKANJAR files
KFJ_LOCAL_USS_TKAYHFS_PATH	GBL_USS_TKAYHFS_PATH	SMP/E TKAYHFS ddname install directory
KFJ_LOCAL_SMS_VOLUME	RTE_SMS_VOLUME	To support non-SMS environments
KFJ_LOCAL_SMS_VSAM_VOLUME	RTE_SMS_VSAM_VOLUME	To support non-SMS environments
KFJ_LOCAL_SMS_UNIT	RTE_SMS_UNIT	To support non-SMS environments
KFJ_LOCAL_SMS_STORCLAS	RTE_SMS_STORCLAS	
KFJ_LOCAL_SMS_VSAM_STORCLAS	RTE_SMS_VSAM_STORCLAS	
KFJ_LOCAL_SMS_MGMTCLAS	RTE_SMS_MGMTCLAS	
KFJ_LOCAL_SMS_VSAM_MGMTCLAS	RTE_SMS_VSAM_MGMTCLAS	

### Sample member RTEDEF(PCK\$PARM)

The sample member, RTEDEF (PCK\$PARM), is shown below.

Figure 57: Example of PCK\$PARM

```

* Local RTE parameters
KFJ_LOCAL_PLIB_HILEV          TSOUID.LOCAL
KFJ_LOCAL_HILEV
KFJ_LOCAL_VSAM_HILEV
KFJ_LOCAL_PDS_HILEV

* High-level qualifier of local SMP/E target libraries
KFJ_LOCAL_TARGET_HILEV       "MONSUITE"

* Path to local z/OS UNIX files
KFJ_LOCAL_USS_RTEDIR         "/var/rtehome"

* Local SMP/E target directory containing TKANJAR files (KGW, KJJ)

### Example

The **RTE\_PLIB\_HILEV** value in RTEDEF (MYRTE) is as follows:

```

RTE_PLIB_HILEV              TDCIT.REG

```

Specifying **KFJ\_LOCAL\_PLIB\_HILEV** with a value of SYS3.PREGEN in RTEDEF (PCK\$PARM) will allocate the data sets that will use a value of **RTE\_PLIB\_HILEV** using SYS3.PREGEN instead of TDCIT.REG. When using the

**DEPLOY** action after having run the **PACKAGE** action and transferring the dump data sets to the target system, the original value as specified in RTEDEF (MYRTE), that is TDCIT.REG in this specific example, will be used to restore the data sets.

## RTEDEF (*trg\_copy\_name*)

The RTEDEF (*trg\_copy\_name*) member is the SMP/E target copy configuration profile. This member contains parameters with the prefixes **GBL**, **CONFIGURE**, and **TRG**.

### GBL\_\*

The source location from where a copy is taken

### TRG\_COPY\_\*

The target destination where the files are copied to

### CONFIGURE\_\*

Products for which configuration files will be copied from the source (**GBL\_\***) to the destination (**TRG\_COPY\_\***)

### Additional TRG\_\* parameters

Target copy libraries are always non-VSAM. You can also include the following parameters in your SMP/E target copy member when allocating SMP/E target copy libraries:

#### TRG\_COPY\_VOLUME

Specifies the VOLSER for target copy non-VSAM libraries.

#### TRG\_COPY\_UNIT

Specifies the unit name for target copy non-VSAM libraries.

#### TRG\_COPY\_STORCLAS

Specifies the STORCLAS for target copy non-VSAM libraries.

## TRG\_COPY\_MGMTCLAS

Specifies the MGMTCLAS for target copy non-VSAM libraries.

## Runtime members

The **GENERATE** action generates runtime members in locations (MVS™ data set names and z/OS® UNIX® System Services paths) that are specified by parameters.

### Runtime member locations

MVS™ data sets:

```
rte_hilev.rte_name.RK*  
rte_hilev.rte_name.ssid.RK*  
rte_vsam_hilev.rte_name.RK*  
rte_vsam_hilev.rte_name.ssid.RK*  
gbl_dsn_sys1_proclib  
gbl_dsn_sys1_vtamlib  
gbl_dsn_sys1_vtamlst
```

z/OS® UNIX® directory paths:

```
rte_uss_dir/rte_name/*
```

where:

- *ssid* is the identifier of a subsystem to be monitored, such as a Db2® subsystem or an IMS subsystem
- Other identifiers in *italics* represent parameter values

### Parameters that specify runtime member locations

#### RTE\_HILEV

High-level qualifiers of non-VSAM data sets.

#### RTE\_VSAM\_HILEV

High-level qualifiers of VSAM data sets.

**RTE\_HILEV** and **RTE\_VSAM\_HILEV** have the same default value: *rte\_plib\_hilev*

#### GBL\_DSN\_SYS1\_PROCLIB

#### GBL\_DSN\_SYS1\_VTAMLIB

#### GBL\_DSN\_SYS1\_VTAMLST

The data set names where the **GENERATE** action writes members intended for your system libraries.  
Default values:

```
rte_hilev.SYS1.PROCLIB  
rte_hilev.SYS1.VTAMLIB  
rte_hilev.SYS1.VTAMLST
```

You must use your own site-specific procedures to copy the members from these locations to your actual PROCLIB, VTAMLIB, and VTAMLST system libraries.

#### RTE\_USS\_RTEDIR

z/OS® UNIX® directory. Default value: */var/rtehome*

#### RTE\_NAME

The runtime environment name is appended to **RTE\_HILEV** and **RTE\_VSAM\_HILEV** as a low-level qualifier and to **RTE\_USS\_RTEDIR** as a directory name.

The following diagram illustrates the relationships between parameters and runtime member locations:

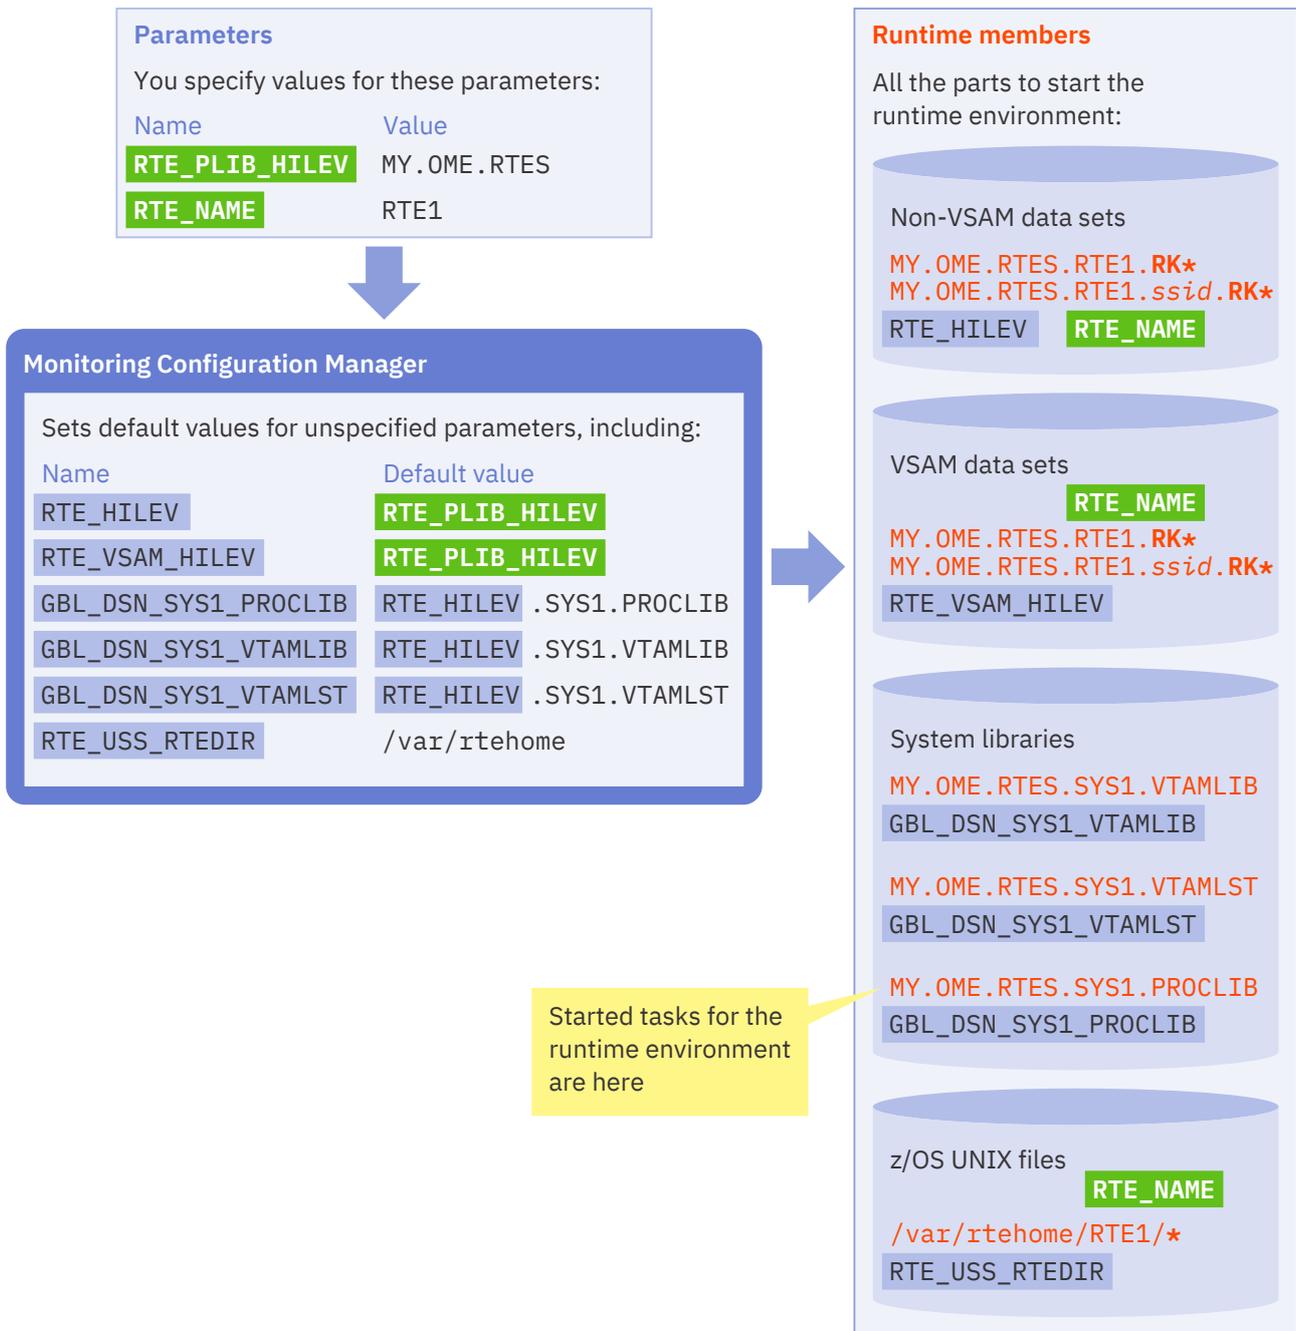

Figure 59: How parameters affect the locations of runtime members

**Tip:** Monitoring Configuration Manager writes concise started tasks to:  
`rte_hilev.SYS1.PROCLIB`  
 and versions with verbose comments to the same location used by PARMGEN:  
`rte_plib_hilev.rte_name.RKANSAMU`  
`rte_plib_hilev.rte_name.RKD2SAM (for Db2®)`

## Communication between monitoring components

In a typical topology, monitoring agents communicate with remote monitoring servers, and remote monitoring servers communicate with a single, central hub monitoring server.

### Typical topology

The following diagram shows a simple example.

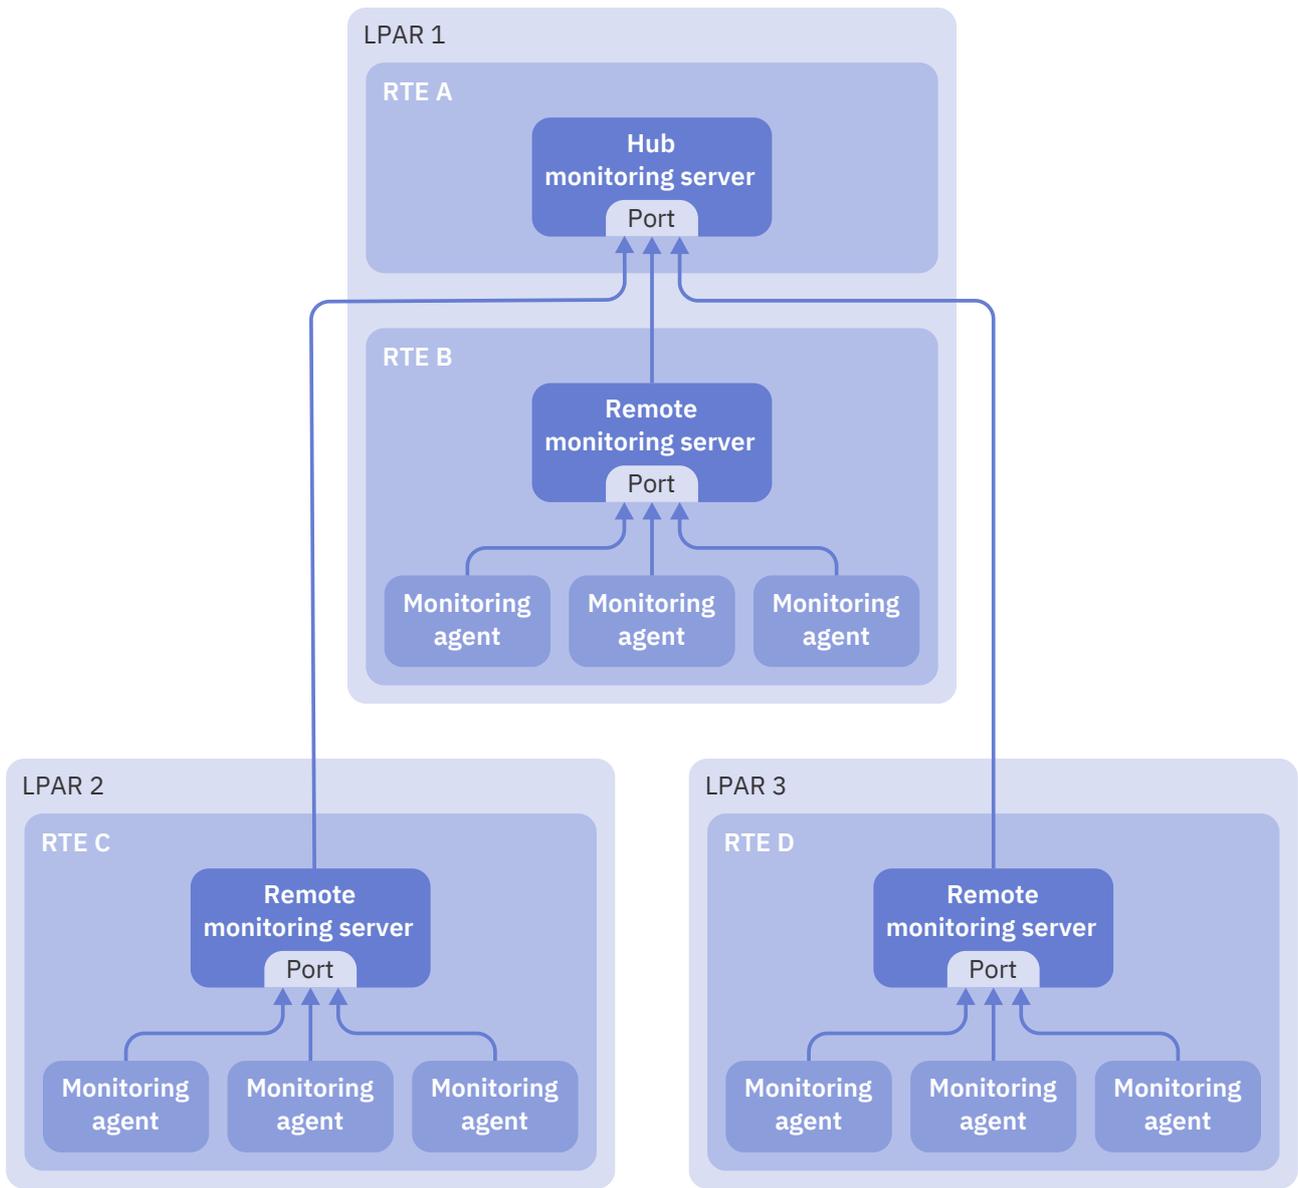

Figure 60: Typical topology of runtime environments in a sysplex

The number of monitoring agents in a runtime environment and the number of LPARs depends on your site.

In a typical topology, monitoring agents communicate with the remote monitoring server that is in the same runtime environment as the agents. Remote monitoring servers are described as *remote* to distinguish them from the *hub* monitoring server. Remote monitoring servers are typically *local* to the monitoring agents with which they communicate, in the sense that they are in the same runtime environment and, hence, the same LPAR.

The default communication protocol for all components is Transport Control Protocol over Internet Protocol version 4 (TCP/IPv4). The hub monitoring server listens on a port for messages from remote monitoring servers. Remote monitoring servers listen on a port for messages from monitoring agents.

### Required parameters

Communication between components involves several parameters. However, for most of these parameters you can use default values.

To configure communication between a remote monitoring server and a hub server, you only need to specify the following parameters:

- In the runtime environment that contains the hub monitoring server (in the previous figure, RTE A):  
**KDS\_TEMS\_TYPE**  
HUB, rather than the default REMOTE.

### RTE\_TCP\_PORT\_NUM

The port on which the hub listens for messages from remote monitoring servers.

- In a runtime environment that contains a remote monitoring server (such as RTE D):

### KDS\_HUB\_TEMS\_NAME\_NODEID

Must match the `RTE_TEMS_NAME_NODEID` parameter of the hub. The default value of `RTE_TEMS_NAME_NODEID` is `rte_name:CMS`.

### KDS\_TCP\_PORT\_NUM

Must match the `RTE_TCP_PORT_NUM` parameter of the hub.

### KDS\_HUB\_TCP\_HOST

Must match the host name or IP address of the LPAR that contains the hub.

You don't need to specify any parameters to configure communication between monitoring agents and a remote monitoring server in the same runtime environment.

The following diagram shows the required parameters in each runtime environment and their relationships:

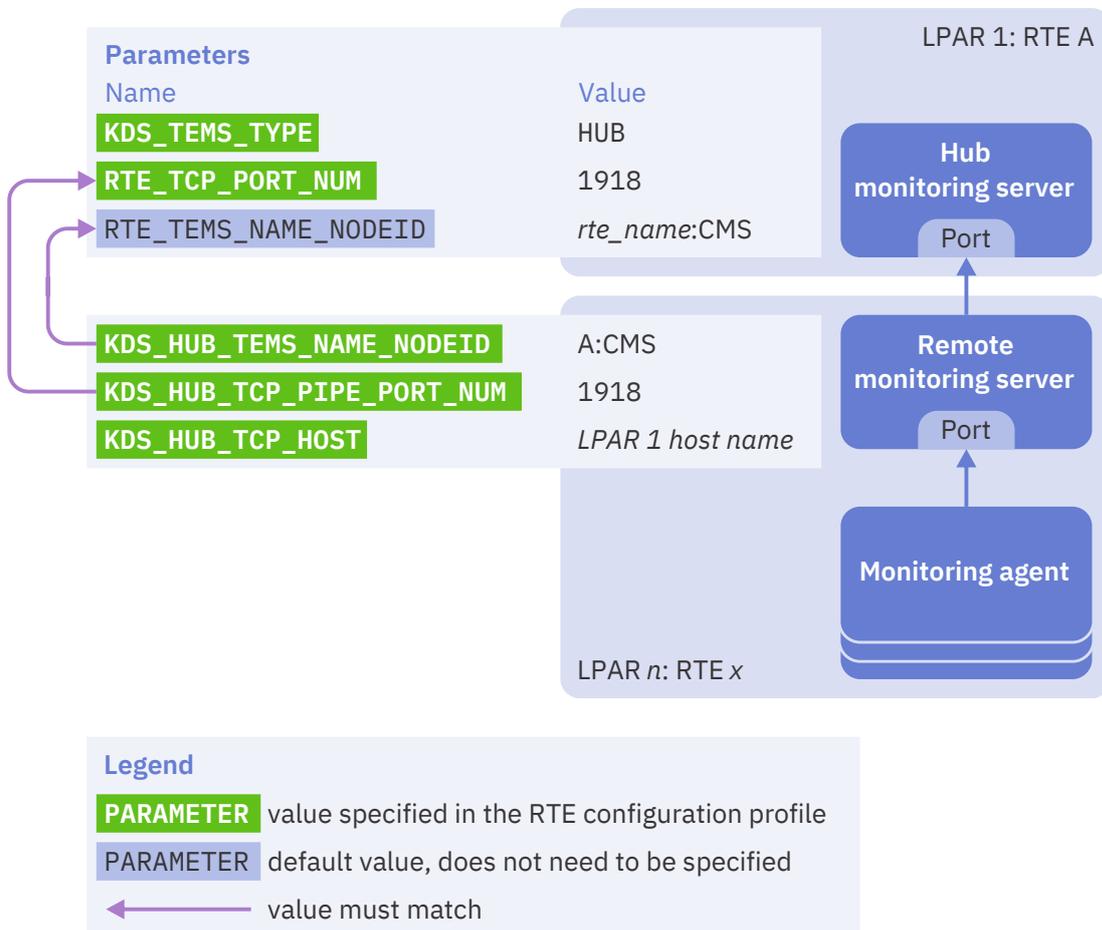

Figure 61: Parameters required to configure a typical topology

### Other parameters

The following diagram shows a more comprehensive overview of the parameters to configure communication between components, including the default values of parameters omitted from the previous diagram.

**For a typical topology, you do not need to be aware of these other parameters.** This diagram is provided as a reference for configuring different topologies.

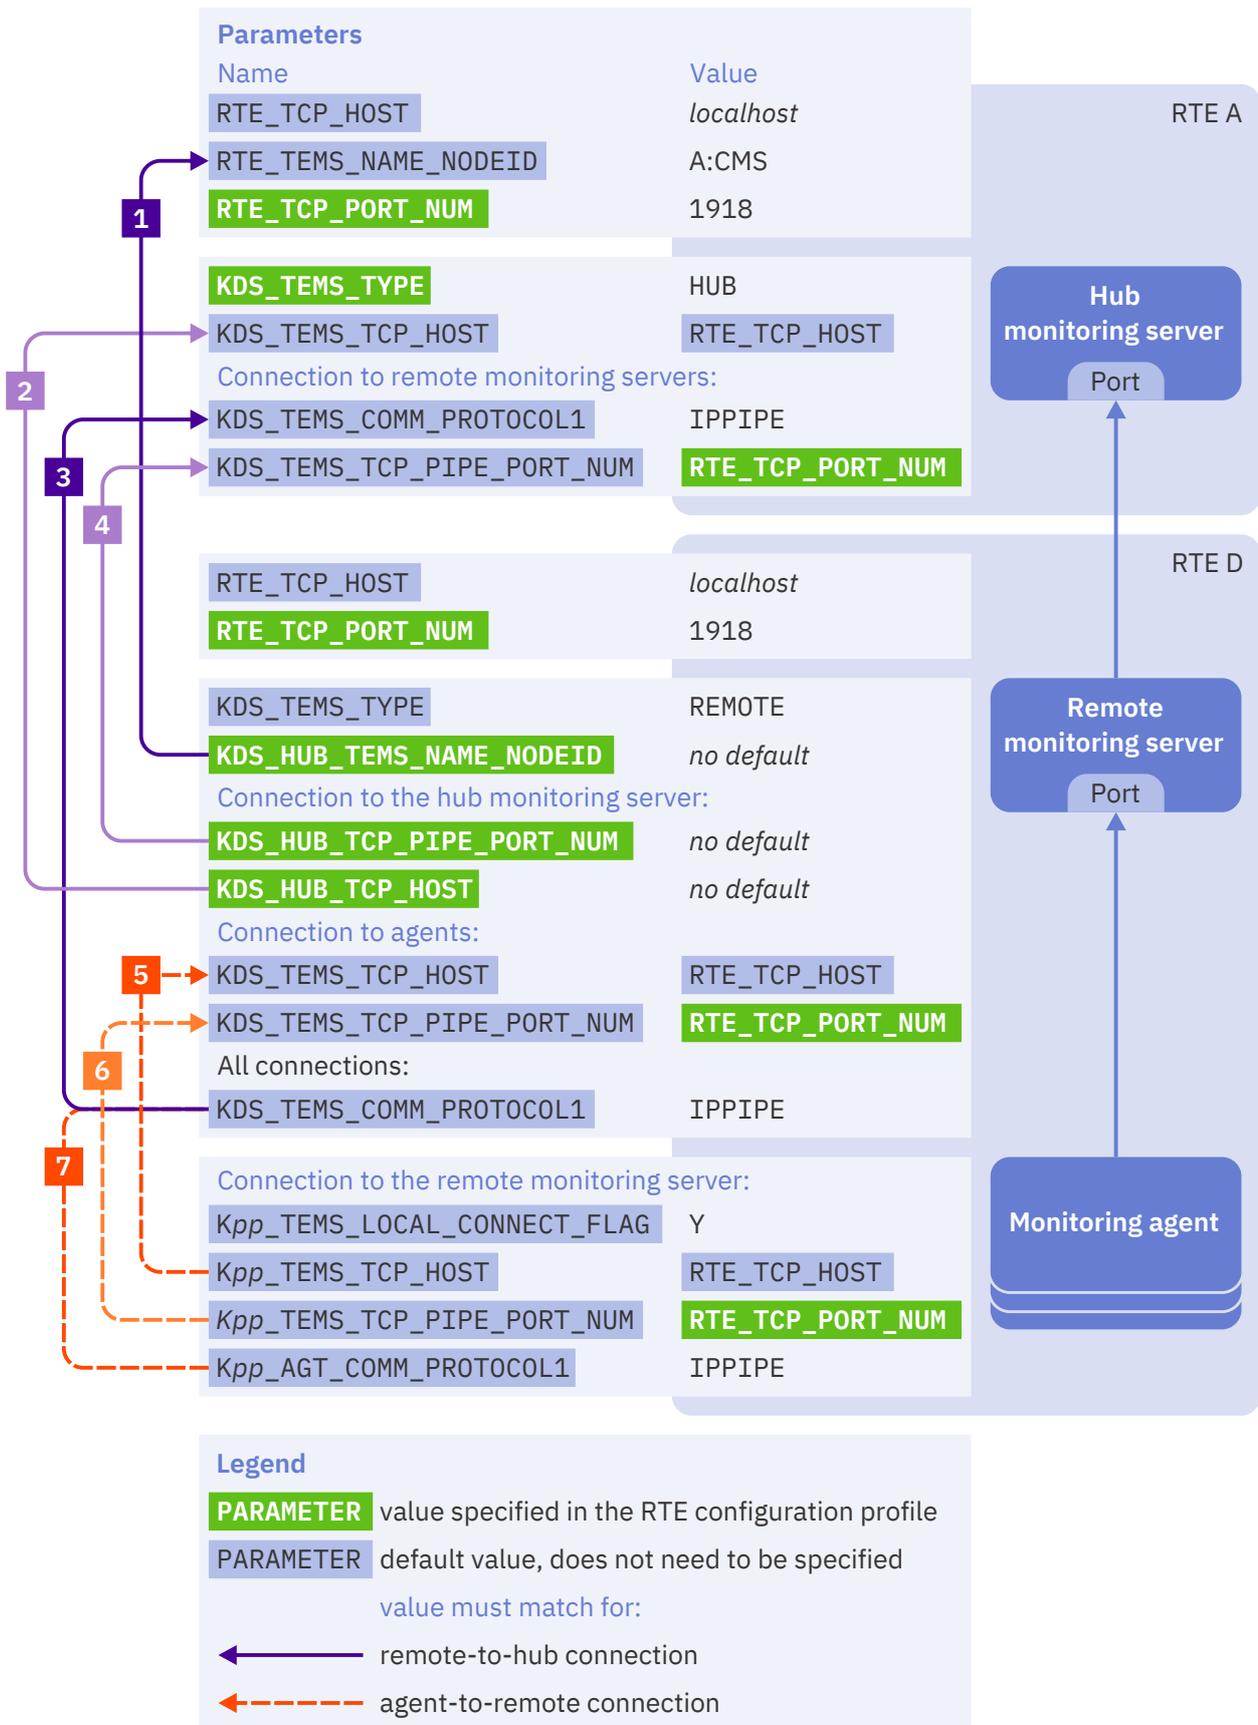

Figure 62: Parameters to configure communication between components, including significant default values

### Communication between a remote monitoring server and the hub monitoring server

For a remote monitoring server to communicate with the hub monitoring server, the following parameters must match:

Figure label	This parameter in the RTE of the remote monitoring server	...must match this parameter in the RTE of the hub
1	<b>KDS_HUB_TEMS_NAME_NODEID</b> The remote monitoring server must refer to the node ID of the hub.	<b>RTE_TEMS_NAME_NODEID</b>
2	<b>KDS_HUB_TCP_HOST</b> The remote monitoring server must refer to the host name of the hub.	<b>KDS_TEMS_TCP_HOST</b>
3	<b>KDS_TEMS_COMM_PROTOCOLn</b> The remote monitoring server and hub must have at least one communication protocol in common.	<b>KDS_TEMS_COMM_PROTOCOLn</b>
4	<b>KDS_HUB_TCP_PIPE_PORT_NUM</b> The remote monitoring server must refer to the port on which the hub is listening.	<b>KDS_TEMS_TCP_PIPE_PORT_NUM</b>

### Communication between monitoring agents and a remote monitoring server

For monitoring agents to communicate with a remote monitoring server, the following parameters must match:

Figure label	This parameter for the monitoring agent...	...must match this parameter for the remote monitoring server
5	<b>Kpp_TEMS_TCP_HOST</b>	<b>KDS_TEMS_TCP_HOST</b>
6	<b>Kpp_TEMS_TCP_PIPE_PORT_NUM</b>	<b>KDS_TEMS_TCP_PIPE_PORT_NUM</b>
7	<b>Kpp_AGT_COMM_PROTOCOLn</b>	<b>KDS_TEMS_COMM_PROTOCOLn</b>

If monitoring agents communicate with the remote monitoring server that is in the same runtime environment, as specified by the default parameter value **Kpp\_TEMS\_LOCAL\_CONNECT\_FLAG** Y, then all of these parameters match by default.

### Choice of communication protocols

You can specify up to seven communication protocols for each monitoring agent and server. When attempting to communicate, a monitoring agent or server tries its protocols in order. If the first choice fails, it tries the second choice, and so on. You can either set the communication protocol choices individually for the monitoring server and each agent in a runtime environment, or you can use the **RTE\_COMM\_PROTOCOLn** parameters to set them all together.

## Variables in parameter values

Many parameter values can optionally refer to variables.

IBM Z® Monitoring Configuration Manager supports the same variables as PARMGEN.

**Tip:** Instead of using variables, consider using LPAR-specific [RTEDEF members](#).

### Variables versus LPAR-specific RTEDEF members

Variables enable you to reuse a configuration profile member for different LPARs where LPARs require different parameter values.

However, using variables adds a precursor step to runtime environment started tasks. The step resolves variable values. The additional processing delays runtime environment startup.

LPAR-specific RTEDEF members, introduced by Monitoring Configuration Manager, offer an alternative to using variables for LPAR-specific parameter values.

Using LPAR-specific RTEDEF members instead of variables removes the variable-resolution precursor step from started tasks.

If you use LPAR-specific RTEDEF members instead of variables, started tasks are simpler and runtime environments start faster.

### Using variables

To use variables, you must set the **RTE\_SYSV\_SYSVAR\_FLAG** parameter to Y.

Variables, like parameters, are defined using name-value pairs and are stored in members of the RTEDEF library.

The following example, without variables, sets the parameter named **RTE\_TCP\_PORT\_NUM** to the literal value 1918:

```
RTE_TCP_PORT_NUM 1918
```

The following example sets the parameter to the value of the variable **RTE\_PORT**:

```
RTE_TCP_PORT_NUM &RTE_PORT.
```

Suppose your sysplex contains two LPARs: ZOS1 and ZOS2. In general, these LPARs have similar runtime environment configurations. However, on ZOS1 you want the monitoring server to listen on port 1918, whereas on ZOS2 you want the monitoring server to listen on port 1919.

In the variables configuration profile member for LPAR ZOS1, VAR\$ZOS1, you set the **RTE\_PORT** variable to 1918:

```
RTE_PORT 1918
```

In VAR\$ZOS2, you set **RTE\_PORT** to 1919:

```
RTE_PORT 1919
```

### RTEDEF members that define variables

In the LPARs column of the following table, *Current* means: the LPAR on which the **GENERATE** action is performed.

<i>Table 49: RTEDEF members that define variables, and the LPARs to which they apply</i>		
Member name	LPARs	Description
VAR\$GLOB	All	Variables configuration profile.
VAR\$lpar	Current	LPAR-specific variables configuration profile.

If a variable is defined in both VAR\$GLOB and VAR\$lpar, then the value in VAR\$lpar is used.

### Unique variable names

While Configuration Manager supports runtime environments with variables (parameter **RTE\_SYSV\_SYSVAR\_FLAG** is set to Y), it does not support cases where the parameter value is a variable with the same name as the parameter itself.

For example, Configuration Manager does not allow the following parameter setting:

```
RTE_USS_RTEDIR &RTE_USS_RTEDIR
```

In this case, you must change the name of the variable to be different from the parameter name, as shown in the following example where the prefix MY\_ has been added to the variable name:

```
RTE_USS_RTEDIR &MY_RTE_USS_RTEDIR
```

### Variables migrated from PARMGEN

Unlike Configuration Manager, PARMGEN does allow the name of a variable to be the same as the parameter to which it is assigned. If any of these same-name settings exist in your PARMGEN parameter definitions, the variables must be renamed for use by Configuration Manager.

When you migrate configuration settings from PARMGEN to Configuration Manager using the **MIGRATE** action, the **MIGRATE** action automatically rectifies any such incompatible settings, as follows:

- For variable names that are 30 characters or less, the **MIGRATE** action renames the variable by adding the following suffix to the name: `_R`  
For example, PARMGEN allows the following parameter setting, which is defined in member `WCONFIG(rte_name)`:

```
RTE_USS_RTEDIR &RTE_USS_RTEDIR
```

The value of the variable is set in member `GBL_USER_JCL(rte_name)`, as follows:

```
RTE_USS_RTEDIR "value"
```

When the configuration settings are imported from PARMGEN to Configuration Manager, the **MIGRATE** action renames the variable, as follows:

- In member `RTEDEF(rte_name)`:

```
RTE_USS_RTEDIR &RTE_USS_RTEDIR_R
```

- In member `RTEDEF(VAR$GLOB)`:

```
RTE_USS_RTEDIR_R "value"
```

- If the variable name is 31 characters, the **MIGRATE** action only adds the following suffix: `_`
- If the variable name is 32 characters (the maximum length), the **MIGRATE** action only adds a comment with a warning in the respective `RTEDEF(VAR$GLOB)` member, indicating that you must rename the variable.

**Note:** To rename your variables to names other than those provided by the default naming convention of the **MIGRATE** action, you must manually rename the variables either before or after you run the **MIGRATE** action.

## Setting up security exits in your runtime environment

Security exits are required for your runtime environment. You can use the **CREATE** and **MIGRATE** actions to set up your security exits library, and use the **GENERATE** action to create the necessary runtime members.

You must set up a library for your runtime environment that contains the OMEGAMON and IBM Tivoli Monitoring-related product security exits (such as KOBSPDT OMEGAMON *KppSUPDI* exits, Tivoli Monitoring Services: Engine security exits, and external security exits).

The following points provide an overview of the configuration that is required in Configuration Manager for security exits in your runtime environment:

- A dedicated library must be allocated and populated with the security exits. The default name for the security exits library is `rte_plib_hilev.rte_name`. `SECEXITS`. (You can override the name of this library using the `KFJ_SECURITY_EXITS_LIB` parameter in the **CREATE** or **MIGRATE** action.) If you use the **CREATE** or **MIGRATE** action to allocate the library, it will be populated with default security exit members. You can also import existing security exit members if you are migrating your runtime environment from PARMGEN.
- A reference to the security exits library is required in the `RTE_X_SECURITY_EXIT_LIB` parameter located in member `rte_plib_hilev.RTEDEF(rte_name)`.

After the security exits library has been set up using Configuration Manager, you can modify the security exit members as needed for your environment. You can then use the **GENERATE** action to rebuild and relink them.

### Setting up security exits using CREATE

You can use the **CREATE** action to allocate the security exits library using the default name and populate it with an initial set of configuration profile members. You can also use the `KFJ_SECURITY_EXITS_LIB` parameter to specify another name for the security exits library. If the specified data set does not exist, it will be allocated and populated with the default security exit members. If the specified data set does exist, it will be populated

with the default security members, but no existing member will be overwritten. The **CREATE** action also populates the required reference to the library in the **RTE\_X\_SECURITY\_EXIT\_LIB** parameter.

For more information about running the **CREATE** action, see [“CREATE” on page 239](#).

### Setting up security exits using MIGRATE

If you are migrating your runtime environment from PARMGEN, you can use the **MIGRATE** action to import the PARMGEN security exits into the new runtime environment. Like the **CREATE** action, the **MIGRATE** action allocates the *rte\_plib\_hilev.rte\_name*.SECEXITS library (or, optionally, the library specified in the **KFJ\_SECURITY\_EXITS\_LIB** parameter). The **MIGRATE** action also copies the security exits used by the PARMGEN environment to the specified security exits library. Because the migration also imports runtime environment configuration settings from the PARMGEN environment, the **RTE\_X\_SECURITY\_EXIT\_LIB** parameter will contain the name of the security exits library used by the PARMGEN environment; you must review this setting and update it to use the proper *rte\_plib\_hilev.rte\_name*.SECEXITS library (if necessary) before running the **GENERATE** action.

**Note:** The security exits library used in PARMGEN is identified in *rte\_hilev.rtename*.RKANSAMU and is not changed as a result of the **MIGRATE** action. For more information about the differences between PARMGEN and Configuration Manager, see [“Comparison with PARMGEN” on page 216](#).

For more information about running the **MIGRATE** action, see [“MIGRATE” on page 261](#).

### Rebuild and relink security exits using GENERATE

The **GENERATE** action automatically performs the required tasks of rebuilding and relinking the security exits. The **GENERATE** action also provides an optional setting, **OPTION SECEXITS**, that allows you to perform the security exits tasks separately from the normal **GENERATE** workflow, which can save valuable CPU cycles.

For more information about running the **GENERATE** action, see [“GENERATE” on page 248](#).

## Using override embed members in Configuration Manager

With Monitoring Configuration Manager, you can use override embed members to provide and maintain customization for your runtime environments.

A Monitoring Configuration Manager configuration creates a set of files that get embedded in a number of the most commonly updated runtime members in the user libraries. These override embed members can be used to specify user-defined parameters and values that might otherwise be overwritten by the **GENERATE** action when maintenance or upgrades are performed, or to override existing values.

The override embed members are stored in the *embeds data set*. The default name for this data set is *rte\_plib\_hilev.rte\_name*.EMBEDS, or you can use a customized name. You can use one data set per RTE or you can share a common data set across multiple RTEs.

When using Monitoring Configuration Manager, you can enable the use of override embed members when creating an RTE or for an existing RTE.

The following parameters provide support for using override embed members:

#### **KFJ\_USE\_EMBEDS**

This Monitoring Configuration Manager parameter controls whether override embed members are enabled for the RTE. When set to Y on the initial **CREATE** or **MIGRATE** action when creating an RTE, Monitoring Configuration Manager sets up the embeds data set, populates it with supported override embed parameters (if applicable), and defines it to the RTE using the **RTE\_X\_OVERRIDE\_EMBEDS\_LIB** parameter. Valid values are Y and N. The default is N.

#### **KFJ\_EMBEDS\_LIB**

This Monitoring Configuration Manager parameter identifies the data set that contains the override embed values for the RTE. Use a valid MVS data set name for the value.

#### **RTE\_X\_OVERRIDE\_EMBEDS\_LIB**

This parameter specifies the name of the source library for override embed members for the RTE and is located in RTEDEF (*rte\_name*). This parameter and value is set up automatically when the initial **CREATE**

or **MIGRATE** action runs to create an RTE and **KFJ\_USE\_EMBEDS** is set to Y. It needs to be added manually if you decide to [add override embed support to an existing RTE](#).

## Example

An example of how to specify the override embed parameters is shown below. By default, the override embed support is disabled. However, this example shows that it is enabled and provides the data set name.

```
//KCIVARS DD *  
ACTION          CREATE  
RTE_NAME        DEMO  
RTE_PLIB_HILEV  TEST1.TST  
...  
KFJ_USE_EMBEDS  Y          * Y|N valid values  
KFJ_EMBEDS_LIB  TEST1.TST.DEMO.MYEMBEDS * override default EMBEDS library
```

**Tip:** For more information about override embed members, see PARMGEN topics [Override embed members](#) and [Customizing the override embed members](#). The override embed parameters and values are the same regardless if Monitoring Configuration Manager or PARMGEN is used to configure your RTE. Note that customization of the override embed members is also the same except, whereas in PARMGEN it is done from the WCONFIG, in Monitoring Configuration Manager it is done in the embeds data set specified in **RTE\_X\_OVERRIDE\_EMBEDS\_LIB**.

## Enable override embed members when creating an RTE

Use this procedure to enable override embed members when creating a runtime environment (RTE).

### Before you begin

Read [“Using override embed members in Configuration Manager”](#) on page 337.

This task applies to creating an RTE using the Monitoring Configuration Manager [“CREATE”](#) on page 239 or [“MIGRATE”](#) on page 261 action. For more information, see [“Creating your first, minimal runtime environment”](#) on page 222.

### About this task

Override embed members can be used to specify user-defined parameters and values that might otherwise be overwritten by the **GENERATE** action when maintenance or upgrades are performed, or to override existing values. Using override embed members for your runtime environment requires a data set (the *embeds data set*) that contains the override embed parameters and values.

You can enable the use of override embed members when creating your RTE by including the **KFJ\_USE\_EMBEDS** parameter set to Y in the KCIVARS DD statement for the **CREATE** or **MIGRATE** actions. With the inclusion of this setting, Monitoring Configuration Manager creates the embeds data set, populates the override embed parameters and values, and defines the data set to the RTE using the **RTE\_X\_OVERRIDE\_EMBEDS\_LIB** parameter.

For the **CREATE** action, by default, the embeds data set is populated with the override embed parameters and values for the products that are installed in the respective CSI used to build the RTE. For the **MIGRATE** action, this library will contain the embed parameters and values from the source PARMGEN installation (as specified by parameter **KFJ\_MIGRATE\_WCONFIG**).

The default embeds data set name is *rte\_plib\_hilev.rte\_name.EMBEDS*. Optionally, you can include the **KFJ\_EMBEDS\_LIB** parameter to use a custom data set name rather than the default name. Use of this parameter allows you to use the same embeds data set and settings for multiple RTEs.

**Note:** If you specify the name of an existing data set using parameter **KFJ\_EMBEDS\_LIB**, its contents will not be overwritten.

## Procedure

1. As part of the process to create an RTE, submit a job that performs the **CREATE** action or **MIGRATE** action with **KFJ\_USE\_EMBEDS** set to Y and, optionally, **KFJ\_EMBEDS\_LIB** set to a custom data set name.  
Example JCL:

Figure 63: Example JCL to enable override embed members for a new RTE

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<plib_hlq>.TKANMOD
//KCIFFLOW DD DISP=SHR,DSN=<plib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION CREATE | MIGRATE
RTE_NAME <rte_name>
RTE_PLIB_HILEV <rte_plib_hilev>
...
KFJ_USE_EMBEDS Y * Y|N valid values
KFJ_EMBEDS_LIB <embeds_data_set_name> * override default EMBEDS library
/*
```

Where *<rte\_name>* and *<rte\_plib\_hilev>* specify the RTE, and *<embeds\_data\_set\_name>* is the optional custom embeds data set name.

2. Complete the creation of the RTE. For more information, see [“Creating or updating a runtime environment” on page 229](#).
3. Update the override embed members as needed.

## Result

Monitoring Configuration Manager sets up the embeds data set, populates it with supported override embed parameters (if applicable), and defines it to the RTE using the **RTE\_X\_OVERRIDE\_EMBEDS\_LIB** parameter.

## Enable override embed members for an existing RTE

Use this procedure to enable override embed members for an existing runtime environment (RTE).

### Before you begin

Read [“Using override embed members in Configuration Manager” on page 337](#).

This task assumes that you have an existing runtime environment (RTE) that was created using Monitoring Configuration Manager. For more information, see [“Creating or updating a runtime environment” on page 229](#).

### About this task

Override embed members can be used to specify user-defined parameters and values that might otherwise be overwritten by the **GENERATE** action when maintenance or upgrades are performed, or to override existing values. Using override embed members for your runtime environment requires a data set (the *embeds data set*) that contains the override embed parameters and values.

You can enable the use of override embed members after you have created your RTE by running the **CREATE** action with the **KFJ\_USE\_EMBEDS** parameter set to Y. With the inclusion of this setting, Monitoring Configuration Manager creates the embeds data set and populates it, by default, with the override embed parameters and values for the products that are installed in the respective CSI.

**Note:** Running the **CREATE** action after the RTE has been created does not affect existing settings.

The default embeds data set name is *rte\_plib\_hilev.rte\_name.EMBEDS*. Optionally, you can include the **KFJ\_EMBEDS\_LIB** parameter to use a custom data set name rather than the default name. Use of this parameter allows you to use the same embeds data set and settings for multiple RTEs.

**Note:** If you specify the name of an existing data set using parameter **KFJ\_EMBEDS\_LIB**, its contents will not be overwritten.

After the **CREATE** action is performed, you manually define the override embed data set to use for the RTE using the **RTE\_X\_OVERRIDE\_EMBEDS\_LIB** parameter.

## Procedure

1. Submit a job that performs the **CREATE** action with **KFJ\_USE\_EMBEDS** set to Y and, optionally, **KFJ\_EMBEDS\_LIB** set to a custom data set name.

Example JCL:

Figure 64: Example JCL to enable override embed members for an existing RTE

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<plib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<plib_hlq>.TKANCUS(KFJOMEGA)
//KCIIVARS DD *
ACTION CREATE
RTE_NAME <rte_name>
RTE_PLIB_HILEV <rte_plib_hilev>
...
KFJ_USE_EMBEDS Y * Y|N valid values
KFJ_EMBEDS_LIB <embeds_data_set_name> * override default EMBEDs library
/*
```

Where *<rte\_name>* and *<rte\_plib\_hilev>* specify the RTE, and *<embeds\_data\_set\_name>* is the optional custom embeds data set name.

This job sets up the embeds data set and, if applicable, populates it with supported override embed parameters.

2. Open the RTEDEF(*rte\_name*) member and add the **RTE\_X\_OVERRIDE\_EMBEDS\_LIB** parameter with the embeds data set name.

Example:

```
RTE_X_OVERRIDE_EMBEDS_LIB <embeds_data_set_name>
```

3. Update the override embed members as needed.

## Update override embed members for an existing RTE after maintenance

Use this procedure to update override embed members for an existing runtime environment (RTE) using Configuration Manager after applying maintenance.

### Before you begin

Read [“Using override embed members in Configuration Manager” on page 337](#).

This task assumes the following points:

- You have an existing runtime environment (RTE) that was created using Configuration Manager and has override embed members enabled.
- You used SMP/E to apply maintenance that introduces changes to your override embed members. The PTF ++HOLD text identifies the override embed members that have updates.

### About this task

Some Configuration Manager maintenance includes updates to override embed members. If the RTE has override embed members enabled, Configuration Manager does not apply the changes to the override embed members automatically. Instead, you must perform additional steps manually to apply the updates.

Use the following procedure to update the embeds data set without losing your user modifications.

## Procedure

1. Browse the library that is specified in parameter **RTE\_X\_OVERRIDE\_EMBEDS\_LIB** in member RTEDEF(*rte\_name*), and find the override embed member that was updated. Either rename the override embed member or move it to a different library of your choice that is not controlled by Configuration Manager.

**Important:** You must preserve the override embed member for later use.

2. Submit a job that performs the **CREATE** action with **KFJ\_USE\_EMBEDS** set to Y and, optionally, **KFJ\_EMBEDS\_LIB** set to a custom data set name.  
Example JCL:

Figure 65: Example JCL to obtain updated override embed members from maintenance

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<plib_hlq>.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=<plib_hlq>.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION CREATE
RTE_NAME <rte_name>
RTE_PLIB_HILEV <rte_plib_hilev>
...
KFJ_USE_EMBEDS Y * Y|N valid values
KFJ_EMBEDS_LIB <embeds_data_set_name> * override default EMBEDs library
/*
```

Where *<rte\_name>* and *<rte\_plib\_hilev>* specify the RTE, and *<embeds\_data\_set\_name>* is the optional custom embeds data set name.

This job pulls the updated versions of the override embed members from the updated SMP/E environment.

3. Compare the refreshed override embed member with your backup version. The comparison shows the updates introduced by the latest maintenance and any differences from previous user modifications. Identify the user modifications you must keep, and copy them to the refreshed member.
4. Continue with the standard maintenance procedure (for example, perform the **GENERATE** action).

## Deploying remote runtime environments

Use the topics in this section to guide you through the deployment of runtime environments to remote systems.

Remote deployment is the process of creating a configuration-only runtime environment on a configuration system and then deploying the configured data sets to another system (the target system) where the runtime environment will be used.

### Remote deployment scenario

In a remote deployment scenario, you must create a runtime environment on a specific LPAR (the configuration system), package the runtime environment data sets using the **PACKAGE** action, transfer the data sets to the remote target system (target system), and deploy (restore) the packaged runtime environment data sets on the target LPAR using the **DEPLOY** action.

### Before you begin

Review the following information before you implement a remote deployment:

- Make sure the SMP/E target libraries for TKANMOD and TKANCUS on the target system system and TKANMOD are APF-authorized. APF authorization is needed to run the necessary actions on the target system system.
- If you are using the default RTE\_TYPE (that is, SHARING with SMP), make sure a copy of the SMP/E target libraries is available on the target system system, using the value you specified in **GBL\_TARGET\_HILEV** of member RTEDEF (GBL\$PARM).

If you cannot share your SMP/E target libraries on the target system system, you can use the action **BLDREMS** in the utility flow TKANSAM(KFJMAINT) to build the respective TKANSAM, TKANCUS, and TKANMOD data sets and transfer them to the target system system.

- The z/OS operating system versions on your configuration system and target system should be ideally at the same level. If this is not the case, you will have to customize the z/OS specific libraries, such as SCEELKED in RTEDEF (GBL\$PARM) or RTEDEF (GBL\$lpar), to handle this situation.

For example, parameter **GBL\_DSN\_CEE\_SCEELKED** pointing to the default SCEE.SCEELKED system library could point to the z/OS 2.4 version of the library in **GBL\$1par1** and the z/OS 2.5 version in **GBL\$1par2**, respectively.

When generating the runtime environment locally, the respective **GBL\$1parn** member will be used.

### About this task

The steps in the following procedure describe a sample sequence to be performed for a remote deployment. The procedure uses the terms *configuration system* and *target system* to distinguish the systems. Typically, the target system is a *remote* system.

You cannot customize some parameters when you are creating a runtime environment for remote deployment. For more information, see [“Parameters that cannot be customized for remote deployment” on page 350](#).

**Tip:** If you need to assemble and link elements (for example, when applying maintenance), you can use the **GENERATE** action with **OPTION RELINK**. For more information, see [“RELINK | NORELINK” on page 254](#).

### Procedure

1. For the configuration system, run the **CREATE** action to create an initial RTEDEF data set that will contain the configuration settings of your target system.  
(Optional) Specify the **KFJ\_LOCAL\_PLIB\_HILEV** value in the **KCIVARS DD** statement to indicate that you want to use different high-level qualifiers or z/OS® UNIX® System Services paths on the configuration system and the target system. The **KFJ\_LOCAL\_PLIB\_HILEV** parameter is not needed if you will use the same high-level qualifiers on both the configuration system and the target system. See the [“CREATE” on page 239](#) action for more details.
2. For the target system, run the **DISCOVER** action to discover the subsystems and system symbols. This action will also create a RTEDEF data set that will contain the **Kpp@1par** members for the subsystems discovered as well as the **SYS@1par** member containing the system symbols.
3. For both the configuration system and the target system, transfer the RTEDEF created on the target system to the configuration system, and merge the contents into the RTEDEF created in step 1 on the configuration system.
4. For the configuration system, customize your runtime environment as per your needs, understanding that the customizations will reflect the target system system, such as the high-level qualifiers needed and features enabled in RTEDEF (**Kpp\$PARM** or **Kpp\$1par**) members.  
(Optional) If you used the **KFJ\_LOCAL\_PLIB\_HILEV** parameter, member **RTEDEF (PCK\$PARM)** will be created, which allows you to map local Qshell and z/OS® UNIX® paths for allocating the runtime environment data sets or z/OS® UNIX® directories on the configuration system.

**Note:** The settings in RTEDEF (PCK\$PARM) are applicable for all runtime environments configured in the RTEDEF data sets, that is, for all runtime environments of the respective SYSPLEX. If you want to use a different local high-level qualifier for a specific target system on the configuration system, you can create member RTEDEF (PCK\$Lpar) by copying RTEDEF (PCK\$PARM) and making the respective changes.

5. For the configuration system, run the **GENERATE** action for your target system runtime environment by adding the **KFJ\_SYSNAME** parameter to the KCIVARS DD statement. The value of **KFJ\_SYSNAME** specifies the SYSNAME or LPAR name or the SYSSMFID if the LPAR name is longer than four characters. See [“KFJ\\_SYSNAME” on page 314](#) for more details.  
(Optional) For the configuration system, if you used the **KFJ\_LOCAL\_PLIB\_HILEV** parameter, after the **GENERATE** action completes, your runtime environment data sets are created using the high-level qualifier or z/OS® UNIX® root path name mapping as specified in RTEDEF (PCK\$PARM or PCK\$Lpar). The members RTEDEF (PCK\$PARM) and RTEDEF (PCK\$LPAR) will be read and used during runtime environment generation.

**Note:** In this case, the runtime environment will not be able to start up as the target system settings are used to generate the respective configuration settings.

6. For the configuration system, run the **PACKAGE** action to build transferable dump data sets. Refer to [“PACKAGE” on page 265](#) for more details about the data sets created and the options that can be used.
7. For the configuration system and the target system, transfer the dump data sets to the target system using the procedure of your choice (for example, FTPS).

**Important:** If you transfer your package data sets with a qualifier that is different from **RTE\_PLIB\_HILEV** parameter value, you must use the **KFJ\_PACK\_HILEV** parameter when you deploy the runtime environment in the next step.

8. For the target system, run the **DEPLOY** action to unpack or restore the (tersed) data sets. See [“DEPLOY” on page 268](#) for more details and the options that can be used.
9. For the target system, adjust or copy your started task procedures.

## Remote deployment example using local libraries

This detailed example shows how to use local libraries to implement remote deployment of a runtime environment.

### Overview

Using local libraries in a remote deployment scenario is required when the system that you are deploying to requires different high-level qualifiers than the high-level qualifiers used on your configuration system.

**Tip:** If you can use the same high-level qualifiers on the configuration and target systems, you do not have to use local libraries for remote deployment.

This example demonstrates the steps required to create the necessary data sets and parameter settings using local libraries for a runtime environment that will be deployed to another system.

This example use the following terms:

#### Configuration system

The system where the runtime environment to be deployed is configured and packaged.

**Note:** A configuration runtime environment (that is, the runtime environment that is configured for the purpose of deployment) cannot be started.

### Target system

The system where the package data sets are restored (deployed) and where the runtime environment will be active. Typically, the target system is a *remote* system, but it can also be the same system as the configuration system.

### Local libraries

The data sets on the configuration system that are used for creating, configuring, and packaging a runtime environment to be deployed to another system. The parameters in the local libraries on the configuration system are configured for the target system.

Local libraries cannot be used for an active runtime environment on the configuration system.

Local libraries are defined and used with parameter **KFJ\_LOCAL\_PLIB\_HILEV**. The local library RTEDEF data set contains special member PCK\$PARM, which is used specifically for packaging and deploying a runtime environment using local libraries.

In this remote deployment scenario, the DASD for the configuration system and the target system is not shared and requires the use of different high-level qualifiers from each other. In this example, the high-level qualifiers for the configuration system are DEV . OMEG and the high-level qualifiers for the target system are PROD . OMEG.

**Note:** The following examples include only the parameters related to remote deployment. Additional parameters in the KCIVARS DD might be necessary depending on your requirements.

### Diagram

The following diagram shows an overview of the steps for implementing remote deployment of a runtime environment using local libraries.

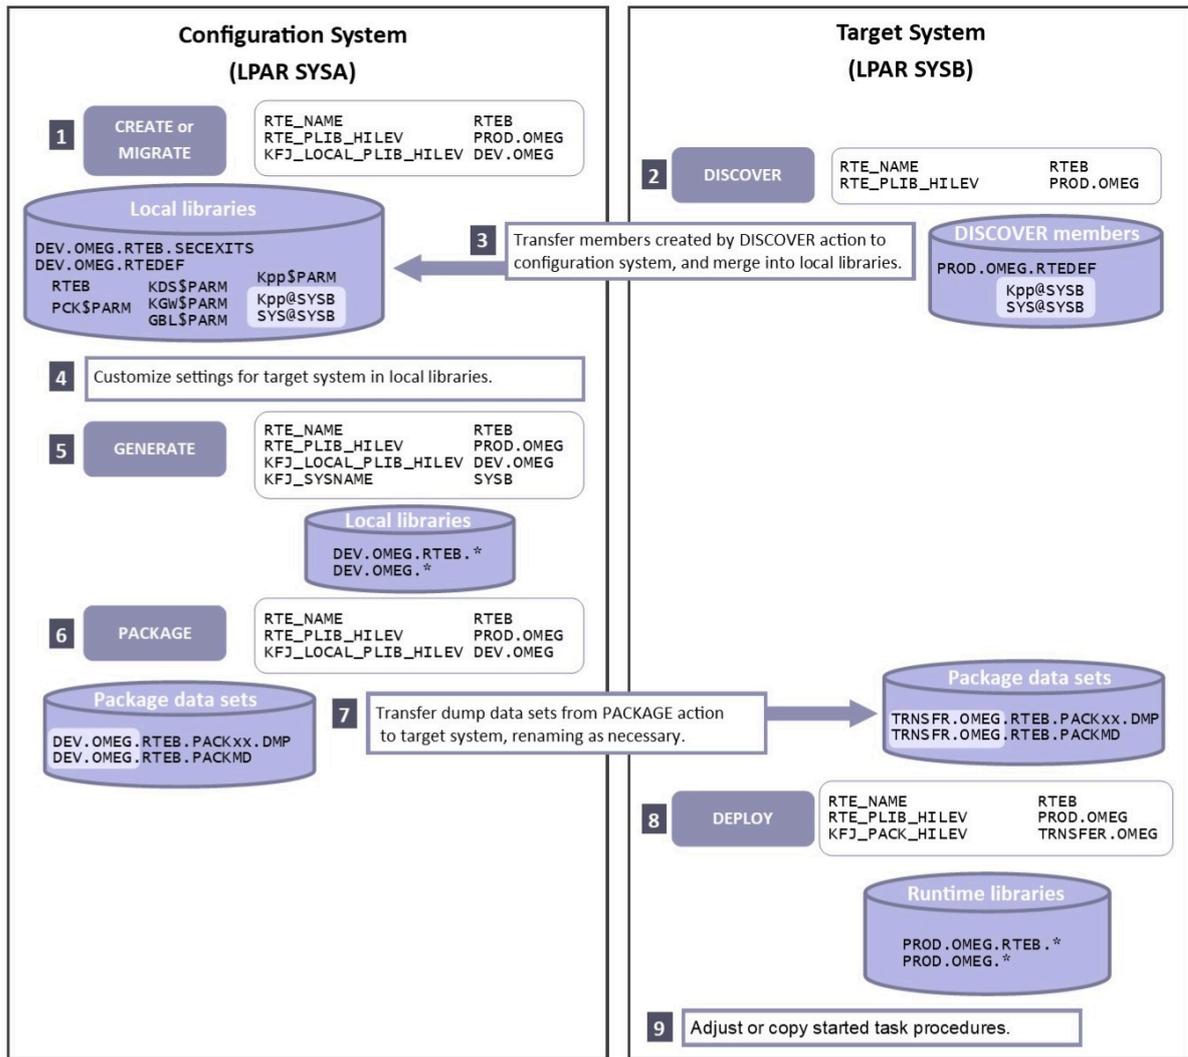

Figure 66: Using local libraries to deploy a runtime environment

For details about each of the numbered steps in the diagram, refer to the following sections.

### 1. CREATE or MIGRATE actions

On the configuration system, use the **CREATE** or **MIGRATE** action to create the initial local libraries and members that will contain the configuration settings of your target system.

Include the following parameters:

#### RTE\_NAME

Specify the name of the runtime environment that will be active on the target system.

#### RTE\_PLIB\_HILEV

Specify the high-level qualifier for the runtime definition (RTEDEF) library to be used on the target system.

#### KFJ\_LOCAL\_PLIB\_HILEV

Specify the high-level qualifier of the local libraries on the configuration system, which will be used for building the configuration-only runtime environment that will be deployed.

ACTION	CREATE   MIGRATE
RTE_NAME	RTEB
RTE_PLIB_HILEV	PROD.OMEG
KFJ_LOCAL_PLIB_HILEV	DEV.OMEG

### Results

Local library data sets and members are created on the configuration system as a result of this step, as follows:

- Local libraries are created on the configuration system using the value specified in **KFJ\_LOCAL\_PLIB\_HILEV** as the high-level qualifier.
- The following members are created in the local library RTEDEF data set:
  - Member *rte\_name* is named using the value specified in parameter **RTE\_NAME**. The **RTE\_PLIB\_HILEV** parameter and value appear in this member. For more information about the contents of this member, see [“RTEDEF\(rte\\_name\)” on page 324](#). This member is used for settings for the target system.
  - Member PCK\$PARM is created and contains information about the configuration system. This member is used to map parameters and values in the configuration-only runtime environment to the target system. For more information about the contents of this member, see [“RTEDEF\(PCK\\$PARM\)” on page 326](#).
  - Product and component-specific members *Kpp\$PARM* (or *Kpp\$lpar*) and *GBL\$PARM* (or *GBL\$lpar*) are created. These members are used for settings for the target system. In this example, *KDS\$PARM*, *KGW\$PARM*, and *GBL\$PARM* are created.

For more information about these RTEDEF members, see [“Initial runtime environment library members” on page 322](#).

**Note:** The **RTE\_NAME** and **RTE\_PLIB\_HILEV** parameter values are used to populate some parameter values. Other parameter values are set by default to settings for the configuration system. Customization of parameter values occurs in a subsequent step.

- A default security exits library is created: *kfj\_local\_plib\_hilev.rte\_name*. SECEXITS

In this example, local libraries using the high-level qualifiers DEV.OMEG are created on the configuration system, as follows:

```
DEV.OMEG.RTEB.SECEXITS
DEV.OMEG.RTEDEF
Members: RTEB
          KDS$PARM
          KGW$PARM
          GBL$PARM
          PCK$PARM
```

## 2. DISCOVER action

On the target system, run the **DISCOVER** action to discover the subsystems and system symbols.

Include the following parameters, set to the same values that were used in the **CREATE** (or **MIGRATE**) action in the previous step:

### RTE\_NAME

Specify the name of the runtime environment that will be active on the target system.

### RTE\_PLIB\_HILEV

Specify the high-level qualifier for the runtime definition (RTEDEF) library to be used on the target system.

ACTION	DISCOVER
RTE_NAME	RTEB
RTE_PLIB_HILEV	PROD.OMEG

### Notes:

- Parameter **KFJ\_LOCAL\_PLIB\_HILEV** is not used with the **DISCOVER** action on the target system.
- You must change the program name from **KCIOMEGA** to **KCIALPHA** for the **DISCOVER** job.
- You do not need to run the **CREATE** action on the target system before running the **DISCOVER** action.

## Results

This action creates an RTEDEF data set on the target system using the value specified in **RTE\_PLIB\_HILEV** as the high-level qualifier. This data set contains the *Kpp@lpar* members for the subsystems discovered on the target system and the *SYS@lpar* member containing the system symbols.

In this example, the RTEDEF data set is created on the target system using the high-level qualifiers **PROD.OMEG** and includes the members for the subsystems and system symbols, as follows:

```
PROD.OMEG.RTEDEF
Members: Kpp@SYSB
        SYS@SYSB
```

The *Kpp@lpar* members that are created depend on the subsystems installed on the system.

**Note:** When discovering MQ subsystems, the **DISCOVER** action creates only a comment member, as indicated by the hash (#) in the member name. For more information, see [“RTEDEF\(KMQ#lpar\)” on page 247](#).

### 3. Manual steps to transfer and merge your DISCOVER results

Transfer the members created by the **DISCOVER** action (members *Kpp@lpar* and *SYS@lpar*) from the *rte\_plib\_hilev*.RTEDEF data set on the target system to the *kfj\_local\_plib\_hilev*.RTEDEF data set on the configuration system.

In this example, members *Kpp@SYSB* and *SYS@SYSB* are copied from data set **PROD.OMEG.RTEDEF** on the target system to data set **DEV.OMEG.RTEDEF** on the configuration system.

### 4. Manual steps to customize your runtime environment before generating runtime members

On the configuration system, customize your configuration-only runtime environment. Perform customization as follows:

- Customize the following RTEDEF members to reflect settings on the target system:
  - Members **KDS\$PARM**, **KGW\$PARM**, and **GBL\$PARM** were created using default values from the configuration system. You must review the parameter values in these members to reflect the appropriate settings for the target system.
  - In the other *Kpp\$PARM* or *Kpp\$lpar* members, specify the high-level qualifiers needed and features enabled.

**Important:** There are some limitations regarding the parameters that can be customized. Certain parameters are not allowed in the respective RTEDEF members. For the list of parameters, see [“Parameters that cannot be customized for remote deployment” on page 350](#).

- Customize the following RTEDEF member to reflect settings on the configuration system:
  - In member **PCK\$PARM**, you must provide z/OS® UNIX® System Services paths for allocating the runtime environment data sets or z/OS® UNIX® directories on the configuration system.

**Important:** Because these values are used to generate the runtime members on the configuration system in the next step, you must specify valid local values for parameters **KFJ\_LOCAL\_USS\_RTEDIR** and **KFJ\_LOCAL\_USS\_TKANJAR\_PATH**.

**Tip:** The settings in RTEDEF (**PCK\$PARM**) are applicable for all runtime environments configured in the RTEDEF data sets; that is, for all runtime environments of the respective SYSPLEX. If you want to use a different local high-level qualifier for a specific target system on the configuration system, you can create member RTEDEF (*PCK\$lpar*) by copying RTEDEF (**PCK\$PARM**) and making the respective changes.

## 5. GENERATE action

On the configuration system, use the **GENERATE** action to generate runtime members for the runtime environment using the configured parameters. The runtime members are for the runtime environment that will be deployed to the target system and is being configured on the configuration system.

Include the following parameters:

### RTE\_NAME

Specify the name of the runtime environment that will be active on the target system. Use the same value specified in the **CREATE** action.

### RTE\_PLIB\_HILEV

Specify the high-level qualifier for the runtime definition (RTEDEF) library to be used on the target system. Use the same value specified in the **CREATE** action.

### KFJ\_LOCAL\_PLIB\_HILEV

Specify the high-level qualifier of the local libraries on the configuration system. Use the same value specified in the **CREATE** action.

### KFJ\_SYSNAME

Specify the target system. The value is the SYSNAME or LPAR name, or the SYSSMFID if the LPAR name is longer than four characters. You must specify this parameter for the **DISCOVER**-generated members *Kpp@lpar* and *SYS@lpar* to be used.

ACTION	GENERATE
RTE_NAME	RTEB
RTE_PLIB_HILEV	PROD.OMEG
KFJ_LOCAL_PLIB_HILEV	DEV.OMEG
KFJ_SYSNAME	SYSB

## Results

The **GENERATE** action creates numerous runtime environment data sets and members in the local libraries on the configuration system using the value specified in **KFJ\_LOCAL\_PLIB\_HILEV** as the high-level qualifier. The parameters in the runtime members are configured to run on the target system using the **RTE\_PLIB\_HILEV** parameter value as the high-level qualifier.

**Important:** The configuration runtime environment cannot run on the configuration system. The configuration settings are for the target system.

In this example, the runtime environment data sets and members are generated in the local libraries on the configuration system using the high-level qualifiers DEV.OMEG and the settings defined in DEV.OMEG.RTEDEF, including the PCK\$PARM member. The following data sets are generated and populated:

```
DEV.OMEG.*
DEV.OMEG.RTEB.*
```

The content of the members point to the target system, as shown, for example, in member DEV.OMEG.RTEB.RKANPARU(KPQHINIT):

```
PDSV1=OFF
PDSV2=ON
DSNHILEV=PROD.OMEG.RTEB
VOLUME=
STORCLAS=
MGMTCLAS=
DATACLAS=
ALLOC_TYPE=CYL
```

The **GENERATE** action also maps the high-level qualifiers and z/OS® UNIX® System Services paths in the local libraries on the configuration system to the runtime libraries on the target system. You can see the mapping results in the **GENERATE** job output in the KCIPRINT DD.

**Note:** If you use **OPTION DEBUG** with the **GENERATE** action, the mapping results are retained in the KFJSDIFM DD in the job output.

The following figure shows the mapping table that was used in this example:

```

KFJ00211I Configuration Manager is allocating data sets using local settings for high level qualifiers and z/OS UNIX system services paths
Configuration LPAR high level qualifiers and z/OS UNIX system services paths | Target LPAR high level qualifiers and z/OS UNIX system services paths
-----|-----
KFJ_LOCAL_PLIB_HILEV          DEV.OMEG          RTE_PLIB_HILEV      PROD.OMEG
KFJ_LOCAL_HILEV              DEV.OMEG          RTE_HILIV           PROD.OMEG
KFJ_LOCAL_VSAM_HILEV         DEV.OMEG          RTE_VSAM_HILEV      PROD.OMEG
KFJ_LOCAL_PDS_HILEV          DEV.OMEG.RTEB     RTE_PDS_HILEV
KFJ_LOCAL_TARGET_HILEV       DEV.ZSMS21R.SMPE  GBL_TARGET_HILEV    PROD.ZSMS21R.SMPE
KFJ_LOCAL_SMS_VOLUME         RTE_SMS_VOLUME
KFJ_LOCAL_SMS_VSAM_VOLUME    RTE_SMS_VSAM_VOLUME
KFJ_LOCAL_SMS_UNIT           RTE_SMS_UNIT
KFJ_LOCAL_SMS_STORCLAS       RTE_SMS_STORCLAS
KFJ_LOCAL_SMS_VSAM_STORCLAS  RTE_SMS_VSAM_STORCLAS
KFJ_LOCAL_SMS_MGMTCLAS       RTE_SMS_MGMTCLAS
KFJ_LOCAL_SMS_VSAM_MGMTCLAS  RTE_SMS_VSAM_MGMTCLAS
KFJ_LOCAL_USS_RTEDIR         /dev/rtehome      RTE_USS_RTEDIR      /prod/rtehome
KFJ_LOCAL_USS_TKANJAR_PATH   /dev/my/smpe      GBL_USS_TKANJAR_PATH /prod/my/smpe
KFJ_LOCAL_USS_TKAYHFS_PATH   /dev/my/smpe      GBL_USS_TKAYHFS_PATH /prod/my/smpe

```

Figure 67: Local library mapping to target system (in KCIPRINT DD)

## 6. PACKAGE action

On the configuration system, run the **PACKAGE** action to build transferable dump data sets.

Include the following parameters:

### RTE\_NAME

Specify the name of the runtime environment that will be active on the target system. Use the same value specified in the **CREATE** action.

### RTE\_PLIB\_HILEV

Specify the high-level qualifier for the runtime definition (RTEDEF) library to be used on the target system. Use the same value specified in the **CREATE** action.

### KFJ\_LOCAL\_PLIB\_HILEV

Specify the high-level qualifier of the local libraries on the configuration system. Use the same value specified in the **CREATE** action.

ACTION	PACKAGE
RTE_NAME	RTEB
RTE_PLIB_HILEV	PROD.OMEG
KFJ_LOCAL_PLIB_HILEV	DEV.OMEG

**Note:** (Optional) You can use parameter **KFJ\_PACK\_HILEV** with the **PACKAGE** action to specify a custom high-level qualifier for the output package data sets, which can be useful to distinguish the package data sets from the many runtime environment data sets in the local libraries.

## Results

The **PACKAGE** action allocates the following package data sets:

```

kfj_local_plib_hilev.rte_name.PACKxx.DMP
kfj_local_plib_hilev.rte_name.PACKMD

```

where *xx* is MN (Main non-VSAM), MV (Main VSAM), HN (History non-VSAM), or HV (History VSAM).

**Note:** If you included parameter **KFJ\_PACK\_HILEV**, the specified value is used as the high-level qualifier of the package data sets.

For more information about the package data sets, see “**PACKAGE**” on page 265.

In this example, the following package data sets are created:

```
DEV.OMEG.RTEB.PACKxx.DMP
DEV.OMEG.RTEB.PACKMD
```

## 7. Manual steps to transfer your package data sets to the remote system

Transfer the package data sets from the configuration system to the target system using the procedure of your choice (for example, FTPS). Make sure to transfer both the DMP and PACKMD data sets. You can rename the high-level qualifier of the data sets if necessary.

In this example, the high-level qualifier of the package data sets is renamed from DEV.OMEG on the configuration system to TRNSFER.OMEG on the target system.

## 8. DEPLOY on target system

On the target system, use the **DEPLOY** action to restore the package data sets that have been transferred from the configuration system.

Include the following parameters:

### RTE\_NAME

Specify the name of the runtime environment that will be active on the target system. Use the same value specified in the **CREATE** action.

### RTE\_PLIB\_HILEV

Specify the high-level qualifier for the runtime definition (RTEDEF) library to be used on the target system. Use the same value specified in the **CREATE** action.

### KFJ\_PACK\_HILEV

Specify the high-level qualifier of the package data sets on the target system. This parameter is required if the high-level qualifier does not match the **RTE\_PLIB\_HILEV** parameter value.

ACTION	DEPLOY
RTE_NAME	RTEB
RTE_PLIB_HILEV	PROD.OMEG
KFJ_PACK_HILEV	TRNSFER.OMEG

## Results

The **DEPLOY** action restores the package data sets with the **KFJ\_PACK\_HILEV** parameter value as the high-level qualifier to data sets with the **RTE\_PLIB\_HILEV** parameter value as the high-level qualifier. The restored data sets constitute the deployed runtime environment.

In this example, package data sets TRNSFER.OMEG.RTEB.PACKxx.DMP are restored to runtime data sets with high-level qualifier PROD.OMEG. The PROD.OMEG data sets are the runtime libraries for the deployed runtime environment.

**Note:** Although the PACKMD metadata file itself is not restored, the **DEPLOY** action requires the PACKMD file when local libraries are used for remote deployment.

## 9. Manual steps to adjust or copy your started task procedures

On the target system, adjust or copy your started task procedures.

## Parameters that cannot be customized for remote deployment

You cannot customize some parameters when you are creating a runtime environment for remote deployment.

The following table ([“Parameters that cannot be customized for a remote deployment runtime environment” on page 351](#)) lists the parameters that you cannot customize when you are creating a runtime environment for remote deployment.

During the **GENERATE** action, if any of these parameters are explicitly specified in the RTEDEF members, message **KFJ00213E** is issued in KCIPRINT and the workflow stops. To continue, you must remove these parameters from the RTEDEF data set members and re-run the **GENERATE** action.

<i>Table 50: Parameters that cannot be customized for a remote deployment runtime environment</i>	
<b>Product or component</b>	<b>Parameter</b>
Global parameters	GBL_USER_JCL
IBM OMEGAMON for CICS	KC2_HSnn_CLASSIC_VSAM_VOLUME KC2_HSnn_CLASSIC_VSAM_STORCLAS KC2_HSnn_CLASSIC_VSAM_MGMTCLAS KC2_HSnn_CLASSIC_VSAM_DATACLAS

## Using SMP/E target library copies

Use the Configuration Manager *target copy* feature to create one or more copies of your SMP/E target libraries, from which you can create or update your runtime environments.

**Tip:** If you are moving from PARMGEN to Configuration Manager, the Configuration Manager target copy feature provides an alternative to the PARMGEN base library feature.

### Define SMP/E target copy settings

Create a member in your RTEDEF library to contain your SMP/E target copy settings, and update the settings as needed.

#### Before you begin

The Configuration Manager target copy feature is used to create and maintain one or more copies of your SMP/E target libraries, from which you can create or update your runtime environments.

The first step in setting up the use of an SMP/E target library copy is to create a dedicated member in your RTEDEF library that will contain the target copy settings. To review the initial content of the SMP/E target copy member that will be created in this task, see [“RTEDEF\(trg\\_copy\\_name\)” on page 328](#).

#### About this task

You use the **CREATE** action with option **TRGCOPY** to create and initially populate a member in an RTEDEF library specifically for SMP/E target copy settings.

The **CREATE** action supports the following settings when creating the SMP/E target copy member:

##### OPTION TRGCOPY

Creates a target copy member inside the RTEDEF library. The member is named using the **TRG\_COPY\_NAME** parameter.

##### TRG\_COPY\_NAME

Specifies the name of the member to create in the RTEDEF data set to contain the SMP/E target copy settings. If the specified member already exists, it is not overwritten.

##### TRG\_COPY\_HILEV

(Optional) Specifies the high-level qualifier for the target copy data sets. If not specified, the **RTE\_PLIB\_HILEV** parameter value is used.

##### RTE\_PLIB\_HILEV

Specifies the high-level qualifier of the RTEDEF library; if the RTEDEF data set does not exist, it is created. This parameter value is also used as the default value for the high-level qualifier for the target copy data sets if **TRG\_COPY\_HILEV** is not specified.

After the member has been created, you must then review and update the settings, as needed. For more information about the created member, see [“RTEDEF\(trg\\_copy\\_name\)” on page 328](#).

<sup>3</sup> The list of parameters for IBM Z® OMEGAMON® AI for Db2 (formerly named IBM OMEGAMON® for Db2 Performance Expert on z/OS) cannot be customized if **KFJ\_LOCAL\_KD5\_RUN\_ALLOC** is specified with the value GENERATE. If you want to customize these parameters, then use the value DEPLOY or NONE.

## Procedure

1. Modify the KFJJMCM sample job in TKANSAM (see example below) to select a **CREATE** action.
2. Specify **OPTION TRGCOPY**.
3. Specify a value for required parameter **TRG\_COPY\_NAME** to use as the name of the target copy member.
4. Specify the high-level qualifier of the RTEDEF in parameter **RTE\_PLIB\_HILEV**.
5. (Optional) Specify a value for parameter **TRG\_COPY\_HILEV** to use as the high-level qualifier for the target copy data sets.
6. Run the KFJJMCM job to create the SMP/E target copy member in the RTEDEF data set. Job messages for the **CREATE** action are written to the KCIPRINT SYSOUT data set.
7. Review and update the RTEDEF (*trg\_copy\_name*) member, as needed.

The following JCL job creates the SMP/E target copy member MYCOPY in data set TSUID.PROD.RTEDEF. If the specified RTEDEF data set does not exist, it is created. If the specified member already exists, it is not overwritten.

## What to do next

Use the new target copy member to make a copy of your SMP/E target libraries. See [“Copy SMP/E target libraries”](#) on page 354.

**Note:** Make sure to carefully review your target copy settings before continuing with the next step.

## Copy SMP/E target libraries

Make a copy of your SMP/E target libraries using your defined SMP/E target copy settings.

### Before you begin

The Configuration Manager target copy feature is used to create and maintain a copy of your SMP/E libraries, from which you can create or update your runtime environments.

Before you can copy the libraries, you must have created and updated your SMP/E target copy settings, as described in [“Define SMP/E target copy settings” on page 352](#). You can then use your defined settings to copy the libraries, as described in this task.

**Important:** Make sure you have carefully reviewed your target copy settings before continuing with this task.

### About this task

You use the **GENERATE** action with option **TRGCOPY** to copy your SMP/E target libraries from the original source to a new set of data sets, as defined in your SMP/E target copy settings in member RTEDEF (*trg\_copy\_name*).

Data sets for the copy of the SMP/E target libraries are allocated with the name *trg\_copy\_hilev.trg\_copy\_name*. Target copy libraries are always non-VSAM. Only the files for the products installed in your environment, as specified by the **CONFIGURE\_\*** flags in the RTEDEF (*trg\_copy\_name*) member, are copied.

When used to copy SMP/E target libraries, the **GENERATE** action supports the following settings

#### OPTION TRGCOPY

Creates a copy of your SMP/E target libraries from the original source to a new set of data sets, as defined in member RTEDEF (*trg\_copy\_name*).

#### TRG\_COPY\_NAME

Specifies the name of the member in the RTEDEF data set that contains the SMP/E target copy settings.

#### RTE\_PLIB\_HILEV

Specifies the high-level qualifier of the RTEDEF library.

### Procedure

1. Modify the KFJJMCM sample job in TKANSAM (see example below) to select a **GENERATE** action.
2. Specify **OPTION TRGCOPY**.
3. Specify the name of the target copy member for required parameter **TRG\_COPY\_NAME**.
4. Specify the high-level qualifier of the RTEDEF in parameter **RTE\_PLIB\_HILEV**.
5. Run the KFJJMCM job to copy your SMP/E target libraries from the original source to a new set of data sets.  
Job messages for the **GENERATE** action are written to the KCIPRINT SYSOUT data set.

The following JCL job copies SMP/E target libraries from the original source to a new set of data sets, as defined in the SMP/E target copy member MYCOPY in data set TSOUID.PROD.RTEDEF. In this example, new data sets are allocated using the high-level qualifier TSOUID.PROD.MYCOPY. The number of data sets copied depends on the products selected for configuration in the target copy member.

**Important:** The high-level qualifier for the data set name specified in the KCIFLOW DD statement must match the **GBL\_TARGET\_HILEV** parameter value that is specified in the RTEDEF (*trg\_copy\_name*) member.

Figure 70: Example JCL to copy SMP/E target libraries

```

RTE_PLIB_HILEV TSUID.PROD
/*
```

## What to do next

You can use the copy of the SMP/E target libraries to create or update your runtime environments.

## Create a target copy for an existing runtime environment

Use this procedure to configure an existing runtime environment to use a copy of SMP/E target libraries.

### Before you begin

This procedure builds upon information provided in the following topics:

- [“Define SMP/E target copy settings” on page 352](#)
- [“Copy SMP/E target libraries” on page 354](#)

You can review these topics for additional details.

### About this task

The following procedure provides the steps to update your existing runtime environment to use a copy of SMP/E target libraries instead of original SMP/E target libraries.

### Procedure

1. Create the target copy member by running the **CREATE** action with **OPTION TRGCOPY** and the following additional settings:
  - Include the **RTE\_PLIB\_HILEV** parameter, which must point to an existing RTEDEF data set.
  - Include the **TRG\_COPY\_NAME** parameter, which must specify a new member name, one that does not exist in the RTEDEF data set.

For more details, see [“Define SMP/E target copy settings” on page 352](#).

2. After new member RTEDEF (*trg\_copy\_name*) has been created, review the settings in the member and update as needed.

**Note:** Make sure to review parameter **TRG\_COPY\_HILEV** in the new member, which specifies the high-level qualifier for the SMP/E target library copy.

3. Create the copy of the SMP/E target libraries by running the **GENERATE** action with **OPTION TRGCOPY** and the following additional settings:
  - Include the **RTE\_PLIB\_HILEV** parameter, which must point to an existing RTEDEF data set.
  - Include the **TRG\_COPY\_NAME** parameter, which must specify the name of the newly created member.

For more details, see [“Copy SMP/E target libraries” on page 354](#).

4. After the **GENERATE** action has completed and the SMP/E target libraries have been copied to the new location, make the following updates:
  - a. Update parameter **GBL\_TARGET\_HILEV** in member RTEDEF (GBL\$PARM) or RTEDEF (GBL\$lpar) to point to the newly created copy of the SMP/E target libraries.

- b. If parameter **GBL\_USS\_TKANJAR\_PATH** parameter is required for your runtime environment, update the **GBL\_USS\_TKANJAR\_PATH** parameter to use the value from **TRG\_COPY\_TKANJAR\_PATH** in member RTEDEF (*trg\_copy\_name*).
5. Run the **GENERATE** action for the modified runtime environment.
6. Perform standard post-configuration steps, such as copying generated started tasks into a site-specific location.
7. (Optional) You can repeat steps 1 through 3 to create multiple copies of your SMP/E target libraries, which you can use to apply a staged rollout of maintenance for an existing runtime environment.

## Maintain SMP/E target library copies

Keep the copy of your SMP/E target libraries up to date.

### Before you begin

The Configuration Manager target copy feature is used to create and maintain one or more copies of your SMP/E target libraries, from which you can create or update your runtime environments.

After you have created a copy of your SMP/E target libraries using the target copy feature, as described in [“Copy SMP/E target libraries”](#) on page 354, you can refresh the copy as needed, as described in this task.

### About this task

You use the **GENERATE** action with option **TRGCOPY** to refresh the copy of your SMP/E target libraries.

### Procedure

- To keep the SMP/E target copy in sync with your original SMP/E target libraries, simply run the **GENERATE** action with option **TRGCOPY** again. It will refresh all the libraries and will copy all the required members from your SMP/E target libraries to a copy of the SMP/E target libraries.

## How-tos using Configuration Manager

*How-tos* provide some best practices and instructions for performing specific tasks. The topics in this section tell you *how to* perform these tasks using Configuration Manager. These instructions are meant to help you complete commonly used processes.

### How to: Migrate to Configuration Manager from PARMGEN

You can migrate a runtime environment that is configured with PARMGEN to one that is configured with Configuration Manager.

To perform the migration, use the Configuration Manager **MIGRATE** action. The **MIGRATE** action imports configuration settings from a runtime environment that is configured with PARMGEN to one that is configured with Configuration Manager.

For more information about moving from PARMGEN to Configuration Manager, see the following topics:

- [Best practices for configuring OMEGAMON products and components](#)
- [PARMGEN: Rectifying your PARMGEN configuration](#)
- [Configuration Manager: Comparison with PARMGEN](#)
- [Configuration Manager: Parameters with different default values than PARMGEN](#)
- [Configuration Manager: MIGRATE](#)

### How to: Add a new agent or product to a runtime environment

This topic describes how to add a new agent or product to an existing runtime environment using Configuration Manager.

## About this task

To add a new agent or product to a runtime environment, you create new members for product-specific parameters in the existing runtime environment definition (RTEDEF) library.

## Procedure

1. Run the JCL with the **CREATE** action. The **RTE\_NAME** and **RTE\_PLIB\_HILEV** parameters should point to an existing RTEDEF library (the one you want to modify). See [“CREATE” on page 239](#) for more information.

If you want to use override embed members, you should also specify Y for that parameter, for example, **KFJ\_USE\_EMBEDS Y**. See [“Using override embed members in Configuration Manager” on page 337](#) for more information.

The first step is to create new members in the RTEDEF library (for example, **KDS\$PARM**), if necessary, where you can set product specific parameters. This step will also copy new override embed members and security exits (if there are any).

**Note:** If the **Kpp\$PARM** member was not created for a new product, that means there are no mandatory or best practice parameters to set. However, if you want to add custom parameters, create the **Kpp\$PARM** member in the RTEDEF library and add custom parameters.

2. When step 1 is complete, manually update the RTEDEF (*rte\_name*) member and specify which agent or product to configure. For example, to configure the KD5 agent, set the **CONFIGURE\_DB2\_AGENT\_KD5** parameter to Y. For the complete list of **CONFIGURE\_\*** parameters, see [“Parameters that determine what products are configured” on page 278](#).

**Note:** If you want to remove an existing agent, set the parameter to N. The primary benefit of the N setting is that less CPU and time is used as the respective product-specific workflows are bypassed.

3. Manually update RTEDEF (**GBL\$PARM**), if there are any initial mandatory parameters for the new product, such as load library names. See [“Parameters in the initial runtime environment configuration profile” on page 279](#) for information on how to add those parameters to **GBL\$PARM** and set correct values.
4. (Optional) Run JCL with the **DISCOVER** action. See [“DISCOVER” on page 242](#) for more information.
5. Run the **GENERATE** action to finalize RTE configuration. See [“GENERATE” on page 248](#) for more information.

## How to: Add OMEGAMON® Data Provider to a runtime environment

This topic describes how to add OMEGAMON® Data Provider to an existing runtime environment using Configuration Manager.

### Before you begin

You can add IBM Z® OMEGAMON Data Provider to an existing runtime environment by manually adding required parameters to your configuration, if the parameters are not present in the runtime environment definition (RTEDEF) library.

**Important:** If you are creating a new runtime environment, Configuration Manager includes the OMEGAMON® Data Provider parameters automatically, and you do not need to perform this task.

Before you begin, you need to know the SMP/E target locations where OMEGAMON® Data Provider is installed. In particular, you must know the z/OS® UNIX® System Services directory path specified by the SMP/E DDDEF **TKAYHFS**. The default path is **/usr/lpp/omdp**. For more information, see [Installing OMEGAMON Data Provider](#).

## About this task

To add OMEGAMON® Data Provider to an existing runtime environment, you perform the following actions:

- Add required parameters to members *rte\_name* and GBL\$PARM (or GBL\$*lpar*) in the runtime environment definition (RTEDEF) library.

You must set the following required parameters:

**CONFIGURE\_ODP\_KAY**

Enables or disables OMEGAMON® Data Provider configuration for the runtime environment

**GBL\_USS\_TKAYHFS\_PATH**

Sets the path to the z/OS® UNIX® System Services directory that the SMP/E installation jobs define using the ddname TKAYHFS

- For parameters that are specific to OMEGAMON® Data Provider, create new member KAY\$PARM (or KAY\$*lpar*) in the existing RTEDEF library.

You can optionally set the following parameters:

**For OMEGAMON Data Broker:**

**KAY\_BROKER\_MEMBER**

Sets the two-character value for the KAYSIP*nn* member name and the OMEGAMON Data Broker procedure MEM=*nn* parameter value

**KAY\_BROKER\_NAME**

Sets the OMEGAMON Data Broker name, which must match the name specified in the KAYOPEN member

**KAY\_BROKER\_STC**

Sets the OMEGAMON Data Broker procedure name

**For OMEGAMON Data Connect:**

**KAY\_CONNECT\_JAVA\_HOME**

Sets the path to the Java 17 installation directory

**Note:** Other Java versions are not supported.

**KAY\_CONNECT\_STC**

Sets the OMEGAMON Data Connect procedure name

Use the following procedure to add OMEGAMON® Data Provider to your existing runtime environment.

**Procedure**

1. In the RTEDEF library, edit member *rte\_name* and add parameter **CONFIGURE\_ODP\_KAY** with the value Y.
2. In the RTEDEF library, edit member GBL\$PARM (or GBL\$*lpar*) and add parameter **GBL\_USS\_TKAYHFS\_PATH** with the value set to the path of the z/OS® UNIX® System Services directory that the SMP/E installation jobs define using the ddname TKAYHFS.
3. (Optional) In the RTEDEF library, create member KAY\$PARM (or KAY\$*lpar*), if necessary, where you can set the following product-specific parameters:

**KAY\_BROKER\_MEMBER**  
**KAY\_BROKER\_NAME**  
**KAY\_BROKER\_STC**  
**KAY\_CONNECT\_JAVA\_HOME**  
**KAY\_CONNECT\_STC**

For example, after you create member KAY\$PARM, add the **KAY\_CONNECT\_JAVA\_HOME** parameter with a value that points to the Java 17 directory, as follows:

```
KAY_CONNECT_JAVA_HOME  "/path/to/Java/J17.0_64"
```

4. Run the **GENERATE** action to finalize the runtime environment configuration.

**Result**

The **GENERATE** action performs the following actions:

- Creates the following OMEGAMON® Data Provider procedures in library GBL\_DSN\_SYS1\_PROCLIB, which is (by default) `rte_plib_hilev.SYS1.PROCLIB`:
  - OMEGAMON Data Connect procedure OMEGODC
  - OMEGAMON Data Broker procedure OMEGODB
- Copies member KAYOPEN to runtime library `rte_hilev.rte_name.RKANPARU`

**Note:** Member KAYOPEN is copied only once and is never replaced.

- Copies member KAYSIP00 to global source library %GBL\_DSN\_GLOBAL\_SOURCE\_LIB%, which is (by default) `rte_hilev.rte_name.RKANPARU`

**Note:** Member KAYSIP00 is copied only once and is never replaced.

- Creates the following z/OS® UNIX® directories for the runtime environment:

**OMEGAMON Data Connect user directory**

- `rte_uss_rtedir/rte_name/kay/user/config`, which contains `connect.yaml` samples
- `rte_uss_rtedir/rte_name/kay/user/extensions`, an empty directory that is ready for optional OMEGAMON® Data Provider extensions

**OMEGAMON Data Connect installation directory**

- For full runtime environments (**RTE\_TYPE** parameter is set to FULL), Configuration Manager extracts the KAY11PAX archive to directory `rte_uss_rtedir/rte_name/kay/kay-110/`

## What to do next

After the Configuration Manager process completes, review [Getting started with OMEGAMON Data Provider](#) to perform other necessary steps.

To stream status information from the Tivoli Enterprise Monitoring Server to OMEGAMON® Data Provider, see [“\(Optional\) Configure situation status streaming”](#) on page 577.

## How to: Use a shared procedure for multiple monitoring servers

You can configure your environment to use the same started task procedure for multiple monitoring servers across different systems in the sysplex. This topic explains how to perform this task using either Configuration Manager or PARMGEN.

### Before you begin

A Tivoli Enterprise Monitoring Server (*monitoring server*) can be configured as one of several types: hub, high-availability hub, remote. By default, the started task procedure for each monitoring server is created to be run as a separate task. The generated procedure is different for each monitoring server by type; for example, the name of the runtime environment, the data set names, and the required DD statements can all vary by monitoring server type.

This default configuration is not suitable for some sites that might have any of the following requirements:

- The SYS1.PROCLIB (or equivalent procedure library) must be shared across all the systems in the sysplex.
- Only a single, specific agent procedure is allowed (that is, only one procedure per agent).

To satisfy such requirements, you must use a procedure that is the same for all monitoring servers across all systems; it must have the same name, the same contents, and reference the same data sets. To accomplish this setup, you can configure your environment to generate a *shared procedure*.

This topic explains how to generate a shared procedure for use with multiple monitoring servers using either Configuration Manager or PARMGEN.

### About this task

This task requires the use of the following parameter:

### **KDS\_TEMS\_PROC\_SHARED**

This flag specifies if the monitoring server procedure can be shared among different systems in the sysplex. When the flag is set to Y, the same procedure is generated for a hub monitoring server or a remote monitoring server, and the procedure can be copied to a shared SYS1 . PROCLIB. The default value for this parameter is N.

The use of system variables is also required.

Use the following steps to create a shared procedure for use with multiple monitoring servers.

## **Procedure**

1. Set the flag parameter that enables the generation of a monitoring server procedure that can be shared:
  - Using Configuration Manager: Add parameter **KDS\_TEMS\_PROC\_SHARED** set to Y to RTEDEF (KDS\$PARM) or RTEDEF (KDS\$lpar), and then run the **GENERATE** action.
  - Using PARMGEN: In WCONFIG (*rte\_name*), set parameter **KDS\_TEMS\_PROC\_SHARED** to Y, and then run the **\$PARSE** job.

**Note:** For more information about making these changes using PARMGEN, see [Scenario SMPE03: Applying SMP/E maintenance with new configuration changes to an existing RTE and overriding the IBM-supplied configuration defaults](#).

2. Review the generated procedure, and proceed as appropriate:
  - If you use system variables in your runtime environment configuration, including a system variable for **RTE\_NAME**, the generated procedure is ready to be shared.
  - If you do not use system variables in your runtime environment configuration, you can use the generated procedure as a shared procedure if there is a variable in your PARMLIB system symbol list that corresponds to your **RTE\_NAME** values across all the LPARs in the sysplex. To enable the procedure to be shared, update the following lines:

```
//TEMS PROC RGN=0M,TIM=1440,MEMLIM=NOLIMIT,  
//          SYS=&SYSNAME . ,
```

In this example, **&SYSNAME .** resolves to an **RTE\_NAME** on each system where it is started.

3. Copy the shared started task procedure to your system library.

## **How to: Create a high-availability hub monitoring server**

You can ensure continuous availability in your monitoring environment by using a high-availability hub monitoring server. This task describes how to create a high-availability hub monitoring server using Configuration Manager.

### **Before you begin**

A configuration that includes a [high-availability hub](#) is resilient and efficient. It is resilient because the high-availability hub can be relocated to any LPAR in the sysplex with minimal disruption to the other components. The configuration is efficient because the remote monitoring server on the same LPAR as the hub handles all communications with the monitoring agents and thus reduces the load on the hub. If your environment supports the requirements for a high-availability hub, you should configure one.

A high-availability hub Tivoli Enterprise Monitoring Server has the following requirements:

- Must reside on z/OS.
- Must be configured in a sysplex. A high-availability hub is not defined to run on any specific system.
- Must use runtime libraries stored on shared DASD. This setup allows the high-availability hub to start on any LPAR in the sysplex without requiring replication of the libraries.

- Must be configured in its own runtime environment, without any monitoring agents configured in the runtime environment. The high-availability hub can be configured on the same LPAR with a remote monitoring server.
- Must have a dynamic virtual IP address (DVIPA). Using a DVIPA allows the high availability hub to respond to the same IP address on any LPAR in the sysplex. The DVIPA must be defined on each LPAR that is a candidate for the high-availability hub. It is recommended that you use the VIPADEFINE statement to designate the DVIPA. For more information, see *z/OS Communications Server: IP Configuration Reference: VIPADYNAMIC - VIPADEFINE statement*.

Additionally, it is recommended that system variables are not used in the runtime environment for the high-availability hub. The high-availability hub retains the same parameter values on any system in the sysplex.

## About this task

To create a high-availability hub monitoring server using Configuration Manager, you must isolate the configuration settings for the monitoring server in a separate runtime environment definition (RTEDEF) library.

Use the following parameters to configure a high-availability hub monitoring server:

- **RTE\_TCP\_HOST**
- **KDS\_TEMS\_TYPE**
- **KDS\_TEMS\_HA\_TYPE**
- **KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST**
- **KDS\_PH01\_TEMS\_TCP\_HOST**

Complete the following steps to create a high-availability hub monitoring server.

## Procedure

1. Run the **CREATE** action to create an initial set of parameters in a new RTEDEF library for the high-availability hub runtime environment.

**Note:** Any generated members other than the global (**GBL\_\***) and monitoring server (**KDS\$\***) members can be removed.

2. Update the RTEDEF (*rte\_name*) member, as follows:
  - Ensure that the runtime environment contains only the high-availability hub monitoring server by setting the following parameter to Y:

```
CONFIGURE_TEMS_KDS          Y
```

All other **CONFIGURE\_\*** parameters are set to N.

- Specify the address where the runtime environment is being defined:

```
RTE_TCP_HOST                dvipa
```

where *dvipa* is the DVIPA for the high-availability hub.

3. Update the RTEDEF (KDS\$PARM) member to include the following parameters and values:

```
KDS_TEMS_TYPE                HUB
KDS_TEMS_HA_TYPE              HA
KDS_TEMS_TCP_KDEB_INTERFACELIST  !dvipa

KDS_PH                        BEGIN
KDS_PH01_ROW                  01
KDS_PH01_TEMS_TCP_HOST        dvipa
KDS_PH                        END
```

where *dvipa* is the DVIPA for the high-availability hub.

4. Use the **GENERATE** action to create runtime members for the high-availability hub runtime environment.

## How to: Configure passphrase and MFA support in the OMEGAMON 3270 Classic interface

In addition to using a regular password, you can also log on securely to the OMEGAMON 3270 Classic interface using a password phrase (passphrase) and multi-factor authentication (MFA). Some configuration steps are necessary to enable passphrase and MFA support for the OMEGAMON 3270 Classic interface. This topic explains how to perform this task using either Configuration Manager or PARMGEN.

### Before you begin

A traditional mainframe password is eight bytes or less, while a passphrase is from nine to 100 bytes. MFA is an authentication method that typically requires a six-digit volatile numeric token that is paired with a password or passphrase value. A user ID must be set up in the security system to use a passphrase.

**Note:** Your security administrator must set up the user ID to use a passphrase. For RACF, use the PHRASE operand with the [ADDUSER](#) or [ALTUSER](#) command. For a security product other than RACF, refer to the documentation for that product for guidance on the equivalent actions.

On a 3270 screen, depending on the screen width, entering a long passphrase value into a field might require multiple lines. For example, if the screen width is 80 bytes, an input field would require multiple lines to support a value longer than 80 bytes. For a wider screen size, you can support a longer value on a single line, up to the available screen width.

On the OMEGAMON 3270 Classic interface logon screen, by default, the password fields support passwords that are eight bytes or less. Optionally, you can configure your product to support passphrase and MFA values for the OMEGAMON 3270 Classic interface; multiple settings are available. When passphrase support is enabled, configuration parameters are used to specify the SAF security class and SAF application ID to use for the OMEGAMON 3270 Classic interface.

**Important:** When passphrase support is enabled, OMEGAMON implements the SAF interface for external security without the use of security exits. For more information, see [OMEGAMON® 3270 Classic interface security](#).

### About this task

To use passphrase values and MFA for the OMEGAMON 3270 Classic interface, you must configure your product to enable passphrase support. Multiple passphrase configuration options are available that affect the length of the passphrase that is supported on a single line and the layout of the logon screen.

**Note:** It is recommended that you review the available configuration options, especially if you use programs to automate the logon process to the OMEGAMON 3270 Classic interface that rely on static placement of keywords and input fields.

Passphrase support for the OMEGAMON 3270 Classic interface is provided for the following products, listed with the respective product code:

- OMEGAMON for CICS (C2)
- OMEGAMON® AI for Db2 (D2)
- OMEGAMON for IMS (I2)
- OMEGAMON for z/OS (M2)
- IBM Z OMEGAMON Monitor for z/OS (M2)

Passphrase enablement and configuration is controlled by parameter **Kpp\_CLASSIC\_PASSPHRASE**, where *pp* is C2, D2, I2, or M2, depending on the supported product. When passphrase support is enabled, the SAF security class is defined by **Kpp\_CLASSIC\_SECCLASS** and the SAF application ID is defined by **Kpp\_CLASSIC\_SAFAPPL**, where *pp* is C2, D2, I2, or M2.

The following configuration options are available for passphrase support:

### Kpp\_CLASSIC\_PASSPHRASE

This parameter specifies the passphrase support setting for the OMEGAMON 3270 Classic interface.

**Note:** In the following figures, a ruler is shown on the screen. The ruler is included in the documentation for illustrative purposes only and is not displayed in the product.

#### PARTIAL

Passphrase support is enabled with the **PASSWORD** and **NEW PASSWORD** fields each consisting of a single line. The minimum length of each of these fields is 34 bytes, and the maximum length (which can be up to 100 bytes) depends on the screen width. With this setting, the fields are aligned in the center of the screen, as shown in the following figure:

```
>
>          Copyright 1980-2022
>      IBM Corporation. All rights reserved.
>          Use permissible by license only.
>

          ENTER USERID ==>
            PASSWORD ==>
              GROUP ==>
            NEW PASSWORD ==>

          Press F3 to exit logon

|...+...1...+...2...+...3...+...4...+...5...+...6...+...7...+...8
1234567890123456789012345678901234567890123456789012345678901234567890
```

**Note:** Passphrase support for the OMEGAMON 3270 Classic interface is introduced with APAR OA57133 (PTF UA98944). With the PARTIAL setting, the input field labels and placement are compatible with the screen layout before passphrase support was introduced.

#### MAX62

Passphrase support is enabled with the **PASSWORD** and **NEW PASSWORD** fields each consisting of a single line. The minimum length of each of these fields is 62 bytes, and the maximum length (which can be up to 100 bytes) depends on the screen width. With this setting, the fields are aligned at the left of the screen, as shown in the following figure:

```
>
>          Copyright 1980-2022
>      IBM Corporation. All rights reserved.
>          Use permissible by license only.
>

ENTER USERID ==>
  PASSWORD ==>
    GROUP ==>
  NEW PASSWORD ==>

          Press F3 to exit logon

|...+...1...+...2...+...3...+...4...+...5...+...6...+...7...+...8
1234567890123456789012345678901234567890123456789012345678901234567890
```

#### FULL

Passphrase support is enabled with the **PASSWORD** and **NEW PASSWORD** fields each consisting of two lines. The value in the second line is concatenated onto the end of the value in the first line. The length of the first line is 34 bytes and the length of the second line is 66 bytes, allowing the maximum

passphrase value of 100 bytes to be entered. With this setting, the fields are aligned in the center of the screen, as shown in the following figure:

```
>
>          Copyright 1980-2022
>      IBM Corporation. All rights reserved.
>      Use permissible by license only.
>

          ENTER USERID ==>
          PASSWORD ==>

          GROUP ==>
          NEW PASSWORD ==>

          Press F3 to exit logon

|...+...1...+...2...+...3...+...4...+...5...+...6...+...7...+...8
123456789012345678901234567890123456789012345678901234567890
```

### NO or NONE

Passphrase support is not enabled. The lengths of the **PASSWORD** and **NEW PASSWORD** fields are eight bytes each. With this setting, if you have external security defined using a security exit, the fields are aligned in the center of the screen, as shown in the following figure:

```
>
>          Copyright 1980-2020
>      IBM Corporation. All rights reserved.
>      Use permissible by license only.
>

          ENTER USERID ==>
          PASSWORD ==>
          GROUP ==>
          NEW PASSWORD ==>

          Press F3 to exit logon

|...+...1...+...2...+...3...+...4...+...5...+...6...+...7...+...8
123456789012345678901234567890123456789012345678901234567890
```

**Note:** If you do not have external security defined, none of the fields for credentials appear on the logon screen.

Use the following procedure to enable passphrase and MFA support for your OMEGAMON 3270 Classic interface. If you do not want to use passphrase or MFA when logging on to the OMEGAMON 3270 Classic interface, no configuration changes are needed.

### Procedure

To enable passphrase support for your OMEGAMON 3270 Classic interface, perform the following steps for each of your supported OMEGAMON products. Use either of the following methods:

- Using Configuration Manager:
  - a. In RTEDEF(Kpp\$PARM) or RTEDEF(Kpp\$lpar), add the following parameters:
    - Kpp\_CLASSIC\_PASSPHRASE** set to value PARTIAL, MAX62, or FULL
    - Kpp\_CLASSIC\_SECCLASS** set to the OMEGAMON SAF security class
    - Kpp\_CLASSIC\_SAFAPPL** set to the OMEGAMON SAF application ID
  - b. Run the **GENERATE** action.

Recycle the OMEGAMON Classic started task for the configuration changes to take effect. See the product-specific documentation for more information.

**Note:** For more information about changing parameter values after you have completed configuration of the runtime environment using Configuration Manager, see [“Creating or updating a runtime environment” on page 229](#).

- Using PARMGEN:
  - a. In WCONFIG(*#rtename*), add the following parameters:
    - Kpp\_CLASSIC\_PASSPHRASE** set to value PARTIAL, MAX62, or FULL
    - Kpp\_CLASSIC\_SECCLASS** set to the OMEGAMON SAF security class
    - Kpp\_CLASSIC\_SAFAPPL** set to the OMEGAMON SAF application ID
  - b. Submit the \$PARSE job to refresh the profile.

Recycle the OMEGAMON Classic started task for the configuration changes to take effect. See the product-specific documentation for more information.

**Note:** For more information about changing parameter values after you have completed configuration of the runtime environment using PARMGEN, see [Scenario RTE03: Changing parameters in an RTE](#).

## Troubleshooting

Use these topics to troubleshoot issues with Monitoring Configuration Manager.

### Navigating Configuration Manager action output

Use the method described in this procedure to navigate Configuration Manager output when troubleshooting a problem.

#### Before you begin

Configuration Manager writes job output for the **KCIOMEGA** actions to a number of output data sets. Output from invoked utilities is also generated, with each utility writing to its own output data set.

**Note:** **KCIALPHA** is an APF-authorized version of the **KCIOMEGA** program. The information in this topic also applies when using **KCIALPHA**.

For a list of the standard sysout data sets, see [“Action job output” on page 275](#).

#### About this task

When troubleshooting an issue with Configuration Manager jobs, use the steps in the following procedure to navigate the Configuration Manager output.

To view Configuration Manager output, it is recommended that you use SDSF and the ? action character to list the output data sets. Consider sorting by DSID in SDSF to get the proper order.

Since most problems cause the Configuration Manager action to immediately stop, it is likely that the last utility invoked is the cause of the problem.

**Note:** For most problems, you do not need to examine the KCITRACE sysout data set as it is typically only required when there is a logic error in the workflow. KCITRACE is mostly used by IBM Software Support.

#### Procedure

1. View the KCIPRINT sysout data set, and look for the error message that explains why the problem occurred.

2. If the problem was caused by a utility, then scroll down to the end of the data set list and select the last file.  
This is typically the output from the failed utility and should provide more information about the problem.
3. In the event of a system problem (for example, an abend), then view JESMSGLG (the JES message log) and look for abnormal system messages.

## Collecting diagnostic data using PDCOLLECT

Use the Problem Determination Data Collection (PDCOLLECT) action to collect diagnostic information. This section explains how to perform this task using Configuration Manager.

**Important:** The Configuration Manager PDCOLLECT utility action was enhanced with [PTF UJ98129 for APAR OA68463 \(3Q25\)](#). The procedure that you use to run PDCOLLECT and the features that are available depend on whether this maintenance has been applied to your environment.

Use one of the following procedures, as appropriate for your environment.

### Using PDCOLLECT (with OA68463)

Use the Problem Determination Data Collection (PDCOLLECT) action to collect diagnostic information. This topic explains how to perform this task using Configuration Manager with APAR OA68463 applied.

### Before you begin

**Note:** The content in this topic is relevant only for environments with [PTF UJ98129 for APAR OA68463 \(3Q25\)](#) applied. If you do not have this maintenance applied, see [“Using PDCOLLECT \(without OA68463\)” on page 371](#).

To use the **PDCOLLECT** action, you must install SDSF and be licensed to use it.

**Note:** If you do not have SDSF, you can copy the complete address space logs, including the JES output, RKLVLG, RKPLOG, RKPLOG, SYSPRINT, and so on, into a data set. The DCB information for the output data set can be as follows:

```
Organization: PS
Record format: VB
Record length: 240
Block size: 27998
```

### About this task

The **PDCOLLECT** utility action collects the following types of diagnostic data:

- System configuration information
- Runtime environment (RTE) libraries, including configuration files
- Configuration Manager-related information (RTEDEF and EMBEDS data sets)
- Network information, such as output from the **netstat** utility
- Output from the started task jobs, including address space logs
- SDSF Display Active Users (DA) panel statistics
- Self-describing agent (SDA) information:
  - Results of **ls -al** for your `rte/kds/support` and `rte/kds/support/TEMS`

- Contents for `spawn_cmd.sh` and `spawn_cmd.tris`
- Results of `java - version`

The following list provides details about specifying collection criteria for the **PDCOLLECT** action:

- The **PDCOLLECT** action does not require the **RTE\_NAME** and **RTE\_PLIB\_HILEV** parameters and values. Omitting the runtime environment information provided by these parameters limits the types of diagnostic data that the **PDCOLLECT** action can collect. To collect the most information available about your environment, include the **RTE\_NAME** and **RTE\_PLIB\_HILEV** parameters and values.
- You must specify information about your OMEGAMON address space logs. The parameters you use depend on where the logs are located, as follows:
  - If your OMEGAMON address space logs are in the SDSF output queue, use the **KFJ\_PDCOL\_JOB\_NAME** and **KFJ\_PDCOL\_JOB\_ID** parameters and values. To collect data for a single job, specify the job name and job ID in parameters **KFJ\_PDCOL\_JOB\_NAME** and **KFJ\_PDCOL\_JOB\_ID**, respectively.

You can also capture multiple started task logs and SDSF Display Active Users (DA) panel snapshots by using filtering and wildcard characters. To specify multiple started task logs, enable filtering by specifying parameter **KFJ\_PDCOL\_JOB\_FILTER** set to Y. You can then use the asterisk (\*) and percent sign (%) as wildcard characters in the **KFJ\_PDCOL\_JOB\_NAME** and **KFJ\_PDCOL\_JOB\_ID** parameter values to define the filters, as shown in the following example. Only started task logs matching the filters will be collected.

<b>KFJ_PDCOL_JOB_NAME</b>	OMEG*
<b>KFJ_PDCOL_JOB_ID</b>	*
<b>KFJ_PDCOL_JOB_FILTER</b>	Y

**Tip:** When job filtering is enabled (**KFJ\_PDCOL\_JOB\_FILTER** set to Y), parameter **KFJ\_PDCOL\_JOB\_ID** defaults to the asterisk (\*) wildcard. If you accept this default value, you can omit parameter **KFJ\_PDCOL\_JOB\_ID** from your `KCIVARS DD` statement.

- If your OMEGAMON address space logs have been copied to a sequential data set, use the **KFJ\_PDCOL\_JOB\_OUTPUT** parameter and value to specify the data set name.
- You can select the diagnostic data to collect at a detailed level by using the **KFJ\_PDCOL\_COLLECT\_data** collection flags. By collecting only the types of data that you need, you can reduce both the time and storage used by the **PDCOLLECT** action job. For more information, see [“PDCOLLECT collection flags” on page 369](#).
- The **PDCOLLECT** action creates a configuration data set named `kfj_pdcoll_hlq.PDCLEF` that contains the diagnostic data collection settings. Within this data set is member \$USER, which you can use to customize and save your collection settings. For more information, see [“PDCLDEF\(\\$USER\)” on page 370](#).

**Note:** The **PDCOLLECT** action also creates members **DEFAULTS** and **KCIVARS**. These members are for internal use by the utility and for reference only. Do not update these members.

- You can fetch several SDSF DA snapshots for specified started tasks. The default is 10 samples every 10 seconds, and you can customize these settings using parameters **KFJ\_PDCOL\_DA\_SAMPLES** and **KFJ\_PDCOL\_DA\_INTERVAL**.
- When specifying how to store the collected diagnostic data, you can configure your job to produce output in one (or more, if needed) of the following formats:

#### **TERSE**

You can store the collected diagnostic data in a terse (.TRS) file by setting parameter **KFJ\_PDCOLLECT\_COMPATIBILITY** to Y. With this option, the **PDCOLLECT** action uses the IEBCOPY UNLOAD function to package the diagnostic data.

The file `kfj_pdcoll_hlq.PDCOLPDS.TRS` is generated.

**Note:** The TERSE format option is not available in environments where alternate utilities replace IEBCOPY. If IEBCOPY is not available, set parameter **KFJ\_PDCOLLECT\_COMPATIBILITY** to N.

## PAX

You can store the collected diagnostic data in a PAX (.pax) file on a z/OS® UNIX® System Services file system by setting parameter **KFJ\_PDCOLLECT\_PAX** to Y and specifying the path in parameter **KFJ\_PDCOLLECT\_PAX\_DIR**.

The file `kcipdcol.pax` is generated.

**Note:** When producing output in the PAX (.pax) file format, the **PDCOLLECT** action writes the Tivoli Enterprise Monitoring Server started task QA1 files (if collected) to the z/OS® UNIX® file system in hexadecimal print format. Additionally, the hex print data is converted to ASCII format and placed in the `/converted` subdirectory.

## ADRSSU

You can store the collected diagnostic data in a z/OS DFSMSdss dump data set by setting parameter **KFJ\_PDCOLLECT\_ADRSSU** to Y. This option requires the use of the KCIALPHA program. KCIALPHA is an APF-authorized version of KCIOMEGA.

The file `kfj_pdcoll_hlq.ADR.ARCHIVE` is generated.

**Note:** With this option, the **PDCOLLECT** action uses the z/OS DFSMSdss **DUMP** command. You might need authority to run **ADRSSU**, which is the program that is invoked when using DFSMSdss.

- If you need to redirect your results to a different high-level qualifier, specify the **KFJ\_PDCOL\_HLQ** parameter in the `KCIVARS DD` statement.

The **PDCOLLECT** action writes status messages for the job to the `KCIPRINT SYSOUT` data set.

To collect diagnostic information using the **PDCOLLECT** action, use the following procedure.

## Procedure

1. Modify the KFJMAINT sample job in TKANSAM (see example below) to use the **PDCOLLECT** action.
2. (Optional) Specify the **RTE\_NAME** and **RTE\_PLIB\_HILEV** parameters that point to the RTEDEF data set.
3. Specify information about your OMEGAMON address space logs, as follows:
  - If the OMEGAMON address space logs are in the SDSF output queue, specify the **KFJ\_PDCOL\_JOB\_NAME** and **KFJ\_PDCOL\_JOB\_ID** parameters.  
To collect data for a single job, specify the job name and job ID in parameters **KFJ\_PDCOL\_JOB\_NAME** and **KFJ\_PDCOL\_JOB\_ID**, respectively.  
To specify multiple started task logs, specify parameter **KFJ\_PDCOL\_JOB\_FILTER** set to Y, and define the job filters by using the asterisk (\*) and percent sign (%) as wildcard characters in the **KFJ\_PDCOL\_JOB\_NAME** and **KFJ\_PDCOL\_JOB\_ID** parameter values.
  - If your OMEGAMON address space logs have been copied to a sequential data set, specify the **KFJ\_PDCOL\_JOB\_OUTPUT** parameter, and specify the data set name.
4. (Optional) To override the default values of any of the diagnostic data collection settings (such as, collection flags, output package format, or SDSF DA settings), specify each override parameter and value in the `KCIVARS DD` statement. For more information about the available collection settings, see [“PDCOLLECT collection flags” on page 369](#) and [“PDCLDEF\(\\$USER\)” on page 370](#).
5. Specify the high-level qualifier for the **PDCOLLECT** action data sets in parameter **KFJ\_PDCOL\_HLQ**.
6. Submit the updated JCL.

## Result

The archive of collected diagnostic data is generated. You can FTP the output data set to IBM Software Support.

## Example

The following example collects diagnostic data for the OMEGAMON started task OMEGDS that has the job ID S654321. This job uses the default collection settings that are defined in the PDCLDEF (\$USER) member with the exception of the override setting to omit collection of network information. Because the runtime environment information is provided, the **PDCOLLECT** action can collect all available information.

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256

RTE_PLIB_HILEV                        TSOUID.MONSUITE

KFJ_PDCOL_JOB_NAME                    OMEGDS
KFJ_PDCOL_JOB_ID                      S654321

KFJ_PDCOL_COLLECT_NETSTAT             N
```

## PDCOLLECT collection flags

When using the **PDCOLLECT** action to gather diagnostic data, you can choose what content to collect at a detailed level.

**Note:** The content in this topic is relevant only for environments with [PTF UJ98129 for APAR OA68463 \(3Q25\)](#) applied. If you do not have this maintenance applied, see [“Using PDCOLLECT \(without OA68463\)” on page 371](#).

The collection flags are defined by parameters with the naming pattern **KFJ\_PDCOL\_COLLECT\_\***. Each of these parameters accepts Y and N as values.

The following table lists the collection flags that are available and describes the content that each setting collects.

Parameter	Description
KFJ_PDCOL_COLLECT_STC	Collects the started task log
KFJ_PDCOL_COLLECT_NETSTAT	Collects network information using the <b>netstat</b> utility
KFJ_PDCOL_COLLECT_DASTATS	Collects SDSF Display Active Users (DA) statistics
KFJ_PDCOL_COLLECT_RK	Collects libraries RKANSAMU, RKANPARU, RKANCMDU, RKANDATV, RKCPDEFW, RKD2PAR, RKD2SAM
KFJ_PDCOL_COLLECT_TRG	Collects libraries <i>x</i> KANCMD, <i>x</i> KANSAM, <i>x</i> KANPAR, where <i>x</i> is T or R (shared or full RTE)
KFJ_PDCOL_COLLECT_LISTCAT	Collects <b>LISTCAT</b> command output, which lists all the data sets under the runtime environment qualifiers
KFJ_PDCOL_COLLECT_RTEDEF	Collects the runtime environment definition (RTEDEF) library
KFJ_PDCOL_COLLECT_EMBEDS	Collects the EMBEDS data set
KFJ_PDCOL_COLLECT_USERJCL	Collects the data set specified in the GBL_USER_JCL parameter
KFJ_PDCOL_COLLECT_WCONFIG	Collects the WCONFIG data set
KFJ_PDCOL_COLLECT_SNMP	Collects member RKANSAMU (KN3SNMP) or the data set specified in parameter KN3_SNMP_CONFIG_FILE

Parameter	Description
KFJ_PDCOL_COLLECT_STDENV	Collects the data sets mapped to the SDTENV DD statement
KFJ_PDCOL_COLLECT_SDADIR	Collects various information about the self-describing agent (SDA) directory, permission bits, contents, spawn_cmd . sh contents
KFJ_PDCOL_COLLECT_QA1	Collects QA1 files from the Tivoli Enterprise Monitoring Server started task  <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> <p><b>Note:</b> When producing output in the PAX (. pax) file format, the <b>PDCOLLECT</b> action writes the QA1 files to the z/OS® UNIX® System Services file system in hexadecimal print format. Additionally, the hex print data is converted to ASCII format and placed in the /converted subdirectory.</p> </div>
KFJ_PDCOL_COLLECT_OPSLOG	Collects data sets mapped to the RKMSLG DD statement
KFJ_PDCOL_COLLECT_MANIFEST	Collects component level information

## Example

The following example show the collection flags with default settings:

```
* Data collection flags
KFJ_PDCOL_COLLECT_STC      Y
KFJ_PDCOL_COLLECT_NETSTAT Y
KFJ_PDCOL_COLLECT_DASTATS Y
KFJ_PDCOL_COLLECT_RK      Y
KFJ_PDCOL_COLLECT_TRG     Y
KFJ_PDCOL_COLLECT_LISTCAT Y
KFJ_PDCOL_COLLECT_RTEDEF  Y
KFJ_PDCOL_COLLECT_EMBEDS  Y
KFJ_PDCOL_COLLECT_USERJCL Y
KFJ_PDCOL_COLLECT_WCONFIG Y
KFJ_PDCOL_COLLECT_SNMP    Y
KFJ_PDCOL_COLLECT_STDENV  Y
KFJ_PDCOL_COLLECT_SDADIR  Y
KFJ_PDCOL_COLLECT_QA1     Y
KFJ_PDCOL_COLLECT_OPSLOG  N
KFJ_PDCOL_COLLECT_MANIFEST Y
```

## PDCLDEF(\$USER)

You can customize and save your diagnostic data collection settings for use with the **PDCOLLECT** action.

**Note:** The content in this topic is relevant only for environments with PTF UJ98129 for APAR OA68463 (3Q25) applied. If you do not have this maintenance applied, see [“Using PDCOLLECT \(without OA68463\)” on page 371](#).

The **PDCOLLECT** action creates a configuration data set named *kfj\_pdcoll\_hlq*.PDCLDEF that contains diagnostic data collection settings.

Within this data set is member \$USER, which you can use to customize and save your settings.

The first time you run the **PDCOLLECT** action, Configuration Manager creates the data set named *kfj\_pdcoll\_hlq*.PDCLDEF, including member \$USER.

Initially, the \$USER member contains the **PDCOLLECT** action parameters set to program defaults. If you have customized any of the same parameters in the KCIVARS DD statement in your JCL the first time you run the **PDCOLLECT** action, these settings override the default values and are stored in the \$USER member.

After the \$USER member has been created and populated during the first run of the utility, the **PDCOLLECT** action no longer updates the \$USER member. To modify the settings in the \$USER member, you must edit the member directly.

Parameters specified in the KCIVARS DD statement in the JCL override the settings in member \$USER. Any settings that are in the \$USER member do not need to be specified in the KCIVARS DD statement.

## Example

The following example shows the KCIPDCOL.PDCLDEF(\$USER) member with default settings:

```
***** Top of Data *****
* Data collection flags

KFJ_PDCOL_COLLECT_STC      Y
KFJ_PDCOL_COLLECT_NETSTAT Y
KFJ_PDCOL_COLLECT_DASTATS Y
KFJ_PDCOL_COLLECT_RK      Y
KFJ_PDCOL_COLLECT_TRG     Y
KFJ_PDCOL_COLLECT_LISTCAT Y
KFJ_PDCOL_COLLECT_RTEDEF  Y
KFJ_PDCOL_COLLECT_EMBEDS  Y
KFJ_PDCOL_COLLECT_USERJCL Y
KFJ_PDCOL_COLLECT_WCONFIG Y
KFJ_PDCOL_COLLECT_SNMP    Y
KFJ_PDCOL_COLLECT_STDENV  Y
KFJ_PDCOL_COLLECT_SDADIR  Y
KFJ_PDCOL_COLLECT_QA1     Y
KFJ_PDCOL_COLLECT_OPSLOG  N
KFJ_PDCOL_COLLECT_MANIFEST Y

KFJ_PDCOLLECT_ADRDSSU     N
KFJ_PDCOLLECT_PAX        N
KFJ_PDCOLLECT_COMPATIBILITY Y

KFJ_PDCOLLECT_PAX_DIR    $HOME

KFJ_PDCOL_DA_SAMPLES     10
KFJ_PDCOL_DA_INTERVAL    10

***** Bottom of Data *****
```

**Note:** The following parameters can only be specified in the KCIVARS DD and are not supported in the \$USER member:

- RTE\_PLIB\_HILEV
- RTE\_NAME
- KFJ\_PDCOL\_HLQ
- KFJ\_PDCOL\_JOB\_\*
- KFJ\_PDCOL\_ADR\_ARCHIVE<sup>1</sup>
- KFJ\_PDCOL\_RESTORE\_HLQ<sup>1</sup>
- KFJ\_PDCOLLECT\_RESTORE<sup>1</sup>

<sup>1</sup>These parameters are for use by IBM Software Support only.

## Using PDCOLLECT (without OA68463)

Use the Problem Determination Data Collection (PDCOLLECT) action to collect diagnostic information. This topic explains how to perform this task using Configuration Manager without APAR OA68463 applied.

## Before you begin

**Note:** The content in this topic is relevant only for environments without [PTF UJ98129](#) for APAR [OA68463 \(3Q25\)](#) applied. If you have this maintenance applied, see [“Using PDCOLLECT \(with OA68463\)”](#) on page 366.

To use the PDCOLLECT utility, you must install SDSF and be licensed to use it. If you do not have SDSF, you can copy the complete address space logs, including the JES output, RKLVLG, RKPLOG, RKPLOG, RKPLOG, SYSPRINT, and so on, into a data set. The DCB information for the output data set can be:

Organization: PS  
Record format: VB  
Record length: 240  
Block size: 27998

## About this task

The Configuration Manager PDCOLLECT utility action collects data that includes the following:

- System configuration
- Network information
- Self-describing agent (SDA) information
- Configuration Manager-related information (RTEDEF and EMBEDS data sets)
- Run Time Environment (RTE) data sets
- Output from the specified job

**Note:** This feature is available with APAR OA62230 (PTF UJ06864).

## Procedure

1. Locate the sample JCL job in the SMP/E target library *thilev*.TKANSAM(KFJMAINT).
2. Specify the following parameters in the KCIVARS DD statement:
  - a. Use **ACTION PDCOLLECT**.
  - b. Specify the **RTE\_PLIB\_HILEV** and **RTE\_NAME** parameters that will point to the required RTEDEF data set.
  - c. If the OMEGAMON address space logs are in the SDSF output queue, specify the **KFJ\_PDCOL\_JOB\_NAME** and **KFJ\_PDCOL\_JOB\_ID** parameters.
  - d. If your OMEGAMON address space logs were copied to a sequential data set, replace the **KFJ\_PDCOL\_JOB\_NAME** and **KFJ\_PDCOL\_JOB\_ID** parameters with the **KFJ\_PDCOL\_JOB\_OUTPUT** parameter, and specify the data set name.
3. Submit the updated JCL.

## Result

The file &SYSUID.KCIPDCOL.PDCOLPDS.TRS is generated. You can FTP the output data set to the IBM Support Center.

If you have to redirect your results to a different high-level qualifier, specify the **KFJ\_PDCOL\_HLQ** parameter in KCIVARS DD statement.

## Example

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=<lpar>
//S1 EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=<tlib_hlq>.TKANMOD
//KCIFFLOW DD DISP=SHR,DSN=<tlib_hlq>.TKANCUS(KFJMAINT)
//KCIVARS DD *
ACTION                PDCOLLECT
RTE_NAME              RTEZOS1
RTE_PLIB_HILEV       TSUID.MONSUITE

* For PDCOLLECT: following parameters are required

KFJ_PDCOL_JOB_NAME    OMEGDS
KFJ_PDCOL_JOB_ID      S654321
```

# Messages

Use the information in these messages to help you diagnose and solve problems running Monitoring Configuration Manager jobs.

## Message format

Monitoring Configuration Manager message identifiers have the following format:

`KF $\alpha$ nnnnns`

where:

### **KF $\alpha$**

Origin of the message:

#### **KFJ**

A Monitoring Configuration Manager workflow.

#### **KFU**

The underlying KCIOMEGA program or its APF-authorized version, KCIALPHA. KCIOMEGA is the job template engine that runs Monitoring Configuration Manager workflows.

### **nnnnn**

5-digit message identification number.

### **s**

Severity of the message:

#### **I**

Informational.

#### **W**

Warning to alert you to a possible error condition.

#### **E**

Error. Workflow processing typically stops.

The documentation for each message includes the following information:

### **Explanation**

Describes what the message text means, why the message occurred, and what its variables represent.

### **System action**

Describes what the system will do in response to the event that triggered this message.

### **User response**

Describes whether a response is necessary, what the appropriate response is, and how the response will affect the system or program.

## KFJ messages

Messages with the prefix KFJ are from Monitoring Configuration Manager workflows.

Many messages from Monitoring Configuration Manager workflows are self-explanatory and do not begin with an identifier. Only the messages that require further explanation have an identifier.

### **KFJ00001E: Kpp version *version* is not supported by this configuration tool**

#### **Explanation**

IBM Z® Monitoring Configuration Manager checks the installed versions of products to be configured in the runtime environment.

#### **System action**

No action is performed. The job ends.

### User response

In the JCL that runs Monitoring Configuration Manager, specify a KCIFLOW DD statement that refers to an installation containing product versions supported by Monitoring Configuration Manager.  
If you have only earlier product versions that are not supported by Monitoring Configuration Manager, then consider upgrading.

## **KFJ00002I: Kpp version *version* is not supported by this configuration tool**

### Explanation

IBM Z® Monitoring Configuration Manager checks the installed versions of products in an SMP/E installation target library. The Kpp product version cannot be configured using Monitoring Configuration Manager.

### System action

The system proceeds with job execution.

### User response

In the JCL that runs Monitoring Configuration Manager, specify a KCIFLOW DD statement that refers to an installation containing product versions supported by Monitoring Configuration Manager.

If you have only earlier product versions that are not supported by Monitoring Configuration Manager, then consider upgrading.

## **KFJ00003E: CONFIGURE\_ *agent* is set to Y but K\_pp\_ is not installed.**

### Explanation

The GENERATE action found the CONFIGURE\_ *agent* parameter set to "Y" in RTEDEF, but this version of the K\_pp agent is not installed.

### System action

The GENERATE action stops before generating runtime members.

### User response

In the JCL that runs Monitoring Configuration Manager, verify that the correct installation data set is specified. Set CONFIGURE\_ *agent* to "N" in RTEDEF.

## **KFJ00004E: CONFIGURE\_ *agent* is set to Y but K\_pp\_ installed version is unknown.**

### Explanation

The GENERATE action found the CONFIGURE\_ *agent* parameter set to "Y" in RTEDEF, but could not determine the K\_pp version of the agent.

### System action

The GENERATE action stops before generating runtime members.

### User response

In the JCL that runs Monitoring Configuration Manager, verify that the correct installation data set is specified. Set CONFIGURE\_ *agent* to "N" in RTEDEF.

## **KFJ00005E: RTE NAMES do not match.**

### Explanation

The MIGRATE action has not found the specified RTE in the source WCONFIG data set.

### System action

The MIGRATE action stops.

### User response

Verify that the RTE\_NAME and KFJ\_MIGRATE\_WCONFIG values are correct.

**KFJ00006E: *rte\_name* has not been found in *kfj\_migrate\_wconfig***

**Explanation**

The specified RTE member, *rte\_name*, has not been found in the migrate source WCONFIG data set listed in the message.

**System action**

The MIGRATE action stops.

**User response**

Verify that the RTE\_NAME and KFJ\_MIGRATE\_WCONFIG values are correct.

**KFJ00007E: RTEDEF dataset *rtedef* already exists.**

**Explanation**

Specified target RTEDEF data set, listed as *rtedef* in the message, already exists so it cannot be created again.

**System action**

The MIGRATE action stops.

**User response**

Use a different RTE\_PLIB\_HILEV or specify CONFIRM=Y in the job to overwrite the existing RTEDEF data set.

**KFJ00008W: Agent *Kpp* is not installed in the target SMP/E**

**Explanation**

The MIGRATE action has detected that the agent *Kpp* is set to CONFIGURE\_*agent\_Kpp*=Y in the source WCONFIG, but it is not installed in the target SMP/E environment.

**System action**

The MIGRATE action sets CONFIGURE\_*agent\_Kpp*=N and continues.

**User response**

Verify that the correct SMP/E environment has been set in the job running the MIGRATE action.

**KFJ00200E: Parameter required but not specified: *parameter***

**Explanation**

Before generating runtime members, the GENERATE action checks whether this required parameter has been specified.

**System action**

The GENERATE action stops before generating runtime members.

**User response**

Specify the required parameter in the appropriate RTEDEF member, and then resubmit the job.

**KFJ00201E: GBL\_USS\_TKANJAR\_PATH directory *path* does not exist**

**Explanation**

The GBL\_USS\_TKANJAR\_PATH parameter specifies the path of the target z/OS® UNIX® System Services directory that is defined in the SMP/E installation jobs by ddname TKANJAR. Before generating runtime members, the GENERATE action checks whether this directory exists.

**System action**

The GENERATE action stops before generating runtime members.

## User response

Specify the correct path in the appropriate [RTEDEF member](#), and then resubmit the job. If you do not know the path, contact the person who installed the products.

The default path for the TKANJAR ddname is /usr/lpp/kan/bin/IBM.

## KFJ00202E: RTE\_USS\_RTEDIR must not be a subdirectory of GBL\_USS\_TKANJAR\_PATH

### Explanation

The **RTE\_USS\_RTEDIR** and **GBL\_USS\_TKANJAR\_PATH** parameters each specify the path of a z/OS® UNIX® System Services directory. **GBL\_USS\_TKANJAR\_PATH** is an SMP/E target directory, or a copy. **RTE\_USS\_RTEDIR** specifies where to generate runtime members; some runtime environment started tasks also write to files under this directory.

**RTE\_USS\_RTEDIR** must not be a subdirectory of **GBL\_USS\_TKANJAR\_PATH** because SMP/E target directories and their descendants should be read-only for most users. However, some OMEGAMON® products write to files under the **RTE\_USS\_RTEDIR** directory.

Before generating runtime members, the **GENERATE** action checks whether **RTE\_USS\_RTEDIR** is a subdirectory of **GBL\_USS\_TKANJAR\_PATH**.

### System action

The **GENERATE** action stops before generating runtime members.

### User response

Change the value of **RTE\_USS\_RTEDIR**, and then resubmit the job.

## KFJ00203E: User requires write access to the zos\_unix\_path\_parameter directory path

### Explanation

The user who runs the job that performs the **GENERATE** action must be able to write to the z/OS® UNIX® System Services directory specified in the parameter, where *zos\_unix\_path\_parameter* is **RTE\_USS\_RTEDIR** or **TRG\_COPY\_TKANJAR\_PATH**, and *path* is the directory path.

The **RTE\_USS\_RTEDIR** parameter specifies the path of the z/OS® UNIX® directory where the **GENERATE** action writes runtime members.

The **TRG\_COPY\_TKANJAR\_PATH** parameter specifies the path of the z/OS® UNIX® directory where the **GENERATE** action with option **TRGCOPY** copies SMP/E installation files.

### System action

The **GENERATE** action stops before generating runtime members.

### User response

Follow your local site practices to grant the user write access to the directory.

For example, set the directory permissions to 775. The following z/OS® UNIX® shell command sequence (requires superuser for **chmod**) recursively sets the permissions of /var/rtehome and its descendants:

```
echo chmod -R 775 /var/rtehome | su
```

## KFJ00204E: An error occurred creating RTE\_USS\_RTEDIR directory path

### Explanation

The **RTE\_USS\_RTEDIR** parameter specifies the path of the z/OS® UNIX® System Services directory where the **GENERATE** action writes runtime members. If this directory does not exist, then the user who runs the job that performs the **GENERATE** action must be able to create this z/OS® UNIX® directory.

### System action

The **GENERATE** action stops before generating runtime members.

## User response

Follow your local site practices to grant the user write access to create the directory.

## KFJ00205E: [GBL\_USS\_TKANJAR\_PATH | KFJ\_LOCAL\_USS\_TKANJAR\_PATH] directory path is empty

### Explanation

The z/OS® UNIX® System Services directory specified in the **GBL\_USS\_TKANJAR\_PATH** or **KFJ\_LOCAL\_USS\_TKANJAR\_PATH** parameter must contain installation files.

### System action

The **GENERATE** action stops before generating runtime members.

### User response

Verify if the **GBL\_USS\_TKANJAR\_PATH** or **KFJ\_LOCAL\_USS\_TKANJAR\_PATH** parameter is specified correctly.

## KFJ00205W: The length of SYSNAME exceeds 4.

### Explanation

Before generating members in the RTEDEF library, the DISCOVERY, GENERATE, and MIGRATE actions verify if the SYSNAME parameter exceeds 4 characters in length.

### System action

The system action depends on whether KFJ\_SYSNAME is specified.

- If KFJ\_SYSNAME is not specified in the KCIVARS DD statement in the JCL, the system will use the SYSSMFID parameter instead of SYSNAME.
- If KFJ\_SYSNAME is specified and it does not exceed 4 characters in length, the system will use the KFJ\_SYSNAME value instead of SYSNAME.

### User response

If you want to change the SYSNAME system parameter, specify the KFJ\_SYSNAME parameter in the KCIVARS DD statement in the JCL **before** submitting DISCOVERY and GENERATE actions. See the example below.

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1 EXEC PGM=KCIALPHA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUITE.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=MONSUITE.TKANCUS(KFJOMEGA)
//KCIVARS DD *
ACTION          DISCOVER
RTE_NAME        RTE1
RTE_PLIB_HILEV  TSOUID.MONSUITE
KFJ_SYSNAME     MVS1
/*
```

## KFJ00206E: RTE\_X\_SECURITY\_EXIT\_LIB data set name is not allocated

### Explanation

The data set specified in parameter **RTE\_X\_SECURITY\_EXIT\_LIB** is not allocated. Typically, this data set is allocated during the **CREATE** or **MIGRATE** action.

### System action

The **GENERATE** action stops before generating runtime members.

### User response

Verify that the **RTE\_X\_SECURITY\_EXIT\_LIB** parameter is correctly specified in the RTEDEF (*rte\_name*) member. Ensure that the **RTE\_X\_SECURITY\_EXIT\_LIB** data set is allocated and contains the required security exits.

## **KFJ00207E: Full discovery not attempted - APF authorization required**

### **Explanation**

The KCIALPHA load library has been used for the DISCOVER action, but it is not APF authorized.

### **System action**

KCIALPHA performed a partial discovery.

### **User response**

Partial discovery was still performed and relevant members might have been created in RTEDEF. These members will not be overwritten by a full discovery process. If full discovery is required, APF authorize the KCIALPHA load library and rerun the job.

## **KFJ00208E: User requires read access to the *name* directory**

### **Explanation**

The user who runs the job that performs the **PACKAGE** action must be able to read this z/OS® UNIX® System Services directory.

### **System action**

The **PACKAGE** action stops before generating DUMP data sets.

### **User response**

Follow your local site practices to grant the user READ access to the directory. WRITE access is also recommended as it will be used during the GENERATE action too.

## **KFJ00209E: Directory does not exist: *name***

### **Explanation**

z/OS® UNIX® System Services directory does not exist. Specified directory should be created during GENERATE action.

### **System action**

The **PACKAGE** action stops before generating DUMP data sets.

### **User response**

Review GENERATE JCL Job output log for any z/OS® UNIX® errors.

## **KFJ00210E: Unable to create PAX archive *name***

### **Explanation**

Unexpected error while trying to create PAX archive on configuration system.

### **System action**

The **PACKAGE** action stops before generating DUMP data sets.

### **User response**

Verify job output for more details. Consider multiple issues: permissions, space shortage.

## **KFJ00211I: Configuration Manager is allocating data sets using local settings for high-level qualifiers and z/OS UNIX System Services paths**

### **Explanation**

During runtime environment generation, the KFJ\_LOCAL\_\* local parameters will be used to allocate runtime environment data sets instead of RTE\_\* or GBL\_\* parameters.

### System action

The **GENERATE** action performs runtime environment generation using local parameters.

### User response

Review the mapping table and make sure that all of the KFJ\_LOCAL\_\* parameters are specified correctly.

## KFJ00212E: No DUMP data sets found to deploy

### Explanation

The **DEPLOY** action did not find any DUMP data sets to restore.

### System action

The **DEPLOY** action stops with a return code of 8.

### User response

Check that expected DUMP data sets are available on the system. Verify KFJ\_PACK\_\* parameters, if they are used.

## KFJ00213E: Customizing parameter *parameter\_name* is not supported by the GENERATE action when using option parameter KFJ\_LOCAL\_PLIB\_HILEV. Use the product provided default.

### Explanation

The **KFJ\_LOCAL\_PLIB\_HILEV** parameter was specified in the JCL (KCIVARS DD statement). The **GENERATE** action does not allow certain parameter customization for runtime environment generation for remote systems. In the following example, one of the parameters, **GBL\_USER\_JCL**, was found in the RTEDEF members, which caused the program to stop with a return code of 8:

```
KFU00002I INVOKE processing is about to commence; MEMBER=KFJOMEGA DDNAME=KCIFLOW
DSN=TEST1.SYSPLEX.SMPE.TKANCUS Maintenance level: OA61601
01. Using parameters in TEST1.CM.R683L.RTEDEF(PGVK)
02. Using parameters in TEST1.CM.R683L.RTEDEF(KDS$PARM)
03. Using parameters in TEST1.CM.R683L.RTEDEF(GBL$PARM)
04. Using parameters in TEST1.CM.R683L.RTEDEF(PCK$PARM)
KFJ00213E Customizing parameter GBL_USER_JCL is not supported by the GENERATE action when
using option parameter KFJ_LOCAL_PLIB_HILEV. Use the product provided default.
KFU00086E REXX routine has failed; EXEC=VALVARS RC=8

KFU00004I KCIOMEGA is ending; RC=8 SYSPLEX=RSPLX0K LPAR=1234 DATE=2021-08-25 08:23:21
Thursday
```

### System action

The **GENERATE** action stops with return code 8.

### User response

Review parameter *parameter\_name* to ensure that it is not used by the **GENERATE** action. To achieve this, you can comment out this parameter from the RTEDEF members and restart the **GENERATE** action.

If parameter *parameter\_name* is related to KD2 operational data set allocation, you can resolve this error by using parameter **KFJ\_LOCAL\_KD5\_RUN\_ALLOC** set to value **DEPLOY** or **NONE**.

## KFJ00214E: Unable to extract PAX archive

### Explanation

An unexpected error occurred while trying to extract the PAX archive on a remote (target) system.

### System action

The **DEPLOY** action stops with a return code of 8.

**User response**

Review the job output for more details. Consider multiple issues: permissions, space shortage, corrupted data set.

**KFJ00215W: RTE\_X\_HILEV\_SHARING not supported. Parameter ignored.****Explanation**

Monitoring Configuration Manager does not support the **RTE\_X\_HILEV\_SHARING** parameter. The parameter value does not migrate from the existing PARMGEN configuration to the Configuration Manager RTEDEF data set.

**System action**

The **RTE\_X\_HILEV\_SHARING** parameter value is ignored and not used. Processing continues.

**User response**

No action is required.

**KFJ00216E: OPTION *option* not supported****Explanation**

The **OPTION** parameter value specified in KCIVARS is not supported.

**System action**

The action stops with a return code of 8.

**User response**

Review the **OPTION** parameter value specified. Make sure that the option value is spelled correctly and that is available for the specific action.

**KFJ00217E: OPTION *option\_1* not compatible with option *option\_2*****Explanation**

Certain options are not compatible due to conflicting outcomes.

**System action**

The action stops with a return code of 8.

**User response**

Remove one or more of the conflicting options and rerun the job.

**KFJ00218E: \*\$PARM and/or \*\$GLOB members already exist****Explanation**

The **MIGRATE** action checked the existing *rte\_plib\_hilev*. RTEDEF and found sysplex level members in the library.

**System action**

The **MIGRATE** action stops with a return code of 8.

**User response**

Delete or rename the members listed in KCIPRINT and rerun the **MIGRATE** action.

### **KFJ00219E: \*\$lpar members already exist**

#### **Explanation**

The **MIGRATE** action checked the existing *rte\_plib\_hilev*.RTEDEF and found LPAR-specific members in the library.

#### **System action**

The **MIGRATE** action stops with a return code of 8.

#### **User response**

Delete or rename the members listed in KCIPRINT and rerun the **MIGRATE** action.

### **KFJ00220E: RTE\_NAME member already exists**

#### **Explanation**

The **MIGRATE** action checked the existing *rte\_plib\_hilev*.RTEDEF and found the RTE\_NAME member in the library.

#### **System action**

The **MIGRATE** action stops with a return code of 8.

#### **User response**

Delete or rename the RTE\_NAME member listed and rerun the **MIGRATE** action.

### **KFJ00221I: DEBUG does not impact the deletion of DDs in JES3**

#### **Explanation**

JES3 does not support the deletion of DD outputs from the spool, so the function of **OPTION DEBUG** will not have impact on this function.

#### **System action**

No impact. Processing continues.

#### **User response**

No action is required.

### **KFJ00222I: Package *data\_set\_name* not found**

#### **Explanation**

The **DEPLOY** action expects certain data sets to be available during the restore process. The availability of the data sets depends on the results of the **PACKAGE** action.

#### **System action**

No impact. Processing continues.

#### **User response**

Review the results from the **PACKAGE** action. Ensure that all data sets created by the **PACKAGE** action are processed during the **DEPLOY** action.

### **KFJ00223I: Global RTE PDS V1 setting is ON | OFF**

#### **Explanation**

This message denotes the global persistent data store version 1 status for the runtime environment. This status is the final status that is set by the configuration process and is also written to the KPQHINIT member in RKANPARU. This status applies to all agents and does not reflect the initial status of, for example,

**RTE\_PDS2\_ACTIVATION**, or individual **Kpp\_PDS2\_ACTIVATION** flags. This value is derived from the combined parameter flags that are used in the runtime environment.

This message is always followed by message [KFJ00224I](#). If PDS V1 is ON, details about why PDS V1 is ON appear after message KFJ00224I. This information includes a list of agents for which PDS V2 is not activated and also indicates if PDS V2 is not activated due to an unsupported agent version. For more information about supported product versions, see [PDS V2 support](#).

For more information, see [How to: Activate PDS V2](#).

#### **System action**

No impact. Processing continues.

#### **User response**

No action is required.

### **KFJ00224I: Global RTE PDS V2 setting is ON | OFF**

#### **Explanation**

This message denotes the global persistent data store version 2 status for the runtime environment. This status is the final status that is set by the configuration process, which is also written to the KPQHINIT member in RKANPARU. This status applies to all agents and does not reflect the initial status of, for example, **RTE\_PDS2\_ACTIVATION**, or individual **Kpp\_PDS2\_ACTIVATION** flags. This value is derived from the combined parameter flags that are used in the runtime environment.

For more information, see [How to: Activate PDS V2](#).

#### **System action**

No impact. Processing continues.

#### **User response**

No action is required.

### **KFJ00225E: EMBEDS data set invalid or not allocated - *rte\_x\_override\_embeds\_lib***

#### **Explanation**

If parameter **RTE\_X\_OVERRIDE\_EMBEDS\_LIB** is found in the RTE\_NAME member of RTEDEF, it must be set to a valid value that corresponds to an existing embeds library. If the parameter value is empty or mistyped, this error is issued. The message provides the specified parameter value in *rte\_x\_override\_embeds\_lib*; an empty string indicates that the parameter value was empty.

#### **System action**

Processing stops.

#### **User response**

Either correct the value specified in parameter **RTE\_X\_OVERRIDE\_EMBEDS\_LIB**, or, if no embed overrides are required, remove the parameter from the RTE\_NAME member.

### **KFJ00226W: Non-secure TEMS communication protocol is used**

#### **Explanation**

Runtime environment parameter **RTE\_TEMS\_TRANSPORT\_MODE** is set to HTTP. The runtime environment is using the non-secure HTTP communication protocol for all agents.

#### **System action**

Processing continues.

#### **User response**

Consider changing the communication protocol to HTTPS. For more information, see [Update runtime environment to use HTTPS](#).

## KFJ00227E: *hilev\_parameter* parameter value must match a data set name used in JCL KCIFLOW DD statement

### Explanation

The high-level qualifier value for the SMP/E target libraries that was specified in parameter *hilev\_parameter* was not found in the KCIFLOW DD statement in the JCL, where *hilev\_parameter* is **GBL\_TARGET\_HILEV** or **KFJ\_LOCAL\_TARGET\_HILEV**. The KCIFLOW DD statement and the RTEDEF members must point to the same SMP/E target libraries.

For the **GBL\_TARGET\_HILEV** parameter, the parameter and value are specified in the GBL\$PARM or GBL\$lpar member.

For the **KFJ\_LOCAL\_TARGET\_HILEV** parameter, the parameter and value are specified in the PCK\$PARM or PCK\$lpar member.

For example, in the GBL\$PARM or GBL\$lpar member, the high-level qualifier for the SMP/E target libraries is defined as follows:

```
GBL_TARGET_HILEV      "MONSUITE"
```

In the JCL, this same high-level qualifier value must be specified in the KCIFLOW DD statement, as shown:

```
//UID#ZMCM JOB ,CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
/*JOBPARM SYSAFF=ZOS1
//S1      EXEC PGM=KCIOMEGA,REGION=0M,DYNAMNBR=256
//STEPLIB DD DISP=SHR,DSN=MONSUITE.TKANMOD
//KCIFLOW DD DISP=SHR,DSN=MONSUITE.TKANCUS(KFJOMEGA)
//KCIIVARS DD *
ACTION    GENERATE
RTE_NAME  RTE1
RTE_PLIB_HILEV TSOUID.MONSUITE
```

### System action

Processing stops.

### User response

Ensure that the KCIFLOW DD statement in the JCL points to the same SMP/E target libraries that are used inside the RTEDEF members.

- For a standard **GENERATE** action, verify the **GBL\_TARGET\_HILEV** parameter value.
- If **KFJ\_LOCAL\_PLIB\_HILEV** is specified in the KCIIVARS DD statement, verify the **KFJ\_LOCAL\_TARGET\_HILEV** parameter value.

## KFJ00228W: RTE\_SHARE xxx not supported. RTE\_SHARE changed to SMP.

### Explanation

Configuration Manager supports RTE\_TYPE FULL, or RTE\_TYPE SHARING with RTE\_SHARE SMP. However, the **MIGRATE** action has detected that the PARMGEN WCONFIG configuration uses an RTE\_SHARE value that is not equal to SMP. If RTE\_TYPE is set to SHARING, and RTE\_SHARE is not equal to SMP, you will receive this warning message.

### System action

RTE\_SHARE is reset to the default value, which is SMP.

### User response

None. If you were using a base library with PARMGEN, you might consider using the Configuration Manager target copy feature, which allows you to create and use a copy of your SMP/E target libraries. For more information, see [“Using SMP/E target library copies” on page 352](#).

## **KFJ00229E: Failed to copy files from *source\_path* to TRG\_COPY\_TKANJAR\_PATH directory *target\_path***

### **Explanation**

The **GENERATE** action failed to copy files from the directory specified in parameter **GBL\_USS\_TKANJAR\_PATH** to the directory specified in **TRG\_COPY\_TKANJAR\_PATH**.

### **System action**

The **GENERATE** action stops before copying installation files.

### **User response**

Ensure that the directory specified in parameter **GBL\_USS\_TKANJAR\_PATH** contains all the required files. Ensure that the directory specified in parameter **TRG\_COPY\_TKANJAR\_PATH** exists and the user who runs the job that performs the **GENERATE** action has the required permissions to create new files.

## **KFJ00230I: Checkpoint created**

### **Explanation**

The checkpoint for the impacted runtime environment has been created in the WKANPARU library. It indicates that the **GENERATE** action with **OPTION PREPARE** has completed successfully.

### **System action**

Processing continues.

### **User response**

Review the generated artifacts. For more information, see [GENERATE action with OPTION PREPARE](#).

## **KFJ00231I: Checkpoint detected**

### **Explanation**

The **GENERATE** action detected a checkpoint, which was created by a previous run of the **GENERATE** action with **OPTION PREPARE**.

**Note:** The **GENERATE** action does not attempt to detect a checkpoint if any of the following options are used: **USS**, **SECEXITS**, **RELINK**, **QUICKLOAD**.

### **System action**

The **GENERATE** action processes the remaining workflow stages, bypassing the stages performed by the **PREPARE** option.

### **User response**

Review the KCIPARSE DD statement output for more details.

## **KFJ00232I: Checkpoint deleted**

### **Explanation**

The **GENERATE** action detected a checkpoint. At the end of processing, the **GENERATE** action attempts to delete the checkpoint from the WKANPARU data set. This message indicates that the checkpoint was deleted successfully.

### **System action**

Processing continues.

### **User response**

No action is required.

## **KFJ00233E: Prepared RTE and SMP/E maintenance levels do not match**

### **Explanation**

The SMP/E maintenance level does not match the maintenance level in the checkpoint that was created by the **GENERATE** action with **OPTION PREPARE**. This happens when additional PTFs are applied to your SMP/E libraries prior to completing the full maintenance cycle for the impacted runtime environment.

### **System action**

Processing stops.

### **User response**

The checkpoint must be refreshed for the impacted runtime environment. With the additional maintenance applied to the SMP/E libraries, use the **GENERATE** action with **OPTION PREPARE** to regenerate the runtime environment work libraries and checkpoint.

## **KFJ00234W: Unable to delete checkpoint**

### **Explanation**

The **GENERATE** action detected a checkpoint. At the end of processing, the **GENERATE** action attempts to delete the checkpoint from the WKANPARU data set. This message indicates that the **GENERATE** action was unable to delete the checkpoint.

### **System action**

Processing continues.

### **User response**

Make sure the checkpoint member \$PREPARE in the WKANPARU data set is not locked by another process. If needed, remove the \$PREPARE member manually.

## **KFJ00235I: Alias KFJ\_X\_ALIAS\_DSN resolved to KFJ\_X\_ALIAS\_DSN\_RESOLVED**

### **Explanation**

If an alias is used for SMP/E target data sets, Configuration Manager must resolve the alias before checking if the KCIFLOW DD statement and the RTEDEF members point to the same SMP/E target libraries. See the related error message [KFJ00227E](#).

### **System action**

Processing continues.

### **User response**

No action is required.

## **KFJ00236W: Netstat command failed**

### **Explanation**

During the **PDCOLLECT** action, a network diagnostics step running a **netstat** utility failed.

### **System action**

Processing continues.

### **User response**

If you want to retry network statistics collection, review the error message printed in the NETSTAT member in the PDCOLLECT archive. Make sure you have the appropriate authorizations to run the network statistics collection. After the problem is resolved, you can rerun the **PDCOLLECT** utility action.

## **KFJ00237E: RTEDEF data set %KFJ\_I\_PLIB\_HILEV%.RTEDEF does not exist**

### **Explanation**

The Configuration Manager action that issued this message requires the use of a defined runtime environment definition (RTEDEF) library, but the library does not exist.

The **GENERATE**, **DELETE**, and **PACKAGE** actions require the use of the RTEDEF library, but these actions do not create the library. Only the **MIGRATE**, **CREATE**, **DEPLOY**, and **DISCOVER** actions create the RTEDEF library.

### **System action**

Processing stops.

### **User response**

In the KCIVARS input data set, review the specified value for parameter **RTE\_PLIB\_HILEV**, which must point to an existing RTEDEF library.

## **KFJ00240I: RTE\_PLIB\_HILEV parameter is not defined in KCIVARS**

### **Explanation**

Parameter **RTE\_PLIB\_HILEV** was not defined in the KCIVARS DD for the **PDCOLLECT** action. Some collection flags that normally require runtime environment information are disabled. To collect additional information, you must specify values for both the **RTE\_PLIB\_HILEV** and **RTE\_NAME** parameters.

### **System action**

Processing continues.

### **User response**

To collect more information about your environment, specify the value of parameter **RTE\_PLIB\_HILEV** for the next run.

## **KFJ00241I: RTE\_NAME parameter is not defined in KCIVARS**

### **Explanation**

Parameter **RTE\_NAME** was not defined in the KCIVARS DD statement for the **PDCOLLECT** action. Some collection flags that normally require runtime environment information are disabled. To collect additional information, you must specify values for both the **RTE\_PLIB\_HILEV** and **RTE\_NAME** parameters.

### **System action**

Processing continues.

### **User response**

To collect more information about your environment, specify the value of parameter **RTE\_NAME** for the next run.

## **KFJ00242E: You must use PGM=KCIALPHA to create an ADRDSSU archive**

### **Explanation**

To be able to run the **ADRDSSU** program, you must use the APF-authorized program **KCIALPHA**.

### **System action**

Processing stops.

### **User response**

Specify **PGM=KCIALPHA** in the JCL and rerun the **PDCOLLECT** action.

## KFJ00243E: Use PGM=KCIOMEGA to run PDCollect

### Explanation

If you archive the collected diagnostic data only to a TERSE (.TRS) or PAX (.pax) file, then you must run the **PDCOLLECT** action with the KCIOMEGA program.

### System action

Processing stops.

### User response

Specify PGM=KCIOMEGA in the JCL and rerun the **PDCOLLECT** action.

## KFJ00244E: KFJ\_PDCOL\_JOB\_NAME or KFJ\_PDCOL\_JOB\_OUTPUT must be specified

### Explanation

The **PDCOLLECT** action must be given a reference to a running OMEGAMON started task, either by specifying a job name or a data set that contains the job output.

### System action

Processing stops.

### User response

Specify either the **KFJ\_PDCOL\_JOB\_NAME** or the **KFJ\_PDCOL\_JOB\_OUTPUT** parameter.

**Note:** Using the **KFJ\_PDCOL\_JOB\_NAME** parameter also requires parameter **KFJ\_PDCOL\_JOB\_ID** to be specified if **KFJ\_PDCOL\_JOB\_FILTER** "Y" is not specified.

## KFJ00245E: *data\_set\_name* data set not found

### Explanation

A data set that is essential for the **PDCOLLECT** action was not found.

### System action

Processing stops.

### User response

Check why the data set *data\_set\_name* does not exist.

## KFJ00246E: KFJ\_PDCOL\_JOB\_ID must be specified

### Explanation

If the **PDCOLLECT** action runs without the enabled job filter option, then parameter **KFJ\_PDCOL\_JOB\_ID** is required.

### System action

Processing stops.

### User response

Specify parameter **KFJ\_PDCOL\_JOB\_ID** set to the job ID of the started task name specified in parameter **KFJ\_PDCOL\_JOB\_NAME**.

## **KFJ00247I: Job output data set *kfj\_pdcoll\_job\_output* will not be used**

### **Explanation**

For the log analysis, the **PDCOLLECT** action can use either a running started task in SDSF or the job output. If both are specified, then the job output is ignored.

### **System action**

Processing continues.

### **User response**

If you have SDSF and use the combination of job ID and job name to identify the started task, you can remove parameter **KFJ\_PDCOL\_JOB\_OUTPUT** from the parameter list in the **KCIVARS DD** statement.

## **KFJ00248W: No RTE definition given. Some collection flags will be forced off.**

### **Explanation**

Some collection items require the runtime environment definition to be specified in the **KCIVARS DD** statement. If the runtime environment definition is not provided using parameters **RTE\_PLIB\_HILEV** and **RTE\_NAME**, then Configuration Manager automatically disables the flags for the items that cannot be collected.

### **System action**

Processing continues.

### **User response**

No action is required; however, if you want to collect the diagnostic data that was not collected, specify the runtime environment information in parameters **RTE\_PLIB\_HILEV** and **RTE\_NAME**.

## **KFJ00249I: Collection flags in effect: *collection\_flags\_list***

### **Explanation**

The **PDCOLLECT** action lists the items that can be collected in this run.

### **System action**

Processing continues.

### **User response**

No action is required.

## **KFJ00250E: No collection flags selected. PDCollect cannot proceed.**

### **Explanation**

The **PDCOLLECT** action did not find any item to collect.

### **System action**

Processing stops.

### **User response**

Check that at least one flag is set in the **PDCLDEF (\$USER)** definition file or if there are any messages in the **KCIPRINT SYSOUT** output indicating that selected flags have been forced to N.

## **KFJ00251W: No data to terse.**

### **Explanation**

When you use the **KFJ\_PDCOLLECT\_COMPATIBILITY** mode, the **PDCOLLECT** action passes a final data container to the **AMATERSE** program. If no data was collected, the **AMATERSE** program issues a non-zero return code that indicates that it had zero bytes to process.

This result usually means that either the job ID and job name combination was incorrect, not pointing to a valid OMEGAMON started task; or too few collection flags were selected, and no data was found to collect.

### System action

Processing stops.

### User response

Check that the **KFJ\_PDCOL\_JOB\_NAME** and **KFJ\_PDCOL\_JOB\_ID** parameter values point to a valid OMEGAMON started task and that the collection flags are set correctly.

## **KFJ00252I: *data\_set\_name* data set not found**

### Explanation

A data set that is not essential for the **PDCOLLECT** action was not found, but processing can continue.

### System action

Processing continues.

### User response

No action is required.

## **KFJ00253E: Undefined symbols detected in RTEDEF: *&symbol***

### Explanation

The validation process encountered symbol *&symbol*, which is not defined. The validation process checks the following locations for the symbol definition:

- System symbols defined in the PARMLIB library or member RTEDEF (SYS@*lpar*)
- User variables defined in members RTEDEF (VAR\$GLOB) or RTEDEF (VAR\$*lpar*)

### System action

The system action depends on the **RTE\_VALIDATION\_LEVEL** parameter setting, as follows:

- If parameter **RTE\_VALIDATION\_LEVEL** is set to W (Warning) or E (Error), the **GENERATE** action stops with a return code of 8.
- If parameter **RTE\_VALIDATION\_LEVEL** is set to I (Informational), processing continues, allowing you to use the undefined symbol in your parameter setting. This behavior is acceptable in the following scenarios:
  - You have an undefined symbol that becomes defined when the agent starts, as the symbol can be defined in the PARMLIB library and added dynamically.
  - Your runtime environment is being packaged for deployment to another system; during the **GENERATE** action, the validation process does not have access to the remote system symbols.

**Tip:** Optionally, you can discover the system symbols on the target system and send the results back the configuration system for validation.

### User response

Verify that the system symbol definition is correct.

**KFJ00254I: A collection configuration data set *kfj\_pdc0l\_hlq*.PDCLDEF has been created. You can edit the flags in the \$USER member to control what information is collected.**

**Explanation**

The **PDCOLLECT** action created data set PDCLDEF where you can customize your diagnostic data collection preferences. This data set persists after the **PDCOLLECT** action job completes and is used by subsequent **PDCOLLECT** action jobs.

**System action**

Processing continues.

**User response**

No action is required.

**KFJ00255I: Using collection flags from *kfj\_pdc0l\_hlq*.PDCLDEF**

**Explanation**

The **PDCOLLECT** action found that data set *kfj\_pdc0l\_hlq*.PDCLDEF exists and attempts to use preferences found in member \$USER as overrides.

**System action**

Processing continues.

**User response**

No action is required.

**KFJ00256E: Specified z/OS Unix PDCOLLECT directory cannot be empty**

**Explanation**

You cannot specify an empty value in parameter **KFJ\_PDCOLLECT\_PAX\_DIR** as it is used as the root to create directory *kcipdc0l/*.

**System action**

Processing stops.

**User response**

You must specify a non-empty value for the z/OS® UNIX® System Services directory parameter **KFJ\_PDCOLLECT\_PAX\_DIR** in the KCIVARS DD statement.

**KFJ00257I: When using a job filter, only STC logs and DA panel information can be collected.**

**Explanation**

When job filtering is enabled (parameter **KFJ\_PDCOL\_JOB\_FILTER** set to Y), the **PDCOLLECT** action can only fetch started task and SDSF DA panel information. All other flags are turned off.

**System action**

Processing continues.

**User response**

To collect more detailed information, you must specify the job name and job ID values for a specific started task.

**KFJ00258E: KFJ\_PDCOL\_JOB\_\* parameters do not support filters. Use KFJ\_PDCOL\_JOB\_FILTER 'Y' to enable filters.**

**Explanation**

By default, the parameters for the started task job name (**KFJ\_PDCOL\_JOB\_NAME**) and job ID (**KFJ\_PDCOL\_JOB\_ID**) do not support wildcard characters \* and %. To collect diagnostic data for more than one started task, you must enable job filtering. Only started task and SDSF Display Active Users (DA) data can be collected with a filter.

**System action**

Processing stops.

**User response**

Enable job filtering by specifying parameter **KFJ\_PDCOL\_JOB\_FILTER** set to Y, and rerun the **PDCOLLECT** action job.

**KFJ00259E: KFJ\_PDCOL\_RESTORE\_HLQ is required**

**Explanation**

For the **PDCOLLECT** action to extract the **ADRSSU** archive, a valid high-level qualifier must be specified, as the restore process must rename some collected data sets.

**System action**

Processing stops.

**User response**

Set parameter **KFJ\_PDCOL\_RESTORE\_HLQ** to a valid high-level qualifier value. For example, use your TSO user name or any other high-level qualifier to which you have **UPDATE** access.

**KFJ00260E: KFJ\_PDCOL\_RESTORE\_HLQ must be a single qualifier**

**Explanation**

A value consisting of multiple qualifiers is invalid. The **ADRSSU** program uses the specified value as the first qualifier for a rename option.

**System action**

Processing stops.

**User response**

Specify only one qualifier.

**KFJ00262I: PDCOLLECT ADRSSU archive restored from archive *kfj\_pdcoll\_adr\_archive* to HLQ *kfj\_pdcoll\_restore\_hlq***

**Explanation**

The **PDCOLLECT** action successfully restored the **ADRSSU** archive under the given high-level qualifier.

**System action**

Processing continues.

**User response**

No action is required.

**KFU messages**

Messages with the prefix **KFU** are from the **KCIOMEGA** program or its APF-authorized version, **KCIALPHA**.

KCIOMEGA is the underlying job template engine that runs Monitoring Configuration Manager.

**KFU00001I: KCIOMEGA is starting; SYSPLEX=*name* LPAR=*name* DATE=*date and time***

**Explanation**

The KCIOMEGA workflow utility is starting. The system, date and time are reported. The KCIALPHA utility, the APF-authorized version of KCIOMEGA, issues the same message.

**System action**

Processing continues.

**User response**

None required.

**KFU00002I: *command* processing is about to commence; MEMBER=*name* DDNAME=*name* DSN=*name***

**Explanation**

A command to process a sub-workflow (**INVOKE**) or read parameters (**CONFIG**) is about to commence. The source member, ddname, and data set name are reported.

**System action**

For **INVOKE**, the sub-workflow is given control, returning the invoking workflow upon completion. For **CONFIG**, the parameters are read in and made available for the workflow to reference.

**User response**

None required.

**KFU00003I: Workflow task recap: Programs=*program\_count* MaxRC=*max\_program\_rc* REXX=*rexx\_exec\_count* MaxRC=*max\_rexx\_rc***

**Explanation**

Workflow processing has ended. The number of programs and REXX execs that were invoked is reported, along with the maximum return code for each.

**System action**

Processing ends.

**User response**

If either return code is greater than zero, then look in the KCIPRINT sysout data set for error or warning messages that indicate the cause of the problem and recommend corrective action. The return code issued in message KFU00004I will help determine if the return codes issued in KFU00003I are acceptable. If you suspect an error, contact IBM Software Support.

**KFU00004I: KCIOMEGA is ending; RC=*return\_code* SYSPLEX=*sysplex\_name* LPAR=*LPAR\_name* DATE=*date\_and\_time***

**Explanation**

The KCIOMEGA workflow utility is ending. The reported return code, *return\_code*, represents the maximum return code for the Configuration Manager action that was performed. The message also provides the system information, date, and time.

Return code	Description
0	The workflow completed with no errors.

Return code	Description
4	<p>The workflow completed with one or more warnings. To determine the significance of the warnings, review the preceding messages in the KCIPRINT sysout data set and also, if necessary, KCITRACE.</p> <div style="border: 1px solid blue; padding: 5px; margin-top: 10px;"> <p><b>Tip:</b> The <b>DISCOVER</b> action ends with return code 4 if you are performing <i>rediscovery</i>: if you have previously performed discovery for an LPAR, and RTEDEF (<i>Kpp@lpar</i>) members already exist. Instead of overwriting those members, the <b>DISCOVER</b> action writes RTEDEF (<i>Kpp#lpar</i>) members. For details, see <a href="#">“Members created by the DISCOVER action”</a> on page 245.</p> </div>
8	The workflow stopped processing due to an unrecoverable error.

The workflow can also set its own return code via the **STOP** command.

### System action

Processing ends.

### User response

If the return code is greater than zero, then a previous error or warning message indicates the cause of the problem and recommends corrective action.

### KFU00005I: Program is about to be invoked; PROGRAM=*name*

#### Explanation

The program is about to be invoked to perform a task.

#### System action

The program is given control, typically as a subtask.

#### User response

None required.

### KFU00006I: Program has ended; PROGRAM=*name* OUTPUT=*output* WORKFLOW=*workflow* STEP=*step* RC=*return\_code*

#### Explanation

The program has ended with the reported return code. The program is deemed to have succeeded because the return code is expected. Specifically, the return code is less than the MAXRC setting of the active workflow.

#### System action

Processing continues.

#### User response

No action is required.

### KFU00007E: Program has abnormally terminated; PROGRAM=*name* ABEND=*system code*

#### Explanation

The program has abnormally terminated with the reported system code.

#### System action

Processing of the workflow stops.

### **User response**

*z/OS® MVS™ System Codes* in IBM® Documentation describes the abend system code. Additional diagnostic messages may be recorded in the job log. The abend system code or job log messages may recommend or indicate corrective action. Otherwise, re-run the job with a SYSUDUMP DD to generate a dump and report the problem to IBM® Software Support.

### **KFU00008I: Workflow was told to stop**

#### **Explanation**

The **STOP** command was issued by the workflow, typically as a result of an error condition, incorrect parameter input, or further action required.

#### **System action**

Processing of the workflow stops.

#### **User response**

See the KCIPRINT sysout data set for a message that describes why the workflow stopped, and then perform the recommended action.

### **KFU00009E: Workflow has stopped due to an unrecoverable error**

#### **Explanation**

An unrecoverable error occurred in the workflow.

#### **System action**

Processing of the workflow stops.

#### **User response**

A previous error or warning message will indicate the cause of the problem and recommend corrective action.

### **KFU00010E: DD statement is missing, DDNAME=KCIPRINT or KCITRACE**

#### **Explanation**

The reported file, either KCIPRINT or KCITRACE, is not allocated. If it is not explicitly specified in the job's JCL as a DD statement, then it is dynamically allocated to SYSOUT=\*. Therefore, this error should not occur in normal circumstances and indicates an environmental problem that KCIOMEGA cannot recover from.

#### **System action**

Processing stops.

#### **User response**

Check in the job log for messages associated with the ddname and take corrective action. Otherwise contact IBM® Software Support.

### **KFU00011E: DD statement is missing, DDNAME=*name***

#### **Explanation**

The reported file, typically a system-generated ddname, is not allocated. The file was dynamically allocated but could not be found. This error should not occur in normal circumstances and indicates an environmental problem that KCIOMEGA cannot recover from.

#### **System action**

Processing stops.

#### **User response**

Check in the job log for messages associated with the ddname and take corrective action. Otherwise contact IBM® Software Support.

**KFU00012E: MVS™ service has failed; MACRO=BLDL PROGRAM=*name* R15=*return code* R0=*reason code***

**Explanation**

The reported program, about to be run by the workflow, could not be located.

**System action**

Processing stops.

**User response**

For return code 4, check that the program exists in the workflow STEPLIB. For all other return codes, refer to the **BLDL** completion codes in IBM® Documentation for corrective action. Otherwise, contact IBM® Software Support.

**KFU00013E: MVS™ service has failed; MACRO=LOAD PROGRAM=*name* R1=*system code* R15=*reason code***

**Explanation**

The reported program, about to be run by the workflow, could not be loaded.

**System action**

Processing stops.

**User response**

Check the job log for messages associated with the failed load request. A common abend condition is S806-04 indicating that the module could not be found. Check that the program exists in the workflow STEPLIB. Otherwise, contact IBM® Software Support.

**KFU00014E: MVS™ service has failed; MACRO=LINK PROGRAM=*name* R1=*system code* R15=*reason code***

**Explanation**

The reported program, about to be run by the workflow, could not be invoked.

**System action**

Processing stops.

**User response**

Check the job log for messages associated with the failed link request. A typical abend condition is S806-04 indicating that the module could not be found. Check that the program exists in the workflow STEPLIB. Otherwise, contact IBM® Software Support.

**KFU00015E: MVS™ service has failed; MACRO=ATTACH PROGRAM=*name* R15=*return code***

**Explanation**

The reported program, about to be run by the workflow, could not be invoked.

**System action**

Processing stops.

**User response**

Check the job log for messages associated with the failed attach request. Refer to the **ATTACH** return codes in IBM® Documentation for corrective action. Otherwise, contact IBM® Software Support.

**KFU00016E: Program has failed; PROGRAM=*name* OUTPUT=*output*  
WORKFLOW=*workflow* STEP=*step* RC=*return\_code***

**Explanation**

The program invoked by the workflow has ended with the reported return code. The program is deemed to have failed because the return code is higher than expected. Specifically, the return code is not less than the MAXRC setting of the active workflow.

**System action**

Processing stops.

**User response**

The failing program will typically issue its own error messages to indicate the cause of the problem and recommend corrective action. These messages can be written to the following locations:

- In the KCIPRINT or KCITRACE sysout data set, immediately prior to this message.
- The output data set associated with the program or utility. OUTPUT=*output* in the error message identifies this data set.
- The job log containing the system messages for the job.

IBM Z® Monitoring Configuration Manager uses system and OMEGAMON® utilities to configure the runtime environment. These utilities control their own output messages; those messages will typically not appear in KCIPRINT or KCITRACE.

Utilities such as IEBGENER, IEBCOPY, and IDCAMS write messages to their SYSPRINT output data set. Note that the KCIOMEGA program might have renamed the SYSPRINT ddname to the name of the workflow step that invoked the program.

The OMEGAMON® utility KCIPARSE is used extensively to prepare the runtime members. Error messages might be written to either the associated SYSPRINT or to the job log.

If you cannot locate an associated error message or that message does not recommend corrective action, then contact IBM® Software Support.

**KFU00019E: Variable value end quote is missing; VAR=*name source***

**Explanation**

The reported variable or parameter has an invalid value. The value is assumed to be enclosed in quotes because it starts with a quote, but the end quote is missing. Additional information is recorded in the message to identify the source of the variable, typically the KCIVARS data set or an RTEDEF library member.

**System action**

Processing stops.

**User response**

1. Ensure that the variable value, if it contains embedded blanks, is enclosed in quotes.
2. Ensure that the variable value, including quotes, does not extend beyond column 70.
3. Retry the request.

**KFU00020E: CONFIG or INVOKE MEMBER= command has exceeded the maximum nesting level**

**Explanation**

The CONFIG or INVOKE command in the workflow could not be run because it will exceed the maximum level of command nesting permitted.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00021E: Command is invalid: *workflow statement*****Explanation**

The reported workflow statement has invalid syntax.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00022E: INVOKE member was not found; Member=*name* DSN=*name*****Explanation**

The workflow **INVOKE** command could not find the member to be invoked in the reported data set.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00023W: CONFIG member was not found; Member=*name* DSN=*name*****Explanation**

The workflow **CONFIG** command could not find the member to be processed in the reported data set.

**System action**

Processing continues, without any new parameters.

**User response**

If the workflow expects and requires the **CONFIG** member then create the member and re-run the job. If the **CONFIG** is intended to provide optional parameters only then no action is required.

**KFU00024E: RC is not in the range 0 to 2147483647: *return code*****Explanation**

The workflow tried to set the return code variable (RC) with a value outside the allowed range.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00025E: DD statement is missing, DDNAME=*name* RC=*return code*****Explanation**

The reported file, typically a system-generated ddname, is not allocated. The file was dynamically allocated but could not be found. This error should not occur in normal circumstances and indicates an environmental problem that KCIOMEGA cannot recover from.

**System action**

Processing stops.

**User response**

Check the job log for messages associated with the ddname and take corrective action. Otherwise contact IBM® Software Support.

**KFU00026E: DD OPEN error, DDNAME=*name* ABEND=*system code-reason code*****Explanation**

The reported file, typically a system-generated ddname, could not be opened. A common abend condition is S913 indicating that access to the data set is not allowed by the security server, such as RACF®.

**System action**

Processing stops.

**User response**

Check the job log for messages associated with the ddname and take corrective action. Otherwise contact IBM® Software Support.

**KFU00027E: Copy I/O error, DDNAME=*name* ABEND=*system code-reason code*****Explanation**

The request to copy data from one file to another has failed.

**System action**

Processing stops.

**User response**

Check the job log for messages associated with the ddname and take corrective action. Otherwise contact IBM® Software Support.

**KFU00028E: TCP/IP settings are not available; RET=*return\_code* REAS=*reason\_code*  
REQUEST=BPX1*xxx* GET*yyyyyyyyy*****Explanation**

The request to fetch TCP/IP settings has failed. The request originated from either BPX1HST GETHOSTNAME or BPX1GAI GETADDRINFO.

**System action**

Processing stops.

**User response**

If this error was seen in security exits processing, check if z/OS Integrated Cryptographic Service Facility (ICSF) is active on the system where the configuration job is run. Otherwise contact IBM® Software Support.

**KFU00030E: Workflow command is not recognized; Member=*name* Line=*number*****Explanation**

The workflow encountered a command that was not recognized. The workflow member name and line number within the workflow identify the offending command.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00031E: JCL statement has a syntax error; Member=*name* Line=*number***

**Explanation**

The workflow encountered a JCL statement that was not recognized. The workflow member name and line number within the workflow identify the offending statement.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00032E: Workflow command is invalid, Member=*name* Line=*number***

**Explanation**

The workflow encountered a command with invalid syntax or used out of context. The workflow member name and line number within the workflow identify the offending command.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00037E: String in quotes is not terminated; Member=*name* Line=*number***

**Explanation**

The workflow encountered a string that started with a quote but was not terminated with a quote. The workflow member name and line number within the workflow identify the offending command.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00040E: JCL statement name is longer than 8; *statement***

**Explanation**

The reported JCL statement has a name longer than 8 characters. For an EXEC statement this is the step name. For a DD statement this is the ddname.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00041E: JCL statement operation is not EXEC or DD; *statement***

**Explanation**

The reported JCL statement does not specify a recognized operation. Only EXEC and DD statements are supported.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00042E: DD statement has an unsupported keyword parameter value; *parameter*****Explanation**

The reported JCL DD statement has specified a keyword parameter with an unsupported value. Only some of the actual JCL DD statement parameter values are supported in workflows.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00043E: DD statement keyword parameter value is missing; *parameter*****Explanation**

The reported JCL DD statement has specified a keyword parameter that has no value. This typically occurs when the value is parameterized, and the parameter is not defined or has no value. Some parameters support missing or null values, in which case the system default is used. Other keyword parameters, such as **DSNAME**, if specified in the DD statement must be resolved to an allowed value.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00044W: DD statement keyword parameter is not recognized; *statement*****Explanation**

The reported JCL DD statement has specified a keyword parameter that is not supported in workflows. Only some of the actual JCL DD statement parameters are supported in workflows.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

**KFU00045E: EXEC statement has an unsupported keyword parameter value; *statement*****Explanation**

The reported JCL EXEC statement has specified a keyword parameter with an unsupported value. Only some of the actual JCL EXEC statement parameter values are supported in workflows.

**System action**

Processing stops.

**User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

## **KFU00046E: EXEC statement keyword parameter value is missing; *statement***

### **Explanation**

The reported JCL EXEC statement has specified a keyword parameter that has no value. This typically occurs when the value is parameterized, and the parameter is not defined or has no value. Some parameters support missing or null values, in which case the system default is used. Other keyword parameters, such as **PGM**, must be resolved to an allowed value.

### **System action**

Processing stops.

### **User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

## **KFU00047W: EXEC statement keyword parameter is not recognized; *statement***

### **Explanation**

The reported JCL EXEC statement has specified a keyword parameter that is not supported in workflows. Only some of the actual JCL EXEC statement parameters are supported in workflows.

### **System action**

Processing stops.

### **User response**

If the problem occurs in an IBM®-supplied workflow then contact IBM® Software Support.

## **KFU00050E: DYNALLOC request has failed; REQUEST=ALLOC EC=*error code* IC=*information code* DSN=*data set name***

### **Explanation**

The DD statement in the workflow failed dynamic allocation with the reported error code. The message severity is reduced to a warning if the dynamic allocation is used only to check for the existence of the data set. Additional messages issued by dynamic allocation will be reported immediately after this message, explaining the problem.

### **System action**

Processing stops when the message severity is an error. Processing continues when the message severity is a warning.

### **User response**

Refer to the additional messages issued by dynamic allocation for corrective action. If the problem persists then contact IBM® Software Support.

## **KFU00051I: DYNALLOC request has failed; REQUEST=ALLOC EC=*error code* IC=*information code* DSN=*data set name***

### **Explanation**

The DD statement in the workflow failed dynamic allocation with the reported error code. The dynamic allocation error is informational because the allocation is used only to check for the existence of the data set, or to allocate it. The **WARNING=RETURN** option was specified in the DD statement.

See message KFU00050E for more information about dynamic allocation errors.

### **System action**

Processing continues.

### **User response**

None required.

**KFU00055E: MVS™ service has failed; MACRO=\$SWAREQ R15=*return code*  
SVA=*address* CB=*control block name***

**Explanation**

An internal service similar to SWAREQ was invoked to extract an SWA control and has failed.

**System action**

Processing stops.

**User response**

If the problem persists then contact IBM® Software Support.

**KFU00060E: DD statement is missing, DDNAME=*name* RC=*return code***

**Explanation**

The reported file, typically a system-generated ddname, is not allocated. The file was dynamically allocated but could not be found. This error should not occur in normal circumstances and indicates an environmental problem that KCIOMEGA cannot recover from.

**System action**

Processing stops.

**User response**

Check the job log for messages associated with the ddname and take corrective action. Otherwise contact IBM® Software Support.

**KFU00061E: MVS service has failed; MACRO=DESERV FUNC=GET R15=*return code*  
R0=*reason code* DDNAME=*name* DSN=*name***

**Explanation**

The DESERV system service was invoked to provide information about a member in a data set, but failed with the reported return code.

**System action**

Processing stops.

**User response**

Check the job log for system messages associated with this service and take corrective action. Otherwise contact IBM® Software Support.

**KFU00062I: PDS library data set is empty; MACRO=DESERV FUNC=GET\_ALL  
R15=*return code* R0=*reason code* DDNAME=*name* DSN=*name***

**Explanation**

The DESERV system service was invoked to provide the list of members in a data set, but the data set is empty.

**System action**

Processing continues.

**User response**

None required.

**KFU00063E: MVS™ service has failed; MACRO=DESERV FUNC=GET\_ALL R15=*return code* R0=*reason code* DDNAME=*name* DSN=*name***

**Explanation**

The DESERV system service was invoked to provide the list of members in a data set, but failed with the reported return code.

**System action**

Processing stops.

**User response**

Check the job log for system messages associated with this service and take corrective action. Otherwise contact IBM® Software Support.

**KFU00064E: REXX service has failed; Routine=IRXEXCOM RETC=*return code* VAR=*name***

**Explanation**

The IRXEXCOM service was invoked to set the value of a REXX variable but failed with the reported return code.

**System action**

The REXX exec will throw an exception that either causes the exec to fail or give unpredictable results.

**User response**

Contact IBM® Software Support.

**KFU00070E: DD statement is missing, DDNAME=*name* RC=*return code***

**Explanation**

The reported file, typically a system-generated ddname, is not allocated. The file was dynamically allocated but could not be found. This error should not occur in normal circumstances and indicates an environmental problem that KCIOMEGA cannot recover from.

**System action**

Processing stops.

**User response**

Check the job log for messages associated with the ddname and take corrective action. Otherwise contact IBM® Software Support.

**KFU00071E: MVS™ service has failed; MACRO=DESERV FUNC=DELETE R15=*return code* R0=*reason code* DDNAME=*name* DSN=*name***

**Explanation**

The DESERV system service was invoked to delete a member in a data set, but failed with the reported return code.

**System action**

Processing stops.

**User response**

Check the job log for system messages associated with this service and take corrective action. Otherwise contact IBM® Software Support.

**KFU00072E: MVS™ service has failed; MACRO=STOW FUNC=DELETE R15=12 R0=1234  
DDNAME=12345678 DSN=**

**Explanation**

The STOW system service was invoked to delete a member in a data set, but failed with the reported return code.

**System action**

Processing stops.

**User response**

Check the job log for system messages associated with this service and take corrective action. Otherwise contact IBM® Software Support.

**KFU00080E: REXX service has failed; Routine=IRXINIT RETC=*return code*  
REAS=*reason code***

**Explanation**

The IRXINIT service was invoked to initialize the REXX environment but failed with the reported return code.

**System action**

Processing stops.

**User response**

Contact IBM® Software Support.

**KFU00081I: REXX routine is about to be invoked; EXEC=*name***

**Explanation**

The REXX exec is about to be invoked to perform a task.

**System action**

The exec is given control under the control of the REXX environment.

**User response**

None required.

**KFU00082I: REXX routine has completed; EXEC=*name* OUTPUT=*output*  
WORKFLOW=*workflow* STEP=*step* RC=*return\_code***

**Explanation**

The REXX exec has ended with the reported return code. The REXX exec is deemed to have succeeded because the return code is expected. Specifically, the return code is less than the MAXRC setting of the active workflow.

**System action**

Processing continues.

**User response**

No action is required.

**KFU00083E: REXX service has failed; Routine=IRXTERM RETC=*return code***

**Explanation**

The IRXTERM service was invoked to terminate the REXX environment but failed with the reported return code.

**System action**

Processing stops.

**User response**

Contact IBM® Software Support.

**KFU00084E: REXX service has failed; Routine=IRXEXCOM RETC=*return code***

**VAR=*name***

**Explanation**

The IRXEXCOM service was invoked to set the value of a REXX variable but failed with the reported return code. The service was invoked during REXX initialization to populate the REXX variable pool with the workflow variables.

**System action**

The REXX exec will be processed, but some of the workflow variables will not be available to the REXX exec.

**User response**

Contact IBM® Software Support.

**KFU00085E: REXX service has failed; Routine=IRXSAY RETC=*return code*****Explanation**

The IRXSAY service was invoked to write a message to the REXX output file but failed with the reported return code.

**System action**

The message is not issued and the REXX exec processing continues. The message was likely written to the KCITRACE sysout data set as a backup.

**User response**

Contact IBM® Software Support.

**KFU00086E: REXX routine has failed; EXEC=*name* OUTPUT=*output***

**WORKFLOW=*workflow* STEP=*step* RC=*return\_code***

**Explanation**

The REXX exec invoked by the workflow has ended with the reported return code. The REXX exec is deemed to have failed because the return code is higher than expected. Specifically, the return code is not less than the MAXRC setting of the active workflow.

**System action**

Processing stops.

**User response**

The failing REXX will typically issue its own error messages to indicate the cause of the problem and recommend corrective action. These messages can be written to the following locations:

- In the KCIPRINT or KCITRACE sysout data set, immediately prior to this message.
- The output data set associated with the REXX exec. OUTPUT=*output* in the error message identifies this data set.
- The job log containing the system messages for the job.

REXX typically writes messages to the SYSTSPRT output data set. The KCIOMEGA program might have renamed the SYSTSPRT ddname to the name of the workflow step that invoked the REXX.

If you cannot locate an associated error message or that message does not recommend corrective action, then contact IBM® Software Support.

**KFU00090E: Command is not recognized; REXX=*name* COMMAND=*command***

**Explanation**

The KCIEXEC host command environment set up for REXX processing did not recognize the command in the exec.

**System action**

The REXX exec will throw a failure that will either stop exec processing or cause unpredictable results.

**User response**

If the REXX is supplied by IBM® then contact IBM® Software Support.

**KFU00091E: Command is not recognized; REXX1=*name* REXX2=*name*  
COMMAND=*command***

**Explanation**

This message is a variation of message KFU00090E. In this case, the REXX exec that issued the command is not the original EXEC REXX=*name* specified in the workflow. REXX1 is the original workflow exec and REXX2 is the most recently called exec.

**System action**

The REXX exec will throw a failure that will either stop exec processing or cause unpredictable results.

**User response**

If the REXX is supplied by IBM® then contact IBM® Software Support.

**KFU00092W: Command is not supported; REXX=*return code* COMMAND=*command***

**Explanation**

The KCIEXEC host command environment set up for REXX processing recognized the command but does not support it. For example, the **SUBMIT** command is recognized but is not performed.

**System action**

The REXX exec treats the command as a null operation and continues.

**User response**

If the task needs to be performed then you must do that manually after the workflow has completed. For example, you can submit the job after the workflow has completed.

**KFU00093W: Command is not supported; REXX1=*name* REXX2=*name*  
COMMAND=*command***

**Explanation**

This message is a variation of message KFU00092W. In this case, the REXX exec that issued the command is not the original EXEC REXX=*name* specified in the workflow. REXX1 is the original workflow exec and REXX2 is the most recently called exec.

**System action**

The REXX exec treats the command as a null operation and continues.

**User response**

If the task needs to be performed then you must do that manually after the workflow has completed. For example, you can submit the job after the workflow has completed.

## **KFU00095E: REXX service has failed; Routine=IRXEXCOM RETC=*return code***

### **Explanation**

The IRXEXCOM service was invoked to fetch or store one or more REXX variables but failed with the reported return code. The service was invoked during the processing of a KCIEXEC request.

### **System action**

The REXX exec will continue processing but results in exec or workflow will be unpredictable.

### **User response**

If the REXX is supplied by IBM® then contact IBM® Software Support.

## **KFU00100W: Full discovery requires APF authorization; PROGRAM=*name***

### **Explanation**

The subsystem discovery service was invoked using a program that is not APF-authorized. KCIALPHA is the APF-authorized version of KCIOMEGA and is recommended for discovery. If KCIALPHA is the program that was used, then the job's STEPLIB data set is not an APF-authorized library.

### **System action**

Discovery continues, all the subsystems will be discovered, but some of their attributes will be incomplete.

### **User response**

For a complete discovery, APF-authorize the TKANMOD library using the following system command:

```
SETPROG APF,ADD,DSNAME=hlg.TKANMOD,SMS
```

Otherwise manually edit the discovery members in the RTEDEF library to complete the process.

## **KFU00101W: Discovery has abended; ABEND=12345678 SSID=*name* PHASE=*diagnostics***

### **Explanation**

The subsystem discovery service has abended during the analysis of the reported subsystem. If the subsystem is not Db2®, MQ, CICS®, or IMS, then this is not a problem. This problem might occur when discovery is scanning control blocks to detect the type of subsystem, but encounters a control block whose storage is inaccessible.

### **System action**

Discovery ignores this subsystem and moves onto the next subsystem.

### **User response**

If the subsystem is Db2®, MQ, CICS® or IMS, then contact IBM® Software Support. Otherwise the message can be ignored.

## **KFU00102E: MVS™ service has failed; MACRO=ALESERV FUNCTION=ADD RC=*return code***

### **Explanation**

Discovery is using the ALESERV system service to access, via cross-memory, the subsystem address space in order to extract its discoverable information but the service has failed with the reported return code.

### **System action**

Discovery continues, the subsystem will be discovered, but some of its attributes will be incomplete.

### **User response**

If the problem persists then contact IBM® Software Support.

**KFU00103E: MVS™ service has failed; MACRO=ALESERV FUNCTION=DELETE  
RC=*return code***

**Explanation**

Discovery is using the ALESERV system service to terminate its access to the subsystem address space but the service has failed with the reported return code.

**System action**

Discovery continues, the subsystem is discovered, and its attributes will be incomplete.

**User response**

If the problem persists then contact IBM® Software Support.

**KFU00104E: MVS service has failed; MACRO=LOAD PROGRAM=EZBNMIFR  
R1=<*abend\_code*> R15=<*reason\_code*>**

**Explanation**

Network discovery could not load program EZBNMIFR, which is the TCP/IP NMI service. A common problem is the ABENDS806-04 module is not found. Typically, EZBNMIFR is in SYS1.CSSLIB, the common services library, which is always included in the LINKLIST.

**System action**

The TCPIP stacks are discovered with incomplete information.

**User response**

Copy module EZBNMIFR to the LINKLIST and retry the request. To proceed with the configuration process, first review member KN3@<*lpar*> in your RTEDEF library and correct the parameters.

**KFU00105E: NMI (EZBNMIFR) failed to get TN3270 settings; RET=<*return\_code*>  
REAS=<*reason\_code*> TCPIP=<*name*>**

**Explanation**

Network discovery issued a TCP/IP NMI service poll request to obtain the TN3270 servers with an affinity to the reported TCPIP stack. The request failed with the reported return and reason codes. When RET=0000006F, permission is denied (EACCES) because the discovery job is not APF authorized. Message KFU00100W is issued prior to this message and recommends corrective action.

**System action**

The TCPIP stacks are discovered with incomplete information.

**User response**

If the return code indicates a program error then contact IBM. To proceed with the configuration process, first review member KN3@<*lpar*> in your RTEDEF library and correct the parameters.

**KFU00110I: Some SYSOUT files were not deleted; count=*number***

**Explanation**

Some of the output files that are not important could not be deleted. The number of files not deleted is reported. The files will remain part of the output for the completed job.

**System action**

This situation does not impact the function being performed by the workflow and has no effect on the final return code of the job. Processing continues.

**User response**

If the situation occurs in an IBM-supplied workflow, then contact IBM Software Support.

**KFU00111I: SYSOUT file delete was requested; DDNAME=*name* DSN=*name***

**Explanation**

The output file is not important, and its delete request was sent to JES2. In certain situations, the request may not be successful. This occurrence is normal and can occur when the output is busy being processed by JES2.

**System action**

Processing continues. If the output was not deleted on the first attempt, then the request will be retried later.

**User response**

No action is required.

**KFU00112I: SYSOUT file is not used; DDNAME=*name* DSN=*name***

**Explanation**

The output file is eligible to be deleted but could not be found. It is likely that the file is already deleted because it was not used. You might consider removing it from the workflow.

**System action**

Processing continues.

**User response**

No action is required.

**KFU00113I: SYSOUT file could not be located; RDJFCB RC=*return\_code*  
DDNAME=*name***

**Explanation**

The output file is eligible to be deleted because it is not important. However, it will not be deleted because its JES data set name could not be located. The file will remain part of the output for the completed job.

**System action**

This situation does not impact the function being performed by the workflow and has no effect on the final return code of the job. Processing continues.

**User response**

If the situation occurs in an IBM-supplied workflow, then contact IBM Software Support.

**KFU00114I: JES STATUS request failed: FUNCTION=SSST(80) STATTYPE=*code*  
RC=*return\_code* SSOBRETN=*return\_code* STATREAS=*reason\_code*  
JOBNAME=*name* JOBID=*id***

**Explanation**

The JES subsystem interface Extended status function call (SSI 80) was made to locate the output files created by the workflow steps. The request failed with the reported return and reason codes. SYSOUT files that are not important are not deleted and will remain part of the output for the completed job.

**System action**

This situation does not impact the function being performed by the workflow and has no effect on the final return code of the job. Processing continues.

**User response**

If the situation occurs in an IBM-supplied workflow, then contact IBM Software Support.

**KFU00115I: SYSOUT Application Program Interface (SAPI) failed; FUNCTION=SSS2(79)  
SSS2TYPE=code SSS2UFLG=flag RC=return\_code SSOBRETN=return\_code  
SSS2REAS=reason\_code DDNAME=name CTOKEN=string**

**Explanation**

The JES subsystem interface SYSOUT application program interface (SAPI SSI=79) call was made to delete an output file that is not important. The request failed with the reported return and reason codes. The SYSOUT file is not deleted and will remain part of the output for the completed job.

**System action**

This situation does not impact the function being performed by the workflow and has no effect on the final return code of the job. Processing continues.

**User response**

If the situation occurs in an IBM-supplied workflow, then contact IBM Software Support.

**KFU00116I: SYSOUT file delete request failed; DDNAME=name DSN=name  
STATUS=code CTOKEN=string**

**Explanation**

The output file is not important but could not be deleted. Status information is recorded for diagnostic purposes.

**System action**

This situation does not impact the function being performed by the workflow and has no effect on the final return code of the job. Processing continues.

**User response**

If the situation occurs in an IBM-supplied workflow, then contact IBM Software Support.

**KFU00140E: REXX service has failed; Routine=IRXEXCOM RETC=return code  
VAR=name**

**Explanation**

The IRXEXCOM service was invoked to fetch or store REXX variable but failed with the reported return code. The service was invoked during KCIEXEC command processing of a VGET or VPUT request.

**System action**

The REXX exec will throw an exception that either causes the exec to fail or give unpredictable results.

**User response**

Contact IBM® Software Support.

**KFU00142E: Command syntax or parameter is not supported; REXX=name  
COMMAND=LISTDS**

**Explanation**

The REXX exec issued the TSO/E LISTDS command. The request was intercepted and processed as a KCIEXEC command. A command parameter was not recognized.

**System action**

The command is not processed, and the exec throws an exception. The results of the exec are unpredictable unless the exec handles error conditions.

**User response**

If the REXX exec is supplied by IBM® then contact IBM® Software Support.

**KFU00143E: Command syntax or parameter is not supported; REXX1=*name*  
REXX2=*name* VAR=*name* COMMAND=LISTDS**

**Explanation**

This message is a variation of message KFU00142W. In this case, the REXX exec that issued the command is not the original EXEC REXX=*name* specified in the workflow. REXX1 is the original workflow exec and REXX2 is the most recently called exec.

**System action**

The REXX exec will throw an exception that either causes the exec to fail or give unpredictable results.

**User response**

Contact IBM® Software Support.

**KFU00144E: REXX service has failed; Routine=IRXEXCOM RETC=*return code*  
VAR=*name***

**Explanation**

The IRXEXCOM service was invoked to set the value of a REXX variable but failed with the reported return code. The service was called by the LISTDS command.

**System action**

The REXX exec will throw an exception that either causes the exec to fail or give unpredictable results.

**User response**

Contact IBM® Software Support.

**KFU00145E: DD statement is missing, DDNAME=*name***

**Explanation**

The reported file, typically a system-generated ddname, is not allocated. The file was dynamically allocated but could not be found. This error should not occur in normal circumstances and indicates an environmental problem that KCIOMEGA cannot recover from. This error is associated with the processing of a TSO/E CALL command issued in a REXX exec.

**System action**

The REXX exec will throw an exception that either causes the exec to fail or give unpredictable results.

**User response**

Contact IBM® Software Support.

**KFU00147E: Command syntax or parameter is not supported; REXX=*name*  
COMMAND=CALL**

**Explanation**

The REXX exec issued the TSO/E CALL command. The request was intercepted and processed as a KCIEXEC command. A command parameter was not recognized.

**System action**

The command is not processed, and the exec throws an exception. The results of the exec are unpredictable unless the exec handles error conditions.

**User response**

If the REXX exec is supplied by IBM® then contact IBM® Software Support.

**KFU00148E: Command syntax or parameter is not supported; REXX1=*name*  
REXX2=*name* COMMAND=CALL**

**Explanation**

This message is a variation of message KFU00147E. In this case, the REXX exec that issued the command is not the original EXEC REXX=*name* specified in the workflow. REXX1 is the original workflow exec and REXX2 is the most recently called exec.

**System action**

The command is not processed, and the exec throws an exception. The results of the exec are unpredictable unless the exec handles error conditions.

**User response**

If the REXX exec is supplied by IBM® then contact IBM® Software Support.

**KFU00149E: MVS™ service has failed; MACRO=LOAD PROGRAM=*name* R1=*system*  
code R15=*reason code***

**Explanation**

The REXX exec issued the TSO/E **CALL** command. The request was intercepted and processed as a KCIEXEC command. The call program could not be loaded.

**System action**

The command is not processed, and the exec throws an exception. The results of the exec are unpredictable unless the exec handles error conditions.

**User response**

Verify that the program being called is in the call library. Otherwise if the REXX exec is supplied by IBM® then contact IBM® Software Support.

**KFU00150E: Command syntax or parameter is not supported; REXX=*name*  
PROBLEM=*reason* COMMAND=ALLOC**

**Explanation**

The REXX exec issued the TSO/E **ALLOC** command. The request was intercepted and processed as a KCIEXEC command. A command parameter was not recognized. Not all the actual TSO/E **ALLOCATE** options are supported. The reported problem describes the option that is not supported.

**System action**

The command is not processed, and the exec throws an exception. The results of the exec are unpredictable unless the exec handles error conditions.

**User response**

If the REXX exec is supplied by IBM® then contact IBM® Software Support.

**KFU00151E: Command syntax or parameter is not supported; REXX1=*name*  
REXX2=*name* PROBLEM=*reason* COMMAND=ALLOC**

**Explanation**

This message is a variation of message KFU00150E. In this case, the REXX exec that issued the command is not the original EXEC REXX=*name* specified in the workflow. REXX1 is the original workflow exec and REXX2 is the most recently called exec.

**System action**

The command is not processed, and the exec throws an exception. The results of the exec are unpredictable unless the exec handles error conditions.

## User response

If the REXX exec is supplied by IBM® then contact IBM® Software Support.

## Parameter Generator (PARMGEN)

---

Parameter Generator, also known as PARMGEN, is an application that you can use to configure, replicate, maintain, and update runtime environments.

With PARMGEN, you edit a comprehensive list of parameters for all the installed products and components that you want to configure in an RTE. Then, PARMGEN generates the customized files needed to execute the products, and you submit a series of jobs to create the RTE with the parameter values you specified. You can edit the parameters and submit the jobs yourself, or you can use the PARMGEN Workflow interface.

The PARMGEN configuration software often determines default values best suited to your site and validates data assigned to parameters to ensure values are in range. It checks for prerequisites and tries to ensure data sets are allocated properly and that jobs run to proper completion.

However, the configuration software cannot determine all the specifics of your site, nor precisely what you want to do with the products. So you need to customize IBM® template files to configure the products to your specifications. For example, you are probably familiar with modifying the JCL used by applications to submit jobs. At a minimum, you typically have to modify vendor-supplied JCL to add a job card and to change various values to suit your site, such as those values that define the DASD used by the job.

To help facilitate the modifications you need to make to configuration files, the IBM-provided templates are standardized to use variables and string substitutions. The values for almost all of these customizable elements are set in a single location, an editable configuration Profile. The variables names are long enough to helpfully describe the purpose of the parameter.

Sometimes data larger than a single parameter needs to be added into a runtime file. For example, PARMGEN supplies a template job card that you customize once, adding as many lines of input as necessary for your site. The whole job card file gets embedded into template configuration profiles so that the JCL is ready to be submitted. The same concept applies to other types of embedded data, such as program SYSIN data that the configuration software may conditionally embed based on the settings in your RTE profile. The \$PARSE program reads the configuration profiles and the embed files and generates tailored user versions of the IBM® templates. The output files and jobs are first stored in a work data set, so that your production files are not replaced until you are ready to implement the changes.

Variables can be resolved during the \$PARSE process or left as symbolics and substituted at runtime. The use of variables reduces the number of changes you need to make if you clone the RTE to new systems, because system-specific values are automatically picked up by the variables.

Note that both the framework and the monitoring products require additional configuration outside the PARMGEN configuration software. For example, OMEGAMON® for Db2® requires that you run some bind procedures. These product-specific additional required configuration tasks are documented in the *Planning and Configuration Guide* for each product.

## Before you begin

To ensure a successful configuration, your system should be properly prepared before you begin and you should familiarize yourself with the parameter generator, or PARMGEN, configuration method. Use the information in this section to learn about configuring Tivoli® Management Services on z/OS® using PARMGEN and the configuration process and requirements common to the OMEGAMON® family of products. Then use the information in the *Planning and Configuration Guide* for each product to learn the product-specific configuration requirements.

- Ensure that you have completed SMP/E installation of the required levels of IBM® Tivoli® Management Services on z/OS® components and OMEGAMON® products for your monitoring environment. Check that all components that you want to configure are of the minimum supported level to support the PARMGEN method.
- Back up the %GBL\_TARGET\_HILEV%.TKAN\* target libraries that were installed by SMP/E. As a minimum, back up the %GBL\_TARGET\_HILEV%.TKANMOD and %GBL\_TARGET\_HILEV%.TKANCUS libraries.
- Apply the latest HKCI310 PTF to ensure that you have the latest version of PARMGEN support.
- Ensure that the following requirements for using the PARMGEN Workflow user interface are met:

- A minimum region size of 6000K for the TSO user session

**Note:** The PARMGEN Workflow user interface uses several standard TSO/E commands, and REXX and ISPF services. If you have modified or restricted access to any of these commands or services, the PARMGEN tool may not function correctly.

- If you are planning to configure a monitoring server on a z/OS® system and intend to enable the self-describing agent feature, ensure that you have created the appropriate directory structure on z/OS® UNIX™ System Services under the Hierarchical File System (HFS) or zSeries File System (zFS). This step is required to store and process the provided self-describing files. The monitoring server also requires a Java™ RTE running under the IBM® 31-bit or 64-bit JAVA SDK Version 5 (or higher), which is to be installed within the z/OS UNIX file system. A sample job to create a zFS file system is provided in the *gbl\_target\_hilev.TKANSAM(KCIUSSJB)* member.
- Read through the checklists available through the Welcome panel of the z/OS® Installation and Configuration Tools.

For information on configuring components on distributed systems such as Windows™, UNIX™, and Linux™, see the *IBM® Tivoli® Monitoring: Installation and Setup Guide*.

## The PARMGEN configuration method

Tivoli® Management Services on z/OS® and the OMEGAMON® family of products use the Parameter Generator, or PARMGEN, configuration method. With the PARMGEN method, you edit the parameters in several configuration profiles to configure all the products and components that run in a runtime environment (RTE). Then, you submit a series of jobs to create the RTE with the parameter values you specify. The PARMGEN Workflow interface provides a convenient way for you to navigate through the steps for creating a new RTE, cloning an existing RTE, or maintaining or upgrading an RTE.

### Workflow user interface

You can manually edit and submit the jobs necessary to set up and configure runtime environments. However, you can also use the Parameter Generator (PARMGEN) Workflow interface. The Workflow interface steps you through the process of editing the PARMGEN configuration profiles, and creating, editing, and submitting the jobs that set up and tailor the runtime environment. The interface also provides access to PARMGEN libraries and utilities.

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ===>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN? <=== Revised
```

When you select option 3, the following panel is displayed:

```

----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>                               Scroll ==> PAGE

                               Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).
Press F1=Help for more information.

GBL_USER_JCL:  -----
               (for example, TDITNT.DEV.ITM63053.SYSPLEX.PARMGEN.JCL)
               Specify the dataset name of the PARMGEN common/global
               library for the different LPAR runtime environments (RTEs).
               PARMGEN stores cross-RTE values for the RTEs created
               using the same GBL_USER_JCL PARMGEN common library.

RTE_PLIB_HILEV: -----
               Specify the High-Level Qualifier (&hlq) portion of the
               PARMGEN interim staging and work libraries for this LPAR RTE:
               - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
               - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
               - &hlq.&rte_name.WCONFIG

RTE_NAME:     ----- (Type ? for a list of configured RTEs)
               Specify the runtime environment (&rte_name) for this LPAR.

```

On this panel, you identify the runtime environment that you want to create or modify. After you enter the required values, the Workflow - Primary Option Menu is presented:

```

----- PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>                               Scroll ==> PAGE

                               Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TSTEST.&userid
RTE_NAME:     DEMO

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary,
      until the status of each step is RC=0. Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1.  Set up PARMGEN work environment for an RTE.  KCIJPCFG
2.  Customize PARMGEN configuration profiles.    $MDLHFV
3.  Create the RTE members and jobs.             $PARSESV  Enter 3 for details.
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT    Enter 4 for details.
5.  Perform post configuration steps.            POSTCFG
R   Reset RTE, Status and Date fields. (Optional) New RTE

Press F1=Help for more information. Type UTIL to access utility menu.

```

See [Configuration workflow](#) for information about these options and the configuration process.

**Note:** The PARMGEN Workflow user interface uses several standard TSO/E commands, and REXX and ISPF services. If you have modified or restricted access to any of these commands or services, the PARMGEN tool may not function correctly. A minimum region size of 6000K is required for the TSO user session.

Any ISPF panel presented with a **More: - +** scroll indicator is scrollable upwards (denoted by **More: - +**) or scrollable downwards (denoted by **More: - -**). Scroll up or down using the standard ISPF keys assigned to scroll down (F7 key by default) or scroll up (F8 key by default).

### Configuration profiles

The configuration values for each runtime environment (RTE) are stored in *configuration profiles*. The *RTE configuration profile* contains the values for each runtime environment and for the components and products configured in it. The *global configuration profile* contains values for global system libraries. The *variables configuration profile* contains definitions of user-defined variables and RTE-specific system variables.

%RTE\_NAME%

The RTE-specific configuration file. This file contains parameters that define the configuration for the RTE itself, for infrastructure components and features, and for the product configured in the runtime environment. This profile is named for the runtime environment and is stored in the WCONFIG data set. The RTE configuration profile contains two types of parameters:

- RTE\$/RTE\_\* parameters, which specify values for the RTE.
- Kpp\$\* or Kpp\_\* parameters (where Kpp is the three-letter code for a component or product), which specify product-specific values.

This profile is customized by the KCIJPUP1 job with values provided during the setup of the work environment. Default values are provided for all required parameters and some optional ones.

Customization of this profile is required provide to override defaults and specify custom or site-specific values and to enable optional features.

### **\$GBL\$USR**

The configuration file for global or common system libraries and other common values that can be shared across different products. This file can be copied to other runtime environments if these global system libraries are typically the same across RTEs. This profile is stored in the WCONFIG data set. The parameters in this profile all begin with GBL\_\*.

Review of the \$GBL\$USR profiles is required to customize product-specific GBL\_\* common or global parameters that may apply to more than one product or apply to several components within a product family.

### **%GBL\_USR\_JCL(%RTE\_NAME%)**

Variables configuration file. The variables used in PARMGEN configuration and their resolved values are defined in a resolution member named GBL\_USER\_JCL(%RTE\_NAME%). This member is referred to as the *variables configuration profile*. If support for variables has been enabled for a runtime environment, any user-defined variables and their resolution values must be defined in the variables configuration profile. Any system variables whose resolution values cannot be determined from the IPL PARMLIB must also be defined.

A small subset of parameters cannot use variables. See [Parameters ineligible to use variables](#) in the Reference section for more information.

PARMGEN maintains default RTE (\$CFG\$IBM) and global profiles (\$GBL\$IBM), which are used as the templates for user-customized profiles. These default profiles are refreshed with any new or changed configuration parameters when the KCIJPUP1 job is run during upgrades or maintenance.

Default values are provided for all required parameters and for some optional parameters. If you do not want to customize these parameters, and you do not want to enable optional features, you can complete the configuration by accepting these defaults. Otherwise, you can specify custom values for these parameters. You can also specify custom values for optional parameters that have no defaults.

**Tip:** The PARMGEN configuration profiles can have a large number of parameters to review. It might be useful, therefore, to exclude certain PARMGEN parameters while you focus on a particular configuration task. For example, exclude all PARMGEN parameters that are for started tasks. Then, find all occurrences of these parameters so you can quickly use a CHANGE ALL command. PARMGEN configuration provides an EXCLUDE-FIND (XF) macro for this task (see [“XF edit macro” on page 426.](#)).

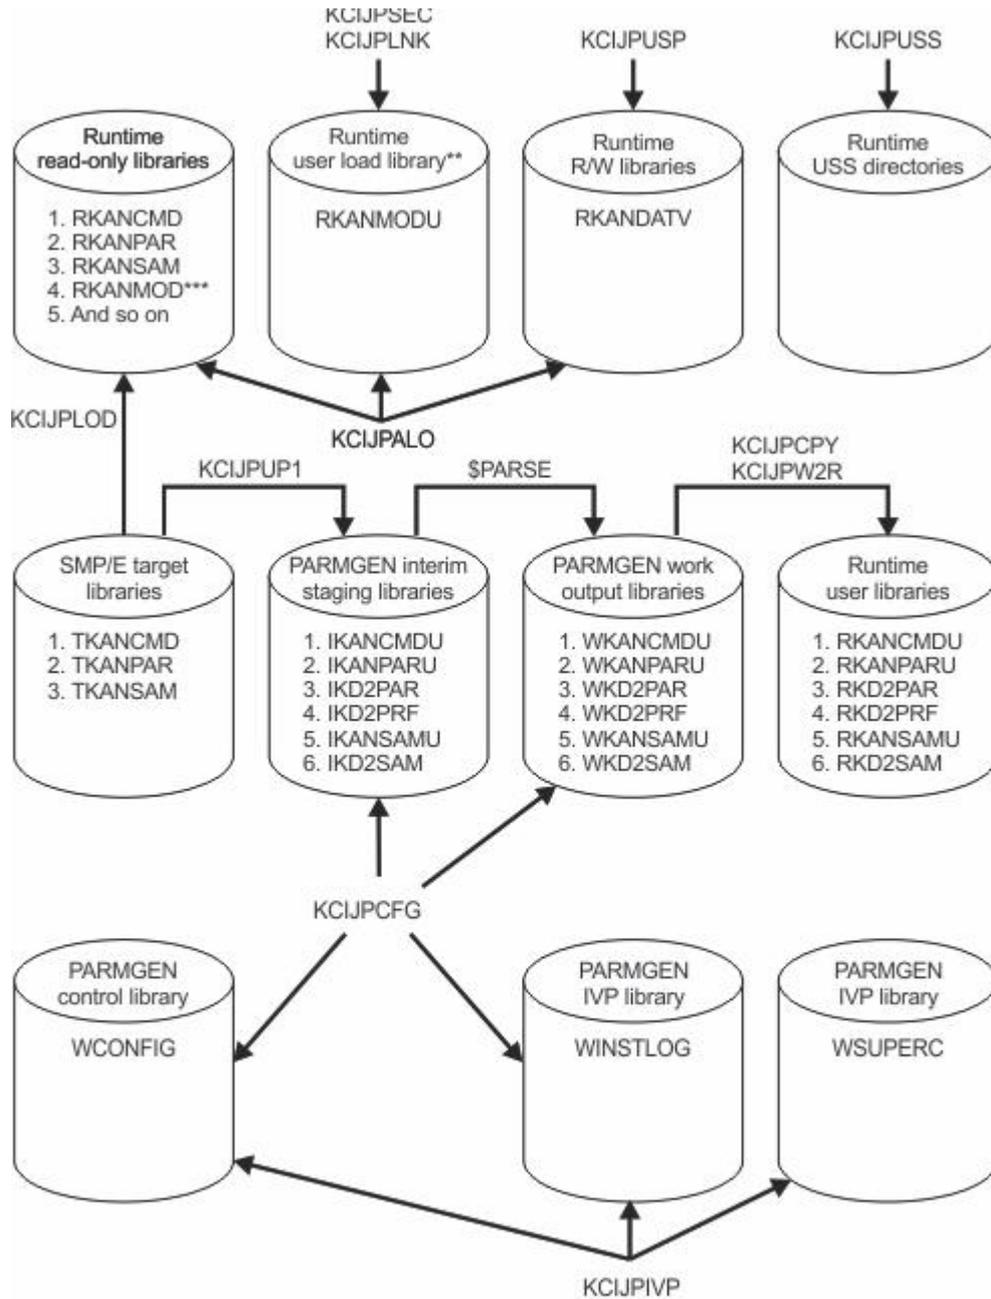

For help with the parameter values, consult the following resources:

- Comments in the profiles
- Online help for parameters (F1)
- [“Common parameters” on page 1257](#)
- The *Parameter Reference* for each product

## **PARMGEN batch jobs**

Using the PARMGEN method, you create runtime environments by submitting a series of batch jobs. These jobs are tailored with the values you specify in the configuration profiles, and with the values you supply either by editing the jobs directly or by providing values in the PARMGEN Workflow configuration panels.

“Figure: PARMGEN libraries and the PARMGEN jobs that create and populate them” on page 417 shows the PARMGEN-created jobs and the libraries that they create and populate, grouped by functional area.

\*\* For security and global modules

\*\*\* %KD2\* libraries are allocated if the OMEGAMON XE for DB2 PE/PM component is configured in the runtime environment (RTE).

Figure 71: PARMGEN libraries and the PARMGEN jobs that create and populate them

The \$JOBINDX member is an index of jobs used by PARMGEN. The names and descriptions of the jobs are presented in the order in which they should be submitted. You can review this file from anywhere in the Workflow interface by entering UTIL on the command line.

## Override embed members

A PARMGEN configuration creates a set of files that get embedded in a number of the most commonly updated runtime members in the user libraries. These embed files can be used to add new user-defined parameters that might otherwise be overwritten when maintenance or upgrades are performed, or to override existing values.

The embed files include the following members:

Kpp\$C\*,  
Kpp\$P\* and Kpp@P\*  
Kpp\$S\*  
KCI\$XW2R

where \* represents either ENV, SYSIN, or *started\_task\_name*. The embed members are copied from the IK\* interim staging libraries to the corresponding WCONFIG PARMLIB control library by the KCIJPUP1 (Refresh IK\* templates/WCONFIG \*\$IBM profiles) job, or the KCIJPPRF profile refresh job which is equivalent to the KCIJPUP1 job except the user LPAR RTE profile is refreshed automatically. These members are then embedded into the appropriate members (such as started tasks and profiles) by the \$PARSE or \$PARSESV job. For a list of embed files, the library in which the affected member is located, and the purpose of the embed file, see [Customizing the override embed members](#).

To enable the embed parameters, complete the following steps.

- For an existing Run Time Environment (RTE):
  - a. Edit %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(&imbed\_name) referenced by the enabling product PTF or new product version. Modify the parameter accordingly before rerunning the WCONFIG(\$PARSE) job.

**Note:** The new default parameter is typically introduced in a PARMGEN APAR maintenance. For existing RTEs created before the PARMGEN APAR that introduced the new parameter, the WCONFIG(&imbed\_name) already exists. To enable the function, add the new override parameter to WCONFIG(&imbed\_name).

- b. Submit WCONFIG(\$PARSEPR) job to recreate the RTE's %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WKANPARU(&runtime\_member) where the &imbed\_name is imbedded.
  - c. Submit WKANSAMU(KCIJPW2R) job to refresh the &runtime\_member from the PARMGEN work dataset (WKANPARU for example) to the corresponding product execution user library (RKANPARU for example) when you are ready to stage your runtime member updates.
  - d. Recycle the product started task.
  - e. Repeat step 1 to step 4 for additional RTEs that will enable the function.
- For a new Run Time Environment (RTE):
    - a. Follow the preferred RTE Implementation Scenario documented in [Implementation scenarios](#).
    - b. As part of the "Customizing the configuration profiles" step, edit %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(&imbed\_name) that will override the WKANPARU(&runtime\_member). Modify the parameter accordingly before rerunning the WCONFIG(\$PARSE) job.
    - c. Complete the remaining steps as documented in the RTE Implementation Scenario.

To preserve these customizations, embed files are not overlaid during maintenance or upgrades. To refresh the files, you must rename them. Then, after the new files have been created, you can merge back in any customizations you have made from the backed up version.

Edit the embed files before you run the \$PARSE (or \$PARSESV) job. You can edit the files using the PARMGEN Workflow interface. Select option **4** on the **Customize PARMGEN Profile Members** panel, or enter **UTIL** on the command line of any Workflow panel to access the **Utilities** panel and select the WCONFIG library (option **7**). After you customize the files, you can copy the tailored versions from one runtime environment to another. You can use the KCIJPCCF utility job to copy them.

The OLDWCNFG DDNAME in the KCIJPCCF job can be edited to copy the imbeds from either another RTE's WCONFIG dataset, or the PARMGEN IK\* template datasets. Consider the following conditions before submitting the \$PARSE job.

- WCONFIG override imbeds are preserved.
- Review the deltas and implement the changes accordingly if you want to exploit the changes. You can rename the WCONFIG(Kpp\$\*) imbed prior to resubmitting the KCIJPPRF or KCIJPUP1 job if you want to refresh your copy. Note that these members are typically preserved so KCIJPPRF or KCIJPUP1 job will not update your WCONFIG(Kpp\$\*) user copy if the imbed already exists in WCONFIG library. Merge back your original customizations accordingly into the refreshed WCONFIG override imbed.
- Kpp\$\* refresh considerations:

- KCIJPPRF profile refresh job is rebuilt by the KCIJPCFG if you provide a backup LPAR RTE profile name.
- The quickest way to find deltas is to compare your original WCONFIG imbed (backup copy) with the refreshed version or with the copy in the respective PARMGEN IK\* library. For example, if an imbed is called WCONFIG(Kpp\$PENV), this imbed is processed by the \$PARSE job into the WKANPARU(KppENV) runtime member. It means that the IBM default version of Kpp\$PENV is in the PARMGEN IKANPARU library. The preserved user copy is in your WCONFIG(Kpp\$PENV).
- If you want to move the Kpp\$\* imbeds out of the WCONFIG dataset into a new backup dataset, you can use the KCIRMVCP macro. See *KCIRMVCP move/copy/allocate macro and KCIPCPY\* panels help* topic for more information. Once the imbeds are removed from the WCONFIG dataset, the KCIJPUP1 or KCIJPPRF job will copy the latest versions of the imbeds from the PARMGEN IK\* template datasets to the RTE's WCONFIG dataset.

Individual products may include their own embed members. See the product configuration documentation for more information.

## Model configuration profiles

PARMGEN provides a number of model profiles to be used as templates for creating runtime environments (RTEs). These templates make it easy for users who do not need site-customized environments to quickly create RTEs of the most frequently built types.

**Important:** If you use one of the PARMGEN model profiles described in this topic to create your runtime environment, you will need to make updates to the configuration to support the latest product features and best practices.

For an improved process of creating your runtime environment that automatically uses the most current and recommended settings, consider moving to Configuration Manager. For more information, see [“Best practices for configuring OMEGAMON products and components” on page 213](#).

The IBM-provided models are copied to the % RTE\_PLIB\_HILEV%.%RTE\_NAME%.RKANSAMU library. You select a configuration to use as the model for your RTE when you set up the work libraries by entering a question mark (?) in the model profile field on the **Set up PARMGEN Work Environment for an RTE (1 of 3)** panel (KCIPQPG1).

The \$MDLVARS model contains symbols for the best-practice variables. Cloning the \$MDLVARS member substitutes the symbols for a subset of parameter values in the RTE configuration profile. Then, you customize the resolution values in the variables profile to suit your site. Using \$MDLVARS saves you from having to update dozens or even hundreds of parameters manually. For more information about using these predefined variables, see [How to: Merge predefined variables into configuration profiles](#).

The following are best-practice configurations for RTEs.

This table summarizes the features of the runtime environments in the Quick configuration scenarios.

Scenario	Template name	RTE type	Monitoring server type	System variables	Description
QCF01	\$MDLHA	Full	High-availability hub	No	RTE configuration template for full, standalone RTE (High Availability (HA) Hub TEMS)
QCF02	\$MDLHFV	Full	Static hub	Yes	RTE configuration template for full, standalone RTE (Static Hub TEMS and Agents with variables enabled)

Scenario	Template name	RTE type	Monitoring server type	System variables	Description
QCF03	\$MDLRSBV	Sharing-with-base	Remote	Yes	RTE configuration template for sharing-with-base read-only libraries RTE (Remote TEMS and Agents with variables enabled)
QCF04	@MDLHF	Full	Static hub	No	RTE configuration template for full, standalone RTE (Static Hub TEMS and Agents)
QCF05	@MDLRF	Full	Remote	No	RTE configuration template for full, standalone RTE (Remote TEMS and Agents)
QCF06	@MDLRFV	Full	Remote	Yes	RTE configuration template for full, standalone RTE (Remote TEMS and Agents with variables enabled)
QCF07	@MDLRSB	Sharing-with-base	Remote	No	RTE configuration template for sharing-with-base read-only libraries RTE (Remote TEMS and Agents)
QCF08	@MDLRSS	Sharing-with-SMP/E	Remote	No	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Remote TEMS and Agents)
QCF09	@MDLRSSV	Sharing-with-SMP/E	Remote	Yes	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Remote TEMS and Agents with variables enabled)
QCF10	@MDLHSS	Sharing-with-SMP/E	Hub	No	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Static Hub TEMS and Agents)
QCF12	@MDLHSB	Sharing-with-Base	Hub	No	RTE configuration template for sharing-with-base read-only libraries RTE (Hub TEMS and Agents)
QCF13	\$MDLAFV	Full	Remote	Yes	RTE configuration template for full, stand-alone RTE (Agents only with variables enabled connecting to a z/OS TEMS in another RTE)

Scenario	Template name	RTE type	Monitoring server type	System variables	Description
QCF14	@MDLAF	Full	Remote	No	IBM-provided RTE configuration template for full, standalone RTE (Agents only connecting to a z/OS TEMS in another RTE)
QCF15	\$MDLASBV	Sharing-with-base	Remote	Yes	RTE configuration template for sharing-with-base read-only libraries RTE (Agents only with variables enabled connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)
QCF16	@MDLASB	Sharing-with-base	Remote	No	RTE configuration template for sharing-with-base read-only libraries RTE (Agents only connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)
QCF17	@MDLASSV	Sharing-with-SMP/E	Remote	Yes	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Agents only with variables enabled connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)
QCF18	@MDLASS	Sharing-with-SMP/E	Remote	No	RTE configuration template for sharing-with-SMP/E datasets RTE (Agents only connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)
QCF19	\$MDLHSSV	Sharing-with-SMP/E	Hub	Yes	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Static Hub TEMS, enhanced 3270 user interface (TOM) and OMEGAMON for JVM (KJJ) Agent only with variables enabled)

Scenario	Template name	RTE type	Monitoring server type	System variables	Description
QCF20	\$MDLHSS	Sharing-with-SMP/E	Hub	No	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Static Hub TEMS, enhanced 3270 user interface (TOM) and OMEGAMON for JVM (KJJ) Agent only)

The use of these model profiles is documented in the QCF [Implementation scenarios](#). @MDLHSS, which forms the basis for QCF Scenario 10, is suggested for creating a proof-of-concept or test RTE.

## PARMGEN generated runtime members

The PARMGEN configuration process allocates a set of libraries which contain runtime members that are tailored by the \$PARSE job and referenced at the time product started task are executed.

### xKANCMDU

Contains startup members.

### xKANPARU

Contains parameter members, environment file members, and near-term history persistent datastore control files.

### xKANSAMU

Contains sample jobs and file-tailored jobs, started tasks, VTAM nodes, security jobs, allocation and load jobs, and the like.

PARMGEN creates a started task (STC) for every product and component that is configured in a runtime environment (RTE). The STCs are included in a composite STC that can be used to start all the products and components, in the required order. The composite STC is named %RTE\_STC\_PREFIX%STRT, where %RTE\_STC\_PREFIX% is the started task prefix that is specified in the **RTE\_STC\_PREFIX** parameter. By default, all started tasks are started. Comment out the START statement for any STCs that are not in use. The started tasks must be copied from the WKANSAMU library to your GBL\_SYS1\_PROCLIB library (default SYS1.PROCLIB).

The KCIJPSYS job copies runtime members, such as started tasks and VTAM® major node members, for the products and components into system libraries. The job also copies several optional members for your use:

- %RTE\_STC\_PREFIX%APF: composite SETPROG/VARY ACTIVATE member listing load libraries that must be APF-authorized for the different products.
- %RTE\_STC\_PREFIX%STRT: composite /S startup of all customized product started tasks from the RTE's WKANSAMU library to the customized global system procedure library
- %RTE\_STC\_PREFIX%STOP: composite /P stop. - .

The job also assembles or links product modules into system libraries.

The KCIJPSYS job is submitted from the **Submit Batch Jobs to Complete PARMGEN Setup** panel. You can submit it individually or using the composite submit job KCIJPSUB. The KCIJPSYS job is not automatically submitted by KCIJPSUB, because it requires write access to system libraries. If you use the composite job, you must uncomment the KCIJPSYS job in the KCIJPSUB JCL.

## Utilities

The Parameter Generator (PARMGEN) software provides a number of utilities to assist you in performing configuration tasks, such as editing configuration members, submitting stand-alone utility jobs, and accessing configuration readme files. PARMGEN also supports an EXCLUDE FIND macro.

## Utilities panel

From the **Utilities** panel you can edit the members of the configuration libraries, access a set of readmes, and submit utility jobs.

You can access the **Utilities** panel through the Workflow interface by entering UTIL on the command line of any panel.

```

 15. Composite PARMGEN z/OS Discovery Library Adapter (DLA) job. KCIJPDLA
      ** OI **
 16. Create the z/OS DLA IDML books on active z/OS resources. KCIJPD L1
 17. Generate PARMGEN $DLARPT report from DLA IDML books dataset. KCIJPD L2
 18. Refresh DEMO/$GBL$USR user profiles with $DLARPT data. KCIJPD L3
 19. Generate $SYSVAR autodiscovered system/user symbols report. $PARSEDV

Submit a utility job (Maintenance):
      Description                                         Job/Label
-----
 20. Refresh IK* templates/WCONFIG *$IBM profiles. KCIJPUP1
 21. Convert an ICAT RTE Batch member. KCIJPCNV
 22. Merge profile from a backup LPAR RTE profile. KCIJPMCF
 23. Validate PARMGEN profile parameter values. KCIJPVAL
 24. Back-up WK* work user libraries. KCIJPCPW
 25. Back-up RK* product execution user libraries. KCIJPCPR
 26. Recall migrated DEMO RTE datasets. KCIJPHRC
 27. Compare work and runtime user libraries. KCIJPSPC
 28. Empty runtime members in RK* user libraries. KCIJPMTY
 29. Copy WK*->RK* user libraries keeping EXCLUDE members. KCIJPW1R
 30. Restore back-up user libs. to current set. KCIJPB2R
 31. Resolve system symbolics in PARMGEN jobs. KCIJVS RV
 32. Collect diagnostic information for this RTE. KCIJPCOL
 33. Delete RTE: DEMO KCIJPDEL

Submit a utility job (Clone/Transport):
      Description                                         Job/Label
-----
 34. Clone customized WCONFIG members. KCIJPCCF
 35. Allocate read-only base RK* libraries. KCIJPBSA
 36. Load read-only base RK* libraries. KCIJPBSL
 37. Clone customized data from another RTE. KCIJPCLN

Press F1=Help for more information.
```

**Note:** Depending upon your screen resolution, you might have to scroll down to see all the options on the panel. Look for the MORE+ that indicates there are additional options.

## Runtime Environments (RTEs) panel

The **Runtime Environments (RTEs)** panel provides a list of the configured RTEs in the PARMGEN global library and a set of actions you can perform on selected RTEs or on all RTEs in the library.

You access the **Runtime Environments (RTEs)** panel by typing a question mark in the **RTE\_NAME** field of the Workflow menu.

```

----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>                               Scroll ==> PAGE

                               Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).
Press F1=Help for more information.

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
               (for example, TDITNT.DEV.ITM62351.SYSPLEX.PARMGEN.JCL)
               Specify the dataset name of the PARMGEN common/global
               library for the different LPAR runtime environments (RTEs).
               PARMGEN stores cross-RTE values for the RTEs created
               using the same GBL_USER_JCL PARMGEN common library.

RTE_PLIB_HILEV: TDITN.IDTST_____
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:     ?DOCRTE_ (Type ? for a list of configured RTEs)
               Specify the runtime environment (&rte_name) for this LPAR.

```

Figure 72: Invoking the Runtime Environments (RTEs) panel

“Figure: The Runtime Environments (RTEs) panel ” on page 424 shows the Runtime Environments panel.

```

KCIP@RTE ----- RUNTIME ENVIRONMENTS (RTEs) ----- Row 6 to 10 of 17
Command ==>                               Scroll ==> PAGE
Locate the RTE you want to process from the list of RTEs inventoried from
the PARMGEN global library (QISUN.IDTST.PARMGEN.JCL).
See F1=Help for additional cross-RTE Actions/RTE Commands available.

Single RTE Actions: Type the action character next to the RTE name:
  "S" or "/" Switch to an RTE.
  "P" Display the products configured in an RTE.
  "D" Delete an RTE. You cannot delete the active RTE.

Multiple RTE Actions: Type the action character next to one or more RTEs:
  "L" Copy read-only (RO) elements from the SMP/E target libraries
      to the RO RK* runtime libraries (KCIJPLOD job).

Multiple RTE Commands: Type the indicated command on the command line:
  "LOADALL" Submit multi-load (KCIJPLOD) job for all listed RTEs.
  "SHOWDESC"/"HIDEDESC" Show/Hide RTE Description for all listed RTEs.

RTE Name Read-only (RO) shared libraries (SHRLIBs)      Load SHRLIBs?  VARS?
_ DEMO    N/A (TSTEST.CCAPI.DEMO.RK* FULL RTE libs)      N/A (FULL RTE)  N
_ DEMOHA  N/A (TDITN.IDTST.DEMOHA.RK* FULL RTE libs)     N/A (FULL RTE)  N

```

Figure 74: Runtime Environments (RTEs) panel with descriptions displayed

From this panel, you can perform the following actions.

**Single RTE actions**

The following actions can be performed on a single selected RTE by typing the action character next to the RTE name:

**S or /**

Switch to an RTE. Use this action to select a different RTE to reconfigure using the Workflow panels. After you enter your selection, you are returned to the main panel.

**P**

Display a list of the products and components. Use this action, for example, to find an RTE you want to clone.

**D**

Delete an RTE.

**Multiple RTE actions**

You can perform the following actions on one or more selected RTEs:

**L**

Copy read-only files from the SMP/E target libraries to the user runtime libraries.

**W**

Copy files from the WK\* work libraries to the user RK\* libraries.

**Global RTE commands**

You can perform the following actions by typing the indicated command on the command line:

**LOADALL**

Copy read-only files from the SMP/E target libraries to the user runtime libraries for all listed RTEs.

**W2RALL**

```

```

For more information about the available commands, see [“PARMGEN z/OS DLA utility jobs and commands” on page 442](#).

## Configuration workflow

The process of creating a new runtime environment (RTE) is streamlined. You perform only four steps to configure a new RTE whether you are creating from scratch, using a product-provided model, or cloning an existing PARMGEN RTE. The configuration software automatically runs any required update, merge, clone, and conversion jobs, as appropriate.

There are four ways of creating a new runtime environment in PARMGEN:

- From scratch.  
Creating an RTE from scratch means that you provide all the required information to define and configure the RTE. There are no presets, other than parameter defaults.
- By modifying a product-provided model RTE  
Using one of the provided model RTEs means that you do not have to do as much configuration. There are many preset features, depending on which template you select, such as support of system and user-defined variables.
- By cloning (and possibly modifying) an existing PARMGEN RTE  
Cloning an existing PARMGEN RTE allows you to create the RTE using values you have already customized for your site.

Creating a new runtime environment requires four steps:

1. Setting up the PARMGEN work environment.
2. Editing the configuration profiles.
3. Creating the runtime members and jobs.
4. Submitting the jobs to set up the configured runtime environment.

However, you will need to complete additional configuration steps outside the configuration software to complete the configuration.

The steps required to apply maintenance or to upgrade an environment depends upon whether or not you want to exploit or customize any new features.

## Accessing the Workflow menu

On the **Installation and Configuration Tools Welcome** panel, when you select option 3 (Configuration Workflow), you are presented with a panel on which you identify or define the runtime environment (RTE) that you want to configure. After you enter the information, the **Workflow - Primary Option Menu** is displayed.

### About this task

Take the following steps to access the Workflow interface:

#### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```

KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM

```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```

KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT      /  STORCLAS /
                                VOLSER   /  MGMTCLAS
GBL_TARGET_HILEV: _____ / _____ /
                                HLQ of SMP/E target (TK*) datasets  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:

```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Specify the requested values to define or identify the runtime environment (RTE) that you want to create or modify.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN . IDTST . PARMGEN . JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN . IDTST .

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. After you supply the appropriate values, press Enter to proceed to the **Workflow Primary Options Menu**. If you entered the name of a new RTE on the panel, the following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```

KCIPQPGB  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

      Description                               Job/Label  Status    Date
      -----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.   SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.          POSTCFG
R   Create next RTE - Reset fields.           New RTE

```

## Setting up the work environment

The **Set up the PARMGEN Work Environment** option on the Workflow primary options menu presents a series of panels in which you provide or review information about the specified runtime environment (RTE), such as the type of RTE, the properties of the RTE, the products configured in it, and certain values common to all the products. The configuration software uses this information to set up the work environment by updating the interim libraries, creating or updating the configuration profiles, and running any additional required jobs (clone, convert, merge).

### Before you begin

If you are setting up a new RTE, review [Planning a first deployment](#). Make sure that you understand what an RTE is, that you know what type of RTE you want to configure, what products and components you want to configure in the RTE, and what naming conventions you will follow. If possible, ensure that all prerequisites (such as authorizing new started tasks) are met.

Access the Workflow - Primary Option Menu (see [“Accessing the Workflow menu” on page 428](#)).

### About this task

If you are creating a new RTE from scratch, you use the panels to specify a number of global attributes and properties of the RTE. If you are configuring a new RTE that is based on an existing RTE or on an IBM-supplied model profile, the configuration software extracts the required information from the model. You modify the values that are presented to customize the new RTE. Similarly, if you are reconfiguring an existing RTE (for example, to apply maintenance or upgrade the RTE), you use these panels to modify an existing RTE.

The following procedure documents the series of panels that collect the information that is required to set up the environment.

### Procedure

1. From the **Workflow - Primary Option Menu**, select **Set up PARMGEN work environment for an RTE**. The **Set up PARMGEN Work Environment for an RTE (1 of 3)** panel (KCIPQPG1) is displayed:

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>

                                Quick Configuration Mode

                                More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSMEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSMEMBER=%SYSMEMBER%-----
==> /*** \~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==>
(Type ? for last referenced JOBGEN library discovered, if any.)

```

2. Complete the fields as appropriate, then press Enter to continue.

### RTE model profile

The information you provide in the RTE model profile field determines what jobs the configuration software will run after the work environment is set up. The following options are available:

- If you are creating a brand new RTE, leave this field blank. In this case, the configuration software sets up the RTE using only values that you provide.
- If you want to create an RTE based on an IBM-provided model RTE, enter a question mark ("?) and select the model that matches your needs.
- If you want to create (clone) an RTE based on an already configured PARMGEN RTE, provide the WCONFIG profile library and member name for that RTE (for example: *hilev.rte.WCONFIG(rte\_name)*, where *rte\_name* is the member you want to clone from).

If a value is supplied, PARMGEN queries the member to determine what products or components are already configured within the RTE to tailor the configuration parameters set. If the specified data set or member does not exist, you are prompted to correct the name.

### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*.TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed:

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                                Quick Configuration Mode
GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:     SYSA

Enter parameter values appropriate for your environment:
                                UNIT   /  STORCLAS /
                                VOLSER /  MGMTCLAS /
GBL_TARGET_HILEV: IBM.TARGET.ITM63055_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  _____
GBL_SYSDA_UNIT:   SYSDA___
                   Work datasets UNIT name
GBL_REGION:      0M_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

- The values on this panel are read from the profile library and runtime member name you specified on the preceding panel. Review the values on the panel and override them as necessary, then press Enter to proceed to the next panel.

**GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, 0M). The default is 0M.

The **Set up PARMGEN Work Environment for an RTE (3 of 3)** panel (KCIPQPG3) is displayed. The values that are already specified on this panel are determined by the information you provided on previous panels, especially the RTE model profile. If you did not specify a model RTE profile, these values are the IBM® defaults. If you specified a model profile, the values are taken from that profile. The values on this panel are inherited by the corresponding parameters in the configuration profile for the new RTE.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      DEMO description_____
More:                +

RTE_TYPE:             FULL_____ (Full, Sharing)
RTE_HILEV:           TDITN.IDTST_____ (ex.: TDITN.IDTST
(&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:     TDITN.IDTST_____ (ex.: TDITN.IDTST
(&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:     _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:   _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:   _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
(&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
(*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y (Y, N) (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: N (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   _____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:   _____
GBL_DSN_ACF2_MACLIB1:  _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:         HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:      -- (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:     1918_____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:       IBM_____ (1-4 char.started task prefix)
Note: Type BACK to go back one panel. Type UTIL to access utility menu.

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is more content on the panel.)

4. Customize the following parameters as appropriate.

#### **RTE\_DESCRIPTION**

A brief description that characterizes the RTE. This description is useful when you are choosing an RTE to clone and you want to select for certain features.

#### **SMS parameters**

If you are using a SMS-managed high-level qualifier index, volume, unit, storage class, and management class parameters for the global **RTE\_\*** parameters and the **Kpp\_\*** product-specific parameters are not required. If you are using non-SMS-managed **RTE\_HILEV** and **RTE\_VSAM\_HILEV** high-level qualifiers, the **RTE\_SMS\_VOLUME**, **RTE\_SMS\_VSAM\_VOLUME**, and **RTE\_SMS\_UNIT** values are required, as well as the product-specific **Kpp\_\*** VOLUME, UNIT, STORCLAS, and MGMTCLAS equivalent parameters. (Certain products allow for product-specific **Kpp\_\*** VOLUME, UNIT, STORCLAS, and MGMTCLAS parameters for their specific data set needs.) Review all **\*\_VOLUME** and other SMS and non-SMS parameters in the `WCONFIG(rte_name)` RTE configuration profile.

#### **RTE\_SMS\_PDSE\_FLAG**

Specifies whether (Y or N) partitioned data sets are to be allocated as PDSE. The default is Y.

#### **RTE\_SMS\_UNIT**

Specifies the non-VSAM disk UNIT type to be used for data set allocation.

#### **RTE\_SMS\_VOLUME**

Specifies the non-VSAM disk VOLSER to be used for data set allocation.

#### **RTE\_SMS\_MGMTCLAS**

Specifies the non-VSAM disk MGMTCLAS to be used for data set allocation.

#### **RTE\_SMS\_STORCLAS**

Specifies the non-VSAM disk STORCLAS to be used for data set allocation.

#### **RTE\_SMS\_VSAM\_VOLUME**

Specifies the VSAM disk VOLSER to be used for data set allocation.

#### **RTE\_SMS\_VSAM\_MGMTCLAS**

Specify the VSAM disk VOLSER to be used for data set allocation. Specify the VSAM disk MGMTCLAS to be used for data set allocation.

#### **RTE\_SMS\_VSAM\_STORCLAS**

Specifies the VSAM disk STORCLAS to be used for data set allocation.

### **RTE parameters**

#### **RTE\_TYPE**

Specifies the type of RTE being created. The following types are valid:

##### **Full**

Allocates both private and base libraries. Use this type if you have only one RTE or if you have an RTE for an unique set of products.

##### **Sharing**

Allocates private libraries only. This type can either share base libraries with a base or full RTE, or use target libraries that were installed by SMP/E for its base libraries. Define one sharing RTE for each z/OS® image.

**Note:** In PARMGEN, base libraries are created as part of creating the first RTE that shares the base. RTEs created after this one can point to the existing base using the **RTE\_SHARE** parameter.

#### **RTE\_HILEV**

Specifies the non-VSAM high-level qualifier that you want to use for the allocation of the non-VSAM production runtime (RK\*) libraries. By default, the initial value for a brand new RTE is the **RTE\_PLIB\_HILEV** value that you specified on the Parameter Generator (PARMGEN) Workflow - Welcome panel.

#### **RTE\_VSAM\_HILEV**

Specifies the VSAM high-level qualifier that you want to use for the allocation of the VSAM production runtime (RK\*) libraries. By default, the initial value for a brand new RTE is the **RTE\_PLIB\_HILEV** value you specified on the **Parameter Generator (PARMGEN) Workflow - Welcome** panel.

### **Sharing RTE parameters**

#### **RTE\_X\_HILEV\_SHARING**

Specifies the value of the non-VSAM high level qualifier of the RTE being shared to.

#### **RTE\_SHARE**

Specifies the name of the Base or Full RTE from which the sharing RTE obtains its base library information. Required for a sharing RTE.

## RTE\_LOAD\_SHARED\_LIBS

Determines whether to include the shared libraries in the Load job of a sharing-with-base or sharing-with-full RTE. Accept the default value (Y) to ensure that all maintenance is loaded properly into the RTE.

**Tip:** If you have multiple RTEs that share read-only data sets, configure only one of the environments to load the common shared base libraries (**RTE\_LOAD\_SHARED\_LIBS=Y**). Set all the other sharing environments set to N. This configuration prevents the same libraries from being loaded every time that you run the KCIJPLOD load job for each sharing environment.

- To create a sharing-with-base environment, specify a name for the shared (base) RTE using **RTE\_SHARE** and the high-level qualifier for the shared RTE using **RTE\_X\_HILEV\_SHARING**.
- To create a sharing RTE that shares target libraries that were installed by SMP/E, provide the value SMP for **RTE\_SHARE**.
- To create a sharing-with-full environment, provide the name and high-level qualifier of the full RTE. If the RTE you specify has not yet been created, the configuration software creates the libraries for the full environment you have yet to create. If the RTE you are creating will have variables enabled, you can use symbolics to specify these values so that you will not have to replace started tasks across RTEs.

## Variables (symbolics) parameters

### RTE\_SYSV\_SYSVAR\_FLAG

Indicates whether to enable use of variables. Using variables allows systems to share PARMGEN definitions while using unique values in those definitions.

If you are going to use variables, set any occurrence of the system name here or in the configuration profile to &SYSNAME.. (For example, set **RTE\_TEMS\_NAME\_NODEID** to PLB3&SYSNAME. : CMS.)

## Security parameters

### RTE\_SECURITY\_USER\_LOGON

Security system to be used for the RTE. If you specify a security system, verify that it is installed and configured correctly for your site. Specify one of the following values: RACF®, ACF2, TSS, NAM, SAF, or None. If you specify ACF2, you must also provide the name of the ACF2 macro library as the value of the **GBL\_DSN\_ACF2\_MACLIB** parameter. The System Authorization Facility (SAF) provides a generic API to interface to z/OS® security software.

Specifying a security system here indicates which system is used for security validation of users who sign on to the Tivoli® Enterprise Portal, but it does not enable validation. Security validation of users is enabled by the **KDS\_TEMS\_SECURITY\_KDS\_VALIDATE** parameter.

### RTE\_SECURITY\_FOLD\_PASSWORD\_FLAG

Determines if password and password phrase (passphrase) values are folded to uppercase. By default, logon password and passphrase values are folded to uppercase (default value Y). If you want to implement mixed-case password and passphrase values, set this field to N.

### RTE\_SECURITY\_CLASS

Specifies a common System Authorization Facility (SAF) security class name for OMEGAMON® Enhanced 3270 user interface security controls. The individual products have SAF security settings that are specific to them (for example, to secure product-specific Take Action requests). For more information, see the product-specific documentation.

### RTE\_X\_SECURITY\_EXIT\_LIB

Specifies the name of the global library that houses all the OMEGAMON® and Tivoli® Management Services related product security exits (such as KOBSPDPT OMEGAMON® KppSUPDI exits, TMS:Engine security exits, external security exits). This value overrides the SYSIN DD statement where the user exits may have been customized (if other than the default RKANSAM location). The KppJPSC3 input members to the composite KCIJPSEC security job point the SYSIN DD statement to RKANSAMU by default. If you must make further changes to the sample exit, copy

the user exit to the `xKANSAMU` library, and make your changes accordingly. Then, modify the `RTE_X_SECURITY_EXIT_LIB` parameter and change the value to `RKANSAMU` instead.

#### **GBL\_DSN\_ACF2\_MACLIBn**

Specifies the name of an ACF2 macro library. Parameter `GBL_DSN_ACF2_MACLIB` is required if the value specified for the `RTE_SECURITY_USER_LOGON` environment variable is `ACF2`. To specify an additional ACF2 macro library, use parameter `GBL_DSN_ACF2_MACLIB1`.

### **Monitoring server settings**

#### **RTE\_TEMS\_CONFIGURED\_FLAG**

Specifies whether a Tivoli® Enterprise Monitoring Server is to be configured in this RTE. Required for a full or sharing RTE that contains a monitoring server. If you are creating an RTE for stand-alone monitoring agents without a monitoring server, specify `N`. Otherwise, specify `Y` (the default) to allocate libraries for the monitoring server.

#### **RTE\_TEMS\_NAME\_NODEID**

Specifies the unique name that identifies the monitoring server for internal processing. Required for a full or sharing RTE that contains a monitoring server.

#### **KDS\_TEMS\_TYPE**

Specifies whether to configure a hub monitoring server or a remote monitoring server.

#### **KDS\_TEMS\_HA\_TYPE**

Specify whether to configure the Tivoli® Enterprise Monitoring Server as a high-availability hub. This configuration requires a sysplex environment with dynamic virtual IP addressing (DVIPA) and shared DASD. A high-availability hub is configured in its own RTE, without monitoring agents, and can be configured on the same LPAR with a remote monitoring server.

### **Communications and started task settings**

#### **RTE\_TCP\_PORT\_NUM**

Number of the well-known port to be used for IP communications. For detailed information about assigning port numbers, see [Port number assignments](#) in the Planning topics.

#### **RTE\_VTAM\_APPLID\_PREFIX**

This parameter specifies the prefix to be used when building the VTAM applids for products in this RTE. If variables are enabled in this RTE, you can use a symbolic for this value (for example, `k&SYSCONE`). The resolved prefix can have a maximum of 4 characters. Be sure to place a period (.) after the last symbolic in the specification. If none of the products or components you intend to configure require SNA communications, delete the default value and leave this parameter value blank.

#### **RTE\_STC\_PREFIX**

For full and sharing RTEs, specify a prefix to be used when generating started task procedures for products that are configured in the RTE. The default value of `IBM` is provided, but specifying your own prefix prevents confusion with jobs generated by other RTEs on the same system.

- If required by your site conventions, use `RTE_STC_PREFIX` to specify a prefix of up to 4 characters to replace the default `IBM`® prefix for the names of started tasks that are created by the configuration software. If you choose to use symbolics, you can use up to 18 characters that resolve to 4 characters. For example, `&SYSCONE` . .
- If required by your site conventions, use `RTE_VTAM_APPLID_PREFIX` to specify a prefix of up to 4 characters (or a symbolic of up to 18 characters that resolve to 4) for all VTAM® major nodes and applids. For example, `TS&SYSCONE` . .

5. After you specify all required parameters, press `Enter`. The **Include Products in this PARMGEN RTE** panel (`KCIP@PGI`) is displayed. This panel lists the products that are installed in the CSI target zone and are therefore available for configuration. By default, all of the products in the target zone are selected. If you specified an existing PARMGEN WCONFIG profile as the model, only the products that are configured within that member are selected. If the list exceeds screen size, you can scroll down using `F8`.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE
```

```
Select ("S" or "/" ) products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected
```

```
When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)
```

```
 Kpp Component or Product Name and Version
-----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181

End of data
```

6. To exclude any of the products from the runtime environment that you are configuring, delete the / before the product code. To add products, place a slash (/) before the product name.
7. After you review the product set and customize it as required, change confirm ==> N to Y and press Enter.  
The %GBL\_USER\_JCL%(KCIJPCFG) job is generated, tailored with the values you supplied.
8. Review this job and submit it.  
After you return to the main Workflow panel, you will note a > before option 1 to indicate that this is the last step you performed. The status and date fields for that option are updated.  
The KCIJPCFG job submits the KCIJPPRF job, which updates the work libraries and merges the values from the existing RTE. You see a status of SUBMITTED until both jobs complete. Do not proceed to the next step until you see a successful return code.

## Result

The configuration software allocates the work libraries, creates the configuration profiles with values taken from the model RTE or specified on the KCIP@PG3 panel, and populates the PARMGEN templates in IKAN\* libraries with runtime members for the products that are selected for configuration.

## What to do next

Now you can review or customize the configuration profiles for the RTE.

## Customizing the configuration profiles

Customizing the configuration profiles is a critical part of the configuration process. The profiles contain the values that define the runtime environment, communication protocols and addresses, the framework features that are enabled, product-specific values, and so forth. The configuration profiles are tailored with the information you specify when you set up the RTE work environment. Default values are provided for all other required parameters and some optional ones. The amount of editing required to customize the configuration profiles depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults.

## About this task

If you do not want to customize these parameters, and you do not want to enable optional features, you can complete the configuration by accepting these defaults. Alternatively, you can edit the profiles to override defaults and provide custom values for optional parameters that have no defaults.

- Review and customization of the RTE configuration profile is required to override defaults with any required site-specific values, such as port numbers and to enable optional features such as automatic APF authorization, event forwarding, or support for self-describing agents.
- Review of the \$GBL\$USR profiles is required under either of the following conditions:
  - If the RTE is being upgraded and there may be new GBL\_\* parameters introduced in the new version of the product.
  - To customize product-specific GBL\_\* common or global parameters that may apply to more than one product or apply to several components within a product family.
- Customization of the variables configuration file is required if the runtime environment is enabled for system variables (RTE\_SYSV\_SYSVAR\_FLAG=Y) and user-defined symbols are being used. Any system variables whose resolution values cannot be determined from the IPL PARMLIB must also be defined.
- [“Configuration profiles” on page 415](#) describes the three configuration profiles.
- [“Customizing the runtime environment configuration profile” on page 449](#) discusses the values and features that users typically customize in the RTE configuration profile.
- [“Customizing the global configuration profile” on page 468](#) discusses the values typically customized in the global profile.
- [“Customizing the variables profile” on page 469](#) discusses the variables typically customized in the variables profile.

**Usage note:** Include parameter values in quotation marks (") if they include mixed casing, embedded blanks, or special characters, or if they are followed by a comment.

For help with the parameter values, consult the following resources:

- Comments in the profiles
- Online help for parameters (F1 )
- [“Common parameters” on page 1257](#)
- The *Parameter Reference* for each product

## Procedure

1. To customize the configuration profiles, select option 2 from the Workflow - Primary Option Menu.

```

----- PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==> 2                               Scroll ==> PAGE

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TSTEST.&userid
RTE_NAME:     DEMO

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary,
      until the status of each step is RC=0. Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

      Description                               Job/Label  Status      Date
      -----
1> Set up PARMGEN work environment for an RTE.  KCIJPCFG RC= 00000 2014/03/08
2. Customize PARMGEN configuration profiles.    DEMO
3. Create the RTE members and jobs.             $PARSE   Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5. Perform post configuration steps.            POSTCFG
R  Reset RTE, Status and Date fields. (Optional) New RTE

Press F1=Help for more information.  Type UTIL to access utility menu.

```

The Customize PARMGEN Configuration Profile Members panel is displayed.

```

KCIP@PG6 ----- CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS -----
Option ==>
                Quick Configuration Mode
(Required) Customize the RTE profile and the $GBL$USR user profiles:
(Tip) Review KCIJPDLA autodiscovery job in Utility menu or type DLAJOB cmd.

    *1. SYSA RTE LPAR-specific CONFIG profile in WCONFIG (User copy)
    *2. $GBL$USR Global parameters CONFIG profile in WCONFIG (User copy)

(Required) Customize the Variables profile if RTE_SYSV_SYSVAR_FLAG=Y:
    *3. SYSA Variables (system, user) CONFIG profile in GBL_USER_JCL PARMGEN
        global library (TDITN.IDTST.PARMGEN.JCL).
        Add/Modify system/user-defined symbols and their
        resolution values, for override variables used as parameter
        values in the $DOCRTE RTE and $GBL$USR global profiles.

(Tip) Review/Customize WCONFIG Kpp$C*/Kpp$P*/Kpp$S* user imbeds:
(Cloning Tip) Review KCIJPCCF job in Utility menu prior to customization.
    4. WCONFIG TDITN.IDTST.$DOCRTE.WCONFIG

(Tip) Review if you want to compare with IBM-supplied default profile values:

    5. $CFG$IBM RTE LPAR-specific CONFIG profile in WCONFIG (IBM copy)
    6. $GBL$IBM Global parameters CONFIG profile in WCONFIG (IBM copy)

(Optional) Override SYSIN member to supply additional (User) profiles:
    7. $SYSIN $PARSE/$PARSESV SYSIN controls (CONFIG/SELECT MEMBER)

Press F1=Help for more information. Type UTIL to access utility menu.

```

2. To customize the profiles, select each configuration profile as required.

## What to do next

If you need to include further customize the configuration using the override embed files, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the Customize PARMGEN Configuration Profile Members panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [“Customizing the override embed members” on page 471](#).

## Preparing the configuration profiles by running the KCIJPDLn jobs

By running the KCIJPDLn jobs in PARMGEN, the function of IBM® Discovery Library Adapter for z/OS® (DLA) is used to automatically discover the properties of online subsystems and other z/OS resources. These details are then included within the PARMGEN runtime environment (RTE) configuration user profiles, which reduces the time and effort in creating accurate configuration files.

## Before you begin

Important PARMGEN z/OS DLA system requirements:

- The KCIJPDLA composite job must run authorized. Dynamic SETPROG APF statement is included in this job. If the z/OS DLA SMP/E target load library (*GBL\_TARGET\_IZDHLQ.SIZDLOAD*) is in a NONSMS-managed volume, the dynamic SETPROG APF statement must specify the VOL() volume parameter. For example:

```
// SETPROG APF,ADD,
// DSN=IBM.TARGET.SIZDLOAD,VOL(VOL001)
```

If you supplied a GBL\_TARGET\_VOLUME value during KCIJPCFG "Set up/Refresh PARMGEN work environment" processing (KCIP@PG2 panel), then the KCIJPDLA or the KCIJPD1 job's SETPROG statement will include the tailored VOL() parameter. If this is not the volume that the SIZDLOAD data set is on, customize the VOL() parameter accordingly. Otherwise, the DLADISC step will encounter the following error message:

```
IZD0021E APF Discovery requested but not running APF Authorized
```

**Note:** It is ideal to run the DLADISC discovery function (KCIJPD1 job function of the KCIJPDLA composite job) when the z/OS resources you plan to monitor are active.

- If you are staging the z/OS DLA IDML data sets for other LPARs, you can use the `/*JOBPARM=` parameter.

```
JOBPARM SYSAFF=&SYSNAME.
JOBPARM SYSAFF=*
```

If you use the **SYSAFF** parameter, the LPAR must belong in the same JES Multi-Access Spool (MAS) Complex. If it is not in the same MAS, an alternative is to route the job by using the `/*ROUTE XEQ` parameter.

```
ROUTE XEQ &SYSIPHOSTNAME
```

- The user ID that runs the KCIJPDLA or KCIJPD1 job must have the following RACF authorities:
  - READ access for all the data sets in the system PARMLIB concatenation that are used during IPL.
  - READ access to profiles in the MQCMDS class (if active) to allow the z/OS DLA to run MQ DISPLAY commands via the MQ command interface.
  - If RACF is used to protect Db2 resources, then authority is required to run Db2 DISPLAY commands and to access (READ) SYSIBM resources by using dynamic SQL. In addition, for the Db2 version autodiscovery, the z/OS DLA extracts the Db2 version via the Instrumentation Facility Interface (IFI). The ID that runs the KCIJPDLA or KCIJPD1 job must have the appropriate authorization to issue the Db2 commands. Otherwise, the PARMGEN DLA jobs will not be able to set values to the KD2\_DBnn\_DB2\_VER LPAR RTE profile parameter in the WCONFIG(RTE\_NAMES) LPAR RTE profile.
  - READ access to WebSphere configuration files. An OMVS segment with authority to issue the netstat, host, and home commands.

IBM® Discovery Library Adapter for z/OS® (DLA) is packaged in several product suites. Refer to the program directories of the suites for more information.

During SMP/E installation of DLA, the following SMP/E target data sets are allocated and processed:

- `gbl_target_hilev.SIZDEXEC`
- `gbl_target_hilev.SIZDINST`
- `gbl_target_hilev.SIZDLOAD`
- `gbl_target_hilev.SIZDMAPS` (applicable for FMID HIZD310)
- `gbl_target_hilev.SIZDMESG`
- `gbl_target_hilev.SIZDSAMP`

Ensure that you have the latest product maintenance for DLA.

**Note:** If you have a separate SMP/E installation of the DLA, you can still use the PARMGEN z/OS DLA integration jobs (KCIJPDLA or KCIJPD1). If you have a separate SMP/E environment where the z/OS DLA target data sets exist, modify the KCIJPD $n$  jobs to point to the appropriate `IZDHLQ=DLA_FMID` SMP/E target high-level qualifier. Review the KCIJPD $n$  jobs for more information.

## About this task

The PARMGEN z/OS DLA autodiscovery job (KCIJPDLA) discovers active z/OS resources and their connections and relationships. The z/OS DLA discovers the following resources:

- TCP/IP information
- z/OS information such as active PARMLIB members, IPL information, authorized programs
- System z hardware information such as serial numbers, LPARs, and z/VM guest information
- CICS information such as transactions, programs, and files
- Db2 for z/OS information such as databases and table spaces
- IMS information such as transactions, programs, and databases
- WebSphere information such as cell, node, and configuration files
- IBM MQ information such as queue managers, queues, channels, and ports

- Address space information such as type, data set allocations, program name, and TCP/UDP ports
- DASD volume information

For a list of the parameters that can be auto-discovered by the KCIJPDLA job, see [The parameters that can be auto-discovered by the KCIJPDLA job](#).

## Procedure

Use one of the following ways to run the KCIJPDLn jobs:

- Run the jobs by using DLA commands in the **CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS** pane.
  - a. Select **Customize PARMGEN Configuration Profiles** from the Workflow primary option menu.
  - b. In the Command line, type DLAJOB and press **Enter** to review the KCIJPDLA autodiscovery job.
  - c. Make necessary changes and submit the job.
- Run the KCIJPDLn job directly in the **UTILITIES** pane.
  - a. In the Command line, type U or UTIL to enter the utility menu.
  - b. Type 15 and press **Enter** to review the composite KCIJPDLA, or type 16, 17, or 18 and press **Enter** to review each function job.  
You can also type corresponding DLA commands in the Command line to review the jobs. For more information about the DLA commands, see [PARMGEN z/OS DLA utility jobs and commands](#).
  - c. Make necessary changes and submit the job.

## Result

Configuration profiles are filled with values that are discovered from your environment.

## What to do next

Continue the configuration by modifying the parameters in configuration profiles.

## PARMGEN z/OS DLA utility jobs and commands

The PARMGEN z/OS DLA integration provides not only the KCIJPDLA composite job, but also some function jobs and commands that you can run based on your requirements.

**DLA jobs in the UTILITIES menu**In the UTILITIES menu, you have additional utility options for the KCIJPDLn jobs. Enter the option numbers in UTILITIES menu to bring up the jobs.

Table 54: DLA jobs in Utilities menu

Option number in the UTILITIES menu	DLA job description
15	<p>The composite KCIJPDLA job is presented for submission. You can also run the DLAJOB command on the Utilities menu command line to bring up the KCIJPDLA job in edit mode. Review the job for more information. KCIJPDLA job performs the functions of the standalone KCIJPD1, KCIJPD2 and KCIJPD3 jobs. Other available sub-options under option 15 are as follows:</p> <p><b>15s1</b></p> <p>Similar to the DLAIDML command to view the KCIJPDLA output #1:  <i>RTE_PLIB_HILEV.RTE_NAME.IZD.IDML z/OS DLA IDML XML books dataset.</i></p> <p><b>15s2</b></p> <p>Similar to the DLARPT command to edit the KCIJPDLA output #2:  <i>RTE_PLIB_HILEV.RTE_NAME.WCONFIG(\$DLARPT) PARMGEN DLA report.</i></p> <p><b>15s3r</b></p> <p>Similar to the DLARTE command to edit the KCIJPDLA output #3:  <i>RTE_PLIB_HILEV.RTE_NAME.WCONFIG(DEMO) PARMGEN LPAR RTE user profile.</i></p> <p><b>15s3g</b></p> <p>Similar to the DLAGBL command to edit the KCIJPDLA output #4:  <i>RTE_PLIB_HILEV.RTE_NAME.WCONFIG(\$GBL\$USR) PARMGEN global user profile.</i></p>
16	<p>The KCIJPD1 job is presented for submission. You can also run the DLAJOB1 command on the Utilities menu command line to bring up the KCIJPD1 job in edit mode. Review the job for more information.</p> <p>Other available sub-option under option 16 is as follows:</p> <p><b>16s</b></p> <p>Similar to the DLAIDML command to view the KCIJPD1 output  <i>RTE_PLIB_HILEV.RTE_NAME.IZD.IDML z/OS DLA IDML XML books dataset.</i></p>
17	<p>The KCIJPD2 job is presented for submission. You can also run the DLAJOB2 command on the Utilities menu command line to bring up the KCIJPD2 job in edit mode. Review the job for more information.</p> <p>Other available sub-option under option 17 is as follows:</p> <p><b>17s</b></p> <p>Similar to the DLARPT command to edit the KCIJPD2 output  <i>RTE_PLIB_HILEV.RTE_NAME.WCONFIG(\$DLARPT) PARMGEN DLA report.</i></p>

Option number in the UTILITIES menu	DLA job description
18	<p>The KCIJPD3 job is presented for submission. You can also run the DLAJOB3 command on the Utilities menu command line to bring up the KCIJPD3 job in edit mode. Review the job for more information.</p> <div style="border: 1px solid blue; padding: 5px; margin: 10px 0;"> <p><b>Tip:</b> When reviewing the resulting WCONFIG DEMO.... LPAR RTE and \$GBL\$USR global user profiles, run EXCLUDE FIND (XF Macro if set-up) on * from \$DLARPT references to find all the parameter values extracted from the \$DLARPT DLA report. For the updated WCONFIG override imbeds such as KMQ\$CUSR or KQI\$XML, look for the Discovered headers to find all the auto-discovered lines added to the imbeds for applicable active z/OS resources.</p> </div> <p>Other available sub-options under option 18 are as follows:</p> <p><b>18sr</b></p> <p style="padding-left: 20px;">Similar to the DLARTE command to edit the KCIJPD3 output #1: RTE_PLIB_HILEV.RTE_NAME.WCONFIG(DEMO) PARMGEN LPAR RTE user profile.</p> <p><b>18sg</b></p> <p style="padding-left: 20px;">Similar to the DLAGBL command to edit the KCIJPD3 output #2: RTE_PLIB_HILEV.RTE_NAME.WCONFIG(\$GBL\$USR) PARMGEN global user profile.</p>

#### DLA commands

Instead of typing the options in the UTILITIES menu, you can run DLA commands to bring up the jobs.

<i>Table 55: DLA jobs in Utilities menu</i>	
DLA commands	Command description
DLAJOB	The RTE_PLIB_HILEV.RTE_NAME.WCONFIG(KCIJPDLA) "Composite PARMGEN z/OS Discovery Library Adapter (DLA) job." is presented for review and submission.
DLAJOB1	The RTE_PLIB_HILEV.RTE_NAME.WCONFIG(KCIJPD1) "Create the z/OS DLA IDML books on active z/OS resources." is presented for review and submission.
DLAJOB2	The RTE_PLIB_HILEV.RTE_NAME.WCONFIG(KCIJPD2) "Generate PARMGEN \$DLARPT report from DLA IDML books dataset." is presented for review and submission.
DLAJOB3	The RTE_PLIB_HILEV.RTE_NAME.WCONFIG(KCIJPD3) "Refresh DEMO/\$GBL\$USR user profiles with \$DLARPT data." is presented for review and submission.
DLAIDML	View the RTE_PLIB_HILEV.RTE_NAME.IZD.IDML dataset that contains the IDML DLA XML books. This dataset is created by submitting the KCIJPDLA composite job or the KCIJPD1 "Create the z/OS DLA IDML books on active z/OS resources." job. The DLAIDML command displays the IDML books dataset in view mode only.
DLARPT	Review the RTE_PLIB_HILEV.RTE_NAME.WCONFIG(\$DLARPT) DLA report. This report is created by submitting the KCIJPDLA composite job or the KCIJPD2 "Generate PARMGEN \$DLARPT report from DLA IDML books dataset." job. The DLARPT command displays the \$DLARPT in edit mode if you want to customize the report further, prior to submitting the next job (KCIJPD3), which uses the \$DLARPT DLA report data to refresh the PARMGEN user profiles.
DLAMAP	Review the RTE_PLIB_HILEV.RTE_NAME.WCONFIG (\$DLAMAP) parameter DLA map report. This report is created by submitting the KCIJPDLA composite job, or the KCIJPD3 "Refresh rte/\$GLB&USR" user profiles with \$DLARPT data" job. DLAMAP command displays the \$DLAMAP report that maps what \$DLARPT parameters equate to the equivalent PARMGEN rte and \$GLB&USR user profile parameters.

DLA commands	Command description
DLADLTA	Review the <i>RTE_PLIB_HILEV.RTE_NAME.WCONFIG(\$DLADLTA)</i> DLA delta report. This report is created by submitting the KCIJPDLA composite job, or the KCIJPD2 "Generate PARMGEN \$DLARPT report from DLA IDML books dataset" job if both \$DLARPT and \$DLAMAP reports already exist in the RTE's WCONFIG dataset. DLADLTA command displays the \$DLADLTA delta report that compares the previous \$DLARPT report with the latest \$DLARPT report run. The delta report highlights the changes in the RTE user profile and the \$GBL\$USR global user profile.
DLARTE	Review the <i>RTE_PLIB_HILEV.RTE_NAME.WCONFIG(DEMO)</i> LPAR RTE user profile. The LPAR RTE user profile is refreshed by the KCIJPDLA composite job or the KCIJPD3 "Refresh DEMO / \$GBL\$USR user profiles with \$DLARPT data." job. The DLARTE command displays the DEMO.... LPAR RTE user profile in edit mode if you want to customize the member further.
DLAGBL	Review the <i>RTE_PLIB_HILEV.RTE_NAME.WCONFIG(\$GBL\$USR)</i> global user profile. The \$GBL\$USR user profile is refreshed by the KCIJPDLA composite job or the KCIJPD3 "Refresh DEMO / \$GBL\$USR user profiles with \$DLARPT data." job. The DLAGBL command displays the \$GBL\$USR global user profile in edit mode if you want to customize the member further.

### PARMGEN DLA menu

You can view DLA reports and run DLA jobs in the DLA menu, which makes it easy to access the PARMGEN DLA autodiscovery tasks.

You can access the PARMGEN DLA Menu (KCIQDLA panel) by running the DLAMENU command from the UTILITIES (KCIQPGU panel).

```

KCIQPGU ----- UTILITIES -----
Option ==> DLAMENU_                               Scroll ==> PAGE
                                                    More:      +

Enter n (0-37) to perform tasks.
Enter ns* (15s* - 19s, 23s, 27s) if a task generates a report ($DLARPT DLA
report, $VALRPT validation report), or if a task generates a dataset/member
to review (DLA IDML dataset/books, DLA RTE/$GBL$USR, WSUPERC dataset).
See Utility options/shortcut commands help topic for more information.

Process a Runtime Environment (RTE) or perform cross-RTE functions:
 0. Runtime Environments (RTEs)

Display/Edit a dataset member list:
 1. WKANCMU           QISUN.IDTST.JVM.WKANCMU
 2. WKANPARU         QISUN.IDTST.JVM.WKANPARU
 3. WKANSAMU         QISUN.IDTST.JVM.WKANSAMU
 4. WKD2PAR          QISUN.IDTST.JVM.WKD2PAR
 5. WKD2PRF          QISUN.IDTST.JVM.WKD2PRF
 6. WKD2SAM          QISUN.IDTST.JVM.WKD2SAM
 7. WCONFIG           QISUN.IDTST.JVM.WCONFIG
 8. GBL_USER_JCL     QISUN.IDTST.PARMGEN.JCL

F1=HELP   F2=SPLIT   F3=END     F4=RETURN   F5=RFIND   F6=RCHANGE
F7=UP     F8=DOWN    F9=SWAP   F10=LEFT   F11=RIGHT  F12=RETRIEVE

```

Figure 76: Run DLAMENU command in UTILITIES

The DLAMENU menu lists the various KCIJPD\* jobs to perform DLA autodiscovery tasks for the RTE.

```

KCIJPDLA ----- PARMGEN DLA MENU -----
Option ==>                                     Scroll ==> PAGE

More:      +

Enter n (1-11) to perform DLA autodiscovery tasks for RTE=JVM.

Submit a DLA utility job:

      Description                                     Job/Label
-----
 1. Composite PARMGEN z/OS Discovery Library Adapter (DLA) job. KCIJPDLA
    ** OR **
 2. Create the z/OS DLA IDML books on active z/OS resources.   KCIJPD1
 3. Generate PARMGEN $DLARPT report from DLA IDML books dataset. KCIJPD2
 4. Refresh JVM/$GBL$USR user profiles with $DLARPT data.     KCIJPD3

Display/Edit WCONFIG dataset where DLA members are generated:
 5. WCONFIG repository      QISUN.IDTST.JVM.WCONFIG

Display/Edit IDML books created by KCIJPDLA job or KCIJPD1 job:
 6. DLA IDML XML books      QISUN.IDTST.JVM.IZD.IDML

Display/Edit $DLA* reports created by KCIJPDLA job or KCIJPD2 job:
Note: $DLADLTA delta report only gets generated if $DLARPT report exists.
 7. $DLARPT report          QISUN.IDTST.JVM.WCONFIG($DLARPT)
 8. $DLADLTA report          QISUN.IDTST.JVM.WCONFIG($DLADLTA)

Display/Edit user profiles refreshed by KCIJPDLA job or KCIJPD3 job:
 9. LPAR RTE user profile    QISUN.IDTST.JVM.WCONFIG(JVM)
10. $GBL$USR user profile    QISUN.IDTST.JVM.WCONFIG($GBL$USR)

Display/Edit $DLAMAP report created by KCIJPDLA job or KCIJPD3 job if
$DLARPT report and JVM/$GBL$USR user profiles exist:
11. $DLAMAP report          QISUN.IDTST.JVM.WCONFIG($DLAMAP)

F1=HELP      F2=SPLIT      F3=END      F4=RETURN      F5=RFIND      F6=RCHANGE
F7=UP         F8=DOWN       F9=SWAP     F10=LEFT      F11=RIGHT     F12=RETRIEVE

```

For more information about the available commands, see [“PARMGEN z/OS DLA utility jobs and commands” on page 442](#).

**The parameters that can be auto-discovered by the KCIJPDLA job**

The KCIJPDLA job can automatically discover properties of on-line subsystems and other z/OS resources, then include these details in the PARMGEN runtime environment (RTE) configuration user profiles. See the table for the parameters that can be auto-discovered by the job.

<i>Table 56: DLA jobs in Utilities menu</i>	
Component	Parameters that can be auto-discovered
Common to all z/OS TEMS and z/OS agents	<p>The following parameters in the \$GBL\$USR global user profile are auto-discovered:</p> <ul style="list-style-type: none"> <li>• <b>GBL_DSN_CSF_SCSFMODE</b></li> <li>• <b>GBL_DSN_TCP_SYSTCPD_TCPDATA</b></li> <li>• <b>GBL_DSN_TCP_PROFILES</b></li> <li>• <b>GBL_DSN_CEE_SCEERUN2</b></li> <li>• <b>GBL_DSN_NETVIEW_CNMLINK</b></li> <li>• <b>GBL_DSN_TCP_SYSTCPD_TCPDATA</b></li> </ul>

Component	Parameters that can be auto-discovered
IBM OMEGAMON for JVM on z/OS	<p>The JVM subsystem and application types, and their respective z/OS® UNIX® System Services directories are auto-discovered. The z/OS UNIX directories for the following parameters are listed in the <b>KJJDFINL Post-configuration README</b> for the KJJ agent:</p> <ul style="list-style-type: none"> <li>• <b>JVMPROFILEDIR</b></li> <li>• <b>USSHOME</b></li> <li>• <b>STDENV</b></li> <li>• <b>JVMOPMAS</b></li> <li>• <b>PROCLIB</b></li> </ul>
OMEGAMON® AI for Db2	<p>The following LPAR RTE user profile parameters are auto-discovered for each Db2 subsystem:</p> <ul style="list-style-type: none"> <li>• <b>KD2_DBnn_DB2_SSID</b></li> <li>• <b>KD2_DBnn_DB2_VER</b></li> <li>• <b>KD2_DBnn_DB2_LOADLIB</b></li> <li>• <b>KD2_DBnn_DB2_RUNLIB</b></li> <li>• <b>KD2_DBnn_PWH_LOADLIB</b></li> <li>• <b>KD2_DBnn_PWH_EXITLIB</b></li> <li>• <b>KD2_DBnn_DB2_SYSNAME</b></li> </ul> <p>The following \$GBL\$USR global user profile parameters are auto-discovered for each Db2 subsystem:</p> <ul style="list-style-type: none"> <li>• <b>GBL_DSN_DB2_LOADLIB_V11</b></li> <li>• <b>GBL_DSN_DB2_RUNLIB_V11</b></li> <li>• <b>GBL_DSN_DB2_LOADLIB_V12</b></li> <li>• <b>GBL_DSN_DB2_RUNLIB_V12</b></li> <li>• <b>GBL_DSN_DB2_SDSNLOAD</b></li> <li>• <b>GBL_DSN_DB2_DSNEXT</b></li> </ul>
OMEGAMON for CICS	<p>The following LPAR RTE user profile parameter for each CICS region is auto-discovered:</p> <ul style="list-style-type: none"> <li>• <b>KC2_HSnn_CLASSIC_CICS_REGION</b></li> </ul>
OMEGAMON for CICS TG	<p>The following LPAR RTE user profile parameter for each CICS TG Gateway Daemon STC name or the WebSphere region is auto-discovered:</p> <ul style="list-style-type: none"> <li>• <b>KGW_SAnn_CTG_DAEMON_STC</b></li> </ul> <p>The following \$GBL\$USR global user profile parameter is auto-discovered:</p> <ul style="list-style-type: none"> <li>• <b>GBL_DSN_CICS_CTG_DLL</b></li> </ul>

Component	Parameters that can be auto-discovered
OMEGAMON for IMS on z/OS	<p>The following LPAR RTE user profile parameters for each IMS subsystem are auto-discovered:</p> <ul style="list-style-type: none"> <li>• <b>KI2_I1nn_CLASSIC_IMSID</b></li> <li>• <b>KI2_I1nn_CLASSIC_IMS_RESLIB</b></li> </ul> <p>The following \$GBL\$USR global user profile parameters are auto-discovered:</p> <ul style="list-style-type: none"> <li>• <b>GBL_DSN_IMS_RESLIB</b></li> <li>• <b>GBL_DSN_IMS_SCEXLINK</b></li> <li>• <b>GBL_DSN_IMS_SFUNLINK</b></li> </ul>
IBM MQ Monitoring	<p>The following \$GBL\$USR global user profile parameters are auto-discovered:</p> <ul style="list-style-type: none"> <li>• <b>GBL_DSN_WMQ_SCSQANLE</b></li> <li>• <b>GBL_DSN_WMQ_SCSQAUTH</b></li> <li>• <b>GBL_DSN_WMQ_SCSQLOAD</b></li> </ul> <p>Auto-discover WCONFIG(KMQ\$CUSR) RKANCM DU(KMQUSER) imbed to add placeholder entries for discovered MQ Queue managers.</p>
IBM Integration Bus (IIB) Monitoring	<p>The following LPAR RTE user profile parameters are auto-discovered:</p> <ul style="list-style-type: none"> <li>• <b>KQI_XML_XIMBNAME_MON_BRKR_NAME</b></li> <li>• <b>KQI_XML_XIMBDIR1</b></li> </ul> <p>The following \$GBL\$USR global user profile parameter is auto-discovered:</p> <ul style="list-style-type: none"> <li>• <b>GBL_DSN_CEE_SCEERUN</b></li> </ul> <p>Auto-discover WCONFIG(KQI\$XML) RKANDATV(KQIXML) imbed to add XML entries for additional QI brokers to monitor.  Auto-discover monitored brokers and list each discovered broker's <b>STDENV USS directory in the KQIDFINL "Post-configuration"</b> tailored on-line README for the KQI Agent.</p>
OMEGAMON for Networks	<p>The following LPAR RTE user profile parameters for each TCP/IP stack are auto-discovered:</p> <ul style="list-style-type: none"> <li>• <b>KN3_TCPXnn_TCPIP_PROFILES_DSN</b></li> <li>• <b>KN3_TCPXnn_TCPIP_PROFILES_MBR</b></li> </ul>

Component	Parameters that can be auto-discovered
OMEGAMON for JVM V5.4.0	<p>Auto-discover the various JVM subsystem and application types running that are eligible for monitoring, and their respective z/OS UNIX directories to make it easier for customer to add the OMEGAMON for JVM monitoring Agent's (-javaagent) and IBM Java Health Center Agent's (-Xbootclasspath, -agentpath) respective enablement options. List each discovered z/OS UNIX directory or file location for these parameters in the xKANSAMU(KJJDFINL) post-configuration tailored on-line README for KJJ Agent:</p> <ul style="list-style-type: none"> <li>• JVMPROFILEDIR / USSHOME from CICS SIT for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in CICS JVMs.</li> <li>• STDENV for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in CICS Transaction Gateway (CTG) JVMs.</li> <li>• JVMOPMAS PROCLIB for IMS JMP for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in IMS JVMs.</li> <li>• STDENV for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in WebSphere Liberty z/OS Connect EE JVMs.</li> <li>• JVM_OPTIONS in HBRMSTR file for enabling the Health Center Agent and OMEGAMON for JVM Agent enablement options in ODM.</li> </ul>

## Helpful PF keys for configuration profile customization

Apart from the common PF keys for panel navigation, the PARMGEN configuration method also provides several PF keys that are specifically designed to help you with the configuration profile customization.

Use the following PF keys properly to make the configuration profile customization easier.

### F1

Place the cursor on a parameter and press **F1** to show the online help information of this parameter.

### F15 (or Shift + F3)

Press **F15** in the configuration profile to hide profile comments. Type **RESET** to return to the full configuration profile with comments.

### F16 (or Shift + F4)

Press **F16** to clone parameter section for a table row.

### F22 (or Shift + F10)

Place the cursor on a parameter and press **F22** to search the parameter in PARMGEN IK\*/W\*/RK\* libraries. With this function you will be able to location the datasets that are affected by the change of a parameter.

### F23 (or Shift + F11)

Press **F23** in the configuration profile to show only the following parameters:

- Required product parameters
- Parameters with best-practice IBM default values. You might need to change the values based on your site deployment needs.

Type **RESET** to return to the full configuration profile with all parameters.

### F24 (or Shift + F12)

Press **F24** in the configuration profile to show only the ADVANCED parameters that are optional or conditional. Best-practice IBM default values are provided, but you might need to change the values based on your site deployment needs. Type **RESET** to return to the full configuration profile with all parameters.

## Customizing the runtime environment configuration profile

The runtime environment (RTE) configuration profiles contains the parameter values that define an RTE: the type of RTE, the communication protocols and addresses, the framework features that are enabled, and the products and components that are configured in it. The profile is already tailored (by the KCIJPUP1 job) with values supplied during the process of setting up the environment. In addition, default values are provided for all

other required parameters and some optional ones. If you do not want to customize these parameters, and you do not want to enable optional features, you do not need to edit the profile. However, if you want to override defaults with site-specific values, or you want to use optional features, you can edit the profile.

## Before you begin

Make sure that you are aware of any site-specific requirements and any other prerequisites (such as authorization for started tasks, naming conventions, available ports, z/OS® UNIX® System Services data sets). Check the documentation for every product that you are configuring in the RTE for any product-specific configuration requirements.

## About this task

For help with the parameters and permissible values, consult the following resources:

- Comments in the profiles
- Online help for parameters (F1)
- [“Common parameters” on page 1257](#)
- The *Parameter Reference* for each product

## Procedure

1. To edit the profile, select **Customize PARMGEN Configuration Profiles** from the Workflow primary option menu.

The Customize the PARMGEN Configuration Profile Members (KCIP@PG06) panel is displayed.

```
KCIP@PG6 ----- CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS -----
Option ==>
                Quick Configuration Mode
(Required) Customize the RTE profile and the $GBL$USR user profiles:
(Tip) Review KCIJPDLA autodiscovery job in Utility menu or type DLAJOB cmd.

    *1. SYSA RTE LPAR-specific CONFIG profile in WCONFIG (User copy)
    *2. $GBL$USR Global parameters CONFIG profile in WCONFIG (User copy)

(Required)      Customize the Variables profile if RTE_SYSV_SYSVAR_FLAG=Y:
    *3. SYSA Variables (system, user) CONFIG profile in GBL_USER_JCL PARMGEN
        global library (TDITN.IDTST.PARMGEN.JCL).
        Add/Modify system/user-defined symbols and their
        resolution values, for override variables used as parameter
        values in the $DOCRTE RTE and $GBL$USR global profiles.

(Tip) Review/Customize WCONFIG Kpp$C*/Kpp$P*/Kpp$S* user imbeds:
(Cloning Tip) Review KCIJPCCF job in Utility menu prior to customization.
    4. WCONFIG TDITN.IDTST.$DOCRTE.WCONFIG

(Tip) Review if you want to compare with IBM-supplied default profile values:

    5. $CFG$IBM RTE LPAR-specific CONFIG profile in WCONFIG (IBM copy)
    6. $GBL$IBM Global parameters CONFIG profile in WCONFIG (IBM copy)

(Optional) Override SYSIN member to supply additional (User) profiles:
    7. $SYSIN $PARSE/$PARSESV SYSIN controls (CONFIG/SELECT MEMBER)

Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to display the RTE configuration profile in edit mode.

## What to do next

Specify the appropriate RTE- and product-specific parameter values.

## Update the USER PROLOG

The RTE configuration profile contains a prolog section in which you can log changes you make in this member for future reference.

## Procedure

- Perform a FIND on USER PROLOG to locate this section and update it accordingly.

“Figure: Update the user prolog” on page 451 shows an example of this section in the profile for the DEMO runtime environment.

## Verify the list of products to be configured within this runtime environment

The configuration profile contains a list of products and components to be configured as part of this runtime environment (RTE). This list should match with the list of products that you selected when you set up the work libraries for the RTE. If any products are added or removed from this RTE after initial configuration, update this section accordingly.

## Procedure

- Review the list of products in the CONFIGURE PRODUCTS section and set the flags as required. “Figure: Verify the list of products in the runtime environment” on page 451 shows an example of this section.

```

SP22 TSTEST.&userid.DEMO.WCONFIG(DEMO)
Command
====> Scroll ===> CSR
000216 * =====
000217 * Master Flags from CONFIGURE_PRODUCTS USER SECTION in KCIJPCFG job:

```

Figure 78: Verify the list of products in the runtime environment

## Update the TCP/IP port values used across the runtime environment

The ports for all monitoring agents and any monitoring servers must be the same for communication to be successful. If you are configuring the runtime environment (RTE) with the default protocols of IP and IP.PIPE and plan to use a different port number than the default value (1918), update the values for all ports specified within the profile.

### Procedure

1. Perform an EXCLUDE FIND on \_PORT to list all the TCP/IP port values to be used by the products within this RTE to communicate with each other.
2. Update all port numbers to the value that you want to use.  
“[Figure: Update TCP/IP port values](#)” on [page 452](#) shows an example of this step, where nnnnn is the port number that you choose to use.

```
SP22 TSTEST.&userid.DEMO.WCONFIG(DEMO) - 01.00 Columns 00001 00072

```

Figure 79: Update TCP/IP port values

### Specify the TCPIP.DATA data set

Every agent and monitoring server started task generated in a runtime environment contains an SYSTCPD DD statement. This statement specifies the data set to be used to obtain the parameters defined by TCPIP.DATA if no GLOBALTCPIPDATA statement is configured. The DD statement is tailored using parameters specified in the RTE configuration profile.

### About this task

If you customize these parameters, you must also customize the GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA parameter in the \$GBL\$USR global profile.

### Procedure

- To enable the SYSTCPD DDNAME automatically for all started tasks in a runtime environment, ensure that the value of the following parameters is set to Y:  
KDS\_X\_STC\_SYSTCPD\_INCLUDE\_FLAG  
KAG\_X\_STC\_SYSTCPD\_INCLUDE\_FLAG

```
EDIT          IBM . ITM62351 . DEMO . WCONFIG (DEMO)
Command ==>
000541 KDS_X_STC_SYSTCPD_INCLUDE_FLAG      Y
000542 KAG_X_STC_SYSTCPD_INCLUDE_FLAG      Y
```

### Result

When PARMGEN creates the monitoring server and agent started tasks, the DDNAME is automatically generated and file-tailored to point to the TCPDATA library.

## Update the global VTAM major node

By default, the name of the VTAM major node is KCANDLE1. You might want to change the name in accordance with the naming conventions for your environment.

### Procedure

1. Perform a FIND on RTE\_VTAM\_GBL\_MAJOR\_NODE to find the parameter for the global VTAM major node:

```
000568 ** VTAM SNA values:
000569
000570 RTE_VTAM_APPLID_PREFIX   CTD
000571 RTE_VTAM_NETID          USCAC001
000572 RTE_VTAM_LU62_DLOGMOD   CANCTDCS
000573 RTE_VTAM_LU62_MODETAB   KDSMTAB1
000574 RTE_VTAM_GBL_MAJOR_NODE KCANDLE1
000575 RTE_VTAM_APPLID_MODEL    Y
```

2. Replace KCANDLE1 with the appropriate value.

## Enable APF-authorization statements

PARMGEN provides the ability to generate the required APF-authorization commands for all libraries concatenated within the STEPLIB and RKANMODL DD names for all generated started tasks (STCs). If you do not enable this parameter, you must manually APF-authorize all libraries.

(For more information on APF authorizing libraries, see [“Completing the configuration outside the configuration software” on page 522.](#))

### Procedure

1. In the RTE configuration profile, perform a FIND on RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG.
2. Change the value of the parameter to Y.

```
SP22 TSTEST.&userid.DEMO.WCONFIG(DEMO) - 01.00 Columns 00001 00072
Command ==>                               Scroll ==> CSR
000528 ** (Optional) INAPF INCLUDE statement in product started tasks (STCs):
000529 ** Specify "Y" if you want to generate this statement as uncommented
000530 ** out in all product STCs: "INAPF INCLUDE MEMBER=%RTE_STC_PREFIX%APF"
000531 ** This sample composite member contains APF-authorization commands for
000532 ** libraries concatenated in the STC STEPLIB and RKANMODL DDNAMEs.
000533 ** This member also contains the VARY activate command pointing to the
000534 ** %RTE_VTAM_GBL_MAJOR_NODE% VTAM major node (TSSND122 by default).
000535 ** Review %RTE_STC_PREFIX%APF and %RTE_STC_PREFIX%STRT WKANSAMU
000536 ** members for more information.
000537 RTE_X_STC_INAPF_INCLUDE_FLAG          Y
```

## Update the z/OS® UNIX® System Services directory

If any of the products that you are configuring require any z/OS UNIX directories running on either the Hierarchical File System (HFS) or on the zSeries File System (zFS), or if you are planning to enable the self-describing agent feature, you must specify the directory to be used.

### Procedure

1. Perform a FIND on the RTE\_USS\_RTEDIR parameter.
2. Replace the default value with the name of the z/OS UNIX directory reserved for this purpose.

```
RTE_USS_RTEDIR          "/rtehome"
```

## Configuring OMNIMON Base

OMNIMON Base is a set of common code that is used by several OMEGAMON components and the OMEGAMON Enhanced 3270 user interface to control initialization, security, and I/O for all sessions. You can also configure the components for functions like near-term history data collection.

## About this task

OMNIMON Base has two components:

### OMEGAMON Subsystem

A z/OS subsystem that runs in its own address space. The subsystem enables OMEGAMON components in other address spaces to monitor dynamic device activity. A single OMEGAMON Subsystem can support multiple OMEGAMON products on a single z/OS image. Some OMEGAMON monitoring products, such as OMEGAMON for Networks, do not use the OMEGAMON Subsystem.

### OMEGAMON enhanced 3270 user interface

A 3270-based user interface that collects and displays data from the Tivoli Enterprise Monitoring Server and OMEGAMON monitoring agents for z/OS. One instance of the interface must be installed in each Sysplex for use by all supporting agents.

## Procedure

Configure the OMEGAMON Subsystem by modifying the following parameters.

- Code sample of the parameters that are not specific to any subsystem feature.

```
RTE_KCNSTR00_SSID          CNDL
RTE_KCNSTR00_XCFGROUP     KCNXCFCF
RTE_KCNSTR00_WTO          ERROR
RTE_KCNDLSSI_IEFSSN00_FORMAT K
RTE_X_KCNSTR00_REFRESH    60
RTE_X_KCNSTR00_PLEXCOLLECT YES
RTE_X_KCNDLSSI_INITPARM_FLAG Y
```

For more information about each parameter, see the following topics:

- [RTE\\_KCNSTR00\\_SSID](#)
  - [RTE\\_KCNSTR00\\_XCFGROUP](#)
  - [RTE\\_KCNSTR00\\_WTO](#)
  - [RTE\\_KCNDLSSI\\_IEFSSN00\\_FORMAT](#)
  - [RTE\\_X\\_KCNSTR00\\_REFRESH](#)
  - [RTE\\_X\\_KCNSTR00\\_PLEXCOLLECT](#)
  - [RTE\\_X\\_KCNDLSSI\\_INITPARM\\_FLAG](#)
- In the OMEGAMON Subsystem, the following parameters are related to the OMEGAMON enhanced 3270 user interface:

```
RTE_CANSCN_STC            IBMCN
RTE_KCN_VTAM_APPL_LOGON   CTDCNAP    * Cache APPL
RTE_KCN_VTAM_NODE         CTDCNN     * Cache Node
RTE_KM5_NTH               Y          * Y, YES, N, NO
```

For more information about each parameter, see the following topics:

- [RTE\\_CANSCN\\_STC](#)
  - [RTE\\_KCN\\_VTAM\\_APPL\\_LOGON](#)
  - [RTE\\_KCN\\_VTAM\\_NODE](#)
  - [RTE\\_KM5\\_NTH](#)
- For the OMEGAMON components that use ITM persistent datastore (PDS):

**Important:** The content in this step, including the parameters, was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated. For information about configuring PDS V2, see [“Configuring PDS V2” on page 1237](#).

- The LPAR RTE profile parameters in the following code sample control the ITM PDS settings for all products that collect ITM short-term history for the OMEGAMON Enhanced 3270 User Interface.

```

RTE_PDS_HILEV          USR.IBM.RTE
RTE_PDS_KPDPROC_PREFIX  IBMPD
RTE_PDS_BATCHINIT_FLAG      N          * xKANPARU(KppPCTL) option
RTE_PDS_BACKUP_FLAG        N          * xKANPARU(KppPG) option
RTE_PDS_EXPORT_FLAG        N          * xKANPARU(KppPG) option
RTE_PDS_EXTRACT_FLAG       N          * xKANPARU(KppPG) option
RTE_PDS_SMS_VOLUME         ""         * xKANPARU(KppAL) option
RTE_PDS_SMS_UNIT           ""         * xKANPARU(KppAL) option
RTE_PDS_SMS_STORCLAS       ""         * xKANPARU(KppAL) option
RTE_PDS_SMS_MGMTCLAS       ""         * xKANPARU(KppAL) option

```

For more information on each parameter, see the following topics:

- [RTE\\_PDS\\_HILEV](#)
- [RTE\\_PDS\\_KPDPROC\\_PREFIX](#)
- [RTE\\_PDS\\_BATCHINIT\\_FLAG](#)
- [RTE\\_PDS\\_BACKUP\\_FLAG](#)
- [RTE\\_PDS\\_EXPORT\\_FLAG](#)
- [RTE\\_PDS\\_EXTRACT\\_FLAG](#)
- [RTE\\_PDS\\_SMS\\_VOLUME](#)
- [RTE\\_PDS\\_SMS\\_UNIT](#)
- [RTE\\_PDS\\_SMS\\_STORCLAS](#)
- [RTE\\_PDS\\_SMS\\_MGMTCLAS](#)
- The following parameters are product-specific for TEMS and Agents that determine the size and number of the allocated files per product.
  - [Kpp\\_PD\\_\\*](#)
  - [Kpp\\_PDS\\_FILE\\_COUNT](#)
  - [Kpp\\_X\\_PD\\_HISTCOLL\\_DATA\\_\\*](#)

The following code sample is for configuring TEMS PDS.

```

KDS_PDS_FILE_COUNT      6          * xKANPARU(KppAL) option
KDS_PD_CYL              36         * GROUP=GENHIST

```

The following code sample is for configuring OMEGAMON for CICS Agent history data collection in the Agent address space.

```

KC5_PD_HISTCOLL_DATA_IN_AGT_STC  Y          * Enablement Parameter *
KC5_PD_CYL                    600         * GROUP=OMCICS

```

The following code sample is for configuring OMEGAMON for z/OS Agent history data collection in the TEMS address space.

```

KM5_PD_HISTCOLL_DATA_IN_TEMS_STC  Y          * Enablement Parameter *
KM5_PD_CYL_LPARDATA              605         * GROUP=LPARDATA
KM5_PD_CYL_PLEXDATA              190         * GROUP=PLEXDATA

```

For more information on each parameter, see the following topics:

- [KPP\\_PD\\_CYL](#)
- [KPP\\_PD\\_HISTCOLL\\_DATA\\_IN\\_TEMS\\_STC](#)
- [KPP\\_PD\\_HISTCOLL\\_DATA\\_IN\\_AGT\\_STC](#)
- [KPP\\_PDS\\_FILE\\_COUNT](#)
- [KPP\\_X\\_PD\\_HISTCOLL\\_DATA\\_TEMS\\_STC](#)

- KPP\_X\_PD\_HISTCOLL\_DATA\_AGT\_STC

## Allocate data sets and configure maintenance for historical data

To collect historical data for display in either the Tivoli® Enterprise Portal or the OMEGAMON® Enhanced 3270 user interface, you must allocate data sets to store the data. You must configure the persistent datastore (PDS) that manages the collected data.

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

You can use the defaults or configure any of the following parameters:

- A high-level qualifier for the historical data sets and a prefix for the PDS maintenance procedures.
- The number of files to be allocated for historical data storage.
- For non-SMS managed files, the location where the files are allocated.
- Disposition of the data in data sets that are being emptied by PDS maintenance.
- The address space that does the data collection.
- The number of cylinders to set aside on behalf of each product and the name of the PDS group.

No collection of historical data occurs unless collection is configured through either the Tivoli® Enterprise Portal or the OMEGAMON® Enhanced 3270 user interface.

For more information about these parameters, see [Common parameters](#).

### Procedure

- Specify a high-level qualifier for the historical data sets and a prefix for the PDS maintenance procedures other than the defaults.

TUTORIAL INFORMATION

#### **RTE\_PDS\_HILEV**

The default for data sets is %RTE\_HILEV.%RTE\_NAME%.

#### **RTE\_PDS\_KPDPROC\_PREFIX**

The default is %RTE\_STC\_PREFIX%.PD (IBMPD, previously KPDPROC).

- For non-SMS managed files, specify where the files are allocated.

**RTE\_PDS\_SMS\_VOLUME**  
**RTE\_PDS\_SMS\_UNIT**  
**RTE\_PDS\_SMS\_STORCLAS**  
**RTE\_PDS\_SMS\_MGMTCLAS**

- Configure maintenance for the PDS.

The PDS periodically empties and reuses the data set with the oldest data. You can configure what is to be done with historical data that is sitting in a data set that is being emptied. The default is to delete the data. Alternatively, you can configure maintenance to back up the data to tape or DASD, export the data to an external program for processing, or extract the data and write it in a viewable format by specifying Y or N for the following parameters. The default for each is N.

**RTE\_PDS\_BACKUP\_FLAG**  
**RTE\_PDS\_EXPORT\_FLAG**  
**RTE\_PDS\_EXTRACT\_FLAG**

- Specify the PDS initialization option.

The PDS initialization process can take place in the running address space so long as BACKUP, EXPORT, and EXTRACT are set to N. The **RTE\_PDS\_BATCHINT\_FLAG** defaults to N. To run the PDS maintenance as a batch process, set this flag to Y.

- Specify which address space does data collection.

Location of data collection is configured on a product-by-product basis. Historical data may be collected by the agent address space or the monitoring server address. Some products (OMEGAMON® for z/OS® and OMEGAMON® for Storage on z/OS®) can collect data only at the monitoring server address space (`Kpp_PD_HISTCOLL_DATA_IN_TEMS_STC=Y`). Other products (OMEGAMON® for IMS™, OMEGAMON® AI for Db2, and OMEGAMON® for CICS®) can collect with either monitoring server or agent address space. Some products can collect data at either, but collecting data in the stand-alone agent address space is preferred.

`Kpp_PD_HISTCOLL_DATA_IN_AGT_STC`  
`Kpp_PD_HISTCOLL_DATA_IN_TEMS_STC`

Or (if no corresponding parameter existed in the previous configurations)

`Kpp_X_PD_HISTCOLL_DATA_IN_AGT_STC`  
`Kpp_X_PD_HISTCOLL_DATA_IN_TEMS_STC`

- Specify the number of cylinders to set aside on behalf of each product and the name of the PDS group.

`Kpp_PD_CYL`

- Specify the number of files to be allocated (if other than the default).

`Kpp_PDS_FILE_COUNT`

The default is 6 files.

## What to do next

To complete configuration of historical data collection, perform the following tasks:

- Run the jobs that allocate the data sets (\$PARSE, KCIPPALO).
- If not already done during preconfiguration preparation, provide access to the PDS files.
- Authorize the KPDDSCO module.
- Verify the PDS configuration.
- Configure data collection through either the Tivoli® Enterprise Portal or the OMEGAMON® Enhanced 3270 user interface.

See the configuration information for each monitoring agent for product-specific configuration details. For more information about the persistent datastore, see [Maintaining the persistent data store](#). For instructions for completing configuration tasks outside the configuration software, see [“Completing the configuration outside the configuration software” on page 522](#).

## Configure a Tivoli Enterprise Monitoring Server

The presence or absence of a monitoring server and the type of server (hub or remote, static or high-availability) can be defined as part of setting up of the runtime environment (RTE) or in the RTE configuration profile. If a monitoring server has already been defined for this RTE, you might still need to edit the RTE configuration profile to enable or disable specific features and to specify properties specific to monitoring servers (such as communications protocols, or, for a remote, the name of the hub to which it connects). The parameters that affect this component use the prefix KDS.

## About this task

When you configure a monitoring server, you can accept the defaults or specify the following properties:

- Started task name
- Communications protocols to be used with other components
- Interface list support (if required)
- Address translation support (if required)
- VTAM information
- Applids
- Security settings

In addition, the following features are configured for a monitoring server in the RTE configuration profile.

- Support for self-describing agents  
By default, support for self-describing agents is disabled on monitoring servers.
- Event forwarding (hub only)

- SOAP server
- Auditing

For information about specific parameters, see [Tivoli Enterprise Monitoring Server \(KDS\) parameters](#).

#### Configuring a high-availability hub

A configuration that includes a high-availability (HA) hub is resilient and efficient. It is resilient because the HA hub can be relocated to any LPAR in the sysplex with minimal disruption to the other components. The configuration is efficient because the remote monitoring server on the same LPAR as the hub handles all communications with the monitoring agents and thus reduces the load on the hub. If your environment supports the requirements for a HA hub, you should configure one.

### About this task

You can configure a high-availability hub monitoring server in any sysplex environment with dynamic virtual IP addressing (DVIPA) and shared DASD. A high-availability hub is configured in its own runtime environment, without any monitoring agents, and can be configured on the same LPAR with a remote monitoring server. It is recommended that system variables are not enabled on an high-availability hub. This configuration allows the hub monitoring server to be relocated to any suitable LPAR in the sysplex with no changes, and with minimal disruption to the components connecting to the hub.

“[Figure: High-availability hub monitoring server and its connections](#)” on page 458 depicts an HA hub monitoring server connected to a remote monitoring on the same LPAR, to remote monitoring servers on other LPARs, to remote monitoring servers on distributed systems, and to the Tivoli Enterprise Portal server.

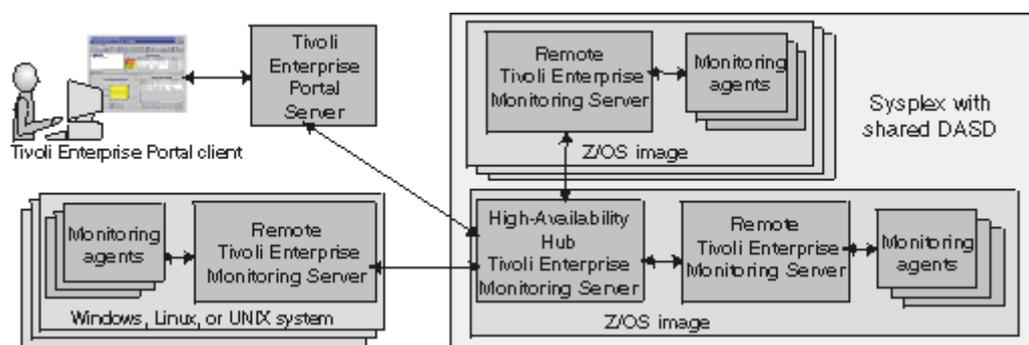

Figure 80: High-availability hub monitoring server and its connections

**Reminder:** An HA hub is the only type of hub that can be on the same LPAR with a remote monitoring server that reports to it. You can configure monitoring agents to report to the remote hub. You should not configure monitoring agents to report directly to the HA hub.

#### Tips:

- The parameters shown in this section are not the only parameters you might need to set in the configuration profile for the runtime environment. After you set the parameters shown here, be sure to go through the entire configuration profile to make sure the parameter values are correct for the configuration you want.
- The parameters with names beginning **KDS\_HUB** are *not* parameters for the hub monitoring server; they are parameters for remote monitoring servers.
- For information on the XF ("EXCLUDE FIND") macro, see "[XF edit macro](#)" on page 426.

The following instructions assume that the **KDS\_TEMS\_TYPE** parameter was set to HUB and the **KDS\_TEMS\_HA\_TYPE** parameter was set to HA during the set up of the environment. If this is not the case, set those parameters in the RTE configuration profile before completing the following procedure.

### Procedure

1. Do an EXCLUDE FIND of all **\_TCP\_HOST** strings, then customize all occurrences of the LPAR name to the reserved DVIPA name.

In this example, this is hostname OMEGHAHUB.

```
ISREDDE2 TSTEST.&userid.HAHUB.WCONFIG(HAHUB)
Command ==> C &hostname OMEGHAHUB ALL                               Scroll ==> CSR
***** ***** Top of Data *****
- - - - - 307 Line(s) not Displayed
000308 **      000029 RTE_TCP_HOST          "OMEGHAHUB"
- - - - - 197 Line(s) not Displayed
000506 RTE_TCP_HOST          "OMEGHAHUB"
- - - - - 186 Line(s) not Displayed
000693 ** Note: If this is a High-Availability Hub TEMS, KDS_TEMS_TCP_HOST
- - - - - 1 Line(s) not Displayed
000695 KDS_TEMS_TCP_HOST      "OMEGHAHUB"
- - - - - 90 Line(s) not Displayed
000786 ** Note: If this is a High-Availability Hub TEMS, KDS_PH01_TEMS_TCP_HOST
- - - - - 9 Line(s) not Displayed
000796 KDS_PH01_TEMS_TCP_HOST "OMEGHAHUB"
- - - - - 32 Line(s) not Displayed
***** ***** Bottom of Data *****
```

2. Do an EXCLUDE FIND of all **\_PORT** parameters, then customize **\_PORT** according to your site's conventions.

```
ISREDDE2 TSTEST.&userid.HAHUB.WCONFIG(HAHUB)
Command ==> C ' 1918 ' ' nnnnn ' ALL                               Scroll ==> CSR
***** ***** Top of Data *****
- - - - - 507 Line(s) not Displayed
==CHG> RTE_TCP_PORT_NUM          nnnnn
- - - - - 176 Line(s) not Displayed
==CHG> KDS_TEMS_TCP_PIPE_PORT_NUM nnnnn * IP.PIPE
==CHG> KDS_TEMS_TCP_UDP_PORT_NUM  nnnnn * IP.UDP
- - - - - 110 Line(s) not Displayed
==CHG> KDS_PH01_TEMS_TCP_PORT_NUM nnnnn
- - - - - 151 Line(s) not Displayed
***** ***** Bottom of Data *****
```

3. Customize the monitoring server protocols to support only IP: At least one of the values must be IPPPIPE, IP6PIPE, IPSPIPE, or IP6SPIPE. Nullify the **KDS\_TEMS\_COMM\_PROTOCOL3** parameter by setting it to "" (instead of the SNA value set initially).

```
ISREDDE2 TSTEST.&userid.HAHUB.WCONFIG(HAHUB)
Command ==>                               Scroll ==> CSR
000658 ** TEMS communication protocols:
000659 ** Specify the communication protocols to be used by the local TEMS.
000660 ** Valid values are IPPPIPE, IP, SNA, IP6PIPE, IP6, IPSPIPE, and
000661 ** IP6SPIPE. When communication with another ITM component (TEPS, Hub
000662 ** TEMS or Remote TEMS, Agents) is initiated, the TEMS tries Protocol 1
000663 ** first and goes to Protocol 2 and so on, in case of failure.
000664 ** Note: Update the corresponding KDS_TEMS_TCP_*_PORT_NUM port number
000665 ** parameter for each KDS_TEMS_COMM_PROTOCOLx parameter enabled.
000666 ** For example, if KDS_TEMS_COMM_PROTOCOL1="IPPIPE", set the
000667 ** corresponding KDS_TEMS_TCP_PIPE_PORT_NUM parameter.
000668 ** If KDS_TEMS_COMM_PROTOCOL2="IP" (for IP.UDP), set the
000669 ** corresponding KDS_TEMS_TCP_UDP_PORT_NUM parameter.
000670 ** If this is a Remote TEMS, update the KDS_HUB_* parameters
000671 ** by uncommenting out the corresponding KDS_HUB_TCP_*_PORT_NUM
000672 ** parameters and specify the Remote's Hub TEMS port numbers.
000673 KDS_TEMS_COMM_PROTOCOL1      IPPPIPE
000674 KDS_TEMS_COMM_PROTOCOL2      IP
000675 KDS_TEMS_COMM_PROTOCOL3      ""
```

4. Uncomment the **KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST** parameter, then change its value from the default (!\*) to *!dvipa\_hostname*, where *dvipa\_hostname* is the private DVIPA name set for the **KDS\_TEMS\_TCP\_HOST** parameter (in this example, !OMEGHAHUB). This setting ensures that the high-availability hub is restricted to its private DVIPA address and cannot interfere with the remote monitoring server configured on the same LPAR.

```
ISREDDE2 TSTEST.&userid.HAHUB.WCONFIG(HAHUB)
Command ==>                               Scroll ==> CSR
000698 ** If the TEMS requires network interface list support:
000699 ** Note: If this is a High-Availability Hub TEMS, uncomment the
000700 **      KDS_TEMS_TCP_KDEB_INTERFACELIST and set its value to
000701 **      "!<dvipa_address>"
000702 KDS_TEMS_TCP_KDEB_INTERFACELIST  "!OMEGHAHUB"
```

## What to do next

These are not the only parameters you might want to set. For example, you might want to configure the monitoring server to enable event forwarding, support for self-describing agents, auditing, or the SOAP server.

#### Configuring a static hub monitoring server

A hub monitoring server that is not configured for high availability is sometimes referred to as a *static* hub. A static hub can be configured in the same runtime environment as some or all of the agents that report to it.

### About this task

The configuration shown in “[Figure: Hub monitoring server and monitoring agents in the same runtime environment](#)” on page 460 depicts the hub monitoring server and several monitoring agents installed in the same RTE on a single z/OS® image, with the monitoring agents reporting directly to the hub. This configuration is a basic one that you can expand to accommodate more systems.

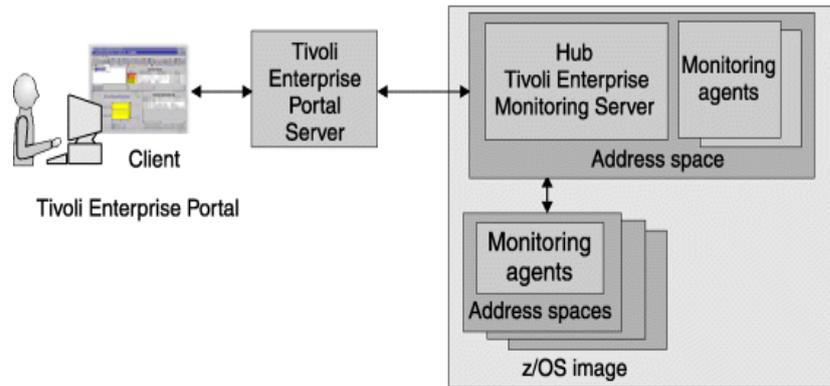

Figure 81: Hub monitoring server and monitoring agents in the same runtime environment

#### Tips:

- The parameters shown in this section are not the only parameters you might need to set in the configuration profile for the runtime environment. After you set the parameters shown here, be sure to go through the entire configuration profile to make sure the parameter values are correct for the configuration you want.
- The parameters with names beginning **KDS\_HUB** are *not* parameters for the hub monitoring server; they are parameters for remote monitoring servers.
- For information on the XF ("EXCLUDE FIND") macro, see “[XF edit macro](#)” on page 426.

The following instructions assume that the **KDS\_TEMS\_TYPE** parameter was set to HUB during the set up of the environment. If this is not the case, set those parameters in the RTE configuration profile before completing the following procedure.

### Procedure

1. Set the **KDS\_TEMS\_COMM\_PROTOCOL<sub>n</sub>** parameters.  
At least one of the values must be IPPPIPE, IP, IP6PIPE, IP6, IPSPIPE, or IP6SPIPE. If this monitoring server will communicate with any monitoring agents that require SNA, SNA must be one of the protocols chosen, but it does not have to be Protocol 1. Examples of such monitoring agents include OMEGAMON® for z/OS® (for the EPILOG facility of the OMEGAMON II® component) and OMEGAMON® for Messaging on z/OS® (for the 3270 interface component). See the product-specific configuration guides for further information about SNA requirements.
2. Set the **KDS\_TEMS\_TCP\_PIPE<sub>c</sub>\_PORT\_NUM** parameter for each protocol.  
The port number that you set for each protocol used by the hub must be re-specified for every component that will communicate with the hub.

### What to do next

There are many other **KDS\_\*** parameters that are required for hub monitoring server configuration. You must either accept the defaults for these parameters or customize them for your site. See [Tivoli Enterprise Monitoring Server \(KDS\) parameters](#) for more information on these parameters. You may also want to enable the following optional features:

- [Support for self-describing agents](#)
- [Auditing and logging](#)

- [Event forwarding](#)
- [SOAP server](#)

Be sure to uncomment any parameters that are needed for your configuration but are commented out by default. For example, if you want to enable event forwarding, uncomment the `KDS_TEMS{EIF_FLAG` parameter and make sure its value is `Y`. To uncomment a parameter in the configuration profile, delete the two asterisks (\*\*\*) from the beginning of the line.

See [Scenario QCF02: Configuring a full RTE with a static hub and variables enabled](#) for step-by-step instructions for configuring an RTE with a static hub and several monitoring agents and many of these features enabled.

### Configuring a remote monitoring server

A remote monitoring server can be configured to report to a high-availability or a static hub monitoring server. Although most sites prefer to have z/OS® agents report to a hub monitoring server on z/OS®, they can also report to a remote monitoring server that reports to a hub on a distributed system.

### About this task

The configuration shown in “[Figure: Remote monitoring server on z/OS® reporting to a hub on a distributed system](#)” on page 461 depicts a remote monitoring server reporting to a static hub monitoring server on another z/OS® LPAR.

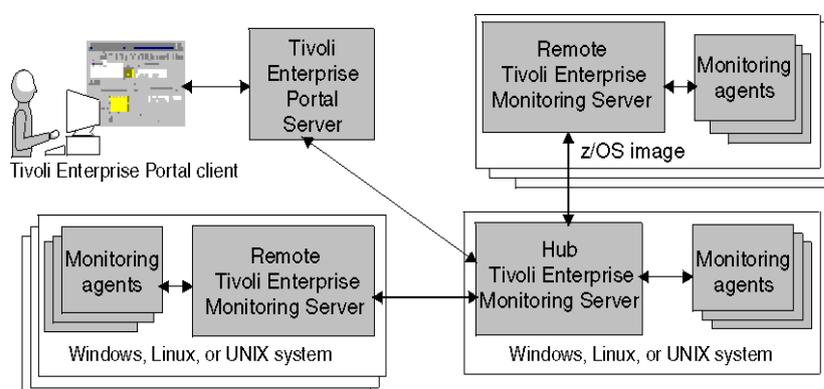

Figure 82: Remote monitoring server on z/OS® reporting to a hub on a distributed system

By default, monitoring agents are configured to report to the local monitoring server.

### Procedure

1. Set the `KDS_TEMS_COMM_PROTOCOLn` parameters.  
At least one of the communication protocols must be the same as a protocol selected for the hub.
2. Set the `KDS_TEMS_TCP_HOST` parameter to the TCP/IP host name (in dot-decimal format) of the z/OS® system where the remote monitoring server is installed.
3. Set the `KDS_HUB_TCP_HOST` parameter to the TCP/IP host name (in dot-decimal format) of the system where the hub monitoring server is installed.
4. Set the `KDS_HUB_TCP_pipe_type_PORT_NUM` to the value of the port number of the hub for each protocol selected.

### What to do next

There are many other `KDS_*` parameters that are required for monitoring server configuration. You must either accept the defaults for these parameters or customize them for your site. See [Tivoli Enterprise Monitoring Server \(KDS\) parameters](#) for more information on these parameters. You may also want to enable the following optional features:

- [Auditing and logging](#)
- [SOAP server](#)

### Enabling the self-describing agent feature at a monitoring server

By default, the self-describing agent feature is disabled. If you want to use the self-describing agent (SDA) feature, you must enable it at the agent and the remote monitoring server to which the agent reports, and at the hub monitoring server to which the remote reports.

### Before you begin

You must perform z/OS® UNIX® System Services system preparation set-up tasks to create the z/OS UNIX file system before you can enable SDA. For more information, see [RTE\\_USS\\_RTEDIR](#).

## Procedure

1. If you are configuring a monitoring server as part of this runtime environment and you want to enable SDA support, perform a FIND on KDS\_KMS\_SDA in the RTE configuration profile.
2. Change the value from N to Y.  
“[Figure: Enable the self-describing agent feature](#)” on page 462 shows an example of this change.

```
SP22                TSTEST.&userid.DEMO.WCONFIG(DEMO)
Command ==>                               Scroll ==> CSR
000839 ** Enable TEMS Self-Describing Agent (SDA) processing:
000840 ** This is required if you are enabling the Self-Describing
000841 ** Agent (SDA) functionality in the z/OS TEMS and Agents:
000842 ** Note: By default, the TEMS KMS_SDA xKANPARU(KDSENV) parameter is
000843 ** initially disabled (KMS_SDA=N). Enabling SDA requires USS
000844 ** system preparation set-up tasks to create the USS file system.
000845 ** Review other required PARMGEN profile parameters to complete
000846 ** SDA enablement.
000847 ** Related PARMGEN CONFIG profile parameters:
000848 ** - GBL_HFS_JAVA_DIRn (typically in WCONFIG($GBL$USR))
000849 ** - GBL_DSN_SYS1_SBPXEXEC (typically in WCONFIG($GBL$USR))
000850 ** - RTE_USS_RTEDIR
000851 ** - RTE_USS_MKDIR_MODE
000852 ** - KDS_KMS_SDA_NO_GRANULAR (applicable to ITM6.3.0+ only)
000853 ** - KDS_TEMA_SDA
000854 ** - Kpp_AGT_TEMA_SDA (per Kpp Agent exploiting SDA)
000855 ** -----
KDS_KMS_SDA                N          * Enablement Parameter *
```

Figure 83: Enable the self-describing agent feature

Ensure that the related parameters are set appropriately. The related GBL\_ parameters are found in the WCONFIG(\$GBL\$USR) profile for further customization.

### Configuring auditing on a monitoring server

Auditing captures significant events occurring in your site's monitoring environment and records them in permanent storage for later retrieval and analysis. Each audit record fully describes some event that has changed the state of your monitoring environment: authorization and authentication failures (such as those that allow or disallow the execution of Take Action commands), and major and minor state changes (though they do not reflect the minor service messages stored in the RAS logs). You can configure the Tivoli Enterprise Monitoring Server running on z/OS to write audit records to the z/OS System Management Facility (SMF). This configuration enables you to use SMF to integrate OMEGAMON events with the event data recorded by other products and components that run on your z/OS system. You can extract OMEGAMON audit record data from SMF data sets (or from the archives of such data sets) for analysis of performance or resource utilization, and for validation of security events (authorization and authentication).

## About this task

Initially, the auditing function is turned off by default on all Tivoli Management Services nodes. In the RTE configuration profile, set the following parameters to control the audit function:

### KDS\_AUDIT\_TRACE

This parameter is used to enable or disable auditing collection in SMF and set the level of tracing. Message trace levels (from low to high) are X (Disabled), M (Minimum), B (Basic), and D (Detail). Higher levels imply all lower levels.

### KDS\_AUDIT\_MAX\_HIST

This parameter specifies the maximum number of entries kept in the in-memory cache for direct queries. Possible values are 10–1000.

### KDS\_AUDIT\_ITM\_DOMAIN

This parameter specifies an identifier that may be used to associate audit records. Possible value is a string of up to 32 characters.

For more information on auditing, see [Auditing](#) in the Planning section.

### Configuring event forwarding on a hub monitoring server

If you use either Netcool/OMNIbus or the Tivoli Enterprise Console, in addition to the Tivoli Enterprise Portal or the Enhanced 3270 user interface, to manage events in your enterprise, you can configure a hub monitoring server to forward situation events to these event servers for correlation and management. The hub monitoring server must be configured to enable forwarding and to specify the default destination server.

## About this task

Use the following parameters to configure event forwarding in the RTE configuration profile of a hub monitoring server:

### **KDS\_TEMS{EIF\_FLAG**

Determines whether or not event forwarding is enabled.

### **KDS\_TEMS{EIF\_HOST**

The fully qualified host name or dotted decimal IPV4 address of the primary event server and of up to seven backup event servers.

### **KDS\_TEMS{EIF\_PORT\_NUM**

The port number on which the Tivoli Enterprise Console® event server or OMNIBus EIF probe listens for events.

### **KDS\_TEMS{EIF\_EVENT\_LISTENER**

The type of event server: Tivoli Enterprise Console or Netcool/OMNIBus.

### **KDS\_TEMS{EIF\_DISABLE\_TEC\_EMITTER**

Disables emitter activities in workflow policies running on the Tivoli Enterprise Portal.

### **KDS\_X\_TEMS{EIF\_BFR\_EVT**

Determines whether or not events are buffered or stored when they cannot be sent to the event server.

### **KDS\_X\_TEMS{EIF\_BFR\_EVT\_PATH**

The full path name of the file in which forwarded events are stored.

### **KDS\_TEMS{EIF\_BUFFER\_EVENT\_MAXSIZE**

The maximum size, in KB, of the cache in which events are stored when they cannot be sent to the event server.

### **KDS\_X\_TEMS{EIF\_FLT\_ATTR1**

The name of an attribute in a statement that is used to filter events that are forwarded.

### **KDS\_X\_TEMS{EIF\_FLT\_CLASS1**

The name of the event class included in the filter statement.

### **KDS\_X\_TEMS{EIF\_FLT\_MODE**

Determines whether events that match the filter criteria statement are forwarded or discarded.

For more information about these parameters and their permissible values, see .

## What to do next

The following tasks must be completed outside the configuration software to implement situation event forwarding:

- The destination event server or servers must be configured to receive the events.
- A situation update forwarding process (the event synchronization component) must be installed on the event receivers.
- For situation events forwarded to the Tivoli Enterprise Console:
  - The .baroc files for the monitoring agents reporting to the hub must be installed and imported on the Tivoli Enterprise Console server, and the rule base must be updated.
  - If any distributed agents report either directly or indirectly (through a distributed remote monitoring server) to a z/OS® hub, map and resource files for each monitoring agent must be transferred from a hub monitoring server on a Windows®, Linux®, or UNIX® system to the RKANDATV library of the runtime environment that contains the hub monitoring server on z/OS®.
  - If z/OS® agents report to a z/OS® hub monitoring server in another CSI, their map files must be copied to the RKANDATV library of the runtime environment that contains the hub.

The section on “Integrating event management systems” in the *IBM Tivoli Monitoring: Installation and Setup Guide* provides detailed instructions for configuring the Tivoli Event Console and OMNIBus to receive forwarded events, including installing the event synchronization component and the .baroc files.

For more information on event forwarding, see [Event forwarding](#).

Enabling and configuring the SOAP server on a monitoring server

The Web Services Simple Object Access Protocol (SOAP) server is an application server plug-in that receives and sends XML data, and provides XML SOAP interfaces into the Tivoli Management Services components and the monitoring agents. The SOAP server is installed with each monitoring server and is enabled during configuration of the hub monitoring server. During configuration, you specify the list of non-local hub monitoring servers with which the local SOAP server can communicate.

## Before you begin

ICSF password encryption is required for SOAP Server. For more information on the SOAP server and SOAP server security, see [SOAP server](#).

**Note:** If you enable the SOAP server while configuring the hub, at least one of the communication protocols you specify must be either IP\*.PIPE or IP\*.UDP. The communication protocols for the SOAP server are automatically initialized to the protocol values set for the runtime environment.

## About this task

Use the following parameters to enable the SOAP server.

### **KDS\_TEMS\_SOAP\_SERVER\_FLAG**

This parameter determines whether to enable the Web Services Simple Object Access Protocol (SOAP) server. The default is Y.

### **KDS\_TEMS\_HTTP\_PORT\_NUM**

This parameter contains the HTTP port number for communications with the SOAP server. The default is 1920.

For a hub monitoring server, SOAP server configuration creates a KSHXHUBS member in the *rhilev.rte.RKANPARU* library. The KSHXHUBS member contains a table of hub monitoring servers, an aliasing mechanism for identifying the hub monitoring servers with which the local SOAP server can communicate. Use the following parameters to create the table:

### **KDS\_PH**

Table BEGIN and END delimiter.

### **KDS\_PH01\_ROW**

First row delimiter.

### **KDS\_PH01\_TEMS\_RTE**

This parameter contains the name of the runtime environment where the hub is configured.

### **KDS\_PH01\_TEMS\_COMM\_PROTOCOL1**

This parameter contains the communication protocol to be used by the SOAP server.

### **KDS\_PH01\_TEMS\_TCP\_HOST**

If this is a high-availability hub, this parameter must be set to the DVIPA.

### **KDS\_PH01\_TEMS\_TCP\_PORT\_NUM**

This parameter defines the TCP port number of the SOAP server.

### **KDS\_PH01\_TEMS\_VTAM\_NETID**

This parameter defines the VTAM® network identifier for the SOAP server.

### **KDS\_PH01\_TEMS\_VTAM\_APPL\_GLB\_BKR**

This parameter defines the VTAM® applid for the global location broker of the SOAP server.

### **KDS\_PH01\_TEMS\_VTAM\_LU62\_DLOGMOD**

This parameter defines the LU6.2 logmode entry required by the SOAP server for SNA communication.

### **KDS\_PH01\_TEMS\_ALIAS\_NAME**

This parameter contains the monitoring server name (node ID) that identifies a non-local hub monitoring server to the SOAP server. For best results, accept the default name.

### **KDS\_PH01\_TEMS\_USER\_QUERY**

This parameter defines the user ID with query access to the SOAP server.

#### **KDS\_PH01\_TEMS\_SYSV\_FLAG**

This parameter determines whether system variables are to be enabled for the SOAP server.

#### **KDS\_PH01\_TEMS\_KSH\_SECURE**

This parameter defines the security status of the SOAP server.

To create the access list for the SOAP server, use the following parameters:

#### **KDS\_PU**

Table BEGIN and END delimiter.

#### **KDS\_PU01\_ROW**

First row delimiter.

#### **KDS\_PU01\_TEMS\_USER\_ID**

This parameter contains the user ID defined to have access to the SOAP server.

#### **KDS\_PU01\_TEMS\_USER\_QUERY**

This parameter determines query access of a user ID to the SOAP server.

#### **KDS\_PU01\_TEMS\_USER\_UPDATE**

This parameter determines update access of a user ID to the SOAP server.

#### **KDS\_PU**

Table END delimiter.

For more information about SOAP server security, see [SOAP server configuration and security](#). For more information about the parameters, see [Tivoli Enterprise Monitoring Server \(KDS\) parameters](#).

Enabling the validation of TEP user IDs and passwords in Hub TEMS

If your z/OS TEMS is the SOAP Server and you want to secure the TEMS, set the parameter

**KDS\_TEMS\_SECURITY\_KDS\_VALIDATE** value to Y to enable the authentication of Tivoli Enterprise Portal user IDs and passwords.

### **About this task**

The parameter **KDS\_TEMS\_SECURITY\_KDS\_VALIDATE** determines whether the hub monitoring server validates the user IDs and passwords of users signing on to the Tivoli Enterprise Portal.

**Note:** The PARMGEN PTF UA91952 (2Q17) changed the default value of this parameter from N to Y, which means the validation is enabled by default for the RTEs that are created after you apply this PTF. However, for the RTEs that were created before you apply this PTF, the following steps are required if you need the TEMS security requirement.

### **Procedure**

1. In the RTE's LPAR-specific configuration profile, set the value of the parameter **KDS\_TEMS\_SECURITY\_KDS\_VALIDATE** to Y.
2. Resubmit the WCONFIG(\$PARSEPR) job to refresh the KDSENV member in the PARMGEN WKANPARU staging dataset.
3. Resubmit the WKANSAMU(KCIJPW2R) job to refresh the KDSENV member from the WKANPARU staging dataset to the product execution RKANPARU user dataset that is read by the z/OS TEMS started task.
4. Recycle the z/OS TEMS started task when it's ready to deploy the change.

### **Result**

The validation of users is enabled to access to z/OS TEMS.

## Configure the OMEGAMON® enhanced 3270 user interface

If you want to use the OMEGAMON enhanced 3270 user interface, you must configure at least one instance in each sysplex. The parameters that affect this component use the prefix KOB in the configuration profile. Default values are supplied for all KOB parameters, so the interface is configured in every runtime environment unless you explicitly exclude it from configuration. However, you can customize the parameters to meet site requirements.

### Before you begin

The enhanced 3270 user interface uses BPXmmm services for TCP/IP communications. BPXmmm services are a part of z/OS® UNIX® System Services, so a user ID for the enhanced 3270 user interface started task must be defined with an OMVS segment (see [“Create a z/OS UNIX System Services ID for the address space”](#) on page 575).

### About this task

You can set site-specific values for the started task name for the interface address space, VTAM applid, and VTAM node.

You can also configure security for enhanced 3270 interface. Authentication and authorization for users of the enhanced 3270 user interface is provided using the interface. Security for the enhanced 3270 user interface is configured by specifying the name of a system authorization facility (SAF) general resource class for the RTE\_SECURITY\_CLASS parameter. However, you should not enable security until you have completed and verified configuration of the runtime environments that the interface will serve. For more information, see [“Enable security for the OMEGAMON enhanced 3270 user interface”](#) on page 564

Complete the following steps to configure the OMEGAMON® enhanced 3270 user interface as part of this runtime environment.

### Procedure

- Find the KOB\$ section and update the parameters as needed. [“Figure: Configure an OMEGAMON® enhanced 3270 user interface”](#) on page 466 shows an example of this section.

```
EDIT          TDITN.&userid.DEMO.WCONFIG(DEMO) - 01.02      Columns 00001 00072

```

Figure 84: Configure an OMEGAMON® enhanced 3270 user interface

where:

**KOB\_TOM\_STC**

Is the name of the started task for the enhanced 3270 user interface (by default, IBMTOM).

**KOB\_TOM\_VTAM\_NODE**

Is the name used to build the VTAM node entry for the OMEGAMON enhanced 3270 user interface (by default, CTDOBN).

### KOB\_TOM\_VTAM\_APPL\_LOGON

Is the name used to build the VTAM logon APPLID for the enhanced 3270 user interface (by default, CTDOBN).

See the [Enhanced 3270 user interface \(KOB\) parameters](#)

- To enable security, specify a value for RTE\_SECURITY\_CLASS. This parameter specifies the SAF security class to be used for log-on, query, Take Action, and interface actions. However, you might not want to enable security until you have verified that all components have been successfully configured and started. If you want to enable security after you have completed configuration of the runtime environment, edit the RTE configuration file to specify the RTE\_SECURITY\_CLASS. Then follow the instructions in [Scenario RTE03: Changing parameters in an RTE](#) to refresh the environment. If more granular security is required, you can override the RTE\_SECURITY\_CLASS parameter for logon, queries, and Take Action commands. For more information, see [“Enable security for the OMEGAMON enhanced 3270 user interface”](#) on page 564.

## What to do next

A security administrator must define the system authorization facility (SAF) general resource class if it does not already exist and define profiles to control access to the interface, to control access to the data queries issued by the interface, and to control actions performed by the interface. Users or user groups must be given access to the profiles. [“Enable security for the OMEGAMON enhanced 3270 user interface”](#) on page 564 for more information.

## Configure OMEGAMON® monitoring agents and other components

Before completing all the updates to the PARMGEN profile, review and update, if needed, all parameters specific to the various OMEGAMON® monitoring agents and any other components that are configured within this runtime environment. Component-specific parameters are prefixed with *Kpp* (where *pp* identifies the individual product).

## About this task

See [Product codes](#) for a full list of product codes. Review the product-specific *Planning and Configuration Guide* and *Parameter Reference* for information on requirements or values required for a specific product. At a minimum, you must configure the following parameters.

- If OMEGAMON® AI for Db2 is configured:
  - KD2\_DBnn\_DB2\_SSID
  - KD2\_DBnn\_DB2\_VER
- If OMEGAMON for IMS on z/OS is configured:
  - For each subsystem, uncomment the following block of parameters.

```
KI2_I1                BEGIN                * Table begin *
KI2_I101_ROW          01
KI2_I101_CLASSIC_XMIT 00
KI2_I101_CLASSIC_IMSID IMSA * Not eligible for symbolics *
KI2_I101_CLASSIC_STC   XXXOI0
KI2_I101_CLASSIC_IMS_RESLIB DFS.V12R0M0.SDFSRESL
KI2_I101_CLASSIC_MPREFIX M0
KI2_I101_CLASSIC_VTAM_NODE XXX&SYSCONE.OI0N
KI2_I101_CLASSIC_VTAM_APPL_LOGON XXX&SYSCONE.OI0
KI2_I101_CLASSIC_LROWS 255
KI2_I101_CLASSIC_USER_PROFILE /C
KI2_I101_CLASSIC_CTRL_UNIT_ADDR XXXX
KI2_I1                END                * Table end *
```

- At a minimum, customize the following two parameters:
  - KI2\_I101\_CLASSIC\_IMSID
  - KI2\_I101\_CLASSIC\_IMS\_RESLIB
- If OMEGAMON for Networks is configured in the RTE, for each monitored TCP/IP stack customize the following parameters:

- KN3\_TCPXnn\_TCPIP\_PROFILES\_DSN
- KN3\_TCPXnn\_TCPIP\_PROFILES\_MBR

## Customizing the global configuration profile

After all the settings in the RTE configuration profile have been updated, the next step is to review and customize the global parameters that will be used by this runtime environment (RTE). This step is required if you have not cloned the \$GBL\$USR profile from another runtime environment.

### About this task

The WCONFIG(\$GBL\$USR) member contains the parameters that define the global system libraries to be used by all components. All global parameters are prefixed GBL\_. Review these parameters to determine whether the default values must be customized for this environment.

The following are the key parameters to check:

- Common system library values

```
GBL_DSN_SYS1_PARMLIB
GBL_DSN_SYS1_PROCLIB
GBL_DSN_SYS1_VTAMLIB
GBL_DSN_SYS1_VTAMLST
```

- ICSF system library

If you are enabling password encryption (KAES256) across the enterprise, you must set the value for the ICSF system library:

```
GBL_DSN_CSF_SCSFMODE0
```

- z/OS® UNIX® System Services Java™ directory

If any of the components that you are configuring within this RTE require Java™ support or if you are planning to enable the self-describing agent feature, a valid path to a Java™ installation on HFS or zFS must be specified. Note that /bin is automatically appended:

```
GBL_HFS_JAVA_DIR1
```

Also, if you are enabling the self-describing agent feature or any other function that uses z/OS®, check the value of the CLIST/EXEC library name. This EXEC library is used during the creation of z/OS UNIX directories running on either the Hierarchical File System (HFS) or on the zSeries File System (zFS):

```
GBL_DSN_SYS1_SBPXEXEC
```

If a monitoring server is using any of the IP.UDP-related or IP.PIPE-related communication protocols for connection, but the IP domain name resolution is not fully configured on the z/OS® system, the SYSTCPD statement must be supported by the monitoring server and all monitoring agents that report to it. SYSTCPD explicitly identifies which data set to use to obtain the parameters defined by TCPIP.DATA when no GLOBALTCPIPDATA statement is configured. To support SYSTCPD, uncomment and set the following parameter:

```
GBL_DSN_TCP_SYSTCPD_TCPDATA
```

The name of the SYSTCPD data set is installation-specific. Get the correct specification from your network administrator.

At a minimum, customize the following parameters for the specific products.

- If OMEGAMON® AI for Db2 is configured in the RTE:
  - Uncomment and customize the following parameters as applicable to your Db2® environment:
    - \*GBL\_DSN\_DB2\_SDSNLOAD
    - \*GBL\_DSN\_DB2\_LOADLIB\_V11
    - \*GBL\_DSN\_DB2\_LOADLIB\_V12
    - \*GBL\_DSN\_DB2\_RUNLIB\_V11
    - \*GBL\_DSN\_DB2\_RUNLIB\_V12

- \*GBL\_DSN\_DB2\_DSNEXT
- If OMEGAMON® for CICS® TG is configured, uncomment and customize the following parameter:
  - \*GBL\_DSN\_CICS\_CTG\_DLL
- If OMEGAMON® for IMS™ on z/OS® is configured, uncomment and customize the following parameter:
  - \*GBL\_DSN\_IMS\_RESLIB
- If OMEGAMON® for Messaging on z/OS® is configured, uncomment and customize the following parameters:
  - \*GBL\_DSN\_WMQ\_SCSQANLE
  - \*GBL\_DSN\_WMQ\_SCSQAUTH
  - \*GBL\_DSN\_WMQ\_SCSQLOAD

## Procedure

1. To edit the \$GBL\$USR member, select option 2 from the **Customize PARMGEN Configuration Profile Members** panel.

```

KCIP@PG6 ----- CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS -----
Option ==>
                Quick Configuration Mode
(Required) Customize the RTE profile and the $GBL$USR user profiles:
(Tip) Review KCIJPDLA autodiscovery job in Utility menu or type DLAJOB cmd.

    *1. SYSA RTE LPAR-specific CONFIG profile in WCONFIG (User copy)
    *2. $GBL$USR Global parameters CONFIG profile in WCONFIG (User copy)

(Required) Customize the Variables profile if RTE_SYSV_SYSVAR_FLAG=Y:
    *3. SYSA Variables (system, user) CONFIG profile in GBL_USER_JCL PARMGEN
        global library (TDITN.IDTST.PARMGEN.JCL).
        Add/Modify system/user-defined symbols and their
        resolution values, for override variables used as parameter
        values in the $DOCRTE RTE and $GBL$USR global profiles.

(Tip) Review/Customize WCONFIG Kpp$C*/Kpp$P*/Kpp$S* user imbeds:
(Cloning Tip) Review KCIJPCCF job in Utility menu prior to customization.
    4. WCONFIG TDITN.IDTST.$DOCRTE.WCONFIG

(Tip) Review if you want to compare with IBM-supplied default profile values:

    5. $CFG$IBM RTE LPAR-specific CONFIG profile in WCONFIG (IBM copy)
    6. $GBL$IBM Global parameters CONFIG profile in WCONFIG (IBM copy)

(Optional) Override SYSIN member to supply additional (User) profiles:
    7. $SYSIN $PARSE/$PARSESV SYSIN controls (CONFIG/SELECT MEMBER)

Press F1=Help for more information. Type UTIL to access utility menu.

```

The WCONFIG(\$GBL\$USR) member is displayed.

2. Review and update the parameter values as appropriate.
3. After you make all the required changes, save the changes and return to the **Customize PARMGEN Configuration Profile Members** panel.

## What to do next

If necessary, customize the %GBL\_USER\_JCL%(RTE\_NAME%) variables configuration file and any necessary embed files. Then, return to the main Workflow menu and create the runtime members and jobs.

## Customizing the variables profile

If support for variables is enabled and you are using user-defined variables, you must customize the variables profile, %GBL\_USER\_JCL%(RTE\_NAME%), to define those variables and their resolution values. If you are using IBM-provided models for RTEs that support variables, you must customize the resolution values for any symbolics used in the model if those values differ from the IBM defaults.

## About this task

The variables profile must be customized under the following conditions:

- For Type 1 and 2 symbolics, if you are using any of the IBM-provided predefined symbolics, and the resolution values for those symbolics cannot be automatically discovered in IEASYM or the system IPL PARMLIB data sets, you must provide those resolution values.
- For any Type 3 symbolics, you must provide both the symbolics and the resolutions values. You can use the IBM-provided "best practice" user symbolics, but you must provide the site specific resolution values for those symbolics.
- If you are not configuring the RTE on the target system, and there are resolution values that cannot be automatically discovered on the target system, you must provide those values, such as overrides for &SYSNAME. or &SYSCLONE..

Regardless of the type of symbolic, any symbolics that appear in started task procedures must follow MVS rules. In the RTE profile, the following parameters are the ones whose symbolic values appear in started tasks:

- **RTE\_NAME**
- **RTE\_HILEV**
- **RTE\_VSAM\_HILEV**
- **RTE\_X\_HILEV\_SHARING**
- **RTE\_SHARE**
- **Kpp\_\*\_VTAM\_APPL\_\***

In the global profiles, the symbolics for the following parameters appear in started tasks:

- **GBL\_DSN\_DB2\_\***
- **GBL\_DSN\_IMS\_\***
- **GBL\_DSN\_CICS\_CTG\_DLL**
- **GBL\_DSN\_WMQ\_\***
- **GBL\_DSN\_CSF\_SCSFMODE**
- **GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA**

**Tip:** You can run the \$PARSEDV job in WCONFIG to get a list of all the variables you can use on this system. The output report is called \$SYSVAR1 and it is also found in the RTE WCONFIG data set. You can invoke the job from the Utilities panel. Enter UTIL on the command line of any Workflow panel and select option 22.

**Note:** Variables cannot be used with a small subset of parameters. See [Parameters ineligible to use variables](#) in the Reference section for more information.

## Procedure

1. To edit the variables profile, select option 3 on the **Customize PARMGEN Configuration Profile Members** panel.

```

KCIP@PG6 ----- CUSTOMIZE PARMGEN CONFIGURATION PROFILE MEMBERS -----
Option ==>
                Quick Configuration Mode
(Required) Customize the RTE profile and the $GBL$USR user profiles:
(Tip) Review KCIJPDLA autodiscovery job in Utility menu or type DLAJOB cmd.

    *1. SYSA RTE LPAR-specific CONFIG profile in WCONFIG (User copy)
    *2. $GBL$USR Global parameters CONFIG profile in WCONFIG (User copy)

(Required) Customize the Variables profile if RTE_SYSV_SYSVAR_FLAG=Y:
    *3. SYSA Variables (system, user) CONFIG profile in GBL_USER_JCL PARMGEN
        global library (TDITN.IDTST.PARMGEN.JCL).
        Add/Modify system/user-defined symbols and their
        resolution values, for override variables used as parameter
        values in the $DOCRTE RTE and $GBL$USR global profiles.

(Tip) Review/Customize WCONFIG Kpp$C*/Kpp$P*/Kpp$S* user imbeds:
(Cloning Tip) Review KCIJPCCF job in Utility menu prior to customization.
    4. WCONFIG TDITN.IDTST.$DOCRTE.WCONFIG

(Tip) Review if you want to compare with IBM-supplied default profile values:

    5. $CFG$IBM RTE LPAR-specific CONFIG profile in WCONFIG (IBM copy)
    6. $GBL$IBM Global parameters CONFIG profile in WCONFIG (IBM copy)

(Optional) Override SYSIN member to supply additional (User) profiles:
    7. $SYSIN $PARSE/$PARSESV SYSIN controls (CONFIG/SELECT MEMBER)

Press F1=Help for more information. Type UTIL to access utility menu.

```

The system variables profile is displayed.

2. Provide values for any user-defined variables, any variables that differ from the IBM-provided defaults, and any variables whose values cannot be automatically discovered from the system IPL PARM data set.
3. Press F3 to save the changes in the profile, then press F3 to return to the main Workflow panel.

## What to do next

Customize the embed files as necessary, then create the runtime members and jobs.

## Customizing the override embed members

Override embeds provide a permanent way to support special customizations. Embed override files can be used to add user-defined parameters that might be overwritten when maintenance or upgrades are performed if they were added to the configuration profiles.

## About this task

To customize override embed members, select option **4** on the **Customize PARMGEN Configuration Profile Members** panel. (You can also enter UTIL on the command line of any Workflow panel, then select option 7 to access the WCONFIG library.)

[“Override embeds” on page 471](#) lists some override embeds, the library in which the affected members are located, and the purpose of the embed member.

You can find a complete list of override embeds by reviewing the \$JOBINDX README. The \$JOBINDX is available in the RTE's **WCONFIG** dataset which is refreshed each time when one of the following maintenance scenarios is performed:

- SMPE02
- SMPE03
- SMPE04
- SMPE05
- SMPE06

For more information about the maintenance scenarios, see [SMP/E maintenance and upgrade scenarios](#).

This table lists the override embeds, the library in which the affected members are located, and the purpose of the embed member.

Table 57: Override embeds		
Embed member	Library	Purpose
Kpp\$CSTR	xKANCMDU	Product-specific override embed in Tivoli® Enterprise Monitoring Server xKANCMDU(KDSSSTR1), Agent xKANCMDU(KppAGST) and CUA-specific startup runtime members. (CUA names vary by OMEGAMON® product.) (where x = I, W, R)
KMQ\$CSTn *	xKANCMDU	OMEGAMON® for Messaging (MQ Monitoring component only) override embed for xKANCMDU(KMQSTART) startup runtime member. *(where n = 1 – 5)
KMQ\$CUSR	xKANCMDU	OMEGAMON for Messaging (MQ Monitoring component only) override embed for xKANCMDU(KMQUSER) startup runtime member.
KAG\$PENV	xKANPARU	Common Agent override embed in all standalone Agents' xKANPARU(KppENV) runtime member.
Kpp\$PENV	xKANPARU	Product-specific override embed in Tivoli Enterprise Monitoring Server xKANPARU(KDSENV), Agent xKANPARU(KppENV) and applicable CUA xKANPARU(KppENV) runtime members.
Kpp\$PSYS	xKANPARU	Product-specific override embed in Tivoli Enterprise Monitoring Server's and Agents' xKANPARU(KppSYSIN) and CUA-specific runtime members. (CUA names vary by OMEGAMON product)
KDS\$PTEC	xKANPARU	Tivoli Enterprise Monitoring Server override embed in xKANPARU(KMSOMTEC) Event Integration Facility (EIF) runtime member.
KD2\$PCPT	xKD2PAR	OMEGAMON for Db2 override embed that is appended to the xKD2PAR(COPTxxxx) members.
KD2\$POMD	xKD2PAR	OMEGAMON for Db2 override embed for xKD2PAR(OMPE&dbid) OMEGAMON Server private parameter file.
KD2\$POMP	xKD2PAR	OMEGAMON for Db2 override embed for xKD2PAR(OMPE00) OMPE subsystem initialization runtime member.
KD2\$POPT	xKD2PAR	OMEGAMON for Db2 override embed for xKD2PAR(OMPEOPTS) OMPE Collector Realtime Customer Options runtime member (1 of 2).
KD2\$POP1	xKD2PAR	OMEGAMON for Db2 override embed for xKD2PAR(OMPEOPTS) OMPE Collector Realtime Customer Options runtime member (2 of 2).
KEP\$PESD	xKANPARU	OMEGAMON for z/OS override embed for xKANPARU(KEPESD) Epilog runtime member.
KEP\$POPT	xKANPARU	OMEGAMON for z/OS override embed for xKANPARU(KEPOPTN) Epilog runtime member.
KI2\$PTRF	xKANPARU	OMEGAMON for IMS override embed for xKANPARU(KI2ATFmp) TRF runtime member (where mp = MPREFIX; one per IMS subsystem configured in the RTE).
KOI\$PJLF	xKANPARU	OMEGAMON for IMS override embed for xKANPARU(KOIJLF00) Journal Logging Facility (JLF) runtime member.
KM5\$PDEV	xKANPARU	OMEGAMON for z/OS override embed for xKANPARU(KOSDEVIN) DASD Device runtime member.
KDF\$PDEV	xKANPARU	OMEGAMON for Storage override embed for xKANPARU(KDFDEVIN) DASD Device runtime member.
KDF\$PDVS	xKANPARU	OMEGAMON for Storage override embed for xKANPARU(KDFDEVSU) DASD Device runtime member.
KDF\$PHSN	xKANPARU	OMEGAMON for Storage override embed for xKANPARU(KDFDHSIN) HSM monitoring and log analysis (LOGY) options runtime member.
KAG\$SST1	xKANSAMU	Common Agent STEPLIB DD override in all Agents' started tasks.
KAG\$SST2	xKANSAMU	Common Agent RKANMODL DD override in all Agents' started tasks.
KAG\$SST3	xKANSAMU	Common Agent additional DD override in all Agents' started tasks (for example, add SYSMDUMP DD, etc. in each of the Agent started tasks [default xKANSAMU(IBMpp)]).

Embed member	Library	Purpose
Kpp\$SST1	xKANSAMU	Product-specific STEPLIB DD override in the product started task.
Kpp\$SST2	xKANSAMU	Product-specific RKANMODL DD override in product started task.
Kpp\$SST3	xKANSAMU	Product-specific additional DD override in product started tasks (for example, add SYSMDUMP DD, etc. in the product started task [default xKANSAMU(IBMpp)]).
Kpp\$SDLn	xKANSAMU	Product-specific imbeds to the xKANSAMU(KppDFINL) post-configuration README steps for autodiscovered subsystems by the PARMGEN KCIJPDLA z/OS DLA job (for example, KJJ\$SDLn imbeds for KJJDFINL for autodiscovered JVMs directories where the OMEGAMON for JVM agent options are added for detailed monitoring).
KI2\$SSCn **	xKANSAMU	OMEGAMON for IMS KOICTXX module statement input to the KCIJPSEC/KOISUPD Classic command table security jobs for OMEGAMON for IMS **where n = 1 – 2.
KCI\$SST1	xKANSAMU	Common accounting imbed for adding information about the started tasks, such as owner, type of task, type of LPAR. This embed is originally populated with job card information.
KJT\$PPRP	xKANPARU	KJTCOLL override in Agent's xKANPARU(KJTTPR00) common collector property file of the OMEGAMON for JVM Agent.

Placeholder parameters are provided in the embed files. You can uncomment and customize the values for these parameters or add your own.

For example, you might want to change the refresh rate of the OMEGAMON Enhanced 3270 user interface local registry. This registry stores information about OMEGAMON agent data sources. By default, the registry information is refreshed every 5 minutes. You can change the refresh rate temporarily by using the MVS MODIFY command, or you can change it permanently by using the **REGREF** parameter in the KOB\$PENV embed.

In the KDS\$PENV file, one set of place holder parameters points to user variable symbols that are already defined in the variables configuration profile in the %GBL\_USER\_JCL%(%RTE\_NAME%) PARMGEN global library: **KDS\_HEAP\_SIZE=&KDS\_HEAP\_SIZE .**, **KGL\_GMMSTORE=&KGL\_GMMSTORE .**, and **KDS\_NCSLISTEN=&KDS\_NCSLISTEN**. If you use these parameters, edit the variables profile to set the appropriate resolution values.

```

000049 ** *****
000050 KDS_HEAP_SIZE=1024
000051 *KDS_HEAP_SIZE=&KDS_HEAP_SIZE.
000052 KGL_GMMSTORE=1024
000053 *KGL_GMMSTORE=&KGL_GMMSTORE.
000054 KDS_NCSLISTEN=256
000055 *KDS_NCSLISTEN=&KDS_NCSLISTEN.
000056 ** *****
000057 ** Additional common Agent parameters:
000058 ** *****
000059 *CTIRA_HEARTBEAT=5
000060 *CTIRA_RECONNECT_WAIT=600
000061 *CTIRA_PRIMARY_FALLBACK_INTERVAL=1500
000062 *CTIRA_HOSTNAME="%RTE_NAME%:CMS"
000063 *CTIRA_SUBSYSTEM_ID=&subsystem
000064 *TEMA_SDA_ACK_WAIT=300
000065 *TEMA_SDA_RETRY_WAIT=300
000066 *TEMA_SDA_MAX_ATTEMPT=1
000067 *KDEB_INTERFACELIST_IPV6=-
000068 * ----- END - USER SECTION: OVERRIDE ----- *

```

Figure 85: KDS\$PENV override file

This figure show the user section of the KDS\$PENV override file.

## What to do next

The next step is to create the RTE members and jobs.

## Creating the runtime environment members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job (or \$PARSESV if variable support is enabled). This job generates a set of jobs that extract the profile parameter values specified during set up and in the configuration profiles. The jobs then generate the runtime environment (RTE) members and jobs required to complete the creation of the RTE.

### About this task

The composite \$PARSE/\$PARSESV job processes the PARMGEN templates from the interim (IK\*) staging libraries into the corresponding work (WK\*) output libraries. The job performs the string substitutions and embeds required by the user overrides in the PARMGEN configuration profile member. Part of this job's function is to create runtime members and file-tailored jobs in the work output libraries. After completion of the \$PARSE\* job, you have a complete set of customized runtime members in the work output libraries (WKANCMDU, WKANPARU, WKANSAMU (additionally, WKD2PAR, WKD2PRF, and WKD2SAM if OMEGAMON® AI for Db2 is configured in this RTE).

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
   reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
   WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

      Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles. KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE

Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job.  
If you want to create (or recreate) only certain runtime members, press F5 for a menu of the individual jobs submitted by the composite job.

**Tip:** Note that the library-specific \$PARSE%% jobs regenerate the runtime members in the PARMGEN work libraries (such as WKANPARU and WKANCMDU, and so on) because PARMGEN supports a staged deployment and does not update the running production user libraries and execution libraries (such as RKANPARU and RKANCMDU). You must then run the WKANSAMU(KCIJPW2R) job to deploy runtime members from the WK\* libraries to the RK\* production user libraries. However, if you want to update the production user libraries directly, without having to run KCIJPW2R, update the SYSUT2 DD to point to RK\* instead of the WK\* PARMGEN work libraries.

To view a list of all the variables (symbolics) used in the RTE, select option 2.

### Result

The runtime members and jobs are created.

### What to do next

Submit the jobs to complete the set up of the RTE.

## Completing the setup of the runtime environment

To complete the setup of the runtime environment using the Parameter Generator configuration software, you submit the batch jobs created by the \$PARSE job in the previous step. These jobs allocate the runtime libraries, copy members from the target libraries to the runtime libraries, run required security jobs, and the like, using the values you supplied during the configuration process. You will have to complete additional tasks outside of the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```
KCIPQPGB  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.
```

Description	Job/Label	Status	Date
1. Set up/Refresh PARMGEN work environment.	KCIJPCFG		
2. Customize PARMGEN configuration profiles.	SYSA		
3. Create this RTE's runtime members and jobs.	\$PARSE	Enter 3 for details.	
4. Submit batch jobs to complete PARMGEN setup.	SUBMIT	Enter 4 for details.	
5. Perform post configuration steps.	POSTCFG		
R Create next RTE - Reset fields.	New RTE		

Press F1=Help for more information. Type U or UTIL to access utility menu.

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.
```

Description	REQ	Job Name	Status	Date
1. Composite SUBMIT job (See JCL comments) ** OR **		KCIJPSUB		More: +
2. Allocate runtime RO and RW datasets	(Yes)	KCIJPALO		
3. Copy SMP/E mbrs from TK*->RK* RO libs	(Yes)	KCIJPLOD		
4. Run product security steps	(Yes)	KCIJPSEC		
5. Update variable-named runtime mbrs	(No )	KCIJPUPV		
6. (Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7. Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8. Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9. Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10. Verify the configuration jobs	(Tip)	KCIJPIVP		
11. Back-up RK* product execution user libs (Tip)		KCIJPCPR		
12. Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

Press F1=Help for more information. Type UTIL to access utility menu.

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

2. Choose one of the following approaches.
  - To submit the full set of actions within a single job, choose option 1.
  - To submit each action individually in turn, choose options 2 through 12, as required.

Note that some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE

may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization. If you decide to submit all the jobs automatically, submit the composite KCIJPSUB job. Otherwise, submit the jobs individually.

### **KCIJPALO**

This required job allocates the RK\* runtime libraries for all the products and components in the runtime environment.

### **KCIJPLOD**

This required job copies members of the target libraries that were installed by SMP/E to the read-only RK\* libraries.

The job also deletes any runtime members from the different libraries based on the product versions' FMID requirements if, for example, the latest version of the product removes or renames any SMP/E elements. If any of the libraries listed in the DELRUN DDNAME is part of the system link libraries, or the library may be in use, the KCIJcLOD RTE load job may not be able to delete these elements if the libraries are enqueued. If either of these situations is true, run the BUILDDEX/DELRUN step when those libraries are available.

### **KCIJPSEC**

This job is required if the product-specific IBM®-supplied security exit or input must be customized. The job creates security-related members (load modules, encryption key, and other elements) based on the product security requirements.

Review the *KppSUPDI* "Modify Classic command table" security steps. The *KppJPSCO* input members to the composite KCIJPSEC security job point SYSIN DD to your security exit library (RTE\_X\_SECURITY\_EXIT LIB). Also see the RTE\_X\_SECURITY\_EXIT\_LIB parameter in the RTE profile.

### **KCIJPUSP**

This job is required if you are configuring at least one product that requires z/OS UNIX. The job creates the z/OS UNIX-related members in the RKANDATV runtime library for use in the composite KCIJPUSS job.

**Tip:** This job is required if you enabled the self-describing agent feature.

### **KCIJPUSS**

This job is required if you are configuring at least one product that requires z/OS UNIX. The job creates the Hierarchical File System (HFS) or the zSeries File System (zFS) directories and subdirectories, and copies files to HFS or zFS.

**Tip:** This job is required if you enabled the self-describing agent feature.

### **KCIJPSYS**

This job copies the product started tasks and VTAM major node members for the products and components into system libraries, and assembles and links product modules into system libraries. The job requires write access to system libraries.

### **KCIJPLNK**

The job assembles and links elements into the SYSLMOD RKANMOD\* load library.

### **KCIJPUPV**

If system variables are enabled (RTE\_SYSV\_SYSVAR\_FLAG = Y), this job must be submitted in the target LPAR where the symbolics are resolved. This job populates variable-named members contained in the application-specific *KppJPUPB* composite IEBUPDTE members in the WK\* work output libraries. See the KCIP@SUB help panels for more information.

### **KCIJPCPR**

This job clones the existing production runtime user libraries (RK\*).

## KCIJPW2R/KCIJPW1R

These jobs (Option 12) copies the WK\* work output libraries to the respective production RK\* runtime libraries. If you do not run this job, you must copy the work output libraries to the runtime libraries by some other method, following your normal change control process. If you run either of these jobs, run KCIJPCPR to back up the RK\* production libraries. KCIJPW2R is run by default when the composite submit job KCIJPSUB is run. KCIJPW2R replaces all RK\* members with members from WK\*. It will leave non-PARMGEN managed members in RK\* libraries. KCIJPW1R deletes all RK\* members except for the ones that are added in the IBM provided WKANSAMU(KCI\$IW2R) and user defined WCONFIG(KCI\$XW2R) exclude lists, and then copies WK\* members to RK\* libraries. Users must add members they want saved to their RTE WCONFIG(KCI\$XW2R) member.

3. On completion of these jobs, review the output of the KCIJPIVP configuration verification job:
  - a. Review the \$IVPRPT report.

This report is stored in the WCONFIG library. The report shows the results of each KCIJP\* job that was run to configure the runtime environment. In the following example, the report shows that the KCIJPLOD job had an ABEND E37 out-of-space condition in one or more of the libraries loaded by the job:

JOB	STATUS	JOBNAME	JOB#	DATE	TIME	HI-CC
KCIJPCFG	OK	CCAPI\$JP	J29242	10.056	22:46:42	00000
KCIJPUP1	OK	CCAPI\$JP	J29243	10.056	22:48:09	00000
KCIJPCNV	OK	CCAPI\$JP	J28705	10.056	13:33:21	00000
\$PARSE	OK	CCAPI\$JP	J29248	10.057	00:33:44	00000
KCIJPUP2	OK	CCAPI\$JP	J06969	10.057	03:21:59	00000
KCIJPALO	WARNING	CCAPI\$JP	J07021	10.057	03:46:46	00002
KCIJPLOD	ERROR	CCAPI\$JP	J06973	10.057	03:26:14	SE37

- b. Review the WSUPERC SYSTSPRT report, which is stored in the WSUPERC sequential library. This report compares the PARMGEN WK\* work output libraries with the production RK\* runtime libraries. The PARMGEN WK\* work output libraries are the data sets created and populated by the \$PARSE job.  
In the following example, two files in the new WKANCMDU data set do not have equivalents in the existing RKANCMDU data set:

```
48 TOTAL MEMBER(S) PROCESSED AS A PDS
1 TOTAL MEMBER(S) PROCESSED HAD CHANGES
47 TOTAL MEMBER(S) PROCESSED HAD NO CHANGES
2 TOTAL NEW FILE MEMBER(S) NOT PAIRED
0 TOTAL OLD FILE MEMBER(S) NOT PAIRED
1 ISRSUPC - MVS/PDF FILE/LINE/WORD/BYTE/SFOR COMPARE UTILITY- ISPF
NEW: &rhilev.&rte.WKANCMDU      OLD: &rhilev.&rte..RKANCMDU
                                MEMBER SUMMARY LISTING (LINE COMPARE)
NON-PAIRED NEW FILE MEMBERS | NON-PAIRED OLD FILE MEMBERS
    KC20PS01                 |
    KC2STA01                 |
```

- c. Correct any errors and rerun any jobs that did not complete successfully. Resubmit the KCIJPIVP job whenever the work output libraries change (for example, after applying maintenance and rerunning the \$PARSE or \$PARSEV job). You can submit the job by typing UTIL on the command line of any Workflow panel, then selecting Validate PARMGEN profile parameters.

## Result

The runtime environment DEMO is created.

## What to do next

Complete any configuration required outside of the configuration software. To see the required steps, return to the Workflow - Primary Option Menu and select **Perform post configuration steps**. This option displays a set of readme files that describe the additional configuration steps that must be taken for the components and products that are configured in this RTE. For additional information, see [Completing the configuration outside the configuration software](#) and the *Planning and Configuration Guide* for each of the configured products.

## Replicating configured runtime environments

After you configure one or more runtime environments, you can clone them to other LPARs. Cloning runtime environments allows you to replicate environments with considerably less customization.

There are seven main steps that are involved in cloning a runtime environment:

1. Set up PARMGEN work environment for the runtime environment.
2. Clone customized WCONFIG members to the WCONFIG library of the new runtime environment.
3. Update interim libraries and create configuration profiles.
4. Merge the configuration profile parameter values from the model runtime environment into the new runtime environment.
5. Customize the configuration profiles.
6. Create the runtime environment members and jobs (\$PARSE/\$PARSESV).
7. Submit batch jobs to complete PARMGEN setup.

Steps 2, 3, and 4 are performed automatically by the configuration software. The location where these steps are performed depends upon which transport scenario you are using to replicate the environment to another LPAR.

To clone an existing RTE, you specify the fully-qualified name of the profile for that RTE as the model profile on the first panel when you set up the work environment (see [“Figure: Specifying the fully qualified name of the RTE profile that is being cloned” on page 478](#)).

```

KCIPQPG1 ---- SET UP PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode

Specify the RTE model profile to use:
==> &hlq.&rte.WCONFIG(&clone_from) -----
- To create an RTE from scratch, leave this field blank.
- To create an RTE based on a predefined IBM model, type a ? in the
  field and press Enter, then select the appropriate template.
- To create an RTE that is a clone of an existing PARMGEN RTE, specify
  the WCONFIG profile library and RTE member name to clone;
  for example: &hlq.&rte.WCONFIG(&clone_from)
  - To create an RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: &hlq.ICAT.INSTJOBS(DEMO)
  - To reconfigure or upgrade this existing RTE, specify its values;
  for example: (TDITN.IDTST.DEMO.WCONFIG(DEMO))

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
(Type ? for last referenced JOBGEN library discovered, if any.)

Enter Jobcard data:
==> //SSABSA JOB (IDD),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=OM-----
==> /*** RTE_NAME=%RTE_NAME%-----
==> /*** SYSJOBNAME=%SYSJOBNAME% SYSTEMBER=%SYSTEMBER%-----

F1=HELP      F2=SPLIT    F3=END      F4=RETURN   F5=RFIND    F6=RCHANGE
F7=UP        F8=DOWN     F9=SWAP     F10=LEFT    F11=RIGHT   F12=RETRIEVE

```

Figure 86: Specifying the fully qualified name of the RTE profile that is being cloned

In the RTE configuration profile of the new RTE you might need to change some or all of the following parameters, depending upon the configuration of the RTE you are cloning.

- If you are replicating runtime environments that share base libraries, to avoid loading the libraries multiple times, designate one environment to load the base libraries by leaving **RTE\_LOAD\_SHARED\_LIBS=Y** for that environment only, and disable loading of base libraries in all the other RTEs (**RTE\_LOAD\_SHARED\_LIBS=N**).
- If you are changing a hub monitoring server to a remote, change **KDS\_TEMS\_TYPE=HUB** to **KDS\_TEMS\_TYPE=REMOTE**.
- If you are cloning an RTE that contains a hub monitoring server and changing a hub to a remote, configure the remote to connect to the hub.

### **KDS\_TEMS\_COMM\_PROTOCOLn**

At least one of the communication protocols must be the same as a protocol selected for the hub. For information about the communication protocols, see [Decision 6: How to set up communications between components](#).

### **KDS\_TEMS\_TCP\_HOST**

This value is the TCP/IP host name (in IPV4 dotted decimal format) of the z/OS® system where the remote monitoring server is installed.

### **KDS\_HUB\_TCP\_HOST**

This value is the TCP/IP host name (in IPV4 dotted decimal format) of the distributed system where the hub monitoring server is installed.

### **KDS\_HUB\_TCP\_pipe\_type\_PORT\_NUM**

The value must be the port number of the hub for each protocol selected.

- If you are cloning an RTE that has OMEGAMON® for z/OS® configured, and the model environment is already configured as the primary sysplex proxy (**KM5\_SYSPLEX\_PROXY\_POSITION=PRIMARY**), ensure that cloned environments are set to **KM5\_SYSPLEX\_PROXY\_POSITION=BACKUP**. Otherwise, the KCIJPALO allocation job tries to allocate the sysplex-related persistent data store files for the environment (or all the RKM5\* PDS history data sets are left allocated but not initialized).

#### **Tips:**

- The parameters that are discussed here are not the only parameters that you might want to change. Many other **KDS\_\*** parameters are needed for the remote monitoring server configuration. See [Common parameters](#) for information about KDS parameters. After you set the parameters that are shown here, go through the entire configuration profile to ensure that the parameter values are correct for the configuration you want.
- Be sure to uncomment any parameters that are needed for your configuration but are commented out by default. For example, the configuration profile for an RTE that contains a remote monitoring server that uses the IP.PIPE protocol to communicate with the hub requires the **KDS\_HUB\_TCP\_PIPE\_PORT\_NUM** parameter, which is commented out by default. For such a configuration, you must uncomment this parameter and insert the port number between the quotation marks for the parameter value.

If the hub monitoring server to which the remote is reporting has SDA enabled, uncomment and customize the following parameters in the \$GBL\$USR global configuration profile:

- **GBL\_DSN\_SYS1\_SBPXEXEC** to the appropriate SYS1 library (default is SYS1.SBPXEXEC)
- **GBL\_HFS\_JAVA\_DIR1** (default is "/usr/lpp/java/IBM/J6.0")

**Note:** The Java™ directory can be any working Java™ directory.

If variables are enabled, edit the variables configuration profile to supply the values for any user-defined variables or any variables whose values are being overridden in this environment.

For step-by-step instructions for cloning RTEs, see [Deployment scenarios](#).

## **PARMGEN transport scenarios**

The way in which you decide to share or transport work and runtime libraries determines where you run the configuration jobs required by the replication scenario you are using to create new runtime environments.

For a first-time deployment, it is ideal to keep the deployment simple by creating the RTE on the same system that the PARMGEN deployment jobs and product started tasks will be running.

The following are all possible methods of sharing or transporting the runtime libraries between one runtime environment and another.

- Method 1: Defining a runtime environment on a z/OS image using shared DASD.  
This scenario employs a central site that defines and maintains the runtime environment configuration for both local and remote z/OS images. Each unique runtime environment that is defined represents a z/OS image. If a site has 10 shared-DASD z/OS systems (LPARs), the central site defines 10 unique runtime environments (either sharing-with-SMP/E targets, Full, or sharing-with-base) as part of the normal PARMGEN configuration process. These runtime environments are configured based on each remote site's respective configuration requirements (data set naming conventions, VTAM nodes, and the like). The central site must allow for the necessary DASD to allocate the libraries needed for each runtime environment.

Using this method, all jobs run on the same system and no libraries are copied.

- Method 2: Transporting a runtime environment from one z/OS image to another.  
This scenario is similar to method 1, except the 10 LPARs are on unshared DASD. During rollout of the initial runtime environment or during maintenance, you transport the product execution libraries (RK\*) to each LPAR using unshared DASD.

Using this method, all jobs are run on the same system. Only the RK\* libraries are copied to the target system. If system variables are enabled, the GBL\_USER\_JCL library must also be copied.

If the PARMGEN jobs are being submitted on the central staging LPAR for a non-local RTE, ensure that you modify the site-specific values to the system values for the RTE being transported during the "Customize PARMGEN configuration profile members" step. Specifically, change the LPAR-specific values autodiscovered by the PARMGEN KCIJPCFG/KCIJPPRF set-up jobs because LPAR RTE profile values for WCONFIG(PLB1SP22) for parameters for system name, IP hostname, Sysplex name, VTAM network ID, and other system values will reflect autodiscovered values on the system that the PARMGEN job ran on. Change these values accordingly before RTE transport or after you transported the jobs to the target LPAR.

- Method 3: Transporting PARMGEN WKANSAMU batch jobs from one z/OS image to another equipped with the SMP/E target libraries.

In this method, a central site maintains the OMEGAMON and Tivoli Management Services CSI and the SMP/E maintenance of the target data sets. Initial build distribution of the PARMGEN-supported OMEGAMON and Tivoli Management Services products to the remote z/OS images is done by copying the SMP/E target libraries and the PARMGEN batch jobs in the %RTE\_HILEV%.%RTE\_NAME%.WK\* and WCONFIG libraries to the remote sites. If system variables are enabled, the GBL\_USER\_JCL library must also be copied.

All the required steps are performed at the central site, up to \$PARSE or \$PARSESV job. Then the WKANSAMU jobs and the SMP/E target libraries are transported to the remote LPARs. On the remote site, only the WKANSAMU jobs (such as the KCIJPALO allocation job and the KCIJPLOD load job) are run to complete setup of the runtime environment (option 11 on the PARMGEN Workflow main panel). During maintenance, the latest fixes are applied to the central site, which then redistributes the updated target libraries to each remote site. The remote sites simply run the KCIJPLOD job to copy the new fixes from the updated or upgraded SMP/E target data sets to their product execution libraries (RK\*).

- Method 4: Transporting PARMGEN runtime environment work libraries from one z/OS image to another that is equipped with the SMP/E target libraries.

This scenario is similar to scenario 3, except in this scenario the PARMGEN setup is done at the remote LPAR. That is, the \$PARSE or \$PARSESV job is run at the remote site instead of the central site. That means that the runtime environment members and jobs are created on the remote LPAR, and you have the option of cloning from an existing set of PARMGEN work environments with already customized configuration profiles in WCONFIG, then transporting the PARMGEN work libraries (%RTE\_PLIB\_HILEV%.%RTE\_NAME%.IK\*, %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG, %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WK\*, GBL\_USER\_JCL) to the remote LPAR, and completing the remaining PARMGEN setup there.

Methods 1 and 2 support the use of system variables; methods 3 and 4 do not.

In methods 1 and 2, if system variables have been enabled for the runtime environment, there are several ways you can implement these symbolics as profile parameter values, depending on which type of system variables are being used (static symbols, KCIPARSE-extracted symbols, or user-defined symbols).

Symbolics for PARMGEN parameters like RTE\_NAME and RTE\_HILEV are used directly in the KCIJP\* and KCIJV\* batch jobs created by \$PARSESV in the WKANSAMU library. If these symbolics are static system symbols (&SYSNAME., &SYSCLONE., for example) or KCIPARSE-extracted symbols (&SYSIPHOSTNAME., &SYSVTAMNETID.) that resolve to different values on each LPAR, rather than user-defined symbols whose resolution values are controlled by the %GBL\_USER\_JCL%(RTE\_NAME%) LPAR system variables resolution member, the PARMGEN process assumes you plan to submit the WKANSAMU(KCIJV\*) jobs on the system where the symbolics resolve.

If you want to complete the setup in the local system (the central site) rather than the target system (the remote LPAR) where you intend to deploy the product execution RK\* runtime libraries, ensure that the system variables member in the user JCL on the target LPAR properly defines the static system symbols with your override values. Lines 12-14 in the following screen show an example of KCIPARSE-extracted symbols and your override values for LPAR2 if you intend to run the LPAR2 KCIJV\* jobs on LPAR1.

```

LPAR1  EDIT          TDITNT.PARMGEN.JCL(LPAR2)

Required LPAR2 WKANSAMU jobs:

- KCIJPALO
- KCIJPUPV
- KCIJVSUB
- KCIJVALO
- KCIJVL0D
- KCIJVUPV

Optional WKANSAMU LPAR2 jobs (depending on the configuration):

- KCIJVSEC
- KCIJVUSP
- KCIJVUSS
- KCIJVLNK
- KCIJVSYS
- KCIJVIVP
- KCIJVCPPY
- KCIJVW2R
- KCIJVDEL
- KCIJVMNT

## How-tos using PARMGEN

*How-tos* provide some best practices and instructions for performing specific tasks. The topics in this section tell you *how to* perform these tasks using PARMGEN. These instructions are meant to help you complete commonly used processes.

### How to: Convert an existing static hub monitoring environment to a high-availability hub environment

To convert an existing hub environment to a high-availability (HA) hub runtime environment (RTE), you create a new RTE with an HA hub and then either create a new RTE with a remote monitoring server or convert the existing hub RTE to a remote and configure it and any other remotes to connect to the new HA. This topic explains how to perform this task using PARMGEN.

#### About this task

When converting from a standard, static z/OS hub to an HA hub, you create a new runtime environment (either full or sharing) for the HA hub. The old static hub is either decommissioned if no longer needed or replaced by a remote monitoring server. The newly converted remote will take over all non-hub responsibilities of the old hub, such as collecting data for OMEGAMON for z/OS product or hosting agents. The new HA hub handles only hub-type functions. To preserve any customization (situations, managed systems list, and the like), the Enterprise Information Base from the static hub can be given to the new HA hub. Any application support such as the catalog and attribute files for distributed agents that were manually added to the old, static hub will need to be copied from the old hub to the new HA hub.

## Procedure

1. Create a new runtime environment and configure a high-availability hub in it (see [“Scenario QCF01: Configuring a full RTE with a high-availability hub monitoring server”](#) on page 615).
2. Before shutting down the old hub for the last time, create a member in RKANSQLU with the following statements:

```
DELETE FROM O4SRV.TSITDESC WHERE SITNAME LIKE 'UADVISOR_KM5_V*';
DELETE FROM O4SRV.SITDB WHERE RULENAME LIKE 'KM5.V*';
```

3. Execute the commands by using a Modify command:

```
F <hub stc>,CTDS START SPUFIL <name of member>
```

These situations are seeded using the configuration software and must not be in the database of the HA hub because they can trigger data collection attempts.

4. Back up the old hub runtime environment, preferably with the hub down.
5. Delete the following data sets from the new HA hub runtime environment and replace them with the old hub data sets. :
  - %HILEV%.%RTENAME%.RKDS\*
  - %HILEV%.%RTENAME%.RKCF\* if applicable
  - %HILEV%.%RTENAME%.RKCP\* if applicable

TUTORIAL INFORMATION This gives the new hub the entire EIB of the old one as well as the MQ Configuration Database (if applicable) and the CICSplex Service Level parameters (if applicable).

6. Take one of the following paths:
  - Build a new runtime environment for the LPAR where the old hub used to run. Define the monitoring server as remote and configure it to report to the new HA hub (see, for example, [“Scenario QCF04: Configuring a full RTE with a static hub monitoring server”](#) on page 646).
  - Modify the existing runtime environment to convert the hub to a remote (see, for example, [“Scenario RTE04: Converting a hub monitoring server to a remote”](#) on page 847).
7. Reconfigure any portal server or agent connecting directly to the hub, such as Warehouse Proxy Agents. For the portal server, do not rebuild the portal server database but use the same one that was used for the old hub (respond No to the pop-up). Reconfigure any remote monitoring servers to report to the new HA hub (see [“Scenario RTE04: Converting a hub monitoring server to a remote”](#) on page 847 for step-by-step instructions).
8. After a portal server is connected to the new HA hub, use the Managed Systems List (MSL) editor to review all custom MSLs that include monitoring server node IDs (if any) and use the situation editor to review all situations that are distributed to remote monitoring servers directly or to Managed Systems Lists that include monitoring server Node IDs. Also, review all Historical Data Collection configuration.

## How to: Convert a full RTE to a sharing RTE

To convert a full runtime environment (RTE) to a sharing RTE, you change the type to SHARING and provide the appropriate values for the high-level qualifier and the name of the shared RTE. If the shared RTE is a base RTE that does not already exist, you do not have to create it separately. PARMGEN sets up both the sharing runtime data sets and members and the set of shared base libraries. This topic explains how to perform this task using PARMGEN.

### About this task

Three parameters in the RTE configuration profile together define a sharing RTE:

**RTE\_TYPE**

The type of RTE (full or sharing)

#### **RTE\_X\_HILEV\_SHARING**

The non-VSAM high level qualifier of the base or full RTE that this RTE is sharing.

#### **RTE\_SHARE**

The name of the RTE from which this RTE gets its base library information. (If the RTE shares with the SMP/E target libraries, the value is SMP).

If the RTE\_TYPE is specified as FULL, the other two parameters are null.

**Tip:** Leave the **RTE\_LOAD\_SHARED\_LIBS** parameter set to Y to designate this RTE as the RTE that loads the base libraries. If another sharing RTE is already set to load the base libraries, set **RTE\_LOAD\_SHARED\_LIBS** to N to avoid loading the libraries multiple times when you refresh the RTEs.

After you edit the parameters, run the \$PARSE job to recreate the runtime members and jobs using the new values. Then, submit the following jobs:

- KCIJPALO job to allocate the runtime libraries
- KCIJPLOD job to copy RTE-specific read-only members from the SMP/E target libraries and load the base libraries.
- KCIJPW2R job to copy runtime members from the work libraries to the runtime libraries.
- KCIJPSYS job to refresh the started tasks in the PROCLIB. (You can also refresh the started tasks manually.)

## **How to: Convert a sharing-with-SMP/E RTE to sharing-with-base**

To convert a sharing-with-SMP/E RTE to a sharing-with-base RTE, leave the type set to SHARING and add the appropriate values for the high-level qualifier and the name of the shared base RTE. If the shared RTE is a base RTE that does not already exist, you do not have to create it separately. PARMGEN sets up both the sharing runtime data sets and members and the set of shared base libraries. This topic explains how to perform this task using PARMGEN.

### **About this task**

Three parameters in the RTE configuration profile together define a sharing RTE:

#### **RTE\_TYPE**

The type of RTE (full or sharing)

#### **RTE\_X\_HILEV\_SHARING**

The non-VSAM high level qualifier of the base or full RTE that this RTE is sharing. If this RTE is sharing-with-SMP/E, this value is null.

#### **RTE\_SHARE**

The name of the RTE from which this RTE gets its base library information. (If the RTE shares with the SMP/E target libraries, the value is SMP).

**Tip:** Leave the **RTE\_LOAD\_SHARED\_LIBS** parameter set to Y to designate this RTE as the RTE that loads the base libraries. If another sharing RTE is already set to load the base libraries, set **RTE\_LOAD\_SHARED\_LIBS** to N to avoid loading the libraries multiple times when you refresh the RTEs.

After you edit the parameters, run the \$PARSE job to recreate the runtime members and jobs using the new values. Then, submit the following jobs:

- KCIJPALO job to allocate the runtime libraries
- KCIJPLOD job to copy RTE-specific read-only members from the SMP/E target libraries and load the base libraries.
- KCIJPW2R job to copy runtime members from the work libraries to the runtime libraries.

- KCIJPSYS job to refresh the started tasks in the PROCLIB. (You can also refresh the started tasks manually.)

## How to: Clone customized data from an existing RTE

If you have cloned an existing runtime environment (RTE) or upgraded an RTE by pointing to new libraries, you might have customized data that you want to copy to the new RTE. For example, you might have customized data such as monitoring situations stored in VSAM data sets; OMEGAMON workspace definitions, profiles, and thresholds; or Enhanced 3270 user interface workspace definitions and profiles. This topic explains how to perform this task using PARMGEN.

### Before you begin

The following parameters must be customized in the RTE configuration profile before the KCIJPCLN job is submitted:

- **RTE\_CLONE\_FROM\_HLQRTE**
- **RTE\_CLONE\_FROM\_VSAM\_HLQRTE**

If these parameters are not already set to the appropriate values, modify the RTE configuration profile, then resubmit the \$PARSESM job before you submit the KCIJPCLN job.

### About this task

The KCIJPCLN job copies the following elements from the RTEs identified by the CLONE\_FROM parameters:

- any customized non-VSAM data such as profiles, workspaces, or screenspaces
- any customized VSAM data such as situations, SDA status data, and managed objects
- customized globals
- customized security modules and exits
- sequential data

Run this job before you bring up your started tasks.

### Procedure

1. Enter UTIL on the command line of the Workflow panel.  
The **Utilities** panel is displayed.
2. Select **Clone customized data from another RTE.** (option 29).  
The KCIJPCLN JCL is displayed.
3. Edit the job for other RTEs as needed and review the job for certain product restrictions.
4. Submit the job.
5. Bring up your started tasks.

## How to: Merge predefined variables into configuration profiles

Using variables makes it much easier to change operational values, such as storage-related values or port numbers, that affect multiple products and runtime environments. You can change the resolution values of the variables without recreating the runtime environments. IBM provides a set of system variables and user-defined variables that you can import into your configuration profiles. The variable symbols automatically replace the values for the corresponding parameters so you do not have to edit the parameters individually. This topic explains how to perform this task using PARMGEN.

### Before you begin

If your RTE needs to be updated in any way (for example, to apply the latest maintenance), reconfigure the RTE before you merge the model variables into your profile (KCIJPCFG). Follow the appropriate SMP/E scenario for applying the maintenance.

### About this task

The KCIJPMCF job sets the variables support flag if necessary and merges the set of variables in the %GBL\_TARGET\_HILEV%.TKANSAM(\$MDLVARS) member into the current RTE configuration profile. The merge replaces current configuration values with symbolics. These symbolics are predefined with IBM defaults. You need to import these definitions from %GBL\_USER\_JCL%(KCI\$RTEV) into your variables profile.

The merge job does not overlay values like high-level qualifiers, started task prefixes and names, and VTAM applid prefix and names that are inherited from the KCIP@PG3 panel. After you run the merge job, review these parameters in the RTE configuration profile to decide whether you to change them to variables such as &SYSNAME, or &SYSCLONE..

This procedure consists of six steps:

1. Merge the model variables into the configuration profiles.
2. Edit the RTE configuration profile.
3. Copy the KCI\$RTEV member into the variables profile and edit the profile.
4. Recreate members and jobs (\$PARSESV).
5. Submit the jobs necessary to complete the set up of the RTE.
6. Recycle any affected started tasks.

## Procedure

1. Merge the model variables.
  - a. Enter UTIL on the command line of a Workflow panel. The **Utilities** panel is displayed.
  - b. Select **Merge profile from a backup LPAR RTE profile** (option 16). The JCL for the KCIJPMCF job is displayed.
  - c. Edit the value for OLDMEM to point to %GBL\_TARGET\_HILEV%. TKANSAM (\$MDLVARS).

```
000079 //* Merge the changes in %OLDMEM% into %NEWMEM% member.
000080 //* *****
000081 //MERGECHG EXEC PGM=IKJEFT01,DYNAMNBR=99,REGION=4M
000082 //SYSEXEC DD DISP=SHR,
000083 // DSN=TDITNT.DEV.ITM63053.TKANCUS
000084 //SYSTSPRT DD SYSOUT=*
000085 //SYSPRINT DD SYSOUT=*
000086 //SYSTSIN DD *
000087 KCIRPLBX +
000088 BATCH +
000089 SKIPVAR(TDITNT.DEV.ITM63053.TKANCUS(KCIDPGNX)) +
000090 OLDMEM(%GBL_TARGET_HILEV%.TKANSAM($MDLVARS)) +
000091 NEWMEM(TDITN.FTU.$MDLHFV.WCONFIG($MDLHFV))
```

- d. Submit the job.
2. Edit the RTE configuration profile.
  - a. From the Workflow main menu, select **Customize PARMGEN configuration profiles**. The **Customize PARMGEN Configuration Profile Members** panel is displayed.
  - b. Enter 1 to edit the RTE configuration profile.
  - c. Edit the profile to implement variables for any of the inherited parameter values that were not overwritten.
 

For example, RTE\_NAME is inherited as part of multiple parameters, such as RTE\_TEMS\_NAME\_NODEID, RTE\_X\_SECURITY\_EXIT\_LIB, or RTE\_PDS\_HILEV. Change the static RTE name in the parameter values to &SYSNAME. by doing XF on the RTE name, and then doing a change all to &SYSNAME..
  - d. Change the value of RTE\_NAMESV back to the static RTE name.
  - e. Save your changes and return to the **Customize PARMGEN Configuration Profile Members** panel.
3. Copy the KCI\$RTEV member into the variables profile and edit the profile.
  - a. Select option 3 (Customize the Variables Profile).
  - b. To customize the variables profile, copy the contents of %GBL\_USER\_JCL%(KCI\$RTEV) and append them to the end of the RTE variables profile.
  - c. Customize the resolution values as necessary for your site.

Edit the values for any system variables that cannot be determined from the IPL PARMLIB and the values for any user-defined variables whose site-specific values differ from the IBM supplied defaults.

4. Recreate members and jobs.
    - a. From the Workflow main menu, select **Create RTE members and jobs**.
    - b. Submit the \$PARSESV job.
  5. Submit the jobs necessary to complete the set up of the RTE.
    - a. From the Workflow main menu, select **Submit batch jobs to complete PARMGEN setup** . The Submit Batch Jobs to Complete PARMGEN Setup is displayed.
    - b. Submit the KCIJPSYS job to refresh started tasks or manually refresh the started tasks in the PROCLIB.

If the RTE was previously enabled for variables, and you did not make any changes to previously defined RTE parameters with symbols, you do not need to submit the KCIJPSYS job. Instead, you can just edit the RKLVIN DDNAME as follows:
- ```
//RKLVIN DD DISP=(OLD,PASS),  
// DSN=&&TMPPARU(&STARTUP),  
// VOL=REF=* .KCIPARSE.TMPPARU,  
//*RKLVIN DD DISP=SHR,  
//* DSN=&USERPARU(&STARTUP),  
// FREE=CLOSE
```
- c. Submit the KCIJPW2R job to deploy the updated runtime members from the WK\* libraries to the RK\* production user libraries.
6. Recycle the affected started tasks.

## How to: Change SMP/E target libraries

If you want to install maintenance or upgrades while leaving your current CSI to support your production environment, install the new software into a new CSI and then change the SMP/E target libraries to upgrade the runtime environments (RTEs). This topic explains how to perform this task using PARMGEN.

### Before you begin

If you are installing maintenance or upgrades into a new set of target libraries, use a ServerPac to install the new FMIDs. Make sure that the ServerPac includes all the products in the original CSI or they will not be configured in the updated RTE.

### About this task

To change the target libraries, you modify the GBL\_TARGET\_HILEV, refresh the configuration profile, recreate the runtime members, copy the new read-only SMP/E libraries to the read-only RK\* runtime libraries, and load the refreshed runtime members.

### Procedure

1. Change the target libraries and refresh the work environment.
  - a. In the Workflow - Primary Option panel, select **Set up PARMGEN work environment for an RTE**. A message reminds you that if you make any changes to the parameters on the following panels, you will have to rerun the KCIJPCFG job.
  - b. Press Enter to proceed to the first set up panel, then press Enter again to display the second set up panel.

This panel contains the high-level qualifier for the current SMP/E libraries.

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                                Quick Configuration Mode
GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:
                                UNIT / STORCLAS /
                                VOLSER / MGMTCLAS /
GBL_TARGET_HILEV: IBM.TARGET.ITM63055_____ / _____ /
                                HLQ of SMP/E target (TK*) datasets _____
GBL_SYSDA_UNIT:  SYSDA___
                                Work datasets UNIT name
GBL_REGION:      OM_____
                                JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel. Type UTIL to access utility menu.

```

- c. Change the high-level qualifier (GBL\_TARGET\_HILEV) to the high-level qualifier for the new libraries, then press Enter.
  - d. Press Enter again on the third set up panel to retain the same parameter values.
  - e. On the **Include Products in this PARMGEN RTE** panel, set **Confirm ==>** to Y to accept the current product set, then press Enter.  
Note that if this RTE includes only a high-availability hub, the Include Products panel is not displayed. If new versions of products are included in the target libraries, the products configured in the RTE will be upgrade to those versions.  
A message asks you to provide a backup name for the RTE configuration profile.
  - f. Provide the requested name, then press Enter.  
The KCIJPCFG JCL is displayed.
  - g. Submit the job.  
The KCIJPCFG job submits the KCIJPPRF job, which updates the libraries and merges the backed up profile with the newly generated one that contains any new parameters introduced by maintenance or upgrades.
  - h. Return to the Workflow primary options menu. Wait until both jobs have completed before proceeding to the next step. No return code is displayed on the Workflow main panel until both jobs have completed.
2. Recreate the runtime members and jobs.
    - a. From the primary options menu, select **Create the RTE members and jobs**.
    - b. On the **Create the RTE Members and Jobs** panel (KCIP@PR1), select option **1** to submit the \$PARSE job (or \$PARSESV job if variables are enabled).  
The \$PARSE JCL is displayed.
    - c. Submit the job and return to the Workflow - Primary Options Menu. Wait until the job completes, then proceed to the next step.
3. Submit the LOAD job and any other jobs required by affected products or components.
    - a. From the primary options menu, select **Submit batch jobs to complete PARMGEN setup**.  
The **Submit Batch Jobs to Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.
    - b. Submit the following jobs and any other jobs indicated by a Yes in the REQ column or by the HOLD+ data for each product or component.
      - KCIJPLOD: This required job copies members of the target libraries that were installed by SMP/E to the read-only RK\* libraries.
      - KCIJPW2R: This job deploys the updated runtime members from the WK\* work libraries to the RK\* production user libraries.

If you run KCIJPW2R, run KCIJPCPR to back up the RK\* production libraries.  
You might have to submit one or more of the following jobs:

- KCIJPSEC (if upgrade introduces changes in security) to create security-related members (load modules, encryption key, and other elements) based on the product security requirements
- KCIJPALO (if the upgrade introduces new data sets)
- KCIJPUSP and KCIJPUSS (if upgrade introduces changes in z/OS® UNIX® System Services requirements)
- KCIJPLNK (if OMEGAMON® for IMS™ on z/OS® is installed)
- KCIJPSYS (if upgrade introduces new started tasks or nodes)

## Result

Any maintenance or upgrades installed in the new CSI are applied to the reconfigured RTE.

## How to: Switch base read-only libraries using a user-defined variable

To leave started tasks running from one set of base read-only libraries while you apply maintenance or upgrades to a second set, use a user-defined symbol for the name of the base runtime environment (RTE) and create a second set of read-only libraries. Then, after you successfully apply and test the changes, you can point the STCs to the second set either by editing the value of the symbol in the RTE's variables profile, or by modifying the composite STC (IBMSSTRT by default). This topic explains how to perform this task using PARMGEN.

### About this task

In a sharing RTE, the values for the RTE\_X\_HILEV\_SHARING and the RTE\_SHARE parameters in the RTE configuration profile become part of the BASEHLEV symbol in the PARMGEN-created STCs. For example, the parameters in the following example:

```
000025 RTE_X_HILEV_SHARING "IBM.ITM63051"
.
000039 RTE_SHARE "BASE&BASELVL."
```

become BASEHLEV=IBM.ITM63051.BASE&BASELVL..R in the following started task:

```
000020 //IBMDS PROC RGN=0M,TIM=1440,
000021 // SYS=&SYSNAME.,
000022 // RHILEV=IBM.ITM63053,
000023 // BASEHLEV=IBM.ITM63053.BASE&BASELVL..R,
```

After both BASE1 and BASE2 libraries are created, the BASEHLEV symbol in all product points to the generic BASEHLEV=IBM.ITM63051.BASE&BASELVL..R. The CONFIG DD in the product started tasks determines which set of libraries the started task is pointing to.

To set up a sharing-with-base RTE that has two sets of read-only base libraries, complete the following steps.

## Procedure

- To create a sharing-with-base RTE that uses variables, complete the following steps:
  - a. Create a sharing-with-base RTE and enable it for system variables (RTE\_SYSV\_SYSVAR\_FLAG=Y). Use a variable such as &BASELVL for the name of the base RTE (for example, RTE\_SHARE=BASE&BASELVL). Define the variable in the RTE's variables profile (%GBL\_USER\_JCL%(RTE\_NAME%)) and set its value to 1. This creates a set of BASE1 read-only libraries named IBM.ITM63051.BASE1.RK\* (RKANMOD, RKANMODL, RKANPENU, RKANEXEC, and so on).  
  
For step-by-step instructions, see [“Scenario QCF09: Creating a sharing-with-SMP/E runtime environment with a remote monitoring server and variables enabled” on page 692.](#)
  - b. Create a second set of shared read-only BASE2 libraries:
    - a. Edit the variables profile for the sharing RTE that you created in the previous step and specify the value for BASELVL as 2.
    - b. Submit the WKANSAMU(KCIJVBSA) stand-alone base-only allocation job to allocate the new base libraries.
    - c. Submit the WKANSAMU(KCIJVBSL) standalone base-only allocation job to load the new base libraries.

- c. To control which base libraries are used at product start up, customize the IBMSTRT composite startup member supplied by PARMGEN to override the value of the user-defined symbol. (If you start your products from SDSF, customize each STC to set the appropriate value.) The following example shows two ways to modify the startup procedures to change the value. You can override just the BASELVL symbol (line 000071), or you can override the entire base high level symbol, by changing the value for the base libraries (line 000073).

```

EDIT      CAN.USER.PROCLIB(IBMSTRT) - 01.14          CHARS 'DSR2' found
Command ===>                                     Scroll ===> CSR
000069 //*****
000070 //* IBMDS - Tivoli Enterprise Monitoring Server
000071 //* START IBMDS&AR,MSGCLASS=X,BASELVL=1
000072 //* START IBMDS&AR,MSGCLASS=X,BASEHLEV=TSTEST.ITM6353.BASE1.R
000073 //* START IBMDS&AR,MSGCLASS=X,BASEHLEV=TSTEST.ITM6353.BASE2.R
000076 //*

```

- To convert an existing RTE to use a second shared base RTE, complete the following steps:
  - a. If variables are not already enabled in the sharing RTE, or a static value was used for the RTE\_SHARE parameter:
    - a. Edit the RTE configuration profile to set RTE\_SYSV\_SYSVAR\_FLAG=Y.
    - b. Edit the RTE\_SHARE parameter in the RTE profile to use a variable such as &BASELVL. as part of the name of the base RTE.
    - c. Edit the RTE's variables profile (%GBL\_USER\_JCL%(%RTE\_NAME%)) to define the variable and set its value to the value you want to use for the first shared RTE.
    - d. Run the \$PARSESV job.
    - e. Resubmit the following batch jobs to refresh the RTE members and jobs:
      - KCIJVSYS (to refresh the updated system members such as the started tasks and VTAM major nodes)
      - KCIJVCPR (to backup the current user product execution user libraries)
      - KCIJW2R (to copy the work libraries to the product execution user libraries--RKANCMDU, RKANPARU, RKANSAMU, and so on)
  - b. Create the second set of base libraries:
    - a. Edit the variables profile for the sharing RTE and specify the value for BASELVL for the second base RTE, for example 2.
    - b. Submit the WKANSAMU(KCIJVBSA) job to allocate the new base libraries.
    - c. Submit the WKANSAMU(KCIJVBSL) job to load the new base libraries.
  - c. See step 3 in the previous procedure.

## How to: Change PDS file count and file size

After you have been collecting and displaying historical data for a while, you might find it that you need to adjust the amount of data that you store. To change the amount of data, you adjust the number and size of files used in the persistent data store. This topic explains how to perform this task using PARMGEN.

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

To increase or decrease the file count and file size, edit the **Kpp\_PDS\_FILE\_COUNT** and **Kpp\_PD\_CYL** parameter in the RTE configuration profile. The default value of **Kpp\_PDS\_FILE\_COUNT** is 6, with a range of permissible values from 3 to 36. The default value of **Kpp\_PD\_CYL** is different for different agents. After you make the desired adjustment to the number of files, refresh the profile and reallocate the PDS data sets.

## Procedure

1. In the RTE configuration profile, edit the **Kpp\_PDS\_FILE\_COUNT** parameter to specify the desired number of files.  
For more information about the parameter, see [Kpp\\_PDS\\_FILE\\_COUNT](#).
2. Edit the value of **Kpp\_PD\_CYL** to change the size of each file.  
For more information about the parameter, see [Kpp\\_PD\\_CYL](#).
3. Submit the \$PARSE job to refresh the profile.

**Tip:** Because only RKANPARU data set is affected by this change, you can run the \$PARSEPR job instead. On the **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel, press F5, to access the library-specific jobs.

4. Allocate the PDS data sets. Submit the KCIJPALO job to reallocate the PDS data sets.
  - For new RTEs that have not created the persistent data store files, submit the KCIJPALO job to allocate the PDS files.
  - For existing RTEs that already have allocated the persistent data store files, you must rename or delete the files, and then submit the KCIJPALO job to reallocate the PDS files. For more information about reallocating the PDS files, see [“How to: Reallocate PDS files” on page 490](#).
5. Submit the WKANSAMU(KCIJPW2R) job on the SUBMIT panel.

## How to: Reallocate PDS files

If the persistent data store files fill up or become corrupted, new historical data cannot be collected. To correct this problem, the data sets must be reallocated. This topic explains how to perform this task using PARMGEN.

### Before you begin

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The started task for the monitoring server or monitoring agent collecting the data must be stopped when you perform this procedure. Schedule the procedure for a time when the server or agent is scheduled to be down or can be recycled.

### About this task

To reallocate the files that store historical data, you delete the files and then reallocate the data sets.

## Procedure

1. Delete the persistent data store files using the RKANSAMU(KppDELJB) job.  
Keep the Delete statements for the data sets you want to delete. Comment out or delete the Delete statements for any data sets you want to keep.
2. Submit the composite KCIJPALO job to reallocate the files for multiple products, or the stand-alone KppJPALP job for a specific product.  
The stand-alone jobs are created in the WKANSAMU data set after the \$PARSE (or \$PARSESV) job is run.

## How to: Avoid refreshing shared read-only base libraries multiple times

Running the KCIJPLOD load job is part of most maintenance scenarios. For sharing-with-base environments, this job loads both the LPAR-unique libraries and the common shared base libraries by default. The RTE\_LOAD\_SHARED\_LIBS parameter in the configuration profile of each runtime environment controls whether or not the base libraries are loaded. If you have multiple runtime environments sharing the same base libraries, to avoid loading the base libraries multiple times designate one environment to load the base libraries by

leaving its flag set to Y, and disable loading of base libraries in all the others. This topic explains how to perform this task using PARMGEN.

## About this task

If the RTE\_LOAD\_SHARED\_LIBS parameter is set to Y (the default) in the profiles for all the runtime environments that share the same base libraries, then the KCIJPLOD job for each environment loads the base libraries each time you run the KCIJPLOD job. Although it does not hurt the configuration to do so, running the job multiple times will perform multiple IEBCOPY steps to the RK\* libraries for the same SMP/E code. If you have multiple runtime environments sharing the read-only base libraries, it is a best practice designate one environment to load the base libraries; for this environment, leave the RTE\_LOAD\_SHARED\_LIBS parameter set to the default. Set the value for the other environments to N.

## Procedure

- To disable loading of base libraries in sharing runtime environments, locate the RTE\_LOAD\_SHARED\_LIBS parameter in the configuration profile and set its value to N:

```
IBM.ITM62351.LPAR1.WCONFIG(LPAR1)
Command ==>                               Scroll ==> CSR
000358 ** Runtime environment (RTE) settings:
000359 ** Specify the name of the RTE in the RTE_NAME parameter if this RTE
000360 ** is not enabled for System Variables (RTE_SYSV_SYSVAR_FLAG=N).
000361 RTE_NAME                               LPAR1
000362
000365 ** Type of RTE:
000366 ** There are three types of RTEs:
000367 ** FULL      - Allocates Image-specific and Base libraries.
000368 ** SHARING   - Allocates Image-specific libraries and shares Base
000369 **             libraries with another RTE or SMP/E target libraries.
000370 RTE_TYPE                               SHARING      * FULL, SHARING *

000381 ** If RTE high-level qualifier of the production runtime (RK*)
000382 ** libraries is different from PARMGEN RTE_PLIB_HILEV qualifier,
000383 ** then specify. Otherwise, default is the PARMGEN RTE_PLIB_HILEV
000384 ** qualifier. For an ICAT-to-PARMGEN converted RTE, RTE_HILEV and
000385 ** RTE_VSAM_HILEV are set to the same RTE HLQ previously used
000386 ** prior to conversion.
000387 RTE_HILEV                               IBM.ITM62351
000388 RTE_VSAM_HILEV                          IBM.ITM62351
000389
000390 ** Required if RTE_TYPE is SHARING:
000391 ** Specify the Non-VSAM HLQ in the "RTE_X_HILEV_SHARING" of the
000392 ** RTE being shared to by LPAR1 RTE.
000393 ** For RTE_SHARE parameter, specify "SMP" value if this RTE is sharing
000394 ** with SMP/E target libraries.
000395 ** Otherwise, specify the name of the shared-to RTE in the "RTE_SHARE"
000396 ** parameter.
000397 RTE_X_HILEV_SHARING                     "IBM.ITM62351"

000398 RTE_SHARE                               "BASEA"

000400 ** (Optional) Only valid when RTE_TYPE is SHARING, and RTE_SHARE is
000401 ** not SMP. Specify "Y" to include shared runtime datasets in the
000402 ** RTE Load job.
000403 RTE_LOAD_SHARED_LIBS                    "Y"
```

**Important:** In sharing runtime environments where RTE\_LOAD\_SHARED\_LIBS has been set to N, some of the IEBCOPY steps that refresh the read-only libraries are not generated as part of the KCIJPLOD job. However, these steps are generated in the KCIJPLOD job for the runtime environment where RTE\_LOAD\_SHARED\_LIBS has been set to Y. Examples of these types of IEBCOPY steps that will not be generated are as follows.

```

EDIT          IBM.ITM62351.LPAR1.WKANSAMU(KCIJPL0D)

## How to: Use KOBSPDPT security exits with PARMGEN

When using a PARMGEN configuration, you can use KOBSPDPT OMEGAMON security command table exits for the PARMGEN KCIJPSEC composite security job. This topic explains how to perform this task using PARMGEN.

### About this task

The table below provides the source for the external security exits and modules that are used in the KOBSPDPT KppSUPDI exit .

Source of the OMEGAMON external security exits and modules referenced in the KOBSPDPT KppSUPDI exit

| <i>Table 58: Source of the OMEGAMON external security exits and modules referenced in the KOBSPDPT KppSUPDI exit</i> |                                                                                                                                           |                                                                                                             |                                                                  |                                                                  |

## Procedure

1. If the RTE\_X\_SECURITY\_EXIT\_LIB parameter in the RTE configuration profile is pointing to RKANSAM (the original default), change it to point to the appropriate library. The new default is RKANSAMU. This global security exit data set is allocated by the KCIJPALO allocation job. The RTE\_X\_SECURITY\_EXIT\_LIB parameter defaults to the RKANSAMU library of the runtime environment, because this is where the KCIJPLOD job copies all the product security exits, including KppSUPDI.

In this example, IBM.ITM62351.LPAR1.SECURITY is the RTE\_X\_SECURITY\_EXIT\_LIB value, as shown in line 536 of the following example.

```

EDIT  IBM.ITM62351.LPAR1.WCONFIG(LPAR1)
Command ==>
000524 ** Library where user security exits are located:
000525 ** Override the SYSIN DD where the user exits may have been
000526 ** customized (if other than default RKANSAM location).
000527 ** The KppJPSC3 input members to the composite KCIJPSEC security job
000528 ** point SYSIN DD to RKANSAM by default. If you need to make further
000529 ** changes to sample exit, copy the user exit to xKANSAMU library and
000530 ** make changes accordingly. Then modify the RTE_X_SECURITY_EXIT_LIB
000531 ** parameter and change the value to RKANSAMU instead.
000532 ** ICAT->PARMGEN conversion considerations:
000533 ** If this is an ICAT RTE conversion, the security exit source
000534 ** library varies for each product. Please refer to the
000535 ** application-specific security jobs for more information.
000536 RTE_X_SECURITY_EXIT_LIB  IBM.ITM62351.LPAR1.SECURITY

```

2. Run the \$PARSE or \$PARSESV job to recreate the runtime members and update the jobs.
3. Submit the following jobs from the **Submit Batch Jobs to Complete PARMGEN Setup** panel (KCIP@SUB):
  - a. If you changed the name of the library, rerun KCIJPALO.
  - b. Run the KCIJPLOD job.
4. Select option 4 (KCIJPSEC).  
The following message is displayed:

```

----- PARMGEN MESSAGES -----
Command ==>

You are about to run the security job. Before editing the
security job, you will first be given an opportunity to edit
the security exits in lib TSTEST.&username.PLB1SP22.RKANSAMU.
If desired, customize the security exits.
-----

```

5. Press Enter to proceed.
6. Select the exits you want to edit, and customize them as appropriate.  
For example, if they have not already been customized, edit the RACF-related or ACF2-related external security exits to point to the preferred resource class if other than the IBM-supplied default. If not already customized, edit the applicable *KppSUPDI* KOBSPDPT security exits to point the **MODULE=** parameter to your external security module. (See the columns labeled External Security MODULE Referenced in KOBSPDPT Exit Name in [“Source of the OMEGAMON external security exits and modules referenced in the KOBSPDPT KppSUPDI exit”](#) on page 492).
7. After you finish making the changes, press F3.  
The modified KCIJPSEC job is presented.
8. Submit the job.
9. Submit the KCIJPW2R job to copy the work libraries (WK\*) to the production libraries (RK\*).

## Result

The KOBSPDPT OMEGAMON security command table exits are available in the new PARMGEN runtime environment.

## How to: Configure passphrase and MFA support in the OMEGAMON 3270 Classic interface

In addition to using a regular password, you can also log on securely to the OMEGAMON 3270 Classic interface using a password phrase (passphrase) and multi-factor authentication (MFA). Some configuration steps are necessary to enable passphrase and MFA support for the OMEGAMON 3270 Classic interface. This topic explains how to perform this task using either Configuration Manager or PARMGEN.

### Before you begin

A traditional mainframe password is eight bytes or less, while a passphrase is from nine to 100 bytes. MFA is an authentication method that typically requires a six-digit volatile numeric token that is paired with a password or passphrase value. A user ID must be set up in the security system to use a passphrase.

**Note:** Your security administrator must set up the user ID to use a passphrase. For RACF, use the PHRASE operand with the [ADDUSER](#) or [ALTUSER](#) command. For a security product other than RACF, refer to the documentation for that product for guidance on the equivalent actions.

On a 3270 screen, depending on the screen width, entering a long passphrase value into a field might require multiple lines. For example, if the screen width is 80 bytes, an input field would require multiple lines to support a value longer than 80 bytes. For a wider screen size, you can support a longer value on a single line, up to the available screen width.

On the OMEGAMON 3270 Classic interface logon screen, by default, the password fields support passwords that are eight bytes or less. Optionally, you can configure your product to support passphrase and MFA values for the OMEGAMON 3270 Classic interface; multiple settings are available. When passphrase support is enabled, configuration parameters are used to specify the SAF security class and SAF application ID to use for the OMEGAMON 3270 Classic interface.

**Important:** When passphrase support is enabled, OMEGAMON implements the SAF interface for external security without the use of security exits. For more information, see [OMEGAMON® 3270 Classic interface security](#).

## About this task

To use passphrase values and MFA for the OMEGAMON 3270 Classic interface, you must configure your product to enable passphrase support. Multiple passphrase configuration options are available that affect the length of the passphrase that is supported on a single line and the layout of the logon screen.

**Note:** It is recommended that you review the available configuration options, especially if you use programs to automate the logon process to the OMEGAMON 3270 Classic interface that rely on static placement of keywords and input fields.

Passphrase support for the OMEGAMON 3270 Classic interface is provided for the following products, listed with the respective product code:

- OMEGAMON for CICS (C2)
- OMEGAMON® AI for Db2 (D2)
- OMEGAMON for IMS (I2)
- OMEGAMON for z/OS (M2)
- IBM Z OMEGAMON Monitor for z/OS (M2)

Passphrase enablement and configuration is controlled by parameter **Kpp\_CLASSIC\_PASSPHRASE**, where *pp* is C2, D2, I2, or M2, depending on the supported product. When passphrase support is enabled, the SAF security class is defined by **Kpp\_CLASSIC\_SECCLASS** and the SAF application ID is defined by **Kpp\_CLASSIC\_SAFAPPL**, where *pp* is C2, D2, I2, or M2.

The following configuration options are available for passphrase support:

### **Kpp\_CLASSIC\_PASSPHRASE**

This parameter specifies the passphrase support setting for the OMEGAMON 3270 Classic interface.

**Note:** In the following figures, a ruler is shown on the screen. The ruler is included in the documentation for illustrative purposes only and is not displayed in the product.

## PARTIAL

Passphrase support is enabled with the **PASSWORD** and **NEW PASSWORD** fields each consisting of a single line. The minimum length of each of these fields is 34 bytes, and the maximum length (which can be up to 100 bytes) depends on the screen width. With this setting, the fields are aligned in the center of the screen, as shown in the following figure:

```
>
>                               Copyright 1980-2022
>                               IBM Corporation. All rights reserved.
>                               Use permissible by license only.
>

                                ENTER USERID ==>
                                PASSWORD ==>
                                GROUP ==>
                                NEW PASSWORD ==>

                                Press F3 to exit logon

|...+...1...+...2...+...3...+...4...+...5...+...6...+...7...+...8
123456789012345678901234567890123456789012345678901234567890
```

**Note:** Passphrase support for the OMEGAMON 3270 Classic interface is introduced with APAR OA57133 (PTF UA98944). With the PARTIAL setting, the input field labels and placement are compatible with the screen layout before passphrase support was introduced.

## MAX62

Passphrase support is enabled with the **PASSWORD** and **NEW PASSWORD** fields each consisting of a single line. The minimum length of each of these fields is 62 bytes, and the maximum length (which can be up to 100 bytes) depends on the screen width. With this setting, the fields are aligned at the left of the screen, as shown in the following figure:

```
>
>          Copyright 1980-2022
>          IBM Corporation. All rights reserved.
>          Use permissible by license only.
>

ENTER USERID ==>
      PASSWORD ==>
            GROUP ==>
NEW PASSWORD ==>

          Press F3 to exit logon

|...+...1...+...2...+...3...+...4...+...5...+...6...+...7...+...8
1234567890123456789012345678901234567890123456789012345678901234567890
```

## FULL

Passphrase support is enabled with the **PASSWORD** and **NEW PASSWORD** fields each consisting of two lines. The value in the second line is concatenated onto the end of the value in the first line. The length of the first line is 34 bytes and the length of the second line is 66 bytes, allowing the maximum passphrase value of 100 bytes to be entered. With this setting, the fields are aligned in the center of the screen, as shown in the following figure:

```
>
>          Copyright 1980-2022
>          IBM Corporation. All rights reserved.
>          Use permissible by license only.
>

          ENTER USERID ==>
                PASSWORD ==>

                GROUP ==>
          NEW PASSWORD ==>

          Press F3 to exit logon

|...+...1...+...2...+...3...+...4...+...5...+...6...+...7...+...8
1234567890123456789012345678901234567890123456789012345678901234567890
```

## NO or NONE

Passphrase support is not enabled. The lengths of the **PASSWORD** and **NEW PASSWORD** fields are eight bytes each. With this setting, if you have external security defined using a security exit, the fields are aligned in the center of the screen, as shown in the following figure:

```

>
> Copyright 1980-2020
> IBM Corporation. All rights reserved.
> Use permissible by license only.
>
>
> ENTER USERID ==>
> PASSWORD ==>
> GROUP ==>
> NEW PASSWORD ==>
>
> Press F3 to exit logon
>
|...+...1...+...2...+...3...+...4...+...5...+...6...+...7...+...8
1234567890123456789012345678901234567890123456789012345678901234567890

```

**Note:** If you do not have external security defined, none of the fields for credentials appear on the logon screen.

Use the following procedure to enable passphrase and MFA support for your OMEGAMON 3270 Classic interface. If you do not want to use passphrase or MFA when logging on to the OMEGAMON 3270 Classic interface, no configuration changes are needed.

## Procedure

To enable passphrase support for your OMEGAMON 3270 Classic interface, perform the following steps for each of your supported OMEGAMON products. Use either of the following methods:

- Using Configuration Manager:
  - a. In RTEDEF(*Kpp\$PARM*) or RTEDEF(*Kpp\$lpar*), add the following parameters:
    - Kpp\_CLASSIC\_PASSPHRASE** set to value PARTIAL, MAX62, or FULL
    - Kpp\_CLASSIC\_SECCLASS** set to the OMEGAMON SAF security class
    - Kpp\_CLASSIC\_SAFAPPL** set to the OMEGAMON SAF application ID
  - b. Run the **GENERATE** action.

Recycle the OMEGAMON Classic started task for the configuration changes to take effect. See the product-specific documentation for more information.

**Note:** For more information about changing parameter values after you have completed configuration of the runtime environment using Configuration Manager, see [“Creating or updating a runtime environment” on page 229](#).

- Using PARMGEN:
  - a. In WCONFIG(*#rtename*), add the following parameters:
    - Kpp\_CLASSIC\_PASSPHRASE** set to value PARTIAL, MAX62, or FULL
    - Kpp\_CLASSIC\_SECCLASS** set to the OMEGAMON SAF security class
    - Kpp\_CLASSIC\_SAFAPPL** set to the OMEGAMON SAF application ID
  - b. Submit the \$PARSE job to refresh the profile.

Recycle the OMEGAMON Classic started task for the configuration changes to take effect. See the product-specific documentation for more information.

**Note:** For more information about changing parameter values after you have completed configuration of the runtime environment using PARMGEN, see [Scenario RTE03: Changing parameters in an RTE](#).

## How to: Override the currently configured default storage limit within the RKANPARU(KppSYSIN) startup member

In general, when in PARMGEN mode, *any* storage-related parameters are available for customization and overrides. Defaults are set using the IBM-supplied values. In this scenario, you change the storage limit parameter reflected in the KppSYSIN start up member. This topic explains how to perform this task using PARMGEN.

### About this task

This task involves three main steps:

1. Edit the applicable \*\_LIMIT\_EXTEND parameter in the LPAR configuration profile.
2. Run the \$PARSE or \$PARSESV job, as appropriate to recreate the runtime members and jobs.
3. Resubmit the appropriate batch jobs to complete the setup.

Follow this procedure to complete this task using the PARMGEN Workflow user interface.

### Procedure

1. Edit the LPAR configuration profile:
  - a. On the main Workflow panel, set the name of the runtime environment you want to modify and select option 8 to edit its LPAR profile.
  - b. On the Customize PARMGEN Configuration Profile Member panel, select option 1. The profile is displayed.
  - c. Change the appropriate parameters.
    - To modify the storage limit for a z/OS monitoring server, locate the KDS\_TEMS\_STORAGE\_LIMIT\_EXTEND and provide the desired value.

```
Command ==>                                     Scroll ==>
CSR
000916 KDS_TEMS_STORAGE_LIMIT_PRIMARY      20
000917 KDS_TEMS_STORAGE_LIMIT_EXTEND      30
000918 KDS_TEMS_KGL_WTO                     Y
000919 KDS_TEMS_KDC_DEBUG                    N
000920 KDS_TEMS_KLX_TCP_TOLERATERECYCLE    Y
```

- To modify the storage limit for agents running in their own address space, do an EXCLUDE FIND on AGT\_STORAGE and specify the desired values. (For information on EXCLUDE FIND, see [“XF edit macro” on page 426.](#))

```

The Kpp codes and the products they represent are listed in [Product codes](#).

- e. Save the changes and return to the main Workflow panel.
2. Recreate the runtime environment members and jobs.
    - a. From the main menu, select option 10.  
The \$PARSE/\$PARSESV: Create the RTE Members and Jobs panel is displayed.

- b. Select the \$PARSE (or \$PARSESV) composite job or the appropriate \$PARSE%% library specific job.  
The JCL is presented.
    - c. Review the job and make any required adjustments, then submit it and return to the main Workflow panel.
  3. Edit and submit the batch jobs to complete the setup.
    - a. Select option 11 from the main menu.  
The Submit Batch Job to Complete PARMGEN Setup panel is displayed
    - b. If system variables are enabled, select option 5 and submit the KCIJVUPV job.
    - c. (Optional, but best practice) Select option 12 and submit the KCIJcCPR job to backup the product libraries.
    - d. Select option 13 to submit KCIJcW2R to copy the work libraries to the production libraries.

## Result

The LPAR configuration profile is updated, and the KppSYSIN members are updated with the new values.

## How to: Connect agents on local RTE and agents on remote RTEs to the HUB TEMS

Agents on different RTEs can be configured to report to the same HUB TEMS. This topic explains how to perform this task using PARMGEN.

Decide the primary TEMS, regardless if it is a Hub or a Remote TEMS, that the agents connect to. If you enable the backup TEMS feature by changing the agent's Kpp\_TEMS\_BKUP1\_\* parameters, you must also decide the backup TEMS that the agents connect to.

Refer to the following configuration scenario among 3 RTEs in different LPARs to understand how to connect agents on different RTEs to the HUB TEMS. The LPARs are:

- LPAR 1: RTE\_NAME = SYSA (&sysname = SYSA; &sysplex = TESTPLEX; &sysiphostname = SYSA)
- LPAR 2: RTE\_NAME = SYSB (&sysname = SYSB; &sysplex = TESTPLEX; &sysiphostname = SYSB)
- LPAR 3: RTE\_NAME = SYSC (&sysname = SYSC; &sysplex = TESTPLEX; &sysiphostname = SYSC)

The components and configurations on each RTE are different:

- SYSA RTE configures the following products:
  - A Hub TEMS (KDS)
  - OMEGAMON enhanced 3270 User Interface (KOB)
  - OMEGAMON for Db2 (KD5)
  - OMEGAMON for IMS (KI5)
  - OMEGAMON for Networks (KN3)

KD5, KI5, and KN3 agents report directly to the local z/OS Hub TEMS via IPPPIPE and SNA protocols. Take the default values in PARMGEN for most of the following parameters in the LPAR RTE profile in WCONFIG. You can define most of these parameter values in option 1 (Set up/Refresh PARMGEN work environment -KCIJPCFG). The backup TEMS feature is not enabled on this RTE.

- a. Specify common RTE parameters values during KCIJPCFG setup depending on preferred RTE scenario.

```
RTE_TEMS_CONFIGURED_FLAG      y
RTE_TEMS_NAME_NODEID         "SYSA:CMS"
```

- b. Specify typical z/OS TEMS common parameters.
    - Specify the TEMS type on this RTE as HUB.

```
KDS_TEMS_TYPE                 HUB
```

- Specify the communication protocols in priority sequence to be used by the local TEMS to communicate with other ITM components such as another TEMS, Agents, TEPS, etc. Valid values are "IPPIPE", "IP", "SNA", "IP6PIPE", "IP6", "IPSPIPE", and "IP6SPIPE".

```
KDS_TEMS_COMM_PROTOCOL1      IPPPIPE
KDS_TEMS_COMM_PROTOCOL2      SNA
```

- Specify the protocol port number for the HUB TEMS, which must be used across the enterprise. Remote TEMS and Agents connecting to the Hub TEMS must use the same port numbers.

```
KDS_TEMS_TCP_PIPE_PORT_NUM  1918 * IP.PIPE
```

- Specify the TEMS VTAM information. You can take default values for the KDS\_TEMS\_VTAM\_APPL\_GLB\_BROKER and KDS\_TEMS\_VTAM\_APPL\_LLB\_BROKER parameters, or use different values. The value CTDHDSL B is used across this scenario.

```
KDS_TEMS_VTAM_LU62_DLOGMOD    CANCTDCS
KDS_TEMS_VTAM_LU62_MODETAB    KDSMTAB1
KDS_TEMS_VTAM_NETID           USCAC001
KDS_TEMS_VTAM_APPL_GLB_BROKER CTDHDSL B
KDS_TEMS_VTAM_APPL_LLB_BROKER CTDHDSL B
KDS_TEMS_VTAM_APPL_KDS_VTAMID CTDDSDS
KDS_TEMS_VTAM_APPL_MQ         CTDDSMQ
```

- c. Specify typical common agent parameters. Only OMEGAMON for Db2 (KD5) parameters are listed. Other agents have similar parameters.

- Specify the communication protocols in priority sequence to be used to communicate with other ITM components such as the TEMS, agents, TEPS, etc. Valid values are "IPPIPE", "IP", "SNA", "IP6PIPE", "IP6", "IPSPIPE", and "IP6SPIPE".

```
KD5_AGT_COMM_PROTOCOL1      IPPPIPE
KD5_AGT_COMM_PROTOCOL2      SNA
```

- Specify protocol port numbers for agent to connect to TEMS.

```
KD5_TEMS_TCP_PIPE_PORT_NUM  1918 * IP.PIPE
```

- Specify values that describe the primary TEMS the agents connect to.

```
KD5_TEMS_LOCAL_CONNECT_FLAG  Y
KD5_TEMS_NAME_NODEID         "SYSA:CMS"
```

- Specify primary TEMS TCP/IP information and agent local TCP/IP information.

```
KD5_TEMS_TCP_HOST            "SYSA"
KD5_AGT_TCP_HOST             "SYSA"
```

- Specify primary TEMS VTAM information and agent's local VTAM and logon information.

```
KD5_TEMS_VTAM_LU62_DLOGMOD    CANCTDCS
KD5_TEMS_VTAM_LU62_MODETAB    KDSMTAB1
KD5_TEMS_VTAM_NETID           USCAC001
KD5_TEMS_VTAM_APPL_LLB_BROKER CTDHDSL B
KD5_AGT_VTAM_NODE            CTDD5N
```

- Specify agent's APPLIDs.

```
KD5_AGT_VTAM_APPL_OPERATOR    CTDD50R
KD5_AGT_VTAM_APPL_KD5INVPO    CTDD5VP
KD5_AGT_VTAM_APPL_NCS         CTDD5NC
```

|                      |         |
|----------------------|---------|
| KD5_AGT_VTAM_APPL_AA | CTDD5AA |
|----------------------|---------|

Based on the customizations, the xKANPARU(KppENV) runtime members reflect the KDE\_TRANSPORT parameter and CT\_CMSLIST parameter based on the specified values, in the preferred order of the protocols, which is IPPIPE first and then try SNA if connection by IP wire is not available.

- SYSB RTE configures the following products:
  - A local z/OS Remote TEMS (KDS) reporting to the z/OS Hub on SYSA
  - OMEGAMON for Db2 (KD5)
  - OMEGAMON for IMS (KI5)
  - OMEGAMON for Networks (KN3)

No OMEGAMON enhanced 3270 User Interface (KOB) is configured. KD5, KI5, and KN3 agents report to the local z/OS Remote TEMS via IPPIPE and SNA protocols, not directly to the Hub to reduce the burden on the SYSA Hub TEMS.

Take the default values in PARMGEN for most of the following parameters in the LPAR RTE profile in WCONFIG. You can define most of these parameter values in option 1 (Set up/Refresh PARMGEN work environment -KCIJPCFG).

- a. Specify common RTE parameters values during KCIJPCFG set-up depending on preferred RTE scenario.

|                          |            |
|--------------------------|------------|
| RTE_TEMS_CONFIGURED_FLAG | y          |
| RTE_TEMS_NAME_NODEID     | "SYSB:CMS" |

- b. Specify typical z/OS TEMS common parameters.

- Specify the TEMS type on this RTE as REMOTE.

|               |        |
|---------------|--------|
| KDS_TEMS_TYPE | REMOTE |
|---------------|--------|

- Specify the communication protocols in priority sequence to be used by the local TEMS to communicate with other ITM components such as another TEMS, agents, TEPS, etc. Valid values are "IPPIPE", "IP", "SNA", "IP6PIPE", "IP6", "IPSPIPE", and "IP6SPIPE".

|                         |        |
|-------------------------|--------|
| KDS_TEMS_COMM_PROTOCOL1 | IPPIPE |
| KDS_TEMS_COMM_PROTOCOL2 | SNA    |

- Specify the protocol port number for the remote TEMS same as the port number that is used by the Hub TEMS.

|                            |                |
|----------------------------|----------------|
| KDS_TEMS_TCP_PIPE_PORT_NUM | 1918 * IP.PIPE |
|----------------------------|----------------|

- Specify the TEMS VTAM information.

|                               |          |
|-------------------------------|----------|
| KDS_TEMS_VTAM_LU62_DLOGMOD    | CANCTDCS |
| KDS_TEMS_VTAM_LU62_MODETAB    | KDSMTAB1 |
| KDS_TEMS_VTAM_NETID           | USCAC001 |
| KDS_TEMS_VTAM_APPL_GLB_BROKER | CTDHSDLB |
| KDS_TEMS_VTAM_APPL_LLB_BROKER | CTDDSLB  |
| KDS_TEMS_VTAM_APPL_KDS_VTAMID | CTDDSDS  |
| KDS_TEMS_VTAM_APPL_MQ         | CTDDSMQ  |

- Specify its Hub TEMS values. These parameters are key settings for the Remote TEMS that tell PARMGEN where the HUB TEMS is and how to set up the RTEMS KDSENV and KDCSSITE runtime members. In this scenario, you must specify the values of the Hub TEMS on RTE SYSA.

```

KDS_HUB_TEMS_NAME_NODEID      "SYSA:CMS"      * Hub RTE_TEMS_NAME_NODEID
KDS_HUB_TCP_HOST              "SYSA"         * Hub KDS_TEMS_TCP_HOST
KDS_HUB_TCP_PIPE_PORT_NUM    "1918"         * Hub KDS_TEMS_TCP_PIPE_PORT_NUM
KDS_HUB_VTAM_APPL_GLB_BROKER "CTDHDSL B"    * Hub
KDS_TEMS_VTAM_APPL_GLB_BROKER
KDS_HUB_VTAM_NETID           "USCAC001"     * Hub KDS_TEMS_VTAM_NETID

```

- c. Specify typical common agent parameters. Only OMEGAMON for Db2 (KD5) parameters are listed. Other agents have similar parameters.

- Specify the communication protocols in priority sequence to be used to communicate with other ITM components such as the TEMS, agents, TEPS, etc. Valid values are "IPPIPE", "IP", "SNA", "IP6PIPE", "IP6", "IPSPIPE", and "IP6SPIPE".

```

KD5_AGT_COMM_PROTOCOL1      IPPPIPE
KD5_AGT_COMM_PROTOCOL2      SNA

```

- Specify protocol port numbers for agent to connect to TEMS.

```

KD5_TEMS_TCP_PIPE_PORT_NUM  1918 * IP.PIPE

```

- Specify values that describe the primary TEMS the agents connect to.

```

KD5_TEMS_LOCAL_CONNECT_FLAG      Y
KD5_TEMS_NAME_NODEID            "SYSB:CMS"

```

- Specify primary TEMS TCP/IP information and agent local TCP/IP information.

```

KD5_TEMS_TCP_HOST              "SYSB"
KD5_AGT_TCP_HOST               "SYSB"

```

- Specify primary TEMS VTAM information and agent's local VTAM and logon information.

```

KD5_TEMS_VTAM_LU62_DLOGMOD      CANCTDCS
KD5_TEMS_VTAM_LU62_MODETAB      KDSMTAB1
KD5_TEMS_VTAM_NETID             USCAC001
KD5_TEMS_VTAM_APPL_LLB_BROKER   CTDDSLB
KD5_AGT_VTAM_NODE               CTDD5N

```

- Specify agent's APPLIDs.

```

KD5_AGT_VTAM_APPL_OPERATOR      CTDD50R
KD5_AGT_VTAM_APPL_KD5INVPO      CTDD5VP
KD5_AGT_VTAM_APPL_NCS           CTDD5NC
KD5_AGT_VTAM_APPL_AA            CTDD5AA

```

- d. You can enable the backup TEMS feature for the agents to report to the z/OS Hub TEMS on RTE SYSA in case the z/OS RTEMS local on RTE SYSB gets an ABEND. In this scenario, uncomment out the following parameters and specify the values of the Hub TEMS, which become the second entries in CT\_CMSLIST for RKANPARU(KD5ENV).

```

KD5_TEMS_BKUP1_NAME_NODEID      "SYSA:CMS"
KD5_TEMS_BKUP1_TCP_HOST         "SYSA"
KD5_TEMS_BKUP1_VTAM_LU62_DLOGMOD CANCTDCS
KD5_TEMS_BKUP1_VTAM_APPL_LLB_BKR CTDHDSL B
KD5_TEMS_BKUP1_VTAM_NETID       USCAC001

```

Based on the customizations, the xKANPARU(KppENV) runtime members reflect the KDE\_TRANSPORT parameter and CT\_CMSLIST parameter based on the specified values, in the preferred order of the protocols, which is IPPPIPE first and then try SNA if connection by IP wire is not available. The KD5 agent is configured to report to a backup TEMS, which in this scenario is the Hub TEMS on SYSA, if the local RTEMS on SYSB is not running.

- SYSC RTE configures the following products:
  - OMEGAMON for Db2 (KD5)
  - OMEGAMON for IMS (KI5)
  - OMEGAMON for Networks (KN3)

No TEMS (KDS) or OMEGAMON enhanced 3270 User Interface (KOB) is configured. KD5, KI5, and KN3 Agents report to z/OS Hub TEMS configured in the other LPAR (RTE\_NAME = SYSA) via IPPIPE and SNA protocols.

Take the default values in PARMGEN for most of the following parameters in the LPAR RTE profile in WCONFIG. You can enable the backup TEMS feature on this RTE to have the agents report to the HUB TEMS on SYSA or the RTEMS on SYSB. However, in this scenario the backup TEMS feature is not enabled.

- Specify common RTE parameters values during KCIJPCFG set-up depending on preferred RTE scenario. In this scenario, no TEMS is configured in the RTE.

```
RTE_TEMS_CONFIGURED_FLAG      N
RTE_TEMS_NAME_NODEID         ""
```

When RTE\_TEMS\_CONFIGURED\_FLAG=N, PARMGEN ignores the KDS\_\* parameters in the profile.

- Specify typical common agent parameters. Only OMEGAMON for Db2 (KD5) parameters are listed. Other agents have similar parameters.
  - Specify the communication protocols in priority sequence to be used to communicate with other ITM components such as the TEMS, agents, TEPS, etc. Valid values are "IPPIPE", "IP", "SNA", "IP6PIPE", "IP6", "IPSPIPE", and "IP6SPIPE".

```
KD5_AGT_COMM_PROTOCOL1      IPPIPE
KD5_AGT_COMM_PROTOCOL2      SNA
```

- Specify protocol port numbers for agent to connect to TEMS.

```
KD5_TEMS_TCP_PIPE_PORT_NUM  1918 * IP.PIPE
```

- Specify values that describe the primary TEMS the agents connect to. If the primary TEMS that this agent connects to is configured on another RTE, or running on a non-z/OS platform, specify 'N' to the KD5\_TEMS\_LOCAL\_CONNECT\_FLAG parameter, then customize the KD5\_TEMS\_\* parameters accordingly to point to the non-local primary TEMS.

```
KD5_TEMS_LOCAL_CONNECT_FLAG  N
KD5_TEMS_NAME_NODEID         "SYSA:CMS"
```

- Specify primary TEMS TCP/IP information and agent local TCP/IP information.

```
KD5_TEMS_TCP_HOST           "SYSA"
KD5_AGT_TCP_HOST            "SYSC"
```

- Specify primary TEMS VTAM information and agent's local VTAM and logon information.

```
KD5_TEMS_VTAM_LU62_DLOGMOD   CANCTDCS
KD5_TEMS_VTAM_LU62_MODETAB   KDSMTAB1
KD5_TEMS_VTAM_NETID          USCAC001
KD5_TEMS_VTAM_APPL_LLB_BROKER CTDHDSL B
KD5_AGT_VTAM_NODE            CTDD5N
```

- Specify agent's APPLIDs.

```
KD5_AGT_VTAM_APPL_OPERATOR   CTDD50R
KD5_AGT_VTAM_APPL_KD5INVPO   CTDD5VP
KD5_AGT_VTAM_APPL_NCS        CTDD5NC
KD5_AGT_VTAM_APPL_AA         CTDD5AA
```

Based on the customizations, the xKANPARU(KppENV) runtime members reflect the KDE\_TRANSPORT parameter and CT\_CMSLIST parameter based on the specified values, in the preferred order of the protocols, which is IPPIPE first and then try SNA if connection by IP wire is not available.

## How to: Remove SNA protocol from an RTE

After you set up the RTE, you might find that the SNA protocol is no longer needed. You can remove the SNA protocol by changing corresponding parameters. This topic explains how to perform this task using PARMGEN.

### About this task

To remove the SNA protocol, edit the parameters in the configuration profile, re-create the RTE and jobs, and then copy the runtime members from the work libraries to the production libraries.

### Procedure

1. Define the RTE that you want to configure.
  - a. Start the installation and configuration tool by running the command EX 'gbl\_target\_hilev.TKANCUS' where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.  
The Welcome screen for the z/OS Installation and Configuration Tools is displayed.
  - b. Select 3 (Configuration Workflow), and press Enter.
  - c. Specify the information of the RTE that you want to configure including **GBL\_USER\_JCL**, **RTE\_PLIB\_HILEV**, and **RTE\_NAME**, and press Enter.  
**PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** is displayed.
2. Edit the parameters in the configuration profile.
  - a. From the Workflow - Primary Option Menu, select 2 (**Customize PARMGEN configuration profiles**).  
The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
  - b. Select 1 to edit the RTE profile.
  - c. Remove the SNA value from all **KDS\_TEMS\_COMM\_PROTOCOLn** parameters and **Kpp\_AGT\_COMM\_PROTOCOLn** parameters.
  - d. Save the changes and return to the Workflow - Primary Options Menu panel.
3. Re-create the RTE and jobs.
  - a. Select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.
  - b. Select option 1 to submit the \$PARSE job (or the \$PARSESV job, if variables are enabled).
  - c. Return to the Workflow - Primary Options Menu panel.
4. Copy the runtime members from the work libraries to the production libraries.
  - a. Select **Submit batch jobs to complete PARMGEN setup** from the menu.  
The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.
  - b. Select option 11 and submit the KCIJPCPR job to back up the production libraries.
  - c. Select option 12 and submit the KCIJPW2R job (or the KCIJPW1R job) to copy the work libraries to the production libraries.

### Result

The SNA protocol is safely removed from the RTE.

## How to: Configure the z/OS Remote TEMS for Fault Toleration Option (FTO)

The Remote TEMS in your RTE can be configured to participate in Hot Standby configuration between distributed Hub TEMS for FTO. This topic explains how to perform this task using PARMGEN.

### Before you begin

Make sure that you configure an RTE with a Remote TEMS. See the following table for the QCF scenarios that you can follow to create an RTE with a Remote TEMS based on your requirements.

| Scenario              | Template name | RTE type           | Monitoring server type | System variables | Description                                                                                                                     |
|-----------------------|---------------|--------------------|------------------------|------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">QCF03</a> | \$MDLRSBV     | Sharing-with-base  | Remote                 | Yes              | RTE configuration template for sharing-with-base read-only libraries RTE (Remote TEMS and Agents with variables enabled)        |
| <a href="#">QCF05</a> | @MDLRF        | Full               | Remote                 | No               | RTE configuration template for full, standalone RTE (Remote TEMS and Agents)                                                    |
| <a href="#">QCF06</a> | @MDLRFV       | Full               | Remote                 | Yes              | RTE configuration template for full, standalone RTE (Remote TEMS and Agents with variables enabled)                             |
| <a href="#">QCF07</a> | @MDLRSB       | Sharing-with-base  | Remote                 | No               | RTE configuration template for sharing-with-base read-only libraries RTE (Remote TEMS and Agents)                               |
| <a href="#">QCF08</a> | @MDLRSS       | Sharing-with-SMP/E | Remote                 | No               | RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Remote TEMS and Agents)                        |
| <a href="#">QCF09</a> | @MDLRSSV      | Sharing-with-SMP/E | Remote                 | Yes              | RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Remote TEMS and Agents with variables enabled) |

## About this task

Enable the `KDS_X_HUB_CMS_FTO_FLAG` and set values for other related parameters to connect a z/OS Remote TEMS to a non-z/OS Hub TEMS with the Hot Standby feature enabled.

## Procedure

1. Define the RTE that you want to configure.
  - a. Start the installation and PARMGEN by running the command `EX 'gbl_target_hilev.TKANCUS'` where `gbl_target_hilev` is the high-level qualifier for the SMP/E target libraries where the products are installed.  
The Welcome screen is displayed.
  - b. Select 3 (Configuration Workflow), and press Enter.
  - c. Specify the information of the RTE that you want to configure including `GBL_USER_JCL`, `RTE_PLIB_HILEV`, and `RTE_NAME`, and press Enter.  
**PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** is displayed.
2. Edit the parameters in the configuration profile.
  - a. From the Workflow - Primary Option Menu, select 2 (**Customize PARMGEN configuration profiles**).

- The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
- b. Select 1 to edit the RTE profile.
  - c. Set the communication protocols and related parameters.
    - **KDS\_TEMS\_COMM\_PROTOCOLn**
    - **KDS\_TEMS\_TCP\_\*\_PORT\_NUM**
  - d. Set the **KDS\_HUB\_\*** parameters to the appropriate values for the primary hub monitoring server to which this remote TEMS reports.
    - **KDS\_HUB\_TEMS\_NAME\_NODEID**
    - **KDS\_HUB\_TCP\_HOST**
    - **KDS\_HUB\_TCP\_\*\_PORT\_NUM** (if the hub uses IP-related protocol)
    - **KDS\_HUB\_VTAM\_APPL\_GLB\_BROKER** (if the hub uses SNA)
    - **KDS\_HUB\_VTAM\_NETID** (if the hub uses SNA)
  - e. Set the **KDS\_X\_HUB\_CMS\_FTO\_FLAG** parameter to YES.  
**CMS\_FTO=YES** is generated in the xKANPARU{KDSENV} TEMS runtime member.
  - f. Set the **KDS\_X\_HUB\_BKUP1\_\*** parameters according to the protocols that are enabled to specify the Standby Hub TEMS.
    - Set the **KDS\_X\_HUB\_BKUP1\_TCP\_HOST** parameter to the IP hostname where the Standby HUB TEMS is running if IP-related protocol is enabled.
    - Set the **KDS\_X\_HUB\_BKUP1\_TEMS\_VTAM\_NETID** and **KDS\_X\_HUB\_BKUP1\_VTAM\_APPL\_GLBKR** parameters if SNA protocol is enabled by the Standby Hub TEMS.
  - g. Save the changes and return to the Workflow - Primary Options Menu panel.
3. Re-create the RTE and jobs.
    - a. Select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.
    - b. Press F5 to enter the library-specific \$PARSE\* jobs.
    - c. Select option 2 and submit the \$PARSEPR job.
    - d. Return to the Workflow - Primary Options Menu panel.
  4. Copy the runtime members from the work libraries to the production libraries.
    - a. Select **Submit batch jobs to complete PARMGEN setup** from the menu.  
The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.
    - b. Select option 11 and submit the KCIJPCPR job to back up the production libraries.
    - c. Select option 12 and submit the KCIJPW2R job to copy the work libraries to the production libraries.

## How to: Collect diagnostic information using PDCOLLECT

Use the Problem Determination Data Collection (PDCOLLECT) tool to collect diagnostic information. This topic explains how to perform this task using PARMGEN.

### Before you begin

**Note:** If you use Configuration Manager as your configuration tool, see [“Collecting diagnostic data using PDCOLLECT”](#) on page 366.

Use the WCONFIG(KCI\$SPDC) KCIPCOL imbed of the KCIJPCOL PDCOLLECT job to collect diagnostic information from the machine on which the product address spaces are executed.

To use this tool, you must install SDSF and are licensed to use it. If you do not have SDSF, you can copy the complete address space logs, including the JES output, RKLVLG, RKPDLG, RKPDLG, SYSPRINT, and so on, into a data set. The DCB information for the output data set can be as follows:

```
Organization: PS
Record format: VB
Record length: 240
Block size: 27998
```

Use the following format:

```
/* ----- BEGIN - USER SECTION: OVERRIDE ----- *
//KCIJPCOL EXEC PGM=IKJEFT1A,REGION=0M,
//          DYNAMNBR=99,COND=EVEN
//SYSTSPRT DD SYSOUT=*
//SYSPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//SYSTSIN DD *
  EX '&gbl_target_hilev.TKANCMD(KCIJPCOL)' +
    'JOBOUT(data_set_name) +
      SYS(&rte_name) +
      RHILEV(&rte_hilev) +
      RVHILEV(&rte_vsam_hilev) +
      BASEHLEV(&rte_hilev.&rte_name.R) +
      PGNJCL(&gbl_user_jcl) +
      PGNRTE(&rte_plib_hilev.&rte_name.WCONFIG) +
      INCLQA1(Y)'
/*
//* ----- END -USER SECTION: OVERRIDE ----- *
```

## About this task

The PARMGEN KCIJPCOL job uses the problem determination data collection tool KCIJPCOL to collect data that includes the following aspects:

- System configuration
- Runtime environment (RTE) libraries, including configuration files
- Network information, such as output from the **netstat** utility
- Self-describing agent (SDA) information:
  - Results of **ls -al** for your *rte/kds/support* and *rte/kds/support/TEMS*
  - Contents for *spawn\_cmd.sh* and *spawn\_cmd.trs*
  - Results of **java - version**
- Output from the specified job, including logs for the requested started task

Before you submit the \$PARSE\* "Create runtime members and jobs", review the RTE's WCONFIG(KCI\$SPDC) override imbed to KCIJPCOL to decide whether you have additional collection options you want to enable.

**Note:** The WCONFIG(KCI\$SPDC) imbed might not be the latest version. Check the RTE's IKANSAMU(KCI\$SPDC) template for changes to the imbed if you want to implement it in your user copy in WCONFIG(KCI\$SPDC), and then rerun the \$PARSESM job (which recreates the runtime members from IKANSAMU to WKANSAMU) and KCIJPW2R job to refresh the KCIJPCOL job.

## Procedure

1. Define the RTE that you want to configure.
  - a. Start the installation and configuration tool by running the command EX *'gbl\_target\_hilev.TKANCUS'* where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.  
The Welcome screen for the z/OS Installation and Configuration Tools is displayed.
  - b. Select 3 (Configuration Workflow), and press Enter.
  - c. Specify the information of the RTE that you want to configure including **GBL\_USER\_JCL**, **RTE\_PLIB\_HILEV**, and **RTE\_NAME**, and press Enter.  
**PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** is displayed.

2. Type U or UTIL in the Option line and press Enter to go to Utilities panel.
3. Select option 32 to configure the KCIJPCOL job.
  - Default parameters are provided in the USER SECTION. Add your advanced PDCOLLECT parameters, if any.
  - The JOB(NAME(IBM\*)) parameter of KCIJPCOL is set to collect data based on the global RTE started task prefix value of RTE\_STC\_PREFIX=IBM. If you use started task names different from NAME(IBM\*), modify the NAME() parameter accordingly. Each KCIJPCOL submission collects data for STCs matching NAME(IBM\*) convention.
  - You can choose whether to include the HUB TEMS &rte\_plib\_hilev.&rte\_name.RKDS\* VSAM datasets that are referenced in the QA1\* DDNAMEs in the IBMDS TEMS started task. The default value is Y.
  - For %&var% parameter variables, do not modify actual PARMGEN profile parameters that are referenced as RTE\_HILEV\_BASEHLEV, RTE\_STC\_PREFIX, GBL\_USER\_JCL, or RTE\_PLIB\_HILEV. RTE\_NAME. PARMGEN's \$PARSE\* job automatically substitutes these variables with actual customization values that are supplied in the LPAR RTE profile (WCONFIG(RTE\_NAME)). WCONFIG(KCI\$SPDC) override imbed is embedded into xKANSAMU(KCIJPCOL) job by the \$PARSE\* "Create runtime and members" job.

Assume that an environment has the following settings:

- RTE\_NAME=\$DEFAULT
- RTE\_TYPE=SHARING RTE (allocates its data sets as **TDITN.FTU.RTENVSM.\$DEFAULT.RKANPARU**, **TDITN.FTU.RTENVSM.\$DEFAULT.RKANDATV**, **TDITN.FTU.RTEVSAM.\$DEFAULT.RKDSSITF**, and so on)
- This LPAR sharing RTE shares a read-only set of base libraries that are called '**TDITN.FTU.RTEBASEA.RK\***' (that is, **TDITN.FTU.RTEBASEA.RKANCMD**, **TDITN.FTU.RTEBASEA.RKANMOD**, **TDITN.FTU.RTEBASEA.RKANMODL**, and so on)
- This \$DEFAULT sharing RTE uses a different HLQ for its PARMGEN work data sets (**TDITN.FTU.PGNWORK.\$DEFAULT.W\***, that is, **TDITN.FTU.PGNWORK.\$DEFAULT.WCONFIG**, **TDITN.FTU.PGNWORK.\$DEFAULT.WKANPARU**, and so on)

The settings of the KCIJPCOL job are as follows:

```

/* ----- BEGIN - USER SECTION: OVERRIDE ----- *
//KCIJPCOL EXEC PGM=IKJEFT1A,REGION=0M,
              DYNAMNBR=99,COND=EVEN
//SYSPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//SYSTSIN DD *
  EX 'TDITN.FTU.RTEBASEA.RKANCMD(KCIJPCOL)' +
     'JOB(NAME(IBM*)) NO(STC*) +
     SYS($DEFAULT) +
     RHILEV(TDITN.FTU.RTENVSM) +
     RVHILEV(TDITN.FTU.RTEVSAM) +
     BASEHLEV(TDITN.FTU.RTEBASEA.R) +
     PGNJCL(TDITNT.COMMON.PARMGEN.GLOBAL.JCL) +
     PGNRTE(TDITN.FTU.PGNWORK.$DEFAULT.WCONFIG) +
     INCLQA1(Y)'
/*
/* ----- END - USER SECTION: OVERRIDE ----- *
//*****

```

4. Submit the job.

## Result

The file &SYSUID.KCIJPCOL.PDCOLPDS.TRS is generated. You can FTP the output data set to IBM Support Center.

## How to: Configure an autonomous agent to send SNMP events

Customize the autonomous agent parameters in the product-specific WCONFIG(Kpp\$PENV) imbed for the agent to send SNMP events. This topic explains how to perform this task using PARMGEN.

## Before you begin

Back up the WCONFIG, RKANPARU, and RKANDATV datasets of the RTE where the agent resides.

## About this task

In the following instructions, the variable *pp* is the two-digit product code of the agent that you configure.

## Procedure

1. Add the following parameters to the WCONFIG(Kpp\$PENV) imbed.

```
*IRA_AUTONOMOUS_MODE=Y
*IRA_AUTONOMOUS_LIMIT=50
*IRA_DEBUG_AUTONOMOUS=N
*IRA_EIF_DEST_CONFIG=ppEVDST.RKANDATV
*IRA_EIF_MSG_LOCALE=en_US
*IRA_EVENT_EXPORT_CHECKUSAGE_INTERVAL=180
*IRA_EVENT_EXPORT_EIF=Y
IRA_EVENT_EXPORT_SIT_STATS=N
*IRA_EVENT_EXPORT_SIT_STATS_DETAIL=N
*IRA_EVENT_EXPORT_SNMP_TRAP=Y
*IRA_EVENT_EXPORT_SNMP_TRAP_CONFIG=ppTRAPS.RKANDATV
*IRA_LOCALCONFIG_DIR=RKANDATV
```

You can copy these parameters from the common WCONFIG(KAG\$PENV) imbed.

2. Customize and enable the following parameters.

```
IRA_AUTONOMOUS_MODE=Y
IRA_EVENT_EXPORT_SNMP_TRAP=Y
IRA_EVENT_EXPORT_SNMP_TRAP_CONFIG=ppTRAPS.RKANDATV
```

3. Create a **ppTRAPS** member in the *RTE\_HILEV.RTE\_NAME.RKANDATV* dataset by using one of the following methods.

- Create the **ppTRAPS** member locally by using the following code sample:

```
<SNMP>
  <TrapDest name="OMNIONE" Address="hostname" />
  <Situation name="*" Target="OMNIONE" />
</SNMP>
```

By changing the value of the parameter **IRA\_EVENT\_EXPORT\_SNMP\_TRAP\_CONFIG**, you can define one member to be shared by multiple agents that have access to the *RTE\_PLIB\_HILEV.RTE\_NAME.RKANDATV* dataset.

- Create the **ppTRAPS** by using the Central Configuration Server (CCS) as described in ITM Administrator's Guide. Specify the following parameters in WCONFIG(Kpp\$PENV), uncomment out the parameters, and give values to the parameters accordingly.

```
** *****
** Private Situations parameters:
** *****
** Central Configuration Server (CCS) parameters:
** Note: Instead of defining RKANDATV(ppTRAPS) locally, customize
**       the following variables accordingly:
** *****
*IRA_CONFIG_SERVER_URL=xxx
*IRA_CONFIG_SERVER_USERID=xxx
*IRA_CONFIG_SERVER_PASSWORD=xxx
*IRA_CONFIG_SERVER_FILE_PATH=xxx
*IRA_CONFIG_SERVER_FILE_NAME=xxx
*IRA_SERVICE_INTERFACE_CONFIG_INTERVAL=xxx
*IRA_PRIVATE_SITUATION_OUTPUT_LOCAL=Y or N
```

**Note:** The agent downloads the latest configuration files from the CCS during startup to update the RKANDATV members, including **ppTRAPS**.

Repeat this step for other agents by updating their product-specific WCONFIG(Kpp\$PENV) member so that their corresponding xKANPARU(KppENV) file is updated. If you want all z/OS agents to share this

change, update the parameters in the common WCONFIG(KAG\$PENV) member. This common imbed is appended in xKANPARU(KppENV) of every z/OS agent in this RTE.

4. Run the WCONFIG(\$PARSEPR) job to re-create the WKANPARU(KppENV) files of the RTE and update the WCONFIG(Kpp\$PENV) user imbed.
5. Run the WKANSAMU(KCIJPCPR) and WKANSAMU(KCIJPW2R) jobs of the RTE to refresh the product execution RKANPARU user dataset.
6. Recycle the agent started task. The task name is the value of the parameter **Kpp\_AGT\_STC** in the configuration profile. The default value is *IBMpp*.

## Result

The autonomous agents are configured and send SNMP events.

## How to: Remove subsystems from an RTE

To remove a subsystem from a particular runtime environment, clear out all the runtime members that are no longer used in your production libraries. This topic explains how to perform this task using PARMGEN.

## About this task

To remove subsystems from your runtime environment using PARMGEN, delete the corresponding parameters in the configuration profile, re-run the \$PARSE job and clear out the obsolete members.

## Procedure

1. Define the RTE that you want to configure.
  - a. Start the installation and PARMGEN by running the command **EX 'gbl\_target\_hilev.TKANCUS'** where **gbl\_target\_hilev** is the high-level qualifier for the SMP/E target libraries where the products are installed. The Welcome screen is displayed.
  - b. Select option 3 (Configuration Workflow) to enter PARMGEN.
  - c. Specify the information of the RTE that you want to configure including **GBL\_USER\_JCL**, **RTE\_PLIB\_HILEV**, and **RTE\_NAME**. **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** is displayed.
2. Delete the corresponding parameters in the configuration profile. In the following example, Db2 subsystem SS02 is being deleted from the RTE.
  - a. From the **Workflow - Primary Option Menu**, select option 2 (Customize PARMGEN configuration profiles). The **Customize PARMGEN Configuration Profile Members** panel is displayed.
  - b. Select option 1 to edit the RTE profile.
  - c. Block delete all the **KD2\_DB02\_\*** parameters in the RTE profile.
  - d. Save the changes and return to the **Workflow - Primary Options Menu** panel by pressing F3.
3. Re-create the RTE and jobs.
  - a. Select option 3 (Create this RTE's members and jobs). The **Create the Members and Jobs** panel (KCIP@PR1) is displayed.
  - b. Select option 1 to go over the job profile and then submit the job.
  - c. Press F3 to return to the **Workflow - Primary Options Menu** panel.
4. Clear out the obsolete members in production user libraries.
  - a. Type **U** on the workflow main panel to enter the **Utilities** panel.
  - b. Select option 29 to see the detailed information of KCIJPW1R job. This composite job empties out the production user libraries and then copies the work libraries to the production libraries.
  - c. Type **Submit** in the command line to submit the job.

## Result

The subsystem is removed from the RTE.

## How to: Configure an RTE created by another user

To take over the configuration of an RTE from another user, you need to supply the **GBL\_USER\_JCL**, the RTE high-level qualifier, and your preferred job card information. This topic explains how to perform this task using PARMGEN.

### Procedure

1. Start the installation and PARMGEN by running the following command .

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed. The Welcome screen is displayed.

2. Select option 3 (Configuration Workflow) to enter PARMGEN.
3. Optional: If this is the first time that you invoke PARMGEN using this TSO user ID, you need to specify the high-level qualifier for the SMP/E target data sets: **GBL\_TARGET\_HILEV**. If the high-level qualifier is NONSMS-managed, you also need to supply the **VOLSER**.

4. Specify the information of the RTE that you want to configure by providing the following values:

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. .

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE that you create.

5. In the prompt main PARMGEN workflow window, select option 1 to proceed.
6. Customize your jobcard.
  - a. In the **Customize jobcard data** section, uncomment out the first two lines of the pre-filled value.
  - b. Replace the default jobname with a new one. If you want to establish a common jobcard that any users managing this RTE will submit, use a generic job name like 'PARMGENA'.
  - c. Save your jobcard information by proceeding to the next panel. The customized jobcard is saved in the ISPF user profile pool and persists across ISPF sessions.

### Result

You can now continue to run the jobs or make changes to the configuration using your ID.

## How to: Enable new parameters in *Kpp\$\** user imbeds that are introduced by PARMGEN PTFs

Advanced parameters that are introduced by the PARMGEN PTFs are customized via the parameters in the *Kpp\$\** user imbeds. This topic explains how to perform this task using PARMGEN.

### Before you begin

In each PARMGEN PTF, new advanced parameters might be introduced in the user imbeds. Review the *Kpp\$\** default user imbeds that are provided by the PARMGEN PTF in the *rte\_plib\_hilev.rte\_name.IKAN\** datasets. Go through the description of new parameters to determine which new parameters you want to enable.

### Procedure

1. Add the new parameters to the *rte\_plib\_hilev.rte\_name.WCONFIG(Kpp\$\*)* user imbeds. You must recreate the user imbeds to include the new parameters.
  - a. Rename the existing *rte\_plib\_hilev.rte\_name.WCONFIG(Kpp\$\*)* user imbeds.
  - b. Rerun the *rte\_plib\_hilev.rte\_name.WCONFIG(KCIJPUP1)* job to recreate the *rte\_plib\_hilev.rte\_name.WCONFIG(Kpp\$\*)* user imbeds with default values.

You can also find the KCIJPUP1 job in the PARMGEN utility menu.

2. Customize the parameters in the new `rte_plib_hilev.rte_name.WCONFIG(Kpp$*)` user imbeds.
  - For the parameters that are previously customized, compare their values with the ones in the old `WCONFIG(Kpp$*)` user imbeds that are renamed in [Step 1a](#), and bring the values to the new `WCONFIG(Kpp$*)` user imbeds.
  - For new parameters that you want to enable, uncomment out the parameters in the recreated `rte_plib_hilev.rte_name.WCONFIG(Kpp$*)` user imbeds.
    - If variables are not enabled in the RTE, uncomment out the parameters with exact values.
    - If variables are enabled in the RTE, uncomment out the parameters with variable placeholders.
3. Change the parameter values if needed.
  - If variables are not enabled in the RTE, change the parameter values in the `rte_plib_hilev.rte_name.WCONFIG(Kpp$*)` user imbeds.
  - If variables are enabled in the RTE, change the resolution values of the placeholders in the `GBL_USER_JCL(rte_name)` RTE variables profile.
4. Run the `$PARSE*` job to recreate the RTE's `rte_plib_hilev.rte_name.WKAN*(runtime_member)` where the `Kpp$*` is imbedded.
  - For `Kpp$C*`, run the `$PARSEC` job to recreate runtime members in `WKANCMU` library.
  - For `Kpp$P*`, run the `$PARSEPR` job to recreate runtime members in `WKANPARU` library.
  - For `Kpp$S*`, run the `$PARSESM` job to recreate runtime members in `WKANSAMU` library.
5. Submit the `WKANSAMU(KCIJPW2R)` job to refresh the `RKAN*` libraries when ready to stage the update.
6. Recycle the product started task.

## How to: Validate PARMGEN profile parameter values

The KCIJPVAL job validates the parameter values in PARMGEN profile. The job can be run either as a standalone job from the **Utilities** panel, or be invoked from `$PARSE` or `$PARSESV` job in the `WCONFIG` library. This topic explains how to perform this task using PARMGEN.

### About this task

To validate parameter value settings in customer override `CONFIG` profile members, you need to run the KCIJPVAL job. The job is included in `$PARSE` (Create runtime members and jobs in `WK*`) job and `$PARSESV` (Create runtime members and jobs in `WK*`) job (if System Variables is enabled in the RTE). If the `VALIDATE` step gets a condition code greater than 4 (`COND CODE 0004`), the remaining steps in `$PARSE` job will not be executed unless you correct all the errors in `$VALRPT`. You can also run the KCIJPVAL job outside `$PARSE` from the **Utilities** panel as a standalone job.

### Procedure

1. On the command line of panel **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu (KCIPQPGB)**, type `UTIL` to enter the **Utilities** panel.
2. Select the option 23 (Validate PARMGEN profile parameter values) to run the KCIJPVAL job.
3. Review the job information and submit the job. The job generates a Parameter Validation Report in `hilev.rte.WCONFIG($VALRPT)`.
4. After the job is completed, check the condition code that is returned. If the condition code is greater than 4 (`COND CODE 0004`), you need to go over the validation report and correct the errors.
  - a. On the command line of the **Utilities** panel, type `23s` to see the `$VALRPT` validation report. The validation report contains the following four sections:
    - Parameter Validation Errors.
    - Parameter Values Changed from Defaults.
    - Components Configured in this RTE.

- Parameter Validation Errors.
- b. Review the errors listed in section 1 and section 4 of the validation report and correct the parameter values.
  - c. Resubmit the KCIJPVAL job.

## How to: Use a shared procedure for multiple monitoring servers

You can configure your environment to use the same started task procedure for multiple monitoring servers across different systems in the sysplex. This topic explains how to perform this task using either Configuration Manager or PARMGEN.

### Before you begin

A Tivoli Enterprise Monitoring Server (*monitoring server*) can be configured as one of several types: hub, high-availability hub, remote. By default, the started task procedure for each monitoring server is created to be run as a separate task. The generated procedure is different for each monitoring server by type; for example, the name of the runtime environment, the data set names, and the required DD statements can all vary by monitoring server type.

This default configuration is not suitable for some sites that might have any of the following requirements:

- The SYS1 . PROCLIB (or equivalent procedure library) must be shared across all the systems in the sysplex.
- Only a single, specific agent procedure is allowed (that is, only one procedure per agent).

To satisfy such requirements, you must use a procedure that is the same for all monitoring servers across all systems; it must have the same name, the same contents, and reference the same data sets. To accomplish this setup, you can configure your environment to generate a *shared procedure*.

This topic explains how to generate a shared procedure for use with multiple monitoring servers using either Configuration Manager or PARMGEN.

### About this task

This task requires the use of the following parameter:

#### **KDS\_TEMS\_PROC\_SHARED**

This flag specifies if the monitoring server procedure can be shared among different systems in the sysplex. When the flag is set to Y, the same procedure is generated for a hub monitoring server or a remote monitoring server, and the procedure can be copied to a shared SYS1 . PROCLIB. The default value for this parameter is N.

The use of system variables is also required.

Use the following steps to create a shared procedure for use with multiple monitoring servers.

### Procedure

1. Set the flag parameter that enables the generation of a monitoring server procedure that can be shared:
  - Using Configuration Manager: Add parameter **KDS\_TEMS\_PROC\_SHARED** set to Y to RTEDEF (KDS\$PARM) or RTEDEF (KDS\$lpar), and then run the **GENERATE** action.
  - Using PARMGEN: In WCONFIG (*rte\_name*), set parameter **KDS\_TEMS\_PROC\_SHARED** to Y, and then run the **\$PARSE** job.

**Note:** For more information about making these changes using PARMGEN, see [Scenario SMPE03: Applying SMP/E maintenance with new configuration changes to an existing RTE and overriding the IBM-supplied configuration defaults](#).

2. Review the generated procedure, and proceed as appropriate:
  - If you use system variables in your runtime environment configuration, including a system variable for **RTE\_NAME**, the generated procedure is ready to be shared.
  - If you do not use system variables in your runtime environment configuration, you can use the generated procedure as a shared procedure if there is a variable in your PARMLIB system symbol

list that corresponds to your **RTE\_NAME** values across all the LPARs in the sysplex. To enable the procedure to be shared, update the following lines:

```
//TEMS PROC RGN=0M,TIM=1440,MEMLIM=NOLIMIT,  
//          SYS=&SYSNAME. ,
```

In this example, **&SYSNAME.** resolves to an **RTE\_NAME** on each system where it is started.

3. Copy the shared started task procedure to your system library.

## Rectifying your PARMGEN configuration

If manual modifications exist in your PARMGEN configuration, follow these steps to standardize your configuration. This task applies only to runtime environments that were created using PARMGEN.

### Before you begin

If you set up your runtime environment using PARMGEN, then any maintenance should also occur using the PARMGEN tool. You should not manually modify any of the parameters or members.

In some cases, members or parameters are modified manually (either intentionally or unintentionally), which can cause problems when applying maintenance or upgrading products within the runtime environment. It is recommended that you follow the guidance in this task to standardize your configuration so that you can perform future maintenance properly and without issue.

**Important:** If you plan to migrate from PARMGEN to IBM Z® Monitoring Configuration Manager, you must standardize your PARMGEN configuration for a smooth migration. Complete this task to prepare your PARMGEN configuration for migration.

### About this task

The following six libraries are within the OMEGAMON runtime environment and contain configurable members:

RKANPARU  
RKANSAMU  
RKANCMDU  
RKD2PAR  
RKD2PRF  
RKD2SAM

**Note:** Libraries RKD2PAR, RKD2PRF, and RKD2SAM (and respective WK\* libraries) are applicable only when OMEGAMON® AI for Db2 is configured.

The members in these libraries should be configured using PARMGEN and standard PARMGEN parameters or embed overrides.

**Note:** For more information about embed members, see [“Override embed members” on page 417](#) and [“Customizing the override embed members” on page 471](#).

If any of these members contain manual modifications, or if you are unsure if there are manual modifications, perform the steps in the following procedure to synchronize your PARMGEN configuration with parameter values inside configurable members. The steps are divided into the following sections:

- [Part I: Identify and isolate](#)
- [Part II: Fix impacted members](#) (with subsection [Embed overrides](#))
- [Part III: Regenerate WK\\* libraries](#)

### Procedure

## Part I: Identify and isolate

Identify and isolate all manual changes inside the PARMGEN runtime environment members.

**Important:** In some rare cases, extra members might exist in the data sets. If such a member is needed for the runtime environment, make sure to include the member in the user-defined exclude list WCONFIG (KCI\$XW2R).

1. Use the PARMGEN tailored JCL job KCIJPSPC to compare WK\* libraries against RK\* libraries (for example, compare WKANSAMU to RKANSAMU). To perform this step, open the “Utilities panel” on page 423, and choose option 27.

```
Submit a utility job (Maintenance):
-----
Description                                     Job/Label
-----
20. Refresh IK* templates/WCONFIG *$IBM profiles.      KCIJPUP1
21. Convert an ICAT RTE Batch member.                 KCIJPCNV
22. Merge profile from a backup LPAR RTE profile.     KCIJPMCF
23. Validate PARMGEN profile parameter values.       KCIJPPVAL
24. Back-up WK* work user libraries.                 KCIJPCPW
25. Back-up RK* product execution user libraries.   KCIJPCPR
26. Recall migrated DEMO RTE datasets.               KCIJPHRC
27. Compare work and runtime user libraries.         KCIJPSPC
28. Empty runtime members in RK* user libraries.    KCIJPMTY
29. Copy WK*->RK* user libraries keeping EXCLUDE members. KCIJPW1R
30. Restore back-up user libs. to current set.      KCIJPB2R
31. Resolve system symbolics in PARMGEN jobs.       KCIJVSrv
32. Collect diagnostic information for this RTE.     KCIJPCOL
33. Delete RTE: DEMO                                KCIJPDEL
```

**Note:** Depending on your screen resolution, you might have to scroll down to see all the options on the panel. Look for **MORE+** on the screen, which indicates there are additional options.

This job compares all libraries with configurable members against working data sets and writes the results to data set `rte_plib_hilev.rte_name.WSUPERC` (for example, `TDXMP.HLQ.DEMO.WSUPERC`). The following comparisons are performed:

- RKANPARU compared with WKANPARU
  - RKANSAMU compared with WKANSAMU
  - RKANCMDU compared with WKANCMDU
  - RKD2PAR compared with WKD2PAR
  - RKD2PRF compared with WKD2PRF
  - RKD2SAM compared with WKD2SAM
2. Open data set `rte_plib_hilev.rte_name.WSUPERC` in view mode, and issue the following command to filter the results:

```
res; x all; hide x; f 'TOTAL CHANGES' all
```

This command helps you to quickly identify data sets and members that are impacted, as follows:

- If you find only 0 (zeros) before TOTAL CHANGES, your runtime environment is in sync with your PARMGEN parameters, and you do not need to perform any additional steps in this task.
- If there are changes, you will see the results similar to the following example and will need to continue with the task to rectify the differences::

```
107 NUMBER OF LINE MATCHES      0 TOTAL CHANGES (PAIRED+NONPAIRED CHNG)
5951 NUMBER OF LINE MATCHES     9 TOTAL CHANGES (PAIRED+NONPAIRED CHNG)
56072 NUMBER OF LINE MATCHES    0 TOTAL CHANGES (PAIRED+NONPAIRED CHNG)
```

3. Issue the following command to identify the data sets and members that are impacted by filtering the impacted members only:

```
res; x all; hide x; f R'NEW:..+([\ ])' all
```

This command produces a list of members that most likely were manually modified and should be fixed, as shown in the following example:

```
NEW: TDXMP.HLQ.DEMO.WKANPARU(KDSENV)    OLD: TDXMP.HLQ.DEMO.RKANPARU(KDSENV)
NEW: TDXMP.HLQ.DEMO.WKANPARU(KC5ENV)    OLD: TDXMP.HLQ.DEMO.RKANPARU(KC5ENV)
NEW: TDXMP.HLQ.DEMO.WKANPARU(KD5ENV)    OLD: TDXMP.HLQ.DEMO.RKANPARU(KD5ENV)
```

You now have a list of all members that are impacted and can start looking for parameters within your PARMGEN configuration that can fix those members, as described in the next section.

### Part II: Fix impacted members

After you have identified the differences that exist, you can start standardizing your configuration, as described in these steps.

4. Continue viewing data set `rte_plib_hilev.rte_name.WSUPERC`, as it contains all the information needed to identify manual modifications.
5. Perform the following steps for each of the impacted members:
  - a. Issue the following command to view the differences for a specific member, where the data set name and member are from the list of impacted members:

```
res; f 'NEW: TDXMP.HLQ.DEMO.WKANPARU(KDSENV)' all
```

**Note:** The string depends on the list produced in the previous steps.

The following example shows the result of the previous command. In this example, there are six lines that do not match in the KDSENV member.

**Note:** In this example, the first three differences can be rectified using standard parameters, which are described in the subsequent steps. The last three differences use embed overrides, which are described in the step in section [Embed overrides](#).

NEW: TDXMP.HLQ.DEMO.WKANPARU(KDSENV)  
TDXMP.HLQ.DEMO.RKANPARU(KDSENV)

OLD:

LISTING OUTPUT SECTION (LINE COMPARE)

```
ID          SOURCE LINES
  TYPE     LEN N-LN#  O-LN#
-----+-----1-----+-----2-----+-----3-----+-----4-----+-----5-----+-----6-----+-----7-----
+-----8-----

I - HTTP:1920 USE:Y \
D - HTTP:1921 USE:Y \

I - IP.PIPE PORT:1918 \
D - IP.PIPE PORT:11918 \

I - IP6.PIPE PORT:1918 \
D - IP6.PIPE PORT:11918 \

I - *KOE_MFSB_WUI=600
D - KOE_MFSB_WUI=600

I - *KOE_MFSB_MDI=18000
D - KOE_MFSB_MDI=18000

I - *KOE_MFSB_TBI=18000
D - KOE_MFSB_TBI=18000
```

- b. Address each of the differences individually, as follows.  
The following explanation uses the first identified difference as an example, where member WKANPARU(KDSENV) contains the original value of 1920 and the runtime member RKANPARU(KDSENV) has a different port value of 1921:

```
I - HTTP:1920 USE:Y \
D - HTTP:1921 USE:Y \
```

You can locate the parameter responsible for this line as follows:

- i. Open member `rte_plib_hilev.rte_name.WCONFIG(rte_name)`.
- ii. Use the following command to exclude all lines and find all occurrences of the value 1920. It is important to search for the original value from the WK\* libraries.

```
x all; hide x; f '1920' all
```

For this example, the result of the search is as follows:

```
KDS_TEMS_HTTP_PORT_NUM          1920      * HTTP port number
```

**Note:** If no results are found, the setting might be an embed override. See section [Embed overrides](#).

- iii. Review [IBM Documentation](#) for information about this parameter and to ensure it is correct.

**Tip:** You can use the search bar on the [IBM Documentation](#) landing page to locate information for the parameter by name. Note that some common parameters are documented using prefix *Kpp*, where *pp* is a placeholder for the product code. You can also use the links on page [OMEGAMON product codes and documentation](#) to navigate through the documentation for the various OMEGAMON products.

- iv. Change the value for the parameter (which, in this example, is from 1920 to 1921), and save the member.
- v. Repeat these steps for the next identified difference.
- c. Repeat these steps for the next member.

*Embed overrides*

If the identified difference is from an embed override, it cannot be rectified using standard parameters. The following example shows another identified difference in the KDSENV member, from the example in the previous steps:

```
I - *KOE_MFSB_WUI=600
D - KOE_MFSB_WUI=600
```

Because **KOE\_MFSB\_WUI** is not a standard parameter, the parameter cannot be located in the WCONFIG(*rte\_name*) member. Use the following steps to determine if this setting is controlled by an embed override member, and how to proceed if it is.

- 6. To rectify embed override settings:
  - a. Open the member that contains the identified difference. In this example, it is member WKANPARU(KDSENV).
  - b. Locate the parameter in the member. Typically, embed overrides are grouped together, as shown in the following example:

```
* *****
* USER SECTION: OVERRIDE FOR MEMBER WKANPARU(KDSENV)
* *****
. . . overrides are here . . .
*KOE_MFSB_WUI=600
** ----- END - USER SECTION: OVERRIDE ----- *
```

If you found your parameter within this code block, it means that you can control it using embed override members located in the *rte\_plib\_hilev.rte\_name*.WCONFIG data set. The embed member that is used to add user-defined parameters to WKANPARU(KDSENV) is WCONFIG(KDS\$PENV).

**Tip:** If you do not know the embed member name, you can find the location of the parameter setting using the **SRCHFOR** command against the WCONFIG data set, as shown in the following example:

```
srchfor KOE_MFSB_WUI
```

The results indicate the location of the parameter in the respective override embed member:

```

Menu  Functions  Confirm  Utilities  Help

VIEW          TDXMP.HLQ.DEMO.WCONFIG          String(s)
found
Command ==>          Scroll ==>
CSR
      Name      Prompt      Size  Created      Changed
ID
----- KDS$PENV *Found
----- KDS$PSYS

```

**Note:** For more information about using override embed members and the embed member names, see [“Override embed members” on page 417](#) and [“Customizing the override embed members” on page 471](#).

- c. Edit the override embed member, which in this example is `rte_plib_hilev.rte_name.WCONFIG(KDS$PENV)`, locate the parameter (`KOE_MFSB_WUI`), remove the asterisk from the first column, and save the member.

**Part III: Regenerate WK\* libraries**

After you have updated all the parameters and embed override members, you can proceed with the remaining steps. In this section, you use your updated parameters and embed overrides when regenerating the following working data sets:

- WKANPARU
- WKANSAMU
- WKANCMDU
- WKD2PAR
- WKD2PRF
- WKD2SAM

- 7. In PARMGEN, run the \$PARSE job, as follows:
  - a. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```

KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=DEMO.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

      Description                      Job Name  Status  Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1

1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type U or UTIL to access utility menu.

```

- b. Select option 1 to submit the composite job to regenerate all libraries.

**Note:** If you want to create (or re-create) only certain runtime members, press F5 for a menu of the individual jobs submitted by the composite job.

The \$PARSE job regenerates working data sets only, so it will not impact any of your running started tasks or other actively used data sets.

8. After the \$PARSE job is completed, go back to the first step, and compare your WK\* data sets against your RK\* data sets again.  
Repeat these steps until your WK\* libraries are exactly the same as your RK\* libraries.

## Completing the configuration outside the configuration software

You must take additional steps outside the configuration software to complete the configuration of your runtime environment, as described in this section.

### Before you begin

After you finish the configuration steps that are described in [“Configuration Manager” on page 214](#) or [“Parameter Generator \(PARMGEN\)” on page 413](#), you must take additional steps outside the configuration software to complete the configuration of your runtime environment. The steps that you are required to complete depend on the steps that you have already taken, the configuration options that you have chosen, and the components or products that you are configuring. Some of the steps are required and others are optional.

### About this task

Many of the steps required are the same for multiple products and can be completed all at one time for all the products. To help you configure your components correctly, work through the topics in this section in conjunction with the corresponding section within the product-specific planning and configuration guides.

**Note:** You can locate the product-specific content using the links provided in [“Complete the configuration for OMEGAMON monitoring agents and components” on page 556](#).

## APF-authorize the runtime load libraries

The runtime load libraries created by the configuration software must be added to your list of APF-authorized libraries.

### About this task

This step is applicable only if you did not enable the optional RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG parameter to generate inline APF-authorized statements in the product started tasks.

### Procedure

- Add the following runtime load libraries to your list of APF-authorized libraries.
  - *rhilev.rte.RKANMOD*
  - *rhilev.rte.RKANMODU*
  - *rhilev.rte.RKANMODL*
  - *rhilev.rte.RKANMODP*

You can run the following commands to do this:

```
*/commands to APF the needed libraries
SETPROG APF,ADD,DSNAME=&RHILEV..&SYS..RKANMOD,VOL(xxxxxx)
SETPROG APF,ADD,DSNAME=&RHILEV..&SYS..RKANMODU,VOL(xxxxxx)
SETPROG APF,ADD,DSNAME=&RHILEV..&SYS..RKANMODL,VOL(xxxxxx)
SETPROG APF,ADD,DSNAME=&RHILEV..&SYS..RKANMODP,VOL(xxxxxx)
```

Any other runtime libraries concatenated in the STEPLIB DDNAME or in the RKANMODL DDNAME of started tasks must also be APF-authorized.

If the runtime environment shares target libraries that were installed by SMP/E, you must also APF-authorize the following libraries:

- *thilev.TKANMOD*

- `thilev.TKANMODL`
- `thilev.TKANMODP`

## What to do next

Some monitoring agents require additional target libraries. Check the product-specific planning and configuration guides for a complete list of runtime libraries to include.

# Complete the configuration of a Tivoli Enterprise Monitoring Server

You must take a number of steps outside the configuration software to complete the configuration of a monitoring server.

## About this task

The following tasks are typically required for completing the configuration of a monitoring server.

1. If you have configured more than one hub monitoring server on z/OS®, you must refresh the KSHXHUBS member in other runtime environments. You can find this member in:

```
rHilev.rte.RKANPARU(KSHXHUBS)
```

2. For more information on starting/stopping the monitoring server, see [“Verifying that you can start and stop the monitoring server” on page 523](#).
3. If you want to enable IBM Z® NetView authorization of Take Action commands, see [“Configuring IBM Z NetView authorization of z/OS commands” on page 544](#).
4. If ICSF is not installed on the system: [“\(If applicable\) Editing the portal server environment file” on page 525](#).
5. If you want to enable event forwarding to Netcool/OMNIbus: [“\(Optional\) Enabling event forwarding” on page 526](#).

## Verifying that you can start and stop the monitoring server

At this point in the configuration, you can verify that the monitoring server can be started and stopped.

### Procedure

1. Start the hub monitoring server.  
If your hub is on a z/OS® system, start the monitoring server started task (by default, IBMDS):

```
S IBMDS
```

If your hub is on a distributed system, see the *IBM Tivoli Monitoring Installation and Setup Guide*.

2. If you have configured remote monitoring servers on z/OS®, start the started task for each server:

```
S IBMDS
```

3. In the RKLVLLOG for the monitoring server address space, look for the following messages to indicate successful startup:

```
KDSMA001 Tivoli Enterprise Monitoring Server (TEMS) data collection server started.
K04SRV032 Tivoli Enterprise Monitoring Server (TEMS) startup complete.
```

4. Look also for the following messages to indicate successful establishment of a communications path by the local location broker:

```
KDSNC007 Local Location Broker is active
KDSNC004 Bind of local location broker complete= protocol_name:address
```

If the monitoring server is a hub, additional messages indicate successful establishment of a communications path by the global location broker:

```
KDSNC004 Bind of global location broker complete= protocol_name:address
KDSNC005 Bind of global location broker complete at address protocol_name:address on
port number
KDSNC008 Global Location Broker is active
```

For a remote monitoring server, look for a message similar to this one to indicate a successful connection with the hub:

```
KDS9141I The TEMS RTEname:CMS is connected to the hub TEMS protocol_name:address
```

The number of messages depends on the number of protocols defined.

5. Stop the monitoring server started task:

```
P IBMDS
```

If you encounter problems starting or stopping the monitoring server, refer to [IBM Tivoli Monitoring: Troubleshooting Guide](#).

## (If applicable) Installing the tacmd CLI component

If needed, use this procedure to manually install the tacmd CLI component on a distributed platform.

### Before you begin

Some features and configuration options, such as self-describing agent (SDA) administration and importing and exporting situations, require access to the Tivoli administrative commands (tacmd) Command Line Interface (CLI).

The tacmd CLI is part of the Tivoli Enterprise Services User Interface extensions component of Tivoli Management Services, which must be installed on a distributed system. This component provides the ability to interact with a monitoring server and is available on the IBM® Tivoli Monitoring DVD image.

The interface is automatically installed if you install distributed components, such as a Tivoli Enterprise Monitoring Server, a Tivoli Enterprise Portal Server, or a Tivoli Enterprise Portal desktop client on a distributed system. It is not available on z/OS. If you do not want to install a monitoring server or a portal server on a distributed platform, but you do intend to use a feature that requires access to the tacmd CLI, you can install just the tacmd CLI component on at least one distributed platform. The system on which it is installed requires access via a SOA services connection to the hub monitoring server.

See the [IBM Tivoli Monitoring Command Reference](#) for information about tacmd CLI usage and parameters.

### About this task

Use the following procedure to install the tacmd CLI component on a distributed platform.

If your Tivoli Enterprise Monitoring Server resides on a z/OS system that is using multi-factor authentication (MFA), you must also make sure that the necessary maintenance has been installed on both the z/OS and distributed platforms, as described in the following procedure. Besides installing the necessary maintenance, no additional setup is needed for using the tacmd CLI in an MFA environment.

**Note:** For more information about MFA, see [Multi-Factor Authentication for z/OS](#).

### Procedure

1. If your Tivoli Enterprise Monitoring Server resides on a z/OS system that is using MFA, ensure that your environment has the necessary maintenance installed, as follows:
  - APAR OA62146 must be applied on the z/OS hub monitoring server.
  - IBM Tivoli Monitoring fix pack 6.3.0.7-TIV-ITM-SP0012 or later must be installed on the distributed platform. Installation-related instructions, prerequisites, and corequisites are provided in the [readme](#).

2. To install the tacmd CLI component from the IBM Tivoli Monitoring installation image, perform either of the following steps:
  - On Windows, on the **Select Products** window of the installer, select the **Tivoli Enterprise Services User Interface Extensions feature (KUE)** which appears under the **Tivoli Enterprise Monitoring Agents - TEMA feature**. When you select it, the prerequisite **Tivoli Enterprise Monitoring Agent Framework** is automatically selected.
  - On Linux or UNIX, select the **Tivoli Enterprise Services User Interface Extensions feature (KUE)** when prompted to choose which IBM Tivoli Monitoring components to install.
3. After selecting the required installation features, follow the installation program instructions to complete the install.

## (If applicable) Enabling granular control of SDA application support files

By default, granular control of self-describing agent (SDA) application support data is disabled on z/OS hub monitoring servers. To enable granular support, you must use the tacmd CLI to specify the products and versions for which data is to be installed.

### Before you begin

SDA administration requires access to the Tivoli administrative commands (tacmd) Command Line Interface (CLI) from a distributed platform, such as Windows, Unix or Linux. The tacmd CLI is a product component that is installed on a distributed system and allows interaction with the monitoring server. For more information about the tacmd CLI, see [“\(If applicable\) Installing the tacmd CLI component” on page 524](#).

### Procedure

- To enable granular control of application support for self-describing agents, issue one of the following commands using the tacmd CLI:
  - **tacmd addSdaInstallOptions** to specify the products and versions that the self-describing agent facility is allowed to install.
  - **tacmd editSdaInstallOptions -t DEFAULT -i ON** to allow installations for all products and versions without any blocking. (This setting is essentially the default self-describing agent behavior in V6.2.3 and V6.2.3 FP1.)

After modifying your installation options, you can use the **tacmd listSdaInstallOptions** command to display the current installation configurations for the hub monitoring server. You can use the **tacmd listappinstallrecs** command to monitor the application support installation records and the **tacmd listSdaStatus** command to monitor the self-describing enablement and suspend status for all monitoring servers in your environment.

## (If applicable) Editing the portal server environment file

Communication between a hub monitoring server and the Tivoli Enterprise Portal Server is encrypted. On the Tivoli Enterprise Portal Server, the Global Security Toolkit (GSKit) is used for encryption and decryption. On z/OS, GSKit is known as the Integrated Cryptographic Service Facility (ICSF). Because both components must use the same schema, if the hub system does not use ICSF, the portal server must be configured to use a less secure schema, EGG1.

### About this task

You configure the Tivoli Enterprise Portal Server to use the EGG1 scheme by editing the environment file (kfwenv).

### Procedure

1. On the Windows® or Linux® system where you have installed the portal server, launch the Manage Tivoli® Monitoring Services application.
2. In the application window, right-click **Tivoli Enterprise Portal Server**, and select **Advanced> Edit ENV File**.  
The environment file kfwenv is opened in a text editor.
3. Add the following line to the end of the file, and then save the file and close the editor.

```
USE_EGG1_FLAG=1
```

(or USE\_EGG1\_FLAG=Y)

4. Restart the Tivoli Enterprise Portal Server.

## (Optional) Enabling event forwarding

If you have configured a hub monitoring server on z/OS® to forward situation events to IBM® Tivoli® Netcool/OMNIbus, you must complete additional tasks for event forwarding to succeed.

### Before you begin

To perform this procedure, a Tivoli® Enterprise Portal Server or the Tivoli® Enterprise Services User Interface Extensions feature (KUE) must be installed on a Windows™, UNIX™, or Linux™ system.

### About this task

Perform the following steps to complete the enablement of event forwarding.

The [IBM Tivoli Monitoring: Installation and Setup Guide](#) provides detailed instructions for configuring OMNIbus servers to receive the situation events from the hub and for installing the event synchronization component that allows the servers to return updated status to the hub. The [IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide](#) explains how to use the Situation editor to specify event destinations and the severity of set situations.

### Procedure

1. Configure the destination event server or servers to receive the events.
2. Install a situation update forwarding process (the event synchronization component) on the event server or servers.
3. Use the `tacmd createEventDest` command to specify additional destination servers, if desired.
4. Use the Tivoli Enterprise Portal Situation editor to specify the following information:
  - the specific event servers to receive events (EIF receivers)
  - the event severity.
  - Specify which events are sent to which event servers.

## Adding application support to a monitoring server on z/OS®

**IMPORTANT:** *If your site has activated the self-describing agents capability at the hub monitoring server, it is not necessary to take any additional steps to add support for any agent that has the self-describing capability. You can skip this section.* However, if your site has agents reporting to the hub that do not have self-describing capability, or if you have not enabled the capability at the hub, you must install application support.

### About this task

Before you can view data collected by a monitoring agent, support for the agents must be added to the Tivoli Enterprise Portal Server, to the hub monitoring server, and in some cases, to a remote monitoring server.

Application support for a monitoring agent includes two types of files:

- **Catalog and attribute (CAT and ATR) files** are required for presenting workspaces, online help, and expert advice for the agent in Tivoli Enterprise Portal.
- **SQL files** are required for adding product-provided situations, templates, and policies to the Enterprise Information Base (EIB) tables maintained by the hub monitoring server. These SQL files are also called *seed data*, and installing them on a monitoring server is also called *seeding* the monitoring server.

**Important:** The catalog and attribute files for a monitoring agent must be added to a monitoring server on z/OS® *before* the SQL files can be added to that monitoring server.

The way you implement the application support requirements depends on your setup.

- If a monitoring agent and a monitoring server are installed in the same CSI, the catalog and attribute files are added automatically to the monitoring server when its runtime libraries are loaded.

**Tip:** A monitoring agent on z/OS® have additional requirements. See the configuration documentation for each monitoring agent product.

- If a monitoring agent and a monitoring server are installed in different CSIs, and if data collected by the monitoring agent will flow through the monitoring server, you must copy or transfer the catalog and attribute files (KppATR and KppCAT) from the *thilev.TKANDATV* library in the CSI where the monitoring agent is installed to the *rhilev.rte.RKANDATV* library for the runtime environment in which the monitoring server is configured.
- You add the catalog and attribute files for the Warehouse Proxy agent and for the Summarization and Pruning agent to the hub monitoring server on z/OS® from the Manage Tivoli Monitoring Services utility on a Windows®, Linux®, or UNIX® computer where a portal server is installed and where either the portal server or a monitoring server is configured to communicate with the hub on z/OS®.
- You add the SQL files for one monitoring agent or more, for the Warehouse Proxy agent, and for the Summarization and Pruning agent to the hub monitoring server on z/OS® from the Manage Tivoli Monitoring Services utility.
- If a distributed monitoring agent (a monitoring agent installed on a Windows®, Linux®, or UNIX® system) or a monitoring agent on a z/VM® system reports directly to a hub monitoring server on a z/OS® system, you must add both the catalog and attribute files and the SQL files to the hub on z/OS® from Manage Tivoli Monitoring Services.

This topics in this section provide instructions for adding application support to a monitoring server on z/OS®. For instructions on adding application support to a monitoring server on Windows®, Linux®, or UNIX®, see the *IBM Tivoli Monitoring: Installation and Setup Guide*.

## Prerequisites

Before you add application support to a monitoring server, you must complete certain prerequisite tasks.

- Verify that every monitoring agent for which you plan to add application support is compatible with the version 6.3.0 Fix Pack 2 or higher components of Tivoli Management Services. If you have any question about whether the components are compatible, see the planning information in the monitoring agent documentation or [Planning a first deployment](#).
- Install the distributed components of Tivoli Management Services (IBM Tivoli Monitoring). The procedures described in this chapter require that a portal server be installed on a Windows®, Linux®, or UNIX® system and that either the portal server or a monitoring server be configured to communicate with the hub on z/OS®. For instructions, see the *IBM Tivoli Monitoring: Installation and Setup Guide*.
- Install any distributed non-base monitoring agents that you have purchased. For instructions, see the documentation for each monitoring agent.
- Make sure you have access to the application support data files for every monitoring agent for which you plan to add application support.
  - Some monitoring agents that run on z/OS® or z/VM® are packaged with their own CD or DVD that contains the data files for adding application support to the monitoring server.
  - Other monitoring agents that run on z/OS® are packaged with a CD or DVD that contains application support data files for a number of agents.
  - Distributed agents (including the Warehouse Proxy agent and the Summarization and Pruning agent) already have the necessary application support files available on the appropriate system, if the agents are installed on a computer with a portal server installed and with either the portal server or a monitoring server configured to communicate with the hub on z/OS®.

**Tip:** During installation of the components of Tivoli Management Services (IBM Tivoli Monitoring) on a distributed system, you are prompted to add application support to the monitoring server. Select the option **On this computer** to add application support to the local monitoring server. Do *not* select the option **On a different computer** to add application support to the hub on z/OS® at this point.

- For a distributed agent installed on a computer on which no portal server is installed or on which neither the portal server nor a remote monitoring server is configured to communicate with the hub monitoring server on z/OS®, use the product CD or DVD to install the application support files on a different computer where a portal server is installed and where either the portal server or a remote monitoring server is configured to communicate with the hub monitoring server on z/OS®. For instructions, see the installation instructions in the monitoring agent library, or see the [IBM Tivoli Monitoring: Installation and Setup Guide](#).

To determine where application support files can be found for z/OS® monitoring agents and to ensure that you install application support for your monitoring agents in the correct order, see technote [Locating ITM Workspace Application Support Files for z/OS® Agents](https://www.ibm.com/support/pages/locating-itm-workspace-application-support-files-for-zos-agents) (<https://www.ibm.com/support/pages/locating-it-workspace-application-support-files-zos-agents>).

## Selecting the correct procedure

The procedure for adding application support to a monitoring server depends on your configuration. Some configurations, while supported, do not represent best practices and might not yield the best possible results in performance and reporting.

The best-practice configurations are identified in [“Procedures for adding application support to a monitoring server on z/OS®” on page 528](#). For more detailed information about best practices for configuring your monitoring environment, see [Planning a first deployment](#).

## About this task

Monitoring agent location	Best practice?	Follow these instructions
Same CSI as the hub or remote monitoring server on z/OS®	Yes	<ol style="list-style-type: none"> <li>1. Install the application support files on a distributed system where a portal server is installed and where either the portal server or a remote monitoring server is configured to communicate with the hub monitoring server on z/OS®. See <a href="#">“Install the application support files on a distributed system where a portal server is installed” on page 530</a>.</li> <li>2. Copy or transfer catalog and attribute files to the monitoring server on z/OS® for the Warehouse Proxy agent and the Summarization and Pruning agent, if you want to store long-term history data. See <a href="#">“Copy or transfer catalog and attribute files to the monitoring server on z/OS” on page 534</a>.</li> <li>3. Use Manage Tivoli® Monitoring Services to add application support SQL files to the hub monitoring server on z/OS®. See <a href="#">“Use Manage Tivoli Monitoring Services to add application support SQL files to the hub monitoring server on z/OS” on page 535</a>.</li> </ol>

Monitoring agent location	Best practice?	Follow these instructions
Different CSI from the hub or remote monitoring server on z/OS®	No	<ol style="list-style-type: none"> <li>1. Copy or transfer the monitoring agent's catalog and attribute files (<i>KppCAT</i> and <i>KppATR</i>) from the <i>thilev.TKANDATV</i> library in the CSI where the monitoring agent is installed to the <i>rhilev.rte.RKANDATV</i> library for the runtime environment in which the monitoring server is configured. You can use IEBCOPY or FTP file transfer.</li> <li>2. Install the application support files on a distributed system where a portal server is installed and where either the portal server or a remote monitoring server is configured to communicate with the hub monitoring server on z/OS®. See <a href="#">“Install the application support files on a distributed system where a portal server is installed” on page 530.</a></li> <li>3. Copy or transfer catalog and attribute files to the monitoring server on z/OS® for the Warehouse Proxy agent and the Summarization and Pruning agent, if you want to store long-term history data. See <a href="#">“Copy or transfer catalog and attribute files to the monitoring server on z/OS” on page 534.</a></li> <li>4. Use Manage Tivoli® Monitoring Services to add application support SQL files to the hub monitoring server on z/OS®. See <a href="#">“Use Manage Tivoli Monitoring Services to add application support SQL files to the hub monitoring server on z/OS” on page 535.</a></li> </ol>

The remaining topics in this section provide instructions for these carrying out these procedures.

**Tip:** Complete only the procedures that apply to your configuration. Use [“Procedures for adding application support to a monitoring server on z/OS®” on page 528](#) to determine which procedures you must complete, and complete them in the order indicated in the table.

## Install the application support files on a distributed system where a portal server is installed

This step involves installing the application support files on a Windows®, Linux®, or UNIX® system where a portal server is installed and where either the portal server or a remote monitoring server is configured to communicate with the hub monitoring server on z/OS®.

For base agents (distributed agents included in the purchase of IBM Tivoli Monitoring) and for other distributed agents installed on a system that meets these requirements, you can skip to [“Copy or transfer catalog and attribute files to the monitoring server on z/OS” on page 534.](#)

### About this task

Follow the instructions for installing the application support files on the appropriate system:

#### Installing application support files on Windows

### About this task

Following the correct order for installing application support files on Windows® is essential. To determine where application support files can be found and to ensure that you install application support for your monitoring agents in the correct order, see technote [Locating ITM Workspace Application Support Files for z/OS® Agents](https://www.ibm.com/support/pages/locating-it-workspace-application-support-files-zos-agents) (<https://www.ibm.com/support/pages/locating-it-workspace-application-support-files-zos-agents>).

To install the application support files on Windows®, follow this procedure:

### Procedure

1. Insert a CD or DVD containing the application support files into the CD-ROM drive of a Windows® workstation where a portal server is installed and where either the portal server or a remote monitoring server is configured to communicate with the hub monitoring server on z/OS®. (See [“Prerequisites” on page 527.](#))
  - Some monitoring agents that run on z/OS® or z/VM® are packaged with their own CD or DVD that contains the data files for adding application support to the monitoring server.

Other monitoring agents that run on z/OS® are packaged with a CD or DVD that contains data files for a number of agents.

If in doubt, refer to the configuration guide for each of your monitoring agents to find the exact name of the CD or DVD to use.

- For a distributed agent installed on a computer without a portal server or monitoring server configured to communicate with the hub on z/OS®, use the product CD or DVD to install the application support files on a different workstation where a portal server is installed and where either the portal server or a remote monitoring server is configured to communicate with the hub monitoring server on z/OS®. For instructions, see the installation instructions in the monitoring agent library, or see *IBM Tivoli Monitoring: Installation and Setup Guide*.

Installation begins automatically. If the installer does not start, go to the Windows® directory on your CD-ROM drive and run **setup.exe**. If **setup.exe** initialization fails, you might not have enough free disk space to extract the setup files.

2. Read the text that welcomes you to the installation, and click **Next** to continue.
3. On the Install Prerequisites window, check boxes are cleared if the required software is already installed. Otherwise, a message instructs you to install the required software.
4. Click **Next** to continue.
5. Read the software license agreement and click **Accept**.
6. On the Select Features window, expand **Tivoli Enterprise Portal Server** and **Tivoli Enterprise Portal Desktop Client** (and **Tivoli Enterprise Monitoring Server**, if it is installed on the Windows® workstation). For each component, select support for the monitoring agents you have installed on z/OS®.

**Tip:** The **Eclipse Help Server** component might be included in the list on the Select Features window. However, this component is not selectable because it does not require application support.

The rest of the instructions assume that you are installing application support on the portal server and desktop client.

7. Click **Next** to continue.
8. In the Current® Settings pane of the Start Copying Files window, read the list of actions to be performed, and click **Next**.  
A window notifies you that you will be unable to cancel the installation after this point, and asks whether you want to continue.
9. Click **Yes** to continue.  
Application support for the selected monitoring agents is installed on the portal server and desktop client. This installation step can take several minutes.
10. On the Setup Type window, select the following items:
  - Configure Tivoli Enterprise Portal
  - Launch Manage Tivoli® Monitoring Services for additional configuration options and to start Tivoli® Monitoring Services.
11. Click **Next** to continue.
12. On the TEPS Hostname window, make sure that the host name of the Tivoli Enterprise Portal Server is correct and does not include the domain name. Click **Next**.  
Presentation files for the Tivoli Enterprise Portal are built. This process can take up to 20 minutes.
13. On the InstallShield Wizard Complete window, click **Finish**.
14. Use Manage Tivoli Monitoring Services to copy catalog and attribute files and to add SQL files to the monitoring server on z/OS®. Follow the instructions in [“Transferring the catalog and attribute files from Windows” on page 534](#) and [“Adding application support SQL files from Manage Tivoli Monitoring Services on Windows” on page 536](#).

## Installing application support files on Linux® or UNIX®

### About this task

Installing application support on a Linux® or UNIX® system is a procedure with three iterations:

- Installing application support on the browser client component of the portal server.
- Installing application support on the portal server.
- Installing application support on the monitoring server (if a monitoring server is installed on the local Linux® or UNIX® system).

Application support can be installed on only one component at a time.

This procedure uses the command-line interface. For instructions on using the GUI interface or silent mode, see *IBM Tivoli Monitoring: Installation and Setup Guide*.

To install the application support files on Linux® or UNIX®, follow this procedure.

### Procedure

1. On a system where either a portal server or a remote monitoring server is configured to communicate with the hub monitoring server on z/OS®, run the following command from the application support installation media:

```
./install.sh
```

The installation media can be either the agent product CD or DVD for a distributed monitoring agent, or a data files CD or DVD for a monitoring agent that run on z/OS® or z/VM®. See “Prerequisites” on page 527.

2. When prompted for the IBM® Tivoli® Monitoring home directory, press Enter to accept the default (/opt/IBM/ITM) or type the full path to the installation directory you used. The installer presents a list of installation options:

```
Select one of the following:  
1) Install products to the local host.  
2) Install products to depot for remote deployment (requires TEMS).  
3) Install TEMS support for remote seeding  
4) Exit install.  
Please enter a valid number:
```

3. Enter 1 to start the installation. The software license agreement is displayed.
4. Review the license agreement, and then enter 1 to accept it.
5. Select the components on which you want to install application support. A list of available product packages is displayed:

```
Product packages are available for this operating system and component support categories:
```

```
1) IBM Tivoli Monitoring components for this operating system  
2) Tivoli Enterprise Portal Browser Client support  
3) Tivoli Enterprise Portal Server support  
4) Tivoli Enterprise Monitoring Server support  
5) Other operating systems
```

**Tip:** Tivoli Enterprise Portal Browser Client support is the component of Tivoli Enterprise Portal Server that supports presentation of the Tivoli Enterprise Portal for browser clients. You must install the browser client support on the computer where you installed the portal server.

6. If you have not already installed the Tivoli Management Services components on the current operating system, enter 1. Otherwise, select one of the components for installation of application support. Only one item can be selected at a time.
7. At the prompt for products to install, select and confirm either an individual monitoring agent or **all of the above**.

(Although the prompts seem to indicate that the monitoring agents themselves are being installed, only the application support files for the monitoring agents are actually being installed.)

```
The following products are available for installation:
1) monitoring_agent_1 Vnn.nn.nn.nn
2) monitoring_agent_2 Vnn.nn.nn.nn
3) all of the above

Type your selections here: 3
The following products will be installed:
  monitoring_agent_1 Vnn.nn.nn.nn
  monitoring_agent_2 Vnn.nn.nn.nn

Are your selections correct [ y or n; "y" is default ]?
... installing "monitoring_agent_1 Vnn.nn.nn.nn for Linux S390 R2.6 (32 bit)";
please wait.
... installing "monitoring_agent_2 Vnn.nn.nn.nn for Linux S390 R2.6 (32 bit)";
please wait.
```

8. Enter **y** at the next prompt:

```
Do you want to install additional products or product support packages [ y or n; "n"
is default ]?
```

9. Repeat the procedure to install browser client, portal server, and monitoring server (if a monitoring server is installed on the local system) support.  
Only one item can be installed at a time. For each item, select the same monitoring agent (product) to install.
10. After you have selected and installed application support for all installed components, enter **n** at the following prompt:

```
Do you want to install additional products or product support packages [ y or n; "n"
is default ]?
```

You are prompted to add application support to all locally installed components. For example, if there is a local monitoring server, you see a prompt similar to this one:

```
Following Tivoli Enterprise Monitoring Server product support were installed:
  monitoring_agent_1
  monitoring_agent_2

Note: This operation causes the monitoring server to restart.
Do you want to seed product support on the Tivoli Enterprise Monitoring Server?
[ 1=Yes, 2=No ; default is "1" ]
```

11. Enter **1** to add application support to the local monitoring server.  
The installer starts the monitoring server, adds application support, and stops the monitoring server; and repeats the procedure for each of the other components installed on the local system. This message indicates successful completion:

```
All supports successfully seeded.
```

12. Exit the installation program.
13. Stop the portal server and the portal client:

```
./itmcmd agent stop cq
./itmcmd agent stop cj
```

14. Reconfigure the portal server with the new agent information:

```
./itmcmd config -A cq
```

**Tip:** If you already configured the portal server after installing it, you can press Enter at each prompt to accept the previously entered parameters.

15. Reconfigure the portal client with the new agent information:

```
./itmcmd config -A cj
```

16. Restart the portal server and the portal client:

```
./itmcmd agent start cq  
./itmcmd agent start cj
```

17. Use Manage Tivoli Monitoring Services to copy catalog and attribute files and to add SQL files to the monitoring server on z/OS®. Follow the instructions in [“Transferring the catalog and attribute files from Linux or UNIX” on page 535](#) and [“Adding application support SQL files from Manage Tivoli Services on Linux or UNIX” on page 537](#).

## Copy or transfer catalog and attribute files to the monitoring server on z/OS®

### About this task

The requirements for catalog and attribute files depend on your setup.

- For monitoring agents in the same CSI with a monitoring server on z/OS®, catalog and attribute files are added automatically to the monitoring server when its runtime libraries are loaded. However, if you want to store long-term history data, you must still transfer catalog and attribute files to the monitoring server on z/OS® for the Warehouse Proxy agent and the Summarization and Pruning agent.
- For a monitoring agent that is not installed in the same CSI as a z/OS® monitoring server through which the agent's data flows, you must copy or transfer the agent's catalog and attribute files (*KppATR* and *KppCAT*) from the *thilev.TKANDATV* library in the CSI where the monitoring agent is installed to the *rhilev.rte.RKANDATV* library for the runtime environment in which the monitoring server is configured. You can use IEBCOPY or FTP file transfer to put the files into the *rhilev.rte.RKANDATV* data set.
- For distributed monitoring agents reporting to a monitoring server on z/OS®, you transfer catalog and attribute files to the monitoring server on z/OS® from Manage Tivoli Monitoring Services on a system where a portal server is installed and where either the portal server or a monitoring server is configured to communicate with the monitoring server on z/OS®.
- If you want to store long-term history data, you transfer catalog and attribute files for the Warehouse Proxy agent and the Summarization and Pruning agent to the hub monitoring server on z/OS® from Manage Tivoli Monitoring Services on a system where a portal server is installed and where either the portal server or a monitoring server is configured to communicate with the monitoring server on z/OS®.

The required catalog and attribute files were installed on a Windows®, Linux®, or UNIX® computer when you installed application support from the appropriate media. Follow the instructions for transferring the catalog and attribute files to a monitoring server on z/OS® from a system where the portal server is installed:

### Transferring the catalog and attribute files from Windows®

#### About this task

Complete this procedure to transfer the catalog and attribute files from Manage Tivoli® Monitoring Services on Windows®.

#### Procedure

1. On the Windows® workstation where you installed the application support data files and where the Tivoli Enterprise Portal Server is installed, select Start > Programs (or All Programs) > IBM Tivoli Monitoring > Manage Tivoli Monitoring Services.
2. On the Manage Tivoli Monitoring Services window, select **Actions > Advanced > Utilities > FTP Catalog and Attribute files**.
3. On the FTP Catalog and Attribute Files window, select the files you want to transfer, and click **OK**.
4. On the FTP TEMS Data to z/OS® window, provide the following information:
  - The fully qualified host name or the IP address of the monitoring server on z/OS®.
  - A valid FTP user ID and password.

- The fully qualified name of the *rhilev.rte.RKANDATV* data set (DSN).

**Important:** When you type the data set name, make sure that it does not end with a trailing blank, or the FTP will fail.

5. After you have completed these fields, click **OK** to transfer the files. Click **OK** again to confirm.
6. Stop and restart the monitoring server on z/OS®.

## What to do next

Go on to add SQL files to the hub on z/OS®. Follow the instructions in [“Adding application support SQL files from Manage Tivoli Monitoring Services on Windows”](#) on page 536.

## Transferring the catalog and attribute files from Linux® or UNIX®

### About this task

Complete this procedure to transfer the catalog and attribute files from Manage Tivoli Monitoring Services on a Linux® or UNIX® system where you have already installed the Tivoli Enterprise Portal Server and the application support files.

### Procedure

1. To start Manage Tivoli Monitoring Services, go to the ITM installation bin directory (example: `/opt/IBM/ITM/bin`) on the system where you installed the application support data files, and run this command:

```
./itmcmd manage &
```

A GUI window opens for Manage Tivoli® Monitoring Services.

2. Select **Actions > FTP Catalog and Attribute files**.
3. On the Select Attribute and Catalog Data for Transfer window, select the files you want to transfer, and click **OK**.
4. On the FTP TEMS Data to z/OS® window, provide the following information:
  - The fully qualified host name or the IP address of the monitoring server on z/OS®.
  - A valid FTP user ID and password.
  - The fully qualified name of the *rhilev.rte.RKANDATV* data set (DSN).

**Important:** When you type the data set name, make sure that it does not end with a trailing blank, or the FTP will fail.

5. After you have completed these fields, click **OK** to transfer the files.  
Look for this message in the log window of Manage Tivoli® Monitoring Services: Done sending files
6. Stop and restart the monitoring server on z/OS®.

## What to do next

Go on to add SQL files to the hub on z/OS®. Follow the instructions in [“Adding application support SQL files from Manage Tivoli Services on Linux or UNIX”](#) on page 537.

## Use Manage Tivoli® Monitoring Services to add application support SQL files to the hub monitoring server on z/OS®

### About this task

You can use Manage Tivoli Monitoring Services to add application support SQL files to the hub monitoring server on z/OS® from any Windows®, Linux®, or UNIX® system where a portal server or monitoring server has been

installed and configured to communicate with the hub. For a monitoring agent on z/OS® or z/VM®, the application support files must also have been installed from the appropriate data files CD or DVD.

For a monitoring agent on z/OS®, the application support SQL files are required on the hub monitoring server but not on a remote monitoring server. Plex agents are the exception: they require SQL files on any hub or remote monitoring server. However, SQL files for the plex agents are added automatically to each remote monitoring server on z/OS® when the agent is registered with the monitoring server, so you do not have to concern yourself with them.

To add application support SQL files to a hub monitoring server on z/OS® from Manage Tivoli Monitoring Services, follow the instructions for the operating system where you have installed the files:

## Adding application support SQL files from Manage Tivoli Monitoring Services on Windows®

### About this task

To add application support SQL files to the hub monitoring server on z/OS®, complete this procedure.

### Procedure

1. Ensure that the hub monitoring server is running.
2. On a Windows® workstation where the application support files are installed, select Start > Programs (or All Programs) > IBM Tivoli Monitoring > Manage Tivoli Monitoring Services.
3. On the Manage Tivoli Monitoring Services window, select **Actions > Advanced > Add TEMS application support**.
4. On the Add Application Support to the TEMS window, select On a different computer and click **OK**.
5. When you are prompted to ensure that the hub monitoring server is configured and running, click **OK**.
6. On the Non-Resident TEMS Connection window, provide the hub monitoring server TEMS name (node ID), specify that it is a hub, select the communication protocol to use in sending the application support SQL files to the hub, and provide any values required by the selected communication protocol. Then click **OK** to continue.

If you made a note of the TEMS name you specified when you defined the runtime environment, find it now. Otherwise, you can find the TEMS name as the case-sensitive value of the CMS\_NODEID environment variable in this location:

```
rhilev.rte.RKANPARU(KDSENV)
```

7. On the next panel, select the products for which you want to add application support. (If you want to collect historical data, be sure to select the Warehouse Proxy and Summarization and Pruning agents, in addition to any monitoring agents you have purchased.) Then specify whether you want to add the default managed system groups to situations when you process the application support files:

#### All

Add the default managed system groups to all applicable situations.

**Tip:** Make this selection if you have never customized situations from previous releases.

#### None

Do not add the default managed system groups to any situation.

**Tip:** Make this selection if you do not want any predefined managed system groups to be applied to your environment.

#### New

Add the default managed system groups to all situations from the application support packages being installed for the first time. Modifications are not made to managed system groups in previously upgraded application support packages.

**Tip:** Make this selection if you have customized situations from previous releases and you want to protect your customized settings, but you want to apply the predefined managed system groups to new situations.

Make a selection and click **OK**. The SQL application support files are added to the hub monitoring server. This process might take several minutes, depending on the number of products.

**Tip:** Not all situations support the default managed group setting. You might have to define the distribution of some situations later from the Tivoli Enterprise Portal. For more information about managed system groups, see the [IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide](#).

The Application Support Addition Complete window gives you information about the status and location of the SQL application support files. A return code of 0 (rc=0) indicates that the process succeeded.

8. Click **Save As** if you want to save the information in a text file. Click **Close** to close the window. If the Application Support Addition Complete window is not displayed after 20 minutes, look in the IBM\ITM\CNPS\Log\NonResSeed $pp$ .log files (where  $pp$  is the 2-character code for each monitoring agent) for diagnostic messages that help you determine the cause of the problem. See the [IBM Tivoli Monitoring: Messages Guide](#) and [IBM Tivoli Monitoring: Troubleshooting Guide](#) for information about messages and abnormal return codes.
9. Stop and restart the hub monitoring server.

## Adding application support SQL files from Manage Tivoli Services on Linux® or UNIX®

### About this task

To add application support SQL files to the hub monitoring server on z/OS®, complete this procedure.

### Procedure

1. Enable the GUI interface. Your Linux® or UNIX® environment might already have a GUI interface enabled. Otherwise, perform the following tasks to enable it:
  - a. Enable X11.
  - b. Make sure you have access to a native X-term monitor or an X Window System emulator.
  - c. If using an X Window System emulator, enable X11 access to the X Window System server (command example: `xhost +`).
  - d. If using an X Window System emulator, set the display environment variable to point to the X Window System server:

```
export DISPLAY=pc_ip_address:0
```

2. Ensure that the hub monitoring server on z/OS® is running.
3. To start Manage Tivoli Monitoring Services, go to the \$CANDLEHOME bin directory (example: `/opt/IBM/ITM/bin`) on the system where you installed the application support data files, and run this command:

```
./itmcmd manage &
```

A GUI window opens for Manage Tivoli® Monitoring Services.

4. Select **Actions > Install product support**.
5. On the Add Application Support to the TEMS window, select **On a different computer** and click **OK**.
6. When you are prompted to ensure that the hub monitoring server is configured and running, click **OK**.
7. On the Non-Resident TEMS Connection window, provide the hub monitoring server TEMS name (node ID), specify that it is a hub, select the communication protocol to use in sending the application support SQL files to the hub, and provide any values required by the selected communication protocol. Then click **OK** to continue.

If you made a note of the TEMS name you specified when you defined the runtime environment, find it now. Otherwise, you can find the TEMS name as the case-sensitive value of the CMS\_NODEID environment variable in this location:

```
rhilev.rte.RKANPARU(KDSENV)
```

- On the next panel, select the products for which you want to add application support. (If you want to collect historical data, be sure to select the Warehouse Proxy and Summarization and Pruning agents, in addition to any monitoring agents you have purchased.) Then specify whether you want to add the default managed system groups to situations when you process the application support files:

#### All

Add the default managed system groups to all applicable situations.

**Tip:** Make this selection if you have never customized situations from previous releases.

#### None

Do not add the default managed system groups to any situation.

**Tip:** Make this selection if you do not want any predefined managed system groups to be applied to your environment.

#### New

Add the default managed system groups to all situations from the application support packages being installed for the first time. Modifications are not made to managed system groups in previously upgraded application support packages.

**Tip:** Make this selection if you have customized situations from previous releases and you want to protect your customized settings, but you want to apply the predefined managed system groups to new situations.

Make a selection and click **OK**. The SQL application support files are added to the hub monitoring server. This process might take several minutes, depending on the number of products.

**Tip:** Not all situations support the default managed group setting. You might have to define the distribution of some situations later from the Tivoli Enterprise Portal. For more information about managed system groups, see the [IBM Tivoli Monitoring: Tivoli Enterprise Portal User's Guide](#).

- In Manage Tivoli® Monitoring Services, look for this message:

```
Remote seeding complete!
```

- Stop and restart the hub monitoring server.

## Configuring security on a monitoring server on z/OS®

Access to the Tivoli Enterprise Portal is controlled by user IDs defined to the Tivoli Enterprise Portal Server. If security verification is enabled on the hub Tivoli Enterprise Monitoring Server, passwords are also required.

### About this task

How security verification is controlled depends upon the operating system on which the hub is installed. A hub monitoring server running on z/OS® validates user IDs and passwords using either the product-provided security feature, Network Access Method (NAM), or one of several system authorization facility (SAF) products.

The monitoring server supports secure password encryption through the Integrated Cryptographic Service Facility (ICSF). The ICSF provides a robust encryption and decryption scheme for stored passwords and is the preferred method of password encryption. (If you do not use ICSF, the monitoring server uses a less secure encryption method.) ICSF uses symmetric secret keys for encrypting and decrypting data. For instructions on setting the password encryption key on a z/OS® monitor server with the PARMGEN method, see the comments in the KCIJVSEC (if system variables are enabled) or KCIJPSEC (if system variables are not enabled) member of the *rhilev.rte.WKANSAMU* library.

In addition to validating user IDs and passwords, a z/OS® monitoring server can be configured to redirect Take Action commands to IBM Z® NetView for authorization and execution. IBM Z® NetView uses the Tivoli Enterprise Portal user ID to check command authorization. If the user ID is authorized, the command is issued and the response is logged in the IBM Z® NetView log.

The topics in this section provide instructions for the following security configuration tasks. For information on setting up security on a hub on a distributed system, see [IBM Tivoli Monitoring: Installation and Setup Guide](#). Some monitoring agents might require additional security configuration; see the configuration documentation for the monitoring agent.

- [“Enabling security validation on a z/OS hub” on page 539](#)
- [“Resetting the password encryption key” on page 543](#)
- [“Configuring IBM Z NetView authorization of z/OS commands” on page 544](#)

## Enabling security validation on a z/OS® hub

If security validation is enabled on a z/OS® hub monitoring server, Tivoli Enterprise Portal user IDs and valid passwords must be defined to the security system used by the Tivoli Enterprise Monitoring Server.

A hub Tivoli Enterprise Monitoring Server running on z/OS® validates user IDs and passwords using either the product-provided security feature, Network Access Method (NAM), or one of the following system authorization facility products:

- RACF®
- CA-ACF2
- CA-TOP SECRET

### Before you begin

Before you enable security, your security administrator must define to the selected security system each logon ID that will be allowed to access the Tivoli Enterprise Portal Server, and the Tivoli Enterprise Portal administrator must create user accounts for those IDs. You do not have to define and authorize additional user IDs before you enable security, but you must define and authorize one administrative ID such as the `sysadmin` user ID.

**Tip:** To create additional user IDs after security validation is enabled, use one of the following methods:

- Create a new Tivoli Enterprise Portal user whose user ID matches a new or existing user defined to the security program. This is the preferred method.
- Define a Tivoli Enterprise Portal user ID to the security program.

### About this task

Complete the following steps to enable security on a z/OS® hub monitoring server:

#### Procedure

1. If you have not already done so, define the security system to be used.
  - a. In the runtime environment that contains the hub monitoring server, set the value of the **RTE\_SECURITY\_USER\_LOGON** parameter to specify the security system to be used for the runtime environment: RACF, ACF2, TSS, SAF, NAM, or NONE.
  - b. If you specified ACF2, provide the name of the ACF2 macro library as the value of the **GBL\_DSN\_ACF2\_MACLIB** parameter.
2. Enable security validation on the hub.

- a. Set the value of the **KDS\_TEMS\_SECURITY\_KDS\_VALIDATE** parameter to Y.
- b. Uncomment or add the **RTE\_SECURITY\_KAES256\_KEY** parameter, and either accept the IBM®-supplied default value "IBMTivoliMonitoringEncryptionKey" or specify a unique 32-byte password encryption key. The value is case-sensitive, and the same key must be used for all components that communicate with the hub.

**Tip:** The encryption key is shown in plain text in the configuration profile, so that the value can be used as input to create the KAES256 encryption key file. For this reason, ensure that the *rhilev.rte\_name.WCONFIG* library (for PARMGEN), or the RTEDEF (*rte\_name*) file (for Configuration Manager) is secured.

- c. Depending on whether you use PARMGEN or Configuration Manager, do the following:
    - For PARMGEN, run either the KCIJVSEC (if system variables are enabled) or KCIJPSEC (if system variables are not enabled) job in the *rhilev.rte\_name.WKANSAMU* library to create the security-related members of the runtime libraries. Alternatively, you can run the either the KCIJVSUB or KCIJPSUB composite job, which creates all the runtime members.
    - For Configuration Manager, use the GENERATE action to create the runtime members.
  - d. Set the **GBL\_DSN\_CSF\_SCSFMODO** parameter as described below:
    - For PARMGEN, this parameter can be found in WCONFIG(\$GBL\$USR).
    - For Configuration Manager, use or edit the RTEDEF(GBL\$PARM or GBL\$*par*) members as needed.
  - e. If you are enabling security after the RTE has already been configured, do one of the following:
    - For PARMGEN, recreate the runtime environment as described in [“Scenario RTE03: Changing parameters in an RTE” on page 844](#).
    - For Configuration Manager, use the GENERATE action to recreate the runtime environment.
3. Implement security, following the instructions in the appropriate section:
    - [“Implementing security with RACF” on page 540](#)
    - [“Implementing CA-ACF2 security” on page 541](#)
    - [“Implementing security with CA-TOP SECRET” on page 541](#)
  4. Verify that the user account you created can log on to the Tivoli Enterprise Portal.

### Implementing security with RACF®

To implement RACF® security after enabling security validation, recycle the monitoring server.

#### Procedure

1. If your Tivoli Enterprise Monitoring Server is running, stop it by entering:

```
P ccccccc
```

where ccccccc is the name of your monitoring server started task.

2. (Optional) If your site has a large numbers of users, you might have to increase the value assigned to the RESERVE parameter, which is **KDS\_X\_TEMS\_STORAGE\_RESERVE\_PRI**, of member KDSSYSIN in the *rhilev.rte.RKANPARU* library. After making a change, as usual, you will need to regenerate RKANPARU members accordingly.
3. Restart your Tivoli Enterprise Monitoring Server by entering the following command:

```
S ccccccc
```

where ccccccc is the name of your Tivoli Enterprise Monitoring Server started task.

## Implementing CA-ACF2 security

If you have enabled security on the hub and specified CA-ACF2 as the security system, you must take additional steps to implement it.

### About this task

Follow these steps to install an exit for CA-AF2 security validation.

### Procedure

1. If your Tivoli Enterprise Monitoring Server is running, stop it by entering the following command:

```
P cccccccc
```

where cccccccc is the name of your Tivoli Enterprise Monitoring Server started task.

2. Follow the instructions in KLVA2NEV to assemble and link KLVA2NEV. Change the -RHILEV- and -THILEV- variables as directed.  
Member KLVA2NEV in *thilev*.TKANSAM is the product-supplied interface to CA-ACF2. The product-supplied member KLV@ASM, in *rhilev.rte*.RKANSAMU (for PARMGEN) or *rPlibHilev.rte\_name*.SECEXITS (for Configuration Manager), contains sample assembly JCL. This gets assembled into the runtime environment-specific *rhilev.rte*.RKANMODU data set (for PARMGEN) and *rhilev.rte\_name*.SECEXITS (for Configuration Manager) by running the respective jobs (for PARMGEN) or GENERATE action (for Configuration Manager).
3. Define the Tivoli Enterprise Monitoring Server started task as a MUSASS to CA-ACF2:
  - a. Log on to TSO. At the READY prompt, type ACF and press Enter.
  - b. At the ACF prompt, type SET LID and press Enter.
  - c. At the LID prompt, type the following commands:

```
CH cccccccc MUSASS
```

where cccccccc is the name of the Tivoli Enterprise Monitoring Server started task.

- d. Press Enter.
- e. At the LID prompt, type END and press Enter.

If your site has a large numbers of users, you might have to increase the value assigned to the RESERVE parameter, which is **KDS\_X\_TEMS\_STORAGE\_RESERVE\_PRI**, of member KDSSYSIN in the *rhilev.rte*.RKANPARU library. After making a change, as usual, you will need to regenerate RKANPARU members accordingly. However, do this with **extreme caution** as this member is not normally altered in any way.

4. Restart your Tivoli Enterprise Monitoring Server by entering the following command:

```
S cccccccc
```

where cccccccc is the name of your Tivoli Enterprise Monitoring Server started task.

## Implementing security with CA-TOP SECRET

If you have enabled security on the hub and specified CA-TOP SECRET as the security system, you must take additional steps to implement it.

### About this task

Follow these steps to implement CA-TOP SECRET security.

1. If your Tivoli Enterprise Monitoring Server is running, stop it by entering:

```
P cccccccc
```

where cccccccc is the name of the monitoring server started task.

2. Define the monitoring server as a started task in the STC record and relate it to a master facility accessor identifier. For example:

```
TSS ADD(STC) PROC(ccccccc) ACID(master_facility_acid)
```

where *ccccccc* is the name of your monitoring server started task. The value for *master\_facility\_acid* can be the same as *ccccccc*.

3. Define the name of your Tivoli Enterprise Monitoring Server started task as a FACILITY in the CA-TOP SECRET Facility Matrix Table. Set the SIGN parameter as SIGN(M) and set MODE to MODE=FAIL. Make sure the name of your Tivoli Enterprise Monitoring Server started task and the FACILITY name match. **Example:** This example shows FACILITY statements for a site that uses CA-TOP SECRET. Some statements might not be relevant to your site or might require modification to fit the standards and configuration of your site.

```
FACILITY(USER3=NAME=task)
FACILITY(task=MODE=FAIL,ACTIVE,SHRPRF)
FACILITY(task=PGM=KLV,NOASUBM,NOABEND,NOXDEF)
FACILITY(task=ID=3,MULTIUSER,RES,WARNPW,SIGN(M))
FACILITY(task=NOINSTDATA,NORNDPW,AUTHINIT,NOPROMPT,NOAUDIT,NOMRO)
FACILITY(task=NOTSOC,LOG(INIT,SMF,MSG,SEC9))
```

4. Restart your Tivoli Enterprise Monitoring Server by entering:

```
S cccccc
```

where *ccccccc* is the name of your Tivoli Enterprise Monitoring Server started task.

## Implementing security with Network Access Method (NAM)

As an alternative to third-party security packages, you can use the product-provided security feature NAM (Network Access Method) to secure your Tivoli Enterprise Monitoring Server. However, be aware that this is a less secure method than using one of the three security packages.

### About this task

NAM user IDs are 1 to 8 characters in length and are not case-sensitive.

You can enable NAM from the system console, using the MVS™ MODIFY command. Instructions are given in the following topics.

Adding users to NAM

### About this task

Follow these steps to add users to NAM from the z/OS® system console.

### Procedure

1. Access the z/OS® system console.
2. Define a password for each user who will access the Tivoli Enterprise Portal:

```
F cccccc,NAM SET userid PASSWORD=password
```

where *ccccccc* is the name of your Tivoli Enterprise Monitoring Server started task, *userid* is the user ID, and *password* is the NAM password you want to define for that user

Adding a user ID password file to NAM

### About this task

If you are defining passwords for a large number of users, you might want to use the following procedure to set up a file containing all your NAM SET statements and execute the file once to define all passwords.

### Procedure

1. Access *rhilev.rte.RKANCMU* and create member *userid*s.

2. Edit *userid*s, and populate it with a NAM SET command for each user who will access your Tivoli Enterprise Monitoring Server.

Example:

```
NAM SET userid1 PASSWORD=password1
NAM SET userid2 PASSWORD=password2
NAM SET userid3 PASSWORD=password3
```

**Note:** Make sure there is sufficient security on the *rhilev.rte.RKANCMDU* library, as it now contains sensitive information. Also, be careful to ensure that the "userid" file is managed properly to avoid deletion by mistake (i.e. backup etc.), as this file is not part of the member generation process of the respective configuration method.

3. To execute member *userid*s, enter this command from the z/OS® system console:

```
F ccccccc,userid
```

where *ccccccc* is the name of your Tivoli Enterprise Monitoring Server started task.

## Changing the security system specification

### About this task

When you create the runtime members for the hub Tivoli Enterprise Monitoring Server, appropriate parameters are generated for the security system that you selected.

If you must convert to another security system, change the security system specification in the RTE configuration profile (**RTE\_SECURITY\_USER\_LOGON**). For the change to take effect, you must recreate the runtime members for the monitoring server before you recycle the monitoring server started task. For Configuration Manager, use the GENERATE action to recreate the runtime members. For PARMGEN, use the \$PARSE or \$PARSESV (if variables are enabled) composite job.

## Resetting the password encryption key

### About this task

The Integrated Cryptographic Services Facility (ICSF) uses a symmetric key to encrypt and decrypt data. The key is known as symmetric because the same key is used to transform plain text to cipher text (encryption) as is used to transform cipher text back to plain text (decryption). The configuration process creates a key file named KAES256 in *rhilev.rte\_name.RKANPARU* and loads the encrypted key into it.

The same key must be used on all Tivoli Management Services components in your enterprise. For example, the encryption key you set for the Tivoli Enterprise Portal must be the same value you specify for the encryption key for the hub monitoring server, and the key you set for each of the remote monitoring servers that connect to the hub must also have the same value. If you reset the key for one component, you must reset it for all of them.

The encryption key has the following characteristics:

- The key must be 32 bytes in length.
- The key is case-sensitive.
- The key cannot contain an ampersand (&) value.

If you change the encryption key on any component, you must change the key to the same value on all components that connect to the same hub.

## Procedure

1. When using Configuration Manager for the configuration of the hub runtime environment (RTE), make any additions or changes in RTEDEF(*rte\_name*) by adding or changing the RTE\_SECURITY\_KAES256KEY accordingly. When using PARMGEN for the configuration of the hub runtime environment (RTE), set the RTE\_SECURITY\_KAES256\_KEY parameter to the new value of choice as shown below:

```

000591 ** -----
000592 ** (Required) KAES256 encryption key:
...
...
000617 ** -----
000618 RTE_SECURITY_KAES256_KEY      "IBMTivoliMonitoringEncryptionKey"
000619
000620 ** -----

```

2. *When using Configuration Manager*, simply run the GENERATE action. *When using PARMGEN*, rerun the \$PARSE or \$PARSESV (if variables are enabled) composite job. The PARMGEN composite Jobs recreate the following members:

#### **WKANSAMU(KDSDKAES)**

Stand-alone Tivoli Management Services on z/OS password encryption job, if you want a sample job that you can edit manually.

#### **WKANSAMU(KCIJPSEC)**

Composite security job's KAES256 step, if you want a file-tailored job.

#### **WKANSAMU(IBMDS)**

Monitoring server started task to concatenate the ICSF load library in the STEPLIB DDNAME. IBMDS is the IBM®-supplied default; set the value to whatever you specified for the **KDS\_TEMS\_STC** parameter.

#### **WKANSAMU(KDSDKAES) or WKANSAMU(KCIJPSEC)**

Creates the encryption key member.

#### **WKANPARU(KAES256) or WKANSAMU(KCISYPJB)**

Run either WKANPARU(KAES256), the stand-alone started task procedure copy job, or WKANSAMU(KCIJPSYS), the composite system copy job that copies the modified monitoring server started task to the system procedure library.

3. *When using Configuration Manager*, simply run the GENERATE action again to refresh the required members. *When using PARMGEN*, resubmit the WKANSAMU(KDSDKAES) job to refresh the WKANPARU(KAES256) member.
4. Adjust the Tivoli Enterprise Portal Server to also use the same password encryption key (the same key must be used across your enterprise).
5. Recycle the Tivoli Enterprise Monitoring Server started task.

## **Configuring IBM Z® NetView authorization of z/OS® commands**

z/OS system commands issued from the Tivoli Enterprise Portal using Take Action commands, whether issued by a user or triggered by situations or policies, run without any authorization or audit trail. However, you can configure a monitoring server or monitoring agent address space to redirect z/OS® Take Action commands to IBM Z® NetView through the Program to Program Interface (PPI). Take Action commands issued in NetView® make full System Authorization Facility (SAF) calls for authorization. NetView® uses the Tivoli Enterprise Portal user ID to determine the NetView® operator on which the command authorization is performed. If command authorization passes, the command is executed on the NetView® operator. Messages are written to the NetView® log to provide an audit trail of the commands and the users that issued them.

### **About this task**

If you enable NetView® command authorization on the monitoring server, you must also enable NetView® to execute the commands.

Command authorization for the system commands uses the Tivoli Enterprise Portal user ID, which is passed to the NetView® program with the command. The user ID passed on a Take Action command determines the user ID that issues the command. The user ID passed when a command is driven from a situation is the user ID that last edited the situation. Only the user ID is used for command authorization. Password validation is not performed.

Take Action forwarding requires NetView® V5.3 (or V5.2 with APAR OA18449 applied) or later.

To set up NetView® for Take Action commands, complete the following steps:

1. “[Configure the monitoring server to forward Take Action commands](#)” on page 545.
2. “[Enable IBM Z NetView to authorize Take Action commands](#)” on page 545

**Note:** Some agents provide their own Take Action commands, known as *agent commands*. Agent commands have a 2-character prefix, such as *pp*: (where *pp* is the product code). These commands are not sent to the NetView® program for command authorization and execution. An example of an agent that provides agent commands is IBM® OMEGAMON® for Messaging on z/OS®.

## Configure the monitoring server to forward Take Action commands

### Procedure

- To configure Take Action command forwarding, set the parameters as shown.
  - **PARMGEN method:** In the configuration file for the runtime environment, uncomment the KDS\_PPI\_RECEIVER and KDS\_PPI\_SENDER parameters, and either accept the default values or specify your own values.
  - **Configuration Manager method:** Add the above two parameters to the RTEDEF(KDS\$PARM or KDS\$*par*) member and accept the defaults as documented or specify your own values.

### What to do next

Complete the configuration according to the scenario you are performing:

- **PARMGEN method:** For example, if you are enabling the forwarding of Take Action commands as part of configuring a runtime environment, complete the appropriate steps following the [SMPE01](#) scenario. If you are updating an existing configuration, see scenario [RTE03](#).
- **Configuration Manager method:** Run the GENERATE action on the respective RTE.

## Enable IBM Z® NetView to authorize Take Action commands

### About this task

In addition to configuring Tivoli Enterprise Monitoring Server address spaces to forward z/OS® Take Action commands to IBM Z® NetView, you must also enable NetView® to receive and execute the commands. NetView® does command authorization as part of the execution.

To enable execution of forwarded commands, complete the following steps:

**Note:**

1. If a NetView® operator ID exists that matches a Tivoli Enterprise Portal user ID, the command will be executed on the existing NetView® operator ID, if appropriate command authorization exists.
2. Be careful about mapping a Tivoli Enterprise Portal user ID to a NetView® operator ID that is used to log on to a 3270 terminal. The Take Action command might be run on an active NetView® operator with unwanted results. Mapping Tivoli Enterprise Portal user IDs to NetView® autotasks is preferable.

### Procedure

1. Define Tivoli Enterprise Portal user IDs to NetView®. To define a user ID to NetView®, perform one or more of the following actions:
  - Create a new Tivoli Enterprise Portal user ID that matches a new or existing NetView® operator ID.
  - Define an existing Tivoli Enterprise Portal user ID as a NetView® operator ID.
  - Map the TEP user ID to a valid NetView® operator ID by using the NACMD.OPID.TEPLogonid CNMSTYLE statement.

See *CNMSTYLE Initialization Statements* in *IBM Z® NetView Administration Reference* for more information on the NACMD.OPID statement. For information on defining user IDs, see [Defining Tivoli® Enterprise Portal User IDs](#) in the *IBM Z® NetView Security Reference*.

2. Perform one of the following actions:

- Define the NetView® PPI receiver in the NetView® DSIPARM member CNMSTYLE (see the following figure).

```
*****
*      Tivoli Management Services infrastructure server      *
*      *   *
* Uncomment the following (and, optionally, supply preferred OPID) to *
* initialize support for commands and messages from Tivoli Management *
* Services infrastructure and/or other APF authorized clients. See *
* command help for APSERV for information about the function and *
* clients depending on it. *
* * * * *
*****
function.autotask.APSERV = AUTOTMSI
*
AUTOTASK.?APSERV.Console = *NONE* //
AUTOTASK.?APSERV.InitCmd = APSERV CNMPCMDR
```

Figure 87: CNMSTYLE member after editing

Follow the instructions in the member. The PPI receiver for APSERV will be started during NetView® initialization.

After editing, the member should look like the following figure:

```
*****
*      Tivoli Management Services infrastructure server      *
*      *   *
* Uncomment the following (and, optionally, supply preferred OPID) to *
* initialize support for commands and messages from Tivoli Management *
* Services infrastructure and/or other APF authorized clients. See *
* command help for APSERV for information about the function and *
* clients depending on it. *
* * * * *
*****
function.autotask.APSERV = AUTOTMSI
*
AUTOTASK.?APSERV.Console = *NONE* //
AUTOTASK.?APSERV.InitCmd = APSERV CNMPCMDR
```

Figure 88: CNMSTYLE member after editing

- If you do not customize CNMSTYLE to define the receiver, start the NetView® PPI receiver manually by issuing the APSERV command.  
The APSERV command is a command server that runs on a NetView® autotask or on a virtual OST (VOST). APSERV accepts commands or messages from APF authorized programs only. The APSERV command must be running, whether started during NetView® initialization or manually, to receive the system commands from the TEMS and agent. Refer to the NetView® online help or to the *IBM Z® NetView Application Programmer's Guide* for more information on the APSERV command.
3. Verify that the IBM Z® NetView Subsystem Address Space is active with the PPI enabled. The PPI is enabled by specifying the PPIOPT keyword in sample procedure CNMSJ010 (CNMPSSI), located in the NetView® CNMSAMP data set.

### Verifying the configuration

#### About this task

Complete the following steps to verify the configuration.

#### Procedure

1. If you defined new IBM Z® NetView operator IDs, refresh NetView® operator ID definitions.
2. If you did not complete Step 2 under [“Enable IBM Z NetView to authorize Take Action commands” on page 545](#), issue the APSERV command on a NetView® autotask or VOST.

This step must be completed before monitoring server and agent system commands can successfully be sent to the NetView® program.

3. If you completed Step 2 under [“Enable IBM Z NetView to authorize Take Action commands” on page 545](#), recycle NetView® to start APSERV during NetView® initialization.
4. Restart the monitoring server and agents.
5. Using a Tivoli Enterprise Portal client, complete one of the following steps:
  - Issue an existing Take Action command.
  - Create a new Take Action command and issue it.

If the command executes successfully, you will see messages in the NetView® log. For example: If your Take Action command is D T, you will see messages similar to the following:

```
AUTOTMSI IBMUSER 13:34:21 | BNH806I TAKE ACTION COMMAND 'MVS D T (00000003) '  
RECEIVED FOR TASK SYSADMIN  
  
SYSADMIN IBMN3 13:34:21 * MVS D T  
  
SYSADMIN NTVAF 13:34:21 E IEE136I LOCAL: TIME=13.34.21 DATE=2008.233 GMT:  
TIME=18.34.21 DATE=2008.233
```

## Troubleshooting tips

### About this task

If you encounter problems using the security solution, use the following information to troubleshoot:

- Review your monitoring server or agent RKLVLOG and IBM Z® NetView log for error messages.
- If you see either of the following symptoms, the NetView® CNMLINK data set has not been concatenated as part of the monitoring server or monitoring agent RKANMODL DD statement in the startup procedure:
  - A return code of 17 in the Action Status pop-up window after a Take Action command is issued
  - A message in the RKLVLOG stating “NetView interface module unavailable: CNMCNETV”
- If you see any of the following symptoms, the NetView® APSERV command is not running:
  - A message in RKLVLOG, stating “NetView PPI send buffer rejected: 26”
  - A return code of 9 in the Action Status pop-up window after a Take Action command is issued
  - Message KRAIRA002 in RKLVLOG, similar to "KRAIRA002, Executed <DA,L> with status 9, Producer(Automation Command)
- If you see “NetView PPI send buffer rejected: 24” in the RKLVLOG, the NetView® Subsystem Interface is not active.
- If you see “NetView PPI send buffer rejected: 28” in the RKLVLOG, the Program-to-Program Interface has not been enabled.

## Enable RACF® authorization of Take Action commands

As of fix pack 1 for IBM Tivoli Monitoring Version 6.2.3, all z/OS® Take Action commands issued by the OMEGAMON agents, plus any other agents based on the Tivoli Management Services framework that run on z/OS®, can now be associated with the Tivoli Enterprise Portal user ID instead of the user ID of the started task running the agent. Using the user ID allows you to authorize the use of Take Action commands by individual portal server users while restricting it from others. You can secure these user IDs (or the RACF® groups they are in) using standard security objects provided by your site's security product. For RACF®, these are the OPERCMDS facility class and its profiles.

**Note:** This enhancement does not alter the existing behavior of the following commands:

- Prefix-style Take Action commands such as those issued by OMEGAMON for CICS and prefixed with **CP:**. These are still secured by the agent-specific security profiles set up for that purpose.

- Commands already protected by the OMEGAMON® NetView® Take Action command security facility.
- Commands issued by either the OMEGAMON® classic interfaces or the OMEGAMON® CUA interfaces and covered by their command security.

## Before you begin

Before activating this feature, you also must ensure that every Tivoli Enterprise Portal user ID (and the RACF® groups that contain it) that either manually invokes Take Action commands or indirectly invokes them via situations or policies are connected to the appropriate RACF® OPERCMDS profiles. Otherwise, RACF® may fail some of your z/OS® Take Action commands.

If your Tivoli Enterprise Portal user IDs are not currently set up in RACF® (for example, if you're using distributed LDAP to authenticate your site's Tivoli Enterprise Portal user IDs), you must either:

- Add your Tivoli Enterprise Portal user IDs to RACF®, and connect them to the appropriate OPERCMDS profiles.
- Use the user ID mapping capability (as described in [“Setting up the user ID mapping capability” on page 548](#)) to map Tivoli Enterprise Portal user IDs to new or existing RACF® user IDs that you will connect to the appropriate OPERCMDS profiles.

## About this task

As initially installed, z/OS® Take Action commands are associated with the user ID of the agent started task (the previous behavior). Use the following procedure to take advantage of the new security behavior for all agents in a particular runtime environment.

All successful and failed command executions create entries in the console log. The agent also creates audit records for all automation command actions. On z/OS®, these audit records are written to the SMF audit repository (as described in [Auditing](#)).

1. The user ID that last updated an enterprise situation or a policy is the user ID that gets authenticated for the Take Action command associated with the situation or policy.
2. The user ID defined in the <LSTUSRPRF> segment for a private situation is the user ID that gets authenticated for the Take Action command associated with the situation. If the segment is not defined, the default user ID is **AGENTCFG**.

## Procedure

1. Create a new member called KGLUMAP in your RKANPARU data set.
2. Add at least a one-line comment such as the following to the new member:

```
* z/OS Take Action commands now secured
```

This turns on the new security feature so that all z/OS® Take Action commands issued by all agents in this runtime environment will be associated with the Tivoli Enterprise Portal user ID instead of the started task user ID.

3. To revert to the old behavior of using the user ID of the started task as the issuer of the z/OS® commands for a particular agent (while retaining the new behavior for other agents), place the following line in the appropriate KxxENV member in RKANPARU, where xx is the two-character agent identifier:

```
KGL_COMMAND_AUTHOR_SECURITY_REQUIRED=N
```

## Setting up the user ID mapping capability

Instead of adding Tivoli Enterprise Portal user IDs to RACF, you can use the user ID mapping capability to map the IDs to new or existing RACF® user IDs that you will connect to the appropriate OPERCMDS profiles.

## About this task

**Important:** When creating member KGLUMAP in the RKANPARU data set, measures must be in place to secure the KGLUMAP member and also to back it up. If not, the PARMGEN reload jobs or the Configuration Manager GENERATE actions could remove this member.

## Procedure

- To map Tivoli Enterprise Portal user IDs to new or existing RACF® user IDs for Take Action validation, create member KGLUMAP in the RKANPARU data set, and add to it one or more one-line mappings of this form:

```
tepuser1 racfuser1
tepuser2 racfuser2
tepuser3 racfuser3
```

where *tepuser* is the 1- to 10-character Tivoli Enterprise Portal user ID, and *racfuser* is the 1- to 8-character RACF® user ID. The *tepuser* field (but only that field) allows a trailing \* to indicate a wildcard, as in these examples:

```
tepuser* racfuserA
sys* racfuserB
```

Note that no TSO or OMVS segments are required for any new RACF® user IDs you choose, since they will not be used to actually log on to z/OS®. Instead, they are used only for authorization against the OPERCMDS facility profiles.

## Configuring Take Action command access using SAF profiles

Configure Take Action command access using SAF profiles.

Take Action commands can be issued from the Tivoli Enterprise Portal and the OMEGAMON enhanced 3270 user interface. Users must be authorized to issue these commands.

System authorization facility (SAF) profiles can be used to define Take Action command authorization and access settings. This option provides centralized control to Take Action command access by a security administrator.

**Note:** Take Action command authorization and access can also be controlled by settings in the KGLUMAP, KGLCMAP and KppINNAM members and various environmental variables. Using these settings, any user that has update access for the KGLUMAP, KGLCMAP and KppINNAM members can manage access for Take Action commands. When using SAF profiles to define Take Action command authorization and access settings, if duplicate settings exist, the settings defined by SAF profiles are used, overriding any others.

The following tasks describe how to implement Take Action command authorization and access using SAF profiles. It is recommended that a security administrator perform these tasks.

- [“Define user access to Take Action commands using SAF profiles” on page 549](#)
- [“Define Take Action environment variables using SAF profiles” on page 552](#)
- [“Define Take Action command security settings using SAF profiles” on page 553](#)

## Define user access to Take Action commands using SAF profiles

Configure Take Action command authorization and access using SAF profiles.

### Before you begin

The use of SAF profiles for controlling Take Action command authorization and access is optional. Using SAF profiles for this purpose requires a SAF general resource class named \$KOBSEC. If resource class \$KOBSEC does not exist, it must be defined. For more information, see [“Define a SAF general resource class for securing access to OMEGAMON resources” on page 566](#).

**Note:** The OMEGAMON® enhanced 3270 user interface (enhanced 3270UI) and TEMS REST services also use the SAF interface for securing access to resources. For the enhanced 3270UI, the SAF general resource class name is customizable and specified in parameter **RTE\_SECURITY\_CLASS**. For TEMS REST services, the class name must also be \$KOBSEC.

#### About this task

The purpose of this task is to provide secure access to Take Action commands by controlling authorization and access settings using SAF profiles. Take Action commands can be associated with Tivoli Enterprise Portal user IDs instead of the user ID of the started task by mapping the IDs, and granular access to specific Take Action commands by individual users can be established.

Securing Take Action command authorization and access using SAF profiles requires the creation of the following profiles, where *smfid* is the name of the LPAR and *stc* is the name of the started task:

#### ***smfid.stc.KGLUMAP.\****

This generic profile and related discrete profiles are used to associate Take Action command security with the Tivoli Enterprise Portal user ID instead of the user ID of the started task running the agent. Using the user ID allows you to authorize the use of Take Action commands by individual users while restricting it from others.

#### ***smfid.stc.KGLCMAP.\****

This generic profile and related discrete profiles are used for Take Action command authorization management. You can authorize the use of specific Take Action commands by individual users while restricting it from others.

**Important:** To successfully implement this feature, you must define both profiles.

**Note:** Take Action command authorization and access can also be controlled using settings in the KGLUMAP and KGLCMAP members in the RKANPARU data set, as described in [“Enable RACF authorization of Take Action commands” on page 547](#). When using the settings in the KGLUMAP and KGLCMAP members to manage Take Action command access, any user that has update access to the members can control the command access, whereas with SAF profiles, managed access can be more centralized and limited. When using SAF profiles to define Take Action command authorization and access settings, if duplicate settings exist, the settings defined by SAF profiles are used, and the settings in the KGLUMAP and KGLCMAP members are ignored.

To secure Take Action commands using SAF profiles, complete the following procedure, which consists of these steps:

1. [Map user IDs using SAF profiles.](#)
2. [Define command access using SAF profiles.](#)

#### Procedure

**Important:** To successfully implement this feature, you must complete both procedures.

#### ***Map user IDs using SAF profiles***

Perform the following steps to associate user IDs to Take Action commands instead of the user ID of the started task running the agent:

1. Create the following profile in the RACF security class \$KOBSEC, and ensure the started task owner ID has READ access to the profile:

```
smfid.stc.KGLUMAP.*
```

Where *smfid* is the name of the LPAR and *stc* is the name of the started task.

2. To map Tivoli Enterprise Portal user IDs to RACF user IDs for Take Action validation:
  - a. Create generic or discrete profiles, as follows:
    - `smfid.stc.KGLUMAP.*`
    - `smfid.stc.KGLUMAP.tep_userid`
    - `smfid.stc.KGLUMAP.tep_userid_prefix*`

Where *smfid* is the LPAR name and *stc* is the started task name.

- b. Within the profile, use the APPLDATA field to specify the RACF user ID to which the Tivoli Enterprise Portal user ID is mapped.

#### Examples:

In the following example, *smfid* is the LPAR name, *stc* is the started task name, and the started task user ID does not have access to the profile:

- Generic profile `smfid.stc.KGLUMAP.*` with UACC(NONE) and empty APPLDATA (no mapping of user IDs) exists, no discrete profiles are defined, and the started task user ID does not have access to this profile. As a result, all Take Action commands are denied.

In the following examples, *smfid* is the LPAR name, *stc* is the started task name, and the started task user ID has READ access to the profile:

- Generic profile `smfid.stc.KGLUMAP.*` with empty APPLDATA (no mapping of user IDs) exists and no discrete profiles are defined. In this example, any Tivoli Enterprise Portal user can create Take Action commands running under the same authority (that is, the Tivoli Enterprise Portal user ID is not mapped).
- Generic profile `smfid.stc.KGLUMAP.*` with APPLDATA set to `RACF_userid` exists. In this example, all Tivoli Enterprise Portal user IDs are mapped to a single RACF user ID. Any Tivoli Enterprise Portal user can create Take Action commands running under the specified RACF user ID authority.
- Discrete profile `smfid.stc.KGLUMAP.tep_userid` with empty APPLDATA (no mapping of user IDs) exists. In this example, a particular Tivoli Enterprise Portal user can create Take Action commands running under the same authority (that is, the Tivoli Enterprise Portal user ID is not mapped to a RACF user ID).
- Discrete profile `smfid.stc.KGLUMAP.tep_userid` with APPLDATA set to `RACF_userid` exists. In this example, a particular Tivoli Enterprise Portal user can create Take Action commands running under the specified RACF user ID authority. This is because the Tivoli Enterprise Portal user ID is mapped to a RACF user ID.
- Generic profile `smfid.stc.KGLUMAP.tep_userid_prefix*` with APPLDATA set to `RACF_userid` exists. In this example, a group of Tivoli Enterprise Portal users can create Take Action commands running under the specified RACF user ID authority. This is because the Tivoli Enterprise Portal user IDs that match the specified prefix (`tep_userid_prefix*`) are mapped to the RACF user ID.

#### Define command access using SAF profiles

Perform the following steps to authorize user IDs for individual Take Action commands:

1. Create the following profile in the RACF security class \$KOBSEC, and ensure the started task owner ID has READ access to the profile:

```
smfid.stc.KGLCMAP.*
```

Where *smfid* is the name of the LPAR and *stc* is the name of the started task.

2. To authorize specific Take Action commands, for each command:
  - a. Create a discrete profile using the following format:

```
smfid.stc.KGLCMAP.take_action_command
```

Where *smfid* is the LPAR name, *stc* is the started task name, and *take\_action\_command* is the name of a specific Take Action command.

- b. Assign READ access to this profile for each user that should have access to this command.

### Examples:

In the following examples, *smfid* is the LPAR name and *stc* is the started task name:

- Generic profile *smfid.stc.KGLCMAP.\** does not exist. In this example, all Take Action commands are denied.
- Generic profile *smfid.stc.KGLCMAP.\** with UACC(NONE) exists, and no discrete profiles are defined. In this example, all Take Action commands are denied.
- Generic profile *smfid.stc.KGLCMAP.\** with UACC(READ) exists, and no discrete profiles are defined. In this example, any Take Action command can be run.
- Generic profile *smfid.stc.KGLCMAP.\** with UACC(NONE) exists, and no discrete profiles are defined. Any mapped user with READ access can run any Take Action command.
- Generic profile *smfid.stc.KGLCMAP.\** with UACC(NONE) exists, and discrete profile *smfid.stc.KGLCMAP.take\_action\_command* with UACC(READ) is also defined. In this example, any mapped user can run the Take Action command specified in the discrete profile.
- Generic profile *smfid.stc.KGLCMAP.\** with UACC(NONE) exists, and discrete profile *smfid.stc.KGLCMAP.take\_action\_command* is also defined. In this example, any mapped user that has READ access to the discrete profile can run the specified Take Action command.

## Define Take Action environment variables using SAF profiles

Configure environment variables for Take Action command authorization and access using SAF profiles.

### Before you begin

The use of SAF profiles for controlling Take Action command authorization and access is optional. Using SAF profiles for this purpose requires a SAF general resource class named \$KOBSEC. If resource class \$KOBSEC does not exist, it must be defined. For more information, see [“Define a SAF general resource class for securing access to OMEGAMON resources” on page 566](#).

**Note:** The OMEGAMON® enhanced 3270 user interface (enhanced 3270UI) and TEMS REST services also use the SAF interface for securing access to resources. For the enhanced 3270UI, the SAF general resource class name is customizable and specified in parameter **RTE\_SECURITY\_CLASS**. For TEMS REST services, the class name must also be \$KOBSEC.

### About this task

The following environment variables specify security settings that are used for Take Action command authorization and access:

- SOAP\_IS\_SECURE
- CMS\_VALIDATE
- KDS\_VALIDATE
- RTE\_SECURITY\_CLASS

These parameters can be set using SAF profiles, which ensures that the parameter settings are checked and enforced.

Setting the values of any of these variables using SAF profiles is optional. If these variables are set using SAF profiles, any duplicate settings of these variables are ignored.

Perform the following procedure to optionally set any of these variables with a SAF profile.

### Procedure

1. To set the value of one of the supported environment variables with a SAF profile, do the following steps:
  - a. Create a profile in the RACF security class \$KOBSEC using the following format:

```
smfid.stc.environment_variable_name
```

Where *smfid* is the name of the LPAR and *stc* is the name of the started task.

- b. Within the profile, use the APPLDATA field to specify the value of the environment variable.
2. If any variable is present in the *rHilev.ret\_name*.RKANPARU(KppENV) member, it can also be overridden by an SAF profile. If the profile is present, the value for the variable will be taken from the profile APPLDATA.

## Define Take Action command security settings using SAF profiles

Configure the **FOLD** and **CNTRLPT** (control point) security parameters for Take Action command authorization and access using SAF profiles.

### Before you begin

Review the following information:

- Security parameters **FOLD** and **CNTRLPT** are used for Take Action command authorization and access.
- In addition to using the SAF interface to set the **FOLD** and **CNTRLPT** parameters, you can also configure these parameters in the *rHilev.rte\_name*.RKANPARU(KppINNAM) member. If you use SAF profiles to set the **FOLD** and **CNTRLPT** parameters, duplicate settings in the KppINNAM members are ignored.
- Of the Take Action command security settings, only the **FOLD** and **CNTRLPT** parameters can be configured using SAF profiles. All other parameters (for example, parameters **DATA** or **VALIDATE**) are taken from the KppINNAM member.
- The use of SAF profiles for setting the **FOLD** and **CNTRLPT** parameters is optional. Using SAF profiles for this purpose requires a SAF general resource class named \$KOBSEC. If resource class \$KOBSEC does not exist, it must be defined. For more information, see [“Define a SAF general resource class for securing access to OMEGAMON resources”](#) on page 566.

**Note:** The OMEGAMON® enhanced 3270 user interface (enhanced 3270UI) and TEMS REST services also use the SAF interface for securing access to resources. For the enhanced 3270UI, the SAF general resource class name is customizable and specified in parameter **RTE\_SECURITY\_CLASS**. For TEMS REST services, the class name must also be \$KOBSEC.

### About this task

To set the **FOLD** and **CNTRLPT** parameters using the SAF interface, you must define the following profiles in SAF general resource class \$KOBSEC:

- *smfid.stc*.KLVINNAM.FOLD
- *smfid.stc*.KLVINNAM.CNTRLPT $xx$

Where *smfid* is the name of the LPAR, *stc* is the name of the started task, and  $xx$  is 01 - 99.

The **APPLDATA** field is then used to define the parameter values, respectively.

**Important:** To successfully implement this feature, you must define both profiles. If the profile for the **FOLD** parameter does not exist, the profile for the **CNTRLPT** parameter is ignored.

To set the **FOLD** and **CNTRLPT** values using SAF profiles, complete the following procedure.

### Procedure

1. Define the **FOLD** parameter, as follows:
  - a. Create the following profile in the RACF security class \$KOBSEC:

```
smfid.stc.KLVINNAM.FOLD
```

Where *smfid* is the name of the LPAR and *stc* is the name of the started task.

- b. Within the profile, use the **APPLDATA** field to specify the value of the **FOLD** parameter.
2. Perform the following steps for each control point to define:
    - a. Create the following profile in the RACF security class \$KOBSEC:

```
smfid.stc.KLVINNAM.CNTRLPTxx
```

Where *smfid* is the name of the LPAR, *stc* is the name of the started task, and *xx* is 01 - 99. For multiple control points, *xx* must be a consecutive integer value starting with 01 and not omitting any numbers.

- b. Within the profile, use the **APPLDATA** field to specify control point keywords, where *xx* is 01 - 99.

## Example

For example, creating profile *smfid.stc*.KLVINNAM.FOLD in \$KOBSEC security class with APPLDATA YES and creating profile *smfid.stc*.KLVINNAM.CNTRLPT01 in \$KOBSEC security class with **APPLDATA** containing DEFAULT APPL(CANDLE) SAF NORACF will override the settings in the KDSINNAM member:

```
FOLD(NO)
DEFAULT APPL(CANDLE) -
DSNAME(ite.RKDSNAM) -
NOSAF -
NORACF -
NODB
```

## Complete the configuration for the OMEGAMON® subsystem

Tasks described in this section are required to complete the configuration of the OMEGAMON® subsystem. This component is not used by all OMEGAMON® monitoring agents.

### Before you begin

Check whether the OMEGAMON® subsystem has already been defined to z/OS®.

For example, issue the following **DISPLAY MVS™** system command to list subsystems:

```
D SSI
```

The default name of the OMEGAMON® subsystem is CNDL.

### About this task

This subsystem is required if you have configured any of the following OMEGAMON® monitoring agents in the runtime environment:

- IBM Z® OMEGAMON® for CICS® (optional)
- IBM® OMEGAMON for IMS® on z/OS®
- IBM® OMEGAMON for Storage on z/OS®
- IBM® OMEGAMON for z/OS®

You must define the OMEGAMON® subsystem on each LPAR where you plan to start runtime environments that contain any of these monitoring agents.

When you create a runtime environment that contains one of these monitoring agents, the generated runtime members include a started task that starts the OMEGAMON® subsystem.

Optionally, you can configure your LPAR to start the OMEGAMON® subsystem whenever z/OS® restarts (IPL).

For Configuration Manager steps, refer to [“Defining the OMEGAMON subsystem to z/OS” on page 221](#). For PARMGEN steps, see below.

### Procedure

- Update the IEFSSN*xx* member of the SYS1.PARMLIB.

Create a subsystem ID entry in the appropriate PARMLIB IEFSSN $\alpha\alpha$  member. The default subsystem name generated by the configuration methods is CNDL. The default started task name is IBMCN, so an example of the SSN entry would be as follows:

```
SUBSYS SUBNAME(CNDL) INITRTN(KCNDLINT) INITPARM('SSPROC=IBMCN')
```

In addition to identifying the OMEGAMON® subsystem to the z/OS® system, this example causes an automatic start of the subsystem address space. If you do not want the subsystem started at IPL, the entry would be the following:

```
SUBSYS SUBNAME(CNDL) INITRTN(KCNDLINT)
```

**Tip:** Use the  $\alpha\alpha\alpha\alpha$ STRT member to start all configured products in the order that they should be started.

- Copy the OMEGAMON® subsystem started task (default: IBMCN) from the RKANSAMU library (PARMGEN) or *rPlibHilev.SYS1.PROCLIB* library (Configuration Manager) to PROCLIB. You can change the name of this JCL procedure to any name that meets the installation standards of your site. However, do not use the name of the OMEGAMON® subsystem (subsystem ID) as the name of your JCL procedure.
- Copy the KCNDLINT load module to an appropriate library in the LINKLIST. Follow the installation standards at your site in making the decision about an appropriate library.

## Use the RESTART parameter

The optional RESTART parameter forces the subsystem to complete initialization by passing checks designed to prevent the start of a second address space.

### About this task

The RESTART parameter requires the FORCE operand, as in this example:

```
START IBMCN,RST=' ',RESTART=FORCE'
```

You can stop the subsystem by issuing the z/OS® STOP command, as in this example:

```
STOP IBMCN
```

#### Important:

Use the RESTART parameter only if the subsystem address space ends abnormally and subsequent attempts to start the subsystem result in the CNDL018I message; this message indicates that the subsystem is already active. Verify that the subsystem address space named in the CNDL018I message is not active before using the RESTART parameter. If the RESTART parameter is used when the subsystem is already active, results are unpredictable. You must restart the subsystem to pick up any maintenance that was installed.

The OMEGAMON® subsystem cannot be executed as a batch job; it must be invoked as a started task.

## Verify the OMEGAMON® subsystem installation

To verify a first-time installation, either issue the z/OS® SETSSI command, or perform an IPL.

### About this task

If an IPL is performed, the SYSLOG contains the CNDL184I message, informing you that the OMEGAMON® subsystem initialization routine has completed. If the message is not displayed after an IPL, check your update to the IEFSSN $\alpha\alpha$  member of SYS1.PARMLIB.

If you chose automatic startup of the OMEGAMON® subsystem address space, the following messages are displayed: CNDL001, CNDL190I, CNDL034I, and CNDL027I. If the keyword parameter form of the IEFSSNxxx PARMLIB member was used, you can choose to issue the SETSSI command to define the subsystem (rather than IPL). If you choose to use the SETSSI command, or if you did not choose automatic startup at IPL, you can issue the MVS START command to start the subsystem. The following messages are displayed: CNDL001I, CNDL190I, CNDL034I, and CNDL027I.

## Complete the configuration for OMEGAMON® monitoring agents and components

Before you verify your configuration in the runtime environment, make sure you have completed all the required steps for the individual OMEGAMON monitoring agents and components.

Use this topic to locate information for completing the configuration for individual OMEGAMON products and components. The following table lists the individual OMEGAMON products and components with links to information about completing the configuration. Use this information in conjunction with the steps for multiple products in the section “Completing the configuration outside the configuration software” on page 522.

Type of subsystem monitored	Monitoring agent or component	Latest version	Links
CICS	<a href="#">IBM Z® OMEGAMON for CICS®</a>	5.6.0	<a href="#">Completing the configuration</a>
CICS	<a href="#">IBM Z® OMEGAMON® AI for CICS 6.1</a>	6.1.0	<a href="#">Completing the configuration</a>

## Install language support

If you want the Tivoli Enterprise Portal user interface, online help, and expert advice for your products to be displayed in a language other than English, you must also add *language support* to the portal server.

### About this task

For instructions on adding language support, see the [IBM Tivoli Monitoring: Installation and Setup Guide](#).

## Verify the configuration

After completing the post configuration tasks described in this section, you are ready to confirm that the products and components can run and communicate with each other.

### Procedure

1. If you have not already done so, run the configuration verification job KCIJPVAL in each runtime environment to confirm that all the required data sets, members, and configuration jobs were created, and that the jobs completed successfully. If the configuration verification report shows that a required item is missing or that a job failed, repeat the necessary configuration steps.
2. After you have verified all runtime environments, validate the operation of all components and the communication between them as follows:

<i>Table 62: Validation of the runtime environment</i>	
Configuration method	Steps
<p>If you used the Configuration Manager or the PARMGEN configuration method, a job containing all the tasks configured within the runtime environment is available to use. Complete the adjacent steps.</p>	<ol style="list-style-type: none"> <li>a. If your hub is on a distributed system or another runtime environment, start it. For more information, see the <a href="#">IBM Tivoli Monitoring: Installation and Setup Guide</a>.</li> <li>b. Run the composite job to start all tasks within this runtime environment: <div style="background-color: #f0f0f0; padding: 5px; margin: 5px 0;"> <pre>/s xxxxSTRT</pre> </div> <p>where xxxx= %RTE_STC_PREFIX% (The PARMGEN default is IBM®.)</p> <div style="border: 1px solid #0070c0; padding: 5px; margin: 5px 0;"> <p><b>Note:</b> An equivalent xxxxSTOP job is generated for stopping all tasks within the runtime environment.</p> </div> </li> <li>c. In the RKLVLOG for each monitoring agent address space, look for the messages that indicate successful startup. Also look for messages indicating that the monitoring agents or remote monitoring server have successfully connected to the hub, if applicable. Consult the product-specific Planning and Configuration guides for more information.</li> <li>d. If you have enabled the self-describing agent feature, check the status of the self-describing agent application support at the hub monitoring server log, monitoring agent logs and finally any remote agent logs to ensure that the self-describing agent process has completed. For more information, see the <a href="#">IBM Tivoli Monitoring: Installation and Setup Guide</a>.</li> </ol>

3. Ensure that data collected by the monitoring agents is available on the user interface that you have chosen to use as follows:

Table 63: Data validation on user interfaces	
User interface	Steps
OMEGAMON® enhanced 3270 user interface	<p>a. If you have not already done so, start the OMEGAMON® enhanced 3270 user interface address space:</p> <pre style="background-color: #f0f0f0; padding: 5px;">/S IBMTOM</pre> <p>b. Check the SYSPRINT of the OMEGAMON® enhanced 3270 user interface and look for the messages that indicate a successful startup. The following message accompanied by no error messages indicates the completion of the OMEGAMON® enhanced 3270 user interface startup process:</p> <pre style="background-color: #f0f0f0; padding: 5px;">KOBGM0058I: Registry Refresh statistics:</pre> <p>c. Log on to the OMEGAMON® enhanced 3270 user interface and check that the initial workspace panels contain data sourced from the monitoring agents within this runtime environment.</p>
Tivoli Enterprise Portal	<p>a. On a distributed system, start the Tivoli Enterprise Portal Server and client.</p> <p>b. Log on to the Tivoli Enterprise Portal client. When the Tivoli Enterprise Portal starts, check for the managed system name that you have configured (listed under the z/OS® Systems entry in the Physical Navigator tree).</p>

**Note:** If you encounter problems, see the [IBM Tivoli Monitoring: Troubleshooting Guide](#) and the troubleshooting guide for each of your monitoring agents.

## Enable security

After you have established that your new runtime environment is configured correctly, you can safely enable the required level of security on each of the components within your runtime environment.

### About this task

Review the following list for guidance:

- If you are using mixed-case passwords, password phrase (passphrase) values, or multi-factor authentication (MFA), review possible additional configuration in [“OMEGAMON user authentication \(passwords, password phrases, and MFA\)”](#) on page 559.
- If you are using the OMEGAMON® enhanced 3270 user interface to view data, you can configure authorization by following the steps described in [“Enable security for the OMEGAMON enhanced 3270 user interface”](#) on page 564.
- If you are using the Tivoli Enterprise Portal to view data, you can create user accounts that authorize users to view the monitored data and enable authentication of those accounts by enabling security through the hub monitoring server or through the portal server. For instructions on enabling authentication on a hub monitoring server on Windows, Linux™ and UNIX™ operating systems, see the [IBM Tivoli Monitoring: Administrator's Guide](#). For instructions on enabling authentication on a hub monitoring server on z/OS® systems, see [“Configuring security on a monitoring server on z/OS”](#) on page 538.
- If you are using Tivoli Enterprise Monitoring Server (TEMS) REST services, you can enable security by following the steps described in [“Securing TEMS REST services”](#) on page 1081.

- If you intend to use the OMEGAMON® 3270 Classic interface for a monitoring agent, review security considerations in [OMEGAMON 3270 Classic interface security](#). Also, see the product-specific planning and configuration guide for each agent.
- If you use the SAF general resource class \$KOBSEC for security for any of your components, review [“Using SAF general resource class \\$KOBSEC” on page 560](#).
- If you intend to use autonomous agents on a z/OS® system and the ICSF subsystem is available on the z/OS® system, you can enable SNMP V3 passwords. For more information, see [“Enabling SNMP V3 passwords for autonomous agents” on page 563](#).

## OMEGAMON user authentication (passwords, password phrases, and MFA)

You can use a password, a password phrase (passphrase), and multi-factor authentication (MFA) to log on securely to an OMEGAMON product or component.

A password is a traditional one to eight character alphanumeric value. A password phrase is a character string that consists of mixed-case letters, numbers, and special characters including blanks. MFA is an authentication method that typically requires a six-digit volatile numeric token that is paired with a password or passphrase value.

Depending on the OMEGAMON component and the authentication method you choose to use, some additional configuration might be necessary, especially if you are moving from traditional passwords to more secure methods. This topic provides general information about some of the considerations and configuration steps that might be required.

**Note:** Support for mixed-case passwords on your system requires activation of the SETROPTS PASSWORD(MIXEDCASE) option in RACF®.

### Allowing mixed-case values in Tivoli Management Services

By default, the TMS:Engine folds password and passphrase values to uppercase. To use mixed-case password or passphrase values with certain OMEGAMON products and components, you must allow mixed-case values by disabling the folding of these values to uppercase. This behavior is controlled using the **RTE\_SECURITY\_FOLD\_PASSWORD\_FLAG** parameter. The default setting for this parameter is Y, which folds the password and passphrase values to uppercase. To use mixed-case password or passphrase values, you must change this setting to N, which disables the folding of the value to uppercase, allowing mixed-case values to persist.

Use of the **RTE\_SECURITY\_FOLD\_PASSWORD\_FLAG** parameter affects the following components:

- Tivoli Enterprise Monitoring Server
- Tivoli Enterprise Portal
- Tivoli Enterprise Monitoring Server (TEMS) REST services
- OMEGAMON enhanced 3270 user interface (passwords only)

**Note:** See the following section, [OMEGAMON enhanced 3270 user interface](#), for details about using passphrase with this interface.

- OMEGAMON Classic 3270 interface (passwords only)

**Note:** See the later section, [OMEGAMON Classic 3270 interface](#), for details about using passphrase with this interface.

### OMEGAMON enhanced 3270 user interface

By default, the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) is configured to use traditional passwords in uppercase, and mixed-case passphrase and multi-factor authentication values. To use mixed-

case passwords (eight characters or less), parameter `RTE_SECURITY_FOLD_PASSWORD_FLAG` must be set to N.

For more information, see the **Passphrase and MFA (KOBHLPPM)** topic in the online help in the product.

**Note:** Parameter `RTE_SECURITY_FOLD_PASSWORD_FLAG` does not impact passphrase values for the OMEGAMON enhanced 3270UI.

### OMEGAMON Classic 3270 interface

By default, the OMEGAMON 3270 Classic interface is configured to use traditional passwords in uppercase. To use mixed-case passwords (eight characters or less), parameter `RTE_SECURITY_FOLD_PASSWORD_FLAG` must be set to N.

To use passphrase values and multi-factor authentication for the OMEGAMON 3270 Classic interface, you must configure your product to enable support. Multiple passphrase configuration options are available that affect the length of the passphrase that is supported on a single line and the layout of the logon screen. For more information, see [OMEGAMON 3270 Classic interface security](#) and “[How to: Configure passphrase and MFA support in the OMEGAMON 3270 Classic interface](#)” on page 362.

**Note:** Parameter `RTE_SECURITY_FOLD_PASSWORD_FLAG` does not impact passphrase values for the OMEGAMON 3270 Classic interface.

**Note:** If you will be using passphrase values and MFA with the OMEGAMON 3270 Classic interface, OMEGAMON uses the System Authorization Facility (SAF) interface (which is used to implement external security) without the use of external security exits.

### Using SAF general resource class \$KOBSEC

You can use the SAF general resource class named \$KOBSEC to secure access to resources for multiple product components.

Various Tivoli® Management Services on z/OS® and OMEGAMON components use (or can use) the system authorization facility (SAF) interface to implement security. By using SAF, you can centrally control access to z/OS resources (such as data sets and commands) and access to OMEGAMON resources (such as situations, Take Action commands, and user interface elements).

Security is enabled by specifying the name of a SAF general resource class and defining resource profiles to control access. When using the SAF interface to secure TEMS REST services or control access to Take Action commands for all of the TEMS, the SAF general resource class must be named \$KOBSEC. When using the SAF interface for securing the OMEGAMON® enhanced 3270 user interface (enhanced 3270UI), you can optionally use the \$KOBSEC class. If you use the class \$KOBSEC for the enhanced 3270UI, it is possible for the resource profiles to overlap.

The following sections provide an overview of the resource profiles that are used for securing the resources for these components and considerations when using the \$KOBSEC general resource class.

### Protected resources

The following table summarizes the resources for which access can be controlled by the SAF interface for these components:

- [TEMS REST services](#)

- [OMEGAMON® enhanced 3270 user interface](#)
- [TEMS Take Action commands](#)

**Note:** For more information about any of the resources in the table, use the link provided in the *Resource description* column.

Table 64: Protected resources			
Component	Resource description	Resource pattern	Resource class
TEMS REST services	<a href="#">Collection data requested with GET /data</a>	<i>Kpp.node_name.table_name</i>	\$KOBSEC
TEMS REST services	<a href="#">Retrieve or delete history collection configurations with /data/historycollections</a>	04SRV.HISTORYCOLLECTIONS. <i>uadvisor_name</i>	\$KOBSEC
		<b>Note:</b> The required access varies depending on the REST method used.	
TEMS REST services	<a href="#">Retrieve, edit, create, replace, or delete situations with /situations</a>	04SRV.SITUATIONS. <i>situation_name</i>	\$KOBSEC
		<b>Note:</b> The required access varies depending on the REST method used.	
TEMS REST services	<a href="#">Situation status information requested with GET /situations/status and GET /situations/status/history</a>	04SRV.SITUATIONS.STATUS. <i>situation_name</i>	\$KOBSEC
TEMS REST services	<a href="#">Start and stop situations with POST /situations/start and POST /situations/stop</a>	04SRV.SITUATIONS.STARTSTOP. <i>situation_name</i>	\$KOBSEC
TEMS REST services	<a href="#">Retrieve or delete Take Action definitions with /system/actions</a>	04SRV.ACTIONS. <i>Kpp.key</i>	\$KOBSEC
		<b>Note:</b> The required access varies depending on the REST method used.	
TEMS REST services	<a href="#">Execute a Take Action with POST /system/actions/execute</a>	04SRV.ACTIONS.EXECUTE. <i>Kpp.key</i>	\$KOBSEC
		<b>Note:</b> If you use resource class \$KOBSEC to secure the use of Take Action commands in the enhanced 3270UI, then resource profile <i>Kpp.msn</i> . TAKEACTION also applies when executing a Take Action in TEMS REST services.	
Enhanced 3270UI	<a href="#">Logon access</a>	KOB.LOGON.**	user-defined

Component	Resource description	Resource pattern	Resource class
Enhanced 3270UI	<u>Near-term history</u>	KOBUI.ADMIN.DEFINEHISTORY.hub_name  <b>Note:</b> To authorize updates to near-term history, the 04SRV.** resource must be defined to the general SAF security class (RTE_SECURITY_CLASS), or the query security class (KOB_SAF_QUERY_CLASS_NAME), if one is defined.	user-defined
Enhanced 3270UI	<u>Take Action command access</u>	Kpp.msn.TAKEACTION	user-defined
Enhanced 3270UI	<u>Query profiles (access to data sources)</u>	Kpp.msn.tablename	user-defined
Enhanced 3270UI	<u>Additional interface activities</u>	KOBUI.ADMIN.interface_activity KOBUI.USER.COMMAND.command  SYSTEM.**	user-defined
Enhanced 3270UI	<u>Multi-tenancy mode tenant definitions</u>	KOBUI.MULTI.CUST.customerID KOBUI.MULTI.GROUP.group	user-defined
TEMS Take Action commands	<u>Take Action command access</u>	smfid.stc.KGLUMAP.tep_userid smfid.stc.KGLCMAP.take_action_command	\$KOBSEC
TEMS Take Action commands	<u>Take Action environment variables</u>	smfid.stc.SOAP_IS_SECURE smfid.stc.CMS_VALIDATE  smfid.stc.KDS_VALIDATE smfid.stc.RTE_SECURITY_CLASS	\$KOBSEC
TEMS Take Action commands	<u>Take Action command security settings</u>	smfid.stc.KLVINNAM.FOLD smfid.stc.KLVINNAM.CNTRLPTxx	\$KOBSEC

### Considerations when using the \$KOBSEC class

Review the following information:

- When using the SAF interface to secure TEMS REST services or to control access to Take Action commands across all TEMS applications, the SAF general resource class must be named \$KOBSEC.
- For the OMEGAMON® enhanced 3270 user interface, the SAF general resource class name is customizable and specified in parameter **RTE\_SECURITY\_CLASS**.  
If you decide to use \$KOBSEC as the SAF general resource class for the enhanced 3270UI, then it must be specified in the **RTE\_SECURITY\_CLASS** parameter in the runtime environment configuration.  
For more information about defining the SAF general resource class for the enhanced 3270UI, see [“Enable security for the OMEGAMON enhanced 3270 user interface” on page 564](#).
- If resource class \$KOBSEC does not exist, it must be defined. For more information, see [“Define a SAF general resource class for securing access to OMEGAMON resources” on page 566](#).
- If you use class \$KOBSEC for securing the enhanced 3270UI, it is possible for the resource profiles to overlap with those for TEMS REST services. Review the following cases:
  - You might define resource profile 04SRV.\*\* with UACC(NONE) to secure near-term history in the enhanced 3270UI. If this profile exists in your \$KOBSEC resource class, it would overrule the profiles that are used with TEMS REST services. If this is the case, define the following profiles (as applicable) to allow access using TEMS REST services to all situations (including the ability to start and stop situations), situation statuses, history collection configurations, and Take Action activities before restricting access to specific resources:

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.* UACC(READ)
```

**Note:** To allow users to edit or create situations, you must provide UPDATE access. To allow users to replace or delete situations, you must provide ALTER access.

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.STATUS.* UACC(READ)
```

```
RDEFINE $KOBSEC 04SRV.SITUATIONS.STARTSTOP.* UACC(READ)
```

```
RDEFINE $KOBSEC 04SRV.HISTORYCOLLECTIONS.* UACC(READ)
```

**Note:** To allow users to delete history collection configurations, you must provide ALTER access.

```
RDEFINE $KOBSEC 04SRV.ACTIONS.** UACC(ALTER)
```

```
RDEFINE $KOBSEC 04SRV.ACTIONS.EXECUTE.** UACC(READ)
```

- If you use resource profile *Kpp.msn.TAKEACTION* to secure the use of Take Action commands in the enhanced 3270UI, this profile also applies when executing a Take Action in TEMS REST services.

## Enabling SNMP V3 passwords for autonomous agents

If you intend to use autonomous agents on a z/OS® system and the ICSF subsystem is available on the z/OS® system, you can enable SNMP V3 passwords.

### Procedure

1. From the distributed installation media for either IBM Tivoli Monitoring or IBM Tivoli Management Services on z/OS®, install the Tivoli Enterprise Monitoring Agent Framework. When you select **Tivoli Enterprise Monitoring Agent Framework** during installation, the following components are installed:
  - Tivoli Enterprise Monitoring Agent Framework
  - IBM GSKit Security Interface
  - Tivoli Enterprise Services User Interface

This software includes the **itmpwdsnmp** tool, which converts the passwords in SNMP trap configuration files from plain text into GSKit-encrypted passwords. For installation instructions, see *IBM Tivoli Monitoring: Installation and Setup Guide*.

2. Run the **itmpwdsnmp** tool on the distributed system to encrypt the passwords in an SNMP trap configuration file. For instructions, see the “SNMP PassKey encryption: itmpwdsnmp” topic in the *IBM Tivoli Monitoring: Administrator's Guide*. If you must encrypt only a few passwords, you can run the **itmpwdsnmp** tool in interactive mode.
3. Upload the SNMP trap configuration file in text mode to the *rhilev.rte.RKANDATV* data set for the runtime environment in which the monitoring agent is configured.
4. Use one of the following methods to create a KAES256 member in the *rhilev.rte.RKANPARU* data set for the runtime environment in which the monitoring agent is configured.
  - Copy the KAES256 member from the *rhilev.rte.RKANPARU* data set for the runtime environment in which the monitoring server is configured to the *rhilev.rte.RKANPARU* data set

for the runtime environment in which the monitoring agent is configured. For instructions on creating the KAES256 member, see [“Enabling security validation on a z/OS hub” on page 539](#).

- In binary mode, copy the KAES256.ser file from the keyfiles directory of the distributed system where you ran the itmpwdsnmp tool to the KAES256 member of the *rhilev.rte*.RKANPARU data set for the runtime environment in which the monitoring agent is configured. The KAES256.ser file contains 48 bytes on distributed systems and is padded with blanks in the KAES256 member of the *rhilev.rte*.RKANPARU data set.
5. Concatenate the ICSF modules for monitoring agent procs by setting the [“GBL\\_DSN\\_CSF\\_SCSFMODE” on page 280](#) parameter depending on whether you use PARMGEN or Configuration Manager:
    - For *PARMGEN*, this parameter can be found in WCONFIG(\$GBL\$USR).
    - For *Configuration Manager*, use or edit the RTEDEF(GBL\$PARM) or RTEDEF(GBL\$lpar) members as needed.
  6. Restart the monitoring agent and verify that the passwords are decrypted. Check RKLVLLOG for error messages indicating failure of GSKit password decryption or failure to create SNMP V3 trap destinations.

## Complete configuration of the OMEGAMON enhanced 3270 user interface

To complete configuration of the enhanced 3270 user interface you must finish setting up security. If one has not already been created, you need to create a z/OS® UNIX® System Services user ID for the system ID used by the enhanced 3270 user interface address space.

### Enable security for the OMEGAMON enhanced 3270 user interface

Enable security for the OMEGAMON enhanced 3270 user interface by specifying the name of the SAF general resource class (or classes) to use for the runtime environment.

#### Before you begin

Authentication and authorization for users of the enhanced 3270 user interface is provided using the system authorization facility (SAF) interface. Security is enabled by specifying the name of a SAF general resource class for the runtime environment (RTE) in which the enhanced 3270 user interface is configured. A security administrator must define the general resource class if it does not already exist and define profiles to control access to the interface, the data queries issued by the interface, and the actions performed by the interface. Users or user groups must be given access to the profiles.

#### About this task

Security for the enhanced 3270 user interface is configured by specifying the name of a SAF general resource class for the **RTE\_SECURITY\_CLASS** parameter in the RTE configuration.

**Attention:** At a minimum, to use the enhanced 3270UI, the user must have SAF read authority for all data sets that are specified in the enhanced 3270UI started task procedure (except for STEPLIB). For more advanced use, the user must have SAF write authority for certain user data sets. For example, saving user settings in a profile requires write access to the runtime profile data set (RKOBPFVS DD), and modifying workspaces requires write access to the user workspace data set (UKANWENU DD). For more information, see [“Define profiles for additional interface activities” on page 570](#).

If the name of the global security class was specified during configuration of the runtime environment, no further configuration of the environment is required. If no security class was specified at the time the RTE was configured, modify the RTE by completing the steps provided in the procedure in this section.

If more granular security definitions are required, you can override the global SAF class for logon, queries, or Take Action commands. You cannot override the **RTE\_SECURITY\_CLASS** value for other enhanced user interface activities: for example, controlling auto update and access to particular hubs. You cannot override the SAF resource name prefix used for other enhanced user interface activities; the prefix is always KOBUI.

To override the **RTE\_SECURITY\_CLASS** value, add the following parameters to the *rte\_plib\_hilev.rte\_name*.WCONFIG(KOB\$PENV) member (for PARMGEN) or to the *rte\_plib\_hilev.rte\_name*.EMBEDS(KOB\$PENV) member (for Configuration Manager).

**KOB\_SAF\_LOGON\_CLASS\_NAME**

Specifies a specific security class name that is to be used for interface logon authentication. This parameter defaults to the **RTE\_SECURITY\_CLASS** parameter value. This parameter should only be specified if the **RTE\_SECURITY\_CLASS** is not being specified or a unique security class name is required for logon authorization.

#### **KOB\_SAF\_QUERY\_CLASS\_NAME**

Specifies a specific security class name that is to be used for authorization of an interface query (data retrieval). This parameter defaults to the **RTE\_SECURITY\_CLASS** parameter value. This parameter should only be specified if the **RTE\_SECURITY\_CLASS** is not being specified or a unique security class name is required for data retrieval authorization

#### **KOB\_SAF\_ACTION\_CLASS\_NAME**

Specifies a specific security class name that is to be used for Take Action authorization. This parameter defaults to the **RTE\_SECURITY\_CLASS** parameter value. This parameter should only be specified if a unique security class name is required for take action authorization.

#### **KOB\_SAF\_LOGON\_RESOURCE\_PREFIX**

Authorization to log on to the enhanced 3270 user interface is verified by checking for access to a SAF resource named in the following pattern:

```
KOB.LOGON.
```

where `KOB.LOGON.` is the logon resource prefix. This prefix can be changed by setting this parameter to another value.

**Important:** Remember to run the PARMGEN \$PARSE job or the Configuration Manager **GENERATE** action after the customization above has been done.

The enhanced 3270 user interface provides a pseudo security class named OMEGDEMO. This class name is used to implement Demo mode. In Demo mode, no authorization checks are performed. This mode should be used only at the instruction of IBM Support. To activate Demo mode, see [“Using Demo mode”](#) on page 573.

### **Procedure**

Choose the steps that apply to your installation, depending on whether you use Configuration Manager or PARMGEN.

- For Configuration Manager, perform the following steps:
  - a. Edit the `rtePlibHilev.rte_name.RTEDEF(rte_name)` member to specify the resource class name for the **RTE\_SECURITY\_CLASS** parameter.
  - b. Run the GENERATE action.
- For PARMGEN, perform the following steps:
  - a. Edit the RTE configuration profile to specify the resource class name for the **RTE\_SECURITY\_CLASS** parameter.
  - b. Resubmit the \$PARSE (or \$PARSESV) job to recreate the profile.
  - c. Submit the following jobs to update the runtime environment:
    - KCIJPLOD
    - KCIJPCPR (backs up the RKAN\* user libraries)
    - KCIJPW2R (copies WKAN\* to RKAN)

See [Scenario RTE03: Changing parameters in an RTE](#) for more information.

### **What to do next**

To complete the security setup for the OMEGAMON® enhanced 3270 user interface, the following tasks must be completed by a security administrator:

1. Define a SAF general resource class. See [“Define a SAF general resource class for securing access to OMEGAMON resources”](#) on page 566 for more information.

2. Define logon profiles to control access to the OMEGAMON® enhanced 3270 user interface. See [“Define logon profiles to control access to the interface” on page 567](#) for more information.
3. Define Take Action profiles to control access to enhanced 3270 user interface data actions. See [“Define Take Action profiles to control access to data actions in the e3270UI” on page 568](#) for more information.
4. Define Query profiles to control access to OMEGAMON® enhanced 3270 user interface data sources. See [“Define query profiles to control access to data sources” on page 570](#).
5. Define profiles to control permission for additional activities performed using the enhanced 3270 user interface. See [“Define profiles for additional interface activities” on page 570](#) for more information.
6. Permit access to the profiles by appropriate personnel. See [“Permit access to profiles” on page 573](#) for more information.

If no z/OS® UNIX® System Services ID has been created for the address space, one must be created.

## Define a SAF general resource class for securing access to OMEGAMON resources

Use this procedure to define the SAF general resource class that is used for controlling access to the OMEGAMON enhanced 3270 user interface.

### Before you begin

The resource profiles that control access to the OMEGAMON® enhanced 3270 user interface (enhanced 3270UI) are defined within a SAF general resource class. If you already have a general resource class that you want to use that has the appropriate CDT characteristics, use that class. If you do not have an appropriate class, or you want to use a different class, one must be defined.

**Note:** If you are using SAF profiles for [controlling Take Action command access](#) or for [securing TEMS REST services](#), you can use this procedure for defining the required SAF general resource class \$KOBSEC.

The enhanced 3270UI security will be significantly different from OMEGAMON security definitions that you might already have for other OMEGAMON interfaces like the OMEGAMON II CUA and or Classic interfaces. It is recommended that a new security class along with its required resource definitions be established for the enhanced 3270UI, as without change prior security definitions will not be compatible. However, you can review existing OMEGAMON security definitions to review authorizations granted to users.

The SAF general resource class must have the following CDT characteristics (DCT entry values):

- CASE(UPPER)
- FIRST(ALPHA,NATIONAL)
- OTHER(ALPHA,SPECIAL,NUMERIC,NATIONAL)
- MAXLENGTH(246)
- MAXLENX(246)
- KEYQUALIFIERS(0)
- PROFILESALLOWED(YES)
- GENERIC(ALLOWED)
- RACLIST(REQUIRED)

### About this task

You can define a SAF general resource class dynamically or by updating the CDT. If you are using RACF, *special* authority is required. The following procedure documents the steps for using RACF. Consult the product documentation for other security applications.

For the enhanced 3270UI, the SAF general resource class name (*classname* in the following procedure) is customizable and is specified in parameter **RTE\_SECURITY\_CLASS**.

**Note:** For controlling Take Action command access using SAF profiles or for securing TEMS REST services, the SAF general resource class name (*classname* in the following procedure) must be \$KOBSEC.

## Procedure

- Take one of the following approaches:
  - To define a SAF general resource class using the ICHERCDE macro (for RACF), code:

```
ICHERCDE CLASS=classname,
      CASE=UPPER,
      DFTRETC=4,
      DFTUACC=NONE,
      FIRST=ALPHA,
      GENLIST=ALLOWED,
      GENERIC=ALLOWED,
      MAXLENX=246,
      OTHER=ANY,
      POSIT=nnn,
      PROFDEF=YES,
      RACLIST=ALLOWED
```

Both the *classname* and POSIT number should be unique. POSIT values 0 - 18, 57 - 127, and 528 - 1023 are reserved for IBM use and should not be used for your dynamic class entries. To list the POSIT numbers currently in use, use the following command:

```
RLIST CDT * NORACF CDTINFO
```

- To define a RACF class dynamically, use the following commands:

```
SETROPTS CLASSACT(CDT) RACLIST(CDT)
RDEFINE CDT classname UACC(NONE) CDTINFO( +
  CASE(UPPER) FIRST(ALPHA,NATIONAL) OTHER(ALPHA,NATIONAL,SPECIAL,NUMERIC) +
  MAXLENGTH(246) MAXLENX(246) KEYQUALIFIERS(0) +
  PROFILESALLOWED(YES) POSIT(nnn) GENERIC(ALLOWED) +
  RACLIST(REQUIRED) )
SETROPTS RACLIST(CDT) REFRESH
SETROPTS RACLIST(classname)
SETROPTS GENERIC(classname)
SETROPTS CLASSACT(classname)
```

- If your security implementation is configured to deny access to undefined SAF resources by default and you want to enable near-term history (NTH), you must update your configuration to add the O4SRV.\*\* resource that is used to secure configuration actions.  
If a query class is being employed, the O4SRV.\*\* profile definition is added to that class instead.  
Following are example RACF SAF definitions to accomplish the security updates:

```
RDEFINE classname O4SRV.** UACC(NONE)
SETROPTS RACLIST(classname) REFRESH

PERMIT O4SRV.** ID(userid) ACCESS(READ) CLASS(classname)
```

## What to do next

Now you can define the profiles that control access to the interface itself and control administrative and user actions.

## Define logon profiles to control access to the interface

Authorization to log on to the enhanced 3270 user interface is controlled by logon profiles. These profiles must be created by a security administrator. If no SAF profile exists to protect an enhanced 3270 user interface instance, logging on to that instance is prevented.

## About this task

The enhanced 3270 user interface verifies a user's authority to log on by checking for access to an SAF resource named in the following pattern:

```
KOB.LOGON.
```

You can define a profile to control all logons to enhanced user interfaces by using the following commands:

```
RDEFINE $KOBSEC KOB.LOGON.** UACC(NONE)
SETROPTS RACLIST($KOBSEC) REFRESH
```

The logon prefix can be changed by adding the KOB\_SAF\_LOGON\_RESOURCE\_PREFIX parameter to the RKANPARU(KOBENV) member of the runtime environment in which the enhanced 3270 user interface is configured. For example:

```
KOB_SAF_LOGON_RESOURCE_PREFIX="E3270I.LOGON"
```

changes the resource name pattern for resource profiles used to control logon to the OMEGAMON® enhanced 3270 user interface to

```
E3270I.LOGON
```

*If you are using Configuration Manager, use the rPlibHilev.rte\_name.EMBEDS(KOB\$PENV) library imbed file to add the parameter to the RKANPARU(KOBENV) file.*

*If you are using PARMGEN, modify the WCONFIG(KOB\$PENV) imbed file to add the parameter to the KOBENV file.*

For both Configuration Manager and PARMGEN, the contents of the KOB\$PENV file are dynamically embedded in the KOBENV file. This prevents the parameter from being overwritten when updates or maintenance is applied.

For initial testing of your configuration, the OMEGDEMO value can be used temporarily for the RTE\_SECURITY\_CLASS value to allow unrestricted logons to the enhanced 3270 user interface. The use of OMEGDEMO should be stopped as soon as you have verified the successful installation, configuration, and data gathering capabilities of the user interface started task.

## Define Take Action profiles to control access to data actions in the e3270UI

To control authorization for Take Action commands in the OMEGAMON® enhanced 3270 user interface, the security administrator must define SAF resource profiles, as described in this topic.

### Before you begin

Authorization to transmit Take Action requests from the OMEGAMON® enhanced 3270 user interface (enhanced 3270UI) to a product agent instance is controlled by a Take Action profile named for the specific Take Action command. Enhanced 3270UI Take Action authorization is performed at both the enhanced 3270UI and the agent. Consequently, security configuration must be performed for both the enhanced 3270UI and the OMEGAMON agent.

For related considerations, refer to the agent security configuration documentation, including the following topics:

- [OMEGAMON for CICS security for Take Action commands](#)
- [OMEGAMON for Db2 security for Take Action commands](#)
- [OMEGAMON for IMS security for Take Action commands](#)
- [OMEGAMON for Messaging security for Take Action commands](#)
- [OMEGAMON for Networks security for Take Action commands](#)
- [OMEGAMON for z/OS security for Take Action commands](#)

### About this task

The enhanced 3270UI verifies the authority for a user to transmit Take Action commands by checking for access to a SAF resource named in the following pattern:

```
Kpp.msn.TAKEACTION
```

where:

**Kpp**

Is the product code of the agent instance. (See [Product codes](#).)

**msn**

Is a managed system name. A managed system name typically identifies a unique Tivoli Enterprise Monitoring Server agent instance. Note that the form of managed system names differs from product to product. Check the agent-specific documentation for information about the form used for managed system names.

**TAKEACTION**

Is a literal.

At a minimum, a SAF profile using this resource pattern must be defined in the global security class (**RTE\_SECURITY\_CLASS**) and UPDATE access authority to the profile must be given to the users allowed to issue Take Action commands for the agent. Other profiles can be created for more granular access control.

To control access to individual Take Action commands, a profile must be defined for each Take Action command. If there is no matching profile for a particular Take Action command, a request to transmit the action to the managed system name is denied.

**Note:** The format of the resource pattern for a specific Take Action command differs from product to product. Typically, the format of the resource pattern is as follows:

```
Kpp.msn.TAKEACTION.commandname
```

where *commandname* is the name of the Take Action command.

For details about defining the profiles for specific Take Action commands, refer to the agent-specific documentation.

## Example

To control the ability to issue all Take Action commands to an OMEGAMON® for z/OS® agent, define the following profile by entering the following commands:

```
RDEFINE $KOBSEC KM5.**.TAKEACTION UACC(NONE)
SETROPTS RACLIST($KOBSEC) REFRESH
```

To control the ability to issue a Take Action command to an OMEGAMON® for z/OS® agent running on sysplex IBMTST on sysplex member TSTA, in a SAF class named \$KOBSEC, define a profile named KM5.IBMTST:TSTA:MVSSYS.TAKEACTION by entering the following commands:

```
RDEFINE $KOBSEC KM5.IBMTST:TSTA:MVSSYS.TAKEACTION UACC(NONE)
SETROPTS RACLIST($KOBSEC) REFRESH
```

## What to do next

- After the Take Action profile has been defined, the security administrator must assign UPDATE access authority to the profile for the allowed users. For more information, see [“Permit access to profiles” on page 573](#).
- To control access to individual Take Action commands, a profile for each Take Action command must be defined. For more information, see the agent-specific documentation.

## Define query profiles to control access to data sources

Query profiles control access to data sources. These profiles are defined to the general SAF class (RTE\_SECURITY\_CLASS). If more granular access control is required, the profiles are defined to the class identified by the KOB\_SAF\_QUERY\_CLASS\_NAME parameter.

### About this task

The authority to issue query requests from the OMEGAMON® enhanced 3270 user interface to a product agent instance is verified by checking for access to an SAF resource named in this pattern: *Kpp.msn.tablename*

where

#### **Kpp**

Is the product code of the agent instance. For example, for OMEGAMON® for CICS, the product code is KCP. For OMEGAMON® for z/OS®, the product code is KM5. See [Product codes](#) for other products.

#### **msn**

Is a managed system name. A managed system name typically identifies a unique Tivoli Enterprise Monitoring Server agent instance. Note that the form of managed system names differs from product to product. Check the agent-specific *Configuration and Planning Guide* for information about the form used for managed system names.

#### **tablename**

Is the name of the data source (attribute group, or table) defined within the product agent. Note that if a matching SAF profile does not exist to protect a given query, that query is allowed. For example, suppose you want to control the ability to issue a query to an OMEGAMON® for z/OS® agent running on Sysplex IBMTEST on Sysplex member TSTA, for table KM5xxxxx. Assuming that the SAF class name is \$KOBSEC, you would define a profile named KM5.IBMTEST:TSTA:MVSSYS.KM5xxxxx by entering these commands:

```
RDEFINE $KOBSEC KM5.IBMTEST:TSTA:MVSSYS.KM5xxxxxx UACC(NONE)
SETROPTS RACLIST($KOBSEC) REFRESH
```

More generally, you could define a profile to control all data queries for a specific product:

```
RDEFINE $KOBSEC KM5.** UACC(NONE)
SETROPTS RACLIST($KOBSEC) REFRESH
```

To secure near-term history configuration actions, the O4SRV.\*\* profile definition must be added to the global security class definition, or to the query class, if one is used. The following are example RACF SAF definitions to accomplish the security updates:

```
RDEFINE classname O4SRV.** UACC(NONE)
SETROPTS RACLIST(classname) REFRESH

PERMIT O4SRV.** ID(userid) ACCESS(READ) CLASS(classname)
```

## Define profiles for additional interface activities

In addition to Log-on, Take Action, and Query profiles, profiles can be created to control authorization to perform additional tasks using the enhanced 3270 user interface. These profiles are defined to the class identified by the RTE\_SECURITY\_CLASS parameter.

### About this task

Depending upon how your security implementation is configured, if no SAF profile is defined for the activities listed in [“Interface activities and resource names” on page 570](#), either no users are permitted to perform the action, or all users are permitted to perform the activities. To selectively allow access, the exact resource name shown for each activity must be used in the corresponding SAF profile.

Lists the activities that can be controlled by SAF profiles and the corresponding resource names

Table 65: Interface activities and resource names	
Activity	Resource name
List users of the enhanced 3270 user interface.	KOBUI.ADMIN.LISTUSERS

Activity	Resource name
Start or stop user interface tracing.	KOBUI.ADMIN.TRACE.UI.<trace_type> where <trace_type> is one of the following values: BASIC 3270 DATA SECURITY ISPF FLOW OFF
Start or stop internal tracing.	KOBUI.ADMIN.TRACE.INTERNAL.<trace_type> where <trace_type> is one of the following values: REQUESTROUTER CONDUITMANAGER REGISTRY STATUSTHRESHOLDING SESSIONCONTROL GATEWAY ODI SAF OFF
Create or modify a profile member name that is the same as the user's user ID.	KOBUI.ADMIN.MEMBER.WRITE.RKOBPFVS.<member> then either: SAF_CLASS='DATASET' SAF_RESOURCE=<dataset_name> ACCESS=UPDATE USER=<logged_on_e3270ui_userid> or SAF_CLASS='DATASET' SAF_RESOURCE=<dataset_name> ACCESS=UPDATE USER=<interface_started_task_userid>
Modify ( <b>Save, Save As</b> ) any PDS member (for example, a workspace in DD=UKANWENU or a profile member in DD=RKOBPFVS) that is named differently than the signed-on user's user ID.	KOBUI.ADMIN.MEMBER.WRITE.<dd>.<member> Then: USER=<logged_on_e3270ui_userid> SAF_CLASS=DATASET SAF_RESOURCE=<dataset_name> ACCESS=UPDATE
Change auto-update preferences.	KOBUI.ADMIN.PREFS.AUTOUUPDATE
Enter a command on the command line.	KOBUI.USER.COMMAND.<command>
Use a hub Tivoli® Enterprise Monitoring Server from within the user interface.	KOBUI.ADMIN.USEHUB.<hub_name>
Configure near-term history	KOBUI.ADMIN.DEFINEHISTORY.<hub_name>  <div style="border: 1px solid blue; padding: 5px;"> <p><b>Note:</b> To authorize updates to near-term history, the 04SRV.** resource must be defined to the general SAF security class (RTE_SECURITY_CLASS), or the query security class (KOB_SAF_QUERY_CLASS_NAME), if one is defined.</p> </div>

Activity	Resource name
Stop a user session on the Tools -> Active Enhanced 3270 User Interface workspace, KOBUSERS	KOBUI.ADMIN.KILLUSER
Enable Situation Editor and Object Editor functions	<p>The following security resource profiles must be defined for these editors.</p> <ul style="list-style-type: none"> <li>• KOBUI.ADMIN.SITEDITOR</li> <li>• KOBUI.ADMIN.OBJECTEDITOR</li> <li>• 04SRV.**</li> </ul> <p>To view the editors, the users must have either read or update permission to the corresponding editor profiles (<b>KOBUI.ADMIN.SITEDITOR</b> for the Situation Editor and <b>KOBUI.ADMIN.OBJECTEDITOR</b> for the Object Editor). Users with none permission to the profiles are not able to access the editors.</p> <p>To save updates in the editors, the users must have read or update permission to the <b>04SRV.**</b> profile, as well as either read or update permission to the corresponding editor profiles. Users with none permission to the <b>04SRV.**</b> profile are not able to save updates in the editors.</p>

Configure multi-tenancy	KOBUI.MULTI.CUST.<customerID> KOBUI.MULTI.GROUP.<group> For more information, see <a href="#">Creating tenant definitions in RACF</a> .

## Examples

Note that the resource rules begin with KOBUI.USER.xxx, KOBUI.ADMIN.xxx, or KOBUI.MULTI.xxx. This naming convention enables the administrator to write a minimal number of SAF resource rules and still secure important parts of the user interface. For example, the administrator could DENY all users access to tracing functions by creating this single SAF rule:

```
RDEFINE $OMEGZOS KOBUI.ADMIN.TRACE.** UACC(NONE)
```

In all cases of resource checking, the SAF class name used is the name that was configured for the enhanced 3270 address space with the RTE\_SECURITY\_CLASS environmental variable (found in the KOBENV PDS member of the dataset associated with the RKANPAR DD name), for example: RTE\_SECURITY\_CLASS=\$OMEGZOS.

Here are a few examples of securing user interface activities using RACF® commands. For security products other than RACF® (such as CA Top Secret for z/OS® and CA ACF2 for z/OS®) use the corresponding commands instead of RDEFINE and PERMIT to perform the same type of function.

```
DEFINE $OMEGZOS KOBUI.ADMIN.PREFS.AUTOUUPDATE UACC(NONE)
```

Prevents all users from altering the Auto Update interval in the user interface.

```
PERMIT KOBUI.ADMIN.PREFS.AUTOUUPDATE CLASS($OMEGZOS) ID(DHODS2) ACCESS(READ)
```

Allows user DHODS2 to change the Auto Update interval in the user interface.

```
RDEFINE $OMEGZOS KOBUI.ADMIN.MEMBER.WRITE.RKOBPFVS.Q* UACC(NONE)
```

Prevents all users from saving profile PDS members that start with the letter Q.

```
RDEFINE $OMEGZOS KOBUI.ADMIN.MEMBER.WRITE.UKANWENU.KCP* UACC(NONE)
```

Prevents users from saving workspace PDS members that start with the letters KCP

```
RDEFINE $OMEGZOS KOBUI.ADMIN.USEHUB.** UACC(READ)
```

Allows all users access to queries using any hub monitoring server name.

```
RDEFINE $OMEGZOS KOBUI.ADMIN.USEHUB.M5D0HAHB:CMS UACC(NONE)
```

Prevents all users from access to queries using the hub monitoring server named M5D0HAHB:CMS.

```
PERMIT KOBUI.ADMIN.USEHUB.M5D0HAHB:CMS CLASS($OMEGZOS) ID(DHODS2) ACCESS(READ)
```

Allows user DHODS2 to issue queries using the hub monitoring server named M5D0HAHB:CMS.

```
RDEFINE $OMEGZOS KOBUI.ADMIN.KILLUSER UACC(NONE)
```

If this resource does not exist, or if it exists with UACC(NONE), then all users are prevented from stopping Enhanced 3270 User Interface sessions. Stopping your own session is never permitted, regardless of the SAF setting.

```
PERMIT KOBUI.ADMIN.KILLUSER CLASS($OMEGZOS) ID(DHODS2) ACCESS(READ)
```

Allows user DHODS2 to stop other Enhanced 3270 User Interface sessions.

## Permit access to profiles

To be authorized for an OMEGAMON enhanced 3270 user interface protected resource, a user or group must be *permitted* access to the associated resource profile.

## About this task

The following list describes the authorizations that are needed:

- To log on to the enhanced 3270 user interface, a user requires READ access authority to the [logon profile](#).
- To transmit a Take Action request from the enhanced 3270 user interface to a product agent instance, a user requires UPDATE access authority to the [Take Action profile](#). Note that if no matching SAF profile exists to protect a Take Action, that Take Action command is denied.
- To issue a query request from the enhanced 3270 user interface to a product agent instance, a user requires READ access authority to the [query profile](#).

Your security administrator will know best how to grant permissions to access these resources.

## Example

As an example, assuming a SAF class name of \$KOBSEC, your security administrator can allow a user or group access to the following enhanced 3270 user interface resource profiles by entering the following commands:

```
PERMIT KOB.LOGON.** ID(userid) ACCESS(READ) CLASS($KOBSEC)
PERMIT Kpp.**.TAKEACTION ID(userid) ACCESS(UPDATE) CLASS($KOBSEC)
PERMIT Kpp.** ID(userid) ACCESS(READ) CLASS($KOBSEC)
```

## Using Demo mode

The OMEGAMON® enhanced 3270 user interface provides a pseudo security class named OMEGDemo. This class name is used to implement demo mode. In demo mode, no authorization checks are performed. Use this mode only if instructed by IBM® Software Support.

## Procedure

- To activate Demo mode, use the configuration method of your choice (Configuration Manager or PARMGEN) to set the RTE\_SECURITY\_CLASS parameter for the runtime environment in which the enhanced 3270 user interface is configured to OMEGDemo.
- If Demo mode is in effect at startup, the following messages are written to the DDNAME SYSPRINT log that is written to SYSOUT:  
KOBSC0001A PLEASE REVIEW THE SECURITY SET UP INFORMATION

KOBCS0001A SAF SECURITY HAS NOT BEEN ENABLED/CONFIGURED

KOBCS0001A THIS PRODUCT IS RUNNING UNSECURED!!

## (Optional) Define SAF application ID

You can optionally specify a SAF application ID for use with the OMEGAMON enhanced 3270 user interface, overriding the default value.

### Before you begin

The OMEGAMON enhanced 3270 user interface reads the PDS member `rte_plib_hilev.rte_name.RKANPARU(KOBENV)` to obtain the SAF security configuration values for authentication and authorization.

Parameter **KOB\_SAF\_APPLID** can be added to the file to specify the SAF application ID. If parameter **KOB\_SAF\_APPLID** is omitted from `RKANPARU(KOBENV)`, the value `CANDLE` will be used.

### About this task

The default value for the SAF application ID that is used for the enhanced 3270 user interface is `CANDLE`. You can change this value by adding the **KOB\_SAF\_APPLID** parameter to the `RKANPARU(KOBENV)` member of the runtime environment in which the enhanced 3270 user interface is configured. For example:

```
KOB_SAF_APPLID=safapplid
```

where *safapplid* is the name of the SAF application ID.

You can use the embed file `KOB$PENV` to add the statement to the `RKANPARU(KOBENV)` file, which prevents the parameter from being overwritten when updates or maintenance is applied.

### Procedure

To define the SAF application ID for your OMEGAMON enhanced 3270 user interface, overriding the default value, perform the following steps using either of the following methods:

- Using Configuration Manager:
  - a. Add the following statement to the `rte_plib_hilev.rte_name.EMBEDS(KOB$PENV)` embed file:

```
KOB_SAF_APPLID=safapplid
```

where *safapplid* is the name of the SAF application ID.

- b. Run the **GENERATE** command.  
The contents of the `KOB$PENV` file are dynamically embedded in the `KOBENV` file.

Recycle the OMEGAMON enhanced 3270 user interface started task for the configuration changes to take effect.

**Note:** For more information about changing parameter values after you have completed configuration of the runtime environment using Configuration Manager, see [“Creating or updating a runtime environment” on page 229](#).

- Using PARMGEN,
  - a. Add the following statement to the `WCONFIG(KOB$PENV)` embed file:

```
KOB_SAF_APPLID=safapplid
```

where *safapplid* is the name of the SAF application ID.

- b. Submit the `$PARSE` job to refresh the profile.  
The contents of the `KOB$PENV` file are dynamically embedded in the `KOBENV` file.

Recycle the OMEGAMON enhanced 3270 user interface started task for the configuration changes to take effect.

**Note:** For more information about changing parameter values after you have completed configuration of the runtime environment using PARMGEN, see [“Scenario RTE03: Changing parameters in an RTE” on page 844](#).

## Create a z/OS® UNIX® System Services ID for the address space

The enhanced 3270 user interface address space uses the z/OS UNIX API for TCP/IP communications, so the user ID associated with the address space must be defined to your security product as a z/OS UNIX user. If this user ID is not already defined, you should define it now.

### About this task

The user ID for the address space must be defined using the security authorization facility (RACF, for example) to contain what is known as an OMVS Segment. As part of defining the OMVS Segment for the user ID, you must also supply a z/OS UNIX UID. The UID you supply does not need to have superuser authority (that is, UID=0 is not required). The following is an example of a RACF ADDUSER command that defines an OMVS Segment and a UID for a new RACF user ID:

```
ADDUSER userid ... OMVS(UID(nnn) ...)
```

## (Optional) Enable maintenance of the historical data store

If you intend to enable historical data collection and have allocated the historical data set and configured maintenance for data store, you must perform two additional tasks to enable the maintenance.

### About this task

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

The KPDPROC1 maintenance procedure that is used to maintain the physical files must have the required authority to read, write, and update the files.

The KPDPROCC REXX™ procedure runs in a TSO environment and must be enabled to run as an authorized program under TSO. To authorize the KPDPROCC procedure, you must authorize the KPDDSCO module.

If you are upgrading an existing monitoring server, you must also refresh the KPDPROC1 maintenance procedure in your system procedure library.

### Procedure

1. Ensure that KPDPROC1 procedure has the necessary authority to read, write, and update the persistent data store files.
2. Authorize the KPDDSCO module by adding KPDDSCO to the system PARMGEN(IKJTSONn) under the AUTHPGM section and refresh the IKJTSONn member by issuing the set command (**T IKJTSONn**). You might request that authorized system programmers perform this step so it can be scheduled with the LPAR change control processes.
3. Verify that the configuration and authorization has been successful:
  - a. Bring up the started task (for monitoring server or monitoring agent) that will collect historical data into the product's persistent data store libraries. In the RKPDLLOG DDNAME started task, find any persistent data store libraries in a non-Offline status (for example, Partial or Full status).
  - b. From a z/OS® operator console, issue the following z/OS® MODIFY command:

```
/F stcname,KPDCMD RECOVER FILE=DSN:pds_data set
```

where *stcname* is the name of the started task performing the persistent data store collection, and *pds\_data set* is the persistent data store data set.

For example, issue the following MODIFY command for the monitoring server:

```
/F CIDSST,KPDCMD RECOVER FILE=+  
DSN:rhilev.rte.RGENHIS1
```

- c. Wait 5 minutes.
- d. In the RKPDLLOG DDNAME started task, find the following Command: and KPDDSTR: references as shown in the following monitoring server RKPDLLOG DDNAME example:

```
Command: RESUME FILE=DSN:rhilev.rte.RGENHIS1  
KPDDSTR: CONNECT processing started for DataStore file  
DSN:rhilev.rte.RGENHIS1  
KPDDSTR: CONNECT processing ended for DataStore file  
DSN:rhilev.rte.RGENHIS1
```

- e. If these references are not found, view the KPDPROC1 started task in SDSF and look for any obvious errors.

## What to do next

Even though the historical data store is allocated and configured, no historical data is collected until collection is enabled using the Tivoli Enterprise Portal.

## (Optional) Configure historical data collection

No historical data is collected unless the collection of historical data is configured in the Tivoli Enterprise Portal or the OMEGAMON enhanced 3270 user interface (3270UI).

### Before you begin

**Important:** The content in this section was created for and applies to the original persistent data store, referred to as PDS V1. A new PDS version (referred to as PDS V2) now exists. PDS V1 will eventually be deprecated.

Data sets for storing the collected historical data must be allocated before you begin historical data collection.

### About this task

In the Tivoli Enterprise Portal, you configure and start historical data collection through the History Collection Configuration window of the Tivoli Enterprise Portal. In this window, you specify the attribute groups for which you want data to be collected, the interval for data collection, the location where you want the collected data to be stored (at the monitoring server or at the agent), and whether you want the data to be migrated to the Tivoli® Data Warehouse.

In the enhanced 3270UI, you configure historical data collection using the OMEGAMON History Configuration workspace. The workspace is displayed after you select the application and attribute group for which you want to collect data. Then, you specify the interval for data collection, the location where you want the collected data to be stored (at the monitoring server or at the agent), and the managed system or managed system list on which you want data collected. You cannot configure data warehousing through the enhanced 3270UI, nor can you configure summarization and pruning. Only a subset of attributes can be configured and displayed in the enhanced 3270UI.

Both interfaces list the attribute groups, or *tables*, for each application that are enabled for historical collection and reporting. To enable historical data collection, you must select and configure each attribute table for which you want to collect data, and then start collection for those tables. If you want to warehouse the data for long-term historical reporting, you must set the Warehouse Interval to the interval at which data is warehoused.

For detailed instructions on configuring history data collection in the Tivoli Enterprise Portal, see the [IBM Tivoli Monitoring: Administrator's Guide](#) and the Tivoli Enterprise Portal online help. For instructions on configuring historical data collection in the enhanced 3270UI, see [“Configuring near-term history” on page 932](#).

## (Optional) Configure situation status streaming

Enable situation status streaming from the Tivoli Enterprise Monitoring Server to IBM Z® OMEGAMON Data Provider. You must use Configuration Manager to configure situation status streaming.

### Before you begin

*Situation status streaming* forwards situation status updates from the Tivoli Enterprise Monitoring Server (*monitoring server*) to IBM Z® OMEGAMON Data Provider in JSON format. OMEGAMON® Data Provider can then forward the data to integrated third-party analytics platforms.

When situation status streaming is enabled, it is enabled for all situations; you cannot enable situation status streaming for only specific situations. For more information about using situation status streaming, see [“Stream situation status updates to OMEGAMON Data Provider” on page 1126](#).

### About this task

The following list describes the requirements for configuring situation status streaming:

- IBM Z OMEGAMON Data Provider (with APAR OA68403) must be installed and configured with OMEGAMON Data Broker and OMEGAMON Data Connect components configured and running and at least one analytics platform integrated. For more information, see [Getting started with OMEGAMON Data Provider](#).

**Note:** If OMEGAMON Data Provider is not installed, the error message `Unable to load KAY10DP` is displayed in the log.

- Situation status streaming must be enabled by setting monitoring server parameter **KDS\_STREAM\_SITUATION\_STATUS** to Y.
- Situation status streaming requires mapping extension JAR file `ksm-odp-model-v.jar`.

**Note:** The three-character product code for situation status streaming is `ksm`.

Complete the following steps to configure situation status streaming.

### Procedure

1. If you have not already done so, perform the steps to [add OMEGAMON Data Provider to your runtime environment](#). The [results](#) describe the changes made to the runtime environment.
2. If you have not already done so, configure OMEGAMON Data Provider. See [Getting started with OMEGAMON Data Provider](#).
3. (Optional) If you want to use the mapping extension JAR file for situation status streaming in your [user directory](#), copy the `ksm-odp-model-v.jar` file to subdirectory `rte_uss_rtedir/rte_name/kay/user/extensions` from either of the following locations:
  - For a full runtime environment: `rte_uss_rtedir/rte_name/kay/kay-110/lib/ext/`
  - For a sharing runtime environment: `gbl_uss_tkayhfs_path/kay-110/lib/ext/`
4. In RTEDEF (KDS\$PARM) or RTEDEF (KDS\$lpar), add (or update, as appropriate) parameter **KDS\_STREAM\_SITUATION\_STATUS**, and set the value to Y.
5. Run the [GENERATE](#) action to update the runtime environment configuration.
6. Restart the monitoring server.

### What to do next

For information about the situation properties that are forwarded to OMEGAMON Data Provider, see [“Stream situation status updates to OMEGAMON Data Provider” on page 1126](#).

# Securing communications for Tivoli Management Services on z/OS components and OMEGAMON products

Review information about setting up secure communications for Tivoli Management Services on z/OS components and your OMEGAMON products.

## Where to find information about securing communications

Use this topic to locate information about securing communications between Tivoli Management Services on z/OS components and for individual OMEGAMON products.

The table contains links to topics about securing communication between Tivoli Management Services on z/OS components and for individual OMEGAMON products.

<i>Table 66: Topics about securing communications for Tivoli Management Services on z/OS components and OMEGAMON products</i>	
<b>Description</b>	<b>Where to find information</b>
Securing communications between components on z/OS	<p><i>OMEGAMON shared documentation:</i></p> <ul style="list-style-type: none"> <li>• <a href="#">“Decision 6: How to set up communications between components” on page 147</a></li> <li>• <a href="#">“Secure communication between components” on page 157</a></li> <li>• <a href="#">“Setting up AT-TLS for Tivoli Management Services on z/OS components” on page 583</a></li> </ul>

IBM Z® OMEGAMON® AI for Db2 6.1	<a href="#">Configuring AT-TLS encryption</a>
IBM Z OMEGAMON AI for z/OS 6.1	<a href="#">Enabling AT-TLS Secure Connectivity to the RMF Distributed Data Server (DDS)</a>

## Initial setup to activate AT-TLS

Use the information in this section if you are setting up AT-TLS at your site for the first time to secure communications for Tivoli Management Services on z/OS components and OMEGAMON products.

General AT-TLS set up occurs only once per system. AT-TLS might already be implemented at your site.

If you have not yet set up AT-TLS for your system, you can use this section for high-level guidance when setting up AT-TLS to secure communications for Tivoli Management Services on z/OS components and OMEGAMON

products. For more information about AT-TLS, see [z/OS Communications Server: IP Configuration Guide: Application Transparent Transport Layer Security data protection](#).

If AT-TLS is already enabled for your system and you are ready to modify your setup to protect Tivoli Management Services on z/OS components and OMEGAMON products, see [“Setting up AT-TLS for Tivoli Management Services on z/OS components”](#) on page 583.

At a high level, setup of AT-TLS requires updates in the following systems or locations:

- z/OS® UNIX® System Services (OMVS)
- RACF
- PARMLIB
- PROCLIB

**Note:** The examples that are provided are intended as a guide; your setup will differ, depending on the requirements of your site.

## Define security authorization for Policy Agent

Define the appropriate security authorizations for Policy Agent.

### Before you begin

You can use RACF for authorizing the necessary components for secure communications. For other security management products, refer to your product documentation.

The following terms appear in this task:

#### Policy Agent

Policy definition for AT-TLS. For more information, see [z/OS Communications Server: IP Configuration Guide: Policy Agent](#).

#### PAGENT

Policy Agent started task.

#### pasearch

z/OS® UNIX® System Services command used to query information from Policy Agent, such as displaying policy definitions.

#### syslogd

The z/OS® UNIX® System Services syslog daemon. The TCP/IP documentation recommends writing Policy Agent messages to the z/OS UNIX syslog instead of using the default log file. AT-TLS always writes messages to the z/OS UNIX syslog.

#### Related information

- [z/OS Communications Server: IP Configuration Guide: Steps for configuring the Policy Agent](#)
- [z/OS Communications Server: IP Configuration Guide: TCP/IP stack initialization access control](#)

### About this task

You must define the RACF authorization for Policy Agent started task (PAGENT) and **pasearch** commands. The steps in this procedure include providing the following protections:

#### INITSTACK protection

Policy Agent is started after TCP/IP is initialized. This means that there is a (small) window where applications can use the TCP/IP stack without the TTLS policy being enforced. Define the EZB.INITSTACK.\*.\* profile in the SERVAUTH class to prevent access to the stack during this time window, except for applications with READ access to the profile. You must permit a limited set of administrative applications to the profile to ensure full initialization of the stack, as documented in [z/OS Communications Server: IP Configuration Guide: TCP/IP stack initialization access control](#).

## pasearch protection

Define profile EZB.PAGENT.\*\* in the SERVAUTH class to restrict access to the pasearch command.

The following procedure provides example RACF commands to perform these steps.

**Note:** The examples are intended as a guide; you can organize your security definitions differently, depending on the requirements of your site.

## Procedure

Complete the following steps to set up security definitions for Policy Agent in RACF.

1. Define the RACF authorization for the PAGENT started task and **pasearch** command.  
In this example, Policy Agent runs as a z/OS started task named PAGENT. To define the Policy Agent started task to RACF, use the RDEFINE command to create the PAGENT.\* profile in the STARTED class. (The SETROPTS commands are included for completeness. These commands have no effect when the STARTED class is already activated.)

```
SETROPTS CLASSACT(STARTED)
SETROPTS RACLIST(STARTED)
SETROPTS GENERIC(STARTED)
RDEFINE STARTED PAGENT.*
RDEFINE STARTED SYSLOGD.*
```

2. Define the PAGENT user ID.  
In this example, Policy Agent runs under the z/OS user ID named PAGENT and has a default group (DFLTGRP) of OMVS and an OMVS segment with a UID of 0.

```
ADDUSER PAGENT NAME('user-name') DFLTGRP(OMVS)
ALTUSER PAGENT OMVS(UID(0),HOME(/u),PROGRAM(/bin/sh))
RALTER STARTED PAGENT.* STDATA(USER(PAGENT))
RALTER STARTED PAGENT.* STDATA(USER(SYSLOGD))
```

3. Refresh the in-storage generic profiles.

```
SETROPTS RACLIST(STARTED) REFRESH
SETROPTS GENERIC(STARTED) REFRESH
```

4. Grant Policy Agent the ability to make socket requests during TCP/IP stack initialization.  
A TCP/IP stack initializes before Policy Agent installs policies into the stack. During the initialization window, only user IDs that are permitted to the EZB.INITSTACK.*sysname*.*tcpname* profile in the SERVAUTH class can make socket requests.

```
SETROPTS CLASSACT(SERVAUTH)
SETROPTS RACLIST(SERVAUTH)
RDEFINE SERVAUTH EZB.PAGENT.sysname.tcpname.* UACC(READ)
RDEFINE SERVAUTH EZB.INITSTACK.sysname.tcpname.* UACC(READ)
SETROPTS GENERIC(SERVAUTH) REFRESH
SETROPTS RACLIST(SERVAUTH) REFRESH
```

Where *sysname* is the system name (for example, TVT5011), and *tcpname* is the TCP/IP job name (for example, TCPIP).

## (Optional) Define Common INET PFS

Define Common INET (CINET) Physical File System (PFS), if not already defined.

### Before you begin

If you want to run multiple z/OS Communications Server TCP/IP stacks concurrently, you must use the Common INET (CINET) configuration.

**Note:** Setting up and managing several TCP/IP stacks on z/OS is a separate task that is not directly related to security or encryption setup.

For more information, see the following topics in *z/OS Communications Server: IP Configuration Guide*: [Common INET PFS](#) and [Specifying BPXPRMxx values for a CINET configuration](#).

## About this task

If not already defined, you must add values for a CINET configuration.

## Procedure

1. Add the following statements to USER.PARMLIB(BPXPRM01):

```
MAXFILEPROC(20000)
SHRLIBRGNsize(134000000)

FILESYSType TYPE(CINET)
                ENTRYPOINT(BPXTcINT)
NETWORK DOMAINNAME(AF_INET)
                DOMAINNUMBER(2)
                MAXSOCKETS(20000)
                TYPE(CINET)
NETWORK DOMAINNAME(AF_INET6)
                DOMAINNUMBER(19)
                MAXSOCKETS(35000)
                TYPE(CINET)
SUBFILESYSType NAME(TCPIP)
                TYPE(CINET)
                ENTRYPOINT(EZBPFINI)
SUBFILESYSType NAME(TCIPB)
                TYPE(CINET)
                ENTRYPOINT(EZBPFINI)
```

2. Perform an IPL of the system.

## Configure Policy Agent

Complete this task to configure Policy Agent to run as a z/OS started task. You can skip this task if a Policy Agent started task is already configured on your system.

### About this task

AT-TLS is managed by the Policy Agent, which can be started as a started task.

Policy Agent reads, parses, and installs AT-TLS policies (or, TTLS) in the TCP/IP stack. The policies contain information that is necessary to negotiate secure connections.

The Policy Agent uses a configuration file to know which policies must be enforced, and where they can be found. The default configuration file is `/etc/pagent.conf`, but a different location can be specified in the Policy Agent started task JCL.

For more information about Policy Agent and running Policy Agent as a started task, see *z/OS Communications Server: IP Configuration Guide: Policy Agent and policy applications*.

## Procedure

1. Copy `hlq.SEZAINST(PAGENT)` to USER.PROCLIB.
2. Define the PAGENT environment file on the STDENV DD statement in the Policy Agent JCL.  
For example:

```
//STDENV DD PATH='/etc/pagent/pagent.env',PATHOPTS=(ORDONLY)
```

3. In the PAGENT environment file, point to a configuration file.  
For example:

```
PAGENT_CONFIG_FILE=// 'USER.PARMLIB(PAGENT)'
```

4. In the configuration file, set up policy files for each TCP/IP stack image.  
For example:

```
TcpImage TCPIP /etc/pagent/TCPIP.policy FLUSH PURGE
TcpImage TCPIPB /etc/pagent/TCPIPB.policy FLUSH PURGE
```

5. In the TcpImage file, point to the TTLS configuration file.  
For example:

```
TTLSSConfig /etc/pagent/ttls.policy
```

## Start and stop Policy Agent

Start and stop the Policy Agent started task.

### Procedure

- Issue the MVS START command to start Policy Agent as a started task.  
For example:

```
S PAGENT
```

- To perform a normal shutdown of Policy Agent, issue the MVS STOP command.  
For example:

```
P PAGENT
```

## Display policies

Use the z/OS UNIX System Services **pasearch** command to query information from the Policy Agent.

### Before you begin

For more information about the **pasearch**, see *z/OS Communications Server: IP System Administrator's Commands: [The z/OS UNIX pasearch command: Display policies.](#)*

### About this task

The **pasearch** command is issued from the z/OS UNIX System Services shell, which is invoked using the **OMVS** command.

**pasearch -t** displays all Application Transparent Transport Layer Security (AT-TLS) policy entries that match the input options for **pasearch**.

### Procedure

- From the z/OS UNIX shell, enter the following command:

```
pasearch -t
```

## Update TCP/IP profile

Activate or deactivate the AT-TLS function for the TCP/IP stack.

### Before you begin

To determine if the AT-TLS function is activated for the TCP/IP stack, you can use the following command to display TCP/IP configuration data:

```
DISPLAY TCPIP, <procname>, NETSTAT, CONFIG
```

For more information about this command, see the following topics in *z/OS Communications Server: IP System Administrator's Commands*: [DISPLAY TCPIP command](#) and [DISPLAY TCPIP,,NETSTAT](#).

## About this task

The AT-TLS function is activated by the TTLS parameter on the TCPCONFIG statement. The TTLS option must be specified to activate the AT-TLS function for the TCP/IP stack. Specifying NOTTLS deactivates the AT-TLS function for the TCP/IP stack.

The TCPCONFIG statement exists in the TCP/IP profile (PROFILE . TCPIP).

For more information, see the following topics in *z/OS Communications Server: IP Configuration Reference*: [TCP/IP profile \(PROFILE.TCPIP\)](#) and [configuration statements](#) and [TCPCONFIG statement](#).

**Note:** OBEYFILE can also be used to dynamically enable or disable TTLS .

## Procedure

- To activate or deactivate the AT-TLS function for the TCP/IP stack, update the TCPCONFIG statement in the current TCP/IP profile, as follows:
  - To activate the AT-TLS function, specify the TTLS parameter, as follows:

```
TCPCONFIG    TTLS
```

- To deactivate AT-TLS function, specify the NOTTLS parameter, as follows:

```
TCPCONFIG    NOTTLS
```

**Note:** NOTTLS is the default value.

## Setting up AT-TLS for Tivoli Management Services on z/OS components

To protect your data, you should encrypt all communication channels that are used by Tivoli Management Services on z/OS components. You can use Application Transparent Transport Layer Security (AT-TLS) to achieve secure communication.

Setting up AT-TLS for use with Tivoli Management Services on z/OS components is required if you plan to use HTTPS for communication between the Tivoli Enterprise Monitoring Server (TEMS) and other components, such as the SOAP server, the IBM Tivoli Monitoring Service Console, the **tacmd** CLI, and TEMS REST services.

**Important:** The tasks in this section require the following prerequisites:

- General AT-TLS setup has been implemented at your site. If AT-TLS is not yet activated, see [“Initial setup to activate AT-TLS”](#) on page 578.
- Security authorization for your OMEGAMON started tasks has been defined. For more information, see [“\(If needed\) Define security authorization for OMEGAMON started tasks”](#) on page 584.

To update your existing AT-TLS configuration to enable secure connections for Tivoli Management Services on z/OS components, complete the following steps:

1. [“Create digital certificates and key ring using RACF”](#) on page 585.
2. [“Define AT-TLS policy rules”](#) on page 586.

**Note:** The examples that are provided are intended as a guide; you can organize your certificates and AT-TLS rules differently, depending on the requirements of your site.

## (If needed) Define security authorization for OMEGAMON started tasks

Authorize the OMEGAMON started tasks. If you have an OMEGAMON product installed and running, then the OMEGAMON started tasks have already been authorized; you do not need to perform this task again.

### Before you begin

In this task, you authorize the z/OS user ID under which the OMEGAMON started tasks will run. This user ID is required when creating certificates and the key ring, as described in the next topic, [“Create digital certificates and key ring using RACF” on page 585](#).

If you have already authorized your OMEGAMON started tasks, you will need the z/OS user ID under which the OMEGAMON started tasks run, and you can skip this task.

If you are setting up a new installation and need to authorize your OMEGAMON started tasks, you can use the following procedure, which uses RACF for authorization. For other security management products, refer to your product documentation.

For more information about setting up your system for the first time, including [authorizing the started tasks](#), see [“FTU Task 3: Prepare the system for configuration” on page 75](#).

### About this task

You must add the OMEGAMON started task user ID to the required RACF groups. The user ID requires superuser authority (a TSO ID with an OMVS segment defined to it). For more information, see *z/OS® UNIX® System Services Planning: Superusers in z/OS UNIX*.

If you use Configuration Manager to configure your runtime environment, the prefix of the started task names is set to OMEG. Otherwise, the default prefix value is IBM. The example in the following procedure uses the OMEG prefix.

The following procedure provides example RACF commands to perform these steps.

**Note:** The examples are intended as a guide; you can define your authorizations differently, depending on the requirements of your site.

### Procedure

1. Define the z/OS user ID under which the OMEGAMON started tasks will run.  
In this example, the OMEGAMON started tasks run under the z/OS user ID named ITMUSER with the default group (DFLTGRP) of OMVS and an OMVS segment with a UID of 0:

```
ADDUSER ITMUSER NAME('user-name') DFLTGRP(OMVS)
ALTUSER ITMUSER OMVS(UID(0),HOME(/u),PROGRAM(/bin/sh))
RDEFINE STARTED OMEG*.* UACC(NONE) AUDIT(ALL(READ)) OWNER(IBMUSER)
RALTER STARTED xxx*.* DATA('installation-defined-data') +
STDATA(USER(ITMUSER) GROUP(OMVS))
```

**Note:** This example assigns a UID of 0 to give the user ID superuser authority. For more information about this method, see [Assigning a UID of 0](#).

2. Refresh the in-storage generic profiles, as follows:

```
SETROPTS REFRESH GENERIC(*)
SETROPTS REFRESH RACLIST(STARTED)
```

# Create digital certificates and key ring using RACF

Create the certificates and key ring for use with AT-TLS to secure communication between Tivoli Management Services on z/OS components.

## Before you begin

Certificates are used for authentication. You can use RACF for handling certificates for secure communications, as described in this topic.

**Tip:** You can also generate certificates outside of z/OS according to your organization policy and then import the certificates to RACF or Integrated Cryptographic Service Facility (ICSF).

For other security management products, refer to your product documentation for information about handling certificates and key rings.

### Related information

- *z/OS Security Server RACF Security Administrator's Guide: [RACF and digital certificates](#)*. For a sample setup that uses RACF, see [Scenario 1: Secure server with a certificate signed by a certificate authority](#) and [Scenario 2: Secure server with a locally signed certificate](#).
- *z/OS Planning for Multilevel Security and the Common Criteria: [Authentication via client digital certificates](#)*

## About this task

When you set up your certificates and key ring, you perform the following actions:

- Generate the certificates.
- Create the key ring that will be used in the AT-TLS rules, and add the OMEGAMON started task user ID as the owner.

**Note:** For more information about authorizing the OMEGAMON started tasks, see [“\(If needed\) Define security authorization for OMEGAMON started tasks” on page 584](#).

- Add the certificate chain to the created key ring: root, intermediate, personal certificates (certificates might vary depending on your company policies).

The following procedure provides example RACF commands to perform these actions. In the example, ITMUSER is the z/OS user ID under which the OMEGAMON started tasks run, and ITMkeyring is the name of the key ring.

**Note:** The examples are intended as a guide; you can organize your certificates differently, depending on the requirements of your site.

## Procedure

1. Enter the following RACF command to add user authority for the RACF **RACDCERT** command. In this example, ITMUSER is the z/OS user ID under which the OMEGAMON started tasks run.

```
SETROPTS CLASSACT(DIGTCERT DIGTRING)
RDEFINE FACILITY IRR.DIGTCERT.LISTRING UACC(NONE)
RDEFINE FACILITY IRR.DIGTCERT.LIST UACC(NONE)

PERMIT IRR.DIGTCERT.LIST CLASS(FACILITY) ACCESS(CONTROL) ID(ITMUSER)
PERMIT IRR.DIGTCERT.LISTRING CLASS(FACILITY) ACCESS(READ) ID(ITMUSER)

SETROPTS RACLIST (DIGTRING) REFRESH
SETROPTS RACLIST (DIGTCERT) REFRESH
SETROPTS RACLIST (FACILITY) REFRESH
SETROPTS RACLIST (FACILITY) REFRESH
```

**Tip:** Permits to IRR.DIGTCERT profiles in the FACILITY class is one way to grant key ring access permission. Another way, which is more precise, is to create a profile and grant permission to it in the RDATA LIB class. Access level CONTROL to RDATA LIB profiles is required only in some cases (for example, if the SITE certificate is used in the key ring as PERSONAL). For more information, see the following topics in *z/OS Security Server RACF Callable Services*: [RACF authorization](#) and [Usage notes](#).

2. Enter the following RACF command to generate a certificate authority (CA) certificate:

```
RACDCERT CERTAUTH
GENCERT
SUBJECTSDN(OU('<sysname>CA')
           O('IBM')
           L('Raleigh')
           SP('NC')
           C('US'))
NOTAFTER(DATE(2030-12-31))
WITHLABEL('<SYSNAME>CA')
KEYUSAGE(CERTSIGN)
```

3. Enter the following RACF command to generate a site certificate:

```
RACDCERT ID(ITMUSER)
GENCERT
SUBJECTSDN(CN('sysname.tivlab.raleigh.ibm.com')
           OU('<SYSNAME>')
           O('IBM')
           L('Raleigh')
           SP('NC')
           C('US'))
NOTAFTER(DATE(2030-12-31))
WITHLABEL('<SYSNAME>Certificate')
SIGNWITH(CERTAUTH LABEL('<SYSNAME>CA'))
```

4. Enter the following RACF commands to define the key ring, connect the certificate, and activate your changes. In this example, ITMkeyring is the name of the key ring.

```
RACDCERT ID(ITMUSER)
ADDRING(ITMkeyring)

RACDCERT ID(ITMUSER)
CONNECT(CERTAUTH LABEL('<SYSNAME>CA')
        RING(ITMkeyring))

RACDCERT ID(ITMUSER)
CONNECT(ID(ITMUSER)
        LABEL('<SYSNAME>Certificate')
        RING(ITMkeyring) DEFAULT)

SETROPTS REFRESH RACLIST(STARTED)
```

5. For a configuration with multiple systems where the remote TEMS and hub TEMS run on different LPARs, the public key of the CA certificate must be exported and saved in a data set. You must add the public key of the CA certificate to the key ring for remote clients.

```
RACDCERT CERTAUTH
EXPORT(LABEL('<sysname>CA'))
DSN('<output-data-set-name>')
```

## Define AT-TLS policy rules

Update the AT-TLS policy with rules to secure communication between Tivoli Management Services on z/OS components.

### Before you begin

The AT-TLS policy describes the AT-TLS rules. The location of the AT-TLS policy is specified in the Policy Agent configuration file.

The information in this topic provides guidance and recommendations on what is needed in the AT-TLS rules for securing communication between your Tivoli Management Services on z/OS components. Complete setup and management of AT-TLS rules requires additional RACF and IBM z/OS Communication Server administration, as follows:

- Ensure that the basic setup for Policy Agent is done. For information about policy-based networking and data protection, see [z/OS Communications Server: IP Configuration Reference](#).
- Enablement of AT-TLS and encrypted communication between your Tivoli Management Services on z/OS components requires a certificate and key ring. For more information, see [“Create digital certificates and key ring using RACF”](#) on page 585.

#### Related information:

- [z/OS Communications Server: IP Configuration Guide: Application Transparent Transport Layer Security data protection](#)
- [z/OS Communications Server: IP Configuration Guide: AT-TLS policy configuration](#)
- [z/OS Communications Server: IP Configuration Guide: Getting started with AT-TLS](#)
- [z/OS Communications Server: IP Configuration Reference: AT-TLS policy statements](#)
- [z/OS Communications Server: IP Configuration Reference: TTLSRule statement](#)

#### About this task

Review the following requirements for defining AT-TLS rules for secure communication between your Tivoli Management Services on z/OS components:

- You must define a rule (and corresponding environment action statements) for both the server and the client. In an OMEGAMON environment, all Tivoli Management Services on z/OS components can act as both the server and the client, depending on the nature of request. The following rules are required:
  - For server: Rule for inbound connection with `HandshakeRole` as `Server`
  - For client: Rule for outbound connection with `HandshakeRole` as `Client`

**Important:** Because all Tivoli Management Services on z/OS components can send data, all components can be both server and client.

- Rules must include the **Jobname** parameter set to the mask for the OMEGAMON started tasks; the mask is OMEG\* in the example later in this topic. If needed, you can narrow the scope of a rule by including additional criteria, such as rule parameters that specify IP address or port range. For details about available rule parameters, see [TTLSRule statement](#).

**Note:** Limiting your rule by port or port range requires the use of the [POOL](#) and [EPHEMERAL:Y](#) modifiers when configuring the ports in your runtime environment.

**Important:** Depending on the components installed at your site, new rules created for Tivoli Management Services on z/OS components might overlap with your existing rules. If you encounter overlapping rules, you can create one or more additional rules that are more specific to bypass the conflict. It is recommended that you code the specific rules preceding the general rules so that the specific rules have higher priority and are applied before the general rules. It is possible that you might need to modify your runtime environment (for example, changing [port number assignments](#)) to satisfy the implementation of new AT-TLS rules.

- Both inbound and outbound rules should have the **ApplicationControlled** parameter enabled.

**Tip:** This setting allows you to use secure protocols (for example, IP.SPIPE and HTTPS) at the same time as protocols that are not secure (for example, IP.PIPE and HTTP) in the same environment. This configuration is helpful during migration to a secure protocol.

The following AT-TLS policy properties are set in this task, as follows:

**TTLRule: Jobname**

(Required) Specifies the mask for the OMEGAMON started tasks. This value is OMEG\* in the example, which is the started task prefix set in Configuration Manager.

**TTLRule: Direction**

(Required) Specifies the direction from which a connection must be initiated for this action to be performed.

- Inbound means that the rule applies to connection requests that arrive inbound to the local host. An application must issue an accept request to service this connection.
- Outbound means that the rule applies to connection requests that are issued from the local host. An application must issue a connect request to initiate a connection.

**TTLRule: Priority**

Specifies the optional priority setting. Priority setting is required when more than one rule can match a specific connection. In this example, the priority for the server rule is 10 and the priority for the client rule is 20; the client rule has the higher priority.

**TTLSEnvironmentAction: HandshakeRole**

Specifies the SSL handshake role to be taken for connections in this AT-TLS environment. Valid values are:

**Client**

Perform the SSL handshake as a client.

**Server**

Perform the SSL handshake as a server.

**ServerWithClientAuth**

Perform the SSL handshake as a server requiring client authentication. With this setting, you can indicate the type of client certificate validation to be performed using the **TTLSEnvironmentAdvancedParms: ClientAuthType** parameter.

**TTLSEnvironmentAdvancedParms: Keyring**

Specifies the key ring name, which is ITMkeyring in the example.

**TTLSEnvironmentAdvancedParms: ApplicationControlled**

Enablement of this setting allows you to use secure protocols (like IP.SPIPE and HTTPS) at the same time as protocols that are not secure (like IP.PIPE and HTTP) in the same environment.

**Note:** This configuration is helpful during migration to a secure protocol.

**TTLSEnvironmentAdvancedParms: ClientAuthType**

Specifies the type of client certificate validation to be performed for connections in this AT-TLS environment. Client certificates are requested only if **HandshakeRole** is set to **ServerWithClientAuth**. Valid values are:

**PassThru**

Bypasses client certificate validation.

**Full**

Performs client certificate validation if the client presents a certificate.

**Required**

Requires the client to present a certificate and performs client certificate validation. This is the default.

## SAFCheck

Requires the client to present a certificate, performs client certificate validation and requires the client certificate to have an associated user ID defined to the security product.

## TTLSCipherParms

Defines the cipher specifications. Make sure to review the list of cipher suites to match up-to-date security recommendations.

**Requirement:** AES-GCM ciphers require the Integrated Cryptographic Services Facility (ICSF) to be active. The user ID running the AT-TLS application must have READ access to the following resources in the RACF CSFSERV class:

CSF1TRC  
CSF1SKD  
CSF1SKE  
CSF1TRD

For more information, see *z/OS Communications Server: IP Configuration Reference: [TTLSCipherParms statement](#)* and *z/OS Cryptographic Services System SSL Programming: [RACF CSFSERV resource requirements](#)*.

Use the following procedure to define your AT-TLS rules to establish secure communications between the Tivoli Management Services on z/OS components.

**Note:** The examples are intended as a guide; you can organize your AT-TLS rules differently, depending on the requirements of your site.

## Procedure

Add statements to the AT-TLS policy file, as shown in the following policy examples. All rules, actions, parameters, and attributes described in this step are required.

1. Define the rule and corresponding environment action statements for the server.  
*Figure 89: Sample AT-TLS rule and environment action for the server*

```
TTLRule                                KDEBEIN
{
  Jobname                               OMEG*
  Direction                              Inbound
  Priority                                10
  TTLGroupActionRef                      KDEBGRPACT
  TTLEnvironmentActionRef                 KDEBEENVIN
}

TTLEnvironmentAction                   KDEBEENVIN
{
  HandshakeRole                           Server
  TLSKeyringParms
  {
    Keyring                               ITMkeyring
  }
  TTLSCipherParmsRef                      KDEBECPRM
  TTLEnvironmentAdvancedParmsRef         KDEBEADV
}
```

**Tip:** For `TTLEnvironmentAction:HandshakeRole`, you can specify `ServerWithClientAuth`, which indicates that client authentication is required.

2. Define the rule and corresponding environment action statements for the client.  
*Figure 90: Sample AT-TLS rule and environment action for client systems*

```

TTLRule                                KDEBEOU
{
  Jobname                               OMEG*
  Direction                             Outbound
  Priority                               20
  TTLGroupActionRef                     KDEBGRPACT
  TTLEnvironmentActionRef               KDEBEENVOUT
}
TTLEnvironmentAction                   KDEBEENVOUT
{
  HandshakeRole                         Client
  TLSKeyringParms
  {
    Keyring                              ITMkeyring
  }
  TTLS cipherParmsRef                   KDEBECPRM
  TTLEnvironmentAdvancedParmsRef       KDEBEADV
}

```

3. Create the group action statement.

Figure 91: Sample AT-TLS group action

```

TTLGroupAction                          KDEBGRPACT
{
  TTLEnabled                            On
  TRACE                                  2
}

```

4. Create the environment action advanced parameters.

Figure 92: Sample AT-TLS environment action advanced parameters

```

TTLEnvironmentAdvancedParms             KDEBEADV
{
  ApplicationControlled                  On
  TLSv1                                  Off
  TLSv1.1                                Off
  TLSv1.2                                On
  TLSv1.3                                On
}

```

**Tip:** If you set **TTLEnvironmentAction:HandshakeRole** to **ServerWithClientAuth**, you can specify **TTLEnvironmentAdvancedParms:ClientAuthType** to indicate the type of client certificate validation to be performed.

5. Create the list of cipher suites.

Figure 93: Sample AT-TLS environment cipher specifications

```

TTLS cipherParms                        KDEBECPRM
{
  V3CipherSuites TLS_AES_128_GCM_SHA256
  V3CipherSuites TLS_AES_256_GCM_SHA384
  V3CipherSuites TLS_CHACHA20_POLY1305_SHA256
  V3CipherSuites TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
  V3CipherSuites TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
  V3CipherSuites TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA
  V3CipherSuites TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA
  V3CipherSuites TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256
  V3CipherSuites TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384
  V3CipherSuites TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256
  V3CipherSuites TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
  V3CipherSuites TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA
  V3CipherSuites TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA
  V3CipherSuites TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256
  V3CipherSuites TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384
  V3CipherSuites TLS_DHE_RSA_WITH_AES_128_GCM_SHA256
  V3CipherSuites TLS_DHE_RSA_WITH_AES_256_GCM_SHA384
  V3CipherSuites TLS_DHE_RSA_WITH_AES_128_CBC_SHA
}

```

```
V3CipherSuites TLS_DHE_RSA_WITH_AES_256_CBC_SHA
V3CipherSuites TLS_DHE_RSA_WITH_AES_128_CBC_SHA256
V3CipherSuites TLS_DHE_RSA_WITH_AES_256_CBC_SHA256
}
```

- Refresh the Policy Agent to have your changes take effect. You can refresh the Policy Agent by issuing the **MODIFY PAGENT, REFRESH** command from the console.

## Setting the Hypertext Transfer Protocol for OMEGAMON products

The following topics describe how to configure your runtime environment to use HTTPS or HTTP, or to disable both.

### Update runtime environment to use HTTPS

Update your runtime environment to use HTTPS or to use an HTTPS port other than the default.

#### Before you begin

**Important:** With APAR OA64188, HTTPS is the default communication protocol for new runtime environments. For existing runtime environments, if you do not make the necessary manual configuration updates after applying the APAR, HTTPS will be the default protocol using the default HTTPS port number 3661. You must make the updates before running the Configuration Manager **GENERATE** action or the PARMGEN \$PARSE job.

Complete the following steps:

- [“Create digital certificates and key ring using RACF” on page 585](#)
- [“Define AT-TLS policy rules” on page 586](#)

#### About this task

Perform this task to specify HTTPS as the communication protocol to use between the Tivoli Enterprise Monitoring Server (TEMS) and other components, such as the SOAP server, the IBM Tivoli Monitoring Service Console, the **tacmd** CLI, and TEMS REST services.

You will use the following parameters when configuring your runtime environment to use HTTPS:

#### For the TEMS:

```
RTE_TEMS_TRANSPORT_MODE
KDS_TEMS_HTTPS_PORT_NUM
```

#### For the agents (if applicable):

```
Kpp_X_KDE_TRANSPORT_HTTP_OPTIONS
```

#### Procedure

- Add (or update) the parameters, as follows:

- Using Configuration Manager:

#### For the TEMS:

Add the following parameter to RTEDEF(*rte\_name*):

```
RTE_TEMS_TRANSPORT_MODE    "HTTPS"
```

Add the following parameter to RTEDEF(KDS\$PARM), RTEDEF(KDS\$lpar), or both:

```
KDS_TEMS_HTTPS_PORT_NUM    https_port_num
```

**Note:** If the `RTE_TEMS_TRANSPORT_MODE` and `KDS_TEMS_HTTPS_PORT_NUM` parameters are not specified, and your runtime environment is refreshed, the default values will be used (that is, the HTTPS protocol and HTTPS port number 3661).

**For the agents (if you want your agents to use HTTPS):**

Add the following parameter to `RTEDEF(Kpp$PARM)`, and specify a value that is different from the port number that is used for the TEMS:

```
Kpp_X_KDE_TRANSPORT_HTTP_OPTIONS    "HTTPS:https_port_num USE:Y"
```

- Using PARMGEN:

**For the TEMS:**

Add the following parameters to `WCONFIG(rte_name)`:

```
RTE_TEMS_TRANSPORT_MODE    "HTTPS"  
KDS_TEMS_HTTPS_PORT_NUM    https_port_num
```

**Note:** If the `RTE_TEMS_TRANSPORT_MODE` and `KDS_TEMS_HTTPS_PORT_NUM` parameters are not specified, and your runtime environment is refreshed, the default values will be used (that is, the HTTPS protocol and HTTPS port number 3661).

**For the agents (if you want your agents to use HTTPS):**

Add the following parameter to `WCONFIG(rte_name)`, and specify a value that is different from the port number that is used for the TEMS:

```
Kpp_X_KDE_TRANSPORT_HTTP_OPTIONS    "HTTPS:https_port_num USE:Y"
```

2. Refresh your runtime environment, as follows:
  - Using Configuration Manager: Use the **GENERATE** action to re-create the runtime environment. Optionally, you can use the **GENERATE** action with the **QUICKCONFIG** or **NOUSS** options.
  - Using PARMGEN: Recreate the runtime environment as described in “[Scenario RTE03: Changing parameters in an RTE](#)” on page 844.
3. Start your OMEGAMON started tasks. You should see the following messages in the log:

**For the TEMS:**

```
KDE_TRANSPORT=KDC_FAMILIES="HTTP:0 HTTPS:https_port_num USE:Y <...> "  
listening: ip.ssl.https:26089  
listening: ip.ssl.https:3661
```

**For the agent:**

- With parameter `Kpp_X_KDE_TRANSPORT_HTTP_OPTIONS` specified:

```
KDE_TRANSPORT=KDC_FAMILIES="HTTP:0 USE:Y  
HTTPS:agent_https_port_num USE:Y <...> "  
listening: ip.ssl.https:26055
```

- Without parameter `Kpp_X_KDE_TRANSPORT_HTTP_OPTIONS` specified:

```
KDE_TRANSPORT=KDC_FAMILIES="HTTP:0 USE:Y <...> "
```

4. Test your HTTPS connection using the following methods:
  - If you have `tacmd` configured, issue the following `tacmd` command using your TEMS IP or DNS and the HTTPS port number. For example:

```
C:\Users\userID>tacmd login -s ip:https_port_num
Username? tso_user_id
Password?

Validating user...
KUIIC00007I: User tso_user_id logged into server on https://ip:https_port_num
```

**Note:** To test your connection using **tacmd**, secure communications must be enabled on the Tivoli Monitoring distributed system where the **tacmd** CLI component is installed. For more information, see [Securing communications](#).

- Access the Service Console using `https://ip:https_port_num`. If the connection is successful, then the Service Console items will be displayed.
- Attempt to access the Service Console using `http://`. This attempt should fail.

## Update runtime environment to use HTTP

Update your runtime environment to use HTTP or to use an HTTP port other than the default.

### Before you begin

**Important:**

With APAR OA64188, HTTPS is the default communication protocol for new runtime environments. For existing runtime environments, if you do not make the necessary manual configuration updates after applying the APAR, HTTPS will be the default protocol using the default HTTPS port number 3661.

To use HTTP, you must have parameter **RTE\_TEMS\_TRANSPORT\_MODE** set to value HTTP in either `RTEDEF(rte_name)` for Configuration Manager or `WCONFIG(rte_name)` for PARMGEN before running the Configuration Manager **GENERATE** action or the PARMGEN \$PARSE job, respectively, as described in this procedure.

### About this task

Perform this task to specify HTTPs as the communication protocol to use between the Tivoli Enterprise Monitoring Server (TEMS) and other components, such as the SOAP server, the IBM Tivoli Monitoring Service Console, the **tacmd** CLI, and TEMS REST services.

To use the HTTP protocol, you must add the **RTE\_TEMS\_TRANSPORT\_MODE** parameter with HTTP value as described by this procedure. Otherwise, HTTPS will be the protocol by default, which could impact your environment if AT-TLS is not fully set up.

You will use the following parameters when configuring your runtime environment to use HTTP:

**For the TEMS:**

[RTE\\_TEMS\\_TRANSPORT\\_MODE](#)  
["KDS\\_TEMS\\_HTTP\\_PORT\\_NUM"](#) on page 1402

### Procedure

1. Add (or update) the parameters, as follows:

- Using Configuration Manager:

**For the TEMS:**

Add the following parameter to `RTEDEF(rte_name)`:

```
RTE_TEMS_TRANSPORT_MODE    "HTTP"
```

Add the following parameter to `RTEDEF(KDS$PARM)`, `RTEDEF(KDS$lpar)`, or both:

```
KDS_TEMS_HTTP_PORT_NUM    http_port_num
```

- Using PARMGEN:

**For the TEMS:**

Add the following parameters to WCONFIG(*rte\_name*):

```
RTE_TEMS_TRANSPORT_MODE    "HTTP"
KDS_TEMS_HTTP_PORT_NUM     http_port_num
```

- Refresh your runtime environment, as follows:

- Using Configuration Manager: Use the **GENERATE** action to re-create the runtime environment. Optionally, you can use the **GENERATE** action with the **QUICKCONFIG** or **NOUSS** options.
- Using PARMGEN: Recreate the runtime environment as described in “Scenario RTE03: Changing parameters in an RTE” on page 844.

- Start your OMEGAMON started tasks. You should see the following messages in the log:

**For the TEMS:**

```
KDE_TRANSPORT=KDC_FAMILIES="HTTP:http_port_num USE:Y <...> "
listening: ip.tcp.http:35646
listening: ip.tcp.http:1920
```

- Test your HTTP connection using the following methods:

- If you have **tacmd** configured, issue **tacmd** commands using your TEMS IP or DNS and the HTTP port number. For example:

```
C:\Users\userID>tacmd login -s ip:http_port_num
Username? tso_user_id
Password?

Validating user...
KUIIC00007I: User tso_user_id logged into server on http://ip:http_port_num
KUIIC00008W: The connection you are using is not secure.
```

- Access the Service Console using `http://ip:http_port_num`. If the connection is successful, then the Service Console items will be displayed.
- Attempt to access the Service Console using `https://`. This attempt should fail.

## Update runtime environment to disable HTTP and HTTPS

Update your runtime environment to disable HTTP and HTTPS.

### Before you begin

**Important:** With APAR OA64188, HTTPS is the default communication protocol for new runtime environments. For existing runtime environments, if you do not make the necessary manual configuration updates after applying the APAR, HTTPS will be the default protocol using the default HTTPS port number 3661. You must make the updates before running the Configuration Manager **GENERATE** action or the PARMGEN \$PARSE job.

### About this task

If you do not want to communicate between the Tivoli Enterprise Monitoring Server (TEMS) and the IBM Tivoli Monitoring Service Console, **tacmd**, SOAP, or TEMS REST services, you can disable HTTP and HTTPS protocols by performing the following procedure. With these steps, you will disable the HTTP and HTTPS protocols for both the TEMS and the agents.

You will use the following parameter when disabling HTTP and HTTPS for your runtime environment:

**For the TEMS:**

RTE\_TEMS\_TRANSPORT\_MODE

### Procedure

1. Add (or update) the following parameter in RTEDEF (*rte\_name*) for Configuration Manager or WCONFIG(*rte\_name*) for PARMGEN:

**For the TEMS:**

```
RTE_TEMS_TRANSPORT_MODE    "NONE"
```

2. Refresh your runtime environment, as follows:
  - Using Configuration Manager: Use the **GENERATE** action to re-create the runtime environment. Optionally, you can use the **GENERATE** action with the **QUICKCONFIG** or **NOUSS** options.
  - Using PARMGEN: Recreate the runtime environment as described in “[Scenario RTE03: Changing parameters in an RTE](#)” on page 844.
3. Start your OMEGAMON started tasks. You should see the following message in the log:

```
KDE_TRANSPORT=KDC_FAMILIES="HTTP:0 HTTPS:0 USE:Y <...> "
```

You should not see any `listening:` messages for HTTP or HTTPS in the log.

4. Test your configuration using the following methods:
  - If you have **tacmd** configured, issue **tacmd** commands using your TEMS IP or DNS and the HTTP or HTTPS port number. For example:

```
C:\Users\userID>tacmd login -s ip:http_port_num
Username? tso_user_id
Password?

Validating user...

KUIIC00003E: Cannot connect to a hub monitoring server at addresses:
https://ip:http_port_num , http://ip:http_port_num
```

- Attempt to access the Service Console using `ip:http_port_num` or `dns:http_port_num`. These attempts should fail.

## Setting a secure Transmission Control Protocol (TCP) for OMEGAMON products

This section describes how to update your runtime environment to use a secure TCP protocol (IP.SPIPE, IP6.SPIPE).

When modifying your runtime environment, you can use Configuration Manager or PARMGEN, as described in the following topics.

### Update runtime environment to use secure TCP communication (Configuration Manager)

Use Configuration Manager to update your runtime environment to use secure TCP communication.

#### Before you begin

If you are using a TCP protocol that is non-secure (IP.PIPE, IP6.PIPE) and want to update your runtime environment to use a secure TCP protocol (IP.SPIPE, IP6.SPIPE), you must modify settings for the runtime environment by using Configuration Manager or PARMGEN. This task describes the process using Configuration Manager.

**Note:** If you use PARMGEN, see “[Update runtime environment to use secure TCP communication \(PARMGEN\)](#)” on page 598.

For more information about configuring secure communication using Configuration Manager, review the following related topics:

- *IBM Z Monitoring Configuration Manager: “Communication between monitoring components” on page 330*
- *IBM Z Monitoring Configuration Manager: “Runtime environment (RTE) parameters introduced by Configuration Manager” on page 294*

Before you begin this task, complete the following steps:

- *“Create digital certificates and key ring using RACF” on page 585*
- *“Define AT-TLS policy rules” on page 586*

## About this task

To change the TCP protocol that your runtime environment uses, you must modify the communication protocol setting for both the Tivoli Enterprise Monitoring Server and the monitoring agents. Optionally, you can also modify the ports that are used, if you want to use a port other than the default secure communications port, 3660.

You will use the following parameters when updating your runtime environment to use a secure TCP communication using Configuration Manager:

Component	Parameter	Description
Tivoli Enterprise Monitoring Server Monitoring agents	<u>RTE_COMM_PROTOCOLn</u>	Sets the communication protocol of all components in the runtime environment, where <i>n</i> corresponds to a number between 1 and 7 to indicate the priority sequence for the communication protocols. The <b>RTE_COMM_PROTOCOLn</b> ( <i>n</i> : 1 - 7) parameters set the value of the <b>KDS_TEMS_COMM_PROTOCOLn</b> and <b>Kpp_AGT_COMM_PROTOCOLn</b> parameters.
	<u>RTE_TCP_PIPES_PORT_NUM</u>	Sets the port number for all components in the runtime environment that use the secure TCP over IPv4 communication protocol (IP.SPIPE). The <b>RTE_TCP_PIPES_PORT_NUM</b> parameter sets the value of the <b>KDS_TEMS_TCP_PIPES_PORT_NUM</b> and <b>Kpp_TEMS_TCP_PIPES_PORT_NUM</b> parameters. This parameter is used only if one of the parameters that sets communication protocol choices, <b>*_COMM_PROTOCOLn</b> , specifies the value for this protocol, IPSPIPE.
	<u>RTE_TCP_PIPE6S_PORT_NUM</u>	Sets the port number for all components in the runtime environment that use the secure TCP over IPv6 communication protocol (IP6.SPIPE). The <b>RTE_TCP_PIPE6S_PORT_NUM</b> parameter sets the value of the <b>KDS_TEMS_TCP_PIPE6S_PORT_NUM</b> and <b>Kpp_TEMS_TCP_PIPE6S_PORT_NUM</b> parameters. This parameter is used only if one of the parameters that sets communication protocol choices, <b>*_COMM_PROTOCOLn</b> , specifies the value for this protocol, IPS6PIPE.
Remote monitoring server	<u>KDS_HUB_TCP_PIPES_PORT_NUM</u>	Well-known port for the hub monitoring server for the IP.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPV4), specified during configuration of a remote monitoring server. The default port number is 3660.

Component	Parameter	Description
	<code>KDS_HUB_TCP_PIPE6S_PORT_NUM</code>	Well-known port for the hub monitoring server for the IP6.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPV6), specified during configuration of a remote monitoring server. The default port number is 3660.

**Note:** You can set up your runtime environment to use both IP.SPIPE and IP.PIPE concurrently. This configuration might be useful when transitioning from a non-secure protocol to a secure protocol. For a secure environment, it is recommended that you disable the non-secure protocol after transitioning to the secure protocol as soon as possible.

**Note:** If multiple protocols are specified, you must have a corresponding port assigned for each specified protocol.

The following procedure describes how to specify the use of secure TCP communication (IPSPIPE, IP6SPIPE) for your runtime environment using Configuration Manager.

## Procedure

1. Update the settings for the monitoring server and monitoring agents to use secure TCP communication:
  - a. In member RTEDEF (*rte\_name*), make the following updates:

- Assign a secure communication protocol (IPSPIPE, IP6SPIPE) as the first priority protocol. The following example sets the first priority protocol to use secure TCP over IPv4:

```
RTE_COMM_PROTOCOL1          IPSPIPE * Secure TCP over IPv4
```

**Note:** If you use IPv6, set the protocol value to IP6SPIPE.

- If you want to use a secure communication port other than default port 3660, assign the port number by using the corresponding parameter for the specified protocol (IPv4 or IPv6):

```
RTE_TCP_PIPES_PORT_NUM      3660 * Secure IP.PIPE for IPv4
```

```
RTE_TCP_PIPE6S_PORT_NUM     3660 * Secure IP.PIPE for IPv6
```

- b. If this monitoring server is a remote monitoring server, in member RTEDEF (KDS\$*PARM*) or RTEDEF (KDS\$*lpar*), specify the port number of the hub monitoring server by using the corresponding parameter for the specified protocol (IPv4 or IPv6):

```
KDS_HUB_TCP_PIPES_PORT_NUM  3660 * Secure IP.PIPE for IPv4
```

```
KDS_HUB_TCP_PIPE6S_PORT_NUM 3660 * Secure IP.PIPE for IPv6
```

2. Run the **GENERATE** action.
3. Recycle the started tasks for the monitoring server and the monitoring agents.

## Example

The following example shows the parameters required for a configuration that specifies multiple protocols. If you are transitioning to a secure protocol from a non-secure protocol, you might use this configuration to add the secure protocol before disabling the non-secure protocol. After all components are communicating

securely, you can then disable the non-secure protocol. Note that each specified protocol requires a corresponding port number.

**For the monitoring server and monitoring agents:**

- In member RTEDEF (*rte\_name*):
  - Use the **RTE\_COMM\_PROTOCOLn** parameters to specify the protocols in priority order:

RTE_COMM_PROTOCOL1	IPPIPE	* First choice: secure TCP over IPv4
RTE_COMM_PROTOCOL2	IPPIPE	* Second choice: non-secure TCP over IPv4

- Use the **RTE\_TCP\_\*\_PORT\_NUM** parameters to specify corresponding ports, if you want to use values other than the default values:

RTE_TCP_PIPE_PORT_NUM	1918	* IP.PIPE for IPv4
RTE_TCP_PIPES_PORT_NUM	3660	* Secure IP.PIPE for IPv4

- If the monitoring server is a remote monitoring server, in member RTEDEF (KDS\$PARM) or RTEDEF (KDS\$lpar), use the **KDS\_HUB\_TCP\_\*\_PORT\_NUM** parameters to specify the ports to use:

KDS_HUB_TCP_PIPE_PORT_NUM	1918	* IP.PIPE for IPv4
KDS_HUB_TCP_PIPES_PORT_NUM	3660	* Secure IP.PIPE for IPv4

## Update runtime environment to use secure TCP communication (PARMGEN)

Use PARMGEN to update your runtime environment to use secure TCP communication.

### Before you begin

If you are using a TCP protocol that is non-secure (IP.PIPE, IP6.PIPE) and want to update your runtime environment to use a secure TCP protocol (IP.SPIPE, IP6.SPIPE), you must modify settings for the runtime environment by using Configuration Manager or PARMGEN. This task describes the process using PARMGEN.

**Note:** If you use Configuration Manager, see [“Update runtime environment to use secure TCP communication \(Configuration Manager\)”](#) on page 595.

Before you begin this task, complete the following steps:

- [“Create digital certificates and key ring using RACF”](#) on page 585
- [“Define AT-TLS policy rules”](#) on page 586

### About this task

To change the TCP protocol that your runtime environment uses, you must modify the communication protocol setting for both the Tivoli Enterprise Monitoring Server and the monitoring agents. Optionally, you can also modify the ports that are used, if you want to use a port other than the default secure communications port, 3660.

You will use the following parameters when updating your runtime environment to use a secure TCP communication using PARMGEN:

Table 68: Parameters for setting secure TCP communication using PARMGEN		
Component	Parameter	Description
Tivoli Enterprise Monitoring Server	<u>KDS_TEMS_COMM_PROTOCOLn</u>	Communication protocol to be supported by the Tivoli Enterprise Monitoring Server, where <i>n</i> corresponds to a number between 1 and 7 to indicate the priority sequence for the communication protocols.

Component	Parameter	Description
	<a href="#">“KDS_TEMS_TCP_PIPES_PORT_NUM” on page 1415</a>	Well-known port for the monitoring server for the IP.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv4). The default port number is 3660.
	<a href="#">“KDS_TEMS_TCP_PIPE6S_PORT_NUM” on page 1414</a>	Well-known port for the monitoring server for the IP6.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv6). The default port number is 3660.
Remote monitoring server	<a href="#">KDS_HUB_TCP_PIPES_PORT_NUM</a>	Well-known port for the hub monitoring server for the IP.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPV4), specified during configuration of a remote monitoring server. The default port number is 3660.
	<a href="#">KDS_HUB_TCP_PIPE6S_PORT_NUM</a>	Well-known port for the hub monitoring server for the IP6.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPV6), specified during configuration of a remote monitoring server. The default port number is 3660.
Monitoring agents	<a href="#">“Kpp_AGT_COMM_PROTOCOLn” on page 1264</a>	Communication protocol to be supported by the monitoring agent, where <i>n</i> corresponds to a number between 1 and 7 to indicate the priority sequence for the communication protocols.
	<a href="#">“Kpp_TEMS_TCP_PIPES_PORT_NUM” on page 1295</a>	Port number for agent connection to the monitoring server for the IP.SPIPE communication protocol.
	<a href="#">“KDS_TEMS_TCP_PIPE6S_PORT_NUM” on page 1414</a>	Port number for agent connection to the monitoring server for the IP6.SPIPE communication protocol.

**Note:** You can set up your runtime environment to use both IP.SPIPE and IP.PIPE concurrently. This configuration might be useful when transitioning from a non-secure protocol to a secure protocol. For a secure environment, it is recommended that you disable the non-secure protocol after transitioning to the secure protocol as soon as possible.

**Note:** If multiple protocols are specified, you must have a corresponding port assigned for each specified protocol.

The following procedure describes how to specify the use of secure TCP communication (IPSPIPE, IP6SPIPE) for your runtime environment using PARMGEN.

## Procedure

1. Update the settings for the monitoring server to use secure TCP communication. In member `WCONFIG(rte_name)`, make the following updates:
  - a. Assign a secure communication protocol (IPSPIPE, IP6SPIPE) as the first priority protocol. The following example sets the first priority protocol to use secure TCP over IPv4:

```
KDS_TEMS_COMM_PROTOCOL1      IPSPIPE * Secure TCP over IPv4
```

**Note:** If you use IPv6, set the protocol value to IP6SPIPE.

- b. If you want to use a secure communication port other than default port 3660, assign the port number by using the corresponding parameter for the specified protocol (IPv4 or IPv6):

```
KDS_TEMS_TCP_PIPES_PORT_NUM 3660 * Secure IP.PIPE for IPv4
```

```
KDS_TEMS_TCP_PIPE6S_PORT_NUM 3660 * Secure IP.PIPE for IPv6
```

- c. If this monitoring server is a remote monitoring server, specify the port number of the hub monitoring server by using the corresponding parameter for the specified protocol (IPv4 or IPv6):

```
KDS_HUB_TCP_PIPES_PORT_NUM 3660 * Secure IP.PIPE for IPv4
```

```
KDS_HUB_TCP_PIPE6S_PORT_NUM 3660 * Secure IP.PIPE for IPv6
```

2. Update the settings for each of the monitoring agents to use secure TCP communication. In member WCONFIG(*rte\_name*), make the following updates:

- a. Assign a secure communication protocol (IPSPIPE, IP6SPIPE) as the first priority protocol. The following example sets the first priority protocol to use secure TCP over IPv4:

```
Kpp_AGT_COMM_PROTOCOL1 IPSPIPE * Secure TCP over IPv4
```

- b. If you want to use a secure communication port other than default port 3660, assign the port number by using the corresponding parameter for the specified protocol (IPv4 or IPv6):

```
Kpp_TEMS_TCP_PIPES_PORT_NUM 3660 * Secure IP.PIPE for IPv4
```

```
Kpp_TEMS_TCP_PIPE6S_PORT_NUM 3660 * Secure IP.PIPE for IPv6
```

3. Submit the **\$PARSE** job to refresh the profile.
4. Recycle the started tasks for the monitoring server and the monitoring agents.

## Example

The following example shows the parameters required for a configuration that specifies multiple protocols. If you are transitioning to a secure protocol from a non-secure protocol, you might use this configuration to add the secure protocol before disabling the non-secure protocol. After all components are communicating securely, you can then disable the non-secure protocol. Note that each specified protocol requires a corresponding port number.

### For the monitoring server:

In member WCONFIG(*rte\_name*):

- Use the **KDS\_TEMS\_COMM\_PROTOCOLn** parameters to specify the protocols in priority order:

```
KDS_TEMS_COMM_PROTOCOL1 IPSPIPE * First choice: secure TCP over IPv4
KDS_TEMS_COMM_PROTOCOL2 IPPIPE * Second choice: non-secure TCP over IPv4
```

- Use the **KDS\_TEMS\_TCP\_\*\_PORT\_NUM** parameters to specify corresponding ports, if you want to use values other than the default values:

```
KDS_TEMS_TCP_PIPE_PORT_NUM 1918 * IP.PIPE for IPv4
KDS_TEMS_TCP_PIPES_PORT_NUM 3660 * Secure IP.PIPE for IPv4
```

- If the monitoring server is a remote monitoring server, use the **KDS\_HUB\_TCP\_\*\_PORT\_NUM** parameters to specify the ports to use:

```
KDS_HUB_TCP_PIPE_PORT_NUM 1918 * IP.PIPE for IPv4
KDS_HUB_TCP_PIPES_PORT_NUM 3660 * Secure IP.PIPE for IPv4
```

### For the monitoring agents:

In member `WCONFIG(rte_name)`:

- Use the `Kpp_AGT_COMM_PROTOCOLn` parameters to specify the protocols in priority order:

<code>Kpp_AGT_COMM_PROTOCOL1</code>	<code>IPPIPE</code>	* First choice: secure TCP over IPv4
<code>Kpp_AGT_COMM_PROTOCOL2</code>	<code>IPPIPE</code>	* Second choice: non-secure TCP over IPv4

- Use the `Kpp_TEMS_TCP_*_PORT_NUM` parameters to specify corresponding ports, if you want to use values other than the default values

<code>Kpp_TEMS_TCP_PIPE_PORT_NUM</code>	1918	* IP.PIPE for IPv4
<code>Kpp_TEMS_TCP_PIPES_PORT_NUM</code>	3660	* Secure IP.PIPE for IPv4

**Tip:** Configuration Manager simplifies the process of configuring communication protocols and ports by offering an easy way to set all components to the same values, rather than setting parameters individually for each component. If you are a PARMGEN user, consider moving to Configuration Manager.

## Setting the Internet Protocol (IPv4, IPv6) for OMEGAMON products

This section describes how to update the Internet Protocol in your runtime environment.

If you are using IPv4, you might want to move to IPv6 for its enhanced security.

When modifying your runtime environment, you can use Configuration Manager or PARMGEN, as described in the following topics.

### Update Internet Protocol in runtime environment (Configuration Manager)

Update the Internet Protocol (IPv4, IPv6) that is used for communication in your runtime environment using Configuration Manager.

#### Before you begin

To update the communication used between the components in an OMEGAMON runtime environment, you must define the communication protocol and ports for each component. You might also have to update the host setting and the list of network interfaces. This topic describes how to modify the settings for the Internet Protocol that is used, focusing on the migration from IPv4 to IPv6.

Before you can update your OMEGAMON runtime environment from IPv4 to IPv6, your mainframe environment must be enabled for IPv6. You must have the name of the IPv6-enabled z/OS host and IP address available. Your site might reconfigure an existing host from IPv4 to IPv6, or it might add a new host with a different host name.

If you are using distributed components, your distributed environment must also be configured to communicate using IPv6. IPv6 communication over IPv4-only networks is not supported.

**Note:** If a component needs to communicate using IPv6 with some components and IPv4 with others, the host must be enabled for dual-stack operation. For more information, see *IBM Tivoli Monitoring Installation and Setup Guide: Choose between IPv6 and IPv4*.

**Note:** IPv6 is not supported for sending EIF events from the hub monitoring server or from monitoring agents.

To update your configuration, you must modify the settings for the runtime environment using Configuration Manager or PARMGEN. This task describes this process using Configuration Manager.

**Note:** If you use PARMGEN, see [“Update Internet Protocol in runtime environment \(PARMGEN\)” on page 604.](#)

**Related links:**

- [IBM Tivoli Monitoring 6.3.0.1 Installation Guide: Configuring IBM Tivoli Monitoring components for IPv6 communication](#)
- [Configuration Manager: “Communication between monitoring components” on page 330](#)
- [OMEGAMON shared documentation: “Decision 6: How to set up communications between components” on page 147](#)
- [OMEGAMON shared documentation: “Managing multiple network interfaces” on page 609](#)

**About this task**

The communication protocol and ports for any monitoring server and all monitoring agents must be the same for communication to be successful.

If you are updating the communication protocol for the runtime environment or plan to use a port number that is different from the default port for the protocol, you must update the values for all communication protocols and ports specified within the profile. You might also have to update the host and the list of network interfaces.

To change the communication protocol that your runtime environment uses, you modify the communication protocol setting for any monitoring servers and the monitoring agents. You might also have to update the name of the host, if it is different; and you can also modify the ports that are used, if you want to use a port other than the default port for the protocol.

You will use the following parameters when updating the Internet Protocol for your runtime environment:

<i>Table 69: Parameters for setting IP protocol using Configuration Manager</i>		
<b>Component</b>	<b>Parameter</b>	<b>Description</b>
Tivoli Enterprise Monitoring Server Monitoring agents	<a href="#">“RTE_TCP_HOST” on page 288</a>	Specifies the TCP/IP host name or IP address of the z/OS system where the runtime environment is defined. If you configure a monitoring server as part of your runtime environment, the <b>RTE_TCP_HOST</b> parameter value sets the value of the <b>KDS_TEMS_TCP_HOST</b> parameter. Depending on other settings in the runtime environment, the <b>RTE_TCP_HOST</b> parameter might also set the value for the <b>Kpp_TEMS_TCP_HOST</b> parameters.
	<a href="#">RTE_COMM_PROTOCOLn</a>	Sets the communication protocol of all components in the runtime environment, where <i>n</i> corresponds to a number between 1 and 7 to indicate the priority sequence for the communication protocols. The <b>RTE_COMM_PROTOCOLn</b> (n: 1 - 7) parameters set the value of the <b>KDS_TEMS_COMM_PROTOCOLn</b> and <b>Kpp_AGT_COMM_PROTOCOLn</b> parameters.
	IPv4 ports: <ul style="list-style-type: none"> <li>• <a href="#">“RTE_TCP_PORT_NUM” on page 289</a></li> <li>• <a href="#">RTE_TCP_PIPES_PORT_NUM</a></li> <li>• <a href="#">“RTE_TCP_UDP_PORT_NUM” on page 297</a></li> </ul>	Ports for all components in the runtime environment that communicate over IPv4.

Component	Parameter	Description
	IPv6 ports: <ul style="list-style-type: none"> <li>• <a href="#">“RTE_TCP_PIPE6_PORT_NUM” on page 296</a></li> <li>• <a href="#">RTE_TCP_PIPE6S_PORT_NUM</a></li> <li>• <a href="#">“RTE_TCP_UDP6_PORT_NUM” on page 298</a></li> </ul>	Ports for all components in the runtime environment that communicate over IPv6.
Remote monitoring server	<a href="#">“KDS_HUB_TCP_HOST” on page 1374</a>	Specifies the TCP/IP host name or IP address of the z/OS® system where the hub monitoring server is installed. This parameter applies only to a remote monitoring server that uses TCP/IP for communications.
	IPv4 ports: <ul style="list-style-type: none"> <li>• <a href="#">“KDS_HUB_TCP_PIPE_PORT_NUM” on page 1374</a></li> <li>• <a href="#">“KDS_HUB_TCP_PIPES_PORT_NUM” on page 1375</a></li> <li>• <a href="#">“KDS_HUB_TCP_UDP_PORT_NUM” on page 1376</a></li> </ul>	Well-known ports for the hub monitoring server over IPv4, specified during configuration of a remote monitoring server.
	IPv6 ports: <ul style="list-style-type: none"> <li>• <a href="#">“KDS_HUB_TCP_PIPE6_PORT_NUM” on page 1374</a></li> <li>• <a href="#">“KDS_HUB_TCP_PIPE6S_PORT_NUM” on page 1375</a></li> <li>• <a href="#">“KDS_HUB_TCP_UDP6_PORT_NUM” on page 1376</a></li> </ul>	Well-known ports for the hub monitoring server over IPv6, specified during configuration of a remote monitoring server.
Network interface lists	IPv4 communication: <ul style="list-style-type: none"> <li>• <a href="#">RTE_TCP_KDEB_INTERFACELIST</a></li> </ul>	Directs all components in the runtime environment to connect to a specific TCP/IP local interface for IPv4 communication.
	IPv6 communication: <ul style="list-style-type: none"> <li>• <a href="#">KDEB_INTERFACELIST_IPV6</a> (embed override parameter)</li> </ul>	Contains a list of interface addresses in the order for which these interface addresses should be discovered and used for IPv6 communication.

The following procedure describes how to change the IP protocol, such as from IPv4 to IPv6, for your runtime environment using Configuration Manager.

## Procedure

1. Update the settings for the monitoring server and monitoring agents to use to communicate, as follows:
  - a. In member RTEDEF (*rte\_name*), make the following updates:
    - Assign the communication protocol as the first priority protocol. The following example sets the first priority protocol to use the IP6.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv6):

```
RTE_COMM_PROTOCOL1          IP6SPIPE * Secure TCP over IPv4
```

- Specify the port number using the corresponding parameter for the specified protocol. The following example sets the port for the IP6.SPIPE communication protocol; in this case, it is the default port number:

```
RTE_TCP_PIPE6S_PORT_NUM    3660      * Secure IP.PIPE for IPv6
```

**Important:** For all port parameters that are not related to the defined communication protocol, remove the parameter value, if defined. Otherwise, parameter validation will fail.

- Specify the host.

**Note:** If you are migrating from IPv4 to IPv6, the host must be IPv6-enabled. Your site might reconfigure the existing host to enable IPv6, or it might add a new host with a different host name or IP address.

```
RTE_TCP_HOST          "SYSA"
```

- b. If this monitoring server is a remote monitoring server, in member RTEDEF (KDS\$PARM) or RTEDEF (KDS\$*lpar*), specify the port number of the hub monitoring server by using the corresponding parameter for the specified protocol (IPv4 or IPv6):

```
KDS_HUB_TCP_PIPE6S_PORT_NUM    3660    * Secure IP.PIPE for IPv6
```

- c. Update the interface lists for the runtime environment. If you are migrating from IPv4 to IPv6, you must update the settings as follows:
- Set the interface list parameter that is used for IPv4 communication to the hyphen (-) character:

```
RTE_TCP_KDEB_INTERFACELIST    "-"
```

- Specify the list of interface addresses for IPv6 communication in the **KDEB\_INTERFACELIST\_IPV6** embed override parameters by editing embed override member EMBEDS (KDS\$PENV) for the monitoring server and EMBEDS (KAG\$PENV) for the monitoring agents. By default, this parameter is commented out; you must remove the asterisk (\*) that precedes the parameter name to enable the parameter setting.

```
KDEB_INTERFACELIST_IPV6=\  
(2002:930:9b04:305:9:48:133:98) \  
(2002:930:9b04:305:9:48:133:100)
```

For more information about configuring interface lists, see [“Managing multiple network interfaces” on page 609](#).

2. Run the **GENERATE** action.
3. Recycle the started tasks for the monitoring server and the monitoring agents.

## Update Internet Protocol in runtime environment (PARMGEN)

Update the Internet Protocol (IPv4, IPv6) that is used for communication in your runtime environment using PARMGEN.

### Before you begin

To update the communication used between the components in an OMEGAMON runtime environment, you must define the communication protocol and ports for each component. You might also have to update the host setting and the list of network interfaces. This topic describes how to modify the settings for the Internet Protocol that is used, focusing on the migration from IPv4 to IPv6.

Before you can update your OMEGAMON runtime environment from IPv4 to IPv6, your mainframe environment must be enabled for IPv6. You must have the name of the IPv6-enabled z/OS host and IP address available. Your site might reconfigure an existing host from IPv4 to IPv6, or it might add a new host with a different host name.

If you are using distributed components, your distributed environment must also be configured to communicate using IPv6. IPv6 communication over IPv4-only networks is not supported.

**Note:** If a component needs to communicate using IPv6 with some components and IPv4 with others, the host must be enabled for dual-stack operation. For more information, see *IBM Tivoli Monitoring Installation and Setup Guide: Choose between IPv6 and IPv4*.

**Note:** IPv6 is not supported for sending EIF events from the hub monitoring server or from monitoring agents.

To update your configuration, you must modify the settings for the runtime environment using Configuration Manager or PARMGEN. This task describes this process using PARMGEN.

**Note:** If you use Configuration Manager, see [“Update Internet Protocol in runtime environment \(Configuration Manager\)” on page 601](#).

**Related links:**

- [OMEGAMON shared documentation: “Managing multiple network interfaces” on page 609](#)

**About this task**

The communication protocol and ports for any monitoring server and all monitoring agents must be the same for communication to be successful.

If you are updating the communication protocol for the runtime environment or plan to use a port number that is different from the default port for the protocol, you must update the values for all communication protocols and ports specified within the profile. You might also have to update the host and the list of network interfaces.

To change the communication protocol that your runtime environment uses, you modify the communication protocol setting for any monitoring servers and the monitoring agents. You might also have to update the name of the host, if it is different; and you can also modify the ports that are used, if you want to use a port other than the default port for the protocol.

You will use the following parameters when updating the Internet Protocol for your runtime environment:

<i>Table 70: Parameters for setting IP protocol using PARMGEN</i>		
<b>Component</b>	<b>Parameter</b>	<b>Description</b>
Tivoli Enterprise Monitoring Server	<a href="#">KDS_TEMS_TCP_HOST</a>	Specifies the TCP/IP host name or IP address of the z/OS® system where the monitoring server is installed.
	<a href="#">KDS_TEMS_COMM_PROTOCOLn</a>	Communication protocol to be supported by the Tivoli Enterprise Monitoring Server, where <i>n</i> corresponds to a number between 1 and 7 to indicate the priority sequence for the communication protocols.

Component	Parameter	Description
	IPv4 ports: <ul style="list-style-type: none"> <li>“KDS_TEMS_TCP_PIPE_PORT_NUM” on page 1413</li> <li>“KDS_TEMS_TCP_PIPES_PORT_NUM” on page 1415</li> <li>“KDS_TEMS_TCP_UDP_PORT_NUM” on page 1416</li> </ul>	Well-known ports for the monitoring server over IPv4.
	IPv6 ports: <ul style="list-style-type: none"> <li>“KDS_TEMS_TCP_PIPE6_PORT_NUM” on page 1414</li> <li>“KDS_TEMS_TCP_PIPE6S_PORT_NUM” on page 1414</li> <li>“KDS_TEMS_TCP_UDP6_PORT_NUM” on page 1417</li> </ul>	Well-known ports for the monitoring server over IPv6.
Remote monitoring server	“KDS_HUB_TCP_HOST” on page 1374	Specifies the TCP/IP host name or IP address of the z/OS® system where the hub monitoring server is installed. This parameter applies only to a remote monitoring server that uses TCP/IP for communications.
	IPv4 ports: <ul style="list-style-type: none"> <li>• “KDS_HUB_TCP_PIPE_PORT_NUM” on page 1374</li> <li>• “KDS_HUB_TCP_PIPES_PORT_NUM” on page 1375</li> <li>• “KDS_HUB_TCP_UDP_PORT_NUM” on page 1376</li> </ul>	Well-known ports for the hub monitoring server over IPv4, specified during configuration of a remote monitoring server.
	IPv6 ports: <ul style="list-style-type: none"> <li>• “KDS_HUB_TCP_PIPE6_PORT_NUM” on page 1374</li> <li>• “KDS_HUB_TCP_PIPE6S_PORT_NUM” on page 1375</li> <li>• “KDS_HUB_TCP_UDP6_PORT_NUM” on page 1376</li> </ul>	Well-known ports for the hub monitoring server over IPv6, specified during configuration of a remote monitoring server.
Monitoring agents	“Kpp_TEMS_TCP_HOST” on page 1293	Specifies the TCP/IP host name or IP address of the z/OS® system of the agent's primary monitoring server.
	“Kpp_AGT_COMM_PROTOCOLn” on page 1264	Communication protocol for the connection between the monitoring agent and the Tivoli Enterprise Monitoring Server, where <i>n</i> corresponds to a number between 1 and 7 to indicate the priority sequence for the communication protocols.
	IPv4 ports: <ul style="list-style-type: none"> <li>• “Kpp_TEMS_TCP_PIPE_PORT_NUM” on page 1294</li> <li>• “Kpp_TEMS_TCP_PIPES_PORT_NUM” on page 1295</li> <li>• “Kpp_TEMS_TCP_UDP_PORT_NUM” on page 1296</li> </ul>	Well-known ports for the monitoring agents over IPv4.

Component	Parameter	Description
	IPv6 ports: <ul style="list-style-type: none"> <li>• <u>“Kpp_TEMS_TCP_PIPE6_PORT_NUM” on page 1295</u></li> <li>• <u>“Kpp_TEMS_TCP_PIPE6S_PORT_NUM” on page 1295</u></li> <li>• <u>“Kpp_TEMS_TCP_UDP6_PORT_NUM” on page 1296</u></li> </ul>	Well-known ports for the monitoring agents over IPv6.
Network interface lists	IPv4 communication: <ul style="list-style-type: none"> <li>• <u>KDS_TEMS_TCP_KDEB_INTERFACELIST</u></li> <li>• <u>Kpp_AGT_TCP_KDEB_INTERFACELIST</u></li> </ul>	Specifies lists of network interfaces for the monitoring server and monitoring agent to use for IPv4 communication, respectively.
	IPv6 communication: <ul style="list-style-type: none"> <li>• <u>KDEB_INTERFACELIST_IPV6</u> (embed override parameter)</li> </ul>	Contains a list of interface addresses in the order for which these interface addresses should be discovered and used for IPv6 communication.

**Tip:** Configuration Manager simplifies the process of configuring communication protocols and ports by offering an easy way to set all components to the same values, rather than setting parameters individually for each component. If you are a PARMGEN user, consider moving to Configuration Manager.

The following procedure describes how to change the IP protocol, such as from IPv4 to IPv6, for your runtime environment using PARMGEN.

## Procedure

1. From the **Workflow - Primary Option Menu**, select option 2, **Customize PARMGEN configuration profiles**.  
The **Customize PARMGEN Configuration Profile Members (KCIP@PG6)** panel is displayed.
2. Select option 1 to edit the runtime environment (RTE) configuration profile.  
The profile member is displayed.
3. Update the settings for the monitoring server to use to communicate with the other components, as follows:
  - a. Assign the communication protocol as the first priority protocol. The following example sets the first priority protocol to use the IP6.SPIPE communication protocol (the TCP/IP protocol that supports Secure Sockets Layer communications over IPv6):

```
KDS_TEMS_COMM_PROTOCOL1      IP6SPIPE * Secure TCP over IPv6
```

- b. Specify the port number using the corresponding parameter for the specified protocol. The following example sets the port for the monitoring server for the IP6.SPIPE communication protocol; in this case, it is the default port number:

```
KDS_TEMS_TCP_PIPE6S_PORT_NUM  3660      * Secure IP.PIPE for IPv6
```

**Important:** For all port parameters that are not related to the defined communication protocol, remove the parameter value, if defined. Otherwise, parameter validation will fail.

- c. If this monitoring server is a remote monitoring server, specify the port number of the hub monitoring server by using the corresponding parameter for the specified protocol:

```
KDS_HUB_TCP_PIPE6S_PORT_NUM      3660      * Secure IP.PIPE for IPv6
```

- d. Specify the host.

**Note:** If you are migrating from IPv4 to IPv6, the host must be IPv6-enabled. Your site might reconfigure the existing host to enable IPv6, or it might add a new host with a different host name or IP address.

```
KDS_TEMS_TCP_HOST                  "SYSA"
```

- e. Update the network interface list. If you are migrating from IPv4 to IPv6, set the interface list parameter that is used for IPv4 communication to the hyphen (-) character:

```
KDS_TEMS_TCP_KDEB_INTERFACELIST  "-"
```

4. Update the settings for each of the monitoring agents to use to communicate with the other components, as follows:

- a. Assign the communication protocol as the first priority protocol for each of the agents. The following example sets the first priority protocol to use the IP6 .SPIPE communication protocol:

```
Kpp_AGT_COMM_PROTOCOL1           IP6SPIPE  * Secure TCP over IPv6
```

- b. Specify the port number using the corresponding parameter for the specified protocol:. The following example sets the well-known port for the monitoring server for the IP6 .SPIPE communication protocol.

```
Kpp_TEMS_TCP_PIPE6S_PORT_NUM      3660      * Secure IP.PIPE for IPv6
```

- c. Specify the host.

```
Kpp_TEMS_TCP_HOST                  "SYSA"
```

- d. Update the network interface list. If you are migrating from IPv4 to IPv6, set the interface list parameter that is used for IPv4 communication to the hyphen (-) character:

```
Kpp_AGT_TCP_KDEB_INTERFACELIST  "-"
```

5. Save the changes and return to the **Customize PARMGEN Configuration Profile Members** panel.

6. If you are using or migrating to IPv6 communication, update the list of interface addresses for IPv6 communication as follows:

- a. Select option 4 on the **Customize PARMGEN Configuration Profile Members** panel to customize the WCONFIG data set.
- b. Specify the list of interface addresses for IPv6 communication in the **KDEB\_INTERFACELIST\_IPV6** embed override parameter by editing embed override member WCONFIG(KDS\$PENV) for the monitoring server and WCONFIG(KAG\$PENV) for the monitoring agents. By default, this parameter is commented out; you must remove the asterisk (\*) that precedes the parameter name to enable the parameter setting.

```
KDEB_INTERFACELIST_IPV6=\
(2002:930:9b04:305:9:48:133:98)\
(2002:930:9b04:305:9:48:133:100)
```

- c. Save the changes and return to the **Customize PARMGEN Configuration Profile Members** panel.

7. Return to the **Workflow - Primary Options Menu** panel.

8. Regenerate the runtime members and jobs, as follows:

- a. Select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** (KCIP@PR1) panel is displayed.

- b. Select option 1 to submit the \$PARSE job (or the \$PARSESV job, if variables are enabled).
  - c. Return to the **Workflow - Primary Options Menu** panel.
9. Copy the runtime members from the work libraries to the production libraries, as follows:
  - a. Select **Submit batch jobs to complete PARMGEN setup** from the menu.  
The **Submit Batch Jobs To Complete PARMGEN Setup** (KCIP@SUB) panel is displayed.
  - b. Optional: Select option 11 and submit the KCIJPCPR job to back up the production libraries.
  - c. Select option 12 and submit the KCIJPW2R job (or the KCIJPW1R job) to copy the work libraries to the production libraries.
10. Recycle the started tasks for the monitoring server and the monitoring agents.

## Managing multiple network interfaces

If you have multiple network interfaces, you can set the priority of the interfaces to use by using interface lists.

If your site runs more than one TCP/IP interface or network adapter on the same z/OS® image, you can specify network interfaces to be used by monitoring servers and monitoring agents on a z/OS® system.

You specify the network interfaces in the IP communication protocol parameters for each component.

When you have multiple network interfaces, you manage their priority of use through a set of configuration and embed parameters named **\*\_KDEB\_INTERFACELIST** and **KDEB\_INTERFACELIST\***, respectively.

The configuration process is different for IPv4 and IPv6 communication.

### Configuration parameters (for IPv4 only)

The following configuration parameters are available for setting the network interface to use for IPv4 communication.

**Note:** For setting the network interface to use for IPv6 communication, you must use embed override variable **KDEB\_INTERFACELIST\_IPV6**, which is described later in this topic.

**Important:** If you need to update the following parameter values, use Configuration Manager or PARMGEN to modify your configuration.

### **RTE\_TCP\_KDEB\_INTERFACELIST** (valid in Configuration Manager only)

This Configuration Manager-only parameter directs all components in the runtime environment to connect to a specific TCP/IP local interface for IPv4 communication.

This parameter sets the value of parameters **KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST** (for the monitoring server) and **Kpp\_AGT\_TCP\_KDEB\_INTERFACELIST** (for the monitoring agents).

If you want to disable all network interfaces for IPv4 in the runtime environment (for example, if you are moving from IPv4 to IPv6), perform the following steps:

1. If defined, remove parameters **KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST** and **Kpp\_AGT\_TCP\_KDEB\_INTERFACELIST** from members RTEDEF (Kpp\$PARM) and RTEDEF (Kpp\$lpar).
2. In RTEDEF (*rte\_name*), set the following parameter and value:

```
RTE_TCP_KDEB_INTERFACELIST " - "
```

### **KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST**

This parameter specifies a list of network interfaces for the monitoring server to use for IPv4 communication.

**For Configuration Manager:**

You can use this parameter to set the list of network interfaces for the monitoring server to use for IPv4 communication, or you can use parameter `RTE_TCP_KDEB_INTERFACELIST`, which sets the value for all components in the runtime environment.

**For PARMGEN:**

This parameter is required to use IPv4 communication.

To disable the network interfaces for IPv4 for the monitoring server, set the value as follows:

```
KDS_TEMS_TCP_KDEB_INTERFACELIST " - "
```

**Kpp\_AGT\_TCP\_KDEB\_INTERFACELIST**

This parameter specifies a list of network interfaces for the monitoring agent to use for IPv4 communication.

**For Configuration Manager:**

You can use this parameter to set the list of network interfaces for the monitoring agent to use for IPv4 communication, or you can use parameter `RTE_TCP_KDEB_INTERFACELIST`, which sets the value for all components in the runtime environment..

**For PARMGEN:**

This parameter is required to use IPv4 communication.

To disable the network interfaces for IPv4 for the monitoring agent, set the value as follows:

```
Kpp_AGT_TCP_KDEB_INTERFACELIST " - "
```

**Embed override parameters (environment variables)**

The following embed override parameters (environment variables) indicate the network interface to use depending on IPv4 or IPv6 communication:

**KDEB\_INTERFACELIST (for IPv4 only)**

Contains a list of interface addresses in the order for which these interface addresses should be discovered and used for IPv4 communication.

To update this setting, you use the [configuration parameters](#), as follows:

- Using Configuration Manager, modify the `RTE_TCP_KDEB_INTERFACELIST` parameter value.
- Using PARMGEN, modify the `KDS_TEMS_TCP_KDEB_INTERFACELIST` and `Kpp_AGT_TCP_KDEB_INTERFACELIST` parameter values.

If you are using IPv6, this parameter must be set as follows:

```
KDEB_INTERFACELIST=' - '
```

**KDEB\_INTERFACELIST\_IPV6 (for IPv6 only)**

Contains a list of interface addresses in the order for which these interface addresses should be discovered and used for IPv6 communication.

By default, this parameter is commented out:

```
*KDEB_INTERFACELIST_IPV6=-
```

To update the parameter, remove the asterisk (\*) and replace the hyphen (-) with one or more interface addresses.

Numeric IPv6 addresses must be enclosed in parentheses. Multiple addresses are separated by a backslash (\). For example:

```
KDEB_INTERFACELIST_IPV6=\
(2002:930:9b04:305:9:48:133:98)\
(2002:930:9b04:305:9:48:133:100)
```

To update this setting::

- Using Configuration Manager, edit embed override member EMBEDS (KDS\$PENV) for the monitoring server and EMBEDS (KAG\$PENV) for the monitoring agents. For more information, see [“Using override embed members in Configuration Manager” on page 337](#).
- Using PARMGEN, edit embed override member WCONFIG (KDS\$PENV) for the monitoring server and WCONFIG (KAG\$PENV) for the monitoring agents by selecting option **4** on the **Customize PARMGEN Configuration Profile Members** panel. For more information, see [“Override embed members” on page 417](#) and [“Customizing the override embed members” on page 471](#).

### Information required for network interface list

When configuring the network interface list for the monitoring server, you need the following information:

- The host name or IP address of the preferred interface.
- A list of host names or IP addresses, in descending order of preference. Use a blank (space) to separate the entries.
- An asterisk (\*) to prefer the interface associated with the default host name for the z/OS® image. To display this value, enter TSO HOMETEST at the command-line.
- An exclamation point followed by an asterisk (!\*) to use only the interface associated with the default host name for the z/OS® image.
- An exclamation point followed by a host name or IP address (!*hostname*) to use only the interface associated with *hostname*.

**Note:** A high-availability hub uses a dynamic virtual IP address (DVIPA).

- A minus sign followed by a host name or IP address (-*hostname*) to use any interface except the one associated with *hostname*.

#### Note:

- If you set the value of this parameter to !\* or !*hostname*, you must specify the same value for every component and product configured in all runtime environments on the same z/OS® image.
- In the default character set (LANG=en\_US.ibm-037), the code for an exclamation point is x'5A'. If you are using a character set other than the default, a different character might map to that code. To require a specific network interface, use the character that maps to x'5A' in your character set.

# Scenarios

Scenarios contain step-by-step instructions for configuring, reconfiguring, maintaining, upgrading, and replicating your runtime environments.

## Implementation scenarios

Implementation scenarios step you through the creation of runtime environments (RTEs) and the configuration of components and products in those environments.

“[Summary of QCF scenario features](#)” on page 612 summarizes the features of the RTEs in the Quick Configuration (QCF) scenarios. Note that model profiles that begin with \$ represent best-practice RTEs.

This table summarizes the features of the runtime environments in the Quick configuration scenarios.

*Table 71: Summary of QCF scenario features*

Scenario	Template name	RTE type	Monitoring server type	System variables	Description
<a href="#">QCF01</a>	\$MDLHA	Full	High-availability hub	No	RTE configuration template for full, standalone RTE (High Availability (HA) Hub TEMS)
<a href="#">QCF02</a>	\$MDLHFV	Full	Static hub	Yes	RTE configuration template for full, standalone RTE (Static Hub TEMS and Agents with variables enabled)
<a href="#">QCF03</a>	\$MDLRBVB	Sharing-with-base	Remote	Yes	RTE configuration template for sharing-with-base read-only libraries RTE (Remote TEMS and Agents with variables enabled)
<a href="#">QCF04</a>	@MDLHF	Full	Static hub	No	RTE configuration template for full, standalone RTE (Static Hub TEMS and Agents)
<a href="#">QCF05</a>	@MDLRF	Full	Remote	No	RTE configuration template for full, standalone RTE (Remote TEMS and Agents)
<a href="#">QCF06</a>	@MDLRFV	Full	Remote	Yes	RTE configuration template for full, standalone RTE (Remote TEMS and Agents with variables enabled)
<a href="#">QCF07</a>	@MDLRBVB	Sharing-with-base	Remote	No	RTE configuration template for sharing-with-base read-only libraries RTE (Remote TEMS and Agents)

Scenario	Template name	RTE type	Monitoring server type	System variables	Description
<a href="#">QCF08</a>	@MDLRSS	Sharing-with-SMP/E	Remote	No	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Remote TEMS and Agents)
<a href="#">QCF09</a>	@MDLRSSV	Sharing-with-SMP/E	Remote	Yes	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Remote TEMS and Agents with variables enabled)
<a href="#">QCF10</a>	@MDLHSS	Sharing-with-SMP/E	Hub	No	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Static Hub TEMS and Agents)
<a href="#">QCF12</a>	@MDLHSB	Sharing-with-Base	Hub	No	RTE configuration template for sharing-with-base read-only libraries RTE (Hub TEMS and Agents)
<a href="#">QCF13</a>	\$MDLAFV	Full	N/A	Yes	RTE configuration template for full, stand-alone RTE (Agents only with variables enabled connecting to a z/OS TEMS in another RTE)
<a href="#">QCF14</a>	@MDLAF	Full	N/A	No	IBM-provided RTE configuration template for full, standalone RTE (Agents only connecting to a z/OS TEMS in another RTE)
<a href="#">QCF15</a>	\$MDLASBV	Sharing-with-base	N/A	Yes	RTE configuration template for sharing-with-base read-only libraries RTE (Agents only with variables enabled connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)

Scenario	Template name	RTE type	Monitoring server type	System variables	Description
<u>QCF16</u>	@MDLASB	Sharing-with-base	N/A	No	RTE configuration template for sharing-with-base read-only libraries RTE (Agents only connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)
<u>QCF17</u>	@MDLASSV	Sharing-with-SMP/E	N/A	Yes	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Agents only with variables enabled connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)
<u>QCF18</u>	@MDLASS	Sharing-with-SMP/E	N/A	No	RTE configuration template for sharing-with-SMP/E datasets RTE (Agents only connecting to a non-local TEMS configured in another RTE or running on another non-z/OS platform)
<u>QCF19</u>	\$MDLHSSV	Sharing-with-SMP/E	Hub	Yes	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Static Hub TEMS, enhanced 3270 user interface (TOM) and OMEGAMON for JVM (KJJ) Agent only with variables enabled)
<u>QCF20</u>	\$MDLHSS	Sharing-with-SMP/E	Hub	No	RTE configuration template for sharing-with-SMP/E target read-only datasets RTE (Static Hub TEMS, enhanced 3270 user interface (TOM) and OMEGAMON for JVM (KJJ) Agent only)

Scenario	Template name	RTE type	Monitoring server type	System variables	Description
<a href="#">QCF21</a>	\$MDLHSBV	Sharing-with-base	Hub	Yes	Predefined RTE models include a z/OS Tivoli Enterprise Monitoring Server (TEMS, whether this is a Hub TEMS or a Remote TEMS), an OMEGAMON enhanced 3270 user interface (TOM) and both types of z/OS monitoring Agents (Agents that run in the z/OS TEMS address space and Agents that run in their own standalone Agent address spaces).
<a href="#">QCF22</a>	@MDLHSSV	Sharing-with-SMP/E	Hub	Yes	Predefined RTE models include a z/OS Tivoli Enterprise Monitoring Server (TEMS, whether this is a Hub TEMS or a Remote TEMS), an OMEGAMON enhanced 3270 user interface (TOM) and both types of z/OS monitoring Agents (Agents that run in the z/OS TEMS address space and Agents that run in their own standalone Agent address spaces).

With the exception of QCF10, the QCF scenarios illustrate the use of IBM-provided model RTEs to create new RTEs.

**Tips:**

- These scenarios assume that you are using the PARMGEN Workflow interface to perform the configuration steps.
- For information on getting help for parameters, see the online help in the configuration profile (F1).
- For locating and changing values for related parameters, see [XF edit macro](#).

Scenarios involving maintenance-type tasks that you can perform using the PARMGEN method are in [SMP/E maintenance and upgrade scenarios](#) and [Runtime environment reconfiguration scenarios](#). Scenarios that illustrate how to clone RTEs and deploy them to other LPARS are in [Deployment scenarios](#).

## Scenario QCF01: Configuring a full RTE with a high-availability hub monitoring server

If your environment meets the requirements, you should create a high-availability (HA) hub monitoring server. An HA hub is not defined to run on any specific system; it retains the same parameter values on any system in the sysplex. So it can be started on any LPAR using the same DVIPA address. Using an HA hub ensures that

monitoring can continue with minimal disruption if the current system goes down, is shut down for maintenance, or suffers any other problem. You can use the IBM-provided template to create this RTE or you can configure it from scratch.

## Before you begin

An HA hub has the following requirements:

- It must be configured in a sysplex.
- It must have a dynamic virtual IP address (DVIPA), so it can respond to the same IP address on any LPAR in the sysplex. The DVIPA address must be defined on any LPAR that is a candidate for the HA hub.
- Its runtime libraries must be stored on shared DASD, so it can start on any LPAR in the sysplex without requiring replication of the libraries.
- It must be configured in its own runtime environment (RTE), without any monitoring agents configured in the RTE.
- It is recommended that its runtime environment not use system variables. The high-availability hub retains the same parameter values on any system in the sysplex.

Before you begin configuring the RTE, make sure that an application-instance-specific (private) DVIPA address has been created and defined to DNS as a new name (for example, OMEGAHUB). If you intend to enable the self-describing agent feature on the monitoring server, or to configure any products that require a z/OS® UNIX® System Services file system, make sure that the required Hierarchical File System (HFS) or z/OS File System has been created or set aside and that it is mounted before you begin configuration. The file system must have access to a Java™ runtime environment running under IBM®'s 31-bit or 64-bit Java™ SDK Version 5 (or higher) on an HFS or zFS file system.

## About this task

For this scenario you use the IBM-provided RTE template \$MDLHA.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

## Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```

KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM

```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```

KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV: _____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:

```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.    SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.           POSTCFG
R   Create next RTE - Reset fields.            New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the Workflow - Primary Options Menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:    +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. To use the IBM-provided model RTE configuration profile, enter a question mark (?) in the first field, then select \$MDLHA from the presented list of models. The configuration software then populates the field

with the fully-qualified name for the RTE. To create an RTE from scratch, leave the field blank. As appropriate, specify the Install Job Generator output library and job card data.

### Jobcard data

If a customized jobcard is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the jobcard is harvested from *gbl\_target\_hilev*.TKANSAM SMP/E target library where the initial PARMGEN sample jobcard default is supplied. If you specified a JOBGEN output library, the jobcard information is harvested from that location. You can modify the retrieved data as needed. The customized jobcard is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

3. Press Enter to proceed to the next panel.  
The "Set up/Refresh PARMGEN Work Environment for an RTE (2 of 3)" panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:
  UNIT   /  STORCLAS /
  VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV: IBM.TARGET.ITM63055_____ / _____ /
                  HLQ of SMP/E target (TK*) datasets  ----- / ----- /

GBL_SYSDA_UNIT:  SYSDA___
                  Work datasets UNIT name

GBL_REGION:      0M_____
                  JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

4. Review the values on the panel and override them as necessary.

#### GBL\_TARGET\_HILEV

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

#### GBL\_SYSDA\_UNIT

Specifies the non-VSAM disk UNIT for global work data sets.

#### GBL\_REGION

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, 0M). The default is 0M.

5. Press Enter to proceed to the next panel.  
The Set Up PARMGEN Work Environment for an RTE (3 OF 3) panel (KCIP@PG3) is displayed.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR          Top of data
Command ==>  Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Full RTE w/ High Availability Hub TEMS_____
More:                +

RTE_TYPE:             FULL_____ (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_____ (ex.: TDITN.IDTST
(&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
(&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:     _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:   _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:   _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
(&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
(*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y (Y, N) (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: N (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   _____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:   _____
GBL_DSN_ACF2_MACLIB1:  _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:         HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:      HA_____ (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:     1918_____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:       IBM_____ (1-4 char.started task prefix)
Note: Type BACK to go back one panel. Type UTIL to access utility menu.

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** that indicates that there is additional content on the panel.)

6. If you are using high-level index for an environment that is not SMS-managed, specify values for the RTE\_SMS\* parameters.
7. If you select the IBM-provided model, you do not need to make any other changes to this panel. If you are setting the RTE from scratch, set **KDS\_TEMS\_HA\_TYPE** to HA. Optionally, you can customize the values for the following parameters as required by your site requirements:
  - **RTE\_TEMS\_NAME\_NODEID**
  - **RTE\_TCP\_PORT\_NUM**
  - **RTE\_VTAM\_APPLID\_PREFIX**
  - **RTE\_STC\_PREFIX**
8. Press Enter to proceed to the next panel. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

There are two conditions as to why this panel is presented:
1. You have asked to configure a High Availability (HA) Hub.
   Only the TEMS (KDS) can be configured in an HA Hub RTE.

2. The only product installed in this SMP/E environment
   is the TEMS (KDS).

RTE_NAME: SYSA
TEMS:     Tivoli Enterprise Monitoring Server V630
GBL_TARGET_HILEV: TDITNT.DEMO

Press ENTER to continue.

```

9. Press Enter.  
The JCL for the KCIJPCFG job is displayed.
10. Review the JCL to understand what the job is doing, then submit the job and return to the Workflow main menu.  
The KCIJPCFG job submits a second job, KCIJPPRF. Do not proceed to the next step until you see a return code indicating that both jobs have finished successfully.

## Result

The PARMGEN work libraries are allocated, and the configuration profiles are created.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided when you set up the work environment. They also contain default values for all required parameters and some optional parameters. The amount of additional customization that is required depends upon how much your environment differs from the model or product-provided defaults. At a minimum, you must supply certain site-specific values. You must also enable and configure any features you want to exploit (such as event forwarding or support for self-describing agents).

### About this task

Only a high-availability (HA) monitoring server has been configured in this runtime environment (RTE). The parameters discussed here are not the only parameters for which you must either accept or override the default values in the configuration profiles for the runtime environment. After you set the parameters shown here, be sure to go through the configuration profiles to make sure the parameter values are correct for the configuration you want.

- [Customizing the runtime environment configuration profile](#) discusses the values and features that are typically customized in the RTE configuration profile.
- [Customizing the global configuration profile](#) discusses the values that should be reviewed or updated if you are creating a new RTE.

### Procedure

1. From the Workflow - Primary Option Menu, select **Customize PARMGEN configuration profiles**. The **Customize PARMGEN Configuration Profile Members** panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the Command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Edit the RTE configuration profile.
  - a. Select option 1 to edit the RTE profile.
  - b. Customize the profile as follows.
    - Change all instances of \_TCP\_HOST host values to the reserved DVIPA name. For example:

```

ISREDDE2 TSTEST.&userid.DEMO.WCONFIG (DEMO)
Command ==> C &hostname OMEGHAHUB ALL                               Scroll
==> CSR

***** ***** Bottom of Data
***** *****

```

- If you are configuring the RTE from scratch, instead of using the model profile, customize the monitoring server protocols to support only IP: At least one of the values must be IPPPIPE, IP6PIPE, IPSPIPE, or IP6SPIPE. Nullify the **KDS\_TEMS\_COMM\_PROTOCOL2** parameter by setting it to "" (instead of the SNA value set initially).

```

ISREDDE2 TSTEST.&userid.DEMO.WCONFIG (DEMO)
Command ==> CSR                               Scroll ==>
000658 ** TEMS communication protocols:
000659 ** Specify the communication protocols to be used by the local TEMS.
000660 ** Valid values are IPPPIPE, IP, SNA, IP6PIPE, IP6, IPSPIPE, and
000661 ** IP6SPIPE. When communication with another ITM component (TEPS,
Hub
000662 ** TEMS or Remote TEMS, Agents) is initiated, the TEMS tries
Protocol 1
000663 ** first and goes to Protocol 2 and so on, in case of failure.
000664 ** Note: Update the corresponding KDS_TEMS_TCP_*_PORT_NUM port
number
000665 ** parameter for each KDS_TEMS_COMM_PROTOCOLx parameter
enabled.
000666 ** For example, if KDS_TEMS_COMM_PROTOCOL1="IPPIPE", set the
000667 ** corresponding KDS_TEMS_TCP_PIPE_PORT_NUM parameter.
000668 ** If KDS_TEMS_COMM_PROTOCOL2="IP" (for IP.UDP), set the
000669 ** corresponding KDS_TEMS_TCP_UDP_PORT_NUM parameter.
000670 ** If this is a Remote TEMS, update the KDS_HUB_* parameters
000671 ** by uncommenting out the corresponding
KDS_HUB_TCP_*_PORT_NUM
000672 ** parameters and specify the Remote's Hub TEMS port numbers.
000673 KDS_TEMS_COMM_PROTOCOL1          IPPPIPE
000674 KDS_TEMS_COMM_PROTOCOL2          ""

```

- Change the value of the **KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST** parameter from the null default ("" ) to *!dvipa\_hostname*, where *dvipa\_hostname* is the private DVIPA name set for

the **KDS\_TEMS\_TCP\_HOST** parameter (in this example, !OMEGAHUB). This setting ensures that the high-availability hub is restricted to its private DVIPA address and cannot interfere with the remote monitoring server configured on the same LPAR.

```
ISREDDE2 TSTEST.&userid.DEMO.WCONFIG(DEMO)
Command ==>                                     Scroll ==>
CSR
000698 ** If the TEMS requires network interface list support:

000699 ** Note: If this is a High-Availability Hub TEMS, uncomment the

000700 **      KDS_TEMS_TCP_KDEB_INTERFACELIST and set its value to

000701 **      "!<dvipa_address>"

000702 KDS_TEMS_TCP_KDEB_INTERFACELIST      "!OMEGAHUB"
```

- If the Integrated Cryptographic Service Facility (ICSF) is installed on the z/OS system, you can configure the monitoring server to enable encryption and decryption of communication among products and framework components. Enable IBM Tivoli Monitoring encryption by uncommenting the **RTE\_SECURITY\_KAES256\_KEY** parameter. If you are using a KAES256 encryption key other than the IBM-supplied PARMGEN default key, specify the value. This value must match across your site. If you enable encryption, you must also edit the \$GBL\$USR profile to set the **GBL\_DSN\_CSF\_SCSFMODE0** parameter to the name of your site's ICSF library.

```
ISREDDE2 TSTEST.&userid.DEMO.WCONFIG(DEMO)
Command ==>                                     Scroll ==>
CSR
000462 ** -----
-
000463 ** (Required) KAES256 encryption key:

000464 ** The "RTE_SECURITY_KAES256_KEY" value is encrypted and

000465 ** xKANPARU(KAES256) member is created as part of the

000466 ** xKANSAMU(KCIJPSEC) composite security or standalone KSDKAES job.

000467 ** The TEMS and Agents started tasks are also updated to concatenate

000468 ** the ICSF load library (GBL_DSN_CSF_SCSFMODE0 parameter value) in
the
000469 ** RKANMODL DD.

000470 ** Notes:

000471 ** 1. Any customizations to the key must now be made through the

000472 **      global RTE RTE_SECURITY_KAES256_KEY parameter as this

000473 **      key is applicable to all components, including the Agents.

000474 ** 2. Starting in ITM6.3.0, specification of the ICSF load library
and
000475 **      enabling the KAES256 key is required.

000476 ** 3. For an existing RTE, ensure that you rerun the

000477 **      xKANSAMU(KCIJPSYS) job to refresh the TMS:Engine started tasks

000478 **      in the system procedure library (GBL_DSN_SYS1_PROCLIB value).

000479 ** 4. Related PARMGEN CONFIG profile parameters:

000480 **      - GBL_DSN_CSF_SCSFMODE0 (DSN value is concatenated in the

000481 **      TEMS and Agent STCs' RKANMODL DD)

000482 **      - KDS_KMS_SECURITY_COMPATMD (applicable to ITM6.3.0+ only)

000483 ** -----
-
000484 RTE_SECURITY_KAES256_KEY      "IBMTivoliMonitoringEncryptionKey"
```

- If you intend to enable support for self-describing agents, or configure any products that require a z/OS® UNIX® System Services directory, set **RTE\_USS\_RTEDIR** to the directory created for that purpose.

```

Command ==>                                     Scroll ==>
CSR
000488 ** (Optional) If any products to be configured in this RTE require
000489 ** Unix System Services (USS) directories created, specify the main
RTE
000490 ** HFS/zFS USS directory (#rtedir):

000491 ** Note: This is also required if you are enabling the Self-
describing
000492 ** Agent (SDA) functionality in the z/OS TEMS and Agents:

000493 ** Related PARMGEN CONFIG profile parameters (for SDA):

000494 **      - GBL_HFS_JAVA_DIRn
000495 **      - GBL_DSN_SYS1_SBPXEXEC
000496 **      - RTE_USS_RTEDIR
000497 **      - KDS_KMS_SDA
000498 **      - KDS_TEMA_SDA
000499 **          - KDS_KMS_SDA_NO_GRANULAR
000500 **      - Kpp_AGT_TEMA_SDA (per Kpp Agent exploiting SDA)
000501 RTE_USS_RTEDIR                "/tstest"

```

- To enable the SDA feature, set **KDS\_KMS\_SDA** to Y.
- Save your changes and return to the **Customize PARMGEN Configuration Profile Members** panel.
- Edit the \$GBL\$USR profile as follows:
    - From the Customize PARMGEN Configuration Profile Members panel, select option 2. The profile is displayed.
    - Set the **GBL\_DSN\_CSF\_SCSFMODE0** parameter to the name of your site's ICSF load library.
    - If any of the components you are configuring within this RTE require Java support or if you enabled the self-describing agent (SDA) feature now or intend to at a later time, customize the **GBL\_HFS\_JAVA\_DIR1** parameter and point to a valid path to a Java installation on HFS or zFS. Note that `/bin` is automatically appended to this value by the PARMGEN KCIJPUS\* z/OS UNIX jobs.

## Result

You have completed the customizations required to set up the configuration profiles for the RTE.

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

## Procedure

- From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```

KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1

1. Create runtime members/jobs in all WK* libs.  $PARSE

Press F1=Help for more information. Type UTIL to access utility menu.

```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

Quick Configuration Mode

GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME: SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
Enter n (1-5) to perform tasks.
Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status   Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5. Perform post configuration steps.        POSTCFG
R Create next RTE - Reset fields.           New RTE

Press F1=Help for more information. Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>
```

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.  
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.  
Enter ns (1s-12s) for detailed job/task status.

Description	REQ	Job Name	Status	Date
1. Composite SUBMIT job (See JCL comments) ** OR **		KCIJPSUB		More: +
2. Allocate runtime RO and RW datasets	(Yes)	KCIJPALO		
3. Copy SMP/E mbrs from TK*->RK* RO libs	(Yes)	KCIJPLOD		
4. Run product security steps	(Yes)	KCIJPSEC		
5. Update variable-named runtime mbrs	(No )	KCIJPUPV		
6. (Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7. Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8. Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9. Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10. Verify the configuration jobs	(Tip)	KCIJPIVP		
11. Back-up RK* product execution user libs	(Tip)	KCIJPCPR		
12. Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

Press F1=Help for more information. Type UTIL to access utility menu.

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

### What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)
- The *Planning and Configuration Guide* for each product.

## Scenario QCF02: Configuring a full RTE with a static hub and variables enabled

If your site does not meet the requirements for a high-availability hub monitoring server, and you want to configure a hub on z/OS, configure a static hub. You can configure other products in the same runtime environment (RTE) as a static hub, and you can also enable system variables in the same runtime environment. You can use an IBM-provided model to create the RTE and do minimal customization to get up and running, or create the RTE from scratch and customize to your exact requirements.

### Before you begin

If you intend to enable the self-describing agent feature on the monitoring server, or to configure any products that require a z/OS® UNIX® System Services file system, make sure that make sure that the required Hierarchical File System (HFS) or z/OS File System has been created or set aside and that it is mounted before you begin configuration. The file system must have access to a Java™ runtime environment running under IBM®'s 31-bit or 64-bit Java™ SDK Version 5 (or higher) on an HFS or zFS file system.

### About this task

This scenario creates a full (RTE) with variables enabled. The RTE comprises a z/OS-based static hub monitoring server, OMEGAMON monitoring agents, and the OMEGAMON enhanced 3270 user interface. For this scenario, you use IBM-provided RTE template \$MDLHFV. You can also create the RTE from scratch. This scenario involves completing five main steps using the configuration software:

1. Defining the new RTE.
2. Setting up PARMGEN work environment for the runtime environment
3. Customizing the configuration profiles
4. Creating the runtime members and jobs
5. Submitting batch jobs to complete the RTE setup

After you complete these steps, you complete any configuration steps required outside the configuration software and start the products.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that, together with the RTE name, uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>
```

PARMGEN stores configuration values in the TSO user's ISPF profile. If this is the first-time your TDITNT TSO user ID is invoking PARMGEN, enter the GBL\_TARGET\_HILEV-related values appropriate for your deployment:

```

UNIT      /  STORCLAS /
VOLSER    /  MGMTCLAS /
GBL_TARGET_HILEV: _____ / _____ /
                    HLQ of SMP/E target (TK*) datasets  ----- / ----- /
```

**Note:**

If this is not the first time your TDITNT ID is invoking PARMGEN, this panel is also presented if the GBL\_TARGET\_HILEV stored value changed from the last time you invoked PARMGEN. Verify GBL\_TARGET\_HILEV, UNIT, VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:

```

GBL_USER_JCL:
RTE_PLIB_HILEV:
RTE_NAME:
Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```
KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>
```

Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

```

GBL_USER_JCL: _____
                (For example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.
```

```

RTE_PLIB_HILEV: _____
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG
```

```

RTE_NAME: _____ (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.
```

3. Provide the requested values to define the RTE that you want to create.

**GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN . IDTST . PARMGEN . JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

**RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN . IDTST .

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

## RTE\_NAME

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.
```

5. Press Enter. The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.
```

	Description	Job/Label	Status	Date
1.	Set up/Refresh PARMGEN work environment.	KCIJPCFG		
2.	Customize PARMGEN configuration profiles.	SYSA		
3.	Create this RTE's runtime members and jobs.	\$PARSE		
4.	Submit batch jobs to complete PARMGEN setup.	SUBMIT		
5.	Perform post configuration steps.	POSTCFG		
R	Create next RTE - Reset fields.	New RTE		

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the **Workflow - Primary Options Menu**. The first Set up PARMGEN work environment for an RTE panel is displayed.

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
                More:      +
Specify the RTE model profile to use:
==> -----
- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSMEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=OM-----
==> /** 0 0 RTE_NAME=%RTE_NAME% SYSMEMBER=%SYSMEMBER%-----
==> /** \_~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
(Type ? for last referenced JOBGEN library discovered, if any.)

```

- To use the IBM-provided model RTE, specify \$MDLHFV in the first field. To create an RTE from scratch, leave the field blank. As appropriate, specify the Install Job Generator output library and job card data.

#### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

- Press Enter to proceed to the next panel. The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:
                UNIT      /  STORCLAS /
                VOLSER    /  MGMTCLAS /
GBL_TARGET_HILEV: IBM.TARGET.ITM63055----- / ----- /
                HLQ of SMP/E target (TK*) datasets ----- / ----- /

GBL_SYSDA_UNIT:  SYSDA___
                Work datasets UNIT name

GBL_REGION:     OM_____
                JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

- Review the values on the panel and override them as necessary.

#### GBL\_TARGET\_HILEV

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

## GBL\_SYSDA\_UNIT

Specifies the non-VSAM disk UNIT for global work data sets.

## GBL\_REGION

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, 0M). The default is 0M.

5. Press Enter to proceed to the next panel.

The Set Up PARMGEN Work Environment for an RTE (3 OF 3) panel (KCIP@PG3) is displayed.

```
KCIP@PG3  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                                     Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Full RTE w/ Static Hub TEMS/Agents w/ variables.
  More:      +
RTE_TYPE:             FULL_____ (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:     _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:   _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:   _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y   (Y, N)   (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                    (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
                    (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y   (Y, N)   (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: Y   (Y, N)   (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y   (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   &OMEGSAF._____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y   (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: &SYSNAME.:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:        HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:     __   (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:     &RTE_PORT._____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: K&SYSCLONE._____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:       IBM_____ (1-4 char.started task prefix)
```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** which indicates that there is additional content on the panel.)

6. If your environment is not SMS-managed, you must specify the VSAM values. If you are using the IBM-provided model, you do not need to make any other changes. If you are setting up the RTE from scratch, set RTE\_SYSV\_SYSVAR\_FLAG to Y. Optionally, you can customize the following parameters using system or user-defined variables:
  - **RTE\_TEMS\_NAME\_NODEID** (for example, &SYSNAME.:CMS)

- **RTE\_TCP\_PORT\_NUM** (for example, &RTE\_PORT)
  - **RTE\_VTAM\_APPLID\_PREFIX** (for example, K&SYSCclone.)
  - **RTE\_STC\_PREFIX** (for example, &STCPREF.)
  - **RTE\_SECURITY\_CLASS** (for example, &OMEGSAF,)
7. Press Enter to proceed to the next panel.  
The Include Products in this PARMGEN RTE panel (KCIP@PGI) is displayed. This panel lists all the products installed in the product library.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
  -----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181
/ KDS Tivoli Enterprise Monitoring Server V630
/ KD4 ITCAM for SOA Agent V711
/ KD5 OMEGAMON for DB2 PE V550
/ KGW OMEGAMON for CICS TG V550
/ KI5 OMEGAMON for IMS V550
/ KJJ OMEGAMON for JVM V540
/ KMQ OMEGAMON for Messaging - MQ V750
/ KM5 OMEGAMON for z/OS V550

/ KRW Tape Optimizer for z/OS Agent V220
/ KS3 OMEGAMON for Storage V540
/ KYN ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

8. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
9. Review the JCL to understand what the job is doing, then submit the job.  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values. You must enable and configure any features you want to exploit (such as event forwarding or support for self-describing agents). In this scenario, you must also edit the variables configuration profile (%GBL\_USER\_JCL%.%RTE\_NAME%) to specify resolution values for any user-defined variables.

## About this task

The RTE profile inherits the symbolics specified on the KCIP@PG3 panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, &SYSNAME.), except for the RTE\_NAMESV parameter instance. You can assign symbolics to additional parameters, but see [“Parameters ineligible to use variables” on page 1248](#) for parameters that must be excluded from use of symbolics. In addition, you must also customize the product-specific parameters listed in [Configure OMEGAMON monitoring agents and other components](#), as applicable. Optionally, you can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).

In the global profile, you can assign symbolics to any of the parameters. At a minimum, you must assign a symbolic value to the GBL\_HFS\_JAVA\_DIR1 parameter, for example, &GBL\_HFS\_JAVA\_DIR1. or change the literal default to a site-appropriate one. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

If you assign symbolics in either the RTE or the global configuration profile to parameters that are concatenated in or part of started task procedures, you must follow the MVS rules governing the use of symbolics in started task procedures and JCL. In the RTE profile, these are the following parameters:

- **RTE\_NAME**
- **RTE\_HILEV**
- **RTE\_VSAM\_HILEV**
- **RTE\_X\_HILEV\_SHARING**
- **RTE\_SHARE**
- **Kpp\_\*\_VTAM\_APPL\_\***

In the global profiles, these are the following parameters:

- **GBL\_DSN\_DB2\_\***
- **GBL\_DSN\_IMS\_\***
- **GBL\_DSN\_CICS\_CTG\_DLL**
- **GBL\_DSN\_WMQ\_\***
- **GBL\_DSN\_CSF\_SCSFMODE**
- **GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA**

In the variables profile (%GBL\_USER\_JCL%.%RTE\_NAME%), if you set the resolution value for the **KDS\_KMS\_SDA** in the RTE profile to Y, provide site-specific values for the following symbols:

- **RTE\_USS\_RTEDIR**
- **GBL\_HFS\_JAVA\_DIR1**

In addition, provide values for any user-defined variables that you add, any variables that whose values differ from the IBM-provided default resolution values, and any variables whose values cannot be automatically discovered from the system IPL PARMLIB data set. See [Customizing the variables profile](#) for more information on customizing variables.

## Procedure

1. To edit the configuration profiles, select Customize PARMGEN configuration profiles from the Workflow. The Customize PARMGEN Configuration Profile Members panel is displayed.
2. Type DLAJOB in the Command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select each profile and make the appropriate edits.
4. Press F3 to save the changes, then press F3 to return to the main Workflow panel.

## What to do next

If you need to further customize the configuration using the override embed files, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on

the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

- From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

- Select option 1 to submit the composite job. The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
- If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - Type 1s in pane KCIP@PR1, and then go through the validation report.
  - Correct the parameter values.
  - Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

- From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KICIPQGB  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1.  Set up/Refresh PARMGEN work environment.  KCIJPCFG
2.  Customize PARMGEN configuration profiles.  SYSA
3.  Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5.  Perform post configuration steps.         POSTCFG
R   Create next RTE - Reset fields.          New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KICIP@SUB) is displayed.

```

KICIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
1.  Composite SUBMIT job (See JCL comments)  KCIJPSUB
    ** OR **
2.  Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3.  Copy SMP/E mbrs from TK*->RK* RO libs    (Yes) KCIJPLOD
4.  Run product security steps               (Yes) KCIJPSEC
5.  Update variable-named runtime mbrs      (No ) KCIJPUPV
6.  (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7.  Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8.  Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9.  Run post-SMP/E RKANMODU ASM/LINK steps   (Yes) KCIJPLNK
10. Verify the configuration jobs            (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

More:      +

Press F1=Help for more information.  Type UTIL to access utility menu.

```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)

- The *Planning and Configuration Guide* for each product.

## Scenario QCF03: Creating a sharing-with-base runtime environment with a remote monitoring server and variables enabled

A sharing-with-base runtime environment (RTE) shares its read-only runtime libraries with other RTEs. The configuration software automatically creates the base RTE when you configure the first RTE that shares it. Sharing RTEs configured subsequently can then reference that base RTE. One advantage to using variables in sharing-with-base RTEs is that you can use them to switch base libraries, for example from test to production libraries. You can configure the RTE from scratch, or use the IBM-provided \$MDLRSB model RTE.

### Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that together with the RTE name uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
                z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).  
If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>
```

PARMGEN stores configuration values in the TSO user's ISPF profile. If this is the first-time your TDITNT TSO user ID is invoking PARMGEN, enter the GBL\_TARGET\_HILEV-related values appropriate for your deployment:

```

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: _____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  ----- / ----- /

```

**Note:**

If this is not the first time your TDITNT ID is invoking PARMGEN, this panel is also presented if the GBL\_TARGET\_HILEV stored value changed from the last time you invoked PARMGEN. Verify GBL\_TARGET\_HILEV, UNIT, VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:

```

GBL_USER_JCL:
RTE_PLIB_HILEV:
RTE_NAME:
Last GBL_TARGET_HILEV:

```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/ MGMTCLAS if necessary. The following panel is displayed.

```
KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>
```

Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

```

GBL_USER_JCL: _____
                (For example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

```

```

RTE_PLIB_HILEV: _____
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

```

```

RTE_NAME: _____ (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

**GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN . IDTST . PARMGEN . JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

**RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN . IDTST .

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

## RTE\_NAME

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```
KCIP@MSG ----- PARMGEN MESSAGES -----  
Command ==>  
  
You have asked to configure a new RTE profile.  
  
Proceed to configure a new RTE profile.  
  
Press ENTER to continue. Press F3 to abort.
```

5. Press Enter. The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----  
Option ==>  
  
Quick Configuration Mode  
  
GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL  
RTE_PLIB_HILEV: TDITN.IDTST  
RTE_NAME: SYSA  
  
Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.  
If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.  
Enter n (1-5) to perform tasks.  
Enter ns (1s-5s) for detailed job/task status.
```

	Description	Job/Label	Status	Date
1.	Set up/Refresh PARMGEN work environment.	KCIJPCFG		
2.	Customize PARMGEN configuration profiles.	SYSA		
3.	Create this RTE's runtime members and jobs.	\$PARSE		
4.	Submit batch jobs to complete PARMGEN setup.	SUBMIT		
5.	Perform post configuration steps.	POSTCFG		
R	Create next RTE - Reset fields.	New RTE		

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the **Workflow - Primary Options Menu**. The first Set up PARMGEN work environment for an RTE panel is displayed.

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>

                Quick Configuration Mode

Specify the RTE model profile to use:
==> -----
More:      +

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSMEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=OM-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSMEMBER=%SYSMEMBER%-----
==> /*** \_~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
(Type ? for last referenced JOBGEN library discovered, if any.)

```

- To use the IBM-provided model RTE, specify \$MDLRBVB in the first field. To create an RTE from scratch, leave the field blank. As appropriate, specify the Install Job Generator output library and job card data.

#### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

- Press Enter to proceed to the next panel. The "**Set up/Refresh PARMGEN Work Environment for an RTE (2 of 3)**" panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:     SYSA

Enter parameter values appropriate for your environment:

                                UNIT / STORCLAS /
                                VOLSER / MGMTCLAS /
GBL_TARGET_HILEV: IBM.TARGET.ITM63055----- / ----- /
                                HLQ of SMP/E target (TK*) datasets ----- / ----- /

GBL_SYSDA_UNIT:  SYSDA___
                                Work datasets UNIT name

GBL_REGION:     OM_____
                                JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel. Type UTIL to access utility menu.

```

- Review the values on the panel and override them as necessary.

#### GBL\_TARGET\_HILEV

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

## GBL\_SYSDA\_UNIT

Specifies the non-VSAM disk UNIT for global work data sets.

## GBL\_REGION

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, 0M). The default is 0M.

5. Press Enter to proceed to the next panel.

The Set Up PARMGEN Work Environment for an RTE (3 OF 3) panel (KCIP@PG3) is displayed.

```
KCIP@PG3  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                                     Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Sharing-w/-Base RTE w/ Remote/Agents w/ vars.____
More:                +

RTE_TYPE:             SHARING_      (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_  (ex.: TDITN.IDTST
                        (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_  (ex.: TDITN.IDTST
                        (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:     _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:   _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:   _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y   (Y, N)   (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                        (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
                        (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y   (Y, N)   (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: Y   (Y, N)   (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y   (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:   &OMEGSAF._____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:   _____
GBL_DSN_ACF2_MACLIB1:  _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y   (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID:  &SYSNAME.:CMS_____ (e.g.,DEMO:cms)))
KDS_TEMS_TYPE:         REMOTE__ (Hub, Remote)
KDS_TEMS_HA_TYPE:     __ (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:     &RTE_PORT._____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: K&SYSCLONE._____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:       IBM_____ (1-4 char.started task prefix)
```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** which indicates that there is additional content on the panel.)

6. If this RTE is not SMS-managed, provide the VSAM values.
  - If you are using the IBM-provided model, provide values for the following parameters:
    - **RTE\_X\_HILEV\_SHARING**
    - **RTE\_SHARE**

Any other changes are optional.

- If you are setting up the RTE from scratch, specify the following values.
  - **RTE\_TYPE=SHARING**
  - **RTE\_X\_HILEV\_SHARING=** *base\_rte\_hlq*
  - **RTE\_SHARE=** *base\_rte\_name*
  - **KDS\_TEMS\_TYPE=REMOTE**
  - **RTE\_SYSV\_SYSVAR\_FLAG=Y**

Optionally, specify variables for the following parameters:

- **RTE\_TEMS\_NAME\_NODEID** (for example, &SYSNAME . :CMS)
- **RTE\_TCP\_PORT\_NUM** (for example, &RTE\_PORT .)
- **RTE\_VTAM\_APPLID\_PREFIX** (for example, K&SYSCLONE .)
- **RTE\_SECURITY\_CLASS** (for example, &OMEGSAF.)

**Tip:** If you have already created a sharing-with-base RTE that shares the same base and is set to load the base libraries, change **RTE\_LOAD\_SHARED\_LIBS** to N to avoid multiple refreshes.

**Note:** You cannot disable variable support in this RTE. If you decide that you do not want to use variables, return to the KCIP@PG1 panel and select another model profile that does not use variables.

7. Press Enter to proceed to the next panel.

The **Include Products in this PARMGEN RTE** panel (KCIP@PGI) is displayed. This panel lists all the products installed in the product library.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>                                     Scroll ==> PAGE

Select ("S" or "/" ) products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version

End of data
```

8. Deselect any products that you do not want to include in the RTE, then change `Confirm ==> N` to `Y`, and press `Enter`.  
The JCL for the `KCIJPCFG` job is displayed.
9. Review the JCL to understand what the job is doing, then submit the job.  
The `KCIJPCFG` job submits a second job, `KCIJPPRF`. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the `PARMGEN` templates in `IKAN*` libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values. You must enable and configure any features you want to exploit (such as event forwarding or support for self-describing agents). In this scenario, you must also edit the variables configuration profile (`%GBL_USER_JCL%.%RTE_NAME%`) to specify resolution values for any user-defined variables.

## About this task

The RTE profile inherits the symbolics specified on the `KCIP@PG3` panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, `&SYSNAME.`), except for the `RTE_NAMESV` parameter instance. You must also edit the variables profile to set the resolution value of the symbolic assigned to the RTE name. You can assign symbolics to additional parameters, but see [“Parameters ineligible to use variables” on page 1248](#) for parameters that must be excluded from use of symbolics. In addition, you must also customize the product-specific parameters listed in [Configure OMEGAMON monitoring agents and other components](#), as applicable. Optionally, you can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).

In the global profile, you can assign symbolics to any of the parameters. At a minimum, you must assign a symbolic value to the `GBL_HFS_JAVA_DIR1` parameter, for example, `&GBL_HFS_JAVA_DIR1.` or change the literal default to a site-appropriate one. You must also edit the value for load library parameters `GBL_DSN_CSF_SCSFMOD0` and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

If you assign symbolics in either the RTE or the global configuration profile to parameters that are concatenated in or part of started task procedures, you must follow the MVS rules governing the use of symbolics in started task procedures and JCL. In the RTE profile, these are the following parameters:

- `RTE_NAME`
- `RTE_HILEV`
- `RTE_VSAM_HILEV`
- `RTE_X_HILEV_SHARING`
- `RTE_SHARE`
- `Kpp_*_VTAM_APPL_*`

In the global profiles, these are the following parameters:

- `GBL_DSN_DB2_*`
- `GBL_DSN_IMS_*`
- `GBL_DSN_CICS_CTG_DLL`
- `GBL_DSN_WMQ_*`
- `GBL_DSN_CSF_SCSFMOD0`
- `GBL_DSN_TCP_SYSTCPD_TCPDATA`

In the variables profile (`%GBL_USER_JCL%.%RTE_NAME%`), if you want to use the self-describing agent feature, set the resolution value for `KDS_KMS_SDA` to `Y`, and provide site-specific values for the following symbols:

- RTE\_USS\_RTEDIR
- GBL\_HFS\_JAVA\_DIR1

In addition, provide values for any user-defined variables that you add, any variables that whose values differ from the IBM-provided default resolution values, and any variables whose values cannot be automatically discovered from the system IPL PARMLIB data set. See [Customizing the variables profile](#) for more information on customizing variables.

## Procedure

1. To edit the configuration profiles, select Customize PARMGEN configuration profiles from the Workflow. The Customize PARMGEN Configuration Profile Members panel is displayed.
2. Type DLAJOB in the Command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select each profile and make the appropriate edits.
4. Press F3 to save the changes, then press F3 to return to the main Workflow panel.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE (or \$PARSES if variable support is enabled) job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

## Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSES: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status    Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.

- a. Type 1s in pane KCIP@PR1, and then go through the validation report.
- b. Correct the parameter values.
- c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
       If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
       Enter n (1-5) to perform tasks.
       Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE    Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT    Enter 4 for details.
5. Perform post configuration steps.         POSTCFG
R Create next RTE - Reset fields.           New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.
```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
** or **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4. Run product security steps              (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs          (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

Press F1=Help for more information.  Type UTIL to access utility menu.
```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

2. Submit the required jobs by using the composite SUBMIT job, or by submitting them individually.

TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

3. If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.

For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)
- The *Planning and Configuration Guide* for each product.

## Scenario QCF04: Configuring a full RTE with a static hub monitoring server

If your site does not meet the requirements for a high-availability hub monitoring server, but you want to configure a hub on z/OS®, configure a static hub. You can configure other products in the same runtime environment (RTE) as a static hub. This scenario creates a full (RTE) comprising a z/OS-based hub monitoring server, OMEGAMON® monitoring agents, and the OMEGAMON® enhanced 3270 user interface. You can use an IBM-provided model to create the RTE and do minimal customization to get up and running, or create the RTE from scratch and customize to your exact requirements.

### Before you begin

If you intend to enable self-describing agents, or to configure any products that require a z/OS® UNIX® System Services directory, and you plan to create a new file system for that purpose, ensure that the file system is created and mounted before submitting the z/OS UNIX jobs. Make sure that the file system has access to a Java™ runtime environment running under IBM®'s 31-bit or 64-bit Java™ SDK Version 5 (or higher) on an HFS or zFS file system.

### About this task

For this scenario, you use IBM-provided RTE model profile @MDLHF.

This scenario involves completing five main steps using the configuration software:

1. Defining the new RTE.
2. Setting up PARMGEN work environment for the runtime environment.
3. Customizing the configuration profiles.
4. Creating the runtime members and jobs.
5. Submitting batch jobs to complete the RTE setup.

After you complete these steps, complete any configuration steps required outside the configuration software and start the products.

**Note:** If your environment meets the requirements for a high-availability (HA) hub monitoring server, consider configuring one first, and then creating a full RTE with a remote monitoring sever on the same LPAR.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that together with the RTE name uniquely identifies the data sets for this RTE.

## Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT   /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV: _____ /  _____ /
                   HLQ of SMP/E target (TK*) datasets  _____  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/ MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.   SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.          POSTCFG
R   Create next RTE - Reset fields.           New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the **Workflow - Primary Options Menu**. The first Set up PARMGEN work environment for an RTE panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:    +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. To use the IBM-provided model RTE, type a question mark (?) in the field, then select the \$MDLHF template. To create an RTE from scratch, leave the field blank. As appropriate, specify the Install Job Generator output library and job card data.

## Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from %gbl\_target\_hilev%. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

3. Press Enter to proceed to the next panel.

The "Set up/Refresh PARMGEN Work Environment for an RTE (2 of 3)" panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```
KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITM.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:
  UNIT   /  STORCLAS /
  VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV: IBM.TARGET.ITM63055_____ / _____ /
                  HLQ of SMP/E target (TK*) datasets  _____
GBL_SYSDA_UNIT:  SYSDA___
                  Work datasets UNIT name
GBL_REGION:     OM_____
                  JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.
```

4. Review the values on the panel and override them as necessary.

### **GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

### **GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

5. Press Enter to proceed to the next panel.

The Set Up PARMGEN Work Environment for an RTE (3 OF 3) panel (KCIP@PG3) is displayed. The preset values are the same whether you selected \$MDLHF or not.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Full RTE w/ Static Hub TEMS/Agents_____
More:                +

RTE_TYPE:             FULL_____ (Full, Sharing)

RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
(&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
(*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y (Y, N) (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: N (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:  _____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:        HUB_____ (Hub, Remote)
KDS_TEMS_HA_TYPE:     -- (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:    1918_____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:      IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Note the **More: +** which indicates that there is additional content on the panel.)

6. If your environment is not SMS-managed, you must specify the VSAM values. Optionally, you can customize the following parameters. These values will be inherited by the corresponding product-specific parameters in the RTE configuration profile.
  - **RTE\_TEMS\_NAME\_NODEID**
  - **RTE\_TCP\_PORT\_NUM**
  - **RTE\_VTAM\_APPLID\_PREFIX**
  - **RTE\_STC\_PREFIX**
7. Press Enter to proceed to the next panel. The Include Products in this PARMGEN RTE panel (KCIP@PGI) is displayed. This panel lists all the products installed in the product target library.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==> Scroll ==> PAGE
```

```
Select ("S" or "/" ) products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected
```

```
When finished, change N to Y to confirm selections. Confirm ==> N (Y, N)
```

```
 Kpp Component or Product Name and Version

```

8. Deselect any products that you do not want to include in the RTE, then change `Confirm ==> N` to `Y`, and press `Enter`.  
The JCL for the `KCIJPCFG` job is displayed.
9. Review the JCL to understand what the job is doing, then submit the job.  
The `KCIJPCFG` job submits a second job, `KCIJPPRF`. Wait until both jobs complete before proceeding to the next step. Until the jobs have completed, you will see a status of "Submitted" for this step on the main Workflow panel.

## Result

The configuration software allocates the PARMGEN work libraries, creates the configuration profiles, and populates the PARMGEN templates in `IKAN*` libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided when you set up the work environment. They also contain default values for all required parameters and some optional parameters. The amount of editing required to customize the configuration profiles depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values. You must also configure the local monitoring server to report to the hub monitor server and enable and configure any features you want to exploit (such as support for self-describing agents).

## About this task

At a minimum, in the RTE configuration profile you must set the `KDS_HUB_*` parameters to point to the appropriate values for the hub monitoring server to which this remote reports.

- `KDS_HUB_TEMS_NAME_NODEID`
- `KDS_HUB_VTAM_APPL_GLB_BROKER` (if the hub is enabled for SNA)
- `KDS_HUB_VTAM_NETID` (if the hub is enabled for SNA)
- `KDS_HUB_TCP_HOST`

- **KDS\_HUB\_TCP\_PIPE\_PORT\_NUM**

If the hub is an HA hub, you must set the monitoring server and agent **KDEB\_INTERFACELIST** parameters (**KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST** and **Kpp\_AGT\_TCP\_KDEB\_INTERFACELIST**) to "!\*"

In addition, you might need to configure one or more of the following parameters:

- If any of the products that you are configuring require any z/OS® UNIX® System Services directories running on either the Hierarchical File System (HFS) or on the zSeries File System (zFS), or if you are planning to enable the self-describing agent (SDA) feature, specify the directory to be used (**RTE\_USS\_RTEDIR**).
- To enable the SDA feature, set **KDS\_KMS\_SDA** to Y.
- To automate APF-authorization of all generated started tasks by generating the required commands for all libraries concatenated within the STEPLIB and RKANMODL DD names of the started tasks, set **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** to Y.
- To collect historical data for display in either the Tivoli Enterprise Portal or the OMEGAMON Enhanced 3270 user interface, data sets must be allocated to store the data. The persistent datastore (PDS) that manages the collected data must be configured (see [Allocate data sets and configure maintenance for historical data](#)). It is enabled by default to collect at the agent.

You may want to configure some or all of the following features on the monitoring server: support for self-describing agents, auditing, event forwarding, SOAP server. For instructions on enabling these features, see [Configure a Tivoli Enterprise Monitoring Server](#).

The parameters discussed here are not the only parameters for which you must either accept or override the default values in the configuration profile for the runtime environment. After you set the parameters shown here, be sure to go through the configuration profiles to make sure the parameter values are correct for the configuration you want.

- [Customizing the runtime environment configuration profile](#) discusses the values and features that are typically customized in the RTE configuration profile.
- [Customizing the global configuration profile](#) discusses the values that should be reviewed or updated if you are creating a new RTE.

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the Command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
4. Select 2 to edit the \$GBL\$USR profile.

## What to do next

If you need to further customize the configuration using the override embed files, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

## Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```

KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ===>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.

```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KCIPQPGGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ===>

Quick Configuration Mode

GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME: SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
Enter n (1-5) to perform tasks.
Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status   Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5. Perform post configuration steps.        POSTCFG
R Create next RTE - Reset fields.           New RTE
Press F1=Help for more information. Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>
```

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.  
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.  
Enter ns (1s-12s) for detailed job/task status.

	Description	REQ	Job Name	Status	Date
				More:	+
1.	Composite SUBMIT job (See JCL comments) ** or **		KCIJPSUB		
2.	Allocate runtime RO and RW datasets	(Yes)	KCIJPALO		
3.	Copy SMP/E mbrs from TK*->RK* RO libs	(Yes)	KCIJPLOD		
4.	Run product security steps	(Yes)	KCIJPSEC		
5.	Update variable-named runtime mbrs	(No )	KCIJPUPV		
6.	(Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7.	Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8.	Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9.	Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10.	Verify the configuration jobs	(Tip)	KCIJPIVP		
11.	Back-up RK* product execution user libs	(Tip)	KCIJPCPR		
12.	Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

Press F1=Help for more information. Type UTIL to access utility menu.

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

### What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)
- The *Planning and Configuration Guide* for each product.

## Scenario QCF05: Configuring a full RTE with a remote monitoring server

If you have already configured a hub monitoring server, you can configure additional remote monitoring servers in their own runtime environments (RTEs). OMEGAMON® on z/OS® and OMEGAMON® for Storage on z/OS® monitoring agents are required to run in the same address space as a monitoring server, so one must be configured in each RTE in which either of these agents is running. Even if you are not running either of these agents, but you are monitoring numerous RTEs, you might want to configure additional monitoring servers to distribute the work load and reduce network traffic. The remote monitoring servers must be configured to connect to a hub monitoring server.

### About this task

In this scenario, you configure a full RTE which contains both a remote monitoring server and several monitoring agents. A full runtime environment (RTE) contains a full set of dedicated libraries, consisting of both RTE-specific libraries and a copy of the SMP/E installation read-only libraries that are eligible for sharing with other RTEs. You can use an IBM-provided model @MDLRF to set up this RTE, or configure it from scratch.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the configured runtime environments (RTEs) is stored, and provide the high-level qualifier that together with the RTE name uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV:  _____ /  _____ /
                   HLQ of SMP/E target (TK*) datasets  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.    SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.           POSTCFG
R   Create next RTE - Reset fields.            New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the **Workflow - Primary Options Menu**. The first Set up PARMGEN work environment for an RTE panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. To use the IBM-provided model RTE, specify @MDLRF in the first field. To create an RTE from scratch, leave the field blank. As appropriate, specify the Install Job Generator output library and jobcard data.

### Jobcard data

If a customized jobcard is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the jobcard is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample jobcard default is supplied. If you specified a JOBGEN output library, the jobcard information is harvested from that location. You can modify the retrieved data as needed. The customized jobcard is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

3. Press Enter to proceed to the next panel.

The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:
                                UNIT   /  STORCLAS /
                                VOLSER /  MGMTCLAS /
GBL_TARGET_HILEV:  IBM.TARGET.ITM63055_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  _____ /
GBL_SYSDA_UNIT:   SYSDA____
                   Work datasets UNIT name
GBL_REGION:       OM_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

4. Review the values on the panel and override them as necessary.

**GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=OM value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, OM). The default is OM.

5. Press Enter to proceed to the next panel.

The Set Up PARMGEN Work Environment for an RTE (3 OF 3) panel (KCIP@PG3) is displayed.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Full RTE w/ Remote TEMS/Agents_____
  More:      +
RTE_TYPE:             FULL_____ (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
                    (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:         _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:      _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:    _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:    _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                    (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
                    (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y (Y, N) (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: N (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:  _____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:        REMOTE__ (Hub, Remote)
KDS_TEMS_HA_TYPE:     __ (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:     1918_____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:       IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** which indicates that there is additional content on the panel.)

6. Customize the parameters as follows:

- If your environment is not SMS-managed, specify the VSAM values.
- If you are using the IBM-provided model, you do not need to make any further customizations. Optionally, you can customize the following parameters to conform to site conventions. These values will be inherited by the corresponding product-specific parameters in the RTE configuration profile.
  - **RTE\_TEMS\_NAME\_NODEID**
  - **RTE\_TCP\_PORT\_NUM**
  - **RTE\_VTAM\_APPLID\_PREFIX**
  - **RTE\_STC\_PREFIX**
- If you are configuring the RTE from scratch, configure the following parameters as indicated.
  - **RTE\_TYPE=FULL**
  - **RTE\_TEMS\_CONFIGURED\_FLAG=Y**

- **KDS\_TEMS\_TYPE=REMOTE**

7. Press Enter to proceed to the next panel.  
The Include Products in this PARMGEN RTE panel (KCIP@PGI) is displayed. This panel lists all the products installed in the product library.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>
   Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp  Component or Product Name and Version
-----
/ KAH  System Automation Monitoring Agent V350
/ KC5  OMEGAMON for CICS V550
/ KDO  Tivoli Decision Support for z/OS Agent V181
/ KDS  Tivoli Enterprise Monitoring Server V630
/ KD4  ITCAM for SOA Agent V711
/ KD5  OMEGAMON for DB2 PE V550
/ KGW  OMEGAMON for CICS TG V550
/ KI5  OMEGAMON for IMS V550
/ KJJ  OMEGAMON for JVM V540
/ KMQ  OMEGAMON for Messaging - MQ V750
/ KM5  OMEGAMON for z/OS V550
/ KNA  NetView for z/OS Agent V621
/ KN3  OMEGAMON for Networks V550
/ KOB  OMEGAMON Enhanced 3270 User Interface V750
/ KQI  OMEGAMON for Messaging - Integration Bus V750

/ KRH  Advanced Reporting and Management for DFSMSshm Agent V260
/ KRJ  Advanced Allocation Management Agent V330
/ KRK  Automated Tape Allocation Manager for z/OS Agent V330
/ KRN  Advanced Catalog Management Agent V260
/ KRV  Advanced Backup and Recovery for z/OS Agent V240
/ KRW  Tape Optimizer for z/OS Agent V220
/ KS3  OMEGAMON for Storage V540
/ KYN  ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

8. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
9. Review the JCL to understand what the job is doing, then submit the job and return to the Workflow - Primary Option Menu..  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided as you set up the work environment. They also contain default values for all required parameters and some optional parameters. The amount of additional customization that is required depends upon how much your environment differs from the model or product-provided defaults. At a minimum, you must supply certain site-specific values, including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

## About this task

### RTE configuration profile

The RTE profile inherits the symbolics specified on the KCIP@PG3 panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, &SYSNAME.), except for the **RTE\_NAMESV** parameter instance. You can assign symbolics to additional parameters, but see [“Parameters ineligible to use variables” on page 1248](#) for parameters that must be excluded from use of

symbolics. In addition, you must also customize the product-specific parameters listed in [Configure OMEGAMON monitoring agents and other components](#), as applicable. Optionally, you can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)). If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.

### Global configuration profile

You can assign symbolics to any of the parameters in the global profile. At a minimum, if you enabled SDA, you must assign a symbolic value to the **GBL\_HFS\_JAVA\_DIR1** parameter (for example, **&GBL\_HFS\_JAVA\_DIR1.**), or change the literal default to a site-appropriate one. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

At a minimum, provide site-appropriate resolution values for the following parameters, which apply to the hub to which the remote monitoring server connects:

- **KDS\_HUB\_TEMS\_NAME\_NODEID**
- **KDS\_HUB\_VTAM\_APPL\_GLB\_BROKER** (if the hub uses SNA)
- **KDS\_HUB\_VTAM\_NETID** (if the hub uses SNA)
- **KDS\_HUB\_TCP\_HOST**
- **KDS\_HUB\_TCP\_PIPE\_PORT\_NUM**

### Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLa job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
4. Select 2 to edit the \$GBL\$USR global profile.

### What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

### Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSESV job. This job generates a set of jobs that extract the parameters values specified during configuration and creates the runtime members.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```

KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ===>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.

```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

Submitting the batch jobs created in the preceding step is the final step in setting up the runtime environment (RTE) using the configuration software.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ===>

Quick Configuration Mode

GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME: SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
Enter n (1-5) to perform tasks.
Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status   Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5. Perform post configuration steps.         POSTCFG
R Create next RTE - Reset fields.           New RTE
Press F1=Help for more information. Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>
```

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.  
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.  
Enter ns (1s-12s) for detailed job/task status.

Description	REQ	Job Name	Status	Date
1. Composite SUBMIT job (See JCL comments) ** or **		KCIJPSUB		More: +
2. Allocate runtime RO and RW datasets	(Yes)	KCIJPALO		
3. Copy SMP/E mbrs from TK*->RK* RO libs	(Yes)	KCIJPLOD		
4. Run product security steps	(Yes)	KCIJPSEC		
5. Update variable-named runtime mbrs	(No )	KCIJPUPV		
6. (Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7. Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8. Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9. Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10. Verify the configuration jobs	(Tip)	KCIJPIVP		
11. Back-up RK* product execution user libs	(Tip)	KCIJPCPR		
12. Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

Press F1=Help for more information. Type UTIL to access utility menu.

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs either by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

### What to do next

Complete any configuration required outside the configuration software. You can access "Complete the configuration" instructions for all installed products and components by selecting option 5 from the Workflow - Primary Option Menu. For more detailed instructions, see the following information:

- [Completing the configuration outside the configuration software](#)
- The *Planning and Configuration Guide* for each product.

## Scenario QCF06: Configuring a full RTE with a remote monitoring server and variables enabled

After you have set up a hub monitoring server, whether on z/OS® or on a distributed system, you can create runtime environments (RTEs) that contain remote monitoring servers that report to hub. Any agents configured in the new RTE connect to the local remote monitoring server. If you create a full RTE, subsequent RTEs can share its read-only libraries. By using variables in the new RTE, you can quickly reconfigure operational values without recreating the RTE, or clone the RTE and transport it to other LPARs. Use the IBM-provided template @MDLRFV to create this environment with minimal configuration, or create your own from scratch.

### Before you begin

If you intend to enable the self-describing agent feature on the monitoring server, or to configure any products that require a z/OS® UNIX® System Services file system, make sure that make sure that the required Hierarchical File System (HFS) or z/OS File System has been created or set aside and that it is mounted before you begin configuration. The file system must have access to a Java™ runtime environment running under IBM®'s 31-bit or 64-bit Java™ SDK Version 5 (or higher) on an HFS or zFS file system.

### About this task

This scenario involves five main steps using the configuration software. After you complete these steps, you may have to perform additional configuration outside the software.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the RTEs that share the same global properties is stored, and provide the high-level qualifier that together with the RTE name uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                   ©Copyright IBM Corporation 1992-2017
                   Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

   UNIT    /  STORCLAS /
   VOLSER  /  MGMTCLAS /
GBL_TARGET_HILEV:  _____ /  _____ /
                   HLQ of SMP/E target (TK*) datasets  -----  -----

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/ MGMTCLAS if necessary. The following panel is displayed.

```
KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                               Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
               (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
               Specify the dataset name of the PARMGEN common/global
               library for the different LPAR runtime environments (RTEs).
               Use the same dataset for managing the different LPAR RTEs.
               Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
               Specify the High-Level Qualifier (&hlq) portion of the
               PARMGEN interim staging and work libraries for this LPAR RTE:
               - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
               - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
               - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
               Specify the runtime environment (&rte_name) for this LPAR.
```

3. Provide the requested values for the RTE that you want to create.

**GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN . IDTST . PARMGEN . JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

**RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN . IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

**RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow primary options menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.  
The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPG) is displayed.

```

KCIPQPG  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                               Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.             KCIJPCFG
2.  Customize PARMGEN configuration profiles.            SYSA
3.  Create this RTE's runtime members and jobs.          $PARSE
4.  Submit batch jobs to complete PARMGEN setup.         SUBMIT
5.  Perform post configuration steps.                     POSTCFG
R   Create next RTE - Reset fields.                      New RTE

```

## Setting up the work environment

To set up the work environment for an RTE, you specify the type of RTE that is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can use the model @MDLRFV to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the primary options menu.  
The first **Set up PARMGEN work environment for an RTE** panel is displayed.

```

KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>

                Quick Configuration Mode

Specify the RTE model profile to use:
==> -----
More:      +

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSMEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=OM-----
==> /** 0 0 RTE_NAME=%RTE_NAME% SYSMEMBER=%SYSMEMBER%-----
==> /** \_~/ SYSJOBNAME=%SYSJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
(Type ? for last referenced JOBGEN library discovered, if any.)

```

- To use the IBM-provided model RTE, enter a question mark (?) on the first line and select @MDLRFV from the list of model profiles. To create an RTE from scratch, leave the field blank. As appropriate, specify the Install Job Generator output library and job card data.

#### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

- Press Enter to proceed to the next panel. The Set up PARMGEN Work Environment for an RTE (2 of 3) panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member you specified on the preceding panel.

```

KCIP@PG2 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:

                                UNIT / STORCLAS /
                                VOLSER / MGMTCLAS /
GBL_TARGET_HILEV: IBM.TARGET.ITM63055----- / ----- /
                                HLQ of SMP/E target (TK*) datasets ----- / ----- /

GBL_SYSDA_UNIT:  SYSDA___
                                Work datasets UNIT name

GBL_REGION:      OM-----
                                JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel. Type UTIL to access utility menu.

```

- Review the values on the panel and override them as necessary.

#### GBL\_TARGET\_HILEV

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

## GBL\_SYSDA\_UNIT

Specifies the non-VSAM disk UNIT for global work data sets.

## GBL\_REGION

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, 0M). The default is 0M.

5. Press Enter to proceed to the next panel.

The **Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed. If you selected the model profile, the panel contains the values shown in the following figure. If you are configuring the RTE from scratch, the panel displays the IBM® defaults.

```
KCIP@PG3  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==>                               Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Full RTE w/ Remote TEMS/Agents w/ variables_____
                                     More:      +
RTE_TYPE:             FULL_____ (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_____ (ex.: TDITN.IDTST
                                     (&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
                                     (&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:      _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:    _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:    _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
                                     (&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
                                     (*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y (Y, N) (Is RTE updater of R0 shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: Y (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:  &OMEGSAF._____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB: _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: &SYSNAME.:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:        REMOTE__ (Hub, Remote)
KDS_TEMS_HA_TYPE:     __ (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:    &RTE_PORT._____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: K&SYSCLONE._____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:      IBM_____ (1-4 char.started task prefix)
```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Look for the **More: +** which indicates that there is additional content on the panel.)

6. If your environment is not SMS-managed, specify the VSAM values. If you are using the IBM-provided model, you do need to make any other changes.

- If you are configuring the RTE from scratch, set **RTE\_TYPE** to FULL, **RTE\_SYSV\_SYSVAR\_FLAG** to Y, and **KDS\_TEMS\_TYPE** to REMOTE.

Optionally, you can customize the following parameters to use system or user-defined variables:

- **RTE\_TEMS\_NAME\_NODEID** (for example, &SYSNAME . : CMS)
- **RTE\_TCP\_PORT\_NUM** (for example, &RTE\_PORT .)
- **RTE\_VTAM\_APPLID\_PREFIX** (for example, K&SYSCLONE .)
- **RTE\_SECURITY\_CLASS** (for example, &OMEGSAF .)

- Press Enter to proceed to the next panel.

The **Include Products in this PARMGEN RTE** panel (KCIP@PGI) is displayed. This panel lists all the products installed in the product library.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>                                     Scroll ==> PAGE

Select ("S" or "/" ) products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp  Component or Product Name and Version
-----
/ KAH  System Automation Monitoring Agent V350
/ KC5  OMEGAMON for CICS V550
/ KDO  Tivoli Decision Support for z/OS Agent V181
/ KDS  Tivoli Enterprise Monitoring Server V630
/ KD4  ITCAM for SOA Agent V711
/ KD5  OMEGAMON for DB2 PE V550
/ KGW  OMEGAMON for CICS TG V550
/ KI5  OMEGAMON for IMS V550
/ KJJ  OMEGAMON for JVM V540
/ KMQ  OMEGAMON for Messaging - MQ V750
/ KM5  OMEGAMON for z/OS V550
/ KNA  NetView for z/OS Agent V621
/ KN3  OMEGAMON for Networks V550
/ KOB  OMEGAMON Enhanced 3270 User Interface V750
/ KQI  OMEGAMON for Messaging - Integration Bus V750
/ KRG  Advanced Audit for DFSMSshm Agent V260
/ KRH  Advanced Reporting and Management for DFSMSshm Agent V260
/ KRJ  Advanced Allocation Management Agent V330
/ KRK  Automated Tape Allocation Manager for z/OS Agent V330
/ KRN  Advanced Catalog Management Agent V260
/ KRV  Advanced Backup and Recovery for z/OS Agent V240
/ KRW  Tape Optimizer for z/OS Agent V220
/ KS3  OMEGAMON for Storage V540
/ KYN  ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

- Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
- Review the JCL to understand what the job is doing, then submit the job and return to the primary option menu.  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete successfully before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, and populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided as you set up the work environment. They also contain default values for all required parameters and some optional parameters. The amount of additional customization that is required depends upon how much your environment differs from the model or product-provided defaults. At a minimum, you must supply certain site-specific values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

## About this task

### RTE configuration profile

The RTE profile inherits the symbolics specified on the KCIP@PG3 panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, &SYSNAME.), except for the RTE\_NAMESV parameter instance. You must also edit the variables profile to set the resolution value of the symbolic assigned to the RTE name.

You must also set the KDS\_HUB\_\* parameters to the appropriate values for the hub monitoring server to which this remote reports.

- **KDS\_HUB\_TEMS\_NAME\_NODEID**
- **KDS\_HUB\_VTAM\_APPL\_GLB\_BROKER** (if the hub is enabled for SNA)
- **KDS\_HUB\_VTAM\_NETID** (if the hub is enabled for SNA)
- **KDS\_HUB\_TCP\_HOST**
- **KDS\_HUB\_TCP\_PIPE\_PORT\_NUM**

If the hub is a high-availability hub, you must set the monitoring server and agent **KDEB\_INTERFACELIST** parameters (**KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST** and **Kpp\_AGT\_TCP\_KDEB\_INTERFACELIST**) to "! \*". In addition, you might need to configure one or more of the following parameters:

- If any of the products that you are configuring require any z/OS® UNIX® System Services directories running on either the Hierarchical File System (HFS) or on the zSeries File System (zFS), or if you are planning to enable the self-describing agent (SDA) feature, specify the directory to be used (**RTE\_USS\_RTEDIR**).
- To enable the SDA feature, set **KDS\_KMS\_SDA** to Y.
- To automate APF-authorization of all generated started tasks by generating the required commands for all libraries concatenated within the STEPLIB and RKANMODL DD names of the started tasks, set **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** to Y.
- To collect historical data for display in either the Tivoli® Enterprise Portal or the OMEGAMON® Enhanced 3270 user interface, data sets must be allocated to store the data. The persistent data store (PDS) that manages the collected data must be configured (see [Allocate data sets and configure maintenance for historical data](#)). It is enabled by default to collect at the agent.

You may want to configure some or all of the following features on the monitoring server: support for self-describing agents, auditing, a SOAP server. For instructions on enabling these features, see [Configure a Tivoli Enterprise Monitoring Server](#).

The parameters discussed here are not the only parameters for which you must either accept or override the default values in the configuration profile for the runtime environment. After you set the parameters shown here, be sure to go through the configuration profiles to make sure the parameter values are correct for the configuration you want. [Customizing the runtime environment configuration profile](#) discusses the values and features that are typically customized in the RTE configuration profile.

### Global configuration profile

If you set the **RTE\_USS\_RTEDIR** parameter in the RTE profile, in the global configuration profile provide a site-appropriate value for **GBL\_HFS\_JAVA\_DIR1** parameter.

You must also edit the value for the **GBL\_DSN\_CSF\_SCSFMODE0** load library parameter and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

### Variables profile

Edit the variables profile to set the resolution value of the symbolic assigned to the **RTE\_NAME** parameter in the RTE profile. The resolution value must be the RTE name.

If you enabled the self-describing agent feature (by setting **KDS\_KMS\_SDA** to Y, provide site-specific values for the following symbols:

- **RTE\_USS\_RTEDIR**
- **GBL\_HFS\_JAVA\_DIR1**

## Procedure

1. From the Workflow - Primary Option Menu, select **Customize PARMGEN configuration profiles**. The **Customize PARMGEN Configuration Profile Members** panel (KCIP@PG6) is displayed.

2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
4. Select 2 to edit the \$GBL\$USR global profile.
5. Select 3 to edit the variables profile.  
Provide values for any user-defined variables that you add, any variables that whose values differ from the IBM-provided default resolution values, and any variables whose values cannot be automatically discovered from the system IPL PARMLIB data set. See [Customizing the variables profile](#) for more information on customizing variables.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSESV job. This job generates a set of jobs that extract the parameters values specified during configuration and creates the runtime members.

### Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**.  
The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status    Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

The final step in setting up the runtime environment (RTE) using the configuration software is submitting the batch jobs that were created in the preceding step. These jobs allocate the necessary data sets,

### About this task

The jobs that required to complete set up depend upon the configuration of the RTE. For example, if the RTE is enabled for variables, the KCIJPUPV job must be run to update variable-named runtime members. If the self-describing agent feature is enabled for this RTE, or any product which requires z/OS® UNIX® System Services, the KCIJPUSP and KCIJPUSJ jobs must be run.

The option menu on the **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) indicates which job are required for this RTE.

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```
KCIPQPGGB  PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

      Description                Job/Label  Status      Date
      -----
1.  Set up/Refresh PARMGEN work environment.      KCIJPCFG
2.  Customize PARMGEN configuration profiles.      SYSA
3.  Create this RTE's runtime members and jobs.   $PARSE    Enter 3 for details.
4.  Submit batch jobs to complete PARMGEN setup.  SUBMIT    Enter 4 for details.
5.  Perform post configuration steps.             POSTCFG
R   Create next RTE - Reset fields.              New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.
```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

      Description                REQ  Job Name  Status      Date
      -----
1.  Composite SUBMIT job (See JCL comments)      KCIJPSUB
    ** OR **
2.  Allocate runtime RO and RW datasets          (Yes) KCIJPALO
3.  Copy SMP/E mbrs from TK*->RK* RO libs        (Yes) KCIJPLOD
4.  Run product security steps                  (Yes) KCIJPSEC
5.  Update variable-named runtime mbrs          (No ) KCIJPUPV
6.  (Re)Create USS runtime mbrs in RKANDATV     (Yes) KCIJPUSP
7.  Create USS dirs./ (Re)Copy USS files        (Yes) KCIJPUSJ
8.  Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9.  Run post-SMP/E RKANMODU ASM/LINK steps      (Yes) KCIJPLNK
10. Verify the configuration jobs                (Tip) KCIJPIVP
11. Back-up RK* product execution user libs    (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs    (Yes) Enter 12 for details.

Press F1=Help for more information.  Type UTIL to access utility menu.
```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

2. Submit the required jobs by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as UNIX™ System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

3. If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).
4. If the jobs complete with any errors, review the \$IVPRPT verification report in the WCONFIG library. Correct any errors and rerun any jobs that did not complete successfully. Rerun the KCIJPIVP verification job until all errors have been eliminated.

### What to do next

Complete any configuration required outside of the configuration software. To see the required steps, return to the **Workflow - Primary Option Menu** and select **Perform post configuration steps**. This option displays a set of readme files that describe the additional configuration steps that must be taken for the components and products that are configured in this RTE. For additional information, see [Completing the configuration outside the configuration software](#) and the *Planning and Configuration Guide* for each of the configuration products.

## Scenario QCF07: Creating a sharing-with-base runtime environment with a remote monitoring server

A sharing-with-base runtime environment (RTE) shares its read-only runtime libraries with other RTEs. The configuration software automatically creates the base RTE when you configure the first RTE that shares it. Sharing RTEs configured subsequently can then reference that base RTE.

### About this task

You can configure the RTE from scratch, or use the IBM-provided @MDLRSB model RTE.

### Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the RTEs that share the same global properties is stored, and provide the high-level qualifier that together with the RTE name uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```

KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM

```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```

KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV: _____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:

```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.    SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.           POSTCFG
R   Create next RTE - Reset fields.            New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the primary options menu. The first **Set up PARMGEN work environment for an RTE** panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYSDJOBNAME=%SYSDJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. To use the IBM-provided model RTE, specify @MDLRB in the first field. To create an RTE from scratch, leave the field blank. As appropriate, specify the Install Job Generator output library and jobcard data.

#### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

3. Press Enter to proceed to the next panel.

The **Set up PARMGEN Work Environment for an RTE (2 of 3)** panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:
                                UNIT   /  STORCLAS /
                                VOLSER /  MGMTCLAS /
GBL_TARGET_HILEV:  IBM.TARGET.ITM63055_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  _____ /
GBL_SYSDA_UNIT:   SYSDA____
                   Work datasets UNIT name
GBL_REGION:      OM_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

4. Review the values on the panel and override them as necessary.

**GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=OM value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, OM). The default is OM.

5. Press Enter to proceed to the next panel.

The **Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed. If you selected the model profile, the panel contains the values shown in the following figure. If you are configuring the RTE from scratch, the panel displays the IBM® defaults.

```

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----
Command ==> Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.
Press F1=Help for more information.

RTE_DESCRIPTION:      Sharing-w/-Base RTE w/ Remote TEMS/Agents_____
More:                +

RTE_TYPE:             SHARING_      (Full, Sharing)
RTE_HILEV:            TDITN.IDTST_____ (ex.: TDITN.IDTST
(&hlq portion of Non-VSAM RK* HLQ=&hlq.&rte_name)
RTE_VSAM_HILEV:      TDITN.IDTST_____ (ex.: TDITN.IDTST
(&hlq portion of VSAM RK* HLQ=&hlq.&rte_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:
RTE_SMS_UNIT:        _____ (Non-VSAM disk UNIT type)
RTE_SMS_VOLUME:      _____ (Non-VSAM disk VOLSER)
RTE_SMS_MGMTCLAS:    _____ (Non-VSAM disk MGMTCLAS)
RTE_SMS_STORCLAS:    _____ (Non-VSAM disk STORCLAS)
RTE_SMS_VSAM_VOLUME: _____ (VSAM disk VOLSER)
RTE_SMS_VSAM_MGMTCLAS: _____ (VSAM disk MGMTCLAS)
RTE_SMS_VSAM_STORCLAS: _____ (VSAM disk STORCLAS)

RTE_SMS_PDSE_FLAG:   Y (Y, N) (Allocate Non-VSAM PDSE libraries)

If RTE_TYPE is SHARING:
RTE_X_HILEV_SHARING: _____ (ex.: TDITN.IDTST)
(&hlq portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_SHARE:           _____ ("SMP" value or *&rte_share)
(*&rte_share portion of shared RTE's HLQ=&hlq.&rte_share)
RTE_LOAD_SHARED_LIBS: Y (Y, N) (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:
RTE_SYSV_SYSVAR_FLAG: N (Y, N) (System/User variables flag)

Security settings:
RTE_SECURITY_USER_LOGON: NONE_____ (RACF, ACF2, TSS, NAM, None)
RTE_SECURITY_FOLD_PASSWORD_FLAG: Y (Y, N) (Fold password to upper case)
RTE_SECURITY_CLASS:  _____
RTE_X_SECURITY_EXIT_LIB: TDITN.IDTST.DEMO.RKANSAMU_____
GBL_DSN_ACF2_MACLIB:  _____
GBL_DSN_ACF2_MACLIB1: _____

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:
RTE_TEMS_CONFIGURED_FLAG: Y (Y, N) (Configure TEMS in this RTE)
RTE_TEMS_NAME_NODEID: DEMO:CMS_____ (e.g., DEMO:cms)))
KDS_TEMS_TYPE:        REMOTE__ (Hub, Remote)
KDS_TEMS_HA_TYPE:     __ (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:
RTE_TCP_PORT_NUM:    1918_____ (1-65535 port number)
RTE_VTAM_APPLID_PREFIX: CTD_____ (1-4 char.VTAM APPLID prefix)
RTE_STC_PREFIX:      IBM_____ (1-4 char.started task prefix)

```

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters. (Note the **More: +** which indicates that there is additional content on the panel.)

6. If your environment is not SMS-managed, specify the VSAM values.
  - If you select the IBM-provided model, supply the high-level qualifier and the name for the base libraries:
    - **RTE\_X\_HILEV\_SHARING**
    - **RTE\_SHARE**
  - If you are setting up the RTE from scratch, customize the following parameters as indicated:
    - **RTE\_TYPE=SHARING**
    - **RTE\_X\_HILEV\_SHARING=base\_rte\_hilev**
    - **RTE\_SHARE=base\_rte\_name**
    - **KDS\_TEMS\_TYPE=REMOTE**

Optionally, configure the following:

- **RTE\_TEMS\_NAME\_NODEID**
- **RTE\_TCP\_PORT\_NUM**

- RTE\_VTAM\_APPLID\_PREFIX
- RTE\_STC\_PREFIX
- RTE\_X\_SECURITY\_EXIT\_LIB

If you have already created another sharing-with-base RTE that is set to load the shared base libraries, best practice is to set **RTE\_LOAD\_SHARED\_LIBS** to N to avoid loading the libraries multiple times.

7. Press Enter to proceed to the next panel.

The **Include Products in this PARMGEN RTE** panel (KCIP@PGI) is displayed. This panel lists all the products installed in the product library.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>                                     Scroll ==> PAGE

Select ("S" or "/") products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
-----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KD0 Tivoli Decision Support for z/OS Agent V181
/ KDS Tivoli Enterprise Monitoring Server V630
/ KD4 ITCAM for SOA Agent V711
/ KD5 OMEGAMON for DB2 PE V550
/ KGW OMEGAMON for CICS TG V550
/ KI5 OMEGAMON for IMS V550
/ KJJ OMEGAMON for JVM V540
/ KMQ OMEGAMON for Messaging - MQ V750
/ KM5 OMEGAMON for z/OS V550
/ KNA NetView for z/OS Agent V621
/ KN3 OMEGAMON for Networks V550

/ KRH Advanced Reporting and Management for DFSMSshm Agent V260
/ KRJ Advanced Allocation Management Agent V330
/ KRK Automated Tape Allocation Manager for z/OS Agent V330
/ KRN Advanced Catalog Management Agent V260
/ KRV Advanced Backup and Recovery for z/OS Agent V240
/ KRW Tape Optimizer for z/OS Agent V220
/ KS3 OMEGAMON for Storage V540
/ KYN ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

8. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
9. Review the JCL to understand what the job is doing, then submit the job and return to the Workflow - Primary Option Menu.  
The KCIJPCFG jobs submits a second job, KCIJPPRF. Wait for both jobs to complete successfully before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, and populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPPIPE and SNA defaults, and the like), including variable resolution values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

## About this task

### RTE configuration profile

The RTE profile inherits the symbolics specified on the KCIP@PG3 panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, &SYSNAME.), except for the **RTE\_NAMESV** parameter instance. You can assign symbolics to additional parameters, but see [“Parameters ineligible to use variables” on page 1248](#) for parameters that must be excluded from use of symbolics. In addition, you must also customize the product-specific parameters listed in [Configure OMEGAMON monitoring agents and other components](#), as applicable. Optionally, you can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)). If you want to use the self-describing agent (SDA) feature, set the resolution value for **KDS\_KMS\_SDA** to Y, and provide site-specific values for **RTE\_USS\_RTEDIR**.

### Global configuration profile

You can assign symbolics to any of the parameters in the global profile. At a minimum, if you enabled SDA, you must assign a symbolic value to the **GBL\_HFS\_JAVA\_DIR1** parameter (for example, &GBL\_HFS\_JAVA\_DIR1.), or change the literal default to a site-appropriate one. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
4. Select 2 to edit the \$GBL\$USR global profile.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

## Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```

KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1

1. Create runtime members/jobs in all WK* libs.  $PARSE

Press F1=Help for more information. Type UTIL to access utility menu.

```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

The final step in setting up the runtime environment (RTE) using the configuration software is submitting the batch jobs that were created in the preceding step. These jobs allocate the necessary data sets,

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

Quick Configuration Mode

GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME: SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
Enter n (1-5) to perform tasks.
Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status   Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5. Perform post configuration steps.         POSTCFG
R Create next RTE - Reset fields.           New RTE

Press F1=Help for more information. Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>
```

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.  
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.  
Enter ns (1s-12s) for detailed job/task status.

	Description	REQ	Job Name	Status	Date
				More:	+
1.	Composite SUBMIT job (See JCL comments) ** OR **		KCIJPSUB		
2.	Allocate runtime RO and RW datasets	(Yes)	KCIJPALO		
3.	Copy SMP/E mbrs from TK*->RK* RO libs	(Yes)	KCIJPLOD		
4.	Run product security steps	(Yes)	KCIJPSEC		
5.	Update variable-named runtime mbrs	(No )	KCIJPUPV		
6.	(Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7.	Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8.	Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9.	Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10.	Verify the configuration jobs	(Tip)	KCIJPIVP		
11.	Back-up RK* product execution user libs	(Tip)	KCIJPCPR		
12.	Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

Press F1=Help for more information. Type UTIL to access utility menu.

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).
- If the jobs complete with any errors, review the \$IVPRPT verification report in the WCONFIG library. Correct any errors and rerun any jobs that did not complete successfully. Rerun the KCIJPIVP verification job until all errors have been eliminated.

## What to do next

Complete any configuration required outside of the configuration software. To see the required steps, return to the **Workflow - Primary Option Menu** and select **Perform post configuration steps**. This option displays a set of readme files that describe the additional configuration steps that must be taken for the components and products that are configured in this RTE. For additional information, see [Completing the configuration outside the configuration software](#) and the *Planning and Configuration Guide* for each of the configuration products.

## Scenario QCF08: Creating a sharing-with-SMP/E runtime environment with a remote monitoring server

A sharing-with-SMP/E runtime environment (RTE) contains LPAR-specific libraries and references the read-only target libraries managed by SMP/E. Because an RTE that shares the SMP/E target libraries is updated when the SMP/E maintenance is applied, a sharing-with-SMP/E configuration is good for testing maintenance before other RTEs are updated.

### About this task

You can use the @MDLRSS model profile to configure this RTE, or you can configure it from scratch.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the RTEs that share the same global properties is stored, and provide the high-level qualifier that together with the RTE name uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ==>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ==>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV:  _____ /  _____ /
                   HLQ of SMP/E target (TK*) datasets  _____ /  _____

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the primary options menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                               Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.             KCIJPCFG
2.  Customize PARMGEN configuration profiles.            SYSA
3.  Create this RTE's runtime members and jobs.         $PARSE
4.  Submit batch jobs to complete PARMGEN setup.        SUBMIT
5.  Perform post configuration steps.                   POSTCFG
R   Create next RTE - Reset fields.                    New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the primary options menu. The first Set up PARMGEN work environment for an RTE panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYJOBNAME=%SYJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. To use the IBM-provided model RTE, specify @MDLRSS in the first field. To create the RTE from scratch, leave the field blank. As appropriate, specify the Install Job Generator output library and job card data.

#### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

3. Press Enter to proceed to the next panel.

The **Set up PARMGEN Work Environment for an RTE (2 of 3)** panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:
                                UNIT   /  STORCLAS /
                                VOLSER /  MGMTCLAS /
GBL_TARGET_HILEV:  IBM.TARGET.ITM63055_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  _____ /
GBL_SYSDA_UNIT:   SYSDA____
                   Work datasets UNIT name
GBL_REGION:       OM_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

4. Review the values on the panel and override them as necessary.

**GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=OM value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, OM). The default is OM.

5. Press Enter to proceed to the next panel.

The **Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed. If you selected the model profile, the panel contains the values shown in the following figure. If you are configuring the RTE from scratch, the panel displays the IBM® defaults.

- **RTE\_X\_SECURITY\_EXIT\_LIB**

7. Press Enter to proceed to the next panel.  
The **Include Products in this PARMGEN RTE** panel (KCIP@PGI) is displayed. This panel lists all the products installed in the product library.

```
KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>                                     Scroll ==> PAGE

Select ("S" or "/" ) products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
-----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181
/ KDS Tivoli Enterprise Monitoring Server V630
/ KD4 ITCAM for SOA Agent V711
/ KD5 OMEGAMON for DB2 PE V550
/ KGW OMEGAMON for CICS TG V550
/ KI5 OMEGAMON for IMS V550
/ KJJ OMEGAMON for JVM V540
/ KMQ OMEGAMON for Messaging - MQ V750
/ KM5 OMEGAMON for z/OS V550
/ KNA NetView for z/OS Agent V621
/ KN3 OMEGAMON for Networks V550
/ KOB OMEGAMON Enhanced 3270 User Interface V750
/ KQI OMEGAMON for Messaging - Integration Bus V750
/ KRG Advanced Audit for DFSMSshm Agent V260
/ KRH Advanced Reporting and Management for DFSMSshm Agent V260
/ KRJ Advanced Allocation Management Agent V330
/ KRK Automated Tape Allocation Manager for z/OS Agent V330
/ KRN Advanced Catalog Management Agent V260
/ KRV Advanced Backup and Recovery for z/OS Agent V240
/ KRW Tape Optimizer for z/OS Agent V220
/ KS3 OMEGAMON for Storage V540
/ KYN ITCAM for Application Diagnostics, TEMA V710.03
End of data
```

8. Deselect any products that you do not want to include in the RTE, then change Confirm ==> N to Y, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
9. Review the JCL to understand what the job is doing, then submit the job and return to the Workflow - Primary Option Menu.  
The KCIJPCFG jobs submits a second job, KCIJPPRF. Wait for both jobs to complete successfully before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, and populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided as you set up the work environment. They also contain default values for all required parameters and some optional parameters. The amount of additional customization that is required depends upon how much your environment differs from the model or product-provided defaults. At a minimum, you must supply certain site-specific values. You must also enable and configure any features you want to exploit (such as support for self-describing agents).

### About this task

In the RTE configuration profile, at a minimum you must set the KDS\_HUB\_\* parameters to the appropriate values for the hub monitoring server to which this remote reports.

- **KDS\_HUB\_TEMS\_NAME\_NODEID**
- **KDS\_HUB\_VTAM\_APPL\_GLB\_BROKER** (if the hub is enabled for SNA)
- **KDS\_HUB\_VTAM\_NETID** (if the hub is enabled for SNA)

- **KDS\_HUB\_TCP\_HOST**
- **KDS\_HUB\_TCP\_PIPE\_PORT\_NUM**

If the hub is an HA hub, you must set the monitoring server and agent **KDEB\_INTERFACELIST** parameters (**KDS\_TEMS\_TCP\_KDEB\_INTERFACELIST** and **Kpp\_AGT\_TCP\_KDEB\_INTERFACELIST**) to "!" \*.  
In addition, you might need to configure one or more of the following parameters:

- If any of the products that you are configuring require any z/OS® UNIX® System Services directories running on either the Hierarchical File System (HFS) or on the zSeries File System (zFS), or if you are planning to enable the self-describing agent (SDA) feature, specify the directory to be used (**RTE\_USS\_RTEDIR**).
- To enable the SDA feature, set **KDS\_KMS\_SDA** to Y.
- To automate APF-authorization of all generated started tasks by generating the required commands for all libraries concatenated within the STEPLIB and RKANMODL DD names of the started tasks, set **RTE\_X\_STC\_INAPF\_INCLUDE\_FLAG** to Y.
- To collect historical data for display in either the Tivoli® Enterprise Portal or the OMEGAMON® Enhanced 3270 user interface, data sets must be allocated to store the data. The persistent datastore (PDS) that manages the collected data must be configured (see [Allocate data sets and configure maintenance for historical data](#)). It is enabled by default to collect at the agent.

You may want to configure some or all of the following features on the monitoring server: support for self-describing agents, auditing, a SOAP server. For instructions on enabling these features, see [Configure a Tivoli Enterprise Monitoring Server](#).

The parameters discussed here are not the only parameters for which you must either accept or override the default values in the configuration profile for the runtime environment. After you set the parameters shown here, be sure to go through the configuration profiles to make sure the parameter values are correct for the configuration you want. [Customizing the runtime environment configuration profile](#) discusses the values and features that are typically customized in the RTE configuration profile.

In the global configuration profile, if you set the **RTE\_USS\_RTEDIR**, you must provide a site-appropriate value for **GBL\_HFS\_JAVA\_DIR1** parameter. You must also edit the value for load library parameter **GBL\_DSN\_CSF\_SCSFMODE0** and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

## Procedure

1. From the Workflow - Primary Option Menu, select 2 (Customize PARMGEN configuration profiles). The Customize PARMGEN Configuration Profile Members panel (KCIP@PG6) is displayed.
2. Type DLAJOB in the Command line and press **Enter** to review the composite KCIJPDLa job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select 1 to edit the RTE profile.
4. Select 2 to edit the \$GBL\$USR global profile.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option 4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSE job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

## Procedure

1. From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```

KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ===>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1

1. Create runtime members/jobs in all WK* libs.  $PARSE

Press F1=Help for more information. Type UTIL to access utility menu.

```

2. Select option 1 to submit the composite job.  
The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
3. If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - a. Type 1s in pane KCIP@PR1, and then go through the validation report.
  - b. Correct the parameter values.
  - c. Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

The final step in setting up the runtime environment (RTE) using the configuration software is submitting the batch jobs that were created in the preceding step. These jobs allocate the necessary data sets,

### Procedure

1. From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ===>

Quick Configuration Mode

GBL_USER_JCL: TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME: SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
Enter n (1-5) to perform tasks.
Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status   Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5. Perform post configuration steps.         POSTCFG
R Create next RTE - Reset fields.           New RTE

Press F1=Help for more information. Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KCIP@SUB) is displayed.

```
KCIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>
```

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.  
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.  
Enter ns (1s-12s) for detailed job/task status.

	Description	REQ	Job Name	Status	Date
				More:	+
1.	Composite SUBMIT job (See JCL comments) ** or **		KCIJPSUB		
2.	Allocate runtime RO and RW datasets	(Yes)	KCIJPALO		
3.	Copy SMP/E mbrs from TK*->RK* RO libs	(Yes)	KCIJPLOD		
4.	Run product security steps	(Yes)	KCIJPSEC		
5.	Update variable-named runtime mbrs	(No )	KCIJPUPV		
6.	(Re)Create USS runtime mbrs in RKANDATV	(Yes)	KCIJPUSP		
7.	Create USS dirs./ (Re)Copy USS files	(Yes)	KCIJPUSS		
8.	Copy runtime mbrs to SYS1-type libs (Caution)		KCIJPSYS		
9.	Run post-SMP/E RKANMODU ASM/LINK steps	(Yes)	KCIJPLNK		
10.	Verify the configuration jobs	(Tip)	KCIJPIVP		
11.	Back-up RK* product execution user libs	(Tip)	KCIJPCPR		
12.	Copy runtime mbrs from WK*->RK* RW libs	(Yes)	Enter 12 for details.		

Press F1=Help for more information. Type UTIL to access utility menu.

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report, correct the errors noted, and resubmit the jobs.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).
- If the jobs complete with any errors, review the \$IVPRPT verification report in the WCONFIG library. Correct any errors and rerun any jobs that did not complete successfully. Rerun the KCIJPIVP verification job until all errors have been eliminated.

### What to do next

Complete any configuration required outside of the configuration software. To see the required steps, return to the **Workflow - Primary Option Menu** and select **Perform post configuration steps**. This option displays a set of readme files that describe the additional configuration steps that must be taken for the components and products that are configured in this RTE. For additional information, see [Completing the configuration outside the configuration software](#) and the *Planning and Configuration Guide* for each of the configuration products.

## Scenario QCF09: Creating a sharing-with-SMP/E runtime environment with a remote monitoring server and variables enabled

A sharing-with-SMP/E runtime environment (RTE) contains LPAR-specific libraries and references the read-only target libraries managed by SMP/E. Because an RTE that shares the SMP/E target libraries is updated when the SMP/E maintenance is applied, a sharing-with-SMP/E configuration is good for testing maintenance before other RTEs are updated. By using variables in the new RTE, you can quickly reconfigure operational values without recreating the RTE, or clone the RTE and transport it to other LPARs. The remote monitoring server in this RTE must be configured to report to a hub monitoring server.

### About this task

You can use the @MDLRSSV model profile to configure this RTE, or you can configure it from scratch.

## Defining the runtime environment

To define the runtime environment (RTE) you want to configure, you specify the name of the RTE, identify the library where the JCL for all the RTEs that share the same features is stored, and provide the high-level qualifier that together with the RTE name uniquely identifies the data sets for this RTE.

### Procedure

1. Launch PARMGEN by using the following command:

```
EX 'gbl_target_hilev.TKANCUS'
```

where *gbl\_target\_hilev* is the high-level qualifier for the SMP/E target libraries where the products are installed.

The Welcome screen for the z/OS Installation and Configuration Tools is displayed:

```
KCIPQPGW
      Welcome to the z/OS Installation and Configuration Tools for
      z Systems Management Suites

Option ===>

1. Checklist: System preparation checklists
   Tip: Read/Print Checklists prior to installation and configuration.

2. Installation Workflow:
   SMP/E-install z/OS products with Install Job Generator (JOBGEN)
   Conditional: JOBGEN is not required when using SystemPac or ServerPac.

3. Configuration Workflow (Post-installation):
   Configure z/OS products with Parameter Generator Workflow (PARMGEN)

I. What's New in PARMGEN?

Maintenance Level: HKCI310 PTF UA94193 (APAR OA53974 4Q17 Interim Feature)
                  ©Copyright IBM Corporation 1992-2017
                  Licensed Material - Program Property of IBM
```

2. Select 3 (Configuration Workflow).

If this is the first time you have invoked PARMGEN using this TSO user ID, or if the CSI target library is different from the last one accessed by the user ID, the **Specify GBL\_TARGET\_HILEV Parameter** panel is displayed:

```
KCIP@TLV ----- SPECIFY GBL_TARGET_HILEV PARAM
Command ===>

PARMGEN stores configuration values in the TSO user's ISPF profile.
If this is the first-time your TDITNT TSO user ID is invoking PARMGEN,
enter the GBL_TARGET_HILEV-related values appropriate for your deployment:

                                UNIT    /  STORCLAS /
                                VOLSER  /  MGMTCLAS
GBL_TARGET_HILEV:  _____ /  _____ /
                   HLQ of SMP/E target (TK*) datasets  -----  -----

Note:
If this is not the first time your TDITNT ID is invoking PARMGEN, this
panel is also presented if the GBL_TARGET_HILEV stored value changed
from the last time you invoked PARMGEN. Verify GBL_TARGET_HILEV, UNIT,
VOLSER, STORCLAS, and/or MGMTCLAS values accordingly.

Reference: Last PARMGEN environment stored in TDITNT's ISPF profile:
          GBL_USER_JCL:
          RTE_PLIB_HILEV:
          RTE_NAME:
          Last GBL_TARGET_HILEV:
```

Enter the high-level qualifier for the SMP/E target data sets, and the UNIT/VOLSER and STORCLAS/MGMTCLAS if necessary. The following panel is displayed.

```

KCIPQPGA ----- PARAMETER GENERATOR (PARMGEN) WORKFLOW MENU -----
Command ==>

                Quick Configuration Mode

Enter parameter values appropriate for the LPAR runtime environment (RTE).

GBL_USER_JCL:  -----
                (for example, TDITNT.ITM63055.SYSPLEX.PARMGEN.JCL)
                Specify the dataset name of the PARMGEN common/global
                library for the different LPAR runtime environments (RTEs).
                Use the same dataset for managing the different LPAR RTEs.
                Multiple users can specify the same dataset to manage RTEs.

RTE_PLIB_HILEV: -----
                Specify the High-Level Qualifier (&hlq) portion of the
                PARMGEN interim staging and work libraries for this LPAR RTE:
                - &hlq.&rte_name.IK* (IKANCMDU,IKANPARU,IKANSAMU)
                - &hlq.&rte_name.WK* (WKANCMDU,WKANPARU,WKANSAMU)
                - &hlq.&rte_name.WCONFIG

RTE_NAME:      ----- (Type ? for a list of configured RTEs)
                Specify the runtime environment (&rte_name) for this LPAR.

```

3. Provide the requested values to define the RTE that you want to create.

#### **GBL\_USER\_JCL**

Specifies the data set name of the PARMGEN global user JCL library. Enter the fully-qualified name that you want to use to store definitions for every RTE you might create on the LPAR. If the data set does not exist, you are prompted to correct the name or allocate the data set. For example: TDITN.IDTST.PARMGEN.JCL.

The PARMGEN global user JCL library is also where the PARMGEN process creates the variables configuration profile.

#### **RTE\_PLIB\_HILEV**

Specifies the non-VSAM high-level qualifier to use for the following PARMGEN work libraries. For example: TDITN.IDTST.

- The WCONFIG control library where configuration profiles and other members are stored
- The interim staging (IK\*) libraries where PARMGEN product runtime members (template versions) are stored
- The work output (WK\*) libraries where PARMGEN file-tailored runtime members and jobs are created

Note that PARMGEN changes are stored in the work libraries. You control when the changes are copied into production libraries.

#### **RTE\_NAME**

Specifies a unique name for the RTE you are creating. The name is appended to the **RTE\_PLIB\_HILEV** value to make each set of PARMGEN and runtime libraries unique: %RTE\_PLIB\_HILEV%.%RTE\_NAME%.WCONFIG(%RTE\_NAME%).

**Tip:** You might want to use the name of the LPAR and some distinguishing element in case more RTEs are created for LPAR. For example: SYSA.

4. Press Enter to proceed to the Workflow Primary Options Menu. The following message is displayed:

```

KCIP@MSG ----- PARMGEN MESSAGES -----
Command ==>

You have asked to configure a new RTE profile.

Proceed to configure a new RTE profile.

Press ENTER to continue. Press F3 to abort.

```

5. Press Enter.

The **PARAMETER GENERATOR (PARMGEN) Workflow - Primary Option Menu** (KCIPQPGB) is displayed.

```
KCIPQPGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>
                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:     SYSA

Note: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, See Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

                Description                Job/Label  Status    Date
-----
1.  Set up/Refresh PARMGEN work environment.    KCIJPCFG
2.  Customize PARMGEN configuration profiles.    SYSA
3.  Create this RTE's runtime members and jobs. $PARSE
4.  Submit batch jobs to complete PARMGEN setup. SUBMIT
5.  Perform post configuration steps.          POSTCFG
R   Create next RTE - Reset fields.           New RTE
```

## Setting up the work environment

To set up the work environment for an RTE, you specify what type of RTE is being configured, set RTE-specific values, and select the products to be configured in the environment. Then you submit the KCIJPCFG job, which uses the values you provide to allocate the work libraries, update the interim libraries, and create the configuration profiles for the RTE. You can select a model RTE to use to set up the new RTE, or configure it from scratch.

### Procedure

1. Select **Set up PARMGEN work environment for an RTE** from the primary options menu. The first **Set up PARMGEN work environment for an RTE** panel is displayed.

```
KCIPQPG1 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (1 OF 3) -----
Command ==>
                Quick Configuration Mode
  More:      +

Specify the RTE model profile to use:
==> -----

- To create a new RTE based on a predefined IBM model, type a ? in
  the field and press Enter, then select the appropriate template.
- To create a new RTE that is a clone of an existing PARMGEN RTE,
  specify the WCONFIG profile library and RTE member name to clone;
  for example: (&hlq.&rte.WCONFIG(&clone_from))
- To create a new RTE that is a clone of an ICAT-created RTE,
  specify the ICAT RTE Batch member location and RTE member;
  for example: (&hlq.ICAT.INSTJOBS(SYSA))
- To create a new RTE from scratch, leave this field blank.
- To reconfigure or upgrade this existing PARMGEN RTE, specify its values;
  for example: (TDITNT.IDTST.SYSA.WCONFIG(SYSA))

Customize jobcard data:
==> //TDITNT JOB (ACCT),'%SYSTEMBER% - NAME',CLASS=A,-----
==> // MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID.,REGION=0M-----
==> /*** 0 0 RTE_NAME=%RTE_NAME% SYSTEMBER=%SYSTEMBER%-----
==> /*** \_~/ SYJOBNAME=%SYJOBNAME% JOBPARM SYSAFF=%SYSNAME%-----

Specify the Install Job Generator (JOBGEN) output library if you want
PARMGEN to reuse CALLLIBS parameters from the JOBGEN repository:
==> -----
      (Type ? for last referenced JOBGEN library discovered, if any.)
```

2. To use the IBM-provided model RTE, specify \$MDKHF in the first field. To create an RTE from scratch, leave the field blank. As appropriate, specify the Install Job Generator output library and jobcard data.

### Jobcard data

If a customized job card is already available, it is retrieved from the ISPF user profile pool. If it is not available and if you did not specify a JOBGEN output library, the job card is harvested from *gbl\_target\_hilev*. TKANSAM SMP/E target library where the initial PARMGEN sample job card default is supplied. If you specified a JOBGEN output library, the job card information is harvested from that location. You can modify the retrieved data as needed. The customized job card is saved in the ISPF user profile pool and persists across ISPF sessions. On this panel, specify the parameter values appropriate for your environment. In most cases, the PARMGEN configuration parameters on this panel are required.

3. Press Enter to proceed to the next panel.

The **Set up PARMGEN Work Environment for an RTE (2 of 3)** panel (KCIP@PG2) is displayed. The values on this panel are read from the profile library and runtime member name you specified on the preceding panel.

```

KCIP@PG2  SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (2 OF 3) -----
Command ==>
                Quick Configuration Mode
GBL_USER_JCL:   TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITM.IDTST
RTE_NAME:      SYSA

Enter parameter values appropriate for your environment:
                                UNIT   /  STORCLAS /
                                VOLSER /  MGMTCLAS /
GBL_TARGET_HILEV:  IBM.TARGET.ITM63055_____ / _____ /
                   HLQ of SMP/E target (TK*) datasets  _____ /
GBL_SYSDA_UNIT:   SYSDA____
                   Work datasets UNIT name
GBL_REGION:      0M_____
                   JCL REGION (specify K/M suffix)

Note: Type BACK to go back one panel.  Type UTIL to access utility menu.

```

4. Review the values on the panel and override them as necessary.

**GBL\_TARGET\_HILEV**

Specifies the SMP/E high-level qualifier of the SMP/E target (TK\*) libraries.

**GBL\_SYSDA\_UNIT**

Specifies the non-VSAM disk UNIT for global work data sets.

**GBL\_REGION**

Specifies the JCL REGION value override if other than the REGION=0M value. This is the required storage value in Kilobytes or in Megabytes for PARMGEN batch jobs and product started tasks. The jobs contain the REGION= parameter on the EXEC statement. The syntax of the JCL REGION parameter is either &valueK or &valueM. Change this value as required by your installation. Specify K/M suffix (ex.: 4096K, 0M). The default is 0M.

5. Press Enter to proceed to the next panel.

The **Set Up PARMGEN Work Environment for an RTE (3 OF 3)** panel (KCIP@PG3) is displayed.

KCIP@PG3 SET UP/REFRESH PARMGEN WORK ENVIRONMENT FOR AN RTE (3 OF 3) -----  
 Command ==> Scroll ==> PAGE

Enter parameter values appropriate for the LPAR RTE=DEMO.  
 Press F1=Help for more information.

More: +

RTE\_DESCRIPTION:       Sharing-w/-SMP RTE w/ Remote/Agents w/ vars.\_\_\_\_

RTE\_TYPE:               SHARING\_       (Full, Sharing)

RTE\_HILEV:              TDITN.IDTST\_\_\_\_\_ (ex.: TDITN.IDTST  
                           (&hlq portion of Non-VSAM RK\* HLQ=&hlq.&rte\_name)

RTE\_VSAM\_HILEV:        TDITN.IDTST\_\_\_\_\_ (ex.: TDITN.IDTST  
                           (&hlq portion of VSAM RK\* HLQ=&hlq.&rte\_name)

If any RTE dataset HLQ-related parameter values are NONSMS-managed:

RTE\_SMS\_UNIT:           \_\_\_\_\_ (Non-VSAM disk UNIT type)

RTE\_SMS\_VOLUME:        \_\_\_\_\_ (Non-VSAM disk VOLSER)

RTE\_SMS\_MGMTCLAS:      \_\_\_\_\_ (Non-VSAM disk MGMTCLAS)

RTE\_SMS\_STORCLAS:      \_\_\_\_\_ (Non-VSAM disk STORCLAS)

RTE\_SMS\_VSAM\_VOLUME:   \_\_\_\_\_ (VSAM disk VOLSER)

RTE\_SMS\_VSAM\_MGMTCLAS: \_\_\_\_\_ (VSAM disk MGMTCLAS)

RTE\_SMS\_VSAM\_STORCLAS: \_\_\_\_\_ (VSAM disk STORCLAS)

RTE\_SMS\_PDSE\_FLAG:     Y   (Y, N)   (Allocate Non-VSAM PDSE libraries)

If RTE\_TYPE is SHARING:

RTE\_X\_HILEV\_SHARING:   \_\_\_\_\_ (ex.: TDITN.IDTST)  
                           (&hlq portion of shared RTE's HLQ=&hlq.&rte\_share)

RTE\_SHARE: SMP\_\_\_\_\_ ("SMP" value or \*&rte\_share)  
                           (\*&rte\_share portion of shared RTE's HLQ=&hlq.&rte\_share)

RTE\_LOAD\_SHARED\_LIBS: Y   (Y, N)   (Is RTE updater of RO shared libs)

If symbolics (system variables or user-defined variables) will be used:

RTE\_SYSV\_SYSVAR\_FLAG: Y   (Y, N)   (System/User variables flag)

Security settings:

RTE\_SECURITY\_USER\_LOGON: NONE\_\_\_\_ (RACF, ACF2, TSS, NAM, None)

RTE\_SECURITY\_FOLD\_PASSWORD\_FLAG: Y (Y, N) (Fold password to upper case)

RTE\_SECURITY\_CLASS:     &OMEGSAF.\_\_\_\_\_

RTE\_X\_SECURITY\_EXIT\_LIB: TDITN.IDTST.DEMO.RKANSAMU\_\_\_\_\_

GBL\_DSN\_ACF2\_MACLIB:   \_\_\_\_\_

GBL\_DSN\_ACF2\_MACLIB1:  \_\_\_\_\_

Local Tivoli Enterprise Monitoring Server (TEMS) settings in this LPAR RTE:

RTE\_TEMS\_CONFIGURED\_FLAG: Y   (Y, N) (Configure TEMS in this RTE)

RTE\_TEMS\_NAME\_NODEID: &SYSNAME.:CMS\_\_\_\_\_ (e.g., DEMO:cms)))

KDS\_TEMS\_TYPE:          REMOTE\_\_ (Hub, Remote)

KDS\_TEMS\_HA\_TYPE:       \_\_       (HA=High Availability Hub TEMS type)

ITM components' communication-related and started tasks settings:

RTE\_TCP\_PORT\_NUM:      &RTE\_PORT.\_\_\_\_\_ (1-65535 port number)

RTE\_VTAM\_APPLID\_PREFIX: K&SYSCLONE.\_\_\_\_\_ (1-4 char.VTAM APPLID prefix)

RTE\_STC\_PREFIX:        IBM\_\_\_\_\_ (1-4 char.started task prefix)

Depending upon your screen resolution, you might have to scroll down (PF8) to see all the parameters.  
 (Look for the **More: +** which indicates that there is additional content on the panel.)

6. If this RTE is not SMS-managed, provide the VSAM values.

- If you are using the IBM-provided model, you do not need to make any other changes.
  - **RTE\_X\_HILEV\_SHARING**
  - **RTE\_SHARE**

Any other changes are optional.

- If you are setting up the RTE from scratch, specify the following values.
  - **RTE\_TYPE=SHARING**
  - **RTE\_SHARE= SMP**
  - **KDS\_TEMS\_TYPE=REMOTE**
  - **RTE\_SYSV\_SYSVAR\_FLAG=Y**

Optionally, specify variables for the following parameters:

- **RTE\_TEMS\_NAME\_NODEID** (for example, &SYSNAME.:CMS)

- **RTE\_TCP\_PORT\_NUM** (for example, &RTE\_PORT.)
  - **RTE\_VTAM\_APPLID\_PREFIX** (for example, K&SYSCLONE.)
  - **RTE\_SECURITY\_CLASS** (for example, &OMEGSAF.)
7. Press Enter to proceed to the next panel.  
The **Include Products in this PARMGEN RTE** panel (KCIP@PGI) is displayed. This panel lists all the products installed in the product library.

```

KCIP@PGI - INCLUDE (CONFIGURE) INSTALLED PRODUCT(S) IN THIS LPAR R Row 1 of 26
Command ==>                                     Scroll ==> PAGE

Select ("S" or "/" ) products to CONFIGURE those product(s) in DEMO RTE.
Select or deselect products to include or exclude from configuration.
Products configured in the model or current RTE (reconfiguring) are preselected

When finished, change N to Y to confirm selections.  Confirm ==> N (Y, N)

  Kpp Component or Product Name and Version
-----
/ KAH System Automation Monitoring Agent V350
/ KC5 OMEGAMON for CICS V550
/ KDO Tivoli Decision Support for z/OS Agent V181
/ KDS Tivoli Enterprise Monitoring Server V630
/ KD4 ITCAM for SOA Agent V711
/ KD5 OMEGAMON for DB2 PE V550
/ KGW OMEGAMON for CICS TG V550
/ KI5 OMEGAMON for IMS V550

End of data

```

8. Deselect any products that you do not want to include in the RTE, then change **Confirm ==> N** to **Y**, and press Enter.  
The JCL for the KCIJPCFG job is displayed.
9. Review the JCL to understand what the job is doing, then submit the job.  
The KCIJPCFG job submits a second job, KCIJPPRF. Wait until both jobs complete before proceeding to the next step.

## Result

The configuration software allocates the runtime libraries, creates the configuration profiles, populates the PARMGEN templates in IKAN\* libraries with runtime members for the products selected for configuration.

## Customizing the configuration profiles

The configuration profiles have been tailored with the values you provided in the previous step. They also contain default values for all required parameters and some optional parameters. The amount of additional customization required depends upon how you are creating the runtime environment (RTE) and how much your environment differs from the model or product-provided defaults. At a minimum, you must supply site-specific values (such as any subsystems you want to monitor, protocols other than the IPPPIPE and SNA defaults, and the like). You must also enable and configure any features you want to exploit (such as event forwarding or support for self-describing agents). In this scenario, you must also edit the variables configuration profile %GBL\_USER\_JCL%.(%RTE\_NAME%) to specify resolution values for any user-defined variables.

## About this task

The RTE profile inherits the symbolics specified on the KCIP@PG3 panel. However, you must replace all instances of the actual RTE name in the RTE profile with a symbolic (for example, &SYSNAME.), except for the RTE\_NAMESV parameter instance. You must also edit the variables profile to set the resolution value of the symbolic assigned to the RTE name. You can assign symbolics to additional parameters, but see [“Parameters ineligible to use variables” on page 1248](#) for parameters that must be excluded from use of symbolics. In addition, you must also customize the product-specific parameters listed in [Configure OMEGAMON monitoring agents and other components](#), as applicable. Optionally, you can configure any monitoring server features that you want to enable ([Configure a Tivoli Enterprise Monitoring Server](#)).

In the global profile, you can assign symbolics to any of the parameters. At a minimum, you must assign a symbolic value to the GBL\_HFS\_JAVA\_DIR1 parameter, for example, &GBL\_HFS\_JAVA\_DIR1. or change the literal default to a site-appropriate one. You must also edit the value for load library parameters GBL\_DSN\_CSF\_SCSFMODO and any of the product-specific parameters listed in [Customizing the global configuration profile](#), as appropriate.

If you assign symbolics in either the RTE or the global configuration profile to parameters that are concatenated in or part of started task procedures, you must follow the MVS rules governing the use of symbolics in started task procedures and JCL. In the RTE profile, these are the following parameters:

- RTE\_NAME
- RTE\_HILEV
- RTE\_VSAM\_HILEV
- RTE\_X\_HILEV\_SHARING
- RTE\_SHARE
- Kpp\_\*\_VTAM\_APPL\_\*

In the global profiles, these are the following parameters:

- GBL\_DSN\_DB2\_\*
- GBL\_DSN\_IMS\_\*
- GBL\_DSN\_CICS\_CTG\_DLL
- GBL\_DSN\_WMQ\_\*
- GBL\_DSN\_CSF\_SCSFMODO
- GBL\_DSN\_TCP\_SYSTCPD\_TCPDATA

In the variables profile (%GBL\_USER\_JCL%.%RTE\_NAME%), if you want to use the self-describing agent feature, set the resolution value for KDS\_KMS\_SDA to Y, and provide site-specific values for the following symbols:

- RTE\_USS\_RTEDIR
- GBL\_HFS\_JAVA\_DIR1

In addition, provide values for any user-defined variables that you add, any variables that whose values differ from the IBM-provided default resolution values, and any variables whose values cannot be automatically discovered from the system IPL PARMLIB data set. See [Customizing the variables profile](#) for more information on customizing variables.

## Procedure

1. To edit the configuration profiles, select Customize PARMGEN configuration profiles from the Workflow. The Customize PARMGEN Configuration Profile Members panel is displayed.
2. Type DLAJOB in the command line and press **Enter** to review the composite KCIJPDLA job that auto-discovers the values to some parameters in the configuration profiles. Submit the job after you review the job settings.  
For more information about the KCIJPDLa jobs, see [Preparing the configuration profiles by running the KCIJPDLa jobs](#), and [PARMGEN z/OS DLA utility jobs and commands](#).
3. Select each Required profile and make the appropriate edits.
4. Press F3 to save the changes, then press F3 to return to the main Workflow panel.

## What to do next

If you need to further customize the configuration using the override embed members, customize the embed files before you run the \$PARSE job to create the RTE members and jobs. To edit the embed files, select option

4 on the **Customize PARMGEN Configuration Profile Members** panel. You can also edit the files by entering UTIL on the command line of any Workflow panel to access the Access PARMGEN Utilities panel, then selecting option 7. For more information on customizing embed files, see [Customizing the override embed members](#).

## Creating the RTE members and jobs

To create the members and jobs that complete the creation of the runtime environment (RTE), you run the \$PARSESV job. This job creates the runtime members and generates a set of jobs that extract the parameters values specified during configuration.

### Procedure

- From the Workflow - Primary Option Menu, select **Create the RTE members and jobs**. The **\$PARSE/\$PARSESV: Create the RTE Members and Jobs** panel (KCIP@PR1) is displayed.

```
KCIP@PR1 ----- CREATE THE RTE MEMBERS AND JOBS -----
Option ==>

Select option 1 to SUBMIT the full $PARSE job in WCONFIG for RTE=SYSA.
$PARSE composite job creates product runtime members and jobs in all the
PARMGEN WK* work libraries.
Tips:
o: Press F5 to access the library-specific $PARSE* jobs (ideal in an RTE
   reconfiguration scenario). First-time RTE deployment must run $PARSE.
o: Select R to submit the KCIJPUP1 job to refresh the IK* product and
   WCONFIG *$IBM profiles before recreating the runtime members.

Enter ns (1s-2s) for detailed job/task status.

-----
Description                               Job Name   Status   Date
-----
R Refresh IK* templates/WCONFIG *$IBM profiles.  KCIJPUP1
1. Create runtime members/jobs in all WK* libs.  $PARSE
Press F1=Help for more information. Type UTIL to access utility menu.
```

- Select option 1 to submit the composite job. The KCIJPVAL job that validates profile parameter values is included in the validation report \$PARSE. If the VALDATE step gets a condition code greater than 4 (COND CODE 0004), the remaining steps in \$PARSE job will not be executed unless you correct all the errors in \$VALRPT.
- If the condition code returned is greater than 4, complete the following steps to correct the errors. Otherwise, press F3 to return to the main menu.
  - Type 1s in pane KCIP@PR1, and then go through the validation report.
  - Correct the parameter values.
  - Resubmit the \$PARSE job.

## Completing the setup of the runtime environment

The final step in setting up the runtime environment (RTE) using the configuration software is submitting the batch jobs that were created in the preceding step. These jobs allocate the necessary data sets.

### Procedure

- From the Workflow - Primary Option Menu, select **Submit batch jobs to complete PARMGEN setup**.

```

KICIPQGB PARAMETER GENERATOR (PARMGEN) WORKFLOW - PRIMARY OPTION MENU -----
Option ==>

                Quick Configuration Mode

GBL_USER_JCL:  TDITN.IDTST.PARMGEN.JCL
RTE_PLIB_HILEV: TDITN.IDTST
RTE_NAME:      SYSA

Notes: Perform steps 1 through 5 in sequence, repeating steps as necessary.
      If reconfiguring this RTE, see Maintenance Scenarios F1=Help topic.
      Enter n (1-5) to perform tasks.
      Enter ns (1s-5s) for detailed job/task status.

-----
Description                               Job/Label  Status      Date
-----
1. Set up/Refresh PARMGEN work environment.  KCIJPCFG
2. Customize PARMGEN configuration profiles.  SYSA
3. Create this RTE's runtime members and jobs. $PARSE   Enter 3 for details.
4. Submit batch jobs to complete PARMGEN setup. SUBMIT   Enter 4 for details.
5. Perform post configuration steps.          POSTCFG
R Create next RTE - Reset fields.           New RTE

Press F1=Help for more information.  Type U or UTIL to access utility menu.

```

The **Submit Batch Jobs To Complete PARMGEN Setup** panel (KICIP@SUB) is displayed.

```

KICIP@SUB ----- SUBMIT BATCH JOBS TO COMPLETE PARMGEN SETUP -----
Option ==>

Select option 1 to SUBMIT the composite jobs in WKANSAMU for SYSA RTE.
Tip: Review the SUBMIT commands in the KCIJPSUB composite job.

Alternatively, select other options (2-12) to submit each job individually.
Enter ns (1s-12s) for detailed job/task status.

-----
Description                               REQ  Job Name  Status      Date
-----
1. Composite SUBMIT job (See JCL comments)  KCIJPSUB
   ** OR **
2. Allocate runtime RO and RW datasets      (Yes) KCIJPALO
3. Copy SMP/E mbrs from TK*->RK* RO libs   (Yes) KCIJPLOD
4. Run product security steps              (Yes) KCIJPSEC
5. Update variable-named runtime mbrs      (No ) KCIJPUPV
6. (Re)Create USS runtime mbrs in RKANDATV (Yes) KCIJPUSP
7. Create USS dirs./ (Re)Copy USS files    (Yes) KCIJPUSS
8. Copy runtime mbrs to SYS1-type libs (Caution) KCIJPSYS
9. Run post-SMP/E RKANMODU ASM/LINK steps  (Yes) KCIJPLNK
10. Verify the configuration jobs           (Tip) KCIJPIVP
11. Back-up RK* product execution user libs (Tip) KCIJPCPR
12. Copy runtime mbrs from WK*->RK* RW libs (Yes) Enter 12 for details.

More:      +

Press F1=Help for more information.  Type UTIL to access utility menu.

```

The jobs that you need to submit to set up this RTE are indicated by a Yes in the REQ column.

- Submit the required jobs by using the composite SUBMIT job, or by submitting them individually.

#### TUTORIAL INFORMATION

If you choose to use the composite SUBMIT job, review and edit it as necessary. For example, some options, such as z/OS® UNIX® System Services system setup, may require specific user authorization to make changes to the file system. Because the user who has been configuring the RTE may not have the correct authorization in place, specific jobs can be excluded from the composite job and submitted separately by a user who does have the correct authorization.

- If the jobs complete with any errors, review the \$IVPRPT verification report in the WCONFIG library. Correct any errors and rerun any jobs that did not complete successfully. Rerun the KCIJPIVP verification job until all errors have been eliminated.  
For more information on the verification report, see [Completing the setup of the runtime environment](#).

## What to do next

Complete any configuration required outside of the configuration software. To see the required steps, return to the Workflow - Primary Option Menu and select **Perform post configuration steps**. This option displays a set of readme files that describe the additional configuration steps that must be taken for the components and products that are configured in this RTE. For additional information, see [Completing the configuration outside the configuration software](#) and the *Planning and Configuration Guide* for each of the configured products.

# Scenario QCF10: Configuring a sharing-with-SMP/E runtime environment with a hub monitoring server

A sharing-with-SMP/E runtime environment (RTE) contains LPAR-specific libraries and references the read-only target libraries managed by SMP/E. Because an RTE that shares the SMP/E target libraries is updated when the SMP/E maintenance is applied, a sharing-with-SMP/E configuration is good for testing maintenance before other RTEs are updated. It is also good for a proof-of-concept configuration. Because the RTE contains a hub monitoring server, it can operate by itself and show data immediately. However, you do not want this type of RTE in a production environment, because you do not want maintenance to be applied without testing.
