Any set of managed systems that are related, such as business function or by geography, can be organized into a managed system group for assigning to situation distributions. The tree lists all available managed system types including All Managed Systems for creating managed system groups that combine multiple managed system types.

### Situation

For a set of frequently distributed situations, you can create a situation group to save time and ensure consistency in applying your best practices.

**Note:** Situation groups can be added to other situation groups.

### Security Requirements

The new Situation Editor and Object Editor functions that are introduced in this PTF are disabled by default due to possible performance impact of certain situations. The following security resource profiles must be defined for these editors.

- **KOBUI.ADMIN.SITEDITOR**
- **KOBUI.ADMIN.OBJECTEDITOR**
- **O4SRV.\*\***

Use combinations of read, update, or none for the profiles to control the access to the editors.

- To view the editors, the users must have either read or update permission to the corresponding editor profiles (**KOBUI.ADMIN.SITEDITOR** for the Situation Editor and **KOBUI.ADMIN.OBJECTEDITOR** for the Object Editor). Users with none permission to the profiles are not able to access the editors.
- To save updates in the editors, the users must have read or update permission to the **O4SRV.\*\*** profile, as well as either read or update permission to the corresponding editor profiles. Users with none permission to the **O4SRV.\*\*** profile are not able to save updates in the editors.

## OMEGAMON enhanced 3270 user interface PTF UA82170 for APAR OA50563

APAR OA50563 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) with APAR OA50563 (PTF UA82170):

### Memory Display/Zap workspace

You can display or modify the memory within any address space on a system where an OMEGAMON on z/OS agent connecting to the selected HUB TEMS is running. To list memory, select the Memory option from the enhanced 3270UI View pull-down menu (fastpath V.M). The Memory Display/Zap workspace is displayed. This workspace can also be invoked from another workspace in the enhanced 3270UI. To invoke this panel in context, the ASID and ADDRESS variables must be set before invoking the Memory Display/Zap workspace via the ACTION statement in the callers' workspace. Both the ASID and Address fields must be integer values when the Memory Display/Zap workspace is invoked.

### The new first workspace after log in

The new first workspace is a tabbed dialog from which you can choose the tab that you want to see first. You can choose the first tab by using **Edit > Preferences**, or invoking **Help > What's New**. By default, the first tab shows workspace KOBSEVTS.

The first tab shows information about active situations that are running in the connected Hub TEMS. If the OMEGAMON Dashboard edition is installed in the e3270UI address space, the situations are displayed as a status tree instead of a simple summary. The status tree shows historical information of each situation so that you can assess the overall health situation from one screen.

Other tabs display information of different OMEGAMON agents. Place your cursor on the tab and press Enter to enter the tab. If you have the 3270 emulator configured for mouse operations, double-click the tab that you want to enter.

## OMEGAMON enhanced 3270 user interface PTF UA80299 for APAR OA49686

APAR OA49686 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) with APAR OA49686 (PTF UA80299):

### Product support

New support has been added for the following products:

- OMEGAMON for JVM on z/OS
- OMEGAMON for Messaging on z/OS: IBM Integration Bus Monitoring agent

### KOBSTART alternate workspace

The OMEGAMON Products workspace (KOBSEVTS, which displays events) is a useful alternative to the existing Enterprise Summary workspace (KOBSTART) as the first workspace when you log on. You can select this workspace as your initial workspace with the following steps:

1. Click on **E** (Edit)
2. Click on **P** (Preferences)
3. Click on the **Session/Logon** tab
4. Select one of the following options:
  - Change "First workspace to be displayed" to KOBSEVTS
  - Click on "Help" and follow instructions to make the currently viewed tab of the workspace be your new first workspace

### User filter support

User filter support has been expanded to include all subpanels in a workspace.

### Performance improvements

APAR OA49686 (PTF UA80299) introduces the following performance improvements for environments where the ITM installation contains many distributive systems:

- Much less data is requested and processed when performing a registry refresh
- CPU load reduction in Hub TEMS and TOM
- TCP traffic volume reduction between the TOM, DRA address spaces, and Hub TEMS
- Performance data availability improvement in TOM

## OMEGAMON enhanced 3270 user interface PTF UA76751 for APAR OA46867

APAR OA46867 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) with APAR OA46867 (PTF UA76751):

### Concurrent user sessions

Up to 100 concurrent enhanced 3270 user interface sessions are supported.

### Support for non-APL emulators

There are new options for running emulators with limited or no APL characters, and a Screen Test for determining which APL characters are supported.

### BACK and HOME buttons

For enhanced navigation, the BACK and HOME buttons are available on every workspace.

### On-screen indicator for off-screen threshold condition

For enhanced problem determination, the highest severity off-screen threshold condition is indicated by the color of the left or right arrow.

### Ability to cancel enhanced 3270 user interface users

If correct SAF authorizations are in place, users can be selectively cancelled from the list shown in Tools -> Active 3270 Users.

### **Product table and attribute displays**

Creating new workspaces is facilitated by Object Definition Interchange (ODI) support, which lists products, tables and column definitions that can be used in QUERY statements.

### **Filter indications**

Filters icons are shown on-screen in the column heading as Green (Defined) or Yellow (Active), to indicate if all data rows in the subpanel are displayed. The icons are also zoom-selectable for editing.

## **OMEGAMON enhanced 3270 user interface V7.3.0**

### **Enhanced 3270UI near-term history display**

The Enhanced 3270UI now supports the display of near-term history collected by OMEGAMON® XE and IBM® Tivoli® Monitoring agents. Near-term history display provides the ability to investigate problems in the recent past. Security authorization checks have been extended to include access and updates to near-term history collection.

If your security implementation is configured to deny access to undefined SAF resources by default, you must update your configuration to secure near-term history (NTH) configuration actions. To secure history updates, the O4SRV.\*\* resource must be added to either the global security class (RTE\_SECURITY\_CLASS) or the query class (KOB\_SAF\_QUERY\_CLASS\_NAME) if it is used. To secure access to the near-term history workspaces, the KOBUI.ADMIN.DEFINEHISTORY.<hub name> resource must be added to the security class used to control user interface interactions such as navigation.

To enable collection of NTH data, you must allocate data sets to store the collected data, configure maintenance of those data sets, and configure what data is collected.

### **Dynamic hub switching**

You can now dynamically specify which hub you want to view data from. Previously, you had to modify the user profile to change hubs. Now you can switch hubs from the interface without modifying the profile.

### **Multi-hub support**

You can use the multi-hub support feature to select a secondary hub monitoring server connection.

### **Continuous operation**

The address space no longer needs to be recycled when an agent is upgraded.

### **Support for IPv6**

Support for IPv6 has been added to the existing IP capability, enabling configurations that employ IPv4 only, IPv6 only, or mixed IPv4 and IPv6.

### **Enhanced 3270UI embedded data**

The Enhanced 3270UI embedded-data feature can be used to bring relevant data from other products into the workspace of the hosting product. The embedded-data feature imports data from other products in a seamless manner that can enable the user to navigate in context directly to other product workspaces.

### **New user preference options**

- You can choose whether your tab key can be used to move between action bar options and also whether it can be used to move to and between push buttons.
- You can configure various history configuration settings.

### **Display of alias commands**

You can use the **View** menu to see a list of Alias commands that can be used on the action and command lines.

## **OMEGAMON enhanced 3270 user interface V7.0.0 Interim Feature 1 (APAR OA42127)**

APAR OA42127 introduces new enhancements since the previous version.

The following enhancements have been made to the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) for OMNIMON Base V7.0.0:

- Security authorization checks have been extended and enhanced. For more information, see [“Security” on page 901](#).
- User preferences can be customized by using the User Profile Member workspace. For more information, see [“Customizing a user profile” on page 937](#).
- You can use the new K0BSITEC workspace to display IBM® Tivoli® Monitoring Situations status information in the enhanced 3270UI. The status information is similar to the information provided by the Tivoli® Enterprise Portal Situation Event Console, that is, situation status for current situations events and situation event history. For more information, see [“Customizing K0BSITEC as the initial workspace” on page 939](#).
- Workspaces are introduced to support viewing and browsing the Runtime environment (RTE). For more information, see [“Runtime environment viewing” on page 973](#).
- Workspace source can be viewed and browsed. For more information, see [“Viewing a workspace source” on page 975](#)
- Cloning and customization
  - The capability to view and copy product provided workspaces, thresholds, and profiles is introduced. You modify workspaces, thresholds, and profiles by first cloning (making a copy) and then editing the copy by using a file editor such as the ISPF editor. For more information, see [“Workspace viewing and cloning” on page 943](#), [“Preparing for threshold member cloning” on page 963](#), and [“Profile viewing and cloning” on page 977](#).
  - Guidance on the customization of product provided workspaces is included. For more information, see [“Customization of product provided workspaces” on page 947](#).
- The action bar has updated menu and context-sensitive capabilities. For more information, see [“Menus” on page 908](#).
- The User Interface drawer is introduced. For more information, see [“Drawer” on page 907](#).
- Hub connectivity administration is used to validate that a requested hub Tivoli® Enterprise Monitoring Server is reachable through a TCP/IP connection during the operation of the enhanced 3270UI. For more information, see [“Hub connectivity administration” on page 981](#).

# Messages

You can review messages for the z/OS®-based components of the IBM® OMEGAMON products and Tivoli® Management Services, such as the Tivoli Enterprise Portal Server, the Tivoli Enterprise Monitoring Server, OMNIMON Base, and the Tivoli® Monitoring Services/Engine (TMS:Engine).

## Introduction to messages

This documentation includes messages for the z/OS®-based components of the IBM® OMEGAMON products and Tivoli® Management Services, such as the Tivoli Enterprise Portal Server, the Tivoli Enterprise Monitoring Server, OMNIMON Base, and the Tivoli® Monitoring Services:Engine (TMS:Engine).

*Message logging* refers to the text and numeric messages created by Tivoli® Management Services components and IBM® Tivoli® OMEGAMON® monitoring agents. These messages relay information about how the system or application is performing and can alert you to exceptional conditions when they occur. Typically, text messages relay information about the state and performance of a system or application. Messages also alert the system administrator to exceptional conditions when they occur. Consult the explanation and operator response associated with the displayed messages to determine the cause of the failure.

Messages are sent to an output destination, such as a file, database, or console screen. Messages are internationalized based on the locale of the originator. If you receive a warning or error message, you can do one of the following:

- Follow the instructions listed in the detail window of the message, if this is included in the message.
- Consult the message details in this documentation to see what action you can take to correct the problem.
- Consult the message log for message ID and text, time and date of the message, as well as other data you can use to diagnose the problem.

Trace data capture transient information about the current operating environment when a component or application fails to operate as designed. IBM® Software Support personnel use the captured trace information to determine the source of an error or unexpected condition.

This documentation contains the following types of messages:

- [“Messages for z/OS components” on page 1520](#)
- [“Messages shared by distributed and z/OS components” on page 2298](#)

[“Prefixes associated with various Tivoli® Management Services components” on page 1519](#) shows the message prefixes associated with the various components and subcomponents of the Tivoli® Management Services environment.

This table lists the prefixes associated with various Tivoli Management Services components.

Component	Subcomponent (optional)	Associated prefix
Distributed Monitoring product	None	AMX
Db2® application agent*	None	KUD*
i5/OS® agent*	None	KA4 *
IBM® Tivoli® Monitoring	Hot standby feature	KQM
	Link wizard	KJR
	Remote deployment	KDY
	Storage allocation and alert. Situations and take action commands.	KFA
	Server shutdown	KMS

Component	Subcomponent (optional)	Associated prefix
	Situation, data queues, and policies. Startup processing. Configuration errors. Global directory server.	KO4
	User interface (both the tacmd command line and displayed messages) and the import and exports of policies and situations.	KUI
Installation and Configuration	Configuration Manager or PARMGEN	KCI, KOB
	UNIX® Installation	KCI
Monitoring agents	None	KRA
MSSQL application agent*	None	KOQ*
Migration Toolkit command line and graphical user interfaces	None	AMK
OMEGAVIEW®	None	KLM, KOS, KSD
Oracle application agent*	None	KOR*
SAP application agent*	None	KSA*
Sybase application agent*	None	KOY*
Tivoli Enterprise Console®	Rules Check Utility	ECO
	Forwarding of situation updates from the TEC Event server back to the hub Tivoli® Enterprise Monitoring Server	KFAIT
Tivoli® Enterprise Monitoring Server	All platforms	KDC, KDS, KFA, KMS, KO4, KQM
	TMS:Engine (z/OS® only)	KBB, KDH, KLB, KLE, KLU, KLV, KLX
Tivoli® Enterprise Portal Server	None	KFW
Tivoli® Universal Agent	None	KUM
UNIX® OS agent*	None	KUX
Windows® OS agent*	None	KNT
<b>z/OS®-only components</b>		
Classic OMEGAMON®	None	IA, IN, LSC
OMEGAMON® Base	None	CI, CND, CS, CT, KOB, OB, OM
OMEGAMON® Enhanced 3270 User Interface	None	KOB
OMNIMON Base	Coupling facility	KCN
Persistent data store	None	KPD, KPQ
*Documented in the <i>IBM® Tivoli® Monitoring: Upgrading from IBM® Tivoli® Monitoring V5.1.2.</i>		

## Messages for z/OS® components

The Tivoli Enterprise™ Monitoring Server on z/OS® and its various subsystems (OMNIMON, TMS:Engine, and OMEGAMON® base) generate log files that contain messages and trace information. The log files contain message and trace information about the events and processing being performed. z/OS® log files provide a complete record of system activity, not just of problems. The log files are created when you start the IBM® Tivoli® Monitoring z/OS® components. “Log locations for z/OS® components” on page 1523 lists the log files created by each z/OS® subcomponent. These files are available to help you resolve problems encountered while

using the products. IBM® Software Support might request some or all of these files while investigating a problem you have reported.

When you encounter a problem, first check the messages in the log files to determine if the source is a problem in the IBM® Tivoli® Monitoring environment or with an OMEGAMON® z/OS® monitoring agent. If you determine that the problem is due to a product defect, contact IBM® Software Support. IBM® Software Support might request that you activate tracing so that the log files collect additional information needed to resolve the problem. Some of the tracing options produce large amounts of trace information. Therefore, monitor the disk or spool space when activating tracing to prevent your disk or spool from reaching capacity. Return the trace settings to the default settings after the desired trace information has been collected. For the locations of various types of logs, see [“Log locations for z/OS® components” on page 1523](#).

The messages for this product are in two formats. One format includes a single-digit component identifier with a message type and the other includes a double-digit component identifier with no message type. Both formats have the following common elements:

**www**

is the message component identifier. The usual length of a component identifier is three characters, though it can be a few as two characters or as many as five. This book includes the message identifiers in [“Message component identifiers documented in this book” on page 1521](#):

*Table 131: Message component identifiers documented in this book*

Message prefix	Components using this prefix
CI	OMEGAMON® Base
CND	OMEGAMON® Base
CSA	OMEGAMON® Base
CT	OMEGAMON® Base
ETE™	End-to-End Response Time Monitor
IA	Classic OMEGAMON®
IN	Classic OMEGAMON®
KBB	Tivoli® Management Services: Engine (TMS:Engine)
KCN	OMNIMON Base
KDH	TMS:Engine
KLB	TMS:Engine
KLE	TMS:Engine C language interface messages
KLU	Tivoli Enterprise™ Monitoring Server on z/OS® or TMS:Engine
KLV	Tivoli Enterprise™ Monitoring Server on z/OS® or TMS:Engine
KLX	Tivoli Enterprise™ Monitoring Server on z/OS® or TMS:Engine
KMV	OMEGAVIEW®
KOB	OMEGAMON® Base (Enhanced 3270 user interface), Parameter Generator (PARMGEN), or Configuration Manager
KPQ	OMEGAMON® Base (Persistent data store)
KSD	OMEGAVIEW®
LSC	Classic OMEGAMON®
OB	OMEGAMON® Base
OM	OMEGAMON® Base

**yyy**

Message number.

Other messages are in the following format:

```
wwwxyyy
```

Where:

**x**

Component identifier.

**yyy**

Message number.

**z**

One-letter message type. Some messages have this message type indicator. It can be one of the following:

- **I** for informational messages, which typically do not require administrator or operator actions.
- **W** for warning messages, which typically require actions.
- **E** for error messages, which indicate a problem that you must resolve before normal operation can continue.

In the message description, most message headings are self-explanatory (for example, **Explanation** or **System Response**). Some messages include a heading for **Severity**. Severity is sometimes defined as a number between 0 and 80, where 0 means it is unimportant and 80 means the matter requires immediate attention. This numerical value is often paired with a system programmer response heading, so that you know how to respond to the severity indicator.

Other times, Severity is expressed as one of the following values:

- **REPLY, VIEW or INFO**: indicates successful completion or attempted completion of a request.
- **ERROR**: indicates that a system action has failed to complete successfully.
- **WARNING or ALERT**: indicates that an error has occurred and offers additional details to help you correct the problem that often involves contacting IBM® Software Support.
- **ABEND**: reports a component failure that requires immediate system programmer response and usually requires running traces and collecting dumps for IBM® Software Support.
- **FATAL**: indicate a condition causing shutdown or catastrophic termination.

Messages with severity tags can sometimes be routed to different console groupings. When the Severity tag is used to describe TMS:Engine errors, the value indicates where the message will be sent. For more information, see [“TMS:Engine message route codes” on page 2387](#).

[“Log locations for z/OS® components” on page 1523](#) contains the locations of logs where distributed component messages are found:

Table 132: Log locations for z/OS® components

z/OS® component	Log location
<p>An OMEGAMON monitoring agent on z/OS</p>	<p>RKLVLOG for the monitoring agent started task is the single most helpful piece of service information for an OMEGAMON monitoring agent on z/OS. The RKLVLOG (R = runtime, KLV = the prefix associated with IBM® Tivoli® Monitoring Services:Engine or TMS:Engine) is the sysout data set or spool file that contains log and trace messages.</p> <p>These additional zSeries® log files (if available) are also useful:</p> <ul style="list-style-type: none"> <li>• The RKLVSnap sysout data set or spool file contains formatted dump output.</li> <li>• The RKPDLLOG sysout data set or spool file contains the information and error messages related to the handling of persistent data stores.</li> <li>• Some agents have other files defined to collect log and trace messages. OMEGAMON for Networks on z/OS, for example, might also use the KN3ACTCS and KN3ANMON sysout data sets or spool files to collect log and trace messages.</li> </ul> <p>Refer to your started procedures for the locations of these serviceability log files.</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> OMEGAMON monitoring agent on z/OS messages are documented in the agent-specific problem determination guide.</p> </div>
<p>Tivoli Enterprise Monitoring Server on z/OS®</p>	<p>RKLVLOG for the monitoring agent started task is the single most helpful piece of service information for an OMEGAMON monitoring agent on z/OS. The RKLVLOG (R = runtime, KLV = the prefix associated with IBM® Tivoli® Monitoring Services:Engine or TMS:Engine) is the sysout data set or spool file that contains log and trace messages.</p> <p>These additional zSeries® log files (if available) are also useful:</p> <ul style="list-style-type: none"> <li>• The RKLVSnap sysout data set or spool file contains formatted dump output.</li> <li>• The RKPDLLOG sysout data set or spool file contains the information and error messages related to the handling of persistent data stores.</li> <li>• Some agents have other files defined to collect log and trace messages. OMEGAMON for Networks on z/OS, for example, might also use the KN3ACTCS and KN3ANMON sysout data sets or spool files to collect log and trace messages.</li> </ul> <p>Refer to your started procedures for the locations of these serviceability log files.</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> OMEGAMON monitoring agent on z/OS messages are documented in the agent-specific problem determination guide.</p> </div> <p>Because the Tivoli Enterprise Monitoring Server on z/OS® runs under TMS:Engine just as an OMEGAMON monitoring agent on z/OS does, all logging under TMS:Engine is handled the same way, that is log and trace data are written to RKLVLLOGs and RKPDLLOGs.</p>

z/OS® component	Log location
ETE™	<p>ETE™ is a base component and does not have its own RKLVLLOG. This component writes messages to the IBM® System Display and Search Facility (SDSF) Job Log. The User Response section of various ETE™ message requests that you collect systems information and memory dumps before contacting IBM® Software Support. How to collect this information for ETE™ is documented in the <i>IBM® Tivoli® End to End Response Time Reference</i> book.</p> <div style="border: 1px solid #0070C0; padding: 5px; margin-top: 10px;"> <p><b>Note:</b> ETE™ messages are documented in the <i>IBM® Tivoli® End to End Response Time Reference</i> book.</p> </div>
IBM® Tivoli® Management Services: Engine (TMS:Engine)	<p>TMS:Engine is a collection of basic operating system and communication service routines built specifically for z/OS®. All address spaces used by OMEGAMON® monitoring agents on z/OS® load and use the services of TMS:Engine.</p> <p>Successful initialization of TMS:Engine is noted by this message:</p> <div style="background-color: #F0F0F0; padding: 5px; margin-top: 10px;"> <pre>KLVIN408 IBM OMEGAMON PLATFORM ENGINE VERSION 400 READY</pre> </div> <p>For troubleshooting information about TMS:Engine problems, refer to the z/OS® initialization section of <i>IBM Tivoli Monitoring: Problem Determination Guide</i>. Explanations for messages generated by TMS:Engine can be found in <i>IBM Tivoli Monitoring: z/OS Messages</i>.</p> <p>TMS:Engine writes messages to the same RKLVLLOG as the product it is running. If you search the RKLVLLOG for an OMEGAMON monitoring agent on z/OS, product-specific messages start with the product code (for example, KN3 for OMEGAMON for Networks on z/OS) but messages for the TMS:Engine start with component prefixes KBB, KDH, KLB, KLE, KLU, KLV, and KLX.</p>
OMEGAMON® subsystem	The OMEGAMON® subsystem does not allocate an RKLVLLOG. This component issues messages directly to the z/OS® system console (or SYSLOG).
Persistent data store	The RKPDLLOG sysout data set or spool file contains the information and error messages related to the handling of persistent data stores.

## CI messages

Messages that begin with the CI prefix are associated with OMEGAMON® Base components.

### CI0410: INVALID COMMAND - ENTER '?' FOR LIST

#### Explanation

The command you entered is not an interface command.

#### System action

OMEGAMON ignores the command.

#### User response

Enter a proper interface command.

### CI0411: PARM MEMBER NAME MISSING

#### Explanation

An EXEC command was issued but the member name was omitted.

**System action**

OMEGAMON ignores the command.

**User response**

Re-enter the command, specifying correct member name.

**CI0412: 'ID=' MISSING - REENTER****Explanation**

A STOP command was issued but did not specify an ID, or had the wrong MODIFY ID to stop a subtask.

**System action**

OMEGAMON ignores the command.

**User response**

Re-enter the command, specifying the correct ID.

**CI0413: TASK ID TO STOP OR MODIFY MISSING - REENTER****Explanation**

A STOP command was entered without specifying an ID.

**System action**

OMEGAMON ignores the command.

**User response**

Re-enter the command, specifying the correct ID.

**CI0414: MISSING TASK TYPE TO START****Explanation**

A START command was entered without specifying a task, such as KKOBCICSCICS or OMVTAM.

**System action**

OMEGAMON ignores the command.

**User response**

Re-enter the command, specifying the correct task.

**CI0415: EXPECTED TASKID MISSING - REENTER****Explanation**

A common interface command requiring a task ID was entered without the task ID.

**System action**

OMEGAMON ignores the command.

**User response**

Re-enter the command, specifying the task ID.

## CI0416: '=' MISSING - REENTER

### Explanation

A parameter that requires a value was entered with the value omitted, for example:

```
START KOBICCS,ROWS,COLS=80,...
```

rather than

```
START KOBICCS,ROWS=24,COLS=80,...
```

### System action

OMEGAMON ignores the command.

### User response

Re-enter the command with an = and a value after the parameter name.

## CI0417: CUU ADDRESS MISSING - REENTER

### Explanation

A common interface start command with a unit keyword was issued without the required unit address.

### System action

OMEGAMON ignores the command.

### User response

Re-enter the command with a unit address.

## CI0418: VALUE MISSING - OR INVALID

### Explanation

A parameter requires a valid value which was not supplied.

### System action

OMEGAMON ignores the command.

### User response

Re-enter the command, specifying a valid value.

## CI0419: USER DATA NAME MISSING - REENTER

### Explanation

A common interface start command with a user keyword was issued without the required user module suffix.

### System action

OMEGAMON ignores the command.

### User response

Re-enter the command with a user module suffix.

## **CI0420: SYSTEM ID MISSING - REENTER**

### **Explanation**

A common interface start command with a SYS keyword was issued without the required system ID.

### **System action**

OMEGAMON ignores the command.

### **User response**

Re-enter the command with a system ID.

## **CI0421: SYSTEM MODE MISSING - REENTER**

### **Explanation**

A common interface start command with a MODE keyword was issued without the required ID.

### **System action**

OMEGAMON ignores the command.

### **User response**

Re-enter the command with a system mode.

## **CI0425: YES OR NO REQUIRED - REENTER**

### **Explanation**

YES or NO was not specified in a parameter where it is required.

### **System action**

OMEGAMON ignores the command.

### **User response**

Re-enter the command, specifying **YES** or **NO**.

## **CI0510: ATTACH PROCESSING - TASK ID=cccccccc**

### **Explanation**

A common interface EXEC or START command has initiated a process to start a new task. The task identifier is cccccccc.

### **System action**

Attach processing continues.

### **User response**

None. This message is informational only.

## **CI0530: DUPLICATE TASK ID - TASK NOT STARTED**

### **Explanation**

This message follows CI0510. It indicates that a task with the identifier named in the CI0510 message is already active. The ID associated with a common interface task must be unique.

**System action**

Attach processing for the new task terminates.

**User response**

Add the 'ID' keyword to the task's START command, or terminate the executing task and start the new task again.

**CI0531: ID=cccccccc PROGRAM=aaaaaaaa****Explanation**

The common interface also issued message CI0530. This message displays the task ID (cccccccc) and program name (aaaaaaaa) associated with message CI0530.

**System action**

None.

**User response**

Use this task ID (cccccccc) to STOP the task.

**CI0532: TASK AREA NOT AVAILABLE - TASK NOT STARTED****Explanation**

This message follows CI0510. It indicates that memory is not available to build a work area needed by the common interface to start a new task.

**System action**

Attach processing for the new task terminates.

**User response**

If the problem persists, restart the common interface with a larger REGION size, or eliminate any currently executing tasks that are no longer needed.

**CI0533: ATTACH COMPLETE FOR TASK cccccccc, TCB xxxxxxxx****Explanation**

Attach processing has completed for an EXEC or START command. The task identifier is cccccccc. The TCB address of the new task is xxxxxxxx

**System action**

Processing continues.

**User response**

None. This message is informational only. and is issued after message CI0510.

**CI0534: ATTACH FAILED FOR TASK cccccccc****Explanation**

This message follows CI0510. Attach processing failed for the cccccccc task.

**System action**

Attach processing for the new task terminates.

**User response**

Contact IBM Software Support.

**CI0535: DUPLICATE ID - TASK NOT STARTED****Explanation**

An attempt was made to start a task with an ID identical to that of another task already running under the common interface.

**System action**

The new task does not start.

**User response**

Re-enter the command with a unique task ID.

**CI0536: ID=cccccccc PROGRAM=aaaaaaaa****Explanation**

The common interface also issued message CI0535. This message displays the task ID (cccccccc) and program name (aaaaaaaa) associated with message CI0535.

**System action**

The new task does not start.

**User response**

Re-enter the command with a unique task ID.

**CI0537: *Common Interface* - UNABLE TO OBTAIN TASK AREA****Explanation**

There is insufficient storage for the Interface to obtain a work area for the starting task.

**System action**

OMEGAMON ignores the common interface start command.

**User response**

Check for error messages on the system console that might provide a reason for the failure. Once the source of the storage constraint is corrected, retry the START command. If this problem persists, increase the region size.

**CI0542: STOP ID NOT FOUND****Explanation**

The STOP command specified an ID that is not active.

**System action**

Processing terminates.

**User response**

Use the DISPLAY or LIST command to display the active task IDs.

## **CI0543: THE FOLLOWING TASK IDS ARE ACTIVE:**

### **Explanation**

The DISPLAY or LIST command shows which tasks are active.

### **System action**

None.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **CI0544: JSCB BUILD FAILED - TASK NOT STARTED**

### **Explanation**

This message follows CI0510. A JSCB control block needed by the common interface to start a new task could not be built.

### **System action**

Attach processing for the new task terminates.

### **User response**

Check the system console for related error messages and contact IBM Software Support.

## **CI0545: CSCB BUILD FAILED - TASK NOT STARTED**

### **Explanation**

This message follows CI0510. A CSCB control block needed by the common interface to start a new task could not be built.

### **System action**

Attach processing for the new task terminates.

### **User response**

Check the system console for related error messages and contact IBM Software Support.

## **CI0546: GETMAIN FAILED FOR SP230 PARAMETER WORK AREA**

### **Explanation**

The common interface was unable to acquire a parameter work area in subpool 230 that is used by subtasks attached with a system key specification.

### **System action**

The subtask creation request is ignored.

### **User response**

Contact IBM Software Support.

## **CI0550: TASK BUSY - MODIFY MESSAGE NOT SENT TO TASK**

### **Explanation**

A request was made to the common interface to issue an z/OS® modify command to a subtask, but the subtask is not currently accepting modify commands.

### **System action**

OMEGAMON ignores the modify request.

### **User response**

Retry the command.

## **CI0551: MODIFY MESSAGE SENT TO TASK**

### **Explanation**

The common interface honored a MODIFY command.

### **System action**

The common interface issues the modify command to the subtask.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **CI0552: TASK TO MODIFY NOT FOUND**

### **Explanation**

A request was made to the common interface to issue a modify command to a subtask whose ID (specified in the MODIFY command) cannot be found among the currently active subtasks.

### **System action**

OMEGAMON ignores the modify request.

### **User response**

Use the LIST command to determine which tasks are active to the common interface. Correct the task ID and reissue the MODIFY command.

## **CI0553: DYNAMIC ALLOCATION FOR SNAP FILE FAILED, ERROR=aaaaa, REASON=bbbb, RI5=cccc.**

### **Explanation**

When the DSNAPON command is presented to the common interface, it attempts to dynamically allocate the response time collector SNAP debugging file. Should an error occur during the allocation process, the above message displays showing the error codes returned by the supervisor allocation routines. Note that the common interface only uses dynamic allocation for the response time collector SNAP file in the absence of a DSNAPDD data definition statement.

### **System action**

The response time collector SNAP debugging file does not allocate or open.

### **User response**

The error, reason, and return codes in this message are described in the IBM® *MVS™ Job Management Manual*. Correct the source of the error message and retry the allocation. Alternatively, a DSNAPDD data definition

statement can be included in the common interface JCL stream, thereby avoiding the need to use dynamic allocation.

## **CI0560: RKANPAR DATA SET OPEN ERROR**

### **Explanation**

The rhilev.RKANPAR data set could not be opened

### **System action**

EXEC processing terminates.

### **User response**

Check that the RKANPAR DD statement is in the JCL for this region. Check that the data set has the proper attributes (see the installation documentation). Contact IBM® Software Support for assistance.

## **CI0561: INVALID LRECL OF RKANPAR - NOT LRECL=80**

### **Explanation**

The rhilev.RKANPAR data set does not have an LRECL of 80.

### **System action**

EXEC processing terminates.

### **User response**

Check and correct the LRECL of the rhilev.TOBDATA data set.

## **CI0562: MEMBER NOT FOUND IN DATA SET**

### **Explanation**

A member name was specified in the EXEC command, but that member does not exist in the rhilev.T.RKANPAR data set.

### **System action**

EXEC processing terminates.

### **User response**

Check the member name entered and re-enter the correct name.

## **CI0563: ERROR OBTAINING A BUFFER FOR READING RKANPAR**

### **Explanation**

The Common Interface was unable to obtain an I/O buffer for reading the rhilev.RKANPAR data set. This is probably the result of a severe storage shortage in the system.

### **System action**

EXEC processing terminates.

### **User response**

Try the command later when storage use lessens. Increase the region size if this condition persists.

## **CI0564: ERROR OBTAINING AN INPUT AREA FOR RECORD**

### **Explanation**

The command processor could not obtain an input cell for a record from the rhilev.RKANPAR data set. EXEC processing terminates.

### **User response**

Try the command later when core use lessens. Increase the region size if this condition persists.

## **CI0565: EXEC LIMIT EXCEEDED**

### **Explanation**

You reached the limit of ten EXEC members to be processed per command invocation. This limit prevents a possible loop in the EXEC process where member A EXECs B and member B EXECs A.

### **System action**

EXEC processing terminates.

### **User response**

Check that the EXEC members do not cause EXEC loops. Reorganize the commands to be executed to fewer than ten members total.

## **CI0567: KEY VALUE OUT OF RANGE, MUST BE 0-7**

### **Explanation**

The KEY= keyword may only specify keys 0-7. Key 8 is used by V=V problem programs and keys 9-15 are reserved for V=R problem programs.

### **System action**

OMEGAMON ignores the request.

### **User response**

Specify a valid KEY= keyword value.

## **CI0580: \*\*\* NO TASKS ARE ACTIVE \*\*\***

### **Explanation**

OMEGAMON issues this message in response to a DISPLAY or LIST command when no tasks are active.

### **System action**

None.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **CI0585: ERROR READING RKANPAR MEMBER - SYNAD MESSAGE:**

### **Explanation**

A system error occurred while processing a member of the hilev.RKANPAR data set. A SYNAD message follows.

**System action**

Command processing terminates.

**User response**

Check the SYNAD message for cause of the error.

**CI0586: FREEMAIN FAILED FOR SP230 PARAMETER WORK AREA FOLLOWING ATTACH FAILURE****Explanation**

The common interface was unable to freemain the parameter work area in subpool 230 that is used by subtasks attached with a system key specification. This occurred after the subtask attach attempt failed.

**System action**

None.

**User response**

Contact IBM Software Support.

**CI0587: FAILURE TO FREE CSCB****Explanation**

The command scheduling control block used by tasks that run under the common interface could not be unallocated.

**System action**

The CSCB storage, if any, is not freed.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**CI0588: FAILURE TO FREE JSCB****Explanation**

The job step control block acquired by the common interface on behalf of one of its subtasks could not be released.

**System action**

The JSCB storage, if any, is not freed.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**CI0592: TASK ID=XXXXXXXX HAS BEEN STOPPED VIA POST****Explanation**

The common interface honored a STOP command.

**System action**

The common interface requests the subtask to stop.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**CI0593: TASK ID=XXXXXXXX HAS BEEN STOPPED VIA DETACH (STAE=YES)****Explanation**

The common interface processed a STOP command where the DETACH=Y parameter was specified.

**System action**

The common interface detaches the subtask which may result in an ABEND 33E.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**CI0594: ID=cccccccc PROGRAM=aaaaaaaa****Explanation**

The common interface also issued message CI0592. This message displays the task ID (cccccccc) and program name (aaaaaaaa) associated with message CI0592.

**System action**

None.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**CI0603: SYMBOL NOT DEFINED: ccccccccc****Explanation**

The symbol displayed is not known to the command processor.

**System action**

Command processing terminates.

**User response**

Check the input for spelling.

**CI0604: AMBIGUOUS SYMBOL: ccccccccc****Explanation**

The symbol entered cannot be uniquely identified.

**System action**

Command processing terminates.

**User response**

Spell out the command operand more fully.

## **CI0605: INVALID INPUT VALUE:**

### **Explanation**

The input value received is not valid for the symbol.

### **System action**

Command processing terminates.

### **User response**

Check to see if the value is correct or respecify differently, for example, as 43 instead of 0043 in number of ROWS on the terminal screen.

## **CI0606: EXPECTED CONTINUATION NOT RECEIVED**

### **Explanation**

An input statement had a continuation indication but was the last statement input to the command processor.

### **System action**

This command processing terminates.

### **User response**

Add a continuation statement or remove the continuation indicator.

## **CI0607: EXPECTED INPUT NOT RECEIVED**

### **Explanation**

A command is expecting some input options but they were not specified (for example, ROWS=).

### **System action**

Command processing terminates.

### **User response**

Specify the required options.

## **CI0608: ERROR IN FREE CELL ROUTINE**

### **Explanation**

The parser had an error trying to free an input command cell.

### **System action**

Processing terminates.

### **User response**

Contact IBM Software Support for assistance.

## **CI0609: ERROR IN FREE POOL ROUTINE**

### **Explanation**

The parser had an error trying to free the input command pool.

**System action**

Processing terminates.

**User response**

Contact IBM Software Support for assistance.

**CI0700: OMEGAMON *Common Interface* READY FOR COMMANDS****Explanation**

The Interface enters a WAIT state to wait for commands to process.

**System action**

The Interface waits.

**User response**

The Interface is now ready to accept commands via MODIFY.

**CI0715: MODIFY IGNORED****Explanation**

The Interface is not in a state where it accepts the MODIFY command.

**System action**

Command processing terminates.

**User response**

Reissue the command.

**CI0720: PROCESS MESSAGES FOLLOW****Explanation**

Informational and error messages generated during command processing follow.

**System action**

None.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**CI0722: SUBTASK LOOP IDENTIFICATION AND ANALYSIS IN PROGRESS****Explanation**

The common interface detected a looping condition in one of its subtasks.

**System action**

The common interface attempts to identify the looping subtask. The common interface will not accept any commands while task-level loop checking is in progress.

**User response**

Determine why the subtask was looping. Correct the problem and restart the subtask.

## **CI0723: LOOPING *Common Interface* SUBTASK SCHEDULED FOR TERMINATION**

### **Explanation**

The common interface identified a looping subtask and scheduled it for termination. Message CI0724 accompanies this one.

### **System action**

OMEGAMON forcibly detaches the looping subtask and generates a SNAP dump (ddname: SNAPFILE).

### **User response**

See accompanying message CI0724 for the name and ID of the looping program. Examine the SNAP dump to determine why the subtask was looping. Correct the problem and restart the subtask. If necessary, contact IBM Software Support with the dump information.

## **CI0724: ID=cccccccc PROGRAM=aaaaaaaa**

### **Explanation**

The subtask specified by the task ID (cccccccc) and program name (aaaaaaaa) is scheduled for termination because of a suspected looping condition. This message accompanies CI0723.

### **System action**

Processing continues.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations. See accompanying message CI0723.

## **CI0725: ZERO POINTER TO CIB FOUND**

### **Explanation**

An unexpected condition occurred and an abend may result.

### **System action**

Processing tries to continue.

### **User response**

If an abend occurs, let the Interface retry. Contact IBM Software Support for assistance.

## **CI0726: SUBTASK LOOP IDENTIFICATION AND ANALYSIS COMPLETED SUCCESSFULLY**

### **Explanation**

The common interface completed its analysis of subtask CPU utilization. Commands will now be accepted normally.

### **System action**

None.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **CI0727: SUBTASK LOOP IDENTIFICATION AND ANALYSIS TERMINATED WITHOUT RESOLUTION**

### **Explanation**

The common interface terminated its analysis of subtask CPU utilization. This occurred because a subtask terminated (normally or abnormally), or the common interface was unable to isolate the errant subtask.

### **System action**

None.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **CI0730: TERMINATION REQUEST ACKNOWLEDGED**

### **Explanation**

The common interface acknowledges the user's stop command.

### **System action**

The common interface begins termination processing.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **CI0731: COMMAND PARSE COMPLETED WITH CRITICAL ERRORS**

### **Explanation**

The parsing of the command results in a failure of the parser.

### **System action**

OMEGAMON ignores the command.

### **User response**

Contact IBM Software Support for assistance and have a copy of the input available.

## **CI0732: FREE INPUT CELL CRITICAL ERROR**

### **Explanation**

Command processing is complete but the Interface is unable to release the input message cell.

### **System action**

Processing continues.

### **User response**

Contact IBM Software Support for assistance.

## **CI0734: FREE INPUT POOL CRITICAL ERROR**

### **Explanation**

Command processing is complete but the Interface was unable to release the input message pool.

**System action**

Command processing continues.

**User response**

Contact IBM Software Support for assistance.

**CI0735: KOBCIIP $n$  LOAD ERROR****Explanation**

The common interface was unable to load the parser and command processing routines.  $n$  is an operating system identifier from 1–4.

**System action**

The common interface terminates the command.

**User response**

Make sure KOBCIIP $n$  is in a load library accessible to the common interface.

**CI0736: FREE MESSAGE CELL CRITICAL ERROR****Explanation**

Command processing is complete but the Interface is unable to release the output message cell.

**System action**

Command processing continues.

**User response**

Contact IBM Software Support for assistance.

**CI0738: FREE MESSAGE POOL CRITICAL ERROR****Explanation**

Command processing is complete but the Interface is unable to release the output message pool.

**System action**

Command processing continues.

**User response**

Contact IBM Software Support for assistance.

**CI0740: UNABLE TO OBTAIN STORAGE FOR COMMAND****Explanation**

Common interface is unable to obtain the storage required to process a command.

**System action**

None.

**User response**

Increase the region available to the common interface.

## **CI0741: PROCESS GET CELL ERROR: CMD IGNORED**

### **Explanation**

The Interface is unable to get an input command cell in which to place the command to process.

### **System action**

OMEGAMON ignores the command.

### **User response**

The lack of available virtual storage may cause the error. Reissue the command when storage usage lessens. If the problem persists, increase the region size. Contact IBM Software Support for assistance.

## **CI0750: MESSAGES PRIOR TO ERROR**

### **Explanation**

After an error is detected and retry started, the messages that resulted appear.

### **System action**

None.

### **User response**

Note which processes completed. Contact IBM Software Support for assistance.

## **CI0756: ATTACH FAILED**

### **Explanation**

An attach of a common interface subtask failed.

### **System action**

None.

### **User response**

Check for messages on the system console, and contact IBM Software Support.

## **CI0759: TASK-LEVEL LOOP CHECKING IN PROGRESS**

### **Explanation**

The common interface is monitoring individual subtasks for excessive CPU utilization. No commands will be accepted while task-level loop checking is in progress.

### **System action**

OMEGAMON ignores the request.

### **User response**

Retry the request after task-level loop checking has completed.

## **CI0760: PROCESSING COMMAND**

### **Explanation**

The processing of the command entered using the MODIFY begins.

**System action**

Command processing starts.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**CI0762: FREE MESSAGE CELL CRITICAL ERROR****Explanation**

Cleanup routine after an error is unable to free up message cells.

**System action**

Cleanup continues.

**User response**

Contact IBM Software Support for assistance.

**CI0764: FREE MESSAGE POOL CRITICAL ERROR****Explanation**

Cleanup routine after an error is unable to free up message pool.

**System action**

Cleanup continues.

**User response**

Contact IBM Software Support for assistance.

**CI0770: INPUT AT TIME OF ERROR \*\*****Explanation**

OMEGAMON displays the command processing at the time of the error.

**System action**

Cleanup continues.

**User response**

Contact IBM Software Support for assistance.

**CI0772: FREE MESSAGE CELL CRITICAL ERROR****Explanation**

The input message cells could not be freed.

**System action**

Cleanup continues.

**User response**

Contact IBM Software Support for assistance.

## **CI0774: FREE MESSAGE POOL CRITICAL ERROR**

### **Explanation**

The input message pool could not be freed.

### **System action**

Cleanup continues.

### **User response**

Contact IBM Software Support for assistance.

## **CI0787: FAILURE TO FREE CSCB**

### **Explanation**

This message indicates either an internal error or storage corruption.

### **System action**

The subtask termination cleanup continues.

### **User response**

Contact IBM Software Support for a problem number and instructions for forwarding the following documentation: a log of the debug screen space sequence and any dumps produced by the common interface address space or related TSO address space.

## **CI0788: FAILURE TO FREE JSCB**

### **Explanation**

This message indicates either an internal error or storage corruption.

### **System action**

The subtask termination cleanup continues.

### **User response**

Follow the instructions given in the support appendix, then contact IBM Software Support.

## **CI0789: FREEMAIN FAILED FOR SP230 PARAMETER WORK AREA FOLLOWING SUBTASK TERMINATION**

### **Explanation**

The common interface was unable to freemain the parameter work area in subpool 230 that is used by subtasks attached with a system key specification. This occurred after the subtask terminated normally or abnormally.

### **System action**

None.

### **User response**

Contact IBM Software Support.

## **CI0798: INVALID RETURN FROM TERMINATION CALL**

### **Explanation**

Internal error. This message should be accompanied by abend U798.

**System action**

The common interface abnormally terminates.

**User response**

Follow the instructions given in the support appendix, then contact IBM Software Support.

**CI0799: UNABLE TO LOCATE RECOVERY HEADER****Explanation**

Internal error. This message should be accompanied by abend U799.

**System action**

The common interface abnormally terminates.

**User response**

Follow the instructions given in the support appendix, then contact IBM Software Support.

**CI0900: *Common Interface* INITIALIZATION****Explanation**

The common interface is beginning initialization.

**System action**

Initialization continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**CI0901: GLOBAL ADDRESS SPACE VECTOR TABLE BUILD FAILED****Explanation**

The GETMAIN for the LSQA to hold the vector table failed.

**System action**

The common interface terminates.

**User response**

Contact IBM Software Support.

**CI0906: PE SERVER SYSPRINT DCB GETMAIN FAILED.****Explanation**

The common interface was unable to obtain virtual storage in the OMEGAMON® address space required for the data server SYSPRINT DCB.

**System action**

The common interface terminates.

**User response**

Increase the region size and restart the OMEGAMON® server.

## **CI0907: PE SERVER SYSPRINT DCB OPEN FAILED.**

### **Explanation**

The common interface failed to open the data server SYSPRINT DCB.

### **System action**

The common interface terminates.

### **User response**

Specify a SYSPRINT DDname in the OMEGAMON® server started task JCL and restart the OMEGAMON® server.

## **CI0908: PE SERVER SYSPRINT TOKEN CREATE FAILED.**

### **Explanation**

The common interface failed to create the data server home-level name/token pair.

### **System action**

The common interface terminates.

### **User response**

Contact the IBM® Software Support.

## **CI0931: SUBTASK ERROR RECOVERY DETECTED INVALID ISDA**

### **Explanation**

This error is caused either by an internal error or by the corruption of virtual storage.

### **System action**

The subtask terminates.

### **User response**

Follow the instructions given in the support appendix, then contact IBM Software Support.

## **CI0935: RETRY FROM Interface A ERROR RECOVERY**

### **Explanation**

Interface D abnormally terminated and control has passed back to Interface A.

### **System action**

System action is dependent on the response made to message CI0995, which always immediately follows this message.

### **User response**

Respond to message CI0995.

## **CI0938: ERROR ENCOUNTERED ATTEMPTING TO SERIALIZE NON-SWAPPABILITY**

### **Explanation**

The common interface was unable to successfully enqueue upon a step-level resource used to regulate non-swapability.

**System action**

The common interface terminates.

**User response**

Contact IBM Software Support.

**CI0940: MODULE KOBCCIID $n$  NOT FOUND****Explanation**

The common interface could not find module KOBCCIID $n$ .  $n$  is an operating system identifier from 1–4.

**System action**

The common interface does not initialize.

**User response**

Verify that KOBCCIID $n$  is installed in the common interface's JOBLIB/STEPLIB, and restart the common interface.

**CI0941: LINK FAILED - Interface D****Explanation**

The link to OBCIID was unsuccessful.

**System action**

The common interface terminates.

**User response**

Check the JES job log for messages. The most Common reason for this failure is that OBCIID is not available from the STEPLIB of the common interface.

**CI0951: PLACE MODULE cccccccc IN A JOB/STEP/LPA LIBRARY****Explanation**

An error (that was logged in a message preceding this one) is caused by the absence of the indicated module.

**System action**

It depends on the error logged in the previous message.

**User response**

Respond as indicated in the previous message.

**CI0952: REPLY GO, STOP (TERMINATES *Common Interface* OPERATION), OR HELP****Explanation**

See **System Action** and **User Response**.

**System action**

Interface retries, or termination of the common interface, depending on the response to the message.

**User response**

A response of GO retries initiation of the Interface. Precede this response with corrective action to address the cause of the problem, such as placing a new, good copy of a program in a library. STOP terminates the common interface. HELP produces an explanatory message and reissues the WTOR.

**CI0960: ENVIRONMENT MISMATCH, SYSTEM MUST BE MVS/SP™ 1.3 OR HIGHER****Explanation**

The common interface was started in an operating system that does not support its functions.

**System action**

The common interface does not initialize.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**CI0961: ENVIRONMENT MISMATCH, 370 VERSION IN XA, OR XA VERSION IN 370****Explanation**

The common interface was started in an incompatible operating system.

**System action**

The common interface does not initialize.

**User response**

Verify that the correct version of the common interface is installed.

**CI0968: *Common Interface* REQUIRES APF-AUTHORIZATION****Explanation**

The common interface determined that it did not possess APF authorization.

**System action**

The common interface terminates with a U0968 abend.

**User response**

Make sure the common interface load modules reside in an APF-authorized library.

**CI0969: *Common Interface* MUST EXECUTE AS PRIMARY NON-SYSTEM JOB STEP TASK****Explanation**

The common interface must run as the primary non-system job step task in the address space. Typically, this requirement is satisfied when the common interface is attached by IEESB605 (started task control) when run as a started task, or by IEFIIC (initiator Interface control) when run as a batch job. The common interface is not designed to run in a TSO environment under the TMP (terminal monitor program).

**System action**

The common interface terminates.

**User response**

Contact IBM Software Support.

**CI0970: OMEGAMON SUBTASK ABEND CODE=cccccccc  
PSW=aaaaaaaaaaaaaaaa TCB=bbbbbbbb**

**Explanation**

A subtask of the common interface abended. This message displays the abend code, the PSW at time of abend, and the address of the abending task's TCB display.

**System action**

The subtask produces a system termination dump.

**User response**

Contact IBM Software Support.

**CI0971: PROGRAM NAME=cccccccc**

**Explanation**

This message follows CI0970 when a subtask abend occurs, and identifies the program that was given control when the subtask was started.

**System action**

The subtask abnormally terminates.

**User response**

Restart the failing subtask.

**CI0985: SUBTASK ID=XXXXXXXX FORCIBLY DETACHED**

**Explanation**

A common interface module (KOBICRT0) detected that a subtask of the common interface was detached by its mother task while the subtask was still active.

**System action**

None.

**User response**

This may or may not be an error. If the subtask's mother task was requested to stop, then no error occurred.

**CI0995: Interface A ERROR RECOVERY RETRY - ENTER 'GO', 'STOP', OR 'HELP'**

**Explanation**

The common interface has abended and requests a response from the operator.

**System action**

The Interface restarts or the common interface terminates, depending on the response to the message.

**User response**

Follow the instructions given in the support appendix, then contact IBM Software Support.

## **CI0997: INVALID RETURN FROM TERMINATION CALL**

### **Explanation**

Internal error. This message should be accompanied by abend U997.

### **System action**

The common interface abnormally terminates.

### **User response**

Follow the instructions given in the support appendix, then contact IBM Software Support.

## **CI0998: UNABLE TO LOCATE RECOVERY HEADER**

### **Explanation**

Internal error. This message should be accompanied by abend U998.

### **System action**

The common interface abnormally terminates.

### **User response**

Follow the instructions given in the support appendix, then contact IBM Software Support.

## **CI0999: LOAD OF OBCIGL FAILED**

### **Explanation**

The common interface was unable to load the global address space vector table service routine.

### **System action**

The common interface terminates.

### **User response**

Make sure OBCIGL is in a load library accessible to the common interface.

## **CND messages**

Messages that begin with the CND prefix are associated with OMEGAMON® Base components.

## **CNDL001I: OMEGAMON® SUBSYSTEM V999” INITIALIZATION - SSID = cccc**

### **Explanation**

OMEGAMON® Subsystem address space initialization processing has begun. The subsystem version number is “999”, and the z/OS® subsystem identifier is cccc.

### **System action**

OMEGAMON® Subsystem processing continues.

### **User response**

None. This message is informational only.

## **CNDL002I: OMEGAMON® SUBSYSTEM V999 TERMINATED - SSID = cccc**

### **Explanation**

OMEGAMON® Subsystem address space termination processing has completed. The subsystem version number is “999”, and the z/OS® subsystem identifier is cccc.

### **System action**

The OMEGAMON® Subsystem address space terminates.

### **User response**

None. This message is informational only.

## **CNDL003A: OMEGAMON® SUBSYSTEM INITIALIZATION FAILED - REGION TOO SMALL**

### **Explanation**

The OMEGAMON® Subsystem address space could not obtain enough private-area storage to complete initialization.

### **System action**

The OMEGAMON® Subsystem address space terminates.

### **User response**

Increase the REGION specification included in the address space start-up JCL.

## **CNDL004A: OMEGAMON® SUBSYSTEM REQUIRES APF AUTHORIZATION**

### **Explanation**

The OMEGAMON® Subsystem address space must execute from an APF-authorized library.

### **System action**

The OMEGAMON® Subsystem address space terminates.

### **User response**

APF-authorize the OMEGAMON® Subsystem’s load library.

## **CNDL005A: OMEGAMON® SUBSYSTEM RECEIVED CONTROL IN AN AUTHORIZED KEY**

### **Explanation**

The OMEGAMON® Subsystem address space received control in execution key 0–7. The Subsystem must be installed to receive control in a non-authorized key. Only APF-authorization is required.

### **System action**

The OMEGAMON® Subsystem address space terminates.

### **User response**

Use the correct procedure to install the OMEGAMON® Subsystem.

## **CNDL006A: ccccccc KEYWORD VALUE INVALID**

### **Explanation**

The value of the ccccccc keyword is not valid.

### **System action**

The request associated with the keyword is rejected. The nature of the request determines the action taken. For example, if a OMEGAMON® Subsystem start parameter is found in error, the Subsystem address space terminates. If an operator command keyword is in error, the command is rejected.

### **User response**

Correct the keyword specification.

## **CNDL007A: ccccccc KEYWORD OCCURS MULTIPLE TIMES**

### **Explanation**

The ccccccc keyword occurs multiple times in a single Subsystem request.

### **System action**

The request associated with the keyword is rejected. The nature of the request determines the action taken. For example, if a OMEGAMON® Subsystem start parameter is found multiple times, the Subsystem address space terminates. If an operator command keyword is found multiple times, the command is rejected.

### **User response**

Correct the keyword specification.

## **CNDL009I: SSCVT CHAIN ENTRY INVALID - ADDRESS X'xxxxxxxx'**

### **Explanation**

The SSCVT chain entry at storage location X'xxxxxxxx' is not formatted correctly. During initialization, the OMEGAMON® Subsystem found the invalid entry while looking for its own SSCVT entry. The Subsystem cannot complete initializing without its SSCVT entry.

### **System action**

The OMEGAMON® Subsystem address space terminates.

### **User response**

Correct the cause of the SSCVT entry formatting error and correct the entry.

## **CNDL010A: OMEGAMON® SUBSYSTEM IS NOT DEFINED - SSID = cccc**

### **Explanation**

The OMEGAMON® Subsystem identifier cccc has not been defined as an z/OS® subsystem. The identifier must be defined to z/OS® during Subsystem installation. A system IPL is required before the new definition becomes effective.

### **System action**

The OMEGAMON® Subsystem address space terminates.

### **User response**

Review the OMEGAMON® Subsystem installation procedures. Verify that subsystem definition statements have been added to the appropriate IEFSSNcc member in SYS1.PARMLIB.

## **CNDL013I: OMEGAMON® SUBSYSTEM INITIALIZED WITH “RESTART=FORCE”**

### **Explanation**

The OMEGAMON® Subsystem address space start parameter included the keyword RESTART=FORCE. This keyword causes Subsystem initialization to continue even if another OMEGAMON® Subsystem address space is active. RESTART=FORCE should not be used unless repeated attempts to start the Subsystem result in message CNDL018I and it is known that no other OMEGAMON® Subsystem address space is active.

### **System action**

The OMEGAMON® Subsystem address space remains active.

### **User response**

None. This message is informational only.

## **CNDL014A: SUBSYSTEM INITIALIZATION MODULE KCNDLINT DID NOT RUN SUCCESSFULLY**

### **Explanation**

OMEGAMON® Subsystem initialization module KCNDLINT did not run successfully during the system IPL.

### **System action**

The OMEGAMON® Subsystem address space terminates.

### **User response**

An IPL is needed to complete the installation of the OMEGAMON® Subsystem. If an IPL was done, check the SYSLOG for messages to determine why KCNDLINT did not execute. Make sure you complete all OMEGAMON® Subsystem installation steps and perform an IPL before starting the OMEGAMON® Subsystem address space.

## **CNDL018I: OMEGAMON® SUBSYSTEM ALREADY ACTIVE - *nnnnnnnn iiiiii***

### **Explanation**

The address space producing this message has determined that the OMEGAMON® Subsystem address space is already active. The name of the already-active address space is *nnnnnnnn*; its address space identifier is *iiiiii*.

### **System action**

The address space producing this message terminates.

### **User response**

None. This message is informational only.

## **CNDL019W: CONDITIONAL STORAGE REQUEST FAILED - *cccccccc***

### **Explanation**

The Subsystem has attempted and failed to obtain private-area storage. The name of the requesting routine is *cccccccc*.

### **System action**

The OMEGAMON® Subsystem address space remains active.

### **User response**

No immediate action is necessary. However, other messages requiring specific action may appear as a result of the failed storage request. If this message appears frequently, it may be necessary to increase the value of the REGION parameter for the Subsystem address space.

## **CNDL020A: START PARAMETER STRING SYNTAX ERROR**

### **Explanation**

The syntax of the parameter string passed to the Subsystem during initialization is in error.

### **System action**

The OMEGAMON® Subsystem address space terminates.

### **User response**

Correct the parameter string error and restart the Subsystem address space.

## **CNDL021I: RKANPAR FILE OPEN ERROR - RC = X'xxxxxxxx'.**

### **Explanation**

The RKANPAR file failed to open. The error code returned by IBM® OPEN processing was X'xxxxxxxx'.

### **System action**

The OMEGAMON® Subsystem address space remains active. Depending on the severity of the error, additional Subsystem messages may appear.

### **User response**

Check the console for any additional Subsystem or IBM-component messages. If the error's cause cannot be determined, contact IBM Software Support.

## **CNDL022I: RKANPAR FILE FAILED TO OPEN**

### **Explanation**

The RKANPAR file failed to open. There was no error code returned by IBM® OPEN processing.

### **System action**

The OMEGAMON® Subsystem address space remains active. Depending on the severity of the error, additional Subsystem messages may appear.

### **User response**

Check the console for any additional Subsystem or IBM-component messages. If the cause of the error cannot be determined, contact IBM Software Support.

## **CNDL024I: ccccccc MEMBER *mmmmmmm* NOT FOUND**

### **Explanation**

The *mmmmmmm* partitioned data set member could not be found. The ddname associated with the partitioned data set is *ccccccc*.

### **System action**

The OMEGAMON® Subsystem address space remains active.

### **User response**

Verify that the partitioned data set member name was specified correctly and retry the Subsystem request.

## **CNDL027I: FUNCTION cccccccc STARTED**

### **Explanation**

Function cccccccc has been started by the Subsystem. The function is now available for use by other IBM® Tivoli® products.

### **System action**

The OMEGAMON® Subsystem address space remains active.

### **User response**

None. This message is informational only.

## **CNDL030I: FUNCTION cccccccc STOPPED**

### **Explanation**

Function cccccccc has been stopped by a user request. The function is no longer available for use by other IBM® Tivoli® products.

### **System action**

The OMEGAMON® Subsystem address space remains active.

### **User response**

None. This message is informational only.

## **CNDL032I: FUNCTION cccccccc STOPPED BY THE SUBSYSTEM**

### **Explanation**

Function cccccccc has been stopped by the Subsystem. The function is no longer available for use by other IBM® Tivoli® products. The Subsystem has stopped the function as a result of an error or Subsystem address space termination.

### **System action**

The OMEGAMON® Subsystem address space remains active.

### **User response**

None. This message is informational only.

## **CNDL034I: SUBSYSTEM START MEMBER cccccccc**

### **Explanation**

RKANPAR member cccccccc was used as the Subsystem initialization member during Subsystem start-up.

### **System action**

The OMEGAMON® Subsystem address space remains active.

### **User response**

None. This message is informational only.

## **CNDL100I: I/O SERVICES NOT AVAILABLE**

### **Explanation**

An error has occurred causing the termination of the dynamic I/O configuration subsystem. This message should be accompanied by another message explaining the error.

### **System action**

The routine terminates.

### **User response**

Follow the response for the accompanying message. Contact IBM Software Support if necessary.

## **CNDL101A: UNABLE TO OBTAIN PRIVATE STORAGE, DYNAMIC I/O SERVICES NOT AVAILABLE**

### **Explanation**

The dynamic I/O configuration monitor initialization routine was unable to obtain private area storage for its work area.

### **System action**

The routine terminates without initializing dynamic I/O monitoring.

### **User response**

Contact IBM Software Support.

## **CNDL102A: DSPSERV RC = X'xx' REASON CODE = yyyyyyyy**

### **Explanation**

The dynamic I/O configuration monitor initialization routine was unable to create a SCOPE=COMMON dataspace for its use. The return code from the DSPSERV macro invocation was X'xx', the reason code was yyyyyyyy.

### **System action**

The routine terminates without initializing dynamic I/O monitoring.

### **User response**

Check the return codes for the DSPSERV macro create function to determine if the failure was due to an installation option. If not, contact IBM Software Support.

## **CNDL103A: ALESERV RC = X'xx'**

### **Explanation**

The dynamic I/O configuration monitor initialization routine was unable to add an entry for a SCOPE=COMMON data space to all PASN-ALs in the system. The return code from the ALESERV macro invocation was X'xx'.

### **System action**

The routine terminates without initializing dynamic I/O monitoring.

### **User response**

Check the return codes for the ALESERV macro add function to determine if the failure was due to an installation option. If not, contact IBM Software Support.

## **CNDL104I: SVC DUMP TAKEN FOR DYNAMIC I/O CONFIGURATION SUBSYSTEM**

### **Explanation**

An abend has occurred and an SVC dump has been successfully produced.

### **System action**

The routine attempts to recover from the abend. If more than one abend has occurred, then the routine will terminate.

### **User response**

Retain the dump. Contact IBM Software Support.

## **CNDL105I: DYNAMIC I/O CONFIGURATION UNABLE TO OBTAIN CSA STORAGE**

### **Explanation**

An attempt to obtain CSA failed.

### **System action**

The dynamic I/O configuration monitor will function without I/O configuration change exits.

### **User response**

Contact IBM Software Support.

## **CNDL106W: UNABLE TO INSTALL I/O RECONFIGURATION COMPLETION EXIT, RC=X'xx'**

### **Explanation**

An attempt to install an I/O reconfiguration completion exit failed with return code X'xx'.

### **System action**

The dynamic I/O configuration monitor will function without the I/O configuration completion exit.

### **User response**

Contact IBM Software Support.

## **CNDL107W: UNABLE TO INSTALL I/O RECONFIGURATION REQUEST EXIT, RC=X'xx'**

### **Explanation**

An attempt to install an I/O reconfiguration request exit failed with return code X'xx'.

### **System action**

The dynamic I/O configuration monitor will function without the I/O configuration request exit.

### **User response**

Contact IBM Software Support.

## **CNDL108A: UNABLE TO BUILD UCB TABLE, RC = X'xx'**

### **Explanation**

An attempt to build a table of UCB addresses failed with return code X'xx'.

**System action**

The dynamic I/O configuration monitor will terminate.

**User response**

Contact IBM Software Support.

**CNDL109A: UCBSCAN RETURN CODE = X'xx'****Explanation**

An invocation of the UCBSCAN macro service failed with return code X'xx'.

**System action**

The dynamic I/O configuration monitor will terminate.

**User response**

Contact IBM Software Support.

**CNDL110A: UCB TABLE REBUILD FAILED WITH RC = X'xx'****Explanation**

An attempt to rebuild the UCB address table failed with return code X'xx'.

**System action**

The dynamic I/O configuration monitor will terminate.

**User response**

Contact IBM Software Support.

**CNDL150A: UNABLE TO OBTAIN STORAGE, DYNAMIC I/O RECONFIGURATION EXIT INOPERATIVE****Explanation**

An I/O reconfiguration exit attempted to obtain private storage and failed.

**System action**

The dynamic I/O configuration exit terminates.

**User response**

Contact IBM Software Support.

**CNDL151A: INVALID ALET, UNABLE TO ACCESS DATA SPACE, DYNAMIC I/O RECONFIGURATION EXIT INOPERATIVE****Explanation**

The ALET for the SCOPE=COMMON data space has been found to be invalid.

**System action**

The dynamic I/O configuration exit terminates.

**User response**

Contact IBM Software Support.

## **CNDL152A: INVALID DATA SPACE, DYNAMIC I/O RECONFIGURATION EXIT INOPERATIVE**

### **Explanation**

The ALET for the SCOPE=COMMON data space has accessed a data space that can not be validated.

### **System action**

The dynamic I/O configuration exit terminates.

### **User response**

Contact IBM Software Support.

## **CNDL153A: UNEXPECTED FUNCTION ENCOUNTERED BY I/O REQUEST EXIT**

### **Explanation**

The dynamic I/O configuration request exit has encountered an unknown function code.

### **System action**

The dynamic I/O configuration exit terminates.

### **User response**

Contact IBM Software Support.

## **CNDL154A: I/O aaaaaaaaaa EXIT UNABLE TO ACCESS DATA SPACE IN RECOVERY ROUTINE.**

### **Explanation**

An abend has caused entry to the recovery routine, and the data space cannot be accessed to notify potential users that the exit has abended. *aaaaaaaa* identifies the exit as either request or completion.

### **System action**

The dynamic I/O configuration exit terminates.

### **User response**

Contact IBM Software Support.

## **CNDL155A: I/O aaaaaaaaaa EXIT ALET INVALID**

### **Explanation**

An abend has caused entry to the recovery routine and the data space cannot be accessed to notify potential users that the exit has abended due to an invalid ALET. *aaaaaaaa* identifies the exit as either request or completion.

### **System action**

The dynamic I/O configuration exit terminates.

### **User response**

Contact IBM Software Support.

## **CNDL156A: I/O aaaaaaaaa EXIT UNABLE TO ACCESS WORK AREA IN RECOVERY ROUTINE**

### **Explanation**

An abend has caused entry to the recovery routine and the exit work area cannot be accessed. *aaaaaaaa* identifies the exit as either request or completion.

### **System action**

The dynamic I/O configuration exit terminates.

### **User response**

Contact IBM Software Support.

## **CNDL157I: SVC DUMP TAKEN FOR I/O aaaaaaaaa ROUTINE**

### **Explanation**

An abend has caused entry to the recovery routine and an SVC dump was produced. *aaaaaaaa* identifies the exit as either request or completion.

### **System action**

The dynamic I/O configuration exit terminates.

### **User response**

Retain the SVC dump. Contact IBM Software Support.

## **CNDL175W: UNABLE TO OBTAIN PRIVATE STORAGE, SUBSYSTEM INITIALIZATION ROUTINE TERMINATING**

### **Explanation**

OMEGAMON® Subsystem initialization routine KCNDLINT cannot obtain working storage.

### **System action**

The routine terminates without performing any functions.

### **User response**

Contact IBM Software Support.

## **CNDL176W: UNABLE TO ESTABLISH RECOVERY, SUBSYSTEM INITIALIZATION ROUTINE TERMINATING**

### **Explanation**

OMEGAMON® Subsystem initialization routine KCNDLINT cannot establish a recovery environment.

### **System action**

The routine terminates without performing any functions.

### **User response**

Contact IBM Software Support.

## **CNDL177W: *aaaa* SUBSYSTEM UNABLE TO OBTAIN ECSA STORAGE RC=X'xx'**

### **Explanation**

OMEGAMON® Subsystem initialization routine KCNDLINT cannot obtain ECSA storage for subsystem *aaaa*.

**aaaa**

name of the subsystem

**X'xx'**

return code from the STORAGE macro

### **System action**

The routine terminates without obtaining or formatting the control block anchor for the OMEGAMON® Subsystem.

### **User response**

If you cannot address the problem indicated by the return code, contact IBM Software Support.

## **CNDL178W: *aaaa* SUBSYSTEM UNABLE TO START ADDRESS SPACE *bbbbbbbb*, RETURN DATA = *xyyy***

### **Explanation**

The OMEGAMON® Subsystem initialization routine KCNDLINT failed to start the subsystem address space.

**aaaa**

name of the subsystem

**bbbbbbbb**

name of the procedure specified by the SSPROC keyword

**X'xx'**

return code from the ASCRE macro

**yy**

reason code from the ASCRE macro

### **System action**

The routine terminates without starting the subsystem address space.

### **User response**

If the return information does not indicate an installation addressable problem, contact IBM Software Support.

## **CNDL179A: INVALID PARAMETER STRING FOR SUBSYSTEM *aaaa***

### **Explanation**

The OMEGAMON® Subsystem initialization routine KCNDLINT found a syntax error in the parameter string passed to it using the IEFSSNcc member of SYS1.PARMLIB. *aaaa* is the name of the subsystem.

### **System action**

The routine terminates without starting the subsystem address space.

### **User response**

Correct the parameter string in the appropriate IEFSSNcc member of SYS1.PARMLIB.

## **CNDL180A: *aaaa* SUBSYSTEM INPUT PARAMETER *bbbbbbbb* OCCURS MULTIPLE TIMES**

### **Explanation**

The OMEGAMON® Subsystem initialization routine KCNDLINT found a keyword parameter to have been entered more than once in the input parameters obtained from the IEFSSNcc member of SYS1.PARMLIB.

#### ***aaaa***

name of the subsystem.

#### ***bbbbbbbb***

keyword parameter occurring multiple times.

### **System action**

The routine terminates without starting the subsystem address space.

### **User response**

Correct the parameter string in the appropriate IEFSSNcc member of SYS1.PARMLIB.

## **CNDL181I: SVC DUMP TAKEN FOR OMEGAMON® SUBSYSTEM *aaaa***

### **Explanation**

The OMEGAMON® Subsystem initialization routine KCNDLINT abended and an SVC dump was produced to gather diagnostic information. *aaaa* is the name of the subsystem.

### **System action**

The routine terminates.

### **User response**

Retain the dump and contact IBM Software Support.

## **CNDL182A: OMEGAMON® SUBSYSTEM *aaaa*, VALUE FOR KEYWORD SSPROC IS INVALID**

### **Explanation**

The OMEGAMON® Subsystem initialization routine KCNDLINT has determined that the value coded for keyword SSPROC in the IEFSSNcc member of SYS1.PARMLIB is invalid. *aaaa* is the name of the subsystem.

### **System action**

The routine terminates without attempting to start the OMEGAMON® Subsystem address space.

### **User response**

Start the subsystem address space manually, or correct the appropriate member of SYS1.PARMLIB and re-IPL.

## **CNDL183A: OMEGAMON® SUBSYSTEM *aaaa*, VALUE FOR RKANPAR KEYWORD MUST BE 2 BYTES LONG**

### **Explanation**

OMEGAMON® Subsystem initialization routine KCNDLINT has determined that the value coded for keyword RKANPAR in the IEFSSNcc member of SYS1.PARMLIB is not 2 bytes long. *aaaa* is the name of the subsystem.

### **System action**

The routine terminates without attempting to start the OMEGAMON® Subsystem address space.

**User response**

Start the subsystem address space manually, or correct the appropriate member of SYS1.PARMLIB and re-IPL.

**CNDL184I: OMEGAMON® SUBSYSTEM *aaaa* INITIALIZATION ROUTINE COMPLETED****Explanation**

The initialization routine specified in the IEFSSNcc member of SYS1.PARMLIB for subsystem *aaaa* has completed successfully. *aaaa* is the name of the subsystem.

**System action**

The routine has successfully completed without error.

**User response**

None. This message is informational only.

**CNDL185I: OMEGAMON® SUBSYSTEM *aaaa* INITIALIZATION ROUTINE RECOVERY SUCCESSFUL****Explanation**

The initialization routine specified in the IEFSSNcc member of SYS1.PARMLIB for subsystem *aaaa* has successfully recovered from an abend. *aaaa* is the name of the subsystem.

**System action**

The initialization routine terminates cleanly and returns control to the system.

**User response**

None. This message is informational only. However, there should be other messages which will require action.

**CNDL189W: SUBSYSTEM ADDRESS SPACE INITIALIZATION ROUTINE VALIDATION FAILURE****Explanation**

The OMEGAMON® Subsystem routine that runs during OMEGAMON® Subsystem address space initialization did not complete successfully.

**System action**

The OMEGAMON® Subsystem address space continues processing; however, the console operator command D A,L will not display the Subsystem address space as an active job on the system. To display the job, you must use the command D A,sssssss, where sssssss is the name of the subsystem started task.

**User response**

Gather SYSLOG and possible SVC dump information, and contact IBM Software Support.

**CS and CT messages**

Messages that begin with the CS and CT® prefixes are associated with OMEGAMON® Base components, especially the CSA Analyzer subsystem.

**CS075: UNABLE TO ESTABLISH VIRTUAL SESSION FOR *sid*. MAKE SURE THE SPECIFIED APPLICATION IS AVAILABLE AND A VALID LOGMODE IS BEING USED.**

**Explanation**

An attempt was made to establish a session using the identified session ID, but the attempt failed.

**System action**

None.

**User response**

Follow the message instructions.

**CSAA000I: CSAA SUBSYSTEM INITIALIZATION IN PROGRESS**

**Explanation**

The CSA Analyzer (CSAA) subsystem initialization started.

**System action**

Initialization processing continues.

**User response**

None.

**CSAA001I: CSAA SUBSYSTEM INITIALIZATION COMPLETED SUCCESSFULLY**

**Explanation**

The CSAA subsystem initialization processing completed successfully.

**System action**

The CSAA subsystem is ready to capture and report common storage usage.

**User response**

None.

**CSAA100E: CSAA SUBSYSTEM ALREADY RUNNING**

**Explanation**

The CSAA subsystem was already running when this CSAA subsystem address space tried to initialize. Only one CSAA subsystem address space can be active at a time.

**System action**

The second CSAA subsystem address space terminates.

**User response**

Stop the CSAA subsystem before starting another CSAA subsystem.

**CSAA200E: PREMATURE END OF INPUT PARAMETERS**

**Explanation**

The input parameters for the CSAA subsystem ended before expected.

**System action**

The CSAA subsystem terminates.

**User response**

Check the input parameters for proper syntax.

**CSAA210E: INPUT PARAMETER SYNTAX ERROR AT POSITION *xx*****Explanation**

CSAA detected an error at the specified position of the input parameter.

**System action**

The CSAA subsystem terminates.

**User response**

Check the input parameters for proper syntax.

**CSAA299E: CSAA SUBSYSTEM TERMINATING DUE TO PARAMETER ERROR.****Explanation**

CSAA detected an error in the input parameter.

**System action**

The CSAA subsystem terminates.

**User response**

Check the input parameters for proper syntax; then restart the CSAA subsystem.

**CSAA300E: UNABLE TO LOAD CSAA MODULE *cccccccc*, ABEND=*xxxx* RC=*yyyy*****Explanation**

The CSA Analyzer™ could not load the specified CSAA module *cccccccc* into virtual storage.

**System action**

The CSAA subsystem terminates.

**User response**

Ensure that the CSA Analyzer can access the CSAA load modules through LPALST, LINKLST, JOBLIB or STEPLIB concatenation.

**CSAA320E: UNABLE TO ATTACH CONSOLE COMMUNICATION TASK****Explanation**

The CSA Analyzer could not attach the console communication subtask.

**System action**

The CSAA subsystem terminates.

**User response**

Ensure that the CSA Analyzer can access the KCSCOMM load module through LPALST, LINKLST, JOBLIB or STEPLIB concatenation.

## **CSAA330E: UNABLE TO ATTACH SYSTEM TREND TASK**

### **Explanation**

The CSA Analyzer could not attach the system trend subtask.

### **System action**

The CSAA subsystem terminates.

### **User response**

Ensure that the CSA Analyzer can access the KCSSTRN load module through LPALST, LINKLST, JOBLIB or STEPLIB concatenation.

## **CSAA340E: UNABLE TO START JOB TREND TIMER**

### **Explanation**

The CSA Analyzer could not start the job trend timer.

### **System action**

The CSAA subsystem terminates.

### **User response**

Call IBM Software Support.

## **CSAA341E: JOB TREND PROCESSING ERROR**

### **Explanation**

Job trend processing routine encountered an error.

### **System action**

The CSAA subsystem terminates.

### **User response**

Call IBM Software Support.

## **CSAA350E: UNABLE TO START ORPHAN PROCESSING TIMER**

### **Explanation**

The orphan processing routine timer could not be started.

### **System action**

The CSAA subsystem terminates.

### **User response**

Call IBM Software Support.

## **CSAA351E: ORPHAN PROCESSING ERROR**

### **Explanation**

Orphan processing routine encountered an error.

**System action**

The CSAA subsystem terminates.

**User response**

Call IBM Software Support.

**CSAA352E: UPDATE PROCESSING ERROR; CSAA SUBSYSTEM SUSPENDED****Explanation**

The CSA Analyzer has experienced an error while processing.

**System action**

The CSAA subsystem is suspended from collecting new data and a system dump is produced.

**User response**

Save the system dump and SYSLOG and contact IBM Software Support for assistance.

**CSAA399E: UNABLE TO LOCATE AND/OR LOAD ALL MODULES****Explanation**

During CSAA initialization, the CSA Analyzer could not locate or load one or more CSAA load modules into virtual storage.

**System action**

The CSAA subsystem terminates.

**User response**

Ensure that the CSA Analyzer can access the CSAA load modules through LPALST, LINKLST, JOBLIB or STEPLIB concatenation.

**CSAA700E: SSCVT CHAIN IS INVALID, UNABLE TO ADD CSAA SSCVT****Explanation**

The CSA Analyzer encountered an error while trying to add the CSAA SSCVT dynamically to the SSCVT chain.

**System action**

The CSAA subsystem terminates.

**User response**

Define the CSAA subsystem in the SYS1.PARMLIB(IEFSSNxx) and IPL the system.

**CSAA710E: UNABLE TO ESTABLISH ERROR RECOVERY ENVIRONMENT****Explanation**

The CSA Analyzer could not establish the CSAA subsystem error recovery environment.

**System action**

The CSAA subsystem terminates.

**User response**

Call IBM Software Support.

## **CSAA720E: UNABLE TO INSTALL THE EXTRACTOR**

### **Explanation**

The CSA Analyzer could not install its extraction routine.

### **System action**

The CSAA subsystem terminates.

### **User response**

The CSA Analyzer cannot co-exist with some common storage monitors from other vendors. Call IBM Software Support.

## **CSAA730E: CSAA EXTRACTOR IN ERROR, EXTRACTOR REMOVED**

### **Explanation**

The CSAA data extraction routine encountered an error. The CSA Analyzer removes the extraction routine from the system.

### **System action**

The CSAA subsystem terminates.

### **User response**

Call IBM Software Support.

## **CSAA740E: UNABLE TO LOCATE THE DATA BUFFER**

### **Explanation**

The CSA Analyzer could not locate the CSAA extraction routine's data buffer.

### **System action**

The CSAA subsystem terminates.

### **User response**

Call IBM Software Support.

## **CSAA800E: UNABLE TO OBTAIN FIXED ECSA STORAGE FOR SSCVT**

### **Explanation**

The CSA Analyzer could not obtain storage for the CSAA SSCVT from extended CSA.

### **System action**

The CSAA subsystem terminates.

### **User response**

Check if all of extended CSA is in use. If not call IBM Software Support.

## **CSAA801E: UNABLE TO OBTAIN FIXED ECSA STORAGE FOR CSAVT**

### **Explanation**

The CSA Analyzer could not obtain storage for the CSAA vector table from extended CSA.

**System action**

The CSAA subsystem terminates.

**User response**

Check if all of extended CSA is in use. If not call IBM Software Support.

**CSAA802E: UNABLE TO OBTAIN FIXED ECSA STORAGE FOR CACHE BUFFER****Explanation**

The CSA Analyzer could not obtain storage for the cache buffer from extended CSA.

**System action**

The CSAA subsystem terminates.

**User response**

Check if all of extended CSA is in use. If not call IBM Software Support.

**CSAA804E: UNABLE TO OBTAIN FIXED ECSA STORAGE FOR DATA BUFFER****Explanation**

The CSA Analyzer could not obtain storage for the data buffer from extended CSA.

**System action**

The CSAA subsystem terminates.

**User response**

Check if all of extended CSA is in use. If not call IBM Software Support.

**CSAA805E: UNABLE TO OBTAIN ESQA STORAGE FOR SRB****Explanation**

The CSA Analyzer was unable to obtain storage for an SRB.

**System action**

The CSAA subsystem terminates.

**User response**

Call IBM Software Support.

**CSAA810E: UNABLE TO OBTAIN PAGABLE ECSA STORAGE****Explanation**

The CSA Analyzer could not obtain storage for the CSAA data areas from extended CSA.

**System action**

The CSAA subsystem terminates.

**User response**

Check if all of extended CSA is in use. If not call IBM Software Support.

## **CSAA811E: UNABLE TO OBTAIN DATA ELEMENT STORAGE IN PAGABLE ECSA**

### **Explanation**

The CSA Analyzer could not obtain storage for the data elements from extended CSA.

### **System action**

The CSAA subsystem terminates.

### **User response**

Increase the value for the PAGE= parameter. If the problem persists, call IBM Software Support.

## **CSAA820E: UNABLE TO OBTAIN EXTENDED PRIVATE STORAGE**

### **Explanation**

The CSA Analyzer could not obtain extended private storage.

### **System action**

The CSAA subsystem terminates.

### **User response**

Increase the region size for the CSAA address space. If the problem persists, call IBM Software Support.

## **CSAA850I: MONITORING ACTIVE FOR *aaa/aaaa***

### **Explanation**

The CSA Analyzer found that the z/OS® Common Storage Tracking function has been enabled and monitoring is now active for the indicated Common Storage Areas. The possible values for *aaa/aaaa* are

- CSA/ECSA - Common Service Area and Extended Common Service Area
- SQA/ESQA - System Queue Area and Extended System Queue Area

### **System action**

The CSAA subsystem is available to report on common storage usage.

### **User response**

None.

## **CSAA851I: MONITORING INACTIVE FOR *aaa/aaaa***

### **Explanation**

The CSA Analyzer found that the z/OS® Common Storage Tracking function has been disabled and common storage usage information is unavailable for the indicated Common Storage Areas. The possible values for *aaa/aaaa* are:

- CSA/ECSA - Common Service Area and Extended Common Service Area
- SQA/ESQA - System Queue Area and Extended System Queue Area

### **System action**

The indicated common storage area will not be reported on.

### **User response**

Enable the z/OS® Common Storage Tracking function. See the *z/OS® MVS™ Initialization and Tuning Reference* for further information on enabling the VSM Storage Tracking function.

**CSAA852I: PROGRAM - *pppppppp* VERSION - *vvvvvvvv* MAINTENANCE - *mmmmmmmm***

**Explanation**

The CSAA program *pppppppp* is at version *vvvvvvvv*. The current maintenance level is *mmmmmmmm*.

**System action**

This diagnostic message may be issued with other CSAA messages.

**User response**

See other CSAA messages for further information. This diagnostic message may provide useful information in determining current maintenance level.

**CSAA860E: MVS™ COMMON STORAGE TRACKING LEVEL NOT SUPPORTED - *nnnn***

**Explanation**

The CSA Analyzer found that the z/OS® Common Storage Tracking function is at LEVEL *nnnn*, a level that is not supported due to maintenance or release level. The z/OS® Common Storage Tracking function is at LEVEL *nnnn*. All common storage usage information is unavailable.

**System action**

The CSAA subsystem address space terminates.

**User response**

Contact IBM Software Support.

**CSAA861E: FAILURE DETECTED IN MVS™ COMMON STORAGE TRACKING**

**Explanation**

The CSA Analyzer found that the z/OS® Common Storage Tracking function has been disabled due to internal problems with the IBM® virtual storage management component. All common storage usage information is unavailable.

**System action**

The CSAA subsystem address space terminates.

**User response**

Contact your system programmer. If an SVC dump was produced by the CSAA address space, this may provide additional diagnostics for IBM® support personnel.

**CSAA890E: USE THE STOP COMMAND TO TERMINATE THE CSAA SUBSYSTEM**

**Explanation**

The CSA Analyzer has experienced an error, described by a previous message. The z/OS® STOP command should be issued to stop the CSAA address space.

**System action**

The CSAA subsystem is suspended from collecting new data.

**User response**

Examine the CSAA message which appears before this message in the SYSLOG; it will describe the reason the CSAA has been suspended. OMEGAMON commands may be used before the CSAA is stopped to examine the

current CSAA data. The z/OS® STOP command should then be issued to stop the CSAA address space. The z/OS® START command can then be issued to restart the CSAA address space.

## **CSAA899E: CSAA SUBSYSTEM TERMINATED DUE TO INSUFFICIENT STORAGE**

### **Explanation**

The CSA Analyzer could not obtain the storage required by the CSAA subsystem. The accompanying CSAA8xxE message identifies the type of storage that could not be obtained.

### **System action**

The CSAA subsystem terminated.

### **User response**

Follow the directions in the accompanying CSAA8xxE messages.

## **CSAA900E: CSAA SUBSYSTEM VERSION DOES NOT MATCH KCSEXTR VERSION**

### **Explanation**

The CSAA subsystem version does not match the initialization routine version.

### **System action**

The CSAA subsystem terminates.

### **User response**

Ensure that all CSAA load modules are of the same version. Check the LPALST and LINKLST concatenation for duplicate modules. If the problem cannot be resolved, call IBM Software Support.

## **CSAA901E: CSAA SUBSYSTEM VERSION DOES NOT MATCH KCSEXTR VERSION**

### **Explanation**

The CSAA subsystem version does not match the extraction routine version.

### **System action**

The CSAA subsystem terminates.

### **User response**

Ensure that all CSAA load modules are of the same version. Check the LPALST and LINKLST concatenation for duplicate modules. If the problem cannot be resolved, call IBM Software Support.

## **CSAA902E: CSAA SUBSYSTEM VERSION DOES NOT MATCH KCSMGR VERSION**

### **Explanation**

The CSAA subsystem version does not match the CSAA manager version.

### **System action**

The CSAA subsystem terminates.

### **User response**

Ensure that all CSAA load modules are of the same version. Check the LPALST and LINKLST concatenation for duplicate modules. If the problem can not be resolved, call IBM Software Support

## **CSAA997E: CSAA SUBSYSTEM ABNORMAL TERMINATION**

### **Explanation**

The CSAA subsystem encountered an error and terminates abnormally.

### **System action**

The CSAA subsystem terminates.

### **User response**

Call IBM Software Support.

## **CSAA998I: CSAA STOP COMMAND ACCEPTED**

### **Explanation**

The CSAA subsystem accepted the stop command.

### **System action**

The CSAA subsystem terminates.

### **User response**

None.

## **CSAA999I: CSAA SUBSYSTEM TERMINATION IN PROGRESS**

### **Explanation**

The CSAA subsystem is terminating.

### **System action**

The CSAA subsystem terminates.

### **User response**

None.

## **CT003: ACCESS FAILED FOR TABLE *tablename*. THE TABLE WAS NOT OPEN**

### **Explanation**

An attempt was made to access a table before the table was opened.

### **System action**

The table is not processed

### **User response**

Call IBM® Software Support.

## **ETE messages**

Messages that begin with the ETE™ prefix are associated with the End-to-End (ETE™) response time monitor component used by some OMEGAMON® monitoring agents.

## ETE0001: COMMAND NOT RECOGNIZED

### Explanation

ETE™ recognized the ETE™ command, but the argument following the command was not valid.

### System action

The command is not processed.

### User response

Enter the ETE™ command followed by a valid ETE™ command argument.

## ETE00014: VERBOSE MODE IN EFFECT

### Explanation

VERBOSE mode is now in effect.

### System action

ETE™ sends additional Application Program Interface (API) request messages and status to the system console.

### User response

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## ETE0002: ETE™ *Vvvvrr #nn LOADLIB=loadlib*

### Explanation

This is a header line for the command output, identifying the ETE™ version, where:

*vvv*

Is the version number (for example, Version 620).

*rr*

Is a release identifier for versions that have more than one release (for example, ETE101R2).

*nn*

Defaults to 0.

*loadlib*

Specifies the load library from which the ETE™ modules were loaded.

### System action

None.

### User response

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## ETE0003: COMPLETE

### Explanation

This is a trailer line for the command output, indicating that ETE™ completed the processing of the command. Note that the command output lines sometimes appear on the z/OS® system log in a different order than ETE™ generated them. Even though this message is the last one produced by the ETE™ subsystem in processing the command, other lines from the command output may appear after it on the log.

**System action**

None.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0004: SUBSYSTEM INACTIVE****Explanation**

ETE™ is inactive as a result of an ETE™ QUIESCE command. Since most of ETE's storage was freed, most commands cannot be meaningfully processed.

**System action**

The command is not processed.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE00041: *job\_name asid tcb\_address user\_type*****Explanation**

This message repeats for each product using the ETE™ subsystem processing the command. For each product, it shows the following:

- Jobname or started task name
- ASID
- TCB address
- ETE™ user type (CAPTURE or RSPTIME)

**System action**

None.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0005: COLLECTOR TRACE CAPTURE INSTALL FAILURE****Explanation**

The installation of the ETE™ capture facility subtask which supports the ETE™ response time collector's diagnostic trace function failed.

**System action**

ETE™ subsystem initialization continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **ETE0010: OMEGAMON® SCHEDULED CSA DUMP IN PROGRESS**

### **Explanation**

The ETE™ dump was started.

### **System action**

An SVC DUMP initiated.

### **User response**

Wait for the dump to complete.

## **ETE0011: OMEGAMON® SCHEDULED CSA DUMP COMPLETE**

### **Explanation**

The ETE™ dump completed.

### **System action**

The SVC DUMP for the ETE™ subsystem storage completed.

### **User response**

Make a tape copy of the ETE™ dump from the SYS1.DUMPnn data set and contact IBM® Software Support.

## **ETE0013: VERBOSE MODE IS ALREADY ON**

### **Explanation**

VERBOSE mode is already in effect; the VERBOSE argument of the ETE™ command that was entered is discarded.

### **System action**

None.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **ETE0015: VERBOSE MODE IS NOT ON**

### **Explanation**

VERBOSE mode is not in effect; the NONVERBOSE argument of the ETE™ command that was entered is discarded.

### **System action**

None.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **ETE0016: VERBOSE MODE IS OFF**

### **Explanation**

VERBOSE mode was turned off.

**System action**

ETE™ operates in normal API mode.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0017: COMMAND BUFFER COULD NOT BE ACQUIRED****Explanation**

A buffer in which to format an MVS MODIFY command to the ETE™ address space to start the ETE™ diagnostic trace was not acquired.

**System action**

The ETE™ diagnostic trace is not started.

**User response**

Increase the REGION= parameter on the EXEC JCL statement of the ETE™ address space JCL procedure. Then terminate and restart ETE™ with the larger region.

**ETE0018: ETE™ ADDRESS SPACE IS NOT EXECUTING****Explanation**

The MVS MODIFY command to the ETE™ address space to start the ETE™ diagnostic trace was not submitted because the ETE™ address space was not executing.

**System action**

The ETE™ diagnostic trace is not started.

**User response**

Restart the ETE™ address space. If the ETE™ address space abended, ensure that a dump was obtained by including a SYSMDUMP DD statement in the ETE™ address space JCL procedure before calling IBM® Software Support.

**ETE0019: ADHT GETMAIN FAILURE****Explanation**

A GETMAIN for common storage above 16M failed.

**System action**

ETE™ address space and subsystem initialization is aborted.

**User response**

Contact IBM® Software Support.

**ETE0030: VERSION ## CMD PREF STATUS INST TYPE****Explanation**

This is a header line for the ETE0031 messages that follow.

**System action**

None.

## User response

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## ETE0031: *Vvvvnn ETE™aaabb status type*

### Explanation

This is a detail line showing ETE™ system information. This message repeats for each ETE™ subsystem installed in the z/OS® operating environment. For each system, it shows the follows:

#### *vvv*

Version number.

#### *nn*

Unique identifier (defaults to 0).

#### *aaabb*

Command suffix.

#### *status*

Status, which is one of the following:

- **ACTIVE:** ETE™ either currently has users or was installed statically.
- **INACTIVE:** ETE™ currently has no users and has become dormant, freeing almost all storage and using almost no CPU cycles.

#### *type*

Install type, which is one of the following:

- **DYNAMIC:** ETE™ will become inactive when the last user product removes itself as an ETE™ user.
- **STATIC:** ETE™ remains active until terminated with the ETE™ QUIESCE command.

### System action

None.

## User response

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## ETE0040: JOBNAME ASID TCB TYPE

### Explanation

This is a header line for the ETE0041 messages that follow.

### System action

None.

## User response

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## ETE0042: NO USERS FOUND

### Explanation

This message is a response to the ETE™ USERS command and indicates that ETE™ has no active request for product response time monitoring.

**System action**

None.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0050: REMOVE REQUEST: RETURN CODE=*nn*, SENSE CODE=*xxxxxxxx*****Explanation**

In processing an ETE™ QUIESCE command, a REMOVE request created the following:

*nn*

Non-zero return code. See “[ETE return codes and sense codes](#)” on page 2394.

*xxxxxxxx*

Sense code. See “[REMOVE request error](#)” in “[ETE return codes and sense codes](#)” on page 2394.

**System action**

The ETE™ quiesce process continues.

**User response**

Submit a copy of the z/OS® system log with this message, and any associated SVC DUMP and LOGREC data, to IBM® Software Support.

**ETE0051: QUIESCE COMPLETE****Explanation**

ETE™ removes itself from the z/OS® operating environment.

**System action**

None.

**User response**

Perform the activities that necessitated the removal of ETE™ from the z/OS® operating environment.

**ETE0052: QUIESCE ALREADY IN PROCESS****Explanation**

An ETE™ QUIESCE command was received while processing of a prior QUIESCE command was still in progress.

**System action**

The later ETE™ QUIESCE command is ignored.

**User response**

Wait for the initial QUIESCE command to finish.

**ETE0060: PRIVATE STORAGE GETMAIN FAILURE (CRWA)****Explanation**

A GETMAIN for private area storage above 16M failed.

**System action**

ETE™ address space and subsystem initialization is aborted.

**User response**

Increase the REGION= parameter on the EXEC JCL statement of the ETE™ address space JCL procedure; then terminate and restart ETE™ with the larger region.

**ETE0061: TCRB MAINTENANCE MODULE LOAD FAILURE****Explanation**

The load of the TCRB maintenance module from the ETE™ address space STEPLIB library failed.

**System action**

ETE™ address space and subsystem initialization is aborted.

**User response**

Consult the z/OS® system log for the reason of the load failure.

**ETE0062: COMMON STORAGE GETMAIN FAILURE (CRCB)****Explanation**

A GETMAIN for common storage above 16M failed.

**System action**

ETE™ address space and subsystem initialization is aborted.

**User response**

Contact IBM® Software Support.

**ETE0063: COMMON STORAGE GETMAIN FAILURE (CUWX)****Explanation**

A GETMAIN for common storage above 16M failed.

**System action**

ETE™ address space and subsystem initialization is aborted.

**User response**

Contact IBM® Software Support.

**ETE0064: COMMON STORAGE GETMAIN FAILURE (CUWH)****Explanation**

A GETMAIN for common storage above 16M failed.

**System action**

ETE™ address space and subsystem initialization is aborted.

**User response**

Contact IBM® Software Support.

## **ETE0065: VTAM® I/O BUFFER SIZE COULD NOT BE DETERMINED**

### **Explanation**

The VTAM® I/O buffer size was not determined because VTAM® control blocks were either corrupted or changed by VTAM® maintenance.

### **System action**

ETE™ address space and subsystem initialization is aborted.

### **User response**

Contact IBM® Software Support.

## **ETE0070: THE FOLLOWING ETE™ COMMANDS ARE AVAILABLE**

### **Explanation**

This is a header line for the output from the ETE™ HELP command.

### **System action**

None.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **ETE0071: *ETE\_help\_information\_detail\_line***

### **Explanation**

This is a detail line of the output from the ETE™ HELP command.

### **System action**

None.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **ETE0072: SSTB SUBSYSTEM RESET SUCCESSFUL**

### **Explanation**

The ETE™ subsystem RESET command completed successfully.

### **System action**

All ETE™ hooks into VTAM® are completely withdrawn, and all ETE™ storage that can be released is released.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **ETE0073: VTAM® INTERFACES RESTORED**

### **Explanation**

This message confirms that the ETE™ subsystem RESET command withdrew all ETE™ hooks.

**System action**

All ETE™ hooks into VTAM® have been completely withdrawn.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0074: UNABLE TO RESTORE VTAM® INTERFACES****Explanation**

The ETE™ subsystem RESET command was unable to withdraw ETE's hooks, probably because additional hooks were established after ETE's.

**System action**

ETE™ subsystem RESET command processing terminates.

**User response**

None. This message is issued in conjunction with ETE0075.

**ETE0075: RESET COMMAND NOT PERFORMED****Explanation**

This message confirms that ETE™ subsystem RESET command processing was unsuccessful.

**System action**

ETE™ subsystem RESET command processing terminates.

**User response**

Issue a system stand-alone dump and contact IBM® Software Support.

**ETE0076: RESET NOT REQUIRED, SSTB SUBSYSTEM NOT FOUND****Explanation**

The ETE™ subsystem RESET command determined that ETE's hooks were not present.

**System action**

ETE™ subsystem RESET command processing terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0078: ETE™ DIAGNOSTIC TRACE STARTED****Explanation**

The ETE™ subsystem TRACEON command started the ETE™ diagnostic trace function.

**System action**

Recording of ETE™ diagnostic trace entries into the ETE™ diagnostic trace table commences.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0079: ETE™ DIAGNOSTIC TRACE STOPPED****Explanation**

The ETE™ subsystem TRACEOFF command stopped the ETE™ diagnostic trace function.

**System action**

Recording of ETE™ diagnostic trace entries into the ETE™ diagnostic trace table terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0080: ETE™ ADDRESS SPACE COMMAND ABENDED****Explanation**

An abend occurred during the processing of an ETE™ subsystem command.

**System action**

The ETE™ subsystem command interface captures diagnostic information and recovers from the error.

**User response**

If the ETE™ subsystem command abends consistently, use the MVS DUMP command to dump the ETE™ address space and call IBM® Software Support.

**ETE0081: ETE™ ADDRESS SPACE STARTUP FAILED—NOT APF AUTHORIZED****Explanation**

ETE™ address space startup failed because ETE™ library is not APF-authorized.

**System action**

ETE™ address space startup task terminated.

**User response**

Make sure the ETE™ library is an APF-authorized library.

**ETE0082: ETE™ ADDRESS SPACE STARTUP FAILED—RECOVERY COULD NOT BE ESTABLISHED****Explanation**

ETE™ address space startup failed due to failure of the ESTAE recovery environment set up.

**System action**

The ETE™ address space startup task terminated.

**User response**

Obtain OMEGAMON® debug screen outputs and contact IBM® Software Support for diagnosis.

## **ETE0083: ETE™ ADDRESS SPACE STARTUP FAILED—UNSUPPORTED ENVIRONMENT**

### **Explanation**

ETE™ address space startup failed due to unsupported z/OS® or ACF/VTAM environment.

### **System action**

The ETE™ address space startup task terminated.

### **User response**

Make sure that the ETE™ library is APF-authorized. Make sure that the ACF/VTAM started and is active. Make sure that the ACF/VTAM release level is a supported version of VTAM®.

## **ETE0084: ETE™ ADDRESS SPACE STARTUP FAILED—INSUFFICIENT PRIVATE STORAGE AVAILABLE**

### **Explanation**

ETE™ address space startup failed due to insufficient private virtual storage.

### **System action**

The ETE™ address space startup task terminated.

### **User response**

Increase the private region size of the REGION parameter on the EXEC statement, and restart the ETE™ startup task.

## **ETE0086: ETE™ ADDRESS SPACE TERMINATED BY SUBSYSTEM QUIESCE**

### **Explanation**

The ETE™ address space was terminated as the result of an ETE™ QUIESCE command.

### **System action**

The ETE™ address space is terminated and all allocated private and ECSA storage is freed. All response time monitoring activities stop and all OMEGAMON® products stop reporting response time data.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations. You must restart the ETE™ address space to resume response time monitoring.

## **ETE0087: ETE™ ADDRESS SPACE TERMINATED BY STOP COMMAND**

### **Explanation**

The ETE™ address space was terminated as the result of a stop command received from the z/OS® console.

### **System action**

The ETE™ address space is terminated and all allocated private and ECSA storage is freed. Standard response time monitoring activities performed by the OMEGAMON® continue, but multi-session manager support is unavailable.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations. You must restart the ETE™ address space to resume multi-session manager support.

## **ETE0088: COMMAND ACCEPTED**

### **Explanation**

The MVS MODIFY command entered from the system console was accepted.

### **System action**

None.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **ETE0089: COMPLETE**

### **Explanation**

This is the output message trailer for an ETE™ address space command.

### **System action**

None.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **ETE0090: ETE™ STARTUP INSTALL REQUEST FAILED: RC=*nn*, SC=*xxxxxxxx***

### **Explanation**

The request to statically install ETE™, resulted in the following:

*nn*

Non-zero return code. See [“ETE return codes and sense codes” on page 2394](#).

*xxxxxxxx*

Sense code. See “REMOVE request error” in [“ETE return codes and sense codes” on page 2394](#).

### **System action**

ETE™ does not install.

### **User response**

Submit a copy of the z/OS® system log with this message, and any associated SVC DUMP and LOGREC data, to IBM® Software Support.

## **ETE0091: ETE™ V620 SUCCESSFULLY INITIALIZED**

### **Explanation**

ETE™ was statically installed successfully. ETE™ will not become inactive when it has no users. You can deactivate ETE™ only with the ETE™ QUIESCE command.

**System action**

None.

**User response**

You can now start user products.

**ETE0092: ETE™ V620 ADDRESS SPACE ALREADY EXECUTING****Explanation**

The ETE™ Version 6.2.0 address space that just started is terminating because there already was an ETE™ 6.2.0 address space with the same subsystem identifier started and running. Only one ETE™ 6.2.0 address space with a specific subsystem identifier can run at a time.

**System action**

The ETE™ 6.2.0 address space that just started terminates. The running ETE™ 6.2.0 address space is not affected.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0094: TRACE TABLE GETMAIN FAILURE****Explanation**

The ETE™ startup task could not obtain ECSA storage for the diagnostic trace table. The diagnostic trace is not required for normal ETE™ operation.

**System action**

ETE™ address space initialization continues. However, the diagnostic trace is disabled.

**User response**

If the trace is needed for problem determination, make sure that enough ECSA storage is available and restart the ETE™ address space.

**ETE0095: INVALID ETE™ ADDRESS SPACE COMMAND****Explanation**

The MVS MODIFY command entered from the z/OS® console is either not recognized or not supported.

**System action**

None.

**User response**

Make sure the command is valid and check the command syntax.

**ETE0100: OMEGAMON® *job\_name* RSP EOT REMOVE REQUEST: RETURN CODE=*nn*, SENSE CODE=*xxxxxxxx*****Explanation**

A REMOVE request issued at end-of-task failed prior to task termination. The message shows the following information:

*job\_name*

Jobname or started task name of the user product.

**nn**

Non-zero return code. See [“ETE return codes and sense codes” on page 2394](#).

**xxxxxxx**

Sense code. See “REMOVE request error” in [“ETE return codes and sense codes” on page 2394](#).

### **System action**

None.

### **User response**

Make a copy of the z/OS® system log with this message, and any associated SVC DUMP and LOGREC data. Contact IBM® Software Support.

## **ETE0101: ETE™ COULD NOT BE STARTED. VTAM® NOT INITIALIZED OR VTAM® IS AT AN UNSUPPORTED LEVEL.**

### **Explanation**

ETE™ could not start because either VTAM® was not initialized or VTAM® was at an unsupported level.

### **System action**

ETE™ discontinues initialization.

### **User response**

If VTAM® was not initialized, wait for VTAM® to initialize and restart ETE™. If VTAM® was already initialized, call IBM® Software Support.

## **ETE0110: ADD FAILED FOR *luname*—NO MULTISESSION MGR INFO PRESENT**

### **Explanation**

This message appears only when the ETE™ subsystem is in verbose mode and an ADD request failed for a virtual terminal because ETE™ did not collect any information about the virtual session between the virtual terminal and the application.

### **System action**

The ADD request fails.

### **User response**

None, if the ETE™ address space was started after IPL time and virtual sessions already existed at the time that it was started.

## **ETE0111: ADD FAILED FOR *luname*—LU CURRENTLY IS IN CONCT STATE**

### **Explanation**

This message appears only when the ETE™ subsystem is in verbose mode and an ADD request failed for a switched LU which is currently not connected to the network.

### **System action**

The ADD request fails.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **ETE0112: ADD REQUEST FAILED—ETE ADDRESS SPACE IS NOT EXECUTING**

### **Explanation**

This message appears only when the ETE™ subsystem is in verbose mode and an ADD request failed because the ETE™ address space is not executing.

### **System action**

The ADD request fails.

### **User response**

Restart the ETE™ address space. If the ETE™ address space abended, ensure that a dump was obtained by including a SYSMDUMP DD card in the ETE™ address space JCL procedure before contacting IBM® Software Support.

## **ETE0113: VETE request REQUEST FAILED: RC=xxxxxxxx, SC=xxxxxxxx**

### **Explanation**

An automatic ADD or DELETE request invoked by the session monitor facility failed with the reported return and sense codes. This message is issued only in verbose mode.

### **System action**

The ADD or DELETE request fails.

### **User response**

If the Session Monitor command abends consistently, use the MVS DUMP command to dump the ETE™ address space and call IBM® Software Support.

## **ETE0114: ATTACH OF COMMAND INTERFACE SUBTASK FAILED**

### **Explanation**

The ETE™ address space command interface subtask attach failed.

### **System action**

ETE™ address space and subsystem initialization is aborted.

### **User response**

Contact IBM® Software Support.

## **ETE0115: ATTACH OF TCRB MAINTENANCE SUBTASK FAILED**

### **Explanation**

The ETE™ address space TCRB/XLE maintenance subtask attach failed.

### **System action**

ETE™ address space and subsystem initialization is aborted.

### **User response**

Contact IBM® Software Support.

## **ETE0116: IDENTIFY OF TCRB MAINTENANCE SUBTASK E.P. FAILED**

### **Explanation**

The ETE™ address space TCRB/XLE maintenance subtask entry point identify failed.

### **System action**

ETE™ address space and subsystem initialization is aborted.

### **User response**

Contact IBM® Software Support.

## **ETE0117: ADD FAILED, SLU=*s luname* PLU=*p luname* RC=*xxxxxxxx* SC=*xxxxxxxx***

### **Explanation**

An ADD request failed for the reason specified in the displayed return code and sense code. This message is issued only in verbose mode.

### **System action**

The ADD request fails.

### **User response**

Respond as the return and sense codes indicate. See “ADD request errors” in [“ETE return codes and sense codes” on page 2394](#).

## **ETE0120: LOCATE FOR MODULE *module\_name* ENTRY POINT *entry\_point\_name***

### **Explanation**

A required VTAM® module was successfully located.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **ETE0121: LOCATE FOR MODULE *module\_name* FAILED**

### **Explanation**

ETE™ was unable to locate a required VTAM® module.

### **System action**

ETE™ startup fails.

### **User response**

Contact IBM® Software Support.

## **ETE0122: UNABLE TO LOCATE VTAM® MODULE TABLE**

### **Explanation**

ETE™ experienced an internal error while locating a required VTAM® module.

### **System action**

ETE™ startup fails.

### **User response**

Contact IBM® Software Support.

## **ETE0123: KETAEVML GETMAIN FAILURE**

### **Explanation**

ETE™ was unable to getmain enough working storage.

### **System action**

ETE™ startup fails.

### **User response**

Increase the region parameter on the ETE™ startup JCL. If symptom persists, contact IBM® Software Support.

## **ETE0200: DR EXCLUSION LIST PROCESSING COMPLETE. RC=xxxxxxxx**

### **Explanation**

ETE™ completed processing the device DR exclusion list option for the ETE™ address space.

### **System action**

ETE™ address space initialization continues.

### **User response**

See previous messages issued for diagnosis.

## **ETE0201: OPEN FAILED RKANPARU DATA SET MEMBER *mbrname***

### **Explanation**

ETE™ is unable to process member *mbrname* in the RKANPARU partitioned data set because of an open error.

### **System action**

ETE™ address space initialization continues.

### **User response**

Determine the cause of the open error. For example, check data set specifications and security authorization.

## **ETE0202: DR EXCLUSION LIST KETXDLDR NOT FOUND**

### **Explanation**

ETE™ is unable to process the device DR exclusion list in the RKANPARU partitioned data set because it was not found.

**System action**

ETE™ address space initialization continues.

**User response**

None.

**ETE0203: I/O ERROR ENCOUNTERED PROCESSING RKANPARU DATA SET  
MEMBER *mbrname*****Explanation**

ETE™ is unable to process member *mbrname* in the RKANPARU partitioned data set because an I/O error was encountered.

**System action**

ETE™ address space initialization continues.

**User response**

Determine cause of the I/O error. For example, check data set specifications and security authorization.

**ETE0204: SYNTAX ERROR ENCOUNTERED PROCESSING DR EXCLUSION LIST  
KETXDLDR****Explanation**

ETE™ is unable to process the device exclusion list in the RKANPARU partitioned data set because of a device name specification error.

**System action**

ETE™ address space initialization continues.

**User response**

Ensure that member KETXDLDR in the RKANPARU partitioned data set is syntactically correct.

**ETE0205: ESQA STORAGE GETMAIN ERROR (DXLHT)****Explanation**

A GETMAIN request for ESQA storage failed.

**System action**

ETE™ address space initialization continues.

**User response**

Increase the ESQA storage and restart the ETE™ address space.

**ETE0206: INVALID DXLHT ENCOUNTERED****Explanation**

An internal logic error occurred in the ETE™ address space.

**System action**

ETE™ address space abends with U700.

## ETE0207: ESQA STORAGE GETMAIN ERROR (DXLHTE)

### Explanation

A GETMAIN request for ESQA storage failed.

### System action

ETE™ address space initialization continues.

### User response

Increase the ESQA storage and restart the ETE™ address space.

## ETE0208: INVALID DXLHTE ENCOUNTERED

### Explanation

An internal logic error occurred in the ETE™ address space.

### System action

ETE™ address space abends with U701.

## ETE0209: DXLHTE=*address* SLUNAME=*sluname*

### Explanation

Output display from the diagnostic command DUMPDXL where *address* is the address of the DXLHTE and *sluname* is the SLUNAME of the device in the device exclusion list.

### System action

None.

### User response

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## ETE0210: DR EXCLUSION LIST PROCESSING FAILED: RC=*xxxxxxxx* SC=*xxxxxxxx*

### Explanation

ETE™ is unable to process the device exclusion list in the RKANPARU partitioned data set.

- If RC=4, these sense codes are returned:

**X'00000004'**

Insufficient private memory. Increase the REGION= parameter on the EXEC JCL statement of the ETE™ address space JCL procedure. Stop and restart the ETE™ address space with the larger region.

**X'00000008'**

RKANPARU partitioned data set not allocated to the ETE™ address space.

**X'0000000C'**

KETXDLDR not found in the RKANPARU partitioned data set.

- If RC=8, these sense codes are returned:

**X'00000004'**

Open failed for RKANPARU data set.

**X'00000008'**

I/O error occurred processing RKANPARU data set.

**X'0000000C'**

Abend occurred processing RKANPARU data set.

**X'00000010'**

ESTAE failed processing RKANPARU data set.

- If RC=C, these sense codes are returned:

**X'00000004'**

GETMAIN failed for DXLHT.

- If RC=10, these sense codes are returned:

**X'00000004'**

GETMAIN failed for DXLHTE.

**X'00000008'**

Syntax error occurred while parsing KETXDLDR.

**X'0000000C'**

Abend occurred while parsing KETXDLDR.

**X'00000010'**

GETMAIN failed for private memory while parsing KETXDLDR.

**X'00000014'**

ESTAE failed while parsing KETXDLDR.

### System action

ETE™ address space initialization continues.

### User response

See previous messages issued for diagnosis.

## **ETE0211: RC=*xxxxxxxx* hexsluname length position**

### Explanation

Output display following ETE0204 output with the following diagnostic information.

*xxxxxxxx*

Return code which may be:

**00000008**

Internal error.

**0000000C**

Invalid SLUNAME specification.

**00000010**

Invalid SLUNAME specification.

**00000014**

Invalid SLUNAME specification.

**00000018**

Internal error.

**0000001C**

Internal error.

***hexsluname***

Hexadecimal representation of failing SLUNAME operand.

***length***

Length of failing operand.

***position***

Position of failing operand in KETXDLDR member data record.

**System action**

None.

**User response**

None.

**ETE0212: NO EXCLUDED DEVICES FOUND**

**Explanation**

The DUMPDXL command was issued, but no excluded devices are specified in the ETE™ address space.

**System action**

None.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0220: ETE™ SUPPORT IN CICS® ADDRESS SPACE (*asid*) IS ENABLED  
GA(*gwaaddr*) GAL(*gwalen*).**

**Explanation**

CICS® SEND exit (XZCOUT) for ETE™ support is enabled where GA represents the address of the global work area, and GAL represents the length of the global work area.

**System action**

None.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0221: ETE™ SUPPORT IN CICS® ADDRESS SPACE (*asid*) IS DISABLED**

**Explanation**

CICS® SEND exit (XZCOUT) for ETE™ support is disabled.

**System action**

None.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**ETE0222: INVALID PARAMETER FOR KETX TRANSACTION IN CICS® ADDRESS SPACE (*asid*). SPECIFY ENABLE, DISABLE, OR STATUS.**

**Explanation**

User entered KETX with unrecognized parameter. The only supported parameters for this transaction are ENABLE, DISABLE, and STATUS.

**System action**

Transaction is ignored.

**User response**

Reenter transaction with correct parameter.

**ETE0223: ENABLING OF ETE™ SUPPORT IN CICS® ADDRESS SPACE (*asid*) HAS FAILED. RC(*xxxx*).**

**Explanation**

Error occurred during exit enable process. RC represents EIBRCODE value after CICS® ENABLE command, which is documented in the CICS® documentation set.

**System action**

CICS® SEND exit is not enabled.

**User response**

Consult CICS® documentation or notify your CICS® administrator. If the problem persists, contact IBM® Software Support.

**ETE0224: DISABLING OF ETE™ SUPPORT IN CICS® ADDRESS SPACE (*asid*) HAS FAILED. RC(*xxxx*).**

**Explanation**

Error occurred during exit disable process. RC represents EIBRCODE value after CICS® DISABLE command, which is documented in the CICS® documentation set.

**System action**

CICS® SEND exit is not disabled.

**User response**

Consult CICS® documentation or notify your CICS® administrator. If the problem persists, contact IBM® Software Support.

**ETE0225: ERROR WHEN EXTRACTING STATUS OF KETXCOUN EXIT IN CICS® ADDRESS SPACE (*asid*). RC(*xxxx*).**

**Explanation**

Error occurred during extraction of the status of ETE™ support in CICS®. RC represents EIBRCODE value after CICS® EXTRACT command, which is documented in the CICS® documentation set.

**System action**

None.

**User response**

Consult CICS® documentation or notify your CICS® administrator. If the problem persists, contact IBM® Software Support.

**ETE0226: ERROR IN CIHT PARAMETER SPECIFICATION****Explanation**

An invalid CIHT size value was entered in the PARM field on the EXEC statement in the ETE™ startup JCL.

**System action**

ETE™ address space initialization continues. The default CIHT size is used.

**User response**

Specify correct value for CIHT size and restart ETE™ if the default size is not sufficient.

**ETE0227: SHUTDOWN CANNOT BE COMPLETED. DISABLE ETE™ SUPPORT IN EVERY CICS® ADDRESS SPACE. THEN REPLY 'Y' TO SHUTDOWN.****Explanation**

ETE™ shutdown routine detected that some CICS® address spaces did not free ETE™ resources at the request of ETE™. This abnormal situation can happen if a CICS® address space with enabled ETE™ support abended.

**System action**

Waits for operator reply.

**User response**

Use CICS® transaction KETX DISABLE in every CICS® address space to disable ETE™ support. Then reply Y to allow ETE™ to terminate. If there are other active ETE™ address spaces, shut them down before disabling ETE™ support in the CICS® address spaces.

**ETE0228: CIHT GETMAIN FAILURE****Explanation**

GETMAIN for common storage above 16M failed.

**System action**

ETE™ address space and subsystem initialization is aborted.

**User response**

Contact IBM® Software Support.

**ETE0229: *xxxxxxxx xxxxxxxx xxxxxxxx xxxxxxxx*****Explanation**

Output display at initiating terminal and at master console from CICS® transaction KETX DIAGNOSE. The four hexadecimal values displayed are for diagnostic purposes only.

**System action**

None.

**User response**

Give values to IBM® Software Support if requested.

**ETE0230: ENABLING OF ETE™ SUPPORT IN CICS® ADDRESS SPACE (*asid*) HAS FAILED. CICS® RELEASE *nn* IS NOT SUPPORTED.**

**Explanation**

ETE™ does not currently support CICS® release *nn*.

**System action**

CICS® SEND exit is not enabled.

**User response**

Contact IBM® Software Support.

**ETE0910: EPILOG® IMS™ COLLECTOR FAILED TO OBTAIN TRANSACTION STATISTICS CELL**

**Explanation**

The RTXU collector called the MVS GETCELL service to obtain a cell in which to store data. The GETCELL routine returned a nonzero return code.

**System action**

The EPILOG® collector terminates with a U0150 abend.

**User response**

Restart the EPILOG® collector and see if it recurs. If the message persists, call IBM® Software Support.

**ETE0920: EPILOG/IMS TRANSACTION STATISTICS RECORD IS TRUNCATED**

**Explanation**

The VSAM record being written is longer than the maximum VSAM record length specified.

**System action**

Processing continues.

**User response**

Redefine the EPILOG® data store with a larger record length. See the product installation documentation for details.

**ETE093: VCHT GETMAIN FAILURE**

**Explanation**

The ETE™ address space startup task could not obtain storage for the VCHT table from private virtual storage below the 16M line. The default REGION size value of your data center or the REGION size specified on the ETE™ start up task JCL may be insufficient.

**System action**

The ETE™ address space terminates.

**User response**

Increase the REGION size and restart the ETE™ address space.

## IA messages

Messages that begin with the IA prefix are associated with Classic OMEGAMON® components.

### **IA0001: INVALID DELIMITER**

#### **Explanation**

The IANL command was entered with incorrect syntax.

#### **System action**

The command is commented out.

#### **User response**

Correct the syntax error and re-enter the command.

### **IA0002: WORKLOAD NAME MUST BE 8 CHARACTERS OR LESS**

#### **Explanation**

A workload name exceeding eight characters was entered.

#### **System action**

The command is commented out.

#### **User response**

Correct the workload name and re-enter the command.

### **IA0003: VALID FORMATS ARE: workload,LIST workload,DELETE GROUP,LIST**

#### **Explanation**

Review the appropriate explanation for your product.

#### **OMEGAMON II for CICS**

The IANL LIST or the DELETE command was entered with incorrect syntax.

#### **All other products**

User entered an IANL command with incorrect usage of the comma. Correct syntax is displayed.

#### **System action**

The command is commented out.

#### **User response**

Correct the syntax error and re-enter the command.

### **IA0004: VALID FORMATS ARE: GROUP=*groupname* PG=*nnnn* (\* not applicable to OMEGAMON II for CICS) LIST=ALL**

#### **Explanation**

An IANL command was entered with incorrect use of the equal sign. The correct syntax is displayed.

#### **System action**

The command is commented out.

**User response**

Correct the syntax error and re-enter the command.

**IA0005: PERFORMANCE GROUPS MUST BE SPECIFIED BY NUMBER****Explanation**

User attempted to select a performance group as a monitored workload (using the PG=performance group command) but entered a non-numeric name for the performance group. The performance group must be specified by number.

**System action**

Command is commented out.

**User response**

Correct the syntax error and re-enter the command.

**IA0006: GROUP NAMES CANNOT BE NUMERIC****Explanation**

The user attempted to select a group workload to be monitored (using the GROUP={Groupname} command), but entered a numeric name for the group. The group workload must be specified by a non-numeric name.

**System action**

The command is commented out.

**User response**

Correct the syntax error and re-enter the command.

**IA0007: VALID FORMAT FOR LIST IS: cccccccc****Explanation**

The IANL LIST command was entered incorrectly.

**System action**

The command is commented out and a model of the correct syntax is shown.

**User response**

Correct the syntax error and re-enter the command.

**IA0008: FORMAT FOR DEFINING A GROUP IS:****Explanation**

GROUP=Groupname=(Member1,Member2,...)

**Explanation**

The user attempted to define a group workload, but did not use the correct syntax.

**System action**

The command is commented out and a model of the correct syntax is shown.

**User response**

Correct the syntax error and re-enter the command.

## **IA0009: GROUPS CANNOT CONTAIN BOTH TASK NAMES AND PG NUMBERS**

### **Explanation**

The user attempted to define a group workload, but mixed task names and PG numbers in the member list.

### **System action**

The command is commented out.

### **User response**

Correct the syntax error and re-enter the command.

## **IA0010: GROUP MEMBER NAMES MUST BE 1 TO 8 CHARACTERS**

### **Explanation**

The user attempted to define a group workload, but entered a member name greater than eight characters. The correct syntax is: `GROUP=Groupname=(member list)`.

### **System action**

The command is commented out.

### **User response**

Correct the syntax error and re-enter the command.

## **IA0011: GROUP (*name*) IS NOT DEFINED**

### **Explanation**

The user attempted to select a group workload to be monitored (using the command `IANL GROUP=Groupname`), but the group has not been defined.

### **System action**

The command is ignored.

### **User response**

Define the group workload using the command `GROUP=Groupname=(member list)` and re-enter the group selection command.

## **IA0012: VALID PREFIXES FOR IANL COMMAND ARE: S - Summary level display D - Detail level display**

### **Explanation**

The IANL command was entered with an invalid prefix.

### **System action**

The command is ignored.

### **User response**

Correct the syntax and re-enter the command.

## **IA0013: VALID SUFFIXES FOR IANL COMMAND ARE: P - Show impactors by Performance group PD - Show impactors by Performance group detailed by job**

### **Explanation**

The IANL command was entered with an invalid suffix.

### **System action**

The command is ignored.

### **User response**

Correct the syntax and re-enter the command.

## **IA0014: GROUPS MUST CONTAIN AT LEAST 1 MEMBER**

### **Explanation**

The user attempted to define a group workload, but did not include any members in the member list. The correct syntax is: GROUP=*Groupname*=(*member list*).

### **System action**

The command is commented out.

### **User response**

Correct the syntax error and re-enter the command.

## **IA0015: MAXIMUM NUMBER OF CONTENTION ANALYSES IS 5**

### **Explanation**

The user attempted to set the number of workloads to be monitored at more than five. The maximum number of workloads to be monitored is five.

### **System action**

The IANC command is rejected and commented out.

### **User response**

Review the appropriate user response for your product.

### **OMEGAMON II for CICS**

Enter a number from 1 to 5.

### **All other products**

None.

## **IA0100: COLLECTOR HAS NOT BEEN STARTED**

### **Explanation**

Certain commands require active data collection when they are issued. Such a command was entered before data collection was started.

### **System action**

The command is ignored.

### **User response**

Start data collection and re-enter the command.

## **IA0101: COMMAND NOT VALID ONCE COLLECTOR STARTED**

### **Explanation**

Certain commands (such as IANQ, which changes the enqueue sampling interval, and IANC, which sets the number of workloads that can be monitored) require that data collection be stopped when they are issued. Such a command was entered while data collection was active.

### **System action**

The command is ignored.

### **User response**

Stop data collection and re-enter the command.

## **IA0102: ENTRY NOT FOUND**

### **Explanation**

The IANL LIST or DELETE command was entered for a workload that was not being monitored.

### **System action**

The command is ignored and commented out.

### **User response**

Correct the workload name and re-enter the command.

## **IA0103: NO ROOM IN TABLE TO ADD ENTRY**

### **Explanation**

The user attempted to start monitoring a workload and exceeded the maximum number of workloads that can be monitored.

### **System action**

The command is ignored.

### **User response**

Delete a workload from monitoring or increase the maximum number of workloads with the IANC command.

## **IA0104: COLLECTOR HAS ABENDED**

### **Explanation**

The collector module has abended, and therefore the workloads under analysis are no longer being monitored.

### **System action**

Diagnostic information is displayed.

### **User response**

Log the diagnostic information; issue the MOD command and log the additional diagnostic information; exit using the IANL END command; contact IBM Software Support. For a definition of the user ABEND codes, see the EB, EP, and EU Abend Codes appendix.

## **IA0105: JOB HAS ENDED**

### **Explanation**

Review the appropriate explanation for your product.

### **OMEGAMON II for CICS**

Impact analysis (OMEGAMON II for Db2) is not monitoring the workload because the workload is no longer running.

### **All other products**

Monitoring of the workload has stopped because the workload is no longer running.

### **System action**

The command is commented out.

### **User response**

None.

## **IA0109: NO MORE THAN 5 SHORT TERM INTERVALS PER LONG TERM INTERVAL**

### **Explanation**

The user attempted to define the long-term interval but entered a number larger than five.

### **System action**

The IACL command is rejected.

### **User response**

Correct the entry and re-enter the command.

## **IA0110: JOB IS NOT A CICS® REGION**

### **Explanation**

The monitoring of a job was requested for a region that is not in CICS®.

### **System action**

The command is ignored.

### **User response**

Re-enter the command with a CICS® job.

## **IA0111: AT® LEAST ONE MEMBER IS NOT A CICS® REGION**

### **Explanation**

The group was monitored, but one or more group members may be incorrect.

### **System action**

None.

### **User response**

Verify that all group members are correct.

## **IA0112: INTERNAL ERROR IN CVAL ROUTINE**

### **Explanation**

This message is the result of an internal error or the corruption of virtual storage.

### **System action**

OMEGAMON II for Db2 attempts to continue command processing.

### **User response**

Contact IBM Software Support.

## **IA0113: MAXIMUM VALUE IS 10**

### **Explanation**

The user attempted to set the value of the enqueue sampling interval (which is defined by multiples of the normal sampling interval) but entered a value greater than 10. (Such values result in a sampling interval that is too infrequent to be significant.) The maximum number of intervals is 10.

### **System action**

The IANQ command is rejected and commented out.

### **User response**

Correct the entry and re-enter the command.

## **IA0200: COLLECTOR HAS ENDED**

### **Explanation**

The data collector stopped in response to a user command.

### **System action**

Review the appropriate system action for your product.

### **OMEGAMON II for CICS**

OMEGAMON II for Db2 processes the command, and comments it out.

### **All other products**

Command is accepted and commented out.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **IA0201: WORKLOAD HAS BEEN ADDED**

### **Explanation**

Monitoring of the workload has begun.

### **System action**

None.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **IA0202: WORKLOAD HAS BEEN DELETED**

### **Explanation**

The workload has been deleted in response to a user command.

### **System action**

Review the appropriate system action for your product.

### **OMEGAMON II for CICS**

OMEGAMON II for Db2 processes the command, and comments it out.

### **All other products**

Command is accepted and commented out.

### **User response**

None.

## **IA0203: LONG TERM DISPLAY WILL REPRESENT *nn* SHORT-TERM INTERVALS**

### **Explanation**

Informs the user of the long term interval.

### **System action**

The IACL command is accepted and commented out.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **IA0204: SHORT TERM DISPLAY WILL BE CLEARED EVERY *nn* MINUTES**

### **Explanation**

Informs the user of the short-term interval.

### **System action**

The IACS command is accepted and commented out.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **IA0205: THE DATA COLLECTOR SAMPLE TIME = *n.n* SECONDS**

### **Explanation**

Informs the user of the sampling interval (in seconds).

### **System action**

The IAST command is accepted and commented out.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **IA0206: PLOT PERCENTAGE THRESHOLD IS *nn*%**

### **Explanation**

Informs the user of the plot threshold. (Contending workloads comprising less than *nn*% of the contention will not be displayed).

### **System action**

The command is accepted.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **IA0207: IA TO SUPPORT UP TO *n* CONTENTION ANALYSES**

### **Explanation**

Informs the user of the maximum number of workloads that can be monitored.

### **System action**

The IANC command is accepted and commented out.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **IA0208: ENQUEUE DATA COLLECTION ENABLED/DISABLED {CYCLE = *nn*}**

### **Explanation**

Informs the user whether enqueue data collection is enabled or disabled. If enqueue collection is enabled, the message also shows the frequency with which enqueue data is collected (as a multiple of sampling intervals).

### **System action**

The IANQ command is accepted and commented out.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **IA0209: GROUP HAS BEEN DEFINED**

### **Explanation**

The user successfully defined a group workload.

### **System action**

The command is commented out.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **IA0215: NO WORKLOADS UNDER ANALYSIS**

### **Explanation**

The user entered the IANL LIST=ALL command but all workloads have been deleted from analysis. (The collector is still running.)

### **System action**

None.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **IA0216: NO GROUPS ARE DEFINED**

### **Explanation**

The user entered the command IANL GROUP,LIST but no group workloads have been defined. (The collector is still running.)

### **System action**

None.

### **User response**

Review the appropriate user response for your product.

#### **OMEGAMON II for CICS**

Define the workloads and restart.

#### **All other products**

None.

## **IA0217: IA COLLECTION TASK TIMES OUT AFTER n MINUTES**

### **Explanation**

Informs the user of the current time-out interval. If the time-out facility has been turned off, the message is **IA COLLECTION TASK WILL NOT TIME OUT**.

### **System action**

The IATO command is accepted.

### **User response**

None.

## **IA0301: PERFORMANCE GROUP OPERANDS UNACCEPTABLE IN GOAL MODE**

### **Explanation**

Performance group information is not available under the Work Load Manager goal mode.

### **System action**

The command terminates.

## IN messages

Messages that begin with the IN prefix are associated with Classic OMEGAMON® components.

### **IN0004: THE KEYWORD FLAGGED ABOVE IS UNKNOWN**

#### **Explanation**

A keyword operand was misspelled or is not valid on this command.

#### **System action**

The command does not execute.

#### **User response**

Correct the command and re-enter.

### **IN0005: PARAMETER WAS EXPECTED BUT NOT FOUND**

#### **Explanation**

A keyword with a parameter list was specified, but the parameter list did not contain enough parameters.

#### **System action**

The command does not execute.

#### **User response**

Correct the command and re-enter.

### **IN0006: THIS PARAMETER MUST BE NUMERIC**

#### **Explanation**

A parameter was specified which must be numeric but is not.

#### **System action**

The command does not execute.

#### **User response**

Correct the command and re-enter.

### **IN0007: ')' MISSING AFTER FIRST PARAMETER**

#### **Explanation**

A ')' was expected after the first parameter and was not found.

#### **System action**

The command does not execute.

#### **User response**

Correct the command format and retry.

## **IN0050: *data set name* FAILED TO ALLOCATE**

### **Explanation**

An error occurred during dynamic allocation of the data set name specified in the MLIB DSN list.

### **System action**

The command continues if there are other data set names in the MLIB DSN list.

### **User response**

Check the reason for the dynamic allocation error and correct accordingly. Message IN0051 might accompany this message.

## **IN0051: DAIR CODE = *rc***

### **Explanation**

The Dynamic Allocation Interface Routine (DAIR) return code is displayed.

### **System action**

Same as message IN0050.

### **User response**

Same as message IN0050.

## **IN0060: *data set name* FAILS MLIB REQUIREMENTS**

### **Explanation**

The data set failed the MLIB requirement because it neither has a Format 1 DSCB nor is in a load module format. Message IN0061 or IN0062 gives more information on the error.

### **System action**

The command continues if there are other data set names in the MLIB DSN list.

### **User response**

Make sure the correct data set name was specified.

## **IN0061: DATA SET IS NOT LOAD MODULE FORMAT**

### **Explanation**

The MLIB failure was due to the data set not being in a load module format.

### **System action**

The command continues if there are other data set names in the MLIB DSN list.

### **User response**

Only load data sets can be specified on the MLIB command.

## **IN0062: FORMAT1 DSCB COULD NOT BE LOCATED**

### **Explanation**

The data set specified in message IN0060 was not found.

**System action**

The command continues if there are other data set names in the MLIB DSN list.

**User response**

Make sure that the data set exists on the volume as indicated by the system catalog and retry the command.

**IN0070: *data set name* FAILED TO OPEN****Explanation**

The OPEN failed for the data set.

**System action**

The command continues if there are other data set names in the MLIB DSN list.

**User response**

Make sure that OMEGAMON is authorized to use the specified data set.

**IN0080: *data set name* IS NOT OPEN****Explanation**

OMEGAMON tried to close a data set that was not open.

**System action**

CLOSE processing continues for remaining data sets.

**User response**

Call IBM Software Support for assistance.

**IN0081: *data set name* FAILED TO CLOSE****Explanation**

The data set cannot be closed.

**System action**

CLOSE processing continues for the remaining data sets.

**User response**

Investigate why the data set failed to close. If necessary, call IBM Software Support for assistance.

**IN0082: *data set name* FAILED TO DE-ALLOCATE****Explanation**

The data set cannot be de-allocated.

**System action**

Deallocate processing continues for remaining data sets.

**User response**

Investigate why the data set failed to de-allocate by examining the accompanying DAIR code in message IN0083.

### **IN0083: DAIR CODE = rc**

#### **Explanation**

The Dynamic Allocation Interface Routine (DAIR) return code is displayed with message IN0082.

#### **System action**

See message IN0082.

#### **User response**

Refer to the appropriate IBM® manual for a description of the return codes.

### **IN0090: ADD AND DEL MUST NOT BE ISSUED TOGETHER**

#### **Explanation**

The ADD and DEL parameters cannot be issued together in the same MLIB command.

#### **System action**

The commands do not execute.

#### **User response**

Issue ADD and DEL separately.

### **IN0091: *data set name* IS NOT IN THE MLIB DSN LIST**

#### **Explanation**

The data set specified with the delete option of the MLIB minor of INSP was not found in the MLIB list because it was never added or was already deleted.

#### **System action**

The operation is ignored.

#### **User response**

Specify the correct data set name for the delete.

### **IN0092: PREVIOUS LINE WAS TRUNCATED**

#### **Explanation**

The previous display line has been truncated because the line length was exceeded.

#### **System action**

None.

#### **User response**

None.

### **IN0100: cccccc HAS A HIGHER PRIORITY THAN OMEGAMON**

#### **Explanation**

The address space dispatching priority of job cccccc, which is being monitored by INSP, is running at a higher priority than OMEGAMON. This is the jobname specified by the JOB() keyword.

**System action**

INSP attempts to take samples, but will probably detect very little activity in the monitored address space. Any results are incorrect.

**User response**

Run OMEGAMON as a performance group which has a higher priority than the address space being monitored.

**IN0101: cccccc IS NO LONGER RUNNING****Explanation**

INSP was monitoring an address space when the jobname cccccc changed. cccccc is the name specified by the JOB() keyword.

**System action**

Sampling terminates.

**User response**

If you want more data, rerun the job and use a shorter sampling period.

**IN0102: START INVALID, ALREADY SAMPLING****Explanation**

The START keyword was specified on the INSP command when sampling of the target address space was already in progress.

**System action**

The START keyword is ignored.

**User response**

None required.

**IN0103: STOP INVALID, NOT SAMPLING****Explanation**

The STOP keyword was specified on the INSP command when sampling of the target address space was not in progress.

**System action**

The STOP keyword is ignored.

**User response**

None required.

**IN0104: ATTACH FAILED****Explanation**

This is an internal error message.

**System action**

Sampling does not start.

**User response**

Call IBM Software Support for assistance.

**IN0105: ccccccc NOT FOUND****Explanation**

No job with the name ccccccc specified is currently active. <jobname> is the name specified by the JOB() keyword.

**System action**

The new jobname specification is not used.

**User response**

Use the JOB() keyword to specify the name of a running job. If necessary, use OMEGAMON commands such as ALLJ to determine a valid jobname.

**IN0106: SAMPLER TASK HAS ABENDED****Explanation**

This is an internal error message.

**System action**

Sampling terminates and diagnostic information appears.

**User response**

Record the diagnostic information and call IBM Software Support.

**IN0900: \$GMEM FAILED FOR INSP WORKAREA****Explanation**

OMEGAMON was unable to obtain memory for the INSP workarea.

**System action**

The command does not execute.

**User response**

Increase the OMEGAMON® region size to correct the problem.

**IN0901: RETURN CODE *rc* FROM OMPBM INITIALIZATION****Explanation**

An error occurred during INSP initialization.

**System action**

The command does not execute.

**User response**

Call IBM Software Support for assistance.

## **IN0902: INSPECT REQUIRES DEXAN®**

### **Explanation**

To run INSP, the DEXAN® product is required.

### **System action**

The command does not execute.

### **User response**

None.

## **IN0903: LOAD MACRO FAILED FOR OMPBM WITH ABEND=*nnn***

### **Explanation**

INSP module OMPBM could not be loaded.

### **System action**

The command does not execute.

### **User response**

Refer to the IBM® system codes manual for an explanation of the abend code.

## **IN0904: INSPECT ERROR CODE *nn***

### **Explanation**

An internal error occurred on the INSP command. The error code is *nn*.

### **System action**

The command does not execute.

### **User response**

Call IBM Software Support for assistance.

## **KBB messages**

Messages that begin with the KBB prefix are associated with the Tivoli® Management Services: Engine (TMS:Engine) component.

## **KBBCM001: COM1ERROR:*rtncd1, rtncd2, rcpri, rcsec, snsi, rplreq, qualify, rpl6what, luname, mode, convid***

### **Explanation**

An APPCCMD command was not completed by VTAM®, or VTAM® conditionally completed the command. This data is displayed:

- *rtncd1*: The general return code provided in R15.
- *rtncd2*: The conditional completion return code or recovery action return code provided in R0.
- *rcpri*: The primary extended return code.
- *rcsec*: The secondary extended return code.
- *snsi*: The inbound sense data.

- *rplrpq*: The APPCCMD CONTROL= value.
- *qualify*: The APPCCMD QUALIFY= value.
- *rpl6what*: The VTAM® what data received flag.
- *luname*: The destination logical unit name.
- *mode*: The associated logmode.
- *convld*: The conversation id created by VTAM®.

### System action

Depends on the error. The request may continue processing or may be terminated by VTAM®.

### User response

If *rtncd1* is 0 and *rtncd2* is B, conditional completion is indicated for the APPCCMD command. This may or may not indicate an error. The *rcpri* and *rcsec* must then be checked to determine if an error occurred. A *rcpri* value of zero indicates that no error occurred. The *rcsec* field contains a non-zero value that contains the information about the processing of the macro. For example, a successful CNOS request may complete without error, but be negotiated by the partner LU. In such cases *rcsec* is set to X'2' to indicate that negotiation took place.

A non-zero value for *rcpri* indicates abnormal completion of an APPCCMD macro. The *rcpri* and *rcsec* fields contain the information needed to determine the error.

If *rtncd1* has a value greater than zero (usually X4), then that indicates a logic error in the application.

Refer to *z/OS® Communications Server SNA Programmer's LU 6.2 Guide* for an explanation of the values and codes displayed in the KBBM001 message, and recommended actions.

## KCN messages

The messages that begin with the KCN prefix are associated with OMNIMON Base.

Return codes associated with these messages can be found in [“z/OS status codes and return codes” on page 2412](#).

### KCNCA001E: UNABLE TO OBTAIN PRIVATE STORAGE, COUPLING FACILITY COLLECTION NOT AVAILABLE

#### Explanation

This message comes from the OMEGAMON® Subsystem attached subtask designed to issue IXCQUERY requests for CF\_ALLDATA and STR\_ALLDATA information (KCNCFAT). It indicates that working storage for this subtask cannot be obtained. Data collection is terminated.

#### System action

None.

#### User response

Recycle the OMEGAMON® Subsystem associated with this message. If the problem persists, call IBM® Software Support for further assistance.

### KCNCA002E: SUBTASK PARMS INVALID, COLLECTION TERMINATED

#### Explanation

This message comes from the OMEGAMON® Subsystem attached subtask designed to issue IXCQUERY requests for CF\_ALLDATA and STR\_ALLDATA information (KCNCFAT). A parameter area passed to the collection subtask does not have the correct identification text (eyecatcher). The subtask must assume the parameters area has been corrupted. Data collection is terminated.

**System action**

None.

**User response**

Recycle the OMEGAMON® Subsystem associated with this message. If the problem persists, call IBM® Software Support for further assistance.

**KCNCA003E: IXCQUERY XXX\_ALLDATA FAILED  
RC(XXXXXXXX),REASON(XXXXXXXX)****Explanation**

This message comes from the OMEGAMON® Subsystem attached subtask designed to issue IXCQUERY requests for CF\_ALLDATA and STR\_ALLDATA information (KCNCFAT). The XXX in “XXX\_ALLDATA” may be either STR or CF. This message indicates that a severe error occurred while trying to get IXCQUERY data. The return code (RC) and reason code (REASON) from the attempt are documented and can be found in the *IBM® z/OS® MVS™ Programming Sysplex Services Reference* for Return and Reason Codes for IXCQUERY. This message may appear up to 6 times if the problem persists. After 6 attempts the OMEGAMON® Subsystem will stop trying to get this data.

**System action**

None.

**User response**

Verify that the authorized OMEGAMON® Subsystem is running and that the Coupling Facility Resource Management (CFRM) data set is accessible from this LPAR. If the problem persists, call IBM® Software Support for further assistance. If it is running and the problem persists, contact IBM® Software Support for further assistance.

**KCNCA004E: UNABLE TO OBTAIN LARGER XXX\_ALLDATA ANSWER AREA,  
SIZE(XXXXXXXX). COLLECTION NOT AVAILABLE****Explanation**

This message comes from the OMEGAMON® Subsystem attached subtask designed to issue IXCQUERY requests for CF\_ALLDATA and STR\_ALLDATA information (KCNCFAT). The XXX in “XXX\_ALLDATA” may be either STR or CF. The value following SIZE is the storage area size, in hexadecimal, that is needed. Subtask collection is terminated.

**System action**

None.

**User response**

Recycle the OMEGAMON® Subsystem associated with this message. If the problem persists, call IBM® Software Support for further assistance.

**KCNCI001E: UNABLE TO OBTAIN PRIVATE STORAGE, COUPLING FACILITY  
COLLECTION NOT AVAILABLE.****Explanation**

This message comes from the main module supporting Coupling Facility data collection in the OMEGAMON® Subsystem (KCNCFIN). Work area storage for this module could not be obtained. The module is terminating and will not be available to support Coupling Facility collection.

**System action**

None.

**User response**

Recycle the OMEGAMON® Subsystem associated with this message. If the message is seen again, call IBM® Software Support for further assistance.

**KCNCI002W: COUPLING FACILITY DATA COLLECTION SUBTASK TERMINATED UNEXPECTEDLY.****Explanation**

This message comes from the main module supporting Coupling Facility data collection in the OMEGAMON® Subsystem (KCNCFIN). The collection subtask terminated unexpectedly.

**System action**

None.

**User response**

None. If this message appears frequently, call IBM® Software Support for further assistance.

**KCNCI003E: COUPLING FACILITY DATA COLLECTION SUBTASK START FAILED, RELINQUISHING COLLECTOR STATUS****Explanation**

This message comes from the main module supporting Coupling Facility data collection in the OMEGAMON® Subsystem (KCNCFIN). The collection subtask attach failed. This address space will stop trying to collect Coupling Facility data. It will participate as a receiver when another OMEGAMON® Subsystem takes over the collection function.

**System action**

None.

**User response**

None. If this message appears frequently, call IBM® Software Support for further assistance.

**KCNCI004E: ERROR: KCNDLCF FUNCTION PARMS NOT FOUND****Explanation**

This message comes from the main module supporting Coupling Facility data collection in the OMEGAMON® Subsystem (KCNCFIN). This is a severe internal error for this function and it cannot continue.

**System action**

None.

**User response**

Recycle the OMEGAMON® Subsystem associated with this message. If this message appears again, call IBM® Software Support for further assistance.

**KCNCI005I: COUPLING FACILITY COLLECTOR SUBTASK STARTED****Explanation**

This message comes from the main module supporting Coupling Facility data collection in the OMEGAMON® Subsystem (KCNCFIN). It indicates that this OMEGAMON® Subsystem is collecting Coupling Facility data for the Sysplex.

**System action**

None.

**User response**

None. This is an informational message.

**KCNCI006W: COUPLING FACILITY COLLECTOR STARTING LOCAL COLLECTION****Explanation**

This message comes from the main module supporting Coupling Facility data collection in the OMEGAMON® Subsystem (KCNCFIN). The OMEGAMON® Subsystem associated with this message has stopped receiving coupling facility data from the Sysplex collector. It has started collecting data itself for the OMEGAMON® products on this system image.

**System action**

None.

**User response**

This message may appear occasionally if the XCF message processing facility is heavily burdened, or if the collecting OMEGAMON® Subsystem has stalled or failed. If neither message KCNCI007W nor message KCNCI008W is seen shortly, try cancelling the last known collecting OMEGAMON® Subsystem (see message KCNCI005I). If the problem persists, call IBM® Software Support for further assistance.

**KCNCI007I: COUPLING FACILITY COLLECTOR RESUMING PLEX RECEPTION****Explanation**

This message comes from the main module supporting Coupling Facility data collection in the OMEGAMON® Subsystem (KCNCFIN). This message indicates that the problem, which caused message KCNCI006W to appear, has been resolved. Another OMEGAMON® Subsystem has begun sending Coupling Facility data and this address space is receiving that data.

**System action**

None.

**User response**

None. This message indicates that a problem state has been resolved. It may also indicate that one of the OMEGAMON® Subsystems in the Sysplex has failed and some action should be taken for that address space.

**KCNCI008I: COUPLING FACILITY COLLECTOR RESUMING PLEX COLLECTION****Explanation**

This message comes from the main module supporting Coupling Facility data collection in the OMEGAMON® Subsystem (KCNCFIN). This message indicates that the problem, which caused message KCNCI006W to appear, has been resolved. This OMEGAMON® Subsystem has begun collecting Coupling Facility data and is sending data to other OMEGAMON® Subsystems in its XCF group.

**System action**

None.

**KCNCI009E: ERROR JOINING XCF GROUP TYPE=XXXXXXXXXXXXXXXXXX.  
FUNCTION TERMINATING.**

**Explanation**

This message comes from the main module supporting Coupling Facility data collection in the OMEGAMON® Subsystem (KCNCFIN). The Coupling Facility collection function tried to join the XCF group to determine the identity of other group members. A problem occurred while trying to perform this task. The specific condition is given by the text following the **TYPE=** phrase, where XXXXXXXXXXXXXXXXXXXX is:

- QUERY GROUP RC>4: the IXCQUERY for group information ended with a return code greater than 4
- QUERY GROUP NOT4: the IXCQUERY for group information ended with a return code 4 but the reason code was not also 4. When both return and reason codes are 4, it is just a matter of resizing the answer area. Otherwise, some serious error has occurred.
- QUERY GROUP LNG< – :the IXCQUERY for group information ended with indication that we should resize. However, the buffer area we used is already big enough for the complete data. This contradiction cannot be resolved.
- QUERY GROUP REPT: Attempts to resize and get group information have failed repeatedly.
- XCF JOIN FAILED: The IXCJOIN to join the XCF group failed. Check the group name for valid characters.

**System action**

None.

**User response**

Recycle the OMEGAMON® Subsystem associated with this message. If this message appears again, call IBM® Software Support for further assistance.

**KCNCI010I: COUPLING FACILITY COLLECTION PARMS IN EFFECT ARE: XCF  
GROUP NAME=XXXXXXXX ADDRESS=XXXXXXXX REFRESH INTERV=XXXXXXXX  
ADDRESS=XXXXXXXX WTO MESSAGES=XXXXX ADDRESS=XXXXXXXX PLEX  
COLLECT=XXX ADDRESS=XXXXXXXX**

**Explanation**

This message comes from the main module supporting Coupling Facility data collection in the OMEGAMON® Subsystem (KCNCFIN). This message documents the collection parameters in effect for this address space, as follows:

- XCF Group Name – specifies the XCF group name we are using to pass Coupling Facility data from the collecting OMEGAMON® Subsystem to the receiving OMEGAMON® Subsystems. The name must be common to all participating OMEGAMON® Subsystems in the Sysplex. The name should be unique from any other XCF group names used in this Sysplex.
- REFRESH INTERV – shows the refresh interval in effect. The value is in seconds. This interval tells you how frequently we are refreshing Coupling Facility data in this address space. All OMEGAMON® Subsystems that are part of the same XCF group should have the same refresh interval.
- WTO MESSAGES – indicates the level of message logging used. There are 3 levels:
  - NO – no messages at all
  - ERROR – error, warning and informational messages that give key status indications for the service. ERROR is the default.
  - ALL – full debugging level messages. This should be used only with IBM® Software Support involvement. The message volume can be extensive.
- PLEX COLLECT – specifies whether or not this address space may become the collector for this Sysplex. There are 2 values:

- YES indicates that this OMEGAMON® Subsystem may become the Coupling Facility data collector for this Sysplex. Only one OMEGAMON® Subsystem at a time is the collector. OMEGAMON® Subsystems with this value may take over data collection should the current collector fail or be terminated. YES is the default.
- NO indicates that this OMEGAMON® Subsystem may not become the collector for this Sysplex. This OMEGAMON® Subsystem may initiate local collection if the Sysplex collector cannot be located.
- ADDRESS – Appended to each parameter, it is the storage location of this parameter within this address space. This value may be helpful for problem resolution efforts.

#### **System action**

None.

#### **User response**

This information documents the settings in use. It may be helpful to compare these to the other OMEGAMON® Subsystems expected to be in the same XCF group for consistency.

### **KCNDR001E: UNABLE TO OBTAIN PRIVATE STORAGE, COUPLING FACILITY COLLECTION NOT AVAILABLE**

#### **Explanation**

This message comes from the client application using the OMEGAMON® Subsystem for Coupling Facility data collection (KCNCFDR). The driver routine that connects to the OMEGAMON® Subsystem cannot obtain working storage. The client will not be able to report on Coupling Facility information.

#### **System action**

None.

#### **User response**

Recycle the client application associated with this message. If the problem persists, call IBM® Software Support for further assistance.

### **KCNDR002W: KXCQUERY HAS RESUMED USING THE OMEGAMON® SUBSYSTEM**

#### **Explanation**

This message comes from the client application using the OMEGAMON® Subsystem for Coupling Facility data collection (KCNCFDR). This application had lost contact with that subsystem but has now regained contact. Processing is continuing normally.

#### **System action**

None.

#### **User response**

None. If this message appears frequently, call IBM® Software Support for further assistance.

### **KCNDR003W: KXCQUERY HAS LOST USE OF THE OMEGAMON® SUBSYSTEM, RESORTING TO LOCAL COLLECTION**

#### **Explanation**

This message comes from the client application using the OMEGAMON® Subsystem for Coupling Facility data collection (KCNCFDR). This application has lost contact with the OMEGAMON® Subsystem. It has begun collection the data itself.

**System action**

None.

**User response**

Recycle the OMEGAMON® Subsystem associated with this application. If message KCNDR002W is not received after several minutes have elapsed, call IBM® Software Support for further assistance.

**KCNDR004W: OMEGAMON SUBSYSTEM REPORTED A COUPLING FACILITY COMMUNICATION ISSUE, SWITCHING TO A LOCAL COLLECTION****Explanation**

This message comes from the client application using the OMEGAMON Subsystem for Coupling Facility data collection (KCNCFDR). This application has communicated with the subsystem, and the subsystem has reported a coupling facility communication failure. The application has begun collecting the data itself.

**System action**

The application has switched to the local mode of data collection, and it will no longer try to communicate with the subsystem. The local collection mode will be used until the application is recycled.

**User response**

No action is required.

**KCNPR001W: COUPLING FACILITY PARMS MAY NOT BE HONORED. RKANPAR FILE BLOCKSIZE IS LESS THAN THE EXPECTED 8880 SIZE. DEFAULTS MAY BE USED.****Explanation**

This message comes from initialization functions in the OMEGAMON® Subsystem (KCNPRSR). Parameters placed by the Configuration tool in the &hilev.RKANPAR data set help control Coupling Facility collection in the OMEGAMON® Subsystem. The parsing code that reads these parameters is expecting the file block size to be the default size of 8880 bytes. This message indicates that the actual file blocksize is smaller than expected and that control parameters may not be properly found as a result. Default values will be used for parameters that are not located.

**System action**

None.

**User response**

Default values for parameters should be reasonable for most users. If the default parameters do not suit local needs, call IBM® Software Support for further assistance. Resizing the RKANPAR file to its standard 8880 size should relieve this problem.

**KCNPR002I: PARMS NOT FOUND. DEFAULTS USED FOR:****Explanation**

This message comes from initialization functions in the OMEGAMON® Subsystem (KCNPRSR). There are parameters placed by the Configuration Software in the &hilev.RKANPARU data set to help control Coupling Facility collection in the OMEGAMON® Subsystem. The parsing code that reads these parameters is expecting values for four keywords:

- XCF=
- REFRESH=
- PLEXCOLLECT=
- KCN\_WTO=

This message documents those values that are not found. Built in defaults will be used for their value.

**System action**

None.

**User response**

None required. If an overriding parameter was specified but not detected, verify that it was spelled correctly, that there are no blanks after the “=” sign, and that the entire KCNSTR00 member is less than 8880 bytes long.

## **KDH messages**

Messages that begin with the KDH prefix are associated with the TMS:Engine.

### **KDHOP001: UNRECOGNIZED SUBCOMMAND: *subcommand***

**Explanation**

The subcommand entered is not recognized.

**System action**

The subcommand is ignored.

**User response**

Check the spelling of the subcommand. Correct and re-enter the subcommand if necessary.

**Message Type**

Error

### **KDHOP002: SERVER NAME OMITTED, REQUIRED**

**Explanation**

The name of the server must be specified on the subcommand, but it was omitted.

**System action**

The subcommand is ignored.

**User response**

Re-enter the subcommand, specifying the server name

**Message Type**

Error

### **KDHOP003: SERVER NOT AVAILABLE: KDH**

**Explanation**

The specified server cannot be contacted.

**System action**

The subcommand is ignored.

**User response**

If the specified server name is correct, try the subcommand later when the server is running.

**Message Type**

Error

**KDHOP004: SERVER STARTED: KDH****Explanation**

The specified server has been started.

**System action**

Processing continues.

**User response**

None

**Message Type**

Info

**KLB messages**

Messages that begin with the KLB prefix are associated with the TMS:Engine.

**KLBIN000: INVALID KLB COMPONENT HEADER: REGID(*hdrlen*)****Explanation**

An error has been detected in the input data to KLB component initialization.

**System action**

Initialization of the KLB component stops.

**User response**

Contact IBM® Software Support.

**Message Type**

Alert

**KLE messages**

The messages that begin with the KLE prefix are associated with the TMS:Engine C language interface.

**KLECF001: LONGJMP ENCOUNTERED UNCROSSABLE BOUNDARY****Explanation**

During LONGJMP processing a condition forbidding the LONGJMP function was detected.

**System action**

The thread is abended.

**User response**

Contact IBM® Software Support with the dump associated with this message.

**Severity**

ABEND

**KLECF002: LONGJMP UNABLE TO LOCATE ENVIRONMENT****Explanation**

During LONGJMP processing it was determined that the LONGJMP environment was no longer intact.

**System action**

The thread is abended.

**User response**

Contact IBM® Software Support with the dump associated with this message.

**Severity**

ABEND

**KLECF003: JMPBDSA IS NULL****Explanation**

During LONGJMP processing it was determined that the LONGJMP buffer chain has been exhausted.

**System action**

The thread is abended.

**User response**

Contact IBM® Software Support with the dump associated with this message.

**Severity**

ABEND

**KLECF011: UNABLE TO ALLOCATE ACB: APPLID(*applid*)****Explanation**

An error occurred while attempting to allocate an ACB for *applid*.

**System action**

The ACB is not allocated.

**User response**

Contact IBM® Software Support.

**Severity**

ERROR

**KLECF012: UNABLE TO OPEN ACB: APPLID(*applid*) REASON(*reason*)****Explanation**

An error occurred while attempting to open an ACB for *applid*. *reason* is the reason code returned from open.

**System action**

The ACB is not opened.

**User response**

The REASON field contains the return code from the OPEN macro instruction. Refer to *IBM® z/OS® Communication Server: SNA Programming* to determine the cause of the error.

**Severity**

ERROR

**KLECF013: APPLICATION *appl* STARTED****Explanation**

Application *appl* was successfully started.

**System action**

None.

**User response**

None.

**Severity**

REPLY, INFO

**KLECF014: APPLICATION *appl* STOPPED****Explanation**

Application *appl* was successfully stopped.

**System action**

None.

**User response**

None.

**Severity**

REPLY, INFO

**KLECF015: DIALOG FUNCTION *function* HAS BEEN DYNAMICALLY REPLACED****Explanation**

A dialog *function* module has been replaced by a new module.

**System action**

None.

**User response**

**KLEIN008: KLEINPRO RKANPAR PARAMETERS:**

**Explanation**

Module KLEINPRO logs its startup parameters as they are read from RKANPAR. This is the header message and will be followed by message KLEIN009.

**System action**

None.

**User response**

None.

**Severity**

LOG

**KLEIN009: parameters**

**Explanation**

As the parameters in module KLEINPRO are read, a log audit trail is created.

**System action**

None.

**User response**

None.

**Severity**

LOG

**KLEIN010: PACKAGE CONTAINS X'10' NON-REENTRANT CONSTRUCTORS:***xxxxxxxx***Explanation**

Informational message issued during TMS:Engine startup while C Language modules are being loaded, where *xxxxxxxx* is the package name.

**System action**

None.

**User response**

None.

**Severity**

INFO

**KLEIN011: ACTION BAR C FUNCTIONS NOT INITIALIZED****Explanation**

The C language action bar initialization routine determined that either the C interface CVT does not exist or the action bar function package could not be found.

**System action**

TMS:Engine initialization is terminated.

**User response**

Save the RKLVLLOG and contact IBM® Software Support with the contents of this message.

**Severity**

INFO

**KLELS000: cccccccc +X'00000000' MADE AN UNSUPPORTED LIBRARY CALL TO nnnnnnnn()****Explanation**

The routine named *cccccccc* at offset *00000000* called a library routine *nnnnnnnn* which is not supported.

**System action**

The routine is terminated abnormally.

**User response**

Contact IBM® Software Support.

**Severity**

Warning

## **KLELS001: UNSUPPORTED KLE LIBRARY CALL**

### **Explanation**

A C language function program made a call to an unsupported module. Message KLELS002 is also issued.

### **System action**

The thread is abended.

### **User response**

Contact IBM® Software Support with the module names shown in message KLELS002.

### **Severity**

ABEND

## **KLELS002: *caller* MADE AN UNSUPPORTED LIBRARY CALL: *nnnn***

### **Explanation**

A C language function program made a call to an unsupported module.

### **System action**

The thread is abended.

### **User response**

Contact IBM® Software Support with the module names shown in this message.

### **Severity**

WARNING

## **KLU messages**

The messages that begin with the KLU prefix are associated with the Tivoli Enterprise™ Monitoring Server on z/OS® or Tivoli® Management Services:Engine (TMS:Engine).

## **KLUAP002: APDSM/ALLOCEAB \$PSM-ALLOCX ERROR**

### **Explanation**

An internal error was detected by TMS:Engine.

### **System action**

TMS:Engine forces an abend with the completion code U0100. The abend is associated with a single TMS:Engine user, whose terminal will hang. System operation for other users will continue normally. A VCANCEL command may be necessary to reinstate the hung user. TMS:Engine automatically writes a formatted dump to the RKLVSnap data set.

### **User response**

Contact IBM® Software Support.

### **Severity**

ABEND

**KLUP003: APDSM DATA STREAM REPROCESSED FOR *session\_id*  
USERID=*userid***

**Explanation**

This error occurred during processing of the application data stream for the specified *session\_id* and *userid*.

**System action**

None.

**User response**

None.

**Severity**

INFO

**KLUDF001: FIELD DATA: *dddddddddddddddddd***

**Explanation**

A VSSDEBUG statement was encountered in a dialog. This message displays the data from a 3270 field.

**System action**

Processing continues.

**User response**

None

**Severity**

INFO

**KLUDF002: FIELD ATTRIBUTE: *xx***

**Explanation**

A VSSDEBUG statement was encountered in a dialog. This message displays the attribute byte from a 3270 field.

**System action**

Processing continues.

**User response**

None

**Severity**

INFO

**KLUDF011: INVALID TRIGGER DEFINITION BLOCK**

**Explanation**

The VSSTRIG function contained an invalid trigger definition block. This is a serious error.

**System action**

The address space terminates.

**User response**

Contact IBM® Software Support.

**Severity**

ABEND

**KLUDF020: rrrrrrrr, VSSINFO 'xxxxxxxxxxxxxxxxxxxx'****Explanation**

A VSSINFO statement was encountered in a dialog but it contains a syntax error indicated by *rrrrrrrr*. The operands on the VSSINFO statement are *xxxxxxxxxxxxxxxxxxxx*.

**System action**

The current dialog is terminated.

**User response**

Edit the dialog and correct the VSSINFO statement.

**Severity**

ABEND

**KLUDF021: option IS NOT A VSSINFO OPTION****Explanation**

The specified option is not valid for the VSSINFO function. FOREGID is currently the only valid option.

**System action**

The current dialog fails.

**User response**

Specify a valid option and retry.

**Severity**

REPLY

**KLUDF022: VSENTRY NOT ISSUED PRIOR TO VSSINFO****Explanation**

A dialog invoked the VSSINFO function before VSENTRY. VSENTRY must be invoked prior to any other VSS function.

**System action**

The current dialog fails.

**User response**

Correct the dialog and retry.

**Severity**

REPLY

## **KLUDF023: FUNCTION VSSDEF INVOKED FROM DIALOG *dialog* IS NO LONGER SUPPORTED**

### **Explanation**

A dialog invoked the VSSDEF function, which is no longer supported.

### **System action**

*dialog* completes with unpredictable results, generating RC=0.

### **User response**

Use VSSALOC instead of VSSDEF and retry.

### **Severity**

LOG

## **KLUGF001: FOREGROUND SET FAILED FOR *userid***

### **Explanation**

Dialog command VSSFOREG failed.

### **System action**

Return code 20 is set for the command.

### **User response**

Retry the command.

### **Severity**

REPLY

## **KLUFT000: VSSFTMGR: DIALOG LOOP DETECTED FOR USER *userid***

### **Explanation**

An error in the controlling dialog causes the dialog to return immediately without moving a session to the foreground.

### **System action**

The user window disappears.

### **User response**

Review the message and correct the controlling dialog. If unable to locate the error, call IBM® Software Support.

### **Severity**

LOG, VIEW

## **KLUFT001: RESOURCE ERROR**

### **Explanation**

An unexpected error has occurred in connection with processing a trigger dialog.

### **System action**

The process is abnormally terminated.

**User response**

Contact IBM® Software Support.

**Severity**

ERROR

**KLUFT002: LOOP AVERTED****Explanation**

An internal error was detected by TMS:Engine.

**System action**

TMS:Engine forces an abend with completion code U0100. The abend is associated with a single TMS:Engine user, whose terminal will hang. System operation for other users will continue normally. TMS:Engine will automatically create a dump.

**User response**

A VCANCEL command may be necessary to reinstate the hung user. Contact IBM® Software Support for help in resolving the error condition or in gathering the problem documentation that IBM® Software Support requires to research the error condition.

**Severity**

ABEND

**KLUFU001: #VSSFUCB ERROR: SESSION STILL ACTIVE****Explanation**

An attempt was made to free a user control block while a session was still active.

**System action**

TMS:Engine takes a diagnostic abend with completion code U0100. The abend is associated with a single TMS:Engine user, whose terminal may hang. A VCANCEL command may be necessary to reinstate the hung user.

**User response**

Contact IBM® Software Support.

**Severity**

ABEND

**KLUFU101: WINDOW INTEGRITY ERROR****Explanation**

An internal error was detected.

**System action**

The user's sessions are terminated.

**Severity**

LOG

**KLUOP001: VSHOW ARGUMENT LIST: argument list****Explanation**

Displays the arguments that were specified for this VSHOW command.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP002: *session (appl, luname, cid, pool, logmode) {TAKEDOWN | SETUP | ACTIVE[-F]} COMPRESSION {nnn% | OFF}*****Explanation**

This reply from the VSHOW command appears if ACTIVE is specified. It follows KLUOP009 and displays information about a virtual session for the user. *session* is the virtual session ID; *applid* is the application name; *luname* is the logical unit name; *cid* is the VTAM® network resource ID; *pool* is the virtual terminal pool name; and *logmode* is the VTAM® logmode.

TAKEDOWN means the session is currently being terminated; SETUP means the session is currently initializing; ACTIVE means the session is active. (-F) is displayed if the session is in the foreground at the user's terminal.

If compression is active, *nnn* displays the percentage of data stream compression; if not active, OFF is shown. The percentage is calculated by:

```
Compression-Percent =
```

PLU-to-SLU-bytes - Term-Update-Bytes  
-----  
PLU-to-SLU-bytes

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP003: PLU ---> SLU: MSGS(*messages*) BYTES(*bytes*)**

**Explanation**

This reply from the VSHOW command appears if STATS is specified. It lists the accumulated number of messages and bytes sent from the primary logical device to the secondary logical device.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP004: SLU ---> PLU: MSGS(*messages*) BYTES(*bytes*)**

**Explanation**

This reply from the VSHOW command follows KLUOP003 and lists the accumulated number of messages and bytes sent from the secondary logical unit to the primary logical unit.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP005: TERM REFRESH: MSGS(*messages*) BYTES(*bytes*)**

**Explanation**

This reply from the VSHOW command follows KLUOP004 and lists the accumulated number of messages and bytes sent to refresh the display on the terminal. A refresh occurs when the user switches between virtual sessions or an asynchronous pop-up is displayed.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP006: TERM UPDATE: MSGS(*messages*) BYTES(*bytes*)****Explanation**

This reply from the VSHOW command follows KLUOP005 and lists the accumulated amount of real traffic to the physical terminal in messages and bytes.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP007: SESSION session INACTIVE****Explanation**

This reply from the VSHOW command appears if INACTIVE is specified. The specified session is currently inactive.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP008: *selected* OF *total* USER(S), *selected* OF *total* SESSION(S)  
SELECTED****Explanation**

This summary message lists the number of users and sessions selected by the VSHOW command options out of the total pool.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP009: *userid*{DISCONNECTED | *userid* (*applid*,*luname*,*cid*)  
ACTIVE [CONNECTED]}**

**Explanation**

This reply from the VSHOW command displays information about a single user. *userid* is the user's ID. CONNECTED and DISCONNECTED indicate whether the user is attached to a terminal. ACTIVE means the user is currently active. *applid* is the application the user has logged onto; *luname* is the logical unit name; *cid* is the VTAM® network resource ID.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP010: TERM INPUT: MSGS(*messages*) BYTES(*bytes*)**

**Explanation**

This reply from the VSHOW command follows KLUOP006 and lists the accumulated number of input messages and bytes received from the physical terminal while it was logically connected to the virtual session.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP011: VCANCEL ARGUMENT LIST: *argument list***

**Explanation**

Displays the arguments that were specified for this VCANCEL command.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP012: VCANCEL - EITHER USER OR ID REQUIRED**

**Explanation**

Either a user ID or a terminal ID must be entered with the VCANCEL command.

**System action**

The VCANCEL request is ignored.

**User response**

Reissue the command with a user ID or terminal ID.

**Severity**

REPLY, ERROR

**KLUOP013: VFORCE - REQUIRES USER=USERID****Explanation**

You must specify a user ID to be forced.

**System action**

The VFORCE command is ignored.

**User response**

Reissue VFORCE with the USER= keyword.

**Severity**

REPLY

**KLUOP014: VFORCE FOR USER *userid* INVALID. FOR CONFERENCE USE CCANCEL****Explanation**

The user you were trying to force is using CL/CONFERENCE®. The VFORCE command will not work until you have used the CL/CONFERENCE® command CCANCEL.

**System action**

The VFORCE command is ignored.

**User response**

Issue CCANCEL to cancel sessions for the CL/CONFERENCE® user, then reissue VFORCE.

**Severity**

REPLY

**KLUOP015: USER *userid* FORCED****Explanation**

The VFORCE command was successful.

**System action**

None.

**User response**

None.

**Severity**

REPLY

## **KLUOP016: USER *userid* NOT FORCED: *reason***

### **Explanation**

The VFORCE command failed for one of the following reasons (which is specified when the message appears):

- **NOT FOUND:** The user ID was not found.
- **VCANCEL TERM NOT ISSUED:** You must issue VCANCEL with the TERM operand before VFORCE.
- **VIRTUAL SESSION(S) FOUND :** VFORCE found one or more virtual sessions and terminated them. Reissue VFORCE.

### **System action**

As noted above.

### **User response**

As noted above.

### **Severity**

REPLY

## **KLUOP017: VCANCEL FOR USER - *userid* MAY FAIL. VIRTUAL SESSIONS HUNG.**

### **Explanation**

This user's virtual sessions are hung.

### **System action**

The system may not respond to the command.

### **User response**

If the system does not respond, wait a few minutes then retry VCANCEL. If VCANCEL does not work, try VFORCE.

### **Severity**

REPLY

## **KLUOP018: *cancelled* OF *total* USER(S), *cancelled* OF *total* SESSION(S) CANCELLED**

### **Explanation**

This message lists the number of users and sessions cancelled by the VCANCEL command out of the total pool.

### **System action**

None.

### **User response**

None.

### **Severity**

REPLY

## **KLUOP019: VFORCE ARGUMENT LIST: *argument list***

### **Explanation**

### **Severity**

REPLY

## **KLUOP020: VSSTRACE(ON | OFF) TRACING(NONE | [*applid*],*luname*)**

### **Explanation**

This reply from the VSHOW command follows KLUOP009 and shows the trace status for the user. It is issued only when ACTIVE was specified. VSSTRACE shows the virtual session trace status, ON or OFF. TRACING shows the GTRACE options: NONE means GTRACE is not active for the user; *applid* is the application id, if ACB tracing is active, and *luname* is the logical unit name if terminal tracing is active.

### **System action**

None.

### **User response**

None.

### **Severity**

REPLY

## **KLUOP021: WINDOW(*winid*) TRACING(NONE | (*applid*),*luname*)**

### **Explanation**

This reply from the VSHOW command follows KLUOP002. It shows the window ID *winid* for the virtual session or a minus sign (-) if the session is not in a window. TRACING shows the GTRACE options for this virtual session: NONE means GTRACE is not active; *applid* is the application ID, if ACB tracing is active, and *luname* is the logical unit name if terminal tracing is active.

### **System action**

None.

### **User response**

None.

### **Severity**

REPLY

## **KLUOP022: VIRTUAL SESSION SERVICES NOT INITIALIZED, VSHOW IGNORED**

### **Explanation**

The VSHOW command was issued before Virtual Session Services have fully initialized.

**System action**

The VSHOW request is ignored.

**User response**

Wait until message KLUIN001 is written to RKLVLOG, showing Virtual Session Services initialization is complete, then retry the command.

**Severity**

WARN

**KLUOP023: STATS INVALID WITH SUMMARY, STATS IGNORED.****Explanation**

The VSHOW command was entered with the SUMMARY and STATS keywords. These are mutually exclusive.

**System action**

The STATS keyword is ignored.

**User response**

If you wish statistics, reissue the VSHOW command without the SUMMARY keyword.

**Severity**

REPLY

**KLUOP030: VIRTUAL SESSION SERVICES NOT INITIALIZED, VCANCEL IGNORED.****Explanation**

The VCANCEL command was issued before Virtual Session Services have fully initialized.

**System action**

The VCANCEL request is ignored.

**User response**

Wait until message KLUIN001 is written to RKLVLOG, showing Virtual Session Services initialization is complete, then retry the command.

**Severity**

WARN

**KLUOP200: TRACE CLASS(USER) STATUS: USER(*userid*): {ENABLED | PENDING | DISABLED} \*\*\* END OF TRACE STATUS \*\*\*****Explanation**

These lines are the output for the VSTRACE command when neither ON nor OFF was specified. They show the current status for each user for which tracing was requested. ENABLED means tracing is active; PENDING means the user is not logged on but a trace request will be issued when he does log on; DISABLED means tracing is currently inactive.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP201: TRACE REQUEST REJECTED. REQUIRED ARGUMENT NOT SPECIFIED****Explanation**

A VSSTRACE command was specified without the required user ID.

**System action**

The VSSTRACE command is ignored.

**User response**

Reissue the VSSTRACE command with a user ID.

**Severity**

ERROR

**KLUOP202: TRACE USER (userid) {ENABLED | QUEUED | DISABLED}****Explanation**

The trace request for userid has been performed. ENABLED means tracing is active. QUEUED means tracing will start when userid logs on. DISABLED means tracing is not active.

**System action**

None.

**User response**

None.

**Severity**

REPLY

**KLUOP203: GTF INTERFACE HAS NOT BEEN ENABLED****Explanation**

A VSSTRACE request has been issued for a resource but the GTF interface has not been enabled.

**System action**

The command continues, but GTF output will not be produced.

**User response**

Issue the GTF ON command to enable GTF tracing.

**Severity**

ALERT

**KLUPM001: PENDING OUTBOUND MESSAGE LIMIT EXCEEDED LU *luname*  
USERID *userid*. ALL VIRTUAL SESSIONS CANCELLED.**

**Explanation**

A runaway application generated too many messages.

**System action**

Cancels sessions for this luname/user ID.

**User response**

None. This is an application problem.

**Severity**

ALERT

**KLUVT000: PENDING OUTBOUND MESSAGE LIMIT EXCEEDED LU(*luname*)  
USERID:(*userid*). PHYSICAL SESSION CANCELLED.**

**Explanation**

An excessive number of outbound messages have been logged, causing the physical session to terminate.

**System action**

Physical session is cancelled.

**User response**

Make sure that there are no runaway applications. If there are no runaway applications, check the outbound message limit; it may be set too low.

**Severity**

LOG

**KLUVT001: PENDING OUTBOUND MESSAGE LIMIT EXCEEDED LU(*luname*)  
USERID(*userid*). ALL VIRTUAL SESSIONS CANCELLED.**

**Explanation**

An excessive number of outbound messages have been logged. All virtual sessions are cancelled.

**System action**

None.

**User response**

Make sure that there are no runaway applications. If there are no runaway applications, check the outbound message limit; it may be set too low.

**KLUVT002: PENDING OUTBOUND MESSAGE LIMIT EXCEEDED. LU(*luname*)  
USERID(*uuuuuuuu*) PHYSICAL SESSION CANCELLED**

**Explanation**

The outbound physical message limit has been exceeded on the virtual session.

**System action**

The session is terminated.

**User response**

This message may indicate that a dialog contains an error that causes large volumes of data to be produced.

**KLUXD001: QUERY REPLY DATA IS NOT VALID FOR USERID *user*****Explanation**

A 3270 datastream READ PARTITION QUERY command is sent to the user's physical terminal device (if the logmode used by the physical terminal can be queried). When the device returns the requested replies, some basic validity checks are performed on the query reply data. This message is issued if any of these checks fail.

**System action**

Initialization is completed for the user, but the invalid query reply data is ignored. Any READ PARTITION QUERYs issued by applications on the virtual sessions are responded to with a single NULL query reply.

**User response**

At the time message KLUXD001 is sent to the RKLVLLOG data set, a snap of the query reply data that filed the validity checks is taken. The snap data is in the RKLVSnap data set and is identified as REQUESTED FROM KLUXQANA. Use timestamps in the RKLVLLOG and RKLVSnap data to correlate messages and snaps if multiple instances exist. Save these data sets and contact IBM® Software Support for further assistance.

**Severity**

LOG

**KLV messages**

The messages that begin with the KLV prefix are associated with the Tivoli Enterprise™ Monitoring Server on z/OS® or Tivoli® Management Services: Engine (TMS:Engine).

**KLVDI001: KLVWAIT INVOKED FROM UNSUPPORTED ENVIRONMENT****Explanation**

TMS:Engine dispatcher was invoked from SRB mode.

**System action**

TMS:Engine abends U0200.

**User response**

Contact IBM® Software Support.

**Message Type**

Reply

**KLVDL001: INVALID LOGON STRING, EXCESS IGNORED****Explanation**

The user data passed to the KLVENTRY dialog contains more than five subfields.

**System action**

The excess fields are ignored.

**User response**

Correct the user data definition to contain no more than five fields, separated by nulls. Valid fields are user ID, password, group, account, and procedure.

**Message Type**

None

**KLVDL002: *key* IS NOT ACTIVE****Explanation**

A function key that is not assigned a function was pressed.

**System action**

The *key* is ignored.

**User response**

Refer to the bottom of the display panel for a list of active keys.

**Message Type**

None

**KLVDL003: *dlg: system Desc=descriptor, Charset=charset, CGCSGID=cgcsgid, APL support=support*****Explanation**

This message is generated when logging onto a CUA® application. *dlg* is the dialog that determines whether the terminal will support APL characters when the screen is displayed. *system* is the terminal-id for the current session. The *descriptor* defines one terminal storage and symbol-set characteristics entry. The *charset* is the terminal storage identification: X'00' to '07'. The *cgcsgid* is the coded graphic character set global identifier value. The *support* value of 0 indicates that APL is not supported, while a value of 1 indicates that APL is supported.

**System action**

None.

**User response**

Refer to the values in the message to resolve problems with APL support for a given terminal.

**Message Type**

None

**KLVDL101: *appl / lang / ddname: INVALID APPLID*****Explanation**

An TMS:Engine-based application has invoked the help processor with an invalid parameter list. *appl* is the product code, which is incorrect. *lang* is the language code. *ddname* is the associated help file.

**System action**

The help processor stops.

**User response**

Save the TMS:Engine RKLVL0G and contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVDL102: *appl* / *lang* / *ddname*: INVALID LANGUAGE****Explanation**

An TMS:Engine-based application has invoked the help processor with an invalid parameter list. *appl* is the product code. *lang* is the language code, which is incorrect. *ddname* is the associated help file.

**System action**

The help processor terminates.

**User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVDL103: *appl* / *lang* / *ddname*: TBCREATE FAILED FOR *table*; RC=*rc*****Explanation**

The TMS:Engine help processor cannot create the table *table* which will contain help information. *rc* is the return code from the TBCREATE SSPL dialog function. *appl* is the product code. *lang* is the language code. *ddname* is the associated help file.

**System action**

The help processor stops processing either the glossary or index.

**User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVDL104: *appl* / *lang* / *ddname*: IPC CREATE FAILED FOR *qname*; RC=*rc*****Explanation**

The TMS:Engine help processor cannot create the communications queue *qname* for its internal processing. *rc* is the return code from the IPC CREATE SSPL dialog function. *appl* is the product code. *lang* is the language code. *ddname* is the associated help file.

**System action**

The help processor terminates.

**User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

**Message Type**

LOG, VIEW

## **KLVDL105: *dlg*: DD(*ddname*) - KLVRDIR FAILED; RC=*rc***

### **Explanation**

The TMS:Engine help processor cannot read the directory of the help library allocated to *ddname*. *dlg* is the dialog that has detected the error; *rc* is the return code from the utility program that was reading the directory.

### **System action**

The help processor terminates.

### **User response**

Ensure that the TMS:Engine address space has the DD *ddname* allocated to it and that it points to a partitioned data set containing help text. If a security package such as RACF® is being used, the TMS:Engine address space must have read access to the help libraries.

### **Message Type**

None

## **KLVDL106: *dlg*: DD(*ddname*) - [INDEX | GLOSSARY] MEMBER(*mem*) PROCESSING FAILED; RC=*rc***

### **Explanation**

The TMS:Engine help processor could not process the help member *mem* to extract the index or glossary information. *dlg* is the dialog that has detected the error, *ddname* is the DD name of the associated help library, and *rc* is the return code from the utility program that was processing *mem*.

### **System action**

The help processor terminates.

### **User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

### **Message Type**

None

## **KLVDL107: *appl* / *lang* / *ddname*: IPC DEQUEUE INVALID HANDLE**

### **Explanation**

During shutdown processing, the TMS:Engine help processor could not release its communications queue. *appl* is the product code. *lang* is the language code. *ddname* is the associated help file.

### **System action**

The help processor terminates.

### **User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVDL108: *appl* / *lang* / *ddname*: IPC DEQUEUE CONTENTION**

### **Explanation**

During shutdown processing, the TMS:Engine help processor detected contention while accessing its communications queue. *appl* is the product code. *lang* is the language code. *ddname* is the associated help file.

### **System action**

The help processor terminates.

### **User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVDL109: *appl* / *lang* / *ddname*: NO [INDEX | GLOSSARY] ENTRIES GENERATED**

### **System action**

The help index or glossary will not be available.

### **User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVDL110: *dlg*: [INDEX | GLOSSARY] TABLE(*table*) CANNOT BE OPENED; RC=*rc***

### **Explanation**

While attempting to respond to a help request, the TMS:Engine help processor was unable to open the table *table* that contains help index or glossary information. *dlg* is the dialog that has detected the error; *rc* is the return code from the TBOPEN SSPL dialog function.

### **System action**

The help processor terminates; help or the glossary is not available for the application.

### **User response**

Review the TMS:Engine RKLVLLOG for other KLVDL*nnn* messages that may have been issued, and respond as directed. Otherwise, save the RKLVLLOG and contact IBM® Software Support.

### **Message Type**

None

## **KLVDL111: *appl / lang / ddname/ member*: MEMBER NOT FOUND**

### **Explanation**

While attempting to update a help index or glossary table, the TMS:Engine help processor was unable to locate the partitioned data set member in the *ddname* file. *appl* is the product code. *lang* is the language code.

### **System action**

No further processing is performed for *member*; the help processor continues with any other pending requests.

### **User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVDL112: *appl / lang / ddname/ member*: NO PRIMARY INDEX FOR *term***

### **Explanation**

While attempting to update a help index table, the TMS:Engine help processor detected an error in partitioned data set member, *member*, in the *ddname* file. *term* is the data associated with the error. *appl* is the product code. *lang* is the language code.

### **System action**

*term* is ignored; the help processor continues with any other pending requests.

### **User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVDL113: *dlg*: TBCREATE FAILED FOR *table*; RC=*rc***

### **Explanation**

The TMS:Engine date processor cannot create the table *table* which will contain date formatting information. *dlg* is the dialog that has detected the error; *rc* is the return code from the TBCREATE SSPL dialog function.

### **System action**

The date processor terminates.

### **User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

### **Message Type**

None

## **KLVDL114: *dlg*: IPC CREATE FAILED FOR *qname*; RC=*rc***

### **Explanation**

The TMS:Engine date processor cannot create the communications queue *qname* for its internal processing. *dlg* is the dialog that has detected the error; *rc* is the return code from the IPC CREATE SSPL dialog function.

**System action**

The date processor terminates.

**User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

**Message Type**

None

**KLVDL115: *dlg*: IPC DEQUEUE INVALID HANDLE; RC=*rc*****Explanation**

During shutdown processing, the TMS:Engine date processor could not release its communications queue. *dlg* is the dialog that has detected the error; *rc* is the return code from the IPC DEQUEUE SSPL dialog function.

**System action**

The date processor terminates.

**User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

**Message Type**

None

**KLVDL116: *dlg*: IPC DEQUEUE CONTENTION; RC=*rc*****Explanation**

During shutdown processing, the TMS:Engine date processor detected contention while accessing its communications queue. *dlg* is the dialog that has detected the error; *rc* is the return code from the IPC DEQUEUE SSPL dialog function.

**System action**

The date processor terminates.

**User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

**Message Type**

None

**KLVDL117: *appl* / *lang* / *ddname*: PDS SETWRT FAILED; RC=*rc*****Explanation**

While attempting to read a partitioned data set directory, the TMS:Engine help processor received return code *rc* from the PDS SSPL dialog function. *appl* is the product code. *lang* is the language code. *ddname* is the associated help file.

**System action**

No help or glossary information is available.

**User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVDL118: *appl* / *lang* / *ddname* / *member*: MISSING INCLUDE NAME****Explanation**

While attempting to update a help index table, the TMS:Engine help processor detected an error in partitioned data set member, *member*, in the *ddname* file. *appl* is the product code. *lang* is the language code.

**System action**

term is ignored; the help processor continues with any other pending requests.

**User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVDL119: *appl* / *lang* / *ddname* / *member*: [INDEX | GLOSSARY] TBMOD FAILED  
RC=*rc*****Explanation**

While attempting to update a help index or glossary table, the TMS:Engine help processor received an error (*rc*) on a TBMOD request. *member* is the partitioned data set member being processed, which resides in the *ddname* file. *appl* is the product code. *lang* is the language code.

**System action**

Further processing for the help index or glossary is terminated.

**User response**

Save the TMS:Engine RKLVLLOG and contact IBM® Software Support.

## **KLVDM001: MINIMUM/MAXIMUM OPTIONS MUTUALLY EXCLUSIVE: RKANPENU *dialog* LINE *line***

### **Explanation**

The MINIMUM and MAXIMUM options specified on a )BODY dialog statement are mutually exclusive. The associated *dialog* and line number are shown for reference.

### **System action**

Panel interpretation fails.

### **User response**

If the problem is with a user-defined dialog, correct the error and try to refresh the panel. If the problem is with an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

WARNING

## **KLVDM002: STRING VARIABLE TOO LONG**

### **Explanation**

The TMS:Engine variables manager detected an attempt to use a string longer than approximately 30,000 bytes.

### **System action**

The thread is terminated with a U0100 abend, sending a dump to the RKLVSnap file or the system's dump data sets or both.

### **User response**

Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

### **Message Type**

Abend

## **KLVD003: VARIABLE NAME EXPECTED: *library(dialog)* LINE(*line*)**

### **Explanation**

The BODY section of dialog *dialog* contains an input field that does not contain a variable name, or a variable name prefix (typically an ampersand, &) that is not followed by a variable name. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

### **System action**

The dialog compilation fails.

### **User response**

Contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD004: ATTRIBUTE CONFLICT FOR ATTR(*attr*) *library(dialog)* LINE(*line*)**

### **Explanation**

The specified attribute, *attr*, in the BODY section of dialog *dialog*, conflicts with either an attribute that was previously defined or the variable name prefix (usually an ampersand, &). *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

### **System action**

The dialog compilation fails.

### **User response**

If the problem is with a user-defined dialog, check your panel definition and correct the error. If the problem is with an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD005: VARIABLE NAME TOO LONG '*varname*': *library(dialog)* LINE(*line*)**

### **Explanation**

The BODY section of dialog *dialog* contains a variable name, *varname*, that is longer than 8 characters.

### **System action**

The dialog compilation fails.

### **User response**

If the problem is with a user-created dialog, shorten the variable name to 8 characters or less and issue the REFRESH command to determine if the panel definition is correct. If the problem is with an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

## **KLVD008: NEGATIVE LENGTH STRING DETECTED BY KLVD0VTR**

### **Explanation**

An internal error has been detected by the TMS:Engine variables manager.

**System action**

The request is terminated with a U0100 abend, sending a dump to the RKLVSnap file or the system's dump data sets.

**User response**

Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

ABEND

**KLVD009: DIALOG VARIABLE BUFFER INTEGRITY LOST****Explanation**

The TMS:Engine variables manager detected an error in its data structures.

**System action**

The request is terminated with a U0100 abend, sending a dump to the RKLVSnap file and the system's dump data sets or both.

**User response**

Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

ABEND

**KLVD010: \$DMFS FAIL CALLED BY *dialog*+X'offset'****Explanation**

This message is for internal use and appears only when DEBUG(Y) is coded in RKLVIN. It can be ignored unless requested by IBM® Software Support. Message KLVD015 follows and contains additional information.

**System action**

None.

**User response**

None.

**Message Type**

LOG, VIEW

**KLVD011: DIALOG *dialog* FAILED; RC(*rc*) REASON(*reason*)****Explanation**

The specified *dialog* failed during execution.

**System action**

TMS:Engine ends the user's session unless ONERROR was specified in the dialog invoking the failing dialog. KLVD015 follows this message and displays information about the dialog, terminal, and application associated with the failure.

## User response

Contact IBM® Software Support or check the return code (*rc*), correct the error in the failing dialog, refresh the dialog, and retry. Possible *rc* values, their meanings, and responses:

Return code	Meaning
4	Dialog not available; either the dialog is not in TLVPNLS or it could not be compiled. Look for other KLVDMxxx messages to identify the problem and correct it.
8	Device dependent routine start-up failed. Save the MVS™ SYSLOG and TMS:Engine TLVLOG and job log. Then contact IBM® Software Support.
12	SSPL function failed during )INIT processing. Look for other KLVDMxxx messages to identify the problem and correct it. Possibilities include using non-numerics in a numeric calculation and passing an invalid parameter to a dialog function.
16	SSPL function failed during )PROLOG processing. Same as RC(12).
20	Device not supported. This is typically caused by a non-terminal dialog attempting to use )BODY, which is not allowed. If this is the case, either do not run the dialog as a non-terminal or correct the dialog design. Otherwise, save the z/OS® SYSLOG and TMS:Engine RKLVLLOG and job log. Then contact IBM® Software Support.
24	An I/O error occurred while trying to write the )BODY data to the terminal. Refer to the TMS:Engine TLVLOG file for additional messages which should identify the problem.
28	SPL function failed during )EPILOG processing. Same as RC(12).
32	SSPL function failed during )TERM processing. Same as RC(12).
36	A RESHOW command was issued in the )TERM section, which is not allowed. Correct the dialog and retry.
40	A SELECT command was issued in the )TERM section, which is not allowed. Correct the dialog and retry.
44	A TBDISPL failed, either because the dialog does not have a )BODY TABLE section, or because the physical terminal was not large enough to display at least one table row. Do not issue TBDISPL against this dialog, add a )BODY TABLE section, or ensure that the )BODY TOP and )BODY BOTTOM sections are not too large. Retry the dialog.

## Message Type

LOG, VIEW, INFO

## KLVDM012: LOOPCTR LIMIT EXCEEDED

### Explanation

The LOOPCTR limit has been exceeded for a dialog. KLVDM015 follows this message and identifies the failing dialog.

### System action

The dialog terminates.

### User response

If the problem is with a user-defined dialog, correct the error, refresh the dialog, and test it. If the problem is with an IBM®-supplied dialog, contact IBM® Software Support.

## Message Type

LOG, VIEW

## KLVDM013: INVALID NUMERIC ARGUMENT

### Explanation

A dialog has attempted a numeric operation on a value that was not numeric. KLVDM015 follows this message and identifies the failing dialog.

### System action

The dialog terminates.

### User response

Contact IBM® Software Support.

### Message Type

LOG, VIEW

## KLVDM014: MAIN STORAGE SHORTAGE

### Explanation

A dialog could not be executed because the dialog manager discovered a storage shortage. KLVDM015 follows this message and identifies the failing dialog.

### System action

The dialog and the user's session terminate.

### User response

If the error persists, notify your system administrator, who should review storage usage in TMS:Engine, and increase the MINIMUM value in the RKLVIN file.

### Message Type

LOG, VIEW

## KLVDM015: DIALOG(*dialog*) [MEMBER(*member*) LINE(*line*)] Language(*ccc*) [LU(*luname*) APPL(*applid*)]

### Explanation

A warning or error has occurred while executing a dialog. This message follows the actual warning or error message and identifies the dialog, *dialog*, where the condition was detected.

If the information can be determined, the location of the error is shown. *member* is either the dialog name or the name of a COPY member included in dialog. *line* is the line number in *member* where the error occurred. *ccc* is the language code currently in effect.

If the executing dialog is associated with a physical terminal, *luname* is the logical unit name and *applid* is the VTAM® application OD.

### System action

None.

### User response

None.

### Message Type

LOG, VIEW

## **KLVD019: VARIABLE NAME TOO LONG: 'name'**

### **Explanation**

The TMS:Engine dialog manager detected the use of a variable name (*name*) that is longer than 8 characters, and `OPTIONS LONGVARIABLE(IGNORE)` was not coded in the `KLVDNDM` member of `RKANPAR`. `KLVD019` follows this message and identifies the dialog associated with the error.

### **System action**

If `LONGVARIABLE(FAIL)` was specified, the dialog fails. Otherwise, the variable name is truncated at 8 characters and processing continues.

### **User response**

Correct the variable name and refresh the dialog.

### **Message Type**

LOG, VIEW

## **KLVD020: UNSUPPORTED/INVALID \$DMFS REQUEST RECEIVED**

### **Explanation**

The TMS:Engine dialog manager was passed an invalid request.

### **System action**

The request is terminated with a `U0200` abend, sending a dump to the `RKLVSNDP` file or the system's dump data sets or both.

### **User response**

Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD021: name IS ALREADY DEFINED: library(dialog) LINE(line)**

### **Explanation**

The SSPL variable *name* is defined more than once in the `DECLARE` section of dialog, *dialog.library* is the DD name that contains the dialog. *line* is the location where the error was detected.

### **System action**

The dialog compilation fails.

### **User response**

If the problem is with a user-defined dialog, correct the error, refresh the dialog, and test it. If the problem is with an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## KLVDM022: STATIC VARIABLE "*name*" IS UNDECLARED; SCOPE(*scope*) ASSIGNED

### Explanation

The dialog manager detected a reference to variable, *name*, which was not defined in the DECLARE section of the dialog. The NOTDECLARED(REPORT) option was requested, either in the KLVINDM member of RKANPAR or on the OPTION statement in the dialog. KLVDM015 follows this message and shows the dialog that contains the undeclared variable.

**Note:** It is acceptable for a dialog to have undeclared variables; this message is intended as a debugging tool.

### System action

*name* is treated as if it were declared as scope *scope*, and the dialog continues executing. The DEFAULTSCOPE keyword on the OPTION statement may be used to change the default scope. This message is issued only once for each individual reference to the variable.

### User response

Review the dialog shown in message KLVDM015 to determine the proper variable scope. Then add it to the DECLARE section.

### Message Type

LOG, VIEW

## KLVDM023: DYNAMIC VARIABLE "*name*" IS UNDECLARED; SCOPE(*scope*) ASSIGNED

### Explanation

The dialog manager detected a reference to a dynamically constructed variable, *name*, which was not defined in the DECLARE section of the dialog. (Dynamically constructed variable names take the general form of &(&varname).) The NOTDECLARED(REPORT) option was requested, either in the KLVINDM member of RKANPAR or on the OPTION statement in the dialog. KLVDM015 follows this message and shows the dialog that contains the undeclared variable.

**Note:** It is acceptable for a dialog to have undeclared variables; this message is intended as a debugging tool.

### System action

*name* is treated as if it were declared as scope *scope*, and the dialog continues executing. The DEFAULTSCOPE keyword on the OPTION statement may be used to change the default scope. This message will be issued each time the dynamic variable is referenced.

### User response

Review the dialog shown in message KLVDM015 to determine the proper variable scope. Then add it to the DECLARE section.

### Message Type

LOG, VIEW

## **KLVD024: INVALID VARIABLE NAME X'*hexstring*'**

### **Explanation**

The dialog manager detected an invalid dynamically constructed variable name, *hexstring*. (Dynamically constructed variable names take the general form of &(&varname).) KLVD015 follows this message and shows the dialog associated with the error.

### **System action**

A null is used for the variable's value.

### **User response**

If the problem is with a user-defined dialog, review the dialog shown in KLVD015 and correct the SSPL code that constructs the invalid variable name. If the problem is with an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD030: KLVTBMGR LOGIC ERROR**

### **Explanation**

The TMS:Engine tables manager detected an invalid condition while performing a request.

### **System action**

The request is terminated with a U0200 abend, sending a dump to the RKLVSnap file of the system's dump data sets or both.

### **User response**

Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log, and then contact IBM® Software Support.

### **Message Type**

REPLY

## **KLVD031: KLVTBMGR INVALID TABLE DELETE POINTER**

### **Explanation**

The TMS:Engine tables manager detected an invalid condition while performing a request.

### **System action**

The request is terminated with a U0200 abend, sending a dump to the RKLVSnap file or the system's dump data sets or both.

### **User response**

Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log, and then contact IBM® Software Support.

### **Message Type**

REPLY

## **KLVDM040: STATEMENT OUT OF PLACE: *library(dialog)* LINE(*line*)**

### **Explanation**

The OPTION statement must appear as the first or top level of a dialog that includes other common members from the panel library. *dialog* is the dialog that was being refreshed; *library* is the name of the DD that contains the member; *line* is the line number in the member where the misplaced statement was found.

### **System action**

The panel interpretation fails.

### **User response**

If the problem is with a user-defined dialog, move the )OPTION statement in member to beginning of the dialog, and refresh it. If the problem is with an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVDM041: *errmsg: 'text': library(dialog)* LINE(*line*)**

### **Explanation**

A statement in dialog *dialog* contains invalid syntax. *library* is the name of the DD that contains the member; *line* is the line number in the member where the error was detected. *errmsg* is an error message beginning with KLVSC; *text* is the text at or near the error.

### **System action**

Compilation of the current source member is terminated. If dialog is a COPY member, processing of the previous source member will continue but the compilation will be failed when all processing is complete.

### **User response**

If the problem is with a user-defined dialog, correct the statement shown, and refresh the dialog. If the problem is with an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVDM042: RECURSIVE COPY DETECTED *copymem): library(member)* LINE(*line*)**

### **Explanation**

A COPY statement for source member *copymem* was found in a dialog that is being processed as a result of a prior COPY for the same member. *member* is the source member that contains the second COPY; *library* is the name of the DD that contains the member; *line* is the line number in the member where the second COPY was found.

### **System action**

Compilation of the current source member is terminated. If member is a COPY member, processing of the previous source member will continue but the compilation will be failed when all processing is complete.

### **User response**

If the problem is with a user-defined dialog, remove or correct the invalid control statement and attempt to refresh the panel. If the command completes successfully, the panel is ready for use. If the problem is with an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD043: COPY MEMBER NOT FOUND: MEMBER(*copymem*): *library*(*member*)  
LINE(*line*)****Explanation**

The source member named on a COPY statement, *copymem*, could not be found. *member* is the source member that contains the COPY; *library* is the name of the DD that contains the member, and that does not contain the copy member; *line* is the line number in the member where COPY was found.

**System action**

Compilation of the current source member is terminated. If member is a COPY member, processing of the previous source member will continue but the compilation will be failed when all processing is complete.

**User response**

If the problem is with a user-defined dialog, check your panel definition and correct the panel's )COPY control statement, or add the member into the panel library. Then refresh the dialog. If the problem is with an IBM®-supplied dialog, contact IBM® Software Support.

LOG, VIEW

**KLVD049: INVALID DBCS DATA: XRC(*xrc*) MEMBER(*panel*) LINE(*lineno*)****Explanation**

An SSPL statement containing invalid DBCS data was encountered while interpreting a panel definition. The message provides the DBVALIDATE return code *xrc*, the panel name *panel* and line number *lineno*. The following are valid *xrc* values:

Table 134: Return codes for invalid DBCS data (message KLVD049)	
Return code	Meaning
8	A DBCS subfield contains an odd number of bytes
12	A DBCS subfield contains an invalid codepoint
16	Missing SO. An SI character was detected before finding an SO.

Return code	Meaning
20	Missing SI. An SO character was detected before finding an SI or end of string was detected.

#### System action

Panel interpretation terminates.

#### User response

Correct the SSPL statement and issue the REFRESH command to determine if the panel is ready for use.

#### Message Type

WARNING

### **KLVD050: *keyword(value)* IS OUT OF RANGE (*min-max*); DEFAULTS TO *def***

#### Explanation

*keyword* in the KLVINDM member of RKANPAR was specified with a value that is too small (*min*) or too large (*max*).

#### System action

The default value, *def*, will be used. TMS:Engine initialization continues.

#### User response

Correct the *keyword* value. If the default value is unacceptable, recycle TMS:Engine.

#### Message Type

WARNING

### **KLVD051: DIALOG MANAGER INITIALIZED: LIMIT(*limit*)**

#### Explanation

A dialog manager initialization that completes successfully logs this message to create an audit trail.

#### System action

None.

#### User response

None.

#### Message Type

INFO

### **KLVD052: DIALOG LIBRARY UNAVAILABLE**

#### Explanation

The RKANPENU dialog library was not present or could not be opened during TMS:Engine dialog manager initialization.

#### System action

Dialog manager initialization fails and TMS:Engine terminates.

**User response**

Ensure the RKANPENU DD is present and points to a dialog library. Then restart the product.

**Message Type**

ALERT

**KLVD053: UNRECOGNIZED INITIALIZATION STATEMENT: *stmttype*****Explanation**

The statement *stmttype* is not a valid initialization statement. The statement is in RKANPAR(KLVINDM).

**System action**

Initialization fails and TMS:Engine terminates.

**User response**

Correct the statement and retry.

**Message Type**

ALERT

**KLVD054: *keyword(value)* IS INVALID; DEFAULTS TO *def*****Explanation**

*keyword* in the KLVINDM member of RKANPAR was specified with a *value* that is not a valid choice.

**System action**

The default value, *def*, will be used. TMS:Engine initialization continues.

**User response**

Correct the keyword value. If the default value is unacceptable, recycle TMS:Engine.

**Message Type**

WARNING

**KLVD056: KLVINDM RKANPAR PARAMETERS:****Explanation**

Module KLVINDM logs its start-up parameters as they are read from RKANPAR. This is the header message and will be followed by message KLVD057.

**System action**

None.

**User response**

None.

**Message Type**

LOG

## **KLVD057: *parameters***

### **Explanation**

As the *parameters* in module KLVINDM are read, a log audit trail is created.

### **System action**

None.

### **User response**

None.

### **Message Type**

LOG

## **KLVD058: SUPPORTED LANGUAGES: *list***

### **Explanation**

The dialog manager has finished searching for language-specific dialog library DD statements. *list* is the list of 3-character language codes that the dialog manager has found.

### **System action**

None.

### **User response**

None.

### **Message Type**

LOG

## **KLVD059: COULD NOT OPEN *ddname* PANEL LIBRARY**

### **Explanation**

The dialog manager could not open the *ddname* DD, which is a dialog library.

### **System action**

Dialog manager initialization fails and TMS:Engine terminates.

### **User response**

Review the job and z/OS® logs for IBM® data management messages (IEC) that identify the problem. Correct the error and restart the product.

### **Message Type**

ALERT

## **KLVD061: DBCS STRING TRUNCATED IN DIALOG(*dialogname*) BODY AT ROW(*rownum*) COL(*column*)**

### **Explanation**

The dialog *dialogname* contains a Double-Byte Character Set (DBCS) string which is not properly terminated by a Shift-Out (SO) character.

**System action**

The system assumes a SO character at the indicated row and column number.

**User response**

Add the proper SO character.

**Message Type**

INFO

**KLVD070: COMPILED DIALOG EXCEEDS MAIN STORAGE LIMIT:  
*library(dialog)*****Explanation**

The compiled dialog, *dialog*, exceeds the maximum memory allocation permitted by TMS:Engine. *library* is the DD name that contains the dialog.

**System action**

The panel compilation is terminated.

**User response**

Split dialog into smaller dialogs.

**Message Type**

LOG, VIEW

**KLVD071: DIALOG *dialog* NOT FOUND IN *ddname* LIBRARY****Explanation**

Dialog *dialog* was referenced on a select statement, dialog statement, COPY statement, or the REFRESH command, but it was not in the panel library, *ddname*.

**System action**

If the error occurs during an operator command, the command terminates. If it occurs during dialog execution, the dialog thread will generally be terminated.

**User response**

If this is a user-supplied dialog, determine the location of the invalid reference, correct it, and retry the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD072: CRITICAL DIALOG MAY NOT HAVE PRESENTATION CAPABILITY  
*library(dialog)*****Explanation**

A critical dialog must have a presentation space. *library* is the DD name that contains the *dialog*.

**System action**

The dialog compilation fails.

**User response**

Contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD073: DOWNLEVEL CONSTRUCTS CONVERTED; CHECK RKLVL0G FOR DETAILS: *library(dialog)*****Explanation**

While compiling the SSPL dialog *dialog*, one or more statements were found with downlevel syntax. *library* is the DD name that contains the *dialog*.

**System action**

None.

**User response**

If this is a user-supplied dialog, refer to the TMS:Engine RKLVL0G file for KLVD0120, KLVD0125, or KLVD0126 messages associated with member. These will identify the downlevel syntax. Modify the dialog as appropriate.

If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD074: TRACE REQUEST IGNORED FOR *dialog* - DIALOG TRACE IS OFF****Explanation**

A REFRESH operator command was issued for dialog with the TRACE keyword specified. However, dialog trace is not currently active.

**System action**

The dialog is compiled without trace information.

**User response**

If you want *dialog* to be traceable, activate dialog trace with the DTRACE operator command. Then reissue the REFRESH command. Otherwise, no action is needed.

**Message Type**

LOG, VIEW

**KLVD0101: EXCESSIVE OPERANDS: *statement* PROVIDED (*n*) ALLOWS (*m*): *library(dialog)* LINE(*line*)****Explanation**

*n* operands are provided in the procedure or function statement *statement*, but only *m* operands are allowed. *dialog* is the dialog that contains the error. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

**System action**

The dialog compilation fails.

**User response**

If this is a user-supplied dialog, correct the error and test the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD102: INSUFFICIENT OPERANDS: *statement* PROVIDED (*n*) REQUIRES (*m*) *library(dialog)* LINE(*line*)****Explanation**

*n* operands are provided in the procedure or function statement *statement* but only *m* operands are required. *dialog* is the dialog that contains the error. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

**System action**

The dialog compilation fails.

**User response**

If this is a user-supplied dialog, correct the error and test the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD103: VOID EXPRESSION: *library(dialog)* LINE(*line*)****Explanation**

An expression was provided without operands, such as (), in dialog *dialog*. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

**System action**

The dialog compilation fails.

**User response**

If this is a user-supplied dialog, correct the error and test the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD104: OPEN EXPRESSION: *library(dialog)* LINE(*line*)****Explanation**

An expression was provided with more opening than closing parentheses, such as ((*expr*), in dialog *dialog*. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

**System action**

The dialog compilation fails.

**User response**

If this is a user-supplied dialog, correct the error and test the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD105: UNBALANCED PARENTHESES: *library(dialog)* LINE(*line*)****Explanation**

An expression was provided with more closing than opening parentheses, such as (*expr*), in dialog *dialog*. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

**System action**

The dialog compilation fails.

**User response**

If this is a user-supplied dialog, correct the error and test the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD106: *label* IS A DUPLICATE LABEL: *library(dialog)* LINE(*line*)****Explanation**

The label *label* is defined more than once within the dialog *dialog*. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

**System action**

The dialog compilation fails.

**User response**

If this is a user-supplied dialog, correct the error and test the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD107: IMPROPER USE OF *statement* CONSTRUCT: *library(dialog)* LINE(*line*)****Explanation**

The dialog management statement *statement* was used improperly. This is usually an END or UNTIL statement without a DO, or an ELSE statement without an IF. *library* is the DD name that contains the *dialog*. *line* is the location where the error was detected.

**System action**

The dialog compilation fails.

**User response**

If this is a user-supplied dialog, correct the error and test the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

## **KLVD109: IMPROPER TOKEN USAGE: *library(dialog)* LINE(*line*)**

### **Explanation**

An invalid token was detected within dialog *dialog*. This is often a misspelled dialog function name. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

### **System action**

The dialog compilation fails.

### **User response**

If this is a user-supplied dialog, correct the error and test the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD110: OPEN CONSTRUCT(S) IN PROCEDURE: *library(dialog)* LINE(*line*)**

### **Explanation**

A DO statement without an END statement was found in dialog *dialog*. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

### **System action**

The dialog compilation fails.

### **User response**

If this is a user-supplied dialog, correct the error and test the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD111: LABEL *label* IS UNRESOLVED: *library(dialog)* LINE(*line*)**

### **Explanation**

A GOTO or CALL statement referenced a label that was not found in the dialog *dialog*. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

### **System action**

The dialog compilation fails.

### **User response**

If this is a user-supplied dialog, correct the error and test the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD112: PREMATURE END OF MEMBER: *library(dialog)* LINE(*line*)**

### **Explanation**

The end of a dialog was reached before a statement was completed. *library* is the DD name that contains the *dialog*. *line* is the location where the error was detected.

### **System action**

The dialog compilation fails.

### **User response**

If this is a user-supplied dialog, correct the error and test the dialog. If this is an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD113: OPEN ENVIRONMENT: '*text*': *library(dialog)* LINE(*line*)**

### **Explanation**

*dialog* contains an opening delimiter, *text*, without a closing delimiter. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

### **System action**

The dialog compilation fails.

### **User response**

If this is a user-supplied dialog, enter the closing delimiter and recompile. If this is an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD120: DOWNLEVEL FUNCTION SYNTAX: '*name*' *library(dialog)* LINE(*line*)**

### **Explanation**

Dialog *dialog* contains a dialog function call (*name*) that does not have parentheses around its argument list. This is known as level 0 syntax. *library* is the DD name that contains the dialog. *line* is the location where the condition was detected.

### **System action**

This is an information message. The dialog continues compiling.

### **User response**

If this is a user-supplied dialog, modify the dialog so that the function arguments are enclosed in parentheses immediately following the function. If the function has no arguments, parentheses are still required, for example, VSSREFR(). After making the changes, add )OPTION LEVEL(1) at the beginning of the dialog to indicate that functions are identified by parenthetical parameter lists.

If this is an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

**KLVD121: UNBALANCED COMMENT DELIMITER(S): *library(dialog)*  
LINE(*line*)**

**Explanation**

A comment-end delimiter (*\*/*) was found in dialog *dialog* without a corresponding comment-start delimiter (*/\**). *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

**System action**

The dialog compilation fails.

**User response**

If this is a user-supplied dialog, correct the error. If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD122: INVALID HEX LITERAL: '\x': *library(dialog)* LINE(*line*)**

**Explanation**

An invalid hexadecimal string, *x* was detected in dialog *dialog*. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

**System action**

The dialog compilation fails.

**User response**

If this is a user-supplied dialog, enter the correct value (\xx, where either x = 0 - 9 or A - F) and recompile. If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

**KLVD123: INVALID STRING FUNCTION: '*func*': *library(dialog)* LINE(*line*)**

**Explanation**

*func* was coded as a string function in dialog *dialog*, but it is either not a valid SSPL statement or dialog function name or is not allowed to be used as a string function. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

**System action**

The dialog compilation fails.

**User response**

If this is a user-supplied dialog, correct the syntax and recompile. If this is an IBM®-supplied dialog, contact IBM® Software Support.

**Message Type**

LOG, VIEW

## **KLVD124: INVALID STRING FORMAT: '*string*': *library*(*dialog*) LINE(*line*)**

### **Explanation**

An invalid string, *string*, was detected in dialog *dialog*. It may be missing a closing quote, or may contain a missing or invalid variable name. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

### **System action**

The dialog compilation fails.

### **User response**

If this is a user-supplied dialog, correct the *string* and recompile. If this is an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD125: DOWNLEVEL REFERENCE: '*text*': *library*(*dialog*) LINE(*line*)**

### **Explanation**

A statement in dialog *dialog* was coded using a syntax that is no longer supported. *library* is the DD name that contains the dialog. *line* is the location where the condition was detected.

### **System action**

*text* is converted internally to the correct syntax and message KLVD126 is issued to display it. The dialog continues compiling.

### **User response**

If this is a user-supplied dialog, refer to KLVD126 for the correct syntax and modify the dialog accordingly. If this is an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD126: CONVERTED REFERENCE: '*text*': *library*(*dialog*) LINE(*line*)**

### **Explanation**

This message follows KLVD125 and displays how the unsupported syntax was converted. *text* is the converted text. *dialog* is the dialog that contains the statement. *library* is the DD name that contains the dialog. *line* is the location where the condition was detected.

### **System action**

None.

### **User response**

None.

### **Message Type**

LOG, VIEW

## **KLVD127: WARNING - OPEN COMMENT BLOCK: *library(dialog)* LINE(*line*)**

### **Explanation**

During refresh processing for dialog *dialog*, the dialog manager detected an open comment block (more /\* than \*/). *line* is the line where the error was detected, and is typically an SSPL section marker (PROLOG, )BODY, etc.). *library* is the DD name that contains the dialog.

### **System action**

This is a warning message only. The dialog continues compiling, but portions of the dialog may be omitted or syntax errors may be reported.

### **User response**

If this is a user-supplied dialog, review dialog member and correct the open comment block. If this is an IBM®-supplied dialog, contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVD128: MAXIMUM ATTRIBUTES EXCEEDED FOR ATTR(*attr*): *library(dialog)* LINE(*line*)**

### **Explanation**

More than 252 panel attributes have been declared in dialog *dialog*. *attr* is the offending attribute. *library* is the DD name that contains the dialog. *line* is the location where the error was detected.

### **System action**

The dialog compilation fails.

### **User response**

Contact IBM® Software Support.

### **Message Type**

LOG, VIEW

## **KLVHS011: MAXPOOLS(*pools*) USING(*rpools*), MAXHANDLES(*handles*) USING(*rhandles*)**

### **Explanation**

The specified MAXPOOLS value *pools* was rounded to *rpools*. The specified MAXHANDLES value *handles* was rounded to *rhandles*. The rounded values will be used by the handle services manager.

### **System action**

Processing continues.

### **User response**

None.

### **Message Type**

INFO

## **KLVHS201: HANDLE NOTIFY ROUTINE ABEND (*tnnnn*) - HANDLE(*handle*) ADDR(*addr*) POOL(*pool*) EXIT(*exit*) PARM(*part*) ASSOC(*assoc*)**

### **Explanation**

During handle name deregistration or handle pool purge processing, a notify routine abended. *t* is the abend type (S)ystem or (U)ser and *nnnn* is the abend code. The abend code is three hexadecimal digits for a system abend and four decimal digits for a user abend. *handle* is the handle name. *addr* is the address of the handle

name block within the handle pool. *pool* is the handle pool address. *exit* is the notify routine address. *parm* is the parameter passed to the exit. *assoc* is the 32-bit associated value for this handle name.

**System action**

A dump is produced and cleanup processing for the handle name is terminated. Processing continues.

**User response**

Contact IBM® Software Support. Keep dump, RKLVLLOG, SYSLOG, and runsheets.

**Message Type**

ERROR

**KLVS202: NO HANDLE POOLS AVAILABLE****Explanation**

A request to initialize a handle pool could not be serviced because no empty table slot was available.

**System action**

A dump is produced and the thread is terminated.

**User response**

Contact IBM® Software Support. Keep dump, RKLVLLOG, SYSLOG, and runsheets.

**Message Type**

ERROR

**KLVS203: HANDLE SERVICES MANAGER VECTOR TABLE IS INVALID****Explanation**

The handle services manager vector table was invalid during the processing of a handle services request.

**System action**

A dump is produced and the thread is terminated.

**User response**

Contact IBM® Software Support. Keep dump, RKLVLLOG, SYSLOG, and runsheets.

**Message Type**

ERROR

**KLVS204: HANDLE SERVICES MANAGER RETURN AREA NOT LARGE ENOUGH****Explanation**

The handle services manager return area (\$HRA) was not large enough to allow required information to be returned during the processing of a handle services request.

**System action**

A dump is produced and the thread is terminated.

**User response**

Contact IBM® Software Support. Keep dump, RKLVLLOG, SYSLOG, and runsheets.

**Message Type**

ERROR

**KLVS205: INVALID RELEASE HANDLE REQUEST****Explanation**

The handle use count was already zero during the processing of a handle services request to release a handle.

**System action**

A dump is produced and the thread is terminated.

**User response**

Contact IBM® Software Support. Keep dump, RKLVLLOG, SYSLOG, and runsheets.

**Message Type**

ERROR

**KLVS811: HANDLE SERVICES MANAGER GLOBAL STATISTICS****Explanation**

This is the title line for the HSM Global Statistics display.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVS812: MAXIMUM POOLS = *maxpools*****Explanation**

The maximum number of handle pools that can be allocated.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVS813: MAXIMUM HANDLES PER POOL = *maxhandles*****Explanation**

The maximum number of handles available in a single handle pool.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVHS814: TOTAL POOLS IN USE = *totalpools*****Explanation**

The total number of handle pools that are currently allocated and in use.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVHS815: TOTAL HANDLES IN USE = *totalhandles*****Explanation**

The total number of handles in use in all pools.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVHS816: TOTAL STORAGE IN USE = *totalstorage*****Explanation**

The total amount of storage currently in use by handle services. This storage is allocated above the 16 M line.

**System action**

None.

**User response**

None.

**Message Type**

INFO

## **KLVS817: TOTAL EXPANSIONS = *totalexpansions***

### **Explanation**

The total number of times the handle services manager performed a handle pool expansion.

### **System action**

None.

### **User response**

None.

### **Message Type**

INFO

## **KLVS818: AVERAGE HANDLES PER POOL = *averagehandles***

### **Explanation**

The average number of handles in a handle pool.

### **System action**

None.

### **User response**

None.

### **Message Type**

INFO

## **KLVS820: QUERYHSM - OWNERID= AND POOLID= KEYWORDS ARE MUTUALLY EXCLUSIVE**

### **Explanation**

The QUERYHSM command was issued with both the OWNERID= and POOLID= keywords specified.

### **System action**

Only GLOBAL statistics are displayed.

### **User response**

Re-enter the command with either POOLID= or OWNERID= specified.

### **Message Type**

INFO

## **KLVS821: HANDLE SERVICES MANAGER GLOBAL STATISTICS DETAIL**

### **Explanation**

This is the title line for the HSM Global Statistics Detail display.

### **System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVS822: POOL ID = *poolid*, OWNERID = *ownerid*, SIZE = *poolsize* BYTES**

**Explanation**

This message is printed when the QUERYHSM GLOBAL DETAIL command is entered. It is printed once for each active handle pool. *poolid* is the handle pool ID, *ownerid* is the owning logical resource name, and *poolsize* is the handle pool size in bytes.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVS829: END OF THE HSM STATISTICS DISPLAY**

**Explanation**

This message indicates that all the requested handle services manager statistics have been displayed.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVS830: INVALID OWNERID SPECIFIED ON QUERYHSM COMMAND -  
*ownerid***

**Explanation**

The specified *ownerid* is not a valid logical resource number or was not 8 characters long. The owner ID must include all leading zeros.

**System action**

Only GLOBAL statistics are displayed.

**User response**

Issue QUERYHSM DETAIL command for a list of valid owner IDs and then reissue the QUERYHSM OWNERID= command specifying all 8 characters of the owner ID.

**Message Type**

INFO

## **KLVHS831: HANDLE SERVICES MANAGER LIST OWNERID STATISTICS**

### **Explanation**

This is the title line for the handle pool owner ID statistics display.

### **System action**

None.

### **User response**

None.

### **Message Type**

INFO

## **KLVHS832: OWNERID = *cccccccc*, NUMBER OF POOLS OWNED = *nn***

### **Explanation**

This message is printed when the QUERYHSM OWNERID= command is issued. *cccccccc* is the owner ID and *nn* is the number of pools owned.

### **System action**

None.

### **User response**

None.

### **Message Type**

INFO

## **KLVHS833: POOLID = *poolid*, SIZE = *nnnnnn* BYTES, HANDLES IN POOL = *hhhhh***

### **Explanation**

In addition to message KLVHS832, this message is printed when the QUERYHSM DETAIL OWNERID= command is issued. It is printed once, immediately following message KLVHS832, for each owned handle pool. *poolid* is the handle pool ID, *nnnnnn* is the size of the handle pool in bytes, and *hhhhh* is the number of handles in the pool.

### **System action**

None.

### **User response**

None.

### **Message Type**

INFO

## **KLVHS840: INVALID POOLID SPECIFIED ON QUERYHSM COMMAND - *poolid***

### **Explanation**

The value *poolid* was specified on a QUERYHSM command, but it is not a valid handle pool ID.

**System action**

Only GLOBAL statistics are displayed.

**User response**

Issue QUERYHSM DETAIL command to get a list of valid pool IDs. Then reissue the QUERYHSM POOLID= command with the correct pool ID.

**Message Type**

INFO

**KLVHS841: HANDLE SERVICES MANAGER LIST POOLID STATISTICS****Explanation**

This is the title line for the handle pool statistics display.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVHS843: HANDLES IN POOL = *handles*, HANDLES IN USE = *inuse*****Explanation**

In addition to message KLVHS822, this message is printed when the QUERYHSM DETAIL POOLID= command is issued. It is printed immediately following message KLVHS822. *handles* is the total number of handles in the handle pool and *inuse* is the number of handles that are currently in use.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVHS844: PRIMARY SIZE = *prsize* HANDLES, EXPANSION SIZE = *expsize* HANDLES****Explanation**

In addition to messages KLVHS822 and KLVHS843, this message is printed when the QUERYHSM DETAIL POOLID= command is issued. It is printed immediately following message KLVHS843. *prsize* is the initial number of handles in the handle pool and *expsize* is the number of new handles added to the pool each time it expands.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVHS845: NUMBER OF EXPANSIONS = *nnn*****Explanation**

In addition to messages KLVHS822, KLVHS843, and KLVHS844, this message is printed when the QUERYHSM DETAIL POOLID= command is issued. It is printed immediately following message KLVHS844. *nnn* is the number of times the handle pool has been expanded.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVHS851: HANDLE SERVICES MANAGER STORAGE ISOLATION STATISTICS****Explanation**

This is the title line for the handle services manager storage isolation statistics display.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVHS852: PRIMARY SIZE = *prsize*, SECONDARY SIZE = *secsize*****Explanation**

The values used to allocate the storage isolation pool used by handle services. *prsize* is the initial storage amount allocated and *secsize* is the additional amount of storage allocated each time the storage pool is expanded.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVS853: CURRENT STORAGE IN USE = *nnnnn***

**Explanation**

The amount of storage in the storage pool that is currently in use.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVS854: MAXIMUM STORAGE EVER IN USE = *nnnnn***

**Explanation**

The maximum amount of storage in the storage pool that was ever in use.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVS855: CURRENT STORAGE ALLOCATED = *nnnnn***

**Explanation**

The total amount of TMS:Engine storage currently allocated to the storage pool.

**System action**

None.

**User response**

None.

**Message Type**

## **KLVIN000: CT/IX INTERFACE INITIALIZED**

### **Explanation**

The POSIX environment has been successfully established.

### **System action**

None.

### **User response**

This message is informational.

## **KLVIN000\_d: UNABLE TO REGISTER CT/iX THREAD or PROCESS ANCHOR: RC(9999)**

### **Explanation**

A fatal an unexpected error has occurred.

### **System action**

The process terminated.

### **User response**

Gather relevant logs and report this problem to IBM® Software Support.

## **KLVIN001: INVALID CT/IX INTERFACE HEADER - <LMOD header>**

### **Explanation**

A fatal an unexpected error has occurred.

### **System action**

The process terminated.

### **User response**

Gather relevant logs and report this problem to IBM® Software Support.

## **KLVIN400: TASK INITIALIZED: \$DQA(*dqa*) TASK(*task*) \$DSA(*dsa*) EVTBL(*evtbl*) DPRTY(*dprty*)**

### **Explanation**

During TMS:Engine start-up, the TMS:Engine dispatcher started the identified task to perform its work. The displayed fields contain information useful for IBM® diagnostic efforts.

### **System action**

None.

### **User response**

None.

### **Message Type**

LOG

## **KLVIN403: COMMAND LIBRARY UNAVAILABLE**

### **Explanation**

During TMS:Engine start-up the command library, DD name RKANCMD, could not be accessed. It is probably not present in the TMS:Engine JCL procedure.

### **System action**

Any data contained in the command library is unavailable.

### **User response**

Refer to the z/OS® system log for any IBM® data management messages (IEC). Determine the reason the command library could not be opened, correct it, and restart TMS:Engine.

### **Message Type**

WARNING

## **KLVIN405: STARTUP MODULE: *modname* [,@*entry-point*] SEQUENCE *num* [,USING RKANPAR MEMBER *member*]**

### **Explanation**

During TMS:Engine start-up, module *modname* with sequence number *num* will be invoked. If an initialization parameter member of RKANPAR is found for this module, it is identified as member in the message. The entry-point address will only be included in the message if debug mode is in effect.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVIN406: STARTUP ERROR: MODULE(*modname*) R15(*r15*)****Explanation**

During TMS:Engine start-up, module *modname* detected an error. *r15* should have a nonzero value.

**System action**

TMS:Engine is terminated after any subsequent start-up modules are invoked.

**User response**

Examine the TMS:Engine log data set for additional messages to determine a more specific reason for the error. Correct it, and restart TMS:Engine.

**Message Type**

ALERT

**KLVIN407: FLUSHING INITIAL MESSAGES****Explanation**

After TMS:Engine is successfully started, any pending messages are written to the log so that start-up messages may be viewed by the site to determine if the TMS:Engine environment was correctly established.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVIN408: CANDLE ENGINE VERSION *ver* READY ON *smfid* SYS *cpuid*:  
GSA(*nnnn*)****Explanation**

TMS:Engine version *ver* is up and running on system *smfid*. The variable *nnn* refers to the address of the Global Storage Area, the TMS:Engine primary control block.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVIN409: INITIALIZATION LIBRARY UNAVAILABLE****Explanation**

During TMS:Engine start-up the parameter library, DD name RKANPAR, could not be accessed. It is probably not present in the TMS:Engine JCL procedure.

**System action**

Any data contained in the parameter library is unavailable.

**User response**

Refer to the z/OS® system log for any IBM® data management messages (IEC). Determine the reason the command library could not be opened, correct it, and restart TMS:Engine.

**Message Type**

WARNING

**KLVIN410: INITLIST MEMBER *member* BEING PROCESSED****Explanation**

The INITLIST keyword was coded and *member* is being processed for start-up member name overrides.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVIN411: *override-statement*****Explanation**

The contents of the INITLIST member are echoed in *override-statement*.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVIN412: STARTUP MODULE *module* NOT FOUND****Explanation**

An override statement references a start-up module that is not present in this TMS:Engine address space.

**System action**

The override is ignored and processing continues.

**User response**

Correct the override statement and restart the TMS:Engine address space if necessary.

**Message Type**

WARNING

**KLVIN413: INITLIST MEMBER *member* NOT FOUND****Explanation**

*member* could not be found in RKANPAR.

**System action**

The start-up is terminated.

**User response**

Correct the INITLIST keyword to specify a valid member name and restart the TMS:Engine address space.

**Message Type**

ERROR

**KLVIN414: OVERRIDE MEMBER *member* FOR STARTUP MODULE *module* NOT FOUND****Explanation**

*member* could not be found in RKANPAR for start-up module *module*. This message will only be issued if the override member name differs from the default.

**System action**

The start-up is terminated.

**User response**

Correct the INITLIST member to specify a valid override member name and restart the TMS:Engine address space.

**Message Type**

ERROR

**KLVIP004: { INVALID TIME SPECIFICATION | KEYWORD NOT FOUND | REQUIRED OPERAND OMITTED | OPERAND TOO SHORT OPERAND TOO LONG | INVALID NUMERIC OPERAND | INVALID QUOTED STRING INVALID DELIMITER USAGE | AMBIGUOUS KEYWORD | REFERENCE }, FUNCTION(IPC):  
*dddddddddddddddddddd*****Explanation**

A syntax error was encountered while parsing an Inter-Process Communications (IPC) command buffer. The contents of the command buffer is displayed in the *dddddddddddddddddddd* field of the message.

**System action**

The command is ignored.

**User response**

Contact IBM® Software Support.

**Message Type**

VIEW

**KLVIP004\_d: UNSUPPORTED IPC SERVICE****Explanation**

A service other than CREATE, DESTROY, DEQUEUE, PUSH, ACCESS, ALARM, or QUEUE was requested from IPC.

**System action**

The dialog is terminated.

**User response**

If this error occurred in a user-created dialog, correct the error and restart the dialog process. If this error occurs while running any other IBM® Tivoli® product, contact IBM® Software Support.

**Message Type**

VIEW

**KLVLG001: CLUSTER INITIAL LOAD FAILED, SERVICE(*service*), RC(*rc*)****Explanation**

During TMS:Engine initialization, an error was encountered while attempting to load the CL/CONFERENCE® log cluster. *service* may be on the following:

- **SHOWCB-1** : A SHOWCB for a VSAM ACB failed.
- **SHOWCB-2** : A SHOWCB for a VSAM RPL failed.
- **GENCBACB**: A GENCB for a VSAM ACB failed.
- **GENCBRPL**: A GENCB for a VSAM RPL failed.
- **OPEN**: An OPEN failed for the VSAM cluster.
- **PUT**: The initial load failed for the cluster.

**System action**

The CL/CONFERENCE® logging facility is unavailable.

**User response**

Using the RC and service name, determine the cause of the error, correct it, and restart TMS:Engine.

**Message Type**

ERROR

**KLVLIO01: LOCK MANAGER INTEGRITY ERROR****Explanation**

An internal error occurred while processing a lock.

**System action**

TMS:Engine terminates.

**User response**

Contact IBM® Software Support.

**Message Type**

ALERT

**KLVL001: MAIN STORAGE SHORTAGE DETECTED, QUIESCE IN EFFECT****Explanation**

TMS:Engine detected a main storage shortage. To recover from the shortage, TMS:Engine will not accept any logons.

**System action**

Users cannot logon or start a session.

**User response**

None. However, if these messages occur frequently on your system, you should examine the memory allocation parameters that are in effect. These are the RKLVIN keywords MINIMUM, MAXIMUM, and RESERVE.

**Message Type**

ALERT

**KLVL002: MAIN STORAGE SHORTAGE RELIEVED, QUIESCE RELEASED****Explanation**

TMS:Engine detected main storage availability and released the quiesce caused by main storage shortage.

**System action**

TMS:Engine will now allow users to logon or start a session.

**User response**

None.

**Message Type**

REPLY

**KLVL003: LOGICAL RESOURCE INTEGRITY ERROR****Explanation**

While accessing the logical resource table, an integrity error was detected.

**System action**

For problem determination, a dump is generated with a user abend code.

**User response**

Contact IBM® Software Support.

## **KLVL004: PURGE/CLEANUP EXIT ERROR DETECTED, DUMP REQUESTED**

### **Explanation**

The TMS:Engine logical resource manager detected an error during resource purge or cleanup processing and has bypassed a purge/cleanup exit to avoid further problems.

### **System action**

A dump is produced because DEBUG(Y) is in effect. Some resources and storage may be hung.

### **User response**

Contact IBM® Software Support.

## **KLVL005: PURGE/CLEANUP EXIT ERROR DETECTED *resnum1* - *resname* - *resnum2***

### **Explanation**

The TMS:Engine logical resource manager detected an error during resource purge or cleanup processing and has bypassed a purge/cleanup exit to avoid further problems.

### **System action**

Some resources and storage may be hung.

### **User response**

Copy the exact contents of the message and contact IBM® Software Support. Be sure to include the debugging data fields *resnum1*, *resname*, and *resnum2* contained in the message.

## **KLVL006: LOGICAL RESOURCE CONTROL BLOCK ERROR**

### **Explanation**

An error was encountered while processing a resource manager request.

### **System action**

The current request is ignored and a U0100 abend is generated to supply information for the logic error.

### **User response**

Acquire the dump from the U0100 abend and contact IBM® Software Support.

### **Message Type**

REPLY

## **KLVL007: MAXIMUM LOGICAL RESOURCE TABLE SIZE EXCEEDED - RESOURCE INITIALIZATION FAILED**

### **Explanation**

The maximum number of logical resources has been exceeded.

### **System action**

The current request is ignored. The system will continue running. As resources are freed, new resources can be created, but the stability of the system is unpredictable since it is not known what resources will be rejected.

### **User response**

Reduce activity on the system and contact IBM® Software Support.

**Message Type**

ALERT

**KLVLW001: RKLVLLOG IS CURRENTLY RECORDING ON *ddname*****Explanation**

In response to the TLVLOG TMS:Engine operator command, this message shows where TMS:Engine messages are currently being written to. *ddname* is the ddname being used for RKLVLLOG.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVLW002: MAXIMUM LINES: *maxlines*****Explanation**

In response to the TLVLOG TMS:Engine operator command, this message shows the maximum number of lines that will be written to the currently active RKLVLLOG before an automatic TLVLOG SWITCH is performed.

**System action**

None.

**User response**

None.

**Notes®**

If the value is zero, there is no maximum.

**Message Type**

REPLY

**KLVLW003: LINES WRITTEN: *lines*****Explanation**

In response to the TLVLOG, TMS:Engine operator command, this message shows the number of lines that have been written to the currently active RKLVLLOG.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

## KLVLW004: RKLVLLOG IS DISABLED BECAUSE OF AN I/O ERROR ON *ddname*

### Explanation

In response to the TLVLOG TMS:Engine operator command, this message reports that an error has caused TMS:Engine to stop writing messages to the RKLVLLOG file. *ddname* is the name of the DD to which TMS:Engine had been recording.

### System action

None.

### User response

Issue TLVLOG SWITCH to attempt to allocate a new RKLVLLOG dynamically.

### Message Type

REPLY

## KLVLW011: DYNAMIC ALLOCATION VALUES:

### Explanation

In response to the TLVLOG TMS:Engine operator command, this message precedes a set of KLVLW012 messages that show the values that will be used for the next RKLVLLOG dynamic allocation.

### System action

None.

### User response

None.

### Message Type

REPLY

## KLVLW012: *keyword - value*

### Explanation

Displays a RKLVLLOG dynamic allocation parameter and its value. Possible message text is as follows:

Table 135: RKLVLLOG dynamic allocation parameters and values (message KLVLW012)	
Keyword	Value
CLASS	The SYSOUT class.
COPIES	The number of copies.
DEST	The SYSOUT destination, if any.
FCD	The FCB name, if any.
FORM	The FORM name, if any.
HOLD	Whether the SYSOUT file will be placed in a operator hold (YES) or not (NO).
UCS	The UCS name, if any.
USER	The user ID associated with the SYSOUT destination, if any.
WTRNAME	The external writer name, if any.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVLW022: RKLVLLOG IS NOW RECORDING ON *ddname*****Explanation**

In response to a TLVLOG SWITCH request, TMS:Engine has dynamically allocated a SYSOUT field and is now writing RKLVLLOG messages to it. *ddname* is the new ddname.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVLW023: *ddname* DD HAS BEEN CLOSED AND RELEASED****Explanation**

In response to a TLVLOG SWITCH request, TMS:Engine has closed and dynamically deallocated the previous RKLVLLOG file. *ddname* is the ddname.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVLW027: COPIES MUST BE BETWEEN 1 AND 254****Explanation**

An invalid COPIES value was entered on a TLVLOG command. Only an integer between 1-254 is accepted.

**System action**

The command terminates.

**User response**

Reissue the command with a valid COPIES value.

**Message Type**

ERROR

## **KLVLW028: MAXLINES MUST BE BETWEEN 0 AND 16000**

### **Explanation**

An invalid MAXLINES value was entered on a TLVLOG command. Only an integer between 0-16000 is accepted.

### **System action**

The command terminates.

### **User response**

Reissue the command with a valid MAXLINES value.

### **Message Type**

ERROR

## **KLVLW029: HOLD VALUE MUST BE "YES" OR "NO"**

### **Explanation**

An invalid HOLD value was entered on a TLVLOG command. Only YES or NO is accepted.

### **System action**

The command terminates.

### **User response**

Reissue the command with a valid HOLD value.

### **Message Type**

ERROR

## **KLVLW031: RKLVLG SWITCH REQUESTED**

### **Explanation**

A TLVLOG SWITCH request has been accepted. TMS:Engine will allocate a new RKLVLG SYSOUT file and begin recording on it. Then close and release the old RKLVLG file. This message is followed by KLVLW022 and KLVLW023, which report successful processing.

### **System action**

None.

### **User response**

None.

### **Message Type**

REPLY

## **KLVLW041: RKLVLG DATA SET DISABLED BY PERMANENT ERROR**

### **Explanation**

A BSAM WRITE issued against the currently active RKLVLG file failed because of a permanent error.

### **System action**

RKLVLG recording is suspended.

### User response

Refer to the z/OS® SYSLOG for any messages that may have been issued by the IBM® data management routines. Issue this command:

```
TLVLOG SWITCH
```

To attempt to allocate a new RKLVLLOG dynamically.

### Message Type

ALERT

## **KLVLW081: DYNAMIC ALLOCATION FAILED FOR RKLVLLOG: R15(*rc*) ERROR(*error*) INFO(*info*)**

### Explanation

A TLVLOG SWITCH request was not successful because the dynamic allocation for a new SYSOUT file failed. *rc* is the return code from the DYNALLOC request; *error* and *info* are the error and information reason codes.

### System action

The command terminates. The previous RKLVLLOG is still active.

### User response

Refer to RKLVLLOG or VIEWLOG for any KLVDAnn messages that may have been issued. Refer to *IBM® z/OS® MVS™ Programming: Authorized Assembler Services Reference* (GC28-1764 through GC28-1767) for DYNALLOC return codes.

### Message Type

LOG, ERROR

## **KLVLW082: COULD NOT OPEN *ddname* FOR RKLVLLOG**

### Explanation

A TLVLOG SWITCH request could not open a dynamically allocated SYSOUT file. *ddname* is the ddname that could not be opened.

### System action

The command terminates. The previous RKLVLLOG is still active; *ddname* remains allocated to the TMS:Engine address space.

### User response

Refer to SYSLOG for any IEFxxxxx messages that may describe the OPEN error.

### Message Type

LOG, ERROR

## **KLVLW083: DYNAMIC DEALLOCATION FAILED FOR RKLVLLOG: R15(*rc*) ERROR(*error*) INFO(*info*)**

### Explanation

A TLVLOG SWITCH request could not dynamically deallocate the RKLVLLOG JCL DD statement. *rc* is the return code from the DYNALLOC request; *error* and *info* are the error and information reason codes.

**System action**

The RKLVLOG JCL DD statement remains allocated to the TMS:Engine address space. Refer to *IBM® z/OS® MVS™ Programming: Authorized Assembler Services Reference* for DYNALLOC return codes.

**Message Type**

LOG, ERROR

**KLVLW084: \*SYSTLG\* OPERATOR LOGON FAILED****Explanation**

The pseudo-operator \*SYSTLG\* could not be initialized.

**System action**

\*SYSTLG\* will not be recognized if specified with the AS operator command. All other RKLVLOG processing continues normally.

**User response**

If you are using operator validation in a NAM user exit (for example, KLVA2NEV), ensure that the \*SYSTLG\* operator is authorized for logon.

**Message Type**

LOG, ERROR

**KLVLW091: STATISTICS SINCE STARTUP:****Explanation**

This is the header of the response to a TLVLOG STATS command. It will be followed by additional KLVLWnnn messages containing the various RKLVLOG counters.

**System action**

Processing continues.

**User response**

None.

**KLVLW092: LINES WRITTEN: nnnnnnn****Explanation**

The indicated number of lines have been written to RKLVLOG.

**System action**

Processing continues.

**User response**

None.

**KLVLW093: FULL BUFFER WRITES: nnnnnnn****Explanation**

The indicated number of buffer writes to RKLVLOG have been performed because the buffer was full.

**System action**

Processing continues.

**User response**

None.

**KLVLW094: OPER REQUESTED WRITES: *nnnnnnn*****Explanation**

The indicated number of writes to RKLVLLOG have been performed in response to operator requests.

**System action**

Processing continues.

**User response**

None.

**KLVLW095: WAITS FOR LOG BUFFERS: *nnnnnnn*****Explanation**

The system needed to wait the indicated number of times for an available log buffer.

**System action**

Processing continues.

**User response**

None.

**KLVNA001: SHOWCB FIELDS=(ACBLEN,RPLLEN) ERROR: R15(*r15*) R0(*r0*)****Explanation**

A VSAM SHOWCB was issued to find the ACB and RPL lengths and failed.

**System action**

NAM initialization terminates without processing any other control point specifications. Any NAM database is unavailable.

**User response**

Consult *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets* to determine the reason the SHOWCB macro instruction failed. Return and reason codes are indicated in the *r15* and *r0* fields.

**Message Type**

WARNING

**KLVNA002: *parameters*****Explanation**

As the parameters in module KLVINNAM are read, a log audit trail is created.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVNA003: DATABASE INACCESSIBLE, NO VSAM LSR RESOURCES:  
DSNAME(*dsname*) CNTRLPT(*cntrlpt*)****Explanation**

NAM database *dsname* on control point *cntrlpt* cannot be used because no LSR resources were allocated during start-up. The parameters required, as specified in the RKLVIN DD, are LSRKEYLN, LSRPOOL, and LSRSTRNO.

**System action**

TMS:Engine start-up terminates.

**User response**

Contact IBM® Software Support.

**Message Type**

WARNING

**KLVNA004: DUPLICATE CONTROL POINT SPECIFICATION: CNTRLPT(*cntrlpt*)****Explanation**

The control point name *cntrlpt* specified in the initialization library member KLVINNAM is a duplicate.

**System action**

TMS:Engine initialization terminates.

**User response**

Correct the error in KLVINNAM and restart TMS:Engine.

**Message Type**

WARNING

**KLVNA005: DATABASE ALLOCATION FAILED: DSNAME(*dsname*)  
CNTRLPT(*cntrlpt*)****Explanation**

TMS:Engine was unable to allocate the data set *dsname*. The control point *cntrlpt* associated with the data set is also displayed.

**System action**

TMS:Engine start-up terminates.

**User response**

This message is accompanied by message KLVDA002, which gives a more specific reason for the error. Use the information provided to determine the cause of the error and restart TMS:Engine.

**Message Type**

WARNING

**KLVNA006: DATABASE INITIAL LOAD COMPLETE: DSNAME(*dsname*)  
CNTRLPT(*cntrlpt*)****Explanation**

Initialization has completed successfully for the NAM database *dsname* in control point *cntrlpt*.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVNA007: DATABASE *dsname* INITIAL LOAD *mm/dd/yy hh:mm:ss* ON *smfid*  
LAST ACCESSED *mm/dd/yy hh:mm:ss* ON *smfid2*****Explanation**

This message is logged to create an audit trail for each NAM database *dsname* specified in member KLVINNAM in the initialization library.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVNA008: KLVINNAM RKANPAR PARAMETERS:****Explanation**

Module KLVINNAM logs its start-up parameters as they are read from RKANPAR. This is the header message and will be followed by message KLVNA002.

**System action**

None.

**User response**

None.

**Message Type**

LOG

## **KLVNA009: UNABLE TO LOAD USER SECURITY EXIT: EP(*member*)**

### **Explanation**

TMS:Engine was unable to LOAD the security exit member chosen as a security validation option. This message is accompanied by message KLVCM003, which provides a more specific reason for the error.

### **System action**

TMS:Engine start-up terminates.

### **User response**

If message KLVCM003 precedes this message, determine the cause of the error, correct it, and restart TMS:Engine. If KLVCM003 does not precede this message, ensure that the load module exists in the RKANMODL concatenation and restart TMS:Engine.

### **Message Type**

ERRO

## **KLVNA010: CONTROLPOINT *cntrlpt* INITIALIZED**

### **Explanation**

NAM control point *cntrlpt* has been initialized.

### **System action**

None.

### **User response**

None.

### **Message Type**

INFO

## **KLVNA011: DATABASE INITIALIZATION FAILED: DSNAME(*dsname*) CNTRLPT(*cntrlpt*)**

### **Explanation**

An error was encountered during NAM initialization of control point *cntrlpt*.

### **System action**

TMS:Engine initialization terminates.

### **User response**

Make sure that the NAM database is available and is not allocated by another region.

### **Message Type**

WARNING

## **KLVNA012: GENCB BLK=ACB ERROR: R15(*r15*) R0(*r0*)**

### **Explanation**

A VSAM GENCB that was issued to create an ACB failed.

**System action**

TMS:Engine initialization terminates.

**User response**

Consult the t *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets* to determine the reason the GENCB macro instruction failed. Return and error codes are indicated in the r15 and r0 fields.

**Message Type**

WARNING

**KLVNA013: GENCB BLK=RPL ERROR: R15(*r15*) R0(*r0*)****Explanation**

A VSAM GENCB issued to create an RPL failed.

**System action**

TMS:Engine start-up terminates.

**User response**

Consult the *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets* to determine the reason the GENCB macro instruction failed. Return and reason codes are indicated in the *r15* and *r0* fields.

**Message Type**

WARNING

**KLVNA014: UNABLE TO OPEN NAM DATABASE: DSNAME(*dsname*) DDNAME(*ddn*) R15(*r15*) ACBERFLG(*acberflg*)****Explanation**

An attempt by TMS:Engine to OPEN the NAM database *dsname* failed. More information is provided in the message for diagnostic purposes.

**System action**

TMS:Engine start-up terminates.

**User response**

Consult the t *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets* to determine the reason the OPEN macro instruction failed. The return code is indicated in the *r15* field.

**Message Type**

WARNING

**KLVNA015: DATABASE INACCESSIBLE: DSNAME(*dsname*) CNTRLPT(*cntrlpt*)****Explanation**

The NAM database *dsname* is not accessible.

**System action**

TMS:Engine start-up terminates.

**User response**

Check the log for other messages concerning this data set to determine a more specific reason for the error. If none can be found, contact IBM® Software Support.

**Message Type**

WARNING

**KLVNA016: DATABASE RELATIVE KEY POSITION NOT 0: DSNAME(*dsname*)  
CNTRLPT(*cntrlpt*)****Explanation**

The NAM database *dsname* relative key position is not 0. The data set was not defined properly.

**System action**

TMS:Engine start-up terminates.

**User response**

Delete the NAM database in error, redefine it, and restart TMS:Engine. You may need to refer to the original installation procedures to determine the correct parameters when defining the NAM database.

**Message Type**

WARNING

**KLVNA017: DATABASE KEY LENGTH NOT *n*: DSNAME(*dsname*)  
CNTRLPT(*cntrlpt*)****Explanation**

While processing the NAM database *dsname* for control point *cntrlpt*, an error was detected in the key length. The length must be equal to *n*. Either an incorrect version of the NAM database is being used, or the database was not defined properly.

**System action**

TMS:Engine start-up terminates.

**User response**

Delete the NAM database in error, redefine it, and restart TMS:Engine. You may need to refer to the original installation procedures to determine the correct parameters when defining the NAM database.

**Message Type**

WARNING

**KLVNA018: DATABASE CONTROL RECORD NOT FOUND: DSNAME(*dsname*)  
CNTRLPT(*cntrlpt*)****Explanation**

While attempting to initialize the NAM environment for control point *cntrlpt*, an error was detected in the VSAM data set *dsname*. The control record for the database could not be located. This message is accompanied by KLVVS*nnn* messages, that give a more specific reason for failure to locate the record.

**System action**

TMS:Engine start-up terminates.

**User response**

Look in the log for other messages concerning this data set to determine a more specific reason for the error. If none can be found, contact IBM® Software Support.

**Message Type**

WARNING

**KLVA019: DATABASE INITIAL LOAD FAILED: DSNAME(*dsname*)  
CNTRLPT(*cntrlpt*) R15(*r15*) RPLERRCD(*rplerrcd*)****Explanation**

An I/O error was detected while processing the NAM cluster.

**System action**

TMS:Engine start-up fails.

**User response**

Consult the *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets* to determine the reason the PUT macro instruction failed. Return and error codes are indicated in the *r15* and *rplerrcd* fields. If the error cannot be attributed to a user error, contact IBM® Software Support.

**Message Type**

WARNING

**KLVA020: *keyword(value)* IS INVALID FOR CNTRLPT(*cntrlpt*); DEFAULTS  
TO *def*****Explanation**

*keyword* in the KLVINNAM member of RKANPAR was specified with a value that is not a valid choice.

**System action**

The default value, *def*, will be used. TMS:Engine initialization continues.

**User response**

Correct the *keyword* value. If the default value is unacceptable, recycle TMS:Engine.

**Message Type**

WARNING

**KLVA021: DATABASE CONTROL RECORD UPDATE FAILED: DSNAME(*dsn*)  
CNTRLPT(*cntrlpt*)****Explanation**

During NAM initialization, TMS:Engine attempted to update the database (*dsn*) associated with control point *cntrlpt*. The update failed.

**System action**

NAM initialization continues, to identify any other errors. TMS:Engine will terminate after NAM initialization finishes.

**User response**

Review RKLVLLOG for KLVVS0nn messages that will identify the error. Correct the error and restart TMS:Engine.

**Message Type**

WARNING

## **KLVNA022: MODCB BLK=ACB ERROR: R15(*r15*) R0(*r0*)**

### **Explanation**

During NAM initialization, TMS:Engine attempted to update a VSAM ACB. The update failed.

### **System action**

NAM initialization continues, to identify any other errors. TMS:Engine will terminate after NAM initialization finishes.

### **User response**

Consult the t *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets* to determine the reason the MODCB macro instruction failed. Return and reason codes are indicated in the *r15* and *r0* fields.

### **Message Type**

WARNING

## **KLVNA023: DATABASE DSNAME RETRIEVAL FAILED, RC(*rc*) ERROR(*error*) INFO(*info*) DDNAME(*ddn*) CNTRLPT(*cntrlpt*)**

### **Explanation**

During NAM initialization, an attempt to determine the data set name associated with DD *ddn*. The z/OS® DYNALLOC function failed with the indicated return, error, and info codes.

### **System action**

NAM initialization continues, to identify any other errors. TMS:Engine will terminate after NAM initialization finishes.

### **User response**

Consult the *IBM® z/OS® MVS™ Programming: Authorized Assembler Services Reference* to determine the reason DYNALLOC failed.

### **Message Type**

WARNING

## **KLVNA024: DATA=*xxxxxxxx* IS INVALID**

### **Explanation**

The value specified for the DATA parameter in the KLVINNAM member is not valid. The valid values are **ABOVE** and **BELOW**.

### **System action**

Initialization is terminated.

### **User response**

Edit the KLVINNAM member and correct the parameter specification.

### **Message Type**

WARNING

## **KLVNA025: CONTROL POINT OPTIONS NOT VALID WITH DATA=**

### **Explanation**

Control point options may not be specified when the DATA parameter is specified.

**System action**

Initialization is terminated.

**User response**

Edit the KLVINNAM member and correct the parameter specification.

**Message Type**

WARNING

**KLVNA026: DATA= ALREADY DEFINED; IGNORED****Explanation**

The DATA parameter is specified more than once in the KLVINNAM member.

**System action**

The first specification is used and the second specification is ignored. Processing continues.

**User response**

Edit the KLVINNAM member and correct the parameter specification.

**Message Type**

WARNING

**KLVNA027: VALUE FOR KEYWORD REUSEPW(*nnnn*) IS INVALID, DEFAULTING TO 8, VALUES FROM 0 TO 8 ARE ACCEPTED.****Explanation**

The value of the REUSEPW parameter is not a decimal integer between 0 and 8.

**System action**

The value of the REUSEPW parameter is assumed to be **8** and processing continues.

**User response**

Edit the KLVINNAM member and correct the parameter specification.

**Message Type**

WARNING

**KLVNA028: UNABLE TO LOAD USER PARAMETER EXIT: EP(*nnnnnnnn*)****Explanation**

The indicated user parameter exit was specified, but no routine by that name can be found.

**System action**

Initialization is terminated.

**User response**

Edit the KLVINNAM member and correct the parameter specification. If the parameter value is correct, check to insure that the load module *nnnnnnnn* exists in a data set accessible to IBM® Tivoli® Monitoring.

**Message Type**

WARNING

## **KLVNA029: CONTROL POINT OPTIONS NOT VALID WITH FIELDEXIT=**

### **Explanation**

Control point options may not be specified when the FIELDEXIT parameter is specified.

### **System action**

Initialization is terminated.

### **User response**

Edit the KLVINNAM member and correct the parameter specification.

### **Message Type**

WARNING

## **KLVNA030: DUPLICATE FIELDEXIT PARAMETER ENCOUNTERED**

### **Explanation**

More than one FIELDEXIT parameter was found in the KLVINNAM member.

### **System action**

The first FIELDEXIT parameter is used and any others are ignored. Processing continues.

### **User response**

Edit the KLVINNAM member and correct the parameter specification.

### **Message Type**

WARNING

## **KLVNA031: CLASSES DESCRIPTION NOT FOUND: CNTRLPT(*cntrlpt*) RKANPAR(RKANPAR)**

### **Explanation**

The member specified on the CLASSES= parameter of control point cntrlpt was not found in RKANPAR.

### **System action**

TMS:Engine start-up fails.

### **User response**

Make sure that the correct member name of the protected class list is specified, and try again.

### **Message Type**

ALERT

## **KLVNA032: DUPLICATE CLASS DEFINITION: CNTRLPT(*cntrlpt*) RKANPAR(RKANPAR) LINE(*line*)**

### **Explanation**

The resource class name specified has already been defined.

### **System action**

TMS:Engine start-up fails.

**User response**

Make sure all resource class names are unique and try again.

**Message Type**

ALERT

**KLVNA033: INVALID READAUTH BYTE X'*xx*', CNTRLPT(*nnnnnnnn*)  
*ddname(member)*****Explanation**

The value specified for READAUTH for control point *nnnnnnnn* in the specified member is not valid.

**System action**

Initialization is terminated.

**User response**

Edit the indicated member and correct the parameter specification.

**Message Type**

ALERT

**KLVNA034: DATABASE ALLOCATION FAILED - RESOURCE ERROR:  
DSNAME(*dsname*) CNTRLPT(*cntrlpt*)****Explanation**

TMS:Engine was unable to allocate the data set *dsname*, because of a logical resource manager error. The control point *cntrlpt* associated with the data set is also displayed.

**System action**

TMS:Engine start-up terminates.

**User response**

This error is probably due to insufficient free storage. Make sure storage pre-allocated by RKANPAR member KLVINSTG has not depleted all storage specified by the MAXIMUM parameter in RKLVIN.

**Message Type**

WARNING

**KLVNA035: DATABASE ALLOCATION FAILED: DSNAME(*dsname*)  
CNTRLPT(*cntrlpt*)****Explanation**

TMS:Engine was unable to allocate the data set *dsname*. The control point *cntrlpt* associated with the data set is also displayed.

**System action**

TMS:Engine start-up terminates.

**User response**

Review RKLVLLOG for message KLVDA002 followed by IBM® IKJ message from SVC99. Correct the problem and retry.

**Message Type**

WARNING

**KLVNA036: CONTROL POINT OPTIONS NOT VALID WITH VALIDATE=****Explanation**

The VALIDATE keyword was specified on the same logical statement as the controlpoint definition in member KLVINNAM in the initialization library.

**System action**

TMS:Engine start-up terminates.

**User response**

Make sure the VALIDATE keyword has been specified as a separate logical statement from the controlpoint definition and try again.

**Message Type**

WARNING

**KLVNA037: VALIDATE= *validagte* IS INVALID****Explanation**

An invalid value for the VALIDATE keyword was specified in member KLVINNAM in the initialization library.

**System action**

TMS:Engine start-up terminates.

**User response**

Make sure the VALIDATE keyword value is either SINGLE or MULTIPLE and try again.

**Message Type**

WARNING

**KLVNA038: VALIDATE= ALREADY DEFINED; IGNORED****Explanation**

The VALIDATE keyword was specified more than once in member KLVINNAM in the initialization library.

**System action**

TMS:Engine start-up continues. The duplicate keyword is ignored.

**User response**

Remove the duplicate keyword.

**Message Type**

WARNING

**KLVNA039: CONTROL POINT OPTIONS NOT VALID WITH FOLD=****Explanation**

Control point options may not be specified when the FOLD parameter is specified.

**System action**

Initialization is terminated.

**User response**

Edit the KLVINNAM member and correct the parameter specification.

**Message Type**

WARNING

**KLVNA040: FOLD= ALREADY DEFINED; IGNORED****Explanation**

More than one FOLD parameter was found in the KLVINNAM member.

**System action**

The first FOLD parameter is used and any others are ignored. Processing continues.

**User response**

Edit the KLVINNAM member and correct the parameter specification.

**Message Type**

WARNING

**KLVNA041: FOLD=*xxxx* IS INVALID****Explanation**

The value specified for the FOLD parameter in the KLVINNAM member is not valid. The valid values are **YES** and **NO**.

**System action**

Initialization is terminated.

**User response**

Edit the KLVINNAM member and correct the parameter specification.

**Message Type**

WARNING

**KLVNA042: SAF PROFILE *ssss.jjjjjjjj*.KLVINNAM.FOLD READING *safrc racfrc racfrsn*****Explanation**

Class \$KOBSEC is always checked for a profile that matches *ssss.jjjjjjjj*.KLVINNAM.FOLD; this message displays the SAF return code, RACF return code, and RACF reason code from that SAF call. *ssss* is the smfid and *jjjjjjjj* is the started-task name.

**System action**

TMS:Engine start-up continues.

**User response**

If the SAF profiles are not in use to specify the FOLD and CNTRLPT parameters, then a non-zero SAF return code is expected and those parameters will be read from RKANPARU(*Kxx*INNAM).

**Message Type**

INFO

**KLVNA043: CONTROL POINT IGNORED CNTRLPT(*cntrlpt*). SAF PROFILE IS USED.****Explanation**

Control point *cntrlpt* was found in RKANPARU(KxxINNAM) but was ignored because SAF profiles were in use.

**System action**

TMS:Engine start-up continues.

**User response**

None required. This message can be avoided by removing or commenting out the CNTRLPT parameters in RKANPARU(KxxINNAM).

**Message Type**

INFO

**KLVNA044: NO APPLDATA RETURNED FOR SAF PROFILE (*ssss.jjjjjjjj.KLVINNAM.cntrlpt*)****Explanation**

This profile was found but the APPLDATA does not contain any CNTRLPT parameters.

**System action**

Initialization is terminated.

**User response**

Ensure that the required CNTRLPT parameters are added to this profile.

**Message Type**

WARNING

**KLVNA045: NO CONTROL POINTS FOUND IN SAF PROFILES****Explanation**

Profile *ssss.jjjjjjjj.KLVINNAM.FOLD* was found, but no *ssss.jjjjjjjj.KLVINNAM.cntrlpt* profiles were found.

**System action**

Initialization is terminated.

**User response**

If SAF profile control of CNTRLPT parameters is required, there needs to be at least one *ssss.jjjjjjjj.KLVINNAM.cntrlpt* profile with valid APPLDATA; if SAF profile control of CNTRLPT parameters is not required, remove profile *ssss.jjjjjjjj.KLVINNAM.FOLD*.

**Message Type**

WARNING

**KLVNA046: TOO MANY CONTROL POINTS FOUND IN SAF PROFILES****Explanation**

More than 99 *ssss.jjjjjjjj.KLVINNAM.cntrlpt* profiles were found.

**System action**

Initialization is terminated.

**User response**

Reduce the number of `ssss.jjjjjjjj.KLVINNAM.cntrlpt` profiles to be 99 or fewer.

**Message Type**

WARNING

**KLVNA047: safprofilename****Explanation**

This shows which profile matched the current resource.

**System action**

TMS:Engine start-up continues.

**User response**

None required.

**Message Type**

INFO

**KLVNA101: UNABLE TO ACCESS NAM DATABASE: DSNAME(*dsname*)  
CNTRLPT(*cntrlpt*)****Explanation**

The network access manager (NAM) was called to validate security for a user. DB was specified as an option for the control point *cntrlpt*, but the database associated with the control point could not be accessed.

**System action**

Security validation fails and the user is logged off.

**User response**

Check initialization library member KLVINNAM to verify that the control point and database have been defined correctly.

**Message Type**

ALERT

**KLVNA102: USER NOT DEFINED: CNTRLPT(*cntrlpt*) USERID(*userid*)  
[GROUP(*group*)] [TERM(*terminal*)] [APPL(*appl*)]****Explanation**

Security validation for the specified user failed when the network access manager (NAM) was called. The supplied user ID is invalid. This message can be generated if the address space is not APF-authorized. Fields of interest are the control point name *cntrlpt*, the userid *userid*, the group *group*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

**System action**

This message is installation specific. The system action depends on the configuration of NAM. If using NAM to do the validation, the userid was not defined in the NAM database. If using a NAM exit, the external security

package was unable to locate the userid. This message will appear in RKLVLOG and may be seen at the terminal if the external security package has not passed a message back to NAM. If a message was passed back by the external security package, that message will be seen.

#### User response

If you are a user viewing this message on your screen, re-enter a valid user ID. Verify that the address space is APF-authorized.

#### Message Type

INFO

### **KLVNA103: PASSWORD NOT AUTHORIZED: CNTRLPT(*cntrlpt*) USERID(*userid*) [GROUP(*group*)] [TERM(*terminal*)] [APPL(*appl*)]**

#### Explanation

Security validation for the specified user failed when the network access manager (NAM) was called. The password supplied is invalid for the userid. Fields of interest are the control point name *cntrlpt*, the userid *userid*, the group *group*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

#### System action

This message is installation specific. The system action depends on the configuration of NAM. If using NAM to do the validation, the password defined in the NAM database was different than the one entered at the terminal. If using a NAM exit, the external security package detected a different password than the one defined for the user. This message will appear in RKLVLOG and may be seen at the terminal if the external security package has not passed a message back to NAM. If a message was passed back by the external security package, that message will be seen.

#### User response

If you are a user viewing this message on your screen, supply a correct password.

#### Message Type

INFO, VIEW

### **KLVNA104: CURRENT PASSWORD EXPIRED: CNTRLPT(*cntrlpt*) USERID(*userid*) [GROUP(*group*)] [TERM(*terminal*)] [APPL(*appl*)]**

#### Explanation

Security validation for the specified user failed when the network access manager (NAM) was called. The current password has expired. Fields of interest are the control point name *cntrlpt*, the userid *userid*, the group *group*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

#### System action

This message is installation specific. The system action depends on the configuration of NAM. If using NAM to do the validation, the password defined in the NAM database has expired. If using a NAM exit, the password defined to the external security package has expired. This message will appear in RKLVLOG and may be seen at the terminal if the external security package has not passed a message back to NAM. If a message was passed back by the external security package, that message will be seen.

#### User response

If you are a user viewing this message on your screen, supply a new password.

## Message Type

INFO, VIEW

### **KLVNA105: NEW PASSWORD INVALID: CNTRLPT(*cntrlpt*) USERID(*userid*) [GROUP(*group*)] [TERM(*terminal*)] [APPL(*appl*)]**

#### Explanation

Security validation for the specified user failed when the network access manager (NAM) was called. The new password was invalid. Fields of interest are the control point name *cntrlpt*, the userid *userid*, the group *group*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

#### System action

This message is installation specific. The system action depends on the configuration of NAM. If using NAM to do the validation, the new password passed to NAM was invalid. If using a NAM exit, the new password passed to the external security package was invalid. This message will appear in RKLVLOG and may be seen at the terminal if the external security package has not passed a message back to NAM. If a message was passed back by the external security package, that message will be seen.

#### User response

If you are a user viewing this message on your screen, supply a valid new password.

## Message Type

INFO, VIEW

### **KLVNA106: USER NOT DEFINED TO GROUP: CNTRLPT(*cntrlpt*) USERID(*userid*) [GROUP(*group*)] [TERM(*terminal*)] [APPL(*appl*)]**

#### Explanation

Security validation for the specified user failed when the network access manager (NAM) was called. The user *userid* is not defined to the group specified. Fields of interest are the control point name *cntrlpt*, the userid *userid*, the group *group*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

#### System action

This message is installation specific. This message will appear with the use of an external security package. The group supplied for the entered userid was not valid. This message will appear in RKLVLOG and may be seen at the terminal if the external security package has not passed a message back to NAM. If a message was passed back by the external security package, that message will be seen.

#### User response

If you are a user viewing this message on your screen, specify a valid group for the userid supplied.

## Message Type

INFO, VIEW

**KLVNA107: USER ACCESS REVOKED: CNTRLPT(*cntrlpt*) USERID(*userid*)  
[GROUP(*group*)] [TERM(*terminal*)] [APPL(*appl*)]**

**Explanation**

Security validation for the specified user failed when the network access manager (NAM) was called. The user (*userid*) access has been revoked. Fields of interest are the control point name *cntrlpt*, the userid *userid*, the group *group*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

**System action**

This message is installation specific. This message will appear with the use of an external security package. Access will no longer be allowed for this userid due to excessive invalid password attempts, userid expiration, or some other internal processing by the external security package. This message will appear in RKLVLLOG and may be seen at the terminal if the external security package has not passed a message back to NAM. If a message was passed back by the external security package, that message will be seen.

**User response**

Access has been revoked for this userid. Contact your security administrator for the external security package and have the userid reset.

**Message Type**

INFO, VIEW

**KLVNA108: GROUP ACCESS REVOKED: CNTRLPT(*cntrlpt*) USERID(*userid*)  
[GROUP(*group*)] [TERM(*terminal*)] [APPL(*appl*)]**

**Explanation**

Security validation for the specified user failed when the network access manager (NAM) was called. Access to the group supplied has been revoked for this userid. Fields of interest are the control point name *cntrlpt*, the userid *userid*, the group *group*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

**System action**

This message is installation specific. This message will appear with the use of an external security package. Access will no longer be allowed for this userid/group due to excessive invalid password attempts, userid expiration, or some other internal processing by the external security package. This message will appear in RKLVLLOG and may be seen at the terminal if the external security package has not passed a message back to NAM. If a message was passed back by the external security package, that message will be seen.

**User response**

Access has been revoked for this userid/group combination. Contact your security administrator for the external security package and have the userid reset.

**Message Type**

INFO, VIEW

## **KLVNA109: TERMINAL NOT AUTHORIZED: CNTRLPT(*cntrlpt*) USERID(*userid*) [GROUP(*group*)] [TERM(*terminal*)] [APPL(*appl*)]**

### **Explanation**

Security validation for the specified user failed when the network access manager (NAM) was called. The user *userid* is not authorized to use this terminal. Fields of interest are the control point name *cntrlpt*, the userid *userid*, the group *group*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

### **System action**

This message is installation specific. This message will appear with the use of an external security package. Access is not allowed for the *userid* from the terminal where signon was attempted. This message will appear in RKLVLOG and may be seen at the terminal if the external security package has not passed a message back to NAM. If a message was passed back by the external security package, that message will be seen.

### **User response**

If you are a user viewing this message on your screen, correct the *userid* or signon from a different terminal. If the problem persists, contact the security administrator for the external security package.

### **Message Type**

INFO, VIEW

## **KLVNA110: APPLICATION NOT AUTHORIZED: CNTRLPT(*cntrlpt*) USERID(*userid*) [GROUP(*group*)] [TERM(*terminal*)] [APPL(*appl*)]**

### **Explanation**

Security validation for the specified user failed when the network access manager (NAM) was called to validate security. The user *userid* is not authorized to use the specified application. Fields of interest are the control point name *cntrlpt*, the userid *userid*, the group *group*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

### **System action**

This message is installation specific. This message will appear with the use of an external security package. Access is not allowed for the *userid* to the application where the signon was attempted. The *userid* is restricted to a set of applications and the application where the signon was attempted was not one of those. This message will appear in RKLVLOG and may be seen at the terminal if the external security package has not passed a message back to NAM. If a message was passed back by the external security package, that message will be seen.

### **User response**

If you are a user viewing this message on your screen, correct the *userid* or signon to a different application. If the problem persists, contact the security administrator for the external security package.

### **Message Type**

INFO, VIEW

**KLVNA111: OPERATOR NOT AUTHORIZED: CNTRLPT(*cntrlpt*)  
[OPERATOR(*operator*)] [TERM(*terminal*)] [APPL(*appl*)]**

**Explanation**

Security validation for the specified user failed when the Network Access Manager (NAM) was called. The operator *operator* is not authorized to use the TMS:Engine operator facility. Fields of interest are the control point name *cntrlpt*, the operator id *operator*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

**System action**

This message is installation specific. This message will appear with the use of an external security package. Access is not allowed for the userid to the TMS:Engine operator facility by the external security package. This message will appear in RKLVLOG and may be seen at the terminal if the external security package has not passed a message back to NAM. If a message was passed back by the external security package, that message will be seen.

**User response**

If you are a user viewing this message on your screen, correct the operator ID. If the problem persists, contact your security administrator for the security package.

**Message Type**

INFO, VIEW

**KLVNA112: COMMAND NOT AUTHORIZED: CNTRLPT(*cntrlpt*)  
[OPERATOR(*operator*)] [COMMAND(*command*)] [TERM(*terminal*)]  
[APPL(*appl*)]**

**Explanation**

Security validation for the specified user failed when the network access manager (NAM) was called. The operator *operator* is not authorized to issue the specified command. Fields of interest are the control point name *cntrlpt*, the operator ID *operator*, the command *command*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

**System action**

The command terminates. This message is installation specific. This message will appear with the use of an external security package. The operator command entered was not allowed by the external security package. This message will appear in RKLVLOG and may be seen at the terminal if the external security package has not passed a message back to NAM. If a message was passed back by the external security package, that message will be seen.

**User response**

If you are a user viewing this message on your screen, correct the command or validate the command. If the problem persists, contact your security administrator for the external security package.

**Message Type**

INFO, VIEW

**KLVNA113: PARAMETER REJECTED BY USER EXIT: CNTRLPT(*cntrlpt*)  
[OPERATOR(*operator*)] [COMMAND(*command*)] [TERM(*terminal*)] [APPL(*appl*)**

**Explanation**

A NAM FIELDEXIT has determined that a NAM request field is not valid. The exit should have provided additional messages about the error. Fields of interest are the control point name *cntrlpt*, the operator ID *operator*, the command *command*, the terminal name *terminal*, and the application name *appl*. The control point name *cntrlpt* may be in the form *cntrlpt1-cntrlpt2*, where *cntrlpt1* refers to the control point used and *cntrlpt2* to the control point requested. The message is logged to create an audit trail, but this can be overridden at start-up time.

**System action**

The function is not completed. This message is installation specific, and may be generated for any NAM function. This message will appear in RKLVLLOG.

**User response**

Contact your system programmer to determine why the installation exit has rejected the value.

**Message Type**

INFO, VIEW

**KLVNA114: PASSTICKET REQUEST NOT AUTHORIZED: CNTRLPT(*cntrlpt*)  
[OPERATOR(*operator*)] [COMMAND(*command*)] [TERM(*terminal*)] [APPL(*appl*)**

**Explanation**

A NAM PASSTICKET request has been denied by the NAM user exit and the exit has not supplied an override message.

**System action**

No PassTicket is generated.

**User response**

Contact your security administrator to ensure that you are authorized to generate a PassTicket for the destination application and userid.

**Message Type**

INFO, VIEW

**KLVNA151: UNABLE TO ACCESS NAM DATABASE: DSNAME(*dsname*)  
CNTRLPT(*cntrlpt*)**

**Explanation**

Security validation for the specified user failed when NAM was called. The database specified as an option for the control point *cntrlpt* could not be accessed.

**System action**

Security validation fails and the user is logged off.

**User response**

Check the definitions of the control point and the database in the initialization library member KLVINNAM.

**Message Type**

ALERT

## **KLVA251: UNABLE TO {DELETE | DEFINE} SAF RESOURCE LIST: CLASS(*class*) R15(*r15*)**

### **Explanation**

The RACROUTE macro was issued to build or delete an in-storage profile for class *class* and failed. *r15* is the code returned by RACROUTE.

### **System action**

For DELETE, the in-storage profile remains in virtual storage. For DEFINE, the profile is unavailable.

### **User response**

Refer to *RACROUTE Macro Reference for MVS™ and VM* (GC28-1366) for the meaning of *r15*.

### **Message Type**

INFO

## **KLVA252: UNABLE TO {DELETE | DEFINE} RACF® RESOURCE LIST: CLASS(*class*) R15(*r15*)**

### **Explanation**

The RACLIST macro was issued to build or delete an in-storage profile for class *class* and failed. *r15* is the code returned by RACLIST.

### **System action**

For DELETE, the in-storage profile remains in virtual storage. For DEFINE, the profile is unavailable.

### **User response**

Refer to the *RACROUTE Macro Reference for MVS™ and VM* for the meaning of *r15*.

### **Message Type**

INFO

## **KLVA253: RESOURCE LIST BUILD DISABLED, NOT APF AUTHORIZED**

### **Explanation**

An attempt was made (either at initialization or through the NAM RACLIST command) to build an in-storage profile (for use by your security system). The attempt failed because the address space is not APF-authorized.

### **System action**

TMS:Engine will use RACHECK macros instead of FRACHECK to verify security access.

### **User response**

If you desire in-storage profiles, APF authorize the address space. If your security system does not provide in-storage profiles, or you have specified your own security exits in KLVINNAM, you may ignore this message.

### **Message Type**

INFO

## **KLVNA254: UNABLE TO CREATE DUMMY ACEE: RC(rc)**

### **Explanation**

The NAM RACLIST command was issued to refresh in-storage profiles, but failed because a dummy ACEE could not be created.

### **System action**

The command is ignored.

### **User response**

Use the return code to determine the reason for the RACROUTE (or possibly RACINIT failure). Refer to the *IBM® z/OS® MVS™ Programming: Authorized Assembler Services Reference* for the meaning of *rc*.

### **Message Type**

INFO

## **KLVNA255: UNABLE TO DELETE DUMMY ACEE: RC(rc)**

### **Explanation**

The NAM RACLIST command was issued to refresh in-storage profiles. The refresh was successful, but the dummy ACEE could not be deleted.

### **System action**

The ACEE remains active.

### **User response**

Use the return code to determine the reason for the RACROUTE (or possibly RACINIT failure). Refer to IBM's RACROUTE Macro Reference (RACROUTE) or *IBM® z/OS® MVS™ Programming: Authorized Assembler Services Reference* for the meaning of *rc*.

### **Message Type**

INFO

## **KLVNA256: REFRESH OF RESOURCE PROFILES COMPLETE**

### **Explanation**

The NAM RACLIST command was issued to refresh in-storage profiles. The refresh was successful.

### **System action**

None.

### **User response**

None.

### **Message Type**

INFO

## **KLVNT001: "NTD *dialog*" DIALOG MANAGER INIT FAILED**

### **Explanation**

While performing an NTD operator command, TMS:Engine could not initialize the dialog manager for the dialog, *dialog*.

**System action**

The NTD command terminates.

**User response**

Save the z/OS® SYSLOG, and the TMS:Engine RKLVLLOG and run sheets. Then contact IBM® Software Support.

**Message Type**

ERROR

**KLVT002: "NTD *dialog*" DIALOG INVOCATION FAILED; DIALOG MANAGER RC(*rc*)****Explanation**

The non-terminal dialog, *dialog*, failed with a return code of *rc*.

**System action**

The NTD command terminates.

**User response**

Refer to message KLVD011 for a list of return codes, their meanings, and responses.

**Message Type**

ERROR

**KLVO001: OPERATOR(*operid*) ddname(*member*) LINE(*nnnn*) 'cccccccc'****Explanation**

The command *cccccccc* from line *nnnn* in the indicated member is being processed on behalf of *operid*.

**System action**

The command is processed.

**User response**

None.

**Message Type**

LOG

**KLVO002: INVALID COMMAND BUFFER [*text*]****Explanation**

A zero or negative length was received by the TMS:Engine command processor. The optional *text* may be added by TMS:Engine modules to further describe the error.

**System action**

The current operation terminates.

**User response**

Contact IBM® Software Support.

**Message Type**

ERROR

## **KLTOP003: INVALID OPERATOR ID [*text*]**

### **Explanation**

A command was issued specifying an inactive operator ID. This typically occurs when the AS command is issued just as the operator the command was directed to was logging off. The optional *text* may be added by TMS:Engine modules to further describe the error.

### **System action**

The command terminates.

### **User response**

If the command cannot be attributed to a user error, contact IBM® Software Support.

### **Message Type**

ERROR

## **KLTOP004: APPLICATION NOT ACTIVE [*text*]**

### **Explanation**

A command was issued and directed to an inactive TMS:Engine application. The optional *text* may be added by TMS:Engine modules to further describe the error.

### **System action**

The command terminates.

### **User response**

Validate the application ID and reissue the command.

### **Message Type**

ERROR

## **KLTOP005: APPLICATION NOT ACCEPTING COMMANDS [*text*]**

### **Explanation**

A command was issued and directed to an TMS:Engine application that does not have a common interface. The optional *text* may be added by TMS:Engine modules to further describe the error.

### **System action**

The command terminates.

### **User response**

Validate the application applid to determine if a command interface is defined. Reissue the command specifying a valid application name.

### **Message Type**

ERROR

## **KLTOP006: COMMAND NOT FOUND [*text*]**

### **Explanation**

The command or CLIST issued could not be located. The optional *text* may be added by TMS:Engine modules to further describe the error.

**System action**

The command fails.

**User response**

Verify that:

1. The command issued is a valid TMS:Engine command, or
2. The CLIST is located in the TMS:Engine command library (RKANCMD).

**Message Type**

ERROR

**KLTOP007: COMMAND NOT AUTHORIZED [*text*]****Explanation**

An TMS:Engine command issued by an unauthorized operator. The optional *text* may be added by TMS:Engine modules to further describe the error.

**System action**

The command fails.

**User response**

None.

**Message Type**

ERROR

**KLTOP008: *clist* CLIST COMPLETED****Explanation**

The RKANCMD clist member *clist* has completed execution.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLTOP009: *command* COMMAND COMPLETED****Explanation**

The command *command* has completed its output.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLTOP011: INVALID CLASS NAME: *class*****Explanation**

The DISPLAY command was issued with an invalid class *class*.

**System action**

The command fails.

**User response**

Re-enter the command with a valid class.

**Message Type**

ERROR

**KLTOP012: \*\*\* ACTIVE RESOURCE LIST \*\*\* *class.arg: USE(user) TOKEN(rsid) OWNER(owner) class.arg: USE(user) TOKEN(rsid) n OF m RESOURCES DISPLAYED*****Explanation**

The DISPLAY command was issued and the resource list specified is displayed. Fields of interest are the class name *class*, the resource number *rsid* and the owner ID *owner*.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLTOP021: SHUTDOWN COMMAND IGNORED, IMMEDIATE SHUTDOWN ALREADY IN PROGRESS****Explanation**

The user has entered a SHUTDOWN command while an immediate shutdown was in progress.

**System action**

The command is ignored.

**User response**

None.

**Message Type**

INFO

## **KL VOP022: SHUTDOWN MUST BE CONFIRMED WITHIN *confirm* SECONDS**

### **Explanation**

The SHUTDOWN command was issued requesting TMS:Engine termination. A confirming SHUTDOWN command must be issued within *confirm* seconds, where *confirm* is the number of seconds that can occur between initial and confirming shutdown requests. This is a TMS:Engine initialization parameter with a default value of 15 seconds.

### **System action**

TMS:Engine shutdown proceeds if confirmed within confirm seconds.

### **User response**

Issue another SHUTDOWN command so TMS:Engine termination can proceed.

### **Message Type**

REPLY, INFO

## **KL VOP023: SHUTDOWN STARTED BY *operator* AT *device***

### **Explanation**

TMS:Engine shutdown was requested and confirmed, and shutdown is proceeding. The *operator* and *device* identify the origin of the command.

### **System action**

None.

### **User response**

None.

### **Message Type**

WARNING

## **KL VOP024: SHUTDOWN PROCEEDING: *rescnt* RESOURCE(S) OUTSTANDING**

### **Explanation**

TMS:Engine termination was requested and confirmed, and termination is proceeding. The number *rescnt* refers to the number of resources awaiting termination.

### **System action**

None.

### **User response**

Issue a second SHUTDOWN command to perform an immediate shutdown and terminate all outstanding resources.

### **Message Type**

INFO, VIEW

## **KL VOP025: *number* SUBTASK(S) QUIESCED: DQA(*addr*)**

### **Explanation**

This message is logged to create an audit trail of each active subtask quiesced during TMS:Engine termination.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLTOP026: SUBTASK *subtask* DETACHED****Explanation**

This message is logged to create an audit trail of the detachment of each subtask during TMS:Engine termination.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLTOP027: SHUTDOWN COMPLETE, *nnnnK* PRIMARY STORAGE UNUSED****Explanation**

TMS:Engine termination has completed. The unused storage figure gives a rough guide to the remaining capacity in the current configuration.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLTOP028: CONFIRMATION NOT RECEIVED, SHUTDOWN BYPASSED****Explanation**

A confirming shutdown request was not issued in the allotted confirm seconds, where confirm is the number of seconds that can occur between initial and confirming shutdown requests. This is a TMS:Engine initialization parameter with a default value of 15 seconds.

**System action**

The shutdown request fails.

**User response**

Issue or confirm another initial shutdown request if TMS:Engine is to be terminated.

**Message Type**

ALERT

**KL VOP029: ABNORMAL TERMINATION REQUESTED BY SHUTDOWN****Explanation**

The SHUTDOWN command with the abend option was requested.

**System action**

TMS:Engine terminates with a dump.

**User response**

Contact IBM® Software Support.

**Message Type**

ALERT

**KL VOP030: IMMEDIATE SHUTDOWN STARTED BY *operator* AT *device*****Explanation**

The CONFIRM initialization parameter is zero for the SHUTDOWN command issued by operator *operator* at device *device*.

**System action**

TMS:Engine terminates.

**User response**

None.

**Message Type**

REPLY, WARNING

**KL VOP031: REPEATING COMMAND SCHEDULED EVERY *n*/****Explanation**

The TMS:Engine EVERY command was issued.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KL VOP032: ZERO INTERVAL NOT ALLOWED ON "EVERY" COMMAND****Explanation**

The TMS:Engine EVERY command was issued with zero as time interval operand.

**System action**

The "EVERY" command is ignored.

**User response**

Re-issue the command with a non-zero time interval operand.

**Message Type**

REPLY

**KLVOP033: TIME INTERVAL GREATER THAN 24:00:00 SPECIFIED****Explanation**

The TMS:Engine EVERY command was issued with a time interval operand which evaluated to greater than 24 hours.

**System action**

The "EVERY" command is ignored.

**User response**

Re-issue the command with a time interval operand that evaluates to less than 24 hours.

**Message Type**

REPLY

**KLVOP041: SESSION PASSED: LU(*luname*) DEST(*applid*)****Explanation**

LU *luname* was successfully passed to destination *applid* by the LOGOFF command.

### **Message Type**

ERROR

## **KL VOP123: INVALID PREFIX CHARACTER: *arg***

### **Explanation**

The TRACE command contains an invalid prefix character *arg* as one of the parameters.

### **System action**

The command fails.

### **User response**

Correct the invalid prefix character (it must be (+) or (-)) and reissue the command.

### **Message Type**

ERROR

## **KL VOP124: INTERNAL TRACE FACILITY DISABLED**

### **Explanation**

The TRACE command failed because the internal trace facility has been disabled.

### **System action**

The command fails.

### **Message Type**

ERROR

## **KL VOP125: TRACE REQUEST REJECTED. REQUIRED ARGUMENT MISSING**

### **Explanation**

The GTRACE command was entered with the ON|OFF operand without specifying a resource to be traced.

### **System action**

The trace request is rejected.

### **User response**

Specify the resource to be traced and reissue the command.

### **Message Type**

ERROR

## **KL VOP126: TRACE REQUEST REJECTED. INVALID CLASS(TERM|ACB) SPECIFIED**

### **Explanation**

An invalid CLASS was specified.

### **System action**

The trace request is rejected.

### **User response**

Specify a correct CLASS and reissue the command.

### **Message Type**

ERROR

## **KL VOP127: TRACE REQUEST REJECTED. INTERNAL TRACE FACILITY DISABLED.**

### **Explanation**

A GTRACE CLASS(INT) ON command has been issued but no internal trace table has been allocated at system startup.

### **System action**

The trace request is rejected.

### **User response**

If an internal trace is desired, specify DEBUG(Y) in the KLVSYSIN member of RKANPAR and recycle the system.

### **Message Type**

ERROR

## **KL VOP128: TRACE TERM|ACB(*resname*) QUEUED|ENABLED|DISABLED**

### **Explanation**

The trace request for *resname* of TERM or ACB has been performed.

### **System action**

None.

### **User response**

None.

### **Message Type**

ERROR

## **KL VOP129: TRACE REQUEST REJECTED. TERM(*resname*) NOT A PHYSICAL TERMINAL.**

### **Explanation**

The trace for *resname* of CLASS(TERM) has been requested, but the *resname* is not a physical terminal.

### **System action**

The trace request is rejected.

**User response**

Specify CLASS(ACB), or use the VSSTRACE command to trace virtual sessions.

**Message Type**

ERROR

**KLTOP130: GTF INTERFACE HAS NOT BEEN ENABLED****Explanation**

A trace request has been issued for a resource but the GTF interface has not been enabled.

**System action**

None.

**User response**

Issue the GTF ON command to enable GTF tracing.

**Message Type**

WARNING

**KLTOP131: TRACE CLASS(INT|TERM|ACB|DLG) STATUS:****Explanation**

This is the header message of the trace status display.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLTOP132: TRACE REQUEST REJECTED. INVALID ARGUMENT SPECIFIED.****Explanation**

A GTRACE command is specified with an invalid resname.

**System action**

The trace request is rejected.

**User response**

Correct and reissue the command.

**Message Type**

ERROR

**KLVP141: MONITOR MASK FOR *operator*: LOG : *mask* REPLY: *mask* ERROR:  
*mask* INFO : *mask* WARN : *mask* ALERT: *mask* VIEW: *mask* USER: *mask***

**Explanation**

The MONITOR command displays the current monitor mask. The mask parameter indicates if the message type is enabled (YES) or disabled (NO) for this operator. Refer to [“TMS:Engine codes” on page 2386](#) for more information on message types.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVP142: INVALID MESSAGE TYPE: *type***

**Explanation**

An invalid message type *type* was specified as one of the parameters of the MONITOR command.

**System action**

The command fails.

**User response**

Refer to the [“TMS:Engine codes” on page 2386](#) for more information on message types.

**Message Type**

ERROR

**KLVP143: INVALID PREFIX CHARACTER: *prefix***

**Explanation**

An invalid message type prefix *prefix* was specified as one of the parameters of the TMS:Engine MONITOR command.

**System action**

The command fails.

**User response**

Correct the invalid message type prefix (it must be (+) or (-)) and reissue the command.

**Message Type**

ERROR

**KLVP152: MODULE NOT FOUND: *module***

**Explanation**

The entry name *module* specified in the LINK command could not be found in the TMS:Engine load library. This message is accompanied by message KLVC003, which indicates a more specific reason why the module could not be found.

**System action**

The command fails.

**User response**

Determine if the entry name *module* is a valid member name or alias in the TMS:Engine load library.

**Message Type**

ERROR

**KLVO161: CLOSE IN PROGRESS: APPLID(*applid*)****Explanation**

The CLOSE command terminates application *applid*.

**System action**

Termination is proceeding for the application.

**User response**

None.

**Message Type**

REPLY

**KLVO162: APPLICATION NOT OPEN: APPLID(*applid*)****Explanation**

Application *applid* specified in the TMS:Engine CLOSE command is not open.

**System action**

The command fails.

**User response**

Re-enter the command with the correct applid.

**Message Type**

ERROR

**KLVO164: CRITICAL APPLICATION CANNOT BE CLOSED: APPLID(*applid*)****Explanation**

Application *applid* specified in the CLOSE command is not eligible to be terminated because it was opened with the critical attribute.

**System action**

The CLOSE command fails.

**User response**

Contact IBM® Software Support.

**Message Type**

ERROR

## **KL VOP165: CLOSE COMPLETE: APPLID(*applid*)**

### **Explanation**

The CLOSE command was issued against *applid* and completed successfully.

### **System action**

None.

### **User response**

None.

### **Message Type**

REPLY

## **KL VOP182: EMULATION SESSION NOT AVAILABLE: STATUS(*sense*)**

### **Explanation**

A virtual session specified in the EMLU3767 command was not available to service the request.

### **System action**

The command fails.

### **User response**

Refer to [“TMS:Engine codes” on page 2386](#) for the format of the STATUS (*sense*) field to determine the correct action to take. Look for other error messages referring to the virtual pool associated with this request.

### **Message Type**

ERROR

## **KL VOP183: EMULATION SESSION STARTED**

### **Explanation**

The emulation session specified in the EMLU3767 command was started successfully.

### **System action**

None.

### **User response**

None.

### **Message Type**

REPLY

## **KL VOP184: INVALID SEND STATUS: R1(hex)**

### **Explanation**

TMS:Engine returned an invalid send status for the EMLU3767 command.

### **System action**

None.

**User response**

Use *IBM® z/OS® Communications Server SNA Programming* and the R1 field to determine the cause of the error and take appropriate corrective action. The format of the R1 field is explained in [“TMS:Engine codes” on page 2386](#).

**Message Type**

ERROR

**KLVO185: EMULATION SESSION ENDED****Explanation**

The emulation session started via the EMLU3767 command has ended.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVO186: UNABLE TO ACQUIRE VIRTUAL SESSION WITH *applid*  
SENSE(*sense*)****Explanation**

The virtual session with *applid* specified by the EMLU3767 command could not be established.

**System action**

None.

**User response**

The format of the SENSE field is explained in [“TMS:Engine codes” on page 2386](#), which explains the cause of the error.

**Message Type**

ERROR

**KLVO191: REPLY FROM *operator*: COMMAND(*command*)****Explanation**

Operator *operator* issued command *command*. This message is issued to create an audit trail.

**System action**

None.

**User response**

None.

**Message Type**

LOG

## **KLVP191\_d: INVALID CLASS NAME: *class***

### **Explanation**

An AUTOPURG command has been issued from an operator session that specifies an invalid CLASS= operand.

### **System action**

The AUTOPURG command is not executed.

### **User response**

Correct the CLASS=values specified on the AUTOPURG command and attempt the command again.

### **Message Type**

ERROR

## **KLVP192: \*\*\* AUTOPURGE CANDIDATE LIST \*\*\* *restype.resname*: USE(*use*), RES(*resaddr*) OWNER(*restype.resname*) *nnn* RESOURCES SCHEDULED FOR AUTOPURGE**

### **Explanation**

AUTOPURG has displayed the candidate list for resources to be AUTOPURGED. The *restype* and *resname* fields show the class and name of the resource to be AUTOPURGED and also of the OWNER of the resource, if one exists. The *use* field shows the current use count for the resource. One line of resource data will appear for each resource which matches the AUTOPURG criteria. The *nnn* field of the last line of the message displays the total number of resources that meet the AUTOPURG criteria.

### **System action**

None.

### **User response**

None.

### **Message Type**

REPLY

## **KLVP193: \*\*\* AUTOPURGED RESOURCES \*\*\* *restype.resname*: USE(*use*), RES(*resaddr*) OWNER(*restype.resname*) *xxx* OF *yyy* RESOURCES REQUIRED AUTOPURGE**

### **Explanation**

AUTOPURG has displayed the resources that actually were AUTOPURGED. The *restype* and *resname* fields show the class and name of the AUTOPURGED resource and also of the OWNER, if one exists. The *use* field shows the current use count for the resource. Resources are not actually terminated until the use count goes to zero. An AUTOPURG must be done for each resource until the use count goes to zero to purge the resource. The last line of the display shows the number of resources that were scheduled (*xxx* field) and the number that actually had their use count decremented (*yyy* field).

### **System action**

None.

### **User response**

If the USE count is still positive, another AUTOPURG command should be issued to purge the resource.

**Message Type**

ALERT

**KLVO194: RESOURCE NAME IS REQUIRED****Explanation**

The AUTOPURGE command requires a resource name as part of the AUTOPURGE criteria.

**System action**

The AUTOPURGE command is not executed.

**User response**

To determine the resource name of the resource to AUTOPURGE, the DISPLAY operator command can be used to show resources that are currently in PURGE status and therefore available for AUTOPURGE.

**Message Type**

ERROR

**KLVO195: *restype.resname1* OWNS *restype.resname2*, NOT PURGEABLE****Explanation**

The AUTOPURGE command has detected that resource named by *resname1* owns the resource named by *resname2*. This resource will not be AUTOPURGED until all resources owned by it have been terminated.

**System action**

An AUTOPURGE is not executed for that resource.

**User response**

All resources owned by the resource named by *resname1* must be AUTOPURGED first.

**Message Type**

ERROR, ALERT

**KLVO201: ANYAPPL SPECIFIED IN A NON DEDICATE POOL IGNORED****Explanation**

The parameter ANYAPPL can be specified only on a DEDICATE pool.

**System action**

TMS:Engine ignores the ANYAPPL parameter.

**User response**

Correct VSM definitions. Review your configuration and call IBM® Software Support if the problem persists.

**Message Type**

REPLY

**KLVO202: INVALID SUBCOMMAND: *subcmd*****Explanation**

Subcommand *subcmd* specified in the VSM command is not supported.

**System action**

The command fails.

**User response**

Contact IBM® Software Support.

**Message Type**

ERROR

**KL VOP203: UNABLE TO ALLOCATE VSM ACB: ACBNAME(*applid*) PSWD *pswd*****Explanation**

An attempt to allocate and initialize a VTAM® ACB failed.

**System action**

Application *applid* is unavailable.

**User response**

Contact IBM® Software Support.

**Message Type**

ERROR

**KL VOP204: APPLICATION *acbname* ALREADY DEFINED TO *pool*****Explanation**

Application *acbname* specified in the VSM command has already been defined to *pool*. Do not define an application more than once to the same pool.

**System action**

The command fails.

**User response**

Reissue the command correctly.

**Message Type**

ERROR

**KL VOP205: INCONSISTENT SPECIFICATION: NETNAME(*netname*)  
ACBNAME(*acbname*) THROUGH(*thru*)****Explanation**

An inconsistency was detected between the *netname* and *thru*, or between the *acbname* and *thru* specified in the VSM command.

**System action**

The command fails.

**User response**

Correct the error and reissue the command.

**Message Type**

ERROR

**KLVOP207: UNABLE TO OPEN VSM ACB: ACBNAME(*acbname*) NETNAME (*netname*) ARG(*arg*)****Explanation**

The TMS:Engine VSM command was issued but one of the following occurred:

1. A VTAM® (OPEN) failed and a KLVVT001 error message indicating the cause of the error is written to RKLVLLOG.
2. The resource could not be defined.
3. The pre-open exit routine specified when the application was opened did not complete successfully.

**System action**

If the THROUGH parameter was specified, an attempt is made to start the other virtual applications. In any case, the virtual application indicated is unavailable.

**User response**

Depends on the reason for the error.

1. Use the TMS:Engine log and *IBM® z/OS® Communications Server SNA Programming* to determine the cause for the OPEN failure and take appropriate corrective action.
2. Contact IBM® Software Support for possible reasons why the resource could not be defined.
3. Contact IBM® Software Support to determine why the pre-open routine exit did not complete successfully.

**Message Type**

ERROR.

**KLVOP208: DEDICATE ATTRIBUTE SPECIFIED, LIMIT=l IGNORED****Explanation**

The parameter LIMIT=l is specified on a VSM pool which also specified DEDICATE. DEDICATE implies a limit of l.

**System action**

TMS:Engine ignores the LIMIT=l parameter.

**User response**

Remove either the LIMIT=l or the DEDICATE parameter to suppress this message.

**Message Type**

REPLY

**KLVOP209: SESSLIM SPECIFIED IN A NON DEDICATE POOL IGNORED****Explanation**

The parameter SESSLIM can be specified only on a DEDICATE pool.

**System action**

TMS:Engine ignores the SESSLIM parameter.

**User response**

Correct VSM definitions. Review your configuration and call IBM® Software Support if the problem persists.

**Message Type**

REPLY

**KLVOP210: NOCAPPL SPECIFIED IN A NON DEDICATE POOL IGNORED****Explanation**

The parameter NOCAPPL can be specified only on a DEDICATE pool.

**System action**

TMS:Engine ignores the NOCAPPL parameter.

**User response**

Correct VSM definitions. Review your configuration and call IBM® Software Support if the problem persists.

**Message Type**

REPLY

**KLVOP211: MODULE LIMIT: *cmmax* MODULE USAGE: *cmcur* PANEL LIMIT: *dmmax* PANEL USAGE: *dmcure* THREADS: *stthr*****Explanation**

The STATUS command was issued. The following information is displayed:

- *cmmax*: The maximum number of bytes of storage TMS:Engine will use when loading modules. Zero means no limit.
- *cmcur*: The current number of bytes of storage TMS:Engine has used to load modules.
- *dmmax*: The maximum number of bytes of storage dialog management may use to store panels. Zero means no limit.
- *dmmure*: The current number of bytes the dialog manager is using to store panels.
- *stthr*: The current number of active threads.

None.

### **User response**

None.

### **Message Type**

REPLY

## **KL VOP412: DIALOG TRACE ALLOCATED STORAGE *nnnn* KB**

### **Explanation**

The amount of storage used by the dialog trace facility for the retention of source statements and control blocks is displayed.

### **System action**

None.

### **User response**

None.

### **Message Type**

REPLY

## **KLVP413: {*luname* | NTD} {ENABLED | DISABLED} TBLSZ *nnnn* ENTRIES [SUSPENDED]**

### **Explanation**

The specified LU or a nonterminal dialog (NTD) was ENABLED or DISABLED. If interactive tracing capabilities were granted, user trace table size, *nnnn*, is displayed. For interactive users, suspension of output to the table destination may be indicated with SUSPENDED.

### **System action**

None.

### **User response**

None.

### **Message Type**

REPLY

## **KLVP414: {*luname* | NTD} MEMBER(*memname*) RANGE(*start-end*) DEST({BP | GTF | TABLE})**

### **Explanation**

A range of statements, *start* through *end*, will be traced from source member *memname* for dialogs (which copy the member and have been compiled for trace) executing at either the specified LU or as nonterminal dialogs. The dialog manager generates trace output to BP, GTF or TABLE.

### **System action**

None.

### **User response**

None.

### **Message Type**

REPLY

## **KLVP415: {*luname* | NTD} FLOWON DEST([BP] [GTF] [TABLE])**

### **Explanation**

FLOW tracing is active for the specified LU or for a nonterminal dialog (NTD). The dialog manager generates trace output to BP, GTF, or TABLE.

### **System action**

None.

### **User response**

None.

### **Message Type**

REPLY

## **KL VOP416: DIALOG TRACE IS {OFF | ON}**

### **Explanation**

This message indicates the status of the dialog trace facility.

### **System action**

If trace was turned **ON**, the DTRACE command can be used to enable terminals or nonterminal dialogs and to add and delete ranges. Commands specifying users, dialogs, and ranges to be traced are rejected if tracing was turned **OFF**. When trace is turned **ON**, all enabled LUs and nonterminal dialog resources can generate trace output.

### **User response**

None.

### **Message Type**

INFO

## **KL VOP417: DESTINATIONS BP AND TABLE INVALID FOR NONTERMINAL DIALOGS AND NON-INTERACTIVE USERS**

### **Explanation**

A command specifying the BP or TABLE destination was issued for a noninteractive user or for nonterminal dialogs. These output destinations are valid only for interactive users enabled by LU name.

### **System action**

The command completes unsuccessfully.

### **User response**

Reissue the command using a different destination or enable the terminal for interactive tracing.

### **Message Type**

INFO

## **KL VOP418: {*luname* | NTD} ENABLED FOR DIALOG TRACE, TBLSZ(*nnnn*)**

### **Explanation**

The specified LU or a nonterminal dialog was enabled for tracing of dialogs. When a terminal identified by *luname* is granted interactive capabilities, user trace table size, *nnnn*, is displayed.

### **System action**

Commands affecting the enabled LU or nonterminal dialogs are accepted.

### **User response**

None.

### **Message Type**

INFO

## **KLVP419: {*luname* | NTD} DISABLED FOR DIALOG TRACE, ENVIRONMENT {RETAINED | DELETED}**

### **Explanation**

Tracing for the specified LU or the nonterminal dialogs was disabled. The trace environment is deleted or retained.

### **System action**

When the trace environment is deleted, all dialogs and ranges that were declared traceable for the user are no longer traceable, even after the user is re-enabled.

### **User response**

None

### **Message Type**

INFO

## **KLVP420: RANGE(*start-end*) ADDED FOR *luname*: MEMBER(*memname*) DEST({BP | GTF | TABLE})**

### **Explanation**

A range of statements, *start* through *end*, was added for the specified LU, specified member and specified destination, or for the nonterminal dialogs (NTD).

### **System action**

When statements within the range for member are executed, trace output can be directed to a trace output destination: BP, GTF, or TABLE.

### **User response**

None

### **Message Type**

REPLY

## **KLVP421: RANGE ({*start-end* | ALL}) DELETED FOR {*luname* | NTD}: MEMBER(*memname*) DEST({BP | GTF | TABLE | ALL})**

### **Explanation**

A range of statements, *start* through *end*, has been deleted for the specified LU or nonterminal dialogs (NTD), specified or all members, and specified or all destinations.

### **System action**

The specified range that was deleted for the specified member, destination, and LU or NTD will no longer be traced.

### **User response**

None

### **Message Type**

REPLY

## **KL VOP422: TRACEABLE COMPILATION MODE IS {ON | OFF}**

### **Explanation**

This message indicates the status of traceable compilation mode.

### **System action**

Output from automatic compilation and the REFRESH command using parameter defaults is a traceable dialog if the mode is **ON**; it is nontraceable if the mode is **OFF**.

### **User response**

None

### **Message Type**

INFO

## **KL VOP423: COMMAND INVALID WHILE DIALOG TRACE IS OFF**

### **Explanation**

A command was issued that requires that the dialog trace facility be activated.

### **System action**

The command completes unsuccessfully.

### **User response**

Turn on DTF and reissue the command.

### **Message Type**

ERROR

## **KL VOP424: {*luname* | NTD} NOT ENABLED FOR TRACING**

### **Explanation**

An attempt was made to disable an LU or nonterminal dialogs (NTD), but the command completed unsuccessfully because the LU or NTD was not enabled for tracing.

### **System action**

The command completes unsuccessfully.

### **User response**

Correct the LU name and reissue the command.

### **Message Type**

ERROR

## **KL VOP427: FLOW TRACE STATUS UNCHANGED**

### **Explanation**

A command was issued to change the state of the flow trace to the state that already exists.

### **System action**

The command completes unsuccessfully.

**User response**

Reissue the command to set the flow trace to the desired state, or do nothing if the desired state is the current one.

**Message Type**

ERROR

**KL VOP428: *keyword=value* INVALID****Explanation**

A command containing an invalid parameter *keyword* was issued.

**System action**

The command completes unsuccessfully.

**User response**

Consult the command documentation, and then reissue the command.

**Message Type**

ERROR

**KL VOP430: {*luname* | NTD} ALREADY ENABLED FOR DIALOG TRACING****Explanation**

An attempt was made to enable an LU or nonterminal dialog (NTD), but the LU or NTD was already enabled for tracing.

**System action**

The command completes unsuccessfully.

**User response**

Correct the LU name or disable the LU or nonterminal dialogs, and reissue the command.

**Message Type**

ERROR

**KL VOP431: STORAGE ISOLATION POOL NOT INITIALIZED****Explanation**

A storage isolation pool could not be initialized during DTF initialization.

**System action**

The dialog trace facility (DTF) is not on.

**User response**

Use the STORAGE command to display storage utilization. Adjust storage allocation parameters and recycle TMS:Engine if storage was underallocated. Otherwise, contact IBM® Software Support.

**Message Type**

ERROR

## **KL VOP432: DIALOG TRACE HANDLE POOL NOT INITIALIZED**

### **Explanation**

An attempt was made to turn on the dialog trace facility (DTF), but a handle pool could not be initialized.

### **System action**

The dialog trace facility (DTF) is not turned on.

### **User response**

Contact IBM® Software Support.

### **Message Type**

ERROR

## **KL VOP433: TRACE ENVIRONMENT INTEGRITY ERROR**

### **Explanation**

Data structures used for representation of dialog trace information are corrupted.

### **System action**

The dialog trace facility (DTF) is turned off and cannot be restarted.

### **User response**

Contact IBM® Software Support.

### **Message Type**

ERROR

## **KL VOP434: LUNAME= AND NTD= PARAMETER CONFLICT**

### **Explanation**

The LUNAME and NTD keyword parameters are mutually exclusive.

### **System action**

The command completes unsuccessfully.

### **User response**

Reissue the command with either the LUNAME or NTD keyword parameter.

### **Message Type**

ERROR

## **KL VOP443: {*luname* | NTD} FLOWOFF DEST({BP | GTF | TABLE})**

### **Explanation**

Flow trace has been turned off for the specified LU or nonterminal dialogs (NTD) and for the specified destinations.

### **System action**

Transfers of control between dialogs for NTD or luname will no longer be traced.

**User response**

None.

**Message Type**

INFO

**KLVO444: DIALOG TRACE IS ALREADY ON****Explanation**

KLVS\$TEM1 returned an unanticipated return code.

**System action**

The command completes unsuccessfully.

**User response**

None.

**Message Type**

ERROR

**KLVO445: INVALID RETURN CODE *nn* PASSED FROM KLVS\$TEM****Explanation**

In attempt was made to activate DTF, but it was already activated.

**System action**

The command completes unsuccessfully.

**User response**

Contact IBM® Software Support.

**Message Type**

ERROR

**KLVO447: RANGE (*start-end*) FOR {*luname* | NTD} MEMBER(*memname*)  
DEST({BP | GTF | TABLE}) ALREADY EXISTS****Explanation**

An attempt was made to add a specified range that already exists.

**System action**

The command completes unsuccessfully.

**User response**

None.

**Message Type**

ERROR

## **KL VOP448: LU *luname* NOT ENABLED FOR INTERACTIVE TRACING**

### **Explanation**

An attempt was made to suspend tracing for luname or an NTD that was not enabled for interactive tracing.

### **System action**

The command completes unsuccessfully.

### **User response**

None.

### **Message Type**

ERROR

## **KL VOP450: *pppppppp*, A REQUIRED PARAMETER, IS MISSING**

### **Explanation**

A command was issued without a required parameter.

### **System action**

The command completes unsuccessfully.

### **User response**

Reissue the command with required parameter.

### **Message Type**

ERROR

## **KL VOP451: LUNAME= OR NTD=YES IS REQUIRED**

### **Explanation**

A command was issued that requires the LUNAME or NTD keyword parameter.

### **System action**

The command completes unsuccessfully.

### **User response**

Reissue the command for a specified LU or NTD.

### **Message Type**

ERROR

## **KL VOP452: TBLSZ= IGNORED FOR REENABLE**

### **Explanation**

A nonzero trace table size was specified for a disabled, interactive trace user with a retained trace environment. The trace table size cannot be changed when the user is re-enabled.

### **System action**

The command completes successfully, but the newly-specified trace table size is ignored.

**User response**

If a new trace table size is desired, disable the user with the KEEP=NO option to delete the user's trace environment. Then re-enable the user with a new trace table size.

**Message Type**

INFO

**KLVO453: DISABLE FAILED FOR NON-UNIQUE LU, *luname*****Explanation**

An attempt was made to disable tracing for *luname*, but the name is not unique to the system.

**System action**

The command completes unsuccessfully.

**User response**

Rename *luname* so that it is unique to the system.

**Message Type**

ERROR

**KLVO501: COMMAND ISSUED AS CN *cnid*:RC (*rc*)****Explanation**

An z/OS® command was issued as console operator *cnid*. The SVC 34 used to submit the command to the operating system received the return code *rc*.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVO502: TMS/Engine JOBSTEP NOT AUTHORIZED, COMMAND REJECTED****Explanation**

TMS:Engine is not running from an APF-authorized library and is not able to issue the requested z/OS® command.

**System action**

The command fails.

**User response**

Run TMS:Engine from an authorized library.

**Message Type**

REPLY

## **KL VOP503: NO TEXT PASSED TO THE MVS™ COMMAND**

### **Explanation**

An TMS:Engine z/OS® command was issued with no argument.

### **System action**

The z/OS® command is ignored.

### **User response**

Reissue the command with an argument.

### **Message Type**

REPLY

## **KL VOP504: TEXT PASSED TO THE MVS™ COMMAND GREATER THAN 126 CHARACTERS, COMMAND REJECTED**

### **Explanation**

The TMS:Engine operator command z/OS® was issued with an argument that was too long.

### **System action**

The z/OS® command is ignored.

### **User response**

Reissue the command with a shorter argument.

### **Message Type**

REPLY

## **KL VOP552: UNABLE TO ALLOCATE FORWARD ACB: APPLID(*appl*)**

### **Explanation**

TMS:Engine was unable to allocate *appl* specified in the FORWARD command.

### **System action**

### **User response**

Contact IBM® Software Support.

### **Message Type**

REPLY

## **KL VOP553: UNABLE TO OPEN FORWARD ACB: APPLID(*appl*) REASON(*rc*)**

### **Explanation**

TMS:Engine was unable to OPEN the *appl* specified in the FORWARD command.

### **System action**

The command fails.

**User response**

The REASON field contains the return code from the z/OS® Communications Server OPEN macro instruction. Refer to *IBM® z/OS® Communications Server SNA Programming* to determine the cause of the error.

**Message Type**

REPLY

**KLVP554: FORWARD TO *appldest* FROM *appl1* STARTED****Explanation**

Application *appl1* will be FORWARDED to *appldest* as specified in the FORWARD command.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVP555: FORWARD TO *appldest* FROM *appl1* STOPPED****Explanation**

The forwarding of application *appl1* was successfully stopped by the FORWARD command.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVP601: VPO FACILITY NOT AVAILABLE****Explanation**

The VPO facility required for the VPO command is not active.

**System action**

The command fails.

**User response**

Contact IBM® Software Support.

**Message Type**

ERROR

## **KLVP651: UNABLE TO ALLOCATE DIALOG ACB: APPLID(*appl*)**

### **Explanation**

TMS:Engine was unable to allocate the appl specified in the DIALOG command.

### **System action**

The command fails.

### **User response**

Contact IBM® Software Support.

### **Message Type**

ERROR

## **KLVP652: UNABLE TO OPEN DIALOG ACB: APPLID(*appl*) REASON(*rc*)**

### **Explanation**

TMS:Engine was unable to OPEN the *appl* specified in the DIALOG command.

### **System action**

The command fails.

### **User response**

The REASON field contains the return code from the z/OS® Communications Server OPEN macro instruction. Refer to *IBM® z/OS® Communications Server SNA Programming* to determine the cause of the error.

### **Message Type**

ERROR

## **KLVP653: DIALOG APPLICATION *aoöl* STARTED: DIALOG(*dialog*) LANGUAGE(*language*)**

### **Explanation**

Application *appl* with controlling dialog *dialog* was successfully started by the DIALOG command. *language* is the language code used to locate the dialog.

None.

### **User response**

None.

### **Message Type**

REPLY, INFO

## **KLVP654: DIALOG APPLICATION *appl* STOPPED: DIALOG(*dialog*) LANGUAGE(*language*)**

### **Explanation**

Application *appl* with controlling dialog *dialog* was successfully stopped by the CLOSE command. *language* is the language code used to locate the dialog.

**System action**

None.

**User response**

None.

**Message Type**

REPLY, INFO

**KL VOP655: LOGON DIALOG UNAVAILABLE: DIALOG(*dialog*)  
LANGUAGE(*language*)****Explanation**

A DIALOG command was issued specifying dialog as the logon dialog and a usable copy of the dialog could not be found in the DD pointed to by the language code, language. This error may be caused by misspelling the dialog name in the command or by syntax errors within the dialog itself. In the case of syntax errors within the dialog, there will be additional messages describing the errors that were detected.

**System action**

The command fails.

**User response**

Contact IBM® Software Support.

**Message Type**

ERROR

**KL VOP656: ATTENTION DIALOG UNAVAILABLE: DIALOG(*dialog*)  
LANGUAGE(*language*)****Explanation**

A DIALOG command was issued specifying dialog as the Window Control dialog and a usable copy of the dialog could not be found in the DD pointed to by the language code, language. This error may be caused by misspelling the dialog name in the command or by syntax errors within the dialog itself. In the case of syntax errors within the dialog, there will be additional messages describing the errors that were detected.

**System action**

The command fails.

**User response**

Contact IBM® Software Support.

**Message Type**

ERROR

**KL VOP657: ATTENTION DIALOG AND NOPSM CONFLICT: DIALOG APPLICATION  
*appl*****Explanation**

A DIALOG command was issued specifying mutually exclusive parameters.

**System action**

The command fails.

**User response**

Correct and reissue the command.

**Message Type**

ERROR

**KL VOP658: UNABLE TO INITIALIZE DIALOG MANAGER: LU(*lu*) APPLID(*appl*)****Explanation**

The named *lu* was attempting to log onto the named DIALOG application and an error was detected while starting execution of the logon dialog associated with the application.

**System action**

The named *lu* is disconnected from the application.

**User response**

Check the TMS:Engine log for associated error messages.

**Message Type**

VIEW

**KL VOP802: UNABLE TO ALLOCATE DATA SET: DSNAME(*dsname*) REASON(*rsn*)****Explanation**

The PRINT command completed unsuccessfully because *dsname* could not be allocated.

**System action**

The command fails.

**User response**

The REASON field refers to the return code from SVC 99 services. This message is accompanied by message KL VDA002, which contains a more detailed explanation why the data set could not be allocated. Refer to that message for more information.

**Message Type**

ERROR

**KL VOP803: UNABLE TO OPEN DATA SET: DSNAME(*dsname*)****Explanation**

The PRINT command completed unsuccessfully because *dsname* could not be opened.

**System action**

None.

### **User response**

None.

### **Message Type**

REPLY

## **KLVOP920: VARIABLE *varname* IS UNDECLARED**

### **Explanation**

The NAM SET command was issued to set a variable *varname* for a particular user ID, but the variable was never declared.

### **System action**

The command fails.

### **User response**

Before a NAM SET command can be issued to manipulate a variable, the variable must be declared with the NAM DECLARE command.

### **Message Type**

REPLY

## **KLVOP921: INVALID VARIABLE REFERENCE: *varname***

### **Explanation**

The NAM SET command was issued, but the command failed because the variable *varname* is illegally referenced. Either the variable name was too long, or there is no colon (:) separating the variable name and the text.

### **System action**

Any remaining variables are processed.

### **User response**

Correct the error and reissue the command.

### **Message Type**

REPLY

## **KLVOP922: VARIABLE EXPRESSION TOO LONG FOR *varname: expr***

### **Explanation**

The NAM SET command was issued, but the command failed because the length of *varname*, defined via the NAM DECLARE command, is not long enough to hold the requested expression *expr*.

**System action**

Any remaining variables are processed.

**User response**

Correct the error and reissue the command. The NAM LIST command can be used to list all the declared variables and their respective lengths.

**Message Type**

REPLY

**KLVOP923: INVALID PASSWORD FOR USERID *xxxxxxxx*****Explanation**

A NAM SET command was issued to change a password, and the password was invalid.

**System action**

The password is changed to an unknown value.

**User response**

Issue the NAM SET command again with a valid password.

**Message Type**

REPLY

**KLVOP924: I/O ERROR: CNTRLPT(*cntrlpt*) DATABASE (*dsname*)****Explanation**

An attempt to put a record to the database *dsname* by a NAM command failed as a result of an I/O error.

**System action**

The command fails.

**User response**

Examine the TMS:Engine log for error message KLVVS021 or KLVVS031. These messages contain a more specific reason why the PUT operation failed.

**Message Type**

ERROR

**KLVOP926: CNTRLPT *cntrlpt* DATABASE UNAVAILABLE****Explanation**

A NAM command was issued but no control point database was defined for this control point.

**System action**

The command fails.

**User response**

Contact IBM® Software Support.

**Message Type**

ERROR

## **KLVOP927: USER cccccccc - PASSWORD NOT DEFINED**

### **Explanation**

A NAM DISPLAY cccccccc command was issued, but no password has been set for this user ID.

### **System action**

None.

### **User response**

Contact your NAM database administrator to have a password set for this user ID.

### **Message Type**

REPLY

## **KLVOP929: cpname[,cntrlpt[,...]]**

None.

### **Message Type**

INFO

## **KL VOP963: COMMAND ERROR, RTM INTERFACE MAY BE SET "ON" OR "OFF"**

### **Explanation**

ON or OFF was not specified as the first positional parameter on an RTM command.

### **System action**

The RTM command is not processed and the RTM interface state is not changed.

### **User response**

Correct the command syntax and reissue the command.

### **Message Type**

ERROR

## **KL VOP964: RTM *rtm-name* INTERFACE IS NOT SUPPORTED FOR VTAM® LEVEL *version-level***

### **Explanation**

An RTM command could not be processed because TMS:Engine is executing under a release of z/OS® Communications Server that does not support the ETE™ or NetSpy RTM interface.

### **System action**

The RTM command is not processed and the RTM interface state remains inactive.

### **User response**

Verify that the release of z/OS® Communications Server that you are running is supported.

### **Message Type**

ERROR

## **KL VOP965: RTM *rtm-name* INTERFACE USEREXIT *exit-name* IS INVALID**

### **Explanation**

While processing an RTM ON command, the specified USEREXIT could not be loaded into virtual storage, or the user exit module did not contain an NOP instruction as the first word of the module.

**System action**

The RTM command is not processed and the RTM interface state remains inactive.

**User response**

Verify that the user exit module was properly assembled and link-edited into an accessible program library, and that the requirement for the initial NOP instruction is met. Contact IBM® Software Support if you need further assistance.

**Message Type**

ERROR

**KL VOP966: COMMAND ERROR, RTM *rtm-name* IS UNKNOWN****Explanation**

An RTM command specified a response time monitor whose name is not recognized. NPM, ETE™, and NetSpy are currently supported.

**System action**

The RTM command in error is not processed and the RTM interface state is not changed.

**User response**

Correct the name and issue the command again.

**Message Type**

ERROR

**KL VOP967: COMMAND ERROR, EXTERNAL NAME NOT VALID FOR RTM *rtm-name*****Explanation**

An RTM ON command specified a parameter that is valid only for the ETE™ or NetSpy interface.

**System action**

The RTM command in error is not processed and the RTM interface state is not changed.

**User response**

Correct the name and issue the command again, or omit the invalid parameter and issue the command again.

**Message Type**

ERROR

**KL VOP968: RTM NPM INTERFACE ENABLED - USEREXIT: *exit-name*****Explanation**

**Message Type**

INFO

**KL VOP973: COMMAND ERROR, GTF INTERFACE MAY BE SET "ON" OR "OFF"****Explanation**

A GTF command with an invalid operand has been entered.

**System action**

The command is rejected.

**User response**

Correct the command and reissue it.

**Message Type**

ERROR

**KL VOP974: COMMAND ERROR, GTRACEID: *id* IS INVALID****Explanation**

A GTF command with an invalid GTRACE ID has been entered.

**System action**

The command is rejected.

**User response**

Make sure that the GTRACE ID is within the range of 1-1023.

**Message Type**

ERROR

**KL VOP975: COMMAND ERROR, INTERNAL: *value* IS INVALID****Explanation**

A GTF command with an invalid value for the INTERNAL operand has been entered.

**System action**

The command is rejected.

**User response**

Valid values for the INTERNAL operand are YES or NO.

**Message Type**

ERROR

## **KLVPA001: SYNAD ERROR: *synadmsg***

### **Explanation**

A physical error occurred while reading a partitioned data set. The operating system provides *synadmsg*, which is documented in *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets*. The text of *synadmsg* includes the jobname, stepname, unit address, device type, ddname, operation, error description, absolute track address, and access method. Message KLVPA002 is issued to provide additional diagnostic information. If the data set is a PDS/E (extended partitioned data set), message KLVPA007 may follow with additional operating system information.

### **System action**

The library is closed then reopened, and the operation is retried.

### **User response**

Examine the text of *synadmsg* and KLVPA002 to determine the reason for the error. If the error description in *synadmsg* is OUT OF EXTENT, compress the library after the TMS:Engine address space has been terminated and is not running.

### **Message Type**

INFO

## **KLVPA002: SYNAD ERROR SENSE AND STATUS BYTES: *xxxxxyyyy***

### **Explanation**

A physical error has occurred while reading a partitioned data set. *xxxx* contains sense bytes 1 and 2, and *yyyy* contains status bytes 1 and 2 as documented in *DFSMS/MVS™ Using Datasets (SC26-4922)*. Message KLVPA001 was issued prior to this to provide additional diagnostic information.

### **System action**

The library is closed, reopened, and the operation is retried.

### **User response**

Review message KLVPA001 and examine the sense and status bytes to determine the cause of the error.

### **Message Type**

INFO

## **KLVPA003: LIBRARY ddname REFRESHED, SYNAD EXIT DRIVEN**

### **Explanation**

A physical error has occurred while reading the library referenced by ddname. The library has been closed and reopened in an attempt to recover from the failure. Messages KLVPA001 and KLVPA002 have been issued to provide diagnostic information regarding the error.

### **System action**

None.

### **User response**

None.

### **Message Type**

INFO

## **KLVPA004: LIBRARY *ddname* UNUSABLE, REFRESH FAILED**

### **Explanation**

A physical error occurred while reading the library referenced by *ddname*. The library was closed and reopened, and the error persisted when the operation was retried.

### **System action**

The request is terminated.

### **User response**

Examine the accompanying KLVPA001 and KLVPA002 messages to determine the cause for the failure. If *ddname* is a critical library such as RKANPENU, the TMS:Engine address space should be stopped and restarted as soon as possible.

### **Message Type**

INFO

## **KLVPA005: *error*, FUNCTION(PDS): '*text*'**

### **Explanation**

A syntax error, *error*, was found while processing the parameters passed to the partitioned data set SSPL dialog function. *text* is the text at or near the error. Message KLVD015 follows and identifies the associated dialog.

### **System action**

The dialog is terminated.

### **User response**

If this error occurs while running CL/SUPERSESSION®, correct the dialog and restart the dialog process. If this error occurs while running any other IBM® Tivoli® product, contact IBM® Software Support.

### **Message Type**

VIEW

## **KLVPA006: NO VALID REQUEST CODED FOR FUNCTION(PDS)**

### **Explanation**

A null string was passed as the request code to the partitioned data set SSPL dialog function. Message KLVD015 follows and identifies the associated dialog.

### **System action**

The dialog is terminated.

### **User response**

If this error occurs while running CL/SUPERSESSION®, correct the dialog and restart the dialog process. If this error occurs while running any other IBM® Tivoli® product, contact IBM® Software Support.

### **Message Type**

VIEW

## **KLVPA007: *synadmsg***

### **Explanation**

A physical error occurred while reading a PDS/E (extended partitioned data set). Message KLVPA007 follows KLVPA001 and displays additional information provided by the operating system.

### **System action**

See KLVPA001.

### **User response**

See KLVPA001.

### **Message Type**

INFO

## **KLVPK001: INSUFFICIENT STORAGE FOR PACKED STRING**

### **Explanation**

During a PACK operation KLV\$PACK determined that a piece of storage large enough to hold a packed string could not be obtained.

### **System action**

The thread is abended.

### **User response**

Contact IBM® Software Support. Keep dump, RKLVLLOG, SYSLOG, and runsheets.

### **Message Type**

ERROR

## **KLVPM001: PSM NOT AVAILABLE: DIALOG(*dlg*) LU(*lu*) APPL(*appl*)**

### **Explanation**

A dialog attempted to execute a PSM dialog function that operates on the presentation space screen-image buffer (for example, PSMATTR) and there was no buffer. This may be caused, for example, by attempting to execute such a function within a dialog that has no BODY. *dlg* is the name of the dialog in error and it was executing on behalf of the terminal user at *lu*. *appl* is the controlling application for *lu*.

### **System action**

The current dialog fails.

### **User response**

Contact IBM® Software Support.

### **Message Type**

VIEW

## **KLVPM002: *eeeeeeeeeeeeeeee* FUNCTION(PSMATTR): *cccccccccccccccc***

### **Explanation**

The syntax error *eeeeeeeeeeeeeeee* has been encountered while parsing the PSM ATTR command *cccccccccccccccc*.

**System action**

The command is ignored and processing continues.

**User response**

Correct the problem and re-enter the command.

**Message Type**

VIEW

**KLVP003: UNSUPPORTED PSM SERVICE: DIALOG(*dlg*) LU(*lu*) APPL(*appl*)****Explanation**

A dialog attempted to execute the PSM function and the service name could not be recognized. This may be caused, for example, by misspelling the service name or by a PSM function that is obsolete. All services of the PSM function have been replaced by discrete functions. For example, PSM ATTR has been replaced by the PSMATTR function. *dlg* is the name of the dialog in error and it was executing on behalf of the terminal user at *lu*. *appl* is the controlling application for *lu*.

**System action**

The current dialog fails.

**User response**

Replace the obsolete PSM function service in error with the corresponding discrete function.

**Message Type**

VIEW

**KLVP005: PSM BUFFER INTEGRITY ERROR****Explanation**

An internal error was detected by TMS:Engine.

**System action**

TMS:Engine forces an abend with completion code U0100. The abend is associated with a single TMS:Engine user, whose terminal will hang. System operation for other users will continue normally. TMS:Engine will automatically create a dump.

**User response**

A VCANCEL command may be necessary to reinstate the hung user. Contact IBM® Software Support for help in resolving the error condition or in gathering the problem documentation that IBM® requires to research the error condition.

**Message Type**

ABEND

**KLVP010: PSM MAXIMUM ERROR POPUP COUNT IS *xx* [, WAS *yy*]****Explanation**

This message is displayed in response to the PSM command. With no operands the current setting for the maximum popup count is displayed. In response to the PSM ERPCOUNT=*xx* command both the original setting and the new setting are displayed.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVPM011: TERMINAL *luname* LOGGED OFF - ERPCOUNT EXCEEDED****Explanation**

A terminal, *luname*, has caused more simultaneous error recovery operations than the ERPCOUNT limit set by the PSM command. *luname* is logged off.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVPM012: PSM PRIVATE EXTENSION NOT INITIALIZED****Explanation**

The PSM command was issued and the PSM private extension was not available.

**System action**

The PSM command is not executed.

**User response**

Wait until TMS:Engine has completed initialization. Then reissue the command.

**Message Type**

INFO

**KLVPM013: PSM ERP INFO BLOCK POINTER IS ZERO****Explanation**

The PSM command was issued and the PSM ERP block was not available.

**System action**

The PSM command is not executed.

**User response**

Wait until TMS:Engine has completed initialization. Then reissue the command.

**Message Type**

INFO

**KLVP021: INPUT PROCESSING EXCEPTION: RC=*rc*,*lu\_name*,  
*modname*,*attention\_code*,*fdbk*,*error\_data*,*datastream***

**Explanation**

An input message from the physical terminal has caused an exception condition in PSM where:

- *rc*: Identifies the reason for the error. See the following reason code analysis table for more information.
- *lu\_name*: Physical terminal LU name.
- *modname*: Module identifier.
- *attention\_code*: Pending AID.
- *fdbk*: Feedback information internal to TMS:Engine.
- *error\_data*: Two bytes of error data. See the following reason code analysis table for a description of the valid data.
- *datastream*: Up to first ten bytes of the input message causing the exception.

The following table lists possible reason codes for the input exception with associated system action codes and user response codes. After locating the reason code, refer to the appropriate system action and user response following this table:

<i>Table 136: Description of reason codes for KLVP021</i>			
<b>Reason Code</b>	<b>Description</b>	<b>System Action</b>	<b>User Response</b>
0601	Internal Exception Condition	1	1
0602	Internal Exception Condition	1	1
0603	Internal Exception Condition	1	1
0604	Internal Exception Condition	1	1
0605	Internal Exception Condition	1	1
0606	Internal Exception Condition	2	1
0607	Internal Exception Condition	2	1
0608	Internal Exception Condition	2	1
0609	Internal Exception Condition	1	1
060A	Internal Exception Condition	1	1
060B	Internal Exception Condition	1	1
060C	Internal Exception Condition	1	1
060D	Internal Exception Condition	1	1
060E	Internal Exception Condition	1	1
0901	Internal Exception Condition	1	1
0902	Internal Exception Condition	1	1
0903	Internal Exception Condition	1	1
0904	Internal Exception Condition	1	1
0905	Unsupported AID received ( <i>error_data</i> = unsupported aid)	1	2
0906	Invalid CLEAR/CLEAR partition	1	2
0907	Internal Exception Condition	1	1
0908	Internal Exception Condition	1	1
0909	Internal Exception Condition	1	1
090A	Invalid buffer address ( <i>error_data</i> = buffer address)	1	2

Reason Code	Description	System Action	User Response
090B	Invalid codepoint detected (error_data = codepoint)	1	2
090C	Invalid value in Set Attribute (error_data = Set Attribute type/ value pair)	1	2
090D	Unexpected end of output (error_data = last 1 or 2 bytes)	1	2
090E	Internal Exception Condition	2	1
090F	Internal Exception Condition	2	1
0910	Internal Exception Condition	2	1
0911	Internal Exception Condition	2	1
0912	Internal Exception Condition	2	1
0913	Unexpected formatted input (error_data = buffer address)	2	2
0914	Input data from unknown field (error_data = buffer address)	2	2
0915	Attention key received during pre- popup read.	2	2
0916	Read modified already satisfied.	2	2

### System action

One of the following:

- Action 1. Error recovery displays the TERMINAL INPUT ERROR message on the terminal. The input message is rejected with an appropriate sense code and normal processing resumes.
- Action 2. Error recovery ignores the input message and normal processing resumes.

### User response

One of the following:

- If the TERMINAL INPUT ERROR message displays, press **ENTER** to remove the message and continue normal operation. If the problem persists, the system administrator should obtain a VSSTRACE of the failure and a copy of any related error messages and contact IBM® Software Support.
- If the TERMINAL INPUT ERROR message displays, press **ENTER** to remove the message and continue normal operation. If the problem persists, the system administrator should analyze the failure and contact the appropriate hardware or software vendor.

### Message Type

INFO

## KLVP051: KLVINPSM RKANPAR PARAMETERS:

### Explanation

Module KLVINPSM logs its start-up parameters as they are read from RKANPAR. This is the header message and will be followed by message KLVP052.

### System action

None.

### User response

None.

**Message Type**

LOG

**KLVPM052: *parameters*****Explanation**

As the parameters in module KLVINPSM are read, a log audit trail is created.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVPM101: QUERY REPLY DATA IS NOT VALID FOR LU(*lu*)****Explanation**

Query reply data received from the named lu, in response to a 3270 Read Partition Query command, could not be correctly interpreted.

**System action**

The session with the named lu continues normally. The TMS:Engine Presentation Space Manager will not allow certain 3270 extended data stream orders (for example color, highlighting) to be used with the named lu.

**User response**

Contact IBM® Software Support.

**Message Type**

LOG

**KLVPR000: *eeeeeeeeeeeeeeee*, FUNCTION(PRODUCT): *cccccccccccccccc*****Explanation**

The syntax error *eeeeeeeeeeeeeeee* has been encountered while parsing the PSM command *cccccccccccccccc*.

**System action**

The current dialog fails.

**User response**

Correct the dialog.

**Message Type**

VIEW

## **KLVP001: PRINT FAILED FOR *user* TO *printer*, SENSE=*xxxxxxxx***

### **Explanation**

A VSSPRINT or PSMPRINT request from user to printer *printer* failed. For a VSSPRINT, user represents an actual userid ID. For a PSMPRINT, user represents a physical terminal ID. The sense code from the failing send request is *xxxxxxxx*.

### **System action**

The print request terminates.

### **User response**

Using the sense information, try to determine the problem with the printer and retry.

### **Message Type**

INFO

## **KLVR001: GCSDISKS REFRESHED**

### **Explanation**

The REFRESH GCSDISKS command was successful.

### **System action**

None.

### **User response**

None.

### **Message Type**

REPLY

## **KLVR002: INVALID REFRESH TYPE: *type***

### **Explanation**

The type specified in the REFRESH command is invalid.

### **System action**

The command fails.

### **User response**

Correct the type parameter and reissue the command.

### **Message Type**

ERROR

## **KLVR003: DIALOG *dlgname* REFRESHED (*tracetype*) LANGUAGE(*language*)**

### **Explanation**

The dialog *dlgname*, specified in the REFRESH command, was successfully refreshed. *tracetype* indicates whether (TRACE) or not (NOTRACE) the dialog is traceable. *language* is the language code.

### **System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVRE004: UNABLE TO REFRESH DIALOG *dlgname* LANGUAGE(*language*)****Explanation**

An error occurred while trying to refresh the DIALOG *dlgname* specified in the REFRESH command. *language* is the language code used during the refresh attempt.

**System action**

The command fails. Any previously compiled copy of *dlgname* remains available.

**User response**

This message is accompanied by KLVDMnnn messages that indicate why the panel could not be refreshed.

**Message Type**

ERROR

**KLVRE005: BLDL FAILED FOR *modname*****Explanation**

A BLDL failed during a refresh operation for module *modname* specified in the REFRESH MODULE command.

**System action**

The command fails.

**User response**

This message is accompanied by message KLVCM003, which indicates why the BLDL failed.

**Message Type**

ERROR

**KLVRE006: BLDL COMPLETE: MODULE(*modname*) SIZE: *size* ENTRY: *entry*****Explanation**

The REFRESH MODULE command completed successfully for *modname*. *size* is the decimal size of the module in bytes. *entry* is the hexadecimal entry point address.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

## **KLVRE007: PARAMETER *pppppppp* INVALID**

### **Explanation**

The trace status specified on a REFRESH command is not **TRACE** or **NOTRACE**.

### **System action**

The command is ignored and processing continues.

### **User response**

Re-enter the command and specify either **TRACE** or **NOTRACE**.

### **Message Type**

ERROR

## **KLVRE008: MISSING OR INVALID DSNAME(*dsname*)**

### **Explanation**

An invalid data set name, *dsname*, was coded on a REFRESH SENSE command.

### **System action**

The sense code table is not refreshed. The previous global sense table remains in effect.

### **User response**

Reissue the REFRESH SENSE command with a valid data set name.

### **Message Type**

ERROR

## **KLVRE009: SENSE CODE TABLE REFRESH FROM "*dsname(member)*" *resulttext***

### **Explanation**

A REFRESH SENSE command has completed. *dsname* is the data set name and *member* is the member name that contain the table definitions. *resulttext* displays the success or failure of the command:

- **COMPLETED SUCCESSFULLY:** The global sense table has been updated.
- **UNSUCCESSFUL, MEMBER NOT FOUND:** Member is not in *dsname*.
- **UNSUCCESSFUL, ALLOCATE FAILED FOR DSN:** *dsname* could not be allocated.
- **UNSUCCESSFUL, OPEN ERROR:** A z/OS® OPEN for *dsname* failed.
- **UNSUCCESSFUL, SYNTAX ERROR ENCOUNTERED:** Member contains an invalid sense code definition.

### **System action**

If the command was successful, the global sense table has been updated. Otherwise, the command terminates and the previous sense table remains in effect.

### **User response**

Depends on *resulttext*.

- **COMPLETED SUCCESSFULLY:** None.
- **UNSUCCESSFUL, MEMBER NOT FOUND:** Reissue the command with the correct member and data set names.

- **UNSUCCESSFUL, ALLOCATE FAILED FOR DSN:** Review RKLVLLOG for message KLVDA002 followed by message IJK56228I from SVC99. Reissue the command with a valid, cataloged data set name.
- **UNSUCCESSFUL, OPEN ERROR:** Review the JES log for IBM® data management messages (IEC). Ensure that data set is a partitioned data set.
- **UNSUCCESSFUL, SYNTAX ERROR ENCOUNTERED:** Review RKLVLLOG for KLVSCnnn and KLVSEnnn error messages. Correct the errors in member. Then reissue the command.

### Message Type

REPLY for success; ERROR otherwise

## KLVRM004: LOGICAL RESOURCE EXIT STACK INTEGRITY ERROR

### Explanation

The TMS:Engine Resource Manager detected inconsistent data while processing a logical resource purge or cleanup request, usually because of a storage overlay.

### System action

The request is terminated with a U0100 abend, sending a dump to the RKLVSnap file or the system dump data sets or both. The resource involved is left in an indeterminate state.

### User response

Recycle the TMS:Engine address space as soon as possible. Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

### Message Type

ABEND

## KLVR001: INVALID \$RSS REQUEST

### Explanation

KLV\$RSS detected an invalid function code in its input parameter list.

### System action

The thread is terminated.

### User response

Contact IBM® Software Support. Keep dump, RKLVLLOG, SYSLOG, and runsheets.

### Message Type

ABEND

## KLVR002: INVALID RSS RELEASE REQUEST

### Explanation

An RSS release request was made for a lock that was not held.

### System action

The thread is terminated.

### User response

Contact IBM® Software Support. Keep dump, RKLVLLOG, SYSLOG, and runsheets.

**Message Type**

ABEND

**KLVRT001: PARAMETER ERROR****Explanation**

TMS:Engine detected an invalid RTM event code.

**System action**

A call to RTM fails. TMS:Engine creates a DUMP and continues processing.

**User response**

Contact IBM® Software Support with the contents of the DUMP.

**Message Type**

ABEND

**KLVRT010: RTM NPM INTERFACE *event* IS UNRECOGNIZED****Explanation**

The NPM interface module does not recognize the session manager event code passed. Event code is a 2 hexadecimal digit field.

**System action**

The NSI vector containing the session manager event is not processed.

**User response**

Contact IBM® Software Support.

**Message Type**

INFO

**KLVRT011: NPM MODULE FNMNSI REQUIRES APF AUTHORIZATION****Explanation**

RTM support for NPM has been selected, but the TMS:Engine job step is not authorized.

**System action**

The RTM command is not processed and the RTM interface state remains inactive.

**User response**

Authorize the job step. Make sure all libraries concatenated to RKANMODL are APF authorized.

**Message Type**

ALERT

**KLVRT012: UNABLE TO LOAD NPM MODULE FNMNSI****Explanation**

TMS:Engine was unable to load the IBM-supplied module FNMNSI because the NPM load library is not in the RKANMODL library concatenation or in LINKLIST.

**System action**

The RTM command is not processed and the RTM interface state remains inactive.

**User response**

Make FNMNSI accessible to TMS:Engine by doing one of the following:

- Copy module FNMNSI to one of the RKANMODL libraries and issue the RTM ON command.
- Concatenate the NPM load library to RKANMODL, restart TMS:Engine, and issue the RTM ON command.

**Message Type**

ALERT

**KLVRT013: \$STG ERROR****Explanation**

TMS:Engine was unable to allocate storage for the NPM/NSI NMVT request units.

**System action**

A call to NSI fails, TMS:Engine creates a DUMP and continues processing.

**User response**

Contact IBM® Software Support with the contents of the DUMP.

**Message Type**

ABEND

**KLVRT014: PARAMETER ERROR****Explanation**

A call to NSI failed because of an invalid internal parameter.

**System action**

A call to NSI fails, TMS:Engine creates a DUMP and continues processing.

**User response**

Contact IBM® Software Support with the contents of the DUMP.

**Message Type**

ABEND

**KLVRT020: RTM NPM SEND REQUEST FAILED: LU=*lu-name* APPL=*applname*  
EVENT=X'*xx*'****Explanation**

A non-zero return code was returned from the IBM-supplied interface module FNMNSI because of a request error or an exceptional condition where:

- *lu-name* is the physical terminal name.
- *applname* is the application name if applicable.

**System action**

Processing associated with the request is terminated.

**User response**

A list of return codes and reason codes can be found in *IBM Z® NetView Messages and Codes*, which you can find at [IBM Z® NetView \(https://www.ibm.com/docs/en/z-netview\)](https://www.ibm.com/docs/en/z-netview). Contact IBM® Software Support if you need further assistance.

**Message Type**

INFO

**KLVRT021: RTM NPM request FAILED: RC=*nn* REASON=*nnn*****Explanation**

A non-zero return code was returned from the IBM-supplied interface module FNMNSI because of a request error or an exceptional condition. This message is produced for CONNECT and DISCONNECT requests.

**System action**

Processing associated with the request is terminated.

**User response**

A list of return codes and reason codes can be found in *IBM Z® NetView Messages and Codes*, which you can find at [IBM Z® NetView \(https://www.ibm.com/docs/en/z-netview\)](https://www.ibm.com/docs/en/z-netview). Contact IBM® Software Support if you need further assistance.

**Message Type**

ALERT

**KLVRT022: RTM NPM VECTOR ERROR****Explanation**

TMS:Engine detected an invalid internal NPM function call.

**System action**

A call to NSI fails, TMS:Engine creates a DUMP and continues processing.

**User response**

Contact IBM® Software Support with the contents of the DUMP.

**Message Type**

ABEND

**KLVRT023: RTM NPM NSI ADDRESS SPACE NOT RUNNING****Explanation**

The NPM NSI address space is not running. NPM has rejected a SEND, CONNECT, or DISCONNECT request by TMS:Engine with a return code of 20.

**System action**

The RTM interface in TMS:Engine is terminated if active. If the rejected request is CONNECT, TMS:Engine sets a timer and retries the request every 60 seconds.

**User response**

Start the NSI address space and reissue the RTM ON command.

**Message Type**

ALERT

**KLVRT030: \$STG ERROR****Explanation**

TMS:Engine was unable to allocate storage for the ETE™ or NetSpy mapping message.

**System action**

TMS:Engine creates a DUMP and continues processing.

**User response**

Contact IBM® Software Support with the contents of the DUMP.

**Message Type**

ABEND

**KLVRT031: PARAMETER ERROR****Explanation**

TMS:Engine was unable to process the mapping message for ETE™ or NetSpy interface because of an internal invalid parameter.

**System action**

TMS:Engine creates a DUMP and continues processing.

**User response**

Contact IBM® Software Support with the contents of the DUMP.

**Message Type**

ABEND

**KLVSC001: KEYWORD NOT FOUND: *keyword environmental\_information*****Explanation**

TMS:Engine was parsing a line and encountered a keyword that was not defined. This is one message in a class of syntax error messages.

**System action**

The action being performed terminates.

**User response**

The environmental portion of the message indicates where the syntax error was detected. Use this information to correct the error.

**Message Type**

ERROR, ALERT, WARNING

## **KLVS002: REQUIRED OPERAND OMITTED: *field environmental\_information***

### **Explanation**

TMS:Engine was parsing a line and encountered a required operand that was omitted. This is one message in a class of syntax error messages.

### **System action**

The action being performed terminates.

### **User response**

The environmental portion of the message indicates where the syntax error was detected. Use this information to correct the error.

### **Message Type**

ERROR, ALERT, WARNING

## **KLVS003: OPERAND TOO SHORT: *operand environmental\_information***

### **Explanation**

TMS:Engine was parsing a line and encountered a keyword or positional operand that was too short. This is one message in a class of syntax error messages.

### **System action**

The action being performed terminates.

### **User response**

The environmental portion of the message indicates where the syntax error was detected. Use this information to correct the error.

### **Message Type**

ERROR, ALERT, WARNING

## **KLVS004: OPERAND TOO LONG: *environmental\_information operand***

### **Explanation**

TMS:Engine was parsing a line and encountered a keyword or positional operand that was too long. This is one message in a class of syntax error messages.

### **System action**

The action being performed terminates.

### **User response**

The environmental portion of the message indicates where the syntax error was detected. Use this information to correct the error.

### **Message Type**

ERROR, ALERT, WARNING

## **KLVSC005: INVALID NUMERIC OPERAND: *operand environmental\_information***

### **Explanation**

TMS:Engine was parsing a line and encountered a keyword or positional operand that must be numeric, but is not. This is one message in a class of syntax error messages.

### **System action**

The action being performed terminates.

### **User response**

The environmental portion of the message indicates where the syntax error was detected. Use this information to correct the error.

### **Message Type**

ERROR, ALERT, WARNING

## **KLVSC006: INVALID QUOTED STRING: *string environmental\_information***

### **Explanation**

TMS:Engine was parsing a line and encountered a string that did not adhere to quoting rules, probably due to a mismatch of quotes. This is one message in a class of syntax error messages.

### **System action**

The action being performed terminates.

### **User response**

The environmental portion of the message indicates where the syntax error was detected. Use this information to correct the error.

### **Message Type**

ERROR, ALERT, WARNING

## **KLVSC007: INVALID DELIMITER USAGE: *string environmental\_information***

### **Explanation**

TMS:Engine was parsing a line and encountered an invalid use of delimiters. This is caused by either a mismatch of delimiters or improper delimiters. Valid delimiters are:

- **<blank>**: Blank separates parameters.
- **,**: Comma separates parameters.
- **=**: Equal separates keyword from keyword value.
- **(**: Open parens separates keyword from keyword value.
- **'x'**: Parameters within single quotes contain text with embedded delimiters.
- **-**: Dash indicates continuation.
- **+**: Plus continues as is.
- **)**: Close parens delimits the end of a keyword value.

A common cause of this error is data added to a keyword that is defined as a keyword without data. This is one message in a class of syntax error messages.

**System action**

The action being performed terminates.

**User response**

The environmental portion of the message indicates where the syntax error was detected. Use this information to correct the error.

**Message Type**

ERROR, ALERT, WARNING

**KLVS008: AMBIGUOUS KEYWORD REFERENCE: keyword environmental\_information****Explanation**

TMS:Engine was parsing a line and encountered a keyword that was ambiguous, probably because not enough characters were included to uniquely define the keyword. This is one message in a class of syntax error messages.

**System action**

The action being performed terminates.

**User response**

The environmental portion of the message indicates where the syntax error was detected. Use this information to correct the error.

**Message Type**

ERROR, ALERT, WARNING

**KLVS009: INVALID TIME SPECIFICATION****Explanation**

A scan failed because time was specified incorrectly.

**System action**

The command fails.

**User response**

Correct the time parameter and try again.

**Message Type**

ERROR

**KLVS010: \$GSA TABLE ID IS INVALID****Explanation**

While processing a STORCHK command, the \$GSA table failed a validity check.

**System action**

The command is ignored and processing continues.

## **KLVSD003: ALLOCATION DETAIL:**

### **Explanation**

This message is a header message and identifies the start of detailed information about TMS:Engine storage use. It is a conditional extension of KLVSD001 and KLVSD002.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVSD004: SIZE(*range*) USE(*usecnt*) TOTAL(*totcnt*) ACCESSED(*accnt*)****Explanation**

This message displays information about a storage pool. It follows KLVSD003.

- *range*: Specifies a range (m-n, in bytes) of the sizes of data blocks in this storage pool. For example, a range of 116 indicates that this pool contains all blocks that are from 116 bytes long.
- *usecnt* Specifies the number of blocks in use in the pool.
- *totcnt* Specifies the total number of blocks in the pool.
- *accnt* Specifies the number of times a request was made against the pool.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVSD005: LIMIT(*stolim*) SLOPE(*sl*) SIZES(*range*) TOTAL(*tot*)****Explanation**

This message appears in response to the TMS:Engine STORAGE operator command and displays storage parameters about primary or extended. It follows KLVSD001 and KLVSD002, or KLVSD004 if DETAIL was requested.

- *stolim*: Specifies (in bytes) the size of the largest block that can be allocated.
- *sl*: An internal parameter.
- *range*: Specifies the number of storage areas.
- *tot*: Specifies (in kilobytes) the total amount of storage available to end-user applications and TMS:Engine functions. Storage not included in this total is storage obtained during TMS:Engine initialization for the following:
  - Resident load modules
  - Internal trace table
  - Logical Resource Table
  - Log buffers

This storage is excluded from the *tot* field of the display because once allocated it remains allocated for the life of the address space.

**System action**

None.

### User response

### Message Type

REPLY

## **KLVS006: FREE(*free*) CARVED(*carved*) OVERHEAD(*ovhead*)**

### Explanation

This message appears in response to the TMS:Engine STORAGE operator command and specifies additional information about primary and extended storage. It follows KLVS005.

- *free*: Specifies (in kilobytes) the amount of storage available.
- *carved*: Specifies (in kilobytes) the amount of storage allocated for use in fulfilling storage requests.
- *ovhead*: Specifies (in bytes) the amount of storage used for storage control.

### System action

None.

### User response

None.

### Message Type

REPLY

## **KLVS007: *pp*% IS IN USE; *tt*% ALLOWED [- THRESHOLD EXCEEDED]**

### Explanation

This message displays the amount of storage in use for primary or extended storage. It follows KLVS006.

- *pp*: Indicates the amount of storage currently in use.
- *tt*: Indicates the defined quiesce threshold level for free storage. This will not appear in the message if the threshold is defined as 0%.

THRESHOLD EXCEEDED will appear when the threshold value has been met (for instance, in quiesce mode for free storage).

### System action

TMS:Engine will inhibit the initiation of new work (sessions, dialogs, and so on). Work that is already active will continue to run. When the storage in use drops below the threshold, normal processing returns.

### User response

If THRESHOLD EXCEEDED persists, contact your systems administrator who should review the TMS:Engine storage use in order to determine what actions should take place.

### Message Type

REPLY

## **KLVS008: *pp*% HAS BEEN CARVED; *tt*% ALLOWED [- THRESHOLD EXCEEDED]**

### Explanation

This message displays the amount of storage carved in primary or extended storage. It follows KLVS007.

- *pp*: Indicates the amount of storage currently carved.

- *tt*: Indicates the defined quiesce threshold level for carved storage. This will not appear in the message if the threshold is defined as 0%.

THRESHOLD EXCEEDED will appear when the threshold value has been met (for instance, in quiesce mode for carved storage).

### System action

TMS:Engine will inhibit the initiation of new work (sessions, dialogs, etc.). Once the threshold has been reached, this inhibition remains until TMS:Engine is restarted.

### User response

When THRESHOLD EXCEEDED is displayed, perform an orderly shutdown of TMS:Engine. Then contact your systems administrator, who should review the TMS:Engine storage use in order to determine what actions should take place.

### Message Type

REPLY

## KLVS021: TMS(*num*) PREFIX(*pf<sub>x</sub>*) CUSHION(*cshn*)

### Explanation

This message appears in response to the TMS:Engine STORAGE operator command and displays information about TMS:Engine temporary storage use.

- *num*: Specifies (in bytes) the amount of temporary storage allocated. TMS:Engine uses this storage, for example, to resolve a string expression. In general, this value should be zero.
- *pf<sub>x</sub>*: Specifies (in bytes) the length of the storage block prefix.
- *cshn*: Specifies (in bytes) the overhead for each storage block. This value is equal to the value of *pf<sub>x</sub>* plus the debug overhead, if any.

### Message Type

REPLY

## KLVS032: POOL BUFSIZE(*bufsize*) SEGSIZE(*segsi*ze) MASK(*mask*) SIDEQ(*n*)

### Explanation

This message provides detailed information about a buffer pool. Currently, there are four buffer pools, one for each of the standard 3270 model sizes. The meaning of the individual fields are as follows:

- *bufsize*: The size of the individual buffers that are allocated from within a buffer segment. The standard sizes of the four buffer pools correspond to the 3270 model types as follows:
  - 1920 for Model2
  - 2560 for Model3
  - 3440 for Model4
  - 3564 for Model5
- *segsi*ze: The size of the buffer segments in the pool. The system automatically determines the segment size, with 65536 (64K) being the largest possible size and also the best size for buffer pool performance.
- *mask*: A bit mask that indicates the possible buffer allocations within the buffer segment.
- *sideq*: A list header to buffers that have been logically released but which are not yet available for reallocation,

## KLVS033: BUFFERS INUSE(*inuse*) MAX(*max*) GETS(*gets*) FREES(*frees*)

### Explanation

This message provides additional information about a buffer pool. It follows KLVS032.

- *inuse*: The number of buffers that are currently in use. This number is obtained from the simple calculation of gets minus frees at the time the display is requested.
- *max*: The maximum number of buffers from this pool that were ever concurrently in use. This statistic is checked and updated, if necessary, every time a buffer is obtained.
- *gets*: The number of buffer allocation requests directed to this pool. This number is a simple running total of get requests throughout the life of the system.
- *frees*: The number of buffer deallocation requests directed to this pool. This number is a simple running total of free requests throughout the life of the system.

### System action

## **KLVS034: SEGMENTS INUSE(*inuse*) MAX(*max*) GETS(*gets*) FREES(*frees*) Q(*q*) QMAX(*qmax*)**

### **Explanation**

This message provides additional information about a buffer pool. It follows KLVS033.

- *inuse*: The number of segments that are currently in use. This number is obtained from the simple calculation of gets minus frees at the time the display is requested.
- *max* The maximum number of segments that were ever concurrently allocated to this pool. This statistic is checked and updated, if necessary, every time a segment is obtained.
- *gets* The number of segment allocations performed for this pool. This number is a simple running total of get requests throughout the life of the system.
- *frees* The number of segment deallocations performed for this pool. This number is a simple running total of free requests throughout the life of the system.
- *q*: The number of segments currently on the free queue of segments containing available buffers. This statistic is updated every time a segment is added to or removed from the free queue.
- *qmax* The maximum number of segments that were ever concurrently on the free queue of segments containing available buffers. This statistic is checked and updated, if necessary, every time a segment is added to the free queue.

**Message Type**

REPLY

**KLVSD103: NAME(*blkid*) SIZE(*length*) TOTAL(*count*)****Explanation**

This message displays information about the content of carved, allocated storage. Storage reported in this message is storage which has been allocated with a specific, printable control block ID. It follows KLVSD107.

- *blkid*: Specifies the control block ID for a data structure found in storage. For example, a *blkid* of **\$ACB** indicates that an Application Control Block was located in storage.
- *length*: Specifies the length in bytes of the *blkid*
- *count*: Specifies the total number of *blkid* of size *length* located in storage.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVSD104: NAME(...) SIZE(*length*) TOTAL(*count*)****Explanation**

This message displays information about the content of carved, allocated storage. Storage reported in this message is storage which has been allocated as a typed, self-defining data structure. These data structures do not contain a printable control block ID. The **NAME** reported in this message is "...".

- *...* : Specifies that the data structure located in storage does not have a printable control block ID.
- *length* Specifies the length in bytes of the "self-defining" data structure.
- *count* Specifies the total number of "typed" structures of size *length* located in storage.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVS105: NAME(*FREE*) SIZE(*length*) TOTAL(*count*)****Explanation**

This message displays information about the content of carved, free storage. Storage reported in this message is storage which has been carved and now resides on a free list. This storage is available for re-use..

- *FREE*: Specifies that the data structure located in storage is on the free list.
- *length*: Specifies the length in bytes of this free block.
- *count*: Specifies the total number of "FREE" blocks of size length located in storage.

**System action**

None.

**User response**

**Message Type**

REPLY

**KLVS106: INSUFFICIENT STORAGE TO PROCESS COMMAND****Explanation**

Processing of the storage MAP command has terminated because there is insufficient storage in the extended private area.

**System action**

The storage MAP command is terminated.

**User response**

Reissue the command after ensuring that there is sufficient storage. If the problem persists, contact IBM® Software Support.

**Message Type**

ERROR

**KLVS107: STORAGE MAP FOR *areadesc* STORAGE****Explanation**

This message displays the specific areas of storage to be mapped. The mapped area is determined from the operands specified on the storage MAP command.

- *areadesc*: Specifies the area of storage to be mapped. PRIMARY indicates only storage below the 16M line will be mapped. EXTENDED indicates only storage above the 16M line will be mapped. PRIMARY AND EXTENDED indicates all TMS:Engine storage will be mapped. PRIMARY AND EXTENDED is the default.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVSD108: STORAGE INTEGRITY ERROR. SCAN TERMINATED****Explanation**

Processing of the storage MAP command has terminated because of errors encountered in the storage management data structures.

**System action**

The command is terminated. TMS:Engine issues snap dumps of the environment for problem determination. TMS:Engine processing continues.

**User response**

Contact IBM® Software Support. Keep the dump and RKLVLLOG.

### **KLVSE056: TABLE CAPACITY OF 64K LU NAMES EXCEEDED FOR SENSE(*xxxxxxxx*)**

#### **Explanation**

The sense code listed had more than 64K names listed for FROMAPPL or FROMLU.

**System action**

If this error is encountered during TMS:Engine initialization, only the default sense rules will be loaded. If this response was from a REFRESH SENSE command then the currently active global sense table is not refreshed.

**User response**

Reduce the number of LU names for the sense code and reissue the REFRESH SENSE command.

**Message Type**

ERROR

**KLVS057: INVALID HEX CHARACTERS IN SENSE CODE FIELDS, '*statement*', STATEMENT# *nnn*****Explanation**

The sense code value in the statement indicated has characters other than 0-9 or A-F.

**System action**

If this error is encountered during TMS:Engine initialization, only the default sense rules will be loaded. If this response was from a REFRESH SENSE command then the currently active global sense table is not refreshed.

**User response**

Correct this sense code to contain valid hex characters and reissue the REFRESH SENSE command.

**Message Type**

ERROR

**KLVS058: SENSE TABLE SIZE (*nnnnn*), EXCEEDS REQUEST LIMIT****Explanation**

The sense code table size is larger than the current storage request limit.

**System action**

If this error is encountered during TMS:Engine initialization, only the default sense rules will be loaded. If this response was from a REFRESH SENSE command then the currently active global sense table is not refreshed.

**User response**

If the table cannot be specified with wildcard names to decrease the storage needed to hold it, the limit value for extended storage must be increased.

**Message Type**

ERROR

**KLVS059: SENSE TABLE TOO LARGE, IGNORED****Explanation**

The sense code table exceeds 2G bytes and cannot be built.

**System action**

If this error is encountered during TMS:Engine initialization, only the default sense rules will be loaded. If this response was from a REFRESH SENSE command then the currently active global sense table is not refreshed.

**User response**

Contact IBM® Software Support.

**Message Type**

ERROR

**KLVS060: DUPLICATE LU ID FOR THIS SENSE CODE, THE FIRST IS RETAINED, '*statement*', STATEMENT# *nnn*****Explanation**

An LU ID was encountered that matches one already stored for this sense code.

**System action**

The processing actions specified on the first definition are retained.

**User response**

Remove the duplicate LU statement(s).

**Message Type**

WARN

**KLVS061: EITHER FROMAPPL OR FROMLU IS REQUIRED, '*statement*', STATEMENT# *nnn*****Explanation**

FROMAPPL or FROMLU must be coded.

**System action**

If this error is encountered during TMS:Engine initialization, only the default sense rules will be loaded. If this response was from a REFRESH SENSE command then the currently active global sense table is not refreshed.

**User response**

Add the required keyword and reissue the REFRESH SENSE command.

**Message Type**

ERROR

**KLVS062: BOTH FROMAPPL AND FROMLU ARE NOT ALLOWED, '*statement*', STATEMENT# *nnn*****Explanation**

FROMAPPL and FROMLU cannot be coded together.

**System action**

If this error is encountered during TMS:Engine initialization, only the default sense rules will be loaded. If this response was from a REFRESH SENSE command then the currently active global sense table is not refreshed.

**User response**

Remove either FROMLU or FROMAPPL and reissue the REFRESH SENSE command.

## **KLVSQ000: QUIESCE MODE *state* FOR *type***

### **Explanation**

This message indicates either a change in one of the possible storage quiesce values or that a quiesce value is still active. This message will appear when a quiesce mode changes or when the STGMON interval forces the message to appear. Possible state values:

- IS IN EFFECT

- HAS BEEN ENTERED
- HAS BEEN RELEASED

Possible value types:

- FREE PRIMARY STORAGE
- CARVED PRIMARY STORAGE
- FREE EXTENDED STORAGE
- CARVED EXTENDED STORAGE

#### **System action**

None.

#### **User response**

If a quiesce mode condition persists, contact your systems administrator, who will contact your product administrator. The systems programmer should review the TMS:Engine storage use in order to determine what actions should take place.

#### **Message Type**

ALERT, WARNING

### **KLVS001: SUBSYSTEM *name* ALREADY ACTIVE**

#### **Explanation**

A name *name* that was already active was used to initialize the TMS:Engine subsystem interface.

#### **System action**

TMS:Engine terminates.

#### **User response**

Look in member KLVINSSI in RKANPAR and verify the subsystem name.

#### **Message Type**

ALERT

### **KLVS002: SUBSYSTEM *name* INITIALIZED: SSCVT(*addr*)**

#### **Explanation**

The TMS:Engine subsystem interface name with SSCVT address *addr* was successfully initialized.

#### **System action**

None.

#### **User response**

None.

#### **Message Type**

INFO

### **KLVS003: SUBSYSTEM *name* UNABLE TO LOAD KLVSSREQ**

#### **Explanation**

TMS:Engine was unable to initialize subsystem interface name. Module KLVSSREQ could not be loaded.

**System action**

TMS:Engine terminates.

**User response**

Look for messages in the KLVCMnnn format to determine a more specific reason the module could not be loaded.

**Message Type**

ALERT

**KLVSS004: SUBSYSTEM *name* DUPLICATED****Explanation**

TMS:Engine found a duplicate subsystem name *name*.

**System action**

TMS:Engine terminates.

**User response**

Look in member KLVINSSI in RKANPAR to locate the duplicate subsystem name.

**Message Type**

ALERT

**KLVSS005: SUBSYSTEM *name* SUCCESSFULLY INSTALLED****Explanation**

The TMS:Engine subsystem interface name was successfully installed.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVSS006: KLVINSSI RKANPAR PARAMETERS:****Explanation**

Module KLVINSSI logs its start-up parameters as they are read from RKANPAR. This is the header message and will be followed by message KLVSS006.

**System action**

None.

**User response**

None.

**Message Type**

LOG

## **KLVSS007: *parameters***

### **Explanation**

As the parameters in module KLVINSSI are read, a log audit trail is created.

### **System action**

None.

### **User response**

None.

### **Message Type**

LOG

## **KLVST001: TMS/Engine INITIALIZATION ERROR(S), ABEND U0012**

### **Explanation**

One or more errors were detected during TMS:Engine start-up.

### **System action**

TMS:Engine terminates with a U0012 abend. Other KLVSTnnn messages precede this one and identify the error(s).

### **User response**

Examine the TMS:Engine and z/OS® logs to determine the error(s) that were detected, take corrective action, and restart TMS:Engine.

### **Message Type**

ALERT

## **KLVST002: TSO OPTION INVALID FOR NON-TSO ADDRESS SPACE**

### **Explanation**

The start-up parameter TSO was specified as Y (for yes), but TMS:Engine is not executing in a TSO address space.

### **System action**

TMS:Engine terminates.

### **User response**

Correct the TSO parameter and retry.

### **Message Type**

ALERT

## **KLVST003: INVALID PARMLIST PARAMETER - *text***

### **Explanation**

A syntax error was detected by TMS:Engine in the parameter list specified by the PARM= keyword on the z/OS® EXEC JCL statement. *text* is the text at or near the point where the error was found.

**System action**

TMS:Engine terminates with a U0012abend.

**User response**

Correct the indicated area of text and restart TMS:Engine.

**Message Type**

ALERT

**KLVST004: INVALID RKLVIN PARAMETER - *text*****Explanation**

A syntax error was detected by TMS:Engine in the RKLVIN start up parameters. *text* is the text at or near the point where the error was found.

**System action**

TMS:Engine terminates with a U0012abend.

**User response**

Correct the indicated area of text and restart TMS:Engine.

**Message Type**

ALERT

**KLVST005: MVS™ JOBSTEP AUTHORIZATION REQUIRED****Explanation**

The initialization parameter SWAP=N was specified, but the job step was not authorized.

**System action**

TMS:Engine terminates.

**User response**

If the SWAP=N parameter is to be used, the job step must be authorized.

**Message Type**

ALERT

**KLVST006: MVS/XA™ EXECUTION ENVIRONMENT REQUIRED****Explanation**

AMODE31(YES) was specified as an initialization parameter but TMS:Engine is not running on an MVS/XA™ or MVS/ESA™ host.

**System action**

TMS:Engine terminates.

**User response**

None.

**Message Type**

ALERT

## **KLVST007: BLDVRP FAILED FOR VSAM LSR BUFFER POOL, RC=*rc***

### **Explanation**

A BLDVRP macro was issued to allocate a VSAM local shared resource buffer pool and ended with a non-zero return code, *rc*. The two most likely causes are:

1. Insufficient main storage to satisfy the request.
2. A previously issued BLDVRP was issued without a corresponding DLVRP in the TMS:Engine address space. This typically occurs when TMS:Engine is running in a TSO address space and has previously abended in the current TSO session.

### **System action**

TMS:Engine terminates.

### **User response**

Refer to the IBM® VSAM or DFP manual that describes the BLDVRP macro for the meaning of *rc*. For the two most likely causes:

1. Adjust the main storage allocation parameters or LSRPOOL values or both and restart the TMS:Engine address space.
2. Start TMS:Engine in a fresh address space.

### **Message Type**

ALERT

## **KLVST008: PRIMARY MAIN STORAGE UNAVAILABLE**

### **Explanation**

A variable length GETMAIN could not be satisfied. The MINIMUM(*nnn*,*P*) start-up parameter regulates the minimum value that will satisfy the GETMAIN request. This refers to below the line storage.

### **System action**

TMS:Engine terminates.

### **User response**

Adjust the MINIMUM parameter and retry.

### **Message Type**

ALERT

## **KLVST009: FREEMAIN TYPE=VC FAILED**

### **Explanation**

A FREEMAIN that was issued for a previously allocated block of main storage has failed.

### **System action**

TMS:Engine terminates.

### **User response**

Contact IBM® Software Support.

### **Message Type**

ALERT

## **KLVST010: PRIMARY RESERVED MAIN STORAGE UNAVAILABLE**

### **Explanation**

Insufficient main storage exists to satisfy the requirements for the start-up parameter RESERVE(nnn,P). This message refers to below the line storage.

### **System action**

TMS:Engine terminates.

### **User response**

Adjust the storage allocation parameters, and retry.

### **Message Type**

ALERT

## **KLVST011: PRIMARY STORAGE NOT REALLOCATED**

### **Explanation**

A GETMAIN macro instruction failed.

### **System action**

TMS:Engine terminates.

### **User response**

Retry the start-up procedure.

### **Message Type**

ALERT

## **KLVST012: EXTENDED MAIN STORAGE UNAVAILABLE**

### **Explanation**

A variable length GETMAIN could not be satisfied. The MINIMUM(nnn,X) start-up parameter regulates the minimum value that will satisfy the GETMAIN request. This message refers to above the line storage.

### **System action**

TMS:Engine terminates.

### **User response**

Adjust the MINIMUM parameter, and retry.

### **Message Type**

ALERT

## **KLVST013: EXTENDED RESERVED MAIN STORAGE UNAVAILABLE**

### **Explanation**

Insufficient main storage exists to satisfy the requirements for the start-up parameter RESERVE(nnn,X). This message refers to above the line storage.

### **System action**

TMS:Engine terminates.

**User response**

Adjust the storage allocation parameters, and retry.

**Message Type**

ALERT

**KLVST014: INVALID TRACE SPECIFICATION****Explanation**

The start-up parameter TRACE is invalid. Possible errors are:

- The value was less than 2.
- The value caused the trace table to use more than one half of the free storage area.

**System action**

TMS:Engine terminates.

**User response**

Contact IBM® Software Support.

**Message Type**

ALERT

**KLVST015: TRACE TABLE STORAGE UNAVAILABLE****Explanation**

Insufficient main storage exists for the allocation of the TMS:Engine internal trace table.

**System action**

TMS:Engine terminates.

**User response**

Increase the MINIMUM parameter, and retry.

**Message Type**

ALERT

**KLVST016: INVALID EVENT SPECIFICATION****Explanation**

The start-up parameter EVENT was invalid. Some possible causes are:

- The value was less than 2.
- The value was greater than one fourth of the free storage area.

**System action**

TMS:Engine terminates.

**User response**

Contact IBM® Software Support.

**Message Type**

ALERT

## **KLVST017: EVENT TABLE STORAGE UNAVAILABLE**

### **Explanation**

Insufficient main storage exists for the allocation of the TMS:Engine event hashing table.

### **System action**

TMS:Engine terminates.

### **User response**

Increase the MINIMUM parameter and retry.

### **Message Type**

ALERT

## **KLVST018: UNABLE TO OPEN RKLVLOG DATA SET**

### **Explanation**

An OPEN macro failed for ddname RKLVLOG, probably because the DD is missing in the startup procedure KLV.

### **System action**

TMS:Engine terminates.

### **User response**

This message will be accompanied by z/OS® messages indicating the reason the data set could not be opened.

### **Message Type**

ALERT

## **KLVST019: UNABLE TO OPEN RKLVSnap DATA SET**

### **Explanation**

An OPEN macro failed for ddname RKLVSnap, probably because the DD is missing in the startup procedure KLV.

### **System action**

TMS:Engine terminates.

### **User response**

This message will be accompanied by z/OS® messages indicating the reason the data set could not be opened.

### **Message Type**

ALERT

## **KLVST020: LIMIT/GRANULE OPTION SPECIFICATION ERROR**

### **Explanation**

The value specified for LIMIT was not greater than the value specified for GRANULE.

### **System action**

TMS:Engine terminates.

**User response**

If this error occurs while running CL/SUPERSESSION®, correct LIMIT value and retry. If this error occurs while running any other IBM® Tivoli® product, contact IBM® Software Support.

**Message Type**

ALERT

**KLVST021: LOG BUFFER STORAGE UNAVAILABLE****Explanation**

This error can be caused by either of the following:

- The startup parameter MINIMUM is too small.
- The startup parameters LOGBLOCK and LOGBUFS are too large.

**System action**

TMS:Engine terminates.

**User response**

Adjust the appropriate start-up parameters and retry.

**Message Type**

ALERT

**KLVST022: RKLVLLOG DCB STORAGE UNAVAILABLE****Explanation**

Insufficient main storage exists for the allocation of the RKLVLLOG.

**System action**

TMS:Engine terminates.

**User response**

Adjust the storage allocation parameters and retry.

**Message Type**

ALERT

**KLVST023: RKLVSnap DCB STORAGE UNAVAILABLE****Explanation**

Insufficient main storage exists for the allocation of the RKLVSnap DCB.

**System action**

TMS:Engine terminates.

**User response**

Adjust the storage allocation parameters and retry.

**Message Type**

ALERT

## KLVS024: FREE STORAGE LIST UNAVAILABLE

### Explanation

TMS:Engine was unable to allocate the free storage list because the MINIMUM parameter is too small.

### System action

TMS:Engine terminates.

### User response

Adjust the storage allocation parameters and retry.

### Message Type

ALERT

## KLVS025: UNABLE TO IDENTIFY SUBTASK ENTRYPOINT

### Explanation

The OS IDENTIFY macro issued to identify an entry point to initialize the TMS:Engine dispatcher did not complete successfully.

### System action

TMS:Engine terminates.

### User response

Contact IBM® Software Support.

### Message Type

ALERT

## KLVS026: *modname concat [address] module info* |TRANSIENT |ALREADY RESIDENT |RELOCATION ERROR |BLDL ERROR [COMMAND=*cmd* |RESIDENT] |CLASS=*class* [,DEFERRED]]

### Explanation

During TMS:Engine start-up, this message displays the attributes and status of each module in the TMS:Engine load library. Fields of interest are the module name *modname*, the relative concatenation number *concat*, and the module information field *module info*. TRANSIENT refers to modules that are not loaded at this time. DEFERRED refers to modules that are not considered to be transient but will be loaded at a later time. Any errors detected are also displayed as ALREADY RESIDENT|RELOCATION ERROR|BLDL ERROR.

**Note:** In case you are parsing the messages based on columns, note that the message strings have changed

### System action

None.

### User response

None, unless error messages ALREADY RESIDENT|RELOCATION ERROR|BLDL ERROR are displayed. If the cause of the error cannot be attributed to a user modification, contact IBM® Software Support.

### Message Type

LOG

## **KLVST027: REQUIRED POINTER(S) NOT RESOLVED, *hex* IS THE OFFSET**

### **Explanation**

One of the pointers required for TMS:Engine execution could not be resolved, probably due to a module that is missing from the TMS:Engine load library.

### **System action**

TMS:Engine terminates.

### **User response**

Cross reference all the modules in the execution library with the modules in the distribution library to determine if a module is missing. If the error cannot be attributed to an installation error, contact IBM® Software Support with the hex value.

### **Message Type**

ALERT

## **KLVST028: LOAD LIBRARY *concat volser dsname***

### **Explanation**

These messages are logged at start-up time to display the data set names and related information associated with the RKANMODL DD statement. Fields of interest are the concatenation number *concat*, the volser *volser* and the data set name *dsname*.

### **System action**

None.

### **User response**

None.

### **Message Type**

LOG

## **KLVST029: INVALID VALUE FOR SLOPE PARAMETER**

### **Explanation**

The SLOPE parameter specified on initialization parameter SLOPE is invalid.

### **System action**

TMS:Engine terminates.

### **User response**

Contact IBM® Software Support.

### **Message Type**

ALERT

## **KLVST030: UNABLE TO DETERMINE CPU IDENTIFICATION**

### **Explanation**

TMS:Engine was unable to determine the CPU ID of the machine it is currently running on.

**System action**

TMS:Engine terminates.

**User response**

Contact IBM® Software Support.

**Message Type**

ALERT

**KLVS032: PERCENTAGE IS INVALID IN QUIESCE PARAMETER****Explanation**

A QUIESCE parameter in the file contains an invalid percentage. The percentage value must be in the range 0-100.

**System action**

The message is displayed and initialization fails.

**User response**

Correct the QUIESCE parameter in error and restart.

**Message Type**

ALERT

**KLVS033: STGMON INTERVAL IS INVALID IN STGMON PARAMETER****Explanation**

The STGMON interval in the file contains an invalid time interval. The value should be in the range 0-120.

**System action**

The message is displayed and initialization fails.

**User response**

Correct the STGMON interval and restart.

**Message Type**

ALERT

**KLVS034: FREE/CARVED INDICATOR IS INVALID IN QUIESCE PARAMETER****Explanation**

A QUIESCE parameter in the KLVSYSIN file contains an invalid storage type indicator. The value should be either **C** for carved storage or **F** for free storage.

**System action**

The message is displayed and initialization fails.

**User response**

Correct the QUIESCE parameter in error and restart.

**Message Type**

ALERT

## **KLVST035: INSTALLING ADDITIONAL ENTRYPOINT, |TRANSIENT |ALREADY RESIDENT |RELOCATION ERROR |BLDL ERROR [COMMAND=cmd |RESIDENT]**

### **Explanation**

An additional entry point for the module listed in message KLVST026, preceding this message, has been processed.

### **System action**

None.

### **User response**

Refer to KLVST026.

### **Message Type**

LOG

## **KLVST036: AN ELEMENT OF COMPONENT CVT(*name*) IS *module***

### **Explanation**

The module *module*, just processed and identified by the preceding KLVST026 message, is part of a group of application modules.

### **System action**

None.

### **User response**

None.

### **Message Type**

LOG

## **KLVST037: COMPONENT VECTOR TABLE INITIALIZED(*name*) |BEGIN VECTORS DIFFER FROM PREVIOUS ELEMENTS |GSA OFFSET DIFFERS FROM PREVIOUS ELEMENTS |GSA VECTOR OFFSET USED -ERROR- MODULE ID(*name*)(*module*) | VECTOR TABLE OFFSET ALREADY USED(*module*)(*entry*) |REQUIRED POINTER MISSING FOR CVT(*name*), AT OFFSET=*hex***

### **Explanation**

A group of application modules has been successfully initialized (first message), or an error has been detected (remaining messages).

### **System action**

For the first message, none. For the remaining messages, TMS:Engine continues processing modules, but will terminate later.

### **User response**

For the first message, none. For the remaining messages, contact IBM® Software Support.

### **Message Type**

LOG

## **KLVST038: STEPLIB AUTHORIZATION REQUIRED**

### **Explanation**

One or more products running in the TMS:Engine address space require the STEPLIB DD to be APF-authorized.

### **System action**

TMS:Engine terminates with a U0012 abend.

### **User response**

APF-authorize the data sets in the STEPLIB concatenation and restart TMS:Engine.

### **Message Type**

ALERT

## **KLVST039: GCSDISKS STORAGE UNAVAILABLE**

### **Explanation**

TMS:Engine initialization could not obtain storage for the GCSDISKS keyword.

### **System action**

TMS:Engine terminates with a U0012 abend.

### **User response**

Adjust the storage allocation parameters and restart TMS:Engine.

### **Message Type**

ALERT

## **KLVST040: WARNING: NO STORAGE FOR SOME LSR HIPERSPACE POOLS**

### **Explanation**

A BLDVRP macro was issued to allocate a VSAM local shared resource buffer pool in Hiperspace™?, but there was not enough Hiperspace™? storage (BLDVRP returned X'2C').

### **System action**

TMS:Engine continues, using virtual storage for the buffer pool(s) that could not be allocated in Hiperspace™.

### **User response**

Refer to the *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets* for the BLDVRP return code X'2C'.

### **Message Type**

LOG

## **KLVST041: ERROR INITIALIZING SYSDUMP DATA SET**

### **Explanation**

An OPEN macro was issued to initialize the SYSDUMP data set, which produced a non-zero return code. Refer to the accompanying IEC141I Fault Analyzer for z/OS® message for details on the OPEN failure.

### **System action**

TMS:Engine terminates with a U0012 abend.

**User response**

Refer to *MVS/ESA™ Planning: Problem Determination and Recovery* (GC28-1629) for details on pre-allocating SYSMDUMP data sets.

**Message Type**

ALERT

**KLVST042: SPLEVEL NOT MATCHED, ASSUMING *assume*. SYSTEM SPLEVEL DETECTED=*level*****Explanation**

TMS:Engine was unable to match the SP™ level of the current operating system (*level*) with an entry in its internal table of supported operating systems.

**System action**

TMS:Engine assumes the SP™ level is *assume*. Execution continues.

**User response**

Contact IBM® Software Support with the contents of this message.

**Message Type**

LOG

**KLVST043: UNABLE TO OPEN RKANPAR DATA SET****Explanation**

An OPEN macro was issued to initialize the RKANPAR data set, which produced a non-zero return code. Refer to the accompanying IEC141I message for details on the OPEN failure.

**System action**

TMS:Engine terminates with a U0012 abend.

**User response**

Correct the problem and restart TMS:Engine.

**Message Type**

ALERT

**KLVST044: LOADLIST MEMBER NOT FOUND IN RKANPAR DATA SET (*membername*)****Explanation**

A FIND macro issued to locate the named LOADLIST member in the RKANPAR data set produced a failing return code.

**System action**

TMS:Engine terminates with a U0012 abend.

**User response**

Specify a valid member name and restart TMS:Engine.

**Message Type**

ALERT

**KLVTB001: TABLE DATABASE INITIAL LOAD COMPLETE: DSNAME(*dsn*)****Explanation**

The table database has been successfully loaded from the indicated data set.

**System action**

Processing continues.

**User response**

None.

**Message Type**

INFO

**KLVTB002: TABLE DATABASE *dsname* INITIAL LOAD *date time* ON *sysid* LAST ACCESSED *date time* ON *date sysid*****Explanation**

TMS:Engine table initialization has successfully opened the tables database (*dsname*). The date, time, and SMF system ID when the database was initially formatted by TMS:Engine, and the last date, time and SMF system ID when the database was last accessed by TMS:Engine are also reported.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVTB003: UNABLE TO ALLOCATE TABLE CLUSTER: DSNAME(*dsname* )****Explanation**

TMS:Engine table initialization could not allocate the tables database (*dsname*).

**System action**

TMS:Engine initialization is terminated.

**User response**

Examine the z/OS® console log or the TMS:Engine RKLVLLOG for KLVDAnnn messages, which will explain the allocation problem. Correct the error and restart TMS:Engine.

**Message Type**

ERROR

## **KLVTB004: *keyword*: 'errormessage' RKANPAR(KLVINTB)**

### **Explanation**

The table initialization member (KLVINTB in RKANPAR) has an invalid keyword *keyword* in it.

### **System action**

TMS:Engine initialization is terminated.

### **User response**

Examine *errormessage* and member KLVINTB in RKANPAR for specific information about the error, and correct it.

### **Message Type**

ERROR

## **KLVTB005: UNABLE TO OPEN TABLE CLUSTER: DSNAME(*dsname*) DDNAME(*ddname*) R15(*r15*) ACBERFLG(*erflg*)**

### **Explanation**

TMS:Engine tables initialization was unable to open the tables database (*dsname*) allocated to *ddname*.

### **System action**

TMS:Engine initialization is terminated.

### **User response**

Refer to the *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets* for the meaning of *r15* and *erflg* for OPEN errors. Correct the problem and restart TMS:Engine.

### **Message Type**

ERROR

## **KLVTB006: NO LSR POOL ALLOCATED**

### **Explanation**

TMS:Engine tables initialization was unable to process the tables database because no VSAM LSR environment was established.

### **System action**

TMS:Engine initialization is terminated.

### **User response**

Examine the z/OS® console log or the TMS:Engine RKLVLLOG for KLVVSnnn messages, which will explain the VSAM problem. Correct the error and restart TMS:Engine.

### **Message Type**

ERROR

## **KLVTB007: UNABLE TO ACCESS TABLE CLUSTER**

### **Explanation**

TMS:Engine tables initialization was unable to process the tables database because it could not establish a VSAM request against the cluster.

**System action**

TMS:Engine initialization is terminated.

**User response**

Keep the TMS:Engine run sheets and dump files, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

ERROR

**KLVTB008: UNABLE TO READ TABLE DATABASE CONTROL RECORD****Explanation**

TMS:Engine tables initialization could not read information it needs to process the tables database.

**System action**

TMS:Engine initialization is terminated.

**User response**

Keep the TMS:Engine run sheets and dump files, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

ERROR

**KLVTB009: UNABLE TO WRITE TABLE DATABASE CONTROL RECORD****Explanation**

TMS:Engine tables initialization could not update the tables database.

**System action**

TMS:Engine initialization is terminated.

**User response**

Keep the TMS:Engine run sheets and dump files, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

ERROR

**KLVTB010: SHOWCB FIELDS = (ACBLEN,RPLLEN) ERROR: R15(r15) R0(r0)****Explanation**

TMS:Engine tables initialization could not format the tables database because the VSAM SHOWCB macro failed.

**System action**

TMS:Engine initialization is terminated.

**User response**

Keep the TMS:Engine run sheets and dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

ERROR

**KLVTB011: UNABLE TO INITIALIZE TABLE CLUSTER DSNAME(*dsname*)  
R15(*value*) DCR(*hex*)****Explanation**

TMS:Engine tables initialization could not format the tables database because the VSAM OPEN macro failed.

**System action**

TMS:Engine initialization is terminated.

**User response**

Keep the TMS:Engine run sheets and dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

ERROR

**KLVTB012: UNABLE TO LOAD TABLE CLUSTER: DSNAME(*dsname*) R15(*value*)  
RPLERRCD(*value*) DCR(*hex*)****Explanation**

TMS:Engine tables initialization could not format the tables database because the VSAM PUT macro failed.

**System action**

TMS:Engine initialization is terminated.

**User response**

Keep the TMS:Engine run sheets and dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

ERROR

**KLVTB013: GENCB MACRO FAILURE R15(*value*) R0(*value*)****Explanation**

TMS:Engine tables initialization could not format the tables database because the VSAM GENCB macro failed.

**System action**

TMS:Engine initialization is terminated.

**User response**

Keep the TMS:Engine run sheets and dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

ERROR

## **KLVTB014: INVALID KEY LENGTH IN TABLE DATABASE: SUPPLIED(*actual*) EXPECTED(*valid*)**

### **Explanation**

The TMS:Engine tables database is incorrectly allocated. *valid* is the required VSAM cluster key length; *actual* is the key length found on the actual cluster.

### **System action**

TMS:Engine initialization is terminated.

### **User response**

Reallocate the tables database cluster with the proper key and control interval sizes. Then restart TMS:Engine.

### **Message Type**

ERROR

## **KLVTB015: INVALID RECORD LENGTH IN TABLE DATABASE: SUPPLIED(*actual*) EXPECTED(*valid*)**

### **Explanation**

The TMS:Engine tables database is incorrectly allocated. *valid* is the minimum VSAM cluster record length; *actual* is the record length found on the cluster.

### **System action**

TMS:Engine initialization is terminated.

### **User response**

Reallocate the tables database cluster with the proper key and control interval sizes. Then restart TMS:Engine.

### **Message Type**

ERROR

## **KLVTB016: NO TABLE DATABASE SPECIFIED - PERMANENT TABLES NOT SUPPORTED**

### **Explanation**

The TMS:Engine initialization member (KLVINTB in RKANPAR) is either not present or is empty.

### **System action**

TMS:Engine initialization continues, but no permanent table services are available. These include TBOPEN, TBSAVE, and TBLIST. Attempts to use these will result in return codes of 8, 12 or 20 or all three from the associated functions.

### **User response**

If permanent table services are desired, allocate a tables database, create or update the KLVINTB member in RKANPAR. Then restart TMS:Engine.

### **Message Type**

WARNING

## **KLVTB017: *keyword(value)* IS OUT OF RANGE (*min-max*); DEFAULTS TO *def***

### **Explanation**

*keyword* in the KLVINTB member of RKANPAR was specified with a value that is too small (*min*) or too large (*max*).

### **System action**

The default value, *def*, will be used. TMS:Engine initialization continues.

### **User response**

Correct the keyword value. If the default value is unacceptable, recycle TMS:Engine.

### **Message Type**

WARNING

## **KLVTB018: MINIMUM/MAXIMUM TUBPOOL CONFLICT; MAXIMUM SET TO *val***

### **Explanation**

The MINIMUMTUBPOOL value in the KLVINTB member of RKANPAR is not less than the MAXIMUMTUBPOOL value.

### **System action**

The MINIMUMTUBPOOL value, plus 8, will be used (*val*). TMS:Engine initialization continues.

### **User response**

Correct the MINIMUMTUBPOOL or MAXIMUMTUBPOOL value. If the default value is unacceptable, recycle TMS:Engine.

### **Message Type**

WARNING

## **KLVTB019: *keyword(value)* IS INVALID; DEFAULTS TO *def***

### **Explanation**

*keyword* in the KLVINTB member of RKANPAR was specified with a value that is not a valid choice.

### **System action**

The default value, *def*, will be used. TMS:Engine initialization continues.

### **User response**

Correct the keyword value. If the default value is unacceptable, recycle TMS:Engine.

### **Message Type**

WARNING

## **KLVTB020: TABLE ERASE FAILED, RC=*rc***

### **Explanation**

An internal request to remove a permanent table from the tables database was not successful.

### **System action**

The request terminates.

**User response**

Contact IBM® Software Support.

**Message Type**

REPLY

**KLVTB020\_d: TABLE ERASED****Explanation**

An internal request to remove a permanent table from the tables database was successful.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVTB021: TABLE CONVERTED: *table*****Explanation**

The TDB CONVERT command has successfully converted table from Version 145 format to Version 146 format.

**System action**

None.

**User response**

None.

**Message Type**

REPLY

**KLVTB022: UNABLE TO ALLOCATE TABLE CLUSTER: DSNAME(*dsname*)****Explanation**

The TDB CONVERT command could not allocate the Version 145 tables database.

**System action**

The TDB CONVERT command ends.

**User response**

Examine the z/OS® console log or the TMS:Engine RKLVLLOG for KLVDAnnn messages, which will explain the allocation problem. Correct the error. Then reissue the TDB CONVERT command.

**Message Type**

WARNING

### **KLVTB023: *keyword: errormessage*' COMMAND(TDB)**

#### **Explanation**

The TDB command was issued with an invalid keyword *keyword*.

#### **System action**

The TDB command ends.

#### **User response**

Examine *errormessage* for specific information about the error and correct it.

#### **Message Type**

ERROR

### **KLVTB024: UNABLE TO OPEN TABLE CLUSTER: DSNAME(*dsname*) DDNAME(*ddname*) R15(*r15*) ACBERFLG(*erflg*)**

#### **Explanation**

The TDB CONVERT command could not open the Version 145 tables database (*dsname*) allocated to *ddname*.

#### **System action**

The TDB CONVERT command ends.

#### **User response**

Refer to the *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets* for the meaning of *r15* and *erflg* for OPEN errors. Correct the problem and reissue the TDB CONVERT command.

#### **Message Type**

ERROR

### **KLVTB025: UNABLE TO INITIALIZE DIALOG MANAGER**

#### **Explanation**

The TDB CONVERT command could not initialize the dialog services function of TMS:Engine for its processing.

#### **System action**

The TDB CONVERT command ends.

#### **User response**

Keep the TMS:Engine run sheets and dump files, as well as the z/OS® system log. Then contact IBM® Software Support.

#### **Message Type**

ERROR

### **KLVTB026: UNABLE TO ACCESS TABLE CLUSTER**

#### **Explanation**

The TDB CONVERT command could not OPEN the Version 145 tables database for processing.

#### **System action**

The TDB CONVERT command ends.

**User response**

Keep the TMS:Engine run sheets and dump files, as well as the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

ERROR

**KLVTB027: INVALID KEY LENGTH IN TABLE DATABASE: SUPPLIED(*actual*) EXPECTED(*valid*)****Explanation**

The Version 145 tables database specified on a TDB CONVERT command does not have the correct key length (*valid*).

**System action**

The TDB CONVERT command ends.

**User response**

Reissue the TDB CONVERT command with the correct Basic Table Services tables database VSAM cluster name.

**Message Type**

ERROR

**KLVTB028: INVALID SUBCOMMAND: *keyword*****Explanation**

An invalid request (*keyword*) was made on the TDB command.

**System action**

The TDB command ends.

**User response**

Contact IBM® Software Support.

**Message Type**

ERROR

**KLVTB029: *action* TABLE REQUEST FAILED: RC(*rc*) TABLE(*table*)****Explanation**

The tables service function action against table failed with the indicated return code.

**System action**

The TDB CONVERT command ends.

**User response**

Some tables may have been successfully converted; refer to TMS:Engine RKLVLLOG for KLVTB021 messages. Keep the TMS:Engine run sheets and dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

ERROR

## **KLVTB030: REQUEST FAILED - TABLE(*table*)**

### **Explanation**

An internal tables request failed.

### **System action**

The request terminates.

### **User response**

Contact IBM® Software Support.

### **Message Type**

ERROR

## **KLVTB031: BLOCK ERROR: TABLE(*table*) SEQUENCE(*nnn*) RECORD(*hex*)**

### **Explanation**

While processing a tables request, the TMS:Engine tables manager detected an invalid block in the tables database for *table*. *nnn* is the record sequence number for the table that contains the block. *hex* is the block that was in error, followed by the remainder of the VSAM record.

### **System action**

The tables manager will attempt to load a previous copy of the table, if one exists (message KLVTB035), or will use the partially loaded table (message KLVTB034).

### **User response**

None.

### **Message Type**

LOG

## **KLVTB032: SORT ERROR: TABLE(*table*)**

### **Explanation**

While processing a tables request, the TMS:Engine tables manager detected invalid sort information in the tables database for *table*.

### **System action**

The tables manager will attempt to load a previous copy of the table, if one exists (message KLVTB035), or will use the partially loaded table (message KLVTB034).

### **User response**

None.

### **Message Type**

LOG

## **KLVTB033: ROW ERROR: TABLE(*table*) READ(*mmm*) EXPECTED(*nnn*)**

### **Explanation**

While processing a tables request, the TMS:Engine tables manager detected a structural error in the tables database for *table*. *mmm* is the number of rows successfully processed; *nnn* is the number of rows that were expected.

**System action**

The tables manager will attempt to load a previous copy of the table, if one exists (message KLVTB035), or will use the partially loaded table (message KLVTB034).

**User response**

None.

**Message Type**

LOG

**KLVTB034: RECOVERED [OLDER COPY] [WITH DATA ERRORS]: TABLE(*table*)****Explanation**

While processing a tables request, the TMS:Engine tables manager detected an error in the tables database for table. If the recovery was performed by loading an older copy of the table, the phrase OLDER COPY appears. If not all of the data in the table could be recovered, the phrase WITH DATA ERRORS appears. Previous KLVTB0nn message(s) should be present that describe the original error.

**System action**

The request continues as if no error had occurred.

**User response**

None.

**Notes®**

This error may occur when the table was not completely written to the database at some earlier point, or when a VSAM I/O error occurs while reading the table.

**Message Type**

LOG

**KLVTB035: RECOVERING OLDER COPY: TABLE(*table*)****Explanation**

While processing a tables request, the TMS:Engine tables manager detected an error in the tables database for table and will attempt to recover using an earlier version of the table. Previous KLVTB0nn messages should be present that describe the original error.

**System action**

The invalid table is erased from the tables database to prevent any future errors, and the request is retried with the earlier version of the table.

**User response**

None.

**Message Type**

LOG

**KLVTB036: RECOVERY FAILED: TABLE(*table*)****Explanation**

While processing a tables request, the TMS:Engine tables manager detected an error in the tables database for table. If there was an older copy of the table on the database, the tables manager attempted to recover it, but

that copy also had errors. These errors were severe enough that no usable information could be recovered. Previous KLVTB0nn messages should be present that describe the original error.

### System action

The request is terminated with a nonzero return code. The invalid table remains on the database.

### User response

Keep the TMS:Engine run sheets, dump files, this message, the z/OS® system log, and a copy of your tables database. Then contact IBM® Software Support. You must recreate the table and save it to the database after the diagnostic information is obtained.

### Message Type

LOG

## KLVTB037: WRITE ERROR: TABLE(*table*) RPLFDBWD(*feedback*) SEQUENCE(*nnn*) RECORD(*hex*)

### Explanation

The TMS:Engine tables manager received a VSAM error while updating the tables database for *table*. *feedback* is the RPL feedback word from the failing request. *nnn* is the record sequence number for the table that was being written. *hex* is the VSAM record contents.

### System action

The request is terminated with a nonzero return code. The table remains open.

### User response

Refer to the *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets* manual for the meaning of the values in *feedback*. If the problem is not apparent, retain the TMS:Engine run sheets, dump files, this message, the z/OS® system log, and a copy of your tables database. Then contact IBM® Software Support.

### Message Type

LOG

## KLVTB038: SYNC ERROR: TABLE(*table*) EXPECTED(*edata*) ACTUAL(*adata*) SEQUENCE(*nnn*) RECORD(*hex*)

### Explanation

While processing a tables request, the TMS:Engine tables manager detected invalid synchronization information in the tables database for *table*. A VSAM record has been read that is not part of the table being loaded. *edata* is the expected sync value; *adata* is the actual data read. *nnn* is the record sequence number for the table that contains the block. *hex* is the block that was in error, followed by the remainder of the VSAM record.

### System action

The tables manager will attempt to load a previous copy of the table, if one exists (message KLVTB035), or will use the partially loaded table (message KLVTB034).

### User response

None.

### Message Type

LOG

## **KLVTB039: ROW-END ERROR: TABLE(*table*) READ(*mmm*) EXPECTED(*nnn*)**

### **Explanation**

While processing a tables request, the TMS:Engine tables manager detected invalid synchronization information in the tables database for table. An internal end-of-row marker is missing. *mmm* is the number of rows successfully processed; *nnn* is the number of rows that were expected.

### **System action**

The tables manager will attempt to load a previous copy of the table, if one exists (message KLVTB035), or will use the partially loaded table (message KLVTB034).

### **User response**

None.

### **Message Type**

LOG

## **KLVTB040: KLVTBMGR LOGIC ERROR**

### **Explanation**

The TMS:Engine tables manager detected an invalid condition while performing a request.

### **System action**

The request is terminated with a U0200 abend, sending a dump to the RKLVSnap file of the system's dump data sets or both.

### **User response**

Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

### **Message Type**

REPLY

## **KLVTB041: KLVTBMGR INVALID TABLE DELETE POINTER**

### **Explanation**

The TMS:Engine tables manager detected an invalid condition while performing a request.

### **System action**

The request is terminated with a U0200 abend, sending a dump to the RKLVSnap file or the system's dump data sets or both.

### **User response**

Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

### **Message Type**

REPLY

## **KLVTB042: FREE \$TUB INTEGRITY CHECK FAILED**

### **Explanation**

The TMS:Engine tables manager detected a problem with an internal control block while performing a request.

**System action**

The request is terminated with a U0200 abend, sending a dump to the RKLVSnap file or the system's dump data sets or both.

**User response**

Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

REPLY

**KLVTB043: UNSUPPORTED/INVALID \$DMTB REQUEST RECEIVED****Explanation**

The TMS:Engine tables manager was passed an invalid request.

**System action**

The request is terminated with a U0200 abend, sending a dump to the RKLVSnap file or the system's dump data sets or both.

**User response**

Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

**Message Type**

REPLY

**KLVTB045: RESIDUAL RECORD DELETED: TABLE(*table*) SEQUENCE(*nnn*)****Explanation**

The TMS:Engine tables manager detected an error while writing table to the tables database. Data from an older copy of the table was not completely removed during an earlier save request. *nnn* is the record sequence number of the invalid data record for table.

**System action**

The tables manager deletes the old, invalid records and continues saving table. This message is issued for each record that is deleted.

**User response**

None.

**Message Type**

LOG

**KLVTB046: CHAINING ERROR: TABLE(*table*) SEQUENCE(*nnn*) RECORD(*hex*)****Explanation**

The TMS:Engine tables manager detected an error while reading the tables database for table. A block that spans multiple VSAM records is not correct. *nnn* is the record sequence number for the table that contains the block. *hex* is the block that was in error, followed by the remainder of the VSAM record.

**System action**

The tables manager will attempt to load a previous copy of the table, if one exists (message KLVTB035), or will use the partially loaded table (message KLVTB034).

**User response**

None.

**Message Type**

LOG

**KLVTB047: UNEXPECTED FIELD: TABLE(*table*) SEQUENCE(*nnn*) RECORD(*hex*)****Explanation**

The TMS:Engine tables manager detected an error while reading the tables database for table. Too many variable names or sort fields have been processed. *nnn* is the record sequence number for the table that contains the block. *hex* is the block that was in error, followed by the remainder of the VSAM record.

**System action**

The tables manager will attempt to load a previous copy of the table, if one exists (message KLVTB035). If there is no alternate table, message KLVTB036 will be issued and the request terminated with a nonzero return code.

**User response**

Refer to message KLVTB036.

**Message Type**

LOG

**KLVTB048: INVALID ERASE REQUEST DETECTED****Explanation**

The TMS:Engine tables manager detected an error before erasing a record from the tables data base.

**System action**

The request is terminated with a U0100 abend, sending a dump to the RKLVSnap file or the system's dump data sets or both.

**User response**

Gather the complete TMS:Engine logs, dump files, this message, and the z/OS® system log. For detailed instructions on resolving this issue, search for KLVTB048 at the IBM Support Portal.

**Message Type**

REPLY

**KLVTB049: INVALID RLB CHAIN DETECTED****Explanation**

The TMS:Engine tables manager detected an error while attempting to lock a row from the tables data base.

**System action**

The request is terminated with a U0100 abend, sending a dump to the RKLVSnap file or the system's dump data sets or both.

**User response**

Keep the TMS:Engine run sheets, dump files, and this message. Then contact IBM® Software Support.

**Message Type**

REPLY

## **KLVTB051: UNSUPPORTED/INVALID \$TBHLP REQUEST RECEIVED**

### **Explanation**

The TMS:Engine tables manager was passed an invalid request.

### **System action**

The request is terminated with a U0200 abend, sending a dump to the RKLVSnap file or the system's dump data sets or both.

### **User response**

Keep the TMS:Engine run sheets, dump files, this message, and the z/OS® system log. Then contact IBM® Software Support.

**KLVL014: DSNAME OR DDNAME IS REQUIRED FOR VIEWLOG****Explanation**

The KLVINVLG member of RKANPAR does not have a data set or DD name or either coded.

**System action**

VIEWLOG initialization ends. VIEWLOG processing is not available. TMS:Engine initialization continues.

**User response**

Modify the KLVINVLG member to specify a data set or DD name or both, and then recycle TMS:Engine.

**Message Type**

WARNING

**KLVL015: VIEWLOG DSNAME RETRIEVAL FAILED, RC(*rc*) ERROR(*error*)  
INFO(*info*) DDNAME(*ddn*)****Explanation**

During VIEWLOG initialization, an attempt to determine the data set name associated with DD *ddn* failed. The z/OS® DYNALLOCC function gave with the indicated return, error, and info codes.

**System action**

VIEWLOG initialization ends. VIEWLOG processing is not available. TMS:Engine initialization continues.

**User response**

Consult the *IBM® z/OS® MVS™ Programming: Authorized Assembler Services Reference* to determine the reason DYNALLOCC failed.

**Message Type**

WARNING

## **KLVVL016: KLVINVLG RKANPAR PARAMETERS:**

### **Explanation**

Module KLVINVLG logs its startup parameters as they are read from RKANPAR. This is the header message and will be followed by message KLVVL017.

### **System action**

None.

### **User response**

None.

### **Message Type**

LOG

## **KLVVL017: *parameters***

### **Explanation**

As the parameters in module KLVINVLG are read, a log audit trail is created.

### **System action**

None.

### **User response**

None.

### **Message Type**

LOG

## **KLVVS003: VSAM ACB CLOSE FAILURE: R15(*r15*) ACBERFLG(*acberflg*)**

### **Explanation**

An unsuccessful attempt was made to close a VSAM ACB.

### **System action**

Any attempt to use the cluster in error may result in an error.

### **User response**

Use the appropriate IBM® DFP or VSAM programmer's reference (typically *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets*) for the CLOSE macro, and the *r15* and *acberflg* fields to determine the cause of the error. Then take appropriate corrective action.

### **Message Type**

ERROR

## **KLVVS010: *text***

### **Explanation**

A control statement in the KLVINVAM RKANPAR member has been read and is being processed. *text* is the statement.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVVS011: VSAM ACB GENERATION ERROR: R15(*r15*) R0(*r0*), TERMINATION SCHEDULED****Explanation**

During TMS:Engine initialization, an error was detected when a GENCB macro was issued to generate an ACB.

**System action**

After any subsequent startup modules are invoked, TMS:Engine terminates.

**User response**

Use the appropriate IBM® DFP or VSAM programmer's reference (typically *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets*) for the GENCB macro, and the *r15* and *r0* fields to determine the cause of the error. Then take appropriate corrective action and restart TMS:Engine.

**Message Type**

ALERT

**KLVVS012: EXCESS BYTES RESERVED IN \$CCB FOR VSAM ACB: NEEDED(*nbytes*) ALLOCATED(*mbytes*) EXCESS(*mbytes* - *nbytes*)****Explanation**

The length of the VSAM ACB generated is less than the amount of storage reserved for the ACB in the TMS:Engine control block \$CCB.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVVS013: VSAM RPL GENERATION ERROR: R15(*r15*) R0(*r0*), TERMINATION SCHEDULED****Explanation**

During TMS:Engine initialization, an error was detected when a GENCB macro was issued to generate an RPL.

**System action**

After any subsequent startup modules are invoked, TMS:Engine terminates.

**User response**

Use the appropriate IBM® DFP or VSAM programmer's reference (typically *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets*) for the GENCB macro, and the *r15* and *r0* fields to determine the cause of the error. Then take appropriate corrective action and restart TMS:Engine.

**Message Type**

ALERT

**KLVS014: EXCESS BYTES RESERVED IN \$CRB FOR VSAM RPL:  
NEEDED(*nbytes*) ALLOCATED(*mbytes*) EXCESS(*mbytes - nbytes*)****Explanation**

The length of the VSAM RPL generated is less than the amount of storage reserved for the RPL in the TMS:Engine control block \$CRB.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVS015: VSAM INITIALIZATION COMPLETE****Explanation**

When the VSAM initialization startup module has successfully completed, this message is logged to create an audit trail.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVS016: VSAM ACB REQUIRES *n* BYTES, ONLY *m* BYTES WERE RESERVED,  
INCREASE &\$CCBSP\$****Explanation**

The amount of storage reserved in the TMS:Engine \$CCB control block is not sufficient for the amount used by the VSAM ACB generated.

**System action**

After any subsequent startup modules are invoked, TMS:Engine terminates.

**User response**

Keep the TMS:Engine run sheets and dump files, this message, the z/OS® system log, and determine your systems DFP release level. Then contact IBM® Software Support.

**Message Type**

WARNING

**KLVS017: VSAM RPL REQUIRES *n* BYTES, ONLY *m* BYTES WERE RESERVED, INCREASE &\$CRBSP\$****Explanation**

The amount of storage reserved in the TMS:Engine \$CRB control block is not sufficient for the amount used by the VSAM RPL generated.

**System action**

After any subsequent startup modules are invoked, TMS:Engine terminates.

**User response**

Keep the TMS:Engine run sheets and dump files, this message, the z/OS® system log, and determine your systems DFP release level. Then contact IBM® Software Support.

**Message Type**

WARNING

**KLVS018: VSAM INITIALIZATION BYPASSED, NO LSR POOL****Explanation**

No LSR pool was allocated during TMS:Engine startup.

**System action**

The TMS:Engine VSAM facility is unavailable.

**User response**

Ensure that one or more LSRPOOL keywords are coded in RKLVIN and restart TMS:Engine.

**Message Type**

LOG

**KLVS019: TOO MANY FREEPCTWARN VALUES****Explanation**

More than 10 values were specified on the KLVINAM RKANPAR keyword, FREEPCTWARN.

**System action**

The remainder of the KLVINAM member will be processed. Then TMS:Engine startup will be terminated.

**User response**

Correct FREEPCTWARN to have 10 or fewer values.

**Message Type**

WARN, ERROR

## **KLVVS020: KLVINVAM RKANPAR PARAMETERS:**

### **Explanation**

Module KLVINVAM logs its startup parameters as they are read from RKANPAR. This is the header message and will be followed by message KLVVS010.

### **System action**

None.

### **User response**

None.

### **Message Type**

LOG

## **KLVVS021: VSAM LOGIC ERROR: RPL(*addr*) CLUSTER(*name*) RPLFDBWD(*rplfdbwd*) RPLIDWD(*rplidwd*) RPLOPTCD(*rploptcd*)**

### **Explanation**

A VSAM request issued by TMS:Engine received RC=8, indicating that a logical error occurred. For resource contention errors received for a given request, this message is issued every 10 errors to reduce message traffic in RKLVLLOG.

### **System action**

If the error indicates VSAM resource contention, message KLVVS026 will be issued and the request retried. Otherwise, the system action depends on the reason for the error.

### **User response**

When this message is followed by KLVVS026, refer to that message for appropriate actions. Otherwise, consult the appropriate IBM® DFP or VSAM reference manual (typically *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets*) for the meaning of RPLFDBWD (the feedback word) to determine the cause of the error. Then take the appropriate corrective action.

### **Message Type**

LOG

## **KLVVS023: FREEPCTWARN VALUE INVALID: *nnnn***

### **Explanation**

The value specified on the FREEPCTWARN parameter in the KLVINVAM member of RKANPAR is not valid.

### **System action**

Initialization is terminated.

### **User response**

Edit the KLVINVAM member of RKANPAR and correct the value specified for FREEPCTWARN. Valid values are 0 to 100.

### **Message Type**

WARNING, ERROR

## **KLVVS026: VSAM *type* CONTENTION - REQUEST WILL BE RETRIED IN 0.50 SECONDS (*nnn* RETRIES)**

### **Explanation**

A VSAM request issued by TMS:Engine was rejected because of resource contention. *type* may be CI, BUFFER, or STRING. *nnn* is the number of prior retries for this request. KLVVS021 precedes this message. For resource contention errors received for a given request, this message is issued every 10 errors to reduce message traffic in RKLVLLOG.

### **System action**

The TMS:Engine requester is suspended for one-half second. Then the request is reissued.

### **User response**

If the condition occurs often, take the following actions:

- **STRING:** Increase the LSRSTRNO value in RKLVIN to allow more concurrent VSAM requests. If the value is at its maximum of 255, no further action is available.
- **BUFFER:** Increase the LSRPOOL value in RKLVIN for the CI size of the cluster identified in the KLVVS021 message.
- **CI:** If the cluster identified in the KLVVS021 message has a CI size greater than 4096, reallocate it with CISIZE(4096) and increase the LSRPOOL value for buffer size 4096. If the CI size is 4096 or smaller, no further action is available.

### **Message Type**

LOG

## **KLVVS031: VSAM PHYSICAL ERROR: RPL(*addr*) CLUSTER(*name*) RPLFDBWD(*rplfdbwd*) RPLIDWD(*rplidwd*) RPLOPTCD(*rploptcd*)**

### **Explanation**

A VSAM physical error was detected.

### **System action**

The system action depends on the reason for the error.

### **User response**

Consult the appropriate IBM® DFP or VSAM reference manual (typically *IBM® z/OS® DFSMS™ Macro Instructions for Data Sets*) for the meaning of RPLFDBWD (the feedback word) to determine the cause of the error. Then take the appropriate corrective action.

### **Message Type**

LOG

## **KLVVS041: FREEPCTWARN VALUE INVALID: *pct***

### **Explanation**

A FREEPCTWARN value is larger than 100 or less than 0.

### **System action**

The remainder of the KLVINVAM member will be processed. Then TMS:Engine startup will be terminated.

### **User response**

Correct FREEPCTWARN so that all values are between 0-100 inclusive.

**Message Type**

WARN, ERROR

**KLVVS042: '*text*' IS NOT VALID FOR *kw*d RKANPAR(KLVINVAM)****Explanation**

The KLVINVAM keyword, *kw*d, had a value, *text*, that is not YES or NO.

**System action**

The remainder of the KLVINVAM member will be processed. Then TMS:Engine startup will be terminated.

**User response**

Correct *kw*d to specify YES or NO.

**Message Type**

WARN, ERROR

**KLVVS043: SPACEINTERVAL VALUE INVALID: *nnn*****Explanation**

The SPACEINTERVAL value is 0 or negative.

**System action**

The remainder of the KLVINVAM member will be processed. Then TMS:Engine startup will be terminated.

**User response**

Correct SPACEINTERVAL so that the value is 1 or greater.

**Message Type**

WARN, ERROR

**KLVVS050: *dd type* EXTENTS=*mmm* FREE=*nnn*% DSNAME=*dsn*****Explanation**

This message documents the current space usage for data set *dsn*, allocated to DD *dd type* is either DATA or INDEX. *mmm* is the current number of extents occupied by the data or index. *nnn* is the current percentage of space free within the cluster.

KLVVS050 is issued for any of these reasons:

- OPENMESSAGE=YES was specified and the cluster is being opened.
- CLOSEMESSAGE=YES was specified and the cluster is being closed.
- The number of data or index extents changed.
- The free space percentage has reached or crossed one of the values specified in the FREEPCTWARN keyword.

**System action**

None.

**User response**

None.

## Notes®

OPENMESSAGE, CLOSEMESSAGE, and FREEPCTWARN are all specified in the RKANPAR member, KLVINVAM.

## Message Type

LOG, WARN

## **KLVVS051: SHOWCB RC=*rc* REASON=*rs dd dsn*; SPACE MESSAGES DISABLED**

### Explanation

Space usage could not be determined for data set *dsn*, allocated to *dd*, because a SHOWCB macro failed. *rc* is the return code (R15); *rs* is the reason code (R0).

### System action

No further space usage monitoring will be done for the cluster. All other VSAM operations are unaffected.

### User response

Contact IBM® Software Support with the contents of this message and your z/OS® and DFP release and maintenance levels.

## Message Type

LOG, WARN, ERROR

## **KLVVS052: INVALID KLVVSSTM REQUEST**

### Explanation

An invalid parameter list was passed to an TMS:Engine VSAM service module.

### System action

The active thread is terminated. A diagnostic dump will be taken to the system dump data sets or RKLVSnap.

### User response

Keep the TMS:Engine run sheets and the dump, and contact IBM® Software Support.

## Message Type

None.

## **KLVVT001: VTAM® OPEN ERROR: APPLID(*applid*) R15(*r15*) ACBERFLG(*acberflg*)**

### Explanation

An unsuccessful attempt was made to open a VTAM® ACB.

### System action

The application terminates.

### User response

Use *IBM® z/OS® Communications Server SNA Programming* and the *r15* and *acberflg* fields to determine the cause of the error and take appropriate corrective action.

## Message Type

LOG, VIEW

**KLVVT002: VTAM® CLOSE ERROR: APPLID(*applid*) R15(*r15*)  
ACBERFLG(*acberflg*)**

**Explanation**

An unsuccessful attempt was made to close a VTAM® ACB.

**System action**

None.

**User response**

Use *IBM® z/OS® Communications Server SNA Programming* and the *r15* and *acberflg* fields to determine the cause of the error and take appropriate corrective action.

**Message Type**

LOG, VIEW

**KLVVT003: CRITICAL APPLICATION TERMINATING: APPLID(*applid*)**

**Explanation**

A critical application *applid* is in the process of terminating. An application is defined as critical at open time.

**System action**

None.

**User response**

None.

**Message Type**

ALERT

**KLVVT004: VTAM® ACCESS METHOD SUPPORT VECTOR LIST RELEASE LEVEL  
*level* COMPONENT ID *id* FUNCTION LIST *list* VECTOR *vector***

**Explanation**

The first VTAM® ACB is successfully opened, causing information about the current level of z/OS® Communications Server to be logged.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVVT005: SETLOGON FAILURE: APPLID(*applid*), REQSTAT(*reqstat*)**

**Explanation**

A SETON request for application ABCNAME failed. *reqstat* is the return code and feedback information: the first byte of which is the return code, the second byte is the feedback, and the third and fourth are the SNA sense code.

**System action**

The application terminates.

**User response**

Use *IBM® z/OS® Communications Server SNA Programming* and the *reqstat* field to determine the cause of the error and take appropriate corrective action.

**Message Type**

INFO

**KLVVT006: GENERIC RESOURCE SUPPORT REQUIRES VTAM® 4.2 OR LATER.****Explanation**

The use of generic resources is required but the level of VTAM® which is installed does not support generic resources. VTAM® must be at the 4.2 or higher level.

**System action**

Initialization is terminated.

**User response**

Either remove the use of generic resources or install a version of VTAM® which supports that function.

**KLVVT007: GENERIC RESOURCE ADD FAILED FOR *applname*****Explanation**

A SETLOGON OPTCD=GNAMEADD macro was issued for *applname* to attempt to register as a generic resource but the macro failed.

**System action**

Initialization is terminated.

**User response**

Check VTAM® configuration to determine if generic resource definitions are correct.

**KLVVT011: PHYSICAL ERROR COUNT EXCEEDED FOR *slname*, SESSION TERMINATED****Explanation**

Too many I/O errors have occurred on *slname*.

**System action**

The session is terminated.

**User response**

Determine the cause of the I/O errors and take corrective action.

**Message Type**

INFO

## **KLVVT015: SESSION PROCEDURE TIMEOUT: LU(*luname*) SPT(*timeout*)**

### **Explanation**

A session initiation request has timed out. A REQSESS for primary LU *luname* or SIMLOGON for secondary LU *luname* was issued and the response to the request exceeded the timeout interval *timeout*.

### **System action**

The session initiation attempt fails.

### **User response**

Increase SPT value in member KLVINVTM in RKANPAR library.

### **Message Type**

INFO

**KLVVT021: *text: appl, <lu><dest>, <cid>, <logmode>, seqno, req, <mod>cntrl, fdbk<, fdbk2><, osens>***

### **Explanation**

VTAM® and TMS:Engine information have been formatted because a VTAM® error has occurred or because TMS:Engine has been directed to trace certain VTAM® actions. The data that may be shown follows (RPL field names are in brackets):

- *text*: Short description of the error.

#### **PI TRACE**

TMS:Engine has been directed to trace the flow of control for this ACB.

#### **EXIT TRACE**

TMS:Engine has been directed to trace the flow of control for this ACB.

#### **DFASY EXIT**

TMS:Engine has been directed to trace the flow of control for this ACB.

#### **REQUEST RETRY**

The request was rejected because of a storage shortage. TMS:Engine will wait one second and then retry the request.

#### **INBOUND -RSP-**

A negative response was received and DEBUG(Y) has been requested.

#### **INBOUND +RSP**

A positive response was received and TMS:Engine has been directed to trace the flow of control for this ACB.

#### **CHAIN RETRY**

An exceptional condition was detected for this request and is being retried.

#### **CHAIN RETRY FAILED**

An attempt to retry a request that failed for an exceptional reason was not successful. The session is terminated. Refer to the data fields in the message to determine the problem.

#### **OUTBOUND -RSP-**

A negative response is being reflected to the requester. Refer to the data fields in the message for more information.

#### **LOGICAL ERROR**

A VTAM® logical error was detected. Refer to the data fields in the message for more information.

## VTAM® NSXIT, UNKNOWN RU

The TMS:Engine Network Services Exit was scheduled, but the request unit (RU) received was not a Cleanup, Notify, or Network Services RU. Contact your site z/OS® Communications Server systems programmer.

## INVALID CORRELATOR

A solicited BIND has been received, but the user-provided correlator returned by VTAM® is not valid. The BIND is rejected. Contact your z/OS® Communications Server systems programmer.

## PHYSICAL ERROR

A z/OS® Communications Server physical error was detected. If the error was a z/OS® Communications Server storage shortage the request is retried until it succeeds or fails for a different reason. Refer to the data fields in the message to determine the problem.

- *appl*: Application ID.
- *lu*: Logical unit name.
- *dest*: Destination (for CLSDST PASS).
- *cid*: Communication identifier.
- *logmode*: Associated logmode.
- *seqno*: RPL sequence number. [RPLSEQNO].
- *req*: Request code. If it is one of a standard set, it is shown in English; otherwise it is formatted in hexadecimal. [RPLREQ].
- *nie*: Control modifier: [RPLSRYP] and [RPLRH3].
  - **R** Response
  - **BB** Begin bracket
  - **EB** End bracket
  - **CEB** Conditional end bracket
  - **CD** Change direction
- *cntrl* Control information. If it is one of a standard set, it is shown in English; otherwise it is formatted in hex. [RPLCNTRL].
- *fdbk*: Request feedback. If it is one of a standard set, it is shown in English; otherwise it is formatted in hex. [RPLFDBK].
- *fdbk2*: More feedback information, displayed in hex. [RPLFDBK2].
- *osens*: Sense code information, displayed in hex. [RPLSENS].

If a data item cannot be located, it is omitted from the message. If DEBUG(Y) was specified in the TMS:Engine KLVSYN file, the contents of any request units, the RPL, and an TMS:Engine control block will be displayed, if they are relevant.

## System action

The system action depends on the reason for the dump.

## User response

Refer to *IBM® z/OS® Communications Server SNA Programming* to obtain information about the FDBK, FDBK2, and OSENS fields. If the dump seems to be associated with a persistent problem, contact IBM® Software Support.

**Note:** Many of these dumps are the result of normal conditions, such as powering a terminal off.

**Message Type**

LOG. If DEBUG(Y) is specified, LOG, VIEW.

**KLVT021\_2: EXCEPTION RESPONSE****Explanation**

An exception response was received by TMS:Engine.

**System action**

The system action depends on the reason for the exception response.

**User response**

If the exception response is not the result of normal network activity, contact IBM® Software Support.

**Message Type**

LOG

**KLVT021\_3: DEFINITE RESPONSE****Explanation**

The EXIT or API traces have been enabled. All responses received by TMS:Engine cause a VTAM® request dump under these circumstances.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVT021\_4: VTAM® LERAD EXIT****Explanation**

A VTAM® logic error was detected, causing the TMS:Engine LERAD exit to be scheduled.

**System action**

None.

**User response**

Consult your site's network systems programmer.

**Message Type**

LOG

**KLVT021\_5: VTAM® NSEXIT, UNKNOWN RU****Explanation**

The TMS:Engine Network Services Exit was scheduled, but the RU received was not a Cleanup RU or a Notify RU.

**System action**

None.

**User response**

Consult your site's network system programmer.

**Message Type**

LOG

**KLVT021\_6: VTAM® SYNAD EXIT****Explanation**

A physical error or special condition was encountered by VTAM®, causing the TMS:Engine SYNAD exit to be scheduled.

**System action**

Unpredictable.

**User response**

Consult your site's network system programmer.

**Message Type**

LOG

**KLVT021\_7: PHYSICAL ERROR****Explanation**

VTAM® encountered a physical error, for example, a storage shortage.

**System action**

The operation is retried until successful. System action is invisible to the user.

**User response**

None. This message is logged for audit purposes only.

**Message Type**

LOG

**KLVT021\_8: API EXIT TRACE ENABLED****Explanation**

The API exit trace has been enabled.

**System action**

A VTAM® request dump is taken.

**User response**

None.

**Message Type**

LOG

## **KLVT021\_9: RPL EXIT TRACE ENABLED**

### **Explanation**

The RPL exit trace has been enabled.

### **System action**

A VTAM® request dump is taken.

### **User response**

None.

### **Message Type**

LOG

## **KLVT021\_10: INVALID CORRELATOR**

### **Explanation**

A solicited BIND has been received, and the user-provided correlator returned by the access method is not valid.

### **System action**

The BIND is rejected.

### **User response**

Consult your site's network system programmer.

### **Message Type**

LOG

## **KLVT031: LOGON REJECTED: LU(*luname*) CID(*cid*)**

### **Explanation**

Either:

- A resource ID could not be assigned, or
- Session initialization failed for the device *luname* and communication ID *cid*.

### **System action**

The session terminates.

### **User response**

Look for other error messages associated with this LU *luname* to isolate the error.

### **Message Type**

INFO

## **KLVT051: NETWORK SERVICES RU: APPLID(*acb*) LRN(*lrn*) RU(*ru*)**

### **Explanation**

The TMS:Engine NSEXIT received a network services RU.

**System action**

For cleanup requests, the session is terminated.

**User response**

The RU field contains the network services RU type. Refer to *SNA Formats (SNA Reference Summary)* (GA27-3136 ) to determine the NS RU type or contact your site's network system programmer.

**Message Type**

LOG

**KLVVT061: RELEASE REQUESTED: LU(*luname*) ACB(*address*)****Explanation**

Another application program has requested a session with logical unit *luname*. *address* is the address of the TMS:Engine ACB for *luname*. VTAM® does not provide information about the application that requested the release.

**System action**

A VTAM® RELREQ command is issued against *luname*.

**User response**

None.

**Message Type**

LOG, VIEW

**KLVVT062: RELEASE REQUESTED, SESSION NOT FOUND: LU(*lu*)****Explanation**

Another application program has requested a session with logical unit *lu* but the session between an TMS:Engine application and LU *lu* could not be found.

**System action**

None.

**User response**

None.

**Message Type**

LOG, VIEW

**KLVVT091: APPLICATION HAS BEEN HALTED: APPLID(*applid*)****Explanation**

The network operator is shutting down the network or this application, or a VTAM® abend has occurred.

**System action**

Sessions between application *applid* and its associated logical units terminate.

**User response**

This message is normally the result of an orderly TMS:Engine shutdown. Each active application is closed by TMS:Engine.

**Message Type**

WARNING

**KLVVT101: VTAM® EXLST GENERATION ERROR: R15(*r15*) R0(*r0*) TERMINATION SCHEDULED****Explanation**

An error was detected during the generation of a VTAM® EXLST.

**System action**

After any subsequent startup modules are invoked, TMS:Engine terminates.

**User response**

Consult *IBM® z/OS® Communications Server SNA Programming* to determine the cause of the error. Correct it, and restart TMS:Engine. The return code appears in the *r15* field and the error return code appears in the *r0* field.

**Message Type**

ALERT

**KLVVT102: VTAM® ACB GENERATION ERROR: R15(*r15*) R0(*r0*) TERMINATION SCHEDULED****Explanation**

An error was detected during the generation of a VTAM® ACB GENCB macro.

**System action**

After any subsequent startup modules are invoked, TMS:Engine terminates.

**User response**

Consult *IBM® z/OS® Communications Server SNA Programming* to determine the cause of the error. Correct it, and restart TMS:Engine. The return code appears in the *r15* field and the error return code appears in the *r0* field.

**Message Type**

ALERT

**KLVVT103: EXCESS BYTES RESERVED IN \$ACB FOR VTAM® ACB: NEEDED(*nbytes*) ALLOCATED(*mbytes*) EXCESS(*mbytes - nbytes*)****Explanation**

The length of the VTAM® ACB generated is less than the amount of storage reserved for the ACB in the TMS:Engine control block \$ACB.

**Message Type**

LOG

**KLVVT109: VTAM® ACB REQUIRES *n* BYTES, ONLY *m* BYTES WERE RESERVED,  
INCREASE &\$ACBSP\$**

**Explanation**

The amount of storage reserved in the TMS:Engine control block \$ACB is not sufficient for the amount used by the VTAM® ACB generated.

**System action**

After any subsequent startup modules are invoked, TMS:Engine terminates.

**User response**

Keep the TMS:Engine run sheets and dump files, this message, and the z/OS® system log. Determine your systems z/OS® Communications Server release level. Then contact IBM® Software Support.

**Message Type**

WARNING

**KLVVT110: VTAM® NIB REQUIRES *n* BYTES, ONLY *m* BYTES WERE RESERVED, INCREASE &\$NIBSP\$**

**Explanation**

The amount of storage reserved in the TMS:Engine control block \$SCB is not sufficient for the amount used by the VTAM® NIB generated.

**System action**

After any subsequent startup modules are invoked, TMS:Engine terminates.

**User response**

Keep the TMS:Engine run sheets and dump files, this message, and the z/OS® system log. Determine your system's z/OS® Communications Server release level. Then contact IBM® Software Support.

**KLVVT111: VTAM® RPL REQUIRES *n* BYTES, ONLY *m* BYTES WERE RESERVED, INCREASE &\$ARBSP\$**

**Explanation**

The amount of storage reserved in the TMS:Engine control block \$ARB is not sufficient for the amount used by the VTAM® RPL generated.

**System action**

After any subsequent startup modules are invoked, TMS:Engine terminates.

**User response**

Keep the TMS:Engine run sheets and dump files, this message, and the z/OS® system log. Determine your system's z/OS® Communications Server release level. Then contact IBM® Software Support.

**Message Type**

WARNING

**KLVVT112: VTAM® INTERFACE INITIALIZED [,XA] [,AUTHORIZED PATH] [,SPT=VTSPT]**

**Explanation**

The VTAM® interface has been initialized and XA and AUTHORIZED PATH are displayed if used. VTSPT specifies the VTAM® session procedure timeout.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVVT113: KLVINVTM RKANPAR PARAMETERS:**

**Explanation**

Module KLVINVTM logs its startup parameters as they are read from RKANPAR. This is the header message and will be followed by message KLVVT114.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVVT114: *parameters*****Explanation**

As the parameters in module KLVINVTM are read, a log audit trail is created.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVVT251: SESSION SETUP ERROR: POOL(*pool*) APPLID(*applid*) PLU(*plu*)  
REQSTAT(*rcfb*)****Explanation**

There has been a failure to establish a virtual session. *pool* and *applid* identify the virtual terminal. *plu* is the requested application. *rcfb* is the 4-byte return code and feedback information:

- **1:** Return code. The high bit (X'80') will be turned on if this message is being issued as a result of a VTAM® NOTIFY request unit. The next bit (X'40') will be turned on if the data shown in bytes 3 and 4 is the user sense code. The remaining bits are the notify reason from the NOTIFY RU or the RPL return code (RPLRTNCD) from the VTAM® acquire request.
- **2:** The reason code, from the NOTIFY RU (notify) or RPLFDB2 (acquire).
- **3,4:** The sense code. This is from the NOTIFY RU for notify or from RPLFDBK2/RPLUSNSI for acquire.

The NOTIFY request unit is described in t *IBM® z/OS® Communications Server SNA Programming*, under "NSEXIT Exit Routine"

**System action**

None.

**User response**

Refer to the appropriate IBM® z/OS® Communications Server manual for the meaning of the sense code provided in bytes 3 and 4 of *rcfb* and correct the problem.

**Message Type**

INFO

## **KLVVT501: INITIALIZATION MEMBER KLVINVPO NOT AVAILABLE**

### **Explanation**

Member KLVINVPO in the initialization library was not available at startup time.

### **System action**

The VTAM® programmed operator facility (VPO) is unavailable.

### **User response**

If use of this facility is desired, define member KLVINVPO in the initialization library and restart TMS:Engine.

### **Message Type**

LOG

## **KLVVT503: INITIALIZATION MEMBER KLVINVPO IS EMPTY**

### **Explanation**

Member KLVINVPO in the initialization library is empty.

### **System action**

The VPO facility is unavailable.

### **User response**

If use of this facility is desired, update member KLVINVPO and restart TMS:Engine.

### **Message Type**

WARNING

## **KLVVT505: VPO SHOWCB ERROR: R15(*r15*) R0(*r0*)**

### **Explanation**

An error was detected upon execution of an z/OS® SHOWCB macro instruction.

### **System action**

The TMS:Engine programmed operator facility (VPO) is unavailable.

### **User response**

Consult *IBM® z/OS® Communications Server SNA Programming* to determine the cause of the error and take appropriate corrective action.

### **Message Type**

WARNING

## **KLVVT506: VPO ACB GENERATION ERROR: R15(*r15*) R0(*r0*)**

### **Explanation**

An error was detected upon execution of an z/OS® GENCB macro instruction.

### **System action**

The TMS:Engine programmed operator facility (VPO) is unavailable.

**User response**

Consult *IBM® z/OS® Communications Server SNA Programming* to determine the cause of the error and take appropriate corrective action. The error is in reference to the VPO ACB defined in initialization library member KLVINVPO.

**Message Type**

WARNING

**KLVVT507: UNABLE TO OPEN VPO ACB: R15(*r15*) ACBERFLG(*acberflg*)  
APPLID(*applid*)****Explanation**

An error was detected upon execution of an z/OS® OPEN macro instruction for the VPO ACB.

**System action**

The TMS:Engine programmed operator facility (VPO) is unavailable.

**User response**

Consult the *IBM® z/OS® Communications Server SNA Programming* to determine the cause of the error and take appropriate corrective action.

**Message Type**

WARNING

**KLVVT508: VPO RPL GENERATION ERROR: R15(*r15*) R0(*r0*)****Explanation**

An error was detected upon execution of an z/OS® GENCB macro instruction.

**System action**

The TMS:Engine programmed operator facility (VPO) is unavailable.

**User response**

Consult *IBM® z/OS® Communications Server SNA Programming* to determine the cause of the error and take appropriate corrective action.

**Message Type**

WARNING

**KLVVT509: VPO APPLID IS NOT AUTHORIZED AS A PROGRAM OPERATOR:  
APPLID(*applid*) RPLRTNCD(*rplrtncd*) RPLFDB2(*rplfdb2*)****Explanation**

A DISPLAY NET,MAJNODES command was issued but the VPO applid was not authorized to issue VTAM® commands. The most probable cause is the absence of the SPO parameter on the APPL definition.

**System action**

The TMS:Engine programmed operator facility (VPO) is unavailable.

**User response**

Consult the *IBM® z/OS® Communications Server SNA Programming* to determine the cause of the error and take appropriate corrective action.

**Message Type**

WARNING

**KLVVT510: UNABLE TO INITIALIZE VPO RESOURCE ID: APPLID(*applid*)****Explanation**

An unsuccessful attempt was made to identify the VTAM® program operator to the TMS:Engine logical resource manager.

**System action**

The VPO facility is unavailable.

**User response**

Contact IBM® Software Support.

**Message Type**

WARNING

**KLVVT511: VPO INITIALIZATION COMPLETE: APPLID(*applid*)****Explanation**

VPO initialization has completed successfully.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVVT512: KLVINVPO RKANPAR PARAMETERS:****Explanation**

Module KLVINVPO logs its startup parameters as they are read from RKANPAR. This is the header message and will be followed by message KLVVT513.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVVT513: *parameters*****Explanation**

As the parameters in module KLVINVPO are read, a log audit trail is created.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVVT601: VTAM® MAXIMUM PHYSICAL ERROR COUNT IS *nnnn* [WAS *nnnn*]****Explanation**

The maximum error count has been changed by the CHANGE ERPCOUNT command.

**System action**

Processing continues.

**User response**

None.

**Message Type**

INFO

**KLVVT602: VTAM® PUBLIC VECTOR NOT INITIALIZED****Explanation**

A CHANGE ERPCOUNT command was entered but the system is unable to locate the VTAM® public vector table.

**System action**

The CHANGE ERPCOUNT command is ignored.

**User response**

Contact IBM® Software Support.

**Message Type**

INFO

**KLVVT851: UNSUPPORTED FUNCTION MANAGEMENT PROFILE: LU(*luname*)  
FM PROF(*prof*)****Explanation**

The function management profile *prof* is unsupported.

**System action**

The session terminates.

**User response**

Logical units with this FM profile cannot establish sessions with TMS:Engine. Consult the *z/OS® Communications Server SNA Programmer's LU 6.2 Reference* for more information on FM profiles and bind parameters.

**Message Type**

LOG, WARNING, VIEW

**KLVVT852: UNSUPPORTED TRANSMISSION SERVICES PROFILE: LU(*luname*)  
TSPROF(*prof*)****Explanation**

The transmission services profile *prof* is unsupported.

**System action**

The session terminates.

**User response**

Logical units with this TS profile cannot establish sessions with TMS:Engine. Refer to *z/OS® Communications Server SNA Programmer's LU 6.2 Reference* for more information on TS profiles and bind parameters.

**Message Type**

LOG, WARNING, VIEW

**KLVVT853: UNSUPPORTED LUTYPE: LU(*luname*) LUTYPE(*lutype*)****Explanation**

An attempt to establish a session with *luname* is rejected because the type of logical unit is not supported.

**System action**

The session is terminated.

**User response**

None

**Message Type**

LOG, WARNING, VIEW

**KLVVT901: ABNORMAL RECEIVE TERMINATION RTNCD(*rplrtncd*)  
FDB2(*rplfdb2*) SSEI(*rplssei*) SSMI(*rplssmi*) USNSI(*rplusnsi*) ACB(*acb*)  
LU(*lu*)****Explanation**

TMS:Engine was unable to determine the correct action to take in response to an exception request.

**System action**

The session terminates.

**User response**

If the reason for the error cannot be determined from the information supplied and the error persists, contact IBM® Software Support.

**Message Type**

REPLY

## **KLVVT902: INBOUND MESSAGE LIMIT EXCEEDED LU(*luname*) SESSION CANCELLED**

### **Explanation**

The limit of inbound messages received either from application or physical terminal luname is exceeded.

### **System action**

The session for the application/terminal is terminated.

### **User response**

Examine initialization parameter INBDLIM. Contact the application or terminal vendor and increase the limit if appropriate.

### **Message Type**

ALERT

## **KLVVT903: INBOUND CHAIN ELEMENT LIMIT EXCEEDED LU(*luname*) SESSION CANCELLED**

### **Explanation**

The limit of SNA chain elements per chain received either from application or physical terminal luname is exceeded.

### **System action**

The session for the application/terminal is terminated.

### **User response**

Examine initialization parameter INBCHAINLIM. Contact the application or terminal vendor and increase the limit if appropriate.

### **Message Type**

ALERT

## **KLVVT904: INBOUND MESSAGE SIZE LIMIT EXCEEDED LU(*luname*) SESSION CANCELLED**

### **Explanation**

The inbound message size received from application or physical terminal luname is greater than 524,288 bytes.

### **System action**

The session for the application/terminal is terminated.

### **User response**

Contact the application or terminal vendor.

### **Message Type**

ALERT

**KLVVT951: VIRTUAL SESSION MANAGER INITIALIZED, TIMEOUT=*tt*,  
RETRY=*rr***

**Explanation**

This message is logged to create an audit trail when the virtual session manager has been successfully initialized. TIMEOUT refers to the virtual session establishment timeout specified in RKANPAR member KLVINVSM or the default value. RETRY refers to the number of times TMS:Engine will retry the TIMEOUT interval.

**System action**

None.

**User response**

None.

**Message Type**

INFO

**KLVVT952: KLVINVSM RKANPAR PARAMETERS:**

**Explanation**

Module KLVINVSM logs its startup parameters as they are read from RKANPAR. This is the header message and will be followed by message KLVVT953.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVVT953: *parameters***

**Explanation**

As the parameters in module KLVINVSM are read, a log audit trail is created.

**System action**

None.

**User response**

None.

**Message Type**

LOG

**KLVXC001: XCF MESSAGE TOO LONG, MESSAGE DISCARDED**

**Explanation**

An XCF message has been received, but not enough storage is available to allocate a buffer to receive it.

**System action**

The message is discarded.

**User response**

None.

**Message Type**

ERROR

## KLX messages

The messages that begin with the KLX prefix are associated with the Tivoli Enterprise™ Monitoring Server or Tivoli® Management Services:Engine (TMS:Engine).

### KLXCP001: WAITING FOR TCP/IP TO INITIALIZE

**Explanation**

After the TCP/IP interface was successfully initialized, the TCP/IP address space is no longer active (perhaps it is being recycled). This message appears both in the log and on the system console.

**System action**

No further use of TCP/IP for communications is possible until the address space is restarted. When TCP/IP is restarted, this message is removed from the system console.

**User response**

Restart the TCP/IP address space if processing is to continue.

**Message Type**

INFO

### KLXIN001: TCP/IP CONFIGURATION: *<content of member>*

**Explanation**

The member KLXINTCP is the configuration member of RKANPAR that is used to configure the IBM® TCP/IP interface. This message displays in the content of member KLXINTCP.

**System action**

The process continues.

**User response**

None. This message is informational.

**Message Type**

VIEW

### KLXIN002: SYNTAX ERROR - *msg: text*

**Explanation**

The KLXINTCP configuration member of RKANPAR is invalid. The syntax error is displayed in this message.

**System action**

Initialization of the TCP/IP interface fails and the application continues with no access to TCP/IP.

**User response**

Correct the KLXINTCP configuration member of RKANPAR and restart the product.

**Message Type**

WARN

**KLXIN003: TCP/IP INTERFACE INITIALIZED****Explanation**

Initialization of the TCP/IP protocol stack has completed successfully.

**System action**

The process continues.

**User response**

This message is informational.

**Message Type**

LOG

**KLXIN004: TCP/IP INTERFACE NOT OPENED: RC(nnnn)****Explanation**

Allocation and initialization of the TCP/IP interface has failed.

**System action**

TCP/IP access is not available to the application.

**User response**

Gather relevant logs and submit them to IBM® Software Support.

**Message Type**

WARN

**KLXIN005: TCP/IP INTERFACE INITIALIZATION BYPASSED****Explanation**

Initialization of the TCP/IP protocol is bypassed: configuration member KLXINTCP is not present in RKANPAR.

Note that this is not necessarily an error.

**System action**

The application continues without TCP/IP access.

**User response**

This message is informational.

**Message Type**

INFO

**KLXIN009: SOCKET INTERFACE TO *tcpipname* UNAVAILABLE: <RC(*nnnn*)  
ERRNO(*nnnn*)>**

**Explanation**

This message indicates that the TCP/IP interface has failed to initialize. The resulting return code and errno should be examined for the cause of failure. Refer to the *z/OS® Communications Server: IP Sockets Application Programming Interface Guide and Reference* (SC31-8788) for an explanation of the return codes and errnos.

**System action**

TCP/IP access is not available to the application.

**User response**

Make sure the KLXINTCP member of RKANPAR contains the correct TCP/IP stack identifier.

**Message Type**

WARN

**KLXOP001: UNRECOGNIZED SUBCOMMAND: <*unrecognized subcommand*>**

**Explanation**

The LBDAEMON operator command failed. The subcommand is not recognized.

**System action**

The LBDAEMON operator command is ignored.

**User response**

Correct the command and re-enter.

**Message Type**

ERROR

**KLXOP002: UNRECOGNIZED DAEMON ID: <*daemon name*>**

**Explanation**

The LBDAEMON START operator command failed because the requested daemon is not valid.

**System action**

The LBDAEMON START command is ignored.

**User response**

Correct the daemon name/ID and retry the LBDAEMON operator command.

**Message Type**

ERROR

**KLXOP003: DAEMON NOT AVAILABLE: <*daemon*>**

**Explanation**

The LBDAEMON command HAS failed because the requested daemon is not available.

**System action**

The LBDAEMON operator command is ignored.

**User response**

This is an unusual condition. Gather relevant logs and report the problem to IBM® Software Support.

**Message Type**

ERROR

**KLXOP004: DAEMON STARTED: <daemon>****Explanation**

The LBDAEMON START command has completed successfully.

**System action**

The requested DAEMON is started.

**User response**

None.

**Message Type**

ERROR

**KLXOP010: eeeeeeeeeeeeeeeeeee ccccccccccccccc****Explanation**

A syntax error eeeeeeeeeeeeeeeeeee was countered while processing an IPMVS command.

**System action**

The command is ignored.

**User response**

Correct the syntax error and re-enter the command, if required.

**Message Type**

ERROR

**KLXOP011: TCP/IP NOT AVAILABLE****Explanation**

An IPMVS command was entered, but the TCP/IP interface has not been initialized.

**System action**

The command is ignored.

**User response**

Configure the TCP/IP interface and restart IBM® Tivoli® Monitoring.

**Message Type**

ERROR

## **KLXOP012: TCP/IP *subcommand* NOT RECOGNIZED: *subcommand***

### **Explanation**

The IPMVS command specifies a subcommand which is not recognized.

### **System action**

The command is ignored.

### **User response**

Re-enter the IPMVS command, specifying a valid subcommand.

### **Message Type**

ERROR

## **KLXOP013: TCP/IP *subcommand* FAILED: RC(*nnnn*)**

### **Explanation**

The indicated IPMVS subcommand failed with return code *nnnn*.

### **System action**

Processing continues.

### **User response**

None.

### **Message Type**

ERROR

## **KLXOP014: TCP/IP *subcommand* COMPLETED**

### **Explanation**

The indicated IPMVS subcommand completed successfully.

### **System action**

Processing continues.

### **User response**

None.

### **Message Type**

REPLY

## **KLXOP015: *nnnn* HOSTNAME: *hostname***

### **Explanation**

An IPMVS HOSTNAME or CONNECT command was issued. The return code from the GETHOSTNAME macro is *nnnn* and the hostname is *hostname*.

### **System action**

Processing continues.

**User response**

None.

**Message Type**

REPLY

## KMV messages

The messages that begin with the KMV prefix are associated with OMEGAVIEW®.

### **KMVCCC001E: UNABLE TO LOCATE KMVCCC GLOBAL AREA**

**Explanation**

The KMVCCC global structure was not located.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

### **KMVCCC002E: INVALID STATUS ITEM NAME IN GETATTRIBUTE REQUEST**

**Explanation**

An invalid status item name was passed in a request to obtain initial attributes.

**System action**

The GetAttribute request is ignored.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

### **KMVCCC003E: MANAGED OBJECT *object* NOT FOUND**

**Explanation**

During a GetAttribute request, the specified object could not be located.

**System action**

The GetAttribute request is ignored.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

## **KMVCCC004E: RULE FOR MANAGED OBJECT *object* IS TOO LONG**

### **Explanation**

While creating or updating the Status Data Manager (SDM) resources for the specified managed object, the SDM rule string became too long. This may be due to the number of children subordinate to the object.

### **System action**

The SDM rule is not updated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC005E: ENTERPRISE OBJECT NOT FOUND**

### **Explanation**

The KMVCCC Enterprise object was not located.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC006E: ENTERPRISE OBJECT IS NOT VALID**

### **Explanation**

The KMVCCC Enterprise object is not in a valid state.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC007I: ERROR *return\_code* WHILE CONNECTING TO HUB -- RETRY IN 2 MINUTES**

### **Explanation**

*return\_code* was received while connecting to the Tivoli Enterprise™ Monitoring Server hub.

### **System action**

The request will be retried in two minutes.

**User response**

Make sure the KDCSHOST and KDSENV configuration members are properly set up for locating the hub. If the problem persists, contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC008E: INTERNAL THREAD DISPATCH ERROR****Explanation**

An error occurred while dispatching a thread.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC009E: UNRECOVERABLE ERROR *return\_code* WHILE CONNECTING TO HUB****Explanation**

*return\_code* was received while connecting to the Tivoli Enterprise™ Monitoring Server hub.

**System action**

No further attempts will be made.

**User response**

Make sure the KDCSHOST and KDSENV configuration members are properly set up for locating the hub. If the problem persists, contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC010E: UNABLE TO INITIALIZE KMVCCC SERVICE QUEUE****Explanation**

An error occurred while setting up the KMVCCC service queue.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

## **KMVCCC011E: UNABLE TO INITIALIZE SDM INTERFACE**

### **Explanation**

An error occurred while setting up the interface to the Status Data Manager (SDM).

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC012I: EIB CHANGE THREAD SHUTTING DOWN**

### **Explanation**

The thread that monitors the Tivoli Enterprise™ Monitoring Server hub for changes to the enterprise, and the managed objects it contains, is shutting down.

### **System action**

Processing continues.

### **User response**

This message will most likely occur when the OMEGAVIEW® region is shutting down. If it occurs at other times, examine the log for other error messages and contact IBM® Software Support.

### **Message Type**

Information.

## **KMVCCC013I: KMVCCC SERVICE THREAD SHUTTING DOWN**

### **Explanation**

The KMVCCC service thread is shutting down.

### **System action**

Processing continues.

### **User response**

This message will most likely occur when the OMEGAVIEW® region is shutting down. If it occurs at other times, examine the log for other error messages and contact IBM® Software Support.

### **Message Type**

Information.

## **KMVCCC014E: UNABLE TO INITIALIZE NODE STATUS THREAD**

### **Explanation**

An error occurred while initializing the thread that monitors the Tivoli Enterprise™ Monitoring Server hub for changes in node status.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC015E: UNABLE TO ATTACH NODE STATUS THREAD****Explanation**

An error occurred while starting the thread that monitors the Tivoli Enterprise™ Monitoring Server hub for changes in node status.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC016E: UNABLE TO INITIALIZE SITUATION STATUS THREAD****Explanation**

An error occurred while initializing the thread that monitors the hub for changes in node status.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC017E: UNABLE TO ATTACH SITUATION STATUS THREAD****Explanation**

An error occurred while starting the thread that monitors the Tivoli Enterprise™ Monitoring Server hub for changes in node status.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

## **KMVCCC018E: UNABLE TO INITIALIZE EIB CHANGE THREAD**

### **Explanation**

An error occurred while initializing the thread that monitors the Tivoli Enterprise™ Monitoring Server hub for changes in node status.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC019E: UNABLE TO ATTACH EIB CHANGE THREAD**

### **Explanation**

An error occurred while starting the thread that monitors the Tivoli Enterprise™ Monitoring Server hub for changes in node status.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC021E: ERROR return\_code TRYING TO ADD SITUATION EVENT**

### **Explanation**

Return\_code was received while processing a situation event.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC022E: INVALID MANAGED OBJECT DEFINITION, NO TEMPLATE**

### **Explanation**

A managed object definition without a template specification was retrieved from the Tivoli Enterprise™ Monitoring Server hub.

### **System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Error.

**KMVCCC023E: NO SDM INTERFACE AVAILABLE****Explanation**

There is no interface to the Status Data Manager (SDM).

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Error.

**KMVCCC024E: ERROR *return\_code* TRYING TO CREATE MESSAGE QUEUE****Explanation**

*return\_code* was received while creating a message queue for internal communications.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC025E: ERROR *return\_code* TRYING TO DESTROY MESSAGE QUEUE****Explanation**

*return\_code* was received while deleting an internal communications message queue.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

## **KMVCCC026E: ERROR *return\_code* TRYING TO ADD MESSAGE TO QUEUE**

### **Explanation**

*return\_code* was received while adding a message to an internal communications message queue.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC027E: ERROR *return\_code* TRYING TO GET MESSAGE FROM QUEUE**

### **Explanation**

*return\_code* was received while getting a message from an internal communications message queue.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC028I: SHUTDOWN DETECTED**

### **Explanation**

Shutdown of the OMEGAVIEW® address space has been detected.

### **System action**

Shutdown continues and shutdown of the KMVCCC component is initiated.

### **User response**

None.

### **Message Type**

Information.

## **KMVCCC029: KMV\_CCC ENVIRONMENT VARIABLE = *value* -- SUPPORT NOT ENABLED**

### **Explanation**

The KMVCCC environment is not enabled. When specifying OMEGAVIEW® configuration values when you use the Configuration Software, the parameter **Display CCC Alerts?** was not specified as **Yes**. The KMV\_CCC environment variable shows the value specified.

### **System action**

Processing continues, but the KMVCCC component will not be activated.

**User response**

None.

**Message Type**

Information.

**KMVCCC030E: UNABLE TO CREATE DIALOG ENVIRONMENT FOR KMVCCC SERVICE THREAD****Explanation**

An internal error occurred that will prevent the creation of the OMEGAVIEW® panel to represent the enterprise.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC031I: KMVCCC SUPPORT INITIALIZATION IS COMPLETE****Explanation**

The KMVCCC component is fully initialized.

**System action**

Processing continues.

**User response**

None.

**Message Type**

Confirmation.

**KMVCCC032I: KMVCCC SHUTDOWN COMPLETE****Explanation**

Shutdown of the KMVCCC component is complete.

**System action**

None.

**User response**

None.

**Message Type**

Confirmation.

## **KMVCCC033E: ERROR *return\_code* WHILE FETCHING DATA FROM HUB**

### **Explanation**

*return\_code* was received while retrieving data from the Tivoli Enterprise™ Monitoring Server hub.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC034E: ERROR *return\_code* INITIALIZING THREAD ATTRIBUTE**

### **Explanation**

*return\_code* was received while initializing a thread attribute.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC035E: ERROR *return\_code* TRYING TO CREATE NEW THREAD**

### **Explanation**

*return\_code* was received while creating a new thread.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC036E: UNABLE TO ATTACH SDM SERVICE THREAD**

### **Explanation**

An error occurred while starting the Status Data Manager (SDM) service thread.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC037E: UNABLE TO CREATE DIALOG ENVIRONMENT FOR SDM SERVICE THREAD****Explanation**

An internal error occurred that prevents the creation of the Status Data Manager (SDM) interface.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC038E: ERROR *return\_code* CREATING NEW STATUS ITEM item****Explanation**

*return\_code* was received while creating the specified status item.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC039E: ERROR *return\_code* OPENING STATUS ITEM item****Explanation**

*return\_code* was received while opening the specified status item.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC040E: ERROR *return\_code* EMITTING VALUE TO ITEM item****Explanation**

*return\_code* was received while emitting a value to the specified status item.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC041E: ERROR *return\_code* UPDATING RULE FOR ITEM item****Explanation**

*return\_code* was received while updating the rule for the specified status item.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC042E: ERROR *return\_code* CLOSING STATUS ITEM item****Explanation**

*return\_code* was received while closing the specified status item.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC043E: ERROR *return\_code* DESTROYING STATUS ITEM item****Explanation**

*return\_code* was received while deleting the specified status item.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

## **KMVCCC044E: INVALID REQUEST *request\_code* RECEIVED BY SDM SERVICE**

### **Explanation**

The Status Data Manager (SDM) service received an invalid request, *request\_code*.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC045E: INVALID REQUEST *request\_code* RECEIVED BY KMVCCC SERVICE**

### **Explanation**

The KMVCCC service received an invalid request, *request\_code*.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC046E: ERROR *return\_code* CREATING SDM SESSION**

### **Explanation**

*return\_code* was received while trying to create the Status Data Manager (SDM) session.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC047E: UNABLE TO CREATE LOGICAL RESOURCE**

### **Explanation**

It was not possible to initialize a logical resource for use by the KMVCCC support component.

### **System action**

The current request is terminated. Candle® Command Center alerts will not be available.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC048E: UNABLE TO PROTECT LOGICAL RESOURCE****Explanation**

It was not possible to protect the logical resource used by the KMVCCC support component.

**System action**

The current request is terminated. Candle® Command Center alerts will not be available.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC049E: CONSTRUCTION OF SQL REQUEST OBJECT FAILED****Explanation**

An SQL request object failed to initialize properly.

**System action**

The current request is terminated. Candle® Command Center alerts will not be available.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC050E: ERROR *return\_code* FROM SQL OPEN REQUEST****Explanation**

*return\_code* was received when opening an SQL request.

**System action**

The current request is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

## **KMVCCC051E: ERROR *return\_code* FROM SQL FETCH REQUEST**

### **Explanation**

*return\_code* was received when fetching rows from an SQL request.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC052E: UNABLE TO LOCATE object MANAGED OBJECT**

### **Explanation**

It was not possible to locate the specified managed object while fetching initial attributes.

### **System action**

The current request is terminated.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC053E: NO CHILDREN FOUND FOR THE ENTERPRISE**

### **Explanation**

While constructing the initial view of the Candle® Command Center Enterprise, no subordinate managed objects were found.

### **System action**

The current request is terminated. Candle® Command Center alerts will not be available.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC054E: ABEND DETECTED IN THREAD ROUTINE**

### **Explanation**

An abend was detected in a thread routine.

### **System action**

The thread is terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC055E: ERROR *return\_code* TRYING TO SUBMIT SDM SERVICE REQUEST****Explanation**

An error was encountered while submitting a request to the Status Data Manager (SDM) server.

**System action**

The current request is ignored.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC056E: ERROR *return\_code* TRYING TO ADD ROW TO EVENTS TABLE****Explanation**

An error was encountered while adding a row to the events table for a managed object.

**System action**

The current request is ignored.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC057E: ERROR *return\_code* TRYING TO OPEN THE EVENTS TABLE****Explanation**

An error was encountered while opening the event table for a managed object.

**System action**

The current request is ignored.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC058E: UNABLE TO LOCATE EVENT FOR SITUATION *situation\_name*  
ON NODE *node\_name***

**Explanation**

No event entry could be found for the specified situation/node combination while fetching initial attributes.

**System action**

The current request is ignored.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC059W: ATTRIBUTE NAME TRANSLATION CANNOT BE PERFORMED**

**Explanation**

The attribute dictionary is unavailable to perform attribute name translation while fetching initial attributes for a situation event.

**System action**

The attribute display will show the untranslated column names.

**User response**

Examine TLVLOG for messages during start-up that might explain why the attribute dictionary was not built.

**Message Type**

Internal error.

**KMVCCC060E: ERROR *return\_code* TRYING TO TRANSLATE® ATTRIBUTE  
NAME *attr***

**Explanation**

An error occurred while translating the specified attribute.

**System action**

The attribute display will show the untranslated column name.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC100E: UNABLE TO OPEN DDNAME RKANDATV OPENDIR**

**Explanation**

An error occurred when opening the directory for the partitioned data set allocated to ddname RKANDATV.

**System action**

Processing of ddname RKANDATV is terminated. Candle® Command Center alerts will not be available.

**User response**

Check the RKANDATV DD statement in the OMEGAVIEW® started task JCL. Verify that the proper runtime data set is allocated and that security authorization for read access is granted to the OMEGAVIEW® started task.

**Message Type**

User error.

**KMVCCC101I: READDIR ERROR RC=*nnn*****Explanation**

An error or end of directory condition was detected when reading the directory of the partitioned data set allocated to ddname RKANDATV. *nnn* is the numeric return code issued by the internal I/O service routine.

**System action**

Processing of ddname RKANDATV continues.

**User response**

None.

**Message Type**

Information.

**KMVCCC102E: OPENFILE ERROR ON RKANDATV(*member*) RC=*rc*****Explanation**

An error occurred while opening the specified member of the partitioned data set allocated to ddname RKANDATV. *Rc* is the return code issued by the internal I/O service routine.

**System action**

Processing of ddname RKANDATV is terminated. Candle® Command Center alerts will not be available.

**User response**

Check the RKANDATV DD statement in the OMEGAVIEW® started task JCL. Verify that the proper runtime data set is allocated and that security authorization for read access is granted to the OMEGAVIEW® started task. Also ensure that the data set directory is not corrupted and the data set was not being updated while OMEGAVIEW® was reading it.

**Message Type**

User error.

**KMVCCC103I: RKANDATV(*member*) RECORD=*data*****Explanation**

An input record was successfully read from the specified member of the RKANDATV data set. Data shows the contents of the record fetched from the RKANDATV member.

**System action**

Processing of the RKANDATV DDNAME continues.

**User response**

None.

**Message Type**

Information.

**KMVCCC104I: RKANDATV(*member*) *state*****Explanation**

A parser state changed after processing an input record read from the RKANDATV data set. *member* is the member name from which the record was read. *state* is the state entered after parsing the new input record.

**System action**

Processing of ddname RKANDATV continues.

**User response**

None.

**Message Type**

Information.

**KMVCCC105W: DUPLICATE COLUMN=*colname* FOR ATTRIBUTE=*attrname* IN  
RKANDATV(*member*) LINE=*nnn*****Explanation**

A duplicate entry for an existing attribute was found. *colname* is the column name. *attrname* is the attribute name. *member* is the member where the duplicate entry was found. *nnn* is the record number within the member.

**System action**

The duplicate entry is ignored and processing continues.

**User response**

None.

**Message Type**

Internal warning.

**KMVCCC106I: ATTRIBUTE CREATED FOR COLUMN=*colname*****Explanation**

A new attribute definition entry was successfully added to the attribute dictionary. *colname* is the column name associated with the new dictionary entry.

**System action**

Processing of the ddname RKANDATV continues.

**User response**

None.

**Message Type**

Confirmation.

## **KMVCCC107I: RKANDATV(*member*) tag=*value***

### **Explanation**

An attribute definition value was successfully parsed from the current input record read from the RKANDATV data set. *member* is the member name from which the value was parsed. Tag is the type of data found in the input record. Value is the value of the data parsed from the input record.

### **System action**

Processing of ddname RKANDATV continues.

### **User response**

None.

### **Message Type**

Confirmation.

## **KMVCCC108I: RKANDATV(*member*) tag=*nnn***

### **Explanation**

An attribute definition value was successfully parsed from the current input record read from the RKANDATV data set. *member* is the member name from which the value was parsed. Tag is the type of data found in the input record. *nnn* is the numeric value parsed from the input record.

### **System action**

Processing of ddname RKANDATV continues.

### **User response**

None.

### **Message Type**

Confirmation.

## **KMVCCC109W: DUPLICATE VALI=*input* FOR VALE=*output* IN RKANDATV(*member*) LINE=*nnn***

### **Explanation**

A duplicate entry for an attribute translation value was found. *input* and *output* are the input and output translation values. *member* is where the duplicate entry was found. The record number within the member is *nnn*.

### **System action**

The duplicate entry is ignored and processing continues.

### **User response**

None.

### **Message Type**

Internal warning.

## **KMVCCC110I: ENUM ENTRY CREATED FOR VALI=*input* VALE=*output***

### **Explanation**

A new attribute translation entry was successfully added to the translation table for an attribute. *input* and *output* are the input and output translation values.

### **System action**

Processing of ddname RKANDATV continues.

### **User response**

None.

### **Message Type**

Information.

## **KMVCCC111E: UNABLE TO ALLOCATE ATTRIBUTE ENTRY**

### **Explanation**

Storage allocation for a new attribute dictionary entry has failed.

### **System action**

Processing continues to the next attribute definition entry in the current member of the RKANDATV data set.

### **User response**

A low storage condition can be the cause of this error. Increase the address space virtual storage region or other storage tuning limits for the OMEGAVIEW® address space. Contact IBM® Software Support if storage limits cannot be increased.

### **Message Type**

Internal error.

## **KMVCCC112E: UNABLE TO CREATE COLUMN KEY=*table.colname***

### **Explanation**

An error occurred while allocating storage for an attribute dictionary key. *Table* is the name of the table and *colname* is the column name of the attribute key.

### **System action**

Processing continues to the next attribute definition entry in the current member of the RKANDATV data set.

### **User response**

A low storage condition can be the cause of this error. Increase the address space virtual storage region or other storage tuning limits for the OMEGAVIEW® address space. If storage limits cannot be increased, contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC118E: ERROR *return\_code* ADDING ROW TO TABLE *table***

### **Explanation**

An error was encountered while adding a row to the table.

**System action**

The current request is ignored.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC119E: ERROR *return\_code* OPENING TABLE *table*****Explanation**

An error was encountered while opening the table.

**System action**

The current request is ignored.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC120W: DUPLICATE ATTRIBUTE=*attrname* FOR COLUMN=*colname*****Explanation**

A duplicate entry for an existing attribute was found for the named column and attribute.

**System action**

The duplicate entry is ignored and processing continues.

**User response**

None.

**Message Type**

Internal warning.

**KMVCCC121E: UNABLE TO CREATE ATTRIBUTE=*attrname*****Explanation**

An error occurred while allocating attribute dictionary entry storage for the named attribute.

**System action**

Processing continues to the next attribute definition entry in the current member of the RKANDATV data set.

**User response**

A low storage condition can cause this error. Increase the address space virtual storage region or other storage tuning limits for the OMEGAVIEW® address space. If storage limits cannot be increased, contact IBM® Software Support.

**Message Type**

Internal error.

## **KMVCCC122I: ENTRY CREATED FOR ATTRIBUTE=*attrname***

### **Explanation**

A new attribute definition entry was successfully added to the attribute dictionary. *attrname* is the attribute name associated with the dictionary entry.

### **System action**

Processing of the ddname RKANDATV continues.

### **User response**

None.

### **Message Type**

Confirmation

## **KMVCCC123E: UNABLE TO LOCATE SITUATION: *sitname***

### **Explanation**

The named situation could not be found.

### **System action**

The current request is ignored.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC124E: ERROR *return\_code* ADDING ROW TO NODE DISPLAY TABLE**

### **Explanation**

An error was encountered while adding a row to the table.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC125E: UNABLE TO ALLOCATE NODE STATUS**

### **Explanation**

An error occurred while allocating storage for a node status object.

### **System action**

Processing continues.

### **User response**

A low storage condition can cause this error. Increase the address space virtual storage region or other storage tuning limits for the OMEGAVIEW® address space. If storage limits cannot be increased, contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC126E: UNABLE TO ALLOCATE ATTRIBUTE ENUMERATION****Explanation**

An error occurred while allocating storage for an attribute enumeration list.

**System action**

Processing continues.

**User response**

A low storage condition can cause this error. Increase the address space virtual storage region or other storage tuning limits for the OMEGAVIEW® address space. If storage limits cannot be increased, contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC127E: UNABLE TO ALLOCATE COMMAND NODE ENTRY****Explanation**

An error occurred while allocating storage for a command node entry.

**Explanation**

A low storage condition can cause this error. Increase the address space virtual storage region or other storage tuning limits for the OMEGAVIEW® address space. If storage limits cannot be increased, contact IBM® Software Support.

**System action**

Processing continues.

**Message Type**

Internal error.

**KMVCCC128E: UNABLE TO ALLOCATE NODE LIST****Explanation**

An error occurred while allocating storage for a node list.

**System action**

Processing continues.

**User response**

A low storage condition can cause this error. Increase the address space virtual storage region or other storage tuning limits for the OMEGAVIEW® address space. If storage limits cannot be increased, contact IBM® Software Support.

**Message Type**

Internal error.

## **KMVCCC130E: CONNECTION TO TEMS UNAVAILABLE**

### **Explanation**

An attempt to access data from a Tivoli Enterprise™ Monitoring Server has failed because the communication link between OMEGAVIEW® and the Tivoli Enterprise™ Monitoring Server address space has failed.

### **System action**

CCC/3270 operations indicate that no data was available for the requested function and panels display no data.

### **User response**

Determine why the Tivoli Enterprise™ Monitoring Server connection has failed.

### **Message Type**

Error.

## **KMVCCC131E: ALLTYPE *type* NOT SUPPORTED**

### **Explanation**

An attempt to access a console from CCC/3270 has failed because the type of object used to determine the list of associated consoles could not be determined or is not one of those supported. The invalid object type is indicated by *type*.

### **Explanation**

Contact IBM® Software Support.

### **System action**

The access console operation ends in error and no consoles are displayed or selectable.

### **Message Type**

Internal error.

## **KMVCCC132E: ERROR *rc* TRYING TO ADD ROW TO TEMP CONSOLE TABLE**

### **Explanation**

An attempt to add a new row to an internal console table has failed, where *rc* is the error return code issued by table add services.

### **System action**

The access console operation ends in error and no consoles are displayed or selectable.

### **User response**

Contact IBM® Software Support.

### **Message Type**

Internal error.

## **KMVCCC133E: ERROR *rc* TRYING TO OPEN THE TEMP CONSOLE TABLE**

### **Explanation**

An attempt to create a temporary internal console table has failed, where *rc* is the error return code issued by table creation services.

**Explanation**

Contact IBM® Software Support.

**System action**

The access console operation ends in error and no consoles are displayed or selectable.

**Message Type**

Internal error.

**KMVCCC134E: UNABLE TO ALLOCATE MANAGED SYSTEM LIST FOR *objname*****Explanation**

An attempt to allocate storage for the list of managed systems has failed. The error can occur when storage shortages occur in the OMEGAVIEW® address space. *objname* is the object associated with the managed system list.

**System action**

The access console operation ends in error and no consoles are displayed or selectable.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KMVCCC135W: NO MANAGED SYSTEMS FOUND FOR *moname*****Explanation**

An attempt to determine the managed systems list for a selected managed object has failed. A null list of managed systems was defined for the managed object indicated by *moname*.

**System action**

The access console operation ends in error and no consoles are displayed or selectable.

**User response**

Update the managed object by locating the managed object in the Candle® Management Workstation Enterprise container and then selecting Settings.

**Message Type**

Warning.

**KMVCCC150E: Error processing predicate: *pdt*****Explanation**

An error occurred processing the situation predicate.

**System action**

The user is prevented from editing the situation.

**User response**

Use the Candle® Management Workstation editor to determine the nature of the error.

## Message Type

Error.

## KOB messages

Messages that begin with the KOB prefix are associated with the OMEGAMON Enhanced 3270 User Interface, which is part of the OMEGAMON Base component; Parameter Generator (PARMGEN); or Configuration Manager.

- Messages for the OMEGAMON Enhanced 3270 User Interface:
  - [“KOBBC – KOBO messages” on page 1941](#)
  - [“KOBRR – KOBUR messages” on page 2025](#)
- Messages for Parameter Generator (PARMGEN) or Configuration Manager:
  - [“KOBPR messages” on page 2016](#)

### KOBBC – KOBO messages

These messages are associated with the OMEGAMON enhanced 3270 user interface, which is part of the OMEGAMON Base component. By default, trace and error logs are created in SYSPRINT. (An alternate log location may have been specified, using standard JCL services.) Most of the messages are prefixed by a timestamp and thread ID.

#### **KOBC0000E: Unable to locate an important internal control block. Contact IBM technical support.**

##### **Explanation**

The address space cannot continue to process because of an internal error that resulted in the inability to find an internal control block.

##### **System action**

The address space terminates.

##### **User response**

Try one time to restart the address space. If the attempt fails, collect dump and log information and contact IBM Software Support.

#### **KOBC00001E: Job or system level memory limit (MEMLIMIT) exceeded.**

##### **Explanation**

z/OS has refused a request for virtual storage for this address space step. The reason information returned by z/OS indicates that the request would have exceeded the MEMLIMIT value for the step.

##### **System action**

The address space continues, but may not function correctly.

##### **User response**

Verify that MEMLIMIT=NOLIMIT is coded on the address space EXEC statement within the started task or job JCL, or increase the step EXEC MEMLIMIT value. (See the documentation for SYS1.PARMLIB member SMFPRMxx, or the *z/OS JCL Reference* for an explanation of MEMLIMIT.)

#### **KOBC00002E: Error attempting key change. This step must be APF authorized.**

##### **Explanation**

This program requires APF authorization.

**System action**

The address space is terminated.

**User response**

Ensure that all libraries concatenated as part of the STEPLIB DD (in the JCL) are APF authorized.

**KOBC00003E: Must be APF authorized.****Explanation**

This program requires APF authorization.

**System action**

The address space is terminated.

**User response**

Ensure that all libraries concatenated as part of the STEPLIB DD (in the JCL) are APF authorized.

**KOBC00004E: Job or system level memory limit (MEMLIMIT) exceeded.****Explanation**

z/OS has refused a request for virtual storage for this address space step. The reason information returned by z/OS indicates that the request would have exceeded the MEMLIMIT value for the step.

**System action**

The address space continues, but may not function correctly.

**User response**

Verify that MEMLIMIT=NOLIMIT is coded on the address space EXEC statement within the started task or job JCL, or increase the step EXEC MEMLIMIT value. (See the documentation for SYS1.PARMLIB member SMFPRMxx, or the *z/OS JCL Reference* for an explanation of MEMLIMIT.)

**KOBC00004I: reserved for later use****KOBC00005I: reserved for later use****KOBC00006E: Unable to create recovery environment. Thread terminates.****Explanation**

The thread management functions were unable to establish a recovery environment during thread creation.

**System action**

The new thread is not created.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00007E: Freeing of lock failed in kob\_TCB\_Thread\_Base(), rc=return\_code, errno=error\_number, rsno=error\_reason.****Explanation**

The thread management functions were unable to free a lock during thread creation, for the reasons indicated in the message.

**System action**

The new thread is not created.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00008E: Sib-lock build failure in pthread\_create(). rc=*n*, errno=*x*, rsnn=*y*.**

**Explanation**

The thread management functions were unable to build a lock during thread creation, for the reasons indicated in the message.

**System action**

The new thread is not created.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00009E: Sib-lock failure in pthread\_create(). rc=*n*, errno=*x*, rsnn=*y*.**

**Explanation**

The thread management functions were unable to obtain a lock during thread creation, for the reasons indicated in the message.

**System action**

The new thread is not created.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00010E: Sib-unlock failure in pthread\_create(). rc=*n*, errno=*x*, rsnn=*y*.**

**Explanation**

The thread management functions were unable to free a lock during thread creation, for the reasons indicated in the message.

**System action**

The address space terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00011E: Sib-lock failure in pthread\_detach(). rc=*n*, errno=*x*, rsnn=*y*.**

**Explanation**

The thread management functions were unable to free a lock during thread detach, for the reasons indicated in the message.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00012E: Lock release failure in pthread\_detach(). rc=*n*, errno=*x*, rsno=*y*.**

**Explanation**

The thread management functions were unable to release locking resources during thread detach, for the reasons indicated in the message.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00013E: Child not found in pthread\_detach() of %016IX.**

**Explanation**

The detachment of a created thread was requested, but the thread was found to be already detached.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00014E: Sib-unlock failure in pthread\_detach(). rc=*n*, errno=*x*, rsno=*y*.**

**Explanation**

The thread management functions were unable to free a lock during thread detach.

**System action**

The address space terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00015E: Lock build failure in pthread\_create(). rc=*return\_code*,  
errno=*error\_number*, rsno=*error\_reason*.**

**Explanation**

The thread management functions were unable to build a lock during thread create.

**System action**

The new thread is not created.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00016E: Lock obtain failure in pthread\_create(). rc=*return\_code*,  
errno=*error\_number*, rsno=*error\_reason*.**

**Explanation**

The thread management functions were unable to obtain a lock during thread create.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00017E: Add2Sibling Chain failure in pthread\_create(). rc=*n*, errno=*x*, rsnnno=*y*.**

**Explanation**

The thread management functions were unable to update internal linkages to add a new thread.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00018E: pthread\_create() failure. rc=*n*, errno=*error\_code*, rsnnno=*error\_reason*.**

**Explanation**

The thread management functions were unable to create a new thread.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00019E: lock cleanup failure in pthread\_create(). rc=*return\_code*, errno=*error\_number*, rsnnno=*error\_reason*.**

**Explanation**

The thread management functions were unable to clean up a lock during thread creation.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00020E: Sibling cleanup failure in pthread\_create(). rc=*n*, errno=*x*, rsnnno=*y*.**

**Explanation**

The thread management functions were unable to insert a sibling thread during thread create.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00021E: Lock destroy failure in pthread\_detach(). rc=*n*, errno=*x*, rsnnno=*y*.**

**Explanation**

The thread management functions were unable to clean up a lock during thread detach.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00022E: Child cleanup failed in pthread\_detach(). rc=*return\_code*,  
errno=*error\_number*, rsnno=*error\_reason*.**

**Explanation**

The thread management functions were unable to remove a sub-thread during thread detach.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00023E: Unable to obtain thread end lock in pthread\_join. rc=*return\_code*,  
errno=*error\_number*, rsnno=*error\_reason***

**Explanation**

An attempt to wait for completion of another thread failed.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00024E: pthread\_detach() failed in pthread\_join(). rc=*return\_code*,  
errno=*error\_number*, rsnno=*error\_reason***

**Explanation**

An attempt to release thread resources after waiting for a thread to complete failed.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBC00025E: Unable to free thread end lock in pthread\_join. rc=*return\_code*,  
errno=*error\_number*, rsnno=*error\_reason***

**Explanation**

The thread management functions were unable to clean up a lock after waiting for a thread to complete.

**System action**

The thread terminates.

**User response**

Collect dump, trace, and system log data. Report the problem to IBM Software Support.

**KOBCM0001E: Create thread for kobcmsrv failed, pthreadstatusI = x**

**Explanation**

The conduit manager attempt to create a query server thread, kobcmsrv, has failed with return code x.

**System action**

No queries can be processed.

**User response**

Restart the enhanced 3270 user interface address space. If the problem persists, call IBM Software Support.

**KOBCM0001I: nnnnnnnn uuuuuuuu. Compiled on x at y.**

**Explanation**

The running copy of module *nnnnnnnn* at Program Temporary Fix (PTF) level *uuuuuuuu* was compiled on date *x* and time *y*.

**System action**

None.

**User response**

Note this PTF for any questions related to query processing within the OMEGAMON Enhanced 3270 User Interface.

**KOBCM0002E: Create thread for kobcmdmt failed, pthreadstatusI = n**

**Explanation**

The conduit manager attempt to create a discovery manager thread, kobcmdmt, has failed with return code *n*.

**System action**

No queries can be processed.

**User response**

Restart the enhanced 3270 user interface address space. If the problem persists, call IBM Software Support.

**KOBCM0003E: Create thread for kobcmdpt failed, pthreadstatusI = *return\_code***

**Explanation**

The conduit manager attempt to create a discovery manager thread, kobcmdpt, has failed with return code *return\_code*.

**System action**

No queries can be processed.

**User response**

Restart the enhanced 3270 user interface address space. If the problem persists, call IBM Software Support.

**KOBCM0004E: Create thread for kobcmsrv failed, pthreadstatusI = *return\_code***

**Explanation**

The conduit manager attempt to create a query server thread, kobcmsrv, has failed with return code *return\_code*.

**System action**

No queries can be processed.

### User response

Restart the enhanced 3270 user interface address space. If the problem persists, call IBM Software Support.

### **KOBCM0005E: Create thread for kobcmmnt failed, pthreadstatusI = *return code*.**

#### Explanation

The Conduit Manager attempt to create a maintenance processing thread, kobcmmnt, has failed with return code *return code*.

#### System action

No maintenance can be performed.

### User response

Re-start the Tivoli OMEGAMON address space. If the problem persists call IBM support.

### **KOBCM0006E: Create thread for kobcmndt failed, pthreadstatusI = *return\_code* + *extended diagnostics context*.**

#### Explanation

The Conduit Manager attempt to create a maintenance worker/ processing thread, kobcmndt, has failed with return code = *return\_code*.

#### System action

No maintenance can be performed.

### User response

Re-start the Tivoli OMEGAMON address space. If the problem persists call IBM support.

### **KOBCM0010E: Conduit manager Recv Error, rc = *return\_code*, retry = *n*, microseconds = *y+extended diagnostics error and context***

#### Explanation

An IP socket recv() function call ended badly. The return code is *return\_code*, the elapsed duration of the receive attempt is *y*. The errno and errno2 values in the extended data can help clarify what receive error occurred. If the errno is retry-able, like EINTR, EWOULDBLOCK, or EAGAIN, then *retry = n* gives the count of retries done. Many of the conduit manager error messages are followed by extended diagnostic information. This information is intended to help users determine the context of the failing query, where:

#### **errno and errno2**

Are further error codes beyond the return code from many system services. When present, the additional codes can help isolate the exact nature of the problem. Since the conduit manager (CM) can be in simultaneous conversation with several data retrieval agents (DRAs) associated with several different hub environments, the following data will help identify just which query to which DRA has encountered a problem.

#### **Target Hub**

Is the hub environment of the DRA involved in this query.

#### **DRA IP**

Is the IP address of the LPAR where the DRA is running.

#### **DRA jobname**

Is the name of the address space where the DRA used is running.

#### **DRA Port**

Is the port number this DRA is listening to.

#### **Sequence #**

Is a unique identifier for this query transaction.

#### **Query**

Is the text string of the query in question.

### **System action**

No further results are processed for this query.

### **User response**

Verify that the partner data retrieval agent (DRA) is okay by inspecting its RKLVLLOG messages. If the errno value is EWOULDBLOCK, it is likely that the query timed out. Compare the microseconds value to the value found in the most recent log message KOBCM0066I, KOBCM0068I, KOBCM0081I, or KOBCM0083I. If the microseconds in this message are slightly longer than the timeout value, in seconds, found in the most recent preceding message, then the query took too long to process.

If the microseconds values are similar to that found in the most recent KOBCM0066I or KOBCM0068I message, you can try increasing the timeout value using command `"/F tom, SO_TIMEOUT x"` to change the timeout value, where *x* is the timeout in seconds and *tom* is the name of the enhanced 3270 address space. You can try increasing the timeout value to see if that resolves the problem.

If the microseconds values are similar to that found in the most recent KOBCM0081I or KOBCM0083I, you can try increasing the timeout value using command `"/F tom, DIS_TIMEOUT x"` to change the timeout value, where *x* is the timeout in seconds, *tom* is the name of the enhanced 3270 address space. Retry the query.

If the problem persists, restarting either the enhanced 3270 user interface or the DRA address space might help.

## **KOBCM0011E: Conduit Mgr Recv Error - Bad Length, is *x* should be *y* +extended diagnostics error and context**

### **Explanation**

The enhanced 3270 user interface address space is expecting to receive *x* bytes, but instead received *y* bytes.

### **System action**

No further results are processed for this query.

### **User response**

Try the query again. If the problem persists, look for connection problems with the data retrieval agent (DRA) identified in the extended diagnostics.

## **KOBCM0012E: read\_response(), recvbuf storage not obtained. + size requested is *x* +extended diagnostics error and context**

### **Explanation**

Buffer storage to receive result rows for this query could not be obtained. The storage size requested is *x*

### **System action**

No further results are processed for this query.

### **User response**

Retry the query. If the problem persists, recycle the enhanced 3270 user interface address space and, if needed, the data retrieval agent address space. Call IBM Software Support if recycling does not resolve the problem.

## **KOBCM0013E: Block Length Error, tries = *n* + should be *x* , but is *y* +extended diagnostics error and context**

### **Explanation**

The received block length, *y*, does not match the expected block length, *x*. It is likely that a connection failure occurred. If the failure type in the extended diagnostics was retryable, such as EINTR, EAGAIN, or EWOULDBLOCK, then *tries = n* indicates how many retries were made before accepting the error.

### **System action**

No further results are processed for this query.

### **User response**

Retry the query. If the problem persists, use the extended context data to determine the data retrieval agent (DRA) involved in the conversation. Look for further error indications from this DRA in its RKLVLLOG.

### **KOBCM0014E: Length Error + Block Length is $x$ + Block Length should be greater than record length which is $y$ +extended diagnostics error and context**

#### **Explanation**

The received block length is  $x$ . This is less than the expected size ( $y$ ) of the record length contained in this block. This should never occur.

#### **System action**

No further results are processed for this query.

### **User response**

Retry the query. If the problem persists, recycle the enhanced 3270 user interface address space and, if needed, the data retrieval agent address space. If recycling fails to resolve the problem, call IBM Software Support.

### **KOBCM0015E: Total of record lengths exceed the block length. Block Length is $x$ Total record lengths are $y$ +extended diagnostics error and context**

#### **Explanation**

The sum of the received record lengths exceeds the block size. This should not occur.

#### **System action**

No further results are processed for this query.

### **User response**

Retry the query. If the problem persists, recycle the enhanced 3270 user interface address space and, if needed, the data retrieval agent address space. If recycling fails to resolve the problem, call IBM Software Support.

### **KOBCM0016E: Unknown Rec-Type in response. Record Type received is $protocol\_type$ +extended diagnostics error and context**

#### **Explanation**

The record type found in the received data ( $protocol\_type$ ) is not recognized as a valid record type.

#### **System action**

No further results are processed for this query.

### **User response**

Inspect the IP address and port number in the extended diagnostic data and verify this is a valid LPAR connection.

### **KOBCM0017E: KOBCM17E: Error condition in DRA. Failed Function is $function\_name$ +extended diagnostics error and context**

#### **Explanation**

The data retrieval agent (DRA) involved found something wrong with the query involved in this transaction. The specific SQL1 operation that failed is  $function\_name$ .

#### **System action**

No further results are processed for this query.

**User response**

Inspect the query text looking for SQL syntax errors. If this is a user-supplied query, ensure that all the column names are spelled correctly. Often the RKLVLLOG of the Tivoli Enterprise Monitoring Server managing the DRA involved will have helpful diagnostic information. Repair the query and retry the operation.

**KOBCM0018E: KOBGW\_RR\_CM\_EndOfRows failed, rc = *x* +*extended diagnostics error and context*****Explanation**

The conduit manager component has completed sending rows for a request and is signaling completion to the next component in the path, the request router. The request router is responding with an error condition.

**System action**

No further results are processed for this query.

**User response**

If the problem persists, call IBM Software Support.

**KOBCM0019E: KOBGW\_RR\_CM\_PutDataRow rc = *x* +*Dump of failing row +extended diagnostics error and context*****Explanation**

The conduit manager component encountered an error trying to pass a query result row through the request router on its way to the 3270 screen.

**System action**

No further results are processed for this query.

**User response**

Retry the query. If the problem persists, call IBM Software Support.

**KOBCM0020W: KOBCM20W: Invalid SQL request received & ignored. +*Dump of request header*****Explanation**

The conduit manager received a malformed SQL query header. The “dump” documents the request header involved.

**System action**

The query is bypassed.

**User response**

If the problem persists, call IBM Software Support. Include the full content of this message in your report.

**KOBCM0021E: Failure getting registered DRA. rc = *error\_code* rs = *error\_reason*****Explanation**

The conduit manager attempted to discover the data retrieval agents registered in this Sysplex.

**System action**

No queries will be processed.

**User response**

Use the appropriate version of the z/OS manual *MVS Programming: Workload Management Services* (SA22-7619). Locate the reference section for the IWMSRSRS macro and compare the rc and rs values in this

message with the return and reason codes documented for this macro. If no reasonable resolution is apparent, contact IBM Software Support.

### **KOBCM0022W: Too many hubs. Hub *hub\_name* ignored. More than *nn* hubs managed.**

#### **Explanation**

While discovering data retrieval agents (DRAs), the conduit manager found more hubs active than it can manage. The current limit for hub management is *xx*. Hub name *hub\_name* and all of its DRAs are ignored.

#### **System action**

No new hubs are added to the managed system list.

#### **User response**

No action is required unless a vital Tivoli Enterprise Monitoring Server hub is being ignored. If an important hub is being ignored, consider reducing the number of less important hubs in your environment.

### **KOBCM0023E: KOBGW\_RR\_CM\_GetAnyRequest failed with rc = *return\_code* + *extended diagnostics context***

#### **Explanation**

The conduit manager received a failure notice while waiting for a new query request. The return code is *return\_code*.

#### **System action**

No more requests are processed.

#### **User response**

Restart the enhanced 3270 user interface address space as soon as possible. If the problem persists, call IBM Software Support.

### **KOBCM0024I: Conduit manager retry with alternate DRA + *extended diagnostics error and context***

#### **Explanation**

A failed query is being retried through an alternate data retrieval agent (DRA). The extended diagnostics has a sequence number specifying the exact query instance being retried, the SQL text, and information about the new DRA path selected.

#### **System action**

The query is resubmitted through a different DRA.

#### **User response**

Look for a prior KOBCM0010E message with the same sequence number. Note the DRA used in this failed transaction. If this DRA is frequently seen in failure messages, please recycle the associated Tivoli Enterprise Monitoring Server or OMEGAMON monitoring agent address space at your earliest convenience.

### **KOBCM0025W: DRA candidate *nn* has invalid . . .**

#### **Explanation**

The e3270 address space found a Data Retrieval Agent candidate that had invalid registration information. The variable portion of this message specifies one or more problems noted with the registration:

- “version number of *vvvvvvvv*. Must be string between 6 and 8 characters.”
- “address space name of *nnnnnnnn*. Must be string between 1 and 8 characters.”
- “DRA IP address of *ccccccc*. Must be string between 14 and 22 characters, starting with *::ffff:*”
- “DRA port number of *%d*. Must be number between 1 and 65535.”
- “Sysplex name of *%s*. Must be string between 1 and 8 characters.”

- “SMF ID of %s. Must be string between 1 and 4 characters.”
- “Space Token, %s. Must be string of form xxxxxxxx\_xxxxxxxx”
- “Hub IP address of %s. Must be string between 14 and 22 characters, starting with ::ffff:”
- “Hub port number of %d. Must be number between 1 and 65535.”
- “Hub origin node of %s. Must be string between 1 and 32 characters.”

### **System action**

The candidate DRA is not included in the e3270 address space registry. If this is the only candidate for a hub, then the hub will not be accessible from the e3270 address space.

### **User response**

Call IBM Software Support.

## **KOBCM0026W: Dropped DRA count is xx it should be yy.**

### **Explanation**

The count of DRAs after eliminating troubled DRAs is found to be xx. Instead, the count should have been yy.

### **System action**

The e3270 address space should work properly as long as there are 1 or more DRAs available for the hub.

### **User response**

If this problem persists after the next restart of the e3270 address space, call IBM Software Support.

## **KOBCM0030E: socket create failed, rc = *return\_code* + *extended diagnostics error and context***

### **Explanation**

The conduit manager attempted to allocate a communication socket for use with the data retrieval agent. The attempt failed with return code *return\_code*.

### **System action**

This query is bypassed.

### **User response**

Retry the associated query found in the extended diagnostics. If the problem persists, call IBM Software Support.

## **KOBCM0031E: setsockopt failed, rc = *return\_code* + *extended diagnostics error and context***

### **Explanation**

The conduit manager is attempting to set communication options for this socket conversation with the data retrieval agent. The attempt failed with return code *return\_code*.

### **System action**

This query is bypassed.

### **User response**

Retry the associated query found in the extended diagnostics. If the problem persists, call IBM Software Support.

**KOBCM0032E: invalid ip or port + ip = x port = y + *extended diagnostics error and context***

**Explanation**

The conduit manager has detected that either the IP or port values for the data retrieval agent are incorrect. The incorrect IP or port number is indicated.

**System action**

This query is bypassed.

**User response**

Retry the associated query found in the extended diagnostics. If the problem persists, call IBM Software Support.

**KOBCM0034E: BLDgwDataRq failed, rc = *return\_code* + *extended diagnostics error and context***

**Explanation**

The conduit manager has an internal error constructing the query for the data retrieval agent. Return code is *return\_code*.

**System action**

This query is bypassed.

**User response**

Retry the associated query found in the extended diagnostics. If the problem persists, call IBM Software Support.

**KOBCM0035E: send block failed, rc = *return\_code*, microseconds = *mmm*+ *extended diagnostics error and context***

**Explanation**

The conduit manager send of the query to the data retrieval agent failed. Return code was *return\_code*. The elapsed time for the connect attempt, in microseconds, is *mmm*.

**System action**

This query is bypassed.

**User response**

If the errno value is EWOULDBLOCK, it is likely the query timed out. Compare the microseconds value to the value found in log message KOBCM0066I. If the microseconds in this message are slightly longer than the time-out value, in seconds, found in KOBCM0066I, then the query took too long to process. Try increasing the time-out value to see if that resolves the problem. Use the command "/F *tom*, SO\_TIMEOUT *x*" to change the time-out value, where *x* is the time out in microseconds and *tom* is the enhanced 3270 address space name. Retry the associated query found in the extended diagnostics. If the problem persists, call IBM Software Support.

**KOBCM0036E: EOD send block failed, rc = *return\_code* + *extended diagnostics error and context***

**Explanation**

The conduit manager send of end-of-query indication to the data retrieval agent failed. Return code was *return\_code*.

**System action**

This query is bypassed.

**User response**

Retry the associated query found in the extended diagnostics. If problem persists, call IBM Software Support.

**KOBCM0040E: Discovery manager thread can not create refresh queue, kob\_init\_queue\_header.rc =return\_code+extended diagnostics error and context**

**Explanation**

The conduit manager discovery and refresh of data retrieval agents, hubs, managed system names and managed system lists can not proceed.

**System action**

The local registry is not initialized.

**User response**

Try restarting this address space. If problem persists, call IBM Software Support.

**KOBCM0041E: Maintenance manager thread can not create Maintenance refresh queue, kob\_init\_queue\_header, rc = return\_code.**

**Explanation**

The Conduit Manager Maintenance Thread can not proceed.

**System action**

No Maintenance requests can be created/submitted to the worker thread to do maintenance refresh.

**User response**

Re-start the Tivoli OMEGAMON address space. If the problem persists call IBM support.

**KOBCM0041W: Add discovery refresh request failed. kob\_add\_to\_queue error. rc =return\_code+extended diagnostics error and context**

**Explanation**

An attempt to request a periodic refresh of data retrieval agents, hubs, managed system names and managed system lists failed.

**System action**

The local registry is updated with any recent changes.

**User response**

If this is a recurring problem, call IBM Software Support.

**KOBCM0042E: Wait for periodic refresh failed. rc =return\_code + extended diagnostics error and context**

**Explanation**

An attempt to wait for the configured time period between discovery refresh cycles has failed.

**Note:** This is an extremely unlikely error condition. Basically, it indicates that normal timer services within the LPAR have failed, so the configured registry refresh time period cannot be honored.

**System action**

To prevent looping, the discovery refresh thread suspends periodic refresh and waits for an operator reply to message KOBCEM0043I.

**User response**

Try replying GO to the associated KOBCEM0043I write to operator with reply (WTOR) message found in the LPAR's SYSLOG. If another KOBCEM0043I WTOR appears immediately, then call IBM Software Support.

**KOBCEM0042W: Add Maintenance refresh request from kobcmmnt failed.**

**kob\_add\_to\_queue error rc = *return\_code + extended diagnostics context*.**

**Explanation**

An attempt to request a maintenance refresh failed from the kobcmmnt Maintenance Manager Thread.

**System action**

No maintenance can be performed.

**User response**

If this is a reoccurring problem, call IBM support.

**KOBCEM0043I: Discovery refresh wait failed. Simulate timed wait reply GO or END.****Explanation**

Write to operator with reply (WTOR) message associated with KOBCEM0042E log message.

**System action**

Discovery refresh thread waits for operator reply.

**User response**

Try replying GO to this write to operator with reply (WTOR) message. If another KOBCEM0043I WTOR appears immediately, then call IBM Software Support.

**KOBCEM0043W: Add Maintenance refresh request from myCommandRoutine failed.**

**kob\_add\_to\_queue error rc = *return\_code + extended diagnostics context*.**

**Explanation**

An attempt to request a periodic refresh of ODI/Thresholds failed.

**System action**

Most recent ODI/Thresholds refresh request have not been added.

**User response**

If this is a reoccurring problem, call IBM support.

**KOBCEM0044W: Discovery refresh thread failed to release the refresh queue properly.**

**kob\_destroy\_queue rc = *return\_code + extended diagnostics error and context***

**Explanation**

Discovery refresh thread is terminating. Its attempt to release storage associated with the refresh queue may be orphaned.

**System action**

Thread termination proceeds.

**User response**

If termination of the discovery refresh thread is unexpected, call IBM Software Support.

**KOBCM0045E: Wait for Maintenance refresh failed. sleep rc = *return code* + *extended diagnostics context*.**

**Explanation**

An attempt to wait for the configured time period between maintenance refresh cycles has failed.

**System action**

To prevent looping, the maintenance refresh thread suspends periodic refresh and waits for an operator reply to message KOBCM0045I.

**User response**

Try replying *GO* to the associated KOBCM0045I write to operator with reply (WTOR) message found in LPAR's SYSLOG. If another KOBCM0045I WTOR message appears immediately, then call IBM support.

**KOBCM0045I: Maintenance refresh wait failed. Simulate timed wait reply *GO* or *END*.**

**Explanation**

Write to operator with reply (WTOR) message associated with KOBCM0045E log message.

**System action**

Discovery refresh thread waits for operator reply.

**User response**

Try replying *GO* to this write to operator with reply (WTOR) message. If another KOBCM0045I WTOR message appears immediately, then call IBM support.

**KOBCM0045W: RC = *return code* in DRA = *Data\_Retrieval\_Agent\_name* IP = *IP\_address*, Hub = *hub\_monitoring\_server\_name* (*application\_name.table\_name*)**

**Explanation**

Message KOBCM0045W indicates that the Data Retrieval Agent (KOBAGENT) was contacted from the Tivoli® OMEGAMON® Manager, but an error was detected in the Data Retrieval Agent. This error indicates that a repeat attempt might be successful.

The following return codes are possible:

**RC=5**

The Hub or Remote Tivoli® Enterprise Monitoring Server is not yet available.

**RC=79**

When attempting to delete a table row, the row was not found.

**RC=80**

When attempting to insert a table row, a duplicate row was found.

**RC=155**

A hub or remote monitoring server could not be contacted.

**RC=202**

A TEMS does not contain application support for a particular column.

**RC=209**

A monitoring server does not contain application support for a particular application and table.

**RC=3000**

Historical data does not exist for the requested table.

**RC=9036**

The hub monitoring server is not yet available.

**RC=9037**

SQL SELECT string is too long, rejected by the DRA

**RC=9038**

SQL query contains invalid column name, rejected by the DRA

**RC=9999**

The hub monitoring server is not yet available.

**RC=67109015**

A hub or remote monitoring server could not be contacted.

**RC=67109019**

A Hub or Remote TEMS could not be contacted.

**RC=67109066**

A TEMS does not contain application support for a particular column.

**RC=67109073**

A monitoring server does not contain application support for a particular application and table.

If this message occurs frequently, check the RKLVLLOG for the Data Retrieval Agent that is listed, which might contain more details. If the message indicates that a remote or hub monitoring server is not yet available, confirm that the monitoring server is running and is not out of storage or abending.

**System action**

The query, insertion or deletion fails and any enhanced 3270 user interface workspace that needs the results might be missing data.

**System programmer response**

Check the message details for the particular return code (RC) and take the appropriate action. For example, if the message return code indicates that the monitoring server is not available, check the system to confirm that the monitoring server is running correctly. If the return codes indicate that application support files are missing, apply application support (also known as seeding) to the necessary remote and hub monitoring servers.

**KOBCM0046I: Refresh Hubs(+aaa,-ddd,ttt) DRAs(+aaa,-ddd,ttt)****MSNs(+aaa,-ddd,ttt) MSLs(+aaa,-ddd,ttt), n seconds****Explanation**

A Registry Refresh occurred. As a result of the Registry Refresh, there is a change in the number of hub monitoring servers (Hubs), Data Retrieval Agents (DRAs), Managed System Names (MSNs), or Managed System Lists (MSLs) known to this Tivoli® OMEGAMON® Manager. The values within parentheses indicate the number of added items (*aaa*), the number of deleted items (*ddd*), and the total number of items (*ttt*). The time taken to perform the Registry Refresh is reported in seconds (*n*).

**System action**

None.

**System programmer response**

None.

**KOBCM0047W: Connect failed, Err = *error code* Rsn = *reason\_code*, *nnn* seconds  
Failed for DRA = *Data\_Retrieval\_Agent\_name* IP = *IP\_address*, Hub =  
*hub\_monitoring\_server\_name (application\_name.table\_name)***

### Explanation

Message KOBCM0047W indicates that a TCP/IP connection attempt failed between this Tivoli® OMEGAMON® Manager and a data retrieval agent (DRA). The error and reason codes are displayed in the Err=*nnn* and Rsn=*nnn* fields.

The following examples show some typical return values:

**Err=0 Rsn=0x00000000**

The destination rejected the connection.

**Err=1127 Rsn=0x0000020A**

The connection attempt timed out.

If Err=0 Rsn=0x00000000 is returned, the DRA might either be not running or not reachable due to a TCP/IP firewall between the Tivoli® OMEGAMON® Manager and the DRA.

### System action

No results from the failed query are available, so any enhanced 3270 user interface workspace that needs the results might be missing data.

### System programmer response

For code Err=0 with Rsn=0x00000000, check that the named DRA is both running and not in an abending address space. Check that any firewall between this address space and the DRA address space is configured to allow TCP traffic for the port number in use by the DRA. You can control the port number of the DRA with the POOL:nnnnn modifier in the KDE\_TRANSPORT environmental variable, contained in the KxxENV file for the DRA address space.

**KOBCM0048I: Retry with DRA = *Data\_Retrieval\_Agent\_name* IP = *IP\_address*, Hub =  
*hub\_monitoring\_server\_name (application\_name.table\_name)***

### Explanation

Message KOBCM0048I indicates that an earlier failure occurred between the Tivoli® OMEGAMON® Manager and a Data Retrieval Agent (DRA) and that same operation will be tried again, with a different DRA. See the earlier message for details about the failure.

### System action

The query is being tried again, with a different DRA.

### System programmer response

None.

**KOBCM0049W: Receive failed, Err = *error code* Rsn = *reason\_code*, *nnn* seconds,  
retry = *n* Failed for DRA = *Data\_Retrieval\_Agent\_name* IP = *IP\_address*, Hub =  
*hub\_monitoring\_server\_name (application\_name.table\_name)***

### Explanation

Message KOBCM0049W indicates that a TCP/IP 'receive' failed between this Tivoli® OMEGAMON® Manager and a Data Retrieval Agent (DRA). The error and reason codes are displayed in the Err = *nnn* and Rsn = *nnn* fields. Typical values that you might see include: Err=1102 Rsn=0x76650211 The receive attempt 'timed out'. You can find details about the failure by examining the Rsn value. For example, you can enter the following TSO command to get Rsn code details: bpxmtext 76650211.

### **System action**

No results from the failed query are available, so any enhanced 3270 user interface workspace that needs the results might be missing data.

### **System programmer response**

Check that the named DRA is running and not in an abending address space. If this message repeats frequently, adjust your enhanced 3270UI "Global Query Timeout" value to a larger number of seconds, to allow a longer period for the query to complete. The Global Query Timeout value is found in the Edit->Preferences (E.P) menu, under the Session/Logon tab.

### **KOBCM0050E: kob\_get\_from\_queue failed, rc = *return\_code* + *extended diagnostics error and context***

#### **Explanation**

While selecting discovery refresh requests the conduit manager received a bad return. The failing return code is *x*.

#### **System action**

Discovery refresh requests will no longer be processed by this address space. The current data retrieval agents, hub monitoring server, managed system names and managed system lists will continue to be available for use, but no changes to the connected Hub environments will be recognized.

#### **User response**

Recycle the address space at the next convenient point or when differences between the locally registered information for the connected hub environments is sufficiently outdated to cause concern.

### **KOBCM0051W: Recalled DRA registry data is unreliable. + *dump of registered data retrieval agents***

#### **Explanation**

After several attempts to recall all registered data retrieval agents (DRAs) in the local registry, only partial data was retrieved. The log has a dump of the registered DRAs that were found.

#### **System action**

Discovery refresh processing continues but possibly with incomplete environmental information.

#### **User response**

The enhanced 3270 user interface address space may not be aware of all your monitored environments. If this warning appears repeatedly, recycle the address space. If the warning continues to appear, call IBM Software Support.

### **KOBCM0052E: reqWork too small for MSN sql. Requested size is *x*.**

#### **Explanation**

After several attempts to size the reqWork workarea to hold the SQL for MSN refresh, the required size could not be obtained. The size desired is shown in the message.

#### **System action**

Local registry refresh activities terminate. The enhanced 3270 user interface address space will gradually become out of date with changes to the monitoring agents.

#### **User response**

Recycle the address space as soon as is practical. If this error occurs frequently, call IBM Software Support.

**KOBCM0053E: reqWork too small for MSL sql. Requested size is *x*.**

**Explanation**

After several attempts to size the reqWork workarea to hold the SQL for managed system list (MSL) refresh, the required size could not be obtained. The size desired is shown in the message.

**System action**

Local registry refresh activities terminate. The enhanced 3270 user interface address space will gradually become out of date with changes to the monitoring agents.

**User response**

Recycle the address space as soon as is practical. If this error occurs frequently, call IBM Software Support.

**KOBCM0054E: kobcmndt kob\_get\_from\_queue failed, rc = *return code* + *extended diagnostics context*.**

**Explanation**

While selecting maintenance refresh requests the Conduit Manager received a bad return. The failing return code is *return code*.

**System action**

Maintenance refresh requests will no longer be processed by kobcmndt. This thread will be terminated.

**User response**

The address space should be recycled at the next convenient point.

**KOBCM0054I: Registry Refresh {configured | defaults} to *x* minutes.**

**Explanation**

This documents the local registry refresh cycle that is in use. If the message says "configured," then the value was supplied as configuration parameter REGREF; otherwise, the message says "defaults".

**System action**

Local registry is refreshed periodically at the time interval specified

**User response**

None.

**KOBCM0055W: REGREF configuration variable is *value*. + Valid values are between 1 minute and 1440 minutes. + Default of 5 minutes will be used.**

**Explanation**

Configuration variable REGREF was imported but was not used. *value* documents the value read. Valid values are between 1 and 1440 minutes (1 day).

**System action**

The default of 5 minutes will be used.

**User response**

Correct the REGREF configuration variable to specify a value within the allowed range, or accept the default.

**KOBCM0056W: Get [MSN | MSL] data for hub. Data at address, rc = return\_code + extended diagnostics context + [MSN | MSL] table header**

**Explanation**

Discovery refresh has received a bad return code (*return\_code*) while trying to obtain managed system name (MSN) or managed system list (MSL) information from the specified hub monitoring server. The returned data structure is located at *address*. The extended diagnostics context and the result table header structure are also provided for further diagnosis.

**System action**

This hub's managed system names or managed system lists are not refreshed in the local registry.

**User response**

If this message appears many times, obtain a dump of the enhanced 3270 user interface address space and capture the logs. Call IBM Software Support.

**KOBCM0057I: Registry refresh period reset to n.**

**Explanation**

This message documents the local registry refresh cycle that is now in use as a result of a REGREFRESH command.

**System action**

Local registry is refreshed periodically at the time interval specified.

**User response**

None.

**KOBCM0058I: Registry refresh ccccccc:**

- + Refresh completed in = *n* millisec
- + Hubs currently active = *n*
- + Hubs no longer active = *n*
- + Hubs just added = *n*
- + DRAs currently active = *n*
- + DRAs newly discovered = *n*
- + DRAs removed = *n*
- + DRAs registration errors = *n*
- + MSNs Currently registered = *n*
- + MSNs Newly Registered = *n*
- + MSNs Removed = *n*
- + MSNs Registration errors = *n*
- + MSLs Currently registerd = *n*
- + MSLs Newly Registered = *n*
- + MSLs Removed = *n*
- + MSLs Registration errors = *n*

**Explanation**

This message appears at the end of every registry refresh cycle, both for periodic refreshes and for "on demand" refreshes. *ccccccc* is either "completed" or "statistics". *n* is the time, in milliseconds, used to complete the refresh. If a hub, a data retrieval agent (DRA), managed system (MSN), or managed system list (MSL) is added or

dropped in the recycle, *cccccccc* will be "statistics" and the option statistics will be presented. The option messages document what the registry content is and the registry changes found in the last refresh operation.

**System action**

None.

**User response**

None.

**KOBCM0059I: Maintenance Refresh period reset to *n*.**

**Explanation**

This documents the local maintenance refresh cycle that is now in use. The value was changed by a MNTREFRESH command.

**System action**

ODI or threshold members are refreshed periodically at the time period specified.

**User response**

None.

**KOBCM0059W: No viable DRA, Hub=*hub-name (application-name.table-name)***

**Explanation**

The enhanced 3270 user interface address space has attempted to send an SQL request against table *table-name* in application *application-name* but could not find a suitable Data Retrieval Agent (DRA) associated with the hub *hub-name* to handle the request.

**System action**

The SQL request is not processed.

**User response**

Check the enhanced 3270 user interface address space configuration. Make sure the hub *hub-name* has one or more DRAs associated with it and that the DRAs are running. Check the DRA and Hub filtering settings to make sure the required DRAs are not excluded. If further assistance is required, contact IBM Software Support.

**KOBCM0060I: processing cmd string = *text*.**

**Explanation**

The conduit manager has received command *text*.

**System action**

The conduit manager processes the command.

**User response**

None.

**KOBCM0061I: Trace level for KOBGWCND is *n*.**

**Explanation**

The conduit manager is setting internal trace level to *n*.

**System action**

The conduit manager will start tracing internal activity messages at interest level *n* and lower.

**User response**

Diagnostic tracing for conduit manager can be prolific. Tracing should be done only under the guidance of IBM Software Support.

**KOBCM0062I: Registry refresh period is now *n* minutes.**

**Explanation**

A REGREFRESH command included a valid refresh period value, which is now in effect.

**System action**

The local registry refresh period for the conduit manager is changed to *n*.

**User response**

Short refresh periods can increase CPU utilization for the enhanced 3270 user interface address space. Use caution in setting refresh intervals.

**KOBCM0063I: Maintenance refresh period is now *n* minutes.**

**Explanation**

A MNTREFRESH command included a valid refresh period value.

**System action**

Conduit Manager's Maintenance refresh period is changed to *n*.

**User response**

Short refresh periods can increase CPU utilization for the Tivoli OMEGAMON address space.

**KOBCM0063W: REGREFRESH command specified *value*. + Valid values are between 1 minute and 1440 minutes. + Original period of *n* minutes will be used.**

**Explanation**

Command REGREFRESH specified an out-of-range value of *value*. Valid values are in the range between 1 and 1440 minutes (1 day).

**System action**

The immediate refresh is done, but the refresh interval is not reset.

**User response**

If a new refresh period is desired, reissue the REGREFRESH command to specify a value within the valid range.

**KOBCM0064I: Conduit manager trace level {configured | defaults} to *x*.**

**Explanation**

This message documents the trace level that is in use by the conduit manager. If the message says "configured," then the value was supplied as the configuration parameter TRACE; otherwise, the message says "defaults".

**System action**

Tracing will be done for all standard messages, plus diagnostic messages at level *x* and below.

**User response**

None.

**KOBCM0064W: MNTREFRESH command specified *value*. + Allowed values are between 0 minute and 1440 minutes. + Original period of *n* minutes will be used.**

**Explanation**

Command MNTREFRESH specified an out of range value of *value*. Allowed values are between 0 and 1440 minutes (1 day).

**System action**

The immediate refresh is done. The refresh period, however, is not reset.

**User response**

If a new refresh period is desired, reissue the MNTREFRESH command to specify a value within the allowed range.

**KOBCM0065I: Maintenance Refresh {*configured* | *defaults*} to *x* minutes.****Explanation**

This documents the maintenance refresh cycle that is in use. If the message says *configured* then the value was supplied as configuration parameter MNTREFRESH, otherwise the message says *defaults*.

**System action**

Maintenance thread is refreshed periodically at the time period specified.

**User response**

None.

**KOBCM0065W: TRACE configuration variable is *value*. + Valid values are integers from 0 and up. + Default of *x* minutes will be used.****Explanation**

The configuration variable TRACE was imported, but was not used. The value read, *value*, was not a valid value. Valid values are 0 and up.

**System action**

The specified default of *x* will be used.

**User response**

Correct the TRACE configuration variable to specify a value within the allowed range or accept the default.

**KOBCM0066I: Conduit Manager socket timeout level {*configured* | *defaults*} to *s*.****Explanation**

This message documents the time-out seconds in use by the conduit manager for socket operation connect, send, and receive. If the message says "configured", then the value was supplied as the configuration parameter SO\_TIMEOUT. Otherwise, the message says "defaults".

**System action**

Conduit manager socket operations with data retrieval agents (DRAs) will time out if they have not started within the specified number of seconds.

**User response**

If communication is slow or error prone and causes many query failures, increase the time-out value.

**KOBCM0067I: THRESHOLDS\_SOURCE environment variable not FOUND.****Explanation**

THRESHOLDS\_SOURCE environment variable was not found. Default value of DD:RKANPAR will be used.

**System action**

THRESHOLDS\_SOURCE set to DD:RKANPAR.

**User response**

If a new source value of THRESHOLDS is desired, specify that in THRESHOLDS\_SOURCE environment variable.

**KOBCM0067W: SO\_TIMEOUT configuration variable is *value*. + Allowed values are integers from 0 and up. + Default of *x* seconds will be used.**

**Explanation**

The configuration variable SO\_TIMEOUT was imported but was not used. *value* documents the value read. Allowed values are 0 and up.

**System action**

The default of *x* is used.

**User response**

Correct the SO\_TIMEOUT configuration variable to specify a value within the allowed range or accept the default.

**KOBCM0070W: Get\_Column\_Affinities failed. rc = *return\_code*, appl = *appl*, table = *table* + *extended diagnostics context***

**Explanation**

Object Definition Interchange (ODI) file information for the named application, *appl* and table, *table*, was not found. The return code was *return\_code*. Extended diagnostics will provide the error code and error reason values as well.

**System action**

No attempt is made to further adjust the query for agent version level. The query will be attempted as-is and may fail.

**User response**

Ensure that the current product ODI table is loaded for the application named in the message.

**KOBCM0081I: Conduit Manager discovery socket timeout {configured | defaults} to *x*.**

**Explanation**

This message documents the time-out seconds in use by the conduit manager for discovery socket operation connect, send, and receive. If the message says "configured", then the value was supplied as a configuration parameter DIS\_TIMEOUT. Otherwise, the message say "defaults".

**System action**

Conduit manager discovery socket operations with data retrieval agents (DRAs) will time out if they have not started within the specified number of seconds.

**User response**

Consult with IBM Software Support before adjusting this value.

**KOBCM0082W: DIS\_TIMEOUT configuration variable is *value*. + Allowed values are integers from 0 and up. + Default of *x* seconds will be used.**

**Explanation**

Configuration variable DIS\_TIMEOUT was imported but was not used. *value* documents the value read. Allowed values are 0 and up.

**System action**

The default of *x* is used.

**User response**

Correct the DIS\_TIMEOUT configuration variable to specify a value within the allowed range or accept the default.

**KOBCM0083I: Discovery socket timeout seconds for KOBGWCND is *n*.**

**Explanation**

Conduit manager is setting discovery socket operations time limit to *n* seconds.

**System action**

Conduit manager will wait up to specified seconds for each discovery socket communication with data retrieval agents (DRAs) to start.

**User response**

Consult with IBM Software Support before adjusting this value.

**KOBCM0084I: Conduit Manager ping socket timeout {configured | defaults} to *x*.**

**Explanation**

This message documents the time-out seconds that is in use by Conduit Manager for ping socket operation receive. If the message says “configured”, the value was supplied as the configuration parameter PNG\_TIMEOUT. Otherwise the message says “defaults”.

**KOBCM0085W: PNG\_TIMEOUT configuration variable is *value*. + Allowed values are integers from 0 and higher. + Default of *x* seconds will be used.**

**Explanation**

Configuration variable PNG\_TIMEOUT was imported but was not used. *value* documents the value read. Allowed values are 0 and above.

**System action**

The default *x* will be used.

**User response**

Correct the PNG\_TIMEOUT configuration variable to specify a value within the allowed range or accept the default.

**KOBCM0086I: Ping socket timeout seconds for KOBGWCND is *n*.**

**Explanation**

The conduit manager is setting the time limit for ping-socket operations to *n* seconds.

**KOBCM0087I: Conduit Manager connect socket timeout {configured | defaults} to *x*.**

**Explanation**

This message displays the number of seconds before timeout that the conduit manager uses when connecting to a data retrieval agent (DRA) socket. If the message says *configured*, the value was supplied in the configuration parameter CON\_TIMEOUT. Otherwise, the message says *defaults*.

**KOBCM0088W: CON\_TIMEOUT configuration variable is *value*. + Allowed values are integers from 0 and higher. + Default of *x* seconds will be used.**

**Explanation**

The configuration parameter CON\_TIMEOUT was specified, but the value is not allowed. Allowed values are integers from 0 and above.

**System action**

The default value of *x* will be used.

### User response

Correct the **CON\_TIMEOUT** parameter value to be within the allowed range, or accept the default.

**KOBCM0089I: Connect socket timeout seconds for KOBGWCND is *n*.**

### Explanation

The conduit manager is setting the time limit for connect-socket operations to *n* seconds.

**KOBCM0090W: Conduit Manager retried the receive *n* operation *x* times before succeeding. + Elapsed time before success is *y* microseconds + extended diagnostics context**

### Explanation

Conduit manager receives data from its partner KOBAGENT in two steps. The first step learns how large the data block will be and the second step receives the actual data. If *n* is 1, the conduit manager is receiving the data block size. If *n* is 2, the conduit manager is receiving the actual data block. *x* is the number of retries before succeeding. *y* is the number of microseconds elapsed trying to receive this data.

**KOBCM0091I: Jobname: *nnnnnnnn* SYSID: *nnnnnnnn* SMFID: *ssss*.**

### Explanation

Conduit Manager documents the address space name, System ID, and SMF ID from which this log is being collected.

**KOBCM0100W: ODIREFRESH command specified *s*. + Allowed values must begin with K and be followed by 2 character product code.**

### Explanation

The ODIREFRESH command entered was not processed. The product code *s* is not valid. The command expects you to specify a single product code for the ODI to be refreshed. The product code must be 3 characters. The first character must be K, the next two characters must be a product code for a valid product, for example, M5 or CP.

### System action

None.

### User response

Retry the command using a valid product code. Look at the concatenated files in the RKANPAR DD statement for this OMEGAMON Enhanced 3270 user interface address space and find the first instance of the KOBFCGAP member. The first column contains the valid product codes for the ODI files that this address space might use.

**KOBCM0110I: Completed *Collection\_type* Situation Collection for *Hub\_Name* (*Total\_Sits*, +*Added\_Sits*, -*Deleted\_Sits*).**

### Explanation

A situation collection processes has completed for the indicated hub TEMS. Details on the collection type and the number of known situations for this hub TEMS is given, where:

- *Collection\_type* = Periodic | Realtime
- *Hub\_Name* = the origin node of the hub TEMS that was sampled
- *Total\_Sits* = number of situations within the Situation Database for this hub TEMS
- *Added\_Sits* = number of new situations added to the Situation Database on this sample
- *Deleted\_Sits* = number of situations deleted from the Situation Database on this sample

**System action**

None.

**System programmer response**

None.

**KOBCM0111W: Registry Refresh in progress. Periodic Situation Collection will not be performed this interval.****Explanation**

An attempt was made to make start collecting situation data. As the Tivoli® OMEGAMON® Manager's internal Registry Refresh processing was taking place a definitive list of hub TEMS was not available. Collection of situation data cannot take place and will wait 1 minute before attempting again.

**System action**

The periodic situation collection is skipped for the current collection interval.

**System programmer response**

Check the frequency of the Registry Refresh process (KOBCM0054I) and time taken to perform a Registry Refresh (KOBCM0046I). If this problem is a regular occurrence, consider changing the situation collection interval, the Registry Refresh process, or both to different intervals to reduce the chance of Registry Refresh and situation collection occurring at the same time.

**KOBCM0112I: Situation sampling interval *type* to *frequency* minutes.****Explanation**

Indicates how often a periodic situation collection against all know hub TEMS will take place, where:

- *type* = configured | defaults
- *frequency* = frequency, in minutes of the periodic situation collection process

The value is read from the Tivoli® OMEGAMON® Manager's environment settings at startup. The default value is 5 minutes.

**System action**

None.

**System programmer response**

None.

**KOBCM0113I: Number of cached recent situation samples *type* to *slot\_number* samples.****Explanation**

Indicates how many recent periodic samples, including status and snapshot data, are retained by the Tivoli® OMEGAMON® Manager for an open situation, where:

- *type* = configured | defaults
- *slot\_number* = number of slots defined.

The value is read from the Tivoli® OMEGAMON® Manager's environment settings at startup. The default value is 12 samples.

**System action**

None.

### System programmer response

None.

### **KOBCM0114I: Number of cached historical situation samples *type* to *slot\_number* samples.**

#### Explanation

Indicates how many historical periodic samples, including status and snapshot data, are retained by the Tivoli® OMEGAMON® Manager for an open situation, where:

- *type* = configured | defaults
- *slot\_number* = number of slots defined.

The value is read from the Tivoli® OMEGAMON® Manager's environment settings at startup. The default value is 16 samples.

#### System action

None.

### System programmer response

None.

### **KOBCM0115I: Historical situation collection range *type* to *time\_period units*.**

#### Explanation

Indicates the time period that historical situation collection will cover, where:

- *type* = configured | defaults
- *time\_period* = time period that historical samples will cover
- *units* = minutes | hours | days

The value is read from the Tivoli® OMEGAMON® Manager's environment settings at startup. The default value is 4 hours. Valid ranges is from 1 minute to 2\*\*32 days.

#### System action

None.

### System programmer response

None.

### **KOBCM0116I: Each historical sample will represent approximately *time\_period units*.**

#### Explanation

Indicates the time period that a single historical collection sample or slot will cover, where:

- *time\_period* = time period that an individual historical sample will cover
- *units* = minutes | hours | days

The value is calculated from overall time period historical situation collection is defined to cover (KOBCM0115I) divided by the number of periods or slots allocated (KOBCM0114I). If default values are used, this is 4 hours / 16 samples = 15 minutes.

#### System action

None.

### System programmer response

None.

**KOBCM0117W: Value of KOB\_SITST\_SAMPLE\_MINUTES configuration variable is *frequency*. Valid range is between 1 and 4294967295 minutes. Default of 5 minutes will be used.**

### Explanation

There was a problem reading the environment variable that defines the situation collection interval, where:

- *frequency* = the value for this environment variable as defined in the read configuration file

The default value of 5 minutes will be used.

### System action

Normal processing continues using the default value.

### System programmer response

Check the value that is set in the Tivoli® OMEGAMON® Manager environment variable files and make any corrections. The Tivoli® OMEGAMON® Manager will need to be recycled for any change to take effect.

**KOBCM0118W: Value of KOB\_SITST\_RECENT\_SLOTS configuration variable is *slot\_number*. Valid range is between 1 and 128 samples. Default of 12 samples will be used.**

### Explanation

There was a problem reading the environment variable that defines the number recent periodic samples to be retained by the Tivoli® OMEGAMON® Manager for an open situation, where:

- *slot\_number* = the value for this environment variable as defined in the read configuration file

The default value of 12 samples will be used.

### System action

Normal processing continues using the default value.

### System programmer response

Check the value that is set in the Tivoli® OMEGAMON® Manager environment variable files and make any corrections. The Tivoli® OMEGAMON® Manager will need to be recycled for any change to take effect.

**KOBCM0119W: Value of KOB\_SITST\_HISTORY\_SLOTS configuration variable is *slot\_number*. Valid range is between 1 and 128 samples. Default of 16 samples will be used.**

### Explanation

There was a problem reading the environment variable that defines the number historical periodic samples to be retained by the Tivoli® OMEGAMON® Manager for an open situation, where:

- *slot\_number* = the value for this environment variable as defined in the read configuration file

The default value of 16 samples will be used.

### System action

Normal processing continues using the default value.

### System programmer response

Check the value that is set in the Tivoli® OMEGAMON® Manager environment variable files and make any corrections. The Tivoli® OMEGAMON® Manager will need to be recycled for any change to take effect.

**KOBCM0120W: Value of KOB\_SITST\_HISTORY\_RANGE configuration variable is *time\_period*. Valid range is between 1 minute and 4294967295 days. Use suffix M (minutes), H (hours) or D (days) to indicate units. Default of 4 hours will be used.**

### Explanation

There was a problem reading the environment variable that defines the time period historical situation will cover, where:

- *time\_period* = the value for this environment variable as defined in the read configuration file

The default value of 4 hours will be used.

### System action

Normal processing continues using the default value.

### System programmer response

Check the value that is set in the Tivoli® OMEGAMON® Manager environment variable files and make any corrections. The Tivoli® OMEGAMON® Manager will need to be recycled for any change to take effect.

**KOBCM0121W: Historical sample slot interval cannot represent time period less than situation sample interval. Each historical sample will represent *time\_period* minutes.**

### Explanation

The calculated historical sample slot interval cannot be less than the defined situation sample interval (KOBCM0112I). The value is therefore reset to match this value meaning each sample interval also represents a single historical sample period, where:

- *time\_period* = time period that an individual historical sample will cover

### System action

None.

### System programmer response

None.

**KOBCM0125E: Unable to create Situation Database for hub *Hub\_Name*.**

### Explanation

There was a problem attempting to create a situation database entry for the given hub, where:

- *Hub\_Name* = the originnode of the hub TEMS that was sampled

### System action

Situation collection for the specified hub is stopped for the current interval. Data collected on this interval will not be retained.

### System programmer response

A likely cause for this issue would be a lack of available storage in the Tivoli® OMEGAMON® Manager address space. Check the amount of storage that has been made available and adjust as appropriate.

## **KOBCM0126E: Unable to create record for hub *Hub\_Name*.**

### **Explanation**

There was a problem attempting to create a single entry situation database entry for the given hub, where:

- *Hub\_Name* = the originnode of the hub TEMS that was sampled

### **System action**

Situation collection for the specified hub is stopped for the current interval. Data collected on this interval will not be retained.

### **System programmer response**

A likely cause for this issue would be a lack of available storage in the Tivoli® OMEGAMON® Manager address space. Check the amount of storage that has been made available and adjust as appropriate.

## **KOBCM0127E: Create thread for kobcmsit failed, pthreadstatusI = *pointer***

### **Explanation**

There was a problem attempting to create a thread for periodic situation collection, where:

- *pointer* = pointer location of the failed pthread status

### **System action**

The Tivoli® OMEGAMON® Manager will continue but periodic situation collection will not take place.

### **System programmer response**

Check the problem and make corrections. The Tivoli® OMEGAMON® Manager will need to be restarted to enable periodic situation collection.

## **KOBCM0128E: Create thread for kobcmrst failed, pthreadstatusI = *pointer***

### **Explanation**

There was a problem attempting to create a thread for realtime situation collection, where:

- *pointer* = pointer location of the failed pthread status

### **System action**

The Tivoli® OMEGAMON® Manager will continue but this instance of a realtime situation collection will not take place.

### **System programmer response**

Check the problem and make corrections. The Tivoli® OMEGAMON® Manager will need to be restarted to use changed settings.

## **KOBCM0129W: kobcmsit nap had a problem. RC: *return\_code***

### **Explanation**

There was a problem that occurred while the periodic situation collection process was sleeping, where:

- *return\_code* = return code

### **System action**

None.

### **System programmer response**

If problem is recurring check the problem and make corrections. The Tivoli® OMEGAMON® Manager may need to be restarted to use changed settings.

## **KOBCM0130E: Unable to perform real-time situation sample. Reason**

### **Explanation**

There was an error when attempting to make a real-time situation collection. The following line in the log will give a reason for the error, where:

- *Reason* = Unable to allocate storage for hub data. | No hub TEMS details supplied.

### **System action**

The real-time situation data collection is not completed.

### **System programmer response**

If problem is recurring check the problem and make corrections. The Tivoli® OMEGAMON® Manager may need to be restarted to use changed settings.

## **KOBCM0131I: Situation Database statistics:**

### **Explanation**

This internal trace message gives a full description as to the current state of the situation database stored at the Tivoli® OMEGAMON® Manager for the specified hub TEMS.

### **System action**

None.

### **System programmer response**

None.

## **KOBCM0132W: There were *number\_situations* new situation records discarded for hub *Hub\_Name*.**

### **Explanation**

The Tivoli OMEGAMON Manager found there was new situations but was unable to collect all the required information to create a record in the situation database, where:

- *number\_situations* = number of discarded situations
- *Hub\_Name* = the hub TEMS this message applies to

The most likely cause of this would be a timeout in the query to get this information. As the required information was not collected, the situation record is discarded.

### **System action**

Processing continues. If the situation is still open on the next collection sample, another attempt to create the record will be made.

### **System programmer response**

Additional tracing (kobflg03 8) may be able to indicate where the problem is. If the issue is caused by a timeout, increase the value with the Tivoli® OMEGAMON® Manager to see if this corrects the issue.

## **KOBCM0133I: The following Hub TEMS are *message\_type* periodic situation sampling: *Hub\_Name***

### **Explanation**

The KOBENV environment file has a variable that provided a comma-separated case-sensitive list of hub TEMS names that will be either included or excluded from periodic situation data collection depending on the variable used. The list of these hub TEMS will be logged on subsequent lines, where:

- *message\_type* = INCLUDED in | EXCLUDED from
- *Hub\_Name* = the hub TEMS this message applies to.

### **System action**

When periodic situation sampling occurs, the name of each known hub TEMS is checked against the list and will be skipped if it matches with a name on an exclude list, or it does not match with a name on an include list.

### **System programmer response**

None.

## **KOBCM0134W: Excluded hub name must be 32 characters or less: *Hub\_Name*.**

### **Explanation**

A name on the *KOB\_SITST\_INCLUDE\_HUBS* or *KOB\_SITST\_EXCLUDE\_HUBS* environment variable exceeded the maximum length permitted for a hub TEMS name, where:

- *Hub\_Name* = the hub TEMS this message applies to.

It will be ignored by the Tivoli® OMEGAMON® Manager when checking hub TEMS names to either include or exclude from sampling.

### **System action**

Processing continues. If the situation is still open on the next collection sample, another attempt to create the record will be made.

### **System programmer response**

Correct the variable value. The Tivoli® OMEGAMON® Manager will need to be restarted to use changed settings.

## **KOBCM0135I: All hubs to be included in periodic situation sampling.**

### **Explanation**

The Tivoli® OMEGAMON® Manager will periodically sample all hub TEMS discovered and recorded in the registry for situation data.

### **System action**

None.

### **System programmer response**

None.

## **KOBCM0136W: Both *KOB\_SITST\_INCLUDE\_HUBS* and *KOB\_SITST\_EXCLUDE\_HUBS* are specified. Values for *KOB\_SITST\_INCLUDE\_HUBS* will be ignored.**

### **Explanation**

When processing the environment variables at Tivoli® OMEGAMON® Manager startup, entries were found for both the *KOB\_SITST\_INCLUDE\_HUBS* and *KOB\_SITST\_EXCLUDE\_HUBS*. As these environment variables conflict with each other, the value for *KOB\_SITST\_INCLUDE\_HUBS* is ignored while the value for *KOB\_SITST\_EXCLUDE\_HUBS* will be processed and applied.

### **System action**

Processing continues.

### **System programmer response**

Check the environment variable settings and make corrections. The Tivoli® OMEGAMON® Manager will need to be restarted to use changed settings.

## **KOBCM0137I: Situation Data Collection disabled.**

### **Explanation**

No periodic situation data collection will take place against any hub TEMS. Real-time situation data collection will take place if a user navigates to the Enterprise Status Tree workspace or refreshes that workspace.

### **System action**

None.

### **System programmer response**

None.

## **KOBCM0157I: Hub *hubname* has been {enabled | disabled} for SSDC**

### **Explanation**

The request in the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) to enable or disable the hub monitoring server (*hubname*) for the Situation Status Data Collector (SSDC) has been successfully completed.

### **System action**

For an enablement request, the enhanced 3270UI resumes collecting SSDC data for the hub monitoring server. For a disablement request, the enhanced 3270UI suspends collecting SSDC data for the hub monitoring server.

### **User response**

None.

## **KOBCM0158W: Hub *hubname* has been already {enabled | disabled} for SSDC. {Enablement | Disablement} request ignored**

### **Explanation**

The request in the OMEGAMON enhanced 3270 user interface (enhanced 3270UI) to enable or disable the hub monitoring server (*hubname*) for the Situation Status Data Collector (SSDC) was rejected because the hub monitoring server has already been enabled or disabled for SSDC.

### **System action**

The request is ignored.

### **User response**

Check that the specified name of the hub monitoring server (*hubname*) is correct. If you intended to enable or disable this hub monitoring server, then no action is needed. If the specified name of the hub monitoring server is not as intended, correct the name and reissue the request.

## **KOBCM0159W: Hub *hubname* not found, command {ENABLE | DISABLE } HUB=*hubname* ignored**

### **Explanation**

A Situation Status Data Collector (SSDC) command was issued to enable or disable the specified hub monitoring server (*hubname*) for SSDC, but no hub monitoring server with the specified name was found.

### **System action**

The request is ignored.

### **User response**

Reissue the command with the correct hub monitoring server name.

**KOBCM0160W: Unexpected Sysplex Name found, name length is zero, Single Sysplex Registry is not possible.**

**Explanation**

The OMEGAMON enhanced 3270UI was started in single-sysplex mode; however, processing failed when attempting to obtain a valid sysplex name.

**System action**

The OMEGAMON enhanced 3270UI continues processing with single-sysplex mode disabled.

**User response**

Collect any related dump, trace, and system log data along with the OMEGAMON enhanced 3270UI job logs. Report the problem to IBM Software Support.

**KOBCM0161W: Failure getting Sysplex Info, rc = *return\_code***

**Explanation**

The OMEGAMON enhanced 3270UI was started in single-sysplex mode; however, processing failed when attempting to obtain sysplex configuration information (for example, sysplex LPAR members using WLM system services).

**System action**

The OMEGAMON enhanced 3270UI continues processing with single-sysplex mode disabled.

**User response**

Collect any related dump, trace, and system log data along with the OMEGAMON enhanced 3270UI job logs. Report the problem to IBM Software Support.

**KOBCM0162W: Failure getting Sysplex Info, ENOMEM, RC=*return\_code*.**

**Explanation**

The OMEGAMON enhanced 3270UI was started in single-sysplex mode; however, processing failed when attempting to obtain memory to store sysplex configuration information.

**System action**

The OMEGAMON enhanced 3270UI continues processing with single-sysplex mode disabled. Other related errors may occur in the case where the address space encounters errors when attempting to obtain memory.

**User response**

Review started task and site definitions associated with address space region size. The OMEGAMON enhanced 3270UI address space is normally started with region size 0M. Adjust the address space region size as required. If this does not address the issue, collect any related dump, trace, and system log data along with the OMEGAMON enhanced 3270UI job logs. Report the problem to IBM Software Support.

**KOBDR001W: server pthread\_attr\_init failed. rc=*return\_code***

**Explanation**

The attempt to set thread attributes needed to continue initializing the KOBAGENT Data Retrieval Agent has failed.

**System action**

Initialization continues.

**User response**

It is likely this KOBAGENT instance is unusable. Try restarting the address space. If the problem persists, contact IBM Software Support.

## **KOBDR002W: server pthread\_create failed. rc=*return\_code***

### **Explanation**

The attempt to start the main TCP/IP server thread within the KOBAGENT data retrieval agent has failed.

### **System action**

The data retrieval agent is unable to process client requests.

### **User response**

It is likely this KOBAGENT instance is unusable. Try restarting the address space if problem persists contact IBM Support. If the problem persists, contact IBM Software Support.

## **KOBDR003W: Data Retrieval Agent is not registered. Registration stage *stage* failed with Return Code = *return\_code***

### **Explanation**

*stage* can assume the follow values:

#### **Discover Host IP Data**

The TCP/IP host name of the LPAR where this address space is located could not be determined. Additional information for this failure can be:

- + *gethost\_rc* = *return\_code*, *gethost\_errno* = *error\_code*
- + *hostname* = *host\_name*
- + *getaddr\_rc* = *return\_code*, *getaddr\_errno* = *error\_code*
- + *freeaddr\_rc* = *return\_code*, *freeaddr\_errno* = *error\_code*

#### **Resolve IP Address**

The IP address associated with the host name could not be determined

#### **Discover HUB Data**

The hub name and IP information for this agent could not be determined

#### **Register DRA**

The attempt to register the information for this data retrieval agent with the IWMSRSRG service failed

### **System action**

The data retrieval agent is unable to process client requests.

### **User response**

It is likely this KOBAGENT instance is unusable. Try restarting the address space if problem persists contact IBM Support. If the problem persists, contact IBM Software Support.

## **KOBDR004W: client pthread\_attr\_init failed. rc=*return\_code***

### **Explanation**

The attempt to set thread attributes needed to initialize the query processing thread in the KOBAGENT data retrieval agent has failed.

### **System action**

The query is abandoned.

### **User response**

Retry the workspace associated with this failure. If the problem persists, contact IBM Software Support.

## **KOBDR005W: client pthread\_create failed. rc=*return\_code***

### **Explanation**

The attempt to initialize the query processing thread in the KOBAGENT data retrieval agent has failed.

**System action**

The query is abandoned.

**User response**

Retry the workspace associated with this failure. If the problem persists, contact IBM Software Support.

**KOBDR006E: ERROR: *storage\_type* storage unavailable****Explanation**

The attempt to acquire storage within the address space failed. The storage types involved are:

**Send block**

1 megabyte is requested

**Send buffer**

64K bytes is requested

**Row buffer**

4K bytes is requested

**System action**

The query is abandoned.

**User response**

Retry the workspace associated with this failure. If the problem persists, contact IBM Software Support.

**KOBDR007E: ERROR: input buffer storage unavailable****Explanation**

The attempt to acquire storage to receive query from the enhanced 3270 user interface address space has failed.

**System action**

The query is abandoned.

**User response**

Retry the workspace associated with this failure. If the problem persists, contact IBM Software Support.

**KOBDR008E: *stage* failure (*return\_code*)****Explanation**

The attempt to start the SQL request in the data retrieval agent failed at stage *stage* with code *return\_code*, where *stage* is one of:

**SQL1\_CreateAccessPlan**

specifies the query to submit

**SQL1\_CreateRequest**

establishes connection with agent

**SQL1\_GetInputSQLDA**

allows for variable input values

**SQL1\_OpenRequest**

collects a table sample

**SQL1\_GetOutputSQLDA**

provides structure for return row

**System action**

The query is abandoned.

**User response**

Retry the workspace associated with this failure. If the problem persists, contact IBM Software Support.

**KOBDR009E: error for SQL, sqlStatus(%d)****Explanation**

Fetching row data failed.

**System action**

The query is abandoned.

**User response**

Retry the workspace associated with this failure. If the problem persists, contact IBM Software Support.

**KOBDR010E: ERROR: Row buffer storage too small****Explanation**

Fetching row data failed.

**System action**

The query is abandoned.

**User response**

Retry the workspace associated with this failure. If the problem persists, contact IBM Software Support.

**KOBDR011E: SQL processing error in call *stage*. Return code is *return\_code*. clsocket is *socket*****Explanation**

Documents failure of an SQL request. This message is usually preceded or followed by KOBDR006E, KOBDR0007E, KOBDR008E, KOBDR009E, or KOBDR010E.

**System action**

The query is abandoned.

**User response**

Retry the workspace associated with this failure. If the problem persists, contact IBM Software Support.

**KOBDR012E: function *function* failed with error code *code* (*code\_name*) at line *line\_number*. Reason *Action*****Explanation**

This message documents many of the possible TCP/IP error codes. The *Action* text may suggest a corrective step.

**System action**

The query is abandoned.

**User response**

if there is an action mentioned that can be implemented try taking that action. Otherwise, contact IBM Software Support.

**KOBDR013I: sent *nnn* bytes to *address space name and SMFID* + for sequence # = *xxxxxxxx\_xxxxxxx*,table = *appl.table***

**Explanation**

This message documents the number of bytes returned for this query, where:

- *nnn* is the count of bytes sent
- *address space name and SMFID* is the name and SMFID of the job
- *xxxxxxxx\_xxxxxxx* is the sequence number tied to the request
- *appl.table* is the name of the application and the table submitting the query

**System action**

None

**User response**

None

**KOBDR020W: CreateRequest failed, possibly due to missing TEMS Catalog entries. Resolve this by adding application support files (seeding) for '*appl.table* in the target {TEMS | Remote TEMS}: *monitoring\_server\_name***

**Explanation**

Message KOBDR020W indicates that a query was relayed by this KOBAGENT (Data Retrieval Agent) to a remote or hub monitoring server that does not contain the necessary monitoring server catalog entries (application support files).

**System action**

The query fails and any enhanced 3270 user interface workspace that needs the results might be missing data.

**System programmer response**

Apply application support (also known as seeding) to the necessary remote and hub monitoring server.

**KOBDR023I: Host address discovery**

**Explanation**

Message KOBDR023I is an internal trace message that is displayed during KOBAGENT (Data Retrieval Agent) Host IP address discovery.

**System action**

None.

**System programmer response**

None.

**KOBDR024I: gethostname() rc(*return\_code*), name(*hostname*)**

**Explanation**

Message KOBDR024I is an internal trace message that is displayed during KOBAGENT (Data Retrieval Agent) Host IP address discovery, which shows the result of the gethostname service.

**System action**

None.

**System programmer response**

None.

**KOBDR025I: IRA\_GetHostname() name(*hostname*)****Explanation**

Message KOBDR025I is an internal trace message that is displayed during KOBAGENT (Data Retrieval Agent) Host IP address discovery, which shows the result of the IRA\_GetHostname service.

**System action**

None.

**System programmer response**

None.

**KOBDR026I: Host name priority: #1 IRA\_GetHostname(*hostname*) #2  
gethostname(*hostname*) or Host name priority: #1 gethostname(*hostname*) #2  
IRA\_GetHostname(*hostname*)****Explanation**

This message displays the host name or names on which the Data Retrieval Agent is running. The gethostname() value can be given priority over the IRA\_GetHostname value (not the default behavior) by supplying the user configuration value KOB\_USE\_IRA\_HOSTNAME=N in the KxxENV file.

**System action**

None.

**System programmer response**

None.

**KOBDR027I: hostname(*hostname*) details:****Explanation**

Message KOBDR027I is an internal trace message that is displayed during KOBAGENT (Data Retrieval Agent) Host IP address discovery.

**System action**

None.

**System programmer response**

None.

**KOBDR030I: getaddrinfo().2 flags *nnn* family *nnn* type *nnn* proto *nnn* addrlen *nnn*****Explanation**

Message KOBDR030I is an internal trace message that is displayed during KOBAGENT (Data Retrieval Agent) Host IP address discovery, which shows the result of the getaddrinfo service.

**System action**

None.

**System programmer response**

None.

### **KOBDR031I: getaddrinfo().3 address: *getaddrinfo\_returned\_answer***

#### **Explanation**

Message KOBDR031I is an internal trace message that is displayed during KOBAGENT (Data Retrieval Agent) Host IP address discovery, which shows the result of the getaddrinfo service.

#### **System action**

None.

#### **System programmer response**

None.

### **KOBDR032E: Unable to obtain DRA Host Address, cannot run DRA**

#### **Explanation**

The Data Retrieval Agent (DRA), a component of the OMEGAMON® enhanced 3270 user interface (enhanced 3270UI), was not able to initialize due to a failure in an attempt to use z/OS® UNIX® System Services TCP/IP services (for example, to obtain the Host system TCP/IP address).

#### **System action**

The DRA will terminate initialization as it cannot function without TCP/IP. TCP/IP is required for communication between the DRA and the enhanced 3270UI (TOM) address space.

#### **System programmer response**

Perform the following actions:

- Verify that TCP/IP has been started and is running in the Host system where the DRA is running.
- Verify that TCP/IP has been started before starting the address space where the DRA will be running.
- Verify that a Security System OMVS Segment has been defined for the address space where the DRA is running.

### **KOBDR033I: Forcing use of a single TCP IPv4 interface(*IPv4\_address\_text*) (*IPv4\_address\_text*) or Forcing use of a single TCP IPv6 interface(*IPv6\_address\_text*)(*IPv6\_address\_text*)**

#### **Explanation**

The user configuration value KOB\_USE\_ONE\_INTERFACE=Y was set in the KxxENV file, so the TCP "listen" for the Data Retrieval Agent component is done on just a single network interface, rather than on all network interfaces on this host.

#### **System action**

None.

#### **System programmer response**

None.

### **KOBDR037I: {host | hub} property = *property\_value***

#### **Explanation**

A Hub Tivoli® Enterprise Monitoring Server and local Host address were successfully discovered and the listed values are the related network addresses, port numbers, and names. The Host Port value is the TCP port number on which this address space "listens" for inbound requests from Tivoli® OMEGAMON® Manager address spaces. The possible properties are shown in the following list:

- Host Name

- Host Address IPv4
- Host Address IPv6
- Host Port
- Host Family
- Hub Name
- Hub Address
- Hub Port

**System action**

None.

**System programmer response**

None.

**KOBDR043I: Hub IP addr = *IP\_address*, port = *port\_number*, orig = *monitoring\_server\_name***

**Explanation**

A Hub Tivoli® Enterprise Monitoring Server was successfully discovered and the listed values are its network address, port number, and monitoring server name.

**System action**

None.

**System programmer response**

None.

**KOBDR044I: Hub Name = *hub\_monitoring\_server\_name* Hub Address = *hub\_monitoring\_server\_address* Hub Port = *hub\_monitoring\_server\_port\_number***

**Explanation**

A Hub Tivoli® Enterprise Monitoring Server was successfully rediscovered and the listed values are the related network addresses, port numbers, and names.

**System action**

None.

**System programmer response**

None.

**KOBDR045I: {Call to | Back from} {Init\_HUB | Drop\_HUB}()**

**Explanation**

These messages indicate the processing flow of Hub Tivoli® Enterprise Monitoring Server discovery within the KOBAGENT (Data Retrieval Agent).

**System action**

None.

**System programmer response**

None.

**KOBDR046I: *programFlowDetails\_controlBlockInformation*****Explanation**

This internal trace message is displayed during data retrieval agent (DRA) processing, showing program flow details and internal control block information.

**System action**

None.

**System programmer response**

None.

**KOBDR047I: KOB\_DRA\_BACKLOG value=*x* is specified****Explanation**

The configuration parameter **KOB\_DRA\_BACKLOG** with the value of *x* has been found in the *KppENV* member of the *RKANPAR* DD concatenation, where *pp* is the two-character product code.

**System action**

The data retrieval agent (DRA) will process the parameter.

**User response**

No action is required.

**KOBDR048W: Incorrect KOB\_DRA\_BACKLOG value=*x* is specified. + Allowed values are integers from *min* to *max*. + Default value of *y* is assigned****Explanation**

The configuration parameter **KOB\_DRA\_BACKLOG** has the value of *x*, which is incorrect. A correct value should be an integer within the limits displayed in the message.

**System action**

The data retrieval agent (DRA) will process the **KOB\_DRA\_BACKLOG** parameter using the default value of *y*.

**User response**

Correct the **KOB\_DRA\_BACKLOG** parameter value to be within the allowed range, or accept the default. The updated value will be picked up when the DRA is restarted.

**KOBDR049I: Default DRA backlog value=*x* will be used****Explanation**

The configuration parameter **KOB\_DRA\_BACKLOG** was not specified.

**System action**

The data retrieval agent (DRA) will continue initialization using the default value of *x*.

**User response**

No action is required.

**KOBGW0091W: Threshold parsing completed with errors.**

**Explanation**

The parsing of a thresholds input file found one or more errors in the threshold specifications. These errors are reported in the preceding KOBGW0090W messages.

**System action**

The enhanced 3270 user interface continues to run.

**User response**

Correct the syntax errors in the threshold specification statements.

**KOBGW0000I: enhanced 3270 user interface address space initialized successfully.**

**Explanation**

The address space has started.

**System action**

None

**User response**

None

**KOBGW0001I: enhanced 3270 user interface address space terminated successfully.**

**Explanation**

The address space has terminated without error.

**System action**

None

**User response**

None

**KOBGW0002E: The enhanced 3270 user interface address space terminated with errors.**

**Explanation**

The address space terminated, but errors were detected in one or more phases of the shutdown.

**System action**

The address space terminates.

**User response**

Check accompanying messages and forward the job message log to IBM Software Support.

**KOBGW0003E: The enhanced 3270 user interface address space is not APF-authorized.**

**System action**

The address space terminates.

**User response**

Make sure that the enhanced 3270 user interface address space started task STEPLIB load libraries are APF-authorized and restart the task.

**KOBGW0004E: enhanced 3270 user interface CVT eyecatcher invalid at storage free.**

**Explanation**

The enhanced 3270 user interface CVT control block storage has been corrupted.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0005E: Name/Token IEANTCR failed rc=*return\_code*.**

**Explanation**

The z/OS Name/Token services call used to create an anchor for the enhanced 3270 user interface address space CVT failed with the return code given.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0006E: EXTRACT parameter list allocation failed.**

**Explanation**

Storage could not be acquired for a z/OS service to establish a communication area for operator console communications.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0007E: Name/Token IEANTDL failed rc=*return\_code*.**

**Explanation**

The z/OS Name/Token services call used to delete an anchor for the enhanced 3270 user interface address space CVT failed with the return code given.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0008E: Attempt to free enhanced 3270 user interface CVT failed.**

**Explanation**

Freeing of the enhanced 3270 user interface address space anchor control block failed. The CVT control block storage has been corrupted.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0009E: SYSEVENT parameter list allocation failed.****Explanation**

Storage could not be acquired for a z/OS service to make the enhanced 3270 user interface address space nonswappable.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0010E: ATTACHX parameter list allocation failed.****Explanation**

Storage could not be acquired for a z/OS service to start a enhanced 3270 user interface address space subcomponent.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0011I: User interface subcomponent *subcomponent* started successfully.****Explanation**

Subcomponent *subcomponent* of the enhanced 3270 user interface address space user interface started successfully.

**KOBGW0012E: LOAD parameter list allocation failed.****Explanation**

Storage could not be acquired for a z/OS service to start an enhanced 3270 user interface address space subcomponent.

**System action**

The address space terminates.

**User response**

Call IBM Software Support.

**KOBGW0013E: Load of subcomponent module *module* failed. rc=*return\_code*,  
rsn=*reason\_number*****Explanation**

The z/OS service used to load the program required to start the Enhanced 3270 User Interface address space subcomponent *module* failed with return code *return\_code* and reason code *reason\_number*.

**System action**

The address space terminates.

**User response**

Call IBM Software Support.

**KOBGW0014E: pthread\_attr\_init() for subcomponent *subcomponent* failed.  
rc=return\_code, rsn=reason\_number**

**Explanation**

A service to initialize attributes for starting an enhanced 3270 user interface address space subcomponent *subcomponent* failed with return code *return\_code* and reason code *reason\_number*.

**System action**

The address space terminates.

**User response**

Call IBM Software Support.

**KOBGW0015E: pthread\_attr\_setJST\_np() for subcomponent *subcomponent* failed.  
rc=return\_code, rsn=reason\_number**

**Explanation**

A service to initialize the task ownership for starting an enhanced 3270 user interface address space subcomponent *subcomponent* failed with return code *return\_code* and reason code *reason\_number*.

**System action**

The address space terminates.

**User response**

Call IBM Software Support.

**KOBGW0016E: pthread\_create() for subcomponent *subcomponent* failed.  
rc=return\_code, rsn=reason\_number**

**Explanation**

A service to start a thread for an enhanced 3270 user interface address space subcomponent *subcomponent* failed with return code *return\_code* and reason code *reason\_number*.

**System action**

The address space terminates.

**User response**

Call IBM Software Support.

**KOBGW0017I: Subcomponent *subcomponent* started.**

**Explanation**

The enhanced 3270 user interface address space subcomponent *subcomponent* started successfully.

**KOBGW0018E: Request router queue initialization failed. rc=return\_code.**

**Explanation**

A problem occurred in the initialization of the communication queue between the user interface and the request router.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0019E: Request router queue destroy failed. rc=*return\_code*.****Explanation**

A problem occurred with the destruction of the communication queue between the user interface and the request router.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0020E: KOBBC\_IO\_Term() failed. rc=*return\_code*.****Explanation**

A problem occurred with the destruction of the file descriptor table.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0021E: Delete of LPA-based load modules failed.****Explanation**

A problem occurred during the deletion of load modules loaded dynamically into the Link Pack Area (LPA).

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0022E: Allocation of registry root area failed.****Explanation**

Allocation of storage for the enhanced 3270 user interface registry root area failed

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0023E: Allocation of request router base area failed.****Explanation**

Storage could not be acquired for a enhanced 3270 user interface request router storage area.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0024E: Allocation of trace base area failed.****Explanation**

Storage could not be acquired for an enhanced 3270 user interface trace storage area.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0025E: LPA-based function load/registration failed. rc=return\_code, rsn=error\_reason, rsn2=error\_reason2.****Explanation**

enhanced 3270 user interface load modules could not be loaded into the Link Pack Area (LPA) or the registration of the modules' functions in the GWCVT anchored function table was unsuccessful. Further information related to the reason codes may be found in the "CSVDYLPA -- Provide Dynamic LPA Services" section of the *MVS Programming: Authorized Assembler Services Reference, Volume 1 (ALE-DYN)*.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0026E: KOBC\_IO\_Init() failed. rc=return\_code, rsn=error\_reason, rsn2=error\_reason2.****Explanation**

The allocation and initialization of the enhanced 3270 user interface file descriptor table failed

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0027E: User interface subcomponent *subcomponent* start up failed. rc=return\_code****Explanation**

The enhanced 3270 user interface address space subcomponent *subcomponent* could not be started due to error *return\_code*.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0028E: The enhanced 3270 user interface address space initialized with errors.**

**Explanation**

The enhanced 3270 user interface address space initialized, but errors were detected in one or more phases of the start up.

**System action**

The address space terminates.

**User response**

Check accompanying messages and forward the job message log to IBM Software Support.

**KOBGW0029E: CSVDYLP A REQUEST=ADD failure rc = *return\_code*, rsn = *error\_reason*.**

**Explanation**

Loading of Link Pack Area (LPA) modules at initialization of the enhanced 3270 user interface failed, with the return and reason codes displayed in message.

**System action**

The address space terminates.

**User response**

Check accompanying messages and forward the job message log to IBM Software Support.

**KOBGW0030E: One or more modules could not be loaded into LPA.**

**Explanation**

Loading of Link Pack Area (LPA) modules at enhanced 3270 user interface initialization failed with return code 4.

**System action**

The address space terminates.

**User response**

Check accompanying messages and forward the job message log to IBM Software Support.

**KOBGW0031I: Module *module* loaded into LPA successfully at *loadpoint*, entry point *entrypoint*.**

**Explanation**

Module *module* was dynamically loaded into LPA at load point *loadpoint*. Its entry point is at location *entrypoint*

**System action**

Address space initialization continues.

**KOBGW0032E: Load of module *module* failed. pcode = *pppp*, rtncd/abndcd = *xxxx*, rsncd/abndrsn = *yyyy*.**

**Explanation**

Dynamic load of load module *module* failed with the return, abend reason, and abend reason codes displayed in the second line of the message. Further information related to the reason codes may be found in the "CSVDYLP A -- Provide Dynamic LPA Services" section of the *MVS Programming: Authorized Assembler Services Reference, Volume 1 (ALE-DYN)*.

**System action**

The address space terminates.

**User response**

Check accompanying messages and forward the job message log to IBM Software Support.

**KOBGW0033E: CSVDYLPA DELETE failure. rc = *return\_code*, rsn =*error\_reason*.**

**Explanation**

Deletion of dynamically loaded Link Pack Area (LPA) modules failed with return code *return\_code* and reason code *error\_reason*.

**System action**

The address space termination continues.

**User response**

Check accompanying messages and forward the job message log to IBM Software Support.

**KOBGW0034E: One or more modules could not be deleted from LPA.**

**Explanation**

Deletion of Link Pack Area (LPA) modules at termination of the enhanced 3270 user interface failed with return code 4.

**System action**

The address space termination continues.

**User response**

Check accompanying messages and forward the job message log to IBM Software Support.

**KOBGW0035I: Module *module* deleted from LPA successfully.**

**Explanation**

Load module *module* was dynamically deleted from the Link Pack Area (LPA) successfully.

**System action**

Termination of the address space continues.

**KOBGW0036E: Delete of module *module* from LPA failed. pcode = *pppp*, rtncd/abndcd = *xxxx*, rsncd/abndrsn = *yyyy*.**

**Explanation**

Dynamic deletion of load module *module* failed with the return, abend reason, and abend reason codes displayed in the second line of the message. Further information related to the reason codes may be found in the "CSVDYLPA -- Provide Dynamic LPA Services" section of the *MVS Programming: Authorized Assembler Services Reference, Volume 1 (ALE-DYN)*.

**System action**

Termination of the address space continues.

**User response**

Check accompanying messages and forward the job message log to IBM Software Support.

**KOBGW0037E: KOBGW\_LoadLPAFunction() registration failed. rc = *return\_code*, errno = *error\_number*, rsno = *reason\_number*.**

**Explanation**

Registration of an Link Pack Area (LPA) based enhanced 3270 user interface address space function failed with return code *return\_code*, errno *error\_number* and rsno *reason\_number*.

**System action**

The address space terminates.

**User response**

Recreate the error with debugging mode switched on. Establish debugging mode by specifying the following in the RKANPARU(KOBENV) member before starting the enhanced 3270 user interface address space:  
TRACEV1=TRACE KOBGWLPA, 1. Check accompanying messages and forward the job message log to IBM Software Support.

**KOBGW0038E: Module *module* function registration failed rc = *return\_code*, errno = *error\_number*, errno2 = *error\_number2*.**

**Explanation**

The entry point initialization routine for dynamically loaded Link Pack Area (LPA) module *module* failed with the return and reason codes displayed in the message.

**System action**

The address space terminates.

**User response**

Recreate the error with debugging mode switched on. Establish debugging mode by specifying the following in the RKANPARU(KOBENV) member before starting the enhanced 3270 user interface address space:  
TRACEV1=TRACE KOBGWLPA, 1. Check accompanying messages and forward the job message log to IBM Software Support.

**KOBGW0039E: RESMGR output token address parameter is zero.**

**Explanation**

A problem occurred with the start of a component enhanced 3270 user interface address space. The value of the RESMGR TOKEN= keyword parameter is zero.

**System action**

The address space terminates.

**User response**

This is a program error. Contact IBM Software Support.

**KOBGW0040E: Allocation of the resource manager LOAD parameter list failed.**

**Explanation**

Insufficient storage is available to allocate the parameter list for LOAD.

**System action**

The address space terminates.

**User response**

Determine whether there were storage shortage problems at the time of the error and contact IBM Software Support.

**KOBGW0041E: Load of resource manager KOBRSMGR failed. rc = *return\_code*, rsn = *error\_reason*.**

**Explanation**

The LOAD of the enhanced 3270 user interface address space resource manager routine failed with the return and reason codes displayed in the message.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0042E: Allocation of the parameter list for RESMGR ADD failed.**

**Explanation**

Insufficient storage is available to allocate the parameter list for RESMGR ADD.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0043E: Allocation of the parameter list for RESMGR DELETE failed.**

**Explanation**

Insufficient storage is available to allocate the parameter list for RESMGR DELETE, causing a problem with the start of the enhanced 3270 user interface address space.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0044E: Establishment of resource manager failed rc = *return\_code*.**

**Explanation**

Establishment of the enhanced 3270 user interface address space resource manager failed with the return code displayed in the message.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0045E: Attempt to free the resource manager LPA module table failed.**

**Explanation**

The enhanced 3270 user interface address space resource manager routine attempted to delete a dynamically loaded LPA module and failed.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0046E: Deletion of resource manager failed rc = *return\_code*****Explanation**

Deletion of enhanced 3270 user interface address space resource manager failed. Further information related to the reason codes may be found in the "RESMGR -- Add or Delete a Resource Manager" section of the *MVS Programming: Authorized Assembler Services Reference, Volume 3 (LLA-SDU)*.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0047I: enhanced 3270 user interface CVT freed by resource manager.****Explanation**

Anchor control block storage for the enhanced 3270 user interface address space was freed successfully during resource manager processing.

**System action**

Resource manager processing continues.

**User response**

None.

**KOBGW0048E: Resource Manager KOBGW\_DeleteLPAFunction() failed rc = *return\_code*****Explanation**

The deletion of dynamically-loaded LPA modules failed during resource manager processing with the return code displayed in the message.

**System action**

Resource manager processing continues.

**User response**

Contact IBM Software Support.

**KOBGW0049E: LPA\_Term() in resource clean up failed rc = *return\_code*.****Explanation**

During processing by the enhanced 3270 user interface address space resource manager, the routine handling the deletion of dynamically loaded LPA modules failed with the return code displayed in the message.

**System action**

Resource manager processing continues.

**User response**

Contact IBM Software Support.

**KOBGW0050E: deleteLPAModTabFromESQA() in resource clean up failed rc = *return\_code*.**

**Explanation**

During processing by the enhanced 3270 user interface address space resource manager, the routine handling the freeing of a common storage area used during deletion of dynamically loaded LPA modules failed with the return code displayed in the message.

**System action**

Resource manager processing continues.

**User response**

Contact IBM Software Support.

**KOBGW0051E: free\_GWCVT() in resource clean up failed rc = *return\_code*.**

**Explanation**

The anchor control block storage for the enhanced 3270 user interface address space could not be freed during resource manager processing for the reason in the return code displayed in the message.

**System action**

Resource manager processing continues.

**User response**

Contact IBM Software Support.

**KOBGW0052I: KOBRSMDR resource manager routine entered.**

**Explanation**

The enhanced 3270 user interface address space resource manager routine installed to clean up orphaned, critical resources was entered due to an operator CANCEL command.

**System action**

Resource manager processing continues.

**User response**

Investigate the reason for the operator CANCEL command being issued.

**KOBGW0053I: KOBRSMDR resource manager routine completed**

**Explanation**

The enhanced 3270 user interface address space resource manager routine installed to clean up orphaned, critical resources completed its processing.

**System action**

Resource manager processing continues.

**User response**

Investigate the reason for the operator CANCEL command being issued. Also check for any error messages issued during normal user interface address space processing and in the resource manager processing.

**KOBGW0054E: Command table entry for thread *thread* not found. rsn = *reason\_code*.**

**Explanation**

The subcomponent has not registered to receive commands. The failure to register was discovered in the subcomponent command processing routine. The reason code will help to determine the cause of the problem.

**System action**

The subcomponent command processing routine terminates.

**User response**

Contact IBM Software Support.

**KOBGW0055E: Attempt to get command from the subcomponent command queue failed. rc = *return\_code*, rsn = *error\_reason*, rsn2 = *error\_reason*.**

**Explanation**

The subcomponent command processing routine experienced a failure attempting to read a command from its command queue. The return and reason codes will help to determine the cause of the problem.

**System action**

The subcomponent command processing routine terminates.

**User response**

Contact IBM Software Support.

**KOBGW0056E: Subcomponent command processing routine failed. rc = *return\_code*, rsn = *error\_reason*, rsn2 = *error\_reason2*.**

**Explanation**

The subcomponent experienced a failure while processing a command. The return code and reason codes will help to determine the cause of the problem.

**System action**

The subcomponent command processing routine terminates.

**User response**

Contact IBM Software Support.

**KOBGW0057E: Command table entry for thread *thread\_name* not found. rsn = *error\_reason*.**

**Explanation**

During subcomponent command registration no thread table entry was found for subcomponent thread *thread\_name*. The reason code will help to determine the cause of the problem.

**System action**

The subcomponent thread terminates.

**User response**

Contact IBM Software Support.

**KOBGW0058E: Command *command* is longer than 16 characters.**

**Explanation**

During subcomponent command registration, registration of a command name with a length greater than the maximum 16 characters allowed was specified.

**System action**

The subcomponent thread terminates.

**User response**

Contact IBM Software Support.

**KOBGW0059E: Creation of subcomponent command queue failed. rc = *return\_code*, rsn = *error\_reason*, rsn2 = *error\_reason2*.**

**Explanation**

During subcomponent command registration, the creation of the subcomponent's command queue failed. The return code and reason codes will help to determine the cause of the problem.

**System action**

The subcomponent thread terminates.

**User response**

Contact IBM Software Support.

**KOBGW0060E: pthread\_attr\_init() for subcomponent message thread failed. rc = *return\_code*, rsn = *error\_reason*, rsn2 = *error\_reason2*.**

**Explanation**

During the subcomponent launch of its command processing thread, the initialization of thread attributes failed. The return code and reason codes will help to determine the cause of the problem.

**System action**

The subcomponent thread terminates.

**User response**

Contact IBM Software Support.

**KOBGW0061E: pthread\_create() for subcomponent message thread failed. rc = *return\_code*, rsn = *error\_reason*, rsn2 = *error\_reason2*.**

**Explanation**

During the subcomponent launch of its command processing thread, the creation of the thread failed. The return code and reason codes will help to determine the cause of the problem.

**System action**

The subcomponent thread terminates.

**User response**

Contact IBM Software Support.

**KOBGW0062E: Command table entry for thread *thread* not found. rsn = *reason\_code*.**

**Explanation**

During subcomponent command deregistration, no thread table entry was found for subcomponent thread *thread*. The reason code will help to determine the cause of the problem.

**System action**

The subcomponent thread terminates.

**User response**

Contact IBM Software Support.

**KOBGW0063E: Destruction of command table entry queue failed. rc = *return\_code*, rsn = *error\_reason*.**

**Explanation**

During subcomponent command deregistration, the destruction of the subcomponent command queue failed. The return code and reason code will help to determine the cause of the problem.

**System action**

The subcomponent thread terminates.

**User response**

Contact IBM Software Support.

**KOBGW0064E: No command text specified in the command buffer.**

**Explanation**

A command issued to the subcomponent did not contain any command text.

**System action**

Processing continues and the subcomponent waits for another command.

**User response**

Make sure that the command issued was specified correctly. If a command greater than 16 characters in length is documented, this is an error. Contact IBM Software Support.

**KOBGW0065E: Command table entry for thread *thread* not found. rsn = *reason\_code*.**

**Explanation**

While issuing a command for a subcomponent, no thread table entry was found for subcomponent thread *thread*. The reason code will help to determine the cause of the problem.

**System action**

Processing continues and the subcomponent waits for another command.

**User response**

Contact IBM Software Support.

**KOBGW0066E: Add of command to command queue failed. rc = *return\_code*, rsn = *error\_reason*, rsn2 = *error\_reason2*.**

**Explanation**

A command issued for the subcomponent could not be added to the subcomponent's command queue. The return code and reason codes will help to determine the cause of the problem.

**System action**

Processing continues and the subcomponent waits for another command.

**User response**

Contact IBM Software Support.

**KOBGW0067E: pthread\_join() failed. rc = *return\_code*, rsn = *error\_reason*, rsn2 = *error\_reason2*.**

**Explanation**

An attempt to synchronize subcomponent termination with the main task on issuance of a STOP command to the subcomponent failed. The return code and reason codes will help to determine the cause of the problem.

**System action**

The subcomponent processes the STOP command, but the subcomponent thread termination is not synchronized with the main thread, possibly forcibly terminating the subcomponent thread with an abnormal termination code.

**User response**

Contact IBM Software Support.

**KOBGW0068E: Command *command* not supported by any active subcomponents.**

**Explanation**

A console command was entered but no active enhanced 3270 user interface subcomponent was registered for the command.

**System action**

The interface continues to wait for the next console command.

**User response**

A console command may have been mistyped. Retry the command. If the command is documented and entered correctly, contact IBM Software Support.

**KOBGW0069E: GW\_Obtain\_GWCVT\_Address() returned NULL. rsn = *error\_reason*, rsn2 = *error\_reason2*.**

**Explanation**

A console command to stop the KOBVTAM subcomponent failed to find a required anchor control block. The reason codes may help determine the cause of the problem.

**System action**

The KOBGWOBV subcomponent terminates without terminating the KOBVTAM subcomponent. The interface will continue to wait for console commands.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0070E: Session header block address is NULL.**

**Explanation**

A console command to STOP the KOBVTAM subcomponent failed to find the head of the session control block chain.

**System action**

The KOBGWOBV subcomponent terminates without terminating the KOBVTAM subcomponent. The interface will continue to wait for console commands.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0071W: nnnnn UI sessions still have requests in progress. Waiting nn more seconds to allow requests to complete.**

**Explanation**

A console command to STOP the KOBVTAM subcomponent has been issued but the user interface component has one or more sessions with active requests. The address space will wait for up to 60 seconds in 5 second increments or until no active user interface requests are detected. After 60 seconds a WTOR will be issued allowing the operator to extend the wait for active requests to complete.

**System action**

The subcomponent KOBGWOBV will issue KOBGW0071W messages every 5 seconds until it detects all active user interface requests have completed. KOBGW0085I will be issued as a WTOR after 60 seconds if active user interface requests persist.

**User response**

This message is most likely issued because at least one long-running request was still active when a console STOP command was issued against the address space. If, however, the duration of the request exceeds an expected amount of time, there may be a problem in the request path. If this is the case, contact IBM Software Support.

**KOBGW0072W: Maximum wait time for session requests to complete at termination exceeded**

**Explanation**

A console command to STOP the KOBVTAM subcomponent has been issued and the operator has responded to the KOBGW0085I WTOR to request that no further waiting for request completion be attempted.

**System action**

The address space will terminate the KOBVTAM subcomponent. Any user interface sessions with active requests will be forcibly terminated.

**User response**

The termination of the KOBVTAM subcomponent may be premature if a long-running request has not been given enough time to complete. If the request should have completed within the allowed interval, capture the logs for the address space and the hub Tivoli Enterprise Monitoring Server from which data was being requested and contact IBM Software support.

**KOBGW0073W: Sessions with active requests will be forcibly terminated.**

**Explanation**

A console command to STOP the KOBVTAM subcomponent has been issued and the operator has responded to the KOBGW0085I WTOR to request that no further waiting for request completion be attempted.

**System action**

The address space will terminate the KOBVTAM subcomponent. Any user interface sessions with active requests will be forcibly terminated.

**User response**

The termination of the KOBVTAM subcomponent may be premature if a long-running request has not been given enough time to complete. If the request should have completed within the allowed interval, capture the logs for the address space and the hub Tivoli Enterprise Monitoring Server from which data was being requested and contact IBM Software support.

**KOBGW0074E: OBVTAM STOP processing failed rc = *return\_code*, rsn = *error\_reason*, rsn2 = *error\_reason2*.**

**Explanation**

The STOP console command to terminate the KOBVTAM subcomponent failed with the return and reason codes provided.

**System action**

The KOBVTAM subcomponent will not be terminated by the current command. The address space will continue to wait for other console commands.

**User response**

Other messages preceding KOBGW0074E will help in determining the cause of the problem in addition to the return and reason codes displayed.

**KOBGW0075E: OBVTAM command *command* not supported by command handler.****Explanation**

The KOBGWOBV command handling process does not support the command *command*.

**System action**

The KOBGWOBV subcomponent returns and the address space continues to wait for other console commands.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0076E: Command registration in KOBGWOBV subcomponent failed. rc = *return\_code*, rsn = *error\_reason*, rsn2 = *error\_reason2*.****Explanation**

KOBGWOBV failed to register for address space console commands.

**System action**

The KOBGWOBV subcomponent returns and the address space continues to wait for other console commands. The KOBVTAM subcomponent will not be able to respond to console commands.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0077E: Command wait in KOBGWOBV subcomponent failed. rc = *return\_code*, rsn = *error\_reason*, rsn2 = *error\_reason2*.****Explanation**

KOBGWOBV failed to establish the routine that waits for its registered console commands.

**System action**

The KOBGWOBV subcomponent returns and the address space continues to wait for further console commands. The KOBVTAM subcomponent will not be able to respond to console commands.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0078E: Command deregistration in KOBGWOBV subcomponent failed. rc = *return\_code*, rsn = *error\_reason*, rsn2 = *error\_reason2*.****Explanation**

KOBGWOBV failed to establish the routine that deregisters its registered console commands.

**System action**

The KOBGWOBV subcomponent returns and the address space continues to wait for further console commands.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0079E: KOBBOBV\_Update\_Session\_Status() TCBAAddress is NULL.****Explanation**

A user interface session registration with the command handler supplied a NULL TCB address.

**System action**

The user interface will issue a popup error message explaining that the session initialization failed.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0080E: KOBBOBV\_Update\_Session\_Status() sessionStatus out of range (1 - 4).**

**Value passed = *nnnn***

**Explanation**

The status parameter values supplied by the internal routine were outside the acceptable range?

**System action**

The user interface will issue a popup error message explaining that the session request failed.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0081E: GW\_Obtain\_GWCVT\_Address() returned NULL. rsn = *error\_reason*, rsn2 = *error\_reason2*.****Explanation**

A user interface session request failed to find a required anchor control block. The reason codes may help determine the cause of the problem.

**System action**

The user interface will issue a popup error message explaining that the session request failed.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0083E: Current session status is *nnnn*, requested status is *nnnn* - invalid transition.****Explanation**

A user interface session request supplied a status value that is an invalid state to transition to from the current session status.

**System action**

The user interface will issue a popup error message explaining that the session request failed.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0084E: Current session status is *nnnn*, requested status is *nnnn* - invalid transition.****Explanation**

A user interface session request supplied a status value that is an invalid state to transition to from the current session status.

**System action**

The user interface will issue a popup error message explaining that the session request failed.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0085I: Enhanced 3270 user interface session requests still active. Reply (Y)es to continue waiting.****Explanation**

A console command to STOP the KOBVTAM subcomponent has been issued but the user interface component has one or more sessions with active requests. The address space has waited for 60 seconds in 5 second increments. After 60 seconds, this WTOR is issued allowing the operator to extend the wait for active requests to complete by replying to the console message number with a Y.

**System action**

If the response to the WTOR is Y, the address space will wait up to another 60 seconds before reissuing the WTOR. If all user interface requests complete in that period, termination of the KOBVTAM subcomponent will continue normally.

**User response**

This is an operator command WTOR. To continue waiting for active user interface requests to complete, respond Y or y to the console message. Any other response will result in sessions with active requests being forcibly terminated and possibly unpredictable results.

**KOBGW0086E: KOBVTAM session TCB address *address* not found on session chain.****Explanation**

A user interface session request supplied a TCB address representing the current session, but the session control block chain did not contain an entry containing the supplied address.

**System action**

The user interface will issue a popup error message explaining that the session request failed.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0087E: USS filepath: */tmp/zzz...* open failed, fd = *nn*, errno = *xxxx*, errno2= *xxxx*.****Explanation**

The enhanced 3270 user interface attempted to open a file in the z/OS® UNIX® System Services */tmp* path with file name based on job name and job ID (e.g., */tmp/jobname.jobid.log*).

**System action**

The enhanced 3270 user interface continues to run.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0088E: USS file close failed, fd = nn, errno = xxxx, errno2= xxxx.**

**Explanation**

The enhanced 3270 user interface attempted to close a file in the z/OS® UNIX® System Services /tmp path with the file name based on job name and job ID (/tmp/jobname.jobid.log).

**System action**

The enhanced 3270 user interface continues to run.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0089E: USS file path: /tmp/zzz... open failed, fd = nn, errno = xxxx, errno2= xxxx.**

**Explanation**

The enhanced 3270 user interface attempted to open or create a file in the z/OS® UNIX® System Services /tmp path with the file name based on job name and job ID (/tmp/jobname.jobid.log).

**System action**

The enhanced 3270 user interface continues to run.

**User response**

This is an internal error. Contact IBM Software Support and be prepared to supply the logs for the address space.

**KOBGW0090W: Threshold parsing encountered an error in the following statement:  
Threshold member: *threshold\_member\_name* Statement: *statement\_with\_error***

**Explanation**

The parsing of threshold input file *threshold\_member\_name* found an error in threshold specification statement *statement\_with\_error*.

**System action**

Threshold parsing continues.

**User response**

Correct the syntax error in the threshold specification statement.

**KOBGW0092E: Allocation of command table failed. rc=return\_code**

**Explanation**

Allocation of the internal table containing operator command processing information failed because sufficient storage is not available. storage

**System action**

The interface address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0093E: Initial setenv() failed rc = *return\_code*, errno = *error\_reason*, errno2 = *error\_reason2*.**

**Explanation**

An operation to initialize an environmental variable during initialization of the interface address space failed with the return and reason codes in the message.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0094E: Allocation of session block header failed.**

**Explanation**

Insufficient storage is available to allocate a control block required for user interface session operations.

**System action**

The address space terminates.

**User response**

Try increasing the size of the region using the MEMLIMIT JCL parameter. If this does not correct the problem, contact IBM Software Support.

**KOBGW0095E: Allocation of thresholding cache header failed.**

**Explanation**

Insufficient storage is available to allocate a control block required for thresholding operations.

**System action**

The address space terminates.

**User response**

Try increasing the size of the region using the MEMLIMIT JCL parameter. If this does not correct the problem, contact IBM Software Support.

**KOBGW0096E: Deallocation of the command table failed. rc=*return\_code*.**

**Explanation**

A problem occurred during an attempt to deallocate the internal table containing operator command processing information.

**System action**

The address space terminates.

**User response**

Contact IBM Software Support.

**KOBGW0097W: Dynamic load of modules into LPA requested but not supported.  
Modules loaded into private area.**

**Explanation**

Loading of function modules into the Link Pack Area was expected but was not allowed by the operating system. This might be due to the SAF-based security for the installation prohibiting the interface from performing dynamic LPA loading operations.

**System action**

Address space initialization continues by loading function modules into the interface private area.

**User response**

If loading of function modules into LPA is required, and supported by the level of operating system, check that the security controls established for loading and deleting modules dynamically into and from LPA allow the interface to perform these operations. If LPALOAD=Y is supplied as a parameter in the interface started task JCL, either eliminating the parameter or coding LPALOAD=N will prevent this message from being generated.

**KOBGW0098E: Allocate of function module LOAD parameter list failed.**

**Explanation**

Insufficient storage is available to allocate the z/OS LOAD parameter list required to load function modules into the enhanced 3270 user interface private area.

**System action**

The enhanced 3270 user interface address space terminates.

**User response**

Try increasing the size of the region using the REGION JCL parameter. If this does not correct the problem, contact IBM Software Support.

**KOBGW0099I: Status thresholds could not be established from *member\_name*. rc = *return\_code***

**Explanation**

The enhanced 3270 user interface initialization could not establish thresholding for member *member\_name* (CUASITE, IBMSITE, or KppTHRSH, where *pp* is the 2-character product code).

**System action**

Initialization of the address space continues.

**User response**

The THRESHOLDS\_SOURCE environmental variable or the libraries in the RKANPAR DD concatenation may specify the wrong DD name. Check to make sure the DD name is correct.

**KOBGW0100W: Open of threshold directory DD:*directory\_name* failed. errno = *error\_number*, rsnno = *error\_reason*.**

**Explanation**

Initialization of the enhanced 3270 user interface could not open the PDS directory allocation *directory\_name* containing the status threshold members.

**System action**

Address space initialization continues.

**User response**

Contact IBM Software Support.

**KOBGW0101W: Read of threshold directory *directory\_name* failed. errno = *error\_number*, rsno = *error\_reason*.**

**Explanation**

Initialization of the enhanced 3270 user interface could not read the next member of the PDS directory containing the status threshold members.

**System action**

Initialization of the address space continues.

**User response**

Contact IBM Software Support.

**KOBGW0102W: Close of threshold directory *directory\_name* failed. errno = *error\_number*, rsno = *error\_reason*.**

**Explanation**

Initialization of the enhanced 3270 user interface could not close the PDS directory containing the status threshold members.

**System action**

Initialization of the address space continues.

**User response**

Contact IBM Software Support.

**KOBGW0103I: Status thresholds successfully established from member *member\_name*.**

**Explanation**

Initialization of the enhanced 3270 user interface address space successfully established status thresholds from member *member\_name*.

**KOBGW0104W: Default thresholds refresh could not be completed - active UI evaluations.**

**Explanation**

The enhanced 3270 user interface address space tried to establish status thresholds but detected that one or more threshold evaluations are currently in progress. The program waited, but the wait interval expired and threshold evaluation did not finish.

**System action**

The enhanced 3270 user interface stops the attempt to refresh status thresholds.

**User response**

Try refreshing the status thresholds later. If the problem persists, check the enhanced 3270 user interface address space logs for related messages. If further assistance is needed, contact IBM Software Support and supply the logs for the enhanced 3270 user interface address space.

**KOBLI0001E: Command registration in KOBLISTN subcomponent failed. rc = *return\_code***

**Explanation**

KOBLISTN failed to register for enhanced 3270 user interface console commands.

**System action**

The KOBLISTN subcomponent returns and the enhanced 3270 user interface continues to wait for further console commands.

**User response**

This is an internal error. Contact IBM Software Support and supply the logs for the enhanced 3270 user interface address space.

**KOBLI0002E: Command wait in KOBLISTN subcomponent failed. rc = *return\_code*****Explanation**

KOBLISTN failed to establish the routine that waits for its registered enhanced 3270 user interface console commands.

**System action**

The KOBLISTN subcomponent returns and the enhanced 3270 user interface continues to wait for further console commands.

**User response**

This is an internal error. Contact IBM Software Support and supply the logs for the enhanced 3270 user interface address space.

**KOBLI0003E: Command deregistration in KOBLISTN subcomponent failed. rc = *return\_code*****Explanation**

KOBLISTN failed to establish the routine that deregisters its registered enhanced 3270 user interface console commands.

**System action**

The KOBLISTN subcomponent returns and the enhanced 3270 user interface continues to wait for further console commands.

**User response**

This is an internal error. Contact IBM Software Support and supply the logs for the enhanced 3270 user interface address space.

**KOBLI0004E: KOBLISTN STOP processing failed. rc = *return\_code*****Explanation**

The enhanced 3270 user interface STOP console command to terminate the KOBLISTN subcomponent failed with the return code *rc*.

**System action**

The KOBLISTN subcomponent will not be terminated by the current command. The enhanced 3270 user interface will continue to wait for other console commands.

**User response**

Use other messages preceding KOBLI0004E in addition to the return and reason codes displayed to determine the cause of the problem.

**KOBLI0005E: KOBLISTN TRACE command processing failed. rc = *return\_code*****Explanation**

The enhanced 3270 user interface TRACE console command to begin tracing for the KOBLISTN subcomponent failed with return code *return\_code*.

**System action**

The KOBLISTN subcomponent will not be able to process the TRACE command. The enhanced 3270 user interface will continue to wait for other console commands.

**User response**

Use other messages preceding KOBLI0004E in addition to the return code displayed to determine the cause of the problem.

**KOBLI0006E: KOBLISTN command *command* not supported by command handler.****Explanation**

The KOBLISTN command handling process does not support the command *command*.

**System action**

The KOBLISTN subcomponent returns and the enhanced 3270 user interface continues to wait for further console commands.

**User response**

This is an internal error. Contact IBM Software Support and supply the logs for the enhanced 3270 user interface address space.

**KOBLI0007I: Processing command string =*command*****Explanation**

The KOBLISTN command handling routine is processing the *command* command.

**System action**

None

**User response**

None

**KOBLI0008I: The Trace Command supplied is *command*.****Explanation**

The KOBLISTN subroutine is echoing the command *command*.

**System action**

None

**User response**

None

**KOBOD0000I: ODI cache initialization has started.****Explanation**

The Object Definition Interchange (ODI) cache initialization (which may involve reading the DOC/ATR files for some applications) has started.

**System action**

None

**User response**

None

**KOBOD0001I: ODI cache initialization has completed.**

**Explanation**

The Object Definition Interchange cache initialization, which might involve reading the DOC/ATR files for some applications, has completed.

**System action**

None.

**User response**

None.

**KOBOD0002I: ODI cache termination has started.**

**Explanation**

The Object Definition Interchange (ODI) cache termination (which involves releasing all the storage for all applications in the cache) has started.

**System action**

None

**User response**

None

**KOBOD0003I: ODI cache termination has completed.**

**Explanation**

The Object Definition Interchange cache termination (which involves releasing all the storage for all applications in the cache) has completed.

**System action**

None

**User response**

None

**KOBOD0004E: Error opening file *filename*; rc=*return\_code*, errno=*error\_number*, rsno=*reason\_number*.**

**Explanation**

An error occurred trying to open the DOC or ATR file for an application.

**System action**

The Object Definition Interchange (ODI) loader subcomponent stops processing the DOC and ATR files for this application.

**User response**

Verify the file exists and that its file permissions allow the enhanced 3270 user interface address space to read it.

**KOBOD0005E: Error reading file *filename*; rc=*return\_code*, errno=*error\_number*, rsno=*reason\_number*.**

**Explanation**

An error occurred trying to read the DOC or ATR file for an application.

**System action**

The Object Definition Interchange (ODI) loader subcomponent stops processing the DOC and ATR files for this application.

**User response**

Verify the file exists in the files concatenated to the RKANDATV DD statement. If the file is not there, check for it in TKANDATV and try to replace the file. If the file is already in RKANDATV, try to access the file to verify its integrity. Also, check the log for security-related messages or some other type of I/O error. If the file is there, and you can access it, but the problem persists, or if the file is not present, call IBM Software Support.

**KOBOD0006E: Error closing file *filename*; rc=*return\_code*, errno=*error\_number*, rsno=*reason\_number*.**

**Explanation**

An error occurred trying to close the DOC or ATR file for an application.

**System action**

The Object Definition Interchange (ODI) loader subcomponent will try to use the DOC and ATR files for this application, if there were no errors reading or parsing the files.

**User response**

Verify the file exists and that its file permissions allow the enhanced 3270 user interface address space to read it. Set the permissions to allow access if necessary.

**KOBOD0007E: Error parsing DOC/ATR files for application *applid*, product code *product\_code*; errno=*error\_number*, rsno=*reason\_number***

**Explanation**

A problem was encountered parsing the information from the DOC or ATR file for the indicated application.

**System action**

The Object Definition Interchange (ODI) loader subcomponent continues processing the DOC and ATR files looking for other parsing errors, but does not keep the information from these files in the ODI cache.

**User response**

Since the DOC and ATR files are generated files, this error should only occur if a file has been corrupted or altered. Restore the original versions of these files.

**KOBOD0008E: The DOC/ATR files for application *applid*, product code *product\_code* will not be used due to errors.**

**Explanation**

The DOC and ATR files for the indicated application will not be used because errors were encountered reading and parsing the ODI information from them.

**System action**

The Object Definition Interchange (ODI) loader subcomponent does not add the ODI information for this application to the cache.

**User response**

Refer to earlier error messages to determine the root cause of the error.

**KOBOD0009E: Error allocating memory for ODI cache. errno=*error\_number*,  
rsnno=*reason\_number***

**Explanation**

An error occurred allocating memory to hold the Object Definition Interchange (ODI) cache information for this application.

**System action**

The ODI loader subcomponent does not add the ODI information for this application to the cache.

**User response**

The ODI cache is maintained in 64-bit virtual storage. Make sure the address space has been given sufficient storage to use for the ODI cache. If necessary, increase the value of the MEMLIMIT JCL parameter.

**KOBOD0010E: The requested application product ID, applid, is not a registered application.**

**Explanation**

A request for the Object Definition Interchange (ODI) information was received for an application product that is not registered with the OMEGAMON Enhanced 3270 user interface.

**System action**

The ODI Loader subcomponent stops processing the request and returns an error return code.

**User response**

The ODI cache is maintained in 64-bit virtual storage. Verify that the address space has been given sufficient storage to use for the ODI cache. Verify that the runtime environment was copied correctly. Also, check that the ODI is referenced in the KOBFCGAP and KOBREGAP members of the data set that is referenced in the RKANPAR DDNAME concatenation list. If the members are present and the ODI is correctly referenced, but the problem persists, contact IBM Software Support.

Capture the following diagnostic information:

- The OMEGAMON Enhanced 3270 user interface SYSPRINT log file
- A directory listing of the data sets referenced by the OMEGAMON Enhanced 3270 user interface RKANPARTV DD name
- A listing of the content for the members KOBFCGAP and KOBREGAP of the data set or data sets referenced in the RKANPAR DDNAME concatenation list

**KOBOD0011E: The application product DOC file, KppDOC, was not found.**

**Explanation**

The DOC file associated with an application could not be found by the Object Definition Interchange (ODI) loader component. The file names are the PDS member names that were used to locate the file. The *pp* value is the two-letter product code for the application that has the file missing.

**System action**

The ODI loader subcomponent stops processing the DOC and ATR files for this application.

**User response**

Verify that the *KppDOC* and *KppATR* files for the application product are located in the appropriate PDS and that the location of the files is in the concatenation list for the RKANPARTV DDNAME statement.

**KOBOD0012E: The application product ATR file, KppATR was not found.**

**Explanation**

The ATR file associated with an application could not be found by the ODI loader component. The file names show the PDS member name and z/OS® UNIX® System Services filename variations that were used.

**System action**

None.

**User response**

None.

**KOBOD0013E: The requested product code, *product\_code*, is not a registered application.****Explanation**

An Object Definition Interchange (ODI) refresh request was received for a product code that is not registered with the enhanced 3270 user interface.

**System action**

The ODI loader subcomponent stops processing the request and returns an error return code.

**User response**

Verify that the application has been properly installed and registered with the enhanced 3270 user interface and retry the request.

**KOBOD0014I: ODI file *filename* opened successfully.****Explanation**

The Object Definition Interchange (ODI) cache initialization process has opened a file in preparation for reading its content as input to its internal cache.

**System action**

The ODI loader subcomponent will process the file contents as input to its internal cache.

**User response**

None.

**KOBOD0015E: Command registration in KOBODISC subcomponent failed, *rc=return\_code, errno=error\_number, rsnno=error\_reason*****Explanation**

The Object Definition Interchange (ODI) loader subcomponent failed to register for enhanced 3270 user interface console commands.

**System action**

The ODI loader subcomponent will continue to run; however, it will not be able to respond to console commands.

**User response**

This is an internal error. Contact IBM Software support and supply the logs for the enhanced 3270 user interface address space.

**KOBOD0016E: Command wait in KOBODISC subcomponent failed, *rc = return\_code, errno=error\_number, rsnno=error\_reason*****Explanation**

The Object Definition Interchange (ODI) loader subcomponent failed to establish the routine that waits for its registered enhanced 3270 user interface console commands.

**System action**

The ODI loader subcomponent will continue to run, but it will not be able to respond to console commands.

### User response

This is an internal error. Contact IBM Software Support and provide the logs for the enhanced 3270 user interface address space.

**KOBOD0017E: Command deregistration in KOBODISC subcomponent failed, rc=return\_code, errno=error\_number, rsno=error\_reason**

### Explanation

The Object Definition Interchange (ODI) loader subcomponent failed to establish the routine that deregisters its registered enhanced 3270 user interface console commands.

### System action

The ODI loader subcomponent will continue its termination process.

### User response

This is an internal error. Contact IBM Software Support and supply the logs for the enhanced 3270 user interface address space.

**KOBOD0018E: KOBODISC STOP processing failed, rc=return\_code, errno=error\_number, rsno=error\_reason**

### Explanation

The Object Definition Interchange (ODI) loader subcomponent encountered an error while processing a console STOP command.

### System action

The ODI loader subcomponent will continue its termination process.

### User response

This is an internal error. Contact IBM Software Support and supply the logs for the enhanced 3270 user interface address space.

**KOBOD0019I: processing cmd string = command**

### Explanation

The Object Definition Interchange (ODI) component has received an operator command.

### System action

The ODI loader subcomponent will process the received command; for example, in the case of the STOP command, it will terminate the ODI cache.

### User response

None

## KOBP messages

Messages that begin with the KOBP prefix are associated with the KCIPARSE program and are generated in the JESMSGLOG message log. KCIPARSE is used by both Parameter Generator (PARMGEN) and Configuration Manager.

For more information about these messages, contact IBM Software Support, and send the following documentation:

#### For PARMGEN:

- \$PARSE\*-related job output
- Contents of the &rte\_plib\_hilev.&rte\_name.WCONFIG data set
- Contents of the &gbl\_user\_jcl data set

**For Configuration Manager:**

- The full output from the JCL job that runs the action (for example, the **GENERATE** action).

**KOBP000E: INVALID PARAMETER**

**User response**

**KOBR – KOBU messages**

These messages are associated with the OMEGAMON enhanced 3270 user interface, which is part of the OMEGAMON Base component. By default, trace and error logs are created in SYSPRINT. (An alternate log location may have been specified, using standard JCL services.) Most of the messages are prefixed by a timestamp and thread ID.

**KOBRR0001E: Column *column\_name* not selected. It cannot be indexed.**

**Explanation**

The column specified was referenced in an ORDER BY clause, but was not selected. If a column is to be used to order the records, it must be explicitly selected in the QUERY statement.

**System action**

The table records are not ordered.

**User response**

Correct your QUERY by adding the column name to the SELECT statement. If the query was distributed by IBM, report this problem to IBM Software Support.

**KOBRR0002E: Eyecatch check of row index failed: *control\_block\_identifier*.**

**Explanation**

The request router has detected an internal error during the process of indexing query data.

**System action**

The data from the query is not ordered.

**User response**

Report this message to IBM Software Support.

**KOBRR0003E: Index tree initialization failed. rc=*n*, errno=*x*, rsn=*y*.**

**Explanation**

The request router has detected an internal error during processing of an ORDER BY keyword or a request for sorted data.

**System action**

The data from the query is not ordered.

**User response**

Report this message to IBM Software Support.

**KOBRR0004E: Index tree corruption found: *eyecatch\_value*.**

**Explanation**

The request router has detected an internal error during processing of an ORDER BY keyword or a request for sorted data.

**System action**

The request router will not function.

**User response**

Report this message to IBM Software Support.

**KOBRR0005E: Conversion of index failed for column *column\_name*. rc=*return\_code*,  
errno=*error\_code*, rsn=*error\_reason***

**Explanation**

The request router has detected an internal error during processing of an ORDER BY keyword or a request for sorted data.

**System action**

The request router will not function.

**User response**

Report this message to IBM Software Support.

**KOBRR0006E: Index cleanup failed for column *column\_name*. rc=*n*, errno=*x*, rsn=*y***

**Explanation**

The request router has detected an internal error during processing of an ORDER BY keyword or a request for sorted data.

**System action**

The request router will not function.

**User response**

Report this message to IBM Software Support.

**KOBRR0007E: Indexing of a row failed. rc=*n*, errno=*error\_code*, rsn=*error\_reason***

**Explanation**

The request router has detected an internal error during processing of an ORDER BY keyword or a request for sorted data.

**System action**

The request router will not function.

**User response**

Report this message to IBM Software Support.

**KOBRR0008E: Indexing of column *column\_name* failed. rc=*return\_code*,  
errno=*error\_code*, rsno=*error\_reason***

**Explanation**

The request router has detected an internal error during processing of an ORDER BY keyword or a request for sorted data.

**System action**

The request router will not function.

**User response**

Report this message to IBM Software Support.

**KOBRR0009E: Re-indexing of column *column\_name* failed. rc=*return\_code*,  
errno=*error\_code*, rsn=*error\_reason***

**Explanation**

The request router has detected an internal error during processing of an ORDER BY keyword or a request for sorted data.

**System action**

The request router will not function.

**User response**

Report this message to IBM Software Support.

**KOBRR0033I: After CELQPIPI init\_sub CELQPIPI=*address* TOKEN=*token* RC=*return-code***

**Explanation**

The Tivoli OMEGAMON Manager (TOM) address space called the z/OS Language Environment® CELQPIPI init\_sub function, but the call ended with a non-zero return code *return-code*.

**System action**

Processing continues. Some TOM functionality might not work. The TOM log might contain subsequent error messages with additional details.

**User response**

If the *return-code* value is 8 or 32, the TOM was unable to load one or both of load modules KOBRES01 and KOBRSRT01. This error can occur if the TOM runtime environment installation (or upgrade) was incomplete or unsuccessful. Check that the TKANMODP load library in the TOM STEPLIB concatenation contains both of these modules and that both of them are AMODE 64. If additional assistance is needed, collect the TOM log and contact IBM Software Support.

For other *return-code* values, collect the TOM log and contact IBM Software Support.

**KOBTC0018E: connect\_local: CONNECT() FAIL Err=nn Rsn=0xnxxxxxxx.**

**Explanation**

OMEGAMON Subsystem Near Term History component is not able to communicate with the RMF Distributed Data Server (DDS - GPMSEVERE) data provider. This message with Err=0 and Rsn=0x00000000 values may occur as part of the normal OMEGAMON Subsystem stop (shutdown) process.

Please refer to TCP/IP documentation for an explanation of the Err (error) and Rsn (reason) codes.

If this message is occurring frequently during the course of normal OMEGAMON Subsystem operation, please verify that the RMF and GPMSEVERE are running and connectable.

**System action**

When this message occurs outside of OMEGAMON Subsystem stop processing, OMEGAMON on z/OS Near Term History (NTH) data collection will not be possible.

**System programmer response**

Verify that RMF and related GPMSEVERE started tasks are running and connectable. If this is the case, examine the Err and Rsn values returned from the TCP/IP for an explanation of the connect error to help determine the cause of the error. Verify that the TCP/IP configuration and operation is running normally. If RMF, GPMSEVERE, and TCP/IP are ruled out as possible causes, capture the OMEGAMON subsystem Job log and contact IBM support.

**KOBUT001I: CreatePath #1 call, type(server\_type), NCS:{SOCKET = protocol :#address} CT/DS:{SERVER = server\_name USER = user\_name TERMPATH = YES}**

**Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process is attempting to create a communications path between this address space and a hub or remote monitoring server endpoint. This discovery process uses the protocol, address, and port that is listed in the message. A type (H) value indicates a hub monitoring server, while a type (R) value indicates a remote monitoring server.

**System action**

None.

**System programmer response**

None.

**KOBUT002I: CreatePath #1 done, type(server\_type), RC=return\_code**

**Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process attempted to create a communications path between this address space and a hub or remote monitoring server endpoint. This process resulted in the return code listed. A type(H) value indicates a hub monitoring server, while a type(R) value indicates a remote monitoring server.

**System action**

None.

**System programmer response**

None.

**KOBUT003W: CreatePath failed, possibly due to a communications protocol mismatch. Check that the KDE\_TRANSPORT value (in this address space) contains at least one**

**enabled protocol that matches the KDE\_TRANSPORT value in the target TEMS:**  
*monitoring\_server\_name*

#### **Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process attempted to create a communications path between this address space and a hub or remote monitoring server endpoint. However, that attempt failed, possibly because there are no communication protocols (for example, IP.PIPE) in common between this address space and the endpoint.

#### **System action**

None.

#### **System programmer response**

Check that the KDE\_TRANSPORT and KDC\_FAMILIES environmental variables in this address space and the monitoring server processes (z/OS® address spaces or non-z/OS processes) contain matching communications protocols. For example, that both sides include IP.PIPE, or IP.SPIPE communication protocols.

**KOBUT004I: CT\_CMSLIST #0.0, LbLookup text(protocol : server\_address)**

#### **Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process is attempting to use Location Broker services to find a hub or remote monitoring server to which a connection can be attempted.

#### **System action**

None.

#### **System programmer response**

None.

**KOBUT005I: CT\_CMSLIST #sequence, LbLookup nodeAddr(hub\_name),  
sockString(protocol :#ipv4\_address.port.) CT\_CMSLIST #sequence, LbLookup  
nodeAddr(hub\_name), sockString(protocol :#(ipv6\_address.port).) CT\_CMSLIST  
#sequence, LbLookup nodeAddr(hub\_name),  
sockString(protocol :#sna\_address.port.)**

#### **Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process found the listed remote or hub monitoring server by using Location Broker services.

#### **System action**

None.

#### **System programmer response**

None.

**KOBUT006I: CT\_CMSLIST #0.0, LbLookup failed RC(return\_code)**

#### **Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process failed to find a hub monitoring server at one of the endpoints when using Location Broker services. This message should not be mistaken for an error. It indicates that the endpoint is a remote monitoring server.

**System action**

None.

**System programmer response**

None.

**KOBUT007I: Init\_TEMS #n, type(*server\_type*), path(*server\_address*)****Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process is attempting to connect to the hub or remote monitoring server that is listed in the message. A type(H) value indicates a hub monitoring server, while a type(R) value indicates a remote monitoring server.

**System action**

None.

**System programmer response**

None.

**KOBUT008I: Init\_TEMS leaving loop, found=*n*****Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process was able to connect to a hub or remote monitoring server if "found=1," otherwise the connection failed.

**System action**

None.

**System programmer response**

None.

**KOBUT009I: HOSTADDR protocol(*communication\_protocol*)****Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process found the listed communications protocol for the hub monitoring server by querying the HOSTADDR field of the O4SRV.INODESTS table.

**System action**

None.

**System programmer response**

None.

**KOBUT010I: HOSTADDR host(*monitoring\_server\_address*)****Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process found the listed host address for the hub monitoring server by querying the HOSTADDR field of the O4SRV.INODESTS table.

**System action**

None.

**System programmer response**

None.

**KOBUT011I: HOSTADDR port(*port\_number*)****Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process found the listed port number for the hub monitoring server by querying the HOSTADDR field of the O4SRV.INODESTS table.

**System action**

None.

**System programmer response**

None.

**KOBUT012I: HOSTADDR PATH (*host\_address\_path* + *communication\_protocol*)****Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process found the complete listed path value for the hub monitoring server by querying the HOSTADDR field of the O4SRV.INODESTS table.

**System action**

None.

**System programmer response**

None.

**KOBUT014I: User supplied KOB\_CREATEPATH(*path*)****Explanation**

The user supplied a KOB\_CREATEPATH environmental variable to control how the KOBAGENT connects to a hub or remote monitoring server. Supplying this variable is not typical and should be done only under the direction of IBM® support.

**System action**

None.

**System programmer response**

None.

**KOBUT015I: KDS\_HUB({\*LOCAL | \*REMOTE}) found****Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process found this address space was either a hub monitoring server(\*LOCAL value) or a remote monitoring server(\*REMOTE value).

**System action**

None.

**System programmer response**

None.

## **KOBUT016I: No KDS\_HUB, running in TEMA**

### **Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process found this address space was an Agent address space (not a hub monitoring server and not a remote monitoring server).

### **System action**

None.

### **System programmer response**

None.

## **KOBUT021I: paths: Path # *n*, server type=*server\_address\_path*.**

### **Explanation**

The Hub Tivoli® Enterprise Monitoring Server discovery process found one or more hub or remote monitoring server destinations, as listed. A connection will be attempted to each of these destinations until a successful connection is established. A server type(H) value indicates a hub monitoring server, while a server type(R) value indicates a remote monitoring server.

### **System action**

None.

### **System programmer response**

None.

## **KOBUT030I: DROP\_HUB delete pConn Object [validation failed], *reason*.**

### **Explanation**

A problem occurred during cleanup after detecting the loss of a hub TEMS connection. The text "validation failed" may not always be present.

The following values are possible for the *reason*:

- ConnObj\*: *addr*, .Sequence#: *xxxx* .Hasid: *asid*, .Haddr: *addr*
- already freed
- pConnHandle is NULL

### **System action**

None.

### **System programmer response**

None.

## **KOBUT031I: Drop\_HUB: *object-name* object is already deleted**

### **Explanation**

The Drop\_HUB subroutine detected and prevented an attempt to delete an instance of object *object-name* that has already been deleted.

### **System action**

Program processing continues.

### **Programmer response**

None.

**KOBUT032I: Drop\_HUB: an attempt to restore old pConn address *xxxx* failed; new address *yyyy* is already in place**

**Explanation**

The Drop\_HUB subroutine detected and prevented an attempt to store an obsolete pConn object address into a control block.

**System action**

Program processing continues.

**Programmer response**

None.

**KOBUT099I: In {NodeHdr | Connect} {ctor(),#n | dtor()}**

**Explanation**

These internal trace messages indicate when a Connect or NodeHdr object is created or destroyed.

**System action**

None.

**System programmer response**

None.

## KPD and KFAPD messages

Messages that begin with the KPD prefix are associated with the persistent data store. Messages that begin with the KFAPD prefix are issued by the KPD component and refer to errors in KPD commands.

**KFAPD0001E: System Name: Data set *variable* is not known to the persistent data store.**

**Explanation**

An INITDS command was encountered and the specified data set name has not been defined to the persistent data store.

**Operator response**

Use the ADDFILE command to assign the specified data set to a file group and then reissue the INITDS command.

**KFAPD0001E\_d: Data set name missing or invalid.**

**Explanation**

An INITDS, REMOVE or an ALLOCATE command was encountered. The data set name parameter on the command was either missing or invalid.

**Operator response**

In the case of the REMOVE or ALLOCATE command, locate the persistent data store startup commands and fix the invalid or missing data set name. In the case of the INITDS command, fix the command in the persistent data store startup commands or reissue the command by using the correct syntax.

**KFAPD0001E\_dd: Error *variable* initializing *variable*.**

**Explanation**

An I/O error occurred while initializing the specified data set. The error value displayed is the I/O error code.

**Operator response**

Allocate the data set on a different I/O device. Then redefine it to the persistent data store and reissue the INITDS command.

**KFAPD0002E: ALLOCATE already issued for this file.**

**Explanation**

The ALLOCATE command has already been issued for this file.

**Operator response**

Issue other persistent data store commands to begin using the allocated file.

**KFAPD0002E\_d: Data set *variable* can not be initialized because it is *variable*.**

**Explanation**

The INITDS was unable to initialize the specified data set *variable* for the reason *variable*.

**Operator response**

If the reason is that the file is the current active data store, issue the SWITCH command to make a different file in the group the active data store. Then reissue the INITDS command. If the reason is that the file is offline, issue the ADDFILE command to add the specified file to a group. Then reissue the INITDS command.

**KFAPD0003E: Error opening file *variable* for output.**

**Explanation**

An I/O error occurred while attempting to open the specified file for output.

**Operator response**

Check the joblog and logrec files for I/O device errors. If the error persists, allocate the file on a different I/O device.

**KPDCM000: *variable*.**

**Explanation**

This message is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KPDCM001: RESULT results*variable*.**

**Explanation**

This message is an informational message and does not require further action. The data displayed is the count of result lines displayed for the command issued.

## **KPDCM010: KPDCCMD persistent data store not available.**

### **Explanation**

While attempting to process a persistent data store command, the system determined that the PDS Service vector was unavailable. The command is ignored.

### **Operator response**

Check the RKPLOG to see if the persistent data store is down or has abended. Shut down the persistent data store address space, collect the RKPLOG and RKLLOG files, and any SVCDUMP file results, produced and send to IBM Software Support. Restart the persistent data store address space.

## **KPDCM011: KPDCCMD persistent data store command interface not available.**

### **Explanation**

While attempting to process a persistent data store command, the system determined that the command interface was unavailable. The command is ignored.

### **Operator response**

Check the RKPLOG to see if the persistent data store is down or has abended. Shutdown the persistent data store address space, collect RKPLOG and RKLLOG, and any SVCDUMP produced and send to IBM Software Support. Restart the persistent data store address space.

## **KPDCM012: KPDCCMD Error *variable* attempting to setup request for commands.**

### **Explanation**

While attempting to process a persistent data store command, an error occurred during setup for processing a command. The command is ignored.

### **Operator response**

Check the RKPLOG to see if the persistent data store is down or has abended. Shutdown the persistent data store address space, collect RKPLOG and RKLLOG, and any SVCDUMP produced and send to IBM Software Support. Restart the persistent data store address space.

## **KPDCM013: KPDCCMD: command length *variable* longer than maximum *variable*.**

### **Explanation**

The persistent data store command that was entered is too long. The command is ignored.

### **Operator response**

Make the command shorter and re-enter the command.

## **KPDMN001: KPDMON starting.**

### **Explanation**

This is an informational message and does not require further action. This message indicates that KPDMON has started. KPDMON is a monitor that tracks the health of the persistent data store processes.

## **KPDMN002: KPDMON giving up after 5 minutes.**

### **Explanation**

This is an informational message indicating that the persistent data store did not complete startup processing.

### **Operator response**

Check the RKPDLLOG to see if the persistent data store is down or has abended. Shutdown the persistent data store address space, collect RKPDLLOG and RKLVLLOG, and any SVCDUMP produced and send to IBM Software Support. Restart the persistent data store address space.

## **KPDMN003: WAITING FOR PDS TO GO ACTIVE.**

### **Explanation**

This is an informational message and does not require further action. This message indicates that KPDMON is waiting for the persistent data store to complete startup processing.

## **KPDMN004: PDS IS INACTIVE.**

### **Explanation**

This is an informational message indicating that the persistent data store is inactive.

### **Operator response**

Check the RKPDLLOG to see if the persistent data store is down or has abended. Shutdown the persistent data store address space, collect RKPDLLOG and RKLVLLOG, and any SVCDUMP produced and send to IBM Software Support. Restart the persistent data store address space.

## **KPDMN005: PDS IS ACTIVE.**

### **Explanation**

This is an informational message and does not require further action. This message indicates that the persistent data store has completed startup processing.

## **KPDMNT00I: Data set = *variable*, Started Task = *variable*, Job Name = *variable*.**

### **Explanation**

This is an informational message and does not require further action. This message indicates a persistent data store maintenance job is currently running. The message will be immediately followed by one of the following messages: KPDMNT01W, KPDMNT02E, or KPDMNT03S.

## **KPDMNT01W: Maintenance for persistent data store has not completed after waiting 0:05:00.**

### **Explanation**

This is a warning level message indicating that a maintenance job has been running for 5 minutes and has not completed yet.

### **Operator response**

If the maintenance should have completed in less than 5 minutes, check the RKPDLLOG file for errors. Also, check the system log for messages that must be replied to or errors that might be holding up the persistent data store maintenance.

## **KPDMNT02E: Maintenance for persistent data store has not completed after waiting 0:10:00.**

### **Explanation**

This is a error level message indicating that a maintenance job has been running for 10 minutes and has not completed yet.

### **Operator response**

If the maintenance should have completed in less that 10 minutes, check the RKPLOG file for errors. Also, check the system log for messages that must be replied to or errors that may be holding up the persistent data store maintenance.

## **KPDMNT03S: Maintenance for persistent data store has not completed after waiting 0:15:00.**

### **Explanation**

This is a severe level message indicating that a maintenance job has been running for 15 minutes and has not completed yet.

### **Operator response**

If the maintenance should have completed in less that 15 minutes, check the RKPLOG file for errors. Also, check the system log for messages that must be replied to or errors that may be holding up the persistent data store maintenance.

## **KPQ messages**

Messages with the KPQ prefix are associated with the persistent data store.

### **KPQA106E: KPQSPDSH: UNABLE TO LOCATE GSA**

#### **Explanation**

An internal control block could not be located.

#### **System action**

OMEGAMON continues; however, near-term history may be lost.

#### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

### **KPQD004E: KPQSPDSH: UNABLE TO FIND PQ VECTOR**

#### **Explanation**

An internal control block could not be located.

#### **System action**

OMEGAMON continues; however, near-term history may be lost.

#### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQD005E: KPQHINIT: APF AUTHORIZATION REQUIRED FOR DATA COLLECT**

### **Explanation**

All load libraries specified in the STEPLIB DD statement of the Tivoli® Enterprise Monitoring Server address space are not APF authorized.

### **System action**

The initialization of the Tivoli® Enterprise Monitoring Server terminates.

### **User response**

Make sure that all the Tivoli® Enterprise Monitoring Server load libraries are APF-authorized prior to restarting the Tivoli® Enterprise Monitoring Server address space. The destination is the Tivoli® Enterprise Monitoring Server Engine log file, RKLVLLOG.

## **KPQD006I: KPQHINIT: RKPDIIN DATASET NOT OPENED, REASON CODE = *rsn***

### **Explanation**

During PDS V2 initialization, the RKPDIIN data set failed to open.

### **System action**

PDS V2 terminates.

### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQD007E: KPQHINIT RKPDIIN DATASET NOT READ, REASON CODE = *rsn***

### **Explanation**

During PDS V2 initialization, the RKPDIIN data set could not be read.

### **System action**

PDS V2 terminates.

### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQD008E: KPQHINIT: APPLICATION TABLE IS EMPTY**

### **Explanation**

During PDS V2 initialization, the RKPDIIN data set was found to be empty. This usually happens when you have enabled PDS V2 by setting the **RTE\_PDS2\_ACTIVATION** parameter to Y but did not install (or did not enable) any of the products that support PDS V2.

### **System action**

PDS V2 terminates. The engine continues to run without enabling PDS V2.

### **User response**

If no product that supports PDS V2 was installed in the RTE, no action is required. If, however, a product that supports PDS V2 was installed and is expected to be activated, collect the contents of the RKPDIIN data set and contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## KPQD009E: KPQHINIT: CONFIGURATION ERROR, RKANPARU(KPQHINIT) NOT FOUND

### Explanation

During PDS V2 initialization, the RKANPARU (KPQHINIT) member was not found. This usually happens when you have enabled PDS V2 by setting the **RTE\_PDS2\_ACTIVATION** parameter to Y but did not install (or did not enable) any of the products that support PDS V2. If, however, a product that supports PDS V2 was installed and is expected to be activated, this could happen if PDS V2 was configured incorrectly or because the member was removed manually.

### System action

PDS V2 terminates. The engine continues to run without enabling PDS V2.

### User response

If no product that supports PDS V2 was installed in the runtime environment, no action is required. If, however, a product that supports PDS V2 was installed and is expected to be activated, PDS V2 should be configured again. For more information, see [How to: Activate PDS V2](#).

## KPQD009I: KPQDTERM: TERMINATING

### Explanation

The PDS V2 component is terminating.

### System action

None.

### User response

No action is required.

## KPQD010E: KPQHINIT: CONFIGURATION ERROR, PDSV1 PARM NOT FOUND

### Explanation

During PDS V2 initialization, the **PDSV1** parameter was not found in the RKANPARU (KPQHINIT) member. **PDSV1** is a mandatory parameter that should be present in the RKANPARU (KPQHINIT) member and be set to ON or OFF. This could happen if PDS V2 was configured incorrectly or because the member was edited manually.

### System action

PDS V2 terminates. The engine continues to run without enabling PDS V2.

### User response

Perform PDS V2 configuration again. For more information, see [How to: Activate PDS V2](#).

## KPQD012E: KPQHINIT: ALLOCATION FAILED FOR [*work\_area*] SIZE=[*bytes*]

### Explanation

Data collection initialization failed during allocation of the required work area name indicated in the message. The size (in bytes) required for the work area is also displayed.

### System action

The initialization of Tivoli® Enterprise Monitoring Server terminates.

### User response

Change the LIMIT parameter depending on the number of devices defined to your system. The LIMIT value is expressed as a power of 2, thus LIMIT (22,x) specifies 4 meg, LIMIT (23,x) specifies 8 meg, and so on. Each device table entry is 320 bytes, so LIMIT (23,x) allows allocation of a device table large enough to accommodate about 26,000 devices. LIMIT (24,x) accommodates twice that many. If the error still occurs, contact IBM® Software Support. The destination is the Tivoli® Enterprise Monitoring Server Engine log file, RKLVLLOG.

## **KPQD013E: KPQSPDSH: ALLOCATION FAILED FOR WORK AREA**

### **Explanation**

A work area could not be allocated.

### **System action**

OMEGAMON continues; however, near-term history may be lost.

### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQD013W: [*module\_name*] LOAD FAILED FOR [*loaded\_module\_name*] - [*result*]**

### **Explanation**

An attempt to load [*loaded\_module\_name*] failed. The effect of this load failure on processing indicated by [*result*].

### **System action**

Processing continues or terminates according to the information contained in [*result*].

### **User response**

Verify that [*loaded\_module\_name*] is in the Tivoli® Enterprise Monitoring Server RKANMODL load library concatenation and is executable. If it is available and executable, contact IBM® Software Support.

## **KPQD029E: [*module name*]: SERVICE TASK ATTACH FAILED [*code*] - [*text*]**

### **Explanation**

This message indicates that an internal error has occurred. Module [*module name*] attempted to do an ATTACH, but it failed with return code [*code*]. The text further identifies the failing component.

### **System action**

The OMEGAMON® product continues, but the operation triggering the error does not complete.

### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQD033W: [*module name*]: SDUMP ERROR, RC = [*code*]**

### **Explanation**

This message indicates that an attempt to issue the SDUMPX service failed with return code *code*. The dump has been attempted as a result of an abend or unexpected situation.

### **System action**

The OMEGAMON® product continues, but the dump that may be required for diagnosis is not available.

### **User response**

Check the return code to see if it indicates an environmental error that can be corrected. Otherwise, contact IBM® Software Support.

## **KPQD034I: [*module name*]: SDUMP [*dumpname*] SUCCESSFULLY TAKEN**

### **Explanation**

This message indicates that an SVC dump was successfully taken with title [*dumpname*]. The dump was taken as a result of an abend or other unexpected situation.

**System action**

The OMEGAMON® product continues. The dump may be required by support for problem determination.

**User response**

Contact IBM® Software Support. Save the dump as it may be required for problem determination. This problem information is stored in the ITMS:Engine log, RKLVL0G.

**KPQD054E: KPQDBCMD COMMAND FUNCTION INVALID OR OMITTED****Explanation**

The PQDEBUG operator command function is invalid.

**System action**

KPQD055I messages are issued.

**User response**

Correct the function and reissue the PQDEBUG command.

**KPQD055I: *help text*****Explanation**

This message documents the PQDEBUG syntax.

**System action**

None.

**User response**

Note the syntax and use when reissuing the PQDEBUG command.

**KPQD056E: KPQDBCMD UNABLE TO ACCESS DEBUG FLAG AREA****Explanation**

OMEGAMON was unable to access the area where debug flags are set.

**System action**

The PQDEBUG command terminates.

**User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVL0G.

**KPQD090E: KPQSPDSH: MODULE [*module name*] NOT AVAILABLE****Explanation**

The historical module [*module name*] is not available.

**System action**

The module encountering the error will terminate. The historical data will be collected by using PDS V1.

**User response**

Contact IBM® Software Support.

## **KPQD0100E: [module name] ABENDED: [abend information]**

### **Explanation**

This message indicates that an internal error has occurred.

### **System action**

The OMEGAMON® product continues, but the operation triggering the error does not complete.

### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQD101E: KPQDBCMD @KPQ@ VECTOR NOT FOUND**

### **Explanation**

During execution of the PQDEBUG operator command, the PDS V2 vector was not found.

### **System action**

The PQDEBUG command terminates.

### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQD102E: KPQDBCMD PQDEBUG VECTOR NOT FOUND**

### **Explanation**

During execution of the PQDEBUG operator command, the PQDEBUG vector was not found.

### **System action**

The PQDEBUG command terminates.

### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQD0102I: KPQHINIT: KPQHINIT INPUT PARAMETER: *parameter***

### **Explanation**

During PDS V2 initialization, RKANPARU(KPQHINIT) was found; this parameter was found in the member.

### **System action**

None.

### **User response**

No action is required.

## **KPQD0105E: [detecting\_module\_name]: UNABLE TO LOAD [module]**

### **Explanation**

An attempt to issue an internal load for the specified [module] failed.

### **System action**

Processing continues; however, a loss of functionality will occur.

**User response**

Verify that *[module]* is in the Tivoli® Enterprise Monitoring Server RKANMOD load library concatenation. If the module appears to be available, contact IBM® Software Support.

**KPQD0106E: *[module name]*: UNABLE TO ALLOCATE *[nnn]* BYTES OF STORAGE, RC = *[rc]*****Explanation**

An attempt to \$GMEM *[nnn]* bytes of storage failed with RC = *[rc]*. Processing for this function terminates.

**System action**

Processing continues; however functionality will be impacted.

**User response**

Contact IBM® Software Support.

**KPQD107E: KPQDBCMD: KPQ VECTOR NOT FOUND****Explanation**

While running the **KPQ** operator command, the KPQ vector was not found.

**System action**

The **KPQ** command terminates.

**User response**

View the related messages in the ITMS:Engine log, RKLVL0G. Contact IBM® Software Support.

**KPQD108E: KPQDBCMD: MODULE KPQSPCMD NOT AVAILABLE, RC = *rc*****Explanation**

While running the **KPQ** operator command, the command handler module was not available. Possible reason: version 2 of the persistent data store (PDS V2) has not been activated in an OMEGAMON® runtime environment (RTE). Using OMEGAMON® monitoring agents as a data source for OMEGAMON® Data Provider requires PDS V2.

**System action**

The **KPQ** command terminates. OMEGAMON monitoring agents will not send data to OMEGAMON® Data Broker.

**User response**

Check that PDS V2 is activated. For example, check that the RTE parameter **RTE\_PDS2\_ACTIVATION** is set to Y (the default value). For more details on activating PDS V2, see [PDS V2 activation](#). Check that PDS V2 has initialized. View the related messages in the ITMS:Engine log, RKLVL0G. Look for message [KPQS217I](#) confirming that PDS V2 has initialized.

If you cannot resolve the issue, contact IBM® Software Support.

**KPQH000E: *[parameter]* ADDRESS IS ZERO****Explanation**

This message indicates that an internal error has occurred.

**System action**

The module encountering the error will terminate. Other product functions may continue to operate as normal.

**User response**

Contact IBM® Software Support.

**KPQH001E: [module\_name]: [parameter] IS INVALID, [details\_if\_any]**

**Explanation**

An error has occurred in the noted module.

**System action**

The system action that occurs varies. Some near-term history may be lost.

**User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVL0G.

**KPQH002I: [parameter] DUMP AT [parameter address]:**

**Explanation**

Content of [parameter] at [parameter address] will be printed in hex after this message.

**System action**

None.

**User response**

No action is required.

**KPQH003I: MODULE STARTED, BUILD NUMBER IS [build number]**

**Explanation**

Module [module\_name] is started and the build number for the module is [build number].

**System action**

None.

**User response**

No action is required.

**KPQH004E: INITIALIZATION ERROR, [details if any]**

**Explanation**

This message indicates that an internal error has occurred during initialization.

**System action**

The module encountering the error will terminate. Other product functions may continue to operate as normal.

**User response**

Contact IBM® Software Support.

**KPQH004W: INITIALIZATION WARNING, [details if any]**

**Explanation**

This message indicates that an unexpected condition has occurred during initialization.

**System action**

The module producing the warning message will continue to work. Depending on the message details, some of the functionality might be disabled.

**User response**

Depending on the message details, take the corresponding action or contact IBM® Software Support.

**KPQH005I: [module\_name]: HISTORY TASK [task\_name] DETACHED****Explanation**

The PDS V2 agent subtask has been detached.

**System action**

None.

**User response**

This behavior is normal during agent termination. If it occurs at other times, contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVL0G.

**KPQH006I: MODULE TERMINATED****Explanation**

The history module [module\_name] has terminated.

**System action**

None.

**User response**

No action is required.

**KPQH007W: INDICES HAVE NOT BEEN RE-BUILT FROM DISK, RC = [return code]****Explanation**

The existing historical data has not been indexed successfully.

**System action**

The module encountering the error will continue to work. Some of the historical data might not be available for the application specified in the last two characters of [module\_name].

**User response**

Contact IBM® Software Support.

**KPQH008E: EXECUTION ERROR, [details if any]****Explanation**

This message indicates that an internal error has occurred during execution.

**System action**

The module encountering the error will continue to work. Depending on the message details, some of the functionality might not be available for the application specified in the last two characters of [module\_name].

**User response**

Contact IBM® Software Support.

## **KPQH008W: EXECUTION WARNING, *[details if any]***

### **Explanation**

This message indicates that an unexpected condition has occurred during execution.

### **System action**

The module producing the warning message will continue to work. Depending on the message details, some of the functionality might not be available for the application specified in the last two characters of *[module\_name]*.

### **User response**

Depending on the message details, take the corresponding action or contact IBM® Software Support.

## **KPQH009I: *[module\_name]*: *[parameter]* - *[details]***

### **Explanation**

This message provides diagnostic information related to a previous message.

### **System action**

None.

### **User response**

Provide diagnostic information if contacting IBM® Software Support.

## **KPQH010I: *[module\_name]*: *[recovery\_information]***

### **Explanation**

This message provides diagnostic information related to a previous ABEND.

### **System action**

None.

### **User response**

Provide diagnostic information to IBM® Software Support.

## **KPQH011E: *[module\_name]*: I/O FAILED, *[details]***

### **Explanation**

An I/O error occurred.

### **System action**

The system action that occurs varies. Some near-term history may be lost.

### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVL0G.

## **KPQH012I: *[module\_name]*: *[IDCAMS\_output]***

### **Explanation**

This message provides IDCAMS output related to a previous message.

### **System action**

None.

**User response**

Provide diagnostic information to IBM® Software Support.

**KPQH013W: [module\_name]: FAILED TO EXTEND A DATASET, WRITE REQUESTS WILL BE IGNORED TO [data\_set\_name]****Explanation**

PDS V2 was unable to extend the current history data set. This behavior usually indicates that the DATACLASS assigned to the history data set does not have Extent Constraint Removal.

**System action**

PDS V2 stops recording near-term history until the start of the next time period.

**User response**

Check the assigned DATACLASS and make changes. If Extent Constraint Removal is not desired, near-term history data is lost until the start of the next time period.

**KPQH014I: [number of datasets] HISTORY DATASETS EXIST, [number of datasets] DATASETS USED, PDS MIGRATION WILL [NOT] BE PERFORMED****Explanation**

The message is printed during the historical modules initialization and indicates the number of historical data sets being used. It also indicates whether the migration of the existing PDS history is going to be performed.

**System action**

None.

**User response**

No action is required.

**KPQH015I: TABLE [table\_name] HAS BEEN MIGRATED, RECORDS MIGRATED = [migrated\_record\_count], IGNORED = [ignored\_record\_count], OUTDATED = [outdated\_record\_count]****Explanation**

The message indicates information about the tables and records being migrated.

**System action**

None.

**User response**

No action is required.

**KPQH016I: KPQHSMGR: PERFORMING [OUT-OF-SPACE | SCHEDULED] DATASET SWITCH FOR *application*****Explanation**

This informational message indicates that the recording data set for the persistent data store is switching to the next available data set for the identified application. OUT-OF-SPACE indicates a space-based switch, and SCHEDULED indicates a time-based switch. The *application* is the code of the component (for example, KC5 for OMEGAMON for CICS).

**System action**

None.

**User response**

No action is required.

**KPQH017I: KPQHSMGR: SWITCH SUCCESSFUL FOR *application*, WRITING TO *data\_set\_name*****Explanation**

This informational message indicates that the recording data set for the persistent data store for the identified application has switched to the next data set successfully. The *application* is the code of the component (for example, KC5 for OMEGAMON for CICS), and the *data\_set\_name* is the active recording data set.

**System action**

None.

**User response**

No action is required.

**KPQH018E: KPQHSMGR: SWITCH FAILED FOR *application*, RC = *return\_code*****Explanation**

An attempt to switch to the next recording data set for the persistent data store failed. The *application* is the code of the component (for example, KC5 for OMEGAMON for CICS).

**System action**

Only partial data may have been written.

**User response**

Check if any storage issues are present on your system. If you cannot address the problem, contact IBM® Software Support.

**KPQH019I: KPQHSMGR: *number\_of\_data\_sets* PDSV2 DATASETS HAVE BEEN FOUND****Explanation**

This informational message provides the number of PDS V2 data sets that have been found. Typically, eight PDS V2 data sets are allocated and online at all times. Seven data sets are used for writing data, and one data set remains empty for future switches.

**System action**

None.

**User response**

No action is required.

**KPQH020I: KPQHSMGR: *data\_set\_statistics*****Explanation**

This informational message provides details about a PDS V2 data set found for a particular application when the monitoring server or monitoring agent starts up. The statistics include the data set name, status, used space and other information. Any timestamps are in GMT.

**System action**

None.

**User response**

No action is required.

**KPQH021I: KPQHSMGR: *application* PDSV2 STORE STATE: ACTIVE  
DATASETS = *data\_set\_number*****Explanation**

This informational message provides the number of PDS V2 data sets that are active for the identified application. The *application* is the code of the component (for example, KC5 for OMEGAMON for CICS). Typically, eight PDS V2 data sets are allocated and online at all times. Seven data sets are used for writing data, and one data set remains empty for future switches.

**System action**

None.

**User response**

No action is required.

**KPQH022I: KPQHSMGR: *data\_set\_LLQ*: *statistics*****Explanation**

This informational message provides details about a specific PDS V2 data set. *data\_set\_LLQ* is the low-level qualifier of the data set name. Statistics include the DD name, status, record count, used space and other information. Any timestamps are in GMT.

**System action**

None.

**User response**

No action is required.

**KPQH023W: KPQHSMGR: DATASET HAS NOT BEEN RESERVED FOR  
*application*, RC = *return\_code*, PLEASE ADDRESS POTENTIAL SPACE  
ISSUES****Explanation**

An attempt to reserve the next recording data set for the persistent data store failed.

**System action**

Recording continues using the active recording data set, but the capacity of the data store will decrease, allowing for fewer records to be stored until the issue is resolved.

**User response**

Check if any storage issues are present on your system. If you cannot address the problem, contact IBM® Software Support.

**KPQH024I: *module\_name*: MIGRATION SUCCESSFULLY COMPLETED****Explanation**

This informational message indicates that migration to PDS V2 data sets completed successfully for the application identified in module *module\_name*. The last two characters of the module name are the code of the component. For example, KPQHSTSC5 is the module collecting history for OMEGAMON for CICS.

**System action**

None.

**User response**

No action is required.

**KPQH024W: *module\_name*: MIGRATION COMPLETED WITH ERRORS****Explanation**

An attempt was made by the application identified in module *module\_name* to migrate from PDS V1 to PDS V2 but did not complete successfully. The last two characters of the module name are the code of the component. For example, KPQHSTSC5 is the module collecting history for OMEGAMON for CICS.

**System action**

Recording to the persistent data store continues but some PDS V1 data may be missing.

**User response**

Contact IBM® Software Support.

**KPQH025W: KPQHSMGR: PERFORMING UNEXPECTED OUT-OF-SPACE DATASET SWITCH FOR *application*****Explanation**

A space-based switch had to be performed on a time-based data set (ECR=YES).

**System action**

Recording continues using the next recording data set, but the capacity of the data store is decreased, resulting in fewer records being stored (less than 24 hours of data per data set) until the issue is resolved. The *application* is the code of the component (for example, KC5 for OMEGAMON for CICS).

**User response**

Check if there is enough storage for the data sets to extend on your system.

**KPQH026W: *module\_name*: INCOMPLETE HISTORICAL DATA MAY HAVE BEEN WRITTEN, WRITE RC = *return\_code*****Explanation**

An attempt to write historical data failed for the application identified in module *module\_name*.

**System action**

Only partial data may have been written.

**User response**

Check previous KPQ error or warning messages in the RKLVLLOG, and check if any storage issues are present on your system. If you cannot address the problem, contact IBM® Software Support.

**KPQH027I: KPQHSMGR: *application* PARAMETER *parameter\_name* WITH VALUE *value* HAS BEEN FOUND****Explanation**

This informational message indicates that the PDS V2 parameter with name *parameter\_name* and value *value* has been found for the identified *application*. The *application* is the code of the component (for example, KC5 for OMEGAMON for CICS).

**System action**

None.

**User response**

No action is required.

**KPQH028W: KPQHSMGR: *application* PARAMETER ERROR, *details*****Explanation**

An error has been detected while processing a PDS V2 parameter for the identified *application*. The *application* is the code of the component (for example, KC5 for OMEGAMON for CICS). The *details* text indicates the cause.

**System action**

The parameter is ignored.

**User response**

Correct the parameter value.

**KPQH029I: KPQHSMGR: *application* PARAMETERS:  
*parameters\_and\_values*****Explanation**

This informational message provides a list of the PDS V2 parameters and settings for the identified *application*. The *application* is the code of the component (for example, KC5 for OMEGAMON for CICS).

**System action**

None.

**User response**

No action is required.

**KPQH030I: KPQHSMGR: LEGACY CONFIGURATION HAS BEEN DETECTED****Explanation**

This informational message indicates that PDS V2 has not found the parameter members supplied by the PARMGEN PTF *ptf\_number* and the legacy parameter source (PDS V1) will be used.

**System action**

None.

**User response**

No action is required.

**KPQH031I: KPQHSMGR: PDS V2 IS DISABLED FOR *application*****Explanation**

This informational message indicates that PDS V2 has been disabled for the identified *application*. This situation can happen due to user action in the configuration tool (PARMGEN or Configuration Manager) or automatically if the identified *application* is not supported by PDS V2. The *application* is the code of the component (for example, KC5 for OMEGAMON for CICS).

**System action**

PDS V1 is used for the application.

**User response**

No action is required.

**KPQH032W: KPQHSMGR: BROKER MODULE *name* NOT LOADED, RC = *rc*, RSN = *rsn***

**Explanation**

The broker API module *name* could not be loaded. The return code (*rc*) and reason (*rsn*) values have the abend and reason codes from the **LOAD** system call.

**System action**

No data is sent to the broker.

**User response**

Review the JCL for the job that runs the OMEGAMON historical collection task. Check that the broker module is in the STEPLIB data sets specified by the JCL. If you cannot resolve the issue, contact IBM® Software Support.

**KPQH033W: KPQSPCMD: COMMAND IGNORED, *reason***

**Explanation**

A **MODIFY** command has been entered for the job that runs the OMEGAMON historical collection task; for example, the monitoring server job. The **MODIFY** command has been ignored. The *reason* specifies the cause of the error.

**System action**

The command is ignored.

**User response**

Enter a correct **MODIFY** command.

**KPQH034I: KPQSPCMD: COMMAND ACCEPTED, *details***

**Explanation**

A **MODIFY** command has been entered for the job that runs the OMEGAMON historical collection task; for example, the monitoring server job. The **MODIFY** command has been accepted. The *details* contain additional command response information.

**System action**

The command is accepted.

**User response**

None required.

**KPQH037I: TABLE *table* HAS BEEN CONNECTED TO PDS**

**Explanation**

The OMEGAMON® historical collection task has successfully written a record of this table to the persistent data store (PDS).

This message is written only if the table is explicitly specified in the RKANPARU (KAYOPEN) configuration member. If the member does not exist, or the member exists but does not explicitly specify the table, then the default behavior is to write records from the table to PDS without reporting this message.

This message is written only in the following situations:

- For the first instance of a record of this table since the task's configuration was loaded: either when the task's job started or when the configuration was reloaded by a **MODIFY** command while the job was running.
- After the issue that caused message [KPQH039W](#) has been fixed.

**Tip:** The frequency of incoming data is determined by the collection interval of the collection for this table. A long collection interval can mean a long delay before this message occurs.

#### System action

None.

#### User response

None required.

### KPQH038I: TABLE *table* HAS BEEN CONNECTED TO BROKER

#### Explanation

The OMEGAMON® historical collection task has successfully sent a record from this table to OMEGAMON® Data Broker.

This message is written only if the table is explicitly specified in the RKANPARU (KAYOPEN) configuration member. If the member does not exist, or the member exists but does not explicitly specify the table, then the default behavior is to write records from the table to PDS without reporting this message.

This message is written only in the following situations:

- For the first instance of a record of this table since the task's configuration was loaded: either when the task's job started or when the configuration was reloaded by a **MODIFY** command while the job was running.
- After the issue that caused message [KPQH040W](#) has been fixed.

**Tip:** The frequency of incoming data is determined by the collection interval of the collection for this table. A long collection interval can mean a long delay before this message occurs.

#### System action

None.

#### User response

None required.

### KPQH039W: PDS CONNECTION FOR TABLE *table* FAILED, *reason*

#### Explanation

The OMEGAMON® historical collection task failed to write records of this table to the persistent data store (PDS). The *reason* provides details of the cause.

This message is written only if the table is explicitly specified in the RKANPARU (KAYOPEN) configuration member. If the member does not exist, or the member exists but does not explicitly specify the table, then the default behavior is to write records from the table to PDS without reporting this message.

#### System action

Until this issue is resolved, no records of this table are written to the PDS.

#### User response

Review the provided details and take appropriate action. If you cannot resolve the issue, contact IBM® Software Support.

### KPQH040W: BROKER CONNECTION FOR TABLE *table* FAILED, *reason*

#### Explanation

The OMEGAMON® historical collection task failed to send records of this table to OMEGAMON® Data Broker. The *reason* provides details of the cause.

This message is written only if the table is explicitly specified in the RKANPARU (KAYOPEN) configuration member. If the member does not exist, or the member exists but does not explicitly specify the table, then the default behavior is to write records from the table to PDS without reporting this message.

### System action

Until this issue is resolved, no records of this table are sent to OMEGAMON® Data Broker.

### User response

Review the provided details and take appropriate action.  
*reason* values and suggested actions:

#### STORE NOT FOUND

Ensure that the OMEGAMON store is defined in the OMEGAMON® Data Broker configuration member.

#### BROKER HAS NO CONNECTION TO SINK

Ensure that OMEGAMON® Data Broker is connected to OMEGAMON® Data Connect.

#### BROKER OFFLINE

Ensure that the OMEGAMON® Data Broker name is correct in the collection configuration member.  
Ensure that the Zowe™ cross-memory server that hosts OMEGAMON® Data Broker is running.

#### RC = *rc*, RSN = *rsn*

Contact IBM® Software Support.

If you cannot resolve the issue, contact IBM® Software Support.

## KPQH041E: *task*: CONFIG NOT LOADED, HISTORY/OPEN DATA PROCESSING IS STOPPED

### Explanation

There are issues with the OMEGAMON® historical collection task configuration member, *rte\_hilev.rte\_name*.RKANPARU (KAYOPEN), for the application identified by *task*. The *task* is the name of the task in which the error originated, in the format KPQHST*pp*, where *pp* is the product code.

### System action

Until the issue is resolved, processing of records from the application (*pp*) stops. No records of tables from this application are sent to OMEGAMON® Data Broker or written to PDS.

### User response

Review the issues reported in previous error messages. If you cannot resolve these issues, contact IBM® Software Support.

## KPQH042W: *task*: CONFIG NOT LOADED, EXISTING CONFIG WILL BE USED

### Explanation

A **MODIFY** command has been entered for the job that runs the OMEGAMON historical collection task, to reload the configuration. However, the new configuration is ignored. Processing of historical data and/or streaming continues the same as before the **RELOAD\_CONFIG** command was issued; the new parameters are ignored. The *task* is the name of the task in which the error originated, in the format KPQHST*pp*, where *pp* is the product code.

### System action

The new configuration is ignored. Processing of historical data and streaming continues the same as before for the application identified by *task* until the issue has been resolved.

### User response

Address the issues reported in previous error messages. If you cannot resolve this issue, contact IBM® Software Support.

## **KPQH043I: KPQHSMGR: DATASTORE INFORMATION: *details***

### **Explanation**

In response to the QUERY DATASTORE command, this informational message provides details about the data sets allocated to the data store for a particular application. Details include the data set name, the application code, the number of allocated bytes, the number of used bytes, and the status of the data set.

### **System action**

None.

### **User response**

No action is required.

## **KPQH044I: KPQSPINI: TCB=*tcb\_address*, FSA=*fsa\_address*, DSA=*dsa\_address*, RC=*return\_code***

### **Explanation**

This informational message is issued during the historical module initialization. It indicates a successful completion of one of the initialization steps and provides technical details about this step.

### **System action**

None.

### **User response**

No action is required.

## **KPQH045I: *module name*: PDS V1 IS DISABLED, PDS MIGRATION FOR APPLICATION *application-name* WILL NOT BE PERFORMED**

### **Explanation**

PDS V2 is enabled for application *application-name*. PDS V1 near-term history files exist for this application, but PDS V2 files do not exist yet. This situation normally triggers the migration process of PDS V1 files to PDS V2. However, the monitoring server or monitoring agent is configured with PDS V1 disabled, so the PDS V1 environment is not initialized, and the migration cannot be performed.

### **System action**

The PDS migration process for the application will not be performed. Empty PDS V2 application files will be created, but the application data from PDS V1 will not be migrated. History data collection for the application will begin in PDS V2. If the *application-name* in the message is KPD, Tivoli Data Warehouse (TDW) export configuration data stored in PDS V1 will be lost, which may cause a spike in CPU usage the next time history data is exported to TDW.

### **User response**

No action is required.

## **KPQM0001W: U\$USM000: FAILURE TO OBTAIN WORKAREA**

### **Explanation**

The PDS V2 Media Manager interface could not obtain storage for a work area.

### **System action**

The PDS V2 Media Manager interface signals IBM Media Manager to attempt to obtain storage.

### **User response**

If this message occurs frequently, contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQM0002W: U\$USM000: ROUTING TABLE AT MAXIMUM**

### **Explanation**

A PDS V2 Media Manager interface routing table is full.

### **System action**

OMEGAMON continues; however, some near-term history may be lost.

### **User response**

If this message occurs frequently, contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQM0003E: U\$USM000: IEAN4RT FAILURE, RETURN CODE: *retcode***

### **Explanation**

A name or token could not be established.

### **System action**

PDS V2 terminates.

### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQM0004E: U\$USM000: IARST64 FAILURE, RETURN CODE: *retcode*, REASON CODE *rsn***

### **Explanation**

64-bit storage could not be obtained.

### **System action**

PDS V2 terminates.

### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQM0005E: U\$USM000: STORAGE OBTAIN FAILURE FOR *n* BYTES, RETURN CODE: *retcode***

### **Explanation**

31-bit storage could not be obtained.

### **System action**

PDS V2 terminates.

### **User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVLLOG.

## **KPQM0006W: U\$USM000: FAILURE TO OBTAIN WORKAREA**

### **Explanation**

An internal work area could not be obtained.

**System action**

OMEGAMON continues; however, some near-term history may be lost.

**User response**

If this message occurs frequently, contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVL0G.

**KPQM0007I: R\$RM0000: DISCONNECT SUCCESSFUL****Explanation**

IBM Media Manager was disconnected successfully.

**System action**

None.

**User response**

No action is required.

**KPQM0008E: R\$RM0000: DISCONNECT UPDATE FAILED WITH RETURN CODE: *retcode*, FEEDBACK: *feedback*****Explanation**

An attempt to disconnect IBM Media Manager during an update operation was not successful.

**System action**

PDS V2 terminates.

**User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVL0G.

**KPQM0009E: R\$RM0000: DISCONNECT WITHOUT UPDATE FAILED WITH RETURN CODE: *retcode*, FEEDBACK: *feedback*****Explanation**

An attempt to disconnect IBM Media Manager during a non-update operation was not successful.

**System action**

PDS V2 terminates.

**User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVL0G.

**KPQS031E: [*module\_name*] ESTAEX macro request rc = [*return\_code*]****Explanation**

The ESTEAX macro returned with a return code of [*return\_code*].

**User response**

Contact IBM® Software Support. This problem information is stored in the ITMS:Engine log, RKLVL0G.

## **KPQS216I: KPQSPDSH: RKANPARU MEMBER [*member name*] NOT FOUND**

### **Explanation**

The specified application member has not been found in RKANPARU.

### **System action**

The historical data will not be collected for the corresponding application as this application has not been installed yet.

### **User response**

No action is required.

## **KPQS217I: KPQSPDSH: PDS V2 HISTORY INITIALIZED**

### **Explanation**

The PDS V2 history has been successfully initialized.

### **System action**

None.

### **User response**

No action is required.

## **KPQS218E: INVALID Z/OS LEVEL**

### **Explanation**

An incompatible z/OS® version has been found.

### **System action**

The module encountering the error will terminate. The historical data will be collected by using PDS V1.

### **User response**

Use z/OS® 2.2 with APAR OA50569 or later.

## **KPQS219E: KPQSPDSH: CANNOT LOAD KPDCSVG RC = [*return\_code*] REASON CODE = [*reason\_code*]**

### **Explanation**

Persistent data store module KPDCSVG cannot be found.

### **System action**

Processing terminates.

### **User response**

Contact IBM® Software Support.

## **KPQS221E: UNABLE TO OBTAIN [*number of bytes*] BYTES OF SUBPOOL 254 STORAGE**

### **Explanation**

This message indicates that an internal error has occurred.

**System action**

The module encountering the error will terminate. The historical data will be collected by using PDS V1.

**User response**

Contact IBM® Software Support.

**KPQS222E: INPUT MODE NOT SUPPLIED, USING NORMAL HISTORY****Explanation**

This message indicates that an internal error has occurred.

**System action**

The module encountering the error will terminate. The historical data will be collected by using PDS V1.

**User response**

Contact IBM® Software Support.

**KPQS223E: INTERNAL ERROR, TABLE MISMATCH****Explanation**

This message indicates that an internal error has occurred.

**System action**

The module encountering the error will terminate. The historical data will be collected by using PDS V1.

**User response**

Contact IBM® Software Support.

**KPQS224E: METAL C LOAD FAILURE, ROUTINE: [*routine name*], RETURN CODE = [*return code value*]****Explanation**

This message indicates that an internal error has occurred.

**System action**

The module encountering the error will terminate. The historical data will be collected by using PDS V1.

**User response**

Contact IBM® Software Support.

**KPQS225E: ATTEMPT TO INTERCEPT HISTORY ROUTINE FAILED****Explanation**

This message indicates that an internal error has occurred.

**System action**

The module encountering the error will terminate. The historical data will be collected by using PDS V1.

**User response**

Contact IBM® Software Support.

## **KPQS226E: UNABLE TO OBTAIN RTE DATASET NAME**

### **Explanation**

This message indicates that an internal error has occurred.

### **System action**

The module encountering the error will terminate. The historical data will be collected by using PDS V1.

### **User response**

Contact IBM® Software Support.

## **KPQS227E: X\$INSSET EYECATCHER MISMATCH AT [address]**

### **Explanation**

This message indicates that an internal error has occurred during an insert setup call.

### **System action**

The corresponding call will be ignored. Some historical data might be missing.

### **User response**

Contact IBM® Software Support.

## **KPQS228E: X\$INSPRO EYECATCHER MISMATCH AT [address]**

### **Explanation**

This message indicates that an internal error has occurred during an insert process call.

### **System action**

The corresponding call will be ignored. Some historical data might be missing.

### **User response**

Contact IBM® Software Support.

## **KPQS229E: X\$INSEND EYECATCHER MISMATCH AT [address]**

### **Explanation**

This message indicates that an internal error has occurred during an insert tear down call.

### **System action**

The corresponding call will be ignored. Some historical data might be missing.

### **User response**

Contact IBM® Software Support.

## **KPQS230E: X\$LOCSET EYECATCHER MISMATCH AT [address]**

### **Explanation**

This message indicates that an internal error has occurred during a locate setup call.

### **System action**

The corresponding call will be ignored. Some historical data might be missing.

### **User response**

Contact IBM® Software Support.

## **KPQS231E: X\$LOCPRO EYECATCHER MISMATCH AT [address]**

### **Explanation**

This message indicates that an internal error has occurred during a locate process call.

### **System action**

The corresponding call will be ignored. Some historical data might be missing.

### **User response**

Contact IBM® Software Support.

## **KPQS232E: X\$LOCEND EYECATCHER MISMATCH AT [address]**

### **Explanation**

This message indicates that an internal error has occurred during a locate tear down call.

### **System action**

The corresponding call will be ignored. Some historical data might be missing.

### **User response**

Contact IBM® Software Support.

## **KPQS233E: X\$TCSFND EYECATCHER MISMATCH AT [address]**

### **Explanation**

This message indicates that an internal error has occurred during a find TCS call.

### **System action**

The corresponding call will be ignored. Some historical data might be missing.

### **User response**

Contact IBM® Software Support.

## **KPQS234E: X\$CMTTAB EYECATCHER MISMATCH AT [address]**

### **Explanation**

This message indicates that an internal error has occurred during a commit table call.

### **System action**

The corresponding call will be ignored. Some historical data might be missing.

### **User response**

Contact IBM® Software Support.

## **KPQS235E: UNABLE TO OBTAIN PDS VECTOR**

### **Explanation**

This message indicates that an internal error has occurred. A possible cause is an incorrect configuration or an improper manual modification of RKANPARU (KPQHINIT).

### **System action**

The module encountering the error will terminate. The historical data will be collected by using PDS V1.

**User response**

Contact IBM® Software Support.

**KPQS236E: KPQSPDSH: [PUBLIC | PRIVATE] PDS V1 *function-name* CALL HAS OCCURRED BUT PDS V1 IS DISABLED****Explanation**

A call has occurred to PDS V1 function *function-name*, but the monitoring server or monitoring agent is running with PDS V1 disabled. Most likely this happened due to a user error (such as issuing a PDS V1 command when PDS V1 is disabled) or a monitoring server or monitoring agent misconfiguration.

**System action**

Processing continues. The PDS V1 request is ignored.

**User response**

Contact IBM® Software Support. This problem information is stored in the TMS:Engine log, RKLVLOG.

**KPQS237I: KPQHINIT: PDS V2 IS RUNNING STAND-ALONE, PDS V1 IS DISABLED****Explanation**

During PDS V2 startup, the program discovered that the monitoring server or the monitoring agent is configured to run with PDS V1 disabled.

**System action**

Processing continues. The PDS V1 environment will not be initialized, and PDS V1 data sets will not be used.

**User response**

No action is required. Optionally, PDS V1 data sets can be deleted.

**KPQS238E: KPQSPDSH: UNABLE TO OBTAIN KPD TOKEN****Explanation**

An internal error has occurred.

**System action**

The module encountering the error terminates. PDS V2 is not able to collect historical data.

**User response**

Contact IBM® Software Support.

**KRAO messages**

The messages that begin with the KRAO prefix are associated with monitoring agents.

**KRAOP001: AGENT FRAMEWORK NOT INITIALIZED.****Explanation**

Agent can not be started because agent framework is not initialized yet. Could be recoverable error that can be ignored or could be fatal depending on how agent loader handles this condition.

## **KRAOP002: NULL COMMAND INVALID.**

### **Explanation**

Check if an invalid command was issued by the user.

## **KRAOP003: AGENT *module\_name* NOT INSTALLED.**

### **Explanation**

An installation failure occurred. Reinstall the agent.

## **KRAOP004: AGENT *module\_name* ALREADY STARTED.**

### **Explanation**

Only one instance of the agent can be running at a time. This is an informational message, and can be ignored.

## **KRAOP005: AGENT *module\_name* NOT ACTIVE.**

### **Explanation**

Contact IBM Software Support.

## **KRAOP006: AGENT ID INVALID *nnnn*.**

### **Explanation**

Contact IBM Software Support.

## **KRAOP007: COMMAND SCHEDULED FOR *module\_name*.**

### **Explanation**

This is an informational message. The command is scheduled to run.

## **KSC messages**

The messages that begin with the KSC prefix are associated with SMF errors reported by the auditing function when running on a z/OS-based Tivoli Enterprise Monitoring Server.

### **Message number**

**KSDIN002I: CHILD *child* PARENT *parent*****Explanation**

This is the specified child and parent.

**System action**

None.

**User response**

None.

**Message Type**

Information.

**KSDRM002E: Receive failed RC = 24 Sense = 0****Explanation**

ERROR PROCESSING AN SDM FUNCTION IN DIALOG KONSDME - APPL(CTDMVSD) SESSION(VTMD) FUNCTION(SDMMLTEM) STATUS\_ITEM(SDMHNDL) RC(40)

**System action**

None.

**User response**

Review the z/OS® Communication Server SNA Messages and Codes to interpret the nature of the problem. Review the message fields that identify the Omegaview Session, and the VTAM® ApplID("APPL") to identify the VTAM® session that is experiencing problems. In general, this may be caused by any of the following:

- Incorrect OMEGAVIEW® Session parameter specification.
- VTAM® Communication disruptions (hardware or network outages).
- OMII Monitor Address Space termination.
- Incorrect VTAM® LOGMODE Table entries.

**Message Type**

Internal error.

**KSDRM003E: Send failed RC 4 Sense 0****Explanation**

ERROR PROCESSING AN SDM FUNCTION IN DIALOG KONSDME - APPL(CTDMVSD) SESSION(VTMD) FUNCTION(SDMMLTEM) STATUS\_ITEM(SDMHNDL) RC(40)

**System action**

None.

**User response**

Review the z/OS® Communication Server SNA Messages and Codes to interpret the nature of the problem. Review the message fields that identify the Omegaview Session, and the VTAM® AppID("APPL") to identify the VTAM® session that is experiencing problems. **KSDXA007E: KSD\_DELXATTR() ERROR RC= *return\_code*****Explanation**

Error encountering when deleting attribute of item.

**System action**

Request terminated.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KSDXA008E: INVALID RULE COLUMN NAME, RC= *return\_code*****Explanation**

Problem when specifying rule of specific roll-up item.

**System action**

Item not matched.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**KSDXA009E: ERROR IN RULE TEXT, RC= *return\_code*****Explanation**

Problem when specifying rule of specific roll-up item.

**System action**

Item not matched.

**User response**

Contact IBM® Software Support.

**Message Type**

Internal error.

**LSC messages**

There is only one LCS message and it is associated with Classic OMEGAMON®.

**LSCXn: (message text varies)****Explanation**

SAS/C generates messages that have LSCX prefixes.

**System action**

None.

**User response**

Contact IBM Software Support.

**OB messages**

The messages that begin with the OB prefix are associated with the OMEGAMON® Base component.

**OB0101: INVALID FIELD DETECTED, INPUT IGNORED****Explanation**

The cursor was placed on a field which the command processor determined to be invalid.

**System action**

Processing continues as determined by the particular command.

**User response**

Make corrections as determined by the particular command.

**OB0104: .MFY ONLY WORKS IN DEDICATED MODE****Explanation**

The OMEGAMON session is not in the proper mode. The .MFY command only works in dedicated mode.

**System action**

The command terminates.

**User response**

Restart OMEGAMON in dedicated mode, or do not attempt to execute this command.

**OB0106: *keyword* KEYWORD VALUE *cc* INVALID****Explanation**

The color or highlighting value entered for the specified keyword is not valid. When Display=BASIC, valid keyword values are HI and LO. When Display=COLOR, valid keyword values are any of the seven color names available on terminals that support the extended data stream.

**System action**

Command execution terminates.

**User response**

Correct the appropriate keyword value and retry.

**OB0107: MAJOR NOT FOUND****Explanation**

The major command name supplied during a help request was not found.

**System action**

Command execution terminates.

**User response**

Correct the major command name and re-enter it.

**OB0108: COMMAND IS NOT A MINOR OF THIS MAJOR****Explanation**

The major command name supplied during a help request exists, but the minor supplied is not valid for this major.

**System action**

Command execution terminates.

**User response**

Correct the minor command name and re-enter.

**OB0109: MAXIMUM MESSAGE LENGTH IS 60 CHARACTERS****Explanation**

An attempt has been made to specify an XTXT message greater than 60 characters.

**System action**

The command terminates.

**User response**

Respecify the message using less than 60 characters.

## **OB0110: INVALID .VAR OPTION - cccccc**

### **Explanation**

The option cccccc is unknown to the .VAR command.

### **System action**

Command execution terminates.

### **User response**

Correct the option and retry the command.

## **OB0111: INVALID VARIABLE NAME - cccccc**

### **Explanation**

The name cccccc contains invalid characters.

### **System action**

Command execution terminates.

### **User response**

Correct the name and retry the command.

## **OB0112: VARIABLE NAME TOO LONG**

### **Explanation**

Name exceeds 8 characters.

### **System action**

Command execution terminates.

### **User response**

Correct the name and retry the command.

## **OB0113: STRING TOO LONG**

### **Explanation**

The length of the replacement string set with .VAR can be no larger than 64 characters.

### **System action**

The string is not installed.

### **User response**

Supply a shorter string and retry the command.

## **OB0114: VARIABLE cccccc HAS BEEN SET**

### **Explanation**

The requested variable cccccc has been updated in the table.

### **System action**

The command executes successfully.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0115: VARIABLE NAME NOT FOUND IN TABLE****Explanation**

The requested name could not be located.

**System action**

The command terminates.

**User response**

Correct the command and retry. To see a list of the values in the table, issue the .VAR command.

**OB0116: VARIABLE TABLE IS EMPTY****Explanation**

The user attempted to list variables with the .VAR command, however there were no variables in the table.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0117: NO ENTRIES FOUND ON STACK****Explanation**

The .DSE command determined that no stack entries exist.

**System action**

The .DSE command terminates normally and waits for the next user request.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0119: VARIABLE NAME IS RESERVED, CANNOT BE SET****Explanation**

The variable name on a .VAR SET operation is reserved. Either the full name as entered is reserved, or the format is reserved. For example, the exception analysis format (ZX....) is reserved.

**System action**

OMEGAMON suppresses the .VAR SET function.

**User response**

Change the variable name to a valid name and re-enter the command.

## **OB0120: CANNOT LOCATE PREVIOUS MAJOR COMMAND**

### **Explanation**

OMEGAMON could not locate the major command associated with this minor command.

### **System action**

OMEGAMON does not execute the minor command.

### **User response**

Enter the minor command after a major command and retry.

## **OB0121: NO WAIT INDICATED**

### **Explanation**

The .WAT command requires a numeric argument. No numeric argument was supplied.

### **System action**

Command execution terminates.

### **User response**

Re-enter the command, specifying a wait value.

## **OB0122: *nn* SECOND WAIT COMPLETED**

### **Explanation**

OMEGAMON completed the requested wait.

### **System action**

Command execution completes normally.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB0123: NO MINOR COMMAND NAME GIVEN**

### **Explanation**

This command expects you to supply a minor command name as an argument.

### **System action**

The command terminates.

### **User response**

Enter a valid minor name.

## **OB0124: MINOR COMMAND NAME TOO LONG**

### **Explanation**

The user entered a minor command name longer than 4 characters.

**System action**

The command terminates.

**User response**

Correct the entry and retry.

**OB0125: NO MAJOR COMMAND HAS A MINOR WITH THIS NAME****Explanation**

The user entered an invalid minor command name.

**System action**

The command terminates.

**User response**

Enter a different minor command.

**OB0126: STATUS MODE *ccc*****Explanation**

Status mode has been turned ON or OFF.

**System action**

The command executes.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0127: INVALID LENGTH FOR KEYWORD - *cccccccc*****Explanation**

A keyword that is too long has been entered. The value *cccccccc* is the first 8 characters of the keyword specified with the invalid length. The maximum length for a conditional keyword is 8; the maximum length for a relational keyword is 2 characters.

**System action**

The screen is not fetched.

**User response**

Correct the keyword and re-enter it.

**OB0128: INVALID RELATIONAL KEYWORD****Explanation**

An invalid relational keyword has been entered. Valid relational keywords are EQ, LT, LE, NE, GT, GE, and the equal (=) sign.

**System action**

The screen is not fetched.

**User response**

Correct the keyword and re-enter it.

**OB0129: INVALID CONDITIONAL SYNTAX****Explanation**

An invalid conditional syntax has been entered. The valid syntax is:

```
condition relation condition
```

**System action**

The screen is not fetched.

**User response**

Correct the keyword and re-enter.

**OB0130: DEFINITION MODE {ENABLED|HELD|DISABLED}****Explanation**

OMEGAMON set definition mode to ENABLED, HELD, or DISABLED.

**System action**

The command completes processing.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0131: DELETE FAILED - ccccccc NOT FOUND IN PROCSAVE****Explanation**

Member ccccccc, the member to delete, was not found.

**System action**

The command terminates.

**User response**

Correct the name and retry the command. You can issue the SCRN command to display a list of screens in RKOMPCSV. You cannot use DELT to delete screens from the KOBICCSOMPROC data set.

**OB0132: DIRECTORY UPDATE FAILED, CODE = xx****Explanation**

An attempt to modify the RKOMPCSV directory failed; the return code (from STOW) is xx. The explanation of the return code is found in the IBM® *MVS™ Data Administration Macro Instruction Reference* manual (STOW macro).

**System action**

The command terminates.

**User response**

Examine the return code and take appropriate action.

### **OB0133: ENTER MEMBER NAME TO BE DELETED**

#### **Explanation**

The DELT command requires a member name. No member name was found.

#### **System action**

The command terminates.

#### **User response**

Enter a member name and retry the command.

### **OB0134: MEMBER NAME LENGTH GREATER THAN 8 BYTES**

#### **Explanation**

The member name exceeds the maximum length of 8 bytes.

#### **System action**

The command terminates.

#### **User response**

Correct the member name and retry the command.

### **OB0135: PROCSAVE MEMBERNAME *ccccccc* CHANGED TO *aaaaaaaa***

#### **Explanation**

The requested name change was made.

#### **System action**

The command terminates normally.

#### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **OB0136: PROCSAVE MEMBERNAME *ccccccc* DELETED**

#### **Explanation**

The named member was deleted.

#### **System action**

The command completes.

#### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **OB0137: RENAME FAILED - *ccccccc* ALREADY EXISTS IN PROCSAVE**

#### **Explanation**

The screen space name already exists in the RKOMPCSV data set.

**System action**

The rename process terminates.

**User response**

Either delete or rename the member in RKOMPCSV, or specify another name and retry.

**OB0138: RENAME FAILED - ccccccc NOT FOUND IN PROCSAVE****Explanation**

The member to be renamed is not in the RKOMPCSV data set.

**System action**

OMEGAMON terminates the command.

**User response**

You can issue the SCRN command to list screens. Correct the name and retry the command.

**OB0139: RENAME FAILED - PROCSAVE DIRECTORY FULL****Explanation**

An attempt to update the directory failed.

**System action**

OMEGAMON terminates the command.

**User response**

Increase the size of the directory or delete members, then retry the command.

**OB0140: DIR ABORT NOT ALLOWED FROM DIRECTOR SESSION****Explanation**

The ABORT function can only be performed from a collector.

**System action**

OMEGAMON terminates the command.

**User response**

If you want to abort the collector, enter the command in the collector segment and retry.

**OB0141: NO SYSTEM ID SPECIFIED. NO LINES TRANSFERRED.****Explanation**

The /GIVE command requires a target collector.

**System action**

OMEGAMON terminates the command.

**User response**

Add the required collector ID and retry.

## **OB0142: SAME SESSION SPECIFIED. NO LINES TRANSFERRED**

### **Explanation**

The target and source for /GIVE are the same.

### **System action**

OMEGAMON terminates the command.

### **User response**

Specify the correct collector ID and retry.

## **OB0143: SESSION NOT FOUND. NO LINES TRANSFERRED**

### **Explanation**

The target ID is not an active session.

### **System action**

OMEGAMON terminates the command.

### **User response**

Specify the correct collector ID and retry.

## **OB0144: PROCSAVE DATA SET CONCATENATED, UPDATE REQUESTS IGNORED**

### **Explanation**

The RKOMPCSV data set cannot be concatenated. Use KOBICSPROC to concatenate data sets for updating screen spaces.

### **System action**

The command terminates.

### **User response**

Correct the starting PROC or JCL, and restart OMEGAMON.

## **OB0145: ENTER FROM AND TO MEMBER NAMES FOR RENAME REQUEST**

### **Explanation**

The user did not specify the old and new names required for the RENM command.

### **System action**

OMEGAMON terminates the command.

### **User response**

Supply the required parameters and retry the command.

## **OB0146: {1st|2nd} MEMBER NAME IS INVALID**

### **Explanation**

The indicated name (from or to) is invalid for OMEGAMON.

**System action**

OMEGAMON terminates the command.

**User response**

Correct the indicated name and retry the command.

**OB0147: SCREEN SPACE NAME MISSING****Explanation**

No screen space name was supplied, or an undefined variable was used. This message usually occurs with the .SGO command.

**System action**

OMEGAMON terminates the command.

**User response**

Enter a valid screen space name or variable and retry the command.

**OB0150: DUPLICATE NAME****Explanation**

The command synonym already exists.

**System action**

OMEGAMON® cancels the request.

**User response**

Specify a unique name and retry.

**OB0151: LOG RESET REQUIRED. USE .LOGOUT****Explanation**

Issue the .LOGOUT command to activate the changes made to the log file.

**System action**

The command continues.

**User response**

Reset the LOG as indicated.

**OB0152: SYNONYM NAME NOT SPECIFIED****Explanation**

A name is required for this function.

**System action**

OMEGAMON® ignores the request.

**User response**

Reissue the command and specify a synonym name.

## **OB0153: SYNONYM VALUE NOT SPECIFIED**

### **Explanation**

You must supply an OMEGAMON® command name for the synonym to represent.

### **System action**

OMEGAMON® terminates the request.

### **User response**

Supply a value for the synonym.

## **OB0154: UNKNOWN REQUEST**

### **Explanation**

An invalid function was specified.

### **System action**

OMEGAMON® terminates the request.

### **User response**

Specify a valid function (for example, ADD, DELETE).

## **OB0155: THIS COMMAND WORKS IN TSO MODE ONLY**

### **Explanation**

The command is reserved for use in the TSO environment.

### **System action**

OMEGAMON terminates the command.

### **User response**

Execute this command only in a TSO environment.

## **OB0156: VALID ONLY IN DIRECTOR OR COLLECTOR MODE**

### **Explanation**

The .DIR command allows execution of director or collector commands from within a screen space. It only works in director or collector mode.

### **System action**

The command does not execute.

### **User response**

Execute this command only in a cross memory or cross system environment.

## **OB0160: .FGO LOOP DETECT HAS BEEN RESET**

### **Explanation**

OMEGAMON processed the RESET=YES parameter of the .FGO command which reset the loop detect function.

**System action**

OMEGAMON execution continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0161: SCREEN SPACE FETCH {DELAYED|PENDING}****Explanation**

The screen space processor suspends processing (delayed) until the count in the label field reaches 0. The screen space is scheduled for fetch (pending).

**System action**

OMEGAMON execution continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0162: SCREEN SPACE NOT FETCHED****Explanation**

The screen space was not fetched because the specified condition was not met.

**System action**

OMEGAMON execution continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0163: NOT A VALID KEYWORD****Explanation**

Conditional screen space fetch processing detected a keyword not contained in its tables.

**System action**

The command terminates.

**User response**

Correct the keyword and retry the command.

**OB0164: .FGO LOOP DETECT, NO FAST GO****Explanation**

There are too many .FGOs in a row (64) without an intervening display. .FGO assumes that OMEGAMON is in a loop.

**System action**

OMEGAMON disables the .FGO function and changes it to .SGO.

**User response**

Correct the screen space loop and reset the .FGO command.

**OB0165: .FGO LOOP DETECT SWITCH SET****Explanation**

OMEGAMON processed the TEST=YES parameter of the .FGO command which set the loop detect function.

**System action**

OMEGAMON execution continues. OMEGAMON continues to treat .FGO as .SGO until you reissue the .FGO command with the RESET=YES keyword.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0170: *n* OF *m* MINOR COMMANDS GENERATED FOR *cccc*****Explanation**

The user issued the .EXM immediate command with parameters. The variable *m* is the total number of minor commands associated with major command *cccc* and the variable *n* is the number of minors that .EXM displays for this request.

**System action**

Command execution continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0171: NO MINOR COMMANDS AVAILABLE****Explanation**

The user issued the .EXM immediate command with parameters. However, there are no minors associated with this major command.

**System action**

The command executes.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0172: CONDITIONAL TEST FAILED - VARIABLE NOT SET****Explanation**

The condition set with the .VAR immediate command tested not true.

**System action**

OMEGAMON does not set the variable.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0201: INVALID COMMAND OPTION SPECIFIED****Explanation**

An incorrect option was specified for the /DEF command. The valid options are ON and OFF.

**System action**

The command terminates.

**User response**

Correct the error and retry.

**OB0202: MEMBER NAME TOO LONG****Explanation**

The member name exceeds 8 characters.

**System action**

The command terminates.

**User response**

Correct the name and retry.

**OB0203: MEMBER ALREADY EXISTS, TO REPLACE, USE /REP****Explanation**

The user attempted to save a screen space with the /SAVE command, but a member with the same name already exists.

**System action**

The command terminates.

**User response**

Use the /REP command or enter a new name and retry.

**OB0204: MEMBER NOT FOUND - USE /SAVE****Explanation**

A replace was attempted but no corresponding member was found in the data set.

**System action**

The command terminates.

**User response**

Correct the name or use the /SAVE command.

## **OB0205: KOBICSPROC DD MISSING**

### **Explanation**

OMEGAMON could not find the KOBICSPROC DD statement and could not open the file.

### **System action**

The command terminates.

### **User response**

Allocate the proper file and restart OMEGAMON.

## **OB0206: PDS IS BUSY (ENQUEUE FAILED)**

### **Explanation**

An attempt to access the data set failed because it was in use by another job.

### **System action**

The command terminates.

### **User response**

Wait a few moments and retry the command.

## **OB0207: NO SPACE IN DIRECTORY**

### **Explanation**

The directory is full. There is no room to add additional members.

### **System action**

The command terminates.

### **User response**

Increase the size of the directory and restart OMEGAMON, use an existing name, or delete entries.

## **OB0208: I/O ERROR**

### **Explanation**

An I/O error has occurred. See other accompanying messages.

### **System action**

The command terminates.

### **User response**

This is a generic message. Examine the specific error messages and take appropriate action.

## **OB0209: PROGRAM ERROR, CONTACT IBM® CORP**

### **Explanation**

An internal error has occurred.

### **System action**

The command terminates.

**User response**

Contact IBM Software Support.

**OB0210: NO PFKS SAVED BECAUSE NONE MODIFIED****Explanation**

No PF keys were modified, so OMEGAMON did not save them in the KOBICSPROC file.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0211: /PWD SUPPRESSED BY SECURITY****Explanation**

The user security verification routine has permanently assigned a security level. This command is therefore disabled.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0212: LOGGED****Explanation**

The screen space was logged to the report data set.

**System action**

The command continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0213: REPORT FILE NOT AVAILABLE****Explanation**

The allocation of a report file has failed.

**System action**

The command terminates.

**User response**

Check the minors of the OUP major command: DDNM, DEST, DSTU, and FORM.

## **OB0214: INVALID ARGUMENT**

### **Explanation**

An operand was found which was not valid for the specified command.

### **System action**

The command terminates.

### **User response**

See the help entry for the specified command to determine the correct operands. Correct the operand and retry.

## **OB0215: VTAM® MINIMUM WAIT IS 5 SECONDS**

### **Explanation**

An attempt was made to set the automatic update interval at less than 5 seconds in VTAM® auto update mode.

### **System action**

The request is denied. An interval of less than 5 seconds is invalid in this mode.

### **User response**

Set a valid time and retry.

## **OB0219: COLLECTOR ATTACHED**

### **Explanation**

The requested collector is attached to this director.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB0220: MEMBER NAME IS INVALID**

### **Explanation**

The name is specified incorrectly; it must begin with an alphanational character.

### **System action**

The command terminates.

### **User response**

Correct the name and retry.

## **OB0221: RKOMPCSV DD STATEMENT MISSING**

### **Explanation**

A DD statement that allocates a user PROCFILE library was not present in the JCL. Therefore, the screen space cannot be saved or replaced.

**System action**

OMEGAMON does not make the screen space available to the user.

**User response**

Supply a DD statement that points to a PROCFILE library.

**OB0222: ARGUMENT NOT ALLOWED ON /RETURN****Explanation**

The /RETURN command (alias /R) does not allow an argument. /R is often mistaken as an alias for /REP, which does allow an argument.

**System action**

OMEGAMON ignores the command.

**User response**

Correct the command and retry.

**OB0223: INVALID STACK ENTRY NUMBER****Explanation**

OMEGAMON attempted to recall an invalid stack entry. A valid stack entry number is greater than 0 but less than the number of entries in the stack.

**System action**

OMEGAMON ignores the command.

**User response**

Correct the stack entry number. Use the .DSE command to display the entries on the stack.

**OB0224: REQUIRED MEMORY FOR ccc NOT AVAILABLE****Explanation**

OMEGAMON is unable to allocate storage for the stack work area, where ccc is either SIA or SIB.

**System action**

The /STK command terminates normally and waits for the next user request.

**User response**

Increase the region size.

**OB0225: ccccccc STACKED****Explanation**

The /STK command successfully placed screen space ccccccc on the stack. This message appears on the INFO-line.

**System action**

The /STK command terminates and waits for the next user request.

**User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations. Enter the next command.

**OB0226: ccccccc RECALLED****Explanation**

The /STK command successfully retrieved screen space ccccccc from the stack. This message appears on the INFO-line.

**System action**

The /STK command terminates and waits for the next user request.

**User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations. Enter the next command.

**OB0227: STACK ENTRY nnnn DELETED****Explanation**

The user successfully deleted stacked screen entry nnnn from the stack. This message appears on the INFO-line.

**System action**

The /STK command terminates and waits for the next user request.

**User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations. Enter the next command.

**OB0228: STACK EMPTIED****Explanation**

The user cleared all stack entries. OMEGAMON freed all GETMAINED storage for the stack. This message appears on the INFO-line.

**System action**

The /STK command terminates and waits for the next user request.

**User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations. Enter the next command.

**OB0229: INVALID KEYWORD ccccccc****Explanation**

The user entered an invalid keyword ccccccc. This message appears on the INFO-line.

**System action**

The /STK command terminates and waits for the next user request.

**User response**

Correct the keyword and retry.

## **OB0230: INVALID CURSOR LOCATION**

### **Explanation**

The cursor must not be in row 0 or in the first or last column of a row.

### **System action**

The command terminates.

### **User response**

Place the cursor in the proper position and retry.

## **OB0231: UNABLE TO LOCATE GENERATING COMMAND**

### **Explanation**

The backscan for a nonblank in column 2 failed. The scanner backed into the INFO-line. This most likely occurred if there were only comments on the screen.

### **System action**

The command terminates.

### **User response**

Correct the screen and retry.

## **OB0232: INVALID COMMAND NAME FOUND - cccc**

### **Explanation**

The command name cccc is not a valid 3 or 4 alphanumeric character name.

### **System action**

The command terminates.

### **User response**

Correct the command name and retry.

## **OB0233: INCORRECT OPTIONAL PARAMETER - cccccccc**

### **Explanation**

The optional parameter for the /ZOOM INFO-line command is invalid. It is not 4 characters long, or it contains invalid characters.

### **System action**

The command terminates.

### **User response**

Correct the parameter and retry.

## **OB0234: THERE ARE NO PFK ASSIGNMENTS AT THIS TIME**

### **Explanation**

The user has not issued any .PFK immediate commands to assign screen spaces or INFO-line commands to PF keys.

**System action**

OMEGAMON waits for the next user request.

**User response**

Use the .PFK immediate command to assign screen spaces or INFO-line commands to PF keys.

**OB0235: PFK *nn* NOT CURRENTLY ASSIGNED****Explanation**

The user pressed PF key *nn* to execute a screen space or an INFO-line command, but a screen space or INFO-line command is not assigned to PF key *nn*. This message appears on the INFO-line.

**System action**

OMEGAMON waits for the next user request.

**User response**

Use the .PFK immediate command to assign a screen space or an INFO-line command to PF key *nn*, or try another PF key.

**OB0236: RECALL DENIED - AT *cccccc* OF STACK****Explanation**

The user entered a /STK U or /STK D command and the stack entry pointer is currently at the top or bottom of the stack. This message appears on the INFO-line.

**System action**

The /STK command terminates and waits for the next user request.

**User response**

Enter the next command.

**OB0237: MAXIMUM STACK ENTRIES****Explanation**

There is currently a maximum of 999 stacked screens; the user cannot save another screen. This message appears on the INFO-line.

**System action**

The /STK command terminates and waits for the next user request.

**User response**

Keep the number of stacked screens under 999.

**OB0238: ERROR IN \$SQZ****Explanation**

There is an error in the \$SQZ routine.

**System action**

The /STK command terminates.

**User response**

Contact IBM Software Support.

**OB0239: EXTERNAL SECURITY ROUTINE CANNOT BE FOUND****Explanation**

An attempt has been made to enter a new user ID via the /PWD command. However, the user's external security routine cannot be located.

**System action**

The command is terminated.

**User response**

Contact your security administrator to verify that an external security routine has been properly installed.

**OB0240: INVALID LENGTH FOR USERID****Explanation**

An attempt has been made to enter a new user ID via the /PWD command that is more than 8 characters.

**System action**

The command is terminated.

**User response**

Correct the user ID and retry.

**OB0241: RELOGON NOT ALLOWED IN TSO OR SPF MODE****Explanation**

An attempt has been made to enter a new user ID via the /PWD command while in TSO or ISPF mode. The relogon function is not allowed in these modes.

**System action**

The command is terminated.

**User response**

Log off from TSO and log on with the new user ID and password.

**OB0242: RELOGON REQUEST DENIED - NO PASSWORD****Explanation**

An attempt was made to relogon via the /PWD command, but no password was entered.

**System action**

The command is terminated.

**User response**

To relogon, re-execute the command and enter a password. If you want to reset the security level, enter /PWD without a user ID.

## OB0243: RELOGON SUCCESSFUL

### Explanation

Relogon via the /PWD command was successful. This is the default message.

### System action

The command executes.

### User response

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations. If you have customized your own message and it failed to display in place of the default message, verify the following information:

- The message has no more than 60 characters.
- U#CHMSGL contains the message's length.
- U#CHMSG contains the message.
- U#CHRESP indicates that a message is pending (U@CHMSHO).

## OB0244: RELOGON REQUEST DENIED

### Explanation

Relogon via the /PWD command was not successful. This is the default message. The user's security exit did not return a message and message length, or returned an invalid message length. Therefore, OMEGAMON issued this default message.

### System action

The command terminates.

### User response

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations. If you have customized your own message and it failed to display in place of the default message, verify the following information:

- The message has no more than 60 characters.
- U#CHMSGL contains the message's length.
- U#CHMSG contains the message.
- U#CHRESP indicates that a message is pending (U@CHMSHO).

## OB0245: INVALID RETURN CODE *nn* FROM EXTERNAL SECURITY EXIT

### Explanation

An invalid return code *nn* was passed from the external security exit.

### System action

OMEGAMON terminated the command and disallowed execution of EXTERNAL=YES commands.

### User response

Correct the external security exit to issue only these valid return codes: 0, 4, 8, and 12.

## **OB0246: /AUPON NOT ALLOWED IN TSO OR SPF MODE**

### **Explanation**

Automatic update is not allowed under the VTM1 interface.

### **System action**

OMEGAMON terminated the command.

### **User response**

If you want to update automatically, use VTAM® or dedicated mode.

## **OB0247: RELOGON NOT ALLOWED UNDER OLD EXIT**

### **Explanation**

The relogon feature is not available with this version of the user exit.

### **System action**

OMEGAMON terminated the command.

### **User response**

Upgrade the user exit to the current version.

## **OB0248: INTERVAL NOT EFFECTIVE IN *ccc* MODE**

### **Explanation**

The interval that was set cannot take effect in the mode in which the user is operating, because the current mode does not support automatic updating.

### **System action**

The interval value set is retained. If the value is saved in a user profile, it may be used in dedicated or VTAM® mode.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB0249: EFFECTIVE INTERVAL IN *ccc* MODE IS *nn.n* SECONDS**

### **Explanation**

The interval that was set cannot take effect in the mode in which the user is operating. The current mode has a minimum interval of *nn.n* seconds.

### **System action**

The interval value set is retained, however the minimum of *nn.n* seconds becomes the effective interval in the current mode of operation. If the value is saved in a user profile, it may be effective in other modes.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0308: INVALID KEYWORD, EXCESSIVE LENGTH - cccccccccccc**

**Explanation**

The character string is longer than OMEGAMON allows (maximum 12 characters).

**System action**

OMEGAMON bypasses the string. It makes no attempt to validate the string against the internal tables.

**User response**

Correct the parameter and retry.

**OB0310: PARAMETER *keyword value* DATA IS INVALID**

**Explanation**

The value associated with the keyword parameter is incorrect.

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

**OB0311: PARAMETER *keyword value* DATA IS NOT UNIQUE**

**Explanation**

The value associated with the keyword parameter is incorrect. The data does not uniquely distinguish between entries.

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

**OB0312: UNKNOWN KEYWORD PARAMETER - cccccccccccc**

**Explanation**

The indicated parameter is not in any of the tables associated with this command.

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

**OB0315: PARAMETER ccccccccccc (*nnnnnnnnnnn*) MAX DECIMALS = *nn***

**Explanation**

The data *nnnn* associated with parameter *cccc* contains too many significant digits to the right of the decimal point.

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

**OB0316: KEYWORD FORMAT ERROR - ccccccccccc****Explanation**

The parameter was specified in the wrong format. It must either be specified as a single word or as a keyword followed by an equal sign (=) and a data value.

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

**OB0317: PARAMETER ccccccccccc (xxxxxxxxxxxx) MUST BE HEX DATA****Explanation**

The data xxxx associated with parameter ccccccc must contain only hex digits (0–9 and A–F).

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

**OB0318: PARAMETER ccccccccccc (aaaaaaaaaaaa) MUST BE bbbbbbbb OR dddddddd****Explanation**

The data aaaaaaaaaaaa associated with parameter ccccccccccc must be either bbbbbbbb or dddddddd. No other values are allowed.

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

**OB0319: PARAMETER ccccccccccc (nnnnnnnnnn) MUST BE NUMERIC****Explanation**

The data nnnn associated with parameter ccccccc must be a numeric value. Only the digits 0–9 and a decimal point are allowed.

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

**OB0320: PARAMETER *ccccccccc* (*aaaaaaaaaaaa*)****Explanation**

The data *aaaaaaaa* associated with parameter *ccccccc* is in error. This message will be followed by additional messages explaining the error.

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

**OB0321: LENGTH MUST BE GE *xxxxxxx* AND LE *yyyyyyy*****Explanation**

The length of the character or hex string data must be within the bounds *xxxxxxx* and *yyyyyyy*.

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

**OB0322: VALUE MUST BE GE *ccccccc* AND LE *aaaaaaaa*****Explanation**

The value of the number in message OB0320 must be within the bounds *ccccccc* and *aaaaaaaa*.

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

**OB0323: EXCESSIVE DATA LENGTH, MUST BE LE 12****Explanation**

The length of the data is too long. The maximum length of any data string is 12 characters.

**System action**

OMEGAMON bypasses the parameter.

**User response**

Correct the parameter and retry.

## **OB0408: EXCEPTION NOT FOUND; CALL IBM® CORPORATION**

### **Explanation**

An exception in the KOBICUSER module could not be processed because of an error in the exception analysis tables.

### **System action**

Exception analysis initialization terminates.

### **User response**

Contact IBM Software Support.

## **OB0409: MAXIMUM BELL INTERVAL IS 99 SECONDS**

### **Explanation**

An attempt has been made to set the bell interval to more than 99 seconds.

### **System action**

The command terminates.

### **User response**

Enter a value that is less than 99 seconds.

## **OB0410: MINIMUM BELL INTERVAL IS 5 SECONDS**

### **Explanation**

An attempt has been made to set the bell interval to less than 5 seconds.

### **System action**

The command terminates.

### **User response**

Enter a value that is 5 seconds or more.

## **OB0411: \$DFNEXC MISSING - CALL IBM® CORPORATION**

### **Explanation**

An internal exception analysis table is missing from the OMEGAMON module.

### **System action**

Exception analysis initialization terminates.

### **User response**

Contact IBM Software Support.

## **OB0412: NEED *nnn*K MORE TO INITIALIZE EXCEPTION ANALYSIS**

### **Explanation**

OMEGAMON requires *nnn*K more storage to initialize exception analysis.

**System action**

The command terminates.

**User response**

Run OMEGAMON in a larger region.

**OB0418: EXCEPTION ANALYSIS NOT INITIALIZED****Explanation**

Exception analysis has not been initialized.

**System action**

None.

**User response**

Contact IBM Software Support.

**OB0419: GROUP ID IS INVALID****Explanation**

OMEGAMON does not recognize the group ID supplied as a valid group ID.

**System action**

OMEGAMON ignores the request.

**User response**

Enter a defined group ID or define the group to OMEGAMON.

**OB0420: EXCEPTION LIMIT OF 25 ENTRIES****Explanation**

A user attempted to enter more than 25 exceptions into this group. It is not possible to have more than 25 exceptions in a single user exception group.

**System action**

The command terminates.

**User response**

Create a group of 25 or less exceptions.

**OB0421: LIST KEYWORD HAS NO EXCEPTIONS****Explanation**

A user entered the keyword LIST= without any exceptions.

**System action**

The command terminates.

**User response**

Enter the desired exceptions for the group.

## **OB0422: cccc ENTRY NON EXISTENT NOT DELETED**

### **Explanation**

A user requested the deletion of an exception from a group that does not have that exception assigned.

### **System action**

The command terminates.

### **User response**

Determine the correct exception to be deleted.

## **OB0423: GROUP ID MUST BE PRESENT**

### **Explanation**

The GROUP= keyword was not entered.

### **System action**

The command terminates.

### **User response**

Enter the GROUP= keyword along with the desired group ID.

## **OB0424: DELETE PARAMETER IS INVALID**

### **Explanation**

The DELETE= keyword does not have GROUP or EXCEPTION specified.

### **System action**

The command terminates.

### **User response**

Enter the DELETE= keyword with either GROUP or EXCEPTION as the option.

## **OB0425: INVALID KEYWORD SPECIFIED FOR COMMAND**

### **Explanation**

An undefined keyword was specified for this command.

### **System action**

The command terminates.

### **User response**

Correct the keyword and retry.

## **OB0426: LAST, WORST, AND CUMULATIVE VALUES HAVE BEEN RESET**

### **Explanation**

Exception group trip statistics were reset.

### **System action**

Last, worst, and cumulative counters were set to zero.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0427: STATE OPTION IS INVALID****Explanation**

A user entered an option for an exception state other than NULL, NDSP, TEST, ON, or OFF.

**System action**

The command terminates.

**User response**

Enter a valid option.

**OB0428: GROUP CHANGED FROM *cc* TO *aa* FOR EXCEPTION *bbbb*****Explanation**

Exception *bbbb* was previously in exception group *cc* before being assigned to group *aa*.

**System action**

None.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0429: DELETE INVALID, GROUP NOT IN TABLE****Explanation**

Requested delete for exception group not processed, exception group is not in the table.

**System action**

The command terminates.

**User response**

Correct the exception group code and retry.

**OB0430: EXCEPTION GROUP *cc* DELETED****Explanation**

OMEGAMON deleted exception group *cc* from exception group table.

**System action**

The command terminates.

**User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB0431: EXCEPTION *cccc* DELETED FROM EXCEPTION GROUP *aa***

### **Explanation**

OMEGAMON deleted exception *cccc* from exception group *aa*. It is now available for assignment to another exception group.

### **System action**

The command terminates.

### **User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB0432: *cccccccc* - INVALID COLOR, PLEASE RE-ENTER**

### **Explanation**

The color entered was not a valid color.

### **System action**

The command terminates.

### **User response**

Enter a valid color (red, yellow, green, blue, turquoise, pink, or white).

## **OB0433: EXCEPTION NAME *cccc* IS INVALID**

### **Explanation**

The exception name specified was not defined.

### **System action**

The command terminates.

### **User response**

Enter a defined exception name.

## **OB0434: SEQUENCE NUMBER IS INVALID**

### **Explanation**

A non-numeric sequence was entered for the exception.

### **System action**

The command terminates.

### **User response**

Enter a numeric sequence number.

## **OB0435: GROUP ID *cc* IS INVALID**

### **Explanation**

The GROUP= parameter for the XACB command was not specified or was specified incorrectly.

**System action**

The XACB command terminates.

**User response**

Enter a valid group identification code.

**OB0437: POSITION KEYWORD HAS NO ENTRY****Explanation**

The POSITION= keyword was entered with no value following it.

**System action**

The command terminates.

**User response**

Enter a correct POSITION= value.

**OB0438: POSITION *nnn* IS INVALID****Explanation**

OMEGAMON received a POSITION=*nnn* request that is greater than the number of entries in the table that was specified.

**System action**

The command terminates.

**User response**

Enter a value within the table range.

**OB0439: NAME KEYWORD PARAMETER IS INVALID****Explanation**

The exception group NAME is null.

**System action**

The command terminates.

**User response**

Enter a valid name for the exception group.

**OB0440: MORE THAN GROUP ID REQUIRED TO ADD ENTRY****Explanation**

An undefined group ID was entered with no other parameters.

**System action**

The command terminates.

**User response**

Enter the group ID, name, and list of desired exceptions to add a new entry to the table.

## **OB0441: ccccccc IS AN INVALID KEYWORD**

### **Explanation**

An undefined keyword was entered.

### **System action**

The command terminates.

### **User response**

Correct the spelling of the keyword.

## **OB0442: KEYWORDS ALL/LIST/GROUP ARE MUTUALLY EXCLUSIVE**

### **Explanation**

The XACB command uses the ALL, LIST, and GROUP keywords to select exceptions for display. Only one of these selection options may be specified at a time.

### **System action**

XACB output is suppressed.

### **User response**

Enter only one of the three keywords.

## **OB0443: VERBOSE AND TERSE ARE MUTUALLY EXCLUSIVE**

### **Explanation**

The XACB command produces either a VERBOSE or TERSE display. The presence of both keywords creates a conflict.

### **System action**

XACB output is suppressed.

### **User response**

Select either VERBOSE or TERSE.

## **OB0444: GROUP cc HAS NO EXCEPTIONS ASSIGNED TO IT**

### **Explanation**

The XACB command was used to select exception group *cc* for display. There are no exceptions currently assigned to group *cc*.

### **System action**

The command is ignored.

### **User response**

Select another exception group for display.

## **OB0445: THERE ARE NO EXCEPTIONS AVAILABLE FOR DISPLAY**

### **Explanation**

The XACB command did not find any exceptions that met the selection criteria specified. This could have happened because the LIST= parameter was specified without any exception name.

**System action**

The command is ignored.

**User response**

Enter a valid group identifier or exception name.

**OB0510: USER PROFILE *cc* ADDED TO LIBRARY****Explanation**

The user added a new profile *cc* to the profile library.

**System action**

The command executes.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0515: USER PROFILE *cc* DELETED FROM LIBRARY****Explanation**

The user deleted profile *cc* from the profile library.

**System action**

The command executes.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0520: USER PROFILE *cc* REPLACED IN LIBRARY****Explanation**

The user replaced existing profile *cc* in the profile library.

**System action**

The command executes.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0525: USER PROFILE *cc* NOT IN LIBRARY****Explanation**

The user attempted to delete profile *cc* which does not exist in the library.

**System action**

The command terminates.

**User response**

Correct the profile ID and retry.

## **OB0526: OMEGAMON WILL EXECUTE USING IBM® DEFAULTS**

### **Explanation**

This message indicates which profile defaults will execute for this session.

### **System action**

The command completes processing.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB0527: OMEGAMON WILL EXECUTE USING YOUR INSTALLATION PROFILE**

### **Explanation**

This message indicates which profile defaults will execute for this session.

### **System action**

The command executes.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB0530: USER PROFILE ID *cc* IS NOT VALID**

### **Explanation**

The user issued a profile command with an invalid profile identifier (suffix).

### **System action**

The command terminates.

### **User response**

Enter a valid 2-character profile identifier. Use the PPRF LIST command to list valid identifiers at your installation.

## **OB0532: USER PROFILE KEYWORD *cccccccc* IS INVALID**

### **Explanation**

The user issued a profile command with an invalid profile keyword.

### **System action**

The command terminates.

### **User response**

Enter the profile keyword SAVE or DELETE.

## **OB0535: INSTALLATION PROFILE *cc* DELETED FROM LIBRARY**

### **Explanation**

The installer deleted the installation profile from the library.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0540: INSTALLATION PROFILE ADDED TO LIBRARY****Explanation**

The installer added a new installation profile to the profile library.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0544: INSTALLATION PROFILE DELETED FROM LIBRARY****Explanation**

The installer deleted the existing installation profile from the profile library.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0545: INSTALLATION PROFILE REPLACED IN LIBRARY****Explanation**

The installer replaced the existing installation profile in the profile library.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0546: INSTALLATION PROFILE IDENTIFIER NOT ALLOWED****Explanation**

The user entered a profile identifier for the installation profile command. It does not accept an identifier.

**System action**

The command terminates.

**User response**

Either use the PPRF command for a user profile, or delete the identifier on the IPRF command for the installation profile.

**OB0547: INSTALLATION PROFILE NOT IN LIBRARY****Explanation**

The installer attempted to delete or replace a non-existent installation profile from the profile library.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0580: COMMENT ccccccccccccccccccc IS MORE THAN 18 CHARACTERS LONG****Explanation**

A comment was added with the PPRF command that is longer than the maximum allowed.

**System action**

The command terminates.

**User response**

Add a comment that is a maximum of 18 characters and retry the command.

**OB0590: PROFILE SERVICE REQUEST FAILED - {reason}****Explanation**

A user profile request failed for the specified reason.

**System action**

The request is terminated.

**User response**

The reasons that appear follow. Take the appropriate action for the reason displayed with this message.

**OB0590(cont.): ABEND X'13' OCCURRED IN cccc****Explanation**

An X'13' abend occurred when the specified routine (cccc) tried to open the profile data set.

**System action**

The request is terminated.

**User response**

Check the SYSLOG for the X'13' abend and correct the problem.

## **OB0590(cont.): INTERNAL PROFILE HEADER ERROR**

### **Explanation**

The user profile header record about to be written to the output data set has an error.

### **System action**

The request is terminated.

### **User response**

Contact IBM Software Support.

## **OB0590(cont.): INVALID DDNAME IN cccc**

### **Explanation**

An internal OMEGAMON error has occurred.

### **System action**

The request is terminated.

### **User response**

Contact IBM Software Support.

## **OB0590(cont.): INVALID SERVICE REQUEST TYPE**

### **Explanation**

An invalid parameter type was presented to the user profile facility I/O driver.

### **System action**

The request is terminated.

### **User response**

Contact IBM Software Support.

## **OB0590(cont.): IOWA NOT AVAILABLE**

### **Explanation**

The user profile I/O work area is not available.

### **System action**

The request is terminated.

### **User response**

Contact IBM Software Support.

## **OB0590(cont.): MEMBER IS EMPTY**

### **Explanation**

The requested profile member contains no records.

### **System action**

The request is terminated.

**User response**

Delete or replace the empty profile.

**OB0590(cont.): nnnnnnnn NOT FOUND****Explanation**

Member *nnnnnnnn* was not found in the profile data set.

**System action**

The request is terminated.

**User response**

Insure that the proper member name was requested. Use the PPRF LIST command to see what profiles are available and what profile data sets are allocated.

**OB0590(cont.): OPEN FAILURE IN cccc****Explanation**

An attempt to open a profile data set in routine *cccc* was not successful.

**System action**

The request is terminated.

**User response**

Insure that the profile data sets are properly defined. If you still cannot open the data set, contact IBM Software Support.

**OB0590(cont.): OUTPUT DCB OPEN FAILED****Explanation**

An attempt to open the output profile data set was not successful.

**System action**

The request is terminated.

**User response**

Make sure that the output profile data set is properly defined. Contact IBM Software Support.

**OB0590(cont.): OUTPUT FILE NOT AVAILABLE****Explanation**

A prior error occurred during user profile facility processing and the output file was flagged as unavailable to this OMEGAMON session.

**System action**

The request is terminated.

**User response**

Another OB0590 message with a different reason was issued prior to this one. Follow the procedure to correct the first error.

## **OB0590(cont.): OUTPUT TEMPORARILY UNAVAILABLE**

### **Explanation**

The output profile data set is being used by another OMEGAMON session.

### **System action**

The request is terminated.

### **User response**

Once the output profile data set is free, you can enter the command again. If the condition persists, contact IBM Software Support.

## **OB0590(cont.): ABEND X'14' OCCURRED IN cccc**

### **Explanation**

An X'14' abend occurred attempting to close the profile data set from routine cccc.

### **System action**

The request is terminated.

### **User response**

Check the SYSLOG for the X'14' abend and correct the problem.

## **OB0590(cont.): PROFILE DATA SETS NOT ALLOCATED**

### **Explanation**

The KOBICSPROF and KOBICSPROFSV data sets are not allocated.

### **System action**

The request is terminated. Profile services are not available.

### **User response**

Allocate the KOBICSPROF and KOBICSPROFSV data sets by DD statements or CLIST as appropriate for the session mode. If the problem persists, contact IBM Software Support.

## **OB0590(cont.): SEQUENCE ERROR IN cccc**

### **Explanation**

An internal error occurred during user profile facility processing in routine cccc.

### **System action**

The request is terminated.

### **User response**

Another OB0590 message with a different reason was issued prior to this one. Follow the procedure to correct the first error.

## **OB0590(cont.): SERVICE NOT AVAILABLE**

### **Explanation**

An invalid parameter was presented to the user profile facility I/O driver.

**System action**

The request is terminated.

**User response**

Contact IBM Software Support.

**OB0590(cont.): SPANNED RECORD ERROR****Explanation**

A profile being read for input was found to have an invalid value in the spanned record field.

**System action**

The request is terminated.

**User response**

Attempt to recreate the profile and if the problem still exists, contact IBM Software Support.

**OB0590(cont.): ABEND X'37' OCCURRED IN cccc****Explanation**

An X'37' abend occurred while processing the profile data set from routine cccc.

**System action**

The request is terminated.

**User response**

Compress and/or re-allocate the data set as required.

**OB0590(cont.): ABEND 913, SECURITY VIOLATION****Explanation**

An abend 913 occurred attempting to access a profile data set.

**System action**

The request is terminated.

**User response**

Contact the person in charge of system security at your installation.

**OB0590(cont.): FILE NOT AVAILABLE****Explanation**

A prior error occurred during user profile facility processing and the file was flagged as unavailable to this OMEGAMON session.

**System action**

The request is terminated.

**User response**

There should be a prior error message. Follow the instructions to correct the first error.

## **OB0590(cont.): GETMAIN FAIL, INCREASE REGION**

### **Explanation**

An attempt to GETMAIN storage failed with a non-zero return code.

### **System action**

The request is terminated.

### **User response**

Increase the region parameter on the EXEC statement or job card of the OMEGAMON session.

## **OB0590(cont.): INPUT DCB OPEN FAILED**

### **Explanation**

An attempt to open the input profile data set was not successful.

### **System action**

The request is terminated.

### **User response**

Make sure that the input profile data set is properly defined. Contact IBM Software Support.

## **OB0590(cont.): INPUT FILE NOT AVAILABLE**

### **Explanation**

A prior error occurred during user profile facility processing and the input file was flagged as unavailable to this OMEGAMON session.

### **System action**

The request is terminated.

### **User response**

Another OB0590 message with a different reason was issued prior to this one. Follow the procedure to correct the first error.

## **OB0590(cont.): INTERNAL ERROR, ccccc**

### **Explanation**

Routine ccccc has detected an OMEGAMON internal error.

### **System action**

The request is terminated.

### **User response**

Contact IBM Software Support.

## **OB0800: INFORMATION UNAVAILABLE—NOT A MULTI-USER ENVIRONMENT**

### **Explanation**

In response to the .VTM command, OMEGAMON determined that the current environment does not support multi-user sessions. There is no meaningful information for the .VTM command to display. Valid multi-user environments are VTM, VTS, and VTT.

**System action**

The command terminates.

**User response**

Use this command only in a valid multi-user environment controlled by OBVTAM.

**OB0801: INFORMATION UNAVAILABLE—INTERNAL ERROR****Explanation**

In response to the .VTM command, OMEGAMON attempted to display multi-session status information. However, OMEGAMON detected one or more problems in the internal subtask configuration for OBVTAM. This problem may be caused by transitory changes in OBVTAM subtask structures, which could result in a program check.

**System action**

The command terminates.

**User response**

Reissue the command. If this message persists, contact IBM Software Support.

**OB0802: NO DATA ONLY SPACES ARE OWNED BY THIS ADDRESS SPACE****Explanation**

No tasks within the address space specified by the PEEK major command own any data-only spaces.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0803: ERROR DETECTED IN INTERNAL SCAN ROUTINE****Explanation**

An internal subroutine detected an error while collecting information on data-only spaces for the specified address space.

**System action**

The command terminates.

**User response**

Try the command again. If this message persists, contact IBM Software Support.

**OB0900: COMMAND *cccc* IS NOT A VALID COMMAND****Explanation**

The command *cccc* is not a minor of the current major command or is not itself a major or immediate command.

**System action**

OMEGAMON bypasses this line.

**User response**

Correct the command and retry.

**OB0901: COMMAND SUPERSEDED BY cccc****Explanation**

OMEGAMON no longer supports the specified command. Command cccc now performs a similar function.

**System action**

OMEGAMON selects the new version of the command.

**User response**

None. In the future, use command cccc.

**OB0902: COMMAND INVALID UNDER nnn****Explanation**

This command is not valid with the MVS™ version you are running (*nnn*).

**System action**

OMEGAMON selects the next command.

**User response**

Use this command with the correct version of MVS™.

**OB0903: INVALID INFO-LINE COMMAND****Explanation**

The INFO-line command entered does not exist.

**System action**

The command is not executed.

**User response**

Correct the command and retry.

**OB0906: COMMAND DISABLED****Explanation**

The specified command was disabled by user security processing.

**System action**

OMEGAMON bypasses this line.

**User response**

Issue another command.

**OB0910: PROGRAM CHECK - RECOVERY SUCCESSFUL - xxxxxxxx****Explanation**

An OMEGAMON command terminated abnormally due to a program check at location xxxxxxxx.

**System action**

OMEGAMON aborts the command.

**User response**

Retry the command. If the problem persists, follow the instructions given in the Preface, then contact IBM Software Support.

**OB0915: CROSS MEMORY ERROR, ADDRESS SPACE SWAPPED OUT****Explanation**

Cross memory operations were attempted to an address space that was swapped out.

**System action**

Program recovery is successful, although the operation is suppressed.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0916: PATTERN MUST BE SET BY .SPT COMMAND****Explanation**

A pattern-controlled operation was requested, but the pattern was not defined.

**System action**

Operation is ignored.

**User response**

Set a proper pattern using the .SPT command.

**OB0917: PATTERN ARGUMENT MUST BE NUMERIC****Explanation**

The command requires a pattern that only has numeric values.

**System action**

Pattern operation is ignored.

**User response**

Correct the command and retry.

**OB0918: NO PATTERN EXISTS****Explanation**

No pattern exists for the requested pattern number.

**System action**

Pattern operation is ignored.

**User response**

Correct the command or assign a pattern.

## **OB0919: PATTERN NUMBER MUST BE 0 THROUGH 9**

### **Explanation**

Invalid pattern number.

### **System action**

Pattern operation is ignored.

### **User response**

Correct the command and retry.

## **OB0920: COMMAND LOOP—RECOVERY SUCCESSFUL**

### **Explanation**

OMEGAMON built-in loop detection encountered a possible loop in an OMEGAMON command processor.

### **System action**

OMEGAMON terminates the command.

### **User response**

Use the .SET command to increase the LOOPTIME and/or LOOPCOUNT values. If the problem persists after setting these values to the maximum, follow the instructions given in the Preface and contact IBM Software Support.

## **OB0921: SECURITY CHECK FAILED (INTERNAL)**

### **Explanation**

A password was not supplied for the security level associated with this command.

### **System action**

OMEGAMON suppresses the command.

### **User response**

Supply a valid password, or see your security administrator.

## **OB0922: SECURITY CHECK FAILED (EXTERNAL)**

### **Explanation**

The OMEGAMON external security interface determined that the command is not authorized for execution.

### **System action**

OMEGAMON suppresses the command.

### **User response**

See your security administrator.

## **OB0924: cccc COMMAND NOT VALID WITH cc ARGUMENT**

### **Explanation**

This command does not support a .D or a .R argument.

**System action**

The command is not executed.

**User response**

Correct the command syntax and retry.

**OB0925: LOOP IN OMEGAMON BASE****Explanation**

OMEGAMON's built-in loop detection encountered a possible loop in an OMEGAMON service module.

**System action**

OMEGAMON terminates with a user ABEND 0925.

**User response**

Use the .SET command to increase the LOOPTIME and/or LOOPCOUNT values. If the problem persists after setting these values to the maximum, follow the instructions given in the Preface and contact IBM Software Support.

**OB0926: LOOP IN OMEGAMON BASE TERMINATION****Explanation**

A loop was detected while termination operations were under way.

**System action**

Termination operations are suspended and OMEGAMON abends.

**User response**

If the problem persists, contact IBM Software Support.

**OB0930: UNEXPECTED PROGRAM CHECK - xxxxxxxx****Explanation**

OMEGAMON abend protection (ESTAE) processing detected a program check error in a module at location xxxxxxxx.

**System action**

OMEGAMON terminates the command.

**User response**

Follow the instructions given in the Preface, then contact IBM Software Support.

**OB0931: CP LOCATE OR CANDLE DIAGNOSE REQUIRED****Explanation**

The command cannot be executed without having either the authority to issue the CP LOCATE, or the IBM® Tivoli® Candle® User Diagnose installed.

**System action**

OMEGAMON® terminates the command.

**User response**

Get the privilege class needed to execute the CP LOCATE command or install the IBM® Tivoli® CandleUser Diagnose as documented in the *OMEGAMON® and EPILOG® for VM Installation and Customization Guide* and regenerate the VM operating system.

**OB0932: CANDLE DIAGNOSE OR CP LOCK COMMAND REQUIRED****Explanation**

The command cannot be executed without having either the IBM® Tivoli® Candle® User Diagnose installed or authority to issue the CP LOCK command.

**System action**

OMEGAMON® terminates the command.

**User response**

Install the IBM® Tivoli® Candle® User Diagnose as documented in the *OMEGAMON® and EPILOG® for VM Installation and Customization Guide* and regenerate the VM operating system, or get the privilege class needed to execute the CP LOCK command.

**OB0933: OMEGAMON® resource cleanup initiated for abend ccccc RC=xxxxxxxx****Explanation**

An abend occurred for an OMEGAMON session, and the non-private area resources will be removed. ccccc is the abend code and xxxxxxxx is the return code associated with the failure. This message is always followed by OB0935.

**System action**

Termination continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0934: LOAD FAILED FOR USER SECURITY EXIT - ccccccc****Explanation**

At initialization, this message appears if OMEGAMON was unable to load the designated user security exit.

**System action**

All EXTERNAL=YES commands with associated security levels of 0 are disabled.

**User response**

Ensure that the user security exit is specified in the MODULE= keyword of the security update program.

**OB0935: OMEGAMON RESOURCE CLEANUP COMPLETE****Explanation**

Abend processing removed non-private area resources in preparation for abnormal termination.

**System action**

Termination continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0936: WARNING—RUNNING KOBAS $nnn$  ON MVS/SP™ $mmm$ . USE KOBAS $bbb$ .****Explanation**

The MVS™ version level of OMEGAMON you are attempting to initialize ( $nnn$ ) does not match the MVS™ version under which you are running ( $mmm$ ). Because we do not distinguish among all possible MVS™ variations,  $mmm$  can be 13x, 2xx, or 3xx. The variable  $bbb$  is the correct level.

**System action**

The system prompts you on whether you want to continue initialization. If you do continue to run an OMEGAMON version that does not match the MVS™ version level, the integrity of some OMEGAMON data may be compromised.

**User response**

Determine whether your site is licensed for the version of OMEGAMON that matches your MVS™ level. If so, check the version level specified in the start-up parameters and change  $nnn$  to  $bbb$ . If not, contact IBM Software Support.

**OB0937: WARNING—RUNNING MVS/SP™ $nnn$  MODULE  $pppppppp$  ON MVS/SP™ $mmm$** **Explanation**

The variable  $nnn$  is the MVS™ version on which the module ( $pppppppp$ ) is supported. It does not match the MVS™ version under which you are running ( $mmm$ ). Because we do not distinguish among all possible MVS™ variations,  $mmm$  can be one of 13x, 2xx, or 3xx.

**System action**

The system prompts you on whether you want to continue initialization. If you do continue and run an OMEGAMON version that does not match the MVS™ version level, the integrity of some OMEGAMON data may be compromised.

**User response**

Determine whether your site is licensed for the version of OMEGAMON that matches your MVS™ level. If so, check the version level specified in the start-up parameters and change  $nnn$  to  $bbb$ . If not, contact IBM Software Support.

**OB0938: WARNING—OMEGAMON UNSUPPORTED ON MVS™ PRE-SP1.3.****Explanation**

OMEGAMON no longer supports versions of MVS™ prior to SP1.3.

**System action**

The system prompts you on whether you want to continue initialization. If you continue to run an OMEGAMON version that does not match the MVS™ version level, the integrity of some OMEGAMON data may be compromised.

**User response**

Upgrade your MVS™ version.

## **OB0939: STORAGE UNAVAILABLE FOR COWA**

### **Explanation**

A collector is starting and needs memory for the work area to communicate with the director. The request for memory has failed.

### **System action**

The collector terminates.

### **User response**

Increase region size and try again.

## **OB0940: NO RESPONSE FROM DIRECTOR FOR 5 MINUTES**

### **Explanation**

During the last 5 minutes, an OMEGAMON collector session did not detect a response from its associated director session.

### **System action**

OMEGAMON terminates the collector.

### **User response**

Determine why the director failed and restart the session.

## **OB0941: COLLECTOR CONNECTION FAILED: NO SEGMENTS AVAILABLE**

### **Explanation**

The user tried to establish more than the maximum number (7) of cross memory collector sessions with a single OMEGAMON director.

### **System action**

OMEGAMON cancels the request.

### **User response**

If you need to display more than 7 cross memory collectors on this system, start another OMEGAMON director.

## **OB0942: COLLECTOR AT WRONG VERSION: CONNECTION FAILED**

### **Explanation**

A cross memory collector at a different (and incompatible) release level tried to start a cross memory session with an OMEGAMON director.

### **System action**

OMEGAMON cancels the request.

### **User response**

Bring up the director and cross memory collector using the same (or a compatible) version of OMEGAMON.

## **OB0943: NO RESPONSE FROM COLLECTOR FOR 5 MINUTES**

### **Explanation**

An OMEGAMON director did not detect a response from one of its associated collectors during the last 5 minutes.

### **System action**

The director terminates this collector session.

### **User response**

Determine why the collector failed, and restart the collector. If the condition continues, contact IBM Software Support.

## **OB0944: DIRECTOR INITIALIZATION FAILED: ID ALREADY IN USE**

### **Explanation**

An attempt to bring up an OMEGAMON director failed because OMEGAMON was already running in another address space using the same system ID (via the SYS= start-up keyword).

### **System action**

OMEGAMON cancels the request.

### **User response**

To initialize the OMEGAMON director, specify a unique value for the SYS= parameter.

## **OB0945: DIRECTOR INITIALIZATION FAILED: NOT AUTHORIZED**

### **Explanation**

An attempt was made to bring up an OMEGAMON director that did not have APF authorization.

### **System action**

OMEGAMON terminates the director.

### **User response**

APF authorize all of the necessary load libraries and restart the director.

## **OB0946: TARGET DIRECTOR NOT FOUND (RC=20)**

### **Explanation**

OMEGAMON could not start the requested OMEGAMON cross memory collector because it could not find the specified director (via the DIR= start-up keyword).

### **System action**

OMEGAMON cancels the request.

### **User response**

Bring up the OMEGAMON director before you try to initialize the collector or specify the ID of an active director.

## **OB0947: ANOTHER COLLECTOR HAS THE SAME ID (RC=24)**

### **Explanation**

An attempt to start the requested OMEGAMON collector failed because another collector was already active using the specified system ID (via the SYS= start-up keyword). You must specify a unique system ID for each collector when you bring up multiple OMEGAMON collectors in the same system.

### **System action**

OMEGAMON cancels the request.

### **User response**

Specify a unique system ID for each collector.

## **OB0948: INVALID NUMBER OF COLUMNS SPECIFIED (RC=36)**

### **Explanation**

The number of columns you specified (via the COLS= keyword) for the cross memory or cross system collector does not match the number of columns for the director with which the collector is attempting to begin a session.

### **System action**

OMEGAMON cancels the request.

### **User response**

Correct the COLS= value at either the collector or director and restart the session.

## **OB0949: DIRECTOR AT WRONG VERSION: CONNECTION FAILED (RC=40)**

### **Explanation**

A cross memory collector tried to start a cross memory session with an OMEGAMON director of a different and incompatible release level.

### **System action**

OMEGAMON cancels the request.

### **User response**

Bring up the director and cross memory collector using the same (or compatible) version of OMEGAMON.

## **OB0950: DISK DATA SET AT WRONG VERSION - REFORMAT (RC=40)**

### **Explanation**

This session's cross system data set was formatted with an incompatible version of the format program.

### **System action**

OMEGAMON cancels the request.

### **User response**

Reformat the cross system data set with the current version of the KOBXDSK program.

## **OB0951: ONLY EIGHT SEGMENTS ALLOWED**

### **Explanation**

The /ATTACH command generates this message. OMEGAMON allows no more than 7 collectors plus the director segment at the director screen for cross memory/cross system mode terminal input/output processing.

### **System action**

OMEGAMON cancels the request.

### **User response**

If you need to display more than 7 collectors on this system, start another OMEGAMON director.

## **OB0952: COLLECTOR ID ALREADY ACTIVE**

### **Explanation**

The /ATTACH command generates this message. While trying to bring up a cross system collector session, OMEGAMON detected that this collector was already in session with a director.

### **System action**

OMEGAMON cancels the request.

### **User response**

Specify the correct collector ID.

## **OB0953: DDNAME MISSING**

### **Explanation**

This message may be issued in either of two situations:

- When the /ATTACH command is issued and OMEGAMON did not find the correct DD statement for the cross system data set.
- When attempting to start a collector and OMEGAMON did not find the correct DD statement for the cross system data set.

### **System action**

OMEGAMON cancels the request.

### **User response**

To correct the error, check the following:

- A collector system ID for the session that matches the name specified on the SYS= start-up parameter.
- A missing or incorrect DD statement in the director start-up JCL or EXEC file to point to the cross system data set.
- A missing or incorrect DD statement in the collector start-up JCL or EXEC file to point to the cross system data set.

When you have corrected the error, restart the OMEGAMON director.

## **OB0954: COLLECTOR ID REQUIRED**

### **Explanation**

The /ATTACH command generates this message. An /ATTACH INFO-line command was entered without a collector ID.

**System action**

OMEGAMON cancels the request.

**User response**

Re-enter the /ATTACH command and specify a valid collector ID.

**OB0955: DATA SET AT WRONG LEVEL - REFORMAT****Explanation**

The /ATTACH command generates this message. A different release level format program was used to format the cross system data set for this cross system session and its director.

**System action**

OMEGAMON cancels the request.

**User response**

Reformat the cross system data set with the current version of the KOBXDSK program.

**OB0956: DATA SET HAS WRONG NUMBER OF COLUMNS - REFORMAT****Explanation**

The /ATTACH command generates this message. The cross system data set used for cross system session initialization was formatted for a different screen size (via the COLS= parameter) than that of the director terminal.

**System action**

OMEGAMON cancels the request.

**User response**

Reformat the cross system data set with KOBXDSK and specify the proper COLS= value.

**OB0957: DIRECTOR MODE IS REQUIRED****Explanation**

The /ATTACH command generates this message. The attempt to attach a cross system collector at an OMEGAMON console failed because it was not initiated as an OMEGAMON director.

**System action**

OMEGAMON cancels the request.

**User response**

Restart OMEGAMON, specifying the proper parameter for director mode.

**OB0958: ENQUEUE ALREADY OUTSTANDING. QNAME: cccc****Explanation**

An enqueue attempt by the director controller failed.

**System action**

The attach is suppressed.

**User response**

If this problem persists, contact IBM Software Support.

**OB0959: DEQUEUE ATTEMPTED FOR RESOURCE NOT OWNED. QNAME:cccc****Explanation**

A dequeue attempt by the director controller failed.

**System action**

The detach is suppressed.

**User response**

If this problem persists, contact IBM Software Support.

**OB0960: BASE(Vnnnccc) AND INIT(Vnnnccc) VERSIONS ARE NOT COMPATIBLE****Explanation**

You are using two incompatible levels of OMEGAMON load modules.

**System action**

OMEGAMON does not start.

**User response**

Verify that the proper libraries are in use. If necessary, reinstall OMEGAMON using the appropriate distribution tape.

**OB0962: UNABLE TO OPEN PRIMARY CONSOLE****Explanation**

OMEGAMON could not bring up the requested dedicated OMEGAMON session because the OMEGAMON console (specified by the UNIT= start-up keyword) is not available.

**System action**

If this is the first OMEGAMON console session in the address space, OMEGAMON terminates. Otherwise, the particular OMEGAMON console session terminates.

**User response**

Check to see whether the terminal address is attached to another user or owned by VTAM®. Specify an available console and retry.

**OB0963: cc MODE INVALID: NOT A TSO SESSION****Explanation**

You can only specify TS or LS mode at OMEGAMON start-up when OMEGAMON is running under a TSO session.

**System action**

OMEGAMON terminates.

**User response**

Correct the MODE= parameter and restart OMEGAMON.

## **OB0964: TS CHANGED TO LS AS THIS IS NOT A SCREEN DEVICE**

### **Explanation**

An OMEGAMON TSO session was altered to low-speed mode, since the OMEGAMON terminal is not a display device.

### **System action**

TS mode becomes LS mode.

### **User response**

Specify MODE=LS when starting OMEGAMON at this device.

## **OB0965: WARNING: NUMBER OF ROWS REQUESTED DOES NOT MATCH YOUR TERMINAL SIZE**

### **Explanation**

The value specified for the ROWS= start-up parameter does not match the actual size of the OMEGAMON terminal screen.

### **System action**

OMEGAMON changes ROWS to match the terminal size; initialization continues.

### **User response**

Specify a ROWS= value that matches your terminal's physical characteristics at OMEGAMON start-up.

## **OB0966: RKOMPCSV DD CONCATENATED, UPDATES IGNORED**

### **Explanation**

The RKOMPCSV DD statement consists of more than one data set.

### **System action**

MVS™ data management constraints prevent OMEGAMON from performing any PDS updates to RKOMPCSV. OMEGAMON ignores requests by the /SAVE and /REP INFO-line commands and the DELT and RENM immediate commands.

### **User response**

Remove the concatenated data sets from the RKOMPCSV DD statement and restart OMEGAMON.

## **OB0967: xxPROCSV PRIOR SECURITY VIOLATION xxPROC —ABEND SX13**

### **Explanation**

A /SAVE or /REP command failed due to a security problem.

### **System action**

The command terminates.

### **User response**

Consult your security coordinator to gain access to the data sets in the xxPROC DD statement.

## **OB0969: INSUFFICIENT MEMORY TO INITIALIZE**

### **Explanation**

OMEGAMON was unable to GETMAIN enough virtual storage to complete initialization.

### **System action**

Start-up fails.

### **User response**

Increase the region size address space and restart OMEGAMON. (See message OB0970).

## **OB0970: INCREASE REGION SIZE BY *nnnK* AND RERUN**

### **Explanation**

Initialization failed because OMEGAMON needed additional virtual storage.

### **System action**

OMEGAMON terminates.

### **User response**

Increase the REGION= parameter by the amount that this message indicates and restart OMEGAMON. (See message OB0969.)

## **OB0971: .....+....1....+....2....+....3....+....4**

### **Explanation**

This ruler appears below message OB0972 to help you locate PARM line errors. The following additional message text displays below the ruler line, followed by the column location of the error, except when the error is in column 1.

### **System action**

The OMEGAMON session terminates.

### **User response**

Examine the message text and make suitable corrections. Additional message text:

- OMEGAMON STARTUP PARAMETER ERROR
- PARM FIELD SYNTAX ERROR
- PARAMETERS MUST BE SEPARATED BY A COMMA
- KEYWORD MUST END IN EQUAL SIGN
- UNKNOWN KEYWORD PARAMETER
- PARAMETER STRING TOO SHORT
- PARAMETER STRING TOO LONG
- PARAMETER NOT VALID HEXADECIMAL VALUE
- PARAMETER VALUE TOO LOW
- PARAMETER VALUE TOO HIGH
- THIRD CHARACTER MUST BE NUMERIC
- FIRST PARAMETER LENGTH ERROR
- UNABLE TO ACQUIRE STORAGE FOR PARAMETER TABLES

- UNIT SAME AS EXISTING TASK
- OMEGAMON HAS PROBABLY BEEN ENTERED AS A TSO COMMAND
- UNSUPPORTED MODE - BASE
- UNSUPPORTED MODE - OMEGAMON
- UNSUPPORTED MODE - NO IC DRIVER

## **OB0972: (USER INPUT APPEARS HERE)**

### **Explanation**

OMEGAMON issues this message with OB0971 (see above).

### **System action**

OMEGAMON terminates.

### **User response**

See the error code for OB0971.

## **OB0973: WARNING -- RUNNING *nnn* OMEGAMON® ON *yyy* SYSTEM**

### **Explanation**

This level of OMEGAMON® (*nnn*) is incompatible with this level of VM (*yyy*).

### **System action**

OMEGAMON® initialization continues, but with unpredictable results.

### **User response**

If OMEGAMON® did not terminate itself, stop it, install the correct OMEGAMON® level, and restart OMEGAMON®.

## **OB0974: *aaaaaaaa* LOADER ERROR**

### **Explanation**

OMEGAMON attempted to load module *aaaaaaaa*, but could not find it in the load library.

### **System action**

The load fails and OMEGAMON issues an abend code 0974.

### **User response**

Check that module *aaaaaaaa* is in the load library.

## **OB0975: *aaaaaaaa* MODULE HAS REENTRANT LINKAGE EDITOR ATTRIBUTE**

### **Explanation**

OMEGAMON could not update the module *aaaaaaaa* because it resides in a store-protected subpool.

### **System action**

OMEGAMON terminates.

### **User response**

Relink module *aaaaaaaa* without the RENT linkage editor parameter.

## **OB0976: RMF™ ASCB NOT FOUND**

### **Explanation**

OMEGAMON was unable to locate proper ASCB during RMF™ search.

### **System action**

The process terminates.

### **User response**

Contact IBM Software Support.

## **OB0977: {SMF|WTO} AUDITING IS BEING SUPPRESSED FOR THIS SESSION**

### **Explanation**

The user security exit has explicitly requested that SMF and/or WTO auditing be suppressed for this session; this request is made at initialization and/or relogin time. This message only appears once.

### **System action**

The command terminates.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB0978: SECURITY ROUTINE HAS ABORTED STARTUP**

### **Explanation**

An external security routine passed back a non-zero return code to initialization.

### **System action**

OMEGAMON terminates.

### **User response**

See your security officer.

## **OB0979: ERROR LOADING PRODUCT MODULE cccccccc**

### **Explanation**

The product module could not be loaded successfully.

### **System action**

OMEGAMON terminates.

### **User response**

Be sure the named module is in the product library. See accompanying MVS™ system messages and take appropriate action. If it is not in the product library, contact IBM Software Support.

## **OB0980: SAVE STACK RECOVERY SUCCESSFUL**

### **Explanation**

The save area stack overflowed.

**System action**

The command terminates.

**User response**

Contact IBM Software Support.

**OB0981: COMMAND TABLE ERROR cccc****Explanation**

A validation error occurred while loading the command table module.

**System action**

OMEGAMON terminates.

**User response**

Contact IBM Software Support.

**OB0982: ERROR DETECTED IN COMMAND TABLES****Explanation**

An error occurred while loading the command tables.

**System action**

This is a secondary message. It follows messages that contain validation error information.

**User response**

Examine the previous errors and follow the recommended user responses.

**OB0983: CANNOT LOCATE COMMAND TABLE MODULE, ABEND=cccc, RC=cc****Explanation**

The usual cause of this message is insufficient region size for OMEGAMON to load the command table module.

**System action**

OMEGAMON aborts the session start.

**User response**

See your installer to increase the region size. For other possible causes, look up the abend code in the IBM® *System Codes* manual for your system. You may also need to refer to the IBM® *System Messages* manual.

**OB0984: NO COMMAND TABLE MODULE NAME****Explanation**

An error occurred in command table processing.

**System action**

OMEGAMON terminates.

**User response**

Contact IBM Software Support.

## **OB0985: SAVE STACK RECOVERY SUCCESSFUL**

### **Explanation**

Invalid stack release by a command.

### **System action**

OMEGAMON terminates the command execution.

### **User response**

This is an internal error. Contact IBM Software Support.

## **OB0986: GETMAIN FAILED FOR COMMAND TABLES**

### **Explanation**

The request for storage for a copy of the command module failed.

### **System action**

OMEGAMON terminates.

### **User response**

Increase the region size for OMEGAMON.

## **OB0987: PRODUCT INITIALIZATION FAILED, RC=*nnn***

### **Explanation**

The product initialization routines have returned an error code which is non-zero.

### **System action**

OMEGAMON terminates.

### **User response**

Read any other messages that accompany this message. If unable to find the problem, contact IBM Software Support.

## **OB0988: PRODUCT LEVEL *nnn* INCOMPATIBLE WITH DRIVER LEVEL *mmm***

### **Explanation**

The base driver module cannot service the current product.

### **System action**

OMEGAMON initialization stops.

### **User response**

Use a base driver which is at the same or greater level than the product you are trying to initialize. Retry using this new driver.

## **OB0989: KOBICUSER<sub>cc</sub> MUST BE REASSEMBLED; IT IS NOT COMPATIBLE WITH THIS RELEASE OF OMEGAMON**

### **Explanation**

The user assembled an old KOBICUSER module that is incompatible with the current release of OMEGAMON.

**System action**

OMEGAMON initialization stops.

**User response**

Obtain the current KOBICUSER from the product tape and reassemble.

**OB0990: SECURITY LOGGING, *userid*, *cccccccc*, ACCESS(*aaaaaaaa*)****Explanation**

The security settings of the command table produce this security logging message. The variable *cccccccc* is the command being validated and *aaaaaaaa* is the result. The *userid* is displayed if AUDIT=WTO is specified.

**System action**

OMEGAMON terminates execution of any command to which it denies access.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB0991: DYNAMIC ALLOCATION ERROR: ERROR=*cccc*, INFO=*cccc*****Explanation**

A dynamic allocation request failed with the ERROR and INFO codes indicated.

**System action**

The allocation process terminates.

**User response**

Examine the error and information codes in the message and take appropriate action.

**OB0992: *aaUSERbb* VALIDATION FAILED. RC=*n*****Explanation**

The user profile *aaUSERbb* did not pass product validation.

**System action**

Session initialization terminates.

**User response**

If other messages were issued previously, take the action suggested for those messages. If no other messages were issued, contact IBM Software Support.

**OB0993: NO ARGUMENT HAS BEEN SUPPLIED****Explanation**

A valid argument was not supplied for the command.

**System action**

The command terminates.

**User response**

Supply a valid argument and reissue the command.

## **OB0994: NO VALID PATTERN HAS BEEN SUPPLIED**

### **Explanation**

A valid pattern was not supplied for the command.

### **System action**

The command terminates.

### **User response**

Supply a valid pattern and reissue the command.

## **OB0995: UNABLE TO LOG AUDIT RECORD TO SMF, RC=cc**

### **Explanation**

A non-zero return code was received from SVC 83 while attempting to track an audited command. These codes are documented in the *IBM® System Programming Library: System Management Facilities (SMF)* manual for your system.

### **System action**

A WTO is issued to the console with audit information.

### **User response**

Consult the appropriate IBM® documentation for an explanation and interpretation of the non-zero return code. This return code may indicate a serious problem with SMF.

## **OB0996: APF AUTHORIZATION REQUIRED FOR SMF LOGGING**

### **Explanation**

OMEGAMON cannot write SMF records unless it is APF-authorized. This message will appear only once; thereafter, all audit activity will be directed to the console for the duration of the session.

### **System action**

A WTO is issued to the console with audit information.

### **User response**

Determine whether OMEGAMON should be authorized. This is an installation decision.

## **OB0997: RECORD NUMBER MUST BE BETWEEN 128 AND 255 (INCLUSIVE) FOR SMF LOGGING**

### **Explanation**

OMEGAMON detected a request to write an SMF record with an invalid record ID. User SMF records must use a record ID between 128 and 255, inclusive. This message will appear only once; thereafter, all audit activity will be directed to the console for the duration of the session.

### **System action**

A WTO is issued to the console with audit information.

### **User response**

Use the Security Update Program to specify a valid SMF record ID.

## **OB0998: EXTERNAL SECURITY IS UNAVAILABLE**

### **Explanation**

OMEGAMON could not locate the user security routine to process a command for which external security was requested. Internal security was not invoked because the command did not have a security level associated with it.

### **System action**

OMEGAMON suppresses command execution.

### **User response**

Determine why the user security routine is missing. Make sure it is in a link-list library or in the OMEGAMON STEPLIB.

## **OB1112: DATA COLLECTOR IS NOT ACTIVE**

### **Explanation**

The requested collector is not currently active.

### **System action**

The IPRO command processor suppresses the display.

### **User response**

Start the collector and retry the command.

## **OB1116: REQUEST NOT SUPPORTED**

### **Explanation**

The request is not supported by the target collector.

### **System action**

The IPRO command processor suppresses the display.

### **User response**

Correct the parameters and retry the request.

## **OB1120: REQUESTED DATA NOT VALID**

### **Explanation**

The IPRO collector's data is currently statistically invalid. Sufficient data has not yet accumulated for a meaningful display.

### **System action**

The IPRO command processor suppresses the display until enough samples have accumulated.

### **User response**

Wait for sufficient time to gather data. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB1124: REQUESTED DATA NOT AVAILABLE**

### **Explanation**

The requested data is not being collected at this time.

### **System action**

The IPRO command processor suppresses the display.

### **User response**

Stop and restart the collector requesting the required data, or correct the collector start-up parameters and retry the request.

## **OB1140: REQUEST INCONSISTENT OR UNDEFINED**

### **Explanation**

The IPRO display parameters are not valid, so the processor suppresses the display.

### **System action**

The extractor was unable to process the parameters successfully.

### **User response**

Correct the parameters and retry.

## **OB1148: SUCCESSFUL ABEND RECOVERY IN EXTRACTOR**

### **Explanation**

An error occurred in the IPRO data display extractor. No presentation is made during this cycle.

### **System action**

The IPRO command processor suppresses the display.

### **User response**

Contact IBM Software Support.

## **OB1191: UNABLE TO LOAD IANL PROCESSOR MODULE**

### **Explanation**

OMEGAMON could not find the Impact Analysis processor module to load.

### **System action**

The IPRO command processor suppresses the display.

### **User response**

If this module should be available, contact IBM Software Support.

## **OB1195: MISSING EXTRACTOR NAME**

### **Explanation**

No extractor identification was given to the IPRO command processor. Either this is the first time the command was used, or it was cleared by the first extractor and there are no new operands.

**System action**

The IPRO command processor suppresses the display.

**User response**

Supply a proper extractor ID.

**OB1196: DATA EXTRACTOR ADDRESS = 0 - xxxx****Explanation**

The IPRO display processor for xxxx could not be located in this set of OMEGAMON modules.

**System action**

The IPRO command processor suppresses the display.

**User response**

Contact IBM Software Support.

**OB1197: UNKNOWN RETURN CODE FROM EXTRACT - cc****Explanation**

The IPRO display processor returned the code cc which is unknown to the IPRO command.

**System action**

The IPRO command processor suppresses the display.

**User response**

Contact IBM Software Support.

**OB1198: INVALID PARAMETER - cccc****Explanation**

The first 4 characters (cccc) of the operand are invalid.

**System action**

The IPRO command processor suppresses the display.

**User response**

Specify a valid IPRO collector and retry.

**OB1199: IPRO COMMAND NOT SUPPORTED****Explanation**

The IPRO command is not supported at this product level. IPRO requires DEXAN®.

**System action**

The IPRO command processor suppresses the display.

**User response**

Contact IBM Software Support.

## **OB1200: SEVERE ISPF ERROR DETECTED**

### **Explanation**

ISPF has returned a severe error condition code to the OMEGAMON ISPF driver.

### **System action**

The ISPF session terminates.

### **User response**

Look for other messages and take appropriate action.

## **OB1201: TSO SERVICE ERROR RETURN CODE *nnn***

### **Explanation**

The TSO service task has returned the error code indicated.

### **System action**

The ISPF session terminates.

### **User response**

Examine the error code and take appropriate action. Refer to the IBM® manual, *TSO Extensions User's Guide*.

## **OB1202: ATTACH FAILED FOR MONITOR TASK**

### **Explanation**

ISPF issued a non-zero return code in response to /ATTACH.

### **System action**

The ISPF session terminates.

### **User response**

Examine the return code and take appropriate action.

## **OB1203: MONITOR TASK COMPLETE, RETURN CODE = *cc***

### **Explanation**

The monitor task (OMEGAMON) terminated with the indicated return code.

### **System action**

The task terminates.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB1204: MONITOR TASK ABENDED, COMPLETION CODE = *cc***

### **Explanation**

The monitor task (OMEGAMON) terminated with the indicated abend code.

**System action**

The task terminates.

**User response**

Contact IBM Software Support.

**OB1210: PARM STRING LENGTH ERROR****Explanation**

The PARM string entered was too long, causing internal buffer overflow.

**System action**

The task terminates.

**User response**

Shorten the PARM string and retry the command.

**OB1211: UNABLE TO LOAD ISPLINK MODULE****Explanation**

The ISPF driver module was unable to load ISPLINK, the ISPF interface.

**System action**

The task terminates.

**User response**

Make sure a copy is available to the ISPF driver.

**OB1212: PANEL OMSPF01 NOT FOUND****Explanation**

The SPF driver module could not find the OMSPF01 panel.

**System action**

The task terminates.

**User response**

Be sure the panel is in the correct ISPF library and retry.

**OB1213: VARIABLE OMSPFD NOT IN PANEL OMSPF01****Explanation**

The OMSPFD variable was not in the panel.

**System action**

The task terminates.

**User response**

Make sure that the correct panel is installed and that user changes have not caused this field to be omitted.

## **OB1214: INSUFFICIENT SPACE FOR PQUERY FUNCTION**

### **Explanation**

ISPF indicated a short-on-storage condition.

### **System action**

The task terminates.

### **User response**

Increase the TSO address space region and retry.

## **OB1215: DATA TRUNCATION HAS OCCURRED**

### **Explanation**

Internal data truncation occurred within a panel variable.

### **System action**

The task terminates.

### **User response**

Make sure that the variable lengths shown in the panel have not been changed.

## **OB1216: VARIABLE NOT FOUND**

### **Explanation**

A variable that the ISPF driver requires could not be found in the ISPF subpools.

### **System action**

The task terminates.

### **User response**

This is an internal error. Contact IBM Software Support.

## **OB1217: INVALID SCREEN SIZE**

### **Explanation**

The screen parameters are invalid for ISPF mode. COLS and ROWS must match the TSO specification for the device.

### **System action**

The task terminates.

### **User response**

Correct the screen specification parameters (COLS and ROWS) and restart.

## **OB1220: UNKNOWN RETURN CODE FROM ISPLINK**

### **Explanation**

ISPLINK returned a code 20 or above to the calling task.

**System action**

The task terminates.

**User response**

Contact IBM Software Support.

**OB1250: cccccccc STORAGE REQUEST FAILED****Explanation**

The request for storage for module cccccccc failed.

**System action**

The TSO or ISPF mode task terminates.

**User response**

Increase the region size for the TSO address space.

**OB1251: ATTACH FAILED FOR cccccccc, RETURN CODE = xx****Explanation**

A non-zero return code from ATTACH of module cccccccc was received.

**System action**

The TSO or ISPF mode task terminates.

**User response**

Examine the error code and call your systems support. If the problem persists, contact IBM Software Support.

**OB1252: MODULE ABENDED, COMPLETION CODE = xxx****Explanation**

The module abended with the indicated return code.

**System action**

The application using the module is terminated.

**User response**

Examine the abend code and call your systems support. If the problem persists, contact IBM Software Support.

**OB1253: SET STFSMODE ON FAILED AT INITIALIZATION****Explanation**

OMEGAMON could not set full-screen mode on as requested for TSO mode.

**System action**

The task terminates.

**User response**

Contact IBM Software Support.

## **OB1254: SET STTMPMD OFF FAILED AT INITIALIZATION**

### **Explanation**

OMEGAMON could not set display manager off as requested for TSO mode.

### **System action**

The task terminates.

### **User response**

Contact IBM Software Support.

## **OB1255: SET STFMODE OFF FAILED AT TERMINATION**

### **Explanation**

OMEGAMON could not set full-screen mode off as requested for TSO mode.

### **System action**

The task terminates.

### **User response**

Contact IBM Software Support.

## **OB1256: SET STTMPMD ON FAILED AT TERMINATION**

### **Explanation**

OMEGAMON could not set display manager on as requested for TSO mode.

### **System action**

The task terminates.

### **User response**

Contact IBM Software Support.

## **OB1257: {TSO|ISPF} MODE TASK TERMINATED**

### **Explanation**

The task completed its processing with a normal termination.

### **System action**

The TSO or ISPF mode task terminates.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB1258: cccccccc FREE STORAGE REQUEST FAILED**

### **Explanation**

The free storage request has failed in module cccccccc.

**System action**

The task terminates.

**User response**

Examine the error code in the SYSLOG. If the problem persists, contact IBM Software Support.

**OB1259: LOAD cccccccc FAILED****Explanation**

The load request for module cccccccc has failed.

**System action**

The task terminates.

**User response**

Examine the error code in the SYSLOG. Ensure that load module cccccccc is in the proper load library. If the problem persists, contact IBM Software Support.

**OB1260: DELETE cccccccc FAILED****Explanation**

The delete request for module cccccccc has failed.

**System action**

The task terminates.

**User response**

Contact IBM Software Support.

**OB1261: GTTERM FAILED****Explanation**

The request to get terminal attributes has failed.

**System action**

The task terminates.

**User response**

Contact IBM Software Support.

**OB1401: MISSING USER ID****Explanation**

The user ID field in the logon panel is missing.

**System action**

OMEGAMON redisplays the logon panel.

**User response**

Enter the required user ID.

## **OB1402: MISSING PASSWORD**

### **Explanation**

The password field in the logon panel is missing.

### **System action**

OMEGAMON redisplay the logon panel.

### **User response**

Enter your password.

## **OB1404: RE-ENTER NEW PASSWORD FOR VERIFICATION**

### **Explanation**

The system asks the user to re-enter the new password.

### **System action**

The system waits for the user to re-enter the new password to verify that the new password is correct.

### **User response**

Enter the new password in the new password field.

## **OB1405: VERIFICATION OF NEW PASSWORD FAILED**

### **Explanation**

When the password was entered a second time for verification, it did not match the new password.

### **System action**

The system waits for the user to attempt another logon.

### **User response**

Enter the correct password.

## **OB1501: INVALID ARGUMENT: cc**

### **Explanation**

The argument field contains invalid data for the command that appears above this message on the screen.

### **System action**

OMEGAMON does not process the command.

### **User response**

Enter appropriate data in the command argument field.

## **OB1502: INSUFFICIENT MEMORY FOR SCRN COMMAND**

### **Explanation**

OMEGAMON does not have sufficient memory to build the screen member name lists from the various sources (main storage, KOBICSPROC, and RKOMPCSV) that the SCRN command displays.

**System action**

OMEGAMON does not process the command.

**User response**

Provide additional storage resources for the executing OMEGAMON.

**OB1503: DATA SET EMPTY****Explanation**

There were no members in the indicated KOBICSPROC data set for the SCRN command to display.

**System action**

The SCRN command displays member names in the other KOBICSPROC data sets.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB1504: NO MEMBERS FOUND WITHIN RANGE (cccccccc THRU cccccccc)****Explanation**

OMEGAMON found no screen names within the from/through range specified by the SCRN command.

**System action**

None.

**User response**

Enter a different from/through selection range.

**OB1505: TOO MANY MEMBERS SPECIFIED****Explanation**

There are too many screen space members for the LSCR command to load into main storage. The maximum number is 62.

**System action**

OMEGAMON does not load the screen spaces into main storage.

**User response**

Reduce the number of members to load.

**OB1506: INVALID MEMBER NAME cccccccc****Explanation**

The LSCR command detected a screen member name that is too long or that contains invalid characters.

**System action**

OMEGAMON does not load the screen into main storage.

**User response**

Correct the screen member name on the LSCR command.

## **OB1507: LOAD FAILED - MEMBER ccccccc NOT FOUND**

### **Explanation**

The user specified screen space ccccccc with an LSCR command; OMEGAMON did not find it in the KOBICSPROC library.

### **System action**

OMEGAMON ignores specification of screen space ccccccc and loads any other specified screen spaces.

### **User response**

Make sure that the specified screen space exists in KOBICSPROC or RKOMPCSV library. Check KOBICSPROC concatenation.

## **OB1508: nnn MEMBERS LOADED**

### **Explanation**

The LSCR command successfully loaded nnn screen spaces to main storage.

### **System action**

The command executes.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB1509: ENTER MEMBER NAMES TO LOAD**

### **Explanation**

The LSCR command attempted to load screen spaces to main storage, but there were no member names specified.

### **System action**

The command terminates.

### **User response**

Enter member names following the LSCR command.

## **OB1521: MEMBER ccccccc DELETED BOTH IN-STORAGE AND FROM RKOMPCSV**

### **Explanation**

The user specified screen space ccccccc with a DELTB command, and OMEGAMON successfully deleted it from main storage (in-storage) and RKOMPCSV.

### **System action**

The command executes.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB1522: MEMBER NAME - ccccccc NOT FOUND IN-STORAGE**

### **Explanation**

The user specified screen space ccccccc with a DELTI or DELTB command; OMEGAMON did not find it in main storage (in-storage).

### **System action**

None.

### **User response**

Verify that the screen space name is correct.

## **OB1523: MEMBER ccccccc DELETED IN-STORAGE**

### **Explanation**

OMEGAMON successfully deleted screen space ccccccc from main storage (in-storage) as a result of DELTB or DELTI command.

### **System action**

The command executes.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB1524: MEMBER ccccccc DELETED FROM RKOMPCSV**

### **Explanation**

OMEGAMON successfully deleted screen space ccccccc from RKOMPCSV as a result of DELTB or DELTD command.

### **System action**

The command executes.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB1525: DELETE FAILED - ccccccc NOT FOUND IN RKOMPCSV**

### **Explanation**

The user specified screen space ccccccc with a DELTB or DELTD command, and OMEGAMON did not find it in RKOMPCSV.

### **System action**

None.

### **User response**

Verify that the screen space name is correct.

## **OB1531: MEMBER *oldname* RENAMED TO *newname* BOTH IN-STORAGE AND IN RKOMPCSV**

### **Explanation**

The user specified screen space *oldname* with a RENMB command, and OMEGAMON successfully renamed it to *newname* in main storage (in-storage) and in RKOMPCSV.

### **System action**

The command executes.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB1532: MEMBER NAME - ccccccc NOT FOUND IN-STORAGE**

### **Explanation**

The user specified screen space *ccccccc* with a RENMI or RENMB command; OMEGAMON did not find it in main storage (in-storage).

### **System action**

None.

### **User response**

Verify that the screen space name is correct.

## **OB1533: MEMBER *oldname* RENAMED TO *newname* IN-STORAGE**

### **Explanation**

OMEGAMON successfully renamed screen space *oldname* to *newname* in main storage (in-storage) as a result of RENMI or RENMB command.

### **System action**

The command executes.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB1534: MEMBER *oldname* RENAMED TO *newname* IN RKOMPCSV**

### **Explanation**

OMEGAMON successfully renamed screen space *oldname* to *newname* in RKOMPCSV as a result of a RENMD or RENMB command.

### **System action**

The command executes.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB1535: RENAME FAILED - ccccccc NOT FOUND IN RKOMPCSV**

### **Explanation**

The user specified screen space ccccccc on a RENMD or RENMB command, and OMEGAMON did not find it in main storage (in-storage).

### **System action**

None.

### **User response**

Verify that the screen space name is correct.

## **OB1537: RENAME FAILED - ccccccc DIRECTORY FULL**

### **Explanation**

The PDS directory for file ccccccc is full and cannot contain additional screen space names.

### **System action**

OMEGAMON does not rename the screen space in RKOMPCSV.

### **User response**

Compress the PDS library or provide additional directory space.

## **OB1538: RENAME FAILED - ccccccc ALREADY EXISTS IN-STORAGE**

### **Explanation**

The user issued a RENMI or RENMB command with a screen space name ccccccc that already exists in main storage (in-storage) and cannot be renamed.

### **System action**

OMEGAMON does not change the original screen space name.

### **User response**

Correct the new screen space name and retry the command.

## **OB1539: RENAME FAILED - ccccccc ALREADY EXISTS IN RKOMPCSV**

### **Explanation**

The user issued a RENMD or RENMB command with a screen space name ccccccc that already exists in RKOMPCSV and cannot be renamed.

### **System action**

OMEGAMON does not change the original screen space name.

### **User response**

Correct the new screen space name and retry the command.

## **OB2001: DATA-ONLY SPACE *cccccccc* DOES NOT EXIST**

### **Explanation**

The data-only space *cccccccc* specified in the command cannot be found. *cccccccc* is the name of the data-only space or the first 1–7 characters of the data-only space name. If *cccccccc* is displayed in the message as less than 8 characters, it means that there were no data-only spaces found beginning with the characters *cccccccc*.

### **System action**

The command is terminated.

### **User response**

Correct the data-only space name and reissue the command. The PEEK command may be used to find the names of data-only spaces owned by a job.

## **OB2002: DATA-ONLY SPACE *cccccccc* IS NOT OWNED BY JOB *aaaaaaaa***

### **Explanation**

Job *aaaaaaaa* is not the owner of data-only space *cccccccc*. *aaaaaaaa* is the jobname given in the command or the name of the job identified by the ASID.

### **System action**

The command terminates.

### **User response**

Correct the data-only space name, the jobname, or ASID and reissue the command. The PEEK command may be used to find the names of data-only spaces owned by a job's TCBs. The OSPC command may be used to find the jobname and ASID of the owning TCB of a data-only space.

## **OB2003: *aaaaaaaa ccccccc* HAS BEEN DELETED**

### **Explanation**

The TCB owning data-only space *aaaaaaaa* of type *ccccccc* has deleted the space or has itself been terminated. The space no longer exists.

### **System action**

The command is terminated.

### **User response**

None.

## **OB2005: DATA-ONLY SPACE PROCESSING UNAVAILABLE - RC=*nnnn***

### **Explanation**

Due to an internal OMEGAMON error, OMEGAMON is unable to perform data-only space processing.

### **System action**

The command terminates.

### **User response**

Contact IBM Software Support with the return code.

## **OB2006: DATA-ONLY SPACE NAME MUST BE 8 CHARACTERS OR LESS**

### **Explanation**

A data-only space name of greater than 8 characters was entered as input.

### **System action**

The command terminates.

### **User response**

Correct the name of the data-only space. The OSPC command may be issued to obtain the name of all data-only spaces in the system.

## **OB2007: DATA-ONLY SPACE NAME IS A REQUIRED PARAMETER**

### **Explanation**

A data-only space command (e.g., SLST, SZAP) was issued without the name of a data-only space as input.

### **System action**

The command terminates.

### **User response**

Correct the command input by supplying a data-only space name as the second parameter. The OSPC command may be issued to obtain the name of all data-only spaces in the system.

## **OB2008: ALESERV ADD NON-ZERO RETURN CODE, RC = *nn***

### **Explanation**

An attempt to obtain addressability to a data space failed with return code *nn*.

### **System action**

The command terminates.

### **User response**

Ensure that the data space input to the affected command has not been deleted. If the data space still exists, contact IBM Software Support.

## **OB2009: HPSERV return code, RC = *xx***

### **Explanation**

An attempt to access a Hiperspace™™ failed with return code *xx*.

### **System action**

The command terminates.

### **User response**

Contact IBM Software Support.

## **OB2010: ACCESS TO *aaaaaaaa* *ccccccc* IS NOT AUTHORIZED**

### **Explanation**

An attempt was made to access a non-shareable data-only space *aaaaaaaa* of type *ccccccc* without authorization.

**System action**

The command terminates.

**User response**

Authorization may be obtained to non-shareable data-only spaces by issuing the command .DSAON.

**OB2011: ACCESS TO DATA SPACE *aaaaaaaa* DENIED, SCOPE UNKNOWN****Explanation**

An attempt was made to access data space *aaaaaaaa*, but OMEGAMON was not able to determine the SCOPE of the data space.

**System action**

The command terminates.

**User response**

Contact IBM Software Support.

**OB2100: RMF™ SUBROUTINE LOAD MODULE OBRMFS*nn* NOT AVAILABLE****Explanation**

OMEGAMON attempted to access module OBRMFS*nn* but failed.

**System action**

The command terminates.

**User response**

Check to make sure that the OBRMFS*nn* modules were copied from the OMEGAMON distribution tape. If the modules are in the OMEGAMON load library, contact IBM Software Support.

**OB2101: RMF™ LEVEL *nnnn* IS NOT IN TABLE****Explanation**

An attempt was made to set the RMF™ level to a level that OMEGAMON did not recognize.

**System action**

The command terminates.

**User response**

Check to make sure that the correct RMF™ level is entered on the input screen. If it is entered correctly but OMEGAMON does not recognize it, contact IBM Software Support. You may need to receive support for a new level of RMF™.

**OB2102: INPUT MUST BE EITHER *nnn* OR *n.n.n*****Explanation**

The operand on the RMFS command must have the format *nnn* or *n.n.n*.

**System action**

The command terminates.

**User response**

Correct the input to the RMFS command and press ENTER.

**OB2103: RMF™ LEVEL HAS BEEN DYNAMICALLY DETERMINED - COMMAND INVALID****Explanation**

OMEGAMON determined the level of RMF™ dynamically. RMFS cannot be used to override the RMF™ level in this situation.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB2104: RMF™ LEVEL UNCHANGED - UNABLE TO LOAD MODULE *nnnnnnnn*****Explanation**

An attempt was made to change to a new level of RMF™, however, the required load module was not available.

**System action**

The command terminates. The RMF™ level stays unchanged.

**User response**

Make sure that the load module is copied from the installation tape. If the module is not on the tape, contact IBM Software Support.

**OB2200: SUBSYSTEM *aaaa* REQUEST RETURNED RC=*bbbb* AND ERRCODE *cccccccc*****Explanation**

A call to the Candle® Subsystem has resulted in a non-zero return code.

***aaaa***

Identifies the type of request: INIT or REQ.

***bbbb***

Identifies the return code.

**4**

Internal error

A common cause of this return code is a version or maintenance level mismatch between the running Candle® subsystem and the product issuing the message. If you have multiple SMP/E environments make sure that all have the same Candle® subsystem FMID and maintenance installed.

**8**

Subsystem not active

**20**

Subsystem module not found

***cccccccc***

Identifies the error code.

**System action**

The interface to the Candle® Subsystem returns the address of the static device table that might be obsolete. You may also need a later version of the Candle® Subsystem.

**User response**

Contact IBM Software Support.

**OB4101: MEMORY FOR USER PROFILE TABLES NOT AVAILABLE****Explanation**

There is not enough memory available for the user profile tables.

**System action**

The command terminates.

**User response**

Increase the region size and retry.

**OB4222: UNABLE TO LOCATE REQUIRED LEVEL-DEPENDENT BASE MODULE  
KOBASnnn****Explanation**

OMEGAMON attempted to locate the corresponding base module required for the current operating system level. The required module could not be found.

**System action**

OMEGAMON terminates.

**User response**

Make sure that OMEGAMON is executed at the operating system level for which your installation is licensed. Contact IBM® Corporation for licensing and sales information.

**OB4223: CURRENT OPERATING SYSTEM LEVEL NOT SUPPORTED****Explanation**

OMEGAMON has determined that the current operating system level is not supported. Only MVS/SP™™ 1, 2, and 3 are supported; earlier versions are not supported. (SP™™ 1 support is further limited to SP™™ 1.3 and above.)

**System action**

OMEGAMON terminates.

**User response**

Run OMEGAMON only on those systems with supported operating system levels.

**OB7001: OVUSERcc DATA FILE NOT FOUND****Explanation**

The OVUSERcc DATA file specified by USER xx in the startup parms or the .USR command was not found.

**System action**

OMEGAMON® uses all default values for execution parameters. The default OVUSER DATA file is 99.

**User response**

Continue with OMEGAMON® initialization or restart OMEGAMON® specifying the correct USER startup parameter value, or reissue the .USR command specifying the correct parameter.

**OB7002: INVALID SWITCH SETTING - MUST BE ON OR OFF****Explanation**

The indicated parameter must be specified as either ON or OFF.

**System action**

OMEGAMON® uses the default value.

**User response**

Correct the parameter value to specify ON or OFF at next execution.

**OB7003: INVALID PARAMETER****Explanation**

The indicated word is not a valid OMEGAMON® startup parameter.

**System action**

OMEGAMON® ignores the entire parameter group (including any possible subordinate keywords).

**User response**

Check for spelling problems. Check to make sure that a previous parameter was not continued incorrectly.

**OB7004: INVALID SYNTAX****Explanation**

The format of the indicated input stream is invalid.

**System action**

OMEGAMON® ignores either all or part of the current parameter group.

**User response**

Correct the formatting error. Ensure that all required delimiters (commas, parentheses, and so on) are entered correctly.

**OB7005: INVALID CHARACTER - ACCEPTED AS DELIMITER****Explanation**

An invalid character was found in the input stream.

**System action**

The character is assumed to be a delimiter.

**User response**

Enter a valid character if a delimiter was not intended.

## **OB7006: INVALID KEYWORD**

### **Explanation**

The indicated word is not a valid keyword for the current parameter group being processed.

### **System action**

OMEGAMON® ignores the keyword.

### **User response**

Check for possible spelling or continuation errors.

## **OB7007: INVALID KEYWORD VALUE**

### **Explanation**

The value specified for the indicated parameter keyword is invalid.

### **System action**

OMEGAMON® ignores the keyword.

### **User response**

Specify the keyword value as required.

## **OB7008: INVALID HEX DATA**

### **Explanation**

EBCDIC characters were specified for a keyword requiring hexadecimal data.

### **System action**

OMEGAMON® ignores the keyword.

### **User response**

Correct the keyword value.

## **OB7009: INVALID NUMERIC DATA**

### **Explanation**

EBCDIC characters were specified for a keyword requiring numeric data.

### **System action**

OMEGAMON® ignores the keyword.

### **User response**

Correct the keyword value.

## **OB7010: KEYWORD VALUE OR LENGTH BELOW ALLOWED MIN**

### **Explanation**

The value specified for the indicated keyword is either too short (character) or too small (integer or hex).

### **System action**

OMEGAMON® ignores the keyword.

**User response**

Check the minimum that can be specified for the keyword and correct the keyword value.

**OB7011: KEYWORD VALUE OR LENGTH ABOVE ALLOWED MAX****Explanation**

The value specified for the indicated keyword is either too long (character) or too large (integer or hex).

**System action**

OMEGAMON® ignores the keyword.

**User response**

Check the maximum that can be specified for the keyword and correct the keyword value.

**OB7012: DUPLICATE PARAMETER****Explanation**

A duplicate keyword has been found in the input stream.

**System action**

OMEGAMON® ignores the duplicate parameter.

**User response**

Remove or correct the duplicate keyword.

**OB7013: MISSVM LIMIT EXCEEDED****Explanation**

The internal buffers required to hold the data specified by the OVUSER MISSVM parameter have overflowed.

**System action**

The MISSVM keyword specifications that will fit in storage will be accepted with the remainder ignored.

**User response**

Increase the virtual storage size of the OMEGAMON® for VM virtual machine or specify few MISSVM keyword values.

**OB7014: MISSDA LIMIT EXCEEDED****Explanation**

The internal buffers required to hold the data specified by the OVUSER MISSDA parameter have overflowed.

**System action**

The MISSDA keyword specifications that will fit in storage will be accepted with the remainder ignored.

**User response**

Increase the virtual storage size of the OMEGAMON® for VM virtual machine or specify few MISSDA keyword values.

## **OB7017: USERID OR ACCOUNT NOT SPECIFIED**

### **Explanation**

For the PGNAMES parameter a USERID= or ACCOUNT= keyword was expected and not found.

### **System action**

OMEGAMON® ignores the entire PGNAMES parameter group.

### **User response**

Check for a spelling error to ensure that either a USERID= or an ACCOUNT= keyword is specified.

## **OB7018: UNEXPECTED END-OF-FILE RECEIVED**

### **Explanation**

While processing a continuation, the end of the OVUSERcc DATA file was reached.

### **System action**

OVUSERcc parameter processing terminates.

### **User response**

Check to see if the OVUSER DATA file is complete. If not, enter the missing parameter keyword(s).

## **OB7019: NAME= KEYWORD MISSING**

### **Explanation**

The NAME keyword was not specified on the PGNAMES statement.

### **System action**

OMEGAMON® ignores the entry.

### **User response**

The PGNAMES statement requires a name for each group being defined. Specify a name.

## **OB7020: UNBALANCED OR INVALID USE OF PARENTHESES**

### **Explanation**

Either an unexpected parenthesis was detected or an expected parenthesis was not detected.

### **System action**

OMEGAMON® ignores either the current keyword or the remaining parameter keywords.

### **User response**

Add or remove parentheses as required.

## **OB7021: MAXIMUM 64 PERFORMANCE GROUP NAMES ALLOWED**

### **Explanation**

For the PGNAMES parameter group more than 64 performance groups were specified.

### **System action**

OMEGAMON® ignores the remaining performance groups.

**User response**

Remove less important performance groups so that the maximum will not be exceeded.

**OB7022: INVALID cccccc THRESHOLD GROUP KEYWORD****Explanation**

A keyword for the DEFVMTG, DASDTG, or RSCSTG parameter was entered that is not a valid exception override name.

**System action**

OMEGAMON® ignores the keyword.

**User response**

Check for a possible spelling error. For DEFVMTG, ensure that the exception name entered is a valid VM exception and not a SYSTEM exception. For DASDTG, ensure that the exception name entered is one of the DASD exceptions. For RSCSTG, ensure that the exception name entered is RSCA or RSCQ.

**OB7023: ON/OFF EXPECTED, ON ASSUMED****Explanation**

The indicated parameter must be specified as either ON or OFF.

**System action**

The keyword value defaults to ON.

**User response**

Correct the parameter value to specify ON or OFF.

**OB7024: EXPECTED PARENTHESIS NOT FOUND****Explanation**

A parenthesis was expected at or near the column indicated by an asterisk.

**System action**

OMEGAMON® ignores the current keyword.

**User response**

Check the format for the keyword and make the appropriate corrections.

**OB7025: EXPECTED ON OR AUTO, AUTO ASSUMED****Explanation**

The indicated parameter must be specified as either ON or AUTO.

**System action**

Missing VM analysis for this VM user ID defaults to AUTO.

**User response**

Correct the parameter value to specify ON or AUTO.

## **OB7026: THRESHOLD EXCEEDS THE MAXIMUM ALLOWED, MAXIMUM WILL BE USED**

### **Explanation**

The value specified for the THRESH= keyword is larger than the value allowed for an exception name.

### **System action**

OMEGAMON® uses the maximum value allowed.

### **User response**

Check the maximum value for this exception name and correct the keyword value.

## **OB7027: THRESHOLD LESS THAN MINIMUM ALLOWED, MINIMUM WILL BE USED**

### **Explanation**

The value specified for the THRESH= keyword is less than the value allowed for an exception name.

### **System action**

OMEGAMON® uses the minimum value allowed.

### **User response**

Check the minimum value for this exception name and correct the keyword value.

## **OB7028: EXPECTED TIME=, SS=, OR SL= KEYWORD NOT RECEIVED**

### **Explanation**

An invalid keyword was received for the TSF parameter group. The only valid keywords are TIME=, and either SS= or SL=.

### **System action**

OMEGAMON® ignores the remaining TSF keywords.

### **User response**

Check for possible spelling problems.

## **OB7029: BOX= KEYWORD INVALID FOR VM EXCEPTIONS. ENTER OK TO CONTINUE OR C TO CANCEL.**

### **Explanation**

The BOX= keyword was specified and is not valid for a VM exception.

### **System action**

OMEGAMON® ignores the BOX= keyword.

### **User response**

Reply OK or C, then remove the BOX= keyword from this exception.

## **OB7030: CHNM CPUID INVALID**

### **Explanation**

The value specified for the CPUID= keyword is invalid (must be between 0 and 15) for the CHNM parameter group.

### **System action**

OMEGAMON® skips the CPUID= keyword and subsequent CHANNELS= keywords.

### **User response**

Specify the correct CPU identification.

## **OB7031: CHNM CHANNEL NUMBER INVALID**

### **Explanation**

One of the values specified for the CHANNELS= keywords is invalid for the CHNM parameter group (must be between 0 and 31).

### **System action**

OMEGAMON® ignores the channel ID value.

### **User response**

Specify the correct channel ID.

## **OB7032: CPUID= KEYWORD MISSING**

### **Explanation**

The CPUID= keyword for the CHNM parameter group was expected and not received.

### **System action**

OMEGAMON® ignores the subsequent CHANNELS= parameter.

### **User response**

Check for spelling errors or enter a CPUID= keyword preceding the CHANNELS= keyword.

## **OB7033: CHANNELS= KEYWORD MISSING**

### **Explanation**

The CHANNELS= keyword for the CHNM parameter group was expected and not received.

### **System action**

OMEGAMON® ignores the current CPUID= value.

### **User response**

Check for spelling errors or enter a CHANNELS= keyword following the CPUID= keyword.

## **OB7036: DUPLICATE KEYWORD FOUND**

### **Explanation**

OMEGAMON® encountered a duplicate keyword in OVUSER.

**System action**

OMEGAMON® displays the message and asks if you wish to continue.

**User response**

Reply OK to continue processing and ignore the error or type C to cancel and correct the OVUSER file.

**OB7037: INCLUDE OR EXCLUDE NOT SPECIFIED****Explanation**

OMEGAMON® requires either an INCLUDE or EXCLUDE list to be specified with the FORCE parameter in OVUSER.

**System action**

OMEGAMON® displays the message and asks if you wish to continue.

**User response**

Reply OK to continue processing and ignore the error or type C to cancel and correct the OVUSER file.

**OB7038: FORCE PARAMETER VALID ONLY FOR VM EXCEPTIONS****Explanation**

OMEGAMON® encountered the FORCE parameter on an exception that is not VM user-related. Force processing is not valid for other than user-related exceptions.

**System action**

OMEGAMON® displays the message and asks if you wish to continue.

**User response**

Reply OK to continue processing and ignore the error or type C to cancel and correct the OVUSER file.

**OB7039: SCREEN SPACE NOT FOUND****Explanation**

The indicated screen space name (with filetype PROCFILE) was not found on any accessed CMS disk.

**System action**

The screen space name is accepted. The error message displays as a warning.

**User response**

Correct the screen space name or create a new screen space with this name.

**OB7040: TABLE WORK AREA OVERFLOW****Explanation**

An internal storage buffer overflowed processing the indicated parameter or keyword.I

**System action**

Processing terminates for the current parameter.

**User response**

Increase your virtual storage size or decrease the number of operands of this parameter.

## **OB7041: INTERNAL ERROR OBTAINING WORK BUFFERS**

### **Explanation**

An internal error occurred attempting to acquire storage.

### **System action**

OVUSERcc processing terminates.

### **User response**

Call IBM Software Support Services.

## **OB7042: KEYWORD DOES NOT APPLY TO THIS EXCEPTION**

### **Explanation**

The indicated keyword does not pertain to the current exception name being processed.

### **System action**

OMEGAMON® ignores the keyword.

### **User response**

Remove the keyword from this exception parameter.

## **OB7101: ERROR, COMMAND ARGUMENT UNKNOWN**

### **Explanation**

An invalid operand was given to the command.

### **System action**

The command terminates.

### **User response**

For the proper operands, see the extended help (;*commandname*) for the command. Correct the operand and retry.

## **OB7102: USER TABLE HAS BEEN DELETED**

### **Explanation**

OMEGAMON deleted the user table.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB7103: NAME NOT IN TABLE**

### **Explanation**

The requested name cannot be found in the tables.

**System action**

The command terminates.

**User response**

Correct the name and retry the command.

**OB7104: cccccccc HAS BEEN DELETED****Explanation**

The indicated memory location symbol was deleted from the symbolic address table.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB7105: cccccccc HAS BEEN ADDED TO THE TABLE****Explanation**

The indicated memory location symbol was added to the symbolic address table.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB7106: TABLE DOES NOT EXIST****Explanation**

No entries have been defined in the table.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB7107: WORKAREA OVERFLOW****Explanation**

The internal work area for string manipulation has overflowed.

**System action**

The command terminates.

**User response**

Use shorter strings to define the storage locations.

## **OB7108: PLPA MZAP CANNOT CROSS PAGE BOUNDARY**

### **Explanation**

The zap would cross a page boundary and this is not allowed.

### **System action**

Command terminates.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB7109: PLPA PAGES FIXED**

### **Explanation**

OMEGAMON fixed PLPA pages as requested.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB7110: MEMORY ZAP SUCCESSFUL**

### **Explanation**

OMEGAMON successfully executed the MZAP command.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB7111: VERIFY REJECT - MEMORY NOT ZAPPED**

### **Explanation**

The verify data in the command does not match the data in storage.

### **System action**

The command terminates.

### **User response**

Correct the data and retry.

## **OB7112: SCAN DATA NOT FOUND**

### **Explanation**

The requested data could not be found within the scan limits.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB7113: DYNAMIC ADDRESS NOT RESOLVED****Explanation**

A symbol in a dynamic address string could not be resolved.

**System action**

The command terminates.

**User response**

Correct the symbol and retry the command.

**OB7114: MODULE NOT AVAILABLE****Explanation**

An OMEGAMON module address was found to be 0, indicating that it is not available for this command.

**System action**

The command terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB7115: OMEGAMON NAME INVALID IN CROSS MEMORY****Explanation**

The cross memory commands are not allowed against this address space.

**System action**

The command terminates.

**User response**

Use the appropriate local commands.

**OB7117: INDIRECT ADDRESS IS 0****Explanation**

The address pointer value was 0 when an indirect request (? or %) was encountered while interpreting the address string.

**System action**

The command terminates.

**User response**

None. This is not necessarily an error.

## **OB7118: JOB NOT FOUND**

### **Explanation**

The requested address space or jobname cannot be found.

### **System action**

The command terminates.

### **User response**

Correct the name and retry.

## **OB7119: REGION DOES NOT BELONG TO CL/SUPPERSESSION and CL\GATEWAY**

### **Explanation**

A cross-memory zap was attempted on an unauthorized region.

### **System action**

The command terminates.

### **User response**

Make sure that the zap is being applied to the correct region.

## **OB7120: USE cccc FOR OMEGAMON PRIVATE AREA**

### **Explanation**

A cross memory command was used where a local command is appropriate.

### **System action**

The command terminates.

### **User response**

Use the local command format.

## **OB7121: ADDRESS IN COMMON AREA - USE cccc**

### **Explanation**

A cross memory command was used where a local command is appropriate.

### **System action**

The command terminates.

### **User response**

Use the local command format.

## **OB7122: GENERATED ADDRESS INVALID - xxxxxxxx**

### **Explanation**

The displayed address was developed while interpreting the address string. It is not valid for the named address space.

**System action**

The command terminates.

**User response**

Correct as necessary.

**OB7123: TARGET ADDRESS INVALID - xxxxxxxx****Explanation**

The displayed address was used to fetch data and is not a valid target address.

**System action**

The command terminates.

**User response**

Correct and retry.

**OB7125: VERIFY FAILED - ACTUAL CODE WAS: nn****Explanation**

The verify data does not match the storage data.

**System action**

The command terminates.

**User response**

Correct and retry.

**OB7126: INVALID RETURN CODE - cc = nn****Explanation**

The SRB that was scheduled returned an unknown code.

**System action**

The command terminates.

**User response**

Contact IBM Software Support.

**OB7127: {TARGET|INDIRECT} ADDRESS xxxxxxxx IS STORE PROTECTED****Explanation**

The target/indirect address xxxxxxxx is store-protected and should not be modified.

**System action**

The command terminates.

**User response**

Use the action character if APF-authorized and retry.

## **OB7128: {TARGET|INDIRECT} ADDRESS xxxxxxxx IS FETCH PROTECTED**

### **Explanation**

The target/indirect address xxxxxxxx is fetch-protected and cannot be read.

### **System action**

The command terminates.

### **User response**

Use the action character if APF-authorized and retry.

## **OB7129: {TARGET|INDIRECT} ADDRESS xxxxxxxx DOES NOT EXIST**

### **Explanation**

The target/indirect address xxxxxxxx cannot be located.

### **System action**

The command terminates.

### **User response**

Correct the address and retry.

## **OB7130: TRUNCATION HAS OCCURRED AT PAGE BOUNDARY**

### **Explanation**

The current display truncated because of an invalid address. The next page of storage is either undefined or fetch-protected.

### **System action**

The command terminates.

### **User response**

Correct the address or length and retry.

## **OB7131: SUBSTITUTION SYMBOL NOT DEFINED - ccccccc**

### **Explanation**

The MDEF command could not define the substitution symbol ccccccc. OMEGAMON cannot define a substitution symbol that begins with an ampersand (&).

### **System action**

The command terminates.

### **User response**

Replace the ampersand with another character and retry the MDEF command.

## **OB8110: NOT ENOUGH REGION FOR WORKAREA - nnnK MORE NEEDED**

### **Explanation**

The specified command could not obtain a work area.

**System action**

The command terminates.

**User response**

Increase the region size of the address space by a minimum of *nnnK*. Alternatively, use the WSIZ minor of PEEK or FNDU to decrease the work area size by *nnnK*.

**OB8111: WARNING - WSIZ TOO SMALL ADDR= xxxxxx, SIZE = yyyyyy, USED =zzzzzz. Refer to documentation for the .SET PEEKSIZE command.**

**Explanation**

The FNDU or PEEK SRB to collect data failed to complete its task because the data area it needed was too small.

**System action**

None.

**User response**

Use the WSIZ minor of FNDU or PEEK to increase the work area. Refer to the product-specific documentation for the .SET PEEKSIZE command.

**OB8112: DATA COLLECTION INITIATED****Explanation**

The command was issued with the action character, and OMEGAMON was collecting.

**System action**

None.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB8113: WARNING cccc FAILED VALIDITY CHECK****Explanation**

The SRB to collect data failed to complete its task because a control block does not contain valid data. The variable *cccc* is one of the following control blocks:

- ASCB
- DSAB
- JFCB
- JFCX
- TCB

**System action**

None.

**User response**

Re-enter the command. You may want to list the control block and verify its contents.

**OB8114: PEEK routine detected a possible loop while scanning a chain. Control block chain was *text*. Refer to documentation for the .SET LOOPCOUNT command.**

**Explanation**

The SRB to collect data failed to complete its task (possibly because the SRB is in a loop). *text* indicates which chain was being processed at the time of loop detection.

**System action**

None.

**User response**

Refer to the product-specific documentation for the .SET LOOPCOUNT command. If the problem persists, contact IBM Software Support.

**OB8115: WARNING - INVALID RETURN CODE - RC = *nn***

**Explanation**

The SRB routine returned a nonstandard code.

**System action**

The PEEK process terminates.

**User response**

If the error persists, contact IBM Software Support.

**OB8116: DANGER - INSUFFICIENT SQA, COMMAND ABORTED**

**Explanation**

There is insufficient SQA.

**System action**

The command aborts.

**User response**

Try the command later when more SQA is available.

**OB8117: INSUFFICIENT MEMORY FOR SRB SAVE AREA**

**Explanation**

There is insufficient memory for the save area.

**System action**

The command terminates.

**User response**

Try the command later when there is more memory available.

## **OB8118: SRBD - SRB FAILED DURING INITIALIZATION**

### **Explanation**

The SRB failed during initialization.

### **System action**

The command terminates.

### **User response**

Contact IBM Software Support.

## **OB8121: CHANNEL SET NOT DEFINED**

### **Explanation**

The user requested an invalid channel set.

### **System action**

Command processing terminates.

### **User response**

Correct command parameters and retry.

## **OB8130: COMMAND TEXT IS TOO LONG**

### **Explanation**

The command text can be a maximum of 126 characters.

### **System action**

The command is not executed.

### **User response**

Specify the command text so that it is no more than 126 characters.

## **OB8131: INVALID CHARACTER AFTER SYSTEM NAME**

### **Explanation**

The system name was not followed by a blank space or by a comma.

### **System action**

The command is not executed.

### **User response**

Supply a system name followed by a blank space or a comma.

## **OB8132: SYSTEM NAME IS TOO LONG, MUST BE 1–8 CHARS**

### **Explanation**

System names must be from 1–8 characters in length.

### **System action**

The command is not executed.

**User response**

Supply a valid system name.

**OB8202: CPU NOT DEFINED****Explanation**

The CPU is not defined in the PCCA.

**System action**

None.

**User response**

Specify a CPU that is defined to your system (see the IBM® OS/VS2 System Programming Library or MVS/Extended Architecture Debugging Handbooks for a CPU definition).

**OB8203: NO CHANNEL AVAILABILITY TABLE****Explanation**

The specified channel does not exist.

**System action**

None.

**User response**

Specify a channel number that exists on the system.

**OB8204: LINK ERROR, CODE = {8|12}****Explanation**

The external routine for GDEV encountered a link error.

**System action**

The command terminates.

**User response**

Contact IBM Software Support.

**OB8205: INVALID INPUT - *aaaaaaaaaaaaaaaa*****Explanation**

An invalid device class was entered as input to the GLST command.

**System action**

The GLST command is terminated.

**User response**

Correct the invalid input parameter. The help text for the GLST command displays the valid input parameters.

## **OB8206: PROCESSING ERROR, DEVICE CLASS *aaaa*, RC=*nn***

### **Explanation**

The EDTINFO interface routine used by the GLST command returned with a non-zero return code, *nn*, processing device class *aaaa*.

### **System action**

Processing continues, but that device class will not be displayed.

### **User response**

Contact IBM Software Support.

## **OB8207: SUBSYSTEM RETURN CODE *aaaaaaaa bbbbbbbb cccccc ddddddd***

### **Explanation**

A call to the Candle® Subsystem has resulted in a non-zero return code during execution of the GDEV command.

#### **aaaaaaaa**

Identifies the Subsystem return code.

#### **bbbbbbbb**

Identifies the function return code.

#### **ccccccc**

Identifies the subroutine invocation return code.

#### **ddddddd**

Identifies the subroutine invocation reason code.

### **System action**

The GDEV command continues to process, however, there will be no data for devices defined as dynamic.

### **User response**

Contact IBM Software Support.

## **OB8208: CN SUBSYSTEM NOT INITIALIZED**

### **Explanation**

A contact to the Candle® Subsystem cannot be made because the Candle® Subsystem has not been initialized by this OMEGAMON session.

### **System action**

The GDEV command continues to process, however, there will be no data for devices defined as dynamic.

### **User response**

Check to see that the Candle® Subsystem is running on the system. If it is not running, start it. If it is running, contact IBM Software Support.

## **OB8209: UCB INFORMATION UNAVAIABLE. RC=*xxxxxxxx yyyyyyyy zzzzzzz***

### **Explanation**

A call to internal OMEGAMON service to obtain UCB information resulted in a non-zero return code.

#### **xxxxxxxx**

Register 15 contains the return code.

yyyyyyyy

Register 0 contains the reason code.

zzzzzzzz

Register 1 contains the associated reason code.

**System action**

The OMEGAMON command is terminated.

**User response**

Contact IBM Software Support.

**OB8277: SYNTAX ERROR NEAR COLUMN FLAGGED ABOVE**

**Explanation**

A syntax error was found in the input command line. An asterisk (\*) marks the start of the invalid field.

**System action**

None.

**User response**

Verify the command syntax, correct the input as needed, and retry the command.

**OB8280: CONSOLE NOT FOUND**

**Explanation**

The console ID or device address specified located a type of device other than a console.

**System action**

None.

**User response**

Specify a valid console ID or device address.

**OB8281: HARDCOPY DEVICE**

**Explanation**

The console specified in the CONS command is a hardcopy device and therefore cannot be monitored.

**System action**

The command terminates.

**User response**

Select a non-hardcopy device to monitor.

**OB8282: INVALID CONSOLE NAME, MUST BE 2-8 CHARS**

**Explanation**

Console names must be from 2-8 characters. The first character must be A-Z, @, #, or \$, and subsequent characters must be A-Z, @, #, \$, or 0-9.

**System action**

The command is not executed.

**User response**

Supply a valid console name or console ID number.

**OB8283: INVALID CONSOLE ID NUMBER, MUST BE 1–99****Explanation**

Console ID numbers must be from 1–99.

**System action**

The command is not executed.

**User response**

Supply a valid console ID number or console name.

**OB8284: MISSING CONSOLE VALUE****Explanation**

Either a console name or console ID number must be supplied after the CONS= keyword.

**System action**

The command is not executed.

**User response**

Supply a valid console name or console ID number.

**OB8285: INVALID CHARACTER AFTER CONSOLE VALUE****Explanation**

The console name or console ID number was not followed by a blank space or by a comma.

**System action**

The command is not executed.

**User response**

Supply a valid console name or console ID number, followed by a blank space or a comma.

**OB8286: CONSOLE DOES NOT EXIST OR IS INACTIVE****Explanation**

The console specified is not defined to the operating system, or is defined but not active.

**System action**

The command is not executed.

**User response**

Supply a valid console name or console ID number.

## **OB8287: INCREASE GDEV UCB SLOTS TO MORE THAN *nnnnn***

### **Explanation**

OMEGAMON needs more than *nnnnn* slots for GDEV command UCBs.

### **System action**

The command terminates.

### **User response**

Increase the number of slots to more than *nnnnn*.

## **OB8288: NO ONLINE DEVICES FOUND WITH THIS GENERIC**

### **Explanation**

No online devices match the generic name specified.

### **System action**

The command terminates.

### **User response**

Try another generic name.

## **OB8289: DLIST OFFSET GREATER THAN DLIST TABLE**

### **Explanation**

The DLIST offset calculation is greater than that allowed in the DLIST table.

### **System action**

The command terminates.

### **User response**

Contact IBM Software Support.

## **OB8290: NO GENERIC DEVICE NAME SUPPLIED**

### **Explanation**

A generic device name was expected.

### **System action**

The command terminates.

### **User response**

Enter a generic device name. Use the GLST device major command to list valid generic names for your site.

## **OB8291: NO GENERIC DEVICES DEFINED FOR THIS NAME**

### **Explanation**

No devices were defined for the generic name specified.

### **System action**

The command terminates.

**User response**

Enter a different generic device name.

**OB8292: GENERIC DEVICE NAME TOO LONG****Explanation**

A generic device name must be 8 characters or less.

**System action**

The command terminates.

**User response**

Enter a valid device name with 8 characters or less.

**OB8293: NO MATCH FOUND FOR THIS GENERIC NAME****Explanation**

The generic device name specified is not defined at your installation.

**System action**

The command terminates.

**User response**

Use the GLST device major command to list all defined generic device names.

**OB8294: IGNORED - DEVICE NOT ALLOCATED, ONLINE DASD OR TAPE****Explanation**

An attempt was made to deallocate a device that was either offline or was not a disk/tape.

**System action**

None.

**User response**

Specify an online disk or tape.

**OB8295: IGNORED - DEVICE IS PERMANENTLY RESIDENT****Explanation**

An attempt was made to deallocate a permanently resident volume.

**System action**

None.

**User response**

Specify a volume that is not permanently resident.

**OB8296: IGNORED - DEVICE NOT PERMANENTLY RESIDENT****Explanation**

An attempt was made to mark a device reserved that was not permanently resident.

**System action**

None.

**User response**

Specify a volume that is permanently resident.

**OB8310: JOB NOT FOUND****Explanation**

The requested jobname could not be found in the queue of currently running jobs.

**System action**

The PEEK command is suppressed.

**User response**

Correct the jobname.

**OB8312: "PEEK" COMMAND NOT SUCCESSFULLY EXECUTED****Explanation**

An error prevented the PEEK command from executing.

**System action**

The PEEK command is suppressed.

**User response**

Observe prior error messages and take appropriate action.

**OB8313: NO cccc INFORMATION AVAILABLE FOR \*MASTER\* ADDRESS SPACE****Explanation**

The control blocks necessary to map virtual storage for the \*MASTER\* address space using the cccc minor of PEEK are incomplete or absent.

**System action**

The command terminates.

**User response**

None. These commands are not supported for the \*MASTER\* address space.

**OB8320: RETURN FETCH DELAYED****Explanation**

The return was delayed due to a cycle count in the command label.

**System action**

The command continues normally.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB8321: RETURN FETCH PENDING**

### **Explanation**

A return is scheduled for the next cycle.

### **System action**

None.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB8322: PROCFILE DD STATEMENT MISSING**

### **Explanation**

The indicated DD statement is missing from the job's JCL.

### **System action**

The command terminates.

### **User response**

Add the statement and restart OMEGAMON.

## **OB8323: NOT IN AUTOMATIC MODE - RETURN IGNORED**

### **Explanation**

The command is valid only in automatic mode.

### **System action**

The command terminates without taking action.

### **User response**

Correct the command or use only in automatic mode.

## **OB8324: NO TARGET SCREEN SPACE**

### **Explanation**

The target screen space name is missing.

### **System action**

The command terminates.

### **User response**

Supply a correct name and retry the command.

## **OB8325: ENTRY DOES NOT EXIST - MUST BE ADDED TO KOBICUSERcc**

### **Explanation**

A search of the currently active KOBICUSER module failed to find the required entry.

**System action**

The command terminates.

**User response**

Check the name and verify the libraries.

**OB8326: SCREEN SPACE cccccccc NOT FOUND****Explanation**

The specified screen space name was not in KOBICSPROC. Either it is missing or the name is incorrect.

**System action**

The command terminates.

**User response**

Correct the screen space name and verify the libraries. Retry the command.

**OB8327: INVALID VALUE ccccc FOR KEYWORD aaaaaa SPECIFIED, INPUT IGNORED****Explanation**

The value ccccc supplied for keyword aaaaaa is not valid.

**System action**

OMEGAMON ignores the invalid input and continues processing.

**User response**

Correct the keyword value and retry the command.

**OB8501: XLF/TSF FUNCTIONS DISABLED****Explanation**

The XLF/TSF functions are not available with this level of OMEGAMON.

**System action**

The associated commands are inoperative.

**User response**

Use a level of OMEGAMON that has these functions.

**OB8551: LOG RESET REQUIRED. USE .XLFOUT.****Explanation**

Changes made to the log file require that it be reset.

**System action**

The command continues.

**User response**

To activate the new parameters, reset the log as indicated.

## **OB8601: LOG RESET FAILED. INVALID cccccccc FIELD.**

### **Explanation**

The log reset failed because of the invalid field.

### **System action**

The log is not available.

### **User response**

Look up dynamic allocation in the appropriate IBM® manual and retry the reset command.

## **OB8602: LOG RESET FAILED. CODE cccccccc,nnnn,xxxx**

### **Explanation**

The log reset failed because of a bad return code from the dynamic allocation routine. The variable *ccccccc* is a return code. The variable *nnnn* is an error code. The variable *xxxx* is an error reason code.

### **System action**

The log is not available.

### **User response**

Look up the dynamic allocation return code in the appropriate IBM® manual and retry the reset command.

## **OB8603: DDNAME NOT AVAILABLE. SYSOUT USED**

### **Explanation**

The ddname specified is not allocated or is in use by another session.

### **System action**

The system used SYSOUT.

### **User response**

If the ddname is not being used by another session, correct the spelling or allocate the intended ddname and retry the reset command. If it is in use by another session, use another ddname, wait for the other session to be done, or accept the system use of SYSOUT.

## **OB8604: LINE COUNT MUST BE NUMERIC**

### **Explanation**

An attempt was made to enter a non-numeric line count.

### **System action**

The command terminates.

### **User response**

Correct the line count value and reissue the command.

## **OB8605: LINE COUNT GREATER THAN 255**

### **Explanation**

An attempt was made to enter a line count greater than the maximum of 255.

**System action**

The command terminates.

**User response**

Correct the line count value and reissue the command.

**OB9001: BAD OPEN ON CONTROL STATEMENT FILE (SYSIN)****Explanation**

This is probably the result of a missing SYSIN DD statement in the JCL.

**System action**

The update terminates. OMEGAMON does not process any updates.

**User response**

Include a SYSIN DD statement in the job's JCL and resubmit the job.

**OB9003: BLANK CARD - IGNORED****Explanation**

OMEGAMON encountered a blank card in the input stream.

**System action**

OMEGAMON ignores the blank card and continues the edit and update.

**User response**

Remove the blank record from control record input. Verify that the record was intentionally blank.

**OB9004: INVALID CONTROL STATEMENT FORMAT****Explanation**

The syntax or the spelling of the control statement was incorrect.

**System action**

OMEGAMON ignores the control statement and continues the edit and update.

**User response**

Correct the syntax or spelling and resubmit the statement.

**OB9005: INVALID LEVEL NUMBER SPECIFIED. PASSWORD IGNORED****Explanation**

OMEGAMON allows only level number 1, 2, or 3 as valid level numbers for passwords.

**System action**

OMEGAMON ignores the control statement and continues the edit and update.

**User response**

Correct the level number and resubmit the statement.

## **OB9006: INVALID LEVEL NUMBER. DEFAULT OF 0 ASSIGNED**

### **Explanation**

You specified an invalid level number for a command. Valid level numbers are 0, 1, 2, or 3.

### **System action**

OMEGAMON assigns a default level of 0 to the command in question. OMEGAMON continues the edit and update.

### **User response**

Correct the level number in the control statement and resubmit it if it is other than 0.

## **OB9007: INVALID KEYWORD SPECIFIED**

### **Explanation**

The keyword specified does not exist or is not valid on this statement. (For example, VOLUME= is invalid on a COMMAND statement, and LEVEL= is invalid on an AUTHLIB statement.)

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Verify the keywords on the control statement to make sure that they belong together. When you find the error, correct it and resubmit the new control statements.

## **OB9008: LEVEL KEYWORD MUST BE SPECIFIED WITH PASSWORD. PASSWORD IGNORED**

### **Explanation**

OMEGAMON did not find the LEVEL= keyword. The PASSWORD statement requires a LEVEL= parameter to specify the password level.

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Add a LEVEL= keyword to all PASSWORD= statements and resubmit the job.

## **OB9009: INVALID COMMAND LENGTH. INFO-LINE COMMANDS MUST BE 1 THROUGH 8 CHARACTERS PLUS A SLASH**

### **Explanation**

The security installation utility detected an INFO-line command that was longer than eight characters, not including the slash (/).

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Correct the command name and resubmit it.

## **OB9010: INVALID EXTERNAL VALUE SPECIFIED. DEFAULT OF NO ASSIGNED**

### **Explanation**

The security installation utility detected an invalid value for the EXTERNAL= keyword.

### **System action**

OMEGAMON assumes EXTERNAL=NO on this statement and continues the edit and update.

### **User response**

Correct the value of the EXTERNAL keyword, and resubmit the statement.

## **OB9011: INTERNAL ERROR IN MESSAGE PROCESSING ROUTINE. NOTIFY CANDLE CORPORATION**

### **Explanation**

OMEGAMON encountered an error in the message processing routine.

### **System action**

The job terminates.

### **User response**

Record any console messages and contact IBM Software Support.

## **OB9012: PASSWORD IS OF AN INVALID LENGTH. MUST BE BETWEEN 1 AND 8 CHARACTERS**

### **Explanation**

The security installation utility detected a password that is not 1–8 characters long.

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Correct the length of the password and resubmit the statement.

## **OB9013: IMPROPER LENGTH FOR DSNAME**

### **Explanation**

The security installation utility detected a data set name of improper length. The data set name for the AUTHLIB keyword must follow the standard rules for data set names (no imbedded blanks or special characters, and 44 or less characters in length).

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Correct the data set name and resubmit the statement.

## **OB9014: MAJOR AND MINOR COMMANDS MUST BE 3 TO 4 CHARACTERS LONG. STATEMENT IGNORED**

### **Explanation**

The security installation utility detected a major or minor command that was not 3–4 characters long.

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Correct the major or minor command name and resubmit it.

## **OB9015: AUTHLIB ALREADY SPECIFIED. STATEMENT IGNORED**

### **Explanation**

The security installation utility detected more than one AUTHLIB statement in this run. OMEGAMON only allows one AUTHLIB statement per update run.

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Make sure that the AUTHLIB statements OMEGAMON found did not have conflicting information. Remove extra AUTHLIB statements and resubmit if necessary.

## **OB9016: PASSWORD FOR THIS LEVEL NUMBER ALREADY SPECIFIED. THIS PASSWORD IGNORED**

### **Explanation**

You can only specify one password for a specific level number.

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Make sure that you specified the correct level number for this password. Correct and resubmit if necessary.

## **OB9017: INTERNAL ERROR DETECTED IN UPDATE PROCESS. CONTACT IBM® CORP.**

### **Explanation**

OMEGAMON encountered an error in the security update program.

### **System action**

The job terminates.

### **User response**

Contact IBM Software Support.

## **OB9018: COMMAND NOT DEFINED**

### **Explanation**

You specified an invalid major, minor, or INFO-line command name, or a command not supported under this operating system (for example, an XA command under a 370 system).

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Check for spelling errors. Correct the command and resubmit it.

## **OB9019: \*\*\* WARNING \*\*\* - UPDATE CANCELLED**

### **Explanation**

This is usually the result of processing the UPDATE=NO control statement. The message appears after the end of the control statement input. If you specified LIST=YES, the listing reflects the contents of the security file as if the changes have already taken place.

### **System action**

OMEGAMON cancels the update.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB9020: INVALID VOLUME SERIAL NUMBER FORMAT**

### **Explanation**

OMEGAMON found an invalid volume serial number. A valid volume serial number or the characters NOVOLUME are the only values OMEGAMON allows.

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Correct the volume serial number and resubmit the statement.

## **OB9021: INVALID VALUE SPECIFIED FOR AUDIT KEYWORD. MUST BE "YES" OR "NO"**

### **Explanation**

The security installation utility detected an invalid value for the AUDIT keyword. The AUDIT keyword only accepts the values YES or NO.

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Resubmit the statement specifying a valid value for the AUDIT= keyword.

## **OB9022: WARNING—INVALID LEVEL NUMBER FOUND IN COMMAND TABLE FOR THIS COMMAND**

### **Explanation**

Security update was attempted on an OMEGAMON version that does not support external security.

### **System action**

The job terminates.

### **User response**

Verify that you are using a current level of OMEGAMON.

## **OB9023: INTERNAL ERROR IN LIST ROUTINE. CONTACT IBM® CORPORATION**

### **Explanation**

OMEGAMON encountered an error in the security update program.

### **System action**

The job terminates.

### **User response**

Contact IBM Software Support.

## **OB9024: MULTIPLE UPDATE STATEMENTS ENCOUNTERED. UPDATE CANCELLED**

### **Explanation**

The security update utility found more than one update control statement in this run. OMEGAMON only allows one UPDATE= statement per run.

### **System action**

OMEGAMON continues the edit but cancels the update.

### **User response**

Remove the extra update statements from the control statement input.

## **OB9025: INVALID KEYWORD VALUE. ACCEPTABLE VALUES ARE “YES” OR “NO”**

### **Explanation**

OMEGAMON received an invalid value for a specified keyword. OMEGAMON only accepts the values YES or NO.

### **System action**

OMEGAMON ignores the control statement and continues the edit and update.

### **User response**

Correct the keyword value and resubmit the statement.

## **OB9026: “LIST” STATEMENT ALREADY SPECIFIED. STATEMENT IGNORED**

### **Explanation**

The security update utility found more than one LIST statement in this run.

**System action**

OMEGAMON ignores the control statement and continues the edit and update.

**User response**

Remove the extra LIST= statements from the control statement input.

**OB9027: ALIASES OF INFO-LINE (SLASH) COMMANDS CANNOT BE UPDATED.  
ACTUAL COMMAND NAME MUST BE SPECIFIED****Explanation**

When you protect an INFO-line command, OMEGAMON also protects its aliases. You cannot protect only an alias. The security file listing identifies the aliases.

**System action**

OMEGAMON ignores the control statement and continues the edit and update.

**User response**

Resubmit with the actual command name.

**OB9028: INTERNAL ERROR DETECTED IN INFO-LINE COMMAND TABLE  
SEARCH. CONTACT IBM® CORP.****Explanation**

OMEGAMON encountered an error in the security update program.

**System action**

The job terminates.

**User response**

Contact IBM Software Support.

**OB9029: "VOL=" KEYWORD MUST BE SPECIFIED FOR AUTHLIB. ENTER  
"VOL=NOVOLUME" IF NO VOLUME SERIAL NUMBER IS TO BE USED****Explanation**

OMEGAMON found no keyword for VOL=.

**System action**

OMEGAMON ignores the control statement and continues the edit and update.

**User response**

Resubmit with a volume serial number or VOL=NOVOLUME if you do not want OMEGAMON to perform volume serial number checking.

**OB9030: COMMAND TABLE IS INVALID. SECURITY UPDATE PROGRAM  
TERMINATED****Explanation**

A security update was attempted on an OMEGAMON version that does not support external security.

**System action**

The job terminates.

**User response**

Verify that you are using a current level of OMEGAMON.

**OB9031: RESET KEYWORD VALUE MUST END WITH A BLANK****Explanation**

A nonblank character terminated the reset operand.

**System action**

OMEGAMON suppresses the operation.

**User response**

Correct the command and retry.

**OB9032: UNKNOWN RESET KEYWORD VALUE****Explanation**

The reset keyword operand is not valid.

**System action**

OMEGAMON suppresses the operation.

**User response**

Correct the keyword value and retry.

**OB9033: MAJOR COMMAND TABLES WILL BE RESET****Explanation**

The security level, audit, and external switches will be cleared for all major and immediate commands. These commands will be unprotected unless you specify new settings and rerun the update program.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB9034: MINOR COMMAND TABLES WILL BE RESET****Explanation**

The security level, audit, and external switches will be cleared for all minor commands. These commands will be unprotected unless you specify new settings and rerun the update program.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB9035: INFO-LINE COMMANDS WILL BE RESET****Explanation**

The security level, audit, and external switches will be cleared for all INFO-line commands. These commands will be unprotected unless you specify new settings and rerun the update program.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB9036: PASSWORDS AND AUTHLIB WILL BE RESET****Explanation**

The passwords and the authorized data set will be cleared.

**System action**

Processing continues.

**User response**

Specify new settings and rerun the update program to reset these fields.

**OB9037: ONLY SECURITY LEVEL 0 ALLOWED FOR /PWD LEVEL 0 ASSIGNED****Explanation**

OMEGAMON allows a security level 0 only for the /PWD INFO-line command.

**System action**

OMEGAMON assigns security level 0.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB9038: INVALID SMF RECORD NUMBER SPECIFIED****Explanation**

Installer specified an invalid parameter for the SMFNUM control statement. Valid SMF record numbers are 128 through 255.

**System action**

The security update program ignored the statement.

**User response**

Correct the SMF record number to a number between 128 and 255 and resubmit.

### **OB9039: SMFNUM ALREADY SPECIFIED. STATEMENT IGNORED.**

#### **Explanation**

Installer specified the SMFNUM parameter in the security update program more than once.

#### **System action**

The security update program ignored the statement.

#### **User response**

Submit a new SMFNUM statement.

### **OB9040: MODULE ALREADY SPECIFIED. STATEMENT IGNORED.**

#### **Explanation**

Installer specified the MODULE parameter in the security update program more than once.

#### **System action**

The security update program ignored the statement.

#### **User response**

Submit a new MODULE statement.

### **OB9041: MODULE LENGTH IS INVALID; MUST BE BETWEEN 1 AND 8 CHARACTERS**

#### **Explanation**

The security installation utility detected a name specified for the MODULE control statement that was not 1–8 characters.

#### **System action**

The security update program ignored the statement.

#### **User response**

Submit a new MODULE statement.

### **OB9042: PASSWORD SPECIFICATION WILL BE RESET**

#### **Explanation**

The installer executed the security update program to reset the indicated password.

#### **System action**

The security update program will reset the password.

#### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **OB9043: SMF RECORD NUMBER SPECIFICATION WILL BE RESET**

#### **Explanation**

Installer executed security update program to reset the indicated SMF record number.

**System action**

The security update program will reset the SMF record number.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OB9044: EXTERNAL SECURITY MODULE NAME SPECIFICATION WILL BE RESET****Explanation**

The installer executed the security update program to clear the indicated module name. The external security exit routine will not be accessible unless you specify a new setting and rerun the security update program.

**System action**

The security update program will clear the name.

**User response**

If you want to use external security specify a valid module name for the security exit and rerun the security update program.

**OB9045: \*\*\*WARNING\*\*\* - UPDATE DENIED BY CONSOLE OPERATOR****Explanation**

This message appears on the security update report. The console operator replied NO to a request to update the security tables, so the request was denied.

**System action**

The update is cancelled.

**User response**

If appropriate, provide information on authorization to the console operator.

**OB9089: UPDATE OF OMEGAMON SECURITY TABLES HAS BEEN REQUESTED BY  
*jobname*****Explanation**

This message appears on the operator console to advise the operator that a job is attempting to update the security tables.

**System action**

None.

**User response**

None.

**OB9090: REPLY "Y" TO ALLOW OR "N" TO DISALLOW UPDATE PROCESSING****Explanation**

This message appears on the operator console following message OB9089. It prompts the operator to allow or disallow updating.

**System action**

The update job waits for the operator's reply.

**User response**

Respond Y or N.

**OB9144: OBSELR00 CALLED TO READ cccccccc****Explanation**

This is an informational message returned from running the security update program. The variable ccccccc is the security table.

**System action**

The security update program completes.

**User response**

None.

**OB9145: OBSELW00 CALLED TO WRITE cccccccc****Explanation**

This is an informational message returned from running the security update program. The variable ccccccc is the security table.

**System action**

The security update program continues processing.

**User response**

None.

**OB9146: LOAD MODULE TEXT SUCCESSFULLY READ****Explanation**

This is an informational message returned from running the security update program.

**System action**

The security update program continues processing.

**User response**

None.

**OB9147: LOAD MODULE TEXT SUCCESSFULLY UPDATED****Explanation**

This is an informational message returned from running the security update program. Message OB9158 accompanies this message.

**System action**

The security update program completes.

**User response**

None.

## **OB9148: SYSLIB DCB {OPENED|CLOSED} SUCCESSFULLY**

### **Explanation**

This is an informational message returned from running the security update program.

### **System action**

Security update program continues processing.

### **User response**

None.

## **OB9149: LIBRARY DSNAME IS: cccccccc**

### **Explanation**

This is an informational message returned from running the security update program. It provides the library data set name *ccccccc*.

### **System action**

Security update program continues processing.

### **User response**

None.

## **OB9150: SYSLIB DCB CLOSED**

### **Explanation**

This is an informational message returned from running the security update program.

### **System action**

The security update program completes.

### **User response**

None.

## **OB9151: SYSLIB DCB FAILED TO OPEN**

### **Explanation**

OMEGAMON encountered an error opening the data set specified in the SYSLIB DD statement.

### **System action**

The job terminates.

### **User response**

Verify that the SYSLIB DD statement specifies a valid and correctly spelled data set.

## **OB9152: SYNADAF ERROR MESSAGE**

### **Explanation**

An error occurred during a read/write of a file by the security update program.

**System action**

The job terminates.

**User response**

Contact IBM Software Support.

**OB9153: BLDL MACRO FAILED WITH RETURN CODE *nnnn/nnnn*****Explanation**

OMEGAMON cannot find the command table. The variable *nnnn/nnnn* is an IBM® return code.

**System action**

The job terminates.

**User response**

Verify that the job specifies the correct load library.

**OB9154: FIND MACRO FAILED WITH RETURN CODE *nnnn/nnnn*****Explanation**

OMEGAMON cannot find the command table. The variable *nnnn/nnnn* is an IBM® return code.

**System action**

The job terminates.

**User response**

Verify that the job specifies the correct load library.

**OB9155: TEXT READ OVERFLOWS DIRECTORY SIZE INDICATION****Explanation**

An error occurred during the security update program's processing.

**System action**

The job terminates.

**User response**

Contact IBM Software Support.

**OB9156: UNEXPECTED END-OF-FILE WHILE READING *cccccccc*****Explanation**

An error occurred during the security update program's processing.

**System action**

The job terminates.

**User response**

Contact IBM Software Support.

## **OB9157: RDJFCB MACRO FAILED WITH RETURN CODE *nnnn***

### **Explanation**

An error occurred during the security update program's processing.

### **System action**

The job terminates.

### **User response**

Contact IBM Software Support.

## **OB9158: LOAD MODULE ID: *cccccccc***

### **Explanation**

This message accompanies OB9146. The list that follows contains information on:

- An internal module name
- An internal version identifier
- An internal date and time stamp

### **System action**

The security update processing completes.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OB9261: KOB SUPDT BEGUN**

### **Explanation**

This is an informational message generated at the start of the security update program.

### **System action**

The security update program continues processing.

### **User response**

None.

## **OB9262: LOAD MODULE *cccccc* RETURN CODE IS *nnnn***

### **Explanation**

The variable *cccccc* is READ, UPDATE, or REWRITE. This is an informational message returned from running the security update program.

### **System action**

The security update program continues processing.

### **User response**

If return code *nnnn* is other than 0, contact IBM Software Support.

## **OB9263: KOBSUPDT LISTING FILE FAILED TO OPEN**

### **Explanation**

The attributes of the SYSPRINT file are wrong.

### **System action**

The job terminates.

### **User response**

Verify that the file is a SYSOUT data set, or that the file has the following attributes: RECFM=FBA, LRECL=133, DSORG=PS, and BLKSIZE is a multiple of 133.

## **OB9269: KOBSUPDT ENDED**

### **Explanation**

This is an informational message returned from running the security update program.

### **System action**

The security update program completes.

### **User response**

None.

## **OBV101: VTPRELOG MODULE ENTERED**

### **Explanation**

This message is issued after the VTM1WK workarea is initialized.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV102: USER INIT EXIT BEING CALLED**

### **Explanation**

This message is issued before the exit is called.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV103: USER INIT EXIT NOT BEING CALLED**

### **Explanation**

The initiation exit is optional. This message indicates that the user did not supply the exit.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV104: OPEN ACB BEING ISSUED****Explanation**

VTM1 must open an ACB that points to an applid. This message is issued before every attempt to open an ACB.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV105: OPEN ACB SUCCESSFUL, NOW ISSUE SETLOGON****Explanation**

This message is issued before the VTAM® SETLOGON instruction.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV106: SETLOGON SUCCESSFUL, NOW ISSUE REQSESS****Explanation**

This message is issued before the VTAM® REQSESS instruction.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV107: REQSESS SUCCESSFUL, NOW ISSUE STIMER****Explanation**

This message is issued before the MVS™ STIMER instruction.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV108: STIMER SUCCESSFUL, NOW ISSUE WAIT****Explanation**

This message is issued before the MVS™ WAIT instruction. VTM1 will wait for one of two ECBs to be posted. This will either be the STIMER ECB (from STIMER) or SCIP exit ECB (from REQSESS).

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV109: WAIT POPPED, BRANCH TO VTENVIR****Explanation**

One of the two ECBs named in OBV108 has been posted. VTM1 branches to module VTENVIR.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV110: MODULE VTENVIR ENTERED****Explanation**

This message is issued upon entry to module VTENVIR.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV111: SCIP ECB POSTED****Explanation**

The VTAM® SCIP exit was scheduled due to the receipt of an SC RU. It posted the SCIP ECB.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV112: BIND RECEIVED FROM PLU**

### **Explanation**

The BIND RU was received by the VTAM® SCIP exit. A previous REQSESS macro resulted in this BIND.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV113: MODULE VTCOMM ENTERED**

### **Explanation**

This message is issued upon entry to module VTCOMM.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV114: UNBIND DETECTED**

### **Explanation**

The UNBIND RU was received by the VTAM® SCIP exit.

### **System action**

Processing terminates.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV115: CALLING ROUTINE TO CREATE RPL FOR RECEIVE**

### **Explanation**

The VTAM® GENCB macro is being issued to create an RPL which a later RECEIVE macro will use.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV116: RECEIVE ISSUED AND COMPLETE**

### **Explanation**

The VTAM® RECEIVE macro has completed.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV117: UNBIND DETECTED****Explanation**

The UNBIND RU was received by the VTAM® SCIP exit.

**System action**

Processing terminates.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV118: SENT DEFINITE RESPONSE****Explanation**

The VTAM® SEND macro, used to send a definite response, has completed. The return code from the SEND has not yet been checked.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV119: CALLING USER PUT EXIT****Explanation**

This message is issued just before the user exit is called.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV120: CALLING USER GET EXIT****Explanation**

This message is issued just before the user exit is called.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV121: CALLING ROUTINE TO CREATE RPL FOR SEND****Explanation**

The VTAM® GENCB macro is being issued to create a RPL which a later SEND macro will use.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV122: CALLING ROUTINE TO ISSUE SEND****Explanation**

This message is issued before the VTAM® SEND instruction is executed.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV123: MODULE VTTERM ENTERED****Explanation**

Issued upon entry to module VTTERM.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV124: CALLING USER TERM EXIT****Explanation**

This message is issued just before the user exit is called.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV125: VTAM® LOSTTERM EXIT ENTERED FOR VTM1**

### **Explanation**

This message is issued upon entry to the VTAM® LOSTTERM exit for VTM1.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV126: VTAM® TPEND EXIT ENTERED FOR VTM1**

### **Explanation**

This message is issued upon entry to the VTAM® TPEND exit for VTM1.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV127: VTAM® SCIP EXIT ENTERED FOR VTM1**

### **Explanation**

This message is issued upon entry to the VTAM® SCIP exit for VTM1.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV128: VTSCIP RECEIVES UNBIND REQUEST**

### **Explanation**

The VTAM® SCIP exit for VTM1 received an UNBIND request.

### **System action**

Processing continues.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OBV129: VTSCIP RECEIVES BIND REQUEST**

### **Explanation**

The VTAM® SCIP exit for VTM1 received a BIND request.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV130: RECEIVED FIRST SDT REQUEST****Explanation**

The VTAM® SCIP exit for VTM1 received its first Start Data Traffic request.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV131: RECEIVED SECOND SDT REQUEST****Explanation**

The VTAM® SCIP exit for VTM1 received its second Start Data Traffic request.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV132: RECEIVED CLEAR REQUEST****Explanation**

The VTAM® SCIP exit for VTM1 received a CLEAR request.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV133: VTSCIP POSTING ECB****Explanation**

The VTAM® SCIP exit for VTM1 posted its ECB to notify the mainline VTM1 code.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV134: MVS™ STIMER EXIT ENTERED FOR VTM1****Explanation**

The MVS™ STIMER issued previously has popped, and its exit is being driven.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV135: VTM1 USER *ccccccc* LOGGING ON TO *aaaaaaaa*****Explanation**

This message is issued via WTO after a user logs onto a VTAM® application through VTM1. The fields *ccccccc* and *aaaaaaaa* are filled in with the user ID and system name of the PLU, respectively.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV136: VTLOGON MODULE ENTERED****Explanation**

The module VTLOGON was entered.

**System action**

Processing continues.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OBV201: ERROR WITH IDENTIFY MACRO USED TO LOCATE MODULE VTPRELOG****Explanation**

An attempt to locate VTM1 module VTPRELOG failed.

**System action**

Processing terminates with an error.

**User response**

Contact IBM Software Support.

## **OBV202: GETMAIN FAILED FOR ATTACH MACRO WORKAREA**

### **Explanation**

Storage request for the ATTACH macro's workarea, as defined by the list form of ATTACH, failed. This area is needed to make the attach request reentrant.

### **System action**

Processing terminates with an error.

### **User response**

Increase the region size.

## **OBV203: ATTACH OF MAIN VTM1 MODULE VTPRELOG FAILED**

### **Explanation**

The ATTACH macro, used to create the main VTM1 task executing module VTPRELOG, failed.

### **System action**

Processing terminates with an error.

### **User response**

Contact IBM Software Support.

## **OBV204: DETACH OF MAIN VTM1 MODULE VTPRELOG FAILED**

### **Explanation**

The detach of the VTM1 module VTPRELOG failed. Note that when this message is issued, regular VTM1 processing was already completed.

### **System action**

Processing terminates with an error.

### **User response**

Contact IBM Software Support.

## **OBV205: FREEMAIN FAILED FOR ATTACH MACRO WORKAREA**

### **Explanation**

Storage request for the ATTACH macro's workarea, as defined by the list form of ATTACH, failed. When this message is issued, regular VTM1 processing is already completed.

### **System action**

Processing terminates with an error.

### **User response**

Contact IBM Software Support.

## **OBV206: GETMAIN FAILED FOR MAIN VTM1 WORKAREA - VTM1WK**

### **Explanation**

The storage request for the main VTM1 workarea failed.

**System action**

Processing terminates with an error.

**User response**

Increase the region size.

**OBV207: GETMAIN FAILED FOR VTALTER****Explanation**

The storage request for the VTM1 workarea failed. This workarea holds information describing the VTM1 processing environment.

**System action**

Processing terminates with an error.

**User response**

Increase the region size.

**OBV208: GETMAIN FAILED FOR VTM1 USER WORKAREA****Explanation**

The storage request for the VTM1 workarea failed. This workarea is for the VTM1 user.

**System action**

Processing terminates with an error.

**User response**

Increase the region size.

**OBV209: ERROR SETTING ESTAE****Explanation**

The MVS™ ESTAE macro that is used to trap VTM1 processing errors failed.

**System action**

Processing terminates with an error.

**User response**

Contact IBM Software Support.

**OBV210: ERROR CREATING NIB CB****Explanation**

The VTAM® GENCB macro that is used to create an NIB control block failed.

**System action**

Processing terminates with an error.

**User response**

Contact IBM Software Support.

## **OBV211: ERROR CREATING RPL CB**

### **Explanation**

The VTAM® GENCB macro that is used to create an RPL control block failed.

### **System action**

Processing terminates with an error.

### **User response**

Contact IBM Software Support.

## **OBV212: ERROR CREATING ACB CB**

### **Explanation**

The VTAM® GENCB macro that is used to create an ACB control block failed.

### **System action**

Processing terminates with an error.

### **User response**

Contact IBM Software Support.

## **OBV213: ERROR CREATING EXLST CB**

### **Explanation**

The VTAM® GENCB macro that is used to create an EXLST control block failed.

### **System action**

Processing terminates with an error.

### **User response**

Contact IBM Software Support.

## **OBV214: USER INIT EXIT RETURNS WITH ERROR**

### **Explanation**

After issuing this message, VTM1 begins termination processing. The message is not passed back to the VTM1 user.

### **System action**

Processing terminates with an error.

### **User response**

Contact IBM Software Support.

## **OBV215: ERROR CREATING RPL CB FOR OPNSEC**

### **Explanation**

The VTAM® GENCB macro that is used to create a RPL control block failed. The RPL was to be used by the VTAM® OPNSEC macro in the SCIP exit.

**System action**

Processing terminates with an error.

**User response**

Contact IBM Software Support.

**OBV216: OPEN ACB FAILED, NONSPECIFIC****Explanation**

An attempt to open an ACB using one of the applids in the pool failed. This message is not passed back to the user.

**System action**

Processing continues; VTM1 tries the next applid in the pool.

**User response**

None.

**OBV217: OPEN ACB FAILED, APPLID ALREADY IN USE****Explanation**

An attempt to open an ACB using one of the applids in the pool failed. This message is not passed back to the user.

**System action**

Processing continues; VTM1 tries the next applid in the pool.

**User response**

None.

**OBV218: OPEN ACB FAILED, APPLID INACT OR UNKNOWN****Explanation**

An attempt to open an ACB using one of the applids in the pool failed. This message is not passed back to the user.

**System action**

Processing continues; VTM1 tries the next applid in the pool.

**User response**

None.

**OBV219: NO LOGON MODE ENTRY AVAILABLE****Explanation**

The user-supplied table was searched, but no logmode entry was found that matched the VTALTER fields.

**System action**

Processing terminates with an error.

**User response**

Check the CALLVT macro parameter VTNAME. Make sure that there is a logon mode table entry specified for the given environment.

**OBV220: SESSION CANNOT START - NO VIRTUAL TERMINAL AVAILABLE****Explanation**

The VTM1 virtual terminal pool was searched, but none of the virtual terminals was available for use.

**System action**

Processing terminates with an error.

**User response**

Verify that the VTAM® major node definition of the virtual terminal pool, KOBVTPL, is active to VTAM®. Also, verify that at least one minor node within the major node has a VTAM® status of CONCT.

**OBV221: SETLOGON FAILED****Explanation**

The VTAM® SETLOGON macro failed.

**System action**

Processing terminates with an error.

**User response**

Contact IBM Software Support.

**OBV222: REQSESS FAILED****Explanation**

The VTAM® REQSESS macro failed.

**System action**

Processing terminates with an error.

**User response**

Contact IBM Software Support.

**OBV223: STIMER FAILED****Explanation**

The MVS™ STIMER macro failed.

**System action**

Processing terminates with an error.

**User response**

Contact IBM Software Support.

## **OBV224: SESSION REQUEST TIMEOUT**

### **Explanation**

VTM1 has not received a response to a session request sent to KOBVTAM. The cause of the failure is not known, but the nature of the problem is probably temporary.

### **System action**

VTM1 session request is terminated.

### **User response**

Try starting another session at a later time. If the condition persists, contact IBM Software Support.

## **OBV225: UNBIND REQUEST RECEIVED**

### **Explanation**

An unexpected UNBIND request was received.

### **System action**

Processing terminates with an error.

### **User response**

Check the application system that VTM1 was logged onto. Try to logon again. If the error persists, contact IBM Software Support.

## **OBV226: UNKNOWN ERROR ENCOUNTERED WHILE EXAMINING THE VTM1 ECB LIST**

### **Explanation**

There is an unclear reason for the transfer of control within VTM1. Neither the STIMER or SCIP ECB was posted.

### **System action**

Processing terminates with an error.

### **User response**

Contact IBM Software Support.

## **OBV228: GETMAIN FOR GBUFF FAILED**

### **Explanation**

The storage request for the VTM1 get buffer area failed.

### **System action**

Processing terminates with an error.

### **User response**

Increase the region size.

## **OBV229: GETMAIN FOR PBUFF FAILED**

### **Explanation**

The storage request for the VTM1 put buffer area failed.

**System action**

Processing terminates with an error.

**User response**

Increase the region size.

**OBV230: UNABLE TO DETERMINE THE USERID****Explanation**

The VTM1 code that examines the ASCB in order to determine user ID encountered an error.

**System action**

Processing terminates with an error.

**User response**

Contact IBM Software Support.

**OBV231: RECEIVE FAILED, NONSPECIFIC REASON****Explanation**

The VTAM® RECEIVE macro failed.

**System action**

VTM1 abends with user abend code U231. This message is seen only by the internal VTM1 trace routine.

**User response**

Contact IBM Software Support.

**OBV232: SENDING OF DEFINITE RESPONSE FAILED****Explanation**

The VTAM® SEND macro that is issued to send a definite response failed.

**System action**

VTM1 abends with user abend code U232. This message is seen only by the internal VTM1 trace routine.

**User response**

Contact IBM Software Support.

**OBV233: USER PUT EXIT RETURNS WITH ERROR****Explanation**

After issuing this message, VTM1 begins termination processing. The message is not passed back to the VTM1 user.

**System action**

Processing terminates with an error.

**User response**

Contact IBM Software Support.

## **OBV234: USER GET EXIT RETURNS WITH ERROR**

### **Explanation**

After issuing this message, VTM1 begins termination processing. The message is not passed back to the VTM1 user.

### **System action**

Processing terminates with an error.

### **User response**

Contact IBM Software Support.

## **OBV235: SEND FAILED, NONSPECIFIC REASON**

### **Explanation**

The VTAM® SEND macro failed.

### **System action**

VTM1 abends with user abend code U235. This message is seen only by the internal VTM1 trace routine.

### **User response**

Contact IBM Software Support.

## **OBV236: ERROR CREATING RPL CB FOR RECEIVE**

### **Explanation**

The VTAM® GENCB macro that is used to create an RPL control block failed.

### **System action**

VTM1 abends with user abend code U236. This message is seen only by the internal VTM1 trace routine.

### **User response**

Contact IBM Software Support.

## **OBV237: TESTCB FAILED**

### **Explanation**

The VTAM® TESTCB macro failed.

### **System action**

VTM1 abends with user abend code U237. This message is seen only by the internal VTM1 trace routine.

### **User response**

Contact IBM Software Support.

## **OBV238: ERROR CREATING RPL CB FOR SEND**

### **Explanation**

The VTAM® GENCB macro that is used to create an RPL control block failed.

**System action**

VTM1 abends with user abend code U238. This message is seen only by the internal VTM1 trace routine.

**User response**

Contact IBM Software Support.

**OBV239: OPNSEC FAILED****Explanation**

The VTAM® OPNSEC macro that is issued from the SCIP exit failed. This message is seen only by the internal VTM1 trace routine.

**System action**

Processing terminates as if an UNBIND had been received.

**User response**

Contact IBM Software Support.

**OBV300: VTM1 LOGMODE *cccccccc* ERROR - FM/TS *nnnn* NOT SUPPORTED****Explanation**

VTAM® logmode *cccccccc* specifies FM/TS profile *nnnn*, which VTM1 does not support. VTM1 requires a logmode with FM/TS profile "0202".

**System action**

The session terminates.

**User response**

Correct the KOBVTPL definitions to specify an appropriate VTAM® logmode, and retry.

**OBV301: OMEGAMON SESSION REQUEST FAILED - OBVTAM APPL NOT SPECIFIED****Explanation**

A null (blank) applid has been specified.

**System action**

The session terminates.

**User response**

Verify that the applid has been properly supplied by all clists, panels, or procedures, and retry.

**OBV302: SESSION REQUEST FAILED - OBVTAM APPL *cccccccc* NOT DEFINED****Explanation**

VTM1 requested a session with the KOBVTAM application specified. VTAM® does not have a network definition for the KOBVTAM APPL.

**System action**

VTM1 session request terminates.

**User response**

Activate the proper network definition and start KOBVTAM. If KOBVTAM is a cross-domain resource, verify that the VTM1 host has a cross-domain resource definition active for KOBVTAM.

**OBV303: VTM1 APPL ccccccc NOT ACTIVE****Explanation**

The VTM1 appl ccccccc is not active.

**System action**

The session terminates.

**User response**

Make sure that the VTM1 appls have been properly defined and are active.

**OBV304: OPEN ERROR cc DETECTED FOR APPL aaaaaaaaa****Explanation**

OPEN failed to complete successfully for APPL aaaaaaaaa, due to error condition cc, where:

cc

Is always ACBERFLG. For more information about the ACBERFLG values, refer to information about "OPEN macroinstruction error fields" in the *z/OS® Communications Server IP and SNA Codes (SC31-8791)* book and "OPEN--Open one or more ACBs" in the *z/OS® Communications Server SNA Programming (SC31-8829)* book.

aaaaaaaa

Is a user-defined applid. Default sample values are in the OBVTM1nn format, where nn can be 01 through 25.

**System action**

The session terminates.

**User response**

Contact IBM Software Support.

**OBV305: TEMPORARY VTAM® ERROR. RETRY LATER****Explanation**

VTAM® is temporarily short on storage.

**System action**

The session terminates.

**User response**

Retry later. If the problem persists, contact your Network Support group.

**OBV306: VIRTUAL TERMINAL POOL ccccccc IS NOT DEFINED TO VTAM®****Explanation**

No match was found in VTAM®'s configuration tables for the VTM1 virtual terminal pool ccccccc.

**System action**

The session terminates.

**User response**

Verify that the VTM1 application major node is properly defined in SYS1.VTAMLST, and active.

**OBV307: VIRTUAL TERMINAL POOL ccccccc DEFINITION ERROR****Explanation**

ccccccc is not a valid APPL entry.

**System action**

The session terminates.

**User response**

Correct the entry and retry.

**OBV308: NO APPL AVAILABLE IN VIRTUAL TERMINAL POOL ccccccc****Explanation**

All ccccccc virtual terminals are currently in use.

**System action**

The session terminates.

**User response**

Retry later.

**OBV309: VIRTUAL TERMINAL POOL ccccccc IS NOT ACTIVE TO VTAM®****Explanation**

VTAM® cannot access the specified virtual terminal pool.

**System action**

The session terminates.

**User response**

Activate the VTM1 application major mode.

**OBV310: SESSION REQUEST FAILED - ERROR cccc DETECTED****Explanation**

REQSESS failed to complete successfully, due to error condition cccc.

**System action**

The session terminates.

**User response**

Contact IBM Software Support.

## **OBV311: SESSION REQUEST FAILED - OBVTAM APPL ccccccc NOT AVAILABLE**

### **Explanation**

The KOBVTAM appl ccccccc is not active, or is terminating.

### **System action**

The session terminates.

### **User response**

Be sure that the KOBVTAM appl is active, and retry.

## **OBV312: SESSION REQUEST REJECTED - VTAM® REASON CODE xxxx yyyy**

### **Explanation**

The session request initiated by VTM1 was rejected by VTAM®. The reason code is described as follows: xxxx is the VTAM® Request Parameter List return code/feedback information, and yyyy is the SNA System Sense information associated with the request.

### **System action**

VTM1 session request terminates.

### **User response**

Refer the VTAM® reason code information to your network support group or contact IBM Software Support.

## **OBV313: SESSION REJECTED - OBVTAM APPL ccccccc AT MAX USERS**

### **Explanation**

The session request initiated by VTM1 was rejected by KOBVTAM APPL ccccccc because KOBVTAM reached its active session limit. The limit was established with the UMAX parameter when KOBVTAM was started.

### **System action**

VTM1 session request terminates.

### **User response**

Try starting another session at a later time, or increase the value of the KOBVTAM start-up parameter UMAX.

## **OBV314: SESSION REJECTED FAILED - LOGMODE ccccccc IS INVALID**

### **Explanation**

The session request initiated by VTM1 failed because VTAM® rejected the logmode name ccccccc as invalid.

### **System action**

VTM1 session request is terminated.

### **User response**

Verify the logmode name definitions in KOBVTPL. If they are correct, it may be necessary to update VTAM®'s logmode tables.

### **OBV315: VTM1 SLU(*sluname*) MATCH(*match#*) BLOCK SENT**

#### **Explanation**

VTM1 full-duplex communications has sent a block for the specified match on the session for the specified SLU. This message is output only if the TRACE keyword is specified on the LOGON command.

#### **System action**

Processing continues.

#### **User response**

None. The message is informational.

### **OBV316: VTM1 SLU(*sluname*) MATCH(*match#*) BLOCK RECEIVED OR BLOCK QUEUED**

#### **Explanation**

VTM1 full-duplex communications has either received or queued a block for the specified match on the session for the specified SLU. This message is output only if the TRACE keyword is specified on the LOGON command.

#### **System action**

Processing continues.

#### **User response**

None. The message is informational.

### **OBV317: SLU(*sluname*) MATCH(*match#*) PLU(*pluname*) LENGTH(*block length*) SEQ(*block seq#*)**

#### **Explanation**

VTM1 full-duplex communications has sent or received a block for the specified match on the session for the specified SLU. Block length and sequence number are given. This message accompanies either message OBV315 or OBV316. This message is output only if the TRACE keyword is specified on the LOGON command.

#### **System action**

Processing continues.

#### **User response**

None. The message is informational.

### **OBV318: VTM1 FDX RECEIVE PROCESS STARTED FOR *luname***

#### **Explanation**

VTM1 full-duplex communications has started receiving from its session partner on the session for the specified SLU. This message is output only if the TRACE keyword is included on the LOGON command.

#### **System action**

Processing continues.

#### **User response**

None. The message is informational.

## **OBV319: SESSION ENDED. LU(*luname*) REASON(*text*)**

### **Explanation**

A VTM1 full-duplex communications session has ended for the specified reason.

### **System action**

The session terminates, and VTM1 cleans up associated session resources.

### **User response**

The following table lists each reason text and describes the response which should be taken:

<b>Reason</b>	<b>Description and User Response</b>
<b>LOGOFF COMMAND ISSUED</b>	The logoff command was issued to intentionally terminate the session.
<b>UNBIND RECEIVED</b>	The session partner has terminated the session. Inspect the job log of the partner component for messages explaining the reason for the session termination.
<b>COMMUNICATIONS ERROR</b>	Inspect the message log for message OBV322, which documents the cause of the communications error.
<b>INVALID SEQUENCE NUMBER</b>	The session partner has transmitted an invalid sequence number. Contact IBM Software Support.
<b>RPL CREATION ERROR</b>	VTAM® was unable to generate an RPL control block. Contact IBM Software Support.
<b>RECEIVE QUEUE CLOSED</b>	The session has terminated. Determine why the session has terminated before expected data block(s) from the session partner were received.
<b>SEND QUEUE CLOSED</b>	Session termination is in progress so no data blocks can be dequeued from the outbound send queue for the session. If the session has terminated prematurely inspect the log for further messages documenting the reason for the session termination.
<b>UNKNOWN ERROR</b>	Contact IBM Software Support. The associated return code is unknown.

## **OBV320: VTM1 SLU(*sluname*) MATCH(*match#*) SEND BLOCK DEQUEUED.**

### **Explanation**

VTM1 full-duplex communications has dequeued a block from the outbound send queue to send it to the partner PLU for the session with the specified SLU. This message is output only if the TRACE keyword is specified on the LOGON command.

### **System action**

Processing continues.

### **User response**

None. The message is informational.

## **OBV321: SLU(*sluname*) MATCH(*match#*) LENGTH(*block length*) SEQ(*block seq#*)**

### **Explanation**

This message gives detailed information on the block associated with message OBV320, including block length and sequence number. This message is output only if the TRACE keyword is specified on the LOGON command.

**System action**

Processing continues.

**User response**

None. The message is informational.

**OBV322: VTAM® ERROR, LU(*luname*) REQ(*request*) RCFB(*rrff*)****Explanation**

VTM1 has encountered an error on a VTAM® request. The request name (such as send or receive) and RPL return code and feedback information are returned.

**System action**

The session is terminated.

**User response**

Look up the return code and feedback information then correct the problem, given the cause of the communications error.

**OBV323: VTAM® ERROR, LU(*luname*) SSENSE(*request*)****Explanation**

This message accompanies message OBV322 and documents the system sense for the VTAM® request error described in that message.

**System action**

The session is terminated.

**User response**

Look up the sense code and correct the problem, given the cause of the communications error.

## OM messages

The messages that begin with the OM prefix are associated with the OMEGAMON® Base component.

**OM0904: OMSR24 OPEN FUNCTION REQUEST PARAMETER ERROR****Explanation**

An attempt to open the specified LPAM data set failed.

**System action**

The command terminates.

**User response**

Check the spelling and existence of the data set. Make sure you are authorized to open the data set.

**OM0905: INTERNAL ERROR DURING INITIALIZATION****Explanation**

The security work area could not be found during OMEGAMON initialization.

**System action**

OMEGAMON does not start.

**User response**

Call IBM Software Support.

**OM7104: WPF NOT ACTIVE; REQUEST IGNORED****Explanation**

WPF STOP was issued, but WPF was not active.

**System action**

WPF STOP request is ignored.

**User response**

None.

**OM7120: INVALID KEYWORD SPECIFIED: cccccccc****Explanation**

Invalid keyword cccccccc was specified on the WPF command.

**System action**

The WPF command is ignored.

**User response**

Correct the error and reissue the WPF command.

**OM7121: WPF IS ACTIVE; START OPERAND INVALID****Explanation**

WPF START was issued, but WPF was already active or initializing.

**System action**

WPF START request is ignored.

**User response**

None.

**OM7122: DEFAULT RKM2PRDS NOT FOUND, SPECIFY THE RKM2PRDS  
KEYWORD****Explanation**

The name of the EPILOG® Profile data store was not found in the user profile, and WPF START was issued without specifying the RKM2PRDS or DSN operand.

**System action**

WPF START request is ignored.

**User response**

Use the RKM2PRDS operand to specify the data set name of the EPILOG Profile data store on the WPF START command.

## **OM7123: RKM2PRDS NAME MISSING**

### **Explanation**

The RKM2PRDS or DSN operand was specified, but the name of the EPILOG® profile data store was omitted.

### **System action**

The WPF command is ignored.

### **User response**

Include the name of the data set following the RKM2PRDS or DSN operand and reissue the WPF command.

## **OM7124: PROFILE COLLECTOR ATTACH FAILED WITH RC=*nn***

### **Explanation**

The ATTACH for the WPF profile collector failed with return code *nn*.

### **System action**

WPF initialization is terminated.

### **User response**

Attempt to determine and correct the error associated with return code *nn* as documented by the ATTACH System Macro Service, and restart WPF. If the error persists, call IBM Software Support.

## **OM7125: PROFILE COLLECTOR LOAD FAILED WITH RC=*nn***

### **Explanation**

The LOAD for the WPF profile collector failed with return code *nn*.

### **System action**

WPF initialization is terminated.

### **User response**

Attempt to determine and correct the error associated with return code *nn* as documented by the LOAD System Macro Service, and restart WPF. If the error persists, call IBM Software Support.

## **OM7126: XLONG OR XSHORT KEYWORD NO LONGER VALID; IGNORED**

### **Explanation**

The XLONG or XSHORT keyword was specified on the WPF command. These keywords are no longer valid for WPF.

### **System action**

The specified keyword is ignored.

### **User response**

None.

## **OM7130: INITIALIZATION GETMAIN FAILED WITH RC=*nn***

### **Explanation**

The GETMAIN for WPF work areas failed with return code *nn*.

**System action**

WPF initialization is terminated.

**User response**

Attempt to determine and correct the error associated with return code *nn* as documented by the GETMAIN System Macro Service, and restart WPF. If the error persists, call IBM Software Support.

**OM7150: WPF RKM2PRDS READ ERROR, RPL code=*nn*****Explanation**

An error occurred reading the EPILOG® Profile data store. The RPL error code is *nn*.

**System action**

WPF is terminated.

**User response**

Correct the VSAM read error associated with RPL code *nn*. Make sure you have used the EPILOG PROFILE command to create the profiles for selected workloads. Then restart WPF. If the error persists, call IBM Software Support.

**OM7151: WPF TIMER TASK ABENDED****Explanation**

The WPF timer subtask has terminated abnormally.

**System action**

WPF is terminated.

**User response**

Restart WPF. If the error persists, call IBM Software Support.

**OM7152: WPF PROFILE COLLECTOR PROTOCOL ERROR****Explanation**

There is a WPF internal error in the profile collector.

**System action**

WPF is terminated.

**User response**

Restart WPF. If the error persists, call IBM Software Support.

**OM7153: WPF PROFILE COLLECTOR GETMAIN FAILED WITH RC=*nn*****Explanation**

The GETMAIN for WPF work areas in the profile collector failed with return code *nn*.

**System action**

WPF is terminated.

**User response**

Attempt to determine and correct the error associated with return code *nn* as documented by the GETMAIN System Macro Service, and restart WPF. If the error persists, call IBM Software Support.

**OM7154: WPF TIMER TASK ATTACH FAILED WITH RC=*nn*****Explanation**

The ATTACH for the timer task in the profile collector failed with return code *nn*.

**System action**

WPF is terminated.

**User response**

Attempt to determine and correct the error associated with return code *nn* as documented by the ATTACH System Macro Service, and restart WPF. If the error persists, call IBM Software Support.

**OM7155: WPF UNABLE TO VALIDATE EPILOG® INSTALLATION****Explanation**

EPILOG routines required for WPF are not available.

**System action**

The WPF profile collector is terminated.

**User response**

If EPILOG is installed on your system, make sure that the data set name for the EPILOG® load library has been correctly specified on the STEPLIB or JOBLIB statements of the OMEGAMON-invoking JCL. Either the data set specified may be available only to a different CPU, the user may not have security access to it, or the data set may not be cataloged. Correct the situation and restart WPF. If EPILOG is not installed on your system, call IBM Software Support.

**OM7156: WPF PROFILE COLLECTOR ESTAE FAILED WITH RC=*nn*****Explanation**

The ESTAE in the profile collector failed with return code *nn*.

**System action**

WPF is terminated.

**User response**

Attempt to determine and correct the error associated with return code *nn* as documented by the ESTAE System Macro Service, and restart WPF. If the error persists, call IBM Software Support.

**OM7157: WPF RKM2PRDS ALLOCATION FAILED, SVC 99 *xxxx* ERROR=*xxxx*  
INFO=*xxxx*****Explanation**

The dynamic allocation request for the EPILOG Profile data store failed with error code *xxxx* and information code *xxxx*.

**System action**

WPF is terminated.

**User response**

Attempt to determine and correct the error associated with the ERROR and INFO codes as documented by the Dynamic Allocation(SVC 99) System Service, and restart WPF. If the error persists, call IBM Software Support.

**OM7158: WPF RKM2PRDS GENCB FAILED WITH RC=*nn*****Explanation**

GENCB failure in the profile collector. The GENCB return code is *nn*.

**System action**

WPF is terminated.

**User response**

Attempt to determine and correct the error associated with return code *nn* of the VSAM GENCB Macro Service, and restart WPF. If the error persists, call IBM Software Support.

**OM7159: WPF RKM2PRDS OPEN FAILED WITH ACB ERROR=*nn*****Explanation**

The OPEN for the EPILOG® Profile data store failed with return code *nn*.

**System action**

WPF is terminated.

**User response**

Attempt to determine and correct the error associated with ACB ERROR code *nn* of the VSAM OPEN Macro Service, and restart WPF. If the error persists, call IBM Software Support.

**OM7160: WPF INVALID RKM2PRDS KEY LENGTH****Explanation**

A key length error occurred attempting to read the Profile data store.

**System action**

WPF is terminated.

**User response**

Restart WPF. If the error persists, call IBM Software Support.

**OM7161: WPF VSAM LOGICAL ERROR, RPL CODE=*nn*****Explanation**

A VSAM logical error occurred while attempting to read the EPILOG® Profile data store. The error code from the VSAM RPL is *nn*.

**System action**

WPF is terminated.

**User response**

Attempt to determine and correct the VSAM read error associated with RPL code *nn*, and restart WPF. If the error persists, call IBM Software Support.

## **OM7162: WPF RKM2PRDS CLOSE FAILED WITH RC=*nn***

### **Explanation**

The CLOSE for the EPILOG® Profile data store failed with return code *nn*.

### **System action**

WPF is terminated, however, the Profile data store may still be open.

### **User response**

If the Profile data store is still open, a VERIFY operation may be required to CLOSE it.

## **OM7163: WPF REQUIRES EPILOG® V*nnn* OR LATER, V*xxx* FOUND**

### **Explanation**

WPF requires EPILOG® Version *nnn*, or a later version for successful operation, but V*xxx* was found.

### **System action**

The WPF profile collector is terminated.

### **User response**

Make sure that the EPILOG® Version *nnn* load library, or a later version of EPILOG®, is available to OMEGAMON and restart WPF.

## **OM7164: WPF PROFILE COLLECTOR STCK FAILED WITH RC=*nn***

### **Explanation**

A store clock operation failed in WPF profile collector.

### **System action**

WPF is terminated.

### **User response**

Attempt to determine and correct the error associated with condition code *nn* of the STCK instruction as documented in the IBM® *Principles of Operation*, and restart WPF. If the error persists, call IBM Software Support.

## **OM7165: WPF PROFILE COLLECTOR ABENDED**

### **Explanation**

The WPF profile collector has abended.

### **System action**

WPF is terminated. The abend code, PSW, and general registers at the time of the abend are printed following the message text.

### **User response**

Restart WPF. If the problem persists, call IBM Software Support.

## **OM7167: WPF USER IS NOT AUTHORIZED TO READ THE RKM2PRDS**

### **Explanation**

The address space in which OMEGAMON is executing is not authorized to read the EPILOG® Profile data store.

**System action**

The WPF profile collector is terminated.

**User response**

Give the WPF user authorization to read the Profile data store and restart WPF.

**OM7168: WPF RKM2PRDS PROCESSING ERROR****Explanation**

An undeterminable error occurred attempting to read the EPILOG® Profile data store.

**System action**

The WPF profile collector is terminated.

**User response**

Restart WPF. If the problem persists, call IBM Software Support.

**OM7180: WPF WORKLOAD PROFILE ENTRY NOT FOUND****Explanation**

A DWPF or JWPF was issued for a specific profile entry, but that profile entry could not be found.

**System action**

None.

**User response**

Specify the correct profile identifier via the JOB, STC, PGN, or PGP operands and reissue the command. If the DWPF or JWPF commands are specified without any operands, they will display a full list of all profile entries.

**OM7181: WPF INVALID JOB OR STC NAME SPECIFIED****Explanation**

An invalid jobname or started task name was specified with the JOB or STC operand of a DWPF or JWPF command. The jobname or started task name must not exceed eight characters in length, and it must contain those characters defined as acceptable by system JCL syntax.

**System action**

None.

**User response**

Specify the jobname or started task name and reissue the command.

**OM7182: WPF INVALID PERFORMANCE GROUP OR PERIOD NUMBER SPECIFIED****Explanation**

An invalid performance group or period was specified with the PGN or PGP operand of a DWPF command. The performance group must be numeric, between 1 and 999. The period must be numeric, between 1 and 9.

**System action**

None.

**User response**

Specify the correct performance group and/or period number and reissue the command.

**OM7183: WPF PARAMETER ERROR; PGN REQUIRED WITH PGP****Explanation**

The performance group number must be specified with the period number. The PGP operand was specified without the PGN operand on a DWPF request.

**System action**

None.

**User response**

Specify the correct performance group using the PGN operand, and reissue the command.

**OM7184: WPF CONFLICTING PARAMETERS SPECIFIED****Explanation**

Mutually exclusive operands have been specified on a DWPF command. PGN or PGP operands cannot be specified along with JOB or STC.

**System action**

None.

**User response**

Specify the correct operands and reissue the command.

**OM7185: PGN OR PGP INVALID FOR JWPF****Explanation**

The PGN and/or PGP operands have been specified on a JWPF command. PGN or PGP operands are valid only for DWPF.

**System action**

None.

**User response**

Specify the correct operands and reissue the command.

**OM7198: WPF INVALID PARMLIST PASSED TO PROFILE GET****Explanation**

An error occurred attempting to obtain a profile entry on a DWPF or JWPF command.

**System action**

None.

**User response**

Make sure that the operands for the DWPF or JWPF command have been specified correctly and reissue the command if necessary. If this does not rectify the error, then STOP and restart WPF. If the error still persists then call IBM Software Support.

## **OM7199: WPF INVALID RETURN CODE FROM PROFILE GET, RC=xxxxxxx**

### **Explanation**

An error occurred while attempting to obtain a profile entry on a DWPF or JWPF command. The return code from the profile get routine is xxxxxxx.

### **System action**

None.

### **User response**

Make sure that the operands for the DWPF or JWPF command have been specified correctly and reissue the command if necessary. If this does not rectify the error, then STOP and restart WPF. If the error still persists then call IBM Software Support.

## **OM8100: VOLUME NOT FOUND**

### **Explanation**

The volume you specified was not found on this system.

### **System action**

Command execution terminates.

### **User response**

Specify a volume attached to this system.

## **OM8101: DATA SET IS NOT CATALOGED**

### **Explanation**

The data set you specified was not found in the system catalog.

### **System action**

Command execution terminates.

### **User response**

Catalog the data set or specify a data set that is cataloged.

## **OM8102: DATA SET IS NOT ON VOLUME**

### **Explanation**

The data set that you requested was not found on the volume specified.

### **System action**

Command execution terminates.

### **User response**

Specify the volume that the data set resides on.

## **OM8103: VOLUME NOT ON SYSTEM (FROM SVOL COMMAND)**

### **Explanation**

The volume you specified was not found on this system.

**System action**

Command execution terminates.

**User response**

Specify a volume attached to this system.

**OM8104: VOLUME IS NOT MOUNTED (FROM SVOL COMMAND)****Explanation**

The volume you specified was not mounted on this system.

**System action**

Command execution terminates.

**User response**

Specify a volume attached to this system.

**OM8112: DEVICE INVALID OR OFFLINE****Explanation**

The specified device either was not found in the UCB lookup table, or was found to be marked offline.

**System action**

Command execution terminates.

**User response**

Specify a valid volume or vary volume online.

**OM8113: WARNING; cccc FAILED VALIDITY CHECK****Explanation**

The specified control block (ASCB, TCB, DSAB, JFCB, or JFCX) failed validation in the SRB routine for FNDU.

**System action**

FNDU does not collect data set information for the address space which has failed validation.

**User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OM8115: WARNING INVALID RETURN CODE - cc = xx (FROM PEEK, FNDU COMMANDS)****Explanation**

The SRB to collect data failed to complete its task and returned an invalid return code to the user.

**System action**

Command execution terminates.

**User response**

Call IBM Software Support to report a possible problem.

**OM8116: WARNING SQA WORKAREA AT ADDR=xxxx SIZE=yyyyDANGER  
INSUFFICIENT SQA - COMMAND ABORTED WARNING (from PEEK, FNDU  
commands)**

**Explanation**

The SRB to collect data failed to complete its task due to a SQA shortage.

**System action**

None.

**User response**

Call IBM Software Support to report a possible problem.

**OM8120: CHANNEL SET NOT VALID**

**Explanation**

An attempt was made to find the channel set in the CST but it was not found.

**System action**

None.

**User response**

Specify a valid channel set.

**OM8121: CHANNEL SET NOT DEFINED (FROM DEV COMMAND)**

**Explanation**

The channel set you entered is not defined to the system.

**System action**

None.

**User response**

Specify a channel set defined to this system.

**OM8122: PARTE NOT IN USE**

**Explanation**

You attempted to display a PARTE that is not currently in use.

**System action**

Command execution terminates.

**User response**

Specify a PARTE that is in use.

**OM8123: RMF™ NOT ACTIVE**

**Explanation**

The command requires the Resource Management Facility (RMF™) or a specific RMF™ report to be active.

**System action**

Command execution terminates.

**User response**

Modify RMF™ to add the required report for collection or start RMF™.

**OM8124: CPU NOT DEFINED****Explanation**

You attempted to list channel sets from a CPU that is not currently available.

**System action**

Command execution terminates.

**User response**

Select a CPU that is currently available.

**OM8125: COMMAND NOT AVAILABLE IN GOAL MODE****Explanation**

You attempted to execute a command that is not valid in goal mode.

**System action**

Command execution terminates.

**User response**

Try a different command, or switch to compatibility mode.

**OM8126: IWMRCOLL FAILED, CODE=*nn*****Explanation**

Indicates a failure in an z/OS® service which provides information for some of the commands.

**System action**

Command execution terminates.

**User response**

Contact IBM Software Support.

**OM8127: CONTROL BLOCK DOES NOT EXIST IN SP5 OR HIGHER SYSTEMS****Explanation**

The control block being accessed does not exist in MVS/SP™ 5.1 or above.

**System action**

Command execution terminates.

**User response**

Try running a different version of z/OS®.

## **OM8128: DMDT DOES NOT EXIST IN SP5 OR HIGHER SYSTEMS IN WLM GOAL MODE**

### **Explanation**

The DMDT, the Domain Descriptor Table, does not exist in MVS/SP™ 5.1 or higher levels of z/OS® running in Workload Manager goal mode. The domain construct has no meaning in goal mode.

### **System action**

Command execution terminates.

### **User response**

Try using an MVS/SP™ 5.1 or above goal mode compatible command.

## **OM8130: WARNING NO GRS VECTOR TABLE**

### **Explanation**

In processing the GRS command the address of the GRS Vector Table was not found.

### **System action**

Command execution terminates.

### **User response**

Activate GRS before you issue the GRS command.

## **OM8140: TSO NOT AVAILABLE IN *xxxx* MODE**

### **Explanation**

The TSO command is not available in this mode, where *xxxx* indicates the mode.

### **System action**

Command execution terminates.

### **User response**

Issue TSO command in TS or LS modes only.

## **OM8141: STAX FAILED; RC=*nn***

### **Explanation**

A STAX SVC was unsuccessful. *nn* is the STAX SVC return code.

### **System action**

Command execution terminates.

### **User response**

Reissue the command. If the problem persists, call IBM Software Support.

## **OM8142: IKJSCAN FAILED; RC=*nn***

### **Explanation**

A non-zero return code was issued by the IKJSCAN routine, where *nn* is a two digit number.

**System action**

Command execution terminates.

**User response**

Reissue the command. If the problem persists, call IBM Software Support.

**OM8143: ATTACH FAILED; RC=*nn*****Explanation**

A non-zero return code was issued by the ATTACH SVC, where *nn* is a two digit number.

**System action**

Command execution terminates.

**User response**

Reissue command. If the problem persists, call IBM Software Support.

**OM8144: COMMAND *cccccccc* ENDED - NON-ZERO RETURN CODE is *nn*****Explanation**

The command *cccccccc* ended with a four digit (*nnnn*) non-zero return code.

**System action**

Command execution terminates.

**User response**

Use the return code to diagnose the error. Correct and re-execute the TSO command.

**OM8145: TEST COMMAND NOT SUPPORTED UNDER OMEGAMON****Explanation**

The OMEGAMON TSO command does not support the TEST command.

**System action**

Command execution terminates.

**User response**

Issue a command other than TEST.

**OM8146: NO INFORMATION AVAILABLE****Explanation**

No second level message chain exists for ? command.

**System action**

Command execution terminates.

**User response**

Issue a command other than ?.

## **OM8147: INVALID COMMAND NAME SYNTAX**

### **Explanation**

Invalid command syntax in TSO command.

### **System action**

Command execution terminates.

### **User response**

Correct and reissue command.

## **OM8148: COMMAND *cccccccc* NOT FOUND**

### **Explanation**

OMEGAMON cannot find command *cccccccc*.

### **System action**

Command execution terminates.

### **User response**

Correct and reissue the command.

## **OM8149: COMMAND *cccccccc* ENDED DUE TO ATTENTION**

### **Explanation**

Command *cccccccc* ended due to depression of the ATTN/PA1 key.

### **System action**

Command execution terminates.

### **User response**

None.

## **OM8150: COMMAND *cccccccc* ENDED DUE TO ERROR - COMPLETION CODE IS *Snnnn|Unnnn***

### **Explanation**

Command *cccccccc* ended abnormally with the System/User abend code displayed.

### **System action**

Command execution terminates.

### **User response**

Use the completion code to diagnose the error. Correct and re-execute the command.

## **OM8201: NO SUCH ADDRESS SPACE THRESHOLD GROUP DEFINED**

### **Explanation**

You entered a command to list an address space threshold group that was not defined.

**System action**

Command execution terminates.

**User response**

Enter an address space threshold group that is coded in your profile or use the ASG command to add this address space threshold group to your profile.

**OM8203: NO CHANNEL AVAILABILITY TABLE****Explanation**

No Channel Availability Table was found for the channel identifier entered.

**System action**

None.

**User response**

Correct and reissue command with a valid channel identifier.

**OM8204: WARNING—RUNNING xxx OMEGAMON® ON yyy SYSTEM TYPE OK (AND HIT ENTER TO CONTINUE OR C TO CANCEL)****Explanation**

OMEGAMON is built for xxx operating system and is running on yyy operating system. This causes functions and commands to fail.

**System action**

Startup continues if you enter OK.

**User response**

Install the yyy level of OMEGAMON and then restart OMEGAMON.

**OM8210: DATA SET NAME LENGTH GREATER THAN 44 (FROM LOC COMMAND)****Explanation**

The data set name that you entered was greater than 44 characters in length.

**System action**

Command execution terminates.

**User response**

Enter a valid data set name.

**OM8211: GQSCAN FAILURE, R/C = nn****Explanation**

GQSCAN returned an invalid return code *nn*.

**System action**

Command execution terminates.

**User response**

Look for a description of the return code in the Supervisor SPL. If problem persists call IBM Software Support.

## **OM8212: MAJOR ENQUEUE NAME LENGTH ERROR (MAX = 8)**

### **Explanation**

The major enqueue name that you entered was greater than eight characters in length.

### **System action**

Command execution terminates.

### **User response**

Enter a valid enqueue name.

## **OM8213: MINOR ENQUEUE NAME LENGTH ERROR (MAX = 44)**

### **Explanation**

The minor enqueue name that you entered was greater than 44 characters in length.

### **System action**

Command execution terminates.

### **User response**

Enter a valid minor enqueue name.

## **OM8214: INVALID GENERIC MINOR ENQUEUE NAME REQUEST**

### **Explanation**

You placed an \* in a position other than the end of the enqueue name.

### **System action**

Command execution terminates.

### **User response**

Delete all characters to the right of the asterisk and retry the command.

## **OM8215: INVALID HEX CHARACTER STRING**

### **Explanation**

You entered hex data that contained characters that are not hex.

### **System action**

Command execution terminates.

### **User response**

Correct the enqueue name and re-enter.

## **OM8216: SYNTAX ERROR**

### **Explanation**

An invalid hex entry was specified for the enqueue name.

### **System action**

Command execution terminates.

**User response**

Correct the enqueue name and re-enter.

**OM8217: ERROR GQSCAN ABEND S09A****Explanation**

GQSCAN encountered an unrecoverable error.

**System action**

Command execution terminates.

**User response**

Try function again. If problem persists call IBM Software Support.

**OM8218: ERROR GQSCAN RETURN CODE - *nn*****Explanation**

GQSCAN returned an invalid return code *nn*.

**System action**

None.

**User response**

Look for a description of the return code in the Supervisor SPL. If problem persists call IBM Software Support.

**OM8230: GREATER THAN MAX PERF GROUP****Explanation**

You requested a performance group that was greater than the highest performance group specified in the system.

**System action**

Command execution terminates.

**User response**

Enter a performance group that is valid for your system.

**OM8231: F IS INVALID WITH THIS COMMAND****Explanation**

No fixed frames exist for the region being displayed.

**System action**

Command execution terminates.

**User response**

Correct and reissue the command without the F argument.

## **OM8240: STAT WORKAREA NOT AVAILABLE**

### **Explanation**

An internal work table was invalidated.

### **System action**

Command execution terminates.

### **User response**

Ensure that RMF™ is still active in the system. If the problem persists call IBM Software Support.

## **OM8241: RMF™ ROUTINE NOT ACTIVE (RC = nn)**

### **Explanation**

You entered a command which requires data from RMF™ and RMF™ is not running on this system.

### **System action**

None.

### **User response**

Start RMF™ and re-enter the command after RMF™ initializes.

## **OM8242: RMF™ NOT ACTIVE (RC = nn)**

### **Explanation**

You entered a command which requires data from RMF™ and RMF™ is not running on this system.

### **System action**

Command execution terminates.

### **User response**

Start RMF™ and re-enter the command after RMF™ has initialized.

## **OM8243: DEVICES NOT BEING MONITORED BY RMF™**

### **Explanation**

The command requires RMF™ Device reporting of tape or DASD to be active and it is not.

### **System action**

None.

### **User response**

Modify RMF™ to add the required report option for collection.

## **OM8244: RMF™ NOT COLLECTING DATA FOR THIS DEVICE CLASS**

### **Explanation**

No RMF™ data is being collected for the device class selected.

### **System action**

Command execution terminates.

**User response**

Correct and reissue the command specifying a different device class.

**OM8245: INTERNAL ERROR (RC=*nn*)****Explanation**

An OMEGAMON logic error was detected.

**System action**

Command execution terminates.

**User response**

Call IBM Software Support.

**OM8246: CHANNEL PATH WORK AREA NOT AVAILABLE****Explanation**

A channel path work area was not available.

**System action**

Command execution terminates.

**User response**

Reissue the command. If the problem persists, call IBM Software Support.

**OM8247: RMF™ DEVICE STATISTICS NOT AVAILABLE (RC=*nn*)****Explanation**

No RMF™ statistics are available for the device you selected.

**System action**

Command execution terminates.

**User response**

Correct and reissue the command specifying a different device.

**OM8248: DATA NOT AVAILABLE FOR DEVICE (RC=*nn*)****Explanation**

No data is available for the logical control unit you selected.

**System action**

Command execution terminates.

**User response**

Correct and reissue the command specifying a different LCU.

## **OM8260: MEMORY AT xxxxxx IS FETCH (STORE)-PROTECTED (FROM MZAP, MLST COMMANDS)**

### **Explanation**

The memory at xxxxxx cannot be fetched or stored into because it is fetch protected.

### **System action**

No zap applied.

### **User response**

Add the authorized character to override the protection.

## **OM8270: MODULE WAS NOT FOUND IN TSO AUTHORIZATION LIST**

### **Explanation**

The OMEGAMON program name was not found in the list of APF programs available to the TSO user.

### **System action**

Command execution continues.

### **User response**

Add OMEGAMON to the TSO authorization list and reassemble.

## **OM8271: MODULE DID NOT COME FROM AN APF LIBRARY**

### **Explanation**

Module was loaded from a library that is not APF authorized or that lost APF authorization.

### **System action**

Command execution continues.

### **User response**

Ensure that STEPLIB references are APF authorized in all libraries.

## **OM8272: MODULE WAS NOT FOUND MARKED AC=1**

### **Explanation**

Module was not link edited with AC=1 in the link edit PARM.

### **System action**

Command execution continues.

### **User response**

Relink module.

## **OM8273: MODULE WAS FOUND IN THE TCB/RB CHAIN**

### **Explanation**

An unexpected module was found in the TCB/RB chain. This may be why OMEGAMON is not authorized.

**System action**

Command execution continues.

**User response**

See this product's *OMEGAMON II for MVS Configuration Guide* for ways to install OMEGAMON authorized.

**OM8274: ENTRY NOT FOUND IN THE APF LIST****Explanation**

You requested to delete a data set from the APF list. The data set was not in the APF list.

**System action**

Command execution terminates.

**User response**

Retry the command with a data set that is in the APF LIST.

**OM8275: ENTRY ALREADY EXISTS IN THE APF LIST****Explanation**

You attempted to add a data set to the APF list. The data set was already in the APF list.

**System action**

Command execution terminates.

**User response**

Retry the command with a data set that is not in the APF list.

**OM8276: GETMAIN FAILED FOR NEW APF LIST****Explanation**

There was not enough SQA storage available to get an area for the new APF list.

**System action**

Command execution terminates.

**User response**

Call IBM Software Support if command repeatedly fails.

**OM8277: SYNTAX ERROR NEAR COLUMN FLAGGED ABOVE****Explanation**

A syntax error was found in validating information about a library.

**System action**

Command execution terminates.

**User response**

Ensure proper specification of DSN and volser, then retry command.

## **OM8278: DATA SET NAME OR VOLUME SERIAL NOT SUPPLIED**

### **Explanation**

You did not enter the data set name and volume serial number required for the command.

### **System action**

Command execution terminates.

### **User response**

Ensure that you specify all required fields (DSN, VOL).

## **OM8279: NEW VOLUME SERIAL NOT SUPPLIED**

### **Explanation**

You attempted to catalog a volume serial number of a data set in the APF list. You did not supply a new volume serial number.

### **System action**

Command execution terminates.

### **User response**

Specify the NVOL operand with the new volume serial number.

## **OM8280: CONSOLE NOT FOUND**

### **Explanation**

The console specified could not be found in the system.

### **System action**

None.

### **User response**

Specify a valid console number.

## **OM8281: CSVAPF FAILED FOR DYNAMIC APF LIST, RC=*nn* REAS=*mmmm***

### **Explanation**

The CSVAPF service returned a non-zero return code.

### **System action**

The system terminates command execution.

### **User response**

Refer to the IBM® *Application Development Reference* manual for CSVAPF return codes and reason codes.

## **OM8283: SVC TABLE UPDATE ERROR - RC = *nnnn***

### **Explanation**

An error occurred updating the SVC table. The return code *nnnn* is from the SVCUPDTE macro.

**System action**

LPAM adds the module, but the SVC table is not updated.

**User response**

Call IBM Software Support.

**OM8284: INVALID LPAM MODIFY REQUEST - PROGRAM IS A TYPE 1, 2, OR 6 SVC****Explanation**

You cannot use LPAM to process SVC type 1, 2, and 6 modules.

**System action**

Command execution terminates.

**User response**

See message OM8307.

**OM8285: MODULE FOUND IN FIXED LPA, NOT DELETED****Explanation**

You cannot delete a module that exists in the FLPA.

**System action**

Command execution terminates.

**User response**

Specify a module name that is not in the FLPA.

**OM8286: MODULE NOT CURRENTLY IN MODIFIED LPA****Explanation**

You attempted to delete a module that was not found in the MLPA.

**System action**

Command execution terminates.

**User response**

Specify a module that is in the MLPA.

**OM8287: MODULE NOT FOUND IN THE LPA****Explanation**

You attempted to list a module that is not in the LPA.

**System action**

Command execution terminates.

**User response**

Specify the name of a module that is currently in LPA.

## **OM8288: LPAM FAILED - MODULE ALREADY ON ACTIVE LPA QUEUE**

### **Explanation**

The LPAMM command is already on the active LPA queue. LPAMM cannot modify a module previously placed in this state.

### **System action**

Command execution terminates.

### **User response**

To modify the module again, first delete the entry using LPAMD and add the new module using LPAMM.

## **OM8289: MODULE NOT FOUND IN cccccccc**

### **Explanation**

A search of the directory of data set cccccccc was made but the module was not found.

### **System action**

Command execution terminates.

### **User response**

Ensure that the specified module exists in the data set specified.

## **OM8290: PROGRAM NAME NOT SUPPLIED - ENTER (PGM=)**

### **Explanation**

The LPAM command was issued without the required operand. You did not specify the required PGM keyword on the LPAMM or LPAMD command.

### **System action**

Command execution terminates.

### **User response**

Respecify the command with the program name that you wish to list.

## **OM8291: LOAD LIBRARY NAME NOT SUPPLIED - ENTER (DSN=)**

### **Explanation**

LPAMA and LPAMM require a library name to get the module from.

### **System action**

Command execution terminates.

### **User response**

Specify the data set name for the library that contains the module.

## **OM8292: LOAD LIBRARY ALLOCATION FAILURE - RC=nn ERROR=cc INFO=cc**

### **Explanation**

An attempt to allocate the specified library failed. RC=nn, ERROR=cc, and INFO=cc are the dynamic allocation return, error, and information reason codes.

**System action**

LPAM command execution terminates.

**User response**

Make sure that the data set name specified on the DSN parameter is correct and that the specified data set is accessible to the system on which the OMEGAMON session is executing.

**OM8293: GLOBAL LOAD FAILED - ABEND CODE = xxx****Explanation**

An attempt to load the LPAMLIB failed. xxx is the load return code.

**System action**

Command execution terminates.

**User response**

Refer to the IBM® *Supervisor Services SPL* manual for load return codes.

**OM8297: JOBNAME ccccccc NOT FOUND****Explanation**

You attempted to cancel job ccccccc, which was not running on the system.

**System action**

Command execution terminates.

**User response**

Specify a currently active job.

**OM8298: ASID nnn REPRESENTS JOB ccccccc****Explanation**

You attempted to cancel job ccccccc where the ASID nnn did not match the jobname specified.

**System action**

Command execution terminates.

**User response**

Verify that the jobname/ASID combination is correct.

**OM8299: CALLRTM FAILED - RC = nn****Explanation**

The RTM service returned a non-zero return code.

**System action**

Command execution terminates.

**User response**

Refer to the IBM® *Supervisor Services SPL* manual for CALLRTM return codes.

## OM8300: NO ASCBCHAP ROUTINE

### Explanation

The address of the CHAP routine was not found in the CVT. In post SE1 systems this is a trivial problem since CHAP does not affect most address spaces. z/OS® has lost its ability to address IEVEACO.

### System action

Command execution terminates.

### User response

If problem persists call IBM Software Support.

## OM8305: *aaa/ccc* - STORAGE UNAVAILABLE

### Explanation

The variable *aaa/ccc* can be one of the following:

#### CSA/MOD

CSA storage unavailable for module.

#### SQA/CDE

SQA storage unavailable to build CDEs.

#### SQA/SMF

SQA storage unavailable for SMF tables.

#### PVT/MOD

Private area storage unavailable for module.

#### PVT/DEL

Private area storage unavailable for DELETE list.(Needed for internal processing of a DELETE request.)

### System action

LPAM command terminates.

### User response

If CSA or SQA was unavailable, retry the request at a time when more area is available. If the private area was unavailable, retry with OMEGAMON running in a larger region.

## OM8306: PRIMARY LOAD MODULE NOT FOUND

### Explanation

You specified an alias name in the PGM= parameter and the primary load module was not found in the load library.

### System action

Command execution terminates.

### User response

Determine the cause of the problem. A possible solution would be to re-linkedit or re-copy the load module and all of its aliases and retry the command.

## **OM8307: ccccccc REPLACES A TYPE 1, 2, or 6 SVC**

### **Explanation**

You attempted to issue LPAM to replace a module that is a type 1, 2, or 6 SVC. LPAM does not support replacement of type 1, 2, or 6 SVCs.

### **System action**

Command execution terminates.

### **User response**

Refer to the IBM® *SPL: System Generation Reference* for instructions to replace the SVC.

## **OM8308: REQUEST TERMINATED DUE TO PREVIOUS ERRORS**

### **Explanation**

Errors occurred during LPAM processing.

### **System action**

Command execution terminates.

### **User response**

See the error preceding the messages to determine whether you can resolve the problems and then retry the command.

## **OM8309: ccccccc INVALID FOR EXTENDED SVC ROUTER TABLE**

### **Explanation**

An SVC router (IGX00ccc) module is being processed and the SVC router code (*nnn*) is higher than the system allows.

### **System action**

Command execution terminates.

### **User response**

See message OM8307.

## **OM8310: SVC VALUE CONFLICTS WITH PGM=cccccccc**

### **Explanation**

The value of the SVC parameter does not match the SVC number indicated by the PGM name.

### **System action**

Command execution terminates.

### **User response**

Verify that the PGM name is correct. If so, the SVC parameter value must equal the SVC indicated by the PGM name. Note that you do not need the SVC parameter in this situation.

### **OM8313: ccccccc IS IN OVERLAY STRUCTURE**

#### **Explanation**

You attempted to process load module *ccccccc*, which is link-edited in an overlay structure. LPAM does not support modules that are link-edited in an overlay structure.

#### **System action**

Command execution terminates.

#### **User response**

Refer to the IBM® *SPL: System Generation Reference* for instructions to replace the module.

### **OM8314: SYNTAX ERROR NEAR COLUMN FLAGGED ABOVE**

#### **Explanation**

A syntax error was found, and the command could not be interpreted. The \* indicates where the error was.

#### **System action**

Command execution terminates.

#### **User response**

Correct the command and re-enter.

### **OM8315: SMF EXIT TABLE ID NOT FOUND: cccc**

#### **Explanation**

The SMF subsystem ID specified by the SMFSYS= parameter was not found in the system.

#### **System action**

Command execution terminates.

#### **User response**

Specify the correct SMF system ID.

### **OM8323: NOT IN AUTOMATIC MODE - RETURN IGNORED**

#### **Explanation**

OMEGAMON received a .RTN command.

#### **System action**

OMEGAMON ignores the command.

#### **User response**

None.

### **OM8324: WARNING: NEW SVC MODULE ccccccc BEING ADDED**

#### **Explanation**

The SVC to be added by LPAMM has no LPDE and its current SVC table entry point is IGCERROR. A subsequent LPAMD deletion of the SVC returns it to its original state.

**System action**

Command continues normally.

**User response**

Note that if you issue the SVC after deleting it with LPAMD, the system abends the issuing task.

**OM8324(IMS): NO TARGET SCREEN SPACE****Explanation**

OMEGAMON found a syntax error in the .RTN command.

**System action**

OMEGAMON ignores the command.

**User response**

Correct the .RTN command, save the screen space, and reinvoke the screen space.

**OM8325: NEW SVC ccccccc HAS UNEXPECTED SVC TABLE ENTRY POINT****Explanation**

The SVC to be added by LPAMM has no LPDE, but the SVC table entry point is not IGCERROR as expected. A subsequent LPAMD deletion of the SVC does not restore it to its original state.

**System action**

Command execution terminates.

**User response**

If you still want to add the SVC, use the FORCE operand of the LPAMM command. Note that if you issue the SVC after deleting it with LPAMD, the system abends the issuing task.

**OM8326: ccccccc INVALID FOR LPAM****Explanation**

You cannot use the LPAM command to load module ccccccc.

**System action**

Command execution terminates.

**User response**

None.

**OM8327: INVALID ARGUMENT. USE M, D, OR BLANK.****Explanation**

The LPAM command allows only the following arguments:

**M**

Modify

**D**

Delete

**(blank)**

List

**System action**

Command execution terminates.

**User response**

Use the appropriate argument for LPAM.

**OM8333: MODULE HAS MORE THAN 16 ALIASES - CANNOT LPAM**

**Explanation**

LPAMM allows only 16 aliases for a module.

**System action**

LPAM command execution terminates.

**User response**

If none of the aliases are needed, use LPAMM with the NOALIAS parameter to add the module.

**OM8335: MORE THAN 49 ALIASES; ONLY FIRST 49 DELETED**

**Explanation**

LPAMD can only delete up to 49 aliases of a module.

**System action**

The module and its first 49 aliases are deleted. Additional aliases remain on the active LPA queue. Programs attempting to access the deleted module with any of the remaining aliases may abend.

**User response**

Schedule an IPL to remove the remaining aliases from the active LPA queue.

**OM8336: TOO MANY SMFSYS NAMES SPECIFIED**

**Explanation**

The SMFSYS parameter of LPAM allows only 7 SMF subsystem names to be specified.

**System action**

The LPAM command terminates.

**User response**

If you want the exit to be added for all SMF subsystems, omit the SMFSYS parameter.

**OM8339: MODULE LOGICALLY DELETED; CSA NOT FREED**

**Explanation**

The specified SMF exit has been logically removed from the subsystems specified on the SMFSYS parameter. However, the exit is still in use by other SMF subsystems. The module storage in CSA is not freed.

**System action**

The LPAMD is successful for the specified subsystems.

**User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OM8342: LOAD LIBRARY UNALLOCATION FAILURE - RC=*nn* ERROR=*cc* INFO=*cc*****Explanation**

An attempt to unallocate the specified library has failed. RC=*nn*, ERROR=*cc*, and INFO=*cc* are the dynamic allocation return, error, and information reason codes.

**System action**

LPAM command execution terminates.

**User response**

If the data set is still allocated by the OMEGAMON session, and it is preventing other users from accessing the data set, you may need to stop and restart the OMEGAMON session to free the allocation.

**OM8343: ccccccc CURRENTLY IN USE****Explanation**

LPAMD was requested for a module that is currently being used.

**System action**

The LPAM request is terminated.

**User response**

Reissue the LPAMD command when the module is no longer in use.

**OM8348: MDF PROCESSING DISABLED. USE POPT COMMAND TO RESET.****Explanation**

This command has been disabled because MDF=OFF was specified in the POPT command.

**System action**

The command is terminated.

**User response**

If you have an Amdahl MDF system, specify MDF=ON.

**OM8349: DOMAIN AUTHORIZED TO OBTAIN DATA ONLY FOR DOMAIN *n*****Explanation**

The current Amdahl™ domain is only authorized to collect data for itself. The current domain number is given in the message.

**System action**

The command continues to display data only for current domain.

**User response**

To avoid this message either specify the current domain number as an argument to the command, or authorize the domain to collect data for all domains (set authorization level "2" via hardware frame).

## **OM8350: COMMAND ONLY VALID FOR AMDAHL MDF SYSTEM**

### **Explanation**

This command pertains specifically to an Amdahl MDF system and will not function on another system.

### **System action**

The command is terminated.

### **User response**

None.

## **OM8351: DOMAIN NOT AUTHORIZED FOR DATA COLLECTION; RC=*nn***

### **Explanation**

The current Amdahl domain is not authorized (via the hardware CA frame) to collect data requested about MDF.

### **System action**

The command discontinues attempts to collect the data.

### **User response**

The authorization level on the Amdahl CA frame should be 2 to collect data for all domains or 1 to collect data for only the current domain. For full OMEGAMON functionality with respect to MDF support, the authorization level should allow all domain data collection (2).

## **OM8352: MDF IIC MRSD INTERFACE ERROR OCCURRED; RC=*nn***

### **Explanation**

A problem occurred while using the Amdahl MDF IIC interface.

### **System action**

The command discontinues attempts to collect MDF data.

### **User response**

Record the message number and return code (RC) and call IBM Software Support.

## **OM8353: MDF IIC MDFWATCH INTERFACE ERROR OCCURRED; RC=*nn***

### **Explanation**

A problem occurred while using the Amdahl MDF IIC interface.

### **System action**

The command discontinues attempts to collect MDF data.

### **User response**

Record the message number and return code (RC) and call IBM Software Support.

## **OM8354: MDF RMI MRSD INTERFACE ERROR OCCURRED; RC=*nn***

### **Explanation**

A problem occurred while using the Amdahl MDF RMI interface.

**System action**

The command discontinues attempts to collect MDF data.

**User response**

Record the message number and return code (RC) and call IBM Software Support.

**OM8355: MDF RMI MDFWATCH INTERFACE ERROR OCCURRED; RC=*nn*****Explanation**

A problem occurred while using the Amdahl MDF RMI interface.

**System action**

The command discontinues attempts to collect MDF data.

**User response**

Record the message number and return code (RC) and call IBM Software Support.

**OM8356: MDF INTERFACE/OMEGAMON INTERNAL ERROR; RC=*nn*****Explanation**

An internal error occurred while using the Amdahl MDF interface.

**System action**

The command discontinues attempts to collect MDF data.

**User response**

Record the message number and return code (RC) and call IBM Software Support.

**OM8357: MDF INTERFACE NOT SUPPORTED IN THIS ENVIRONMENT****Explanation**

The Amdahl MDF interface is not supported in the current system environment, for example in PMA or guest mode environments.

**System action**

The command is terminated.

**User response**

None.

**OM8358: COMMAND REQUIRES APF AUTHORIZATION****Explanation**

OMEGAMON must be authorized for this command to operate.

**System action**

The command is terminated.

**User response**

Authorize OMEGAMON (see *OMEGAMON II for MVS Configuration Guide*).

## **OM8359: UNABLE TO ALLOCATE 4K WORKAREA; RC=*nn***

### **Explanation**

OMEGAMON failed while trying to allocate a 4k page-fixed workarea. Possible meanings of the return code are as follows:

**24**

GETMAIN failed.

**28**

Page fix failed.

### **System action**

The command is terminated.

### **User response**

Increase the region size and try again. If the problem persists, call IBM Software Support.

## **OM8360: COMMAND ONLY VALID FOR PR/SM™ LPAR MODE OPERATIONS**

### **Explanation**

This command is valid only when operating under logical partitioning mode (PR/SM™).

### **System action**

The command is terminated.

### **User response**

None.

## **OM8361: PR/SM™ LPAR INTERFACE FAILURE**

### **Explanation**

The interface needed to gather the logical partitioning data has failed, and OMEGAMON is unable to provide the logical partitioning data.

### **System action**

The command is terminated.

### **User response**

Restart OMEGAMON. If the problem persists, call IBM Software Support.

## **OM8362: INVALID DATA FROM THE PR/SM™ LPAR INTERFACE**

### **Explanation**

Invalid data was returned from the interface so the LPAR command could not provide valid logical partitioning data.

### **System action**

The command is terminated.

### **User response**

Try the LPAR command again. If the problem persists, call IBM Software Support.

## **OM8363: LPAR COMMAND INTERNAL ERROR**

### **Explanation**

An internal error has occurred in the LPAR command.

### **System action**

The command is terminated.

### **User response**

Call IBM Software Support.

## **OM8370: INVALID PARAMETER FOR CHNM**

### **Explanation**

An unrecognized parameter was entered for CHNM.

### **System action**

The command is terminated.

### **User response**

Check the command syntax and respecify with the correct parameter.

## **OM8371: CHANNEL PATH ID NOT SPECIFIED FOR ADD OR DELETE FUNCTION**

### **Explanation**

The ADD or DELETE keyword was specified without a channel path ID.

### **System action**

The command is terminated.

### **User response**

Specify the channel paths to be added or deleted.

## **OM8372: CHANNEL PATH ID MUST BE BETWEEN 00 THRU *ff***

### **Explanation**

The channel path ID specified was outside of the valid range.

### **System action**

The command is terminated.

### **User response**

Specify the channel path (00 through *ff*).

## **OM8373: CHANNEL SET ID MUST BE SPECIFIED**

### **Explanation**

The channel set ID was not specified in MVS/370 mode.

### **System action**

The command is terminated.

**User response**

Specify the channel set ID required for MVS/370 mode.

**OM8376: INVALID PARAMETER FOR CPUM****Explanation**

An unrecognized parameter was entered for CPUM.

**System action**

The command is terminated.

**User response**

Check the command syntax and respecify the command with the correct parameter.

**OM8377: CPU ID NOT SPECIFIED FOR ADD OR DELETE FUNCTION****Explanation**

The ADD or DELETE keyword was specified without a CPU ID.

**System action**

The command is terminated.

**User response**

Specify the CPU IDs to be added or deleted.

**OM8378: CPU ID MUST BE BETWEEN 0 THRU 15****Explanation**

The CPU ID specified was outside of valid range.

**System action**

The command is terminated.

**User response**

Specify the CPU ID between 0 through 15 (decimal).

**OM8380: NOT ADDED. USE \* ONLY IN LAST POSITION OF GROUP NAME.****Explanation**

The input group mask *gggggggg* is not acceptable since the mask character \* occurred before the last character.

**System action**

The command terminates.

**User response**

Correct the input group name mask.

**OM8381: NOT ADDED. *gggggggg* DUPLICATES USERS IN GROUP *hhhhhhh***

**Explanation**

The input group mask *gggggggg* cannot coexist with the group mask *hhhhhhh*; *hhhhhhh* specifies a subset of *gggggggg*.

**System action**

The command terminates.

**User response**

Correct the input group mask *gggggggg* or delete *hhhhhhh*.

**OM8382: NOT ADDED. *gggggggg* IS CURRENTLY MONITORED IN GROUP *hhhhhhh***

**Explanation**

The input group mask *gggggggg* cannot coexist with the group mask *hhhhhhh*; *gggggggg* specifies a subset of *hhhhhhh*.

**System action**

The command terminates.

**User response**

Correct the input group mask *gggggggg* or delete *hhhhhhh*.

**OM8383: NOT ADDED. *gggggggg* IS ALREADY BEING MONITORED.**

**Explanation**

The input group mask *gggggggg* already exists.

**System action**

The command terminates.

**User response**

Respecify a non-existing input group mask.

**OM8384: ADDED. *gggggggg* IS NOW BEING MONITORED.**

**Explanation**

The group mask *gggggggg* was successfully added for monitoring.

**System action**

None.

**User response**

None.

**OM8385: DELETED. *gggggggg* IS NO LONGER BEING MONITORED.**

**Explanation**

The group mask *gggggggg* was successfully deleted from monitoring.

**System action**

None.

**User response**

None.

**OM8386: NOT FOUND. *gggggggg* IS NOT CURRENTLY BEING MONITORED.**

**Explanation**

The group mask *gggggggg* does not exist for deletion.

**System action**

The command terminates.

**User response**

Correct the input group mask.

**OM8387: KEYWORD IGNORED. *kkkkkkkk* IS INVALID; VERIFY SYNTAX.**

**Explanation**

The keyword specified with the command is not valid.

**System action**

The command terminates.

**User response**

Correct the keyword for the function to be performed.

**OM8388: INVALID PARAMETER. RESPECIFY *kkkkkkkk* KEYWORD PARAMETER.**

**Explanation**

The parameter specified with keyword *kkkkkkkk* is not valid.

**System action**

The command does not process the parameter.

**User response**

Enter an allowable parameter for the keyword.

**OM8389: RTA NOT OPERATIONAL. INSUFFICIENT PRIVATE REGION. RTA NOT OPERATIONAL. INSUFFICIENT ECSA. RTA NOT OPERATIONAL. VTAM® INTERNAL TRACE INACTIVE. RTA NOT OPERATIONAL. VTAM® NOT AT SUPPORTED LEVEL. RTA NOT OPERATIONAL. RC= *xx* SC= *xxxxxxxx*; CALL CANDLE CORP.**

**Explanation**

The RTA™ command cannot initialize. The message indicates the required action or, in some cases, gives the failure return code and sense code.

**System action**

The command does not operate.

**User response**

Follow the suggestion given in the message text.

**OM8390: TSO RESPONSE TIME ANALYZER NOT INSTALLED; CALL CANDLE CORP.****Explanation**

The RTA command has not been installed in the load library currently being used.

**System action**

The command does not operate.

**User response**

Call IBM Software Support to order the RTA command.

**OM8391: RTA NOT AVAILABLE. LOAD ABEND=xxx-yy FOR OMRTASSS.****Explanation**

The RTA command load module (system level sss) could not be loaded for the reason indicated by the ABEND code xxx and reason code yy.

**System action**

The command does not operate.

**User response**

Correct the situation indicated by the ABEND and reason codes. These codes are documented in *IBM System Messages and Codes*.

**OM8392: RTA WILL NOT UPDATE USER PROFILE FOR THIS SESSION****Explanation**

The RTA command encountered an unexpected situation during initialization with the User Profile Facility, and subsequent RTA updates to the profile during the session are not effective.

**System action**

The command continues as normal. Any changes made (that is, group additions or deletions) are not reflected in a User Profile saved during the current OMEGAMON session.

**User response**

None.

**OM8400: ENTRY NOT FOUND: cccc****Explanation**

The entry requested does not exist.

**System action**

None.

**User response**

Check to make sure that the request is valid.

## **OM8401: INVALID PARAMETER SPECIFIED: *cccc***

### **Explanation**

The error may be due to an invalid keyword or invalid label.

### **System action**

None.

### **User response**

Correct the problem and retry.

## **OM8402: INVALID KEYWORD VALUE: *cccc***

### **Explanation**

The error is due to an invalid value for keyword *cccc*.

### **System action**

None.

### **User response**

Correct problem and retry.

## **OM8403: ERROR DURING UPF INITIALIZATION**

### **Explanation**

An internal error occurred during User Profile Facility initialization.

### **System action**

OMEGAMON continues its initialization processing, but all UPF-related functions are disabled for this session.

### **User response**

Call IBM Software Support.

## **OM8406: SYNTAX ERROR: *reason***

### **Explanation**

A syntax error occurred. The reason for the error is listed.

### **System action**

The command does not execute.

### **User response**

Correct the error and retry.

## **OM8407: COMMAND ERROR: *reason***

### **Explanation**

An error occurred while processing the command. The reason for the error is listed.

### **System action**

The command does not execute.

**User response**

Correct the error, if possible, or call IBM Software Support.

**OM8410: ERROR STORING INTO MEMORY-RESIDENT PROFILE OPTIONS TABLE****Explanation**

An error occurred while OMEGAMON attempted to update the profile options.

**System action**

The user request cannot be completed.

**User response**

Further updates will probably fail. Restart OMEGAMON if immediate resolution is required. If the problem persists, call IBM Software Support.

**OM8411: ERROR READING FROM THE MEMORY-RESIDENT PROFILE OPTIONS TABLE****Explanation**

An error occurred while OMEGAMON attempted to read the profile options.

**System action**

The user request can not be completed.

**User response**

Further profile commands will probably fail. Restart OMEGAMON if immediate resolution is required. If the problem persists, call IBM Software Support.

**OM8420: ERROR UPDATING ASTG TABLE****Explanation**

An error occurred while OMEGAMON attempted to update the memory-resident Address Space Threshold Group table.

**System action**

The user request can not be completed.

**User response**

Further ASG updates will probably fail. Restart OMEGAMON if immediate resolution is required. If the problem persists, call IBM Software Support.

**OM8421: ASTG TABLE INTERNAL ERROR****Explanation**

An error occurred in the memory-resident Address Space Threshold Group table.

**System action**

The user request can not be completed.

**User response**

Further ASG commands will fail. Restart OMEGAMON if immediate resolution is required. If the problem persists, call IBM Software Support.

## **OM8430: ERROR UPDATING DMN TABLE**

### **Explanation**

An error occurred while OMEGAMON attempted to update the memory-resident Domain Name table.

### **System action**

The user request can not be completed.

### **User response**

Further DMN updates will probably fail. Restart OMEGAMON if immediate resolution is required. If the problem persists, call IBM Software Support.

## **OM8440: ERROR UPDATING PGN TABLE**

### **Explanation**

An error occurred while OMEGAMON attempted to update the memory-resident Performance Group Name table.

### **System action**

The user request can not be completed.

### **User response**

Further PGN updates will probably fail. Restart OMEGAMON if immediate resolution is required. If the problem persists, call IBM Software Support.

## **OM8500: CSAF EXECUTES ONLY ONCE PER CYCLE**

### **Explanation**

Only one CSAF command can be on the screen at once.

### **System action**

The CSA Analyzer ignores all subsequent CSAF commands on the screen.

### **User response**

Enter only one CSAF command on the screen.

## **OM8501: SUBPOOL *nnn* IS NOT IN <CSA|ECSA|SQA|ESQA >**

### **Explanation**

Subpool number *nnn* is not in the common storage area specified by the AREA keyword.

### **System action**

The CSA Analyzer ignores the command.

### **User response**

Correct the value of the SUBPOOL keyword or the AREA keyword.

## **OM8502: RANGE DOES NOT OVERLAP CSA OR SQA**

### **Explanation**

The address range specified does not fall into any common storage area.

**System action**

The CSA Analyzer ignores the command.

**User response**

Correct the address range values specified in the RANGE keyword.

**OM8503: SYSTEM AND JOB KEYWORDS ARE MUTUALLY EXCLUSIVE****Explanation**

You cannot specify both SYSTEM and JOB keywords.

**System action**

The CSA Analyzer ignores the command.

**User response**

Enter only the SYSTEM or JOB keyword.

**OM8504: PARAMETER FOR KEYWORD xxxxxxxx IS INVALID****Explanation**

An invalid value for keyword xxxxxxxx was entered.

**System action**

The CSA Analyzer ignores the command.

**User response**

Re-enter the keyword, specifying a valid value.

**OM8505: JOB REQUIRED. ENTER COMMAND WITH JOB PARAMETER****Explanation**

The CSA Analyzer requires a JOB keyword for the command.

**System action**

The CSA Analyzer ignores the command.

**User response**

Re-enter the command, specifying a JOB keyword.

**OM8506: ONLY KEY ZERO IS VALID FOR (E)SQA****Explanation**

You specified a non-zero storage key for SQA or ESQA storage.

**System action**

The CSA Analyzer ignores the command.

**User response**

Re-enter the command, specifying KEY(0).

## **OM8510: NO DATA AVAILABLE**

### **Explanation**

CSAA has no information for the command request.

### **System action**

None.

### **User response**

None.

## **OM8511: CSAA IS NOT ACTIVE**

### **Explanation**

The CSAA manager address space is not running.

### **System action**

The CSA Analyzer ignores the command.

### **User response**

Start the CSAA Manager address space and retry the command. Refer to the *OMEGAMON II for MVS Configuration Guide* for details.

## **OM8512: LOAD OF CSAA SUPPORT MODULE FAILED**

### **Explanation**

The CSA Analyzer did not find a required module for the operation of CSAA.

### **System action**

The CSA Analyzer ignores the command.

### **User response**

Ensure that all CSAA modules reside in the OMEGAMON for MVS load library. Refer to the *OMEGAMON II for MVS Configuration Guide* for details.

## **OM8513: CSAA REPORTER INTERNAL LOGIC ERROR**

### **Explanation**

The CSAA reporter module abended.

### **System action**

The CSA Analyzer ignores the command.

### **User response**

Call IBM Software Support.

## **OM8514: CSAA MANAGER BUSY. TRY AGAIN**

### **Explanation**

The CSAA reporter could not process the command request because the CSAA manager was busy.

**System action**

The CSA Analyzer ignores the command.

**User response**

Retry the command.

**OM8515: CSAA REPORTER ERROR. RC=nnnnnnnn****Explanation**

The CSAA reporter encountered an error.

**System action**

The CSA Analyzer ignores the command.

**User response**

Call IBM Software Support.

**OM8516: <CSA|ECSA|SQA|ESQA> MONITORING IS NOT ACTIVE****Explanation**

CSAA is not monitoring the area specified in the AREA keyword.

**System action**

The CSA Analyzer ignores the command.

**User response**

When you next start the CSAA address space, specify monitoring for the given area. Refer to the *OMEGAMON II for MVS Configuration Guide* for details.

**OM8517: <SYSTEM|JOB> TRENDING IS NOT ACTIVE****Explanation**

CSAA did not gather the necessary trending data.

**System action**

The CSA Analyzer ignores the command.

**User response**

When the CSAA address space is next started, specify trending for SYSTEM or job. Refer to the *OMEGAMON II for MVS Configuration Guide* for details.

**OM8518: VERSION MISMATCH. MANAGER Vmmm. REPORTER Vnnn****Explanation**

The CSA Analyzer Manager's version, *mmm*, does not match the Reporter's version, *nnn*.

**System action**

The CSA Analyzer ignores the command.

**User response**

Ensure that all CSAA modules are at the same version.

## OM8519: FREEMAIN EVENTS MISSED

### Explanation

The CSA Analyzer was unable to record some freemains due to a buffer full condition.

### System action

The CSA Analyzer ignores the command.

### User response

When you next start CSAA, increase its amount of available fixed storage. Refer to the *OMEGAMON II for MVS Configuration Guide* for details.

## OM8520: CSAA UPDATE PROCESSING SUSPENDED AT *mm/dd/yy hh:mm*

### Explanation

The CSA Analyzer has stopped processing.

### System action

The system does not process the command.

### User response

Make sure that the CSA Analyzer started task is running.

## OM8521: OPERAND *<operand>* NOT PERMITTED

### Explanation

The keyed parameter has been recognized but you used it incorrectly as an operand.

### System action

The OMCSAA command processing edits the second and subsequent keyed parameters following the command. Those parameters must be operands which must be syntactical elements of the OMCSAA command argument being processed.

**Note:** The OMCSAA/CSAA arguments that use the JOB and SYSTEM adverbs to distinguish different report processing requirements use two specific sets of operands which are similar but not identical.

### User response

Make the following changes:

1. Remove or correct the indicated operand.
2. Remove the command inhibit character (>).
3. Resubmit the command.

## OM8522: VALUE *<value>* NOT PERMITTED

### Explanation

Some of the OMCSAA keyed parameter specifications are keywords (i.e., they are unique names without an associated assignment value). The OMCSAA/CSAA arguments and the SYSTEM adverb are always keywords. They neither require nor permit an associated assignment value.

### **System action**

Each keyed parameter is edited and evaluated syntactically. Whenever a specification violates a syntax rule, the appropriate OMCSAA diagnostic message is issued.

### **User response**

Make the following changes:

1. Correct the command syntax.
2. Remove the command inhibit character (>).
3. Resubmit the command.

## **OM8523: <operand> IS REQUIRED**

### **Explanation**

You have not declared a required operand and no substitute value assignment is available. The JOB adverb and the AREA operand both lack default assignment values.

### **System action**

When a specific OMCSAA command argument requires a particular operand that you have not supplied, the OMCSAA command processing attempts to provide an assignment value for the missing operand in the following manner:

1. The inherited value, the last value assigned to that operand when an OMCSAA command was processed successfully, is assigned to the current operand.
2. When an inheritable assignment value is a null value, the operand's default value is assigned.
3. When the result is still a null value, a violation occurs and this message is issued.

### **User response**

Make the following changes:

1. Provide the missing operand and value assignment.
2. Remove the command inhibit character (>).
3. Resubmit the command.

## **OM8525: <operand> VALUE NOT NAME**

### **Explanation**

The operand assignment value is not a name.

### **System action**

A name value begins with an alphabetic character (A–Z). The JOB adverb and the AREA operand are associated with alphabetic assignment values.

### **User response**

Make the following changes:

1. Correct the value assignment.
2. Remove the command inhibit character (>).
3. Resubmit the command.

## OM8526: <operand> VALUE NOT NUMERIC

### Explanation

The operand assignment value is not a number.

### System action

A numeric value begins with the decimal digits (0–9) or with hexadecimal digits (A–F). The ASID, SUBPOOL, BOUNDS, MINSIZE, and RANGE operands are all associated with numeric assignment values.

### User response

Make the following changes:

1. Correct the value assignment.
2. Remove the command inhibit character (>).
3. Resubmit the command.

## OM8527: <operand> VALUE LIST NOT PERMITTED

### Explanation

OMEGAMON® does not directly support lists of assignment values.

### System action

The (\*) assignment value is a quasi-list list assignment. You may specify only the ASID and SUBPOOL operands with the (\*) assignment value.

### User response

Make the following changes:

1. Correct the value assignment.
2. Remove the command inhibit character (>).
3. Resubmit the command.

## OM8530: ARGUMENT <text> NOT RECOGNIZED

### Explanation

Each argument is a keyword which must be specified immediately after the command on the command line. The keyed parameter is not recognized as a valid OMCSAA specification if an argument is required.

### System action

The OMCSAA command processing edits the first keyed parameter following the command. That parameter must be an argument.

**Note:** The OMCSAA/CSAF command is an exception to this rule.

### User response

Make the following changes:

1. Correct the command specifications.
2. Remove the command inhibit character (>).
3. Resubmit the command.

## **OM8531: OPERAND <text> NOT RECOGNIZED**

### **Explanation**

Each operand is a keyword which must be entered as documented. Each operand is associated with a specific abbreviation.

### **System action**

Operand specifications that are neither the acceptable full text nor the acceptable abbreviation are rejected.

### **User response**

Make the following changes:

1. Correct the command specifications.
2. Remove the command inhibit character (>).
3. Resubmit the command.

## **OM8540: INSUFFICIENT MEMORY. REQUEST NOT PROCESSED**

### **Explanation**

The OMCSAA/CSAA DETAIL command may generate a significant number of CSA Events Extract Records. The nominal OMCSAA CSA Events Extraction Work Area is only 5120 bytes. OMCSAA has logic that will acquire a larger Extraction Work Area but that logic is conditional.

### **System action**

OMCSAA command logic inhibits the automatic acquisition of a larger Extraction Work Area in order to minimize the overhead generated by continually issuing GETMAIN requests to the operating system. last request.

### **User response**

Either restrict the scope of the request or resubmit the command with the OMEGAMON action character in column 1.

## **OM8541: INSUFFICIENT MEMORY. <xxxxxx> KB ADDITIONAL MEMORY REQUIRED**

### **Explanation**

The OMCSAA/CSAA Events Extract Work Area may be expanded but the expansion requires allocatable memory in SUBPOOL (0).

### **System action**

OMCSAA command processing has attempted to acquire the memory required to support the Extract Work Area. There is not enough memory available in SUBPOOL (0).

### **User response**

Either restrict the scope of the OMCSAA/CSAA DETAIL command or re-initialize a new OMEGAMON session with a larger REGION size.

## **OM8542: SCREEN OUTPUT EXCEEDS LROWS LIMIT**

### **Explanation**

Irrespective of the size of the OMCSAA/CSAA Events Extract Work Area, the ultimate limit upon the ability of OMEGAMON to display the CSA Analyses is the number of logical lines of display.

**System action**

There are more lines of data to be displayed than OMEGAMON can support.

**User response**

Either restrict the scope of the OMCSAA/CSAA DETAIL command or re-initialize a new OMEGAMON session with a larger LROWS size.

**Note:** The additional memory required to support a larger number of logical lines of display may reduce the ability to extract the analytical data from the CSA Events Database.

**OM8550: NOT ENOUGH MEMORY FOR WORKAREA - *nnnnnn*K NEEDED.****Explanation**

The specified command could not obtain a work area.

**System action**

The command terminates.

**User response**

Increase the region size of the address space by a minimum of *nnn*K. Alternatively, use the DATA minor of SEEK to decrease the work size area by *nnn*K.

**OM8551: WARNING WSIZ TOO SMALL - ADDR= *xxxxxxxx* SIZE= *nnnn* USED= *nnnn*.****Explanation**

The SEEK SRB to collect data failed to complete its task because the data area it needed was small.

**System action**

None.

**User response**

Use the DATA minor of SEEK to increase the work area.

**OM8552: DEVICE INVALID OR OFFLINE****Explanation**

The specified device either was not found in the UCB lookup table, or was found to be marked offline.

**System action**

Command execution terminates.

**User response**

Specify a valid volume or vary volume online.

**OM8553: WARNING; *cccc* FAILED VALIDITY CHECK****Explanation**

The specified control block (ASCB, TCB, DSAB, JFCB, or JFCX) failed validation in the SRB routine for DATA minor of SEEK.

**System action**

DATA minor of SEEK does not collect data set information for the address space which has failed validation.

**User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OM8555: WARNING INVALID RETURN CODE = xxxxxxxx (FROM DATA minor of SEEK COMMAND)****Explanation**

The SRB to collect data failed to complete its task and returned an invalid return code to the user.

**System action**

Command execution terminates.

**User response**

Call IBM Software Support to report a possible problem.

**OM8556: INVALID PARAMETER SPECIFIED.****Explanation**

An invalid parameter was encountered on the SEEK or DATA command line.

**System action**

The command is terminated.

**User response**

Check the syntax and respecify with the correct parameter.

**OM8557: VOLSER OR DEVICE PARAMETER REQUIRED.****Explanation**

The volsr or device address required by SEEK has not been specified.

**System action**

None.

**User response**

Specify the volsr or device address and reissue the command.

**OM8558: SPECIFIED ITEM NOT FOUND.****Explanation**

A seek operation was not observed on the sample number specified in the ITEM parameter, or no seek operations were observed for the specified jobname.

**System action**

No detail data items are displayed.

**User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OM8559: WARNING INVALID INTERVAL TIME SPECIFIED.****Explanation**

The specified sample interval must be between 5 and 500 milliseconds.

**System action**

Processing continues with the default of 5 milliseconds assumed.

**User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OM8560: WARNING INVALID SAMPLE COUNT SPECIFIED.****Explanation**

The specified sample count was greater than 100.

**System action**

Processing continues with the maximum of 1000 samples assumed.

**User response**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**OM20001: OM2INIT HAS BEEN ENTERED****Explanation**

Informational message concerning the progress of initialization.

**System action**

None.

**User response**

None.

**OM20002: OM2CVT ADDRESS = *hhhhhhh*****Explanation**

Informational message displaying the address of the communications vector table.

**System action**

None.

**User response**

None.

## **OM20003: MODULE FAILED LOAD *modname***

### **Explanation**

During initialization, a number of functions must be loaded into storage. The message indicates that the module *modname* was not loaded into storage.

### **System action**

OMEGAMON II for MVS cannot proceed without all functions available; therefore, the initialization is canceled.

### **User response**

This is probably an installation problem. Review the installation process for errors.

## **OM20004: KM2RULE MODULE FAILED RC = *rc***

### **Explanation**

The rules database must be loaded into storage during installation. The message indicates that the function responsible for KM2RULE failed and gave a return code of *rc*.

### **System action**

OMEGAMON II for MVS cannot proceed without all data available; therefore, the initialization is canceled.

### **User response**

This is probably an installation problem. Review the installation process for errors.

## **OM20005: RULES TABLE ADDR = *hhhhhhh***

### **Explanation**

Informational message indicating the address of the rules table.

### **System action**

None.

### **User response**

None.

## **OM20006: GLOBAL DATA ARRAY ADDR = *hhhhhhh***

### **Explanation**

Informational message indicating the address of the global data area.

### **System action**

None.

### **User response**

None.

## **OM20007: RULE DEFINED TO OM2ROUTER, ADDR= *hhhhhhh* NAME= *rulename***

### **Explanation**

Informational message indicating the storage address that has been assigned to a rule.

**System action**

None.

**User response**

None.

**OM20008: OM2\_DEFINE FAILED, RC= rcADDR RULE= *hhhhhhh*****Explanation**

The rule at address *hhhhhhh* could not be defined, and the error return code was *rc*.

**System action**

The initialization has been canceled due to insufficient data.

**User response**

This is probably an installation problem. Review the installation process for errors.

**OM20009: OM2INIT COMPLETE****Explanation**

Informational message concerning the progress of initialization.

**System action**

None.

**User response**

None.

**OM20010: OM2OPEN HAS BEEN ENTERED****Explanation**

Informational message concerning the progress of initialization.

**System action**

None.

**User response**

None.

**OM20011: OM2SCVT ADDR = *hhhhhhh*****Explanation**

Informational message indicating the address of the secondary communications vector table.

**System action**

None.

**User response**

None.

## OM20012: VTAM® FAILURE SENSE CODE= xxx

### Explanation

OMEGAMON II for MVS needs to log onto the realtime collector. The message indicates that the connection was not successful. VTAM® provides a sense code which can help diagnose the problem.

### System action

The session ends.

### User response

This is most often a setup problem. Check to make sure that the realtime collector is running and that the VTAM® controls are properly activated. The sense code '100A0000' indicates that the VTAM® name of the collector (luname) is missing or inactive.

**Note:** See message KLVVT251 for complete return code information.

Refer to the IBM® *Systems Network Architecture Format and Protocol Reference Manual* for further information.

## OM20013: OM2OPEN HAS COMPLETED

### Explanation

Informational message concerning the progress of initialization.

### System action

None.

### User response

None.

## OM20016: OM2CLOSE HAS BEEN ENTERED

### Explanation

Informational message concerning the progress of initialization.

### System action

None.

### User response

None.

## OM20017: SESSION NO LONGER ACTIVE WITH *luname*

### Explanation

The user is logging off the session. The connection to the real time collector must also be closed. *luname* is the VTAM® application name of the realtime collector.

### System action

None.

### User response

None.

## **OM20018: OM2CLOSE HAS COMPLETED**

### **Explanation**

Informational message concerning the progress of initialization.

### **System action**

None.

### **User response**

None.

## **OM22001: M2SESS HAS BEEN ENTERED**

### **Explanation**

Informational message concerning the progress of initialization. Module M2sess routine has been entered.

### **System action**

None.

### **User response**

None.

## **OM22002: NOW USING PROFILE *pp***

### **Explanation**

This is an informational message indicating that the user requested an alternate collector profile using the Signon Panel logon options (F11).

### **System action**

None.

### **User response**

Check to make sure that the correct profile is being used.

## **OM22003: COLLECTOR SESSION ESTABLISHMENT FAILURE**

### **Explanation**

M2SESS attempted to connect to each of the three lunames specified in *rhilev.RKANPARU(KM2IPARM)* None were successful.

### **System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

### **User response**

Determine if the *rhilev.RKANPARU(KM2IPARM)* lunames are spelled correctly. If so, determine if the required applications have been started and the application names have been varied active.

## **OM22004: PURGE EXIT CREATION FAILURE**

### **Explanation**

M2SESS failed to establish a purge exit to keep track of cases when the terminal is lost.

**System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

**User response**

This is an internal error. Notify IBM Software Support.

**OM22005: PURGE EXIT CREATED FOR PHYSICAL DEVICE****Explanation**

This is an informational message indicating that M2SESS successfully established a purge exit to keep track of cases when the terminal is lost.

**System action**

None.

**User response**

None.

**OM22006: OMEGAMON COPYRIGHT SCREEN RECEIVE FAILURE****Explanation**

M2SESS failed to read the first screen (a copyright notice).

**System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

**User response**

Check to see if your VTAM® parameters have been set up correctly.

**OM22007: LOGON SCREEN SEND FAILURE****Explanation**

M2SESS attempted to send the logon commands to the realtime collector. The send did not complete successfully.

**System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

**User response**

Check to see if your VTAM® parameters have been set up correctly.

**OM22008: LOGON SCREEN RECEIVE FAILURE****Explanation**

M2SESS attempted to read a realtime collector screen. The receive did not complete successfully.

**System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

**User response**

Check to see if your VTAM® parameters have been set up correctly.

**OM22009: OMEGAMON REJECTED USERS LOGON ATTEMPT****Explanation**

M2SESS attempted to understand a realtime collector screen.

**System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

**User response**

Check that *rhilev*.RKANPARU(KM2IPARM) specifies a correct realtime collector. If not, it may be a communications error. Additionally, the failure may be due to insufficient authority to logon OMEGAMON; check with your security administrator. Also, check the RKLVSnap data set for additional diagnostic information.

**OM22010: COLLECTOR PROFILE(pp) REQUESTED(qq)****Explanation**

M2SESS determined that the realtime collector profile is different from the one requested.

**System action**

The attempt to logon is continued.

**User response**

Check that DATA=YES is specified for the realtime collector. DATA=NO would cause the requested profile to be ignored. Check also if the profile exists in the real time collector profile libraries.

**OM22013: LOG SEND FAILURE****Explanation**

M2SESS attempted to send the LOG command to the realtime collector, to turn on screen logging. The send did not complete successfully.

**System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

**User response**

Check to see if your VTAM® parameters have been set up correctly.

**OM22014: LOG RECEIVE FAILURE****Explanation**

M2SESS attempted to receive the screen following the LOG command. The receive did not complete successfully.

**System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

**User response**

Check to see if your VTAM® parameters have been set up correctly.

**OM22015: COMMAND SEND FAILURE****Explanation**

M2SESS attempted to send a command to the realtime collector. The send did not complete successfully.

**System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

**User response**

Check to see if your VTAM® parameters have been set up correctly.

**OM22016: COMMAND RECEIVE FAILURE****Explanation**

M2SESS attempted to read the screen following a command to the realtime collector. The receive did not complete successfully.

**System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

**User response**

Check to see if your VTAM® parameters have been set up correctly.

**OM22017: SESSION ESTABLISHED WITH *luname* FOR USER *userid*****Explanation**

Informational message concerning progress of the initialization. *luname* is the realtime collector luname and *userid* is the userid which has been used to logon to the realtime collector.

**System action**

None.

**User response**

None.

**OM22018: M2SESS ROUTINE COMPLETE****Explanation**

The connection between OMEGAMON® for MVS™ and OMEGAMON II for MVS has completed.

**System action**

None.

**User response**

None.

## **OM22019: M2SESS: LROWS(XXXX) INVALID; SESSION TERMINATED**

### **Explanation**

M2SESS determined that the LROWS parameter was invalid.

### **System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

### **User response**

Correct the LROWS value in *rhilev.RKANPARU(KM2IPARM)*.

## **OM22020: M2SESS: LROWS(XX) IS TOO SMALL AND MINIMUM IS 99; SESSION TERMINATED**

### **Explanation**

M2SESS determined that the LROWS parameter was invalid.

### **System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

### **User response**

Correct the LROWS value in *rhilev.RKANPARU(KM2IPARM)*.

## **OM22021: OMEGAMON® COPYRIGHT SCREEN TOO SMALL, DATA(XXXX)**

### **Explanation**

The expected OMEGAMON® copyright screen was not received.

### **System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

### **User response**

Check to see if your VTAM® parameters have been set up correctly.

## **OM22022: LOGMODE xxxxxxxx INVALID. MUST NOT BE QUERABLE.**

### **Explanation**

The expected OMEGAMON® copyright screen was not received.

### **System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

### **User response**

The LOGMODE for the terminal being used must not be queriable.

## **OM22023: LOGON FAILED, OM SECURITY NOT INSTALLED**

### **Explanation**

The logon to OMEGAMON® failed.

### **System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

### **User response**

Refer to the *OMEGAMON II for MVS Configuration Guide* for how to install command level security.

## **OM22024: LOGON TO OMEGAMON® FAILED; SEE RKLVS NAP**

### **Explanation**

The logon to OMEGAMON® failed.

### **System action**

The attempt to logon to the realtime collector has ended. After the error message is displayed, the user is terminated.

### **User response**

Check the RKLVS NAP data set for diagnostic information.

## **OM22030: SUBTASK COLLECTOR SESSION ESTABLISHMENT FAILURE**

### **Explanation**

The attempt to establish a session with the OMEGAMON subtask realtime collector failed.

### **System action**

The user is terminated.

### **User response**

Call IBM Software Support and have the RKLVLOG messages available.

## **OM22031: SESSION ESTABLISHED WITH OMEGAMONSUBTASK FOR USER *userid***

### **Explanation**

Informational message concerning progress of the initialization. *userid* is the userid which has been used to logon to the realtime collector.

### **System action**

None.

### **User response**

None.

## **OM22032: OMEGAMON SUBTASK TERMINATED FOR USER *userid***

### **Explanation**

Informational message indicating that the connection between OMEGAMON and OMEGAMON II has been terminated for *userid*.

### **System action**

None.

### **User response**

None.

## **OM22033: \$OMON START RETURNED RC=*nn*, R0=*nn***

### **Explanation**

A session with the OMEGAMONSUBTASK could not be started.

### **System action**

The user is terminated.

### **User response**

Call IBM Software Support and have the RKLVLLOG messages available.

## **OM22034: \$OMON RCV RETURNED RC=*nn***

### **Explanation**

A receive from the OMEGAMON SUBTASK failed.

### **System action**

User session is terminated.

### **User response**

This is an internal error. Notify IBM Software Support.

## **OM22035: \$OMON SEND RETURNED RC=*nn***

### **Explanation**

A send to the OMEGAMON SUBTASK failed.

### **System action**

User session is terminated.

### **User response**

This is an internal error. Notify IBM Software Support.

## **OM22036: WARNING - PUTVAR FOR KM2DEHDL RETURNED RC=*nn***

### **Explanation**

The user's session identification for the OMEGAMON® SUBTASK could not be saved.

**System action**

User session is terminated.

**User response**

This is an internal error. Notify IBM Software Support.

**OM22037: SESSION TERMINATED WITH *applid* FOR USER *userid*****Explanation**

Informational message indicating that the connection between OMEGAMON and OMEGAMON II has been terminated for *userid*.

**System action**

None.

**User response**

None.

**OMV001I: OBVTAM VERSION *Vnnn* INITIALIZATION****Explanation**

The OBVTAM support program, version *nnn*, is initializing.

**System action**

OBVTAM processing continues.

**User response**

None.

**OMV002I: APPL *applid* OPENED SUCCESSFULLY****Explanation**

The OPEN macro for the VTAM® ACB was successful.

**System action**

Initialization processing continues.

**User response**

None. OBVTAM is ready to accept logons.

**OMV003I: APPL *ccccccc* FAILED TO OPEN - *reason*****Explanation**

OBVTAM attempted to open an ACB to VTAM® with the identifier *ccccccc*. The attempt failed for the reason specified.

**System action**

If the reason is a retryable condition (for example, if the network APPL is inactive at the time OBVTAM attempts access), OBVTAM retries the operation for up to 30 minutes. Otherwise, OBVTAM terminates.

**User response**

The reasons that appear follow. Take the appropriate action for the reason that appears with this message.

## **OMV003I(cont.): APPL ALREADY OPEN**

### **Explanation**

Another z/OS® job or started task has the OBVTAM network APPL allocated.

### **System action**

OBVTAM terminates.

### **User response**

Contact the VTAM® systems programmer at your installation.

## **OMV003I(cont.): APPL IS INACTIVE**

### **Explanation**

OBVTAM attempted to open an ACB to VTAM® for an network APPL that was inactive.

### **System action**

OBVTAM attempts access again for up to 30 minutes.

### **User response**

Activate the network APPL.

## **OMV003I(cont.): APPL IS IN CLEANUP**

### **Explanation**

VTAM® has not completed recovery processing after an OBVTAM failure.

### **System action**

Once VTAM® processing is complete, the network APPL becomes available to OBVTAM automatically.

### **User response**

None. This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **OMV003I(cont.): APPL NOT DEFINED**

### **Explanation**

The OBVTAM APPL was not defined to VTAM®.

### **System action**

OBVTAM terminates.

### **User response**

Contact the VTAM® systems programmer at your installation to define an APPL to VTAM® for OBVTAM. Restart OBVTAM.

## **OMV003I(cont.): VTAM® ERROR CODE *nn***

### **Explanation**

The error code associated with the VTAM® OPEN ACB process was *nn*.

**System action**

If the error code is 14, OBVTAM retries the operation for up to 30 minutes. Otherwise, OBVTAM terminates.

**User response**

Write down the VTAM® error code and contact the VTAM® systems programmer at your installation, or contact IBM Software Support.

**OMV003I(cont.): VTAM® IS NOT ACTIVE****Explanation**

OBVTAM was started before VTAM®.

**System action**

OBVTAM attempts to open the network APPL for up to 30 minutes.

**User response**

Start VTAM®, then restart OBVTAM.

**OMV004I: OBVTAM MUST BE APF AUTHORIZED TO BE NON-SWAPPABLE****Explanation**

The OBVTAM start parameter included SWAP=N, but OBVTAM cannot mark itself non-swappable without APF authorization.

**System action**

OBVTAM processing continues, but OBVTAM will remain non-swappable.

**User response**

If you want OBVTAM to be non-swappable, restart it from an APF-authorized library.

**OMV005I: ccccccc FM/TS PROFILE *nnnn* NOT SUPPORTED****Explanation**

Secondary Logical Unit *ccccccc* tried to establish a session using a VTAM® Logmode that specifies an FM/TS session profile of *nnnn*. OBVTAM supports FM/TS profiles 0303 and 0202 only.

**System action**

OBVTAM rejects the session request from SLU *ccccccc*.

**User response**

Select a VTAM® Logmode which specifies a supported FM/TS profile, or select an alternate device.

**OMV006I: SESSION ESTABLISHED FOR *aaaaaaaa/bbbbbbbb*****Explanation**

A VTAM® session was established between OBVTAM (network identifier *aaaaaaaa*) and Secondary Logical Unit *bbbbbbbb*.

**System action**

OBVTAM processing continues; initialization starts for an OMEGAMON session.

**User response**

None.

**OMV007I: SESSION INITIATION FAILED FOR *aaaaaaaa/bbbbbbbb: cc dddd eeee  
ffff*****Explanation**

The initiation of a session between OBVTAM (network identifier *aaaaaaaa*) and Secondary Logical Unit *bbbbbbbb* failed. The VTAM® status associated with the request is:

**cc**

VTAM® request code

**dddd**

VTAM® return code information

**eeee**

SNA system sense field

**ffff**

SNA user sense field

**System action**

OBVTAM rejects the session request from SLU *bbbbbbbb*.

**User response**

Refer the VTAM® status information to your Network Support group or contact IBM Software Support for assistance.

**OMV008I: KOBDSQZ MODULE NOT FOUND. NO DATA COMPRESSION****Explanation**

The program module KOBDSQZ was not found in the OBVTAM program library.

**System action**

OBVTAM processing continues, but the 3270 data stream created by OMEGAMON will not be compressed for those sessions that requested data compression.

**User response**

Contact IBM Software Support for assistance.

**OMV009I: ROWS/COLS IN CONFLICT WITH VTAM® LOGMODE *ccccccc*****Explanation**

The ROWS= and/or COLS= OMEGAMON startup parameter does not match VTAM®'s definition for the terminal. The VTAM® logmode used to start the session was *ccccccc*.

**System action**

OBVTAM displays the OBUSRMSG panel and then terminates.

**User response**

Correct the values of the OBVTAM startup parameter or select another VTAM® logmode that is the same as the OBVTAM startup parameter.

## OMV010I: TIMEOUT KEYWORD VALUE INVALID - SET TO 0

### Explanation

The value of the OBVTAM start parameter keyword TIMEOUT was not in the range 0–99.

### System action

Processing continues.

### User response

OBVTAM sets the TIMEOUT value to 0, and idle OMEGAMON sessions are not subject to timeout cancellation.

### User response

Correct the TIMEOUT value and restart OBVTAM.

## OMV012I: OMEGAMON SESSION TIMEOUT - cccccccc

### Explanation

The OMEGAMON session with terminal cccccccc was idle for the length of time specified on the TIMEOUT parameter.

### System action

OBVTAM cancels the idle session.

### User response

You may start another session.

## OMV013I: WSF (QUERY) TIMEOUT - cccccccc

### Explanation

Terminal cccccccc has not replied to the WSF (Query) sent by OBVTAM.

### System action

OBVTAM terminates the session with terminal cccccccc.

### User response

Configure terminal cccccccc to support WSF (Query) or select a VTAM® logmode that does not indicate that WSF (Query) is supported.

## OMV014I: SESSION SECURITY MODULE [NOT IN USE | {[KOCARACF | KOB SAF00] *build\_timestamp*}]

### Explanation

During OMEGAMON Classic session initialization, this message provides security-related information for the session, where:

- NOT IN USE indicates that a session security module is not used.
- KOCARACF Build: *mm/dd/yy-hh.mm* indicates the use of module KOCARACF, which is used when password security is configured. The timestamp when the module was built is provided.
- KOB SAF00 Build: *mm/dd/yy-hh.mm* indicates the use of module KOB SAF00, which is used when passphrase security is configured. The timestamp when the module was built is provided.

**System action**

OBVTAM processing continues; initialization starts for the OMEGAMON session.

**User response**

None.

**OMV020I: UMAX Maximum 3270 Sessions is *nnn*****Explanation**

The maximum number of concurrent users that can be logged on is shown.

**System action**

Initialization processing continues.

**User response**

None. OBVTAM is ready to accept logons if the current session count is less than the maximum value.

**OMV980I: SESSION REQUEST FAILED FOR *cccccccc/aaaaaaaa* - INSUFFICIENT MEMORY****Explanation**

OBVTAM (application *cccccccc*) failed to obtain enough memory to establish a session with terminal *aaaaaaaa*.

**System action**

OBVTAM rejects the session request from terminal *aaaaaaaa*.

**User response**

It may be possible to start a session by using a terminal with a smaller screen size, or by eliminating the use of 3270 data stream compression. Specify DC=N as part of the OBVTAM startup parameter to eliminate data compression. If the session still cannot be started, it may be necessary to increase the value of the z/OS® REGION SIZE to make more memory available to OBVTAM.

**OMV981I: DEVICE ERROR *aaaaaaaa* DETECTED FOR *bbbbbbbb/cccccccc*****Explanation**

OBVTAM (network identifier *bbbbbbbb*) received device status information from Secondary Logical Unit *cccccccc*. The information *aaaaaaaa* is the status value received in an SNA LUSTAT command.

**System action**

OBVTAM terminates the session with SLU *cccccccc*.

**User response**

Refer the LUSTAT information to your Network Support group or contact IBM Software Support for assistance.

**OMV982I: GETMAIN FAILED - INCREASE REGION SIZE****Explanation**

There is insufficient region size for OMEGAMON to obtain buffers.

**System action**

OMEGAMON aborts the session start.

### User response

See your installer to increase the region size.

**OMV983I: OM= KEYWORD INVALID - MODULE *aaaaaaaa* NOT FOUND *bbbbbbbb*/  
*cccccccc***

### Explanation

The module specified by the OM session start parameter could not be found by OBVTAM (network identifier *bbbbbbbb*). Module *aaaaaaaa* was specified explicitly or by default.

### System action

OBVTAM terminates the session with SLU *cccccccc*.

### User response

Include module *aaaaaaaa* in the OBVTAM runtime program library or specify a different module with the OM session start parameter.

**OMV984I: EXTENDED ATTRIBUTE ERROR *aaaa bbbb* DETECTED FOR *cccccccc***

### Explanation

Secondary Logical Unit *cccccccc* rejected a screen sent to it by OMEGAMON. The screen may have contained extended color or highlighting attributes. The VTAM® status associated with the error is: *aaaa* - SNA system sense field and *bbbb* - SNA user sense field.

### System action

OBVTAM terminates the session with SLU *cccccccc*.

### User response

Verify that the terminal supports extended attributes and is properly defined to VTAM®. If the terminal does not support extended color, the OMEGAMON session cannot be used with extended color support turned on. If the problem persists, refer the VTAM® status information to your Network Support group or contact IBM Software Support for assistance.

**OMV986I: SESSION ERROR *aa bbbb cccc dddd* FOR *eeeeeeee/ffffff***

### Explanation

An error occurred on the session between OBVTAM (network identifier *eeeeeeee*) and Secondary Logical Unit *ffffff*. The VTAM® status associated with the error is:

**aa**

VTAM® request code

**bbbb**

VTAM® return code information

**cccc**

SNA system sense field

**dddd**

SNA user sense field

### System action

OBVTAM terminates the session with SLU *ffffff*.

**User response**

Refer the VTAM® status information to your Network Support group or contact IBM Software Support for assistance.

**OMV987I: VTAM® ACB CLOSE FAILED; RETURN CODE=*rc*, REASON CODE=*rs*****Explanation**

VTAM® close processing failed as indicated.

**System action**

OBVTAM terminates.

**User response**

Contact IBM Software Support.

**OMV988I: UNABLE TO START OBVTAM SESSION (REASON CODE *rs*)****Explanation**

An error occurred while trying to start the VTAM® session, possibly because of lack of storage.

**System action**

OBVTAM terminates.

**User response**

Try to increase region size in the startup JCL. If failure recurs, contact IBM Software Support.

**OMV989I: TPEND EXIT-*code* DRIVEN FOR *applid*****Explanation**

Either a network shutdown is in progress, or the user has varied the OBVTAM network APPL inactive.

**System action**

Normally none.

**User response**

If this message recurs, contact IBM Software Support.

**OMV990I: INVALID LOGON PASSWORD FOR *applid/sluname*****Explanation**

The password specified in the LOGON DATA parameter does not match the password in the PARM string.

**System action**

OBVTAM terminates the logon process.

**User response**

Determine the correct password and retry.

## **OMV992I: SESSION cccccccc - PGM CHK xxxx yyyyyyyy, aaaa + bbbb**

### **Explanation**

OBVTAM encountered a program error while processing the session with terminal cccccccc. The variable message is defined as follows: *xxxx* is the program check interrupt code, *yyyyyyy* is the address where the program check occurred, *aaaa* is the module name where the program check occurred, and *bbbb* is the module offset where the program check occurred.

### **System action**

OBVTAM terminates.

### **User response**

Record the message and contact IBM Software Support. You may restart the session.

## **OMV994I: TERMINATION REQUESTED BY bbbbbbbb - REASON CODE xx**

### **Explanation**

The Secondary Logical Unit *bbbbbbbb* requested to terminate the VTAM® session between itself and OBVTAM. The VTAM® reason code was *xx*.

### **System action**

OBVTAM terminates the OMEGAMON session and then terminates the VTAM® session.

### **User response**

This may or may not indicate a problem. If the message persists, refer the VTAM® reason code information to your Network Support group or contact IBM Software Support for assistance.

## **OMV996I: SESSION TERMINATED FOR aaaaaaaa/bbbbbbbb**

### **Explanation**

The VTAM® session between OBVTAM (network identifier *aaaaaaa*) and Secondary Logical Unit *bbbbbbb* ended.

### **System action**

OBVTAM processing continues; OBVTAM will accept a new session request from any SLU.

### **User response**

None.

## **OMV997I: SESSION TERMINATION FAILED FOR aaaaaaaa/bbbbbbbb: cc dddd eeee ffff**

### **Explanation**

Session termination processing between OBVTAM (network identifier *aaaaaaa*) and Secondary Logical Unit *bbbbbbb* failed. The VTAM® status associated with the request is

#### **cc**

VTAM® request code

#### **dddd**

VTAM® return code information

#### **eeee**

SNA system sense field

**ffff**

SNA user sense field

**System action**

OBVTAM stops servicing the session with SLU *bbbbbbbb*.

**User response**

Refer the VTAM® status information to your Network Support group or contact IBM Software Support for assistance.

**OMV998I: STOP COMMAND CAUSES TERMINATION FOR *applid***

**Explanation**

The systems programmer issued an z/OS® STOP console command, instructing OBVTAM to terminate and all OMEGAMON sessions that are currently active beneath it.

**System action**

OBVTAM begins termination processing.

**User response**

None. This is an informational message about a normal OBVTAM condition.

**OMV999I: OBVTAM ENDED**

**Explanation**

The OBVTAM support program ended.

**System action**

OMEGAMON terminates.

**User response**

None. This is an informational message about a normal OBVTAM condition.

---

## Messages shared by distributed and z/OS® components

Because the Tivoli Enterprise Monitoring Server can run on both distributed platforms and z/OS®, this component has some messages that can appear in both distributed logs and in the RKLVLLOG on z/OS®. These shared Tivoli Enterprise Monitoring Server messages can have the following prefixes:

- KDC
- KDS
- KFA
- KMS
- KO4
- KQM

[“Log locations for the Tivoli Enterprise Monitoring Server” on page 2298](#) shows the locations of logs for Tivoli Enterprise Monitoring Server on distributed platforms and z/OS®.

This table provides the locations of the logs for the Tivoli Enterprise Monitoring Server.

Table 138: Log locations for the Tivoli Enterprise Monitoring Server		
Component	Windows® systems	UNIX-based systems
Tivoli Enterprise Monitoring Server on a distributed platform message logs	<p><code>\install_dir\cms\kdsmain.msg</code></p> <p>Where <code>install_dir</code> specifies the directory where Tivoli Enterprise™ Portal Server was installed.</p>	<p><code>install_dir/logs/hostname_ms_timestamp.msg</code></p> <p>Where:  <b>install_dir</b>  Specifies the directory where Tivoli Enterprise™ Portal Server was installed.</p> <p><b>hostname</b>  Specifies the name of the system hosting the product</p> <p><b>ms</b>  Indicates that these messages are for the Tivoli Enterprise™ Portal Server.</p> <p><b>timestamp</b>  A decimal representation of the time at which the process was started.</p>
Tivoli Enterprise Portal Server on a distributed platform trace logs	<p><code>\install_dir\logs\kfwservices.msg</code></p> <p>Where:  <b>install_dir</b>  Specifies the directory where Tivoli Enterprise™ Portal Server was installed.</p>	<p><code>install_dir/logs/kfwservices.msg</code></p> <p>Where:  <b>install_dir</b>  Specifies the directory where Tivoli Enterprise™ Portal Server was installed.</p>
Tivoli Enterprise Monitoring Server on z/OS®	<p>RKLVLOG for the Tivoli Enterprise Monitoring Server on z/OS® is the single most helpful piece of service information available for the monitoring server. The RKLVLOG (R = runtime, KLV = the prefix associated with Tivoli® Monitoring Services: Engine or TMS:Engine) is the sysout data set or spool file that contains log and trace messages.</p> <p>These additional zSeries® log files (if available) are also useful:</p> <ul style="list-style-type: none"> <li>• The RKLVSnap sysout data set or spool file contains formatted dump output.</li> <li>• The RKPLOG sysout data set or spool file contains the information and error messages related to the handling of persistent data stores.</li> <li>• The RKPLOG contains KPDXTRA log messages for debugging persistent data store problems.</li> <li>• The JES2 and JES3 system log contains information about JES issues.</li> </ul> <p>Refer to your JCL started task procedures for the locations of these serviceability log files.</p>	

## KDS messages

Messages that begin with the KDS prefix are associated with the Tivoli Enterprise™ Monitoring Server on both z/OS® and distributed platforms.

**KDS9101I: System Name: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9102I: Program Name: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9103I: Process ID: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9104I: User Name: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9105I: Job Name: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9106I: Task Name: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9107I: System Type: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9108I: CPU Count: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9109I: Page Size: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9110I: Physical Memory: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9111I: Virtual Memory: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9112I: Page Space: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9113I: Service Point: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9114I: ITM Home: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9115I: Executable Name: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9116I: KBB\_RAS1: *variable*****Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KDS9117I: KBB\_RAS1\_LOG: *variable***

#### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KDS9118I: Node ID: *variable***

#### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KDS9119I: Build: *variable***

#### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KDS9131E: The table name *variable* for application *variable* was not found.**

#### **Explanation**

A table name specified in a query for the specified application was not found. Possible installation or configuration error.

#### **Operator response**

Verify that the application support files for the specified application have been installed on the server machine where this message was logged.

### **KDS9133E: Column *variable* in table *variable* for application *variable* was not found.**

#### **Explanation**

A query was issued that included the specified column in the specified table for the specified application. The specified column was not found in the specified table. Possible installation or configuration error.

#### **Operator response**

Verify that the correct version of the application support files for the specified application have been installed on the server machine where this message was logged.

### **KDS9134E: Change key column *variable* in table *variable* for application *variable* was not found.**

#### **Explanation**

A query was issued that included the specified key column in the specified table for the specified application. The specified key column was not found in the specified table. Possible installation or configuration error.

#### **Operator response**

Verify that the correct version of the application support files for the specified application have been installed on the server machine where this message was logged.

**KDS9141I: The TEMS *variable* is connected to the hub TEMS *variable*.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9142I: The TEMS *variable* is disconnected from the hub TEMS *variable*.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDS9143I: An initial heartbeat has been received from the TEMS *variable* by the hub TEMS *variable*.**

**Explanation**

A regularly scheduled heartbeat is used by the Tivoli Enterprise™ Monitoring Server to monitor the status of connected nodes as well as itself. As a result, in some cases the sender and receiver of the heartbeat may both be the hub Tivoli Enterprise™ Monitoring Server.

**KDS9144I: A shutdown notification has been received from the TEMS *variable* by the hub TEMS *variable*.**

**Explanation**

This message indicates a normal shutdown of the specified Tivoli Enterprise™ Monitoring Server. In some cases the sender and receiver of the notification may both be the hub Tivoli Enterprise™ Monitoring Server.

**KDS9150I: The TEMS Sitmon thread is BUSY. Process *variable* has been in the BUSY state for longer than *variable* seconds.**

**Explanation**

The Tivoli Enterprise™ Monitoring Server Sitmon thread has been busy longer than is expected under a normal load. When this condition clears message KDS9152I will be logged.

**Operator response**

If this conditions persists for longer than an hour, contact IBM® Service Support.

**KDS9151E: The heartbeat from remote TEMS *variable* was not received at its scheduled time and the remote TEMS has been marked offline.**

**Explanation**

A heartbeat signal is sent from the remote Tivoli Enterprise™ Monitoring Server to the hub Tivoli Enterprise™ Monitoring Server on a regular schedule to indicate the status of the remote Tivoli Enterprise™ Monitoring Server. The remote TEMS specified failed to send its heartbeat at the scheduled time and has been marked offline by the hub Tivoli Enterprise™ Monitoring Server.

**Operator response**

Verify that the specified remote Tivoli Enterprise™ Monitoring Server is running and if not, restart it. Verify network connectivity between the hub and remote Tivoli Enterprise™ Monitoring Server. Verify the Tivoli Enterprise™ Monitoring Server installation and configuration.

## **KDS9152I: The TEMS Sitmon thread BUSY condition has cleared.**

### **Explanation**

The Tivoli Enterprise™ Monitoring Server Sitmon thread is no longer BUSY.

## **KDSDC001: Initial load of the TEMS Catalog now in progress.**

### **Explanation**

The Tivoli Enterprise™ Monitoring Server is loading its runtime Catalog data set. No other activity takes place during this load. The loading process could take as long as 2 minutes, depending on the number of applications installed.

### **Operator response**

This message is followed by another message when the loading is completed.

## **KDSDC002: Initial load of the TEMS catalog complete.**

### **Explanation**

The Tivoli Enterprise™ Monitoring Server has completed the loading of its runtime Catalog data set.

## **KDSDC003: Updating the catalog is not allowed without a catalog cache.**

### **Explanation**

The catalog cache has been disabled either through configuration or because the cache has become corrupted.

### **Operator response**

Enable the catalog cache if disabled by configuration. Restart the Tivoli Enterprise™ Monitoring Server.

## **KDSMA001: Tivoli Enterprise™ Monitoring Server (TEMS) data collection server started.**

### **Explanation**

Initialization in progress.

## **KDSMA002: Tivoli Enterprise™ Monitoring Server (TEMS) did not start. Status=*variable*. Reason=*variable***

### **Explanation**

The Tivoli Enterprise™ Monitoring Server did not start. Operation *variable* was in progress and completed with status *variable* and reason *variable*.

### **Operator response**

Verify installation and configuration procedures.

## **KDSMA003: Tivoli Enterprise™ Monitoring Server (TEMS) data collection server ended successfully.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDSMA004: Internal services failed during *variable* while attempting to end. Status= *variable*. Reason= *variable***

**Explanation**

Tivoli Enterprise™ Monitoring Server (TEMS) did not end successfully. Services have ended, but problems exist.

**Operator response**

Refer to the *IBM® Tivoli® Monitoring: Problem Determination Guide* for more information.

**KDSMA005: Stop of internal services ended abnormally. Reason *variable*.**

**Explanation**

An internal error occurred. *variable* is an internal code that aids in problem resolution.

**Operator response**

Refer to the *IBM® Tivoli® Monitoring: Problem Determination Guide* for more information.

**KDSMA006: Tivoli Enterprise™ Monitoring Server (TEMS) data collection server did not start.**

**Explanation**

The data collection server did not start.

**Operator response**

View all error messages that were logged to the Tivoli Enterprise™ Monitoring Server product log. Also, check the joblog of the failed job for messages.

**KDSMA007: Logon did not complete. Not enough memory. User *variable*.**

**Explanation**

You tried to log onto Tivoli Enterprise™ Monitoring Server (TEMS) but not enough memory is currently available to process the request.

**Operator response**

See your Tivoli Enterprise™ Monitoring Server administrator to determine memory requirements.

**KDSMA008: Duplicate logon attempted. User *variable*.**

**Explanation**

You tried to log onto Tivoli Enterprise™ Monitoring Server (TEMS) more than once.

**KDSMA009: User *variable* logged off server *variable*.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDSMA010: Communication did not succeed. User *variable variable* cancelled.**

**Explanation**

Tivoli Enterprise™ Monitoring Server (TEMS) has detected a loss of communication to the user. Automatic cleanup processing is invoked.

**KDSMA011: Logon successful to server *variable* user *variable*.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KDSMA012: Logon did not complete. User *variable*.**

**Explanation**

You tried to log onto the Tivoli Enterprise™ Monitoring Server (TEMS) data collection server, but a possible logon string error has occurred.

**Operator response**

Verify installation and configuration procedures.

**KDSMA013: APPLID *variable* is not valid or is unavailable.**

**Explanation**

An attempt to bind to the APPLID *variable* failed. This could be due to the APPLID being unavailable or because the APPLID is not correct.

**Operator response**

Verify installation and configuration procedures.

**KDSMA014: Node ID &1 length is too long.**

**Explanation**

The length of the node ID must be less than 32 characters.

**User response**

Verify installation and configuration procedures.

**Severity**

0

**System Programmer Response**

No

**KDSNC001: Checking location broker status.**

**Explanation**

The location brokers are being checked to determine if they are already active.

**Operator response**

Verify installation and configuration procedures.

**KDSNC002: Local location broker is not active.****Explanation**

The local location broker has not yet been started. The Tivoli Enterprise™ Monitoring Server will start it.

**KDSNC003: Global location broker is not active.****Explanation**

The global location broker has not yet been started. The Tivoli Enterprise™ Monitoring Server will start it.

**KDSNC004: Bind of local location broker complete at address *variable* on port *variable*.****Explanation**

The local location broker initialized successfully using the specified address and port.

**KDSNC005: Bind of global location broker complete at address *variable* on port *variable*.****Explanation**

The global location broker initialized successfully using the specified address and port.

**KDSNC006: Bind of local and global location broker complete at address *variable* on port *variable*.****Explanation**

The local and global location broker initialized successfully. Both are using the specified address and port.

**KDSNC007: Local Location Broker is active.****Explanation**

The local location broker initialized successfully.

**KDSNC008: Global Location Broker is active.****Explanation**

The global location broker initialized successfully.

**KDSNC009: Unable to create location brokers, status = *variable*.****Explanation**

The local or global location broker or both failed to start.

**Operator response**

Verify installation and configuration procedures.

**KDSPA001: Logon validation did not complete. User ID not valid. User *variable* *variable*.**

**Explanation**

You tried to log onto the Tivoli Enterprise™ Monitoring Server data collection server, but the user ID is not a valid user ID.

**Operator response**

Enter a valid user ID.

**KDSPA002: Logon validation did not complete. Password not valid. User *variable* and *variable*.**

**Explanation**

You tried to log onto the Tivoli Enterprise™ Monitoring Server (TEMS) data collection server, but the password supplied for the user ID is not valid.

**Operator response**

Enter a valid password.

**KDSPA003: Logon validation did not complete - system error. User *variable* *variable*.**

**Explanation**

You tried to log onto the Tivoli Enterprise™ Monitoring Server (TEMS) data collection server, but a possible system error occurred.

**Operator response**

Refer to the *IBM® Tivoli® Monitoring: Problem Determination Guide* for additional information about logon validation failures.

**KDSPA004: Logon validation failed. User *variable* *variable*.**

**Explanation**

You tried to log onto the Tivoli Enterprise™ Monitoring Server (TEMS) but the logon validation failed.

**Operator response**

Ensure the user ID and password used are correct.

**KDSPM001: Remote request directory service lookup failed for node *variable*.**

**Explanation**

The location of the node specified in a remote request cannot be determined. Possible configuration error.

**Operator response**

Verify installation and configuration procedures.

**KDSPM021: Storage limit exceeded attempting to process *variable1*  
*variable2*.**

**Explanation**

A SQL Where clause contains too many elements or large elements.

**Operator response**

Reduce the number and size of elements or use multiple queries, such as imbedded situations.

**KDSRU001: Remote request communication failure to destination *variable*.**

**Explanation**

The Tivoli Enterprise™ Monitoring Server (TEMS) data collection server has lost or could not communicate with a remote partner. Possible configuration error.

**Operator response**

Try again later. If still not successful, verify installation and configuration procedures.

**KDSSA001: Seeding started for product *variable* using file *variable* with seed  
option *variable***

**Explanation**

The seeding process was started for the specified product.

**KDSSA002: Seeding ended for product *variable* using file *variable* with seed  
option *variable***

**Explanation**

The seeding process ended for the specified product.

**KDSSA003: Product *variable* not seeded, seed file not found.**

**Explanation**

The indicated product was not seeded, as the seed file could not be found.

**KDSSA004: Seeding for product *variable* for install type *variable* is  
configured as DISABLE. Seeding is not performed.**

**Explanation**

For the product specified and the install type (pristine or upgrade), either the product specific SDA seeding configuration or the system SDA seeding configuration indicates the setting as <DISABLE>.

**Operator response**

Refer to the *IBM Tivoli Monitoring Command Reference* for more information.

## **KFA messages**

Messages that begin with the KFA prefix are associated with the Tivoli Enterprise™ Monitoring Server on both z/OS® and distributed platforms.

## **KFAA060W: UNABLE TO READ *kdscnfg* FILE**

### **Explanation**

An attempt to read the *kdscnfg* file from the Tivoli Enterprise™ Monitoring Server configuration file directory (/tables directory) has failed.

### **System action**

No connection to Tivoli Enterprise™ Monitoring Server can be established for alert automation processing. Alert processing is disabled.

### **User response**

Ensure that the SMAF process is started from the proper directory and that the *kdscnfg* file is present. Restart Tivoli Enterprise™ Monitoring Server after corrections have been made.

## **KFAAL00E: INVALID SE LOCK STATE IN *module* COUNTER=*lockcounter***

### **Explanation**

An invalid state was detected in a shared or exclusive lock control block. An internal error has occurred that may cause integrity errors on shared resource access. The *module* value indicates the module where the problem was detected. The *lockcounter* value specifies the number of shared locks in progress. A *lockcounter* value of -1 means that a single user has an exclusive lock. A value of 0 means that no locks are in progress.

### **System action**

Processing continues.

### **User response**

Contact IBM® Software Support.

## **KFAOT001: Starting TEC Event Integration facility. Time = *<variable>***

### **Explanation**

TEC Event Integration facility initialization in progress.

## **KFAOT002: TEC Event Integration facility started successfully.**

### **Explanation**

TEC Event Integration facility has started successfully.

## **KFAOT003: TEC Event Integration facility startup failed. status = *<variable>*.**

### **Explanation**

TEC Event Integration facility has failed to initialize.

## **KFAOT004: TEC Event Integration facility has ended.**

### **Explanation**

TEC Event Integration facility has ended.

**KFAOT005: Load KFAOTTEV failed, status = *<variable>*. TEC Event Integration disabled.**

**Explanation**

Unable to load KFAOTTEV. KFAOMTEC dll may be missing or corrupt.

**KFAOT006: TEC Event Integration entered quiesced mode**

**Explanation**

TEC Event Integration is refreshing the EIF configuration or mapping files or both.

**KFAOT007: TEC Event Integration exited quiesced mode**

**Explanation**

TEC Event Integration finished refreshing the EIF configuration or mapping files or both.

**KFAOT008: TEC Event Integration not enabled. Refresh command ignored.**

**Explanation**

TEC Event Integration is not enabled. The **refresh** command is ignored.

**KFAOT009: Refresh of EIF config and/or mapping files is successful.**

**Explanation**

The refresh operation is successful.

**KFAOT010: Refresh of EIF config and/or mapping files failed. Status *<variable>*.**

**Explanation**

The refresh operation failed. See the Tivoli Enterprise™ Monitoring Server logs for details. The most common status codes follow:

**1**

Bad input.

**5**

No members found.

**7**

No memory.

**8**

Library I/O or system call error.

**KFAOT011: Event destination *<variable>* no longer valid for situation *<variable>*.**

**Explanation**

The specified event destination is no longer defined.

**KFAOT012: <variable> attribute file <variable> successfully refreshed.**

**Explanation**

TEC Event Forwarder has successfully processed the new or updated attribute file.

**KFAOT013: Load KFAOTRFH failed, status=<variable>. The TEC Event Integration product refreshing is disabled.**

**Explanation**

Unable to load KFAOTRFH. The KFAOMTEC library may be missing or corrupt.

**KFAS001: Product <variable> cannot be seeded.**

**Explanation**

The indicated product could not be seeded, because a required Tivoli Enterprise Monitoring Server (TEMS) service could not be loaded.

**System action**

None.

**User response**

Contact IBM Software Support.

**KFASD001: Detected that product <variable> version <variable> id <variable> id version <variable> support files manually installed.**

**Explanation**

During startup, the Tivoli Enterprise Monitoring Server (TEMS) determined that the support files for the specified product were manually installed.

**System action**

None.

**User response**

None.

**KFASD002: Detected that product <variable> version <variable> id <variable> id version <variable> support files manually removed.**

**Explanation**

During startup, the Tivoli Enterprise Monitoring Server (TEMS) determined that the version and catalog support files for the specified product were manually removed.

**System action**

None.

**User response**

If the specified version of this product is still in use, manually re-install the support files for the product and restart the Tivoli Enterprise Monitoring Server. Otherwise, no action is required.

**KFASD003: Detected that product version was manually changed from <variable> to <variable> for product <variable> id <variable> id version <variable>.**

**Explanation**

During startup, the Tivoli Enterprise Monitoring Server (TEMS) determined that a different version of an existing product was manually installed.

**System action**

None.

**User response**

If the new product support version does not match your product version, install the correct support files and restart the Tivoli Enterprise Monitoring Server. Otherwise, no action is required.

**KFASD004: Detected that catalog version <variable>,<variable> was manually replaced with version <variable>,<variable> for product <variable> version <variable> id <variable> id version <variable>.**

**Explanation**

During startup, the Tivoli Enterprise Monitoring Server (TEMS) determined that the catalog file for an installed product was manually replaced with a different catalog.

**System action**

None.

**User response**

If the new product catalog version is incorrect, install the correct support files for the product and restart the Tivoli Enterprise Monitoring Server. Otherwise, no action is required.

**KFASD005: Detected that the catalog is missing for product <variable> version <variable> id <variable> id version <variable>. Catalog version was <variable>,<variable>, state <variable>, status <variable>.**

**Explanation**

During startup, the Tivoli Enterprise Monitoring Server (TEMS) determined that the catalog for an installed product was removed. The most common status codes (the value of the STATUS column in the TAPPLPROPS table) and their descriptions are:

**0**

Operation successful

**1001**

Request queued

**1002**

Out of memory

**1003**

Bad argument

**1004**

Not found

**1005**

System error

**1006**

Request for same product already in progress or queued

**1007**

KT1 error

**1008**

Self-Describing Agent (SDA) feature disabled at TEMS

**1009**

Hub not there

**1010**

TEMS shutdown in progress

**1011**

Invalid content in manifest file

**1012**

Wrong TEMS version

**1013**

Unsupported feature

**1014**

Unknown error

**1015**

Bad input argument

**1016**

Record updated by the manual install detection process

**1017**

Temp install error, agent expected to retry install request

**1018**

Error refreshing catalog files

**1019**

Error refreshing attribute files

**1020**

Error refreshing Omegamon2TEC files

**1021**

Time expired waiting for SDA install completion

**1022**

Seeding error

**1023**

SDA not initialized due to config error

**System action**

None.

### User response

If the specified product is still in use, manually reinstall the support files and restart the Tivoli Enterprise Monitoring Server. Otherwise, no action is required.

**KFASD006: Detected failure state <variable>, status <variable>, in a prior auto install of product <variable> version <variable> id <variable> id version <variable>. State changed to <variable>.**

### Explanation

During startup, the Tivoli Enterprise Monitoring Server (TEMS) determined that a prior attempt to automatically install the indicated product failed. Use `tacmd listappinstallrecs` to display the STATE of the application install records. The most common status codes (the value of the STATUS column in the TAPPLPROPS table) and their descriptions are listed in the description of message "[KFASD005](#)" on page 2313.

### System action

None.

### User response

Follow the instructions in the IBM Tivoli Monitoring (ITM) documentation for recovering from automatic product installation failures.

**KFASD007: Detected failure STATE <variable>, STATUS <variable>, SEEDSTATE <variable>, in a prior auto install of PRODUCT <variable> VERSION <variable> ID <variable> IDVER <variable>.**

### Explanation

During startup, the Tivoli Enterprise Monitoring Server (TEMS) determined that a prior attempt to automatically install the indicated product failed. The most common status codes (the value of the STATUS column in the TAPPLPROPS table) and their descriptions are listed in the description of message "[KFASD005](#)" on page 2313.

### System action

None.

### User response

Use `tacmd listappinstallrecs` to display the STATE of the application install records. Follow the instructions in the IBM Tivoli Monitoring (ITM) documentation for recovering from automatic product installation failures.

**KFASD008: Detected an incomplete automatic install of product <variable> version <variable> id <variable> id version <variable>: state <variable>, status <variable>. State promoted to <variable>.**

### Explanation

During startup, the Tivoli Enterprise Monitoring Server (TEMS) determined that a prior attempt to automatically install the indicated product did not finish. The most common status codes (the value of the STATUS column in the TAPPLPROPS table) and their descriptions are listed in the description of message "[KFASD005](#)" on page 2313.

### System action

None.

### User response

Use `tacmd listappinstallrecs` to display the STATE of the application install records. Follow the instructions in the IBM Tivoli Monitoring (ITM) documentation for recovering from automatic product installation failures.

## **KFASD009: Self-Describing Agent feature enabled on local TEMS.**

### Explanation

Initialization of the Self-Describing Agent (SDA) feature has successfully completed on the local Tivoli Enterprise Monitoring Server (TEMS) and is available for use.

### System action

None.

### User response

If you do not want SDA to be enabled on the local TEMS, you must set the `KMS_SDA=N` environment variable. Otherwise, no action is required.

## **KFASD010: Self-Describing Agent feature disabled on local TEMS.**

### Explanation

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because the `KMS_SDA=N` environment variable has been specified.

### System action

None.

### User response

If you want SDA to be enabled on the local TEMS, you must set the `KMS_SDA=Y` environment variable. Otherwise, no action is required.

## **KFASD011: Self-Describing Agent feature disabled on local TEMS because of error during initialization.**

### Explanation

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because an error occurred while the components of the SDA feature were being constructed and initialized.

### System action

None.

### User response

View the TEMS product log to find specific information pertaining to the SDA initialization error.

## **KFASD012: Self-Describing Agent feature disabled on local TEMS because TEMS\_MANIFEST\_PATH length <variable> exceeds maximum length <variable>**

### Explanation

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because the length of the directory value specified in the `TEMS_MANIFEST_PATH` environment variable exceeds the 512 character limit.

**System action**

None.

**User response**

If you want to use the SDA feature, you must ensure that a valid TEMS\_MANIFEST\_PATH environment variable has been specified in the TEMS configuration file.

**KFASD013: Self-Describing Agent feature disabled on local TEMS because TEMS\_MANIFEST\_PATH not specified.****Explanation**

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because a required environment variable, TEMS\_MANIFEST\_PATH, has not been specified to indicate the directory where SDA files should be installed.

**System action**

None.

**User response**

If you want to use the SDA feature, you must ensure that a valid TEMS\_MANIFEST\_PATH environment variable has been specified in the TEMS configuration file.

**KFASD014: Self-Describing Agent feature disabled on local TEMS because Distributed Request Manager failed to initialize.****Explanation**

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because a vital component of the SDA feature, the Distributed Request Manager, failed to initialize.

**System action**

None.

**User response**

View the TEMS product log to find specific information pertaining to the Distributed Request Manager initialization error.

**KFASD015: Self-Describing Agent feature disabled on local TEMS because Notification Manager failed to initialize.****Explanation**

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because a vital component of the SDA feature, the Notification Manager, failed to initialize.

**System action**

None.

**User response**

View the TEMS product log to find specific information pertaining to the Notification Manager initialization error.

## **KFASD016: Self-Describing Agent feature disabled on local TEMS because SDM Request Manager thread failed to initialize.**

### **Explanation**

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because a vital component of the SDA feature, the SDM Request Manager thread, failed to initialize.

### **System action**

None.

### **User response**

View the TEMS product log to find specific information pertaining to the SDM Request Manager thread initialization error.

## **KFASD017: Self-Describing Agent feature disabled on local TEMS because of failure to allocate <&1> bytes for SDM Communication Area.**

### **Explanation**

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because a vital component of the SDA feature, the SDM Communication Area, could not be allocated.

### **System action**

None.

### **User response**

View the TEMS product log to determine if there is a severe memory shortage problem in this TEMS or if there are other errors relevant to the inability to allocate the SDM Communication Area.

## **KFASD018: Self-Describing Agent feature has config <variable> at hub TEMS. SDA also being disabled at this remote TEMS.**

### **Explanation**

While (re)connecting to the hub Tivoli Enterprise Monitoring Server (TEMS), this remote TEMS detected that the Self-Describing Agent (SDA) feature is not enabled at the hub because the environment variable, KMS\_SDA=N, has been specified at the hub. Therefore, the SDA feature must also be disabled at this remote TEMS to prevent SDA requests from being sent to the hub.

### **System action**

None.

### **User response**

If you require SDA support at this remote TEMS, you must ensure that KMS\_SDA=Y is also specified at the associated hub TEMS.

## **KFASD019: Self-Describing Agent feature has config <variable> status <variable> at hub TEMS. SDA also being disabled at this remote TEMS.**

### **Explanation**

While (re)connecting to the hub Tivoli Enterprise Monitoring Server (TEMS), this remote TEMS detected that the Self-Describing Agent (SDA) feature is not enabled at the hub because of an error encountered during the hub's SDA initialization. Therefore, the SDA feature must also be disabled at this remote TEMS to prevent SDA requests from being sent to the hub.

### System action

None.

### User response

The error status code value from the hub can be one of the following:

1. SDA initialization failed
2. ITM\_HOME/CANDLEHOME directory not specified
3. TEMS\_MANIFEST\_PATH env var not specified
4. TEMS\_MANIFEST\_PATH directory length exceeds maximum
5. TEMS\_MANIFEST\_PATH directory doesn't exist
6. KMS\_SDA env var contains unexpected value
7. SDA Distributed Request Manager failed to initialize
8. SDA Notification Manager failed to initialize
9. Unable to create SDA Request Manager thread
10. SDA disabled at HUB, disabling at RTEMS
11. SDA error status at HUB, disabling at RTEMS
12. SDA status unknown at HUB, disabling at RTEMS
13. Unable to contact HUB for SDA status, disabling at RTEMS
14. SDA Broadcast Request Manager failed to initialize
15. Unable to create SDA Broadcast Manager thread
16. KMS\_SDA=N configured on local TEMS
17. CMS\_FTO=YES configured on local TEMS

You can also view errors in the hub TEMS product log to obtain additional information as to why SDA is not available there. After the problem at the hub has been corrected, the SDA feature will be enabled at this remote TEMS following the next hub connection.

### **KFASD020: Self-Describing Agent feature has config <variable> at hub TEMS. SDA also being disabled at this remote TEMS.**

### Explanation

While (re)connecting to the hub Tivoli Enterprise Monitoring Server (TEMS), this remote TEMS was not able to obtain the status of the Self-Describing Agent (SDA) feature at the hub. Because the hub SDA feature may be inactive or non-responsive, the feature must also be disabled at this remote TEMS to prevent SDA requests from being sent to the hub.

### System action

None.

### User response

If you require SDA support at this local RTEMS, you should view the hub TEMS product log to find information pertaining to the status of SDA, and if there were errors encountered during SDA initialization or operation at the hub. After the problem at the hub has been corrected, the SDA feature will be enabled at this remote TEMS following the next hub connection.

**KFASD021: Self-Describing Agent feature has been enabled at hub TEMS. SDA also being enabled at this remote TEMS.**

**Explanation**

While (re)connecting to the hub Tivoli Enterprise Monitoring Server (TEMS), this remote TEMS detected that the Self-Describing Agent (SDA) feature has been enabled at the hub. Therefore, the feature can now be enabled at this remote TEMS.

**System action**

None.

**User response**

If you do not want SDA to be enabled at this remote TEMS, you must set the KMS\_SDA=N environment variable. Otherwise, no action is required.

**KFASD022: Unexpected value <variable> found in KMS\_SDA environment variable. Self-Describing Agent feature disabled on local TEMS.**

**Explanation**

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because the KMS\_SDA environment variable has been assigned an undefined value. The only two supported values are Y for enabling the SDA feature, and N for disabling the feature.

**System action**

None.

**User response**

Correct the KMS\_SDA environment variable to assign it either a Y or N value.

**KFASD023: Unable to contact hub TEMS, status <variable>, to determine if Self-Describing Agent feature is enabled.**

**Explanation**

This remote Tivoli Enterprise Monitoring Server (TEMS) was not able to communicate with its hub to obtain the status of the Self-Describing Agent (SDA) feature at the hub.

**System action**

None.

**User response**

View the TEMS product logs for both the hub and remote TEMS to determine the cause of the communication failure between the remote and hub TEMS.

**KFASD024: Self-Describing Agent feature disabled on local TEMS because <variable> not specified.**

**Explanation**

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because the required ITM home directory was not specified.

**System action**

None.

**User response**

Ensure that the ITM home directory has been properly specified in the Tivoli Enterprise Monitoring Server configuration file.

**KFASD025: Self-Describing Agent feature disabled on local TEMS because TEMS\_MANIFEST\_PATH <variable> not found.****Explanation**

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because a required environment variable, TEMS\_MANIFEST\_PATH, has been assigned a directory that does not exist in the local file system.

**System action**

None.

**User response**

If you want to use the SDA feature, you must ensure that a valid directory has been specified for the TEMS\_MANIFEST\_PATH environment variable in the Tivoli Enterprise Monitoring Server configuration file.

**KFASD026: The remote TEMS has become disconnected from the HUB while performing a SDA synchronization.****Explanation**

This remote Tivoli Enterprise Monitoring Server (TEMS) encountered a communication failure with the hub during a Self-Describing Agent (SDA) request. SDA requests cannot be honored until the connection is re-established.

**System action**

None.

**User response**

View the TEMS product logs for both the hub and remote TEMS to determine the cause of the communication failure between the remote and hub TEMS. Once the failure has been corrected, SDA request support can be resumed.

**KFASD027: Unexpected failure <variable> during RTEMS SDA synchronization with the HUB.****Explanation**

This remote Tivoli Enterprise Monitoring Server (TEMS) encountered an unexpected failure with the hub during the Self-Describing Agent (SDA) synchronization phase. The SDA feature is disabled at this remote TEMS.

**System action**

None.

**User response**

View the TEMS product logs for both the hub and remote TEMS to determine the location of the issue, and recycle the appropriate TEMS that is responsible for the issue. Once the remote TEMS reconnects, SDA request support can be resumed.

**KFASD028: Self-Describing Agent feature disabled on local TEMS because Broadcast Manager failed to initialize.**

**Explanation**

The Self-Describing Agent (SDA) feature is disabled on the local Tivoli Enterprise Monitoring Server (TEMS) because a vital component of the SDA feature, the Broadcast Manager, failed to initialize.

**System action**

None.

**User response**

View the Tivoli Enterprise Monitoring Server product log to find specific information pertaining to the Broadcast Manager initialization error.

**KFASD030: Detected seeding error, SEEDSTATE <variable>, STATE <variable>, STATUS <variable>, in a prior auto install of PRODUCT <variable> VERSION <variable> ID <variable> IDVER <variable>.**

**Explanation**

During startup, the Tivoli Enterprise Monitoring Server (TEMS) determined that a prior attempt to automatically seed the indicated product encountered an error. Prior installation continued. Use the tacmd listappinstallrecs to display the STATE and SEEDSTATE of the application install records.

**System action**

None.

**User response**

View the previous TEMS product log to find specific information pertaining to the product seeding error.

**KFASD031: *variable* Self-Describing Agent install configurations record after RTEMS reconnected to HUB failed. status *variable***

**Explanation**

Processing of install configuration records after RTEMS reconnects to the HUB has failed. See the RTEMS RAS1 log for details.

**System action**

None.

**User response**

None.

**KFASD100: Self-Describing Install Started for PRODUCT <variable>, VER <variable>, ID <variable>, IDVER <variable>.**

**Explanation**

Self-Describing Agent installation has begun for the specified product.

**System action**

None.

**User response**

None.

**KFASD101: Self-Describing Install Completed Successfully for PRODUCT <variable>, VER <variable>, ID <variable>, IDVER <variable>.**

**Explanation**

Self-Describing Agent installation has successfully completed for the specified product.

**System action**

None.

**User response**

None.

**KFASD102: Self-Describing Install Failed with STATUS <&1> for PRODUCT <variable>, VER <variable>, ID <variable>, IDVER <variable>.**

**Explanation**

Self-Describing Agent installation has failed for the specified product.

**System action**

None.

**User response**

View the TEMS product log to find specific information pertaining to the product installation error.

**KFASD103: Self-Describing Agent Seeding Failed for PRODUCT <variable>, VER <variable>, ID <variable>, IDVER <variable>. Install continuing.**

**Explanation**

Self-Describing Agent seeding has failed for the specified product. The installation process has ignored the error, and is continuing with the product install.

**System action**

None.

**User response**

View the TEMS product log to find specific information pertaining to the product seeding error.

**KFASD106: FTO requested Self Describing Install at Mirror for PRODUCT <variable>, VER <variable>, ID <variable>, IDVER <variable>.**

**Explanation**

Self-Describing Agent installation has been requested at the Mirror for the specified product.

**System action**

None.

**User response**

None.

**KFASD107: Pending Self-Describing Install request is cancelled for PRODUCT <variable>, VER <variable>, ID <variable>, IDVER <variable> due to FTO hub switch.**

**Explanation**

Pending Self-Describing Agent requests are cancelled when a hub switch takes place to avoid connection error.

**System action**

None.

**User response**

None.

**KFASD108: Self-Describing Agent User Configuration Record *variable* Error detected by UserID <variable> at <variable> for PRODUCT <variable> ID <variable> OPTION <variable> reason <variable>.**

**Explanation**

The User Configuration Record change was in error and not accepted. Note that this message is generated only for the hub monitoring server, not the remote monitoring server. For a hub monitoring server v6.3 or later, the tacmd resumeSda command and tacmd suspendSda command are available at the hub, but not at the downlevel remote monitoring server (for example, v6.2.3 Fix Pack 1).

**System action**

None.

**User response**

None.

**KFASD109: Self-Describing Agent User Configuration Record *variable* by UserID <variable> at <variable> for GRPID <variable> PRODUCT <variable> ID <variable> CONFIG <variable>.**

**Explanation**

The User Configuration Record was processed successfully. Note that this message is generated only for the hub monitoring server, not the remote monitoring server. For a hub monitoring server v6.3 or later, the tacmd resumeSda command and tacmd suspendSda command are available at the hub, but not at the downlevel remote monitoring server (for example, v6.2.3 Fix Pack 1).

**System action**

None.

**User response**

None.

**KFASD110: Self-Describing Agent feature *variable* on local TEMS.**

**Explanation**

The Self-Describing Agent (SDA) feature is suspended or resumed by a Suspend User Configuration Record change. Note that this message is generated only for the hub monitoring server, not the remote monitoring server. For a hub monitoring server v6.3 or later, the tacmd resumeSda command and tacmd suspendSda

command are available at the hub, but not at the downlevel remote monitoring server (for example, v6.2.3 Fix Pack 1).

**System action**

None.

**User response**

None.

**KFASD111: Self-Describing Agent Initialization *variable* Record Error detected for PRODUCT <*variable*> ID <*variable*> OPTION <*variable*> reason <*variable*>.**

**Explanation**

The Initialization Record processing was in error and not completed.

**System action**

None.

**User response**

Review the TEMS product logs for the TEMS to determine the location of the issue. Correct the appropriate Record that is causing the issue. Restart the TEMS to initialize the SDA feature.

**KFASD112: Self-Describing Agent Suspend/Install User Configuration Features are *variable* at the hub TEMS.**

**Explanation**

This remote Tivoli Enterprise Monitoring Server (TEMS) has detected that the Self-Describing Agent (SDA) Suspend/Install User Configuration Features are <Not Supported> or <Now Available> at the hub (TEMS). Note that this message is generated only for the hub monitoring server, not the remote monitoring server. For a hub monitoring server v6.3 or later, the tacmd resumeSda command and tacmd suspendSda command are available at the hub, but not at the downlevel remote monitoring server (for example, v6.2.3 Fix Pack 1).

**System action**

None.

**User response**

The remote (TEMS) SDA feature will not process Suspend/Install User Configuration controls from the hub (TEMS) when it does not have support for the feature or will process Suspend/Install User Configuration Controls that the hub (TEMS) has recently upgraded support for.

**KFASD190: Self-Describing Agent feature terminated on the local TEMS.**

**Explanation**

The Self-Describing Agent (SDA) feature has been stopped.

**System action**

None.

**User response**

View the local TEMS product logs if the feature has not been stopped by normal TEMS shutdown to determine the location of the issue for SDA termination. Correct the appropriate issue. Start the local TEMS to restart the SDA feature.

## **KFAST001: Agent node name error- *variable variable variable***

### **Explanation**

An agent has attempted to insert itself with an invalid node name. The values given are the NODE name, THRUNODE name and HOSTADDR. NODE name is the incorrect name and HOSTADDR is the address of the computer on which the agent resides.

## **KFAST002: Select request for the EIBLOG table cannot be performed at a remote TEMS.**

### **Explanation**

Select request for the TEIBLOGT table was issued to this Tivoli Enterprise™ Monitoring Server. The TEIBLOGT is a hub Tivoli® Enterprise Monitoring Server-only table and therefore the request cannot be processed.

## **KFAST003: Take Action command *variable* completed with status of *variable*.**

### **Explanation**

The Take Action command specified was executed with the identified result. This message reflects that status of the Take Action command. The first variable represents the command that was executed. The second variable is the status code from the execution of the action. This status code is operating system- or application-specific and indicates whether or not this Take Action command was executed only. For determination regarding success or failure for the action, refer to documentation associated with the action.

### **Operator response**

If the result is not as expected, verify that the command configured successfully execute by issuing the command manually. This will ensure any necessary platform resources are available for the command to complete.

The following list describes the return codes for the KFAST003 message on z/OS® systems:

**0**

Operation completed successfully

**1**

One or more attributes invalid

**2**

USERID attribute not supplied

**3**

COMMAND not supplied

**4**

Command not successfully executed

**5**

An unhandled exception occurred during command execution

**6**

Process not authorized

**7**

Command is too long

**8**

Heap storage unavailable

9

IBM Z® NetView PPI rejected request

10

User ID is too long

11

Unable to assume user profile

12

Unable to restore user profile

13

Unable to restore user profile

14

An exception occurred during command execution

15

Unable to release user profile

16

Current profile unavailable

17

IBM Z® NetView PPI interface CNMCNETV not loaded

## **KFAST004: Unsupported Node or Nodelist request: *variable***

### **Explanation**

A request to add a node or nodelist to the Tivoli Enterprise™ Monitoring Server contained unsupported characters in either the nodename, thrunode, nodelist, affinities or nodetype. Typically this request is made by an IBM® Tivoli® Monitoring agent or probe attempting to connect to the Tivoli Enterprise™ Monitoring Server. One or some of the required values provided contained unsupported characters.

### **Operator response**

Refer to the Tivoli Enterprise™ Monitoring Server log where the node, thrunode, nodelist, affinities, and nodetype values have been dumped. These rules apply:

- The rule set for supported values for node, thrunode, and nodelist: A-Z, a-z, 0-9, \*-\_ : and space.
- Affinities must be 43 characters, and the static affinity rule set is A-Z, a-z, 0-9, \* #.
- A dynamic affinity is indicated when the first character is a \$ or %. For dynamic affinities, the initial 23 characters are validated as follows:
  - a. The valid dynamic affinity characters are A-Z, a-z, 0-9 and \_.
  - b. A single period is required to separate the vendor and app ID.
  - c. Spaces are only supported as trailing characters in the dynamic portion before the static portion.
  - d. The remaining 19 characters are validated using static affinity rules.
- The supported values for nodetype are: space, M and V.
- Additionally, nodelist, node, and thrunode values cannot start with a space, and node values cannot start with an \*.

Examine the memory dump in the trace log to determine the illegal value that is being attempted. For further action, contact IBM®.

## **KFAA001W: KFAASITR LOOKUP TABLE NOT LOADED**

### **Explanation**

The alert automation environment could not be initialized, and the Situation Trap table could not be loaded into storage for alert processing.

### **System action**

Alert automation is disabled. No alerts are issued when events are detected.

### **User response**

Review the messages issued before this message to determine the cause of environment initialization failure. This message is normal if no entries are specified in the KFAASITR runtime parameter file or if no KFAASITR parameter file is found.

## **KFAA002E: THREAD CREATION ERROR ERROR= *errno***

### **Explanation**

An attempt to start a thread of execution has failed. Threads are used to distribute action requests to alert emitters. The *errno* value indicates the status code issued by the POSIX `pthread_create` function.

### **System action**

No further action is taken to transmit the action request to the alert emitter.

### **User response**

Determine whether POSIX threading restrictions prevent the thread creation. If restrictions cannot be determined, contact IBM® Software Support.

## **KFAA003E: GET LOCK ERROR=*status***

### **Explanation**

An attempt to acquire a lock (`pthread_mutex_lock`) has failed. POSIX mutex locks are used to serialize access and update to internal control blocks shared by multiple threads of execution. The *status* value indicates the error code issued by the POSIX `pthread_mutex_lock` function.

### **System action**

Alert processing is terminated. No further action requests are sent to the alert emitter.

### **User response**

Contact IBM® Software Support.

## **KFAA004E: COMMAND BUFFER OVERFLOW SITUATION=*sitname* DESTNODE=*destnode* ARG=*arg***

### **Explanation**

An attempt to format the command string to be executed by an alert emitter has overflowed the internal buffer. The *sitname* and *arg* values indicate, respectively, the situation and argument being processed. The *destnode* value specifies the alert emitter.

### **System action**

Alert processing for the event is terminated.

### User response

Reduce the amount of data substituted into the command string by eliminating unnecessary attributes from the ARG n values specified for this event in the Situation Trap table (KFAASITR). If this error cannot be corrected, contact IBM® Software Support.

## KFAA005S: UNABLE TO ALLOCATE KFAASITR TABLE

### Explanation

An attempt to allocate a control block for the alert automation environment has failed. This error can occur when virtual storage is constrained.

### System action

The automation environment cannot be initialized, and alert processing is disabled.

### User response

Determine why the storage constraint occurred. If possible, increase storage limits for all the environments to be initialized, and then restart the Tivoli Enterprise™ Monitoring Server.

## KFAA006S: UNABLE TO INITIALIZE *lockname* ERRNO=*status*

### Explanation

An attempt to initialize a lock (pthread\_mutex\_init) has failed. POSIX locks are used to serialize access and update to control blocks shared by multiple threads of execution. The *lockname* value specifies the lock whose initialization failed. The *status* value indicates the POSIX error code.

### System action

No further attempt is made to initialize the lock, and alert automation initialization terminates. Alerts are not transmitted to alert emitters.

### User response

Contact IBM® Software Support.

## KFAA008W: KFAASITR LOOKUP TABLE IS EMPTY

### Explanation

No destination node entries for alert emitters were specified in the Situation Trap table. This is a warning message.

### System action

Alert automation is disabled until the table is refreshed.

### User response

If alert automation is desired, review the contents of the Situation Trap table file, KFAASITR. Correct any syntax errors reported by messages issued previous to this message. After you correct the KFAASITR file, issue a KFAASITR REFRESH console command (z/OS® Tivoli Enterprise™ Monitoring Server only) or restart the SMAF process to activate the new situation traps.

## KFAA009W: KFAASITR COULD NOT BE OPENED

### Explanation

The Situation Trap table (KFAASITR file) could not be found in the runtime parameter persistent data store (z/OS® Tivoli Enterprise™ Monitoring Server) or the /tables directory (UNIX® Tivoli Enterprise™ Monitoring Server). This is a warning message.

### System action

Alert automation is disabled until the table is refreshed.

### User response

If alert automation is desired, ensure that the Situation Trap table file KFAASITR exists and contains at least one destination node entry. After the KFAASITR file has been created, issue a KFAASITR REFRESH console command (z/OS® Tivoli Enterprise™ Monitoring Server only) or restart the SMAF process to activate the new situation traps.

## KFAA010E: DESTNODE NOT SPECIFIED IN LINE *line* NEAR token

### Explanation

The DESTNODE tag was not specified in an entry for the Situation Trap table (KFAASITR file). The DESTNODE tag must be specified for each entry in the table. The *line* value specifies the line number in the KFAASITR runtime parameter file in which the error was detected. The token value indicates text near the entry where the destination node was not specified.

### System action

The current entry is ignored, and processing continues with the next entry in the table.

### User response

Correct the invalid Situation Trap table entry by ensuring that a DESTNODE tag is specified. Also ensure that each entry ends with a semicolon (;).

## KFAA011E: INVALID KFAASITR PARM=*parm*

### Explanation

An unexpected KFAASITR command parameter was specified. A MODIFY command issued to the z/OS® Tivoli Enterprise™ Monitoring Server address space has the following syntax:

```
MODIFY cmsjobname,CTDS KFAASITR parm
```

Where *cmsjobname* is the jobname of the Tivoli® Enterprise Monitoring Server address space and *parm* is one of the following:

- REFRESH: Reread the contents of the KFAASITR file to reinitialize the Situation Trap table.
- DISPLAY: Display the current contents of the Situation Trap table in memory.
- TESTSIT: Simulate the detection of a situation (named TestSituation) to verify proper operation of the alert automation environment and the alert emitters.

### System action

The KFAASITR console command is ignored.

### User response

Change the KFAASITR command parameter to one of those listed above.

## KFAA012W: UNABLE TO ESTABLISH KFAASITR COMMAND STATUS=*status* REASON=*reason*

### Explanation

An attempt to establish the KFAASITR console command in an z/OS® Tivoli Enterprise™ Monitoring Server environment has failed. The *status* and *reason* values indicate the status code and reason issued by the internal service function, OPER\_DefineCommand.

**System action**

The KFAASITR command will not be accepted for the life of the z/OS® Tivoli Enterprise™ Monitoring Server address space.

**User response**

Contact IBM® Software Support.

**KFAA013E: MISSING SEMICOLON IN LINE *line* NEAR *token*****Explanation**

The end of the KFAASITR file containing Situation Trap table entries was found before the last entry in the table ended with a semicolon. The *line* value specifies the line number in the KFAASITR runtime parameter file in which the error was detected. The *token* value indicates text near the entry where the destination node was not specified. This is a warning message.

**System action**

The last entry is processed and accepted if no syntax errors are detected.

**User response**

Review the KFAASITR file and ensure that all entries in the file end with a semicolon (;).

**KFAA014W: MULTIPLE VALUES DETECTED FOR *tag* IN LINE *line* NEW VALUE=*new* OLD=*old* CHECK SEMICOLONS****Explanation**

A duplicate tag was found for an entry in the Situation Trap table KFAASITR.

**System action**

The last value for the tag is accepted for the entry.

**User response**

Review the contents of the KFAASITR file and ensure that a single value is specified for each tag. Also check to ensure that all entries in the file end with a semicolon (;).

**KFAA015E: UNABLE TO LOAD *mod entry* STATUS=*status* REASON=*reason*****Explanation**

An attempt to load a module into storage or to locate the address of a module in storage has failed. The *mod entry* value specifies the name of the module that could not be loaded. The *status* value is the STC1 status code associated with the error. The *reason* value is the RSN1 reason code associated with the error.

**System action**

The call to the module is aborted.

**User response**

Ensure that the libraries have been properly installed and configured. Contact IBM® Software Support.

**KFAA020E: INVALID LENGTH=*length* FOR *tag*="value" IN LINE *reason*****Explanation**

The value specified for a tag in the Situation Trap table KFAASITR has exceeded the maximum length for the tag. The maximum length varies for each tag. The *length* value specifies the maximum length acceptable for

the tag. The *tag* and its value are specified in tag and value. The *line* value specifies the line number in the KFAASITR runtime parameter file in which the error was detected.

### **System action**

The tag is ignored, and syntax checking continues with the next tag for the current entry. The current entry is not accepted.

### **User response**

Correct the invalid length. After you update the KFAASITR file, issue a KFAASITR REFRESH console command (z/OS® Tivoli Enterprise™ Monitoring Server only) or restart the SMAF process to activate the new situation traps.

## **KFAA021E: INVALID VALUE FOR *tag=value* IN LINE *line***

### **Explanation**

The value specified for a tag in the Situation Trap table KFAASITR is not acceptable. The *tag* and the value specified for it are shown in tag and value. The *line* value specifies the line number in the KFAASITR runtime parameter file in which the error was detected.

### **System action**

The tag is ignored, and syntax checking continues with the next tag for the current entry. The current entry is not accepted.

### **User response**

Correct the invalid value. After the KFAASITR file has been updated, issue a KFAASITR REFRESH console command (z/OS® Tivoli Enterprise™ Monitoring Server only) or restart the SMAF process to activate the new situation traps.

## **KFAA022E: INVALID SYNTAX: *badtag* IN LINE *line***

### **Explanation**

A tag specified in the Situation Trap table KFAASITR is not acceptable. The *badtag* value specifies the unexpected entry. The *line* value specifies the line number in the KFAASITR runtime parameter file in which the error was detected.

### **System action**

The tag is ignored, and syntax checking continues with the next tag for the current entry. The current entry is not accepted.

### **User response**

Correct the invalid tag. Ensure that the tag is spelled properly and specified in upper case. After you update the KFAASITR file, issue a KFAASITR REFRESH console command (z/OS® Tivoli Enterprise™ Monitoring Server only) or restart the SMAF process to activate the new situation traps.

## **KFAA023E: UNABLE TO ALLOCATE *tag=value***

### **Explanation**

The storage required to store the value associated with a tag in the Situation Trap table KFAASITR could not be allocated. The *tag* and its value are specified in tag and value.

### **System action**

The tag is ignored, and syntax checking continues with the next tag for the current entry. The current entry is not accepted.

**User response**

Correct the invalid value. Ensure that the tag is spelled properly and specified in upper case. After you update the KFAASITR file, issue a KFAASITR REFRESH console command (z/OS® Tivoli Enterprise™ Monitoring Server only) or restart the SMAF process to activate the new situation traps.

**KFAA024E: ENDING QUOTE FOR TAG VALUE NOT FOUND IN LINE *line*****Explanation**

The value specified for an entry in the Situation Trap table KFAASITR was not properly enclosed in quotes.

**System action**

The tag is ignored, and syntax checking continues with the next tag for the current entry. The current entry is not accepted. The line value specifies the line number in the KFAASITR runtime parameter file in which the error was detected.

**User response**

Make sure that end quotes are specified in quoted values. Strings enclosed in quotes are processed as specified, and no attribute substitution is performed for these values (if tags are ARG1-ARG9). After you update the KFAASITR file, issue a KFAASITR REFRESH console command (z/OS® Tivoli Enterprise™ Monitoring Server only) or restart the SMAF process to activate the new situation traps.

**KFAA025E: WILDCARD NOT ALLOWED IN *tag=value* IN LINE *line*****Explanation**

An asterisk was specified in the value associated with a tag in the Situation Trap table KFAASITR, but the value for this tag cannot be a wildcard. The tag and its specified value are shown in *tag* and *value*. The *line* value specifies the line number in the KFAASITR runtime parameter file in which the error was detected.

**System action**

The tag is ignored, and syntax checking continues with the next tag for the current entry. The current entry is not accepted.

**User response**

Correct the invalid value. After you update the KFAASITR file, issue a KFAASITR REFRESH console command (z/OS® Tivoli Enterprise™ Monitoring Server only) or restart the SMAF process to activate the new situation traps.

**KFAA026E: TOO MANY WILDCARDS IN *tag=value* IN LINE *line*****Explanation**

Two or more asterisks were specified in the value associated with a tag in the Situation Trap table KFAASITR, but only a single wildcard character is acceptable. The tag and its specified value are shown in *tag* and *value*. The *line* value specifies the line number in the KFAASITR runtime parameter file in which the error was detected.

**System action**

The tag is ignored, and syntax checking continues with the next tag for the current entry. The current entry is not accepted.

**User response**

Correct the invalid value. After you update the KFAASITR file, issue a KFAASITR REFRESH console command (z/OS® Tivoli Enterprise™ Monitoring Server only) or restart the SMAF process to activate the new situation traps.

## **KFAA030E: *oper* SQL ERROR ON *hdsee sql1api* STATUS=*status***

### **Explanation**

An attempt to transmit an action request to an alert emitter has failed during SQL processing. The *oper* value specifies the SQL operation which failed. The *sql1api* value specifies the SQL1 service function which failed. The *status* value specifies the SQL1 status code returned by the function.

### **System action**

The alert automation action is terminated, and no further attempt is made to transmit the request to the alert emitter.

### **User response**

Contact IBM® Software Support.

## **KFAA040I: ACTION STARTED FOR SITNAME=*sitname* DESTNODE=*destnode* STATE=*state* REQUESTID=*requestid***

### **Explanation**

An alert automation action request has been successfully transmitted to an alert emitter. This is an informational message.

The *sitname* value specifies the situation associated with the alert. The *destnode* value specifies the alert emitter. The *state* value specifies the current state of the associated event:

- 1 The situation has become true.
- 2 The situation has become false.

The *requestid* value is a unique integer assigned to the action request.

### **System action**

The alert emitter proceeds to issue alerts or execute automation scripts for the alert.

### **User response**

None.

## **KFAA041I: TEMS=*commandstring***

### **Explanation**

This informational message follows message KFAA040I. The *commandstring* value specifies the formatted command string transmitted to the alert emitter.

### **System action**

The alert emitter proceeds to issue alerts or execute automation scripts for the alert.

### **User response**

None.

## **KFAA042E: NO RESPONSE FROM DESTNODE=*destnode* FOR SITNAME=*sitname* ORIGINNODE=*originnode* STATE=*state* ERRNO=*status* REQUESTID=*reqid***

### **Explanation**

This message follows messages KFAA040I and KFAA041I. No response was received within 60 seconds from the alert emitter responsible for alert automation requests.

The *destnode* value specifies the alert emitter. The *sitname* value specifies the situation associated with the alert. The *originnode* value specifies the node from which the situation event was collected. The *state* value specifies the current state of the associated event:

- 1 The situation has become true.
- 2 The situation has become false.

The *status* value is the error number returned by the `pthread_cond_timedwait` service function. The *reqid* value is the unique integer request ID assigned to the action request.

### System action

No further action is taken to determine the final disposition of the alert action request.

### User response

End-user automation scripts must be written to complete execution as soon as possible. If automation scripts cannot complete within 60 seconds, a new thread of execution should be started by the automation script so that the successful response of automation can be recorded in the Tivoli Enterprise™ Monitoring Server message log. If this error persists, review the execution log provided by the alert emitter to determine whether automation failures have occurred.

## **KFAA050I: ACTION COMPLETED FOR SITNAME=*sitname* DESTNODE=*destnode* STATE=*state* RC=*rc* REQUESTID=*requestid***

### Explanation

This informational message indicates the success or failure of an action request executed by an alert emitter, and marks the completion of the request.

The *sitname* value specifies the situation associated with the alert. The *destnode* value specifies the alert emitter. The *state* value specifies the current state of the associated event:

- 1 The situation has become true.
- 2 The situation has become false.

The *rc* value specifies the return code issued by the automation script or by the alert sub-agent:

- **Zero:** Successful completion. Other Automation or alert processing failure. You can find further information about the failure in the message log of the alert emitter.
- **2:** The situation has become false.

The *requestid* value is a unique integer assigned to the action request.

### System action

No further processing is performed for the event.

### User response

None.

## **KFAA051W: DESTNODE=*destnode* OFFLINE FOR SITNAME=*sitname* ORIGINNODE=*originnode* STATE=*state* REQUESTID=*requestid***

### Explanation

An attempt to distribute an action request to an alert emitter has failed because the alert emitter is off-line and cannot be reached.

The *destnode* value specifies the alert emitter. The *sitname* value specifies the situation associated with the alert. The *originnode* value specifies the node from which the situation event was collected. The *state* value specifies the current state of the associated event:

- 1 The situation has become true.
- 2 The situation has become false.

The *requestid* value is a unique integer assigned to the action request.

### System action

No further action is taken to transmit the action request to the alert emitter.

### User response

If this message persists, ensure that the alert emitter is started and registered with the Tivoli Enterprise™ Monitoring Server. If the alert emitter is properly started, an entry for the emitter will appear in the Nodes folder on the Candle® Management Workstations desktop.

If the emitter continues to remain off-line and alerts no longer need to be distributed to the emitter, update the Situation Trap table KFAASITR to remove the entry for the off-line alert emitter. After you update the KFAASITR file, issue a KFAASITR REFRESH console command (Tivoli Enterprise™ Monitoring Server on z/OS® only) or restart the SMAF process to activate the new situation traps.

## **KFAA070I: USING TEMS NODE=*nodename***

### Explanation

The Tivoli Enterprise™ Monitoring Server node specified in the *nodename* value will be used to issue action requests to alert emitters. This is an informational message.

### System action

Alert automation environment initialization continues.

### User response

None.

## **KFAA090I: KFAASITR REFRESHED. STATUS=*status***

### Explanation

This message is issued to indicate the completion of a KFAASITR REFRESH command (z/OS® Tivoli Enterprise™ Monitoring Server only) to refresh the Situation Trap table. The *status* value indicates the status code issued by refresh processing:

### System action

If a zero value for the status is displayed, a new Situation Trap table is established, and subsequent events are processed from the updated entries in the table.

### User response

If a non-zero value for the status is displayed, determine the cause of the failure by reviewing messages issued before this message.

## **KFAA091I: TESTSIT INVOKED. STATUS=*status***

### Explanation

This message is issued to indicate the completion of a KFAASITR TESTSIT command (z/OS® Tivoli Enterprise™ Monitoring Server only) to simulate the occurrence of a real event and to test the current Situation Trap table entries. The command triggers a dummy situation named **TestSituation**. The *status* value indicates the status code issued by test processing:

### System action

If a zero value for the status is displayed, the Situation Trap table was searched and action requests were issued (if the simulated event matched any entries in the table).

**User response**

If a non-zero value for the status is displayed, determine the cause of the failure by reviewing messages issued before this message.

**KFAA092I: ACTIONS HAVE BEEN DISABLED****Explanation**

An attempt to initialize the alert automation environment or to read the KFAASITR file to initialize the Situation Trap table has failed.

**System action**

Alert automation is disabled.

**User response**

Review messages issued before this message, and take appropriate action based on those messages.

**KFAA093I: ACTION ENVIRONMENT INITIALIZE****Explanation**

This informational message indicates that the alert automation environment has been successfully initialized.

**System action**

Situation events matching those defined in the Situation Trap table will cause action requests to be distributed to alert emitters.

**User response**

None.

**KFAA094I: KFAASITR LOOKUP TABLE:****Explanation**

This informational message is issued in response to a KFAASITR DISPLAY console command (z/OS® Tivoli Enterprise™ Monitoring Server only).

**System action**

The current contents of the Situation Trap table follow this message.

**User response**

None.

**KFAA095I: IF SITNAME=*sitname* AND ORIGINNODE=*originnode* AND STATE=*state* THEN****Explanation**

This informational message displays the situation event data required to match the current entry in the Situation Trap table.

The *sitname* value specifies the situation name or name pattern for the entry. An asterisk indicates a wildcard character. The *originnode* value specifies the source where the situation data was collected. An asterisk indicates a wildcard character. The *state* value specifies the current state of the situation required to match an event. Valid values are TRUE, FALSE, UNKNOWN, or ANY.

### System action

Message KFAA096I follows this message to display the action and alert emitter assigned to situation events that match this entry.

### User response

None.

**KFAA096I: DESTNODE=*destnode* CALLTYPE=*calltype* SCRIPT=*script***

### Explanation

This informational message, which follows message KFAA095I, displays the alert emitter destination node and the method to be used by the alert emitter to deliver the alert.

The *destnode* value specifies the alert emitter name. The *calltype* value specifies the call method to be used to deliver action requests and alerts to the alert emitter:

- **Zero:** An automation script (REXX™ exec) is executed by the alert emitter.
- **Non-zero:** The alert is forward to an alert subagent by the alert emitter.

The *script* value specifies the command to be executed (if CALLTYPE=0) or the name of the alert subagent to be notified (if CALLTYPE is non-zero).

### System action

Message KFAA097I follows this message to display the action arguments to be passed to the alert emitter.

### User response

None.

**KFAA097I: ARGn=*value***

### Explanation

This informational message, which follows message KFAA096I, lists all arguments to be passed in the formatted command string transmitted to alert emitters.

### System action

The next Situation Trap table entry follows.

### User response

None.

**KFAA100I: STACK SIZES: OG=*curr/hih2o* CT=*curr/hih2o* SNMP=*curr/hih2o***

### Explanation

This informational message is issued after all Situation Trap table entries are displayed in response to a KFAASITR REFRESH console command (z/OS® Tivoli Enterprise™ Monitoring Server only). The message displays the number of elements cached for OG/z/OS, CT®, and SNMP alert emitters.

The *curr* value indicates the current number of cached SQL1 requests stored. The *hih2o* value indicates the highwater mark of cached SQL1 requests created since the start of the Tivoli Enterprise™ Monitoring Server.

### System action

None.

### User response

None.

## **KFAA193E: ACTION ENVIRONMENT INITIALIZATION ERROR=*errno***

### **Explanation**

The action environment could not be initialized because of a POSIX pthread\_once service routine failure. The *errno* value shows the error number.

### **System action**

No further action is taken to initialize the environment.

### **User response**

Contact IBM® Software Support.

## **KFAA200E: ACTION ENVIRONMENT NOT INITIALIZED DISPLAY COMMAND ENDED**

### **Explanation**

This message is issued when a console command to display the situation trap table (as defined by the KFAASITR runtime parameter file) could not be executed because the action environment failed to initialize.

### **System action**

No further action is taken to display the situation trap table.

### **User response**

Review the messages issued before this message, to determine the cause of environment initialization failure.

## **KHD messages**

Messages that begin with the KHD prefix are associated with the Warehouse Proxy Agent on both z/OS® and distributed platforms.

## **KHD001: Inserted *variable* rows of data into *variable* (application *variable*) for *variable***

### **Explanation**

The Warehouse Proxy Agent successfully inserted data in the database table for the given agent managed system.

### **System action**

None.

### **User response**

None.

## **KHD004: Stopped writing short-term historical data to files. Total size of historical files *variable*KB exceeded the maximum of *variable*KB.**

### **Explanation**

Writing of historical data into the short term historical files has been suspended.

**System action**

The threshold specified by the variable KHD\_TOTAL\_HIST\_MAXSIZE for the specified directory has been met and historical data writing to the short term history files has been suspended. After the data has been offloaded to the WPA and the threshold is no longer exceeded, writing of data will restart. If this does not happen, delete short term historical files to resume the write operation.

**User response**

None.

**KHD005: Restarted writing short-term historical data to files. Total size of historical files *variable*KB is now less than maximum of *variable*KB. Data was not recorded for *variable* hours**

**Explanation**

The threshold specified by the KHD\_TOTAL\_HIST\_MAXSIZE is no longer being exceeded, so writing of data into the short term history files has been resumed. No further action is necessary.

**System action**

None.

**User response**

None.

**KHD006: Export failed for attribute group *variable***

**Explanation**

An error occurred while attempting to export historical data to the Warehouse Proxy Agent to be inserted into the Tivoli Data Warehouse.

**System action**

None.

**User response**

The operator should inspect if the Warehouse Proxy Agent is active and running and if there are any problems with its connection to the database or between the agent and the Warehouse Proxy Agent.

**KHD007: History initialization failed for attribute group *variable***

**Explanation**

An error occurred while attempting to initialize the history collection for the given attribute group.

**System action**

None.

**User response**

The operator should check the log files where the error occurred for the details on the problem that resulted in failure to export the data after an upgrade introduced new columns to the attribute group.

**KMS messages**

The messages that begin with the KMS prefix are associated with the Tivoli Enterprise™ Monitoring Server on both z/OS® and distributed platforms.

## **KMS0101: Tivoli Enterprise™ Monitoring Server (TEMS) shutdown requested.**

### **Explanation**

A request to shutdown the Tivoli Enterprise™ Monitoring Server (TEMS) has been received.

## **KMS0150: Tivoli Enterprise™ Monitoring Server (TEMS) shutdown deferred.**

### **Explanation**

A request to shutdown the Tivoli Enterprise™ Monitoring Server (TEMS) has been received but cannot be processed immediately. Shutdown will proceed as soon as possible.

## **KO4 messages**

The messages that begin with the KO4 prefix are associated with the Tivoli Enterprise™ Monitoring Server, both on the distributed and z/OS® platforms.

## **KO40017: Distributed request failed for *variable* with status= *variable*.**

### **Explanation**

The Tivoli Enterprise Monitoring Server (TEMS) program encountered a communications error.

### **Operator response**

A communications error has occurred. The TEMS is not connected to the HUB. Correct the condition causing the communications error.

## **KO41031: Situation *variable* is true.**

### **Explanation**

Situation *variable* is occurring. This situation continues to be true until message KO41032 is written to the Tivoli Enterprise™ Monitoring Server (TEMS) product log.

### **Operator response**

If you have AUTOMATED FACILITIES, you may want to define or start a policy.

## **KO41032: Situation *variable* is no longer true.**

### **Explanation**

Situation *variable* is no longer occurring.

### **Operator response**

View all error messages that were logged to the Tivoli Enterprise™ Monitoring Server product. Message KO41031 shows you when the situation *variable* became true.

## **KO41034: Monitoring for situation *variable* ended.**

### **Explanation**

Monitoring for non-enterprise situation *variable* ended. AUTOMATED FACILITIES policies may also end situations.

## **KO41035: Object *variable* changed by *variable*.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO41036: Monitoring for situation *variable* started.**

### **Explanation**

You may start a situation using a start situation command. All situations defined to autostart do so during the start of Tivoli Enterprise™ Monitoring Server (TEMS) processing. AUTOMATED FACILITIES policies may also start situations.

## **KO41037: Situation *variable* is no longer true.**

### **Explanation**

Situation *variable* is no longer occurring.

### **Operator response**

View all error messages that were logged to the Tivoli Enterprise™ Monitoring Server (TEMS) product log. Message KO41031 shows you when the situation became true.

## **KO41038: Situation *variable* is true.**

### **Explanation**

Situation *variable* is occurring. This situation continues to be true until message KO41037 is written to the Tivoli Enterprise™ Monitoring Server (TEMS) product log.

### **Operator response**

If you have AUTOMATED FACILITIES, you may want to define or start a policy.

## **KO41039: Error in request *variable*. Status= *variable*. Reason= *variable*.**

### **Explanation**

The Tivoli Enterprise™ Monitoring Server (TEMS) program encountered an error.

### **Operator response**

The following lists possible error codes. If a reason code appears that is not on this list, note it and contact IBM® Software Support.

Status/Return code	Meaning
1131	Embedded situation not found. -- Check to make sure that all embedded situations exist. If they do, call your service representative.
1133	Incorrect attribute name. Verify that the correct version of application support files for the application in error has been installed on the Tivoli Enterprise™ Monitoring Server and restart the Tivoli Enterprise™ Monitoring Server.
1134	Configuration file in library not found or damaged. -- Install the product again.
1136	Object not found. -- Delete and create the object again. If problem occurs again, contact your service representative.
1145	Incorrect situation name supplied. -- Contact your service representative.

Status/Return code	Meaning
1168	More than 10 levels of embedded situations found. -- Simplify your situation.
1174	Cannot retrieve current attributes for event type situation.
1178	Situation definition is too complex and exceeds system capacity. -- Simplify your situation.
1200	Unexpected *AND
1201	Unexpected *OR
1202	Parenthesis do not match
1203	Generic rule syntax error
1204	Bad comparison operator
1205	Number of subrules exceeds limit
1206	Number of embedded situations exceeds limit
1207	Bad network rule syntax
1208	Rule too complex for reflex
1209	A list enclosed in '(' and ')' is expected
1210	Bad logical operator
1211	Bad argument passed to a function

### KO41041: Enterprise situation *variable* is true.

#### Explanation

A situation, such as CPU greater than 90%, is occurring at the time and date indicated. Situation continues to be true until message KO41042 is written to the log.

### KO41041I: SITUATION EVENT *situation\_event\_id*

*situation\_name:node\_name* <*optional\_display\_item\_value*> T|F *user\_supplied\_content*

#### Explanation

This message is created by the situation Take Action command **ZOSWTO**. A multi-line WTO message is generated when the situation for which the **ZOSWTO** is defined occurs. The message is issued on the z/OS monitoring server (TEMS) that an agent is connected to or on a z/OS agent (TEMA).

The event is identified in the WTO message by the *situation\_event\_id*. *situation\_name* is the name of the situation, and *node\_name* is the origin node related to the event. *optional\_display\_item\_value* is the display item, if one is defined for the situation.

This message is produced when the situation is true (T) or false (F). The *user\_supplied\_content* is the content as defined in the **ZOSWTO** command. When the situation is false, the values of any substitution variables in the *user\_supplied\_content* are N/A.

The message data is divided into 70-character sections on a maximum of five consecutive lines.

### KO41042: Enterprise situation *variable* is no longer true.

#### Explanation

The status is no longer true for this situation.

#### Operator response

View all error messages that were logged to the Tivoli Enterprise™ Monitoring Server (TEMS) product log. Message KO41041 shows you when the situation *variable* became true.

### **KO41044: Monitoring for enterprise situation *variable* ended.**

#### **Explanation**

A user or program ended a running situation. AUTOMATED FACILITIES policies may also end situations.

### **KO41046: Monitoring for enterprise situation *variable* started.**

#### **Explanation**

A situation has been started. Possible reasons are:

1. As soon as the Tivoli® Enterprise Monitoring Server starts, all situations set as autostart will be started automatically.
2. New situations marked as autostart will also start automatically as soon as they are created or changed.
3. A situation has been manually started from the Tivoli® Enterprise Portal.
4. A policy has changed the situation state from stopped to started.

### **KO41047: Situation *variable* distribution *variable* variable.**

#### **Explanation**

A situation is distributed or undistributed.

### **KO41048: Policy *variable* distribution *variable* variable.**

#### **Explanation**

A policy is distributed or undistributed.

### **KO41050: Monitoring for situation *variable* paused due to unresolved attributes.**

#### **Explanation**

One or more attributes used in this situation are not defined. The situation is paused until corresponding attribute files are added or updated.

### **KO41052: Monitoring for enterprise situation *variable* paused due to unresolved attributes.**

#### **Explanation**

One or more attributes used in this situation are not defined. The situation is paused until corresponding attribute files are added or updated.

### **KO41054: Monitoring for situation *variable* resumes.**

#### **Explanation**

Monitoring for situation *variable* resumes.

### **KO41056: Monitoring for enterprise situation *variable* resumes.**

#### **Explanation**

Monitoring for enterprise situation *variable* resumes.

**KO42076: Operator reply required for Policy *variable*.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO46254: Situation *variable* was reset.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO46255: Situation definition *variable* was updated by *variable*.**

**Explanation**

The situation definition was updated.

**KO46256: Situation definition *variable* was created by *variable*.**

**Explanation**

The situation definition was created.

**KO46257: Situation definition *variable* was deleted by *variable*.**

**Explanation**

The situation definition was deleted.

**KO46258: Predicate compare value *variable* for predicate *variable* is not valid.**

**Explanation**

The predicate compare value *variable* for the predicate *variable* is not valid. It must be numeric.

**Operator response**

Change the compare value to be numeric.

**KO46259: Name not allowed for the message queue library name.**

**Explanation**

Select a message queue in another library.

**KO46260: Predicate data cannot contain a blank field.**

**Explanation**

The first parameter for the PDT field cannot contain a blank.

**Operator response**

Remove the blank in the parameter in the PDT field.

### **KO46261: Only one selection allowed.**

#### **Explanation**

More than one option selected. Only one option can be selected at a time.

#### **Operator response**

Blank out the additional selections and try again.

### **KO46262: Situation definition *variable* printed.**

#### **Explanation**

You printed the situation *variable*.

#### **Operator response**

View the printed situation definition.

### **KO46263: A Tivoli Enterprise™ Monitoring Server (TEMS) data queue error was detected.**

#### **Explanation**

An error message was received.

### **KO46264: Time portion of monitor interval not valid.**

#### **Explanation**

For the TIMEFRQ parameter, the time portion of the monitor interval cannot be less than 000030 if the day portion contains zero.

#### **Operator response**

Increase the monitor interval to at least 000030.

### **KO46265: Attribute *variable* not allowed.**

#### **Explanation**

Attribute *variable* is not allowed in conjunction with attribute *variable* in a predicate. Some attributes cannot be combined in a predicate to form a situation.

#### **Operator response**

Refer to the appropriate Tivoli Enterprise Monitoring Server (TEMS) reference manual to determine if a particular attribute can be combined with another.

### **KO46266: Date and time portions of monitor interval must both be zero.**

#### **Explanation**

For the TIMEFRQ parameter, the day and time portions of the monitor interval must both be zero if all attributes in the situation definition are notification attributes with the same prefix. Attributes can be of two types: Sampled or Notification.

#### **Operator response**

Refer to the appropriate Tivoli Enterprise Monitoring Server (TEMS) reference manual to determine the type of a particular attribute.

**KO46267: Situation definition validation did not occur.**

**Explanation**

You attempted to use \*AVG with a non-integer attribute.

**KO46268: Situation definition *variable* displayed.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO46269: Name *variable* cannot contain blanks.**

**Explanation**

The name *variable* contains embedded blanks.

**Operator response**

Remove embedded blanks from the name.

**KO48001: AUTOMATED FACILITIES started.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO48008: AUTOMATED FACILITIES received request to stop.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO48009: Policy *variable* ended.**

**Explanation**

The policy has completed a pass through its activity graph. No activities are running. Depending on its completion option, the policy then either deactivates or starts another pass through the activity graph.

**KO48010: Policy *variable* started.**

**Explanation**

The policy is starting a pass through its activity graph. All activities having no predecessors are in the running state; all other activities are in the pre-run state. The pass completes when no activities remain in the running state. At that time, message KO48009 is issued. The policy may also be deactivated before it finishes running.

**KO48071: Policy *variable* activated.**

**Explanation**

The policy has been activated. This may occur for three reasons:

1. The policy is marked to autostart and TEMS is starting.
2. A user just created an autostart policy or is manually starting a policy.

3. Another policy contains a CHANGE\_POLICY or embedded policy activity that activates this policy.

**KO48073: Policy *variable*, activity *variable* has started.**

**Explanation**

Activity started in the policy.

**KO48074: Policy *variable*, activity *variable* ended with end code *variable* reason *variable*.**

**Explanation**

Activity *variable* in policy *variable* has finished.

**Operator response**

See the appropriate Automated Facilities reference manual for explanations of end codes.

**KO48076: Policy *variable* has deactivated itself.**

**Explanation**

The policy ended and its **restart upon completion** option was set to **No**. The policy ceases all operations.

**Operator response**

Activate the policy again. To make the policy restart upon completion, change the policy definition so that the restart option is **YES** and then activate it.

**KO48077: Policy *variable* deactivated by external request.**

**Explanation**

An external agent (user or other policy) requested the policy to deactivate. The policy immediately ceases all operations, canceling activities in progress.

**KO48078: Policy *variable* updated by *variable*.**

**Explanation**

The policy *variable* has been updated by policy *variable*.

**KO48079: Activity *variable* in policy *variable* updated by *variable*.**

**Explanation**

The policy has been updated by the user.

**KO48080: Ranking group *variable* updated by *variable*.**

**Explanation**

The ranking group has been updated by the user.

**KO48081: Ranking group entry *variable* in ranking group *variable* updated by *variable*.**

**Explanation**

The ranking group entry in ranking group has been updated by the user.

**KO48082: Policy *variable* created by *variable*.**

**Explanation**

The policy has been created by the user.

**KO48083: Activity *variable* in policy *variable* created by *variable*.**

**Explanation**

The activity in the policy has been created by a user.

**KO48084: Ranking group *variable* created by *variable*.**

**Explanation**

The ranking group has been created by the user.

**KO48085: Ranking group entry *variable* in ranking group *variable* created by *variable*.**

**Explanation**

The ranking group entry in ranking group was created by the user.

**KO48086: Policy *variable* deleted by *variable*.**

**Explanation**

The policy has been deleted by the user.

**KO48087: Activity *variable* in policy *variable* deleted by *variable*.**

**Explanation**

The activity in policy was deleted by the user.

**KO48088: Ranking group *variable* deleted by *variable*.**

**Explanation**

The ranking group was deleted by the user.

**KO48089: Ranking group entry *variable* in ranking group *variable* deleted by *variable*.**

**Explanation**

The ranking group entry in the ranking group was deleted by the user.

**KO48090: Policy *variable* has deactivated. Restart limit exceeded.**

**Explanation**

The policy was defined to restart upon completion and did so more than 5 times in a 10-minute interval. Since the policy was defined with the **limit restarts** option set to **YES**, the policy deactivates instead of restarting. The policy immediately ceases all operations.

**Operator response**

View the error messages that were logged to the product log to determine what the policy was doing. If a logic error was causing the policy to fire too frequently, correct the involved definitions and reactivate the policy.

**KO48091: Changing priority for job *variable* (job number *variable*) to *variable*.**

**Explanation**

The policy *variable* with an activity *variable* is changing the priority for job *variable* to *variable*.

**KO48092: Changing job queue for job *variable* (job number *variable*) to *variable*.**

**Explanation**

The policy *variable* with an activity *variable* is changing the job queue for the job *variable* to *variable*.

**KO48093: Changing time slice for job *variable* (job number *variable*) to *variable*.**

**Explanation**

The policy *variable* with an activity *variable* is changing the time slice for the job *variable* to *variable*.

**KO48095: Changing output queue for job *variable* (job number *variable*) to *variable*.**

**Explanation**

The policy *variable* with an activity *variable* is changing the output queue for the job *variable* to *variable*.

**KO48096: Policy *variable*, activity *variable* - Changing policy *variable* to status *variable*.**

**Explanation**

The policy *variable* with an activity *variable* is changing the policy's status. *variable* to *variable*.

**KO48097: Changing activity level for pool *variable* to *variable*.**

**Explanation**

The policy *variable*, activity *variable* is changing the activity level for pool *variable* to *variable*.

**KO48098: Changing size for pool *variable* to *variable*.**

**Explanation**

The policy *variable*, activity *variable* is changing the size for the pool *variable* to *variable*.

**KO48099: Policy *variable*, activity *variable* - Changing situation *variable* to status *variable*.**

**Explanation**

The policy *variable*, activity *variable* is changing the situation *variable* to status *variable*.

**KO48100: The definition of Policy *variable* contains an error which is preventing the Policy from starting.**

**Explanation**

The definition of the specified Policy contains an error that has prevented its construction. Usually this occurs because an Activity within the Policy's Workflow could not be created. If this is the case, additional messages will identify the relevant Activities. Further details regarding the problem will be provided in the TEMS RAS log.

**KO48101: Policy *variable* encountered an error while adding Activity *variable* to its Workflow.**

**Explanation**

The specified Policy could not add the named Activity to its Workflow. Such errors prevent the Policy from running. Further details regarding the problem will be provided in the TEMS RAS log.

**KO48106: Ending job *variable* (job number *variable*).**

**Explanation**

The policy *variable*, activity *variable* is ending the job *variable*.

**KO48110: Policy *variable*, activity *variable* - Evaluating situation *variable*.**

**Explanation**

The policy *variable*, activity *variable* is evaluating the situation *variable*.

**KO48112: Holding job *variable* (job number *variable*).**

**Explanation**

The policy *variable*, activity *variable* is holding the job *variable*.

**KO48113: Policy *variable*, activity *variable* paused while waiting for the situation to be created.**

**Explanation**

Policy *variable*, activity *variable* paused until the situation becomes available.

**KO48114: Policy *variable*, activity *variable* resumes.**

**Explanation**

Policy *variable*, activity *variable* resumes after previous reported problem has been resolved.

**KO48115: Policy *variable*, activity *variable* paused due to unresolved attributes.**

**Explanation**

Policy *variable*, activity *variable* paused due to unresolved attributes in the situation.

**KO48119: Releasing job *variable* (job number *variable*).**

**Explanation**

The policy *variable*, activity *variable* is releasing job *variable*.

**KO48139: Policy *variable*, activity *variable* - Writing data to user automation data queue.**

**Explanation**

The policy *variable*, activity *variable* is writing data to a user automation data queue.

**KO48140: Policy *variable*, activity *variable* - Proceeding to user choice activity - *variable***

**Explanation**

The policy *variable*, activity *variable* is proceeding to the user choice activity *variable*.

**KO48141: Policy *variable*, activity *variable* - Presenting user choice to *variable*.**

**Explanation**

The policy *variable*, activity *variable* is presenting the user choice to *variable*.

**KO48142: Policy *variable*, activity *variable* - Transferring user choice from *variable* to *variable* at request of *variable*.**

**Explanation**

The policy *variable*, activity *variable* is transferring the user choice from *variable* to *variable* at the request of *variable*.

**KO48143: Policy *variable*, activity *variable* - Escalating user choice from *variable* to *variable* due to timeout.**

**Explanation**

The policy *variable*, activity *variable* is escalating the user choice from *variable* to *variable* due to timeout.

**KO48144: Policy *variable*, activity *variable* - Escalating user choice from *variable* to *variable* at request of *variable*.**

**Explanation**

The policy *variable*, activity *variable* is escalating the user choice from *variable* to *variable* at the request of *variable*.

**KO48145: Policy *variable*, activity *variable* - Canceling user choice action due to timeout.**

**Explanation**

The policy *variable*, activity *variable* is canceling the user choice action due to a timeout.

**Operator response**

Change the timeout parameters.

**KO48148: Policy *variable*, activity *variable* - Waiting for *variable* seconds.**

**Explanation**

The policy *variable*, activity *variable* is waiting for *variable* seconds.

**KO48150: Policy *variable*, activity *variable* - Running policy *variable*.**

**Explanation**

The policy *variable*, activity *variable* is running policy *variable*.

**KO48151: Policy *variable*, activity *variable* - Waiting for event from situation *variable*.**

**Explanation**

The policy *variable*, activity *variable* is waiting for an event from situation *variable*.

**KO48152: Situation *variable* could not find message queue *variable*.**

**Explanation**

The message queue specified to receive reports of situations firing could not be found.

**Operator response**

Create the queue or add the library where the queue exists.

**KO48153: Policy *variable*, activity *variable* - Executing command at *variable* - *variable*.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO48154: Execute command- *variable*.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO48155: Execute command- *variable* and *variable* additional commands of the same form.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO48156: Not able to start monitoring for situation *variable*.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO49014: Situation list printed.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO49015: Situation *variable* embedded in situation *variable*. Not deleted.**

**Explanation**

The situation you have requested to delete is imbedded in another situation.

**Operator response**

Either delete situation *variable* or change it so that it does not reference situation *variable*.

**KO49016: Situation *variable* imbedded in policy *variable*. Not deleted.**

**Explanation**

The situation you requested to delete is imbedded in a policy.

**Operator response**

Either delete policy *variable* or change it so that it does not reference situation *variable*.

**KO49017: Policy *variable* embedded in policy *variable*. Not deleted.**

**Explanation**

The policy you requested to delete is imbedded in another policy.

**Operator response**

Either delete policy *variable* or change it so that it does not reference policy *variable*, or delete policy *variable* first.

## **KO49019: Tivoli Enterprise™ Monitoring Server (TEMS) log not displayed.**

### **Explanation**

Not able to display the message queue for the Tivoli Enterprise™ Monitoring Server.

### **Operator response**

View the joblog for specific reasons.

## **KO49020: Situation validation failed. \*MAX cannot be used with this attribute.**

### **Explanation**

Attempt to use \*MAX with a non-integer attribute.

## **KO49021: Situation validation failed. \*MIN cannot be used with this attribute.**

### **Explanation**

Attempt to use \*MIN with a non-integer attribute.

## **KO49022: Situation validation failed. This operator cannot be used with this attribute.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO49023: Situation validation failed. \*COUNT not valid for this attribute.**

### **Explanation**

Attempt to use \*COUNT with a non-integer attribute.

## **KO49024: Situation validation failed. \*STR cannot be used with this attribute.**

### **Explanation**

Attempt to use \*STR with a non-string attribute.

## **KO49025: Situation validation failed. Incorrect compare value for \*STR.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO49026: Situation validation failed. \*TIME cannot be used with this attribute.**

### **Explanation**

Attempt to use \*TIME with a non-time attribute.

**KO49027: Situation validation failed. Compare value not valid for \*TIME.**

**Explanation**

Format of \*TIME compare value was not entered correctly.

**User response**

Enter the correct format for the \*TIME compare value. Refer to the appropriate Tivoli Enterprise Monitoring Server (TEMS) reference manual for details.

**KO49028: Tivoli Enterprise™ Monitoring Server (TEMS) did not complete startup.**

**Explanation**

Security level validation did not complete.

**Operator response**

View the joblog for additional messages.

**KO49029: Situation *variable* not a candidate for get current attribute.**

**Explanation**

The situation *variable* contains event-driven attribute.

**Operator response**

Do not attempt to add a get current attribute for this situation.

**KO49030: Situation validation did not complete. \*SUM cannot be used with this attribute.**

**Explanation**

Attempted to use \*SUM with a non-integer attribute.

**KO49031: Status list printed.**

**Explanation**

View the status list.

**KO49032: Situation status printed.**

**Explanation**

View the printed situation status.

**KO49033: Nothing printed; list is empty.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO49034: Situation *variable* is an enterprise situation. Not deleted.**

**Explanation**

The situation *variable* is an enterprise situation that can be deleted only from OMEGAVIEW®.

**Operator response**

Delete situation *variable* from OMEGAVIEW®.

**KO49035: Object *variable* in library *variable* type *variable* not found or not usable.**

**Explanation**

The startup process cannot continue because object *variable* could not be used.

**Operator response**

Check library *variable* for *variable* and fix the problem. If not found, install Tivoli Enterprise™ Monitoring Server (TEMS) again.

**KO49036: Situation *variable* is an enterprise situation. Not changed.**

**Explanation**

The situation *variable* is an enterprise situation that can be changed only from OMEGAVIEW®.

**Operator response**

Change situation *variable* from OMEGAVIEW®.

**KO49037: Tivoli Enterprise™ Monitoring Server (TEMS) or AUTOMATED FACILITIES command failure occurred.**

**Explanation**

An error occurred in an Tivoli Enterprise™ Monitoring Server (TEMS) or an AUTOMATED FACILITIES command.

**Operator response**

To determine cause, view the Tivoli Enterprise™ Monitoring Server job log, restart the Tivoli Enterprise™ Monitoring Server and fix the problem accordingly.

**KO49038: Situation validation failed; cannot use \*SNGPDT predicate with \*SIT predicate.**

**Explanation**

Attempted to create a situation with a single situation predicate. A \*SIT predicate must have a minimum of two predicates.

**Operator response**

Add more predicates using \*AND or \*OR in the predicate relation.

**KO49040: Situation *variable* is not a candidate for the Reset option.**

**Explanation**

The situation *variable* is a sample-driven situation and thus cannot be reset.

## **KO49041: Situation *variable* ended abnormally.**

### **Explanation**

An error was encountered on this situation or possibly on another situation for which a similar message is being issued. The error required this situation and the situation in error (if different) to be shut down. Some examples of the types of errors that can cause this condition follow:

- The situation predicate may not have sufficiently narrowed the scope of things to be examined. This may have resulted in overloading Tivoli Enterprise™ Monitoring Server (TEMS) with too much data.
- The situation may have used \*ACGJB or \*SEC attributes without having the necessary SYSVALs set, or without having set up the necessary journals and journal receivers.
- A job or subsystem required to evaluate the situation may have been ended by an operator.

The above is not an exhaustive list of possible errors.

### **Operator response**

Look for a KO49044 log entry issued at about the same time as this message. That log entry indicates which TEMS job encountered the error. The job may still be active. Examine the joblog for clues about the ultimate cause of the error. Correct the situation in error before attempting to restart it.

### **Administrator Response**

If the situation was started explicitly by an operator, then the situation is shut down. If the situation was running in an AUTOMATED FACILITIES policy as a \*SIT activity type or an \*EVALUATE\_SITUATION activity program, then the activity containing the situation ends with a \*PROBLEM endcode.

## **KO49042: Situation *variable* is occurring; *variable* events available for status.**

### **Explanation**

The event is occurring; the data of 10 events is kept and the previous events are deleted.

## **KO49043: Situation *variable* is occurring; *variable* events available for status; oldest events discarded.**

### **Explanation**

The event is occurring; the data of 10 events is kept and the previous events are deleted.

## **KO49044: Job *variable* encountered an error.**

### **Explanation**

An error was encountered by this Tivoli Enterprise™ Monitoring Server (TEMS) job. Some examples of the types of errors that may have been encountered follow:

- A situation predicate may not have sufficiently narrowed the scope of things to be examined. This may have resulted in overloading TEMS with too much data.
- A situation may have used \*ACGJB or \*SEC attributes without having the necessary SYSVALs set, or without having set up the necessary journals and journal receivers.
- A job or subsystem required to evaluate a situation may have been ended by an operator.

The above is not an exhaustive list of possible errors.

### **Operator response**

Examine the joblog for *variable* to find the error or errors. Correct the errors before attempting the same functions again.

**KO40V01I: Override *<variable>* for situation *<variable>* starting.**

**Explanation**

A situation override is starting.

**KO40V02I: Override *<variable>* for situation *<variable>* stopped.**

**Explanation**

A situation override is stopped.

**KO40V03E: Override *<variable>* for situation *<variable>* encountered error code *<variable>*.**

**Explanation**

A situation override encountered an error.

**KO40V04W: Override *<variable>* for situation *<variable>* uses unknown type *<variable>*.**

**Explanation**

A situation override encountered an unknown type.

**KO40V05I: Calendar *<variable>* starting.**

**Explanation**

A calendar is starting.

**KO40V06I: Calendar *<variable>* stopped.**

**Explanation**

A calendar is stopped.

**KO40V07E: Calendar *<variable>* encountered error code *<variable>*.**

**Explanation**

A calendar encountered an error.

**KO40V08I: Override *<variable>* for situation *<variable>* activated.**

**Explanation**

Activation request has been sent to the agents.

**KO40V09I: Override *<variable>* for situation *<variable>* deactivated.**

**Explanation**

Deactivation request has been sent to the agents.

**KO40V010I: Override <variable> for situation <variable> waiting for calendar <variable>.**

**Explanation**

Override is waiting for a Calendar to be added.

**KO40V011I: Calendar <variable> activated.**

**Explanation**

Calendar activation request has been sent to the agents.

**KO40V012I: Calendar <variable> deactivated.**

**Explanation**

Calendar deactivation request has been sent to the agents.

**KO4SRV001: Tivoli Enterprise™ Monitoring Server (TEMS) startup in progress.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO4SRV002: Tivoli Enterprise™ Monitoring Server (TEMS) startup job already running.**

**Explanation**

You tried to start the Tivoli Enterprise™ Monitoring Server but it is already in the process of starting. Another user has already issued the start command.

**User response**

Wait until the earlier startup process is complete and then try again.

**KO4SRV003: Starting Tivoli Enterprise™ Monitoring Server (TEMS) network server.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO4SRV004: Network server active.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV005: Starting Tivoli Enterprise™ Monitoring Server (TEMS) network requesters.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV006: Network requesters active.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV007: Starting Tivoli Enterprise™ Monitoring Server (TEMS) local directory server.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV008: Local directory server active.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV009: Starting Tivoli Enterprise™ Monitoring Server (TEMS) global directory server.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV010: Global directory server active.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV011: Starting Tivoli Enterprise™ Monitoring Server (TEMS) data collection server.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KO4SRV012: Data collection server active.**

#### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KO4SRV013: Starting Tivoli Enterprise™ Monitoring Server (TEMS) network data collection server.**

#### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KO4SRV014: Network data collection server active.**

#### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KO4SRV015: Starting Tivoli Enterprise™ Monitoring Server (TEMS) situation monitor.**

#### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KO4SRV016: Situation monitor active.**

#### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KO4SRV017: Tivoli Enterprise™ Monitoring Server (TEMS) shutdown in progress.**

#### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KO4SRV018: Stopping Tivoli Enterprise™ Monitoring Server (TEMS) situation monitor.**

#### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

### **KO4SRV019: Situation monitor stopped.**

#### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV020: Stopping Tivoli Enterprise™ Monitoring Server (TEMS) data collection server.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV021: Data collection server stopped.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV022: Stopping Tivoli Enterprise™ Monitoring Server (TEMS) network data collection server.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV023: Network data collection server stopped.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV024: Stopping Tivoli Enterprise™ Monitoring Server (TEMS) network services.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV025: Network services stopped.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV026: Stopping Tivoli Enterprise™ Monitoring Server (TEMS) global directory server.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV027: Global directory server stopped.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV028: Stopping Tivoli Enterprise™ Monitoring Server (TEMS) local directory server.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV029: Local directory server stopped.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV030: Tivoli Enterprise™ Monitoring Server (TEMS) shutdown completed.**

### **Explanation**

The Tivoli Enterprise™ Monitoring Server was requested to shut down.

## **KO4SRV031: Tivoli Enterprise™ Monitoring Server (TEMS) startup job already on job queue.**

### **Explanation**

The job queue already contains a Tivoli Enterprise™ Monitoring Server startup job.

### **Operator response**

Ensure the library subsystem is active and the job queue is not held.

## **KO4SRV032: Tivoli Enterprise™ Monitoring Server (TEMS) startup complete.**

### **Explanation**

All required components of the Tivoli Enterprise™ Monitoring Server are active in the library subsystem.

## **KO4SRV033: Tivoli Enterprise™ Monitoring Server (TEMS) no longer active.**

### **Explanation**

The Tivoli Enterprise™ Monitoring Server has ended since this command was last used.

### **Operator response**

View all error messages that were logged to the Tivoli Enterprise™ Monitoring Server product log and then restart the Tivoli Enterprise™ Monitoring Server.

## **KO4SRV034: Tivoli Enterprise™ Monitoring Server (TEMS) requested to end during startup.**

### **Explanation**

Before the Tivoli Enterprise™ Monitoring Server startup processing completed, an end the Tivoli Enterprise™ Monitoring Server command was issued.

### **Operator response**

Restart the Tivoli Enterprise™ Monitoring

## **KO4SRV035: Starting Tivoli Enterprise™ Monitoring Server (TEMS) worklist manager.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV036: Worklist manager active.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV037: Stopping Tivoli Enterprise™ Monitoring Server (TEMS) worklist manager.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV038: Worklist manager ended.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV039: Starting Tivoli Enterprise™ Monitoring Server (TEMS) data collection event notification.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV040: Data collection event notification active.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO4SRV041: Starting Tivoli Enterprise™ Monitoring Server (TEMS) situation monitor status queuing.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO4SRV042: Situation monitor status queuing active.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO4SRV043: Ending Tivoli Enterprise™ Monitoring Server (TEMS) data collection event notification.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO4SRV044: Data collection event notification ended.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO4SRV045: Stopping Tivoli Enterprise™ Monitoring Server (TEMS) situation monitor status queuing.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO4SRV046: Situation monitor status queuing ended.**

**Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

**KO4SRV047: Validation could not be performed.**

**Explanation**

Tivoli Enterprise™ Monitoring Server (TEMS) is not active. Validation requires that the Tivoli Enterprise™ Monitoring Server be active.

**Operator response**

Activate the Tivoli Enterprise™ Monitoring Server.

## **KO4SRV048: Tivoli Enterprise™ Monitoring Server (TEMS) did not start. Status codes- *variable/variable*.**

### **Explanation**

The Tivoli® Enterprise Monitoring Server did not start successfully.

### **Operator response**

View all error messages that were logged to the Tivoli Enterprise™ Monitoring Server product log. Restart the Tivoli Enterprise™ Monitoring Server. Usually the second code is 0, and the first code is the Windows® error, unless the first code is 8, in which case the second code is the Windows® error. The most common error codes to expect in the first error codes position are as follows:

- 13 ERROR\_INVALID\_DATA: The specified dispatch table contains entries that are not in the proper format.
- 123 ERROR\_INVALID\_NAME: The specified service name is invalid.
- 1056 ERROR\_SERVICE\_ALREADY\_RUNNING: The process has already called StartServiceCtrlDispatcher. Each process can call StartServiceCtrlDispatcher only one time. On Windows NT®, this value is not supported.
- 1060 ERROR\_SERVICE\_DOES\_NOT\_EXIST: The specified service does not exist.
- 1063 ERROR\_FAILED\_SERVICE\_CONTROLLER\_CONNECT: Typically, this error indicates that the program is being run as a console application rather than as a service. If the program will be run as a console application for debugging purposes, structure it such that service-specific code is not called when this error is returned.

## **KO4SRV049: The Tivoli Enterprise™ Monitoring Server (TEMS) started.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV050: Startup failed due to errors in environment definitions.**

### **Explanation**

A startup parameter file in a library does not contain all required parameter fields, and startup is ended. The startup parameter file in the library contains fewer parameter fields than the startup program expects.

### **Operator response**

Verify installation procedures. You can also install and then try to start Tivoli Enterprise™ Monitoring Server (TEMS) again.

## **KO4SRV051: Tivoli Enterprise™ Monitoring Server (TEMS) cannot process this command.**

### **Explanation**

This command returned a completion code. Completion codes and their meanings follow:

<i>Table 140: Completion codes for Tivoli Enterprise™ Monitoring Server program (message KO41039)</i>	
<b>Completion code</b>	<b>Meaning</b>
5	The Tivoli Enterprise™ Monitoring Server program is not active
4	This command is not at the correct release level.
3	The services that this command requests are busy.

### Operator response

If the Tivoli Enterprise™ Monitoring Server is not active, start it. If the command is not at the correct release level, ensure all required maintenance is installed and try again. If the requested services are busy, try the command again.

### **KO4SRV052: The Tivoli Enterprise™ Monitoring Server (TEMS) not active.**

#### Explanation

The system received a Tivoli Enterprise™ Monitoring Server command, but the Tivoli Enterprise™ Monitoring Server has not been started. Check the message log to identify which command was sent.

### Operator response

Start the Tivoli Enterprise™ Monitoring Server and then try the command again.

### **KO4SRV053: Tivoli Enterprise™ Monitoring Server (TEMS) already active.**

#### Explanation

The START TEMS command has already been issued and the Tivoli Enterprise™ Monitoring Server is already active.

### **KO4SRV054: Job *variable/variable* submitted.**

#### Explanation

Job *variable/variable* was submitted to job queue *variable* in *variable*. The job that starts the Tivoli Enterprise™ Monitoring Server (TEMS) program has submitted the CMS program batch job. The Tivoli Enterprise™ Monitoring Server is now active.

### **KO4SRV055: Job *variable* submitted to batch job queue.**

#### Explanation

The START TEMS command submitted job *variable*.

### User response

Determine which job queue contains the batch job and review other details about the job.

### **KO4SRV056: Unable to start Tivoli Enterprise™ Monitoring Server (TEMS) task *variable*.**

#### Explanation

The Tivoli Enterprise™ Monitoring Server command could not start the task *variable*, which is missing or incorrect.

### Operator response

Check the log for messages. Also, ensure that the library subsystem, job queue, user profile, path, and/or library path exist and are correct. If these are missing, install the Tivoli Enterprise™ Monitoring Server again.

### **KO4SRV057: Tivoli Enterprise™ Monitoring Server (TEMS) not ended.**

#### Explanation

The value for the **Confirm request to end** prompt was **No**. The Tivoli Enterprise™ Monitoring Server is still active.

### Operator response

To end the Tivoli Enterprise™ Monitoring Server, reply **Yes** to **Confirm request to end**.

### **KO4SRV058: Tivoli Enterprise™ Monitoring Server (TEMS) had ended.**

#### Explanation

The Tivoli Enterprise™ Monitoring Server stopped.

### **KO4SRV059: Tivoli Enterprise™ Monitoring Server (TEMS) stopped unexpectedly.**

#### Explanation

The Tivoli Enterprise™ Monitoring Server program cannot continue because of an unexpected processing failure.

### Operator response

Check the job log for messages and Tivoli Enterprise™ Monitoring Server job status.

### **KO4SRV060: Tivoli Enterprise™ Monitoring Server (TEMS) ended Situation *variable*.**

#### Explanation

The Tivoli Enterprise™ Monitoring Server received and acknowledged a request to end the situation and has ended the situation.

### **KO4SRV061: Tivoli Enterprise™ Monitoring Server (TEMS) starting Situation *variable*.**

#### Explanation

The Tivoli Enterprise™ Monitoring Server received and acknowledged a request to start the situation and is now doing so.

### **KO4SRV062: Command *variable* did not complete.**

#### Explanation

The *variable* command is pending, but the Tivoli Enterprise™ Monitoring Server (TEMS) subsystem is busy. A timeout error occurred between issuing command and running and running of Tivoli Enterprise™ Monitoring Server jobs. The Tivoli Enterprise™ Monitoring Server program did not acknowledge the request.

### Operator response

Check the status of the job and view the previously listed messages. If no errors occur, try command again.

### **KO4SRV063: Tivoli Enterprise™ Monitoring Server (TEMS) request *variable* did not complete.**

#### Explanation

The command *variable* was not able to complete the request due to a program error. An incorrect response was received from the situation monitor component.

### Operator response

View all error messages that were logged to the Tivoli Enterprise™ Monitoring Server product log. Check all Tivoli Enterprise™ Monitoring Server joblogs for messages.

**KO4SRV064: Situation definition *variable* was deleted.**

**Explanation**

The definition is deleted. If the situation was active, it remains active until you stop it.

**Operator response**

Verify that the situation *variable* is active.

**KO4SRV065: Situation definition *variable* was created.**

**Explanation**

The Tivoli Enterprise™ Monitoring Server (TEMS) **CREATE SITUATION** command created situation *variable*.

**KO4SRV066: Situation list printed.**

**Explanation**

Pressing the appropriate function key caused the entire situation list to be printed.

**User response**

View the situation list.

**KO4SRV067: The situation definition *variable* changed.**

**Explanation**

The Tivoli Enterprise™ Monitoring Server (TEMS) change situation command changed the situation definition.

**Operator response**

If the situation is active, changes do not take place until the situation is ended and then restarted.

**KO4SRV068: Input was not supplied for required fields.**

**Explanation**

A required parameter was not specified.

**Operator response**

Enter the correct value for highlighted fields.

**KO4SRV069: The situation definition *variable* not found.**

**Explanation**

The Tivoli Enterprise™ Monitoring Server (TEMS) could not locate situation definition *variable*.

**Operator response**

Ensure that situation *variable* is spelled correctly.

**KO4SRV070: Configuration information has changed.**

**Explanation**

The **CONFIGURE TEMS** command was used to change configuration options.

### **Operator response**

View current configuration options. End the Tivoli Enterprise™ Monitoring Server (TEMS) and then start it again to run with new options.

### **KO4SRV071: Data not valid for this field.**

#### **Explanation**

Tivoli Enterprise Monitoring Server (TEMS) detected incorrect data for a specific field. For example, a field that requires numeric data contains character data.

#### **Operator response**

Verify that you are using the type of data required for this field.

### **KO4SRV072: Not able to read record in configuration file.**

#### **Explanation**

The Tivoli Enterprise™ Monitoring Server (TEMS) encountered an error condition with a message ID while reading a keyed record in a file. Either the key length is incorrect or an I/O error occurred. The configuration file is not read.

#### **Operator response**

Check the file for errors and try the configuration command again.

### **KO4SRV073: Not able to locate record in configuration file.**

#### **Explanation**

The Tivoli Enterprise™ Monitoring Server (TEMS) encountered an error condition with an error ID while locating keyed a record in a file. Either the file was not opened for read operations or an I/O error occurred. The configuration file was not read.

#### **Operator response**

Check the configuration file for errors and try the command again.

### **KO4SRV074: Not able to update record in configuration file.**

#### **Explanation**

The Tivoli Enterprise™ Monitoring Server (TEMS) encountered an error condition with an error ID, while updating a keyed record in a file. Either the file was not opened for update operations, or an I/O error occurred. The configuration file is not updated.

#### **Operator response**

Check the configuration file for errors and try the command again.

### **KO4SRV075: Situation definition *variable* already exists.**

#### **Explanation**

The Tivoli Enterprise™ Monitoring Server (TEMS) detected that situation definition *variable* was already defined.

#### **Operator response**

Before creating or renaming this situation definition, change the situation definition name, delete the existing situation definition, or omit the command.

### **KO4SRV076: Situation monitoring for *variable* already is active.**

#### **Explanation**

A Tivoli Enterprise™ Monitoring Server (TEMS) start command was issued for situation definition *variable*. The Tivoli Enterprise™ Monitoring Server display situation command shows all active situations.

#### **Operator response**

If situation *variable* contains mixed case, put quotes around definition and try command again.

### **KO4SRV077: Situation monitoring for *variable* is not active.**

#### **Explanation**

The Tivoli Enterprise™ Monitoring Server (TEMS) detected that situation *variable* is not active. The Tivoli Enterprise™ Monitoring Server display situation command shows all active situations.

#### **Operator response**

If situation *variable* contains mixed case, put quotes around definition and try command again.

### **KO4SRV078: National Language Support conversion failed.**

#### **Explanation**

Tivoli Enterprise™ Monitoring Server (TEMS) program was not able to translate the contents of a text description field.

#### **Operator response**

View specific messages in the product and job logs.

### **KO4SRV079: Value *variable* is not valid for parameter *variable*.**

#### **Explanation**

A required value was not entered for this parameter.

#### **Operator response**

Enter the correct value for this parameter.

### **KO4SRV080: Value *variable* is not valid for parameter *variable*.**

#### **Explanation**

A required value was not entered for the parameter.

#### **Operator response**

Enter the correct value for the required field.

### **KO4SRV081: Value *variable* is not valid for parameter *variable*.**

#### **Explanation**

The first character must be alphabetic.

**KO4SRV082: \*PROMPT is not allowed for parameter *variable*.**

**Explanation**

The Tivoli Enterprise™ Monitoring Server (TEMS) allows only \*PROMPT for specific fields. This field is not allowed.

**Operator response**

Enter a specific name in field for the *variable* parameter.

**KO4SRV083: Value *variable* not valid for parameter *variable*.**

**Explanation**

No imbedded blanks are allowed.

**Operator response**

Refer to the appropriate Tivoli Enterprise Monitoring Server (TEMS) reference manual for correct values.

**KO4SRV084: Irrecoverable errors while updating configuration file.**

**Explanation**

Not authorized to access this file.

**Operator response**

Contact a user with access privileges. Check the work object authority to see what kind of access you need.

**KO4SRV085: Local directory server *LName* must match Tivoli Enterprise™ Monitoring Server (TEMS) *LName*.**

**Explanation**

The network directory server *LName* must match the one that you specified earlier.

**Operator response**

Enter the correct network directory server *LName*.

**KO4SRV089: Specify \*SNA Directory Server.**

**Explanation**

An \*SNA directory server must be specified when no Tivoli Enterprise Monitoring Server (TEMS) TCP/IP address is present. Message CPF0002 follows.

**KO4SRV090: Value *variable* is not valid for parameter *variable*.**

**Explanation**

Contains variant characters. Invariant characters are uppercase A - Z, lowercase a - z, +, %, &, \*, /, (), ", \_, ., ;, and ?.

**Operator response**

Enter invariant characters.

**KO4SRV091: Predicate attribute *variable* is not known or not valid.**

**Explanation**

You entered an attribute that is not valid.

**Operator response**

Enter a valid attribute or use \*PROMPT to choose an attribute.

**KO4SRV093: Value *variable* is not valid for parameter *variable*.**

**Explanation**

A required value was not specified.

**Operator response**

The first character must be alphabetic or the value must be \*ALL.

**KO4SRV094: Value *variable* not valid for parameter *variable*.**

**Explanation**

First character must be alphabetic or value must be \*PROMPT.

**Operator response**

Change the first character in the parameter *variable* to alphabetic, or change parameter *variable* to \*PROMPT.

**KO4SRV095: Multiple predicates is not allowed with PDTREL value \*SNGPDT.**

**Explanation**

You entered \*SNGPDT in the PDTREL field with more than 1 predicate.

**Operator response**

Enter \*AND or \*OR in the PDTREL field or delete all but 1 predicate in the situation.

**KO4SRV096: Multiple predicates required with PDTREL value \*AND or \*OR.**

**Explanation**

You entered \*AND or \*OR in the PDTREL field but did not enter more than 1 predicate.

**Operator response**

Enter more predicates or enter \*SNGPDT in the PDTREL field.

**KO4SRV097: Predicate relational operator must be \*EQ when function is \*SIT.**

**Explanation**

You entered something other than \*EQ in the relational field when the predicate is another situation.

**Operator response**

Enter \*EQ in the relational operator field or change the PDT field to something other than \*SIT.

### **KO4SRV098: Predicate compare value must be \*TRUE when function is \*SIT.**

#### **Explanation**

You entered something other than \*TRUE in the compare value field when the predicate is another situation.

#### **Operator response**

Enter \*TRUE in the compare value field or change the predicate function to something other than \*SIT.

### **KO4SRV099: Predicate compare value not valid.**

#### **Explanation**

Predicate compare value *variable2* for attribute *variable3* is not valid. Allowed values range from *variable4* to *variable5*.

#### **Operator response**

Refer to the appropriate Tivoli Enterprise Monitoring Server (TEMS) reference manual for compare values.

### **KO4SRV100: Predicate compare value for attribute *variable3* not valid.**

#### **Explanation**

Predicate compare value *variable2* for attribute *variable3* is not valid; allowed values are *variable4*, *variable5*, *variable6*, *variable7*, *variable8*, *variable9*, *variable10*, *variable11*, *variable12*, and *variable13*.

#### **Operator response**

Change the predicate compare value to one of the following: *variable4*, *variable5*, *variable6*, *variable7*, *variable8*, *variable9*, *variable10*, *variable11*, *variable12*, and *variable13*.

### **KO4SRV101: Predicate compare value not known or not valid.**

#### **Explanation**

Compare value *variable* for attribute *variable* not known or not valid.

#### **Operator response**

Enter a correct value. Refer to the appropriate Tivoli Enterprise Monitoring Server (TEMS) reference manual for compare values.

### **KO4SRV102: Predicate attribute *variable* not valid.**

#### **Explanation**

A situation cannot reference itself.

#### **Operator response**

Enter a correct value for this attribute. Refer to the appropriate Tivoli Enterprise Monitoring Server (TEMS) reference manual for attribute values.

### **KO4SRV103: Unable to create the Tivoli Enterprise™ Monitoring Server message queue.**

#### **Explanation**

The Tivoli Enterprise™ Monitoring Server tried to create a message queue to communicate with its companion processes and the create failed.

## **KO4SRV104: The Tivoli Enterprise™ Monitoring Server message receipt failed.**

### **Explanation**

The Tivoli Enterprise™ Monitoring Server tried to receive a message from its message queue and the receive failed.

## **KO4SRV105: Send to *variable* failed.**

### **Explanation**

The Tivoli Enterprise™ Monitoring Server manager tried to send a message to *variable*, but the send operation failed.

## **KO4SRV106: Unsupported TEMS option specified.**

### **Explanation**

The parameter passed to the Tivoli Enterprise™ Monitoring Server is not recognized as a valid operand.

### **Operator response**

Enter a correct value for the Tivoli Enterprise™ Monitoring Server operand. Valid options are START and STOP.

## **KO4SRV107: Detecting Tivoli Enterprise™ Monitoring Server (TEMS) local directory server.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV108: Detecting Tivoli Enterprise™ Monitoring Server (TEMS) global directory server.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV109: TEMS *variable* on *variable* is starting.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV110: TEMS *variable* on *variable* is running.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KO4SRV111: TEMS *variable* on *variable* is stopping.**

### **Explanation**

This is an informational message and does not require further action. Typically, this type of message clarifies some aspect of system behavior during normal operations.

## **KQM messages**

The messages that begin with the KQM prefix are associated with Tivoli Enterprise™ Monitoring Server, specifically the hot standby feature.

### **KQM0001: FTO started at *variable*.**

#### **Explanation**

FTO started.

### **KQM0002: FTO ended at *variable*.**

#### **Explanation**

FTO Hot-Standby ended.

### **KQM0003: FTO connected to *variable* at *variable*.**

#### **Explanation**

FTO is trying to connect to the parent Tivoli Enterprise™ Monitoring Server.

### **KQM0004: FTO detected lost parent connection at *variable*.**

#### **Explanation**

FTO/HotStandby has lost connection.

### **KQM0005: FTO has recovered parent connection at *variable*.**

#### **Explanation**

FTO/HotStandby has recovered the lost parent connection.

### **KQM0006: FTO inserted *variable* with id *variable* at *variable*.**

#### **Explanation**

FTO inserted an object with a key.

### **KQM0007: FTO updated *variable* with id *variable* at *variable*.**

#### **Explanation**

FTO updated object *variable* with a key.

**KQM0008: FTO deleted *variable* with id *variable* at *variable*.**

**Explanation**

FTO deleted object *variable*.

**KQM0009: FTO promoted *variable* as the acting HUB.**

**Explanation**

FTO promoted the *variable* Tivoli Enterprise™ Monitoring Server as the hub.

**KQM0010: FTO detected a manual switch at *variable*.**

**Explanation**

FTO detected a manual switch.

**KQM0011: *variable*.**

**Explanation**

An open-ended FTO response.

**KQM0012: FTO routing node *variable* to the parent TEMS.**

**Explanation**

FTO is rerouting a Tivoli Enterprise™ Monitoring Server or a monitoring agent to another Tivoli Enterprise™ Monitoring Server.

**KQM0013: The TEMS *variable* is now the acting HUB.**

**Explanation**

The TEMS has successfully switched to the role of the acting HUB.

**KQM0014: The TEMS *variable* is now the standby HUB.**

**Explanation**

The TEMS has successfully switched to the role of the standby HUB.

**KQMSD100: Inconsistent Self-Describing Agent configuration at FTO peers: Local (*State variable/Status variable*) Peer (*State variable/Status variable*).**

**Explanation**

This message indicates that SDA is not configured consistently on both FTO peers. The State value includes ON, OFF, or ERROR. The Status value includes any integer from 0 to 16 inclusive.

- If SDA is enabled on one peer but not on the other, simply modify the KMS\_SDA environment variable on one of the peers so that the configuration is the same on both monitoring servers.
- If SDA is enabled but the state is ERROR, examine the logs, messages, and audit traces for the offending hub monitoring server. Make any required configuration and environment correction and recycle the hub monitoring server.

The error status code value can be one of the following:

<i>Table 141: Inconsistent Self-Describing Agent configuration at FTO peers status</i>	
<b>Status</b>	<b>Description</b>
1	SDM initialization failed
2	ITM_HOME/CANDLEHOME directory not specified
3	TEMS_MANIFEST_PATH not specified
4	TEMS_MANIFEST_PATH directory length exceeds maximum
5	TEMS_MANIFEST_PATH directory doesn't exist
6	KMS_SDA contains unexpected value
7	SDM Distributed Request Manager failed to initialize
8	SDM Notification Manager failed to initialize
9	Unable to create SDM Request Manager thread
14	SDM Broadcast Request Manager failed to initialize
15	Unable to create SDM Broadcast Manager thread
16	KMS_SDA=N configured on local TEMS

## KRAA messages

The messages that begin with the KRAA prefix are associated with the Audit log of each monitoring agent (SDA refers to a Self-Describing Agent).

**KRAA0001: Self-Describing Agent Installation started for *PRODUCT variable*, with *TEMS variable*, *VERSION\_INFO variable*.**

### Explanation

This message is informational only.

**KRAA0002: Self-Describing Agent Installation has completed successfully for *PRODUCT variable*, with *TEMS variable*, *VERSION\_INFO variable*.**

### Explanation

This message is informational only.

**KRAA0003: Self-Describing Agent Register/Install failed with *STATUS variable* for *PRODUCT variable*, with *TEMS variable*, *VERSION\_INFO variable*.**

### Explanation

This message is informational only.

**KRAA0004: Self-Describing Agent Register/Install giving up after *variable* failed attempts for *PRODUCT variable*.**

### Explanation

This message is informational only.

**KRAA0005: Self-Describing Agent that is connected to non-SDA TEMS *variable* TEMS Version *variable*, for PRODUCT *variable*.**

**Explanation**

This message is informational only.

**KRAA0006: Self-Describing Agent package file *variable* specified in manifest file *variable* does not exist.**

**Explanation**

This message is informational only.

**KRAA0007: Self-Describing Agent manifest file *variable* contains invalid package version specification *variable*.**

**Explanation**

This message is informational only.

**KRAA0008: Validation failed for Self-Describing Agent manifest file *variable* PRODUCT *variable*.**

**Explanation**

This message indicates an validation error occurred and that the agent is not be able to provide SDA support.

**User response**

Refer to the Audit log and RAS1 for other similar messages that indicate the specific SDA manifest file validation error. After you correct the error, recycle the agent to participate in SDA processing.

**KRAA0011: Self-Describing Agent Register/Install has *variable* failed attempts for PRODUCT *variable*. Will retry a maximum of *variable* times.**

**Explanation**

This message is informational only.

**KRAA0012: Self-Describing Agent function disabled by TEMA\_SDA configuration for PRODUCT *variable***

**Explanation**

This message indicates that the TEMA\_SDA=N variable is set for an SDA enabled agent. The SDA feature was intentionally turned off at this agent. This message is informational only.

**KRAA0013: Self-Describing Agent function disabled by TEMS *variable* for PRODUCT *variable*.**

**Explanation**

This message indicates that an SDA-enabled agent connects to a Tivoli Enterprise Monitoring Server that has SDA disabled.

### User response

The Tivoli Enterprise Monitoring Server must have SDA enabled in order for any SDA installations to occur from this agent.

### **KRAA0014: Self-Describing Agent function enabled and ready for PRODUCT *variable*, TEMS *variable***

#### Explanation

This message indicates normal SDA operation for this agent. This message is only issued when the agent SDA operational status changes from “Disabled” to “Enabled” as a result of connecting to a Tivoli Enterprise Monitoring Server that now has SDA turned on. This message is informational only.

### **KRAA0015: Self-Describing Agent function disabled for PRODUCT *variable* due to local SDA file validation error.**

#### Explanation

This message indicates that agent SDA status was disabled due to manifest file validation error. This condition can occur at agent startup time, or while the agent is running and was asked to provide SDA support.

#### User response

After you correct the error condition, recycle the agent to enable its SDA function

### **KRAA0016: Ignoring TEMA\_SDA Configuration! Agent SDA package not found for PRODUCT *variable***

#### Explanation

This message indicates that the TEMA\_SDA=Y setting is ignored because the agent SDA package was not found.

#### User response

Set the variable only when an agent is packaged with SDA support files.

### **KRAA0017: Self-Describing Agent function disabled, expected TEMA\_SDA configuration not found for PRODUCT *variable***

#### Explanation

This message indicates that SDA is disabled because TEMA\_SDA configuration was not set (although the SDA package exists).

#### User response

This variable is required for the agent to provide its SDA support.

### **KRAA0018: Agent operating in Autonomous Only Mode. Self-Describing Agent function disabled for PRODUCT *variable*.**

#### Explanation

This message indicates that the agent is running in Autonomous Only Mode.

#### User response

To use the SDA product installation feature, you must configure the agent to connect to a Tivoli Enterprise Monitoring Server that supports SDA.

## KRA messages

The messages that begin with the KRA prefix are associated with the agent operations log.

### **KRAACMD00: Incorrect FTO configuration! Configure secondary TEMS for this agent!**

#### **Explanation**

The agent received a command from the FTO monitoring server to switch to secondary monitoring server, but no secondary monitoring server is configured on the agent.

### **KRAE042I: EIF event configuration definition failed. Agent EIF emitter feature disabled.**

#### **Explanation**

EIF configuration file was not found or an XML parsing error occurred. Autonomous agent EIF event emitter is disabled as a result.

#### **User response**

1. Message can be ignored if autonomous agent EIF emitter feature is not used.
2. Confirm the location of the EIF configuration XML file. Agent RAS1 log contains the name and location of EIF configuration file in the following message:
  - On distributed systems: \*INFO: Local Agent EIF destination configuration file name <\$ITMHOME\XXX\<pc>\_eventdest.xml>
  - On z/OS: \*INFO: Local Agent EIF destination configuration file name <MQEVDST.RKANDATV>
3. Check the agent operator's log and the agent RAS1 trace log for XML parsing errors. Use KBB\_RAS1=ERROR(UNIT:KRA ALL) trace to determine the line number and XML token causing the parsing error.

### **KRAIRA000: Starting Enterprise situation <situation> <xxxxxxxxxxx,xxxxxxxxxxx> for <pc.attribute\_name>**

#### **Explanation**

The agent successfully started monitoring for the situation. This message appears twice for situations with a take action command.

### **KRAIRA002: Executed <cmd> with status <errno>.**

#### **Explanation**

Indicates the execution of an action command, where *cmd* is the take action command associated with the situation and *errno* is the error code returned by OS when take action command is executed. The explanation of this error code can be found in standard C library header file *errno.h*.

### **KRAIRA003: TakeSample call abended for <situation> <xxxxxxxxxxx,xxxxxxxxxxx> on <pc.attribute\_name>, stopping request.**

#### **Explanation**

The situation sample failed in the agent collector with an unrecoverable error. The situation request will be stopped by the framework.

## **KRAIRA008: Unable to export SNMP and EIF events for duperized situation *\_Z\_<situation\_name>*, Producer(IRA Constructor)**

### **Explanation**

Agent can not determine the list of situations that were combined into the duperized situation and therefore the agent is unable to export SNMP and EIF events for these situations. To resolve this problem, perform one of the following procedures:

- Disable the duper mechanism on the monitoring server by setting the environment variable CMS\_DUPER=NO.
- Identify situations that are combined into a duperized situation. Then change each situation sampling interval to make it ineligible for duperization.

**Tip:** Use ERROR(UNIT:ko4lodge STATE) trace on TEMS to determine situations combined into a duperized situation. For example, "ko4lodge.cpp,1282,"newSitRec::buildNameAndPredicate") created a new situation *\_Z\_<WTHPHYSDSK2>* by melding <NT\_Physical\_Disk\_Busy\_Warning NT\_Physical\_Disk\_Busy\_Critical> where *\_Z\_<WTHPHYSDSK2>* represents the duperized situation that combines sampling for situations NT\_Physical\_Disk\_Busy\_Warning and NT\_Physical\_Disk\_Busy\_Critical. To resolve the original problem, change the sampling interval for situation NT\_Physical\_Disk\_Busy\_Warning and situation NT\_Physical\_Disk\_Busy\_Critical by a few seconds.

## **KRALOG000: New log file created**

### **Explanation**

The agent operations log (LG0) has been successfully created.

## **KRAMGR000: RPC call Sample for <tems\_handle,agent\_handle> failed, status = <status>**

### **Explanation**

For <status> = 1c010001, the monitoring server process is down or unreachable. The agent lost monitoring server connection and will attempt to reconnect.

For <status> = 210102bd, the monitoring server is unable to locate request matching request handle <tems\_handle>, because the situation was stopped or restarted on the monitoring server, but not on the agent. The agent sent data for the old instance of this situation request. The monitoring server will stop or restart the situation on the agent.

## **KRAMGR001: No HEARTBEAT request found. Initiating reconnect.**

### **Explanation**

The agent deactivated and restarted connection with the monitoring server.

## **KRAREG001: CMS lookup failed.**

### **Explanation**

The agent failed to connect to the monitoring server. The agent will wait for ten minutes before attempting to reconnect.

**KRAREG003: RPC call SubnodeRequest for <xxxxxxxxxx,xxxxxxxxxx> failed, status = <status>**

**Explanation**

The RPC call to register agent subnodes failed. The agent will deactivate the monitoring server connection and attempt to reconnect and re-register subnodes.

**KRRARMN000: IRA rmt server shutting down.**

**Explanation**

The agent is shutting down.

**KRAS021I: SNMP trap emitter stopped.**

**Explanation**

SNMP trap configuration file was not found or an XML parsing error occurred. Autonomous agent SNMP trap emitter feature is disabled due to this error.

**User response**

1. Ignore the message if the autonomous agent SNMP trap-emitted feature is not used.
2. Confirm the location of the SNMP trap configuration file. The agent RAS1 log contains the name and location of the SNMP configuration file in the following message:
  - On distributed systems: \*INFO: Local SNMP Trap configuration file name <\$ITMHOME\XXX\<pc>\_trapcnfg.xml>
  - On z/OS: \*INFO: Local SNMP Trap configuration file name<MQTRAPS.RKANDATV>
3. Check the agent operator's log and the agent RAS1 trace log for XML parsing errors. Use KBB\_RAS1=ERROR(UNIT:KRA ALL) trace to determine the line number and XML token causing the parsing error.

**KRAS022I: SNMP trap configuration definition failed. Agent trap emitter feature disabled.**

**Explanation**

SNMP trap configuration file was not found or an XML parsing error occurred. Autonomous agent SNMP trap emitter feature is disabled due to this error.

**User response**

1. Ignore the message if the autonomous agent SNMP trap-emitted feature is not used.
2. Confirm the location of the SNMP trap configuration file. The agent RAS1 log contains the name and location of the SNMP configuration file in the following message:
  - On distributed systems: \*INFO: Local SNMP Trap configuration file name <\$ITMHOME\XXX\<pc>\_trapcnfg.xml>
  - On z/OS: \*INFO: Local SNMP Trap configuration file name<MQTRAPS.RKANDATV>
3. Check the agent operator's log and the agent RAS1 trace log for XML parsing errors. Use KBB\_RAS1=ERROR(UNIT:KRA ALL) trace to determine the line number and XML token causing the parsing error.

## **KRAS041I: EIF event emitter stopped.**

### **Explanation**

EIF configuration file was not found or an XML parsing error occurred. Autonomous agent EIF event emitter is disabled as a result.

### **User response**

1. Message can be ignored if autonomous agent EIF emitter feature is not used.
2. Confirm the location of the EIF configuration XML file. Agent RAS1 log contains the name and location of EIF configuration file in the following message:
  - On distributed systems: \*INFO: Local Agent EIF destination configuration file name <\$ITMHOME\XXX\<pc>\_eventdest.xml>
  - On z/OS: \*INFO: Local Agent EIF destination configuration file name <MQEVDST.RKANDATV>
3. Check the agent operator's log and the agent RAS1 trace log for XML parsing errors. Use KBB\_RAS1=ERROR(UNIT:KRA ALL) trace to determine the line number and XML token causing the parsing error.

## **KRATBM000: Sample error <status\_code>, for <situation\_name> <xxxxxxxxxxx,xxxxxxxxxx> <pc.attribute\_name>**

### **Explanation**

The situation sample failed with a minor error. The framework expects the agent collector to recover on the next sample. The situation is not stopped.

## **KRAX005E: Unable to open XML definition file:<\$ITMHOME\XXX\<pc>\<pc>\_cnfglist.xml>, reason: No such file or directory.**

### **Explanation**

The Centralized Configuration load list XML file was not found or XML parsing errors occurred while processing this file.

### **User response**

1. Message can be ignored if Centralized Configuration functionality is not used.
2. Confirm the location of the Configuration load list XML file. Agent RAS1 log contains the name and location of Configuration load list XML file in the following message:
  - On distributed: \*INFO: Local Configuration Load file name <\$ITMHOME\XXX\  
\<pc>\<pc>\_cnfglist.xml>
  - On z/OS: \*INFO: Local Configuration Load file name <MQCFGLST.RKANDATV>
3. Check the agent operator's log and agent RAS1 trace log for XML parsing errors. Use KBB\_RAS1=ERROR(UNIT:KRA ALL) trace to determine the line number and XML token causing parsing error.

## **KRAX005I: Unable to open XML definition file:<\$ITMHOME\XXX\<pc>\<pc>\_cnfglist.xml>, reason: No such file or directory.**

### **Explanation**

The centralized configuration load list XML file was not found or XML parsing errors occurred while processing this file.

## User response

1. Message can be ignored if Centralized Configuration functionality is not used.
2. Confirm the location of the Configuration load list XML file. Agent RAS1 log contains the name and location of Configuration load list XML file in the following message:
  - On distributed: \*INFO: Local Configuration Load file name <\${ITMHOME}\XXX\  
\<pc>\<pc>\_confglist.xml>
  - On z/OS: \*INFO: Local Configuration Load file name <MQCFGLST.RKANDATV>
3. Check the agent operator's log and agent RAS1 trace log for XML parsing errors. Use KBB\_RAS1=ERROR(UNIT:KRA ALL) trace to determine the line number and XML token causing parsing error.

## KRAX014E: Threshold XML override document object name not defined.

### Explanation

Situation threshold override XML file was not found or an XML parsing error occurred while processing this file.

### User response

1. Message can be ignored if situation override functionality is not used.
2. Confirm the location of the threshold override XML file. Agent RAS1 log contains the name and location of the threshold override file in the following message:
  - On distributed: \*INFO: Local threshold override file name  
<\${ITMHOME}\XXX\<<hostname>\_<pc>\_thresholds.xml>
  - On z/OS: \*INFO: Local threshold override file name <MQTHRES.RKANDATV>
3. Check the agent operator's log and agent RAS1 trace log for XML parsing errors. Use KBB\_RAS1=ERROR(UNIT:KRA ALL) trace to determine the line number and XML token causing the parsing error.

## TMS:Engine codes

This appendix contains information you need to interpret IBM® Tivoli® Management Server: Engine (TMS:Engine) messages and logs. This includes the codes for the following:

- [“TMS:Engine abend and snap dump codes” on page 2386](#)
- [“TMS:Engine message route codes” on page 2387](#)
- [“TMS:Engine sense data format” on page 2388](#)

## TMS:Engine abend and snap dump codes

This section describes the TMS:Engine abend codes and snap dump codes.

TMS:Engine can issue the following abend codes:

Code	Description
U0000	After TMS:Engine termination is requested and confirmed, a program timer is set limiting the shutdown time to 30 seconds. If the timer expires, user abend 0 is invoked to purge TMS:Engine from the system. The unexpected halt of a component usually causes. If the problem persists, contact IBM® Software Support.
U0004	The TMS:Engine load library cannot be opened during initialization. This is usually the result of an invalid RKANMODL DD statement in the TMS:Engine JCL procedure. There should also be z/OS® messages in the JES sysout log indicating a specific reason why the library could not be opened. Use this information to correct the error and restart TMS:Engine.

Code	Description
U0008	During start-up, TMS:Engine detected an exception condition. While trying to issue a WTO indicating the source of the error, the integrity of the TMS:Engine address was found to be corrupted. Contact IBM® Software Support.
U0012	During start-up, TMS:Engine detected an exception condition. A message indicating the source of the error is written to the TMS:Engine log. Refer to the error message to determine your course of action.
U0100	This is a run-time abend invoked by the TMS:Engine product to generate dump documentation for a recoverable software failure. The abend is accompanied by a message written to the TMS:Engine log, which explains the reason for the abend. Most of the reasons refer to storage allocation/deallocation errors. After a system dump is taken, the product attempts to recover from this failure automatically. Successful recovery is indicated by the message KLVER011  <div style="border: 1px solid blue; padding: 5px; margin: 10px 0;"> <p><b>Note:</b> You should shut down the TMS:Engine product and restart as soon as possible after receiving this abend code. Although recovery may be successful, the address space may be damaged.</p> </div>
U0200	This is a run-time abend invoked by the TMS:Engine product to generate dump documentation for a non-recoverable software failure. The abend is accompanied by a message written to the TMS:Engine log, which explains the reason for the abend. These abends are generally caused by storage exhaustion or storage overlays and cannot be retried. This abend can also be forced by the SHUTDOWN ABEND operator command. TMS:Engine terminates after a system dump is taken.

TMS:Engine can generate the following snap dumps.

<i>Table 143: TMS:Engine snap dump codes</i>	
Code	Description
10	An abend has occurred in TMS:Engine and the scheduled abend is intercepted by the ESTAE exit routine. All resident TMS:Engine load modules and various TMS:Engine control blocks and tables are dumped. Message KLVER001 is also issued, and gives the reason for the abend.
11	An abend has occurred in TMS:Engine and the scheduled abend is intercepted by the ESTAE exit routine. For each TMS:Engine subtask, the contents of the JPA, control blocks, queue control blocks, error control blocks, data management information, and I/O control areas are dumped. Message KLVER001 is also issued, and gives the reason for the abend.
99	An TMS:Engine application has requested a snap dump. Message KLVER001 is also issued, and identifies who requested the snap.

## TMS:Engine message route codes

This section lists the TMS:Engine message route codes. Messages can be routed to different console groupings. Routing is based on the type coded internally with the message. The routing types are:

<i>Table 144: TMS:Engine message route codes</i>	
Code	Description
ABEND	Abend messages are routed to the system console.
ALERT	Alert messages are routed to all consoles.
ERROR	Error messages are routed to the console that made the request that caused the error.
INFO	Information messages are routed to all consoles.
LOG	Log messages are recorded in the TMS:Engine log data set.
REPLY	Reply messages are routed to the console that made the request.
USER	Reserved.
VIEW	View messages are written to the VIEWLOG cluster.

Code	Description
WARN	Warning messages are routed to all consoles.

Initial defaults are for all consoles to accept ALERT, ERROR, INFO, REPLY, and WARNING messages addressed to the console. The master console receives all ALERT, INFO, and WARNING messages, regardless of the message origin, as well as ERROR and REPLY messages in response to commands issued from the master console.

The defaults for the VIEWLOG cluster are ALERT, ERROR, INFO, VIEW, and WARNING. These can be changed with the AS \*SYSVLG\* MONITOR command.

Defaults for the system log are ALERT, ERROR, INFO, REPLY, and WARNING.

**Note:** Although you can change message routing, you are strongly encouraged to accept the initial defaults.

## TMS:Engine sense data format

This section describes the TMS:Engine sense data format. SNA exception sense codes may appear in some messages. These sense codes have the same meaning as identified in IBM® SNA documentation. Each code consists of a 4-byte fullword field. The first byte is the category, the second the modifier, and the final two bytes are sense code specific information or user-defined data. For more information on interpreting these fields, refer to *IBM® Systems Network Architecture Format and Protocol Reference Manual: Architectural Logic*. The category and modifier bytes hold the sense code defined for the exception condition that occurred. The following categories of messages, as identified by the first two bytes, might display:

**00**

User Sense Data Only

**08**

Request Reject

**10**

Request Error

**20**

State Error

**40**

Request Header (RH) Usage Error

**80**

Path Error

This table lists the TMS:Engine message route codes.

Table 145: TMS:Engine message route codes	
Code	Description
BYTE 0	BIT 0 - REQSTAT origin flag: <ul style="list-style-type: none"> <li>0 if associated with an RPL based request.</li> <li>1 if associated with a NOTIFY request.</li> </ul>
	BIT 1 - Sense data flag <ul style="list-style-type: none"> <li>0 if system sense, or no sense data available.</li> <li>1 if user sense data present.</li> </ul>

Code	Description
	BITS 2-7 - Return code or status information <ul style="list-style-type: none"> <li>• RPL Return code (RPLRTNCD).</li> <li>• NOTIFY Notify status code, currently supported values:               <ul style="list-style-type: none"> <li>◦ x'02' Session established.</li> <li>◦ x'03' Procedure error</li> </ul> </li> </ul>
BYTE 1	Feedback or reason code <ul style="list-style-type: none"> <li>• RPL Feedback code (RPLFDB2).</li> <li>• NOTIFY Reason flags, currently valid only for status x'03'. This field refers to the 10th byte of the Third Party Notification NOTIFY vector.</li> </ul>
BYTES 2-3	Sense data <ul style="list-style-type: none"> <li>• <b>System sense</b> Refers to the RPLSSEI and RPLSSMI fields, respectively.</li> <li>• <b>User sense</b> Refers to the RPLUSNSI field.</li> </ul>

## IBM Tivoli Monitoring product codes

The following table lists the product codes that identify the different IBM Tivoli Monitoring components and agents. Use these codes when running commands.

<i>Table 146: IBM Tivoli Monitoring product codes</i>	
Component	Product code
Active Directory monitoring agent	3z
Alert Adapter for AF/REMOTE®	a2
i5/OS® monitoring agent	a4
System Automation for z/OS	ah
OMEGACENTER Gateway MVS Alert Adapter	am
Tivoli Enterprise Monitoring Automation Server	as
CA-Unicenter Alert Emitter	au
IBM Tivoli Monitoring Shared Libraries	ax
RAS1 programming building blocks	bb
ITCAM System Edition for WebSphere DataPower	bc
CASP Directory Server Monitoring Agent	bl
CASP Exchange Connector Monitoring Agent	br
Basic Services	bs
IBM Tivoli Monitoring for CICS	c3
IBM Z® OMEGAMON® for CICS®	c5
TEMS Configurator	cf <sup>9</sup>
IBM Tivoli Monitoring for Cryptographic Coprocessors	cg
IBM Tivoli Monitoring Product Installer	ci
IBM Tivoli Monitoring SQL Files	cicatrsql
IBM Tivoli Monitoring Product Installer	cienv
Tivoli Enterprise Portal Desktop Client	cj
Command and Control	co

<b>Component</b>	<b>Product code</b>
IBM Tivoli Monitoring for CICS	cp
Tivoli Enterprise Portal Server	cq
ICU globalization support	cu
Tivoli Enterprise Portal Browser Client	cw
IBM Tivoli Monitoring CommandPro	cz
IBM Tivoli Monitoring for Db2	d3
ITCAM for SOA	d4
IBM Z® OMEGAMON® AI for Db2	d5
distributed communications	dc
Distributed Database common code	dd
distributed communications transport protocol	de
OMEGAMON II for SMS	df
Internet http server	dh
IBM Tivoli Decision Support for z/OS	do
IBM Z® OMEGAMON® AI for Db2	dp
granular security on distributed platforms	dq
Tivoli Enterprise Management Server	ds
remote deploy (os agent only)	dy
R/3 Clients (for ETEWatch) Monitoring Agent	e3
Siemens APOGEE Agent	e4
OSIsoft PI Agent	e5
Johnson Controls Metasys Agent	e6
APC InfraStruXure Agent	e7
Eaton Power Xpert Agent	e8
Active Energy Manager Agent	e9
Internet Monitoring Agent	ea
Lotus Notes Clients (for ETEWatch) Monitoring Agent	el
Event manager	em
SNMP Gateway on Windows NT	en
Management Agent for Tivoli Enterprise Console Gateway	er
EIF to WS-Notification Converter	es
End-to-End	et
Custom Clients (for ETEWatch) Monitoring Agent	eu
Web Browsers (for ETEWatch) Monitoring Agent	ew
Monitoring Agent for Microsoft Exchange Server	ex
OMA for eBA Solutions	ez
Tivoli Enterprise Monitoring Server	fa
Monitoring Agent for Tivoli Management Framework	fn
Windows NT Tivoli Enterprise Portal	fw
SNMP Gateway on AIX	ga
IBM Tivoli Monitoring for Domino	gb
general library	gl

<b>Component</b>	<b>Product code</b>
Graphics and Sound Library for TEP	gr
IBM GSKit Security Interface	gs
IBM Z® OMEGAMON® for CICS® TG	gw
HMC Alert Adapter	hc
Warehouse Proxy	hd
HP OpenView IT/Operations Alert Adapter	hi
OMEGAMON z/OS Management Console	hl
HP OpenView NNM Alert Adapter	ho
Monitoring Agent for Web Servers	ht
OMEGAMON II for IMS	i2
OMEGAMON for IMS on z/OS	i5
WebSphere InterChange Server Monitoring Agent	ic
OpenView ITO Alert Emitter	ih
OMEGAMON for IMS on z/OS	ip
IBM Tivoli Composite Application Manager for Internet Service Monitoring	is
TEC GUI Integration	it
IBM HTTP Server	iu
IBM Tivoli Enterprise Portal Server Extensions Update	iv
IBM Tivoli Enterprise Portal Server Extensions	iw
Tivoli Enterprise-supplied JRE	jr
Monitoring Agent for JMX JSR-77	ju
Monitoring Agent for Tivoli Enterprise Console	ka
IBM Eclipse Help Server	kf
ITCAM for Response Time Enabler on z/OS	kt
IBM Tivoli LAP tool	la
Lotus Notes Monitoring Agent	ln
Monitoring Agent for Netcool\OMNIbus Logfiles	lo
ITMS:Engine	lv
POSIX pthread mapping service (CT/Engine)	lx
Monitoring Agent for Linux OS	lz
OMEGAMON II for MVS	m2
IBM Tivoli Monitoring for OS/390	m3
OMEGAMON on z/OS	m5
Remedy ARS Alert Adapter	ma
WebSphere MQ Configuration Agent	mc <sup>9</sup>
PQEdit	md
IBM MQ Monitoring Agent	mq
Tivoli Enterprise Monitoring Server	ms
OMEGAMON for Networks on z/OS	n3
IBM Z® NetView Enterprise Management Agent	na
Monitoring Agent for IBM Z® NetView Server	nd

<b>Component</b>	<b>Product code</b>
Tivoli Omnibus ObjectServer Agent	no
IBM Tivoli Network Manager	np
Monitoring Agent for Windows OS	nt
IBM Z® NetView/AIX Alert Adapter	nv
Novell NetWare Monitoring Agent	nw
Tivoli Enterprise Monitoring Server	o4
OMNIMON BASE	ob
OMEGAMON for z/OS (z/OS UNIX System Services)	oe
OMEGAMON II for Mainframe Network	on
Monitoring Agent for Microsoft SQL Server	oq
Monitoring Agent for Oracle	or
IBM Tivoli Monitoring for Sysplex	os
Informix Monitoring Agent	ox
Monitoring Agent for Sybase Server	oy
Base Monitoring Agent for AIX	p5
ITCAM Agent for PeopleSoft Enterprise Application Domain	p8
ITCAM Agent for PeopleSoft Enterprise Process Scheduler	p9

## ETE™ return codes and sense codes

This appendix lists the return codes and sense codes for the End-to-End (ETE™) response time monitor component used by some monitoring agents on z/OS®.

### Return codes

“Decimal and hex return codes with meanings for return codes 16 and 20” on page 2394 shows the return code as a decimal value followed by the hexadecimal equivalent. Note that the sense codes apply only to return codes 16 and 20.

Dec	Hex	Meaning
0	00	Request successfully completed.
4	04	ETE™ is not APF-authorized.
8	08	Invalid handle.
12	0C	ETE™ not active.
16	10	Maintenance mismatch. Sense code has first fix number not matching.
20	14	Request failed. Sense code has reason for failure.
24	18	Load of KETTINSN module failed.

<sup>9</sup> IBM has discontinued support for Tivoli OMEGAMON for Messaging for z/OS 7.3.x, which uses product codes CF and MC.

## Sense codes

This section lists the End-to-End sense codes.

### ETE™ address space sense codes

**X'01000E0'**

Insufficient private storage

**X'01000E1'**

Unsupported operating environment

**X'01000E2'**

Recovery not established

### ETE™ capture facility ADD sense codes

**X'018001E0'**

Insufficient private storage

**X'018001E1'**

Unsupported environment

**X'018001E2'**

Recovery not established

**X'018001E3'**

ETE™ is not running

**X'018001E4'**

Unknown category

**X'018001E5'**

CRCA GETMAIN failure

**X'018001E8'**

CUWB lock obtain failure

**X'018001EA'**

RU capture facility is not up

**X'018001EB'**

CRCB build failure

**X'018001EC'**

Collector abended

**X'018001ED'**

VIT PIU trace is inactive

**X'018001EE'**

Abend occurred during request

**X'018001EF'**

Load of KETTCAP stub failed

**X'018001F0'**

LU not found (Index into parm block is 12th bit for 1 byte)

**X'018001F1'**

Control block corruption detected

**X'018001F2'**

CRCB entry length error

## **EXTRACT request errors**

These sense codes are returned by OMEGAMON® messages.

**X'02000C0'**

Insufficient private (NCWA)

**X'02000C1'**

Enqueue failure

**X'02000C2'**

User not monitoring this device

**X'02000C3'**

Dequeue failure

**X'02000C4'**

Control block corruption detected

**X'02000C5'**

Abend occurred during request

**X'02000C6'**

Collector abended

**X'02000C7'**

Unsupported environment

**X'02000C8'**

Recovery not established

**X'02000C9'**

Lock obtain timeout

**X'02000CA'**

VIT PIU trace is inactive

**X'02000CB'**

Extract area specification error

**X'02000CC'**

Extract area page fix error

**X'02000CD'**

SLUL corruption detected during extract request

**X'02000CE'**

SLUL is not active during extract request

**X'02000CF'**

No terminal for extract request

**X'02000D0'**

No partner for extract request

## **ETE™ Capture Facility REMOVE sense codes**

**X'028001C0'**

Insufficient private storage

**X'028001C1'**

Unsupported environment

**X'028001C2'**

Recovery not established

**X'028001C3'**

Collector abended

**X'028001C4'**

VIT PIU trace is inactive

**X'028001C5'**

Abend occurred during request

**X'028001C6'**

ETE™ is not running

**X'028001C7'**

CUWB lock obtain failure

**X'028001C8'**

Unable to locate CUWB

**X'028001C9'**

Subtask terminated

**X'028001CA'**

Subtask did not terminate

**X'028001CB'**

REBF READY Q ENQ failed

**X'028001CC'**

Control block corruption detected

**REFRESH request errors**

These sense codes are returned by OMEGAMON® messages.

**X'040000A0'**

Insufficient private (NCWA)

**X'040000A1'**

Enqueue failure

**X'040000A2'**

User not monitoring this device

**X'040000A3'**

Dequeue failure

**X'040000A4'**

Control block corruption detected

**X'040000A5'**

Abend occurred during request

**X'040000A6'**

Collector abended

**X'040000A7'**

Unsupported environment

**X'040000A8'**

Recovery not established

**X'040000A9'**

Lock obtain timeout

**X'040000AA'**

VIT PIU trace is inactive

**X'040000AB'**

SLUL corruption detected during refresh request

**X'040000AC'**

SLUL is not active during refresh request

**X'040000AD'**

No terminal for refresh request

**X'040000AE'**

No partner for refresh request

## **ETE™ capture facility install API sense codes**

**X'048001A0'**

Insufficient private storage

**X'048001A1'**

Unsupported environment

**X'048001A2'**

Recovery not established

**X'048001A3'**

ETE™ is not running

**X'048001A4'**

CUWB GETMAIN failure

**X'048001A5'**

CRWA GETMAIN failure

**X'048001A7'**

KETTCAP ATTACH failure

**X'048001A8'**

CUWB lock obtain failure

**X'048001A9'**

PSQT overflow

**X'048001AA'**

RU capture facility is not up

**X'048001AB'**

CRCB build failure

**X'048001AC'**

Collector abended

**X'048001AD'**

VIT PIU trace is inactive

**X'048001AE'**

Abend during request

**X'048001AF'**

Load of KETTCAP stub failed

**X'048001B0'**

LU not found (Index into PARM block is at the 12th bit of 1 byte)

**X'048001B1'**

Load of PIU delivery exit failed

## **STATUS request errors**

These sense codes are returned by OMEGAMON® messages.

**X'08000080'**

Insufficient private (NCWA)

**X'08000081'**

Enqueue failure

**X'08000082'**

User not monitoring this device

**X'08000083'**

Dequeue failure

**X'08000084'**

Control block corruption detected

**X'08000085'**

Abend occurred during request

**X'08000086'**

Collector abended

**X'08000087'**

Unsupported environment

**X'08000088'**

Recovery not established

**X'08000089'**

Lock obtain timeout

**X'0800008A'**

VIT PIU trace is inactive

**X'0800008B'**

KETTAPRN call to KETTSTSN failed

**X'0800008C'**

SLUL corruption detected during status request

**X'0800008D'**

SLUL is not active during status request

**X'0800008E'**

No terminal for status request

**X'0800008F'**

No partner for status request

## **ETE™ capture facility sense codes**

**X'08800180'**

Load failure for KETTCAP

**X'08800181'**

GM failure for KETTCAP

**X'08800182'**

Load failure for KETCAPIc API RTR

**X'08800183'**

GM failure for KETCAPIc API RTR

**X'08800184'**

Load failure for KETCAPIc API

**X'08800185'**

GM failure for KETCAPIc API

**X'08800186'**

Load failure for KETTCAP

**X'08800187'**

GM failure for KETTCAP

**X'08800188'**

Load failure for KETEPIDN

**X'08800189'**

GM failure for KETEPIDN

## **DELETE request errors**

These sense codes are returned by OMEGAMON® messages.

**X'10000060'**

Insufficient private (NCWA)

**X'10000061'**

Enqueue failure

**X'10000062'**

User not monitoring this device

**X'10000063'**

Dequeue failure

**X'10000064'**

Control block corruption detected

**X'10000065'**

Abend occurred during request

**X'10000066'**

Collector abended

**X'10000067'**

Unsupported environment

**X'10000068'**

Recovery not established

**X'1000069'**

Lock obtain timeout

**X'100006A'**

VIT PIU trace is inactive

**X'100006B'**

Lock obtain failure

**X'100006C'**

CID not found during CIHT delete processing

**X'100006D'**

ADPB not found

**X'100006E'**

No terminal for delete request

**X'100006F'**

No partner for delete request

## **RASTOP sense codes**

**X'10800160'**

Insufficient private storage

**X'10800161'**

Enqueue failure

**X'10800163'**

VIT PIU trace is inactive

**X'10800164'**

Collector abended

**X'10800165'**

Abend occurred during request

**X'10800166'**

Dequeue failure

**X'10800167'**

ETE™ address space is inactive

**X'10800168'**

XMEM FREEMAIN failed (ADPB)

**X'10800169'**

XMEM services failed

**X'1080016A'**

ADPB lock obtain failure

**X'1080016B'**

Recovery not established

**X'1080016C'**

ADPB not found for token

**X'1080016D'**

PSQE deletion failure

**X'1080016E'**

Lock obtain timeout

**X'1080016F'**

SLUL corruption detected during STOPMON request

**X'10800170'**

SLUL is not active during STOPMON request

## **ADD request errors**

These sense codes are returned by OMEGAMON® messages.

**X'20000040'**

Insufficient private (NCWA)

**X'20000041'**

Enqueue failure X'20000042' This sense code is returned for one of the following reasons:

1. Device luname not found in network (no data provided for VERBOSE WTO)
2. LU is a virtual terminal, but no information is available from the MSM.
3. ETE™ address space is no longer running
4. LU is a switched LU or a 37xx TIC-attached token ring LU that has a status of CONCT

Issue the ETE™ VERBOSE command to produce a WTO to the system console each time this sense code is returned (except for reason 1 above). The WTO specifies which of the above reasons caused the failure.

**X'20000043'**

Device not suitable for monitoring X'20000044' Device does not support SLU-PLU rspi

**X'20000045'**

User already monitoring this device

**X'20000046'**

Insufficient CSA-TDBA

**X'20000047'**

Insufficient CSA-TDBE

## z/OS® status codes and return codes

This appendix contains explanations for various status codes and return codes used the IBM® Tivoli® Monitoring z/OS® components. These codes are organized by message prefix as follows:

- [“KDCNCnnn message status codes” on page 2412](#)
- [“KSM and KIB return codes” on page 2418](#)
- [“KFA return codes” on page 2421](#)

### KDCNCnnn message status codes

The KDCNCnnn message print status codes for calls to basic services APIs. These explanations for these codes are shown in [“KDCNCnnn message status codes” on page 2412](#).

This table lists the KDCNC message status codes and provides explanations for those codes.

Table 148: KDCNCnnn message status codes		
Enumerated value displayed in the log file	Status code	Explanation
Distribution request status codes		
0	typedef enum SQL1_	SQL1_Success
1		SQL1_BadArgument,
2		SQL1_BadObject
3		SQL1_BusyObject
4		SQL1_Duplicate
5		SQL1_NotThere
6		SQL1_ProtocolError
7		SQL1_Shortage
8		SQL1_SystemError
9		SQL1_UnknownError
10		SQL1_Warning
11		SQL1_Authority
50	SQL1_NoStorage = 50	Requested storage not available
51	SQL1_InvalidObject	Invalid handle
52	SQL1_InvalidError	Invalid error ID
53	SQL1_InvalidErrorLen	Invalid error ID length
54	SQL1_InvalidMessage	Invalid message
55	SQL1_InvalidName	Invalid name
56	SQL1_InvalidNameLen	Invalid name length
57	SQL1_InvalidValue	Invalid value
58	SQL1_InvalidValueLen,	Invalid value length
59	SQL1_ValueTruncated,	Value truncated
60	SQL1_NotAvailable	Requested parameter not available
61	SQL1_EndOfList	No more elements are in the list

Enumerated value displayed in the log file	Status code	Explanation
62	SQL1_EndOfData	No JVAL is avail. to the LOCATOR
63	SQL1_EndOfIndex	No more index filter
64	SQL1_Error	Error
65	SQL1_BadRequest	Bad request detected by probe
66	SQL1_AbandonSubview	Abandon subview
67	SQL1_AbandonRow	Abandon row
68	SQL1_RestartSubview	Restart subview
69	SQL1_RestartRow	Restart row
70	SQL1_MonitorError	Error in monitored system
71	SQL1_AbandonView	Abandon view
72	SQL1_Abend	ABEND
73	SQL1_NullRow	Row with NULLs
74	SQL1_NoView	No view created
75	SQL1_EventError	EVENT error
76	SQL1_DeferSetup	Defer SetupSample until notified
77	SQL1_DeferProcess	Defer ProcessSample
78	SQL1_DeferOpen	Defer Open (TakeSample)
79	SQL1_RecordsNotFound	Record(s) Not Found
80	SQL1_DuplicateKey	Duplicate Key Found
81	SQL1_IOError	Input/Output Error
82	SQL1_FileFull	File Full Error
Data Server interface-related status codes		
100	SQL1_Security	Security check failed
101	SQL1_Inop	CT/DS® inoperative
102	SQL1_InvalidIntfc	Invalid interface handle
103	SQL1_CTDSIDNotFound	CT/DS® ID not found
104	SQL1_InvalidCTDSID	Invalid character(s) in CT/DS® ID
105	SQL1_InvalidPath	Invalid server handle or server not open
106	SQL1_InvalidAPPLID	Invalid character(s) in Application ID
107	SQL1_Incompatible	Requestor is at incompatible release level
108	SQL1_InvalidSocket	Invalid socket address specified
110	SQL1_PathMissingProcess	WJS: 931009: Error in path specification
111	SQL1_PathInvalidProcess	WJS: 931009: Error in path specification
112	SQL1_PathMissingKeyword	WJS: 931009: Error in path specification
113	SQL1_PathInvalidKeyword	WJS: 931009: Error in path specification
114	SQL1_PathMissingDelimiter	WJS: 931009: Error in path specification
115	SQL1_PathInvalid SocketAddress	WJS: 931009: Error in path specification
116	SQL1_PathInvalidServerID	WJS: 931009: Error in path specification
117	SQL1_PathInvalidUserID	WJS: 931009: Error in path specification
118	SQL1_PathInvalid LocalApplID	WJS: 931009: Error in path specification

Enumerated value displayed in the log file	Status code	Explanation
119	SQL1_PathInvalid RemoteApplID	WJS: 931009: Error in path specification
120	SQL1_PathInvalidMode	WJS: 931009: Error in path specification
140	SQL1_NetworkInterfaceError	WJS: 931009: NCS-related CT/DS® abnormal codes
141	SQL1_NetworkError	WJS: 931009: NCS-related CT/DS® abnormal codes
142	SQL1_NetworkClientTimeout	WJS: 931009: NCS-related CT/DS® abnormal codes
143	SQL1_RemoteServerFailure	WJS: 931009: NCS-related CT/DS® abnormal codes
144	SQL1_NotLBRegistered	WJS: 931009: NCS-related CT/DS® abnormal codes
145	SQL1_LocationBrokerError	WJS: 931009: NCS-related CT/DS® abnormal codes
146	SQL1_ConfigFileNoFamily	WJS: 940325: NCS-related CT/DS® abnormal codes
147	SQL1_NCSFailure = 150	NCS-generated stub code abend
148	SQL1_BusyAddress	NCS socket address already in use
149	SQL1_BadPacket	NCS client or server got bad packet
150	SQL1_BindFailure	NCS cannot bind socket to socket addr
151	SQL1_SocketCreateFailed	NCS cannot create a socket
152	SQL1_NoResponse	NCS-defined server does not respond
153	SQL1_NCSIllRegister	NCS interface already registered
154	SQL1_InternalNCSFailure	NCS internal program error
155	SQL1_NoSuchRPCCall	NCS RPC call not defined in interface
156	SQL1_NCSProtocolError	NCS internal protocol error
157	SQL1_MaximumInterfaces	NCS at registered-intereface limit
158	SQL1_MaximumSocekets	NCS server at in-use-socket limit
159	SQL1_BadRPCHandle,	NCS RPC handle not bound to socket
160	SQL1_BadRPCInterface	NCS interface is not defined
161	SQL1_ServerRestarted	NCS server restarted during session
162	SQL1_ServerCrashed	NCS server crashed during client RPC
163	SQL1_NCSInterfaceError	NCS/CTDS interface internal error
164	SQL1_UndefinedNCSError	NCS undocumented return code
165	SQL1_LBNoDBAccess	NCS location broker can't access the database
166	SQL1_LBBusyDB	NCS location broker locked out of the database
167	SQL1_LBInvalidDBFormat	NCS location broker database obsolete format
168	SQL1_LBNotResgistered	No matching entry in location broker database
169	SQL1_LBNoServer	NCS location broker cannot be accessed
170	SQL1_LBUpdateFailure	NCS location broker database update failure
171	SQL1_NoRemoteShutdown	NCS remote server shutdown not allowed
172	SQL1_InvalidNumericName	NCS socket invalid numeric host name
173	SQL1_BufferTooBig	NCS caller's buffer is too large
174	SQL1_BufferTooSmall	NCS caller's buffer is too small
175	SQL1_SocketCreateFailure	NCS cannot create a socket
176	SQL1_SocketConvertFailure	NCS cant convert socket addr to name
177	SQL1_SocketNameNotThere	NCS socket name lookup failed

Enumerated value displayed in the log file	Status code	Explanation
178	SQL1_NoInterfaceConfig	NCS cant get hst interface config list
179	SQL1_NoLocalHostname	NCS cant get the name of local host
180	SQL1_SocketFamilyInvalid	NCS socket family invalid on local hst
181	SQL1_SocketInternalError	NCS socket code internal error
182	SQL1_InvalidSocketName	NCS socket invalid name format
183	SQL1_CleanupOrderError	NCS PFM cleanup handler release out-of-sequence
184	SQL1_NoCleanupHandler	NCS PFM no cleanup handler is pending
185	SQL1_CleanupSet,	NCS PFM cleanup handler established
186	SQL1_CleanupSignaled	NCS PFM pfm_\$cleanup_set used as signal
187	SQL1_InvalidCleanupRecord	NCS PFM caller's cleanup record invalid
188	SQL1_NoCleanupSpace	NCS PFM no storage for cleanup handler
Compiler Services related status codes		
200	SQL1_CompileFailure	CTDS compilation failure
201	SQL1_BadInput	VPM parser encountered bad input
202	SQL1_CatalogError	VPM catalog lookup error
203	SQL1_InputError	VPM parser error
204	SQL1_OutputError	VPM access plan generation error
205	SQL1_FilterError	VPM filter optimization error
206	SQL1_CreateError	VPM object creation error
207	SQL1_NotFound	VPM object not found
208	SQL1_TableError	VPM table object generation error
209	SQL1_ViewError	VPM view/table processing error
210	SQL1_JoinError	VPM join processing error
211	SQL1_DomainError	VPM domain processing error
212	SQL1_IndexError	VPM index processing error
213	SQL1_FunctionError	VPM function processing error
214	SQL1_ColumnError	VPM column processing error
215	SQL1_ParmError	VPM parmD processing error
216	SQL1_InvalidValueSize	Literal value too MAC1_i32_t or too large
217	SQL1_InternalDistReq	Optimize distribution request as an internal request
218	SQL1_InvalidGroupByClause	At least 1 col function required
219	SQL1_RecordModeIncompat	Record mode incompatibility
220	SQL1_FilterElemIDError	Internal Compiler error resolving ID
Request Service-related status codes		
300	SQL1_InvalidReqHdl	Invalid request handle or request not defined to the Virtual Data Manager
301	SQL1_InUse	Object is already in use
302	SQL1_SampleIncomplete	One or more Views have not completed sampling - for asynch. open only
303	SQL1_InvalidNotifyMethod	Notify method specified is invalid
304	SQL1_InvalidAttribute	Invalid Attribute Type specified.

Enumerated value displayed in the log file	Status code	Explanation
305	SQL1_InvalidInterval	Invalid Request Interval specified
306	SQL1_InvalidBoundary	Invalid Request Boundary specified
307	SQL1_InvalidSuppress	Invalid Request Suppress Notify attr
308	SQL1_InvalidAttrCount	Invalid Attribute Count specified
309	SQL1_InvalidAttrValue	Invalid Attribute Value *b kk981119
310	SQL1_InvalidEventAttr	Invalid Request Event attribute
311	SQL1_InvalidCodePage	Invalid Code Page attribute
312	SQL1_InvalidLanguageId	Invalid Language Id. attr. *e kk981119*
SQL Parcer-related status codes		
350	SQL1_InvalidSQLSyntax	Invalid SQL statement or token
351	SQL1_InvalidSymbolLength	SQL Symbol exceeds maximum length
352	SQL1_InternalParserError	Internal Parser Error
353	SQL1_InvalidHexData	Hex Data Invalid or Too Long
Event Services-related status codes		
400	SQL1_InvalidTrigger	Invalid trigger list or trigger list address
401	SQL1_EventServiceError	Internal Error
402	SQL1_EventThreshold	Event threshold occurred b kk981119
403	SQL1_EventSlowdown	Timer re-open next sample
404	SQL1_EventSlowdownClose	Close and Timer re-open next sample
405	SQL1_EventSuppress	Suppress and Timer open next sample e kk981119
VRS-related status codes		
500	SQL1_NoBuffer	
501	SQL1_AlreadyStarted	Row already started
502	SQL1_AlreadyAccepted	Row already accepted
503	SQL1_AlreadyAbandoned	Row already abandoned
504	SQL1_InvalidSubview	Invalid Subview
505	SQL1_InvalidColimnAtt	Invalid Column attribute
506	SQL1_CompileFailed	Compile View failed
507	SQL1_DuplicateSortSeq	Sort sequence number already defined
508	SQL1_AlreadyConfigured	Column already configured for sort
509	SQL1_DuplicateOutput	Output column already defined
510	SQL1_LastBuffer	Last data buffer
511	SQL1_NoSampleAvailable	No Sample Available
512	SQL1_InvalidParm	Invalid input parm
513	SQL1_InternalVRSFailure	Internal error in VRS
514	SQL1_EOD	End of data: the sample has no rows or there are no more rows to be retrieved from this sample
515	SQL1_MaxRowSizeExceeded	Row exceeds rowset buffer size
516	SQL1_EmptyRowsetBuffer	Requester's rowset buffer has no rows
517	SQL1_LimitExceeded	Row limit exceeded TCK980722

Enumerated value displayed in the log file	Status code	Explanation
VWV-related status codes		
600	SQL1_InvalidView	Invalid view or view address
601	SQL1_NoSharedView	Invalid view or view address
602	SQL1_SharedViewFound	Invalid view or view address
603	SQL1_CreateFailed	Invalid view or view address
604	SQL1_InvalidViewName	Invalid view or view address
605	SQL1_SampleInProgress	Invalid view or view address
606	SQL1_SharedBufferFound	Invalid view or view address
607	SQL1_SetupViewFailed	Invalid view or view address
608	SQL1_SetupRequestFailed	Invalid view or view address
609	SQL1_CreateThreadFailed	Invalid view or view address
610	SQL1_InternalVWVFailure	Invalid view or view address
Status codes issued by SIT1		
800	SQL1_OpenError	
801	SQL1_WaitError	
802	SQL1_PostError	
803	SQL1_CreateThreadError	
804	SQL1_DestroyThreadError	
805	SQL1_ResourceError	
806	SQL1_AdvisorError	
807	SQL1_RuleProcessError	
Status codes issued by RUL1		
850	SQL1_AllocateError	
851	SQL1_RequestError	
852	SQL1_AccessPlanError	
853	SQL1_InvalidRuleNode	
854	SQL1_InvalidOperator	
855	SQL1_InvalidPredicate	
856	SQL1_SQLError	
857	SQL1_LoadError	
858	SQL1_BadFunctionName	
859	SQL1_BadPredicateName	
860	SQL1_SQLOpenError	
861	SQL1_ReadError	
862	SQL1_DeltaError	
863	SQL1_PathError	
Status codes issued by an Candle® Technologies Data Server component		
1000	SQL1_NoMemory	Insufficient storage to satisfy request
1001	SQL1_InvalidHandle	Invalid handle
1002	SQL1_SystemFailure	A CT/DS® system failure occurred.

Enumerated value displayed in the log file	Status code	Explanation
1003	SQL1_Unknown	Unknown error.
1004	SQL1_NotSupported	Request not supported in designated environment
1005	SQL1_InvalidUserID	Invalid Logon User ID
1006	SQL1_InvalidPassword,	Invalid Logon Password
1007	SQL1_LogonInfoError	Error attempting to obtain logon information
1008	SQL1_RequestDestroyed	Request destroyed
1009	SQL1_OpenCancelled	Async. open cancelled
1010	SQL1_PasswordExpired	User password expired tck0314
1011	SQL1_PasswordRevoked	User password revoked tck0314
1012	SQL1_InternalError	Internal component error
1013	SQL1_NoEvent	
1014	SQL1_LicenseWarn,	1014 License Management warning. V114
1015	SQL1_NoLicense	1015 No License available. V114
1016	SQL1_CreateReqFailed	Create Request failed - ExecuteTrans.
1017	SQL1_TakeSampleFailed	Take Sample failed - ExecuteTrans
1018	SQL1_AccessRowsetsFailed	AccessRowsets .failed - ExecuteTrans
1019	SQL1_ReleaseRowsetsFailed	ReleaseRowsets.failed - ExecuteTrans
1020	SQL1_DestroyRequestFailed	Destroy Req.failed - ExecuteTrans.
1021	SQL1_LogonFailed	generic logon failed TCK970120
1022	SQL1-NLS1Error	NLS1 component error kk981119

## KSM and KIB return codes

The KSM and KIB messages print status codes for the situation monitor and information base components. The explanations for these codes are shown in “KSM and KIB message status codes” on page 2418

*Table 149: KSM and KIB message status codes*

Enumerated value displayed in the log file	Identifier	Explanation
0	ERR_NOERROR	No Error
1101	ERR_SQL1INIT	SQL1 Init Error
1102	ERR_SQL1OPEN	SQL1 Open Error
1103	ERR_PREPARE	SQL1 Prepare Error
1104	ERR_FETCH	SQL1 Fetch Error
1105	ERR_CLOSE	SQL1 Close Error
1106	ERR_PREPAREDROP	SQL1 Drop Error
1107	ERR_REGTABLE	ibTableList create failure
1108	ERR_TOBJECT	ibTable create failure
1109	ERR_SQL1OBJ	WsSql400 create failure
1110	ERR_SQL1STMT	Sql statement create failure
1111	ERR_IBREQUEST	IBRequest create failure

Enumerated value displayed in the log file	Identifier	Explanation
1112	ERR_NOTABLEFOUND	No tObjectList defined
1113	ERR_REQUESTER	Sql statement create failure
1114	ERR_REQUESTDROP	Sql prepare error
1115	ERR_SQL1CLOSE	Sql close error
1116	ERR_RWITERATOR	RW Iterator create failure
1117	ERR_RWKEYCREATE	RW key create failure
1118	ERR_RWDICTCREATE	RW Dictionary create failure
1119	ERR_NODATAFOUND	No data returned.
1120	ERR_TYPEERR	No column found in index
1121	ERR_DELETEERR	Delete error
1122	ERR_TABLENAMETAG	Allocate table name tag failure
1123	ERR_IDTAG	Allocate id tag failure
1124	ERR_SORTDATAROW	Allocate sort data failure
1125	ERR_LISTCREATE	Create list error
1126	ERR_XTABLETOOBJ	Table-object xref create error
1127	ERR_BADSLISTARG	Null sList provided
1128	ERR_SLISTITERR	Iterator create erro
1129	ERR_XATTRERROR	Attribute table error
1130	ERR_ITEMPTY	No sList in sList #define
1131	ERR_LODGEERROR	Bad lodge request #define
1132	ERR_NOTABLEARG	No IBTable argument provided
1133	ERR_NOATTRIBUTE	No attribute found
1134	ERR_NOCONFIG	No configuration file found
1135	ERR_DATAROW	Data row create failure
1136	ERR_NODATA	No data back from fetching
1137	ERR_THRESHERROR	Setting up toThreshold table
1138	ERR_NOKEYFOUND	No data from key
1139	ERR_NEWKEYALLOCATE	New key allocation failure
1140	ERR_NOTABLEDEF	No table definition found
1141	ERR_NOKEYNAME	No key object name found
1142	ERR_USERID	No user id
1143	ERR_USERPASSWORD	No password id
1144	ERR_DUPLICATEINSERT	Duplicate record exists
1145	ERR_INVALIDSITNAME	invalid *stiname supplied
1146	ERR_PORTID	No port id
1147	ERR_SLINKEDCREATE	Slist create error
1148	ERR_NULLSLIST	Null sList discovered
1149	ERR_NULLDEF	Null tableDef discovered
1150	ERR_CACHEONLY	Getting an absent cache only
1151	ERR_NONDXFOUND	illegal key index
1152	ERR_BADSQLVAR	Null SQL var

Enumerated value displayed in the log file	Identifier	Explanation
1153	ERR_BADSQLDATA	Null SQL data in var
1154	ERR_NULLTOBJECT	empty Tobject found
1155	ERR_NEWCHARALLOCATE	New char allocation failure
1156	ERR_INVALIDUPDATE	Overwrite of missing record
1157	ERR_CREATEREQUEST	Create request failed
1158	ERR_CREATEREQUEST2	Create request no two
1159	ERR_INPUTSQLDA	get input SQLDA failed
1160	ERR_OUTPUTSQLDA	get output SQLDA failed
1161	ERR_NEWREPLYSTORE	new replystore failure
1162	ERR_NULLINFO	null requestorinfo
1163	ERR_NONOTIFICATION	Bad notification
1164	ERR_ROWDICTIONARY	Error making rowDic
1165	ERR_XREFDATAFOUND	X Reference data is found
1166	ERR_EMPTYKEYS	No keys in dictionary
1167	ERR_ENTERPRISESCOPE	Scope of data error
1168	ERR_LODGERECURSION	more then 10 situations
1169	ERR_MISSINGOBJECTID	Missing object id
1170	ERR_UNKNOWNSQLTYPE	Unknown SQL type
1171	ERR_UNSUPPORTEDSQLTYPE	Unsupported SQL type
1172	ERR_BADKEYDEF	ATOMIC/SUPER key problem
1173	ERR_BADPREDICATE	bad STR predicate @00
1174	ERR_CURRENTEVENT	situation with event-attr @01
1175	ERR_NOCANCEL	Cancel no matches
1176	ERR_TERMINATEREQUEST //	Terminate request issued
1177	ERR_SQLTOKEN	
1178	ERR_SITUATIONOVERFLOW	Situation overflow
1179	ERR_SYNCMATCH	Put parms mismatch
1180	ERR_CHARCREATE	char create error
1200	ERR_UNEXPECTEDAND	Unexpected *AND
1201	ERR_UNEXPECTEDOR	Unexpected *OR
1202	ERR_RULESYNTAX	Generic rule syntax error
1203	ERR_MISMATCHEDPAREN	Parenthesis do not match
1204	ERR_BADCOMPARISONOP	Bad comparison operator
1205	ERR_TOOMANYSUBRULES	# of subrules exceeds limit
1206	ERR_WAYTOOMANYRULES	# of embedded sit exceeds limit
1207	ERR_NETRULE	Bad network rule syntax
1208	ERR_INVALID4REFLEX	Rule too complex for reflex
5000	RELODGE_STATE	Relodge state pseudo error.
1	FORCE_CANCEL_STATE	Force reply store to cancel

## KFA return codes

The KFAyynnn messages print status codes the framework agent component. The explanations for these codes are shown in [“KFAyynnn message status codes” on page 2421](#)

<i>Table 150: KFAyynnn message status codes</i>	
<b>Enumerated value displayed in the log file</b>	<b>Explanation</b>
1500	KO4PRB1_ACCESSLISTOPENERROR
1501	KO4PRB1_ACCESSLISTBROWSEERROR
1502	KO4PRB1_ACCESSLISTREADERROR
1503	KO4PRB1_ACCLISTENTRYNOTFOUND
1504	KO4PRB1_ACCLISTENTRYDELETESTATUS
1505	KO4PRB1_ACCLISTINDEXWRITEERROR
1506	KO4PRB1_ACCLISTINDEXREADERROR
1507	KO4PRB1_ACCLISTINDEXDELETEERROR
1508	KO4PRB1_COPYOBJALLOCERROR
1509	KO4PRB1_COPYOBJCOPYFERROR
1510	KO4PRB1_COPYOBJDUPLICATE
1511	KO4PRB1_COPYOBJINPUTOPENERROR
1512	KO4PRB1_COPYOBJOUTPUTOPENERROR
1513	KO4PRB1_COPYOBJREADERROR
1514	KO4PRB1_COPYOBJWRITEERROR
1515	KO4PRB1_ENTRYEXISTS
1516	KO4PRB1_IBLOGOPENERROR
1517	KO4PRB1_INDEXDELETEERROR
1518	KO4PRB1_INDEXNOTFOUND
1519	KO4PRB1_INDEXREADERROR
1520	KO4PRB1_INDEXWRITEERROR
1521	KO4PRB1_LOGFILEDELETEERROR
1522	KO4PRB1_LOGFILEREADERROR
1523	KO4PRB1_LOGFILEWRITEERROR
1524	KO4PRB1_LOGROPENERROR
1525	KO4PRB1_NOIBFILENAME
1526	KO4PRB1_NODECHANGE
1527	KO4PRB1_NODELISTBROWSEERROR
1528	KO4PRB1_NODELISTDELETEERROR
1529	KO4PRB1_NODELISTLOOP
1530	KO4PRB1_NODELISTOPENERROR
1531	KO4PRB1_NODELISTREADERROR
1532	KO4PRB1_NODENAMENOTFOUND
1533	KO4PRB1_NOLIBRARYPARMA
1534	KO4PRB1_PARMAERROR
1535	KO4PRB1_STATUSENTRYNOTFOUND

Enumerated value displayed in the log file	Explanation
1536	KO4PRB1_INDEXCREATEERROR
1537	KO4PRB1_NODELISTUPDATEERROR
1538	KO4PRB1_NODEFERREDONLINES
1539	KO4PRB1_ONLINE_NODE_DELETE
1540	KO4PRB1_NONLEAF_NODE_DELETE
1541	KO4PRB1_NO_THRUNODE_STATUS
1542	KO4PRB1_NODE_TIMED_OUT
1543	KO4PRB1_NO_PLEX_XCF_AREA
1544	KO4PRB1_LOGFILEFULL
1545	KO4PRB1_LOGFILEUPDATEERROR
1546	KO4PRB1_DUPLICATENODENAME
1547	KO4PRB1_NLSTRANSLATEERROR
1548	KO4PRB1_STALE_NODE_STATUS

## KMS return codes

The KMS messages print status codes related to historical data collection. These explanations for these codes are shown in [“KFAyynnn message status codes” on page 2422](#)

<i>Table 151: KFAyynnn message status codes</i>	
Enumerated value displayed in the log file	Explanation
3000	KMS_HistoryNotCollected
3001	KMS_History_File_IOError
3002	KMS_History_Internal_Error
3003	KMS_History_RemoteProbeNotSupported History view probe not supported
3004	KMS_PX_RemoteProbeNotSupported Requested probe-table not supported

## Privacy policy considerations

---

IBM® Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

Depending upon the configurations deployed, this Software Offering may use session cookies that collect each user’s user name for purposes of session management, authentication, and single sign-on configuration. These cookies can be disabled, but disabling them will also likely eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see [IBM Privacy Statement](https://www.ibm.com/privacy) (<https://www.ibm.com/privacy>).

LUGROUP field [1357](#)

## M

macro library [1322](#)

maintenance [823](#)

Maintenance procedure prefix field [1342](#)

### **maintenance scenarios**

- adding a new product to an existing RTE [209](#)
- apply maintenance to existing environment [818](#)
- base libraries for the sharing RTE, refreshing [490](#)
- configuring a newly added product [209](#)
- disabling configuration of a deleted product [852](#)
- effects of changing PARMGEN parameters [844](#)
- overriding the default storage limit [498](#)
- performing post-SMP/E maintenance steps [818](#)
- refreshing read-only base libraries [490](#)
- retaining KOB SUPDT security exits updates [492](#)
- storage limit, increasing the default [498](#)
- upgrading a product to an existing runtime environment [206](#)
- upgrading an OMEGAMON to a production RTE [206](#)
- using PARMGEN [839](#)

Major Node field [1282](#)

managed system group [1064](#)

### **managed system groups**

- predefined [1148](#)

Managed System Node (MSN) [1061](#), [1064](#)

Managed Systems List (MSL) [1061](#), [1064](#), [1065](#)

### **Managed Systems List (MSL)**

- creating using TEP [1066](#)
- naming convention [1065](#)

management of historical data [456](#)

Map Length field [1204](#)

map user ID [549](#)

master facility accessor identifier [541](#)

maximizing subpanels [920](#)

Maximum storage request size (extended) field [1410](#)

Maximum storage request size (primary) field [1410](#)

member [337](#)

member, \$JOB CARD [1250](#)

member, IKJTSONN [575](#)

members and jobs [474](#)

menu interface [160](#)

menus [908](#)

### **message logging**

- components [1519](#)
- defined [1519](#)
- destination [1519](#)
- log locations [2298](#)
- log locations**
  - z/OS components [1520](#)
- prefixes [1519](#)
- RKLVLOG [2298](#)
- RKLVSnap [2298](#)
- RKPDLOG [2298](#)

RKPDOUT [2298](#)

z/OS components [1520](#)

### **z/OS components**

- component identifier [1520](#)
- ETE [1520](#)
- message format [1520](#)
- message number [1520](#)
- severity [1520](#)
- TMS:Engine [1520](#)

messages [373](#), [1573](#)

### **messages**

- KFJ messages [373](#)
- KFU messages [391](#)
- KLVIN411 [1221](#)
- types [1519](#)

Mgmtclas field [1350](#), [1351](#)

Mid-level qualifier field [1332](#)

mid-level qualifiers [124](#)

MIGRATE action [237](#)

migrate to IPv6 [595](#), [601](#), [604](#)

MIGRPT sysout data set [275](#)

minimizing subpanels [920](#)

Minimum extended storage field [1274](#), [1411](#)

MINIMUM parameter [1411](#)

MINMAX keyword [1041](#)

missing data [534](#), [535](#)

mixed environment [171](#)

MODE keyword [1030](#)

MODE keyword (subpanel) [1041](#)

MODE parameter [1074](#)

modifying thresholds [963](#)

### **monitoring agent**

- advanced agent configuration values**
  - K\_AGT\_ICU\_LANGUAGE\_LOCALE [1267](#)
  - K\_AGT\_WTO\_MSG [1282](#)

### **monitoring agents**

- address space [145](#)
- address spaces [145](#)
- autonomous [146](#), [173](#)
- base [59](#)
- completing the configuration [522](#)
- configure using PARMGEN [467](#)
- defined [59](#)
- OMEGAMON [59](#)
- overview [56](#)
- packaging [67](#)
- stand-alone [145](#), [145](#)

monitoring components [330](#)

### **monitoring server**

- high-availability hub [458](#)
- hub**
  - high-availability [458](#)
- remote [461](#)

MSL [1065](#)

MULTI parameter [1076](#)

multi-factor authentication [1509](#)

multiple hub support [894](#)  
MUSASS started task [541](#)  
MVS MODIFY command [542](#)

## N

Name field [1340](#)  
NAME keyword [1041](#)  
names, parameter [1258](#)  
**naming**  
    backup historical data sets [1200](#)  
    data sets, [124](#)  
    jobs, [125](#)  
    members, JCL [125](#)  
    TEMS name [134](#)  
NAV1TEXT keyword [1030](#)  
NAV2TEXT keyword [1030](#)  
**navigation**  
    closing subpanels [921](#)  
    collapsing subpanels [920](#)  
    expanding subpanels [920](#)  
    fastpath [922](#)  
    maximizing [920](#)  
    minimizing [920](#)  
    paging [922](#)  
    scrolling [922](#)  
    selecting [918](#)  
    SHOWNAV command [923](#)  
    zooming [922](#)  
    Zooming [922](#)  
Navigation History option [923](#)  
navigator [1149](#), [1149](#)  
**navigator**  
    tour [1149](#)  
**near-term history**  
    application selection [933](#)  
    data collection configuration [933](#)  
    historical snapshot [931](#)  
    historical summary [929](#)  
    history time-span [932](#)  
Netcool/OMNIbus [140](#)

Parameters [278](#)

#### Parameters

different default values [292](#)  
for communication between servers [330](#)  
initial RTE [279](#)  
KFJ\_EMBEDS\_LIB [337](#)  
KFJ\_SYSNAME [314](#)  
KFJ\_USE\_EMBEDS [337](#)  
significant default values [291](#)  
spare parm tables [318](#)  
SYSNAME [314](#)  
use of variables [334](#)  
validation report [275](#)

parameters covered in this guide [1260](#)

parameters eligible to use symbolics [1247](#)

parameters eligible to use variables [1247](#)

parameters ineligible to use symbolics [1248](#)

parameters ineligible to use variables [1248](#)

parameters, overview [1257](#), [1257](#)

PARM\_BATCH batch parameter [1322](#)

#### PARMGEN

complete set up [475](#)

configuring a [457](#)

configuring an OMEGAMON enhanced 3270 user interface [466](#)  
 configuring OMEGAMON monitoring agents [467](#)  
 enable APF-authorization statements (Optional) [453](#)  
 enable self-describing agent feature [461](#)  
 maintenance scenarios [818](#), [818](#), [839](#)  
**maintenance scenarios**  
   adding a new product to an existing RTE [209](#)  
   base libraries for the sharing RTE, refreshing [490](#)  
   configuring a newly added product [209](#)  
   disabling configuration of a deleted product [852](#)  
   effect of changed parameters [844](#)  
   KOBSUPDT security exits [492](#)  
   overriding the default storage limit [498](#)  
   refreshing read-only base libraries [490](#)  
   retaining KOBSUPDT security exits updates [492](#)  
   storage limit, increasing the default [498](#)  
   upgrading a product to an existing runtime environment [206](#)  
   upgrading an OMEGAMON to a production RTE [206](#)  
 scenarios [612](#)  
**scenarios**  
   full runtime environment [646](#)  
   PGN06 [876](#)  
 submit batch jobs [475](#)  
 SYSTCPD DD statement [452](#)  
 update global parameters [468](#)  
 update global VTAM major node [453](#)  
 update TCP/IP port values [452](#)  
 update the HFS/zFS z/OS UNIX directory [453](#)  
 update user prolog (optional) [450](#)  
 upgrade scenarios [205](#)  
 verify products [451](#)  
 PARMGEN how-to instructions [612](#)  
 PARMGEN jobs, KCIJV\* [1246](#)  
**PARMGEN parameter names**

## V

Validate security field [1407](#)  
 Value field [919](#)  
 Variable Cols field [1204](#)  
 variable representation [1054](#)  
 variables [1054](#), [1054](#)  
**variables**  
   in parameter values [334](#)  
   user-defined [1057](#)  
 variables profile, customizing [438](#)  
 variables runtime processing [1246](#)  
 verify [1013](#), [1014](#), [1012](#), [1014](#)  
 verify hub configuration [523](#)  
 verifying the configuration [557](#)  
 viewing workspace source [975](#)  
**VIPA**  
   dynamic [147](#)  
   name [147](#)  
   requirements [147](#)  
 Virtual IP Address (VIPA) type field [1278](#)  
 Volser field [1352](#)  
**VSAM files**  
   control area splits [122](#)  
   fragmentation [122](#)  
   managing [122](#)  
   performance considerations [122](#)  
 VSAM high-level qualifier field [1381](#)  
 VSEPARATORS [1052](#)  
**VTAM**  
   logmode tables [1325](#)  
   macro library [1324](#)  
   VTAMLST library [1325](#)  
 VTAM applid for Alert Adapter field [1279](#)  
 VTAM load library field [1325](#)  
 VTAM macro library field [1324](#)  
 VTAM major node name field [1362](#)

**W**

Warehouse Proxy agent [56](#)  
 WCONFIG(%RTE\_NAME%) profile [415](#)  
**well-known port**  
   authorization [149](#)  
   changing [151](#)  
   default number [150](#)  
 what's new [14](#), [1129](#), [1508](#)  
 WHENDATA keywords [1052](#)  
 WHENNODATA keywords [1053](#)  
 WHENNOHEADER keyword [1030](#)  
 WHENNOTEXT keyword [1031](#)  
 where configured parameters are stored [1258](#)  
 WHEREAMI command [923](#)  
**Workflow Primary Option Menu**  
   Quick configuration mode [428](#)  
 Workflow user interface [414](#)  
**Workload Manager (WLM)**  
   started task settings [1254](#)  
**workspace**  
   refresh [1152](#)  
   tour [1149](#)  
 workspace customization [947](#)  
**workspace customization**  
   adjusting the filterable columns [957](#)  
   Allotted subpanel row count [960](#)  
   change a column caption and width [954](#)  
   change a workspace and subpanel header [951](#)  
   change the order of displayed columns [953](#)  
   customizing a workspace [950](#)  
   further workspace customization [960](#)  
   Local or agent filter definitions [960](#)  
   Number and order of workspace subpanels [960](#)  
   Number of columns displayed [960](#)  
   remove a subpanel [956](#)  
   Statically defined columns [960](#)  
   Workspace initial and refresh cursor position [960](#)  
   Workspace sort columns [960](#)  
**workspace keywords**  
   IMBED [1029](#)  
**workspace operations**  
   sorting data [918](#)  
 workspace panel definitions [1024](#)  
 Workspace source viewing [973](#)  
 workspace viewing and cloning [943](#)  
**workspace viewing and cloning**  
   customization [947](#)  
 workspaces [1077](#)  
**workspaces**  
   characteristics [1151](#)  
   overview [1151](#)  
   parts of [904](#)  
   predefined [1148](#)  
 WTO parameter [1436](#)

**X**

XF macro [426](#)  
**XTAG**  
   sense codes [2411](#)

**Z**

z/OS data set encryption [1239](#)  
 z/OS UNIX System Services [1360](#)
