                                                                      * 00001000
     STATUS = VERSION 7
                                                                       * 00001100
                                                                       * 00001200
  Function: Formats a given numeric amount with a specified currency \star 00001300
            symbol and, if specified, one of the following debit/
                                                                      * 00001400
            credit indicators.
                                                                      * 00001500
                                                                       * 00001600
            +/-: Place a hyphen between the currency symbol and the * 00001700 amount if the amount is less than 0. * 00001800
            (/): Place a left parenthesis between currency symbol
                                                                      * 00001900
                 and the amount and place a right parenthesis to the * 00002000
                 right of the amount if the amount is less than 0. * 00002100
          CR/DB: Place CR to the right of the amount if it is less
                                                                      * 00002200
                 than 0; otherwise place DB to the right of the
                                                                      * 00002300
                 amount.
                                                                      * 00002400
                                                                       * 00002500
            Example invocations:

EXEC SQL SET :money = CURRENCY( -123, "DM" );
            Example invocations:
                                                                      * 00002600
                                                                      * 00002700
                                                                      * 00002800
             ==> money = DM -123.00
                                                                      * 00002900
                                                                      * 00003000
                                                                      * 00003100

             => money = DM (123.00)
                                                                      * 00003500
                                                                      * 00003600
                                                                      * 00003700
* Notes:
   Dependencies: Requires IBM C/C++ for OS/390 V1R3 or higher
                                                                      * 00003800
                                                                       * 00003900
   Restrictions:
                                                                       * 00004000
                                                                      * 00004100
* Module type: C program
                                                                      * 00004200
   Processor: IBM C/C++ for OS/390 V1R3 or higher
                                                                      * 00004300
 Module size: See linkedit output
                                                                       * 00004400
   Attributes: Re-entrant and re-usable
                                                                       * 00004500
                                                                       * 00004600
```

```
Entry Point: DSN8DUCY
                                                                           * 00004700
    Purpose: See Function
                                                                             00004800
    Linkage: DB2SQL
                                                                             00004900
              Invoked via SQL UDF call
                                                                           * 00005000
                                                                           * 00005100
 Parameters: DSN8DUCY uses the C "main" argument convention of
                                                                           * 00005200
              argv (argument vector) and argc (argument count).
                                                                             00005300
                                                                           * 00005400
              The location of input and output parameters depends
                                                                           * 00005500
              on whether the CURRENCY UDF is invoked with two
                                                                           * 00005600
              input arguments (amount and currency symbol) or with
                                                                             00005700
              three input arguments (amount, currency symbol, and
                                                                           * 00005800
              credit/debit indicator).
                                                                           * 00005900
                                                                           * 00006000
              If the CURRENCY UDF is invoked with two arguments
                                                                           * 00006100
              only (an amount and a currency symbol):
                                                                           * 00006200
                          = (input) pointer to a char[9], null-
               - ARGV[0]
                                                                           * 00006300
                             terminated string having the name of
this program (DSN8DUCY)
                                                                           * 00006400
                                                                           * 00006500
              - ARGV[1]

   STATUS = VERSION 7
                                                                                              00160000
                                                                                              00190000
  Function: Returns the name or the schema name or the location name * 00250000
               of an alias according to the name of the UDF and the
                                                                                           * 00260000
               number of input parameters passed, as follows:
                                                                                           * 00270000
                                                                                           * 00280000
               TABLE_NAME( objectname )
                                                                                           * 00290000
                  returns the unqualified name of the object found after * 00300000
                  any alias chains have been resolved. The specified
                                                                                           * 00310000
                  object name, the default schema, and a location name
                                                                                           * 00320000
                  of "%" (for any location) are used as the starting point of the resolution. If the starting point does
                                                                                           * 00330000
                                                                                           * 00340000
                  not refer to an alias, the unqualified name of the * 00350000 starting point is returned. The resulting name may be * 00360000 + 00370000
                  of a table, view, or undefined object.
                                                                                           * 00370000
                                                                                           * 00380000
               TABLE_NAME( objectname, objectschema ) * 00390000 returns the unqualified name of the object found after * 00400000
                                                                                           * 00410000
                  any alias chains have been resolved. The specified
                  object name and schema, and a location name of "%"
                                                                                           * 00420000
                  (for any location), are used as the starting point of \star 00430 the resolution. If the starting point does not refer \star 00440 to an alias, the unqualified name of the starting \star 00450000
                                                                                          * 00430000
                                                                                           * 00440000
                  point is returned. The resulting name may be of a
                                                                                           * 00460000
                  table, view, or undefined object.
                                                                                           * 00470000
                                                                                           * 00480000
               TABLE_NAME( objectname, objectschema, objectlocation ) * 00490000 returns the unqualified name of the object found after * 00500000 any alias chains have been resolved. The specified * 00510000
                  object name, schema, and location name are used as the * 00520000
                  starting point of the resolution. If the starting * 00530000 point does not refer to an alias, the unqualified name * 00540000 of the starting point is returned. The resulting name * 00550000 may be of a table, view, or undefined object. * 00560000
                                                                                           * 00570000
               TABLE_SCHEMA( objectname ) returns the schema name of
                                                                                           * 00580000
                  the object found after any alias chains have been resolved. The specified object name, the default schema, and a location name of "%" (for any location)
                                                                                           * 00590000
                                                                                           * 00600000
                                                                                           * 00610000
                  are used as the starting point of the resolution. If
                                                                                           * 00620000
                  the starting point does not refer to an alias, the
                                                                                           * 00630000
                  schema name of the starting point is returned. The
                                                                                           * 00640000
                                                                                           * 00650000
                  resulting schema name may be of a table, view, or
                  undefined object.
                                                                                           * 00660000
                                                                                           * 00670000
               {\sf TABLE\_SCHEMA(\ objectname,\ objectschema\ )\ returns\ the}
                                                                                           * 00680000
                  schema name of the object found after any alias chains * 00690000 have been resolved. The specified object name and * 00700000 schema and a location name of "%" (for any location) * 00710000
                  are used as the starting point of the resolution. If
the starting point does not refer to an alias, the
                                                                                           * 00720000
                                                                                           * 00730000
                  schema name of the starting point is returned. The
                                                                                           * 00740000
                                                                                           * 00750000
                  resulting schema name may be of a table, view, or
                  undefined object.
                                                                                           * 00760000

"Sample applications in TSO" on page 1043

A set of Db2 sample applications run in the TSO environment.

DSN8DUWC

Invokes the sample UDF table function WEATHER to demon- strate how a UDF and UDF table handling using static SQL.

```
/***************************
* Module name = DSN8DUWC (DB2 sample program)
* DESCRIPTIVE NAME = Client for sample UDF table function WEATHER
    LICENSED MATERIALS - PROPERTY OF IBM
     5645-DB2
     (C) COPYRIGHT 1998 IBM CORP. ALL RIGHTS RESERVED.
     STATUS = VERSION 6
* Function: Invokes the sample UDF table function WEATHER to demon-
            strate how a UDF and UDF table handling using static SQL.*
* Notes:
   Dependencies: Requires IBM C/C++ for OS/390 V1R3 or higher
   Restrictions:
* Module type: C program
   Processor: IBM C/C++ for OS/390 V1R3 or higher
* Module size: See linkedit output
  Attributes: Re-entrant and re-usable
* Entry Point: DSN8DUWC
      Purpose: See Function
      Linkage: DB2SQL
               Invoked via SQL UDF call
   Parameters: DSN8DUWC uses the C "main" argument convention of
               argv (argument vector) and argc (argument count).
               - ARGV[0] = (input) pointer to a char[9], null-
                            terminated string having the name of
                            this program (DSN8DUWC)
               - ARGV[1] = (input) pointer to a char[45], null-
                            terminated string having the name of the *source data for the weather reports. *
  Normal Exit: Return Code: 0000
               - Message: none
   Error Exit: Return Code: 0008
               - Message: DSN8DUWC failed: Invalid parameter count
               - Message: <formatted SQL text from DSNTIAR>
     External References:
              - Routines/Services: DSNTIAR: DB2 msg text formatter
              - Data areas : None
              - Control blocks : None
   Pseudocode:
    DSN8DUWC:
    - Verify that 2 input parameters (program name and weather data
      set name) were passed.
      · if not, issue diagnostic message and end with code 0008
    - Open WEATHER_CURSOR, the client cursor for the WEATHER UDF
      table function, passing the weather data set name as a host
      variable
      - if unsuccessful, call sql_error to issue a diagnostic mes-
        sage, then end with code \overline{0008}.
    - Do while not end of cursor
      - Read the cursor
      - If successful, print the result
      - else if not end of cursor, call sql_error to issue a diag-
        nostic message, then end with code 0008.

A set of Db2 sample applications run in the TSO environment.

DSN8EUDN

Returns the day of the week (Monday through Sunday) on which a given date in ISO format (YYYY-MM-DD) falls.

```
STATUS = VERSION 7
Function: Returns the day of the week (Monday through Sunday) on which a given date in ISO format (YYYY-MM-DD) falls.
           Example invocation:
            EXEC SQL SET :dayname = DAYNAME( "2000-01-29" );
==> dayname = Tuesday
Notes:
  Dependencies: Requires IBM C/C++ for OS/390 V1R3 or higher
  Restrictions: Assumes the Gregorian calendar was adopted in September, 1752. Code modifications are required
                   to handle a different adoption date.
Module type: C++ program
Processor: IBM C/C++ for OS/390 V1R3 or higher Module size: See linkedit output
 Attributes: Re-entrant and re-usable
Entry Point: DSN8EUDN
    Purpose: See Function
    Linkage: DB2SQL
               Invoked via SQL UDF call
       Input: Parameters explicitly passed to this function:
                                : pointer to a char[11], null-termi-
               - *ISOdateIn
                                   nated string having a date in ISO
                                   format.
               - *niISOdateIn : pointer to a short integer having the null indicator variable for
                                   *ISOdateIn.
               - *fnName
                                 : pointer to a char[138], null-termi-
                                   nated string having the UDF family
               name of this function.
- *specificName: pointer to a char[129], null-termi-
                                   nated string having the UDF specific *
                                   name of this function.
      Output: Parameters explicitly passed by this function:
               - *dayNameOut : pointer to a char[10], null-termi-
                                   nated string to receive the dayname
                                   for ISOdateIn.

    *niDayNameOut: pointer to a short integer to receive the null indicator variable

                                   for *dayNameOut.
                                 : pointer to a char[06], null-termi- *
nated string to receive the SQLSTATE.*
                - *sqlstate
                                 : pointer to a char[70], null-termi-
               - *message
                                   nated string to receive a diagnostic *
                                   message if one is generated by this
                                   function.
Normal Exit: Return Code: SQLSTATE = 00000
                - Message: none
 Error Exit: Return Code: SQLSTATE = 38601
                Message: DSN8EUDN Error: No date entered
               Return Code: SQLSTATE = 38602
                - Message: DSN8EUDN Error: Input date not valid
                                               or not in ISO format"

              - Control blocks
 Pseudocode:
  DSN8EUDN:
    Verify that a date was passed in:
     - if *ISOdateIn blank or niISOdateIn is not 0, no date passed: *

    issue SQLSTATE 38601 and a diagnostic message.
    Use strptime to validate the entry

    if *ISOdateIn is not a valid ISO date:

       - issue SQLSTATE 38602 and a diagnostic message
```

```
- Parse out the year, month, and day
   - Compute the weekday number (0=Sunday, ..., 6=Saturday)
- Use strptime and strftime to convert the day number to the full weekday name of the current locale.
   End DSN8EUDN

"Sample applications in TSO" on page 1043

A set of Db2 sample applications run in the TSO environment.

DSN8EUMN

Returns the calendar name of the month name in which a given date in ISO format (YYYY-MM-DD) falls.

```
/*********************************
* Module name = DSN8EUMN (DB2 sample program)
* DESCRIPTIVE NAME = Query calendar month name (UDF)
* LICENSED MATERIALS - PROPERTY OF IBM
* 5675-DB2
* (C) COPYRIGHT 1998, 2000 IBM CORP. ALL RIGHTS RESERVED.
* STATUS = VERSTON 7
* Function: Returns the calendar name of the month name in
            which a given date in ISO format (YYYY-MM-DD) falls.
            Example invocation:
            EXEC SOL SET :monthname = MONTHNAME( "2000-01-29" );
             ==> monthname = January
   Dependencies: Requires IBM C/C++ for OS/390 V1R3 or higher
   Restrictions:
* Module type: C++ program
* Processor: IBM C/C++ for OS/390 V1R3 or higher
* Module size: See linkedit output
```

```
Attributes: Re-entrant and re-usable
  Entry Point: DSN8EUMN
Purpose: See Function
      Linkage: DB2SQL
                Invoked via SQL UDF call
        Input: Parameters explicitly passed to this function:
    - *ISOdateIn : pointer to a char[11], null-termi-
                                   nated string having a date in ISO
                                   format.
                - *niISOdateIn : pointer to a short integer having
                                   the null indicator variable for
                                   *ISOdateIn.
                - *fnName
                                 : pointer to a char[138], null-termi-
                                   nated string having the UDF family
                                   name of this function.
                - *specificName: pointer to a char[129], null-termi-
                                   nated string having the UDF specific *
                                   name of this function.
       Output: Parameters explicitly passed by this function:
- *monthNameOut: pointer to a char[10], null-termi-
                                   nated string to receive the month-
                                   name for ISOdateIn.
                - *niMonthNameOut: pointer to a short integer to re-
                                   ceive the null indicator variable
                                   for *monthNameOut.
                - *sqlstate
                                 : pointer to a char[06], null-termi-
                                 nated string to receive the SQLSTATE.*: pointer to a char[70], null-termi- *
                - *message
                                   nated string to receive a diagnostic *
                                   message if one is generated by this
                                   function.
  Normal Exit: Return Code: SQLSTATE = 00000
                - Message: none
   Error Exit: Return Code: SQLSTATE = 38601
                  Message: DSN8EUMN Error: No date entered

       - Extract the employee serial from this record
    - Call openBMPfile to open the data set associated with
      DD BMPINnn
    - Call getBMPrec to read the first record of the data set
    - Call primeBLOBcols to:
(a) UPDATE the PSEG_PHOTO and BMP_PHOTO columns of the
           employee's row in the EMP_PHOTO_RESUME table with the
      contents of these first records
(b) SELECT the PSEG_PHOTO and BMP_PHOTO columns back into
           BLOB locators
    - Call getPSEGrec to read the next record from the PSEGINnn DD *
    - Do while not end of file for the PSEGINnn DD
        Call buildPSEGcol to append the current PSEGINnn record to *
         the PSEG BLOB locator
    - Call getPSEGrec to read the next record from PSEGINnn
- Call getBMPrec to read the next record from the BMPINnn DD
    - Do while not end of file for the BMPINnn DD
        Call buildBMPcol to append the current BMPINnn record to
         the BMP BLOB locator
    - Call getBMPrec to read the next record from BMPINnn
- Call updateBLOBcols to apply the BLOB locators to the PSEG_PHOTO and BMP_PHOTO columns of the employee's row in
       the EMP_PHOTO_RESUME table
    - If all went well, call commitWorkUnit to commit the changes
    - Else call rollbackWorkUnit to roll back the changes
    - Print a status line
    - Close the PSEGINnn and BMPINnn DD's
    - Increment DD counter (nn) by 1.
If an SQL error occurs, invoke the sql_error routine to gener-
    ate and display message text
  End DSN8DLPL
  openPSEGfile:
  - Open the data set associated with the PSEGINnn DD
  - If the open fails, set validDD to false
  End openPSEGfile

"Sample applications in TSO" on page 1043

A set of Db2 sample applications run in the TSO environment.

DSN8DLRV

Prompts the user to choose an employee, then retrieves the resume data for that employee from the RESUME (CLOB) column of the EMP_PHOTO_RESUME table into a CLOB locator, uses LOB locator-handling functions to locate and break out data elements, and puts them in fields for display by ISPF.

```
/**********************************
* Module name = DSN8DLRV (DB2 sample program)
* DESCRIPTIVE NAME = Display the resume of a specified employee
  LICENSED MATERIALS - PROPERTY OF IBM
   5675-DB2
   (C) COPYRIGHT 1982, 2000 IBM CORP. ALL RIGHTS RESERVED.
   STATUS = VERSION 7
 Function: Prompts the user to choose an employee, then retrieves * the resume data for that employee from the RESUME (CLOB) * column of the EMP_PHOTO_RESUME table into a CLOB locator,*
            uses LOB locator-handling functions to locate and break
            out data elements, and puts them in fields for display
            by ISPF.
* Notes:

"Sample applications in TSO" on page 1043

A set of Db2 sample applications run in the TSO environment.

DSN8DLPV

Prompts the user to choose an employee, then retrieves the PSEG photo image for that employee from the PSEG_- PHOTO column of the EMP_PHOTO_RESUME table and passes it to GDDM for formatting and display.

```
to GDDM for formatting and display.
* Notes:
    Dependencies: Requires IBM C/C++ for OS/390 V1R3 or higher
                  Requires IBM Graphical Data Display Manager (GDDM)
                  V3R1 or higher
   Restrictions:
* Module type: C program
* Processor: IBM C/C++ for OS/390 V1R3 or subsequent release
* Module size: See linkedit output
  Attributes: Re-entrant and re-usable
* Entry Point: CEESTART (Language Environment entry point)
* Purpose: See Function
      Linkage: Standard MVS program invocation, no parameters
  Normal Exit: Return Code = 0000
               - Message: none
  Error Exit: Return Code = 0008
               - Message: *** ERROR: DSN8DLPV DB2 Sample Program

        STATUS = Version 12
//*
//*
//*
     Function = This JCL creates a sample application, DSN8EC1, that
                   demonstrates a DB2 stored procedure for IMS ODBA.
                   DSN8EC1 can be used to insert, retrieve, update, and delete rows in the IMS IVP telephone directory
//*
//*
//*
                   database, DFSIVD1.
                   DSN8EC1 has one input-only parm, five input/output
                   parms, and three output-only parms.
//*
                   - Input only:
//*
//*
                      (1) TDBCTLID : ID of IMS subsystem where data resides
                   - Input/Output:
                     (2) COMMAND
                                       : Action to be taken, or action taken
//*
//*
                          - ADD: Add an entry
- DEL: Delete an entry
//*
//*
                          - DIS: Retrieve an entry
- UPD: Update an entry
                     (3) LAST_NAME : Operand for, or result of, COMMAND
(4) FIRST_NAME: " " " " "
                                                    п
                      (5) EXTENSION:
                                                    п
                      (6) ZIP-CODE
                   - Output only:
                     (7) AIBRETRN : Return code from IMS AIB
(8) AIBREASN : Reason code from IMS AIB
(9) ERROR-CALL: DL/I command executed
//*
//*
     Dependencies:
//*
//*
     (1) Run this job at the server site before running sample job
DSNTEJ62 at the client site
//*
//*
     (2) The server site must have an IMS subsystem running IMS/ESA V6
          or a subsequent release
//*
      (3) This IMS subsystem must have the following IMS IVP parts
//*
//*
          available
          (A) DFSIVD1, the IMS IVP telephone directory database(B) DFSIVP64, the IMS IVP Cobol PSB for BMP access to DFSIVD1
     (4) Specify the id for this IMS subsystem in DB2 sample job
DSNTEJ62, step PH062S03
      (5) The server site must also have a WLM environment started by
          a proc that references the IMS reslib in both the STEPLIB DD and the DFSRESLB DD. See the DB2 Installation Guide for more
//*
          information.
     (6) Before running this job, verify that this WLM environment is
the one specified in the CREATE PROCEDURE statement in step
//*
//*
          PH061S01.

"Sample applications in TSO" on page 1043
A set of Db2 sample applications run in the TSO environment.

DSNTEJ62

This JCL prepares and executes a sample application program, DSN8EC2, that demonstrates how to call a Db2 stored procedure for IMS ODBA.

```
//**********************
//* Name = DSNTEJ62
//*
//*
//*
    Descriptive Name = DB2 Sample Application
                         Phase 6
//*
//*
//*
                         Sample Client: Stored procedure for IMS ODBA
                         Cobol Language
       LICENSED MATERIALS - PROPERTY OF IBM
//*
       5650-DB2
//*
//*
       (C) COPYRIGHT 1982, 2016 IBM Corp. All Rights Reserved.
//*
       STATUS = Version 12
     Function = This JCL prepares and executes a sample application
//*
//*
                program, DSN8EC2, that demonstrates how to call a DB2 stored procedure for IMS ODBA. The results are
                directed to the SYSOUT DD.
//*
//*
//*
                DSN8EC2 accepts a runtime parameter in step PH062S03
                that specifies -both- the DB2 server location name
                where the stored procedure is registered -and- the id
                of the IMS subsystem where the ODBA activity is to
                occur. You must modify this job to provide the IMS subsystem id. See step PH062S03 for details.
//*
//*
     Dependencies:
    (1) Run sample job DSNTEJ61 at the server site before running this
//*
//*
         job; DSNTEJ61 prepares the sample stored proc for IMS ODBA
     (2) Modify this job as directed in step PH062S03
     (3) Run this job at the client site
//*
//*
//*
    Change activity =
       08/18/2014 Single-phase migration
                                                      s21938 inst1 s21938

//*
//*
     Function =
       This JCL prepares and executes DSN8ED3, a sample caller for the
//*
//*
//*
       sample SQL procedure DSN8ES1. DSN8ED3 passes a sample department number to DSN8ES1, then processes what is returned:

    Parameters containing:

         - The total earnings (salaries and bonuses) of employees in
//*
           that department
//*
//*
       - The number of employees who got a bonus
- A result set containing a row of data (serial no, first and
//*
         last name, salary, and bonus) for each employee who got a
//*
//*
//*
//*
     Pseudocode = PH064S01 Step
                           Prepare DSN8ED3 load module from DSN8ED3 src
//*
       PH064S02 Step
                           Bind DSN8ED3 package in collection DSN8ED!!
                           Bind DSN8ED3 plan from DSN8ED!! and DSN8ES!! collection ids
//*
//*
//*
//*
       PH064S03 Step
                           Run DSN8ED3 to call stored procedure DSN8ES1
//*
    Dependencies =
//*
//*
//*
     (1) Run sample job DSNTEJ63 prior to running this job
     (2) This job requires the DB2-provided JCL procedure DSNHC

"Sample applications in TSO" on page 1043

A set of Db2 sample applications run in the TSO environment.

DSNTEJ6W

This JCL does the following.

```
//*
//*
        DB2 Sample Application
        Phase 6
//*
        Sample caller for Stored Procedure WLM_REFRESH
        IBM C/C++ for z/OS
//*
        Licensed Materials - Property of IBM
        (C) COPYRIGHT 1982, 2016 IBM Corp. All Rights Reserved.
        STATUS = Version 12
//*
//*
        This JCL does the following:
        * Prepares and executes DSN8ED6, a sample caller of the WLM_REFRESH stored procedure. WLM_REFRESH refreshes a
//*
//*
//*
          WLM environment specified as an input parameter using an
          authorization ID also specified as an input parameter. The
          authorization ID must have READ access on a resource profile
//*
//*
          called !DSN!.WLM_REFRESH.!WLMENV!
Use job DSNTIJRA job step DSNTWR to create and permit access
//*
          to this resource profile.
        * Optional: Prepares DSNTWR and DSNTWRE, external modules for
          WLM_REFRESH. These modules are provided in SDSNLOAD so
//*
//*
          preparing them is required only if you maintain a customized copy of DSNTWRS, the sample source code for DSNTWR, or
//*
          DSNTWRE, the sample source code for DSNTWRE.
//*
//*
//*
     Pseudocode =
                             Optional: Prepare DSNTWRE, a program for
        PH06WS00 Step
                              getting the DB2 Environment Info Block (EIB)
                              -> Uncomment and run this step if you want to
                                 override the DB2-supplied DSNTWRE module
                             Optional: Prepare DSNTWR, the external module
        PH06WS01 Step
//*
//*
                             for SYSPROC.WLM_REFRESH
                             -> Uncomment and run this step if you want to override the DB2-supplied DSNTWR module
//*
        PH06WS02 Step
                             Optional: Bind the package for DSNTWR
```

```
-> Uncomment and run this step only if you
                              also uncomment and run the step PH06WS01
//*
//*
       PH06WS03 Step
                           Prepare DSN8ED6
       PH06WS04 Step
                           Bind the plan and package for DSN8ED6
//*
//*
       PH06WS05 Step
                           Invoke DSN8ED6
     Dependencies =
//*
//*
     (1) This job requires the DB2-provided JCL procedures DSNHASM and
DSNHC
      (2) Run this job only after running jobs DSNTIJTM and DSNTIJRT
         The DSN8ED6 program receives parameters that contain the name
//*
         of the WLM environment to be refreshed and the authorization
//*
//*
         ID to be used for the request. The authorization ID must have
         READ access an a resource profile called
            !DSN!.WLM_REFRESH.!WLMENV!
         Use job DSNTIJRA job step DSNTWR to create and permit access
//*
         to this resource profile.
//*
//*

"Sample applications in TSO" on page 1043

A set of Db2 sample applications run in the TSO environment.

DSNTEJ66

This JCL does the following.

```
//****************************
//* Name = DSNTEJ66
//*
    Descriptive Name = DB2 Sample Application - Native SQL Procedure
//*
//*
                        Phase 6
//*
//*
      Licensed Materials - Property of IBM
//*
//*
      5650-DB2
       (C) COPYRIGHT 2006, 2016 IBM Corp. All Rights Reserved.
//*
//*
      STATUS = Version 12
//*
//*
//*
    Function = This JCL does the following:
                - Creates a sample native SQL procedure called
//*
                  DSN8.DSN8ES3 that generates and returns (by result
                  set) a CREATE PROCEDURE statement for a given stored
//*
//*
                  procedure.
                - Prepares and executes a sample caller of DSN8ES3 called DSN8ED9.
                - Shows how to use ALTER PROCEDURE ... ADD VERSION to
                  create a version V2 of DSN8ES3 that does the same
                  thing as the original version but also adds a
//*
                  terminating semicolon at the end of the generated
                  CREATE PROCEDURE statement
//*
                - Shows how to ALTER ACTIVATE version V2 to make it
                  the active version of DSN8ES3
```

```
//*
                 - Shows how to DEPLOY DSN8ES3 at a remote site
//*
//*
//*
     Restrictions =
       As part of the setup to DEPLOY DSN8ES3, the DSNTEP2 application
//*
//*
       needs to be able to connect to the remote site.
//*
     Notice =
//*
//*
     Pseudocode =
//*
//*
       PH066S01 Step
                           Drop objects created by prior runs of this job
       PH066S02 Step
                           Create the global temporary table for
//*
                           DSN8.DSN8ES3
//*
//*
                           Prepare DSN8ES3 as a native SQL procedure
       PH066S03 Step
                            -> Also generates a package called
                              DSN8.DSN8ES3
       PH066S04 Step
                           Prepare DSN8ED9, sample caller for the DSN8ES3
//*
                           SQL proc
                           Bind the plan for DSN8ED9
Execute DSN8ED9 to request a CREATE PROC
//*
//*
       PH066S05 Step
       PH066S06 Step
//*
                           statement for the stored procedure
                           SYSPROC.DSNUTILS
       PH066S07 Step
                           Create a work copy of the DSN8ES3 source code
//*
//*
                           Use TSO edit to modify the work copy into an ALTER PROCEDURE that will make a trivial
       PH066S08 Step
                           change to DSN8ES3 as VERSION V2
                            -> The generated CREATE PROC statement will be
//*
                              terminated by a semicolon
//*
//*
       PH066S09 Step
                           Save the work copy as DSN8ES3 in DSN!!0.NEW.SDSNSAMP
//*
       PH066S10 Step
                           Process the ALTER PROCEDURE DSN8ES3 to ADD
//*
//*
                           VERSION V2
                           -> Also generates a package called
    DSN8.DSN8ES3 (VERSION V2)
//*
//*
//*
       PH066S11 Step
                           Activate V2 as the current version of DSN8ES3
       PH066S12 Step
                           Execute DSN8ED9 to request a CREATE PROC
//*
//*
                           statement for SYSPROC.DSNUTILU
-> When using DSN8ES3 V2, it's terminated by a
//*
//*
                           semicolon
       PH066S13 Step
                           Setup to DEPLOY DSN8ES3: Create a global
                           temporary table on the remote server
//*
//*
                           -> To rerun this step, uncomment the DROP
                              and COMMIT statements
//*
                           DEPLOY DSN8ES3 on the remote server
       PH066S14 Step
       PH066S15 Step
                           Bind the plan for DSN8ED9 on the remote server
       PH066S16 Step
                           Execute DSN8ED9 to request a CREATE PROC
//*
//*
                           statement for SYSPROC.DSNUTILS at the remote
                           site

//*
//*
       STATUS = VERSION 12
//*
     FUNCTION = PREPARES AND RUNS THE FOLLOWING PROGRAMS IN SUPPORT
                OF THE DB2 LOB SAMPLE C APPLICATION:
- DSN8DLPL: POPULATES THE PSG AND BMP IMAGE COLUMNS
IN THE DSN8!!0.EMP_PHOTO_RESUME SAMPLE LOB
//*
//*
//*
//*
                                     THE INPUT DATA IS READ FROM A TSO
                              TABLE.
                              DATA SET. THIS PROGRAM DEMONSTRATES HOW
                              TO POPULATE LOB COLUMNS WITH MORE THAN 32
                              KB OF DATA.
                 - DSN8DLTC: VALIDATES THE CONTENTS OF THE LOB COLUMNS
                             IN THE DSN8!!O.EMP PHOTO RESUME TABLE.
//*
//*
                              THIS IS DONE BY COMPARING THE DATA IN THE
                             TABLE TO THE SOURCE DATA SETS.

Sample applications in IMS

A set of Db2 sample applications run in the IMS environment.

Table 183. Sample Db2 applications for IMS

Application	Program name	JCL member name	Description
Organization	DSN8IC0 DSN8IC1 DSN8IC2	DSNTEJ4C	IMS COBOL Organization Application
Organization	DSN8IP0 DSN8IP1 DSN8IP2	DSNTEJ4P	IMS PL/I Organization Application
Project	DSN8IP6 DSN8IP7 DSN8IP8	DSNTEJ4P	IMS PL/I Project Application
Phone	DSN8IP3	DSNTEJ4P	IMS PL/I Phone Application. This program lists employee telephone numbers and updates them if requested.

Related reference

Data sets that the precompiler uses

When you invoke the precompiler you need to provide data sets that contain input for the precompiler, such as the host programming statements and SQL statements. You also need to provide data sets where the precompiler can store its output, such as the modified source code and diagnostics messages.

DSN8ICO

THIS MODULE RECEIVES AN INPUT MESSAGE AND DEFORMATS IT, CALLS DSN8IC1, FORMATS OUTPUT MESSAGE AND SENDS IT.

"Sample applications in IMS" on page 1363

A set of Db2 sample applications run in the IMS environment.

Sample applications in CICS

A set of Db2 sample applications run in the CICS environment.

Table 184. Sample Db2 applications for CICS

Application	Program name	JCL member name	Description
Organization	DSN8CC0 DSN8CC1 DSN8CC2	DSNTEJ5C	CICS COBOL Organization Application
Organization	DSN8CP0 DSN8CP1 DSN8CP2	DSNTEJ5P	CICS PL/I Organization Application
Project	DSN8CP6 DSN8CP7 DSN8CP8	DSNTEJ5P	CICS PL/I Project Application
Phone	DSN8CP3	DSNTEJ5P	CICS PL/I Phone Application. This program lists employee telephone numbers and updates them if requested.

Related reference

Data sets that the precompiler uses

When you invoke the precompiler you need to provide data sets that contain input for the precompiler, such as the host programming statements and SQL statements. You also need to provide data sets where the precompiler can store its output, such as the modified source code and diagnostics messages.

DSN8CC0

THIS MODULE ISSUES CICS RECEIVE MAP TO RETRIEVE INPUT, CALLS DSN8CC1, AND ISSUE CICS SEND MAP AFTER RETURNING.

```
FUNCTION = THIS MODULE ISSUES CICS RECEIVE MAP TO RETRIEVE
                INPUT, CALLS DSN8CC1, AND ISSUE CICS SEND MAP
                AFTER RETURNING.
   NOTES =
        1. THIS IS A CICS PSEUDO CONVERSATION PROGRAM WHICH
           INITIALIZES ITSELF WHEN A TERMINAL OPERATOR ENTERS INPUT AFTER VIEWING THE SCREEN SENT BY PREVIOUS
           ITERATIONS OF THE PROGRAM.
       DEPENDENCIES = TWO CICS MAPS(DSECTS) ARE REQUIRED:
                                DSN8MCMG AND DSN8MCMD
                      MODULE DSN8CC1 IS REQUIRED.

"Sample applications in CICS" on page 1409

A set of Db2 sample applications run in the CICS environment.

DSNTEJ5P

THIS JCL PERFORMS THE PHASE 5 SETUP FOR THE SAMPLE APPLICATIONS AT SITES WITH PL/I.

Programming interface information

This information is intended to help you to write programs that contain SQL statements. This information primarily documents General-use Programming Interface and Associated Guidance Information provided by Db2 12 for z/OS. However, this information also documents Product-sensitive Programming Interface and Associated Guidance Information provided by Db2 12 for z/OS.

General-use Programming Interface and Associated Guidance Information

General-use Programming Interfaces allow the customer to write programs that obtain the services of Db2 12 for z/OS.

Product-sensitive Programming Interface and Associated Guidance Information

Product-sensitive Programming Interfaces allow the customer installation to perform tasks such as diagnosing, modifying, monitoring, repairing, tailoring, or tuning of this IBM software product. Use of such interfaces creates dependencies on the detailed design or implementation of the IBM software product. Product-sensitive Programming Interfaces should be used only for these specialized purposes. Because of their dependencies on detailed design and implementation, it is to be expected that programs written to such interfaces may need to be changed in order to run with new product releases or versions, or as a result of service.

Product-sensitive Programming Interface and Associated Guidance Information is identified where it occurs by the following markings:

PSPI Product-sensitive Programming Interface and Associated Guidance Information... PSPI

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered marks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at "Copyright and trademark information" at: http://www.ibm.com/legal/copytrade.shtml.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Terms and conditions for product documentation

Permissions for the use of these publications are granted subject to the following terms and conditions:

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Personal use: You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

Commercial use: You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights: Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek

your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Statement at http://www.ibm.com/privacy.

Glossary

The glossary is available in IBM Documentation

For definitions of Db2 for z/OS terms, see Db2 glossary (Db2 Glossary).

Index

Special Characters	application program (continued) checking success of SQL statements 477
_ (underscore)	coding SQL statements
assembler host variable 554	data entry 334
'(apostrophe)	dynamic SQL 499, 503
string delimiter precompiler option 872	selecting rows using a cursor 403
<u> </u>	design considerations
Numerics	checkpoint 451
Numerics	IMS calls 451
31-bit addressing 942	programming for DL/I batch 451
<u> </u>	SQL statements 451
Δ.	structure 956
A	synchronization call abends <u>451</u>
abend	using ISPF (interactive system productivity facility)
effect on cursor position 406	<u>851</u>
for synchronization calls 451	XRST call <u>451</u>
IMS	duplicate CALL statements 768
U0102 961	external stored procedures 227
	object extensions <u>172</u>
system X"04E" 451	preparation
	assembling 883
abend recovery routine in CAF 43	binding 884
