IP address: *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket***.**

Explanation

An incoming client request could not be processed because an unexpected error occurred when obtaining storage to process the request.

System action

An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

You need assistance from IBM to resove this problem.

Module:
DFHRPMS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *eibresp*
6. *eibresp2*

14. *socket*

Destination

CRPO

DFHRP0639   *date time applid tranid* **The CICS ONC RPC server controller received an incorrect response on a call made to CICS.**

Explanation

The server controller has received a response that indicates a logic error while calling CICS to establish its initialization information.

System action

The server controller abends with abend code ARP2. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

You need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHRPAS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CRPO

DFHRP0640	*date time applid tranid* **The CICS ONC RPC server controller has been started incorrectly.**

Explanation

The server controller transaction CRPM has been started by a means other than the connection manager program, possibly by a user at a terminal.

System action

The server controller abends with abend code ARP5.

User response

Check that the CRPM transaction id was not entered by a terminal user.

Module:
DFHRPMS

XMEOUT parameters/Message inserts

1. *date*

2. *time*
3. *applid*
4. *tranid*

Destination

CRPO

DFHRP0663	*date time applid tranid* **The CICS ONC RPC server controller could not start alias transaction** *alias_tranid*. **Host IP address:** *hostaddr* **Program:** *prognum* **Version:** *versnum* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket* **Client IP address:** *clientaddr*

Explanation

An internal error has prevented the server controller from starting the alias transaction.

System action

An **svcerr_systemerr** call is used to send a reply to the client.

User response

You need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHRPMS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *alias_tranid*
6. *hostaddr*

10. *port*
11. *socket*
12. *clientaddr*

Destination

CRPO

DFHRP0686	*date time applid tranid* **The CICS ONC RPC server controller encountered an internal error while attempting to start an alias transaction. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket*.

Explanation

An internal error has prevented the server controller from starting an alias transaction.

System action

A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

You need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module:
DFHRPMS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *clientaddr*
6. *hostaddr*
7. *X'prognum'*
8. *X'versnum'*
9. *X'procnum'*
10. *protocol*
11. *port*
12. *socket*

Destination

CRPO

DFHRP0687	*date time applid tranid* **The CICS ONC RPC server controller could not start alias transaction** *alias_tranid* **because the CICS default temporary storage data set is full. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket*.

Explanation

The server controller cannot start the alias transaction because temporary storage is not available.

System action

A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Determine why the CICS default temporary storage data set is full. Enlarge the data set, or alter your CICS load to free space on it.

Module:
DFHRPMS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *alias_tranid*
6. *clientaddr*
7. *hostaddr*

10. *X'procnum'*
11. *protocol*
12. *port*
13. *socket*

Destination

CRPO

DFHRP0688	*date time applid tranid* **The CICS ONC RPC server controller detected an error while starting alias transaction *alias_tranid*. The error indicated that the transaction is remote. Client IP address: *clientaddr* Host IP address: *hostaddr* Program: *X'prognum'* Version: *X'versnum'* Procedure: *X'procnum'* Protocol: *protocol* Port: *port* Socket: *socket*.**

Explanation

The alias transaction is defined as remote, but aliases must run in the same CICS region as CICS ONC RPC.

System action

A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Define the alias as a local transaction.

Module:
DFHRPMS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *alias_tranid*
6. *clientaddr*
7. *hostaddr*
8. *X'prognum'*
9. *X'versnum'*

11. *protocol*
12. *port*
13. *socket*

Destination

CRPO

DFHRP0689	*date time applid tranid* **The CICS ONC RPC server controller tried to start alias transaction *alias-tranid*, but the surrogate user security check failed. Client IP address: *clientaddr* Host IP address: *hostaddr* Program: *X'prognum'* Version: *X'versnum'* Procedure: *X'procnum'* Protocol: *protocol* Port: *port* Socket: *socket*.**

Explanation

An attempt by a user ID to access an alias transaction failed because of a security check. This may not be an error as you may wish to prevent the client involved from accessing the alias transaction.

System action

An **svcerr_auth** call with a why-value of AUTH_TOOWEAK is used to send a reply to the client.

User response

If you wish the user ID to access the alias, reenable CICS ONC RPC with a different value for CRPM Userid, or alter your surrogate user ID tables.

Module:
DFHRPMS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *alias-tranid*
6. *clientaddr*
7. *hostaddr*

9. *X'versnum'*
10. *X'procnum'*
11. *protocol*
12. *port*
13. *socket*

Destination

CRPO

DFHRP0690	*date time applid tranid* **The CICS ONC RPC server controller received an unexpected response**

from CICS while starting alias transaction *alias-tranid*. **Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket*.

Explanation

A client request has failed because of an error in CICS.

System action

A system dump is taken. An **svcerr_systemerr** call is used to send a reply to the client. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

See the associated diagnostics issued by CICS for problem determination.

Module:
DFHRPMS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *alias-tranid*
6. *clientaddr*
7. *hostaddr*
8. *X'prognum'*
9. *X'versnum'*
10. *X'procnum'*
11. *protocol*
12. *port*
13. *socket*

Destination

CRPO

DFHRP0691   *date time applid tranid* **The CICS ONC RPC server controller found that the user ID attempting to access alias transaction *alias-tranid* is not known to the external security manager. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:**

X'prognum' **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket*.

Explanation

The server controller could not start the alias with the user ID because the user ID is not known to the external security manager.

System action

An **svcerr_auth** call with a why-value of AUTH_TOOWEAK is used to send a reply to the client.

User response

If you wish the alias to run under this user ID, define the userid to the external security manager, and change your surrogate user ID tables.

Module:
DFHRPMS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *alias-tranid*
6. *clientaddr*
7. *hostaddr*
8. *X'prognum'*
9. *X'versnum'*
10. *X'procnum'*
11. *protocol*
12. *port*
13. *socket*

Destination

CRPO

DFHRP0692   *date time applid tranid* **The CICS ONC RPC server controller found that the external security manager cannot validate the user ID for alias transaction *alias-tranid*. Client IP address:** *clientaddr* **Host IP address:** *hostaddr* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol* **Port:** *port* **Socket:** *socket*.

Explanation

An attempt to start the alias with an alias user ID failed as the external security manager cannot determine whether the user ID is valid.

System action

An **svcerr_systemerr** call is used to send a reply to the client.

User response

Determine the reason why the external security manager was unable to perform the request.

Module:
DFHRPMS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *alias-tranid*

3. *applid*
4. *tranid*

Destination

CRPO

DFHRP0724   *date time applid tranid* **The CICS ONC RPC server controller has detected an error when attempting to issue a FREEMAIN for the RPC caller program.**

Explanation

During CICS ONC RPC disable processing, the server controller issues a FREEMAIN for the RPC caller program to remove it from storage, but received an error response. This could either be as a result of problems with CICS which will probably be reflected in CICS diagnostics, or as a result of problems with CICS ONC RPC, which will probably be reflected in other CICS ONC RPC diagnostics.

System action

Disable processing continues.

User response

It might not be possible to reenable CICS ONC RPC without restarting CICS. If the problem is not a symptom of a wider problem, you need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CRPO

DFHRP0726   *date time applid tranid* **During disable processing, the CICS ONC RPC server controller found that the task-related user exit was already disabled.**

Explanation

During disable processing, the server controller found that the task-related user exit was already disabled or that it has not been defined as an exit. This is probably the result of operator intervention.

System action

Disable processing continues.

User response

Take steps to prevent operator interference with the task-related user exit.

Module:
DFHRPMS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CRPO

DFHRP0727   *date time applid tranid* **During disable processing, the CICS ONC RPC server controller found that**

the task-related user exit is in use by another task.

Explanation

During disable processing, the server controller found that the task-related user exit is currently invoked by another task. This may be a temporary condition, or it may be that the task related user exit has already been disabled.

System action

Disable processing continues.

User response

Investigate whether the operator has disabled the task related user exit DFHRPTRU for any reason.

Module:
DFHRPMS

DFHRP1501　　*date time applid tranid* **The value entered in field *fieldname* exceeds the maximum allowed.**

Explanation

The value entered on a connection manager panel in field *fieldname* exceeds the maximum allowed.

System action

The panel is redisplayed and the field in error is highlighted.

User response

Enter valid data in the field indicated. See the CICS documentation for further guidance.

Module:
DFHRPC0B

Destination

Terminal End User

DFHRP1505　　*date time applid tranid* **The CICS ONC RPC connection manager has not been started correctly.**

Explanation

The connection manager has been started from a non-BMS terminal but is not being used to enable or disable CICS ONC RPC.

System action

The connection manager terminates.

User response

The connection manager can be used as follows from a non-BMS terminal:

- If CICS ONC RPC is disabled, the connection manager can be used for automatic enable, either by setting automatic enable to YES on the CICS ONC RPC data set or by entering a fast path command with YES for automatic enable.
- If CICS ONC RPC is enabled, the connection manager can be used for disable by entering a valid disable fast path command.

See the CICS documentation for guidance on how to start the connection manager.

CRPO

DFHRP1510	*date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename*. **EIBRESP:** *eibresp*.

Explanation

The connection manager could not access the CICS ONC RPC data set, CICS file *filename*. An EXEC CICS READ was issued, but received the response *eibresp*. The data set has not been correctly defined to CICS for one of the following reasons:

- No file definition has been found for *filename*. CICS ONC RPC has therefore not been installed correctly.
- READ operations are not allowed on the file.
- The file is DISABLED, either due to an incorrect file definition, or due to operator intervention.
- The file cannot be opened because it has not been defined correctly, or because it has been closed by operator intervention.
- The connection manager transaction, or the user running it, does not have the necessary level of authority to access the file.

System action

The requested operation is not performed.

User response

Use Appendix A of the CICS Application development reference manual to find out what the EIBRESP value means, and take appropriate action.

Module:
DFHRPC09

Destination

CRPO

DFHRP1511	*date time applid tranid* **The CICS ONC RPC connection manager has detected a logic error accessing the CICS ONC RPC data set, CICS file** *filename*.

Explanation

The connection manager received an unexpected error when accessing the CICS ONC RPC data set, CICS file *filename*. This is a logic error. The connection manager has received an unexpected response from CICS following an EXEC CICS command.

System action

A system dump is taken. The requested operation is not performed. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

You need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module:
DFHRPC09

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *filename*

Destination

CRPO

DFHRP1512	*date time applid tranid* **The CICS ONC RPC connection manager cannot access the CICS ONC RPC data set, CICS file *filename*.**

Explanation

The connection manager could not access the CICS ONC RPC data set, CICS file *filename*. The data set has not been correctly defined to CICS for one of the following reasons:

- No file definition has been found for *filename*. CICS ONC RPC has therefore not been installed correctly.
- READ operations are not allowed on the file.
- The file has been disabled, either due to an incorrect data set definition, or due to operator intervention.
- The file cannot be opened because it has not been defined correctly, or because it has been closed by operator intervention.
- The connection manager transaction, or the user running the connection manager, does not have the necessary level of authority to access the file.

System action

The message is displayed at the terminal.

User response

Ensure that all the CEDA groups for CICS ONC RPC have been installed correctly.

Investigate whether the operator has changed the status of the file for any reason.

Module:
DFHRPC01

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

4. *tranid*
5. *filename*

Destination

CRPO

DFHRP1513	*date time applid tranid* **The CICS ONC RPC connection manager has detected invalid data in the definition record of the CICS ONC RPC data set, CICS file *filename*.**

Explanation

The connection manager detected an error in the definition record in the CICS ONC RPC data set.

System action

A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Ensure that the first record in the data set has been correctly initialized. You can do this by manually updating the record (see the CICS documentation for further guidance), or by deleting the first record in the data set, and rerunning the connection manager. This creates a new definition record using the default settings which can then be updated using the connection manager panels.

Module:
DFHRPC01

5. *filename*

Destination

CRPO

DFHRP1514	*date time applid tranid* **The CICS ONC RPC connection manager has detected that the CICS ONC RPC global work area does not have the expected length.**

Explanation

The connection manager detected that the length of the associated global work area is not correct.

System action

A system dump is taken. CICS ONC RPC is disabled. It is not possible to enable CICS ONC RPC until the problem is resolved. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Make sure that no user-written version of program DFHRPTRU is being used. Only the CICS ONC RPC supplied program can be used with CICS ONC RPC. Similarly, the CICS ONC RPC supplied task-related user exit DFHRPTRU should only be enabled and disabled by the connection manager. It should not be necessary to enable or disable DFHRPTRU in any other way.

Module:
DFHRPC01

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CRPO

DFHRP1515	*date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file *filename*. EIBRESP: *eibresp*.**

Explanation

The connection manager could not access the CICS ONC RPC data set, CICS file *filename*. An EXEC CICS READ was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the READ.

System action

A system dump is taken. The requested operation is not performed. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use Appendix A of the CICS Application development reference manual to find out what the EIBRESP value means, and take appropriate action.

Module:
DFHRPC09

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

4. *tranid*
5. *filename*

Destination

CRPO

DFHRP1518   *date time applid tranid* **The CICS ONC RPC connection manager cannot find the global work area.**

Explanation

The connection manager cannot access its global work area.

System action

A system dump is taken. The connection manager continues, but CICS ONC RPC cannot be enabled. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

End the connection manager. Ensure that all the CEDA groups containing the CICS ONC RPC definitions have been correctly installed. Then try running the connection manager again.

Investigate whether the operator has disabled the task-related user exit DFHRPTRU.

Module:
DFHRPC01

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CRPO

DFHRP1519   *date time applid tranid* **The CICS ONC RPC connection manager cannot find the task-related user exit.**

Explanation

The connection manager cannot access its task-related user exit for one of the following reasons:

- DFHRPTRU has not been defined to CICS
- DFHRPTRU is not in the CICS load library
- DFHRPTRU has been disabled

System action

A system dump is taken. CICS ONC RPC is disabled. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

End the connection manager. Ensure that all the CEDA groups containing CICS ONC RPC definitions have been installed correctly. Then try running the connection manager again.

If CICS ONC RPC has been correctly installed, check that the operator has not disabled DFHRPTRU.

CRPO

DFHRP1523	*date time applid tranid* **CICS ONC RPC cannot be enabled because the connection manager cannot access the task-related user exit DFHRPTRU.**

Explanation

The connection manager could not enable CICS ONC RPC because an error occurred accessing the task related user exit DFHRPTRU.

System action

A system dump is taken. This instance of connection manager can only be used to inquire on, or update the CICS ONC RPC data set. Message DFHME0116,

which contains the symptom string for this problem, is produced.

User response

See the CRPO transient data queue for messages indicating the nature of the error, and take the appropriate action. Then restart the connection manager transaction and select the enable option again.

Module:
DFHRPC01

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CRPO

DFHRP1524	*date time applid tranid* **CICS ONC RPC cannot be enabled because the server controller is already running.**

Explanation

The connection manager detected that the task-related user exit DFHRPTRU is disabled, but the server controller transaction is still running.

System action

A system dump is taken. This instance of connection manager can only be used to inquire on, or update, the CICS ONC RPC data set. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Investigate why the last attempt to disable CICS ONC RPC did not complete successfully. Investigate the possibility of operator intervention.

Once you have established that it is safe to continue, use CEMT SET TASK or EXEC CICS SET TASK to purge the server controller. Then run the connection manager again to enable CICS ONC RPC.

Module:
DFHRPC01

XMEOUT parameters/Message inserts

Explanation

The connection manager could not access the CICS ONC RPC data set.

The error occurred while processing a request to register 4-tuples from the data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were registered.

An EXEC CICS STARTBR, EXEC CICS READNEXT, or EXEC CICS ENDBR was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- No file definition has been found for the file, implying that CICS ONC RPC has not been installed correctly.
- BROWSE or READ operations are not allowed, implying that CICS ONC RPC has not been installed correctly.
- The file is DISABLED, either due to an incorrect file definition, or due to operator intervention.
- The file is NOTOPEN, either due to an incorrect file definition, or due to operator intervention.

- BROWSE or READ operations are not authorized, implying that security has not been set up correctly.

System action

A system dump is taken. The connection manager cannot register 4-tuples from the data set. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use Appendix A of the CICS Application development reference manual to find out what the EIBRESP value means, and take appropriate action.

Module:
DFHRPC09

3. *applid*
4. *tranid*

Destination

CRPO

DFHRP1542   *date time applid tranid* **CICS ONC RPC detected an error while**

accessing the CICS ONC RPC data set, CICS file *filename*, while registering 4-tuples from the data set. EIBRESP: *eibresp*.

Explanation

The connection manager could not access the CICS ONC RPC data set.

The error occurred while processing a request to register 4-tuples from the data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were registered.

An EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDBR was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the BROWSE or READ command.

System action

A system dump is taken. The connection manager cannot register 4-tuples from the data set. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use Appendix A of the CICS Application development reference manual to find out what the EIBRESP value means, and take appropriate action. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

CRPO

DFHRP1543 *date time applid tranid* **The CICS ONC RPC connection manager detected a logic error while accessing the CICS ONC RPC data set, CICS file** *filename***, while registering 4-tuples from the data set.**

Explanation

The connection manager has detected an error while accessing the CICS ONC RPC data set. This is a logic error since connection manager has received an unexpected response from CICS following an EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDBR command.

The error occurred while processing a request to register 4-tuples from the data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were registered.

System action

A system dump is taken. The connection manager cannot register 4-tuples from the data set. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

You need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

CRPO

DFHRP1577   *date time applid tranid* **The CICS ONC RPC connection manager cannot access its task-related user exit DFHRPTRU.**

Explanation

The connection manager was unable to access its task-related user exit DFHRPTRU during enable processing.

System action

A system dump is taken. The enable attempt is abandoned. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Check that the task-related user exit has not been disabled by operator intervention. See the associated diagnostics issued by CICS for problem determination.

Destination

CRPO

DFHRP1579   *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while registering 4-tuples from the CICS ONC RPC data set, CICS file** *filename***.**

Explanation

The connection manager has detected an internal error while processing a request to register 4-tuples from the CICS ONC RPC data set. Associated message DFHRP1545 may have been issued to indicate the number of 4-tuples that were successfully registered.

System action

A system dump is taken. Registration of 4-tuples from the data set does not continue. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

You need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

CRPO

DFHRP1583	*date time applid tranid* **The CICS ONC RPC connection manager found no entry for this 4-tuple in the CICS ONC RPC data set, CICS file** *filename***.**

Explanation

The connection manager has not found this 4-tuple in the CICS ONC RPC data set *filename*.

System action

None.

User response

Enter a 4-tuple that has already been saved in the data set.

Module:
DFHRPC09

Destination

Terminal End User

DFHRP1584	*date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file** *filename***. EIBRESP:** *eibresp***.**

Explanation

The connection manager could not access the CICS ONC RPC data set. An EXEC CICS DELETE was issued, but received the response *eibresp*. The data set has not been correctly defined to CICS for one of the following reasons:

- No file definition has been found for *filename*. CICS ONC RPC has therefore not been installed correctly.

- DELETE operations are not allowed on the file.
- The file has been disabled, either due to an incorrect file definition, or due to operator intervention.
- The file cannot be opened because it has not been defined correctly, or because it has been closed by operator intervention.
- The connection manager, or the user running it, does not have the necessary level of authority to access the file.

System action

The requested operation is not performed. The connection manager cannot perform any operation requiring access to the data set.

User response

Use Appendix A of the CICS Application development reference manual to find out what the EIBRESP value means, and take appropriate action.

Investigate whether the operator has changed the status of the data set for any reason.

CRPO

DFHRP1585	*date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file *filename*. EIBRESP: *eibresp*.**

Explanation

The connection manager could not access CICS ONC RPC data set, CICS file *filename*. An EXEC CICS DELETE was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.

- An I/O error occurred on the DELETE.

System action

A system dump is taken. The requested operation is not performed. The connection manager cannot perform any function requiring access to the data set. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use Appendix A of the CICS Application development reference manual to find out what the EIBRESP value means, and take appropriate action.

Explanation

The connection manager is unable to complete the current unregister operation because an error occurred freeing storage associated with the 4-tuple.

System action

The connection manager continues. If the requested 4-tuple was the only instance of a particular program/version/protocol 3-tuple registered with TCP/IP for MVS, then this 3-tuple has been unregistered with TCP/IP for MVS.

User response

See the associated diagnostics issued by CICS and TCP/IP for MVS for problem determination.

Destination

CRPO

DFHRP1766	*date time applid tranid* **The CICS ONC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file *filename*. EIBRESP: *eibresp*.**

Explanation

The connection manager could not access the CICS ONC RPC data set.

The error occurred while processing a request to display 4-tuple definitions from the data set.

An EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDBR was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- No file definition has been found for DFHRPCD, implying that CICS ONC RPC has not been installed correctly.
- BROWSE or READ operations are not allowed, implying that CICS ONC RPC has not been installed correctly.
- The file is DISABLED, either due to an incorrect file definition, or due to operator intervention.
- The file is NOTOPEN, either due to an incorrect file definition, or due to operator intervention.
- BROWSE or READ operations are not authorized, implying that security has not been set up correctly.

System action

A system dump is taken. Without access to the data set, CICS ONC RPC cannot display 4-tuple definitions. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use Appendix A of the CICS Application development reference manual to find out what the EIBRESP value means, and take appropriate action.

Module:

Destination

CRPO

DFHRP1767	*date time applid tranid* **The CICS ONC RPC connection manager detected an error while accessing the CICS ONC RPC data set, CICS file *filename*. EIBRESP: *eibresp*.**

Explanation

The connection manager cannot access the CICS ONC RPC data set.

The error occurred while processing a request to display 4-tuple definitions from the data set.

An EXEC CICS STARTBR, EXEC CICS READNEXT or EXEC CICS ENDBR was issued, but received the response *eibresp*. The error can occur for one of the following reasons:

- The file is defined as remote, and there is an error on the connection to the owning system.
- VSAM has returned an unexpected response to CICS.
- An I/O error occurred on the BROWSE or READ command.

System action

A system dump is taken. Without access to the data set, CICS ONC RPC cannot display 4-tuple definitions. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use Appendix A of the CICS Application development reference manual to find out what the EIBRESP value means, and take appropriate action.

Destination

CRPO

DFHRP1868	*date time applid tranid* **The CICS ONC RPC connection manager could not complete the requested operation. It could not obtain the required CICS storage. Host IP address: *hostaddr*.**

Explanation

A GETMAIN issued by connection manager when attempting to build a list of registered 4-tuples returned an error response.

System action

A system dump is taken. Processing continues. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

CICS may be temporarily short on storage. Retry the operation. If the condition persists, contact your system administrator to see if there are problems with CICS storage. If CICS is not short on storage, you need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

4. *tranid*
5. *hostaddr*

Destination

CRPO

DFHRP1900   *date time applid tranid* **The CICS ONC RPC connection manager could not find the global work area.**

Explanation

The connection manager could not find the global work area. The task related user exit DFHRPTRU has been wrongly defined.

System action

A system dump is taken. CICS ONC RPC remains disabled. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Ensure that all the CEDA groups for CICS ONC RPC have been installed correctly, then try to enable CICS ONC RPC again.

Investigate whether the operator has disabled DFHRPTRU for any reason.

Module:
DFHRPC0B

XMEOUT parameters/Message inserts

1. *date*

3. *applid*

4. *tranid*

Destination

CRPO

DFHRP1901	*date time applid tranid* **The CICS ONC RPC connection manager could not find the task-related user exit, program DFHRPTRU.**

Explanation

The connection manager cannot find the task-related user exit, DFHRPTRU, for one of the following reasons:

- DFHRPTRU has not been defined to CICS
- DFHRPTRU is not in the CICS load library
- DFHRPTRU has been disabled

System action

A system dump is taken. CICS ONC RPC remains disabled. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Ensure that all the CEDA groups for CICS ONC RPC have been installed correctly, then try the enable request again.

Module:
DFHRPC0B

XMEOUT parameters/Message inserts

Destination

CRPO

DFHRP1902	*date time applid tranid* **The CICS ONC RPC connection manager does not have sufficient authority to issue the EXEC CICS EXTRACT EXIT command. EIBRESP2: *eibresp2*.**

Explanation

The connection manager does not have the correct authority to issue the privileged EXEC CICS EXTRACT

EXIT command. It cannot function without this authority.

System action

A system dump is taken. The connection manager abends with abend code ARPZ. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the EIBRESP2 value to identify the problem. Ensure that the connection manager and its associated program DFHRPC00 have the necessary level of security to issue the EXEC CICS EXTRACT EXIT command for the CICS ONC RPC task related user exit DFHRPTRU.

Module:
DFHRPC0B

Explanation

The connection manager used EXEC CICS LOAD for the CICS program *xdrname*, which has been requested as the XDR routine for the 4-tuple being processed, but received an error response.

System action

The 4-tuple is not registered.

User response

The problem is probably due to an error in defining the requested program *xdrname* to CICS, or to wrongly defining an XDR routine name for the 4-tuple. Use the values provided in *eibresp* and *eibresp2* to identify the reason for the error in the LOAD, and use the CICS CEDA transaction or the connection manager to rectify the problem.

DFHRP1961	*date time applid tranid* **Data entered in field *fieldname1* is incompatible with data entered in field *fieldname2*.**

Explanation

Data was entered on a connection manager panel in *fieldname1* that is incompatible with data entered in *fieldname2*.

System action

The connection manager panel is redisplayed and the field in error is highlighted.

User response

Enter compatible data in the fields indicated.

Module:
DFHRPC0D, DFHRPC05

Destination

Terminal End User

DFHRP1962	*date time applid tranid* **Enter the Program Number, Version Number, Procedure Number and Protocol for the 4-tuple to be displayed.**

Explanation

To retrieve information about a 4-tuple in the CICS ONC RPC data set you must supply the program number, version number, procedure number, and protocol.

System action

None.

User response

Enter the required data.

Module:
DFHRPC0D, DFHRPC03

Destination

Terminal End User

DFHRP1963	*date time applid tranid* **Enter the following fields before**

register or save to data set: **Program Number, Version Number, Procedure Number, XDR Routines, and Program Name.**

Explanation

The following fields are required before registration or saving of the 4-tuple: the Program Number, Version Number, Procedure Number, Inbound XDR Routine, Outbound XDR Routine (if RPC Call Type of blocking), and Program Name.

System action

The connection manager panel is redisplayed.

User response

Enter valid data in the field(s) indicated.

Module:
DFHRPC0D, DFHRPC05

Destination

Terminal End User

DFHRP1964   *date time applid tranid* **Data entered in the Getlengths field is incompatible with data entered in the Server Input Length or Server Output Length fields.**

Explanation

Either you have specified YES for Getlengths and put information in Server Input Length or Server Output Length, or you have specified NO for Getlengths but put no information in Server Input Length and Server Output Length.

System action

The connection manager panel is redisplayed.

User response

Decide whether the lengths are to be specified on this panel, or to be supplied by the **Getlengths** function of the converter for this 4-tuple.

Module:
DFHRPC0D, DFHRPC05

Destination

Terminal End User

DFHRP1965   *date time applid tranid* **With Server Data Format of CONTIGUOUS, the Server Input Length and Server Output Length together must not exceed 32767 Bytes.**

Explanation

An invalid server data length has been detected on a CRPC panel. The maximum total data length which can pass between the alias and the CICS program that services the client request is 32767. If server data format of CONTIGUOUS is specified, the Server Input Length and the Server Output Length added together must not exceed this value.

System action

The connection manager panel is redisplayed.

User response

Enter valid data in the fields.

Module:
DFHRPC0D, DFHRPC05

Destination

Terminal End User

DFHRP1966   *date time applid tranid* **Procedure Number of 0 is not allowed.**

Explanation

A value of zero has been entered in the Procedure Number field. This is not allowed.

System action

The connection manager panel is redisplayed, and the field in error is highlighted.

User response

Enter valid data in the field indicated.

Module:
DFHRPC0D, DFHRPC05, DFHRPC06

Destination

Terminal End User

DFHRP1967   *date time applid tranid* **The CICS ONC RPC connection manager detected an internal error while trying to register a 4-tuple. Program:** *X'prognum'*

Version: *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol*. **Host IP address:** *hostaddr*.

Explanation

The connection manager detected an internal error while trying to register a 4-tuple.

System action

A system dump is taken. The connection manager continues. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

See associated messages to find out whether the 4-tuple was registered. You need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

DFHRP1983	*date time applid tranid* **The CICS ONC RPC connection manager detected an error while linking to the converter *converter_program_name*. EIBRESP: *eibresp* EIBRESP2: *resp2val* Program: X'prognum' Version: X'versnum' Procedure: X'procnum' Protocol: protocol. Host IP address: hostaddr.**

Explanation

The connection manager used EXEC CICS LINK for the converter to perform **Getlengths** processing for the 4-tuple. The response was PGMIDERR.

System action

The 4-tuple is not registered.

User response

Use the EIBRESP2 value to identify the problem.

Module:
DFHRPC0E

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *converter_program_name*

CRPO

DFHRP1984	*date time applid tranid* **The CICS ONC RPC connection manager cannot link to converter** *converter_program_name* **because it is remote. EIBRESP:** *eibresp* **EIBRESP2:** *resp2val* **Program:** *X'prognum'* **Version:** *X'versnum'* **Procedure:** *X'procnum'* **Protocol:** *protocol*. **Host IP address:** *hostaddr*.

Explanation

The connection manager used EXEC CICS LINK for the converter to perform **Getlengths** processing, but the response was TERMERR or SYSIDERR. The connection manager passes pointers to the converter, so the converter must be in the same CICS region as CICS ONC RPC.

System action

The 4-tuple is not registered.

User response

Install and define the converter program in the same CICS region as CICS ONC RPC.

CRPO

DFHRP2000	*date time applid tranid* **A browse of the CICS ONC RPC alias list could not be performed because another browse is active.**

Explanation

Only one task can browse the alias list at a time. This is enforced by use of an ENQ in the connection manager. However, the alias list component has been called to start a browse and has found that there is already a browse active. This is due either to a logic error in CICS ONC RPC code, or to a storage overwrite.

System action

A system dump is taken. The browse request is rejected. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If the problem is due to a storage overwrite, it is almost certain that there are errors in other CICS functions for no apparent reason. If this is not the case, you may need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

CRPO

DFHRSnnnn messages

DFHRS0001   *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

3. *X'offset'*
4. *modname*

Destination

Console

DFHRS0002   *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname,* you should bring CICS down in a controlled shutdown.

See the CICS Trace Entries for a description of the exception trace point ID, X'*code*' and the data it contains.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHRSDM, DFHRSDU, DFHRSSM, DFHRSSR, DFHRSTP, DFHRSXM

XMEOUT parameters/Message inserts

2. *X'code'*
3. *modname*

Destination

Console

DFHRS0004   *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System action

An exception entry is made in the trace table.

A system dump is taken unless you have specifically suppressed the dump by a user exit program at the XDUREQ exit, in the dump table, or by global system dump suppression. CICS processing continues unless you have specified in the dump table that CICS should terminate.

User response

If CICS has not terminated, you must decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message might have been caused by a long-running function and there might not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval that you have specified in the ICVR system initialization parameter. This means that execution of module *modname* is terminated and CICS continues.

If you have specified system initialization parameter ICVR=0 and you believe that module *modname* is looping, you must terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you believe that it was not a runaway, you should increase the value of the ICVR system initialization parameter. You can use the CEMT transaction to change the ICVR time interval while CICS is running. To change the ICVR time interval permanently, shut down CICS and restart with the new setting.

If increasing the value of ICVR does not solve the problem, you might need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHRSDU, DFHRSSM, DFHRSTP, DFHRSXM

XMEOUT parameters/Message inserts

1. *applid*
2. *X'offset'*
3. *modname*

Destination

Console

DFHRS0007E   *applid* **The RS domain long running task has terminated abnormally.**

Explanation

The region status (RS) domain long running task has terminated because an unexpected error has occurred. This task was started because the region is running as a CICSPlex/SM (CPSM) workload manager (WLM) target region which has been acivated for WLM optimization.

System action

A system dump is taken unless you have specifically suppressed the dump by a user exit program at the XDUREQ exit, in the dump table, or by global system dump suppression.

CICS processing continues without the RS domain long running task unless you have specified in the dump table that CICS should terminate.

User response

Review any other error messages that have been issued, and take appropriate action. If the problem persists, contact your IBM support representative for further assistance, providing the complete job output, auxtrace datasets and any dumps.

Note that the RS domain long running task is responsible for marking the region as healthy following the end of a short-on-storage (SOS), system dump

(SDUMP) or transaction dump (TDUMP) condition. If this task is no longer running, other processing within the region will assume this function, but depending upon the activity within the region, return to healthy status may be delayed for up to 15 seconds.

The task can be restarted by one of the following methods:

- Stopping and restarting the region.
- Stopping and restarting the CPSM MAS agent in the region. The COSH transaction can be used the stop the agent, and the COLM transaction can be used to restart the agent.
- Disabling and enabling WLM optimization in the region. The CPSM MAS resource table SET action can be used to perform these functions.

Module:
DFHRSTP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHRS2110   *date time applid* **Abnormal reply to exchange log name request received from system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation

An abnormal reply has been received in response to an exchange log name request sent either following a session failure or at first session initiation after system restart. The abnormal reply may indicate that:

- The remote system detected a warm or cold mismatch, or a log name mismatch.
- The remote system failed to interpret the exchange log name data sent to it.

System action

For APPC protocol, any synclevel 2 attaches are inhibited. This prevents recoverable activity between the two systems.

For IRC protocol, the message indicates that resynchronization was attempted and failed.

User response

The most likely cause of the message is an initial start (as opposed to emergency restart or its

equivalent) of this system when the remote system has resynchronization work outstanding. If it is a cold or warm mismatch or log name mismatch, other diagnostic messages on the local system may indicate the reason for the error. If it is not, examine the log of the remote system which should have generated diagnostic information describing the reason for the abnormal response.

For APPC protocol where a logname mismatch is suspected, override the error situation by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

For IRC, the message may indicate an initial start of one system when the other has resynchronization outstanding; the resynchronization was started before the initial start occurred and becomes invalid. The associated unit of work may need to be committed by using CEMT SET UOW. The message should not recur.

Module:

6. *protocol*

Destination

CSMT and Console

DFHRS2111   *date time applid* **Cold/Warm restart mismatch with system** *sysid***,netname** *netname***,protocol** *protocol***.**

Explanation

A cold start indication was received from the remote system during an exchange log names sequence. However, this system has units of work that need resynchronizing from the previous run. An exchange log names sequence is started either following a

session failure or at first session initiation after system restart; both the local and remote systems may initiate the sequence at the same time.

System action

Any synclevel 2 attaches are inhibited. This means that recovery activity between the two systems is prevented.

User response

Override the error by issuing CEMT SET CONN(*sysid*) NOTPENDING commands for the failing connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization with the remote system.

Module:

DFHRS2112	*date time applid* Log name mismatch with system *sysid*, netname *netname*, protocol *protocol*. Expected **LUNAME.LOGNAME** *local_logname* **Received LUNAME.LOGNAME** *remote_logname* .

Explanation

A failure has occurred in the exchange log names process which is carried out either following a session failure or at first session initiation after system restart. This system's memory of the remote system's log name conflicts with the log name sent by the remote system.

System action

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, resynchronization was attempted and failed.

User response

For APPC, override the error by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization activity with the remote system. The message may indicate a logic error in CICS or the remote system, and you may need assistance from IBM to prevent a recurrence. See Working with IBM to solve your problem for guidance on how to proceed.

For IRC, the message may indicate the initial start of one system when the other has resynchronization outstanding; the resynchronization was started before the initial start occurred and becomes invalid. The associated unit of work may need to be committed by using CEMT SET UOW. The message should not recur.

Refer to DFHRM0240, DFHRM0241 and DFHRM0242 messages for information about changes to log names for APPC or IRC connections.

DFHRS2113	*date time applid* **Log name mismatch with system** *sysid***, netname** *netname***, protocol** *protocol***, local LOGNAME** *local_logname* **, received LOGNAME** *remote_logname* **.**

Explanation

This message is issued when a failure has occurred in the exchange log names process which is carried out prior to resynchronization following an earlier session failure. System *sysid* has sent an exchange log names request which contains the remote system's memory (*remote_logname*) of this system's log name (*local_logname*).

This system has detected a log name mismatch. This indicates that system *sysid* and this system do not have the correct logs for resynchronization.

System action

For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed.

User response

For APPC, override the error by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization activity with the remote system. CSMT and Console

DFHRS2114	*date time applid* **Abnormal termination of exchange log names sequence received from system** *sysid***, netname** *netname***, protocol** *protocol***.**

Explanation

This message is issued when an FMH7 has been received in response to an exchange log name reply. An exchange log names sequence is sent either following a session failure or at first session initiation after system restart. The remote system started the sequence, and the FMH7 reply indicates that the remote system failed to interpret the exchange log name reply data sent to it.

System action

For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

User response

Investigate the cause of the error using the system dump. Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the Troubleshooting and support.)

Determine from the message which session was being used for this exchange log names conversation.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. For

IRC, the TIOA contains the equivalent data. Check the data against the format of the exchange log names reply GDS variable. The correct format of this SNA defined field can be found in the Systems Network Architecture Formats (GA27-3136) manual.

Examine the log of the remote system. If a protocol violation was detected, the remote system may have generated diagnostic information itself which may help to diagnose the cause.

Module:
DFHCRRSY

CSMT and Console

DFHRS2115　　*date time applid protocol* **protocol support mismatch with system *sysid*, netname *netname*. Expected support byte *X'ww'*, received support byte *X'xx'*, expected extended support bytes *X'yyyy'*, received extended support bytes *X'zzzz'*.**

Explanation

This system's memory of the protocols previously negotiated with the remote system conflicts with the indicators sent in an exchange log names variable.

System action

For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocols, resynchronization fails. Communications continue normally.

User response

For APPC protocols, the indicators expected from a CICS Transaction Server system are: basic support, X'70'; extended support, X'C000'. For CICS/ESA 4.1 the expected indicators are: basic support, X'40'; extended support, X'0000'. If this combination of

the four indicator fields appears in the message, first check that you have Initial started the partner system at the CICS Transaction Server level during a migration from CICS/ESA 4.1, or Cold started a CICS/ESA 4.1 system after running CICS Transaction Server. If this possibility can be ruled out, the message may indicate a logic error in CICS or in the remote system and you may need assistance from IBM to prevent a recurrence. See Working with IBM to solve your problem for guidance on how to proceed.

You can override the error situation by issuing CEMT SET CONN(*sysid*) NORECOVDATA commands for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization activity with the remote system.

For IRC protocols, you may need to use the CEMT SET UOW command to resolve the state of any units or work which cannot be resolved by the normal resynchronization process.

DFHRS2116　　*date time applid* **Abnormal termination of exchange log names sequence received from system *sysid*, netname *netname*, protocol *protocol*. The connection was in a cold state.**

Explanation

An FMH7 has been received in response to an exchange log names reply. An exchange log names sequence is sent either following a session failure or at first session initiation after system startup. This system was either started with the SIT parameter START=INITIAL or CEMT SET CONN(*sysid*) NORECOVDATA has been issued, both of which reset the state of the connection. This means that no log name is stored for the remote system.

For APPC protocols, the FMH7 reply may indicate one of two causes:

- The remote system has resynchronization work outstanding following a previous failure of a conversation during sync point processing and has detected a cold/warm mismatch.
- The remote system failed to interpret the exchange log names reply data sent to it.

For IRC protocol, the problem is caused by the failure of the remote system to interpret the exchange log names reply data.

System action

For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

User response

The most likely cause of the message is an initial start (as opposed to emergency restart or its equivalent) of this system when the other has resynchronization work outstanding. This can be confirmed by examining the message log of the remote system.

For APPC protocol, the connection on the remote system may need to be reset by issuing the CEMT SET CONN(sysid) NOTPENDING command against the connection entry for this system.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization.

For IRC protocol, a protocol violation or logic error is the only possible cause.

If a cold/warm mismatch is eliminated as the cause of the error, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

CSMT and Console

DFHRS2117	*date time applid* **Abnormal reply to exchange log names received from system** *sysid*, **netname** *netname*, **protocol** *protocol*. **The connection on this system was in a cold state.**

Explanation

This message is issued when an abnormal reply has been received in response to an exchange log name request. An exchange log names sequence is sent either following a session failure or at first session initiation after system startup. This system was either started with the SIT parameter START=INITIAL, or CEMT SET CONN(*sysid*) NORECOVDATA has been issued, and no log name is stored for the remote system. The abnormal reply may indicate one of two causes in the case of APPC protocol.

- The remote system has resynchronization work outstanding following a previous failure of a conversation during sync point processing and has detected a cold/warm mismatch.
- The remote system failed to interpret the exchange log name data sent to it.

For IRC protocol, the problem is caused by the failure of the remote system to interpret the exchange log name data.

System action

For APPC protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

User response

The most likely cause of the message is an intial start (as opposed to emergency restart or its equivalent) of this system when the other has resynchronization work outstanding. This can be confirmed by examining the message log of the remote system.

For APPC protocol, the connection on the remote system may need to be reset by issuing the CEMT SET CONN(sysid) NOTPENDING command against the connection entry for this system.

Note:

If this command is issued, CICS unilaterally commits any resources waiting for APPC resynchronization.

For IRC protocol, a protocol violation or logic error is the only possible cause.

If a cold/warm mismatch is eliminated as the cause of the error, you need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

2. *time*
3. *applid*
4. *sysid*
5. *netname*
6. *protocol*

Destination

CSMT and Console

DFHRS2118 *date time applid* **Abnormal termination of exchange log names sequence received from system** *sysid*, **netname** *netname*, **protocol** *protocol*. **There has been previous contact with that system.**

Explanation

This message is issued when an FMH7 has been received in response to an exchange log name reply.

An exchange log names sequence is sent either following a session failure or at first session initiation after system startup. Both systems have records of previous contact and have log names stored which were being verified by the exchange log names protocol, which was initiated by the remote system.

The FMH7 may indicate one of two causes:

- The remote system has detected a mismatch in the log names or protocol support indicated in the exchange log name reply sent to it.
- The remote system failed to interpret the exchange log name reply data sent to it.

System action

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

For LU6.2 protocol, any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

User response

For APPC protocol, the connection may need to be reset by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

The cause of the error may be indicated by diagnostic information produced by the remote system. The system dump taken by local system can be used to investigate the possibility of an error in the exchange log names reply GDS.

Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the Troubleshooting and support.)

Determine from the message which session was being used for this exchange log names conversation.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. For IRC, the TIOA contains the equivalent data. Check that the data against the format of the exchange log names reply GDS variable. The correct format of this SNA defined field can be found in the Systems Network Architecture Formats (GA27-3136) manual.

CSMT and Console

DFHRS2134	*date time applid* **An error has occurred while sending an exchange log names request on session** *sessid* **to remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation

An error has occurred during the transmission of an exchange log names request to a remote system. CICS was attempting to establish the connection on first contact with the partner, or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This message implies a failure of the session used to carry the transmission.

System action

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

In many cases CICS continues to operate normally, and the resynchronization or connection establishment is retried in an attempt to overcome the session failure. However for APPC protocol, a repeated failure may have resulted in exchange log names flows being unsuccessful preventing any synclevel 2 attaches between the local system and the remote system.

For IRC protocol, resynchronization has failed but the connection continues to operate normally.

User response

Issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done,

the exchange log names process can be retried by issuing the CEMT SET CONN(*sysid*) RESYNC command.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system, and examine the log of the remote system. If a protocol violation was detected, the remote system may have generated diagnostic information itself.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

Determine from the message which session was being used for this exchange log names conversation.

If the internal trace table is available, use it to track the commands issued against that session and check that the state transitions of the User state machine are correct. If any of the state transitions are not valid, it is possible that there has been a CICS logic error.

Module:
DFHCRRSY

CSMT and Console

DFHRS2135	*date time applid* **An error has occurred while sending a compare states request on session** *sessid* **to remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation

An error has occurred during the transmission of a compare states request to a remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This implies one of the following:

- The remote system has detected a protocol violation in the local system's exchange log names GDS variable.

- Some other error in communications has occurred.

System action

For APPC protocol connections (but not IRC protocol), the failure may have prevented the completion of the exchange log names protocol and this prevents any synclevel 2 attaches between the local system and the remote system.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

For APPC protocol, investigate the state of the connection. Issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done, the exchange log names process can be retried by issuing the CEMT SET CONN(*sysid*) RESYNC command. If there has been previous successful contact between the systems the connection can be reset to its original state and retried. The state can be reset by issuing CEMT SET CONN(*sysid*) NORECOVDATA. It may be necessary to issue this command on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

The cause of the error may be indicated by diagnostic information produced by the remote system. Use the system dump taken by the local system to investigate the possibility of an error in the GDS variables.

Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the Troubleshooting and support.)

Determine from the message which session was being used for this exchange log names conversation.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. For IRC, the TIOA contains the equivalent data. Check that the data against the format of the exchange log names and compare states GDS variables. DFHRS2136	*date time applid* **An error has occurred while receiving an exchange log names reply on session** *sessid* **from remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation

An error has occurred during an attempt to receive exchange log names reply data from a remote system. CICS was attempting to initialize the connection, or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

The message means that:

- The remote system has detected a protocol violation in the local system's exchange log names GDS variable or compare states GDS variable and sent an FMH7 to indicate the error.
- Some other error in communication has occurred in either the local or the remote system.

System action

For APPC protocol the failure of exchange log names may mean that any synclevel 2 attaches are inhibited. This means that recoverable activity between the two systems is prevented.

For IRC protocol, the message indicates that resynchronization was attempted and failed. Communication continues.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

For APPC protocol, investigate the state of the connection. Issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done, the exchange log names process can be retried by issuing the CEMT SET CONN(*sysid*) RESYNC command. If there has been previous successful contact between the systems the connection may be reset to its original state and retried. The state can be reset by issuing CEMT SET CONN(*sysid*) NORECOVDATA. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition CICS does not carry out any APPC resynchronization activity with the remote system.

The cause of the error may be indicated by diagnostic information produced by the remote system. Use the system dump taken by the local system to investigate the possibility of an error in the GDS variables.

Format the control blocks for the trace domain and the terminal control program. (For guidance on how to do this, see the Troubleshooting and support.)

Determine from the message which session was being used for this exchange log names conversation.

Destination

CSMT and Console

DFHRS2137	*date time applid* **An error has occurred while receiving a compare states reply on session *sessid* from remote system *sysid*, netname *netname*, protocol *protocol*.**

Explanation

An error has occurred during the receipt of a compare states reply from a remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This implies one of the following:

- The remote system has detected a protocol violation in the local system's compare states GDS variable.
- There has been an internal error in CICS APPC processing.

System action

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

CICS continues to operate normally and the resynchronization attempt is retried at the next opportunity.

User response

Investigate the cause of the error first by examining the log of the remote system which may have produced diagnostic information about the data it received. The problem can be investigated locally using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain and the terminal control program. (For guidance on how to do this, see the Troubleshooting and support.)

Determine from the message which session was being used for this resynchronization conversation.

If the internal trace table is available, use this to track the commands issued against that session and check that the state transitions of the user state machine are correct. If any of the state transitions are not valid, it is possible that there has been a CICS logic error.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. Similar information is contained in the TIOA for IRC sessions. Locate the data for the session in question, and check that the contents of the buffer are correct. The buffer contains the compare states GDS variable. The correct format of this SNA defined data can be found in the Systems Network Architecture Formats (GA27-3136) manual.

CSMT and Console

DFHRS2138   *date time applid* **Invalid exchange log names reply data has been received on session** *sessid* **from remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation

The local system has received data which it attempted to parse using the exchange log names reply GDS format. Either the data could not be parsed, or invalid data was detected.

This system was attempting to initialize the connection for synclevel 2 work, or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. Exchange log names was sent and an invalid reply received.

This failure implies an error in the remote system or a CICS logic error.

System action

If resynchronization was being attempted it has failed and is retried at the next opportunity.

For APPC protocol connections (but not IRC protocol) the failure prevents the completion of the exchange log names protocol and this may prevent any synclevel

2 attaches between the local system and the remote system.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

For APPC protocol, investigate the state of the connection. Issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done, the exchange log names process can be retried by issuing the CEMT SET CONN(*sysid*) RESYNC command. If there has been previous successful contact between the systems the connection may be reset to its original state and retried. The state can be reset by issuing CEMT SET CONN(*sysid*) NORECOVDATA. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the exchange log names reply GDS variable. The correct format of this SNA defined field can be found in the Systems Network Architecture Formats (GA27-3136) manual.

Module:
DFHCRRSY

7. *protocol*

Destination

CSMT and Console

DFHRS2139	*date time applid* **Invalid compare states reply data has been received on session** *sessid* **from remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation

The local system has received data which it attempted to parse using the compare states reply GDS format. Either the data could not be parsed or invalid data was detected.

The local system was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. Data from the remote system received in reply to the compare states was invalid.

This failure implies an error in the remote system or a CICS logic error.

System action

A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

The failure prevents the completion of the resynchronization of distributed resources.

User response

Investigate any units of work for which resynchronization is outstanding using the CEMT INQUIRE UOWLINK SYSID(*sysid*) command. Use the same command on the remote system to determine whether to commit or backout the unit of work. Alternatively, for APPC connections, resynchronization can be overridden by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for resynchronization. Also, CICS does not carry out any resynchronization activity with the remote system.

Investigate the cause of the error using the system dump. Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the compare states reply GDS variable. The correct format of this SNA defined field can be found in the Systems Network Architecture Formats (GA27-3136) manual.

Module:
DFHCRRSY

XMEOUT parameters/Message inserts

1. *date*

DFHRS2140	*date time applid* **A protocol violation has occurred while resynchronizing with remote system** *sysid*, **netname** *netname*, **protocol** *protocol*, **via session** *sessid*. **The resynchronization was initiated by the local system.**

Explanation

The local system has detected a protocol violation while resynchronizing with the remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. The resynchronization was initiated by the local system.

This implies one of the following:

- An error was detected by the remote system and the resynchronization sequence was abnormally terminated.
- A logic error exists in the remote system which caused it to send invalid data.
- A CICS logic error.

System action

CICS continues to operate normally and the resynchronization attempt is retried at the next opportunity.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Diagnostics may have been output by the local CICS system, the access methods, or the operating system. Also, investigate the cause of the error in the remote system. It may have produced diagnostic messages indicating why the resynchronization sequence was terminated.

The resynchronization sequence can be analyzed locally by formatting the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

Determine from the message which session was being used for this resynchronization conversation.

The trace entries for the DFHCRRSY program show the state of the conversation which was being used and the data received. At the point of failure a confirmation was expected from the remote system as the final flow in the sequence but was not received.

Compare the resynchronization flows with those documented in the z/OS Communications Server: SNA Programmer's LU 6.2 Reference manual, (SC30-6808). A possible cause of this error is that the remote system did not observe the correct protocols. Investigation at the remote system may be necessary.

Module:
DFHCRRSY

sessid. **The resynchronization was initiated by the remote system.**

Explanation

The local system has detected a protocol violation while resynchronizing with the remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. The resynchronization was initiated by the remote system.

This implies one of the following:

- An error was detected by the remote system and the resynchronization sequence was abnormally terminated.
- A logic error exists in the remote system which caused it to send invalid data.
- A CICS logic error.

System action

CICS continues to operate normally and the resynchronization attempt is retried at the next opportunity.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

See any diagnostics output by the local CICS system, the access methods, or the operating system. Also, investigate the cause of the error in the remote system; it may have produced diagnostic messages indicating why the resynchronization sequence was terminated.

The resynchronization sequence can be analyzed locally by formatting the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

Determine from the message which session was being used for this resynchronization conversation.

The trace entries for the DFHCRRSY program show the state of the conversation which was being used and the data received. At the point of failure a request confirmation message was expected from the remote system as the third flow in the sequence but was not received.

Compare the resynchronization flows with those documented in the z/OS Communications Server: SNA Programmer's LU 6.2 Reference manual, (SC30-6808).

A possible cause of this error is that the remote system did not observe the correct protocols; investigation at the remote system may be necessary.

Module:
DFHCRRSY

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *sysid*
5. *netname*
6. *protocol*
7. *sessid*

Destination

CSMT and Console

DFHRS2142   *date time applid* **Compare states request data could not be received on session *sessid* from remote system *sysid*, netname *netname*, protocol *protocol*.**

Explanation

The local system has received an exchange log names request from the remote system but failed while attempting to receive subsequent data which was assumed to be a compare states GDS variable. The remote system was probably attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This implies one of the following:

- An error in the remote system
- A session failure during the resynchronization
- A CICS logic error.

System action

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

The resynchronization attempt should be retried at the next opportunity by the remote system. However, for APPC protocol connections, the failure may have resulted in exchange log names flows being unsuccessful and this prevents any synclevel 2

attaches between the local system and the remote system.

User response

Issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done, the error situation may be correctable by issuing CEMT SET CONN(*sysid*) RESYNC. If this fails to cure the problem, resynchronization can be canceled for an APPC connection by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for resynchronization. In addition, CICS does not carry out any resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

Locate the exception trace entries for the DFHCRRSY program and examine any data sent by the remote system. Also examine the state of the conversation at the point of failure. It should have been in receive state.

A possible cause is that the remote system did not send valid data or failed to follow the protocol for compare states. Compare the resynchronization flows with those documented in the z/OS Communications Server: SNA Programmer's LU 6.2 Reference manual, (SC30-6808). Investigation at the remote system may be necessary.

Module:
DFHCRRSY

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *sessid*
5. *sysid*
6. *netname*

Destination

CSMT and Console

DFHRS2143 *date time applid* **Do_know confirmation was not received on session** *sessid* **from remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation

The local system sent a Do_know GDS variable to the remote system but did not receive a valid reply. This indicates an earlier failure of a protected conversation during sync point processing and the resolution of the unit of work. This system was using the Do_know GDS variable to cause resynchronization to be started by the remote system.

This implies an error in the remote system or a CICS logic error.

System action

The resynchronization attempt should be retried at the next opportunity by the remote system.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Issue CEMT SET CONN(*sysid*) RESYNC to cause resynchronization to be retried.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

Locate the exception trace entries for the DFHCRRSY program and examine any data sent by the remote system. Also examine the state of the conversation at the point of failure.

A possible cause is that the remote system did not send valid data, or failed to follow the protocol for Do_Know in which case it may be necessary to obtain further diagnostic material from the remote system.

Module:
DFHCRRSY

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *sessid*
5. *sysid*
6. *netname*
7. *protocol*

Destination

CSMT and Console

DFHRS2144 *date time applid* **System_restart confirmation was not received on session** *sessid* **from remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation

The local system sent a System_restart GDS variable to the remote system but did not receive a valid reply. This indicates that the local system has restarted and not previously contacted the remote system as part of the initiation of resynchronization protocols.

This indicates an error in the remote system or a CICS logic error.

System action

The transmission of the message is retried the next time the connection is initialized.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Issue CEMT SET CONN(*sysid*) RESYNC to cause transmission to be retried.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

Locate the exception trace entries for the DFHCRRSY program and examine any data sent by the remote system. Also examine the state of the conversation at the point of failure.

A possible cause is that the remote system did not send valid data or failed to follow the protocol for the System_restart message. In this case it may be necessary to obtain further diagnostic material from the remote system.

Module:
DFHCRRSY

XMEOUT parameters/Message inserts

1. *date*

4. *sessid*
5. *sysid*
6. *netname*
7. *protocol*

Destination

CSMT and Console

DFHRS2145   *date time applid* **Invalid exchange log names data has been received on session** *sessid* **from remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation

The local system has received data which it attempted to parse using the exchange log names GDS format. Either the data could not be parsed or invalid data was detected.

The remote system was attempting to initialize the connection for synclevel 2 work or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing. Exchange log names is sent in both of these cases.

This failure indicates either an error in the remote system or a CICS logic error.

System action

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

If resynchronization was being attempted, it has failed and is retried at the next opportunity.

For APPC protocol connections (but not IRC protocol), the failure prevents the completion of the exchange log names protocol. This prevents any synclevel 2

attaches between the local system and the remote system.

User response

For APPC protocol connections, issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done but there has been previous contact between the systems, the error can be overridden by resetting the state of the connection. To do this, issue CEMT SET CONN(*sysid*) NORECOVDATA commands for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources waiting for APPC resynchronization. Also CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the exchange log names GDS variable. The correct format of this SNA defined field can be found in the Systems Network Architecture Formats (GA27-3136) manual.

The format of the GDS variable is incorrect and the cause of the error should be located. A likely cause is that the remote system did not send a valid GDS variable in which case it may be necessary to obtain further diagnostic material from the remote system.

Destination

CSMT and Console

DFHRS2146   *date time applid* **Invalid compare states data has been received on session *sessid* from remote system *sysid*, netname *netname*, protocol *protocol*.**

Explanation

The local system has received data which it attempted to parse using the compare states GDS format. Either the data could not be parsed or invalid data was detected.

The remote system was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This failure indicates either an error in the remote system or a CICS logic error.

System action

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

The failure prevents the completion of the resynchronization of distributed resources.

User response

Investigate any units of work for which resynchronization is outstanding using the command CEMT INQUIRE UOWLINK SYSID(*sysid*). Use the same command on the remote system to determine whether to commit or backout the unit of work. Alternatively, resynchronization can be overridden by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for resynchronization. In addition CICS does not carry out any resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

An exception trace entry contains the received data, and the reason for the failure is interpreted. Check the format of the compare states GDS variable. The correct format of this SNA defined field can be found in the Systems Network Architecture Formats (GA27-3136) manual.

The format of the GDS variable is incorrect and the cause of the error should be located. A possible cause is that the remote system did not send a valid GDS variable, in which case it may be necessary to obtain further diagnostic material from the remote system.

Module:
DFHCRRSY

XMEOUT parameters/Message inserts

5. *sysid*
6. *netname*
7. *protocol*

Destination

CSMT and Console

DFHRS2147   *date time applid* **Unrecognized data was received following transmission of an exchange log names reply on session *sessid* to remote system *sysid*, netname *netname*, protocol *protocol*.**

Explanation

An exchange log names request was received from another system and a reply was sent. More data was expected from the other system but this was not recognized as part of the exchange log names protocol.

This implies one of the following:

- The remote system has detected a protocol violation in the local system's exchange log names reply GDS variable.

- There has been an internal error in CICS processing.

System action

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

For APPC protocol, the failure may have resulted in no exchange log name flows being successful preventing any synclevel 2 attaches between the local system and the remote system.

For IRC protocol, resynchronization may fail but communications links remain active.

User response

For links using APPC protocol, issue CEMT INQUIRE CONN(*sysid*) and look at the XOK field. If exchange log names has not been done, the error situation can be overridden by issuing the CEMT SET CONN(*sysid*) NORECOVDATA command for the failing connection. It may be necessary to issue this command (or its equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits any resources which may be waiting for APPC resynchronization. In addition, CICS does not carry out any APPC resynchronization activity with the remote system.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system. The remote system may also have created diagnostic messages if it detected an error in the data it received.

The data sent by the local system can be investigated by formatting the system dump to show the control blocks belonging to the trace domain and the terminal control program. (For guidance on how to do this, see the Troubleshooting and support.)

Determine from the message which session was being used for this exchange log names conversation.

If the internal trace table is available, use it to track the commands issued against that session and check that the state transitions of the user state machine are correct. If any of the state transitions are not valid, it is possible that there has been a CICS logic error.

The APPC send and receive buffers for a session are clearly labelled in the dump and are printed below the TCTTE for the session to which they belong. The TIOA contains similar information for IRC. Locate the send/receive buffer for the session in question and check that the contents of the buffer are correct. The buffer should contain a valid exchange log names GDS reply variable. The correct format of this SNA defined field can be found in the Systems Network Architecture Formats (GA27-3136) manual.

6. *protocol*

Destination

CSMT

DFHRS2149   *date time applid*
**Resynchronization/Exchange log
names with system *netname*
(protocol *protocol*) could not be
executed because no suitable
connection entry was found.**

Explanation

CICS has initiated a resynchronization sequence
following the failure of a protected conversation during
syncpoint processing. Data exists describing the
conversation but no suitable connection definition was
found for the partner system. The resynchronization
could not continue because communications could not
be established.

System action

Processing continues.

User response

The condition may be due to the discarding of the
connection definition or to a cold start which has
caused a connection definition to be deleted by
CICS; the definition may have been autoinstalled.
An autoinstalled definition may be reinstalled by
subsequent activity in the system. Alternatively, a
suitable definition can be installed manually using
CEDA.

Module:
DFHCRRSY

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *protocol*

Destination

CSMT

DFHRS2150   *date time applid* **Invalid data
has been received during the
resynchronization sequence on
session *sessid* from remote system
sysid, netname *netname*, protocol
protocol.**

Explanation

The local system has received data which it attempted
to parse as one of the following types of SNA GDS
data:

> Exchange log names
> Do_know
> System_restart

The data could not be recognized.

The remote system was attempting to initialize the
connection for synclevel 2 work, or to resynchronize
distributed resources following an earlier failure of a
protected conversation during sync point processing.

This failure implies one of the following:

- An error was detected by the remote system and it
  sent an error indication in an FMH7.
- An error has occurred in the remote system.
- A CICS logic error has occurred.

System action

A system dump is taken unless you have specifically
suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom
string for this problem, is produced.

If resynchronization was being attempted, it has failed
and is retried at the next opportunity.

For APPC protocol connections (but not IRC protocol),
the failure prevents the completion of the exchange
log names protocol and this prevents any synclevel
2 attaches between the local system and the remote
system.

User response

For APPC protocol connections, issue CEMT INQUIRE
CONN(*sysid*), and examine the XOK field. If exchange
log names has not been done but there has been
previous contact between the systems, the error can
be overridden by resetting the state of the connection.
To do this, issue the CEMT SET CONN(*sysid*)
NORECOVDATA command for the failing connection.
It may be necessary to issue this command (or its
equivalent) on both sides of the connection.

Note:

If this command is issued, CICS unilaterally commits
any resources which may be waiting for APPC
resynchronization. In addition, CICS does not carry out
any APPC resynchronization activity with the remote
system.

Investigate the cause of the error using the system dump and any diagnostic information provided by CICS, the access methods, or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on this, see the Troubleshooting and support.)

An trace entry contains the received data. Check the format of this data. The correct format of the SNA defined field can be found in the Systems Network Architecture Formats (GA27-3136) manual.

A possible cause is that the remote system did not send a valid GDS variable. In this case, it may be necessary to obtain further diagnostic material from the remote system.

CSMT and Console

DFHRS2151   *date time applid* **Invalid data has been received during the resynchronization sequence on session** *sessid* **from remote system** *sysid*, **netname** *netname*, **protocol** *protocol*.

Explanation

The local system was attempting to receive data as part of a resynchronization sequence but the conversation was in the wrong state or an error FMH was received.

The remote system was attempting to initialize the connection for synclevel 2 work or to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

The failure implies one of the following:

- An error was detected by the remote system and it sent an error indication in an FMH7.

- An error occurred in the remote system

- A CICS logic error has occurred.

System action

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

If resynchronization was being attempted, it has failed and will be retried at the next opportunity.

User response

The sequence of resynchronization can be retried by issuing CEMT SET CONN(*sysid*) RESYNC.

Investigate the cause of the error using the system dump and any diagnostic information already issued by CICS, the access methods or the operating system.

Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

The trace entries show the state of the conversation with the remote system and the arrival of any error FMH indicating an error detected in the remote system. If necessary, obtain further diagnostic material from the remote system.

Destination

CSMT and Console

DFHRS2153   *date time applid* **An error has occurred while sending**

a system_restart request on session *sessid* to remote system *sysid*, netname *netname,* protocol *protocol*.

Explanation

An error has occurred during the transmission of a System_restart request to a remote system. CICS was attempting to resynchronize distributed resources following an earlier failure of a protected conversation during sync point processing.

This implies one of the following:

- The remote system has detected a protocol violation during the preceding exchange log names sequence.
- Some other error in communications has occurred.

System action

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

The cause of the error may be indicated by diagnostic information produced by the remote system. Diagnostics issued by the local system, the access method, or the operating system may indicate a reason for the failure. Format the system dump to show the control blocks belonging to the trace domain. (For guidance on how to do this, see the Troubleshooting and support.)

Determine from the message which session was being used for this exchange log names conversation.

If the internal trace table is available, use it to track the commands issued against the session reported in the message. Check that the state transitions of the user state machine are correct and that the conversation was in send state at the time of the error. If any of the state transitions are not valid, there may have been a CICS logic error.

DFHRS2155　　*date time applid* **Affinity changed by partner resource known as connection** *sysid***, netname** *netname***. Old LUNAME was** *old-*

*luname***, new LUNAME is** *new-luname***.**

Explanation

A change in the generic resource member associated with the partner system has occurred but the local system has resynchronization work to complete.

The local system has previously made contact with the generic resource known as connection *sysid* (netname *netname*), and synclevel(2) work has been exchanged with the assigned member, identified by *old-luname*. Since that time, the affinity with *old-luname* has been changed to *new-luname* by action in the remote system. Resynchronization of the synclevel(2) work cannot take place.

System action

No system action is taken, but subsequent messages may indicate an exchange log names failure which could prevent the connection being used for synclevel(2) work. Alternatively, messages may indicate that resynchronization work has subsequently been erased by CICS as a result of the XLNACTION setting on the connection definition.

User response:

Module:

7. *new-luname*

Destination

CSMT

DFHRS2156　　*date time applid* **A logic error occurred during resynchronization with system** *sysid***, netname** *netname***.**

Explanation

The CLS2 transaction was processing exchange lognames or resynchronization for a connected partner identified by a netname *netname*. The connection entry associated with this netname is *sysid*, and was

located and locked, but could not be unlocked in subsequent processing. This indicates a CICS internal logic error.

System action

A system dump is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

An ASQK abend is subsequently issued by the transaction processing the resynchronization, and a transaction dump is taken.

User response

The condition indicates an error in the CICS table manager (which may have produced its own exception trace records), or in the resynchronization program itself. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCRRSY

DFHRTnnnn messages

DFHRT0001   *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the z/OS MVS System Codes manual.

Next, look up the CICS abend code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

5. *netname*

Destination

CSMT

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

For further information about *code*, see the Troubleshooting and support.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

3. *X'offset'*
4. *modname*

Destination

Console

DFHRT0002   *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain.

In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname,* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

DFHRT4401	*time applid* No transaction identification specified. Please try again.

Explanation

The terminal operator has not entered an identifier for this transaction.

System action

CICS processing continues.

User response

Enter a valid transaction identifier.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4402	*time applid* You cannot use a Program Function key to start transactions on other systems.

Explanation

Program function keys cannot be used to initiate a transaction on another system using the routing transaction (CRTE).

System action

CICS processing continues.

User response

Enter a valid transaction identifier.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4403	*time applid* The routing session to system *sysid* has been terminated. Further transactions will not be routed to the connected system.

Explanation

The routing session has been terminated. Subsequent transaction identifiers will not be shipped to the connected system.

System action

CICS processing continues without the connection to system *sysid*.

User response

If you need to use system *sysid*, investigate why the routing session has terminated.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4404	*time applid* Please change format of request to CRTE SYSID=XXXX,TRPROF=YYYYYYYY.

Explanation

The request to the routing transaction CRTE contained incorrect syntax.

System action

CICS processing continues.

User response

Reenter the request to the routing transaction CRTE using the correct syntax.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4405   *time applid* **System *sysid* cannot be found. Please check that you have used the correct system name.**

Explanation

System *sysid* is not defined to CICS.

System action

CICS processing continues.

User response

Check that you have used the correct system name. Either reenter the request specifying the correct system name, or define system *sysid* to CICS.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4406   *time applid* **System *sysid* is released, back-level or is not in service.**

Explanation

The system *sysid* is released, back-level or is not in service.

System action

CICS processing continues. If a routing session had been established before the connection became unavailable, it remains in force until the user enters CANCEL. If the connection becomes usable before this, transactions are again routed. If this message is in response to the initial CRTE command, no routing session is in force and no routing is attempted for subsequent terminal input. If you are using IPIC with the CRTE transaction, the partner system is running a CICS release that does not support this routing service.

User response

If MRO is being used, wait until system *sysid* becomes available. Enter CANCEL to terminate an existing routing session. If IPIC is being used, verify that the CICS systems are at a release level where transaction routing over IPIC connections is supported. This support is in CTS 4.1 and higher level systems. Consider setting up MRO connections between the CICS systems.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4407   *time applid* **This system does not include support of Intersystem Communication.**

Explanation

The system has not been generated with support for intersystem communication.

System action

CICS processing continues without support for intersystem communication.

User response

Generate the system with support for intersystem communication.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4408   *time applid* **Terminal *termid* is not of the type supported by routing transaction *tranid*.**

Explanation

The routing transaction does not support the type of terminal being used.

System action

CICS processing continues without support for terminal *termid*.

User response

Use a terminal of the type supported by the routing transaction, that is, a 3270 display terminal or a console.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4409   *time applid* **The routing session to system *sysid* has been started.**

Explanation

The routing session has been started.

System action

CICS processing continues.

User response

None.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4410   *time applid* **System *sysid* is unavailable. The routing session to it is terminated.**

Explanation

The routing transaction has been terminated because the system became unavailable. Subsequent transaction identifiers will not be shipped to the connected system.

System action

CICS processing continues.

User response

If appropriate, re-enter the transaction when the routing session to system *sysid* becomes available.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4411   *time applid* **The Communication Profile cannot be found.**

Explanation

The profile, specified for a transaction invoked from the terminal to which the message is directed, is not defined to CICS.

System action

CICS stops initialization of the transaction.

User response

Define the communication profile to CICS and reinvoke the transaction. For further information on how to define the profile, refer to the CICS documentation.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4412   *time applid* **The transaction code is not defined on the remote system.**

Explanation

A transaction identification, routed to a remote CICS system, is not an installed transaction definition in the remote system. CICS directs this message to the terminal at which the transaction identification was entered.

This message is similar to DFHAC2001 in a local system.

System action

CICS stops initialization of the transaction.

User response

Enter a valid transaction ID, or install the transaction on the remote system.

Module:
DFHZTSP, DFHAPRR

Destination

Terminal End User

DFHRT4413	*time applid* **The transaction has been disabled on the remote system.**

Explanation

A transaction, routed to a remote CICS system, is disabled in the installed transaction definition of the remote system. CICS directs this message to the terminal at which the transaction identification was entered.

This message is similar to DFHAC2008 in a local system.

System action

CICS stops initialization of the transaction.

User response

Enable the transaction on the remote system.

Module:
DFHZTSP, DFHAPRR

Destination

Terminal End User

DFHRT4414	*time applid* **Transaction** *tranid* **cannot run. CICS shutdown is in progress in the remote system.**

Explanation

A transaction *tranid* was routed to a remote CICS system that was being quiesced. CICS directs this message to the terminal at which the transaction identification was entered.

This message is similar to DFHAC2007 in a local system.

System action

The remote CICS system continues quiescing.

User response

Reenter the transaction when the remote CICS system is in normal execution mode.

Module:

DFHZTSP, DFHAPRR

Destination

Terminal End User

DFHRT4415	*time applid* **Transaction CXRT was invoked directly by terminal input. This is not allowed.**

Explanation

The transaction code CXRT, which is reserved for an internal CICS transaction, was entered from a terminal.

System action

The transaction is run with no effect.

User response

Do not enter transaction code CXRT at a terminal.

Module:
DFHCRT

Destination

Terminal End User

DFHRT4416	*date time applid* **Abend** *abcode* **has occurred in the** *{Dynamic	Distributed}* **Routing Program. Module name:** *modname*.

Explanation

Either the dynamic routing program or the distributed routing program has abnormally terminated with abend code *abcode*.

System action

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

User response

See the description of abend code *abcode* for further guidance.

If the code is not a CICS transaction abend code, it is a user abend code. Request an explanation from the programmer responsible for this area.

Module:
DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *abcode*
5. Value chosen from the following options:

   1=Dynamic,

   2=Distributed

6. *modname*

Destination

CSMT

DFHRT4417	*date time applid* Abend *abcode* in *modname* - *{Dynamic | Distributed}* routing program must be AMODE=31.

Explanation

CICS has failed to link to EITHER the dynamic routing program OR the distributed routing program because it is not AMODE 31.

System action

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

User response

Recompile, reassemble, and link edit the dynamic routing program to AMODE 31.

Module:
DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *abcode*
5. *modname*
6. Value chosen from the following options:

   1=Dynamic,

   2=Distributed

Destination

CSMT

DFHRT4418	*date time applid* Abend *abcode* in *modname* - *{Dynamic | Distributed}* routing program resource definition not found.

Explanation

CICS was unable to find a PROGRAM resource definition for EITHER the dynamic routing program OR the distributed routing program.

System action

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

User response

Ensure that EITHER

1. the dynamic routing program specified by the system initialization parameter DTRPGM=*program name*, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(*program name*) has been correctly defined to CICS
2. the distributed routing program specified by the system initialization parameter DSRTPGM=*program name*, or specified via the EXEC CICS SET SYSTEM DSRTPROGRAM(*program name*) has been correctly defined to CICS

Module:
DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *abcode*
5. *modname*

   2=Distributed

Destination

CSMT

DFHRT4419	*date time applid* **Abend** *abcode* **in** *modname* **- Fetch for** *{dynamic	distributed}* **routing program failed.**

Explanation

CICS was unable to load EITHER the dynamic routing program or. the distributed routing program.

System action

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

User response

Ensure that EITHER

1. the dynamic routing program specified by the system initialization parameter DTRPGM=*program name*, or specified via the EXEC CICS SET SYSTEM DTRPROGRAM(*program name*) has been correctly defined. Ensure that it is also in a load library accessible to CICS.
2. the distributed routing program specified by the system initialization parameter DSRTPGM=*program name*, or specified via the EXEC CICS SET SYSTEM DSRTPROGRAM(*program name*) has been correctly defined. Ensure that it is also in a load library accessible to CICS.

Module:

DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *abcode*
5. *modname*
6. Value chosen from the following options:

   1=dynamic,

   2=distributed

Destination

CSMT

DFHRT4420	*date time applid* **Abend** *abcode* **in** *modname* **- Link to the** *{dynamic	distributed}* **routing program failed.**

Explanation

An unexpected return code was returned from the link to the dynamic routing program.

System action

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - a PGMIDERR condition is returned to the program issuing the Link command.
3. Non-terminal dynamically routed start requests - normal transaction abend processing continues unless the abend is during task termination. In this case message DFHRT4423 is issued.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHAPRT, DFHEIIC, DFHEPC, DFHICXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *abcode*

6. Value chosen from the following options:

   1=dynamic,

   2=distributed

Destination

CSMT

DFHRT4421   *date time applid* **Unable to Delete remote Terminal** *termid* **that is connected to system** *sysid***.**

Explanation

A transaction could not be started because the remote terminal definition for *termid*, system *sysid* was flagged for deletion but the DELETE failed. This might indicate a transaction looping on the terminal.

System action

The user transaction abends with abend code AZTI.

User response

See the associated DFHZCxxxx messages for further guidance. Once corrected, you can attempt to run the transaction again.

Module:
DFHZTSP

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *termid*

5. *sysid*

Destination

CSMT and Console

DFHRT4422   *time applid* **The connection to system** *sysid* **does not support transaction routing. Please check that you have used the correct system name.**

Explanation

The connection to system *sysid* is not an MRO or APPC connection.

System action

CICS processing continues.

User response

Check that you have used the correct system name. Either reenter the request specifying the correct system name, or define the connection to system *sysid* as an MRO or APPC connection.

Module:
DFHRTE

Destination

Terminal End User

DFHRT4423   *date time applid* **An error has occurred while attempting to invoke the distributed routing program.**

Explanation

An error has been detected while attempting to invoke the distributed routing program for a non-terminal start request. This error would normally result in a transaction abend but in this case no abend is issued because doing so would result in the task being suspended indefinitely.

System action

None

User response

See the preceding DFHRTxxxx messages for further guidance.

Module:
DFHICXM

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

Destination

CSMT and Console

DFHRT4424   *time applid* **Use of EDF is not supported with IPIC communication to system** *sysid***. The routing session is still active.**

To terminate the routing session type CANCEL.

Explanation

There has been an attempt to use EDF with transaction routing to the system identified and IPIC communication is in use to that system. Use of EDF with IPIC communication is not supported to system *sysid* The system identified is running a CICS release which does not support use of EDF with IPIC communication.

System action

CICS processing continues. If a CRTE routing session had been established, it remains in force until the user enters CANCEL.

User response

Consider setting up an MRO or ISC connection between the CICS systems, or use EDF from a terminal which is locally attached to the system identified.

Module:
DFHRTE

DFHRUnnnn message

DFHRU2816   *applid* **Exit program** *progname* **is not available**

Explanation

The user-defined global exit program, *progname*, is

- not defined, or
- disabled, or
- missing from the program library.

System action

CICS abnormally terminates the recovery control restart task with transaction abend ARCB. CICS then terminates abnormally.

User response

Make program *progname* available.

Module:
DFHRCEX

XMEOUT parameters/Message inserts

1. *applid*
2. *progname*

Destination

DFHRT4480   *time applid* **The CSSF transaction is no longer supported. Please use CESF.**

Explanation

A user has attempted to run the CSSF transaction. The CSSF transaction is only invoked internally by CICS for CRTE cancel processing.

System action

The transaction terminates.

User response

Use the CESF transaction to sign off.

Module:
DFHRTC

Destination

Terminal End User

DFHRXnnnn messages

DFHRX0001	*applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHRXDM

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHRX0002	*applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname,* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:

2. *X'code'*
3. *modname*

Destination

Console

DFHRX0100I	*applid* RX domain initialization has started.

Explanation

This is an informational message indicating the start of RX domain initialization.

System action

Initialization continues.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHRXDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHRX0101I	*applid* RX domain initialization has ended.

Explanation

RX domain initialization has completed successfully.

System action

Initialization continues.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHRXDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHRX0102	*applid* Errors were encountered during initialization of the RX domain. Domain initialization has ended.

Explanation

Errors have been detected by the Resource Recovery Services (RX) domain during CICS initialization. Accompanying messages describe the nature of the errors.

System action

A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

User response

If your CICS system will not use any services that depend on Resource Recovery Services, no action is necessary. Otherwise, you will need to shut CICS down, and restart it once the problems identified by the earlier messages have been corrected.

Module:
DFHRXDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHRX0103	*applid* **An unexpected return code X'rc' was received from RRMS service xxxxxxxx.**

Explanation

An unexpected return code was received when CICS issued a request to Recoverable Resource Management Services (RRMS). The name of the RRMS service included in the message indicates the component of RRMS as follows:

CRGxxxx

Registration Services

CTXxxxx

Context Services

ATRxxxx

Resource Recovery Services (RRS)

This message may indicate a problem with RRMS.

System action

CICS continues, but - depending on the service and the return code - CICS services that depend on RRMS may not be available. Further messages will provide more information.

User response

Record the name of the RRMS service and the return code. RRMS return codes are documented in z/OS MVS Programming: Resource Recovery.

If you are unable to determine the cause of the problem from this information, you may need assistance from IBM. See Part 4 of the Troubleshooting and support for guidance on how to proceed.

DFHRX0104I	*applid* **The Resource Recovery Services (RRS) exit manager aaaaaaaaaaaaaaaa is now available.**

Explanation

This message is issued when CICS discovers that a Resource Recovery Services (RRS) exit manager is available. The insert *aaaaaaaaaaaaaaaa* is the name of the exit manager.

System action

CICS begins restart processing with RRS.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHRXDM

XMEOUT parameters/Message inserts

1. *applid*
2. *aaaaaaaaaaaaaaaa*

Destination

Console

DFHRX0105I	*applid* **The Resource Recovery Services (RRS) exit manager aaaaaaaaaaaaaaaa is now unavailable.**

Explanation

This message is issued when CICS discovers that a Resource Recovery Services (RRS) exit manager is unavailable. The insert *aaaaaaaaaaaaaaaa* is the name of the exit manager. Transactions which use RRS to coordinate their updates cannot be successfully executed.

System action

CICS continues. Message DFHRX0104 will be issued when the exit manager becomes available once more.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHRXDM

XMEOUT parameters/Message inserts

1. *applid*

2. *aaaaaaaaaaaaaaaa*

Destination

Console

DFHRX0106I   *applid* **Restart processing with Resource Recovery Services (RRS) is beginning.**

Explanation

This message is issued when CICS begins restart processing with Resource Recovery Services (RRS).

System action

CICS continues.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHRXDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHRX0107I   *applid* **Restart processing with Resource Recovery Services (RRS) has ended.**

Explanation

This message is issued when restart processing with Resource Recovery Services (RRS) ends. If RRS has become unavailable during restart processing (indicated by message DFHRX0105) restart processing may be incomplete.

System action

CICS continues. If RRS has become unavailable, CICS will resume restart processing when RRS becomes available once more.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHRXDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHRX0108   *date time applid* **Log name mismatch with Resource Recovery Services. Expected Log name *logname*. Received Log name *logname*.**

Explanation

During the exchange of log names with Resource Recovery Services (RRS), which occurred when RRS restarted, this system's memory of RRS's log name did not match the log name retrieved from RRS. RRS may have performed a cold start.

System action

CICS execution continues. Units of work that are awaiting resynchronization with RRS will not be resolved automatically.

User response

The associated units of work may need to be resolved by using CEMT SET UOW. The message should not recur.

Module:
DFHRXDM

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *logname*

5. *logname*

Destination

CSMT and Console

DFHRX0109   *date time applid* **Invalid pass token received on connection** *sysid* **session** *termid***.**

Explanation

A batch program using the extended External CICS Interface (EXCI) has issued a DPL request which does not include the SYNCONRETURN option. However, the value of the pass token received from the batch region does not match that which was lodged with Recoverable Resource Management Services (RRMS) in the batch region.

System action

DFHRXUW provides console message DFHRX0002, and possibly a system dump (depending on the options in the dump table). The transactional DPL request will not be processed, and the batch job which issued the request may be suspended until it times out.

User response

Investigate why the pass token was incorrect. It is possible that an unauthorized user has attempted to guess the value of the pass token in order to influence the outcome of a Unit of Work that has expressed interest in an RRMS Unit of Recovery.

If you are satisfied that there has been no attempt to interfere with the pass token, you may need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHRXUW

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *sysid*
5. *termid*

Destination

CSCS and Console

DFHRX0110   *applid* **Restart processing with Resource Recovery Services (RRS) was attempted on the wrong system.**

Explanation

Resource Recovery Services (RRS) has rejected a request to begin restart processing because there is incomplete recoverable work associated with this CICS applid on another system in the sysplex.

System action

CICS execution continues, but CICS services that depend upon RRS will not be available until the problem is corrected.

User response

If your CICS system will not use any services that depend on RRS, no action is necessary. Otherwise, close CICS down and restart it on the correct system in the sysplex. Use the RRS ISPF panels to scan the RRS Resource Manager Data log in order to find the correct system on which to restart CICS.

If, for some reason, you cannot restart CICS on another system in the sysplex, you can take the following steps. However, if you do so, resources may be out of synchronization:

1. Use the RRS Unit of Recovery list panels to force completion of the incomplete recoverable work
2. Restart CICS or RRS
3. Force any CICS units of work that are awaiting resolution from RRS.

Module:
DFHRXDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHRX0111   *applid* **Resource Recovery Services (RRS) has lost logged data. Resynchronization information may be missing.**

Explanation

While attempting to recover resynchronization information from its logs, Resource Recovery Services (RRS) has discovered that some data is missing. This is due to a problem with the RRS log streams.

System action

CICS restart processing with RRS continues, but RRS may not be able to provide a decision for all indoubt units or work. In these cases, updates to local resources will be committed or backed out according to the ACTION attribute in the corresponding transaction definition.

The Recovery Manager domain will issue one of the following messages for each unit of work affected, indicating the outcome:

> DFHRM0112
> DFHRM0113

User response

Use the information provided in the Recovery Manager message to decide what action is needed. You may need to take steps to resynchronize resources in local and remote systems.

Module:
DFHRXDM

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHRZnnnn messages

DFHRZ0001	*applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively:

- Unexpected data has been input,
- Storage has been overwritten, or
- There has been a program check within a user program.

The code *aaa* is, if applicable, a 3-digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code *bbbb*, which follows *aaa*, is a user abend code produced either by CICS or by another product on the user's system.

If X'*offset*' contains the value X'FFFF', then module *modname* was in control at the time of the abend, but the program status word (PSW) was not addressing this module.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer.

Look up the MVS code *aaa*, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If the *modname* insert contains the value *????*, then CICS was unable to determine which module has abnormally terminated. In this case, examine the system dump to determine which area of code has caused the program check.

The user should examine other messages to determine what the module which issued this message was doing at the time the abend occurred. From these messages they can deduce which product has produced the abend code *bbbb*. If *bbbb* is identified as a CICS code, it may be either alphameric or numeric.

- If the CICS code is alphameric (for example AKEA) then it is a CICS transaction abend code.
- If the CICS code is numeric (for example 1310), it refers to a CICS message (DFHTS1310 in our example).

If the user abend code is from another product (for example, IMS), refer to the appropriate messages and codes manual to determine the cause of the abend.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response.

Note:

The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the Configuring.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

Console

DFHRZ0002	*APPLID* **A severe error (code** ***X'code'***) **has occurred in module** ***module*.**

Explanation

The RZ domain has received an unexpected error response from some other part of CICS. The operation requested by recovery manager is described by code X'*code*'.

For further information about CICS exception trace entries, refer to the Troubleshooting and support.

System action

A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Investigate the cause of the problem as follows:

1. Determine if the problem can be explained by any previous messages issued from some other CICS component.
2. Examine the symptom string.
3. Examine the dump.

If you cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHRZRT1, DFHRZRT2, DFHRZDM, DFHRZRM, DFHRZRG2

XMEOUT parameters/Message inserts

1. *APPLID*
2. *X'code'*
3. *module*

Destination

Console

DFHRZ0201	*date time applid* **The call to invoke the Distributed Routing Program,** ***program*,** **has failed. The program was not defined.**

Explanation

An error occurred when attempting to link to the Distributed Routing Program, identified by the DSRTPGM SIT parameter.

System action

A ARZU dump may be produced depending on type of failure.

User response

Ensure that the Distributed Routing Program is available to the system. It must be defined to Program Manager and it must be present in the DFHRPL library concatenation. Alternatively, name a new Distributed Routing Program using SET SYSTEM DSRTPROGRAM or from CEMT.

Module:
DFHRZRT2

4. *program*

Destination

CSSH

DFHRZ0203   *date time applid* **The call to invoke the Distributed Routing Program,** *program*, **has failed. The Distributed Routing Program has abnormally terminated with abend Code** *abcode*.

Explanation

The Distributed Routing Program has abnormally terminated with abend code *abcode*.

System action

1. Transaction Routing - normal transaction abend processing continues.
2. Dynamic Distributed Program Link - an abended condition is returned to the calling program.

User response

See the description of abend code *abcode* for further guidance.

If the code is not a CICS transaction abend code, it is a user abend code. Request an explanation from the programmer responsible for this area.

Module:
DFHRZRT2

CSSH

DFHRZ0205   *date time applid* **The call to invoke the Distributed Routing Program, *program*, has failed. The program was not loadable.**

Explanation

An error occurred when attempting to link to the Distributed Routing Program, identified by the DSRTPGM SIT parameter.

System action

An ARZU dump may be produced depending on type of failure.

DFHSHnnnn messages

DFHSH0001   *applid* **An abend (code *code*) has occurred at offset *X'offset'* in module *module*.**

Explanation

An unexpected program check or abend occurred with abend code *aaa/bbbb*.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset X'*offset*' in module *modname*. This may have been caused by corruption of CICS code or control blocks.

System action

A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Investigate the cause of the program check or abend using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

User response

Ensure that the Distributed Routing Program is available to the system. It must be defined to Program Manager and it must be present in the DFHRPL library concatenation. Alternatively, name a new Distributed Routing Program using SET SYSTEM DSRTPROGRAM or from CEMT.

CSSH

DFHSH0105   *date time applid* **Request (Id: *requestid*, Processtype: *processtype*, Processname: *processname*, Activityname: *activityname*, Transaction: *tranid*) cannot be serviced. It will be retried every minute and will be purged after 24 hours if not serviced then.**

Explanation

A request cannot be serviced immediately. This is either because the Distributed Routing Program, identified by the DSRTPGM SIT parameter, has returned a response which indicates that it is unable to route a request, or a temporary error occurred during an attempt to service the request locally.

The request is identified by the request id *id* (the key of the request on the Local Request Queue data set (DFHLRQ)), the process type *processtype*, the process name *processname*, the activity name *activityname*, and the transaction id *tranid*.

System action

No dumps are taken. The request is marked unserviceable, and is then retried every minute until it is either serviced, or 24 hours have elapsed in which case the request is purged and message DFHSH0107 issued.

Message DFHSH0106 is issued once every hour while the request cannot be serviced. If the request is serviced successfully, message DFHSH0108 is issued.

User response

Investigate why the request cannot be serviced. This may be caused by one of the following:

- The local request queue is unavailable.
- The request refers to a resource (activity or process) which is unavailable.

- The system to which the request is to be routed is down, or the link is down.
- The Distributed Routing Program is failing or is returning an invalid target system.

Module:
DFHSHRM

DFHSH0106   *date time applid* **Request (Id:** *requestid***, Processtype:** *processtype***, Processname:** *processname***, Activityname:** *activityname***, Transaction:** *tranid***) still cannot be serviced. It will be retried every minute and will be purged after** *hours* **hours if not serviced successfully.**

Explanation

Following message DFHSH0105, this message is issued every hour while a request cannot be successfully serviced.

The request is identified by the request id *requestid* (the key of the request on the Local Request Queue data set (DFHLRQ)), the process type *processtype*, the process name *processname*, the activity name *activityname*, and the transaction id *tranid*.

System action

No dumps are taken. The request continues to be retried every minute until it is either serviced successfully, or 24 hours have elapsed since message DFHSH0105 was issued, in which case the request is purged and message DFHSH0107 is issued.

User response

See message DFHSH0105.

DFHSH0109	*date time applid* **An error has occurred when attempting to access the Local Request Queue data set (DFHLRQ). *{The file could not be found.	The file was closed.	The file was disabled.	There was insufficient space.	An I/O error occurred.	The data set is being copied.}* The Local Request Queue is now unavailable.**

Explanation

One of the following errors was detected when attempting to access the Local Request Queue data set (DFHLRQ):

- The file could not be found.
- The file was closed.
- The file was disabled.
- There was insufficient space.
- An I/O error occurred.
- The dataset is being copied.

System action

The Local Request Queue is made unavailable. CICS then attempts to access the data set every minute. If successful, message DFHSH0110 is issued to indicate the data set is now available.

User response

Investigate the error which caused the Local Request Queue to be made unavailable.

Module:
DFHSHRE, DFHSHRQ, DFHSHSY

XMEOUT parameters/Message inserts

1. *date*

Destination

Console

DFHSI1530   *applid* **Purge of non-executable ATI request inoperative.**

Explanation

CICS is unable to initiate the CRSQ task to delete automatic transaction initiation (ATI) requests from the system when those requests are not honored for longer than the ATI purge delay interval.

System action

System initialization continues.

User response

If ATI purge is required, ensure that the CRSQ task is available next time CICS is initialized.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSI1531   *applid* **Terminal control incompatibility.** *macro* **VTAM return code:** *retcode* **error code:** *errcode* **(modname: DFHZRPL).**

Explanation

CICS found an inconsistency during the initialization of terminal control. *macro* is the name of the failing

VTAM macro. *retcode* is the VTAM hexadecimal return code in Register 15. *errcode* contains the contents of Register 0, which is the associated error code in hexadecimal. Refer to the z/OS Communications Server: SNA Programming manual for a complete description of the VTAM return code *retcode* and the VTAM error code *errcode*.

The probable cause of this inconsistency is that VTAM=YES was specified (perhaps by default) in the SIT, but the VTAM macros GENCB and SHOWCB are not available.

System action

After issuing this message, CICS system initialization abnormally terminates with a system dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the VTAM return code and error code to determine the cause of failure in the VTAM macro *macro*. Correct the error using the z/OS Communications Server: SNA Programming manual, and restart CICS.

Module:
DFHZRPL

DFHSI1539	*Applid* **Error attaching the CESC (Terminal Timeout) transaction.**

Explanation

The CESC transaction failed to start during initialization of an alternate XRF region. Although CICS continues to initialize, terminals left signed on after the takeover are not timed out.

System action

A dump is produced and CICS continues initialization. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the dump to investigate why the transaction could not be started. It may be that the system was short on storage or that the transaction has been disabled.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts

1. *Applid*

Destination

Console

DFHSI1542	*applid* **Takeover by the CICS alternate system has failed. Emergency restart could not be performed.**

Explanation

This CICS alternate system is attempting to take over from its associated active CICS system but the recovery manager component has indicated that an initial start is required because of a system log failure.

System action

CICS is abnormally terminated and a dump is provided. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Look for console messages issued by the active CICS system which indicate the nature of the log failure. If no such messages have been issued, an internal CICS error may have occurred. In this case you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSII1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSI1543   *applid* **Time-Of-Day clock inoperative.**

Explanation

System initialization was unable to establish the time-of-day clock values for CICS.

System action

CICS is abnormally terminated and a dump is provided.

User response

The time-of-day clock is external to CICS execution and may have been disabled. Enable the time-of-day clock and restart CICS.

Module:
DFHSII1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSI1547   *applid* **Notification of a default qualified LUNAME to the recovery manager domain has failed.**

Explanation

CICS is running with VTAM=NO, or an attempt to open the VTAM ACB has failed.

If VTAM=NO is specified, CICS uses the UOWNETQL system initialization parameter to form a default qualified LUNAME to pass to the recovery manager. If the VTAM ACB failed to open, CICS uses UOWNETQL to form the default qualified LUNAME. If UOWNETQL has not been specified, CICS sets UOWNETQL to the invalid value '9UNKNOWN' to highlight the problem.

An attempt was then made to transfer the default qualified LUNAME of the system to the recovery manager domain for use in constructing unit of work (UOW) identifiers. The attempt failed, indicating a serious error.

System action

CICS continues. UOW identifiers constructed by the recovery manager domain do not contain a qualified luname.

User response

Keep the exception trace data produced by the recovery manager domain. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSIF1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSI1548   *applid* **After opening the VTAM ACB, CICS has failed to transfer the fully qualified LUNAME to the recovery manager domain.**

Explanation

The VTAM ACB was opened by CICS to allow communication via VTAM. An attempt was then made to transfer the fully qualified LUNAME of the system. The LUNAME is provided to the recovery manager domain by VTAM for use in constructing unit of work (UOW) identifiers. The attempt failed, indicating a serious error.

System action

CICS continues. Unit of work identifiers constructed by the recovery manager domain do not contain a fully qualified LUNAME.

User response

Keep the exception trace data produced by the recovery manager domain. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZSLS

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSI1549	*applid* **Logic error when building TCT module list.**

Explanation

The format of the modules DFHZCA, ZCB, ZCP, ZCW, ZCX, ZCY, ZCZ and ZCXR was not as expected.

System action

CICS is abnormally terminated and a dump is provided.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Possible reasons for this message are:

1. The modules listed were generated without VTAM facilities, but the system initialization table (SIT) specifies VTAM=YES.
2. The entry points of the listed modules are incorrect.
3. The module list in each of the listed modules is incorrect.

If reason 1, correct the error. Otherwise, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSIF1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSI1550	*applid* **A severe error has occurred while making a *domain* domain call with response (*X'response'*) and reason (*X'reason'*).**

Explanation

An unexpected error was returned from the specified domain. The response and reason codes are given.

System action

A system dump is taken, unless the failing domain has previously taken diagnostics.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system administrator. This failure indicates a serious error in CICS.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSII1

XMEOUT parameters/Message inserts

1. *applid*
2. *domain*
3. *X'response'*
4. *X'reason'*

Destination

Console

DFHSI1551	*applid* **The CICS region userid *userid* is not authorized to use the PLTPIUSR parameter userid *userid*. Initialization cannot continue, so CICS is terminated.**

Explanation

The userid specified in the job control statements for the CICS region is not authorized to use the userid specified in the PLTPIUSR system initialization parameter.

System action

CICS initialization terminates.

User response

Ensure that the correct userid is specified for PLT processing.

Ensure that the userid for the CICS region has the necessary authorization. This may require the assistance of a security administrator.

When the necessary corrections have been made rerun the CICS job.

Module:
DFHSII1

XMEOUT parameters/Message inserts

1. *applid*
2. *userid*
3. *userid*

Destination

Console

DFHSI1552	***applid* Userid *userid* specified for the PLTPIUSR parameter has not been defined correctly to the external security manager (ESM). SAF codes are (*X'safresp'*,*X'safreas'*). ESM codes are (*X'esmresp'*,*X'esmreas'*).**

Explanation

The userid specified for the PLTPIUSR initialization parameter has been defined incorrectly.

System action

CICS terminates abnormally with a dump.

User response

Ensure that the desired userid is specified for PLT processing and that external security manager (ESM) definitions have been specified correctly.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the z/OS MVS Programming: Authorized Assembler Services Guide and in z/OS Security Server RACROUTE Macro Reference (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Correct the errors and restart CICS.

Module:
DFHSII1

XMEOUT parameters/Message inserts

1. *applid*
2. *userid*
3. *X'safresp'*

4. *X'safreas'*
5. *X'esmresp'*
6. *X'esmreas'*

Destination

Console

DFHSI1553	***applid* The unit of work network qualifier specified via the UOWNETQL parameter contains invalid characters or begins with a number. A dummy qualifier is substituted.**

Explanation

The UOWNETQL system initialization parameter has been specified incorrectly. The UOWNETQL parameter must consist of uppercase letters (A through Z), or numbers in the range 0 through 9. The first character must be a letter.

CICS is running with VTAM=NO, or an attempt to open the VTAM ACB has failed.

When VTAM=NO is specified, CICS uses UOWNETQL to form a default qualified LUNAME to pass to the recovery manager.

If the VTAM ACB fails to open, CICS uses UOWNETQL to form the default qualified LUNAME.

System action

CICS continues but with the UOWNETQL deliberately set to the invalid value '9UNKNOWN' to highlite the problem.

User response

Correct the UOWNETQL system initialization parameter.

Module:
DFHSIF1

1. *applid*

Destination

Console

DFHSI1556	***applid* SKRP *{A	F} x* disabled due to extension of PGRET value.**

Explanation

The new PGRET value supplied as an initialization option has caused all the single-key retrieval values to be rebuilt. The value shown in the message exceeds 16 bytes. *x* can be a value 1 through 3 for A and 1 through 12 for F.

System action

The key given in the message (PA1-PA3 and PF1-PF12 respectively) is disabled.

User response

If it has been specified (by PARM) that initialization overrides can be entered by means of the console, the opportunity will be given to re-enter the PGRET and/or the SKR*xxxxx* initialization option.

Module:
DFHPASY

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

    1=A,

    2=F

3. *x*

Destination

Console

DFHSI1558   *applid* **Program** *progname* **cannot be found.**

Explanation

Program *progname* is essential for CICS to initialize correctly, but was not defined in a group referenced by the group list specified in the startup job stream.

System action

A dump is provided and CICS is terminated.

User response

Ensure that the program is defined in a group referenced by the group list specified in the startup job stream.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts

1. *applid*
2. *progname*

Destination

Console

DFHSI1559   *applid* **Profile DFHCICSE cannot be found.**

Explanation

The DFHCICSE profile is essential for CICS to initialize correctly. However it was not defined in the group list specified in the startup job stream.

System action

A dump is provided and CICS is terminated.

User response

Ensure that the DFHCICSE profile is defined in the group list specified in the startup job stream. A definition of DFHCICSE is provided in the DFHSTAND group on the CICS system definition (CSD) file.

Module:
DFHXCPA, DFHSIJ1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSI1562   *applid* **Unable to initialize application domain statistics.**

Explanation

During CICS initialization, an error was detected while the application domain (AP) statistics control module, DFHSII1, was being initialized. This could indicate a problem with the AP component of CICS.

System action

An exception trace entry is made in the trace table and CICS terminates abnormally with a system dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This error may have occurred because of an earlier error detected by the kernel (KE) domain of CICS. Look for earlier messages from the KE domain beginning DFHKE*xxxx*, CICS trace table entries with the prefix KE and a dump. These indicate the type of error and the action that should be taken.

If no earlier error is detected by the KE component, DFHSII1 makes an exception entry in the trace table (id=X'0700') and terminates CICS abnormally with code=1562 and with a system dump. In this case you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHSI1574   *APPLID* **TCTUA Subpool not added in DFHZRPL. CICS initialization cannot continue.**

Explanation

An attempt to add a subpool by the storage manager has failed. Module DFHZRPL has failed in an attempt to add a subpool for use by the TCTUA's associated with non-VTAM terminals. Since it is necessary to have the subpool present for use when needed, this is a serious error.

System action

The initialization of the CICS system which tried to perform the addition of the subpool abends. If it was not able to add the subpool, then CICS is not able to execute properly.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZRPL

XMEOUT parameters/Message inserts

1. *APPLID*

Destination

Console

DFHSI1575   *APPLID* **Getmain failed for TCTUA subpool in module DFHZRPL. CICS initialization cannot continue.**

Explanation

The module DFHZRPL has failed in an attempt to GETMAIN an area of storage for use by the TCTUA

subpool. This subpool has already been added but no storage yet exists for it. This is a serious error.

System action

As a result of the GETMAIN failure so early in the initialization sequence, it is not possible to continue the CICS initialization. The CICS system which tried and failed to perform the GETMAIN terminates.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZRPL

3. *CANCEL*

Destination

Console

DFHSI1579D *applid* **Module *modname* { *PLT* | *connection* }program *progname* not found. Reply *GO* or *CANCEL*.**

Explanation

This message indicates that either a program defined in the post-initialization program list table (PLTPI) cannot be found, or a connection program used when connecting to CICSPlex SM, DBCTL, DB2 or MQ cannot be found. The attempt to invoke a connection program results from coding CPSMCONN=CMAS, or CPSMCONN=LMAS, or CPSMCONN=WUI, or DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES in the SIT.

For PLT programs, if the message is issued during the first PLT phase in initialization, the program does not exist in the CICS program library. If the message is produced during the post-initialization PLT phase, the program did not have a program entry which was installed and enabled, or the program was not found in the CICS program library.

For connection programs, the program did not have an installed program entry or was not found in the CICS program library.

modname indicates which of the modules issued the message. *progname* is the name of the program which cannot be found.

System action

If the response is 'CANCEL', CICS is terminated. If the response is 'GO', the program is bypassed.

User response

Reply 'CANCEL' or 'GO'.

Module:
DFHSIPLT

XMEOUT parameters/Message inserts

1. *applid*
2. *modname*
3. Value chosen from the following options:

   1= PLT ,

Destination

Console

DFHSI1580D *applid* **{ *PLT* | *Connection* }program *program-name* has abended, code *abcode*. Reply *GO* or *CANCEL*.**

Explanation

CICS was processing either the initialization program list table (PLT) when the PLT program *program-name* abended with abend code *abcode*, or was processing connection program *program-name* and it abended with abend code *abcode*.

System action

If the response is 'CANCEL', CICS is terminated. If the response is 'GO', the program is bypassed.

User response

Reply 'CANCEL' or 'GO'.

Module:
DFHSIPLT

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

    1= PLT ,

    2= Connection

3. *program-name*
4. *abcode*
5. *GO*
6. *CANCEL*

Destination

Console

DFHSI1582   *applid* **Local DLI PSBs present in the PDIR. CICS does not support local DLI.**

Explanation

CICS has detected that local PSBs are present in the user specified PDIR. CICS no longer supports local DLI. A PDIR is only required for remote DLI, and must contain only remote PSB definitions. A PDIR is not required for DBCTL.

System action

A CICS abend dump is produced, and CICS is terminated.

User response

If remote DLI is required, correct the PDIR by removing the local PSBs. Then reassemble and relinkedit the PDIR, and resubmit the CICS job.

If remote DLI support is not required, change the system initialization table (SIT) to specify PDIR=NO.

Module:
DFHSIH1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSI1589   *applid* **VTAM is not currently active.**

Explanation

CICS initialization cannot OPEN the VTAM access method control block (ACB) because VTAM is not active.

System action

If this is an alternate system, CICS waits for 15 seconds and retries the OPEN indefinitely.

If this is not an alternate system, CICS proceeds with the rest of initialization. The Open VTAM Retry transaction COVR is attached, and retries the OPEN every 5 seconds for ten minutes.

User response

In the case of an alternate, check that VTAM is on its way up. If it is not, you can cancel this alternate.

Module:
DFHSIF1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSI1590   *applid* **XRF alternate cannot proceed without VTAM.**

Explanation

CICS initialization cannot OPEN the VTAM access method control block (ACB). The ACB error code may be found in the preceding message DFHSI1572.

System action

CICS is terminated with a dump.

User response

Refer to DFHSI1572 and use the information to try and resolve the causes of the errors.

Module:
DFHSIF1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSI1591   *applid* **Unable to attach**
                  transaction CFCT.

Explanation

CICS initialization cannot attach transaction CFCT
which is used for file control replication logging.

System action

CICS is terminated with a dump.

User response

Keep the dump produced by CICS initialization. If
you need further assistance from IBM to resolve this
problem, see Working with IBM to solve your problem
for guidance on how to proceed.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHSI1592   *applid* **CICS applid not (yet) active**
                  to VTAM.

Explanation

CICS initialization cannot OPEN the VTAM access
method control block (ACB) because VTAM does not
recognize the APPLID (VTAM error X'5A'). There may
be a user error in the value of APPLID (for example, on
a SIT override) or the application subarea containing
APPLID may not be active in VTAM. Alternatively, it
may be possible that VTAM is still coming up. If so, the
problem may correct itself when VTAM completes its
initialization.

System action

If this is an alternate CICS, wait for 15 seconds and
retry the OPEN indefinitely. If this is not an alternate,
CICS proceeds with the rest of initialization.

User response

In the case of an alternate, check that VTAM is on its
way up. If it is, check that the required application
sub-area is active in VTAM. If it is, you may cancel this

alternate. If this is not an alternate, you can use CEMT
to retry the OPEN when CICS has initialized.

Destination

CSSL

DFHSI8434I   *applid* **Control returned from PLT programs during the third stage of initialization.**

Explanation

Control is returned to CICS to continue system initialization.

System action

Control is returned to CICS.

User response

None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Module:
DFHSIPLT

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSI8440I   *applid* **Initiating connection to *resmanager*.**

Explanation

CICS is about to connect to the specified resource manager immediately prior to running PLT programs during the third stage of initialization. The resource manager is CICSPlex SM, DBCTL, DB2 or MQ. Connection is initiated because CPSMCONN=CMAS, or CPSMCONN=LMAS, or CPSMCONN=WUI, or DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES was specified in the SIT.

System action

Control is passed to the resource manager connect program.

User response

None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Module:

DFHSIPLT

XMEOUT parameters/Message inserts

1. *applid*
2. *resmanager*

Destination

Console

DFHSI8441I	*applid* **Connection to** *resmanager qualifier* **successfully completed.**

Explanation

CICS has successfully connected to the specified resource manager immediately prior to running PLT programs during the third stage of initialization. The resource manager name is shown along with the resource manager qualifier.

System action

CICS processing continues.

User response

None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Module:
DFHSIPLT

XMEOUT parameters/Message inserts

1. *applid*
2. *resmanager*
3. *qualifier*

Destination

Console

DFHSI8442	*applid* **Connection to** *resmanager* **has failed.**

Explanation

CICS was unable to connect to resource manager *resmanager* immediately prior to running PLT programs during the third stage of initialization. The resource manager is DBCTL, DB2 or MQ. Connection was initiated because DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES was specified in the SIT.

System action

CICS processing continues.

User response

Refer to previous messages issued by CICS or the resource manager adapter to determine why the connection attempt failed.

Module:
DFHSIPLT

XMEOUT parameters/Message inserts

1. *applid*
2. *resmanager*

Destination

Console

DFHSI8443	*applid* **Connection to** *resmanager* **not completed. Adapter is awaiting initialization of** *resmanager*.

Explanation

CICS was unable to complete connection to resource manager *resmanager* immediately prior to running PLT programs during the third stage of initialization. The resource manager is DBCTL, DB2 or MQ. Connection was initiated because DBCTLCON=YES, or DB2CONN=YES, or MQCONN=YES was specified in the SIT.

The resource manager adapter is waiting for the resource manager to be initialized.

System action

CICS processing continues. The connection is completed when the resource manager is initialized, provided that the resource manager was defined to the system before the initial connection attempt.

User response

Refer to messages issued by the relevant resource manager adapter to determine when connection is completed.

Module:
DFHSIPLT

DFHSJnnnn messages

DFHSJ0001   *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An unexpected program check or abend occurred with abend code *aaa/bbbb*.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset X'*offset*' in module *modname*. This may have been caused by corruption of CICS code or control blocks.

System action

A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Investigate the cause of the program check or abend using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

If you cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:

DFHSJDM, DFHSJIN, DFHSJIS, DFHSJRM

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHSJ0002　　*applid* **A severe error (code *X'code'*) has occurred in module *module*.**

Explanation

The recovery manager domain has received an unexpected error response from some other part of CICS. The operation requested by recovery manager is described by code X'*code*'.

For further information about CICS exception trace entries, refer to the Troubleshooting and support.

System action

A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Investigate the cause of the problem as follows:

1. Determine if the problem can be explained by any previous messages issued from some other CICS component.
2. Examine the symptom string.
3. Examine the dump.

If you cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSJDM, DFHSJIN, DFHSJIS, DFHSJRM

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *module*

Destination

Console

DFHSJ0004　　*applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System action

An exception entry is made in the trace table.

A system dump is taken unless you have specifically suppressed the dump by a user exit program at the XDUREQ exit, in the dump table, or by global system dump suppression. CICS processing continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS has not terminated, you must decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message might have been caused by a long-running function and there might not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval that you have specified in the ICVR system initialization parameter. This means that execution of module *modname* is terminated and CICS continues.

If you have specified system initialization parameter ICVR=0 and you believe that module *modname* is looping, you must terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you believe that it was not a runaway, you should increase the value of the ICVR system initialization parameter. You have to close down CICS at a suitable time to do this permanently. You can change the ICVR time interval temporarily online using the CEMT transaction.

If increasing the value of ICVR does not solve the problem, you might need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

Console

DFHSJ0006   *applid* **AN UNEXPECTED ABEND HAS OCCURRED ON THE INITIAL PTHREAD TCB FOR NODEJSAPP:** *nodejsapp*.

Explanation

The initial pthread TCB for NODEJSAPP resource *nodejsapp* has abended unexpectedly.

System action

CICS attempts to take a system dump with dumpcode KERNDUMP.

User response

Investigate the cause of the program check or abend using the system dump and any previously output

diagnostic information provided by CICS, the access methods, or the operating system.

If you cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSJNDI

Destination

Console

DFHSJ0007   *applid* **Unexpected signal received by JVMSERVER:** *jvmserver*.

Explanation

The initial pthread TCB for JVMSERVER resource *jvmserver* has received a signal. This JVM server is not expected to be the target of external signals.

System action

None.

User response

The JVMSERVER resource *jvmserver* has been the target of a signal. The effect of the signal on the JVM depends on the type of signal that was sent.If the signal forces termination of the JVM then message DFHSJ0008 will also be issued.

No action is required, but this message could be used in a MSGID SLIP to capture a dump which can help identify the cause of the signal.

Module:
DFHSJPTI

Destination

Console

DFHSJ0008   *applid* **Unexpected termination of the JVM has been detected for JVMSERVER:** *jvmserver*.

Explanation

The initial pthread TCB for JVMSERVER resource *jvmserver* has detected that the JVM has unexpectedly terminated.

System action

None.

User response

The JVMSERVER resource *jvmserver* will become unresponsive and it will not be possible to restart it. You should cancel CICS if you cannot run without the JVM server.

Module:

DFHSJ0102I   *applid* **SJ domain initialization has ended.**

Explanation

The SJ domain initialized correctly.

System action

Initialization continues.

User response

```
None. The message can be suppressed with the
system initialization
parameter MSGLVL=0.
```

Module:

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSJ0103   *applid* **SJ domain initialization has failed.**

Explanation

The SJ domain did not correctly initialize.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. CICS could be shut down by the caller, for example, the domain manager, DFHDMDM. A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This message indicates a possible error in CICS code. The severity of its impact depends on the importance of the function that is being run at the time of the error.

CICS might not have been shut down. If the message occurs once and the domain is not crucial to the running of your CICS system, you can continue initialization and shut down CICS at a convenient time to resolve the problem.

If the message recurs or if you cannot continue without the full use of SJ domain, shut down CICS using a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

CSMT

DFHSJ0210   *date time applid* **An attempt to start a JVM for the JVMSERVER resource** *jvmserver* **has failed. Reason code:** *{JVMPROFILE_ERROR | OPEN_JVM_ERROR | JNI_CREATE_NOT_FOUND | SETUP_CLASS_NOT_FOUND | TERMINATION_CLASS_NOT_FOUND | CREATE_JVM_FAILED |*

CHANGE_DIRECTORY_CALL_FAILE D | WORK_DIR_READ_ONLY | ERROR_LOCATING_MAIN_METHOD | ATTACH_JNI_THREAD_FAILED | SETUP_CLASS_TIMEDOUT | ENCLAVE_INIT_FAILED | USS_WORKDIR_CHECK_FAILED | REDIRECT_IO_FAILED | ANGEL_UNAVAILABLE | ERROR_CODE_UNRECOGNIZED | WORKDIR_TOO_LONG}.

Explanation

An attempt to start a JVM for the JVMSERVER resource *jvmserver* has failed. The reason code provides further information about why the JVM failed to start:

ANGEL_UNAVAILABLE

The Liberty angel process is unavailable.

ATTACH_JNI_THREAD_FAILED

An attempt to attach a thread and run setup or termination classes in the JVM server has failed.

CHANGE_DIRECTORY_CALL_FAILED

An attempt to change the zFS working directory has failed.

CREATE_JVM_FAILED

An attempt to create a JVM has failed. Additional diagnostic messages have been output to the standard error stream.

ENCLAVE_INIT_FAILED

The Language Environment enclave failed to initialize successfully. Check for additional diagnostic messages in the standard error stream.

ERROR_CODE_UNRECOGNIZED

START_JVM returned an error that was not handled.

ERROR_LOCATING_MAIN_METHOD

An attempt to locate the main method within a setup or termination class has failed. An exception has been output to the standard error stream.

JNI_CREATE_NOT_FOUND

JNI Create has not been found. This error might occur because the JAVA_HOME value in the JVM profile does not specify the correct Java installation location.

JVMPROFILE_ERROR

An error occurred when processing the JVM profile. Additional diagnostic messages have been output to the standard error stream. The standard

error stream is usually redirected to the location on zFS specified by the WORK_DIR parameter of the JVM profile. However, for early failures prior to redirection, the standard error stream might be located in SYSPRINT, or in the CICS log as a dynamically generated DD name.

OPEN_JVM_ERROR

An error occurred when opening the JVM DLL. This error might occur because the JAVA_HOME value in the JVM profile does not specify the correct Java installation location.

REDIRECT_IO_FAILED

An attempt to redirect stdout, stderr, or jvmtrace output for the JVM has failed. Additional diagnostic messages have been output to the standard error stream either on zFS, in SYSPRINT, or in the CICS log as a dynamically generated DD name.

SETUP_CLASS_NOT_FOUND

A setup class specified in the JVM profile cannot be found. An exception has been output to the standard error stream.

SETUP_CLASS_TIMEDOUT

A setup class did not return in a reasonable amount of time and was therefore canceled.

WORK_DIR_READ_ONLY

An attempt to write to the USS working directory has failed. The most likely reason is that the CICS job has read access only to the directory specified by WORK_DIR in the JVM profile.

TERMINATION_CLASS_NOT_FOUND

A termination class specified in the JVM profile cannot be found. An exception has been output to the standard error stream.

USS_WORKDIR_CHECK_FAILED

An attempt to write to the USS working directory has failed. This might be because the file system is full, or because the CICS region lacks sufficient authority to write to the directory specified by WORK_DIR in the JVM profile.

USS_WORKDIR_TOO_LONG

The value of the WORKDIR entry in the JVM profile is greater than the maximum supported value.

System action

CICS was unable to create the JVM and returns an error to the calling module.

User response

Examine reason code *msg_reason* to determine why the JVM creation failed and, if required, perform one of the following user actions:

JVMPROFILE_ERROR

Use the additional messages in the standard error stream to determine the cause of the problem. The messages that are output prior to the redirection can be found either in SYSPRINT or in a dynamically generated DD name in the CICS log.

OPEN_JVM_ERROR

Check that the JAVA_HOME value in the JVM profile specifies the correct Java installation location.

JNI_CREATE_NOT_FOUND

Check that the JAVA_HOME value in the JVM profile specifies the correct Java installation location.

SETUP_CLASS_NOT_FOUND

Check the following:

- The directory or archive containing the setup class is added to the classpath using the CLASSPATH_SUFFIX JVM Profile option.
- The setup class is fully qualified.

Use the exception output to the standard error stream, to determine the cause of the problem.

TERMINATION_CLASS_NOT_FOUND

Check the following:

- The directory or archive containing the termination class is added to the classpath using the CLASSPATH_SUFFIX JVM Profile option.
- The termination class is fully qualified.

Use the exception output to the standard error stream, to determine the cause of the problem.

CREATE_JVM_FAILED

Use the diagnostic messages output to the standard error stream to determine the cause of the problem.

CHANGE_DIRECTORY_CALL_FAILED

Check that the CICS job has read, write and execute access to the directory specified by WORK_DIR in the JVM profile.

STDOUT/STDERR_ACCESS_FAILED

Check that the CICS job has read and write access to the directory specified by WORK_DIR in the JVM profile.

ERROR_LOCATING_MAIN_METHOD

Use the exception in the standard error stream to determine the cause of the problem.

ATTACH_JNI_THREAD_FAILED

Contact IBM Support.

SETUP_CLASS_TIMEDOUT

Ensure your setup classes are not long running and return from the JVM within a reasonable time limit.

ENCLAVE_INIT_FAILED

To determine the cause of the problem check SYSPRINT, or the CICS log, for error messages that are output by the Language Environment. It is likely that there is not enough storage available to Language Environment. Additional information may be available in message DFHSJ0216.

USS_WORKDIR_CHECK_FAILED

Review the USS permissions that are set for the WORK_DIR directory. If the file system is full, either allocate additional space, or consider removing or archiving files that are no longer needed from the working directory.

ANGEL_UNAVAILABLE

Review the actions of the accompanying DFHSJ1400E, DFHSJ1401E, DFHSJ1402W, DFHSJ1403W or DFHSJ1404D message.

REDIRECT_IO_FAILED

Use the exception in the standard error stream to determine the cause of the problem.

ERROR_CODE_UNRECOGNIZED

Contact IBM Support.

CSMT and Console

DFHSJ0212   *date time applid* **An error occurred while terminating the JVM belonging to the JVMSERVER resource** *jvmserver*. **Reason code:** *{TERMINATION_CLASS_NOT_FOUND | ERROR_LOCATING_MAIN_METHOD | ERROR_CODE_UNRECOGNIZED | TERMINATION_CLASS_TIMED_OUT | TERMINATION_TIMED_OUT}*

Explanation

An error occurred when terminating the JVM belonging to the JVMSERVER resource *jvmserver*. The reason code provides further information about why the JVM failed to terminate correctly.

TERMINATION_CLASS_NOT_FOUND

A termination class that was specified in the JVM profile cannot be found. An exception is output to the standard error stream.

ERROR_LOCATING_MAIN_METHOD

An attempt to locate the main method a termination class has failed. An exception is output to the standard error stream.

ERROR_CODE_UNRECOGNIZED

TERMINATE_JVM returned an error that was not handled.

TERMINATION_CLASS_TIMED_OUT

A termination class that was specified in the JVM profile has not completed execution in the time allowed by CICS. Execution of the class was halted.

TERMINATION_TIMED_OUT

TERMINATE_JVM timed out.

System action

CICS continues terminating the JVM and returns an error to the calling module.

User response

Examine reason code *msg_reason* to determine why the error occurred during JVM termination and, if required, perform one of the following user actions:

TERMINATION_CLASS_NOT_FOUND

Check the following in the JVM profile:

- The directory or archive containing the termination class is added to the class path using the CLASSPATH_SUFFIX option.
- The termination class is fully qualified.

Use the exception output to the standard error stream, to determine the cause of the problem.

ERROR_LOCATING_MAIN_METHOD

Use the exception output to the standard error stream to determine the cause of the problem.

ERROR_CODE_UNRECOGNIZED

Contact IBM Support.

TERMINATION_CLASS_TIMED_OUT

Ensure that the classes specified in the JVM profile are not long running tasks and that they complete within a reasonable amount of time.

TERMINATION_TIMED_OUT

Review SYSOUT/SYSPRINT or the JVM server standard error stream to determine why the server could not terminate cleanly

DFHSJ0214	*date time applid* **A class in JVMSERVER *jvmserver* has invoked System.exit(). CICS will shut down immediately.**

Explanation

A class in a JVM server has invoked the System.exit() method, which causes the JVM to shut down.
CICS must immediately shut down to preserve data integrity.

System action

CICS takes a system dump, and shuts down immediately.

User response

Alter the Java class to return normally instead of invoking System.exit(). Alternatively, enable a Java security manager to return an exception when attempting to run a Java class invoking System.exit(). To identify the caller of System.exit(),

specify option '-Xtrace:trigger=method{java/lang/System.exit,sysdump}' in the JVM profile to cause the JVM to take a system dump the moment System.exit() is invoked.

DFHSJ0216	*Date time applid jvmserver* **A call to CELQPIPI with function code INIT_SUB has failed. (Return code - *X'rc'*).**

Explanation

The JVM server attempted to initialize a Language Environment enclave using the pre-initialized interface. This failed with return code *rc*.

System action

CICS was unable to initialize a Language Environment enclave and returns an error to the calling module.

User response

Review the STDERR log for any messages that may have been issued prior to the failure. The location of the STDERR file is defined in the JVM profile. If the error has occurred early in the initialization, STDERR will be written to SYSOUT or SYSnnnnn in the CICS job log.

Look at SYSOUT or CESE destination for Language Environment messages. Look in z/OS Language Environment Programming Guide for the CELQPIPI function and find the explanation of the return code (Register 15) for that function.

Ensure that SCEERUN2 and SCEERUN are in the RPL concatenation.

Ensure that the OMVS segment has been set up for the userid that the CICS region runs under.

Ensure that the OMVS RACF (or equivalent) segment has been defined for the userid that the CICS region runs under.

If the problem persists you may need to contact your IBM support representative.

Explanation

The JCICS method 'Container.put(String)' is deprecated and will be removed in a future release of CICS.

System action

This message will not be issued again for this JVM server.

User response

You should review all of your Java applications and change them to use ?Container.putString(String)? rather than the deprecated (and soon to be removed from CICS) ?Container.put(String)? method. The Java compiler will issue deprecation warning messages of its own if you attempt to recompile the application without making the necessary change. You may rely on this behavior to help identify the source of the problem.

CSMT and Console

DFHSJ1002   *date time applid userid* **The class *classname* that was specified to be run in JVMSERVER *jvmserver* cannot be found.**

Explanation

The class *classname* that was specified to run in JVM server *jvmserver* cannot be found. An exception is output to the standard error stream.

System action

CICS was unable to run the specified class in the JVM server and returns an error to the calling module.

User response

Perform the following checks:

- Ensure the PROGRAM resource contains the fully-qualified class name and points to the correct JVM server.
- If the class is in an OSGi bundle, ensure that the OSGi bundle is in the STARTING or ACTIVE state. The CICS-MainClass manifest entry must specify the class.
- If an application is using the linkable interface, ensure the directory or archive containing the class has been added to the class path. The JVM profile for the JVM server must include the CLASSPATH_SUFFIX option.

Use the information in the standard error stream to determine the cause of the problem.

4. *userid*
5. *jvmserver*
6. *return_code*

Destination

CSMT and Console

DFHSJ1006 E	*date time applid userid* **An attempt to attach to JVMSERVER** *jvmserver* **has failed because** *{the channel name used is invalid	the JVMSERVER name is missing	the JVMSERVER name is too long	the userclass name is missing	the user channel is invalid	the XML in the PIPELINE configuration file is invalid	the JVMSERVER does not exist	the JVMSERVER is not enabled	the wrapper class cannot be found	the transaction abended	the attach of the thread failed	the wrapper method was not found	the detach of the thread failed	the JVM threw an exception	the DFH-HANDLERPLIST container is missing	the thread was forced to terminate abnormally	the thread could not be created	the JVMSERVER failed to start the OSGi service	the Liberty link request listener is not available	of an error invoking the Liberty class	the Liberty link request has timed out}.*

Explanation

An attempt to attach to a JVMSERVER failed.

System action

CICS is unable to attach to the JVMSERVER and returns an error to the calling module.

User response

Consider the error code. If the message indicates a configuration error, make the appropriate correction.

If the error indicates a failure to access the 'wrapper' class, this might indicate that an OSGi-enabled JVM server has been used by mistake. Add

JAVA_PIPELINE=YES to the JVM profile of the JVM server.

If the message indicates a failure, review any other messages issued by CICS for further information. If no other error messages were issued, locate the stderr destination of the JVM for further details.

If attaching the JVMSERVER using DFHSJJI, check that the parameters passed to DFHSJJI are valid and that the target JVMSERVER is enabled. If an application running in the JVMSERVER failed, locate the diagnostics for that problem.

If the problem persists, you might need to use the trace facility to determine the cause of the problem.

Destination

CSMT and Console

DFHSJ1007 W	*date time applid tranid trannum* **JVMSERVER** *jvmserver* **is being disabled and restarted by CICS because it is in an inconsistent state.**

Explanation

JVMSERVER *jvmserver* is being restarted by CICS because it is in an inconsistent state. CICS can disable the JVMSERVER resource for different reasons. For example, a 0Cx abend occurs in user JNI code, a 0Cx abend occurs because of an OutOfMemoryError, a 0Cx abend occurs in a JVM thread, or a JVM thread is terminated by a task purge.

System action

CICS has detected that an abend has left the JVM in an inconsistent state. CICS disables the JVMSERVER resource with the PHASEOUT option to allow existing work in the JVM to complete where possible and prevent new work from using the JVM. If this fails to disable the JVMSERVER within the interval specified by the PURGE_ESCALATION_TIMEOUT JVM server option, CICS escalates to the next disable action, until the JVMSERVER is disabled. After the JVMSERVER is successfully disabled, message DFHSJ1008 is issued. CICS attempts to re-enable the resource to create a new JVM.

User response

Review the JVM output and the CICS logs to determine the cause of the abend. For an abend in user JNI code, correct the JNI source code. For an OutOfMemoryError, the JVM might be configured with a maximum heap or stack size that is too small or the error might occur when a Java program has a memory leak. Use standard JVM monitoring tools to help determine the cause. For an 0Cx in a JVM thread, contact IBM Support.

DFHSJ1010 W	*date time applid* JVMSERVER *jvmserver* is being disabled and restarted by CICS because *tranid* task *trannum* running in the JVMSERVER has triggered a runaway condition, leaving the JVMSERVER in an inconsistent state.

Explanation

JVMSERVER *jvmserver* is being restarted by CICS because it is in an inconsistent state. A task runaway condition has occured, leaving the JVM in an inconsistent state.

System action

CICS disables the JVMSERVER resource with the PHASEOUT option to allow existing work in the

JVM to complete where possible and prevent new work from using the JVM. After the JVMSERVER is successfully disabled, message DFHSJ1008 is issued. CICS attempts to re-enable the resource to create a new JVM.

User response

Determine why the transaction *tranid* task *trannum* triggered runaway processing.

Module:
DFHSJJS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *jvmserver*
5. *tranid*
6. *trannum*

Destination

CSMT and Console

DFHSJ1100	*date time applid* An attempt to install the *bundletype* bundle with symbolic name *symbolicname*, version *version* into JVM server *jvmserver* has failed with reason code *{ERROR_CODE_UNRECOGNIZED	JVMSERVER_NOT_FOUND	EXCEPTION_FROM_JVMSERVER	JVMSERVER_NOT_OSGI_ENABLED	INTERNAL_ERROR	DUPLICATE_RESOURCE_FOUND	JVMSERVER_NOT_LIBERTY_SERVER	JVMSERVER_IS_LIBERTY_SERVER}*.

Explanation

An attempt to install the OSGi, WAR, EBA or EAR bundle with symbolic name *symbolicname* at version *version* in the JVM server *jvmserver* has failed. This error can occur when installing a CICS BUNDLE resource that contains one or more OSGi, WAR, EBA or EAR bundles. The reason code provides further information about why the bundle installation failed. The *version* will display as 1.0.0 for WAR, EBA and EAR bundles.

ERROR_CODE_UNRECOGNISED

An unexpected error occurred.

JVMSERVER_NOT_FOUND

The target JVM server is not available.

EXCEPTION_FROM_JVMSERVER

An exception has been thrown in the JVM server when installing the bundle.

JVMSERVER_NOT_OSGI_ENABLED

The JVM server is not configured to support OSGi.

INTERNAL_ERROR

An internal system error occurred.

DUPLICATE_RESOURCE_FOUND

A resource with the same name and version is already installed in the JVM server.

JVMSERVER_NOT_LIBERTY_SERVER

An attempt has been made to install a WAR bundle into a JVM server which is not running the Liberty Profile.

JVMSERVER_IS_LIBERTY_SERVER

An attempt has been made to install an OSGi bundle into a JVM server which is running the Liberty Profile.

System action

CICS was unable to install the OSGi, WAR, EBA or EAR bundle. The bundle part in the CICS BUNDLE resource is placed in an UNUSABLE state, and the CICS BUNDLE resource is disabled.

User response

Examine the reason code to determine why the OSGi, WAR, EBA or EAR bundle installation failed. If required, perform one of the following actions:

ERROR_CODE_UNRECOGNIZED

Contact IBM Support.

JVMSERVER_NOT_FOUND

Check that the target JVM server is correct. If not, specify the correct JVM server using the CICS Explorer SDK. If the correct JVM server is specified, ensure the specified JVMSERVER resource is installed and enabled.

EXCEPTION_FROM_JVMSERVER

Check for other DFHSJ messages and the JVM server diagnostic information on zFS to determine the cause of the exception.

JVMSERVER_NOT_OSGI_ENABLED

Check that the JVM server is correctly configured in the JVM profile that is specified in the JVMSERVER resource. The presence of JVM profile options such as JAVA_PIPELINE, STS, and CLASSPATH_SUFFIX prevent an OSGi framework from loading.

INTERNAL_ERROR

Contact IBM Support

DUPLICATE_RESOURCE_FOUND

Ensure that the resource has the correct symbolic name and version. Check that the resource is not already installed in a different BUNDLE resource.

JVMSERVER_NOT_LIBERTY_SERVER

Ensure that the JVM server is running the Liberty Profile.

JVMSERVER_IS_LIBERTY_SERVER

Ensure that the JVM server is not running the Liberty Profile.

When you have corrected the problem, discard and reinstall the CICS BUNDLE resource.

CSMT

DFHSJ1108   *date time applid* **An attempt
              to install the *bundletype* bundle
              with symbolic name *symbolicname*
              referenced by bundle part
              bundlepartname of BUNDLE
              bundlename into JVMSERVER
              jvmserver has failed with reason
              code *{INVALID_VERSION_RANGE}*.**

Explanation

The install of the OSGi bundle with symbolic
name *symbolicname* into JVMSERVER *jvmserver* has
failed because the OSGi Bundle Project Reference
bundlepartname in CICS BUNDLE *bundlename*
specifies an invalid versionRange= attribute. The
reason code provides further information about why
the bundle installation failed.

INVALID_VERSION_RANGE

   The versionRange= attribute of the OSGi Bundle
   Project Reference *bundlepartname* has an invalid
   format. It should have the following format

{ [| (} *minimumVersion*, *maximumVersion* {] |) }

All leading, trailing or embedded spaces are ignored.

System action

CICS was unable to install the OSGi bundle into the OSGi framework. The bundle part *bundlepartname* is placed in an UNUSABLE state, and the CICS BUNDLE resource *bundlename* is disabled.

User response

Correct the value specified on the versionRange= attribute in the OSGi Bundle Project Reference *bundlepartname* then discard and reinstall the CICS BUNDLE resource *bundlename*.

CSMT

DFHSJ1109	*date time applid* **An attempt to determine the highest semantic version of the** *bundletype* **bundle with symbolic name** *symbolicname* **referenced by bundle part** *bundlepartname* **of BUNDLE** *bundlename* **to install into JVMSERVER** *jvmserver* **has failed with reason code** *{JVMSERVER_NOT_FOUND	JVMSERVER_NOT_ENABLED	NO_BUNDLE_IN_VERSION_RANGE	EXCEPTION_FROM_JVMSERVER	INTERNAL_ERROR}.*

Explanation

An attempt to determine the highest semantic version of the OSGi bundle with a symbolic name of *symbolicname* which is referenced by bundle part *bundlename* of CICS BUNDLE resource *bundlename* has failed. This error can occur when either installing a CICS BUNDLE resource that contains one or more OSGi bundles or after issuing a SET BUNDLE PHASEIN command. The reason code provides further information about why the bundle installation failed.

JVMSERVER_NOT_FOUND

The target JVMSERVER is not available.

JVMSERVER_NOT_ENABLED

The target JVMSERVER is not enabled.

NO_BUNDLE_IN_VERSION_RANGE

No version of the OSGi bundle with a symbolic name of *symbolicname* found in the version range defined by the versionRange= attribute of its associated OSGi Bundle Project Reference.

EXCEPTION_FROM_JVMSERVER

The JVM has thrown an exception while reading a JAR file to determine the highest semantic version of the OSGi bundle with a symbolic name of *symbolicname*.

INTERNAL_ERROR

An internal system error occurred.

System action

CICS was unable to install the OSGi bundle into the OSGi framework. The OSGi Bundle Project Reference *bundlepartname* of the CICS BUNDLE resource *bundlename* is placed in an UNUSABLE state, and the CICS BUNDLE resource is disabled.

User response

Examine the reason code to determine why the OSGi bundle installation failed. If required, perform one of the following actions:

JVMSERVER_NOT_FOUND

Check that the target JVM server *jvmserver* specified on the jvmserver= attribute in the OSGi Bundle Project Reference *bundlepartname* in CICS BUNDLE *bundlename* is correct. If not, specify the correct JVM server using the CICS Explorer SDK. If the correct JVM server is specified, ensure it is installed and enabled.

JVMSERVER_NOT_ENABLED

Enable the target JVMSERVER *jvmserver*.

NO_BUNDLE_IN_VERSION_RANGE

Check that the version range specified on the versionRange= attribute in the OSGi Bundle Project Reference *bundlepartname* in CICS BUNDLE *bundlename* is correct and/or the jar for the OSGi bundle has been exported to the same directory as its associated .osgibundle bundle part.

EXCEPTION_FROM_JVMSERVER

Check the system log for other DFHSJ messages and the JVM server diagnostic information on zFS to determine the cause of the exception.

Destination

CSMT

DFHSJ1302	*date time applid userid* **NODEJSAPP** *nodejsapp* **was not discarded because {an internal error occurred.	it was not found.}**

Explanation

NODEJSAPP *NODEJSAPP* was not discarded. This error can occur for various reasons.Details are given in the message.

System action

The NODEJSAPP is not discarded.

User response

Correct the reported problem and try again.

Module:
DFHSJNA

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *nodejsapp*
6. Value chosen from the following options:

1=an internal error occurred.,

2=it was not found.

Destination

CSMT

DFHSJ1303   *date time applid userid* **NODEJSAPP** *nodejsapp* **has been {enabled | disabled | discarded}.**

Explanation

The state of a NODEJSAPP resource has been changed. This may be caused by an operator action such as enabling or disabling a Bundle, or it may be caused by an application activity such as a Node.js application running to completion and ending.

System action

Processing continues.

User response

None.

Module:
DFHSJNA

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *nodejsapp*
6. Value chosen from the following options:

    1=enabled,

    2=disabled,

    3=discarded

Destination

CSMT

DFHSJ1304 E   *date time applid userid* **NODEJSAPP** *nodejsapp* **has ended abnormally with return code** *retcode.*

Explanation

The processing for a NODEJSAPP resource has ended abnormally. This could be caused by the application requesting a premature exit, or by an error detected by the Node.js runtime environment.

System action

The NODEJSAPP is placed in disabled state; the Node.js process may have captured additional diagnostics.

User response

Review the NODEJSAPP resource's STDERR destination for any further diagnostic information generated by the Node.js application and runtime. The *retcode* can be set by either the application or the Node.js runtime. If the application has set the code (using a process.exit() system call) then the meaning is defined by the application. A set of response codes are defined for use by the Node.js runtime; refer to the Node.js product documentation for further details, the following are some of the more common Exit Codes:

- 1. Uncaught Fatal Exception.
- 3. Internal JavaScript Parse Error.
- 4. Internal JavaScript Evaluation Failure.
- 5. Fatal Error.
- 6. Non-function Internal Exception Handler.
- 7. Internal Exception Handler Run-Time Failure.
- 9. Invalid Argument.
- 10. Internal JavaScript Run-Time Failure.
- 12. Invalid Debug Argument.
- >128. Signal Exits.

Module:
DFHSJNA

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *nodejsapp*
6. *retcode*

Destination

CSMT

DFHSJ1305 E   *date time applid userid tranid* **An attempt to send Unix signal**

signal to process identifier **PID** has failed with error code *{EINVAL | EMVSSAF2ERR | EPERM}.*

Explanation

CICS has attempted to send a USS signal to a process, and has received an error response.

System action

Processing continues.

User response

A code of EMVSSAF2ERR or EPERM implies that the CICS task did not have permission to issue the signal. The EINVAL code implies that the signal was invalid.

Module:
DFHSJRT

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *tranid*
6. *signal*
7. *PID*
8. Value chosen from the following options:

    1=EINVAL,

    2=EMVSSAF2ERR,

    3=EPERM

Destination

CSMT

DFHSJ1306 E   *date time applid userid tranid* **An attempt to load LE RUNOPTS module** *name* **has failed because** *{it cannot be loaded | the contents are too long | of an internal error}.*

Explanation

CICS cannot load or process the requested LE RUNOPTS module. The file must exist on the DFHRPL concatenation, be loadable, and have contents of a sufficiently short length. CICS appends additional LE configuration parameters to the contents, the

combined total of which must not exceed 255 characters.

System action

Processing continues.

User response

Ensure that the requested file is available as part of the DFHRPL concatenation, and that the contents do not exceed the maximum length.

Module:
DFHSJRT

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *tranid*
6. *name*
7. Value chosen from the following options:

    1=it cannot be loaded,

    2=the contents are too long,

    3=of an internal error

Destination

CSMT

DFHSJ1307 I   *date time applid userid tranid* **NODEJSAPP** *name* **has not yet terminated, a SIGKILL signal will be issued.**

Explanation

CICS has attempted to stop a NODEJSAPP process by sending it a SIGTERM signal and then waiting for it to end. It has not ended, and so a SIGKILL signal will be issued for the process; this will cause the NODEJSAPP process to end immediately in an uncontrolled fashion.

System action

CICS issues the SIGKILL signal.

User response

Consider implementing a signal handler in the Node.js application. If the application implements a suitable SIGTERM signal handler then it can respond to that

signal by terminating the application processing in an orderly fashion. This might involve closing any open resources, ending any server processes, and releasing any persistent sockets.

Module:
DFHSJRT

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *tranid*
6. *name*

Destination

CSMT

DFHSJ1308 I	*date time applid userid tranid* **NODEJSAPP** *name* **failed to enable because {of a memory allocation failure	a thread could not be started	a thread could not be joined	of a profile parsing error	of an unidentified error	an attempt to change the working directory failed	CICS does not have write authority to the working directory	either the working directory is full, or CICS can't write to it	an attempt to redirect an IO stream failed	NODE_HOME in the profile is not defined or is empty	NODE_HOME in the profile is invalid	the NODE_HOME/lib directory is invalid	the NODE_HOME/bin directory is invalid	LIB_PREFIX in the profile is invalid	LIB_SUFFIX in the profile is invalid	NODEJSAPP_DISABLE_TIMEOUT in the profile is invalid	NODEJSAPP_DISABLE_TIMEOUT in the profile is too small	NODEJSAPP_DISABLE_TIMEOUT in the profile is too big	there are too many command line options in the profile	STDERR cannot be redirected away from zFS	STDOUT cannot be redirected away from zFS	the WORKDIR value in the profile is too long}.**

Explanation

The processing for a NODEJSAPP resource has ended abnormally. If the NODEJSAPP process is terminated in this fashion then resources (including shared memory allocations) can remain allocated and unrecoverable.

System action

The NODEJSAPP resource is placed in disabled state; the Node.js process may have captured additional diagnostics.

User response

Review the SYSPRINT and STDERR destinations for any further diagnostic information generated by the Node.js application and runtime.

Module:

1. *applid*
2. *X'xxxx'*

Destination

Console

DFHSK1103	*applid* **ESTAE macro failed in general purpose subtask - system return code = X'xxxx'**

Explanation

A general purpose subtask issued an MVS ESTAE macro. *xxxx* is the nonzero response from MVS.

System action

CICS continues in degraded mode.

User response

Find out why the macro failed (this is a failure in MVS). Response code is output with the message.

Module:
DFHSKP

XMEOUT parameters/Message inserts

1. *applid*
2. *X'xxxx'*

Destination

Console

DFHSK1104I   *applid* **General purpose subtask terminated because error threshold has been reached**

Explanation

A general purpose subtask has failed several times while executing its own code. CICS has terminated the task.

System action

CICS continues in degraded mode.

User response

Find out why the subtask failed.

Module:
DFHSKP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSK1106I   *applid* **Unable to authorize a general purpose subtask - RC=***nn*

Explanation

The CICS subtask program issued the CICS SVC to CICS authorize the TCB of an MVS subtask. The SVC returned the error response code *nn*. The possible values of *nn* and their meanings are:

nn
    Meaning

01

    SVC service is not authorized.

02

    Load of DFHASV failed.

03

    Internal error in CICS SVC.

04

    Internal error in CICS SVC. RB check failed.

10

    DFHAUTH TYPE=CHECK macro failed.

14

    Invalid TCB address passed to DFHASV.

18

    DFHAUTH TYPE=subtask AFCB storage failed.

1C

    GETMAIN for subtask AFCB storage failed.

20

    Main task AFCB version is pre-CICS 1.7.

24

    Main task AFCB version is too large for the SVC version in use.

Other

    The SVC has not been defined and installed as described in the Installing CICS TS.

System action

CICS continues. The CICS SVC may fail again if reinvoked by a general purpose subtask.

User response

Use the response code in the message to determine the cause of the failure.

Module:
DFHSKP

2. *nn*

Destination

Console

DFHSMnnnn messages

DFHSM0001   *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSMAD, DFHSMAR, DFHSMCK, DFHSMDM, DFHSMGF, DFHSMMCI, DFHSMMC2, DFHSMMF, DFHSMMG, DFHSMPQ, DFHSMPP, DFHSMSR, DFHSMST, DFHSMSU, DFHSMSY

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHSM0002   *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to

continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname,* you should bring CICS down in a controlled shutdown.

See the CICS Trace Entries for a description of the exception trace point ID, X'*code*' and the data it contains.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSMAD, DFHSMAR, DFHSMCK, DFHSMGF, DFHSMMC2, DFHSMMF, DFHSMMG, DFHSMPQ, DFHSMPP DFHSMSCP, DFHSMSR, DFHSMST, DFHSMSU, DFHSMSY

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHSM0004   *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname,* and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSMMCI, DFHSMST

XMEOUT parameters/Message inserts

1. *applid*
2. *X'offset'*
3. *modname*

Destination

Console

DFHSM0006   *applid* **Insufficient storage to satisfy Getmain (code *X'code'*) in module *modname*. MVS code *mvscode*.**

Explanation

An MVS GETMAIN was issued by module *modname,* but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

System action

An exception entry is made in the trace table (code X'*code*'). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

See the CICS Trace Entries for a description of the exception trace point ID, X'*code*' and the data it contains.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual.

Try decreasing the limits of the CICS dynamic storage areas (DSAs), or increasing the MVS region size. You can vary the CICS DSAs dynamically using the DSALIM and EDSALIM parameters on the CEMT main terminal command. To increase the MVS region size you must bring CICS down and change the MVS JCL REGION parameter.

Module:
DFHSMDM

XMEOUT parameters/Message inserts

1. *applid*

3. *modname*
4. *mvscode*

Destination

Console

DFHSM0102	*applid tranid trannum* **A storage violation (code *X'code'*) has been detected by module *modname*.**

Explanation

A storage violation has been detected by module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies the type of storage violation.

System action

An exception entry (X'*code*' in the message) is made in the trace table. Use the exception trace point ID, X'*code*', to investigate the cause of the storage violation. A description of the exception trace point ID, and the data it contains, is in the CICS Trace Entries. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If you have enabled storage recovery (by specifying the system initialization parameter STGRCVY=YES), CICS attempts to repair the storage violation. Otherwise, the storage is left unchanged.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the exception trace point ID, X'*code*', to investigate the cause of the storage violation. See the CICS Trace Entries for a description of the exception trace point ID and the data it contains.

Module:
DFHSMAR, DFHSMCK, DFHSMGF, DFHSMMC2, DFHSMMF

3. *trannum*
4. *X'code'*
5. *modname*

Destination

Console

DFHSM0103	*applid* **A storage violation (code X'*code*') has been detected by the storage violation trap. Trap is now inactive.**

Explanation

A storage violation has been detected by the storage violation trap, which may be enabled via the CHKSTSK or the CHKSTRM system initialization parameters or via the CSFE transaction. The code X'*code*' is the exception trace point ID which uniquely identifies the type of storage violation detected.

System action

CICS disables the storage violation trap. An exception entry (X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If you have enabled storage recovery (by specifying the system initialization parameter STGRCVY=YES), CICS attempts to repair the storage violation. Otherwise, the storage is left unchanged.

Message DFHME0116, which contains the symptom string for this problem, is produced.

Note:

Even if CICS is able to repair the storage, the storage violation trap still remains inactive.

User response

Use the exception trace point ID, X'*code*', to investigate the cause of the storage violation. See the CICS Trace Entries for a description of the exception trace point ID and the data it contains.

DFHSM0136I   *applid* **The size of the *dsaname* was specified as *dsasize*K.**

Explanation

This is an informatory message giving the size *dsasize* of the dynamic storage area (DSA) *dsaname*.

System action

CICS continues.

User response

None. You can suppress this message with the message level system initialization parameter, MSGLVL=0.

Module:
DFHSMDM

XMEOUT parameters/Message inserts

1. *applid*
2. *dsaname*
3. *dsasize*

Destination

Console

DFHSM0137   *applid* **The amount of MVS storage available to CICS is low.**

Explanation

When MVS storage is requested by a JVM from Language Environment, CICS intercepts the request. This message is produced when the size of the largest contiguous unallocated block of storage above 16MB that is available for use by MVS has fallen below a system-defined threshold.

System action

An exception entry is made in the trace table to record the event.

CICS continues to operate but takes steps to alleviate the situation by deleting any JVMs that are currently inactive. This will have the effect of freeing any MVS storage that the inactive JVMs are holding.

User response

No immediate action is required. However, if the problem persists and if you are a user of Java transactions you could reduce the value of the MAXJVMTCBs parameter. This would reduce the number of JVMs which exist concurrently within CICS. For more information about how to do this, see the Improving performance.

Console

DFHSM0138   *applid* **The amount of MVS storage available to CICS is no longer low.**

Explanation

The MVS storage shortage reported by message DFHSM0137 has ceased.

System action

CICS continues.

User response

None.

Module:
DFHSMVN

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSM0139   *applid* **The amount of MVS storage available to CICS is critically low.**

Explanation

This message is produced when there is no unallocated block of storage large enough to satisfy an MVS request for storage. When MVS storage is requested by a JVM from Language Environment, CICS will intercept these requests. The message means that insufficient contiguous storage was available to satisfy the MVS storage request. Either CICS has been forced to attempt to satisfy the request by releasing storage from an MVS storage cushion that it keeps in reserve or there is at least one transaction suspended due to insufficient contiguous free storage.

System action

An exception entry is made in the trace table to record the event.

CICS continues to operate but takes steps to alleviate the situation by deleting JVMs as the programs that own them complete and not starting new JVMs until the storage shortage is relieved.

User response

No immediate action is required. However, if the problem persists and if you run Java transactions you could decrease the MAXJVMTCBS parameter. For more information about how to do this, see the Improving performance.

DFHSMSY

DFHSNnnnn messages

DFHSN0001	*applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the description of the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run

Destination

Console

and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSNUS, DFHSNAS, DFHSNPU, DFHSNSU, DFHSNTU, DFHSNXR,

2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHSN0002	*applid* **A severe error (code *X'code'*) has occurred in program *progname*.**

Explanation

CICS has detected a severe error while running module *progname*. This error is associated with exception trace point ID *code*. For further information about CICS exception trace entries, refer to the Troubleshooting and support.

System action

The task issuing the signon abends.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSNUS, DFHSNAS, DFHSNPU, DFHSNSU, DFHSNTU, DFHSNXR

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *progname*

Destination

Console

DFHSN0004   ***applid* A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

   3=terminal

5. *portname*
6. *userid*

Destination

CSCS

DFHSN1130	*date time applid* **Signon at {*netname | console | terminal* } *portname* by user *userid* failed because the userid was not found in the specified group.**

Explanation

A signon has been issued from terminal *portname* which has failed. Either the userid is not in the specified group, or the group specified for this user to be associated with after signon is not known to the ESM.

System action

The signon request is rejected.

User response

Check that the groupid specified is correct. If it is, contact your security administrator to ensure that this group is defined properly, and that the user is connected to this group.

Module:
DFHSNTU

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

4. Value chosen from the following options:

   1=netname ,

   2=console ,

   3=terminal

5. *portname*
6. *userid*

Destination

CSCS

DFHSN1131	*date time applid* **Signon at {*netname | console | terminal* } *portname* by user *userid* has failed because security is not active in this CICS region.**

Explanation

A signon has been issued from terminal *portname* which has failed. This is because this CICS region is running without security active.

System action

The signon request is rejected.

User response

None.

Module:
DFHSNTU

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. Value chosen from the following options:

   1=netname ,

   2=console ,

   3=terminal

5. *portname*
6. *userid*

Destination

CSCS

DFHSN1132   *date time applid* **Signon at terminal *termid* by user *userid* has failed because the terminal is a session.**

Explanation

A signon has been issued from terminal *termid* which is a session. The security attributes of a session can only be changed on receipt of a valid FMH-5 attach header.

System action

The signon request is rejected.

User response

Investigate how and why users are attempting to use signon for a session.

Module:
DFHSNTU

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *userid*

Destination

CSCS

DFHSN1133   *date time applid* **Signon at {netname | console | terminal } portname by user *userid* has failed because of an error during SNSCOPE checking.**

Explanation

A signon has been issued from terminal *portname*. The SNSCOPE initialization parameter disallows signon to more than one terminal at a time. An internal failure during SNSCOPE checking means that CICS is unable to confirm if the user is already signed on elsewhere. The failure has occurred because the limit of concurrent MVS ENQ requests has been reached.

System action

The signon request is rejected. Message DFHUS0120 will have been written to the console. See the explanation of this message for further information.

User response

Please report this problem to your CICS systems programmer.

See the Configuring for more information about the SNSCOPE parameter.

DFHSOnnnn messages

DFHSO0001   *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSOCK

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHSO0002   *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

If the exception entry made in the trace table has a trace ID with a value of X'0425', message DFHKE0501 was issued by the CICS Kernel earlier during CICS initialization.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

If the exception entry made in the trace table has a trace ID with a value of X'0425', further information

can be found in message DFHKE0501 issued by the CICS Kernel earlier during CICS initialization.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname,* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSODM, DFHSOL, DFHSOCK, DFHSORD, DFHSOIS.

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHSO0004	***applid* A possible loop has been detected at offset *X'offset'* in module *modname.***

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System action

An exception entry is made in the trace table.

A system dump is taken unless you have specifically suppressed the dump (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function, and there may not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval that you have specified in the ICVR system initialization parameter. This means that execution of module *modname* is terminated and CICS continues.

If you have specified system initialization parameter ICVR=0 and you consider that module *modname* is looping, you must terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the value of the ICVR system initialization parameter. You have to close down CICS at a suitable time to do this permanently. You can change the ICVR time interval temporarily online using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHSO0102   *date time applid* **A UNIX System Services Assembler Callable Service error (code *X'code'*) has occurred on receipt of a severe TCP/IP return code; the TCPIPSERVICE *tcpipservice* on port *portnumber* at IP address *ipaddress* will be closed.**

Explanation

An error has been detected in DFHSOLS. The error has been caused by a severe return code received from TCP/IP.

System action

An exception entry X'*code*' is made in the trace table. No system dump is taken, unless you have specifically requested a dump in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

The TCPIPSERVICE *tcpipservice* on port *portnumber* at the specified IP address will be shutdown. When this is complete then message DFHSO0108 will be issued. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This error could have been returned if TCP/IP had been shutdown, for example. The exception trace entry will tell you which service routine was called and the return values that were returned. Refer to the z/OS UNIX System Services Messages and Codes book to determine the cause of the error.

The TCPIPSERVICE *tcpipservice* will be closed, and after the TCP/IP region has been restarted the closed TCPIPSERVICE should be reopened. At this point normal work can resume on the TCPIPSERVICE.

DFHSO0104   *applid* **Secure sockets program *pgmname* could not be loaded. Secure Sockets Layer is not available.**

Explanation

The program module *pgmname*, which is required to implement the secure sockets layer, could not be loaded.

If *pgmname* is GSKCMS, GSKSSL, or GSKX509, the System SSL component of z/OS has not been installed properly.

System action

System initialization continues, but support for the secure sockets layer is not enabled.

User response

If *pgmname* is GSKCMS, GSKSSL, or GSKX509, ensure that the System SSL library is available to CICS. This library is *prefix..SIEALNKE*, where *prefix* is defined by the installation. You should ensure that it is installed in the system linklist or referenced in the STEPLIB concatenation in the CICS JCL. If it is included in the CICS STEPLIB the library must be APF-authorized.

Console

DFHSO0106   *date time applid* **A UNIX System Services Assembler Callable Service error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code or the called Assembler Callable Service routine. The exception trace entry will tell you which service routine was called and the return values that were returned. Refer to the z/OS UNIX System Services Messages and Codes manual to determine the cause of the error. The

severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname,* you should bring CICS down in a controlled shutdown.

CSOO

DFHSO0109 *date time applid* **The
TCPIPSERVICE** *tcpipservice* **could
not be opened because the port**
portnumber **is already in use on
the IP address** *ipaddress* **.**

Explanation

This message is issued when the open of a
TCPIPSERVICE cannot be completed. The port number
specified is already in use in combination with the IP
address. By default, TCP/IP allows only one server to
be listening on a port at any one time.

Specifically, this message is issued when the TCP/IP
bind call fails with a return code of EADDRINUSE.

System action

The TCPIPSERVICE does not open, but remains
closed. An exception trace entry is written detailing
the return values from the TCP/IP bind call.
An application using the EXEC API to set the
TCPIPSERVICE open receives an RESP(INVREQ)
RESP2(9).

User response

Check that there are no other TCPIPSERVICES open
using the same port number and IP address as the
failing one. If there is another TCPIPSERVICE open
using the port, it must be closed before the new one
can be opened.

If no TCPIPSERVICESs are using the requested port,
there might be another application acting as a TCP/IP
server already listening on the port. Use the TSO
command NETSTAT to display TCP/IP servers on the
system. Choose an unused port for the TCPIPSERVICE.

If your system has more than one TCP/IP stack
you can specify another stack's IP address on the
TCPIPSERVICE definition. This will allow you to install
multiple TCPIPSERVICEs each using the same port
number. You can also configure support in TCP/IP for
virtual IP addresses on a single system. This will also
allow more than one TCPIPSERVICE to share the same
port.

Finally, TCP/IP can be configured with port sharing.
This allows multiple servers (TCPIPSERVICES) to use
the same port with TCP/IP using load balancing to
direct incoming connections to the set of servers
on the port. If port sharing is enabled, multiple
TCPIPSERVICEs can each be opened on the same
IP address with the same port, if port sharing
is supported by the protocol specified in the
TCPIPSERVICE resource definition.

6. *ipaddress*

Destination

CSOO

DFHSO0110   *date time applid* **The TCPIPSERVICE** *tcpipservice* **cannot be opened on the IP address** *ipaddress* **because the address is unknown to TCP/IP.**

Explanation

Opening the TCPIPSERVICE has failed because the IP address specified on the definition is not known to TCP/IP.

This message is issued when the TCP/IP bind call fails with the return value of EADDRNOTAVAIL.

System action

The IP address must be a valid address known to TCP/IP. It must also be an address that the TCP/IP stack supports. IPv6 addresses can only be supported if the stack is dual-mode and therefore supports IPv4 and IPv6 addresses. It is possible to configure multiple TCP/IP stacks for a single OS/390 system, or to have virtual IP addresses on a single stack. If the system only has one IP address then the IP address field of the TCPIPSERVICE definition can be left blank, or specified as ANY. This causes the bind to use the default IP address for the system. To use an alternative, a valid address must be specified.

User response

Check that the address specified on the TCPIPSERVICE definition is known to TCPIP on the system.

If you have specified a low IPv6 address, that is, the address has leading zeros in the first six or more segments, CICS stores and displays the IPv6 address in IPv4 format.

If IPv6 addresses are being used, check that the TCP/IP stack supports IPv6. See the z/OS Communications Server IP Diagnosis Guide on using Netstat to find information about the stack.

Destination

CSOO

DFHSO0111   *date time applid* **Opening the TCPIPSERVICE** *tcpipservice* **has failed because the region jobname is not authorized to bind to port** *portnumber***.**

Explanation

Opening the TCPIPSERVICE has failed because the jobname of the region is not authorized to use the port number specified.

Binding to port numbers below 1024 requires TCP/IP configuration directives specifying the CICS jobname to TCP/IP and associating it with the specified port. This may also be done for ports greater than 1024, thus a CICS region may also fail to open a port greater than 1024 if the port has been associated with another job.

This message is issued when the TCP/IP bind call fails with a return value of EPERM.

System action

The TCPIPSERVICE is not opened. If an application has used the EXEC API to open the TCPIPSERVICE, it receives RESP(INVREQ) RESP2(3) values.

User response

The CICS region's jobname must be authorized to open the specified port. Consult the z/OS Communications Server IP Configuration Guide for details on how to do this.

Module:

CSOO

DFHSO0113   *applid* **The IP address *ip_address* cannot be resolved to a host name by the BPX1GNI function. UNIX System Services return code *X'retcode'*, reason code *X'rc'*.**

Explanation

CICS has issued the Unix System Services function BPX1GNI to resolve the IP address *ip_address* to a host name, but the call failed.

System action

An exception trace entry is made. CICS will continue to attempt to access the name server for subsequent requests.

User response

The BPX1GNI function will usually perform a name server reverse lookup to resolve the IP address into a host name. This can fail if CICS is unable to contact a name server.

If a SYSTCPD DD name has been defined in the CICS job, check that the file it references correctly defines the name server. If SYSTCPD is not used, then check that the name server defined to TCP/IP in the /etc/resolv.conf file is valid and responding correctly. You can issue the TSO NSLOOKUP command to query the name server. If the name server is defined correctly to CICS, then contact the administrator to determine why the IP address lookup failed.

The TCP/IP RESOLVERTIMEOUT parameter can be used to control the duration of a BPX1GNI call.

CSOO

DFHSO0115   *date time applid* **CICS has registered the group name *groupname* with Workload Manager. The TCP/IP host name *genericname* will become available for DNS connection optimization.**

Explanation

The group name has been registered with Workload Manager for Domain Name Service (DNS) connection optimization. This occurs when a TCPIPSERVICE is opened where its name begins with the character 'D'. The new generic TCP/IP host name becomes available for clients to use to access the CICS system, and any others that have registered with the named group name.

System action

CICS has issued the Workload Manager macro IWMSRSRG to register the specified group name for DNS connection optimization. This only occurs when the name of the TCPIPSERVICE begins with a 'D'. Workload manager registration only occurs once for a given group name. If multiple TCPIPSERVICES define the same group name, then registration will only occur once.

The group name registered is taken from a combination of part of the name of the TCPIPSERVICE and the transaction defined for the TCPIPSERVICE. Any characters of the name following a dot '.' are concatenated with the transaction identifier to form the group name. For example, a TCPIPSERVICE has the name D1.CICS and is defined with the transaction IIOP (the IIOP transaction being an alias of the CICS-supplied CIRR transaction). The group name generated is 'CICSIIOP'. If the TCPIPSERVICE name does not contain a dot, then only the transaction identifier is used. For example, a TCPIPSERVICE with a name of 'DYNWEB' and a transaction of WWW will generate a registration for the group 'WWW'.

The group name registered effectively becomes a new name in the sysplex TCP/IP domain. When multiple

CICS systems in a sysplex each register with the same group name, the DNS server uses Workload Manager to resolve the group name into one of the IP addresses of the associated systems. The IP address returned is that of the system that is most eligible according to Workload Manager's load balancing rules. For example, two OS/390 systems in a sysplex are mvs1.plex.hursley.ibm.com and mvs2.plex.hursley.ibm.com; and on each system, CICS registers with the group name cicsiiop. The new name cicsiiop.plex.hursley.ibm.com is dynamically added to the DNS name server's tables. Client TCP/IP applications can use this name instead of the name of one of the specific OS/390 images. When a client resolves the name to an IP address using the DNS, it will get the IP address of the most eligible system. Since the DNS dynamically knows when systems register and deregister, additional CICS systems can be registered as required to expand the list of available IP addresses returned for a group name. If a system fails, its IP address will be removed from the DNS server's list of associated addresses for any groups with which it was registered.

User response

No user action is necessary.

Module:
DFHSOCK

Destination

CSOO

DFHSO0116   *date time applid* **CICS has deregistered the group name *groupname* with Workload Manager.**

Explanation

The group name has been deregistered from Workload Manager. This CICS system will no longer participate in connection optimization in the group specified. This occurs when a TCPIPSERVICE is closed where its name begins with a 'D'.

System action

The Workload Manager IWMSRDRS call is made to deregister the group name. This will remove the IP address of the system from the table of the DNS server that is associated with the group name.

If more than one open TCPIPSERVICE share the same group name, then the WLM deregistration only occurs when the last one is closed.

User response

Check the availability of the name server.

Console

DFHSO0118	*applid* **The BPX1GNI call to resolve IP address *ip_address* to a host name took over 3 seconds to complete.**

Explanation

CICS has issued the Unix System Services function BPX1GNI to resolve the IP address *ip_address* to a host name. This call took more than three seconds. During this time, the sockets TCB was blocked, and no socket IO was possible.

System action

CICS continues.

User response

The BPX1GNI function will usually perform a name server reverse lookup to resolve the IP address into a host name. This call took over three seconds to complete. The BPX1GNI function is most commonly driven by EXEC CICS EXTRACT TCPIP CLIENTNAME.

If a SYSTCPD DD name has been defined in the CICS job, check that the file it references correctly defines the name server. If SYSTCPD is not used, then check that the name server defined to TCP/IP in the /etc/resolv.conf file is valid and responding correctly. You can issue the TSO NSLOOKUP command to query the name server. If the name server is defined correctly to CICS, then contact the administrator to determine why the IP address lookup has not completed within 3 seconds.

The TCP/IP RESOLVERTIMEOUT parameter can be used to control the duration of a BPX1GNI call.

DFHSO0123   *date time applid* **Return code** ***rc* received from function** *{unknown | gsk_environment_init | gsk_environment_open | gsk_environment_close | gsk_secure_socket_init | gsk_secure_socket_open | gsk_secure_socket_close | gsk_secure_socket_read | gsk_secure_socket_write | gsk_attribute_set_buffer | gsk_attribute_set_callback | gsk_attribute_set_enum | gsk_attribute_set_numeric_value}* **of System SSL. Reason:** *{Unrecognized return code | Key database not found | Key database access not authorized | Invalid password for key database | Expired password for key database | Stashed password file not found | Session timeout value is invalid | An I/O error occurred | An unknown error occurred | Invalid distinguished name | No common ciphers negotiated | No certificate available | Certificate validation failed | Root certificate authority not supported | Unsupported operation | Invalid certificate signature | SSL protocol violation | Not authorized | Self-signed certificate | Invalid session state | Handle creation failed | No private key | Untrusted Certificate Authority | Certificate date invalid | Invalid cipher suite | Handshake abandoned by peer | Cannot open key database | Host certificate not yet valid | Certificate parsing error | Certificate is revoked | LDAP server is inactive | Unknown Certificate Authority | Internal error on partner | Unknown alert received | Client authentication alert | Incorrect key usage | Server name not recognized | Bad message length | Cryptographic error detected | Export restriction | TLS extension mismatch | No Negotiation | Signature algorithm not in signature algorithm pairs list | Certificate key algorithm is not in signature algorithm pairs list | GSKCMS Error}.* **Peer:** *peeraddr,* **TCPIPSERVICE:** *tcpipservice.*

Explanation

A non-zero return code *rc* was received from the specified function of the z/OS System SSL service. A brief interpretation of the return code is shown. The service was processing a connection with a partner at IP address *peeraddr* to TCPIPSERVICE *tcpipservice*. When the error reason is certificate related the CERTIFICATE named on the TCPIPSERVICE resource is checked.

System action

The secure sockets operation is abandoned. A sockets domain severe error message, DFHSO0002, may be produced with error code X'080C'.

User response

If this message is not accompanied by message DFHSO0002, the error is probably due to some unexpected action by the connected partner, and this message is for information only. If this message is accompanied by message DFHSO0002, the error is probably due to some sort of configuration error. If the message shows Peer: 0.0.0.0, TCPIPSERVICE: *NONE* the error is probably due to a PERFORM SSL REBUILD failure. A PERFORM SSL REBUILD failure should preserve the old SSL environment. Use the description in the message to determine what is wrong. For descriptions of the return code *rc* (which is in decimal and may need converting to hex), see z/OS Cryptographic Services: System SSL Programming, SC24-5901. For further guidance see the CICS documentation.

If the brief interpretation of the return code is *Certificate date invalid* the certificate may either have expired or be not yet valid, and may refer to either the local certificate or the remote partner's certificate.

If the brief interpretation of the return code is *No certificate available* the certificate may have been recently added to the keyring. Issue a PERFORM SSL REBUILD to refresh the SSL environment.

If the brief interpretation of the return code is *Certificate validation failed* then either the server or client certificate (if client certificates are being used) is invalid.

CSOO

DFHSO0124   *APPLID* **The MAXSOCKETS system initialization parameter has a value of** *mmmmm* **which exceeds the MAXFILEPROC value of** *nnnnn*. **The MAXSOCKETS value has been set to the lower value.**

Explanation

The value specified in the MAXSOCKETS system initialization parameter is greater than the value specified in the z/OS UNIX System Services MAXFILEPROC option.

CICS has attempted to set the MAXSOCKETS value higher than the MAXFILEPROC value, but has been unable to do so because the userid under which CICS is running does not have superuser authority.

System action

CICS continues execution with the MAXSOCKETS value set equal to the MAXFILEPROC value.

User response

You may:

- Restart CICS with a value of MAXSOCKETS that does not exceed MAXFILEPROC. This will limit the number of sockets that CICS can have active at one time.
- Increase the MAXFILEPROC value and then restart CICS. This will affect all z/OS UNIX System Services processes in this system.
- Restart CICS with a userid that has superuser authority.

DFHSO0125   *APPLID* **The MAXSOCKETS parameter retrieved from the catalog has a value of** *mmmmm* **which exceeds the MAXFILEPROC value of** *nnnnn*. **The MAXSOCKETS value has been set to the lower value.**

Explanation

The value of the MAXSOCKETS system initialization parameter retrieved from the catalog during a warm or emergency restart is greater than the value specified in the z/OS UNIX System Services MAXFILEPROC option.

CICS has attempted to set the MAXSOCKETS value higher than the MAXFILEPROC value, but has been unable to do so, because the userid under which CICS is running does not have superuser authority.

This situation may arise when:

- CICS was previously running under a userid that had superuser authority, but has restarted under a different userid
- CICS was previously running under a userid that had superuser authority, but the authority was changed before CICS restarted
- CICS was previously running under a userid that did not have superuser authority, and the value of MAXFILEPROC was reduced before CICS restarted.

System action

CICS continues execution with the MAXSOCKETS value set equal to the MAXFILEPROC value.

User response

You may:

- Restart CICS with a value of MAXSOCKETS that does not exceed MAXFILEPROC. This will limit the number of sockets that CICS can have active at one time.
- Increase the MAXFILEPROC value and then restart CICS. This will affect all z/OS UNIX System Services processes in this system.
- Restart CICS with a userid that has superuser authority.

DFHSOMG

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSO0128A   *applid* **Information to specify a bind to an LDAP server cannot be obtained from the PROXY segment of CRLPROFILE *profile*.**

Explanation

The CRLPROFILE system initialization parameter has been specified, but the information required by CICS and System SSL to perform a bind to an LDAP server cannot be obtained from the profile that it identifies.

CICS has attempted to extract the following information from the PROXY segment of the profile *profile* in the LDAPBIND class of the external security manager's database:

LDAPHOST

   The Uniform Resource Locator (URL) of an LDAP server that contains certificate revocation information

BINDDN

   The LDAP distinguished name of a user who is authorized to access certificate revocation lists in the specified LDAP server

BINDPW

   The password used to authenticate the user specified by BINDDN.

Either the specified profile does not exist, or CICS does not have authority to access the profile, or one or more of the required components are missing from the profile.

System action

The CICS SSL function cannot retrieve certificate revocation lists to determine whether certificates have been revoked. To prevent further error messages, the CRLPROFILE function has been disabled. Therefore CICS will be unable to check whether SSL certificates are revoked.

User response

Ensure that the *profile* profile in the LDAPBIND class of the security manager is defined with a PROXY segment that contains all three required components. Also ensure that the CICS region userid had READ access to the profile, then restart CICS.

Module:
DFHSOSE

XMEOUT parameters/Message inserts

1. *applid*
2. *profile*

Destination

Console

DFHSO0129A   *applid* **The LDAP server whose name was obtained from CRLPROFILE is inactive. Certificate revocation checks have been disabled.**

Explanation

The LDAP server, whose name was obtained from the PROXY segment of the external security manager's profile specified by the CRLPROFILE system initialization parameter, cannot be accessed.

System action

The CICS SSL function cannot retrieve certificate revocation lists to determine whether certificates have been revoked. To prevent further error messages, the CRLPROFILE function has been disabled. CICS will not make any further attempts to acquire certificate revocation lists from the LDAP server. Therefore CICS will be unable to check whether SSL certificates are revoked.

User response

To re-enable certificate revocation list checking, the LDAP server specified within the CRLPROFILE must be restarted. All CICS systems, that specify a CRLPROFILE definition that references this server, must then also be restarted.

Console

DFHSO0130	*date time applid* **A TCP/IP ACCEPT call has failed. The TCPIPSERVICE** *tcpipservice* **on port** *portnumber* **at IP address** *ipaddress* **will be closed. The values returned are bpx_return_value(** *bpx_return_value* **), bpx_return_code(** *bpx_return_code* **), and bpx_reason_code(** *X'bpx_reason_code'* **).**

Explanation

A TCP/IP ACCEPT call has returned an error.

System action

An exception trace entry is made in the trace table. No system dump is taken, unless you have specifically requested a dump in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

The TCPIPSERVICE *tcpipservice* on port *portnumber* at the specified IP address is shutdown. When this shutdown is complete message DFHSO0108 is issued.

The return value, return code and reason code reported by Unix System Services are displayed to aid with diagnostics.

User response

Determine the reason for the ACCEPT failure. The return code and reason code included in the message text are described in the z/OS UNIX System Services Messages and Codes manual. A possible cause of this error is if TCP/IP has reached MAXSOCKETS. Check the system console for any messages issued by TCP/IP and take the recovery action indicated.

The TCPIPSERVICE *tcpipservice* is closed, and after the TCP/IP problem has been resolved, the closed TCPIPSERVICE should be reopened.

DFHSO0134A	*applid* **TCPIPSERVICE** *tcpipservice* **was not restored because certificate** *certificate* **{is expired | is not yet current | does not have a private key | is not trusted | is not found}**

Explanation

TCPIPSERVICE *tcpipservice* was valid when the resource was installed, but invalid when CICS restarted because the certificate is unusable. An explanatory phrase in the message describes why:

is expired

The date and time at which the certificate is no longer valid has already passed.

is not yet current

The date and time at which the certificate is to become active has not yet been reached.

does not have a private key

The specified certificate does not have a private key.

This error may occur if the user does not have access to the private key due to a lack of authority to access IRR.DIGTCERT.GENCERT.

is not trusted

The certificate has been given the NOTRUST attribute by the security administrator. This indicates that the certificate is not to be used.

is not found

The certificate is not found.

System action

The TCPIPSERVICE is not restored from the catalog.

User response

Replace the certificate in the keyring with one that is usable, or specify a different certificate. Then reinstall TCPIPSERVICE *tcpipservice* manually.

For a message insert of 'does not have a private key' check the system log for RACF messages that indicate a lack of authority to access IRR.DIGTCERT.GENCERT.

DFHSO0147 W *applid* **A non-secure client connection has been received for ATTLSAWARE TCPIPSERVICE** *tcpipservice*. **Client IP address:** *clientaddr*. **TTLS_IOCTL value** *X'ttlsioctl'*

Explanation

The TCP/IP listener task has received a connection from a client that is not secure. The TCPIPSERVICE is defined with SSL(ATTLSAWARE) so new connections must be secured by AT-TLS.

System action

CICS always sends an HTTP 403 error response to the client for a non-secure connection on an SSL(ATTLSAWARE) TCPIPSERVICE. This message is only ever issued once per active TCPIPSERVICE.

User response

You should make sure that the port used by the TCPIPSERVICE has been secured by an active AT-TLS policy.

If after receiving this message you activate AT-TLS for the TCPIPSERVICE port, you should close and re-open the TCPIPSERVICE.

Module:
DFHSOLS

Explanation

The CICS socket listener task, CSOL, is no longer accepting new inbound connections. The listener sockets for all OPEN TCPIPSERVICEs have now been closed. This happens during CICS shutdown or as part of the SET TCPIP CLOSED or SET TCPIP IMMCLOSED commands.

System action

CICS shutdown or SET TCPIP processing continues.

User response

None.

Module:
DFHSOLS

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHSO0223   *date time applid* **Return code *rc* received from function *{unknown | gsk_environment_init | gsk_environment_open | gsk_environment_close | gsk_secure_socket_init | gsk_secure_socket_open | gsk_secure_socket_close | gsk_secure_socket_read | gsk_secure_socket_write | gsk_attribute_set_buffer | gsk_attribute_set_callback | gsk_attribute_set_enum | gsk_attribute_set_numeric_value}* of System SSL. Reason: *{Unrecognized return code | Key database not found | Key database access not authorized | Invalid password for key database | Expired password for key database | Stashed password file not found | Session timeout value is invalid | An I/O error occurred | An unknown error occurred | Invalid distinguished name | No common ciphers negotiated | No certificate available | Certificate rejected by peer | Root certificate authority not supported | Unsupported operation | Invalid certificate signature | SSL protocol violation | Not authorized | Self-signed certificate | Invalid session state | Handle creation failed | No private key | Untrusted Certificate Authority | Certificate date invalid | Invalid cipher suite | Handshake abandoned by peer | Cannot open key database | Host certificate not yet valid | Certificate parsing error | Certificate is revoked | LDAP server is inactive | Unknown Certificate Authority | Internal error on partner | Unknown alert received | Client authentication alert | Incorrect key usage | Server name not recognized | Bad message length | Cryptographic error detected | Export restriction}.* **Peer:** *peeraddr,* **TCPIPSERVICE:** *tcpipservice.***

Explanation

A non-zero return code *rc* was received from the specified function of the z/OS System SSL service. A brief interpretation of the return code is shown. The service was processing a connection with a partner at IP address *peeraddr* to TCPIPSERVICE *tcpipservice*.

System action

The secure sockets operation is abandoned. A sockets domain severe error message, DFHSO0002, may be produced with error code X'080C'.

User response

If this message is not accompanied by message DFHSO0002, the error is probably due to some unexpected action by the connected partner, and this message is for information only. If this message is accompanied by message DFHSO0002, the error is probably due to some sort of configuration error. If the message shows Peer: 0.0.0.0, TCPIPSERVICE: *NONE* the error is probably due to a PERFORM SSL REBUILD failure. A PERFORM SSL REBUILD failure should preserve the old SSL environment. Use the description in the message to determine what is wrong. For descriptions of the return code *rc*, see z/OS Cryptographic Services: System SSL Programming, SC24-5901. For further guidance see the CICS documentation.

If the brief interpretation of the return code is *Certificate date invalid* the certificate may either have expired or be not yet valid, and may refer to either the local certificate or the remote partner's certificate.

If the brief interpretation of the return code is *No certificate available* the certificate may have been recently added to the keyring. Issue a PERFORM SSL REBUILD to refresh the SSL environment.

Console

DFHSO1000	*date time applid* **A request for TCP/IP communication failed (code** *X'code'*) for IPCONN *ipconn* **using applid** *applid*. **z/OS UNIX system services supplied bpx_return_value(** *bpx_return_value*) **bpx_return_code(** *bpx_return_code* **), and bpx_reason_code(** *X'bpx_reason_code'* **).**

Explanation

A request to z/OS UNIX system services for TCP/IP communications failed. The request was made for IPIC communication with another CICS region using IPCONN *ipconn* and applid *applid*. The code X'*code*' is an SO domain exception trace point ID that identifies what the error is and where the error was detected, for example:

- 0E02 BPX1AIO asyncio failure
- 0E03 BPX1AIO asyncio request failure
- 0E09 BPX1GIV give socket failure
- 0E0C BPX1TAK take socket failure
- 0E0F BPX1GCL get client id failure
- 0E13 BPX1SOC socket faliure
- 0E16 BPX1BND bind failure

- 0E19 BPX1LSN listen failure
- 0E1C BPX1GNM get socket name failure
- 0E1F BPX1IOC ioctl failure
- 0E20 BPX1AIO asyncio return failure
- 0E23 BPX1OPT socketopt failure

System action

An exception trace entry (code X'*code*' in the message) is made in the trace table.

This message indicates an error in the execution of CICS to communicate using IPIC communication. CICS continues but IPIC communication using IPCONN *ipconn* might have failed temporarily or permanently.

Additional error messages are produced to report the effect this failing request has on IPIC communication.

User response

The exception trace entry will tell you which z/OS UNIX system service was called. Refer to the z/OS UNIX System Services Messages and Codes manual to determine the cause of the error. If the value of the z/OS UNIX system services reason code *bpx_reason_code* is not zero, you might be able to use the z/OS UNIX System Services command BPXMTEXT to provide more information.

The impact of this failure depends on the IPIC processing that is being executed at the time. Refer to other messages for IPIC communication using the specified IPCONN to obtain more information.

If IPIC communication using IPCONN *ipconn* does not subsequently resume normal operation successfully, verify the IPCONN and its related TCPIPSERVICE resource definition have attributes that are correct for your installation. Also, verify these resource definitions are correct in the CICS region that issued this message and the CICS region with which IPIC communication is being attempted. It might also be necessary to verify parameter definitions for z/OS Communications Server are correct for operation of this IPCONN. When doing so consider the z/OS system on which the CICS region that issued this message runs and the z/OS system with which IPIC communication is being attempted.

CSOO

DFHSO1001   *date time applid* **A Communications Server TCP/IP callable NMI error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected, for example:

- 043A statistics SVC call abended
- 043B statistics SVC call rejected
- 043C statistics NMI INQUIRE failed
- 0CA6 SVC call rejected
- 0CA7 SVC call abended
- 0CA8 NMI INQUIRE failed

NMI INQUIRE is used to obtain the value of z/OS Communications Server TCP/IP parameter SOMAXCONN for use with a TCPIPSERVICE attribute BACKLOG. It is also used to obtain information on socket backlog and connections dropped for TCPIPSERVICE resource statistics.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

A possible cause of this error is an incorrect set up of the CICS Type 3 SVC. Verify the CICS Type 3 SVC has been correctly installed. The exception trace entry may tell you the value returned by the CICS Type 3 SVC in register 15. Values other than -1 and 0 indicate a failure with the call to the CICS Type 3 SVC itself. This can occur with an incorrect set up of the CICS Type 3 SVC.

Alternatively if the CICS Type 3 SVC has been correctly installed, this indicates a possible error in CICS code or the called Communications Server TCP/IP NMI request. This can be the case when the value returned in register 15 is -1 or 0. The exception trace entry will tell you which request was called and the response values that were returned. z/OS Communications Server IP Programmer's Guide and Reference provides more information. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname,* you should bring CICS down in a controlled shutdown.

In the case of a failed NMI INQUIRE for obtaining SOMAXCONN (codes 0CA6-8), the value used for a TCPIPSERVICE attribute BACKLOG cannot be set to the value of z/OS Communications Server TCP/IP parameter SOMAXCONN. In the case of a failed NMI INQUIRE for obtaining TCPIPSERVICE resource statistics (codes 043A-C), the statistics will report 0 for the following fields for the appropriate stack:

- SOR_CURR_BACKLOG
- SOR_CURR_MAX_BACKLOG
- SOR_CONNS_DROPPED
- SOR_CONN_LAST_DROPPED

DFHSO1002	*date time applid* CICS is unable to determine the secure state of a new connection received on **ATTLSAWARE TCPIPSERVICE** *tcpipservice* from client IP address *ipaddress*. UNIX System Services values returned are bpx_return_value(*bpx_return_value*), bpx_return_code(*bpx_return_code*), and bpx_reason_code(*X'bpx_reason_code'*).

Explanation

A web client attempted to connect to a CICS region which is secured by an Application Transparent Transport Layer Security (AT-TLS) aware TCPIPSERVICE.

The socket listener task (CSOL) made a UNIX BPXIOCTL call to obtain information relating to a new connection but the call failed.

If the IP Address is 'UNKNOWN' then the client has already disconnected before CICS could obtain the IP Address.

System action

An exception trace entry is made in the trace table. No system dump is taken, unless specifically requested in the dump table.

CICS continues unless the dump table specifies that CICS should terminate.

The socket accepted for the client is closed.

User response

Refer to the z/OS UNIX System Services Messages and Codes z/OS UNIX System Services Messages and Codes manual to determine the cause of the error.

CSOO

DFHSO1003I	*applid* CICS is using minimum key sizes of 256 (ECC) and 2048 (DH/DSA/RSA) during TLS handshakes.

Explanation

CICS is using a minimum key size of 256 for ECC keys and 2048 for RSA, DSA and Diffie-Hellman keys during TLS handshakes. The following System SSL settings are in effect:

- GSK_CLIENT_ECURVE_LIST=0025002400230030 0029
- GSK_SERVER_ALLOWED_KEX_ECURVES=00250024 002300300029
- GSK_CLIENT_EPHEMERAL_DH_GROUP_SIZE=2048
- GSK_SERVER_EPHEMERAL_DH_GROUP_SIZE=2048
- GSK_PEER_DH_MIN_KEY_SIZE=2048
- GSK_PEER_DSA_MIN_KEY_SIZE=2048
- GSK_PEER_ECC_MIN_KEY_SIZE=256
- GSK_PEER_RSA_MIN_KEY_SIZE=2048

System action

System initialization continues.

User response

The System SSL settings are in effect because feature toggle com.ibm.cics.tls.minimumkeystrength=2048 was set. If the settings are not required then remove the feature toggle. The message can be suppressed with the system initialization parameter MSGLVL=0.

DFHSRnnnn messages

DFHSR0001	*applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in program *progname*.**

Explanation

An abnormal end (abend) or program check has occurred in program *progname*. Storage protection is active, and CICS was executing in USER key at the time of the abend or program check.

The code *aaa* is a three digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The four digit code *bbbb*, which follows *aaa*, is a user abend code, produced either by CICS or by another product on the user's system. Message DFHME0116, which contains the symptom string for this problem, is produced.

System action

An exception trace entry is made giving details of the error. System dump SR0001 is taken unless you have specifically suppressed dumps for that dumpcode in the dump table.

CICS continues and abends the transaction, unless you have specified in the dump table that CICS should terminate. The transaction abend code is ASRA, ASRB, ASRD or ASRE.

User response

As the execution key was USER key, *modname* is probably a customer application program. Review this program and correct the error.

Note that if the error was an 0C4 program check caused by an attempt to overwrite a CICS DSA, the exception trace entry indicates which DSA the program attempted to overwrite. If this is the case, also refer to the explanation for message DFHSR0622.

For advice on problem determination, refer to the Troubleshooting and support.

Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

If you want to suppress system dumps that precede ASRA, ASRB, ASRD or ASRE abends when the execution key is USER, you must specify this on an entry in the dump table for system dumpcode SR0001. Use either CEMT or an EXEC CICS command. Further guidance on this can be found in the Configuring.

Console

DFHSR0605	*applid* Error from KE Domain - DFHSRP initialization

Explanation

Module DFHSRP has detected a severe error during the initialization phase of CICS. It is unlikely that any recovery functions can run until the error is found and corrected.

System action

CICS abnormally terminates with system dump SR0605. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the dump to determine, if possible, the cause of the problem and what must be done to correct it.

For advice on problem determination, refer to the Troubleshooting and support

Module:
DFHSRP

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHSR0606	*applid* Abend (code *aaa/bbbb*) has been detected.

Explanation

DFHSRP has detected an abnormal termination which CICS is not able to handle fully (for example, the abend code cannot be found in the SRT). In this instance it is the CICS system and not merely a transaction, that has abnormally terminated.

The code *aaa* is a three digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The four digit code *bbbb*, which follows *aaa*, is a user abend code produced either by CICS or by another product on the user's system. Message DFHME0116, which contains the symptom string for this problem, is produced.

System action

CICS abnormally terminates. A system dump (dumpcode SR0606) can be taken with this message depending on the abend code. An exception trace entry is produced giving the kernel error data for the abend.

User response

Use the dump to determine the abnormal termination, and to investigate its cause.

Module:
DFHSRP

XMEOUT parameters/Message inserts

 1. *applid*
 2. *aaa/bbbb*

Destination

Console

DFHSR0612	*applid* Abend recovery has been entered by same task

Explanation

An operating system abnormal termination occurred. CICS started to abend the task with abend code ASRB

when another operating system abnormal termination occurred. As this is a potentially recursive situation, DFHSRP terminates CICS.

System action

CICS abnormally terminates with system dump SR0612 and exception trace entries giving the kernel error data for each operating system abend. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

The most likely cause of the second operating system abend is an error in a global user exit program running at the XSRAB exit. This is the global user exit that can be invoked when an abend code is found in the SRT. If such a program was running, determine the cause of the second abend and take steps to prevent a recurrence.

Note that this message will also be issued if a global user exit program running at the XSRAB exit gets into a loop (runaway), or issues an unknown XPI call (kernerror). The second exception trace entry should help to diagnose this.

For advice on problem determination, see the Troubleshooting and support.

Module:

CDB2 and Console

DFHSR0622   *applid* **An attempt to {overwrite | access} the *dsaname* has caused the abend which follows**

Explanation

An 0C4 program interrupt (protection exception) has occurred. CICS has diagnosed the cause of the 0C4 as an attempt to either *access* or *overwrite* storage in DSA *dsaname*. The DSA is one of CDSA, RDSA, UDSA, ECDSA, ERDSA, ETDSA, EUDSA or GCDSA for *overwrite*, or either UDSA or EUDSA for *access*.

If *dsaname* is CDSA, ECDSA, ETDSA or GCDSA:

> CICS is running with storage protection active. The CDSA, ECDSA, ETDSA and GCDSA therefore contain CICS key storage. They are write protected from user programs executing in User key. The most likely causes of the 0C4 are:

> - A program executing in CICS key passed the address of CICS key storage in the CDSA, ECDSA, ETDSA or GCDSA to a user program executing in User key and this user program attempted to write to this storage.

> - A user program executing in User key contains an error and accidentally attempted to write to CICS key storage in the CDSA, ECDSA, ETDSA or GCDSA.

- A user program executing in User key deliberately attempted to write to CICS key storage in the CDSA, ECDSA, ETDSA or GCDSA.

If *dsaname* is ERDSA or RDSA:

CICS may be running with or without storage protection active. The ERDSA or RDSA contains only reentrant CICS and user programs. If RENTPGM=PROTECT was specified as a system initialization parameter, the ERDSA or RDSA is write protected from programs executing in both CICS key and User key. If RENTPGM=NOPROTECT, the ERDSA or RDSA is only protected from user programs executing in User key. The most likely causes of the 0C4 are:

- A user program residing in the ERDSA or RDSA has attempted to modify its own storage, (that is, the program is not reentrant).
- A user program contains an error and accidentally attempted to overwrite program storage in the ERDSA or RDSA.

If *dsaname* is EUDSA or UDSA:

CICS is running with both storage protection and transaction isolation active. The EUDSA and UDSA contain only USER key non-shared storage. The most likely causes of the 0C4 are:

- If the action is *overwrite*, a program has attempted to modify the non-shared storage belonging to another transaction.
- If the action is *access*, a program has attempted to either read storage or execute an instruction within another transaction's non-shared storage.

System action

Either, the transaction abends with abend code ASRA. This message is followed by message DFHAP0001 or

DFHSR0001 which gives the name of the program in error and the offset into that program at which the error occurred. Additionally, an exception trace entry is taken which gives program, offset, execution key and the DSA in question.

Or, this is a critical error and CICS is terminated. This message is followed by a DFHSR06xx message giving the reason for the termination.

User response

Depending on the cause and *dsaname*, do one of the following:

- Correct any error in the program.
- Redefine transactions with ISOLATE(NO) where they have to share storage.
- Change the program resource definition so that it executes in CICS key (and the basespace).
- Ensure that the program is not loaded into the ERDSA by not link-editing it with the RENT option.

Module:
DFHSRP

DFHSTnnnn messages

DFHST0001	*applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively, unexpected data has been input, or storage has been overwritten.

Note:

There is NO *applid* for DFHSTUP modules.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table.

For modules DFHSTST and DFHSTTI, a dump is taken and the collection interval is set to 24 hours. Message DFHST0101 is also issued.

For module DFHSTDM, the action depends on the initialization error action value which is used by the domain (DM) manager. The usual action is to terminate CICS with a dump.

For module DFHSTUE, processing continues.

For modules DFHSTWR, DFHSTRD, and DFHSTU*x* (modules within DFHSTUP), the job step is terminated with a dump.

For ALL modules, a system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the z/OS MVS System Codes manual. Then look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, a runaway or a recovery percolation, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

2. *X'code'*
3. *modname*

Destination

Console

DFHST0003	*applid* **Insufficient storage to satisfy GETMAIN (code *X'code'*) in module *modname*.**

Explanation

A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request. The code X'*code*' is the exception trace point id which uniquely identifies the place where the error was detected. This error has occurred above the 16MB line.

System action

An exception entry is made in the trace table (code X'*code*' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the size limits of the DSAs or EDSAs. If CICS is not already terminated, you need to bring CICS down to do this. See the Configuring or the Improving performance for further information on CICS storage.

2. *X'code'*
3. *modname*

Destination

Console

DFHST0004	*applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

Note that no *applid* is included for DFHSTUP modules.

System action

An exception entry is made in the trace table.

For modules DFHSTST and DFHSTTI, a system dump is taken and the collection interval is set to 24 hours. Message DFHST0101 will also be issued.

For module DFHSTDM, the action depends on the initialization error action value which is used by the domain (DM) manager. The usual action will be to terminate CICS with a dump.

For module DFHSTUE, processing continues.

For modules DFHSTWR, DFHSTRD, and DFHSTU*x* (modules within DFHSTUP), the job step is terminated with a dump.

For ALL modules, a system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in

milliseconds). This means that module *modname* is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTST, DFHSTDM, DFHSTTI, DFHSTUE, DFHSTUx (Modules within DFHSTUP), DFHSTWR, DFHSTRD

XMEOUT parameters/Message inserts

1. *applid*
2. *X'offset'*
3. *modname*

Destination

Console

DFHST0005	*applid* **A hardware error has occurred (module *modname*, code *X'code'*). The Time-of-Day clock is invalid.**

Explanation

Execution of the STCK machine instruction resulted in a non-zero condition code.

System action

A system dump is taken and interval collections are cancelled. Message DFHST0102 is also issued.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. This is in all probability a hardware error and you should in the first instance investigate the MVS Store Clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTST, DFHSTDM

XMEOUT parameters/Message inserts

1. *applid*
2. *modname*
3. *X'code'*

Destination

Console

DFHST0101I	*applid* **The Statistics Domain has set the collection interval to 24 hours.**

Explanation

A problem has been detected by, or has been passed back to, the statistics (ST) domain. As a result, the collection interval has been set to the maximum value. The end-of-day collection time is unchanged.

A message explaining the problem has already been issued by the module in error.

System action

Other processing continues.

User response

Refer to the associated message for guidance on resolving the original problem.

Use CEMT SET STATISTICS to reset the interval when the problem has been resolved.

Module:
DFHSTST, DFHSTDM, DFHSTTI

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHST0102I	*applid* **The Statistics Domain has cancelled interval collections.**

Explanation

A problem has been detected by, or has been passed back to, the statistics (ST) domain. A message explaining the problem may have already been issued by the module in error.

To reduce the occurrence of this problem, the interval collections have been cancelled. The end-of-day collection time is unchanged.

System action

Other processing continues.

User response

Refer to any associated message for guidance on resolving the original problem.

If no associated message has been issued, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTST, DFHSTDM, DFHSTTI

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHST0103   *applid* **An SMF error has occurred with return code *X'rc'*.**

Explanation

SMF has returned to the statistics (ST) domain with an error return code X'*rc*' from the SMFEWTM macro.

System action

Other CICS processing continues.

User response

Refer to the z/OS MVS System Management Facilities (SMF) manual for a detailed explanation of the meaning of the return code.

Module:
DFHSTST

XMEOUT parameters/Message inserts

1. *applid*

2. *X'rc'*

Destination

Console

DFHST0201 S   **An attempt to open the statistics data set has failed.**

Explanation

DFHSTUP has tried to open the unloaded SMF data set but has failed.

System action

A dump is taken and the job step is terminated.

User response

Ensure that the JCL for the job is correct. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS documentation.

If incorrect JCL is not the cause of the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTRD

Destination

SYSPRINT

DFHST0202 S   **A read error on the statistics data set has occurred**

Explanation

A read error was encountered on the unloaded SMF data set.

System action

A dump is taken and the job step is terminated.

User response

Inform the system programmer. First check that the JCL for the job is correct. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS documentation. Resubmit the job.

Module:
DFHSTRD

Destination

SYSPRINT

DFHST0203 W   **The statistics data set is empty.**

Explanation

An end-of-file condition was detected during the first attempt to read the unloaded SMF data set, or the unloaded SMF dataset contained no CICS statistics from any CICS system.

System action

The job step is terminated.

User response

The most likely cause is an error in the JCL which unloads the SMF dataset. First check that the JCL is correct. A sample set of JCL to unload the SMF dataset is contained in the CICS documentation. Also check that you have unloaded the correct SMF dataset. Resubmit the job.

Module:
DFHSTIN

Destination

SYSPRINT

DFHST0204 S   **Invalid record id *"recid"* encountered on the statistics data set.**

Explanation

An invalid record identifier *recid* has been encountered in the unloaded SMF data set.

System action

A dump is taken and the job step is terminated.

User response

Check that the unloaded SMF data set contains statistics records. CICS statistics records are of SMF record type 110, sub-type 2. For further information, see the CICS Data Areas.

If the SMF data set does contain statistics records, the most likely cause of the problem is a corrupted SMF dataset. Unload the SMF dataset again and rerun the DFHSTUP utility. If the problem persists, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTU*x* (modules within DFHSTUP)

Destination

SYSPRINT

DFHST0206 S   **An invalid parameter (*"parameter"*) has been specified for the DFHSTUP utility.**

Explanation

One or more of the parameters specified in the SYSIN data set were incorrect.

System action

The job step is terminated.

User response

Correct the erroneous parameter as identified in the message and resubmit the job.

Module:
DFHSTUP1

Destination

SYSPRINT

DFHST0207 W   **An incomplete data record has been encountered on the statistics data set.**

Explanation

A record input from the unloaded SMF data set specifies that the data it contains is incomplete.

System action

Processing continues.

User response

For an incomplete data record to have been encountered, there must have been an error in the running of CICS. This should result in an exception trace and perhaps a dump being issued.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTUx (modules within DFHSTUP)

Destination

SYSPRINT

DFHST0208 S　　An attempt to open the SYSIN data set has failed.

Explanation

DFHSTUP has tried to open the SYSIN data set but has failed.

System action

A dump is taken and the job step is terminated.

User response

Ensure that the JCL for the job is correct. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS documentation.

If incorrect JCL is not the cause of the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTRD

Destination

SYSPRINT

DFHST0209 S　　A read error on the SYSIN data set has occurred.

Explanation

A read error was encountered on the SYSIN data set.

System action

A dump is taken and the job step is terminated.

User response

Inform the system programmer.

To resolve the problem, collect the dumps and any relevant messages and determine why the read failed. Resubmit the job.

Module:
DFHSTRD

Destination

SYSPRINT

DFHST0210 I　　No statistics are available for applid *applid*.

Explanation

No statistics data records exist for applid *applid* in the unloaded SMF data set. This is because

- Applid *applid* is unknown, or
- You have unloaded the wrong SMF data set, or
- You have specified a COLLECTION TYPE= parameter for which applid *applid* has no statistics, or
- No CICS statistics records were written for applid *applid*.

System action

The job step continues.

User response

Check that you have specified the correct applid. If necessary, respecify the correct applid. Check that you have unloaded the correct SMF data set. If necessary, unload the correct SMF data set. If you have specified the correct applid and unloaded the correct SMF data set, then there are no statistics data records for applid *applid*.

Module:
DFHSTUP1

Destination

SYSPRINT

DFHST0211 S　　Processing terminated. Getmain failed with a short on storage condition.

Explanation

The DFHSTUP utility detected an error from a GETMAIN macro while obtaining working storage. This was because DFHSTUP had exhausted the available storage.

System action

A dump is taken and the job step terminates.

User response

Check that you have specified the correct REGION size on the EXEC JCL command used to execute the DFHSTUP utility. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS documentation.

If you have specified the correct REGION size, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
All DFHSTUP modules

Destination

SYSPRINT

DFHST0212 S	Processing terminated. DFSORT message dataset (DD=SYSOUT) is missing.

Explanation

The dataset used by the DFSORT utility to output its messages is missing.

System action

A dump is taken and the job step is terminated.

User response

Check the JCL used to execute the DFHSTUP utility to ensure that the SYSOUT DD was correctly specified. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS documentation.

If you have specified the correct SYSOUT DD statement, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTUP1

Destination

SYSPRINT

DFHST0213 S	Processing terminated. Error detected by DFSORT. Check DFSORT messages.

Explanation

An error was detected by the DFSORT utility and the DFHSTUP utility terminated.

System action

A dump is taken and the job step is terminated.

User response

The user must inspect the DFSORT message dataset and search for messages indicating the reason for the failure of the DFSORT utility. A detailed explanation of the messages produced by DFSORT can be found in the z/OS DFSORT Application Programming Guide (SC33-4035).

After analyzing the DFSORT error message, take the appropriate corrective actions and resubmit the job.

Module:
DFHSTUP1

Destination

SYSPRINT

DFHST0214 S	Processing terminated. Failure to obtain system time and date.

Explanation

The DFHSTUP utility was unable to obtain the system time and date from the CICS kernel.

System action

A dump is taken and the job step is terminated.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTUP1

Destination

SYSPRINT

DFHST0216 W	An incompatible statistics record version number *"version"*, was detected by module *"module"*.

Explanation

The statistics utility program has detected that a statistics record has a version number which is incompatible with the version number expected by the DFHSTUP utility.

System action

The statistics record containing the invalid version number is ignored. Statistics records immediately following which are of the same type and which also

contain an invalid version number are also ignored.
Processing continues.

User response

Obtain a dump of the SMF data set. If you need further
assistance from IBM to resolve this problem, see
Working with IBM to solve your problem for guidance
on how to proceed.

Module:
All DFHSTUP modules.

Destination

SYSPRINT

DFHST0217 S   **An attempt to open the
                     DFHSTWRK data set has failed.**

Explanation

The statistics utility program has detected an error
while attempting to open the DFHSTWRK data set
during non-summary statistics processing.

System action

The statistics utility program ends abnormally.

User response

Ensure that the DFHSTWRK data set has been
specified on the job, and that the attributes of the data
set are correct.

Module:
DFHSTU17

Destination

SYSPRINT

DFHST0218 S   **A write error has occurred on the
                     DFHSTWRK data set.**

Explanation

The statistics utility program has detected an error
while attempting to write to the DFHSTWRK data set
during non-summary statistics processing.

System action

The statistics utility program ends abnormally.

User response

Ensure that the DFHSTWRK data set has been
specified on the job, that the attributes of the data set
are correct, and that the data set is large enough.

Module:
DFHSTU17

Destination

SYSPRINT

DFHST0219 S   **A read error has occurred on the
                     DFHSTWRK data set.**

Explanation

The statistics utility program has detected an error
while attempting to read from the DFHSTWRK data set
during non-summary statistics processing.

System action

The statistics utility program ends abnormally.

User response

Check that the DFHSTWRK data set has been specified
on the job, that the attributes of the data set are
correct, and that the data set is large enough.

Module:
DFHSTU17

Destination

SYSPRINT

DFHST0220 S   **An attempt to open the
                     DFHSTWRK data set has failed.**

Explanation

The statistics utility program has detected an error
while attempting to open the DFHSTWRK data set
while processing summary statistics.

System action

The statistics utility program ends abnormally.

User response

Check that the DFHSTWRK data set has been specified
on the job, and that the attributes of the data set are
correct.

Module:
DFHST17X

Destination

SYSPRINT

DFHST0221 S   A write error has occurred on the DFHSTWRK data set.

Explanation

The statistics utility program has detected an error while attempting to write to the DFHSTWRK data set during summary statistics processing.

System action

The statistics utility program ends abnormally.

User response

Check that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Module:
DFHST17X

Destination

SYSPRINT

DFHST0222 S   A read error has occurred on the DFHSTWRK data set.

Explanation

The statistics utility program has detected an error while attempting to read from the DFHSTWRK data set during summary statistics processing.

System action

The statistics utility program ends abnormally.

User response

Check that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Module:
DFHST17X

Destination

SYSPRINT

DFHST0223 I   There are no data table statistics to report.

Explanation

The file subsection of the DFHSTUP report entitled 'Data Table Requests Information' only contains formatted information if the data currently being processed contains statistics records for files accessed as data tables. This message is written to the DFHSTUP report, when the utility program detects that there are no data table statistics in this section of the statistics report.

System action

Processing continues normally.

User response

Take no action unless you expect data table statistics in the DFHSTUP report. In this case, ensure that the data tables feature is in use during the time period covered by the statistics being processed.

Module:
DFHSTU17, DFHST17X

Destination

SYSPRINT

DFHST0224 I   There are no intrapartition queues to report.

Explanation

The transient data subsection of the DFHSTUP report entitled 'Transient Data - Intrapartition' contains no data.

System action

Processing continues normally.

User response

Take no action unless you expect TD intrapartition statistics in the DFHSTUP report.

Module:
DFHSTUTQ, DFHSTTQX

Destination

SYSPRINT

DFHST0225 I   There are no extrapartition queues to report.

Explanation

The transient data subsection of the DFHSTUP report entitled 'Transient Data - Extrapartition' contains no data.

System action

Processing continues normally.

User response

Take no action unless you expect TD extrapartition statistics in the DFHSTUP report.

Module:
DFHSTUTQ, DFHSTTQX

Destination

SYSPRINT

DFHST0226 I   There are no indirect queues to report.

Explanation

The transient data subsection of the DFHSTUP report entitled 'Transient Data - Indirect' contains no data.

System action

Processing continues normally.

User response

Take no action unless you expect TD indirect statistics in the DFHSTUP report.

Module:
DFHSTUTQ, DFHSTTQX

Destination

SYSPRINT

DFHST0227 I   There are no remote queues to report.

Explanation

The transient data subsection of the DFHSTUP report entitled 'Transient Data - Remote' contains no data.

System action

Processing continues normally.

User response

Take no action unless you expect TD remote statistics in the DFHSTUP report.

Module:
DFHSTUTQ, DFHSTTQX

Destination

SYSPRINT

DFHST0228 S   An invalid extract parameter (*"parameter"*) has been specified for the DFHSTUP utility.

Explanation

One or more of the parameters on the extract command specified in the SYSIN data set were incorrect.

System action

The job step is terminated.

User response

Correct the erroneous parameter as identified in the message and resubmit the job.

Module:
DFHSTUP1

Destination

SYSPRINT

DFHST0229 W   A duplicate extract command has been detected. Command ignored.

Explanation

A duplicate EXTRACT USERPROGRAM command has been detected.

System action

The duplicate command is ignored and the extract exit program specified on the first command is used. Processing continues.

User response

Remove the erroneous command.

Module:
DFHSTUP1

Destination

SYSPRINT

DFHST0230 E   **Unable to locate the extract library member *member*.**

Explanation

The member is not in the libraries named in the JCL.

System action

The utility terminates processing of the command that required access to library member *member*.

User response

Ensure that the member is correctly link-edited into the library and resubmit the job.

Module:
DFHSTUP

Destination

SYSPRINT

DFHST0231 E   **Unable to load the extract library member *member*.**

Explanation

DFHSTUP could not load the extract library member *member*.

System action

The utility terminates processing of the command that required access to the library member.

User response

Ensure that the member is correctly link-edited into the library and resubmit the job.

Module:
DFHSTUP

Destination

SYSPRINT

DFHST0232 S   **An abend (code *aaa/bbbb*) has occurred in extract exit program *modname*. Extract exit processing has been terminated.**

Explanation

During processing of an EXTRACT command, a program check or abend *aaa/bbbb* has occurred in extract exit program *modname*.

The code *aaa/bbbb* is, if applicable, a 3-digit hexadecimal MVS system completion code *aaa* (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code *bbbb*, which follows *aaa* is, if applicable, a user abend code produced by the extract exit program. If the user abend code is not applicable, this field is filled with four hyphens.

System action

The EXTRACT command is terminated.

User response

For a program check, refer to prior messages to resolve the error in the extract exit program. For a user abend code consult the relevant documentation of the user exit program to determine the error.

Module:
DFHSTUP

Destination

SYSPRINT

DFHST0233 I   **DFHSTUP report suppressed. Report options requested only an EXTRACT userprogram to be invoked.**

Explanation

No report was produced by DFHSTUP due to the fact that an EXTRACT exit program was specified and no other report options. DFHSTUP invokes the exit program to process the statistics records and suppresses all its reporting

System action

EXTRACT processing continues.

User response

If a DFHSTUP report is required in addition to the report produced from the specified EXTRACT exit, specify the necessary DFHSTUP reporting options.

Module:
DFHSTUP

Destination

SYSPRINT

DFHST0234 S   **EXTRACT terminated at user's request RC=*retcode*.**

Explanation

A batch job has issued a DFHSTUP utility EXTRACT command. The EXTRACT command has been terminated because of a non-zero value in register 15 on return from an extract user exit program.

System action

Execution of the utility EXTRACT command is terminated.

User response

Determine the cause of the error detected by the user exit program using the return code *retcode* provided and the relevant documentation of the user exit program.

Module:
DFHSTUP

Destination

SYSPRINT

DFHST0235 S   **An abend (code *aaa/bbbb*) has occurred in program *modname*.**

Explanation

During processing of an DFHSTUP command, a program check or abend *aaa/bbbb* has occurred in module *modname*.

The code *aaa/bbbb* is, if applicable, a 3-digit hexadecimal MVS system completion code *aaa* (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code *bbbb*, which follows *aaa* is, if applicable, a Language Environment abend code. If the abend code is not applicable, this field is filled with four hyphens.

DFHSZnnnn messages

DFHSZ4001 I   ***date time applid* FEPI initialization has started.**

Explanation

The Front End Programming Interface (FEPI) is being initialized.

System action

The DFHSTUP command is terminated.

User response

Look up the MVS code, if there is one, in the z/OS MVS System Codes manual. Look up the Language Environment abend code in the z/OS Language Environment Debugging Guide manual.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTUP

Destination

SYSPRINT

DFHST0236 I   **DFHSTUP has reached its reporting limit of 2000 applids, subsequent applid reporting is now suppressed.**

Explanation

DFHSTUP has reached its limit of 2000 for the number of applids it can produce a report for. Reports for subsequent applids are suppressed.

System action

Processing continues.

User response

Consider reducing the number of applids in the statistics data.

Module:
DFHSTOT

Destination

SYSPRINT

This means the CSZI transaction - FEPI - has started its processing. CSZI is started as part of CICS system initialization, if the system initialization parameter FEPI is set to YES.

If you specified FEPI=YES and this message does not appear during CICS initialization, CSZI failed to start; the most common reason for this is that group

DFHFEPI is not included in the list specified by the GRPLIST system initialization parameter.

If message DFHSZ4001 is not followed by message DFHSZ4002, FEPI failed to start. In this case, a DFHSZnnnn message is issued to indicate the error.

System action

FEPI initialization proceeds.

User response

None.

Module:
DFHSZRMP(DFHSZSIP)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSZL and Console

DFHSZ4002 I   *date time applid* **FEPI initialization has ended.**

Explanation

The Front End Programming Interface (FEPI) has finished initialization.

System action

EXEC CICS FEPI commands are made available.

User response

None.

Module:
DFHSZRMP(DFHSZSIP)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSZL and Console

DFHSZ4003 I   *date time applid* **FEPI termination complete.**

Explanation

The Front End Programming Interface (FEPI) has ended.

A DFHSZnnnn message may precede message DFHSZ4003 to indicate what caused FEPI to terminate.

System action

EXEC CICS FEPI commands are made unavailable.

User response

Resolve the problem indicated by the messages, then restart CICS.

Module:
DFHSZRMP(DFHSZSIP)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSZL and Console

DFHSZ4004 E   *date time applid* **FEPI cannot be started: FEPI=YES not specified in the SIT.**

Explanation

The Front End Programming Interface (FEPI) cannot be started because the FEPI system initialization parameter was set to NO indicating that FEPI is not required.

This message usually means that you attempted to start the FEPI transaction (CSZI) manually, but did not set up the correct environment for it to run.

System action

The FEPI transaction is not run.

User response

If you require FEPI in the CICS system, restart CICS specifying the system initialization parameter FEPI=YES. You do not need to start the FEPI transaction manually.

Module:
DFHSZRMP(DFHSZSIP)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSZL and Console

DFHSZ4005 E   *date time applid* **FEPI cannot be started: FEPI is already active, in state** *X'sssssss'*.

Explanation

The Front End Programming Interface (FEPI) cannot be started because FEPI is already active in the system.

This message usually means that you attempted to start a new instance of FEPI manually by running the FEPI transaction (CSZI), but the previous instance of FEPI failed in some way that caused an 'active' indication to be left in error.

The possible FEPI states (X'sssssss') are:

State
    Meaning
X'00000002'

    FEPI is being initialized

X'00000003'

    FEPI is active

X'00000004'

    FEPI is terminating as CICS is undergoing a normal shutdown

X'00000005'

    FEPI is terminating as CICS is undergoing an immediate shutdown

X'00000006'

    FEPI is terminating as CICS is undergoing an abnormal shutdown

System action

The request to start a new instance of FEPI is rejected.

User response

If the state suggests that a previous instance of FEPI failed, you must restart CICS to resolve the problem. You do not need to start the FEPI transaction manually.

Module:
DFHSZRMP(DFHSZSIP)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *X'sssssss'*

Destination

CSZL and Console

DFHSZ4006 E   *date time applid* **FEPI initialization failed: enqueue failure, code** *X'rr'*.

Explanation

The Front End Programming Interface (FEPI) cannot be initialized because an attempt to enqueue on the FEPI enqueue name SZENQRMI failed, indicating that FEPI is already active in the system. FEPI initialization issues this enqueue to prevent a second instance of FEPI being present in the system.

This message usually means that you attempted to start the FEPI transaction (CSZI) manually, but there is a previous instance of CSZI still running.

The possible values of X'*rr*', the reason for failure, are:

Code
    Meaning
X'31'

    Duplicate enqueue on SZENQRMI attempted.

X'32'

    Failure during enqueue processing.

System action

The request to start a second instance of FEPI is rejected.

User response

None.

Module:
DFHSZRMP(DFHSZSIP)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

4. *X'rr'*

Destination

CSZL and Console

DFHSZ4007 E	*date time applid* **FEPI initialization failed: storage ADD_SUBPOOL failure for subpool *pppppppp*, reason *X'rr'* response *X'ee'*.**

Explanation

The Front End Programming Interface (FEPI) cannot be initialized because creating the named storage subpool for FEPI use failed.

The values of X'*rr*', the reason for failure, are:

Reason
Meaning

X'01'

Insufficient storage available for the subpool

X'03'

Subpool requested with an invalid fixed length

X'04'

Subpool requested with an invalid boundary alignment

X'05'

Subpool requested with an invalid initial number of elements

X'06'

Subpool requested with an invalid name

X'08'

Subpool requested already exists

X'11'

Access to the Storage Manager was denied

The values of X'*ee*', the response to the failed request, are:

Response
Meaning

X'01'

Request completed successfully

X'02'

Exception response generated

X'03'

Disaster response generated

X'04'

Invalid response generated

X'05'

A kernel error was detected

X'06'

The request was purged

System action

FEPI initialization ends, and EXEC CICS FEPI commands are unavailable. An exception trace entry is generated.

User response

The only action you can take is when there is insufficient storage, in which case you can increase the storage available to CICS on restart.

All other errors are system failures, and you should consult the system programmer. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:

1. *date*
2. *time*
3. *applid*
4. *pppppppp*
5. *X'rr'*
6. *X'ee'*

Destination

CSZL and Console

DFHSZ4008 E	*date time applid* **FEPI initialization failed: Non-runaway task setting failure, reason *X'rr'* response *X'ee'*.**

Explanation

The Front End Programming Interface (FEPI) cannot be initialized. Because FEPI is a long-running transaction (CSZI), it must not be subject to a runaway task time out. The request to prevent this failed.

The value of X'*rr*', the reason for failure, is always X'00'.

The values of X'*ee*', the response to the failed request, are:

Response
    Meaning

X'01'

Request completed successfully

X'02'

Exception response generated

X'03'

Disaster response generated

X'04'

Invalid response generated

System action

FEPI initialization ends, and EXEC CICS FEPI commands are made unavailable. An exception trace entry is generated.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSZRMP(DFHSZSIP)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *X'rr'*
5. *X'ee'*

Destination

CSZL and Console

DFHSZ4009 E	*date time applid* FEPI initialization failed: change-priority failure, response *X'ee'*.

Explanation

The Front End Programming Interface (FEPI) cannot be initialized because changing the dispatching priority of the FEPI transaction (CSZI) failed.

Because FEPI runs as a transaction, a high priority is required. The request to set this dispatching priority failed.

The values of X'*ee*', the response to the failed request, are:

Response
    Meaning

X'01'

Request completed successfully

X'03'

Disaster response generated

X'04'

Invalid response generated

X'05'

A Kernel error was detected

System action

FEPI initialization ends, and EXEC CICS FEPI commands are made unavailable. An exception trace entry is generated.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSZRMP(DFHSZSIP)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *X'ee'*

Destination

CSZL and Console

DFHSZ4010 E	*date time applid* FEPI initialization failed: SZ TCB swap failure, response *X'ee'*.

Explanation

The Front End Programming Interface (FEPI) usually runs under the CICS SZ TCB. Transferring the FEPI transaction (CSZI) from running under the QR TCB to the SZ TCB failed.

The values of X'*ee*', the response to the failed request, are:

Response
    Meaning

X'01'

Request completed successfully

X'02'

Exception response generated

X'03'

Disaster response generated

X'04'

Invalid response generated

X'05'

A kernel error was detected

System action

FEPI initialization ends, and EXEC CICS FEPI commands are made unavailable. An exception trace entry is generated.

User response

The SZ TCB is created as part of the early CICS initialization and you should examine the console log to see if any messages were generated indicating a TCB creation failure.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

CSZL and Console

DFHSZ4011 E *date time applid* **FEPI storage GETMAIN failed in subpool NB, reason *X'rr'* response *X'ee'*.**

Explanation

The Front End Programming Interface (FEPI) issued a GETMAIN storage request in the SZSPFCNB storage subpool for NIB usage which failed.

The values of X'*rr*', the reason for failure, are:

Reason
Meaning

X'01'

Insufficient storage for the request

X'02'

Invalid subpool token given

X'04'

Invalid length of element requested

X'05'

Length of element not specified

X'08'

Access was denied to the storage subpool

X'11'

Invalid initial image supplied

X'12'

An abnormal end occurred in the storage manager

X'13'

A loop was detected in the storage manager

The values of X'*ee*', the response to the failed request, are:

Response
Meaning

X'01'

Request completed successfully.

X'02'

Exception response generated.

X'03'

Disaster response generated.

X'04'

Invalid response generated.

X'05'

A Kernel error was detected.

X'06'

The request was purged.

All these responses indicate that a system error has occurred.

System action

An exception trace entry is generated.

FEPI tries to recover from this error by retrying the request. However, no action is taken to prevent multiple occurrences.

User response

If this message occurs frequently, you should take a dump of the CICS system before restarting it. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Destination

CSZL and Console

DFHSZ4014 E   *date time applid* **FEPI storage FREEMAIN failed in subpool DA| NB|RP, reason** *X'rr'* **response** *X'ee'*.

Explanation

The Front End Programming Interface (FEPI) issued a FREEMAIN storage request in an SZSPxxxx storage subpool. The request failed.

The values of X'*rr*', the reason for failure, are:

Reason
   Meaning

X'02'

   Invalid subpool token given.

X'03'

   The address of the element to be freed is invalid.

X'06'

   Invalid length of element specified.

X'07'

   Length of element not specified.

X'08'

   Access was denied to the storage subpool.

X'10'

   The specified storage subpool was empty.

X'12'

   An abnormal end occurred in the storage manager.

X'13'

   A loop was detected in the storage manager.

The values of X'*ee*', the response to the failed request, are:

Response
   Meaning

X'01'

   Request completed successfully.

X'02'

   Exception response generated.

X'03'

   Disaster response generated.

X'04'

   Invalid response generated.

X'05'

   A kernel error was detected.

X'06'

   The request was purged.

All of these responses indicate that a system error occurred.

System action

The request is rejected, and a retry is not attempted (perhaps leaving storage that is never subsequently accessible). An exception trace entry is generated.

User response

CSZL and Console

DFHSZ4015 I	*date time applid* **FEPI {normal | immediate | forced} termination has started.**

Explanation

The Front End Programming Interface (FEPI) has acknowledged a shutdown request and is starting to terminate.

Message DFHSZ4003 is issued when FEPI completes termination.

FEPI terminates only in response to a CICS shutdown request (such as CEMT PERFORM SHUTDOWN). Some types of CICS shutdown can result in more than one DFHSZ4015 message being issued.

System action

Certain EXEC CICS FEPI commands are made unavailable during FEPI termination.

Normal termination allows all transactions using FEPI resources to end before FEPI itself ends. However, no new usage of FEPI resources is permitted.

Immediate termination stops usage of FEPI facilities immediately but does a controlled shutdown of communication functions.

Forced termination stops usage of FEPI facilities immediately, and does the quickest possible shutdown of communication functions (which may lead to many VTAM messages being issued).

Destination

CSZL

DFHSZ4158 W *date time applid* **The VTAM OPEN request for FEPI node *nnnnnnnn* failed with a reason code of *X'rrrrrrrr'*. This operation will be retried.**

Explanation

The Front End Programming Interface (FEPI) has detected an error during VTAM OPEN processing for the named node.

The possible values of X'*rrrrrrrr*', the reason for failure, are:

Code
  Meaning

X'00000000'
  VTAM TPEND occurred with error code 0.

X'00000004'
  VTAM TPEND occurred with error code 4.

X'00000008'
  VTAM TPEND occurred with error code 8.

X'0000000C'
  VTAM SETLOGON failed.

other values
  VTAM OPEN failed with error code given.

Refer to z/OS Communications Server: SNA Programming for a description of these error codes.

System action

Processing continues; the VTAM OPEN for the node is repeated after a short interval.

User response

None.

Module:
DFHSZRMP(DFHSZRIO)

DFHSZ4203 I   ***date time applid* FEPI target *tttttttt* now has status *{INSERVICE | OUTSERVICE | GOINGOUT}.***

Explanation

The status of a Front End Programming Interface (FEPI) target has been changed by an EXEC CICS FEPI SET TARGET or a CEMT SET FETARGET command, and is now as described.

System action

Processing continues.

DFHTAnnnn messages

DFHTA0001   ***applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname.***

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller

User response

None

Module:
DFHSZRMP(DFHSZRIW)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

5. Value chosen from the following options:

    1=INSERVICE,

    2=OUTSERVICE,

    3=GOINGOUT

Destination

CSZL

(for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTADM, DFHTASO

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHTA0002   *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTADM

XMEOUT parameters/Message inserts

1. *applid*

DFHTCnnnn messages

DFHTC1001	*applid* **Terminal control initialization failed (*modname*).**

Explanation

The CICS terminal control restart task could not complete because a necessary step failed. The task has done some essential recovery operations and has abnormally terminated itself with code ATC1.

System action

CICS writes a transaction dump for the terminal control restart task. CICS sends two messages to the console, one to identify the error detected by the terminal control restart task, and one, DFHTC1001, to say that the task has failed. A third message follows, either to say that CICS has terminated abnormally with a dump or to ask you to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

First, if CICS has requested a response, you must reply. If you reply 'GO', CICS continues processing, but without terminal control. If you reply 'CANCEL', CICS terminates abnormally with a dump. Use the messages and dumps to find out the cause of the failure. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

1. *applid*
2. *modname*

Destination

Console

DFHTC1002	*applid* **Unable to link to program DFHTCRP.**

Destination

Console

Explanation

The CICS terminal control recovery program, DFHTCRP, is unavailable. CICS cannot find DFHTCRP in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System action

CICS terminates abnormally with a dump.

User response

To correct this error, place DFHTCRP in a partitioned data set in the DFHRPL DD statement.

Module:
DFHSII1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTC1004	*applid* **Program DFHTORP cannot be found. Typeterms cannot be initialized**

Explanation

The CICS terminal object resolution program, DFHTORP, is not available. CICS cannot find DFHTORP in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System action

CICS terminates abnormally with a dump.

User response

To correct this error, place DFHTORP in a partitioned data set in the DFHRPL DD statement.

Module:
DFHTCRP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTC1011	*applid* **Unable to load** *xxxxxx*

Explanation:

System action

CICS initialization continues, but, even if it completes, VTAM resource initialization will be incorrect in some respect, depending on the function of module DFH*xxxxxx*.

User response

If CICS completes initialization, processing of VTAM resources will be invalid. You should cancel CICS, make module DFH*xxxxxx* available and then restart CICS.

Module:
DFHTCRP

XMEOUT parameters/Message inserts

1. *applid*
2. *xxxxxx*

Destination

Console

DFHTC1012	*applid* **Failure in installing VTAM resources**

Explanation

During a cold or initial start, CICS could not install all the VTAM resources defined to CICS. CICS has issued other message(s) identifying which resources could not be installed.

System action

CICS initialization continues.

User response

If any of the uninstalled resources is essential, use RDO to make it available, or cancel CICS. The most likely reasons for this message are:

- A previous CICS message such as DFHTC1011, **or**
- CICS code contains a logic error.

If you suspect an error in CICS, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:

Destination

Console

DFHTC1013	*applid* **Restore failed for** *xxxxxx*

Explanation

During a warm or emergency restart, CICS could not restore the resource *xxxxxx*.

System action

CICS continues initialization.

User response

If resource *xxxxxx* is essential to your system, cancel CICS. This problem is probably caused by a CICS logic error. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTCRP

XMEOUT parameters/Message inserts

1. *applid*
2. *xxxxxx*

Destination

Console

DFHTC1014	*DATE TIME APPLID* **Communication resource definition for (***resname***) was not restored from the catalog because the resource definition for (***highname***) was not installed.**

Explanation

During an emergency restart, CICS could not restore the resource *resname* from the catalog, because the definition for another resource *highname* that it depends on is not present. Usually *resname* is a session or modegroup and *highname* is a connection.

System action

CICS continues restart, and deletes this resource from the CICS catalog. If the definition referred to was being installed when the previous CICS failed, both definitions are restored from the system log later in the restart.

User response

If resource *resname* is essential to your system and is not restored later in initialization you can reinstall the resource having first installed the resource that it depends on. This message can be caused by:

- An install which was not complete when CICS failed, in which case it is forward recovered from the system log later, and no action is needed.

- A failure during warm shutdown in the previous run. In this case messages are produced for connections that were autoinstalled and were not uncataloged by the warm shutdown. In this case some auto-installed connections which would have been removed from the catalog if the warm shutdown had completed are recovered, but those which cause these messages are not.

- A corrupted CICS catalog. If large numbers of unrelated resources are missing, and the preceding CICS run was not warm keypointing at the time of failure, the catalog may have been corrupted. CICS continues, but you may want to initial start in order to get your definitions to a known state.

- A CICS logic error. In this case you need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

XMEOUT parameters/Message inserts

1. *applid*
2. *type*
3. *key*

Destination

Console

DFHTC1023　　*applid* **Logic error in tracking**
　　　　　　　　　　　condition

Explanation

During XRF tracking, a condition was detected which
is not possible within the intended design. The insert
indicates which of the checked conditions has been
detected:

1. No broadcast message accepted outside tracking.
   The GETMSG routine in DFHTCRP should only
   accept broadcast messages and those whose id
   matches that in field GETMSPEC. This field should
   only be set during tracking.
2. Broadcast message with null key. A null-key record
   indicates that the catch-up stream that it arrives in
   is complete. This can only happen to the broadcast
   tracking stream if the active has just done a normal
   (warm) shut-down.

System action

The message in question is ignored

User response

If you need further assistance from IBM to resolve this
problem, see Working with IBM to solve your problem
for guidance on how to proceed.

DFHTC1042I	*applid* **Waiting for terminal control tracking to drain.**

Explanation

An alternate is taking over and is processing the remaining few tracking records from the active. This message is issued every 15 seconds while the takeover is held up for processing to complete. This is potentially an error, especially if it is repeated an unusual number of times. The likely causes include a delay in STANDBY BIND or UNBIND processing in VTAM, or a CICS logic error. The system issues this message twice and then flushes the outstanding tracking activity as described in message DFHTC1046.

System action:

User response

Look for message DFHTC1046.

Module:
DFHZXQO

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTC1043I	*applid* **Terminal control tracking ended - *nnn* records received.**

Explanation

An XRF alternate system is taking over. The last of the terminal control tracking records from the failing active system has been received and is being processed.

System action

Takeover continues.

User response

None.

Module:
DFHTCRP

XMEOUT parameters/Message inserts

1. *applid*
2. *nnn*

Destination

Console

DFHTC1044I	*applid* **Terminal control catch-up started.**

Explanation

An XRF alternate system is preparing to standby and has received the first message from the active containing information about terminal control resources installed and/or bound before this alternate was started.

System action

Initialization continues.

User response

None.

Module:
DFHTCRP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTC1045I	*applid* **Terminal control catch-up complete.**

Explanation

An XRF alternate system is standing by, and has now received all the terminal control information it needs about terminal control resources installed and/or bound in the active before this alternate was started.

System action

Normal tracking continues.

User response

None.

Module:
DFHTCRP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTC1046I   *applid* **Flushing terminal control tracking.**

Explanation

An alternate is taking over and is processing the remaining few tracking records from the active. Message DFHTC1042 has been issued twice. DFHZXQO is now doing a controlled flush of the outstanding activity.

System action

CICS posts one outstanding action every 2 seconds in an attempt to free the hold-up. A system dump is taken for the first action only.

User response

This processing only occurs when an error or unforeseen circumstance arises. If the problem can be reproduced, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZXQO

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTC1047I   *applid* **Higher node missing. Record dropped for** *key*

Explanation

An XRF alternate has received a tracking message from the active CICS, but either the associated system entry for this terminal is not present, or the ordering of terminal catalog records on the restart data set is incorrect (in that the terminal in error comes before the associated system entry).

key is the location of an object in the TCTTE hierarchy. This situation occurs if the active CICS was unable to send all of its tracking messages. This sometimes results in the system entry not being sent.

System action

The tracking message is discarded and so the associated action (an INSTALL or LOGON) is not performed.

User response

Ensure the CAVM message data set is large enough and restart the alternate. Check that the active CICS job is referring to the correct restart data set.

Module:
DFHTCRP

XMEOUT parameters/Message inserts

1. *applid*
2. *key*

Destination

Console

DFHTC1060   *applid* **Insufficient storage - code(*X'code'*) in module DFHTCRP.**

Explanation

A request for storage could not be satisfied in module DFHTCRP. The specific error is identified by the X'*code*' in the message. This implies that the dynamic storage area (DSA) size is too small. The X'*code*' identifies an exception trace record.

System action

Terminal control initialization is terminated with a system dump and message DFHTC1001 is issued.

User response

Since sufficient storage should be obtainable from within the minimum size DSA, this may imply a logic error within CICS. Try to increase the CDSASZE parameter in the system initialization table (SIT). If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTCRP

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*

Destination

Console

DFHTC1575   *applid* **No TCT entry for** *termid*

Explanation

This message is issued when system initialization reads a warm start record for which there is no matching terminal control table (TCT) entry. *termid* is the the name of the terminal that is missing.

System action

The record is ignored.

User response

If terminal *termid* is required, system initialization should be canceled.

Module:
DFHTCRP

XMEOUT parameters/Message inserts

1. *applid*
2. *termid*

Destination

Console

DFHTC1600   *applid* **The value for SYSIDNT,** *sysid1*, **does not match the one specified in the last cold or initial start,** *sysid2*. **CICS normal operation may be affected.**

Explanation

SYSIDNT has been specified in the SIT or as a system initialization parameter override on a warm or emergency start of CICS. The value of SYSIDNT does not match that specified on the last cold or initial start. SYSIDNT should be updated only on a cold or initial start.

System action

System initialization continues.

User response

For an emergency or warm start of CICS, ensure that SYSIDNT has the same value as in the last cold or initial start. It is recommended that CICS is re-

initialized with the appropriate value specified for the SYSIDNT parameter for correct operation of CICS.

Module:
DFHTCRP

Destination

CSMT

DFHTC2501　　　**Msg too long, please resubmit**

Explanation

The terminal operator has keyed in more data than was expected for this READ.

System action

The transaction in progress is terminated.

User response

Reset the terminal and restart the transaction after the message TRANSACTION HAS BEEN ABENDED has been received.

Module:
DFHTACP

Destination

Terminal End User

DFHTC2502　　　*date time applid* **TCT search error {on line w/term | at term } termid {, trans | , dest } tranid/destid {, rel line=} rr,time**

Explanation

An invalid terminal address was received on the line identified by terminal *termid*. This error can normally occur only on control unit devices such as a 2980 or a 3270. This is because CICS uses general polling and not all terminals on the control unit may be defined to CICS. All other conditions are undefined. The optional part of the message " **dest** *destid* " applies only to TCAM. The destination *destid* is given when it does not match any of the network names (netnames) specified on the TCTTE generation.

System action

The control unit is placed out of service or, if it is not a general polled device, the line is placed out of service.

User response

Ensure that all terminals on the failing control unit are defined to CICS.

Where applicable, ensure that the TCAM MCP terminal generation names match the CICS DFHTCT TYPE=TERMINAL NETNAME parameter.

Destination

CSMT

DFHTC2511	*date time applid* **Invalid write request** *{on line w/term | at term } termid {, trans } tranid {, rel line=} rr,time*

Explanation

This message is issued when one of the following has occurred.

1. A transaction has issued a write to its terminal facility that currently has a terminal status of input.
2. A transaction has issued a write to a 3735 during batch transmission prior to receipt of the end-of-file (EOF) condition.

System action

The write request is not executed, and the transaction terminates abnormally. CICS processing continues.

User response

The user response depends on the condition that has occurred. For condition

1. ensure that transactions do not issue write requests to terminals in input status.
2. ensure that the 3735 batch transaction does not issue its first write request before it has received the EOF condition.

10. *time*

Destination

CSTL

DFHTC2515	*date time applid* **Output area exceeded *{on line w/term | at term } termid {, trans } tranid {, rel line=} rr,time***

Explanation

One of the following has occurred:

- The terminal I/O area (TIOA) is not large enough to contain both the data and carrier control characters.
- The TIOA data length is greater than the TCAM block size specified in the DFHTCT TYPE=SDSCI macro.
- The application requires a TIOA larger than 32767 bytes.

System action

The write request is not executed, the terminal write storage is freed (if possible), and the transaction terminates abnormally. CICS processing continues.

User response

Ensure that application programs do not set the value of TIOATDL greater than the TIOA GETMAIN size, and that the TIOA data length is not greater than the TCAM blocksize. Also ensure that the application program does not require a TIOA larger than 32767 bytes.

CSTL

DFHTC2516	*date time applid* **Unit check SNS=*ss {on line w/term | at term } termid {, trans } tranid {, rel line=} rr,time***

Explanation

A unit check error has occurred on the line defined by terminal *termid*. The sense (SNS=*ss*) is provided. D/T 3275 dialed gives an automatic two-minute time out if there is no activity on the line.

System action

The line is placed out of service on SAM lines.

Intervention on a switched line causes the task to be abnormally terminated and the line to be logically disconnected. Intervention on a non-switched line with a dummy (unidentified) terminal causes the line to be placed out of service. With a real terminal, intervention causes the terminal to be placed out of service and the transaction to be abnormally terminated.

A data check with a dummy terminal causes the line to be placed out of service. With a real terminal, it causes the terminal to be placed out of service and the transaction to be abnormally terminated.

Lost data on a READ,TEXT command causes a MESSAGE TOO LONG response to be sent to the terminal. The transaction is abnormally terminated.

Time-out on a READ,TEXT command causes a MESSAGE TOO LONG response to be sent to the terminal. Time-out with a dummy terminal causes the line to be placed out of service. With a real terminal, it causes the terminal to be placed out of service and the transaction to be abnormally terminated.

User response

Examine the system console log message generated by SAM for this error and have the unit error corrected.

DFHTD0001　　　*applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a three 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; TS1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the z/OS MVS System Codes manual. Then look up the CICS alphanumeric code. This tells you, for example, whether the error is a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

4. *termid*

Destination

CSMT

If you cannot run without the full use of module *modname,* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDA, DFHTDB, DFHTDRM, DFHTDOC

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHTD0002　　　*applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the Troubleshooting and support.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller

(for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

The severity of this error depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDA, DFHTDB, DFHTDRM, DFHTDOC

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHTD0100I	*applid* **Transient Data initialization has started.**

Explanation

This is an informational message indicating that transient data initialization has started.

System action

System initialization continues.

User response

None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTD0101I	*applid* **Transient Data initialization has ended.**

Explanation

This is an informational message indicating that transient data initialization has completed successfully.

System action

System initialization continues.

User response

None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP, DFHTDRM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTD0102	*applid* **Transient Data initialization has failed.**

Explanation

Transient data initialization has failed.

The SETXIT routine in DFHTDRP has been entered following abnormal termination of the transient data initialization task.

Alternatively an attempt to open the intrapartition data set failed.

System action

Provided there are no subsequent serious errors which prevent further initialization of CICS, CICS issues one of two messages depending on what other errors, if any, have occurred during initialization.

If DFHSI1521 is issued, CICS initialization is terminated. If DFHSI1522 is issued, decide if CICS initialization is to be continued in degraded mode or to be terminated.

If, as part of a restart of CICS rather than during an initial start or a cold start, the intrapartition data set fails to open successfully when it was successfully opened on the previous CICS run, message DFHSI1521 is issued and CICS is terminated.

User response

Check previous console messages, one of which should explain why transient data initialization has failed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHTD0103I	*applid* **Transient Data initialization has been suspended pending takeover.**

Explanation

This is an informational message indicating that transient data initialization has been suspended pending takeover. Some transient data initialization can be performed while CICS is operating in standby mode. However the remaining initialization can not be performed until takeover is complete because transient data sets, with the exception of the DFHCXRF data set, are assumed to be passively shared.

System action

System initialization continues.

User response

None. The message can be suppressed with the SIT parameter MSGLVL=0.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHTD0104I	*applid* **Transient Data initialization has been resumed following takeover.**

Explanation

This is an informational message indicating that transient data initialization has been resumed following takeover.

System action

System initialization continues.

User response

None. This message can be suppressed with the system initialization parameter MSGLVL=0.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHTD0105I   *applid* **Transient Data intrapartition queues will be initialized empty as EMPTY was specified on the TDINTRA SIT parameter.**

Explanation

This is an informational message indicating that transient data is being initialized with TDINTRA=EMPTY specified on the SIT. This has the effect of initializing all intrapartition TD queues in an empty state. The TDINTRA SIT parameter is ignored during a cold or initial start.

System action

System initialization continues.

User response

None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTD0170   *applid* **The intrapartition data set has been corrupted.**

Explanation

During a warm or emergency restart, CICS has found that the contents of the intrapartition data set are not consistent with that recorded by CICS. The intrapartition data set could have been corrupted.

System action

CICS terminates after producing a dump and writing an exception trace.

A system dump with dumpcode TD0170 is taken unless you have specifically suppressed dumps in the dump table.

User response

Reinitialize the intrapartition data set.

Perform a cold start or an initial start of CICS.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTD0180   *applid* **Unexpected response (code X'response') and reason (code X'reason') from a *dfhxxyym* call.**

Explanation

A transient data module cannot continue processing following the failure of a *dfhxxyym* call to domain *xx*.

The response (code X'*response*') and reason (code X'*reason*') are those returned from the domain call (that is, *xxyy_response* and *xxyy_reason*).

System action

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0180 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDA, DFHTDB, DFHTDOC, DFHTDRM

XMEOUT parameters/Message inserts

1. *applid*
2. *X'response'*
3. *X'reason'*
4. *dfhxxyym*

Destination

Console

| DFHTD0182 | *applid* Unexpected response (code *X'response'*) and reason (code *X'reason'*) from a *dfhxxyym* call. |

Explanation

Module DFHTDRP cannot continue processing following the failure of a *dfhxxyym* call to domain *xx*.

The response (code X'*response*') and reason (code X'*reason*') are those returned from the domain call (that is, *xxyy_response* and *xxyy_reason*).

System action

This is a critical error.

CICS writes a dump and terminates abnormally.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

1. *applid*
2. *X'response'*
3. *X'reason'*
4. *dfhxxyym*

Destination

Console

| DFHTD0183 | *applid* Unexpected response (code *X'response'*) and reason (code *X'reason'*) from a *dfhxxyym* call during processing of intrapartition queue *queue.* |

Explanation

The trigger level has been reached for intrapartition transient data queue *queue*.

Module DFHTDB or DFHTDRM could not initiate the associated transaction following the response of a *dfhxxyym* call to domain *xx*.

The response (code X'*response*') and reason (code X'*reason*') are those returned from the domain call (that is, *xxyy_response* and *xxyy_reason*).

Initiation of the associated transaction has failed.

System action

This is probably a CICS logic error.

Each subsequent write to the transient data queue causes another attempt to initiate the transaction, which will fail. However, this message is only issued the first time the error is detected.

CICS writes a dump and continues processing. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDB, DFHTDRM

XMEOUT parameters/Message inserts

1. *applid*
2. *X'response'*
3. *X'reason'*
4. *dfhxxyym*
5. *queue*

Destination

Console

DFHTD0240 · *applid* Queue *queue* (DD name *ddname*) is full.

Explanation

No more data can be written to extrapartition queue *queue*.

A system abend, MVS code X'37', has occurred during processing on the data set with ddname *ddname*.

System action

If the system abend occurs during processing of an EXEC CICS WRITEQ TD command, the NOSPACE condition is returned.

If the system abend occurs during processing of an EXEC CICS SET TDQUEUE CLOSED command, the data set is not closed and the IOERR condition is returned.

Note that a second attempt to close the data set succeeds.

User response

Consider allocating more space to the data set before you bring CICS up again.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDA, DFHTDOC

XMEOUT parameters/Message inserts

1. *applid*
2. *queue*
3. *ddname*

Destination

Console

DFHTD0242 · *applid* Abend *abcode* has been detected during processing for queue *queue* (DD name *ddname*).

Explanation

A system abend, MVS code *abcode,* has occurred during processing on the extrapartition queue *queue* (that is, the data set with ddname *ddname*).

System action

A system dump with dumpcode TD0242 is taken unless you have specifically suppressed dumps in the dump table.

Since this may not be a critical error, CICS is not terminated, and the IOERROR condition is returned.

User response

Examine the CICS job log. QSAM issues a message explaining the reason for the system abend. See z/OS MVS System Messages, Volume 1 (ABA-AOM) for a description of this message.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDA, DFHTDOC

XMEOUT parameters/Message inserts

1. *applid*
2. *abcode*
3. *queue*
4. *ddname*

Destination

Console

DFHTD0244 · *applid* An I/O error has occurred during an output operation to an extrapartition dataset for queue *queue*. (DD name = *ddname*).

Explanation

An I/O error has occurred during the processing of an output operation to the extrapartition data set *ddname* on queue *queue*.

System action

An IOERR condition is returned. Subsequent put requests are returned IOERR.

User response

Close data set *ddname* via CEMT. If the I/O errors persist after a subsequent open, you probably need to reallocate this data set on a different volume.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDA, DFHTDOC

XMEOUT parameters/Message inserts

1. *applid*
2. *queue*
3. *ddname*

Destination

Console

DFHTD0245   *applid* **NOSPACE condition on a PUT to the intrapartition data set (DD name *ddname*). The RBA of the next CI would have exceeded 2 gigabytes.**

Explanation

An attempt to write to intrapartition transient data set with ddname *ddname* has failed due to a NOSPACE condition. CICS did attempt to extend the data set but the relative byte address (RBA) of the next control interval (CI), if it were added, would have exceeded 2 gigabytes (x'7FFFFFFF').

System action

The system continues normally.

User response

Delete unwanted transient data queues from the intrapartition data set.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDB

XMEOUT parameters/Message inserts

1. *applid*
2. *ddname*

Destination

Console

DFHTD0246   *applid* **An I/O error has occurred during an input operation to an extrapartition dataset for queue *queue*. (DD name = *ddname*).**

Explanation

An I/O error has occurred during the processing of an input operation to the extrapartition data set *ddname* on queue *queue*.

System action

An IOERR condition is returned. Subsequent put requests are returned IOERR.

User response

Close data set *ddname* via CEMT. If the I/O errors persist after a subsequent open, you probably need to reallocate this data set on a different volume.

Check the definition of the extrapartition transient data queue. The specification of an invalid blocksize or recordsize may have caused the I/O error.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDA, DFHTDOC

XMEOUT parameters/Message inserts

1. *applid*
2. *queue*
3. *ddname*

Destination

Console

DFHTD0247   *applid* **NOSPACE condition on a PUT to the intrapartition data set (DD name *ddname*). The data set is full.**

Explanation

An attempt to write to intrapartition transient data set with ddname *ddname* has failed due to a NOSPACE condition. CICS did attempt to extend the data set but no secondary space was defined or available.

System action

The system continues normally.

User response

Delete unwanted transient data queues from the intrapartition data set, or consider redefining the intrapartition data set with additional secondary storage allocation.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDB

XMEOUT parameters/Message inserts

1. *applid*
2. *ddname*

Destination

Console

DFHTD0250   *applid* **Dynamic allocation of queue** *queue* **failed. Return code** **X'rrrr',X'cccc' in module** *module*.

Explanation

While dynamically allocating queue *queue,* CICS transient data issued an MVS DYNALLOC macro. The DYNALLOC failed with return code *cccc. rrrr* is the additional return code in register 15.

System action

CICS continues with queue *queue* closed.

User response

For the meaning of the DYNALLOC return codes, see the z/OS MVS Programming: Authorized Assembler Services Guide.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

5. *module*

Destination

Console

DFHTD0251   *applid* **Dynamic deallocation of queue** *queue* **failed. Return code -** **X'rrrr',X'cccc' in module** *module*.

Explanation

While closing queue *queue*, CICS transient data issued the MVS macro, DYNALLOC, to dynamically deallocate the queue. Deallocation failed with the MVS return code, *cccc. rrrr* is the return code in register 15.

System action

CICS continues with the queue closed, but still allocated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you change the DSNAME attribute in the resource definition for the transient data queue, and then reopen the queue in the same CICS run, CICS may open the original data set. For an explanation of the MVS return code, see the z/OS MVS Programming: Authorized Assembler Services Guide.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDOC

XMEOUT parameters/Message inserts

1. *applid*
2. *queue*
3. *X'rrrr'*
4. *X'cccc'*
5. *module*

Destination

Console

DFHTD0252   *applid* **Open of queue** *queue* **failed.** **DSNAME not available from JCL**

or resource definition. Module
module.

Explanation

An attempt by CICS to open queue *queue* failed because neither the JCL nor the resource definition for the queue specified the data set name.

CICS transient data has not opened queue *queue*, for the following reasons:

- At initialization time, the startup JCL did not include a DD statement.
- No user-submitted routine allocated the queue dynamically.
- The TDQUEUE resource definition does not contain a DSNAME attribute to enable CICS to allocate the file dynamically.

System action

CICS continues processing with queue *queue* closed.

User response

Before resubmitting the transaction, supply the data set name in the JCL or the resource definition.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:

1. *applid*
2. *queue*
3. *module*

Destination

Console

DFHTD0340	*applid* **Transaction** *tranid* **initiated when the trigger level is reached for Transient Data queue** *queue* **is defined as REMOTE. The transaction initiation has failed.**

Explanation

The trigger level has been reached for the transient data queue *queue*. The transaction associated with the queue is remote, which is invalid for trigger transactions. The initiation of the transaction has, therefore, failed.

System action

Until the error is corrected, each subsequent write to the transient data queue causes another attempt to initiate the transaction, which fails. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User response

If the transaction ID specified in the TDQUEUE resource definition is incorrect, amend the resource definition to specify a transaction that is local.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDXM

XMEOUT parameters/Message inserts

1. *applid*
2. *tranid*
3. *queue*

Destination

Console

DFHTD0341	*applid* **Transaction** *tranid* **associated with the trigger level for Transient Data queue** *queue* **has not been initiated.**

Explanation

The trigger level has been reached for transient data queue *queue*. Initiation of the associated transaction has failed due to an error in system set up.

System action

Until the error is corrected, each subsequent write to the transient data queue causes another unsuccessful attempt to initiate the transaction. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User response

Check the TDQUEUE resource definition for the transient data queue. The queue must have a

transaction associated with it that exists, is defined as local, and is installed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDB, DFHTDRM

XMEOUT parameters/Message inserts

1. *applid*
2. *tranid*
3. *queue*

Destination

Console

DFHTD0342	*applid* **Transaction** *tranid* **associated with the trigger level for Transient Data queue** *queue* **has not been scheduled.**

Explanation

The trigger level has been reached for the transient data queue *queue*. The schedule of the associated transaction has failed due to an error in system set up.

System action

Until the error is corrected, each subsequent write to the transient data queue causes another attempt to schedule the transaction, which fails. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User response

Check the following and amend if necessary:

- The queue must have a transaction associated with it that exists, is defined as local, and is installed. The transaction was local since the Remote attributes were not set in the transaction definition, yet the dynamic parm indicated that it could be remote.

- For a transient data queue defined with an ATIFACILITY attribute of SYSTEM or TERMINAL, the named facility must exist, and any required system links must be installed and in service.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:

DFHTD0363   *applid* **Physical I/O error occurred during a PUT request to the intrapartition data set (DD name *ddname*); VSAM return codes are R15=*X'retcode'*, FDBK=*X'fdbkcode'*.**

Explanation

An attempt to write or rewrite a control interval to the intrapartition data set with ddname *ddname* has failed due to a physical I/O error. *retcode* is the return code in register 15 and *fdbkcode* is the value of the feedback field in the request parameter list (RPL).

System action

A system dump with dumpcode TD0363 is taken unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

User response

For the meaning of the codes in the message, refer to the z/OS DFSMS Macro Instructions for Data Sets.

A copy of the physical error message produced by VSAM will appear in (one of) the transient data VSAM error message area(s) in the system dump.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDB, DFHTDRM

XMEOUT parameters/Message inserts

1. *applid*
2. *ddname*
3. *X'retcode'*
4. *X'fdbkcode'*

Destination

Console

DFHTD0380   *applid* **Illegal attempt to read control interval 0 for the intrapartition data set (DD name *ddname*).**

Explanation

Control interval 0 in the intrapartition data set is reserved for transient data control information. The remaining control intervals are allocated to hold data for queues as determined by transient data processing on behalf of application program requests.

An invalid attempt has been made to read control interval 0 for the intrapartition data set with ddname *ddname*.

System action

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0380 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Each CICS record for an intrapartition transient data queue contains pointers which, if the queue is not empty, are relative byte addresses (RBAs) associated with the intrapartition data set with *ddname*.

Furthermore each allocated control interval, apart from the first, contains one or more user records as well as a queue control record. This latter record, the first in the control interval, contains the forward chain pointer or RBA for the next control interval containing data for the queue.

In each case, transient data assumes that RBAs address record boundaries within the intrapartition data set.

The assumption can be violated in several ways. The type of violation may be determined from:

- a control interval print of the intrapartition data set, or
- using Access Method Services, or
- using the system dump.

Violations include:

- THE WRONG INTRAPARTITION DATA SET WAS USED If the wrong data set has been used, that is, the data set used for this CICS start up was not used for the previous CICS start up, then it is highly probable that most of the RBAs in the CICS records for an intrapartition transient data queue will not address record boundaries in the intrapartition data set. A cold start or an initial start of CICS must be carried out.

- THE INTRAPARTITION DATA SET WAS ALTERED If the records have been moved, possibly through data set compression, then it is highly probable that control interval 0 will contain more than one record and that most of the RBAs in the CICS records for an intrapartition transient data queue will not address record boundaries in the intrapartition data set. A cold start or an initial start of CICS must be carried out.

- A CICS record for an intrapartition transient data queue WAS CORRUPTED If a CICS record for an intrapartition transient data queue has been corrupted, it is highly probable that just one or two RBAs will not address record boundaries in the intrapartition data set. A specialized trap may be required to identify the offending program.

  CICS may be restarted. An emergency restart for transient data will result in the RBAs being reconstructed from the system log and the intrapartition data set.

  If an activity keypoint was taken between the occurrence of the error and its detection, it may prove necessary for a cold start or an initial start of CICS to be carried out.

- AN I/O BUFFER WAS CORRUPTED If an I/O buffer has been corrupted, it is highly probable one of the RBAs in the CICS record for an intrapartition transient data queue will not address record boundaries in the I/O buffer. A specialized trap may be required to identify the offending program.

  CICS may be restarted. An emergency restart for transient data results in the RBAs being reconstructed from the system log and the intrapartition data set.

  Note: If the contents of the I/O buffer were written to the intrapartition data set between the occurrence of the error and its detection, it may prove necessary to perform a cold start or an initial start of CICS.

- A CICS LOGIC ERROR OCCURRED If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

- The High Write RBA of the DFHINTRA data set may have reached, or exceeded, the allowed maximum value of x'7FFFFFFF'.

  CICS may be restarted. An emergency restart for transient data will back out all uncommitted records from the intrapartition queues.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDB, DFHTDRM

XMEOUT parameters/Message inserts

1. *applid*
2. *ddname*

Destination

Console

DFHTD0381   *applid* **Invalid attempt to (re)write control interval 0 for the intrapartition data set (DD name *ddname*).**

Explanation

Control interval 0 in the intrapartition data set is reserved for transient data control information; the remaining control intervals are allocated to hold data for queues as determined by transient data processing on behalf of application program requests.

An invalid attempt has been made to (re)write control interval 0 for the intrapartition data set with ddname *ddname*.

System action

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0381 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Refer to message DFHTD0380.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Console

DFHTD0384	*applid* A forward chain pointer for queue *qqqq* does not match the contents of the intrapartition data set (DD name *ddname*).

Explanation

A forward chain pointer for queue *qqqq* is invalid with respect to the intrapartition data set with ddname *ddname*.

System action

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. A system dump with dumpcode TD0384 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Refer to message DFHTD0380.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDB, DFHTDRM

XMEOUT parameters/Message inserts

1. *applid*
2. *qqqq*
3. *ddname*

Destination

Console

DFHTD0385	*applid* Invalid attempt to allocate/deallocate CI 0 for the intrapartition data set (DD name *ddname*).

Explanation

Control interval (CI) 0 in the intrapartition data set, *ddname*, is reserved for transient data control information. The remaining control intervals are allocated to hold data for queues as determined by transient data processing on behalf of application program requests.

System action

System dump TD0385 is taken unless you have specifically suppressed dumps in the dump table.

This is a critical error. CICS is terminated even if you have specified in the dump table that CICS should not terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Refer to the **User Response** of message DFHTD0380.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDB, DFHTDRM

XMEOUT parameters/Message inserts

1. *applid*
2. *ddname*

Destination

Console

DFHTD0386   *applid* **The high RBA value of the current allocation for intrapartition data set (DD name *ddname*) is *X'highrba'*. This exceeds the maximum allowable value of 2GB, and will be capped to a value of X'80000000' minus the CI size of the data set.**

Explanation

The high RBA value of the current allocation for intrapartition data set (DD name *ddname*), is X'*highrba*'. This exceeds the maximum allowable value of 2GB.

System action

Message DFHTD0387 is issued to seek approval to cap.

User response

Consider reducing the currently allocated size of the intrapartition data set (primary and secondary extents).

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

1. *applid*
2. *ddname*
3. *X'highrba'*

Destination

Console

DFHTD0387D   *applid* **Allow the intrapartition data set to be capped - Enter *GO* or *CANCEL*.**

Explanation

The high RBA value of the primary extent for the intrapartition data set exceeds the maximum allowable value of 2GB. See message DFHTD0386 for details which will have preceeded this message.

System action

If you reply GO, CICS will cap the area that can be used to a value of X'80000000' minus the CI size of the data set.

If you reply CANCEL, CICS will be terminated.

User response

Consider reducing the size of the primary extent of the intrapartition data set.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

CSQL

DFHTD1210	*applid* **DCT index in error,** *xxxx* **failed**

Explanation

While carrying out operation *xxxx* (INSTALL) CICS found an error in the destination control table (DCT) index. This message is issued on warm or emergency restarts when transient data is installing entries from

the global catalog. The most likely reasons for this error are:

1. Storage violation.

    An application program has overwritten the index, **or**

2. CICS logic error

    The CICS Directory Domain created the index incorrectly. **or**

3. Corrupt global catalog entries

    The global catalog has been corrupted.

System action

CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Respond GO or CANCEL to message DFHSI1522.

Look at the contents of the global catalog, to determine if the catalog entry has been corrupted for the DCTE that is failing to install.

Assuming that the error is a storage violation, and that you have activated the trace facility, find in the trace the unsuccessful attempt to access the DCT by DFHTDP. Then find the last preceding successful access. You have now narrowed the search to programs that were running between these two accesses. Examine these programs for an error that could cause a storage violation.

If you have not activated trace, but you can recreate the error, activate trace, recreate the error, and proceed as in the previous paragraph.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

1. *applid*
2. *xxxx*

Destination

Console

DFHTD1217   *applid* **Unable to install resource definition for transient data queue *xxxx*.**

Explanation

During a warm or emergency restart, CICS was unable to install the resource definition for the transient data queue *xxxx*.

System action

CICS ignores the definition and continues initialization.

User response

The cause of this install failure may be indicated in earlier messages issued from the transient data (TD) component. It may be the result of a failure to open the DFHINTRA data set, or a security error associated with any userid included in the definition. In the latter case, it is possible to create an RDO definition for the entry, with the correct userid, once CICS has initialized, and then to install it using the CEDA transaction.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

1. *applid*
2. *xxxx*

Destination

Console

DFHTD1221   *applid* **Transient data queue definitions not restored, *xxxx* failed**

Explanation

During a warm start, while carrying out operation *xxxx* (STARTBROWSE, GETNEXT or ENDBROWSE), the transient data recovery program (DFHTDRP) found an error in the catalog table of transient data queue definitions.

The most likely reasons for this error are I/O errors in the catalog data set, or a logic error in the CICS module, DFHCCCC.

System action

CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Respond GO or CANCEL to message DFHSI1522.

Determine and correct the I/O errors on the catalog data set. If you cannot restore the catalog data set, or suspect that there might be a CICS logic error in DFHCCCC, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

1. *applid*
2. *xxxx*

Destination

Console

DFHTD1260	*applid* No DD statement for intrapartition data set *ddname*

Explanation

CICS is unable to open the intrapartition data set *ddname* because no DD statement has been provided.

System action

During a cold or initial start, transient data initialization continues until any transient data queue resource definitions have been processed. Any intrapartition queues found are not installed and message DFHTD1217 is issued for each install failure encountered. At the end of TD initialization, message DFHTD0102 is issued. If no other initialization errors occur, message DFHSI1522 is issued.

For all other starts, TD checks the catalog to see if DFHINTRA had opened successfully on the previous CICS run. If it did, initialization is terminated. If it did not, TD initialization continues normally.

User response

During a cold or initial start, respond GO or CANCEL to message DFHSI1522.

Modify the CICS JCL to add a DD statement defining the intrapartition data set (DFHINTRA).

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

1. *applid*
2. *ddname*

Destination

Console

DFHTD1261	*applid* Intrapartition data set *ddname* not defined as VSAM ESDS

Explanation

CICS is unable to open the intrapartition data set *ddname* because it is not defined as VSAM ESDS.

System action

During a cold or initial start, transient data initialization continues until any transient data queue resource definitions have been processed. Any intrapartition queues found are not installed and message DFHTD1217 is issued for each install failure encountered. At the end of TD initialization, message DFHTD0102 is issued. If no other initialization errors occur, message DFHSI1522 is issued.

For all other starts, TD checks the catalog to see if DFHINTRA had opened successfully on the previous CICS run. If it did, initialization is terminated. If it did not, TD initialization continues normally.

User response

On a cold or initial start, respond GO or CANCEL to message DFHSI1522.

Recreate the intrapartition data set as a VSAM ESDS and restart CICS.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

1. *applid*
2. *ddname*

Destination

Console

DFHTD1262   *applid* **Intrapartition data set** *ddname* **not formatted**

Explanation

The intrapartition data set *ddname* is not formatted (it is empty). Initial formatting is done (if necessary) when CICS is cold or initial started.

System action

CICS continue to initialize until all resource definitions for transient data queues have been installed. Any intrapartition definitions being read from the global catalogue will fail to install because of the original failure. When DFHTDRP completes its processing, CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

User response

Respond GO or CANCEL to message DFHSI1522.

Perform a cold or initial start when CICS is next brought up.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

1. *applid*
2. *ddname*

Destination

Console

DFHTD1263   *applid* **Invalid control record for Intrapartition data set** *ddname*

Explanation

The intrapartition data set *ddname* was not initialized for intrapartition transient data. The most likely reason for this is data corruption by:

- VSAM export and import
- DFHSM migration and recall.

System action

CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

User response

Respond GO or CANCEL to message DFHSI1522.

Reinitialize the intrapartition data set.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

DFHTD1279   *applid* **Unexpected response (code X'response') and reason (code X'reason') from a dfhxxyym call.**

Explanation

Module DFHTDTM detected the failure of a *dfhxxyym* call to domain *xx* while attempting to install an intrapartition entry containing a USERID.

The response (code X'*response*') and reason (code X'*reason*') are those returned from the domain call (that is, *xxyy_response* and *xxyy_reason*).

This can be due to a CICS logic error.

System action

If the error occurred during transient data initialization, this process will continue if possible. If processing cannot continue then a dump will be taken and an abend ATDY is issued.

User response

Refer to earlier messages and the dump produced by domain *xx*.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDTM

Console

DFHTD1280   *applid* **An attempt to establish security has failed for userid *userid*. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').**

Explanation

An attempt was made to establish security for userid *userid*. The attempt was rejected by the external security manager (ESM).

System action

Security has not been established for the userid.

User response

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the z/OS MVS Programming: Authorized Assembler Services Guide and in z/OS Security Server RACROUTE Macro Reference (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

DFHTFnnnn messages

DFHTF0001	*applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not

DFHTD1290	*applid* Program DFHTDRP cannot be found.

Explanation

CICS cannot link to the transient data recovery program (DFHTDRP).

CICS cannot find DFHTDRP in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System action

CICS is terminated as Transient Data queues cannot be recovered.

User response

To correct this error, place DFHTDRP in a partitioned data set in the DFHRPL DD statement.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDX

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error occurred in a crucial XM domain module.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHTF0002	*applid* A severe error (code *X'code'*) has occurred in module *modname*.

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some

circumstances CICS is terminated directly if the error is critical.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname,* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

userid tranid **Ipaddr** *ipaddr* **Mapset**
mapset **Map** *map* **Field** *field* **Attr**
attr **Invalid 3270 datastream from**
client

Explanation

The 3270 datastream received from a terminal
emulator client attempted to override a protected
field.

The *field* value returned in the DFHTF0200 message
is a 3270 buffer address in decimal.This address
represents the position of a field on the screen, 0
being Row 1 Column 1 and 1919 being Row 24
Column 80 for a 24X80 display image screen size.

The *field* value can be converted into Row/Column
using the following method below (where W is the
column width of the display screen):

- (Field value / W) + 1 = Row number
- The remainder + 1 = Column number

For example, given a display image of 24 rows and 80
columns the Row/Column of FIELD value 1602 is:

- (1602 / 80) + 1 = Row 21
- (1602 -(20 * 80)) = 2 + 1 = Column 03

The *attr* values returned are:

DFHTInnnn messages

DFHTI0001	*applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation

An abnormal end (abend) or program check has occurred in module *module*. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

Message DFHME0116, which contains the symptom string for this problem, is produced.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual. Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHTI0004   *applid* **A possible loop has been detected at offset *X'offset'* in module *modname.***

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time when the error was detected.

Message DFHME0116, which contains the symptom string for this problem, is produced.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

User response

If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname* and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTISR, DFHTIDM

XMEOUT parameters/Message inserts

1. *applid*
2. *X'offset'*
3. *modname*

Destination

Console

DFHTI0005   *applid* **A hardware error has occurred (module *modname*, code *X'code'*). The Time-of-Day clock is invalid.**

Explanation

An error has occurred during the running of module *modname*. The MVS Store Clock facility is the timing mechanism for the operating system.

The code X'*code*' is the exception trace point id which uniquely identifies the place where the error was detected.

Message DFHME0116, which contains the symptom string for this problem, is produced.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues if possible, unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

User response

If CICS is still running, it is necessary to decide whether to terminate CICS. First, investigate the MVS Store Clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHTM1786I   *date time applid* **CICS shutdown cannot complete because some JVMSERVERs have not been disabled.**

Explanation

This message is issued during shutdown of the CICS region and indicates that one or more JVMSERVERs are still active, and are delaying the successful termination of CICS.

System action

CICS shutdown waits until the active JVMSERVER resources are successfully disabled.

If the default shutdown transaction (CESD) is active, it attempts, after a delay, to purge all JVMSERVERs. This usually leads to a successful termination of CICS within a few minutes without operator intervention.

User response

If the default shutdown transaction (CESD) is not active, determine which JVMSERVER resources are still enabled using the CEMT INQUIRE JVMSERVER command, and take whatever steps are necessary to disable them.

Destination

CSMT

DFHTO6020 E *date time applid* **SESSIONS sesdef refers to single-session CONNECTION condef but has an invalid MAXIMUM option specified.**

Explanation

The value specified for the MAXIMUM option in the SESSIONS definition *sesdef* is incompatible with the CONNECTION definition *condef* because *condef* is defined as single-session. This was detected when *sesdef* referred to *condef* during installation of a

GRPLIST at initialization, during CEDA INSTALL of a GROUP, or following a CHECK command, or during an EXEC CICS CREATE.

When a SESSION definition refers to a single-session CONNECTION definition, the value of the MAXIMUM option should be *(1,0)*.

System action

The SESSIONS definition is not installed.

User response

There are two ways to solve this problem:

- Correct the SESSIONS definition by specifying MAXIMUM(1,0) using either CEDA or the CSD batch update utility DFHCSDUP.
- Redefine the CONNECTION definition so that it is no longer single-session by specifying SINGLESESS=NO.

CSMT

DFHTPnnnn messages

DFHTP4101   **Cannot reset from temporary paging to autopaging.**

Explanation

A terminal requested that it be reset from temporary paging status to autopaging status. However, the terminal is defined as a paging terminal, or the message is marked to state that the operator must purge it.

System action

Other processing continues.

User response

If the terminal is defined as a purging terminal, use the main terminal program to change the status of the terminal.

If the message is so marked, the operator must purge the message. The system then automatically resets the status to autopaging.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4102   ***nnnn* messages are queued for immediate delivery.**

Explanation

The operator requested the *nnnn* messages to be delivered via the page retrieve command queue.

System action

The count of messages queued for this operator or terminal is displayed.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4103   **Attempting to PURGE, COPY or CHAIN, but no pages are currently connected to this terminal.**

Explanation

There are currently no tasks attached to this terminal.

System action

Other processing continues.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4104   **A paging request was received but there are no pages for display.**

Explanation

The CICS paging command (CSPG) or a request for paging was entered from a terminal in transaction status, but there are no pages to be displayed at the terminal.

System action

Other processing continues.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4105   **The specified message is not recognized.**

Explanation

The terminal operator tried to retrieve or purge a specific message using a message identifier (rather than the current or next available message). However, the specified message does not exist, or is not destined for this terminal.

System action

Other processing continues.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4106   **You are not allowed to RETRIEVE or PURGE this message.**

Explanation

The terminal operator tried to retrieve or purge a specific message using a message identifier (rather than the current or next available message). However, the specified message is not destined for this operator identifier.

System action

Other processing continues.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4107   **Chain value *chain* is less than 1 or greater than the level of chaining allowed.**

Explanation

The chain value, *chain*, as indicated by the page retrieval command, is either less than one or is greater than the level of chaining at that terminal.

System action

Other processing continues.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4108   **Requested page *pageno* does not exist (it is less than 1 or more than the number of pages in the message).**

Explanation

The page *pageno*, as indicated by the page retrieval command, is either less than one or is greater than the number of pages in the message. This can be caused, for example, by requesting the previous page after the first page, or the next page after the last page.

System action

Other processing continues.

User response

The paging session can be continued with a valid page value. The last valid page displayed is still the current page. For example, to recall the last valid page displayed, execute the page retrieval command used to get a current page.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4109   **The requested command *command* was not recognized. Check that you have the correct value.**

Explanation

Transaction CSPG was entered at the terminal, but what follows cannot be identified as a paging command. *command* represents the first four nonblank characters after CSPG.

System action

Other processing continues.

User response

Terminal End User

DFHTP4110   *function* **is not valid. Page RETRIEVE function must be A, C, L, N, P, Q, or a number.**

Explanation

The page retrieve function represented by *function* is not one of the following: A, C, L, N, P, Q, or a number that may be preceded by a + (plus) or a - (minus) sign, where:

Function
   Meaning

A

   All logical messages destined for and being displayed on that terminal.

C

   The current (level) logical message.

L

   The last page.

N

   The next page.

P

   The previous page.

Q

   (Query) display the identifier of all logical messages destined for this terminal. If the message is security protected, its identifier is displayed only if the operator identifier and class for the signed-on operator match those in the message. The identifier consists of 1-to-6-digit hexadecimal number, and optionally, a message title.

System action

Other processing continues.

User response

Use a valid page retrieve function.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4111   *function* **is not valid. Page PURGE function must be A, B, C, H, or R.**

Explanation

The page purge function represented by *function* is not A, B, C, H, or R. The functions have the following meanings.

Function
   Meaning

A

   All logical messages destined for and being displayed on that terminal.

B

   The logical message being displayed on that terminal and all logical messages chained to it.

C

   The current (level) logical message.

H

   All logical messages chained to the base logical message being displayed on that terminal.

R

   All logical messages queued for immediate delivery (routed) to the terminal.

System action

Other processing continues.

User response

Use a valid page purge function.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4112   **The terminal identifier** *termid* **is unknown or is not supported.**

Explanation

The terminal identifier represented by *termid* does not exist or is not supported under basic mapping support (BMS).

System action

Other processing continues.

User response

Use a valid terminal identifier.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4113 *date time applid msgno termtype pageno* **I/O error on MCR or Page (MODULE NAME:** *modname***).**

Explanation

While attempting to retrieve a message control record (MCR) or page of a message, a temporary storage I/O error occurred. *msgno* represents the message number in hexadecimal; *termtype* is the terminal type; *pageno* is zero if the error occurred for the MCR, or is the page number. The message or page noted may be lost for this and/or other terminals.

System action

If pages are being displayed at an autopaging terminal, the next page if any is displayed. Otherwise no action takes place.

User response

Purge the current message (T/C).

Module:
DFHTPR

Destination

Terminal End User

DFHTP4116 **Your message request cannot be done while another message is being displayed.**

Explanation

While viewing a message, the operator entered a request for a specific message (for example, P/1,*xxx*) or requested the message identifiers of messages waiting to be displayed (P/Q). CICS cannot service

this request while another message is being displayed. *xxx* is the message identifier of one of the messages waiting to be displayed.

System action

Other processing continues.

User response

If desired, reenter the request when there are no messages being displayed at the terminal.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4117　　　　**Purge display % after viewing.**

Explanation

The operator at a 3270 has requested a display of message identifiers waiting to be displayed. The reply is constructed as one or more pages stored in temporary storage and can be viewed like any page message. *%* is the page number indicator.

System action

Other processing continues.

User response

Purge the message when viewing is complete.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4118　　　　**An ID error occurred while retrieving a Message Control Record (MCR) or Message Page. Message *bmsid*, terminal type *termtype*, page *pageno*.**

Explanation

CICS was trying to retrieve page *pageno* of a message from temporary storage when an identifier error was received.

Alternatively, if page *pageno* is equal to zero, CICS could have been trying to retrieve a message control record (MCR) when the identifier error was received.

The probable cause of the error is that temporary storage was cold started after the message was scheduled or after the message was saved. Otherwise the message had already been purged.

The insert *bmsid* is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page or message. The insert *termtype* identifies the terminal type.

System action

The message or page may be lost. Other processing continues.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4119　　　　**An invalid request on Message Control Record (MCR) or Page Retrieval has occurred. Message *bmsid*, terminal type *termtype*, page *pageno*.**

Explanation

CICS was trying to store or retrieve page *pageno* of a message when a temporary storage invalid request occurred. Alternatively, CICS could have been trying to store or retrieve a message control record (MCR) if the page *pageno* equaled zero when the temporary storage invalid error was received.

The message or page may be lost. The probable cause is that temporary storage was not loaded. *bmsid* is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page or message. *termtype* is the terminal type.

System action

Other processing continues.

User response

Ensure that the temporary storage program is loaded.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4120   **Unable to interpret input. Please try again.**

Explanation

The operator entered data that could not be interpreted.

System action

Input is discarded.

User response

Verify that input is valid under existing conditions.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4121   **An I/O error occurred while retrieving a message control record or message page. Message *bmsid*, terminal type *termtype*, page *pageno*.**

Explanation

CICS was trying to retrieve page *pageno* of a message when a temporary storage I/O error occurred. Alternatively, CICS could have been trying to store or retrieve a message control record (MCR) if the page *pageno* equaled zero when the temporary storage I/O error occurred.

The message or page may be lost. *bmsid* is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page or message. *termtype* is the terminal type.

System action

If pages are being displayed at an autopaging terminal, the next page, if any, is displayed. Otherwise no action takes place.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4122   **Requested purge completed successfully.**

Explanation

CICS has completed a page purge function requested from the terminal.

System action

Processing continues.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4123   **Terminal is now Autopaging.**

Explanation

The terminal operator has requested that CICS reset a terminal that is temporarily in paging status, to autopaging status.

System action

The rest of the pages in the message are displayed. If there are none left and the message can be purged automatically, it is purged.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4124   **Page copied from terminal *termid* (Message number *msgno*).**

Explanation

This message appears in the display of messages waiting to be displayed (P/Q) and identifies a copied page. *msgno* is the message number of the copied page and *termid* is the terminal for which it is queued.

System action

Processing continues.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4126   *msgno* **has been copied.**

Explanation

This message is issued in response to a request to copy to another terminal. *msgno* is the message number of the message being displayed.

System action

Processing continues.

User response

None.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4127   *nnnn* **must be a number. Please try again.**

Explanation

The characters *nnnn* are not valid. The system expected a decimal value for a page or chain number, or a hexadecimal value for a message number.

System action

Other processing continues.

User response

Reenter the paging command. Use a valid number.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4128   *command* **is undefined for page retrieval.**

Explanation

After a page retrieval (PR) session had been started, the operator pressed a PA or PF key for which no PR command had been defined in the SIT.

System action

The command is ignored. The display status bit is not altered.

User response

Ensure that the PR command in question is defined in the SIT.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4130   **You have used an unrecognized logical device. The valid names are** *xxx,yyy***.**

Explanation

A paging command containing an invalid logical device mnemonic was entered. *xxx,yyy,...* indicates the valid logical device mnemonics for the requested logical message.

System action

Input is discarded and other processing continues.

User response

Reenter the paging command with a logical device mnemonic chosen from those listed in the message.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4131   **Requested page cannot be copied to that terminal.**

Explanation

The operator has tried to copy a page that refers to an outboard format:

- To a terminal that does not support outboard formats, or
- To a terminal that does support outboard formats, but which has a different page width or a smaller page depth than the source terminal.

System action

The paging request is ignored.

User response

Carry out whichever one of the following is appropriate:

- Copy the offending page to a terminal that supports outboard formatting
- Make the referenced format nonoutboard
- Copy the offending page to a terminal that does support outboard formatting and which has a page size the same as that of the source terminal.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4132	**No pages have been built for this partition.**

Explanation

This an information message issued during a page retrieval session. It appears in a screen partition for which no pages have been built.

System action

Processing continues.

User response

None, unless a display was expected in the affected partition. In this case, check for an operator or application error.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4133	*date time applid bmsid termtype pageno* **ID error on MCR or page.**

Explanation

CICS was trying to retrieve page *pageno* of a message when an identifier error was received. Alternatively, CICS could have been trying retrieve a message control record (MCR) if the page *pageno* equaled zero when the identifier error was received. The message or page may be lost.

The probable cause is that temporary storage was cold-started after the message was scheduled or saved, or the message has already been purged.

bmsid is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page/message. *termtype* is the terminal type.

1. *date*

2. *time*

3. *applid*

4. *msgno*

5. *nnnn*

Destination

CSMT

DFHTP4161	**Message *msgno* was not delivered. It was purged from terminal(s) *termid*. Message title was *title*.**

Explanation

The message numbered *msgno* has been purged because it was not delivered within the system-defined time limit.

title is the title of message *msgno* and appears in this message only if one exists. *termid* is the terminal from which the message was purged.

System action

The message is purged from the system. No further attempt is made to deliver the message.

User response

None.

Module:
DFHTPQ

Destination

Terminal End User

DFHTP4162	*date time applid nnnn* **BMS system messages purged as undeliverable from error notification terminal.**

Explanation

Basic mapping support (BMS) system messages (for example, DFHTP4161) have been waiting to be displayed at the error notification terminal, but the terminal is unable to display them because its status is not consistent with their status, or because traffic is too heavy.

nnnn is the number of BMS system messages purged and *termid* is the error notification terminal's identifier.

System action

To avoid affecting system performance, messages waiting longer than a time specified by the installation, are purged.

User response

Either alter the status of the terminal to allow messages to be displayed or increase purge delay time at CICS system initialization.

Module:
DFHTPQ

XMEOUT parameters/Message inserts

6. *termid*

Destination

CSMT

DFHTP4174	*date time applid* **Message routing has failed for terminal** *termid*. **The termid was invalid or could not be located.**

Explanation

BMS has received a request to route a message to terminal *termid*. The request could not be executed because *termid* is invalid or could not be located.

This message is produced if an attempt is made to route to some of the terminals for which CICS supplies default or sample definitions, perhaps by using the ALL option on CMSG. An example of this is the default 3270 bridge template terminal CBRF, which fails for routing because it is defined with REMOTESYSTEM(CBR), for which no definition is supplied.

System action

Processing continues.

User response

There are several possible courses of action, depending on the cause of the message.

- Remove or correct the terminal definition.
- Remove the terminal from the routing list.
- Ignore the message if the terminal is a sample or default definition.

Module:
DFHTPS

4. *termid*
5. *msgno*
6. *sysid*

Destination

CSMT

DFHTP4190	**Please enter your data again in the partition containing the cursor.**

Explanation

The terminal operator entered data from a partition other than the expected input partition. The expected input partition is activated (that is, the cursor is moved into it), and the terminal operator should reenter data in this partition.

DFHTRnnnn messages

DFHTR0001	***applid* An abend (code *abcode*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively, unexpected data has been input, or storage has been overwritten.

The code *abcode* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

System action

Processing continues.

User response

Ensure that the terminal operator enters data in the correct partition.

Module:
DFHPHP

Destination

Terminal End User

Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTRSR, DFHTRPT, DFHTRDM , DFHTRFT

XMEOUT parameters/Message inserts

1. *applid*
2. *abcode*
3. *X'offset'*
4. *modname*

Destination

Console

DFHTR0002	***applid* A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS

exception trace entries, refer to the Troubleshooting and support.

System action

An exception entry (code X'*code*') is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

There may be an error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTRSR

2. *X'code'*
3. *modname*

Destination

Console

| DFHTR0004 | *applid* A possible loop has been detected at offset *X'offset'* in module *modname*. |

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in

module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname* and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTRSR, DFHTRPT, DFHTRDM, DFHTRFT

XMEOUT parameters/Message inserts

1. *applid*
2. *X'offset'*
3. *modname*

Destination

Console

DFHTR0103   TRACE TABLE SIZE IS K.

Explanation

The internal trace table acquired during CICS initialization has a table size *nn*KB.

This is either the same as that specified on the TRTABSZ keyword of the SIT or message DFHTR0123 has preceded this on the console.

System action

CICS continues.

User response

None.

Module:
DFHTRDM

Destination

Console

DFHTR0104   *applid* **No buffer storage available for auxiliary trace data set. Auxiliary trace is inoperative.**

Explanation

An attempt to start auxiliary trace failed because there was insufficient storage available from MVS for the 4KB output buffer.

System action

A CICS system dump with dump code TR0104 is taken. CICS then continues with auxiliary trace inactive.

User response

Determine why so little MVS storage above 16MB is available and retry if possible.

Module:
DFHTRSR

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHTR0105   AUXILIARY TRACE DATA SET *dataset* COULD NOT BE

OPENED -AUXILIARY TRACE INOPERATIVE.

Explanation

An attempt to start auxiliary trace or to switch auxiliary trace extents has failed because the request to BSAM to open data set *dataset* failed.

System action

There are two cases:

- If the error occurs after an explicit request to start auxiliary trace (as opposed to switching extents), a CICS system dump with dump code TR0105 is taken. CICS then continues with auxiliary trace inactive.
- If the error occurs when auxiliary trace is already active, that is, an explicit switch request when auxiliary trace starts or an end-of-extent with autoswitching active, an SDUMP with dump code KERNDUMP is taken. This type of dump is not subject to suppression or modification by use of the dump table.

User response

Check that the DD statement for data set *dataset* is present.

If it is, format the system dump and examine the TR domain information. The DCB for the auxiliary trace data set should be present. Use this to determine the reason for the open failure.

Module:
DFHTRSR, DFHTRSU

Destination

Console

DFHTR0106   *applid* **DFHTRAO could not be loaded. Auxiliary trace is inoperative.**

Explanation

An attempt to start auxiliary trace failed because the CICS module, DFHTRAO, which is used to write to the auxiliary trace data set, could not be loaded.

System action

The loader domain (LD) will have issued messages and dumps as necessary. CICS continues with auxiliary trace inactive.

User response

Refer to the associated loader domain messages for further information and guidance.

Module:
DFHTRSR

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHTR0107 **ABEND** *X'abcode'* **ON AUXILIARY TRACE DATA SET** *dataset* **- AUXILIARY TRACE STOPPED.**

Explanation

The DCB abend exit for named auxiliary trace data set *dataset* was driven after a request to BSAM.

The 3-digit abend code is indicated as X'*abcode*'

System action

CICS continues with auxiliary trace inactive.

User response

Refer to the z/OS MVS System Codes manual for an explanation of the abend code, X'*abcode*'.

Module:
DFHTRAO

Destination

Console

DFHTR0108 **I/O ERROR ON AUXILIARY TRACE DATA SET** *dataset* **- AUXILIARY TRACE STOPPED.**

Explanation

The SYNAD exit for the auxiliary trace data set *dataset* was driven after a request to BSAM.

System action

CICS will continue with auxiliary trace inactive.

User response

Use this message and any BSAM messages to determine the source of the error.

Module:
DFHTRAO

Destination

Console

DFHTR0109 **AUXILIARY TRACE DATA SET** *dataset* **FULL -AUXILIARY TRACE HAS BEEN STOPPED.**

Explanation

The auxiliary trace data set *dataset* is full. Auxiliary trace has been stopped because autoswitch is not active.

System action

CICS continues with auxiliary trace inactive.

User response

The auxiliary trace data set *dataset* can now be processed by the print routine DFHTU720.

Module:
DFHTRSU

Destination

Console

DFHTR0110 **AUXILIARY TRACE DATA SET** *dataset1* **FULL - SWITCHING TO** *dataset2***.**

Explanation

The auxiliary trace data set *dataset1* is full. Auxiliary trace is continuing on data set *dataset2* because autoswitching was requested.

System action

CICS continues with auxiliary trace active on the data set *dataset2*.

User response

Process the full data set if required.

Module:
DFHTRSU

Destination

Console

DFHTR0111   *applid* Unable to acquire storage for GTF buffer - GTF trace inoperative.

Explanation

An attempt to start CICS tracing to the MVS Generalized Trace Facility (GTF) failed because there was insufficient storage available from MVS for the 256-byte buffer required.

This message can be issued by DFHTRDM during CICS initialization if GTFTR=ON is specified on the SIT or start-up overrides, or by DFHTRSU if the request to start GTF was made after CICS was up and running.

System action

CICS continues with GTF tracing inactive.

User response

The failure to acquire even 256 bytes of storage indicates that the CICS region is probably in a stall condition. This can only be relieved by removing some of the users of MVS storage or by restarting CICS, possibly with a larger region size.

Module:
DFHTRDM, DFHTRSU

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTR0112   *applid* Bad data passed for tracing to module *modname*.

Explanation

Some data passed to the trace (TR) domain for addition to the internal trace table, auxiliary trace data set or GTF trace caused a program check when an attempt was made to access it.

This could either be as a result of a request made by CICS system code or a request made by a user program through the API or XPI.

If transaction isolation is active, this message can be issued if a transaction passes another transaction's storage to CICS. A program check occurs when CICS attempts to trace this storage because the storage is fetch protected.

System action

A system dump with dump code TR0112 is taken.

If the message was issued by DFHTRPT the dump contains an exception trace entry (point ID TR0102) that includes the erroneous parameter list passed to DFHTRPT.

If the message was issued by DFHTRFT the dump contains an exception trace entry (point ID TR0402) that includes the erroneous parameter list passed to DFHTRFT.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Examine the interpreted exception trace entry to determine the domain that issued the call and the ID of the entry. Then look at the specified addresses and lengths in the data*n* fields to see if they contain reasonable values. The fault is in the module that set up these fields for the trace call.

If transaction isolation is active, examine the calling domain's parameter list, data2, for storage that belongs to another transaction. Correct the offending application program. It should not be passing another transaction's storage. Alternatively, alter the definition of the application so that it can validly access another transaction's storage. See the Defining resources for more information on how to alter the definition.

Module:
DFHTRPT, DFHTRFT

XMEOUT parameters/Message inserts

1. *applid*
2. *modname*

Destination

Console

DFHTR0113   *applid* Auxiliary trace is being started on data set *dataset*.

Explanation

A request to start auxiliary trace has been successfully processed. The trace records are being written to data set *dataset*.

System action

CICS continues with auxiliary trace active.

User response

None.

Module:
DFHTRSR

XMEOUT parameters/Message inserts

1. *applid*
2. *dataset*

Destination

Console

DFHTR0114	AN ABEND HAS OCCURRED DURING INITIALIZATION OF TRACE IN MODULE *modname*.

Explanation

Module *modname*'s recovery routine received control during pre-initialization of the trace (TR) domain. This indicates that a program check has occurred in module *modname*.

There are three possible causes of this condition.

1. The module has been overwritten in main storage.
2. The module is at an incompatible level with the rest of the CICS modules.
3. There is an error in the module.

System action

A system dump with dump code KERNDUMP is taken.

User response

Inform the system programmer.

There may be an error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

Use the dump to determine the cause of the condition.

Module:
DFHTRDM , DFHTRSR

Destination

Console

DFHTR0115	AN ABEND HAS OCCURRED IN THE AUXILIARY TRACE MODULE DFHTRAO.

Explanation

Module DFHTRAO's recovery routine has received control.

This indicates a program check or MVS abend has occurred in DFHTRAO.

There are three possible causes of this condition:

- DFHTRAO has been overwritten in main storage
- DFHTRAO is at an incompatible level with the rest of the CICS modules
- There is an error in DFHTRAO.

System action

A system dump with dump code KERNDUMP is taken.

User response

There may be an error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module DFHTRAO is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module DFHTRAO, you should bring CICS down in a controlled shutdown.

Use the dump to determine the cause of the condition.

Module:
DFHTRAO

Destination

Console

DFHTR0116	AN ABEND HAS OCCURRED IN THE TRACE SUBROUTINES MODULE DFHTRSU.

Explanation

The recovery routine belonging to the trace domain module DFHTRSU has received control.

This indicates a program check or MVS abend has occurred in that module.

There are three possible causes of this condition:

- DFHTRSU has been overwritten in main storage.
- DFHTRSU is at an incompatible level with the rest of the CICS modules.
- There is an error in DFHTRSU.

System action

A system dump with dump code KERNDUMP is taken.

User response

There may be an error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module DFHTRSU is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module DFHTRSU, bring CICS down in a controlled shutdown.

Use the dump to determine the cause of the condition.

Module:
DFHTRSU

Destination

Console

DFHTR0117	*applid* **Auxiliary trace on data set** ***dataset*** **has been stopped.**

Explanation

An operator or application program request, to stop CICS tracing to the auxiliary trace data set *dataset*, has been successfully processed.

System action

CICS continues with auxiliary trace inactive.

User response

The auxiliary trace data set *dataset* can now be processed by the print routine DFHTU720.

Module:
DFHTRSR

XMEOUT parameters/Message inserts

1. *applid*
2. *dataset*

Destination

Console

DFHTR0118	*applid* **Auxiliary trace is being switched from** ***dataset1*** **to** ***dataset2*.**

Explanation

An operator or application program request to switch extents on the auxiliary trace data set while auxiliary trace is active is being processed.

System action

CICS stops tracing on the first named data set *dataset1*, and resumes tracing on the second named data set *dataset2*.

User response

The first named auxiliary trace data set *dataset1* can now be processed by the print routine DFHTU720.

Module:
DFHTRSR

XMEOUT parameters/Message inserts

1. *applid*
2. *dataset1*
3. *dataset2*

Destination

Console

DFHTR0119	*applid* **No DCB storage available for auxiliary trace data set. Auxiliary trace is inoperative.**

Explanation

An attempt to start auxiliary trace failed because there was insufficient storage available from MVS for the auxiliary trace data set DCB.

System action

A CICS system dump with dump code TR0119 is taken. CICS then continues with auxiliary trace inactive.

User response

Determine why so little MVS storage below 16MB is available and retry if possible.

Module:
DFHTRSR

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHTR0120   *applid* **DFHTRAOX could not be loaded. Auxiliary trace is inoperative.**

Explanation

An attempt to start auxiliary trace failed because the CICS module, DFHTRAOX, which is the auxiliary trace DCB abend exit, could not be loaded.

System action

The loader domain (LD) will have issued messages and dumps as necessary. CICS continues with auxiliary trace inactive.

User response

Refer to the associated loader domain messages for further information and guidance.

Module:
DFHTRSR

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHTR0122   **STORAGE FOR INTERNAL TRACE TABLE NOT AVAILABLE -TRACE INOPERATIVE.**

Explanation

During CICS initialization, there was insufficient storage available to allocate even the minimum size (1MB) of above the bar storage for the internal trace table.

System action

CICS terminates with a system dump.

User response

The failure to allocate even 1MB of above the bar storage at this stage of initialization almost certainly means that other areas of CICS and other system functions will not be able to acquire the storage they require to operate, so the system is unlikely to initialize completely. A possible solution is to increase the value of the MEMLIMIT parameter.

Module:
DFHTRDM

Destination

Console

DFHTR0123   **REQUESTED TRACE TABLE SIZE NOT AVAILABLE.**

Explanation

CICS issues a GETSTOR request to MVS for the internal trace table storage. This message indicates that there is insufficient above the bar storage available to allocate the size of trace table specified on the TRTABSZ paremeter, but a subsequent request for the minimum possible size of 1MB succeeded.

Message DFHTR0103 which follows this message gives the actual size of the trace table that will be used.

System action

CICS continues with an internal trace table of the size given by message DFHTR0103.

User response

There are three possible courses of action:

- Allow CICS to run with the decreased table size if this is thought to be adequate.
- Terminate the system and reinitialize after increasing the MEMLIMIT parameter for 64-bit storage available to CICS.
- Once the system is initialized, use CETR to increase the table size to the required value.

Module:
DFHTRDM

Destination

Console

DFHTR0124   *applid* **UNABLE TO BUILD TRACE CELL POOL IN 64-BIT STORAGE.**

Explanation

An attempt to allocate the cell pool for trace failed because there was insufficient 64-bit storage available. This cell pool is used to allocate working storage for the global trap trace exit , DFHTRAP, and the buffer for GTF trace. Therefore, neither of these facilities can be used.

System action

CICS continues but DFHTRAP cannot be activated and GTF trace is disabled.

User response

There are two possible courses of action: 1. If neither DFHTRAP nor GTF trace are required, allow CICS to continue 2. If DFHTRAP or GTF trace is required, increase the MEMLIMIT parameter to allow CICS access to more 64-bit storage. Then restart CICS.

Module:
DFHTRDM

Destination

Console

DFHTR0130   *applid* **Internal trace is being started.**

Explanation

A request to start internal trace has been successfully processed.

System action

CICS continues with internal trace active.

User response

None.

Module:
DFHTRSR

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHTR0131   *applid* **Internal trace has been stopped.**

Explanation

A request to stop internal trace has been successfully processed.

System action

CICS continues with internal trace not active.

User response

None.

Module:
DFHTRSR

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHTR0140   *applid* **GTF trace is being started.**

Explanation

A request to start GTF trace has been successfully processed.

System action

CICS continues with GTF trace active.

User response

None.

Module:
DFHTRSR

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHTR0141   *applid* **GTF trace has been stopped.**

Explanation

A request to stop GTF trace has been successfully processed.

System action

CICS continues with GTF trace not active.

User response

None.

Module:
DFHTRSR

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTR1000   *applid* **CICS abend requested by global trap exit DFHTRAP in module** *modname***.**

Explanation

The field engineering global trap exit program (DFHTRAP) requested termination of CICS.

System action

CICS disables the trap exit so that it will not be reentered, and terminates CICS.

User response

Determine why DFHTRAP has requested system termination and act accordingly. **You should use the global trap exit only in consultation with an IBM support representative.**

Module:
DFHTRPT, DFHTRFT

XMEOUT parameters/Message inserts

1. *applid*
2. *modname*

Destination

Console

DFHTR1001   *applid* **Program check occurred within global trap exit - DFHTRAP now marked unusable by module** *modname***.**

Explanation

After making a trace entry, the CICS trace domain (TR) called the field engineering global trap exit program (DFHTRAP). A program check occurred during execution of DFHTRAP.

System action

CICS marks the currently active version of DFHTRAP unusable, and will ignore it on future calls to TR domain. CICS then takes a dump with system dump code TR1001, and continues execution.

User response

Use the dump to find the cause of the program check. To replace the currently active but unusable DFHTRAP by a new version in the CICS program library, issue the following commands in the sequence shown:

> CSFE DEBUG,TRAP=OFF (to deactivate the current trap)
> CEMT SET PROGRAM(DFHTRAP) NEWCOPY (to update the trap disk address known to CICS)
> CSFE DEBUG,TRAP=ON (to activate the new version of the trap)

You should use the global trap exit only in consultation with an IBM support representative.

Module:
DFHTRPT, DFHTRFT

XMEOUT parameters/Message inserts

1. *applid*
2. *modname*

Destination

Console

DFHTR1002   *applid* **Program DFHTRAP is not available - global trap not activated**

Explanation

CICS could not activate the field engineering global trap exit program, DFHTRAP, during processing of the TRAP=ON SIT keyword or override in CICS initialization. This is almost certainly because DFHTRAP is not present in the program library.

System action

CICS takes a system dump with dump code TR1002 and continues with the global trap not activated.

User response

Ensure that DFHTRAP is defined to RDO and made available in the program library.

You should use the global trap exit only in consultation with an IBM support representative.

Module:
DFHTRDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTR1003   *applid* **CICS system dump requested by global trap exit DFHTRAP in module** *modname***.**

Explanation

The user-coded global trap exit program (DFHTRAP) has requested a system dump in its return action settings.

System action

CICS takes a system dump with dump code TR1003 and continues with the global trap still active.

User response

Analyze the requested dump.

Use the global trap exit only in consultation with IBM support.

Module:
DFHTRPT, DFHTRFT

XMEOUT parameters/Message inserts

1. *applid*
2. *modname*

Destination

Console

DFHTR1004   *,applid* **CICS system dump requested whilst holding the trace lock by global trap exit DFHTRAP in module** *modname***.**

Explanation

The user-coded global trap exit program (DFHTRAP) has requested in its return action settings that a system dump be taken whilst holding the trace lock.

System action

CICS takes a system dump with dump code TR1004 and continues with the global trap still active.

User response

Analyze the requested dump.

Use the global trap exit only in consultation with IBM support.

Module:

XMEOUT parameters/Message inserts

1. *applid*
2. *modname*

Destination

Console

DFHTR2000   **INCOMPLETE ENTRY IGNORED.**

Explanation

CICS trace entries longer than 256 bytes have to be split into multiple Generalized Trace Facility (GTF) entries because of GTF's length restriction. The CICS entry becomes a header entry followed by one or more continuation entries. This message in the GTF printout indicates that a CICS entry on GTF longer than 256 bytes has not been printed because a new header entry from the same MVS TCB was encountered before all of the continuation entries from a previous split entry were received.

System action

The incomplete entry is ignored.

User response

This situation can arise in one of two ways:

- The MVS TCB making the first split trace entry abnormally terminated while writing the continuation entries.

  This results in messages and a system dump during the CICS run.

Refer to the associated messages for further information and guidance. Use the dump to determine and solve the problem.

- GTF has failed to record one or more of the continuation entries because of an internal error. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTRPRG

Destination

SYSPRINT

DFHTR2001	INSUFFICIENT STORAGE FOR RECONSTRUCTION BUFFER.

Explanation

A CICS entry longer than 256 bytes has been split into a header record and one or more continuation records on the generalized trace facility (GTF). It cannot be formatted because MVS could not allocate sufficient working storage for a buffer to allow reconstruction of the segmented entry.

System action

The entry is printed in hexadecimal and the print job continues.

User response

Rerun the GTF print job with a larger region size.

Module:
DFHTRPRG

Destination

SYSPRINT

DFHTR2002	INVALID ENTRY PASSED FOR FORMATTING.

Explanation

A GTF entry with the CICS format identifier (X'EF') has been passed to the CICS GTF print routine but the data it contains is not part of a valid CICS trace entry.

System action

The invalid entry is printed in hexadecimal and the print job continues.

User response

Examine the entry for clues to its origin.

Module:
DFHTRPRG

Destination

SYSPRINT

DFHTR2003	UNEXPECTED CONTINUATION ENTRY ENCOUNTERED.

Explanation

CICS trace entries longer than 256 bytes have to be split into multiple GTF entries because of GTF's length restriction. The CICS entry becomes a header entry followed by one or more continuation entries. This message in the GTF printout indicates that a GTF entry has been passed to the CICS GTF print routine that is not the start of a CICS segmented entry and the entry type is not one for which a continuation is currently expected.

System action

The invalid entry is printed in hexadecimal and the print job continues.

User response

This situation could arise if the header record for a segmented entry is overwritten because of GTF's normal cyclic re-use of space in its data set. In this case the invalid entries would be very close to the start of the printout.

If this is not so, examine the entry for clues to its origin.

Module:
DFHTRPRG

Destination

SYSPRINT

DFHTR2004	THE MAXIMUM NUMBER OF BUFFERS (*nn*) HAVE BEEN ALLOCATED. NONE ARE FREE FOR REUSE.

Explanation

A CICS trace entry longer than 256 bytes has been split into a header record and one or more continuation records on the generalized trace facility (GTF). However, it cannot be formatted

because the maximum number of buffers allowed for reconstruction of segmented entries for a specific type has been reached. This maximum is currently set to *nn*. The number of buffers for a specific type relates directly to the number of regions or systems writing trace entries to the GTF trace data set. During writing, the segmented entries for some of the different regions or systems could become interleaved in the data set. To ensure that the entries are formatted completely and correctly, it is necessary to have a buffer available for each region or system whose trace entries have become interleaved in this way. For further information on trace types and segmented entries see the section on trace formatting in the CICS Diagnostics reference.

System action

The entry is printed in hexadecimal and the print job continues.

User response

None, but if the situation occurs regularly, contact your IBM Support Center to discuss whether the maximum value set is too low.

Module:
DFHTRPRG

Destination

SYSPRINT

DFHTR2005	THE LOAD FAILED FOR LOAD MODULE *modname*. PLACE MODULE IN THE LINK LIST AND TRY AGAIN.

Explanation

The generalized trace facility (GTF) trace formatter tried to load the correct release of trace formatter for the trace entry being processed.

System action

The job continues printing trace entries in hexadecimal only.

User response

Place the named trace formatter load module into the link list and rerun the job. If the named trace formatter is not available, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:

DFHTRPRG

Destination

SYSPRINT

DFHTR2006	UNKNOWN ENTRY PASSED FOR FORMATTING.

Explanation

An unknown CICS GTF trace entry has been passed to the CICS GTF print routine. The probable reason for this is that the CICS GTF formatting routine being used is from a previous CICS release and therefore does not recognize entries from the current release.

System action

The unknown entry is printed in hexadecimal and the print job continues.

User response

Examine the entry for clues to its origin. Ensure you are running GTF formatting routine DFHTGxxx where xxx is the current CICS release level.

Module:
DFHTRPRG

Destination

SYSPRINT

DFHTR3001	ERROR IN OPENING DFHAXPRT FILE.

Explanation

The auxiliary trace print program DFHTU720 could not open the data set defined to receive the print output.

System action

The print job terminates with a return code of 8.

User response

Ensure that the DD statement for DFHAXPRT is present and correct in the DFHTU720 job.

Module:
DFHTRPRA

Destination

Console

DFHTR3002   ERROR IN OPENING DFHAUXT FILE.

Explanation

The auxiliary trace print program DFHTU720 could not open the auxiliary trace data set to be processed.

System action

The print job terminates with a return code of 8.

User response

Ensure that the DD statement for DFHAUXT is present and correct in the DFHTU720 job.

Module:
DFHTRPRA

Destination

Console

DFHTR3003   ERROR IN OPENING DFHAXPRM FILE.

Explanation

The auxiliary trace print program DFHTU720 could not open the parameter input data set DFHAXPRM.

System action

The print job terminates with a return code of 8.

User response

Ensure that the DD statement for DFHAXPRM is present and correct in the DFHTU720 job, or specify your input parameters on the PARM keyword of the EXEC statement.

Module:
DFHTRPRA

Destination

Console

DFHTR3004   NO MVS STORAGE FOR TRACE SUMMARY TABLE.

Explanation

The auxiliary trace print program DFHTU720 could not obtain storage required for generating the trace summary table.

System action

The print job continues, but the trace summary table will not be produced.

User response

Investigate why the system is so short on storage.

Module:
DFHTRPRA

Destination

Console

DFHTR3010   ERROR IN TRACE DATA - ENTRIES MAY HAVE BEEN LOST.

Explanation

The trace block being formatted contains invalid length and/or pointer fields. This can happen if the trace table is accidentally overwritten.

System action

The trace formatting code scans the block to try and find valid entries. Any that are found are printed. The rest of the data is ignored.

User response

Try and determine what caused the overwriting of the internal trace table.

Ignore the trace entries immediately before and after this message in the print out as they might contain incorrect data.

Module:
DFHTRFPB

Destination

SYSPRINT

DFHTR4001   Pos *position*, Blank record.

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. There were no valid selective trace print parameters found.

System action

The print job terminates with a return code of 8.

User response

Ensure that the DD statement for DFHAXPRM is present and correct in the print job, or specify your input parameters on the PARM keyword of the EXEC statement. A blank line has been found as input on a job control statement. Specify at least one valid selection parameter on this job control statement and rerun the print job. Please refer to the CICS documentation. for a list of valid trace print selection parameters.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR4002   Pos *position*, Invalid keyword.

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. The keyword found in *position* of the control statement is not a valid trace selection parameter or has been specified incorrectly.

System action

The print job terminates with a return code of 8.

User response

Specify a valid selective trace print parameter and rerun the job. Please refer to the CICS documentation for a list of valid trace print selection parameters. DFHTRFPP

Module:

Destination

SYSPRINT

**DFHTR4003   Pos *position*, Unexpected end of
                          data.**

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. An unexpected end of data has been encountered.

System action

The print job terminates with a return code of 8.

User response

Ensure that the DD statement for DFHAXPRM is present and correct in the print job, or specify your input parameters on the PARM keyword of the EXEC statement. Specify the trace selection parameters correctly. Refer to the CICS documentation for further information on how to do this.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR4004   Pos *position*, Missing parenthesis.

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. Keywords have been specified which need matching parentheses and one of these is missing.

System action

The print job terminates with a return code of 8.

User response

To specify more than one entry for a selection, you must put the list of entries in parentheses. For example, to select tranids ABRQ, AORD, and MYTR, specify TRANID=(ABRQ,AORD,MYTR). Ensure you have specified matching pairs of parentheses as required.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR4005   Pos *position*, Null data.

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. Null data has been found at *position* in the trace selection parameter statement.

System action

The print job terminates with a return code of 8.

User response

Ensure you put valid data in the trace selection parameters. Please refer to the CICS documentation for guidance on valid trace print selection parameters.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR4007	**Pos *position*, Invalid separator.**

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. An invalid separator has been found at *position*.

System action

The print job terminates with a return code of 8.

User response

You must use commas to separate keywords and entries in a list.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR4008	**Pos *position*, Parameter length invalid.**

Explanation

The trace selection parameters for the auxiliary trace print program DFHTU720 the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. A trace selection parameter has been specified with an incorrect length.

System action

The print job terminates with a return code of 8.

User response

Ensure that the length of the specified trace selection parameter is correct.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR4009	**Pos *position*, Parameter value invalid.**

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. A trace selection parameter has been specified with an invalid value at *position*.

System action

The print job terminates with a return code of 8.

User response

Correct the incorrect parameter value. Refer to the CICS documentation for guidance on valid trace print selection parameters.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR4010	**Pos *position*, Parameter range invalid.**

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. A value has been specified at *postion* which is outside the valid range for this parameter.

System action

The print job terminates with a return code of 8.

User response

Ensure that the value specified is in the correct range for this selection parameter. Refer to the CICS documentation for guidance on valid trace print selection parameters.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR4011   **Pos *position*, Invalid page size range.**

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, or the system dump print program DFHPD720 are not correctly specified. The value specified at *position* for the PAGESIZE=(value) selection parameter is outside the valid range allowed.

System action

The print job terminates with a return code of 8.

User response

Specify a value for PAGESIZE=(value) in the range 20 through 9999 lines per page.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR4012   **Pos *position*, Invalid combination of FULL, ABBREV and SHORT trace.**

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. Two or more of the selection parameters ABBREV, SHORT, or FULL have been specified together. These parameters are mutually exclusive.

System action

The print job terminates with a return code of 8.

User response

Specify either ABBREV or SHORT or FULL and rerun the print job.

SYSPRINT

DFHTR5001   **THE LOAD FOR A FEATURE PROGRAM HAS FAILED.**

Explanation

The load for a feature formatting program has failed. This can happen if the program text is not included in one of the named datasets for the job.

System action

The trace formatting continues without feature tracing.

User response

Try and determine what caused the load error.

Module:
DFHTRFFE

Destination

SYSPRINT

DFHTR5002   **FEATURE FORMATTING PROGRAM HAS FAILED.**

Explanation

A feature formatting program has failed.

System action

The trace formatting continues without feature tracing.

User response

Refer to the documentation provided with your feature.

Module:
DFHTRFFE

Destination

SYSPRINT

DFHTSnnnn messages

DFHTS0001   *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname.***

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTSAM, DFHTSBR, DFHTSDM, DFHTSPT, DFHTSQR, DFHTSRM, DFHTSSH, DFHTSSR, DFHTSST, DFHTSWQ.

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHTS0002   *applid* **A severe error (code *X'code'*) has occurred in module *modname.***

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname,* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTSAM, DFHTSBR, DFHTSDM, DFHTSPT, DFHTSQR, DFHTSRM, DFHTSSH, DFHTSSR, DFHTSST, DFHTSWQ.

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHTS0100I	*applid* **Temporary Storage initialization has started.**

Explanation

This is an informational message indicating the start of temporary storage domain initialization.

System action

Initialization continues.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHTSDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTS0101I	*applid* **Temporary Storage initialization has ended.**

Explanation

Temporary storage domain initialization has completed successfully

System action

Initialization continues.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHTSDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTS0102I	*applid* **About to format the temporary storage data set (*numcis* control intervals).**

Explanation

Temporary storage has been cold-started with a new data set. This message is issued when formatting of the data set commences, and indicates the number *numcis* of control intervals which will be formatted.

System action

CICS continues. Message DFHTS0101 is issued when temporary storage initialization has been completed. Note that formatting can take a significant time if the data set is large.

User response

None. You can suppress this message with the message level system initialization parameter, MSGLVL=0.

Module:
DFHTSDM.

XMEOUT parameters/Message inserts

1. *applid*
2. *numcis*

Destination

Console

DFHTS0103	*applid* **Invalid attempt to switch between a TST and RDO for Temporary Storage. The attempt is ignored.**

Explanation

Temporary storage has detected an implicit attempt to switch between using a TST and RDO for TS queues, but CICS has not been COLD started.

Switching from using a TST to RDO for TS (or vice versa) is permitted only on a COLD or INITIAL start of CICS.

System action

CICS continues. The attempt to switch is ignored. CICS will use a TST (if specified) or RDO models for TS queues, as for the previous CICS run.

User response

You may wish to restart CICS specifying an INITIAL or COLD start in order to complete the switch.

CSMT

DFHTS1301	*applid {READ | WRITE}* **Error detected by temporary storage. RPL feedback area is** *X'yyyyy'*.

Explanation

An I/O error has been detected by temporary storage. Either:

- A hardware error occurred while a task was accessing the temporary storage data set, or

- VSAM detected a logic error in the request. The most likely cause of this is that the data set was defined incorrectly.

System action

An abend ATSD or ATSU is returned to the application program.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Ensure that the definition of the temporary storage data set is correct. For logic errors see the z/OS DFSMS Macro Instructions for Data Sets manual for assistance in interpreting RPL feedback codes.

See the Troubleshooting and support for more guidance in dealing with temporary storage problems.

Module:
DFHTSAM

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

    1=READ,

    2=WRITE

3. *X'yyyyy'*

Destination

Console

DFHTS1310	*applid* **Temporary storage data set does not match bit map**

Explanation

The temporary storage domain has detected an inconsistency between its control blocks. The inconsistency was detected either during compression of an I/O buffer or by the TS control block checking which is enabled via TS trace level 3.

Possible causes of the inconsistency are:

- An incorrect temporary storage data set (DFHTEMP) was used.
- The control interval size (CISIZE) of the temporary storage data set was changed between CICS runs.
- A storage overlay has occurred.
- An internal error has occurred within the TS domain.

System action

CICS is abnormally terminated with a dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

To determine the cause of the error, check that:

- The correct data set was used.
- The CISIZE of DFHTEMP was not altered between CICS runs (if CISIZE **was** altered, temporary storage should have been cold started).

Whatever the cause of the error, temporary storage must now be cold started.

See the Troubleshooting and support for more guidance in dealing with temporary storage problems. If an overlay has occurred, you will need further assistance from IBM.

See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTSAM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTS1311	*applid* Temporary storage data set is full and cannot be extended

Explanation

The temporary storage data set is full. CICS has failed in an attempt to extend it.

System action

Processing continues.

Message DFHTS1311 is reissued if any task subsequently attempts to write to the temporary storage dataset and the out-of-space condition persists (regardless of whether the dataset has been extended in the interim). However, message DFHTS1311 is not issued more often than once every 5 minutes.

User response

Consider whether you need to increase the space allocation for the temporary storage data set.

Module:
DFHTSAM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTS1315	*applid* The temporary storage data set has exceeded the maximum number of control intervals supported.

Explanation

During a temporary storage write request, an attempt has been made to add a new control interval to the temporary storage data set. The temporary storage data set already contains the maximum number of supported control intervals and cannot be extended.

System action

Processing continues.

User response

Consider whether you need to increase the control interval size for the temporary storage data set. See the Configuring for guidance on defining the temporary storage data set.

Module:
DFHTSAM

XMEOUT parameters/Message inserts

CSMT

DFHTS1576	*applid* Temporary storage format error

Explanation

A nonzero return code was received from the VSAM macro GENCB when CICS was attempting to build a VSAM request parameter list (RPL).

System action

CICS terminates abnormally with a system dump. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTSDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTS1599	*applid* Region/Partition size insufficient to initialize CICS.

Explanation

The temporary storage domain has been unable to GETMAIN sufficient storage for its own control blocks during initialization.

System action

CICS terminates with a system dump.

User response

Increase the region/partition size and retry. You can get information about the size and number of occurrences of relevant control blocks by using the CICS Data Areas in conjunction with the system dump.

Module:
DFHTSDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTS1601	*applid* Main temporary storage usage has reached *xx*% of TSMAINLIMIT storage.

Explanation

The amount of main storage used by temporary storage queues above the bar has reached the percentage shown in the message of the maximum allowed storage use, which is specified by the TSMAINLIMIT setting.

System action

Processing continues.

User response

Consider whether it is possible to delete some temporary storage queues which have not been accessed for a long time or whether to increase TSMAINLIMIT.

Module:
DFHTSMN

XMEOUT parameters/Message inserts

1. *applid*
2. *xx*

Destination

Console

DFHTS1602   *applid* **Main temporary storage has attempted to exceed the TSMAINLIMIT storage limit.**

Explanation

An attempt has been made to exceed the TSMAINLIMIT storage limit. This specifies the maximum amount of above the bar storage which can be used by main temporary storage queues.

System action

Attempts to write to temporary storage queues in main storage fail until storage becomes available.

User response

Consider whether it is possible to delete some temporary storage queues which have not been accessed for a long time or whether to increase TSMAINLIMIT.

Module:
DFHTSMN

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHTS1603   *applid* **The TSMAINLIMIT storage limit has been changed from *xxxx* Mb to *yyyy* Mb.**

Explanation

The TSMAINLIMIT setting has been changed. If you requested a decrease in TSMAINLIMIT, the new value will be either the value requested or the current utilization plus 33%. If the value you requested would not leave 33% of the current utilization free, CICS will change the value so as to leave 33% of current utilization as a buffer, subject to not increasing the TSMAINLIMIT. This means that 25% of the new limit is free. TSMAINLIMIT will not increase if you request a decrease. If you requested an increase in

TSMAINLIMIT, the new value will be the requested value, assuming that a valid value was requested.

System action

Processing continues.

User response

If CICS has set the new value higher than the value you requested when you reduced the limit, consider deleting some temporary storage queues and re-issuing the command to lower the TSMAINLIMIT.

Module:
DFHTSMN

XMEOUT parameters/Message inserts

1. *applid*
2. *xxxx*
3. *yyyy*

Destination

Console

DFHTS1604   *applid* **Main temporary storage usage has fallen below 70% of TSMAINLIMIT.**

Explanation

The current utilization of storage by main temporary storage queues has fallen below 70% of the TSMAINLIMIT setting.

System action

Processing continues.

User response

None.

2. *TIME*
3. *APPLID*
4. *XXXX*
5. *YYYY*

Destination

CSMT

DFHTS1606   *APPLID* **The TSMAINLIMIT has been left unchanged at** *xxxx* **Mb.**

Explanation

This message can be issued when an attempt has been made to decrease the TSMAINLIMIT setting. The requested value would not have left at least 33% of the currently used amount of storage as a buffer for future use. CICS will not reduce the limit below this level, so as to avoid temporary storage write requests immediately causing the TSMAINLIMIT to be reached. The TSMAINLIMIT is left unchanged. This message will also be issued if the TSMAINLIMIT requested was the same as the current setting.

System action

Processing continues.

User response

Consider deleting some temporary storage queues and re-issuing the command to lower the TSMAINLIMIT if it is required to decrease TSMAINLIMIT.

Module:
DFHTSSR

XMEOUT parameters/Message inserts

1. *APPLID*
2. *xxxx*

Destination

Console

DFHTS1607   *DATE TIME APPLID* **An attempt to increase TSMAINLIMIT has failed. The TSMAINLIMIT setting has been left unchanged.**

Explanation

An attempt to increase the TSMAINLIMIT setting has failed. This is because the requested value would have exceeded 25% of the MEMLIMIT setting. This is not allowed.

System action

The TSMAINLIMIT has not been changed.

User response

It is only possible to increase TSMAINLIMIT to a value less than or equal to 25% of MEMLIMIT. If an increase of TSMAINLIMIT is required, calculate the upper limit allowed and try again.

Module:
DFHTSSR

XMEOUT parameters/Message inserts

Console

DFHTS1609	***DATE TIME APPLID* The TS queue clean up task could not start because it was already running.**

DFHUPnnnn messages

DFHUP0201	***applid* ANOTHER PRODUCT HAS ALREADY REGISTERED FOR THIS DOMAIN. IFAUSAGE RC 4 HAS BEEN ISSUED. MODULE *module***

Explanation

A return code of 4 has been issued in response to an IFAUSAGE macro call. Another product has already registered to collect resource usage information for this IFAUSAGE domain. The *module* indicates the module that is being registered through IFAUSAGE.

System action

The current request is accepted but there is duplicate recording of data for both products.

Explanation

An attempt to run the TS clean up task failed because a previous instance of the task is still running. It is unusual for the TS clean up task to take a long time to run. This might happen if locks are being held on queues.

System action

Automatic deletion of TS queues is not performed. The clean up task that is already running needs to complete first.

User response

Check whether there are any signs of problems with your TS queues. Refer to the section, "Automatic deletion of temporary storage queues" in the CICS Knowledge Center.

A return code of 16 has been issued in response to an IFAUSAGE macro call. The usage data collection function is not available on this system.

System action

Processing continues.

User response

If SMF usage processing is not available on this system (for example, if apar 0W02855 is not installed), you can ignore this message.

DFHUSnnnn messages

DFHUS0001	*applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname*.

See the z/OS MVS System Management Facilities (SMF) manual for an explanation of the return code.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTUP, DFHWOS, DFHKETCB, DFHSIP

Destination

Console

DFHUP0204	*applid* **AN INVALID REQUEST HAS BEEN MADE. IFAUSAGE RETURN CODE** *X'code'*. **MODULE** *module*

Explanation

The return code X'*code*' has been issued in response to an IFAUSAGE macro call. An invalid request or an internal parameter error has occurred.

System action

Processing continues.

User response

If SMF usage processing is not available on this system (for example, if apar 0W02855 is not installed) you can ignore this message.

See the z/OS MVS System Management Facilities (SMF) manual for an explanation of the return code.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP, DFHDRPA, DFHDUP, DFHJUP, DFHKETCB, DFHMNDUP, DFHMSCAN, DFHSTUP, DFHTUP, DFHWOS

Destination

Console

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*

4. *modname*

Destination

Console

DFHUS0002	*applid* A severe error (code *X'code'*) has occurred in module *modname*.

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where it was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHUS0004   ***applid* A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. However you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

XMEOUT parameters/Message inserts

1. *applid*
2. *X'offset'*
3. *modname*

Destination

Console

DFHUS0006   ***applid* Insufficient storage to satisfy Getmain (code *X'code'*) in module *modname*. MVS code *mvscode*.**

Explanation

An MVS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

System action

An exception entry is made in the trace table (code X'*code*'). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be

terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the User Response for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. See the Configuring or the Improving performance for more information on CICS storage.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHUSDM, DFHUSAD

Console

DFHUS0100	*applid*CICS is unable to listen for ENF event 71. Changing a user's RACF attributes will only take effect after the USRDELAY timeout.

Explanation

CICS was unable to register with z/OS to listen to ENF event 71. This event notifies CICS when a user's RACF profile has changed so that the new profile will be applied the next time an eligible user ID is used.

System action

A system dump is taken, unless you have specifically disabled dumps for this dumpcode in the dump table. RACF profile changes will only take effect when the USRDELAY period expires for the session. See the

USRDELAY SIT parameter for a description of this mechanism.

User response

Error information is provided in exception trace point DMDM 0090 for this failure. See MVS Authorized Assembler Services Guide for a description of the event.

Module:
DFHUSDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHUS0120	*applid* An error occurred when performing **SNSCOPE checking for a signon request.**

Explanation

The MVS ENQ issued as part of SNSCOPE checking has failed. The return code indicates that the CICS job has reached the limit of concurrent resource requests.

System action

A system dump is suppressed, unless you have specifically enabled dumps for this dumpcode in the dump table. The request to signon is rejected.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

See the OS/390 MVS Programming Authorized Assembler Services Guide for guidance on increasing the MVS ENQ limit. The MVS ENQ is issued by CICS in an unauthorized state.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHUSAD, DFHUSFL

XMEOUT parameters/Message inserts

1. *applid*
2. *userid*
3. *X'safresp'*
4. *X'safreas'*
5. *X'esmresp'*
6. *X'safreas'*

Destination

Console

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

2. *X'code'*
3. *modname*

Destination

Console

DFHW20004   *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction that was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module *modname* will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

DFHW20122	*date time applid* **The XML in the configuration file for ATOMSERVICE** ***atomservice*** **is not well-formed. Response codes from the XML System Services parser are (***X'return-code'*, *X'reason-code'***).**

Explanation

The XML in the configuration file for ATOMSERVICE *atomservice* is not well-formed. The z/OS XML System Services parser returned with return code *return-code* and reason code *reason-code*.

System action

The ATOMSERVICE is not installed.

User response

Refer to the XML System Services User's Guide and Reference manual in the z/OS documentation to

determine what the return and reason codes returned by the parser mean.

For example, if the return code is set to '4' and the reason code is set to '1301' then this imples a 'warning' because 'the end of the input buffer has been reached'. This in turn may indicate that then end of the XML block has been reached before an expected closing tag was found.

Correct the XML syntax in the configuration file.

CWBO

DFHWBnnnn messages

DFHWB0001	*applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWBWB

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*

4. *modname*

Destination

Console

DFHWB0002   *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWBST, DFHWBTC, DFHWBDM, DFHWBQM, DFHWBSR, DFHWBXM

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*

3. *modname*

Destination

Console

DFHWB0004   *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction that was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module *modname* will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWBST, DFHWBTC

XMEOUT parameters/Message inserts

1. *applid*
2. *X'offset'*
3. *modname*

Destination

Console

DFHWB0006	*applid* **Insufficient storage to satisfy Getmain (code *X'code'*) in module *modname*. MVS code *mvscode*.**

Explanation

An MVS GETMAIN was issued by module *modname* but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System action

CICS will terminate with a system dump. An exception entry is made in the trace table (code *code* in the message).

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the overall size limit of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you will need to bring CICS down to do this. See the Configuring or the Improving performance for further information on CICS storage.

Explanation

Program DFHWBBLI has returned an error response to the alias.

System action

The request is abandoned. The error response returned by program DFHWBBLI is returned to the Web Browser in an HTTP response:

403

   The userid associated with the request is not authorized to invoke the requested converter program, or the requested server program.

404

   A link to the converter program or to the server program failed because CICS could not locate the requested program.

500

   A link to the converter program or to the server program failed with an unexpected error.

503

   A link to the converter program or to the server program failed for one of the following reasons:

   • The server program is defined as remote, but the link to this program failed with a SYSID error, so the remote connection is either not defined correctly, or not active.

   • The link to the converter or the server program failed with the ROLLEDBACK response.

The alias abends with abend code AWBM unless suppressed by the URM DFHWBEP.

8. *tcpipservice*

Destination

CWBO

DFHWB0103	*date time applid tranid* **The CICS Web Interface alias program has received an error response (code *X'code'*) on a call made to CICS during alias initialization.*{ | TCPIPSERVICE: } tcpipservice*

Explanation

The alias program was unable to locate the START data for this request, or the START data was invalid. The error response code X'*code*' is the exception trace point id that uniquely identifies which error has occurred. A code of '4565'X means that the START data was missing, and '4566'X means that the START data was invalid.

System action

The alias abends with abend code AWBF and a trace entry is made in the trace table.

User response

The alias program DFHWBA is only to be used for alias transactions started by the CICS Web Interface. User-written applications should not be starting alias transactions, as data passed to the alias will not be in the expected format.

Module:
DFHWBA

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *tranid*

CWBO

DFHWB0109I   *applid* **Web domain initialization has started.**

Explanation

This is an informational message indicating the start of Web domain initialization.

System action

CICS initialization continues.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHWBDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHWB0110I   *applid* **Web domain initialization has ended.**

Explanation

Web domain initialization has completed successfully.

System action

CICS initialization continues.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHWBDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHWB0111   *applid* **WB Domain initialization failed. Reason Code:** *X'rc'.*

Explanation

The CICS Web domain initialization failed with reason code *rc*.

System action

CICS initialization continues. Subsequent calls to the components of the CICS Web environment may fail.

User response

Use the reason code *rc* to determine why initialization failed. The possible reasons are:

1

  Storage for the Web anchor block could not be obtained.

5

  Storage for the State Manager anchor block could not be obtained.

6

  The creation of the State Token Directory failed.

7

>The subpool required for state management could not be added.

8

>The subpool required for HTTP buffers could not be added.

9

>The addition of the Web State Manager lock failed.

A

>The subpool required for 3270 buffers could not be added.

B

>The initialization of the webrequest class failed.

Module:
DFHWBDM

XMEOUT parameters/Message inserts

1. *applid*
2. *X'rc'*

Destination

Console

DFHWB0112I	*applid* **The defaultciphers.xml file was unable to be used because** *{there was a problem reading the file | the file contains invalid ciphers | the region does not support outbound HTTPS connections}*

Explanation

CICS was requested to use the defaultciphers.xml file for outbound HTTPS requests. There was a problem processing the file.

System action

CICS initialization continues. Outbound HTTPS requests will continue to use the default list of 2 digit ciphers instead of the ciphers in the defaultciphers.xml file.

User response

Make sure that the defaultciphers.xml file exists in the USSCONFIG/security/ciphers directory, is readable by the CICS region userid, and contains a valid list of ciphers.

Module:
DFHWBDM

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

>*1=there was a problem reading the file,*

>*2=the file contains invalid ciphers,*

>*3=the region does not support outbound HTTPS connections*

Destination

Console

DFHWB0114	*date time applid tranid* **A non-HTTP request has been received by an HTTP service. The request has been rejected. Host IP address:** *hostaddr.* **Client IP address:** *clientaddr.{ | TCPIPSERVICE: } tcpipservice*

Explanation

CICS Web Support has received a non-HTTP request or a SSL request for a HTTP TCPIPSERVICE.

System action

The request is rejected.

User response

Correct the TCPIPSERVICE definition to suit the type of request being sent. If you receive this message when trying to connect CICS Explorer to a particular region verify that you are connecting to the correct region and that you have NOT specified CPSMCONN=LMAS in the SIT.

CWBO

DFHWB0121	*date time applid tranid* **The CICS Web Interface program DFHWBBLI encountered an error during Decode processing in the converter *program*. Response code: *respcode*, reason code: *reasoncode*.{	TCPIPSERVICE: } tcpipservice**

Explanation

The Decode function of the converter has returned an error.

System action

An error message is sent to the client.

User response

The response code insert gives the RESPONSE code returned by the converter program. The reason code insert gives the REASON code returned by the converter program.

The values defined by CICS for these fields are defined in copybook DFHWBUCD. The CICS defined values for the RESPONSE code are:

0

    OK

4

    Exception

8

    Invalid data supplied

16

    Disaster

The CICS defined values for the REASON code are:

1

Security failure

2

Corrupt client data

Users can architect their own response and reason code values to be returned by the analyzer, but they should use values other than those defined in the CICS supplied copybook DFHWBUCD.

Examine the response and reason codes returned to determine the cause of the error.

CWBO

DFHWB0130   *date time applid tranid* **No state token passed to program DFHWBLT.*{ | TCPIPSERVICE: }* tcpipservice**

Explanation

Program DFHWBLT was not passed the expected state token.

System action

The transaction abends with code AWC2, and an exception trace entry 410C is written.

User response

You may need further assistance from IBM to resolve this problem. See External Interfaces Guide and [Working with IBM to solve your problem](#) for guidance on how to proceed.

Module:
DFHWBLT

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

5. Value chosen from the following options:

    1= ,

    2= TCPIPSERVICE:

6. *tcpipservice*

Destination

CWBO

DFHWB0131   *date time applid tranid* **An error code *X'code'* occurred in DFHWBLT while accessing the Web state data for this transaction.*{ | TCPIPSERVICE: }* tcpipservice**

Explanation

The Web Bridge Exit program, DFHWBLT, has detected an error when attempting to access the Web state data held for this transaction.

System action

An exception trace entry is made in the trace table using code X'*code*. The transaction abends with abend code AWC1 if the Bridge Exit was trying to establish a partnership with the CICS Web Interface alias transaction.

User response

Use the error code *code* to determine the reason for the failure:

4106

Unable to establish a partnership with the associated CICS Web Interface alias transaction.

4107

A call to terminate the partnership between this instance of DFHWBLT and its associated CICS Web Interface alias transaction failed.

4108

A call to wait for the CICS Web Interface alias transaction associated with this instance of DFHWBLT failed.

4109

A call to reactivate the CICS Web Interface alias transaction associated with this instance of DFHWBLT failed.

4112

A call to update the state data for this transaction failed.

4113

A call to retrieve the state data for this transaction failed.

4114

The alias task associated with this instance of DFHWBLT was not in the required state.

4116

A call to break the partnership between this instance of DFHWBLT and its associated CICS Web Interface alias transaction failed.

411B

A call to destroy the state data for this instance of DFHWBLT failed.

The most likely cause of the error is that the timeout interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the timeout interval for the state data is set to a suitable value. You may need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

CWBO

DFHWB0133   *date time applid tranid* **Error X'code' occurred during CICS Web 3270 transaction processing.{ | TCPIPSERVICE: } tcpipservice**

Explanation

Program DFHWBTTA detected an error when attempting to attach the Web bridge transaction or the Web 3270 Bridge exit program DFHWBLT encountered an internal error.

System action

The transaction returns an internal server error (HTTP response 500) to the HTTP client.

User response

The error code *code* identifies the CICS trace entry that corresponds to the failure. You may determine the transaction identifier of the Web bridge transaction from this entry and its significant characteristics.

Collect the CICS trace output. You may need further assistance from IBM to resolve this problem. See

External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWBTTA, DFHWBLT

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

    2= TCPIPSERVICE:

7. *tcpipservice*

Destination

CWBO

DFHWB0134	*date time applid tranid* **Error X'code' occurred resolving the AID from HTTP forms data in the CICS Web terminal translation application.{	TCPIPSERVICE: } tcpipservice**

Explanation

Program DFHWBTTA is unable to resolve an attention identifier from the HTTP forms data returned from a web browser. DFHWBTTA translates the HTTP forms data into the correct 3270 format required by the CICS terminal-oriented transaction that is the target of this request. The attention identifier or AID is a mandatory part of this format. DFHWBTTA cannot locate a name=value pair in the HTTP forms data that adheres to the naming convention defined by the CICS Web Interface to represent an AID, and so cannot return an AID value to the terminal-oriented transaction.

System action

DFHWBTTA returns an internal server error (HTTP response 500) to the HTTP client, and terminates the exchange with the terminal-oriented transaction.

User response

The error code *code* identifies the CICS trace entry that corresponds to the failure. The HTTP forms data is produced as trace data. Collect the CICS trace output.

Examine the HTTP forms data to determine what was returned from the web browser. Identify what HTML input type caused the web browser to submit the HTML form. Corruption of the HTTP forms data may be the cause of the problem. You may need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWBTTA

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

7. *tcpipservice*

Destination

CWBO

DFHWB0135	*date time applid tranid* **Error X'code' occurred resolving the next transaction identifier from HTTP forms data in the CICS Web terminal translation application.{	TCPIPSERVICE: } tcpipservice**

Explanation

Program DFHWBTTA is unable to resolve the next transaction identifier from the HTTP forms data returned from a web browser. DFHWBTTA translates the HTTP forms data and extracts the identifier of the next transaction to be executed. DFHWBTTA cannot locate a name=value pair in the HTTP forms data that adheres to the naming convention defined by CICS to represent the next transaction identifier and so it cannot determine which terminal-oriented transaction to start.

System action

DFHWBTTA returns an internal server error (HTTP response 500) to the HTTP client.

User response

The error code *code* identifies the CICS trace entry that corresponds to the failure. The HTTP forms data is produced as trace data. Collect the CICS trace output. Examine the HTTP forms data to determine what was returned from the web browser. Corruption of the HTTP forms data may be the cause of the problem. You may need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:

Destination

CWBO

DFHWB0136	*date time applid tranid* **An error code *X'code'* has occurred as a result of the Web State Garbage Collection process.*{ | TCPIPSERVICE: } tcpipservice***

Explanation

Program DFHWBLT detected an error when attempting to access the Web state data held for this transaction. The transaction wait time has exceeded the garbage collection limit and the state block has been deleted by the garbage collection process.

System action

If the error occurs in DFHWBLT, a TERMERR condition is returned to the application and processing continues. If the error occurs in DFHWBTTA, an error response is sent to the browser and processing continues.

User response

Use the error code *code* to determine which module received the error:

4108

The error occurred in DFHWBLT.

420B

The error occurred in DFHWBTTA.

The cause of the error is that the garbage collection interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the garbage collection interval for the state data is set to a suitable value. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:

Destination

CWBO

DFHWB0137	*date time applid tranid* **An error code *X'code'* occurred in DFHWBTTA while accessing the Web state data for this transaction.*{ | TCPIPSERVICE: } tcpipservice***

Explanation

The Web Terminal Translation Application program, DFHWBTTA, has detected an error when attempting to access the Web state data held for this transaction.

System action

An exception trace entry is made in the trace table using code X'*code.*

User response

Use the error code *code* to determine the reason for the failure:

4203

Unable to establish a partnership with the associated CICS Web Interface alias transaction.

4204

Unable to initialize a partnership with the associated CICS Web Interface alias transaction.

4205

The alias task associated with this instance of DFHWBTTA was not in the required state.

4206

A call to create the state data for this instance of DFHWBTTA failed.

4207

A call to destroy the state data for this instance of DFHWBTTA failed.

4208

A call to retrieve the state data for this instance of DFHWBTTA failed.

4209

A call to break the established partnership between the associated transaction and DFHWBTTA has failed.

420A

A call to reactivate the CICS Web Interface alias transaction associated with this instance of DFHWBTTA failed.

420B

A call to wait for the CICS Web Interface alias transaction associated with this instance of DFHWBTTA failed.

420C

A call to terminate the partnership between this instance of DFHWBTTA and its associated CICS Web Interface alias transaction failed.

4213

A call to update the state data for this transaction failed.

The most likely cause of the error is that the timeout interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the timeout interval for the state data is set to a suitable value. You may need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

CWBO

DFHWB0150	*date time applid tranid* **The CICS HTML template manager could not locate template** *template_name* **in the HTML template data set.{ | TCPIPSERVICE: }** *tcpipservice*

Explanation

The CICS HTML template manager DFHWBTL could not find template name *template_name* in the HTML data set.

System action

Because 3270 / HTML conversion cannot be performed without the template, CICS returns a TERMERR condition to the application. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Make sure that the template exists in the template library. See the CICS documentation for guidance on how to create HTML templates. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module:
DFHWBTC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *template_name*
6. Value chosen from the following options:

    1= ,

    2= TCPIPSERVICE:

7. *tcpipservice*

Destination

CWBO

DFHWB0151	*date time applid tranid* **The CICS Web Interface 3270 emulation code was unable to process the data it was passed.{ | TCPIPSERVICE: } tcpipservice**

Explanation

The CICS Web Interface routine that converts 3270 data streams to HTML, and vice versa, has detected an error. This is probably because it has been passed an invalid 3270 data stream on an EXEC CICS SEND command, or because the browser has returned some data that it is incapable of handling in response to an EXEC CICS RECEIVE command.

System action

The transaction is abended with code AEIP (INVREQ). There will be subsequent messages from the web state management code as it tidies up for the abending task. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use CEDX or trace to look at the data that was in error and then correct the sending application. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

6. *transaction*

Destination

CWBO

DFHWB0153 E	*DATE TIME APPLID client_ip_addr tcpipservice* **The web asynchronous socket receive failed with an IO error.**

Explanation

The Web socket notify gate was driven with an action code of ERROR because an outstanding asynchronous socket receive request ended with an IO error.

System action

Exception trace point 0B05 is issued. The socket is closed and the request is terminated.

User response

Determine why an IO error occurred on this port.

Module:
DFHWBSO

XMEOUT parameters/Message inserts

1. *DATE*
2. *TIME*
3. *APPLID*
4. *client_ip_addr*
5. *tcpipservice*

Destination

CWBO

DFHWB0154 E *DATE TIME APPLID client_ip_addr tcpipservice* **The request receiver SOCB notify gate is unable to obtain storage.**

Explanation

The socket domain received a request for a TCPIP service which specified PROTOCOL(ISC). However, the socket notify gate in module DFHWBSO was unable to obtain storage. This is because a short-on-storage (SOS) condition has caused the failure of a GETMAIN.

System action

Exception trace point 0B09 is issued.

User response

Investigate the reason for the SOS condition. See the Troubleshooting and support for guidance on dealing with the SOS condition.

Retry the request later.

Module:
DFHWBSO

DFHWB0360 *date time applid* **An attempt to establish security for userid** *userid* **has failed. Transaction** *tranid* **cannot be started. SAF codes are (***X'safresp'***,***X'safreas'***). ESM codes are (***X'esmresp'***,***X'esmreas'***). Host IP address:** *hostaddr***. Client IP address:** *clientaddr***. TCPIPSERVICE:** *tcpipservice***.**

Explanation

An attempt was made to establish security for userid *userid* but it was rejected by the external security manager (ESM).

In order to start transaction *tranid* CICS Web attach processing requires security to be established for userid *userid*, as selected for this transaction by the Analyzer URM specified for TCPIPSERVICE *tcpipservice*

System action

Security has not been established for the userid. The attempt to start the transaction has failed.

User response

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the z/OS MVS Programming: Authorized Assembler Services Guide, and in z/OS Security Server RACROUTE Macro Reference (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

CWBO

DFHWB0361	*date time applid* **An attempt to attach a CICS Web alias transaction for userid** *userid* **has failed because the user is not authorized to execute transaction** *tranid*. **Host IP address:** *hostaddr*. **Client IP address:** *clientaddr*. **TCPIPSERVICE:** *tcpipservice*.

Explanation

An attempt was made to start transaction *tranid* by userid *userid* but it was rejected.

CICS Web attach processing could not start transid *tranid* processing because userid *userid* is not authorized to execute transaction *tranid*, which was selected for this HTTP Request by the Analyzer URM specified for TCPIPSERVICE *tcpipservice*

System action

The attach for transaction *tranid* fails, then processing continues.

User response

Either determine why the Analyzer URM selected transaction *tranid*, or modify the Analyzer URM to select an authorized transaction identifier.

DFHWB0366   *date time applid tranid* **A client certificate was supplied but could not be used because it *{was not known to the ESM | was marked as UNTRUSTED}*. Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCPIPSERVICE: *tcpipservice*. Certificate Serial number: *certsernum*. Certificate common name: *certcomname*.**

Explanation

The client at IP address *clientaddr* has tried to connect to CICS on a TCPIPSERVICE that requires a client certificate but the supplied certificate is unusable. An explanatory phrase in the message describes why:

was not known to the ESM

The certificate is not known to the external security manager (ESM).

was marked as UNTRUSTED

The certificate has been given the NOTRUST attribute by the security administrator. This indicates that the certificate is not to be used.

System action

The connection is rejected with an HTTP 403 (forbidden) response.

User response

Ensure that the client has a valid certificate that is installed in the ESM and is marked as trusted.

CWBO and Console

DFHWB0551	*date time applid tranid* **The CICS Web Interface server controller detected an abend ACN1 processing a request from client *clientaddr*. Host IP address: *hostaddr*.**

Explanation

The HTTP caller detected an error after invoking program DFHCCNV to perform data conversion on incoming data.

System action

If there is no DFHCNV table defined, the CICS Web Interface cannot perform data conversion on incoming data. An exception disable of the CICS Web Interface is initiated. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Ensure that there is a valid DFHCNV table link-edited into one of the libraries in the DFHRPL library concatenation.

Module:
DFHWBM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *clientaddr*
6. *hostaddr*

Destination

CWBO

DFHWB0723	*date time applid tranid* **The CICS Web analyzer program returned an error response. Program name: *progname*. RESPONSE: *response*. REASON: *reason*. Host IP address: *hostaddr*. Client IP address: *clientaddr*.{	TCPIPSERVICE: } tcpipservice**

Explanation

As part of its normal processing of a request, CICS Web attach processing invokes the user replaceable analyzer to tailor the required actions. This program returns RESPONSE and REASON values. If a CICS supplied sample analyzer is being used, possible RESPONSE code values are:

0

OK

4

Exception

8

Invalid

12.

Disaster

possible REASON code values are:

1

URL of incoming HTTP request is too short

2

No "/" character in the URI of the HTTP request

3.

There is more data to be received for this request

4

Converter program name is less than 1 or greater than 8 bytes long

5

Alias transaction ID is less than 1 or greater than 4 bytes long

6

Server program name is less than 1 or greater than 8 bytes long

7

User token passed as query string data on this request is not valid

8

URL passed on this request is not valid

Users can also architect their own response and reason code values to be returned by the analyzer, but they should use values other than those defined in the CICS supplied copybook DFHWBUCD.

If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN" in the message.

System action

An error response is sent to the client and processing of the request is terminated.

User response

Examine the RESPONSE and REASON code values in the message to determine the cause of the error.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *progname*

Destination

CWBO

DFHWB0726	*date time applid tranid* **CICS Web attach processing cannot link to the analyzer user replaceable program. No analyzer specified. Host IP address: *hostaddr*. Client IP address: *clientaddr*.{	TCPIPSERVICE: } tcpipservice**

Explanation

CICS Web attach processing cannot invoke the analyzer user replaceable module because none was specified for the TCPIPSERVICE associated with the request being processed. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action

An error response is sent to the client and the request is terminated. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use CEMT SET TCPIPSERVICE to specify an analyzer name on the URM parameter. CEDA can be used to alter the stored definitions. The URM name for CICS Web TCPIPSERVICEs (those TCPIPSERVICEs which have CWXN specified as the transaction ID) MUST specify a valid analyzer program name for the URM keyword.

Module:
DFHWBXN, DFHWBXM

CWBO

DFHWB0732	*date time applid tranid* **CICS Web attach processing encountered a sockets I/O error while receiving a client request. Host IP address:** *hostaddr*. **Client IP address:** *clientaddr*.{	*TCPIPSERVICE: } tcpipservice*

Explanation

A sockets I/O error has forced CICS Web processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action

The Web error program DFHWBEP is driven, but no error response can be sent to the client. The request is terminated.

User response

Check for any associated sockets domain error messages, which may give more details on the error which has occurred. The error may have been caused by a user terminating their Web Browser before CICS has been able to process the request. The error might also have been caused by a user sending a non-SSL HTTP request to an SSL-enabled CICS region. If the problem persists, there may be a problem with the TCP/IP network, ensure HTTPS is used to replace HTTP when sending an SSL request. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *tranid*

5. *hostaddr*

6. *clientaddr*

7. Value chosen from the following options:

1= ,

2= TCPIPSERVICE:

8. *tcpipservice*

Destination

CWBO

DFHWB0733	*date time applid tranid* **CICS Web attach processing failed because there were no available SSL TCBs. Host IP address:** *hostaddr*. **Client IP address:** *clientaddr*.**{ |** **TCPIPSERVICE: }** *tcpipservice*

Explanation

A Secure Sockets Layer connection from a client with address *ipaddr* was received on TCPIPSERVICE(*service*), but there were no available TCBs to process the request.

System action

The socket for the connection is closed. No message is sent to the client because the client expects the response to be encrypted by SSL, but SSL services cannot be provided.

User response

If this message occurs frequently, consider raising the value of the MAXSSLTCBS system initialization parameter. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *hostaddr*
6. *clientaddr*
7. Value chosen from the following options:

   1= ,

   2= TCPIPSERVICE:

8. *tcpipservice*

Destination

CWBO

DFHWB0734	*date time applid tranid* **CICS Web attach processing failed because the SSL handshake with the client has failed. Host IP address:** *hostaddr*. **Client IP address:** *clientaddr*.**{ |** **TCPIPSERVICE: }** *tcpipservice*

Explanation

A Secure Sockets Layer connection from a client with address *ipaddr* was received on TCPIPSERVICE(*service*), but the SSL handshake failed.

System action

The socket for the connection is closed. No message is sent to the client because the client expects the response to be encrypted by SSL, but SSL services cannot be provided. The reason for the handshake failure may be displayed in an earlier DFHSO0123 message.

User response

If the DFHSO0123 message indicates a CICS configuration error, correct it. Otherwise, the problem is likely to be a client error, and can be ignored. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *hostaddr*
6. *clientaddr*
7. Value chosen from the following options:

   1= ,

   2= TCPIPSERVICE:

8. *tcpipservice*

Destination

CWBO

DFHWB0736   *date time applid tranid* **The method in the received HTTP request is not implemented by the server. Host IP address:** *hostaddr*. **Client IP address:** *clientaddr*. **TCPIPSERVICE:** *tcpipservice*.

Explanation

As part of its normal processing of a request, CICS Web Support checks the supplied method with the HTTP version of the request and the version of HTTP supported by the server. The HTTP version supported by CICS depends on the version that the server application is running at. CICS may also report this error if the method is valid but any of the supplied headers are incorrect, as this means that CICS cannot implement the method.

System action

An error response is sent to the client and processing of the request is terminated.

User response

Correct the method in the request to one supported by the version of HTTP being used and the version that the server application is capable of running at. The version of the server is that supplied on the HTTP response. If the method is correct, check that all the headers supplied in the request are correct.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *hostaddr*
6. *clientaddr*
7. *tcpipservice*

Destination

CWBO

DFHWB0737   *date time applid tranid* **CICS Web support has detected that the version of the incoming HTTP request is higher than the version that CICS supports. Host IP address:** *hostaddr*.

Client IP address: *clientaddr*. **TCPIPSERVICE:** *tcpipservice*.

Explanation

As part of its normal processing of a request, CICS Web Support checks the version of the incoming HTTP request. If it is higher than the version CICS supports and the method is not recognized the request is rejected.

System action

An error response is sent to the client and processing of the request is terminated.

User response

Examine the version in the HTTP response to determine the HTTP version that is supported.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *hostaddr*
6. *clientaddr*
7. *tcpipservice*

6. *tcpipservice*

Destination

CWBO

DFHWB0740   *date time applid tranid* **An HTTP/1.0 client has sent an EXPECT header which is not supported. Client IP address:** *clientaddr*. **TCPIPSERVICE:** *tcpipservice*

Explanation

While processing an EXPECT header CICS has detected that the client is not using HTTP version 1.1.

System action

The request is rejected with an HTTP/1.0 status code of 400 Bad Request.

User response

Correct the HTTP Client.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *clientaddr*
6. *tcpipservice*

Destination

CWBO

DFHWB0741   *date time applid tranid* **An HTTP socket receive request has timed out. Client IP address:** *clientaddr*. **TCPIPSERVICE:** *tcpipservice*

Explanation

There are two possible reasons for this message

- CICS has timed out while receiving data from the client.
- CICS has sent a 100 Continue header in response to an EXPECT: header however the request has timed out before the client has sent the message body.

System action

The possible causes are

- The value of the SOCKECTCLOSE parameter on the TCPIPSERVICE is too low
- The client has sent an incorrect Content-Length header
- The client has not sent the body of the request

User response

Possible solutions are

- Increase the value of the SOCKETCLOSE parameter on the TCPIPSERVICE.
- Correct the HTTP Client.

Module:
DFHWBXN, DFHWBXM

CWBO

DFHWB0762   *date time applid tranid* **The received HTTP request specifies the OPTIONS method but cannot be handled by CICS. Status code:** *statuscode.* **Host IP address:** *hostaddr.* **Client IP address:** *clientaddr.* **TCPIPSERVICE:** *tcpipservice.*

Explanation

As part of its normal processing of a request, CICS Web Support checks the validity of the request for the specified method. In this case the method is OPTIONS but CICS cannot process the request. The status code *statuscode* indicates the reason for this as follows:

- 400 : the request is not valid HTTP/1.1

- 405 : the request is valid in HTTP/1.1 terms but is not allowed by CICS for the OPTIONS method. For example CICS does not support OPTIONS for a path. CICS returns a HTTP response containing an ALLOW header stating which methods CICS supports when a path is specified.

System action

An error response with status code *statuscode* is sent to the client and processing of the request is terminated.

User response

The HTTP request should be corrected.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Console

DFHWB0770	*date time applid tranid* **The CICS OPTIONS handler program returned an error response. Program name:** *progname*. **Host IP address:** *hostaddr*. **Client IP address:** *clientaddr*. **TCPIPSERVICE:** *tcpipservice*

Explanation

An OPTIONS handler user replaceable analyzer has been invoked. This program has failed to return normally.

Users can architect their own response and reason code values to be returned by the handler.

If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN" in the message.

System action

An error response is sent to the client and processing of the request is terminated.

User response

Examine the OPTIONS handler to determine the cause of the error.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts

Destination

CWBO

DFHWB0771	*date time applid tranid* **CICS Web attach processing detected an error linking to the OPTIONS handler user replaceable module *progname*. Host IP address: *hostaddr*. Client IP address: *clientaddr*. TCPIPSERVICE: *tcpipservice***

Explanation

An error linking to the OPTIONS handler user replaceable module forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action

An error response is sent to the client and the request is terminated. The tcpipservice remains open and usable.

User response

Ensure that the program specified has been correctly installed and defined to CICS. If the user replaceable module (URM) has been set dynamically using CEMT

or the SPI command, then ensure that the module is defined to CICS and enabled, or available in the library if autoinstall is active.

Module:
DFHWBXN, DFHWBXM

Destination

CWBO

DFHWB0801 *date time applid* **BUNDLE** ***bundlename* has failed to install URIMAP *urimdef* because *{the definition is invalid | of an installation failure | an internal error occurred}.***

Explanation

The CICS bundle *bundlename* has failed to install URIMAP *urimdef* The reason for the error is also given.

System action

The BUNDLE resource is disabled and the URIMAP is not created.

User response

Investigate and correct the cause of the failure. Check for any previous messages which may give you more information about the reason for the failure as follows:

definition is invalid

Check for a preceding DFHCAnnnn message. For example DFHCA5501 is output if the required attribute HOST has not been specified.

installation failure

Check for a preceding DFHAMnnnn console message. For example DFHAM4950 is output if a URIMAP with the same name already exists.

Discard and reinstall the BUNDLE resource.

Console

DFHWB1009　　*applid* **CICS Web environment initialization failed. Reason Code: X'rc'.**

Explanation

The CICS Web 3270 environment initialization failed with reason code *rc*.

System action

CICS initialization continues. Subsequent calls to the components of the CICS Web environment may fail.

User response

Use the reason code *rc* to determine why initialization failed. The possible reasons are:

1

　　Storage for the Web anchor block could not be obtained.

3

　　Load for module DFHWBST failed.

4

　　Load for module DFHWBTC failed.

5

> Storage for the State Manager anchor block could not be obtained.

6

> The creation of the State Token Directory failed.

7

> The subpool required for state management could not be added.

8

> The subpool required for HTTP buffers could not be added.

9

> The addition of the WBST lock failed.

A

> Load for module DFHWBIP failed.

Reason codes 1 to 9 originate in DFHWBIP. Reason code A originates from DFHSIJ1.

Destination

Console

DFHWB1020   *date time applid* **CICS Web State Manager could not find state data for state token *stoken* for a {destroy | retrieve | store} request. { | TCPIPSERVICE: } tcpipservice**

Explanation

The CICS Web State Manager could not find the state data for the state token *stoken* or the supplied state token *stoken* does not exist.

System action

The requested state data cannot be destroyed, updated or retrieved by the Web State Manager. An exception trace entry is made in the trace table.

User response

Ensure that the supplied state token *stoken* is correct. On a busy CICS region, the most likely cause of this

error is that the state data has been discarded by the Web garbage collection process before the Web state manager could access it. Check that the system initialization *WEBDELAY* parameters are appropriate values. See the Configuring for guidance on setting the values of the Web garbage collection interval and the Web terminal timeout interval.

Explanation

The CICS Web State Manager could not find the state data for the state token *stoken* because the supplied state token *stoken* does not exist. The running task is task number *taskid* and the associated CICS unit of work id is *cuowid*.

System action

The Web State Manager cannot therefore perform the requested partnership function for the running task. An exception trace entry is made in the trace table.

User response

Ensure that the supplied state token *stoken* is correct. On a busy CICS region, the most likely cause of this error is that the state data has been discarded by the Web garbage collection process before the Web State Manager could access it for the running task. Check that the system initialization *WEBDELAY* parameters are appropriate values. CWBO and Console

DFHWB1200	*date time applid tranid* **The CICS Web Interface analyzer program set parameter WBRA_USER_DATA_LENGTH to more than the maximum. Program name:** *progname*. **RESPONSE:** *response*. **REASON:** *reason*. **Host IP address:** *hostaddr*. **Client IP address:** *clientaddr*. **Data offset:** *X'dataoffset'*. **Data length:** *X'datalength'*. **Buffer length:** *X'bufferlength'.{	TCPIPSERVICE: }* *tcpipservice*

Explanation

As part of its normal processing of a request, Web attach processing invokes the user replaceable analyzer to tailor the required actions. This program is passed the length of the user data part of the HTTP request in parameter WBRA_USER_DATA_LENGTH, which it can modify. However, the modified value is greater than the maximum allowable value which represents the available space in the data buffer.

System action

An error response is sent to the client and processing of the request is terminated.

User response

Modify the analyzer program so that it does not set the parameter WBRA_USER_DATA_LENGTH to be greater than the maximum. The sum of the data offset and the data length should not exceed the buffer length.

DFHWB7001	**HTTPD_extract for *envvar* failed. Processing of this request terminated rc=*retcode*.**

Explanation

The CICS GWAPI program received an error response
retcode when it executed the `HTTPD_extract`
function to retrieve the specified environment variable
envvar.

System action

The CICS GWAPI program terminates and returns an
HTTP server error response (code 500) to the Web
browser.

User response

Investigate whether the ICSS/390 server has been
correctly configured to use the CICS GWAPI DLL. Refer
to the CICS documentation for further information.

Module:
DFHWBAPI

Destination

SYSPRINT

DFHWB7002   **HTTPD_read for HTTP user data failed. Processing of this request terminated rc=*retcode*.**

Explanation

The CICS GWAPI program received an error response *retcode* when it executed the HTTPD_read function to retrieve the user data sent with an HTTP request.

System action

The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User response

Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the CICS documentation for further information.

Module:
DFHWBAPI

Destination

SYSPRINT

DFHWB7003   **Invalid URL passed to DFHWBAPI: *url*. Processing of this request terminated rc=*retcode*.**

Explanation

The CICS GWAPI program has attempted to analyze the path name section of the Uniform Resource Locator *url* that it received from the Web browser, but has determined that its syntax is not in the standard format expected to decide which CICS region, transaction, and program should process the request.

The reason for the failure is given by one of the following values for the return code *retcode*.

1

    The path name contains fewer than eight characters.

2

    The path name does not begin with a leading slash ('/') character.

3

    The CICS applid is invalid.

4

    The converter name is invalid.

5

    The transaction name is invalid.

6

    The server program name is invalid.

System action

The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User response

Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the CICS documentation for further information.

Module:
DFHWBAPI

Destination

SYSPRINT

DFHWB7006   **Link to program *program_name* at applid *applid* failed for URL *url*. Processing of this request terminated RESP=*resp* RESP2=*resp2*.**

Explanation

The CICS GWAPI program has attempted to use the CICS External Call Interface (EXCI) to link to the Business Logic Interface program *program_name* in the CICS region with applid *applid*, but the link was unsuccessful. The EIBRESP and EIBRESP2 values from the EXEC CICS LINK command are *resp* and *resp2*.

System action

The CICS GWAPI program terminates and returns an HTTP error response to the Web browser. If *resp* and *resp2* indicate that there is a temporary problem establishing an Inter-Region Communication connection, the HTTP error response is 503 (system not available), otherwise it is 500 (server error).

User response

Investigate whether the target CICS region has been correctly configured to receive EXCI requests from this ICSS/390 server address space.

The following must be set up:

- The target CICS region must be active.
- There must be a generic EXCI pipe, or a specific EXCI pipe for *applid*, installed in the target CICS region.
- Inter-Region Communication must be active in the target CICS region.

Refer to the CICS documentation for further information.

Module:

SYSPRINT

DFHWB7007   **Error detected by program *program_name*. Processing of this request terminated rc=*retcode*.**

Explanation

The CICS GWAPI program has attempted to use the CICS External Call Interface (EXCI) to link to the Business Logic Interface program *program_name* in a CICS region, but an error response was returned by the program. The return code *retcode* is the Business Logic Interface response that was returned in `wbbl_response`.

System action

The CICS GWAPI program terminates and returns *retcode* as the HTTP server response to the Web browser.

User response

Investigate the reason for the error response. The values that can be returned in `wbbl_response` are documented in the CICS documentation, and are generally caused by a programming error in either the converter program or the server application program.

Module:
DFHWBAPI

Destination

SYSPRINT

DFHWB7008   **HTTPD_set for *variable* failed for URL *url*. Processing of this request terminated rc=*retcode*.**

Explanation

The CICS GWAPI program received an error response *retcode* when it executed the `HTTPD_set` function to set a value for the specified variable *variable* while processing URL *url*.

System action

The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User response

Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the CICS documentation for further information.

Module:
DFHWBAPI

Destination

SYSPRINT

DFHWB7009   **HTTP_write failed for URL *url*. Processing of this request terminated rc=*retcode*.**

Explanation

The CICS GWAPI program received an error response *retcode* when it executed the `HTTPD_write` function to write the user data to be sent with an HTTP response for URL *url*.

System action

The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User response

Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the CICS documentation for further information.

DFHWUnnnn messages

DFHWU0001 E   *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively:

- Unexpected data has been input,
- Storage has been overwritten, or
- There has been a program check within a user program.

The code *aaa* is, if applicable, a 3-digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code *bbbb*, which follows *aaa*, is a user abend code produced either by CICS or by another product on the user's system.

If X'*offset*' contains the value X'FFFF', then module *modname* was in control at the time of the abend, but the program status word (PSW) was not addressing this module.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer.

Look up the MVS code *aaa*, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If the *modname* insert contains the value *????*, then CICS was unable to determine which module has abnormally terminated. In this case, examine the system dump to determine which area of code has caused the program check.

The user should examine other messages to determine what the module which issued this message was doing at the time the abend occurred. From these messages they can deduce which product has produced the abend code *bbbb*. If *bbbb* is identified as a CICS code, it may be either alphameric or numeric.

- If the CICS code is alphameric (for example AKEA) then it is a CICS transaction abend code.
- If the CICS code is numeric (for example 1310), it refers to a CICS message (DFHTS1310 in our example).

If the user abend code is from another product (for example, IMS), refer to the appropriate messages and codes manual to determine the cause of the abend.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response.

Note:

The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the Configuring.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWUIPG

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHWU0002   *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS will continue unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

For further information about CICS exception trace entries, refer to the Troubleshooting and support.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWUIN1, DFHWURP

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHWU0004   *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

2. *X'offset'*
3. *modname*

Destination

Console

DFHWU0910 I *applid* **Instruction address X'aaaaaaaa', offset X'offset' in CSECT** *csect*.

Explanation

The CICSPlex SM recovery routine has been entered as a result of an abend in a CICS system.

This message describes the location of an abend that occurred in CICSPlex SM, where:

applid

is the VTAM application ID of the CICS system that abended.

aaaaaaaa

is the address of the instruction that caused the abend.

offset

is the offset of the instruction in the CSECT that caused the abend.

csect

is the name of the CSECT that contains the instruction that caused the abend.

System action

The recovery routine attempts to capture and format any relevant diagnostic information. All available information is presented in the DFHWU09nn messages that follow this message.

User response

Collect as much of the following information as possible, and contact your IBM support center.

- Job log for the job that received the abend. If the job log is not available, get the system log.
- EYULOG file. If a CMAS abended, get the EYULOG file for that CMAS. If a CICS system abended, get the

EYULOG file for the CMAS to which the CICS system was connected.

- Formatted transaction dump, if one was taken.
- Unformatted SVC dump, if one was taken.
- AUXTRACE file, if available. If a CICS system abended and AUXTRACE was not active in that CICS system, get the AUXTRACE file from the CMAS to which the CICS system was connected.

DFHWUIPG

DFHWU4025   **A specified attribute was not valid for this resource.**

Explanation

An error has occurred in the CICS management client interface. The request cannot be processed. A specified attribute was not valid for this resource.

System action

The system stops processing the request.

User response

Supply an appropriate attribute and resubmit the request.

Module:
DFHWUIPG

DFHWU4026   **The DEFVER attribute was not specified or was specified with a value of zero.**

Explanation

An error has occurred in the CICS management client interface. The request cannot be processed. The DEFVER attribute was not specified or was specified with a value of zero.

System action

The system stops processing the request.

User response

Supply a valid DEFVER attribute and resubmit the request.

Module:
DFHWUIPG

DFHWU4027   **A value of a specified attribute was out-of-range or not valid.**

Explanation

An error has occurred in the CICS management client interface. The request cannot be processed. A value of a specified attribute was out-of-range or not valid.

System action

The system stops processing the request.

User response

Supply a valid attribute and resubmit the request.

Module:
DFHWUIPG

DFHWU4029   **The result cache token specified exceeded its maximum allowable length. CACHETOKEN value:** *cachetoken*

Explanation

An error has occurred in the CICS management client interface. The request cannot be processed. The result cache token specified exceeded its maximum allowable length. The *cachetoken* is the value specified for the cache token.

System action

The system stops processing the request.

User response

Supply a cache token value of the correct length and resubmit the request.

Module:
DFHWUIPG

DFHWU4030   **The resource name was not specified in the URI.**

Explanation

An error has occurred in the CICS management client interface. The request cannot be processed. The resource name was not specified in the URI.

System action

The system stops processing the request.

User response

Specify the resource name in the URI and resubmit the request.

Module:
DFHWUIPG

DFHWU4031   **Multiple ORDERBY expressions were found in the URI.**

Explanation

An error has occurred in the CICS management client interface. The request cannot be processed. Multiple ORDERBY expressions were found in the URI.

System action

The system stops processing the request.

User response

Remove the multiple ORDERBY expressions in the URI and resubmit the request.

Module:
DFHWUIPG

DFHWU4032   **ORDERBY is only valid for HTTP GET requests.**

Explanation

An error has occurred in the CICS management client interface. The request cannot be processed. Use of

an ORDERBY expression is only valid for HTTP GET requests.

System action

The system stops processing the request.

User response

Remove the ORDERBY expression on this request and resubmit.

Module:
DFHWUIPG

DFHWU4033	Multiple OVERRIDEWARNINGCOUNT expressions were found in the URI.

Explanation

An error has occurred in the CICS management client interface. The request cannot be processed. Multiple OVERRIDEWARNINGCOUNT expressions were found in the URI.

System action

The system stops processing the request.

User response

Remove the multiple OVERRIDEWARNINGCOUNT expressions in the URI and resubmit the request.

Module:
DFHWUIPG

DFHWU4300	The result cache token specified in the URI does not belong to the user who made the request.

Explanation

An error has occurred in the CICS management client interface. The result cache token specified in the URI does not belong to the user who made the request.

System action

Access to the specified result cache has been denied.

User response

Respecify the request with the correct result cache token.

Module:
DFHWUIPG

DFHWU4301	It is not possible to run requests in this environment. This region is not configured correctly.

Explanation

An error has occurred in the CICS management client interface. It is not possible to run requests in this environment. This region is not configured correctly. The CICS management client interface should only be started on either a CICSPlex SM Web User Interface or a single server (SMSS) region.

System action:

User response

Ensure that you are using the correct environment for your requests.

Module:
DFHWUIPG

DFHWU4302	The requested record count will exceed the current default warning count limit. current_record_count value: *currcount* default_warning_count value: *warncount* override_warning_count_allowed value: *override_warning_count_allowed*

Explanation

An error has occurred in the CICS management client interface. The request has been denied as it exceeded a resource limit. The requested record count will exceed the current default warning count limit.

System action

The system stops processing the request.

User response

Respecify the request to reduce the number of records returned or specify the OVERRIDEWARNINGCOUNT URI query parameter if override_warning_count_allowed is set to "YES".

Module:
DFHWUIPG

DFHWU4303	An error has occurred in the CICS management client interface. The request cannot be processed.

Explanation

An error has occurred in the CICS management client interface.

System action

Access to the CICS management client interface has been denied.

User response

See the full message description for further details.

Module:
DFHWUIPG

DFHWU4400 **The resource specified in the URI could not be found.**

Explanation

An error has occurred in the CICS management client interface. The resource specified in the URI could not be found. The resource type is not supported by this version of the CICS management client interface.

System action

The system stops processing the request.

User response

Check that the specified CICS resource name is correct. Specify a valid resource in the URI and resubmit the request.

Module:
DFHWUIPG

DFHWU4401 **The result cache record specified could not be found.**

Explanation

An error has occurred in the CICS management client interface. The result cache record specified could not be found because the result cache record index was out of range.

System action

The system stops processing the request.

User response

Check that the specified result cache record index is correct.

Module:
DFHWUIPG

DFHWU4402 **The result cache specified could not be found.**

Explanation

An error has occurred in the CICS management client interface. The result cache specified could not be found because the result cache token could not be found.

System action

The system stops processing the request.

User response

Check that the specified result cache token is correct.

Module:
DFHWUIPG

DFHWU4500 **A method has been specified that is not valid for the URI sent to the CICS management client interface. METHOD value:** *method*

Explanation

An error has occurred in the CICS management client interface. The specified HTTP method is not allowed for the URI. The *method* is not valid for the URI sent to the CICS management client interface.

System action

The system stops processing the request.

User response

Check that you have specified a valid HTTP method and resubmit the request.

Module:
DFHWUIPG

DFHWU5000 **There was insufficient GCDSA storage available to complete the request.**

Explanation

An internal error has occurred in the CICS management client interface. There was insufficient GCDSA storage available to complete the request.

System action

The system stops processing the request.

User response

Contact your system administrator.

Module:
DFHWUIPG

DFHWU5001 **The CICS management client interface server has gone Short On Storage BELOW the bar.**

Explanation

An internal error has occurred in the CICS management client interface. The CICS management client interface server has gone short-on-storage below the bar.

System action

The system stops processing the request.

User response

Contact your system administrator.

DFHXAnnnn messages

DFHXA6521I *applid* **CICS shutdown initiated by CEBT event**

Explanation

This is an informational message issued from the CICS TCB.

System action

CICS terminates normally.

User response

None.

Module:
DFHXRCP

Destination

Console

DFHXA6526I *applid* **MESSAGE RECEIVED FOR UNSUPPORTED QUEUE X'queue'.**

Module:
DFHWUIPG

DFHWU5002 **An internal error has occurred in the CICS management client interface.**

Explanation

An internal error has occurred in the CICS management client interface.

System action

The system stops processing the request.

User response

Contact your IBM support center to help resolve the problem.

Module:
DFHWUIPG

Explanation

This message is issued from the CAVM TCB. A tracking message has been received for a queue with hexadecimal name X'*queue*'. However this queue is not recognized by CICS.

System action

CICS processing continues, but tracking messages for queue X'*queue*' are ignored.

User response

Check that the active CICS system and the alternate CICS system are at the same functional level with respect to XRF.

If both CICS systems are at the same level, check why the active CICS system has written data to the alternate system.

Ensure that the queue name has not been corrupted.

Module:
DFHXRB

Destination

Console

DFHXA6528I *applid* **Unable to link to program *progname***

Explanation

This message is issued from the CICS TCB. CICS is unable to link to program *progname*.

System action

CICS terminates abnormally with a system dump and abend code 0210.

User response

Examine the dump to determine why CICS was unable to link to program *progname*.

Ensure that the named program is not missing from the data sets concatenated in the DFHRPL DD statement. If *progname* is missing, obtain a copy of the program and include it in the library. In addition, ensure that enough storage is available for the dynamic storage areas.

Destination

Console

DFHXA6530	*applid* START=STANDBY specified. CICS start-up is terminated because XRF=NO is specified

Explanation

START=STANDBY and XRF=NO cannot be specified together.

System action

CICS terminates abnormally with a dump.

User response

Correct the conflicting values of the operands START and XRF.

Module:
DFHSIC1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXA6540I	XRF HAS FAILED. ERROR NUMBER *nn* ON XRF MESSAGE DATA SET IN CONTROL INTERVAL WITH RBA HEX'*xx*'.

Explanation

The XRF message manager has encountered a problem with the contents of the given control interval in the message data set. The message includes an error number *nn* which can take one of the following values:

01

The CI does not contain an XRF message manager control record.

02

The XRF message control record contains a cycle number less than that of the current read cycle.

03

The XRF message manager did not find a message record boundary where it expected one.

04

There is an XRF message sequence number error.

05

The CIDF is invalid (for example, the free area length is negative).

06

The length in the RDF is less than the length of a message record header, or is inconsistent with the data length in the message record header.

07

The end of the record lies outside the data area defined by the data length field of the CIDF.

System action

Surveillance by the alternate system ceases.

User response

Check that the active and alternate systems are using the same pair of data sets for XRF surveillance. If they are, this is almost certainly a CICS error affecting either the alternate system, the active system, or both.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWMRD

Destination

Console

DFHXA6541I   **XRF HAS FAILED. THE XRF MESSAGE READER IN THE ALTERNATE SYSTEM HAS FALLEN TOO FAR BEHIND.**

Explanation

The alternate system has been unable to keep up with the messages generated by the active CICS system. Its read position in the wrap-round message data set has been 'lapped' by the active system.

System action

Surveillance by the alternate system ceases.

User response

Try to determine and correct the reason for the delay to the alternate system. It may be that the message data set is too small to allow adequate buffering, or the message data set has been reserved by the active CEC - not necessarily by the active CICS.

Module:
DFHWMRD

Destination

Console

DFHXA6560I   *applid* **TERMINATION COMMAND FAILED:** *command***.**

Explanation

The command issued by the alternate CICS during takeover to terminate the active CICS failed. MVS rejected the system operator command *command* issued under program control as being invalid.

System action

Message DFHXA6581 or DFHXA6582 is also displayed. The alternate CICS continues with its processing to detect termination of the active CICS job.

User response

Ensure that the active CICS job terminates. See messages DFHXA6581 and DFHXA6582. For problem

determination, hard copy of the console log may be required.

Module:
DFHWTI

Destination

Console

DFHXA6561D   *applid* **WHEN** *jesno jobname* **ENDS REPLY** *JOB* **OR WHEN CEC** *sid* **HAS FAILED REPLY** *CEC***.**

Explanation

During a takeover attempt, the issuing CICS system was unable to determine whether job *jobname*, running on a different CEC, has terminated. This is for one of the following reasons:

- CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560, DFHXA6569 or DFHXA6570 has been produced.
- CICS has either successfully issued a cancel command, or job *jobname* is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If *jobname* is the active CICS. Takeover cannot continue until *jobname* has ended. If *jobname* is a DBCTL subsystem, an alternate DBCTL cannot be started until *jobname* has ended.

System action

The system waits for a reply. In the meanwhile, the issuing CICS system continues processing to detect termination of the job.

If termination is detected while the reply is still outstanding, this message is deleted and message DFHXA6564 is displayed. In this case, a reply is no longer required.

If the reply is 'JOB', then processing continues as if CICS had detected the termination itself.

This also happens if the reply is 'CEC', but in addition an internal record is created indicating that the CEC is inoperative at this time. Other alternate CICS which have issued this message for jobs executing on the CEC specified, and which are still waiting for a reply, will detect the internal record of the failed CEC. Having done so they delete their outstanding replies and issue message DFHXA6563.

User response

The operator should either:-

- Ensure that job *jobname* with JES number *jesno* terminates, and then reply 'JOB', or
- Ensure that the CEC with MVS system identifier *sid* is inoperative at this time, for example by selecting SYSTEM RESET on that CEC, and then reply 'CEC'.

No action is necessary if at any time CICS deletes this message, as described above.

Module:
DFHWTI

Destination

Console

DFHXA6563I	*applid jesno jobname* ENDED DUE TO FAILURE OF CEC *sid*.

Explanation

During takeover, the alternate CICS has detected that the CEC with MVS system identifier *sid* has failed and therefore that the active CICS job with job name *jobname* and JES job number *jesno* is regarded to have ended.

System action

The alternate CICS continues with its takeover processing.

User response

None.

Module:
DFHWTI

Destination

Console

DFHXA6564I	*applid* TERMINATION OF *jesno jobname* DETECTED.

Explanation

During takeover, the alternate CICS has detected that the active CICS job with specified job name and JES job number has ended.

System action

The alternate CICS continues with its takeover processing.

User response

None.

Module:
DFHWTI

Destination

Console

DFHXA6566I	*applid modname* NOT LINK-EDITED REENTERABLE.

Explanation

Module *modname*, the CLT or RST currently in use, was found not to have been link-edited with the reenterable module attribute.

The initialization option CLT=*xx* or RST=*xx* specifies the suffix of the CLT or RST currently in use by this alternate CICS.

System action

Further messages are issued which describe the action taken by CICS.

User response

The appropriate response is indicated by subsequent messages.

Module:
DFHWTI

Destination

Console

DFHXA6567I	*applid* APPLID *applid2* NOT FOUND IN *modname*.

Explanation

Module *modname*, the CLT or RST currently in use by this alternate CICS, was found not to contain the APPLID *applid2*.

System action

Further messages are issued which describe the action taken by CICS.

User response

The appropriate response is indicated by subsequent messages.

Module:

DFHWTI

Destination

Console

DFHXA6568I   *applid* **JOBNAME** *jobname* **NOT FOUND IN** *modname***.**

Explanation

Module *modname* is either a CLT or an RST.

If the module is a CLT, it was found not to contain the job name *jobname* associated with the APPLID of this alternate CICS.

If the module is an RST, it was found not to contain the job name *jobname* associated with the DBCTL subsystem identified in the message.

jobname is the job name which the alternate CICS would have used to cancel the active CICS job or DBCTL job during a takeover

System action

Further messages are issued which describe the action taken by CICS.

User response

The appropriate response is indicated by subsequent messages.

Module:
DFHWTI

Destination

Console

DFHXA6569I   *applid* **MVS SYSTEM IDENTIFIER** *sid* **NOT FOUND IN DFHCLT***xx***.**

Explanation

The CLT currently in use was found not to contain the specified MVS system identifier *sid,* which identifies the CEC on which the active CICS was executing.

The initialization option CLT=*xx* specifies the suffix of the CLT currently in use by this alternate CICS.

System action

Further messages are issued by the alternate CICS to describe the action taken.

User response

The appropriate response is indicated by subsequent messages.

Module:
DFHWTI

Destination

Console

DFHXA6570I   *applid* **JES SUBSYSTEM NAME** *jesname* **NOT FOUND IN DFHCLT***xx* **FOR MVS SYSTEM** *sid***.**

Explanation

The CLT currently in use does not contain the JES subsystem name *jesname* associated with the MVS system *sid* of the CEC on which the active CICS was executing.

The initialization option CLT=*xx* specifies the suffix of the CLT currently in use by this alternate CICS.

System action

Further messages are issued by the alternate CICS to describe the action taken.

User response

The appropriate response is indicated by subsequent messages.

Module:
DFHWTI

Destination

Console

DFHXA6571I   *applid* **CICS IS NOT DEFINED AS AN MVS SUBSYSTEM.**

Explanation

The alternate CICS attempted to access an internal record of CEC failures to determine whether the CEC on which the active CICS job was executing had failed. To access this information CICS has to be defined as an MVS subsystem. Because it is not, the attempt failed.

System action

Processing continues.

User response

None. For further information about defining CICS as an MVS subsystem, see the Installing CICS TS.

Module:
DFHWTI

Destination

Console

DFHXA6572I   *applid* **UNABLE TO LOAD** *modname*.

Explanation

The module *modname*, defined by the CLT or RST for use by the alternate CICS that issued this message, cannot be loaded.

System action

Further messages are issued by the alternate CICS to describe the action taken.

User response

The appropriate response is indicated by subsequent messages.

Module:
DFHWTI

Destination

Console

DFHXA6573I   *applid* **LOAD MODULE** *modname* **IS NOT VALID.**

Explanation

Module *modname*, the CLT or RST defined for use by this CICS system, is not valid.

System action

Further messages are issued by the alternate CICS to describe the action taken.

User response

The appropriate response is indicated by subsequent messages.

Module:
DFHWTI

Destination

Console

DFHXA6574I   *applid* **ERROR FOUND WITH DFHCLT***xx***.**

Explanation

The alternate CICS that issued this message is unable to load a CLT, or has performed a check on the CLT contents and has found an error. If the specified CLT is used during a future takeover, the takeover might not be successful. A new or corrected CLT can be made available and loaded at takeover.

System action

Processing continues.

User response

Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if not.

Locate the previous message issued by this alternate CICS, which provides details of the CLT error.

Perform the appropriate source edit, assembly and link-edit tasks necessary to make a correct CLT available for this alternate CICS.

Module:
DFHWTI

Destination

Console

DFHXA6575I   *applid* **SUBSYSTEM NAME** *subsysid* **NOT FOUND IN** *rstname* **FOR THIS APPLID.**

Explanation

This is an informational message indicating that RST *rstname*, which was selected via the SIT, does not include an entry for DBCTL subsystem *subsysid* in any RSE containing the specific APPLID *applid* of this CICS.

System action

No action results directly when this message is issued. Other messages may be issued following this verification failure.

User response

Check the RST suffix specified in the SIT, the RST, and the DBCTL subsystem to which CICS is connected.

Check any other messages that may also have been issued.

Module:
DFHWTI

Destination

Console

DFHXA6576I   *applid* **CLT PROCESSING NOT POSSIBLE OWING TO ERROR IN DFHCLT*xx*.**

Explanation

During takeover, the alternate CICS that issued this message performed a check on the CLT contents and found an error.

A previous message specifies the error.

System action

Commands in the CLT are not issued by this alternate CICS. Other takeover processing continues.

User response

Verify that the alternate CICS job is authorized to perform a takeover of the active CICS and take appropriate action if it is not.

If the takeover is to be successful, the system operator should monitor and coordinate execution of the active CICS and alternate CICS jobs in the XRF complex.

Perform the source edit, assembly and link-edit tasks necessary to correct the CLT.

Module:
DFHWTI

Destination

Console

DFHXA6577I   *applid* **NOT AUTHORIZED TO CANCEL *jesno jobname* ON CEC *sid*.**

Explanation

The issuing alternate CICS is attempting a takeover of the specified active CICS job. It has been unable to find the data that is needed to fully authorize takeover in the CLT or RST. This may be because the alternate

cannot load the table, or because job *jobname* cannot be found:

- In the CLT, for an active CICS, or
- In the RST, for a DBCTL subsystem, or
- Because the CLT or RST is invalid.

Further messages specify the error with the CLT or RST, or define why the CLT or RST is invalid.

System action

The issuing CICS system cannot issue a CANCEL, but attempts to alert the active CICS system to the takeover request via the XRF control data set. In most cases this causes the active system to initiate termination. The alternate continues processing to detect termination of the job.

When termination is detected, message DFHXA6563 or DFHXA6564 is displayed.

User response

Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if the alternate CICS job is not authorized.

Your CLT and/or RST may require some maintenance action.

Module:
DFHWTI

Destination

Console

DFHXA6578I   *applid* **NOT AUTHORIZED TO CANCEL *jesno jobname*.**

Explanation

The issuing alternate CICS is attempting a cancel of the specified active CICS job. It has been unable to find the data that is needed to fully authorize the cancellation in the CLT or RST. This may be because the alternate cannot load the table, or because job *jobname* cannot be found:

- In the CLT, for an active CICS, or
- In the RST, for a DBCTL subsystem. or
- Because the CLT or RST is invalid.

Further messages specify the error with the CLT or RST, or define why the CLT or RST is invalid.

System action

The issuing CICS system cannot issue a CANCEL, but attempts to alert the active CICS system to the takeover request via the XRF control data set. In most cases this causes the active system to initiate termination. The alternate continues processing to detect termination of the job.

When termination is detected, message DFHXA6564 is displayed.

User response

Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if the alternate CICS job is not authorized.

Your CLT and/or RST may require maintenance action.

Module:
DFHWTI

Destination

Console

**DFHXA6580I   PROGRAM LOGIC ERROR
                  DETECTED.**

Explanation

An internal error has been detected that prevents the CICS XRF CAVM supervisor state processing from continuing.

Depending on the CAVM supervisor state service being processed at the time, CICS may or may not abnormally terminate.

The CAVM TCB for processing the service has abnormally terminated.

Job output should include a dump of MVS LSQA associated with the SYSABEND DD statement.

Diagnostics: Register 2 is the base register for DFHWTI global storage. This storage begins with the eye catcher WTISTOR. The format of this storage is defined in DSECT WSTORAGE in source member DFHWTI.

DFHWTI request arguments copied to global storage begin at field WGLODATA.

Source member DFHWTADS defines the format of global storage arguments.

Field WGLOLOCA contains the address of the first register save area for a routine in DFHWTI.

In the SVRB for the CICS SVC call that invoked DFHWTI, the first *fullword* in the FEPARM field contains the address of DFHWTI global storage.

Register 4 is the base register for local storage for each routine in DFHWTI. Its format is defined in a DSECT whose name is of the form WLOC*xxx* where *xxx* is the short name of the routine (see below for a list of routine names).

These DSECTs are in source member DFHWTI. The first *halfword* is the internal return code for the routine. The values used for internal return codes are the same as the DFHWTI request reason codes as defined in source member DFHWTADS field name WTARRC.

In addition, internal return codes of the format X'40nn' are used. X'40F0' is 'Internal Logic Error' variable name, RCLOGERR.

Other internal return codes of this format are defined in the local storage DSECTs.

The DFHWTI request type for the CAVM supervisor state service is copied into local storage associated with the DFHWTI initialization and termination routine, field name WWTIREQ, DSECT WLOCWTI in source member DFHWTI.

Register 6 is the base register for each routine in DFHWTI. When set, it points at a location immediately following an eye catcher of the routine's long name (see list of routine names).

Register 13 is the base register for a register save area local to a routine in DFHWTI. These save areas are standard MVS format except the first *fullword* contains the routine's short name (see list of names). They are chained in the standard way with backward and forward pointers set on entry to a routine and zeroed on return.

Register save areas physically precede the storage local to a routine.

If a routine has to access the CLT, its address is in local storage for the routine. The field name for the CLT address is of the form W*xxx*CLTA, where *xxx* is the short name of the routine.

System action

In general, the CAVM request issued by this CICS job will fail. For the effect this has on processing by this CICS job, refer to messages issued after this one.

CAVM XRF supervisor state processing issues an MVS abend with system abend code 0214 and an MVS SYSABEND dump is produced.

User response

Keep the job output and console log for problem determination.

Using the SYSABEND dump of the MVS LSQA, and if available, the MVS symptom dump output, find the DFHWTI routine that detected the error from the value of register 6 or register save area chain fields.

Find the internal return code currently set in local storage for the routine.

Using the reason code value, remaining content of local storage and global storage, try to determine the cause of the action by the routine.

An assembly listing of the CLT assembled with the PRINT NOGEN option may be required.

Routine names Long names are used for:

- The routine entry point name, and
- The routine entry eye catcher.

Short names are used for:

- The routine register save area eye catcher,
- Characters 2 to 4 of routine local storage field names,
- Characters 5 to 7 of routine local storage DSECT names, and
- Characters 1 to 3 of routine labels.

Routines are as follows:

DFHXA6581I	*applid* **UNABLE TO DETERMINE STATUS OF JOB** *jesno jobname*.

Explanation

The issuing CICS system was unable to determine whether job *jobname*, running on the same CEC, has terminated. This is for one of the following reasons:

1. CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560 has been produced.
2. CICS has successfully issued a cancel command, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

3. Job *jobname* is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If *jobname* is the active CICS, takeover cannot continue until *jobname* has ended.

If *jobname* is a DBCTL subsystem, an alternate DBCTL cannot be started until *jobname* has ended.

System action

Takeover is suspended until the issuing CICS system detects the termination of the named job.

When termination is detected the message DFHXA6564 is displayed.

User response

Ensure that the active CICS job terminates.

Module:
DFHWTI

Destination

Console

DFHXA6582I	*applid* **UNABLE TO DETERMINE STATUS OF JOB** *jesno jobname* **ON MVS SYSTEM** *mvsname*(*sid*).

Explanation

The issuing CICS system was unable to determine whether job *jobname*, running on MVS image *mvsname*, has terminated. This is for one of the following reasons:

- CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560, DFHXA6569, or DFHXA6570 has been produced.

- CICS has successfully issued a cancel command, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

- Job *jobname* is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

DFHXCnnnn messages

DFHXC6600I	*applid* **CAVM DATA SET INITIALIZATION FAILED.**

If *jobname* is the active CICS, takeover cannot continue until *jobname* has ended.

If *jobname* is a DBCTL subsystem, an alternate DBCTL cannot be started until *jobname* has ended.

System action

Takeover is suspended until the issuing CICS system detects the termination of the named job.

When termination is detected the message DFHXA6583 is displayed.

DFHXA6583I	*applid* **TERMINATION OF JOB** *jesno jobname* **ON MVS SYSTEM** *mvsname*(*sid*) **HAS BEEN DETECTED.**

Explanation

During takeover, the alternate CICS has detected that the active CICS job *jobname* with JES job number *jesno* running on MVS image *mvsname* has ended.

System action

The CICS alternate continues takeover processing.

User response

None.

Module:
DFHWTI

Destination

Console

Explanation

The CICS job which displayed this message attempted to sign on to the CAVM but the signon request failed because the CAVM data sets could not be initialized properly. This is due to one of the following:

- The data set formatting subtask had not completed its processing in 2 minutes. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs cause a CAVM data set's DASD volume or a VSAM catalogue to remain inaccessible for a protracted period.
- SIGNON found that one of the CAVM data sets had already been formatted by a different CICS job but that the other was either empty or could not be opened because of conflict with another user of the data set. SIGNON waited for the other CICS job to finish the data set formatting, but 5 minutes later, this still had not been done. This might occur if a CICS job failed during data set formatting. A specific error reported in a previous message prevented successful completion of data set initialization.

System action

See following message issued by this CICS job.

User response

Correct the JCL or redefine the CAVM data sets if necessary and resubmit the CICS job. See the Configuring for information on CAVM data sets.

Destination

Console

DFHXC6606I   *applid* **CI SIZE OF CAVM DATA SET *dsname* MUST BE AT LEAST 4K.**

Explanation

The CICS job which displayed this message issued a SIGNON to the CAVM. The CAVM is attempting to open the CAVM data sets, but the error condition described in the message text has been detected.

System action

See following message issued by this CICS job.

User response

See message DFHXC6600

Module:
DFHWSSN3

Destination

Console

DFHXC6607I   *applid* **SIGNON IS WAITING TO RESERVE OR ACCESS CAVM DATA SET *dsname***

Explanation

The CICS job which displayed this message issued a sign on to the CAVM. CAVM is attempting to reserve or access the CAVM data set indicated in the message text, but for some considerable time, either the required resource has remained unavailable or an outstanding I/O request has not completed. The reason for issuing this particular message cannot be failure of a conditional reserve request unless new empty CAVM data sets are being used for the first time. The reserve attempt should not fail anyway unless another CICS job using the same CAVM data set and executing a sign on, sign-off or takeover request has been held up, possibly by I/O delays, after issuing a successful reserve. I/O delay might be caused by reserves issued by jobs (not necessarily CICS) running in other CECs that have made the CAVM data set's DASD volume temporarily inaccessible.

System action

After a short delay, the CICS job that displayed this message either reissues the conditional reserve macro or checks for completion of the outstanding I/O. If the required resource is now available or the I/O request has completed, normal processing continues. Otherwise, this message is reissued.

User response

None, unless the condition persists. If so, another CEC might have failed after reserving the DASD volume containing a CAVM data set. In this case, follow your installation's operations procedure for removing an outstanding reserve for a shared DASD. (For example, issue system reset on the failed CEC.)

DFHWSSN2

Destination

Console

DFHXC6621I	*applid* CAVM SIGNON CANNOT PROCEED BECAUSE JES IS EITHER NOT RUNNING OR NOT RESPONDING TO JOB STATUS ENQUIRIES.

Explanation

The CICS job that displayed this message issued a sign on to the CAVM. To process the request, CAVM needs to know the status of a job identified by an entry in the control data set, but cannot obtain this information for the reason given in the message text.

System action

After a one minute delay, the CICS job that displayed this message reissues the failing job status enquiry. If the request is completed successfully this time, normal processing continues. Otherwise, this message is reissued.

User response

If JES is not running, restart it if possible. Otherwise, if the condition persists, try to correct the problem that is preventing job status enquiries from being answered. In some cases, just stopping JES and restarting it again may achieve the desired effect. In a JES2 environment, a possible cause of this trouble is that another CEC has failed after reserving the DASD volume containing the check-point data set. See message DFHXC6607. In a JES3 environment, job status enquiries cannot be answered if the global processor has failed.

Module:
DFHWSSN2

Destination

Console

Destination

Console

DFHXC6626D	*applid* **POSSIBLE CAVM SIGNON CONFLICT. IS JOB** *jobname,jesno* **RUNNING ON SYSTEM** *sid*? **REPLY** *YES* **OR** *NO*.

Explanation

The CICS job which issued this message issued a SIGNON to the CAVM but the CAVM needs the operator's help in order to decide whether it is safe to accept the request. The CAVM has found that the control data set refers to a job satisfying all the following conditions:

- JES believes that this job is still executing.
- If JES is right, the current sign on request must be rejected because the presence of this job would conflict with it.
- This job is not running in the same CEC as the CICS job which is attempting to sign on.
- This job's surveillance signals appear to be absent.

Such a situation might have arisen as a result of a failure of the CEC in which the conflicting job was running and if so, the CAVM should not reject the sign on request unless it finds another reason for doing so. If the job which displayed this message is a CICS active, the conflicting job is another active or an alternate which has started a takeover. If the job which displayed this message is a CICS alternate, the conflicting job is another alternate. The jobname, JES job identifier and CEC SMF identifier of the conflicting job are specified in the message text.

System action

The CICS job waits for a reply.

User response

If the job which displayed this message is a CICS active job, reply NO only if:

1. You are certain that the job referred to in the message text is not executing. It might be necessary to perform a System Reset of the CEC where it was running to guarantee this.

   AND

2. The job which issued this message ought to continue with its CAVM sign on request and become the CICS active job.

Otherwise reply YES.

If the job which displayed this message is a CICS alternate job, reply NO only if:

1. You are certain that the job referred to in the message text is not executing. It might be necessary to perform a System Reset of the CEC where it was running to guarantee this.

   AND

2. The job which issued this message ought to continue with its CAVM sign on request and become the CICS alternate job.

Otherwise reply YES.

The CICS job which issued this message issued a takeover request to the CAVM and the request was accepted, but takeover processing could not be completed because of an error encountered in using the CAVM services provided by the CICS SVC.

System action

See following message issued by this CICS job.

User response

For problem determination, consult the Troubleshooting and support. The console log and job output may be required.

Module:
DFHWSTKV

Destination

Console

DFHXC6637I *applid* **TAKEOVER IS WAITING TO RESERVE OR ACCESS THE CAVM CONTROL DATA SET.**

Explanation

The CICS job that issued this message issued a TAKEOVER request to the CAVM. CAVM is attempting to reserve or access the CAVM control data set in order to process the request, but for some considerable time, either the required resource has remained unavailable or an outstanding I/O request has not completed. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a SIGNON, SIGNOFF or TAKEOVER request

has been held up, possibly by I/O delays, after issuing a successful reserve.

System action

See message DFHXC6607.

User response

See message DFHXC6607.

Module:
DFHWSTKV

Destination

Console

DFHXC6638I *applid* **NOTIFY RC=** *retcode - text*

Explanation

The CICS job that displayed this message has found that the return code passed back to CAVM by the NOTIFY exit (DFHXRB) was non-zero. The message includes the actual return code value *retcode* (or greater than 99) and some text identifying the type of event which was being processed when the error occurred. This message always indicates either an internal error in CAVM or CICS or that code or data has become corrupted.

System action

Processing continues but XRF function is probably degraded.

User response

Inform your installation's system programmer.

Module:
DFHWSTKV

Destination

Console

DFHXC6640I *applid* **ALL STATUS WRITERS ARE IN I/O WAIT.**

Explanation

The CICS job which displayed this message has found that the writes of its latest status issued to the control data set and the message data set are both taking a long time to complete. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs have made the DASD volumes of both CAVM data sets temporarily inaccessible.

System action

The CICS job re-issues this warning message at intervals until one of its status writes completes. Meanwhile, it continues to perform any processing which is not dependent on status write completion. If the job which displayed this message is a CICS active and the condition persists for long enough, it is possible that an unwanted takeover will be initiated when the alternate (assuming that it is able to read the CAVM data sets because it is running in a different CEC) notices that the active system's surveillance signals have ceased.

User response

If this message is issued by an CICS active job which does not seem to be experiencing other problems, it might be advisable to issue a suitable command to the corresponding alternate job to prevent it from initiating an unnecessary takeover. See also message DFHXC6607.

Module:
DFHWSSW

Destination

Console

DFHXC6641I	*applid* STATUS WRITE I/O ERROR ON *dsname*

Explanation

The CICS job which displayed this message has encountered an I/O error in writing its latest status to either the control data set or the message data set.

System action

If the CICS job is able to write its status successfully to either the control data set or the message data set, processing continues. Further writes to the failing data set might be attempted later on because it is possible that the error condition was transient. If both data sets become unusable simultaneously, the CAVM TCB ABENDs.

User response

Inform your installation's system programmer.

Module:
DFHWSSW

Destination

Console

DFHXC6642I	*applid* ALL STATUS READERS ARE IN I/O WAIT.

Explanation

The CICS job which displayed this message has found that the reads it has issued to the control data set and the message data set to obtain the latest available status of its partner system are both taking a long time to complete. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs have made the DASD volumes of both CAVM data sets temporarily inaccessible.

System action

The CICS job reissues this warning message at intervals until one of the status reads completes. Meanwhile, it continues to perform any processing which is not dependent on status read completion. If the job which displayed this message is a CICS alternate, It is possible that a takeover will not be initiated if the active fails, since the alternate cannot detect that the active's surveillance signals have ceased.

User response

See message DFHXC6607.

Module:
DFHWSSR

Destination

Console

DFHXC6643I	*applid* STATUS READ I/O ERROR ON *dsname*

Explanation

The CICS job which displayed this message has encountered an I/O error in reading the latest available status of its partner system from either the control data set or the message data set. *dsname* is the name of the data set.

System action

Processing continues but XRF function will be degraded because the affected system might not be able to detect changes in its partner's status. Further reads from the failing data set might be attempted later on because it is possible that the error condition was transient. If this error is encountered in an alternate system while it is processing a takeover request, the takeover will fail.

User response

Inform your installation's system programmer.

Module:
DFHWSSR

Destination

Console

DFHXC6644I   *applid* **NOTIFY RC=** *retcode - text*

Explanation

The CICS job which displayed this message has found that the return code passed back to CAVM by the NOTIFY exit (DFHXRB) was non-zero. The message includes the actual return code value *retcode* (or a value greater than 99) and some text identifying the type of event that was being processed when the error occurred. This message always indicates either an internal error in CAVM or CICS or that code or data has become corrupted.

System action

Processing continues but XRF function is probably degraded.

User response

Module:
DFHWSSR

Destination

Console

DFHXC6645I   *applid* **ERROR IN INQUIRE HEALTH EXIT.**

Explanation

The CICS job which displayed this message has found that the return code passed back to CAVM by the INQUIRE HEALTH exit (DFHXRC) was nonzero. This message indicates either an internal error in CAVM or in CICS, or that code or data has become corrupted.

System action

Processing continues but XRF function is probably degraded.

User response

Inform your installation's system programmer.

Module:
DFHWSTI

Destination

Console

DFHXC6646I   *applid* **ERROR CALLING CICS SVC -** *xxxxxxxxxxxx*

Explanation

The CICS job which displayed this message has encountered an error calling the CICS supervisor code (SVC) to determine the status of another MVS image in the same XCF sysplex as the calling CICS MVS image.

System action

Processing continues but XRF function is probably degraded.

User response

Ensure that the correct level of CICS SVC has been specified. Also ensure that MVS has issued an acceptable return code as this error can be caused by a change in MVS response codes. If the error is caused by neither of these, it could be the result of an internal error in CAVM. If this is the case, you need further guidance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWSSR

Destination

Console

DFHXC6649I   *applid* **SIGNOFF IS UNABLE TO RESERVE THE CAVM CONTROL DATA SET.**

Explanation

The CICS job which issued this message issued a SIGNOFF request to the CAVM or SIGNOFF processing was invoked implicitly by abnormal termination of the CAVM TCB. CAVM attempted to reserve the CAVM control data set in order to process the request, but for some considerable time, the required resource remained unavailable. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a SIGNON, SIGNOFF or TAKEOVER request has been held up, possibly by I/O delays, after issuing a successful reserve.

System action

The CAVM TCB terminates without updating the CAVM data sets to indicate that this CICS job has signed off. See also any following message issued by this CICS job.

User response

None.

Module:
DFHWSSOF

Destination

Console

DFHXC6650I   *applid* **CAVM HAS FAILED, CODE = code**

Explanation

The CICS XRF job that issued this message has encountered an unexpected severe error during CAVM processing. The code *code* in the message identifies both the error, and the CAVM module that detected it, as follows:

Errors detected by DFHWSRTR (00xx)

0002

CAVM dispatcher has no ready processes to dispatch and no external event to wait for.

Errors detected by DFHWSSN1 (10xx)

1001

Nonzero return code from ATTACH for CAVM TCB.

Errors detected by DFHWSSN2 (20xx)

2001

Function code in SIGNON parameter block is invalid.

2002

Function modifier in SIGNON parameter block is invalid.

2003

Length of SIGNON parameter block extension is incorrect.

2004

Requested surveillance interval is not positive.

2005

Nonzero return code from ESTAE to establish recovery for CAVM TCB.

2006

Nonzero return code from asynchronous VSAM GET or CHECK while reading the state management record. (This could be caused by an I/O error.)

2007

Nonzero return code from asynchronous VSAM PUT or CHECK while updating the state management record. (This could be caused by an I/O error.)

2008

Nonzero return code from a request to start a check for the presence of surveillance signals.

2009

Unexpected return code from a request to complete a check for the presence of surveillance signals.

200A

Nonzero return code from asynchronous VSAM GET or CHECK while reading a status CI to check for the presence of surveillance signals. (This could be caused by an I/O error.)

200B

Routine to check for the presence of surveillance signals found that the sequence number in a status CI has decreased.

200C

Nonzero return code from asynchronous VSAM GET or CHECK while reading a status CI in order to update it. (This could be caused by an I/O error.)

200D

Content of the state management record has changed but its security count is unaltered.

200E

Nonzero return code from asynchronous VSAM PUT or CHECK while updating a status CI in the control data set. (This could be caused by an I/O error.)

200F

Unexpected return code from the conditional RESERVE macro.

2010

Nonzero return code from VSAM MODCB macro to change OPTCD in RPL to UPD.

2011

Nonzero return code from VSAM MODCB macro to change ACB address in RPL.

2012

Nonzero return code from ATTACH for TCB to issue a job STATUS enquiry request to the CICS SVC.

2013

Unexpected return code from CICS SVC (A version of DFHCSVC which includes XRF support might not have been installed on the MVS/ESA system, or the wrong SVC number might have been specified on the SIT or as an override.)

2014

Unexpected return code from a requested JES job STATUS enquiry function. (This error could also be caused by using a wrong SVC number which does not correspond to any version of the CICS SVC.)

2015

Unexpected return code from a XCF IXCQUERY function.

2016

Unexpected response code from CICS SVC when attempting to determine details of a job that is running under a release of MVS which supports XCF.

2017

Unexpected reason code from CICS SVC when attempting to determine details of a job that is running under a release of MVS which supports XCF.

Errors detected by DFHWSSN3 (30xx)

3001

Nonzero return code from VSAM GENCB macro to build an RPL.

3002

Nonzero return code from VSAM SHOWCB macro to obtain the length of an ACB.

3003

Nonzero return code from VSAM SHOWCB macro to obtain the length of an RPL.

3004

Nonzero return code from VSAM SHOWCB macro to obtain ACB OPEN error code.

3005

Nonzero return code from VSAM SHOWCB macro to obtain ACB CI size and RBA data.

3006

The high-used RBA of a CAVM data set is zero when it should not be empty.

3007

Nonzero return code from asynchronous VSAM GET while reading the Control CI from a CAVM data set.

3008

Nonzero return code from VSAM MODCB macro to change STRNO in an ACB.

3009

Unexpected return code from the conditional RESERVE macro.

300A

Nonzero return code from ATTACH for TCB to format a new pair of CAVM data sets.

300B

Internal logic error while processing a new pair of CAVM data sets.

300C

Nonzero return code from VSAM TESTCB macro to test whether the data set associated with an open ACB is an ESDS.

300D

Nonzero return code from VSAM SHOWCB macro to obtain ACB CI size and RBA data during the data set formatting.

300E

Nonzero return code from synchronous VSAM PUT while formatting a new pair of CAVM data sets. (This could be caused by an I/O error.)

300F

Nonzero return code from VSAM GENCB macro to build an ACB.

3010

Nonzero return code from VSAM SHOWCB macro to obtain ACB CI size and RBA data.

3011

Nonzero return code from VSAM MODCB macro to change the ACB address in RPL.

Errors detected by DFHWSSOF (40xx)

4001

Nonzero return code from VSAM GENCB macro to build RPLs.

4002

Error return code from PURGE macro (SVC 16).

4003

Nonzero return code from VSAM MODCB macro or synchronous GET, or I/O request was purged by the timer exit, when trying to read the state management record. (This could be caused by an I/O error.)

4004

The MVS/ESA system no longer has an SMF SMCA although it existed when this CICS XRF job signed on to the CAVM.

4005

This CICS XRF job no longer has an SMF TCT although it existed at SIGNON.

4006

This CICS XRF job no longer has an SMF JMR although it existed at SIGNON.

4007

State management record contains invalid duplicate entries for this CICS XRF job.

4008

The location of this CICS XRF job's description in the state management record is inconsistent with the current value of SMDR1NDX.

4009

The sequence numbers in this CICS XRF job's pair of status CIs in the control and message data sets are equal but nonzero.

400A

Unexpected return code from the conditional RESERVE macro.

400B

Unable to RESERVE control data set after repeated attempts.

400C

Nonzero return code from VSAM MODCB macro or return code 4 from synchronous PUT when trying to update status CI.

400D

Nonzero return code from VSAM MODCB macro or synchronous GET, or I/O request was purged by the timer exit, when trying to update the state management record. (This could be caused by an I/O error.)

Errors detected by DFHWSSR (50xx)

5001

Nonzero return code from VSAM GENCB macro to build an RPL.

5002

The alternate has detected that the active's status CI was still being updated after the active job had signed off or terminated. (This error could be caused by an invalid XRF configuration in which the active and alternate do not share a common JES job queue. The problem was not discovered when the second job signed on to the CAVM because at that time it was unable to detect the first job's surveillance signals.)

5003

The sequence number in a status CI of an XRF partner job has decreased.

5004

The alternate has detected that the sequence numbers in the active's pair of status CIs in the control and message data sets are equal but nonzero.

5005

The estimate of the lower bound of the difference between the active's and alternate's TOD clocks derived from the time-stamp in the status CI which has just been read is greater than the existing estimate of the upper bound of this difference.

5006

The estimate of the upper bound of the difference between the active's and alternate's TOD clocks derived from the time-stamp in the status CI which has just been read is less than the existing estimate of the lower bound of this difference.

5007

The sequence numbers in an XRF partner job's pair of status CIs in the control and message data sets are equal but nonzero.

5008

The sequence number in a status CI of an XRF partner job is now inconsistent with previously observed values.

5009

The instance and version numbers in a status CI of an XRF partner job are now less than the corresponding values in the public status area.

500A

The instance and version numbers in a status CI of an XRF partner job are unaltered but the job state

indicator has changed from 'signed off' to 'signed on'.

500B

Public status area seems to contain valid data about an XRF partner job before it should.

500C

Attempt to indicate that public status is available for another XRF partner job when it is already available for all partners.

500D

The alternate has encountered I/O errors in consecutive attempts to read the active's status CIs from both control and message data sets.

500E

The alternate has encountered an I/O error in trying to read one of the active's status CIs during a takeover.

500F

Logical error return code from VSAM CHECK of an asynchronous GET.

5010

Nonzero return code from asynchronous VSAM GET.

5011

This alternate has been invalidated by the active, probably because of message transmission difficulties. This can also be caused by a message data set that is too small. In this case, increase the size of the message data set to allow the alternate CICS to apply its updates before they are overwritten by those of the active CICS.

Errors detected by DFHWSSW (60xx)

6001

Logical error return code from VSAM CHECK of an asynchronous PUT.

6002

I/O errors have been encountered in consecutive attempts to write to this job's status CIs in both control and message data sets.

6003

Nonzero return code from asynchronous VSAM PUT.

6004

The 'status write completed' event masks have been corrupted.

6005

WSAGINDX has been corrupted.

6006

Nonzero return code from VSAM GENCB macro to build an RPL.

6007

The sequence number in one of this job's status CIs has been corrupted in the control or message data set. (This error could be caused by an invalid XRF configuration in which two actives or two alternates do not share a common JES job queue. The problem was not discovered when the second job signed on to the CAVM because at that time, it was unable to detect the first job's surveillance signals.)

Errors detected by DFHWSTKV (80xx)

8001

Nonzero return code from VSAM GENCB macro to build an RPL.

8002

State management record indicates that the alternate attempting to take over already holds the takeover lock.

8003

State management record indicates that the alternate attempting to take over already holds the resources which are freed by SIGNOFF of the active job.

8004

State management record indicates that the alternate attempting to take over already holds the resources which are freed by termination of the active job.

8005

DFHWTI encountered an error in trying to confirm termination of the active job after the alternate performing the takeover had already acquired the resources freed by the active SIGNOFF.

8006

Another alternate has started a preemptive takeover after this alternate had already acquired the resources freed by the active SIGNOFF.

8007

The time-stamp associated with the resources freed by termination of the active job cannot be updated because an unexpected problem has arisen with the TOD clock difference data after this

alternate had already acquired the resources freed by the active SIGNOFF.

8008

Nonzero return code from asynchronous VSAM GET to read the state management record.

8009

Nonzero return code from VSAM CHECK of asynchronous GET for the state management record. (This could be caused by an I/O error.)

800A

Nonzero return code from asynchronous VSAM PUT to update the state management record.

800B

Nonzero return code from VSAM CHECK of asynchronous PUT for the state management record. (This could be caused by an I/O error.)

800C

Nonzero return code from asynchronous VSAM GET to read the state management record in QUIESCE routine.

800D

Nonzero return code from VSAM CHECK of asynchronous GET for the state management record in QUIESCE routine. (This could be caused by an I/O error.)

800E

Nonzero return code from VSAM MODCB macro to change OPTCD in RPL to UPD.

800F

Nonzero return code from VSAM MODCB macro to change OPTCD in RPL to NUP.

8010

Unexpected return code from the conditional RESERVE macro.

8011

Invalid request code passed to the routine which attaches subtask TCBs to issue XRF requests to the CICS SVC.

8012

Nonzero return code from ATTACH for TCB to issue XRF request to the CICS SVC.

8013

Nonzero return code from DETACH for subtask TCB.

System action

An ABEND U0218 is issued with a reason code equal to the code in message DFHXC6650. This results in abnormal termination of the CICS XRF job. See also any following messages issued by this CICS XRF job.

User response

Inform your installation's system programmer.

Module:
DFHWSRTR, DFHWSSN1, DFHWSSN2, DFHWSSN3, DFHWSSOF, DFHWSSR, DFHWSSW, DFHWSTKV

Destination

Console

DFHXC6651I   *applid* **CAVM HAS DETECTED AN INVALID REQUEST.**

Explanation

CAVM has found that the parameter block passed to it is invalid, or that the request is being made at an inappropriate time.

System action

An ABEND U0218 is issued with reason code 1. This results in the abnormal termination of the CICS job. See also any following messages issued by this CICS job.

User response

Restart the failing CICS job and inform your installation's system programmer.

Module:
DFHWSRTR

Destination

Console

DFHXGnnnn messages

DFHXG6215　　*applid progname operation* **failure, response code** *cccc cccc* **keyrange:** *rrrr {. | key: } key*

Explanation

Table builder services (DFHTBSS) failed in an operation on the global catalog (DFHCCCC).

The failing operation is shown in the message, and is a DELETE, WRITE_NEXT, START_WRITE or END_WRITE. request.

- *cccc cccc* are the response and reason codes from the catalog domain.
- *rrrr* is the internal RQ token passed to the catalog domain.
- *key* appears in the message only for a WRITE or DELETE operation, and usually includes the name of the resource for which CICS failed to record information on the global catalog.

This is normally an internal CICS error, however, it can occur during shut down if one task initiates a normal shut down, and another initiates an immediate shut down shortly afterwards. This is because the immediate shut down closes resources that are being used by the normal shut down task.

This can also occur if the global catalog is not big enough and a large group is being installed.

System action

CICS terminates.

User response

Check the size of the global catalog. Redefine a larger one if necessary.

Alternatively this message could be caused by an immediate shutdown of CICS because tasks not yet quiesced may abend trying to access a service removed by the shutdown process.

Destination

Console

DFHXG6416I   *applid* **APPARENT FAILURE OF ALTERNATE CICS DETECTED.**

Explanation

This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the alternate CICS appears to have failed.

System action

The system continues with normal processing. However, you should be aware that takeover may not occur should the active CICS fail.

User response

Determine the reason for the apparent failure of the alternate CICS.

Module:
DFHXRSP

Destination

Console

DFHXG6417I   *applid* **Recovery of alternate CICS detected.**

Explanation

This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that alternate CICS has recovered from the apparent failure reported by message DFHXG6416.

System action

The system continues with normal processing.

User response

None.

Module:
DFHXRSP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6422I   *applid* **Sign off normal from the CAVM assumed.**

Explanation

This is an informational message issued from the CICS TCB. It indicates that CICS has assumed that the alternate CICS has signed off from the CAVM.

This is likely to occur when the active CICS is running on CEC 1 and:

1. the CICS alternate is started on CEC 2, or
2. the CEC 2 initial program load is repeated, or
3. CICS alternate is restarted on CEC 2.

System action

CICS processing is continued.

User response

None.

Module:
DFHXRSP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6423I   *applid* **CAVM failure detected. CICS cannot continue as active.**

Explanation

This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has failed.

Messages are produced by the CAVM to note the reasons for failure.

System action

CICS terminates abnormally with abend code 212.

User response

Correct the error.

1. *applid*

Destination

Console

DFHXG6427I   *applid* **Terminal control restart task has failed. CICS execution will be terminated.**

Explanation

This is an informational message issued from the CICS TCB. It indicates that the terminal control restart task has failed. It is no longer possible for CICS to continue either as active or as alternate.

Messages are produced by the terminal control restart task to note the reasons for failure.

System action

CICS terminates abnormally with abend code 209.

User response

Correct the error.

Module:
DFHXRSP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6429I　　*applid* **Transaction CXCU cannot be attached.**

Explanation

This is an informational message issued from the CICS TCB. It indicates that CICS is unable to attach transaction CXCU. Therefore, CICS is unable to initiate the transmission of tracking messages. Takeover is adversely affected if CXCU cannot be attached. This can occur if:

1. CXCU is not defined to CICS, or
2. CICS is short on storage

System action

CICS attempts to attach CXCU at regular intervals.

User response

Either install CXCU using RDO, or alleviate the storage shortage.

DFHSIC1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6440I　　**I/O ERROR ON XRF MESSAGE DATA SET. RPL ADDRESS = HEX'*xx*'.**

Explanation

VSAM reported a physical I/O error on the XRF message data set. The address X'*xx*' is that of the VSAM RPL which reported the error.

System action

Surveillance by the XRF system ceases.

User response

It is necessary to restart both the active and alternate CICS systems with a fresh pair of surveillance data sets. For diagnostic purposes, the message gives the address of the RPL being used at the time the error was reported. The RPL has an associated VSAM message area.

Module:
DFHWMMT

Destination

Console

DFHXG6441I　　**LOGICAL ERROR ON XRF MESSAGE DATA SET. VSAM FEEDBACK DATA = HEX'*xx*'.**

Explanation

VSAM reported a logical error on the XRF message data set.

System action

Surveillance by the XRF system ceases.

User response

This is an error in the CICS system. For diagnostic purposes the message contains the VSAM feedback data for the error.

Module:
DFHWMMT

Destination

Console

DFHXG6442I   INTERNAL ERROR IN XRF MESSAGE MANAGER.

Explanation

Request chains maintained by the CICS message manager are in an inconsistent state.

System action

Surveillance by the XRF system ceases.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWMQS

Destination

Console

DFHXG6443I   INTERNAL ERROR IN XRF SURVEILLANCE COMPONENT.

Explanation

An invalid internal call has been made to a routine in XRF surveillance component.

System action

Surveillance by the XRF system ceases.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWCCS

Destination

Console

DFHXG6444I   VSAM REQUEST REJECTED FOR XRF MESSAGE DATA SET.

Explanation

A VSAM PUT or GET request directed to the XRF message data set has been rejected.

System action

Surveillance by the XRF system ceases.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWMMT

Destination

Console

DFHXG6445I   XRF MESSAGE DATA SET FORMATTING STARTED.

Explanation

The XRF message data set is new and must be formatted before it can be used to pass messages from the active to the alternate.

System action

Normal service continues.

User response

Depending on the size of the message data set, there will be some delay before the active can send messages to the alternate. It may be advisable to defer starting an alternate system until the corresponding message DFHXG6446 has been received.

Module:
DFHWMMT

Destination

Console

DFHXG6446I   XRF MESSAGE DATA SET FORMATTING COMPLETED.

Explanation

The XRF message data set has now been formatted. It can be used to pass messages from the active to the alternate.

System action

Normal service continues.

User response

None. See message DFHXG6445.

Module:
DFHWMMT

Destination

Console

DFHXG6447I   NON CRUCIAL XRF MESSAGE(S) DISCARDED.

Explanation

The XRF message data set is full. Some messages are being discarded in preference to invalidating the alternate system by overwriting messages that it has not yet read.

System action

Normal service continues.

User response

This situation is likely to arise in circumstances similar to those described for message DFHXA6541. The alternate has not yet become invalid but is likely to become so and corrective action is warranted. Refer to message DFHXA6541 for further guidance.

Module:
DFHWMWR

Destination

Console

DFHXG6450I   SVC GETMAIN FAILED IN XRF SURVEILLANCE.

Explanation

An SVC GETMAIN issued by the CICS surveillance component has failed. The GETMAIN may have been issued under either the CICS TCB or the XRF TCB.

System action

An MVS abend 0190 is issued.

User response

Since the GETMAIN requests storage above the 16MB line, it is extremely unlikely that the request cannot be satisfied.

A system error may have occurred. If this is the case, you will require further assistance from IBM. See

Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWCCS

Destination

Console

DFHXG6451I   SVC GETMAIN FAILED IN XRF SURVEILLANCE.

Explanation

An SVC GETMAIN issued by the CICS surveillance component has failed. The GETMAIN may have been issued under either the CICS TCB or the XRF TCB.

System action

An MVS abend 0191 is issued.

User response

Since the GETMAIN requests storage above the 16MB line it is extremely unlikely that the request cannot be satisfied.

A system error may have occurred. If this is the case, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWLGET

Destination

Console

DFHXG6452I   INTERNAL ERROR IN XRF SURVEILLANCE.

Explanation

A consistency check made by the XRF LIFO storage manager has failed. The failure may have occurred while running under either the CICS TCB or the XRF TCB.

System action

An MVS abend 0192 is issued.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWLFRE

Destination

Console

DFHXG6453I	**INTERNAL ERROR IN XRF SURVEILLANCE.**

Explanation

A consistency check made by the XRF process manager has failed. A process has made an invalid internal lock request.

System action

An MVS abend 0193 is issued.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWDWAT

Destination

Console

DFHXG6454I	**PROGRAM CHECK IN XRF SURVEILLANCE. PSW = HEX'*xx*' '*xx*'. ADDRESS OF EPIE COPY = HEX'*xx*'.**

Explanation

A program check occurred from which the XRF process was unable to recover.

System action

An MVS abend 0194 is issued and a dump is produced.

User response

This is an error in the CICS system. The message gives the PSW at which the check occurred. Further information is preserved in the dump.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWDSRP

Destination

Console

DFHXG6475	***applid iiii* Backup simlogon(s) abandoned**

Explanation

An XRF alternate is taking over, and is processing the last few session tracking requests.

CICS has issued a SIMLOGON for a standby session, but VTAM has not yet returned the logon request to CICS's VTAM logon exit.

Message DFHXG6480 has been issued twice, and CICS has now assumed that the logons will not appear.

Normal processing continues, though the state of the sessions currently pending backup SIMLOGON is unpredictable at the end of CICS initialization.

The reconnection process attempts to BIND these sessions normally.

System action

Normal takeover processing continues.

User response

The CSTL log and CICS trace should be collected.

Module:
DFHZXST

Console

DFHXG6476I	***applid* XRF catch-up abandoned - all XRF alternates signed off**

Explanation

A run of the XRF catch-up transaction has been abandoned because there are no XRF alternates. A failing alternate may have issued some messages.

System action

Normal processing continues.

User response

None.

Module:
DFHZXCU

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6477I   *applid* **Generic and Specific Ids have same value**

Explanation

A CICS system has issued the command to re-assign the VTAM USERVAR representing the XRF complex so that from now on logon requests to the XRF complex are directed to this CICS. However, this system is an XRF primary, and the value of the specific ID is the same as the generic ID for the XRF complex.

System action

Normal processing continues.

User response

None. However special care must be taken when using the application ID. You must make it clear whether reference is being made to the CICS system or to the XRF complex.

Module:
DFHZXSTS

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6479   *applid* **Modify USERVAR issued unsuccessfully. Return code** *nn*

Explanation

A CICS system has unsuccessfully issued a command to re-assign the VTAM USERVAR representing the XRF complex.

System action

Normal processing continues.

User response

The system operator can issue the command on CICS's behalf. The format is as follows:

F procname,USERVAR,ID=generic-id,VALUE=specific-id

Where:

- 'procname' is the procedure name for VTAM,
- 'generic-ID' is the VTAM application ID for the whole complex, and
- 'specific-ID' is the VTAM application ID for the new CICS

If it is not possible to change the USERVAR, end-user logons which name the generic-ID value continue to be directed to the old specific-applid, with unpredictable results.

(However, logons quoting the specific-ID of the new system are routed to that system.)

Module:
DFHZXSTS

XMEOUT parameters/Message inserts

1. *applid*
2. *nn*

Destination

Console

DFHXG6480I   *applid* **Waiting for backup simlogon processing to drain**

Explanation

An XRF alternate is taking over, and is processing the last few session tracking requests.

CICS has issued SIMLOGON for a standby session, but VTAM has not yet returned the logon request to the CICS VTAM logon exit.

This message is issued every 5 seconds for 20 seconds while the takeover is being held up.

This indicates either a VTAM error or a CICS logic error.

System action

This message is issued twice and then message DFHXG6475 is issued.

User response

If this message is repeated look for other evidence of failure in CICS or VTAM.

Module:
DFHZXQO

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHXG6481I   *applid* **Autoconnect delayed for** *hh* **hours,** *mm* **minutes,** *ss* **seconds.**

Explanation

CICS has delayed running the reconnection transaction CXRE for an interval of *hh* hours, *mm* minutes, *ss* seconds, to either:

- acquire AUTOCONNECT terminals after a CICS startup, or
- reacquire terminal sessions after an XRF takeover.

The delay value, *hh* hours, *mm* minutes, *ss* seconds, is taken from the AUTCONN system initialization parameter. In the case of XRF takeover, a value calculated from the number of standby BINDs held at the time of takeover. This extra interval allows the switching of XRF-capable terminals before non-XRF sessions are reconnected by CXRE.

System action

Normal processing continues.

User response

None.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts

 1. *applid*
 2. *hh*
 3. *mm*
 4. *ss*

Destination

Console

DFHXG6482   *applid* **Unable to issue SETLOGON HOLD (***reqcode,reg15,reg0***)**

Explanation

This message is issued if VTAM SETLOGON START fails during initialization or if in preparation for changing the routing of VTAM logons, this system (which is currently doing an XRF takeover) has attempted to request VTAM to stop passing any more logon requests to it. The attempt failed, and the details of the failure are given in the message, as follows. The first insert is one of the following.

- 'S'?The SETLOGON START request failed.
- 'H'?The SETLOGON HOLD request failed.

The second and third inserts are the values of registers 15 and 0, respectively, at the time of the failure.

See the z/OS Communications Server: SNA Programming manual for your release of VTAM for the interpretation of these values.

Valid logons reaching CICS before message DFHSI1517 is issued may be rejected.

System action

Normal processing continues.

User response

Note the message.

Module:
DFHZXSTS

XMEOUT parameters/Message inserts

 1. *applid*
 2. *reqcode*
 3. *reg15*
 4. *reg0*

Destination

Console

DFHXG6483I   *applid* **This will be the last pass.**

Explanation

The reconnection transaction CXRE is about to scan the VTAM terminals and sessions that were to be (re)connected for the last time. All those found are listed in message DFHXG6486.

System action

Processing continues

User response

If any of the VTAM terminals or sessions listed in message DFHXG6486 are crucial, then check whether they are successfully connected as a result of this pass.

Module:
DFHZXRE

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6484I	*applid* **Autoconnect processing now complete.**

Explanation

The reconnection transaction CXRE has just scanned all the VTAM terminals and sessions, and all those that were to be (re)connected are now connected.

System action

Processing continues

User response

None.

Module:
DFHZXRE

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6485	*applid* **Unable to schedule Autoconnection / Reconnection process.**

Explanation

CICS initialization attempted to schedule the reconnection process, but was unable to do this as CICS rejected the DFHPC TYPE=LINK call.

See following message DFHXG6487 or DFHXG6488 for the reason.

System action

The reconnection process is not run.

User response

CEMT must be used to restore individual terminals to the desired state.

Module:
DFHZOPA

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6486I	*applid termid* **may not be acquired after takeover**

Explanation

The reconnection transaction, CXRE, is making its last run, but has discovered that terminal or session *termid* is still not bound in the same status that it was in during the previous failed run of CICS.

System action

Normal processing continues.

User response

Note the terminal identification *termid* in the message, and try to discover why previous reconnection attempts failed. The terminal may not have been physically switched, for example, CEMT may be used to acquire individual terminals after such problems have been cleared.

Module:
DFHZXRE0

XMEOUT parameters/Message inserts

1. *applid*
2. *termid*

Destination

Console

DFHXG6487 *applid* **Unexpected IC/PC error code *X'code'*. Module *modname***

Explanation

The reconnection transaction CXRE could not be scheduled or rescheduled., as the DFHIC TYPE=INITIATE or DFHPC TYPE=LINK was rejected with code X'*code*'. This is caused by a CICS logic error.

This message follows either:

- DFHXG6485 if CICS was unable to schedule CXRE, or
- DFHXG6489 if CICS was unable to reschedule CXRE.

System action

The action taken by CICS depends upon whether the error occurred during scheduling or rescheduling of CXRE.

Refer to the system action for either DFHXG6485 or DFHXG6489 for further details about the action taken by CICS.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSIJ1, DFHZOPA

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHXG6488 *applid* **Required transaction CXRE is not defined to CICS. Module *modname***

Explanation

The reconnection transaction, CXRE, could not be rescheduled. This was because either the transaction code required no longer has an installed transaction definition, or the program required does not have an installed program definition.

This message follows DFHXG6489 or DFHXG6485

System action

The current run of the reconnection transaction is the last one. Message DFHXG6486 is issued for all terminals and sessions found.

User response

If non-XRF terminals are to be reconnected, correct the problem.

Module:
DFHSIJ1, DFHZOPA

XMEOUT parameters/Message inserts

1. *applid*
2. *modname*

Destination

Console

DFHXG6489 *applid* **Unable to schedule Autoconnection / Reconnection transaction CXRE. Module *modname*.**

Explanation

The reconnection transaction, CXRE, attempted to reschedule itself, but was unable to as CICS interval control rejected the DFHIC TYPE=INITIATE call.

This message is followed either by DFHXG6487 or DFHXG6488, which provides further information about the cause of the error.

System action

The current run of the reconnection transaction is the last one. Message DFHXG6486 is issued for all terminals and sessions found.

User response

See the following message. CEMT may be used to acquire individual terminals.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts

1. *applid*
2. *modname*

Destination

Console

| DFHXG6490I | *applid* **Reconnecting VTAM session - pass number *xxxx*** |

Explanation

Control has recently been given to CICS after an XRF takeover. The reconnection transaction, CXRE, which attempts to start acquire processing for logical units that were in session in the failed active, has just started for the pass number *xxxx*.

System action

Normal processing continues.

User response

Note any error messages arising as CICS attempts to reconnect terminals and sessions.

Module:
DFHZXRE0

XMEOUT parameters/Message inserts

1. *applid*
2. *xxxx*

Destination

Console

| DFHXG6491 | *applid* **Logic error during session tracking. REASON *rcode terminal/ session event*** |

Explanation

XRF session tracking encountered an unexpected circumstance probably due to a design error. The reason code (*rcode*) is one of the following.

1

POST called but no pending action for terminal or session.

Inserts:

- name of terminal or session.

2

DFHZXST called with bad request value.

3

XRF-capable session lacks a correlation id.

Inserts:

- name of terminal or session,
- code for event being tracked.

The following are valid for DFHSUSX only.

- X'01'?Send sign on data
- X'02'?Send sign on data (catchup)
- X'03'?Receive sign on data

The following are valid for DFHZXST only.

- X'F1'?BIND
- X'F2'?Free LOGON data
- X'F3'?UNBIND

4

Could not get key to build tracking message.

Inserts:

- name of terminal or session
- code for event being tracked (see 3 above)

5

Could not get send tracking message.

Inserts:

- name of terminal or session
- code for event being tracked (see 3 above)

6

Could not find session named in tracking message.

Inserts:

- name of terminal or session
- code for event being tracked (see 3 above)

7

Illegal entry named in tracking message.

Inserts:

- name of terminal or session
- code for event being tracked (see 3 above)

8

Bad request code in tracking message.

Inserts:

- name of terminal or session
- bad request code (see 3 above for valid DFHZXST codes)

9

Correlator in tracking message is longer than 8.

Insert:

- name of terminal or session

10

> Unable to schedule standby BIND.
>
> Insert:
>
> • name of terminal or session.

System action

Normal processing continues.

User response

Note the message. Resources and states may be incorrect should the backup take over. If many of these messages are issued, then it is likely that there is a more general problem.

Module:
DFHSUSX, DFHZXST

3. *terminal/session*
4. *event*

Destination

Console

DFHXG6492I   *applid* **XRF catch-up logic error**
**   *reason length***

Explanation

The XRF catch-up program encountered an unexpected circumstance probably due to a CICS design error. The reason, indicated by the first insert, is one of the following:

1

> Catalog record internal length value not correct.

2

> Catalog record format error. There is no room for a key.

3

> Catalog record format error. The key is longer than 16.

4

> Catalog record too long for buffer (variable CUBUFFER). The second insert gives the required length.

5

> Unexpected ABEND or response from EXEC CICS command.

6

> Catalog record format error. There is no resource manager prefix.

System action

In cases 1, 2, 3, and 6 above, normal processing continues.

In case 4, DFHZXCU abends with abend code AZXB. In case 5, DFHZXCU abends with abend code AZXA.

User response

Note the message. Resources and states may be incorrect should the alternate take over. If many of these messages are issued, it is likely that there is a more general problem.

Destination

Console

DFHXG6493   *date time applid* **XRF tracking**
**   record could not be sent *xxxx xxxx***
**   *xxxx xxxx xxxx* (Module: *modname*)**

Explanation

The XRF catch-up program obtained a bad return code from the XRF message manager and was unable to send a record that the alternate would require to obtain a correct copy of the active. The inserts (internal diagnostic information) are:

1. WMSRETC

   DFHWMS return code. (For values and meanings of the return codes, refer to the XRF CICS manager request interface block (WMSPS) listing in the CICS Data Areas.)

2. WMSREASN

   DFHWMS reason code. (For values and meanings of the reason codes, please refer to the XRF CICS

manager request interface block (WMSPS) listing in the CICS Data Areas.)

3. XTR-KEY-VALUE is the key of the tracking record.

4. XTR-ID is the record ID, where

- zero = tracking, and
- non-zero = catch-up.

5. XTR-TYPE is the record type (see DFHZXTR), where

- X = tracking control,
- C = TCT contents,
- S = ZCP session tracking, and
- U = sign on data

The message is issued from module *modname*.

System action

Normal processing continues.

User response

Note the message. Resources and states may be incorrect should the alternate take over. If many of these messages are issued, then it is likely that there is a more general problem.

Destination

Console

DFHXG6517I   *applid* **Recovery of active CICS detected.**

Explanation

This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that active CICS has recovered from the apparent failure reported by message DFHXG6516.

System action

CICS initialization continues.

User response

None.

Module:
DFHXRSP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6518A   *applid* **APPARENT FAILURE OF ACTIVE CICS DETECTED. REPLY** *TAKEOVER* **OR** *IGNORE*

Explanation

This is an action message issued from the CICS TCB. It is issued when the current value of the active CICS appears to have failed.

System action

If the reply is 'TAKEOVER', CICS requests the CAVM to initiate takeover.

If the reply is 'IGNORE', CICS assumes one of the following:

- The active CICS system recovers from the apparent failure.
- The active CICS system is restarted.
- The CEBT PERFORM TAKEOVER command is used to initiate takeover.

Subsequent events may mean that the user need not reply to message DFHXG6518A. Examples of this are :

- If CICS is notified that the active CICS system has recovered from the apparent failure reported by message DFHXG6516, messages DFHXG6517 and DFHXG6519 are sent to the console.
- If CICS is notified that the active CICS system has signed off abnormally from the CAVM, messages DFHXG6511 and DFHXG6519 are sent to the console.
- If takeover is initiated (from the alternate CICS system) at the same time as the active CICS recovers from the apparent failure reported by message DFHXG6516, messages DFHXG6513 and DFHXG6539 are sent to the console.

User response

Determine the reason for the apparent failure of the active CICS. If possible, resolve the failure and make the appropriate reply.

Module:
DFHXRSP

Destination

Console

DFHXG6519I	*applid* **The reply to message DFHXG6518 is assumed to be IGNORE.**

Explanation

System action

CICS initialization continues.

User response

None.

Module:
DFHXRSP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6520I	*applid* **CICS shutdown initiated by CAVM event.**

Explanation

This is an informational message issued from the CICS TCB. CICS initiated shutdown occurs in the following situations:

1. CICS is notified that active CICS has signed off normally from the CAVM. Message DFHXG6507 is sent to the console.
2. CICS is notified that active CICS has been restarted "in place". Message DFHXG6511 is sent to the console.
3. CICS assumes that the active CICS has signed off normally from the CAVM. Message DFHXG6522 is sent to the console.

System action

CICS terminates normally, but note that takeover does not occur if (active) CICS fails.

User response

Consider restarting (alternate) CICS.

Module:
DFHXRSP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6522I	*applid* **Sign off normal from the CAVM assumed.**

Explanation

This is an informational message issued from the CICS TCB. It indicates that CICS has assumed that the active CICS has signed off from the CAVM. This is likely to occur when the alternate CICS is running on CEC 1 and:

1. Active CICS is started on CEC 2.
2. CEC 2 is reinitialized.
3. Active CICS is restarted on CEC 2.

System action

CICS processing is terminated.

User response

None.

Module:
DFHXRSP

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHXG6523I	*applid* **CAVM failure detected. CICS cannot continue as Alternate.**

Explanation

This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has failed. Messages are produced by the CAVM to note the reasons for failure.

System action

CICS terminates abnormally. The abend code is 207.

User response

Correct the error.

Module:
DFHXRSP

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHXG6524I	*applid* **CAVM error detected. CICS cannot continue as Alternate.**

Explanation

This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has detected an error that prevents CICS from continuing as an alternate.

This would be the case, for example, where the alternate CICS has been unable to keep up with the messages generated by the active CICS.

Messages are produced by the CAVM to note the reasons for failure.

System action

CICS terminates abnormally. The abend code is 213.

User response

Correct the error.

Module:
DFHXRSP

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHXG6539I	*applid* **The reply to message DFHXG6518 is assumed to be TAKEOVER.**

Explanation

This is an informational message issued from the CICS TCB. It indicates that CICS no longer requires the user to respond to message DFHXG6518.

System action

CICS initialization continues.

User response

None.

Module:
DFHXRSP

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHXG6680I	*applid* **TIME-OF-DAY CLOCK DIFFERENCE IS AT LEAST *sss* SECONDS.**

Explanation

This is an informational message issued from the CICS TCB. Active CICS and alternate CICS systems are executing on different CECs, and the time-of-day clock on the alternate CEC is earlier than that on the active CEC. If takeover occurs then some CICS processing will have to be delayed until the time-of-day clock on

the alternate CEC is later than that on the active CEC. The CAVM has estimated the lower bound to the clock difference and this is at least 15 seconds; the message contains the estimated difference. Note that the lower bound may change as more surveillance signals are processed by the CAVM. This may be the case within the first 3 to 5 surveillance signals of the active CICS starting. An elapsed time of some 10 seconds. This message is repeated as necessary.

System action

CICS processing continues.

User response

Ensure that the time-of day clocks are synchronized as closely as possible. Note that takeover times may be increased if the difference in values is significant.

Module:
DFHXRSP

Destination

Console

DFHXG6681I	*applid* **TIME-OF-DAY CLOCK DIFFERENCE IS AT MOST** *sss* **SECONDS.**

Explanation

This is an informational message issued from the CICS TCB. Active CICS and alternate CICS systems are executing on different CECS, and the time-of-day clock on the alternate CEC is earlier than that on the active CEC. If takeover occurs then some CICS processing will have to be delayed until the time-of-day clock on the alternate CEC is later than that on the active CEC. The CAVM has estimated the upper bound to the clock difference and this is at least 15 seconds; the message contains the estimated difference. Note that the upper bound may change as more surveillance signals are processed by the CAVM; message DFHXG6681 will be repeated as necessary.

System action

CICS processing continues.

User response

Ensure that the time-of day clocks are synchronized as closely as possible. Note that takeover times may be increased if the difference in values is significant.

Module:
DFHXRSP

Destination

Console

DFHXG6682I	*applid* **XRF clock synchronization started**

Explanation

This is an informational message issued from the CICS TCB. The time-of-day clock on the alternate CEC is earlier than that on the active CEC; time dependent processing must be suspended. Such processing is delayed until the time-of-day clock value on the alternate is later than that on the active CEC when the active job terminated.

System action

Some CICS initialization continues.

User response

Ensure that the time-of-day clocks are synchronized as closely as is possible. Note that takeover times may be increased if the difference in values is significant.

Module:
DFHXRA

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXG6683I	*applid* **XRF clock synchronization ended**

Explanation

This is an informational message issued from the CICS TCB. The time-of-day clock on the alternate CEC is now later than that on the active CEC; time dependent processing can be resumed.

System action

CICS initialization continues.

User response

None.
Module:
DFHXRA

DFHXMnnnn messages

DFHXM0001   ***applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error occurred in a crucial XM domain module.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. for further guidance.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

Destination

Console

If you need further assistance from IBM to resolve this problem, see <u>Working with IBM to solve your problem</u> for guidance on how to proceed.

Module:
DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMDM, DFHXMER, DFHXMFD, DFHXMIQ, DFHXMLD, DFHXMQD, DFHXMQC, DFHXMRP, DFHXMSR, DFHXMTA, DFHXMXD, DFHXMXE

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHXM0002   ***applid* A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error is critical.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If severe error code is X'1112', there are no free transaction numbers to allocate to new transactions as all available transaction numbers are in use. If you are using transaction classes to limit the number of CICS tasks within your system, you should specify a transaction class purge threshold (PURGETHRESH) for any transaction class bearing a heavy transaction load. See the Defining resources and the Improving performance for more information.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHXMAT, DFHXMBD, DFHXMCL, DFHXMDD, DFHXMDM, DFHXMER, DFHXMFD, DFHXMIQ, DFHXMLD, DFHXMQD, DFHXMQC, DFHXMRP, DFHXMSR, DFHXMTA, DFHXMXD, DFHXMXE

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

| DFHXM0004 | *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.** |

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System action

An exception entry is made in the trace table.

A system dump is taken unless you have specifically suppressed the dump (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless

you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that execution of module *modname* is terminated and CICS continues.

If you have specifies ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

CSKL

DFHXM0110   *date time applid* **Transaction definition** *transid1* **has been installed with the same REMOTENAME and REMOTESYSTEM as existing definition** *transid2***.**

Explanation

Transaction definition *transid1* has been installed with the same REMOTENAME and REMOTESYSTEM as transaction definition *transid2*.

If this CICS system routes a transaction to the CICS system named as the REMOTESYSTEM of both the definitions and that transaction issues an EXEC CICS START request for the transaction-id named as the REMOTENAME of *transid1* and *transid2*, CICS can either attach *transid1* or *transid2* on the local system to satisfy the START request.

System action

The install of transaction definition *transid1* continues normally.

If an EXEC CICS START request is issued on a remote system as described in the message explanation, CICS attaches *transid1* and not *transid2* on the local system.

CICS does not always resolve this ambiguity in the same way after a warm or emergency restart, however.

User response

This situation usually causes no problems because the correct transaction is attached in the remote system. However, the correct transaction in the local system may not have been attached and this can manifest itself in the following ways:

- Inconsistent statistics being accumulated in the local system.

- The incorrect TRPROF being used when routing the START request back over to the remote system.
- CEMT INQUIRE TASK showing the wrong set of transactions running in the local system.

Although these are not necessarily problems, you may want to check the definitions of the remote transactions in this system in case they have been defined incorrectly.

If remote START requests are issued as described, and it does matter which transaction CICS attaches in the local system, you should modify and reinstall the transaction definition that should not be attached. This removes any ambiguity.

4. *transid1*
5. *transid2*

Destination

CSMT

DFHXM0111   *date time applid* **Catalog failure while processing** *{INSTALL | SET | DISCARD}* **request for transaction definition** *transid***.**

Explanation

An error has occurred while altering the catalog during the processing of an install, set, or discard request for transaction definition *transid*.

System action

The request continues as normal.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the image of transaction definition *transid* and the following problems may occur only on a warm or emergency restart.

INSTALL

If it is a reinstall, the old version of the transaction definition is recovered. If it is an install, the transaction definition is not recovered.

SET

The change requested by the SET is not recovered. Instead the transaction definition is recovered to the state prior to the SET request being issued.

DISCARD

The transaction definition is recovered on the restart even though it is currently discarded.

User response

No immediate action is required. Consider performing a cold or initial start the next time CICS is restarted to remedy the problem. If a cold or initial start is not appropriate and the problem is only localized to transaction definition *transid,* remedy the effects outlined for each case previously.

For example,

INSTALL

Reinstall the tranclass definition after the restart.

SET

Reissue the SET command after CICS has been restarted.

DISCARD

Reissue the DISCARD command after CICS has been restarted.

If the catalog problem persists after the restart, you need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHXM0115	*date time applid* **The install of transaction definition *transid1* has removed TPNAME *tpname* of *transid2*.**

Explanation

Transaction definition *transid1* has been installed with a TPNAME of *tpname*. However, TPNAME *tpname* currently invokes transaction definition *transid2*.

System action

The install of *transid1* continues as normal.

The TPNAME *tpname* now invokes transaction definition *transid1* and not *transid2* as previously.

User response

If removal of transaction definition *transid2*'s TPNAME was expected, no action is required. However, transaction definition *transid2* should be modified on the CSD so that it no longer specifies the TPNAME.

If the TPNAME has been removed in error, reinstall transaction definition *transid2* to reinstate its TPNAME. Transaction definition *transid1* should be modified on the CSD so that it no longer specifies the TPNAME.

Module:
DFHXMXD

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *transid1*
5. *tpname*
6. *transid2*

Destination

CSMT

DFHXM0116   *date time applid* **PROGRAM parameter missing from transaction definition** *transid*. **PROGRAM is required because REMOTESYSTEM is the same as the local system.**

Explanation

Transaction definition *transid* has been installed without a PROGRAM parameter. Since it has been defined with a REMOTESYSTEM equal to the local system, a program is required if the transaction is executed on this system.

System action

The install of *transid* continues as normal. Any attempt to run the transaction *transid* will fail because there is no program to link to.

User response

This message is issued for information only. There is no problem if transaction *transid* is not executed on this system. If it is to be executed, the definition of *transid* needs to be modified and then reinstalled.

If the transaction is not executed, you may wish to investigate why the transaction definition has been installed. It could be that the transaction is defined in an RDO group that is shared between a number of different CICS systems. For example *transid* may be TTT1 in the following pair of definitions used to implement transaction routing to this local system CICB.

```
   Transaction  Remotesystem    Remotename
Program
   TTT1         CICB            TTT2          -
   TTT2         -               -             PROGA
```

In this example, a single definition would suffice if the transaction was made to have the same name on this system.

```
   Transaction  Remotesystem    Remotename
Program
   TTT1         CICB            TTT1          PROGA
```

CSKL

DFHXM0211   *date time applid* **Catalog failure while processing** *{INSTALL | SET | DISCARD}* **request for TRANCLASS definition** *tranclassname***.**

Explanation

An error has occurred while altering the catalog during the processing of an install, set, or discard request for tranclass definition *tranclassname*.

System action

The request continues normally.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog

domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the image of tranclass definition *tranclassname* and the following problems may occur only on a warm or emergency restart.

INSTALL

If it is a reinstall, the old version of the tranclass definition is recovered. If it is an install, the tranclass definition was not recovered.

SET

The change requested by the SET is not recovered. Instead the tranclass definition is recovered to the state it was in before the SET request was issued.

DISCARD

The tranclass definition is recovered on the restart even though it is currently discarded.

User response

No immediate action is required. To fully resolve the problem, consider performing a cold or initial start the next time CICS is restarted. If a cold or initial start is not appropriate and the problem is only localized, to tranclass definition *tranclassname*, you can resolve each of the symptoms separately.

For example:

INSTALL

Reinstall the tranclass definition after CICS has been restarted.

SET

Reissue the SET command after CICS has been restarted.

DISCARD

Reissue the DISCARD command after CICS has been restarted.

If the catalog problem persists after the restart, you may need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

CSMT and Console

DFHXM0212   *applid* **Transaction** *transid* **has been attached with unknown TRANCLASS** *tranclassname***.**

Explanation

Transaction *transid* has just been attached. It is defined as belonging to tranclass *tranclassname* but *tranclassname* does not exist.

This message is only issued the first time transaction *transid* is attached with the unknown tranclass.

System action

The attach of transaction *transid* proceeds as normal but without being subject to any tranclass scheduling constraints.

User response

If transaction *transid* should belong to tranclass *tranclassname*, install that tranclass. If not, modify the transaction definition for *transid* as appropriate, and reinstall.

The CEDA CHECK command can be used to ensure that each of the tranclasses referenced by transaction definitions are defined within the same startup GRPLIST.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHXMQC

XMEOUT parameters/Message inserts

1. *applid*
2. *transid*
3. *tranclassname*

Destination

Console

DFHXM0213 *applid* **Insufficient storage for system attach of transaction** *transid*.

Explanation

There is insufficient storage for a new task to be created for the attach of transaction *transid*.

Since the majority of the storage required for the new task is obtained from DSA storage, CICS is probably short on storage in one of the DSAs.

System action

The attach request is queued. It is retried later when more storage should have become available. If the retried attach fails, it is queued and retried repeatedly until it succeeds.

User response

If CICS is short on storage, message DFHSM0133 is also issued. Refer to that message for advice on how to resolve the condition.

If message DFHSM0133 has not been issued, the problem has been caused by insufficient MVS storage. In this case consider lowering the EDSALIM of the system to increase the amount of available MVS storage.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHXMAT

Explanation

A restartable transaction abended and the transaction manager linked to the user-replaceable transaction restart program (DFHREST). DFHREST abended.

System action

The transaction is not restarted.

User response

If the problem is not rectified, a message is issued each time DFHREST abends. To avoid this, fix the problem in DFHREST and ensure that it is properly defined and present in a library specified in the DFHRPL concatenation.

See the Developing system programs for CICS for more information about user-replaceable programs.

Destination

Console

DFHXM0303	*applid* **A severe error (code *X'code'*) has occurred while initializing task number *tasknum* with transaction identifier *tranid*. Terminal *termid* has not been released. The task is suspended indefinitely.**

Explanation

An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The principal facility of the task is a terminal. No message may be sent to the terminal and it is unusable by CICS. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on this message.

System action

The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager

also takes a dump. Message DFHME0116, which contains the symptom string for this problem, is produced.

The terminal principal facility of the task is unusable by CICS until CICS is canceled.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User response

You must cancel CICS if you need to release the terminal associated with the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code X'*code*'. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHXM0305	*applid* **A severe error (code *X'code'*) has occurred while initializing task number *tasknum* with transaction identifier *tranid*. The interval control element has not been released. The task is suspended indefinitely.**

Explanation

An internal error has prevented the initialization of task number *tasknum* with identifier *tranid*.

The task cannot run and cannot be abended. The principal facility of the task is an interval control element. Any start data associated with the ICE will not be retrieved. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry always to terminate CICS on this message.

System action

The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116, which contains the symptom string for this problem, is produced.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User response

You must cancel CICS if you need to destroy the ICE. Any start data will remain in temporary storage until it is deleted unless it is nonrecoverable in which case it will disappear on the next cold, initial or emergency restart of CICS. You cannot quiesce CICS since this task will not terminate. You cannot purge or force-purge the task.

Note the error code X'*code*'. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

3. *tasknum*
4. *tranid*

Destination

Console

DFHXM0501   *applid* **CICS cannot satisfy request for MXT. Value** *mxtvalue* **has been used instead.**

Explanation

The value entered for MXT cannot be handled by the system. *mxtvalue* is the largest value for which CICS has been able to acquire task storage.

The majority of the task storage required is now acquired from CICS DSAs.

System action

The system continues to run with a MXT value of *mxtvalue*.

User response

Check that the original value entered for MXT was correctly typed. If the value is mistyped, use CEMT to amend the MXT value (you are unlikely to be able to force the value higher). Remember that MXT now only includes user tasks and so it should not need to be set to a value as high as in previous releases.

If the value *mxtvalue* is acceptable, no action is necessary.

If the value *mxtvalue* is too small, check to see which programs, apart from CICS, are running in this region. To relieve the storage constraint, either increase the DSALIM or EDSALIM of the system to give CICS more storage for its own use. For further details about storage allocation at initialization, see the Installing CICS TS.

Module:
DFHXMSR

XMEOUT parameters/Message inserts

1. *applid*
2. *mxtvalue*

Destination

Console

DFHXM0502   *applid* **A catalog failure has occurred while saving the MXT setting.**

Explanation

An error has occurred while saving the requested MXT setting on the catalog.

System action

The requested MXT change request continues as normal.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the MXT value and only it may not be recovered on a warm or emergency restart.

User response

No immediate action is required. Consider performing a cold or initial start, with the required MXT value specified in the SIT the next time CICS is restarted. If a cold start is not appropriate, add MXT as a SIT override specifying the required MXT value.

Module:
DFHXMSR

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXM0503   *applid* **CICS cannot support minimum MXT value of *minmxt*. CICS is terminated.**

Explanation

A severe lack of storage has resulted in CICS not being able to acquire enough task storage to satisfy even the minimum MXT value of *minmxt*.

CICS cannot perform any useful work without *minmxt* number of user tasks.

System action

CICS is terminated.

User response

Investigate why there is insufficient storage for CICS to support such a low number of user tasks.

To relieve the storage constraint, either increase the DSALIM or EDSALIM of the system to give CICS more storage for its own use. For further details about storage allocation at initialization, see the Installing CICS TS.

Module:

DFHXM0611	*date time applid userid tranid* **An application entry point for operation** *operationname* **of application** *applicationname***, version** *majorversion.minorversion.microversion***, on platform** *platformname* **has been set disabled and unavailable because TRANSACTION** *trandef* **has been {replaced	deleted}.**

Explanation

An application entry point for *operationname* of application *applicationname* version *majorversion.minorversion.microversion*on platform *platformname* has been set disabled and unavailable because the public TRANSACTION *trandef* which was adopted by the application as a transaction entry point has been either deleted or replaced.

System action

CICS continues normally.

User response

To make the application entry point available again first reinstall the transaction if it was deleted, and then enable the bundle and set it available.

Module:
DFHXMDD, DFHXMXD

User response

Correct the error.

Module:
DFHWOSA

Destination

Console

DFHXO6720	THE CICS XRF OVERSEER HAS RECEIVED AN INVALID RESPONSE TO A SUBSYSTEM INTERFACE REQUEST.

Explanation

Overseer services has received an inconsistent response to an MVS subsystem interface request for job status. The response indicates insufficient storage although more than the indicated necessary amount is provided.

System action

A dump is taken and the overseer job abnormally terminates with MVS user abend code 224.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

DFHXQnnnn messages

DFHXQ0101I	Shared TS queue server initialization is in progress.

Module:
DFHWOSB

Destination

Console

DFHXO6721	THE CICS XRF OVERSEER HAS BEEN UNABLE TO GET STORAGE FOR A SUBSYSTEM INTERFACE REQUEST.

Explanation

The XRF overseer application program has issued a DFHWOSM FUNC=JJC, JJS or QJJS macro. The MVS subsystem interface request issued by the overseer services program while processing this request has failed. The response indicates that the reply area is too small. The MVS GETMAIN request to obtain a larger area is not satisfied.

System action

The subsystem options block (SSOB), indicating 'status array too small' (SSOBRETN=SSCSMALL), is returned to the caller in the 256 byte SSOB return area specified in the DFHWOSM macro.

User response

Since the areas involved are small, the condition should not normally occur. If it persists, or disrupts the effectiveness of your overseer application, you may need to cancel the overseer job with a dump to investigate the reason for the shortage of storage.

Module:
DFHWOSB

Destination

Console

Explanation

The queue server program has started execution.

System action

Initialization continues.

User response

None.

Module:
DFHXQMN

Destination

Console and SYSPRINT

DFHXQ0102I   **Shared TS queue server for pool *poolname* is now active.**

Explanation

The queue server for the named pool has completed initialization and is now ready to accept connections.

System action

The server waits for connection requests or operator commands.

User response

None.

Module:
DFHXQMN

Destination

Console and SYSPRINT

DFHXQ0103   **The pool name parameter is missing.**

Explanation

The shared TS queue server program needs to know the name of the queue pool in order to complete initialization but no pool name was specified in the SYSIN or PARM field parameters.

System action

The queue server is terminated.

User response

Ensure that the parameter POOLNAME=name is specified either in the SYSIN parameters or in the PARM field of the JCL for the queue server.

Module:
DFHXQMN

Destination

Console and SYSPRINT

DFHXQ0104   **Shared TS queue server initialization failed because program DFHXQMN is not APF authorized.**

Explanation

The queue server main program DFHXQMN cannot complete initialization because it is not running with APF authorization.

System action

The queue server is terminated.

User response

Ensure that the queue server program DFHXQMN is loaded from an APF authorized library and has been linkedited with the option AC(1).

Module:
DFHXQMN

Destination

Console and SYSPRINT

DFHXQ0105   **Shared TS queue server initialization failed because program DFHXQMN is not licensed for use.**

Explanation

The queue server main program DFHXQMN cannot complete initialization because the validate license check failed.

System action

The queue server is terminated.

User response

Ensure that the queue server program DFHXQMN is licensed for use by adding the required licensing dataset to the STEPLIB DD statement.

Module:
DFHXQVL

Destination

Console and SYSPRINT

DFHXQ0111I   **Shared TS queue server for pool *poolname* is terminating.**

Explanation

The queue server has started termination processing, so no further requests will be processed.

System action

Termination continues.

User response

None.

Module:
DFHXQMN

Destination

Console and SYSPRINT

DFHXQ0112I   **Shared TS queue server has terminated, return code *retcode*, reason code *rsncode*.**

Explanation

The queue server has completed termination processing. If the termination was caused by an error, the return code will be non-zero and the reason code will normally be the number of a previous DFHXQnnnn message giving the reason for termination.

System action

The queue server program returns control (via the AXM termination routines) to MVS for job step termination.

User response

None.

Module:
DFHXQMN

Destination

Console and SYSPRINT

DFHXQ0113   **Shared TS queue server completion code is *cmpcode*, reason code *rsncode*.**

Explanation

The queue server has terminated after intercepting an abnormal termination (ABEND) request. If the completion code is a system completion code, it is

shown as three hexadecimal digits, otherwise it is shown as four decimal digits for a user completion code.

System action

The queue server program returns control (via the AXM termination routines) to MVS for job step termination.

User response

None.

Module:
DFHXQMN

Destination

Console and SYSPRINT

DFHXQ0121I   **Automatic restart support is not available because &SYSCLONE may not be unique within the sysplex.**

Explanation

The server attempted to generate a default ARM element identifier to use for automatic restart registration, using the one or two character &SYSCLONE value to identify the MVS system. Normally, MVS verifies during start-up that &SYSCLONE is unique within the sysplex. However, the server is running on a level of MVS where this check is optional and has not been performed, so the server is unable to generate a unique element identifier.

System action

The server is terminated.

User response

Servers should not normally be run on a level of MVS which does not enforce unique &SYSCLONE values. However, the problem can be bypassed by specifying an ARM element name explicitly on the server ARMELEMENT parameter.

Module:
DFHXQRS

Destination

Console and SYSPRINT

DFHXQ0122   **IXCARM REQUEST=*reqtype* failed, return code *retcode*, reason code *rsncode*.**

Explanation

A request to the MVS automatic restart manager (ARM) gave an unexpected return code. The return code and reason code are shown in hexadecimal notation.

System action

The server is terminated.

User response

See the IXCARM macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHXQRS

Destination

Console and SYSPRINT

DFHXQ0123   **IXCARM REQUEST=*reqtype* failed, return code *retcode*, reason code *rsncode*.**

Explanation

Automatic restart support is not available. The MVS automatic restart manager (ARM) gave a return code and reason code which indicates that ARM services are not available, but the reason could possibly be intentional or unavoidable, so the server is being allowed to continue execution without automatic restart support. The return code and reason code are shown in hexadecimal notation.

System action

The server continues initialisation without automatic restart support.

User response

See the IXCARM macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHXQRS

Destination

Console and SYSPRINT

DFHXQ0201I   **Processing *type parameters***

Explanation

The queue server parameter processing routine is interpreting the specified parameter string. The first word gives the type of parameter (SYSIN/PARM/SET/DISPLAY/PRINT) and the rest is the specified parameters optionally followed by descriptive comment text after one or more spaces. If the parameters start with an asterisk or a space, the whole line is taken as descriptive comments.

System action

Any specified parameters will be processed.

User response

None.

Module:
DFHXQPR

Destination

SYSPRINT

DFHXQ0202   **Unknown parameter keyword: *keyword***

Explanation

This parameter keyword did not match any of the defined parameter keywords for the queue server.

System action

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0203   **Value *value* for parameter *keyword* is incorrect. It must be a name of up to *maxlength* characters.**

Explanation

The value of this parameter should have been specified as a name containing not more than the indicated number of characters.

System action

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0204	Value *value* for parameter *keyword* is incorrect. It must be a decimal number.

Explanation

The value of this queue server parameter should have been specified as a decimal number but was not in a valid format. (Numeric parameters can optionally be followed by the letter K, M, G or T to denote the appropriate powers of 1024).

System action

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0205	Value *value* for parameter *keyword* is greater than the maximum allowed value *maximum*.

Explanation

The value of this queue server parameter exceeded the maximum allowed value *maximum*. This message also occurs if the numeric part of a decimal value exceeds the maximum unsigned 32-bit integer (4294967295) even if a larger value is allowed to be specified by using a suffix "K", "M", "G" or "T".

System action

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0206	Value *value* for parameter *keyword* is less than the minimum allowed value *minimum*.

Explanation

The value of this queue server parameter was less than the minimum allowed value *minimum*.

System action

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0207   **Value *value* for parameter *keyword* is incorrect. It should be a time hh:mm:ss or hh:mm or a number of seconds.**

Explanation

The value of this queue server parameter did not conform to the correct syntax for a time interval.

System action

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0208   **Parameter keyword *keyword* is not supported for *command*.**

Explanation

A queue server parameter keyword was specified in a context where it is not valid, usually indicating an attempt to SET dynamically a parameter which can only be specified at initialization time.

System action

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module:

DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0209   **Parameter text contains invalid character: *text***

Explanation

The queue server parameter processing routine found some unexpected text when attempting to process parameters.

System action

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameters (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0210   **Parameter keyword *keyword* should not have a value for *command*.**

Explanation

A queue server parameter keyword was specified in the form keyword=value in a context where it was not expected, for example on a DISPLAY command.

System action

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Reenter the command without specifying a value for the parameter to be displayed.

Module:

DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0211I   Parameter value: *keyword=value*

Explanation

This message is issued to show the current value of a queue server parameter setting in response to a DISPLAY or PRINT command.

System action

Processing continues normally.

User response

None.

Module:
DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0212   Value *value* for parameter *keyword* is incorrect. It must be one of *validlist*.

Explanation

The value of this queue server parameter was not recognized. It should have been specified as one of the indicated list of values.

System action

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0213   Value for parameter *keyword* is missing. The correct form is keyword=value.

Explanation

A parameter keyword was specified without an associated parameter value on a queue server SET command or in a SYSIN or PARM parameter string. Note that the only character which should appear between the parameter keyword and its intended value is the equals sign, without any extra spaces.

System action

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Reenter the parameter specification in the correct form keyword=value.

Module:
DFHXQPR

Destination

Console and SYSPRINT

DFHXQ0301I   Console operator *consname* issued command: *command*

Explanation

A queue server operator command has been issued via the MVS MODIFY or STOP command. This message identifies the console name (or TSO userid) from which the command was issued and the text of the command.

System action

Processing continues.

User response

None.

Module:
DFHXQOP

Destination

SYSPRINT

DFHXQ0302I   *command* **command ignored because no valid parameters were given.**

Explanation

A queue server command was issued which had no valid parameters on it but was otherwise syntactically valid. The command has had no effect.

System action

Processing continues normally.

User response

Ensure that the command was entered correctly.

Module:
DFHXQOP

Destination

Console and SYSPRINT

DFHXQ0303I   *command* **command has been processed.**

Explanation

A queue server command has been processed successfully.

System action

Processing continues.

User response

None.

Module:
DFHXQOP

Destination

Console and SYSPRINT

DFHXQ0304I   **STOP command is waiting for connections to be closed. Number of active connections =** *connections*.

Explanation

A queue server STOP command has been issued (either via an MVS STOP command or via an MVS MODIFY command with the text STOP) but there are still active connections to the server, so the STOP command has not yet taken effect.

System action

The server rejects any further attempts to establish new connections, but continues processing requests for existing connections. Each time a connection is terminated, this message is repeated for as long as there are more active connections.

User response

Further information about the connections which are still active can be obtained using the command DISPLAY CONNECTIONS.

If the server needs to be shut down without waiting for connections to be closed, issue the queue server CANCEL command. Note that this immediately terminates any active connections, causing any further requests for that server to be given a SYSIDERR indication. (The MVS CANCEL command can also be used, but should preferably be avoided because it prevents the server from producing its normal closedown statistics and reports).

Note that if a CICS region is abnormally terminated while server connect or disconnect processing is in progress, or is terminated without going through end of task processing (for example using the FORCE command) there is a slight chance that the server will not be notified that the connection has been terminated. In this case the server is not able to be closed down with the server STOP command, but only with the server CANCEL command.

Module:
DFHXQOP

Destination

Console and SYSPRINT

DFHXQ0305I   **STOP command has been processed.**

Explanation

Processing of a queue server STOP command has now been successfully completed. This means that there are no longer any active connections and the server is ready to close down.

System action

The queue server starts termination processing.

User response

None.

Module:

DFHXQOP

Destination

Console and SYSPRINT

DFHXQ0306   **Shared TS queue server does not support this command: *command***

Explanation

An operator command was addressed to the queue server using the MVS MODIFY command, but the first word of the MODIFY text is not a recognized queue server command (SET, DISPLAY, PRINT, STOP or CANCEL).

System action

The command is ignored.

User response

Correct and reenter the command.

Module:
DFHXQOP

Destination

Console and SYSPRINT

DFHXQ0307I   **CANCEL *parm* command has been processed. Number of active connections = *connections*.**

Explanation

A queue server CANCEL command has been issued, either from an operator console or internally by the queue server in response to a severe error. This message includes any restart parameter specified on the command and the number of active connections which may be affected by this command.

System action

The queue server terminates immediately, without waiting to close connections.

User response

None.

Module:
DFHXQOP

Destination

Console and SYSPRINT

DFHXQ0309   **Parameter *parm* on CANCEL command is incorrect. The only valid parameters are RESTART=YES or RESTART=NO.**

Explanation

A queue server **CANCEL** command was issued with a parameter which did not match the valid parameter keywords.

System action

The command is ignored.

User response

Correct and reenter the command.

Module:
DFHXQOP

Destination

Console and SYSPRINT

DFHXQ0310   **Parameter *parm* on STOP command is incorrect. No parameters should be specified.**

Explanation

A queue server **STOP** command was issued with parameters, but the **STOP** command does not support any parameters.

System action

The command is ignored.

User response

Correct and reenter the command.

Module:
DFHXQOP

Destination

Console and SYSPRINT

DFHXQ0351I   **Connection: Job *jobname* Appl *applid* Idle *idletime***

Explanation

This describes a single connection in response to the command DISPLAY CONNECTIONS or PRINT CONNECTIONS. The information shows the job name, the specific APPLID and the time in hours, minutes

and seconds since the most recent queue request or inquire call was issued using the connection.

System action

This message is issued for each active connection then message DFHXQ0352I is issued to show the total number of active connections.

User response

None.

Module:
DFHXQCN

Destination

Console and SYSPRINT

DFHXQ0352I   **Queue pool *poolname* total active connections: *connections*.**

Explanation

This describes the total number of active connections to the queue pool server, in response to the server command DISPLAY CONNECTIONS or PRINT CONNECTIONS.

System action

Processing continues.

User response

None.

Module:
DFHXQCN

Destination

Console and SYSPRINT

DFHXQ0401I   **Connected to CF structure *strname*.**

Explanation

The queue server has successfully established a connection to the coupling facility list structure for the queue pool, using the IXLCONN macro.

System action

Processing continues.

User response

None.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0402I   **CF structure *strname* was allocated by this connection.**

Explanation

The list structure did not previously exist and was allocated as part of the connection process.

System action

List structure initialization will be performed if necessary.

User response

None.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0403   **Connection to CF structure *strname* failed, IXLCONN return code *retcode*, reason code *rsncode*.**

Explanation

The IXLCONN macro to connect the queue server to its coupling facility list structure failed.

System action

The queue server is terminated.

User response

See the IXLCONN macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code. If the reason code is of the form xxxx0C08, indicating structure allocation failure, this message is followed by message DFHXQ0409 giving the facility reason code for each CF in which allocation was attempted.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0404   **CF structure *strname* cannot be used because it has been allocated with attribute *attribute*.**

Explanation

The queue server has successfully connected to its list structure but has found that the structure has been allocated using an IXLCONN structure attribute keyword which is not supported by the queue server.

System action

The queue server is terminated.

User response

This probably indicates that the structure has been allocated or modified by some program other than the queue server. In this case, the incorrect structure should be deleted (for example using the SETXCF FORCE command) so that it will be reallocated correctly when the queue server is restarted.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0405   **CF structure *strname* element size *elemsize* is incorrect. It should be a power of 2 in the range 256 to 4096.**

Explanation

The queue server list structure element size (specified via the ELEMSIZE initialization parameter) is not a power of two, or is outside the range supported by the list structure hardware.

System action

The queue server is terminated (without attempting to connect to the list structure).

User response

Correct the ELEMSIZE parameter and restart the queue server.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0406   **Initialization failed for CF structure *strname* with response *response*.**

Explanation

Queue server processing to initialize the list structure failed with an abnormal internal response code.

System action

The server is terminated.

User response

If the response code is 8 (I/O error), it indicates that an IXLLIST macro gave an abnormal return code, in which case a previous DFHXQ0441 message will have been issued giving the IXLLIST return code and reason code. If this response code is any other value, this indicates that the list structure is in a state which should not occur, probably indicating that it was allocated or modified by a program other than the queue server. In this case the structure may need to be deleted (using SETXCF FORCE) so that it will be reallocated when the server is restarted.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0407   **CF structure *strname* is not available for shared use.**

Explanation

The queue pool is currently locked for exclusive use by some other job such as a queue pool unload or reload job. (This serialization uses an MVS ENQ with scope SYSTEMS for major name SYSZDFH minor name DFHXQLS_poolname).

System action

The server is terminated.

User response

Check whether a queue pool maintenance job is currently running. If it is, wait until it has finished before trying to start the server again.

Module:

DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0408   **CF structure *strname* is not available for exclusive use.**

Explanation

The current job (an unload or reload) requires exclusive use of the queue pool, but some other job is running which already has shared or exclusive use of the pool. (This serialization uses an MVS ENQ with scope SYSTEMS for major name SYSZDFH minor name DFHXQLS_poolname).

System action

The server is terminated.

User response

Check whether a queue pool server or maintenance job is currently running. If it is, wait until it has finished before trying to run the current job again.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0409   **CF structure *strname* could not be allocated in facility *cfname*, reason code *rsncode*.**

Explanation

If a previous message DFHXQ0403 indicated an IXLCONN failure because the structure could not be allocated, this message is issued for each CF in which allocation was attempted to show the facility reason code indicating why structure allocation failed. If the reason code is known to the server, the name of the reason code is given (without the ConaRsn prefix), otherwise its decimal value is shown.

If the response indicates InvalidStructureSize, this means that the initial list structure size (specified on the server POOLSIZE parameter or in the CFRM policy INITSIZE parameter) is not large enough to contain the required structure control information. The size of the control information is affected by the number of list headers (determined by the server MAXQUEUES parameter) and by the maximum structure size specified in the CFRM policy.

System action

The queue server is terminated.

User response

See the descriptions of the reason codes in the MVS macro IXLYCONA which maps the connect answer area.

If the response was InvalidStructureSize, increase the initial structure size specification in the server POOLSIZE parameter or the CFRM policy INITSIZE parameter to ensure that there is enough space for data in addition to the structure control information. Also, check that the server MAXQUEUES parameter and the maximum structure size specified in the CFRM policy are not unnecessarily large. See the Configuring for more information on how to estimate temporary storage queue pool sizes.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0410   **CF structure *strname* cannot be used, coupling facility maintenance level is too low.**

Explanation

Initialization test routines executed against the allocated list structure gave incorrect results, indicating that the coupling facility control code does not include all maintenance necessary to support shared temporary storage.

System action

The queue server is terminated.

User response

Ensure that the required level of coupling facility maintenance is applied.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0411I   **CF structure *strname* now has *percentage*% of entries in use.**

Explanation

This message is issued by the queue server when the percentage of list entries in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after an ALTER request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio.

System action

The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User response

Note that the structure may soon become full, preventing queues from being created. If the structure was allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be altered dynamically using the MVS SETXCF command with the START,ALTER options.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0412I	CF structure *strname* now has *percentage*% of elements in use.

Explanation

This message is issued by the queue server when the percentage of list data elements in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after an ALTER request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio.

System action

The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User response

Note that the structure may soon become full, preventing queues from being created. If the structure was allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be altered dynamically using the MVS SETXCF command with the START,ALTER options.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0413I	Starting ALTER to adjust CF structure *strname* entry/element ratio to *entries*/*elements*.

Explanation

The queue server has determined that the ratio of free entries to free elements is significantly different from the ratio of entries to elements actually in use. It is issuing an IXLALTER macro to request the coupling facility to adjust the ratio to make better use of the coupling facility storage.

System action

The server continues by issuing the IXLALTER macro. A further message will be issued when the ALTER request is accepted or rejected by MVS.

User response

None.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0414I	ALTER started for CF structure *strname*.

Explanation

The queue server has successfully started an ALTER request to change the entry to element ratio for the list structure.

System action

The queue server event exit will be notified by MVS when the ALTER request completes and a further message will then be issued.

User response

None.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0415I   **ALTER rejected for CF structure *strname*, ALTER already active.**

Explanation

The queue server attempted to start an ALTER to change the entry to element ratio for the list structure, but this was rejected by the system because another ALTER was already active.

System action

The queue server event exit will be notified by MVS when the ALTER request completes and a further message will then be issued.

User response

None.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0416   **ALTER request failed for CF structure *strname*, IXLALTER return code *retcode*, reason code *rsncode*.**

Explanation

The queue server attempted to start an ALTER to change the entry to element ratio for the list structure, but this was rejected by the system with an unexpected return code.

System action

The current ALTER attempt is abandoned. Another attempt may be made when the minimum alter interval has expired.

User response

See the IXLALTER macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0417I   **ALTER completed normally for CF structure *strname*.**

Explanation

The queue server has been notified by the system that an ALTER request has completed normally.

System action

New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHXQ0411 and DFHXQ0412 to indicate the new usage percentages.

User response

None.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0418I   **ALTER ended abnormally for CF structure *strname* with status *status*.**

Explanation

The queue server has been notified by the system that an ALTER request has ended abnormally. The two bytes of status information in this message are taken from EEPLALTERENDSTATEFLAGS in the event exit parameter list (defined in the IXLYEEPL macro).

System action

No action is taken as a result of this notification, but the problem which caused the ALTER to fail will probably result in other related problems.

User response

None.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0419I   **ALTER ended normally for CF structure *strname* but target was not attained.**

Explanation

The queue server has been notified by the system that an ALTER request has ended normally but that the target ratio or target size was not attained.

System action

New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHXQ0411 and DFHXQ0412 to indicate the new usage percentages.

User response

None.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0424   **Connectivity has been lost to CF structure *strname*. The shared TS queue server cannot continue.**

Explanation

The queue server has been notified by the system that connectivity has been lost to its list structure.

System action

The server issues an internal CANCEL command to terminate itself immediately.

User response

Restart the server when connectivity to the server from the current system has been reestablished. If connectivity is still available from other systems, CICS transactions which require access to the affected queue pool should be diverted to those systems if possible.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0425   **CF structure *strname* has failed. The shared TS queue server cannot continue.**

Explanation

The queue server has been notified by the system that its list structure has been lost due to coupling facility failure. All data in the queue pool has been lost.

System action

Each queue server for the affected pool issues an internal CANCEL command to terminate itself immediately.

User response

If another coupling facility is available and is included in the CFRM preference list for the failed structure, delete the failed structure and restart the servers to cause a fresh copy of the list structure to be allocated on the alternate coupling facility. If no other coupling facility is available, wait until the original coupling facility has been made available again before restarting the servers.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0431I   **Access statistics for CF structure *strname*:**

Explanation

This message gives a summary of coupling facility access statistics. It is issued in response to a DISPLAY or PRINT command which includes the CFSTATS parameter, and may also be produced on the

SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

```
Index: Wrt Adjs Writes Reads Deletes
Rereads
            n      n     n      n
n
       Read Adjs
             n
Data: Creates Writes Reads Deletes Rereads
         n      n     n      n       n
       Rewrites
          n
Responses: Asynch Unavail Normal Len err
             n      n       n      n
           Not fnd Vers chk List chk
             n       n        n
           List full  Str full   I/O err
             n          n          n
```

System action

Processing continues.

User response

The statistics are described in detail in the DFHXQS1D data area. For queues which do not exceed 32K bytes, the data is included in the queue index, otherwise it is stored as a separate list. The individual fields have the following meanings:

- Index access counts:

  Wrt Adjs

  Number of index writes to update adjunct area only. (This area contains the read cursor for small queues and the queue status including last used data).

  Writes

  Number of queue writes (new or update) including data.

  Reads

  Number of queue index reads.

  Delete

  Number of queue deletes.

  Rereads

  Number of reads which had to be repeated because the data was larger than the default data transfer size.

  Read Adjs

  Number of index reads for the status area only. This is used for inquire processing, and also to

read the queue details if necessary during delete processing.

- Data access counts:

  Creates

  Number of times a separate data list was created.

  Writes

  Number of writes to add items to separate data lists.

  Reads

  Number of reads from separate data lists.

  Delete

  Number of times a separate data list was deleted.

  Rereads

  Number of reads which had to be repeated because the data was larger than the default data transfer size.

  Rewrites

  Number of writes to replace items in separate data lists.

- Response counts:

  Asynch

  Number of requests for which completion was asynchronous.

  Unavail

  Number of times requests were deferred because the structure was temporarily unavailable, for example because system-managed rebuild was in progress.

  Normal

  Number of normal responses.

  Len err

  The input buffer was too small to contain the data. The server often tries a buffer size of only 4K in order to use a synchronous read if possible. If this response occurs, the server sets up the maximum sized buffer and reissues the read.

  Not fnd

  The specified entry (queue or item) was not found.

  Vers chk

  A version check failed for an entry being updated or created, indicating that another task had updated it first.

List chk

A list authority comparison failed, usually meaning that the queue is in the process of being deleted.

List full

A queue reached the maximum number of items, causing the relevant list to be marked as full.

Str full

The list structure became full.

I/O err

Some other error code was returned by IXLLIST.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0432I   **Queue pool statistics for CF structure *strname*:**

Explanation

This message gives a summary of the usage statistics for the queue pool list structure. It is issued in response to a DISPLAY or PRINT command which includes the POOLSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

```
Structure: Size Max size Elem size
           nK        nK          n

n%       n%
```

System action

Processing continues.

User response

The statistics are described in detail in the DFHXQS1D data area. Pool usage statistics are calculated from information returned by coupling facility requests, and are not always very accurate, especially if the relevant information has not been accessed recently by the current server. The individual fields have the following meanings:

- Structure:

Size

Current allocated size of the list structure.

Max size

Maximum size to which this structure could be altered.

Elem size

Data element size used for the structure.

- Queues:

Current

Number of queues currently in existence.

Highest

Highest number of queues at any time (since last reset).

- Lists:

Total

Maximum number of list headers in the structure.

In Use

Number currently in use.

Max Used

Maximum number in use (since last reset).

Control

Number of lists in use for control information.

Data

Number of lists in use for queue data.

- Entries:

Total

Total entries in the currently allocated structure. (Obtained at connection time, may be updated by ALTER).

In Use

Number of entries currently in use.

Max Used

Maximum number in use (since last reset).

Free

Number of entries currently free (total minus used).

Min Free

Minimum number of free entries (since last reset).

- Elements:

Total

Total data elements in the currently allocated structure. (Obtained at connection time, may be updated by ALTER).

In Use

Number of elements currently in use.

Max Used

Maximum number in use (since last reset).

Free

Number of elements currently free (total minus used).

Min Free

Minimum number of free elements (since last reset).

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0441   **CF structure *strname* request failed, IXLLIST return code *retcode*, reason code *rsncode*.**

Explanation

A coupling facility access request issued via the IXLLIST macro gave an abnormal return code.

System action

The failing request is given an I/O error indication, giving an IOERROR condition if it originated from a CICS API request.

User response

See the IXLLIST macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0442   **CF structure *strname* request failed, structure is full.**

Explanation

A coupling facility access request issued via the IXLLIST macro failed because there are insufficient free entries or elements to store the new data in the structure.

System action

The failing request is given a NOSPACE indication if it originated from a CICS API request. For reload processing, if an automatic ALTER is in progress, the request may be suspended until the outcome of the ALTER is known, then retried. This message will not be issued again for further failures until the used numbers of elements and entries fall well below the warning threshold.

User response

Any queues which are no longer in use should be deleted so that the space can be reused. If the structure is not at its maximum size, it may be possible to start an ALTER request to increase the size using the MVS SETXCF command.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0443   **CF structure *strname* request failed, all lists are in use.**

Explanation

A coupling facility access request issued via the IXLLIST macro failed because all list headers defined in the structure are now in use. The number of list headers is determined by the MAXQUEUES server initialization parameter when the structure was allocated.

System action

The failing request is given a NOSPACE indication if it originated from a CICS API request. This message will not be issued again for further failures while the shortage of list entries remains. The number of list entries in use needs to have fallen below 75% of the value specified by MAXQUEUES before the server will issue this message again for a further failure.

User response

Any queues of total size greater than 32K bytes which are no longer in use should be deleted to free up data lists. As the number of lists is fixed when the structure is allocated, the only way to increase the number of lists is to unload the structure, use SETXCF FORCE to delete it then reload it with a larger MAXQUEUES parameter.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0444I	CF request has been suspended to await ALTER completion.

Explanation

A coupling facility access request issued from the server address space (during reload processing) ran out of space in the list structure, but an automatic ALTER attempt to free up more space is either already active or is being started at this point. The request is therefore being suspended to await the outcome of the ALTER attempt.

System action

The request is suspended until either the ALTER request completes (normally or abnormally), then the request is retried.

User response

None.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0445I	CF request is being retried after ALTER completion.

Explanation

A request which was suspended to await the completion of an ALTER request is now being retried because the ALTER has either completed or failed.

System action

The suspended request will be restarted.

User response

None.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0451	Purge for CF structure *strname* failed, IXLPURGE return code *retcode*, reason code *rsncode*.

Explanation

A queue access request was terminated abnormally and the queue server issued an IXLPURGE macro to ensure any active IXLLIST request was purged before releasing the I/O buffer, but the IXLPURGE macro gave a non-zero return code.

System action

The error is ignored because this only occurs when a request is already being terminated abnormally.

User response

See the IXLPURGE macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0461I	Disconnected from CF structure *strname*.

Explanation

The server has successfully disconnected from the CF structure (using the IXLDISC macro).

System action

Processing continues.

User response

None.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0462   **Disconnect from CF structure *strname* failed, IXLDISC return code *retcode*, reason code *rsncode*.**

Explanation

The IXLDISC macro to disconnect the queue server from its coupling facility list structure failed.

System action

The error is ignored, as disconnection only occurs when the server is already terminating.

User response

See the IXLDISC macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHXQCF

Destination

Console and SYSPRINT

DFHXQ0481I   **Waiting for structure *strname* to become available.**

Explanation

The queue server was unable to connect to its coupling facility structure because of an environmental error, such as the structure being unavailable, as described in a previous DFHXQ0403 message. The server is now waiting for this problem to be fixed, and will retry the connection request when it is notified via the ENF facility that the specific structure may now be available or that some change has occurred in the status of general coupling facility resources.

System action

The server waits to be notified of a relevant event.

User response

No action is required, but the waiting server can optionally be terminated using the MVS **CANCEL** command if it is no longer required.

Module:
DFHXQEN

Destination

Console and SYSPRINT

DFHXQ0482I   **Retrying connection to structure *strname*.**

Explanation

The queue server has been notified via ENF that its list structure may now be available or that a change has occurred in the status of some general coupling facility resources, so it is about to make another attempt to connect to the structure.

System action

The original IXLCONN request is retried.

User response

None.

Module:
DFHXQEN

Destination

Console and SYSPRINT

DFHXQ0491   **ENFREQ ACTION=*action* failed, return code *retcode*.**

Explanation

An ENF request issued by the queue server gave an unexpected return code.

System action

If this occurs on the ENFREQ ACTION=LISTEN request and the server is subsequently unable to connect to the list structure, the server will be terminated instead of waiting for the structure to become available.

User response

See the documentation of the ENFREQ macro in z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) (GC28-1765) for the explanation of the return and reason code.

Module:
DFHXQEN

Destination

Console and SYSPRINT

DFHXQ0501   **Insufficient storage, only *actual* of *requested* data buffers allocated.**

Explanation

The queue server was unable to allocate the specified number of data buffers (of 32K bytes) during initialization because the relevant storage pool (AXMPGANY) was exhausted.

System action

The server is terminated.

User response

Decrease the BUFFERS initialization parameter to a value less than the number which were successfully allocated (to leave plenty of storage for request processing) and restart the server. Alternatively, increase the region size for the queue server to allow more buffers to be allocated.

Module:
DFHXQBF

Destination

Console and SYSPRINT

DFHXQ0511I   **Queue index buffer pool statistics:**

Explanation

This message gives a summary of the usage statistics for the queue index buffer pool, which is used to read and write queue index entries and their associated data, and to save recently accessed index entries in storage to reduce coupling facility I/O. It is issued in response to a DISPLAY or PRINT command which includes the BUFSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

```
Buffers: Total  Max used  Active  On LRU
Empty
            n         n        n
n      n
Requests: Gets  Puts  Keeps  Frees  Purges
          n     n     n      n       n
```

```
Results: Got hit Got free Got new Got LRU
No buff
(Get)          n         n       n
n      n
Errors: Not freed  No purge  Not owned
               n          n           n
Waits: Pool lock  Buf lock
               n          n
```

System action

Processing continues.

User response

The statistics are described in detail in the DFHXQS2D data area. The individual fields have the following meanings:

- Buffers:

  Total

  Number of buffers in the pool.

  Max used

  Highest number ever used (not affected by reset).

  Active

  Buffers currently in use.

  On LRU

  Buffers with valid contents on LRU chain to allow reuse.

  Empty

  Buffers previously used but now empty.

- Requests:

  Gets

  Requests to get a buffer.

  Puts

  Requests to put back a buffer with valid contents.

  Keeps

  Requests to put back a buffer with modified contents. (This function is not currently used by the queue server).

  Frees

  Requests to put back a buffer as empty.

  Purges

  Requests to discard contents of a previously valid buffer.

- Results (Get):

Got hit

Request found a valid match on the LRU chain.

Got free

Request obtained an empty buffer.

Got new

Request obtained a buffer not previously used.

Got LRU

Request discarded and reused the oldest valid buffer.

No buff

Request failed to obtain a buffer.

- Errors:

Not freed

Request tried to free a buffer which it did not own. (This can occur during error recovery).

No purge

A purge request did not find any matching buffer.

Not owned

A purge request hit a buffer owned by another task.

- Waits:

Pool lock

Number of waits for the buffer pool header lock.

Buf lock

Number of waits because another request owned the buffer.

Module:
DFHXQBF

Destination

Console and SYSPRINT

DFHXQ0601I	Starting statistics collection for interval since *lasttime*.

Explanation

The queue server is about to collect interval, end of day or closedown statistics. This message identifies the start of the time interval to which the statistics apply, which is either the time that the server was started up or the time of the last reset, which occurs whenever interval or end of day statistics are produced. The format of the timestamp is yyyy-mm-dd hh:mm:ss.

System action

The queue server proceeds with statistics collection.

User response

None.

Module:
DFHXQST

Destination

SYSPRINT

DFHXQ0602I	Statistics collection completed, reset performed.

Explanation

Queue server statistics have been collected and counters have been reset. This occurs for interval or end of day statistics.

System action

Processing continues.

User response

None.

Module:
DFHXQST

Destination

SYSPRINT

DFHXQ0603I	Statistics collection completed.

Explanation

Queue server statistics have been collected but counters have not been reset. This normally occurs at server closedown.

System action

Processing continues.

User response

None.

Module:
DFHXQST

Destination

SYSPRINT

DFHXQ0604   **Timer SET failed, return code**
retcode, **reason code** *rsncode*.

Explanation

An attempt by the queue server statistics subtask to set up a timer wait interval failed.

System action

The interval statistics function is terminated with message DFHXQ0606.

User response

Check the return code and reason code. A return code of 4 indicates an attempt to set up more than one concurrent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM SET.

Module:
DFHXQST

Destination

Console and SYSPRINT

DFHXQ0605   **Timer CANCEL failed, return code**
retcode, **reason code** *rsncode*.

Explanation

An attempt by the queue server statistics subtask to cancel a timer wait interval failed.

System action

The interval statistics function is terminated with message DFHXQ0606.

User response

Check the return code and reason code. A return code of 4 indicates an attempt to cancel a nonexistent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM CANCEL.

Module:
DFHXQST

Destination

Console and SYSPRINT

DFHXQ0606   **Statistics collection function is no longer available.**

Explanation

The queue server statistics collection subtask was unable to continue processing and has terminated. The reason will have been indicated by an earlier message.

System action

The interval statistics subtask terminates and no further interval statistics or end of day statistics will be produced for this run of the server.

User response

See the earlier message indicating the reason for the termination of the subtask.

Module:
DFHXQST

Destination

Console and SYSPRINT

DFHXQ0610I   **Statistics written to SMF, return code was** *retcode*.

Explanation

Queue server statistics have been sent to SMF. The return code from the SMFEWTM macro is indicated in this message. A non-zero return code usually indicates that SMF recording was suppressed because of current SMF options or an installation exit.

System action

Processing continues.

User response

If the return code is non-zero but SMF statistics were expected to be successfully written, see the SMFEWTM macro in z/OS MVS System Management Facilities (SMF) (GC28-1457) for more information about return codes.

Module:
DFHXQST

Destination

SYSPRINT

DFHXQ0701I   **Shared TS queue pool** *poolname* **is to be unloaded.**

Explanation

The server program has been started with the UNLOAD option requesting that the queue pool is unloaded to a sequential data set.

System action

The server starts to process the unload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User response

None.

Module:
DFHXQUL

Destination

Console and SYSPRINT

DFHXQ0702I	Shared TS queue pool *poolname* has been successfully unloaded.

Explanation

The queue pool has been unloaded successfully.

System action

The server closes down normally.

User response

None.

Module:
DFHXQUL

Destination

Console and SYSPRINT

DFHXQ0703I	Number of unloaded queues: *queues*. Blocks written: *blocks*.

Explanation

This message provides additional information about the results of the unload process, giving the number of queues which were unloaded and the number of 4K data blocks written to the unloaded queue pool data set.

System action

Server termination continues.

User response

None.

Module:
DFHXQUL

Destination

Console and SYSPRINT

DFHXQ0704	DFHXQUL data set for unload could not be opened.

Explanation

The data set to contain the unloaded queue pool could not be opened.

System action

Unload processing is terminated and the server is closed down with message DFHXQ0706.

User response

Check that the DFHXQUL DD statement is present in the JCL for the unload job.

Module:
DFHXQUL

Destination

Console and SYSPRINT

DFHXQ0705	Unload access to CF structure *strname* failed with response *response*.

Explanation

The unload process failed because of a problem with coupling facility access.

System action

Unload processing is terminated and the server is closed down with message DFHXQ0706.

User response

If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous error message will have been issued. Any other response code indicates an internal logic error.

Module:
DFHXQUL

Destination

Console and SYSPRINT

DFHXQ0706   **Unload for shared TS queue pool *poolname* was unsuccessful.**

Explanation

The queue pool unload process failed. The reason will have been described in a previous message.

System action

The server is terminated.

User response

See the previous message giving the reason for the unload failure. Note that any unload data set produced in this case will be incomplete and will not be valid for reload purposes.

Module:
DFHXQUL

Destination

Console and SYSPRINT

DFHXQ0801I   **Shared TS queue pool *poolname* is to be reloaded.**

Explanation

The server program has been started with the RELOAD option requesting that the queue pool is to be reloaded from a sequential data set produced using the UNLOAD option.

System action

The server starts to process the reload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User response

None.

Module:
DFHXQRL

Destination

Console and SYSPRINT

DFHXQ0802I   **Shared TS queue pool *poolname* has been successfully reloaded.**

Explanation

The queue pool has been reloaded successfully.

System action

The server closes down normally.

User response

None.

Module:
DFHXQRL

Destination

Console and SYSPRINT

DFHXQ0803I   **Queues reloaded: *queues*. Queues bypassed: *duplicates*. Blocks read: *blocks*.**

Explanation

This message provides additional information about the results of the reload process. Queues on the unloaded data set are bypassed during reload processing if they already exist in the pool (for example as a result of a previous reload which could not be completed due to lack of space).

System action

Server termination processing continues.

User response

None.

Module:
DFHXQRL

Destination

Console and SYSPRINT

DFHXQ0804   **DFHXQRL data set for reload could not be opened.**

Explanation

The data set containing the queue pool to be reloaded could not be opened.

System action

Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response

Check that the DFHXQRL DD statement is present in the JCL for the reload job.

Module:
DFHXQRL

Destination

Console and SYSPRINT

DFHXQ0805   **Reload access to CF structure *strname* failed with response *response*.**

Explanation

The reload process failed because of a problem with coupling facility access.

System action

Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response

If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHXQ0441 will have been issued. Any other response code indicates an internal logic error.

Module:
DFHXQRL

Destination

Console and SYSPRINT

DFHXQ0806   **Unexpected end of file encountered on reload data set.**

Explanation

End of file was encountered on the unloaded data set before the logical end of the unloaded data was encountered.

System action

Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response

This indicates that the unloaded data set is incomplete, perhaps because the unload process was abnormally terminated.

Module:
DFHXQRL

Destination

Console and SYSPRINT

DFHXQ0807   **Reload data set contains incorrect data near block *block*, offset *offset*.**

Explanation

The reload process failed because the unloaded queue pool data set is not in the correct format.

System action

Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response

Check that the correct data set is being used and that the unload process completed normally.

Module:
DFHXQRL

Destination

Console and SYSPRINT

DFHXQ0808   **Reload for shared TS queue pool *poolname* was unsuccessful.**

Explanation

The queue pool reload process could not be completed. The reason will have been described in a previous message.

System action

The program is terminated.

User response

See the previous message giving the reason for the reload failure.

Module:
DFHXQRL

Destination

Console and SYSPRINT

DFHXQ0809   **Reload for CF structure *strname* failed, structure is full.**

Explanation

Reload processing failed because there are insufficient free entries or elements to store the new data in the structure.

System action

Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response

If the structure is not at its maximum size, use the MVS SETXCF FORCE to delete the structure, then change the reload parameters to specify a larger POOLSIZE parameter and rerun the reload job. The approximate amount of information which could not be reloaded can be estimated by comparing the numbers of blocks read and queues reloaded, as described by following message DFHXQ0803, with the corresponding numbers from message DFHXQ0703 in the unload job.

Module:
DFHXQRL

Destination

Console and SYSPRINT

DFHXQ0810	**Reload for CF structure** *strname* **failed, all lists are in use.**

Explanation

Reload processing failed because all list headers defined in the structure are now in use.

System action

Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response

Use the MVS SETXCF FORCE to delete the structure, then change the reload MAXQUEUES parameter to a large value and rerun the reload job.

Module:
DFHXQRL

DFHXSnnnn messages

DFHXS0001   ***applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to

a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHXS0002	*applid* A severe error (code *X'code'*) has occurred in module *modname*.

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHXS0004	*applid* A possible loop has been detected at offset *X'offset'* in module *modname*.

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

XMEOUT parameters/Message inserts

1. *applid*
2. *X'offset'*
3. *modname*

Destination

Console

| DFHXS0006 | *applid* **Insufficient storage to satisfy Getmain (code *X'code'*) in module *modname*. MVS code *mvscode*.** |

Explanation

An MVS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

System action

An exception entry is made in the trace table (code X'*code*'). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is

not already at maximum size. See the Configuring or the Improving performance for further information on CICS storage.

Destination

Console

| DFHXS0201I | *date time applid* **External security initialization has been tracked, and has failed with return code X'xx' and reason code X'yy'.** |

Explanation

An external security initialization was performed on an active CICS system by use of a CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD.

The external security initialization has been tracked to the XRF alternate system, but has failed with return code *xx* and reason code *yy*.

xx and *yy* are the values placed in registers 15 and 0 by the external security manager.

System action

CICS provides a system dump of the XRF alternate system, and continues tracking security initializations.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Use the return codes in the message, to determine why the security initialization failed.

If the codes are invalid, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHXS1105	_applid_ **Resource profiles for class _classname_ have been built.**

Explanation

The security resource profiles for the class _classname_ have been successfully loaded into storage by the external security manager.

System action

The profiles are used in subsequent resource checks to determine users' authorizations to access resources in the named class.

User response

None.

Module:
DFHXSRC

XMEOUT parameters/Message inserts

1. _applid_
2. _classname_

Destination

Console

DFHXS1106	_applid_ **Resource profiles could not be built for class _classname_. CICS is terminated. SAF codes are (_X'safresp'_,_X'safreas'_). ESM codes are (_X'esmresp'_,_X'esmreas'_).**

Explanation

The security resource profiles for the class _classname_ could not be loaded into storage by the external security manager. The response and reason codes (_safresp_ and _safreas_) returned by the system authorization facility (SAF), and the response and reason codes (_esmresp_ and _esmreas_) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following:

- The initialization of the security domain
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

System action

CICS is unable to provide reliable resource security, so it terminates.

User response

Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

Module:

DFHXSRC

XMEOUT parameters/Message inserts

1. *applid*
2. *classname*
3. *X'safresp'*
4. *X'safreas'*
5. *X'esmresp'*
6. *X'esmreas'*

Destination

Console

DFHXS1107   *applid* **Partner-LU profiles for class APPCLU have been built.**

Explanation

The partner-LU profiles for the class APPCLU have been successfully loaded into storage by the external security manager.

System action

The profiles are used in subsequent bind authorization checks for LU6.2 sessions whose CONNECTION definition specifies BINDSECURITY(YES).

User response

None.

Module:
DFHXSRC

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHXS1108   *applid* **Partner-LU profiles could not be built for class APPCLU. SAF codes are (*X'safresp'*,*X'safreas'*). ESM codes are (*X'esmresp'*,*X'esmreas'*).**

Explanation

The partner-LU profiles for the class APPCLU could not be loaded into storage by the external security manager. CICS therefore has no APPCLU security profiles. The response and reason codes (*safresp* and *safreas*) returned by the system authorization

facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following:

- The initialization of VTAM support in terminal control
- The CEMT command SET VTAM OPEN
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS SET VTAM OPEN command.
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

System action

If the failure occurs during CICS initialization or PERFORM SECURITY REBUILD, CICS terminates. If the failure occurs during SET VTAM OPEN, the VTAM ACB is closed and CICS continues.

User response

Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

Console

DFHXS1109   *applid* **APPC PROFILE *profile* COULD NOT BE AUDITED. SAF CODES ARE (*X'safresp'*,*X'safreas'*). ESM CODES ARE (*X'esmresp'*,*X'esmreas'*).**

Explanation

An audit request for a partner-LU verification check has failed for profile *profile*.

During the start-up of an APPC session, each partner can validate the other. During this validation process, the system:

- Retrieves the relevant APPCLU profile from the external security manager
- Checks that the session key is still usable
- Requests the external security manager to write audit records concerning this profile and the validation to the system management facility (SMF).

The following events are audited:

- Whether the session partner was correctly validated
- Whether the session partner failed validation
- Whether the session key will expire in less than six days
- Whether the retrieved profile is "locked"
- Whether the session key is null, or all zero
- Whether the session key has expired.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=AUDIT macro.

System action

The CICS system is not affected by this event, and CICS continues.

User response

Use the external security manager codes to determine why the RACROUTE REQUEST=AUDIT operation failed. Correct the problem in the external security manager, then perform a security rebuild, if appropriate.

Module:
DFHXSSB

Destination

Console

DFHXS1110	*applid* **Security is requested, but the external security manager is inactive.**

Explanation

Security was requested for this region, but the external security manager (ESM) was found to be inactive. The SEC system initialization parameter was specified as YES or left as its default value. CICS cannot initialize its security manager unless the ESM is active.

System action

CICS terminates.

User response

If you have an ESM installed on your system, ensure that it is active before attempting to start CICS. Otherwise, restart CICS without security by specifying SEC=NO as a system initialization parameter. Note that the SEC parameter cannot be entered as a console override.

Module:
DFHXSIS

1. *applid*

Destination

Console

DFHXS1111	*date time applid tranid* **Security violation by user** *userid* **{ at netname	at console } portname for resource** *resource* **in class** *classname*. **SAF codes are (***X'safresp'***,***X'safreas'***). ESM codes are (***X'esmresp'***,***X'esmreas'***). RACF request made was** *reqtype*.

Explanation

CICS has detected a security violation by user *userid* while performing an authority check for resource *resource* in resource class *classname*.

If the userid causing the violation is signed on at a VTAM terminal, the phrase "at netname *portname* " reports the netname at which the violation occurred. If the userid causing the violation is signed on at a console, the phrase "at console *portname* " reports the console name at which the violation occurred. If the userid causing the violation is not signed on or this is a non terminal task, the entry port does not appear in this message as it is not available.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=FASTAUTH or RACROUTE REQUEST=AUTH macros. These return codes are described in the z/OS MVS Programming: Authorized Assembler Services Guide and in z/OS Security Server RACROUTE Macro Reference.

CICS can also issue this message when you use the EXEC CICS QUERY SECURITY command with the LOGMESSAGE(LOG) option.

System action

CICS abnormally terminates the task requesting the invalid access except under one of the following conditions:

- The command is issued within the scope of an EXEC CICS HANDLE NOTAUTH command.
- The command is issued as a result of an EXEC CICS QUERY SECURITY command.

User response

Note the security violation.

DFHXS1112	*applid* **The CICS region userid and groupid could not be determined. SAF codes are (*X'safresp'*,*X'safreas'*). ESM codes are (*X'esmresp'*,*X'esmreas'*).**

Explanation

CICS could not determine the userid and groupid for this CICS region.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=EXTRACT macro.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

User response

Use the external security manager codes to determine why the RACROUTE REQUEST=EXTRACT operation failed. Then, either correct the errors for the failing region userid and groupid, and restart CICS, or restart CICS with a different userid and groupid.

Module:
DFHXSIS

Console

DFHXS1113	*applid* **The region userid cannot access system transaction *tranid*. SAF codes are (*X'safresp'*,*X'safreas'*). ESM codes are (*X'esmresp'*,*X'esmreas'*).**

Explanation

The region userid for this CICS system is not authorized to attach the system transaction *tranid*. It is a CICS requirement that the region userid must be able to access this transaction.

The response and reason codes (*safresp* and *safreas*) returned by the system authorization facility (SAF), and the response and reason codes (*esmresp* and *esmreas*) returned by the external security

manager (ESM) are those issued by the RACROUTE REQUEST=FASTAUTH or AUTH macro.

System action

CICS will issue message **DFHXS1404** and terminate.

User response

Authorize the CICS region userid to access all the required CICS system transactions, or specify a different region userid that does have the required authority. (The required transactions are documented as the 'Category 1' transactions in the CICS Security. To authorize the region userid to use these transactions, you should execute the sample clist DFH$CAT1, as described in the Installing CICS TS.)

Then restart CICS.

Explanation

CICS has detected a security violation by user *userid* while performing an authority check for the UNIX System Services zFS file *filename*.

If the userid causing the violation is using CICS Web support, the phrase "at IP address *location* " may be present. Otherwise, the location does not appear in this message as it is not available.

The response codes *ussvalue*, *ussreturn*, and *ussreason* are those returned by the UNIX System Services **access** function (BPX1ACC), and are described in z/OS UNIX System Services Messages and Codes (SA22-7807).

System action

If the zFS file is being accessed to deliver static web content for the CICS Web support, CICS returns an HTTP 403 (Not Authorized) response to the web client. Otherwise, CICS abnormally terminates the task requesting the invalid access unless it is protected by an EXEC CICS HANDLE NOTAUTH command.

User response

Note the security violation.

CSCS

DFHXS1218	*applid* **The CICS region userid** *userid* **is not authorized to access key ring** *keyring***.**

Explanation

The KEYRING system initialization parameter has been used to specify a key ring named *keyring,* but the CICS region userid (*userid*) does not have sufficient authority to access it.

System action

If the PARMERR=ABEND system initialization parameter is specified, CICS initialization terminates.

If the PARMERR=IGNORE system initialization parameter is specified, CICS initialization continues without a key ring. CICS does not initialize support for secure sockets layer, is not able to install TCPIPSERVICEs that specify SSL(YES) or SSL(CLIENTAUTH), or CORBASERVERs that specify CERTIFICATE.

If the PARMERR=INTERACT system initialization parameter is specified, you are prompted to enter a new key ring name, but you can only reply with a blank name, which causes CICS to continue initialization without a key ring.

User response

If CICS is to use the secure sockets layer, the CICS region userid must be given READ access to the IRR.DIGTCERT.LIST and IRR.DIGTCERT.LISTRING resources in the FACILITY class. For further information, see the CICS Security.

DFHXS1402	*date time applid* **A request to inquire the client principal of a kerberos token obtained from a Security Token Service has failed, reason = {*R_TICKETSERV service responded not authorized by ESM.	Security not active.	ESM not active.	KDC not active.	KDC not responding.	R_TICKETSERV service responded not a kerberos region.	R_TICKETSERV service responded invalid client principal name.	R_TICKETSERV service responded invalid kerberos token.	R_TICKETSERV service responded ticket expired.	R_TICKETSERV service responded authenticator expired.	Unclassified ESM error.	R_TICKETSERV service responded invalid server principal name.	R_USERMAP service responded no userid for client principal.	R_USERMAP service responded not authorized by ESM.	R_GENSEC ACCEPT service responded attempted replay.	R_GENSEC ACCEPT service did not return an output token.	Kerberos not configured.*} SAF codes are (*X'safresp'*,*X'safreas'*) ESM codes are (*X'esmresp'*,*X'esmreas'*) Taskid (*taskid*) Tranid (*tranid*) Task userid (*userid*)**

Explanation

There has been a request to an External Security Manager to inquire the client principal of a kerberos token obtained from a Security Token Service but the request failed. A request to inquire a client principal results in a call to one or more z/OS callable services that may have failed. An example of when an inquire the client principal request can be issued is with EXEC CICS VERIFY TOKEN. The reason shown in the message indicates the cause of the failure.

Reasons:

R_TICKETSERV service responded not authorized by ESM

The External Security Manager did not authorize a request to the z/OS R_TICKETSERV callable service to inquire a client principal.

Security not active

CICS security is not active.

ESM not active

The External Security Manager is not active.

KDC not active

The Key Distribution Center is not active.

KDC not responding

The Key Distribution Center is not responding.

R_TICKETSERV service responded not a kerberos region

A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response from the External Security Manager that the CICS region is not defined to use kerberos.

R_TICKETSERV service responded invalid client principal name

A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response from the External Security Manager that the client principal name is invalid.

R_TICKETSERV service responded invalid kerberos token

A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response from the External Security Manager that the kerberos token is invalid.

R_TICKETSERV service responded ticket expired

A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response from the External Security Manager that the interval during which the ticket is valid has expired.

R_TICKETSERV service responded authenticator expired

A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response that the difference between the time in the kerberos token and the current system time exceeds the limit for the External Security Manager to authenticate.

Unclassified ESM error

A response from the External Security Manager was received which is not classified by CICS.

R_TICKETSERV service responded invalid server principal name

A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response that the server principal in the kerberos token does not match the principal name associated with the CICS region userid.

R_USERMAP service responded no userid for client principal

A request to the z/OS R_USERMAP callable service responded that the External Security Manager does not have a userid mapped to the client principal name.

R_USERMAP service responded not authorized by ESM

The External Security Manager did not authorize a request to the z/OS R_USERMAP callable service to obtain the userid mapped to the client principal name.

R_GENSEC ACCEPT service responded attempted replay

The External Security Manager detected an attempt to replay a prior request. For example, there has been a second attempt to run EXEC CICS VERIFY TOKEN KERBEROS ENCRYPTKEY for the same kerberos token.

R_GENSEC ACCEPT service did not return an output token

The External Security Manager did not return an output token when expected for EXEC CICS VERIFY TOKEN KERBEROS OUTTOKEN.

Kerberos not configured

This CICS region is not configured to support Kerberos. To enable Kerberos support, specify the SIT parameter KERBEROSUSER with the user id associated with the service principal.

System action

CICS continues.

CSCS

DFHXS1403   *date time applid* **A request to a z/OS Callable Service failed during processing for encryption, reason = {R_GENSEC service responded not authorized by ESM. | Security not active. | ESM not active. | KDC not active. | KDC not responding. | Unclassified ESM error. | Invalid security context. | Invalid confidentiality state.} SAF codes are (*X'safresp'*,*X'safreas'*) ESM codes are (*X'esmresp'*,*X'esmreas'*) Taskid (*taskid*) Tranid (*tranid*) Task userid (*userid*)**

Explanation

A request was made to z/OS Callable Service R_Gensec during processing related to encryption but the request failed. Examples of when this processing can occur include execution of commands EXEC CICS VERIFY TOKEN or EXEC CICS REQUEST ENCRYPTPTKT. The reason shown in the message indicates the cause of the failure.

Reasons:

R_GENSEC service responded not authorized by ESM

> The External Security Manager did not authorize a request to the z/OS R_GENSEC callable service.

Security not active

> CICS security is not active.

ESM not active

> The External Security Manager is not active.

KDC not active

> The Key Distribution Center is not active.

KDC not responding

> The Key Distribution Center is not responding.

Unclassified ESM error

> A response from the External Security Manager was received which is not classified by CICS.

Invalid context

> The External Security Manager detected a security context is not valid or is no longer valid. An invalid value may have been supplied with an EXEC CICS command using the ENCRYPTTOKEN option.

Invalid confidentiality state

> The External Security Manager failed an encryption request. For example, an EXEC CICS REQUEST ENCRYPTPTKT command was run but its

ENCRYPTKEY option is associated with a kerberos token that originated from a system that does not support message confidentiality.

System action

CICS continues.

Explanation

A request to an External Security Manager was made for a PassTicket for task userid *userid* for use in a system with ESM application name *esmappname*) but the request failed. Authorization by the External Security Manager failed. The request was made by task *taskid* using transaction id *tranid*.

System action

CICS continues.

User response

Contact your security administrator for assistance in order to obtain the necessary authorization to request a passticket. The External Security Manager must have appropriate definitions for the task userid *userid* to have this authorization. For example, if the ESM is RACF, the task userid *userid* must have READ access to a profile in the PTKTDATA resource class that is associated with the ESM application name *esmappname*. For more information refer to 'Generating and using PassTickets for secure sign-on'.

DFHZCnnnn messages

DFHZC0001	*applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the z/OS MVS System Codes manual.

Next, look up the CICS abend code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

For further information about *code*, see the Troubleshooting and support.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHZC0002	*applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

2. *X'code'*
3. *modname*

Destination

Console

DFHZC0004	*applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHZC0101I

date time applid A predatory takeover has forced VTAM to allow another application to open the ACB which CICS was using.

Explanation

A predatory takeover is occurring. This means that a job is initializing which has the same applid as the CICS system. This initiates a takeover of the network. As a normal part of this process, VTAM drives the TPEND exit.

System action

All requests on VTAM sessions are abnormally terminated and the sessions closed. The VTAM ACB is then opened by the application which is using the same APPLID as the CICS region. The new system recovers any persisting sessions.

User response

If this takeover of the network was unintentional, you can prevent it happening in future by using RACF to protect the APPLID. Refer to the VTAM application security section in the z/OS Communications Server: SNA Network Implementation Guide, SC31-6434 for details of how to do this.

DFHZC0110

date time applid The LU6.2 NIB and the TCTTE/BIND data for session *sessid* did not match during a persistent sessions restart. Reason code *X'n'*.

Explanation

A node initialization block (NIB) has been passed to CICS by VTAM during a persistent sessions restart. An attempt was made by CICS to match the NIB to a session TCTTE. The reason code explains the cause of the mismatch.

Reason
  Explanation
1

  Single/parallel session indication did not match.

2

  LU type did not match.

3

  LU type and single/parallel session did not match.

System action

The attempt to match a persisting session with a TCTTE has failed. The session is unbound. CICS ignores this session and continues with the next session if there is one.

User response

The production of this message means that there is no suitable global catalog record to match the NIB which VTAM has passed in. This implies that the wrong global catalog is being used for this initialization of CICS, or that the catalog records are corrupted. Ensure that the global catalog being used is correct.

DFHZC0111

date time applid No session TCTTE is available to match sysid *sysid* for modename *modename* because VTAM has returned more NIBs than the CNOS session limit values require.

Explanation

During persistent sessions restart VTAM has returned more node initialization blocks (NIBs) than the current CNOS session limit values require. This is probably because a CNOS from a high session limit to a lower session limit was in progress when CICS failed.

System action

The process NIB function is terminated. The session is unbound. CICS ignores this session and continues with the next session if there is one.

This situation has no effect on the restored CICS. The last catalogued CNOS values are restored.

User response

None.

DFHZC0125   *date time applid netname* **persistent session will be terminated.** *sense* **((***instance***) Module name: {*DFHZGRP | DFHZGRP | DFHZGRP*})**

Explanation

CICS was initializing with an EMERGENCY start and some VTAM sessions persisted from a previous CICS with a nonzero PSDI value.

However, the session with a NETNAME of *netname* is terminated for one of the following reasons as indicated by the *instance* in the message. An AP exception trace entry is made for each *instance* as follows.

Instance
  Point ID and Explanation

1

  X'FB21' There is not enough storage to recover an APPC session.

2

  X'FB22' There is not enough storage to recover a terminal session.

3

  X'FB25' The NIB and the TCTTE with the same NETNAME were not of the same LU TYPE.

System action

An AP exception trace with a point ID as above is issued. The session is terminated and CICS continues.

User response

The exception trace point identifies where the message was issued and determines the action to take.

CSNE

DFHZC0126I   *applid* **No VTAM sessions persisted for an EMERGENCY restart.**

Explanation

CICS was initializing with an EMERGENCY start but no VTAM sessions persisted from a previous CICS run. Possible reasons are:

- No persistence was specified in the previous run.
- CICS crashed with the ACB open but no sessions were in use.
- The PSDI value expired.
- An error occurred before DFHZGRP could determine if any sessions persist.

System action

CICS continues.

User response

None.

Module:
DFHZGRP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHZC0127   *applid* **Cannot reestablish persisting sessions - VTAM ACB is closed. Code:** *X'code'*. **Module name:** *module*

Explanation

The VTAM ACB has been opened and CICS is processing VTAM persisting sessions, however the ACB was closed, or is being closed by operator action before all the sessions could be restored or terminated.

System action

CICS continues to close the VTAM ACB and then runs without VTAM support.

User response

Determine why the operator closed the ACB and either continue without VTAM, dynamically open the ACB, or shut CICS down normally and restart it.

X'code' is the AP exception trace entry that determines which VTAM macro diagnosed the ACB as being closed and where it was issued.

Module:
DFHZGRP DFHZGUB

2. *X'code'*
3. *module*

Destination

Console

DFHZC0128	*applid* **Cannot reestablish persisting sessions - VTAM not responding. Module name:** *module*

Explanation

CICS is processing VTAM persisting sessions. However it has issued a VTAM macro and has waited for 8 minutes for the response.

System action

If this occurs during start up, CICS terminates. If this occurs during dynamic open, the VTAM ACB is closed and CICS continues without VTAM.

A dump is taken for this message in both cases. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

You can restart CICS again immediately, or wait for the persistent sessions to time out and then restart CICS.

If this problem recurs you need to find out why VTAM is not responding to the INQUIRE or OPNDST macro (if the message is issued by DFHZGRP), or the CLSDST or TERMSESS macro (if the message is issued by DFHZGUB).

You can determine which macro is not responding by examining the TCP section of the dump and looking at the RPLs in the PS POOL labeled PS_RPL. The first RPL is for use by INQUIRE or OPNDST, the next 10 by CLSDST or TERMSESS.

DFHZC0137   *applid* **PSDI value indicated persistence but the TCT assemble time VTAM does not support persistent sessions.**

Explanation

The PSDI value is nonzero. This specifies that VTAM sessions are to persist across CICS failures. However, DFHTCT*xx* was assembled against a release of VTAM that cannot support persistent sessions.

System action

CICS sets the PSDI value to 0 and continues without persistent session support.

User response

Reassemble the TCT against ACF/VTAM Release 3 Version 4 Modification 1 or higher in order to take advantage of CICS persistent session support.

To prevent this message being issued when using an earlier release of VTAM, set the PSDINT system initialization parameter to zero, and when using the EXEC CICS SET VTAM command, either omit, or specify a value of zero for the PSDINTERVAL operand.

Module:
DFHZSLS

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHZC0140   *applid* **SETLOGON PERSIST failed. RTNCD,FDB2:** *X'rc',X'fd'*. **Code:** *X'code'*

Explanation

CICS was opening the VTAM ACB, setting the PSDI value from an operator command or doing a WARM shut down. It attempted to issue the VTAM command SETLOGON OPTCD=PERSIST or OPTCD=NPERSIST. However, VTAM returned a RTNCD,FDB2 of *rc,fd*.

System action

An AP exception trace entry, *code*, is made.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

If the ACB was being opened, no VTAM sessions persist and the PSDI value is set to 0.

If just the PSDI value was being changed, either by the operator or during termination, the value is unchanged, both to CICS and to VTAM.

If this occurs during a VTAM shut down and some sessions are not closed, sessions may exist on VTAM start-up and are terminated then. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the dump taken or the exception trace entry *code* and the [z/OS Communications Server: SNA Programming](#) to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.

DFHZC0144	*date time applid sysid termid* **Synclevel 2 conversation started by** *netname* **before completion of exchange lognames.** *sense* **((***instance***) Module name: {DFHZGDA})**

Explanation

CICS has received an attach FMH5 for a synclevel 2 conversation from a partner with netname *netname* before exchange lognames processing is complete.

System action

A Deallocate(Abend) with sense code 08640001 is issued for the conversation.

User response

No further APPC synclevel 2 conversations can be started by the partner until exchange lognames has completed. Use CEMT to inquire on the status of the connection in order to determine whether exchange lognames has completed (see the [CICS Supplied Transactions](#) for more information).

DFHZC0146	*date time applid* VTAM session for *termid* successfully recovered following a persistent sessions restart *sense* ((*instance*) Module name: {*DFHZXRC*})

Explanation

CICS has restored the VTAM persistent session for terminal *termid* following a persistent sessions restart.

The equivalent message for APPC sessions is DFHZC0156.

System action

If recovery notification is specified for this terminal, the recovery message is sent to the terminal, or the transaction requested to run at recovery notification time is started.

User response

If required, code an NEP to override the recovery notification option originally specified in the TYPETERM definition for this session. See the Defining resources and the Developing system programs for CICS for more information.

DFHZC0147	*date time applid sysid termid* Error occurred recovering persisting session. *sense* ((*instance*) Module name: {*DFHZGDA	DFHZGDA	DFHZGDA	DFHZGDA	DFHZGDA*})

Explanation

An error has prevented the recovery of an APPC conversation which persisted across an emergency restart.

The session with a termid of *termid* is terminated. The reason and the corresponding AP exception trace entry are indicated by the *instance* in the message;

Instance
    Point ID and explanation
1

    X'FB79' SEND not executed due to invalid bracket state.

2

    X'FB7B' Insufficient storage for session recovery.

3

    X'FB76' Recovery status byte TCTE_PRSS contains an unexpected value.

4

    X'FB7A' RECEIVE not executed due to invalid bracket state.

5

    X'FB78' Unexpected sense received during persistent sessions recovery.

System action

An AP exception trace with a point ID as above is issued. The session is terminated and CICS continues.

User response

If recovery failed due to insufficient storage, try increasing the DSA or EDSA size limits (see the Developing system programs for CICS). If any of the other instances occur, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

CSNE

DFHZC0152   *date time applid termid* **Signon of user at termid** *termid* **failed following a persistent sessions restart. Return code** *rc* **was received from the user domain.**

Explanation

CICS attempted to sign on a user following a persistent sessions restart. The user domain replied with one of the following return codes:

Return code
   Explanation

005

   The user is already signed on.

006

   The userid is not authorized for this terminal.

008

   The user's access to the specific group has been revoked.

009

   The security label associated with the userid in the ESM does not have the necessary authority.

010

   The userid was not contained in the group specified.

011

   The userid has been revoked.

012

   The userid is not known to the ESM.

015

   SEC=NO was specified in the SIT.

016

   The ESM is not responding.

017

   The ESM is not responding.

018

   The ESM returned a response which was not recognized by the CICS security domain.

27

   The user domain returned a disaster response.

System action

An AP exception trace with point ID FB9B is issued.

The terminal is available but the user is not signed on to it. The terminal has the attributes of the default user.

User response

Note the return code and take the necessary action. Look for messages output earlier by the ESM or the security domain. If no reason can be

Explanation

The VTAM APPC session *sysid termid* persisted during a CICS persistent session restart, but an error occurred while processing the session state data returned by VTAM following an OPNDST OPTCD=RESTORE.

If the error needs further investigation, a dump is taken.

No dump is taken if one has already been taken for an earlier problem, or if the problem is known as one for which a session cannot be allowed to persist. An example of this is bind security processing not completing for this session when CICS terminated.

The reason and the corresponding AP exception trace entry are indicated by the *instance* in the message.

Instance
Point ID and Explanation

1

X'FBFD'

During reject attach processing a call was made to DFHZGDA but DFHZGDA rejected the call with invalid format or invalid function.

2

X'FBFD'

An error occurred during reject attach processing. The session is in an unknown state.

3

X'FBD2'

The TCTE_PRSS status byte was set to 0 but reject attach processing was not taking place. This session state is not valid for entry to DFHZXPS.

4

X'FBE4'

An error occurred during DEALLOCATE ABEND processing. This will have been handled by DFHZGDA so no dump is taken but the session is terminated.

5

X'FBD2'

The TCTE_PRSS byte (persistent sessions status byte) contained an unknown value on entry to DFHZXPS.

6

X'FBE6'

The TCTE_PRSS_CV29_PTR (pointer to data returned by VTAM) contained zeroes on entry to DFHZXPS.

7

X'FBD3'

The CV29 data returned from VTAM had a zero length on entry to DFHZXPS.

8

X'FBD4'

The BIS flow data returned by VTAM showed BIS RQE1 received but the outbound BIS flow was not consistent with this.

9

X'FBD4'

The BIS flow data returned by VTAM showed BIS RQE3 received but the outbound BIS flow was not consistent with this.

10

X'FBD4'

The BIS flow data returned by VTAM showed that no BIS flow had been received but the outbound BIS flow was not consistent with this.

11

X'FBD4'

The BIS flow data returned from VTAM was not recognized.

12

X'FBD5'

The bid flow data returned by VTAM showed a request that was not recognized where this session is the contention winner.

13

X'FBD5'

The bid flow data returned by VTAM showed that a negative X'088B' response had been sent but there was nothing to indicate that the session was closing down. This session is the contention winner.

14

> X'FBD5'

> The bid flow data returned by VTAM contained a response that was not recognized where this session is the contention winner.

15

> X'FBD5'

> The bid flow data returned by VTAM was not recognized. This session is the contention winner.

> CICS could not determine the direction of the last flow from the CV29 data returned by VTAM. (This session was the secondary.)

30

> X'FBD9'

> The last_thing_to_flow byte contained an invalid value. This indicates a logic error in DFHZXPS.

31

X'FBDA'

The last inbound flow was a response that was not for the previous request.

32

X'FBDA'

A negative response was received that was not for a command and was not a X'0846' negative response.

33

X'FBDA'

The last inbound flow was a response that was not for this bracket. (This session is the primary and started the current bracket).

34

X'FBDA'

The last inbound flow was a response that was not for this bracket. (This session is the secondary and started the current bracket.

35

X'FBDA'

The last inbound flow was a response that was not for this bracket. (This session is the primary and did not start the current bracket).

36

X'FBDA'

The last inbound flow was a response that was not for this bracket. (This session is the secondary and did not start the current bracket).

37

X'FBDA'

The last flow was a positive response outbound and was not for the previous request.

38

X'FBDB'

The last flow was an inbound LUSTAT command that could not be identified.

39

X'FBDB'

The last flow was an inbound RTR that was not processed by the bid analysis routine.

40

X'FBDB'

The last flow was an inbound command that could not be identified.

41

X'FBDB'

The last flow was an outbound LUSTAT command that could not be identified.

42

X'FBDB'

The last flow was an outbound RTR request that was not processed by the bid analysis routine.

43

X'FEDB'

The last flow was an outbound command request that could not be identified.

44

X'FBDC'

The last flow was an inbound response to BIS that was not processed with the BIS flow data.

45

X'FBDD'

The last flow was an inbound positive response to a command that could not be identified.

46

X'FBDA'

The last flow was an inbound response to an LUSTAT command but there was no corresponding outbound request.

47

X'FBDA'

The last flow was an inbound negative response to an LUSTAT request which could not be identified.

48

X'FBDC'

The last flow was a negative response inbound to a BIS request that did not show up in the BIS flow data.

49

X'FBDD'

The last flow was a negative response inbound to a command that could not be identified.

50

X'FBDC'

The last flow was a positive response outbound to BIS that was not consistent with the BIS flow data.

51

X'FBDD'

The last flow was a positive response outbound to a command that could not be identified.

52

X'FBDC'

The last flow was a negative response outbound to BIS that was not consistent with the BIS flow data.

53

X'FBDD'

The last flow was an outbound negative response to a command that could not be identified.

54

X'FBE1'

The last request to flow was SIGNAL (expedited flow) but no normal flow data appears in the CV29 normal flow data area.

55

X'FBE1'

The last flow was a SIGNAL request (expedited flow). However analysis of the normal flow data shows both sides sending which is not possible. (Outbound flow was with EC.)

56

X'FBE1'

The last flow was a SIGNAL request (expedited flow). However analysis of the normal flow data shows both sides sending which is not possible. (Outbound flow was in chain.)

57

X'FBD5'

The tctewin/tctelse bits in the TCTTE have not been set correctly.

58

X'FBDF'

The session is not in CS mode when analysis of the CV29 data shows that a call to DFHZGDA to ABEND the current transaction is required.

59

X'FBE7'

A SEND_FMH7 call to DFHZGDA was rejected with invalid_format or invalid_function.

60

X'FBE7'

A SEND_FMH7 call to DFHZGDA was rejected because of a disastrous error in DFHZGDA.

61

X'FBE7'

A RECEIVE_FMH7 call to DFHZGDA was rejected with invalid_format or invalid_function.

62

X'FBE7'

A RECEIVE_FMH7 call to DFHZGDA was rejected because of a disastrous error in DFHZGDA.

63

X'FBE0'

Internal DFHZXPS logic error. The input parameters are invalid when a call is about to be made to DFHZGDA.

64

X'FBE5'

An invalid return code was received from a call to DFHTCPCL with ENTRY=DFHZRST1.

65

X'FBDE'

The tcte_bid_status byte contained an unrecognized value.

System action

An AP exception trace with a point ID is issued. The state of the session after the restart cannot be determined, and the session is terminated in order to reset the states. The session is restarted. A system dump is produced for all instances except 04.

User response

If the session is not successfully restarted, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

DFHZC0156	*date time applid sysid* **VTAM APPC session** *termid* **successfully recovered following a persistent sessions restart.** *sense* **((***instance***) Module name: {DFHZXPS	DFHZXPS})**

Explanation

CICS has restored the VTAM APPC persisting session for *sysid termid* following a persistent sessions restart.

The equivalent message for non-APPC sessions is DFHZC0146. Note that the RECOVNOTIFY option that applies to message DFHZC0146 is not applicable to APPC sessions.

System action

Processing continues.

User response

None.

Module:
DFHZXPS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *sysid*
5. *termid*
6. *sense*
7. *instance*
8. Value chosen from the following options:

CSNE

DFHZC0157	*date time applid sysid* **VTAM APPC session** *termid* **could not be recovered following a persistent sessions restart. The session will be unbound.***sense* **((***instance***) Module name: *{DFHZXPS}*)**

Explanation

CICS was unable to restore the APPC persisting session for *sysid termid* following a persistent sessions restart. There are three possible reasons for this:

1. The BIND processing was incomplete when CICS failed.
2. Resynchronization was in progress for the session when CICS failed.

3. The recovery data returned by VTAM for the session was capable of more than one interpretation.

The TCTTE and TIOA are output for information only.

System action

The session is unbound and rebound.

User response

None.

Module:
DFHZXPS

XMEOUT parameters/Message inserts

CSNE

DFHZC0158	*date time applid* **Persistent sessions signon data for terminal** *termid* **could not be written to the catalog.**

Explanation

CICS was attempting to write signon data for *termid* to the global catalog so that the signon status could be recovered after a persistent sessions restart, but the catalog write failed.

System action

An exception trace is output. Loss of the data may mean that *termid* will not be signed on or off correctly after a persistent sessions restart.

User response

Investigate the cause of the error. Look for earlier messages and trace entries from the catalog domain indicating the cause of the error, for example the catalog may be full.

CSNE

DFHZC0160   *date time applid tranid* **CNOS changes for modename** *modename* **to node** *netname* **connection** *sysid* **are incomplete.**

Explanation

CICS has made two attempts to implement the change number of sessions (CNOS) command for the modename *modename* on the APPC connection *sysid*. The command was not successful because of other activity on the modegroup. This only happens on modegroups which are very busy. The state of one or more of the sessions has changed during the processing of the CNOS request.

The CNOS command results from a connection acquire, a connection release, or a request for a specific modename on this system or the connected system. If the connected system is not CICS, commands specific to that system may have been used.

System action

The modegroup is left in the state reached after the second attempt to implement the changes.

User response

Use the CEMT INQUIRE MODENAME command to determine the current state of the modegroup. The command may show the modegroup as you expect for successful CNOS completion. This is because the command only shows data for available and active sessions. CICS may have had problems with CNOS values for loser sessions, which would not be apparent by using CEMT. If the values are not as required, re-issue the original command.

Module:
DFHZGCA

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *modename*
6. *netname*
7. *sysid*

Destination

CSNE

DFHZC0161   *date time applid tranid* **CNOS command for modename** *modename* **to node** *netname* **connection** *sysid* **has failed with code** *X'code'*.

Explanation

CICS has encountered an error while attempting to execute a change number of sessions (CNOS) command for the modename *modename* on the APPC connection *sysid*. The failure code X'*code*' is one of the following:

X'FBA2'

> The request to create a lock manager lock for *modename* failed.

X'FBA3'

> CICS could not allocate a session for the CNOS negotiation conversation.

X'FBA6'

> The request to obtain a lock manager lock for *modename* failed.

X'FBAA'

> *modename* was not found or has been defined with one of the reserved names SNASVCMG or CPSVCMG.

X'FBAB'

> *sysid* is known, but not as a connection.

X'FBAC'

> The specified connection *sysid* has no modegroups. This is probably caused by a storage overwrite.

X'FBAD'

The first modegroup on the specified connection *sysid* has no sessions. This is probably caused by a storage overwrite.

X'FBAF'

The receive command for the CNOS reply failed.

X'FBB1'

The send command for the CNOS command or CNOS reply failed.

X'FBB2'

The session for the single-session connection could not be found. This is probably caused by a storage overwrite.

X'FBB3'

sysid is not a known connection name.

X'FBB4'

The connection is defined to CICS as not supporting CNOS. This is probably caused by a storage overwrite.

X'FBB9'

CICS sent a CNOS command for a specific modename but the partner system returned a CNOS reply indicating all modegroups. This is a protocol violation.

System action

CICS makes an exception trace with ID AP *xxxx*; where *xxxx* is the code in the message. CICS takes a system dump for all failure codes except X'FBA2', X'FBA3', X'FBA6', X'FBAF', X'FBB1', and X'FBB9'. CICS continues without completing the request. The task does not abend. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This depends on the error code as follows:

X'FBA2'

Follow the guidance given for the lock manager console message that precedes this.

X'FBA3'

If all the sessions are busy, make one available and retry.

X'FBA6'

Follow the guidance given for the lock manager message that precedes this.

X'FBAA'

Reissue the request with the correct modename.

X'FBAB'

Reissue the request with the correct connection name.

X'FBAC'

See the Troubleshooting and support for further guidance on storage problems.

X'FBAD'

Same as for X'FBAC'.

X'FBAF'

The connected system, or the link to it, has failed. Determine the reason for this from any other messages produced.

X'FBB1'

Same as for X'FBAF'.

X'FBB2'

Same as for X'FBAC'.

X'FBB3'

Reissue the request with the correct connection name.

X'FBB4'

Same as for X'FBAC'.

X'FBB9'

Investigate why the connected system is not following the APPC protocols.

Module:
DFHZGCN

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *modename*
6. *netname*
7. *sysid*
8. *X'code'*

Destination

CSNE

| **DFHZC0162** | *date time applid tranid* **CNOS transaction for connection** *sysid* |

**has failed with code *X'code'*
subcode *X'subcode'*.**

Explanation

The change number of sessions (CNOS) transaction
program DFHZLS1 could not complete successfully.
The error code X'*code*' is one of the following:

X'FB92'

> The transaction was not started as an IC request
> with data or by an attach flow from a connected
> system. The insert *subcode* is the start code from
> XMIQ_START_CODE.

X'FB93'

> The transaction was started with data, but no data
> was found.

X'FB94'

> The transaction was started with data, but the data
> was not in the form of the correct parameter list.

X'FB95'

> The transaction was started with the correct
> format parameter list, but the function code was
> invalid.

X'FB96'

> The transaction was started by an attach from a
> connected system but there was no CNOS data.

X'FB97'

> The transaction was started by an attach from a
> connected system but the associated data was not
> a CNOS command.

X'FB9E'

> The transaction was started but CICS is shutting
> down and the VTAM ACB is closed.

> This may have occurred because a number of CLS1
> tasks were started before shutdown was issued
> but are held up because CICS was at MAXTASK.
> During shutdown the VTAM ACB was closed and
> this task was then started.

System action

CICS produces an exception trace, and except for
in the case of an invalid start, a system dump is
taken. The task terminates. Message DFHME0116,
which contains the symptom string for this problem,
is produced.

User response

This depends on the error code as follows:

X'FB92'

> The transaction was probably started by entering
> the transaction ID at a terminal. This is not
> allowed.

X'FB93'

> Analyze the dump to determine why IC could not
> find the data.

X'FB94'

> Analyze the dump to determine what the data was.

X'FB95'

> Analyze the dump to determine what the data was.

X'FB96'

> Analyze the dump to determine why no data was
> available.

X'FB97'

> Analyze the dump to determine why the correct
> data was not sent with the attach.

X'FB9E'

> No action to take.

DFHZC0167	*date time applid termid* **An attempt to sign off a user at termid** *termid* **failed following a multinode persistent sessions restart. Response code** *rc1* **and reason code** *rc2* **were received.**

Explanation

CICS attempted to sign off a user at termid *termid* because of a signon timeout following a multinode persistent sessions restart. An exception or disaster response was received from the signon program DFHSNTU with one of the following reason codes:

Reason code
  Explanation

002

There is no active ESM.

003

The ESM is not responding.

010

The terminal type is invalid for this operation.

017

> The terminal has preset security.

019

> Security is not active for this CICS.

022

> The terminal is a surrogate terminal.

028

> The ESM returned a response which was not recognized by the CICS security domain.

038

> The signon program went into recovery following an ABEND.

048

> The signon program detected a loop and went into recovery.

052

> The signon program received a bad response from transaction manager.

System action

An AP exception trace with point ID FB9D is issued.

User response

Reason codes 002, 003, 019 and 028 indicate a problem with the ESM or the security domain. The remaining reason codes may indicate an internal error in CICS. Look for messages output earlier by the ESM or the security domain. If security was active when the problem occurred and there was no problem with the ESM or the security domain contact your IBM support center.

DFHZC0172I   *applid* **CICS deregistered successfully from VTAM generic resource name *grname*.**

Explanation

CICS has deregistered from VTAM generic resource group *grname*.

System action

None. CICS will not reregister to the generic resource until the VTAM ACB has been closed and opened again.

User response

None.

Module:
DFHZGSL

XMEOUT parameters/Message inserts

1. *applid*
2. *grname*

Destination

Console

DFHZC0173   *applid* **CICS deregistration from VTAM generic resource name *grname* failed. VTAM return code: *X'rc'*. FDB2: *X'fd'*.**

Explanation

CICS failed to deregister from VTAM generic resource group *grname*.

VTAM returned a RTNCD,FDB2 of *rc,fd* in response to the SETLOGON OPTCD=GNAMEDEL macro.

This may be due to a hardware failure in another part of the sysplex or to corruption of the TCT prefix causing CICS to attempt to deregister with the wrong name.

System action

An AP exception trace entry is output with a trace point of X'FB8E'.

User response

Use the z/OS Communications Server: SNA Programming to determine the meaning of the register 15 and register 0 values output by VTAM. If the problem is not caused by use of the wrong version of VTAM, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZGLS

1. *applid*
2. *grname*
3. *X'rc'*
4. *X'fd'*

Destination

Console

DFHZC0174   *applid* **Control block initialization has failed. Generic resource registration or deregistration will not be attempted. Return codes *r15,r0*.**

Explanation

A call to a VTAM macro to initialize the node initialization block (NIB) before registering or deregistering as a VTAM generic resource has failed.

A possible explanation is that the wrong level of VTAM is being used.

System action

The values of register 15 and register 0 returned by VTAM are output.

An exception trace is output with trace point X'FBED'.

If registration was about to be attempted, CICS continues without generic resource support.

If deregistration was about to be attempted, ACB shutdown continues. VTAM removes CICS as a member for the generic resource name when the ACB is closed.

User response

Use the z/OS Communications Server: SNA Programming to determine the meaning of the register 15 and register 0 values output by VTAM. If the problem is not caused by use of the wrong version of VTAM, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZGLS

1. *applid*
2. *r15*
3. *r0*

Destination

Console

DFHZC0175	*applid* **A value was specified for GRNAME but the assemble time or run time VTAM does not support generic resource registration.**

Explanation

A value was specified for the GRNAME system initialization parameter. This indicates that CICS is to register as a VTAM generic resource. However, either DFHTCT*xx* was assembled against a release of VTAM that cannot support generic resource registration, or CICS is running on a VTAM earlier than release 4 version 2.

System action

CICS sets the generic resource name to blanks and continues without attempting generic resource registration.

User response

If you are running with ACF/VTAM Release 4 Version 2 or higher, reassemble the TCT against this level of VTAM in order to take advantage of CICS support for generic resource registration.

To prevent this message being issued when using an earlier release of VTAM, do not specify a value for the GRNAME system initialization parameter.

Module:
DFHZSLS

CSNE

DFHZC0177	*date time applid* Connection *sysid* has created an affinity between this application, which is a member of generic resource *grname*, and a remote LU with netid *netid* netname *netname*.

Explanation

A generic resource member has established an APPC synclevel 2, APPC limited resource, or LU6.1 connection with another LU. For connections of these types VTAM creates affinities which are owned by CICS and have to be ended by the CICS operator using the SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. The message is output whenever the connection is acquired but the affinity is not recreated for each acquire unless it has been ended in the meantime.

System action

Processing continues.

User response

None, but note that the affinity has to be ended before the partner LU can establish a connection with another generic resource member.

The affinity may be ended automatically by the connection quiesce transaction when the connection is released. However, it is not done if the system crashes or is shut down 'immediate' whilst the connection is still acquired.

DFHZC0184	*date time applid* **VTAM was unable to execute an INQUIRE OPTCD=SESSNAME macro to determine the member of generic resource set *grname* to which logical unit *netid.luname* is logged on. VTAM return code: *X'rc'*, FDB2: *X'fd'*, R15: *X'r15'*.**

Explanation

CICS has attempted to determine the member of a generic resource set *grname* to which logical unit *netid.luname* is logged on. The attempt has failed because a problem with VTAM prevented the VTAM INQUIRE OPTCD=SESSNAME macro from being issued.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'*rc*',X'*fd*' in response to the INQUIRE OPTCD=NQN macro.

R15 *r15* is the register 15 value returned by VTAM.

System action

The CICS component which needs to know where the logical unit is logged on determines whether any further action is called for.

User response

See the z/OS Communications Server: SNA Programming manual for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.

Module:
DFHZGIN

DFHZC0185	*date time applid* **An attempt to determine the member of generic resource set *grname* to which logical unit *netid.luname* is logged on was rejected by VTAM. VTAM return code: *X'rc'*. FDB2: *X'fd'*.**

Explanation

CICS has attempted to determine the member of generic resource set to which *grname* logical unit *netid.luname* is logged on. The request has been rejected by VTAM.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'*rc*',X'*fd*' in response to the INQUIRE OPTCD=SESSNAME macro.

System action

The CICS component which requires the member name decides whether further action is called for.

User response

See the z/OS Communications Server: SNA Programming manual for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.

Module:
DFHZGIN

DFHZC0186	*date time applid* **Connection *sysid* which is a member of generic resource *grname* has a duplicate remote LU netname *netname*. *sense* ((*instance*) Module name: {DFHZOPN | DFHZOPN})**

Explanation

Node *nodeid* attempted to log on to CICS but the logon is invalid.

The *nodeid* in the message always starts with the netname of the node attempting to connect to CICS. For some instances of the message resulting from an APPC log on, the modename of the session is concatenated to the netname with a dot separator. Since a string consisting of eight blanks is the default modename, this can lead to idiosyncratic formatting of the message.

If the message is issued by DFHZATA, CICS has failed in its attempt to autoinstall the terminal or connection.

The instance *instance* is one of the following:

1

During the acquire process for a secondary session CICS attempted to add the membername of the partner to a table but this name already exists for a different generic resource connection.

2

During the acquire process for a secondary session CICS attempted to add the membername of the partner to a table but this name has just been used as the netname of a terminal by an install occurring at the same time as the install of this connection.

System action

The acquire of the connection continues.

User response

Use the instance number to determine why the netname already exists:

1

Use the CEMT INQUIRE CONNECTION API to see which generic resource has the same membername.

Since this problem should not occur under normal circumstances, you may need further assistance from IBM.

2

Investigate why the LU name of the partner is the same as the LU name of a terminal and remove one of the definitions.

Module:

CSNE

DFHZC0199   **CICS has recovered after a system failure. Execute recovery procedures. *{ Already signed on. | Please sign on.}***

Explanation

This message is sent to a terminal when the associated VTAM session is successfully recovered following a persistent sessions restart of CICS.

This is the default message issued by CICS if RECOVNOTIFY(MESSAGE) is specified on the TYPETERM for a device (see the Defining resources), or in the node error program (see the Developing system programs for CICS). If RECOVNOTIFY(MESSAGE) is used, it is recommended that the CICS supplied sample mapset DFHXMSG be tailored to meet the installation recovery requirements.

System action

Processing continues.

User response

Sign on if required, and take any recovery actions required.

Module:
DFHZNAC

Destination

Terminal End User

DFHZC0200   ***applid* An attempt by the COVR transaction to OPEN VTAM has failed with return code *X'retcode'*; CICS will retry.**

Explanation

The COVR transaction has attempted an EXEC CICS SET VTAM OPEN, but the operation failed with the return code *retcode* from the OPEN ACB.

System action

CICS continues. The COVR transaction retries the operation every 5 seconds. This message is reissued every minute until the operation succeeds, or until 10 minutes has passed, in which case message DFHZC0201 is issued.

User response

Investigate the reason for VTAM being unavailable. See the z/OS Communications Server: SNA Programming manual for an explanation of the ACB return code.

Destination

CSNE

DFHZC2115 *applid termid* **Potential CICS hang detected following a SEND to node *netname*, CID *X'cid'*. Investigation is required. ((*instance*) Module name: {DFHZRAC})**

Explanation

CICS has issued a VTAM SEND macro to send a response but no notification has been received that the response has completed. Until this SEND operation completes, one of the limited number of receive-any RPLs remains unusable (the number of receive-any RPLs is defined by the RAPOOL system initialization parameter).

This is a serious condition. If all the receive-any RPLs become unusable in this way, CICS is unable to accept any new requests from VTAM. Similarly, a reduction in the number of available receive-any RPLs can adversely affect terminal performance and transaction throughput.

Additionally, while the RPL is hanging, a normal CICS shutdown might be unable to complete.

The CID is the 32-bit VTAM communication identifier which was assigned when the session was established.

System action

CICS continues to monitor for the SEND operation to complete. Until this happens, CICS reissues this message at approximately three minute intervals.

User response

This problem is usually caused by a failure in the network which stops the SEND completing. Check the session and the associated logical unit to ensure that there is no error condition which stops VTAM completing the SEND request.

DFHZC2116 E   *date time applid*
Resynchronization of LU6.1 session *termid* with remote system *sysid* failed.

Explanation

Resynchronization of an LU6.1 session with a remote system has failed to complete for one of the following reasons:

1. There is an apparent inconsistency between the sequence numbers in the two systems
2. There was a protocol error during the exchange of the sequence numbers
3. Neither system requested resynchronization, but there was a shunted unit of work associated with the session.

System action

1. A system dump is taken unless dumps have been specifically suppressed in the dump table.
2. The TCTTE for the session on which the error occurred is printed. The local system's sequence numbers, and the numbers or responses received from the remote system can be found in the TCTTE.
3. The failure of resynchronization is reported to recovery manager. Recovery manager issues diagnostics relating to any unit of work affected by the failure.

User response

1. Determine whether changes to data in the local and remote system are synchronized. Diagnostics issued by recovery manager will help you to do this. If necessary, take action to resynchronize the data.
2. Determine why the resynchronization failure happened. You will normally need assistance from IBM to do this. See Working with IBM to solve your problem for guidance on how to proceed.

CSNE

DFHZC2118   *applid* **Receive Any stall for netname** *netname***.**

Explanation

All the CICS Receive Any RPLs have been posted but the TCTTE for each one is waiting for a response from a VTAM terminal or session. All the Receive Any RPLs have been stalled for 10 dispatches of the TCP task (CSTP). This message is produced for each session that is in this situation. A VTAM session has not responded to a command such as BID or SHUTD sent by CICS. This is typically caused by a protocol error.

System action

CICS is NOT running with system initialization parameter RAPOOL=(n,n,FORCE) so CICS VTAM activity is held up until one of the commands completes.

User response

Issue the VTAM command V NET,INACT,ID=netname,I for one or more of the sessions indicated by *netname*, to try and free a Receive Any RPL. Note - if the

sessions are LU6.2 then the above command will inactivate the partner APPLID to VTAM.

Investigate why the CICS terminal control commands that have caused the stall have not completed. If this is due to a protocol error from the partner or device, attempt to get the protocol error corrected.

Consider increasing the number of Receive Any RPLs specified in the RAPOOL System Initialization parameter. For instance, if you were using the old default of 2, increase this to the new default of 50.

If you still get this message after changing the RAPOOL value consider running CICS with system initialization parameter RAPOOL=(n,n,FORCE), which attempts to issue CLSDST for all the offending sessions or terminals and to re-issue the Receive Any RPLs.

CSNE

DFHZC2300 *APPLID* **Recovery action requested for connection *sysid*.**

Explanation

The XZIQUE global user exit program has been invoked by CICS because of a potential problem with the connection. The global user exit has used return code UERCAKLL indicating that throughput on the connection is abnormally low and some exceptional action is required. The poor performance of the connection can be caused by:

- Poor response on the receiving end
- Increased load on the sending end.

The condition may be intermittent. Message DFHZC2301 may follow indicating that the connection has recovered.

This message may also occur when the XZIQUE global user exit is disabled but the connection has been at the QUEUELIMIT for MAXQTIME where both parameters are specified in the connection definition.

System action

CICS cancels all transactions which have outstanding queued requests to use the connection.

User response

Investigate the cause of the poor performance of the connection. Check the availability and condition of the connected system.

Destination

Console

DFHZC2302 *applid* **SETLOGON start command rejected**

Explanation

CICS issues the SETLOGON START command after a successful OPEN VTAM ACB. The SETLOGON START command is rejected in the following cases:

- The CICS OPEN VTAM ACB was successful, but VTAM subsequently terminated abnormally, or
- The CICS OPEN VTAM ACB was successful, but insufficient system storage was available to satisfy the SETLOGON START command, or
- The CICS OPEN VTAM ACB was successful, but VTAM was subsequently terminated by a VTAM HALT QUICK command.

System action

If the error occurs during CICS initialization, CICS abnormally terminates with a U2302 abend and a system dump.

If the error occurs as a result of a CEMT or EXEC CICS SET VTAM OPEN, CICS terminates the task abnormally with abend code ATC2 and a transaction dump, and the VTAM ACB is closed.

User response

The VTAM return code can be found in RTNCD-FDBK2 in the first RPL in the RA pool addressed from TCTVRVRA in the system dump or the transaction dump.

Use the z/OS Communications Server: SNA Programming manual, (SC23-0115-3), to determine the cause of the error and the actions necessary to correct it.

After correcting the error, either reinitialize CICS (for abend U2302) or follow the suggestions documented for abend ATC2.

Module:
DFHZSLS

Destination

Console

DFHZC2303　　　*applid* **No storage available when initiating RECEIVE-ANY's. Code: *X'code'***

Explanation

While trying to acquire receive-any I/O areas, the SETLOGON START VTAM command found that storage was not available.

System action

CICS terminates with a dump. An exception entry *code* is made in the trace table.

A system dump is taken unless dumps have been specifically suppressed in the dump table.

Message DFHZC0133 is issued.

User response

Reduce the size of the RAMAX value in the system initialization table (SIT).

For further information, see the Improving performance.

Module:
DFHZGRP

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*

Destination

Console

DFHZC2304　　　*applid* **RECEIVE-ANY command rejected. Code: *X'code'***

Explanation

This message is issued when the ACB has been opened either during initialization or dynamic open. DFHZGRP was initiating the VTAM RECEIVE-ANY's but VTAM was short on storage or the VTAM HALT QUICK command was issued.

System action

An exception entry *code* is made in the trace table.

A system dump is taken unless you have specifically suppressed dumps in the dump table.

If the error occurs during CICS initialization, CICS issues message DFHZC0133 and terminates.

If the error occurs as a result of a CEMT or EXEC CICS SET VTAM OPEN, CICS closes the VTAM ACB.

User response

The VTAM return code can be found in RTNCD-FDBK2 in the RPL, which is either in the exception trace entry *code*, or in the RA pool addressed from TCTVRVRA in the system dump.

Use the z/OS Communications Server: SNA Programming manual, (SC31-6436), to determine the cause of the error and the actions necessary to correct it.

After correcting the error, either reinitialize CICS or reopen the VTAM ACB.

CORRUPTED TCTTE ADDRESS FOUND DURING SHUTDOWN.

Explanation

A DFHTC CTYPE=LOCATE macro has returned an error indication while shutting down VTAM. This implies that the TCTTE chain has been corrupted, possibly by an overlay of the table manager control blocks.

System action

CICS is abnormally terminated with a system dump.

User response

Investigate the dump to determine the cause of the problem.

Module:
DFHZSHU

Destination

Console

DFHZC2350A

Date Time Applid CICS Terminal Control shutdown threshold (mm minutes) exceeded. Sessions still active: sesslist ((instance) Module name: {DFHZSHU})

Explanation

CICS' attempt to shut down the network has not been completed within the time period allowed. This time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter.

In the message, *mm* is the value of TCSWAIT, and *sesslist* is the VTAM network names of the first 10 (if there are that many) hung VTAM terminals.

System action

CICS issues this message to both the CSNE transient data queue and the operating system console. This message is issued to the operating system console

with an MVS write to operator (WTO) message descriptor code of 2. This means that the message is held by the operating system (that is, it does not roll off the screen) until the operator deletes it. For each hung VTAM session, message DFHZC2351 is also issued. DFHZC2351 gives further details of the session and is issued only to the CSNE transient data queue. CICS may attempt a FORCECLOSE on the session (see message DFHZC2351 for further details) but otherwise CICS terminal control shutdown continues as normal.

This message, DFHZC2350, is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation's DFHZNEP (node error program). Note however that DFHZC2351 is processed by DFHZNAC and may be intercepted by the installation's DFHZNEP.

User response

Note the message, then delete it from the operating system console using the MVS CONTROL E (or K E) system command. See message DFHZC2351 for further guidance.

Module:
DFHZSHU

XMEOUT parameters/Message inserts

1. *Date*
2. *Time*
3. *Applid*
4. *mm*
5. *sesslist*
6. *instance*
7. Value chosen from the following options:

    1=DFHZSHU

CSNE and Console

DFHZC2351	*Date Time Applid termid netname* **Session still active after TC shutdown threshold expired. Reason:** *{01 Request in progress | 02 Task still active | 03 Waiting for SHUTC | 04 Waiting for BIS | 05 Waiting for UNBIND | 06 Waiting for RTR | 07 BID in progress | 08 Other TC work pending | 99 Undetermined} sense ((instance)* **Module name:** *{DFHZSHU}).*

Explanation

CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter. This message is issued for each VTAM terminal that is still active (not shut down) after the time period has expired.

In the message *termid* and *netname* are respectively, the CICS terminal identifier, and the VTAM network name of the hung terminal. One of the following is also included in the message to indicate the reason for the hang:

01

   Request in progress

02

   Task still active

03

   Waiting for SHUTC

04

   Waiting for BIS

05

   Waiting for UNBIND

System action

CICS may attempt a FORCECLOSE on the session but otherwise CICS terminal control shutdown continues normally. Whether CICS attempts a FORCECLOSE depends upon:

- The coding of the TCSACTN system initialization parameter, and
- How the installation's DFHZNEP (node error program) handles this condition.

If either of the following conditions is true:

- TCSACTN=UNBIND, and this action is not changed by DFHZNEP,

- TCSACTN=NONE, and this action is changed to FORCECLOSE (UNBIND) by DFHZNEP

CICS terminal control issues a VTAM CLSDST and sends an SNA UNBIND command. If neither of the conditions is true, no special action is taken.

Note:

CLSDST is not guaranteed to work in all circumstances.

The first 10 terminals (if there are that many) reported by this message are also included in message DFHZC2350.

User response

Check the state of the terminal. Check whether the associated DFHZC3437 message includes CLSDST. If DFHZC3437 does not include CLSDST, or it does but the CLSDST still fails to complete, take appropriate action outside of CICS to shut down the terminal.

If after a reasonable interval, terminal control shutdown still fails to complete (message DFHZC2316 is not displayed), take one of the following actions:

- FORCECLOSE the CICS/VTAM ACB.
- Perform a CICS CEMT PERFORM SHUTDOWN IMMEDIATE.
- Cancel the CICS job from the operating system console.

Warning: Do not perform one of these actions unless there are no other suitable actions to take.

The reason why the terminal does not shutdown is more likely to be a problem with the terminal device or the network, than with CICS.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TCSWAIT system initialization parameter on future runs of CICS. Once CICS has initialized, TCSWAIT cannot be changed.

CSNE

DFHZC2352	*DATE TIME APPLID sysid netname* **Intersystem parallel connection still active after TC shutdown threshold expired. ((***instance***) Module *{DFHZSHU}*).**

Explanation

CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter. This message is issued for the first VTAM intersystem parallel session in each connection (LU Type 6.1 and LU Type 6.2, but not LU Type 6.2 single-session APPC terminals) that is still active (not shut down) after the time period has expired.

In the message *sysid* and *netname* are respectively, the CICS system identifier and the VTAM network name.

System action

If the TCSACTN=FORCE system initialization parameter has been specified CICS will attempt to force close the CICS VTAM ACB, provided that CNOS close processing has completed for LU Type 6.2 parallel session connections, otherwise CICS terminal control shutdown continues as normal. This message is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation's DFHZNEP (node error program). Parallel connections reported by this message are not included in message DFHZC2350.

User response

If the TCSACTN=FORCE system initialization parameter has not been specified, or has been specified but the VTAM ACB still does not close, check the state of the connection. Take appropriate action outside of this CICS system to shut down the connection.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TCSWAIT system initialization parameter on future runs of CICS. Once CICS has initialized TCSWAIT cannot be changed.

DFHZC2400 E	*date time applid termid tranid* **Error not supported.** *sense* **((***instance***) Module name: {DFHZSYX	DFHZSYX	DFHZSYX	DFHZSYX	DFHZSYX	DFHZSYX	DFHZSYX	DFHZSYX	DFHZSYX	DFHZSYX})**

Explanation

CICS received an unexpected error code from VTAM.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

The *sense* data consists of three hexadecimal values - *xx yy zzzz*, where *xx* is the VTAM sense information byte, *yy* is the VTAM sense modifier byte, and *zzzz* represents two bytes of user sense information. The possible values of *xx* are as follows:

xx
    meaning

X'00'

    User sense data only (see *zzzz*)

X'08'

    Request reject

X'10'

    Request error

X'20'

    State error

X'40'

    Request header (RH) usage error

X'80'

    Path error

For the meaning of *yy*, see the Systems Network Architecture Formats (GA27-3136) manual.

System action

CICS terminates the session. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the symptom string, and if necessary the transaction dump, to determine the source of the error.

Module:
DFHZSYX

CSNE

DFHZC2402 I	*date time applid termid tranid netname* **VTAM has returned error on synchronous receive.** *sense* **((***instance***) Module name: {***DFHZRAS***})**

Explanation

VTAM has indicated that a synchronous receive issued by DFHZRAS during receive-any slow-down processing did not complete successfully. This indicates a serious mismatch between CICS's view of the state of the session and that of VTAM. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The request is ignored. CICS prints the associated session TCTTE on the CSNE transient data destination. The RPL returned by VTAM is included in exception trace entry AP FCA2.

User response

Determine from the RPL in the exception trace why VTAM raised the error.

CSNE

DFHZC2403 E   *date time applid termid tranid* **Bind failure.** *sense* **((***instance***) Module name: {DFHZSYX | DFHZSYX})**

Explanation

An attempt to establish a session has failed. This can be because a physical path to the device could not be found for one of the following reasons:

- The device does not exist
- The device has been defined incorrectly
- The device has rejected the bind

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

If this is a LU62 or LU61 session and the partner LU has sent sense bytes of X'0835nnnn' where nnnn is the offset of the NETNAME in the BIND. This indicates that the partner LU was unable to find a suitable session.

If the sense bytes are X'08010000', this can mean that the partner LU has failed to autoinstall a connection.

If the VTAM RETURN CODE FEEDBACK is X'1018' then VTAM generic resource is in use but the coupling facility is unavailable.

If *instance* is 1 with *sense* code '0805', and the following are true:

- This system (TOR2) is a member of a generic resource (GR) and the partner (AOR) is not
- An affinity already exists between another member (TOR1) of the same generic resource (GR) and the AOR

this indicates that it is not valid to acquire this connection. This message is normally accompanied by DFHZC2411 instance 36 for the equivalent sessions in the AOR. DFHZC2411 indicates that the AOR cannot find a connection defined with the real name of

TOR2. The AOR connection is defined with the generic resource name of the TOR.

System action

Because communication cannot be established with a node, a VTAM CLSDST macro is issued to release any control blocks previously built, and the node could be placed out of service.

User response

Use the VTAM sense code given in the message to determine the cause of failure. If appropriate, ensure that the node name was included in the network control program/virtual storage (NCP/VS) generation deck and investigate for a possible bad communication line.

If the sense bytes were X'0835nnnn' (where nnnn is the offset of the NETNAME in the BIND), the partner LU was unable to find a suitable session. If the partner LU is CICS, look in the partner LU's log for DFHZC2411 and previous messages for the same session. This should give some indication as to why no session could be found.

If LU62 autoinstall is in use and the sense bytes were X'08010000' look in the partner LU's log for messages DFHZC2411 and DFHZC69xx which should indicate the reason for failure to autoinstall a connection.

If the VTAM RETURN CODE FEEDBACK is X'1018': the logon can be retried once the coupling facility becomes available.

If *instance* is 1 with *sense* X'0805', determine if TOR2 was started intentionally with a different APPLID and the same generic resource name and if not, correct the problem. If it was and you need a connection between these two systems you need to end the affinity between AOR and TOR1. The affinity can be ended by:

1. Bring up TOR1, acquire the connection and release it or

2. Bring up TOR1 and use the CEMT SET CONNECTION ENDAFFIN, CEMT PERFORM ENDAFFIN or EXEC CICS ENDAFFIN command.

3. Use a batch program described in 'Writing a batch program to end affinities' in the CICS intercommunication.

However, if the AOR is within the same sysplex as the TOR you should be using MRO connections rather than APPC - you then get no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired from the TOR you need to use a HUB as described in 'Using a HUB' in the CICS

intercommunication to prevent two TORs from attempting to connect to one AOR using the generic resource name.

Alternatively you can change the AOR connection to address TOR2 by its real name as opposed to its generic resource name and always acquire the connection from the AOR. This implies that you must not use AUTOCONNECT in the TOR connection.

You should release the connection as soon as possible.

DFHZC2404 E	*date time applid termid tranid* **VTAM Detected Logic Error.** *sense* **((***instance***) Module name: {DFHZLEX | DFHZLEX | DFHZLEX | DFHZLEX | DFHZLEX | DFHZLEX})**

Explanation

VTAM detected an error in a request. The request was either incomplete or not executable. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS breaks communication with the node (CLSDST), abnormally terminates any attached task, places the node out of service and produces a transaction dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Ensure that all application programs running concurrently have proper addressability, thereby avoiding alteration of CICS control blocks such as the TCTTE or the RPL. If this message occurs during normal system execution, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

This message may also occur if VTAM is terminating. Under these conditions it is not a serious problem, and usually no response is necessary.

For more information about VTAM return codes, see the Feedback code data structure page of the z/OS 2.1.0 documentation.

CSNE

DFHZC2405 E	*date time applid termid tranid* **Node** *netname* **not activated.** *sense* **((***instance***) Module name: {DFHZSIM | DFHZSIM | DFHZSIM | DFHZSIM | DFHZSIM | DFHZSYX | DFHZSYX | DFHZSYX | DFHZSIX | DFHZSYX | DFHZSYX})**

Explanation

The node was not activated, or was deactivated by the network operator, or a generic resource affinity

already exists with another system in the same generic resource.

Instance 6 - If the partner is a member of a generic resource (TOR2) and this system (AOR) is not and an affinity already exists between the AOR and another member of the same generic resource (TOR1) because TOR1 crashed, then VTAM has indicated that you cannot acquire this connection. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding SEND and RECEIVE requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node, and internal LOGONs are prevented.

If this message is issued during takeover, the acquire is retried at intervals of 1, 2, 4 and 8 minutes after the first attempt. This allows time for sessions which require manual intervention before the acquire can succeed.

User response

Use the VTAM VARY command to activate the node before using it in the network. Alternatively, for ISC with IMS, enable IMS for LOGONs.

It is possible that the node in question has previously been used as a generic APPLID (or in VTAM terms - a USERVAR). Use the VTAM operator command DISPLAY USERVAR to see if this is the case. If it is, you can use MODIFY USERVAR,OPTION=DELETE,ID=node to delete the USERVAR.

Instance 6 - Determine if TOR2 was started intentionally with a different APPLID and the same GR name and if not, correct the problem. If it was and you need a connection between these two systems then you need to end the affinity between the AOR and TOR1. The affinity can be ended by:

1. Bring up TOR1, acquire the connection and release it cleanly or

2. Bring up TOR1 and use ENDAFFIN via CEMT or EXEC CICS or

3. Use a batch program described in 'Writing a batch program to end affinities' in the CICS intercommunication.

However, if the AOR is within the same sysplex as the TOR you should be using MRO connections rather than APPC - you then get no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired from the TOR then you need to use

a HUB as described in 'Using a HUB' in the CICS intercommunication to prevent two TORs from attempting to connect to one AOR using the generic resource name.

Alternatively you can change the AOR connection to address TOR2 by its real name as opposed to its generic resource name and always acquire the connection from the AOR. This implies that you must not use AUTOCONNECT in the TOR2 connection.

DFHZC2411 E	*date time applid termid tranid nodeid* **attempted invalid logon.** *sense* **((*instance*) Module name: {DFHZSCX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZATA | DFHZLGX | DFHZLGX | DFHZLGX | DFHZSCX | | DFHZLGX | DFHZLGX | DFHZLGX | DFHZLGX | DFHZLGX | DFHZLGX | DFHZLGX | DFHTFP | DFHZLGX | DFHZSCX | DFHZLGX | DFHZLGX | DFHZSCX | DFHZLGX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZLGX | DFHZBLX | DFHZSCX | DFHZBLX})**

Explanation

Node *nodeid* attempted to log on to CICS but the logon is invalid.

The *nodeid* in the message will always start with the 'netname' of the node attempting to connect to CICS. For some instances of the message resulting from an LU6.2 log on, the modename of the session will be concatenated to the 'netname' with a dot separator. Since a string consisting of eight blanks is the default modename, this can lead to idiosyncratic formatting of the message.

If the message is issued by DFHZATA, CICS has failed in its attempt to autoinstall the terminal or connection.

The instance *instance* is one of the following:

1

For LU6.1 no suitable TCTTE can be found, or no session TCTTE exists This could occur for one of the following reasons:

1. The bind did not contain a modename.
2. There is an RDO definition for a member name connection in a generic resource communicating with another generic resource over an LU6.1 link.

2

No PLUNAME has been found in the LU6.2 bind processed by CICS.

3

An attempt to autoinstall a member name connection in a generic resource system has failed because the bind was not for a SNA service manager.

4

Autoinstall is not allowed because the system is terminating.

5

Autoinstall is not allowed because the VTAM ACB is closing.

6

ISC support is not present because ISC=NO specified in the SIT.

7

Used by DFHZATA for several reasons, for example BIND bad and user exit bad.

8

The TCTTE address restored and the address found by NIBSEARCH do not agree.

9

The system is terminating.

10

VTAM is terminating.

11

RESERVED.

12

RESERVED.

13

No address is present in the RPL.

14

LU6.1 cannot autoinstall.

If both CICS systems are registered as different generic resources, the LU61 connections must be defined with each other's generic resource netnames; they cannot communicate by member name. In this case CICS looked for the generic resource netname and was unable to find it.

15

ISC support is not present.

16

A CINIT arrived for an APPC parallel session. This is not supported All input for an APPC parallel session should be via a BIND. Also, no connection exists with this NETNAME.

17

Session is not bound.

18

Not used.

19

LU is not enabled. Typically it is an XRF alternate CICS.

20

A second CINIT with the same netname has arrived.

21

Logon rejected due to CATA abend.

22

A CINIT initiated by SIMLOGON occurred for an APPC paralled session. A matching connection exists, but it is being deleted. This should not occur because either the delete should have been cancelled (if it had been scheduled but not started) or the SIMLOGON should have been queued until

the delete was attempted and fails because there is SIMLOGON activity.

23

A BIND was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.

Change the partner's connection definition for this system to use a NETNAME of this system's generic resource name.

24

Not used.

25

A CINIT was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.

Change the partner's connection definition for this system to use a NETNAME of this system's generic resource name.

26

A BIND was received for an LU6.1 connection. This CICS is registered as the same generic resource as the partner. However, the partner addressed CICS by the generic resource name instead of the member name which it should use for intra-plex communication.

Change the partner's connection definition for this system to use a NETNAME of this system's member name.

27

A CINIT was received for an LU6.1 connection. This CICS is registered as the same generic resource as the partner. However, the partner addressed CICS by the generic resource name rather than the member name which it should use for intra-plex communication.

Change the partner's connection definition for this system to use a NETNAME of this system's member name.

28

An LU62 bind was received for the netname specified. CICS has found a connection with the relevant netname but the connection was not defined as APPC.

29

A system entry for the connection indicated by the bind has been found but none of its sessions are usable.

30

No modename field UDSS02 was found in the bind.

31

Examination of the session tctte has indicated it to be out of service, a non-SNA service manager session and to have the associated connection released.

32

An attempt to autoinstall a GR name or XRF connection has failed because the bind was not for a SNA service manager.

33

This bind is a SNA service manager request for an existing partner.

34

There is a problem with the user data supplied in the bind. Specifically one of the following.

- There is no user data.
- The user data supplied is too short.
- The user data is not architected.

35

A delete is pending for the connection found. This delete is for a non-transient terminal definition and has been requested explicitly.

36

For a non-generic resource request, examination of the bind has indicated that it is not for a SNA service manager.

This instance also indicates that you should not acquire this connection if the partner is a member of a generic resource, and this system is not, and an affinity already exists between this system and another member of the same generic resource. See message DFHZC2403, which is issued for the partner's equivalent sessions, for how you correct the situation.

37

The current session count has exceeded the maximum session count indicated in the mode group entry.

This can be caused by a VTAM LU definition with a duplicate netname. At session initiation time VTAM cannot detect that there may be two Independant Logical Units (ILUs) with the same netname. This can lead to CICS being requested to bind more sessions than specified in the mode group.

38

An attempt to acquire a generic resource connection failed because there is a member name connection defined for the generic resource member to which VTAM has chosen to route it.

39

This CICS has deregistered from a generic resource but a remote partner is attempting to bind an APPC session using a generic resource name. This indicates that VTAM affinities have not been ended on both sides.

40

This CICS has deregistered from a generic resource but a remote partner is attempting to bind an LU6.1 session using a generic resource name. This indicates that VTAM affinities have not been ended on both sides.

41

A bind has been received for an APPC SNA Service Manager session while the connection is in the process of being released. As the maximum number of SNASVCMG sessions has already been set to zero, acceptance of this bind would leave the connection in a Freeing state and is therefore rejected. Retry the Acquire of the connection when all the user sessions have been CLSDST and the connection is released.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

If ???????? is displayed in the second half of the *nodeid* field, the BIND may contain a SESSION QUALIFIER or MODENAME with an invalid length.

System action

The logon is rejected. If the reject is from DFHZSCX via the dummy TCTTE, an attempt is made to print the failing BIND and sense code with which it was rejected as part of the message.

User response

Use the instance number to determine why the attempted logon has been rejected and take the appropriate action.

DFHZC2412 E   *date time applid termid tranid*
Receive any request failed.
sense **((*instance*) Module name:**
{DFHZRAC | DFHZRAC})

Explanation

A receive-any request to VTAM failed. VTAM was terminated. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The VTAM RPL control block is logged to the CSMT log for visual inspection.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Determine the reason why the receive-any failed. First, check to see if the VTAM RPL has been altered. If it has been altered, check to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the z/OS Communications Server: SNA Programming manual, (SC23-0115), during problem determination.

Unsupported command received.
sense **((***instance***) Module name:**
{DFHZRLP | DFHZRLP | DFHZRVX |
DFHZRVX | DFHZRAC | DFHZRAC |
DFHZRAC | DFHZRAC | DFHZRAC})

Explanation

An unknown command or request was detected, or the RPL contains logical unit (LU) status. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

If an invalid command or request was detected, all outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node.

For ISC sessions, this error may be caused by specifying incompatible session types at each node. (For example, SESSIONTYPE=SEND in one node and SESSIONTYPE=FASTRECV in the other node.)

If the RPL contains logical unit (LU) status, one of the following messages is issued: DFHZC2461, DFHZC2462, DFHZC2464, DFHZC2465, or DFHZC2466.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

An invalid command or request indicates inconsistencies or errors in the definitions of the named terminals/sessions in CICS, VTAM or the connected system for LU6 sessions. Ensure that these definitions are consistent and correct for the device or session characteristics.

Module:
DFHZRAC, DFHZRVX, DFHZRLP

DFHZRAC | DFHZRAC | DFHZRAC |
DFHZRAC | DFHZRAC | DFHZRAC |

DFHZRAC | DFHZARL | DFHZARL | DFHZEV2 | DFHZEV2 | DFHZRAC | DFHZRAC | DFHZOPN})

Explanation

During terminal processing, CICS detected an invalid internal state in DFHZCP.

Instance 1 of the message could be caused by a loss of data following a persistent sessions restart in a partner system. In this case, no logic error has occurred because any updates are backed out. This normally follows an AZCD for the same session and the message DFHZC0144 for the partner session. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding send and receive requests are purged, and the task is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to the CSMT destination for debugging purposes.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Ensure that the application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to locate the source of the error.

It may be useful to examine the debugging data printed on the CSMT log for clues about what possibly went wrong.

CSNE

DFHZC2423 E   *date time applid termid tranid* **Attempted to send unsupported command.** *sense* **((***instance***) Module name: {*DFHZSDS*})**

Explanation

A request to send data synchronously was incomplete. Possible reasons are as follows:

1. The TCTTE was altered.

2. A logic error was encountered.

3. The TCTTE was inadvertently placed on the send-synchronous queue.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User response

For reasons 1 to 3 listed above, ensure that application programs running concurrently do not alter the TCTTE.

If you suspect a logic error (2), check that the VTAM RPL has not been corrupted. If you still cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHZC2424 E   *date time applid termid tranid* **SESSIONC command request invalid.** *sense* **((***instance***) Module name: {*DFHZSES | DFHZSES | *})**

Explanation

A SESSIONC request is incomplete or invalid. Possible reasons are as follows:

1. The TCTTE was altered.

2. The command request bits are incomplete. DFHZSES checks TCTEISDT for a Start Data Traffic (SDT) command, TCTEISTS for a Set and Test Sequence Number (STSN) command, and TCTEICLR for a CLEAR command. If it does not find any of these, DFHZSES causes the message to be issued.

3. The wrong request was queued to SESSIONC.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User response

Ensure that application programs running concurrently do not alter the TCTTE.

If the TCTTE is not altered, check for conditions 2 or 3.

Send DFSYN request incomplete.
sense **((***instance***) Module name:**
{*DFHZSDS*})

Explanation

A send-synchronous request was issued without
indicating that either a command or data was to be
sent. This imbed is inserted in DFHZC *xxxx* messages
with *sense* inserts. For the meaning of *sense* , see
message DFHZC2400.

System action

All outstanding send and receive requests are purged.
If a task is attached, it is abnormally terminated with a
transaction dump.

Message DFHME0116, which contains the symptom
string for this problem, is produced.

User response

Check the VTAM RPL for obvious errors. Ensure that
application programs running concurrently do not alter
the TCTTE. If the TCTTE is not being altered, use
the symptom string, and if necessary, the dump to
determine the source of the error.

RESETSR request invalid RTYPE.
sense **((***instance***) Module name:**
{*DFHZRST | DFHZRST | DFHZRST*})

Explanation

An invalid RESETSR request was made in the VTAM
macro issued by CICS. The invalid request can be
because an RTYPE was not specified or was incorrectly
specified, or the TCTTE was altered. This imbed is

inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Check the VTAM RPL for obvious errors. Ensure that application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the symptom string, and if necessary the dump, to determine the source of the error.

DFHZC2433 E	*date time applid termid tranid nodeid* **Logon has failed because autoinstall is disabled.** *sense* **((***instance***) Module name:** ***{DFHZLGX | DFHZLGX | DFHZBLX | DFHZBLX})***

Explanation

Node *nodeid* attempted to log on to CICS. The logon has failed because autoinstall is disabled. Possible reasons are:

- Autoinstall system initialization parameters have been incorrectly defined.
- An error has been detected in CICS terminal attach processing.
- The system is short on storage. Autoinstall is reenabled once the SOS condition ends.

System action

The logon is rejected.

User response

Ensure that the value for the AIQMAX system initialization parameter is greater than zero. If an autoinstall user program has been specified for system initialization parameter AIEXIT, check that the program name has been defined to CICS. See the Configuring for further information about autoinstall parameters.

If the system is short on storage, see the associated messages for further guidance.

Destination

CSNE

DFHZC2435 E *date time applid termid tranid* **RPL missing.** *sense* **((***instance***) Module name: *{DFHZRVS}*)**

Explanation

CICS issued a receive-specific request VTAM without specifying a request parameter list (RPL). This condition could result from one of the following reasons:

- An RPL was not allocated
- An RPL was allocated, but later freed
- TCTERPLA was altered.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A CLSDST macro is issued to terminate communication with the node.

User response

Use the dump to determine whether the TCTTE was altered by an application program. If it was, correct the error. If the TCTTE has not been altered, check for potential RPL problems.

The application program either sent a begin-bracket indicator while the transaction was in bracket state, or sent an end-bracket indicator. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro, and the node is placed out of service.

User response

Correct the application program.

Module:
DFHZRAC, DFHZRVX

XMEOUT parameters/Message inserts

Destination

CSNE

DFHZC2450 E   *date time applid termid tranid* **Bid issued but ATI cancelled.**

sense **((***instance***) Module name:** *{DFHZRVX | DFHZRVX | DFHZRVX | DFHZSSX | DFHZSSX | DFHZSSX | DFHZRAC | DFHZRAC | DFHZRAC})*

Explanation

An automatic task initiation (ATI) request was issued without an ATI pending for that terminal. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS will satisfy the BB pending condition by sending a standalone BB-EB.

User response

If ATI is time-initiated, increase the timer value.

Module:
DFHZRAC, DFHZRVX, DFHZSSX

XMEOUT parameters/Message inserts

Destination

CSNE

DFHZC2451 E   *date time applid termid tranid* **Outstanding request when clear**

was issued. *sense* **((***instance***)**
Module name: {*DFHZSYX*})

Explanation

A request was outstanding when clear was issued.
A receive-specific request was pending when a clear
indicator was issued. A clear indicator is sent when
any of the following occurs:

- The logical unit is lost (LOSTERM).
- CICS issues a VTAM CLSDST macro.
- CICS issues the clear during message
  resynchronization.

This imbed is inserted in DFHZC *xxxx* messages with
sense inserts. For the meaning of *sense* , see message
DFHZC2400.

System action

All outstanding requests are purged. If a task
is attached, it is abnormally terminated with a
transaction dump.

User response

None.

Module:
DFHZSYX

Destination

CSNE

DFHZC2452 E   *date time applid termid tranid*
Invalid command received.
sense **((***instance***) Module name:**
{*DFHZSCX*})

Explanation

CICS received an invalid command (VTAM indicator).
The CICS session-control input exit-routine (SCIP)
encountered an indicator other than request-recovery.
This routine should be scheduled only when a request-
recovery indicator is received from the controller
application program. This imbed is inserted in DFHZC
xxxx messages with *sense* inserts. For the meaning of
sense , see message DFHZC2400.

System action

If a task is attached, it is abnormally terminated with
a transaction dump. The session is terminated and the
node is placed out of service.

User response

Check the VTAM RPL for obvious errors. Use the dump
to help determine the source of the problem.

Destination

CSNE

DFHZC2453 E   *date time applid termid tranid*
Request recovery received.
sense **((***instance***) Module name:**
{*DFHZSCX*})

Explanation

A request for recovery was received. The secondary
logical unit requested message resynchronization by
sending a request-recovery indicator, but a message
sequence number is inconsistent with the sequence
number maintained by the 3601 application program.
This imbed is inserted in DFHZC *xxxx* messages with

sense inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Message resynchronization is then initiated by CICS.

User response

None.

Module:
DFHZSCX

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *tranid*
6. *sense*
7. *instance*
8. Value chosen from the following options:

    1=DFHZSCX

Destination

CSNE

DFHZC2454 E	*date time applid termid tranid* **Exception in chain.** *sense* **((*instance*) Module name: {DFHZSYX})**

Explanation

An exception response was returned on a POST=RESP chain-data send. CICS normally does not send chained data using POST=RESP. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the symptom string, and if necessary the transaction dump, to determine the source of the error.

Module:
DFHZSYX

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *tranid*
6. *sense*

Destination

CSNE

DFHZC2455 E	*date time applid termid tranid* **In CA mode - Task attached.** *sense* **((*instance*) Module name: {DFHZATT})**

Explanation

An attempt to attach a task to a logical unit (LU) was made, despite the task being in continue-any (CA) mode. However, terminal *termid* already had a task attached to it. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The task that is already attached to terminal *termid* is abnormally terminated with a transaction dump.

Message DFHME0116, which contains the symptom string for this problem, is produced. Communication with the node is terminated by issuing the VTAM CLSDST macro. CICS then reestablishes communication with the node by issuing the SIMLOGON macro.

User response

Use the symptom string, and if necessary the dump, to determine the source of the error. Try to determine why there was an attempt to attach a task to terminal *termid* while it already had a task attached to it.

Module:
DFHZATT

XMEOUT parameters/Message inserts

Destination

CSNE

DFHZC2467 E *date time applid termid tranid* **Invalid communications ID (CID) detected.** *sense* **((***instance***) Module name:** *{DFHZLEX}***)**

Explanation

CICS issued a VTAM request containing a communications identifier (CID) which VTAM did not recognize. This may be due to the TCTECID field having been altered. Alternatively, it may mean that the session is in the process of being closed down by VTAM and that CICS has tried to use it before the process was complete. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. If the losterm exit was driven with return code X'0C', X'10', or X'14', CICS issues a CLSDST to VTAM.

User response

Ensure that application programs running concurrently do not alter the TCTECID field in the TCTTE. Also check that the session is still active; that is, that the system being communicated with is still functioning.

Destination

CSNE

DFHZC2468 E *date time applid termid tranid* **Name** *netname* **unknown or vary activate required.** *sense* **((***instance***) Module name:** *{DFHZLEX}***)**

Explanation

Either the node has not been activated by VARY ACTIVATE or CICS issued a VTAM request containing an invalid symbolic node name where:

- The name may have been altered in the node initialization block (NIB)
- The name was specified during VTAM definition and does not agree with the name in the TCT.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service.

User response

Either issue VARY ACTIVATE for the node, or ensure that application programs running concurrently do not alter the NIB name. Names specified during VTAM definition must agree with those in the CICS definitions.

Destination

CSNE

DFHZC2470 E   *date time applid termid tranid* **Task active at Shutdown.** *sense* **((*instance*) Module name: {DFHZASX})**

Explanation

One of the following has occurred:

- A request shutdown indicator was received from the controller application program on behalf of the node while a task was still attached.
- During VTAM shutdown, a shutdown complete indicator was received from the controller application program on behalf of the node while a task was still attached

- During VTAM shutdown, a task was still attached to a VTAM 3270 (which cannot send request shutdown or shutdown complete).

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

In the first two cases, CICS honors the command. In all cases, all outstanding send and receive requests are purged, and if a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro.

User response

None.

CSNE

DFHZC2475 E	*date time applid termid tranid* **Function cancelled by LU device.** *sense* **((***instance***) Module name: {***DFHZNAC***})**

Explanation

The logical unit (LU) has terminated all processing connected with one of its components. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response

Correct the problem with the LU component and bring it back online. Possible causes of the problem include the following:

- Power for the device is switched off
- A line that is down
- A hardware problem
- In the case of an LU6 link, the connected transaction, for example, CSMI, has terminated abnormally.

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *tranid*
6. *sense*
7. *instance*
8. Value chosen from the following options:

   1=DFHZNAC

Destination

CSNE

DFHZC2476 E	*date time applid termid tranid* **Resource unavailable.** *sense* **((***instance***) Module name: {***DFHZNAC***})**

Explanation

A component of the logical unit (LU) is no longer available. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response

Correct the problem with the LU component and bring it back online. Possible causes of the problem include the following.

- Power for the device is switched off.
- A line that is down.
- A hardware problem.

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *tranid*

6. *sense*

7. *instance*

8. Value chosen from the following options:

   1=DFHZNAC

Destination

CSNE

DFHZC2477 E   *date time applid termid tranid* **Chaining not supported.** *sense* **((***instance***) Module name: {***DFHZNAC***})**

Explanation

The logical unit (LU) does not support chaining of data from the host. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All send requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response

Ensure that the maximum amount of data being transmitted to the LU does not exceed the length specified in the buffer parameter of the DFHTCT macro instruction.

Note: The buffer parameter value can be increased only to the maximum acceptable limit of the LU.

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *termid*

5. *tranid*

6. *sense*

7. *instance*

8. Value chosen from the following options:

   1=DFHZNAC

Destination

CSNE

DFHZC2478 E   *date time applid termid tranid* **Invalid FMH.** *sense* **((***instance***) Module name: {***DFHZNAC***})**

Explanation

The function management header (FMH) transmitted to the logical unit (LU) had no counterpart on the translate table. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All send and receive requests are purged. If the batch data interchange program is not being used, the transaction is abnormally terminated with a transaction dump. The first part of the TIOA, containing the FMH, is written to the CSNE log.

User response

Correct the application program so that the LU has a counterpart on the translate table.

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *termid*

5. *tranid*

6. *sense*

7. *instance*

8. Value chosen from the following options:

Destination

CSNE

DFHZC2479 E   *date time applid termid tranid* **Function not supported.** *sense* **((***instance***) Module name: {***DFHZNAC***})**

Explanation

The response unit (RU) received by the logical unit (LU) contains a request that this device does not support. This imbed is inserted in DFHZC *xxxx* messages with

sense inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response

Ensure that the terminal control table (TCT) generation specifications for the device are valid as well as able to accommodate the application requests. (For example, a read-only device being defined as transceive, yet having a bid sent to it.)

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *tranid*
6. *sense*
7. *instance*
8. Value chosen from the following options:

    1=DFHZNAC

Destination

CSNE

DFHZC2480 E	*date time applid termid tranid* **Retry requested.** *sense* **((***instance***) Module name: {***DFHZNAC***})**

Explanation

The logical unit (LU) has indicated, via sense codes contained in an exception response or an LU status message, that it requires the data to be retransmitted. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

Retransmission of data will be attempted only in the case of protected tasks (message integrity). If the exception response containing the retry sense codes is received for an unprotected task while in chain

processing, a cancel command will be sent to the LU and the task will be resumed. If CICS is not in chain processing, the transaction will be resumed.

User response

If message retransmission is necessary for the LU, ensure that the retry sense codes are imbedded in the exception response. Also ensure that the host transaction is defined as a protected task (message integrity).

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *tranid*
6. *sense*
7. *instance*
8. Value chosen from the following options:

    1=DFHZNAC

Destination

CSNE

DFHZC2481 E	*date time applid termid tranid* **RU Error.** *sense* **((***instance***) Module name: {***DFHZNAC***})**

Explanation

The response unit (RU) received by the logical unit (LU) was either not translatable or had an invalid length. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response

Retrying the request a number of times by use of the node error program (NEP) mechanism may be necessary. This is because this type of error may stem from a bad communication line. If this

fails, check for possible invalid or inappropriate terminal specifications at terminal control table (TCT) generation time.

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*

Destination

CSNE

DFHZC2482 E	*date time applid termid tranid* **Pipeline session bracket error.** *sense* **((***instance***) Module name: {*DFHZATT*})**

Explanation

Terminal *termid* was defined in the terminal control table (TCT) as running in pipeline session mode. However, the BRACKET operand in that definition was either omitted or was specified as BRACKET=YES. Bracket protocol is not enforced on a pipeline session terminal. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All send and receive requests are purged and the session is terminated. If a task is attached, it is abnormally terminated with a transaction dump.

User response

Correct the resource definition by inserting the BRACKET=NO operand.

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*

2. *time*
3. *applid*
4. *termid*
5. *tranid*

DFHZBLX | DFHZLGX | DFHZLGX |
DFHZLGX | DFHZLGX | DFHZLGX |
***DFHZLGX | DFHZLGX | DFHZLGX}*)**

Explanation

A connection request was rejected. CICS is temporarily unable to carry out the connection request. The TCTTE for node *nodeid* indicated that the session could not be established. *returncode* gives the reason, as follows:

1. The CLSDST macro has been scheduled for this node
2. The node is in an abnormal condition
3. The node has an error condition raised against it
4. The node is already in use
5. CICS is terminating
6. VTAM is terminating.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The connection request is rejected.

User response

Retry the connection request when the node becomes available. See the Developing system programs for

CICS for more information on the CLSDST macro and for an explanation of abnormal node conditions.

Module:
DFHZLGX, DFHZSCX, DFHZBLX

3270 - Invalid copy request.
sense **((***instance***) Module name:**
{*DFHZARQ | DFHZARQ | DFHZARQ***})**

Explanation

The TYPETERM or TERMINAL resource definition of the device from which the information is to be copied ("from" device) did not specify the COPY feature. Alternatively, the "from" device:

- Is not defined to CICS, or
- Is not a 3270, or

- Is not connected to CICS via VTAM.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

If a task is attached, it is abnormally terminated with a transaction dump.

User response

Ensure that the application program is aware of the device configuration. Furthermore, ensure that the "from" device is defined to CICS as a 3270 device AND is connected to CICS.

Module:
DFHZARQ

Destination

CSNE

DFHZC2492 E *date time applid termid tranid* **Intervention required on 3270 printer.** *sense* **((*instance*) Module name: {DFHZNAC})**

Explanation

This message is sent to the CSNE message log when an INTERVENTION REQUIRED condition is detected on a 3270 printer. This condition could occur for any of the reasons listed below.

- A transaction has requested the use of a printer that does not exist.
- The printer adapter feature is not present.
- There is no paper in the printer.
- The printer cover is open.
- The printer is offline.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

No action is performed except printing of the RPL and the TCTTE.

User response

Check that the printer is in proper working order. If it is, check that the printer is properly defined to CICS and that the transaction requests proper printer operations.

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSNE

DFHZC2494 E	*date time applid termid tranid* **Error status** *sense* **received from 3270. ((***instance***) Module name: {DFHZNAC})**

Explanation

An error status message *sense* was received from a 3270 Information Display System. An INTERVENTION REQUIRED condition causes an "intervention required" message to be output instead of this message.

System action

If a task is attached, it is abnormally terminated with a transaction dump. If bad data, sent by Basic Mapping Support (BMS), causes an operation check, the bad data is purged.

User response

Analyze the error status codes to determine the proper course of action required to correct the unit error or program error.

For non-SNA 3270 devices, the sense code is 0000 xxxx, where xxxx is sense data returned by the control unit to which the 3270 device is attached. Datastream errors are rejected with an Operation Check, and commands with a Command Reject. Details of error status codes are given in the IBM 3274 Control Unit Planning, Setup, and Customizing Guide (provided in Archived CICS documentation).

CSNE

DFHZC2495 E	*date time applid termid tranid* **Printer Outserv/int reqd/ineligible. Req queued.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation

DFHZNAC has performed an interval control PUT to a 3270 printer on behalf of a DFHZC2497 "unavailable printer" condition. The printer is:

- Out of service,
- Has an intervention situation, or
- Does not have a RECEIVE or TRANSCEIVE status.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

Other processing continues.

User response

Determine why the printer is unavailable. If the terminal is out of service, put it back into service. If the terminal has an intervention situation, determine what this situation is and correct it. If the terminal does not have a RECEIVE or TRANSCEIVE status, place it into RECEIVE or TRANSCEIVE status.

DFHZC2496 E *date time applid termid tranid* **IC put to printer failed{ | IOERROR | TRNIDER | TRMIDER | INVREQ}.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation

DFHZNAC has attempted to perform a DFHIC TYPE=PUT macro as the result of a DFHZC2497 "unavailable printer" condition and has failed. This message is written to the CSNE log. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

DFHZNEP is recalled by DFHZNAC to allow for further processing.

User response

Ensure that:

- The interval control program (ICP) is capable of handling the request that DFHZNAC is issuing for the IOERROR and INVREQ errors
- CSPP is an installed transaction definition for the TRNIDER error
- DFHZNEP is passing DFHZNAC as a valid terminal address for the TRMIDER error.

    1=DFHZNAC

Destination

CSNE

DFHZC2497 E *date time applid termid tranid* **Unavailable printer.** *sense* **((***instance***) Module name: {DFHZARQ})**

Explanation

A print function was requested on a 3270 display device. Neither the PRINTTO or the ALTPRT printer was available to receive the information. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

If no NEP action is specified, the print request is halted.

User response

A possible solution is to route the data available at TCTTEDA in the provided terminal entry to a transient data queue that causes automatic task initiation later to a printer. This would be done in DFHZNEP. For more information, see the Developing system programs for CICS.

Destination

CSNE

DFHZC2498 E   *date time applid termid tranid*
IC put to printer failed.
sense **((***instance***) Module name:**
{*DFHZARQ***})**

Explanation

A 3270 print request has failed because transaction
CSPP could not be initiated. Either transaction CSPP is
not an installed transaction definition, or the message
to be printed cannot be written to temporary storage.
This imbed is inserted in DFHZC *xxxx* messages with
sense inserts. For the meaning of *sense* , see message
DFHZC2400.

System action

Processing continues.

User response

Check that transaction CSPP is an installed transaction
definition and that you have sufficient temporary
storage to accommodate the data to be printed.

Module:
DFHZARQ

4. *msgtext*

Destination

CSTL

DFHZC3202 E   *date time applid* **Transaction CCIN**
- VTAM netname *netname*. The
value *codepage* in the codepage
parameter is not supported.

Explanation

A CCIN transaction has been run from a CICS client.
The codepage which the CICS client has requested is
not supported.

netname is the VTAM netname of the CICS client.

System action

CICS cannot perform the translations required to
support the CICS client with the requested character
set and codepage. CICS continues but uses a default
codepage instead of the supplied one. For details of
the default codepage, see the Using SNA manual.

The request to install the CICS client continues,
but uses the default codepage. A response code of
EXCEPTION and a reason code of INVALIDCODEPAGE
is sent to the client.

User response

See the Using SNA manual for a list of the client
codepage values which are supported. It may be
necessary to reconfigure the client locale.

DFHZC3203 E   *date time applid* **Transaction CCIN - VTAM netname** *netname*. **The capabilities parameter is not valid.**

Explanation

A CCIN transaction has been run from a CICS client. The capabilities which have been received are not valid. The CICS client has specified that it supports features which no CICS client is supposed to support. The CICS client is violating the CICS client communications architecture.

netname is the VTAM netname of the CICS client.

System action

Exception trace point AP301A is written.

The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Destination

CSCC

DFHZC3205 E   *date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname*. **CICS cannot support the** *{n.a. | n.a. | n.a. | combination of client and virtual terminal codepage. | client codepage. | virtual terminal codepage.}*

Explanation

A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation.

CICS was checking the codepage specified by the CICS client and the codepage specified by the virtual terminal. However one of the following occurred:

1 - 3

> *n.a.* - not applicable and should not occur.

4

> *unsupported combination of CICS client and virtual terminal codepage.* indicates that the two codepages above are known about but CICS does not support data conversion between the CICS client codepage and the virtual terminal codepage.

5

> *unsupported CICS client codepage* indicates that CICS is unable to support the codepage supplied by the CICS client in the CCIN or CTIN transaction.

6

> *unsupported virtual terminal codepage* indicates that the CGCSGID parameter defining the virtual terminal codepage is not supported for CICS data conversion. If the virtual terminal was autoinstalled, CGCSGID was specified in the autoinstall model requested by the CICS client. If the virtual terminal was defined, CGCSGID was defined in the TYPETERM named by the virtual terminal definition.

CICS cannot perform the translations required to support the CICS client with the requested codepage.

netname is the VTAM netname of the CICS client.

System action

Exception trace point AP3035 is written.

4

> *unsupported combination of CICS client and virtual terminal codepage.*
>
> A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.

5

> *unsupported CICS client codepage*.
>
> The request to install the virtual terminal continues and the invalid codepage is replaced by a default as specified in the Using SNA manual.
>
> A response code of EXCEPTION and a reason code of INVALIDCODEPAGE is sent to the client.

6

> *unsupported virtual terminal codepage*.
>
> A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.

User response

See the Using SNA manual and check the list of the client codepage values then reconfigure the workstation locale or correct the virtual terminal TYPETERM definition.

The exception trace point AP3035 contains the CICS client codepage and the virtual terminal CGCSGID values.

Destination

CSCC

DFHZC3206 E	*date time applid* **Transaction CTIN - virtual terminal** *termid* **VTAM netname** *netname*. **The client's terminal install limit has been exceeded.**

Explanation

A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the CICS client whose VTAM netname is *netname* already has 512 virtual terminals.

termid is the name that would have been given to the new virtual terminal. If the CICS client did not supply the name it is blank.

System action

The request to install the virtual terminal is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response

Check why the CICS client has sent so many CTIN installs without corresponding CTIN uninstall functions.

To correct the problem the CICS client must send a CTIN uninstall for each virtual terminal that needs to be deleted.

Module:
DFHZCT1

XMEOUT parameters/Message inserts

5. *netname*

Destination

CSCC

DFHZC3207 E	*date time applid* **Transaction CTIN - VTAM netname** *netname*. **The request has failed because CCIN has not been run.**

Explanation

A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However there was no previous CCIN install request for the CICS client with the VTAM netname of *netname*. CCIN must always run before CTIN.

This may have been caused by a CICS restart.

netname is the VTAM netname of the CICS client.

System action

If the request was to install a virtual terminal then it is rejected with a response code of CTIN_ERROR and a reason code of CTIN_CCIN_INACTIVE.

User response

The CICS client must carry out CCIN uninstall/install before the next CTIN install.

Module:
DFHZCT1

6. *modelid*

Destination

CSCC

DFHZC3209 E	*date time applid* **Transaction CTIN - VTAM netname** *netname*. **CICS cannot supply a terminal name because all available names are in use.**

Explanation

A CTIN install request has been received from a CICS client as as a result of a CICS_EpiAddTerminal function or terminal emulator operation. The parameter list did not supply a NetName indicating that CICS should supply the name. However there are only 46,656 possible names available and they are all currently in use.

netname is the VTAM netname of the CICS client.

System action

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

User response

As CICS clients issue CTIN uninstalls for autoinstalled virtual terminals these termids will be freed.

It is possible that some of the CICS clients were switched off leaving autoinstalled virtual terminals around. When these are switched back on again they should issue CCIN install which will free the virtual terminals if they are not in use.

DISCARD can be used to delete a virtual terminal - but this should be done with discretion.

If the SIT VTPREFIX coincides with the first character of the termid allocated to a normal autoinstall terminal by the autoinstall URM (default DFHZATDX), there may be some names reserved because the autoinstall terminal existed when CTIN install tried to use the same name. Avoid doing this if possible because the only way to free these names is to restart CICS.

Explanation

A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. CICS attempted to parse this data but found a discrepancy between the number of parameters, the length of the parameters and the length of the data received. *netname* is the VTAM netname of the CICS client.

System action

Exception trace point AP3033 is written - data 2 contains the data received. The CTIN transaction abnormally terminates with abend code AZAI.

User response

Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZCT1

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

Destination

CSCC

DFHZC3230 E   *date time applid* **Transaction CTIN - VTAM netname** *netname*. **CICS has received a client request on an unsupported sync level.**

Explanation

A CTIN request has been received on a conversation which is not at synchronization level 0 or 1. *netname* is the VTAM netname of the CICS client.

System action

Exception trace point AP302B is written. The CTIN transaction abnormally terminates with abend code AZAI.

User response

Ensure that the CICS client converses at sync level 0 or 1.

Module:
DFHZCT1

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

Destination

CSCC

DFHZC3231 E   *date time applid* **Transaction CTIN - VTAM netname** *netname*. **The client header data contains an invalid version number.**

Explanation

A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However there is an invalid version number in the header. *netname* is the VTAM netname of the CICS client.

System action

Exception trace point AP3036 is written - data 2 contains the data received. The CTIN transaction abnormally terminates with abend code AZAI.

User response

Since the version used in the CICS client must match with the version used by the server, one or the other is at the wrong level and should be changed. You may need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZCT1

Destination

CSCC

DFHZC3246 *date time applid* **Transaction CCIN - virtual terminal** *termid* **VTAM netname** *netname***. CICS cannot attach the CDTS transaction.**

Explanation

A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction was called to delete virtual terminal *termid*. However CICS was unable to attach the CDTS transaction.

netname is the VTAM netname of the CICS client.

System action

The attempt to delete the virtual terminal fails. If this is a CCIN install request, the install continues.

User response

Ensure that the CDTS transaction and the DFHZATS program are defined correctly as specified in IBM supplied group DFHSPI and that they are installed.

Module:
DFHZCN2

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *netname*

Destination

CSCC

DFHZC3247 *date time applid* **Transaction CCIN - virtual terminal** *termid* **VTAM netname** *netname***. The CCIN transaction has timed out waiting for CDTS to run.**

Explanation

A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction is called to delete virtual terminal *termid*. However the CCIN transaction has waited for the CDTS transaction for two minutes and has timed out.

netname is the VTAM netname of the CICS client.

System action

The CDTS attempt to delete the virtual terminal continues and occurs when the CDTS transaction starts or is 'unsuspended'.

If this is a CCIN install request, the install continues.

User response

Check to see why the CDTS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CITS TRANCLASS allocation.

Module:
DFHZCN2

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *netname*

Destination

CSCC

DFHZC3248 E *date time applid* **Transaction CCIN - virtual terminal** *termid* **VTAM netname** *netname***. The surrogate TCTTE is in use and cannot be deleted.**

Explanation

A CCIN request has been received from a CICS client. There should not be any virtual terminals installed, however, one or more were located. The surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted. If this was caused by an immediate shut down of the client the transaction abend might not have completed before CICS attempted to delete the client.

netname is the VTAM netname of the CICS client.

System action

Exception trace point AP301C is written. The attempt to delete the virtual terminal is rejected.

If this is a CCIN install request, the install continues.

User response

Determine why the virtual terminal was installed when CCIN was run.

Either wait for the transaction to finish or PURGE the transaction. Once the transaction completes the virtual terminal will be deleted at the next CCIN install/ uninstall.

Module:
DFHZCN2

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *netname*

Destination

CSCC

DFHZC3249 E   *date time applid* **Transaction CCIN - VTAM netname *netname*. CICS has received invalid data from the client.**

Explanation

A CCIN install request has been received from a CICS client. CICS attempted to parse this data but found a discrepancy between the number of parameters, the length of the parameters, and the length of the data received. *netname* is the VTAM netname of the CICS client.

System action

Exception trace point AP300E is written - data 2 contains the data received. The CCIN transaction abnormally terminates with abend code AZAF.

User response

Examine the data sent to CICS from the CICS client. You may need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

CSNE

DFHZC3407 E *date time applid termid tranid* **READ command does not carry change direction indicator.** *sense* **((***instance***) Module name: {DFHZNAC})**

Explanation

A request for input (for example, a READBUF command) sent to a logical unit (LU) type 2 (3270 compatibility mode logical unit) must carry the SNA change direction indicator. The LU has received such a request, but the indicator is not set.

Since the setting of the change direction indicator is controlled by terminal control, this message indicates that an internal logic error may have occurred. The error is not necessarily in terminal control, but may be in the logical unit or some other element of the network. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The task and the VTAM session for the logical unit are abnormally terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Identify the request that caused the error, and locate the element of the network responsible.

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSNE

DFHZC3409 E   *date time applid termid tranid*
**Unexpected negative response
received.** *sense* **((***instance***) Module
name: {*DFHZRAC*})**

Explanation

CICS received a negative response to a command
for which a negative response would not normally
be expected. This imbed is inserted in DFHZC *xxxx*
messages with *sense* inserts. For the meaning of
sense , see message DFHZC2400.

System action

All outstanding send and receive requests are purged.
If a task is attached, it is abnormally terminated with
a transaction dump. The node is placed out of service
and the TCTTE, RPL, and action flags are logged to
CSNE.

Message DFHME0116, which contains the symptom
string for this problem, is produced.

User response

Ensure that the application programs running
concurrently do not alter the TCTTE. Check that the
SNA flows on the session are valid and that the logical
unit is not violating SNA protocols.

Module:
DFHZRAC

**Invalid input when LU status
expected.** *sense* **((***instance***) Module
name: {*DFHZRVX | DFHZRVX |
DFHZRVX*})**

Explanation

Input (other than a logical unit status message)
was received after a request was rejected with a
system sense code indicating a possibly rectifiable
error condition at the terminal node: for example,
Intervention Required. The subsequent LU status
message indicates that the error situation has now
been corrected, or that the request is permanently
not executable. This imbed is inserted in DFHZC *xxxx*
messages with *sense* inserts. For the meaning of
sense , see message DFHZC2400.

System action

If a task is attached, it is abnormally terminated with a
transaction dump.

User response

Conform to SNA protocol by ensuring that the next
transmission is an LUSTATUS message with a system
sense for either Resource Available (0001) or Function
Not Executable (081C).

Module:
DFHZRVX

Destination

CSNE

DFHZC3412 E   *date time applid termid tranid* **Intervention required on secondary resource.** *sense* **((*instance*) Module name: {DFHZNAC})**

Explanation

Operator action is requested for the secondary resource of a logical unit (LU). However, no such resource is immediately available. In the case of a 3270-compatible LU, this message means that the printer most likely to be available for a PRINT request has an Intervention Required status. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The system waits for a logical unit status message and, when this is received, takes appropriate system action.

User response

Correct the problem that relates to the device.

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *termid*

5. *tranid*

6. *sense*

Destination

CSNE

DFHZC3414 E   *date time applid termid tranid* **Request not executable. Secondary resource unavailable.** *sense* **((***instance***) Module name: {***DFHZNAC***})**

Explanation

The secondary resource of a logical unit is permanently unavailable to complete a request. For a 3270-compatible LU, this means that a printer was not available for a PRINT request. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump.

User response

Determine the reason why the resource is not available at the remote terminal.

Module:
DFHZNAC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *tranid*
6. *sense*
7. *instance*
8. Value chosen from the following options:

    1=DFHZNAC

Destination

CSNE

DFHZC3415 E   *date time applid termid tranid* **No data available.** *sense* **((***instance***) Module name: {***DFHZNAC***})**

Explanation

A receive request has been rejected by the logical unit because it has no data to send for one of the following reasons:

- The device is not capable of input (for instance, it is a printer)
- The logical unit is not capable of sending data at the time. For example, a requested 3790 data set is not available at the time.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The receive request is halted. If a task is attached, it is abnormally terminated with a transaction dump.

User response

Verify that the request was issued to the correct device and that the device is capable of data transmission.

Module:
DFHZNAC

Destination

CSNE

DFHZC3417 E	*date time applid termid tranid* **Session processing error. A request for synchronization has been ignored.** *sense* **((***instance***) Module name: {***DFHZSDR}***)**

Explanation

A request for a sync point to be taken was ignored. COMMIT or ABORT has not been issued. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

If a task is attached, it is abnormally terminated with a transaction dump.

User response

To determine the cause of the problem, inspect the CSNE, CSMT and CSTL logs for further diagnostic information. Also inspect transaction *tranid*.

Module:
DFHZSDR

CSNE

DFHZC3418 E	*date time applid termid tranid* **System generation error. The** *netname* **logon request was rejected.** *sense* **((***instance***) Module name: {***DFHZSCX	DFHZBLX	DFHZLGX***})**

Explanation

A logon request was rejected because the TCTTE for the ISC session had been generated with an incompatible SESSIONTYPE. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The request is rejected.

User response

Change the TCTTE generation to specify a secondary logical unit at one end of the connection, and a primary logical unit at the other end.

A primary logical unit should have SESSIONTYPE=SEND or SESSIONTYPE=FASTSEND, and a secondary logical unit should have SESSIONTYPE=RECEIVE or SESSIONTYPE=FASTRECV.

Module:
DFHZSCX, DFHZLGX, DFHZBLX

The bind parameter for node** *netname* **is unacceptable.** *sense* **((***instance***) Module name: {	DFHZBLX |** *DFHZSCX	DFHZSCX	DFHZBLX	DFHZBLX	DFHZSCX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZSCX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZSCX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX})*

Explanation

A connection request was rejected because the characteristics specified for the connecting system were unacceptable.

Possible reasons for the rejection are:

- For a MEMBER name connection, the network identifier (NETID) passed to CICS is different from that already stored in the system entry (instance 39).
- For a MEMBER name connection, the GRNAME specified in the sessions bind - UDSS04 - is different from that already stored in the system entry (instance 40).
- For a GR name connection, the network identifier (NETID) passed to CICS is different from that already stored in the connections system entry (instance 41).

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The request is rejected. The bind parameter is printed on the CSNE log.

User response

Determine whether the connecting system has specified its characteristics correctly. If it has not, correct the requesting system.

Module:
DFHZSCX

FM function not supported. A
function requested in an FMD RU
is not supported by the receiver.
sense **((***instance***) Module Name:**
***{DFHZNAC}*)**

Explanation

CICS has received a negative response (VTAM sense
code 0826). The receiver does not support the
function requested by the sender. This imbed is
inserted in DFHZC *xxxx* messages with *sense* inserts.
For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding SENDs and RECEIVEs are purged. If
a task is attached, it is abnormally terminated with a
transaction dump.

User response

Investigate the reason for issuing a request for a
function that the receiver does not support.

Module:
DFHZNAC

tranid **Session failure. Session**
terminated immediately. *sense*
((*instance***) Module name:**
***{DFHZNSP | DFHZNSP | DFHZNSP}*)**

Explanation

Communication with a node was interrupted during a
session because a session outage was detected, or
because a VTAM VARY INACT command was issued.

Error messages produced for the same session after
this message may be caused by the session failure
and may not be the reason for it. If this is the case,
they can be ignored. This imbed is inserted in DFHZC
xxxx messages with *sense* inserts. For the meaning of
sense , see message DFHZC2400.

System action

The session is canceled. The session may be
recovered later by VTAM. See also messages
DFHZC2409 and DFHZC2410.

User response

Check if the failure was caused by an operator-issued
VTAM VARY INACT. If this is not the case, use
the sense data and any associated messages to
investigate the reason for the failure.

Module:
DFHZNSP

Destination

CSNE

DFHZC3433 E   *date time applid termid tranid* **FMH7 was received on ISC session. Sense code is :** *xxxxxxxx* *{ Error log data is : | No error log data received. | No error log data available. }* *xxxxxxxx* *sense* **((***instance***) Module name: {DFHZRVX | DFHZRAC | DFHZRAC | DFHZERH})**

Explanation

The transaction is communicating with a logical unit (LU) type LU6.1 or LU6.2.

The logical unit sent an FMH7 which may carry error log data. If error log data is included, then the text is inserted in this message. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The action taken depends upon the sense code.

User response

If the receiving transaction is designed to handle this situation, no action is necessary. However, if this is not the case, use the sense code and any error log data to determine why the connected logical unit sent the FMH7.

If the connected LU is another CICS system, the error log data is a CICS message.

If the connected LU is not a CICS system, see that product's documentation for details of error log data. Some products permit the user to define the contents of error log data.

Module:
DFHZRVX, DFHZRAC, DFHZERH

CSNE

DFHZC3442 I	*date time applid* **Immediate termination of VTAM sessions requested.** *sense* **((***instance***) Module name: {*DFHZSHU*			*DFHZTPX*	*DFHZSHU*})**

Explanation

A request for an immediate close of all VTAM sessions and subsequent close of CICS VTAM ACB has been received. The request may have been initiated by the CICS main terminal command or by the VTAM network closing down.

This message is also issued if V NET,ID=...,INACT is issued by the VTAM operator. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All requests on a VTAM session are abnormally terminated and the session is closed. The VTAM ACB is then closed.

If V NET,ID=...,INACT was issued by the VTAM operator, VTAM waits for all sessions to be closed before informing CICS. In this case there are no sessions to be abnormally terminated. This message may be issued twice, once by DFHZTPX and once by DFHZSHU. The messages will have different instance numbers.

User response

CSNE

DFHZC3444 E *date time applid termid tranid* **Unexpected condition detected during RECEIVE processing. *sense* ((*instance*) Module name: {DFHZRVS | DFHZRAC})**

Explanation

CICS has detected that more than 32k of data has been transmitted while receiving data from terminal "termid". This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS terminates the session and places the terminal out of service. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

To determine the cause of this error,

- Check for a terminal malfunction, for example the device may be sending the same data repeatedly, or
- Check for a network problem.

Module:
DFHZRVS, DFHZRAC

CSNE

DFHZC3445 E *date time applid termid tranid* **State error. *sense* ((*instance*) Module name: {DFHZNAC})**

Explanation

CICS has received a state error negative response (VTAM sense code 20*yy*). This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response

Determine the reason for the error before restarting the session.

Module:
DFHZNAC

6. *sense*
7. *instance*
8. Value chosen from the following options:

    1=DFHZNAC

Destination

CSNE

DFHZC3448 E	*date time applid termid tranid* **Security identification error.** *sense* **((*instance*) Module name: {*DFHZNAC*})**

Explanation

CICS has received a negative response to a request to access a resource because it was not authorized. If it was an OPNDST (BIND) request, CICS did not send the authorization sequence expected by a logical unit. CICS does not support the security feature in the bind. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The logical unit is placed out of service and the session is closed.

User response

CICS does not support the security feature in the bind. Modify the authorization parameters in the remote logical unit so that it does not require authorization to initiate a session.

Module:
DFHZNAC

Destination

CSNE

DFHZC3449 I	*date time applid termid tranid* **Leaving unattended mode.** *sense* **((*instance*) Module name: {*DFHZNAC*})**

Explanation

CICS has received a status message from a logical unit indicating that the terminal is now attended.

Note that this is the default mode of operation. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The mode of operation bit TCTEMOPU is reset in the TCTTE.

User response

For logical units that can operate in unattended mode, the application programmer should test the mode of operation before starting a conversational sequence with the terminal operator. If the bit is on, no operator action can be expected.

For command level, use the EXEC CICS ASSIGN UNATTEND (data area) command to obtain the value of TCTEMOPU.

                    Currently no data to send.
                    sense **((*instance*) Module name:**
                    {*DFHZNAC*})

Explanation

Following the issue of a READ command to a logical unit, or the completion of a transaction associated with the logical unit, CICS has received a status message from the logical unit indicating that it currently has no data to send. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

If a data interchange (DFHDI) receive request is outstanding, it will complete with DSSTAT condition and a response code X'15'.

If no task is active and no work is outstanding for the terminal, the soft CLSDEST action flag is set and DFHZNEP is called. Unless it is reset by DFHZNEP, the session is terminated.

User response

Ensure that no more receive requests are issued to the terminal.

Module:
DFHZNAC

XMEOUT parameters/Message inserts

CSNE

DFHZC3452 E   *date time applid termid tranid*
                    Signal received - Code *xxxx*.
                    sense **((*instance*) Module name:**
                    {*DFHZASX | DFHZASX*})

Explanation

CICS has received a SIGNAL command from a logical unit. The SIGNAL codes received with the SIGNAL command are made available to the DFHZNEP user program.

If a task is active, the SIGNAL condition is raised on return to the application program. This message is produced only when SIGNAL codes are passed to the node abnormal condition program (DFHZNAC). CICS does this for Type 4 logical units only. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

If the SIGNAL code is 0001 0000 (request change direction), any further output request will cause the IGREQCD condition to be raised. All SIGNAL codes will cause the SIGNAL condition to be raised.

User response

For logical units for which CICS enforces SIGNAL request change direction, if the code is 0001 0000, issue a receive request or terminate transaction *tranid*.

If the code is NOT 0001 0000, terminate transaction *tranid* and refer to the z/OS Communications Server: SNA Programming manual for further guidance.

DFHZRAC | DFHZRAC | DFHZRAC | DFHZRAC | DFHZRAC | DFHZRAC})

Explanation

CICS received a positive response in one of the following circumstances:

- The response was to data sent with exception response
- The response was to a command sent with exception response
- The response was to a send to which a response has already been sent.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to CSNE.

User response

Ensure that the application programs running concurrently do not alter the TCTTE. Check that the SNA flows on the session are valid and that the logical unit is not violating SNA protocols.

DFHZC3467 E   *date time applid termid tranid* **Permanent insufficient resource.** *sense* **((***instance***) Module name: {*DFHZNAC*})**

Explanation

The PS buffer resource required by load PS is not available. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

If a task is attached, it is abnormally terminated with a transaction dump.

User response

Look at the CSNE log. A second message with a sense received code of 084C should have been issued. Refer to this message in the z/OS Communications Server: SNA Programming manual for full details.

Module:
DFHZNAC

Destination

CSNE

DFHZC3468 E   *date time applid termid tranid* **CLEAR command received.** *sense* **((***instance***) Module name: {*DFHZSCX*})**

Explanation

An SNA clear command was received by the node. The other end of the session was unable to handle the current requests for some reason, and purged any outstanding messages on the session. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The session is canceled immediately, and any transaction executing on that session is also abnormally terminated and a transaction dump is produced.

User response

Check the other end of the session to determine why the clear command was sent. It may be due to a lack of buffers in the VTAM region attached to the other session.

Module:
DFHZSCX

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *tranid*
6. *sense*

Destination

CSNE

DFHZC3470 E   *date time applid termid tranid* **LU session failure caused by: {restart/ takeover. LU does not support ACTLU(ERP). | route extension to cluster failed. | LU abend, discontact, DACTPU or ANS. } sense ((instance) Module name: {DFHZSCX | DFHZSCX | DFHZSCX | DFHZSCX})**

Explanation

An LU session has failed because an UNBIND command has been received.

Possible reasons are:

- Restart or takeover. LU does not support ACTLU(ERP)
- Route extension to cluster failed
- Session failed due to LU abend, disconnect, DACTPU, or ANS.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

If a task is attached, it is abnormally terminated with a transaction dump.

User response

Use the symptom string, a VTAM trace, and the dump, if available, to determine the source of the UNBIND before attempting to reestablish the session.

Module:
DFHZSCX

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *tranid*
6. Value chosen from the following options:

CSNE

DFHZC3479 E	*date time applid termid tranid* **Unbind received after session failure detected.** *sense* **((***instance***) Module name: {***DFHZSCX	DFHZSCX}***)**

Explanation

The logical unit in session with CICS has detected a session failure, and has unbound the session with CICS. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The session is terminated, and the transaction using it is abnormally terminated or informed by return code.

User response

Determine the reason for the session failure by using Trace. Check the CSNE log for a second error message associated with DFHZC3479. This message should be located immediately after DFHZC3479.

Refer to the sense code shown in the associated message.

Module:
DFHZSCX

Destination

CSNE

DFHZC3481 E   *date time applid termid tranid*
3270 Data Stream protocol error.
sense **((*instance*) Module name:**
{DFHZRVX | DFHZRAC})

Explanation

CICS has received zero length data from a device defined to CICS as a 3270 terminal. This violates the protocol for 3270 devices. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS cancels the session and any transactions attached to the terminal.

User response

Determine why zero length data was received from a device purporting to be a 3270 terminal, and correct the error.

The most likely reasons are an incorrect resource definition for the terminal, or incorrect programming of a terminal that is simulating 3270 protocols.

Module:
DFHZRAC, DFHZRVX

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*

CSNE

DFHZC3485 E	*date time applid netname* **A CLSDST Pass Procedure error occurred at** *applid*. **Status byte** *xx* **Reason byte** *yy.sense* **((***instance***) Module name: {***DFHZNSP***})**

Explanation

In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is *netname*, to a system whose VTAM APPLID is *applid*. VTAM has notified CICS of an error at *applid*. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS saves the status byte *xx* and reason byte *yy* passed by VTAM in the Notify Request Unit. CICS processing continues.

User response

The reason for the error can be determined by investigating the status byte *xx* and reason byte *yy* given in the message. These bytes are documented in the NSEXIT routine section of z/OS Communications Server: SNA Programming (SC23-0115).

Module:
DFHZNSP

XMEOUT parameters/Message inserts

CSNE

| DFHZC3487 E | *date time applid netname* Unable to PASS to node *nodeid*. CLSDST PASS is not authorized. *sense* ((*instance*) Module name: {*DFHZLEX* \| *DFHZLEX*}) |

Explanation

In executing an ISSUE PASS command, CICS attempted to pass control of a VTAM logical unit whose network name is *netname*. VTAM has notified CICS that CICS is not authorized to use this function. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS continues.

CICS may or may not be able to display the *applid* it was being passed. If CICS can display this *applid*, it appears in the text of this message.

User response

To use the ISSUE PASS command, you must code AUTH=PASS on the VTAM definition of the CICS APPL, then reactivate the APPL.

CSNE

| DFHZC3488 E | *date time applid netname* ISC session connection failure. *sense* ((*instance*) Module name: {*DFHZSIX*}) |

Explanation

A simlogon request to an ISC system was rejected because the *netname* was not known. CICS has now issued the INQUIRE OPTCD=USERVAR command in order to determine if *netname* had been defined as a user variable. That INQUIRE command has been rejected because the user variable does not exist in the USERVAR table. This may be because the USERVAR is either not known or invalid, or the MODIFY USERVAR command has not been issued to define the user variable. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CLSDST is issued to reset the session.

User response

Determine if the netname has been defined correctly to CICS. If the netname is to be used as a user variable then determine why the MODIFY USERVAR command has not been issued to set it.

Module:
DFHZSIX

Destination

CSNE

DFHZC3489 E
date time applid netname **The LU is inhibited for sessions.** *sense* **((***instance***) Module name: {***DFHZSYX***})**

Explanation

CICS has attempted to acquire a session to the logical unit (LU), but VTAM has rejected the request because the LU is inhibited for sessions.

The partner LU could be inhibited because it has issued the VTAM macro SETLOGON OPTCD=QUIESCE. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The request is rejected and the session is set into NOINTLOG state to prevent further requests being issued.

User response

After the partner LU has enabled itself, it can initiate the session request to CICS. Alternatively, the CICS main terminal operator could reset the NOINTLOG state and allow CICS to initiate the session request.

Module:
DFHZSYX

XMEOUT parameters/Message inserts

Destination

CSNE

DFHZC3490 E
date time applid netname **Unable to pass to node** *nodeid*. *sense* **((***instance***) Module name: {***DFHZLEX | DFHZSYX | DFHZCLX***})**

Explanation

In executing an ISSUE PASS command, CICS attempted to pass control of the named VTAM logical unit to a system identified as node *nodeid*. VTAM has notified CICS that this request has failed.

This may occur if the LUNAME specified is a generic resource name and this CICS is the only system registered under this name. You are effectively passing the terminal to yourself.

However, if there is more than one CICS registered under the generic resource name, the terminal should pass successfully to another member (chosen by VTAM) in the same resource. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

A VTAM CLSDST macro is issued to halt communication with the node.

User response

Ensure that the node *nodeid* is defined and active to VTAM.

Module:
DFHZSYX, DFHZLEX, DFHZCLX

XMEOUT parameters/Message inserts

Destination

CSNE

DFHZC3491 E
date time applid netname **Unable to make session XRF capable.** *sense* **((***instance***) Module name: {***DFHZLEX***})**

Explanation

The active CICS system has attempted to OPNDST the session as "XRF capable", but has been refused because the Network Control Program (NCP) has insufficient space to hold the control blocks for a future backup session from the alternate CICS system. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS performs a SIMLOGON, but does not deem the session to be "XRF capable". CICS therefore treats the terminal as class 2.

User response

No immediate action is necessary. You may need to increase the number of buffers in the NCP.

Module:
DFHZLEX

XMEOUT parameters/Message inserts

   1=DFHZLGX

Destination

CSNE

DFHZC3496 E   *date time applid* **System dump has been taken for terminal** *termid* **((***instance***) Module name: {DFHZNAC})**

Explanation

Terminal *termid* has been found to be in error by terminal control.

As terminal *termid* had no task attached to it at the time of the error, DFHZNAC was unable to cause a transaction abend with a transaction dump.

The TWAODNTA flag in the DFHZNAC-DFHZNEP commarea is set ON and DFHZNAC produces a system dump for terminal *termid* instead.

System action

An exception trace entry is made in the trace table at trace point FC73.

A system dump is produced unless you have specifically suppressed dumps in the dump table.

User response

To determine the nature of the problem that caused the dump to be taken, refer to the CSNE log. There should be an associated CICS message which will provide further information.

For more information about TWAODNTA, refer to the Developing system programs for CICS.

Module:
DFHZNAC

DFHZC3497 E	*date time applid* **Link to module DFHZNEP from DFHZNAC failed because {module DFHZNEP is not AMODE 31.	module DFHZNEP could not be loaded.	module DFHZNEP could not be autoinstalled.	of an unexpected error.} ((***instance***) Module name: {DFHZNAC})**

Explanation

While processing an error for a VTAM terminal, CICS attempted to link to user-replaceable module DFHZNEP. The link failed.

See message DFHZC3437 for the default action or actions taken.

System action

The default action or actions set by DFHZNAC are taken.

User response

The reason for the failure is specified in the message. Possible solutions are:

- Ensure that DFHZNEP is linked with AMODE 31.
- Ensure that DFHZNEP is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
- Ensure that there is a valid resource definition for DFHZNEP, and that DFHZNEP can be successfully autoinstalled.

CSNE

DFHZC3498 E	*date time applid* **Abend** *abcode* **has occurred in module DFHZNEP. ((***instance***) Module name: {DFHZNAC})**

Explanation

While processing an error for a VTAM terminal, user-replaceable module DFHZNEP was linked and the program abended with abend code *abcode*. See message DFHZC3437 for the default action or actions that are taken.

System action

Control is passed back to the calling module, DFHZNAC. DFHZNAC reinstates the default actions set before DFHZNEP was called. The actions are then taken.

User response

Refer to abend code *abcode* for details of the original error. Follow the user response given in the abend code to solve the problem.

DFHZC3499 E	*date time applid* OS Getmain failure in module DFH*modname* with return code X'*return_code*' while attempting to process message DFHZC*message_number*. *sense* ((*instance*) Module name: {*DFHZLEX | DFHZSHU | DFHZSCX | DFHZSCX | DFHZSYX | DFHZSYX | DFHZTPX | DFHZRAC | DFHZRAC | DFHZATA | DFHZLGX | DFHZLGX*})

Explanation

An error has been detected by module *modname*. The OS GETMAIN request by this module has failed with return code X'*return_code*', and as a result, the diagnostic information relating to the original error has not been saved and cannot be processed by DFHZNAC.

The only information available for diagnosis of the error is *message_number* which is the number of the message that would have been issued had the OS GETMAIN request not failed. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

Processing continues normally.

User response

Refer to message *message_number* for further guidance.

Refer to the z/OS MVS Programming: Authorized Assembler Services Guide for the meaning of the OS GETMAIN return code.

Module:
DFHZATA, DFHZLGX, DFHZRAC, DFHZSCX, DFHZSHU, DFHZTPX, DFHZLEX, DFHZSYX

DFHZC4900 I	*date time applid termid tranid* **CNOS** *{sent to	received from}* **Node** *netname* **System** *sysid* **Modename** *modename,* **Max = *n1,*** **Win=*n2, {race detected	successful	values amended	modename not recognized	modename closed	CNOS failed}.* ((*instance*) Module name: {DFHZGCN})**

Explanation

A CHANGE-NUMBER-OF-SESSIONS command has been sent or received. The inserts are identified as follows:

- *sysid* is the system identifier.
- *modename* is the modename.
- *n1* is the maximum session count.
- *n2* is the maximum source contention winner sessions.

If the "values amended" option is displayed, the values of the *n1* (maximum session count) and *n2* (maximum source contention winner sessions) have been renegotiated by the target system.

If the "race detected" option is displayed, the CNOS command could not be implemented because the modename *modename* was already locked for a CNOS command from the other system.

If a modename of ALL is produced, it has been set internally by CICS and all of the modegroups for this connection will be affected by the CNOS command.

If the "CNOS failed" option is displayed, the CNOS command could not be implemented because the modename lock was still held on the remote system when a second CNOS command was sent by this CICS, as the CNOS race winner, following a previous CNOS race condition.

System action

The negotiated values are applied.

User response

None.

Module:
DFHZGCN

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *tranid*

    1=sent to,

    2=received from

7. *netname*
8. *sysid*
9. *modename*
10. *n1*
11. *n2*
12. Value chosen from the following options:

    1=race detected,

    2=successful,

    3=values amended,

    4=modename not recognized,

    5=modename closed,

    6=CNOS failed

13. *instance*
14. Value chosen from the following options:

    1=DFHZGCN

Destination

CSNE

DFHZC4901 I	*date time applid termid tranid* **Node** *netname* **System** *sysid* **Modename** *modename,* **Negotiated values: Max=*n1,*** **Win=*n2.* ((*instance*) Module name: {DFHZGCN})**

Explanation

- *modename* is the modename,
- *n1* is the maximum session count,
- *n2* is the maximum source contention winner sessions.

This message follows message DFHZC4900 when the maximum session count (*n1*) and the maximum

source contention winner sessions (*n2*) have been renegotiated.

If a modename of ALL is produced, it has been set internally by CICS and all of the modegroups for this connection will be affected by the CNOS command.

System action

The negotiated values are applied.

User response

None.

CSNE

DFHZC4902 E	*date time applid termid tranid* **Attach FMH or subfield length error.** *sense* **((*instance*) Module name: {DFHZATT | DFHZATT | DFHZATT | DFHZATT | DFHZATT | DFHZATT | DFHZATT})**

Explanation

A request to attach a task has been received across an APPC link. However, there is an error in the function management header (FMH) length or in the length of one of the subfields. As a result, CICS is unable to determine which task to attach. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The task is abnormally terminated with a dump.

User response

The remote APPC system is sending an invalid attach header (FMH type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Module:
DFHZATT

Explanation

The chain finite state machine (FSM) has reported an error in the use of APPC chaining protocols. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The task is abnormally terminated with a dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If this message occurs after a persistent sessions restart, look for associated messages for more guidance. The problem might be temporary.

If this message occurs during normal system execution, investigate any transactions running on the session at the time of failure because the error can be caused by using both the LAST and WAIT options on an EXEC CICS SEND command in an APPC DTP application. This combination of parameters is not recommended. See the CICS documentation for more information. If this is not the cause of the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHZC4918 E　　*date time applid termid tranid* **Unexpected response received.** *sense* **((***instance***) Module name: {***DFHZRLP | DFHZRLP | DFHZRLP | DFHZRLP | DFHZRLP***})**

Explanation

An unexpected response was received that was either a positive response to data of a previous bracket, or a response to a command that cannot be accepted when the logical unit is in "continue specific" mode. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The task is abnormally terminated.

User response

Incorrect flows have been received on a APPC session. The CICS trace will give further details of the flow. It may help to run a VTAM trace TYPE=IO/BUF and repeat the error to obtain complete details of the line flow.

DFHZC4921 E   *date time applid sysid* **LU services manager failure. R15 =**X'xxxxx' **R0 =**X'yyyyy'

Explanation

An error situation has been detected during the operation of the LU services manager transaction program (DFHLUP).

Registers 15 and 0 are set to indicate the nature of the error as shown below:

```
Register 15 = X'0'   Task invalidly started ...
```

```
   Register 0 = X'3'   ... via a perm transid.
   Register 0 = X'4'   ... by a TD trigger.
   Register 0 = X'5'   ... without data.
   Register 0 = >X'6'  ... or is out of range of
                       a valid start code for
this
                       service

Register 15 = X'4'   Call code did not match a
                     supported function (1-5).
 Register 0 = call code

Register 15 = X'8'   Invalid parameters passed
                     for this function.
 Register 0 = keyword #

Register 15 = X'0C'  Function-specific checks
                     failed for this keyword.
 Register 0 = keyword #

Register 15 = X'10'  No input data supplied.
 Register 0 = ^0     The IC_GET for the TS START
                     data failed.
 Register 0 = X'0'   The LUTYPE6.2 RECEIVE
                     returned data
                     length=0.

Register 15 = X'14'  The GDS-ID is not for XLN.
 Register 0 = GDS-ID
```

System action

The task is allowed to complete but the required function is not executed.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If one of the errors mentioned above has occurred, try to discover the reason for the failure. If you fail in this, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHZC4924 E	*date time applid termid tranid* **Bind security password missing or invalid.** *sense* **((*instance*) Module name: *{DFHZOPX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZBLX	DFHZOPX	DFHZOPX	DFHZOPX	DFHZOPX	DFHZSCX}*)**

Explanation

Bind-time security data sent to CICS by its partner LU is missing or invalid. CICS's password for the partner LU system differs from the partner's password for CICS. This can be caused by an attempt to sign on to CICS by an unauthorized user. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The bind is rejected.

User response

Check that an unauthorized user has not tried to log on to CICS. Ensure that the unsuccessful connection is correctly defined to CICS (using RDO or the DFHTCT macro) and to its partner LU system. Ensure that the security requirements are equal at both partners, that is, both have security off, or both have security on. A mismatch is one cause of this message.

Module:
DFHZSCX, DFHZOPX, DFHZBLX

DFHZC4925 E	*date time applid termid tranid* **Inconsistent attach security required.** *sense* **((***instance***) Module name: {*DFHZOPX	DFHZOPN	DFHZOPN	DFHZOPX*})**

Explanation

This message can be issued for any of the reasons listed below.

1. CICS has received a bind request specifying attach time security requirements different from those specified in the first bind.
2. CICS has received a bind requesting persistent verification.
3. CICS has received a bind which does not include an SNA functional management header (FMH12).

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS rejects the bind.

User response

CICS does NOT allow subsequent binds to specify different security requirements from the first bind. It will not support persistent verification on input either.

Where applicable, alter your applications to meet these requirements.

Module:
DFHZOPX, DFHZOPN

DFHZC4929 *date time applid termid tranid*
Invalid or unsupported BIND
for logmode *logmode*. **Response**
X'response'*, Reason *X'reason'
((*instance***) Module: *{DFHZOPN}*)**

Explanation

CICS has detected an error while validating the BIND supplied by VTAM for a CICS typeterm definition defined with LOGMODE=0 or LOGMODE=*logmode*.

The *response* code indicates:

X'04'

 The BIND supplied does not match the TCTTE - detected by DFHZBANS.

X'08'

 The BIND supplied is unsupported - detected by DFHZBANV.

X'0C'

 The BIND supplied is invalid - detected by DFHZBANV.

The *reason* code for a response of X'04' is as follows:

X'1B'

 Unsupported TCTTE type or not VTAM

X'1C'

 No NIB descriptor chained from TCTTE

X'1D'

 No BMS extension chained from TCTTE

X'1E'

 Same as for reason code X'1D'

X'1F'

 LU6.2 BIND, but TCTTE does not match.

The *reason* code for a response of X'08' or X'0C' is as follows:

```
Reason   Invalid   Explanation
Hex      byte
1        3         Should be hex 02, 03, 04 or
07
2-8      4|5|6|7   Invalid for this FM profile
9        2         Should be hex 00, 02, 03,
04,
                   07, 13 or 14
0A,0D,10 1         Invalid for LUTYPE 1,2 or 3
-
                   must be hex 01
0B       4|5|6|7   Invalid for LUTYPE 1

0E       4|5|6|7   Invalid for LUTYPE 2
0F       24        Invalid for LUTYPE 2 should
be
                   hex 00, 01, 02, 03, 7E, or
7F
11       4|5|6|7   Invalid for LUTYPE 3
12       24        Invalid for LUTYPE 3 should
be
                   hex 00, 01, 02, 03, 7E, or
7F
13       16        Invalid for LUTYPE 6.2
14       23        Invalid for LUTYPE 6.2
15-18    24        Invalid for LUTYPE 6.2
19       15        Should be hex 00 or 02
1A       14        Should be hex 00, 01, 02,
03,
                   06
1B and   User Data The reason code matches the
   over            byte position in the BIND
for
                   the error detected. These
can
                   be:
                   - Session ID length
                     unsupported - should
                     be 3 to 11
                   - PLU/SLU name length
                     unsupported - should
                     be 2 to 19
                   - PLU/SLU defined twice
                   - Length invalid
                   - Session qualifier pairs
have
                     inconsistent lengths.
```

System action

CICS rejects the logon request. The BIND being validated is printed with this message.

User response

Use the response and reason codes and the printed BIND, together with the VTAM definition of the BIND for the relevant LOGMODE to determine the reason for the rejection.

Either change the logmode or use a different one that matches CICS requirements.

Destination

CSMT

DFHZC4930 E	*date time applid termid tranid* **Session unbound following read timeout.** *sense* **((*instance*) Module name: {DFHZARL	DFHZARL	DFHZARER})**

Explanation

A READ timeout has occurred on the SNA link. SNA unbinds the session and CICS returns control to the application program. This allows the program to override the system action (for example, the program could free the APPC session). This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS abends the task abnormally with a dump.

User response

This is probably a network problem caused by a high level of network traffic. To avoid this problem, increase

the Read Timeout (RTIMOUT) to a sufficiently high value to compensate for the level of network traffic. Alternatively, this problem may have arisen simply because the partner application failed to respond due to a programming error. If this is the case, correct the partner application and retry the request.

Module:
DFHZARL, DFHZARER.

Destination

CSNE

DFHZC4931 E	*date time applid termid tranid* **VTAM detected bad logmode name.** *sense* **((*instance*) Module name: {DFHZLEX})**

Explanation

Either a MODENAME passed to VTAM during an attempt to bind an APPC session is not known to VTAM, or the logmode name of a VTAM 3270-type terminal is not valid. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS places the session permanently out of service and for APPC, the mode entry is flagged unusable.

User response

Either redefine the sessions using a MODENAME that is known to VTAM, or add the MODENAME to the VTAM LOGMODE table. Alternatively, if the logmode name specified for a VTAM terminal is invalid, redefine the terminal entry using the correct name.

Module:
DFHZLEX

CSNE

DFHZC4936 E   *date time applid termid tranid*
Attach FMH or subfield length
error. *sense* **((*instance*) Module**
name: {DFH62XM | DFH62XM})

Explanation

A request to attach a task has been received across an APPC link. However, there is an error in the FMH length or in the length of one of the sub-fields. This results in CICS being unable to determine which task to attach.

The instance *instance* is one of the following:

1

The FMH Length is not equal to the length of the fixed length portion + the length of all the sub fields.

2

The Conversation Correlator length within the FMH is greater than 8.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

The task abends and a dump is produced.

User response

The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Module:
DFH62XM

DFHZC4937 E   *date time applid* **SAF request for LU6.2 bind has been rejected. Return Codes from the Security Manager are: RF=** *X'rf'* **and R0=** *X'r0' sense* **((***instance***) Module name: {DFHZOPN | DFHZOPN | DFHZOPN | DFHZOPN | DFHZOPN | DFHZOPN | DFHZOPN | DFHZOPN | DFHZEV1 | DFHZEV1 | DFHZEV1 | DFHZEV1 | DFHZEV2 | DFHZEV2 | DFHZEV2 | DFHZEV2}**)

Explanation

A security authorization facility (SAF) request to extract APPC bind-time security information from the external security manager (ESM) has been rejected with return code RF=X'*rf*'. and RO=X'*r0*'.

This is due either to the ESM being inactive or to the appropriate APPC profile not being defined to the ESM. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS rejects the bind.

User response

Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes which may have been produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the z/OS Security Server RACF System Programmer's Guide manual for the meaning of the return codes.

If the appropriate APPC profile had not been defined to the ESM, define the profile, perform a CICS security rebuild and then attempt to reestablish the APPC connection.

DFHZC4940 E	*date time applid* **Bind time failure. No session key found in LU6.2 profile.** *sense* **((***instance***) Module name: {*DFHZOPN	DFHZOPN	DFHZEV1	DFHZEV2*})**

Explanation

APPC bind-time validation has failed. No session key has been found in the requested APPC profile information. When bind-time security has been defined between two logical units (LUs), a valid session key must have been defined for the encryption process. A null session key (that is, when no key is defined) is regarded as an error. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

CICS rejects the bind.

User response

Check the profiles defined to the external security manager (ESM). Create a valid session key for the appropriate APPC profile entry. DO NOT use the NOSESSKEY ESM option for XAPPC security profiles when using RACF.

Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return and reason codes which produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the z/OS Security Server RACF System Programmer's Guide manual for the meaning of the return code and the reason code.

CSMT

DFHZC4945 E	*date time applid termid tranid* **Session unbind request due to the forcepurge of a task.** *sense* **((*instance*) Module name: {DFHZARER})**

Explanation

A task was purged or forcepurged while it was suspended, waiting for an ISC request to complete. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

An unbind is requested for the session against which the ISC request was waiting and the task is abended A FORCEPURGE command causes the task to be abended irrespective of the state of the session. Other VTAM error messages may result from this action.

User response

Investigate the reasons the task was purged or forcepurged because it may have been the result of an application error. In addition, the partner task in the connected CICS system will have session failure notification returned on the next ISC request after the session has been unbound. Check that the partner task has handled the situation.

Module:

CSNE

DFHZC4946 E   *date time applid termid tranid* **Invalid attach parameter was received.** *sense* **((***instance***) Module name: {DFH62XM | DFH62XM | DFH62XM})**

Explanation

A request to attach a task has been received across an APPC link. However there is an error in the FMH attach parameters. An attach parameter is present that is not authorized by the bind security indicators.

The *instance* data can take the following values:

instance
   Meaning

1

   The bind security indicators show that the connection is defined as ATTACHSEC(LOCAL) indicating that this LU does not accept any security parameters in an attach from the partner LU. One or more of the following security parameters has been found: Userid, Password, Profile, AV, PV1 and PV2.

2

   An already-verified (AV) indicator has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the AV indicator.

3

   A persistent verification signon (PV2) indicator, or a persistent verification signed-on (PV1) indicator, has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the PV indicators.

System action

The task abends and a dump is produced and the session is unbound. An exception trace point (number 1737) for component TF is issued, tracing the invalid attach header (FMH type 5).

User response

Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace to determine why the remote system sent an invalid attach request.

Module:
DFH62XM

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *termid*

5. *tranid*

6. *sense*

7. *instance*

8. Value chosen from the following options:

   1=DFH62XM,

   2=DFH62XM,

   3=DFH62XM

Destination

CSNE

DFHZC4947 E   *date time applid termid tranid* **Attach time security check has failed. Security not valid.** *sense* **((***instance***) Module name: {DFH62XM | DFH62XM | DFH62XM | DFH62XM | DFH62XM | DFH62XM | DFH62XM | DFH62XM | DFH62XM})**

Explanation

A request to attach a task has been received over an APPC link. However the FMH5 attach parameters do not conform to the APPC protocol.

The *instance* data can take the following values:

instance
   Meaning

1

   Unrecognized access security subfield

2

   Multiple userid access security subfields present

3

   Multiple profile access security subfields present

4

Multiple password access security subfields present

5

Userid required in FMH but not received

6

PV1 and PV2 security indicators both present in FMH5

7

Password received when AV indicator set

8

Password received when PV1 indicator set

9

Password required for PV2 but not received.

System action

The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued tracing the invalid attach header (FMH type 5).

User response

Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace, to determine why the remote system sent an invalid attach request.

If the remote system has an earlier release of CICS or CICS on another platform and the sense value given is 5 then you may need to set USEDFLTUSER. See 'Attach Time Security and the USEDFLTUSER option' in chapter 12 of the CICS Security.

DFHZC4948 E   *date time applid An error has been detected when processing an{ unknown | inbound | outbound} { request. | Persistent Verify Signoff request. | Persistent Verify Timeout request.} Transaction tranid is{ continuing. | terminating. | terminating abnormally.} Error code: X'xxxxx' Connection: yyyy*

Explanation

An error has been detected during the execution of transaction CLS3. The error code indicates the nature of the error:

X'01'

Transaction CLS3 issued an unsuccessful communications request on an APPC session.

X'02'

Transaction CLS3 was started by a START command with data, but the format of the data was incorrect.

X'04'

Transaction CLS3 is attempting to send a signoff request to a remote system, but the connection to the remote system is not an APPC connection.

X'06'

Transaction CLS3 was not started by terminal input, nor by a START command.

X'09'

Transaction CLS3 was started by a START command with data, but the data could not be retrieved.

X'0A'

Transaction CLS3 is attempting to send a signoff request to a remote system, but there is no connection to the remote system.

X'0B'

Transaction CLS3 unsuccessfully attempted to allocate an APPC session to a remote system.

System action

Depending upon the nature of the event that gave rise to the message, the transaction continues execution, terminates normally, or terminates abnormally. The message text indicates which action is being taken.

User response

This depends upon the error code:

X'01'

Determine why the communications request on the APPC session failed. Possible reasons are:

- There has been a session failure.
- The connected transaction has abended.

:pc.This error produces an exception trace, which helps to determine the cause of the problem.

X'02'

Ensure that transaction CLS3 was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X'04'

Check the connection definition for the remote system. It should be an APPC connection.

X'06'

Ensure that transaction CLS3 was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X'09'

Determine why the data could not be retrieved. If you are unable to do so, contact your IBM Support Center

X'0A'

Ensure that the connection has been correctly defined

X'0B'

Ensure that the connection is acquired and in service

DFHZC4949 E	*date time applid termid tranid netname* **Receive Any stall -** *{data lost. | response lost. | command lost. }***CLSDST return code** *X'rc' sense* **((***instance***) Module name: {***DFHZRAC | DFHZRAC | DFHZRAC}***)**

Explanation

All the CICS Receive Any RPLs have been posted but the TCTTE for each one is waiting for a response from a VTAM terminal or session. All the Receive Any RPLs have been stalled for 10 dispatches of the TCP task (CSTP). This message is produced for each session that is in this situation. A VTAM session has not responded to a command such as BID or SHUTD sent by CICS. This is typically caused by a protocol error.

System action

CICS is running with system initialization parameter RAPOOL=(n,n,FORCE) causing CICS to issue a VTAM CLSDST against the session, which causes the TCTTE's RPL to be completed and the session to be unbound.

The default NEP action is CLSDST, which causes CICS to clean up the TCTTE after the pending command has been terminated.

The Receive Any data received is discarded and the RA RPL is reissued.

User response

Investigate the reason why the command has not completed. The TCTTE RPL is printed with the message.

It is important to look at any earlier DFHZC4949 messages because of the asynchronous nature of DFHZNAC. If the CLSDST has not completed, the RPL printed will be active and will show the RPL that can not complete. If the CLSDST has completed when DFHZNAC runs, the RPL printed will have a RTNCD/FDB2 of X'0C0B' but RPLREQ still shows what command would not complete.

If the CLSDST return code *rc* is non 0, the CLSDST macro has failed in DFHZRAC and the session remains hung. You may be able to free the session by using VTAM command V NET,INACT,ID=netname,I. You can find the reason for the CLSDST failure by looking at the RPL in the AP FC90 trace point for the CLSDST.

DFHZC4950 E   *date time applid* **An error has occurred when attempting to attach the outbound Connection Quiesce Protocol transaction CQPO on session** *termid***. Release of connection** *sysid* **is continuing. ((***instance***) Module name: {*DFHZCLS*})**

Explanation

An error has been detected while attempting to attach the outbound transaction for the Connection Quiesce Protocol (CQPO) on an APPC session.

System action

The release of the connection continues, but the Connection Quiesce Protocol will take place only if the partner system successfully initiates it.

User response

Determine why transaction CQPO failed to attach. If you have installed the correct definition for the transaction, you should never see this message, and you may need to contact your IBM Support Center for assistance.

If the partner system did not initiate the Connection Quiesce Protocol, you may need to determine if there are units of work awaiting resync, or VTAM affinities to be ended before you can INITIAL start either of the connected systems.

DFHZC4951 E	*date time applid* **An error has been detected when processing an***{ unknown | inbound | outbound}* **Connection Quiesce Protocol request. Transaction** *tranid* **is***{ continuing. | terminating. | terminating abnormally.}* **Error code:** *X'xxxxx'* **Connection:** *yyyy*

Explanation

An error has been detected during the execution of transaction *tranid*. The error code indicates the nature of the error:

X'01'

> Transaction *tranid* was not started by terminal input, nor by an internal CICS command.

X'02'

> Transaction *tranid* was started by an inbound FMH5, but the TPN was not the correct value for the Connection Quiesce Protocol.

X'03'

> Transaction *tranid* issued an unsuccessful communications request on an APPC session.

X'04'

> Transaction *tranid* has been attached by an inbound FMH5. The format of the data received from the remote system did not comply with the architecture for the Connection Quiesce Protocol.

X'05'

> Transaction *tranid* has received an unexpected response from the Recovery Manager.

X'06'

> Transaction *tranid* has been attached by an internal CICS command and has sent a Connection Quiesce Protocol request to the remote system. The format of the reply received from the remote system did not comply with the architecture for the Protocol.

X'07'

> Transaction *tranid* was started, but its principal facility is not a terminal or session.

System action

Depending upon the nature of the event that gave rise to the message, the transaction continues execution, terminates normally, or terminates abnormally. The message text indicates which action is being taken.

User response

This depends upon the error code:

X'01, 02, 07'

> Ensure that transaction *tranid* was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X'03'

> Determine why the communications request on the APPC session failed. Possible reasons are:
>
> • There has been a session failure.
>
> • The connected transaction has abended.
>
> :pc.This error produces an exception trace, which helps to determine the cause of the problem.

In other cases, contact your IBM Support Center.

CSMT

DFHZC5901 E   *date time applid* **Install for *resource* failed. *xxxx* could not obtain *yyyy* storage**

Explanation

When installing resource *resource*, CICS module *xxxx* could not get storage for the extent specified by the value of *yyyy*.

System action

CICS continues.

User response

If possible, increase the size of your CICS address space. Otherwise, consider reducing the number of resources used in one CICS run.

Module:
DFHBSMIR, DFHBSMPP, DFHBSM62, DFHBSS, DFHBSSZM, DFHBSTS, DFHBSTB, DFHBSTB3, DFHBSTC, DFHBSTZ, DFHBSTZB, DFHBSTZO, DFHBSTZR, DFHBSTZV, DFHBSTZ1, DFHBSTZ2, DFHBSZZS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *resource*
5. *xxxx*
6. *yyyy*

Destination

CSMT

DFHZC5902 E   *date time applid* **Deletion of terminal *termid* failed. BMS Paging session still active**

Explanation

CICS cannot delete terminal *termid* because a BMS paging session is still active for the terminal.

System action

CICS continues.

User response

Sign on to terminal *termid* and purge the pages.

Module:
DFHBSTB

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*

Destination

CSMT

DFHZC5903 E   *date time applid* **Deletion of terminal *termid* failed. CICS logic error**

Explanation

CICS cannot delete the terminal *termid*, because the CICS batch data attach function (DIP) is still active for this terminal.

System action

CICS continues. A system dump is taken with dumpcode ZC5903. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSTD

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

4. *termid*

Destination

CSMT

DFHZC5904 E   *date time applid* **Deletion of terminal *termid* failed. CEDF is still active**

Explanation

CICS cannot delete the terminal *termid* because an EDF session is still active for this terminal.

System action

CICS continues.

User response

Deactivate EDF for the terminal, and reinstall the group.

Module:
DFHBSTE

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*

Destination

CSMT

DFHZC5905 E   *date time applid* **Deletion of terminal *termid* failed. CICS logic error**

Explanation

CICS cannot delete terminal *termid* because the command level interface is still active for this terminal.

System action

CICS continues. A system dump is taken with dumpcode ZC5905. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSTH

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*

Destination

CSMT

DFHZC5906 E	*date time applid* **Install failed because '*xxxx*' is not a permitted value for a terminal or connection name**

Explanation

A name of hexadecimal zeros has been used for a TERMINAL or CONNECTION definition.

This is a reserved value. CICS has failed to install the terminal or connection.

xxxx is the reserved value converted to printable hexadecimal. The error has probably been made using autoinstall.

System action

CICS continues.

User response

Correct the definition to use a valid name and reinstall the group.

Module:
DFHBSS, DFHBSTZ, DFHBSTZ1, DFHBSTZ2
DFHBSMPP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *xxxx*

Destination

CSMT

DFHZC5907 E	*date time applid* **Deletion of remote shipped terminal failed for connection *cccc*.**

Explanation

During the deletion of connection *cccc*, the connection was found to have shipped remote terminals. The deletion of one or more of these shipped remote terminals has failed.

System action

CICS continues. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

See message DFHZC5915 for further information.

Use CEMT to release the connection and put it OUT OF SERVICE, then retry the install of the connection.

Module:
DFHBSSZ

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *cccc*

Destination

CSMT

DFHZC5908 E	*date time applid* **Install for terminal *termid* failed. The security manager gave return code *retcode***

Explanation

CICS cannot install terminal *termid*. DFHXSMN gave the return code *retcode*.

System action

CICS continues.

User response

Check the value of the return code *retcode* in the Developing system programs for CICS.

Module:
DFHBSTS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *retcode*

Destination

CSMT

DFHZC5909 E   *date time applid* **Install of resource *resource* failed. Call to DFHIRP *irp_function Return_code* did not succeed, See DFHIRSDS for return code.**

Explanation

When installing resource *resource*, the CICS module DFHBSSZR made a call to an IR service *irp_function* which failed due to the specified return code,

System action

CICS continues. The MRO connection *resource* is not installed.

User response

For an explanation of the return code, see DFHIRSDS in the CICS Data Areas manual.

Also see the user response section of message DFHIR3780. This gives a list of reasons why starting IRC can fail. However, some of the reasons are now also applicable when adding an IRC connection when IRC is OPEN. For instance a return code of E8 is issued if you add an IRC connection when cross memory is requested on the new connection but is not being used on any existing connection and when the CICS DB2 attachment has been initialized.

Module:
DFHBSSZR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *resource*
5. *irp_function*

6. *Return_code*

Destination

CSMT

DFHZC5911 E   *date time applid* **Install for resource *resource* failed. Connection *cccc* not found**

Explanation

CICS could not find the connection *cccc* associated with resource *resource*.

System action

CICS continues.

User response

Install connection *cccc*.

Module:
DFHBSMIR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *resource*
5. *cccc*

Destination

CSMT

DFHZC5912 E   *date time applid* **Install for terminal *termid* failed. It is incompatible with connection *cccc***

Explanation

The terminal *termid* and the connection *cccc* are mutually incompatible.

System action

CICS continues.

User response

Modify your definition of *termid* or *cccc*.

Module:
DFHBSTZ, DFHBSTZ2

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *cccc*

Destination

CSMT

DFHZC5913 E *date time applid* **Deletion of node *id* failed. {A table entry is locked. | A table entry was not found. | There was a logic error.} Table=*tabname* Key(*key*) Module(*modname*) Instance=*inst*.**

Explanation

CICS cannot delete node *id*. The message explains the reason for the failure.

1. One of its TMP table entries is locked by other tasks.
2. A TMP table entry could not be found, possibly because the node was already deleted by another task.
3. There was a CICS logic error. A DFHTM0002 error message may have been issued as well.

The TMP table entry is identified by *tabname*. The key used in the table has a value *key*. The module that issued the message is identified by *modname* and the instance of the message in that module by *inst*.

System action

The resource is not deleted. If the entry was locked, CICS issues one or more message DFHZC5980.

User response

Choose the action which corresponds to the reason identified in the message:

1. See message DFHZC5980 for further information and guidance.
2. If the node is deleted, no action is needed. If the node exists, determine whether it was replaced while this request was running. If the entry exists and has not been replaced, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

3. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSS, DFHBSSZ, DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSTZV, DFHBSTZS, DFHBSTZZ

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *id*
5. Value chosen from the following options:

   1=A table entry is locked.,

   2=A table entry was not found.,

   3=There was a logic error.

6. *tabname*
7. *key*
8. *modname*
9. *inst*

Destination

CSMT

DFHZC5914 E *date time applid* **Deletion of terminal *termid* found another deletion of it in progress**

Explanation

CICS has failed to delete terminal *termid* because it is already marked as pending deletion.

It is likely that a CEDA user is installing this terminal.

System action

CICS continues.

User response

Check if a CEDA user is installing the terminal.

Module:
DFHBSMIR, DFHBSMPP, DFHBSS, DFHBSTZ

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

4. *termid*

Destination

CSMT

DFHZC5915 E   *date time applid* **Deletion of node**
id failed. {The node is still in
service. | The system entry is still
in service. | The node has a task
attached.} Module(modname).

Explanation

CICS cannot delete node *id* The reason is identified in
the message.

1. The terminal or session is still in service.
2. The system entry of this session is still in service.
3. A task is still attached to this terminal or session.

The module issuing the message is identified as
modname.

System action

CICS continues and does not delete the node.

User response

Before retrying the deletion or replacement, perform
the action which corresponds to the reason given in
the message.

1. Set the node OUT OF SERVICE
2. Set the system entry OUT OF SERVICE.
3. Wait for activity to cease for this node.

Module:
DFHBSMIR, DFHBSTZ, DFHBSTZP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *id*
5. Value chosen from the following options:

   1=The node is still in service.,

   2=The system entry is still in service.,

   3=The node has a task attached.

6. *modname*

Destination

CSMT

DFHZC5916 E   *date time applid* **Deletion of**
terminal termid failed. It has
pending DFHZCP activity

Explanation

CICS cannot delete resource *termid* because DFHZCP
activity is pending for this terminal. The resource could
be a session belonging to a connection or a terminal
TCTTE.

System action

CICS continues.

User response

Use exception trace point AP FCDE to determine what
sort of activity is pending.

If this indicates that the VTAM CLSDST command
is in progress, VTAM could be trying to contact a
nonexistent or unavailable resource (indicated by
NETNAME in the CEDA definition for the resource). In
this case, wait for a few minutes and retry the reinstall
or discard. If you have access to the JOBLOG, message
DFHZC3462 for the resource in question indicates that
the CLSDST has finished.

If the resource is a terminal, put the terminal briefly
into service and then take it out of service again, using
the CEMT transaction.

3. *applid*
4. *modename*

Destination

CSMT

DFHZC5938 E *date time applid* **Deletion of modename** *modename* **failed. Unable to delete session(s)**

Explanation

CICS is unable to delete a SESSIONS definition with MODENAME *modename* because of one or more errors reported in previous messages.

System action

CICS continues.

User response

Refer to any preceding messages for further information and guidance. Correct the reported errors.

Module:
DFHBSM61

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *modename*

Destination

CSMT

DFHZC5939 E *date time applid* **Install for** *name* **failed. Duplicate session- or**

modegroup-name for connection *sysid*

Explanation

CICS is unable to install a session or modegroup as the session-name or modegroup-name *name* is duplicated. The duplicate might be another connection, session, modegroup or terminal. However it might also be the local connection which has the name specified by SYSIDNT in the system initialization table.

System action

CICS continues processing, but the session or modegroup is not installed.

User response

Change the duplicated session-name or modegroup-name.

Module:
DFHBSMIR, DFHBSM62

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *name*
5. *sysid*

Destination

CSMT

DFHZC5940 E *date time applid* **Install for terminal** *termid* **failed. Error console cannot be deleted**

Explanation

You have tried to replace the error console, CERR. CICS does not allow this.

System action

CICS continues with original error console.

User response

Note this restriction.

Module:
DFHZCQDL

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*

Destination

CSMT

DFHZC5941 E   *date time applid* **Install for terminal** *termid* **failed. Console** *consname* **has a conversation outstanding**

Explanation

CICS was unable to install terminal *termid* because the console *consname* has posted an ECB.

System action

Processing continues.

User response

Put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Module:
DFHBSTZO

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

5. *consname*

Destination

CSMT

DFHZC5942 E   *DATE TIME APPLID* **Node** *nodeid* **was not installed. The addition of key** *key* **to table** *tablename* **failed. RC=***X'return'***. Module(***modname***).**

Explanation

CICS cannot install the definition of node *nodeid* because an addition to a TMP table failed. CICS was trying to add the key *key* to the table *tablename*.

The return code from TMP is given in *return*. If the return code is 4, the entry was a duplicate. It is

possible that another entry was added at the same time as this entry and used the same key. If this is not the case, CICS has suffered a logic error. The module that issued the message is indicated by *modname*.

System action

CICS does not install the definition.

User response

If the entry was not overlapped by another definition which conflicted with its key, or if the return code is not 4, you will need assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSS, DFHBSTZ, DFHBSTZS, DFHBSTZZ, DFHBSTZ1, DFHBSTZ2

8. *modname*

Destination

CSMT

DFHZC5943 E   *DATE TIME APPLID* **MRO connection** *conname* **could not be deleted because IRC is open.**

Explanation

CICS cannot delete the connection *conname* because it is an MRO connection and interregion communication (IRC) is open.

System action

The connection is not deleted.

User response

Close the IRC definition and retry the Delete or Replace.

Module:
DFHBSS

XMEOUT parameters/Message inserts

1. *DATE*
2. *TIME*
3. *APPLID*
4. *conname*

Destination

CSMT

DFHZC5944 E   *DATE TIME APPLID* **Install for**
type(id) has failed. It would make
a loop of connection definitions.
Module(modname).

Explanation

CICS cannot install definition of *type* called *id* because
it would make a loop of connection definitions. The
connection *type* may be an indirect connection or
a remote connection. Indirect connections point to
other connections with the INDSYS field, and remote
connections point to other connections with the
REMOTESYSTEM field. The module that issued the
message is identified by *modname*.

System action

CICS does not install the definition.

User response

Determine the source of the loop either in the already
installed definitions or in this definition, and change it
before attempting to reinstall this definition.

Module:
DFHBSSZI, DFHBSTZ2

XMEOUT parameters/Message inserts

1. *DATE*
2. *TIME*
3. *APPLID*
4. *type*
5. *id*

Destination

CSMT

DFHZC5945 E   *date time applid* **Deletion of**
sessions ssss failed. Connection
cccc is defined to IRC

Explanation

CICS has not deleted the SESSIONS definition, *ssss*,
because the CONNECTION is still defined to IRC.

System action

CICS continues.

User response

Issue a CEMT SET IRC CLOSED command.

Module:
DFHBSTZR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *ssss*
5. *cccc*

Destination

CSMT

DFHZC5946 E   *date time applid* **Install for**
sessions ssss failed. Connection
cccc is defined to IRC

Explanation

CICS has not installed the SESSIONS definition, *ssss*,
because the CONNECTION is already defined to IRC.

System action

CICS continues.

User response

Issue a CEMT SET IRC CLOSED command.

Module:
DFHBSTZR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *ssss*
5. *cccc*

Destination

CSMT

DFHZC5947 E	*date time applid* **Install for sessions** *ssss* **failed. CICS logic error**

Explanation

CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION name is not specified.

System action

CICS continues. A system dump is taken with dumpcode ZC5947. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSMIR, DFHBSTZR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *ssss*

Destination

CSMT

DFHZC5948 E	*date time applid* **Install for sessions** *ssss* **failed. Connection** *cccc* **is not suitable for IRC**

Explanation

CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION specified is not suitable for IRC.

System action

CICS continues.

User response

Modify your definition of *cccc*.

Module:

DFHBSTZR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *ssss*
5. *cccc*

Destination

CSMT

DFHZC5949 E	*date time applid* **Install for sessions** *ssss* **failed. It is incompatible with connection** *cccc*

Explanation

CICS has not installed the SESSIONS definition, *ssss*, because the CONNECTION specified does not support the required type of session. If you are replacing a connection of the same name but of a different type and the install fails for some other reason then this message may occur.

System action

CICS continues.

User response

Modify your definition of *cccc*.

Module:
DFHBSMIR, DFHBSTZS, DFHBSTZR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *ssss*
5. *cccc*

Destination

CSMT

DFHZC5950 E	*date time applid* **Install for terminal** *termid* **failed. Console** *consname* **already exists**

Explanation

CICS has not installed the CONSOLE definition *termid* because the console ID, *consname*, already exists.

System action

CICS continues without installing the terminal.

User response

Use the CEDA transaction to define a different console ID in the CONSNAME of the terminal definition and reinstall the terminal.

Module:
DFHBSTZO

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *consname*

Destination

CSMT

DFHZC5951 E   *date time applid* **Deletion of connection *ssss* failed. Unable to delete sessions**

Explanation

CICS has not deleted the CONNECTION definition, *ssss*, because it cannot delete one or more sessions. A preceding message or messages should explain this failure.

System action

CICS continues.

User response

Refer to the preceding message for further information and guidance.

Module:
DFHBSSZR, DFHBSSZ6

XMEOUT parameters/Message inserts

1. *date*

3. *applid*

4. *ssss*

Destination

CSMT

DFHZC5952 E   *date time applid* **Deletion of terminal *termid* failed. It needs to be SET RELEASED**

Explanation

CICS cannot delete terminal *termid* because of its current state.

System action

CICS continues.

User response

Use the CEMT transaction to set terminal *termid* released and out of service.

Module:
DFHBSTZV

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*

Destination

CSMT

DFHZC5953 E   *date time applid* **CICS logic error**

Explanation

An object being installed did not have a bind-image.

System action

CICS continues. A system dump is taken with dumpcode ZC5953. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSM62

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSMT

DFHZC5954 E   *date time applid* **Install for resource *resource* failed. Unable to install sessions component**

Explanation

CICS has failed to install resource *resource*. Previous message(s) should give the reason for the failure.

System action

CICS continues.

User response

Refer to any preceding messages for further information and guidance.

Module:
DFHBSTZC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *resource*

Destination

CSMT

DFHZC5957 E   *date time applid* **Arch. User-Data ID X'*xx* occurs in bind. CICS logic error**

Explanation

The APPC SESSIONS object being installed is invalid because architected user-data IDs greater than X'02' occur in bind.

System action

CICS does not install the object. A system dump is taken with dumpcode ZC5957. Message DFHME0116, which contains the symptom string for this problem, is produced. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

3. *applid*

4. *pppp*

Destination

CSMT

DFHZC5982 E   *date time applid* **Deletion of pool** ***pppp*** **failed. Pool entry is in use for** ***termid***

Explanation

CICS has failed to delete POOL *pppp* because the pool still has an entry in use for terminal *termid*.

System action

CICS continues.

User response

Put the terminal out of service (using the CEMT transaction) and retry.

Module:
DFHBSMPP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *pppp*
5. *termid*

Destination

CSMT

DFHZC5983 E   *date time applid* **Unable to replace** ***resource***

Explanation

CICS failed to install resource *resource* either because it already exists, or for reasons explained in previous messages.

Possible causes are:

- Non-VTAM and VTAM terminals defined with the same name. If a non-VTAM terminal is installed, CICS will not autoinstall a VTAM terminal with the same name.
- An attempt to replace your own terminal, or a terminal with the same name as the terminal being used to issue the CEDA command.

- An attempt to replace a terminal with the same REMOTENAME and REMOTESYSTEM as an earlier definition in the same group.

System action

CICS continues.

User response

Refer to previous messages for further information and guidance.

If no previous messages were issued, check your terminal identifiers.

System action

CICS continues. A system dump is taken with dumpcode ZC5992. Message DFHME0116, which

contains the symptom string for this problem, is produced.

User response

CICS is unable to warm start correctly. You should therefore shut CICS down and perform a cold or initial start.

Module:
DFHZCQRS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSMT

DFHZC5993 E   *date time applid* **CICS logic error**

Explanation

CICS rejected a RESTORE request because the resource types table (DFHZCQRT) in DFHZCQ is incompatible with the recovery record from the log or CICS catalog.

System action

CICS continues. A system dump is taken with dumpcode ZC5993. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZCQRS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSMT

DFHZC5994 E   *date time applid* **CICS logic error**

Explanation

CICS rejected a RESTORE request because no recovery record was passed.

System action

CICS continues. A system dump is taken with dumpcode ZC5994. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZCQRS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSMT

DFHZC5995 E   *date time applid* **CICS logic error. Resource Type Code** *xxxx* **Subtype** *yyyy* **not recognized with associated bind image**

Explanation

CICS failed to install a resource with resource type code (RTC) *xxxx* and subtype *yyyy* (from the Builder Parameter Set) because a resource with type code *xxxx*, sub-type *yyyy*, and the associated BIND-image, is not a builder resource type. The RTC and subtype are defined in module DFHZCQRT.

This is a CICS logic error (probably in DFHTRZ*x*P).

System action

CICS continues. A system dump is taken with dumpcode ZC5995. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZCQIS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *xxxx*
5. *yyyy*

Destination

CSMT

DFHZC5996 E   *date time applid* **CICS logic error**

Explanation

CICS has rejected an INSTALL request because the resource type code in the request is zero.

System action

CICS continues. A system dump is taken with dumpcode ZC5996. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZCQIS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSMT

DFHZC5997 E   *date time applid* **CICS logic error**

Explanation

CICS has rejected an INQUIRE request because no TCT entry was passed.

System action

CICS continues. A system dump is taken with dumpcode ZC5997. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZCQIQ

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSMT

DFHZC5998 E   *date time applid* **Install specified a resource that cannot be replaced**

Explanation

CICS rejected a DELETE request because the entry passed is of a type that cannot be deleted, for example, a non-VTAM terminal.

System action

CICS continues.

User response

The failing delete/replace was necessitated by an INSTALL request. Correct the resource type in that request.

Module:
DFHZCQCH, DFHZCQDL

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSMT

DFHZC5999 E   *date time applid* **CICS logic error.**

Explanation

If DFHZCQCH issues this message, CICS has rejected a CATALOG request because the required entry parameter was not passed.

If DFHZCQDL issues this message, CICS has rejected a DELETE request because the required entry parameter was not passed.

System action

CICS continues. A system dump is taken with dumpcode ZC5999. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZCQCH, DFHZCQDL

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSMT

DFHZC6201 E   *applid* **CICS table builder services has detected a severe error in module *modname* code *X'code'*.**

Explanation

While executing a request, CICS table builder services detected a severe error. The error is identified by the error code *code* and the module *modname*.

System action

CICS rejects the request and takes a dump. CICS writes an exception trace record identified by *code*, then issues message DFHZC6208 either to the user of the CEDA transaction, or if the request did not originate from CEDA, to the CSMT transient data queue Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This failure indicates either an error in CICS, or a storage overlay. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTBSB, DFHTBSD, DFHTBSBP, DFHTBSDP, DFHTBSL, DFHTBSLP, DFHTBSS

1. *date*
2. *time*
3. *applid*
4. *pattern*

Destination

CSMT

DFHZC6207 E   *date time applid* **Catalog key too long or zero. Pattern** *pattern*

Explanation

While executing a request, CICS table builder services has detected that builder cited in the pattern *pattern* has returned an invalid CC key on MAKEKEY. *pattern* is the name of the pattern as coded in the DFHBSPTE macro.

System action

CICS rejects the request. A system dump is taken with dumpcode ZC6207. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTBSBP, DFHTBSDP, DFHTBSL

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *pattern*

Destination

CSMT

DFHZC6208 E   *date time applid* **CICS table builder services has detected a severe error in module** *modname*, **code(***X'code'***.**

Explanation

While executing a request, CICS table builder services detected a severe error. The error is identified by the error code *code* and the module *modname*.

System action

CICS rejects the request. It has already issued message DFHZC6201, written an exception trace record identified by *code,* and taken a dump.

User response

This failure indicates either an error in CICS, or a storage overlay. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTBSB, DFHTBSD, DFHTBSBP, DFHTBSDP, DFHTBSL, DFHTBSLP, DFHTBSS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

1. *date*
2. *time*
3. *applid*
4. *xxxx*

Destination

CSMT

DFHZC6210 E   *date time applid* **Table builder could not obtain storage for control block code** *X'code'***, module** *modname***.**

Explanation

While executing a BUILD, a DESTROY or a RESTORE request, CICS table builder services could not obtain storage for a control block. The control block could be a RRAB, a RABN, an action_block, a recovery record, or a recovery segment. The error code *code* identifies the element that could not be obtained by the module *modname*.

System action

CICS rejects the request. It has already written an exception trace record identified by *code*.

User response

This failure may be a symptom of a expanded dynamic storage area (EDSA) that is too small. If so, you can solve the problem by increasing the size of your CICS region. For guidance on estimating the size of the DSA and the CICS region, see the Configuring and the Improving performance. You can identify which control block that could not be obtained by formatting the exception trace record.

The failure may also be caused by an error in another transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

Module:
DFHTBSB, DFHTBSD, DFHTBSL, DFHTBSBP, DFHTBSDP, DFHTBSLP, DFHTBSS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *X'code'*
5. *modname*

Destination

CSMT

DFHZC6212 E   *date time applid* **Level mismatch with catalog record. DFHBS** *xxx*

Explanation

While executing a request during a warm or emergency start, CICS Table Builder Services has detected that the CC record is not compatible with the pattern it names. *xxx* is the builder ID.

System action

CICS rejects the request.

User response

The CC record was probably written by an earlier level of CICS. That is, you have applied one or more PTF maintenance fixes to the system since the CC record was written. Assuming this is the case, you must either:

- Cold or initial start CICS, **or**
- Remove the maintenance to enable a warm start or emergency restart.

Module:
DFHTBSR, DFHTBSRP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *xxx*

Destination

CSMT

DFHZC6213 E	*date time applid* **Recovery record abandoned. Key is** *key*

Explanation

While processing a RESTORE request, CICS Table Builder Services detected an error reported in a previous message. *key* is the catalog key for the abandoned record, or, if the key is unknown to CICS, *key* is the single character **?**.

System action

See the previously issued message for the cause of the problem, and follow the recommended user action.

User response:

Module:
DFHTBSR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *key*

Destination

CSMT

DFHZC6214 E	*date time applid* **Unable to obtain recovery record storage**

Explanation

While processing a CATALOG request, CICS Table Builder Services could not obtain recovery record storage.

System action

CICS rejects the request.

User response

This failure may be a symptom of a dynamic storage area (DSA) that is too small. If so, you can solve the problem by increasing the size of your CICS region. For advice on estimating the size of the DSA and the CICS region, see the Configuring and the Improving performance.

The failure may also be caused by an error in another transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

1. *date*
2. *time*
3. *applid*

Destination

CSMT

DFHZC6216 E	*DATE TIME APPLID* **Install for** *restype1* **(***resname1***) failed and caused the backout of the whole set of RDO resources for** *restype2* **(***resname2***).**

Explanation

The RDO definition for a resource of type *restype1* named *resname1* could not be installed because of an error. This causes the installable set of RDO definitions associated with *restype2* named *resname2* to be backed out.

The resource type of the definition that failed *restype1* can be connection, session, modegroup, pool, or pooled terminal. The resource type of the associated definition *restype2* can be connection, or a pool_name for pipeline terminals.

System action

CICS backs out the installation of the set of associated RDO definitions and continues without them.

User response

Correct the reason for the failure of the definition, identified by previous DFHZX*nnnn* messages, and then retry the install.

Module:
DFHTBSB

XMEOUT parameters/Message inserts

1. *DATE*
2. *TIME*
3. *APPLID*
4. *restype1*
5. *resname1*
6. *restype2*
7. *resname2*

Destination

CSMT

DFHZC6301 E   *date time applid* **Install for** ***tttt* failed. Duplicate netname** ***netname* for resource *rrrr* found.**

Explanation

A resource *tttt* was being installed but was found to have the same network name *netname* as resource *rrrr*.

System action

The resource is not installed, CICS continues.

User response

If you want the definitions to be installed, use CEDA to correct the network name and reinstall the definition.

Module:
DFHBSTZV

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tttt*
5. *netname*
6. *rrrr*

Destination

CSMT

DFHZC6302 E   *date time applid* **Install for connection** *cccc* **failed. Duplicate netname** *netname* **for resource** *rrrr* **found.**

Explanation

A connection *cccc* was being installed but was found to have the same network name *netname* as resource *rrrr*.

System action

The resource is not installed, CICS continues.

User response

You cannot have an APPC connection with the same network name as another APPC connection or an LU6.1 connection. That is, you cannot have more than one APPC connection between two systems and an APPC connection cannot be installed with an LU6.1 connection between two systems.

Neither APPC or LU6.1 network names can be the same as a terminal's network name.

Also you cannot have an IRC (or XM) connection with the same network name as another IRC (or XM) connection. However, an IRC network name can be the same as any VTAM network name (APPC or LU61 connection or terminal).

If you want the definitions to be installed, use CEDA to correct the network name and then reinstall the definition.

If you need to replace a connection with a different network name, it must have the same connection name as the one you are replacing.

Module:
DFHBSS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *cccc*
5. *netname*
6. *rrrr*

Destination

CSMT

DFHZC6303 E   *date time applid* **Install for *tttt* failed. Duplicate netname *netname* found.**

Explanation

A resource *tttt* was being installed but was found to have a duplicate network name *netname*.

This message occurs:

- If the duplicate NETNAME occurred in the same group as this definition, or
- If two CEDA transactions were run at the same time and the other CEDA transaction added a NETNAME between the BUILD and CONNECT routines of DFHBSTZV.

System action

The resource is not installed; CICS continues.

User response

If you want the definitions to be installed, use CEDA to correct the network name and then reinstall the definition.

Module:
DFHBSTZV

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tttt*

5. *netname*

Destination

CSMT

DFHZC6304 W   *date time applid* **Deletion of remote terminal *termid* failed because it is in use by another transaction.**

Explanation

CICS has issued a logoff transaction to the remote terminal *termid* but this terminal cannot be deleted because it is in use by another transaction.

System action

The remote terminal can be reused. CICS continues.

User response

This situation usually occurs because the remote CICS is under stress. Consider allocating more resources. For example, you might need to allocate more storage.

Module:
DFHBSTZ

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*

Destination

CSMT

DFHZC6305 E   *date time applid* **Install for EXCI generic connection *cccc* failed. Duplicate EXCI generic connection *rrrr* found.**

Explanation

A connection *cccc* specifying protocol(exci) and conntype(generic) was being installed but an existing EXCI generic connection *rrrr* was found.

System action

The resource is not installed. CICS continues.

User response

There can be only one EXCI generic connection installed in a CICS system. Determine which EXCI generic connection definition is required and remove the duplicate definition.

If you need to replace the EXCI generic connection definition, it must have the same connection name as the one you are replacing.

Module:
DFHBSS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *cccc*
5. *rrrr*

Destination

CSMT

DFHZC6307 E   *date time applid* **Install for connection *cccc* failed. Netname *netname* is the same as the generic resource name.**

Explanation

A connection *cccc* was being installed but the netname *netname* is the same as the generic resource name for this CICS (as defined in the SIT GRNAME parameter).

Communication within a SYSPLEX (intra-plex) must be done using member names.

System action

The resource is not installed, CICS continues.

User response

If this connection is for communication within a sysplex, use CEDA to change the NETNAME to the member name of the connection with which you wish to communicate.

If this is for communication between two sysplexes, change the NETNAME to the generic resource name of the partner sysplex.

Module:
DFHBSS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *cccc*
5. *netname*

Destination

CSMT

DFHZC6308 E   *date time applid* **Restore for connection *cccc* failed. Netname *netname* is the same as the generic resource name.**

Explanation

During an emergency or warm restart CICS tried to restore connection *cccc*. However its netname *netname* is the same as the generic resource name for this CICS (as defined in the GRNAME system initialization parameter).

This is probably because the GRNAME specified in the SIT has been changed. It should only be changed at INITIAL start time.

System action

Processing continues. The resource is not installed.

User response

If this connection is for communication within a sysplex, use CEDA to change the NETNAME to the member name of the connection with which you wish to communicate.

If this is for communication between two sysplexes, change the NETNAME to the generic resource name of the partner sysplex.

If you need to change the GRNAME parameter, remember to do so only during an INITIAL start.

Module:
DFHBSS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *cccc*
5. *netname*

Destination

CSMT

DFHZC6312 E   *date time applid* **Install for connection *cccc* failed. An IPCONN with this name already exists and its applid is not *netname*.**

Explanation

A CONNECTION *cccc* install failed because there is already an IPCONN of this name installed in the system and its APPLID is not the same as the NETNAME *netname* of this CONNECTION. This is not permitted.

System action

The resource is not installed. CICS continues.

User response

An IPCONN and a CONNECTION of the same name must represent a link to the same system, so either the IPCONN APPLID or the CONNECTION NETNAME is incorrect. Establish which of these is the case and re-install with the correct value.

Module:
DFHBSS

XMEOUT parameters/Message inserts

1. *date*

DFHZC6341 E   *date time applid* **Loop or ABEND has been detected in *inmodule* by module *bymodule*.**

Explanation

CICS has previously detected a loop or abend. Module *bymodule* called module *inmodule* which looped or abended.

System action

CICS issues message DFHZC0001 if an abend is detected or DFHZC0004 if a loop is detected. The install or delete being performed is backed out. CICS continues. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

See the associated message for more guidance.

Module:
DFHBSM61 DFHBSTZS, DFHBSTZR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *inmodule*
5. *bymodule*

Destination

CADL

DFHZC6350 I   *date time applid* **The *type* session name BITMAP was corrupt and**

has been rebuilt. Error code: AP FB05.

Explanation

A connection was being installed but the APPC or MRO session name BITMAP which is used to create a session name, was corrupt. The corrupt BITMAP has been rebuilt.

The APPC session name BITMAP is always used for an APPC session, however the MRO session name BITMAP is only used if the session name is prefixed with '<' or '>'.

System action

A dump is taken with dumpcode ZC6350. Trace point ID AP X'FB05' is produced. The install continues. CICS continues. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the dump provided to determine the cause of the storage overwrite. See the Troubleshooting and support for guidance on dealing with storage problems.

Module:
DFHZGBM

2. *time*
3. *applid*
4. *type*

Destination

CSMT

DFHZC6360 W	*date time applid* **A GETMAIN failed to obtain storage for a message set.**

Explanation

A ZCP install has failed. This would normally result in a message being issued. However, the GETMAIN attempting to obtain storage from the CDSA for use as a message area has failed. This means that there is no more free storage available in the CDSA.

System action

The message which should have reported the ZCP install failure cannot be issued. Subsequent messages also cannot be issued while there is no free storage available in the CDSA. However, subsequent messages can be issued if storage becomes available on subsequent GETMAIN attempts.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use trace to determine the source of the problem. Trace point AP FCDD, the TBSM entry, gives the message number which should have been issued and the message insert data. Refer to the description of this message for further guidance.

Module:
DFHBSTS, DFHBSTZO, DFHZATA2

CSNE

DFHZC6595 I	*date time applid termid tranid* **Node *netname* backup session not attempted.** *sense* ((*instance*) **Module name: {DFHZOPN	DFHZOPN	DFHZOPN})**

Explanation

Before the OPNDST is issued, the backup system has abandoned the attempt to establish a backup session for one of the following reasons:

- There is no XRF support in VTAM (TCTVXRFS), or
- the TCTTE is flagged as a secondary. This CICS receives the BIND, but does not send it (TCTE2RY), or
- the TCTTE indicates that the LOGMODE keyword was specified on the terminal definition.

This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

If this system takes over, the autoconnect process attempts to acquire a session. In this case, it probably

takes longer for the session to become available for use.

User response

Do not attempt a backup session.

Rectify error, or downgrade the recovery option specified for this terminal.

Destination

CSNE

DFHZC6596   *applid* **CICS terminal control program cannot support XRF functions.** *sense* **((***instance***) Module name: {*DFHZSEX | DFHZSLS*})**

Explanation

The VTAM ACB has been opened, and the function level of the terminal control program (ZCP) and VTAM has been examined. It has been determined that XRF terminal functions cannot be supported in this execution of CICS.

This can be because one of the DFHZC*x* modules, or the TCT, was assembled against a version of VTAM earlier than 3.1, or because the level of VTAM that has just been opened is pre-3.1. This imbed is inserted in DFHZC *xxxx* messages with *sense* inserts. For the meaning of *sense* , see message DFHZC2400.

System action

Processing continues. Processing continues, but no VTAM XRF functions can be supported.

User response

If VTAM XRF functions are required, check the assembly of each of the DFHZC*x* modules and the TCT.

If a pre-3.1 release of VTAM was used in the assembly process, then a warning MNOTE will have been issued.

The relevant modules should then be reassembled against the correct level of VTAM.

If the assembly of all modules is correct, then the VTAM used in this execution is at a pre-3.1 level.

Console

DFHZC6901 W   *date time applid* **Autoinstall BIND for NETNAME** *netname* **is invalid. Internal RC(***X'response'***).**

Explanation

The bind passed for AUTOINSTALL of a resource has shown an error in the bind image check call. The fixed part of the BIND is printed (this is the part on which the validation code operates ? see the [Systems Network Architecture Formats (GA27-3136)](#) for details of the BIND RU). The internal return code X'*code*' identifies the location within the module that invalidated the BIND.

System action

CICS continues but the session is not installed. The request is rejected and message DFHZC2411 is issued. The terminal is not usable until a VTAM LOGOFF command is issued.

User response

Investigate the fixed part of the BIND data to determine the reason for the rejection. The internal return code gives more information that can be used by IBM to help you to determine the cause of the problem. See [Working with IBM to solve your problem](#) for guidance on how to proceed.

7. *id*
8. *model*

Destination

CADL

DFHZC6904 W	*date time applid* **Autoinstall for {*netname* | *consolename*} *id* failed. CATA task abended (abend *abend*).**

Explanation

Transaction CATA was autoinstalling a terminal or console, *id*, when the task abended with abend *abend*. If the resource being autoinstalled was a terminal, then the issuing module was DFHZATA. Otherwise, the issuing module was DFHZATA2 if the resource was a console. The *id* can be either a netname or a consolename.

System action

CICS continues but the resource is not installed.

User response

Retry the logon attempt. If the abend indicates a TIMEOUT and this occurs frequently, increase the CATA DTIMOUT value. If you do not want the CATA transaction to time out, remove the DTIMOUT parameter from the CATA DEFINE TRANSACTION command. However, if you do this, and if the system is short on storage, a large number of CATA transactions running at the some time with no other transactions present could cause a deadlock.

Module:

DFHZATA, DFHZATA2

2. *time*
3. *applid*
4. Value chosen from the following options:

    1=netname,

    2=consolename

5. *id*
6. *abend*

Destination

CADL

DFHZC6905 W	*date time applid* **Autoinstall delete for *resource resid*, {*netname* | *consolename*} *id* failed. CATD task abended (abend *abend*).**

Explanation

Transaction CATD, program DFHZATD was deleting an autoinstalled *resource resid*, when the task abended with abend *abend*.

System action

CICS continues. If the resource still exists, it is reused next time the same TERMID or SYSID is used.

User response

See the description of abend *abend* for further guidance.

If the abend indicates a TIMEOUT and this occurs frequently, increase the CATD DTIMOUT value. If you do not want the CATD transaction to time out, remove the DTIMOUT parameter from the CATD DEFINE TRANSACTION command. However, a large number of CATD tasks running at the same time with no purgeable tasks present could cause a deadlock if the system is also short on storage.

8. *abend*

Destination

CADL

DFHZC6906   ***date time applid* Install or delete of remote terminal *termid* failed. *tranid* task abended (abend *abend*).**

Explanation

One of the functions of DFHZATS (transaction CITS, CDTS, CMTS or CFTS) has abended with abend *abend*.

System action

CICS continues.

For CITS (remote install), if the remote terminal (skeleton) was actually built, CICS might use it.

For CDTS (remote delete), If the remote terminal (skeleton) has not been deleted, it might be reused.

For CMTS (remote mass delete), terminals which have not been deleted by CMTS might be deleted at a later stage.

For CFTS (remote mass flag), terminals which have been flagged for deletion might be deleted at a later stage. If any terminals have not been flagged, attempts might be made to reuse them. This can have unpredictable results.

User response

See the description of abend *abend* for further guidance.

The most likely reason for this message is a timeout of CITS or CDTS. In the case of CITS, reissue your transaction if necessary.

If the TIMEOUTs occur frequently, consider increasing the CITS or CDTS DTIMOUT values. If you do not want the transactions to time out, remove the DTIMOUT parameter from the CITS or CDTS DEFINE TRANSACTION command. However, a large number of CITS tasks running at the same time with no purgeable

tasks present could cause a deadlock if the system is also short on storage.

Note that CFTS and CMTS do not have a DTIMOUT parameter and should not be given one because they only run once after a warm or emergency restart and should not be allowed to time out.

5. *tnaddr*

Destination

CADL

DFHZC6910 W *date time applid* **Install for remote terminal** *termid* **failed.**

Explanation

An INSTALL for the remote terminal *termid* has failed. The reason for the failure is specified in associated DFHZC59xx and DFHZC62xx messages.

System action

DFHZATS terminates abnormally with a CICS transaction dump.

User response

See the associated messages for further guidance.

Module:
DFHZATS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*

Destination

CADL

DFHZC6911 W *date time applid* **Delete for remote terminal** *termid* **failed.**

Explanation

A DELETE for remote terminal *termid* has failed. Possible causes are that the terminal has already been deleted or that it is in use by another task.

If this message is repeated a number of times, there could be a more serious problem.

System action

If the message is associated with message DFHZC6912, CICS continues normally. If message DFHZC6912 is not issued, DFHZATS is abnormally terminated with a transaction dump.

User response

If the message is associated with message DFHZC6912, no action is necessary. If DFHZC6912 is not issued, see the associated DFHZC59xx, DFHZC62xx and DFHZC63xx messages for the reason for the DELETE failure.

2. *time*
3. *applid*
4. *termid*
5. *X'SNUS_RESPONSE'*

Destination

CADL

DFHZC6920 E *date time applid* **APPC autoinstall for NETNAME** *netname* **failed. RC** *x*

Explanation

An autoinstall attempt to install APPC NETNAME *netname* has failed. The autoinstall program call to the autoinstall control program failed with return code *x*.

The return codes are mapped from the program manager LINK_URM response and reason. More precise reasons for failure can be obtained from trace point PG 0A02.

System action

CICS continues.

User response

The appropriate response depends on the return code as follows:

1

The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.

2

The user exit program has no resource definition. Ensure that the PROGRAM resource definition for the user exit program is installed.

3

The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.

4

The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.

5

Loading of the user exit program failed for some other reason. Check the DFHPGLU exit trace entry (PG 0A02) to see why the program manager was unable to load the program.

Module:

5. *x*

Destination

CADL

DFHZC6921 W *date time applid* **Autoinstall for NETNAME** *netname* **has been disallowed by the autoinstall control program. Code** *X'code'*

Explanation

An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has given a nonzero return code indicating that the install cannot go ahead.

If you do not support APPC autoinstall, the autoinstall control program (DFHZATDX is the default name) automatically returns a nonzero return code to disallow this function.

System action

The exception trace entry *code* shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

User response

The failure code X'*code*' is as follows:

X'FA07'

If APPC autoinstall is not supported, use the *netname* to determine which device is attempting autoinstall.

If APPC autoinstall is supported, examine the autoinstall control program to determine why it has not set the return code to allow the install.

Module:
DFHZGAI

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *X'code'*

Destination

CADL

DFHZC6922 E   *date time applid* **Parameter list error during autoinstall for NETNAME** *netname*. **Code** *X'code'*

Explanation

An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has returned an invalid parameter, or a parameter that has led to an invalid template being used.

System action

The exception trace entry *code* shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

User response

The failure code X'*code*' is one of the following:

X'FA08'

No netname or sysid was supplied for the template. Change the autoinstall control program to supply either the netname or the sysid.

X'FA09'

The sysid for the new connection has invalid characters. It can only contain A-Z a-z 0-9 and £#@ (where £ is X'5B') Redefine the connection name in the autoinstall control program.

X'FA0A'

The sysid for the new connection already exists. Change the autoinstall control program to supply a unique name.

X'FA0B'

CICS is unable to locate the supplied template netname. Change the autoinstall control program to supply the correct template name, or use CEDA to install the template connection.

X'FA0C'

CICS is unable to locate the supplied template sysid. Change the autoinstall control program to supply the correct template sysid or use CEDA to install the template connection.

X'FA0D'

The template is not an APPC connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

X'FA0E'

The bind indicates that a parallel session connection is required. The template is a single session connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

X'FA0F'

The bind indicates that a single session connection is required. The template is a parallel session connection. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

X'FA10'

The modename in the bind does not match the modename in the connection.

For parallel sessions, the SNASVCMG modegroup is missing. The install for the template may have failed - check for any CADL messages mentioning the template name. The template connection may have been corrupted. Try and re-install the template.

For single sessions, the user modegroup name does not match. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

X'FA11'

The program that attempted to INQUIRE on the template has detected an error in the template and is unable to create a BPS with which to install the new connection. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the CONNECTION is correct.

X'FA12'

The program that attempted to INQUIRE on a user modegroup for the named template has detected an error in the template and is unable to create a BPS with which to install a user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also use CEMT to ensure that the MODEGROUP is correct.

X'FA13'

The template connection has no user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and the CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the MODEGROUP is correct.

X'FA14'

The template connection is out of service so this install cannot continue. If the install should have been allowed to continue, put the relevant template connection INSERVICE using CEMT.

X'FA15'

The incoming bind user data does not have a PLUNAME Network Name subfield (id 04). This is required and should have been supplied by the PLU.

X'FA16'

The incoming bind user data does not have a MODENAME Network Name subfield (id 02). This is required and should have been supplied by the PLU.

Module:
DFHZGAI

2. *time*
3. *applid*
4. *netname*
5. *X'code'*

Destination

CADL

DFHZC6923 E   *date time applid* **Unacceptable bind parameter during autoinstall for NETNAME** *netname***. Code** *X'code'*

Explanation

CICS has received a BIND from an unknown APPC node. The autoinstall process was initiated, but an invalid bind parameter has been detected. The parameter in error is indicated by the failure code X'*code*' which is one of the following:

X'FA18'

There was no session instance ID field in the bind user data.

X'FA19'

There was no primary logical unit (PLU) name in the bind user data.

X'FA1A'

The PLU name in the bind user data is the same as the LU name of this CICS.

X'FA1B'

Security information (an encryption seed) was expected, but not present, in the bind user data.

X'FA1C'

Security information (an encryption seed) was found in the bind user data but its length was too high for it to be valid.

X'FA1D'

Security information (an encryption seed) was found in the bind user data when none was expected.

X'FA1E'

The received bind indicated that it was not negotiable. This is not acceptable for an APPC connection.

X'FA1F'

The received bind specified a primary RU size of zero.

X'FA20'

The received bind specified a secondary RU size of zero.

X'FA21'

The received bind contained inconsistent access security indicators.

X'FA22'

Two security information fields (seed and nonce field) were found in the received BIND where only one was expected.

X'FA23'

The received BIND contained a nonce field with an incorrect length.

X'FA24'

The received BIND did not contain a nonce field.

X'FA25'

The received BINDs security mechanisms field length was smaller than the minimum defined by the Architecture.

X'FA26'

The received BINDs security mechanisms field contained an invalid length for the mechanism identifier field.

System action

The exception trace entry with trace point ID 'AP xxxx' (where xxxx is X'*code*') shows the bind that was received. The session is terminated. CICS continues.

User response

Change the definitions on the connecting LU so that the bind parameters are acceptable to CICS.

Destination

CADL

DFHZC6936 I *date time applid* **Autoinstall for NETNAME** *netname*, **model** *modelname* **in MTS control vector not known to CICS.**

Explanation

The VTAM MTS control vector contained a model name *modelname* not defined to CICS.

System action

CICS continues. This message is informational.

User response

There are four possible ways of correcting this problem:

- Use the CEDA transaction to define and install the autoinstall model
- Change the VTAM MTS MDLTAB MODEL= entry to the name of an existing autoinstall model.
- Logon to CICS with a MODEL= parameter that defines an existing autoinstall model.
- Code an Autoinstall User Program. Examples are given in the Developing system programs for CICS in the Sample Programs and Copybooks section.

5. *modelname*

Destination

CADL

DFHZC6937 I	*date time applid* **Autoinstall for NETNAME** *netname*, **MTS model** *modelname* **and bind image mismatch.**

Explanation

An autoinstall attempt occurred using the modelname printed. The MODEL BIND (from the CICS model definition) did not match with the incoming bind in CINIT. The MISMATCH_BITS show which bind bits did not match.

System action

CICS continues.

User response

There are four possible ways of correcting this problem:

- Change the CICS autoinstall MODEL *modelname* to produce a bind that matches the incoming CINIT.
- Change the MTS MDLTAB MODEL= entry to a model name defined to CICS whose bind matches the CINIT defined in the LOGMODE for this terminal.

- Change the VTAM LOGMODE for this terminal to match the chosen CICS MODEL_BIND.
- Code an autoinstall user program. Examples are given in the Sample Programs and Copybooks section of the Developing system programs for CICS.

5. *modelname*

Destination

CADL

DFHZC6939 W	*date time applid* **Autoinstall for NETNAME** *netname*, **Invalid length** *nn* **found in cinit control vector at offset** *offset*

Explanation

CICS verification checks on the format of the control vectors in the CINIT have failed.

offset indicates the first point of failure. This is either a length field greater than 128, or a length field which would cause CICS to overrun the end of a CINIT vector or subvector.

This is either due to incorrect format of the CINIT RU (and therefore probably a VTAM logic error), or due to incorrect parsing of the CINIT RU by DFHZATD, which is a CICS logic error.

System action

CICS continues. The logon request is rejected.

User response

Inspect the format of the CINIT RU as captured by the autoinstall program for all rejected logon requests. The first point of failure may be at *offset* or before it since CICS verification checks are permissive.

If the format is incorrect, the origin of the invalid CINIT should be tracked and the problem resolved there.

If the format is correct, this is a CICS logic error. In this case you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

CADL

DFHZC6948 W   *date time applid* **Delete for connection** *sysid*, **NETNAME** *netname* **failed due to CATD initiation failure. Module** *module*.

Explanation

CICS was attempting to delete an autoinstalled APPC connection *sysid* but the attempt failed because CICS was unable to initiate the CATD transaction. The specific circumstances depend on the module:

DFHZATR

 After a CICS restart transaction, DFHZATR was driven to delete autoinstalled connections but CATD failed to initiate.

DFHZCLS

 Connection *sysid* was released and DFHZCLS was attempting to initiate the CATD transaction to delete the connection but CATD failed to initiate.

DFHZGCH

 An attempt was made to delete *sysid* after a successful CHANGE ENDAFFIN request; however, CATD failed to initiate.

System action

The connection is left in a released state. CICS continues.

User response

Ensure that the definitions for transaction CATD and program DFHZATD are correct. If you still wish to delete this connection, use CEMT DISCARD CONNECTION or EXEC CICS DISCARD CONNECTION.

   1=RESOURCE,

   2=PRINTER,

   3=ALTPRINTER

8. *n*

Destination

CADL

DFHZC6966 I   *date time applid* **Autoinstall delete for *restype resid* with *{netname | consolename} id* was successful.**

Explanation

CICS has successfully deleted the autoinstalled resource *restype resid*. The *restype* can be a terminal, an APPC connection, or a console.

System action

CICS continues.

User response

None.

Module:
DFHZATD

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *restype*
5. *resid*
6. Value chosen from the following options:

   1=netname,

   2=consolename

7. *id*

Destination

CADL

DFHZC6987 W   *date time applid* **Autoinstall best failure for NETNAME *netname* was model *model*.**

Explanation

An autoinstall attempt has failed for lack of an exact match.

netname is the netname of the LU which failed to logon,

model is the name of the model that gave the best failure (that is, the one that had the fewest bits different from the BIND image supplied by VTAM).

The following associated information is also written to CADL:

> *xxxxxxxx...* is a string of hexadecimal digits, where *xx* represents one byte, and each byte position represents the corresponding byte position in the BIND image.
> CINIT BIND: *xxxxxxxx* is the bind image supplied by VTAM.
> MODEL BIND: *xxxxxxxx* is the best model.
> MISMATCH BITS: *xxxxxxxx* represents a comparison of the relevant bits from above. A bit set to '1' indicates a mismatch in that position between the BIND image from VTAM and the BIND image associated with the model.

System action

CICS continues.

User response

1. Determine whether the model *model* is suitable. If there are several models which have options, such as TRANSECKEYS, then only the first such model is named in the above message. It will be up to the user-program to make the choice, when the logmode table entry is corrected.
2. Identify the entry in the VTAM logmode table that is being used.

3. Check that this logmode table entry is not successfully in use with other applications, so that to change it might cause this other use of it to fail.
4. Amend the logmode table entry by switching the bits corresponding to '1' bits in the mismatch string. That is, if the bit in the VTAM bind image corresponding to the bit position set to '1' in *xxxxxxxx...* is '1', set it to '0'. If it is '0', set it to '1'.

For further information, refer to the Developing system programs for CICS.

More on the meaning of the various bits in a bind image may be found in z/OS Communications Server: SNA Programming manual, (SC27-0611).

Details of the preparation of VTAM logmode table entries are given in z/OS Communications Server: SNA Resource Definition Reference manual, (SC27-0613).

Destination

Terminal End User

DFHZE2604	Syst.sense 0811,*termid,taskid*, Unprocessed data at detach

Explanation

The task to be detached did not completely process the inbound data chain.

System action

Purging of data is done until end-of-chain (EOC) or CANCEL has been received.

User response

None.

Module:

DFHZNnnnn messages

DFHZN2130	*date time applid* **A unit of work has been shunted but the connection with the remote system does not support the shunt protocols. Resources on the remote system may be out of sync with those on this CICS after the UOW is resynchronized. Failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *netname* **transaction** *tranid* **task number** *trannum* **operator terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuow'*.

Explanation

This message is preceded by message DFHAC2231. An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction *tranid* has lost contact with its coordinator system during the indoubt period.

System action

In accordance with the transaction definition, the unit of work is not completed. It is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

As part of this processing, CICS has attempted to pass on the shunt request to another partner system. However, this partner does not support the shunting protocols, and so this partner may backout or commit changes to its resources independently of this shunted unit of work.

User response

Following resynchronization with the coordinator system, determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the CICS intercommunication for information on design considerations in a distributed environment.

DFHZN2131	*date time applid* **Intersystem session failure during CICS synclevel one commit. Local resources may be out of sync with those on the remote system. Failure date** *mm/dd/yy* **failure time** *hh:mm:ss* **remote system** *netname* **transaction** *tranid* **task number** *trannum* **operator terminal** *termid* **user** *userid* **network UOW** *netuowid* **local UOW** *X'localuowid'*.

Explanation

A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, a session failure occurred at a critical time during the synclevel 1 commit processing, and the synclevel 1 function shipped resources may have committed successfully or may have backed out.

System action

CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further.

On completion of the syncpoint, CICS abends the user task.

User response

Determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the CICS intercommunication for information on design considerations in a distributed environment.

Explanation

A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the resource voted to backout.

System action

Synclevel 1 commit processing continues with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further.

On completion of the syncpoint, CICS abends the user task.

User response

The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the CICS intercommunication for information on design considerations in a distributed environment.

Module:
DFHCR2U

CSMT

DFHZN2133	*date time applid* **Error detected during CICS synclevel one commit. Reason code** *rc***. Local resources may be out of sync with those on the remote system. Failure date**

mm/dd/yy failure time *hh:mm:ss* remote system *sysid* transaction *tranid* task number *trannum* operator terminal *termid* user *userid* network UOW *netuowid* local UOW *X'localuowid'*.

Explanation

A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the reply indicated that an error has occurred. The reason code provides details of the error and has the following values:

01

   Protocol violation by partner system - unexpected FMH data

02

   Protocol violation by partner system - unexpected syncpoint message data

03

   Abend received

04

   Deadlock or read timeout.

System action

CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible.

For reason code 01, a transaction dump with dump code ASPI is taken. For reason code 02, a transaction dump with dump code ASPJ is taken. On completion of the syncpoint, CICS abends the user task.

User response

The action to take depends on local procedures.

For reason codes 01 and 02, examine the dump to determine what message data was received from the partner. This information is held in one of the terminal input/output areas. A failure in the communication system might have caused corruption of the data.

Reason code 03 indicates that the partner system has sent an abend. There is an error in the partner system which may need to be investigated.

Reason code 04 indicates that the partner system took too long to respond to the synclevel 1 commit.

There could be a problem with the remote system, or the communication system. It may be necessary to increase the deadlock timeout or read timeout values to prevent this recurring.

CSMT

DFHZN2200   *date time applid* **FREE IMPLICIT failed during syncpoint processing for session *session id* , remote system *netname*. Transid *transid*. The original abend code was *abend code*.**

Explanation

A DFHTC FREE IMPLICIT request for a non-principal facility MRO session has failed.

System action

CICS writes an exception trace entry with code '0D86' before issuing a DFHTC FREE DETACH request for the session.

User response

If the task was purged by the operator causing abend AZI9 or a read timeout occurred causing abend AZIG this error may be expected and no further action may be necessary.

Otherwise this failure may represent an error. To investigate further set up a system dump table entry

for system dump code ZN2200. You may need further assistance from IBM to resolve this problem. See Part 4 of the Troubleshooting and support for guidance on how to proceed.

Chapter 3. IBM Health Checker for z/OS messages related to CICS

IBM Health Checker for z/OS identifies potential configuration problems in CICS regions before they impact availability or cause outages. If any CICS regions are identified as non-compliant with any of the best practices for CICS system configuration, IBM Health Checker for z/OS issues warning messages containing details of the non-compliant regions for you to take corrective actions.

For details on health checker rules, see Checking CICS configuration with IBM Health Checker for z/OS.

| DFHH0001E | The CEDA transaction is accessible to unauthenticated users. |

Explanation
The IBM supplied transaction CEDA is accessible to the default user or CICS security is turned off. This means anyone who can connect to the IP address and port number of one of the CICS regions shown can change the configuration of CICS.

To review the details of the Health Check output use the TSO SDSF CK command. For more information, see Health Check panel (CK).

The regions shown have a RC/RSN with more specific information about why the region failed the check:

- 0801 CEDA installed and SEC=NO
- 0802 CEDA installed and DFLTUSER can run it
- 0807 The checking module can't be linked to

System action:
The system continues processing.

Operator response:
Report this error to the System Programmer.

System programmer response:
Correct the security exposure which has been identified.

Reference Documentation

Refer to the topic "Checking CICS configuration with IBM Health Checker for z/OS" in the CICS Knowledge Center for advice on best practice.

| DFHH0002E | The spool is accessible to unauthenticated users. |

Explanation
The SPOOL=YES is defined and the IBM supplied transaction CECI is accessible to the default user or CICS security is turned off. This means anyone who can connect to the IP address and port number of one of the CICS regions shown can submit jobs to run on the z/OS system remotely without authentication.

To review the details of the Health Check output use the TSO SDSF CK command. For more information, see Health Check panel (CK).

The regions shown have a RC/RSN with more specific information about why the region failed the check:

- 0803 SPOOL=YES, CECI installed and SEC=NO
- 0804 SPOOL=YES, CECI installed and DFLTUSER can run it
- 0807 The checking module can't be linked to
- 0809 Surrogate user check for spool jobs is disabled

System action:
The system continues processing.

Operator response:
Report this error to the System Programmer.

System programmer response:
Correct the security exposure which has been identified.

Reference Documentation

Refer to the topic "Checking CICS configuration with IBM Health Checker for z/OS" in the CICS Knowledge Center for advice on best practice.

| DFHH0003E | A TDQ defined to the internal reader is accessible to unauthenticated users. |

Explanation
At least one TD QUEUE defined to the internal reader and the IBM supplied transaction CECI are accessible to the default user or CICS security is turned off. This means anyone who can connect to the IP address and port number of one of the CICS regions shown can submit jobs to run on the z/OS system remotely without authentication.

To review the details of the Health Check output use the TSO SDSF CK command. For more information, see Health Check panel (CK).

The regions shown have a RC/RSN with more specific information about why the region failed the check:

- 0805 A TDQ accesses INTRDR, CECI is installed and the DLFTUSER can run it
- 0806 The SVC99 does not support inquire of SYSOUT
- 0807 The checking module can't be linked to
- 0808 A TDQ accesses INTRDR, CECI is installed and SEC=NO

System action:
The system continues processing.

Operator response:
Report this error to the System Programmer.

System programmer response:
Correct the security exposure which has been identified.

Reference Documentation

Refer to the topic "Checking CICS configuration with IBM Health Checker for z/OS" in the CICS Knowledge Center for advice on best practice.

DFHH0200E	The CICS Health Checker cannot run due to error.

Explanation:
The CICS Health Checker was unable to find the storage used by CICS regions to record health checks.

System action:
The system continues processing, but cannot report on any CICS regions.

Operator response:
Report this error to the System Programmer.

System programmer response:
Use the debug option on the health check to find further details about the problem. Report the problem to IBM Service.

DFHH0301I	All CEDA transactions are protected from unauthenticated users.

Explanation:
No problems were found with the configuration of CEDA which would allow default users access. This applies to all CICS regions on this LPAR running during the last health check interval.

System action:
The system continues processing.

DFHH0302I	The spool is protected from unauthenticated users.

Explanation:
No problems were found with the configuration of the spool which would allow default users access. This applies to all CICS regions on this LPAR running during the last health check interval.

System action:
The system continues processing.

DFHH0303I	No TDQs defined to the internal reader can be written to by unauthenticated users.

Explanation:
No problems were found with the configuration of TDQs defined to the internal reader which would allow default users access. This applies to all CICS regions on this LPAR running during the last health check interval.

System action:
The system continues processing.

Notices

This information was developed for products and services offered in the United States of America. This material might be available from IBM in other languages. However, you may be required to own a copy of the product or product version in that language in order to access it.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Programming interface information

IBM CICS supplies some documentation that can be considered to be Programming Interfaces, and some documentation that cannot be considered to be a Programming Interface.

Programming Interfaces that allow the customer to write programs to obtain the services of CICS Transaction Server for z/OS, Version 5 Release 5 (CICS TS 5.5) are included in the following sections of the online product documentation:

- Developing applications
- Developing system programs
- CICS security
- Developing for external interfaces
- Reference: application development
- Reference: system programming
- Reference: connectivity

Information that is NOT intended to be used as a Programming Interface of CICS TS 5.5, but that might be misconstrued as Programming Interfaces, is included in the following sections of the online product documentation:

- Troubleshooting and support
- Reference: diagnostics

If you access the CICS documentation in manuals in PDF format, Programming Interfaces that allow the customer to write programs to obtain the services of CICS TS 5.5 are included in the following manuals:

- Application Programming Guide and Application Programming Reference
- Business Transaction Services

- Customization Guide
- C++ OO Class Libraries
- Debugging Tools Interfaces Reference
- Distributed Transaction Programming Guide
- External Interfaces Guide
- Front End Programming Interface Guide
- IMS Database Control Guide
- Installation Guide
- Security Guide
- CICS Transactions
- CICSPlex® System Manager (CICSPlex SM) Managing Workloads
- CICSPlex SM Managing Resource Usage
- CICSPlex SM Application Programming Guide and Application Programming Reference
- Java Applications in CICS

If you access the CICS documentation in manuals in PDF format, information that is NOT intended to be used as a Programming Interface of CICS TS 5.5, but that might be misconstrued as Programming Interfaces, is included in the following manuals:

- Data Areas
- Diagnosis Reference
- Problem Determination Guide
- CICSPlex SM Problem Determination Guide

Terms and conditions for product documentation

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability
These terms and conditions are in addition to any terms of use for the IBM website.

Personal use
You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

Commercial use
You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights
Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

IBM online privacy statement

IBM Software products, including software as a service solutions, (*Software Offerings*) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user or for other purposes. In many cases no personally identifiable information (PII) is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect PII. If this Software Offering uses cookies to collect PII, specific information about this offering's use of cookies is set forth below:

For the CICSPlex SM Web User Interface (main interface):
Depending upon the configurations deployed, this Software Offering may use session and persistent cookies that collect each user's user name and other PII for purposes of session management, authentication, enhanced user usability, or other usage tracking or functional purposes. These cookies cannot be disabled.

For the CICSPlex SM Web User Interface (data interface):
Depending upon the configurations deployed, this Software Offering may use session cookies that collect each user's user name and other PII for purposes of session management, authentication, or other usage tracking or functional purposes. These cookies cannot be disabled.

For the CICSPlex SM Web User Interface ("hello world" page):
Depending upon the configurations deployed, this Software Offering may use session cookies that do not collect PII. These cookies cannot be disabled.

For CICS Explorer®:

> Depending upon the configurations deployed, this Software Offering may use session and persistent preferences that collect each user's user name and password, for purposes of session management, authentication, and single sign-on configuration. These preferences cannot be disabled, although storing a user's password on disk in encrypted form can only be enabled by the user's explicit action to check a check box during sign-on.

If the configurations deployed for this Software Offering provide you, as customer, the ability to collect PII from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM Privacy Policy and IBM Online Privacy Statement, the section entitled *Cookies, Web Beacons and Other Technologies* and the IBM Software Products and Software-as-a-Service Privacy Statement.
