CICS Transaction Server for z/OS
5.5

CICS Messages

IBM

Note

Before using this information and the product it supports, read the information in "Notices" on page 2535.

Contents

About this PDF

This PDF explains the format of CICS messages and contains CICS DFH messages. It also contains AMX server environment messages. Before CICS TS V5.4, these messages were split across two PDFs: *CICS Messages and Codes, Volume 1* and *CICS Messages and Codes, Volume 2*.

For details of the terms and notation used in this book, see Conventions and terminology used in the CICS documentation in IBM Knowledge Center.

Date of this PDF

This PDF was created on 2024-04-22 (Year-Month-Date).

Chapter 1. AXM server environment messages

The following messages are issued by the authorized cross-memory (AXM) server environment, which is a package of run-time services used by the Named counter sequence number server, CICS coupling facility (CF) data tables and the CICS shared temporary storage (TS) queue pool server. For more information about AXM and the CICS TS queue pool server, see Initializing CICS data sharing servers.

Note:

1. AXM messages are not issued by a CICS region and hence do not use the CICS message domain. They cannot be viewed with the CMAC transaction or suppressed with the XMEOUT user exit.

2. These messages are normally displayed in mixed case English. If your terminals cannot display lowercase English characters, see Uppercase translation for guidance on converting the messages to uppercase.

AXM error recovery messages

AXMER0001   **ABEND *xxx-rr* occurred at *address*, data *word1 word2 word3*.**

Explanation

The AXM error recovery routine has intercepted an abend in a task running under an AXM server region TCB. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS™ in the SDWA.

System action

The error recovery routine will first call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. After this, if recovery is allowed, the error recovery routine terminates the affected AXM internal task and resumes normal processing, otherwise it percolates the error, causing the server region to be abnormally terminated.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the server region JCL.

User response

Look up the completion code to identify the cause of the abend.

Module:
AXMER

Destination

Console and print file

AXMER0002   **TRAP occurred at offset *offset* in *procname*.**

Explanation

An internal logic error in a server resulted in a TRAP macro being executed at the specified location.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the server region JCL.

System action

The AXM task is abnormally terminated.

User response

This probably indicates a logic error in server code, or an attempt to use some internal component of the server outside its correct context.

If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.

Module:
AXMER

Destination

Console and print file

AXM event management messages

AXMEV0001   **AXM only supports operating system WAIT on MVS.**

Explanation

An attempt has been made to issue an operating system WAIT within an AXM server, but the server is not running on MVS. In this case, the MVS POST exit mechanism used by AXM is unavailable and operating system waits cannot be supported.

System action

The program is abnormally terminated.

User response

None.

Module:
AXMEV

Destination

Console

AXMEV0003   **The AXM POST exit could not be created because AXM system services are not available.**

Explanation

AXM server region initialization needed to define the MVS POST exit used by AXM for operating system waits, but AXM system services were not available within the current MVS image.

System action

The server region is terminated with return code 8.

User response

Start up AXM system services first then restart the server region. AXM system services are normally started at IPL using a subsystem definition in IEASSNxx specifying AXM as the subsystem name and AXMSI as the initialization routine. They can also be started up without an IPL by defining the subsystem dynamically using the SETSSI command.

Module:
AXMEV

Destination

Console and print file

AXMEV0004   **The AXM POST exit could not be created, return code was *rc*.**

Explanation

The MVS POST exit used by AXM for operating system waits could not be created because the AXM system services routine gave a non-zero return code. The only known reason for this is that AXM system services have been withdrawn, which should not be possible in a production environment.

System action

The server region is terminated with return code 8.

User response

None.

Module:
AXMEV

Destination

Console and print file

AXMEV0005I   **The AXM POST exit had already been created for this address space.**

Explanation

During server initialization, AXM system services found that the MVS POST exit used by AXM for operating system waits had already been created for this address space. AXM therefore bypassed trying to create the same POST exit again as this would have resulted in an abend 702-04.

This can occur when a previous server execution in the same address space was terminated abnormally.

System action

Processing continues

User response

None.

Module:
AXMEV

Destination

Console and print file

AXMEV0006I   **The AXM POST exit could not be deleted, return code was *rc*.**

Explanation

The MVS POST exit used by AXM for operating system waits could not be deleted because the AXM system services routine gave a non-zero return code. The only known reason for this is that AXM system services have been withdrawn, which should not be possible in a production environment.

System action

Processing continues.

User response

None.

Module:
AXMEV

Destination

Console.

AXM stack (LIFO) storage messages

AXMLF0001S   **LIFO storage cannot be set up because the PRV size exceeds 4K.**

Explanation

AXM initialization has detected that the total link-edited size of the pseudo-register vector (PRV) for the server application load module exceeds the maximum size of 4096 supported by AXM. The PRV contains task-related variables used by AXM resource management plus any task-related data areas defined by server code using the Assembler DXD operation code or Q-type address constants.

System action

The server is abnormally terminated.

User response

The server programmer needs to decrease the size of task-related variables defined in the PRV. When a large amount of task-related information needs to be stored, it is better to store the information in some separately acquired storage area (such as AXM heap storage) and put only a pointer to it in the PRV.

Module:
AXMLF

Destination

Console

AXM lock management messages

AXMLK0001   **Lock at *address* is already owned for shared use by this task.**

Explanation

An AXM server program attempted to acquire exclusive ownership of an AXM lock which was already in shared ownership for the current task. This is not allowed, as the task cannot wait for itself.

System action

The AXM lock request is rejected.

User response

The server programmer needs to modify the program logic. It could for example use an AXM lock PROMOTE to convert the shared lock to an exclusive lock.

Module:
AXMLK

Destination

Console and print file

AXMLK0002   *function* **failed because lock at** *address* **is not owned by this task.**

Explanation

An AXM server program tried to release, demote or promote an AXM lock but the lock was not owned by the current AXM task.

System action

The AXM lock request is rejected.

AXM operating system interface messages

AXMOS0001I   **The main procedure entry point is** *name* **at address** *address***.**

Explanation

This message is written to the print file during AXM initialization to indicate the name and entry point address of the server main procedure. This is primarily for debugging purposes.

System action

Processing continues.

User response

None.

Module:
AXMOS

Destination

Print file

AXMOS0002   **The main procedure is missing, or the END statement does not name the entry point.**

User response

The server program logic is in error.

Module:
AXMLK

Destination

Console and print file

Explanation

The AXM server load module which is being executed does not contain a procedure which has been identified as the AXM main procedure.

System action

The server region is terminated with return code 16.

User response

Check that the main procedure was correctly included in the link edit. If it was, make sure that its entry point name was correctly specified on the END statement and that it was assembled using AXM macros with the macro AXMSET appearing before the MODULE statement and the option ENVIRON=AXM specified on the MODULE statement.

Module:
AXMOS

Destination

Console and SYSPRINT

AXM storage page pool management messages

AXMPG0001I   **The main free area above 16M was at address** *xxxxxx***, size** *nnnn***K.**

Explanation

This message is written to the print file during AXM initialization to indicate the size of the largest area of 31-bit addressable private region storage available at that time.

System action

Processing continues.

User response

None.

Module:
AXMPG

Destination

Print file

AXMPG0002I   **The main free area below 16M was at address** *xxxxxx1*, **size** *nnnn***K.**

Explanation

This message is written to the print file during AXM initialization to indicate the size of the largest area of 24-bit addressable private region storage available at that time.

System action

Processing continues.

User response

None.

Module:
AXMPG

Destination

Print file

AXMPG0003I   **Storage page pool** *areaname* **created, address** *xxxxxx*, **size** *nnnn***K.**

Explanation

This message is written to the print file during AXM initialization to show the size and address of each storage page pool as it is created. Once this has been done, most AXM storage requests are allocated from this page pool rather than with MVS GETMAIN.

System action

Processing continues.

User response

None.

Module:
AXMPG

Destination

Print file

AXMPG0004I   **Usage statistics for storage page pool** *areaname***:**

Explanation

This message shows statistics for the named storage page pool (since the most recent statistics reset, if any). It is automatically written to the print file at AXM region termination, and may also be requested at other times by the server.

The detailed message layout is as follows:

```
       Size      In Use   Max Used       Free    Min
Free
         nK          nK         nK         nK
nK
        100%         n%         n%         n%
n%
                   Gets      Frees    Retries
Fails
                      n          n          n
n
```

Each of the storage statistics is shown in two forms, as a number of kilobytes and as a percentage of the total size.

The individual fields have the following meanings:

Size
Total size of the storage pool.

In Use
The amount of storage which is currently in use.

Max Used
The highest amount of storage which has been in use.

Free
The amount of storage within the pool which is current free.

Min Free
The lowest amount of storage which has been free.

Gets
The number of requests to obtain storage within the pool.

Frees
The number of requests to release storage within the pool.

Retries
The number of times that a storage request initially failed and was retried after merging any adjacent small free areas to form larger areas.

Fails
The number of times that a storage request was unable to obtain the requested amount of storage even after a retry.

System action

Processing continues.

User response

None.

Module:
AXMPG

AXM resource tracking messages

AXMRS0001   **Tidy-up routine at *address* failed to free resource tracking cell.**

Explanation

A server routine established an AXM resource tracking element specifying that a procedure was to be called to release the resource if the task was terminated without releasing the resource. The AXM task is now terminating, and the procedure identified in the tracking element was called, but the resource tracking element was still in existence when it returned. The entry point address of the relevant procedure is indicated in the message.

System action

The tracking element is released on the assumption that the resource has now been deleted, and AXM task termination continues.

User response

The server programmer needs to ensure that the procedure to release the resource also frees the resource tracking element.

Module:
AXMRS

Destination

Console and print file

AXM server connection and system services messages

AXMSC0011I   AXM system services initialization is in progress.

Explanation

AXM system services are being started up, normally as a result of being called by the AXM subsystem initialization routine.

System action

Processing continues.

User response

None.

Module:
AXMSC

Destination

Print file

Destination

Console

AXMSC0012I   AXM system services initialization has completed.

Explanation

AXM system services are now fully available in the current MVS image.

System action

AXM cross-memory server connection requests and requests for the POST exit system services will now be accepted.

User response

None.

Module:

AXMSC

Destination

Console

AXMSC0013   **AXM system services have already been initialized.**

Explanation

An attempt was made to set up AXM system services again when they are already active in the current MVS image.

System action

The attempt is ignored.

User response

None.

Module:
AXMSC

Destination

Console

AXMSC0021I   **AXM system services termination is in progress.**

Explanation

AXM system services are being withdrawn. This is only possible if they were initialized using the AXM system region program AXMSR instead of being set up via subsystem initialization.

System action

The AXM system services program call table is deleted and all entry points in the AXM system services anchor are replaced with dummy routines which return an indication that the service are not available.

User response

Note that the results of attempting to call any AXM system service around this time are unpredictable. AXM system services should never be withdrawn in a production environment at any time when it is possible that they could be in use.

Module:
AXMSC

Destination

Console

AXMSC0022I   **AXM system services termination has completed.**

Explanation

AXM system services have been closed down for this MVS image.

System action

AXM system services are no longer available.

User response

None.

Module:
AXMSC

Destination

Console

AXMSC0031I   **Connection to server *prefix.name* has been opened.**

Explanation

The current region has established an AXM connection to the AXM server *prefix.name*.

System action

Processing continues.

User response

None.

Module:
AXMSC

Destination

Console

AXMSC0032   **Connection to server *prefix.name* failed because the server was not found.**

Explanation

The current region tried to establish an AXM connection to the AXM server *prefix.name* but could not do so because there is no active server of that name enabled for AXM connections.

System action

The connection attempt is rejected with return code 8, reason code 32.

User response

Ensure that the server is started and that its name was specified correctly.

Module:
AXMSC

Destination

Console

AXMSC0033	Connection to server *prefix.name* was rejected by the security system.

Explanation

The current region tried to establish an AXM connection to the AXM server *prefix.name* but the request was rejected by the security system.

System action

The connection attempt is rejected with return code 8, reason code 33.

User response

See the previous AXM message giving details of the results of the security check.

Module:
AXMSC

Destination

Console

AXMSC0034	Connection to server *prefix.name* failed because all AXM connections are in use.

Explanation

The current region tried to establish an AXM connection to the AXM server *prefix.name* but the maximum number of AXM connections supported within an MVS image (currently 16,384) has been reached.

System action

The connection is rejected with return code 8, reason code 34.

User response

If you anticipate a need for more than 16,384 AXM server connections within a single MVS image, you will need assistance from IBM. See Troubleshooting and support for guidance on how to proceed.

Module:
AXMSC

Destination

Console

AXMSC0035	Connection to server *prefix.name* failed because request limit *reqs* exceeds 9999.

Explanation

The current region tried to establish an AXM connection to the AXM server *prefix.name* but the connection parameter specifying the maximum number of concurrent requests to be supported exceeds 9999.

System action

The connection is rejected with return code 8, reason code 35.

User response

Check whether the server interface program is specifying the correct value for the maximum number of concurrent requests.

Module:
AXMSC

Destination

Console

AXMSC0036	Connection to server *prefix.name* was rejected by the server.

Explanation

The current region tried to establish an AXM connection to the AXM server *prefix.name* but the server-defined connection exit rejected the request.

System action

The connection is rejected with return code 8, reason code 36.

User response

The reason for the rejection depends on the server code, but this typically occurs if the server is preparing to close down or has insufficient resources to accept another connection.

Module:
AXMSC

Destination

Console

AXMSC0037	Connection to server *prefix.name* failed because the server is terminating.

Explanation

The current region tried to establish an AXM connection to the AXM server *prefix.name* but the server entered termination processing while the connection request was in progress.

System action

The connection is rejected with return code 8, reason code 37. The instance of the server that was being terminated will no longer be visible to any new connection attempts.

User response

Retry the connection when the server has been restarted.

Module:
AXMSC

Destination

Console

AXMSC0038	Connection to server *prefix.name* failed because this address space is already connected to it.

Explanation

The current region tried to establish an AXM connection to the AXM server *prefix.name* but it already has a connection to the same server region. AXM does not support multiple connections from the same region to the same server region.

System action

The connection is rejected with return code 8, reason code 38.

User response

None.

Module:
AXMSC

Destination

Console

AXMSC0041I	Connection to server *prefix.name* has been closed.

Explanation

An AXM connection from the current region to the named server has been terminated, either as a result of being explicitly closed by this region or as a result of the termination of the MVS TCB which originally established the connection.

System action

Processing continues.

User response

None.

Module:
AXMSC

Destination

Console

AXMSC0042	Connection close failed for token *xxxxxxxx*, reason is *n*.

Explanation

An attempt was made to close an AXM connection explicitly but the specified connection token did not refer to an active connection owned by the current region, or the connection could not be closed for some other reason.

The reason code indicates which validity check failed within procedure AXMSCCLS. Reason code 9 indicates that a request issued via the connection has not yet completed. Any other reason code probably indicates an incorrect token.

System action

The attempt is rejected with return code 8, reason code 42.

User response

Check that the connection close request is specifying the correct connection token and that there are no incomplete requests for the connection.

Module:
AXMSC

Destination

Console

AXMSC0043I   **Server disconnect SRB was scheduled, IEAMSCHD RC=xx COMP=xx CODE=xx RSN=xx**

Explanation

A client region connected to a CICS cross-memory server region was terminated at end of memory, so the AXM interface in the client region was unable to complete normal server disconnect processing. The AXM end of memory resource manager has therefore scheduled a synchronous SRB to the server region to notify it that the client region has now disconnected, using the IEAMSCHD macro. This message indicates the resulting values returned by that macro, in hexadecimal, consisting of the return code, completion type, completion code and reason code as documented for the IEAMSCHD macro. If the server region is still running and the disconnection process was successful, the return code is zero. In this case, the completion type and completion code are also zero, and any non-zero reason code maybe ignored. If the return code is non-zero, server disconnect processing could not be completed, in which case it is possible that some server resources being used by the disconnected client region may not have been released.

System action

Processing continues.

User response

If the return code is zero, no action is required. If the return code is non-zero, it is possible that subsequent requests to the same server region may fail or hang. If this occurs, the only solution is to cancel and restart the server region.

Module:
AXMSC

Destination

Console

AXMSC0051I   **Server *prefix.name* is now enabled for connections.**

Explanation

This AXM server has completed initialization and is now available for connections from other address spaces.

System action

Processing continues.

User response

None.

Module:
AXMSC

Destination

Console

AXMSC0052   **Server *prefix.name* cannot be enabled because it is already active in another address space.**

Explanation

Only one instance of a given AXM server name can be active in an MVS image at a time.

System action

The attempt to enable the server interface is rejected with return code 8, reason code 52.

User response

None.

Module:
AXMSC

Destination

Console

AXMSC0053   **Server *prefix.name* cannot be enabled because caller is not APF authorized.**

Explanation

AXM requires that an AXM server region must be running APF authorized in order to be allowed to enable its server interface.

System action

The attempt to enable the server interface is rejected with return code 8, reason code 53.

User response

Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Module:
AXMSC

Destination

Console

AXMSC0054	**Server *prefix.name* cannot be enabled because the security system rejected the request.**

Explanation

The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System action

The attempt to enable the server interface is rejected with return code 8, reason code 54.

User response

See the previous AXM message giving details of the results of the security check.

Module:
AXMSC

Destination

Console

AXMSC0061I	**Server *prefix.name* is now disabled for connections.**

Explanation

This AXM server is terminating and is no longer available for connections from other address spaces. This occurs either when the server explicitly disables its interface or when the server job step task terminates.

System action

Processing continues.

User response

None.

Module:
AXMSC

Destination

Console

AXMSC0062	**Server disable failed for token *xxxxxxx*, reason is *n*.**

Explanation

An attempt to disable the server interface failed because the specified server interface token did not correctly identify an active server interface established by the current address space.

The reason code provides an internal indication of which validity check failed within procedure AXMSCDIS. All reason codes probably indicate an incorrect token.

System action

The attempt to disable the server interface is rejected with return code 8, reason code 62. If the server interface is still enabled, it will be disabled automatically when the job step task terminates.

User response

As the server interface token is stored internally by AXM, the only known possible reason for this message is storage overwriting within the server region.

Module:
AXMSC

Destination

Console

AXMSC0063	**Server *prefix.name* cannot be disabled because caller is not APF authorized.**

Explanation

AXM requires that an AXM server region must be running APF authorized in order to be allowed to disable its server interface.

System action

The attempt to disable the server interface is rejected with return code 8, reason code 63.

User response

Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Module:
AXMSC

Destination

Console

AXMSC0071   **Server name *prefix.name* has incorrect syntax for access checks.**

Explanation

The security checking routine has detected that the AXM server name specified on a connection request or on a server enable request is not in the correct form, for example because either the prefix or name is blank. This means that the security check cannot be performed.

System action

A return code is set to indicate that the security check failed.

User response

Check that the server prefix and name are specified correctly. The prefix is normally defined by the server, but the name may be set from a user-specified server parameter.

Module:
AXMSC

Destination

Console

AXMSC0072   ***level* access authorization was denied for FACILITY *facility*.**

Explanation

The external security manager has indicated that the current region is not authorized for the required level of access to the specified facility.

System action

A return code is set to indicate that the security check failed.

User response

Check whether the userid for the region has been authorized to access the specified facility resource name.

Module:
AXMSC

Destination

Console

AXMSC0073   ***level* access authorization is unavailable for FACILITY *facility*.**

Explanation

The external security manager has indicated that it is unable to determine whether the current region is authorized for the required level of access to the specified facility. This message is only issued if it is not possible for the security routine to determine whether security checking is actually required. In cases where it is obvious that no security check is required (for example because no external security manager is installed), access is granted anyway.

System action

A return code is set to indicate that the security check failed.

User response

Check whether the external security manager is available and whether the security definitions for the specified facility have been provided.

Module:
AXMSC

Destination

Console

AXMSC0074   **RACROUTE REQUEST=AUTH gave R15=*xxxxxxxx*, SAFPRRET=*xxxxxxxx*, SAFPRREA=*xxxxxxxx*.**

Explanation

This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.

System action

Processing continues.

User response

None.

Module:
AXMSC

Destination

Console

AXMSC0075	RACROUTE REQUEST=STAT gave R15=*xxxxxxxx*, SAFPRRET=*xxxxxxxx*, SAFPRREA=*xxxxxxxx*.

Explanation

This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.

System action

Processing continues.

User response

None.

Module:
AXMSC

Destination

Console

AXMSC0991I	Creating new AXM system services anchor at *address*.

Explanation

This message is issued during AXM system services initialization to enable the system services anchor to be located if necessary for diagnostic purposes.

AXM subsystem initialization messages

AXMSI0001I	AXM subsystem initialization is in progress.

Explanation

The AXM subsystem initialization program has been started in order to initialize AXM system services.

System action

AXM system services initialization processing continues.

User response

None.

Module:
AXMSC

Destination

Console

AXMSC0992I	Deleting old AXM system services anchor at *address*.

Explanation

This message is issued during AXM system services initialization if AXM system services were previously active but had been terminated (which is not possible in normal production environment). The old system services anchor is retained after AXM termination because it contains the system LX to be used if AXM is restarted. This message gives the address of the old system services anchor for diagnostic purposes.

System action

AXM system services initialization processing continues.

User response

None.

Module:
AXMSC

Destination

Console

System action

AXM system services will be loaded and initialized.

User response

None.

Module:
AXMSI

Destination

Console

AXMSI0002I   **AXM subsystem initialization has completed.**

Explanation

The AXM subsystem initialization program has completed execution.

System action

The program returns control to MVS.

User response

None.

Module:
AXMSI

Destination

Console

AXMSI0003   **AXM subsystem initialization return code *retcode*, reason code *rsncode*.**

Explanation

The AXM subsystem initialization routine has not completed normally. This message indicates the final return code and reason code. This is normally the return code from AXM system services initialization.

System action

The subsystem initialization routine returns control to MVS.

User response

See the previous AXM message describing the cause of the problem. The reason code will normally be the number of an error message issued by AXMSC.

Module:
AXMSI

Destination

Console

AXMSI0004   **AXM subsystem initialization can only run in Main Scheduler address space.**

Explanation

An attempt has been made to invoke the AXM subsystem initialization program AXMSI in some other way than as an MVS subsystem initialization program running in the Main Scheduler region (ASID 0001).

System action

The subsystem initialization program is abnormally terminated.

User response

None.

Module:
AXMSI

Destination

Console

AXM system region messages

AXMSR0001I   **AXM system region initialization is in progress.**

Explanation

An AXM system region is being started. This is used to initialize AXM system services in a testing environment for development purposes, and allows AXM system services to be closed down and restarted without an IPL.

System action

Processing continues.

User response

None.

Module:
AXMSR

Destination

Console

AXMSR0002I **AXM system region initialization has completed.**

Explanation

AXM system services have been successfully initialized from the AXM system region.

System action

Processing continues.

User response

The system region may be closed down again using the MVS STOP command but this should only be done when it is certain that no AXM services are being used within the MVS image.

Module:
AXMSR

Destination

Console

AXMSR0003I **AXM system region termination is in progress.**

Explanation

The operator has requested termination of the AXM system region using the MVS STOP command.

System action

AXM system services are terminated.

User response

None.

Module:
AXMSR

Destination

Console

AXMSR0004I **AXM system region termination has completed.**

Explanation

The AXM system region has completed termination.

System action

Control is returned to MVS and the job step ends.

User response

None.

Module:
AXMSR

Destination

Console

AXMSR0011 **AXM system region can only run under MVS/ESA.**

Explanation

An attempt was made to execute the AXM system region program AXMSR in a non-MVS environment.

System action

The system region program terminates.

User response

None.

Module:
AXMSR

Destination

Console

AXMSR0012 **AXM system region program AXMSR needs to be APF authorized.**

Explanation

An attempt was made to execute the AXM system region program AXMSR without APF authorization.

System action

The system region program terminates.

User response

Ensure that the module AXMSR is stored in an APF-authorized library and is link-edited with AC(1).

Module:
AXMSR

Destination

Console

AXMSR0013   **AXM system region LOAD for** *name* **failed with completion code** *xxx-nn***.**

Explanation

The attempt to LOAD the system services module (AXMSC) failed.

System action

The system region program terminates.

User response

See the description of the system completion code *xxx* in *MVS/ESA System Codes* for the reason that the LOAD failed.

Module:
AXMSR

Destination

Console

AXMSR0021   **AXM system region does not support this command:** *text*

Explanation

An attempt was made to issue a command to the AXM system region using the MVS MODIFY command. The AXM system region only supports the MVS STOP command, and does not support commands entered via MODIFY.

System action

The command is ignored.

User response

If the intention was to close down the system region, use the MVS STOP command instead.

Module:
AXMSR

Destination

Console

AXMSR0022I   **AXM system region STOP command has been accepted.**

Explanation

An operator has issued a STOP command to close down the AXM system region.

System action

AXM system services will be terminated.

User response

None.

Module:
AXMSR

Destination

Console

AXM trace and print file management messages

AXMTR0001   **The** *ddname* **print file could not be opened.**

Explanation

The AXM trace and print file with the specified ddname (usually AXMPRINT or SYSPRINT) could not be opened during AXM initialization.

System action

Print file output requests will be ignored.

User response

Ensure that the appropriate DD statement is present. The default ddname is AXMPRINT, but this may be overridden to SYSPRINT by an AXMTRDEF definition within the server code if the server does not need to reserve the name SYSPRINT for any other purpose.

Module:
AXMTR

Destination

Console

AXM address lookup (WHERE) messages

AXMWH0001I   **Address *address* is at +*offset* in *modtype* module *modname*.**

Explanation

This message may be produced after an abend or TRAP message to identify the module containing the error address, if the module is known to MVS. The information about the module and type is obtained using the MVS macros CSVQUERY or NUCLKUP.

System action

Processing continues.

User response

None.

Module:
AXMWH

Destination

Console and print file

AXMWH0002I   **Address *address* is at +*offset* in procedure *procname*.**

Explanation

This message may be produced after an abend or TRAP message to identify the procedure containing the error address, if the storage is within a known module and a standard SAVE sequence including a procedure identifier appears at some point before the error address.

System action

Processing continues.

User response

None.

Module:
AXMWH

Destination

Console

AXM cross-memory interface messages

AXMXM0011   **Server *prefix.name* cannot be enabled because AXM system services are not available.**

Explanation

An attempt has been made to enable a server interface but AXM system services have not been initialized within this MVS image.

System action

The server enable request is rejected.

User response

Ensure that AXM system services are started then start the server again.

Module:
AXMXM

Destination

Console and SYSPRINT

AXMXM0012   **Enable failed for server *prefix.name*, return code *retcode*, reason *rsncode*.**

Explanation

The server interface could not be enabled. The specific reason will have been indicated by an earlier AXMSC message.

System action

The server enable request is rejected.

User response

None.

Module:
AXMXM

Destination

Console and SYSPRINT

AXMXM0021	ABEND *xxx-rr* occurred at *address*, data *word1 word2 word3*.

Explanation

The ARR routine for an AXM cross-memory program call routine has intercepted an abend in a cross-memory mode AXM task and has passed the associated SDWA to a task in the server address space to issue the appropriate diagnostic messages. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS in the SDWA.

System action

The ARR will already have completed processing when this message is issued, as the message is written out by the server region. If recovery is allowed, the ARR terminates the affected AXM internal task, in which case the return code from the cross-memory request will consist of the completion code in the usual MVS format but with the high-order bit set to indicate an abend. If recovery is not allowed, the ARR percolates the error, passing the abend to the requesting region.

The diagnostic routine which writes this message will call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. It then releases the MVS SDWA. Server execution is not directly affected by an abend in cross-memory mode.

User response

Look up the completion code to identify the cause of the abend.

Module:
AXMXM

Destination

Console and SYSPRINT

AXMXM0022	TRAP occurred at offset *offset* in *procname*.

Explanation

An internal logic error in a server module or invalid parameters on a server request resulted in a TRAP macro being executed at the specified location in cross-memory mode.

The system will normally produce a symptom dump message on the job log, and a full dump of the connected region may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the JCL for the connected region.

System action

The AXM task is abnormally terminated.

User response

This probably indicates a logic error in server code, or an attempt to use some internal component of the server outside its correct context.

If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.

Module:
AXMXM

Chapter 2. CICS messages

CICS produces different types of messages for different users of the product. The messages are intended as a quick reference to get started with problem determination. CICS messages begin with the characters DFH.

Format of CICS messages

CICS provides messages that describe what is happening in the system. These messages have a standard format, including a message identifier and a standard layout. Messages can appear on the system console, at a terminal, in a log, or can be routed to a transient data queue.

DFH*nnnn* identifiers

DFH*nnnn* messages have a prefix of DFH followed by a four-digit message number. DFH is the identifier that is assigned by IBM for CICS modules. The first two digits are the CICS module reference code. The final two digits are assigned by CICS to identify the message or group of messages in an assembled program.

The first two digits reference the following CICS modules:

01
   DFHSSIN
42
   DFHZCNR
51
   DFHCSDUP
52
   DFHCSDUP
55
   DFHCSDUP
56
   DFHCSDUP
7x
   Command-level translators

DFH*ccnnnn* identifiers

DFH*ccnnnn* messages have a prefix of DFH followed by a two-letter component identifier (*cc*), and a four-digit message number (*nnnn*). The component identifier shows the domain or the component which issues the message.

For example, the CICS message DFHAP0002 is issued from the application domain, identified by the two-character identifier AP. The following list associates the component identifiers with the associated CICS domains and components:

AC
   Abnormal condition program component
AD
   CICS Development Deployment Tool messages
AI
   Autoinstall terminal model manager (AITM)
AM
   RDO allocation manager

AP

　TCP error message writer component

ZN
　Syncpoint component

Action codes

Certain messages (for example, DFHDB8208D) include an action code after the message identifier. Action codes give guidance to the operator of the type of action needed when the message appears on the system console.

The following action codes are used:

A
　Immediate action; for example, mount a tape.

D
　Immediate decision; reply to a request, for example, enter GO or CANCEL.

E
　Eventual; action is required, but does not have to be taken immediately.

I

No action required. If issued by the message domain, these messages can be suppressed by specifying MSGLVL=0 as a system initialization override.

Severity codes

Certain messages, especially messages to terminal operators and messages that come from CICS utilities, have a severity code. DFHST0210 I is an example. A severity code indicates to the operator whether a message is associated with an error, and if so, how serious it is.

The following severity codes are used:

E

Error. Something is wrong and action is required of the user before CICS processing can continue.

I

Information only. No action is required.

W

Warning. Something might be wrong, a program loop, for example, but CICS processing continues.

S

Severe error. Something serious is wrong and immediate action is required. CICS processing is suspended until action is taken.

Format of message information

Information about each message is presented in a standard format.

The following format is used for CICS messages:

- **Message identifier** – in the form DFH*nnnn* or DFH*ccnnnn*
- **Message text** – the words and inserts that make up the message as displayed in CICS
- **Explanation** – the events that lead to or following the production of the message
- **System action** – the action that is to be taken by CICS
- **User response** – the action recommended for the user (the console or terminal operator or system programmer)
- **Destination** – the device or log to which the message is sent. The destination is one of the following:
  - Console – refers to a terminal type attached to CICS. (Route codes are 2 and 11 unless otherwise stated.)
  - Terminal end user
  - TERMCDBC – terminals running the CDBC transaction.
  - SYSPRINT (System printer)
  - One of the following transient data queues:

    CADL
    z/OS Communications Server resource definition log

    CADO
    CICS Development Deployment Tool messages

    CAIL
    Autoinstall terminal model manager (AITM) log

    CCPI
    Common programming interface for communications (CPI Communications) messages

    CCZM
    CICS classes

    CDBC
    CICS-DBCTL interface log

CDB2
CICS DB2® messages

CDUL
Transaction dump messages

CECO
Event capture and emission messages

CEJL
Java™

CEPO
Event processing messages

CIEO
IP ECI messages

CISL
IPCONN resource definition log

CISO

CSJO
  Redirected output from CICS JVM

CSKL
  Log for transaction and profile resource definitions

CSLB
  LIBRARY resource definition log

CSML
  Sign on or sign off messages

CSMT
  Write term errors and abends from DFHTACP and DFHACP

CSNE
  Terminal error messages issued from DFHZNAC.

CSOO
  Sockets domain message queue

CSPL
  Log for program resource definitions

CSQL
  TDQUEUE messages

CSRL
  Log for partner resource definitions

CSSH
  Scheduler services

CSSL
  Statistics log

CSTL
  Term I/O error messages from DFHTACP

CSZL
  FEPI message queue

CSZX
  FEPI event queue

CWBO
  CICS Web support messages

CWBW
  HTTP warning headers on messages received by CICS Web support

Note: Destination CXRF is used by the alternative CICS system in an XRF environment until the other destinations are made available during the takeover.

• **Module(s)** – the name of the module or modules that determined that the message is sent. (This name is not necessarily the module that issued the macro to write the message.)

XMEOUT parameters

Messages that can drive the XMEOUT global user exit include a list of XMEOUT parameters. You can use the XMEOUT exit to suppress or reroute messages that use the message domain.

A number of console messages must not be rerouted to a transient data queue. These messages include all DFHTD*nnnn* messages and certain DFHMEXM*nnnn* and DFHUS*nnnn* messages. A note to this effect is included in the descriptions of these messages.

For more information about the XMEOUT user exit, see the Message domain exit XMEOUT.

Route codes

Console messages can be sent to a number of console types. The type of console to which a particular message is sent is determined by the MVS route code. Each route code maps onto one console type. The meanings of the route codes that are normally used by CICS are as follows:

Code
  Meaning

1
  Main console action – indicates a change in system status that requires operator action

2
  Main console information – indicates a change in system status (system default)

3
  Tape pool status or other tape-related information

4
  Direct-access pool status or other related information

5
  Tape library information

6
  Disk library information

7
  Unit record pool information

8
  Teleprocessing control status

9
  System security checking

  Note: This route code suppresses the operator's reply on the screen and on SYSLOG

10
  System error or maintenance information

11
  Programmer information for the MVS log

Unless otherwise stated, console messages have the route codes '2' and '11'.

Console message reformatting

The "console message handling facility" is an optional feature of the CICS subsystem that can affect the appearance of CICS messages that are displayed on an MVS console. It is effective when you specify FORMATMSG=YES as an initialization parameter for the CICS subsystem. For more information, see The console message-handling facility.

Terminal identifiers

Some messages include a terminal identifier (*termid*) in the message text. This terminal identifier is normally shown as a 4-character identifier. However, when CICS cannot completely identify a terminal – for example, when intersystem communication is taking place, the terminal identifier is prefixed by the application identification (*applid*) of the system that owns the terminal.

Abend code inserts

The transaction abend code insert (*abcode*) in some CICS messages is displayed as *'????'* when neither the EXEC CICS ABEND request nor the DFHPC TYPE=ABEND macro request specifies an abend code.

Dumps

A dump is generally available for printing when a CICS system abend or abnormal termination occurs, provided the relevant data set is specified. The dump can be used for problem determination.

Terminology

The terms "abnormally terminates" and "abnormal termination" are frequently used in a general sense to relate, as applicable, to one of the following:

- The termination of CICS as a result of an MVS ABEND macro. (The term "abend" can also be used.)
- The termination of a transaction (task) as a result of a CICS transaction ABEND macro.

Katakana terminal devices

Old-style Katakana terminals that support only single-byte character sets (SBCS) cannot display lowercase Western characters. Therefore, because of the requirement on CICS to issue certain messages in mixed-case, CICS cannot support display or terminal devices that are restricted to the SBCS Katakana part only of code page 930.

MVS user abend codes

DFH messages that accompany a CICS system, utility, or subtask abend have an associated MVS user abend code. Where possible, the value of this code is the numeric part of the corresponding DFH message.

For example, DFH0305 has an 0305 user abend code. If an MVS abend code is issued but not the associated CICS message, the problem probably does not originate with CICS. For more information, see the description of the MVS abend code in z/OS MVS System Codes.

The highest possible value of an MVS user abend code is 4095. Therefore, any DFH message with a number higher than 4095 has an MVS user abend code that does not follow the above convention. The following are lists of the abend codes for messages with numbers above 4095, in order of abend code, and in order of message number.

Ordered by abend code

- 0108 DFH5263
- 0121 DFH5100
- 0123 DFH5175
- 0125 DFH5180
- 0126 DFH5184
- 0127 DFH5148

- DFHXG6454 0194
- DFHXG6524 0213
- DFHXO6700 0220
- DFHXO6702 0222
- DFHXO6703 0223
- DFHXO6704 0221
- DFHXO6720 0224
- DFH5100 0121
- DFH5148 0127
- DFH5175 0123
- DFH5180 0125
- DFH5184 0126
- DFH5263 0108
- DFH5721 0147
- DFH5722 0148
- DFH5723 0149
- DFH5754 0152
- DFH6529 0211

Note:

1. All messages that appear in the JES job log are prefixed by a timestamp and job number. Because of this condition, some messages have their message text truncated. If the full message text is required, consult the MVS log as all messages in the JES log are duplicated in the MVS system log.

2. User abend 0225 is internal to CICS. It is issued by DFHDTES when, during backout, an entry in a hash table is marked empty when it is not expected. This causes the CICS region to be abnormally terminated. If this abend occurs, you need help with resolving the problem.

DFH01nnnn messages

DFH0100	*CICS* SUBSYSTEM IS NOW INITIALIZED

Explanation

The CICS subsystem identified in an entry in an IEFSSNxx member of SYS1.PARMLIB has been successfully initialized.

System action

None.

User response

None.

Module:
DFHSSIN

Destination

Console

DFH0101   *CICS* **SUBSYSTEM WAS NOT INITIALIZED**

Explanation

The CICS subsystem identified in an entry in an IEFSSNxx member of SYS1.PARMLIB could not be successfully initialized.

System action

The system continues without the services of the subsystem.

User response

Use the preceding DFH01xx message to investigate the reason why the subsystem could not be initialized. After correction, re-IPL MVS to initialize the subsystem.

Module:
DFHSSIN

Destination

Console

DFH0102   *CICS* **SUBSYSTEM COULD NOT LOAD MODULE** *module*

Explanation

When trying to initialize the CICS subsystem, module *module* could not be loaded into common storage. The module must either be in the MVS link pack or be capable of being loaded from a library in the MVS linklist concatenation by means of a LOAD GLOBAL=(YES,P) macro.

System action

The system issues message DFH0101 and does not initialize the subsystem.

User response

Investigate the reason why the module could not be loaded. After correction, re-IPL MVS to initialize the subsystem.

Module:
DFHSSIN

Destination

Console

DFH0103   *CICS* **PARAMETER MEMBER NAME** *member* **IS INVALID**

Explanation

The third positional parameter in the subsystem definition for the CICS subsystem is not a valid member name because it contains more than eight characters. In the entry in an IEFSSNxx member of SYS1.PARMLIB that defines the CICS subsystem, a parameter is coded that is not a valid name for a member containing CICS initialization parameters.

System action

The parameter coded is truncated to eight characters and the result is used as the member name for reading CICS parameters from SYS1.PARMLIB. Whether or not the resultant parameters are valid, the system later issues message DFH0101 and does not initialize the subsystem.

User response

Correct the definition of the CICS subsystem in the IEFSSNxx member of SYS1.PARMLIB. After correction, re-IPL MVS to initialize the subsystem.

Module:
DFHSSIN

Destination

Console

DFH0104   *CICS* **PARAMETER ERROR IN** *member - parameter*

Explanation

When examining CICS subsystem initialization parameters from the named member of SYS1.PARMLIB, a syntax error was detected. The record containing the error is shown in the message.

System action

The system issues message DFH0101 and does not initialize the subsystem.

User response

Correct the syntax error in the subsystem parameter. See the CICS intercommunication for details of the syntax of subsystem initialization parameters. After correction, re-IPL MVS to reinitialize the subsystem.

Module:
DFHSSIN

Destination

Console

DFH0105   *CICS* **SUBSYSTEM INITIALIZATION IS NOT**

Explanation

Initialization of the CICS subsystem is not supported on MVS releases earlier than MVS SP 2.2.0.

System action

The system issues message DFH0101 and does not initialize the subsystem.

User response

Defer implementation of the CICS subsystem services until after the prerequisite release of MVS is installed.

Module:
DFHSSIN

Destination

Console

DFH42nn message

DFH4200   *jobname tranid*

Explanation

jobname is the jobname of CICS in the MVS system. CICS transaction *tranid* has issued a TC READ request to the operator console.

System action

The transaction is suspended pending a reply.

User response

Enter a reply at the console.

Module:
DFHZCNR

Destination

Console

DFH51nn messages

DFH5100 S   **SEVERE ERROR IN MODULE** *modname*. **ABEND CODE:** *abcode*

Explanation

An internal error has occurred in module *modname,* when invoked by a CSD utility command.

System action

Processing terminates abnormally with an operating system dump and abend code *abcode*. The CSD utility attempts to:

1. Close any files previously opened internally.

2. Unload any extract exit routines that were dynamically loaded.

3. Invoke the termination exit routine (if supplied).

4. Return control to the invoker of the utility.

User response

See the description of abend code *abcode* for guidance.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5101 I   *command* **COMMAND EXECUTED SUCCESSFULLY.**

Explanation

The execution of a CSD utility command *command* completed successfully.

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5102 I   **WARNING MESSAGES ISSUED WHILE PROCESSING** *command* **COMMAND.**

Explanation

The CSD utility issued messages during syntax-checking and execution of the *command* command.

System action

Normal utility processing continues to the end of the job.

User response

Review the warning messages to see how they have affected utility processing. Then decide whether you need to submit a further CSD utility job.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5103 I   **ERROR(S) OCCURRED WHILE PROCESSING** *command* **COMMAND.**

Explanation

The CSD utility either found a syntax error in the utility command *command*, or the command *command* failed to execute correctly.

System action

Utility command execution is terminated.

If commands are being read from a SYSIN data stream by the utility, then subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

User response

If the command failed because of syntax errors, correct the command.

If the command failed to execute correctly, this may have been caused by a previous error. In such a situation, an associated error message, such as DFH5275, should have been issued. Refer to these error messages for further guidance.

Correct all errors before trying to open the CSD file again.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5104 W   **SUBSEQUENT COMMANDS (EXCEPT LIST) ARE NOT EXECUTED BECAUSE OF ERROR(S) ABOVE.**

Explanation

After the CSD utility program encounters an error, it ceases to execute any further commands read from a data stream (as opposed to supplied by a Put-Message

exit routine). However, it continues to check the syntax of subsequent commands. The exception is the LIST command, which will still be executed if the primary CSD file can be opened.

System action

Subsequent CSD utility commands (except LIST) are ignored.

User response

Check for a syntax error in the commands used and correct it.

There should be associated error messages which identify the problem that caused DFHCSDUP to halt active processing. These messages should appear in DFHCSDUP output before. message DFH5104 is issued.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5105 W   *command* **COMMAND NOT EXECUTED BECAUSE OF PREVIOUS ERROR(S).**

Explanation

If a syntax error (or an execution error) occurred in a command read from a data stream and processed earlier, no further commands (except for LIST commands) are executed. If the primary CSD file could not be opened, the LIST command is not executed either.

System action

The CSD utility command is not executed.

User response

Check for syntax errors or execution errors in commands processed earlier.

Correct the invalid commands.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5107 I   **COMMANDS EXECUTED SUCCESSFULLY:** *nn* **COMMANDS**

GIVING WARNINGS: *nn*
COMMANDS IN ERROR: *nn*

Explanation

The CSD utility has completed input command processing.

Commands giving warnings may or may not have been executed successfully.

System action

Normal processing continues to the end of the job.

User response

If any CSD utility commands in error were executed, decide if the results are what you want.

If they are NOT what you want, correct them and resubmit them in another job.

If any commands were not executed, you must resubmit them. (See message DFH5108.)

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5108 I   **COMMANDS NOT EXECUTED AFTER ERROR(S):** *nn*

Explanation

The CSD utility has completed input command processing. The number of commands not executed because of errors is indicated by *nn*.

System action

Normal processing continues to the end of the job.

User response

Correct the commands in error and resubmit them in another job.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5109 I   **END OF DFHCSDUP UTILITY JOB. HIGHEST RETURN CODE WAS:** *retcode*

Explanation

The CSD utility job is complete.

System action

Control returns to the invoker, that is, either the operating system or to an invoking program.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5110 W   **ERROR FOUND IN 'PARM=' PARAMETER DATA ON EXEC JOB STEP. THIS DATA IS IGNORED.**

Explanation

The value of the PARM parameter on the EXEC job in the JCL to run the DFHCSDUP utility is incorrect.

System action

The PARM parameter is ignored. The CSD is opened for read and write operations.

User response

Correct the erroneous PARM value. The incorrect value can be found in the job step.

The CICS documentation describes how to code the PARM parameter.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5114 S   **THE *{PRIMARY | SECONDARY}* CSD HAS NOT BEEN INITIALIZED. COMMAND NOT EXECUTED.**

Explanation

The primary CSD file must be initialized before any CSD utility command (other than the INITIALIZE or SERVICE commands) can be processed. If a secondary CSD file is used, it must always be initialized before this command can be processed. CICS issues this message if you try to break either of these rules, or

if an attempt to initialize a CSD file fails to complete successfully

System action

The CSD utility ignores the command.

User response

Initialize the CSD file. You may first have to determine why a previous initialization attempt failed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5115 S   **THE PRIMARY CSD IS ALREADY INITIALIZED. COMMAND NOT EXECUTED.**

Explanation

An INITIALIZE or a SERVICE command was encountered but the primary CSD file has already been initialized.

System action

The INITIALIZE or SERVICE command is ignored.

User response

Confirm that the correct CSD file was specified.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5116 S   **THE PRIMARY CSD HAS BEEN DEFINED WITH AN INVALID KEY LENGTH. PROCESSING IS TERMINATED.**

Explanation

The CSD utility cannot initialize the CSD file because it has been defined to VSAM with an invalid key length.

System action

The CSD file remains uninitialized, and no utility commands are processed.

User response

Delete the CSD file, using VSAM Access Method Services (AMS). In the JCL defining the CSD cluster, change the AMS control statements to specify KEYS(22 0). Use this JCL to redefine the CSD file, and use the CSD utility to reinitialize it.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5117 S   **THE PRIMARY CSD HAS BEEN DEFINED WITH AN INVALID RECORD SIZE. PROCESSING IS TERMINATED.**

Explanation

The CSD utility cannot initialize the CSD file, because it has been defined to VSAM with an invalid record length.

System action

The CSD file remains uninitialized, and no utility commands are processed.

User response

Delete the CSD file, using VSAM Access Method Services (AMS). In the JCL defining the CSD cluster, change the AMS control statements to specify RECORDSIZE(200 2000). Use this JCL to redefine the CSD file, and use the CSD utility to reinitialize it.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5120 I   *{PRIMARY | SECONDARY}* **CSD OPENED; DDNAME:** *ddname* **- DSNAME:** *dsname*

Explanation

The VSAM data set specified in the JCL has been successfully opened, and is identified as the primary or secondary CSD file. (All utility commands processed will use the same primary CSD file. Different secondary CSD files may be accessed by different utility commands.)

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5121 S   **I/O ERROR WHILE OPENING** *{PRIMARY | SECONDARY}* **CSD; DDNAME:** *ddname*

Explanation

An I/O error occurred when reading or writing control records of the VSAM data set identified in the JCL as the primary or secondary CSD file.

System action

The utility command is not executed.

User response

Retry the utility command that failed. If the problem persists, restore the CSD file from your own backup procedures.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5122 S   **VSAM ERROR WHILE OPENING** *{PRIMARY | SECONDARY}* **CSD; DDNAME:** *ddname*

Explanation

A VSAM error occurred when opening the data set identified in the JCL as a primary or secondary CSD file.

System action

The utility command is not executed.

User response

Refer to the VSAM diagnostics output in message DFH5179 for further information and guidance.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5123 I   *{PRIMARY | SECONDARY}* **CSD CLOSED; DDNAME:** *ddname* **- DSNAME:** *dsname*

Explanation

The VSAM data set used as the primary or secondary CSD file has been successfully closed, with control records updated if necessary. (The primary CSD file is closed after all the utility commands have been processed; the secondary CSD file is closed after the command for which it was opened.)

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5124 S   **PROCESSING TERMINATED. CORRUPTED CSD CONTROL RECORD DETECTED WHILE CLOSING** *{PRIMARY | SECONDARY}* **CSD; DDNAME:** *ddname*

Explanation

A storage corruption is preventing the CSD control records from being updated when the CSD file is being closed.

System action

No further CSD utility commands are processed.

User response

Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where the errors have occurred because they do not print and are therefore easily identifiable.

Using the information available, determine the cause of the errors and correct them.

Resubmit the CSD utility commands that failed.

If you cannot resolve the problem, or if the problem persists, you will need further help from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5125 S   **ERROR OCCURRED WHILE CLOSING THE** *{PRIMARY | SECONDARY}* **CSD. FILE IS FULL; DDNAME:** *ddname*

Explanation

After processing the CSD utility commands, the CSD control records are updated before closing the data set.

Updating failed because data set *ddname* was full.

System action

Utility command processing is terminated.

User response

Initialize a new primary CSD file with a larger data set size. Then use the IDCAMS IMPORT and EXPORT commands to restore the CSD file onto a larger data set.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5126 S   **I/O ERROR WHILE CLOSING THE** *{PRIMARY | SECONDARY}* **CSD; DDNAME:** *ddname*

Explanation

An I/O error occurred when reading or writing the control records of the CSD file, before closing VSAM data set *ddname*.

System action

No further utility commands are executed.

User response

Resubmit the utility commands that failed. If the problem persists, restore the CSD file from your own backup procedures.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5127 S   **VSAM ERROR WHILE CLOSING {PRIMARY | SECONDARY} CSD; DDNAME: ddname**

Explanation

A VSAM error occurred when closing the data set *ddname* in the JCL as the primary or secondary CSD file.

System action

No further CSD utility commands are executed.

User response

Refer to the VSAM diagnostics output in message DFH5179 for further information and guidance.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5128 S   **PROCESSING TERMINATED. {PRIMARY | SECONDARY} CSD ACCESSED BY ANOTHER USER AND COULD NOT BE SHARED. DDNAME: ddname**

Explanation

An attempt to open the CSD has returned an error from VSAM because the data set is not available for the type of processing requested.

This usually means that:

- An attempt has been made to open the CSD in non-RLS access mode, but the CSD is already being accessed from elsewhere in RLS access mode.
- An attempt has been made to open the CSD in RLS access mode, but the CSD is already being accessed from elsewhere in non-RLS access mode.

- An attempt has been made to open the CSD in non-RLS access mode and the CSD is already being accessed in non-RLS access mode, but the CSD cluster has been defined with SHAREOPTIONS that restrict its concurrent use.

System action

The command is not executed.

User response

You can change the access mode in which you are trying to open the CSD.

Note:

You must specify PARM=CSD(READONLY) if you wish to open a recoverable CSD in RLS access mode from the DFHCSDUP utility program.

Alternatively, wait until the CSD file is no longer being accessed in the conflicting access mode, or until it becomes available again in accordance with the SHAREOPTIONS rules defined for the cluster.

If the conflict is due to SHAREOPTIONS and LIST is the only command you want to execute, you can specify PARM=CSD(READONLY).

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5130 E   **UNABLE TO LOCATE MODULE DFHCICS. PRIMARY CSD NOT INITIALIZED.**

Explanation

The DFHCICS module is missing from the library.

System action

Processing of the INITIALIZE command is terminated.

User response

Ensure that the DFHCICS module is present in the library.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5131 I   **LIST listid CREATED.**

Explanation

The INITIALIZE command has created the header for an IBM-protected list.

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5132 S   UNABLE TO CREATE LIST *listid*

Explanation

The INITIALIZE command has failed when calling the CSD manager routing program, DFHDMP, to create a new list *listid* on the CSD file for the IBM-protected groups. The CSD file may be full or corrupt.

System action

Processing of the INITIALIZE command is terminated.

User response

Check that the data set size for the CSD file is large enough. If it is not, allocate more space.

If there is ample space and you suspect that the CSD file is corrupt, you need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5133 S   CSD CONTAINS ONE OR MORE LISTS. NO LISTS MAY BE PRESENT ON THE CSD WHEN THE INITIALIZE COMMAND IS ISSUED.

Explanation

The CEDA transaction was used to create a list while the INITIALIZE command was executing.

System action

Processing of the INITIALIZE command is terminated.

User response

Redefine the data set and re-run the INITIALIZE command. The CEDA transaction must not be used until the initialization of the CSD file has been successfully completed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5134 S   ERROR OCCURRED WHILE ADDING GROUP *grpname* **TO LIST** *listid*

Explanation

A call to the CSD manager routing program, DFHDMP, to write the definition of group *grpname* to the CSD file as a member of an IBM-protected list *listid* created an error. The CSD file may be full or corrupt.

System action

Processing of the INITIALIZE command is terminated.

User response

Increase the data set size for the CSD file and repeat the INITIALIZE request. If this fails, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5135 I   GROUP *grpname* **ADDED TO LIST** *listid*

Explanation

A group definition *grpname* has been satisfactorily created on the CSD file in list *listid*.

System action

Processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5136 W   **GROUP** *grpname* **IS ALREADY A MEMBER OF LIST** *listid*

Explanation

Group *grpname* already exists in list *listid*. CICS does not create a duplicate entry.

System action

Normal utility processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5137 E   **GROUP** *grpname* **NOT FOUND IN LIST** *listid*

Explanation

The group *grpname* entered in the ADD command as the AFTER or BEFORE name could not be found in the list *listid*. The definition could have been deleted while the user was viewing the outcome of an EXPAND command.

System action

Normal utility processing continues.

User response

Reenter the command with a group name that exists in this list.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5139 W   **CONSIDER IMPLICATIONS OF MIGRATING TYPE=SHARED ENTRIES.**

Explanation

The CSD utility detected a migrate of a TST TYPE=SHARED entry. A DFHTST TYPE=SHARED entry is not directly migrated. Only when a TYPE=REMOTE macro that specifies a SYSIDNT that matches a SYSID in the corresponding TYPE=SHARED macro is a TSMODEL created.

System action

The CSD utility continues processing of the MIGRATE command.

User response

If SYSID is explicitly specified on the EXEC CICS request, or added by a global user exit program, and the intent of the SYSID is to direct the request to a SHARED TS pool, you must use the migrated TST in order to satisfy the request to use the pool. See the Defining resources for more information.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5140 I   **TOTAL** *xxxxxxxx* **DEFINITIONS CREATED:** *nn*

Explanation

CICS issued this message after migrating a CICS table. *nn* definitions of type *xxxxxxxx* have been created on the CSD file.

System action

Normal utility processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5141 S   **UNABLE TO CREATE NEW GROUP** *grpname*

Explanation

The MIGRATE command failed when calling the CSD manager routing program, DFHDMP, to create a new group *grpname* on the CSD file for the data in the table being migrated. The CSD file may be full, corrupt, or not initialized. The group name may be invalid.

System action

Processing of the MIGRATE command is terminated.

User response

Check the group name in the TOGROUP parameter. Reinitialize the CSD file with the INITIALIZE command, providing a larger data set size if necessary.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5142 E	COMMAND NOT EXECUTED. *lgname* WAS NOT UPDATED BECAUSE OF A PREVIOUS UPDATE FAILURE.

Explanation

The list or group *lgname* cannot be used because an operation to update it, using the DFHCSDUP offline utility, failed to execute to completion.

This has probably happened in a previous execution of DFHCSDUP.

System action

The command is not executed, and the execution of subsequent DFHCSDUP commands in the job stream is suppressed.

User response

Use the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5143 I	GROUP *grpname* CREATED.

Explanation

A new CSD group, *grpname*, has been created for the data in the table being migrated.

System action

Migration continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5145 E	COMMAND NOT EXECUTED. *lgname* HAS BEEN LOCKED BY APPLID:*applid*, OPID:*opid* TO PREVENT UPDATING.

Explanation

The list or group *lgname* cannot be used because a user of the CEDA or CEDB transaction has enforced a LOCK command to prevent updating by other users.

System action

The command is not executed.

If commands are being read from a SYSIN data stream, then subsequent commands (except the LISTcommand) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then the DFHCSDUP utility attempts to process subsequent commands.

User response

Negotiate with the user with the specified OPID and APPLID, or create a new group or list by taking a copy of the definitions in the locked one.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5146 E	COMMAND NOT EXECUTED. *lgname* IS CURRENTLY BEING

UPDATED BY APPLID:*applid*, **OPID:***opid*

Explanation

The list or group *lgname* cannot be used because:

- A user of the CEDA or CEDB transaction is currently running a command to update it
- A previous operation to update it using CEDA or CEDB failed to execute to completion.

System action

The command is not executed.

If commands are being read from a SYSIN data stream, then subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then the DFHCSDUP utility attempts to process subsequent commands.

User response

Resubmit the utility job to retry the command that failed. Perform the subsequent commands that were suppressed.

If this fails to resolve the problem, run the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5147 E	COMMAND NOT EXECUTED. *lgname* ALREADY EXISTS AS A {GROUP	LIST}

Explanation

The name chosen for the target group (or list) duplicates that of an existing group or list on the CSD file.

System action

Processing of the utility command is terminated.

User response

Choose a different name for the target group.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5148 E	UNABLE TO GET STORAGE FOR {FCT	RDT	LD} TABLE NAMED *table*

Explanation

There is insufficient storage to satisfy a GETMAIN request for table *table*.

System action

The system action depends on the table specified as follows:

LD (language definition table)

The CSD utility cannot process any commands, and terminates with a dump. The MVS user abend code is 0327.

FCT and RDT

The CSD utility cannot migrate the table, and terminates processing of the utility command.

User response

Allocate additional storage. If your TCT assembly and link-editing is successful, the RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5149 E	COMMAND NOT EXECUTED. *xxxxxxxx* IS IBM-PROTECTED.

Explanation

A user attempted to add a definition to an IBM-supplied group or list (groups or lists beginning with DFH). This is not allowed.

System action

The CSD utility does not create a definition.

User response

Change the input command to name a target group or list whose name does not begin with DFH.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5150 W   *xxxxxxx* **OPTION CONFLICTS WITH** *yyyyyyy* **OPTION AND IS IGNORED FOR** *restype resname*

Explanation

The options, *xxxxxxx* and *yyyyyyy*, specified for the resource type *restype* with name *resname* are mutually exclusive.

System action

The utility ignores option *xxxxxxx*.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5151 I   **RESOURCE NOT ALTERED.** *xxxxxxxx* **IS IBM-PROTECTED.**

Explanation

During the execution of an ALTER command containing a generic group name, a matching group was found which is an IBM-supplied group and is protected.

System action

The CSD utility does not alter the definition in the specified group.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5155 W   *{TDQUEUE} xxxxxxxx* **HAS SAME NAME AS AN IBM SUPPLIED DEFINITION IN GROUP** *grpname***.**

Explanation

The name of the migrated table entry, *xxxxxxxx*, matches the name of an IBM-supplied resource in IBM-protected group *grpname*, created by the INITIALIZE command.

System action

CICS migrates this entry normally.

User response

If necessary, rename the resource, using the CEDA transaction.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5156 W   *{TDQUEUE}* **DID NOT MIGRATE. ITS PROPERTIES MATCH AN IBM-SUPPLIED DEFINITION IN GROUP** *grpname***.**

Explanation

The properties of the resource defined in the user's table entry are the same as those of the IBM-supplied resource of the same name contained in IBM-protected group *grpname*.

System action

The entry for the user's resource is not migrated.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5159 I   *resource object* **DEFINED IN GROUP** *grpname*

Explanation

The CSD utility has successfully added a resource definition to a group, where:

- *resource* is the type of resource (CONNECTION, FILE, JOURNALMODEL, LSRPOOL, MAPSET, PARTITIONSET, PARTNER, PROFILE, PROGRAM, SESSION, TDQUEUE, TERMINAL, TRANCLASS, TRANSACTION, or TYPETERM).
- *object* is the name of the object.
- *grpname* is the name of the group.

System action

Normal utility processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5161 S	TABLE *table* MUST BE LINK-EDITED WITH AMODE(24) RMODE(24).

Explanation

After loading the table *table*, the migration routine checks that the table being processed has been link-edited with the correct AMODE and RMODE attributes. For migration purposes, tables must be link-edited with AMODE(24) RMODE(24).

System action

The MIGRATE command is not processed.

User response

Relink the table with the correct attributes.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5164 W	NO DEFINITION OF *resource object* CREATED. THIS DUPLICATES AN EXISTING DEFINITION IN GROUP *grpname*

Explanation

The CSD utility detected a CSD record with a matching key before adding the definition to the CSD file, where:

- *resource* is the type of resource.
- *object* is the name of the object.
- *grpname* is the name of the group.

System action

The CSD utility does not migrate the resource definition to the CSD file. (If it is a transaction, a generated profile is not created either.)

User response

Use the CEDA transaction to define the resource with a unique name.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5165 S	PROCESSING IS TERMINATED. AN ERROR OCCURRED WHILE WRITING *resource object* TO THE CSD.

Explanation

An error occurred when the CSD utility called DFHDMP to write the definition of the object *object* to the CSD file.

The CSD file may be full or corrupted.

resource is the type of resource.

System action

If the CSD is full, the CSD utility issues message DFH5176, and then terminates with a return code of 12 in message DFH5109.

If the CSD is not full, the CSD utility terminates abnormally with message DFH5175, usually accompanied by one or more of the explanatory messages, DFH5177, DFH5178, and DFH5179.

User response

Use the additional messages to determine the cause of the error and the appropriate user action required.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5166 E   **DISALLOWED CHARACTER IN**
resource **NAME** *object*

Explanation

The call to module DFHDMP has failed to construct
a valid key for the record created on the CSD file
because of an invalid character, or the resource name
for the migrated table entry may be invalid. *resource*
is the type of resource, and *object* is the name of the
object.

System action

A CSD record is not created for this definition. (If it is a
transaction, a generated profile is not created either.)

User response

Use the CEDA transaction to define the resource with a
valid name.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5167 S   **THE CSECTS IN TABLE** *table*
**HAVE BEEN LINK-EDITED IN THE
WRONG ORDER.**

Explanation

While processing a MIGRATE command, the CSD utility
has detected that the CSECTs in table *table* are in
the wrong order. Input to the linkage editor omitted
a control statement to order the CSECTs.

System action

The CSD utility does not process the MIGRATE
command.

User response

Use the IBM-supplied procedure, DFHAUPLK, to
assemble and link-edit CICS tables. This procedure
ensures the correct ordering of CSECTs within the
tables.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5168 S   **TABLE LOADED FROM LIBRARY
MEMBER** *table* **IS NOT A VALID
{FCT | RDT | TCT}.**

Explanation

After loading the table *table*, the migration routine
checks the VMNAME field in the DFHVM expansion of
the data area following the load point. This message is
produced if VMNAME is not that of a valid table.

System action

The MIGRATE command is not processed.

User response

1. Ensure that the correct table is present in the
   library, and that the TABLE parameter of the
   MIGRATE command is correct.
2. Ensure that an ORDER statement was processed in
   the JCL of the link-editing of the table.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5169 S   **PROCESSING IS TERMINATED.
TABLE** *table* **WAS ASSEMBLED FOR
CICS RELEASE** *rrr*. **REASSEMBLE
FOR RELEASE** *sss*.

Explanation

After loading the table *table*, the migration routine
checks the VMVERS field in the DFHVM expansion
of the data area following the load point. This field
indicates the CICS release (*rrr*) for which the table was
assembled, and is invalid for the CICS system (release
sss) that is running.

System action

The MIGRATE command is not processed.

User response

Reassemble the table for the correct release of CICS.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5174 W   **PROCESSING IS TERMINATED. COMMAND CANNOT BE EXECUTED BECAUSE 'PARM=CSD(READONLY)' WAS SPECIFIED.**

Explanation

This command requires the CSD to be opened for read-write access. Your job step specified read-only access for the CSD in the DFHCSDUP utility job stream.

System action

This command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response

Amend the JCL to specify 'PARM=CSD(READWRITE)'.

Note:

If the CSD is recoverable, and you are accessing it in RLS mode, you cannot specify READWRITE access. To perform the command, access the CSD in non-RLS mode.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5175 S   **PROCESSING IS TERMINATED. UNEXPECTED RESPONSE FROM *function* IN CSD MANAGER.**

Explanation

An invocation of the CSD manager, DFHDMP, has resulted in an error. The name of the function that failed is *function*.

System action

DFHCSDUP issues additional messages and then

- Terminates **normally** for CSD open/close errors, and the CSD-full condition, or
- Terminates **abnormally** for all other situations.

User response

Ensure that you have set up your CSD file correctly. If you have migrated your CSD file from a previous release, note that you should have increased your block size to 500. If necessary, use the diagnostics in the additional messages.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5176 S   **PROCESSING IS TERMINATED. CSD IS FULL.**

Explanation

The VSAM data set containing the CSD file is full.

System action

Execution of the CSD utility command is terminated.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then the DFHCSDUP utility attempts to process subsequent commands.

The DFHCSDUP utility leaves a system lock on the group being created at the time of failure. This lock prevents processing of the group by the CSD utility or the CEDA transaction.

User response

First, use the DFHCSDUP VERIFY process to remove the system lock on the partly-created group. Normal RDO processing of the group should then be possible, enabling the group (or any unwanted definitions) to be deleted.

To recover the contents of the CSD file, define a larger data set and use the AMS REPRO command. Usually, you will be able to REPRO from the CSD file that became full. If you are unable to do this, use a backup copy. (You may be able to transfer definitions from the CSD file that filled up by using the DFHCSDUP COPY command with the FROMCSD option.)

Module:
DFHCSDUP

Destination

SYSPRINT

**DFH5177 S   PROCESSING IS TERMINATED.
CSD I/O ERROR OCCURRED.**

Explanation

An I/O error occurred when executing a READ or WRITE of a CSD record on the primary or secondary CSD file.

System action

DFHCSDUP issues additional messages and terminates abnormally.

User response

Restore the CSD file to a new data set from your own backup, or create the new CSD file by using the INITIALIZE, COPY, and APPEND commands to restore existing definitions.

Module:
DFHCSDUP

Destination

SYSPRINT

**DFH5178 S   PROCESSING IS TERMINATED.
SEVERE CSD ERROR OCCURRED.**

Explanation

An error occurred during execution of the CSD manager, DFHDMP, to access the primary or secondary CSD file.

System action

DFHCSDUP issues additional messages and terminates abnormally.

User response

See the VSAM diagnostics given in message DFH5179.

Module:
DFHCSDUP

Destination

SYSPRINT

**DFH5179 S   VSAM ERROR. RETURN CODE = *nn*
ERROR CODE = *ddd*(*yy*) CONTROL
BLOCK TYPE = {*RPL | ACB*}**

Explanation

VSAM returned the following diagnostics when an error occurred, where:

- *nn* is the hexadecimal VSAM return code
- *yy* is the hexadecimal VSAM error code (*ddd* is its decimal equivalent)
- CONTROL BLOCK TYPE points to the relevant error code subset as follows:
  - RPL = Request macro responses from VSAM
  - ACB = OPEN/CLOSE responses

  The error code is:
  - For CONTROL BLOCK TYPE = RPL, the reason code from byte 3 of the feedback word field in the RPL (RPLERRCD)
  - For CONTROL BLOCK TYPE = ACB, the reason code in the ERROR field in the ACB (ACBERFLG)

System action

The CSD utility terminates command processing, and in some situations, produces an operating system dump.

User response

For the meaning of the VSAM return and error codes, refer to the z/OS DFSMS Macro Instructions for Data Sets manual.

When interpreting these diagnostics, ensure that the data set referenced in the JCL exists.

Check the following:

- The data set is being concurrently accessed by CICS running in another region.
- You are not attempting to open a recoverable CSD as READWRITE if DFHCSDUP specifies RLS access mode. You must specify PARM=CSD(READONLY) in this case.
- LOG is defined on the base cluster if RLS access mode is specified.

If DFHCSDUP specifies RLS access mode, a 'record not found' error could mean that the CSD has not been initialized.

Note:

You must use non-RLS access mode to initialize a recoverable CSD.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5180 S   **PROCESSING IS TERMINATED.**
ERROR OCCURRED WHILE
CSD WAS BEING READ
BY *{SETBROWSE | GETNEXT}*
{SCANSETS | SCANOBJS}

Explanation

When the LIST command invoked DFHDMP to scan the objects on the CSD file, an error occurred during execution of the DFHDMP function.

System action

The CSD utility terminates with an MVS abend 0325.

User response

This error should be reported. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5181 W   **NO MATCH FOUND FOR GENERIC**
{GROUP | LIST} **IDENTIFIER**
xxxxxxxx

Explanation

The LIST command was executed with a generic group or list name, but no qualifying group or list exists on the CSD file.

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5182 W   *{GROUP | LIST} xxxxxxxx* **DOES**
NOT EXIST.

Explanation

The LIST command or the DELETE command was executed using the name of a group or list that does not exist on the primary CSD file.

System action

The LIST command or the DELETE command is not processed. Subsequent commands may still be processed.

User response

Correct the LIST command or the DELETE command to use a valid group or list name.

If a CSD upgrade is being performed, no user action is required.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5183 W   *{GROUP | LIST} xxxxxxxx* **EXISTS**
AS A *{GROUP | LIST}* **NAME.**

Explanation

The LIST command or the DELETE command was executed using a group name that is already in use as a list name, or using a list name that is already in use as a group name.

System action

The LIST command or the DELETE command is not processed. Subsequent commands may still be processed.

User response

Correct the LIST command or the DELETE command to use a valid group or list name.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5184 S   **PROCESSING IS TERMINATED. INVALID OUTPUT FROM DFHPUP. CANNOT FORMAT DATA FOR UTILITY LISTING.**

Explanation

There has been an internal logic error in the DFHCSDUP utility program. The data in the back-translated output buffer is invalid. The length code may be out of range or the data fields in the wrong sequence. One or more of the data fields may be invalid.

System action

The CSD utility terminates with an MVS abend 0326.

User response

This error must be reported.

Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where the error(s) have occurred because they will refuse to print and are therefore easily identifiable.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5186 W   **NO RESOURCES DEFINED IN GROUP *grpname* OR NO GROUPS DEFINED IN LIST *lstid***

Explanation

In executing a LIST command, the CSD utility has found a group or list header on the CSD file for which no corresponding group or list elements exist.

System action

The utility continues to process the LIST command, but will not tabulate elements of the group or list named in the message.

User response

Run the DFHCSDUP VERIFY utility.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5187 I   *resource* **IS LOCKED, BUT IS NOT THE NAME OF A GROUP OR LIST.**

Explanation

The CSD utility detected a locked resource that is not a group or list. The reason is that an interrupt or failure occurred during a CEDA transaction or a previous utility job. A lock had been created but not the associated group or list.

System action

The utility continues normal processing of the VERIFY command.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5188 I   *{GROUP | LIST | RESERVED NAME} resource* **IS NOW AVAILABLE FOR USE.**

Explanation

The VERIFY command discovered that the resource was not available for the CEDA transaction or offline commands. The restriction on its availability, which was due to the failure of some previous command affecting it, has now been removed.

System action

Normal processing of the VERIFY command continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5189 I   **CSD VERIFY PROCESS
                     COMPLETED SUCCESSFULLY.**

Explanation

The VERIFY command has been processed
successfully, and any internal locks associated with
groups and lists on the CSD file have been removed.

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5190 S   **COMMAND IS NOT EXECUTED.
                     UNABLE TO GET STORAGE FOR
                     SERVICE MODULE** *progname*

Explanation

There is insufficient storage available to load the
service module *progname*, that is to be loaded and
executed by DFHCSDUP.

System action

Utility command execution is terminated.

If commands are being read from a SYSIN data
stream, then subsequent commands (except LIST
commands) are checked for syntax only. (If the
primary CSD file cannot be opened, the LIST command
is not processed either.)

If commands are being read from a get-command
exit, then DFHCSDUP attempts to process subsequent
commands.

User response

Ensure that there is sufficient storage allocated to load
module *progname*.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5191 I   **SERVICE PROGRAM** *progname* **IS
                     RUNNING.**

Explanation

The service module *progname* has been loaded
correctly. Execution of the module has started.

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5192 S   **COMMAND IS NOT EXECUTED.
                     CSD SERVICE LEVEL** *ttt* **IS
                     INCOMPATIBLE WITH CURRENT
                     SERVICE LEVEL** *sss*

Explanation

Either the LEVEL parameter specified in the SERVICE
command is wrong, or an incorrect version of the CSD
file is being used as the secondary (input) CSD file.

System action

The SERVICE command is not executed.

If commands are being read from a SYSIN data
stream, then subsequent commands (except LIST
commands) are checked for syntax only. (If the
primary CSD file cannot be opened, the LIST command
is not processed either.)

If commands are being read from a get-command
exit, then DFHCSDUP attempts to process subsequent
commands.

User response

The SERVICE command may upgrade the service level
of the CSD file only in increments of one. Check that
the input CSD file is the intended one, and that the
LEVEL parameter takes the value one higher than the
current service level of the CSD file.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5193 S   **COMMAND IS NOT EXECUTED.
SERVICE MODULE *progname* IS
UNABLE TO UPGRADE CSD TO
TARGET SERVICE LEVEL *ttt***

Explanation

The LEVEL parameter specified in the SERVICE
command is incompatible with the status of the
service module *progname* being applied to the CSD
file.

System action

The SERVICE command is not executed.

If commands are being read from a SYSIN data
stream, then subsequent commands (except LIST
commands) are checked for syntax only. (If the
primary CSD file cannot be opened, the LIST command
is not processed either.)

If commands are being read from a get-command
exit, then DFHCSDUP attempts to process subsequent
commands.

User response

Ensure that the service module *progname* being
applied, is correctly updated with the service fix
supplied by IBM. (It should have been amended so as
to be able to process SERVICE commands at the target
level *ttt*.)

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5194 I   **UPGRADING SERVICE STATUS OF
CSD FROM LEVEL *sss* TO LEVEL *ttt***

Explanation

The loaded service module is performing the required
upgrade of the CSD file from service level *sss* to
service level *ttt*.

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5195 I   **EXECUTION OF SERVICE
PROGRAM *progname* COMPLETE.**

Explanation

The loaded service program *progname* has run to
completion. Control is being transferred back to the
CSD offline utility program, DFHCSDUP.

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5196 S   **COMMAND IS TERMINATED.
ERROR OCCURRED WHILE
READING CONTROL SECONDARY
CSD RECORD.**

Explanation

An I/O error has occurred on the specified CSD file.

System action

The SERVICE command is terminated.

If commands are being read from a SYSIN data
stream, then subsequent commands (except LIST) are
checked for syntax only. (If the primary CSD file cannot
be opened, LIST is not processed either.)

If commands are being read from a get-command
exit, then DFHCSDUP attempts to process subsequent
commands.

User response

Retry the command, ensuring that a sufficiently large data set size is specified for the output (primary) CSD file.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5197 S   **COMMAND IS TERMINATED. UNRECOGNIZED CONTROL RECORD ENCOUNTERED WHILE SECONDARY CSD WAS BEING READ.**

Explanation

The contents of a control record of the secondary input CSD are invalid.

System action

The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

User response

Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the OLDCSD parameter in the SERVICE utility command.

If the problem persists, you will need further help from IBM. First, obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where the errors have occurred because they do not print and are therefore easily identifiable. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5198 I   **CSD RECORD MODIFIED FOR *xxxxxxxx***

Explanation

The specified modification to a record on the CSD file has taken place.

The insert, *xxxxxxxx*, is the element type.

System action

Normal processing continues. If the modified record is an element in a GROUP or LIST, its date-and-time field is updated when copied to the output (primary) CSD file.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5199 W   **INVALID FIELD ENCOUNTERED IN EXISTING RECORD FOR *xxxxxxxx***

Explanation

An unexpected value was found in one of the fields of a CSD record that was to be modified for element *xxxxxxxx*.

System action

Normal processing continues, and the invalid record is left unchanged on the new (primary) CSD file.

User response

None.
Module:
DFHCSDUP

Destination

SYSPRINT

DFH52nn messages

DFH5200 S   **COMMAND NOT EXECUTED. NO VALID LANGUAGE TABLE WAS LOADED.**

Explanation

Either the CSD utility found that the RDO language table had not been loaded correctly, or that it contained invalid data.

System action

The CSD utility terminates, because it cannot process any commands.

User response

Check that the correct version of the RDO language table (DFHEITCU) is in the program library.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5201 S   *command* **COMMAND IS NOT VALID. COMMAND NOT EXECUTED.**

Explanation

The CSD utility does not recognize the command.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5202 S   **INCORRECT SYNTAX FOR** *command* **COMMAND. COMMAND NOT EXECUTED.**

Explanation

The syntax of the command is incorrect.

System action

The CSD utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5203 W   **RIGHT PARENTHESIS ASSUMED AFTER THE VALUE OF** *xxxx*.

Explanation

The syntax of the command was incorrect. Either a right parenthesis has been omitted or a keyword value in excess of 256 bytes has been specified.

System action

The CSD utility executes the command as if the right parenthesis was present.

User response

Confirm that the correction applied by the utility generated the required command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5204 E   **COMMAND NOT EXECUTED.** *xxxx* **KEYWORD IS NOT VALID.**

Explanation

The keyword *xxxx* is not valid on this command.

System action

The utility command is ignored.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5205 E   **COMMAND NOT EXECUTED. NO VALUE WAS SPECIFIED FOR** *xxxx*.

Explanation

The option *xxxx* is incomplete, possibly because a value has been omitted.

System action

This CSD utility command is ignored.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5206 E   **COMMAND NOT EXECUTED. DUPLICATE SPECIFICATION OF** *xxxx*.

Explanation

Option *xxxx* appears twice on a single CSD utility command.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5207 E   **COMMAND NOT EXECUTED.** *xxxxxxxx* **DOES NOT REQUIRE A VALUE.**

Explanation

The CSD utility detected an input command coded with a value for option *xxxxxxxx* when no value was required.

System action

The utility does not process the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5208 W   **RESOURCE DEFINED BUT NO VALUE WAS SPECIFIED FOR** *xxxxxxxx*. **ENSURE THAT THE RESOURCE IS UPDATED.**

Explanation

The CSD utility detected that an input command did not have a value for the specified keyword *xxxxxxxx*, when a value was required.

System action

The utility processes the command and ignores the specified keyword.

User response

Correct the input command and update the defined CICS resource.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5209 W   **NO COMMAND ENCOUNTERED. THE INPUT FILE MIGHT BE EMPTY.**

Explanation

The CSD utility detected that an input command was missing. A valid CSD input command was expected but not found.

System action

The utility continues processing the input file.

User response

Ensure that you have valid DFHCSDUP input commands in the SYSIN data stream. If you are using the UPGRADE USING(*file name*) command, ensure that the input file contains valid commands.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5210 E　　**COMMAND NOT EXECUTED. INVALID VALUE WAS SPECIFIED FOR** *xxxx*.

Explanation

The CSD utility detected an input command coded with an invalid value for option *xxxx*.

System action

The utility does not process the command.

User response

Correct the value.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5211 E　　**COMMAND NOT EXECUTED. OPERAND DELIMITER** *x* **WAS MISPLACED.**

Explanation

The CSD utility has detected an input command coded with a misplaced option delimiter *x*.

System action

The utility does not process the command.

User response

Place the delimiter correctly.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5212 E　　**COMMAND NOT EXECUTED.** *comptype string* **IS NOT UNIQUELY IDENTIFIABLE.**

Explanation

An ambiguous DFHCSDUP command has been specified.

- *comptype* is the command component type
- *string* is the actual component.

System action

The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response

Correct the command syntax and retry. See accompanying message DFH5213 for further details of the command failure.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5213 E　　**SPECIFIED** *input* **COULD BE INTERPRETED AS** *match1* **OR** *match2*.

Explanation

An ambiguous DFHCSDUP command has been specified.

- *input* is the ambiguous character string
- *match1* and *match2* are two possible interpretations of *input*.

System action

The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response

Correct the command syntax and retry.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5214 W   *keyword* **IS AN OBSOLETE KEYWORD. IT IS IGNORED. RESPECIFY USING THE COMPAT OPTION.**

Explanation

The CSD utility has detected an input command coded with an obsolete keyword. The keyword specifies an option not valid for this release of CICS, but the command can be used as input to the CSD utility for an earlier release.

System action

The utility ignores the keyword.

User response

Confirm that the resulting utility command is correct for this release of CICS.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5215 E   **COMMAND NOT EXECUTED. A CLOSING PARENTHESIS HAS BEEN OMITTED FROM A NULL VALUE SPECIFIED ON AN ALTER COMMAND.**

Explanation

A closing parenthesis was not added when a null value was specified for a keyword on an ALTER command. A closing parenthesis is automatically added for keyword values other than nulls.

System action

The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response

Correct the command syntax and retry.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5216 E   *restype resname* **IS NOT IN GROUP** *group*.

Explanation

A nonexistent resource of type *restype* and name *resname,* has been specified on an ALTER command.

System action

The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response

Correct the command syntax and retry.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5217 E   **COMMAND NOT EXECUTED. A CLOSING BRACKET HAS BEEN OMITTED FROM A** *xxxx* **KEYWORD.**

Explanation

A closing bracket has been omitted from the *xxx* keyword on a DFHCSDUP DEFINE command.

System action

The DEFINE command is not executed.

User response

Correct the DEFINE command syntax and retry.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5218 I   **ALTERING** *Resourcetype*
             Resourcename **IN GROUP**
             Groupname

Explanation

During the execution of a generic ALTER command,
the CSD batch update utility scans the CSD file
for matches to the specified generic resource name
and/or GROUP keyword. For every match, the
utility processes the request and informs the user
of the resulting *resourcename* and/or *groupname*
respectively.

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5219 W   **NO MATCH FOUND ON CSD FILE**
             FOR *Resourcetype Resourcename*
             GROUP *Groupname*

Explanation

The ALTER command was executed with a generic
resource and/or group name, but no qualifying
resource and/or group exist on the CSD file.

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5220 E   **COMMAND NOT EXECUTED.**
             xxxxxxxx **MUST BE THE FIRST**
             COMMAND.

Explanation

The CSD utility found an INITIALIZE command after
other commands.

System action

The CSD utility ignores the command.

User response

Confirm that the INITIALIZE command was misplaced.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5222 E   **COMMAND NOT EXECUTED.**
             xxxxxxxx **KEYWORD WAS**
             OMITTED OR SPECIFIED
             INCORRECTLY.

Explanation

A required keyword *xxxxxxxx* was omitted from a CSD
utility command.

System action

The utility ignores the command.

User response

Specify keyword *xxxxxxxx*.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5223 E   **COMMAND NOT EXECUTED.**
             xxxxxxxx **KEYWORD CONFLICTS**
             WITH *xxxxxxxx* **KEYWORD.**

Explanation

The syntax of the command is incorrect. Conflicting
keywords have been specified.

System action

The utility command is ignored.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5224 E   **COMMAND NOT EXECUTED. VALUE OF *xxxxxxxx* IS OUT OF VALID RANGE.**

Explanation

The CSD utility detected an input command coded with a numeric value for value *xxxxxxxx* which was outside the valid range.

System action

The utility does not process the command.

User response

Correct the value.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5225 E   **COMMAND NOT EXECUTED. SAME NAME SPECIFIED FOR 'TO' AND *xxxxxxxx*.**

Explanation

This message is issued for one of the following reasons:

1. The utility COPY command has been coded with the same group name for the source and target group.
2. The APPEND command has been coded with the same list name for the source and target list.
3. The ADD command has been coded with the same group name and list name.

System action

The CSD utility or CICS ignores the command.

User response

Correct the name (or names) in error.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5227 E   **COMMAND NOT EXECUTED. USE OF GENERIC NAME CONFLICTS WITH *xxxxxxxx* OPTION.**

Explanation

A CSD utility command used a generic name; that is, one containing asterisk (*) or plus sign (+) characters, in conjunction with an option that conflicted with the use of generic names.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5228 E   **COMMAND NOT EXECUTED. ONLY ONE RESOURCE-TYPE KEYWORD CAN BE SPECIFIED.**

Explanation

The CSD utility detected an input command coded with more than one resource-type keyword.

System action

The utility does not process the command.

User response

Correct the command to refer to only one resource-type keyword.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5229 E   **COMMAND NOT EXECUTED.** *xxxxxxxx* **IS INVALID BECAUSE A RESOURCE-TYPE KEYWORD WAS SPECIFIED.**

Explanation

The CSD utility detected an input command coded with a resource-type keyword (for example, PROGRAM, TRANSACTION) in a situation where a resource-type keyword is invalid.

System action

The utility does not process the command.

User response

Correct the command and resubmit.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5230 I   **ERASE COMMAND IS OBSOLETE. USE THE DELETE COMMAND.**

Explanation

The CSD utility detected the obsolete ERASE command in its input.

System action

The utility processes the command as a DELETE command.

User response

In future, use the DELETE command instead of the ERASE command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5231 E   **COMMAND NOT EXECUTED.** *xxxxxxxx* **IS INCOMPATIBLE WITH THE MIGRATE COMMAND FOR** *table-type* **TABLES.**

Explanation

An attempt has been made to execute the MIGRATE command with an invalid table type and (or) an invalid keyword specified.

System action

The CSD utility terminates.

User response

Correct the command syntax and resubmit the job.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5232 E   **COMMAND NOT EXECUTED.** *xxxxxxxx* **PARAMETER MUST NOT BEGIN WITH 'DFH'.**

Explanation

In a CSD utility MIGRATE command, the *xxxxxxxx* parameter contained an invalid table name or group name.

System action

The utility does not process the command.

User response

Resubmit with a valid table name or group name.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5233 E   **COMMAND NOT EXECUTED.** *xxx* **TABLE TYPE IS NOT SUPPORTED BY RDO.**

Explanation

The CSD utility detected a TABLE parameter that referred to a CICS table type not supported by RDO.

System action

The utility does not process the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5234 E   **COMMAND NOT EXECUTED.**
command **IS NOT SUPPORTED.**

Explanation

The CSD utility detected a command *command* in its input which is not supported by RDO.

System action

The utility does not process the command.

User response

Correct the command

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5235 E   **COMMAND NOT EXECUTED.**
GROUP OR LIST MUST BE
SPECIFIED.

Explanation

A CSD utility EXTRACT command has been submitted. A GROUP or LIST name must be specified with an EXTRACT command.

System action

The utility command is not executed. This message is followed by DFH5104.

User response

Correct the invalid command by adding a valid GROUP or LIST name and rerun the utility job.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5236 I   **A USER EXIT PROGRAM HAS**
BEEN SPECIFIED ON THE
ENTRY LINKAGE AND ON THE
USERPROGRAM KEYWORD. THE
PROGRAM SPECIFIED ON THE
ENTRY LINKAGE HAS BEEN
IGNORED.

Explanation

An EXTRACT user-exit program has been specified via the entry parameter list and on the USERPROGRAM keyword of the EXTRACT command.

System action

The program specified on the USERPROGRAM keyword is used.

User response

Ensure that the user program used is the one intended.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5240 S   **PROCESSING TERMINATED.**
ERROR OCCURRED WHILE INPUT
UTILITY COMMAND WAS BEING
READ.

Explanation

The environment adaptor GETCARD utility cannot read an input utility command.

System action

The CSD utility terminates abnormally without processing the input commands.

User response

Check that the utility commands are prepared correctly and located correctly in the JCL. Check also that the DD statement defining the output data set startup job stream is correct. For JCL examples, refer to the CICS documentation.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5241 S	**PROCESSING TERMINATED. INVALID RECORD LENGTH ON INPUT UTILITY COMMAND DATA STREAM.**

Explanation

The CSD utility detected incorrectly formatted input in the SYSIN data stream.

System action

The CSD utility cannot process any commands. The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response

Ensure that the output data set data stream is formatted with fixed length 80-byte records.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5242 E	**COMMAND NOT PROCESSED. TOO MANY CONTINUATION RECORDS FOR INPUT UTILITY COMMAND.**

Explanation

The CSD utility detected an input command that was too long and extended over too many records.

System action

The utility does not process the command.

User response

This message may be caused by an error in the rejected command or in the preceding or subsequent commands in the input stream. Correct the commands in error.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5250 E	**TO(*groupname*) CONTAINS TOO MANY NON CONTIGUOUS '*'**

Explanation

During the execution of a generic COPY command, the batch update utility found the argument of the TO parameter specified too many non contiguous asterisks.

Only one '*' is allowed in the TO parameter during the execution of a generic copy.

System action

The utility rejects the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5251 I	***resource object* IN GROUP *grpname* IS REPLACED.**

Explanation

A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the definition in the target group with that from the source group.

- *resource* is the type of the resource
- *object* is the name of the object
- *grpname* is the name of the group.

System action

Normal utility processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5252 I   *resource object* **COPIED TO GROUP** *grpname*.

Explanation

The CSD utility has correctly copied a resource definition to the specified group, where:

- *resource* is the type of resource
- *object* is the name of the object
- *grpname* is the name of the group.

System action

Normal utility processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5253 E   **GROUP** *grpname* **NOT FOUND IN CSD FILE - DDNAME:** *ddname*

Explanation

The CSD utility has detected a COPY command that attempted to copy definitions from the non-existent group, *grpname,* in the CSD specified in DDNAME *ddname*.

System action

The utility does not process the command.

User response

Either correct the group name in the command, or make sure that the specified CSD file is the correct one.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5254 E   *resource object* **ALREADY EXISTS IN THE TARGET GROUP.**

Explanation

The CSD utility detected a command that attempted to add a definition to a group that already contained a definition of an object with the same name, where:

- *resource* is the type of resource
- *object* is the name of the object.

System action

The CSD utility does not process the command.

User response

Change the name in the command, or alter the name of the existing definition.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5255 E   **LIST** *xxxxxxxx* **NOT FOUND IN CSD FILE - DDNAME:** *ddname*

Explanation

The CSD utility detected an APPEND or REMOVE command that referred to a nonexistent list in the CSD file specified in DDNAME *ddname*.

System action

The utility does not process the command.

User response

Either correct the list name in the command, or make sure that the specified CSD file is the correct one.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5256 E   **NO RESOURCES DEFINED IN GROUP** *grpname*.

Explanation

In executing a LIST command, the CSD utility has found a group header on the CSD file for which no group elements exist.

System action

The CSD utility continues to process the LIST command, but will not list elements of the named group.

User response

Run the DFHCSDUP VERIFY utility to verify the group.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5257 E	LENGTH OF 'TO' PREFIX MUST BE LESS THAN OR EQUAL TO LENGTH OF 'GROUP' PREFIX.

Explanation

During the execution of a generic COPY command, the batch update utility found the length of the prefix of the generic group specified in the TO keyword to be greater than the length of the prefix of the generic GROUP keyword.

System action

The utility ignores the command to prevent truncation of the TO group name.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5258 I	COPYING GROUP *grpname1* TO *grpname2*

Explanation

During the execution of a generic COPY command, the CSD batch update utility scans the CSD file for matches to the generic GROUP keyword. For every match, the utility resolves the generic TO keyword, and informs the user of the resulting *grpname1* and *grpname2* respectively.

System action

Normal processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5259 I	UNRECOGNIZED RESOURCE TYPE FOUND IN THE CSD FILE AND HAS BEEN IGNORED.

Explanation

CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.

2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.

3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action

The resource is ignored and the operation continues.

User response

Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Ignore the message.

2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.

3. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5260 E   **LENGTH OF 'TO' SUFFIX MUST BE EQUAL TO LENGTH OF 'GROUP' SUFFIX.**

Explanation

During the execution of a generic COPY command, the batch update utility found the length of the suffix of the generic group specified in the TO keyword to be of different length than that of the suffix of the generic GROUP keyword.

System action

The utility ignores the command to prevent ambiguity on the TO group name.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5261 W   **RDT IS EMPTY. NO VTAM RESOURCES IN ASSEMBLED TABLE.**

Explanation

The CSD utility detected an attempt to migrate a TCT that either contains no RDO-supported terminal or sessions definitions, or whose TYPE=INITIAL entry specifies MIGRATE=COMPLETE.

System action

The utility does not create any CSD definitions.

User response

Check the TCT source code to see if it contains any RDO-supported definitions. If it does, check that it has been correctly assembled (MIGRATE=YES specified) and link-edited.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5262 S   **INSUFFICIENT STORAGE TO BUILD TYPE-MATCHING CHAIN.**

Explanation

During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of lack of storage for TYPETERM definitions.

System action

The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

In any of the above cases, definitions that have already been migrated will remain on the CSD.

User response

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Allocate a larger region size in the utility JCL, and retry the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5263 S   **ERROR IN INPUT RDT. INCORRECT SEQUENCE OF COMMANDS.**

Explanation

During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of abnormal data in the assembled table.

System action

The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

Definitions that have already been migrated will remain on the CSD. The MVS user abend code is 0308.

User response

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Keep the assembly listing for the failing table and keep the DFHCSDUP dump, if available. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5264 W   **RESOURCE *object* NOT DEFINED. GROUP *grpname* NOT AVAILABLE.**

Explanation

During the migration of a TCT, the CSD utility could not define a resource *object* because the target group *grpname* was not available. The utility has issued a previous message indicating the reason.

System action

The utility creates no definition for resource *object*. Normal utility processing continues.

User response

Review the original message. If necessary, recode the TYPE=GROUP macro in the TCT source to name a suitable group.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5265 W   **ACTION REQUIRED TO FIND A SUITABLE TYPETERM FOR TERMINAL *termid*.**

Explanation

While migrating a TCT, the CSD utility found a terminal definition for which it could not create a corresponding TYPETERM definition.

System action

The utility adds the terminal definition to the CSD file, but it refers to a TYPETERM that may be unsuitable for this device.

User response

Use the CEDA transaction to define a suitable TYPETERM and alter the TERMINAL definition to refer to the new TYPETERM.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5266 W   **SESSIONS *sessions* NOT DEFINED BECAUSE OF ERROR IN ASSOCIATED CONNECTION.**

Explanation

An error has been detected during the migration of a TCT. When migrating a session, DFHCSDUP checks that the associated CONNECTION has been defined successfully. If it has not, DFHCSDUP abnormally terminates the session definition.

System action

The specified SESSIONS resource is not migrated to the CSD. DFHCSDUP continues with the migration of subsequent TCT entries.

User response

Use the diagnostic information in the output listing from the MIGRATE utility to determine why the CONNECTION definition has failed. You can then use RDO to DEFINE the CONNECTION and the SESSIONS to the CSD.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5270 I   **_{GROUP | LIST} xxxxxxxx_ DELETED FROM THE CSD.**

Explanation

The CSD utility has successfully deleted a group or list from the primary CSD file.

System action

Normal utility processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5271 S   **UNABLE TO DELETE** *{GROUP | LIST} xxxxxxxx* **FROM THE CSD.**

Explanation

During CSD utility processing, an error in accessing the CSD file caused a delete operation to fail.

System action

The utility does not process the DELETE command. The group or list to be deleted remains on the CSD file.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5272 I   *resource object* **DELETED FROM GROUP.**

Explanation

The CSD utility successfully deleted the named resource, where:

- *resource* is the type of resource
- *object* is the name of the object.

System action

Normal utility processing continues.

User response

None.

Module:

DFHCSDUP

Destination

SYSPRINT

DFH5273 W   *resource object* **IS NOT IN GROUP** *grpname.*

Explanation

The CSD utility detected an attempt to delete a resource which did not exist in the named group, where:

- *resource* is the type of resource
- *object* is the name of the object
- *grpname* is the name of the group.

System action

The utility does not process the DELETE command.

User response

Check that you have coded the group and resource names correctly.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5274 W   *resource object* **NOT MIGRATED. GROUP** *grpname* **IS NOT AVAILABLE.**

Explanation

During the migration of a table, the CSD utility could not define the resource *resource* because the target group *groupname* was not available. The utility has issued a previous message indicating the reason why.

System action

The utility creates no definition for the resource named *object*. Normal utility processing continues.

User response

Review the original message. If necessary recode the TYPE=GROUP macro in the table source to name a suitable group.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5275 W	**COMMAND NOT EXECUTED. GROUP** *grpname* **IS NOT THE MEMBER OF LIST** *listname*.

Explanation

The REMOVE command being executed names a GROUP that is not a member of LIST *listname*.

System action

The CSD utility ignores the command

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5276 I	**GROUP** *grpname* **REMOVED FROM LIST** *listname*.

Explanation

The REMOVE command has successfully removed group *grpname* from LIST *listname*.

System action

Normal execution continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5277 I	**LIST** *list* **DELETED FROM CSD.**

Explanation

The final group has been removed from list *listname*. The list has therefore been deleted.

System action

Processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5280 I	**PROCESSING DEFINITIONS FROM LIBRARY MEMBER** *xxxxxxx*.

Explanation

The CSD utility has successfully loaded data from the named library member.

System action

Normal utility processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5281 S	**DATA LOADED FROM LIBRARY MEMBER** *xxxxxxx* **IS INVALID.**

Explanation

The CSD utility has found an error in data loaded from the named library member.

System action

The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response

Obtain a dump containing the failing library member.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:

DFHCSDUP

Destination

SYSPRINT

DFH5282 E   **UNABLE TO GET STORAGE FOR LIBRARY MEMBER** *xxxxxxxx***.**

Explanation

There is insufficient storage available to load the library member *xxxxxxxx*.

System action

The utility terminates processing of the command that required access to the named library member.

User response

Allocate a larger region size in the utility JCL and resubmit the job.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5283 S   **RDL SUBCOMMAND EXCEEDS 1536 BYTES:** *xxxxxxxx***.**

Explanation

The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action

The CSD utility terminates abnormally.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5284 E   **ERROR ANALYZING RDL SUBCOMMAND:** *xxxxxxxx***.**

Explanation

The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action

The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5285 E   **INVALID VERB IN RDL SUBCOMMAND:** *xxxxxxxx***.**

Explanation

The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

System action

The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5286 E　　　**UNABLE TO CREATE RESOURCE DEFINITION ON CSD FILE, RDL SUBCOMMAND:** *xxxxxxxx***.**

Explanation

This message is issued during the processing of the indicated (truncated) command for one of the following reasons:

1. The CSD is full (in which case, messages DFH5175 and DFH5176 accompanies this one)

2. The CSD was defined as read-only (in which case, message DFH5174 accompanies this message)

3. The TCT being migrated contained a terminal entry with a name unacceptable to RDO (in which case, message DFH5165 accompanies this message)

4. A list or group cannot be used due to the failure of a previous update operation (in which case, message DFH5142 accompanies this message)

5. The resource definition list being used to INITIALIZE or UPGRADE the CSD file contained a definition with an invalid resource name or group name

6. A logic error occurred in DFHCSDUP or an internal error was detected in the data contained in the loaded table.

System action

The system action depends on the reason the message is issued, as follows.

1. Migration of the TCT table is terminated immediately.

2. Processing of the UPGRADE or INITIALIZE command is terminated

3. The utility attempts to:

   a. Close any files previously opened internally.

   b. Unload any extract exit routines that were dynamically loaded.

   c. Invoke the termination exit routine (if supplied).

   d. Return control to the invoker of the utility.

4. The command is not executed, and execution of further DFHCSDUP commands in the job stream is suppressed.

5. As in (3) above.

6. As in (3) above.

In ALL cases, all the definitions created by this command up to the point of failure remain on the CSD.

User response

The user response depends on the reason the message is issued, as follows.

1. See message DFH5175 and DFH5176.

2. See message DFH5174.

3. Change the name of the terminal and all references to it. Also refer to the user response for message DFH5165.

4. See message DFH5142.

5. This is a CICS logic error. See instruction for 6 below.

6. This is a CICS logic error. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed. A CICS background trace of the failure may aid them in problem diagnosis.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5287 E　　　**EXTRACT TERMINATED AT USER'S REQUEST. RC=***retcode***.**

Explanation

A batch job has issued a CSD utility EXTRACT command. The EXTRACT command has been terminated because of a non-zero value in register 15 on return from a user exit program. Subsequent messages will indicate any further problems encountered by the utility.

System action

Execution of the utility command is terminated. This message is followed by DFH5104.

User response

Determine the cause of the error detected by the user exit program using the return code *retcode* provided and the relevant documentation of the user exit program.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5288 E   **GET-COMMAND TERMINATED AT USER'S REQUEST. RC=*xx*.**

Explanation

The GET-COMMAND exit has returned a value other than UERCNORM ('00'X) or UERCDONE ('04'X) indicating that the GET-COMMAND exit was unsuccessful.

System action

Execution of the utility command is terminated.

User response

Correct the operation of the GET-COMMAND user exit before re-running the utility. Consult the documentation or listing supplied with the user exit for information on how to diagnose and fix the problem.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5290 W   **TABLE *tabtype* MACRO *mactype=value* IS NOT SUPPORTED. VALUE IS CHANGED TO *newvalue*.**

Explanation

During a table *tabtype* migration for macro *mactype*, *value* is not supported. *value* has been migrated as *newvalue*

System action

The utility creates the definition for the resource with the changed value. Normal utility processing continues.

User response

Review the object definition to ensure that the modified definition is acceptable.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5291 E   **UNABLE TO DEFINE OBJECT *object* IN GROUP *group*. MIGRATION IS TERMINATED.**

Explanation

The DFHCSDUP migration utility could not define *object* in the *group* specified. The migration cannot continue.

System action

The utility terminates the migration of the table.

User response

Verify that the specified group is the correct group and review prior errors to determine why the migration utility could not create the definition in the group.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5292 W   **OBJECT *object* NOT DEFINED FOR TABLE ITEM *name* DUE TO PREVIOUS ERROR. MIGRATION CONTINUES.**

Explanation

The DFHCSDUP migration utility could not define *object* for the table item *name*. The migration continues.

System action

The utility continues the table migration without defining the object.

User response

Correct the prior errors and manually define the skipped objects.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5293 W   **TOTAL *object* DEFINITIONS SKIPPED DUE TO ERROR: *number***

Explanation

CICS issues this message after migrating a CICS table. *number* definitions of type *object* were not migrated. See one or more DFH5292 messages issued prior to this message.

System action

Utility processing continues.

User response

Correct the prior errors and manually define the skipped objects.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5294 E *number object-1* **WERE NOT MATCHED WITH A CORRESPONDING** *object-2.*

Explanation

CICS issues this message if there are *object-1* table definitions that have not been defined because the table was not defined correctly. *object-1* table definitions must refer to a *object-2* in the table.

System action

The migration of the table ends.

User response

Reassemble the table with the current release macro source.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5296 W **TABLE** *tabtype* **TYPE=***mactype parameter* **DOES NOT SUPPORT MULTIPLE VALUES.**

Explanation

Multiple values were specified for TYPE=*mactype parameter* The migration of the *tabtype* table supports only one value.

System action

The migration utility ignores the additional values. The migration continues.

User response

Review the migrated definition to ensure that the new single value is acceptable.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5297 E *command* **IS NO LONGER SUPPORTED.**

Explanation

The CSD utility detected a command, *command*, in its input that is no longer supported by RDO.

System action

The utility does not process the command.

User response

Refer to the Upgrading Guide for details on how to proceed if you need to use the withdrawn command. It is possible that you can run with a back-level version of the CSD utility program that would support the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5298 E *resource object* **IS NOT IN GROUP** *grpname.*

Explanation

The CSD utility detected an attempt to copy a resource which did not exist in the named group, where:

- *resource* is the type of resource
- *object* is the name of the object
- *grpname* is the name of the group.

System action

The utility does not process the COPY command.

User response

Check that you have coded the group and resource names correctly.

Module:
DFHCSDUP

DFH55nn messages

Destination

SYSPRINT

DFH5501 E   COMMAND NOT EXECUTED.
**   *keyword* MUST BE SPECIFIED**

Explanation

A keyword *keyword*, which is required in the command, has been omitted or was incorrectly specified.
An earlier message identifies if the latter case is applicable.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5502 W   *xxxxxxx* IMPLIES *yyyyyyy*

Explanation

The value *xxxxxxxx* specified in a DEFINE or ALTER command has caused another value *yyyyyyyy*, which is not a normal default, to be assumed.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is acceptable. If you accept this default, no further action is required.

If the resultant default is not acceptable, you must decide whether to modify the definition, or to delete it and start again.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5503 E   COMMAND NOT EXECUTED.
**   *xxxxxxx* OPTION CONFLICTS WITH**
**   *yyyyyyy* OPTION AND IS IGNORED.**

Explanation

Two options, *xxxxxxx* and *yyyyyyy*, that are mutually exclusive have been specified.

System action

The utility ignores the command and does not execute subsequent commands (except the LIST command).

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5504 E   COMMAND NOT EXECUTED. USE
**   OF *xxxxxxx* OPTION IMPLIES**
**   *yyyyyyy* OPTION**

Explanation

Option *xxxxxx* requires another value, *yyyyyyy*.

System action

The utility ignores the command.

User response

Specify *yyyyyyy*.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5505 W   PROGRAM DFHMSP REQUIRES A
**   TWASIZE OF AT LEAST 512**

Explanation

A DEFINE PROGRAM command for the message switching program, DFHMSP, has given it a TWASIZE of less than 512 bytes. If it is to be a definition for the CICS-supplied program of that name then it will not execute correctly.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5506 E	COMMAND NOT EXECUTED. FOR *xxxxxxx* MANY OPTIONS, INCLUDING *yyyyyyy* ARE MEANINGLESS

Explanation

A keyword or value has been specified that is not consistent with another.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5507 E	COMMAND NOT EXECUTED. *xxxxxxx* VALUE MUST BE GREATER THAN *yyyyyyy* VALUE.

Explanation

A value has been specified that is not consistent with another. *xxxxxxx* must be greater than *yyyyyyy*.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5508 E	COMMAND NOT EXECUTED. *xxxxxxx* VALUE MUST BE LESS THAN OR EQUAL TO *yyyyyyy* VALUE.

Explanation

A value has been specified that is not consistent with another. The value *xxxxxxx* must be less than or equal to *yyyyyyy*.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5509 E	COMMAND NOT EXECUTED. *xxxxxxx* NAME MUST NOT BE THE SAME AS *yyyyyyy* NAME

Explanation

Some values in DEFINE commands must not be the same as the name of the resource. *xxxxxxx* must not have the same name as *yyyyyyy*.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5510 W   *xxxxxxx* **NAMES BEGINNING WITH** *yyyyyyy* **ARE RESERVED AND MAY BE REDEFINED BY CICS**

Explanation

CICS supplies standard programs and transactions whose names you should usually avoid.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5511 W   *xxxxxxx* **NAME** *yyyyyyy* **IS RESERVED AND MAY BE REDEFINED BY CICS**

Explanation

CICS supplies standard programs and transactions whose names you should usually avoid.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5512 W   **PROGRAM NAME BEGINS WITH 'DFH' BUT TRANSACTION NAME DOES NOT BEGIN WITH 'C'**

Explanation

CICS supplies standard programs and transactions whose naming conventions you should avoid.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5513 E   **COMMAND NOT EXECUTED. THE SECOND VALUE OF** *xxxxxxx* **MUST NOT BE GREATER THAN THE FIRST.**

Explanation

Some keywords take pairs of values which are essentially maximum and minimum values.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5514 E   **COMMAND NOT EXECUTED. WITH SESSNAME THERE CAN ONLY BE ONE COUNT AND ITS VALUE MUST BE 1.**

Explanation

The use of SESSNAME in a DEFINE SESSIONS command means that a single-session, either for sending or receiving, is required.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5515 W	AUTOPAGE(NO) HAS BEEN SPECIFIED FOR A 3270 PRINT DEVICE

Explanation

A DEFINE TYPETERM command has AUTOPAGE(NO) and DEVICE(3270P) or DEVICE(LUTYPE3).

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5516 W	THE VALUES OF DEVICE AND SESSIONTYPE ARE EQUIVALENT TO DEVICE(*devtype*) AND HAVE BEEN REPLACED

Explanation

A DEFINE TYPETERM command has a valid but obsolete DEVICE and SESSIONTYPE combination.

This DEVICE and SESSIONTYPE combination has been replaced by a simpler equivalent indicated by *devtype*.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect. The Defining resources provides further information about device equivalents.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5517 E	COMMAND NOT EXECUTED. *xxxxxxx* PFX AND COUNT TOGETHER MAKE MORE THAN 4 CHARACTERS.

Explanation

In a SESSIONS definition the RECEIVEPFX and SENDPFX values are used as prefixes for the names of as many sessions as are specified in the respective counts. These names cannot be more than 4 characters long.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5518 W	XTRANIDS *xxxxxxx* ARE RESERVED AND MAY BE REDEFINED BY CICS

Explanation

CICS supplies programs and transactions whose names you should usually avoid.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5519 E	COMMAND NOT EXECUTED. *xxxxxxx* VALUE CONTAINS AN INVALID *y*.

Explanation

All character values in DFHCSDUP commands are subject to rules which, depending on the value, disallow certain characters.

System action

The utility ignores the command.

User response

Correct the command.

The Defining resources provides further information about these rules under the individual attributes for the syntax of the DFHCSDUP command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5520 W   **THE VALUE OF DEVICE IS EQUIVALENT TO** *xxxxxxx* **AND HAS BEEN REPLACED**

Explanation

A DEFINE TYPETERM command has a valid but obsolete DEVICE value which has been replaced by a simpler equivalent.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect.

The Defining resources provides further information about these simpler equivalent devices.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5521 E   **COMMAND NOT EXECUTED.** *xxxxxxx* **VALUE** *yyyyyyy* **IS INVALID.**

Explanation

A value *yyyyyyyy* has been specified for keyword *xxxxxxx* which is not valid. It may for instance be non-numeric.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5522 E   **COMMAND NOT EXECUTED. LENGTH OF "***xxxxxxx* **VALUE IS MORE THAN ALLOWED.**

Explanation

All character values in DEFINE commands are of limited length.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5523 E   **COMMAND NOT EXECUTED. FILE DFHCSD MUST BE DEFINED IN THE SIT AND NOT THE CSD.**

Explanation

DFHCSD has been defined in the CSD rather than in the SIT. This is not allowed.

System action

The utility ignores the command.

User response

Correct the command. Define DFHCSD in the SIT.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5524 W **BMS ROUTE FOR CONSOLE MAY CAUSE UNPREDICTABLE RESULTS IF MAPS OR TEXT(ACCUM) USED ON DEVICE.**

Explanation

The routing of multiline maps or accumulated text to the console is not supported.

System action

Normal processing continues.

User response

Ensure that the unsupported console operations are disabled.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5525 W *xxxxxxxx* **VALUE IS NOT VALID, *yyyyyyyy* HAS BEEN ASSUMED**

Explanation

The value *xxxxxxxx* is not valid. The value *yyyyyyyy* has been assumed.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5526 E *xxxxxxxx* **MUST HAVE ROWS AND COLUMNS SPECIFIED**

Explanation

xxxxxxxx must have rows and columns specified.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5527 E **REMOTE OPTIONS ARE IGNORED FOR PROGRAMS STARTING WITH DFH.**

Explanation

CICS supplies standard programs which are not allowed to have remote attributes.

System action

The command is ignored.

User response

Correct the command by deleting the remote attributes from the program definition.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5528 E **COMMAND NOT EXECUTED. VALUE OF *keyword* IS OUT OF VALID RANGE.**

Explanation

An invalid value has been supplied for the specified keyword.

System action

The utility ignores the command.

User response

Supply a valid keyword value and retry.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5529 E	*keyword* OR *keyword* MUST BE SPECIFIED.

Explanation

Neither of the indicated keywords has been specified. When defining a resource, you must specify one of these keywords.

System action

The utility ignores the command.

User response

Supply one of the indicated keywords and retry.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5530 W	XTRANIDS ENDING WITH *string* ARE RESERVED AND MAY BE REDEFINED BY CICS.

Explanation

CICS supplies programs and transactions whose names you should usually avoid.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5531 W	XTRANIDS BEGINNING WITH *string* ARE RESERVED AND MAY BE REDEFINED BY CICS.

Explanation

CICS supplies programs and transactions whose names you should usually avoid.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5532 E	COMMAND NOT EXECUTED. AN INVALID COMBINATION OF ROWS AND COLUMNS HAS BEEN SPECIFIED FOR ALTSCREEN.

Explanation

One of the specified values is zero and the other is non-zero. This is an invalid combination.

System action

The utility ignores the command.

User response

Ensure that a valid combination of ALTSCREEN rows and columns is specified. See the Defining resources for details of valid combinations.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5533 W	SPECIFIED *keyword1* VALUE IS LESS THAN *keyword2* VALUE. THE DEFAULT VALUE HAS BEEN ASSUMED.

Explanation

A value has been specified for *keyword1* that is incompatible with the value for *keyword2*.

System action

DFHCSDUP assumes the default value for *keyword1* and processes the command.

User response

Ensure that the resulting resource definition is acceptable.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5534 W	WHEN YOU CHANGE THE VALUE OF DEVICE MANY OTHER VALUES MAY BE CHANGED FOR YOU.

Explanation

When ALTERing the DEVICE in a TYPETERM resource definition, the batch update utility changes forced values that are incompatible with the new DEVICE. However, dependent default values are not changed, and may now be incompatible.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect. See the Defining resources for more guidance.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5535 E	COMMAND NOT EXECUTED. *restype* NAME *resname* IS RESERVED BY CICS.

Explanation

The user specified a resource name *resname* for resource type *restype* which is reserved for use by CICS.

System action

The utility ignores the command.

User response

Specify a different resource name.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5536 W	*keyword1* AND *keyword2* ATTRIBUTES ARE INCONSISTENT IF DEFINITION IS BEING SHARED WITH A BACK LEVEL RELEASE.

Explanation

keyword1 has been preceded by *keyword2*. However, *keyword1* has been kept for compatibility reasons. After updating the definition, the value specified for *keyword1* has become inconsistent with the value specified for *keyword2*.

System action

The definition is created or updated.

User response

If sharing the CSD file with a back level release, ensure that the resulting resource definition is acceptable. Otherwise, ignore the message.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5537 W	PREFIX ALLOWED TO DEFAULT. USE OF DEFAULTS IS RECOMMENDED FOR MRO SESSIONS ONLY.

Explanation

A null value has been accepted for a send or receive prefix for an LU6.1 or MRO session. The default value '>' is supplied by CICS for send sessions and '<' for receive sessions. These values are the default prefixes for MRO session names. The use of these prefixes is allowed for LU6.1 sessions, but is not recommended if MRO session names with the same prefixes are in use

because duplicate names may occur if large numbers of sessions are defined.

System action

CICS will generate session names using these prefixes.

User response

If this is an LU6.1 session it is recommended that a different prefix should be chosen.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5538 W	*resource* NAMES STARTING WITH *x* MAY CONFLICT WITH SYSTEM SESSIONS NAMES.

Explanation

The resource *resource* has been given a name starting with the character *x* which might be used for system generated SESSIONS names.

System action

The definition is created or updated.

User response

Ensure there is no conflict with the name given to the resource and SESSIONS names.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5539 S	*keyword* IS NOT VALID BECAUSE IT STARTS WITH THE RESERVED CHARACTER OR STRING *string*.

Explanation

The name you have given to keyword *keyword* is not valid because the name begins with a reserved character or string such as "c" or "dfh".

System action

The definition is not created.

User response

Change the name of the keyword.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5540 W	*xxxxxxx* VALUE IS GREATER THAN *yyyyyyy* VALUE. THE LOWER VALUE TAKES PRECEDENCE.

Explanation

A value has been specified that is not consistent with another. The value *xxxxxxx* is greater than value *yyyyyyy*. Value *yyyyyyy* takes precedence and overrides the higher value.

System action

The definition is created or updated with the two values as specified.

User response

Ensure that the two values are defined as you expect. You may decide to leave the values as specified and dynamically change the values online once the resource has been installed in the CICS system.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5541 E	PROGRAM OR REMOTESYSTEM MUST BE SPECIFIED.

Explanation

None of the indicated keywords has been specified. When defining a transaction, you must specify one of these keywords.

System action

The utility ignores the command.

User response

Supply one of the indicated keywords and retry.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5544 E   **COMMAND NOT EXECUTED.** *xxxxxxx* **MUST BE SPECIFIED AS** *yyyyyyy* **BECAUSE A PREVIOUS VALUE IS GENERIC.**

Explanation

The options, *xxxxxxx*, must be specified as *yyyyyyy* because as previous option value was specified as generic.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5545 W   **PROGRAM SHOULD BE SPECIFIED WITH BREXIT.**

Explanation

If the BREXIT option is specified, the PROGRAM option should also be specified. For compatibility with the Bridge transaction definitions in CTS 1.2, this is not mandatory, but if PROGRAM is not specified the transaction definition will not work.

System action

The transaction definition is accepted.

User response

Correct the command when migration from CTS 1.2 has been made.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5546 E   **COMMAND NOT EXECUTED.** *xxxxxxx* **IS NOT VALID AS A TYPE** *yyyyyyy* **PARAMETER.**

Explanation

The options specified conflict. If TYPE EJB is specified, the respective ejb-type options must be specified. The ejb-type attributes are BEANNAME and INTFACETYPE. Likewise, for TYPE CORBA, the corba-type attributes must be specified. These are MODULE and INTERFACE. For TYPE GENERIC, either attributes may be specified but they should be generic.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5547 E   **COMMAND NOT EXECUTED.** *xxxxxxx* **VALUE** *yyyyyyy* **IS INVALID.**

Explanation

A value *yyyyyyyy* has been specified for keyword *xxxxxxxx* which is not valid. It may for instance be non-numeric.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5548 E   *date time applid* **COMMAND NOT EXECUTED.** *xxxxxxx* **OPTION IS INVALID FOR A BACK LEVEL REQUESTMODEL.**

Explanation

The options specified conflict. If CORBASERVER name is blank and the respective previous level attributes (OMGMODULE, OMGOPERATION, and

OMGINTERFACE) are specified, the use of BEANNAME, MODULE, INTERFACE and OPERATION is not allowed. It is not possible to give a back level requestmodel definition new attributes. The old requestmodel must be discarded and redefined with the new attributes if it is required to be used on this level of CICS.

System action

The utility ignores the command.

User response

Correct the command. If this requestmodel is being maintained for a back level CICS system, specify only the attributes OMGMODULE, OMGOPERATION, OMGINTERFACE and TRANSID. However, to use an old requestmodel on this level of CICS, it must be discarded and redefined with the new attributes.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5549 E	COMMAND NOT EXECUTED. *xxxxxxx* VALUE MUST NOT BE THE SAME AS *yyyyyyy* VALUE.

Explanation

The values specified for the two attributes must not be the same.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5550 E	*keyword1* IMPLIES *keyword2*. THE DEFAULT VALUE HAS BEEN ASSUMED.

Explanation

keyword1 has been specified with a value that is incompatible with the value for *keyword2*.

System action

DFHCSDUP changes *keyword1* to set the default value and processes the command.

User response

Ensure that the resulting resource definition is acceptable.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5551 E	COMMAND NOT EXECUTED. *keyword1* CANNOT BE SPECIFIED AS GENERIC UNLESS *keyword2* IS ALSO GENERIC.

Explanation

keyword1 has been specified with a generic name containing wildcard characters (asterisks or plus signs). But this is only permitted when *keyword2* is also specified as a generic name.

System action

The utility ignores the command.

User response

If it is required that *keyword1* must be generic, ensure that *keyword2* is also specified with a generic name.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5552 E	COMMAND NOT EXECUTED. CIPHER VALUE '*value*' IS NOT IN THE VALID SET (*list*).

Explanation

The CIPHER attribute has been specified with an invalid value, *value*, which is not in the valid set of cipher values as indicated by *list*.

System action

The utility ignores the command.

User response

Ensure that you have defined a set of CIPHER values which are correct for this CICS address space.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5553 E	COMMAND NOT EXECUTED. *field* CANNOT START WITH A '*char*'.

Explanation

The named attribute field, *field*, starts with an invalid character, *char*. This is commonly caused by the field starting with an '*' which is not allowed.

System action

The utility ignores the command.

User response

Change the named attribute field to start with a permitted character.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5554 W	USE OF STATIC ATTRIBUTE *field1* FORCES *field2*.

Explanation

The Server URIMAP attribute field, *field1*, is within the set that returns a static response. This has forced the setting of *field2*. This is commonly caused by specifying MEDIATYPE, CHARACTERSET, HOSTCODEPAGE, TEMPLATENAME or HFSFILE with ANALYZER(YES) when ANALYZER(NO) is required.

System action

The utility continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5555 E	COMMAND NOT EXECUTED. THERE MUST BE AT LEAST ONE *attribute* SPECIFIED.

Explanation

At least one of the named attribute fields, *attribute*, must be specified for this resource.

System action

The utility ignores the command.

User response

Ensure that you have specified at least one of the required attributes.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5556 E	COMMAND NOT EXECUTED. *resource* NAMES BEGINNING WITH '*yyy*' ARE RESERVED AND CANNOT BE USED.

Explanation

CICS supplies standard programs and transactions whose names you should avoid. For this type of resource, however, you must not use reserved CICS names.

System action

The utility ignores the command.

User response

Rename the resource definition to an appropriate name.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5557 E	COMMAND NOT EXECUTED. '*xxxxxxx*' IS A RESERVED NAME

AND CANNOT BE USED AS A
resource **NAME.**

Explanation

Certain names are reserved and not allowed to be used as resource names.

System action

The utility ignores the command.

User response

Rename the resource definition to an appropriate name.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5558 W **A RANKING VALUE LESS THAN 10 FOR LIBRARY '*resource*' MEANS IT WILL APPEAR BEFORE DFHRPL IN THE SEARCH ORDER.**

Explanation

The ranking value of 10 is reserved for DFHRPL library. If you specify a ranking value less than 10 your LIBRARY *resource* will appear ahead of the DFHRPL in the library search order.

System action

The utility continues.

User response

Ensure that you definitely want this LIBRARY to appear before the DFHRPL in the library search order. Otherwise, define the LIBRARY *resource* with a RANKING value greater than 10.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5559 W **HOST CONFLICTS WITH IPADDRESS. HOST TAKES PRECEDENCE.**

Explanation

HOST is the preferred attribute for specifying IP addresses for TCPIPSERVICE. If both HOST and IPADDRESS are specified on your TCPIPSERVICE definition and they are different, the system takes the HOST value and ignores the IPADDRESS.

System action

The utility continues.

User response

Use HOST in preference to IPADDRESS or ensure that they are the same.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5560 E **COMMAND NOT EXECUTED.** *Port_attribute* **CONFLICTS WITH PORT NUMBER FOUND IN HOST ATTRIBUTE.**

Explanation

The HOST attribute contains a port number and a different, non-zero PORT attribute has also been specified on the definition of this client URIMAP.

System action

The utility ignores the command.

User response

Use PORT in preference to adding a port to HOST or ensure that they are the same value. PORT must be used to specify a port number for an IPV6 address.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5563 E *name* **IS IGNORED WHEN DEFINING MQMONITOR DFHMQINI.**

Explanation

An unsupported attribute has been specified when defining MQMONITOR DFHMQINI.

System action

The utility ignores the attribute.

User response

None.

DFH56nn messages

DFH5600 E   **UNABLE TO GET STORAGE FOR MODULE DFHCICS. PRIMARY CSD HAS NOT BEEN INITIALIZED.**

Explanation

There is insufficient storage to load module DFHCICS.

System action

Processing of the INITIALIZE command is terminated.

User response

Ensure that there is sufficient storage to load the DFHCICS module.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5601 E   **UNABLE TO LOAD THE *{FCT | RDT | LD}* TABLE NAMED *table*.**

Explanation

Table *table* cannot be loaded.

System action

The system action depends on the type of table.

LD

> DFHCSDUP cannot process the command. The utility attempts to:
>
> 1. Close any files previously opened internally.
> 2. Unload any EXTRACT exit routines that were dynamically loaded.
> 3. Invoke the termination exit routine, if supplied.
> 4. Return control to the invoker of the utility.

FCT or RDT

> The CSD utility cannot load the table, and terminates the processing of the utility command.

Module:
DFHCSDUP

Destination

SYSPRINT

User response

Refer to the preceding MVS message which should specify the reason for the failure.

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5602 E   **UNABLE TO UNLOAD THE *{FCT | RDT | LD}* TABLE NAMED *table*.**

Explanation

Table *table* cannot be unloaded.

System action

The system action depends on the type of table.

LD

> DFHCSDUP cannot process the command. The utility attempts to:
>
> 1. Close any files previously opened internally.
> 2. Unload any EXTRACT exit routines that were dynamically loaded.
> 3. Invoke the termination exit routine, if supplied.
> 4. Return control to the invoker of the utility.

FCT or RDT

> The CSD utility cannot unload the table, and terminates the processing of the utility command.

User response

Refer to the preceding MVS message which should specify the reason for the failure.

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library. The

LD is in the load library of the supplied pregenerated CICS system.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5603 E   **UNABLE TO LOCATE THE *{FCT | RDT | LD | DCT}* TABLE NAMED *table*.**

Explanation

Table *table* cannot be located.

System action

The system action depends on the type of table specified.

LD

> DFHCSDUP cannot process the command. The utility attempts to:
>
> 1. Close any files previously opened internally.
> 2. Unload any EXTRACT exit routines that were dynamically loaded.
> 3. Invoke the termination exit routine, if supplied.
> 4. Return control to the invoker of the utility.

Other tables

> The CSD utility cannot locate the table, and terminates the processing of the utility command.

User response

Determine the reason for the failure.

If your table assembly and link-editing is successful, the table should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5604 E   **UNABLE TO OBTAIN STORAGE FOR THE CROSS-REFERENCE TABLE NAMED *table*.**

Explanation

DFHCSDUP was unable to obtain storage for table *table*.

System action

DFHCSDUP cannot process the command.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response

Increase the region size and retry the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5605 E   **DISALLOWED CHARACTER IN GROUP OR LIST NAME *object*.**

Explanation

The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file. This is because the group or list name contains an invalid character.

System action

A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

User response

Use the CEDA transaction to define the resource with a valid name.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5606 S   **COMMAND IS NOT EXECUTED. UNABLE TO LOAD THE SERVICE MODULE *progname*.**

Explanation

The service module, *progname,* cannot be loaded due to insufficient storage.

System action

Utility command execution is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response

Retry the utility command with an increased region size.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5607 S   **COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE READING THE FIRST SECONDARY CSD RECORD.**

Explanation

An I/O error has occurred on the secondary CSD file.

System action

The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response

Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5608 S   **COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE READING A SECONDARY CSD RECORD.**

Explanation

An I/O error has occurred on the secondary CSD file.

System action

The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response

Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where errors have occurred because they will not print and are therefore easily identifiable.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5609 S   **COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE WRITING A PRIMARY CSD RECORD.**

Explanation

An I/O error has occurred on the primary CSD file.

System action

The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response

Retry the command, ensuring that a sufficiently large data set is specified for the output (primary) CSD file.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5611 E   **COMMAND NOT EXECUTED.** *parameter* **PARAMETER MUST BEGIN WITH 'DFH'.**

Explanation

In a CSD utility MIGRATE command, the specified parameter contained an invalid table name or group name.

System action

The utility does not process the command.

User response

Resubmit the MIGRATE command with a valid table name or group name.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5612 I   *resource object* **IN GROUP** *grpname* **IS UNCHANGED.**

Explanation

A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the resource definition in the target group.

System action

Normal utility processing continues.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5613 E   **UNABLE TO LOCATE THE LIBRARY MEMBER** *member*.

Explanation

The member is not in the libraries named in the JCL.

System action

The utility terminates processing of the command that required access to library member *member*.

User response

Ensure that the member is correctly link-edited into the library and resubmit the job.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5614 E   **UNABLE TO LOAD THE LIBRARY MEMBER** *member*.

Explanation

DFHCSDUP could not load library member *member*.

System action

The utility terminates processing of the command that required access to the library member.

User response

Ensure that the member is correctly link-edited into the library and resubmit the job.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5617 S   **COMMAND IS TERMINATED. AN UNRECOGNIZED TYPE OF RECORD WAS ENCOUNTERED WHILE SECONDARY CSD WAS BEING READ.**

Explanation

The record-type field of an input CSD record is invalid.

System action

The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response

Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where errors have occurred because they will not print and are therefore easily identifiable.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5618 I	AN ATTENTION INTERRUPT WAS REQUESTED DURING DFHCSDUP EXECUTION.

Explanation

An attention interrupt has been requested while DFHCSDUP is executing in a TSO environment.

System action

Normal utility processing continues.

Control is passed to a put-message exit if one has been specified on the extended entry linkage. Refer to the Developing system programs for CICS for more information about put-message exits.

User response

None.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5619 W	AN INVALID VALUE OF THE PAGESIZE PARAMETER HAS BEEN SPECIFIED. THE DEFAULT VALUE OF 60 LINES PER PAGE WILL BE USED.

Explanation

A value of the PAGESIZE parameter outside the allowed range (4-9999) has been specified.

System action

The default value of 60 lines per page is taken.

User response

Ensure that a valid PAGESIZE value is specified in future.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5620 E	AN ILLEGAL RETURN CODE (RC= *ret-code*) HAS BEEN RETURNED FROM THE *{INITIALIZATION	GET-COMMAND	TERMINATION}* EXIT.

Explanation

The specified user-exit routine has returned a disallowed return code.

System action

Processing of the utility command is terminated. The exit is not disabled.

User response

Investigate the specified exit routine for the cause of the illegal return code.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5621 E	A NON-ZERO RETURN CODE HAS BEEN RETURNED FROM THE PUT-MESSAGE EXIT.

Explanation

The put-message exit routine has returned a disallowed return code.

System action

Processing of the utility command is terminated and the put-message exit is disabled.

User response

Investigate the put-message exit routine for the cause of the illegal return code.

DFHCSDUP

DFH7xxx (DFHExP) command-level translator diagnostic messages

Diagnostic messages may be issued by the command-level translator (DFHEAP for assembler language, DFHECP for COBOL, DFHEDP for C, and DFHEPP for PL/I) in the course of processing programs written in assembler language, COBOL, C, or PL/I.

Assembler-language messages are inserted as macro notes (MNOTES) in the translator output file and can be seen by either printing or assembling the translator output file.

COBOL, C, and PL/I messages are delivered to SYSPRINT.

The same diagnostics are issued by the command-level interpreter, by the main terminal transaction (CEMT), and by CEDA.

A diagnostic message can have three components: a message number, a severity code, and message text. Each message is of the form DFH7*nnnI c line text* where

- *nnn* is a number,
- *I* is the information message identifier,
- *c* is the severity code
- *line* is the line number of the error and
- *text* is the text of the message.

In assembler language, COBOL, C, and PL/I, diagnostic messages can be allocated a severity code. This severity code is represented by a letter that, if present, will appear in the message immediately following the message number and preceding the message text. There are five levels of severity. Those for assembler language, C and PL/I are different from those for COBOL. The meanings of the codes and the associated return codes for the languages are as follows:

Assembler, C or PL/I	Return code	COBOL
U = Unrecoverable	16	D = Disaster
S = Severe	12	E = Error
E = Error	8	C = Conditional
W = Warning	4	W = Warning
I = Information	0	I = Information

The message text consists of the message itself, which may or may not include inserts. The inserts are positions within the message text where, in the actual message, specific information is given on the reasons for the diagnostic message. Not all the diagnostic messages, however, require inserts.

Messages issued by the command-level translator are usually self-explanatory, and DFH7000 is an example of this type of message.

DFH7000 I   LISTING FILE CANNOT BE OPENED

Explanation:
The listing data set was not opened.

System action:
The command-level translator is abnormally terminated. A dump is produced if a SYSABEND or SYSUDUMP DD statement has been provided.

User response:

Ensure the JCL is correct, or determine what is causing the error and preventing opening.

Module:
DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)

Destination

Console

DFH7002I U   **UNRECOVERABLE TRANSLATOR ERROR:-** *xxxxxxxx*. *xxxxxxxx* **TRANSLATION TERMINATED. CORRECTION OF SOURCE PROGRAM ERRORS MAY BYPASS THE PROBLEM.**

Explanation

An error has occurred and the translator is unable to recover and resume normal processing.

System action

The translator terminates its processing in an orderly fashion, by issuing this error message and closing all files which have been successfully opened. All messages issued by the translator during this execution should have been directed to the SYSPRINT dataset.

User response

This message may contain the inserted text -

```
      NOT ENOUGH MAIN STORAGE AVAILABLE
```

in which case the user should check that a REGION size of at least 2M (2048K) has been specified in the JCL EXEC statement for the translator job step.

Module:
DFHEIM01

Destination

SYSPRINT

DFH7003I U   **UNABLE TO OPEN** *xxxxxxxx* **FILE.** *xxxxxxxx* **TRANSLATION TERMINATED.**

Explanation

The translator has detected an error after opening the INPUT, PUNCH or LISTING file.

Usually this means that either the record format or the record length of the file is not supported by the translator.

The INPUT file, defined in the Job Control stream by a SYSIN DD statement, may contain fixed or variable length records but the record length must not be greater than 100.

The PUNCH file, defined in the Job Control stream by a SYSPUNCH DD statement, must contain fixed length records and the record length must not be greater than 80.

The LISTING file, defined in the Job Control stream by a SYSPRINT DD statement, can contain either fixed length or variable length records which must have a length in the range 121 through 256.

System action

The translator terminates processing.

User response

Check the record format and length of the file which caused the error. Recreate or change the file so that it meets the requirements of the translator.

Module:
DFHEIM15

Destination

SYSPRINT

DFH7004I W   **THE EXCI OPTION HAS BEEN SPECIFIED BUT CONFLICTS WITH THE CICS OPTION, OR ANOTHER OPTION THAT IMPLIES THE CICS OPTION. THE CICS OPTION HAS BEEN IGNORED.**

Explanation

The EXCI option of the translator has been specified, but it conflicts with another specified option such as the CICS option, or an option (for example, the SP option) which implies the CICS option.

The EXCI option implies that the program is to execute in a batch, non-CICS, environment,and therefore other options such as CICS and SP are in conflict.

System action

The translator ignores the CICS option. Any EXEC CICS LINK commands are interpreted as batch commands.

User response

If the program is intended to be a batch program, ensure that neither the CICS option, nor any other options which imply the CICS option, are specified to the translator.

If the program is intended to run as a CICS application, remove the EXCI option.

Module:
DFHEIM08

Destination

SYSPRINT

DFH7005I W   THE EXCI OPTION HAS BEEN SPECIFIED BUT CONFLICTS WITH THE DLI OPTION. THE DLI OPTION HAS BEEN IGNORED.

Explanation

Both the EXCI and DLI translator options have been specified, but these two options are mutually exclusive.

System action

The translator ignores the DLI option.

User response

If the program is intended to be a DLI program, remove the specification of the EXCI option. Otherwise remove the DLI option.

Module:
DFHEIM08

Destination

SYSPRINT

DFH7010I W   INVALID OPTION STRING:- '*INS#1*' IGNORED.

Explanation

The options specified contain either an option which is not recognised by the translator, or an option which is not valid for the language in which your program is written.

For example, in a COBOL program, the following options specification -

```
CBL XOPTS(CICS DCBS)
```

is invalid because DCBS does not represent a valid option. In this case DCBS should probably be DBCS which is a valid option.

Also for example, the following options specification -

```
CBL XOPTS(CICS GRAPHIC)
```

is invalid because the GRAPHIC option, although recognised by the translator, is only valid for PLI programs.

System action

The translator ignores the invalid option and continues processing.

User response

Refer to the Developing CICS Applications for information about options specification, and amend your options specifications accordingly.

Module:
DFHEIM06 DFHEIM08

Destination

SYSPRINT

DFH7011I W   INVALID *INS#1* SPECIFICATION IGNORED.

Explanation

An option which is specified with a value or values, is specified with a value which the translator cannot accept.

For example, in a COBOL program, the following options specification -

```
CBL XOPTS(CICS FLAG(X))
```

is invalid because the value specified for flag must be 'I', 'W', 'E' or 'S'

Also for example, the following options specification -

```
CBL XOPTS(CICS LC(256))
```

is invalid because the value associated with the LINECOUNT option must be in the range 1 thru 255.

When an option takes an integer value it must always be less than 256.

System action

The translator ignores the option and applies the default value or values.

User response

Refer to the Developing CICS Applications. for information about options specification, and amend your options specifications accordingly.

Module:
DFHEIM06 DFHEIM08

Destination

SYSPRINT

**DFH7012I W   CONFLICTING OPTIONS
                SPECIFIED. *xxxxxxxx* ASSUMED.**

Explanation

An option which is specified with a value, or values, is specified more than once, or an option is specified in both its positive and negative form, or mutually exclusive options are specified.

For example, in a COBOL program, the following options specification -

```
        CBL XOPTS(CICS FLAG(I) NOVBREF QUOTE
FLAG(S) VBREF APOST)
```

will generate three error messages.

FLAG(I) conflicts with FLAG(S), NOVBREF conflicts with VBREF, and QUOTE conflicts with APOST.

System action

The translator uses the last definition found for each option. In the above example therefore the options used are FLAG(S), VBREF and APOST. The translator then continues with its normal processing.

User response

Refer to the Developing CICS Applications for information about options specification, and amend your options specifications accordingly.

Module:
DFHEIM06 DFHEIM08

Destination

SYSPRINT

**DFH7013I W   RIGHT PARENTHESIS ASSUMED
                AFTER '*INS#1*'.**

Explanation

An option which is specified with a value, or values, is not delimited with a right parenthesis.

For example, in a COBOL program, in the following options specification

```
        CBL XOPTS(CICS FLAG(I NOVBREF QUOTE)
```

the value 'I' specified for the FLAG option should be followed by a right bracket.

System action

The translator assumes that a right bracket exists following the option specification and continues processing.

User response

Refer to the Developing CICS Applications for information about options specification, and amend your options specifications accordingly.

Module:
DFHEIM06 DFHEIM08

Destination

SYSPRINT

**DFH7014I W   ERROR IN *PROCESS CARD. TEXT
                AFTER SEMI-COLON IGNORED.**

Explanation

Text has been placed on a *PROCESS statement following the semi-colon which signifies the end of the statement.

This error should only occur in a program written in PLI.

System action

The translator ignores the misplaced text and continues processing. However, the misplaced text is placed in the translated program, and this will probably cause errors to be detected by the compiler.

User response

User action depends on the purpose of the misplaced text. Refer either to the Developing CICS Applications ,or the relevant programming language manual.

Module:
DFHEIM07

Destination

SYSPRINT

**DFH7015I W   ERROR IN *ASM STATEMENT.
                CONTINUATION IGNORED.**

Explanation

An *ASM statement contains a continuation character in column 72. The next line in the program is ignored

by the translator. This error should only occur in a program written in Assembler.

System action

The translator ignores the continuation line and continues processing. However both the *ASM statement and the continuation line are placed in the translated program.

User response

User action depends on the purpose of the continuation. Refer either to the Developing CICS Applications or the High Level Assembler Programmer's Guide.

Module:
DFHEIM07

Destination

SYSPRINT

DFH7016I W   **THE NATLANG OPTION HAS ALREADY BEEN SPECIFIED FOR THIS BATCH AND CANNOT BE ALTERED - CONFLICTING VALUE HAS BEEN IGNORED.**

Explanation

The batch facility of the COBOL translator is in use, but an attempt has been made to change the value of the NATLANG option.

System action

The translator ignores the NATLANG specification and continues to use the specification for NATLANG established at the start of this batch.

User response

Specify the NATLANG option only once either in the PARM statement of the JCL EXEC statement or in the CBL statement preceding the first program in the batch. If programs in this batch require different NATLANG options, split this batch into two or more separate batches specifying the appropriate NATLANG value for each batch.

Module:
DFHEIM06

Destination

SYSPRINT

DFH7017I W   **MESSAGES WERE ISSUED DURING OPTIONS PROCESSING - REFER TO TOP OF LISTING FOR FURTHER DETAILS.**

Explanation

This message indicates that one or more messages have been issued by the translator during options processing.

System action

None.

User response

Refer to the options error messages which have been placed at the top of the translator listing file following the list of options selected for this translation.

Take whatever action is appropriate depending on the messages found.

Module:
DFHEIM01

Destination

SYSPRINT

DFH7020I S   **END OF SOURCE TEXT ENCOUNTERED IN THE MIDDLE OF A LITERAL CONSTANT.**

Explanation

The translator has read the last line of text from the input program, but has detected that the program ends with an unfinished literal constant.

System action

The translator copies all text unchanged from the start of the last literal constant to the end of the program into the translated program. This would result in errors if the following compiler stage were executed.

User response

The cause of this error is almost certainly due to the programmer omitting to code the required delimiter at the end of a literal constant.

Locate and code the missing delimiter, and then rerun the translator.

Module:
DFHEIM01 DFHEIM15

Destination

SYSPRINT

DFH7021I W   **PROGRAM DOES NOT BEGIN WITH A PROCEDURE STATEMENT.**

Explanation

The translator has not located a correctly coded PROCEDURE or PROC statement at or near the beginning of a PLI program.

After checking for the existence of a *PROCESS statement at the start of the program, and allowing for the existence of one or more compiler directives such as %INCLUDE, the translator expects to locate a PROCEDURE or PROC statement. Various syntax checks are performed when the statement is located.

This message is issued if either the statement is not found, or a syntax error is found in the statement.

System action

The translator continues processing as normal, but it is probable that the following compile step would fail if allowed to execute.

When the main PROCEDURE statement cannot be located, the translator does not insert an EIB structure into the translated program, which would usually result in errors if the following compiler stage were executed.

User response

Ensure that a correctly coded PROCEDURE statement is coded near the beginning of the program.
Only a *PROCESS statement (if required) and compiler directives should be coded before the first PROCEDURE statement.

Module:
DFHEIM10

Destination

SYSPRINT

DFH7022I E   **SEMI-COLON INSERTED AT END OF INITIAL PROCEDURE STATEMENT.**

Explanation

The main PROCEDURE statement in a PLI program is not followed by a semi-colon.

System action

The translator inserts a semi-colon to delimit the PROCEDURE statement in the translated program, and then processing continues normally.

User response

Insert a semi-colon following the PROCEDURE statement to prevent the warning message being issued in a subsequent translation.

Module:
DFHEIM10

Destination

SYSPRINT

DFH7023I S   **END OF SOURCE TEXT ENCOUNTERED IN THE MIDDLE OF A COMMENT.**

Explanation

The translator has read the last line of text from the input program, but has detected that the program ends with an unfinished comment.

System action

The translator copies all text unchanged from the start of the last comment to the end of the program into the translated program. This would result in errors if the following compiler stage were executed.

User response

The cause of this error is almost certainly due to the programmer omitting to code the required delimiter at the end of a comment. Locate and code the missing delimiter, and then rerun the translator.

Module:
DFHEIM01 DFHEIM11 DFHEIM15

Destination

SYSPRINT

DFH7024I S   **END OF SOURCE TEXT ENCOUNTERED IN THE MIDDLE OF PSEUDO-TEXT.**

Explanation

The translator has read the last line of text from a COBOL program, but has detected that the program ends in the middle of pseudo text.

System action

The translator copies all text unchanged from the start of pseudo text to the end of the program into the translated program. This would result in errors if the following compiler stage were executed.

User response

The cause of this error is almost certainly due to the programmer omitting to code the required delimiter at the end of the pseudo text. Locate and code the missing delimiter, and then rerun the translator.

Module:
DFHEIM01 DFHEIM15

Destination

SYSPRINT

DFH7025I S   **A PERIOD SHOULD IMMEDIATELY FOLLOW THE PROGRAM NAME '*xxxxxxxx*'. THE END OF FILE WAS ENCOUNTERED BEFORE THIS PERIOD.**

Explanation

In an END PROGRAM statement in a COBOL program, the program name is not followed by a period, and the end of the source text is detected before a period is found.

System action

The translator copies the END PROGRAM statement into the translated program but this would result in errors if the following compiler step were executed.

User response

Delimit the END PROGRAM statement with a period and rerun the translation step.

Module:
DFHEIMSC

Destination

SYSPRINT

DFH7026I S   **A PERIOD SHOULD IMMEDIATELY FOLLOW THE PROGRAM NAME '*xxxxxxxx*'. INTERVENING TEXT HAS BEEN IGNORED.**

Explanation

In an END PROGRAM statement in a COBOL program, the program name is not immediately followed by a period.

System action

The translator copies the END PROGRAM statement into the translated program but this would result in errors if the following compiler step were executed.

User response

Edit the END PROGRAM statement, removing the text between the program name and the period, and rerun the translation step.

Module:
DFHEIMSC

Destination

SYSPRINT

DFH7027I W   **CHARACTER CONSTANT ASSUMED TERMINATED AT RIGHT MARGIN**

Explanation

In a C or C++ program a character constant (a string delimited by single quotes) is neither delimited with a quote nor continued to the next line.

System action

The translator copies the character constant into the translated program assuming that the constant is correctly terminated on this line. This would probably cause compiler error messages to be issued if the compilation were allowed to proceed.

User response

Edit the character constant, either terminating the constant with a single quote or continuing the constant to the next line. Then rerun the translation.

Module:
DFHEIM11

Destination

SYSPRINT

DFH7028I W   **STRING CONSTANT ASSUMED TERMINATED AT RIGHT MARGIN**

Explanation

In a C or C++ program a string constant (a string delimited by double quotes) is neither delimited with a double quote nor continued to the next line.

System action

The translator copies the string constant into the translated program assuming that the constant is correctly terminated on this line. This would probably cause compiler error messages to be issued if the compilation were allowed to proceed.

User response

Edit the character constant, either terminating the constant with a double quote or continuing the constant to the next line. Then rerun the translation.

Module:
DFHEIM11

Module:
DFHEIM11

Destination

SYSPRINT

DFH7030I W   **LITERAL WAS BEING CONTINUED WHEN COMMENT ENCOUNTERED. COMMENT IGNORED.**

Explanation

In a COBOL program, a literal is being continued to the next line but the next line is a comment.

System action

The translator removes the comment indication and terminates the literal However it is likely that the comment or the literal continuation has has been discarded by the translator.

User response

Correct the program, either by correctly terminating the literal or correctly continuing the literal on to the next line. Then rerun the translator.

Module:
DFHEIM14

Destination

SYSPRINT

DFH7031I W   **EXEC COMMAND WAS BEING CONTINUED WHEN COMMENT ENCOUNTERED. COMMENT IGNORED.**

Explanation

In a COBOL program, a comment has been imbedded in an EXEC CICS statement.

System action

The translator ignores the comment and it is not copied into the translated program. However the EXEC CICS statement is processed in the normal way.

User response

Either remove the comment or move the comment so that it precedes or follows the EXEC CICS statement.
DFHEIM14

Module:

Destination

SYSPRINT

DFH7032I E   **QUOTE ASSUMED BEFORE '*xxxxxxxx*'. NON-NUMERIC LITERAL WAS BEING CONTINUED.**

Explanation

In a COBOL program, a non-numeric literal is being continued but the first significant character in area B of the continuation line is not a quotation symbol.

System action

The translator inserts a suitable quotation symbol into the required position in the translated program.

User response

Edit the program by inserting an appropriate quotation symbol in the literal continuation line.

Module:
DFHEIM14

Destination

SYSPRINT

DFH7033I E	**CONTINUATION IGNORED. A NON-NUMERIC LITERAL CAN ONLY CONTINUE AN INCOMPLETE NON-NUMERIC LITERAL.**

Explanation

In a COBOL program, a non-numeric literal is being continued but the previous line does not contain an incomplete non-numeric literal.

System action

The translator removes the continuation indicator from the translated program. However it is probable that a compilation error will occur.

User response

Edit the program by coding a correct literal continuation, or removing the incorrect text.

Module:
DFHEIM14

Destination

SYSPRINT

DFH7034I E	**CONTINUATION ASSUMED. A NON-NUMERIC LITERAL WAS BEING CONTINUED.**

Explanation

In a COBOL program, a non-numeric literal is being continued but a continuation character has not been coded in the continuation line.

System action

The translator inserts a continuation indicator into the translated program.

User response

Edit the program by coding an appropriate continuation character.

Module:
DFHEIM14

Destination

SYSPRINT

DFH7035I E	**CONTINUATION AND TWO QUOTES ASSUMED. A NON-NUMERIC LITERAL WAS BEING CONTINUED.**

Explanation

In a COBOL program, a non-numeric literal is being continued but the next line is not a valid continuation.

System action

The translator inserts a continuation indicator and two quotation marks into the translated program which provides a valid continuation of the literal and then immediately ends the literal. Although this action ensures that the literal is syntactically correct, it is possible that if any text follows the literal it will not be a valid COBOL statement.

User response

Edit the program by coding an appropriate continuation character and quotation marks, or by preventing the continuation.

Module:
DFHEIM14

Destination

SYSPRINT

DFH7036I W	**PROGRAM DOES NOT BEGIN WITH AN IDENTIFICATION DIVISION.**

Explanation

A COBOL program does not contain an IDENTIFICATION DIVISION statement.

System action

This prevents the translator from inserting temporary variables and an EIB structure into the program's DATA DIVISION. However EXEC CICS commands and builtin in functions such as DFHVALUE and DFHRESP will be processed as usual.

User response

If the code being translated is a copybook, the translation may in fact be successful and this warning message can be ignored.

However, if the code being translated constitutes a complete program, it will be necessary to edit the program inserting an appropriate IDENTIFICATION DIVISION statement.

Module:
DFHEIM07 DFHEIM10

Destination

SYSPRINT

DFH7037I E   INVALID CHARACTER IN CONTINUATION COLUMN. CONTINUATION ASSUMED.

Explanation

In a COBOL program, a non-numeric literal is being continued but an invalid continuation character has been coded in the continuation line.

System action

The translator replaces the invalid continuation indicator with a valid continuation character in the translated program.

User response

Edit the program by coding an appropriate continuation character.

Module:
DFHEIM14

Destination

SYSPRINT

DFH7038I W   *xxxxxxxx* SEQUENCE ERRORS IN SOURCE PROGRAM.

Explanation

In a COBOL program, the SEQ translator option has been specified and one or more statements are out of sequence.

System action

In the listing file, each out of sequence statement is prefixed with two asterisks. The message contains the count of out of sequence statements. Otherwise the translator processes the program in the usual way.

User response

The message can be prevented by editing the file so that statement numbers are in sequence, or by setting all sequence fields to blanks, or by specifying the translator option 'NOSEQ'.

However no action is absolutely necessary, since this message is only a warning, and does not prevent a successful translation.

Module:
DFHEIMEE

Destination

SYSPRINT

DFH7039I S   PROGRAM DOES NOT CONTAIN A PROCEDURE DIVISION.

Explanation

This message is issued when the translator finds an IDENTIFICATION DIVISION as the last or only COBOL statement in a program.

System action

The translation is terminated.

User response

It is necessary to edit the program inserting an appropriate PROCEDURE DIVISION and then rerun the translation step.

Module:
DFHEIM10

Destination

SYSPRINT

DFH7040I W   EXEC COMMAND SHOULD BE TERMINATED BY 'END-EXEC'.

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7041I W   NO END CARD FOUND - COPYBOOK ASSUMED.

Explanation

An assembler program does not contain an END statement.

System action

The translator assumes that the program is in fact a copybook, and consequently does not insert invocations of the macros DFHEIRET, DFHEISTG and DFHEIEND at the end of the translated code.

User response

Possibly no action is required in response to this message, but the user should be aware that it is may be necessary to specify the options NOPROLOG and NOEPILOG when translating a copybook.

Module:
DFHEIMSA

Destination

SYSPRINT

DFH7042I S   *xxxxxxxx* IS PERMITTED ONLY IN AMODE(64). COMMAND NOT TRANSLATED.

Explanation

A command is specified that is permitted only in an AMODE(64) program.

System action

The command is rejected by the translator.

User response

Ensure that a SYSSTATE macro has been coded with the AMODE64=YES option or use the 31-bit variant of the command.

Module:
DFHEIMS2

Destination

SYSPRINT

DFH7045I S   AT LEAST ONE OF 'ADDRESS', 'METADATA' OR 'REFPARMS' MUST BE SPECIFIED. COMMAND NOT TRANSLATED.

Explanation

An EXEC CICS WSAEPR CREATE command has been specified without at least one of the required options listed in this message.

System action

The command is rejected and not translated.

User response

Refer to the CICS Application development reference for more information about the usage of this command, and then edit the program to insert one or more of the required options in the WSAEPR command.

Module:

Destination

SYSPRINT

DFH7046I S   'EXIT' OR 'EXITALL' OR 'STOP' OR 'TASKSTART' OR 'SHUTDOWN' OR 'FORMATEDF' OR 'SPI' OR 'PURGEABLE' OPTION MUST BE SPECIFIED. COMMAND NOT TRANSLATED.

Explanation

An EXEC CICS DISABLE PROGRAM command has been specified without at least one of the required options listed in this message.

System action

The command is rejected and not translated.

User response

Refer to the CICS Application development reference for more information about the usage of this command, and then edit the program to insert one or more options in the DISABLE command.

Module:
DFHEIMS2

Destination

SYSPRINT

DFH7047I S   **'INTO' OR 'SET' OR 'RTRANSID' OR 'RTERMID' OR 'QUEUE' OPTION MUST BE SPECIFIED. COMMAND NOT TRANSLATED.**

Explanation

An EXEC CICS RETRIEVE command has been specified without at least one of the required options listed in this message.

System action

The command is rejected and not translated.

User response

Refer to the CICS Application development reference for information about the usage of this command, and then edit the program to insert one or more options in the RETRIEVE command.

Module:
DFHEIMS2

Destination

SYSPRINT

DFH7048I E   **'*xxxxxxxx*' IS NOT VALID AND IS IGNORED.**

Explanation

In an assembler program, an EXEC CICS command contains text which cannot be processed as an option.

For example, if the following were coded -

```
        EXEC CICS DELAY INTERVAL 500
```

instead of -

```
        EXEC CICS DELAY INTERVAL(500)
```

this message would be generated.

System action

The command is rejected and not translated.

User response

Refer to the CICS Application development reference for more information on the rules for coding EXEC CICS commands. Ensure that self-defining terms used as arguments, such as numeric literals used in the example above, are enclosed in parentheses.

It is likely that an error of this nature will produce additional error messages. Check if the same command has generated more than one error message, in which case one of the other messages may give a more specific indication of what is actually wrong.

DFH7049I W   **'*xxxxxxxx*' IS AN OBSOLETE OPTION. '*xxxxxxxx*' IS ASSUMED.**

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7050I S   ***xxxxxxxx* FUNCTION NOT COMPLETELY SPECIFIED. *xxxxxxxx* MUST BE SPECIFIED. COMMAND NOT TRANSLATED.**

Explanation

This CICS command requires a qualifier without which the translator is unable to determine the specific command.

For example, if the following were coded -

```
        EXEC CICS ISSUE CONVID(MYCONV)
```

instead of -

```
        EXEC CICS ISSUE PREPARE CONVID(MYCONV)
```

this message would be generated.

System action

The command is rejected and not translated.

User response

The message contains a list of all the possible qualifiers which may be specified in this command.

Refer to the CICS Application development reference for more information about the coding of the command. Edit the command ensuring that an appropriate qualifier is specified.

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7053I E **OPTION '***xxxxxxxx***' IS NOT VALID AND IS IGNORED.**

Explanation

An EXEC CICS command specification contains text which does not represent a valid option.

System action

The text is rejected and subsequently ignored, but the translator continues to process the command otherwise in the normal way.

User response

Refer to the CICS Application development reference for more information about the coding of the command. Edit the command ensuring that the incorrect text is removed or replaced with a valid option.

Module:
DFHEIMKW DFHEIMS2

Destination

SYSPRINT

DFH7054I S *xxxxxxxx* **COMMAND IS NOT SUPPORTED AND IS NOT TRANSLATED.**

Explanation

A C, C++, or AMODE(64) assembler program contains a PUSH, POP, HANDLE or IGNORE command. None of these EXEC CICS commands are supported for these languages, with the exception of HANDLE ABEND with the PROGRAM option.

System action

The command is rejected and not translated.

User response

In C, C++, and AMODE(64) assembler programs, use the RESP, RESP2 and NOHANDLE options to manage condition handling.

Refer to the Developing CICS Applications for information on dealing with exceptional conditions.

Module:
DFHEIMS2

Destination

SYSPRINT

DFH7055I S *xxxxxxxx* **OPTION IS INCOMPLETE. COMMAND NOT TRANSLATED.**

Explanation:

xxxxxxxx OPTION IS IGNORED.

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7057I W   DUPLICATE SPECIFICATION FOR
xxxxxxxx OPTION IS IGNORED.

Explanation

The same option has been specified more than once in an EXEC CICS command.

System action

The duplicate specification is ignored and the translator continues normal processing of the command. The message contains the name of the option.

User response

Remove the duplicate specification and rerun the translator.

Module:
DFHEIMXS

Destination

SYSPRINT

DFH7058I E   '_xxxxxxxx_' ASSUMED AFTER
'_xxxxxxxx_'.

Explanation

An EXEC CICS command is not correctly delimited. For C, C++ and PLI programs this means that a semicolon does not follow the last option specified. For

COBOL programs this message means that END-EXEC does not follow the last option specified. This message should never occur for assembler programs.

System action

Since the delimiter is missing, it is difficult for the translator to establish that the command specification is complete. Consequently subsequent text in the program is treated as possible options and arguments. The translator decides that a delimiter must be missing either when it locates the next delimiter or when it finds text which cannot be a keyword, whichever happens first.

If another EXEC CICS command immediately follows the command without a delimiter the two commands are treated as one command. This may lead to a large number of error messages being generated.

User response

Edit the program and insert the missing delimiter.

Module:
DFHEIMAN

Destination

SYSPRINT

DFH7059I S   _xxxxxxxx_ COMMAND IS NOT VALID
AND IS NOT TRANSLATED.

Explanation

An EXEC CICS command is not known to the translator.

System action

The command is rejected and not translated.

User response

This error might occur because of a simple typographical error.

This error might occur because a translator option has not been specified. For example, if a program contains an EXEC DLI command, the DLI translator option must be specified; otherwise, DLI commands are 'not known' to the translator. Establish why the command is not known. See CICS Application development reference and Developing CICS Applications.

This error might occur because the command tables referenced by the translator, which are pointed to by the TABLE translator option, do not match the level of the translator itself. Ensure that the matching

command tables are in the STEPLIB for the translate step.

Module:
DFHEIMAN

Destination

SYSPRINT

DFH7060I E   **INCORRECT SPECIFICATION FOR** *xxxxxxxx* **VALUE :- '***xxxxxxxx***'. OPTION IGNORED.**

Explanation

An argument consists of a self-defining term which is either not of the correct datatype for that option or is outside of the range of permitted values. For example, this message would result from the following commands -

```
    EXEC CICS DELAY INTERVAL('TIME')
    EXEC CICS START TRANSID(MYTRAN)
TIME(250000)
```

System action

The option with the incorrect argument is rejected, but the translator continues processing the command.

User response

Establish why the argument is incorrect by reference to the CICS Application development reference.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7061I E   **RIGHT PARENTHESIS ASSUMED BEFORE '***xxxxxxxx***'.**

Explanation

A right hand bracket has been omitted either in an EXEC CICS command or when using one of the translator builtin functions DFHRESP or DFHVALUE.

System action

The translator makes an assumption about the correct position of the missing right hand bracket. The assumed position is likely to be the wrong position however, which in turn is likely to produce incorrect results at runtime or possibly cause a compilation error.

For example in the following statement in a PLI program -

```
    EXEC CICS SEND TEXT FROM(MYTEXT FREEKB
ERASE;
```

the translator assumes that the position of the missing right hand bracket is immediately before the semicolon which delimits the command. This results in the options FREEKB and ERASE becoming part of the argument of the FROM option.

In the following example -

```
    STATUS = DFHVALUE(CONNECTED ;
```

the translator's assumption about the position of the missing bracket is correct, and in this case the builtin function is correctly processed.

User response

Establish the correct position of the missing bracket and edit the program accordingly.

Module:

Destination

SYSPRINT

DFH7062I S   **INCORRECT SYNTAX FOR EXEC COMMAND. COMMAND NOT TRANSLATED.**

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7063I E   **IMPLEMENTATION RESTRICTION: MORE THAN** *xxxxxxxx* **OPTIONS IN ONE COMMAND.** *xxxxxxxx* **OPTION IGNORED.**

Explanation

An EXEC CICS command contains too many options with arguments. The number of options with arguments allowed is, for most commands, kept within the allowed maximum by the command definition.

However certain commands such as the HANDLE and IGNORE commands allow more options than the maximum allowed on each command instance.

System action

When the maximum number of options is reached, this number usually being 16, the remaining options specified are rejected. In other words the command together with the first 16 options specified is accepted.

User response

If the problem occurs on a HANDLE or IGNORE command, spread the options over two or more commands. However if a program is trying to deal with a large number of conditions, this may be accomplished more easily by using the RESP and NOHANDLE options.

Module:
DFHEIMS2 DFHEIMS3

Module:
DFHEIM??

Destination

SYSPRINT

DFH7067I W	**'***xxxxxxxx***' IS NOT VALID. '***xxxxxxxx***' ASSUMED.**

Explanation

A command or option has been mispelt in an EXEC CICS statement. The translator executes an algorithm which compares the mispelt verb or option with valid option spellings and, in most cases, manages to select the option intended by the user.

In some cases, the translator may select an unintended command or option. For example, in the mispelt command -

```
    EXEC CICS SENT SYSTEM GMMTEXT('hello
world')
```

SENT is assumed to be SEND, whereas the user clearly intended to code SET.

System action

The translator substitutes the mispelt command or option with an assumed command or option.

This will probably cause the translator to detect further errors, and issue additional messages.

User response

Edit the program and correct the spelling of the mispelt command or option. Then rerun the translation step.

Destination

SYSPRINT

DFH7076I S **USE OF 'SYSID' OPTION IMPLIES 'LENGTH' OPTION MUST BE SPECIFIED. COMMAND NOT TRANSLATED.**

Explanation

When the SYSID option is specified in a C or C++ program in a command which reads from or writes to a file, temporary storage queue or transient data queue, the LENGTH option must be specified when either the FROM or INTO options are specified.

System action

The command is rejected and not translated.

User response

Refer to the Developing CICS Applications, if necessary, for more information about the usage

of this command, and then edit the program by specifying a LENGTH option.

Module:
DFHEIMS2

Destination

SYSPRINT

DFH7077I E **'*xxxxxxxx*' IS NOT A VALID LANGUAGE DEFINITION TABLE.**

Explanation

The translator has loaded a language definition table into storage, but the table does not appear to be valid. The translator checks the address held in a certain pointer in the table, and also checks an 'eyecatcher' value. If either of these contain unexpected values, the translator considers the table to be corrupted, and issues this message.

System action

The table is flagged as unusable by the translator, and it will not allow the use of any commands or builtin functions defined in this table.

User response

Refer the problem to your installation's CICS systems programming personnel.

Module:
DFHEIM06

Destination

SYSPRINT

DFH7078I I **LITERAL BEGINNING *xxxxxxxx* CONTAINS A *xxxxxxxx*. A QUOTE MAY BE MISSING.**

Explanation

A PLI program contains a literal which has a length exceeding 40 characters and a semicolon character has been found in the literal which may indicate that a quote symbol is missing and should have been coded before the semicolon.

System action

The translator cannot make any assumption about the extent of any literal because a literal may legitimately contain any characters including delimiters such as parentheses and semicolons. Therefore the translator

continues to scan the program until a quote symbol is found.

User response

This is only an informational message and does not necessarily indicate that the program is incorrectly coded.

Module:

                    '***keyword***'. EXCESS ARGUMENTS
                    IGNORED.**

Explanation

In an EXEC CICS command, an option has been coded
with too many arguments.

Currently most options which carry an argument only
allow a single argument. The text of this message
allows for the possibility that an option may carry
multiple arguments (or a sub-operand list).

The current meaning of this message for nearly all
options which carry an argument is that more than one
argument has been coded.

System action

The first argument is processed but the remaining
argument(s) are ignored. Otherwise the command is
processed in the normal way.

User response

Remove the excess arguments and repeat the translation step.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7201I S   **TOO FEW ARGUMENTS FOR '*keyword*'. COMMAND NOT TRANSLATED.**

Explanation

In an EXEC CICS command, an option has been defined with too few arguments.

Currently most options which carry an argument only allow a single argument. The text of this message allows for the possibility that an option may carry multiple arguments (or a sub-operand list), and that a minumum number of arguments must be specified. This message therefore should rarely, if ever, occur in the current implementations of CICS.

System action

The complete command is rejected.

User response

Insert the additional arguments required and repeat the translation step.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7202I S   **INCORRECT SYNTAX IN ARGUMENT LIST FOR '*keyword*'.**

SYSPRINT

DFH7204I S   **'*keyword*' KEYWORD REQUIRES *option* SUB-OPERAND(S). STATEMENT NOT TRANSLATED.**

Explanation

In an EXEC CICS command, an option has been defined without any arguments, but requires at least one argument.

Currently most options which require an argument only allow a single argument. The text of this message allows for the possibility that an option may carry multiple arguments (or a sub-operand list).

System action

The complete command is rejected.

User response

Insert the additional argument(s) required and repeat the translation step.

Module:
DFHEIMKW, DFHEIMS2

Destination

SYSPRINT

DFH7205I U   **INSUFFICIENT STORAGE FOR TRANSLATOR. REASON *reason*.**

Explanation

This message indicates that the translator has insufficient working storage with which to translate an EXEC CICS command.

System action

The command is rejected and not translated.

User response

The most likely reason for this error is that the REGION size specified in the JCL EXEC statement for this

translation is too small. Ensure a REGION size of least 2M is specified.

If this is not the reason for the error, refer the problem to your installation's CICS systems programming facility.

Module:
DFHEIMAB, DFHEIMG1, DFHEIMKW, DFHEIMS2, DFHEIMGM

Destination

SYSPRINT

DFH7206I E   **UNABLE TO APPLY DEFAULT FOR KEYWORD '*keyword*'.**

Explanation

The translator is unable to supply a default argument in an EXEC CICS command. The message usually occurs when either the FROM option is omitted from a SEND MAP command or the INTO option is omitted from a RECEIVE MAP command.

When the argument of the MAP option is a literal, i.e. self-defining, argument, the translator is able to generate the required FROM or INTO argument from the MAP argument.

However when the MAP argument is a data reference, i.e. the name of a variable which contains the MAP name, the translator cannot default the FROM or INTO argument and issues this message.

System action

The option in error is ignored, but the translator continues to process the command.

User response

Edit the program inserting an appropriate specification of the FROM or INTO option.

Module:
DFHEIMS2

Destination

SYSPRINT

DFH7207I W   **'*type command*' ENCOUNTERED BUT NO TRANSLATOR OPTION FOR PROCESSING COMMAND. COMMAND IGNORED.**

Explanation

The translator has located a potential CICS command, but 'EXEC' or 'EXECUTE' is not followed either by 'CICS' or by some other text, such as 'DLI', which indicates that this is a CICS command.

The translator refers to words such as 'EXEC', 'CICS' and 'DLI' as 'triggers' since they cause the invocation of the translator's command processing routines.

When a trigger is not known to the translator, this message is issued.

System action

The command is ignored and not translated.

User response

Ensure that the required triggers have been coded in the command.

Module:
DFHEIMTG

Destination

SYSPRINT

DFH7208I U   **IMPLEMENTATION RESTRICTION. STATEMENT TOO LONG.**

Explanation

The translator has encountered a program statement which has been continued over a large number of lines in the program. The translator attempts to read the whole statement into a buffer. This buffer is of a considerable size however, and a program statement would normally have to occupy more than 400 lines before this error occurred.

System action

The translator terminates processing after issuing this message.

User response

The error may have occurred due to a syntax error such as a missing quotation mark. Check any other messages which have been issued during this translation. Correcting other errors may also correct this error.

If the program statement is syntactically correct, it will be necessary to split the statement into two or more statements in order to avoid the buffer size restriction imposed by the translator. It is possible that

the compiler for which ever language is in use will also impose a similar restriction.

Module:
DFHEIM14

Destination

SYSPRINT

DFH7209I E   **A BLANK IS ASSUMED BETWEEN '*option1*' AND '*option2*'.**

Explanation

The translator has encountered an incorrect option in an EXEC CICS command, but has established that inserting a blank results in a correct option specification.

For example in the following incorrect command -

```
        EXEC CICS SEND MAP(MYMAP) FROM(MYMAPO)
FREEKBERASE
```

the translator assumes a blank between 'FREEKB' and 'ERASE'.

System action

The translator continues to process the command after insertion of the blank. It is possible however there will still be errors in the command specification.

User response

Review the statement specification and insert the missing blank if this is the correct action.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7210I U   **MODULE '*modname*' NOT FOUND. PLEASE CHECK LIBRARIES.**

Explanation

The translator has attempted to load a component, such as a language definition table, but the component was not found in any of the libraries specified for use in this execution of the translator.

System action

The translator attempts to continue processing. If the missing component is a language definition table, none

of the commands specified in that table can be used in this execution of the translator. It is probable therefore that the translation will be unsuccessful.

User response

Review the Job Control statements used for the translation. If you are using a procedure provided by your installation CICS systems programming facility, refer the problem to them.

If you have constructed your own job stream, ensure that a JOBLIB or STEPLIB statement references a library which contains the missing component specified in this message.

Module:
DFHEIM15

Destination

SYSPRINT

SYSPRINT

DFH7212I E   **'*option*' CONFLICTS WITH OTHER KEYWORDS SPECIFIED ON STATEMENT.**

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7213I E   **SUB-OPERAND '*option*' OF '*keyword*' KEYWORD SHOULD BE A LITERAL.**

Explanation

An argument must be coded as a literal and must be of an appropriate data type, depending on whether the option carries a character or arithmetic argument.

System action

In its current implementation, the translator should never issue this message since all arguments are allowed to be data references. There are no arguments which can only be literal, i.e. self-defining, terms.

User response

Refer the problem to your installation CICS systems programming facility.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7214I E   **'*option*' INVALID. REASON CODE = *reasoncode*.**

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7215I W   **SUB-OPERAND '*option*' OF '*keyword*' KEYWORD SHOULD BE DATATYPE CHARACTER.**

Explanation

An argument has been coded as a literal value, i.e. self-defining term, but the literal is either a numeric term or a length reference instead of the expected character constant.

For example the following incorrect statement would cause this message to be issued -

```
EXEC CICS SEND MAP(1234567)
```

System action

The argument is accepted even though this will result in errors occurring at either compile time or run time.

User response

Code a literal of the required type, if necessary with reference to the CICS Application development reference.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7216I W   **SUB-OPERAND '*option*' OF '*keyword*' KEYWORD SHOULD BE DATATYPE ARITHMETIC.**

Explanation

An argument has been coded as a literal value, i.e. self-defining term, but the literal is a character constant instead of the expected arithmetic term.

For example the following incorrect command would cause this message to be issued -

```
EXEC CICS DELAY INTERVAL('TIME')
```

System action

The argument is accepted at this point in the processing. However the argument will be subsequently rejected with message 7060.

User response

Code a literal of the required type, if necessary with reference to CICS Application development reference.

In the example above, if 'TIME' is intended to be a data reference, i.e. a reference to a variable named 'TIME', then remove the enclosing quotes.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7217I S   **FIRST SUB-OPERAND OF '*option*' CANNOT BE NULL. COMMAND NOT TRANSLATED.**

Explanation

An argument has been coded as a null argument. With only a few exceptions, null arguments are not excepted as a valid argument.

For example, the following statement contains null arguments which would be rejected by the translator -

```
        EXEC CICS SEND TEXT FROM(       )
LENGTH()
```

System action

The complete command is rejected.

User response

Code an argument of the required type, if necessary with reference to the CICS Application development reference.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7218I S　　**SUB-OPERAND(S) OF '*option*' CANNOT BE NULL. COMMAND NOT TRANSLATED.**

Explanation

In this EXEC CICS command, an option may be defined with a list of arguments, i.e. more than one sub-operand, but none of the items specified are allowed to be null arguments.

This message is issued when one or more arguments other than the first argument in the list are null arguments. Currently most options which carry an argument only allow a single argument. The text of this message allows for the possibility that an option may carry multiple arguments (or a sub-operand list).

Consequently, in the current implementation of CICS this message should rarely, if ever, be issued.

System action

The complete statement is rejected.

User response

Ensure that all arguments are non-null for the option given in the message text.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7219I E　　**'*option1*' MUST BE PRECEDED BY: '*option2*' IS ASSUMED.**

Explanation

In the EXEC DLI command syntax, there are some options defined as 'second' options. This means that when a 'second' option is coded in an EXEC DLI statement, it must be preceded by an associated 'first' option. These second options are 'PCB', PARENT', UNIQUE', 'NEXT' and 'CHECKPOINT'.

System action

The translator assumes the existence of the required preceding option. For example if 'PCB' is found without a preceding 'USING', the 'USING' option is assumed.

User response

Ensure that the required 'first' option is coded preceding the 'second' option. step.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7220I E　　**MULTIPLE OCCURRENCE OF '*keyword*' KEYWORD IS IGNORED.**

Explanation

In an EXEC CICS command, an option which carries an argument has been specified more than once.

System action

The translator processes the first instance of the option specification and ignores all additional instances.

In the following example -

```
        EXEC CICS SEND TEXT FROM(TEXT1)
LENGTH(80) FROM(TEXT2)
```

the translator takes FROM(TEXT1) as the FROM specification and ignores FROM(TEXT2).

User response

Decide which instance of the option specification is required and delete all other instances.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7221I U   **IMPLEMENTATION RESTRICTION -
TABLE TOO COMPLEX.** *data*.

Explanation

This message may be issued following message 7119,
but should only occur when either an extremely large
number of options have been specified on an EXEC
DLI statement, or the REGION size specified for the
execution of the translator is too small.

It is expected that this message would never be
issued.

System action

The translator rejects the complete command.

User response

This problem might be caused by a syntax error such
as a missing quotation mark. Check through other
messages issued by the translator. Solving another
error in the program might also resolve this problem.
Ensure that an appropriate REGION size has been
specified in your JCL procedure.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7222I E   **SUB-OPERAND LIST FOLLOWING
'*keyword*' KEYWORD SHOULD NOT
BE PRESENT AND IS IGNORED.**

Explanation

An option has been coded with an argument in an
EXEC CICS command, but the option does not carry
an argument.

System action

The argument is ignored and the translator continues
processing the statement.

For example, in the following statement -

```
        EXEC CICS SEND TEXT FROM(MYTEXT)
 LENGTH(80) ERASE(SCREEN)
```

the argument 'SCREEN' following the ERASE option is
ignored.

User response

Delete the incorrect argument specification.

Module:
DFHEIMKW

'*option*'.**

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7224I E   **NO *option1* IN '*option2*' OPERAND.
OPERAND IGNORED.**

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7225I W   **SUB-OPERAND '*option*' OF
'*keyword*' KEYWORD IS TOO LONG
AND IS TRUNCATED.**

Explanation

A character literal has been coded as an argument in
an EXEC command but the literal exceeds the length
specified for the argument.

System action

The argument is truncated by removing characters
from the rightmost end of the character string.

For example, in the following statement -

```
        EXEC CICS SEND MAP('HUURSLEY')
```

since map names must be seven characters in length,
the character string 'HUURSLEY' is truncated to
'HUURSLE'. The translator continues processing the
statement using this truncated map name.

User response

It's probable that the truncated value is not the intended value, and will cause a runtime error.

Refer to the Developing CICS Applications to determine the correct length required for this argument. Then recode the literal with the correct length.

Module:
DFHEIMKW, DFHEIMS1

Destination

SYSPRINT

DFH7226I S	**SUB-OPERAND '*option*' OF '*keyword*' KEYWORD SHOULD BE A DATA REFERENCE NOT AN EXPRESSION OR A CONSTANT. COMMAND NOT TRANSLATED.**

Explanation

An argument has been defined as a literal, i.e. a self-defining term, but a data reference type argument is required for this option.

System action

The command is rejected and not translated.

User response

An example of this error is -

```
     EXEC CICS SEND MAP('MYMAP  ')
FROM('Hello')
```

where the FROM option must be a data reference.

The above command should be correctly coded as -

```
     EXEC CICS SEND MAP('MYMAP  ')
FROM(MYMAPO)
```

Module:
DFHEIMKW, DFHEIMS1, DFHEIMS2

Destination

SYSPRINT

DFH7227I E	**INVALID SYNTAX FOR *option*. REASON GIVEN IN OTHER MESSAGE(S).**

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7228I E	**SUB-OPERAND '*option*' OF '*keyword*' KEYWORD SHOULD BE AN IDENTIFIER.**

Explanation

This error is only likely to occur in an EXEC DLI statement, when a field name is incorrectly coded in a WHERE statement.

The following example would cause this message to be issued -

```
     WHERE(1GNORANCE = 'BLISS')
```

because the field name '1GNORANCE' starts with a numeric character.

System action

The incorrect field name is accepted by the translator, although this will probably cause the compilation of the translated program to fail.

User response

Edit the field name so that it begins with an alphabetic character, and rerun the translator step.

Module:
DFHEIMS1

Destination

SYSPRINT

DFH7229I S	**'*option1*' REQUIRED BUT NOT SPECIFIED FOR *option2*. COMMAND NOT TRANSLATED.**

Explanation

A mandatory option has been omitted from an EXEC CICS command, and the translator cannot make a default specification.

System action

The command is rejected and not translated.

User response

An example of this error is -

```
        EXEC CICS SEND TEXT ERASE
```

where the FROM option is omitted but is mandatory.

Code an appropriate specification of the missing option, and then execute the translation step again.

Module:
DFHEIMXK

Destination

SYSPRINT

DFH7230I E	**'*option1*' CONFLICTS WITH '*option2*' AND HAS BEEN IGNORED.**

Explanation

Mutually exclusive options have been specified in an EXEC CICS command.

System action

The option which appears first in the EXEC CICS command is accepted and the other option is ignored. The translator then continues normal processing of the command.

User response

An example of this error is -

```
      EXEC CICS SEND PAGE RELEASE RETAIN
```

Here the translator accepts the RELEASE option but ignores the RETAIN option. Decide which of the mutually exclusive options is required in the command and then remove the conflicting option specification.

Module:
DFHEIMXK

Destination

SYSPRINT

DFH7231I E	**'*option1*' IS NOT VALID FOR *option2* AND IS IGNORED.**

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7232I S	**'*option1*' MUST SPECIFY A LENGTH FOR '*option2*'.**

Explanation

A mandatory option which specifies a length has been omitted in an EXEC CICS command and the translator is unable to supply a default specification of the option.

System action

The CICS API contains many options which supply lengths. These options usually provide the length of a variable length character argument supplied with another option in that command.

For example, in the EXEC CICS WRITEQ TS command the LENGTH option specifies the length of the FROM argument.

The translator is usually aware of this association between options and is able to default the length specification. However when the associated argument is a data reference, the ability of the translator to default the length argument depends on the programming language of the user program.

When the language is C or C++, the translator issues this message and rejects the complete command. The 'C' languages provide the 'sizeof' function, but this cannot be used with all data types supported by those languages.

User response

Code an appropriate length specification in the EXEC CICS command, and then rerun the translation step.

Module:
DFHEIMAB DFHEIMXS

Destination

SYSPRINT

DFH7233I E	**'*argument*' IS INVALID IN THIS POSITION. KEYWORD IGNORED.**

Explanation

The specification of *argument* is incorrect in this context.

System action

The keyword in error is ignored by the translator.

User response

Code an appropriate keyword argument in the EXEC CICS command, and then rerun the translation step.

Module:
DFHEIMG1, DFHEIMG2, DFHEIMG3, DFHEIMG4, DFHEIMG5, DFHEIMXS

Destination

SYSPRINT

DFH7234I S	UNABLE TO APPLY DEFAULT FOR KEYWORD 'FROMLENGTH'.

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7235I E	MORE THAN *number* OCCURRENCES OF *option*. EXCESS IGNORED.

Explanation

The SEGMENT option has been coded more than 15 times in an EXEC DLI command.

System action

The excess instances of the SEGMENT option are rejected. The translator continues to process the command.

User response

This error might result from a missing quotation mark or some other syntactic error.

If the command is intended to contain more than 15 segments, refer to the relevant IMS manuals for further information.

Module:
DFHEIMG1

Destination

SYSPRINT

DFH7236I S	UNABLE TO APPLY DEFAULT FOR KEYWORD 'LENGTH'.

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7237I S	INCORRECT SYNTAX AFTER '*command option*'. COMMAND NOT TRANSLATED.

Explanation

Following triggers such as 'EXEC' and 'CICS', the translator has found text which is syntactically incorrect. The translator is expecting either another 'trigger', or a command specification.

System action

The complete command is rejected and not translated.

User response

This error might be a typographical error, as in this example

```
EXEC CICS 1NQUIRE PROGRAM('MYPROGGY')
```

where INQUIRE has been keyed with '1' instead of 'I'.

The translator expects to find an 'identifier' in this position. An identifier must begin with an alphabetic character, and the remaining characters must be either alphabetic or numeric. The text must not be coded as a literal, i.e. enclosed in quotation marks.

Module:
DFHEIMAN

Destination

SYSPRINT

DFH7238I S	'*type*' COMMANDS ARE NOT ALLOWED IN PROGRAMS WRITTEN IN *language*. COMMAND IGNORED.

Explanation

An EXEC CICS command is not supported in the language in which this program is written.

System action

The complete command is rejected and not translated.

User response

In the current implementation of CICS, this restriction applies only to the GDS commands, which are not allowed in either COBOL or PLI programs.

The GDS commands may be coded in Assembler, C and C++ programs.

Module:
DFHEIMSA, DFHEIMSC, DFHEIMSD, DFHEIMSP

Destination

SYSPRINT

DFH7239I W **THE CSA OPTION IS NO LONGER SUPPORTED. THE CSA ADDRESS RETURNED BY CICS WILL BE INVALID AND SHOULD NOT BE USED.**

Explanation

An EXEC CICS ADDRESS command specifies the CSA option.

System action

The CSA option is accepted by the translator. However when the program executes, the CSA address returned will be invalid unless the level of the CICS system executing the program is CICS/ESA 3.1.1 or an earlier version of CICS.

User response

The translator accepts the option in order to provide downward compatibility, i.e. to allow the latest level of the translator to process programs intended to execute both at the current and earlier release levels of CICS.

The user is responsible for any incorrect processing which results from the use of this option when used in CICS systems at a level later than CICS/ESA 3.1.1.

Module:
DFHEIMS2

Destination

SYSPRINT

DFH7250I S **'*unit*' OPTION REQUIRED BUT NOT SPECIFIED.**

Explanation

An EXEC CICS command contains an 'AT', 'AFTER', 'FOR' or 'UNTIL' option, but does not contain

the required specification of any of the 'HOURS', 'MINUTES' or 'SECONDS' options.

System action

The command is rejected and not translated.

User response

Refer to the Developing CICS Applications for a full description of the command syntax, and make suitable changes in the application program.

Module:
DFHEIMS2

Destination

SYSPRINT

DFH7251I E **THERE ARE MORE FIELDLENGTH OPERANDS THAN COMPARISON OPERATORS IN THE CORRESPONDING WHERE CLAUSE. EXCESS IGNORED.**

Explanation

In an EXEC DLI command, a FIELDLENGTH option includes more expressions than the number of qualification statements in the preceding WHERE option.

The following statement would cause this error - EXEC DLI GU SEGMENT(PATIENT) WHERE(PATNO>PATNO1 AND NAME=PATN) FIELDLENGTH(3,4,8)

System action

The excess length or lengths are ignored.

The translator matches qualification statements and lengths reading from left to right. In the example above, the length of 8 cannot be matched and is ignored.

User response

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

Module:
DFHEIMS1

Destination

SYSPRINT

DFH7252I E **MAXIMUM NUMBER OF BOOLEANS REACHED FOR '*option*'**

**BUT EXCESS TEXT ENCOUNTERED.
'*text*' IGNORED.**

Explanation

In an EXEC DLI command, a WHERE option contains too many Boolean (or logical) operators, such as 'AND' and 'OR'. The translator sets a limit of 11 Boolean operators in each WHERE option, which allows 12 qualification statements to be connected.

System action

The remaining text in the WHERE option is ignored.

User response

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

Module:
DFHEIMS1

Destination

SYSPRINT

DFH7253I E	**MISSING QUALIFICATION STATEMENT IN '*option*' OPERAND. OPERAND IGNORED.**

Explanation

In an EXEC DLI command, a WHERE option ends with a Boolean operator.

Boolean operators must be followed by a qualification statement. The following example would cause this message to be issued -

```
        WHERE(DOCTOR = 'SPOCK' OR DOCTOR = 'NO
 ' AND)
```

because 'AND' is not followed by a qualification statement.

System action

The Boolean operator at the end of the WHERE argument is ignored.

User response

Either remove the Boolean operator or code an appropriate qualification statement after the operator.

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

Module:
DFHEIMS1

Destination

SYSPRINT

DFH7254I E	**MISSING COMPARISON OPERATOR IN '*option*' OPERAND. OPERAND IGNORED.**

Explanation

In an EXEC DLI command, a WHERE option contains a qualification statement which has no comparison operator.

The following example would cause this message to be issued -

```
        WHERE(DOCTOR 'SPOCK' OR DOCTOR = 'NO   ')
```

because there is no comparison operator between 'DOCTOR' and 'SPOCK'.

System action

The incorrect qualification statement and the Boolean operator which follows it are ignored. In the example above, the WHERE option would be reduced to -

```
        WHERE(DOCTOR = 'NO   ')
```

User response

Insert an appropriate comparison operator in the incorrect qualification statement.

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

Module:
DFHEIMS1

Destination

SYSPRINT

DFH7255I E	**ARGUMENT TO '*keyword*' KEYWORD CONTAINS NO COMPARISON OPERATORS. KEYWORD IGNORED.**

Explanation

In an EXEC DLI statement, a WHERE option contains only a single operand and no other text.

The following example would cause this message to be issued -

```
WHERE(DOCTOR)
```

because the field name 'DOCTOR' is not followed by either a comparison operator or a value.

System action

The entire WHERE option is ignored.

User response

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

Module:
DFHEIMS1

Destination

SYSPRINT

DFH7256I S   **SPECIFICATION OF '*function*' IS INCOMPLETE AND IS NOT TRANSLATED.**

Explanation

A program statement references a translator builtin function such as DFHRESP or DFHVALUE, but the function reference is not followed by a left bracket.

System action

The builtin function specification cannot be translated.

User response

DFHRESP or DFHVALUE must be followed by, respectively, a condition name or a CVDA name, and this name must be enclosed in parentheses.

Refer to the CICS Application development reference for a description of the usage of the translator builtin functions.

Module:
DFHEIM11

Destination

SYSPRINT

DFH7257I S   **'*function*' IS NOT RECOGNISED AND IS NOT TRANSLATED.**

Explanation

A program statement references a translator builtin function such as DFHRESP or DFHVALUE, but the function reference is not followed by a condition name or CVDA name which is known to the translator.

System action

The builtin function specification cannot be translated.

User response

Refer to the CICS Application development reference for details of valid conditions and CVDAs.

If an EXEC CICS command might raise a condition, a list of the relevant conditions and their meanings in the context of this command is given in each command description.

If an EXEC CICS command contains options whose arguments can be expressed or interpreted using CVDAs, the command description specifies which CVDAs are valid for each option.

Module:
DFHEIM11

Destination

SYSPRINT

DFH7258I S   **'*option1*' IS NOT VALID AS AN ARGUMENT TO '*option2*' AND IS NOT TRANSLATED.**

Explanation

A program statement references a translator builtin function such as DFHRESP or DFHVALUE, but the function reference is not followed by text in the form of an identifier. A valid identifier is a string of text in which the first character is alphabetic and the remaining characters are either alphabetic or numeric. The string must not be enclosed in quotes.

System action

The builtin function specification cannot be translated.

User response

This error would be caused by the following statement -

```
IF MYRESP = DFHRESP('INVREQ') ....
```

because the argument of DFHRESP is coded as a literal, and also in the following statement -

```
        IF STATUS = DFHVALUE(228) ........
```

because the argument of DFHVALUE is an arithmetic value.

Refer to the CICS Application development reference for details of how to make use of the DFHRESP and DFHVALUE builtin translator functions.

Module:
DFHEIM11

Destination

SYSPRINT

DFH7259I S   **OPERAND '*INS#1*' OF KEYWORD '*INS#2*' IS INVALID FOR COBOL. A DATA-AREA RATHER THAN A DATA-VALUE MUST BE SPECIFIED. COMMAND NOT TRANSLATED.**

Explanation

In a COBOL program, an argument is coded as a data value but it must be coded as a data reference.

When arguments are coded as data values, i.e. literals or self-defining terms, in a COBOL program, such arguments are passed 'by content' in the 'Call' statement generated by the translator.

This error occurs when the data is of a type which cannot be passed 'by content', and is only likely to occur when the data type is pointer.

System action

The EXEC CICS command is rejected and not translated.

User response

This error would be caused be the following statement -

```
    EXEC CICS FREEMAIN DATAPOINTER(54560)
END-EXEC.
```

where the argument of the DATAPOINTER option must be a data reference, i.e. a reference to a variable in the program, and not a data value. It's unlikely that this statement would succeed anyway, since addresses of GETMAINed storage cannot be known at compilation time.

Module:

DFHEIMAC

Destination

SYSPRINT

DFH7260I S   **ERROR WHEN PROCESSING DECLARATIVES SECTION. END OF FILE FOUND BEFORE END DECLARATIVES.**

Explanation

In a COBOL program, the translator has found a DECLARATIVES section but has not found a subsequent END-DECLARATIVES statement.

System action

Any EXEC CICS commands which follow the DECLARATIVES statement are neither recognised nor translated.

User response

An END-DECLARATIVES statement should be coded in an appropriate position in the program.

Note that there are restrictions on the use of declaratives when used in CICS applications written in COBOL. For details refer to the Developing CICS Applications

Module:
DFHEIM10

Destination

SYSPRINT

DFH7261 W   **''*ins#1*'' IS NO LONGER SUPPORTED BUT HAS BEEN TRANSLATED.**

Explanation

An obsolete option has been specified in an EXEC CICS statement.

System action

The obsolete option has been accepted by the translator and processed in the same way as in the earlier releases of CICS which fully supported this option. However at runtime the specification of this option is ignored.

User response

The translator accepts the option in order to provide downward compatibility, i.e. to allow the latest level of the translator to process programs intended to execute both at the current and earlier release levels of CICS.

The user is responsible for any unexpected results which may occur due to the removal of execution time support for this option when used in CICS systems in which the option is obsolete.

If the translated program is not intended to execute at earlier levels of CICS, the obsolete option specification should be removed so that unnecessary warning messages are no longer issued by the translator.

Module:
DFHEIMKW

Destination

SYSPRINT

DFH7262I S	TRANSLATOR OPTION '*INS#1*' REQUIRED BUT NOT SPECIFIED. COMMAND NOT TRANSLATED.

Explanation

An EXEC CICS command is recognised by the translator, but is not allowed unless a certain translator option is specified.

For example , the program contains an EXEC CICS INQUIRE command but the translator option 'SP' has not been specified.

System action

The EXEC CICS command is rejected and not translated.

User response

Specify the option given as part of the message. If necessary, refer to the Developing CICS Applications for information about how to specify translator options.

Module:
DFHEIMSA, DFHEIMSC, DFHEIMSD, DFHEIMSP

Destination

SYSPRINT

DFH7263I W	SHIFT-IN CODE ENCOUNTERED WHILE SCANNING SINGLE BYTE

CHARACTERS. A SHIFT-OUT CODE MAY BE MISSING.

Explanation

The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is a PLI program and the GRAPHIC option is in effect.

A shift out character (with hexadecimal code X'0F') has been found in SBCS data.

System action

The incorrect data is copied into the translated program, and this would most probably cause a compiler warning or error.

User response

If the translated output is compiled, carefully check all messages in the compiler listing.

However the safest action is to establish the reason for the unexpected shift out character, change the program in an appropriate way, and rerun the translation step.

Module:
DFHEIM11

Destination

SYSPRINT

DFH7264I W	SHIFT-OUT CODE ENCOUNTERED WHILE SCANNING DOUBLE BYTE CHARACTERS. A SHIFT-IN CODE MAY BE MISSING.

Explanation

The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect.

A shift in character (with hexadecimal code X'0E') has been found in DBCS data.

System action

The incorrect data is copied into the translated program, and this would most probably cause a compiler warning or error.

User response

If the translated output is compiled, carefully check all messages in the compiler listing.

However the safest action is to establish the reason for the unexpected shift in character, change the program in an appropriate way, and rerun the translation step.

Module:
DFHEIM11

Destination

SYSPRINT

DFH7265I E	CHARACTER AT RIGHT MARGIN IMMEDIATELY FOLLOWS A SHIFT-IN CODE. A BLANK IS ASSUMED.

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7266I E	A DBCS CHARACTER CANNOT BEGIN AT THE RIGHT MARGIN. A BLANK IS ASSUMED.

Explanation:

System action:

User response:

Module:

Destination

SYSPRINT

DFH7267I W	END OF FILE ENCOUNTERED WHILE SCANNING DOUBLE BYTE CHARACTERS. A SHIFT-IN CODE MAY BE MISSING.

Explanation

The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect.

The translator has reached the end of the source program but is still in 'DBCS mode'.

System action

The incorrect data is copied into the translated program, and this would most probably cause a compiler warning or error.

User response

A DBCS data string has not been terminated with a shift out character (hexadecial code x'0F').

Insert the missing shift out character, and rerun the translation step.

Module:
DFHEIM01, DFHEIM15

Destination

SYSPRINT

DFH7268I S	RIGHT MARGIN ENCOUNTERED WHILE SCANNING DOUBLE BYTE CHARACTERS. A SHIFT-IN CODE MAY BE MISSING.

Explanation

The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect.

When this message is issued, the translator is scanning a DBCS string and has reached the right hand margin of a line, but has not found a shift in character. Both compilers require shift in and shift out characters to be coded as 'matching pairs' on each program line where they are used.

System action

Because there are only one or two characters between the last (or only) shift out character and the right margin, there is insufficient space for a DBCS string. The translator removes both the shift out character, and the one or two characters following the shift out, from the data copied into the translated program.

User response

Although the translated program is syntactically correct, the data string is probably incorrect for the application's purposes.

Examine the incorrect data and make appropriate changes to the program and rerun the translation step.

Refer to the relevant Programming Language Reference manual for rules regarding the coding of DBCS strings.

Module:
DFHEIM14

Destination

SYSPRINT

DFH7269I S	**RIGHT MARGIN ENCOUNTERED WHILE SCANNING DOUBLE BYTE CHARACTERS. A SHIFT-IN CODE IS ASSUMED.**

Explanation

The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect, or because this is a C or C++ program.

When this message is issued, the translator is scanning a DBCS string and has reached the right hand margin of a line, but has not found a shift in character. The compilers require each DBCS string to be contained on a single line within the program.

System action

For programs written in COBOL and PLI, the translator substitutes either the last or the penultimate character in the line with a shift in character, ensuring that an even number of characters are positioned between the shift out and shift in.

In the following examples, < represents shift out, > represents shift in and '.' represents x'42'. If a line ends with the following data characters -

```
<.A.B.C.D
```

the translator converts the string to -

```
<.A.B.C>D
```

If a line ends with following data characters -

```
<.E.F.G.
```

the translator converts the string to -

```
<.E.F.G>
```

For programs written in the C languages, the translator assumes the existence of a shift in character at the right margin, but copies the incorrect data string into the translated program.

User response

Although the translated program may be syntactically correct, the data string is probably incorrect for the application's purposes.

Examine the incorrect data and make appropriate changes to the program and rerun the translation step.

Module:
DFHEIM11, DFHEIM14

Destination

SYSPRINT

DFH7270I S	**FOLLOWING A SHIFT-OUT CODE AN ODD NUMBER OF BYTES WERE ENCOUNTERED BEFORE A SHIFT-IN CODE. THE SHIFT-IN CODE HAS BEEN MOVED.**

Explanation

The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect.

When this message is issued, the translator is scanning a DBCS string and has found an odd number of characters between the shift out and shift in characters delimiting this string.

System action

The translator moves the shift in character so that it trades places with the character immediately preceding the shift in character.

In the following example, '<' represents shift out, '>' represents shift in and '.' represents x'42'.

If a line contains the following DBCS string -

```
<.A.B.C.>
```

the translator converts the string to -

```
<.A.B.C>.
```

in the translated program.

User response

Although the DBCS string is now syntactically correct, the data string is probably incorrect for the application's purposes.

The SBCS data following the DBCS data may also be incorrect because of the translator's action.

Examine the incorrect data and make appropriate changes to the program and rerun the translation step.

Module:
DFHEIM14

Destination

SYSPRINT

DFH7271I E	THE DATA FOLLOWING '*option*' IS NOT CONSIDERED TO BE PART OF THE FIELD NAME AND IS IGNORED. PERHAPS THE FIELD NAME SHOULD BE ENCLOSED IN QUOTES.

Explanation

In an EXEC DLI statement, a field name in a WHERE clause has been mispelt or is followed by incorrect data.

The following example would cause this message to be issued -

```
        WHERE(DOCTO% = 'SPOCK')
```

where a '%' has been coded instead of an alphameric character.

System action

The translator discards the incorrect text and continues processing the command.

User response

Edit the source program to change or remove the incorrect data in or following the field name.

Module:
DFHEIMS1

Destination

SYSPRINT

DFH7272I E	A FIELD VALUE SHOULD BE FOLLOWED BY A BOOLEAN OPERATOR OR A RIGHT PARENTHESIS. '*option*' IS IGNORED.

Explanation

In an EXEC DLI statement, a Boolean operator has been omitted or mispelt in a WHERE option.

The following example would cause this message to be issued -

```
        WHERE(DOCTOR = 'SPOCK' OF DOCTOR = 'NO
')
```

where the user has coded 'OF' instead of 'OR'.

System action

The translator is unable to diagnose this error until it finds a non- alphabetic character following the mispelt or missing Boolean operator. The next non-alphabetic character will usually be the comparison operator in the next qualification statement.

The effect of this is that the translator misinterprets the value field which starts immediately before the missing or mispelt Boolean operator, and rejects the qualification statement following the mispelt or missing Boolean operator.

User response

Insert or correctly code an appropriate Boolean operator.

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

Module:
DFHEIMS1

Destination

SYSPRINT

DFH7273I W	A SHIFT-IN CODE WAS FOUND IN THE SECOND BYTE OF A DBCS CHARACTER. THE SHIFT-IN HAS BEEN ACCEPTED.

Explanation

The translator is validating DBCS data in a C or C++ program. When this message is issued, the translator is scanning a DBCS string and has found an odd number of characters between the shift out and shift in characters delimiting this string.

System action

The translator moves the data unchanged into the translated program.

User response

Examine the incorrect data and make appropriate changes to the program and rerun the translation step.

Module:
DFHEIM14

Destination

SYSPRINT

DFH7274I W   AN INVALID DBCS CHARACTER HAS BEEN FOUND - IT IS ACCEPTED.

Explanation

The translator is validating DBCS data in a C or C++ program. When this message is issued, the translator is scanning a DBCS string and has found an invalid DBCS character.

A valid DBCS character must either contain the value X'4040', or each byte must contain a value in the range X'41' thru X'FE' inclusive.

System action

The translator moves the data unchanged into the translated program.

User response

Examine the incorrect data and make appropriate changes to the program and rerun the translation step.

Module:
DFHEIM11

Destination

SYSPRINT

DFH7275I S   THE FIGURATIVE CONSTANT VALUE *constant* IS NOT COMPATIBLE WITH THE DATA TYPE 'PACKED INTEGER' WHICH IS REQUIRED FOR THE ARGUMENT OF KEYWORD *keyword*.

Explanation

In a COBOL program, a figurative constant has been coded as the argument for an option which takes a binary data value.

However the translator only accepts the ZERO figurative constant (or the ZEROS and ZEROES equivalents) for binary arguments.

System action

The translator rejects the command.

User response

Replace the figurative constant with an argument of the correct data type.

Module:
DFHEIMAC

Destination

SYSPRINT

DFH7276I S   THE FIGURATIVE CONSTANT VALUE *constant* IS NOT COMPATIBLE WITH THE DATA TYPE 'BINARY INTEGER' WHICH IS REQUIRED FOR THE ARGUMENT OF KEYWORD *keyword*.

Explanation

In a COBOL program, a figurative constant has been coded as the argument for an option which takes a packed decimal data value.

However the translator only accepts the ZERO figurative constant (or the ZEROS and ZEROES equivalents) for packed decimal arguments.

System action

The translator rejects the command.

User response

Replace the figurative constant with an argument of the correct data type.

Module:
DFHEIMAC

Destination

SYSPRINT

DFH7277I S   EXEC COMMAND IS LOCATED IN A CLASS-ID PROCEDURE DIVISION. THE COMMAND IS NOT TRANSLATED.

Explanation

In a COBOL program, an EXEC CICS command has been placed in the PROCEDURE DIVISION of a class.

The COBOL compiler does not allow executable code in a class. In an object-oriented COBOL program, EXEC CICS commands must be placed in the PROCEDURE DIVISION of a method.

System action

The translator rejects the command.

User response

Refer to the COBOL manuals for further guidance.

Module:
DFHEIMSC

Destination

SYSPRINT

DFH7278I W   **EXEC COMMAND SHOULD NOT BEGIN IN AREA A. IT WAS PROCESSED AS IF FOUND IN AREA B.**

Explanation

In a COBOL program, an EXEC CICS command has been placed in Area A, that is it starts before column 12.

The translator converts EXEC CICS commands into a COBOL CALL statement and one or more MOVE statements, all of which should be coded in Area B.

System action

The translator normally generates statements so that they begin in the same column as the respective EXEC CICS command. However, when this error occurs, the translator places the generated CALL and MOVE statements in Area B, that is, beginning in column 12.

User response

Put the EXEC command in Area B.

Module:
DFHEIMSC

Destination

SYSPRINT

DFH7279I E   **A QUOTE OR AN APOSTROPHE WAS USED AS A CHARACTER STRING DELIMITER. IT WAS NOT THE DELIMITER OPTION IN EFFECT. ITS USE WAS NOT ACCEPTED.**

Explanation

The character used as the character string delimiter conflicts with the delimiter option in effect and has been rejected.

System action

The command is rejected and not translated.

User response

Correct the character string delimiter and run the translation step again.

Module:
DFHECMAC

Destination

SYSPRINT

DFH7280I E   **A MANDATORY KEYWORD HAS BEEN OMITTED FROM AN EXEC CICS INQUIRE COMMAND. THE MISSING KEYWORD IS *keyword*.**

Explanation

A mandatory keyword has been omitted from an EXEC CICS INQUIRE command and the translator cannot select a default value.

System action

The command is rejected and not translated.

User response

Code all the mandatory keywords on the EXEC CICS INQUIRE command and run the translation step again.

2. *time*
3. *applid*
4. *consname*

Destination

CSMT and Terminal End User

DFHAC2016   *date time applid* **Transaction** *tranid* **cannot run because program** *programname* **is not available.**

Explanation

Transaction *tranid* is not executable because the initial program for transaction *tranid* is not available. Possible reasons for this are:

1. The program is missing.
2. The installed program definition is missing.
3. The program is disabled.

4. The program name in the installed transaction definition is invalid.

5. The installed transaction has been defined as remote and therefore has no program name, but the name of the remote system is the same as that of the local system.

6. The program requires a JVM to run but JVM initialization failed.

7. The autoinstall program abended while attempting to load the program.

8. The program requires a JVM server to run but the JVM server is not available.

Note that destination CSMT is used for non-terminal transactions only.

System action

Other processing continues.

User response

Determine the cause of the error using the list given in the **Explanation**. The response depends on the reason as follows:

1. Load the program into the CICS program library.

2. Create an installed program definition for the program.

3. Enable the program.

4. Use a valid program name in the installed transaction definition.

5. Carry out whichever of the following is appropriate:

   • Use a local version of this transaction.
   • Use the correct remote version of this transaction.
   • Logon to the correct system and retry the transaction.

6. For JVM programs check the CSMT log for further information as to why JVM initialization failed.

7. Check the job output for further information as to why the autoinstall program abended.

4. *tranid*

Destination

CSMT and Terminal End User

DFHAC2023   *time applid* **An invalid sync point level has been requested by node *netname*.**

Explanation

The synchronization level requested in the attach header is invalid for the session being used.

System action

The attach request is rejected.

User response

Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified. The value of the synchronization level in the attach header and the bind should be compared.

Module:
DFHACP

Destination

Terminal End User

DFHAC2024   *date time applid* **A request from node *netname* has invalid security parameters.**

Explanation

The received attach header did not match the required security parameters specified in the bind.

Note that destination CSMT is used for non-terminal transactions only.

System action

The attach request is rejected.

User response

Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified. The value of the ACC requirements in the attach header and the bind should be compared.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

Destination

CSMT

DFHAC2025   *time applid* **An invalid Unit of Work Identification (UOWID) has been supplied by node *netname*.**

Explanation

The received attach header contained an invalid unit of work ID (UOWID). Either the format was wrong, or no UOWID was received when the sync point level required it. This error may also be raised if no conversation correlator is supplied when it is needed.

System action

The attach request is rejected.

User response

Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified. The value of the UOWID/conversation correlator and the sync point level in the attach header should be compared.

Module:
DFHACP

Destination

Terminal End User

DFHAC2026   *time applid* **An invalid Function Management Header (FMH) has been supplied by node** *netname*.

Explanation

The length field in the attach header was invalid.

System action

The attach request is rejected.

User response

Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified.

Module:
DFHACP

Destination

Terminal End User

DFHAC2027   *date time applid* **Transaction** *tranid* **does not support conversation restart.**

Explanation

CICS will not accept LU type 6.2 attach headers with restart requested.

Note that destination CSMT is used for non-terminal transactions only.

System action

The attach request is rejected.

User response

Notify the system programmer. The subsystem that sent the attach header should be inspected to determine why restart was requested.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

Terminal End User and CSMT

DFHAC2028   *date time applid* **Transaction** *tranid* **cannot be used and has been ignored.**

Explanation

The transaction code CSAC or CESC, was entered from a terminal. This is not allowed.

System action

If the transaction is CSAC, the transaction is run with no effect. If the transaction is CESC, the transaction is abnormally terminated with abend code ATOA.

User response

Ensure that these transactions are not entered from a terminal.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

Terminal End User and CSMT

DFHAC2029   *date time applid* **Transaction** *tranid* **is not executable. The system specified by the dynamic routing program is unavailable.**

Explanation

Transaction *tranid* is specified as remote AND dynamic. An attempt to dynamically route transaction *tranid* to the remote system specified by the dynamic routing program has failed because the link is out of service.

This message is also issued if the connection definition for the remote system specified by the dynamic routing program has QUEUELIMIT and MAXQTIME specified and a queued allocate has been rejected.

Note that destination CSMT is used for non-terminal transactions only.

System action

CICS continues.

User response

Wait until the link becomes available, then try to dynamically route the transaction again.

If QUEUELIMIT and MAXQTIME are specified and this message occurs frequently then see the Intersystem Session Queue Management section in the Intercommunication Guide.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

Terminal End User and CSMT

DFHAC2030	*date time applid* **All sessions are busy. Please try again.**

Explanation

Transaction *tranid* is specified as remote AND dynamic. An attempt to dynamically route transaction *tranid* to the remote system specified by the dynamic routing program has failed because no sessions are immediately available.

Note that destination CSMT is used for non-terminal transactions only.

System action

CICS continues.

User response

Wait until a session becomes available, then try to dynamically route the transaction again.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CSMT and Terminal End User

DFHAC2031	*date time applid* **Automatic signon of operator of console *consname* has failed.**

Explanation

The console operator at the console named *consname* has directed a MODIFY command to the CICS region, and the console was defined with USERID(*FIRST) or USERID(*EVERY). When CICS tried to signon the operator automatically, the signon was rejected.

System action

The MODIFY command from the console is ignored.

User response

Contact the system programmer to give the userid in use at the console (which is identified in other messages on the log), the correct access to this console using RACF (or an equivalent External Security manager).

Module:
DFHACP, DFHZATA2

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *consname*

Destination

CSML and Terminal End User

DFHAC2032   *date time applid* **CICS autoinstall for console *consname* has failed.**

Explanation

The console operator at the console named *consname* has directed a MODIFY command to the CICS region, but no terminal definition for that console is installed in the region, and an autoinstall for it has failed.

System action

The MODIFY command from the console is ignored.

User response

Notify the system programmer, who should investigate the failure by looking for abends and messages on the log of the CICS system. For information on implementing autoinstall for MVS consoles see the Defining resources.

Module:
DFHACP, DFHZATA2

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *consname*

Destination

CSML

DFHAC2033   *time applid* **You are not authorized to use transaction *tranid*. Check that the transaction name is correct.**

Explanation

Either an operator has attempted to execute transaction *tranid* while not authorized, or another transaction attempted to start transaction *tranid*, which was not authorized for this terminal.

System action

Other processing continues. Message DFHAC2003 is sent to CSMT.

User response

Either determine why the operator was trying to execute transaction *tranid* or enter an authorized transaction identifier.

Module:
DFHACP

Destination

Terminal End User

DFHAC2034   *time applid* **CICS Logic Error. An invalid error code has been passed to DFHACP. Transaction: *tranid* Terminal: *termid*.**

Explanation

An invalid error code has been passed to DFHACP.

System action

Transaction *tranid* is terminated with a transaction dump. The dump code is AACA. Message DFHAC2035 is sent to the CSMT.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHACP

Destination

Terminal End User

DFHAC2035   *date time applid* **An invalid error code has been passed to DFHACP. Transaction *tranid* is terminated. Terminal *termid*.**

Explanation

An invalid error code has been passed to DFHACP.

System action

Transaction *tranid* is terminated with a transaction dump. A transaction dump is taken. The dump code is AACA. Message DFHAC2034 is sent to the terminal user.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHACP

4. *tranid*
5. *termid*

Destination

CSMT

DFHAC2036   *date time applid* **Transaction** *tranid* **has failed with abend AKCC. Resource backout was successful.**

Explanation

Transaction tranid has abended AKCC.

System action

The transaction (task) is purged.

User response

Resubmit the transaction later.

Module:
DFHTFP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CSMT

DFHAC2037   *date time applid* **Transaction** *tranid* **is not executable on terminal** *termid***.**

Explanation

A conflict has been detected between the options specified for transaction *tranid*'s definition and those specified on terminal *termid*'s DFHTCT table entry. For example, transaction *tranid* is reserved for the use of VTAM terminals but the input came from a non-VTAM terminal.

System action

The input is ignored.

User response

If transaction *tranid* is to be entered from terminal *termid*, ensure that the installed transaction definition value of DVSUPRT is compatible with the DFHTCT entry.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *termid*

Destination

CSMT

DFHAC2038   *date time applid* **The conversation type requested by node** *netname* **was not recognized.**

Explanation

CICS received a conversation-type field in an attach header that was not TYPE=MAPPED or TYPE=UNMAPPED.

System action

The attach request is rejected.

User response

Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the failing subsystem identified.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

Destination

CSMT

DFHAC2039   *date time applid* **An unsupported Data Blocking Algorithm (DBA) field in the attach Function Management Header (FMH) has been received from node *netname*.**

Explanation

The received attach header contained a value for the reserved data blocking algorithm (DBA) field.

System action

The attach request is rejected.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. Check the validity of the attach function management header (FMH), and identify the failing subsystem.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

Destination

CSMT

DFHAC2040   *date time applid* **An invalid sync point level has been requested by node *netname*.**

Explanation

The synchronization level requested in the attach header is invalid for the session being used.

System action

The attach request is rejected.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. Check the validity of the attach function management header (FMH), and identify the failing subsystem. Compare the value of the synchronization level in the attach header and the bind.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

Destination

CSMT

DFHAC2041   *date time applid* **An invalid Unit of Work Identification (UOWID) has been supplied by node *netname*.**

Explanation

The received attach header contained an invalid unit of work ID (UOWID). Either the format was wrong, or no UOWID was received when the sync point level required it. This error may also be raised if no conversation correlator is supplied when it is needed.

System action

The attach request is rejected.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the failing subsystem identified. The value of the UOWID/conversation correlator and the sync point level in the attach header should be compared.

Module:
DFHACP

XMEOUT parameters/Message inserts

4. *netname*

Destination

CSMT

DFHAC2042 *date time applid* **An invalid Function Management Header (FMH) has been supplied by node *netname*.**

Explanation

The length field in the attach header was invalid.

System action

The attach request is rejected.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. Check the validity of the attach function management header (FMH), and identify the failing subsystem.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

Destination

CSMT

DFHAC2043 *date time applid* **Transaction has been rejected - CICS system is being recovered. Please wait for completion of recovery.**

Explanation

A request to initiate a transaction was received while the CICS system was in the process of recovering the session following an XRF takeover or persistent sessions restart. The error is detected by DFHZSUP, which then drives DFHACP to issue this message.

Note that destination CSMT is used for non-terminal transactions only.

System action

Depending upon the recovery notification requested for this terminal, the system will send either the recovery message or initiate the recovery transaction specified on the RECOVNOTIFY option of the typeterm definition for this terminal (see the Defining resources for details).

User response

After the recovery notification has been received, the user is able to continue operations.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*

3. *applid*
4. *consname*

Destination

CSMT

DFHAC2047   *date time applid* **While performing an attach for node** *netname* **a security violation was detected.**

Explanation

A request to attach a remote transaction failed due to a security problem. The security fields extracted from the transaction attach request header were passed to

the Security Domain to sign on the user in the remote system, but the sign on call failed.

System action

The attach request is rejected.

User response

Refer to previous security messages which are written to TDQ CSCS such as DFHSN1604 for further information and guidance. If no previous messages were issued, examine the trace to determine the reason for the sign on failure. Check whether any user ID, password or profile passed in the transaction attach request header are valid.

Module:

3. *applid*
4. *netname*

Destination

CSMT and Terminal End User

DFHAC2050   *time applid* **An invalid function management header (FMH) has been supplied by node** *netname***.**

Explanation

The access security information length field in the attach header is invalid.

System action

An exception trace entry containing the invalid FMH5 is issued. The attach request is rejected.

User response

Notify the system programmer. Check the validity of the attach function management header and identify the cause of the error.

Module:
DFHACP

Destination

Terminal End User

DFHAC2051   *date time applid* **An invalid**
Function Management Header
(FMH) has been supplied by node
netname.

Explanation

The Access Security Information length field in the attach header was invalid.

System action

An exception trace entry containing the invalid FMH5 has been issued. The attach request is rejected.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. Check the validity of the attach function management header (FMH), and identify the failing subsystem.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

Destination

CSMT

DFHAC2052   *time applid* **While performing an**
attach for node *netname* **a security**
violation was detected.

Explanation

A password was required in the attach FMH5, but was missing. A user ID was found, however, because the attach did not specify already verified (AV) or persistent signed-on (PV1), a password should have been present.

System action

An exception trace entry is issued tracing the invalid FMH5. The attach request is rejected.

User response

Notify the system programmer. Inspect the subsystem that sent the attach header to determine why the password was not sent.

Module:
DFHACP

Destination

Terminal End User

DFHAC2053   *date time applid* **While performing**
an attach for node *netname* **a**
security violation was detected.

Explanation

A password was required in the attach FMH5, but was missing. A user ID was found, however, since the attach did not specify already verified (AV) or persistent signed-on (PV1), a password should have been present.

System action

An exception trace entry is issued tracing the invalid FMH5. The attach request is rejected. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. Inspect the subsystem that sent the attach header to determine why the password was not sent.

Module:

2. *time*
3. *applid*
4. *netname*

Destination

CSMT

DFHAC2054   *time applid* **You are not authorized**
to access this system.

Explanation

The attach header that was sent to the remote system did not match the required security parameters specified in the bind.

System action

The attach request is rejected by the remote system and the session is unbound. The remote system issues messages DFHAC2055 on CSMT and DFHZC4946 on CSNE.

User response

Inform the system programmer. Investigate the reason why the attach request failed. See messages DFHAC2055 on CSMT and DFHZC4946 on CSNE issued by the remote system for more diagnostic information.

Module:
DFHACP

Destination

Terminal End User

DFHAC2055	*date time applid* **An attach request from node** *netname* **has sent BIND/FMH5 security data that is invalid.**

Explanation

A request to attach a task has been received across an APPC link. However, there is an error in the FMH attach parameters. An attach parameter is present that is not authorized by the bind security indicators.

System action

The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued, tracing the invalid attach header (FMH type 5). Message DFHZC4946 on CSNE contains sense information to help identify the reason for the failure. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace, to determine why the remote system sent an invalid attach request.

Module:
DFHACP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

Destination

CSMT

DFHAC2056	*time applid* **You are not authorized to access this system.**

Explanation

The attach header that was sent to the remote system did not conform to the APPC protocol.

System action

The attach request is rejected by the remote system and the session is unbound. The remote system will produce messages DFHAC2057 on CSMT and DFHZC4947 on CSNE.

User response

Inform the system programmer. Investigate the reason why the attach request failed. See messages DFHAC2057 on CSMT and DFHZC4947 on CSNE issued by the remote system for more diagnostic information.

Module:
DFHACP

Destination

Terminal End User

DFHAC2057	*date time applid* **While performing an attach for node** *netname* **a security violation was detected.**

Explanation

A request to attach a task has been received across an APPC link. However, the FMH attach parameters do not conform to the APPC protocol.

System action

The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued tracing the invalid attach header (FMH type 5). Message DFHZC4947 is issued.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace to determine why the remote system sent an invalid attach request. See message DFHZC4947 on CSNE which contains sense information to help identify the reason for the failure.

If the remote system has an earlier release of CICS or CICS on another platform then you may need to set USEDFLTUSER. See Attach Time Security and the USEDFLTUSER option in the CICS Security.

Module:

CSMT

DFHAC2058	*date time applid* A severe error has occurred. System task CSKP was unable to run because program DFHRMXN3 could not be loaded.

Explanation

The Activity Keypoint Task CSKP attempted to run but was unable to do so because program DFHRMXN3 could not be loaded.

Possible reasons for this are:

1. The library containing DFHRMXN3 is missing from DFHRPL.
2. DFHRMXN3 is missing from a library in the DFHRPL.

System action

CICS writes an exception trace entry, takes a system dump and writes message DFHAC2058 to the console and CSMT. CICS will continue processing but system log management will be severely compromised.

User response

It is strongly recommended CICS is shut down. Investigate why DFHRMXN3 could not be loaded and restart CICS when the problem is resolved.

Module:
DFHACP

CSMT and Console

DFHAC2201	*time applid* Transaction *tranid* has lost contact with its coordinator system during syncpoint processing and has abended with code ASP1. The unit of work is shunted until contact is restored. *condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'.

In accordance with the transaction definition (WAIT YES), the unit of work is not completed but is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2231 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

None. Any updates performed by the unit of work are resolved automatically when resynchronization with the coordinator takes place.

Alternatively, the user may force resolution of the updates independently of the coordinator system by making a CEMT request to commit or to back out the unit of work.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2202   *time applid* **Transaction** *tranid* **has lost contact with its coordinator system during syncpoint processing and has abended with code ASPO. All updates will be unilaterally committed.** *condmsg*

Explanation

Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. The transaction is abnormally terminated with abend code ASPO.

In accordance with the transaction definition (WAIT NO and ACTION COMMIT), all recoverable updates performed by the unit of work are unilaterally committed. Note that integrity of updates may be lost because the coordinator system may either commit or back out its changes.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2232 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

None. In accordance with the transaction definition, all updates are unilaterally committed.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2203   *time applid* **Transaction** *tranid* **has lost contact with its coordinator system during syncpoint processing and has abended with code ASPP. All**

updates will be unilaterally backed out. *condmsg*

Explanation

Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. The transaction is abnormally terminated with abend code ASPP.

In accordance with the transaction definition (WAIT NO and ACTION BACKOUT), all recoverable updates performed by the unit of work are unilaterally backed out. Note that integrity of updates may be lost because the coordinator system may either commit or back out its changes.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2233 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

None. In accordance with the transaction definition, all updates are unilaterally backed out.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2204   *time applid* **A commit failure has occurred during syncpoint processing for transaction** *tranid*. *condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources local to this CICS system, for example files, temporary storage, transient data, have been updated. A commit failure occurred during phase 2 of the syncpoint protocol for a local resource owner.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2234 is sent to the main terminal operator (destination CSMT). For an EXEC CICS

SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the commit failure remain locked and the unit of work is shunted.

User response

Refer to earlier messages output by the local resource owner to discover the cause of the commit failure.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2205	*time applid* **A backout failure has occurred during syncpoint processing for transaction** *tranid*. *condmsg*

Explanation

An attempt to backout a unit of work has suffered a backout failure. For the local resource owner(s) that suffered the backout failure, the resources updated by the unit of work remain locked. All other resources are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2235 is sent to the main terminal operator (destination CSMT). For an EXEC CICS SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the backout failure remain locked and the unit of work is shunted.

User response

Refer to earlier messages output by the local resource owner to discover the cause of the backout failure.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2206	*time applid* **Transaction** *tranid* **failed with abend** *abcode*. **Updates to local recoverable resources backed out.** *condmsg*

Explanation

Transaction *tranid* is abnormally terminated with abend code *abcode*. Any changes to recoverable resources in the local system that have been performed by the current unit of work are backed out.

abcode is either a CICS transaction abend code or a user abend code generated by a CICS ABEND ABCODE(*abcode*) command. This command is issued either by a user program or by an IBM program (for example, a programming language library module).

If possible, a conditional message *condmsg* from the remote system will be appended to this message.

When this message is issued in the terminal owning region because a remote transaction has failed, there may be no recoverable resources to be backed out in the local system. In this case, the conditional message tells you whether or not resources in the remote system have been backed out.

System action

Message DFHAC2236 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

Use the abend code, *abcode*, to diagnose the problem. In a transaction routing environment, the original cause of the failure is usually indicated in the conditional message. If the abend is issued by an IBM program product other than CICS, the code is documented in the library of that other product.

Resubmit the transaction after the cause of the original abend has been removed.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2215	*time applid* **A CICS-generated syncpoint request has failed because a connected system has requested that the UOW be rolled back. Transaction** *tranid* **has been abnormally terminated with code ASPF.** *condmsg*

Explanation

CICS has been unable to comply with an internally generated syncpoint request because a connected system has notified it that the unit of work must be rolled back. (This may also occur as a result of a session failure or a protocol error).

Transaction *tranid* is abnormally terminated with abend code ASPF. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2245 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

Determine why the connected system sent the indication to roll back the unit of work.

Resubmit the transaction after the cause of the indication to roll back has been removed.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2216	*time applid* **Transaction termination processing for transaction** *tranid* **has failed because a connected system has requested that the UOW be rolled back.** *condmsg*

Explanation

A transaction has issued an EXEC CICS RETURN in backout required program state. The backout required program state is set when an application receives a backout request on a protected conversation.

Recoverable resources updated by the unit of work are backed out and locks released.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2246 is sent to the main terminal operator (destination CSMT). Termination processing continues.

User response

To avoid the error, the application should code an EXEC CICS SYNCPOINT command before the EXEC CICS RETURN. A syncpoint issued in 'backout required' program state results in a backout being performed, and the ROLLEDBACK condition returned on the EXEC CICS SYNCPOINT command. If this condition is then handled, a subsequent EXEC CICS RETURN will complete successfully.

Resubmit the transaction after the cause of the indication to roll back has been removed.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2217	*time applid* **Transaction** *tranid* **has requested rollback, but was using a type of processing for which rollback is not supported. The transaction has been abnormally terminated with code ASP8.** *message*

Explanation

An application requested syncpoint rollback, but was using a type of processing that does not support rollback, for example LU6.1.

Transaction *tranid* is abnormally terminated with abend code ASP8. Any changes to recoverable resources that have been performed by the current unit of work will be backed out.

If possible, a conditional message *condmsg* from the linked system will be appended to this message.

System action

Message DFHAC2247 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

Refer to the explanation of abend ASP8.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2218   *time applid* **Transaction** *tranid* **has failed with abend ASP7 following the failure of a local resource owner in the prepare phase of syncpoint. Updates will be backed out.** *condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources local to this CICS system, for example files, temporary storage, or transient data, have been updated, and so the local resource owners have been sent a syncpoint request. A local resource owner has replied 'No' to a request to 'Prepare', during the two phase syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASP7. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2248 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

Refer to the explanation of abend ASP7.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2219   *time applid* **Transaction** *tranid* **has failed with abend ASP7 following the failure of a remote system in the prepare phase of syncpoint. Updates will be backed out.** *condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system, for example files, temporary storage, transient data

on remote CICS systems, or database managers communicating via the RMI, have been updated, and so the remote resource owners have been sent a syncpoint request. A remote resource owner has replied 'No' to a request to 'Prepare', during the two phase syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASP7. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2249 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

Refer to the explanation of abend ASP7.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2220   *time applid* **The coordinator system has indicated that the current unit of work is to be backed out. Transaction** *tranid* **has been abnormally terminated with abend ASP3.** *condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote. During the syncpoint protocol the remote coordinator has decided that the unit of work cannot be committed and must be backed out.

Transaction *tranid* is abnormally terminated with abend code ASP3. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2250 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

Refer to the remote coordinator system to discover the reason why the unit of work was backed out.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2221	*time applid* **Transaction** *tranid* **has failed with abend ASPQ. Syncpoint commit processing has failed while communicating with a remote system.** *condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system such as files, temporary storage, and transient data on remote CICS systems have been updated, and so the remote resource owners have been sent a syncpoint request. A failure occurred during phase 2 of syncpoint protocol.

Transaction *tranid* has abnormally terminated with abend code ASPQ. Recoverable resources have successfully been committed but a subsequent error occurred.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2251 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

Refer to the associated messages already issued by the communication components of CICS to determine the cause of the intersystem session problem.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2222	*time applid* **Transaction** *tranid* **has lost contact with its coordinator system during syncpoint processing. No updates have been performed by this system; it has abended with code ASPR.** *condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. However no recoverable resources have been updated by this system, so there is no data integrity problem.

Transaction *tranid* is abnormally terminated with abend code ASPR.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

System action

Message DFHAC2252 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

Refer to messages on the remote system to determine if the remote resources were backed out or committed.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2223	*time applid* **Transaction** *tranid* **has failed with abend ASP2 due to the links to the remote systems being in an invalid state. Updates will be backed out.** *condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system, for example files, temporary storage, transient data on remote CICS systems, or database managers communicating via the RMI, have been updated, and

so the remote resource owners would be sent a syncpoint request. The links to the remote resource owners are in an invalid state to be sent the PREPARE request of the two phase syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASP2. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

System action

Message DFHAC2253 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response

See the explanation of abend ASP2 for guidance.

Module:
DFHTFP

Destination

Terminal End User

DFHAC2230	*date time applid* **Transaction *tranid* terminal *termid* not executed due to I/O error at session startup. *message***

Explanation

Transaction *tranid* could not be executed because an I/O error occurred in the start-up program on terminal *termid*.

System action

Transaction *tranid* is not executed.

User response

Correct the cause of the I/O error, which is probably due to the terminal not being powered on.

Module:
DFHACP

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *termid*
6. *message*

Destination

CSMT

DFHAC2231	*date time applid* **Transaction *tranid* running program *program_name* term *termid* has lost contact with its coordinator system during syncpoint and has abended with code ASP1. The unit of work is shunted until contact is restored{. EXCI job = } *exci_id*. condmsg***

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'.

In accordance with the transaction definition (WAIT YES), the unit of work is not completed. It is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action

If possible, message DFHAC2201 is sent to the terminal user. Normal abend processing continues.

User response

Refer to explanation of abend code ASP1.

Module:
DFHTFP

DFHAC2232	*date time applid* **Transaction *tranid* running program *program_name* term *termid* has lost contact with its coordinator system during syncpoint and has abended with code ASPO. All updates will be unilaterally committed{. EXCI job = } *exci_id*. condmsg**

Explanation

Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. The transaction is abnormally terminated with abend code ASPO.

In accordance with the transaction definition (WAIT NO and ACTION COMMIT), all recoverable updates performed by the unit of work are unilaterally committed. Note that integrity of updates may be lost since the coordinator system may either commit or back out its changes.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal

termid represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system *termid* is a terminal identifier (transaction routing) or a session identifier, *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action

If possible, message DFHAC2202 is sent to the terminal user. Normal abend processing continues.

User response

None. In accordance with the transaction definition, all updates are unilaterally committed.

CSMT

DFHAC2234	*date time applid* **A commit failure has occurred during syncpoint processing for transaction** *tranid*, **terminal** *termid*. **The transaction will be allowed to complete normally***{. EXCI job = } exci_id.* *condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources local to this CICS system, for example files, temporary storage, or transient data, have been updated. A failure occurred during phase 2 of the syncpoint protocol for a local resource owner. The affected unit of work has recorded its outcome (either forwards or backwards) on the system log, but the resources managed by the local resource owner that failed will remain locked.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

termid is a terminal identifier (transaction routing) or a session identifier.

System action

If possible, message DFHAC2204 is sent to the terminal user. For an EXEC CICS SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the failure remain locked and the unit of work is shunted.

User response

Refer to earlier messages issued by the local resource owner to determine the cause of the failure.

Module:
DFHTFP

CSMT

DFHAC2236   *date time applid* **Transaction *tranid* transaction number *trannum* abend *secondary_abcode* in program *program_name* term *termid*. Updates to local recoverable resources will be backed out*{. EXCI job = } exci_id*. *condmsg*

Explanation

Transaction *tranid* transaction number *trannum* is abnormally terminated with abend code *abcode* in program *progname*. Any changes to recoverable resources in the local system that have been performed by the current unit of work are backed out.

EXCI Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal

termid represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, and *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

When this message is issued in the Terminal Owning region because a remote transaction has failed, there may be no recoverable resources to be backed out in the local system. In this case, the conditional message will tell you whether or not resources in the remote system have been backed out.

Program *progname* will be unknown when the message is issued in a Terminal Owning region.

System action

If possible, message DFHAC2206 is sent to the terminal user. Normal abend processing continues.

User response

See the description of the abend code *abcode* for guidance. In a transaction routing environment, the original cause of the failure is usually indicated in the conditional message. If *abcode* is not a CICS abend, it is a user code, in which case you should consult the programmer responsible for this area.

CSMT

DFHAC2246	*date time applid* **Transaction termination processing for transaction** *tranid* **could not be completed normally because a connected system has requested that the unit of work be rolled back***{. EXCI job = } exci_id. condmsg*

Explanation

A transaction has issued an EXEC CICS RETURN in backout required program state. The backout required program state is set when an application receives a backout request on a protected conversation.

Recoverable resources updated by the unit of work are backed out and locks released.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, and *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action

If possible, message DFHAC2216 is sent to the terminal user. Termination processing continues.

User response

To avoid the error, the application should code an EXEC CICS SYNCPOINT command before the EXEC CICS RETURN. A syncpoint issued in 'backout required' program state results in a backout being performed, and the ROLLEDBACK condition returned on the EXEC CICS SYNCPOINT command. If this condition is then handled, a subsequent EXEC CICS RETURN will complete successfully.

Resubmit the transaction after the cause of the indication to roll back has been removed.

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system, for example files, temporary storage, transient data on remote CICS systems, or database managers communicating via the RMI, have been updated, and so the remote resource owners have been sent a syncpoint request. A remote resource owner has replied 'No' to a request to 'Prepare', during the two phase syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASP7 in program *progname*. Any changes to recoverable resources that have been performed by the current unit of work will be backed out.

In the case of an MRO or an ISC APPC (parallel sessions) connected system *termid* is a terminal identifier (transaction routing) or a session identifier, and *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action

If possible, message DFHAC2219 is sent to the terminal user. Normal abend processing continues.

User response

Refer to explanation of abend code ASP7.

DFHAC2250	*date time applid* **The coordinator system has indicated that the current unit of work is to be backed out. Transaction** *tranid* **running program** *program_name* **term** *termid* **has been abnormally terminated with abend ASP3{.** *EXCI job = }* *exci_id.* *condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The local unit of work is part of a larger unit of work, and is not the coordinator in the syncpoint. The coordinator is either in a remote system or is another unit of work in the local system (if the transaction is the result of a RUN SYNCHRONOUS command). During the syncpoint protocol the coordinator has decided that the unit of work cannot be committed and must be backed out.

Transaction *tranid* is abnormally terminated with abend code ASP3 in program *progname*. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used this, can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system *termid* is a terminal identifier (transaction routing) or a session identifier,

and *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action

If possible, message DFHAC2220 is sent to the terminal user. Normal abend processing continues.

User response

Refer to the coordinator system to determine the reason why the unit of work was backed out.

CSMT

DFHAC2251	*date time applid* **Transaction *tranid* running program *program_name* term *termid* has failed with abend ASPQ. Syncpoint commit processing has failed while communicating with a remote system*{. EXCI job = } exci_id. condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system such as files, temporary storage, and transient data on remote CICS systems have been updated, and so the remote resource owners have been sent a syncpoint request. A failure occurred during phase 2 of syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASPQ in program *progname*. Recoverable resources have successfully been committed but a subsequent error occurred.

EXCI job = *exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of *jobname.stepname.procname - MVSid* and identifies the EXCI client job. The stepname and procname may be omitted. *MVSid* identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS; not a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, *sysid* is the identifier of the linked CICS system, and the display ends with the termination message *condmsg* issued by the linked system.

System action

If possible, message DFHAC2221 is sent to the terminal user. Normal abend processing continues.

User response

Refer to associated messages already issued by the communication components of CICS to determine the cause of the intersystem session problem.

DFHAC2252	*date time applid* **Transaction** *tranid* **in program** *program_name* **term** *termid* **has lost contact with its coordinator system during syncpoint processing. No updates have been performed by this system; it has abended with code ASPR***{. EXCI job = } exci_id. condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction *tranid* has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. However no recoverable resources have been updated by this system and so there is no data integrity problem.

Exci Job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, and *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action

If possible, message DFHAC2222 is sent to the terminal user. Normal abend processing continues.

User response

Refer to messages on the remote system to determine if the remote resources were backed out or committed.

DFHAC2253	*date time applid* **Transaction** *tranid* **running program** *program_name* **term** *termid* **has failed with abend ASP2 due to the links to the remote systems being in an invalid state. Updates will be backed out***{. EXCI job = } exci_id. condmsg*

Explanation

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system, for example files, temporary storage, transient data on remote CICS systems, or database managers communicating via the RMI, have been updated, and so the remote resource owners would be sent a syncpoint request. The links to the remote resource owners are in an invalid state to be sent the PREPARE request of the two phase syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASP2 in program *progname*. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

Exci job =*exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of *jobname.stepname.procname - MVSid* and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence

the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier and *sysid* is the identifier of the linked CICS system. The display ends with the termination message *condmsg* issued by the linked system.

System action

If possible, message DFHAC2223 is sent to the terminal user. Normal abend processing continues.

User response

See the explanation of abend code ASP2 for guidance.

User response

The user response is error specific.

For an invalid transaction during system quiesce, refer to the **User Response** of message DFHAC2007. For a transaction that has been disabled, refer to the **User Response** of message DFHAC2008.

Module:
DFHACP

Destination

Terminal End User

DFHAD0001	*applid* **An abend (code** *aaa/bbbb*) **has occurred at offset** *X'offset'* **in module** *modname*.

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively:

- Unexpected data has been input,
- Storage has been overwritten, or
- There has been a program check within a user program.

The code *aaa* is, if applicable, a 3-digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code *bbbb*, which follows *aaa*, is a user abend code produced either by CICS or by another product on the user's system.

If X'*offset*' contains the value X'FFFF', module *modname* was in control at the time of the abend, but the program status word (PSW) was not addressing this module.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer.

Look up the MVS code *aaa*, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If the *modname* insert contains the value *????*, CICS was unable to determine which module has abnormally terminated. In this case, examine the system dump to determine which area of code has caused the program check.

The user should examine other messages to determine what the module which issued this message was doing at the time the abend occurred. From these messages they can deduce which product has produced the abend code *bbbb*. If *bbbb* is identified as a CICS code, it may be either alphanumeric or numeric.

- If the CICS code is alphanumeric (for example AKEA), it is a CICS transaction abend code.
- If the CICS code is numeric (for example 1310), it refers to a CICS message (DFHTS1310 in our example).

If the user abend code is from another product (for example, IMS), refer to the appropriate messages and codes manual to determine the cause of the abend.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response.

Note:

The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the Configuring.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

DFHAM4805 E   *applid* **Unable to perform operation:** *name* **is locked to**

APPLID *applid*, **OPID** *opid* **to prevent updating.**

Explanation

An attempt has been made to lock, or update, a group or a list that is currently locked to another user.

System action

Processing continues.

User response

Reenter the command when the group or the list is not locked.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4806 E	*applid* **Group name** *grpname* **exists as a LIST name.**

Explanation

The system initialization table (SIT) GRPLIST parameter names a list that contains an unusable group name *grpname*. CICS cannot find this group because no resources are defined as belonging to it, and also because a list of the same name already exists in the CSD.

Note:

A group and a list cannot coexist with the same name.

System action

CICS issues the request 'IS START-UP TO BE CONTINUED? REPLY GO OR CANCEL'.

If you reply 'GO', CICS is initialized with all the valid definitions in the list.

User response

If you do not require group *grpname*, enter 'GO'.

If group *grpname* is essential, enter 'CANCEL', and reinitialize CICS with a different GRPLIST name as a SIT override parameter. Then use the CEDA transaction to review and correct the faulty list.

DFHAM4812 W　　*applid* **Install of LIBRARY *libname* encountered a data set *{allocation | concatenation | open}* failure. The LIBRARY is installed but disabled.**

Explanation

Install of the dynamic LIBRARY resource *libname* has completed but one of the steps required for the successful completion of the LIBRARY install process has failed. The error occurred while attempting to do one of the following:

- Allocate a data set that was defined as one of the DSNAME attributes in the LIBRARY resource definition
- Concatenate the data sets together
- Open the LIBRARY concatenation.

The message text indicates which of these errors has occurred. Due to the error, the LIBRARY has been installed, but with an enablement status of DISABLED, which means that it will not participate in the search order used when loading programs and program artifacts.

System action

Processing continues. Even if the LIBRARY was defined with enablement status of ENABLED, the resource has been installed as DISABLED. Also, this LIBRARY will not be searched when program artifacts are loaded. Therefore, program artifacts that reside in the data sets defined for LIBRARY *libname* will not be loaded from this LIBRARY.

User response

Examine the messages issued by the Loader domain to determine the type of failure that occurred during install processing for this LIBRARY. When the problem has been resolved, SET LIBRARY *libname* to ENABLED in order for the LIBRARY to participate in the dynamic library search order process.

DFHAM4813 W   *applid* **Install of LIBRARY *libname* encountered an MVS ABEND. The LIBRARY is installed but disabled.**

Explanation

Install of the dynamic LIBRARY resource *libname* has completed but one of the steps required for the successful completion of the LIBRARY install process has failed. Due to the error, the LIBRARY has been installed, but with an enablement status of DISABLED, which means that it will not participate in the search order used when loading programs and program artifacts.

System action

Processing continues. Even if the LIBRARY was defined with enablement status of ENABLED, the resource has been installed as DISABLED. Also, this LIBRARY will not be searched when program artifacts

are loaded. Therefore, program artifacts that reside in the data sets defined for LIBRARY *libname* will not be loaded from this LIBRARY.

User response

Examine the messages issued by the Loader domain to determine the type of failure that occurred during install processing for this LIBRARY. When the problem has been resolved, SET LIBRARY *libname* to ENABLED in order for the LIBRARY to participate in the dynamic library search order process.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *libname*

Destination

Console and Terminal End User

DFHAM4814 E   *applid* **List name *listname* exists as a group name.**

Explanation

The GRPLIST parameter of the system initialization table (SIT) specifies an invalid list name *listname*. CICS cannot find the list because a group of the same name already exists in the CSD.

Note:

A group and a list cannot coexist with the same name.

System action

CICS issues the request 'ENTER ALTERNATIVE NAME OR CANCEL'.

User response

Enter a valid list name, **or** enter 'CANCEL', correct the GRPLIST system initialization parameter and reinitialize CICS.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *listname*

Destination

Console and Terminal End User

DFHAM4815 E   *applid* **Group *grpname* not found in this list.**

Explanation

The AFTER/BEFORE name entered in the command could not be found in this list. The definition could have been deleted while the user was viewing the outcome of an EXPAND command.

System action

Processing continues.

User response

Reenter the command with a group name that exists on this list.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4816 E   *applid* **Unable to install group *grpname* - group not found.**

Explanation

Group *grpname* specified in the list being installed was found to be empty. This error can occur either at group list install during CICS start-up or when using the CEDA transaction to install a list. If the error occurs during CICS start-up, the GRPLIST parameter of the system initialization table (SIT) names a list that contains an unusable group name *grpname*. CICS cannot find group *grpname* because no resources are defined as belonging to it.

System action

The system action depends on when the error occurs. During group list install at CICS start-up, CICS issues the request 'IS START-UP TO BE CONTINUED? REPLY GO OR CANCEL'.

If you reply 'GO', CICS is initialized with all the valid definitions in the list.

However, with CEDA, install of the complete list will be unsuccessful and an error message will be returned to the terminal end user. Valid definitions will be installed, but the empty group will not.

User response

During CICS start-up, if you do not require group *grpname*, enter 'GO'.

If group *grpname* is essential, enter 'CANCEL', and reinitialize CICS with a different GRPLIST name as a SIT override parameter.

In either case, use the CEDA transaction to review and correct the faulty list.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *grpname*

Destination

Console and Terminal End User

DFHAM4817 E   *applid* **Install of LIBRARY *libname* failed with an MVS ABEND. The LIBRARY is not installed.**

Explanation

Install of the dynamic LIBRARY resource *libname* has failed because of an MVS ABEND. Due to the error, the LIBRARY has not been installed, which means that it will not participate in the search order used when loading programs and program artifacts.

System action

Processing continues. This LIBRARY will not be searched when program artifacts are loaded. Therefore, program artifacts that reside in the data sets defined for LIBRARY *libname* will not be loaded from this LIBRARY.

User response

Examine the messages issued by the Loader domain to determine the type of MVS abend that occurred during install processing for this LIBRARY. When the problem has been resolved, re-install LIBRARY *libname* in order for the LIBRARY to participate in the dynamic library search order process.

Module:
DFHAMP

1. *applid*
2. *libname*

Destination

Console and Terminal End User

DFHAM4819 E *applid* **Group already exists in this list.**

Explanation

The group already exists in the list.

System action

Processing continues.

User response

Determine why the group exists and reenter the command, perhaps with a different group name.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4820 S *applid* **Unable to perform request - CSD full.**

Explanation

The CSD file is full.

System action

Processing continues.

User response

Reenter the command when more space is available.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4821 S *applid* **Unable to perform request - I/O error to CSD.**

Explanation

An error occurred while the CSD file was being accessed during CICS initialization. This may be because the disk containing the CSD file was mounted incorrectly.

System action

CICS terminates.

User response

Retry the CICS initialization. If the problem persists, a hardware fault probably exists, and you should load a backup copy of the CSD.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4822 S *applid* **Unable to perform request - DFHCSD data set is invalid.**

Explanation

This message will occur during initialization when CICS tries to open the CSD file (DFHCSD) and finds that it has an incorrect maximum record size. The CSD file should be defined with a specific maximum record size as described in the Configuring. Also, if the CSD data set is dynamically allocated to a running CICS system with an incorrect record size, i.e. one that is too small, CICS will fail to open it and any changes made using CEDA will not be permitted.

System action

CICS terminates.

User response

Ensure that you have defined the DFHCSD file as described in the Configuring.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4823 S *applid* **Unable to perform request - DFHCSD not open.**

Explanation

The CSD file (DFHCSD) is not open.

System action

Other processing continues.

User response

Ask the main terminal operator to open the file. The DFHCSD is defined in the bringup JCL and/or in the SIT.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4824 S   *applid* **Unable to perform request - Insufficient function in file definition for DFHCSD.**

Explanation

During initialization, CICS has found a GRPLIST parameter in the SIT, but cannot access the CSD file because of an error in the file definition entry for DFHCSD.

The most likely cause of this error is an incorrectly coded CSDACC parameter in the SIT entry for DFHCSD.

System action

CICS terminates.

User response

Before the next CICS initialization, correct the error in the system initialization parameters for DFHCSD.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4825 S   *applid* **Unable to perform request - File Control has returned an INVREQ response.**

Explanation

The file control file request handler (DFHFCFR) does not have sufficient function to support the CEDA command entered.

System action

The CEDA command is ignored.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4826 S   *applid* **Unable to perform request - CSD corrupted or not initialized.**

Explanation

During initialization, CICS finds a GRPLIST parameter in the SIT, but cannot access the CSD file because:

1. The CSD file has not been initialized, or

2. CSD initialization did not complete successfully, or

3. the CSD file has been corrupted.

System action

CICS terminates.

User response

If you have not used the CSD file before, initialize it using the offline utility, DFHCSDUP, and check the output listing from the utility for successful completion.

If you have used the CSD file before, it has probably been corrupted. In this case, load a backup copy of the CSD file and use it in place of the corrupted file.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4827 S   *applid* **Unable to perform request - DFHCSD could not be installed.**

Explanation

During initialization, CICS finds a GRPLIST parameter in the system initialization table (SIT), but cannot access the CSD file because file control failed to install it.

System action

CICS terminates.

User response

Before the next CICS initialization, ensure that you have a SIT with the correct parameters for the definition of the DFHCSD file.

Assemble a new SIT as necessary.

Module:
DFHAMP

2. *grpname*

Destination

Console and Terminal End User

DFHAM4829 S   *applid* **Storage violation. CSD primary control record not updated.**

Explanation

The in-store version of the CSD primary record was corrupted.

System action

The version on the CSD was not updated and is not necessarily affected.

User response

None.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4830 E   *applid restype resname* **already exists in the target group.**

Explanation

The COPY operation could not be performed, as a duplicate has been found in the target group.

System action

The COPY command is ignored.

User response

Reenter the command with the MERGE or the REPLACE option.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4831 E *applid* **The new name** *name* **is longer than the four characters allowed for** *restype* **names.**

Explanation

The specified name *name* is invalid because it is longer than four characters.

System action

The command is ignored.

User response

Enter a valid name.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4832 E *applid* **Unable to open TDQUEUE** *tdqname* **because the DFHINTRA data set is not open.**

Explanation

An attempt to install the transient data queue *tdqname* on the CICS system has been rejected because the DFHINTRA data set is not open.

System action

Processing continues. The definition is not installed.

User response

It is not possible to install intrapartition definitions on a system that does not have a DFHINTRA data set defined and opened. If DFHINTRA has been defined, it may have failed to open during initialization. It is necessary to repair the data set and restart the system in order to open it.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *tdqname*

Destination

Console and Terminal End User

DFHAM4833 E *applid* **A security error has occurred while attempting to install** *{TDQUEUE | URIMAP}* *resourcename*. **The definition has not been installed.**

Explanation

An attempt to install the resource *resourcename* on the CICS system has been rejected because of an error encountered while performing a security check for the userid included within the definition.

System action

Processing continues. The definition is not installed.

User response

Refer to the associated messages issued by the security manager for further guidance. Reinstall the definition once the error has been corrected.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

    1=TDQUEUE,

    10=URIMAP

3. *resourcename*

Destination

Console and Terminal End User

DFHAM4834 E *applid* **Install of** *{TDQUEUE | PROCESSTYPE | LIBRARY | URIMAP | ATOMSERVICE}* *resourcename* **failed because the installed definition is not disabled.**

Explanation

An attempt to install the resource *resourcename* on the CICS system has failed because the resource is not disabled.

System action

Processing continues. The definition is not installed.

User response

The specified resource must be disabled before it can be installed. Ensure that the resource is in the required state and then install the new definition.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

   1=TDQUEUE,

   2=PROCESSTYPE,

   5=LIBRARY,

   10=URIMAP,

   11=ATOMSERVICE

3. *resourcename*

Destination

Console and Terminal End User

DFHAM4835 E   *applid* **Install of TDQUEUE *tdqname* failed because the queue has already been defined to the system, and initialization is still in progress.**

Explanation

An attempt to install the transient data queue *tdqname* on the CICS system has failed because the queue has already been defined to the system and initialization has not completed.

It is not possible to replace a TD resource definition while CICS is still initializing. This problem only occurs during a cold or initial start of the system where more than one group is being installed as part of GRPLIST processing.

System action

Processing continues. The definition is not installed.

User response

Remove the duplicate resource definition so that the failure does not recur on a subsequent cold or initial start.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *tdqname*

Destination

Console and Terminal End User

DFHAM4836 E   *applid* **Install of DB2CONN *db2conn-name* failed because a DB2CONN is already installed and is in use.**

Explanation

An attempt to install the DB2CONN *db2conn-name* on the CICS system has failed because there is an existing DB2CONN installed and it is in use by the CICS-DB2 adapter.

System action

Processing continues. The definition is not installed.

User response

Only one DB2CONN can be installed on the CICS system at a time. The install of a second DB2CONN implies the discarding of the first DB2CONN and all its associated DB2ENTRYs and DB2TRANs.

A DB2CONN definition can be replaced or discarded only when it is not in use by the CICS-DB2 adapter. Ensure that the CICS-DB2 interface has been stopped before trying to install a DB2CONN definition.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *db2conn-name*

Destination

Console and Terminal End User

DFHAM4837 E   *applid* **Install of{ *DB2ENTRY | DB2TRAN } name* failed because a DB2CONN is not installed.**

Explanation

An attempt to install the DB2ENTRY or DB2TRAN *name* on the CICS system failed because there is no DB2CONN installed. DB2TRANs and DB2ENTRYs can be installed only after a DB2CONN has been installed.

System action

Processing continues. The definition is not installed.

User response

Install a DB2CONN definition and then retry the install of the DB2ENTRY or DB2TRAN.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

   1= DB2ENTRY ,

   2= DB2TRAN

3. *name*

Destination

Console and Terminal End User

DFHAM4838 E   *applid* **Install of DB2ENTRY**
db2entry-name failed because an
existing definition could not be
deleted. The existing definition is
not disabled.

Explanation

An attempt to install the DB2ENTRY *db2entry-name* on the CICS system has failed because there is an existing DB2ENTRY of the same name which is not in a disabled state.

System action

Processing continues. The definition is not installed.

User response

Existing DB2ENTRY definitions can be replaced only when the DB2ENTRY is in a disabled state. Issue a command to disable the DB2ENTRY and then retry the install.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *db2entry-name*

Destination

Console and Terminal End User

DFHAM4839 E   *applid* **List** *listname* **not found.**

Explanation

The specified list *listname* could not be found in the CSD file and therefore cannot be installed. This error could occur either when using the CEDA transaction to install the list or during group list install at CICS start-up. If group list install is being performed, the error is because the system initialization table (SIT) used for CICS start-up contains a GRPLIST parameter, but CICS cannot find list *listname* which was specified in the GRPLIST.

System action

With the CEDA transaction, this message is simply returned to the terminal end user. During start-up, however, CICS issues the request 'ENTER ALTERNATIVE NAME OR CANCEL'.

User response

Enter a valid list name.

If no suitable user-defined list exists, you can initialize a minimum-function system with GRPLIST=DFHLIST, then use the CEDA transaction to build an appropriate list. Finally, cancel CICS, correct the GRPLIST parameter in the SIT, and reinitialize CICS.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *listname*

3. *resname*

Destination

Console and Terminal End User

DFHAM4843 W *applid GROUP/LIST name* **is internally locked to OPID** *opid* **APPLID** *applid***.**

Explanation

The identified GROUP or LIST *name* is internally locked to operator *opid* on CICS system *applid* when an attempt to install the GROUP or LIST occurred. This could occur at a cold or initial start when the CSD is shared between several CICS regions and operations on that group or list are incomplete.

System action

The installation continues.

User response

Check that the installed definitions correspond to your requirements.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *GROUP/LIST*
3. *name*
4. *opid*
5. *applid*

Destination

Console and Terminal End User

DFHAM4844 W *applid restype resname1* **in group** *grpname1* **has the same name as a** *restype* **later in group** *grpname2***.**

Explanation

The CHECK command encountered a duplicate object name.

System action

None in the CHECK command, but the earlier definition will be ignored when the definitions are installed, because they both belong to the same CICS table in which duplicate entries may not exist.

User response

Determine why the duplicate condition exists and rectify it if necessary.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4845 W	*applid restype1 resname1* **referenced by** *restype2 resname2* **in group** *grpname* **cannot be found.**

Explanation

The CHECK command found a reference in a transaction definition to an object definition that does not exist.

System action

None in the CHECK command, but errors may occur if that definition is installed and used.

User response

Determine why the object definition cannot be found and rectify it if necessary.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4846 W	*applid* **The** *xxxxxxxx* **of transaction** *tranid1* **in group** *grpname* **duplicates that of transaction** *tranid2* **in group** *grpname.*

Explanation

The CHECK command found a transaction definition with the same alias as another transaction.

System action

No system action occurs for the CHECK command. However, errors may occur if that definition is installed and used.

User response

Determine why the duplicate situation occurs and rectify it if necessary.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4847 W	*applid* **RELOAD(YES) has been specified for non-RPG program** *progname* **referenced by transaction** *tranid* **in group** *grpname.*

Explanation

The CHECK command found a transaction definition that referenced a non-RPG II program for which RELOAD=YES was specified.

System action

If the definition is installed, CICS will not release storage for the first program invoked by a transaction unless the language is RPG II.

User response

Specify RELOAD (NO).

Module:
DFHAMP

Destination

Terminal End User

DFHAM4848 W	*applid* **Program** *progname* **in group** *grpname* **specifies language RPG which is not supported on CICS.**

Explanation

The CHECK command, executing under CICS Transaction Server for OS/390 encountered an RPG II program definition. RPG II is not supported on CICS.

System action

If the definition is installed, the program language is overwritten.

User response

Change the language as appropriate.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4849 W *applid* **NETNAME** *netname* **of** *{CONNECTION | TERMINAL}* *rsrcname1* **in group** *grpname1* **duplicates that of** *{CONNECTION | TERMINAL} rsrcname2* **in group** *grpname2***.**

Explanation

The CHECK command found a connection or terminal definition with a NETNAME that is the same as the NETNAME defined in another connection or terminal definition.

System action

None in the CHECK command. However, it is not possible to install two terminals or a terminal and a connection with the same NETNAME. Also, you cannot have two or more APPC links with the same NETNAME, an APPC link and an LUTYPE6.1 link with the same NETNAME or two or more IRC connections with the same NETNAME.

User response

Determine why the duplication exists and rectify the problem.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4850 E *applid* **Install of DB2TRAN** *db2tran-name* **failed because DB2ENTRY** *db2entry-name* **to which it refers has not been installed.**

Explanation

An attempt to install the DB2TRAN *db2tran-name* on the CICS system has failed because the DB2ENTRY to which it refers, *db2entry-name*, has not been installed.

System action

Processing continues. The definition is not installed.

User response

Ensure that the name of DB2ENTRY in the DB2TRAN definition is correct. Install the necessary DB2ENTRY definition first then retry the install of the DB2TRAN.

Module:
DFHAMP

DFHAMP

Destination

Terminal End User

DFHAM4855 W *applid* **DVSUPRT(VTAM) must be specified for PROFILE** *profname* **referenced by transaction** *tranid* **in group** *grpname***.**

Explanation

The CHECK command found a definition for a CICS-supplied transaction *tranid* without DVSUPRT(VTAM) specified in profile *progname*.

System action

Unpredictable results occur if the definition is installed and used.

User response

Specify DVSUPRT(VTAM).

Module:
DFHAMP

Destination

Terminal End User

DFHAM4856 W *applid* **INBFMH(ALL) must be specified for PROFILE** *profname* **referenced by transaction** *tranid* **in group** *grpname***.**

Explanation

The CHECK command found a definition for a CICS-supplied transaction *tranid* without INBFMH(ALL) specified in profile *progname*.

System action

The system abnormally terminates with abend code AXFO if the definition is installed and used.

User response

Specify INBFMH(ALL).

Module:
DFHAMP

Destination

Terminal End User

DFHAM4857 W *applid* **The specified** *{GROUP | LIST}* **contains more than one** *objtype***.**

Explanation

The specified GROUP or LIST contains more than one resource type *objtype*.

System action

Processing continues.

User response

Remove the duplication.

Module:

DFHAMP

Destination

Terminal End User

DFHAM4858 S *applid* **Unable to perform request - DFHCSD not enabled.**

Explanation

The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter, but CICS cannot use the CSD file because it is disabled.

System action

CICS terminates.

User response

If you want to use the CSD file, check the system initialization parameters for DFHCSD and your JCL **before** the next CICS initialization.

Module:
DFHAMP

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console and Terminal End User

DFHAM4859 S *applid* **Unable to perform request - The CSDSTRNO operand in the System Initialization Table (SIT) is too small.**

Explanation

Insufficient VSAM strings are available to allow CEDA to proceed.

System action

No CEDA commands may be executed.

User response

Wait until other CEDA users have terminated their sessions, or specify a CSDSTRNO value of twice the number of concurrent CEDA transactions in the SIT.

Module:
DFHAMP

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console and Terminal End User

DFHAM4860 W   *applid* **The specified LIST contains DB2ENTRY or DB2TRAN definitions before a DB2CONN definition.**

Explanation

The specified LIST contains DB2ENTRY and/or DB2TRAN definitions in a group containing no DB2CONN definition. No DB2CONN definition precedes it in the list.

System action

Processing continues.

User response

A DB2CONN definition must be installed before DB2ENTRY and DB2TRAN definitions can be successfully installed. Ensure a DB2CONN definition is placed in a group before all DB2ENTRY and DB2TRAN definitions in the list, or in the first group in the list containing DB2ENTRYs or DB2TRANs.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4861 W   *applid* **XTRANID of transaction** *tranid* **in group** *grpname* **duplicates transaction ID** *tranid* **in group** *grpname.*

Explanation

The check command found a transaction *tranid* in group *grpname* whose XTRANID duplicated a previous transaction ID.

System action

No system action occurs for the CHECK command. However, the alias is ignored if the definitions are installed.

User response

Determine why the duplication exists and rectify the problem.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4862 W   *applid* **Transaction id** *tranid* **in group** *grpname* **duplicates XTRANID of transaction** *tranid* **in group** *grpname.*

Explanation

The check command found a transaction *tranid* in group *grpname* whose XTRANID duplicated a previous transaction ID.

System action

No system action occurs for the CHECK command. However, the first transaction in the message is ignored if the definitions are installed.

User response

Determine why the duplication exists and rectify the problem.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4863 I   *applid name* **is now locked. No group or list of that name exists.**

Explanation

The LOCK command executed successfully, but no group or list of name *name* was found on the CSD file.

System action

The name is locked.

User response

None.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4864 S   *applid* **Unable to perform operation - DFHCSD cannot be opened.**

Explanation

The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter, but CICS cannot use the CSD file for one of the following reasons:

1. The startup JCL does not contain the definition of the CSD file (DFHCSD).
2. The DDNAME or data set name of the CSD file is incorrectly coded in the startup JCL.
3. VSAM has diagnosed that the CSD file cannot be opened.
4. CICS file control cannot open DFHCSD because insufficient storage has been allocated by the job REGION= parameter.

System action

CICS terminates.

User response

The action to solve the problem depends on the cause as follows:

1. Correct the JCL.
2. Correct the JCL.
3. Check the system operator's console for VSAM messages, and correct all VSAM errors.
4. Increase the size limit of the DSAs or EDSAs.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4865 S   *applid* **Unable to perform operation - DFHCSD currently accessed by another user.**

Explanation

The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter. However, CICS cannot get read access to the CSD file because another region is accessing it, and the CSD cluster is defined to VSAM with either SHAREOPTIONS(1) or SHAREOPTIONS(2).

System action

CICS terminates.

User response

Determine why a second CICS region is attempting to write to the CSD. See the Configuring for further details.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4866 E   *applid* **Unable to perform operation:** *name* **is IBM protected.**

Explanation

The user has attempted to change the contents of a group or list whose name begins with "DFH". These are IBM-protected.

System action

The command is not executed.

User response

You can copy from IBM-supplied groups or lists and change the **copied** group or list.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4867 E   *applid* **File name DFHCSD is reserved and must not be modified.**

Explanation

You cannot define the CSD on the CSD itself.

System action

The command is not executed.

User response

Define DFHCSD via SIT options.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4868 W	*applid* **The LSRPOOLNUM of the LSRPOOL** *lsrname* **in group** *grpname* **duplicates that of LSRPOOL** *lsrname* **in group** *grpname*.

Explanation

When invoking the CEDA CHECK command, an LSRPOOL definition *lsrname* in group *grpname* was found which duplicated the LSRPOOLNUM of another LSRPOOL.

System action

Processing continues.

User response

Determine why the duplication exists and rectify the problem.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4869 E	*applid* **Single resource install of** *restype resname* **in group** *grpname* **is not allowed.**

Explanation

The install of *restype resname* is not allowed via single resource install. It must be installed via group install.

System action

The command is not executed.

User response

Install group *grpname* via group install.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4870 E	*applid* **Install failed for program** *progname* **- language RPG is not supported under MVS.**

Explanation

The GRPLIST parameter of the system initialization table (SIT) names a list in which a group contains a program *progname* that was defined with LANGUAGE(RPG).

System action

CICS initialization continues. The definition in error is ignored.

User response

Redefine program *progname* with the correct LANGUAGE definition.

Module:
DFHAMP

DFHAM4873 S   *applid* **Unable to disconnect the CICS catalog.**

Explanation

DFHAMP was unable to disconnect the CICS catalog for terminal installs.

System action

CICS terminates.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4874 E   *applid* **Install of *{TSMODEL | ENQMODEL} rsrce-name1* failed because *{PREFIX | ENQNAME} attribute-name* already exists in *{TSMODEL | ENQMODEL} rsrce-name2*.**

Explanation

An attempt to install the resource *rsrce-name1* on the CICS system has failed because the attribute *attribute-name* already exists in the installed resource *rsrce-name2*.

If the resource being installed is an ENQMODEL, another ENQMODEL with the same or a more generic nested enqname is installed and enabled.

System action

Processing continues. The definition is not installed.

User response

If you are sure you need to install resource *rsrce-name1* you need to discard resource *rsrce-name2* before attempting the re-install.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

   2=TSMODEL,

   3=ENQMODEL

3. *rsrce-name1*
4. Value chosen from the following options:

   2=PREFIX,

   3=ENQNAME

5. *attribute-name*
6. Value chosen from the following options:

2=TSMODEL,

3=ENQMODEL

7. *rsrce-name2*

Destination

Console and Terminal End User

DFHAM4875 E *applid* **Unable to perform operation:** *name* **is currently being updated by APPLID** *applid* **OPID** *opid* **- please retry later.**

Explanation

The command which you issued cannot be performed because another user of CEDA is currently changing the contents of the group/list to which you referred.

System action

The command is not executed.

User response

Try the command again.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4876 W *applid* **PARTNER** *partnername* **specifies NETNAME** *netname* **which is not found in any CONNECTION definition that specifies access method = VTAM.**

Explanation

There is no VTAM connection within the current group for the netname referenced in the specified partner.

System action

Other processing continues.

User response

None.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4877 W *applid* **PARTNER** *partnername* **specifies a NETNAME and PROFILE for which there is no common implied SESSIONs definition.**

Explanation

The netname in a partner definition implies an associated connection definition which is in turn associated with a session definition. The profile definition referenced in a partner definition specifies a modename which can be associated with a sessions definition.

Within the current group, there is no common sessions definition implied by the specified partner definition.

System action

Other processing continues.

User response

None.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4878 E *applid* **Install of** *{IPCONN}* *resourcename* **failed because one with this name is already installed and is in use.**

Explanation

An attempt to install the resource specified, *resourcename*, on the CICS system has failed because there is already an existing resource of this name installed and in use.

System action

Processing continues. The definition is not installed.

User response

The specified resource definition can be replaced or discarded only when it is out of service. Put the resource out of service before attempting to re-install it.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

    9=IPCONN

3. *resourcename*

Destination

Console and Terminal End User

DFHAM4879 W   *applid {GROUP | LIST} name* **has been partially installed.**

Explanation

During the execution of an INSTALL command for the group or list *name*, some of the elements in the group or list installed successfully, but at least one failed.

System action

Messages are produced indicating why the element or elements failed to install.

User response

Use the messages already produced to determine why the install failed and to rectify the problem.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4880 S   *applid* **Unable to perform operation - not allowed by file attributes for DFHCSD.**

Explanation

The CSDACC parameter in the system initialization table for DFHCSD does not allow CEDA to complete the command entered. The CSDACC parameter specifies the type of access permitted to the file. This can be one of the following:

    READWRITE
    READONLY

In order for a particular command to function, the access must be set appropriately.

System action

The CEDA command is ignored.

User response

Correct the CSDACC parameter in the SIT. The DFHCSD is defined in the bringup JCL and/or in the SIT.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4881 I   *applid* **Group *name* deleted.**

Explanation

The Group *grpname* has been deleted from the CSD.

System action

Processing continues.

User response

Check that the deleted group is not present on any list.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4882 W   *applid* **The *{TPNAME | XTPNAME}* of transaction *tranid* in group *grpname* duplicates the *{TPNAME | XTPNAME}* of transaction *tranid* in group *grpname*.**

Explanation

The CHECK command found a transaction whose XTPNAME matches the TPNAME of another transaction.

System action

No system action occurs for the CHECK command, but the XTPNAME or TPNAME for the first transaction in the message is ignored if the definitions are installed.

User response

Determine why the duplication exists. To rectify the problem, rename either the TPNAME or the XTPNAME.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4883 I   *applid* **List** *listname* **deleted.**

Explanation

The List *listname* has been deleted from the CSD.

System action

Processing continues.

User response

Ensure that the deleted list is not used at a cold or initial start as the GRPLIST DFHSIT parameter.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4884 S   *applid restype* **name** *resname* **is reserved by CICS.**

Explanation

The name *resname* you have selected for resource type *restype* is reserved by CICS and cannot be user defined.

System action

The command is rejected.

User response

Redefine *resname* and resubmit the command.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4885 E   *applid* **Install of IPCONN** *resourcename* **failed. Duplicate applid** *applid* **found.**

Explanation

IPCONN resource *resourcename* was being installed but was found to have the same applid *applid* as an IPCONN which is already installed.

System action

The resource is not installed; CICS continues.

User response

If you want the definitions to be installed, use CEDA to correct the applid on this IPCONN and then reinstall the definition.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *resourcename*
3. *applid*

Destination

Console and Terminal End User

DFHAM4886I   *applid* **Installing list** *listname* **which matches specified generic list** *genlist***.**

Explanation

The GRPLIST parameter of the system initialization table (SIT) specifies a list name *genlist* that contains generic characters. While searching the CSD file, the list name *listname* was found to match the specified generic list.

System action

The list name *listname* is installed.

User response

None.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *listname*
3. *genlist*

Destination

Console

DFHAM4887 I   *applid* **Unrecognized resource type found in the CSD file and has been ignored.**

Explanation

CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action

The resource is ignored and the operation continues.

User response

Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console and Terminal End User

DFHAM4888 I   *applid* **Group *groupname* removed from list *listname*.**

Explanation

During the execution of a DELETE command, the group *groupname* was deleted from the CSD. As a result of that, the list *listname* was updated to remove the deleted group from it.

System action

Processing continues.

User response

None.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4889 E   *applid* **Install of *{JOURNALMODEL | TSMODEL | TCPIPSERVICE | CORBASERVER | IPCONN | URIMAP} resourcename* failed because *attribute attname* is invalid.**

Explanation

An attempt to install the JOURNALMODEL, TSMODEL, TCPIPSERVICE, CORBASERVER, IPCONN, or URIMAP named *resourcename* on the CICS system failed because the *attribute attname* specified is not valid. If the *attribute* is CERTIFICATE, this may be due to one of the following reasons:

- The specified certificate does not exist
- The specified certificate is not properly constructed
- The specified certificate does not have an associated private key
- The specified certificate is not connected to the key ring with a correct USAGE.

System action

The definition is not installed.

User response

Correct the invalid parameter of the resource definition.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

    1=JOURNALMODEL,

    2=TSMODEL,

    7=TCPIPSERVICE,

    8=CORBASERVER,

    9=IPCONN,

    10=URIMAP

5. *attname*

Destination

Console and Terminal End User

DFHAM4890 E   *applid* **Install of TDQUEUE** *tdqname* **failed because the TYPE has not been specified.**

Explanation

An attempt to install the named TDQUEUE *tdqname* on the local CICS system failed because it has been defined with the REMOTESYSTEM attribute and the TYPE cannot be determined.

System action

The definition is not installed.

User response

Make the definition a dual purpose one by specifying both REMOTE attributes and TYPE.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *tdqname*

Destination

Console and Terminal End User

DFHAM4891 W   *applid restype* **name** *resname* **begins with 'C'. Such names are reserved and may be redefined by CICS.**

Explanation

A resource name starting with C was specified. Names starting with C are reserved and may be redefined by CICS.

System action

If the definition is installed, errors may occur.

User response

Specify a different resource name.

Module:
DFHAMP

Destination

Terminal End User

DFHAM4892 W   *DATE TIME APPLID* **Install for group** *grpname* **has completed with errors.**

Explanation

The install of group *grpname* is now complete. All resources that are valid for installation have been installed, and recorded if appropriate, on the CICS catalog. There were errors during the installation of some resources in the group and these resources have been backed-out.

System action

CICS continues. CICS issues messages identifying the cause of each installation failure.

User response

Use the associated messages, available via the messages panel if CEDA is being used, or issued to transient data queues CSMT and CADL during system startup, to determine the cause of the errors. Once the cause of the errors has been eliminated, reinstall the group to install the missing definitions.

Module:
DFHAMP

1. *applid*
2. *tcpipservice*
3. *portno*

Destination

Console and Terminal End User

DFHAM4907 W *applid* **Opening TCPIPSERVICE** *tcpipservice* **has failed because the {IP address | host} is not known.**

Explanation

Opening TCPIPSERVICE *tcpipservice* has failed because either the specified IP address or the specified host is not known. If an IPv6 address is being used ether explicitly or because the specified host resolves to an IPv6 address, the open will fail if the TCP/IP stack does not support IPv6.

System action

The resource is installed but left in the closed state. Message DFHSO0110 or message DFHSO0117 is written to the transient data queue CSOO.

User response

Check that the TCP/IP stack supports the type of IP address being used and also ensure that the host or IP address is known.

If IPv6 addresses are being used, check that the TCP/IP stack supports IPv6. See the z/OS Communications Server IP Diagnosis Guide on using Netstat to find information about the stack.

Refer to the description of message DFHSO0110 or message DFHSO0117 for more information.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *tcpipservice*
3. Value chosen from the following options:

   1=IP address,

   2=host

Destination

Console and Terminal End User

DFHAM4908 E *applid* **Install of DOCTEMPLATE** *doctemplate1* **failed because TEMPLATENAME(***template***) already exists in DOCTEMPLATE** *doctemplate2***.**

Explanation

The install of DOCTEMPLATE *doctemplate1* has failed because the TEMPLATENAME selected is already in use as the full template name for document template *doctemplate2*.

System action

The install fails.

User response

Either select a different TEMPLATENAME for *doctemplate1*, or discard the document template definition for *doctemplate2*.

Module:
DFHAMDH

XMEOUT parameters/Message inserts

1. *applid*
2. *doctemplate1*
3. *template*
4. *doctemplate2*

Destination

Console and Terminal End User

DFHAM4909 E   *applid* **Install of DOCTEMPLATE** *doctemplate* **failed. DDNAME(***ddname***) not found.**

Explanation

The install of DOCTEMPLATE *doctemplate* has failed because the DDNAME(*ddname*) selected is not the name of a Data Definition statement for a partitioned dataset in the JCL for the current CICS job. *ddname* should be allocated to a PDS containing document templates to be used by the Document Handler domain.

System action

The install fails.

User response

Either select a DDNAME that does exist in the JCL for the current CICS job, or stop and restart CICS with the required DD statement added.

Module:
DFHAMDH

XMEOUT parameters/Message inserts

1. *applid*
2. *doctemplate*
3. *ddname*

Destination

Console and Terminal End User

DFHAM4910 E   *applid* **Install of DOCTEMPLATE** *doctemplate* **failed. MEMBER(***membername***) not found in** *ddname*.

Explanation

The install of DOCTEMPLATE *doctemplate* has failed because member *membername* was not found in any of the partitioned datasets specified in the *ddname* concatenation.

System action

The install fails.

User response

Ensure that member *membername* exists in one of the template libraries specified before installing the DOCTEMPLATE that references it.

Module:
DFHAMDH

XMEOUT parameters/Message inserts

1. *applid*
2. *doctemplate*
3. *membername*
4. *ddname*

Destination

Console and Terminal End User

DFHAM4911 W   *applid* **Transaction** *tranid* **installed but at least one of ALIAS, TASKREQ or XTRANID failed to be replaced because it exists as a primary transaction.**

Explanation

Transaction *tranid* was successfully installed but at least one of the specified aliases (ALIAS, TASKREQ or XTRANID) failed to be installed because it already exists as a primary transaction, and this includes the current transaction.

System action

The resource is installed but the alias is not.

User response

Find out which of the aliases is conflicting with a primary transaction id and change its name.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *tranid*

Destination

Console and Terminal End User

DFHAM4912 E   *applid* **Install of *resource resourcename* failed because *attribute* is invalid for this release.**

Explanation

An attempt to install the resource *resource* named *resourcename* on this CICS system failed because the *attribute* specified is not valid as it is an obsolete attribute.

System action

The definition is not installed.

User response

Remove the invalid parameter of the resource definition.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *resource*
3. *resourcename*
4. *attribute*

Destination

Console and Terminal End User

DFHAM4913 E   *applid* **Install of *{IPCONN} resourcename* failed because a CONNECTION resource with this name and a different APPLID is already installed.**

Explanation

An attempt to install the resource specified, *resourcename,* on the CICS system has failed because there is already an existing CONNECTION resource of this name installed that has a different APPLID.

System action

Processing continues. The definition is not installed.

User response

An IPCONN and a CONNECTION with the same name must represent the same system, so the IPCONN APPLID and the CONNECTION NETNAME must be the same. Establish which is incorrect and re-install.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

    9=IPCONN

3. *resourcename*

Destination

Console and Terminal End User

DFHAM4914 E   *applid* **Install of *resourcetype resourcename* failed. The specified *targetresource* is unusable.**

Explanation

Resource *resourcename* cannot be installed because the target resource *targetresource* with which it is associated is not usable.

System action

The resource is not installed.

User response

Discover why the target resource is not usable. It may not exist, or may not have been defined before it is being used. Create or define the referenced target resource.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *resourcetype*
3. *resourcename*
4. *targetresource*

Destination

Console and Terminal End User

DFHAM4915 E   *applid* **Install of** *resourcetype* *resourcename* **failed. Open for data set** *dsname* **has abended.**

Explanation

Resource *resourcename* cannot be installed because an abend occurred when opening the data set *dsname* that contains it.

System action

The resource is not installed.

User response

Look for an earlier IEC143I, IEC144I, IEC145I, IEC148I, IEC150I, or IEC153I message that explains why the dataset could not be opened. Correct whatever problem is described in the related message.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *resourcetype*
3. *resourcename*
4. *dsname*

Destination

Console and Terminal End User

DFHAM4916 E   *applid* **TCPIPSERVICE** *tcpipservice* **has not been opened because the MAXSOCKETS limit has been reached.**

Explanation

TCPIPSERVICE *tcpipservice* has not been opened because the number of active sockets in the system is equal to the current MAXSOCKETS value.

System action

The resource is installed but left in the closed state.

User response

Determine whether your MAXSOCKETS setting is adequate to handle normal system loads. If it is, then this may be a transient condition caused by a peak in work that uses sockets, and you may be able to use CEMT to open the TCPIPSERVICE once the workload diminishes. If not, use CEMT SET SYSTEM to increase the number of sockets in the system.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *tcpipservice*

Destination

Console and Terminal End User

DFHAM4917 W   *applid* **{ CORBASERVER | TCPIPSERVICE | IPCONN | URIMAP }** *resourcename* **was installed with a reduced set of CIPHER codes.**

Explanation

The specified resource *resourcename* was installed but the the set of cipher codes which the resource was originally defined with has been reduced at install time because the running system did not support all of the ciphers specified.

System action

The resource is installed with a reduced set of cipher codes.

User response

Determine whether your CIPHERS setting is acceptable.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

    1= CORBASERVER ,

7= *TCPIPSERVICE* ,

9= *IPCONN* ,

10= *URIMAP*

3. *resourcename*

Destination

Console and Terminal End User

DFHAM4918 E *applid* **The installation of{** *CORBASERVER | TCPIPSERVICE | IPCONN | URIMAP }* **resourcename has failed because its requested CIPHER list was rejected.**

Explanation

Resource *resourcename* cannot be installed because all of the cipher codes specified for the resource have been rejected by the running system.

System action

The resource is not installed.

User response

Determine what your CIPHERS setting should be for the current MVS system.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

    1= *CORBASERVER* ,

    7= *TCPIPSERVICE* ,

    9= *IPCONN* ,

    10= *URIMAP*

3. *resourcename*

Destination

Console and Terminal End User

DFHAM4919 E *applid* **The installation of{** *TCPIPSERVICE | IPCONN | URIMAP }* **resourcename has failed because CIPHERS file filename was not found.**

Explanation

Resource *resourcename* cannot be installed because the CIPHERS file was not found.

System action

The resource is not installed.

User response

Correct the CIPHERS file name.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

    7= *TCPIPSERVICE* ,

    9= *IPCONN* ,

    10= *URIMAP*

3. *resourcename*
4. *filename*

Destination

Console and Terminal End User

DFHAM4920 E *applid* **The installation of{** *CORBASERVER | DJAR | PIPELINE | WEBSERVICE | LIBRARY | BUNDLE | JVMSERVER }* **resourcename has failed because it is a duplicate of one that already exists.**

Explanation

The installation of the specified resource *resourcename* has failed because a resource with this name already exists in your running CICS system.

System action

The resource is not installed.

User response

For some resources, it is not possible to do an update (add/replace). Select a different resource name which is not known to the system. Or, if you want to use the same resource name, you must discard the resource first. The resource may need to be disabled before it can be discarded or updated.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

   1= CORBASERVER ,

   2= DJAR ,

   3= PIPELINE ,

   4= WEBSERVICE ,

   5= LIBRARY ,

   6= BUNDLE ,

   7= JVMSERVER

3. *resourcename*

Destination

Console and Terminal End User

DFHAM4928 E   *applid* **Install of {TCPIPSERVICE | CORBASERVER | IPCONN | URIMAP} resourcename failed because the specified certificate attname {is expired | is not yet current | does not have a private key | is not trusted | is not found}.**

Explanation

Resource *resourcename* cannot be installed because the specified certificate is unusable. An explanatory phrase in the message describes why:

is expired

The date and time at which the certificate is no longer valid has already passed.

is not yet current

The date and time at which the certificate is to become active has not yet been reached.

does not have a private key

The specified certificate does not have a private key. SSL with client authentication is only possible if you possess the private key associated with the certificate.

This error may occur if the user does not have access to the private key due to a lack of authority to access IRR.DIGTCERT.GENCERT.

is not trusted

The certificate has been given the NOTRUST attribute by the security administrator. This indicates that the certificate is not to be used.

is not found

The certificate is not found.

System action

The resource is not installed.

User response

Replace the certificate in the keyring with one that is usable, or specify a different certificate.

For a message insert of 'does not have a private key' check the system log for RACF messages that indicate a lack of authority to access IRR.DIGTCERT.GENCERT.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

   7=TCPIPSERVICE,

   8=CORBASERVER,

   9=IPCONN,

   10=URIMAP

3. *resourcename*
4. *attname*
5. Value chosen from the following options:

   1=is expired,

   2=is not yet current,

   3=does not have a private key,

   4=is not trusted,

   5=is not found

Destination

Console and Terminal End User

DFHAM4929 E   *applid {URIMAP}(resourcename)* **was not installed because of conflicting attributes.**

Explanation

Resource *resourcename* cannot be installed because the specified attributes are inconsistent. This could indicate an internal problem within CICS, because attribute inconsistencies should be resolved in the RDO DEFINE command.

System action

The resource is not installed.

User response

Remove the conflicting attributes.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

   10=URIMAP

3. *resourcename*

Destination

Console and Terminal End User

DFHAM4930 E　　*applid* **URIMAP(***urimap1***) not installed because it maps the same URI as *urimap2*.**

Explanation

URIMAP *urimap1* cannot be installed because it will map the same HOST and PATH (and optional TCPIPSERVICE) as *urimap2*, which is already installed. Each URIMAP must map a unique combination of these parameters.

System action

The resource is not installed.

User response

Specify a different HOST, PATH, or TCPIPSERVICE attribute.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

2. *urimap1*
3. *urimap2*

Destination

Console and Terminal End User

DFHAM4931 E　　*applid* **The installation of WEBSERVICE *resourcename* failed because the associated *{WSBIND file | PIPELINE}* does not exist.**

Explanation

WEBSERVICE *webservice* cannot be installed because the associated PIPELINE cannot be found.

System action

The resource is not installed.

User response

Ensure that the PIPELINE definition is correct and the PIPELINE is installed.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *resourcename*
3. Value chosen from the following options:

   2=WSBIND file,

   3=PIPELINE

Destination

Console and Terminal End User

DFHAM4932 E　　*applid* **The installation of *{PIPELINE | WEBSERVICE}* *resourcename* failed because the *{zFS file | PIPELINE}* setup was not correct.**

Explanation

WEBSERVICE *webservice* or PIPELINE *pipeline* cannot be installed because of setup errors. Either the zFS file does not have the correct authorization or the PIPELINE mode is not correct.

System action

The resource is not installed.

User response

Ensure that the zFS file definitions of the pipeline and webservice are correct.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

    3=PIPELINE,

    4=WEBSERVICE

3. *resourcename*
4. Value chosen from the following options:

    2=zFS file,

    3=PIPELINE

Destination

Console and Terminal End User

DFHAM4933 E   *applid* **The installation of PIPELINE** *resourcename* **failed because the WSDIR file specified is not accessible.**

Explanation

PIPELINE *pipeline* cannot be installed because the WSDIR specified is not correct and therefore the directory cannot be accessed.

System action

The resource is not installed.

User response

Ensure that the zFS file definitions of the WSDIR are correct, remembering that case is significant.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *resourcename*

Destination

Console and Terminal End User

DFHAM4934 E   *applid* **The installation of URIMAP** *resourcename* **failed because HOSTCODEPAGE** *hcodepage* **is not valid in combination with CHARACTERSET** *charset*.

Explanation

The URIMAP resource *resourcename* cannot be installed because the specified attributes are inconsistent. Most inconsistencies are eliminated at resource definition time. However, for a URIMAP resource, the consistency between the value specified for the HOSTCODEPAGE attribute and that specified for the CHARACTERSET attribute cannot be determined until install time.

System action

The resource is not installed.

User response

Check that the combination of CHARACTERSET and HOSTCODEPAGE values specified for the URIMAP is supported by the CICS system on which you are attempting to install the resource *resourcename*.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *resourcename*
3. *hcodepage*
4. *charset*

Destination

Console and Terminal End User

DFHAM4935 E   *applid* **Install of** *{TCPIPSERVICE | CORBASERVER | IPCONN | URIMAP}* *resourcename* **failed because the KEYRING has no default certificate.**

Explanation

The specified resource *resourcename* is not installed because no certificate label was specified in the CERTIFICATE attribute, and no default certificate exists in the keyring for this CICS system.

System action

The resource is not installed.

User response

Either specify a valid certificate label in the CERTIFICATE attribute for *resourcename,* or designate one of the certificates in the keyring as a default.

If you are using the z/OS Security Server (RACF) you designate a certificate as default using the RACDCERT command.

Note:

Whenever you change a keyring, either by adding or removing certificates, or by changing a certificate's status to or from default, the changes are not reflected in CICS until you restart the CICS address space.

Module:
DFHAMP

XMEOUT parameters/Message inserts

DFHAM4939 E   *applid* **The installation of ATOMSERVICE** *resourcename* **failed due to a configuration error.**

Explanation

ATOMSERVICE *resourcename* cannot be installed because it could not be configured successfully.

System action

The resource is not installed.

User response

Ensure that the CONFIGFILE defined for ATOMSERVICE *resourcename* is correct.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *resourcename*

Destination

Console and Terminal End User

DFHAM4940 E   *applid* **Install of MQCONN** *mqconn-name* **failed because an MQCONN is already installed and is in use.**

Explanation

An attempt to install the MQCONN *mqconn-name* on the CICS system has failed because there is an existing MQCONN installed and it is in use by the CICS-MQ adapter.

System action

Processing continues. The definition is not installed.

User response

Only one MQCONN can be installed on the CICS system at a time. The install of a second MQCONN

implies the discarding of the first MQCONN and its associated MQINI.

An MQCONN definition can be replaced or discarded only when it is not in use by the CICS-MQ adapter. Ensure that the CICS-MQ interface has been stopped before trying to install an MQCONN definition.

Module:

XMEOUT parameters/Message inserts

1. *applid*

DFHAM4941 E   *applid* **The installation of {ATOMSERVICE}** *resourcename* **failed because the {CONFIGFILE | BINDFILE} does not exist.**

Explanation

The specified *resourcename* cannot be installed because the UNIX System Services file specified as the CONFIGFILE or BINDFILE does not exist.

System action

The resource is not installed.

User response

Ensure that the appropriate file is defined.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

   11=ATOMSERVICE

3. *resourcename*
4. Value chosen from the following options:

   1=CONFIGFILE,

   2=BINDFILE

Destination

Console and Terminal End User

DFHAM4942 E   *applid* **The installation of**
{ATOMSERVICE} *resourcename*
failed because CICS does not
have authority to access the
{CONFIGFILE | BINDFILE}.

Explanation

The specified *resourcename* cannot be installed
because the CICS region user ID does not have
permission to access the UNIX System Services file
specified as the CONFIGFILE or BINDFILE.

System action

The resource is not installed.

User response

Either specify the name of a different file to which
the CICS region user ID has access, or use the file
authorization facilities of UNIX System Services (such
as the chmod command) to grant permission to the
CICS region user ID to access the specified file.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

Console and Terminal End User

DFHAM4944 W   *applid* **JVMSERVER *resourcename***
has been installed with fewer
threads than requested on its
definition.

Explanation

The specified JVMSERVER *resourcename* was installed
with fewer threads than the requested THREADLIMIT
value on its resource definition.

System action

The resource is installed with limited threads.

User response

Ensure that you have the correct THREADLIMIT
specified on the JVMSERVER definition. If the
THREADLIMIT is correct, consider lowering the
THREADLIMIT value of other installed JVMSERVERs so
that this JVMSERVER can acquire more threads.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *resourcename*

Destination

Console and Terminal End User

DFHAM4945 W   *applid* **JVMSERVER** *resourcename* **has been installed as disabled with a THREADLIMIT of 0.**

Explanation

The specified JVMSERVER *resourcename* was installed as disabled with a THREADLIMIT value of 0 because there are not enough threads available in the running CICS system.

System action

The resource is installed as disabled.

User response

Ensure that you have the correct THREADLIMIT specified on the JVMSERVER definition. If the THREADLIMIT is correct, consider lowering the THREADLIMIT value of other installed JVMSERVERs so that this JVMSERVER can acquire some threads and be enabled.

DFHAM4957 E   *applid* **Opening TCPIPSERVICE** *tcpipservice* **has failed because its specific TCPIPSERVICE** *speciftcps* **is not open.**

Explanation

Opening TCPIPSERVICE *tcpipservice* has failed because the specific TCPIPSERVICE *speciftcps* it requires is not open.

System action

The resource is installed but left in the closed state.

User response

Open the specific TCPIPSERVICE before attempting to open this resource.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *tcpipservice*
3. *speciftcps*

Destination

Console and Terminal End User

DFHAM4958 E   *applid* **Opening TCPIPSERVICE** *tcpipservice* **has failed because its specific TCPIPSERVICE** *speciftcps* **is in use by another TCPIPSERVICE.**

Explanation

Opening TCPIPSERVICE *tcpipservice* has failed because the specific TCPIPSERVICE *speciftcps* it requires is currently associated with another generic TCPIPSERVICE. Only one generic TCPIPSERVICE can use a specific TCPIPSERVICE at any time.

System action

The resource is installed but left in the closed state.

User response

Modify this TCPIPSERVICE so that it includes the name of a different specific TCPIPSERVICE and reinstall it.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *tcpipservice*
3. *speciftcps*

Destination

Console and Terminal End User

DFHAM4959 E   *applid* **Opening TCPIPSERVICE**
**   *tcpipservice* failed because its**
**   specific TCPIPSERVICE** *speciftcps*
**   has different security settings.**

Explanation

Opening TCPIPSERVICE *tcpipservice* has failed
because the specific TCPIPSERVICE *speciftcps* has
different security settings. Both resources must have
identical security settings for the open to succeed.

System action

The resource is installed but left in the closed state.

User response

Modify the security settings in one of these resources
and reinstall it.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*

3. *speciftcps*

Destination

Console and Terminal End User

DFHAM4960 E   *applid* **Opening TCPIPSERVICE**
**   *tcpipservice* has failed because its**
**   specific TCPIPSERVICE** *speciftcps*
**   is not one in use as a specific IPIC**
**   end point.**

Explanation

Opening TCPIPSERVICE *tcpipservice* has failed
because the specific TCPIPSERVICE *speciftcps* is not
one in use as an IPIC specific end point. Generic
TCPIPSERVICEs must reference a TCPIPSERVICE that
is a specific IPIC end point for the local region.

System action

The resource is installed but left in the closed state.

User response

Modify the SPECIFTCPS attribute in the resource
definition, so that it names a TCPIPSERVICE that can
be used as a specific IPIC end point, and reinstall it.

Explanation

An attempt to install resource type *resource* on this CICS system is not possible as the code for install has been disabled for this resource type.

System action

Processing continues. The definition is not installed.

User response

You may define resource definitions for resource *resource* but until full support is available, you cannot INSTALL them.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *resourcetype*

Destination

Console and Terminal End User

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively:

- Unexpected data has been input,
- Storage has been overwritten, or
- There has been a program check within a user program.

The code *aaa* is, if applicable, a 3-digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code *bbbb*, which follows *aaa*, is a user abend code produced either by CICS or by another product on the user's system.

If X'*offset*' contains the value X'FFFF', then module *modname* was in control at the time of the abend, but the program status word (PSW) was not addressing this module.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer.

Look up the MVS code *aaa*, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If the *modname* insert contains the value *????*, then CICS was unable to determine which module has abnormally terminated. In this case, examine the system dump to determine which area of code has caused the program check.

The user should examine other messages to determine what the module which issued this message was doing at the time the abend occurred. From these messages they can deduce which product has produced the abend code *bbbb*. If *bbbb* is identified as a CICS code, it may be either alphameric or numeric.

- If the CICS code is alphameric (for example AKEA) then it is a CICS transaction abend code.
- If the CICS code is numeric (for example 1310), it refers to a CICS message (DFHTS1310 in our example).

If the user abend code is from another product (for example, IMS), refer to the appropriate messages and codes manual to determine the cause of the abend.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response.

Note:

The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the Configuring.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHAP0002	*applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action

An exception entry is made in the trace table (X'*code*' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

If this message is issued from DFHAPEX or DFHSUEX, and the exit point is XDUREQ, then a system dump is not taken in order to prevent recursive dumping.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system administrator. This failure indicates a serious error in CICS. If you have not requested termination in the dump table, you may want to terminate CICS. For further information about CICS exception trace entries, see the Troubleshooting and support.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHAP0003	*applid* **Insufficient storage (code X'code') in module** *modname.*

Explanation

A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point id which uniquely identifies the place where the error was detected.

System action

An exception entry is made in the trace table (code X'*code*' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer.

Try increasing the size of the DSA or EDSA. See the Configuring or the Developing system programs for CICS for further information on controlling CICS storage.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHAPDM, DFHAPSIP

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHAP0004	*applid* **A possible loop has been detected at offset** *X'offset'* **in module** *modname.*

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in

module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

If this message is issued from DFHAPEX or DFHSUEX, and the exit point is XDUREQ, then a system dump is not taken in order to prevent recursive dumping.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module *modname* will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname,* and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHAPDM, DFHAPDN, DFHAPEX, DFHAPIQ, DFHAPJC, DFHAPSM, DFHAPST, DFHAPSI, DFHAPXM, DFHAPXME, DFHDKMR, DFHEDFE, DFHEISR, DFHICXM, DFHSAIQ, DFHSIPLT, DFHSTDT, DFHSTFC,

2. *X'offset'*
3. *modname*

Destination

Console

DFHAP0005	*applid* **A hardware error has occurred (module *modname*, code X'*code*'). MVS Store Clock found inoperative.**

Explanation

A hardware error has occurred during the running of module *module*. The MVS store clock facility is the timing mechanism for the operating system.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

System action

An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Investigate the MVS store clock to determine whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHAP0100	*applid* **Suffixed module** *modname* **cannot be loaded. Enter new suffix,** *YES***(unsuffixed),** *NONE***(dummy), or** *CANCEL*

Explanation

During AP domain initialization, a suffixed CICS module or table could not be loaded.

System action

The AP domain initialization routines wait for the operator to:

- Enter an alternative two-character suffix,
- Enter 'YES' to request the unsuffixed version,
- Enter 'NONE' to request that a dummy version of the program or table be loaded, or
- Enter 'CANCEL'.

    If 'CANCEL' is entered, CICS is abnormally terminated at the end of the nucleus process.

User response

Determine whether the suffix is correct. If it is not, enter one of the replies listed in the System Action.

If you enter 'CANCEL', correct the error by adding the module to the appropriate library and then restart CICS.

Module:
DFHSIB1

CMIG

DFHAP0601	*APPLID* **Force purge of transaction id** *tranid* **transaction number** *trannum* **has been deferred because the transaction is executing post commit syncpoint processing.**

Explanation

CICS has received a request to force purge a transaction. The target of the force purge request is part way through processing the second phase of a two phase syncpoint. If the purge was accepted at this time, the target transaction would be abended and this would cause CICS to fail with a U0408 abend. There is no way of purging the target transaction while it is in this state. Transactions should only remain in this state for a short period of time. A subsequent attempt to force purge the transaction may preempt the deferred abend issued by the system when this condition was detected. This would result in the transaction being purged from the system faster than if the deferred purge is left to take effect.

System action

CICS defers the purge until the target transaction is no longer protected against purge.

User response

Retry the purge after a short interval if the target transaction has not ended.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHAPXME

3. *trannum*

Destination

Console

DFHAP0602   *APPLID* **Force purge of transaction id** *tranid* **transaction number** *trannum* **has been deferred because the transaction is executing transaction backout.**

Explanation

CICS has received a request to force purge a transaction. The target of the force purge request is part way through transaction backout processing (either as a result of an earlier transaction abend, or a syncpoint rollback request). If the purge was accepted at this time, the target transaction would be abended and this would cause CICS to fail with a U0405 abend. There is no way of purging the target transaction while it is in this state. Transactions should only remain in this state for a short period of time. A subsequent attempt to force purge the transaction may preempt the deferred abend issued by the system when this condition was detected. This would result in the transaction being purged from the system faster than if the deferred purge is left to take effect.

System action

CICS defers the purge until the target transaction is no longer protected against purge.

User response

Retry the purge after a short interval if the target transaction has not ended.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHAPXME

XMEOUT parameters/Message inserts

1. *APPLID*
2. *tranid*
3. *trannum*

Destination

Console

DFHAP0603   *applid* **Forcepurge of transaction ID** *tranid*, **transaction number** *trannum*, **recovery token** *X'rtoken'* **has been deferred because the transaction is waiting for a DLI request in DBCTL to complete.**

Explanation

CICS has received a request to forcepurge a transaction. The target of the forcepurge request is waiting in DBCTL (or an IMS DC system which CICS thinks is a DBCTL) for the DLI request to complete. If the forcepurge was accepted at this time, the IMS system would fail with a U113 abend. The target transaction cannot be purged while it is in this state. Transactions should only remain in this state for a short time, unless the transaction is requesting some data or resource held by some other task in DBCTL. The recovery token may be used to identify which DBCTL thread corresponds to your task. (Issue /DIS CCTL ALL against the relevant DBCTL). One of the other active threads probably holds the resource you are waiting for. A subsequent attempt to forcepurge the transaction may preempt the deferred abend issued by the system when this condition was detected. This would result in the transaction being purged from the system faster than if the deferred purge is left to take effect.

System action

CICS defers the forcepurge until the target transaction is no longer protected against purge.

User response

Retry the forcepurge after a short interval if the target transaction has not ended. If the purge is still deferred, you will not be able to purge this transaction until the resource it is waiting for is released.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHAPXME

XMEOUT parameters/Message inserts

1. *applid*
2. *tranid*
3. *trannum*
4. *X'rtoken'*

Destination

Console

DFHAP0604   *applid* **Forcepurge of transaction ID** *tranid*, **transaction number** *trannum*, **recovery token** *X'rtoken'* **has been deferred because the**

transaction is on a CICS-DB2 ready queue waiting for a thread or TCB to become available.

Explanation

CICS has received a request to forcepurge a transaction. The target of the forcepurge request is queued on a CICS-DB2 ready queue awaiting a DB2 thread or TCB to become available. The target transaction cannot be purged while it is in this state.

If the CEMT INQUIRE TASK panel shows the task with an htype value of 'CDB2TCB', this means the task is awaiting a CICS-DB2 subtask TCB to become available, meaning that the DB2CONN defined TCBLIMIT has been reached.

If the CEMT INQUIRE TASK panel shows the task with an htype value of 'CDB2CONN', this means the task is awaiting a CICS-DB2 connection to become available with which to associate with the CICS open tcb to be used for the request. This indicates that the DB2CONN defined TCBLIMIT has been reached which limits the number of open TCBs that can be used for DB2.

If the htype value is 'CDB2RDYQ',this means the task is awaiting a CICS-DB2 thread to become available, and Hvalue identifies the pool, or the particular DB2ENTRY against which it is queued.

Transactions should remain in these states only for a short time.

System action

CICS defers the forcepurge until the target transaction is no longer protected against purge.

User response

If the task is queued awaiting a CICS-DB2 subtask TCB, you can increase the value of TCBLIMIT in the DB2CONN. If the transaction is awaiting a CICS-DB2 thread, you can increase the THREADLIMIT value in the DB2ENTRY, or in the DB2CONN for the pool.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Destination

Console

DFHAP0701	*applid* **An abend (code *abcode*) has occurred in exit program *progname* at exit point *xxxxxxxx*.**

Explanation

An abnormal end (abend) or program check has occurred in the program *progname*. This implies that there is an error in the error program, that unexpected data has been input, or storage has been overwritten.

The code is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to

a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

CICS makes an exception entry in the trace table and returns a zero return code to the exit point. CICS also produces a system dump unless:

- You have specifically suppressed dumps in the dump table, or
- The exit point is XDUREQ. No dump is taken in order to avoid recursive dumping.

Either CICS continues unless you have specified in the dump table that CICS should terminate.

Or This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. If this is the case, a zero return code is returned to the CICS management module.

User response

There might be a logic error in the user exit program *progname*. DISABLE the exit program from all exit points, by using the EXITALL operand in the EXEC CICS DISABLE, and correct the error.

For programming information about coding user exit programs see the Developing system programs for CICS.

Destination

Console

DFHAP0704	***applid* A possible loop has been detected in exit program *progname* at exit point *xxxxxxxx*.**

Explanation

The exit program *progname* was in control and the transaction has consumed more CPU time than has been specified in the ICVR. There is probably a loop.

System action

CICS returns a zero return code to the exit point. CICS also produces a system dump unless

- You have specifically suppressed dumps in the dump table, or
- The exit point is XDUREQ. No dump is taken in order to avoid recursive dumping.

User response

There is a probable logic error in the user exit program *progname*. DISABLE the exit program from all exit points by using the EXITALL operand in the EXEC CICS DISABLE, and correct the error.

Refer to the Developing system programs for CICS for further information about coding user exit programs.

If you think there is no loop, you can increase the runaway task time interval in the ICVR by using CEMT. This is explained in the CICS Supplied Transactions manual.

Module:
DFHSUEX, DFHUEH

XMEOUT parameters/Message inserts

1. *applid*
2. *progname*
3. *xxxxxxxx*

Destination

Console

DFHAP0705 W	***date time applid* The enable of task related user exit program *progname* has caused CICS to force TASKDATALOC(BELOW) for all transactions.**

Explanation

Task-related user exit program *progname* has been enabled with options TASKSTART and LINKEDITMODE, and *progname* has been linkedited AMODE 24. This ensures that it is always invoked in amode 24. An amode 24 task-related user exit program can only be invoked if the calling transaction is defined with TASKDATALOC(BELOW).

By enabling the AMODE 24 task-related user exit for task start, the user has forced CICS to force all subsequent transactions to run with TASKDATALOC(BELOW).

System action

CICS continues, but for the remainder of the CICS run, CICS insists that all transactions run with TASKDATALOC(BELOW).

User response

To avoid all transactions having to run with TASKDATALOC(BELOW), modify the task-related user exit so that it is capable of running AMODE(31) when invoked for task start.

Ideally the task-related user exit should be modified so that it always runs AMODE 31 for whoever is the caller. In this case the exit program can be linkedited with the AMODE 31 attribute, and enabled with the LINKEDITMODE option. This ensures CICS always invokes it in AMODE 31.

Alternatively the task-related user exit could be modified so it is capable of being invoked in either amode. In this case the exit should be enabled without the LINKEDITMODE option. This means the exit will be invoked in the amode of its caller. For CICS calls such as task start, this will always be AMODE 31, but it does allow the exit to be invoked AMODE 24 for calls from an amode 24 application if this is desired.

See the Defining resources. for more information on the TASKDATALOC option.

See the Developing system programs for CICS for programming information on the LINKEDITMODE option when enabling task-related user exits.

CSTL

DFHAP1213	*applid* **An unexpected error has occurred during the LOAD of the** *modname* **module with system completion code** *compcode* **and reason code** *reason* **.**

Explanation

Either an error was detected when CICS tried to load one of the required language interface modules, or the region size you have defined for CICS is too small.

During the language initialization phase of CICS startup, an unexpected error has occurred while CICS

was initializing the necessary support. Possibly CICS has determined that there is insufficient storage to enable run-time language support to be correctly installed. Application program execution is likely to be severely restricted if CICS continues.

System action

CICS initialization continues.

User response

You should examine the console log for any error messages which may have been issued by the operating system immediately preceding this CICS message. If no operating system messages were issued, it is likely that there is insufficient storage for CICS to continue and you should restart CICS with a larger region size.

Console

DFHAP1218	*DATE TIME APPLID* CEEPIPI function *pipifn* failed with return code *r15rc*.

Explanation

CICS XPLINK called CEEPIPI with one of the following function codes:

```
1  = init_main to initialize a new PIPI
execution
            environment
2  = call_main to invoke the main program in the
            PIPI environment
```

```
 5  = term       to terminate a PIPI execution
                  environment
 6  = add_entry  to add an entry to the PIPI
PreInit
                  Table
11 = delete_entry to delete an entry from the
PIPI
                  PreInit Table
```

A non-zero return code from CEEPIPI indicates that the function failed.

System action

Language Environment may have written diagnostic information to the CESE destination. CICS abends the transaction with an abend code of ALX1, ALX2, ALX3, ALX4 or ALX5 depending upon the reason for the call to CEEPIPI.

User response

Look at SYSOUT or the CESE destination for Language Environment messages. Look in z/OS Language Environment Programming Guide for the CEEPIPI function and the explanation of the return code which is in Register 15.

CSMT

DFHAP1226	*date time applid* **Program** *program* **is defined as EXECKEY(USER) but transaction** *transaction* **as TASKDATAKEY(CICS): these attributes are incompatible.**

Explanation

An attempt has been made to run a program defined as EXECKEY(USER) as part of a transaction defined as TASKDATAKEY(CICS). These attributes are incompatible. This incompatibility could occur as a result of the program definition being autoinstalled. See the Developing system programs for CICS and the Defining resources for more information about program autoinstall.

System action

The transaction will be abnormally terminated with abend code AEZD.

User response

Redefine and install a new definition either for the transaction with TASKDATAKEY(USER), or for the program with EXECKEY(CICS).

If this message occurs when running a CICS transaction, a possible cause is that you are not using the CICS-supplied definition for the program. If you are using your own copies of CICS-supplied program definitions, they must be defined as EXECKEY(CICS).

Module:
DFHAPLI

CSMT

DFHAP1300	*DATE TIME APPLID* **The JVM at address** *X'jvm_anchor'* **on thread** *X'thread_anchor'* **has encountered an error (reason code:** *X'reason_code'*) **and has requested further diagnostic data from CICS. More information may be found in the STDERR file:** *stderr***.**

Explanation

An error condition was detected by one of the JVMs in the JVMPool. The JVM invoked CICS services to capture a system dump. The JVM may recover, and continue processing, or may terminate. The JVM may write further data to the current *stderr* file indicated in the message.

System action

A system dump is taken. For critical errors in the JVM, the JVM is terminated. If a CICS program was in control at the time of the failure, the program is abended. If the failure occurred during task termination, the current transaction is rolled back.

Processing continues by recreating the JVM or using other JVMs in the JVMPool.

User response

Read the STDERR log for the JVM. The JVM will have written any of its own diagnostics messages to this location. Examine the system dump using the JVM formatting utility. Use the address (*jvm_anchor*) shown in the message to identify the JVM. Optionally, use the address (*thread_anchor*) shown in the message to identify the thread in the JVM. The failure may be due to a JVM internal error, or to a component loaded by the JVM as a Native method or plug-in. The reason code given (*reason_code*) may be a signal handle or other code defined by the JVM. Use the information generated by the JVM in the *stderr* file to assist in the diagnosis of the problem.

Destination

Console

DFHASnnnn messages

DFHAS0001   *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation

An abnormal end (abend) or program check occurred in module *modname*. This abend or program check implies that there might be an error in the CICS code. Alternatively, unexpected data was input, or storage was overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, the first three characters in the code are filled with three hyphens. The CICS code is an abend code or a number that refers to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you suppressed dumps in the dump table.

CICS continues unless you specify in the dump table that CICS must terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the systems programmer. If CICS is still running, you must decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This code shows, for example, whether the error was a program check, an abend, or a runaway, and might give some guidance to the correct user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue, and terminate CICS at a convenient time to resolve the problem.

If you cannot continue without the full use of module *modname* you must terminate CICS in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHASAS, DFHASDM, DFHASNT, DFHASRM

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHAS0002   *applid* **A severe error (code** *X'code'***) occurred in module** *modname***.**

Explanation

An error occurred in module *modname*. The code X'*code*' is the exception trace point ID that uniquely identifies what the error is and where the error was detected. For more information about CICS exception trace entries, see Troubleshooting and support.

System action

An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you suppressed dumps in the dump table.

CICS continues unless you specified in the dump table that CICS must terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the systems programmer. This exception entry indicates a possible error in CICS code. The severity of its impact depends on the importance of the function that was running at the time of the error.

CICS might not terminate.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you might decide to continue to run and terminate CICS at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname,* you must terminate CICS in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHASAS, DFHASDM

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHAS0004	*applid* **A possible loop has been detected at offset *X'offset'* in module *modname.***

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction that was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which

is measured in milliseconds). This means that the module *modname* will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname,* and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

SYSPRINT

DFHBA0217   **Module** *module* **unexpected keyword at position** *position***.**

Explanation

A sysin parameter error has been detected.

An unexpected keyword has been found. The message contains the name of the module that detected the error and the position of the unexpected keyword.

System action

The program terminates with return code 12.

User response

Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHATUP DFHBARUP

Destination

SYSPRINT

DFHBA0218   **Module** *module* **duplicate auditlog keyword at position** *position***.**

Explanation

A sysin parameter error has been detected.

A duplicate auditlog keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate keyword.

System action

The program terminates with return code 12 after all the sysin parameters have been processed.

User response

Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHATUP DFHBARUP

Destination

SYSPRINT

DFHBA0219   **Module** *module* **continuation not allowed.**

Explanation

A sysin parameter error has been detected.

A parameter card contains an invalid continuation character. The message contains the name of the module that detected the error.

System action

The program terminates with return code 12 after all the sysin parameters have been processed.

User response

Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHATUP DFHBARUP

Destination

SYSPRINT

DFHBA0220   **Module** *module* **unexpected end of file.**

Explanation

A sysin parameter error has been detected.

The last sysin card read before end of file was reached has a continuation indicator. The message contains the name of the module that detected the error.

System action

The program terminates with return code 12.

User response

Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHATUP DFHBARUP

Destination

SYSPRINT

DFHBA0221   **Error opening** *file* **in module**
                   module.

Explanation

An open of the auditlog has failed.

The message contains the name of the module that
detected the error and the name of auditlog data set.

System action

The program terminates with return code 12.

User response

Check if any additional system messages have been
issued that may help you to determine the cause of the
problem.

If the problem cannot be determined and corrected,
you will need further assistance from IBM.

Module:
DFHATUP

Destination

SYSPRINT

DFHBA0222   **Module** *module* **terminated**
                   because of errors, check
                   SYSPRINT for details.

Explanation

The program has detected errors that have caused it to
terminate.

Additional error messages have been output to
SYSPRINT.

System action

The program terminates with return code 12.

User response

Use the additional messages output to SYSPRINT to
determine the cause of the problem.

If the problem cannot be determined and corrected,
you will need further assistance from IBM.

Module:
DFHATUP DFHBARUP

Destination

Console

DFHBA0223   **Module** *module* **terminated**
                   because of errors, check previous
                   console messages for details.

Explanation

The program has detected errors that have caused it to
terminate.

Additional error message will have been issued at the
console.

System action

The program terminates with return code 12.

User response

Use the additional messages issued at the console to
determine the cause of the problem.

If the problem cannot be determined and corrected,
you will need further assistance from IBM.

Module:
DFHATUP DFHBARUP

Destination

Console

DFHBA0224   **Gencb failed in module** *module*.
                   R15 = *X'r15val'* **R0 =** *X'r0val'*.

Explanation

A Vsam gencb macro call has failed.

The message contains the name of the module that
issued the failed gencb and the register 15 and 0
values at the time of the error. At the time of the error
register 15 contains the return code and register 0
contains the reason code. The reason code is only valid
if the return code is 4.

System action

The program terminates with return code 12.

User response

Use the return code and reason code values to
determine the cause of the problem.

Check if any additional system messages have been
issued that may help you to determine the cause of the
problem.

If the problem cannot be determined and corrected,
you will need further assistance from IBM.

Module:

DFHBARUP

Destination

SYSPRINT

DFHBA0225   **Modcb failed in module *module*. R15 = *X'r15val'* R0 = *X'r0val'*.**

Explanation

A Vsam modcb macro call has failed.

The message contains the name of the module that issued the failed modcb and the register 15 and 0 values at the time of the error. At the time of the error register 15 contains the return code and register 0 contains the reason code. The reason code is only valid if the return code value is 4.

System action

The program terminates with return code 12.

User response

Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHBARUP

Destination

SYSPRINT

DFHBA0226   **Showcb failed in module *module*. R15 = *X'r15val'* R0 = *X'r0val'*.**

Explanation

A Vsam showcb macro call has failed.

The message contains the name of the module that issued the failed showcb and the register 15 and 0 values at the time of the error. At the time of the error register 15 contains the return code and register 0 contains the reason code. The reason code is only valid if the return code value is 4.

System action

The program terminates with return code 12.

User response

Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHBARUP

Destination

SYSPRINT

DFHBA0227   **Error opening *file* in module *module*. R15 = *X'r15val'* reason code = *X'reasval'*.**

Explanation

A Vsam open macro call has failed.

The message contains the name of the data set being opened, the name of the module issuing the open, the register 15 and reason code values at the time of the error. At the time of the error register 15 contains the return code.

System action

If the register 15 value is 4 the program continues. If the register 15 value is 8 or greater the program terminates with return code 12.

User response

Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHBARUP

Destination

SYSPRINT

DFHBA0228   **Error closing *file* in module *module*. R15 = *X'r15val'* reason code = *X'reasval'*.**

Explanation

A Vsam close macro call has failed.

The message contains the name of the data set being closed, the name of the module issuing the close, the register 15 and reason code values at the time of the error. At the time of the error register 15 contains the return code.

System action

The program continues. This may indicate a problem with the repository data set.

User response

Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHBARUP

Destination

SYSPRINT

DFHBA0229	Get for *file* failed in module *module*. R15 = *X'r15val'* reason code = *X'reasval'*.

Explanation

A Vsam get macro call has failed.

The message contains the name of the data set that the get is being issued against, the name of the module issuing the get, the register 15 and reason code values at the time of the error. At the time of the error register 15 contains the return code.

System action

The program terminates with return code 12.

User response

Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHBARUP

Destination

SYSPRINT

DFHBA0230	Point for *file* failed in module *module*. R15 = *X'r15val'* reason code = *X'reasval'*.

Explanation

A Vsam point macro call has failed.

The message contains the name of the data set that the point failed on, the name of the module issuing the point, the register 15 and reason code values at the time of the error. At the time of the error register 15 contains the return code.

System action

The program terminates with return code 12.

User response

Use the return code and reason code values to determine the cause of the problem.

Check if any additional system messages have been issued that may help you to determine the cause of the problem.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHBARUP

Destination

SYSPRINT

DFHBA0231	The set of records associated with the activity or process being read are not complete.

Explanation

The set of process or activity records being read is incomplete.

System action

The program continues processing with the next process or activity.

User response

If the repository file is being accessed by a CICS region while the DFHBARUP job is running the CICS region or regions have deleted the set of records being processed by DFHBARUP.

If this is not the case then further investigation will be required.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHBARUP

Destination

SYSPRINT

DFHBA0232	No records selected by module *module*.

Explanation

No records have been selected for printing.

The message contains the name of the module involved.

System action

The program completes with return code 0.

User response

Check that the selection parameters are correct and the correct file is being processed.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHATUP DFHBARUP

Destination

Console

DFHBA0233	Module *module* has completed processing.

Explanation

Processing has completed.

The message contains the name of the module involved.

System action

The program completes with return code 0.

User response

None

Module:
DFHATUP DFHBARUP

Destination

Console

DFHBA0234	Module *module* has a duplicate repository keyword at position *position*.

Explanation

A sysin parameter error has been detected.

A duplicate repository keyword has been found. The message contains the name of the module that detected the error and the position of the duplicate keyword.

System action

The program terminates with return code 12 after all the sysin parameters have been processed.

User response

Correct the error and submit the job again.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:
DFHBARUP

Destination

SYSPRINT

DFHBA0235	The container record being processed is not complete.

Explanation

The container being processed is incomplete.

System action

The program continues processing with the next process or activity.

User response

If the repository file is being accessed by a CICS region while the DFHBARUP job is running the CICS region or regions may be altering the container records as DFHBARUP is processing them.

If this is not the case then further investigation will be required.

If the problem cannot be determined and corrected, you will need further assistance from IBM.

Module:

DFHBRnnnn messages

DFHBR0201   *DATE TIME APPLID* **Transaction** *TRANID* **abend** *abcode* **in bridge exit** *brexit* **bridge transaction** *bridge*

Explanation

The Bridge exit *brexit* terminated abnormally with abend code *abcode*.

abcode is either a CICS transaction abend code or a user abend code generated by a CICS ABEND ABCODE(*abcode*) command. This command is issued either by a user program or by an IBM program (for example, a programming language library module).

Unless the abend occurred whilst the bridge exit was processing the termination or abend call, this abend will also result in CICS issuing a ABRQ abend. In this case a DFHAC2236 abend message will follow this message. See that message for details about recoverable resources.

System action

Abend ABRQ will be issued unless the transaction is calling the bridge exit for termination or abend processing.

User response

Use the abend code *abcode* to diagnose the problem. If the abend is issued by an IBM program product other than CICS, the code is documented in the library of that other product.

Alternatively, there might be a logic error in the bridge exit program *brexit*. For programming information about coding bridge exit programs see the Developing system programs for CICS.

Module:
DFHBRIC, DFHBRMS, DFHBRSP, DFHBRTC, DFHBRXM, DFHBRRM

7. *bridge*

Destination

CSBR

DFHBR0202   *DATE TIME APPLID USERID TRANID* **Bridge facility autoinstall URM** *urmname* **has abended with code** *abcode*.

Explanation

The Bridge facility autoinstall URM terminated abnormally with abend code *abcode*.

abcode is either a CICS transaction abend code or a user abend code generated by a CICS ABEND ABCODE(*abcode*) command.

System action

The autoinstall URM is disabled. This prevents the autoinstalling of new bridge facilities, as well as the other functions of the autoinstall exit.

User response

Use the abend code *abcode* to diagnose the problem. If the abend is issued by an IBM program product other than CICS, the code is documented in the library of that other product.

Alternatively, there might be a logic error in the autoinstall URM.

When the error has been found and the problem corrected enable the autoinstall URM to re-enabled the mechanism.

Module:
DFHBRAI

7. *abcode*

Destination

CSBR

DFHBR0203　　*DATE TIME APPLID USERID TRANID* **Bridge facility autoinstall URM** *urmname* **could not be linked. The autoinstall function has been disabled.**

Explanation

The Bridge facility autoinstall URM could not be linked.

System action

The autoinstall URM is disabled. This prevents the autoinstalling of new bridge facilities, as well as the other functions of the autoinstall exit.

User response

Unless there are other messages preceding this message indicating the cause of the problem, the probable cause is that the URM cannot be found in the DFHRPL concatenation.

When the error has been found and the problem corrected enable the autoinstall URM to re-enabled the mechanism.

Module:
DFHBRAI

XMEOUT parameters/Message inserts

1. *DATE*
2. *TIME*
3. *APPLID*

6. *urmname*

Destination

CSBR

DFHBR0204　　*DATE TIME APPLID USERID TRANID* **Bridge facility autoinstall URM** *urmname* **is disabled. The request will fail.**

Explanation

The Bridge facility autoinstall URM is disabled (other than as a result of an error detected by the bridge).

System action

This prevents the autoinstalling of new bridge facilities, as well as the other functions of the autoinstall exit.

User response

The probable cause of this is either that the URM was disabled by the operator, or as a result of some action of one of the other functions of the autoinstall URM.

The mechanism can be re-started by enabling the URM. Alternatively the command SET AUTOINSTALL AIBRIDGE(AUTO) can be issued to allow autogeneration of bridge facilities.

Module:
DFHBRAI

CSBR

DFHBR0403	*date time applid* **Transaction** *tranid* **definition conflicts with Bridge Link3270 routing requirements.**

Explanation

The client request to execute the transaction in the BRIH cannot be routed to the AOR region because the transaction definition routing information conflicts with the routing information for the bridge facility.

The first application transaction definition that uses a bridge facility is used to determine where all transactions that use that facility are to be executed. The transaction definition of the transaction that the client has supplied in the BRIH conflicts with that definition.

All transactions that are to be executed under a bridge facility must have the same routing characteristics as the first transaction executed under the bridge facility.

System action

The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response

Ensure that the transaction definition of all transactions that are to be used by a bridge facility do not cause routing conflicts.

Module:
DFHBRMR

XMEOUT parameters/Message inserts

DFHBR0427	*date time applid* **The Bridge Link3270 connection for *{request allocate_facility (	request delete_facility (	request continue_conversation (	request get_more_message (	request resend_message (	transaction } tranid {} to system	to system } sysid* has failed.**

Explanation

The Bridge Link3270 request has been routed to a remote CICS region. An unrecoverable error occurred during the conversation with the mirror program DFHBRMP (for example, if a session fails, or the server region fails).

System action

The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response

After the connection has been restored the client can issue a resend message request to determine the status of the application transaction in the AOR.

Module:
DFHBRMR

XMEOUT parameters/Message inserts

1. *date*

DFHBR0430	*date time applid* **Routing of the Bridge Link3270 request for transaction *tranid* to system *sysid* failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system could not be found in the intersystem table.**

Explanation

The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the Bridge Link3270 request to the remote system failed because the remote system could not be found in the intersystem table.

System action

The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response

Ensure that the connection definitions are correct and that the dynamic transaction routing URM supplies a valid system for the request.

Module:
DFHBRMR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *sysid*

Destination

CSBR

DFHBR0431	*date time applid* **Routing of the Bridge Link3270 request for transaction *tranid* to system *sysid* failed. The dynamic transaction routing program completed with return code 8. Last attempt to**

route request failed because the remote system was out of service.

Explanation

The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote system was out of service.

System action

The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response

Investigate the reason for the remote system being out of service.

When the remote system is back in service the client can retry the Bridge Link3270 request.

Module:
DFHBRMR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *sysid*

Destination

CSBR

DFHBR0432	*date time applid* **Routing of the Bridge Link3270 request for transaction** *tranid* **to system** *sysid* **failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the session allocation was rejected.**

Explanation

The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote session allocation was rejected.

System action

The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response

Investigate the reason for the rejection of the allocation of the session.

The transaction definition queuelimit value and global user exit XZIQUE can be used to control the size of the session queue and decide if a request is to be rejected or not. Refer to the Defining resources, the Developing system programs for CICS and the CICS intercommunication manuals for further information.

Module:
DFHBRMR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *sysid*

Destination

CSBR

DFHBR0433	*date time applid* **Routing of the Bridge Link3270 request for transaction** *tranid* **to system** *sysid* **failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the session allocation queue was purged.**

Explanation

The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote session allocation queue was purged.

System action

The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response

Investigate the reason for the purge of the session allocation queue.

The transaction definition queuelimit and maxqtime field values determine when the queue will be purged. Global user exit ZXIQUE can also be used to control the queue. Refer to the Defining resources, the Developing system programs for CICS and the CICS intercommunication manuals for further information.

Module:
DFHBRMR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

5. *sysid*

Destination

CSBR

DFHBR0434	*date time applid* **Routing of the Bridge Link3270 request for transaction** *tranid* **to system** *sysid* **failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system did not support the function.**

Explanation

The transaction *tranid* supplied by the client in the BRIH is defined as remote. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote system did not support the function. The remote system would not support the function for one of the following reasons.

1. The remote system is connected via a LUTYPE 6.1 connection.
2. The remote system does not support the Bridge Link3270 function.

System action

The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response

Ensure that the dynamic transaction routing program does not route Bridge Link3270 request over TYPE6.1 connections and that the requests are routed to a remote region that is at the correct level to support Bridge Link3270 requests.

Module:
DFHBRMR

DFHBR0501	*date time applid* **File *filename* is not available. *{The file is disabled	The file is not open	The file was not found	SMSVSAM server is not available	CFDT server is not available	The dataset is being copied	An IO error occurred	The file is defined as recoverable}*.**

Explanation

One of the following errors was detected when attempting to access the file:

• The file is disabled.

- The file is not open.
- The file was not found.
- The SMSVSAM server is not available.
- The CFDT server is not available.
- The dataset is being copied.
- An I/O error occurred.
- The file is defined as recoverable.

System action

The file is not available. The BRIH returned to the client will contain an unsuccessful return code.

User response

Investigate the error which caused the file to be made unavailable. Correct the cause of the problem and retry the failed transaction.

Module:
DFHBRNS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *filename*
5. Value chosen from the following options:

   1=The file is disabled,

   2=The file is not open,

   3=The file was not found,

   4=SMSVSAM server is not available,

   5=CFDT server is not available,

   6=The dataset is being copied,

   7=An IO error occurred,

   8=The file is defined as recoverable

Destination

CSBR

DFHBR0502   *date time applid* **Not authorized to access file** *filename***.**

Explanation

The external security manager would not allow the file to be accessed.

System action

The BRIH returned to the client contains an unsuccessful return code.

User response

If the user should have access to the file, allow access and retry the transaction.

Module:
DFHBRNS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *filename*

Destination

CSBR

DFHBR0503   *date time applid* **File** *filename* **is full.**

Explanation

The file is full. New records cannot be added to the file.

System action

The BRIH returned to the client contains an unsuccessful return code.

User response

Increase the size of the file and retry the failed transaction.

Module:
DFHBRNS

XMEOUT parameters/Message inserts

5. *sysid*

Destination

CSBR

DFHBR0509　　*date time applid* You are approaching or have reached the maximum number of times a Link3270 bridge routing region can be started.

Explanation

The maximum number of times Link3270 bridge routing regions that use the same DFHBRNSF data set can be started is approaching or has already been reached. An invalid facilitytoken is allocated if the number of times these CICS routing regions are connected (connection_number), exceeds the maximum.

This message is issued if you have exceeded 90% of the available times routing regions using the same DFHBRNSF data set can be started.

System action

The Link3270 bridge request continues to be processed. When 100% of the available times routing regions, using the same DFHBRNSF data set, can be started is reached, the request abends AEXZ.

User response

At a convenient time, stop all regions that use the Link3270 bridge routing data set, DFHBRNSF, and redefine it. This resets connection_number to 0. Restart your routing regions.

Module:
DFHBRNS

XMEOUT parameters/Message inserts

DFHCA4807 E *date time applid tranid* **Install
failed for LSRPOOL with
LSRPOOLNUM(***lsrpoolnum***). The
MAXKEYLENGTH is less than 22
which is incorrect for use by the
CSD.**

Explanation

An attempt to install an LSRPOOL with LSRPOOLNUM
lsrpoolnum has failed. The system detected that the
installation of this LSRPOOL would cause the CSD to
become not readable. The MAXKEYLENGTH parameter
on this LSRPOOL definition is invalid for an LSRPOOL
used by the CSD.

System action

This install fails and the previous LSRPOOL definition
remains installed.

User response

The MAXKEYLENGTH parameter on the LSRPOOL
definition must be at least 22 as this is the keylength
required by the CSD. To resolve this problem,
either change the LSRPOOL definition to have a
MAXKEYLENGTH of 22 or greater, or change the
DFHCSD file definition to use RLS or NSR.

CSMT

DFHCA4812 W   *date time applid tranid* **Install of LIBRARY** *libname* **encountered a data set {allocation | concatenation | open} failure. The LIBRARY is installed but disabled.**

Explanation

Install of the dynamic LIBRARY resource *libname* has completed but one of the steps required for the successful completion of the LIBRARY install process has failed. The error occurred while attempting to do one of the following:

- Allocate a data set that was defined as one of the DSNAME attributes in the LIBRARY resource definition
- Concatenate the data sets together
- Open the LIBRARY concatenation.

The message text indicates which of these errors has occurred. Due to the error, the LIBRARY has been installed, but with an enablement status of DISABLED, which means that it will not participate in the search order used when loading programs and program artifacts.

System action

Processing continues. Even if the LIBRARY was defined with enablement status of ENABLED, the resource has been installed as DISABLED. Also, this LIBRARY will not be searched when program artifacts are loaded. Therefore, program artifacts that reside in the data sets defined for LIBRARY *libname* will not be loaded from this LIBRARY.

User response

Examine the messages issued by the Loader domain to determine the type of failure that occurred during install processing for this LIBRARY. When the problem has been resolved, SET LIBRARY *libname* to ENABLED in order for the LIBRARY to participate in the dynamic library search order process.

3. *applid*
4. *tranid*

Destination

CSMT

DFHCA4820 S *date time applid tranid* **Unable to perform request - CSD full.**

Explanation

The CSD file is full.

System action

Processing continues.

User response

Reenter the command when more space is available.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CSMT

DFHCA4823 S *date time applid tranid* **Unable to perform request - DFHCSD not open.**

Explanation

The CSD file (DFHCSD) is not open.

System action

Other processing continues.

User response

Ask the main terminal operator to open the file. The DFHCSD is defined in the bringup JCL and/or in the SIT.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CSMT

DFHCA4824 S *date time applid tranid* **Unable to perform request - Insufficient function in file definition for DFHCSD.**

Explanation

An EXEC CICS CSD command that required more function than is currently defined for the CSD file was issued.

The most likely causes of this error are an incorrectly coded CSDACC parameter in the SIT, or that a SET FILE command for DFHCSD has changed the allowable functions.

System action:

User response

Determine whether the required function should have been allowed and, if necessary, modify CSDACC or use CEMT SET FILE to change the attributes of DFHCSD.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CSMT

DFHCA4825 S *date time applid tranid* **Unable to perform request - File Control has returned an INVREQ response.**

Explanation

The file control file request handler (DFHFCFR) does not have sufficient function to support the command entered.

System action

The command is ignored.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CSMT

DFHCA4826 S   *date time applid tranid* **Unable to perform request - CSD corrupted**

Explanation

An attempt has been made to access a CSD file which has been corrupted.

1. The CSD file has been corrupted.

System action

Message DFHCA4826 is issued and CICS continues.

User response

Load a backup copy of the CSD file and use it in place of the corrupted file.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CSMT

DFHCA4827 S   *date time applid tranid* **Unable to perform request - DFHCSD could not be installed.**

Explanation

During initialization, CICS finds a GRPLIST parameter in the system initialization table (SIT), but cannot access the CSD file because file control failed to install it.

System action

Message DFHCA4827 is issued and CICS continues.

User response

Before the next CICS initialization, ensure that you have a SIT with the correct parameters for the definition of the DFHCSD file.

Assemble a new SIT as necessary.

   11=ATOMSERVICE

6. *resourcename*

Destination

CSMT

DFHCA4836 E	*date time applid tranid* **Install of DB2CONN** *db2conn-name* **failed because a DB2CONN is already installed and is in use.**

Explanation

An attempt to install the DB2CONN *db2conn-name* on the CICS system has failed because there is an existing DB2CONN installed and it is in use by the CICS-DB2 adapter.

System action

Processing continues. The definition is not installed.

User response

Only one DB2CONN can be installed on the CICS system at a time. The install of a second DB2CONN implies the discarding of the first DB2CONN and all its associated DB2ENTRYs and DB2TRANs.

A DB2CONN definition can be replaced or discarded only when it is not in use by the CICS-DB2 adapter. Ensure that the CICS-DB2 interface has been stopped before trying to install a DB2CONN definition.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *db2conn-name*

Destination

CSMT

DFHCA4837 E	*date time applid tranid* **Install of{ DB2ENTRY	DB2TRAN } name failed because a DB2CONN is not installed.**

Explanation

An attempt to install the DB2ENTRY or DB2TRAN *name* on the CICS system failed because there is no DB2CONN installed. DB2TRANs and DB2ENTRYs can be installed only after a DB2CONN has been installed.

System action

Processing continues. The definition is not installed.

User response

Install a DB2CONN definition and then retry the install of the DB2ENTRY or DB2TRAN.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. Value chosen from the following options:

   1= DB2ENTRY ,

   2= DB2TRAN

6. *name*

Destination

CSMT

DFHCA4838 E	*date time applid tranid* **Install of DB2ENTRY** *db2entry-name* **failed because an existing definition could not be deleted. The existing definition is not disabled.**

Explanation

An attempt to install the DB2ENTRY *db2entry-name* on the CICS system has failed because there is an existing DB2ENTRY of the same name which is not in a disabled state.

System action

Processing continues. The definition is not installed.

User response

Existing DB2ENTRY definitions can be replaced only when the DB2ENTRY is in a disabled state. Issue a command to disable the DB2ENTRY and then retry the install.

Module:
DFHAMP

XMEOUT parameters/Message inserts

4. *tranid*
5. *name*

Destination

CSMT

DFHCA4864 S   *date time applid tranid* **Unable to perform operation - DFHCSD cannot be opened.**

Explanation

CICS cannot use the CSD file for one of the following reasons:

1. The DDNAME or data set name of the CSD file is incorrectly coded in the startup JCL.
2. VSAM has diagnosed that the CSD file cannot be opened.
3. CICS file control cannot open DFHCSD because insufficient storage has been allocated by the job REGION= parameter.

System action

The command is not executed.

User response

The action to solve the problem depends on the cause as follows:

1. Correct the JCL.
2. Check the system operator's console for VSAM messages, and correct all VSAM errors.
3. Increase the size limit of the DSAs or EDSAs.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CSMT

DFHCA4865 S   *date time applid tranid* **Unable to perform operation - DFHCSD currently accessed by another user.**

Explanation

CICS cannot get read access to the CSD file because another region is accessing it, and the CSD cluster is defined to VSAM with either SHAREOPTIONS(1) or SHAREOPTIONS(2).

System action

The command is not executed and the CSD file is set in Unenabled status.

User response

Determine why a second CICS region is attempting to write to the CSD. See the Configuring for further details.

DFHCA4876 W	*date time applid tranid* **PARTNER** *partnername* **specifies NETNAME** *netname* **which is not found in any CONNECTION definition that specifies access method = VTAM.**

Explanation

There is no VTAM connection within the current group for the netname referenced in the specified partner.

System action

Other processing continues.

User response

None.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *partnername*
6. *netname*

Destination

CSMT

DFHCA4877 W	*date time applid tranid* **PARTNER** *partnername* **specifies a NETNAME and PROFILE for which there is no common implied SESSIONs definition.**

Explanation

The netname in a partner definition implies an associated connection definition which is in turn associated with a session definition. The profile definition referenced in a partner definition specifies a modename which can be associated with a sessions definition.

Within the current group, there is no common sessions definition implied by the specified partner definition.

System action

Other processing continues.

User response

None.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *partnername*

Destination

CSMT

DFHCA4878 E	*date time applid tranid* **Install of *{IPCONN} resourcename* failed**

because one with this name is already installed and is in use.

Explanation

An attempt to install the resource specified, *resourcename*, on the CICS system has failed because there is already an existing resource of this name installed and in use.

System action

Processing continues. The definition is not installed.

User response

The specified resource definition can be replaced or discarded only when it is out of service. Put the resource out of service before attempting to re-install it.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. Value chosen from the following options:

    9=IPCONN

6. *resourcename*

Destination

CSMT

DFHCA4879 W   *date time applid tranid {GROUP | LIST} name* **has been partially installed.**

Explanation

During the execution of an INSTALL command for the group or list *name*, some of the elements in the group or list installed successfully, but at least one failed.

System action

Messages are produced indicating why the element or elements failed to install.

User response

Use the messages already produced to determine why the install failed and to rectify the problem.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. Value chosen from the following options:

    1=GROUP,

    2=LIST

6. *name*

Destination

CSMT

DFHCA4880 S   *date time applid tranid* **Unable to perform operation - not allowed by file attributes for DFHCSD.**

Explanation

The CSDACC parameter in the system initialization table for DFHCSD does not allow execution of the specified EXEC CICS CSD command. The CSDACC parameter specifies the type of access permitted to the file. This can be one of the following:

    READWRITE
    READONLY

In order for a particular command to function, the access must be set appropriately.

System action

The command is ignored.

User response

Correct the CSDACC parameter in the SIT. The DFHCSD is defined in the bringup JCL and/or in the SIT.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*

2. *time*

DFHCA4884 S   *date time applid tranid restype*
                    name *resname* is reserved by
                    CICS.

Explanation

The name *resname* you have selected for resource type *restype* is reserved by CICS and cannot be user defined.

System action

The command is rejected.

User response

Redefine *resname* and resubmit the command.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *restype*
6. *resname*

Destination

CSMT

DFHCA4885 E   *date time applid tranid* **Install**
                    of IPCONN *resourcename* failed.
                    Duplicate applid *applid* found.

Explanation

IPCONN resource *resourcename* was being installed but was found to have the same applid *applid* as an IPCONN which is already installed.

System action

The resource is not installed; CICS continues.

User response

If you want the definitions to be installed, correct the applid on this IPCONN and then reinstall the definition.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *resourcename*
6. *applid*

Destination

CSMT

DFHCA4887 I *date time applid tranid* **Unrecognized resource type found in the CSD file and has been ignored.**

Explanation

CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action

The resource is ignored and the operation continues.

User response

Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

CSMT

DFHCA4914 E	*date time applid tranid* **Install of *resourcetype resourcename* failed. The specified *targetresource* is unusable.**

Explanation

Resource *resourcename* cannot be installed because the target resource *targetresource* with which it is associated is not usable.

System action

The resource is not installed.

User response

Discover why the target resource is not usable. It may not exist, or may not have been defined before it is being used. Create or define the referenced target resource.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *resourcetype*
6. *resourcename*
7. *targetresource*

Destination

CSMT

DFHCA4915 E	*date time applid tranid* **Install of** ***resourcetype resourcename*** **failed. Open for data set** *dsname* **has abended.**

Explanation

Resource *resourcename* cannot be installed because an abend occurred when opening the data set *dsname* that contains it.

System action

The resource is not installed.

User response

Look for an earlier IEC143I, IEC144I, IEC145I, IEC148I, IEC150I, or IEC153I message that explains why the dataset could not be opened. Correct whatever problem is described in the related message.

Module:
DFHAMP

CSMT

DFHCA4916 E	*date time applid tranid* **TCPIPSERVICE** *tcpipservice* **has not been opened because the MAXSOCKETS limit has been reached.**

Explanation

TCPIPSERVICE *tcpipservice* has not been opened because the number of active sockets in the system is equal to the current MAXSOCKETS value.

System action

The resource is installed but left in the closed state.

User response

Determine whether your MAXSOCKETS setting is adequate to handle normal system loads. If it is, then this may be a transient condition caused by a peak in work that uses sockets, and you may be able to use CEMT to open the TCPIPSERVICE once the workload diminishes. If not, use CEMT SET SYSTEM to increase the number of sockets in the system.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *tcpipservice*

Destination

CSMT

DFHCA4917 W   *date time applid tranid {CORBASERVER | TCPIPSERVICE | IPCONN | URIMAP} resourcename* **was installed with a reduced set of CIPHER codes.**

Explanation

The specified resource *resourcename* was installed but the the set of cipher codes which the resource was originally defined with has been reduced at install time because the running system did not support all of the ciphers specified.

System action

The resource is installed with a reduced set of cipher codes.

User response

Determine whether your CIPHERS setting is acceptable.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. Value chosen from the following options:

   1=CORBASERVER,

   7=TCPIPSERVICE,

   9=IPCONN,

   10=URIMAP

6. *resourcename*

Destination

CSMT

DFHCA4918 E   *date time applid tranid* **The installation of** *{CORBASERVER | TCPIPSERVICE | IPCONN | URIMAP} resourcename* **has failed because its requested CIPHER list was rejected.**

Explanation

Resource *resourcename* cannot be installed because all of the cipher codes specified for the resource have been rejected by the running system.

System action

The resource is not installed.

User response

Determine what your CIPHERS setting should be for the current MVS system.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. Value chosen from the following options:

   1=CORBASERVER,

   7=TCPIPSERVICE,

7. *filename*

Destination

CSMT

DFHCA4920 E	*date time applid tranid* **The installation of *{CORBASERVER | DJAR | PIPELINE | WEBSERVICE | LIBRARY | BUNDLE | JVMSERVER}* resourcename has failed because it is a duplicate of one which already exists.**

Explanation

The installation of the specified resource *resourcename* has failed because a resource with this name already exists in your running CICS system.

System action

The resource is not installed.

User response

For some resources, it is not possible to do an update (add/replace). Select a different resource name which is not known to the system. Or, if you want to use the same resource name, you must discard the resource first. The resource may need to be disabled before it can be discarded or updated.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

4. *tranid*
5. Value chosen from the following options:

   1=CORBASERVER,

   2=DJAR,

   3=PIPELINE,

6. *resourcename*

Destination

CSMT

DFHCA4928 E	*date time applid tranid* **Install of *{TCPIPSERVICE | CORBASERVER | IPCONN | URIMAP}* resourcename failed because the specified certificate *attname {is expired | is not yet current | is not owned by this CICS | is not trusted | is not found}*.**

Explanation

Resource *resourcename* cannot be installed because the specified certificate is unusable. An explanatory phrase in the message describes why:

expired

The date and time at which the certificate is no longer valid has already passed.

not yet current

The date and time at which the certificate is to become active has not yet been reached.

not owned by this CICS

The specified certificate belongs to a user other than the current CICS region userid. Only certificates belonging to the CICS region userid can be used by CICS.

not trusted

The certificate has been given the NOTRUST attribute by the security administrator. This indicates that the certificate is not to be used.

not found

The certificate is not found.

System action

The resource is not installed.

User response

Replace the certificate in the keyring with one that is usable, or specify a different certificate.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

    3=PIPELINE

Destination

CSMT

DFHCA4933 E *date time applid tranid* **The installation of PIPELINE** *resourcename* **failed because the WSDIR file specified is not accessible.**

Explanation

PIPELINE *pipeline* cannot be installed because the WSDIR specified is not correct and therefore the directory cannot be accessed.

System action

The resource is not installed.

User response

Ensure that the zFS file definitions of the WSDIR are correct, remembering that case is significant.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *resourcename*

Destination

CSMT

DFHCA4934 E   *date time applid tranid*
The installation of URIMAP
resourcename **failed because**
HOSTCODEPAGE *hcodepage* **is**
not valid in combination with
CHARACTERSET *charset***.**

Explanation

The URIMAP resource *resourcename* cannot be installed because the specified attributes are inconsistent. Most inconsistencies are eliminated at resource definition time. However, for a URIMAP resource, the consistency between the value specified for the HOSTCODEPAGE attribute and that specified for the CHARACTERSET attribute cannot be determined until install time.

System action

The resource is not installed.

User response

Check that the combination of CHARACTERSET and HOSTCODEPAGE values specified for the URIMAP is supported by the CICS system on which you are attempting to install the resource *resourcename*.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *resourcename*
6. *hcodepage*
7. *charset*

Destination

CSMT

DFHCA4935 E   *date time applid tranid* **Install of**
{TCPIPSERVICE | CORBASERVER |
IPCONN | URIMAP} resourcename
failed because the KEYRING has
no default certificate.

Explanation

The specified resource *resourcename* is not installed because no certificate label was specified in the CERTIFICATE attribute, and no default certificate exists in the keyring for this CICS system.

System action

The resource is not installed.

User response

Either specify a valid certificate label in the CERTIFICATE attribute for *resourcename*, or designate one of the certificates in the keyring as a default.

If you are using the z/OS Security Server (RACF) you designate a certificate as default using the RACDCERT command.

Note:

Whenever you change a keyring, either by adding or removing certificates, or by changing a certificate's status to or from default, the changes are not reflected in CICS until you restart the CICS address space.

Module:
DFHAMP

Destination

Console and Terminal End User

DFHCA4957 E   *applid* **Opening TCPIPSERVICE *tcpipservice* has failed because its specific TCPIPSERVICE *speciftcps* is not open.**

Explanation

Opening TCPIPSERVICE *tcpipservice* has failed because the specific TCPIPSERVICE *speciftcps* it requires is not open.

System action

The resource is installed but left in the closed state.

User response

Open the specific TCPIPSERVICE before attempting to open this resource.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *tcpipservice*
3. *speciftcps*

Destination

Console and Terminal End User

DFHCA4958 E	*applid* Opening **TCPIPSERVICE** *tcpipservice* **has failed because its specific TCPIPSERVICE** *speciftcps* **is in use by another TCPIPSERVICE.**

Explanation

Opening TCPIPSERVICE *tcpipservice* has failed because the specific TCPIPSERVICE *speciftcps* it requires is currently associated with another generic TCPIPSERVICE. Only one generic TCPIPSERVICE can use a specific TCPIPSERVICE at any time.

System action

The resource is installed but left in the closed state.

User response

Modify this TCPIPSERVICE so that it includes the name of a different specific TCPIPSERVICE and reinstall it.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *tcpipservice*
3. *speciftcps*

Destination

Console and Terminal End User

DFHCA4959 E	*applid* Opening **TCPIPSERVICE** *tcpipservice* **has failed because its specific TCPIPSERVICE** *speciftcps* **has different security settings.**

Explanation

Opening TCPIPSERVICE *tcpipservice* has failed because the specific TCPIPSERVICE *speciftcps* has different security settings. Both resources must have identical security settings for the open to succeed.

System action

The resource is installed but left in the closed state.

User response

Modify the security settings in one of these resources and reinstall it.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. *applid*
2. *tcpipservice*
3. *speciftcps*

Destination

Console and Terminal End User

DFHCA4960 E	*applid* Opening **TCPIPSERVICE** *tcpipservice* **has failed because its specific TCPIPSERVICE** *speciftcps* **is not one in use as a specific IPIC end point.**

Explanation

Opening TCPIPSERVICE *tcpipservice* has failed because the specific TCPIPSERVICE *speciftcps* is not one in use as an IPIC specific end point. Generic TCPIPSERVICEs must reference a TCPIPSERVICE that is a specific IPIC end point for the local region.

System action

The resource is installed but left in the closed state.

User response

Modify the SPECIFTCPS attribute in the resource definition, so that it names a TCPIPSERVICE that can be used as a specific IPIC end point, and reinstall it.

Module:

DFHCA5102 I   *date time applid netname tranid*
**Warning message(s) issued while
processing** *command* **command.**

Explanation

The CSD utility issued messages during syntax-checking and execution of the *command* command.

System action

Normal utility processing continues to the end of the job.

User response

Review the warning messages to see how they have affected utility processing. Then decide whether you need to submit a further CSD utility job.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *command*

Destination

CSMT

DFHCA5103 I   *date time applid netname tranid*
Error(s) occurred while processing
command **command.**

Explanation

The CSD utility either found a syntax error in the utility command *command*, or the command *command* failed to execute correctly.

System action

Utility command execution is terminated.

If commands are being read from a SYSIN data stream by the utility, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response

If the command failed because of syntax errors, correct the command.

If the command failed to execute correctly, this may have been caused by a previous error. In this case, an associated error message, such as DFHCA5275, should have been issued. Refer to these error messages for further guidance.

Correct all errors before trying to open the CSD file again.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *command*

Destination

CSMT

DFHCA5104 W   *date time applid netname tranid*
**Subsequent commands (except
LIST) are not executed because of
error(s) above.**

Explanation

After the CSD utility program encounters an error, it ceases to execute any further commands read from a data stream (as opposed to supplied by a put-message

exit routine). However, it continues to check the syntax of subsequent commands. The exception is the LIST command, which is still executed if the primary CSD file can be opened.

System action

Subsequent CSD utility commands (except LIST) are ignored.

User response

Check for a syntax error in the commands used, and correct it.

There should be associated error messages which identify the problem that caused DFHCSDUP to halt active processing. These messages should appear in the DFHCSDUP output before message DFHCA5104 is issued.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*

Destination

CSMT

DFHCA5105 W	*date time applid netname tranid* *command* **command not executed because of previous error(s).**

Explanation

If a syntax error (or an execution error) occurred in a command read from a data stream and processed earlier, no further commands (except for LIST commands) are executed. If the primary CSD file could not be opened, the LIST command is not executed either.

System action

The CSD utility command is not executed.

User response

Check for syntax errors or execution errors in commands processed earlier.

Correct the invalid commands.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*

CSMT

DFHCA5114 S   *date time applid netname tranid*
**The *csdtype* CSD has not
been initialized. Command not
executed.**

Explanation

The primary CSD file must be initialized before any
CSD utility command (other than the INITIALIZE or
SERVICE commands) can be processed. If a secondary
CSD file is used, it must always be initialized before
this command can be processed. CICS issues this
message if you try to break either of these rules, or
if an attempt to initialize a CSD file fails to complete
successfully

System action

The CSD utility ignores the command.

User response

Initialize the CSD file. You may first have to determine
why a previous initialization attempt failed.

**The primary CSD has been
defined with an invalid key length.
Processing is terminated.**

Explanation

The CSD utility cannot initialize the CSD file because it
has been defined to VSAM with an invalid key length.

System action

The CSD file remains uninitialized, and no utility
commands are processed.

User response

Delete the CSD file, using VSAM Access Method
Services (AMS). In the JCL defining the CSD cluster,
change the AMS control statements to specify
KEYS(22 0). Use this JCL to redefine the CSD file, and
use the CSD utility to reinitialize it.

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *csdtype*
7. *ddname*
8. *dsname*

Destination

CSMT

DFHCA5124 S   *date time applid netname tranid*
                 Processing terminated. Corrupted
                 csdtype **CSD control record**
                 detected while closing CSD;
                 ddname: *ddname*

Explanation

A storage corruption is preventing the CSD control records from being updated when the CSD file is being closed.

System action

No further CSD utility commands are processed.

User response

Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where the errors have occurred because they do not print and are therefore easily identifiable.

Using the information available, determine the cause of the errors and correct them.

Resubmit the CSD utility commands that failed.

If you cannot resolve the problem, or if the problem persists, you will need further help from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

7. *ddname*

Destination

CSMT

DFHCA5128 S   *date time applid netname tranid* **Processing terminated.** *csdtype* **CSD accessed by another user and could not be shared. ddname:** *ddname*

Explanation

An attempt to open the CSD has returned an error from VSAM because the data set is not available for the type of processing requested.

This usually means that

- An attempt has been made to open the CSD in non-RLS access mode, but the CSD is already being accessed from elsewhere in RLS access mode.
- An attempt has been made to open the CSD in RLS access mode, but the CSD is already being accessed from elsewhere in non-RLS access mode.
- An attempt has been made to open the CSD in non-RLS access mode, and the CSD is already being accessed in non-RLS access mode, but the CSD cluster has been defined with SHAREOPTIONS that restrict its concurrent use.

System action

The command is not executed.

User response

You can change the access mode in which you are trying to open the CSD.

Note:

You must specify PARM=CSD(READONLY) if you wish to open a recoverable CSD in RLS access mode from the DFHCSDUP utility program.

Alternatively, wait until the CSD file is no longer being accessed in the conflicting access mode, or until it becomes available again in accordance with the SHAREOPTIONS rules defined for the cluster.

If the conflict is due to SHAREOPTIONS and LIST is the only command you want to execute, you can specify PARM=CSD(READONLY).

Destination

CSMT

DFHCA5132 S   *date time applid netname tranid*
                    Unable to create list *listid*

Explanation

The INITIALIZE command has failed when calling the CSD manager routing program, DFHDMP, to create a new list *listid* on the CSD file for the IBM-protected groups. The CSD file may be full or corrupt.

System action

Processing of the INITIALIZE command is terminated.

User response

Check that the data set size for the CSD file is large enough. If it is not, allocate more space.

If there is ample space and you suspect that the CSD file is corrupt, you need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Consider implications of migrating TYPE=SHARED entries.

Explanation

The CSD utility detected a migrate of a TST TYPE=SHARED entry. A DFHTST TYPE=SHARED entry is not directly migrated. Only when a TYPE=REMOTE macro that specifies a SYSIDNT that matches a SYSID in the corresponding TYPE=SHARED macro is a TSMODEL created.

System action

The CSD utility continues processing of the MIGRATE command.

User response

If SYSID is explicitly specified on the EXEC CICS request, or added by a global user exit program, and the intent of the SYSID is to direct the request to a SHARED TS pool, you must use the migrated TST in order to satisfy the request to use the pool. See the Defining resources for more information.

4. *netname*
5. *tranid*
6. *grpname*

Destination

CSMT

DFHCA5145 E   *date time applid netname tranid*
Command not executed. *lgname*
has been locked by applid: *applid*
opid: *opid* **to prevent updating.**

Explanation

The list or group *lgname* cannot be used because a user of the CEDA or CEDB transaction has enforced a LOCK command to prevent updating by other users.

System action

The command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, the DFHCSDUP utility attempts to process subsequent commands.

User response

Negotiate with the user with the specified OPID and APPLID, or create a new group or list by taking a copy of the definitions in the locked one.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *lgname*
7. *applid*
8. *opid*

Destination

CSMT

DFHCA5146 E   *date time applid netname tranid* **Command not executed.** *lgname* **is currently being updated by applid:** *applid* **opid:** *opid*

Explanation

The list or group *lgname* cannot be used because:

- A user of the CEDA or CEDB transaction is currently running a command to update it
- A previous operation to update it using CEDA or CEDB failed to execute to completion.

System action

The command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, the DFHCSDUP utility attempts to process subsequent commands.

User response

Resubmit the utility job to retry the command that failed. Perform the subsequent commands that were suppressed.

If this fails to resolve the problem, run the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

Module:
DFHCAP

Destination

CSMT

DFHCA5159 I	*date time applid netname tranid* **resource object** **defined in group** *grpname*

Explanation

The CSD utility has successfully added a resource definition to a group, where:

- *resource* is the type of resource (CONNECTION, FILE, JOURNALMODEL, LSRPOOL, MAPSET, PARTITIONSET, PARTNER, PROFILE, PROGRAM, SESSION, TDQUEUE, TERMINAL, TRANCLASS, TRANSACTION, or TYPETERM).
- *object* is the name of the object.
- *grpname* is the name of the group.

System action

Normal utility processing continues.

User response

None.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *resource*
7. *object*
8. *grpname*

Destination

CSMT

DFHCA5164 W *date time applid netname tranid* **No definition of *resource object* created. This duplicates an existing definition in group *grpname***

Explanation

The CSD utility detected a CSD record with a matching key before adding the definition to the CSD file, where:

- *resource* is the type of resource.
- *object* is the name of the object.
- *grpname* is the name of the group.

System action

The CSD utility does not migrate the resource definition to the CSD file. (If it is a transaction, a generated profile is not created either.)

User response

Use the CEDA transaction to define the resource with a unique name.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *resource*
7. *object*
8. *grpname*

Destination

CSMT

DFHCA5165 S *date time applid netname tranid* **Processing is terminated. An error occurred while writing *resource object* to the CSD.**

Explanation

An error occurred when the CSD utility called DFHDMP to write the definition of the object *object* to the CSD file.

The CSD file may be full or corrupted.

resource is the type of resource.

System action

If the CSD is full, the CSD utility issues message DFHCA5176, and then terminates with a return code of 12 in message DFHCA5109.

If the CSD is not full, the CSD utility terminates abnormally with message DFHCA5175, usually accompanied by one or more of the explanatory messages, DFHCA5177, DFHCA5178, and DFHCA5179.

User response

Use the additional messages to determine the cause of the error and the appropriate user action required.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *resource*
7. *object*

Destination

CSMT

DFHCA5166 E   *date time applid netname tranid*
Disallowed character in *resource* name *object*

Explanation

The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file because of an invalid character, or the resource name for the migrated table entry may be invalid. *resource* is the type of resource, and *object* is the name of the object.

System action

A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

User response

Use the CEDA transaction to define the resource with a valid name.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *resource*
7. *object*

Destination

CSMT

DFHCA5167 S   *date time applid netname tranid*
The CSECTs in table *table* have been link-edited in the wrong order.

Explanation

While processing a MIGRATE command, the CSD utility has detected that the CSECTs in table *table* are in the wrong order. Input to the linkage editor omitted a control statement to order the CSECTs.

System action

The CSD utility does not process the MIGRATE command.

User response

Use the IBM-supplied procedure, DFHAUPLK, to assemble and link-edit CICS tables. This procedure ensures the correct ordering of CSECTs within the tables.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *table*

Destination

CSMT

DFHCA5168 S   *date time applid netname tranid*
Table loaded from library member *table* is not a valid *tabletype*.

Explanation

After loading the table *table*, the migration routine checks the VMNAME field in the DFHVM expansion of the data area following the load point. This message is produced if VMNAME is not that of a valid table.

System action

The MIGRATE command is not processed.

User response

1. Ensure that the correct table is present in the library, and that the TABLE parameter of the MIGRATE command is correct.

2. Ensure that an ORDER statement was processed in the JCL of the link-editing of the table.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

8. *sss*

Destination

CSMT

DFHCA5174 S	*date time applid netname tranid* **Processing is terminated. Command cannot be executed because 'PARM=CSD(READONLY)' was specified.**

Explanation

This command requires the CSD to be opened for read-write access. Your job step specified read-only access for the CSD in the DFHCSDUP utility job stream.

System action

This command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response

Amend the JCL to specify 'PARM=CSD(READWRITE)'.

Note:

If the CSD is recoverable and you are accessing it in RLS mode, you cannot specify READWRITE access. In order to perform the command, you need to access the CSD in non-RLS mode.

Module:
DFHCAP

XMEOUT parameters/Message inserts

4. *netname*
5. *tranid*
6. *function*

Destination

CSMT

DFHCA5176 S   *date time applid netname tranid* **Processing is terminated. CSD is full.**

Explanation

The VSAM data set containing the CSD file is full.

System action

Execution of the CSD utility command is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, the DFHCSDUP utility attempts to process subsequent commands.

The DFHCSDUP utility leaves a system lock on the group being created at the time of failure. This lock prevents processing of the group by the CSD utility or the CEDA transaction.

User response

First, use the DFHCSDUP VERIFY process to remove the system lock on the partly-created group. Normal RDO processing of the group should then be possible, enabling the group (or any unwanted definitions) to be deleted.

To recover the contents of the CSD file, define a larger data set and use the AMS REPRO command. Usually, you will be able to REPRO from the CSD file that became full. If you are unable to do this, use a backup copy.

If your CSD is a recoverable data set and you update it from CICS in RLS mode, there are additional steps to be taken when using REPRO to ensure that any retained locks remain associated with the data set. These are explained in the Administering recovery and restart.

You may be able to transfer definitions from the CSD file that filled up by using the DFHCSDUP COPY command with the FROMCSD option.

Destination

CSMT

DFHCA5179 S	*date time applid netname tranid* **VSAM error. Return code =** *nn* **Error code =** *ddd(yy)* **Control block type =** *type*

Explanation

VSAM returned the following diagnostics when an error occurred, where:

- *nn* is the hexadecimal VSAM return code
- *yy* is the hexadecimal VSAM error code (*ddd* is its decimal equivalent)
- CONTROL BLOCK TYPE points to the relevant error code subset as follows:
  - RPL = Request macro responses from VSAM
  - ACB = OPEN/CLOSE responses

The error code is:

- For CONTROL BLOCK TYPE = RPL, the reason code from byte 3 of the feedback word field in the RPL (RPLERRCD)
- For CONTROL BLOCK TYPE = ACB, the reason code in the ERROR field in the ACB (ACBERFLG)

System action

The CSD utility terminates command processing, and in some situations, produces an operating system dump.

User response

For the meaning of the VSAM return and error codes, refer to the z/OS DFSMS Macro Instructions for Data Sets manual.

When interpreting these diagnostics, ensure that the data set referenced in the JCL exists.

Check the following:

- The data set is being concurrently accessed by CICS running in another region.

- You are not attempting to open a recoverable CSD as READWRITE if DFHCSDUP specifies RLS access mode. You must specify PARM=CSD(READONLY) in this case.
- LOG is defined on the base cluster if RLS access mode is specified.

If DFHCSDUP specifies RLS access mode, a 'record not found' error could mean that the CSD has not been initialized.

Note:

You must use non-RLS access mode to initialize a recoverable CSD.

The LIST command or the DELETE command was executed using the name of a group or list that does not exist on the primary CSD file.

System action

The LIST command or the DELETE command is not processed. Subsequent commands may still be processed.

User response

Correct the LIST command or the DELETE command to use a valid group or list name.

If a CSD upgrade is being performed, no user action is required.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *group-or-list*
7. *xxxxxxxx*

Destination

CSMT

DFHCA5183 W *date time applid netname tranid group-or-list xxxxxxxx* **exists as a** *list-or-group* **name.**

Explanation

The LIST command or the DELETE command was executed using a group name that is already in use as a list name, or using a list name that is already in use as a group name.

System action

The LIST command or the DELETE command is not processed. Subsequent commands may still be processed.

User response

Correct the LIST command or the DELETE command to use a valid group or list name.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *group-or-list*
7. *xxxxxxxx*
8. *list-or-group*

Destination

CSMT

DFHCA5184 S *date time applid netname tranid* **Processing is terminated. Invalid output from DFHPUP. Cannot format data for utility listing.**

Explanation

There has been an internal logic error in the DFHCSDUP utility program. The data in the back-translated output buffer is invalid. The length code may be out of range or the data fields in the wrong sequence. One or more of the data fields may be invalid.

System action

The CSD utility terminates with an MVS abend 0326.

User response

This error must be reported.

Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where the error(s) have occurred because they do not print and are therefore easily identifiable.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*

2. *time*
3. *applid*
4. *netname*
5. *tranid*

Destination

CSMT

DFHCA5186 W	*date time applid netname tranid* **No objects** defined in *grpname listid*

Explanation

In executing a LIST command, the CSD utility has found a group or list header on the CSD file for which no corresponding group or list elements exist.

System action

The utility continues to process the LIST command, but will not tabulate elements of the group or list named in the message.

User response

Run the DFHCSDUP VERIFY utility.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

6. *objects*
7. *grpname*
8. *listid*

Destination

CSMT

DFHCA5187 I	*date time applid netname tranid resource* **is locked, but is not the name of a group or list.**

Explanation

The CSD utility detected a locked resource that is not a group or list. The reason is that an interrupt or failure occurred during a CEDA transaction or a previous utility job. A lock had been created but not the associated group or list.

System action

The utility continues normal processing of the VERIFY command.

User response

None.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*

4. *netname*

5. *tranid*

6. *progname*

Destination

CSMT

DFHCA5192 S   *date time applid netname tranid*
Command is not executed. CSD
service level *ttt* is incompatible
with current service level *sss*

Explanation

Either the LEVEL parameter specified in the SERVICE
command is wrong, or an incorrect version of the CSD
file is being used as the secondary (input) CSD file.

System action

The SERVICE command is not executed.

If commands are being read from a SYSIN
data stream, subsequent commands (except LIST
commands) are checked for syntax only. (If the
primary CSD file cannot be opened, the LIST command
is not processed either.)

If commands are being read from a get-command
exit, DFHCSDUP attempts to process subsequent
commands.

User response

The SERVICE command may upgrade the service level
of the CSD file only in increments of one. Check that
the input CSD file is the intended one, and that the
LEVEL parameter takes the value one higher than the
current service level of the CSD file.

Module:
DFHCAP

Destination

CSMT

DFHCA5193 S   *date time applid netname tranid*
Command is not executed. Service

module *progname* is unable to
upgrade CSD to target service
level *ttt*

Explanation

The LEVEL parameter specified in the SERVICE
command is incompatible with the status of the
service module *progname* being applied to the CSD
file.

System action

The SERVICE command is not executed.

If commands are being read from a SYSIN
data stream, subsequent commands (except LIST
commands) are checked for syntax only. (If the
primary CSD file cannot be opened, the LIST command
is not processed either.)

If commands are being read from a get-command
exit, DFHCSDUP attempts to process subsequent
commands.

User response

Ensure that the service module *progname,* being
applied, is correctly updated with the service fix
supplied by IBM. (It should have been amended so as
to be able to process SERVICE commands at the target
level *ttt*.)

Module:
DFHCAP

Upgrading service status of CSD
from level *sss* to level *ttt*

Explanation

The loaded service module is performing the required upgrade of the CSD file from service level *sss* to service level *ttt*.

System action

Normal processing continues.

User response

None.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *sss*
7. *ttt*

Destination

CSMT

DFHCA5195 I   *date time applid netname tranid* **Execution of service program *progname* complete.**

Explanation

The loaded service program *progname* has run to completion. Control is being transferred back to the CSD offline utility program, DFHCSDUP.

System action

Normal processing continues.

User response

None.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

4. *netname*
5. *tranid*
6. *progname*

Destination

CSMT

DFHCA5196 S   *date time applid netname tranid* **Command is terminated. Error occurred while reading control secondary CSD record.**

Explanation

An I/O error has occurred on the specified CSD file.

System action

The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response

Retry the command, ensuring that a sufficiently large data set size is specified for the output (primary) CSD file.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*

Destination

CSMT

DFHCA5197 S   *date time applid netname tranid* **Command is terminated. Unrecognized control record encountered while secondary CSD was being read.**

Explanation

The contents of a control record of the secondary input CSD are invalid.

System action

The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response

Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the OLDCSD parameter in the SERVICE utility command.

If the problem persists, you will need further help from IBM. First, obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a printout of the CSD using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where the errors have occurred because they do not print and are therefore easily identifiable. See Working with IBM to solve your problem for guidance on how to proceed.

5. *tranid*

6. *x*

Destination

CSMT

DFHCA5212 E   *date time applid netname tranid*
**Command not executed. *comptype*
'*string*' is not uniquely identifiable.**

Explanation

An ambiguous DFHCSDUP or CREATE command has
been specified.

- *comptype* is the command component type

- *string* is the actual component.

System action

The command is not executed. For DFHCSDUP, if
commands are being read from a SYSIN data stream,
subsequent commands (except LIST commands) are
checked for syntax only. If commands are being read
from a get-command exit, DFHCSDUP attempts to
process subsequent commands.

User response

Correct the command syntax and retry. See
accompanying message DFHCA5213 for further
details of the command failure.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *netname*

5. *tranid*

6. *comptype*

7. *string*

Destination

CSMT

DFHCA5213 E *date time applid netname tranid* **Specified** *input* **could be interpreted as** *match1* **or** *match2*

Explanation

An ambiguous DFHCSDUP or CREATE command has been specified.

- *input* is the ambiguous character string
- *match1* and *match2* are two possible interpretations of *input*.

System action

The command is not executed. For DFHCSDUP, if commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response

Correct the command syntax and retry.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*

7. *keyword*

Destination

CSMT

DFHCA5225 E	*date time applid netname tranid* **Command not executed. Same name specified for '*xxxxxxxx*' and '*xxxxxxxx*'.**

Explanation

This message is issued for one of the following reasons:

1. The utility COPY command has been coded with the same group name for the source and target group.
2. The APPEND command has been coded with the same list name for the source and target list.
3. The ADD command has been coded with the same group name and list name.

System action

The CSD utility or CICS ignores the command.

User response

Correct the name (or names) in error.

Module:
DFHCAP

CSMT

DFHCA5250 E   **TO(*groupname*) contains too many non contiguous '*'**

Explanation

During the execution of a generic COPY command, the batch update utility found the argument of the TO parameter specified too many non contiguous asterisks.

Only one '*' is allowed in the TO parameter during the execution of a generic copy.

System action

The utility rejects the command.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFHCA5251 I   *date time applid netname tranid resource object* **in group *grpname* is replaced.**

Explanation

A resource definition existed in both source and target groups. Based on the CSD utility commands

submitted, the utility has replaced the definition in the target group with that from the source group.

- *resource* is the type of the resource
- *object* is the name of the object
- *grpname* is the name of the group.

System action

Normal utility processing continues.

User response

None.

Module:
DFHCAP

6. *grpname1*
7. *grpname2*

Destination

CSMT

DFHCA5259 I   *date time applid netname tranid* **Unrecognized resource type found in the CSD file and has been ignored.**

Explanation

CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action

The resource is ignored and the operation continues.

User response

Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

5. *tranid*

Destination

CSMT

DFHCA5260 E   **Length of 'TO' suffix must be equal to length of 'GROUP' suffix.**

Explanation

During the execution of a generic COPY command, the batch update utility found the length of the suffix of the generic group specified in the TO keyword to be of different length than that of the suffix of the generic GROUP keyword.

System action

The utility ignores the command to prevent ambiguity on the TO group name.

User response

Correct the command.

Module:
DFHCSDUP

Destination

SYSPRINT

DFHCA5261 W   *date time applid netname tranid* **RDT is empty. No VTAM resources in assembled table.**

Explanation

The CSD utility detected an attempt to migrate a TCT that either contains no RDO-supported terminal or sessions definitions, or whose TYPE=INITIAL entry specifies MIGRATE=COMPLETE.

System action

The utility does not create any CSD definitions.

User response

Check the TCT source code to see if it contains any RDO-supported definitions. If it does, ensure that it has been correctly assembled (MIGRATE=YES specified) and link-edited.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*

Destination

CSMT

DFHCA5262 S   *date time applid netname tranid*
Insufficient storage to build types-matching chain.

Explanation

During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of lack of storage for TYPETERM definitions.

System action

The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

In any of the above cases, definitions that have already been migrated remain on the CSD.

User response

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Allocate a larger region size in the utility JCL, and retry the command.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*

Destination

CSMT

DFHCA5263 S   *date time applid netname tranid*
Error in input RDT. Incorrect sequence of commands.

Explanation

During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of abnormal data in the assembled table.

System action

The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

Definitions that have already been migrated remain on the CSD. The MVS user abend code is 0308.

User response

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Keep the assembly listing for the failing table and keep the DFHCSDUP dump, if available.
4. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

5. *tranid*
6. *termid*

Destination

CSMT

DFHCA5266 W   *date time applid netname tranid*
Sessions *sessions* not defined, because of error in associated connection.

Explanation

An error has been detected during the migration of a TCT. When migrating a session, DFHCSDUP checks that the associated CONNECTION has been defined successfully. If it has not, DFHCSDUP abnormally terminates the session definition.

System action

The specified SESSIONS resource is not migrated to the CSD. DFHCSDUP continues with the migration of subsequent TCT entries.

User response

Use the diagnostic information in the output listing from the MIGRATE utility to determine why the CONNECTION definition has failed. You can then use RDO to DEFINE the CONNECTION and the SESSIONS to the CSD.

7. *xxxx*
8. *xxxx*

Destination

CSMT

DFHCA5286 E	*date time applid netname tranid* **Unable to create resource definition on CSD file:** *xxxx xxxx xxxx....*

Explanation

This message is issued during the processing of the indicated (truncated) command for one of the following reasons:

1. The CSD is full (in which case, messages DFHCA5175 and DFHCA5176 accompanies this one)
2. The CSD was defined as read-only (in which case, message DFHCA5174 accompanies this message)
3. The TCT being migrated contained a terminal entry with a name unacceptable to RDO (in which case, message DFHCA5165 accompanies this message)
4. A list or group cannot be used due to the failure of a previous update operation (in which case, message DFHCA5142 accompanies this message)
5. The resource definition list being used to INITIALIZE or UPGRADE the CSD file contained a definition with an invalid resource name or group name
6. A logic error occurred in DFHCSDUP or an internal error was detected in the data contained in the loaded table.

System action

The system action depends on the reason the message is issued, as follows.

1. Migration of the TCT table is terminated immediately.
2. Processing of the UPGRADE or INITIALIZE command is terminated
3. The utility attempts to:

   a. Close any files previously opened internally.

b. Unload any extract exit routines that were dynamically loaded.

c. Invoke the termination exit routine (if supplied).

d. Return control to the invoker of the utility.

4. The command is not executed, and execution of further DFHCSDUP commands in the job stream is suppressed.

5. As in (3) above.

6. As in (3) above.

In ALL cases, all the definitions created by this command up to the point of failure remain on the CSD.

User response

The user response depends on the reason the message is issued, as follows.

1. See message DFHCA5175 and DFHCA5176.

2. See message DFHCA5174.

3. Change the name of the terminal and all references to it. Also refer to the user response for message DFHCA5165.

4. See message DFHCA5142.

5. This is a CICS logic error. See instruction for 6 below.

6. This is a CICS logic error. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed. A CICS background trace of the failure may aid them in problem diagnosis.

Destination

CSMT

DFHCA5288 E	**Get-command terminated at user's request. RC=***retcode*

Explanation

The GET-COMMAND exit has returned a value other than UERCNORM ('00'X) or UERCDONE ('04'X) indicating that the GET-COMMAND exit was unsuccessful.

System action

Execution of the utility command is terminated.

User response

Correct the operation of the GET-COMMAND user exit before re-running the utility. Consult the documentation or listing supplied with the user exit for information on how to diagnose and fix the problem.

Module:
DFHCAP

Destination

SYSPRINT

DFHCA5290 W   **Table *tabtype* macro *mactype=value* is not supported. Value is changed to *newvalue*.**

Explanation

During a table *tabtype* migration for macro *mactype*, *value* is not supported. *value* has been migrated as *newvalue*.

System action

The utility creates the definition for the resource with the changed value. Normal utility processing continues.

User response

Review the object definition to ensure that the modified definition is acceptable.

Module:
DFHCSDUP

Destination

SYSPRINT

DFHCA5291 E   **Unable to define object *object* in group *group*. Migration is terminated.**

Explanation

The DFHCSDUP migration utility could not define *object* in the *group* specified. The migration cannot continue.

System action

The utility terminates the migration of the table.

User response

Verify that the specified group is the correct group and review prior errors to determine why the migration utility could not create the definition in the group.

Module:
DFHCSDUP

Destination

SYSPRINT

DFHCA5293 W   **Total *object* definitions skipped due to error: *number***

Explanation

CICS issues this message after migrating a CICS table. *number* definitions of type *object* were not migrated. See one or more DFHCA5292 messages issued prior to this message.

System action

Utility processing continues.

User response

Correct the prior errors and manually define the skipped objects.

Module:
DFHCSDUP

Destination

SYSPRINT

DFHCA5294 E   ***number object-1* were not matched with a corresponding *object-2*.**

Explanation

CICS issues this message if there are *object-1* table definitions that have not been defined because the table was not defined correctly. *object-1* table definitions must refer to a *object-2* in the table.

System action

The migration of the table ends.

User response

Reassemble the table with the current release macro source.

Module:
DFHCSDUP

Destination

SYSPRINT

DFHCA5296 W   **Table *tabtype* TYPE=*mactype parameter* does not support multiple values.**

Explanation

Multiple values were specified for TYPE=*mactype parameter* The migration of the *tabtype* table supports only one value.

System action

The migration utility ignores the additional values. The migration continues.

User response

Review the migrated definition to ensure that the new single value is acceptable.

Module:
DFHCSDUP

Destination

SYSPRINT

DFHCA5501 E   *date time applid netname tranid* **Command not executed.** *keyword* **must be specified.**

Explanation

A keyword *keyword*, which is required in the command, has been omitted or was incorrectly specified.
An earlier message identifies if the latter case is applicable.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *keyword*

Destination

CSMT

DFHCA5502 W   *date time applid netname tranid xxxxxxx* **implies** *yyyyyyy*.

Explanation

The value *xxxxxxxx* specified in a DEFINE or CREATE command has caused another value *yyyyyyyy*, which is not a normal default, to be assumed.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is acceptable. If you accept this default, no further action is required.

If the resultant default is not acceptable, you must decide whether to modify the definition, or to delete it and start again.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*

Destination

CSMT

DFHCA5513 E   *date time applid netname tranid* **Command not executed. The second value of** *xxxxxxx* **must not be greater than the first.**

Explanation

Some keywords take pairs of values which are essentially maximum and minimum values.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxx*

Destination

CSMT

DFHCA5514 E   *date time applid netname tranid* **Command not executed. With SESSNAME there can only be one COUNT and its value must be 1.**

Explanation

The use of SESSNAME in a DEFINE or CREATE SESSIONS command means that a single-session, either for sending or receiving, is required.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

5. *tranid*

Destination

CSMT

DFHCA5515 W   *date time applid netname tranid* **AUTOPAGE(NO) has been specified for a 3270 print device.**

Explanation

A DEFINE or CREATE TYPETERM command has AUTOPAGE(NO) and DEVICE(3270P) or DEVICE(LUTYPE3).

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*

Destination

CSMT

DFHCA5516 W   *date time applid netname tranid* **The values of DEVICE and SESSIONTYPE are equivalent to DEVICE(***devtype***) and have been replaced.**

Explanation

A DEFINE or CREATE TYPETERM command has a valid but obsolete DEVICE and SESSIONTYPE combination.

This DEVICE and SESSIONTYPE combination has been replaced by a simpler equivalent indicated by *devtype*.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect. The Defining resources provides further information about device equivalents.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *devtype*

Destination

CSMT

DFHCA5517 E   *date time applid netname tranid* **Command not executed.** *prefix* **and COUNT together make more than four characters.**

Explanation

In a SESSIONS definition, the *prefix* parameter (SENDPFX or RECEIVEPFX) is used to generate session names by adding numeric suffixes up to the corresponding count value (SENDCOUNT or RECEIVECOUNT). Since the session names cannot be longer than four characters, when the count of sessions exceeds 99 the prefix can only be one character.

System action

The command is not executed.

User response

Correct the command.

has been specified for *ALTSCREEN*.

Explanation

One of the specified values is zero and the other is
nonzero. This is an invalid combination.

System action

The utility ignores the command.

User response

Ensure that a valid combination of ALTSCREEN rows and columns is specified. See the Defining resources for details of valid combinations.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *ALTSCREEN*

Destination

CSMT

DFHCA5533 W　　*date time applid netname tranid* **Specified *keyword1* value is less than *keyword2* value. The default value has been assumed.**

Explanation

A value has been specified for *keyword1* that is incompatible with the value for *keyword2*.

System action

The utility assumes the default value for *keyword1* and processes the command.

User response

Ensure that the resulting resource definition is acceptable.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *keyword1*
7. *keyword2*

Destination

CSMT

DFHCA5534 W　　*date time applid netname tranid* **When you change the value of DEVICE many other values may be changed for you.**

Explanation

When ALTERing the DEVICE in a TYPETERM resource definition, the batch update utility changes forced values that are incompatible with the new DEVICE. However, dependent default values are not changed, and may now be incompatible.

System action

Normal utility processing continues.

User response

Check that the resulting resource definition is as you expect. See the Defining resources for more guidance.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*

Destination

CSMT

DFHCA5535 E　　*date time applid netname tranid* **Command not executed. *restype* name *resname* is reserved by CICS.**

Explanation

The user specified a resource name *resname* for resource type *restype* which is reserved for use by CICS.

System action

The utility ignores the command.

User response

Specify a different resource name.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *restype*
7. *resname*

Destination

CSMT

DFHCA5536 W	*date time applid netname tranid* ***keyword1*** **and** ***keyword2*** **attributes are inconsistent if definition is being shared with a back-level release.**

Explanation

keyword1 has been preceded by *keyword2*. However, *keyword1* has been kept for compatibility reasons. After updating or creating the resource, the value specified for *keyword1* has become inconsistent with the value specified for *keyword2*.

System action

The resource is created or updated.

User response

If sharing the resource with a back level release, ensure that the resulting resource definition is acceptable. Otherwise, ignore the message.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *keyword1*

7. *keyword2*

Destination

CSMT

DFHCA5537 W	*date time applid netname tranid* **Prefix allowed to default. Use of defaults is recommended for MRO sessions only.**

Explanation

A null value has been accepted for a send or receive prefix for an LU6.1 or MRO session. The default value '>' is supplied by CICS for send sessions and '<' for receive sessions. These values are the default prefixes for MRO session names. The use of these prefixes is allowed for LU6.1 sessions, but is not recommended if MRO session names with the same prefixes are in use, because duplicate names may occur if large numbers of sessions are defined.

System action

CICS generates session names using these prefixes.

User response

If this is an LU6.1 session, it is recommended that a different prefix should be chosen.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*

Destination

CSMT

DFHCA5538 W	*date time applid netname tranid* ***resource*** **names starting with** ***x*** **may conflict with system sessions names.**

Explanation

The resource *resource* has been given a name starting with the character *x*, which might be used for system-generated SESSIONS names.

System action

The definition is created or updated.

User response

Ensure there is no conflict with the name given to the resource and SESSIONS names.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *resource*
7. *x*

Destination

CSMT

DFHCA5539 S	*date time applid netname tranid keyword* **is not valid because it starts with the reserved character or string** *string***.**

Explanation

The name you have given to keyword *keyword* is not valid because the name begins with a reserved character or string such as "C" or "DFH".

System action

The definition is not created.

User response

Change the name of the keyword.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *keyword*
7. *string*

Destination

CSMT

DFHCA5540 W	*date time applid netname xxxxxxx* **value is greater than** *yyyyyyy* **value. The lower value takes precedence.**

Explanation

A value has been specified that is not consistent with another. The value *xxxxxxx* is greater than value *yyyyyyy*. Value *yyyyyyy* takes precedence and overrides the higher value.

System action

The definition is created or updated with the two values as specified.

User response

Ensure that the two values are defined as you expect. You may decide to leave the values as specified and dynamically change the values online once the resource has been installed in the CICS system.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *xxxxxxx*
6. *yyyyyyy*

Destination

CSMT

DFHCA5542 E	*date time applid netname tranid* **Command not executed.** *xxxxxxx* **and** *yyyyyyy* **must be the same length.**

Explanation

Two options, *xxxxxxx* and *yyyyyyy*, have been specified but the length of the respective operands must be the same.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxx*
7. *yyyyyyy*

Destination

CSMT

DFHCA5543 E   *date time applid netname tranid* **Command not executed. Generic characters must be in the same position in *xxxxxxx* and *yyyyyyy*.**

Explanation

Two options, *xxxxxxx* and *yyyyyyy*, have been specified containing generic characters. The generic characters must be placed in the same position for both keywords.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxx*

---

7. *yyyyyyy*

Destination

CSMT

DFHCA5544 E   *date time applid netname tranid* **Command not executed. *xxxxxxx* must be specified as *yyyyyyy* because a previous value is generic.**

Explanation

The options, *xxxxxxx*, must be specified as *yyyyyyy* because a previous option value was specified as generic.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxx*
7. *yyyyyyy*

Destination

CSMT

DFHCA5546 E   *date time applid netname tranid* **Command not executed. *xxxxxxx* is not valid as a type *yyyyyyy* parameter.**

Explanation

The options specified conflict. If TYPE EJB is specified, the respective ejb-type options must be specified. The ejb-type attributes are BEANNAME and INTFACETYPE. Likewise, for TYPE CORBA, the corba-type attributes must be specified. These are MODULE and INTERFACE. For TYPE GENERIC, either attributes may be specified but they should be generic.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxx*
7. *yyyyyy*

Destination

CSMT

DFHCA5547 E   *date time applid netname tranid*
Command not executed. *xxxxxxx*
value *yyyyyy* **is invalid.**

Explanation

A value *yyyyyyyy* has been specified for keyword *xxxxxxxx* which is not valid. It may for instance be non-numeric.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxx*
7. *yyyyyy*

Destination

CSMT

DFHCA5548 E   *date time applid netname tranid*
Command not executed. *xxxxxxx*
option is invalid for a back level
REQUESTMODEL.

Explanation

The options specified conflict. If CORBASERVER name is blank and the respective previous level attributes (OMGMODULE, OMGOPERATION, and OMGINTERFACE) are specified, the use of BEANNAME, MODULE, INTERFACE and OPERATION is not allowed. It is not possible to give a back level requestmodel definition new attributes. The old requestmodel must be discarded and redefined with the new attributes if it is required to be used on this level of CICS.

System action

The utility ignores the command.

User response

Correct the command. If this requestmodel is being maintained for a back level CICS system, specify only the attributes OMGMODULE, OMGOPERATION, OMGINTERFACE and TRANSID. However, to use an old requestmodel on this level of CICS, it must be discarded and redefined with the new attributes.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxx*

Destination

CSMT

DFHCA5549 E   *date time applid netname tranid*
Command not executed. *xxxxxxx*
value must not be the same as
yyyyyy **value.**

Explanation

The values specified for the two attributes must not be the same.

System action

The utility ignores the command.

User response

Correct the command.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxx*
7. *yyyyyyy*

Destination

CSMT

DFHCA5550 W *date time applid netname tranid* **keyword1 implies keyword2. The default value has been assumed.**

Explanation

keyword1 has been specified with a value that is incompatible with the value for *keyword2*.

System action

The utility changes *keyword1* to set the default value and processes the command.

User response

Ensure that the resulting resource definition is acceptable.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

---

4. *netname*
5. *tranid*
6. *keyword1*
7. *keyword2*

Destination

CSMT

DFHCA5551 E *date time applid netname tranid* **Command not executed. keyword1 cannot be specified as generic unless keyword2 is also generic.**

Explanation

keyword1 has been specified with a generic name containing wildcard characters (asterisks or plus signs). But this is only permitted when *keyword2* is also specified as a generic name.

System action

The utility ignores the command.

User response

If it is required that *keyword1* must be generic, ensure that *keyword2* is also specified with a generic name.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *keyword1*
7. *keyword2*

Destination

CSMT

DFHCA5552 E *date time applid netname tranid* **Command not executed. CIPHER value '*value*' is not in the valid set (*list*).**

Explanation

The CIPHER attribute has been specified with an invalid value, *value*, which is not in the valid set of cipher values as indicated by *list*.

System action

The utility ignores the command.

User response

Ensure that you have defined a set of CIPHER values which are correct for this CICS address space.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*

4. *netname*
5. *tranid*
6. *value*
7. *list*

Destination

CSMT

DFHCA5553 E   *date time applid netname tranid*
Command not executed. *field*
cannot start with a '*char***'.**

Explanation

The named attribute field, *field*, starts with an invalid character, *char*. This is commonly caused by the field starting with an '*' which is not allowed.

System action

The utility ignores the command.

User response

Change the named attribute field to start with a permitted character.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*

2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *field*
7. *char*

Destination

CSMT

DFHCA5554 W   *date time applid netname tranid*
Use of static attribute *field1* **forces**
*field2***.**

Explanation

The Server URIMAP attribute field, *field1* is within the set that returns a static response. This has forced the setting of *field2*. This is commonly caused by specifying MEDIATYPE, CHARACTERSET, HOSTCODEPAGE, TEMPLATENAME or HFSFILE with ANALYZER(YES) when ANALYZER(NO) is required.

System action

The utility continues.

User response

None.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *field1*
7. *field2*

Destination

CSMT

DFHCA5555 E   *date time applid netname tranid*
Command not executed. There
must be at least one *attribute*
specified.

Explanation

At least one of the named attribute fields, *attribute*, must be specified for this resource.

System action

The utility ignores the command.

User response

Ensure that you have specified at least one of the required attributes.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *attribute*

Destination

CSMT

DFHCA5556 E   *date time applid netname tranid* **Command not executed. *resource* names beginning with '*yyy*' are reserved and cannot be used.**

Explanation

CICS supplies standard programs and transactions whose names you should avoid. For this type of resource, however, you must not use reserved names.

System action

The utility ignores the command.

User response

Rename the resource definition to an appropriate name.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*

3. *applid*
4. *netname*
5. *tranid*
6. *resource*
7. *yyy*

Destination

CSMT

DFHCA5557 E   *date time applid netname tranid* **Command not executed. '*xxxxxxx*' is a reserved name and cannot be used as a *resource* name.**

Explanation

Certain names are reserved and are not allowed to be used as resource names.

System action

The utility ignores the command.

User response

Rename the resource definition to an appropriate name.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxx*
7. *resource*

Destination

CSMT

DFHCA5558 W   *date time applid netname tranid* **A ranking value less than 10 for LIBRARY '*resource*' means it will appear before DFHRPL in the search order.**

Explanation

The ranking value of 10 is reserved for DFHRPL library. If you specify a ranking value less than 10 this

LIBRARY *resource* will appear ahead of the DFHRPL in the library search order.

System action

The utility continues.

User response

Ensure that you definitely want the specified LIBRARY to appear before the DFHRPL in the library search order. Otherwise, define the LIBRARY *resource* with a RANKING value greater than 10.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*

5. *tranid*
6. *table*

Destination

CSMT

DFHCA5605 E   *date time applid netname tranid*
Disallowed character in group or
list name *object*.

Explanation

The call to module DFHDMP has failed to construct a
valid key for the record created on the CSD file. This
is because the group or list name contains an invalid
character.

System action

A CSD record is not created for this definition. (If it is a
transaction, a generated profile is not created either.)

User response

Use the CEDA transaction to define the resource with a
valid name.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *object*

Destination

CSMT

DFHCA5606 S   *date time applid netname tranid*
Command is not executed. Unable
to load the service module
***progname*.**

Explanation

The service module, *progname*, cannot be loaded due
to insufficient storage.

System action

Utility command execution is terminated. If commands
are being read from a SYSIN data stream by the utility,
subsequent commands are checked for syntax only.

User response

Retry the utility command with an increased region
size.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*

6. *progname*

Destination

CSMT

DFHCA5607 S   *date time applid netname tranid* **Command is terminated. An error occurred while reading the first secondary CSD record.**

Explanation

An I/O error has occurred on the secondary CSD file.

System action

The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, subsequent commands are checked for syntax only.

User response

Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

7. *resourcename*

Destination

CSMT

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System action

An exception entry is made in the trace table, provided that trace is available at this time. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code in this manual. This will tell you, for example, whether the error was a program check, an abend, a runaway or a recovery percolation, and may give you some guidance concerning user response.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHCC0100	*applid* Global Catalog initialization failure. *{GENERATE ACB | OPEN ACB | GENERATE RPL | OPEN, SHOWCB.}* R15 = X'*yy*' VSAM error code = X'*zz*'

Explanation

A VSAM error has occurred during global catalog initialization.

The VSAM codes given are explained in the z/OS DFSMS Macro Instructions for Data Sets manual.

The possible versions of this message include the text

- "GENERATE ACB".
- "GENERATE RPL".

  The GENCB failed with the R15 condition given in X'*yy*'.

  The X'*zz*' code is only meaningful if X'*yy*' is X'04' when: X'*zz*' is the error code returned by VSAM Register 0 in response to a GENCB macro.

- "OPEN ACB".

  OPEN has failed with the R15 condition code X'*yy*'. This was followed by a successful SHOWCB which has placed the OPEN error code into X'*zz*'. Also see the message that VSAM writes to the operator console and programmer's listing.

- "OPEN, SHOWCB".

  OPEN has failed with the R15 condition code X'*yy*'.

  This was followed by a SHOWCB which failed, and the R0 return code from the SHOWCB is given in X'*zz*'. Also see the message that VSAM writes to the operator console and programmer's listing.

During initialization, CICS may not have access to the user's *applid* coded in the SIT. If CICS produces this message in these circumstances, it uses the default *applid* value DBDCCICS.

System action

A system dump is produced, then CICS is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Look up the error codes in the Introduction to VSAM Programming, correct it then retry.

If this fails, notify the system programmer. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

DFHCC0103 **LOCAL CATALOG DATA SET IS ALREADY IN USE.**

Explanation

The VSAM error reported in the previous DFHCC0101 message suggests that the local catalog is already

being used, possibly by another CICS region. The local catalog data set cannot be shared.

System action

CICS is terminated.

User response

Ensure that the DFHLCD DD statement for this CICS specifies a different local catalog data set from any CICS job that is already running.

If CICS still fails, notify the system programmer. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCCDM

Destination

Console

DFHCC0104 **AN ABEND HAS OCCURRED DURING INITIALIZATION OF CATALOG DOMAIN IN MODULE DFHCCDM.**

Explanation

DFHCCDM's recovery routine received control during pre-initialization of the local catalog (CC) domain.

System action

A system dump with dump code KERNDUMP is taken and CICS terminates.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCCDM

Destination

Console

DFHCC0105 *applid* **The {local | global} catalog is incorrectly defined. Expected:keylen=*req_keylen*, lrecl=*req_lrecl*. Defined:keylen=*def_keylen*, lrecl=*def_lrecl*.**

Explanation

The catalog data set, DFHLCD or DFHGCD, has been defined incorrectly for this release of CICS. Either the key length or the maximum record size is incorrect. The key length must be equal to the expected key length *req_keylen*. The maximum record size must be greater than or equal to the expected maximum record size *req_lrecl*.

System action

An exception entry is made in the trace table, provided that trace is available at this time. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

User response

Recreate and initialize the catalog as described in the relevant section of the information center for this release of CICS.

Module:
DFHCCDM

DFHCC0201	**VSAM ERROR ON THE LOCAL CATALOG DATA SET, VSAM RETURN CODE IN R15 = X'*yy*' FDBK=X'*zz*'.**

Explanation

A local catalog VSAM operation has produced the VSAM error given.

An exception trace, code CC 2B60 or GC 2B60 has also been made.

System action

A system dump is produced then CICS is terminated. This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

User response

If possible correct the VSAM error and restart CICS. For the meaning of the return codes, refer to the Introduction to VSAM Programming.

Inform the system programmer as this indicates a possible error in CICS code. You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCCCC

Destination

Console

DFHCC0202	*applid* **The *{local	global}* catalog has started to use new secondary space allocation.**

Explanation

Secondary space may be specified when the catalog data sets DFHLCD and DFHGCD are defined. This message is issued when the catalog starts using an additional space allocation.

See the Configuring for more information on controlling CICS storage.

System action

An exception entry is made in the trace table, provided that trace is available at this time.

User response

There are two possibilities.

- The system is in a loop which involves calls to the catalog to write onto the catalog data set. This is the most likely cause if the system suddenly starts to produce this message repeatedly.
- Insufficient primary space was allocated for the catalog when it was defined. This is the most likely cause if this message is produced either:
  - during or shortly after CICS initialization, or
  - this message is only produced infrequently (and only a few are ever produced).

Look for any other symptoms of possible looping, and act accordingly. If looping has occurred then the system programmer should redefine the catalog during the next CICS initial start.

If CICS was not looping then notify the system programmer, who should increase the primary space allocated for this data set during the next CICS initial start.

Module:
DFHCCCC

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

   1=local,

   2=global

Destination

Console

DFHCC0203	*applid* **The *{local	global}* catalog is full.**

Explanation

The specified catalog data set (DFHLCD or DFHGCD) is full. There are two possible reasons for this error:

- The system is in a loop which involves calls to the catalog to write onto the catalog data set.
- Insufficient primary space was allocated for the catalog when it was defined. This is the most likely cause if this message is issued during or shortly after CICS initialization.

System action

If the error occurs during initialization, a system dump is produced then CICS is terminated. If the error occurs after initialization, the domain invoking the catalog services will decide what action is appropriate.

User response

Check for any other symptoms of looping and act accordingly.

If CICS is not looping, notify the system programmer who should increase the primary space allocated for this data set. Either copy the catalog data from the old data set to the new larger data set (DFHRMUTL can be used to do this for a COLD start, otherwise use IDCAMS) and restart CICS, or perform an initial start of CICS with an empty catalog.

If CICS is looping, this indicates an error in CICS code. You might need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCCCC

Destination

Terminal End User

DFHCE3504 **Incorrect new password length. Sign-on is terminated.**

Explanation

The value of the NEWPS keyword is incorrect. A password is between 1 and 8 characters. A password phrase is between 9 and 100 characters. Your security administrator may change the minimum or maximum lengths.

System action

Signon terminates.

User response

Enter a password of the right length. If this still fails, check with your security administrator whether they have changed the minimum or maximum password lengths.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3506 **Your groupid must be 1-8 characters. Sign-on is terminated.**

Explanation

The value of the GROUPID keyword has less than 1 or more than 8 characters.

System action

Signon terminates.

User response

Use a valid group name.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3507 **Your language code must be three characters. Sign-on is terminated.**

Explanation

The value of the LANGUAGE keyword is not a three-letter code.

System action

Signon terminates.

User response

Use a valid language code.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3520 **Please type your userid.**

Explanation

The system requests a userid.

System action

None.

User response

Enter your userid.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3521 **CICS sign-on. Please type your userid.**

Explanation

The system requests a userid.

System action

The system waits for a response.

User response

Enter your userid.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3522   **CICS sign-on. Please type your userid==>**

Explanation

The system requests a userid.

System action

The system waits for a response.

User response

Enter your userid.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3523   **Please type your password.**

Explanation

The system requests a password.

System action

The system waits for a response.

User response

Enter your password.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3524   **Please type your password==>@@@@@@@@**

Explanation

The system requests a password. @@@@@@@@ represents a character string provided by CICS to prevent the password being seen.

System action

The system waits for a response.

User response

Enter your password.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3525   **Your password has expired. Please type your new password.**

Explanation

The system requires a new password.

System action

The system waits for a response.

User response

Enter a new password.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3526   **Your password has expired. Please type your new password==>@@@@@@@@**

Explanation

The system requests a new password. @@@@@@@@ represents a character string provided by CICS to prevent the new password being seen.

System action

The system waits for a response.

User response

Enter a new password.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3527   **Use your magnetic (OPID) card or press ENTER to cancel.**

Explanation

A magnetic card is required.

System action

The system waits for an opid (magnetic) card.

User response

Supply badge or terminate transaction.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3528 **Signon failed during SECLABEL checking.**

Explanation

The signon request has failed because the external security manager (ESM) detected a critical error.

System action

The signon transaction terminates.

User response

Refer to message DFHSN1108 on the CSCS log for the information and actions necessary to resolve this problem.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3529 **The ESM is currently not accepting signons. Please try later.**

Explanation

The signon request has failed because the external security manager (ESM) was in a tranquil state. When in a tranquil state, only signons from special users are accepted.

System action

The sign on transaction terminates.

User response

The ESM has probably been put into a tranquil state to allow for ESM database maintenance. Determine whether maintenance is currently occurring and how long it will take. When maintenance is finished the tranquil state should be removed from the ESM which will allow you to sign on to CICS. If the ESM has not been put into a tranquil state then, refer to message DFHSN1108 on the CSCS log for the information and actions necessary to resolve this problem.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3534 **Your new password is invalid. Please retype.**

Explanation

The new password entered was invalid.

System action

None.

User response

Enter a valid password.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3535 **Your new password is invalid. Please retype==>@@@@@@@@**

Explanation

The new password entered was invalid.

System action

The system waits for a response.

User response

Enter a valid password.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3536   **Invalid OPID. Please enter a valid card or press ENTER to cancel.**

Explanation

The OPID entered is invalid.

System action

The system waits for a response.

User response

Enter a valid card or press ENTER to cancel the signon.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3537   **Language is invalid. Please retype.**

Explanation

The language code entered is invalid.

System action

The system waits for a response.

User response

Enter a valid language code.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3538   **Language is invalid. Please retype==>**

Explanation

The language code entered is invalid.

System action

The system waits for a response.

User response

Enter a valid language code.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3539   **Please reenter the new password for verification.**

Explanation

You have entered a new password in the new password field and you are now being prompted to reenter the same password to assure yourself of the new password data.

System action

The system waits for a response.

User response

Reenter the new password in the password field.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3540   **Ensure that passwords are entered in the correct case.**

Explanation

This message is issued for CESL which supports passwords and password phrases. It is also issued for CESN on systems whose External Security Manager supports mixed case passwords. It is to remind you that passwords must be entered with exactly the correct lower case and upper case letters.

System action

The password will not be folded to upper case.

User response

Enter passwords in the correct case.

Module:

Destination

Terminal End User

DFHCE3541   **Security interface error (*rc*). Sign-on is terminated.**

Explanation

An error has been detected in an external security manager. *rc* is the return code from the external security manager.

System action

Signon terminates.

User response

For a RACF signon, *rc* is the return code from the RACINIT macro. See the appropriate RACF manual for details of the macro return codes. The return codes are macro specific.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3542	Sign-on is not allowed at this terminal. Your sign-on is ignored.

Explanation

The sign on transaction cannot be executed at the current terminal for one of the following reasons:

- The terminal is defined with a preset userid that cannot be changed by signing on
- The terminal is a surrogate of a terminal in another CICS region, but the sign on transaction is not executing within a session established by the CRTE transaction.

System action

The sign on transaction terminates.

User response

Do not use the sign on transaction at this terminal.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3543	You have cancelled your sign-on request. Sign-on is terminated.

Explanation

The user has pressed ENTER when an OPID card was requested or has entered PF3 on a 3270 terminal device.

System action

The sign on transaction terminates.

User response

Retry the sign on procedure.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3544	Terminal authorization failed. Sign-on is terminated.

Explanation

RACF has responded to a security request with 'Terminal not authorized' and RACF response code X'30'.

System action

The sign on transaction terminates.

User response

Inform the systems programmer, who should refer to message DFHSN1118 on the CSCS log for the relevant information and actions necessary to resolve this problem.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3545	Application authorization failed. Sign-on is terminated.

Explanation

RACF has responded to a security request with 'Application not authorized' and RACF response code X'34'.

System action

The sign on transaction terminates.

User response

Inform the systems programmer, who should refer to message DFHSN1119 on the CSCS log for the relevant information and actions necessary to resolve this problem.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3546	Your signon *{userid	group access}* has been revoked. Signon is terminated.

Explanation

The response from RACF indicates that either the userid that you use to signon to CICS, or your access to the RACF group that contains it, has been revoked by the system.

System action

The signon transaction terminates.

User response

Contact your RACF administrator, who can re-authorize the revoked user ID.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3547	Security is not active. Sign-on cannot be performed.

Explanation

A request to sign on to the CICS system was rejected because the CICS security system was not active.

A user can only sign on to CICS when CICS security is active.

The CICS security system is activated using the system initialization parameter SEC=YES.

System action

The sign on transaction terminates.

User response

None.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3548	*date time applid* Critical error has occurred in DFHSNP. Codes: **1,2,3,4,5.**

Explanation

The sign on program, DFHSNP, is abnormally terminated due to a critical error.

The five codes indicate the cause of the error and where the error occurred.

Code 1 is an abend code. It can be one of ASNA, ASNB or ASNC.

Codes 2, 3, 4 and 5 are codes which help IBM to identify the source of the error. They are id_location, EIBFRCODE, EIBRESP and EIBRESP2.

System action

DFHSNP is abnormally terminated with a transaction dump.. Message DFHAC2206 is normally issued, but if no terminal is associated with the task, DFHAC2236 may be issued instead.

User response

Refer to message DFHAC2206 or DFHAC2236. If DFHAC2236 has been issued, the absence of a terminal is probably the reason for the abend.

Use the abend code given in the message to determine the reason for the error and the course of action to take. This enables you to determine whether the abend was caused by user error or by an error in CICS code. (An error in CICS code is signalled by abend code ASNA.)

If you suspect an error in CICS code, you need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSNP

5. *2*
6. *3*
7. *4*
8. *5*

Destination

CSMT

DFHCE3549   **Sign-on is complete (Language *language*).**

Explanation

The user has successfully signed on to the CICS system.

System action

CICS is ready to receive user transactions.

User response

Use terminal as required for CICS transactions.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3550   **Sign-off option must be LOGOFF or GOODNIGHT. Sign-off is ignored.**

Explanation

An option other than LOGOFF|GOODNIGHT was detected.

System action

The sign-off transaction terminates.

User response

Specify the correct option when invoking sign-off.

Module:
DFHSFP

Destination

Terminal End User

DFHCE3551   ***date time applid termid* DFHSNP has detected an invalid**

COMMAREA. It has been ignored. The data is lost.

Explanation

While processing a CESN transaction DFHSNP was passed a commarea that was not its own. This may be the result of an application issuing the EXEC CICS RETURN TRANSID(...) COMMAREA(...) with a *transid* of nulls (X'00000000'). This could be because the pointer to the *transid* is incorrectly set up or may be part of the system design.

System action

DFHSNP continues with CESN transaction processing.

User response

Investigate whether this message is issued validly as part of the system design, in which case the message can be ignored, or is an error. Investigate the previous transaction at this terminal.

Module:
DFHSNP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *termid*

Destination

CSMT

DFHCE3554   **You cannot mix passwords and password phrases in a change request.**

Explanation

You cannot authorize a new password with a password phrase or a new password phrase with a password.

System action

None.

User response

Use a password to change a password, or a password phrase to change a password phrase.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3560   **Sign-off is not allowed at this terminal. Sign-off is ignored.**

Explanation

The sign-off transaction cannot be executed at the current terminal for one of the following reasons:

- The terminal is defined with a preset userid that cannot be changed by signing off
- The terminal is a surrogate of a terminal in another CICS region, but the sign-off transaction is not executing within a session established by the CRTE transaction.

System action

The sign-off transaction terminates.

User response

Do not use the sign-off transaction at this terminal.

Module:
DFHSFP

Destination

Terminal End User

DFHCE3570   **Invalid credentials entered.**

Explanation

An invalid userid or password or groupid was entered.

Signon requires valid values.

System action

The system waits for a response.

User response

Enter valid credentials.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3571   **Your groupid is invalid. Please retype==>**

Explanation

Your group identifier is invalid.

The system requests a group identifier.

System action

The system waits for a response.

User response

Enter a valid group identifier.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3587   **You cannot signon at this terminal at this time.**

Explanation

You cannot signon at this terminal at this time. The SNSCOPE initialization parameter disallows signon to more than one terminal at a time. An internal failure during SNSCOPE checking means that CICS is unable to confirm if the user is already signed on elsewhere. The failure has occurred because the limit of concurrent MVS ENQ requests has been reached.

System action

The signon transaction terminates. Message DFHUS0120 will have been written to the console. See the explanation of this message for further information.

User response

Please report this problem to your CICS systems programmer.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3588   **You are already signed on at another terminal. Signon cannot be performed.**

Explanation

You cannot sign on at the current terminal because you are already signed on at another terminal. The

SNSCOPE initialization parameter for the CICS system does not allow you to sign on to more than one terminal at a time.

System action

The sign on transaction terminates.

User response

Sign off from the other terminal before you attempt to sign on again.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3589	The external security manager is inactive. Signon cannot be performed.

Explanation

You cannot sign on because the external security manager is not active.

System action

The sign on transaction terminates.

User response

Wait until the external security manager has been reactivated before attempting to sign on again.

Module:
DFHSNP

Destination

Terminal End User

DFHCE3590	Sign-off is complete.

Explanation

If the user issued a CESN to sign on to the system, then sign-off has been successful. If the user was not signed on, and CICS security was active (SEC=YES system initialization parameter) then message DFHSN1213 is written to the CSCS log to indicate that the user has logged off but has not been allowed to sign off.

System action

Other processing continues.

User response

Use the terminal as required for CICS transactions.

Module:
DFHSFP

Destination

Terminal End User

DFHCE3591	Sign-off is complete. LOGOFF option is invalid when using CRTE.

Explanation

The terminal is now signed off. The LOGOFF option which was specified has been ignored as it is invalid when using CRTE.

System action

The CICS system, to which the user has connected via CRTE, has been signed off.

User response

Do not use the LOGOFF option when signing off via CRTE.

Module:
DFHSFP

Destination

Terminal End User

DFHCE3592	Sign-off is complete. GOODNIGHT option is invalid when using CRTE.

Explanation

The terminal is now signed off. The GOODNIGHT option which was specified has been ignored as it is invalid when using CRTE.

System action

The CICS system, to which the user has connected via CRTE, has been signed off.

User response

Do not use the GOODNIGHT option when signing off via CRTE.

Module:
DFHSFP

Destination

Terminal End User

DFHCE3598   *date time applid* **Critical error has occurred in DFHSFP. Codes: 1,2,3,4,5.**

Explanation

The signoff program, DFHSFP, will abnormally terminate due to a critical error.

The five codes indicate the cause of the error and where the error occurred.

Code 1 is an abend code. It can be ASFA, ASFB or ASFC.

Codes 2, 3, 4 and 5 are codes which help IBM to identify the source of the error. They are id_location (in hexadecimal), EIBFRCODE, EIBRESP and EIBRESP2.

System action

DFHSFP is abnormally terminated with a transaction dump. Message DFHAC2206 is normally issued, but if no terminal is associated with the task, DFHAC2236 may be issued instead.

User response

Refer to message DFHAC2206 or DFHAC2236. If DFHAC2236 has been issued, the absence of a terminal is probably the reason for the abend.

Use the abend code given in the message to determine the reason for the error and the course of action to take. This will enable you to determine whether the abend was caused by user error or by an error in CICS code. (An error in CICS code is signalled by abend code ASFA.)

If you suspect an error in CICS code, you need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

CSMT

DFHCFnnnn messages

DFHCF0101I   **CF data table server initialization is in progress.**

Explanation

The coupling facility data table server program has started execution.

System action

Initialization continues.

User response

None.

Module:
DFHCFMN

Destination

Console and SYSPRINT

DFHCF0102I   **CF data table server for pool *poolname* is now active.**

Explanation

The coupling facility data table server for the named pool has completed initialization and is now ready to accept connections.

System action

The server waits for connection requests or operator commands.

User response

None.

Module:
DFHCFMN

Destination

Console and SYSPRINT

DFHCF0103   **CF data table server initialization failed because the POOLNAME parameter was not specified.**

Explanation

The coupling facility data table server program needs to know the name of the associated coupling facility data table pool in order to complete initialization, but no pool name was specified in the SYSIN or PARM field parameters.

System action

The server is terminated.

User response

Ensure that the parameter **POOLNAME=** *name* is specified either in the SYSIN parameters or in the PARM field of the JCL for the server.

Module:
DFHCFMN

Destination

Console and SYSPRINT

DFHCF0104   **CF data table server initialization failed because program DFHCFMN is not APF authorized.**

Explanation

The coupling facility data table server main program DFHCFMN cannot complete initialization because it is not running with APF authorization.

System action

The server is terminated.

User response

Ensure that the coupling facility data table server program DFHCFMN is loaded from an APF authorized library and has been link-edited with the option AC(1).

Module:
DFHCFMN

Destination

Console and SYSPRINT

DFHCF0105   **CF data table server initialization failed because program DFHCFMN is not licensed for use.**

Explanation

The coupling facility data table server main program DFHCFMN cannot complete initialization because the validate license check failed.

System action

The server is terminated.

User response

Ensure that the coupling facility data table server program DFHCFMN is licensed for use by adding the required licensing dataset to the STEPLIB DD statement.

Module:
DFHCFVL

Destination

Console and SYSPRINT

DFHCF0111I   **CF data table server for pool** *poolname* **is terminating.**

Explanation

The coupling facility data table server has started termination processing, so no further requests will be processed.

System action

Termination continues.

User response

None.

Module:
DFHCFMN

Destination

Console and SYSPRINT

DFHCF0112I   **CF data table server has terminated, return code** *retcode***, reason code** *rsncode***.**

Explanation

The coupling facility data table server has completed termination processing. For normal termination, the

return code and reason code are both zero. If the termination was caused by an error, the return code will be 8 and the reason code will be the number of the previous DFHCFnnnn message giving the reason for termination.

System action

The coupling facility data table server program returns control (via the AXM termination routines) to MVS for job step termination.

User response

None.

Module:
DFHCFMN

Destination

Console and SYSPRINT

DFHCF0113   **CF data table server completion code is *cmpcode*, reason code *rsncode*.**

Explanation

The coupling facility data table server has terminated after intercepting an abnormal termination (ABEND) request. If the completion code is a system completion code, it is shown as three hexadecimal digits, otherwise it is shown as four decimal digits for a user completion code. Any associated reason code is shown as a four byte hexadecimal value, which will be zero if no reason code was provided.

System action

The coupling facility data table server program returns control (via the AXM termination routines) to MVS for job step termination.

User response

None.

Module:
DFHCFMN

Destination

Console and SYSPRINT

DFHCF0121I   **Automatic restart support is not available because &SYSCLONE may not be unique within the sysplex.**

Explanation

The server attempted to generate a default ARM element identifier to use for automatic restart registration, using the one or two character &SYSCLONE value to identify the MVS system. Normally, MVS verifies during start-up that &SYSCLONE is unique within the sysplex. However, the server is running on a level of MVS where this check is optional and has not been performed, so the server is unable to generate a unique element identifier.

System action

The server is terminated.

User response

Servers should not normally be run on a level of MVS which does not enforce unique &SYSCLONE values. However, the problem can be bypassed by specifying an ARM element name explicitly on the server ARMELEMENT parameter.

Module:
DFHCFRS

Destination

Console and SYSPRINT

DFHCF0122   **IXCARM REQUEST=*reqtype* failed, return code *retcode*, reason code *rsncode*.**

Explanation

A request to the MVS automatic restart manager (ARM) gave an unexpected return code. The return code and reason code are shown in hexadecimal notation.

System action

The server is terminated.

User response

See the IXCARM macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHCFRS

Destination

Console and SYSPRINT

DFHCF0123   **IXCARM REQUEST=*reqtype* failed, return code *retcode*, reason code *rsncode*.**

Explanation

Automatic restart support is not available. The MVS automatic restart manager (ARM) gave a return code and reason code which indicates that ARM services are not available, but the reason could possibly be intentional or unavoidable, so the server is being allowed to continue execution without automatic restart support. The return code and reason code are shown in hexadecimal notation.

System action

The server continues initialisation without automatic restart support.

User response

See the IXCARM macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHCFRS

Destination

Console and SYSPRINT

DFHCF0201I   **Processing *type parameters***

Explanation

The coupling facility data table server parameter processing routine is interpreting the specified parameter string. The first word gives the type of parameter (SYSIN/PARM/SET/DISPLAY/PRINT) and the rest is the specified parameters optionally followed by descriptive comment text after one or more spaces. If the parameters start with an asterisk or a space, the whole line is taken as descriptive comments.

System action

Any specified parameters will be processed.

User response

None.

Module:
DFHCFPR

Destination

SYSPRINT

DFHCF0202   **Unknown parameter keyword: *keyword***

Explanation

This parameter keyword did not match any of the defined parameter keywords for the coupling facility data table server.

System action

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0203   **Value *value* for parameter *keyword* is incorrect. It must be a name of up to *maxlength* characters.**

Explanation

The value of this parameter should have been specified as a name containing not more than the indicated number of characters.

System action

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value and reenter the command or restart the server.

Module:

DFHCFPR

Destination

Console and SYSPRINT

DFHCF0204   **Value *value* for parameter *keyword* is incorrect. It must be a decimal number.**

Explanation

The value of this coupling facility data table server parameter should have been specified as a decimal number but was not in a valid format. (Numeric parameters can optionally be followed by the letter K, M, G or T to denote the appropriate powers of 1024).

System action

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value and reenter the command or restart the server.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0205   **Value *value* for parameter *keyword* is greater than the maximum allowed value *maximum*.**

Explanation

The value of this coupling facility data table server parameter exceeded the maximum allowed value, given in the message. This message also occurs if the numeric part of a decimal value exceeds the maximum unsigned 32-bit integer (4294967295) even if a larger value is allowed to be specified by using a suffix "K", "M", "G" or "T".

System action

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which

will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value and reenter the command or restart the server.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0206   **Value *value* for parameter *keyword* is less than the minimum allowed value *minimum*.**

Explanation

The value of this coupling facility data table server parameter was less than the minimum allowed value, given in the message.

System action

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value and reenter the command or restart the server.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0207   **Value *value* for parameter *keyword* is incorrect. It should be a time hh:mm:ss or hh:mm or a number of seconds.**

Explanation

The value of this coupling facility data table server parameter did not conform to the correct syntax for a time interval.

System action

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value and reenter the command or restart the server.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0208   **Parameter keyword *keyword* is not supported for *command*.**

Explanation

A coupling facility data table server parameter keyword was specified in a context where it is not valid, such as an attempt to **SET** a parameter which can only be specified at initialization time, or to specify at initialization time a parameter which is only valid on **DISPLAY**.

System action

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

If the error occurred at initialization, remove the incorrect parameter and restart the server. If it occurred on a server command, check that the command and parameter were correctly entered.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0209   **Parameter text contains invalid character: *text***

Explanation

The coupling facility data table server parameter processing routine found some unexpected text when attempting to process parameters.

System action

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameters (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0210   **Parameter keyword *keyword* should not have a value for *command*.**

Explanation

A coupling facility data table server parameter keyword was specified in the form *keyword=value* in a context where it was not expected, for example on a **DISPLAY** command.

System action

Processing of the current line of parameters is terminated.

User response

Reenter the command without specifying a value for the parameter to be displayed.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0211I   **Parameter value: *keyword=value***

Explanation

This message is issued to show the current value of a coupling facility data table server parameter setting in response to a **DISPLAY** or **PRINT** command.

System action

Processing continues normally.

User response

None.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0212 **Value *value* for parameter *keyword* is incorrect. It must be one of *validlist*.**

Explanation

The value of this coupling facility data table server parameter was not recognized. It should have been specified as one of the indicated list of values.

System action

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value and reenter the command or restart the server.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0213 **Value for parameter *keyword* is missing. The correct form is keyword=value.**

Explanation

A parameter keyword was specified without an associated parameter value on a coupling facility data

table server **SET** command or in a SYSIN or PARM parameter string. Note that the only character which should appear between the parameter keyword and its intended value is the equals sign, without any extra spaces.

System action

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Reenter the parameter specification in the correct form *keyword=value*.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0214 **Value *value* for parameter *keyword* is incorrect. Pattern matching is not supported in this context.**

Explanation

A parameter value containing one of the pattern matching (wild card) characters '*', '%' or '?' was specified in a context where only a single identifier is supported.

System action

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response

Correct the parameter value and reenter the command.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0215 Value *value* for applid.uowid parameter *keyword* is incorrect. The APPLID part should be a name of up to 8 characters.

Explanation

The value of this coupling facility data table server parameter did not conform to the correct syntax for the APPLID part of a unit of work identifier.

System action

Processing of the current line of parameters is terminated.

User response

Correct the parameter value and reenter the command.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0216 Value *value* for applid.uowid parameter *keyword* is incorrect. The UOWID part should be 16 hexadecimal digits or '*'.

Explanation

The value of this coupling facility data table server parameter did not conform to the correct syntax for a unit of work identifier.

System action

Processing of the current line of parameters is terminated.

User response

Correct the parameter value and reenter the command.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0217 Parameter keyword *keyword* requires a table name. It should be preceded by TABLE=name in the same command line.

Explanation

This coupling facility data table server parameter can only be set for a specific table, but it was not preceded by a **TABLE=** *name* parameter in the same command line.

System action

Processing of the current line of parameters is terminated.

User response

Insert the parameter **TABLE=** *name* before the specified keyword and reenter the command.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0218 TABLE=*table* was specified without any table-related parameter.

Explanation

A coupling facility data table server **SET** command was issued including a parameter of the form **TABLE=** *name* to select a specific table, but it was not followed by any table-related parameter within the same command.

System action

The table name parameter is ignored.

User response

If a table-related parameter was to be set, ensure that it is included on the same **SET** command as the table name.

Module:
DFHCFPR

Destination

Console and SYSPRINT

DFHCF0301I Console operator *consname* issued command: *command*

Explanation

A coupling facility data table server operator command has been issued via the MVS **MODIFY** or **STOP**

command. This message identifies the console name (or TSO userid) from which the command was issued and the text of the command.

System action

Processing continues.

User response

None.

Module:
DFHCFOP

Destination

SYSPRINT

DFHCF0302I	*command* **command ignored because no valid parameters were given.**

Explanation

A coupling facility data table server command was issued which had no valid parameters on it but was otherwise syntactically valid. The command has had no effect.

System action

Processing continues normally.

User response

Ensure that the command was entered correctly.

Module:
DFHCFOP

Destination

Console and SYSPRINT

DFHCF0303I	*command* **command has been processed.**

Explanation

A coupling facility data table server command has been processed successfully.

System action

Processing continues.

User response

None.

Module:
DFHCFOP

Destination

Console and SYSPRINT

DFHCF0304I	**STOP command is waiting for connections to be closed. Number of active connections =** *connections***.**

Explanation

A coupling facility data table server **STOP** command has been issued (either via an MVS **STOP** command or via an MVS **MODIFY** command with the text **STOP**) but there are still active connections to the server, so the **STOP** command has not yet taken effect.

System action

The server rejects any further attempts to establish new connections, but continues processing requests for existing connections. Each time a connection is terminated, this message will be repeated as long as there are more active connections.

User response

Further information about the connections which are still active may be obtained using the command **DISPLAY CONNECTIONS**.

If the server needs to be shut down without waiting for connections to be closed, issue the server **CANCEL** command. Note that this will immediately terminate any active connections, causing any further requests for that server to be given a SYSIDERR indication. (The MVS **CANCEL** command can also be used, but should preferably be avoided because it will prevent the server from producing its normal closedown statistics and reports).

Note that if a CICS region is abnormally terminated while server connect or disconnect processing is in progress, or is terminated without going through end of task processing (for example using the **FORCE** command) there is a slight chance that the server will not be notified that the connection has been terminated. In this case the server will not be able to be closed down with the server **STOP** command, but only with the server **CANCEL** command.

Module:
DFHCFOP

Destination

Console and SYSPRINT

DFHCF0305I   **STOP command has been processed.**

Explanation

Processing of a coupling facility data table server **STOP** command has now been successfully completed. This means that there are no longer any active connections and the server is ready to close down.

System action

The coupling facility data table server starts termination processing.

User response

None.

Module:
DFHCFOP

Destination

Console and SYSPRINT

DFHCF0306   **CF data table server does not support this command:** *command*

Explanation

An operator command was addressed to the coupling facility data table server using the MVS **MODIFY** command, but the first word of the **MODIFY** parameter text is not a recognized server command (**SET**, **DISPLAY**, **PRINT**, **STOP**, **CANCEL** or an accepted abbreviation for one of these).

System action

The command is ignored.

User response

Correct and reenter the command.

Module:
DFHCFOP

Destination

Console and SYSPRINT

DFHCF0307I   **CANCEL** *parm* **command has been processed. Number of active connections =** *connections***.**

Explanation

A coupling facility data table server **CANCEL** command has been issued, either from an operator console or internally by the server in response to a severe error such as coupling facility failure. This message includes any restart parameter specified on the command and the number of active connections which may be affected by this command.

System action

The server terminates immediately, without waiting to close connections.

User response

None.

Module:
DFHCFOP

Destination

Console and SYSPRINT

DFHCF0308   **CF data table server does not support CICS commands. To close it down, you can use the STOP command.**

Explanation

An operator command which appears to be a CICS command (a four-character transaction code of the form 'CExx') was addressed to the coupling facility data table server using the MVS **MODIFY** command.

System action

The command is ignored.

User response

Correct and reenter the command. If the intention is to close down the server, use the server **STOP** or **CANCEL** command.

Module:
DFHCFOP

Destination

Console and SYSPRINT

DFHCF0309   **Parameter** *parm* **on CANCEL command is incorrect. The only valid parameters are RESTART=YES or RESTART=NO.**

Explanation

A coupling facility data table server **CANCEL** command was issued with a parameter which did not match the valid parameter keywords.

System action

The command is ignored.

User response

Correct and reenter the command.

Module:
DFHCFOP

Destination

Console and SYSPRINT

DFHCF0310   **Parameter *parm* on STOP command is incorrect. No parameters should be specified.**

Explanation

A coupling facility data table server **STOP** command was issued with parameters, but the **STOP** command does not support any parameters.

System action

The command is ignored.

User response

Correct and reenter the command.

Module:
DFHCFOP

Destination

Console and SYSPRINT

DFHCF0321   **Pool state error, reason code *reason*, processing *request* request for table *table*, key *key*, task *task*, region *region*.**

Explanation

Integrity checks during coupling facility data table request processing found that data or control information in the pool list structure was in a state that should not be possible in normal processing. The reason codes are based on the response codes returned by the internal coupling facility interface.

• Reason codes:

2

Entry exceeds maximum data length.

3

Entry not found.

4

Wrong version.

5

Wrong list authority.

6

Maximum number of entries in list reached.

7

No space left in structure.

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed. For example, a wrong version response from the coupling facility interface normally simply indicates that an entry has changed, causing the entry to be read again, and this is only treated as a pool state error if the data or control information in the changed entry is not consistent with the expected state of the record.

System action

The request is terminated with a pool state error exception.

User response

This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for data records in a particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

Module:
DFHCFRQ

Destination

Console and SYSPRINT

DFHCF0331I   **Table *table* maximum records limit now set to *maxrec* (was *oldmax*). Current number of records is *records*.**

Explanation

The maximum number of records allowed to be stored in the specified table has been successfully modified in response to a coupling facility data table server **SET TABLE** command with the **MAXRECS** parameter. The previous maximum number is shown, and the current number of records. The new or previous maximum number may also be shown as **NOLIMIT** for the special value indicating that no limit applies. (For a recoverable table with uncommitted updates, this number includes the original versions of changed records, as these are retained until syncpoint time to allow for possible backout).

System action

Processing continues using the new value for the maximum number of records. If the current number of records already exceeds this value, no further records can be added (or, for a recoverable table, updated) until enough records have been deleted to bring the current number below the limit.

User response

None.

Module:
DFHCFOC

Destination

Console and SYSPRINT

DFHCF0332I   **Table *table* was not found.**

Explanation

The table specified on a coupling facility data table server **SET TABLE** command was not found in the pool.

System action

The command is ignored.

User response

Ensure that the table name was entered correctly, and that the command was addressed to the correct pool server.

Module:
DFHCFOC

Destination

Console and SYSPRINT

DFHCF0333   **Pool state error, reason code *reason*, processing SET command for table *table*.**

Explanation

The status of the table specified on a coupling facility data table server **SET TABLE** command could not be modified because the control information in the list structure was in a state that should not be possible in normal processing. The reason codes are based on the response codes returned by the internal coupling facility interface.

- Reason codes:

  2

    Entry exceeds maximum data length.

  3

    Entry not found.

  4

    Wrong version.

  5

    Wrong list authority.

  6

    Limit number of entries in list reached.

  7

    No space left in structure.

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed.

System action

The command is ignored.

User response

This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for attempts to modify a particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

Module:
DFHCFOC

Console and SYSPRINT

DFHCF0334	Table *table* status could not be modified, CF access error.

Explanation

During processing of a coupling facility data table server **SET TABLE** command, an unexpected error response was received. This message is preceded by message DFHCF0441 giving the details of the coupling facility access error.

System action

The command is ignored.

User response

Check the system log for a preceding DFHCF0441 message and see the explanation of that message.

Module:
DFHCFOC

Destination

Console and SYSPRINT

DFHCF0335I	Table *table* is now marked as available.

Explanation

The state of the specified table has been changed from unavailable to available in response to a coupling facility data table server **SET TABLE** command with the option **AVAILABLE=YES**.

System action

Processing continues. New OPEN requests for the table will now be allowed.

User response

None.

Module:
DFHCFOC

Destination

Console and SYSPRINT

DFHCF0336I	Table *table* is now marked as unavailable.

Explanation

The state of the specified table has been changed from available to unavailable in response to a coupling facility data table server **SET TABLE** command with the option **AVAILABLE=NO**.

System action

Processing continues. New OPEN requests for the table will be rejected with an indication that the table is unavailable.

User response

None.

Module:
DFHCFOC

Destination

Console and SYSPRINT

DFHCF0337I	Table *table* was already marked as available.

Explanation

This is a response to the coupling facility data table server **SET TABLE** command with the parameter **AVAILABLE=YES** when the table is already marked as available.

System action

Processing continues.

User response

None.

Module:
DFHCFOC

Destination

Console and SYSPRINT

DFHCF0338I	Table *table* was already marked as unavailable.

Explanation

This is a response to the coupling facility data table server **SET TABLE** command with the parameter **AVAILABLE=NO** when the table is already marked as unavailable.

System action

Processing continues.

User response

None.

Module:
DFHCFOC

Destination

Console and SYSPRINT

DFHCF0341I   **Server request statistics for table** *table***:**

Explanation

This message gives table access statistics for the current coupling facility data table server, listing the total number of requests of each type handled since the previous statistics reset. It is issued in response to a **DISPLAY** or **PRINT** command which includes the **TABLESTATS** parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output. Note that this message is suppressed if all statistics are zero.

The detailed message layout is as follows:

```
Table:   Open    Close  Set Attr    Delete
           n        n        n           n
         Stats
           n
Record: Point  Highest    Read  Read Del
           n        n        n         n
         Unlock     Load   Write   Rewrite
           n        n        n         n
         Delete Del Mult
           n        n
```

System action

Processing continues.

User response

The statistics are described in detail in the DFHCFS7D data area. The individual fields have the following meanings:

- Table requests:

  Open

    Number of successful OPEN requests for the table

Close

Number of successful CLOSE requests for the table

Set Attr

Number of times new table status was set

Delete

Number of times the table of that name was deleted

Extract

Number of times table access statistics were extracted

- Record requests:

  Point

    Number of POINT requests

  Highest

    Number of requests for current highest key

  Read

    Number of READ requests (including those for UPDATE)

  Read Del

    Number of combined READ and DELETE requests

  Unlock

    Number of UNLOCK requests

  Loads

    Number of records written by initial load requests

  Write

    Number of WRITE requests for new records

  Rewrite

    Number of REWRITE requests

  Delete

    Number of DELETE requests

  Del Mult

    Number of multiple (generic) delete requests

The coupling facility architecture supports some options and types of request such as combined READ and DELETE which are not currently supported by CICS File Control, but the server supports them for completeness. Server request counts for such options and request types are always zero.

Module:
DFHCFCN

Destination

Console and SYSPRINT

DFHCF0342I   **Server request statistics for all tables:**

Explanation

This message gives overall request statistics for the current coupling facility data table server, listing the total number of requests of each type handled since the previous statistics reset. It is issued in response to a **DISPLAY** or **PRINT** command which includes the **TABLESTATS** parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

```
Table:   Open       Close  Set Attr

n
         Inquire    Restart
           n           n
```

System action

Processing continues.

User response

The statistics are described in detail in the DFHCFS8D data area. The individual fields have the following meanings:

- Table requests:

   Open

   Number of successful OPEN requests for the table

   Close

   Number of successful CLOSE requests for the table

Set Attr

Number of times new table status was set

Delete

Number of times the table of that name was deleted

Extract

Number of times table access statistics were extracted

Inquire

Number of inquire table requests

- Record requests:

Point

Number of POINT requests

Highest

Number of requests for current highest key

Read

Number of READ requests (including those for UPDATE)

Read Del

Number of combined READ and DELETE requests

Unlock

Number of UNLOCK requests

Loads

Number of records written by initial load requests

Write

Number of WRITE requests for new records

Rewrite

Number of REWRITE requests

Delete

Number of DELETE requests

Del Mult

Number of multiple (generic) delete requests

- UOW requests:

Prepare

Number of units of work prepared

Retain

Number of units of work whose locks were retained

Commit

Number of units of work committed

Backout

Number of units of work backed out

Inquire

Number of unit of work inquire requests

Restart

Number of times recoverable connections were restarted

The coupling facility architecture supports some options and types of request such as combined READ and DELETE which are not currently supported by CICS File Control, but the server supports them for completeness. Server request counts for such options and request types are always zero.

Module:
DFHCFCN

Destination

Console and SYSPRINT

DFHCF0343I   **The number of recently accessed tables matching *table* is *number*.**

Explanation

This gives the number of tables matching the specified name expression which were accessed via this coupling facility data table server within the current statistics interval. This is shown at the end of the response to a **DISPLAY TABLESTATS=** *name* command, following any DFHCF0341I messages for matching tables and a DFHCF0342I message if all tables were selected.

System action

Processing continues.

User response

None.

Module:
DFHCFCN

Destination

Console and SYSPRINT

DFHCF0351I   **Connection: Job *jobname* Applid *applid* Idle *idletime***

Explanation

This describes a single connection from a CICS region to the coupling facility data table server, in response to the server command **DISPLAY CONNECTIONS** or **PRINT CONNECTIONS**. The information shows the job name, the generic APPLID and the time in hours, minutes and seconds since the most recent table request or inquire call was issued using the connection.

System action

A message in this form is issued for each active connection to the current server, then message DFHCF0352I is issued to show the total number of active connections.

User response

None.

Module:
DFHCFCN

Destination

Console and SYSPRINT

DFHCF0352I   **Total connections to this server: *connections*.**

Explanation

This describes the total number of active connections from CICS regions to the coupling facility data table server, in response to the server command **DISPLAY CONNECTIONS** or **PRINT CONNECTIONS**.

System action

Processing continues.

           Loaded
                  x
Statistics:   Users   Servers      Opens
Records
                  n          n
n          n
```

System action

Processing continues.

User response

The individual fields have the following meanings:

- Attributes:

  Recsize

    Record size specified when table was created.

  Keylength

    Key length specified when table was created.

  Max recs

    Indicates the current limit value if any which has been set on the number of records in the table, or 'NO' if there is no current limit value.

  Upd model

    Indicates the update model being used: 'CONT' or 'CONT+' for the contention model, 'LOCK' for the non-recoverable locking model or 'RECOV' for the recoverable locking model. For a contention model table where the maximum record size is 63 or less, this usually shows 'CONT+', which indicates that access has been further optimized by storing the record data in the coupling facility entry adjunct area, instead of using separate data elements.

  Init Load

    Indicates whether initial load was required: 'YES' or 'NO'.

- Status:

  Available

    Indicates whether new opens are currently allowed: 'YES' or 'NO'.

Open mode

Indicates whether the table is open for read/write access, open for read-only access or not open: 'R/W', 'R/O' or 'NONE'.

Access

Indicates whether the table is currently open for exclusive access, or otherwise indicates shared: 'EXCL' or 'SHR'.

Sharing

Indicates what level of shared access is currently allowed for the table, 'R/W', 'R/O' or 'NONE'.

Loaded

Indicates 'YES' if the table has been loaded or if loading is not required, otherwise 'NO'.

- Statistics

Users

Indicates the current number of users of this table, which is normally the number of CICS regions that currently have it open. It is also possible for a CICS region to have the same table open more than once at a time using different file names.

Servers

Indicates the number of server regions that currently have the table open internally for recoverable access. For a non-recoverable table this is zero. For a recoverable table, this is normally the same as the number of CICS regions which have currently have the table open, but when there are unresolved recoverable changes a server may have the table open internally even when the CICS region has not explicitly opened it, or has explicitly closed it.

Opens

Indicates the total number of opens issued for this table since it was created.

Records

Indicates the current number of records in the table.

Module:
DFHCFIQ

Destination

Console and SYSPRINT

DFHCF0364   **No table was found matching** *table***.**

Explanation

A table name specified on the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLE=** *name* or **TABLEUSERS=** *name* did not match any existing table in the pool.

System action

The command is ignored.

User response

Ensure that the table name was entered correctly, and that the command was addressed to the correct pool server.

Module:
DFHCFIQ

Destination

Console and SYSPRINT

DFHCF0365I   **The number of tables in the pool matching** *table* **is** *tables***.**

Explanation

This indicates the number of matching tables within the pool for which information was displayed in response to the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLES=** *name* or **TABLEUSERS=** *name* where the table name contained one or more wild card characters.

System action

Processing continues.

User response

None.

Module:
DFHCFIQ

Destination

Console and SYSPRINT

DFHCF0366I   Table *table* users: *region1 region2 region3 region4*

Explanation

This message lists the names (normally the CICS APPLIDs) of up to four regions which are currently using the named coupling facility data table, in response to the coupling facility data table server

command **DISPLAY** (or **PRINT**) **TABLEUSERS**. A region is considered to be using a table if it has one or more files open for the table, or if it has one or more unresolved units of work which have made recoverable updates to the table.

System action

This message is issued as many times as is necessary to list all regions which are currently using the table (sorted by name). If one of the regions was in the process of loading the table, message DFHCF0367I is issued to identify that region. Finally, message DFHCF0368I is issued to show the total number of users.

User response

None.

Module:
DFHCFIQ

Destination

Console and SYSPRINT

DFHCF0367I   **Table *table* is being loaded by region *region*.**

Explanation

If a table specified on the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLEUSERS** is currently open for loading, this message is issued to identify the name (normally the CICS APPLID) of the region which is loading it. This name also appears in the list of regions using the table.

System action

Processing continues.

User response

None.

Module:
DFHCFIQ

Destination

Console and SYSPRINT

DFHCF0368I   **The number of regions using table *table* is *users*.**

Explanation

This indicates the total number of regions which are currently using the table specified on the coupling facility data table server command **DISPLAY** (or **PRINT**) **TABLEUSERS**.

System action

Processing continues.

User response

None.

Module:
DFHCFIQ

Destination

Console and SYSPRINT

DFHCF0371I   **Table *table* has now been deleted.**

Explanation

The specified table was successfully deleted in response to a coupling facility data table server **DELETE TABLE=** *name* command.

System action

Processing continues.

User response

None.

Module:
DFHCFOC

Destination

Console and SYSPRINT

DFHCF0372I   **Table *table* was not found.**

Explanation

The table specified on a coupling facility data table server **DELETE TABLE=** *name* command was not found in the pool.

System action

The command is ignored.

User response

Ensure that the table name was entered correctly, and that the command was addressed to the correct pool server.

Module:
DFHCFOC

Destination

Console and SYSPRINT

DFHCF0373I   **Table** *table* **cannot be deleted because it is in use.**

Explanation

The table specified on a coupling facility data table server **DELETE TABLE=** *name* command is currently open for access, so it cannot be deleted.

System action

The command is ignored.

User response

Check that the correct table name was entered. Ensure that the table is closed from all regions which are no longer using it. The server command **DISPLAY TABLE=** *name* can be used to determine how many users currently have the table open, or whether one or more servers have it open for recoverable access.

Module:
DFHCFOC

Destination

Console and SYSPRINT

DFHCF0374   **Table** *table* **could not be deleted, CF access error.**

Explanation

During processing of a coupling facility data table server **DELETE TABLE=** *name* command, an unexpected error response was received. This message is preceded by message DFHCF0441 giving the details of the coupling facility access error.

System action

The command is ignored.

User response

Check the system log for a preceding DFHCF0441 message and see the explanation of that message.

Module:
DFHCFOC

Destination

Console and SYSPRINT

DFHCF0381I   **APPLID** *applid* **is connected on** *system*.

Explanation

This message is issued in response to a successful coupling facility data table server **DISPLAY APPLID** command. This is issued for each recoverable connection matching the given APPLID name or pattern, or for all recoverable connections if no APPLID value was given.

System action

Processing continues.

User response

None.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0382I   **APPLID** *applid* **is not currently connected.**

Explanation

This message is issued in response to a coupling facility data table server **DISPLAY APPLID** command for a single APPLID when the given APPLID does not match any active recoverable connection.

System action

Processing continues.

User response

Check that the correct APPLID was entered.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0383I   **APPLID** *applid* **total connections:** *applids***.**

Explanation

This message is issued at the end of the responses to a coupling facility data table server **DISPLAY APPLIDs** command to summarize the total number of connections listed. The total is zero if no matching connections were found.

System action

Processing continues.

User response

None.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0384I   **APPLID** *applid* **UOW status:** *indoubts* **in doubt,** *commits* **in commit,** *backouts* **in backout, active on** *system*

Explanation

This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command where the APPLID identifies a CICS region that has an active recoverable connection to the pool on the indicated MVS system. If UOWID details were requested, this message follows the details for the individual units of work. The *indoubts* count represents units of works which have been prepared for commit but have not yet been scheduled to be committed or backed out. The *commits* count represents units of work for which commit processing is in progress. The *backouts* count represents units of work for which backout processing is in progress.

System action

Processing continues.

User response

None.

Module:

DFHCFSP

Destination

Console and SYSPRINT

DFHCF0385I   **APPLID** *applid* **UOW status:** *indoubts* **in doubt,** *commits* **in commit,** *backouts* **in backout, not active**

Explanation

This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command for an APPLID which identifies a CICS region that previously established a recoverable connection to the pool and has recoverable work pending, but is not currently connected to the pool. If UOWID details were requested, this message follows the details for the individual units of work. The *indoubts* count represents units of work which have been prepared for commit but have not been scheduled to be committed nor backed out. These will normally be resolved by resynchronization processing when the connection is restarted. The *commits* count represents units of work for which commit processing has been started, and will be completed when the connection is restarted. The *backouts* count represents units of work for which backout processing has been started, and will be completed when the connection is restarted.

System action

Processing continues.

User response

None.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0386I   **UOWID** *applid.uowid* **is in doubt.**

Explanation

This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command. The unit of work has been prepared for commit, but has been neither committed nor backed out. If the APPLID is currently inactive, the state will normally be resolved by resynchronization processing the next time it is restarted.

System action

Processing continues.

User response

None.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0387I	UOWID *applid*.*uowid* is being committed.

Explanation

This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command. The unit of work has started the commit process. If the APPLID is currently inactive, the commit process will be completed the next time it is restarted.

System action

Processing continues.

User response

None.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0388I	UOWID *applid*.*uowid* is being backed out.

Explanation

This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command. The unit of work has started to be backed out. If the APPLID is currently inactive, the backout process will be completed the next time it is restarted.

System action

Processing continues.

User response

None.

Module:

DFHCFSP

Destination

Console and SYSPRINT

DFHCF0389	UOWID *applid*.*uowid* was not found.

Explanation

This message is issued in response to a coupling facility data table server **DISPLAY UOWID** command.

System action

Processing continues.

User response

Check that the correct UOWID was entered.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0390I	UOWID *applid*.*uowid* total matching entries: *uowids*

Explanation

This message is issued at the end of the responses to a coupling facility data table server **DISPLAY UOWIDs** command to summarize the total number of units of work listed. The total is zero if no matching units of work were found.

System action

Processing continues.

User response

None.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0391	APPLID *applid* does not have any unresolved units of work.

Explanation

This message is issued in response to a coupling facility data table server **SET** command which attempted to modify the recovery status for the given APPLID. There are no unresolved units of work in the pool which match the given APPLID.

System action

The requested function is ignored.

User response

Check that the correct APPLID was entered.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0392	APPLID *applid* recovery status cannot be modified while it is connected.

Explanation

This message is issued in response to a coupling facility data table server **SET** command which attempted to modify recovery status for the given APPLID. This is not possible if the APPLID is already connected to the pool, on this server or another server.

System action

The requested function is ignored.

User response

Check whether the correct APPLID was entered.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0393	APPLID *applid* recovery status cannot be modified because connection restart failed with reason code *reason*.

Explanation

This message is issued in response to a coupling facility data table server **SET** command which attempted to modify recovery status for the given

APPLID. The attempt failed because the server was unable to establish a recoverable connection on behalf of that APPLID. The reason code from the failing internal FCCU RESTART function is included.

System action

The requested function is ignored.

User response

See the server trace file and job log for further details about the failure.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0394	UOWID *applid.uowid* is not in doubt.

Explanation

This message is issued in response to a coupling facility data table server **SET** command which attempted to modify the recovery status of a specific unit of work. The APPLID had one or more unresolved units of work and was successfully restarted, but the UOWID did not match any in-doubt unit of work owned by that APPLID after restart completed. Note that if the unit of work was previously in the process of being committed or backed out, restart processing will have resolved it.

System action

The requested function is ignored. A further message will appear indicating whether any units of work remain unresolved after the successful restart.

User response

Check that the correct APPLID and UOWID were entered.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0395I	APPLID *applid* now has no unresolved units of work.

Explanation

This message is issued in response to a successful coupling facility data table server **SET** command to perform restart processing. All units of work associated with the APPLID were resolved by restart processing (which means that they must have been in commit or backout processing).

System action

Processing continues.

User response

None.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0396I   **APPLID** *applid* **units of work remaining in doubt:** *indoubts***.**

Explanation

This message is issued in response to a successful coupling facility data table server **SET** command to perform restart processing. One or more units of work remain in doubt.

System action

Processing continues.

User response

None.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0397I   **APPLID** *applid* **units of work now committed:** *commits***.**

Explanation

This message is issued in response to a successful coupling facility data table server **SET** command which committed one or more units of work.

System action

Processing continues.

User response

None.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0398I   **APPLID** *applid* **units of work now backed out:** *backouts***.**

Explanation

This message is issued in response to a successful coupling facility data table server **SET** command which backed out one or more units of work.

System action

Processing continues.

User response

None.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0399   **UOWID** *applid.uowid* **syncpoint failed, reason code** *reason***.**

Explanation

This message is issued in response to a coupling facility data table server **SET** command which attempted to commit or backout the given UOWID but failed. The reason code from the failing internal FCCU COMMIT or BACKOUT function is included.

System action

The requested function is ignored.

User response

See the server trace file and job log for further details about the failure.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0401I   **Connected to CF structure *strname*.**

Explanation

The coupling facility data table server has successfully established a connection to the coupling facility list structure for the table pool, using the IXLCONN macro.

System action

Processing continues.

User response

None.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0402I   **CF structure *strname* was allocated by this connection.**

Explanation

The coupling facility data table pool list structure did not previously exist and was allocated as part of the connection process.

System action

List structure initialization will be performed if necessary.

User response

None.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0403   **Connection to CF structure *strname* failed, IXLCONN return code *retcode*, reason code *rsncode*.**

Explanation

The IXLCONN macro to connect the coupling facility data table server to its pool list structure failed.

System action

The coupling facility data table server is terminated.

User response

See the documentation of the IXLCONN macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code. If the reason code is of the form xxxx0C08, indicating structure allocation failure, this message will be followed by message DFHCF0409 giving the facility reason code for each coupling facility in which allocation was attempted.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0404   **CF structure *strname* cannot be used because it has been allocated with attribute *attribute*.**

Explanation

The coupling facility data table server has successfully connected to its pool list structure but has found that the structure has been allocated using an IXLCONN structure attribute keyword which is not supported by the server.

System action

The server is terminated.

User response

This probably indicates that the structure has been allocated or modified by some program other than the coupling facility data table server program. In this case, the incorrect structure should be deleted (using the MVS **SETXCF FORCE** command) so that it will be reallocated correctly when the server is restarted.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0405   **CF structure *strname* element size *elemsize* is incorrect. It should be a power of 2 in the range 256 to 4096.**

Explanation

The list structure element size specified in the **ELEMSIZE** initialization parameter for the coupling facility data table server is not a power of two, or is outside the range supported by the coupling facility interface.

System action

The server is terminated (without attempting to connect to the list structure).

User response

Correct the **ELEMSIZE** parameter and restart the server.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0406	Initialization failed for CF structure *strname* with response *response*.

Explanation

Coupling facility data table server processing to initialize the pool list structure failed with an abnormal internal response code.

System action

The server is terminated.

User response

If the response code is 8 (I/O error), it indicates that an IXLLIST macro gave an abnormal return code, in which case a previous DFHCF0441 message will have been issued giving the IXLLIST return code and reason code. If this response code is any other value, this indicates that the list structure is in a state which should not occur, probably indicating that it was allocated or modified by a program other than the coupling facility data table server. In this case the structure may need to be deleted (using the MVS **SETXCF FORCE** command) so that it will be reallocated when the server is restarted.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0407	CF structure *strname* is not available for shared use.

Explanation

The coupling facility data table pool is currently locked for exclusive use by some other job such as a pool unload or reload job. (This serialization uses an MVS ENQ with scope SYSTEMS, major name 'SYSZDFH' and minor name equal to the structure name, 'DFHCFLS_poolname').

System action

The server is terminated.

User response

Check whether a pool maintenance job is currently running. If it is, wait until it has finished before trying to start the server again. You can find out what jobs are currently using the pool using this MVS command:

```
DISPLAY GRS,RES=(SYSZDFH,'DFHCFLS_poolname')
```

Note that for this command the pool name must be exactly eight characters, padded with trailing spaces if necessary.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0408	CF structure *strname* is not available for exclusive use.

Explanation

The current coupling facility data table unload or reload job requires exclusive use of the pool, but some other job is running which already has shared or exclusive use of the pool. (This serialization uses an MVS ENQ with scope SYSTEMS, major name 'SYSZDFH' and minor name equal to the structure name, 'DFHCFLS_poolname').

System action

The server is terminated.

User response

Check whether a coupling facility data table server or maintenance job is currently running. If it is, wait until it has finished before trying to run the current job

again. You can find out what jobs are currently using the pool using this MVS command:

```
DISPLAY GRS,RES=(SYSZDFH,'DFHCFLS_poolname')
```

Note that for this command the pool name must be exactly eight characters, padded with trailing spaces if necessary.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0409   **CF structure *strname* could not be allocated in facility *cfname*, reason code *rsncode*.**

Explanation

If a previous coupling facility data table server message DFHCF0403 indicated an IXLCONN failure because the structure could not be allocated, this message is issued for each coupling facility in which allocation was attempted to show the facility reason code indicating why structure allocation failed. If the reason code is known to the server, the name of the reason code is given (as defined in the MVS macro IXLYCONA, but without the 'ConaRsn' prefix), otherwise its decimal value is shown.

If the response indicates InvalidStructureSize, this means that the initial list structure size (specified on the server **POOLSIZE** parameter or in the CFRM policy **INITSIZE** parameter) is not large enough to contain the required structure control information. The size of the control information is affected by the number of list headers (determined by the server **MAXTABLES** parameter) and by the maximum structure size specified in the CFRM policy.

System action

The server is terminated.

User response

If further details are required, see the descriptions of the reason codes in the source of the MVS macro IXLYCONA which maps the connect answer area.

If the response was InvalidStructureSize, increase the initial structure size specification in the server **POOLSIZE** parameter or the CFRM policy **INITSIZE** parameter to ensure that there is enough space for data in addition to the structure control information. Also, check that the server **MAXTABLES** parameter

and the maximum structure size specified in the CFRM policy are not unnecessarily large. See the Configuring for more information on how to estimate pool sizes.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0410   **CF structure *strname* cannot be used, coupling facility maintenance level is too low.**

Explanation

Initialization test routines executed against the allocated list structure gave incorrect results, indicating that the coupling facility control code does not include all maintenance necessary to support coupling facility data tables.

System action

The server is terminated.

User response

Ensure that the required level of coupling facility maintenance is applied.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0411I   **CF structure *strname* now has *percentage*% of entries in use.**

Explanation

This message is issued by the coupling facility data table server when the percentage of list entries in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after a structure alter request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio. The percentage is calculated using information that is returned by successful coupling facility access requests, so if the message was triggered by structure alter completion and the current server has not processed any successful requests recently, the information may not be accurate.

System action

The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User response

Note that the structure may soon become full, preventing tables from being created. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS **SETXCF** command with the **START,ALTER** option, and any active servers will be able to use the increased space immediately.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0412I	CF structure *strname* now has *percentage*% of elements in use.

Explanation

This message is issued by the coupling facility data table server when the percentage of list data elements in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after a structure alter request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio. The percentage is calculated using information that is returned by successful coupling facility access requests, so if the message was triggered by structure alter completion and the current server has not processed any successful requests recently, the information may not be accurate.

System action

The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full

use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User response

Note that the structure may soon become full, preventing tables from being created. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be altered dynamically using the MVS **SETXCF** command with the **START,ALTER** option, and any active servers will be able to use the increased space immediately.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0413I	Issuing alter request to adjust CF structure *strname* entry/element ratio to *entries*/*elements*.

Explanation

The coupling facility data table server has determined that the ratio of free entries to free elements is significantly different from the ratio of entries to elements actually in use. It is issuing an IXLALTER macro to request the coupling facility to adjust the ratio to make better use of the coupling facility storage.

System action

The server continues by issuing the IXLALTER macro. A further message will be issued when the structure alter request is accepted or rejected by MVS.

User response

None.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0414I	Alter request successfully started for CF structure *strname*.

Explanation

The coupling facility data table server has successfully started a structure alter request to change the entry to element ratio for the list structure.

System action

The server event exit will be notified by MVS when the structure alter request completes and a further message will then be issued.

User response

None.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0415I   **Alter request rejected for CF structure *strname*, another alter request for this structure is already active.**

Explanation

The coupling facility data table server attempted to start a structure alter request using IXLALTER to change the entry to element ratio for the list structure, but this was rejected by the system because another structure alter request was already active.

System action

The server event exit will be notified by MVS when the structure alter request completes and a further message will then be issued.

User response

None.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0416   **Alter request failed for CF structure *strname*, IXLALTER return code *retcode*, reason code *rsncode*.**

Explanation

The coupling facility data table server attempted to start a structure alter request to change the entry to element ratio for the list structure, but this was rejected by the system with an unexpected return code.

System action

The current structure alter attempt is abandoned. Another attempt may be made when the minimum alter interval has expired.

User response

See the documentation of the IXLALTER macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0417I   **Alter request completed normally for CF structure *strname*.**

Explanation

The coupling facility data table server has been notified by the system that a structure alter request has completed normally.

System action

New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHCF0411 and DFHCF0412 to indicate the new usage percentages.

User response

None.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0418I   **Alter request ended abnormally for CF structure *strname* with status *status*.**

Explanation

The coupling facility data table server has been notified by the system that a structure alter request has ended abnormally. The two bytes of status information in this message are taken from EEPLALTERENDSTATEFLAGS in the event exit parameter list (defined in the MVS macro IXLYEEPL).

System action

No action is taken as a result of this notification, but any problem which caused the alter request to fail may result in other related problems.

User response

If further information is required, look for MVS messages on the system log indicating the reason for the structure alter request failure. For further information about the status flags, see the source of the MVS macro IXLYEEPL.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0419I	Alter request ended normally for CF structure *strname* but target was not attained.

Explanation

The coupling facility data table server has been notified by the system that a structure alter request has ended normally but that the target ratio or target size was not attained.

System action

New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHCF0411 and DFHCF0412 to indicate the new usage percentages.

User response

None.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0424	Connectivity has been lost to CF structure *strname*. The CF data table server cannot continue.

Explanation

The coupling facility data table server has been notified by the system that connectivity has been lost to the coupling facility containing the pool list structure. If the loss of connectivity was due to an IPL

of the coupling facility, all tables and data records are lost.

System action

The server issues an internal **CANCEL** command to terminate itself immediately.

User response

Restart the server when connectivity to the coupling facility from the current system has been reestablished. If connectivity is still available from other systems, CICS transactions which require access to the affected pool should be diverted to those systems if possible.

If the loss of connectivity was due to an IPL of the coupling facility the restart causes a fresh copy of the list structure to be allocated.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0425	CF structure *strname* has failed. The CF data table server cannot continue.

Explanation

The coupling facility data table server has been notified by the system that the pool list structure has been lost due to coupling facility structure failure. All tables and data records in the pool have been lost.

System action

Each server for the affected pool issues an internal **CANCEL** command to terminate itself immediately.

User response

If another coupling facility is available and is included in the CFRM preference list for the failed structure, restart the servers to cause a fresh copy of the list structure to be allocated on the alternate coupling facility. If no other coupling facility is available, wait until the original coupling facility has been made available again before restarting the servers.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0431I   Access statistics for CF structure *strname*:

Explanation

This message gives a summary of coupling facility access statistics. It is issued in response to a coupling facility data table server **DISPLAY** or **PRINT** command which includes the **CFSTATS** parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

```
Requests:          Reads Writes Rewrites
Deletes
 Table data records    n      n
n      n
 Data list controls    n      n
n      n
 Table index list      n      n
n      n
 UOW index list        n      n
n      n
 APPLID index list     n      n
n      n
 Lock release msgs     n      n
Responses: Asynch Unavail Normal  Len err
Not fnd
                n      n      n
n      n
    Vers chk List chk List full Str full
I/O err
            n      n      n
n      n
```

System action

Processing continues.

User response

The statistics are described in detail in the DFHCFS6D data area. The individual fields have the following meanings:

- Table data record request counts:

  Reads

      Number of data entry reads.

  Writes

      Number of data entry writes.

  Rewrites

      Number of data entry rewrites.

  Deletes

      Number of data entry deletes.

- Data list controls request counts:

  Reads

      Number of reads to check list usage (open or inquire).

  Writes

      Number of times a new data list was allocated.

  Rewrites

      Number of times data list controls were modified.

  Deletes

      Number of times a data list was deleted for reuse.

- Table index list request counts:

  Reads

      Number of table index reads.

  Writes

      Number of table index writes to create new tables.

  Rewrites

      Number of table index writes to update table status.

  Delete

      Number of table index deletes.

- Unit of work index list request counts:

  Reads

      Number of UOW list reads.

  Writes

      Number of UOW list writes (usually at PREPARE).

  Rewrites

      Number of UOW list rewrites (usually at COMMIT).

  Deletes

      Number of UOW list deletes (usually after COMMIT).

- Lock release notify message request counts:

  Reads

      Number of lock release messages read by this server.

  Writes

      Number of lock release messages sent by this server.

- Response counts:

Asynch

Number of requests for which completion was asynchronous.

Normal

Number of normal responses.

Unavail

Number of times requests were deferred because the structure was temporarily unavailable, for example because system-managed rebuild was in progress.

Len error

Entry data was larger than the input buffer length, which normally results in a retry with a larger buffer.

Not fnd

The specified entry (table or item) was not found.

Vers chk

A version check failed for an entry being updated, indicating that another task had updated it first.

List chk

A list authority comparison failed, usually meaning that the table is in the process of being deleted.

List full

A table reached the maximum number of items, causing the relevant list to be marked as full.

Str full

The list structure became full.

I/O err

Some other error code was returned by IXLLIST.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0432I   Table pool statistics for CF structure *strname*:

Explanation

This message gives a summary of the usage statistics for the table pool list structure. It is issued in response to a coupling facility data table server **DISPLAY** or **PRINT** command which includes the **POOLSTATS** parameter, and may also be produced

on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

```
Structure: Size  Max size  Elem size
           nK        nK            n
Tables: Current   Highest
           n          n
Lists:    Total    In use   Max used
Control
           n          n
n          n
           100%       n%
n%         n%
          Data
           n
           n%
Entries:  Total    In use   Max used

       Min free   Reserve
           n          n
           n%         n%
```

System action

Processing continues.

User response

The statistics are described in detail in the DFHCFS6D data area. Pool usage statistics are calculated from information returned by recent coupling facility requests, and are not always very accurate, especially if the relevant information has not been accessed recently by the current server. The number of tables and the number of lists are updated each time the server opens or closes a table, but are not reliably updated at other times. The element and entry counts are updated on successful completion of most types of coupling facility access request.

The individual fields have the following meanings:

- Structure:

  Size

  Current allocated size of the list structure.

  Max size

  Maximum size to which this structure could be altered.

Elem size

> Data element size used for the structure.

- Tables:

    Current

    > Number of tables currently in existence.

    Highest

    > Highest number of tables at any time (since last reset).

- Lists:

    Total

    > Maximum number of list headers in the structure.

    In Use

    > Number currently in use.

    Max Used

    > Maximum number in use (since last reset).

    Control

    > Number of lists in use for control information.

    Data

    > Number of lists in use for table data.

- Entries:

    Total

    > Total entries in the currently allocated structure (initially set at structure connection time and updated on completion of any structure alter request).

    In Use

    > Number of entries currently in use.

    Max Used

    > Maximum number in use (since last reset).

    Free

    > Number of entries currently free (total minus used).

    Min Free

    > Minimum number of free entries (since last reset).

    Reserve

    > Number of entries reserved for rewrites and server use.

- Elements:

Total

> Total data elements in the currently allocated structure (initially set at structure connection time and updated on completion of any structure alter request).

In Use

> Number of elements currently in use.

Max Used

> Maximum number in use (since last reset).

Free

> Number of elements currently free (total minus used).

Min Free

> Minimum number of free elements (since last reset).

Reserve

> Number of elements reserved for rewrites and server use.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0441	**CF structure *strname* request failed, IXLLIST return code *retcode*, reason code *rsncode*.**

Explanation

A coupling facility access request issued by the coupling facility data table server using the IXLLIST macro gave an abnormal return code.

System action

The failing request is given an I/O error indication, giving an IOERR condition if it originated from a CICS API request.

User response

See the documentation of the IXLLIST macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0442   **CF structure *strname* request failed, structure is full.**

Explanation

A coupling facility access request issued by the coupling facility data table server using the IXLLIST macro failed because there are insufficient free entries or elements to store the new data in the structure.

System action

The failing request is given a NOSPACE indication if it originated from a CICS API request. For reload processing, if an automatic structure alter is in progress, the request may be suspended until the outcome of the alter request is known, then retried. This message will not be issued again for further failures until the used numbers of elements and entries fall well below the warning threshold.

User response

Any tables which are no longer in use should be deleted so that the space can be reused. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS **SETXCF** command with the **START,ALTER** option, and any active servers will be able to use the increased space immediately. However, if this action is possible it should normally have been taken in response to earlier warning message before the structure became full.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0443   **CF structure *strname* request failed, all lists are in use.**

Explanation

A coupling facility access request issued by the coupling facility data table server using the IXLLIST macro failed because all list headers defined in the structure are now in use. The number of list headers is determined by the **MAXTABLES** server initialization parameter when the structure is allocated.

System action

The failing request is given a NOSPACE indication if it originated from a CICS API request. This message will not be issued again for further failures while the shortage of list entries remains.

User response

Any tables which are no longer in use should be deleted to free up data lists. As the number of lists is fixed when the structure is allocated, the only way to increase the number of lists is to unload the structure, use the MVS **SETXCF FORCE,STR** command to delete it then reload it with a larger **MAXTABLES** parameter.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0444I   **CF request has been suspended to await structure alter completion.**

Explanation

A coupling facility access request issued from the coupling facility data table server address space (during reload processing) ran out of space in the list structure, but an automatic structure alter attempt to free up more space is either already active or is being started at this point. The request is therefore being suspended to await the outcome of the structure alter attempt.

System action

The request is suspended until the structure alter request completes (normally or abnormally), then message DFHCF0445I is issued and the request is retried.

User response

None.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0445I   **CF request is being retried after structure alter completion.**

Explanation

A coupling facility data table access request which was suspended to await the completion of a structure alter request is now being retried because the alter request has either completed or failed.

System action

The suspended request will be restarted.

User response

None.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0446	CF structure *strname* free space is below reserve level. New records will be rejected.

Explanation

The coupling facility data table server has detected that the number of free list entries or data elements in the pool structure has fallen below the reserve levels specified on the server parameters **ENTRYRESERVEMIN**, **ENTRYRESERVEPC**, **ELEMENTRESERVEMIN** and **ELEMENTRESERVEPC**.

System action

Any request to create a new record or table in the pool will be rejected for as long as the amount of free space remains below the reserve levels. The failing request is given a NOSPACE indication if it originated from a CICS API request. If free space later increases beyond the reserve levels, requests will be allowed again, and when the amount of free space exceeds the reserve levels by a reasonable margin (based on the server **ENTRYWARNINC** and **ELEMENTWARNINC** parameters) message DFHCF0447 will be issued.

User response

Use the server command **DISPLAY POOLSTATS** to obtain further information about the current pool usage. Any tables which are no longer in use should be deleted so that the space can be reused. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS **SETXCF** command with the

START,ALTER option, and any active servers will be able to use the increased space immediately. However, if this action is possible it should normally have been taken in response to earlier warning messages.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0447	CF structure *strname* free space is no longer below reserve level.

Explanation

The coupling facility data table server issues this message after a recent shortage of free space caused message DFHCF0446 to be issued but the free space has now increased to beyond the reserve levels by a reasonable margin (based on the server **ENTRYWARNINC** and **ELEMENTWARNINC** parameters).

System action

Processing continues.

User response

Use the server command **DISPLAY POOLSTATS** to obtain further information about the current pool usage. Note that even if this message is produced, the structure may still be very short of space and further action may be necessary, as described for message DFHCF0446.

Module:
DFHCFCF

Destination

Console and SYSPRINT

DFHCF0451	Purge for CF structure *strname* failed, IXLPURGE return code *retcode*, reason code *rsncode*.

Explanation

A coupling facility data table access request was terminated abnormally and the server issued an IXLPURGE macro to ensure any active IXLLIST request was purged before releasing the I/O buffer, but the IXLPURGE macro gave a non-zero return code.

System action

The error is ignored because this only occurs when a request is already being terminated abnormally.

User response

See the documentation of the IXLPURGE macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHCFCF

Destination

Console and SYSPRINT

| DFHCF0461I | Disconnected from CF structure *strname*. |

Explanation

The coupling facility data table server has successfully disconnected from the pool list structure (using the IXLDISC macro) during termination.

System action

Processing continues.

User response

None.

Module:
DFHCFCF

Destination

Console and SYSPRINT

| DFHCF0462 | Disconnect from CF structure *strname* failed, IXLDISC return code *retcode*, reason code *rsncode*. |

Explanation

The IXLDISC macro to disconnect the coupling facility data table server from its pool list structure failed.

System action

The error is ignored, as disconnection only occurs when the server is already terminating.

User response

See the documentation of the IXLDISC macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHCFCF

Destination

Console and SYSPRINT

| DFHCF0471 | CF structure *strname* already has the maximum of *maxconn* servers active. |

Explanation

An attempt was made to connect an additional coupling facility data table server to a pool list structure which already has the maximum number of active connections supported by the current version of the server. The coupling facility accepted the connection, but the server does not support this number of simultaneous connections to the pool, so the connection could not be used.

The server has been designed to support a fixed maximum number of connections per pool, which is the same as the maximum number of connections to a list structure supported by current coupling facility implementations, and the maximum number of systems in a sysplex. This means that if this message occurs, a level of coupling facility must be in use which supports more connections, and one or more of those connections must be in use by a program other than the coupling facility data table server, as the server only supports one connection per system within a sysplex.

System action

The server is terminated.

User response

Ensure that no programs other than the data table server are connected to the list structure.

Module:
DFHCFCF

Destination

Console and SYSPRINT

| DFHCF0481I | Waiting for structure *strname* to become available. |

Explanation

The coupling facility data table server was unable to connect to its coupling facility structure because of an environmental error, such as the structure being unavailable, as described in a previous DFHCF0403 message. The server is now waiting for this problem to be fixed, and will retry the connection request when it is notified via the ENF facility that the specific structure may now be available or that some change has occurred in the status of general coupling facility resources.

System action

The server waits to be notified of a relevant event.

User response

No action is required, but the waiting server can optionally be terminated using the MVS **CANCEL** command if it is no longer required.

Module:
DFHCFEN

Destination

Console and SYSPRINT

DFHCF0482I	Retrying connection to structure *strname*.

Explanation

The coupling facility data table server has been notified via ENF that its list structure may now be available or that a change has occurred in the status of some general coupling facility resources, so it is about to make another attempt to connect to the structure.

System action

The original IXLCONN request is retried.

User response

None.

Module:
DFHCFEN

Destination

Console and SYSPRINT

DFHCF0491	ENFREQ ACTION=*action* failed, return code *retcode*.

Explanation

An ENF request issued by the coupling facility data table server gave an unexpected return code.

System action

If this occurs on the ENFREQ ACTION=LISTEN request and the server is subsequently unable to connect to the list structure, the server will be terminated instead of waiting for the structure to become available.

User response

See the documentation of the ENFREQ macro in z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) (GC28-1765) for the explanation of the return and reason code.

Module:
DFHCFEN

Destination

Console and SYSPRINT

DFHCF0501	External security manager was not found, table security cannot be supported.

Explanation

Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager data areas needed by the server security interface (in particular the RCVT) were not found.

System action

The server is terminated.

User response

If these security checks are not required, specify **SECURITY=NO** in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, ensure that the external security manager is installed and active before starting the server.

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0502	**External security manager is inactive, table security cannot be supported.**

Explanation

Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager is not active.

System action

The server is terminated.

User response

If these security checks are not required, specify **SECURITY=NO** in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, ensure that the external security manager is installed and active before starting the server.

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0503	**External security manager does not support global in-storage profiles, table security cannot be supported.**

Explanation

Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager does not support the GLOBAL option for loading security profiles (known as global RACLIST), which is required in order to support cross-memory mode security checking.

System action

The server is terminated.

User response

If these security checks are not required, specify **SECURITY=NO** in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, it will be

necessary to upgrade the external security manager to a level which supports global in-storage profiles.

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0504	**External security manager does not support cross-memory mode, table security cannot be supported.**

Explanation

Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager does not support authorization (FASTAUTH) requests in cross-memory mode, which are required in order to perform table security checks.

System action

The server is terminated.

User response

If these security checks are not required, specify **SECURITY=NO** in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, it will be necessary to upgrade the external security manager to a level which supports cross-memory mode authorization requests.

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0505	**RACROUTE REQUEST=EXTRACT gave R15=*rc*, SAFPRRET=*retcode*, SAFPRREA=*rsncode*.**

Explanation

Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager EXTRACT function used to obtain the userid during server initialization gave an unexpected non-zero return code. This message shows the RACROUTE register 15 return code and the

external security manager return and reason codes returned in the SAF request parameter list.

System action

The server is terminated with message DFHCF0506.

User response

See the documentation of the RACROUTE macro with REQUEST=EXTRACT in z/OS Security Server RACROUTE Macro Reference (GC28-1922) for the explanation of the return and reason codes.

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0506	Security EXTRACT function failed, table security cannot be supported.

Explanation

Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager EXTRACT function issued to obtain the userid during server initialization gave an unexpected return code.

System action

The server is terminated.

User response

See the preceding message DFHCF0505 for the details of the reason for the failure. If these security checks are not required, specify **SECURITY=NO** in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool.

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0507	RACROUTE REQUEST=LIST, ENVIR=CREATE, CLASS='*class*', GLOBAL=YES gave R15=*rc*, SAFPRRET=*retcode*, SAFPRREA=*rsncode*.

Explanation

Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager LIST function to load the security profiles during server initialization gave an unexpected non-zero return code. This message shows the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

System action

The server is terminated with message DFHCF0508.

User response

See the documentation of the RACROUTE macro with REQUEST=LIST in z/OS Security Server RACROUTE Macro Reference (GC28-1922) for the explanation of the return and reason codes.

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0508	Security LIST function failed, table security cannot be supported.

Explanation

Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager LIST function issued to load the security profiles during server initialization gave an unexpected return code.

System action

The server is terminated.

User response

See the preceding message DFHCF0507 for the details of the reason for the failure. If these security checks are not required, specify **SECURITY=NO** in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool.

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0511   **Attempt to open table *table* was rejected because the external security manager is not available.**

Explanation

The coupling facility data table server was attempting to perform a security check for whether the connected region was allowed to open that data table, but the external security manager was unexpectedly unavailable, even though it had been available at server initialization time.

System action

The table open request is rejected.

User response

Note that no further table open requests will succeed unless the external security manager is reactivated.

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0512   **RACROUTE REQUEST=FASTAUTH for resource *resource* gave R15=*rc*, SAFPRRET=*retcode*, SAFPRREA=*rsncode*.**

Explanation

A coupling facility data table OPEN, SET or DELETE security check gave a non-zero return code. This message indicates the resource name used for the check, the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

System action

Access to the table is rejected with message DFHCF0513.

User response

See the documentation of the RACROUTE macro with REQUEST=FASTAUTH in z/OS Security Server RACROUTE Macro Reference (GC28-1922) for the explanation of the return and reason codes.

Module:

DFHCFXS

Destination

Console and SYSPRINT

DFHCF0513   **Attempt to open table *table* was rejected by the external security manager.**

Explanation

A security check was performed by the coupling facility data table server to determine whether the connected region was allowed to open the named table, and the external security manager indicated that access was not allowed.

System action

The table open request is rejected.

User response

See the preceding message DFHCF0512 for the specific reason that access was rejected. Check that the correct table name was specified. Ensure that the client region is authorized to access the resource matching the table name (prefixed by the server region userid if **SECPRFX=YES** was specified) in the CICS file resource class (usually 'FCICSFCT').

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0521   **RACROUTE REQUEST=LIST, ENVIR=DELETE, CLASS='*class*' gave R15=*rc*, SAFPRRET=*retcode*, SAFPRREA=*rsncode*.**

Explanation

The external security manager LIST function to unload the in-storage security profiles during coupling facility data table server termination gave an unexpected non-zero return code. This message shows the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

System action

Server termination processing continues.

User response

See the documentation of the RACROUTE macro with REQUEST=LIST in z/OS Security Server RACROUTE Macro Reference (GC28-1922) for the explanation of the return and reason codes.

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0601I   **Starting statistics collection for interval since *lasttime*.**

Explanation

The coupling facility data table server is about to collect interval, end of day or closedown statistics. This message identifies the start of the time interval to which the statistics apply, which is either the time that the server was started up or the time of the last reset, which occurs whenever interval or end of day statistics are produced. The format of the timestamp is yyyy-mm-dd hh:mm:ss.

System action

The server proceeds with statistics collection.

User response

None.

Module:
DFHCFST

Destination

SYSPRINT

DFHCF0602I   **Statistics collection completed, reset performed.**

Explanation

Coupling facility data table server statistics have been collected and counters have been reset. This occurs for interval or end of day statistics.

System action

Processing continues.

User response

None.

Module:

DFHCFST

Destination

SYSPRINT

DFHCF0603I   **Statistics collection completed.**

Explanation

Coupling facility data table server statistics have been collected but counters have not been reset. This normally occurs at server closedown.

System action

Processing continues.

User response

None.

Module:
DFHCFST

Destination

Console and SYSPRINT

DFHCF0604   **Timer SET failed, return code *retcode*, reason code *rsncode*.**

Explanation

The statistics subtask in the coupling facility data table server tried to set up a timer wait interval but failed.

System action

The interval statistics function is terminated with message DFHCF0606.

User response

Check the return code and reason code. A return code of 4 indicates an attempt to set up more than one concurrent timer interval, which indicates a logic error in the server. The reason code in this case is the MVS STIMERM identifier for the existing timer interval. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM SET.

Module:
DFHCFST

Destination

Console and SYSPRINT

DFHCF0605   **Timer CANCEL failed, return code**
        retcode, **reason code** *rsncode*.

Explanation

The statistics subtask in the coupling facility data table
server tried to cancel a timer wait interval but failed.

System action

The interval statistics function is terminated with
message DFHCF0606.

User response

Check the return code and reason code. A return code
of 4 indicates an attempt to cancel a nonexistent timer
interval, which indicates a logic error in the server.
A return code of 8 indicates that the MVS STIMERM
macro failed, in which case the reason code indicates
the return code received from STIMERM CANCEL.

Module:
DFHCFST

Destination

Console and SYSPRINT

DFHCF0606   **Statistics collection function is no**
        longer available.

Explanation

The statistics collection subtask in the coupling facility
data table server was unable to continue processing
and has terminated. The reason will have been
indicated by an earlier message.

System action

The interval statistics subtask terminates and no
further interval statistics or end of day statistics will
be produced for this run of the server.

User response

See the earlier message indicating the reason for the
termination of the subtask.

Module:
DFHCFST

Destination

Console and SYSPRINT

DFHCF0610I   **Statistics written to SMF, return**
        code was *retcode*.

Explanation

Coupling facility data table server statistics have been
sent to SMF. The return code from the SMFEWTM
macro is indicated in this message. A non-zero
return code usually indicates that SMF recording was
suppressed because of current SMF options or an
installation exit.

System action

Processing continues.

User response

If the return code is non-zero but SMF statistics
were expected to be successfully written, see the
documentation of the SMFEWTM macro in z/OS MVS
System Management Facilities (SMF) (GC28-1783) for
more information about return codes.

Module:
DFHCFST

Destination

SYSPRINT

DFHCF0651   **Restart processing cannot open**
        table *table*, **reason code** *reason*.

Explanation

An application region has attempted to restart its
connection to the coupling facility data table server,
but an unresolved unit of work for that region has
updated a table which cannot be opened at present, so
restart processing cannot be completed. This message
only occurs if the table is still in existence; if it has
been deleted, the updates are simply discarded. The
reason code is from the file open routine in module
DFHCFOC, and indicates why the file could not be
opened. In the current implementation, there are no
user functions which could prevent a file from being
opened by restart, so this condition should not be
possible.

System action

Restart processing is terminated and recoverable
tables cannot be accessed until it is successfully
retried.

User response

None.

Destination

Console and SYSPRINT

DFHCF0652	Pool state error, reason code *reason*, processing *function* request for UOWID *uowid*, task *task*, region *region*.

Explanation

Integrity checks during coupling facility data table server syncpoint or restart processing found that data or control information in the list structure was in a state that should not be possible in normal processing. The reason codes are based on the response codes returned by the internal coupling facility interface.

- Reason codes:

  2

  Entry exceeds maximum data length.

  3

  Entry not found.

  4

  Wrong version.

  5

  Wrong list authority.

  6

  Limit number of entries in list reached.

  7

  No space left in structure.

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed. For example, a wrong version response from the coupling facility interface normally simply indicates that an entry has changed, causing the entry to be read again, and this is only treated as a pool state error if the data or control information in the changed entry is not consistent with the expected state of the record.

System action

The current syncpoint or restart operation is terminated with a pool state error exception.

User response

This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for changes to a particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

Module:
DFHCFSP

Destination

Console and SYSPRINT

DFHCF0701I	CF data table pool *poolname* is to be unloaded.

Explanation

The coupling facility data table server program has been started with the **UNLOAD** option requesting that the table pool is unloaded to a sequential data set.

System action

The server starts to process the unload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User response

None.

Module:
DFHCFUL

Destination

Console and SYSPRINT

DFHCF0702I	CF data table pool *poolname* has been successfully unloaded.

Explanation

The coupling facility data table pool has been unloaded successfully.

System action

The server closes down normally.

User response

None.

Module:
DFHCFUL

Destination

Console and SYSPRINT

DFHCF0703I   **Number of unloaded tables:** ***tables*****. Blocks written:** ***blocks*****.**

Explanation

This message provides additional information about the results of the coupling facility data table pool unload process, giving the number of tables which were unloaded and the number of 4K data blocks written to the unloaded table pool data set.

System action

Server termination continues.

User response

None.

Module:
DFHCFUL

Destination

Console and SYSPRINT

DFHCF0704   **DFHCFUL data set for unload could not be opened.**

Explanation

The data set to contain the unloaded coupling facility data table pool could not be opened.

System action

Unload processing is terminated and the server is closed down with message DFHCF0706.

User response

Check that the DFHCFUL DD statement is present in the JCL for the unload job.

Module:
DFHCFUL

Destination

Console and SYSPRINT

DFHCF0705   **Unload access to CF structure** ***strname*** **failed with response** ***response*****.**

Explanation

The coupling facility data table pool unload process failed because of a problem with coupling facility access.

System action

Unload processing is terminated and the server is closed down with message DFHCF0706.

User response

If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHCF0441 will have been issued. Any other response code indicates an internal logic error.

Module:
DFHCFUL

Destination

Console and SYSPRINT

DFHCF0706   **Unload for CF data table pool** ***poolname*** **was unsuccessful.**

Explanation

The coupling facility data table pool unload process failed. The reason will have been described in a previous message.

System action

The server is terminated.

User response

See the previous message giving the reason for the unload failure. Note that any unload data set produced in this case will be incomplete and will not be valid for reload purposes.

Module:
DFHCFUL

Destination

Console and SYSPRINT

DFHCF0721   **CF data table** ***table*** **has been successfully unloaded,** ***records*** **records.**

Explanation

The named coupling facility data table has been unloaded. Note that if any recoverable updates were pending, the number of table entries unloaded may be slightly larger than the number of records, as the entry for the original record is retained until syncpoint in case it is needed for backout.

System action

Unload processing continues.

User response

None.

Module:
DFHCFUL

Destination

SYSPRINT

DFHCF0731	***uowids* units of work were unloaded for recoverable connection *applid*.**

Explanation

One or more unresolved recoverable units of work were found for the specified recoverable connection identifier during coupling facility data table pool unload processing.

System action

Unload processing will include the status of those units of work in the unloaded data, to allow them to be resolved after the pool is reloaded.

User response

None.

Module:
DFHCFUL

Destination

SYSPRINT

DFHCF0801I	**CF data table pool *poolname* is to be reloaded.**

Explanation

The coupling facility data table server program has been started with the **RELOAD** option requesting that the table pool is to be reloaded from a sequential data set produced using the **UNLOAD** option.

System action

The server starts to process the reload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User response

None.

Module:
DFHCFRL

Destination

Console and SYSPRINT

DFHCF0802I	**CF data table pool *poolname* has been successfully reloaded.**

Explanation

The coupling facility data table pool has been reloaded successfully.

System action

The server closes down normally.

User response

None.

Module:
DFHCFRL

Destination

Console and SYSPRINT

DFHCF0803I	**Tables reloaded: *tables*. Tables bypassed: *duplicates*. Blocks read: *blocks*.**

Explanation

This message provides additional information about the results of the coupling facility data table pool reload process. Tables on the unloaded data set are bypassed during reload processing if they already exist in the pool (for example as a result of a previous reload which could not be completed due to lack of space).

System action

Server termination processing continues.

User response

None.

Module:
DFHCFRL

Destination

Console and SYSPRINT

DFHCF0804   **DFHCFRL data set for reload could not be opened.**

Explanation

The data set containing the coupling facility data table pool to be reloaded could not be opened.

System action

Reload processing is terminated and the server is closed down with message DFHCF0808.

User response

Check that the DFHCFRL DD statement is present in the JCL for the reload job.

Module:
DFHCFRL

Destination

Console and SYSPRINT

DFHCF0805   **Reload access to CF structure *strname* failed with response *response*.**

Explanation

The coupling facility data table pool reload process failed because of a problem with coupling facility access.

System action

Reload processing is terminated and the server is closed down with message DFHCF0808.

User response

If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHCF0441 will have been issued. Any other response code indicates an internal logic error.

Module:
DFHCFRL

Destination

Console and SYSPRINT

DFHCF0806   **Unexpected end of file encountered on reload data set.**

Explanation

End of file was encountered on the data set containing the unloaded coupling facility data table pool before the logical end of the unloaded data was encountered.

System action

Reload processing is terminated and the server is closed down with message DFHCF0808.

User response

This indicates that the unloaded data set is incomplete, perhaps because the unload process was abnormally terminated.

Module:
DFHCFRL

Destination

Console and SYSPRINT

DFHCF0807   **Reload data set contains incorrect data near block *block*, offset *offset*.**

Explanation

The coupling facility data table pool reload process failed because the unloaded pool data set is not in the correct format.

System action

Reload processing is terminated and the server is closed down with message DFHCF0808.

User response

Check that the correct data set is being used and that the unload process completed normally.

Module:
DFHCFRL

Destination

Console and SYSPRINT

DFHCF0808   **Reload for CF data table pool *poolname* was unsuccessful.**

Explanation

The coupling facility data table pool reload process could not be completed. The reason will have been described in a previous message.

System action

The program is terminated.

User response

See the previous message giving the reason for the reload failure.

Module:
DFHCFRL

Destination

Console and SYSPRINT

DFHCF0809   **Reload for CF structure *strname* failed, structure is full.**

Explanation

Coupling facility data table pool reload processing failed because there are insufficient free entries or elements to store the new data in the structure.

System action

Reload processing is terminated and the server is closed down with message DFHCF0808.

User response

If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS **SETXCF** command with the **START,ALTER** option, and the reload job can then be run again as soon as the alter request completes, in which case it will skip over duplicate information which has already been successfully reloaded. If the structure is at its maximum size, use the MVS **SETXCF FORCE** command to delete the structure, then increase the **SIZE** and **INITSIZE** parameters in the current CFRM policy and activate the updated policy, and rerun the reload job. The approximate amount of information which could not be reloaded can be estimated by comparing the numbers of blocks read and tables reloaded, as described by following message DFHCF0803, with the corresponding numbers from message DFHCF0703 in the unload job.

Module:
DFHCFRL

Destination

Console and SYSPRINT

DFHCF0810   **Reload for CF structure *strname* failed, all lists are in use.**

Explanation

Coupling facility data table pool reload processing failed because all list headers defined in the structure are now in use.

System action

Reload processing is terminated and the server is closed down with message DFHCF0808.

User response

Use the MVS **SETXCF FORCE** command to delete the structure, then change the reload job **MAXTABLES** parameter to a value at least as large as the number of tables in the unloaded data, preferably much larger to allow for future expansion, then rerun the reload job.

Module:
DFHCFRL

Destination

Console and SYSPRINT

DFHCF0821   **CF data table *table* has been successfully reloaded, *records* records.**

Explanation

The named coupling facility data table has been reloaded. Note that if any recoverable updates were pending, the number of table entries reloaded may be slightly larger than the number of records, as the entry for the original record is retained until syncpoint in case it is needed for backout.

System action

Reload processing continues.

User response

None.

Module:
DFHCFRL

Destination

SYSPRINT

DFHCF0822   **CF data table *table* is already defined, reloading has been bypassed.**

Explanation

A coupling facility data table which was being reloaded was found to have the same name as an existing table within the pool.

System action

Reloading of the table is bypassed, and reload processing continues with the next table.

User response

None.

Module:
DFHCFRL

Destination

SYSPRINT

DFHCF0831   ***uowids* units of work were reloaded for recoverable connection *applid*.**

Explanation

Coupling facility data table pool reload processing has reloaded one or more unresolved recoverable units of work for the specified recoverable connection identifier.

System action

Reload processing restores the status of those units of work from the unloaded data, to allow them to be resolved when the connection is next restarted.

User response

None.

Module:
DFHCFUL

Destination

SYSPRINT

DFHCF0832   ***uowids* duplicate units of work were skipped for recoverable connection *applid*.**

Explanation

Coupling facility data table pool reload processing found one or more unresolved recoverable units of work in the unloaded data which were found to be already present in the current pool, so they were bypassed in this reload run. This should only happen if the reload job was run more than once, for example to resume reloading after increasing the pool size.

System action

Reload processing skips units of work which are already identified as active in the current pool.

User response

None.

Module:
DFHCFUL

Destination

SYSPRINT

DFHCF0911I   **R12=*prv* RQ Entry *function* Table=*table* Task=*tasknum region***

Explanation

Coupling facility data table server request tracing is active and information from the FCCR parameter list is being traced on entry to the request module DFHCFRQ.

System action

Processing continues.

User response

This message is intended primarily for diagnostic use as advised by your IBM Support Center.

Module:
DFHCFRQ

Destination

SYSPRINT

DFHCF0912I   **R12=*prv* RQ Exit *response* Table=*table* Task=*tasknum region***

Explanation

Coupling facility data table server request tracing is active and information from the FCCR parameter list is being traced on exit from the request module DFHCFRQ.

System action

Processing continues.

User response

This message is intended primarily for diagnostic use as advised by your IBM Support Center.

Module:

Destination

SYSPRINT

DFHCF0913I   **R12=***prv* **RQ Lock** *status*
                Table=*table* **Task=***tasknum region*

Explanation

Coupling facility data table server request tracing is active and the state of a record lock is being traced. (This message is not used in the normal cases of reading a record whose lock is available or releasing a record when no other task expressed an interest in it).

- Record lock status values:

OWNED

     The lock is already held by the same task.

BUSY

     The lock is held by another active task.

RETAINED

     The lock has previously been marked as retained.

RETAIN

     The lock is for an inactive task and will be retained.

RECLAIM

     The lock is inactive and can be reclaimed immediately.

BACKOUT

     The lock will be reclaimed after backing out any change.

POST

     Other tasks are being notified that a lock was released.

WAIT

     The current task is being suspended to await a lock.

DFHCF0933I   **R12=***prv* **OC Closing table** *table* **for** *region* **on** *system***.**

Explanation

Coupling facility data table server request tracing is active and the open/close module DFHCFOC is closing a table on behalf of a region or server which has terminated.

System action

Processing continues.

User response

This message is intended primarily for diagnostic use as advised by your IBM Support Center.

Module:
DFHCFOC

Destination

SYSPRINT

DFHCF0941I   **R12=***prv* **CF Entry** *request options modifiers* **R1=***parmlst table*

Explanation

Coupling facility data table server tracing of coupling facility accesses is active and information from the request interface parameter list is being traced on entry to the coupling facility interface module DFHCFCF. The three-character request mnemonics used by the internal coupling facility interface consist of a two-character code indicating the type of operation followed by a one-character code indicating the type of object on which the operation is performed.

- Coupling facility interface operations:

  CRx

      Create

  DLx

      Delete

  INx

      Inquire

MDx

   Modify

RDx

   Read

RWx

   Rewrite

WRx

   Write (new)

- Coupling facility interface objects:

xxA

   APPLID entry

xxD

   Data record entry

xxI

   Index entry

xxL

   List controls (for list containing data records)

xxM

   Message entry (for lock release notification)

xxU

   Unit of work entry

- The options flags may include the following hexadecimal values:

80

   Read key greater than or equal

40

   Read key less than or equal

20

   Compare entry version with given value

10

   Suppress data transfer (transfer adjunct area only)

08

   Access oldest entry with same key (for before-image)

04

   Write new entry with same key (for after-image)

02

   Non-increasing rewrite (so retry if structure full)

The modifier field is only used at present to specify the target connection number for a lock message, in hexadecimal form.

System action

Processing continues.

User response

This message is intended primarily for diagnostic use as advised by your IBM Support Center.

Module:
DFHCFCF

Destination

SYSPRINT

DFHCF0942I	R12=*prv* CF IXLLIST Req=*request* Adj=*adjarea* Buf=*buffer* List=*listnum* Rsn=*rsncode*

Explanation

Coupling facility data table server tracing for coupling facility accesses is active and the result from an IXLLIST macro is being traced. The information traced includes an abbreviation of the type of request being performed, the addresses of the adjunct area and data buffer (zero when not used), the number of the list being accessed and the reason code returned by the macro. See the documentation of the IXLLIST macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for further details, including the explanation of the reason code.

Processing continues.

User response

This message is intended primarily for diagnostic use as advised by your IBM Support Center.

Module:
DFHCFCF

Destination

SYSPRINT

DFHCF0943I	R12=*prv* CF IXLLIST *keyword=value*

Explanation

Coupling facility data table server tracing for coupling facility accesses is active and an IXLLIST parameter or result value (key, authority value or version) is being traced in hex and (if relevant) character format.

System action

Processing continues.

User response

This message is intended primarily for diagnostic use as advised by your IBM Support Center.

Module:
DFHCFCF

Destination

SYSPRINT

DFHCF0944I	R12=*prv* CF Exit *response table*

Explanation

Coupling facility data table server tracing for coupling facility accesses is active and information from the request interface parameter list is being traced on exit from the CF request module DFHCFCF.

- Response codes:

  OK

  Normal completion.

  LEN ERROR

  Data to be read exceeds buffer length.

  NOT FOUND

  No entry was found with the given key.

  DUPLICATE

  Add was rejected because key already exists.

  WRONG VER

  Change was rejected because version did not match.

  AUTH FAIL

  List authority value did not match.

  LIST LIM

  List has reached maximum number of entries.

  I/O ERROR

  IXLLIST error other than any of the above.

System action

Processing continues.

Destination

SYSPRINT

DFHCF0956I   **R12=*prv* SP Record state *action* UOWID=*uowid* Task=*tasknum region***

Explanation

Coupling facility data table server request tracing is active and the current record state is being traced before commit or backout processing.

- The record state may include the following hexadecimal values:

  80

  The record is locked.

  40

  The record was changed in some way.

  20

  The record was created by this unit of work.

  10

  The record was updated by this unit of work.

  08

  The record was deleted by this unit of work.

  04

  The record lock is marked as retained.

  01

  This was the first record updated by this unit of work.

DFHCP0102I	*applid* CPI initialization has ended.

Explanation

This is an informational message indicating that CPI initialization has completed successfully.

System action

Initialization continues.

User response

None. You can suppress this message with the system initialization parameter MSGLVL=0.

Module:
DFHCPIN1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHCP0103I　　*applid* **CPI initialization has failed.**

Explanation

CPI has failed to initialize successfully.

System action

Message DFHSI1522 will be issued following this message. CICS will terminate or continue initialization depending upon the operator's response to message DFHSI1522.

An exception trace entry will be written at the time the failure was detected.

Other CICS components called by CPI initialization may also issue messages or write trace entries.

User response

Decide whether CICS can continue execution without CPI support, and respond accordingly to message DFHSI1522.

You should also investigate why CPI failed to initialize.

Module:
DFHCPIN1

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHCP0701I　　*date time applid tranid program_name* **CPI-C verb** *verb* **used unrecognized CONVERSATION_ID** *Conversation_ID*.

Explanation

The application program has used an unrecognized conversation_ID on one of its calls to CPI-C. This could mean that:

- The application program has not created a conversation successfully using either the CMINIT (Initialize_Conversation) or the CMACCP (Accept_Conversation) verbs, or
- The application program has used the conversation_ID supplied to it by CPI-C incorrectly.

System action

CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Determine which error has occurred and amend the application program accordingly.

The z/VM: CPI Communications User's Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

7. *Conversation_ID*

Destination

CCPI

DFHCP0702I　　*date time applid tranid program_name Conversation_ID* **CPI-C verb** *verb* **was disallowed because of the conversation state** *state*.

Explanation

The CPI-C state machine detected a state error. This means that the conversation was in the wrong state to issue this verb.

System action

CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Use the state machine defined in the z/VM: CPI Communications User's Guide manual, (SC26-4399), and the CICS trace information to determine the sequence of CPI-C calls issued that caused the state error. Amend the application program in accordance with the supplied guidelines.

CCPI

DFHCP0705I	*date time applid tranid program_name Conversation_ID* **invalid conversation_type parameter (*X'conv_type'*) supplied on the CMSCT (Set_Conversation_Type) verb.**

Explanation

The application program has called CMSCT (Set_Conversation_Type) with an invalid conversation_type parameter value.

System action

CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Amend CMSCT in the application program to use a valid conversation_type parameter.

The z/VM: CPI Communications User's Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module:
DFHCPCSA

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *program_name*
6. *Conversation_ID*
7. *X'conv_type'*

Destination

CCPI

DFHCP0706I	*date time applid tranid program_name conversation_ID* **the supplied conversation_type parameter of CM_MAPPED_CONVERSATION conflicts with the current setting of the fill characteristic CM_FILL_BUFFER.**

Explanation

The application program has called CMSCT (Set_Conversation_Type) with a conversation_type parameter of CM_MAPPED_CONVERSATION when it had previously used the CMSF (Set_Fill) verb to set the *fill* characteristic.

This is not allowed in CPI-C.

System action

CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Amend the application program so that it does not use these two verbs in this invalid combination.

The z/VM: CPI Communications User's Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module:
DFHCPCSA

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *program_name*
6. *conversation_ID*

Destination

CCPI

DFHCP0707I	*date time applid tranid program_name conversation_ID* **the supplied conversation_type parameter CM_MAPPED_CONVERSATION conflicts with the current setting of log_data.**

Explanation

The application program has called CMSCT (Set_Conversation_Type) with a conversation_type parameter of CM_MAPPED_CONVERSATION when it had previously used the CMSLD (Set_Log_Data) verb to create some Log Data.

This is not allowed in CPI-C.

System action

CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Amend the application program so that it does not use these two verbs in this invalid combination.

The z/VM: CPI Communications User's Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module:
DFHCPCSA

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *program_name*
6. *conversation_ID*

Destination

CCPI

DFHCP0708I	*date time applid tranid program_name conversation_ID* **invalid deallocate_type parameter (*X'deallocate_type'*) supplied on the CMSDT (Set_Deallocate_Type) verb.**

Explanation

The application program has called CMSDT (Set_Deallocate_Type) with an invalid deallocate_type parameter.

System action

CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Amend CMSDT in the application program to use a valid deallocate_type parameter.

The z/VM: CPI Communications User's Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module:
DFHCPCSB

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *program_name*

1. *date*

2. *time*

3. *applid*

4. *tranid*

5. *program_name*

6. *conversation_ID*

7. *requested_length*

Destination

CCPI

DFHCP0752I	*date time applid tranid program_name conversation_ID* **data passed on call to CMSEND contains an invalid GDS record.**

Explanation

The application program has called CMSEND (Send_Data). Data passed on this call contains an invalid generalized data stream (GDS) record.

Note: This message is only issued on a basic conversation. That is, when conversation_type is set to CM_BASIC_CONVERSATION.

System action

The data is not sent.

CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Amend the application program to ensure that this parameter is correct.

The z/VM: CPI Communications User's Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called together with information about GDS records.

The CICS documentation provides additional information about GDS records.

Module:
DFHCPCLR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *program_name*
6. *conversation_ID*

Destination

CCPI

DFHCP0753I   *date time applid tranid program_name conversation_ID* **invalid send_length parameter** *send_length* **supplied on CMSEND (send_data).**

Explanation

The application program has called CMSEND (Send_Data) with a send_length parameter that is not in the range 0-32767 bytes.

System action

CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

User response

The send_length parameter should not exceed 32767 bytes. Amend CMSEND to send data that is within the range 0-32767 bytes. This may entail sending the data in two chunks.

The z/VM: CPI Communications User's Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module:
DFHCPCN1, DFHCPCN2, DFHCPCN3, DFHCPCN4, DFHCPCN5

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *program_name*
6. *conversation_ID*
7. *send_length*

Destination

CCPI

DFHCP0754I   *date time applid tranid program_name conversation_ID* **data sent so far is currently in the middle of a GDS record so cannot send CMDEAL, CMCFM or CMPTR requests.**

Explanation

The application is using a basic conversation (that is, the conversation_type characteristic has been set to CM_BASIC_CONVERSATION).

The application has not sent all the data associated with the last Generalized Data Stream (GDS) record.

However, the application has tried to send one of the following requests:

- a CMDEAL (Deallocate),
- a CMCFM (Confirm), or
- a CMPTR (Prepare_to_receive).

System action

CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Inspect the data sent to determine why the previous send was in error. Check if the error was caused by the application truncating the last record or if there was an error in one of the length fields which caused CPI-C to misinterpret the data-stream and amend the application program accordingly.

The z/VM: CPI Communications User's Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called together with information about GDS records.

The CICS documentation provides additional information about GDS records.

5. *program_name*
6. *conversation_ID*

Destination

CCPI

DFHCP0756	*date time applid tranid program_name conversation_ID* **received an unrecognized sense_code** *X'sense_code'* **from the partner** *{program | program - }* *tp_name.*

Explanation

A sense code received from the partner program on a remote system was unrecognized. This could be for one of two reasons.

- a protocol error, or
- the partner program is running on a later release and new sense codes have been added to the APPC architecture.

System action

CICS returns control to the application program with either return_code CM_DEALLOCATE_ABEND or CM_PROGRAM_ERROR_PURGING. This depends on whether the unrecognized sense code has been interpreted as an error or interpreted as a conversation abend.

Note:

tp_name is present only if this message is being issued on the front-end system.

User response

Use the sense code provided in the message and your knowledge of the two communicating systems to determine which of the two possible cases documented above is the error.

If the error is a protocol error, you need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCPCLR

7. *X'sense_code'*
8. Value chosen from the following options:

    2=program,

    1=program -

9. *tp_name*

Destination

CCPI

DFHCP0757I	*date time applid tranid program_name conversation_ID* **unrecognized netname** *netname* **supplied for CMALLC (Allocate) verb.**

Explanation

The allocation of a session for this conversation failed due to an unrecognized netname *netname*.

This value is derived from the partner_lu_name specified either in the partner resource for the conversation, or on a CPI-C CMSPLN (set_partner_lu_name) verb.

System action

CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

No session is allocated.

User response

Amend the application program to use a recognized netname.

Module:
DFHCPCLR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *program_name*
6. *conversation_ID*
7. *netname*

Destination

CCPI

DFHCP0758I *date time applid tranid program_name conversation_ID* **unrecognized mode_name** *mode_name* **supplied for CMALLC (Allocate) verb.**

Explanation

The allocation of a session for this conversation failed due to an unrecognized mode name *mode_name*.

This value is specified either in the profile named in the partner resource for the conversation, or on a CPI-C CMSMN (Set_mode_name) verb.

System action

CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

No session is allocated.

User response

Amend the application program to use a recognized mode_name.

Module:
DFHCPCLR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *program_name*
6. *conversation_ID*
7. *mode_name*

Destination

CCPI

DFHCP0759I *date time applid tranid program_name conversation_ID* **invalid use of the SNA service TP** *X'tp_name'*

Explanation

The allocation of a session for conversation *conversation_id* failed because the transaction program (TP) specified in the conversation control block (CPC) is an SNA service TP. This is not allowed.

System action

CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

User response

Amend the application program so that it uses a different TP.

Module:
DFHCPCAL

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *program_name*

6. *conversation_ID*

7. *X'tp_name'*

Destination

CCPI

DFHCP0760I	*date time applid tranid program_name conversation_ID* **an invalid partner_lu_name** *partner_lu_name* **was specified for the CMALLC (Allocate) verb.**

Explanation

The allocation of a session has failed. This is because the partner_lu_name specified in the conversation control block (CPC) does not conform to the following rules.

1. The partner_lu_name may take one of the following forms:

   - Netname (1-8 characters long), or
   - Network.netname (where network and netname are EACH 1-8 characters long).

2. Netname and network both consist of the following character sets, where the first character is always alphabetic.

   - A-Z
   - a-z
   - @
   - $
   - #
   - 0-9

     Note: Lower case letters are translated to uppercase.

System action

The session is not allocated.

CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

User response

Depending on the application, the partner_lu_name either comes from the partner resource (specified on the CMINIT (initialize_conversation) verb in the sym_dest_name parameter) or an optional CMSPLN (set_partner_lu_name) verb. This value needs to be changed to conform to the rules above.

Module:
DFHCPCAL

7. *mode_name*

Destination

CCPI

DFHCP0763I	*date time applid tranid* *program_name conversation_ID* **the mode_name** *mode_name* **specified for the CMALLC** **(Allocate) verb is unknown to** **VTAM.**

Explanation

The allocation of a session for conversation *conversation_ID* has failed. This is because the mode_name specified in the conversation control block (CPC) is known to the remote system, but is unknown to VTAM.

System action

No session is allocated.

CICS returns control to the application program with return code CM_PARAMETER_ERROR.

User response

Amend the application program so that it uses a different mode_name.

Module:
DFHCPCLR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *program_name*
6. *conversation_ID*
7. *mode_name*

Destination

CCPI

DFHCP0764I	*date time applid tranid* *program_name* **Partner Resource** **Manager is unavailable.**

Explanation

The application program has called CMINIT (Initialize_Conversation), but the partner resource manager (which provides access to the partner resource table) is not available.

System action

CICS returns control to the application program with return_code CM_PRODUCT_SPECIFIC_ERROR.

User response

First determine whether message DFHPR0106 was issued during CICS initialization; if so, refer to the advice given for that message. Otherwise it appears that CICS-owned storage (either the static storage address list, or the PR static storage) has been overlaid. Refer to the Troubleshooting and support for guidance on how to deal with storage violations.

CCPI

DFHCQnnnn messages

DFHCQ0001   *applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a three 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; TS1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the z/OS MVS System Codes manual. Then look up the CICS alphanumeric code. This tells you, for example, whether the error is a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHCQCQ, DFHCQSY

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHCQ0002   *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the Troubleshooting and support.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken,

unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

The severity of this error depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname,* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

2. *X'code'*
3. *modname*

Destination

Console

DFHCQ0100I	*applid* Console queue initialization has started.

Explanation

Console queue initialization has started.

System action

System initialization continues.

User response

None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHCQCQ

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHCQ0101I	*applid* Console queue initialization has ended.

Explanation

Console queue initialization has completed successfully.

System action

System initialization continues.

User response

None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHCQSY

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHCQ0102I	*applid* Console queue initialization has failed.

Explanation

Console queue initialization has failed.

System action

Provided there are no subsequent serious errors which prevent further initialization of CICS, CICS issues one of two messages depending on what other errors, if any, have occurred during initialization.

If DFHSI1521 is issued, CICS initialization is terminated. If DFHSI1522 is issued, decide if CICS initialization is to be continued in degraded mode or to be terminated.

User response

Check previous console messages, one of which should explain why console queue initialization has failed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHCQSY

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHCQ0103I	*applid* **MVS console queue is open.**

Explanation

CICS sets a limit of 255, the MVS maximum, on the number of modify commands that can be queued at any time for the CICS server.

CICS also sets an internal limit of 254 on the number of modifiy commands that can be queued at any time to invoke transactions, for example CEMT.

If this internal limit is reached CICS will reject further modify commands unless these invoke transaction CEKL.

System action

System initialization continues.

User response

None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHCQSY

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHCQ0104I	*applid* **MVS console queue is closed.**

Explanation

CICS will not accept any modify commands from MVS.

System action

System termination continues.

User response

None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHCQSY

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHCQ0105I	*applid* **CICS is busy. MVS modify command has been rejected.**

Explanation

CICS can not accept the modify command as 254 modify commands to invoke transactions are currently queued.

System action

CICS rejects the modify command.

User response

The severity of this error depends on how many terminal definitions are being autoinstalled in your CICS system at the time you entered the modify command.

If the message recurs when you reenter the modify command you can use the CEKL INQUIRE and SET commands to identify the user tasks in your system and which, if any, should be removed from your system.

Module:
DFHCQSY

Destination

Console

DFHCQ0200I   *applid* **CEKL transaction enabled.**

Explanation

CICS supports CEKL INQUIRE and CEKL SET commands.

System action

CICS continues normally.

User response

You can use the CEKL INQUIRE and CEKL SET commands from a console device.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHCQSY

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHCQ0201I   *applid* **CEKL transaction enabled only for INQUIRE.**

Explanation

CICS supports only CEKL INQUIRE commands.

System action

CICS continues normally.

Support for kill in CICS Transaction Server for z/OS 2.2 is being shipped in two PTFs which can be applied independently of each other.

You must apply both PTFs if you want to use the CEKL SET command.

User response

If support for kill is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to install the second PTF.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

DFHCQ0241I　　*applid* **CEKL INQUIRE: task number** *taskno*, **found.**

Explanation

Task number *taskno* has been found.

System action

CICS displays information about task *taskno* on the console and job log.

User response:

Module:
DFHCQSY

Destination

Console

DFHCQ0242I　　*applid* **CEKL INQUIRE: no tasks matched selection criteria.**

Explanation

CICS has not found any tasks that match the options specified on the CEKL INQUIRE command.

System action

The system continues normally.

User response

Check the options specified on the CEKL command. For example specify a lower value for the SUSPENDED option.

Module:
DFHCQSY

Destination

Console

DFHCQ0243I　　*applid* **CEKL INQUIRE:** *notasks* **task(s) matched selection criteria.**

Explanation

notasks tasks have been found matching the options specified on the CEKL INQUIRE command.

System action

CICS displays information about these tasks on the console and job log.

User response

You should use the information to determine, which task, if any, should be removed from your system.

If the list of tasks is too long you may decide to invoke the CEKL INQUIRE command again specifying a different set of options.

Module:

DFHCQSY

Destination

Console

DFHCQ0250I   *applid* **CEKL SET: task number** *taskno* **not found.**

Explanation

The request to remove task number *taskno* from the system has been rejected.

The task can not be found.

System action

The system continues normally.

User response

Check the value that you specified for *taskno*.

If this is correct then the task has been removed from the system.

Module:
DFHCQSY

Destination

Console

DFHCQ0251I   *applid* **CEKL SET: deferred PURGE request issued for task number** *taskno***.**

Explanation

The request to remove task *taskno* from the system has been deferred as it has not yet been attached to the to the dispatcher; the task either belongs to a transaction class that is at its MAXACTIVE limit or the system is at its MXT limit.

System action

CICS will purge the task when it has been attached to the dispatcher.

User response

None.

Module:
DFHCQSY

Destination

Console

DFHCQ0252I   *applid* **CEKL SET: PURGE request issued for task number** *taskno***.**

Explanation

A request has been passed to the dispatcher to purge task number *taskno*.

System action

CICS continues normally.

User response

The CEKL INQUIRE TASK(*taskno*) command can be used to display the progress of the request.

Module:
DFHCQSY

Destination

Console

DFHCQ0253I   *applid* **CEKL SET: PURGE request ignored; task number** *taskno* **is being purged.**

Explanation

The request to purge number *taskno* has been ignored.

A previous request was passed to the dispatcher to purge the task.

System action

CICS continues normally.

User response

None.

Module:
DFHCQSY

Destination

Console

DFHCQ0254I   *applid* **CEKL SET: PURGE request ignored; task number** *taskno* **is being forcepurged.**

Explanation

The request to purge number *taskno* has been ignored.

A previous request was passed to the dispatcher to forcepurge the task.

System action

CICS continues normally.

User response

None.

Module:
DFHCQSY

Destination

Console

DFHCQ0255I   *applid* **CEKL SET: PURGE request ignored; task number *taskno* is being killed.**

Explanation

The request to kill purge number *taskno* has been ignored.

A previous request was passed to the dispatcher to kill the task.

System action

CICS continues normally.

User response

None.

Module:
DFHCQSY

Destination

Console

DFHCQ0256I   *applid* **CEKL SET: FORCEPURGE request issued for task number *taskno*.**

Explanation

A request has been passed to the dispatcher to forcepurge task number *taskno*.

System action

CICS continues normally.

User response

The CEKL INQUIRE TASK(*taskno*) command can be used to display the progress of the request.

Module:

DFHCQSY

Destination

Console

DFHCQ0257I   *applid* **CEKL SET: FORCEPURGE request ignored; task number *taskno* is being forcepurged.**

Explanation

The request to kill forcepurge number *taskno* has been ignored.

A previous request was passed to the dispatcher to forcepurge the task.

System action

CICS continues normally.

User response

None.

Module:
DFHCQSY

Destination

Console

DFHCQ0258I   *applid* **CEKL SET: FORCEPURGE request ignored; task number *taskno* is being killed.**

Explanation

The request to forcepurge number *taskno* has been ignored.

A previous request was passed to the dispatcher to kill the task.

System action

CICS continues normally.

User response

None.

Module:
DFHCQSY

Destination

Console

DFHCQ0259I *applid* **CEKL SET: KILL request issued for task number *taskno*.**

Explanation

A request has been passed to the dispatcher to kill task number *taskno*.

System action

CICS continues normally.

User response

The CEKL INQUIRE TASK(*taskno*) command can be used to display the progress of the request.

Module:
DFHCQSY

Destination

Console

DFHCQ0260I *applid* **CEKL SET: KILL request ignored; task number *taskno* is being killed.**

Explanation

The request to kill task number *taskno* has been ignored.

A previous request was passed to the dispatcher to kill the task.

System action

CICS continues normally.

User response

The CEKL INQUIRE TASK(*taskno*) command can be used to display the progress of the request.

Module:
DFHCQSY

Destination

Console

DFHCQ0261I *applid* **CEKL SET: PURGE request rejected for system task number *taskno*.**

Explanation

The request to purge system task number *taskno* from the system has been rejected.

System action

The system continues normally.

User response

None.

Module:
DFHCQSY

Destination

Console

DFHCQ0262I *applid* **CEKL SET: FORCEPURGE request rejected for system task number *taskno*.**

Explanation

The request to forcepurge system task number *taskno* from the system has been rejected.

System action

The system continues normally.

User response

None.

Module:
DFHCQSY

Destination

Console

DFHCQ0263I *applid* **CEKL SET: KILL request rejected for system task number *taskno*.**

Explanation

The request to kill system task number *taskno* from the system has been rejected.

System action

The system continues normally.

User response

None.

Module:
DFHCQSY

Destination

Console

DFHCQ0264I   *applid* **CEKL SET: PURGE request rejected; task number** *taskno* **is not purgeable.**

Explanation

The request to purge task number *taskno* from the system has been rejected. The transaction definition specifies SPURGE(NO).

System action

The system continues normally.

User response

Retry the request to remove the task from the system specifying either the FORCEPURGE or the KILL option.

Module:
DFHCQSY

Destination

Console

DFHCQ0265I   *applid* **CEKL SET: FORCEPURGE request ignored; task number** *taskno* **is being purged.**

Explanation

The request to forcepurge task number *taskno* has been rejected.

A request to remove the task from the system has been made and deferred as it has not yet been attached to the dispatcher; the task either belongs to a transaction class that is at its MAXACTIVE limit or the system is at its MXT limit.

System action

CICS will purge the task when it has been attached to the dispatcher.

User response

If the task can not be attached to the dispatcher because the system is under stress then

- the CEKL INQUIRE command can be used to identify another task that is already attached to the dispatcher
- the CEKL SET command can be used to remove that task from the system so reducing the stress

Module:
DFHCQSY

Destination

Console

DFHCQ0266I   *applid* **CEKL SET: KILL request ignored; task number** *taskno* **is being purged.**

Explanation

The request to kill task number *taskno* has been rejected.

A request to remove the task from the system has been made and deferred as it has not yet been attached to the dispatcher; the task either belongs to a transaction class that is at its MAXACTIVE limit or the system is at its MXT limit.

System action

CICS will purge the task when it has been attached to the dispatcher.

User response

If the task can not be attached to the dispatcher because the system is under stress then

- the CEKL INQUIRE command can be used to identify another task that is already attached to the dispatcher
- the CEKL SET command can be used to remove that task from the system so reducing the stress

DFHCZ0115	*date time applid userid termid tranid program_name class::method* **This method failed because the object being accessed had a reference to an input message while the program was invoked via the remote program link.**

Explanation

The method reported in the message failed because the object being accessed had a reference to an input message and was invoked through the use of the remote program link. This combination is not supported.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If the calling program is user written then you need to change it so that the object being accessed, either does not have an input message, or the program is not invoked through the use of the remote program link.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

9. *method*

Destination

CCZM

DFHCZ0116	*date time applid userid termid tranid program_name class::method* **This method failed because the object being accessed was not one of the supported classes.**

Explanation

The method reported in the message failed because the object being accessed was not one of the supported classes; IccDataQueue, IccFile, IccFileIterator, IccProgram, IccStartRequestQ, IccTempStore.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If the calling program is user written then you need to change it so that the object is of the correct type before it is accessed in this way.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
ICCRESEC

7. *program_name*
8. *class*
9. *method*

Destination

CCZM

DFHCZ0117	*date time applid userid termid tranid program_name class::method* **This method failed because the object being accessed was of type *object_type*.**

Explanation

The method reported in the message failed because the object being accessed was not of the correct type.

For example the method IccSession::extractProcess() is restricted to access objects of type Back-End only.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If the calling program is user written then you need either to change it or the related CICS definitions, so that the object is of the correct type before it is accessed in this way.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

CCZM

DFHCZ0118	*date time applid userid termid tranid program_name class::method* **This method failed because the object being accessed did not have a reference for the resource *resource*.**

Explanation

The method reported in the message failed because the object being accessed did not have all the resources it needs allocated to it.

For example, the method call, IccFile::readRecord(mode, updateToken), would fail in this way if the object being accessed did not have a valid reference of a record index.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If the calling program is user written then you need to change it, so that the object has the correct resources allocated to it before it is accessed in this way.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

CCZM

DFHCZ0120	*date time applid userid termid tranid program_name class::method* **This method failed because the current number of nested program calls made using this method is already at the maximum of** *max***.**

Explanation

The method reported in the message failed because its usage is restricted to a maximum of 15 nested calls, while the current request would cause this to be exceeded.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If the calling program is user written then you need to change it so that it does not cause the depth of nesting to exceed 15.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

CCZM

DFHCZ0121	*date time applid userid termid tranid program_name class::method* **This method failed because the call is invalid for the object being accessed. The resource type of the object is** *resourcetype***.**

Explanation

The method reported in the message failed because the method is only valid for a restricted set of resource types, and is invalid for the object being accessed.

This method is valid for the following resource types; cDataQueue, cFile, cFileIterator, cProgram, cStartRequestQ, cTempStore.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If the calling program is user written then you need to change it so that it does not call this method for this type of object.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

CCZM

DFHCZ0127	***date time applid userid termid tranid program_name class::method* This method failed because the value of the parameter named *pname*, specified as *length*, was not within the range 1 to *max*.**

Explanation

The method reported in the message failed because the value passed in for the named parameter was invalid.

For example, assuming the definition, IccResource::IccResourceId(cFileId,"ABC"), the call, assign(9999,"PQRS"), would fail because the length value of 9999 is invalid.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, throws an exception, and completes the request having truncated the excess data.

User response

If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

CCZM

DFHCZ0136	*date time applid userid termid tranid program_name class::method* **This method failed because the parameter named *param_name* contained conflicting flags specified as *flag1* and *flag2*.**

Explanation

The method reported in the message failed because one of the parameters supplied was invalid.

This parameter of the method is defined as an integer, where each bit denotes a flag, some of which must not be set simultaneously. The calling parameter had a contradictory pair of flags set. For example, the method call IccFile::setAccess(3) would fail because the access value of 3 contains the two contradictory flags readable and notReadable.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

CCZM

DFHCZ0138	*date time applid userid termid tranid program_name class::method* **This method failed because the parameter named** *pname* **contained an invalid value of** *pvalue***.**

Explanation

The method reported in the message failed because one of the parameters supplied was invalid.

This parameter of the method is defined as an integer (general sense), while the value supplied on the call was not sensible for the functional content of the method. For example the method call IccTerminal::sendLine(9876,buffer) would fail, because the column value of 9876 is greater than the height of the screen.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

11. *pvalue*

Destination

CCZM

DFHCZ0140	*date time applid userid termid tranid program_name class::method* **This constructor failed to create an object because it is a singleton class which already exists.**

Explanation

The constructor method reported in the message failed to create an object because it is a singleton class which already exists. Such classes only allow a single instance of itself to exist at any one moment.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If the calling program is user written, then you need to change it so that it does not call this method more than once per transaction.

You might consider using the method instance(). All CICS singleton classes provide a method of this name or similar, which returns a reference to the unique object, creating it should it not pre-exist. This method can be safely called multiple times, each time returning the reference to the same object.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

CCZM

DFHCZ0142	*date time applid userid termid tranid program_name class::method* **This method failed to create an object of type** *object* **because the CICS task did not have a session as its principal facility.**

Explanation

The method reported in the message failed to create an object because the CICS transaction was not defined with a session as its principal facility. Typically, the program calling this method would be running as a system initiated transaction relating to CICS distributed transaction processing.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

You need to change the CICS configuration definition so that the program calling this method runs in the correct environment.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
ICCCTLEC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*
7. *program_name*
8. *class*
9. *method*
10. *object*

Destination

CCZM

DFHCZ0143	*date time applid userid termid tranid program_name class::method* **This virtual method has not been implemented by the derived class.**

Explanation

The method of the class reported in the message has not been implemented by a derived class.

This method is defined as a virtual method with the intent that it is redefined, when appropriate, by its sub-classes.

The default implementation simply throws an exception to alert the user of this condition.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If you have written a class that inherits this class then you should provide a suitable implementation for this method.

If you are using vendor written software that may inherit this class then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
ICCRESEC

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

CCZM

DFHCZ0233	*date time applid userid termid tranid program_name* **A NULL filename has been passed to a native method in** *module*.

Explanation

A null filename has been passed to a native method used by the JCICS Java class library.

System action

The system writes this message to the TD queue CCZM and ignores the request.

User response

Ensure that a valid file name has been specified using the setName() method for each relevant file object.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHCZ0269   *date time applid userid termid tranid program_name* **JNI call 'GetMethodID()' in** *module* **failed.**

Explanation

A JNI call, GetMethodID() for setProcess(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0270	*date time applid userid termid tranid program_name* **JNI call 'CallVoidMethod()' in** *module* **failed.**

Explanation

A JNI call, CallVoidMethod(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*

6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0271	*date time applid userid termid tranid program_name* **JNI call 'GetMethodID()' in** *module* **failed.**

Explanation

A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts

1. *date*

CCZM

DFHCZ0278	*date time applid userid termid tranid program_name* **JNI call 'CallVoidMethod()' in** *module* **failed.**

Explanation

A JNI call, CallVoidMethod(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0279	*date time applid userid termid tranid program_name* **JNI call 'GetMethodID()' in** *module* **failed.**

Explanation

A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0280	*date time applid userid termid tranid program_name* **JNI call 'NewObject()' in** *module* **failed.**

Explanation

A JNI call, NewObject() for a ConversationPrincipalFacility object, in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0281	*date time applid userid termid tranid program_name* **JNI call 'GetMethodID()' in** *module* **failed.**

Explanation

A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0282	*date time applid userid termid tranid program_name* **JNI call 'FindClass()' in** *module* **failed.**

Explanation

A JNI call, FindClass(), for com/ibm/cics/server/ ConversationPrincipalFacility, in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0283	*date time applid userid termid tranid program_name* **JNI call 'FindClass()' in** *module* **failed.**

Explanation

A JNI call, FindClass() to find the Conversation class, in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*

CCZM

DFHCZ0305   *date time applid userid termid tranid program_name* **JNI call 'GetStringUTFChars(envp, abcode)' in** *module* **failed.**

Explanation

A JNI call, GetStringUTFChars(envp, abcode), in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCTask.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*

CCZM

DFHCZ0317   *date time applid userid termid tranid program_name* **JNI call 'GetStringUTFChars(envp, SysId)' in** *module* **failed.**

Explanation

A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCTDQ.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0324	*date time applid userid termid tranid program_name* **JNI call 'GetByteArrayElements()' in** *module* **failed.**

Explanation

A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCTerminal.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*

6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0325	*date time applid userid termid tranid program_name* **JNI call 'GetMethodID()' in** *module* **failed.**

Explanation

A JNI call, GetMethodID() for the toBinary() method, in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCTerminal.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*

7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0326	*date time applid userid termid tranid program_name* **A text array passed to the SEND_TEXT() method in** *module* **was greater than 32767 bytes. The data has been truncated.**

Explanation

A text array passed to the SEND_TEXT() method in code written to support Java native methods used by the JCICS Java class library was longer than 32767 bytes.

System action

The system writes this message to the TD queue CCZM and sends the first 32767 bytes in the array.

User response

Ensure that the length of text passed to the sendText() method does not exceed 32767.

Module:
DFJCZDTC (DTCTerminal.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0327	*date time applid userid termid tranid program_name* **JNI call 'GetByteArrayElements()' in** *module* **failed.**

Explanation

A JNI call, GetByteArrayElements(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCTerminal.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0328	*date time applid userid termid tranid program_name* **JNI call 'GetMethodID()' in** *module* **failed.**

Explanation

A JNI call, GetMethodID() for the toBinary() method, in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCTerminal.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*

7. *program_name*

8. *module*

Destination

CCZM

DFHCZ0334	*date time applid userid termid tranid program_name* **JNI call 'GetFieldID()' in** *module* **failed.**

Explanation

A JNI call, GetFieldID() for TCTUAP, in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:

DFJCZDTC (DTCTerminal.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*
6. *tranid*
7. *program_name*
8. *module*

Destination

CCZM

DFHCZ0335 *date time applid userid termid tranid program_name* **JNI call 'GetStringUTFChars(envp, SysId)' in** *module* **failed.**

Explanation

A JNI call, GetStringUTFChars(envp, SysId), in code written to support Java native methods used by the JCICS Java class library has failed.

System action

The system writes this message to the TD queue CCZM and takes a system dump.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCTSQ.c)

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *termid*

System action

The system writes this message to the TD queue CCZM and takes a system dump.

DFHDBnnnn messages

DFHDB2001	*date time applid* **CICS-DB2 resynchronization with** *db2id* **for unit of work** *X'uowid'* **cannot take place due to initial start of CICS.**

Explanation

CICS cannot resolve the disposition of unit of work (UOW) *uowid* that DB2 subsystem *db2id* holds from a previous connection because CICS was initial started. A CICS initial start should be avoided when resynchronization is outstanding. CICS cold, warm and emergency starts do not affect resynchronization, which occurs automatically when CICS and DB2 are connected.

System action

The CICS is connected to DB2 but UOW *uowid* will remain indoubt in DB2.

User response

The UOW *uowid* will have to be resolved manually using DB2 -DISPLAY THREAD and -RECOVER INDOUBT operator commands.

User response

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHDB2004   *date time applid* **No threads were found for plan** *plan-name*

Explanation

This message is in response to a CICS-DB2 attachment facility DSNC DISPLAY or DISCONNECT command. No threads were found using the specified plan name *plan-name*. The *plan-name* may be blank if a specific plan was not requested.

System action

The CICS-DB2 attachment facility command is not processed.

User response

Reenter the command with the correct plan name.

Module:
DFHD2CC

Destination

Terminal End User

DFHDB2005   *date time applid* **Transaction** *tran* **is not defined for CICS DB2.**

Explanation

This message is in response to a CICS-DB2 attachment facility DSNC DISPLAY or MODIFY command. The transaction *tran* specified in the command was not defined as a CICS DB2 transaction. That is, there was no DB2TRAN defined for the transid, or the DB2TRAN referred to a DB2ENTRY that does not exist, or the case of the DISPLAY command, no threads were found for the transaction.

System action

The CICS-DB2 attachment facility command is not processed.

User response

Reenter the command with the correct transaction name.

Module:
DFHD2CM1

Destination

Terminal End User

DFHDB2006   *date time applid* **The** *dest* **destination ID is invalid.**

Explanation

This message is in response to a CICS-DB2 attachment facility DSNC MODIFY DESTINATION command. The destination ID *dest* specified on the command to be modified is not one of the destinations currently defined in the DB2CONN as a message queue.

System action

The CICS-DB2 attachment facility command is not processed.

User response

Reenter the command with the correct destination ID.

Module:
DFHD2CM1

Destination

Terminal End User

DFHDB2007   *date time applid* **The command verb is missing or invalid.**

Explanation

The CICS-DB2 attachment facility does not recognize the verb entered on the DSNC command.

System action

The command is not processed.

User response

Reenter the command with the correct syntax.

Module:
DFHD2CM1

Destination

Terminal End User

DFHDB2008   *date time applid* **Keyword missing or invalid.**

Explanation

The CICS-DB2 attachment facility DSNC command contains an unknown positional keyword or a keyword is missing.

System action

The command is not processed.

User response

Reenter the command with the correct syntax.

Module:
DFHD2CM1

Destination

Terminal End User

DFHDB2009   *date time applid* **The value in the command is invalid.**

Explanation

The numeric value in the DSNC modify command is invalid. The error is caused by one of the following:

- The value in the command is greater than 2000.
- The value in the command is greater than the TCBLIMIT specified in the DB2CONN.
- If the pool is being changed - for example, using transaction id CEPL - the value is less than 3.

System action

The CICS-DB2 attachment facility command is not processed.

User response

Reenter the command with a correct value.

Module:
DFHD2CM1

Destination

Terminal End User

DFHDB2010   *date time applid tranid* **Transaction abended because DB2 thread tcbs are unavailable.**

Explanation

The transaction was abnormally terminated because a DB2 thread TCB was not available on which to create a thread for the transaction.

System action

The transaction is abnormally terminated.

User response

Determine if more subtask TCBs should be made available to the CICS-DB2 connection by increasing the TCBLIMIT value of the DB2CONN. The TCBLIMIT value can be altered using a SET DB2CONN command.

Module:
DFHD2EX1

2. *time*
3. *applid*
4. *tranid*

Destination

CDB2

DFHDB2011   *date time applid tranid* **Transaction abended because threads are unavailable for resource *resname***

Explanation

The transaction was abnormally terminated because a thread connection to DB2 was not available for

the transaction. *Resname* identifies the name of the DB2ENTRY or the POOL from which the thread was to be allocated. This error can occur when:

- The DB2ENTRY specifies Threadwait(no) and all threads are currently being used.
- The DB2ENTRY specified Threadwait(pool), but the pool definition within the DB2CONN specifies Threadwait(no), and all threads are currently being used both in the DB2ENTRY and the Pool.
- The transaction was using the pool directly, the pool specifies Threadwait(no) and all pool threads are currently in use.

System action

The transaction is abnormally terminated.

User response

Determine if more threads can be made available to the DB2ENTRY or the POOL by increasing the THREADLIMIT value on the DB2ENTRY or the DB2CONN respectively. The THREADLIMIT value can be increased using SET DB2ENTRY and SET DB2CONN commands.

Module:
DFHD2EX1

Destination

CDB2

DFHDB2012	*date time applid* **Stop quiesce of the CICS-DB2 attachment facility from DB2 subsystem *db2-id* is proceeding.**

Explanation

A DSNC STOP command entered by the main terminal operator is being processed. CICS is disconnected from DB2 subsystem *db2-id*. When the disconnect is complete message DFHDB2025 is output to the terminal.

System action

New CICS transactions attempting to issue SQL commands is abended or receives a negative SQL reason code dependent on the CONNECTERROR setting in the DB2CONN definition.

Existing transactions using the CICS-DB2 interface are allowed to complete before the CICS-DB2 attachment facility is stopped.

User response

If the quiesce is not completed within an acceptable time period, a DSNC STOP FORCE command should be issued from another terminal.

Module:
DFHD2CM1

Destination

Terminal End User

DFHDB2013	*date time applid* **Display report follows for threads accessing DB2 *db2-id***

Explanation

A CICS-DB2 attachment display plan or display tran command was requested and the results follow this message. If not blank, *db2-id* is the name of the DB2 subsystem involved.

The following information is displayed for each thread:

DB2ENTRY

> The name of the DB2ENTRY which contains the thread.

S

> The thread status:

> *****

>> The thread is active within a unit of work and is currently executing in DB2.

> **A**

>> The thread is active within a unit of work but is not currently executing in DB2.

> **I**

>> The thread is inactive. It is a protected thread waiting for new work.

PLAN

> The current plan name.

PRI-AUTH

The DB2 primary authorization ID.

SEC-AUTH

The DB2 secondary authorization ID.

CORRELATION

The DB2 thread correlation ID.

For active threads only:

TRAN

The CICS transaction ID.

TASK

The CICS task number.

UOW-ID

The CICS unit-of-work ID.

System action

Processing continues normally.

User response

None.

Module:
DFHD2CC

DFHDB2014	*date time applid* **Statistics report follows for *db2conn-name* accessing DB2 *db2-id***

Explanation

A CICS-DB2 attachment facility statistics display was requested and follows this message. The name of the DB2CONN that is currently in use is *db2conn-name* and *db2-id*, if not blank, is the name of the DB2 subsystem involved.

The statistics displayed are those that have been accumulated after the expiry of the last statistics collection interval, end of day expiry, or requested reset. These statistics represent a subset of those

available as CICS-DB2 Global and resource statistics collected via the CICS statistics spi commands.

The following information is displayed for each DB2ENTRY and for the command and pool sections of the DB2CONN:

- DB2ENTRY

  The name of the DB2ENTRY or '*COMMAND' for the command section and '*POOL' for the pool section.

- PLAN

  DB2 Plan name

- CALLS

  Total number of SQL calls made

- AUTHS

  Total number of sign-on invocations for transactions associated with this entry. A sign-on does not indicate whether a new thread is created or an existing thread reused. If a thread is reused a sign-on may occur dependent on the ACCOUNTREC setting of the DB2ENTRY.

- W/P

  Number of times all available threads for this entry were busy and the transaction had to wait or the thread request was diverted to the POOL.

- HIGH

  Maximum number of concurrent threads required by transactions associated with this DB2ENTRY at any time since the last reset.

- ABORTS

  Total number of units of work that were rolled back.

- COMMITS

  One of the following two fields is incremented each time a DB2 transaction associated with this DB2ENTRY takes an explicit or implicit (end of task) syncpoint.

- 1-PHASE

  The total number of single-phase commits for transactions associated with this DB2ENTRY.

- 2-PHASE

  The total number of two-phase commits for transactions associated with this DB2ENTRY.

System action

Processing continues normally.

User response

None.

Module:
DFHD2CC

4. *db2conn-name*
5. *db2-id*

Destination

CDB2 and Terminal End User

DFHDB2015	*date time applid* **The CICS-DB2 attachment facility is in standby for DB2 subsystem** *db2-id*

Explanation

The CICS-DB2 attachment facility has dropped into standby mode because DB2 subsystem *db2-id* has stopped and STANDBYMODE=RECONNECT was specified in the DB2CONN.

System action

The CICS-DB2 attachment facility waits for the DB2 subsystem to become active again, at which time it automatically reconnects. While in standby mode, all SQL requests receive a negative SQLCODE or an AEY9 abend depending on whether CONNECTERROR=SQLCODE or CONNECTERROR=ABEND was specified in the DB2CONN.

User response

Notify the system programmer.

Destination

CDB2 and Console

DFHDB2016	*date time applid* **The connection of CICS to DB2 {subsystem	group}**

db2-id **failed with reason** *X'reason-code'.*

Explanation

The CICS-DB2 attachment facility startup cannot complete because an error occurred while connecting to DB2 sub-system or group *db2-id*. The response from DB2 was *reason-code*.

System action

The CICS-DB2 attachment facility initialization does not complete.

User response

Analyze the DB2 reason code given and any prior messages issued to the attachment error destination or CDB2 TS queues to determine the source of the error. Some possible causes include:

- incorrect DB2 subsystem or group specified
- the DB2 subsystem or group was not initialized during MVS IPL processing.
- Another CICS or IMS region has connected to the DB2 coordinator with the same name as the region issuing this message. For CICS the connection name is the same as the applid.

DFHDB2024I	*date time applid* **The CICS-DB2 attachment is in standby. For resync purposes only, connection has been made to DB2 restart-light subsystem** *db2-id {	group } db2-group*

Explanation

The CICS-DB2 attachment facility startup has temporarily connected to DB2 subsystem *db2-id* group *db2-group*. The DB2 subsystem is running in restart-light mode and connection has been made purely to allow resynchronisation to take place.

System action

The CICS-DB2 attachment facility remains in standby for new work, but allows resynchronisation tasks to complete. The DB2 restart-light subsystem is terminated when resynchronisation is complete. If STANDBYMODE(RECONNECT) has been specified in the DB2CONN definition and when the DB2 restart-light subsystem is terminated, the CICS-DB2 attachment facility reverts to standbymode and connection to another active DB2 subsystem is made.

User response

If a group name does not appear, group attach is not active. You can suppress this message with the SIT parameter, MSGLVL = 0.

Module:
DFHD2STR, DFHD2CM1

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *db2-id*
5. Value chosen from the following options:

    1= ,

    2= group

6. *db2-group*

Destination

CDB2, Console and Terminal End User

DFHDB2025I   *date time applid* **The CICS-DB2 attachment has disconnected from DB2 subsystem** *db2-id { | group } db2-group*

Explanation

The CICS-DB2 attachment facility has successfully disconnected from DB2 *db2-id* subsystem group *db2-group*

System action

The CICS-DB2 attachment facility is inactive.

User response

If a group name does not appear then group attach was not being used. You can suppress this message with the SIT parameter, MSGLVL = 0.

Module:
DFHD2STP, DFHD2CM1

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *db2-id*
5. Value chosen from the following options:

   1= ,

   2= group

6. *db2-group*

Destination

CDB2, Console and Terminal End User

DFHDB2027   *date time applid* **CICS-DB2 attachment is shutting down. DSNC DB2 commands may not be entered.**

Explanation

The CICS-DB2 attachment facility cannot accept commands directed to DB2 during or after the termination of the CICS-DB2 attachment facility.

System action

The command is rejected.

User response

Issue the command via the DB2 console instead.

Module:
DFHD2CM1

Destination

Terminal End User

DFHDB2028   *date time applid* **The user is not authorised to issue DB2 commands via DSNC.**

Explanation

DB2 rejected the command request during sign-on of the user. Therefore, the user is assumed not to be authorized for the requested function in the command.

System action

The command is rejected.

User response

Notify the system programmer.

Module:
DFHD2CM1

Destination

Terminal End User

DFHDB2029   *date time applid tranid* **DB2 command failed with IFCARC1=***rc***, IFCARC2=***X'reason-code'*

Explanation

The DB2 command submitted by *tranid* received IFI return code *rc* and reason code *reason-code*

System action

The command processing stops.

User response

Refer to the Messages for CICS Db2 for a description of the *rc* and *reason-code*.

Module:
DFHD2CM1, DFHD2D2

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *tranid*

5. *rc*

6. *X'reason-code'*

Destination

CDB2

DFHDB2031   *date time applid* **CICS-DB2 command is invalid. No DB2CONN is installed.**

Explanation

A DSNC command cannot be executed as there is no DB2CONN installed. For all DSNC commands (including the STRT command) a DB2CONN definition must be installed before issuing the command.

Likewise a CEMT or EXEC CICS SET DB2CONN CONNECTED command cannot be issued to startup the CICS-DB2 Attachment Facility if no DB2CONN definition is installed.

System action

The command is rejected.

User response

Install the necessary DB2CONN. The command can then be re-issued.

Module:
DFHD2CM1, DFHD2STR

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

Destination

CDB2 and Terminal End User

DFHDB2032   *date time applid* **Alternate destination display command complete.**

Explanation

The DSNC DISPLAY command to an alternate destination is complete. The output should be available at the requested destination.

System action

Processing continues normally.

User response

None.

Module:
DFHD2CC

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

Destination

CDB2 and Terminal End User

DFHDB2033   *applid* **Terminal** *termid* **is not supported by BMS or is invalid.**

Explanation

This message is issued in response to a CICS-DB2 attachment facility command, or DB2 command that requested an alternative destination for the response. CICS basic mapping support (BMS) encountered an error while routing to the requested terminal named *termid*.

System action

Output from the command may be suppressed.

User response

Ensure that the terminal ID was correctly entered. Otherwise notify the system programmer. This message may occur if the destination device is not supported by BMS, or is not defined to CICS.

Module:
DFHD2CC

XMEOUT parameters/Message inserts

1. *applid*

2. *termid*

Destination

Console and Terminal End User

DFHDB2035   *date time applid* **Indoubt resolution for Unit of Work**

X'uowid' is incomplete for DB2 subsystem db2id

Explanation

CICS indicates that recovery should not be required for *uowid* but DB2 subsystem *db2id* is indoubt.

System action

The CICS is connected to DB2 but the UOW remains indoubt in DB2.

User response

The indoubt UOW will have to be resolved manually using DB2 -DISPLAY THREAD and -RECOVER INDOUBT operator commands. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHD2EX1

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *X'uowid'*
5. *db2id*

Destination

CDB2 and Console

DFHDB2037	*date time applid* **DB2 {subsystem | group} db2-id { is not active. | has no active members.} The CICS-DB2 attachment facility is waiting.**

Explanation

The CICS-DB2 attachment facility is waiting for notification from DB2. For a DB2 group no active sub-systems have been found. If a DB2 sub-system was specified then that sub-system is not active. The CICS-DB2 attachment facility completes initialization after either

- a sub-system belonging to the DB2 group

  or

- the specific DB2 sub-system

has been started.

System action:

User response

Notify the system programmer that a DB2 subsystem requires to be started according to the information supplied.

Module:
DFHD2STR,DFHD2CM1

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. Value chosen from the following options:

   1=subsystem,

   2=group
5. *db2-id*
6. Value chosen from the following options:

   1= is not active. ,

   2= has no active members.

Destination

CDB2, Console and Terminal End User

DFHDB2038	*date time applid* **The command is invalid while waiting for db2id**

Explanation

The CICS-DB2 attachment facility cannot accept commands directed to DB2 while it is waiting for the DB2 subsystem to start. The name of the DB2 subsystem that is not yet operational is *db2id*.

System action

The command is rejected.

User response

Re-issue the command when DB2 has been started and the attachment facility has connected to DB2.

Module:
DFHD2CM1

Destination

Terminal End User

DFHDB2039	*date time applid* **The error destinations are: dest1 dest2 dest3.**

Explanation

This message is in response to a CICS-DB2 attachment facility DSNC MODIFY DESTINATION command and lists the currently active message destinations known to the attachment facility. Null entries show as '****' and can be modified so they identify actual destinations.

System action

Processing continues.

User response

None.

Module:
DFHD2CM1

Destination

Terminal End User

DFHDB2040	*date time applid tranid* **Module** *modname* **could not be found.**

Explanation

During CICS-DB2 attachment facility initialization, an attempt was made to locate and load the named module, but it was not found in any of the libraries accessible to MVS through the MVS LOAD macro.

System action

CICS-DB2 attachment facility initialization does not complete.

User response

Check the CICS JOBLIB/STEPLIB and ensure that the required DB2 library is defined there and contains the named module. Alternatively, ensure the required DB2 library is in the MVS linklist.

Module:
DFHD2STR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *modname*

Destination

CDB2 and Terminal End User

DFHDB2041	*date time applid* **No active threads found.**

Explanation

A DSNC DISPLAY TRANSACTION or DSNC DISPLAY PLAN command was entered, but there were no active threads found. The CICS-DB2 attachment facility might have identified and signed on some subtasks, but a create thread was not issued for any of the subtasks. Likewise, threads may have been created previously on the subtasks but were subsequently terminated when there were no more DB2 requests to service.

System action

Processing continues normally.

User response

None.

Module:
DFHD2CC

Destination

Terminal End User

DFHDB2042	*date time applid* **Connection not authorized to** *db2-id*

Explanation

The attempt to connect to the *db2-id* DB2 subsystem or group failed because the user was not authorized to access DB2. Authorization was denied by either RACF or a user-written connection exit.

System action

The CICS-DB2 attachment does not connect to DB2.

User response

The userid specified on the CICS job was not authorized to connect to the named DB2 subsystem or group. Refer to the Administering CICS with Db2 and the CICS documentation for information on how to authorize a user to access DB2.

Module:
DFHD2STR

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *db2-id*

Destination

CDB2

DFHDB2044   *date time applid* **Authorization parameters for** *resname* **have been corrupted.**

Explanation

THe CICS-DB2 attachment facility detected that the AUTHTYPE or AUTHID parameters for *resname* have been corrupted since it was last installed or updated by a SET command. *Resname* is the name of the DB2ENTRY involved, or it is set to 'POOL' or 'COMMAND' if it is the pool or command thread authorizations of the DB2CONN that are involved.

System action

The transaction is abnormally terminated.

User response

If it is a DB2ENTRY involved, the DB2ENTRY needs to be reinstalled, or the AUTHID or AUTHTYPE parameters reset using a SET command to make the DB2ENTRY usable.

For pool or command thread authorizations, a SET DB2CONN command needs to be issued to reset the AUTHID or AUTHTYPE parameters, or the DB2CONN needs to be reinstalled. Note however that a DB2CONN cannot be re-installed without stopping the CICS-DB2 attachment facility first.

Module:
DFHD2EX1

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *resname*

Destination

CDB2

DFHDB2045   *date time applid* **Resource Manager** *rmi-name* **is unknown to the CICS-DB2 Attachment facility.**

Explanation

The CICS-DB2 Attachment facility received a request for a resource manager with entryname *rmi-name*. This resource name is not known by the CICS-DB2 attachment facility.

System action

The transaction is abnormally terminated with abend code AD21. A CICS system dump is taken.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHD2EX1

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *rmi-name*

Destination

CDB2

DFHDB2047I   *date time applid* **The CICS-DB2 Attachment cannot find DB2 {subsystem | group} id**

Explanation

The CICS-DB2 attachment facility failed to connect because the DB2ID or DB2GROUPID *id* cannot be found.

System action

The CICS-DB2 attachment facility is inactive.

User response

None.

Module:
DFHD2STR

XMEOUT parameters/Message inserts

1. *date*
2. *time*

CDB2, Console and Terminal End User

DFHDB2048	*date time applid* **Unable to interpret SQL call while formatting an EDF display for transaction** *transid* **task** *taskid*

Explanation

The CICS attachment facility was unable to call its EDF processor DFHD2EDF or the CICS attachment facility was unable to decipher storage associated with an SQL statement for CICS transaction *transid* and task *taskid*. Either the SQL communications area (SQLCA) or the RDS input parameter list (RDI) storage could not be interpreted by the CICS-DB2 attachment facility.

System action

If the CICS attachment facility was unable to call its EDF processor DFHD2EDF and a transaction dump is taken with dump code AD29.

If DFHD2EDF was called but it was unable to decipher storage, a transaction dump of the storage in question is taken with dump code AD22.

User response

For an AD29 dump, analyze the trace in the CICS transaction dump to determine why the call to DFHD2EDF failed. For an AD22 dump, analyze the CICS transaction dump of the storage in question. In this situation the information supplied by the Execution Diagnostic Facility (EDF) of CICS for SQL statements consists of:

- The EDF status: ABOUT TO EXECUTE or COMMAND EXECUTION COMPLETE
- The processing status: CALL TO RESOURCE MANAGER DSNCSQL
- The ARG values associated with this call to the CICS-DB2 attachment facility

No other information is provided about the SQL statement.

Module:

CDB2

DFHDB2064   *date time applid*
**Resynchronization outstanding
for subsystem *db2id* after DB2
Group Attach has connected to
subsystem *db2id2***

Explanation

CICS indicates that resynchronization is outstanding
for subsystem *db2id* after DB2 Group Attach has
connected to subsystem *db2id2*.

System action

The CICS is connected to DB2 subsystem *db2id* but
UOWs remain outstanding for DB2 subsystem *db2id2*.

User response

The DB2CONN definition either
has RESYNCMEMBER(NO) specified, or
RESYNCMEMBER(YES) is specified but CICS detected
that all the UOWs outstanding are shunted indoubt
meaning that resynchronisation with DB2 cannot
take place immediately. Both these situations allow
group attach to proceed, and the result is CICS
has connected to a different DB2 subsystem than
previously. The user must manually reconnect to
the original DB2 subsystem which automatically
resynchronizes the outstanding (non shunted) units of
work. Shunted units of work wait to be unshunted at
which point resynchronisation takes place if CICS is
connected to the original DB2 subsystem.

DFHDB2070   *date time applid* **Syncpoint rollback failed for transaction *transid* with eibresp2 X'eibresp2'**

Explanation

DB2 detected a deadlock and the CICS-DB2 attachment facility attempted a syncpoint rollback command for transaction *transid* because DROLLBACK(YES) was specified for the DB2ENTRY or POOL. The syncpoint rollback command failed with EIBRESP2 set to *eibresp2*.

System action

The transaction is abnormally terminated with abend code AD2Z.

User response

Examine the eibresp2 value *eibresp2* to determine why the syncpoint rollback request failed. One possible reason could be that the transaction running is a DPL server transaction which was DPLed to by a client transaction without specifying the SYNCONRETURN parameter. In this case syncpoints or syncpoint rollbacks cannot be taken by the server transaction, so DROLLBACK(YES) is invalid in this case.

Module:
DFHD2EX1

CDB2

DFHDB2073	*date time applid* **Transaction** *transid* **has been directed to the pool as DB2TRAN** *db2tname* **refers to DB2ENTRY** *db2ename* **which is not installed.**

Explanation

Transaction *transid* is associated with DB2TRAN *db2tname* which is turn refers to DB2ENTRY *db2ename*. However DB2ENTRY *db2ename* is not installed in the CICS system. The DB2TRAN *db2tname* is an 'orphan' in that it refers to a DB2ENTRY that

does not exist. A DB2TRAN cannot be installed unless its associated DB2ENTRY has been installed first. Hence either the DB2ENTRY has subsequently been discarded or the DB2TRAN modified by a SET command to refer to a non existent DB2ENTRY.

System action

The transaction will use a DB2 thread from the pool.

This message is output only when an attempt is made to locate a DB2ENTRY for the transaction. Having decided to use the pool, the CICS-DB2 attachment facility will use the pool for all subsequent transactions of the same name without locating the DB2ENTRY each time. When any DB2TRAN or DB2ENTRY is installed or modified will this force a relocate of the DB2ENTRY next time the transaction is run.

User response

Determine why the DB2ENTRY is not installed. If appropriate re-install the DB2ENTRY.

CDB2

DFHDB2074	*date time applid* **CICS-DB2 Attachment facility startup cannot proceed as the currently installed DB2CONN is not useable.**

Explanation

The CICS-DB2 Attachment facility detected that the currently installed DB2CONN is marked for discard. This implies that a previous discard of the DB2CONN did not complete successfully. A discard of a DB2CONN involves CICS discarding all DB2TRANs and DB2ENTRYs first before discarding the DB2CONN. The discard request failed before finally deleting the DB2CONN.

System action

Startup of the CICS-DB2 interface does not complete.

User response

Re-issue the discard for the DB2CONN. When it has been successfully discarded, re-install the required DB2CONN, DB2ENTRYs and DB2TRANs and then retry the startup of the CICS-DB2 interface.

DFHDB2210   *date time applid* **DB2 subsystem id *db2-id* contains invalid characters. The CICS-DB2 Attachment facility is not started.**

Explanation

The CICS-DB2 attachment facility startup cannot complete because the *db2-id* subsystem id specified on the DSNC STRT command contains invalid characters.

System action

The CICS-DB2 attachment facility does not start.

User response

Correct the DB2 subsystem id and retry the DSNC STRT command.

Module:
DFHD2CM1

Destination

Terminal End User

DFHDB2211I   *date time applid* **Maxopentcbs value of *xxx* conflicts with the tcblimit setting of *yyy* in the DB2CONN definition.**

Explanation

The CICS-DB2 Attachment Facility detected that CICS is connected to DB2 Version 6 or later and that the value of MAXOPENTCBS is lower than the TCBLIMIT setting in the DB2CONN definition. If the MAXOPENTCBS value has not been specified the value is based on the max tasks (MXT) value, namely (2*MXT)+32.

When CICS is connected to DB2 Version 6 or later, the CICS-DB2 Attachment Facility uses CICS open TCBs to access DB2 rather than privately managed subtask TCBs. The MAXOPENTCBS value defines the maximum number of open TCBs allowed in the CICS system for use by all openapi enabled task related user exits. The TCBLIMIT parameter on the DB2CONN definition defines how many of the open TCBs can be used for DB2, that is, a subset of MAXOPENTCBS for use with DB2.

System action

Startup of the CICS-DB2 attachment continues.

User response

Review the setting of TCBLIMIT in the DB2CONN and the MAXOPENTCBS or MXT value.

You can suppress this message with the SIT parameter, MSGLVL = 0.

CDBC

DFHDB8103 E	*date time applid* **IDENTIFY request to DBCTL** *xxxx* **has failed. MVS SSI return code** *rc*, **reason code** *reason*.

Explanation

CICS has attempted to connect to DBCTL. The attempt has failed. CICS has been notified that DBCTL is not currently executing. The return code from MVS SSI, reported in PAPLRETC, is *rc*. The reason code from MVS SSI, reported in PAPLRCOD, is *reason*. The return and reason codes reported in PAPLRETC and PAPLRCOD are explained in the IMS messages and codes.

System action

CICS attempts to connect to DBCTL at 5 second intervals, issuing this message at each attempt, and message DFHDB8297 at 1 minute intervals, until either:

1. Disconnection is requested via the CICS supplied DBCTL support menu transaction, CDBC.

2. 10 minutes have elapsed, after which time CICS stops attempting to connect and IMS message DFS0690 is issued, requesting the operator to type in WAIT (retry the connection attempt) or CANCEL (abandon the connection attempt).

Refer to the explanation of DFHDB8297 for more information. Refer to the IMS messages and codes for further information on message DFS0690.

User response

Check why DBCTL is not running. You can cancel the connection attempts by using the CDBC transaction to issue a disconnect request. If message DFH0690 has been issued you should reply to this.

Module:
DFHDBCT

6. *X'nn'*
7. Value chosen from the following options:

    1=, system abend code ,

    2=, IMS user abend code ,

    3=, DBCTL return code

8. *rc*
9. *xxxx*

Destination

CDBC

DFHDB8110 E   *date time applid* **Non zero return code from DFHDBAT. Return code *rc* for *request* request.**

Explanation

The module DFHDBAT, which is a task related user exit forming part of the CICS-DBCTL interface, returns a nonzero return code in reply to a request issued from CICS to DBCTL.

System action

The request to DBCTL fails.

Three types of request to DBCTL can fail in this way:

1. A request to connect to DBCTL from module DFHDBCON
2. A request to disconnect from DBCTL from module DFHDBDSC
3. A DL/I request from an application program via module DFHDLIDP

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

The return code is one of the following:

4 ? CALL NOT UNDERSTOOD

This can be returned when attempting to connect, disconnect or issue DL/I requests to DBCTL. The most likely cause is a storage overwrite. If CICS detects a storage overwrite, a dump is taken.

8 ? REDUNDANT INTERFACE CALL

This can be returned when attempting to connect or disconnect from DBCTL. The request is ignored.

16 ? DISCONNECT PRE-EMPTED

This can be returned when attempting to disconnect from DBCTL while a disconnection request is already being processed.

24 ? ADAPTER NOT READY

A request has been made to the adaptor DFHDBAT but CICS is still in the process of connecting to DBCTL.

28 ? ADAPTER IS DISABLED

This indicates that the CICS-DBCTL interface is not available.

Note:

The DBCTL interface terminates normally after any inflight tasks accessing DBCTL complete the unit of work. Subsequently any new unit of work or ATI task can receive this return code because of a PCB schedule failure.

Module:
DFHDBCON, DFHDBDSC, DFHDLIDP

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *rc*
5. *request*

Destination

CDBC

DFHDB8111 E   *date time applid* **Connection has failed. DBCTL return code *rc*.**

Explanation

DBCTL returns a nonzero response code when CICS is attempting to connect to it.

System action

The connection attempt is abandoned.

User response

Notify the system programmer.

For further information about the DBCTL return code, refer to the IMS messages and codes.

Module:
DFHDBCON

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *rc*

Destination

CDBC

DFHDB8112 E   *date time applid* **Unable to generate Task Token due to purge request.**

Explanation

The module, DFHDBTOX, was invoked:

- To set up a task token, or
- To GETMAIN some storage.

The GETMAIN failed.

System action

Processing continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This message indicates that there is a storage management problem. You should check for other messages issued from the CICS region to the MVS console.

See the Troubleshooting and support for guidance on dealing with storage problems.

Module:
DFHDBTOX

XMEOUT parameters/Message inserts

1. *date*

2. *time*
3. *applid*

Destination

CDBC

DFHDB8113 E   *date time applid* **Getmain failure for storage to hold the indoubt list. Resync has not taken place.**

Explanation

Connection to DBCTL has been completed, but there are some in-doubts outstanding. The GETMAIN to store the in-doubts has failed.

System action

CICS remains connected to DBCTL but the in-doubts are not resolved.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This message indicates that there is a storage management problem. You should check for other messages issued from the CICS region to the MVS console.

See the Troubleshooting and support for guidance on dealing with storage problems.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CDBC

DFHDB8114 E   *date time applid* **Connection has failed. DRA startup table with suffix *xx* cannot be found.**

Explanation

An attempt has been made to connect CICS to DBCTL but the DRA Startup Table with the suffix *xx* cannot be found.

System action

The connection attempt is abandoned.

User response

If you were using the DBCTL Support Menu transaction, CDBC, check to see if you have mistyped the suffix value.

If you have not mistyped the suffix value then notify the system programmer.

Place the DRA Startup Table in a CICS STEPLIB library. For further guidance on how to do this, see the CICS documentation.

Module:
DFHDBCON

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *xx*

Destination

CDBC

DFHDB8115 E	*date time applid* **Connection has failed. Module DFSPRRC0 cannot be found.**

Explanation

An attempt has been made to connect CICS to DBCTL but the DRA Router module, DFSPRRC0, cannot be found.

System action

The connection attempt is abandoned.

User response

Place the module DFSPRRC0 in a CICS STEPLIB library. For further guidance on how to do this, refer to the CICS documentation.

Module:
DFHDBCON

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CDBC

DFHDB8116 I	*date time applid* **Connection to DBCTL *xxxx* is proceeding. Startup Table Suffix used is *xx*.**

Explanation

The first phase of connecting CICS to DBCTL has been completed.

System action

CICS connection to DBCTL proceeds.

User response

None.

Module:
DFHDBCON

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *xxxx*
5. *xx*

Destination

CDBC

DFHDB8117 W	*date time applid* **No connection to DBCTL made although the connection program is in the PLT.**

Explanation

The connection program, DFHDBCON, has been placed in the program list table (PLT) but CICS was not connected when CICS last shut down.

System action

CICS will not connect to DBCTL.

User response

This is a warning message. In this case, if you wish to connect CICS to DBCTL then use the DBCTL Support Menu transaction, CDBC.

Module:
DFHDBCON

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*

Destination

CDBC

DFHDB8118 E	*date time applid* **Connection to DBCTL** *xxxx* **has been rejected by CICS. Reason code** *rc***.**

Explanation

CICS has rejected the connection attempt to DBCTL for reason *rc* The value in the reason code field is 4. This indicates an invalid IMS/ESA release for storage protection. That is, CICS storage protection was active, and an attempt was made to connect to a DBCTL system running a release of IMS/ESA that does not support the storage protection function.

System action

On completion of phase 2 connection processing, CICS indicates to the database resource adapter (DRA), in the control exit, that the DRA should terminate. CICS then completes cleanup of the CICS-DBCTL interface. The status of the interface is that CICS is not connected to DBCTL.

User response

Connection to this DBCTL system is only possible if CICS is run with storage protection turned off. To run with storage protection on, install a release of IMS/ESA that supports the storage protection function.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *xxxx*
5. *rc*

Destination

CDBC

DFHDB8119 I	*date time applid* **CICS is INDOUBT about the LUW with recovery token** *X'rectok'* **after issuing a single phase commit request to DBCTL,** *{SYSTEM ABEND CODE	IMS USER ABEND	DBCTL RETURN CODE} rc***.**

Explanation

CICS was attempting to syncpoint updates made to IMS databases via DBCTL for the logical unit of work (LUW) identified by unit of recovery X'*rectok*'. CICS has detected that updates were made to only one resource manager, DBCTL, in this LUW, and hence has issued a single-phase commit to DBCTL, in place of the normal two-phase commit process. An unexpected response to the single-phase commit has been received from DBCTL, and so CICS is INDOUBT about this LUW. CICS is unable to report whether the updates made via DBCTL have been committed or backed out. No local CICS resources are affected.

System action

The transaction terminates abnormally with abend code ADCS and a transaction dump. CICS processing continues.

User response

The unit of recovery X'*rectok*' output with this message can be used in conjunction with IMS message DFSxxxx output on the IMS console to determine the outcome of the LUW.

If the IMS region has failed, on restart of the IMS region, IMS will output DFSxxxx messages for each LUW that has committed using the single-phase commit protocol. The DFSxxxx message contains the same X'*rectok*' recovery token as output in this message. While matching up the recovery tokens, if a DFSxxxx message is found with the same recovery token, then the LUW was committed. Failure to find a relevant DFSxxxx message means that the LUW has been backed out.

Rather than the IMS region failing, if the bad response to single-phase commit was caused by an individual thread failure and the LUW has been committed, then IMS outputs a DFSxxxx message for just this LUW.

For further information on IMS message DFSxxxx, refer to the IMS messages and codes

For further information about the nonzero response code, if *rc* is:

- A **system abend code**, refer to the z/OS MVS System Codes manual
- An **IMS user abend code**, refer to the IMS messages and codes

- A **DBCTL return code**, refer to the IMS messages and codes.

Module:
DFHDBAT

6. *rc*

Destination

CDBC

DFHDB8120 I	*date time applid* **DBCTL may be INDOUBT about the LUW with recovery token** *X'nn'*, **which CICS has** *{committed	backed out}*, *{SYSTEM ABEND CODE	IMS USER ABEND CODE	DBCTL RETURN CODE} rc.*

Explanation

CICS has received a bad return code from DBCTL for a commit or backout request for the logical unit of work (LUW) identified by unit of recovery X'*nn*'.

System action

CICS has either backed out or committed this LUW. CICS continues.

User response

At the next reconnection, CICS and DBCTL resolve all INDOUBTs.

Alternatively you can request DBCTL to find out if the LUW is INDOUBT, and instruct DBCTL to commit it or back it out. For more information on how to do this, refer to the CICS documentation.

For further information about the nonzero response code, if *rc* is:

- a **system abend code**, refer to the z/OS MVS System Codes manual

- an **IMS user abend code**, refer to the IMS messages and codes

- a **DBCTL return code**, refer to the IMS messages and codes.

1. *applid*

Destination

Console

DFHDB8123I	*applid* **CICS disconnection from DBCTL for CICS shutdown has completed successfully.**

Explanation

CICS was connected to DBCTL when CICS termination commenced. CICS has successfully disconnected from DBCTL.

System action

CICS shutdown continues.

User response

None. You can suppress this message with the SIT parameter, MSGLVL = 0.

Module:
DFHDBAT

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDB8124 E	*date time applid* **CICS disconnection from DBCTL for CICS shutdown has** *{failed,	timed out.} {System abend code	IMS user abend code	DBCTL return code	}* *rc*

Explanation

CICS was connected to DBCTL when CICS termination commenced. CICS disconnection from DBCTL failed for one of the reasons given in the message text.

System action

CICS shutdown continues.

User response

If the failure is due to a timed out condition, the message indicates that the time elapsed since CICS requested disconnection has reached the interval

specified in the TIMEOUT parameter of the DRA interface without a response from DCBTL. The default interval is 60 seconds.

If failure is due to any other condition, a nonzero return code is given. If *rc* is:

- A **system abend code**, refer to the z/OS MVS System Codes manual
- An **IMS user abend code**, refer to the IMS messages and codes
- A **DBCTL return code**, refer to the IMS messages and codes.

Destination

CDBC

DFHDB8199 E   **GETMAIN REQUEST FOR CICS-DBCTL CONTROL WORK ELEMENT (CWE) HAS FAILED.**

Explanation

While notifying the CICS-DBCTL control transaction of changes to the state of the CICS-DBCTL interface a GETMAIN request for storage to hold a CICS-DBCTL control work element failed.

System action

CICS uses control exit storage in DBCTL global block (DGB) to notify the control transaction of the error. The control transaction issues message DFHDB8129 to transient data destination CDBC. CICS abandons the attempt to change the state of the CICS-DBCTL interface.

User response

This message indicates that there is a storage management problem. See any other messages issued from the CICS region to the MVS console for further guidance. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDBCTX

Destination

Console

DFHDB8201I   **The key that you pressed has no meaning on this panel.**

Explanation

The terminal operator has pressed the wrong key when using either

- CDBI, the CICS-DBCTL support inquiry transaction (Module DFHDBIQ), or
- CDBC, the CICS-DBCTL support menu transaction (Module DFHDBME).

System action

CICS ignores the key pressed.

User response

Check the allowable keys display which appears at the bottom of the screen and try a valid key.

Module:
DFHDBIQ, DFHDBME

Destination

TERMCDBC

DFHDB8202　　**Selection must be one of those shown above.**

Explanation

The terminal operator has typed in an invalid option when using CDBC, the DBCTL Support Menu Transaction.

System action

CICS rejects the invalid option.

User response

Check the allowable options that appear on the screen and choose the appropriate one.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8204　　**Invalid DRA startup table suffix supplied.**

Explanation

The terminal operator has typed an invalid startup table suffix when using CDBC, the DBCTL Support Menu Transaction. The suffix must be one or two characters long consisting only of characters valid for a partitioned data set member name.

System action

CICS rejects the invalid Startup Table Suffix.

User response

Correct the startup table suffix and try again. You may need to check the suffix with your system programmer.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8207D　　**Connection to DBCTL requested. Press PF5 to confirm.**

Explanation

The terminal operator has requested that CICS should be connected to DBCTL.

This message is not used when you are running the CDBC transaction at the console. If you are running the CDBC transaction on the console, the terminal PF5 key function (to confirm the request) is not used.

System action

If the PF5 key is pressed, then CICS will connect to DBCTL. If any other key is pressed in response to this message, CICS will not connect to DBCTL.

User response

Press the PF5 key if you wish to proceed with connecting CICS to DBCTL. If you do not wish the connection to proceed then press the PF3 key to terminate the transaction, or change the input data and press enter.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8208D　　**DBCTL immediate disconnection requested. Press PF5 to confirm.**

Explanation

The terminal operator has requested that CICS should be disconnected from DBCTL immediately.

This message is not used when you are running the CDBC transaction at the console. If you are running the CDBC transaction on the console, the terminal PF5 key function (to confirm the request) is not used.

System action

If the PF5 key is pressed, then all DL/I requests issued from this CICS system and currently being processed in DBCTL will complete and then CICS will disconnect from DBCTL. Tasks which have been using DBCTL but have not yet issued a CICS SYNCPOINT, either explicitly in the application or implicitly as a result of CICS task termination processing, will abnormally

terminate with abend code ASP7. If any other key is pressed in response to this message, CICS will not disconnect from DBCTL.

User response

Press the PF5 key if you wish to proceed with disconnecting CICS from DBCTL immediately. If you do not wish the disconnection to proceed then press the PF3 key to terminate the transaction, or change the input data and press enter.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8209D   **DBCTL orderly disconnection requested. Press PF5 to confirm.**

Explanation

The terminal operator has requested that CICS should be disconnected from DBCTL in an orderly manner.

This message is not used when you are running the CDBC transaction at the console. If you are running the CDBC transaction on the console, the terminal PF5 key function (to confirm the request) is not used.

System action

If the PF5 key is pressed, then all tasks running in this CICS system that have already used DBCTL will complete and then CICS will disconnect from DBCTL. No new tasks running in this CICS system will be permitted to use DBCTL until CICS is connected to DBCTL again. If any other key is pressed in response to this message, CICS will not disconnect from DBCTL.

User response

Press the PF5 key if you wish to proceed with disconnecting CICS from DBCTL in an orderly way. If you do not wish the disconnection to proceed then press the PF3 key to terminate the transaction, or change the input data and press enter.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8210D   **Connection to DBCTL is proceeding. Check CDBC TD queue.**

Explanation

The operator has pressed PF5 in response to message DFHDB8207 or the CDBC transaction was used from the MVS operator console to connect to DBCTL. CICS issues further messages concerning the connection to the CDBC transient data destination.

System action

CICS proceeds with the connection attempt.

User response

Press PF3 to terminate the transaction. Press PF2 to refresh the status information on the screen. If you are running the CDBC transaction on the console, the PF key functions are not available. Check the CDBC transient data destination for further messages.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8211D   **Orderly disconnection from DBCTL is proceeding. Check CDBC TD queue.**

Explanation

The operator has pressed PF5 in response to message DFHDB8209. CICS issues further messages concerning the disconnection to the CDBC transient data destination. Additionally, DBCTL issues some messages to the MVS console.

System action

CICS proceeds with the disconnection attempt.

User response

You are now able to use your terminal to perform other functions. You can check to see how the disconnection attempt is proceeding by using the refresh key to refresh the CICS-DBCTL status information on the screen. In case of problems, for example, CICS does not disconnect from DBCTL, check the CDBC transient data destination.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8212D   **Immediate disconnection from DBCTL is proceeding. Check CDBC TD queue.**

Explanation

The operator has pressed PF5 in response to message DFHDB8208. CICS issues further messages concerning the disconnection to the CDBC transient data destination. Additionally, DBCTL issues some messages.

System action

CICS proceeds with the disconnection attempt.

User response

You are now able to use your terminal to perform other functions. You can check to see how the disconnection attempt is proceeding by using the refresh key to refresh the CICS-DBCTL status information on the screen. In case of problems, for example, CICS does not disconnect from DBCTL, check the CDBC transient data destination.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8213   **Connection to DBCTL is already in progress. Request is ignored.**

Explanation

The terminal operator has requested that CICS should connect to DBCTL and CICS is already trying to connect to DBCTL.

System action

This connection request is ignored.

User response

Use the PF2 key to refresh the CICS-DBCTL status information on the screen. If the "DBCTL connected and ready" message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was connecting to DBCTL. The operator should also check the MVS console as the message DFS0690 may have been issued, and be waiting for a reply.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8214   **Connection to DBCTL has already been done. Request is ignored.**

Explanation

The terminal operator has requested that CICS should connect to DBCTL when CICS is already connected to DBCTL.

System action

This connection request is ignored.

User response

If you did not expect DBCTL to be connected to CICS then check the CDBC transient data destination to see when CICS did connect to DBCTL (message DFHDB8101).

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8215   **Orderly disconnection from DBCTL in progress. Request is ignored.**

Explanation

The terminal operator has either:

- Requested that CICS should disconnect from DBCTL when CICS is already disconnected from DBCTL, or
- Requested that CICS should connect to DBCTL when CICS is still disconnecting from DBCTL.

System action

This disconnection request is ignored.

User response

Use the refresh key to refresh the CICS-DBCTL status information on the screen. If the 'DBCTL not connected to CICS' message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was disconnecting from DBCTL.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8216   **Immediate disconnection from DBCTL in progress. Request is ignored.**

Explanation

The terminal operator has either:

- Requested that CICS should disconnect from DBCTL while CICS is already disconnected from DBCTL, or
- Requested that CICS should connect to DBCTL while CICS is still disconnecting from DBCTL.

System action

This disconnection request is ignored.

User response

Use the PF2 key to refresh the CICS-DBCTL status information on the screen. If the 'DBCTL not connected to CICS' message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was disconnecting from DBCTL. If necessary, check the location of the CDBC destination with your system programmer.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8217   **DBCTL not currently connected to CICS. Request ignored.**

Explanation

The terminal operator has requested that CICS should disconnect from DBCTL when CICS is not connected to DBCTL.

System action

This disconnection request will be ignored.

User response

If you did not expect DBCTL to be disconnected from CICS then check the CDBC transient data destination to see when and why CICS did disconnect from DBCTL (message DFHDB8102). If you do not know where the CDBC destination is, then please check with your system programmer.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8218   **CDBC - Please specify CONNECT or DISCONNECT.**

Explanation

The terminal operator has used CDBC, the DBCTL support menu transaction, from the MVS operator console and has not selected an option.

System action

No action is taken until the operator selects an option.

User response

Select an option by typing in CDBC with a connect or disconnect option.

See the CICS Supplied Transactions for guidance on using CDBC.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8219   **DBCTL connection phase 1 in progress. Request is ignored.**

Explanation

The first phase of connecting CICS to DBCTL has not completed yet, but the terminal operator has requested disconnection from DBCTL.

System action

This disconnection request is ignored.

User response

Try requesting disconnection again if you wish to proceed with disconnecting CICS from DBCTL. If you still cannot disconnect then check the CDBC transient data destination to see if any messages have been issued which indicate that there are problems with the connection attempt. Also check if any messages have been issued from DBCTL.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8220   **CICS-DBCTL connection is unusable. Request is ignored.**

Explanation

A failure has occurred in the CICS-DBCTL interface.

System action

Any requests to connect or disconnect from DBCTL is ignored.

User response

Look for earlier messages identifying the source of the error by checking the CDBC transient data destination for any messages issued from CICS and also by checking for any messages issued from DBCTL.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8221   **Non zero return code *rc* from DFHDBAT. The request is ignored.**

Explanation

The module DFHDBAT returns a nonzero return code in reply to a request issued to DBCTL. DFHDBAT is a task-related user exit and forms part of the CICS-DBCTL interface.

System action

The request to DBCTL fails.

User response

See message DFHDB8110 for further guidance.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8222   **Connection has failed. DBCTL return code is *rc*.**

Explanation

DBCTL rejects a request from CICS to connect to it.

System action

The connection does not proceed.

User response

See the IMS messages and codes for an explanation of the DBCTL return code.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8223   **DRA startup table with suffix *xx* cannot be found. Request is ignored.**

Explanation

A connection request has been issued and the startup table with the suffix specified cannot be found.

System action

The connection does not proceed.

User response

If you were using the DBCTL Support Menu transaction, CDBC, check if you have mistyped the suffix value.

Place the DRA startup table in a CICS STEPLIB library. For guidance on how to do this, see the CICS documentation.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8224   **Module DFSPRRC0 cannot be found. Connection cannot be done.**

Explanation

The DRA router module, DFSPRRC0, could not be found during an attempt to connect to DBCTL.

System action

The connection does not proceed.

User response

Place the module DFSPRRC0 in a CICS STEPLIB library. For guidance on how to do this, see the CICS documentation.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8225I *applid* **The DBCTL ID is** *xxxx*. **The DRA Startup Table suffix is** *xx*.

Explanation

This message is issued from module DFHDBME when CDBC, the DBCTL support menu transaction, is used from the MVS operator's console. This message is issued from module DFHDBIQ when CDBI, the DBCTL support inquiry transaction, is used from the MVS operator's console.

System action

Processing continues.

User response

None.

Module:
DFHDBME, DFHDBIQ

Destination

TERMCDBC

DFHDB8226 **There was an error starting CDBT. Disconnection from DBCTL failed.**

Explanation

An error has occurred, starting the disconnection transaction CDBT.

System action

The disconnection attempt fails.

User response

Look for earlier messages identifying the source of the error on the CDBC or CSMT transient data destinations. Check that the disconnection transaction CDBT is available. Check that the disconnection module DFHDBDSC is available.

Module:

DFHDBME

Destination

TERMCDBC

DFHDB8227 **There was an error linking to DFHDBCON. Connection to DBCTL failed.**

Explanation

An attempt was made to connect to DBCTL but there was an error when linking to the connection module.

System action

The connection attempt fails.

User response

Look for earlier messages identifying the source of the error on the CDBC or CSMT transient data destinations. Check that module DFHDBCON is available.

Module:
DFHDBME

Destination

TERMCDBC

DFHDB8228 **The period (.) and subsequent characters have been removed.**

Explanation

A comment was found at the end of the command. The CDBM transaction has removed the comment before sending the IMS command. Comments start with the period character (.) and continue to the end of the command.

System action

The IMS command is sent without the comment.

User response

None.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8229 **Spaces immediately after the CRC (/) have been removed.**

Explanation

One or more spaces were found between the command recognition character (CRC) and the IMS verb. The default CRC is the oblique stroke (/). Spaces in this position would normally cause an IMS command to fail.

System action

The CDBM transaction removes the spaces before sending the IMS command.

User response

None. The operator should not add spaces between the CRC and the command.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8230   **The key that you pressed has no meaning on this panel.**

Explanation

The terminal operator has pressed the wrong key.

System action

CICS ignores the key pressed.

User response

Check the display of key functions at the bottom of the screen and try a valid key.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8231   **FORCE IMS LOG END OF VOLUME was not set to 1 or 2.**

Explanation

When entering a /DBDUMP or /DBRECOVER IMS command, the value in the FORCE IMS LOG END OF VOLUME field must be set to either 1 or 2. If you select 1, which is the default, the command has the NOFEOV option set; this does not force IMS End OF LOG for this command. To override this, select option 2; the NOFEOV option is not added.

System action

The command is not sent.

User response

Choose option 1 or 2 and press Enter.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8232   **Initial CRC (/) was not found. Reenter the IMS command.**

Explanation

The command recognition character (CRC) is expected at the start of the command line. The default CRC is the oblique stroke (/).

System action

The command is not sent.

User response

Reenter the command with the CRC as the initial character.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8233   **A second CRC (/) was found. Reenter the IMS command.**

Explanation

The command field can accept only one command. A command must start with the command recognition character (CRC). The default CRC is the oblique stroke (/). A second CRC within the command field is not allowed and must be removed before the command is sent to IMS.

System action

The command is not sent.

User response

Correct the command field by removing the second command or correcting the command syntax.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8234   **An invalid wildcard was found. Reenter the IMS command.**

Explanation

More than one database name contains a wildcard. You can use the asterisk (*) to refer to any number of characters, or the plus sign (+) to refer to a single character. However, in a command you can use wildcard characters in one database name only. Wildcards in more than one database name are not permitted and should be removed.

System action

The command is not sent.

User response

Remove the invalid wildcard. Either change the first wildcard string to include the database names matched by the second wildcard string, or explicitly name the databases. Alternatively issue the command with the first wildcard string, retrieve the command by pressing F9 (Retrieve) and replace the first wildcard string with the second. If there are other database names within the command, you may need to remove them before sending the command.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8235   **Incorrect wildcard position. Reenter the IMS command.**

Explanation

You can use a wildcard character in a command only to refer to database names. In this case a wildcard character, an asterisk (*) or plus sign (+), has been wrongly positioned in the command.

System action

The command is not sent.

User response

Correct the command by moving the wildcard to a position where it can refer to a database name or names.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8236   **Invalid IMS command verb. Reenter the IMS command.**

Explanation

The command has been rejected by IMS because the verb is not recognized as a valid IMS operator command.

System action

IMS rejects the command.

User response

Correct the command and press Enter.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8237   **Command not allowed. Enter a valid IMS command.**

Explanation

This command has been rejected by IMS because it cannot be executed using the AIB interface used by CICS.

Certain IMS operator commands such as /MODIFY are not valid with the CDBM transaction and must be issued via the MVS console.

System action

IMS rejects the command.

User response

Enter a valid IMS operator command.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8238   **Command not authorized. Enter a valid IMS command.**

Explanation

The command has been rejected by IMS because the application or user does not have the necessary authorization to execute the command as entered.

System action

IMS rejects the command.

User response

Get the necessary authorization and reissue the command.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8239   *aaaa* **call failed, AIB Return** *X'bbbb'* **Reason** *X'cccc'*

Explanation

The command has been rejected by IMS.

System action

IMS rejects the command.

User response

For the IMS function code, examine the AIB return code and reason code to determine the cause of the error. See the IMS Database Administration manual, SC26-8015 for an explanation of these codes.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8240   **DBCTL not connected. Run CDBC to connect.**

Explanation

CICS was unsuccessful in its attempt to schedule the program specific block (PSB) DFHDBMP before issuing the IMS command.

System action

The command is not sent.

User response

Ensure that the DBCTL system is attached using the CICS supplied transaction CDBC.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8241   **PSB schedule unsuccessful. UIB return codes (***X'aaaa'***)**

Explanation

CICS was unsuccessful in its attempt to schedule the program specification block (PSB) DFHDBMP before issuing the IMS command.

System action

The command is not sent.

User response

Ensure that PSB DFHDBMP is available to your system. See the summary of abends and return codes in the CICS documentation for an explanation of the UIB return codes.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8242   **Command in progress. Issue / DISPLAY command for status.**

Explanation

The command sent to IMS has not returned a segment but has sent an acknowledgment.

System action

The IMS command is proceeding or has completed.

User response

Issue a /DISPLAY command to determine the status. Press F9 (Retrieve) to retrieve the IMS command and change the command to a /DISPLAY command. Alternatively press F12 (Cancel) and enter a new command to display the status.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8243　　　**No match has been found for wildcard (*aaaaaaaa*).**

Explanation

CICS was unsuccessful in its attempt to match any IMS databases with the wildcard supplied.

System action

The command is not sent.

User response

Check the names of the databases required and/or the wildcard supplied.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8244　　　**The requested command cannot be found in the command file.**

Explanation

The group command entered does not exist in the command file.

System action

No action

User response

Check that the group name and command were typed correctly. A list of all available commands can be found using the browse function in the group command maintenance section of CDBM.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8245　　　**The command file, DFHDBFK, cannot be opened.**

Explanation

CDBM failed to open the command file, DFHDBFK.

System action

CDBM will not allow the user to enter the maintenance section.

User response

Determine the cause of the open failure, and correct the error. Retry selecting the maintenance option from within CDBM.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8246　　　**An error has occurred reading the command file, DFHDBFK.**

Explanation

An error occurred whilst CDBM was trying to read a record from the command file, DFHDBFK.

System action

CDBM cannot read and execute the requested group command.

User response

Determine the cause of the read failure, and correct the error. Retry issuing the group command again from within CDBM.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8247　　　**Record not found.**

Explanation

There was no record in the group command file, DFHDBFK, for the specified group and command.

System action

None.

User response

Browse the group command file to locate the correct record. If this message was issued during a browse request, clear the group and name fields and retry the browse.

Module:
DFHDBMP

Destination

Terminal End User

| DFHDB8248 | End of file reached during browse. Press enter to wrap. |

Explanation

The end of the file was reached during a browse request on the group command file, DFHDBFK.

System action

None.

User response

Press return to browse the group command file from the beginning.

Module:
DFHDBMP

Destination

Terminal End User

| DFHDB8249 | A record already exists for this command in this group. |

Explanation

A record with a matching group and command names already exists in the group command file, DFHDBFK.

System action

A new group command record is not added to the group command file.

User response

Check the command name is correct. If it is, use a different group name.

Module:

DFHDBMP

Destination

Terminal End User

| DFHDB8250 | A record must be read before updating. |

Explanation

Before a record in the group command file, DFHDBFK, can be updated, it must first be read.

System action

The group command record is not updated in the group command file.

User response

Read the record and apply the changes before issuing an update request.

Module:
DFHDBMP

Destination

Terminal End User

| DFHDB8251 | A record must be read before deletion. |

Explanation

Before a record in the group command file, DFHDBFK, can be deleted, it must first be read.

System action

The record is not deleted from the group command file.

User response

Read the record before issuing a delete request.

Module:
DFHDBMP

Destination

Terminal End User

| DFHDB8252 | Group and command must not be altered. Record not updated. |

Explanation

The group and command fields must not be altered during a group command record update request.

System action

The record is not updated in the group command file, DFHDBFK.

User response

Add a new record with the required group and name fields. Delete the unwanted record.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8253   **Group and command must not be altered. Record not deleted.**

Explanation

The group and command fields must not be altered during a group command record delete request.

System action

The record is not deleted from the group command file, DFHDBFK.

User response

Read the correct record before issuing a delete request.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8254   **Cannot update during browse. Read record to update.**

Explanation

Before a record in the group command file, DFHDBFK, can be updated, it must first be read.

System action

The group command record is not updated in the group command file.

User response

Read the record and apply the changes before issuing an update request.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8255   **Cannot delete during browse. Read record to delete.**

Explanation

Before a record in the group command file, DFHDBFK, can be deleted, it must first be read.

System action

The record is not deleted from the group command file.

User response

Read the record before issuing a delete request.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8256   **Both group and command must be specifed.**

Explanation

The group and command fields must both be specified when adding a new group command record to the group command file, DFHDBFK.

System action

A new group command record is not added to the group command file.

User response

Enter data in both the group and command fields and issue the add request.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8257   **Function invalid. Must be A, B, D, R or U.**

Explanation

An action requested was not valid.

System action

None.

User response

Enter a valid action letter.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8258   **File *{write | rewrite | delete | read | browse}* failure. EIBRESP=*eibresp*, EIBRESP2=*eibresp2*.**

Explanation

An unexpected error has occurred during a file operation on the group command file, DFHDBFK.

System action

The requested update to the group command file is not made.

User response

Determine the reason for the failure using the EIBRESP and EIBRESP2 values. Fix the cause of the error and retry the operation.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8259   **Group command, *group command, {added | updated | deleted | read | browsed}.***

Explanation

The operation indicated has been performed on the group command file, DFHDBFK.

System action

The group command file has been successfully modified.

User response

None.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8260   **Record length exceeds screen size.**

Explanation

The record read from the group command file, DFHDBFK, was found to contain more data than could be displayed on the screen.

System action

None.

User response

The data set associated with the group command file, DFHDBFK, has been created with a larger record size than allowed. Recreate the data set with the correct record size, and reload the data.

Module:
DFHDBMP

Destination

Terminal End User

DFHDB8290I   **DBCTL not connected to CICS.**

Explanation

This message is issued when CICS is not connected to DBCTL.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, then the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

System action

Processing continues.

User response

None.

Module:
DFHDBME, DFHDBIQ

Destination

TERMCDBC

DFHDB8291I   **DBCTL connect phase 1 in progress.**

Explanation

CICS is in phase 1 of connecting to DBCTL and has not yet moved into phase 2 of connection processing.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, this message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, this message is issued from module DFHDBIQ.

System action

Processing continues.

User response

Press the PF2 key to refresh the status information on the screen. Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

Module:
DFHDBME, DFHDBIQ

Destination

TERMCDBC

DFHDB8292I   **DBCTL connect phase 2 in progress.**

Explanation

CICS is in phase 2 of connecting to DBCTL. (That is, phase 1 of connection has been completed and CICS has not yet heard from DBCTL that phase 2 of connection has been completed.)

If you are using the CDBC transaction, the DBCTL Support Menu transaction, this message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, then this message is issued from module DFHDBIQ.

System action

Processing continues.

User response

Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface. Check that the DBCTL system you are trying to connect to has been initialized.

Check the MVS operator console for any IMS console messages that need a reply (for example, message DFS0690).

Module:
DFHDBME, DFHDBIQ

Destination

TERMCDBC

DFHDB8293I   **DBCTL connected and ready.**

Explanation

CICS is connected to DBCTL.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

System action

Processing continues.

User response

Press the PF3 key to terminate the transaction.

Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

Module:
DFHDBME, DFHDBIQ

Destination

TERMCDBC

DFHDB8294I   DBCTL orderly disconnect in progress.

Explanation

CICS is disconnecting from DBCTL in an orderly manner. (That is, all tasks using DBCTL from this CICS system will run to termination before CICS is disconnected from DBCTL.)

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

System action

Processing continues.

User response

Press the PF3 key to terminate the transaction.

Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

Module:
DFHDBME, DFHDBIQ

Destination

TERMCDBC

DFHDB8295I   DBCTL immediate disconnect in progress.

Explanation

CICS is disconnecting from DBCTL immediately. (That is, all DL/I requests issued from this CICS system and currently being processed by DBCTL will complete before CICS is disconnected from DBCTL.)

If you are using the CDBC transaction, the DBCTL Support Menu transaction, this message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, this message is issued from module DFHDBIQ.

If there is an IMS console message DFS0690 waiting for an operator reply, this message continues to be displayed until the operator replies to the IMS console message.

System action

Processing continues.

User response

Press the PF3 key to terminate the transaction.

Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

Module:
DFHDBME, DFHDBIQ

Destination

TERMCDBC

DFHDB8296I   DBCTL cannot be connected to CICS.

Explanation

A failure has occurred in the CICS-DBCTL interface.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

System action

Processing continues.

User response

Look for earlier messages identifying the source of the error by checking the CDBC transient data destination and checking any messages issued from DBCTL.

Module:
DFHDBME, DFHDBIQ

Destination

TERMCDBC

DFHDB8297   *applid* CICS/DBCTL CONNECTION BEING ATTEMPTED

Explanation

This message only occurs when there is no recoverable service table (RST). CICS has attempted to connect to DBCTL but has failed on one or more

occasions. DBCTL may not be running, or it may be restarting after a DBCTL abend.

System action

CICS continues to attempt to connect every 5 seconds. This message is reissued every minute for ten minutes or until connection is made.

If the connection is not made in ten minutes, CICS will stop attempting to connect and IMS message DFS0690 is issued. If the user replies WAIT to the IMS DFS0690 message, then the IMS DRA will take over responsibility for retrying the connection attempt. The TIMER parameter in the DRA startup table specifies how often the DRA will retry the connect to DBCTL.

User response

Check why DBCTL is not running. You can cancel the connection attempts using the CDBC transaction by issuing a disconnect request.

Module:
DFHDXAX

Destination

Console

DFHDB8298   *APPLID* **An attempt has been made to connect to DBCTL via PLT phase 1. The request has been rejected.**

Explanation

The attempt to connect to DBCTL has been unsuccessful.

You are using a startup PLT and the request for DFHDBCON has been issued in PLT phase 1 processing. It can only be issued from PLT phase 2.

System action

Processing continues.

User response

Look at the source for your startup PLT. Ensure the DBCTL startup program (DFHDBCON) is after the statement specifying DFHDELIM.

Module:
DFHDBME, DFHDBCON

Console

DFHDB8300   *date time applid* **BUNDLE** *bundlename* **has failed to install the PACKAGESET** *packageset* **because {*its name contains invalid characters.* | *the PACKAGESET XML data could not be parsed.* | *its not defined in a platform or application bundle.* | *the PACKAGESET XML encoding is invalid.*}**

Explanation

The CICS BUNDLE *bundlename* has failed to install the PACKAGESET *packageset*. Possible reasons include:

name contains invalid characters

> The PACKAGSET name *packageset* contains invalid characters. Valid characters are: A-Z, a-z, 0-9 and special characters _#@$. Leading and embedded blank characters are not permitted.

PACKAGESET XML data could not be parsed

> The parse of XML for PACKAGESET *packageset* failed. A preceding DFHPI*nnnn* message may give further information about the cause of the problem.

not defined in a platform or application bundle

> The PACKAGESET *packageset* is defined in a standalone CICS bundle. CICS only supports PACKAGESET installed as part of a platform or application.

XML encoding invalid

> The conversion of the XML to IBM 037 failed.

System action

The BUNDLE resource is disabled and the PACKAGESET is not created.

User response

The probable cause is an error or inconsistency in the PACKAGESET XML. Check for any previous messages which may give you more information about the reason for the failure. Correct the PACKAGESET XML, discard the BUNDLE, and reinstall it.

Module:
DFHD2RL

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *bundlename*

5. *packageset*

6. Value chosen from the following options:

   1=its name contains invalid characters.,

   2=the PACKAGESET XML data could not be parsed.,

   3=its not defined in a platform or application bundle.,

   4=the PACKAGESET XML encoding is invalid.

Destination

CDB2

DFHDB8301	***date time applid* Packageset name was not specified or is too long in BUNDLE *bundlename*.**

Explanation

The CICS BUNDLE *bundlename* has failed to install a PACKAGESET because the resource name was not specified or is more than 128 characters in length.

System action

The BUNDLE resource is disabled and the PACKAGESET is not created.

User response

Correct the name of the PACKAGESET resource in the bundle manifest file. Discard and reinstall the BUNDLE resource.

Module:
DFHD2RL

XMEOUT parameters/Message inserts

2. *time*

3. *applid*

4. *bundlename*

Destination

CDB2

DFHDB8302	***applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

bundlename has failed to install
the PACKAGESET packageset
because {its schema level is not
supported | pkgsetSchemaVersion
is invalid | pkgsetSchemaRelease is
invalid}: error_data.

Explanation

The CICS BUNDLE *bundlename* has failed to install the PACKAGESET *packageset*. Possible reasons include:

schema level is not supported

The pkgsetSchemaVersion and pkgsetSchemaRelease of PACKAGESET *packageset* are higher than the schema level supported by this release of CICS.

pkgsetSchemaVersion is invalid

The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be a value in the range 1-99.

pkgsetSchemaRelease is invalid

The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be a value in the range 0-99.

System action

The BUNDLE resource is disabled and the PACKAGESET is not created.

User response

The probable cause is an error or inconsistency in the PACKAGESET XML. Check for any previous messages which may give you more information about the reason for the failure. Correct the PACKAGESET XML, discard the BUNDLE, and reinstall it.

DFHDDnnnn messages

DFHDD0001   *applid* **An abend (code aaa/bbbb)**
has occurred at offset X'offset' in
module modname.

Explanation

An unexpected program check or abend occurred with abend code *aaa/bbbb*.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset X'*offset*' in module *modname*. This may have been caused by corruption of CICS code or control blocks.

System action

A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Investigate the cause of the program check or abend using the system dump and any previously output

diagnostic information provided by CICS, the access methods, or the operating system.

If you cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDDAP, DFHDDDM, DFHDDDI, DFHDDLO, DFHDDBR

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHDD0002   *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

Directory Domain has received an unexpected error response from some other part of CICS. The operation requested by Directory Domain is described by code X'*code*'.

For further information about CICS exception trace entries, refer to the Troubleshooting and support.

System action

A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Investigate the cause of the problem as follows:

1. Determine if the problem can be explained by any previous messages output from some other part of CICS.
2. Examine the symptom string.
3. Examine the dump.

If you cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDDAP, DFHDDDM, DFHDDDI, DFHDDLO, DFHDDBR

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHDD0004   *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should

increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. However you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDDAP

3. *modname*

Destination

Console

DFHDD0006	*applid* **Insufficient storage to satisfy Getmain (code *X'code'*) in module *modname*. MVS code *mvscode*.**

Explanation

An MVS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code *mvscode* is the MVS GETMAIN return code.

System action

An exception entry is made in the trace table (code X'*code*'). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

DFHDHnnnn messages

DFHDH0001	*applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which corrects itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. See the Configuring or the Improving performance for further information on CICS storage.

Module:
DFHDDAP

Either CICS continues unless you have specified in the dump table that CICS should terminate. This action is taken by DFHDMIQ.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. This action is taken by DFHDMDM, DFHDMDS and DFHDMWQ.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified

in the SIT (this is the ICVR which is measured in milliseconds). This means that the module *modname* is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname* and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDMDM, DFHDMEN, DFHDMENF, DFHDMIQ, DFHDMDS, DFHDMWQ

XMEOUT parameters/Message inserts

1. *applid*
2. *X'offset'*
3. *modname*

Destination

Console

DFHDM0005   *applid* **A hardware error has occurred (module *modname*, code *X'code'*). The Time-of-Day clock is invalid.**

Explanation

A hardware error has occurred during the running of module *modname*. The MVS Store Clock facility is the timing mechanism for the operating system.

The code *code* is the exception trace point id which uniquely identifies the place where the error was detected.

System action

An exception entry (code *code* in the message) is made in the trace table. A dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This is in all probability a hardware error and you should in the first instance investigate the MVS Store Clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDMDM, DFHDMWQ, DFHDMDS

XMEOUT parameters/Message inserts

1. *applid*
2. *modname*
3. *X'code'*

Destination

Console

DFHDM0101I   *applid* **CICS is initializing.**

Explanation

This message is for information only.

CICS initialization has started. The domain (DM) manager is about to attach an initialization task for each domain defined in the local CICS catalog, DFHLCD.

System action

Processing continues.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHDMDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDM0102I   *applid* **CICS is quiescing.**

Explanation

This message is for information only.

The controlled shutdown of CICS has started. The domain (DM) manager is about to attach a quiesce task for each CICS component.

System action

Processing continues.

User response

None. You can suppress this message with the SIT parameter, MSGLVL=0.

Module:
DFHDMDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDM0103   *applid* **Unsuccessful quiesce of *domain* domain. CICS will terminate.**

Explanation

A domain has failed to quiesce.

System action

CICS terminates. An exception trace and a dump are issued by the domain in error.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDMDS

XMEOUT parameters/Message inserts

1. *applid*
2. *domain*

Destination

Console

DFHDM0104   *applid* **Unsuccessful load of program *domain*. CICS will terminate.**

Explanation

The domain (DM) manager has called the loader to load a program for an initialization task but the load has failed. The module is missing from the DFHRPL concatenation, possibly because the SDFHLOAD is missing. Alternatively, if the module name given in the message is not a legitimate CICS module, the CICS catalog could be corrupted.

System action

CICS terminates. A system dump with dump code DM0006 is taken unless you have suppressed dumps in the dump table.

An exception trace is issued by the domain manager. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDMDM

XMEOUT parameters/Message inserts

1. *applid*
2. *domain*

Destination

Console

DFHDM0105   *applid* **Unsuccessful initialization of *domain* domain. CICS will terminate.**

Explanation

A domain has failed to initialize.

System action

CICS terminates with a dump.

Diagnostics are issued by the domain in error. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Review the diagnostics and take remedial action for any installation-related problems. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDMDS

XMEOUT parameters/Message inserts

1. *applid*
2. *domain*

Destination

Console

DFHDM0106	*applid* **The Domain Manager records on the CICS Catalog may have been corrupted.**

Explanation

A problem was detected when calling the CICS catalog to browse the domain (DM) manager records. For example, the domain manager records may not be present.

DFHDPnnnn messages

DFHDP0001	*applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHDP1310).

This message may follow message DFHDM0002.

System action

This is a critical error and CICS terminates, even if you have specified in the dump table that CICS should not terminate.

A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Try reinitializing the local CICS catalog, DFHLCD, using DFHCCUTL, and perform an initial start of CICS.

If this does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDMDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If you cannot continue without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDP*

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHDP0002	*applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDPFM, DFHDPLM, DFHDPUM.

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHDP0100	*applid* **An unexpected exception response with reason code *X'code'* has been returned by CICS file control to module *modname*. The debugging profiles file, *filename*, is not usable.**

Explanation

A call to CICS file control from a DP domain module has received an unexpected exception response from DFHFCFR. The reason code given in the message is the reason from the FCFR parameter list on return from file control.

System action

The file given in the message is not usable.

The application debugging profiles manager will fail until the problem has been corrected. It the CICS supplied transaction, CADP, is being used to define debugging profiles it will fail with an ADPA abend.

The meaning of the reason code in the message is given below:

• X'08' (FCFR_CACHE_FAILURE)

There has been an input/output(IO) error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- X'15' (FCFR_DATASET_BEING_COPIED)

  The data set for the debugging profiles file, DFHDPFMB, is currently unavailable because it is being copied. Retry when it becomes available.

- X'1F' (FCFR_FILE_DISABLED)

  The file definition for the debugging profiles base data set, DFHDPFMB, or path data set, DFHDPFMP, is disabled. Enable the disabled file and retry.

- X'20' (FCFR_FILE_NOT_OPEN)

  The file definition for the debugging profiles base data set, DFHDPFMB, or path data set, DFHDPFMP, cannot be opened. Examine the console to find file control or VSAM messages that will indicate the reason for the error. Note that Debug Profile support is deactivated following a file not open response.

- X'22' (FCFR_FILENOTFOUND)

  A definition for the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, could not be found. Sample definitions for these files are available and should be defined and installed before retrying.

- X'27' (FCFR_INSUFFICIENT_SPACE)

  The debugging profiles base file, DFHDPFMB, is full. Investigate whether there are debugging profiles that can be deleted. Or, increase the storage allocation for the underlying VSAM data set, and recreate. Existing profiles could be backed up on another data set and then copied to the newly defined debugging profiles data set as part of the JCL to recreate it. To achieve this, replace REPRO INFILE with REPRO INDATASET in the JCL and replace SYS01 with the name of the data set containing the backed up profiles.

- X'2B' (FCFR_IO_ERROR)

  There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- X'2D' (FCFR_ISC_NOT_SUPPORTED)

  An attempt has been made to ship a file control request but ISC=NO for the system. Determine if ISC should be YES or if the file definition should be changed so that shipping is not required and retry.

- X'31' (FCFR_LOCKED)

  An attempt has been made to write a record to the debugging profiles base file, DFHDPFMB, but a retained lock exists against the key of the record being written.

- X'32' (FCFR_LOST_LOCKS)

  There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- X'33' (FCFR_LOCK_STRUCTURE_FULL)

  There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- X'37' (FCFR_NOTAUTH)

  The user is not authorized to use the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. If the user should have access to the files, allow access and retry.

- X'39' (FCFR_PREVIOUS_RLS_FAILURE)

  The debugging profiles file, DFHDPFMB, has been defined as record level sharing(RLS) but RLS is currently unavailable due to a failure. Investigate the reason for the RLS failure by looking for messages from file control and VSAM on the console. Retry when RLS is available.

- X'3B' (FCFR_READ_NOT_AUTHORISED)

  The external security manager would not allow the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, to be accessed. If the user should have access to the files, allow access and retry. .

- X'3D' (FCFR_RECLEN_EXCEEDS_LOGGER_BFSZ)

  A journal referenced in the definition for the debugging profiles file, DFHDPFMB, is using an MVS which in turn, is using a coupling facility structure that has been defined with a MAXBUFSIZE parameter less than the recommended 64000. Redefine the coupling facility structure that the logstream is using with a MAXBUFSIZE parameter of 64000. The journal in error can be the forward recovery log or the journal used for auto-archiving.

- X'46' (FCFR_RLS_DISABLED)

  The debugging profiles file, DFHDPFMB, has been defined as record level sharing(RLS) but RLS is currently disabled. Investigate why RLS is disabled by examining the console for file control and VSAM messages. Retry when RLS is available.

- X'47' (FCFR_RLS_FAILURE)

  The debugging profiles file has been defined as record level sharing(RLS) but RLS is currently unavailable due to a failure. Investigate the reason

for the failure by examining the console for file control and VSAM messages. Retry when RLS is available.

- X'4B' (FCFR_SERVREQ_VIOLATION)

  The definition for the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, does not allow all types of file request to be issued. Alter the file definitions to allow all file requests and retry.

- X'4E' (FCFR_SUPPRESSED)

  A user exit has suppressed the writing of records to the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. The exit should not be allowed to suppress records being written to these files. Correct the exit and retry.

- X'4F' (FCFR_SYSIDERR)

  The SYSID for the file definition for the debugging profile base file, DFHDPFMB, or path file, DFHDPFMP, specifies a name that is neither the local CICS region nor a remote system defined to CICS by a CONNECTION definition. SYSIDERR can also occur if the link to the remote system is closed. Correct the SYSID or reopen the link and retry.

- X'52' (FCFR_TIMEOUT) A request to file control has timed out. Investigate the reason for the timeout by examining the console for messages.

- X'58' (FCFR_UPDATE_NOT_AUTHORISED)

  The external security manager would not allow the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, to be accessed. If the user should have access to the files, allow access and retry. .

- X'59' (FCFR_VSAM_REQUEST_ERROR)

  There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- X'61' (FCFR_RREPL_VIOLATION)

  The file is flagged as RREPL and the program is not a REPLICATOR. If the program should be allowed to modify the file then change the file or program attributes.

User response

Investigate and correct the error based on the reason given and retry. In the case of an X'20' (FCFR_FILE_NOT_OPEN) reason code, once the underlying data set problem has been resolved, CICS Debug Profile support can be reactivated.

Module:
DFHDPFM, DFHDPLM, DFHDPUM.

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*
4. *filename*

Destination

Console

DFHDP0200	*APPLID* Debug Tool is back level. Compiled Debugging profiles may be defined but not used on this system.

Explanation

CICS is running with a level of Debug Tool which is older than Version 3.1.

System action

The CADP transaction and the web interface can be used to define debugging profiles and they can be activated. However, Debug Tool will not be able to use these profiles.

User response

If you do not intend to perform compiled debugging on this system or you only want to use CADP and the web interface to define profiles for use on another CICS region which does have Debug Tool at least at the version 3.1 level, then no action is required. If the intention is to use compiled debugging profiles on this CICS, then Debug Tool version 3.1 or later must be installed.

Module:
DFHDPLU

Console

DFHDS0002	*applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, see the Troubleshooting and support.

System action

An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

The system action taken depends on the context.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDSAT, DFHDSBR, DFHDSDM, DFHDSDS2,
DFHDSDS3, DFHDSDS4, DFHDSIT, DFHDSKE,
DFHDSSM, DFHDSSR, DFHDSST, DFHDSTCB,
DFHDSUE

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHDS0003	*applid* **Insufficient storage (code *X'code'*) in module *modname*.**

Explanation

A CICS GETMAIN was issued by module *modname* but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point id which uniquely identifies the place where the error was detected. This error has occurred above the 16M line.

System action

An exception entry is made in the trace table (code *code* in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the overall size limits of the DSAs or EDSAs. If CICS is not already terminated, you will need to bring CICS down to do this. See the Configuring or the Improving performance for more information on CICS storage.

You may need further assistance from IBM to fully resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDSBR

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHDS0004   *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116,

which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *module* will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDSAT, DFHDSBR, DFHDSDM, DFHDSDS2, DFHDSDS3, DFHDSDS4, DFHDSIT, DFHDSKE, DFHDSSM, DFHDSSR, DFHDSST, DFHDSTCB, DFHDSUE

DFHDS0006	*applid* **Insufficient storage to satisfy GETMAIN (code *X'code'*) in module *modname*. MVS code *mvscode*.**

Explanation

An MVS GETMAIN was issued by module *modname* but there was insufficient storage available to satisfy the request.

The code *code* is the exception trace point ID which uniquely identifies the place where the error was detected.

This error may occur either above or below the 16M line. This depends on context.

The code *mvscode* is the MVS GETMAIN return code.

System action

An exception entry is made in the trace table (code *code* in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

The system action depends on the context.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the overall size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you will need to bring CICS down to do this. See the Configuring or the Improving performance for more information on CICS storage.

You may need further assistance from IBM to fully resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHDS0007　　*applid* **Module** *module* **has detected a** *{suspend resume area overflow | architecture limit}* **(code X'code')**{. **CICS will be terminated.** | .}

Explanation

A dispatcher architecture limit has been detected. This could be one of the following limits.

- Suspend resume area overflow
- Architecture limit

The code *code* is the exception trace point ID which uniquely identifies the place where the error was detected.

System action

An exception entry is made in the trace table (code *code* in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either If the message does not state that CICS will be terminated then CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Or This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. The message will state that CICS will be terminated.

The system action depends on the context.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. The exception trace may help you identify the architecture limit that has been detected. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem might be a temporary one that you can resolve by retrying the operation.

You may need further assistance from IBM to fully resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

Console

DFHDS0101	*applid* **Dispatcher cannot enable the CICS post exit.**

Explanation

The dispatcher has been unable to gain authorization to enable the CICS post exit. This is probably because the CICS SVC number has been defined incorrectly in the SIT.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Check to see whether the CICS SVC number has been defined correctly in the SIT and the SIT overrides.

Check that the SVC and other code has been correctly installed as described in the Installing CICS TS. In particular, ensure that the CICS post-exit stub (DFHDSPEX) is in the LPA.

Module:
DFHDSDM

XMEOUT parameters/Message inserts

Destination

Console

DFHDUnnnn messages

DFHDU0001   *applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table.

For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

For module DFHDUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

For module DFHDUDU, a system dump cannot be taken as doing so could cause CICS to loop. CICS processing continues.

For other modules, a system dump is taken.

CICS processing continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, a runaway or a

recovery percolation, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If the abend occurred in modules DFHDUDT or DFHDUTM, the dump table is not available. Therefore, any EXEC API commands relating to dump codes fail and any dumps taken are processed using default information (for example, whether to terminate CICS or not) rather than information you may have put on the dump table for specific dump codes.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Destination

Console

DFHDU0002   *applid* **A severe error (code** *X'code'***) has occurred in module** *modname***.**

Explanation

An error has been detected in module *modname*. The code *code* is the exception trace point ID which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the Troubleshooting and support.

System action

An exception entry (code *code* in the message) is made in the trace table.

For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you've specified in the dump table that CICS should terminate.

For module DFHDUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller. A message will be issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If the error occurred in modules DFHDUDT or DFHDUTM, the dump table may not be available. Therefore, any EXEC API commands relating to dump codes may fail and any dumps taken may be processed using default information (for example, whether to terminate CICS or not) rather than information you may have put on the dump table for specific dump codes.

2. *X'code'*
3. *modname*

Destination

Console

DFHDU0004	*applid* A possible loop has been detected at offset *X'offset'* in module *modname*.

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System action

An exception entry is made in the trace table.

For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

For module DFHDUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See

Working with IBM to solve your problem for guidance on how to proceed.

Module:

DFHDUDU

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHDU0201	*applid* **About to take SDUMP. Dumpcode:** *dumpcode*, **Dumpid:** *dumpid*.

Explanation

An error, possibly signalled by a previous message, has caused a call to the CICS dump (DU) domain. Dump domain will issue this message immediately before calling the MVS SDUMP facility if the following conditions are satisfied:

- The SIT option, DUMP=YES, for SDUMPS has been specified.
- The dump table entry for dump code *dumpcode* specifies that a system SDUMP is required.
- The maximum dump limit for this dump code in the dump table entry has not been exceeded.
- The user exit XDUREQ does not suppress the taking of this dump.

The dump code *dumpcode* is an 8-character system dump code identifying the CICS problem. However some of these characters may be blanks. A system dump code is a CICS message number with the DFH prefix removed.

The dumpid *dumpid* is the unique 9-character string identifying this dump.

System action

When the dump is complete, message number DFHDU0202 is issued.

User response

Inform the system programmer, who should refer to the CICS message indicated by *dumpcode* to resolve the problem.

Module:
DFHDUDU

Destination

Console

DFHDU0202	*applid* **SDUMP complete.**

Explanation

This message is issued on successful completion of an SDUMP.

System action

Processing continues unless a CICS shutdown is requested by either the dump table entry for this dump or the dump call to the dump (DU) domain.

User response

Print off the system dump if required. A previous MVS message identifies in which SYS1.DUMP data set this dump can be found.

Module:
DFHDUDU

Destination

Console

DFHDU0203I	*date time applid* **A transaction dump was taken for dumpcode:** *dumpcode*, **Dumpid:** *dumpid*, **Tranid:** *tranid*, **Tranum:** *trannum*, **Program:** *program*.

Explanation

A CICS transaction has abnormally terminated, possibly signalled by a previous message, and the CICS dump (DU) domain has taken a transaction dump.

The dump code *dumpcode* is normally the 4-character CICS transaction abend code if the dump was requested as a result of a transaction abend. It may

also be the value of the DUMPCODE operand on an EXEC CICS DUMP TRANSACTION request.

The dump ID *dumpid* is the unique 9-character string identifying this dump.

The transaction name *tranid*, transaction number *trannum* and program name *program* provide more information about the circumstances when the dump was taken.

System action

A transaction dump is written to the current CICS dump data set, either DFHDMPA or DFHDMPB.

CICS may terminate if the dump table entry for the specified abend code specifically requests it.

User response

Print off the transaction dump if required.

CDUL

DFHDU0205	*applid* A system dump for dumpcode: *dumpcode* was suppressed by the *reason*.

Explanation

An error, possibly signalled by a previous message, has caused a call to the CICS (DU) dump domain, which failed to take a system dump for reason *reason*. Reason *reason* indicates what has caused dump suppression.

- The XDUREQ user exit.
- The dump table option for dump code *dumpcode*.
- The global system dump suppression option.

The dump code *dumpcode* is an 8-character system dump code identifying the CICS problem. However some of these characters may be blanks. A system dump code is a CICS message number with the DFH prefix removed.

System action

A system dump is not produced. However, CICS is terminated if the dump table entry for this dump code or the caller of the dump domain requests CICS termination.

User response

If a system dump is required for this dump code, perform the user action appropriate to the reason *reason* given in the message.

- If the user exit XDUREQ has suppressed the dump, either inactivate this exit, or as a more permanent measure change the user exit program not to suppress the dump.
- If the dump table has suppressed the dump, use CEMT or CECI to browse and update the dump table entry for dump code *dumpcode*.
- If the global system dump suppression option has suppressed the dump, specify DUMP=YES on the SIT to allow future system dumps to be taken.

  The SIT DUMP option can be over-ridden by using CEMT or the system programming interface for SET SYSTEM DUMPING (NOSYSDUMP|SYSDUMP).

Module:
DFHDUDU

Destination

Console

DFHDU0206I	*date time applid* A transaction dump for dumpcode: *dumpcode* was suppressed by the *reason*.

Explanation

A CICS transaction has abnormally terminated, possibly signalled by a previous message, and the CICS dump (DU) domain has failed to take a transaction dump for the reason *reason*. Reasons *reason* indicates the reason for dump suppression.

- XDUREQ user exit.
- Dump table option for this dump code.

The dump code *dumpcode* is the 4-character CICS transaction abend code.

System action

A transaction dump is not produced. However, CICS is terminated if the dump table entry for this dump code or the caller of the dump domain specifically requests such.

User response

If a transaction dump is required for this dump code, perform the user action appropriate to the reason *reason* given in the message.

- If the user exit, XDUREQ, has suppressed the dump, either inactivate this exit, or as a more permanent measure, change the user exit program so that it does not suppress the dump.
- If the dump table has suppressed the dump, use CEMT or CECI to browse and update the dump table entry for dump code *dumpcode*.

4. *dumpcode*
5. *reason*

Destination

CDUL

DFHDU0207I   *date time applid* **Transaction and system dumps for dumpcode:** *dumpcode* **were suppressed by the** *reason***.**

Explanation

Either an EXEC CICS DUMP TRANSACTION DUMPCODE command has been issued, or a CICS transaction has abnormally terminated, possibly signalled by a previous message, and the CICS dump (DU) domain has failed to take a transaction dump nor a system dump for reason *reason*. Reasons *reason* indicates what caused dump suppression.

- XDUREQ user exit.
- Dump table option for this dump code.

The dump code *dumpcode* is the 4-character CICS transaction abend code.

System action

Neither a transaction nor a system dump is produced. However, CICS is terminated if the dump table entry for this dump code or the caller of the dump domain makes such a request.

User response

If a transaction dump and/or a system dump is required for this dump code, perform the user action appropriate to the reason *reason* given in the message:

- If the user exit XDUREQ has suppressed the dump, either inactivate this exit, or, as a more permanent measure change, the user exit program so it does not suppress the dump.
- If the dump table has suppressed the dump, use CEMT or CECI to browse and update the dump table entry for this dump code.

CDUL

DFHDU0208   *applid* **SDUMP busy - CICS will retry in five seconds.**

Explanation

At the time of the MVS SDUMP request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This caused MVS to reject the new request. A non-zero value for the DURETRY parameter on the SIT means that CICS is waiting for five seconds before reissuing the SDUMP request.

System action

CICS issues an MVS STIMERM macro which caused CICS to stop for five seconds. The request is reissued when the delay interval has expired. CICS will delay and retry every five seconds for a total time equal to the number of seconds specified on the DURETRY SIT parameter.

User response

None.

Module:
DFHDUDU

Destination

Console

DFHDU0209   *applid* **Retrying SDUMP.**

Explanation

At the time of the MVS SDUMP request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This caused MVS to reject the new request. CICS has waited for five seconds (as indicated by message DFHDU0208) and is now about to reissue the SDUMP request.

System action

CICS reissues the SDUMP request.

User response

None.

Module:
DFHDUDU

Destination

Console

DFHDU0210   *applid* **SDUMPX REQUEST FAILED - *reason*.**

Explanation

An MVS SDUMPX request from CICS signalled by message DFHDU0201 has failed to complete successfully. The possible reasons, (*reason*) for the failure are as follows:

SDUMPX RETURN CODE X'nn' REASON X'mm' SDUMPX BUSY

At the time of the MVS SDUMPX request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. If a nonzero value is specified for the DURETRY SIT parameter, CICS retries the SDUMPX request every five seconds for the specified period. This message is only issued if SDUMPX is still busy after the final retry.

SDUMPX RETURN CODE X'nn' REASON X'mm' NO DATA SET AVAILABLE

No SYS1.DUMP data sets were available at the time the SDUMPX request was issued.

SDUMPX RETURN CODE X'nn' REASON = X'mm'

MVS has rejected the SDUMPX request for some other reason than those listed above. X'nn' gives the SDUMPX return code and X'mm' gives the SDUMPX reason code.

STIMERM FAILED

In order to delay for five seconds before retrying SDUMPX after an SDUMPX BUSY condition, CICS issues an MVS STIMERM macro request. MVS has indicated that the STIMERM request has failed.

NOT AUTHORIZED IN CICS

SDUMP is not authorized for this CICS run.

INSUFFICIENT STORAGE

CICS issued an MVS GETMAIN for Subpool 253 storage during the processing of the SDUMPX request. The GETMAIN has been rejected by MVS.

DFHDUSVC FESTAE FAILED

CICS issued an MVS FESTAE request from DFHDUSVC during the processing of the SDUMPX request. The FESTAE has been rejected by MVS.

IWMWQWRK RETURN CODE X'xx' REASON X'yy' REMOTE DUMPS NOT TAKEN

CICS issued an MVS IWMWQWRK request during the processing of the SDUMPX request for dumps of related CICS systems. The IWMWQWRK request has been rejected by MVS return code X'xx' and reason X'yy'. In this case CICS was unable to dump related CICS address spaces but has attempted to dump the local address space.

DFHDUSVC INVALID PROBDESC

The SDUMPX PROBDESC parameters, created by DFHDUSVC, contain invalid data.

System action

CICS proceeds as if the dump had been successful.

User response

The user response depends on the reason, (*reason*), for the failure.

SDUMPX RETURN CODE X'nn' ONLY PARTIAL DUMP.

See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the SDUMPX return code X'nn'. Use

MVS problem determination methods to determine why a partial dump was taken.

SDUMPX RETURN CODE X'nn' REASON X'mm' SDUMPX BUSY

Cause the SDUMP to be reissued after, if appropriate, increasing the value of the DURETRY system initialization parameter. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the SDUMPX return code X'nn' and reason X'mm'.

SDUMPX RETURN CODE X'nn' REASON X'mm' NO DATA SET AVAILABLE

Clear a SYS1.DUMP data set and then cause the SDUMP request to be reissued. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the SDUMPX return code X'nn' and reason X'mm'.

SDUMPX RETURN CODE X'nn' REASON X'mm'

No action is required if the dump was suppressed deliberately. If the dump has failed because of an error in the MVS SDUMP routine, use MVS problem determination methods to fix the error and then cause the SDUMP request to be reissued. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the SDUMPX return code X'nn'. and reason code X'mm'

STIMERM FAILED

Use MVS problem determination methods to fix the STIMERM failure and then cause the SDUMP request to be reissued.

NOT AUTHORIZED IN CICS

This reason is unlikely to occur because SDUMPX is unconditionally authorized during CICS initialization, and should be authorized throughout the CICS run. If you do get this reason, the CICS AFCB (authorized function control block) has probably been accidentally overwritten.

INSUFFICIENT STORAGE

Ensure sufficient storage is available to MVS for subpool 253 requests.

DFHDUSVC FESTAE FAILED

Use MVS problem determination methods to fix the FESTAE failure and then cause the SDUMP request to be reissued. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the FESTAE macro.

IWMWQWRK RETURN CODE X'xx' REASON X'yy'.

CICS issued an MVS IWMWQWRK request during the processing of the SDUMPX request. The IWMWQWRK request has been rejected by MVS return code X'xx' and reason X'yy'. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the return and reason codes.

DFHDUSVC INVALID PROBDESC

The SDUMPX PROBDESC parameters, created by DFHDUSVC during the processing of the SDUMPX request, are invalid. The PROBDESC parameters have probably been accidentally overwritten.

Module:
DFHDUDU

Destination

Console

DFHDU0211	*applid* **THE XDUREQ USER EXIT IS NOT CALLED FOR DUMPCODE** *dumpcode*.

Explanation

Because of a severe system error, the XDUREQ user exit (which allows you to suppress system dumps) has not been called for system dump *dumpcode*.

System action

The XDUREQ user exit is not called.

DFHDU0211 is followed either by message DFHDU0201, indicating that dump *dumpcode* was taken, or by message DFHDU0205, indicating that dump *dumpcode* was suppressed. Message DFHDU0201 or DFHDU0205 is followed by message DFHDU0309 if CICS terminates.

The XDUREQ user exit is called for subsequent system dumps.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDUDU

Destination

Console

DFHDU0212	*applid* **Requested transaction dump code** *dumpcode* **is invalid.**

Explanation

A requested transaction dump code has unprintable characters, or has leading or imbedded blanks.

System action

A transaction dump is produced unless suppressed by the user exit XDUREQ. However, no dump statistics are committed. The transaction dump is complete when message DFHDU0203 is issued. The invalid dump code is shown in dump domain (DU) trace points X'0600' and X'0601'.

User response

Print off the transaction dump and determine how an abend or EXEC CICS request was issued with an invalid dump code.

Module:
DFHDUDU

XMEOUT parameters/Message inserts

1. *applid*
2. *dumpcode*

Destination

Console

DFHDU0213   **REMOTE SDUMPX REQUEST FAILED -** *reason*.

Explanation

A remote MVS SDUMPX request from CICS has failed to complete successfully. The possible reasons, (*reason*) for the failure are as follows:

DFHDUMPX AUTOMATIC STORAGE GETMAIN FAILED.

CICS issued an MVS GETMAIN for Subpool 253 storage during the processing of the SDUMPX request. The GETMAIN has been rejected by MVS.

DFHDUMPX NOT RUNNING IN THE MAIN ADDRESS SPACE.

DFHDUMPX must run in the MAIN address space. CICS stops processing the remote SDUMPX request if it detects that DFHDUMPX is running in another address space.

IWMWQWRK FOUND NO ADDRESS SPACES TO DUMP.

The MVS IWMWQWRK service found no CICS address spaces with work relating to the remote SDUMPX request.

IWMWQWRK FAILED WITH A WARNING.

CICS issued an MVS IWMWQWRK request from DFHDUMPX during the processing of the remote SDUMPX request. MVS has rejected the IWMWQWRK request with a warning return code.

IWMWQWRK FAILED WITH AN ERROR.

CICS issued an MVS IWMWQWRK request from DFHDUMPX during the processing of the remote SDUMPX request. MVS has rejected the IWMWQWRK request with an error return code.

DFHDUMPX OUTPUT WORKAREA GETMAIN FAILED

CICS issued an MVS GETMAIN for Subpool 253 storage during the processing of the SDUMPX request. The GETMAIN has been rejected by MVS.

DFHDUMPX RECOVERY ROUTINE ENTERED

An abnormal end (abend) or program check has occurred in DFHDUMPX. This implies that there is an error in CICS code.

Alternatively, unexpected data has been input, or storage has been overwritten.

CICS adds diagnostic data to the MVS SDWA and makes an entry in SYS1.LOGREC.

System action

CICS proceeds as if the dump had been successful.

User response

The user response depends on the reason, (*reason*), for the failure.

DFHDUMPX AUTOMATIC STORAGE GETMAIN FAILED.

Ensure sufficient storage is available to MVS for subpool 253 requests.

DFHDUMPX NOT RUNNING IN THE MAIN ADDRESS SPACE.

This reason is unlikely to occur because CICS requests that the MVS CSVDYNEX service adds DFHDUMPX as an IEASDUMP.QUERY exit in the MAIN address space.

If you do get this reason, there was probably an error during CICS initialization.

Notify the system programmer.

You will need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

IWMWQWRK FOUND NO ADDRESS SPACES TO DUMP.

This is unlikely to be an error. DFHDUMPX is invoked on all the MVS images in a SYSPLEX for a remote SDUMPX request. Some of the images may not have any CICS address spaces with work relating to the CICS system which originated the remote SDUMPX request.

IWMWQWRK FAILED WITH A WARNING.

The IWMWQWRK return code and reason are included in a CICS trace entry which is written to the GTF data set. The trace entry is not written to the CICS internal trace or in the CICS auxiliary trace data set because DFHDUMPX does not execute under a CICS TCB.

See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the IWMWQWRK return code and reason.

IWMWQWRK FAILED WITH AN ERROR.

The IWMWQWRK return code and reason are included in a CICS trace entry which is written to the GTF data set. The trace entry is not written to the CICS internal trace or in the CICS auxiliary trace data set because DFHDUMPX does not execute under a CICS TCB.

See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the IWMWQWRK return code and reason.

DFHDUMPX OUTPUT WORKAREA GETMAIN FAILED

Ensure sufficient storage is available to MVS for subpool 253 requests.

DFHDUMPX RECOVERY ROUTINE ENTERED

Notify the system programmer.

To resolve the problem, collect any data from SYS1.LOGREC, any dumps and any relevant messages. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDUMPX

Destination

Console

DFHDU0214   DFHDUMPX IS ABOUT TO REQUEST A REMOTE SDUMP.

Explanation

DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message immediately before returning to MVS if the following conditions are satisfied:

- a dump has been requested for a CICS dump code, whose dump table entry specified that related dumps are required, and DFHDUMPX has found related CICS work on this MVS image or

- the operator requested remote dumps from the console, including the CICS DFHJOBN keyword in the MVS PROBDESC parameters, and DFHDUMPX has found CICS jobs on this MVS image which match the DFHJOBN data.

System action

Processing continues.

User response

None.

Module:
DFHDUMPX

Destination

Console

DFHDU0215   DFHDUMPX IS ABOUT TO SUPPRESS A REMOTE SDUMPX.

Explanation

DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message immediately before returning to MVS if it has found that a remote dump should be suppressed.

The remote dump is suppressed under the following conditions :

- A dump has been requested for a CICS dump code, whose dump table entry specified that related dumps are required, and DFHDUMPX has found no related CICS work on this MVS image or

- The operator requested remote dumps from the console, including the CICS DFHJOBN keyword in the MVS PROBDESC parameters, and DFHDUMPX has found no CICS jobs on this MVS image which match the DFHJOBN data.

The remote dump is also suppressed if an error occurred during the DFHDUMPX processing. Look for a previous DFHDU0213 message to find the reason for the error.

System action

Processing continues.

User response

To determine whether action is necessary refer to any DFHDU0213 message preceding this one.

Module:
DFHDUMPX

Destination

Console

| DFHDU0216 | PROBDESC DOES NOT CONTAIN CICS DATA. |

Explanation

DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message if it has found that the SDUMPX PROBDESC parameters do not contain CICS data. It is probable that this is not an error and that the remote dump was requested by a product other than CICS. However, if you were expecting a CICS remote dump it could be that the PROBDESC parameters were accidentally overwritten.

System action

DFHDUMPX will request that MVS suppresses the remote dump and then processing continues.

User response

You need to take the action only if you were expecting a remote CICS dump.

Notify the system programmer.

To resolve the problem, collect any data from GTF trace, any dumps and any relevant messages. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDUMPX

Destination

Console

| DFHDU0217 | *applid* SDUMPX request completed with a return code of X'04'. A complete or partial dump has been taken. |

Explanation

An MVS SDUMPX request from CICS signalled by message DFHDU0201 may have resulted in a complete or partial SVC dump. Even though the request completed with an SDUMPX return code x'04', it is possible that sufficient information has been dumped to enable successful diagnosis of the problem that caused the dump to be taken. The accompanying message(s) IEA611E/IEA911E should be used to determine the suitability of the dump for successful diagnosis.

System action

CICS proceeds as if the dump had been successful.

User response

See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the SDUMPX return code X'04'.

Module:
DFHDUDU

Destination

Console

| DFHDU0218 | NO PROBDESC PARAMETERS SUPPLIED TO DFHDUMPX. |

Explanation

A remote MVS SDUMPX request has failed to complete successfully because there were no SDUMPX PROBDESC parameters supplied.

MVS invokes DFHDUMPX under the IEASDUMP.QUERY exit and without the SDUMPX PROBDESC parameters DFHDUMPX cannot determine whether to take or suppress a remote dump.

This is only an error if the remote SDUMPX request was made by CICS for a system dump code that included the RELATED option, or if the operator entered a remote SDUMPX request that included PROBDESC parameters. This is not an error if another non-CICS component intentionally calls DFHDUMPX without PROBDESC.

System action

CICS proceeds as if the dump had been successful.

User response

If you believe this is an error you will need further assistance from IBM to resolve this problem. Collect any data from GTF trace, any dumps, and any relevant messages then see Part 4 of the "Troubleshooting and support" for guidance on how to proceed.

Module:
DFHDUMPX

Destination

Console

DFHDU0302I	*applid* **Transaction Dump Data set** *dataset* **to be closed due to** *text-descr*

Explanation

This message is output when attempting to write a record to the transaction dump data set. *text-descr* is one of the following:

- DCB ABEND
- TASK TIMEOUT
- TASK CANCEL

System action

None unless *text-descr* is DCB ABEND, in which case an exception entry is made in the trace table and a system dump is taken.

User response

Notify the system programmer.

In the case of DCB ABEND, there will normally be an accompanying MVS error message to help identify the problem with the data set.

If the problem is not due to a major corruption of CICS, successful switching of dump data sets will reinstate the transaction dump environment. Otherwise, the transaction dump environment will be available only if the XDUOUT user-exit is active.

The message can be suppressed with the system initialization parameter MSGLVL=0.

Module:
DFHDUIO

XMEOUT parameters/Message inserts

1. *applid*
2. *dataset*
3. *text-descr*

Destination

Console

DFHDU0303I	*applid* **Transaction Dump Data set** *dataset* **closed.**

Explanation

This message is issued in one of the following situations:

- A request to close the dump data set is issued by the operator.
- The CICS system is shut down.
- A request to switch between dump data sets is issued by the operator.
- A transaction dump data set becomes full.

The insert *dataset* indicates the name of the data set being closed.

System action

Processing continues.

If autoswitching of the transaction dump data set is not active, the transaction dump environment is available only if the XDUOUT user-exit is active.

If autoswitching is enabled, this message is followed by DFHDU0304 and DFHDU0305 to indicate that the data set switch is successful.

If the switch is unsuccessful, this message is followed by DFHDU0306.

The message can be suppressed with the system initialization parameter MSGLVL=0.

User response

None.

Module:
DFHDUSU

XMEOUT parameters/Message inserts

1. *applid*
2. *dataset*

Destination

Console

DFHDU0304I	*applid* **Transaction Dump Data set** *dataset* **opened.**

Explanation

This message is output when any of the following situations occur:

- A request to open the dump data set is issued by the operator.
- The CICS system is brought up.
- A request to switch between dump data sets is issued by the operator.
- Automatic switching between dump data sets is being performed.

dataset in the message indicates the name of the data set being opened.

System action

Processing continues.

User response

None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Module:
DFHDUSU

XMEOUT parameters/Message inserts

1. *applid*
2. *dataset*

Destination

Console

DFHDU0305I	*applid* **Transaction Dump Data set switched to** *ddname*

Explanation

This message is issued when one of the following situations occurs:

- A command is issued by the operator to switch dump data sets.
- Automatic switching is being performed between dump data sets due to a dump data set being full.

This message is always preceded by message DFHDU0304 and also, if the old dump data set was open, by message DFHDU0303.

ddname in the message indicates the ddname of the active transaction dump data set (either DFHDMPA or DFHDMPB).

System action

Processing continues.

User response

Print or copy the completed dump data set, and if required, reissue the command CEMT SET DUMP AUTO.

The message can be suppressed with the system initialization parameter MSGLVL=0.

Module:
DFHDUSU

XMEOUT parameters/Message inserts

1. *applid*
2. *ddname*

Destination

Console

DFHDU0306	*applid* **Unable to open Transaction Dump Data set** *dataset* **-** *text-descr*

Explanation

This message occurs when attempting to open a transaction dump data set.

text-descr is one of:

OPEN ERROR

　An attempt was made to open the dump data set, and an abend exit was invoked. This condition is usually accompanied by MVS system messages.

INSUFFICIENT STORAGE

　An MVS GETMAIN was issued to obtain storage below the 16MB line. This request was unsuccessful.

System action

An exception entry is made in the trace table.

In both cases, the transaction dump data set is not open, and unless the XDUOUT exit is active, the transaction dump is inoperative.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

See any associated MVS messages for further guidance.

Module:
DFHDUIO

XMEOUT parameters/Message inserts

1. *applid*
2. *dataset*
3. *text-descr*

Destination

Console

DFHDU0307   *applid* **Module DFHDUIO is unavailable. Transaction dump is inoperative.**

Explanation

This message is issued either when an attempt is made to open or close a dump data set, or when switching between dump data sets, to remind the user that CICS could not locate module DFHDUIO during initialization. CICS will have issued message DFHDU0102 during initialization to warn the user of this condition.

System action

CICS continues with the transaction dump facility inoperative.

User response

If necessary, refer to the user response for message DFHDU0102.

Module:
DFHDUSU

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDU0308I   *applid* **CICS will terminate because the Dump Table entry for the transaction dump code: *dumpcode* specifies shutdown.**

Explanation

This message is issued when a transaction dump has been requested for the transaction dump code *dumpcode* and the associated dump table entry specifies that CICS should be terminated.

This message records that it was a transaction dump table entry which requested the termination of CICS.

System action

CICS is terminated.

User response

Process any transaction dump in the normal way.

On a warm or emergency start, explicitly defined dump table entries are restored from the catalog. If the dump table entry for *dumpcode* was explicitly defined, it can be modified to prevent CICS from terminating, if desired, using CEMT or EXEC API commands.

Implicitly defined dump table entries are not recorded on the catalog and are therefore not restored. On a cold or initial start, CICS does not restore the dump table from the catalog.

The message can be suppressed with the system initialization parameter MSGLVL=0.

Module:
DFHDUDU

XMEOUT parameters/Message inserts

1. *applid*
2. *dumpcode*

Destination

Console

DFHDU0309I   *applid* **CICS will terminate because the Dump Table entry for the system dump code: *dumpcode* specifies shutdown.**

Explanation

This message is issued when a system dump has been requested for the system dump code *dumpcode* and the associated dump table entry specifies that CICS should be terminated.

This message records that it was a system dump table entry which requested the termination of CICS.

System action

CICS is terminated.

User response

Print off any system dump if required.

On a warm or emergency start, explicitly defined dump table entries are restored from the catalog. If the dump table entry for *dumpcode* was explicitly defined, it can be modified to prevent CICS from terminating using CEMT or EXEC API commands.

Implicitly defined dump table entries are not recorded on the catalog and are therefore not restored. On a cold or initial start, CICS does not restore the dump table from the catalog.

Module:
DFHDUDU

Destination

Console

DFHDU0310	*applid* XDUCLSE auto-switch request overridden. Transaction dump data sets are too small.

Explanation

This message is issued when

- the transaction dump is too large to fit in the current dump data set.
- a request to auto-switch between transaction dump data sets is issued by the XDUCLSE user-exit.
- the transaction dump is too large to fit in the newly opened dump data set.
- a second request to auto-switch between transaction dump data sets is issued by XDUCLSE.

System action

CICS can not write the transaction dump to a transaction dump data set because the data sets are too small. CICS closes the data sets and processing continues.

User response

Inform the system programmer.

You need to bring CICS down and increase the space allocation for the transaction dump data sets to resolve this problem.

You may decide to delay terminating CICS until a convenient time. You can issue the command CEMT SET DUMP OPEN to reinstate the transaction dump environment but you will continue to lose any dumps that are too large to be written to the data sets.

Module:
DFHDUSU

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDU1601	DATA SET READ ERROR.

Explanation

The access method has indicated a read error. The dump data set may not have been opened during the most recent CICS execution.

System action

The record is skipped.

User response

Either ensure that the JCL is correct, or determine the reason for the read errors.

Module:
DFHDU720

Destination

Console

DFHDU1602	36 CONSECUTIVE UNIDENTIFIABLE RECORDS, DUMP UTILITY TERMINATED.

Explanation

An identification record has an incorrect code or format. The most common reasons for this error include the following.

- The wrong data set is being processed.
- The dump data set that the utility is trying to process has not been used in the current CICS execution.

In the latter case, the error would arise because no dumps were produced in the current execution or because the data sets had been switched.

System action

Records are skipped and execution is terminated with a return code of 8.

User response

Ensure that the correct data set is being processed. Alternatively, check for a possible error in the dump control program, DFHDCP.

If two dump data sets are being used, check that the data set being processed has been used before in the current CICS execution.

Module:
DFHDU720

Destination

Console

DFHDU1603 **NO *{DUMP | PRINT}* DATA SET DD CARD *{DFHDMPDS | DFHPRINT}*, DUMP UTILITY TERMINATED.**

Explanation

A dump or a print data set was not successfully opened.

System action

If it was a dump data set that failed to open successfully, the system prints the message on the print data set and terminates execution with a return code of 12.

If it was the print data set that failed to open successfully, the system terminates execution with a return code of 16.

User response

If the JCL is correct with the stated ddnames as in the message, determine why the data set cannot be opened. The return codes are issued by DFHDU720. They only identify whether a dump or print data set failed.

Module:
DFHDU720

Destination

Console

DFHDU1604 **END OF FILE ENCOUNTERED, LAST DUMP MAY BE INCOMPLETE.**

Explanation

The dump data set has been filled.

System action

The dump utility program DFHDU720 terminates.

User response

Check that the dump is complete and that no incomplete message is at the end of it. If there is an incomplete message at the end of the dump, the last dump in the data set may not contain all the information required. You should recreate the problem to try and get a complete dump. If dump data set auto-switching was active at the time the dump was taken, a complete version of the dump is present on the alternate dump data set.

Module:
DFHDU720

Destination

SYSPRINT

DFHDU1609 **36 READ ERRORS ENCOUNTERED. DUMP UTILITY TERMINATED.**

Explanation

The access method has indicated 36 invalid records in the dump data set. The most probable cause of this problem is an invalid end-of-file marker which caused the access method to attempt to read beyond the last record in the data set. This problem may also have been caused if:

- DFHDU720 has been run with a data set that has never been accessed by CICS before. The data set may contain an invalid type of record format.
- DFHDU720 has been run with a data set that has been copied with the wrong block size and record format.

System action

The dump utility execution is terminated with a return code of 8 from DFHDU720.

User response

Determine and correct the reason for the access failure. Recreate the dump if necessary.

Module:
DFHDU720

Destination

Console

DFHDU1610 **DUMP FORMATTING HAS ENCOUNTERED AN INVALID TRACE BLOCK. TRACE ENTRIES MAY BE LOST.**

Explanation

The dump utility program, DFHDU410, has detected an error while copying trace records from the trace data set. Trace records may be omitted from the formatted output.

System action

DFHDU410 attempts to read the next trace block and continues formatting trace records.

User response

To resolve the problem, keep the dump and contact your IBM Support Center. Further guidance on how to prepare information for IBM support is given in the Troubleshooting and support. If you are not familiar with this process, refer to the guide before contacting IBM.

Module:
DFHDU720

Destination

Console

DFHDU1611	FILE ERROR, FULL TRACE FAILED. DUMP FORMATTING WILL CONTINUE WITH ABBREVIATED TRACE.

DFHDXnnnn messages

DFHDX8300I	*applid* GETMAIN REQUEST FAILED. NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.

Explanation

The CICS system, with specific applid given, was unable to obtain working storage to control the sequencing of DBCTL connection attempts defined in the RST. (Recovery Service Table).

System action

CICS attempts to connect only to the DBCTL subsystem defined in the DBCTL start-up table.

User response

The working storage can be above the 16MB line so the GETMAIN request is unlikely to fail for genuine lack of space. If the error is persistent it may be necessary to cancel CICS with a dump to resolve the problem.

Module:

Explanation

Due to an error in the MVS NOTE macro, the dump utility program, DFHDU720 was unable to note the position on the data set at which the trace data started. It is therefore not possible to return to the start of the trace data after the abbreviated trace has been formatted in order to print the trace with format FULL.

System action

Transaction dump formatting continues with only abbreviated trace for this dump.

User response

If only the full trace is required, rerun the DFHDU410 job with the NOABBREV parameter. Otherwise attempt to recreate the dump. If the problems recurs, keep the dump and contact your IBM Support Center. Further guidance on how to prepare information for IBM support is given in the Troubleshooting and support. If you are not familiar with this process, refer to the guide before contacting IBM.

Module:

DFHDX8301I	*applid* LOAD REQUEST FAILED FOR *rstname*. NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.

Explanation

The CICS system, with the specific applid given, was unable to load the RST *rstname* while looking for the names of alternative DBCTL subsystems to which to connect.

System action

CICS will attempt to connect only to the DBCTL subsystem defined in the DBCTL start-up table.

User response

Check that the RST suffix in the SIT is correct and that the RST is actually present in the authorized library.

Module:
DFHDXAX

Destination

Console

DFHDX8302I   *applid* **VALIDATION FAILED FOR *rstname*. NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.**

Explanation

The CICS system, with the specific applid given, found that the RST *rstname* was invalid.

It is unable to use it to look for the names of alternative DBCTL subsystems to which to connect.

System action

CICS will attempt to connect only to the DBCTL subsystem defined in the DBCTL start-up table.

User response

Check that the RST suffix in the SIT is correct and that the RST has been correctly prepared using the DFHRST macro that is supplied as part of the CICS product.

Module:
DFHDXAX

Destination

Console

DFHDX8303   *applid* **DELETE REQUEST FAILED FOR *rstname*.**

Explanation

The CICS system, with the specific applid given, was unable to delete the RST *rstname* after completing an attempt to connect to a DBCTL subsystem.

System action

CICS continues normally.

User response

If the error is persistent it may be necessary to cancel CICS with a dump to resolve the problem.

Module:
DFHDXAX

Destination

Console

DFHDX8304   *applid* **CICS/DBCTL RECONNECTION IN PROGRESS.**

Explanation

This message occurs in an XRF environment only. It occurs when CICS attempts to connect to DBCTL but believes that DBCTL is restarting.

The message is displayed two minutes after the attempted connection, and then after each subsequent minute.

System action

CICS continues to attempt to reconnect.

User response

Check why DBCTL is not restarting. You can cancel the connection using the CDBC transaction.

Module:
DFHDXAX

Destination

Console

DFHDX8309   *applid* **Unable to detach subtask during CICS termination.**

Explanation

CICS has detected that a subtask, attached during CICS XRF support of DBCTL, cannot be detached during CICS termination.

System action

CICS abends with code A03.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

None. This abend occurs as a result of a previous error. Check for earlier DFHDX832*x*, DFHDX833*x*, or DFHDX834*x* error messages for further information and guidance.

Module:
DFHAPDM

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDX8310I *applid* **Initiating catch-up tasks.**

Explanation

The catch-up transaction, CXCU, has received control.

System action

The catch-up transaction is about to initiate the catch-up tasks for specific functional areas.

User response

None. This is simply a "work is in progress" message. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHCXCU

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDX8311I *applid* **System initialized with XRF=NO. Catch-up transaction CXCU took no action.**

Explanation

The catch-up transaction, CXCU, was invoked but the CICS system specified XRF=NO. Catchup functions are not relevant.

System action

The catch-up transaction terminates normally without taking any action.

User response

None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Module:
DFHCXCU

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDX8312I *applid* **Catch-up transaction failed to run program *progname*. Catch-up is incomplete.**

Explanation

The catch-up transaction, CXCU, running on the CICS system with specific applid given, was unable to call the specific catch-up service routine *progname*. This may be either DFHDXCU (DBCTL catch-up) or DFHZXCU (terminal catch-up).

System action

The catch-up associated with routine *progname* is not performed.

The active and alternate CICS systems continue, but the alternate will be less effective in the event of a takeover.

User response

Retry by entering 'CXCU' from a terminal. If the error persists check that the routine *progname* is present in the load library.

The message can be suppressed with the system initialization parameter MSGLVL=0.

Module:
DFHCXCU

XMEOUT parameters/Message inserts

1. *applid*
2. *progname*

Destination

Console

DFHDX8313I *applid* **Catch-up transaction failed.**

Explanation

The catch-up transaction, CXCU, running on the CICS system with specific applid given, has failed. CXCU runs either in response to a transaction request from an end-user, or automatically by an active CICS system in response to the appearance of an alternate CICS system. Its purpose is to inform the alternate

of the active's state regarding terminals and DBCTL connection.

System action

The CXCU transaction abends with a dump and transaction abend code ACXA.

Both active and alternate CICS systems continue, but the alternate will be less effective in the event of a takeover. For example, terminal backup sessions may not be established.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Retry by entering 'CXCU' from a terminal. If the error persists diagnose problem from the dump.

Module:

Destination

Console

DFHDX8315I　　*applid* **XRF DBCTL state catch-up starting.**

Explanation

The catch-up transaction to transmit the active's DBCTL state to the alternate has been started on the CICS system with specific applid named.

System action

None.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHDXCU

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDX8316I　　*applid* **XRF DBCTL state catch-up ending.**

Explanation

The catch-up transaction to transmit the active's DBCTL state to the alternate has been completed on the CICS system with specific applid given.

System action

None.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHDXCU

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDX8317I　　*applid* **XRF DBCTL state catch-up ignored for reason .**

Explanation

The XRF DBCTL catch-up transaction has been invoked on the CICS system with the given specific applid.

Although this system has DL/I installed, and an RST has been specified in the SIT, catch-up for DBCTL has proved unnecessary for reason *nn*, where *nn* may be one of the following.

Reason
　Meaning

01

DBCTL has not been used yet.

02

XRF DBCTL has not been used yet.

03

There is no connection state information to send.

04

The system is running with XRF=NO.

05

There is no alternate CICS to which to send state data.

System action

None. No catch-up is needed.

User response

None. You can suppress this message with the system initialization parameter, MSGLVL=0.

Module:
DFHDXCU

XMEOUT parameters/Message inserts

1. *applid*
2.

Destination

Console

DFHDX8318I	*applid* **XRF DBCTL state catch-up failed for reason .**

Explanation

The XRF DBCTL catch-up transaction has been invoked on the CICS system with the given specific applid.

The transaction has failed for reason *nn*, where *nn* may be one of the following.

Reason
  Meaning

01

  The CAVM message service returned an unidentifiable return code.

02

  The CAVM message service returned an unexpected exception return code.

03

  The CAVM message service returned an unexpected failure reason code.

System action

The DBCTL catch-up transaction is terminated with a dump. The transaction abend code is ADXB.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Check for any other messages relating to CAVM data set problems for further information and guidance.

Module:

DFHDXCU

XMEOUT parameters/Message inserts

1. *applid*
2.

Destination

Console

DFHDX8319I	*applid* **XRF DBCTL state catch-up failed.**

Explanation

The XRF DBCTL catch-up transaction has been invoked on the CICS system with the given specific applid.

The transaction has failed.

System action

The DBCTL catch-up transaction is terminated with a dump. The transaction abend code is ADXA.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Diagnose the error from the dump.

Module:
DFHDXCU

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDX8320I	*applid* **DBCTL Restart processing completed after DBCTL failure.**

Explanation

The user exit XXDFA requested a restart of DBCTL. The restart was initiated successfully.

System action

The active CICS continues normally and will attempt to reconnect to DBCTL.

User response

None. You can suppress this message with the SIT parameter, MSGLVL=0.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDX8321   *applid* **Unable to determine JES affiliation of DBCTL subsystem for reason *X'nn'*.**

Explanation

CICS can offer full XRF support only if the DBCTL to which it is connected is running under the same JES as CICS itself.

nn may be one of the following.

nn
    Meaning
X'09'

    MVS GETMAIN failure.

X'10'

    MVS ATTACH failure.

System action

The active CICS continues, but, in the event of failure, CICS will not attempt to restart DBCTL automatically.

User response

None.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. *applid*
2. *X'nn'*

Destination

Console

DFHDX8322   *applid* **LOAD request failed for . DBCTL/XRF support will not be provided for this connection.**

Explanation

CICS has been notified of a DBCTL failure, but has been unable to load the specified Recovery Service Table (RST) to determine if XRF support is required.

System action

CICS continues as if no XRF support had been requested for the failing DBCTL subsystem.

User response

Re-link-edit a valid RST into STEPLIB. DBCTL may have to be restarted manually.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. *applid*
2.

Destination

Console

DFHDX8323   *applid* **Unable to complete search for DBCTL alternate.**

Explanation

CICS has been notified of a DBCTL failure, but has been unable to complete the search for a DBCTL alternate, possibly due to an unexpected return code from an IEFSSREQ request.

System action

CICS continues as if no DBCTL alternate had been found. An ADDI transaction dump will be produced. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:

It may be necessary to restart DBCTL manually.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDX8324 *applid* **Unable to restart DBCTL for reason *X'nn'.***

Explanation

CICS was unable to restart DBCTL owing to an internal failure indicated by the value of *n*. *n* may be one of the following.

n
>   **Meaning**

X'08'
>   An MVS GETMAIN failed.

X'09'
>   An MVS ATTACH failed.

System action

The active CICS continues but was not able to restart DBCTL automatically. However, it will attempt to reconnect to DBCTL in the normal way.

User response

It may be necessary to restart DBCTL manually.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. *applid*
2.
3. *X'nn'*

Destination

Console

DFHDX8325 *applid* **Restart command issued unsuccessfully to *subsysid* for reason *X'xx' X'yy'.***

Explanation

The user exit XXDFA requested a restart of DBCTL. The restart request was issued to *subsysid* but was rejected with hexadecimal reason codes X'*xx*' and X'*yy*'.

System action

The active CICS continues normally and will attempt to reconnect to DBCTL.

User response

It may be necessary to restart DBCTL manually.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. *applid*
2. *subsysid*
3. *X'xx'*
4. *X'yy'*

Destination

Console

DFHDX8326 *applid* **DBCTL state message lost owing to message services error.**

Explanation

The active CICS system was unable to report a change of DBCTL connection status to the alternate.

System action

The active system writes an error entry in its CAVM status record, but otherwise continues normally.

User response

Check for any other messages relating to CAVM data set problems.

Were the CICS alternate to take over now it might try to restart the wrong DBCTL. There would be no database integrity exposure but there might some loss of availability as well as operational inconvenience. It may be preferable to cancel the alternate and restart it, either manually or via an overseer.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDX8327 *applid* **DBCTL state message lost owing to CAVM services failure.**

Explanation

The active CICS system was unable to report a change of DBCTL connection status to the overseer.

System action

Processing continues.

User response

Check for any other CICS messages relating to CAVM data set problems (DFH66*xx*).

Were the overseer to oversee a takeover now it might try to restart the wrong DBCTL. There would be no database integrity exposure but there might some loss of availability as well as operational inconvenience.

If the overseer is being used to control XRF takeovers then disconnecting and reconnecting to the DBCTL will cause a re-write of the status record.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHDX8328 *applid* **Unable to determine Jes affiliation of (*jobname*, *jobid*).**

Explanation

CICS can offer full XRF support only if the DBCTL to which it is connected is running under the same JES as CICS itself.

System action

The active CICS continues, but, in the event of failure, CICS will not attempt to restart DBCTL automatically.

User response

It is recommended that DBCTL should be run under the same JES as the active CICS system.

The message indicates that either a system or set-up problem has occurred. If there is a system problem then message DFHDX8321 will also be displayed.

Module:

DFHDBCT

XMEOUT parameters/Message inserts

 1. *applid*
 2. *jobname*
 3. *jobid*

Destination

Console

DFHDX8329 *applid* **Restart request after DBCTL failure ignored for reason *X'nn'*.**

Explanation

The user exit XXDFA requested a restart of DBCTL. This request has been ignored for the reason indicated by *nn*.

The reason code *nn* should be one of the following.

nn

   Meaning

X'09'

   There is no alternate DBCTL to be restarted.

X'10'

   Possibly, the DBCTL subsystem is under a different JES from the active CICS system.

X'11'

   The DBCTL subsystem was an IMS DB/DC system.

System action

The active CICS continues as if the user exit had indicated 'no action'.

User response

Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

 1. *applid*
 2. *X'nn'*

Destination

Console

DFHDX8330   *applid* **IMS DB/DC region has requested XRF support.**

Explanation

This message is produced when CICS connects to an IMS system for which the user has requested XRF support (via the RST), but which is unable to participate in XRF. For example, in an IMS/DC system without the XRF option.

System action

The system continues to run without XRF.

User response

Either enable IMS/DC for XRF, or remove SSID from RST.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDX8331   *applid* **CAVM message input service error , *X'nn'*, .**

Explanation

The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has received an error response from the CAVM message input service.

System action

The tracking transaction terminates. No further action will be taken in response to DBCTL status changes. The global exits XXDFB and XXDTO will never be invoked and no attempt at a DBCTL restart will be made in the event of a takeover. An ADMA transaction dump is produced.

User response

Check for any other messages relating to CAVM data set problems. In the event of a takeover it may be necessary to restart DBCTL manually.

Module:
DFHDBCR

XMEOUT parameters/Message inserts

1. *applid*
2.
3. *X'nn'*
4.

Destination

Console

DFHDX8332I   *applid* **Connection to notified after failure initiated takeover.**

Explanation

The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has received a message from the CAVM message input service, after a takeover decision from the global user exit XXDFB has been accepted.

This problem is usually caused by a setup or an operational error.

System action

The takeover continues. If the message is a notification of a successful connection, then the global user exit XXDTO may be driven.

User response

In order for the active CICS system to reconnect to an element of the RSE, a DBCTL must have been restarted in the active CEC. Consequently, the alternate CICS will not be able to restart an element of the RSE in the alternate CEC without terminating this new active DBCTL.

The global user exit XXDTO will be driven as part of CICS takeover processing. This exit could be used to request a takeover of the DBCTL that was restarted in the active CEC.

Locate and correct any setup or operational errors.

Module:
DFHDBCR

XMEOUT parameters/Message inserts

1. *applid*
2.
3.

Destination

Console

DFHDX8333   *applid* **Unrecognized message type received by DBCTL tracking task.**

Explanation

The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has received an unrecognized message from the CAVM message input service.

System action

The tracking transaction terminates. No further action will be taken in response to DBCTL status changes. The global exits XXDFB and XXDTO will never be invoked and no attempt at a DBCTL restart will be made in the event of a takeover. An ADMB transaction dump is produced. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

In the event of a takeover it may be necessary to restart DBCTL manually.

Module:
DFHDXCU

XMEOUT parameters/Message inserts

1. *applid*
2.

Destination

Console

DFHDX8334   *applid* **Error detected in for reason *nn*.**

Explanation

The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has detected an invalid recovery service table (RST) during processing of a CICS|DBCTL failure.

nn may be one of the following.

nn
    Meaning

01

The CICS SVC detected an error in the RST. Refer to the accompanying DFHXG64*xx* or DFHXA65*xx* message for the reason for the error.

02

The RST could not be loaded by the XRF/DBCTL tracking task, or the XRF/DBCT tracking task detected that the RST was invalid.

03

The CICS SVC detected an error in the RST during initialization. Refer to the accompanying DFHXG64*xx* or DFHXA65*xx* message for the reason for the error.

04

The CICS SVC detected an error in the RST during connect time. Refer to the accompanying DFHXG64*xx* or DFHXA65*xx* message for the reason for the error.

System action

The tracking transaction continues as if no XRF support had been requested via the RST for the connected DBCTL.

User response

In the event of a takeover it may be necessary to restart DBCTL manually. When the failure is detected during the initialization of the XRF/DBCTL tracking task the RST should be assembled and link-edited to resolve the problem.

Module:
DFHDBCR

XMEOUT parameters/Message inserts

1. *applid*
2.
3. *nn*

Destination

Console

DFHDX8335   *applid* **Unable to complete search for DBCTL alternate.**

Explanation

The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has been unable to complete its search for a DBCTL alternate, possibly due to an unexpected return code from an IEFSSREQ request.

System action

The tracking transaction continues as if no DBCTL alternate had been found. An ADMD transaction dump will be produced.

User response

In the event of a takeover it may be necessary to restart DBCTL manually.

Module:
DFHDBCR

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHDX8336	*applid* **Unable to provide DBCTL/XRF support for reason: *X'nn'*.**

Explanation

The user exit XXDFB or XXDTO requested a restart of DBCTL. This request has been ignored for the reason indicated by the value of *nn*.

n may be one of the following.

nn
    Meaning

X'46'

    No valid RST was found. Refer to DFHDX8334.

X'50'

    DBCTL subsystem is an IMS DB/DC system.

X'51'

    There is no alternate DBCTL to be restarted.

X'52'

    The DBCTL subsystem is, or may be, under a different JES from the active CICS system.

X'53'

    The active CICS system has already attempted a restart of DBCTL.

System action

The alternate CICS continues as if the user exit had indicated 'no action'.

User response

Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options.

Module:
DFHDBCR

XMEOUT parameters/Message inserts

1. *applid*
2. *X'nn'*

Destination

Console

DFHDX8337	*applid* **Takeover request rejected by CAVM, reason code *X'nn'*.**

Explanation

The user exit XXDFB requested a takeover as a result of a DBCTL failure, but the CAVM rejected the takeover request.

System action

The alternate CICS continues as if the user exit had indicated 'no action'.

User response

Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options. The message indicates that a CICS internal error has occurred, normally as a result of an earlier problem. It may be necessary to initiate a manual CICS takeover.

Module:
DFHDBCR

XMEOUT parameters/Message inserts

1. *applid*
2. *X'nn'*

Destination

Console

DFHDX8338	*applid* **Unable to issue *command* command to *subsysid* for reason *X'nn'*.**

Explanation

The user exit XXDFB/XXDTO issued a restart request to the DBCTL/XRF tracking task, the task was unable to process the request for the reason indicated in the message.

The issued command should either be a switch system backup command or an ERE command.

The reason code X'*nn*' should be one of the following.

nn

    Meaning

X'09'

    MVS GETMAIN failure

X'10'

    MVS ATTACH failure.

System action

The takeover continues.

User response

Restart the DBCTL subsystem manually.

Module:
DFHDBCR

XMEOUT parameters/Message inserts

1. *applid*
2. *command*
3. *subsysid*
4. *X'nn'*

Destination

Console

DFHDX8339	***applid command* command issued unsuccessfully to *subsysid* for reason *X'nn'.***

Explanation

The DBCTL/XRF tracking task issued a restart command (either switch or ERE) to an alternate DBCTL subsystem but the request was rejected for reason *nn*.

XXDFA or XXDTO requested CICS takeover with DBCTL. The error was detected when the request was made.

System action

The takeover continues.

User response

Restart the DBCTL subsystem manually.

Module:
DFHDBCR

XMEOUT parameters/Message inserts

1. *applid*
2. *command*
3. *subsysid*
4. *X'nn'*

Destination

Console

DFHDX8340	***applid* DBCTL tracking task started in an invalid environment reason *X'nn'.***

Explanation

The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has been started in an environment which does not support DBCTL/XRF.

Reason code X'*nn*' may be one of the following.

nn

    Meaning

X'65'

    XRF=NO specified in the SIT.

X'67'

    CICS system is running as active.

X'69'

    MVS GETMAIN failure.

System action

The tracking transaction terminates. No further action will be taken in response to DBCTL status changes. The global exits XXDFB and XXDTO will never be invoked and no attempt at a DBCTL restart will be made in the event of a takeover.

User response

The user response depends on the reason code issued.

For reasons X'65' and X'67', there is a possible error in CICS code. In this case you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

For reason X'69', specify a smaller overall size limit for the EDSAs.

Module:
DFHDBCR

XMEOUT parameters/Message inserts

1. *applid*

DFHECnnnn messages

DFHEC0001　　*applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to

Destination

Console

DFHDX8342I　　*applid* **Restart command issued successfully.**

Explanation

The DBCTL/XRF tracking task issued a restart command to an alternate DBCTL subsystem due to a request from user exit XXDFB/XXDTO. The request was issued successfully.

System action

Takeover continues.

User response

None. You can suppress this message with the system initialization parameter MSGLVL = 0.

Module:
DFHDBCR

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this component. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHECEB, DFHECEC, DFHECEI, DFHECIN1, DFHECIS, DFHECRL, DFHECSE

XMEOUT parameters/Message inserts

1. *applid*
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHEC0002	***applid* A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID that uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS might be terminated by the caller. A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This message indicates a possible error in CICS code. The severity of the impact depends on the importance of the function being performed at the time of the error.

CICS might not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring down CICS at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring down CICS in a controlled manner.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHECDF, DFHECEB, DFHECEC, DFHECEI, DFHECIN1, DFHECIS, DFHECRL, DFHECRP, DFHECSE, DFHECSC

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHEC0004	***applid* A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

If this message is issued from DFHAPEX or DFHSUEX, and the exit point is XDUREQ, then a system dump is not taken in order to prevent recursive dumping.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module *modname* will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

EVENTBINDING is a duplicate in the BUNDLE.}

Explanation

An error has occurred creating EVENTBINDING *evbname* in BUNDLE *bundle*. Possible reasons include:

The event binding name is invalid

The acceptable 1-32 characters of an event binding name are A-Z a-z 0-9 and _. Leading and embedded blank characters are not permitted. The name must not begin with 0-9, _ or the characters xml (in any case).

XML data in the event binding could not be parsed

The preceding DFHPInnnn message gives further information about the cause of the problem.

The eventDispatcher is missing or invalid

The eventDispatcher section of the event binding cannot be located by the XML parser.

The EPADAPTER create failed

An unexpected exception was received from the CREATE_EPADAPTER function for the embedded EP adapter specification.

The eventBinding is invalid

The eventBinding section of the event binding XML contains invalid data.

There are no capture specifications

The event binding must include at least one capture specification.

The EVENTBINDING is a duplicate in the BUNDLE

An EVENTBINDING of the same name has already been installed from this BUNDLE.

System action

An exception entry is made in the trace table.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This is probably caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor, this might indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages. Validate the event binding against the event processing schema for the CICS system into which the

bundle is being installed. Correct the event binding, discard the bundle, and reinstall it.

CECO

DFHEC1009 *date time applid* **The CICS event capture component found an inconsistency in one or more values during install of EVENTBINDING** *evbname* **in BUNDLE** *bundle* **because the capture specification** *capspec { has an overlength formatPrecision in data item: | has an invalid formatlength in data item: } dataItem***.**

Explanation

A potentially incompatible value was found during install of event binding *evbname* in bundle *bundle*. One or more attributes may be specified incorrectly in data item *dataItem* in capture specification *capspec*. Possible reasons include:

Overlength formatPrecision

The formatPrecision value of a capture data item is too big for the formatlength and/or formatType of the item. For example, it may be too big for:

the formatlength of a numeric item when sign, decimal point and leading digit are taken into account.

the formatlength of a scientific item when signs for both mantissa and exponent are taken into account.

the maximum precision of a scientific item. Hexadecimal floating point has a maximum precision of 6 for short (fullword) and 15 for long (doubleword) floating point.

Invalid formatlength

The formatlength of a capture data item is invalid for the capture data type. This message is issued when:

the format length of HEX data doesn't allow space for a leading 0x

the format length of HEX data isn't a multiple of 2.

the format length of numeric data doesn't allow space for a sign.

Note: When formatted by the IBM supplied EP adapters, negative data is prefixed with a minus sign. When formatted into one of the XML formats by the IBM supplied EP adapters, positive data is not prefixed with a plus sign but positive data in the CFE or CCE formats is prefixed with a plus sign.

System action

An exception entry is made in the trace table.

The event binding is installed. The IBM supplied EP adapters may be unable to format the item and might replace it with asterisks.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inconsistencies in the format definition of the event specification are tolerated to allow flexibility for custom EP adapters. If IBM supplied adapters are in use, format definition problems should be corrected before using the EVENTBINDING to capture events. Other problems may be caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor this may indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages. Correct the event binding, discard the bundle and reinstall it.

Explanation

An error has occurred creating event binding *evbname* in bundle *bundle* due to a problem with capture specification *capspec*. Possible reasons include:

Filter predicate could not be built

    An unexpected exception was received from the BUILD_PREDICATE_LIST function.

Capture specification name is invalid

    The acceptable 1-32 characters of a capture spec name are A-Z a-z 0-9 and _. Leading and embedded blank characters are not permitted. The name may not begin with 0-9, _ or the characters xml (in any case).

Capture specification is a duplicate

    The event binding has another capture spec of the same name.

System action

An exception entry is made in the trace table.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This is probably caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor, this may indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages.     1= filter predicate could not be built.,

    2= has an invalid name.,

    3= is a duplicate.

Destination

CECO

DFHEC1012   *date time applid* **The CICS event capture component failed to create the EVENTBINDING resource** *evbname* **in BUNDLE** *bundle* **because the capture specification** *capspec { has an invalid event name | exceeds the maximum number of data items | contains invalid capture data type, item number | has an invalid business information name | has an overlength formatPrecision in data item | has an invalid captureDataPrecision in data item | has an invalid captureLength in data item | has an invalid formatdataType in data item | has an invalid formatLength in data item | has an invalid captureDataType in data item | has a filter with an invalid filterOperator | has a filter with an invalid keyword | has a filter with an invalid filterValue | has an invalid context capture item | has an invalid capturePoint}:* *error_data*.

Explanation

An error has occurred creating event binding *evbname* in bundle *bundle* due to a problem with capture specification *capspec*. Possible reasons include:

Event name is invalid

    The acceptable 1-32 characters of an event name are A-Z a-z 0-9 and _. Leading and embedded

blank characters are not permitted. The name may not begin with 0-9, _ or the characters xml (in any case).

Exceeds the maximum number of data items

The number of capture data items is bounded by the maximum size of the EPDE descriptor which must fit into a global catalog record.

Invalid capture data type

Capture data item number *error_data* is of an unknown or unsupported type.

Business information name is invalid

The acceptable 1-32 characters of a business information name are A-Z a-z 0-9 and _. Leading and embedded blank characters are not permitted. The name may not begin with 0-9, _ or the characters xml (in any case).

Invalid formatPrecision

The formatPrecision value of a capture data item is too large for the formatlength of the item when decimal point and leading digit are taken into account.

Invalid captureDataPrecision

The capture data precision exceeds the total number of digits captured.

Invalid captureLength

The capture data length is invalid for the capture data type. Numeric capture data types have the following restrictions:

- PACKED must be between 1-16 bytes
- ZONED must be between 1-32 bytes
- UHWORD must be 2 bytes
- UFWORD must be 4 bytes
- SHWORD must be 2 bytes
- SFWORD must be 4 bytes
- HEXFLOAT must be 4 or 8 bytes
- BINFLOAT must be 4 or 8 bytes
- DECFLOAT must be 4 or 8 bytes

Invalid formatdataType

The format data type is unsupported or invalid for the capture data type. For example, a format data type of scientific is only valid for one of the xxxFLOAT capture data types.

Invalid formatLength

The formatted data length is invalid for the format type. For example, a format type of scientific requires space for the mantissa, 'E' and the exponent: a minimum of 3 bytes. A format length must be specified for floating point capture data unless it has a format type of scientific.

Invalid captureDataType

The capture data type is unsupported.

Invalid filterOperator

The filter operator is invalid or unsupported for the filter keyword.

Invalid keyword

The filter keyword is invalid or unsupported for the capture point.

Invalid filterValue

The filter value is invalid for the filter keyword. For example this situation can occur when the filter keyword is a status field and the filter value given is not a valid status.

Invalid context capture item

The context capture item is invalid or unsupported for the capture point.

Invalid capture point

The capture point name is invalid or is not a supported system capture point.

System action

An exception entry is made in the trace table.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This is probably caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor, this message might indicate an error in CICS code. CECO

DFHEC1013	*date time applid* **The CICS event capture component failed to create the EVENTBINDING resource** *evbname* **in BUNDLE** *bundle* **because** *{the LOCALCCSID SIT parameter is not supported | the event binding schema level is not supported | the event binding USERTAG is invalid | the EP adapter name is invalid | of an invalid numeric filter value | the EP adapterset name is invalid | CICSEPSchemaVersion is invalid | CICSEPSchemaRelease is invalid}*: *error_data*.

Explanation

An error has occurred creating event binding *evbname* in bundle *bundle*. Possible reasons include:

LOCALCCSID SIT parameter is not supported

Event processing uses the LOCALCCSID system initialization parameter as the default CCSID for code page conversion of character data. It must be a CICS supported single or multibyte EBCDIC CCSID.

Schema level is not supported

The CICSEPSchemaVersion and CICSEPSchemaRelease of the event binding *error_data* must not be higher than the schema level supported by this release of CICS. The schema level can be found using the INQUIRE EVENTPROCESS command.

USERTAG is invalid

The acceptable 1-8 characters of a userTag are A-Z a-z 0-9 and _. Leading and embedded blank characters are not permitted. The name must not begin with 0-9, _ or the characters xml (in any case).

EP adapter name is invalid

The eventAdapterName in the event binding XML is invalid. The adapter name has the same restrictions as the userTag mentioned previously.

Invalid numeric filter value

The value is invalid for a numeric filter predicate.

EP adapterset name is invalid

The eventAdapterSetName in the event binding XML is invalid. The adapterset name has the same restrictions as the userTag mentioned previously.

CICSEPSchemaVersion is invalid

The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be in the range 1-99.

CICSEPSchemaRelease is invalid

The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be in the range 0-99.

System action

An exception entry is made in the trace table.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Console

DFHEC3100   *date time applid* **An error (code X'code') has occurred during creation of capture specification** *cs_name* **in event binding** *evb_name***.**

Explanation

An error has occurred creating event capture specification *cs_name* The code X'*code*' is the exception trace point ID which uniquely identifies the error and where it was detected, for example:

- 35AE Conversion error during packed decimal conversion.
- 35B6 Incorrect values specified in command response filter.
- 35B7 Incorrect mask length - The data provided for comparison was longer than the target datatype allows in the filter.

System action

An exception entry (code X'*code*' in the message) is made in the trace table.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This is probably caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor, this may indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages. Correct the event binding and reinstall it.

Module:
DFHECEI

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *X'code'*
5. *cs_name*
6. *evb_name*

Destination

CECO

DFHEC3101　　　*date time applid* **Invalid or unsupported codepage (***codepage***) found in capture specification *cs_name* in event binding *evb_name*.**

Explanation

There was a problem converting the specified codepage into a CICS CCSID (Coded Character Set ID). CICS does not support the codepage specified, or it is an invalid name.

System action

An exception entry is made in the trace table. The event binding is not installed.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Check the codepage specified in the event binding for the capture data. Check the codepage is listed as supported in the CICS documentation, and that it has been entered correctly. Inspect the CICS trace and EC domain message log for any related trace entries or messages. Correct the event binding and reinstall it.

Module:
DFHECEI

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *codepage*
5. *cs_name*
6. *evb_name*

Destination

CECO

DFHEC3102　　　*date time applid* **Invalid API Command (***command***) specified in capture specification *cs_name* in event binding *evb_name*.**

Explanation

An invalid API command was specified in the event binding XML configuration file, and therefore the binding could not be installed into CICS.

System action

Installation of the event binding will be rejected.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This is probably caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor, this may indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages. Correct the event binding and reinstall it.

Module:
DFHECEI

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *command*
5. *cs_name*
6. *evb_name*

Destination

CECO

DFHEC3103　　　*date time applid* **Invalid comparison operator (***code***) specified in capture specification**

cs_name in event binding
evb_name.

Explanation

An invalid operator was specified in the event binding XML configuration file. The operator is used when comparing the provided filter data with the API parameter at runtime, and it is not of the expected type for that parameter. Valid operators include:

- EQ Equality
- NEQ Non-equality
- GT/LT Greater-Than/Less-Than
- GTE/LTE Greater-Than-or-Equal/Less-Than-or-Equal
- EXS/NEX Existence/Non-existence
- SW/NSW Starts-with/Not-Starts-With
- OFF Filter not active

System action

An exception entry (code X'*code*' in the message) is made in the trace table.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This is probably caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor, this may indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages. Correct the event binding and reinstall it.

Module:
DFHECEI

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *code*
5. *cs_name*
6. *evb_name*

Destination

CECO

DFHEC3104	*date time applid {PRE_API | POST_API}* **event point** *command*

in capture specification *cs_name*
in event binding *evb_name* **is not**
supported.

Explanation

The *command* specified in capture spec *cs_name* of event binding *evb_name* is not event enabled, or not event enabled as either a pre or post API command. This means that CICS cannot perform filtering for it at the location requested. Not all CICS API calls are exposed for business event filtering, and those that are may not be exposed for filtering both before and after execution of the API call.

System action

An exception entry is made in the trace table. The event binding is not created.

An exception response is returned to the caller of this function and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This is probably caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor, this may indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages. Correct the event binding, discard and reinstall the bundle containing it.

Module:
DFHECEI

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. Value chosen from the following options:

    1=PRE_API,

    2=POST_API

6. *cs_name*
7. *evb_name*

Destination

CECO

DFHEC3105	*date time applid* **Invalid data type(***datatype***) was specified in capture specification** *cs_name* **in event binding** *evb_name***.**

Explanation

An invalid data type was specified in the event binding XML configuration file. The data type is used when comparing the provided filter data with the API parameter at runtime, and it is not of the expected type for that parameter. Valid data types include:

- CHAR Character data
- CHARZ Null (binary zero) terminated character data
- HEX HEX encoded binary data (e.g. 'F1F2F3')
- HEXZ Null (binary zero) terminated HEX encoded binary data
- UHWORD Unsigned Halfword numeric
- UFWORD Unsigned Fullword numeric
- SHWORD Signed Halfword numeric
- SFWORD Signed Fullword numeric
- PACKED Packed decimal
- ZONED Zoned decimal
- HEXFLOAT Hexadecimal floating point
- BINFLOAT Binary floating point
- DECFLOAT Decimal floating point

System action

An exception entry is made in the trace table. The event binding is not installed.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This is probably caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor, this may indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages. Correct the event binding and reinstall it.

Destination

CECO

DFHEC3111	*date time applid* **The decimal floating point facility (DFP) is not installed, but is required for capture specification** *cs_name* **in event binding** *evb_name*.

Explanation

Capture specification *csname* of event binding *evbname* specifies the use of decimal floating point (DFP) numbers, but the decimal floating point facility is not installed.

System action

The event binding install will be rejected.

An exception response is returned to the caller of this domain and the event binding create is terminated.

User response

Use of decimal floating point in event processing requires installation of the decimal floating point facility, which is an optional hardware feature.

If decimal floating point is required then install the decimal floating point facility and reinstall the event binding.

If decimal floating point is not required then change your programs and event binding to use a different data type and reinstall the event binding.

Module:
DFHECEI

DFHEC4006 E	*date time applid tranid* **Transaction start EP adapter failed to emit an event to transaction** *tranid* **for event binding** *evbname*. **START TRANSID failed with RESP=***resp* **and RESP2=***resp2*.

Explanation

The Event Processing Transaction Start adapter received a CICS EIB RESP of *resp* with RESP2 of *resp2* from the START TRANSID command used to emit an event for event binding *evbname* to transaction *tranid*.

System action

The event is not emitted. An exception trace entry is made. The EP adapter program terminates abnormally with abend code AECO. If emission mode is synchronous, the capturing transaction terminates abnormally with abend code ASP7 at the next sync point.

User response

This is likely to be due to an error in the event definition or EP adapter configuration. Use the RESP and RESP2 values to determine the cause of the error. Verify that:

- the transaction specified for this event is defined to CICS and enabled
- the sysid, if specified, is valid and a connection to the target system is defined and available
- the userid, if specified, is valid, not revoked and security is active

Module:
DFHECEAS

DFHEC4008	*date time applid tranid* **TSQ EP adapter failed to emit an event to queue** *queuename* **for event binding** *evbname*. **WRITEQ TS returned with RESP=***resp* **RESP2=***resp2*.

Explanation

The Event Processing TSQ adapter received a CICS EIB RESP of *resp* with RESP2 of *resp2* from the WRITEQ TS command used to emit an event for event binding *evbname* to TSQueue *queuename*.

System action

The event is not emitted. An exception trace entry is made. The EP adapter program terminates abnormally with abend code AECO. If emission mode is synchronous, the capturing transaction terminates abnormally with abend code ASP7 at the next sync point.

User response

This is likely to be due to a problem in the CICS environment at the time the transaction was running. Check the WRITEQ TS condition in the CICS documentation and examine the trace to determine why the command failed.

Module:
DFHECEAT

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*

Destination

CECO

DFHEC4009	*date time applid tranid* **TSQ EP Adapter failed to emit an event to queue** *queuename* **for event binding** *evbname* **because**

the queue is not defined as recoverable.

Explanation

The TSQ EP adapter was unable to emit an event for event binding *evbname* because TS queue *queuename* is not defined as recoverable. Synchronous transactional events require a recoverable TS queue. A TS queue will be recoverable if there is a matching TSMODEL specifying RECOVERY(YES).

System action

The event is not emitted. An exception trace entry is made. The transaction is abnormally terminated.

User response

Correct or create and install a TSMODEL resource definition for the queue, delete any pre-existing TS queue of the same name and rerun the capturing transaction.

Module:
DFHECEAT

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *queuename*
6. *evbname*

Destination

CECO

DFHEC4010	*date time applid tranid* **TSQ EP Adapter failed to emit an event to queue** *queuename* **for event binding** *evbname* **because the queue is defined as recoverable.**

Explanation

The TSQ EP adapter was unable to emit an event for event binding *evbname* because TS queue *queuename* is defined incorrectly. It is recoverable when it is required to be non-recoverable. Synchronous non-transactional events require a non-recoverable TS queue. A TS queue will be recoverable if there is a matching TSMODEL specifying RECOVERY(YES) or a matching TST TYPE=RECOVERY entry.

System action

The event is not emitted. An exception trace entry is made. The transaction is abnormally terminated.

User response

Correct or delete the TSMODEL resource definition, delete any pre-existing TS queue of the same name and rerun the capturing transaction.

Module:
DFHECEAT

DFHEC4111	*date time applid tranid* **WebSphere MQ EP adapter failed to emit an event to queue** *queue_name* **for event binding** *evbname*. **WebSphere MQ function MQPUT1 returned with completion code** *comp_code*.

Explanation

A WebSphere MQ function call issued from the Event Processing WebSphere MQ event adapter was unsuccessful and has set a non-zero return code.

System action

The event is not emitted. An exception trace entry is made. The EP adapter program terminates abnormally with abend code AECO. If emission mode is synchronous, the capturing transaction terminates abnormally with abend code ASP7 at the next sync point.

User response

This is likely to be caused by problem in the CICS or WebSphere MQ environment at the time the transaction was running. Check the WebSphere MQ reason code in the IBM MQ messages manual, and examine the trace to determine why the WebSphere

MQ function call failed. You might need help from IBM to resolve this problem.

Explanation

The HTTP EP adapter received HTTP error code *http_status_code* from the HTTP server targeted by URIMAP *urimap_name* in response to an HTTP POST request.

System action

The event is not emitted. An exception trace entry is made. The EP adapter program terminates abnormally with abend code AECC. If emission mode is synchronous, the capturing transaction terminates abnormally with abend code ASP7 at the next sync point.

User response

This is likely to be due to a configuration error in the EP adapter section of the event binding or in the URIMAP. Examine the CICS trace and diagnostics from the HTTP server to determine why the HTTP POST failed.

Destination

CECO

DFHEC4131	*date time applid tranid* **The TDQ EP Adapter failed to emit an event to TDQUEUE** *queuename* **for event binding** *evbname* **because the queue is not defined as recoverable.**

Explanation

The Transient data (TDQ) EP adapter was unable to emit an event for event binding *evbname* because TDQUEUE *queuename* is not defined as recoverable. Synchronous transactional events require a recoverable TDQUEUE. A TDQUEUE is recoverable if its defined as TYPE(INTRA) with RECOVSTATUS(LOGICAL) or RECOVSTATUS(PHYSICAL).

System action

The event is not emitted. An exception trace entry is made. The transaction is abnormally terminated with abend code AECC.

User response

Correct and re-install the TDQUEUE resource definition for the queue, and rerun the capturing transaction.

Module:
DFHECEAQ

DFHEJnnnn messages

DFHEJ0001	*applid* **An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to

event to TDQUEUE *queuename* for event binding *evbname* because the queue is not defined.

Explanation

The Transient Data (TDQ) EP adapter was unable to emit an event for event binding *evbname* because because the TDQUEUE *queuename* is not defined.

System action

The event is not emitted. The EP adapter program terminates abnormally with abend code AECC.

User response

Install the required TDQUEUE resource definition, and rerun the capturing transaction.

Destination

CECO

a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If you cannot continue without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHEJ**

2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHEJ0002   *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry (code X'*code*' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller

(for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot continue without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHEJ**

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHEJ0004   *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller

(for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function, so there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently, but you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

5. *CorbaServer_name*

6. *tcpipservice*

Destination

CEJL

DFHEJ0751 I	*date time applid userid* **About to wait for the availability of CorbaServer** ***CorbaServer_name.***

Explanation

A function needs to ensure that a CorbaServer is available for use, so it is going to wait until the CorbaServer becomes available (it enters the INSERVICE State).

This message will usually appear while Resolution is proceeding (or pending) for the CorbaServer. However, it can also occur after this time during consistency processing for the items associated with the CorbaServer.

System action

The transaction enters a Wait state until the CorbaServer becomes INSERVICE.

If the Wait is associated with consistency processing, it is likely that this delay will be short.

User response

None.

Module:
DFHEJCG

XMEOUT parameters/Message inserts

6. *CorbaServer_name*

Destination

CEJL

DFHEJ0947 E   *date time applid userid* **Beans contained within DJar *DJar_name* within CorbaServer *CorbaServer_name* are invalid and unusable.**

Explanation

An error occurred while installing the Beans from DJar *DJar_name* during the Bean copying phase of Resolution.

The most probable reason is that an attempt was made to install a duplicate Bean twice within the scope of the CorbaServer. In other words the duplicate Bean occurs in more than one DJar.

System action

The partially processed Beans within the DJar are deleted and the DJar is put into the UNRESOLVED state.

User response

Investigate why the Beans within the DJar within the scope of the CorbaServer caused this error to occur. In the most likely case, check that the contents of the DJar are not already present within the scope of the CorbaServer (for example, copying a Bean and then using both copies).

Destination

Console

DFHEJ1510 E   *date time applid userid*
CorbaServer *CorbaServer_name*
previously failed Resolution and
was found in the INITING state.

Explanation

A prior Resolution transaction (CEJR) failed and left a CorbaServer in the INITING state.

System action

The CorbaServer is put into the DISABLED state in order to prevent its use.

User response

A prior message should indicate the cause of the previous error.

Module:
DFHEJIO

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *CorbaServer_name*

Destination

CEJL

DFHEJ1513 E   *date time applid userid* **CorbaServer *CorbaServer_name* previously failed Resolution and was found in an intermediate state.**

Explanation

A prior Resolution transaction (CEJR) failed and left a CorbaServer in an intermediate state.

System action

The CorbaServer will be put into the DISABLED state in order to prevent its use.

User response

Examine the message log to determine why the CorbaServer Resolution failed. The CorbaServer should either be discarded or reenabled.

Module:
DFHEJIO

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *userid*
5. *CorbaServer_name*

Destination

CEJL

DFHEJ1518 E   *date time applid userid* **CorbaServer *CorbaServer_name* is UNUSABLE.**

Explanation

The CorbaServer *CorbaServer_name* failed to complete the part of the Resolution process which involves

creation of the shelf onto which components associated with the CorbaServer are placed.

System action

The CorbaServer is put into the DISABLED state.

User response

Check that the CICS region id has write permission to the shelf zFS directory structure.

The CorbaServer should be discarded and reinstalled.

If the problem persists you may have to use the trace facility to determine the cause of the problem.

Module:
DFHEJIO

Destination

CEJL

DFHEJ1530 E   *date time applid userid* **DJar**
***DJar_name* previously failed**
Resolution and was found in the
INITING state.

Explanation

A prior Resolution transaction (CEJR) failed and left a DJar in the INITING state.

System action

The DJar will be put into the UNUSABLE state to prevent its use.

User response

A prior message will usually indicate the cause of the previous error. Discard and reinstall the Djar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module:
DFHEJIO

XMEOUT parameters/Message inserts

1. *date*

2. *time*

3. *applid*

4. *userid*

5. *DJar_name*

Destination

CEJL

DFHEJ1533 E   *date time applid userid* **DJar**
***DJar_name* previously failed**
Resolution and was found in the
RESOLVING state.

Explanation

A prior Resolution transaction (CEJR) failed and left a DJar in the RESOLVING state.

System action

The DJar will be put into the UNRESOLVED state to prevent its use.

User response

A prior message will usually indicate the cause of the previous error. Discard and reinstall the CorbaServer.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module:
DFHEJIO

XMEOUT parameters/Message inserts

1. *date*

Destination

CEJL

DFHEJ1801 E   *DATE TIME APPLID userid* **The EJ domain is unable to run the Enterprise Java event URM:** *module*. **Reason(***X'reason'***)**

Explanation

The EJ domain attempted to invoke the Enterprise Java event URM *module* but failed with a code supplied as *reason*.

System action

Exception trace point 6000 is issued. Enterprise resource processing continues.

User response

Possible causes of the problem and an indication of how to solve them are given in the following list of reason code meanings:

Reason
  Meaning and Solution

1

The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.

2

The user exit program has no resource definition. Ensure that the PROGRAM resource definition for the user exit program is installed.

3

The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.

4

The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.

5

The user exit program is not enabled. CICS may have disabled the program due to an earlier error or the program may have been defined as disabled.

6

CICS is unable to load the user exit program for some other reason. Use trace to determine why the DFHPGLU call failed.

CEJL

DFHEJ5035 W	*date time applid userid* **The pickup directory for CorbaServer** *CorbaServer***could not be read.**

DFHEMnnnn messages

DFHEM0001	*applid* **An abend (code** *aaa/bbbb***) has occurred at offset** *X'offset'* **in module** *modname***.**

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

Explanation

A CorbaServer scan has discovered that the pickup directory could not be read. This may be because the region does not have read access to the zFS directory.

System action

The scan ends and no djar resources are installed.

User response

Check that the directory exists and that the read access permissions are set.

Module:
DFHEJDG

Destination

CEJL

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program

check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHEMDM, DFHEMEM.

5. *adapter_userid*
6. *evbname*

Destination

CEPO

DFHEP0115   *applid* **Event Processing event dispatcher task limit reached.**

Explanation

The upper limit of open TCBs used for event processing dispatcher tasks has been reached. Event processing limits the number of open TCBs used for EP dispatchers to one third of the value of MAXOPENTCBS, which if not specified, is set automatically based on the maximum number of tasks specified for the CICS region (the MXT value), using the following formula: (2 * MXT Value) + 32.

System action

The event processing event queue server task is not able to create any new dispatcher tasks but will append any new events to be dispatched to existing dispatcher tasks.

User response

If the configured event adapter is linked to by the dispatcher task then ensure that the consumer of the event is able to process the event. Increasing either MAXOPENTCBS, or MXT if MAXOPENTCBS allowed to default, may enable the event processing event queue server to start more dispatcher tasks.

Module:
DFHEPSY

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHEP0116   *applid* **Event Processing event dispatcher task limit relieved.**

Explanation

Event processing dispatcher task limit is relieved.

System action

The event processing event queue server task is now able to create new dispatcher tasks to process any new events.

User response

If the configured event adapter is linked to by the dispatcher task then ensure that the consumer of the event is able to process the event. Ensure that event processing does not use an excessive number of open TCBs. Event processing limits the number of open TCBs used for EP dispatchers to one third of the value of MAXOPENTCBS, which if not specified, is set automatically based on the maximum number of tasks specified for the CICS region (the MXT value), using the following formula: (2 * MXT Value) + 32. Decreasing the value of MAXOPENTCBS, or MXT if MAXOPENTCBS allowed to default, will enable the event processing event queue server to limit the number of dispatcher tasks.

DFHEP2001　　*date time applid* **The CICS event processing domain failed to create EPADAPTER resource** *adapter* **in BUNDLE** *bundle* **because the EP adapter, which is of type** *adapterType* **and emission mode** *emitmode* **{, requires a program name. | , does not support transactional events. | , requires a transaction ID. | , is invalid or unrecognised. | , has an invalid or unsupported event format. | , has an unsupported combination of attributes. | , failed the surrogate user check for some unexpected reason.}**

Explanation

An error has occurred creating EPADAPTER *adapter* in BUNDLE *bundle* because of a problem with the EP adapter specification. The EPADAPTER is either being installed as a separate EPADAPTER bundle part or as part of an EVENTBINDING bundle part of the same name. The EPADAPTER is of type *adapterType* and its emission mode is *emitmode*. Possible reasons include:

Requires a program name

A program name is required for a custom EP adapter when the emission mode is synchronous.

Does not support transactional events

The EP adapter cannot be used for assured transactional events because it does not emit events to a recoverable transport. Transactional events and synchronous emission mode are mutually exclusive options for this EP adapter type.

Requires a transaction ID

A transaction ID is required for a custom adapter when the emission mode is asynchronous.

Is invalid or unrecognized

The EP adapter type, emission mode or both are unrecognized by this release of CICS.

Has an invalid or unsupported event format

The format field in the EP adapter configuration container returned by the XML parse function is invalid or not supported by the EP adapter type.

Has an unsupported combination of attributes

The emission mode is not supported by this type of EP adapter.

Unexpected reason during the surrogate user check

The userid installing the EP adapter goes through a surrogate check for the userid specified in the EP adapter configuration. The surrogate user check failed for some unexpected reason.

System action

An exception entry is made in the trace table.

An exception response is returned to the caller of this domain and the EP adapter create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If this is a separately installed EPADAPTER, the condition is probably caused by an error or inconsistency in the EP adapter XML. If installed as part of an EVENTBINDING, the condition is probably caused by an error in the eventDispatcherSpecification section of the event binding XML. If the XML was built by the CICS event binding editor, this condition might indicate an error in CICS code. Inspect the CICS trace and EP domain message log for any related trace entries or messages. Validate the XML against the appropriate event processing schema for the CICS system into which the bundle is being installed. Correct the XML, discard the BUNDLE, and reinstall it.

DFHEP2002	*date time applid* **The CICS event processing domain failed to create the EPADAPTER resource *adaptername* in BUNDLE *bundle* because {the EP adapter name is invalid.	the XML data for the EP adapter could not be parsed.	the eventDispatcher is missing or invalid.	the configuration data is too long.	it is a duplicate of another EPADAPTER in the BUNDLE.}**

Explanation

An error has occurred creating EPADAPTER *adaptername* in BUNDLE *bundle*. The EPADAPTER is either being installed as a separate EPADAPTER bundle part or as part of an EVENTBINDING bundle part of the same name. Possible reasons include:

EP adapter name is invalid.

The acceptable 1-32 characters of an EP adapter name are A-Z a-z 0-9 and _. Leading and embedded blank characters are not permitted. The name must not begin with 0-9, _ or the characters xml (in any case).

XML data for the EP adapter could not be parsed.

The preceding DFHPInnnn message gives further information about the cause of the problem.

eventDispatcher is missing or invalid

The eventDispatcher section of the event binding or EP adapter cannot be located by the XML parser.

Configuration data is too long

The configuration data specified for a custom EP adapter is too long.

Duplicate of another EPADAPTER

The EPADAPTER being installed has the same name as a previously installed EPADAPTER from the same BUNDLE. Note that an EPADAPTER may be:

- standalone: installed from a separate epadapter part within the BUNDLE
- embedded: installed with an EVENTBINDING from an evbind part within the bundle. The EPADAPTER has the same name as the related EVENTBINDING.

System action

An exception entry is made in the trace table.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If this is a separately installed EPADAPTER, the condition is probably caused by an error or inconsistency in the EP adapter XML. If installed as part of an EVENTBINDING, the condition is probably caused by an error in the eventDispatcherSpecification section of the event binding XML. If the XML was built by the CICS event binding editor, this condition might indicate an error in CICS code. Inspect the CICS trace and EP domain message log for any related trace entries or messages. Validate the XML against the event processing schema for the CICS system into which the bundle is being installed. Correct the event binding, discard the BUNDLE, and reinstall it.

DFHEP2003   *date time applid* **The CICS event processing domain failed to create the EPADAPTER resource** *adaptername* **in BUNDLE** *bundle* **because the {LOCALCCSID SIT parameter is not supported | EP adapter schema level is not supported | CICSEPSchemaVersion is invalid | CICSEPSchemaRelease is invalid}:** *error_data.*

Explanation

An error has occurred creating EPADAPTER *adaptername* in BUNDLE *bundle*. Possible reasons include:

LOCALCCSID SIT parameter is not supported

Event processing uses the LOCALCCSID system initialization parameter as the default CCSID for codepage conversion of character data. It must be a CICS supported single or multibyte EBCDIC CCSID.

Schema level is not supported

The CICSEPSchemaVersion and CICSEPSchemaRelease of EP adapter, *error_data*, must not be higher than the schema level supported by this release of CICS, which can be found by using the INQUIRE EVENTPROCESS command.

CICSEPSchemaVersion is invalid

The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be in the range 1-99.

CICSEPSchemaRelease is invalid

The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be in the range 0-99.

System action

An exception entry is made in the trace table.

An exception response is returned to the caller of this domain and the EPADAPTER create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This is probably caused by an error or inconsistency in the EP adapter XML. If the EP adapter was built by the CICS event binding editor, this may indicate an error in CICS code. Inspect the CICS trace and EP domain message log for any related trace entries or messages. Validate the EP adapter against the event processing schema for the CICS system into which the BUNDLE is being installed. Correct the EP adapter, discard the BUNDLE, and reinstall it.

CEPO

DFHEP2005	*date time applid* **The CICS event processing domain found an inconsistency in the advanced options during install of EPADAPTER *adaptername* with emission mode *emitmode* and type *adapterType*. The *option* option is ignored.**

Explanation

An incompatible option was found during install of EPADAPTER *adaptername*. The EPADAPTER is either being installed as a separate EPADAPTER bundle part

or as part of an EVENTBINDING bundle part of the same name. The EPADAPTER is of type *adapterType* and its emission mode is *emitmode*. Possible reasons include:

Transaction ID, User ID and Priority

These options are irrelevant when the emission mode is synchronous as the EP adapter is invoked within the unit of work (UOW) of the originating application.

Program name

This option is only required for a custom EP adapter in synchronous emission mode.

System action

An exception entry is made in the trace table.

The incompatible option is ignored and the EPADAPTER installation continues.

User response

If this is a separately installed EPADAPTER, this is probably caused by an error or inconsistency in the EP adapter XML. If installed as part of an EVENTBINDING, this is probably caused by an error in the eventDispatcherSpecification section of the event binding XML. If the XML was built by the CICS event binding editor this might indicate an error in CICS code. Inspect the CICS trace and EP domain message log for any related trace entries or messages. Correct the XML, discard the BUNDLE, and reinstall it.

DFHEP2006　*date time applid* **The CICS event processing domain failed to create the EPADAPTERSET resource *adaptersetname* in BUNDLE *bundle* because {the EP adapterset name is invalid. | the XML data for the EP adapterset could not be parsed. | it is a duplicate of another EPADAPTERSET in the BUNDLE. | no EP adapter names are specified in the EP adapterset. | the EPADAPTER name has a duplicate in the EP adapterset. | an EPADAPTER name contained in the EP adapterset is invalid.}**

Explanation

An error has occurred creating EPADAPTERSET *adaptersetname* in BUNDLE *bundle*. Possible reasons include:

EP adapterset name is invalid

The acceptable 1-32 characters of an EP adapterset name are A-Z a-z 0-9 and _. Leading and embedded blank characters are not permitted. The name must not begin with 0-9, _ or the characters xml (in any case).

XML data for the EP adapterset could not be parsed

The preceding DFHPInnnn message gives further information about the cause of the problem.

Duplicate of another EPADAPTERSET

The EPADAPTERSET being installed has the same name as a previously installed EPADAPTERSET from the same BUNDLE.

No EP adapter names are specified in the EP adapterset

There should be at least one EP adapter name being specified in the EP adapterset XML data.

Duplicate of EPADAPTER name

The EPADAPTERSET contains duplicated EP adapter names.

Invalid EPADAPTER name

The EPADAPTERSET contains invalid EP adapter name.

System action

An exception entry is made in the trace table.

An exception response is returned to the caller of this domain and the EPADAPTERSET create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

The condition is probably caused by an error or inconsistency in the EP adapterset XML. If the XML was built by the CICS event binding editor, this condition might indicate an error in CICS code. Inspect the CICS trace and EP domain message log for any related trace entries or messages. Validate the XML against the event processing schema for the CICS system into which the bundle is being installed. Correct the EP adapterset XML, discard the BUNDLE, and reinstall it.

Console

DFHEX0002   **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code X'*code*' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action

An exception entry is made in the EXCI internal trace table and to GTF if it is active, (X'*code*' in the message). A system dump is taken.

This is a critical error and the EXCI request is terminated. The external CICS interface attempts to recover to a consistent state so that further EXCI requests can be issued. For applications using the EXCI CALL API, the EXCI_REASON returned to the application indicates the reason for the error. For applications using the EXCI EXEC API, the reason is returned in the EXEC_RESP2 field of the RETCODE area.

User response

This failure indicates a serious error in the external CICS interface code. For further information about the EXCI exception trace entries, refer to the Troubleshooting and support.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:

Module:

Destination

Console

DFHEX0100   **The installed level of CICS SVC**
**   does not support the EXCI call.**

Explanation

The external CICS interface module DFHXCPRH
detected that the level of CICS SVC (DFHCSVC) in use
does not support the external CICS interface.

System action

The EXCI request is terminated. An exception trace
is made in the EXCI internal trace table, and if GTF
is active, in the GTF trace data set. The external
CICS interface module DFHXCPRH issues abend 0407

which drives the ESTAE exit. Message DFHEX0001 is
issued, and a SYSMDUMP is taken.

User response

Check the level of DFHCSVC installed in the LPA. A
CICS/ESA 4.1 level of DFHCSVC is required for the
external CICS interface. Generally, the latest level of
DFHCSVC must be used when running CICS and the
external CICS interface. For more information about
installing DFHCSVC see the Installing CICS TS.

Module:
DFHXCPRH

Destination

Console

DFHEX0101   **Unable to start interregion**
**   communication because DFHIRP**
**   level check failed.**

Explanation

The call to DFHIRP to check DFHIRP's service level
has failed.

This is probably because the version of DFHIRP being
used is at a lower level than that of the External
CICS Interface (EXCI) module DFHXCPRH. A less likely
reason is that a failure occurred before DFHIRP could
make the level check.

System action

The EXCI allocate pipe request is rejected. A return
code is passed back to the batch application.

User response

Ensure that the correct level of DFHIRP exists in the
LPA such that it matches the level of the latest CICS
version in use.

Module:
DFHXCPRH

Destination

Console

DFHEX0110   **EXCI SDUMP has been taken.**
**   Dumpcode:** *dumpcode*, **Dumpid:**
**   *dumpid*.**

Explanation

This message is issued on successful completion of a
MVS SDUMP issued by external CICS interface module

DFHXCDMP. An error, signalled by a previous message, caused a call to be made to DFHXCDMP to take a system dump.

The dump code *dumpcode* is an 8-character system dump code identifying the external CICS interface problem. A system dump code is the EXCI message number with the DFH prefix removed.

dumpid is the unique 9-character string identifying this dump.

System action

The EXCI request is terminated.

User response

See the EXCI message indicated by *dumpcode* for further guidance.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHXCDMP.

Destination

Console

DFHEX0111   **EXCI SDUMP attempted but SDUMP is busy - will retry every five seconds for *nnnn* seconds.**

Explanation

At the time of the MVS SDUMP request issued by DFHXCDMP another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. A nonzero value for the dump retry parameter in the DFHXCOPT table means that the external CICS interface waits five seconds before retrying the SDUMP request. If necessary, the external CICS interface retries every five seconds for the total time specified on the retry parameter.

System action

The external CICS interface issues an MVS STIMERM macro which causes it to wait for five seconds. The request is reissued when the delay interval has expired.

User response

None.

Module:

DFHXCDMP.

Destination

Console

DFHEX0112   **SDUMP request failed - *reason X'nn'*.**

Explanation

An MVS SDUMP request issued from the external CICS interface has failed to complete successfully. The possible reasons, (*reason*) for the failure are as follows:

ONLY PARTIAL DUMP

The SYS1.DUMP data set to which the dump is written is not large enough to contain all of the dumped storage.

SDUMP BUSY

At the time of the MVS SDUMP request issued by the EXCI, another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. If a nonzero value is specified for the dump retry parameter in DFHXOPTS table, the EXCI has retried the SDUMP request every five seconds for the specified period. This message is only issued if SDUMP is still busy after the final retry.

STIMERM FAILED

In order to delay for five seconds before retrying SDUMP after an SDUMP BUSY condition, the EXCI issues an MVS STIMERM macro request. MVS has indicated that the STIMERM request has failed.

NO DATA SET AVAILABLE

No SYS1.DUMP data sets were available at the time the SDUMP request was issued.

REJECTED BY MVS, REASON = X'nn'

MVS has rejected the SDUMP request because of user action (for example, specifying DUMP=NO in the MVS IPL) or because of an I/O error or terminating error in the SDUMP routine. X'nn' is the SDUMP reason code.

NOT AUTHORIZED FOR EXCI

SDUMP is not authorized for the external CICS interface.

INSUFFICIENT STORAGE

The EXCI issued an MVS GETMAIN for subpool 253 storage during the processing of the SDUMP request. The GETMAIN has been rejected by MVS.

System action

The EXCI proceeds as if the dump had been successful.

User response

The user response depends on the reasons, (*reason*), for the failure.

ONLY PARTIAL DUMP

Increase the size of the SYS1.DUMP data sets and cause the SDUMP request to be reissued.

SDUMP BUSY

Cause the SDUMP to be reissued after, if appropriate, increasing the dump retry time in DFHXCOPT.

STIMERM FAILED

Use MVS problem determination methods to fix the STIMERM failure and then cause the SDUMP request to be reissued.

NO DATA SET AVAILABLE

Clear a SYS1.DUMP data set and then cause the SDUMP request to be reissued.

REJECTED BY MVS, REASON = X'nn'

No action is required if the dump is suppressed deliberately. If the dump has failed because of an error in the MVS SDUMP routine, use MVS problem determination methods to fix the error and then cause the SDUMP request to be reissued. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1). for an explanation of the SDUMP reason code X'nn'.

NOT AUTHORIZED FOR EXCI

This reason is unlikely because SDUMP is unconditionally authorized during EXCI initialization, and should be authorized throughout the EXCI run. If you do get this reason, the EXCI AFCB (authorized function control block) has probably been accidentally overwritten.

INSUFFICIENT STORAGE

Ensure sufficient storage is available to MVS for subpool 253 requests.

Module:
DFHXCDMP

Destination

Console

DFHEX0113	EXCI trace Initialization has failed.

Explanation

An attempt to initialize external CICS interface (EXCI) trace facilities during EXCI initialization has failed.

System action

The EXCI request continues without trace facilities. An earlier message identifies the cause of the failure.

User response

Refer to the earlier message to determine the cause of the failure.

Module:
DFHXCTRI

Destination

Console

DFHEX0114	Incorrect data has been passed for EXCI tracing causing a program check in DFHXCTRP.

Explanation

Some data passed to the external CICS interface (EXCI) trace module DFHXCTRP for addition to the EXCI internal trace table, or GTF trace, caused a program check to occur when an attempt was made to access it.

The most likely cause of this error is incorrect data passed on an EXCI CALL API request that the trace program DFHXCTRP is attempting to access.

System action

The EXCI request is terminated and a SYSMDUMP is taken.

User response

Examine the dump to determine the source of the incorrect data.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHXCTRI

Destination

Console

DFHEX0115	EXCI trace services have been disabled due to a previous error.

Explanation

An error occurred in the external CICS interface (EXCI) trace module DFHXCTRP indicated by message DFHEX0001. In trying to recover from the error, module DFHXCTRI determined that the error was not caused by accessing incorrect data passed to DFHXCTRP, but was due to a program check in DFHXCTRP.

System action

The EXCI trace facilities are disabled to prevent further errors. A SYSMDUMP is taken.

User response

See the DFHEX0001 message and the SYSMDUMP to determine the cause of the error.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHXCTRI

Destination

Console

DFHEX0116	Program check occurred within global trap exit - DFHXCTRA now marked unusable.

Explanation

After making a trace entry, the external CICS interface (EXCI) trace program DFHXCTRP called the EXCI field engineering global trap program DFHXCTRA. A program check occurred during execution of DFHXCTRA.

System action

The EXCI marks the currently active version of DFHXCTRA as unusable and ignores it on subsequent calls to DFHXCTRP for all subsequent calls made

DFHFCnnnn messages

DFHFC0001	*applid* An abend (code *aaa/bbbb*) has occurred at offset *X'offset'* in module *modname*.

under this TCB. The EXCI request is terminated, and a SYSMDUMP is taken.

User response

Use the dump to find the cause of the program check.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

You should use the global trap exit only in consultation with an IBM support representative.

Module:
DFHXCTRI

Destination

Console

DFHEX0400	Channel storage exceeds 5% of MEMLIMIT.

Explanation

The EXCI has refused to store data in a Container because the total storage allocated for the Channel will exceed 5% of MEMLIMIT.

System action

EXCI abends the transaction with code 0417.

User response

Review the storage requirements for the PROGRAM. If the volume of data is correct, either delete any unnecessary Containers from the Channel, or increase MEMLIMIT so that the program does not use more than 5% of the storage available.

Module:
DFHXCCR

Destination

Console

Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively,

- Unexpected data has been input, or

- Storage has been overwritten.

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some further guidance.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHFCAT, DFHFCCA, DFHFCDN, DFHFCDTS, DFHFCDTX, DFHFCES, DFHFCFL, DFHFCFR, DFHFCFS, DFHFCIR, DFHFCLF, DFHFCLJ, DFHFCMT, DFHFCQI, DFHFCQR, DFHFCQS, DFHFCQU, DFHFCRC, DFHFCRL, DFHFCBU, DFHFCRO, DFHFCRP, DFHFCRR, DFHFCRS, DFHFCRV, DFHFCSD, DFHFCST, DFHFCVR, DFHFCVS

XMEOUT parameters/Message inserts

1. *applid*

2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

Destination

Console

DFHFC0002   *applid* **A severe error (code *X'code'*) has occurred in module *modname*.**

Explanation

An error has been detected in module *modname*. The code *code* is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

To discover the cause of the problem, examine the exception trace entry and immediately preceding entries. For further information about CICS exception trace entries, see the Troubleshooting and support.

System action

An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHFCAT, DFHFCCA, DFHFCDN, DFHFCDTS, DFHFCDTX, DFHEIFC, DFHFCES, DFHFCFL, DFHFCFR, DFHFCFS, DFHFCIR, DFHFCLF, DFHFCLJ, DFHFCMT, DFHFCOR, DFHFCQI, DFHFCQR, DFHFCQS, DFHFCQU, DFHFCRC, DFHFCRD, DFHFCRL, DFHFCBU, DFHFCRO,

DFHFCRP, DFHFCRR, DFHFCRS, DFHFCSD, DFHFCST, DFHFCVR, DFHFCVS, DFHFCRF

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHFC0003   *applid* **Insufficient storage (code X'code') in module *modname*.**

Explanation

A CICS GETMAIN was issued by module *modname*, but there was insufficient storage available to satisfy the request.

The code X'*code*' is the exception trace point ID which uniquely identifies the place where the error was detected.

System action

An exception entry is made in the trace table (code *code* in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from the domain manager, for example), and look up the user response for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module *modname*, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the size limits of the DSAs or EDSAs. See the Configuring or the Improving performance for further information on CICS storage.

Module:
DFHFCRP

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*
3. *modname*

Destination

Console

DFHFC0004   *applid* **A possible loop has been detected at offset *X'offset'* in module *modname*.**

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module *modname* at offset X'*offset*'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* is terminated and CICS continues.

But if you have declared ICVR=0 as a system initialization parameter and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will require further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHFCAT, DFHFCDN, DFHFCDTS, DFHFCDTX, DFHFCFR, DFHFCFS, DFHFCMT, DFHFCRL, DFHFCRP, DFHFCSD, DFHFCST, DFHFCVR, DFHFCVS

XMEOUT parameters/Message inserts

1. *applid*
2. *X'offset'*
3. *modname*

Destination

Console

DFHFC0005	*applid* A hardware error has occurred (module *modname*, code *X'code'*). The Time-of-Day clock is invalid.

Explanation

A hardware error has occurred during the running of module *modname*. The MVS store clock facility is the timing mechanism for the operating system.

The code *code* is the exception trace point ID which uniquely identifies the place where the error was detected.

System action

An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message to this effect is issued.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. This is in all probability a hardware error and you should in the first instance investigate the MVS store clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will require further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Explanation

The reply to message DFHFC0107 was invalid. The reply may have been too long or may have contained invalid characters.

System action

Message DFHFC0107 is reissued and initialization waits for a reply.

User response

Reply to message DFHFC0107.

Module:
DFHFCRP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHFC0110   *applid* **Error, a** *xxxx* **version of** *DFHFCTxx* **has been loaded.**

Explanation

DFHFCRP loaded DFHFCT*xx* that was assembled for CICS release *xxxx*. It is not valid to run CICS with an FCT assembled against a previous release.

System action

File control initialization, and hence CICS, is terminated.

User response

Reassemble DFHFCT*xx* for the CICS release being used. Cold start CICS.

Module:
DFHFCRP

XMEOUT parameters/Message inserts

1. *applid*
2. *xxxx*
3. *DFHFCTxx*

Destination

Console

DFHFC0111   *applid* **Error, CICS is attempting to initialize with release *xxxx* of DFP.**

Explanation

DFHFCRP detected that CICS was being initialized with data facility product (DFP) level *xxxx*. CICS does not support this level of DFP.

System action

File control initialization, and hence CICS, is terminated.

User response

Install a level of DFP supported by this release of CICS.

Module:
DFHFCRP

XMEOUT parameters/Message inserts

1. *applid*
2. *xxxx*

Destination

Console

DFHFC0116   *applid* **The load of callable service IGWARLS has failed with return code *X'eeee'*.**

Explanation

Callable service IGWARLS is required by file control for processing files which have update SERVREQs and are using the VSAM catalog as a repository for data set recovery attributes. The load of IGWARLS requested by file control initialization has failed. This is a serious problem because CICS is using a level of VSAM that supports use of the VSAM catalog for specifying data set recovery attributes.

System action

CICS initialization fails.

User response

IGWARLS is supplied on SYS1.CSSLIB. Ensure that SYS1.CSSLIB is in the concatenation for the MVS linklist or LPA. If the failure persists, this is likely to be an internal CICS error. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHFCRP

XMEOUT parameters/Message inserts

1. *applid*
2. *X'eeee'*

Destination

Console

DFHFC0118   *applid* **System initialization parameter requesting RLS support has been ignored because the level of VSAM does not support RLS.**

Explanation

RLS=YES has been specified on CICS startup but the level of VSAM does not support RLS access.

System action

CICS initialization continues without RLS support.

User response

If you intend to use RLS access ensure that the level of VSAM is DFSMS 1.3 or later.

Module:
DFHFCRP

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHFC0119   *applid* **The load of callable service IGGCSI00 has failed with return code *X'eeee'* .**

Explanation

Callable service IGGCSI00 is required by file control for examining catalog entries for data sets. The load of IGGCSI00 requested by file control initialization has failed.

System action

CICS initialization fails.

User response

IGGCSI00 is supplied on SYS1.CSSLIB. Ensure that SYS1.CSSLIB is in the concatenation for the MVS linklist or LPA. If the failure persists, this is likely to be an internal CICS error. See Working with IBM to solve your problem for guidance on how to proceed.

Module:

XMEOUT parameters/Message inserts

1. *applid*
2. *X'eeee'*

Destination

Console

DFHFC0150   *date time applid termid tranid* **An attempt to release locks for unit of work** *X'uowid'* **failed. VSAM return code** *X'rrrr'* **reason code** *X'cccc'***.**

Explanation

Unit of work *uowid* for tranid *tranid* has attempted to release its RLS locks. The release locks request made to VSAM has failed because VSAM detected an error.

The IDALKREL response is *rrrr* and the reason code is *cccc*.

termid identifies the terminal running this transaction.

System action

CICS continues with the completion of the unit of work.

The unit of work is shunted. The shunt reason indicates that a further release locks attempt is required.

Some records may remain locked until a successful lock release command can be processed by VSAM.

If the failure is caused by the SMSVSAM server being unavailable, CICS automatically retries the completion of the UOW when the server becomes available.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the VSAM codes to determine the cause of the problem. The most likely cause of this failure is that the SMSVSAM server failed at the time of the error. For the meaning of the VSAM codes, see z/OS DFSMS Macro Instructions for Data Sets.

When the condition that caused the lock release to fail has been resolved, you may need to retry the unit of work using

```
CEMT SET DSNAME RETRY
```

or

```
EXEC CICS SET DSNAME(dsname) ACTION(RETRY)
```

.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

6. *X'uowid'*
7. *X'rrrr'*
8. *X'cccc'*

Destination

CSFL and Console

DFHFC0151   *date time applid termid tranid* **An attempt to retain locks for unit of work** *X'uowid'* **failed. VSAM return code** *X'rrrr'* **reason code** *X'cccc'***.**

Explanation

Unit of work *uowid* for transaction *tranid* has gone indoubt because it has lost contact with

its coordinating system. Consequently CICS has attempted to convert all RLS locks owned by this unit of work into retained locks. This attempt has failed because VSAM has detected an error.

The IDARETLK macro response is *rrrr* and the reason code is *cccc*.

termid identifies the terminal running this transaction.

System action

CICS continues shunting this unit of work. It is possible that some locks may remain as active locks (which cause other transactions to wait until their timeout value is reached) rather than as retained locks (which cause other transactions to encounter LOCKED responses.)

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see z/OS DFSMS Macro Instructions for Data Sets. The most likely reason for the failure to convert locks into retained locks is that the SMSVSAM server was not available. Other VSAM codes may indicate a more severe error.

Normally no other action should be necessary. When contact is reestablished, the coordinating system instructs this system to commit or backout. At the end of commit or backout, all retained and active locks are released.

A problem that you may encounter is that some locks may have been left as active locks. This may cause slow response (and eventual failures) from transactions that wait for these locks and have to wait for their full timeout interval.

In this case, you can use the CEMT SET UOW command to force the unit of work to commit or backout, or to make a decision to commit or backout according to the ACTION attribute in the transaction definition. Alternatively, you can use the CEMT SET DSNAME command which will force all in-doubt units of work which had updated the specified data set. However, you should not normally use these commands because they can cause this CICS to become out of step with its coordinating system with consequent loss of data integrity.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHFC0152	*date time applid termid tranid* **An attempt to retain locks for data set within unit of work** *X'uowid'* **failed. VSAM return code** *X'rrrr'* **reason code** *X'cccc'*.

Explanation

Unit of work *uowid* for transaction *tranid* has failed backout for one of its data sets. CICS has attempted to convert all the RLS locks owned by this unit of work that are associated with the failing data set into retained locks. This attempt has failed because VSAM has detected an error.

The IDARETLK response is *rrrr* and the reason code is *cccc*.

termid identifies the terminal running this transaction.

This message is followed by message DFHFC0312 which identifies the failing data set.

System action

CICS continues shunting this unit of work. Some locks may remain as active locks (which cause other transactions to wait until their timeout value is reached) rather than as retained locks (which cause other transactions to encounter LOCKED responses).

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see z/OS DFSMS Macro Instructions for Data Sets.

The most likely reason for the failure to convert locks into retained locks is that the SMSVSAM server was not available. It is also possible to get a failure because the specified logical unit of work ID does not exist for the subsystem (that is, the unit of work does not hold any locks) during lost locks recovery, or after a CICS restart which specified OFFSITE=YES as a system initialization override. If you are performing RLS lost locks recovery, message DFHFC0555 will have been issued when lost locks recovery started; if you are performing RLS offsite recovery, message DFHFC0574 will have been issued during file control initialization. Other VSAM codes may indicate a more severe error.

Normally no other action is necessary. When the condition that caused the backout failure has been resolved, the backout of this unit of work is retried. If the attempt to retry the backout succeeds, all locks are released.

Message DFHFC4701 specifies the cause of the backout failure. The most common cause of backout failures is a hardware problem causing I/O errors. In this case the data set needs to be restored and forward recovered. If CICSVR (or a functionally equivalent product) is used to perform forward recovery, and the data set was being accessed in RLS mode, units of work that have failed backout for this data set are retried automatically. If the data set was quiesced, you need to unquiesce it to allow the backout to succeed. When the data set is unquiesced, CICS automatically retries the backout.

Backouts may also be retried using

```
CEMT SET DSNAME RETRY
```

or

```
EXEC CICS SET DSNAME(dsname) ACTION(RETRY)
```

.

The only problem that you may encounter is that some locks may have been left as active locks. This can cause a slow response (and eventual failures) from transactions that wait for these locks and have to wait for their full timeout interval.

In this case, consider releasing all locks held against this data set using the CEMT SET DSNAME RESETLOCKS command. This command should only be considered in extreme cases because it discards both the retained locks held by this CICS system against the named data set and all associated log records. The consequence is that the corresponding backout operations are never performed and data integrity is lost.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

CSFL and Console

DFHFC0153	*applid* **The previous instance of the SMSVSAM server has failed. File control RLS access is being closed down.**

Explanation

The SMSVSAM server is the separate VSAM address space that handles all VSAM requests made in RLS mode. The instance of this address space which CICS has been using has terminated, and CICS has just detected the failure. CICS must close down all accesses from file control to this instance of the SMSVSAM server in order to be able to register with the next server instance when the server restarts.

If message DFHFC0568 is issued before DFHFC0153, CICS did not detect the failure until the server restarted and notified CICS that a new instance was available. If message DFHFC0568 is not issued before DFHFC0153, CICS detected the failure when it tried to access the failed instance of the server.

System action

CICS disables all further RLS accesses, closes all files which were open in RLS mode, and attempts to unregister the RLS control ACB.

Transactions that attempt to access files previously opened in RLS mode abend. The abend code depends upon what the transaction was doing at the time of the failure.

User response

The SMSVSAM server address space should normally restart itself. If it does not, restart the SMSVSAM server address space manually. If the SMSVSAM server address space fails to restart, there may be a more severe error. In this case, you need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHFC0157   *applid tranid termid userid* **An I/O error has occurred on base data set *dsname* accessed via file *filename* component code *X'code'*.**

Explanation

An I/O error has been reported by VSAM after a request to update VSAM file *filename*.

The name of the base data set associated with the file is *dsname* although the error may have been encountered elsewhere. This is indicated by the value of the component code X'*code*'. Its possible values and the corresponding error locations are as follows.

- X'00' or X'01' - Base cluster.
- X'02' or X'03' - Alternate index.
- X'04' or X'05' - Upgrade set.

System action

The application request which encountered the error receives an 'IOERR' response.

CICS also issues message DFHFC0158 to display the VSAM diagnostic information for this error.

User response

Follow standard procedure for I/O errors. No special additional action is required to respond to this particular message although the data set name and component code may help in identifying the problem.

DFHFC0158   *applid vsam-error-data*

Explanation

This message displays additional VSAM diagnostic information that is available following I/O errors and cache failures. The message is provided for information only.

The format of the data contained in message DFHFC0158 is described in z/OS DFSMS Macro Instructions for Data Sets. in the section describing the physical error message format. This is a common data format used by other IBM products following I/O errors.

This message is issued after messages DFHFC0157, DFHFC0162 and DFHFC0163 and provides additional information to go with those messages.

System action

Processing continues.

User response

See the description of the associated preceding message (DFHFC0157, DFHFC0162 or DFHFC0163.)

Module:
DFHFCRS, DFHFCVS

XMEOUT parameters/Message inserts

1. *applid*
2. *vsam-error-data*

Destination

Console

DFHFC0159	*applid* **A request issued to cold start the RLS subsystem has failed. VSAM return code** *X'rrrr'* **reason code** *X'cccc'.*

Explanation

A cold or initial start of CICS has been requested, or CICS has been started with OFFSITE=YES specified as a system initialization parameter. CICS has made a call to the RLS component of VSAM which requested RLS to cold start its status with respect to this CICS. This request has failed because VSAM RLS detected an error while performing cold start processing.

System action

CICS continues to initialize. However, the restart of the RLS component of file control has failed and all RLS eligible files are unusable.

No dump is taken with this message. However, file control restart may subsequently produce message DFHFC0001 and take a dump if the error is of a type which should not occur during normal running.

User response

If the VSAM return code indicates that the SMSVSAM server has failed, restart the SMSVSAM server (if it has not already automatically restarted). You also need to restart CICS because CICS has been warm started with respect to RLS when the server returns.

If the SMSVSAM server has not failed, this is probably an error in CICS or VSAM. You should keep the dump associated with message DFHFC0001. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHFCCA

XMEOUT parameters/Message inserts

1. *applid*
2. *X'rrrr'*
3. *X'cccc'*

Destination

Console

DFHFC0160	*applid* **An attempt to notify VSAM that CICS has completed lost locks processing for a data set has failed. VSAM return code** *X'rrrr'* **reason code** *X'cccc'.*

Explanation

Following a failure of the VSAM lock structure, VSAM has marked a data set as being in lost locks state with regard to this CICS. CICS has performed all recovery actions necessary to resolve its locks against this data set and has attempted to inform VSAM that it has completed its recovery. This attempt has failed.

The VSAM response is *rrrr* and the VSAM reason is *cccc*.

This message is followed by message DFHFC0312 which identifies the failing data set.

System action

If the VSAM return code does not indicate that the SMSVSAM server has failed, CICS takes a system dump.

User response

The most likely cause of this failure is that the SMSVSAM server failed at the time that CICS issued the request.

If the problem was caused by the SMSVSAM server having failed at the time that the request was issued, restart the SMSVSAM server (if it has not already automatically restarted). Otherwise, you can make CICS retry the attempt to notify VSAM of the completion of lost locks processing either by restarting CICS or by restarting the SMSVSAM server.

It is possible that your installation may have performed some action, such as deleting the data set, which would cause VSAM not to recognize the data set and therefore return an error. If this is the case for the data set named in message DFHFC0312, you need take no further action.

If the VSAM return and reason codes suggest an internal CICS or VSAM error, you will need further assistance from IBM.See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHFCCA

XMEOUT parameters/Message inserts

1. *applid*
2. *X'rrrr'*
3. *X'cccc'*

Destination

Console

DFHFC0161	*applid* **Inquire recovery has failed. VSAM return code *X'rrrr'* reason code *X'cccc'*.**

Explanation

During restart CICS has issued an inquire recovery request to VSAM. This request has failed because VSAM has detected an error.

System action

CICS restart continues. All RLS files are unusable.

If the VSAM return code does not indicate that the SMSVSAM server has failed, CICS later issues message DFHFC0001 which has an associated system dump.

User response

The most likely cause of this failure is that the SMSVSAM server failed at the time that CICS issued the request. In that case you should restart the SMSVSAM server, if it has not already automatically restarted. There is no need to restart CICS.

If the VSAM return and reason codes indicate an internal CICS or VSAM error, keep the dump from message DFHFC0001. You will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:

2. *X'rrrr'*
3. *X'cccc'*

Destination

Console

DFHFC0162	*applid* **A VSAM data cache has failed.**

Explanation

A data cache structure being used by VSAM RLS has failed.

System action

The application request which encountered the error receives an 'IOERR' response.

CICS also issues message DFHFC0158 to display the VSAM diagnostic information for this error. The name of the failing cache can be derived from the information displayed in the following DFHFC0158 message.

While the data cache remains unusable, all data sets bound to this cache are also unusable. Any attempt to read from or write to such a data set cause an IOERR response.

CICS issues messages DFHFC0162 and DFHFC0158 the first time that an I/O request fails because of a cache failure. To prevent flooding the console with messages, CICS does not display these messages again until it is notified that a cache has been recovered. If several caches fail, DFHFC0162 and DFHFC0158 are only displayed for the first cache to fail. However, VSAM issues messages for all failed caches.

User response

Allocate a new data cache and bring it on line to VSAM.

CICS is notified as soon as the new cache is available and is able to take appropriate recovery action.

Module:
DFHFCRS

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHFC0163	*applid* **Connectivity to a VSAM RLS data cache has been lost.**

Explanation

Connectivity has been lost to a data cache that is being used by VSAM RLS.

System action

The application request which encountered the error receives an 'IOERR' response.

CICS also displays message DFHFC0158 to display the VSAM diagnostic information for this error. The name of the failing cache can be derived from the information displayed in the following DFHFC0158 message.

While the data cache remains unusable, all data sets bound to this cache are also unusable. Any attempt to read from or write to such a data set receives an 'IOERR' response.

CICS issues messages DFHFC0163 and DFHFC0158 the first time that an I/O request fails because contact has been lost between the processor running this MVS image and the coupling facility that holds the data cache. To prevent flooding the console with messages, CICS does not display these messages again until it is notified that a cache has been recovered. If contact with several caches is lost, messages DFHFC0163 and DFHFC0158 are only displayed for the first cache to fail. However, VSAM issues messages for all caches for which contact has been lost.

User response

Reestablish contact between the processor running CICS and the coupling facility that contains the cache.

CICS is notified as soon as contact has been reestablished and is able to take appropriate recovery action.

Destination

Console

DFHFC0164	*date time applid tranid trannum termid userid*. **A request has timed out waiting for an RLS lock. There are *nn* transactions or Transactional VSAM units of recovery holding this lock.**

Explanation

This message and the following DFHFC0165 or DFHFC0175 messages are issued to assist in problem determination when transactions abend with the AFCV abend code, or when application programs receive the RECORDBUSY condition.

An attempt made by transaction *tranid* with task number *trannum* to update a file which is open in VSAM RLS mode has failed because the request timed out waiting to obtain a lock on a record.

VSAM RLS has detected that a request has waited for a lock for more than the timeout interval. However, RLS was unable to detect any deadlock. Possibly there is a deadlock between VSAM RLS requests and requests to another resource manager such as DB2 or DBCTL.

When the timeout occurred there were *nn* other transactions or Transactional VSAM units of recovery holding the required lock.

System action

If the application request which encountered the error specified NOSUSPEND, it receives the RECORDBUSY condition and continues. If the request did not specify NOSUSPEND, it receives an AFCV abend.

CICS displays message DFHFC0164 to identify the failing transaction and the number of owners of the lock. CICS also issues message DFHFC0165 or DFHFC0175 once for each lock owner. CICS issues message DFHFC0168 instead of DFHFC0165 or DFHFC0175 in the unlikely event that VSAM RLS is unable to identify the lock owner.

User response

The following DFHFC0165 or DFHFC0175 messages identify the transactions that are holding the required lock and the CICS systems that they are running in or the unit of recovery holding the required lock and the Transactional VSAM instance this is running in, respectively. Examine these transactions or units of recovery to see why they are not releasing VSAM RLS locks. For example:

- They may be holding VSAM RLS locks and waiting for terminal input.
- They may be trying to access resources from both VSAM RLS and another resource manager, creating an inter-resource manager deadlock.

DFHFC0165	*date time applid tranid trannum termid userid*. **Transaction** *transid* **(***tasknum***) unit of work X'***uowid***' running in job** *jobname* **with applid** *applid2* **in MVS** *mvsid* **holds {add to end lock | internal lock | exclusive lock on key | shared lock on key } X'***keyid***' in data set** *dsname* **causing {***true | false***} contention.**

Explanation

This message and the preceding message DFHFC0164 or DFHFC0174 are issued to assist in problem determination when transactions abend with the AFCV or AFCW abend codes, or when applications receive the RECORDBUSY condition.

Normally this message appears after VSAM returns a timeout response to CICS. However, it may also appear after VSAM returns a deadlock response to CICS when that deadlock arises as a result of a failure to promote a lock. When this message is associated with a timeout response from VSAM, it is preceded by message DFHFC0164. When this message is associated with a deadlock response from VSAM it is associated with message DFHFC0174.

There is one occurrence of message DFHFC0165 for each transaction currently owning the required lock.

The name of the transaction that has failed is *tranid* and it has task number *trannum*.

The message inserts that identify the owner of the lock which caused this transaction to time out are as follows:

- *transid* is the name of the transaction running in the system that owns the lock. If the job that holds the lock is not a CICS system, this is displayed as *????*.
- *tasknum* is the task number of *transid*. If the job that holds the lock is not a CICS system, this is displayed as *?????*.
- *uowid* is the unit of work ID associated with the above transaction. The unit of work ID is also used by VSAM RLS as its logical unit of work ID (luwid).
- *jobname* is the job name of the CICS system that owns the lock.
- *applid2* is the applid of the CICS system whose job name was given by the previous insert.
- *mvsid* is the name of the MVS in which this CICS is running.
- *dsname* is the name of the data set against which the lock is held.
- *keyid* identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that the transaction is waiting for an add to end lock or an internal lock, no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock:

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

A lock causes true contention if the request was for a lock against the locked key. A lock causes false contention if the request was for a lock against a different key but the lock requests clashed because of the RLS key hashing algorithm which is used when the key length exceeds 16 characters.

System action

This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the system action associated with this message.

User response

This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the user actions associated with this message.

CSFL

DFHFC0166   *date time applid tranid termid userid.* **VSAM RLS has detected**

a deadlock. There are *nn* **transactions or Transactional VSAM units of recovery in the deadlock chain.**

Explanation

This message and the following DFHFC0167 or DFHFC0177 messages are issued to assist in problem determination when transactions abend with AFCW abend codes.

An attempt made by transaction *tranid* to update a file which is open in VSAM RLS mode has failed because VSAM RLS detected that this request would have caused a deadlock with other transactions.

At the time that the timeout occurred there were *nn* other transactions or Transactional VSAM units of recovery in the chain which caused deadlock.

System action

The application request which encountered the error receives an AFCW abend.

CICS issues message DFHFC0166 to identify the failing transaction and the number of transactions or units of recovery in the deadlock chain.

CICS also issues message DFHFC0167 or DFHFC0177 once for each transaction or unit of recovery involved in the deadlock chain. DFHFC0167 and DFHFC0177 identify the resource that the transaction or unit of recovery is holding and the resource that the transaction is waiting for.

User response

Examine the transactions or units of recovery in the deadlock chain to determine why deadlock arose. If necessary, correct the programming logic to avoid deadlock-creating situations.

For guidance on writing programs that avoid deadlock problems, see the Developing CICS Applications.

Explanation

This message and the preceding DFHFC0166 message are issued to assist in problem determination when transactions abend with AFCW abend codes.

The preceding message DFHFC0166 reports that a deadlock has been detected and includes how many transactions exist in the deadlock chain.

Message DFHFC0167 is issued once for each transaction in the deadlock chain and includes the resource that transaction holds and which resource it is waiting for.

The message inserts are as follows:

- *transid(tasknum)* is the transaction name and the associated task number of a transaction that owns a lock and is waiting for another lock. If this participant in the deadlock chain is not a CICS system, this will appear as ????(?????).
- *uowid* is the unit of work ID associated with task *transid(tasknum)*. The unit of work is also used by VSAM as the logical unit of work ID (luwid).
- *jobname/applid2* is the job name and applid of the CICS system in which this transaction is running.
- *mvsid* is the name of the MVS in which this CICS job is running.
- *dsname1* is the name of the data set against which this transaction holds a lock.
- *key1* identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that an add to end lock or an internal lock is held then no key information is displayed.
- *dsname2* is the name of the data set against which this transaction is attempting to acquire a lock.
- *key2* identifies the key which this transaction is attempting to lock. If the message indicates that the

transaction is attempting to obtain an add to end lock or an internal lock then no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock and whether the transaction is attempting to acquire an exclusive or shared lock.

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

System action

The application request which encountered the error receives an AFCW abend.

User response

See the description of message DFHFC0166.

DFHFC0168   *date time applid tranid trannum termid userid.{ An exclusive | A shared}* **lock on key** *X'keyid'* **in data set** *dsname* **is causing** *{true | false}* **contention but the owner of this lock is unknown.**

Explanation

This message and the preceding DFHFC0164 message are issued to assist in problem determination when transactions abend with AFCV abend codes.

Message DFHFC0168 is issued whenever VSAM RLS is unable to determine the owner of a lock. This is an abnormal condition. It may indicate that a processor in the sysplex is stopped.

dsname is the name of the data set against which the lock is held. *keyid* identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation.

The message identifies whether the lock is held as an exclusive lock or a shared lock.

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

A lock causes true contention if the request was for a lock against the locked key. A lock causes false contention if the request was for a lock against a different key but the lock requests clashed as a result of hashing algorithms used in creating RLS keys.

System action

Processing continues.

User response

None. The message is issued to assist in problem determination.

CSFL

DFHFC0169   *date time applid termid userid.* **Transaction** *tranid* **with transaction number** *trannum* **encountered an RLS retained lock held on data set** *dsname* **by unit of work** *X'uowid'* **within CICS with applid** *applid2*.

Explanation

An attempt was made to update a record which is currently held locked by a retained RLS lock.

Message inserts are as follows:

- *applid2* is the applid of the CICS system which owns the lock.
- *uowid* is the identifier of the unit of work that owns the lock.
- *dsname* is the name of the data set against which the lock is held.

This message is issued to aid in problem diagnosis. It identifies the owner of the lock that is causing a request to fail with a 'LOCKED' response.

System action

The application request which encountered the error receives a 'LOCKED' response.

User response

If repeated LOCKED responses are causing a problem, note the name of the CICS system and the identifier of the unit of work and attempt to find why this unit of work is holding a retained lock. There are three reasons why a unit of work can hold a retained lock.

1. The unit of work was running in a CICS system that has failed. If this CICS system is restarted, the lock is normally released.

2. The unit of work has gone indoubt. Indoubt failures occur as a result of a failure in communication between two CICS systems, neither of which need be the CICS system that is encountering the 'LOCKED' response.

   From a terminal connected to the CICS system with applid *applid2*, issue the command

   ```
   CEMT I UOW(
   uowid)
   ```

   or

   ```
   CEMT I UOWDSNFAIL
   ```

   to identify the applid of the CICS system that is coordinating the distributed unit of work. Then attempt to reestablish contact between the coordinating CICS and the system that owns the lock.

3. The unit of work has failed backout. From a terminal connected to the CICS system with applid *applid2*, issue the command

   ```
   CEMT INQUIRE
   UOWDSNFAIL DATASET(
   dsname)
   ```

   to determine the reason why unit of work *uowid* failed backout while processing data set *dsname*. There are several reasons why a unit of work can fail backout, each identified by a different reason code from CEMT INQUIRE UOWDSNFAIL. See the Troubleshooting and support for guidance on how to resolve each of these types of backout failure.

| DFHFC0170 | *applid* An attempt to release locks which are held by RLS but unknown to CICS has failed. |

Explanation

An attempt was made to release locks which are held on behalf of this CICS system by the VSAM RLS lock manager, but about which CICS has no knowledge. Such locks are known as "orphan" locks. The attempt to release the locks failed, either because the VSAM RLS server is not available or because there were no locks to release.

System action

CICS continues. The locks are automatically released after the VSAM RLS server becomes available again.

The presence of these "orphan" locks could prevent the running of non-RLS applications against the data sets which hold such locks. "Orphan" locks can also cause LOCKED responses to be returned to applications running on CICS systems which have access to an available VSAM RLS server and try to update the locked records, or try to read the records with one of the read integrity options.

Since CICS has no knowledge of "orphan" locks, it is not possible to get information about them using CICS API commands.

User response

If the failure is due to the server not being available, wait for the VSAM RLS server to restart. If it does not restart automatically, determine the reason and attempt to start it manually.

If the failure is due to there being no locks to release, this could either be a result of some user action resulting in locks being deleted such as deleting the data set, or it could indicate a severe VSAM error. If user action is not responsible, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHFCRR

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHFC0171   *applid* **Lost locks recovery might be delayed by inflight transactions.**

Explanation

A coupling facility (CF) lock structure failure has occurred, and SMSVSAM has been unable to rebuild the lock structure dynamically. This has resulted in the loss of VSAM RLS locks. SMSVSAM has notified CICS of this event so that CICS can perform lost locks recovery processing. In the course of this processing, CICS has attempted to purge inflight transactions that hold one or more of the lost locks in order to expedite recovery from the lost locks condition. However, it has not been possible to purge all of the transactions.

RLS lost locks recovery cannot complete until all UOWs that have updated data sets in RLS mode are completed. It is unlikely that an inflight transaction can complete normally in a lost locks situation because it will abend at the next attempt to access RLS. CICS attempts to purge inflight transactions because allowing them to run to completion (when they will probably abend anyway) could take a long time. This is particularly the case for conversational transactions.

System action

CICS continues.

If the failure to purge a transaction is due to a severe error, message DFHFC0002 is issued and a dump is taken.

User response

It may not be necessary to take any action because the purging of transactions is only a precautionary measure.

This message indicates that there are inflight UOWs that have not yet completed only when there are data sets that return a LOSTLOCKS value of RECOVERLOCKS after you have resolved any failed units of work that had updated the data sets. (See the EXEC CICS INQUIRE DSNAME(?) command for information about the LOSTLOCKS parameter.)

If it is possible to identify the transactions in question, either ensure that they run to normal completion,

or attempt to force purge them using the CEMT main terminal command. However, as this should be a rare situation, consider performing an immediate shutdown of CICS followed by an emergency restart as an alternative solution. This causes all inflight transactions to be backed out.

Module:
DFHFCRR

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHFC0172   *applid* **File control is unable to return to processing on the QR TCB because a change mode request has failed. CICS will terminate.**

Explanation

Normally most CICS functions are run on a TCB called the QR TCB. Exceptionally, file control issues OPEN and CLOSE requests on a TCB called the FO TCB. File control may also process VSAM read and write requests on a TCB called the CO TCB if SUBTSKS=1 has been specified in the SIT.

After completing its work on the RO or CO TCB, file control must return to processing on the QR TCB. In order to return to the QR TCB, file control has issued a CHANGE_MODE call to the CICS dispatcher. This request has failed.

System action

This is a severe error. CICS is unable to continue processing because it must be running on the QR TCB in order to do so. CICS is terminated with a dump.

The dispatcher domain has put out messages to describe the failure in the CHANGE_MODE request.

User response

See the messages issued by the dispatcher domain for further guidance.

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHFC0173	*date time applid* **VSAM has issued a *{deadlock	timeout	locked}* response but cannot supply problem determination data.**

Explanation

After certain failures, VSAM normally provides problem determination information which CICS uses to issue diagnostic messages and create exception trace entries.

However, although VSAM set a return code indicating that a failure occurred, it is unable to provide any problem determination information.

The failure detected by VSAM RLS is one of the following:

- A deadlock - CICS normally issues message DFHFC0166 and two or more DFHFC0167 or DFHFC0177 messages.
- A timeout - CICS normally issues message DFHFC0164 and one or more DFHFC0165 or DFHFC0175 messages.
- A record locked by a retained lock - CICS normally issues message DFHFC0169 or DFHFC0179.

System action

CICS continues processing the error in the normal way but cannot issue any of the normal problem determination messages or create the usual exception trace entries.

CICS does not take a dump. However, you can request a dump via the dump table in the usual way.

User response

This indicates an error in VSAM RLS. You may wish to take a dump of the SMSVSAM server. See the appropriate DFSMS/MVS manual for further guidance.

CSFL

DFHFC0174	*date time applid tranid trannum termid userid* **A deadlock has occurred as a result of a lock promote failure. There are *nnn* transactions or Transactional VSAM units of recovery holding this lock.**

Explanation

This message and the following DFHFC0165 or DFHFC0175 messages are issued to assist in problem determination when transactions abend with the AFCW abend code or receive RECORDBUSY response as NOSUSPEND was specified.

An attempt made by transaction *tranid* with transaction number *trannum* to update a file which is open in VSAM RLS mode has failed because VSAM has detected a deadlock while attempting to promote a shared lock to become an exclusive lock.

VSAM RLS returns problem determination information to CICS to assist with debugging the deadlock. However, this type of deadlock looks to VSAM like a timeout and thus the information returned to CICS looks like the information returned after a timeout. Hence this message is followed by one or more DFHFC0165 or DFHFC0175 messages instead of the DFHFC0167 messages which follow other types of deadlocks.

When the deadlock occurred there were *nnn* other transactions or Transactional VSAM units of recovery holding the required lock.

System action

The transaction receives an AFCW abend or RECORDBUSY response.

CICS displays message DFHFC0174 to identify the failing transaction and the number of owners of the lock. CICS also issues message DFHFC0165 or DFHFC0175 once for each lock owner. CICS issues message DFHFC0168 instead of DFHFC0165 or DFHFC0175 in the unlikely event that VSAM RLS is unable to identify the lock owner.

User response

The following DFHFC0165 or DFHFC0175 messages identify the transactions that are holding the required lock and the CICS systems that they are running in, or the units of recovery which are holding the locks and the Transactional VSAM instances they are running in, respectively. Examine these transactions or units of recovery to determine why they are not releasing VSAM RLS locks. Examine other RLS resources they acquire to determine whether this could cause a deadlock with the failing transaction.

Module:
DFHFCRS

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *tranid*
5. *trannum*
6. *termid*
7. *userid*

Destination

CSFL

DFHFC0175	*date time applid tranid trannum termid userid*. **Transactional VSAM unit of recovery *X'urid'* running in job *jobname* on Transactional VSAM instance *TVSInstance* in MVS *mvsid* holds {add to end lock | internal lock | exclusive lock on key | shared lock on key } X'keyid' in data set *dsname* causing {true | false} contention.**

Explanation

This message and the preceding message DFHFC0164 or DFHFC0174 are issued to assist in problem determination when transactions abend with the AFCV or AFCW abend codes, or when applications receive the RECORDBUSY condition.

Normally this message appears after VSAM returns a timeout response to CICS. However, it may also appear after VSAM returns a deadlock response to CICS when that deadlock arises as a result of a failure to promote a lock. When this message is associated with a timeout response from VSAM, it is preceded by message DFHFC0164. When this message is associated with

a deadlock response from VSAM it is associated with message DFHFC0174.

There is one occurrence of message DFHFC0175 for each unit of recovery currently owning the required lock.

The name of the transaction that has failed is *tranid* and it has task number *trannum*.

The message inserts that identify the owner of the lock which caused this transaction to time out are as follows:

- *urid* is the unit of recovery id running in the Transactional VSAM instance which owns the lock.
- *jobname* is the job name of the CICS system that owns the lock.
- *TVSInstance* is the name of the Transactional VSAM instance whose job name was given by the previous insert.
- *mvsid* is the name of the MVS in which this Transactional VSAM instance is running.
- *dsname* is the name of the data set against which the lock is held.
- *keyid* identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that the transaction is waiting for an add to end lock or an internal lock, no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock:

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

A lock causes true contention if the request was for a lock against the locked key. A lock causes false contention if the request was for a lock against a different key but the lock requests clashed because of the RLS key hashing algorithm which is used when the key length exceeds 16 characters.

System action

This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the system action associated with this message.

User response

This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the user actions associated with this message.

Explanation

This message and the preceding DFHFC0166 message are issued to assist in problem determination when transactions abend with AFCW abend codes.

The preceding message DFHFC0166 reports that a deadlock has been detected and includes how many units of recovery exist in the deadlock chain.

Message DFHFC0177 is issued once for each unit of recovery in the deadlock chain and includes the resource that unit of recovery holds and which resource it is waiting for.

The message inserts are as follows:

- *urid* is the unit of recovery ID which owns a lock and is waiting for another lock.
- *jobname/TVSInstance* is the job name and TVS instance in which this unit of recovery is running.
- *dsname1* is the name of the data set against which this unit of recovery holds a lock.
- *key1* identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that an add to end lock or an internal lock is held then no key information is displayed.
- *dsname2* is the name of the data set against which this unit of recovery is attempting to acquire a lock.
- *key2* identifies the key which this unit of recovery is attempting to lock. If the message indicates that the unit of recovery is attempting to obtain an add to end lock or an internal lock then no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock and whether the unit of recovery is attempting to acquire an exclusive or shared lock.

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

System action

The application request which encountered the error receives an AFCW abend.

User response

See the description of message DFHFC0166.

DFHFC0179   *date time applid termid userid*. **Transaction** *tranid* **with transaction number** *trannum* **encountered an RLS retained lock held on data set** *dsname* **by unit of recovery** *X'urid'* **within Transactional VSAM instance** *TVSInstance*.

Explanation

An attempt was made to update a record which is currently held locked by a retained RLS lock.

Message inserts are as follows:

- *TVSInstance* is the number of the Transactional VSAM instance which owns the lock.
- *urid* is the identifier of the unit of recovery that owns the lock.
- *dsname* is the name of the data set against which the lock is held.

This message is issued to aid in problem diagnosis. It identifies the owner of the lock that is causing a request to fail with a 'LOCKED' response.

System action

The application request which encountered the error receives a 'LOCKED' response.

User response

If repeated LOCKED responses are causing a problem, note the name of the Transactional VSAM instance and the identifier of the unit of recovery and attempt to find out why the unit of recovery is holding a retained lock. The Transactional VSAM unit of recovery may have failed or suffered backout failure. If the Transactional VSAM application has failed the lock will normally be released if the application is rerun. If the Transactional VSAM application has suffered backout failure you will need to use Transactional VSAM procedures to perform backout failure retry in order to release the lock.

DFHFC0208I	*applid* **LSR pool** *n* **is being built dynamically by CICS because all of the necessary parameters have not been supplied. Either there is no LSRPOOL definition or it is incomplete. The following are not defined:** *'CISIZE' 'STRINGS' 'MAXKEYLENGTH'*. **A delay is possible.**

Explanation

If one or more of the parameters, CI size, strings and maxkeylength are not defined for a LSR pool, either because there is no LSRPOOL definition or it is incomplete, then CICS will calculate the size by using information from the VSAM Catalog for data sets allocated to this LSR pool.

System action

CICS will issue SHOWCATS to obtain the information necessary to calculate the LSR pool size. If any data sets have been migrated the SHOWCAT could take longer than expected.

User response

If there are severe delays due to SHOWCAT processing, you will have to wait for migrated data sets to be recalled, and for the calculation of the LSR pool size to complete. If you wish to avoid similar problems in the future, consider defining the LSR pool explicitly. The missing parameters are contained in this message.

Normally, you will not experience delays, in which case no user action is required.

You can suppress this message with the system initialization parameter, MSGLVL=0.

DFHFC0304   *applid* **Dump taken in *module_name* due to a file control OPEN/CLOSE error.**

Explanation

This message is issued after DFHFCFS has made an OPEN or CLOSE request which has completed with an error. The specific error is identified by another message. In most cases the other message appears before this message, but if the error occurs during the building of a shared resources pool, the other message appears after this message.

The failure is identified as one of the following:

- An invalid request (not OPEN or CLOSE) has been sent
- There has been a subtask failure
- There has been a system failure other than "DSNAME NOT FOUND" or "VSAM CATALOG DOMAIN NOT FOUND".
- There has been a failure during shared resources pool building.

System action

A trace entry is made and a dump is taken with dumpcode FC0304.

User response

Locate the fault by examining the trace entry and the dump.

Module:
DFHFCL, DFHFCM, DFHFCN

XMEOUT parameters/Message inserts

1. *applid*
2. *module_name*

Destination

Console

DFHFC0305   *applid* **Message *msgno* file '*filename*' dsname '*dataset*'.**

Explanation

This message follows message DFHFC0300, DFHFC0302, DFHFC0307, DFHFC0308 or DFHFC0309. It identifies the VSAM data set name referred to in those messages.

If this message follows DFHFC0300 or DFHFC0302, it is issued from DFHFCVR.

If this message follows DFHFC0308 or DFHFC0309, it is issued from DFHFCRV.

If this message follows DFHFC0307, it is issued from DFHFCVS.

System action

Processing continues in the way specified in the preceding message from the list above, whichever is applicable.

User response

Find the earlier message to which this information refers and follow the user response for that message.

Module:
DFHFCVR, DFHFCVS, DFHFCRV

XMEOUT parameters/Message inserts

1. *applid*
2. *msgno*
3. *filename*
4. *dataset*

Destination

Console

DFHFC0307	*applid* **I/O error on file '***filename***', component code** *X'code'*. **File is temporarily disabled.**

Explanation

An I/O error was reported by VSAM after a request to update VSAM file *filename*.

The file has been specified with LSR so VSAM has not released the buffers it assigned to process the request. Therefore, CICS must take special action to release them.

The name of the data set associated with the file is in message DFHFC0305 which follows, although the error may have been encountered elsewhere. This is indicated by the value of the component code X'*code*'. Its possible values and the corresponding error locations are as follows.

- X'00' or X'01' - base cluster.
- X'02' or X'03' - alternate index.
- X'04' or X'05' - upgrade set.

System action

Activity against the file is stopped. The file is closed, then reopened in an attempt to release the VSAM output buffers. Further action might be required, see user response section.

Until the close has completed successfully, the file appears UNENABLED to new, potential users. They receive a NOTOPEN response to requests to use the file. The application request which encountered the error receives an IOERR response.

User response

The installation should follow the standard procedure for I/O errors. The data set name and component code might help in identifying the problem. To fully release the VSAM LSR output buffers, it might be necessary to close every file in this CICS region that uses the same LSRPOOL, and subsequently reopen those files. If that is not possible, then you should consider restarting CICS, to reclaim the full complement of buffers.

If there are sufficient buffers defined, subsequent requests are not prevented from processing normally after an IOERR response. You should close all the LSRPOOL files or restart CICS as soon as possible.

Module:
DFHFCVS

2. *filename*
3. *X'code'*

Destination

Console

DFHFC0308	*applid tranid termid* **Purge deferred due to incomplete I/O operation on VSAM RLS file** *filename*

Explanation

An attempt has been made to purge a transaction using FORCE. Transaction *tranid* is currently waiting for completion of an I/O operation on the VSAM RLS file *filename*. *termid* identifies the terminal running this transaction. The data set name is included in message DFHFC0305 which follows this message.

System action

The transaction waits until the I/O operation is completed before the purge is allowed to take effect. This is done to avoid a risk to data integrity. After the I/O operation is completed, the transaction is terminated with transaction abend code AFCY.

User response

If the transaction does not terminate within a few seconds, the I/O wait might be genuine (for example, another CEC has reserved the DASD volume). If this is the case, wait until the I/O situation is relieved before trying again.

Alternatively, there may be a system problem that warrants terminating CICS and using emergency restart to guarantee data integrity. If this is the case, terminate CICS and perform an emergency restart.

Module:
DFHFCRV

XMEOUT parameters/Message inserts

1. *applid*
2. *tranid*
3. *termid*
4. *filename*

Destination

Console

DFHFC0309   *applid tranid termid* **Failure while waiting for I/O operation on VSAM RLS file** *filename*

Explanation

A DISASTER type error occurred when the transaction *tranid* was waiting for the completion of an I/O operation on the VSAM RLS file *filename*

System action

CICS returns to VSAM who completes the wait for the I/O operation on CICS behalf. Since VSAM rather than CICS completes the wait for I/O to complete, there may be a significant degradation in CICS performance until the operation completes.

User response

This problem was caused by an earlier error. Look for earlier messages and return codes (for example, from the dispatcher domain) and associated trace entries and dumps.

If the problem cannot be traced to an application error, you will require further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

Console

DFHFC0314I   *applid* **VSAM has insufficient LSR buffers to fully backout the failed request.**

Explanation

VSAM has returned an error for VSAM file mentioned in DFHFC0313 and an error code of X'98'.

An ILLOGIC response is returned to the application.

The error code indicates that VSAM has insufficient LSR buffers to backout the failed request fully.

System action

An ILLOGIC response is returned to the application.

User response

Increase the allocation of LSR buffers. You may also need to delete, redefine and re-build your alternate indices based on this file.

Module:
DFHFCVS

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHFC0400   *applid* **This CICS system is not authorized to provide shared access to data tables - reason code *X'code'*.**

Explanation

CICS is about to open a data table but has been unable to make provision for sharing the table with other CICS systems because a security check for update access to the resource name DFHAPPL.*applid* has failed. The value of the reason code, X'*code*', provides further information on the reason for the failure of the security check. It has the format X'*ffrraaaa*' where *ff*

identifies the authorization check which failed, *rr* gives the register 15 return code from SAF, and *aaaa* is the SAFPRRET value.

The values of X'*ff*' are

X'01'

Access was refused by an AUTH security check.

X'02'

Access was refused by a FASTAUTH security check.

System action

CICS continues normally but no other CICS systems are able to share any data tables it creates until authority is granted and a table is subsequently opened.

User response

Ensure that CICS has the necessary authorization to provide shared access to data tables. Refer to the description of either the AUTH or FASTAUTH macro in the RACF documentation for explanations of the values that were reported in the reason code, X'*code*', and to determine the changes to the security definitions or setup that are required to allow the CICS system to act as a shared data table server (assuming that this is desired).

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*

2. *X'code'*

Destination

Console

DFHFC0401   *applid* **This CICS system is now authorized to provide shared access to data tables.**

Explanation

CICS is about to open a data table. On a previous occasion message DFHFC0400 was issued because authorization checks failed preventing this CICS system from making provision for sharing its data tables with any other CICS system. The check has been retried successfully.

System action

CICS continues normally. Subject to specific authorization checks, other CICS systems are now able to share this system's data tables.

User response

None.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHFC0402   *applid* **CICS cannot provide shared access to data tables because CICS is not defined as an MVS subsystem.**

Explanation

CICS is about to open a data table but has been unable to make provision for sharing the table with other CICS systems because CICS has not been defined as an MVS subsystem.

System action

CICS continues normally but no other CICS systems are able to share any data tables it creates.

User response

CICS must be defined as an MVS subsystem in order to permit the sharing of data tables between CICS systems.

See the Introduction to shared data tables for more guidance.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHFC0403   *applid* **CICS cannot provide shared access to remote data tables**

because CICS is not defined as an MVS subsystem.

Explanation

CICS is about to access a remote file resource. However, shared data tables cannot be used to access any remote tables because CICS has not been defined as an MVS subsystem.

If this message is issued on a CICS system at release 3.2.1, it means that the shared data tables module DFHDTINS is installed in the LPA or in the load library used by this CICS system, and has therefore been loaded by mistake.

System action

CICS continues normally and function ships this and subsequent remote file requests.

User response

CICS must be defined as an MVS subsystem in order to permit the sharing of data tables between CICS systems.

If the message was issued by a CICS/ESA 3.2.1 system, check where the DFHDTINS module is located. If DFHDTINS is in the load library specified by this CICS, it should be removed: shared data tables support cannot be installed on a CICS system at a lower level than 3.3. If it is in the link pack area (LPA) of this MVS system, it should be removed: the DFHDTINS module should not be placed in the LPA of an MVS system which contains any CICS regions at release 3.2.1 which might want to use data tables, unless a PTF has been applied to the CICS 3.2.1 regions.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHFC0405   *applid* **This CICS system cannot provide shared access to data tables because an earlier job step has used MVS cross-memory services.**

Explanation

CICS is prevented from using shared data tables because of the use of MVS cross-memory services by an earlier job step. CICS has attempted to create an entry table during LOGON as a shared data table server, but this has resulted in an MVS 052 ABEND because a prior jobstep owned space-switching entry tables. (MVS does not allow subsequent job steps to establish a cross-memory environment.)

System action

CICS continues normally but other CICS systems are unable to gain shared access to any data tables that this CICS system creates.

User response

In order to use the shared access to data tables feature, review the sequence of job steps in the job which includes this CICS system.

See the Introduction to shared data tables and also the explanation of system abend code 052, reason code 0314 in z/OS MVS System Codes for more guidance.

Module:
DFHFCFS

1. *applid*

Destination

Console

DFHFC0406   *applid* **This CICS system is not authorized for shared access to any data tables owned by the CICS system with applid** *applid2* **- reason code** *X'code'*.

Explanation

A file request for a remote file resource is about to be passed to a CICS system with the specified applid. The remote system has registered as a shared data table server, but this system cannot access any of its tables because a security check for read access to the resource name DFHAPPL.*applid2* has failed, where *applid2* is the applid of the data table owning CICS system. The value of the reason code, X'*code*', provides further information on the reason for the failure of the bind security check. It has the format X'*ffrraaaa*' where *ff* identifies the authorization check

which failed, *rr* gives the register 15 return code from SAF, and *aaaa* is the SAFPRRET value.

The values of X'*ff*' are

X'01'

Access was refused by an AUTH security check.

X'02'

Access was refused by a FASTAUTH security check.

System action

CICS continues normally and function ships this and subsequent requests directed to the specified remote system until authority is granted. Access is retried after about 10 minutes.

User response

If it was intended that this CICS system should be able to access data tables owned by the system *applid2*, refer to the description of either the AUTH or FASTAUTH macro in the RACF documentation for explanations of the values that were reported in the reason code, X'*code*', and to determine what changes to the security definitions or setup are required.

Module:
DFHFCFS

3. *X'code'*

Destination

Console

DFHFC0407   *applid* **This CICS system is now authorized for shared access to data tables owned by the CICS system with applid** *applid2*.

Explanation

The security check which failed earlier and was reported in message DFHFC0406, has now succeeded. This system can now attempt to access shared data tables owned by the CICS system with applid *applid2*.

System action

CICS continues normally. Subject to specific resource authorization checks, shared data tables owned by

the remote CICS system can now be accessed by this system.

User response

None.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *applid2*

Destination

Console

DFHFC0408	*applid* **This CICS system is not authorized for shared access to remote file** *filename* **- reason code** *X'code'***.**

Explanation

A file request to the specified remote file resource has just been processed. The file owning region contains shared data tables. An attempt was made to connect to any data table associated with the file but the connecting region failed the security check for shared access to the file resource. However, function shipped access was not similarly prevented.

This message can be issued whether or not the remote file has an associated data table. This is because it is not possible to determine whether a table exists until cross-memory linkage has been established to the file owning region, and this is only done after a connection attempt has passed all security checks. Once cross-memory linkage has been set up, any further connection attempts can first check whether a table exists. The shared access security check is then only needed when a data table is known to be available.

The value of the reason code, X'*code*', provides further information on the reason for the failure of the file security check. It has the format X'*ffrraaaa*'; where *ff* identifies the userid that was refused access, *rr* gives the register 15 return code from SAF, and *aaaa* is the SAFPRRET value.

The values of X'*ff*' are

X'01'

> The requesting system's own userid was refused read access to the remote file *filename*.

X'02'

> The default userid of the CICS system which owns the remote file *filename* was used in the security check for read access to the file, and access was refused.

System action

CICS continues normally and function ships this and subsequent requests directed to the specified remote file until authority to use shared access is granted. Access is retried after about 10 minutes.

User response

Check whether shared access from this system to the specified file is intended. If it is, use the additional information provided in the reason code to determine what changes to the security definitions or set-up are required.

See the Introduction to shared data tables for an explanation of the rules determining which userid is used for a file security check.

DFHFC0409	*applid* **This CICS system is now authorized for shared access to remote file** *filename***.**

Explanation

The security check which failed earlier, and was reported in message DFHFC0408, has now succeeded. This system can now use shared access to the specified table.

System action

CICS continues normally.

User response

None.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*

Destination

Console

DFHFC0410   *applid* **Data table cannot be opened. Data table initialization has failed for reason** *X'code'.*

Explanation

CICS is about to open a data table but has been unable to initialize shared data table services. The value of the reason code, X'*code*', provides further information about why CICS was unable to initialize shared data table services.

The format of the reason code is either: X'*ffaaaaaa*', in which *ff* is a value less than X'80' that identifies the type of failure, and *aaaaaa* is additional information provided for some of the failures, or when an abnormal termination (abend) has occurred, X'*axxxrrrr*' in which *a* is a value greater than or equal to X'8' that categorizes the type of abend, *rrrr* contains any register 15 abend reason code, and *xxx* contains the system or user completion code as three hexadecimal digits.

When X'*code*' < X'80000000', the values of X'*ff*' are:

X'01'

An unexpected failure occurred. This code is reported when the data tables SVC detects an unexpected error.

X'04'

An error was returned by the MVS RESMGR macro, called to establish an MVS resource manager for end-of-task processing. The first byte of the additional information, X'*aa0000*' contains the low order byte of the register 15 return code from the MVS RESMGR macro.

X'06'

An error was returned by the CICS SVC. The first byte of the additional information, X'*aa0000*' is the register 15 return code from the attempt to call the CICS SVC.

X'08'

An error was returned by the MVS DSPSERV macro. The additional information in the reason code consists of 1 byte containing the register 15 return code followed by 2 bytes containing the middle bytes from the register 0 reason code returned by DSPSERV.

X'09'

An error was returned by the MVS ALESERV macro, called to create an access list entry either for the data space or for references to the primary address space. The additional information in the reason code consists of one byte containing the register 15 return code followed by two bytes containing the ALESERV function code (service type) and qualifier (options) which identify the failing request.

X'0E'

An attempt to serialize the use of shared data table services (thus ensuring that only one TCB per address space can use the services) has failed. The first byte of additional information contains the ENQ return code.

When X'*code*' > X'80000000', the values of X'*a*' are formed from combinations of:

X'8'

An abend was detected.

X'4'

A user abend was detected, in which case *xxx* contains the hexadecimal equivalent of the user completion code (otherwise, *xxx* contains the hexadecimal system completion code).

X'2'

An abend was detected but could not be analyzed fully because no SDWA was available.

X'1'

An asynchronous abend was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action

CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved. A system dump is taken for unexpected errors (X'*ff*' =X'01') and for abends (if dumps are requested for that abend code).

User response

The response depends on the reason for the failure as indicated in the first byte of the reason code:

X'01'

Use the system dump to help you determine the cause of the problem.

X'04'

Refer to the documentation of the MVS RESMGR macro to interpret the low-order byte of the register 15 return code reported in the reason code.

X'06'

The most likely reason for a failure of the CICS SVC call is that the data tables SVC module DFHDTSVC could not be loaded, in which case the return code value is X'02'. If this is the case, check that the DFHDTSVC module is in the LPA or in an authorized library in the link list of the MVS system. If the module is in the correct location, investigate why it could not be loaded. There might be a hardware fault on the disk. Another less likely value for the return code is X'06', which implies that DFHDTSVC has been relink-edited and not marked reentrant.

X'08'

Refer to the documentation of the MVS DSPSERV macro to interpret the register 0 and register 15 return codes reported in the additional information part of the reason code.

X'09'

The function code (service type) and qualifier (options) reported in the reason code can be used to determine which ALESERV request was being attempted. Refer to the MVS ALESERV documentation and macro to interpret the function code, qualifier, and register 15 return code reported in the reason code.

X'0E'

This might indicate that the limit on the number of ENQs per address space has been reached, or that another TCB running in this CICS address space has already initialized as a requester of shared data table services.

> X'80'

When the reason code indicates that an abend has been detected, use the additional information provided in the reason code to find out what the abend was, and refer to information on that abend code to determine the cause.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

2. *X'code'*

Destination

Console

| **DFHFC0411** | *applid* **Data table cannot be opened. Data table initialization has failed owing to a storage failure - reason code *X'code'*.** |

Explanation

CICS is about to open a data table but has been unable to initialize shared data table services because of a failure to obtain storage. The value of the reason code, X'*code*', provides further information about the type of storage which could not be obtained.

The format of the reason code is X'*ttnnnnnn*' in which *tt* identifies the type of storage and, for some of the codes, *nnnnnn* gives the hexadecimal size in bytes of the storage which could not be obtained. For fixed-length storage blocks, the reason code does not usually report the size.

The values of X'*tt*' are:

X'01'

Private storage from MVS subpool 230 (key 0) for a work area used by the data tables SVC

X'02'

Private storage from MVS subpool 0 for the local header block used by a shared data table server

X'03'

Private storage from MVS subpool 0 for a pool for data table blocks

X'04'

Private storage from MVS subpool 0 for a pool for file blocks

X'08'

MVS/ESA data space storage

X'09'

Private storage from MVS subpool 230 (key 0) for a region anchor

X'11'

Private storage from MVS subpool 0 for a dummy recovery block

X'12'

Storage from MVS subpool 252 required to load the DFHDTAM load module

X'13'

Private storage from MVS subpool 230 (CICS key) for a parameter list used by the data tables SVC

X'14'

Private storage from MVS subpool 230 (key 0) for a new ALET list section

System action

CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved.

User response

The response depends on the type of storage indicated by the reason code. If it indicates private storage, you should reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

If it indicates data space storage, check whether the size of data spaces in this MVS system has been limited by use of the IEFUSI installation exit.

Destination

Console

DFHFC0412   *applid* **Data table cannot be opened. Data table initialization has failed owing to a module loading failure - reason code** *X'code'*.

Explanation

CICS is about to open a data table but a module loading failure has prevented the initialization of shared data table services. The value of the reason code, X'*code*', provides further information about which module was being loaded, and what went wrong with the attempt to load it.

The format of the reason code is X'*mfrraaaa*' in which *m* identifies the module and *f* is a code for the type of failure. For some failures, *rr* contains the register 15 return code from the failing macro call, and *aaaa* might contain additional information.

The value of X'*m*' can be:

X'1'

DFHDTFOR

X'2'

DFHDTAM

X'6'

DFHMVRMS

The values of X'*f*' are:

X'1'

module not found by a LOAD, BLDL or CSVQUERY macro call.

X'2'

an error was returned by the MVS LOAD macro. The two bytes X'*aaaa*' of additional information in the reason code contain the completion code from the LOAD. X'*rr*' is the register 15 return code.

X'3'

an error was returned by the MVS CSVQUERY macro. X'*rr*' is the register 15 return code.

X'4'

an error was returned by the MVS BLDL macro. The two bytes X'*aaaa*' of additional information in the reason code contain the R0 reason code returned by BLDL.

X'5'

the module is not reentrant.

X'6'

the module had the wrong AMODE.

X'7'

the module had the wrong RMODE.

:note text='Note for CICS/ESA 3.2.1 users'. There is an additional code of X'08000000' which is only seen on a CICS/ESA 3.2.1 system that has DFHDTINS installed in the LPA or in its load library, and has mistakenly loaded this module.

System action

CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The

following message indicates the action taken for the table involved.

User response

The response depends on the reason for the failure as indicated in the second hex digit of the reason code:

X'1'

Use the first hex digit to determine which module could not be found, and ensure that it is in the correct library.

X'2'

Refer to the documentation of the MVS LOAD macro to interpret the return and completion codes given in the reason code. There might also be a message from the MVS LOAD which explains the reason for the failure.

X'3'

Refer to the documentation of the MVS CSVQUERY macro to interpret the return code given in the second byte of X'*code*'.

X'4'

This indicates an I/O error or a storage allocation failure. Refer to the documentation of the MVS BLDL macro to interpret the values in the reason code X'*code*'.

X'5', X'6', X'7'

Use the first digit of the reason code to determine the name of the module, then check the status of that module. These errors imply that it is either not the module which was supplied with CICS or that it has become corrupted.

:note text='Note for CICS/ESA 3.2.1 users'. If the reason code was X'08000000', the shared data tables module DFHDTINS has been incorrectly installed in a library which is used by this CICS/ESA 3.2.1 system. If DFHDTINS is in the load library specified by this CICS, it should be removed: shared data tables support cannot be installed on a CICS system at a lower level than 3.3. If it is in the link pack area (LPA) of this MVS system, it should be removed: the DFHDTINS module should not be placed in the LPA of an MVS system which contains any CICS regions at release 3.2.1 which might want to use data tables, unless a PTF has been applied to the CICS 3.2.1 regions

1. *applid*

2. *X'code'*

Destination

Console

| DFHFC0415 | *applid* **Remote data tables cannot be accessed. Shared data table initialization has failed for reason X'*code*'.** |

Explanation

CICS is about to access a remote file resource which may have an associated shared data table. However, shared data tables cannot be used to access any remote tables because CICS has been unable to initialize data table services. Note that if CICS finds module DFHTDINS in the STEPLIB concatenation or in the LPA it will assume that shared data tables is required and will thus try to initialize it. The value of the reason code, X'*code*', provides further information about why this CICS region was unable to perform the initialization required to act as a requester of shared data table services.

The format of the reason code is either: X'*ffaaaaaa*' in which *ff* is a value less than X'80' that identifies the type of failure, and *aaaaaa* is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, X'*axxxrrrr*' in which *a* is a value greater than or equal to X'8' that categorizes the type of abend, *rrrr* contains any register 15 abend reason code, and *xxx* contains the system or user completion code as three hexadecimal digits.

When X'*code*' < X'80000000', the values of X'*ff*' are:

X'01'

An unexpected failure occurred. This code is reported when the data tables SVC detects an error which should never occur.

X'06'

An error was returned by the CICS SVC. The first byte of the additional information, *aa0000*, is the register 15 return code from the attempt to call the CICS SVC.

X'0E'

An attempt to serialize the use of shared data table services (thus ensuring that only one TCB per address space can use the services) has failed. The first byte of additional information contains the ENQ return code.

When X'*code*' > X'80000000', the values of X'*a*' are formed from combinations of:

X'8'

An abend was detected.

X'4'

A user abend was detected, in which case *xxx* contains the hexadecimal equivalent of the user completion code (otherwise, *xxx* contains the hexadecimal system completion code).

X'2'

An abend was detected but could not be analyzed fully because no SDWA was available.

X'1'

An asynchronous abend was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action

CICS continues normally and function ships this and subsequent remote file requests. Initialization is retried after about 10 minutes. A system dump is taken for unexpected errors (X'*ff*' =X'01') and for abends (if dumps are requested for that abend code).

User response

The response depends on the reason for the failure as indicated in the first byte of the reason code:

X'01'

Use the system dump to help you determine the cause of the problem.

X'06'

The most likely reason for a failure of the CICS SVC call is that the data tables SVC module DFHDTSVC could not be loaded, in which case the return code value is X'02'. If this is the case, check that the DFHDTSVC module is in the LPA or in an authorized library in the link list of the MVS system. If the module is in the correct location, then investigate why it could not be loaded; possibly there might be a hardware fault on the disk. Another less likely value for the return code is X'06', which implies that DFHDTSVC has been relink-edited and not marked reentrant.

X'0E'

This might indicate that the limit on the number of ENQs per address space has been reached, or that another TCB running in this CICS address space has already initialized as a requester of shared data table services.

> X'80'

When the reason code indicates that an abend has been detected, use the additional information provided in the reason code to find out what the abend was, and refer to information on that abend code to determine the cause.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*

Destination

Console

DFHFC0416	*applid* **Remote data tables cannot be accessed. Shared data table initialization has failed owing to a storage failure - reason code *X'code'*.**

Explanation

CICS is about to access a remote file resource. However, a failure to get storage has prevented CICS from initializing shared data table services. The value of the reason code, X'*code*', provides further information about the type of storage which could not be obtained:

The format of the reason code is X'*ttnnnnnn*' in which *tt* identifies the type of storage and, for some of the codes, *nnnnnn* gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of X'*tt*' are:

X'01'

Private storage from MVS subpool 253 (below the 16MB line) for a work area required by module DFHQSSS

X'02'

Private storage from MVS subpool 0 for the shared data table header block required for this CICS to act as a data tables requester

X'09'

Private storage from MVS subpool 230 (key 0) for a region anchor

X'0A'

ECSA storage from subpool 241 (key 0) for a
qualified subsystem block

X'0B'

ECSA storage from MVS subpool 241 (key 0) for a
system anchor

X'0E'

Private storage from MVS subpool 230 (key 0) for a
connect header block

System action

CICS continues normally and function ships this
and subsequent remote file requests. Initialization is
retried after about 10 minutes.

User response

The response depends on the type of storage indicated
by the reason code.

If it indicates private storage, you should reconsider
the various region size parameters which have been
specified on the CICS job or have been set as defaults
for the system by IEALIMIT or the IEFUSI installation
exit. It might be necessary to take an SDUMP of the
CICS job and process it using the VERBEXIT VSMDATA
in order to investigate the way in which MVS storage
has been allocated to the various subpools.

If it indicates ECSA (extended common service area)
storage, you should review the CSA size specified in
system parameter list IEASYSxx, or by use of the
CSA override on initialization of the MVS system. You
should also review the size of the ESQA, since the
system might have started to use ECSA storage if the
ESQA storage is depleted.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *X'code'*

Destination

Console

DFHFC0417	*applid* **Remote data tables cannot be accessed. Shared data table initialization has failed owing to a module loading failure - reason code** *X'code'*.

Explanation

CICS is about to access a remote file resource.
However, shared data tables cannot be used to access
any remote tables because a module loading failure
prevents CICS from initializing data table services.

The value of the reason code, X'*code*', provides further
information about which module was being loaded,
and what went wrong with the attempt to load it.

The format of the reason code is X'*mfrraaaa*' in which
m identifies the module and *f* is a code for the type
of failure. For some failures, *rr* contains the register
15 return code from the failing macro call, and *aaaa*
might contain additional information.

The value of X'*m*' can be:

X'3'

DFHDTAOR

X'4'

DFHDTCV

The values of *f* are:

X'1'

module not found by LOAD

X'2'

an error was returned by the MVS LOAD macro. The
two bytes X'*aaaa*' of additional information in the
reason code contain the completion code from the
LOAD. X'*rr*' contains the register 15 return code

X'5'

the module is not reentrant.

X'6'

the module had the wrong AMODE.

System action

CICS continues normally and function ships this
and subsequent remote file requests. Initialization is
retried after about 10 minutes.

User response

The response depends on the reason for the failure as
indicated in the second hex digit of the reason code:

X'1'

Use the first hex digit to determine which module
could not be found, and ensure that it is in the
correct library.

X'2'

Refer to the documentation of the MVS LOAD macro to interpret the return and completion codes reported in the reason code. There might also be a message from the MVS LOAD which explains the reason for the failure.

X'5', X'6'

Use the first digit of the reason code to determine the name of the module, then check the status of that module. This error implies that it is either not the module which was supplied with CICS or that it has become corrupted.

Module:
DFHFCFS

2. *X'code'*

Destination

Console

DFHFC0420   *applid* **Shared access to data tables cannot be provided by this CICS system because it has not been registered as a shared data table server - reason code *X'code'*.**

Explanation

CICS is about to open a data table but has been unable to do so because this CICS system has not been registered as a shared data table server. The value of the reason code, X'*code*', provides further information about why this CICS system was unable to register (LOGON) as a shared data table server.

The format of the reason code is either: X'*ffaaaaaa*' in which *ff* is a value less than X'80' that identifies the type of failure, and *aaaaaa* is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, X'*axxxrrrr*' in which *a* is a value greater than or equal to X'8' that categorizes the type of ABEND, *rrrr* contains any register 15 ABEND reason code, and *xxx* contains the system or user completion code as three hexadecimal digits.

When X'*code*' < X'80000000', the values of X'*ff*' are:

X'01'

This code is reported when the data tables SVC detects an unexpected error.

X'02'

Another region within the MVS image with the same APPLID as this region is already registered (logged on) as a shared data tables server.

X'03'

DFHDTRM has supplied the data tables SVC with an invalid address for the PC vector, or the PC vector specifies an invalid number of entry table entries (ETEs). In the latter case, X'*aaaaaa*' contains the number of ETEs that were requested.

X'04'

A failure occurred when attempting to establish an MVS resource manager for end-of-memory processing. The first byte of the additional information, X'*aa0000*' contains the low order byte of the register 15 return code from the MVS RESMGR macro.

X'05'

A failure occurred when attempting to make the server address space permanently non-swappable. The additional information, X'*aaaaaa*', contains the low order 3 bytes of the code posted in an ECB that was specified when the SYSEVENT TRANSWAP macro was issued.

X'06'

An error was returned by the CICS SVC. The first byte of the additional information, X'*aa0000*' is the register 15 return code from the attempt to call the CICS SVC.

X'0D'

An error occurred when issuing an MVS ENQ to ensure that, at any given time, only one server per MVS system can be active for a given APPLID. The first byte of the additional information, X'*aa0000*' contains the return code from ENQ.

X'10'

An attempt to create the environment for shared data tables connect security checks has found that the security environment has already been set up.

X'11'

There is a disparity between the actual version of the CICS security block and the version which was used to assemble the shared data tables module DFHDTXS.

When X'*code*' > X'80000000', the values of X'*a*' are formed from combinations of:

X'8'

An ABEND was detected.

X'4'

A user ABEND was detected, in which case *xxx* contains the hexadecimal equivalent of the user completion code (otherwise, *xxx* contains the hexadecimal system completion code).

X'2'

An ABEND was detected but could not be analyzed fully because no SDWA was available.

X'1'

An asynchronous ABEND was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action

CICS continues normally and attempts to open the table for local use only. A system dump is taken for unexpected errors (X'*ff* =X'01') and for ABENDs (if dumps are requested for that ABEND code).

User response

The response depends on the reason for the failure as indicated in the first byte of the reason code:

X'01'

Use the system dump to help you determine the cause of the problem.

X'02'

There cannot be more than one region with a given APPLID acting as a shared data table server within the same MVS image.

X'03'

This error might indicate that some corruption of the system has occurred, or that there is an error in CICS code.

X'04'

Refer to the documentation of the MVS RESMGR macro to interpret the return code reported in the additional information part of the reason code.

X'05'

Refer to the documentation of the MVS SYSEVENT macro to interpret the ECB contents reported in the additional information part of the reason code.

X'06'

Server initialization should have been completed before LOGON is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDTSVC should not be encountered.

Therefore this error probably indicates a logic problem or corruption of your system.

X'0D'

Refer to the documentation of the MVS ENQ macro to interpret the return code reported in the additional information part of the reason code.

X'10'

This error might indicate that some corruption of the system has occurred, or that there is an error in CICS code.

X'11'

This error might indicate that service has been applied which requires PTFs to both base CICS and the shared data tables code, and only one has been correctly updated, or that some corruption of the system has occurred, or that there is an error in CICS.

> X'80'

When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that ABEND code to determine the cause.

DFHFC0432	*applid* **Data table request for file** *filename* **has failed because the table is full for reason** *eibresp2***.**

Explanation

CICS has attempted to add or rewrite a record to the data table for file resource *filename* but has failed with a NOSPACE condition. The value of eibresp2 can be:

102

> The maximum number of table entries specified for the user-maintained table or coupling facility data table has already been reached. This condition can also occur for a recoverable coupling facility data table when the table apparently

contains fewer than the maximum number of records allowed if there are uncommitted updates outstanding.

103

> CICS is unable to get sufficient storage in the CICS address space to create an in-memory table entry for the record being written.

108

> There is insufficient space in the coupling facility data table pool to store the record.

System action

CICS continues normally.

User response

Examine the eibresp2 reason code to determine why the NOSPACE condition occurred. Increase the appropriate storage available to the data table or thee number of entries allowed in the table.

Module:
DFHEIFC

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*
3. *eibresp2*

Destination

Console

DFHFC0435	*applid* **Data table access request for remote file** *filename* **has failed for reason** *X'code'***.**

Explanation

An error has occurred while the requesting region was attempting to establish a connection to the remote file *filename* owned by the serving region. The value of the reason code, X'*code*', provides further information about why CICS was unable to connect to the remote file.

The format of the reason code is either: X'*ffaaaaaa*' in which *ff* is a value less than X'80' that identifies the type of failure, and *aaaaaa* is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, X'*axxxrrrr*' in which *a* is a value greater than or equal to X'8' that categorizes the type of ABEND, *rrrr* contains any register 15 ABEND reason code, and *xxx*

contains the system or user completion code as three hexadecimal digits.

When X'*code*' < X'80000000', the values of X'*ff*' are:

X'01'

An unexpected failure occurred. This code is reported when the data tables SVC detects an error which should never occur.

X'06'

An error was returned by the CICS SVC. The first byte of the additional information, *aa0000*, is the register 15 return code from the attempt to call the CICS SVC.

X'07'

The connection index returned by the data tables SVC exceeds the maximum value supported by the calling module (2^{20} - 1).

X'0A'

The scan of the chain of files owned by the serving region has failed because there is a permanently invalid entry on the chain which indicates that the chain has become damaged.

X'0B'

The number of connections by this requesting CICS region to the remote file is already at the allowed maximum (2^{32} - 1).

X'0C'

The vector which records details of all connections to shared data tables by this requesting CICS region needs expanding, but this would cause it to equal or exceed a size of 16MB.

X'0F'

An attempt to serialize with termination of the server has failed because the number of ENQs has reached the address space limit. The first byte of the additional information, X'*aa0000*', contains the return code from the ENQ.

When X'*code*' > X'80000000', the values of X'*a*' are formed from combinations of:

X'8'

An ABEND was detected.

X'4'

A user ABEND was detected, in which case *xxx* contains the hexadecimal equivalent of the user completion code (otherwise, *xxx* contains the hexadecimal system completion code).

X'2'

An ABEND was detected but could not be fully analyzed because no SDWA was available.

X'1'

An asynchronous ABEND was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action

CICS continues normally and function ships this and subsequent remote file requests. Use of shared tables is retried after about 10 minutes. A system dump is taken for unexpected errors (X'*ff*' =X'01') and for ABENDs (if dumps are requested for that ABEND code).

User response

The response depends on the reason for the failure as indicated in the first byte of the reason code:

X'01'

Use the system dump to help you determine the cause of the problem.

X'06'

Requester initialization should have been completed before CONNECT is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDTSVC should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.

X'07'

Some changes to your system configuration should be made, as this requesting region is trying to access too many shared data tables owned by other regions. It is necessary either to reduce the number of remote files being used, or to split the requesting CICS region into a number of smaller regions.

X'0A'

This indicates corruption of subpool 0 storage in the server region.

X'0B'

This indicates that either the requesting region contains more than 2^{32} - 1 remote file definitions, all of which refer to the same file in the server region, or that storage has been corrupted.

X'0C'

Same response as X'07'.

X'0F'

Refer to the documentation of the MVS ENQ macro to interpret the return code reported in the additional information part of the reason code.

> X'80'

When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that ABEND code to determine the cause.

Console

DFHFC0436   *applid* **Data table access request for remote file *filename* has failed because of a storage failure - reason code *X'code'*.**

Explanation

CICS has attempted to access the remote file resource *filename* but cannot do so because of a failure to get storage.

The value of the reason code, X'*code*', provides further information about the type of storage which could not be obtained:

The format of the reason code is X'*ttnnnnnn*' in which *tt* identifies the type of storage and, for some of the codes, *nnnnnn* gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of X'*tt*' are:

X'01'

Private storage from MVS subpool 230 (key 0) for a work area used by module DFHDTXS or for a work area used by data tables SVC CONNECT processing.

X'0F'

Private storage from MVS subpool 230 (key 0) for a connect vector

System action

CICS continues normally and function ships this and subsequent remote file requests. Use of shared tables is retried after about 10 minutes.

User response

The response depends on the type of storage indicated by the reason code.

As it indicates private storage, you should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*
3. *X'code'*

Destination

Console

DFHFC0440   *applid* **Data table close request for file *filename* has failed for reason *X'code'*.**

Explanation

CICS has attempted to close a data table for file resource *filename* but has been unable to do so.

System action

CICS continues normally. The table is treated as having been closed.

A system dump is taken for unexpected errors (X'*ff*' =X'01') and for abends (if dumps are requested for that abend code).

User response

The response depends on the reason for the failure as indicated in the first byte of the reason code:

X'01'

Use the system dump to help you determine the cause of the problem.

X'06'

Server initialization should have been completed before LOGON is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDTSVC should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.

X'09'

The function code (service type) and qualifier (options) reported in the reason code can be used to determine which ALESERV request was being attempted. Refer to the MVS ALESERV documentation and macro to interpret the function code, qualifier, and register 15 return code reported in the reason code.

> X'80'

When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that abend code to determine the cause.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*
3. *X'code'*

Destination

Console

DFHFC0441	*applid* Data table close request for file *filename* has failed owing to a storage failure - reason code *X'code'*.

Explanation

CICS has attempted to close a data table for file resource *filename* but has been unable to do so owing to a failure to release storage.

The format of the reason code is X'*ttnnnnnn*' in which *tt* identifies the type of storage and, for some of the codes, *nnnnn* gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of X'*tt*' are:

X'14'

private storage from MVS subpool 230 (key 0) for a new ALET list section

System action

CICS continues normally. The table is treated as having been closed.

User response

You should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It may be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*
3. *X'code'*

Destination

Console

DFHFC0445	*applid* Data table disconnect request for remote file *filename* has failed for reason *code*.

Explanation

CICS has attempted to disconnect from the remote data table *filename* but has been unable to do so.

An error has occurred while the requesting region was attempting to break the connection to the remote file *filename* owned by the serving region. The value of the reason code, X'*code*', provides further information about why CICS was unable to disconnect from the remote file.

The format of the reason code is either: X'*ffaaaaaa*' in which *ff* is a value less than X'80' that identifies the type of failure, and *aaaaaa* is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, X'*axxxrrrr*' in which *a* is a value greater than or equal to X'8' that categorizes the type of ABEND, *rrrr* contains any register 15 ABEND reason code, and *xxx*

contains the system or user completion code as three hexadecimal digits.

When X'*code*' < X'80000000', the values of X'*ff*' are:

X'01'

An unexpected failure occurred. This code is reported when the data tables SVC detects an error which should never occur.

X'06'

An error was returned by the CICS SVC. The first byte of the additional information, *aa0000*, is the register 15 return code from the attempt to call the CICS SVC.

When X'*code*' > X'80000000', the values of X'*a*' are formed from combinations of:

X'8'

An ABEND was detected.

X'4'

A user ABEND was detected, in which case *xxx* contains the hexadecimal equivalent of the user completion code (otherwise, *xxx* contains the hexadecimal system completion code).

X'2'

An ABEND was detected but could not be analyzed fully because no SDWA was available.

X'1'

An asynchronous ABEND was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action

CICS continues normally. The table is treated as having been disconnected from the requesting CICS system. A system dump is taken for unexpected errors (X'*ff*' =X'01') and for ABENDs (if dumps are requested for that ABEND code).

User response

The response depends on the reason for the failure as indicated in the first byte of the reason code:

X'01'

Use the system dump to help you determine the cause of the problem.

X'06'

Requester initialization should have been completed before DISCONNECT is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDTSVC should not

be encountered. Therefore this error probably indicates a logic problem or corruption of your system.

> X'80'

When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that ABEND code to determine the cause.

1. *applid*
2. *filename*

Destination

Console

DFHFC0503	*applid* **Non-RLS OPEN of file *filename* failed. Access type switch to non-RLS attempted while other files open for the same data set have RLS access type.**

Explanation

While CICS was opening file *filename*, the CICS file control open/close routine detected that the access type for the file has been changed to non-RLS but there are still other files open for the data set with RLS access type. The file cannot be opened until all the other files have closed.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

User response

Close all the other files or change access of this file back to RLS. Files for the same data set should have the same access type.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*

Destination

Console

DFHFC0504	*applid* **RLS OPEN of file *filename* failed. The VSAM SHOWCB macro has detected a RLS VSAM server failure. RLS access has been disabled.**

Explanation

While CICS was opening file *filename*, the CICS file control RLS open/close routine received a return code of X'1A' in register 15. This means that the RLS VSAM server is not available so file control has disabled RLS access. The return code was returned by the SHOWCB macro when CICS was attempting to find the reason for the open failure that had just been detected.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition. CICS reenables RLS access when the RLS VSAM server restarts.

User response

None.

Module:
DFHFCRO

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*

Destination

Console

DFHFC0505	*applid* **RLS CLOSE of file *filename* failed. The VSAM SHOWCB macro has detected a RLS VSAM server failure. RLS access has been disabled.**

Explanation

While CICS was closing file *filename*, the CICS file control RLS open/close routine received a return code which indicates that the RLS VSAM server is unavailable. Consequently file control has disabled and closed down RLS access. This does not affect the rest of the close processing. The return code is returned by the SHOWCB macro which is invoked during CICS close.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any subsequent close requests for other files which are issued while the server is unavailable also receive the error return code but do not issue this message. CICS reenables RLS access when the RLS VSAM server restarts.

User response

None.

Module:
DFHFCRO

Destination

Console

DFHFC0512	*applid* Non-RLS OPEN of file *filename* failed. This CICS has other files open for the data set (or its associated base) with RLS access mode. The data set name is *dsname*.

Explanation

While CICS was opening file *filename,* the CICS file control non-RLS open/close routine detected that this region has other files open for the data set *dsname,* or its associated base data set, in RLS access mode. This file cannot be opened in non-RLS access mode until all the other RLS mode files have closed, even if this file is opening the data set in read-only mode. This constraint is to ensure a consistent view of this data set from within each CICS region.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

User response

Close all the other files or change access of this file to RLS mode. Files accessing the same base data set from within a given CICS region must all have the same access mode. This includes access via a path data set.

Module:

DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*
3. *dsname*

Destination

Console

DFHFC0513	*applid* **Non-RLS OPEN of file** ***filename*** **has failed. CICS has unresolved RLS recovery work for the data set (or its associated base). The data set name is** ***dsname*****.**

Explanation

While CICS was opening file *filename*, the CICS file control non-RLS open/close routine detected that this region has unresolved recovery work for the data set *dsname*, or its associated base data set, which requires the base data set and any associated path data sets to be accessed in RLS mode. This file cannot be opened until all the RLS recovery work has been resolved. This constraint ensures that any automatic resolution of the recovery work is not impeded by non-RLS accesses to the data set.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

User response

Use the INQUIRE UOWDSNFAIL command to investigate the RLS recovery work, and take action to resolve it. This may involve retrying backout-failed units of work and resynchronising indoubt-failed units of work. See the Administering recovery and restart for more information on unit of work failures and their resolution.

2. *filename*
3. *dsname*

Destination

Console

DFHFC0555	*applid* **One or more data sets are in lost locks status. CICS will perform lost locks recovery.**

Explanation

CICS had one or more data sets open in RLS access mode at the time of a failure of the coupling facility lock structure from which SMSVSAM was not able to recover transparently. As a result, the RLS locks held by CICS for those data sets have been lost.

SMSVSAM has informed CICS that one or more data sets are in a lost locks state with respect to this CICS. CICS must therefore perform lost locks recovery for those data sets.

This can occur on a CICS warm or emergency restart, and on a dynamic RLS restart. On a CICS cold or initial start, if there are any data sets with lost locks status, that status is cleared with respect to this CICS.

System action

The data sets with lost locks status are marked as being unavailable for general use. Units of work that attempt to access such data sets abend with an AFCU abend code.

CICS performs lost locks recovery for the data sets. For each data set, lost locks recovery involves waiting until all units of work that had made uncommitted updates to the data set have completed. These units of work are allowed to access the data set, in order to perform their recovery. When CICS has completed lost locks recovery for a data set, it reports this fact to SMSVSAM. When all CICS regions that had been accessing the data set have completed their lost locks recovery, then the data set is made available for general use again. Note that a data set becomes

available for general use as soon as its lost locks recovery has been completed; it does not have to wait for all data sets to be recovered.

CICS takes the following actions to expedite lost locks recovery:

- Backout-failed and commit-failed units of work are driven for retry
- On a dynamic RLS restart, inflight transactions that had updated the data set are purged (on a warm or emergency restart, inflight units of work are automatically backed out).

User response

Lost locks recovery normally completes automatically without requiring any action from the user. However, if there are shunted units of work which had updated a data set with lost locks status, these prevent lost locks recovery from completing until they are resolved. Use the INQUIRE UOWDSNFAIL command to investigate these shunted units of work.

If lost locks recovery appears to be taking a long time, you can compare the output obtained by issuing the IDCAMS SHCDS LISTSUBSYS(ALL) command at different intervals, to determine what progress has been made.

See the Administering recovery and restart for guidance on resolving shunted units of work which hold RLS retained locks.

Module:
DFHFCRR

XMEOUT parameters/Message inserts

1. *applid*

Destination

Console

DFHFC0556	*applid* **Unexpected notification of completion of lost locks recovery for data set** *dsname***.**

Explanation

CICS has received a notification from SMSVSAM that lost locks recovery has completed for data set *dsname*, but CICS still has outstanding lost locks recovery work for that data set. This notification has therefore been issued out of sequence.

System action

CICS continues processing. The data set remains in a lost locks state, and CICS continues with its lost locks recovery. New file control requests against the data set will continue to be rejected with AFCU abends. When all CICS regions have completed their lost locks recovery for the data set, then a valid notification will be received and CICS will remove the data set from the lost locks state.

There will be an instance of this message on each CICS system for each data set when an unexpected notification is received.

User response

Lost locks recovery processing should complete normally without any user intervention.

However, this message is an indication of a probable logic error in SMSVSAM, so you should take dumps of all the SMSVSAM servers and their associated data spaces in the sysplex. See Working with IBM to solve your problem for guidance on how to proceed.

RLS access is now available.

System action

Processing continues.

User response

None.

Module:
DFHFCRR.

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHFC0571   *applid* **RLS access cannot be restarted.**

Explanation

An error has occurred while attempting to restart CICS access to VSAM RLS, either at startup, or during a dynamic RLS restart which took place when the VSAM RLS server became available while CICS was running. Because of this error, it may not be possible to access VSAM RLS again during this CICS run.

Access is made available again only if the VSAM RLS server in this MVS system fails causing CICS to perform dynamic RLS restart processing when it restarts, or if you choose to deliberately recycle the RLS server to trigger a dynamic restart.

System action

CICS continues, but with access to VSAM RLS disabled (unless an offsite restart is being performed). Other CICS functions, including access to non-RLS VSAM files, should continue.

At the time the error affecting RLS restart is detected, CICS issues one or more messages and takes a system dump.

This error might also affect other aspects of this CICS system, for example if it is due to the corruption of internal CICS control structures.

If an **offsite restart** is being performed; that is, if OFFSITE=YES was specified as a system initialization override, then CICS does not continue, but is terminated with a system dump. When RLS offsite recovery is required, then there is no value in continuing without RLS, because it will be needed in order for the offsite restart to be able to complete. Until all CICS systems complete their offsite recovery work, including this one, no other CICS system in the CICSplex will be allowed to perform new RLS work either.

User response

If you do not need access to any VSAM RLS files from this CICS system, you can allow CICS to continue. For example, this CICS system might never open files in RLS access mode, or you might prefer to continue without RLS access in order to continue this CICS run.

If you do need to access VSAM RLS files from this CICS, consider shutting CICS down and restarting it, or recycling the VSAM RLS server. However, be aware that recycling the server causes all CICS systems in this MVS to go through dynamic RLS restart processing, which implicitly closes all files that were open in RLS access mode.

To determine the cause of the original error, examine the messages and the system dump that were issued when the error was detected.

If you are performing an **offsite restart**, then restart CICS with OFFSITE=YES still specified as a system initialization override.

Module:
DFHFCRR.

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHFC0574   *applid* **RLS offsite recovery will be performed. Normal RLS access is not allowed.**

Explanation

OFFSITE=YES has been specified as a SIT override, and RLS is supported by this CICS (RLS=YES has been specified and the level of DFSMS/MVS supports RLS). This message is issued during file control initialization to indicate that RLS offsite recovery processing is to be carried out during this CICS run.

System action

RLS access is not allowed until after this CICS has performed its RLS recovery work. Only tasks performing the recovery work are allowed RLS access. Message DFHFC0575 is issued when RLS recovery has been completed by this CICS. RLS access for normal work is not allowed until this CICS has issued message DFHFC0575 and received the reply GO. The description of message DFHFC0575 explains when it is safe to reply to the message.

User response

Wait for message DFHFC0575 to be issued. If this does not happen shortly after CICS restart has completed, there are probably some backout failed or indoubt failed units of work which had updated RLS data sets, and which are now delaying the completion of RLS recovery. In this case you should use the INQUIRE UOWDSNFAIL command to determine the causes of such failures, and to resolve them.

If some of the failures cannot be resolved cleanly, you may decide to force indoubt units of work and to reset locks for backout failed units of work. See the Administering recovery and restart for guidance on resolving RLS retained locks.

If CICS terminates for any reason before message DFHFC0575 is issued, specify OFFSITE=YES on the restart.

OFFSITE=YES must be specified on all restarts until the offsite recovery has completed and you have responded to message DFHFC0575.

Module:
DFHFCRP

XMEOUT parameters/Message inserts

 1. *applid*

Destination

Console

DFHFC0575D	*applid* Reply *GO* only after all CICS regions have completed offsite recovery and issued this message.

Explanation

This message is issued when a CICS system is participating in an offsite recovery of a CICSplex.

The message is issued when this CICS system has completed all of its RLS recovery work. CICS has backed out or committed all units of work which had made updates to data sets open in RLS mode, and which were either inflight or shunted at the time of the disaster at the primary site (or, more exactly, which were in that state at the common point in time to which the CICS system logs have been pruned).

System action

CICS processing continues, but the system task which issued this message waits for your reply. RLS access is not allowed for user applications until the reply is received, after which CICS allows new RLS work to run.

The User Response explains when it is safe for you to reply.

User response

The message indicates that RLS recovery work has been completed by a particular CICS region. Replying to it indicates that all RLS recovery for the offsite CICSplex has been completed. Do not reply until all CICS regions in the CICSplex have issued this message. When this has happened, you should reply GO. When you next restart this CICS region after having replied GO, you should revert to the default value of NO for the system initialization parameter OFFSITE.

GO is the only reply allowed. If you supply any other response, the message is reissued with a new reply number.

If you suspect that there will be a problem getting some of the CICS regions in the CICSplex to complete their RLS recovery work, and would therefore prefer to shut this CICS down in the meantime, you can use the main terminal to do so. You must specify OFFSITE=YES when you restart the CICS region because offsite recovery for the CICSplex has not been completed. Remember that OFFSITE=YES must be specified on all restarts until the offsite recovery has completed and you have responded to message DFHFC0575.

Module:
DFHFCOR

XMEOUT parameters/Message inserts

 1. *applid*
 2. *GO*

Destination

Console

DFHFC0577	*applid* RLS offsite recovery is now complete. RLS access is allowed.

Explanation

This message is issued when a CICS system is participating in an offsite recovery of a CICSplex.

The message is issued when the reply GO has been supplied to message DFHFC0575.

System action

CICS allows user applications to access RLS because it is assumed that a reply of GO means that all CICS systems in the CICSplex have completed their RLS

recovery work, and it is therefore safe to allow sharing of RLS data sets.

User response

Once you have received this message, you can recode your SIT overrides so that OFFSITE=NO is specified when this CICS is next restarted.

Console

DFHFC0578   *applid* **File Control has opened file** *filename* **which is a recoverable** *filetype*, **however no XFCLDEL global user exit program is enabled.**

Explanation

If CICS is required to back out a unit of work that performed a write operation to a VSAM ESDS, or a BDAM data set, a backout failure will occur.

System action

None. The message is informational.

User response

To prevent a backout failure in the case described above, enable and start a suitable XFCLDEL exit program. For further information, refer to Exit XFCLDEL, file control logical delete exit.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*
3. *filetype*

Destination

Console

DFHFC0579   *applid* **The last XFCLDEL global user exit program has been disabled.**

Explanation

As the result of a DISABLE PROGRAM command, there are no XFCLDEL global user exit programs enabled. If CICS is required to back out a unit of work that performed a write operation to a VSAM ESDS, or a BDAM data set, a backout failure will occur.

System action

None. The message is informational.

User response

To prevent a backout failure in the case described above, enable and start a suitable XFCLDEL exit program. For further information, refer to Exit XFCLDEL, file control logical delete exit.

Module:
DFHFCMT

XMEOUT parameters/Message inserts

1. *applid*

Console

DFHFC0600   *date time applid* **BUNDLE** *bundlename* **has successfully installed FILE** *filename* **as {Enabled | Disabled}.**

Explanation

The CICS bundle *bundlename* has successfully installed FILE *filename*

System action

CICS continues normally.

User response

None.

Module:
DFHFCBU

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *bundlename*
5. *filename*

6. Value chosen from the following options:

   1=Enabled,

   2=Disabled

Destination

CSFL

DFHFC0601 *date time applid* **BUNDLE** ***bundlename* has failed to install FILE** *filename* **because** *{the definition is invalid | of an installation failure | the file name cannot begin with 'DFH' | an internal error occurred}.*

Explanation

The CICS bundle *bundlename* has failed to install FILE *filename* The reason for the error is also given.

System action

The BUNDLE resource is disabled and the FILE is not created.

User response

Investigate and correct the cause of the failure. Check for any previous messages which may give you more information about the reason for the failure as follows:

definition is invalid

Check for a preceding DFHCAnnnn message. For example DFHCA5504 is output if the REMOTESYSTEM attribute is specified but the REMOTENAME attribute is not specified.

installation failure

Check for a preceding DFHAMnnnn console message. For example DFHAM4950 is output if a FILE with the same name already exists.

Discard and reinstall the BUNDLE resource.

Module:
DFHFCBU

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *bundlename*
5. *filename*
6. Value chosen from the following options:

   1=the definition is invalid,

   2=of an installation failure,

   3=the file name cannot begin with 'DFH',

   4=an internal error occurred

Destination

CSFL

DFHFC0602 *date time applid* **File name was not specified or is too long in BUNDLE** ***bundlename.***

Explanation

The CICS bundle *bundlename* has failed to install a FILE because the resource name was not specified or was too long.

System action

The BUNDLE resource is disabled and the FILE is not created.

User response

Correct the name of the file resource in the bundle manifest file. Discard and reinstall the BUNDLE resource.

Module:
DFHFCBU

XMEOUT parameters/Message inserts

2. *time*
3. *applid*
4. *bundlename*

Destination

CSFL

DFHFC0920 *applid* **Open of empty file** *filename* **failed. VSAM codes -** *eeee,rrrr,cccc*

Explanation

CICS file control issued an OPEN command for VSAM file *filename* but the command failed with VSAM return code *cccc*. The CICS internal error code *eeee* has a value of 8509 and *rrrr* is the return code in register 15.

This failure is probably caused by the file not being loaded before use by CICS.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116, which contains the symptom string for this problem, is produced.

VSAM issues a console error message.

User response

Check whether the file has been loaded before being accessed by CICS. This condition is probably the result of a user error in passing an empty file to CICS.

For the meaning of the VSAM return code, see z/OS DFSMS Macro Instructions for Data Sets.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*
3. *eeee*
4. *rrrr*
5. *cccc*

Destination

Console

DFHFC0931   *applid* **OPEN of data table** *name* **failed for reason** *n.*

Explanation

CICS was unable to OPEN the user-maintained data table *name* for reason *n*, where *n* may have one of the following values:

1

  The data table support initialization module DFHDTINS could not be loaded.

2

  Initialization of data table support has failed. This message is preceded by one of messages DFHFC0410, DFHFC0411 or DFHFC0412 which identifies the reason for the failure.

3

  The source data set for the data table is not a KSDS base data set.

4

  The data table OPEN module DFHDTST has reported an error. This message is preceded by one of messages DFHFC0430 or DFHFC0431 which identifies the error.

6

  The file definition for the data table allows neither read nor browse access.

System action

The data table remains closed and is DISABLED. CICS processing continues.

User response

The appropriate user response depends on the reason code *n* as follows:

1

  Check that module DFHDTINS is present in the library.

2

  See the user action for the preceding message (which will be one of DFHFC0410, DFHFC0411 or DFHFC0412).

3

  Check whether the data table has been associated with the intended source data set.

4

  See the user action for the preceding message (which will be one of DFHFC0430 or DFHFC0431).

6

  Change the SERVREQs in the file definition. There is no benefit in using data tables support for a file which cannot be read or browsed.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *name*
3. *n*

Destination

Console

DFHFC0932   *applid* **OPEN of data table** *name* **was incomplete for reason** *n.*

Explanation

CICS was unable to treat *name* as a CICS-maintained data table for reason *n*.

System action

The data table's source data set is opened for access as a normal VSAM data set, and no main storage table is built. CICS processing continues.

User response

The appropriate user response depends on the reason code *n*. Refer to message DFHFC0931 for a list of reason codes and their appropriate user responses.

Urgent action is probably not necessary when this message occurs, as no function has been lost. However, READ performance may be adversely affected.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *name*
3. *n*

Destination

Console

DFHFC0933	*applid* **MVS FREEMAIN failure detected during CLOSE of data table** *name*.

Explanation

An MVS FREEMAIN, issued while CICS was attempting to release the storage associated with data table *name*, returned the error response R15=4. Some storage in the CICS address space has not been freed. The error is probably the result of some earlier overwriting of data table control areas.

System action

CICS closes data table *name*. CICS processing continues.

User response

This condition does not adversely affect the data tables function. However, if the problem recurs take a system dump (SDUMP) as soon as possible after the appearance of this message. For example, by means of a CEMT PERFORM SNAP command.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *name*

Destination

Console

DFHFC0935	*applid* **SHAREOPTIONS of the source for data table** *name* **allow inconsistencies between table and source.**

Explanation

The cross region SHAREOPTION for the source data set associated with the data table *name* is 3 or 4, or the SHAREOPTION is 2 and the table is being opened only for read access. It is possible for another job in this MVS system to update the source without notifying CICS. The result of this is that the data table may no longer match the source data set.

System action

Opening and loading of the data table continues normally. CICS processing continues.

User response

Check that the SHAREOPTION is specified correctly and that the DISP parameter is correct.

Note that source data set changes are reflected in the data table only when the changes are made by the CICS system which owns the table.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *name*

Destination

Console

DFHFC0936	*applid* **Initiation of loading of data table** *name* **has failed.**

Explanation

An attempt to initiate the table loading transaction for the data table *name* has failed.

System action

CICS processing continues. The effect this has is that the table always appears to be in the process of being loaded and the load completion exit, XDTLC, is not invoked.

One consequence of this is that the table is effectively **demand loaded**. This means that an entry is only made in the table when a transaction refers to it explicitly. A further consequence is that, for user maintained tables, API requests (other than READ) always result in a LOADING condition.

User response

Take remedial action after determining the cause of the failure from the trace of the OPEN request and from any related messages and dumps. It may be that the system action of leaving the table open, but not loaded, adversely affects your application. For example, if the application depends on being able to update a user maintained table as soon as loading is complete. If so, closing and reopening the data table may be successful as an immediate response, if the problem was simply a temporary lack of resources.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *name*

Destination

Console

DFHFC0937 *applid* **OPEN of *name1* as a data table was not possible. The file has been opened and will use data table *name2* which has the same source.**

Explanation

File *name1* could not be opened as a CICS-maintained data table (CMT) because another CMT *name2* is already open for the source data set specified in the file definition of *name1*. However, *name1* is still able to benefit from shared data tables support by accessing the already open CMT.

System action

name1 is opened as a normal CICS file, and therefore automatically uses the existing data table *name2* whenever possible.

User response

This is not normally a problem, but you should ensure that the data table *name2* has the required characteristics in terms of its maximum number of records and in the behavior of any data table user exits that refer to it.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *name1*
3. *name2*

Destination

Console

DFHFC0940 I *date time applid* **CICS data table load has started for data table *name*.**

Explanation

CICS file control has detected that an open request has been issued for data table *name*, and a task has been attached to load the data table.

System action

CICS processing continues.

User response

None.

Module:
DFHDTLX

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *name*

Destination

CSFL

DFHFC0941 I *date time applid* **CICS data table load has completed successfully for data table *name*.**

Explanation

The task that was attached to load the data table *name* has successfully completed loading.

System action

The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate a successful load. CICS processing continues.

User response

None.

Module:
DFHDTLX

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *name*

Destination

CSFL

DFHFC0942 E *date time applid* **CICS data table load has terminated abnormally for data table *name*, reason code = X'*xx*'.**

Explanation

The CICS task that is loading data table *name* has received a reason code X'*xx*', where X'*xx*' has one of the following values:

X'FB'

CICS file control has requested that the data table load be abandoned. This may occur, for example, if a close request has been made against the data table

X'FD'

an attempt has been made to add more entries to the data table than the maximum specified in the table definition

X'FE'

a shortage of virtual storage has been reported by the add entry (from DASD) service, due to a

failure to get storage for the record. DFHDTUP trace entry AB 0B26 gives further information on the function, response and reason code, error code, and qualifier flags, associated with the failing request

System action

The user exit XDTLC is invoked, if enabled, unless file control has requested that the load be abandoned (reason code X'FB'). The value of the UEPDTORC parameter passed to the exit indicates that loading completed abnormally. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added are retrieved from the source data set to satisfy API requests.

If the table is user-maintained, requests to access any record which was not added results in a "not found" response code. If the table has been closed, then API requests result in an "unenabled" response code.

CICS processing continues.

User response

The appropriate user response depends on the reason code. User responses are as follows:

X'FB'

no action necessary

X'FD'

increase the size specified for the data table using the MAXNUMRECS field in its resource definition

X'FE'

review the dataspace storage use. For lack of storage problems, the most common error codes will be 06 (table entry descriptor storage), 07 (index node storage), or 08 (data storage). CICS uses dataspace DFHDT001 for descriptor entries, DFHDT002 for index nodes, and DFHDT003 through to DFHDT100 for data records. If there is insufficient space for entry descriptors or index nodes, consider splitting the data tables into different CICS regions; for example, different FORs. If a single data table has run out of space on its own, the limit of space for it has been reached, in which case consider whether it should be split into two or more separate tables. See the section "Storage use for shared data tables" in the CICS TS for z/OS 5.1: Shared Data Tables Guide" for more information on storage usage

Module:

DFHDTLX

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *name*
5. *X'xx'*

Destination

CSFL and Console

DFHFC0943 E   *date time applid* **CICS data table load has terminated abnormally for data table** *name***, reason code = *X'xx'*.**

Explanation

The CICS task that is loading data table *name* has received an unexpected return code from CICS file control while browsing the source data set. The reason code X'*xx*' should be one of the following.

X'02'

ILLOGIC?A VSAM error which does not fall into one of the other categories.

X'0C'

NOTOPEN?The file is CLOSED and UNENABLED, or still open and in use, but a CLOSE request has been received.

X'0D'

DISABLED?The file is disabled.

X'80'

IOERR?I/O error.

System action

The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added are retrieved from the source data set to satisfy API requests.

If the table is user maintained, requests to access any record which was not added results in a "not found" response code. If the table has been closed, API requests result in an "unenabled" response code.

CICS processing continues.

User response

Investigate the reason for the return code from CICS file control. For further information about the reason code, see the description of exception conditions for the STARTBR and READNEXT commands, in the CICS Application development reference.

Module:
DFHDTLX

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *name*
5. *X'xx'*

Destination

CSFL and Console

DFHFC0945 E   *date time applid* **CICS data table load has terminated abnormally for data table** *name***.**

Explanation

The special CICS transaction that was loading data table *name* has detected an abnormal termination.

System action

Depending on the cause of this abnormal termination, CICS may produce either a system dump or a transaction dump.

The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. CICS then terminates the loading transaction with abend code AFCM. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added, are retrieved from the source data set to satisfy API requests.

If the table is user-maintained, requests to access any record which was not added result in a "not found" response code. If the table has been closed, then API requests result in an "unenabled" response code.

CICS processing continues.

User response

Look at the system log for related CICS messages to determine the original abend detected by the loading transaction. Refer to the description of abend code AFCM for further information about the cause of the original termination.

For more information on how to determine system problems, refer to the Troubleshooting and support.

Module:

4. *name*

Destination

CSFL and Console

DFHFC0946 E	*date time applid* CICS data table load has terminated abnormally for data table *name*, a call to FCFR has failed for reason code = *n*.

Explanation

The CICS task that is loading data table *name* has failed while calling file control to browse the source data set. The value of the reason code *n* indicates the type of failure as follows:

1. Response from FCFR was INVALID.
2. Response from FCFR was DISASTER.
3. Response from FCFR was PURGED.
4. FCFR failed for some unexpected reason.

System action

The user exit XDTLC is invoked, if enabled, with parameter UEPDTORC set to indicate that loading has completed abnormally. CICS then terminates the loading transaction with abend code AFCM. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, records which were not added are retrieved from the source data set to satisfy API requests. If the table is user-maintained, requests to access any record which was not added result in a "not found" response code. If

the table has been closed, API requests result in an "unenabled" response code.

CICS processing continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Determine the cause of the failure of the domain call using the diagnostic information provided by file control.

Module:
DFHDTLX

XMEOUT parameters/Message inserts

1. *date*
2. *time*
3. *applid*
4. *name*
5. *n*

Destination

CSFL and Console

DFHFC0947 E	*date time applid* CICS data table load has failed to close data table *name*, a call to FCFS has failed for reason code = *n*.

Explanation

The CICS task that is loading data table *name* has failed while trying to close the file at the request of an exit program invoked at exit point XDTLC. The value of reason code *n* indicates the type of failure as follows:

1. Response from FCFS was INVALID.
2. Response from FCFS was DISASTER.
3. Response from FCFS was PURGED.
4. FCFS failed for some unexpected reason.

System action

CICS terminates the loading transaction with abend code AFCM.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

It is unlikely that the user exit invoked at the XDTLC exit point would request that the file should be closed

unless a previous problem had occurred with the load. Determine the cause of any such previous problem by checking for earlier messages which may have been issued referring to data table *name*. Diagnostic information provided by file control may be used to investigate the failure of the close file call.

CICS processing continues.

Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

Module:
DFHDTLX

3. *applid*
4. *name*
5. *n*

Destination

CSFL and Console

DFHFC0949	*date time applid* CICS shared data table table load has terminated abnormally. A call to DFHXMIQ to retrieve the parameters for the load transaction has failed with response code = *n*.

Explanation

The CICS task to load a shared data table has failed while trying to inquire on the parameters passed to it during attach. The value of the reason code *n* indicates the type of failure as follows:

1. Response from XMIQ was INVALID.
2. Response from XMIQ was DISASTER.
3. Response from XMIQ was PURGED.
4. XMIQ failed for some unexpected reason.

System action

The user exit XDTLC is not invoked as failure to retrieve the attach parameters means the filename is not known. CICS terminates the loading transaction with abend code AFCL. No records are loaded into the data table.

Requests to access any record which was not added result in a "not found" response code.

CICS processing continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Determine the cause of the failure of the domain call using the diagnostic information provided by the CIS Transaction Manager.

The file should be closed so that a load may be attempted again when it is next opened.

1. *applid*
2. *filename*

Destination

Console

DFHFC0951   *applid {RLS | Non-RLS}* **OPEN of file** *filename* **failed. DSNAME not available from JCL or resource definition. Module** *module*.

Explanation

A CICS attempt to open file *filename* failed because neither the JCL nor the resource definition specified the data set name.

CICS file control did not open file *filename*, because:

1. At initialization time, the startup JCL did not include a DD statement, *and*

2. No user-submitted routine allocated the file dynamically, *and*

3. The resource definition does not contain a DSNAME parameter to enable CICS to allocate the file dynamically.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response

Before resubmitting the transaction, you must supply the data set name in the JCL or the resource definition. You can set the name in the resource definition while CICS is running by using the CEMT transaction or the EXEC CICS SET command or by using CEDA to correct and reinstall the FCT entry.

Destination

Console

DFHFC0952   *applid* **Dynamic allocation of** *{RLS | Non-RLS}* **file** *filename* **failed. Return code** *X'rrrr',X'cccc'* **in module** *module*.

Explanation

While dynamically allocating file *filename*, CICS file control issued an MVS DYNALLOC macro. The DYNALLOC failed with return code *cccc*. *rrrr* is the additional return code in register 15.

System action

CICS continues with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response

For the meaning of the DYNALLOC return codes, see the z/OS MVS Programming: Authorized Assembler Services Guide.

Module:
DFHFCFS DFHFCRO

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

   1=RLS,

   2=Non-RLS

3. *filename*
4. *X'rrrr'*
5. *X'cccc'*
6. *module*

Destination

Console

DFHFC0953   *applid* **Non-RLS OPEN or CLOSE of file** *filename* **failed. CICS logic error** *eeee,cccc*

Explanation

While processing a request to open or close file *filename*, CICS detected an internal logic error in the file control services program. The value of *eeee* identifies the error as follows:

8105

The DFHFCFS set base dsname block failed. *cccc* is the return code from DFHFCFS.

8302

Request to DFHFCN for a pool that is not defined to CICS.

8701

Request to DFHFCN is not OPEN or CLOSE.

8704

Request to DFHFCL is not BUILD or DELETE.

8705

Request to DFHFCL is for invalid pool number *cccc*.

8706

Request to DFHFCL is for pool number *cccc* that is not defined to CICS.

8707

DFHFCL failed to build BLDVRP parameters. *cccc* is the pool number.

8798

Logic error at OPEN detected in DFHFCN at offset *cccc*.

System action

CICS terminates the task abnormally, produces a dump and continues processing with the status of file *filename* unchanged.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

This is probably a logic error in CICS. You should note, however, that terminating CICS with an immediate shutdown while opening or closing files may cause such logic errors to happen as a normal occurrence. This is because CICS terminated immediately without regard to running tasks.

It is also possible for this error to occur if CICS has to calculate parameters for the BLDVRP macro, (this happens if you do not supply an LSR pool definition), and all attempts to access the VSAM catalog for files in this LSR pool fail. Other messages are issued for the individual catalog failures.

Module:
DFHFCFS

2. *filename*
3. *eeee*
4. *cccc*

Destination

Console

DFHFC0954	*applid {RLS | Non-RLS}* **OPEN of file** *filename* **failed. No disposition specified for dynamic allocation. Module** *module***.**

Explanation

CICS file control cannot open file *filename*, because it is not allocated. It is not allocated because:

1. At initialization time, the startup JCL did not include a DD statement, *and*
2. The resource definition does not contain a DISPOSITION attribute to enable CICS to allocate the file dynamically.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file are sent a NOTOPEN condition.

User response

If you want to use file *filename* in this run, supply the DISPOSITION attribute with the CEMT transaction or with a user transaction using the EXEC CICS SET command. When you have done this, transactions are able to access the file successfully.

The change described above is only effective for the lifetime of the CICS system. You can change the disposition of a file permanently using a JCL DD statement or the CEDA DEFINE FILE command.

               file *filename* failed. VSAM catalog
               error. Return code - *X'eeee',X'cccc'*
               in module *module*.

Explanation

While reading the VSAM catalog to open the VSAM
data set *filename,* CICS file control received the return
code *cccc* from a SHOWCAT macro. The value of *eeee*
is an error code from DFHFCN as follows:

8112

SHOWCAT for the AIX of a path failed.

8113

SHOWCAT for the data component of a base failed.

8116

SHOWCAT for the base of a path failed.

8117

SHOWCAT for an upgrade member failed.

System action

CICS writes a system dump, and continues processing,
with file *filename* closed and its state UNENABLED.
Any transaction attempting to use this file is sent a
NOTOPEN condition.

Message DFHME0116, which contains the symptom
string for this problem, is produced.

User response

For the meaning of the SHOWCAT return code, see
z/OS DFSMS Macro Instructions for Data Sets.

Module:
DFHFCFS, DFHFCRO

XMEOUT parameters/Message inserts

1. *applid*
2. Value chosen from the following options:

   1=RLS,

   2=Non-RLS

3. *filename*
4. *X'eeee'*
5. *X'cccc'*
6. *module*

Destination

Console

DFHFC0958   *applid* **Non-RLS OPEN of file**
               ***filename* failed. VSAM resource**
               usage conflict with open file.

Explanation

CICS did not open file *filename* because it found that
its access method control block (ACB) specified a
different buffer/string resource (NSR or LSR pool) from
that specified by another ACB that is already open for
the same base cluster.

VSAM provides integrity for different ACBs open for the
same base cluster only if they use the **same** buffer/
string resource.

System action

CICS writes a system dump and continues processing
with file *filename* closed and its state UNENABLED.

Any transaction attempting to use this file is sent a NOTOPEN condition.

User response

Determine the correct buffer/string resource and modify the resource definition.

Alternatively, if you specify DSNSHARING(MODIFYREQS) in the resource definition and open the file for read only, CICS permits the use of different buffer/string resources because no integrity exposure exists.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*

Destination

Console

DFHFC0960   *applid* **Non-RLS OPEN of file** *filename* **failed. Unable to build its LSR pool** *n*. **Return code -** *cccc*.

Explanation

CICS has requested VSAM to build the local shared resource (LSR) pool specified in the resource definition for file *filename*. However, VSAM was unable to complete the request. *n* is the pool number, and *cccc* is the VSAM BLDVRP return code.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Note:

The first time this error occurs, CICS writes a system dump before continuing.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

For the meaning of the BLDVRP return code, see z/OS DFSMS Macro Instructions for Data Sets.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*
3. *n*
4. *cccc*

Destination

Console

DFHFC0961   *date time applid* **Calculation of LSR pool** *n* **parameters incomplete. Filename** *filename* **has no DSNAME.**

Explanation

While dynamically calculating the parameters for the local shared resource pool (LSR) *n*, CICS found a FILE resource definition for which no DSNAME exists (either the resource definition has no DSNAME, or no DD statement exists).

System action

CICS processing continues.

Without a DSNAME, CICS cannot use the VSAM catalog to determine the file attributes. Therefore, in the LSR calculation, CICS uses the number of strings specified in the STRINGS attribute of the FILE resource definition but does not use the BUFFERS or KEYLEN information.

User response

Ensure that each FILE resource definition has either a DSNAME, or a DD statement corresponding to its DATASET name.

Exceptionally, if you use CPSM, please note that this message is normal for file EYUDREPN in a CMAS. Do not attempt to allocate a DSNAME or a DD statement for EYUDREPN in the JCL for the CMAS.

Module:
DFHFCFS

3. *applid*
4. *n*
5. *filename*

Destination

CSMT and Console

DFHFC0962	*date time applid* **Calculation of LSR pool *n* parameters incomplete for file *filename*. VSAM catalog access error. Return code - *cccc***

Explanation

While CICS was dynamically calculating the parameters for the local shared resource (LSR) pool *n*, a VSAM SHOWCAT or a VSAM LOCATE failed with return code *cccc*. Parameters for file *filename* are incomplete.

System action

CICS retains the accumulated LSR parameters for file *filename* and continues processing. No further attempts at calculating LSR parameters for file *filename* are made.

An exception trace is taken which identifies the failing VSAM request and its return code.

User response

For the meaning of the SHOWCAT return code, see z/OS DFSMS Macro Instructions for Data Sets. For the meaning of the LOCATE return code, see z/OS DFSMSdfp Advanced Services. This error indicates a corrupted VSAM catalog. If you cannot restore the catalog, you will need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

2. *n*
3. *cccc*

Destination

Console

DFHFC0964	*applid* **Non-RLS OPEN of file *filename* failed. VSAM codes - *eeee,rrrr,cccc.***

Explanation

CICS file control issued an open for a VSAM file, *filename*. The open has failed with VSAM return code, *cccc*. *eeee* has a value of 8502 and represents the CICS internal error code and *rrrr* is the return code in register 15.

System action

CICS continues processing, with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

VSAM will have issued a console error message. Use the VSAM message and the VSAM return code in the CICS message to solve the problem.

Note that if the eeee,rrrr,cccc values are 8502,0008,0088, then this is a storage issue and VSAM was unable to obtain sufficient storage for some area needed to open the dataset. In some instances, even if the file is defined to use an LSRPOOL, CICS will open it in NSR mode. This will happen if the file is empty. When the file is empty, CICS will open it in Load Mode until the first record is written. The file will then be closed and reopened to use LSRPOOLs as defined in the file definition. When opened in Load Mode, bit FCTDLFLG in byte FCTVSVR2 will indicate this, and VSAM will issue GETMAINs for NSR buffers. These buffers are not part of the CICS DSAs, and the size of the GETMAINs will depend on the BUFFERSPACE(size) used in the IDCAMS DEFINE command.

For the meaning of the VSAM return code, see z/OS DFSMS Macro Instructions for Data Sets.

3. *eeee*
4. *rrrr*
5. *cccc*

Destination

Console

DFHFC0965   *applid* **Open of BDAM file** *filename* **failed.**

Explanation

CICS file control issued an open for a BDAM file, *filename*. The open failed.

System action

CICS takes a system dump and continues processing, with file *filename* closed and with its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

BDAM will have issued a console error message. Refer to the BDAM message for further guidance to solve the problem.

Module:

DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*

Destination

Console

DFHFC0966   *applid* **Non-RLS OPEN of file** *filename* **failed. Unable to position ESDS. Error codes:** *eeee,rrrr,cccc.*

Explanation

Before opening the VSAM ESDS file *filename* for output, CICS file control could not determine the end-of-data relative byte address (RBA) correctly. During the positioning process, CICS may perform **any** of the following steps, each of which can fail:

- Dynamically allocate the base cluster to DDname DFHESDS (if it is a path that is being opened)
- Open the base cluster for control interval (CI) processing
- Read the last CI in the file
- Determine the end-of-data in the file
- Close the base cluster
- Dynamically deallocate the base cluster.

The value of *eeee* in the message indicates the error or the failing function as follows:

8503

Open base cluster. *rrrr* is the VSAM return code in register 15. *cccc* is the error field in the VSAM ACB.

8504

Read last control interval (CI). *rrrr* is the VSAM return code in register 15. *cccc* is the FDBK field in the VSAM RPL.

8505

Last CI middle of spanned record.

8506

Close base cluster. *rrrr* is the VSAM return code in register 15. *cccc* is the error field in the VSAM ACB.

8507

Insufficient storage to get CI

8508

> Dynamic allocation of base. *rrrr* is the MVS return code in register 15. *cccc* is the MVS DYNALLOC return code.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

For the meaning of the VSAM return codes, see z/OS DFSMS Macro Instructions for Data Sets. For the meaning of the DYNALLOC return codes, refer to the z/OS MVS Programming: Authorized Assembler Services Guide. CICS file control uses control interval processing when opening a VSAM ESDS. Therefore, ensure that you have specified ACCESS(CONTROL) for the data set.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*
3. *eeee*
4. *rrrr*
5. *cccc*

Destination

Console

DFHFC0967	*applid* **Error detected while closing** ***{RLS	Non-RLS}*** **file** ***filename*** **- VSAM codes** ***X'rrrr',X'cccc'*** **in module** ***module***.

Explanation

CICS file control issued a close for VSAM file *filename*. The close failed with VSAM return code *cccc*. *rrrr* is the return code in register 15.

System action

CICS processing continues. CICS marks file *filename* as closed because VSAM will have closed the access method control block (ACB).

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the VSAM return code, *cccc* and the preceding VSAM console message to determine the cause of the problem.

For the meaning of the VSAM return code, see z/OS DFSMS Macro Instructions for Data Sets.

2. *filename*
3. *rrrr*
4. *cccc*

Destination

Console

DFHFC0970   *applid* **Recoverable non-RLS file *filename* opened with VSAM SHROPT 3 or 4. CICS cannot ensure integrity.**

Explanation

While opening the recoverable VSAM file *filename* for update, CICS detected that it was defined with SHAREOPTION 3 or 4, which allows updating from multiple regions. CICS issues this message to warn you that it cannot ensure data integrity.

System action

CICS opens file *filename* and continues processing.

User response

If this integrity exposure is acceptable, no further user action is required.

If this integrity exposure is unplanned and unacceptable, cancel CICS, redefine file *filename* with a different SHAREOPTION, and restart.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*

Destination

Console

DFHFC0971   *applid* **Non-RLS OPEN of file *filename* returned warning when positioning ESDS. Error codes: *rrrr,cccc.***

Explanation

Before opening the VSAM ESDS file *filename* for output, CICS file control had to determine the end-of-data relative byte address (RBA). The positioning process involved the dynamic allocation and deallocation of the base cluster to DDname DFHESDS. The deallocation failed.

The MVS DYNALLOC return code is *cccc. rrrr* is the additional return code in register 15.

System action

CICS opens the file *filename* and continues processing.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

For the meaning of the DYNALLOC return codes, see the z/OS MVS Programming: Authorized Assembler Services Guide.

Console

DFHFC0978	*applid {RLS | Non-RLS}* **OPEN of file** *filename* **failed. VSAM catalog error. Return code -** *X'eeee'* **in module** *module*.

Explanation

While CICS was opening file *filename* and retrieving information from the VSAM catalog, CICS file control open/close detected a CICS logic error. *eeee* is as follows:

8118

A VSAM catalog entry for a path does not have a base cluster or an AIX as its first association.

8119

In a VSAM catalog entry for an AIX, either the data association or the base cluster association is missing.

811A

In a VSAM catalog entry for a base cluster, the data association or the index association is missing.

811C

The open was requested against the data association or the index association. The base cluster, AIX or path should be specified instead.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response

Obtain a VSAM LISTCAT listing for file *filename*. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

DFHFC0982   *applid* **Non-RLS OPEN of base for file *filename* failed. VSAM codes - *rrrr,cccc*.**

Explanation

While trying to open the VSAM KSDS base of a path through which a record insert has been requested for file *filename*, CICS file control issued an OPEN which failed with the VSAM error code *cccc* from the ACB. *rrrr* is the VSAM return code in register 15.

System action

CICS takes a system dump and terminates the transaction abnormally.

User response

VSAM issues a console error message. Use the VSAM message and the VSAM return code in the CICS message to solve the problem.

For the meaning of the VSAM return code, see the z/OS DFSMS Managing Catalogs.

Module:
DFHFCM

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*
3. *rrrr*
4. *cccc*

Destination

Console

DFHFC0983   *applid* **Non-RLS CLOSE of base for file *filename* failed. CICS logic error *eeee,cccc*.**

Explanation

While trying to close the VSAM KSDS base of a path through which a record insert has been requested for file *filename*, CICS has detected an error. *eeee* is as follows:

8E05

Failure in DFHFCM to close VSAM base. *cccc* is the error code from the VSAM ACB.

8E07

SVC 99 dynamic deallocation in DFHFCM failed. *cccc* is the SVC 99 error return code.

System action

CICS takes a system dump and continues processing, with base left open.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHFCM

XMEOUT parameters/Message inserts

1. *applid*
2. *filename*
3. *eeee*
4. *cccc*

Destination

Console

DFHFC0987   *applid* **{RLS | Non-RLS} OPEN of file *filename* failed: Not available for type of processing. VSAM codes - 0008, 00A8 in module *module*.**

Explanation

When CICS attempted to open the VSAM file *filename*, the OPEN failed with the VSAM return codes shown in the message text. The probable reason for the failure is that the data set is in use by another region or another ACB in the CICS region, and that the VSAM share options prohibit the level of sharing needed to permit the OPEN.

A data set cannot be opened by different files in both RLS and non-RLS mode at the same time, with two exceptions:

- Another CICS region or batch process can open a data set in non-RLS read-only mode at the same time as the data set is open in RLS mode.

- The XFCRLSCO user exit can override the default behavior and open the data set using both RLS and non-RLS files, provided that the non-RLS files have read-only access.

System action

CICS continues processing, with the file left closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If the data set is in use by another user, wait until it is free and then retry the OPEN.

If the problem recurs and you cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Destination

Console

DFHFC0988 *applid* **Non-RLS OPEN of file *filename* failed. This data set type is not supported by CICS.**

Explanation

An attempt to open file *filename* has failed because the file referenced a data set of a type not supported by CICS.

CICS File Control supports opening VSAM KSDS, ESDS, RRDS and VRRDS data sets, paths over KSDS and ESDS data sets, and BDAM data sets. No other data set types are supported. For example, CICS does not support opening a VSAM linear data set.

System action

CICS continues processing with *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

You have probably specified DSNAME incorrectly in the file definition. Correct the file definition.

Console

DFHFC0990	*applid {RLS	Non-RLS}* **OPEN of file** *filename* **failed. Recovery specified, but the path is not in the upgrade set. Base data set** *dsname*. **Module** *module*.

Explanation

An attempt was made to open a recoverable file, associated with a VSAM path over an alternate index, for update processing (SERVREQ=ADD, DELETE or UPDATE set). However, the alternate index is not in the upgrade set of the base. CICS detects this condition and does not attempt to open the file.

If the alternate index is not in the upgrade set of the base, any updates made via the base are not reflected in the alternate index and so updates made via the path may compromise data integrity. Note the open of the path fails if RECOVERY=ALL or RECOVERY=BACKOUTONLY is specified on the resource definition for the path, or on the base data set.

The base takes the recovery attributes of the first file to open for update against it since a cold or initial start. Those attributes remain in force on the data set, and consistency checks are performed between the resource definition and the data set at file open time.

System action

CICS continues processing with file *filename* closed and not enabled.

User response

Take the data set offline and modify the resource definition for the alternate index. Run a BLDINDEX job to bring the alternate index up to date with the base data set and then retry the open of the file.

Destination

Console

DFHFC0991	*applid* **Non-RLS OPEN of file** *filename* **failed. Recovery attributes conflict with those on the VSAM data set -** *cccc*. **Base data set** *dsname*

Explanation

An attempt was made to open a file *filename* for update processing. (SERVREQ=ADD, DELETE or UPDATE set), CICS detected that the recovery attributes on the file were inconsistent with those currently in force for the VSAM data set as recorded in the CICS data set name block. The file was not opened in order to maintain data integrity.

The data set takes the recovery attributes of the first file to open for update against it since a cold or initial start. Code *cccc* identifies the inconsistency found and takes the following values:

8514

Both the file and the data set have RECOVERY=ALL specified, but the forward recovery logs specified are different.

8515

The data set has RECOVERY=BACKOUTONLY or RECOVERY=NONE specified, and the file is trying to open with RECOVERY=ALL.

8516

The data set has RECOVERY=NONE specified. The file is attempting to open with RECOVERY=BACKOUTONLY.

851B

The file specified RECOVERY=NONE or BACKOUTONLY. The VSAM data set had RECOVERY=ALL specified.

851C

The file specified RECOVERY=NONE. The VSAM data set had BACKOUTONLY specified.

System action

CICS continues processing with file *filename* closed and not enabled.

User response

Ensure that files referencing the same VSAM data set have the same recovery attributes specified.

Modify the FILE resource definitions and reinstall them.

To nullify the recovery attribute set for the base data set, the user can issue a CEMT SET DSNAME REMOVE or EXEC CICS SET DSNAME REMOVE command. This deletes the base cluster block, and leaves CICS with no record of prior recovery settings for this VSAM data set. The **first** file to subsequently open against this data set causes a new base cluster block to be built. If the file is opened for update processing, the recovery attributes of this file are copied into the base cluster block.

If you want to have files referencing the same VSAM data set with different **backout** recovery attributes you should use Global User Exit XFCNREC.

Console

DFHFC0995	*applid* **Hiperspace allocation for LSR pool** *n* **was incomplete or zero.**

Explanation

CICS requested VSAM to provide hiperspace buffers when building local shared resource (LSR) pool number *n*, but there was insufficient expanded storage available to satisfy the request completely.

System action

CICS continues processing. VSAM uses the buffers it has been able to provide.

User response

Review your installation's use of expanded storage and use MVS facilities to adjust its allocation, or change your LSRPOOL resource definition, to reduce the hiperspace buffer requirements for pool *n.*

Destination

Console

DFHFC0996	*date time applid {Open	Close	Enable	Disable	Cancel of close}* **of file** *filename* **suppressed due to intervention of User Exit.**

Explanation

An open, close, enable, disable or cancel close request has been issued against the specified file. An exit program enabled at the global user exit point XFCSREQ in CICS file control has directed CICS not to carry out the request.

System action

If the request being issued is an enable, disable, close or cancel close request, the file state remains unchanged, that is, it remains in the same state as before the request was issued.

If the request is an open request, the state remains unchanged unless the file was in a closed, enabled state. In this state, the open request could be an implicit open request, (that is, the file is being opened as part of a file API request). If it is an implicit open request, the file state is changed to closed unenabled to ensure the file API request is halted, and a NOTOPEN condition is returned to the application.

User response

Examine the reason for the command being suppressed. This is installation specific.

Console

DFHFC0998   *applid* **User exit XFCNREC is causing file** *filename* **to be opened even though a file recovery inconsistency of type** *X'code'* **exists. CICS cannot guarantee data integrity for base data set** *dsname*

Explanation

An attempt was made to open file *filename* for update processing, (SERVREQ=ADD, DELETE or UPDATE set), and CICS detected that the backout recovery attribute on the file was inconsistent with that on the VSAM base data set. Normally CICS would fail the open on detection of an inconsistency. However, a program

running at user exit XFCNREC has indicated that the open should continue even though an inconsistency has been detected. CICS can no longer guarantee the integrity of the data on the associated data set. Code X'*code*' identifies the inconsistency and can take one of the following values:

X'8516'

   The data set has RECOVERY=NONE specified. The file is attempting to open with RECOVERY=BACKOUTONLY.

X'851C'

   The file specified RECOVERY=NONE. The VSAM data set had BACKOUTONLY specified.

An INQUIRE on the RECOVSTATUS for the data set from this point onwards returns a NOTRECOVABLE response. The data set is marked as not recoverable until the next CEMT SET DSNAME REMOVE, EXEC CICS SET DSNAME REMOVE command or cold or initial start.

System action

CICS opens file *filename* and continues processing using the recovery setting from the file definition to determine whether backout logging should be performed.

User response

Ensure that it is correct for the backout recovery attribute inconsistency to be ignored for this data set.

If the backout recovery attribute inconsistency should not have been ignored, ensure that files referencing the same VSAM data set have the same recovery attributes. If they do not, modify and reinstall their resource definitions.

To nullify the recovery attribute set for the base data set, issue a CEMT SET DSNAME REMOVE or EXEC CICS SET DSNAME REMOVE command. This deletes the base cluster block and leaves CICS with no record of prior recovery settings for this VSAM data set. The **first** file to subsequently open against this data set causes a new base cluster block to be built. If the file is opened for update processing, the recovery attributes of this file are copied into the base cluster block.

DFHFC3001   ***date time applid* Record not backed out because it may have been overridden by a non-RLS batch job. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work *X'local-uowid'* for file *filename*, base data set *data-set-name***

Explanation

A log record was presented to file control for backing out, but although the updated record was protected by a VSAM RLS lock, a non-RLS batch job had elected to override the RLS locks held on this data set and therefore the condition of the record can no longer be guaranteed. The update had been made to the base data set *data-set-name* via the CICS file *filename*, under the unit of work identified by *local_uowid*.

System action

The update is not backed out because the condition of the updated record cannot be guaranteed, The updated data is committed instead. Diagnostic information is provided by this message and the subsequent message DFHFC3010.

User response

See the associated message DFHFC3010 for more information and guidance.

The record was updated by unit of work** *X'local-uowid'* **for file** *filename*, **base data set** *data-set-name*

Explanation

A log record was presented to file control for backing out, but although the updated record was protected by a VSAM RLS lock, a non-RLS batch job had elected to override the RLS locks held on this data set. However, an exit program enabled at the XFCBOVER exit point decided that the non-RLS batch job would not have caused corruption of the record, and requested that the backout should go ahead. The update had been made to the base data set *data-set-name* via the CICS file *filename*, under the unit of work identified by *local_uowid*.

System action

An attempt to backout the update is made because the user exit requested that backout should go ahead. Diagnostic information is provided by this message and the subsequent message DFHFC3010.

User response

See the associated message DFHFC3010 for more information and guidance.

Module:
DFHFCRC

XMEOUT parameters/Message inserts

Destination

CSFL

DFHFC3003   *date time applid* **Record not backed out because locks for a backout-failed data set have been reset. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work** *X'local-uowid'* **for file** *filename*, **base data set** *data-set-name*

Explanation

An update made by unit of work *local-uowid* to the base data set *data set name* via the CICS file *filename* was protected by a lock while awaiting successful backout, but a decision has been taken locally to reset the locks for this data set. The log record representing the update has therefore been presented to file control for the purpose of providing diagnostic information in this and the subsequent message DFHFC3010.

System action

The update is not backed out and the lock is released. The implication of resetting the locks for a data set is that the backout has failed for some reason which cannot be easily corrected. Diagnostic information is provided by this message and the subsequent message DFHFC3010.

User response

See the associated message DFHFC3010 for more information and guidance.

DFHFC3004   *date time applid* **Record backed out because of the forced back out of an indoubt unit of work. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work** *X'local-uowid'* **for file** *filename*, **base data set** *data-set-name*

Explanation

A log record has been presented to file control for backing out because the local unit of work *local-uowid*, which was part of a distributed unit of work, has gone in-doubt, and CICS has backed out the local unit of work. This decision to back out the record is the result of one of the following:

- CICS received an SPI SET UOW or SET DSNAME command that specified BACKOUT.
- CICS received an SPI SET UOW or SET DSNAME command that specified FORCE and the indoubt attributes on the transaction definition specified BACKOUT.
- An indoubt WAIT timeout occurred, and the transaction definition specified BACKOUT.
- One of the resource managers involved in the unit of work did not support waiting during the indoubt period.

The update being backed out was made to the base data set *data-set-name* via the CICS file *filename*. This and the subsequent message provides diagnostic information which is of use in correcting the situation if the actual resolution of the distributed unit of work was to commit it rather than to back it out.

System action

The update is backed out, and diagnostic information is provided by this message and the subsequent message DFHFC3010.

User response

See the associated message DFHFC3010 for more information and guidance.
