Chapter 3. IBM Health Checker for z/OS messages related to CICS...........2533

Notices............................................................................................................2535

Index..............................................................................................................2541
About this PDF

This PDF explains the format of CICS messages and contains CICS DFH messages. It also contains AMX server environment messages. Before CICS TS V5.4, these messages were split across two PDFs: *CICS Messages and Codes, Volume 1* and *CICS Messages and Codes, Volume 2*.

For details of the terms and notation used in this book, see Conventions and terminology used in the CICS documentation in IBM Knowledge Center.

Date of this PDF

This PDF was created on 2024-07-17 (Year-Month-Date).
# Chapter 1. AXM server environment messages

The following messages are issued by the authorized cross-memory (AXM) server environment, which is a package of run-time services used by the Named counter sequence number server, CICS coupling facility (CF) data tables and the CICS shared temporary storage (TS) queue pool server. For more information about AXM and the CICS TS queue pool server, see Initializing CICS data sharing servers.

**Note:**

1. AXM messages are not issued by a CICS region and hence do not use the CICS message domain. They cannot be viewed with the CMAC transaction or suppressed with the XMEOUT user exit.
2. These messages are normally displayed in mixed case English. If your terminals cannot display lowercase English characters, see Uppercase translation for guidance on converting the messages to uppercase.

## AXM error recovery messages

<table>
<thead>
<tr>
<th>Message ID</th>
<th>Description</th>
<th>Destination</th>
<th>Module</th>
<th>User response</th>
</tr>
</thead>
<tbody>
<tr>
<td>AXMER0001</td>
<td><strong>ABEND</strong> xxx-rr occurred at address, data word1 word2 word3.</td>
<td>Console and print file</td>
<td>AXMER</td>
<td>Look up the completion code to identify the cause of the abend.</td>
</tr>
</tbody>
</table>

**Explanation**

The AXM error recovery routine has intercepted an abend in a task running under an AXM server region TCB. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS™ in the SDWA.

**System action**

The error recovery routine will first call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. After this, if recovery is allowed, the error recovery routine terminates the affected AXM internal task and resumes normal processing, otherwise it percolates the error, causing the server region to be abnormally terminated.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the server region JCL.

**User response**

Look up the completion code to identify the cause of the abend.

**Module:** AXMER

<table>
<thead>
<tr>
<th>Message ID</th>
<th>Description</th>
<th>Destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>AXMER0002</td>
<td><strong>TRAP</strong> occurred at offset offset in procname.</td>
<td>Console and print file</td>
</tr>
</tbody>
</table>

**Explanation**

An internal logic error in a server resulted in a TRAP macro being executed at the specified location.

The system will normally produce a symptom dump message on the job log, and a full dump may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the server region JCL.

**System action**

The AXM task is abnormally terminated.

**User response**

This probably indicates a logic error in server code, or an attempt to use some internal component of the server outside its correct context.

If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.

**Module:** AXMER

**Destination**

Console and print file
AXM event management messages

**AXMEV0001**  AXM only supports operating system WAIT on MVS.

**Explanation**
An attempt has been made to issue an operating system WAIT within an AXM server, but the server is not running on MVS. In this case, the MVS POST exit mechanism used by AXM is unavailable and operating system waits cannot be supported.

**System action**
The program is abnormally terminated.

**User response**
None.

**Module:**
AXMEV

**Destination**
Console

**AXMEV0003**  The AXM POST exit could not be created because AXM system services are not available.

**Explanation**
AXM server region initialization needed to define the MVS POST exit used by AXM for operating system waits, but AXM system services were not available within the current MVS image.

**System action**
The server region is terminated with return code 8.

**User response**
None.

**Module:**
AXMEV

**Destination**
Console and print file

**AXMEV0004**  The AXM POST exit could not be created, return code was rc.

**Explanation**
The MVS POST exit used by AXM for operating system waits could not be created because the AXM system services routine gave a non-zero return code. The only known reason for this is that AXM system services have been withdrawn, which should not be possible in a production environment.

**System action**
The server region is terminated with return code 8.

**User response**
None.

**Module:**
AXMEV

**Destination**
Console and print file

**AXMEV0005I**  The AXM POST exit had already been created for this address space.

**Explanation**
During server initialization, AXM system services found that the MVS POST exit used by AXM for operating system waits had already been created for this address space. AXM therefore bypassed trying to create the same POST exit again as this would have resulted in an abend 702-04.

This can occur when a previous server execution in the same address space was terminated abnormally.

**System action**
Processing continues

**User response**
None.

**Module:**
AXMEV

**Destination**
Console and print file
AXMEV0006I  The AXM POST exit could not be deleted, return code was rc.

Explanation
The MVS POST exit used by AXM for operating system waits could not be deleted because the AXM system services routine gave a non-zero return code. The only known reason for this is that AXM system services have been withdrawn, which should not be possible in a production environment.

System action
Processing continues.

AXM stack (LIFO) storage messages

AXMLF0001S  LIFO storage cannot be set up because the PRV size exceeds 4K.

Explanation
AXM initialization has detected that the total link-edited size of the pseudo-register vector (PRV) for the server application load module exceeds the maximum size of 4096 supported by AXM. The PRV contains task-related variables used by AXM resource management plus any task-related data areas defined by server code using the Assembler DXD operation code or Q-type address constants.

System action
The server is abnormally terminated.

User response
The server programmer needs to decrease the size of task-related variables defined in the PRV. When a large amount of task-related information needs to be stored, it is better to store the information in some separately acquired storage area (such as AXM heap storage) and put only a pointer to it in the PRV.

Module:
AXMLF

Destination
Console

AXM lock management messages

AXMLK0001  Lock at address is already owned for shared use by this task.

Explanation
An AXM server program attempted to acquire exclusive ownership of an AXM lock which was already in shared ownership for the current task. This is not allowed, as the task cannot wait for itself.

System action
The AXM lock request is rejected.

User response
The server programmer needs to modify the program logic. It could for example use an AXM lock PROMOTE to convert the shared lock to an exclusive lock.

Module:
AXMLK

Chapter 1. AXM server environment messages 3
**Destination**
Console and print file

**AXMLK0002**  
*function* failed because lock at  
*address* is not owned by this task.

**Explanation**
An AXM server program tried to release, demote or  
promote an AXM lock but the lock was not owned by  
the current AXM task.

**System action**
The AXM lock request is rejected.

---

**AXM operating system interface messages**

**AXMOS0001I**  
The main procedure entry point is  
*name* at address *address*.

**Explanation**
This message is written to the print file during AXM  
initialization to indicate the name and entry point  
address of the server main procedure. This is primarily  
for debugging purposes.

**System action**
Processing continues.

**User response**
None.

**Module:**
AXMOS

---

**AXM storage page pool management messages**

**AXMPG0001I**  
The main free area above 16M was  
at address *xxxxxx*, size *nnnnK*.

**Explanation**
This message is written to the print file during AXM  
initialization to indicate the size of the largest area of  
31-bit addressable private region storage available at  
that time.

**System action**
Processing continues.

**User response**
None.

**Module:**
AXMPG
The main free area below 16M was at address xxxxxx1, size nnnnK.

This message is written to the print file during AXM initialization to indicate the size of the largest area of 24-bit addressable private region storage available at that time.

System action
Processing continues.

User response
None.

Module:
AXMPG

Storage page pool areaname created, address xxxxxx, size nnnnK.

This message is written to the print file during AXM initialization to show the size and address of each storage page pool as it is created. Once this has been done, most AXM storage requests are allocated from this page pool rather than with MVS GETMAIN.

System action
Processing continues.

User response
None.

Module:
AXMPG

Usage statistics for storage page pool areaname:

The detailed message layout is as follows:

<table>
<thead>
<tr>
<th></th>
<th>Size</th>
<th>In Use</th>
<th>Max Used</th>
<th>Free</th>
<th>Min</th>
</tr>
</thead>
<tbody>
<tr>
<td>Free</td>
<td>nK</td>
<td>nK</td>
<td>nK</td>
<td>nK</td>
<td></td>
</tr>
<tr>
<td>nK</td>
<td>100%</td>
<td>n%</td>
<td>n%</td>
<td>n%</td>
<td></td>
</tr>
<tr>
<td>Fails</td>
<td>Gets</td>
<td>Frees</td>
<td>Retries</td>
<td></td>
<td></td>
</tr>
<tr>
<td>n</td>
<td>n</td>
<td>n</td>
<td>n</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Each of the storage statistics is shown in two forms, as a number of kilobytes and as a percentage of the total size.

The individual fields have the following meanings:

Size
Total size of the storage pool.

In Use
The amount of storage which is currently in use.

Max Used
The highest amount of storage which has been in use.

Free
The amount of storage within the pool which is current free.

Min Free
The lowest amount of storage which has been free.

Gets
The number of requests to obtain storage within the pool.

Frees
The number of requests to release storage within the pool.

Retries
The number of times that a storage request initially failed and was retried after merging any adjacent small free areas to form larger areas.

Fails
The number of times that a storage request was unable to obtain the requested amount of storage even after a retry.

Processing continues.

Chapter 1. AXM server environment messages 5
**AXM resource tracking messages**

**AXMR50001**  
Tidy-up routine at *address* failed to free resource tracking cell.

**Explanation**

A server routine established an AXM resource tracking element specifying that a procedure was to be called to release the resource if the task was terminated without releasing the resource. The AXM task is now terminating, and the procedure identified in the tracking element was called, but the resource tracking element was still in existence when it returned. The entry point address of the relevant procedure is indicated in the message.

**System action**

The tracking element is released on the assumption that the resource has now been deleted, and AXM task termination continues.

**User response**

The server programmer needs to ensure that the procedure to release the resource also frees the resource tracking element.

**Module:**
AXMRS

**Destination**

Console and print file

---

**AXM server connection and system services messages**

**AXMSC0011I**  
AXM system services initialization is in progress.

**Explanation**

AXM system services are being started up, normally as a result of being called by the AXM subsystem initialization routine.

**System action**

Processing continues.

**User response**

None.

**Module:**
AXMSC

**Destination**

Console

**AXMSC0012I**  
AXM system services initialization has completed.

**Explanation**

AXM system services are now fully available in the current MVS image.

**System action**

AXM cross-memory server connection requests and requests for the POST exit system services will now be accepted.

**User response**

None.

**Module:**
AXMSC

Destination

Console

AXMSC0013  AXM system services have already been initialized.

Explanation

An attempt was made to set up AXM system services again when they are already active in the current MVS image.

System action

The attempt is ignored.

User response

None.

Module: AXMSC

Destination

Console

AXMSC0021I  AXM system services termination is in progress.

Explanation

AXM system services are being withdrawn. This is only possible if they were initialized using the AXM system region program AXMSR instead of being set up via subsystem initialization.

System action

The AXM system services program call table is deleted and all entry points in the AXM system services anchor are replaced with dummy routines which return an indication that the service are not available.

User response

Note that the results of attempting to call any AXM system service around this time are unpredictable. AXM system services should never be withdrawn in a production environment at any time when it is possible that they could be in use.

Module: AXMSC

Destination

Console

AXMSC0022I  AXM system services termination has completed.

Explanation

AXM system services have been closed down for this MVS image.

System action

AXM system services are no longer available.

User response

None.

Module: AXMSC

Destination

Console

AXMSC0031I  Connection to server prefix.name has been opened.

Explanation

The current region has established an AXM connection to the AXM server prefix.name.

System action

Processing continues.

User response

None.

Module: AXMSC

Destination

Console

AXMSC0032  Connection to server prefix.name failed because the server was not found.

Explanation

The current region tried to establish an AXM connection to the AXM server prefix.name but could not do so because there is no active server of that name enabled for AXM connections.
**System action**
The connection attempt is rejected with return code 8, reason code 32.

**User response**
Ensure that the server is started and that its name was specified correctly.

**Module:**
AXMSC

**Destination**
Console

**Explanation**
The current region tried to establish an AXM connection to the AXM server `prefix.name` but the request was rejected by the security system.

**System action**
The connection attempt is rejected with return code 8, reason code 33.

**User response**
See the previous AXM message giving details of the results of the security check.

**Module:**
AXMSC

**Destination**
Console

**Explanation**
The current region tried to establish an AXM connection to the AXM server `prefix.name` but the request was rejected by the server.

**User response**
If you anticipate a need for more than 16,384 AXM server connections within a single MVS image, you will need assistance from IBM. See Troubleshooting and support for guidance on how to proceed.

**Module:**
AXMSC

**Destination**
Console

**Explanation**
The current region tried to establish an AXM connection to the AXM server `prefix.name` but the maximum number of concurrent AXM connections supported within an MVS image (currently 16,384) has been reached.

**System action**
The connection is rejected with return code 8, reason code 34.

**User response**
Check whether the server interface program is specifying the correct value for the maximum number of concurrent requests.

**Module:**
AXMSC

**Destination**
Console

**Explanation**
The current region tried to establish an AXM connection to the AXM server `prefix.name` but the server-defined connection exit rejected the request.

**System action**
The connection is rejected with return code 8, reason code 36.
User response
The reason for the rejection depends on the server code, but this typically occurs if the server is preparing to close down or has insufficient resources to accept another connection.

Module:
AXMSC

Destination
Console

AXMSC0037 Connection to server prefix.name failed because the server is terminating.

Explanation
The current region tried to establish an AXM connection to the AXM server prefix.name but the server entered termination processing while the connection request was in progress.

System action
The connection is rejected with return code 8, reason code 37. The instance of the server that was being terminated will no longer be visible to any new connection attempts.

User response
Retry the connection when the server has been restarted.

Module:
AXMSC

Destination
Console

AXMSC0038 Connection to server prefix.name failed because this address space is already connected to it.

Explanation
The current region tried to establish an AXM connection to the AXM server prefix.name but it already has a connection to the same server region. AXM does not support multiple connections from the same region to the same server region.

System action
The connection is rejected with return code 8, reason code 38.

User response
None.

Module:
AXMSC

Destination
Console

AXMSC0041I Connection to server prefix.name has been closed.

Explanation
An AXM connection from the current region to the named server has been terminated, either as a result of being explicitly closed by this region or as a result of the termination of the MVS TCB which originally established the connection.

System action
Processing continues.

User response
None.

Module:
AXMSC

Destination
Console

AXMSC0042 Connection close failed for token xxxxxxxx, reason is n.

Explanation
An attempt was made to close an AXM connection explicitly but the specified connection token did not refer to an active connection owned by the current region, or the connection could not be closed for some other reason.

The reason code indicates which validity check failed within procedure AXMSCCLS. Reason code 9 indicates that a request issued via the connection has not yet completed. Any other reason code probably indicates an incorrect token.

System action
The attempt is rejected with return code 8, reason code 42.
User response
Check that the connection close request is specifying the correct connection token and that there are no incomplete requests for the connection.

Module: AXMSC

Destination
Console

**AXMSC0043I** Server disconnect SRB was scheduled, IEAMSCHD RC=xx
COMP=xx CODE=xx RSN=xx

Explanation
A client region connected to a CICS cross-memory server region was terminated at end of memory, so the AXM interface in the client region was unable to complete normal server disconnect processing. The AXM end of memory resource manager has therefore scheduled a synchronous SRB to the server region to notify it that the client region has now disconnected, using the IEAMSCHD macro. This message indicates the resulting values returned by that macro, in hexadecimal, consisting of the return code, completion type, completion code and reason code as documented for the IEAMSCHD macro. If the server region is still running and the disconnection process was successful, the return code is zero. In this case, the completion type and completion code are also zero, and any non-zero reason code maybe ignored. If the return code is non-zero, server disconnect processing could not be completed, in which case it is possible that some server resources being used by the disconnected client region may not have been released.

System action
Processing continues.

User response
If the return code is zero, no action is required. If the return code is non-zero, it is possible that subsequent requests to the same server region may fail or hang. If this occurs, the only solution is to cancel and restart the server region.

Module: AXMSC

Destination
Console

**AXMSC0051I** Server prefix.name is now enabled for connections.

Explanation
This AXM server has completed initialization and is now available for connections from other address spaces.

System action
Processing continues.

User response
None.

Module: AXMSC

Destination
Console

**AXMSC0052** Server prefix.name cannot be enabled because it is already active in another address space.

Explanation
Only one instance of a given AXM server name can be active in an MVS image at a time.

System action
The attempt to enable the server interface is rejected with return code 8, reason code 52.

User response
None.

Module: AXMSC

Destination
Console

**AXMSC0053** Server prefix.name cannot be enabled because caller is not APF authorized.

Explanation
AXM requires that an AXM server region must be running APF authorized in order to be allowed to enable its server interface.
System action
The attempt to enable the server interface is rejected with return code 8, reason code 53.

User response
Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Module:
AXMSC

Destination
Console
AXMSC0054 Server prefix.name cannot be enabled because the security system rejected the request.

Explanation
The security system detected that the server region userid was not correctly authorized to act as an AXM server with the specified server name.

System action
The attempt to enable the server interface is rejected with return code 8, reason code 54.

User response
See the previous AXM message giving details of the results of the security check.

Module:
AXMSC

Destination
Console
AXMSC0061I Server prefix.name is now disabled for connections.

Explanation
This AXM server is terminating and is no longer available for connections from other address spaces. This occurs either when the server explicitly disables its interface or when the server job step task terminates.

System action
Processing continues.

User response
None.

Module:
AXMSC

Destination
Console
AXMSC0062 Server disable failed for token xxxxxxxx, reason is n.

Explanation
An attempt to disable the server interface failed because the specified server interface token did not correctly identify an active server interface established by the current address space.

The reason code provides an internal indication of which validity check failed within procedure AXMSCDIS. All reason codes probably indicate an incorrect token.

System action
The attempt to disable the server interface is rejected with return code 8, reason code 62. If the server interface is still enabled, it will be disabled automatically when the job step task terminates.

User response
As the server interface token is stored internally by AXM, the only known possible reason for this message is storage overwriting within the server region.

Module:
AXMSC

Destination
Console
AXMSC0063 Server prefix.name cannot be disabled because caller is not APF authorized.

Explanation
AXM requires that an AXM server region must be running APF authorized in order to be allowed to disable its server interface.

System action
The attempt to disable the server interface is rejected with return code 8, reason code 63.
User response
Ensure that the server program is executed from an APF authorized library and is link-edited with AC(1).

Module: AXMSC

Destination
Console
AXMSC0071 Server name prefix.name has incorrect syntax for access checks.

Explanation
The security checking routine has detected that the AXM server name specified on a connection request or on a server enable request is not in the correct form, for example because either the prefix or name is blank. This means that the security check cannot be performed.

System action
A return code is set to indicate that the security check failed.

User response
Check that the server prefix and name are specified correctly. The prefix is normally defined by the server, but the name may be set from a user-specified server parameter.

Module: AXMSC

Destination
Console
AXMSC0072 level access authorization was denied for FACILITY facility.

Explanation
The external security manager has indicated that the current region is not authorized for the required level of access to the specified facility.

System action
A return code is set to indicate that the security check failed.

User response
Check whether the external security manager is available and whether the security definitions for the specified facility have been provided.

Module: AXMSC

Destination
Console
AXMSC0073 level access authorization is unavailable for FACILITY facility.

Explanation
The external security manager has indicated that it is unable to determine whether the current region is authorized for the required level of access to the specified facility. This message is only issued if it is not possible for the security routine to determine whether security checking is actually required. In cases where it is obvious that no security check is required (for example because no external security manager is installed), access is granted anyway.

System action
A return code is set to indicate that the security check failed.

User response
Check whether the userid for the region has been authorized to access the specified facility resource name.

Module: AXMSC

Destination
Console
AXMSC0074 RACROUTE REQUEST=AUTH gave R15=xxxxxxxx, SAFPRRET=xxxxxxxx, SAFPRREA=xxxxxxxx.

Explanation
This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.
System action
Processing continues.

User response
None.

Module:
AXMSC

Destination
Console

**AXMSC0075**
RACROUTE REQUEST=STAT
gave R15=xxxxxxxx,
SAFPRRET=xxxxxxxx,
SAFPRREA=xxxxxxxx.

Explanation
This message provides additional details about the results of a security check in any case where access is not granted. See the documentation of the RACROUTE macro for further information.

System action
Processing continues.

User response
None.

Module:
AXMSC

Destination
Console

**AXMSC0991I**
Creating new AXM system services anchor at address.

Explanation
This message is issued during AXM system services initialization to enable the system services anchor to be located if necessary for diagnostic purposes.

System action
AXM system services initialization processing continues.

User response
None.

Module:
AXMSC

Destination
Console

**AXMSC0992I**
Deleting old AXM system services anchor at address.

Explanation
This message is issued during AXM system services initialization if AXM system services were previously active but had been terminated (which is not possible in normal production environment). The old system services anchor is retained after AXM termination because it contains the system LX to be used if AXM is restarted. This message gives the address of the old system services anchor for diagnostic purposes.

System action
AXM system services initialization processing continues.

User response
None.

Module:
AXMSC

Destination
Console

**AXMSI0001I**
AXM subsystem initialization is in progress.

Explanation
The AXM subsystem initialization program has been started in order to initialize AXM system services.

System action
AXM system services will be loaded and initialized.

User response
None.

Chapter 1. AXM server environment messages

13
AXMSI0002I AXM subsystem initialization has completed.

**Explanation**
The AXM subsystem initialization program has completed execution.

**System action**
The program returns control to MVS.

**User response**
None.

AXMSI0003 AXM subsystem initialization return code retcode, reason code rsncode.

**Explanation**
The AXM subsystem initialization routine has not completed normally. This message indicates the final return code and reason code. This is normally the return code from AXM system services initialization.

**System action**
The subsystem initialization routine returns control to MVS.

**User response**
See the previous AXM message describing the cause of the problem. The reason code will normally be the number of an error message issued by AXMSC.

AXMSI0004 AXM subsystem initialization can only run in Main Scheduler address space.

**Explanation**
An attempt has been made to invoke the AXM subsystem initialization program AXMSI in some other way than as an MVS subsystem initialization program running in the Main Scheduler region (ASID 0001).

**System action**
The subsystem initialization program is abnormally terminated.

**User response**
None.

AXMSR0001I AXM system region initialization is in progress.

**Explanation**
An AXM system region is being started. This is used to initialize AXM system services in a testing environment for development purposes, and allows AXM system services to be closed down and restarted without an IPL.

**System action**
Processing continues.

**User response**
None.
**Destination**
Console

**AXMSR0002I**  AXM system region initialization has completed.

**Explanation**
AXM system services have been successfully initialized from the AXM system region.

**System action**
Processing continues.

**User response**
The system region may be closed down again using the MVS STOP command but this should only be done when it is certain that no AXM services are being used within the MVS image.

**Module:**
AXMSR

**Destination**
Console

**AXMSR0003I**  AXM system region termination is in progress.

**Explanation**
The operator has requested termination of the AXM system region using the MVS STOP command.

**System action**
AXM system services are terminated.

**User response**
None.

**Module:**
AXMSR

**Destination**
Console

**AXMSR0011**  AXM system region can only run under MVS/ESA.

**Explanation**
An attempt was made to execute the AXM system region program AXMSR in a non-MVS environment.

**System action**
The system region program terminates.

**User response**
None.

**Module:**
AXMSR

**Destination**
Console

**AXMSR0012**  AXM system region program AXMSR needs to be APF authorized.

**Explanation**
An attempt was made to execute the AXM system region program AXMSR without APF authorization.

**System action**
The system region program terminates.

**User response**
None.

**Module:**
AXMSR

**Destination**
Console

**AXMSR0004I**  AXM system region termination has completed.

**Explanation**
The AXM system region has completed termination.

**Module:**
AXMSR
### AXM system region LOAD for name failed with completion code xxx-nn.

**Explanation**
The attempt to LOAD the system services module (AXMSC) failed.

**System action**
The system region program terminates.

**User response**
See the description of the system completion code xxx in MVS/ESA System Codes for the reason that the LOAD failed.

**Module:**
AXMSR

### AXM system region STOP command has been accepted.

**Explanation**
An operator has issued a STOP command to close down the AXM system region.

**System action**
AXM system services will be terminated.

**User response**
None.

**Module:**
AXMSR

### AXM system region does not support this command: text

**Explanation**
An attempt was made to issue a command to the AXM system region using the MVS MODIFY command. The AXM system region only supports the MVS STOP command, and does not support commands entered via MODIFY.

**User response**
If the intention was to close down the system region, use the MVS STOP command instead.

**Module:**
AXMSR

### AXM trace and print file management messages

**AXMTR0001**
The *ddname* print file could not be opened.

**Explanation**
The AXM trace and print file with the specified ddname (usually AXMPRINT or SYSPRINT) could not be opened during AXM initialization.

**System action**
Print file output requests will be ignored.

**User response**
Ensure that the appropriate DD statement is present. The default ddname is AXMPRINT, but this may be overridden to SYSPRINT by an AXMTRDEF definition within the server code if the server does not need to reserve the name SYSPRINT for any other purpose.
AXM address lookup (WHERE) messages

AXMWH0001I  Address address is at +offset in modtype module modname.

Explanation
This message may be produced after an abend or TRAP message to identify the module containing the error address, if the module is known to MVS. The information about the module and type is obtained using the MVS macros CSVQUERY or NUCLKUP.

System action
Processing continues.

User response
None.

Module: AXMWH

Destination
Console

AXMWH0002I  Address address is at +offset in procedure procname.

AXM cross-memory interface messages

AXMXM0011  Server prefix.name cannot be enabled because AXM system services are not available.

Explanation
An attempt has been made to enable a server interface but AXM system services have not been initialized within this MVS image.

System action
The server enable request is rejected.

User response
Ensure that AXM system services are started then start the server again.

Module: AXMXM

Destination
Console and SYSPRINT

AXMXM0012  Enable failed for server prefix.name, return code retcode, reason rsnecode.

Explanation
The server interface could not be enabled. The specific reason will have been indicated by an earlier AXMSC message.
System action
The server enable request is rejected.

User response
None.

Module:
AXMXM

Destination
Console and SYSPRINT

AXMXM0021   ABEND xxx-rr occurred at address, data word1 word2 word3.

Explanation
The ARR routine for an AXM cross-memory program call routine has intercepted an abend in a cross-memory mode AXM task and has passed the associated SDWA to a task in the server address space to issue the appropriate diagnostic messages. The abend code is shown as three hexadecimal digits for a system completion code or four decimal digits for a user completion code. The data consists of the twelve bytes around the PSW address as provided by MVS in the SDWA.

System action
The ARR will already have completed processing when this message is issued, as the message is written out by the server region. If recovery is allowed, the ARR terminates the affected AXM internal task, in which case the return code from the cross-memory request will consist of the completion code in the usual MVS format but with the high-order bit set to indicate an abend. If recovery is not allowed, the ARR percolates the error, passing the abend to the requesting region.

The diagnostic routine which writes this message will call AXMWH which attempts to identify the module and procedure in which the abend occurred and writes out a further message if successful. It then releases the MVS SDWA. Server execution is not directly affected by an abend in cross-memory mode.

User response
Look up the completion code to identify the cause of the abend.

Module:
AXMXM

Destination
Console and SYSPRINT

AXMXM0022   TRAP occurred at offset offset in procname.

Explanation
An internal logic error in a server module or invalid parameters on a server request resulted in a TRAP macro being executed at the specified location in cross-memory mode.

The system will normally produce a symptom dump message on the job log, and a full dump of the connected region may be produced if an appropriate DD statement (SYSUDUMP, SYSMDUMP or SYSABEND) is present in the JCL for the connected region.

System action
The AXM task is abnormally terminated.

User response
This probably indicates a logic error in server code, or an attempt to use some internal component of the server outside its correct context.

If the procedure name in the message begins with AXM, this probably indicates that the server code which called it has passed inconsistent parameters, such as an invalid address when releasing main storage.

AXMXM

Destination
Console
Chapter 2. CICS messages

CICS produces different types of messages for different users of the product. The messages are intended as a quick reference to get started with problem determination. CICS messages begin with the characters DFH.

Format of CICS messages

CICS provides messages that describe what is happening in the system. These messages have a standard format, including a message identifier and a standard layout. Messages can appear on the system console, at a terminal, in a log, or can be routed to a transient data queue.

DFHnnnn identifiers

DFHnnnn messages have a prefix of DFH followed by a four-digit message number. DFH is the identifier that is assigned by IBM for CICS modules. The first two digits are the CICS module reference code. The final two digits are assigned by CICS to identify the message or group of messages in an assembled program.

The first two digits reference the following CICS modules:

- **01**: DFHSSIN
- **42**: DFHZCNR
- **51**: DFHCSDUP
- **52**: DFHCSDUP
- **55**: DFHCSDUP
- **56**: DFHCSDUP
- **7x**: Command-level translators

DFHccnnnn identifiers

DFHccnnnn messages have a prefix of DFH followed by a two-letter component identifier (cc), and a four-digit message number (nnnn). The component identifier shows the domain or the component which issues the message.

For example, the CICS message DFHAP0002 is issued from the application domain, identified by the two-character identifier AP. The following list associates the component identifiers with the associated CICS domains and components:

- **AC**: Abnormal condition program component
- **AD**: CICS Development Deployment Tool messages
- **AI**: Autoinstall terminal model manager (AITM)
- **AM**: RDO allocation manager

Action codes

Certain messages (for example, DFHDB8208D) include an action code after the message identifier. Action codes give guidance to the operator of the type of action needed when the message appears on the system console.

The following action codes are used:

A  Immediate action; for example, mount a tape.
D  Immediate decision; reply to a request, for example, enter GO or CANCEL.
E  Eventual; action is required, but does not have to be taken immediately.
No action required. If issued by the message domain, these messages can be suppressed by specifying MSGLVL=0 as a system initialization override.

**Severity codes**

Certain messages, especially messages to terminal operators and messages that come from CICS utilities, have a severity code. DFHST0210 I is an example. A severity code indicates to the operator whether a message is associated with an error, and if so, how serious it is.

The following severity codes are used:

- **E**
  - Error. Something is wrong and action is required of the user before CICS processing can continue.

- **I**
  - Information only. No action is required.

- **W**
  - Warning. Something might be wrong, a program loop, for example, but CICS processing continues.

- **S**
  - Severe error. Something serious is wrong and immediate action is required. CICS processing is suspended until action is taken.

**Format of message information**

Information about each message is presented in a standard format.

The following format is used for CICS messages:

- **Message identifier** – in the form DFHnnnn or DFHccnnnn
- **Message text** – the words and inserts that make up the message as displayed in CICS
- **Explanation** – the events that lead to or following the production of the message
- **System action** – the action that is to be taken by CICS
- **User response** – the action recommended for the user (the console or terminal operator or system programmer)
- **Destination** – the device or log to which the message is sent. The destination is one of the following:
  - Console – refers to a terminal type attached to CICS. (Route codes are 2 and 11 unless otherwise stated.)
  - Terminal end user
  - TERMCDBC – terminals running the CDBC transaction.
  - SYSPRINT (System printer)
  - One of the following transient data queues:
    - **CADL**
      - z/OS Communications Server resource definition log
    - **CADO**
      - CICS Development Deployment Tool messages
    - **CAIL**
      - Autoinstall terminal model manager (AITM) log

Note: Destination CXRF is used by the alternative CICS system in an XRF environment until the other destinations are made available during the takeover.

- Module(s) – the name of the module or modules that determined that the message is sent. (This name is not necessarily the module that issued the macro to write the message.)

XMEOUT parameters

Messages that can drive the XMEOUT global user exit include a list of XMEOUT parameters. You can use the XMEOUT exit to suppress or reroute messages that use the message domain.

A number of console messages must not be rerouted to a transient data queue. These messages include all DFHTDnnnn messages and certain DFHMEXMnnnn and DFHUSnnnn messages. A note to this effect is included in the descriptions of these messages.

For more information about the XMEOUT user exit, see the Message domain exit XMEOUT.
**Route codes**

Console messages can be sent to a number of console types. The type of console to which a particular message is sent is determined by the MVS route code. Each route code maps onto one console type. The meanings of the route codes that are normally used by CICS are as follows:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Main console action – indicates a change in system status that requires operator action</td>
</tr>
<tr>
<td>2</td>
<td>Main console information – indicates a change in system status (system default)</td>
</tr>
<tr>
<td>3</td>
<td>Tape pool status or other tape-related information</td>
</tr>
<tr>
<td>4</td>
<td>Direct-access pool status or other related information</td>
</tr>
<tr>
<td>5</td>
<td>Tape library information</td>
</tr>
<tr>
<td>6</td>
<td>Disk library information</td>
</tr>
<tr>
<td>7</td>
<td>Unit record pool information</td>
</tr>
<tr>
<td>8</td>
<td>Teleprocessing control status</td>
</tr>
<tr>
<td>9</td>
<td>System security checking</td>
</tr>
<tr>
<td>10</td>
<td>System error or maintenance information</td>
</tr>
<tr>
<td>11</td>
<td>Programmer information for the MVS log</td>
</tr>
</tbody>
</table>

**Note:** This route code suppresses the operator’s reply on the screen and on SYSLOG

Unless otherwise stated, console messages have the route codes ‘2’ and ‘11’.

**Console message reformatting**

The “console message handling facility” is an optional feature of the CICS subsystem that can affect the appearance of CICS messages that are displayed on an MVS console. It is effective when you specify FORMATMSG=YES as an initialization parameter for the CICS subsystem. For more information, see The console message-handling facility.

**Terminal identifiers**

Some messages include a terminal identifier (termid) in the message text. This terminal identifier is normally shown as a 4-character identifier. However, when CICS cannot completely identify a terminal – for example, when intersystem communication is taking place, the terminal identifier is prefixed by the application identification (applid) of the system that owns the terminal.

**Abend code inserts**

The transaction abend code insert (abcode) in some CICS messages is displayed as ‘????’ when neither the EXEC CICS ABEND request nor the DFHPC TYPE=ABEND macro request specifies an abend code.
Dumps

A dump is generally available for printing when a CICS system abend or abnormal termination occurs, provided the relevant data set is specified. The dump can be used for problem determination.

Terminology

The terms "abnormally terminates" and "abnormal termination" are frequently used in a general sense to relate, as applicable, to one of the following:

- The termination of CICS as a result of an MVS ABEND macro. (The term "abend" can also be used.)
- The termination of a transaction (task) as a result of a CICS transaction ABEND macro.

Katakana terminal devices

Old-style Katakana terminals that support only single-byte character sets (SBCS) cannot display lowercase Western characters. Therefore, because of the requirement on CICS to issue certain messages in mixed-case, CICS cannot support display or terminal devices that are restricted to the SBCS Katakana part only of code page 930.

MVS user abend codes

DFH messages that accompany a CICS system, utility, or subtask abend have an associated MVS user abend code. Where possible, the value of this code is the numeric part of the corresponding DFH message.

For example, DFH0305 has an 0305 user abend code. If an MVS abend code is issued but not the associated CICS message, the problem probably does not originate with CICS. For more information, see the description of the MVS abend code in z/OS MVS System Codes.

The highest possible value of an MVS user abend code is 4095. Therefore, any DFH message with a number higher than 4095 has an MVS user abend code that does not follow the above convention. The following are lists of the abend codes for messages with numbers above 4095, in order of abend code, and in order of message number.

Ordered by abend code

- 0108 DFH5263
- 0121 DFH5100
- 0123 DFH5175
- 0125 DFH5180
- 0126 DFH5184
- 0127 DFH5148
- 0147 DFH5721
- 0148 DFH5722

Note:
1. All messages that appear in the JES job log are prefixed by a timestamp and job number. Because of this condition, some messages have their message text truncated. If the full message text is required, consult the MVS log as all messages in the JES log are duplicated in the MVS system log.
2. User abend 0225 is internal to CICS. It is issued by DFHDTES when, during backout, an entry in a hash table is marked empty when it is not expected. This causes the CICS region to be abnormally terminated. If this abend occurs, you need help with resolving the problem.

</tbody>
</table>
System action
None.

User response
None.

Module: DFHSSIN

Destination
Console

DFH0101 CICS SUBSYSTEM WAS NOT INITIALIZED

Explanation
The CICS subsystem identified in an entry in an IEFSSNxx member of SYS1.PARMLIB could not be successfully initialized.

System action
The system continues without the services of the subsystem.

User response
Use the preceding DFH01xx message to investigate the reason why the subsystem could not be initialized. After correction, re-IPL MVS to initialize the subsystem.

Module: DFHSSIN

Destination
Console

DFH0102 CICS SUBSYSTEM COULD NOT LOAD MODULE module

Explanation
When trying to initialize the CICS subsystem, module module could not be loaded into common storage. The module must either be in the MVS link pack or be capable of being loaded from a library in the MVS linklist concatenation by means of a LOAD GLOBAL=(YES,P) macro.

System action
The system issues message DFH0101 and does not initialize the subsystem.

User response
Investigate the reason why the module could not be loaded. After correction, re-IPL MVS to initialize the subsystem.

Module: DFHSSIN

Destination
Console

DFH0103 CICS PARAMETER MEMBER NAME member IS INVALID

Explanation
The third positional parameter in the subsystem definition for the CICS subsystem is not a valid member name because it contains more than eight characters. In the entry in an IEFSSNxx member of SYS1.PARMLIB that defines the CICS subsystem, a parameter is coded that is not a valid name for a member containing CICS initialization parameters.

System action
The parameter coded is truncated to eight characters and the result is used as the member name for reading CICS parameters from SYS1.PARMLIB. Whether or not the resultant parameters are valid, the system later issues message DFH0101 and does not initialize the subsystem.

User response
Correct the definition of the CICS subsystem in the IEFSSNxx member of SYS1.PARMLIB. After correction, re-IPL MVS to initialize the subsystem.

Module: DFHSSIN

Destination
Console

DFH0104 CICS PARAMETER ERROR IN member - parameter

Explanation
When examining CICS subsystem initialization parameters from the named member of SYS1.PARMLIB, a syntax error was detected. The record containing the error is shown in the message.
**System action**
The system issues message DFH0101 and does not initialize the subsystem.

**User response**
Correct the syntax error in the subsystem parameter. See the CICS intercommunication for details of the syntax of subsystem initialization parameters. After correction, re-IPL MVS to reinitialize the subsystem.

**Module:**
DFHSSIN

**Destination**
Console

**CICS SUBSYSTEM INITIALIZATION IS NOT SUPPORTED FOR THIS MVS RELEASE**

**Explanation**
Initialization of the CICS subsystem is not supported on MVS releases earlier than MVS SP 2.2.0.

**System action**
The system issues message DFH0101 and does not initialize the subsystem.

**User response**
Defer implementation of the CICS subsystem services until after the prerequisite release of MVS is installed.

**Module:**
DFHSSIN

**Destination**
Console

---

**DFH42nn message**

**DFH4200**

**Explanation**

*jobname tranid*

*jobname* is the jobname of CICS in the MVS system. CICS transaction *tranid* has issued a TC READ request to the operator console.

**System action**
The transaction is suspended pending a reply.

**User response**
Enter a reply at the console.

**Module:**
DFHZCNR

**Destination**
Console

---

**DFH51nn messages**

**DFH5100 S**

**Explanation**

A严重错误模块*modname*. ABEND CODE: *abcode*

An internal error has occurred in module *modname*, when invoked by a CSD utility command.

**System action**
Processing terminates abnormally with an operating system dump and abend code *abcode*. The CSD utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

**User response**
See the description of abend code *abcode* for guidance.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
The execution of a CSD utility command *command* completed successfully.

**System action**
Normal processing continues.

**User response**
None.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
The CSD utility issued messages during syntax-checking and execution of the *command* command.

**System action**
Normal utility processing continues to the end of the job.

**User response**
Review the warning messages to see how they have affected utility processing. Then decide whether you need to submit a further CSD utility job.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
After the CSD utility program encounters an error, it ceases to execute any further commands read from a data stream (as opposed to supplied by a Put-Message
exit routine). However, it continues to check the syntax of subsequent commands. The exception is the LIST command, which will still be executed if the primary CSD file can be opened.

**System action**

Subsequent CSD utility commands (except LIST) are ignored.

**User response**

Check for a syntax error in the commands used and correct it.

There should be associated error messages which identify the problem that caused DFHCSDUP to halt active processing. These messages should appear in DFHCSDUP output before message DFH5104 is issued.

**Module:**

DFHCSDUP

**Destination**

SYSPRINT

**DFH5105 W**  
command COMMAND NOT EXECUTED BECAUSE OF PREVIOUS ERROR(S).

**Explanation**

If a syntax error (or an execution error) occurred in a command read from a data stream and processed earlier, no further commands (except for LIST commands) are executed. If the primary CSD file could not be opened, the LIST command is not executed either.

**System action**

The CSD utility command is not executed.

**User response**

Check for syntax errors or execution errors in commands processed earlier.

Correct the invalid commands.

**Module:**

DFHCSDUP

**Destination**

SYSPRINT

**DFH5106 I**  
COMMANDS EXECUTED SUCCESSFULLY: nn COMMANDS

**Explanation**

The CSD utility has completed input command processing.

Commands giving warnings may or may not have been executed successfully.

**System action**

Normal processing continues to the end of the job.

**User response**

If any CSD utility commands in error were executed, decide if the results are what you want.

If they are NOT what you want, correct them and resubmit them in another job.

If any commands were not executed, you must resubmit them. (See message DFH5108.)

**Module:**

DFHCSDUP

**Destination**

SYSPRINT

**DFH5108 I**  
COMMANDS NOT EXECUTED AFTER ERROR(S): nn

**Explanation**

The CSD utility has completed input command processing. The number of commands not executed because of errors is indicated by nn.

**System action**

Normal processing continues to the end of the job.

**User response**

Correct the commands in error and resubmit them in another job.

**Module:**

DFHCSDUP

**Destination**

SYSPRINT

**DFH5109 I**  
END OF DFHCSDUP UTILITY JOB. HIGHEST RETURN CODE WAS: retcode
**Explanation**
The CSD utility job is complete.

**System action**
Control returns to the invoker, that is, either the operating system or to an invoking program.

**User response**
None.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
The value of the PARM parameter on the EXEC job in the JCL to run the DFHCSDUP utility is incorrect.

**System action**
The PARM parameter is ignored. The CSD is opened for read and write operations.

**User response**
Correct the erroneous PARM value. The incorrect value can be found in the job step.

The CICS documentation describes how to code the PARM parameter.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
The primary CSD file must be initialized before any CSD utility command (other than the INITIALIZE or SERVICE commands) can be processed. If a secondary CSD file is used, it must always be initialized before this command can be processed. CICS issues this message if you try to break either of these rules, or if an attempt to initialize a CSD file fails to complete successfully

**System action**
The CSD utility ignores the command.

**User response**
Initialize the CSD file. You may first have to determine why a previous initialization attempt failed.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
An INITIALIZE or a SERVICE command was encountered but the primary CSD file has already been initialized.

**System action**
The INITIALIZE or SERVICE command is ignored.

**User response**
Confirm that the correct CSD file was specified.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
The CSD utility cannot initialize the CSD file because it has been defined to VSAM with an invalid key length.

**System action**
The CSD file remains uninitialized, and no utility commands are processed.
User response
Delete the CSD file, using VSAM Access Method Services (AMS). In the JCL defining the CSD cluster, change the AMS control statements to specify KEYS(22 0). Use this JCL to redefine the CSD file, and use the CSD utility to reinitialize it.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5117 S THE PRIMARY CSD HAS BEEN DEFINED WITH AN INVALID RECORD SIZE. PROCESSING IS TERMINATED.

Explanation
The CSD utility cannot initialize the CSD file, because it has been defined to VSAM with an invalid record length.

System action
The CSD file remains uninitialized, and no utility commands are processed.

User response
Delete the CSD file, using VSAM Access Method Services (AMS). In the JCL defining the CSD cluster, change the AMS control statements to specify RECORDSIZE(200 2000). Use this JCL to redefine the CSD file, and use the CSD utility to reinitialize it.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5120 I (PRIMARY | SECONDARY) CSD OPENED; DDNAME: ddname - DSNAME: dsname

Explanation
The VSAM data set specified in the JCL has been successfully opened, and is identified as the primary or secondary CSD file. (All utility commands processed will use the same primary CSD file. Different secondary CSD files may be accessed by different utility commands.)

System action
Normal processing continues.

User response
None.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5121 S I/O ERROR WHILE OPENING (PRIMARY | SECONDARY) CSD; DDNAME: ddname

Explanation
An I/O error occurred when reading or writing control records of the VSAM data set identified in the JCL as the primary or secondary CSD file.

System action
The utility command is not executed.

User response
Retry the utility command that failed. If the problem persists, restore the CSD file from your own backup procedures.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5122 S VSAM ERROR WHILE OPENING (PRIMARY | SECONDARY) CSD; DDNAME: ddname

Explanation
A VSAM error occurred when opening the data set identified in the JCL as a primary or secondary CSD file.

System action
The utility command is not executed.

User response
Refer to the VSAM diagnostics output in message DFH5179 for further information and guidance.
**Module:** DFHCSDUP

**Destination** SYSPRINT

**DFH5123 I** {PRIMARY | SECONDARY} CSD CLOSED; DDNAME: ddname - DSNAME: dsname

**Explanation**
The VSAM data set used as the primary or secondary CSD file has been successfully closed, with control records updated if necessary. (The primary CSD file is closed after all the utility commands have been processed; the secondary CSD file is closed after the command for which it was opened.)

**System action**
Normal processing continues.

**User response**
None.

**Module:** DFHCSDUP

**Destination** SYSPRINT

**DFH5124 S** PROCESSING TERMINATED. CORRUPTED CSD CONTROL RECORD DETECTED WHILE CLOSING {PRIMARY | SECONDARY} CSD; DDNAME: ddname

**Explanation**
A storage corruption is preventing the CSD control records from being updated when the CSD file is being closed.

**System action**
No further CSD utility commands are processed.

**User response**
Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where the errors have occurred because they do not print and are therefore easily identifiable.

Using the information available, determine the cause of the errors and correct them.

Resubmit the CSD utility commands that failed.

If you cannot resolve the problem, or if the problem persists, you will need further help from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHCSDUP

**Destination** SYSPRINT

**DFH5125 S** ERROR OCCURRED WHILE CLOSING THE {PRIMARY | SECONDARY} CSD. FILE IS FULL; DDNAME: ddname

**Explanation**
A storage corruption is preventing the CSD control records from being updated when the CSD file is being closed. Updating failed because data set ddname was full.

**System action**
Utility command processing is terminated.

**User response**
Initialize a new primary CSD file with a larger data set size. Then use the IDCAMS IMPORT and EXPORT commands to restore the CSD file onto a larger data set.

**Module:** DFHCSDUP

**Destination** SYSPRINT

**DFH5126 S** I/O ERROR WHILE CLOSING THE {PRIMARY | SECONDARY} CSD; DDNAME: ddname

**Explanation**
An I/O error occurred when reading or writing the control records of the CSD file, before closing VSAM data set ddname.

**System action**
No further utility commands are executed.
**User response**

Resubmit the utility commands that failed. If the problem persists, restore the CSD file from your own backup procedures.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5127 S**  
VSAM ERROR WHILE CLOSING {PRIMARY | SECONDARY} CSD; DDNAME: ddname

**Explanation**
A VSAM error occurred when closing the data set \textit{ddname} in the JCL as the primary or secondary CSD file.

**System action**
No further CSD utility commands are executed.

**User response**
Refer to the VSAM diagnostics output in message DFH5179 for further information and guidance.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5128 S**  
PROCESSING TERMINATED. {PRIMARY | SECONDARY} CSD ACCESSED BY ANOTHER USER AND COULD NOT BE SHARED. DDNAME: ddname

**Explanation**
An attempt to open the CSD has returned an error from VSAM because the data set is not available for the type of processing requested.

This usually means that:

- An attempt has been made to open the CSD in non-RLS access mode, but the CSD is already being accessed from elsewhere in RLS access mode.
- An attempt has been made to open the CSD in RLS access mode, but the CSD is already being accessed from elsewhere in non-RLS access mode.

- An attempt has been made to open the CSD in non-RLS access mode and the CSD is already being accessed in non-RLS access mode, but the CSD cluster has been defined with SHAREOPTIONS that restrict its concurrent use.

**System action**
The command is not executed.

**User response**
You can change the access mode in which you are trying to open the CSD.

**Note:**

You must specify PARM=CSD(READONLY) if you wish to open a recoverable CSD in RLS access mode from the DFHCSDUP utility program.

Alternatively, wait until the CSD file is no longer being accessed in the conflicting access mode, or until it becomes available again in accordance with the SHAREOPTIONS rules defined for the cluster.

If the conflict is due to SHAREOPTIONS and LIST is the only command you want to execute, you can specify PARM=CSD(READONLY).

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5130 E**  
UNABLE TO LOCATE MODULE DFHCICS. PRIMARY CSD NOT INITIALIZED.

**Explanation**
The DFHCICS module is missing from the library.

**System action**
Processing of the INITIALIZE command is terminated.

**User response**
Ensure that the DFHCICS module is present in the library.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5131 I**  
LIST listid CREATED.
**Explanation**
The INITIALIZE command has created the header for an IBM-protected list.

**System action**
Normal processing continues.

**User response**
None.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
The INITIALIZE command has failed when calling the CSD manager routing program, DFHDMP, to create a new list listid on the CSD file for the IBM-protected groups. The CSD file may be full or corrupt.

**System action**
Processing of the INITIALIZE command is terminated.

**User response**
Check that the data set size for the CSD file is large enough. If it is not, allocate more space.

If there is ample space and you suspect that the CSD file is corrupt, you need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
A call to the CSD manager routing program, DFHDMP, to write the definition of group grpname to the CSD file as a member of an IBM-protected list listid created an error. The CSD file may be full or corrupt.

**System action**
Processing of the INITIALIZE command is terminated.

**User response**
Increase the data set size for the CSD file and repeat the INITIALIZE request. If this fails, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
The CEDA transaction was used to create a list while the INITIALIZE command was executing.

**System action**
Processing continues.
**User response**
None.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5136 W**
GROUP `grpname` IS ALREADY A MEMBER OF LIST `listid`

**Explanation**
Group `grpname` already exists in list `listid`. CICS does not create a duplicate entry.

**System action**
Normal utility processing continues.

**User response**
None.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5137 E**
GROUP `grpname` NOT FOUND IN LIST `listid`

**Explanation**
The group `grpname` entered in the ADD command as the AFTER or BEFORE name could not be found in the list `listid`. The definition could have been deleted while the user was viewing the outcome of an EXPAND command.

**System action**
Normal utility processing continues.

**User response**
Reenter the command with a group name that exists in this list.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5139 W**
CONSIDER IMPLICATIONS OF MIGRATING TYPE=SHARED ENTRIES.

**Explanation**
The CSD utility detected a migrate of a TST TYPE=SHARED entry. A DFHTST TYPE=SHARED entry is not directly migrated. Only when a TYPE=REMOTE macro that specifies a SYSIDNT that matches a SYSID in the corresponding TYPE=SHARED macro is a TSMODEL created.

**System action**
The CSD utility continues processing of the MIGRATE command.

**User response**
If SYSID is explicitly specified on the EXEC CICS request, or added by a global user exit program, and the intent of the SYSID is to direct the request to a SHARED TS pool, you must use the migrated TST in order to satisfy the request to use the pool. See the Defining resources for more information.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5140 I**
TOTAL `xxxxxxxx` DEFINITIONS CREATED: `nn`

**Explanation**
CICS issued this message after migrating a CICS table. `nn` definitions of type `xxxxxxxx` have been created on the CSD file.

**System action**
Normal utility processing continues.

**User response**
None.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5141 S**
UNABLE TO CREATE NEW GROUP `grpname`
The MIGRATE command failed when calling the CSD manager routing program, DFHDMP, to create a new group \texttt{grpname} on the CSD file for the data in the table being migrated. The CSD file may be full, corrupt, or not initialized. The group name may be invalid.

\textbf{System action}
Processing of the MIGRATE command is terminated.

\textbf{User response}
Check the group name in the TOGROUP parameter.
Reinitialize the CSD file with the INITIALIZE command, providing a larger data set size if necessary.

\textbf{Module:}
DFHCSDUP

\textbf{Destination}
SYSPRINT

\texttt{DFH5142 E} \hspace{1em} \texttt{COMMAND NOT EXECUTED.}
\texttt{lgname WAS NOT UPDATED BECAUSE OF A PREVIOUS UPDATE FAILURE.}

The list or group \texttt{lgname} cannot be used because an operation to update it, using the DFHCSDUP offline utility, failed to execute to completion.

This has probably happened in a previous execution of DFHCSDUP.

\textbf{System action}
The command is not executed, and the execution of subsequent DFHCSDUP commands in the job stream is suppressed.

\textbf{User response}
Use the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

\textbf{Module:}
DFHCSDUP

\textbf{Destination}
SYSPRINT

\texttt{DFH5143 I} \hspace{1em} \texttt{GROUP grpname CREATED.}

A new CSD group, \texttt{grpname}, has been created for the data in the table being migrated.

\textbf{System action}
Migration continues.

\textbf{User response}
None.

\textbf{Module:}
DFHCSDUP

\textbf{Destination}
SYSPRINT

\texttt{DFH5145 E} \hspace{1em} \texttt{COMMAND NOT EXECUTED.}
\texttt{lgname HAS BEEN LOCKED BY APPLID:applid, OPID:opid TO PREVENT UPDATING.}

The list or group \texttt{lgname} cannot be used because a user of the CEDA or CEDB transaction has enforced a LOCK command to prevent updating by other users.

\textbf{System action}
The command is not executed.
If commands are being read from a SYSIN data stream, then subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)
If commands are being read from a get-command exit, then the DFHCSDUP utility attempts to process subsequent commands.

\textbf{User response}
Negotiate with the user with the specified OPID and APPLID, or create a new group or list by taking a copy of the definitions in the locked one.

\textbf{Module:}
DFHCSDUP

\textbf{Destination}
SYSPRINT

\texttt{DFH5146 E} \hspace{1em} \texttt{COMMAND NOT EXECUTED.}
\texttt{lgname IS CURRENTLY BEING}
Explanation

The list or group *lgname* cannot be used because:

- A user of the CEDA or CEDB transaction is currently running a command to update it
- A previous operation to update it using CEDA or CEDB failed to execute to completion.

System action

The command is not executed.

If commands are being read from a SYSIN data stream, then subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then the DFHCSDUP utility attempts to process subsequent commands.

User response

Resubmit the utility job to retry the command that failed. Perform the subsequent commands that were suppressed.

If this fails to resolve the problem, run the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5147 E COMMAND NOT EXECUTED.
*lgname* ALREADY EXISTS AS A {GROUP | LIST}

Explanation

The name chosen for the target group (or list) duplicates that of an existing group or list on the CSD file.

System action

Processing of the utility command is terminated.

User response

Choose a different name for the target group.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5148 E UNABLE TO GET STORAGE FOR {FCT | RDT | LD} TABLE NAMED *table*

Explanation

There is insufficient storage to satisfy a GETMAIN request for table *table*.

System action

The system action depends on the table specified as follows:

LD (language definition table)

The CSD utility cannot process any commands, and terminates with a dump. The MVS user abend code is 0327.

FCT and RDT

The CSD utility cannot migrate the table, and terminates processing of the utility command.

User response

Allocate additional storage. If your TCT assembly and link-editing is successful, the RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module:
DFHCSDUP

Destination

SYSPRINT

DFH5149 E COMMAND NOT EXECUTED.
*xxxxxxxx* IS IBM-PROTECTED.

Explanation

A user attempted to add a definition to an IBM-supplied group or list (groups or lists beginning with DFH). This is not allowed.

System action

The CSD utility does not create a definition.
User response
Change the input command to name a target group or list whose name does not begin with DFH.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5150 W xxxxxxx OPTION CONFLICTS WITH yyyyyyy OPTION AND IS IGNORED FOR restype resname

Explanation
The options, xxxxxxx and yyyyyyy, specified for the resource type restype with name resname are mutually exclusive.

System action
The utility ignores option xxxxxxx.

User response
None.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5156 W {TDQUEUE} DID NOT MIGRATE. ITS PROPERTIES MATCH AN IBM-SUPPLIED DEFINITION IN GROUP grpname.

Explanation
The properties of the resource defined in the user's table entry are the same as those of the IBM-supplied resource of the same name contained in IBM-protected group grpname.

System action
The entry for the user's resource is not migrated.

User response
None.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5159 I resource object DEFINED IN GROUP grpname

Explanation
The migrated table entry, xxxxxxxx, matches the name of an IBM-supplied resource in IBM-protected group grpname, created by the INITIALIZE command.

System action
CICS migrates this entry normally.

User response
If necessary, rename the resource, using the CEDA transaction.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5155 W {TDQUEUE} xxxxxxxx HAS SAME NAME AS AN IBM SUPPLIED DEFINITION IN GROUP grpname.

Explanation
During the execution of an ALTER command containing a generic group name, a matching group was found which is an IBM-supplied group and is protected.

System action
The CSD utility does not alter the definition in the specified group.

User response
None.

Module: DFHCSDUP

Destination
SYSPRINT
Explanation

The CSD utility has successfully added a resource definition to a group, where:

- **resource** is the type of resource (CONNECTION, FILE, JOURNALMODEL, LSRPOOL, MAPSET, PARTITIONSET, PARTNER, PROFILE, PROGRAM, SESSION, TDQUEUE, TERMINAL, TRANCLASS, TRANSACTION, or TYPETERM).
- **object** is the name of the object.
- **grpname** is the name of the group.

System action

Normal utility processing continues.

User response

None.

Module:

DFHCSDUP

Destination

SYSPRINT

**Explanation**

The CSD utility detected a CSD record with a matching key before adding the definition to the CSD file, where:

- **resource** is the type of resource.
- **object** is the name of the object.
- **grpname** is the name of the group.

System action

The CSD utility does not migrate the resource definition to the CSD file. (If it is a transaction, a generated profile is not created either.)

User response

Use the CEDA transaction to define the resource with a unique name.

Module:

DFHCSDUP

Destination

SYSPRINT

**Explanation**

An error occurred when the CSD utility called DFHDMP to write the definition of the object to the CSD file.

The CSD file may be full or corrupted.

**System action**

If the CSD is full, the CSD utility issues message DFH5176, and then terminates with a return code of 12 in message DFH5109.

If the CSD is not full, the CSD utility terminates abnormally with message DFH5175, usually accompanied by one or more of the explanatory messages, DFH5177, DFH5178, and DFH5179.

User response

Use the additional messages to determine the cause of the error and the appropriate user action required.

Module:

DFHCSDUP
**Explanation**
The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file because of an invalid character, or the resource name for the migrated table entry may be invalid. resource is the type of resource, and object is the name of the object.

**System action**
A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

**User response**
Use the CEDA transaction to define the resource with a valid name.

**Module:** DFHCSDUP

---

**Explanation**
While processing a MIGRATE command, the CSD utility has detected that the CSECTs in table table are in the wrong order. Input to the linkage editor omitted a control statement to order the CSECTs.

**System action**
The CSD utility does not process the MIGRATE command.

**User response**
Use the IBM-supplied procedure, DFHAUPLK, to assemble and link-edit CICS tables. This procedure ensures the correct ordering of CSECTs within the tables.

**Module:** DFHCSDUP

---

**Explanation**
After loading the table table, the migration routine checks the VMNAME field in the DFHVM expansion of the data area following the load point. This message is produced if VMNAME is not that of a valid table.

**System action**
The MIGRATE command is not processed.

**User response**
1. Ensure that the correct table is present in the library, and that the TABLE parameter of the MIGRATE command is correct.
2. Ensure that an ORDER statement was processed in the JCL of the link-editing of the table.

**Module:** DFHCSDUP

---

**Explanation**
After loading the table table, the migration routine checks the VMVERS field in the DFHVM expansion of the data area following the load point. This field indicates the CICS release (rrr) for which the table was assembled, and is invalid for the CICS system (release sss) that is running.

**System action**
The MIGRATE command is not processed.

**User response**
Reassemble the table for the correct release of CICS.

**Module:** DFHCSDUP
Destination
SYSPRINT

**DFH5174 W** PROCESSING IS TERMINATED. COMMAND CANNOT BE EXECUTED BECAUSE 'PARM=CSD(READONLY)' WAS SPECIFIED.

**Explanation**
This command requires the CSD to be opened for read-write access. Your job step specified read-only access for the CSD in the DFHCSDUP utility job stream.

**System action**
This command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response**
Amend the JCL to specify 'PARM=CSD(READWRITE)'.

**Note:**
If the CSD is recoverable, and you are accessing it in RLS mode, you cannot specify READWRITE access. To perform the command, access the CSD in non-RLS mode.

**Module:** DFHCSDUP

**DFH5175 S** PROCESSING IS TERMINATED. CSD IS FULL.

**Explanation**
The VSAM data set containing the CSD file is full.

**System action**
Execution of the CSD utility command is terminated.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then the DFHCSDUP utility attempts to process subsequent commands.

The DFHCSDUP utility leaves a system lock on the group being created at the time of failure. This lock prevents processing of the group by the CSD utility or the CEDA transaction.

**User response**
First, use the DFHCSDUP VERIFY process to remove the system lock on the partly-created group. Normal RDO processing of the group should then be possible, enabling the group (or any unwanted definitions) to be deleted.

To recover the contents of the CSD file, define a larger data set and use the AMS REPRO command. Usually, you will be able to REPRO from the CSD file that became full. If you are unable to do this, use a backup copy. (You may be able to transfer definitions from the CSD file that filled up by using the DFHCSDUP COPY command with the FROMCSD option.)
DFH5177 S  PROCESSING IS TERMINATED.
CSD I/O ERROR OCCURRED.

Explanation
An I/O error occurred when executing a READ or WRITE of a CSD record on the primary or secondary CSD file.

System action
DFHCSDUP issues additional messages and terminates abnormally.

User response
Restore the CSD file to a new data set from your own backup, or create the new CSD file by using the INITIALIZE, COPY, and APPEND commands to restore existing definitions.

DFH5178 S  PROCESSING IS TERMINATED.
SEVERE CSD ERROR OCCURRED.

Explanation
An error occurred during execution of the CSD manager, DFHDMP, to access the primary or secondary CSD file.

System action
DFHCSDUP issues additional messages and terminates abnormally.

User response
See the VSAM diagnostics given in message DFH5179.

DFH5179 S  VSAM ERROR. RETURN CODE = nn
ERROR CODE = ddd(yy) CONTROL BLOCK TYPE = {RPL | ACB}

Explanation
VSAM returned the following diagnostics when an error occurred, where:

• nn is the hexadecimal VSAM return code
• yy is the hexadecimal VSAM error code (ddd is its decimal equivalent)
• CONTROL BLOCK TYPE points to the relevant error code subset as follows:
  – RPL = Request macro responses from VSAM
  – ACB = OPEN/CLOSE responses

The error code is:
  – For CONTROL BLOCK TYPE = RPL, the reason code from byte 3 of the feedback word field in the RPL (RPLERRCD)
  – For CONTROL BLOCK TYPE = ACB, the reason code in the ERROR field in the ACB (ACBERFLG)

System action
The CSD utility terminates command processing, and in some situations, produces an operating system dump.

User response
For the meaning of the VSAM return and error codes, refer to the z/OS DFSMS Macro Instructions for Data Sets manual.

When interpreting these diagnostics, ensure that the data set referenced in the JCL exists.

Check the following:

• The data set is being concurrently accessed by CICS running in another region.
• You are not attempting to open a recoverable CSD as READWRITE if DFHCSDUP specifies RLS access mode. You must specify PARM=CSD(READONLY) in this case.
• LOG is defined on the base cluster if RLS access mode is specified.

If DFHCSDUP specifies RLS access mode, a 'record not found' error could mean that the CSD has not been initialized.

Note:
You must use non-RLS access mode to initialize a recoverable CSD.
When the LIST command invoked DFHDMF to scan the objects on the CSD file, an error occurred during execution of the DFHDMF function.

System action
The CSD utility terminates with an MVS abend 0325.

User response
This error should be reported. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Explanation
The LIST command or the DELETE command was executed using the name of a group or list that does not exist on the primary CSD file.

System action
The LIST command or the DELETE command is not processed. Subsequent commands may still be processed.

User response
Correct the LIST command or the DELETE command to use a valid group or list name.

If a CSD upgrade is being performed, no user action is required.

Explanation
The LIST command or the DELETE command was executed using a group name that is already in use as a list name, or using a list name that is already in use as a group name.

System action
The LIST command or the DELETE command is not processed. Subsequent commands may still be processed.

User response
Correct the LIST command or the DELETE command to use a valid group or list name.
**Explanation**
There has been an internal logic error in the DFHCSDUP utility program. The data in the back-translated output buffer is invalid. The length code may be out of range or the data fields in the wrong sequence. One or more of the data fields may be invalid.

**System action**
The CSD utility terminates with an MVS abend 0326.

**User response**
This error must be reported.

Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where the error(s) have occurred because they will refuse to print and are therefore easily identifiable.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
The CSD utility detected a locked resource that is not a group or list. The reason is that an interrupt or failure occurred during a CEDA transaction or a previous utility job. A lock had been created but not the associated group or list.

**System action**
The utility continues normal processing of the VERIFY command.

**User response**
None.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**Explanation**
The VERIFY command discovered that the resource was not available for the CEDA transaction or offline commands. The restriction on its availability, which was due to the failure of some previous command affecting it, has now been removed.

**System action**
Normal processing of the VERIFY command continues.

**User response**
None.

**Module:** DFHCSDUP

**Destination**
SYSPRINT
**DFH5189 I**  CSD VERIFY PROCESS COMPLETED SUCCESSFULLY.

**Explanation**

The VERIFY command has been processed successfully, and any internal locks associated with groups and lists on the CSD file have been removed.

**System action**

Normal processing continues.

**User response**

None.

**Module:**

DFHCSDUP

**Destination**

SYSPRINT

---

**DFH5190 S**  COMMAND IS NOT EXECUTED.
UNABLE TO GET STORAGE FOR SERVICE MODULE proname

**Explanation**

There is insufficient storage available to load the service module proname, that is to be loaded and executed by DFHCSDUP.

**System action**

Utility command execution is terminated.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

**User response**

Ensure that there is sufficient storage allocated to load module proname.

**Module:**

DFHCSDUP

**Destination**

SYSPRINT

---

**DFH5191 I**  SERVICE PROGRAM proname IS RUNNING.

**Explanation**

The service module proname has been loaded correctly. Execution of the module has started.

**System action**

Normal processing continues.

**User response**

None.

**Module:**

DFHCSDUP

**Destination**

SYSPRINT

---

**DFH5192 S**  COMMAND IS NOT EXECUTED.
CSD SERVICE LEVEL ttt IS INCOMPATIBLE WITH CURRENT SERVICE LEVEL sss

**Explanation**

Either the LEVEL parameter specified in the SERVICE command is wrong, or an incorrect version of the CSD file is being used as the secondary (input) CSD file.

**System action**

The SERVICE command is not executed.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST commands) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

**User response**

The SERVICE command may upgrade the service level of the CSD file only in increments of one. Check that the input CSD file is the intended one, and that the LEVEL parameter takes the value one higher than the current service level of the CSD file.

**Module:**

DFHCSDUP

**Destination**

SYSPRINT
Destination
SYSPRINT
DFH5193 S COMMAND IS NOT EXECUTED.
SERVICE MODULE proname IS
UNABLE TO UPGRADE CSD TO
TARGET SERVICE LEVEL ttt

Explanation
The LEVEL parameter specified in the SERVICE
command is incompatible with the status of the
service module proname being applied to the CSD
file.

System action
The SERVICE command is not executed.
If commands are being read from a SYSIN data
stream, then subsequent commands (except LIST
commands) are checked for syntax only. (If the
primary CSD file cannot be opened, the LIST command
is not processed either.)
If commands are being read from a get-command
exit, then DFHCSDUP attempts to process subsequent
commands.

User response
Ensure that the service module proname being
applied, is correctly updated with the service fix
supplied by IBM. (It should have been amended so as
to be able to process SERVICE commands at the target
level ttt.)

Module:
DFHCSDUP

Destination
SYSPRINT
DFH5194 I UPGRADE SERVICE STATUS FROM LEVEL sss TO LEVEL ttt

Explanation
The loaded service module is performing the required
upgrade of the CSD file from service level sss to
service level ttt.

System action
Normal processing continues.

Chapter 2. CICS messages 51
User response
Retry the command, ensuring that a sufficiently large data set size is specified for the output (primary) CSD file.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5197 S COMMAND IS TERMINATED. UNRECOGNIZED CONTROL RECORD ENCOUNTERED WHILE SECONDARY CSD WAS BEING READ.

Explanation
The contents of a control record of the secondary input CSD are invalid.

System action
The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, then subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, then DFHCSDUP attempts to process subsequent commands.

User response
Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the OLDCSD parameter in the SERVICE utility command.

If the problem persists, you will need further help from IBM. First, obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where the errors have occurred because they do not print and are therefore easily identifiable. See Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5198 I CSD RECORD MODIFIED FOR xxxxxxxx

Explanation
The specified modification to a record on the CSD file has taken place.

The insert, xxxxxxxx, is the element type.

System action
Normal processing continues. If the modified record is an element in a GROUP or LIST, its date-and-time field is updated when copied to the output (primary) CSD file.

User response
None.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5199 W INVALID FIELD ENCOUNTERED IN EXISTING RECORD FOR xxxxxxxx

Explanation
An unexpected value was found in one of the fields of a CSD record that was to be modified for element xxxxxxxx.

System action
Normal processing continues, and the invalid record is left unchanged on the new (primary) CSD file.

User response
None.

Module: DFHCSDUP

Destination

SYSPRINT

**DFH5205 E** COMMAND NOT EXECUTED. NO VALUE WAS SPECIFIED FOR xxxx.

**Explanation**
The option xxxx is incomplete, possibly because a value has been omitted.

**System action**
This CSD utility command is ignored.

**User response**
Correct the command.

**Module:**
DFHCSDUP

**Destination**

SYSPRINT

**DFH5206 E** COMMAND NOT EXECUTED. DUPLICATE SPECIFICATION OF xxxx.

**Explanation**
Option xxxx appears twice on a single CSD utility command.

**System action**
The utility ignores the command.

**User response**
Correct the command.

**Module:**
DFHCSDUP

**Destination**

SYSPRINT

**DFH5207 E** COMMAND NOT EXECUTED. xxxxxxxx DOES NOT REQUIRE A VALUE.

**Explanation**
The CSD utility detected an input command coded with a value for option xxxxxxxx when no value was required.

**System action**
The utility does not process the command.

**User response**
Correct the command.

**Module:**
DFHCSDUP

**Destination**

SYSPRINT

**DFH5208 W** RESOURCE DEFINED BUT NO VALUE WAS SPECIFIED FOR xxxxxxxx. ENSURE THAT THE RESOURCE IS UPDATED.

**Explanation**
The CSD utility detected that an input command did not have a value for the specified keyword xxxxxxxx, when a value was required.

**System action**
The utility processes the command and ignores the specified keyword.

**User response**
Correct the input command and update the defined CICS resource.

**Module:**
DFHCSDUP

**Destination**

SYSPRINT

**DFH5209 W** NO COMMAND ENCOUNTERED. THE INPUT FILE MIGHT BE EMPTY.

**Explanation**
The CSD utility detected that an input command was missing. A valid CSD input command was expected but not found.

**System action**
The utility continues processing the input file.
Ensure that you have valid DFHCSDUP input commands in the SYSIN data stream. If you are using the UPGRADE USING(file name) command, ensure that the input file contains valid commands.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5210 E**
COMMAND NOT EXECUTED.
INVALID VALUE WAS SPECIFIED FOR xxxx.

**Explanation**
The CSD utility detected an input command coded with an invalid value for option xxxx.

**System action**
The utility does not process the command.

**User response**
Correct the value.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5211 E**
COMMAND NOT EXECUTED.
OPERAND DELIMITER x WAS MISPLACED.

**Explanation**
The CSD utility has detected an input command coded with a misplaced option delimiter x.

**System action**
The utility does not process the command.

**User response**
Place the delimiter correctly.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5212 E**
COMMAND NOT EXECUTED.
comptype string IS NOT UNIQUELY IDENTIFIABLE.

**Explanation**
An ambiguous DFHCSDUP command has been specified.

- comptype is the command component type
- string is the actual component.

**System action**
The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response**
Correct the command syntax and retry. See accompanying message DFH5213 for further details of the command failure.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5213 E**
SPECIFIED input COULD BE INTERPRETED AS match1 OR match2.

**Explanation**
An ambiguous DFHCSDUP command has been specified.

- input is the ambiguous character string
- match1 and match2 are two possible interpretations of input.

**System action**
The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response**
Correct the command syntax and retry.
Explanation
The CSD utility has detected an input command coded with an obsolete keyword. The keyword specifies an option not valid for this release of CICS, but the command can be used as input to the CSD utility for an earlier release.

System action
The utility ignores the keyword.

User response
Confirm that the resulting utility command is correct for this release of CICS.

Module: DFHCSDUP
Destination SYSPRINT
DFH5214 W **keyword** IS AN OBSOLETE KEYWORD. IT IS IGNORED. RESPECIFY USING THE COMPAT OPTION.

Explanation
A nonexistent resource of type **restype** and name **rename**, has been specified on an ALTER command.

System action
The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response
Correct the command syntax and retry.

Module: DFHCSDUP
Destination SYSPRINT
DFH5215 E **COMMAND NOT EXECUTED. A CLOSING PARENTHESIS HAS BEEN OMITTED FROM A NULL VALUE SPECIFIED ON AN ALTER COMMAND.**

Explanation
A closing parenthesis was not added when a null value was specified for a keyword on an ALTER command. A closing parenthesis is automatically added for keyword values other than nulls.

System action
The command is not executed. If commands are being read from a SYSIN data stream, subsequent commands (except LIST commands) are checked for syntax only. If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response
Correct the command syntax and retry.

Module: DFHCSDUP
Destination SYSPRINT
DFH5216 E **restype** **rename** IS NOT IN GROUP **group**.

Explanation
A closing bracket has been omitted from the xxx keyword on a DFHCSDUP DEFINE command.

System action
The DEFINE command is not executed.

User response
Correct the DEFINE command syntax and retry.
During the execution of a generic ALTER command, the CSD batch update utility scans the CSD file for matches to the specified generic resource name and/or GROUP keyword. For every match, the utility processes the request and informs the user of the resulting resourcename and/or groupname respectively.

System action
Normal processing continues.

User response
None.

Module: DFHCSDUP

Explanation
The ALTER command was executed with a generic resource and/or group name, but no qualifying resource and/or group exist on the CSD file.

System action
Normal processing continues.

User response
None.

Module: DFHCSDUP

Explanation
A required keyword xxxxxxxxx was omitted from a CSD utility command.

System action
The utility ignores the command.

User response
Specify keyword xxxxxxxxx.

Module: DFHCSDUP

Explanation
The syntax of the command is incorrect. Conflicting keywords have been specified.
**System action**
The utility command is ignored.

**User response**
Correct the command.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**DFH5224 E**  COMMAND NOT EXECUTED. VALUE OF xxxxxxxxx IS OUT OF VALID RANGE.

**Explanation**
The CSD utility detected an input command coded with a numeric value for value xxxxxxxxx which was outside the valid range.

**System action**
The utility does not process the command.

**User response**
Correct the value.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**DFH5225 E**  COMMAND NOT EXECUTED. SAME NAME SPECIFIED FOR 'TO' AND xxxxxxxxx.

**Explanation**
This message is issued for one of the following reasons:
1. The utility COPY command has been coded with the same group name for the source and target group.
2. The APPEND command has been coded with the same list name for the source and target list.
3. The ADD command has been coded with the same group name and list name.

**System action**
The CSD utility or CICS ignores the command.

**User response**
Correct the name (or names) in error.

**Module:** DFHCSDUP

**DFH5227 E**  COMMAND NOT EXECUTED. USE OF GENERIC NAME CONFLICTS WITH xxxxxxxxx OPTION.

**Explanation**
A CSD utility command used a generic name; that is, one containing asterisk (*) or plus sign (+) characters, in conjunction with an option that conflicted with the use of generic names.

**System action**
The utility ignores the command.

**User response**
Correct the command.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**DFH5228 E**  COMMAND NOT EXECUTED. ONLY ONE RESOURCE-TYPE KEYWORD CAN BE SPECIFIED.

**Explanation**
The CSD utility detected an input command coded with more than one resource-type keyword.

**System action**
The utility does not process the command.

**User response**
Correct the command to refer to only one resource-type keyword.

**Module:** DFHCSDUP

**Destination**
SYSPRINT
**DFH5229 E** COMMAND NOT EXECUTED. 

**Explanation**

The CSD utility detected an input command coded with a resource-type keyword (for example, PROGRAM, TRANSACTION) in a situation where a resource-type keyword is invalid.

**System action**

The utility does not process the command.

**User response**

Correct the command and resubmit.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

---

**DFH5230 I** ERASE COMMAND IS OBSOLETE. USE THE DELETE COMMAND.

**Explanation**

The CSD utility detected the obsolete ERASE command in its input.

**System action**

The utility processes the command as a DELETE command.

**User response**

In future, use the DELETE command instead of the ERASE command.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

---

**DFH5231 E** COMMAND NOT EXECUTED. 

**Explanation**

An attempt has been made to execute the MIGRATE command with an invalid table type and (or) an invalid keyword specified.

**System action**

The CSD utility terminates.

**User response**

Correct the command syntax and resubmit the job.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

---

**DFH5232 E** COMMAND NOT EXECUTED. 

**Explanation**

In a CSD utility MIGRATE command, the parameter contained an invalid table name or group name.

**System action**

The utility does not process the command.

**User response**

Resubmit with a valid table name or group name.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

---

**DFH5233 E** COMMAND NOT EXECUTED.

**Explanation**

The CSD utility detected a TABLE parameter that referred to a CICS table type not supported by RDO.

**System action**

The utility does not process the command.
User response
Correct the command.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5234 E COMMAND NOT EXECUTED. command IS NOT SUPPORTED.

Explanation
The CSD utility detected a command command in its input which is not supported by RDO.

System action
The utility does not process the command.

User response
Correct the command

Module: DFHCSDUP

Destination
SYSPRINT

DFH5235 E COMMAND NOT EXECUTED. GROUP OR LIST MUST BE SPECIFIED.

Explanation
A CSD utility EXTRACT command has been submitted. A GROUP or LIST name must be specified with an EXTRACT command.

System action
The utility command is not executed. This message is followed by DFH5104.

User response
Correct the invalid command by adding a valid GROUP or LIST name and rerun the utility job.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5236 I A USER EXIT PROGRAM HAS BEEN SPECIFIED ON THE ENTRY LINKAGE AND ON THE USERPROGRAM KEYWORD. THE PROGRAM SPECIFIED ON THE ENTRY LINKAGE HAS BEEN IGNORED.

Explanation
An EXTRACT user-exit program has been specified via the entry parameter list and on the USERPROGRAM keyword of the EXTRACT command.

System action
The program specified on the USERPROGRAM keyword is used.

User response
Ensure that the user program used is the one intended.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5240 S PROCESSING TERMINATED. ERROR OCCURRED WHILE INPUT UTILITY COMMAND WAS BEING READ.

Explanation
The environment adaptor GETCARD utility cannot read an input utility command.

System action
The CSD utility terminates abnormally without processing the input commands.

User response
Check that the utility commands are prepared correctly and located correctly in the JCL. Check also that the DD statement defining the output data set startup job stream is correct. For JCL examples, refer to the CICS documentation.

Module: DFHCSDUP
Destination

**SYSPRINT**

**DFH5241 S**  
**PROCESSING TERMINATED. INVALID RECORD LENGTH ON INPUT UTILITY COMMAND DATA STREAM.**

**Explanation**  
The CSD utility detected incorrectly formatted input in the SYSIN data stream.

**System action**  
The CSD utility cannot process any commands. The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

**User response**  
Ensure that the output data set data stream is formatted with fixed length 80-byte records.

**SYSPRINT**

**DFH5242 E**  
**COMMAND NOT PROCESSED. TOO MANY CONTINUATION RECORDS FOR INPUT UTILITY COMMAND.**

**Explanation**  
The CSD utility detected an input command that was too long and extended over too many records.

**System action**  
The utility does not process the command.

**User response**  
This message may be caused by an error in the rejected command or in the preceding or subsequent commands in the input stream. Correct the commands in error.

**Module:**  
DFHCSDUP

---

**Destination**

**SYSPRINT**

**DFH5250 E**  
**TO(groupname) CONTAINS TOO MANY NON CONTIGUOUS ‘*’**

**Explanation**  
During the execution of a generic COPY command, the batch update utility found the argument of the TO parameter specified too many non contiguous asterisks.

Only one ‘*’ is allowed in the TO parameter during the execution of a generic copy.

**System action**  
The utility rejects the command.

**User response**  
Correct the command.

**Module:**  
DFHCSDUP

**SYSPRINT**

**DFH5251 I**  
**resource object IN GROUP grpname IS REPLACED.**

**Explanation**  
A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the definition in the target group with that from the source group.

- **resource** is the type of the resource
- **object** is the name of the object
- **grpname** is the name of the group.

**System action**  
Normal utility processing continues.

**User response**  
None.

**Module:**  
DFHCSDUP

---

Chapter 2. CICS messages 61
DFH5252 I resource object COPIED TO GROUP grpname.

Explanation
The CSD utility has correctly copied a resource definition to the specified group, where:
- resource is the type of resource
- object is the name of the object
- grpname is the name of the group.

System action
Normal utility processing continues.

User response
None.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5253 E GROUP grpname NOT FOUND IN CSD FILE - DDNAME: ddname

Explanation
The CSD utility has detected a COPY command that attempted to copy definitions from the non-existent group, grpname, in the CSD specified in DDNAME ddname.

System action
The utility does not process the command.

User response
Change the name in the command, or alter the name of the existing definition.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5255 E LIST xxxxxxxx NOT FOUND IN CSD FILE - DDNAME: ddname

Explanation
The CSD utility detected an APPEND or REMOVE command that referred to a nonexistent list in the CSD file specified in DDNAME ddname.

System action
The utility does not process the command.

User response
Either correct the list name in the command, or make sure that the specified CSD file is the correct one.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5256 E NO RESOURCES DEFINED IN GROUP grpname.

Explanation
In executing a LIST command, the CSD utility has found a group header on the CSD file for which no group elements exist.
System action
The CSD utility continues to process the LIST command, but will not list elements of the named group.

User response
Run the DFHCSDUP VERIFY utility to verify the group.

Module:
DFHCSDUP

Destination
SYSPRINT

DFH5257 E LENGTH OF 'TO' PREFIX MUST BE LESS THAN OR_EQUAL TO LENGTH OF 'GROUP' PREFIX.

Explanation
During the execution of a generic COPY command, the batch update utility found the length of the prefix of the generic group specified in the TO keyword to be greater than the length of the prefix of the generic GROUP keyword.

System action
The utility ignores the command to prevent truncation of the TO group name.

User response
Correct the command.

Module:
DFHCSDUP

Destination
SYSPRINT

DFH5258 I COPYING GROUP grpname1 TO grpname2

Explanation
During the execution of a generic COPY command, the CSD batch update utility scans the CSD file for matches to the generic GROUP keyword. For every match, the utility resolves the generic TO keyword, and informs the user of the resulting grpname1 and grpname2 respectively.

System action
Normal processing continues.

User response
None.

Module:
DFHCSDUP

Destination
SYSPRINT

DFH5259 I UNRECOGNIZED RESOURCE TYPE FOUND IN THE CSD FILE AND HAS BEEN IGNORED.

Explanation
CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action
The resource is ignored and the operation continues.

User response
Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCSDUP

Destination
SYSPRINT
**Explanation**

During the execution of a generic COPY command, the batch update utility found the length of the suffix of the generic group specified in the TO keyword to be of different length than that of the suffix of the generic GROUP keyword.

**System action**

The utility ignores the command to prevent ambiguity on the TO group name.

**User response**

Correct the command.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

---

**Explanation**

The CSD utility detected an attempt to migrate a TCT that either contains no RDO-supported terminal or sessions definitions, or whose TYPE=INITIAL entry specifies MIGRATE=COMPLETE.

**System action**

The utility does not create any CSD definitions.

**User response**

Check the TCT source code to see if it contains any RDO-supported definitions. If it does, check that it has been correctly assembled (MIGRATE=YES specified) and link-edited.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

---

**Explanation**

During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of abnormal data in the assembled table.

**System action**

The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

Definitions that have already been migrated will remain on the CSD. The MVS user abend code is 0308.

**User response**

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Allocate a larger region size in the utility JCL, and retry the command.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

---

**Explanation**

During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of lack of storage for TYPETERM definitions.

**System action**

The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

In any of the above cases, definitions that have already been migrated will remain on the CSD.

**User response**

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Allocate a larger region size in the utility JCL, and retry the command.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

---

**Explanation**

During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of lack of storage for TYPETERM definitions.

**System action**

The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

In any of the above cases, definitions that have already been migrated will remain on the CSD.

**User response**

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Allocate a larger region size in the utility JCL, and retry the command.

**Module:** DFHCSDUP

**Destination**

SYSPRINT
**User response**

1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Keep the assembly listing for the failing table and keep the DFHCSDUP dump, if available. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**Explanation**

During the migration of a TCT, the CSD utility could not define a resource *object* because the target group *grpname* was not available. The utility has issued a previous message indicating the reason.

**System action**

The utility creates no definition for resource *object*. Normal utility processing continues.

**User response**

Review the original message. If necessary, recode the TYPE=GROUP macro in the TCT source to name a suitable group.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**Explanation**

An error has been detected during the migration of a TCT. When migrating a session, DFHCSDUP checks that the associated CONNECTION has been defined successfully. If it has not, DFHCSDUP abnormally terminates the session definition.

**System action**

The specified SESSIONS resource is not migrated to the CSD. DFHCSDUP continues with the migration of subsequent TCT entries.

**User response**

Use the diagnostic information in the output listing from the MIGRATE utility to determine why the CONNECTION definition has failed. You can then use RDO to DEFINE the CONNECTION and the SESSIONS to the CSD.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**Explanation**

The CSD utility has successfully deleted a group or list from the primary CSD file.
**System action**
Normal utility processing continues.

**User response**
None.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

DFH5271 S UNABLE TO DELETE {GROUP / LIST} xxxxxxxx FROM THE CSD.

**Explanation**
During CSD utility processing, an error in accessing the CSD file caused a delete operation to fail.

**System action**
The utility does not process the DELETE command. The group or list to be deleted remains on the CSD file.

**User response**
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

DFH5272 I resource object DELETED FROM GROUP.

**Explanation**
The CSD utility successfully deleted the named resource, where:
- resource is the type of resource
- object is the name of the object

**System action**
Normal utility processing continues.

**User response**
None.

**Module:**
DFHCSDUP

DFH5273 W resource object IS NOT IN GROUP grpname.

**Explanation**
The CSD utility detected an attempt to delete a resource which did not exist in the named group, where:
- resource is the type of resource
- object is the name of the object
- grpname is the name of the group.

**System action**
The utility does not process the DELETE command.

**User response**
Check that you have coded the group and resource names correctly.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

DFH5274 W resource object NOT MIGRATED. GROUP grpname IS NOT AVAILABLE.

**Explanation**
During the migration of a table, the CSD utility could not define the resource resource because the target group grpname was not available. The utility has issued a previous message indicating the reason why.

**System action**
The utility creates no definition for the resource named object. Normal utility processing continues.

**User response**
Review the original message. If necessary recode the TYPE=GROUP macro in the table source to name a suitable group.

**Module:**
DFHCSDUP
**Command Not Executed.**

**Explanation**
The REMOVE command being executed names a GROUP that is not a member of LIST listname.

**System action**
The CSD utility ignores the command.

**User response**
None.

**Module:**
DFHCSUDP

---

**Processing Definitions from Library Member xxxxxxxxx.**

**Explanation**
The CSD utility has successfully loaded data from the named library member.

**System action**
Normal utility processing continues.

**User response**
None.

**Module:**
DFHCSUDP

---

**List Deleted from CSD.**

**Explanation**
The final group has been removed from list listname. The list has therefore been deleted.

**System action**
Processing continues.

---

**Data Loaded from Library Member xxxxxxxxx Is Invalid.**

**Explanation**
The CSD utility has found an error in data loaded from the named library member.

**System action**
The utility attempts to:

1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

**User response**
Obtain a dump containing the failing library member.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHCSUDP
The CSD utility found an internal error in the data loaded while processing the indicated (truncated) UPGRADE, INITIALIZE, or MIGRATE command.

The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHCSDUP
**Explanation**

This message is issued during the processing of the indicated (truncated) command for one of the following reasons:

1. The CSD is full (in which case, messages DFH5175 and DFH5176 accompanies this one)
2. The CSD was defined as read-only (in which case, message DFH5174 accompanies this message)
3. The TCT being migrated contained a terminal entry with a name unacceptable to RDO (in which case, message DFH5165 accompanies this message)
4. A list or group cannot be used due to the failure of a previous update operation (in which case, message DFH5142 accompanies this message)
5. The resource definition list being used to INITIALIZE or UPGRADE the CSD file contained a definition with an invalid resource name or group name
6. A logic error occurred in DFHCSDUP or an internal error was detected in the data contained in the loaded table.

**System action**

The system action depends on the reason the message is issued, as follows.

1. Migration of the TCT table is terminated immediately.
2. Processing of the UPGRADE or INITIALIZE command is terminated.
3. The utility attempts to:
   a. Close any files previously opened internally.
   b. Unload any extract exit routines that were dynamically loaded.
   c. Invoke the termination exit routine (if supplied).
   d. Return control to the invoker of the utility.
4. The command is not executed, and execution of further DFHCSDUP commands in the job stream is suppressed.
5. As in (3) above.
6. As in (3) above.

In ALL cases, all the definitions created by this command up to the point of failure remain on the CSD.
**DFH5288 E**  GET-COMMAND TERMINATED AT USER’S REQUEST. RC=xx.

**Explanation**
The GET-COMMAND exit has returned a value other than UERCNORM ('00'X) or UERCDONE ('04'X) indicating that the GET-COMMAND exit was unsuccessful.

**System action**
Execution of the utility command is terminated.

**User response**
Correct the operation of the GET-COMMAND user exit before re-running the utility. Consult the documentation or listing supplied with the user exit for information on how to diagnose and fix the problem.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**DFH5290 W**  TABLE tabtype MACRO mactype=value IS NOT SUPPORTED. VALUE IS CHANGED TO newvalue.

**Explanation**
During a table tabtype migration for macro mactype, value is not supported. value has been migrated as newvalue

**System action**
The utility creates the definition for the resource with the changed value. Normal utility processing continues.

**User response**
Review the object definition to ensure that the modified definition is acceptable.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**DFH5291 E**  UNABLE TO DEFINE OBJECT object IN GROUP group. MIGRATION IS TERMINATED.

**Explanation**
The DFHCSDUP migration utility could not define object in the group specified. The migration cannot continue.

**System action**
The utility terminates the migration of the table.

**User response**
Verify that the specified group is the correct group and review prior errors to determine why the migration utility could not create the definition in the group.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**DFH5292 W**  OBJECT object NOT DEFINED FOR TABLE ITEM name DUE TO PREVIOUS ERROR. MIGRATION CONTINUES.

**Explanation**
The DFHCSDUP migration utility could not define object for the table item name. The migration continues.

**System action**
The utility continues the table migration without defining the object.

**User response**
Correct the prior errors and manually define the skipped objects.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**DFH5293 W**  TOTAL object DEFINITIONS SKIPPED DUE TO ERROR: number

**Explanation**
CICS issues this message after migrating a CICS table. number definitions of type object were not migrated. See one or more DFH5292 messages issued prior to this message.
System action
Utility processing continues.

User response
Correct the prior errors and manually define the skipped objects.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5294 E number object-1 WERE NOT MATCHED WITH A CORRESPONDING object-2.

Explanation
CICS issues this message if there are object-1 table definitions that have not been defined because the table was not defined correctly. object-1 table definitions must refer to a object-2 in the table.

System action
The migration of the table ends.

User response
Reassemble the table with the current release macro source.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5296 W TABLE tabtype TYPE=mactype parameter DOES NOT SUPPORT MULTIPLE VALUES.

Explanation
Multiple values were specified for TYPE=mactype parameter. The migration of the tabtype table supports only one value.

System action
The migration utility ignores the additional values. The migration continues.

User response
Review the migrated definition to ensure that the new single value is acceptable.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5297 E command IS NO LONGER SUPPORTED.

Explanation
The CSD utility detected a command, command, in its input that is no longer supported by RDO.

System action
The utility does not process the command.

User response
Refer to the Upgrading Guide for details on how to proceed if you need to use the withdrawn command. It is possible that you can run with a back-level version of the CSD utility program that would support the command.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5298 E resource object IS NOT IN GROUP grpname.

Explanation
The CSD utility detected an attempt to copy a resource which did not exist in the named group, where:

- resource is the type of resource
- object is the name of the object
- grpname is the name of the group.

System action
The utility does not process the COPY command.

User response
Check that you have coded the group and resource names correctly.
DFH55nn messages

**DFH5501 E** COMMAND NOT EXECUTED. 
*keyword* MUST BE SPECIFIED

**Explanation**
A keyword *keyword*, which is required in the command, has been omitted or was incorrectly specified. An earlier message identifies if the latter case is applicable.

**System action**
The utility ignores the command.

**User response**
Correct the command.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5502 W** *xxxxxx* IMPLIES *yyyyyy*

**Explanation**
The value *xxxxxx* specified in a DEFINE or ALTER command has caused another value *yyyyyy*, which is not a normal default, to be assumed.

**System action**
Normal utility processing continues.

**User response**
Check that the resulting resource definition is acceptable. If you accept this default, no further action is required.

If the resultant default is not acceptable, you must decide whether to modify the definition, or to delete it and start again.

**Module:**
DFHCSDUP

**Destination**

**DFH5503 E** COMMAND NOT EXECUTED. 
*xxxxxx* OPTION CONFLICTS WITH *yyyyyy* OPTION AND IS IGNORED.

**Explanation**
Two options, *xxxxxx* and *yyyyyy*, that are mutually exclusive have been specified.

**System action**
The utility ignores the command and does not execute subsequent commands (except the LIST command).

**User response**
Correct the command.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5504 E** COMMAND NOT EXECUTED. USE OF *xxxxxx* OPTION IMPLIES *yyyyyy* OPTION

**Explanation**
Option *xxxxxx* requires another value, *yyyyyy*.

**System action**
The utility ignores the command.

**User response**
Specify *yyyyyy*.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5505 W** PROGRAM DFHMSP REQUIRES A TWASIZE OF AT LEAST 512
**Explanation**
A DEFINE PROGRAM command for the message switching program, DFHMSP, has given it a TWASIZE of less than 512 bytes. If it is to be a definition for the CICS-supplied program of that name then it will not execute correctly.

**System action**
Normal utility processing continues.

**User response**
Check that the resulting resource definition is as you expect.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**DFH5506 E** COMMAND NOT EXECUTED. FOR many options, including yyyyyyy ARE MEANINGLESS

**Explanation**
A keyword or value has been specified that is not consistent with another.

**System action**
The utility ignores the command.

**User response**
Correct the command.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**DFH5508 E** COMMAND NOT EXECUTED. xxxxxxxx VALUE MUST BE LESS THAN OR EQUAL TO yyyyyyy VALUE.

**Explanation**
A value has been specified that is not consistent with another. The value xxxxxxxx must be less than or equal to yyyyyyy.

**System action**
The utility ignores the command.

**User response**
Correct the command.

**Module:** DFHCSDUP

**Destination**
SYSPRINT

**DFH5509 E** COMMAND NOT EXECUTED. xxxxxxxx NAME MUST NOT BE THE SAME AS yyyyyyy NAME

**Explanation**
Some values in DEFINE commands must not be the same as the name of the resource. xxxxxxxx must not have the same name as yyyyyyy.

**System action**
The utility ignores the command.

**User response**
Correct the command.

**Module:** DFHCSDUP
Destination
SYSPRINT
DFH5510 W  xxxxxx NAMES BEGINNING WITH yyyyyy ARE RESERVED AND MAY
BE REDEFINED BY CICS

Explanation
CICS supplies standard programs and transactions whose names you should usually avoid.

System action
Normal utility processing continues.

User response
Check that the resulting resource definition is as you expect.

Module: DFHCSDUP

Destination
SYSPRINT
DFH5511 W  xxxxxx NAME yyyyyy IS RESERVED AND MAY BE
REDEFINED BY CICS

Explanation
CICS supplies standard programs and transactions whose names you should usually avoid.

System action
Normal utility processing continues.

**DFH5532 E**

COMMAND NOT EXECUTED. AN INVALID COMBINATION OF ROWS AND COLUMNS HAS BEEN SPECIFIED FOR ALTSCREEN.

**Explanation**
One of the specified values is zero and the other is non-zero. This is an invalid combination.

**System action**
The utility ignores the command.

**User response**
Ensure that a valid combination of ALTSCREEN rows and columns is specified. See the Defining resources for details of valid combinations.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5533 W**

SPECIFIED keyword1 VALUE IS LESS THAN keyword2 VALUE. THE DEFAULT VALUE HAS BEEN ASSUMED.
**Explanation**

A value has been specified for \textit{keyword1} that is incompatible with the value for \textit{keyword2}.

**System action**

DFHCSDUP assumes the default value for \textit{keyword1} and processes the command.

**User response**

Ensure that the resulting resource definition is acceptable.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

**Explanation**

When ALTERing the DEVICE in a TYPETERM resource definition, the batch update utility changes forced values that are incompatible with the new DEVICE. However, dependent default values are not changed, and may now be incompatible.

**System action**

Normal utility processing continues.

**User response**

Check that the resulting resource definition is as you expect. See the Defining resources for more guidance.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

**Explanation**

The user specified a resource name \textit{resname} for resource type \textit{restype} which is reserved for use by CICS.

**System action**

The utility ignores the command.

**User response**

Specify a different resource name.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

**Explanation**

\textit{keyword1} and \textit{keyword2} attributes are inconsistent if definition is being shared with a back level release.

**System action**

The definition is created or updated.

**User response**

If sharing the CSD file with a back level release, ensure that the resulting resource definition is acceptable. Otherwise, ignore the message.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

**Explanation**

When ALTERing the DEVICE in a TYPETERM resource definition, the batch update utility changes forced values that are incompatible with the new DEVICE. However, dependent default values are not changed, and may now be incompatible.

**System action**

Normal utility processing continues.

**User response**

Check that the resulting resource definition is as you expect. See the Defining resources for more guidance.

**Module:** DFHCSDUP

**Destination**

SYSPRINT

**Explanation**

A null value has been accepted for a send or receive prefix for an LU6.1 or MRO session. The default value ‘>’ is supplied by CICS for send sessions and ‘<’ for receive sessions. These values are the default prefixes for MRO session names. The use of these prefixes is allowed for LU6.1 sessions, but is not recommended if MRO session names with the same prefixes are in use.
because duplicate names may occur if large numbers of sessions are defined.

**System action**
CICS will generate session names using these prefixes.

**User response**
If this is an LU6.1 session it is recommended that a different prefix should be chosen.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5538 W** resource NAMES STARTING WITH x MAY CONFLICT WITH SYSTEM SESSIONS NAMES.

**Explanation**
The resource resource has been given a name starting with the character x which might be used for system generated SESSIONS names.

**System action**
The definition is created or updated.

**User response**
Ensure there is no conflict with the name given to the resource and SESSIONS names.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5539 S** keyword IS NOT VALID BECAUSE IT STARTS WITH THE RESERVED CHARACTER OR STRING string.

**Explanation**
The name you have given to keyword keyword is not valid because the name begins with a reserved character or string such as "c" or "dfh".

**System action**
The definition is not created.

**User response**
Change the name of the keyword.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5540 W** xxxxxxx VALUE IS GREATER THAN yyyyyyy VALUE. THE LOWER VALUE TAKES PRECEDENCE.

**Explanation**
A value has been specified that is not consistent with another. The value xxxxxxx is greater than value yyyyyyy. Value yyyyyyy takes precedence and overrides the higher value.

**System action**
The definition is created or updated with the two values as specified.

**User response**
Ensure that the two values are defined as you expect. You may decide to leave the values as specified and dynamically change the values online once the resource has been installed in the CICS system.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5541 E** PROGRAM OR REMOTESYSTEM MUST BE SPECIFIED.

**Explanation**
None of the indicated keywords has been specified. When defining a transaction, you must specify one of these keywords.

**System action**
The utility ignores the command.

**User response**
Supply one of the indicated keywords and retry.

**Module:**
DFHCSDUP
**Destination**

SYSPRINT

**DFH5544 E** COMMAND NOT EXECUTED. 

**Explanation**

The options specified conflict. If TYPE EJB is specified, the respective ejb-type options must be specified. The ejb-type attributes are BEANNAME and INTFACETYPE. Likewise, for TYPE CORBA, the corba-type attributes must be specified. These are MODULE and INTERFACE. For TYPE GENERIC, either attributes may be specified but they should be generic.

**System action**

The utility ignores the command.

**User response**

Correct the command.

**Module:**

DFHCSDUP

**Destination**

SYSPRINT

**DFH5547 E** COMMAND NOT EXECUTED. 

**Explanation**

A value yyyy yyyy has been specified for keyword xxxxxxxx which is not valid. It may for instance be non-numeric.

**System action**

The utility ignores the command.

**User response**

Correct the command.

**Module:**

DFHCSDUP

**Destination**

SYSPRINT

**DFH5548 E** COMMAND NOT EXECUTED. 

**Explanation**

The options specified conflict. If CORBASERVER name is blank and the respective previous level attributes (OMGMODULE, OMGOPERATION, and
OMGINTERFACE) are specified, the use of BEANNAME, MODULE, INTERFACE and OPERATION is not allowed. It is not possible to give a back level requestmodel definition new attributes. The old requestmodel must be discarded and redefined with the new attributes if it is required to be used on this level of CICS.

System action
The utility ignores the command.

User response
Correct the command. If this requestmodel is being maintained for a back level CICS system, specify only the attributes OMGMODULE, OMGOPERATION, OMGINTERFACE and TRANSID. However, to use an old requestmodel on this level of CICS, it must be discarded and redefined with the new attributes.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5549 E COMMAND NOT EXECUTED.

xxxxxxx VALUE MUST NOT BE THE SAME AS yyyyyyy VALUE.

Explanation
The values specified for the two attributes must not be the same.

System action
The utility ignores the command.

User response
Correct the command.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5550 E keyword1 IMPLIES keyword2.

THE DEFAULT VALUE HAS BEEN ASSUMED.

Explanation
keyword1 has been specified with a value that is incompatible with the value for keyword2.

System action
DFHCSDUP changes keyword1 to set the default value and processes the command.

User response
Ensure that the resulting resource definition is acceptable.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5551 E COMMAND NOT EXECUTED.

keyword1 CANNOT BE SPECIFIED AS GENERIC UNLESS keyword2 IS ALSO GENERIC.

Explanation
keyword1 has been specified with a generic name containing wildcard characters (asterisks or plus signs). But this is only permitted when keyword2 is also specified as a generic name.

System action
The utility ignores the command.

User response
If it is required that keyword1 must be generic, ensure that keyword2 is also specified with a generic name.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5552 E COMMAND NOT EXECUTED.

CIPHER VALUE 'value' IS NOT IN THE VALID SET (list).

Explanation
The CIPHER attribute has been specified with an invalid value, value, which is not in the valid set of cipher values as indicated by list.

System action
The utility ignores the command.
User response
Ensure that you have defined a set of CIPHER values which are correct for this CICS address space.

Module:
DFHCSDUP

Destination
SYSPRINT

**DFH5553 E COMMAND NOT EXECUTED. field CANNOT START WITH A 'char'.**

Explanation
The named attribute field, *field*, starts with an invalid character, *char*. This is commonly caused by the field starting with an '*' which is not allowed.

System action
The utility ignores the command.

User response
Change the named attribute field to start with a permitted character.

Module:
DFHCSDUP

Destination
SYSPRINT

**DFH5554 W USE OF STATIC ATTRIBUTE field1 FORCES field2.**

Explanation
The Server URIMAP attribute field, *field1*, is within the set that returns a static response. This has forced the setting of *field2*. This is commonly caused by specifying MEDIATYPE, CHARSETSET, HOSTCODEPAGE, TEMPLATENAME or HFSFILE with ANALYZER(YES) when ANALYZER(NO) is required.

System action
The utility ignores the command.

User response
None.

Module:
DFHCSDUP

Destination
SYSPRINT

**DFH5555 E COMMAND NOT EXECUTED. THERE MUST BE AT LEAST ONE attribute SPECIFIED.**

Explanation
At least one of the named attribute fields, *attribute*, must be specified for this resource.

System action
The utility ignores the command.

User response
Ensure that you have specified at least one of the required attributes.

Module:
DFHCSDUP

Destination
SYSPRINT

**DFH5556 E COMMAND NOT EXECUTED. field NAMES BEGINNING WITH 'yyy' ARE RESERVED AND CANNOT BE USED.**

Explanation
CICS supplies standard programs and transactions whose names you should avoid. For this type of resource, however, you must not use reserved CICS names.

System action
The utility ignores the command.

User response
Rename the resource definition to an appropriate name.

Module:
DFHCSDUP

Destination
SYSPRINT

**DFH5557 E COMMAND NOT EXECUTED. 'xxxxxxx' IS A RESERVED NAME**
Explanation
Certain names are reserved and not allowed to be used as resource names.

System action
The utility ignores the command.

User response
Rename the resource definition to an appropriate name.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5558 W A RANKING VALUE LESS THAN 10 FOR LIBRARY 'resource' MEANS IT WILL APPEAR BEFORE DFHRPL IN THE SEARCH ORDER.

Explanation
The ranking value of 10 is reserved for DFHRPL library. If you specify a ranking value less than 10 your LIBRARY resource will appear ahead of the DFHRPL in the library search order.

System action
The utility ignores the command.

User response
Ensure that you definitely want this LIBRARY to appear before the DFHRPL in the library search order. Otherwise, define the LIBRARY resource with a RANKING value greater than 10.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5560 E COMMAND NOT EXECUTED. Port_attribute CONFLICTS WITH PORT NUMBER FOUND IN HOST ATTRIBUTE.

Explanation
The HOST attribute contains a port number and a different, non-zero PORT attribute has also been specified on the definition of this client URIMAP.

System action
The utility ignores the command.

User response
Use PORT in preference to adding a port to HOST or ensure that they are the same value. PORT must be used to specify a port number for an IPV6 address.

Module: DFHCSDUP

Destination
SYSPRINT

DFH5563 E name IS IGNORED WHEN DEFINING MQMONITOR DFHMQINI.

Explanation
An unsupported attribute has been specified when defining MQMONITOR DFHMQINI.
System action
The utility ignores the attribute.

User response
None.

DFH56nn messages

DFH5600 E UNABLE TO GET STORAGE FOR MODULE DFHCICS. PRIMARY CSD HAS NOT BEEN INITIALIZED.

Explanation
There is insufficient storage to load module DFHCICS.

System action
Processing of the INITIALIZE command is terminated.

User response
Ensure that there is sufficient storage to load the DFHCICS module.

Module: DFHCSDUP
Destination SYSPRINT

DFH5601 E UNABLE TO LOAD THE {FCT | RDT | LD} TABLE NAMED table.

Explanation
Table table cannot be loaded.

System action
The system action depends on the type of table.

LD
DFHCSDUP cannot process the command. The utility attempts to:
1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

FCT or RDT
The CSD utility cannot load the table, and terminates the processing of the utility command.

User response
Refer to the preceding MVS message which should specify the reason for the failure.

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

Module: DFHCSDUP
Destination SYSPRINT

DFH5602 E UNABLE TO UNLOAD THE {FCT | RDT | LD} TABLE NAMED table.

Explanation
Table table cannot be unloaded.

System action
The system action depends on the type of table.

LD
DFHCSDUP cannot process the command. The utility attempts to:
1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

FCT or RDT
The CSD utility cannot unload the table, and terminates the processing of the utility command.

User response
Refer to the preceding MVS message which should specify the reason for the failure.

If your FCT or TCT assembly and link-editing is successful, the FCT or RDT should be in the library. The

Chapter 2. CICS messages 85
LD is in the load library of the supplied pregenerated CICS system.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5603 E** UNABLE TO LOCATE THE \{FCT | RDT | LD | DCT\} TABLE NAMED table.

**Explanation**
Table table cannot be located.

**System action**
The system action depends on the type of table specified.

**LD**
DFHCSDUP cannot process the command. The utility attempts to:
1. Close any files previously opened internally.
2. Unload any EXTRACT exit routines that were dynamically loaded.
3. Invoke the termination exit routine, if supplied.
4. Return control to the invoker of the utility.

**Other tables**
The CSD utility cannot locate the table, and terminates the processing of the utility command.

**User response**
Determine the reason for the failure.

If your table assembly and link-editing is successful, the table should be in the library. The LD is in the load library of the supplied pregenerated CICS system.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5604 E** UNABLE TO OBTAIN STORAGE FOR THE CROSS-REFERENCE TABLE NAMED table.

**Explanation**
DFHCSDUP was unable to obtain storage for table table.

**System action**
DFHCSDUP cannot process the command.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response**
Increase the region size and retry the command.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5605 E** DISALLOWED CHARACTER IN GROUP OR LIST NAME object.

**Explanation**
The call to module DFHDMP has failed to construct a valid key for the record created on the CSD file. This is because the group or list name contains an invalid character.

**System action**
A CSD record is not created for this definition. (If it is a transaction, a generated profile is not created either.)

**User response**
Use the CEDA transaction to define the resource with a valid name.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5606 S** COMMAND IS NOT EXECUTED.
UNABLE TO LOAD THE SERVICE MODULE progname.

**Explanation**
The service module, progname, cannot be loaded due to insufficient storage.
System action
Utility command execution is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response
Retry the utility command with an increased region size.

Module: DFHCSDUP

Destination
SYSPRINT
DFH5607 S COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE READING THE FIRST SECONDARY CSD RECORD.

Explanation
An I/O error has occurred on the secondary CSD file.

System action
The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response
Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.
If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where errors have occurred because they will not print and are therefore easily identifiable.

Module: DFHCSDUP

Destination
SYSPRINT
DFH5608 S COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE READING A SECONDARY CSD RECORD.

Explanation
An I/O error has occurred on the secondary CSD file.

System action
The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response
Retry the command, ensuring that a sufficiently large data set is specified for the output (primary) CSD file.

Module: DFHCSDUP

Destination
SYSPRINT
DFH5609 S COMMAND IS TERMINATED. AN ERROR OCCURRED WHILE WRITING A PRIMARY CSD RECORD.

Explanation
An I/O error has occurred on the primary CSD file.

System action
The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response
Retry the command, ensuring that a sufficiently large data set is specified for the output (primary) CSD file.

Module: DFHCSDUP

Destination
SYSPRINT
DFH5611 E COMMAND NOT EXECUTED. parameter PARAMETER MUST BEGIN WITH 'DFH'.

Chapter 2. CICS messages 87
Explanation
In a CSD utility MIGRATE command, the specified parameter contained an invalid table name or group name.

System action
The utility does not process the command.

User response
Resubmit the MIGRATE command with a valid table name or group name.

Module:
DFHCSDUP

Destination
SYSPRINT
DFH5612I resource object IN GROUP grpname IS UNCHANGED.

Explanation
A resource definition existed in both source and target groups. Based on the CSD utility commands submitted, the utility has replaced the resource definition in the target group.

System action
Normal utility processing continues.

User response
None.

Module:
DFHCSDUP

Destination
SYSPRINT
DFH5617S COMMAND IS TERMINATED. AN UNRECOGNIZED TYPE OF RECORD WAS ENCOUNTERED WHILE SECONDARY CSD WAS BEING READ.

Explanation
The record-type field of an input CSD record is invalid.

System action
The SERVICE command is terminated. If commands are being read from a SYSIN data stream by the utility, then subsequent commands are checked for syntax only.

User response
Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the FROMCSD parameter in the SERVICE utility command.
If the problem persists, try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where errors have occurred because they will not print and are therefore easily identifiable.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5618 I** AN ATTENTION INTERRUPT WAS REQUESTED DURING DFHCSDUP EXECUTION.

**Explanation**
An attention interrupt has been requested while DFHCSDUP is executing in a TSO environment.

**System action**
Normal utility processing continues.

Control is passed to a put-message exit if one has been specified on the extended entry linkage. Refer to the Developing system programs for CICS for more information about put-message exits.

**User response**
None.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5619 W** AN INVALID VALUE OF THE PAGESIZE PARAMETER HAS BEEN SPECIFIED. THE DEFAULT VALUE OF 60 LINES PER PAGE WILL BE USED.

**Explanation**
A value of the PAGESIZE parameter outside the allowed range (4-9999) has been specified.

**System action**
The default value of 60 lines per page is taken.

**User response**
Ensure that a valid PAGESIZE value is specified in future.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5620 E** AN ILLEGAL RETURN CODE (RC=ret-code) HAS BEEN RETURNED FROM THE {INITIALIZATION | GET-COMMAND | TERMINATION} EXIT.

**Explanation**
The specified user-exit routine has returned a disallowed return code.

**System action**
Processing of the utility command is terminated. The exit is not disabled.

**User response**
Investigate the specified exit routine for the cause of the illegal return code.

**Module:**
DFHCSDUP

**Destination**
SYSPRINT

**DFH5621 E** A NON-ZERO RETURN CODE HAS BEEN RETURNED FROM THE PUT-MESSAGE EXIT.

**Explanation**
The put-message exit routine has returned a disallowed return code.

**System action**
Processing of the utility command is terminated and the put-message exit is disabled.

**User response**
Investigate the put-message exit routine for the cause of the illegal return code.

**Module:**
DFHCSDUP
**Explanation**

An abend has occurred during DFHCSDUP processing. The secondary CSD has been closed during post ABEND clean up processing.

**System action**

Processing of the utility command is terminated.

**User response**

Refer to prior messages for further information regarding this problem.

**Module:**

DFHCSDUP

---

**Explanation**

An abend has occurred during DFHCSDUP processing. The primary CSD has been closed during post ABEND clean up processing.

**System action**

The EXTRACT command is terminated.

**User response**

Refer to prior messages for further information regarding the problem.

**Module:**

DFHCSDUP

---

**Explanation**

The user program has supplied an alternative ddname as a parameter for either DFHCSD, SYSIN or SYSPRINT. The alternative ddname is invalid because it begins with a blank.

**System action**

The default DDNAME is used instead.

**User response**

Correct the invalid DDNAME parameter.

**Module:**

DFHCSDUP

---

**Explanation**

The extract exit program specified on the USERPROGRAM keyword of the EXTRACT utility command has been unloaded during post-abend clean-up processing.

**System action**

The EXTRACT command is terminated.

**User response**

Refer to prior messages for further information regarding this problem.

**Module:**

DFHCSDUP

---

**Explanation**

The user program has passed an invalid DDNAME parameter for ddname to DFHCSDUP.

**System action**

The default DDNAME is used instead.

**User response**

Correct the invalid DDNAME parameter.

**Module:**

DFHCSDUP

---

**Explanation**

No IBM supplied definition found for resourcetype resourcename.
Explanation
While performing a SCAN command, the named resource type was not found in the CSD file on any of the IBM supplied groups. Note that compatibility groups are not used for the SCAN command.

System action
The utility continues.

User response
None.

Module: DFHCSDUP

Destination
Console

DFH5631 I resourcetype resourcename IN GROUP groupname1 MATCHES THE IBM SUPPLIED DEFINITION IN GROUP groupname2.

Explanation
While performing a SCAN command, the resource resourcetype name resourcename was found in group groupname1 and it matches the IBM supplied definition in group groupname2.

System action
The utility continues.

User response
None.

Module: DFHCSDUP

Destination
Console

DFH5632 W resourcetype resourcename NOT FOUND IN USER GROUPS.

Explanation
While performing a SCAN command, the resource resourcetype name resourcename was not found in any user groups.

System action
The utility continues.

User response
None.
DFH7xxx (DFHExP) command-level translator diagnostic messages

Diagnostic messages may be issued by the command-level translator (DFHEAP for assembler language, DFHECP for COBOL, DFHEDP for C, and DFHEPP for PL/I) in the course of processing programs written in assembler language, COBOL, C, or PL/I.

Assembler-language messages are inserted as macro notes (MNOTES) in the translator output file and can be seen by either printing or assembling the translator output file.

COBOL, C, and PL/I messages are delivered to SYSPRINT.

The same diagnostics are issued by the command-level interpreter, by the main terminal transaction (CEMT), and by CEDA.

A diagnostic message can have three components: a message number, a severity code, and message text. Each message is of the form DFH7nnnI c line text where

- nnn is a number,
- I is the information message identifier,
- c is the severity code
- line is the line number of the error and
- text is the text of the message.

In assembler language, COBOL, C and PL/I, diagnostic messages can be allocated a severity code. This severity code is represented by a letter that, if present, will appear in the message immediately following the message number and preceding the message text. There are five levels of severity. Those for assembler language, C and PL/I are different from those for COBOL. The meanings of the codes and the associated return codes for the languages are as follows:

<table>
<thead>
<tr>
<th>Assembler, C or PL/I</th>
<th>Return code</th>
<th>COBOL</th>
</tr>
</thead>
<tbody>
<tr>
<td>U = Unrecoverable</td>
<td>16</td>
<td>D = Disaster</td>
</tr>
<tr>
<td>S = Severe</td>
<td>12</td>
<td>E = Error</td>
</tr>
<tr>
<td>E = Error</td>
<td>8</td>
<td>C = Conditional</td>
</tr>
<tr>
<td>W = Warning</td>
<td>4</td>
<td>W = Warning</td>
</tr>
<tr>
<td>I = Information</td>
<td>0</td>
<td>I = Information</td>
</tr>
</tbody>
</table>

The message text consists of the message itself, which may or may not include inserts. The inserts are positions within the message text where, in the actual message, specific information is given on the reasons for the diagnostic message. Not all the diagnostic messages, however, require inserts.

Messages issued by the command-level translator are usually self-explanatory, and DFH7000 is an example of this type of message.

DFH7000 I LISTING FILE CANNOT BE OPENED

Explanation:
The listing data set was not opened.

System action:
The command-level translator is abnormally terminated. A dump is produced if a SYSABEND or SYSUDUMP DD statement has been provided.

User response:
Ensure the JCL is correct, or determine what is causing the error and preventing opening.

Module:
DFHEAP (for assembler language), DFHECP (for COBOL), DFHEDP (for C), DFHEPP (for PL/I)

Destination
Console
Explanation

An error has occurred and the translator is unable to recover and resume normal processing.

System action

The translator terminates its processing in an orderly fashion, by issuing this error message and closing all files which have been successfully opened.

All messages issued by the translator during this execution should have been directed to the SYSPRINT dataset.

User response

This message may contain the inserted text -

| NOT ENOUGH MAIN STORAGE AVAILABLE |

in which case the user should check that a REGION size of at least 2M (2048K) has been specified in the JCL EXEC statement for the translator job step.

Module:  DFHEIM01

Destination  SYSPRINT

The LISTING file, defined in the Job Control stream by a SYSPRINT DD statement, can contain either fixed length or variable length records which must have a length in the range 121 through 256.

System action

The translator terminates processing.

User response

Check the record format and length of the file which caused the error. Recreate or change the file so that it meets the requirements of the translator.

Module:  DFHEIM15

Destination  SYSPRINT

The EXCI option of the translator has been specified, but it conflicts with another specified option such as the CICS option, or an option (for example, the SP option) which implies the CICS option.

The EXCI option implies that the program is to execute in a batch, non-CICS, environment and therefore other options such as CICS and SP are in conflict.

System action

The translator ignores the CICS option. Any EXEC CICS LINK commands are interpreted as batch commands.

User response

If the program is intended to be a batch program, ensure that neither the CICS option, nor any other options which imply the CICS option, are specified to the translator.

If the program is intended to run as a CICS application, remove the EXCI option.

Module:  DFHEIM08
Destination
SYSPRINT

DFH7005I W  THE EXCI OPTION HAS BEEN SPECIFIED BUT CONFLICTS WITH THE DLI OPTION. THE DLI OPTION HAS BEEN IGNORED.

Explanation
Both the EXCI and DLI translator options have been specified, but these two options are mutually exclusive.

System action
The translator ignores the DLI option.

User response
If the program is intended to be a DLI program, remove the specification of the EXCI option. Otherwise remove the DLI option.

Module:
DFHEIM06 DFHEIM08

Destination
SYSPRINT

DFH7010I W  INVALID OPTION STRING:- 'INS#1' IGNORED.

Explanation
The options specified contain either an option which is not recognised by the translator, or an option which is not valid for the language in which your program is written.

For example, in a COBOL program, the following options specification -

[CODE]
CBL XOPTS(CICS DCBS)
[/CODE]
is invalid because DCBS does not represent a valid option. In this case DCBS should probably be DBCS which is a valid option.

Also for example, the following options specification -

[CODE]
CBL XOPTS(CICS GRAPHIC)
[/CODE]
is invalid because the GRAPHIC option, although recognised by the translator, is only valid for PLI programs.

System action
The translator ignores the invalid option and continues processing.

User response
Refer to the Developing CICS Applications for information about options specification, and amend your options specifications accordingly.

Module:
DFHEIM06 DFHEIM08

Destination
SYSPRINT

DFH7011I W  INVALID INS#1 SPECIFICATION IGNORED.

Explanation
An option which is specified with a value or values, is specified with a value which the translator cannot accept.

For example, in a COBOL program, the following options specification -

[CODE]
CBL XOPTS(CICS FLAG(X))
[/CODE]
is invalid because the value specified for flag must be 'I', 'W', 'E' or 'S'

Also for example, the following options specification -

[CODE]
CBL XOPTS(CICS LC(256))
[/CODE]
is invalid because the value associated with the LINECOUNT option must be in the range 1 thru 255.

When an option takes an integer value it must always be less than 256.

System action
The translator ignores the option and applies the default value or values.

User response
Refer to the Developing CICS Applications for information about options specification, and amend your options specifications accordingly.

Module:
DFHEIM06 DFHEIM08
**Destination**

**SYSPRINT**

**DFH7012I W** CONFLICTING OPTIONS SPECIFIED. xxxxxxxx ASSUMED.

**Explanation**

An option which is specified with a value, or values, is specified more than once, or an option is specified in both its positive and negative form, or mutually exclusive options are specified.

For example, in a COBOL program, the following options specification -

```
CBL XOPTS(CICS FLAG(I) NOVBREF QUOTE FLAG(S) VBREF APOST)
```

will generate three error messages.

FLAG(I) conflicts with FLAG(S), NOVBREF conflicts with VBREF, and QUOTE conflicts with APOST.

**System action**

The translator uses the last definition found for each option. In the above example therefore the options used are FLAG(S), VBREF and APOST. The translator then continues with its normal processing.

**User response**

Refer to the Developing CICS Applications for information about options specification, and amend your options specifications accordingly.

**Module:** DFHEIM06 DFHEIM08

---

**Destination**

**SYSPRINT**

**DFH7013I W** RIGHT PARENTHESIS ASSUMED AFTER 'INS#1'.

**Explanation**

An option which is specified with a value, or values, is not delimited with a right parenthesis.

For example, in a COBOL program, in the following options specification -

```
CBL XOPTS(CICS FLAG(I) NOVBREF QUOTE
FLAG(S) VBREF APOST)
```

the value 'I' specified for the FLAG option should be followed by a right bracket.

**System action**

The translator assumes that a right bracket exists following the option specification and continues processing.

**User response**

Refer to the Developing CICS Applications for information about options specification, and amend your options specifications accordingly.

**Module:** DFHEIM06 DFHEIM08

---

**Destination**

**SYSPRINT**

**DFH7014I W** ERROR IN *PROCESS CARD. TEXT AFTER SEMI-COLON IGNORED.

**Explanation**

Text has been placed on a *PROCESS statement following the semi-colon which signifies the end of the statement.

This error should only occur in a program written in PLI.

**System action**

The translator ignores the misplaced text and continues processing. However, the misplaced text is placed in the translated program, and this will probably cause errors to be detected by the compiler.

**User response**

User action depends on the purpose of the misplaced text. Refer either to the Developing CICS Applications, or the relevant programming language manual.

**Module:** DFHEIM07

---

**Destination**

**SYSPRINT**

**DFH7015I W** ERROR IN *ASM STATEMENT. CONTINUATION IGNORED.

**Explanation**

An *ASM statement contains a continuation character in column 72. The next line in the program is ignored.
by the translator. This error should only occur in a program written in Assembler.

**System action**
The translator ignores the continuation line and continues processing. However both the *ASM statement and the continuation line are placed in the translated program.

**User response**
User action depends on the purpose of the continuation. Refer either to the Developing CICS Applications or the High Level Assembler Programmer’s Guide.

**Module:**
DFHEIM07

**Destination**
SYSPRINT

**DFH7016I W**
THE NATLANG OPTION HAS ALREADY BEEN SPECIFIED FOR THIS BATCH AND CANNOT BE ALTERED - CONFLICTING VALUE HAS BEEN IGNORED.

**Explanation**
The batch facility of the COBOL translator is in use, but an attempt has been made to change the value of the NATLANG option.

**System action**
The translator ignores the NATLANG specification and continues to use the specification for NATLANG established at the start of this batch.

**User response**
Specify the NATLANG option only once either in the PARM statement of the JCL EXEC statement or in the CBL statement preceding the first program in the batch. If programs in this batch require different NATLANG options, split this batch into two or more separate batches specifying the appropriate NATLANG value for each batch.

SYSPRINT

**DFH7020I S**
END OF SOURCE TEXT ENCOUNTERED IN THE MIDDLE OF A LITERAL CONSTANT.

**Explanation**
The translator has read the last line of text from the input program, but has detected that the program ends with an unfinished literal constant.

**System action**
The translator copies all text unchanged from the start of the last literal constant to the end of the program into the translated program. This would result in errors if the following compiler stage were executed.

**User response**
The cause of this error is almost certainly due to the programmer omitting to code the required delimiter at the end of a literal constant.

Locate and code the missing delimiter, and then rerun the translator.

**Module:**
DFHEIM01 DFHEIM15
Destination
SYSPRINT
DFH7021I W PROGRAM DOES NOT BEGIN WITH A PROCEDURE STATEMENT.

Explanation
The translator has not located a correctly coded PROCEDURE or PROC statement at or near the beginning of a PLI program.

After checking for the existence of a *PROCESS statement at the start of the program, and allowing for the existence of one or more compiler directives such as %INCLUDE, the translator expects to locate a PROCEDURE or PROC statement. Various syntax checks are performed when the statement is located.

This message is issued if either the statement is not found, or a syntax error is found in the statement.

System action
The translator continues processing as normal, but it is probable that the following compile step would fail if allowed to execute.

When the main PROCEDURE statement cannot be located, the translator does not insert an EIB structure into the translated program, which would usually result in errors if the following compiler stage were executed.

User response
Ensure that a correctly coded PROCEDURE statement is coded near the beginning of the program. Only a *PROCESS statement (if required) and compiler directives should be coded before the first PROCEDURE statement.

Module: DFHEIM10

Destination
SYSPRINT
DFH7023I S END OF SOURCE TEXT ENCOUNTERED IN THE MIDDLE OF A COMMENT.

Explanation
The translator has read the last line of text from the input program, but has detected that the program ends with an unfinished comment.

System action
The translator copies all text unchanged from the start of the last comment to the end of the program into the translated program. This would result in errors if the following compiler stage were executed.

User response
The cause of this error is almost certainly due to the programmer omitting to code the required delimiter at the end of a comment. Locate and code the missing delimiter, and then rerun the translator.

Module: DFHEIM01 DFHEIM11 DFHEIM15

Destination
SYSPRINT
DFH7024I S END OF SOURCE TEXT ENCOUNTERED IN THE MIDDLE OF PSEUDO-TEXT.

Explanation
The translator has read the last line of text from a COBOL program, but has detected that the program ends in the middle of pseudo text.
System action
The translator copies all text unchanged from the start of pseudo text to the end of the program into the translated program. This would result in errors if the following compiler stage were executed.

User response
The cause of this error is almost certainly due to the programmer omitting to code the required delimiter at the end of the pseudo text. Locate and code the missing delimiter, and then rerun the translator.

Module: DFHEIM01 DFHEIM15

Destination
SYSPRINT

DFH7025I S A PERIOD SHOULD IMMEDIATELY FOLLOW THE PROGRAM NAME 'xxxxxxxx'. THE END OF FILE WAS ENCOUNTERED BEFORE THIS PERIOD.

Explanation
In an END PROGRAM statement in a COBOL program, the program name is not immediately followed by a period.

System action
The translator copies the END PROGRAM statement into the translated program but this would result in errors if the following compiler step were executed.

User response
Edit the END PROGRAM statement, removing the text between the program name and the period, and rerun the translation step.

Module: DFHEIMSC

Destination
SYSPRINT

DFH7026I W CHARACTER CONSTANT ASSUMED TERMINATED AT RIGHT MARGIN

Explanation
In a C or C++ program a character constant (a string delimited by single quotes) is neither delimited with a quote nor continued to the next line.

System action
The translator copies the character constant into the translated program assuming that the constant is correctly terminated on this line. This would probably cause compiler error messages to be issued if the compilation were allowed to proceed.

User response
Edit the character constant, either terminating the constant with a single quote or continuing the constant to the next line. Then rerun the translation.

Module: DFHEIM11

Destination
SYSPRINT

DFH7027I W STRING CONSTANT ASSUMED TERMINATED AT RIGHT MARGIN

Explanation
In an END PROGRAM statement in a COBOL program, the program name is not immediately followed by a period.

System action
The translator copies the END PROGRAM statement into the translated program but this would result in errors if the following compiler step were executed.

User response
Delimit the END PROGRAM statement with a period and rerun the translation step.

Module: DFHEIMSC

Destination
SYSPRINT

DFH7026I S A PERIOD SHOULD IMMEDIATELY FOLLOW THE PROGRAM NAME 'xxxxxxxx'. INTERVENING TEXT HAS BEEN IGNORED.
Explanation
In a C or C++ program a string constant (a string delimited by double quotes) is neither delimited with a double quote nor continued to the next line.

System action
The translator copies the string constant into the translated program assuming that the constant is correctly terminated on this line. This would probably cause compiler error messages to be issued if the compilation were allowed to proceed.

User response
Edit the character constant, either terminating the constant with a double quote or continuing the constant to the next line. Then rerun the translation.

Module: DFHEIM11

Destination
SYSPRINT

DFH7029I W HEADER FILE NAME ASSUMED TERMINATED AT RIGHT MARGIN

Explanation
In a C or C++ program a string is being continued to the next line but the next line is a comment.

System action
The translator removes the comment indication and terminates the literal. However it is likely that the comment or the literal continuation has been discarded by the translator.

User response
Correct the program, either by correctly terminating the literal or correctly continuing the literal on to the next line. Then rerun the translator.

Module: DFHEIM14

Destination
SYSPRINT

DFH7031I W EXEC COMMAND WAS BEING CONTINUED WHEN COMMENT ENCONTERED. COMMENT IGNORED.

Explanation
In a COBOL program, a literal is being continued to the next line but the next line is a comment.

System action
The translator removes the comment indication and terminates the literal. However it is likely that the comment or the literal continuation has been discarded by the translator.

User response
Correct the program, either by correctly terminating the literal or correctly continuing the literal on to the next line. Then rerun the translator.

Module: DFHEIM14

Destination
SYSPRINT

DFH7032I E QUOTE ASSUMED BEFORE 'xxxxxxxx'. NON-NUMERIC LITERAL WAS BEING CONTINUED.
Explanation
In a COBOL program, a non-numeric literal is being continued but the first significant character in area B of the continuation line is not a quotation symbol.

System action
The translator inserts a suitable quotation symbol into the required position in the translated program.

User response
Edit the program by inserting an appropriate quotation symbol in the literal continuation line.

Module: DFHEIM14

Destination
SYSPRINT

DFH7033I E CONTINUATION IGNORED. A NON-NUMERIC LITERAL CAN ONLY CONTINUE AN INCOMPLETE NON-NUMERIC LITERAL.

Explanation
In a COBOL program, a non-numeric literal is being continued but the previous line does not contain an incomplete non-numeric literal.

System action
The translator removes the continuation indicator from the translated program. However it is probable that a compilation error will occur.

User response
Edit the program by coding a correct literal continuation, or removing the incorrect text.

Module: DFHEIM14

Destination
SYSPRINT

DFH7034I E CONTINUATION AND TWO QUOTES ASSUMED. A NON-NUMERIC LITERAL WAS BEING CONTINUED.

Explanation
In a COBOL program, a non-numeric literal is being continued but the next line is not a valid continuation.

System action
The translator inserts a continuation indicator and two quotation marks into the translated program which provides a valid continuation of the literal and then immediately ends the literal. Although this action ensures that the literal is syntactically correct, it is possible that if any text follows the literal it will not be a valid COBOL statement.

User response
Edit the program by coding an appropriate continuation character and quotation marks, or by preventing the continuation.

Module: DFHEIM14

Destination
SYSPRINT

DFH7036I W PROGRAM DOES NOT BEGIN WITH AN IDENTIFICATION DIVISION.
A COBOL program does not contain an IDENTIFICATION DIVISION statement.

This prevents the translator from inserting temporary variables and an EIB structure into the program's DATA DIVISION. However EXEC CICS commands and built-in functions such as DFHVALUE and DFHRESP will be processed as usual.

If the code being translated is a copybook, the translation may in fact be successful and this warning message can be ignored. However, if the code being translated constitutes a complete program, it will be necessary to edit the program inserting an appropriate IDENTIFICATION DIVISION statement.

The translator replaces the invalid continuation indicator with a valid continuation character in the translated program.

The message can be prevented by editing the file so that statement numbers are in sequence, or by setting all sequence fields to blanks, or by specifying the translator option 'NOSEQ'. However no action is absolutely necessary, since this message is only a warning, and does not prevent a successful translation.

This message is issued when the translator finds an IDENTIFICATION DIVISION as the last or only COBOL statement in a program.

The translation is terminated.

It is necessary to edit the program inserting an appropriate PROCEDURE DIVISION and then rerun the translation step.
EXEC Command should be terminated by 'END-EXEC'.

Explanation:
An assembler program does not contain an END statement.

System action:
The translator assumes that the program is in fact a copybook, and consequently does not insert invocations of the macros DFHEIRET, DFHEISTG and DFHEIEND at the end of the translated code.

User response:
Possibly no action is required in response to this message, but the user should be aware that it is may be necessary to specify the options NOPROLOG and NOEPILOG when translating a copybook.

Module:
DFHEIMSA

Destination
SYSPRINT

DFH7041I S  NO END CARD FOUND - COPYBOOK ASSUMED.

System action:
User response:
Module: DFHEIMXS

Destination SYSPRINT
DFH7057I W DUPLICATE SPECIFICATION FOR xxxxxxxx OPTION IS IGNORED.

Explanation
The same option has been specified more than once in an EXEC CICS command.

System action
The duplicate specification is ignored and the translator continues normal processing of the command. The message contains the name of the option.

User response
Remove the duplicate specification and rerun the translator.

Module: DFHEIMAN

Destination SYSPRINT
DFH7059I S xxxxxxxx COMMAND IS NOT VALID AND IS NOT TRANSLATED.

Explanation
An EXEC CICS command is not known to the translator.

System action
The command is rejected and not translated.

User response
This error might occur because of a simple typographical error.
This error might occur because a translator option has not been specified. For example, if a program contains an EXEC DLI command, the DLI translator option must be specified; otherwise, DLI commands are 'not known' to the translator. Establish why the command is not known. See CICS Application development reference and Developing CICS Applications.
This error might occur because the command tables referenced by the translator, which are pointed to by the TABLE translator option, do not match the level of the translator itself. Ensure that the matching
command tables are in the STEPLIB for the translate step.

**Module:**
DFHEIMAN

**Destination**
SYSPRINT

**DFH7060I** INCORRECT SPECIFICATION FOR xxxxxxxx VALUE :- 'xxxxxxx'. OPTION IGNORED.

**Explanation**
An argument consists of a self-defining term which is either not of the correct datatype for that option or is outside of the range of permitted values. For example, this message would result from the following commands -

```
EXEC CICS DELAY INTERVAL('TIME')
EXEC CICS START TRANSID(MYTRAN)
TIME(250000)
```

**System action**
The option with the incorrect argument is rejected, but the translator continues processing the command.

**User response**
Establish why the argument is incorrect by reference to the CICS Application development reference.

**Module:**
DFHEIMKW

**Destination**
SYSPRINT

**DFH7061I** RIGHT PARENTHESIS ASSUMED BEFORE 'xxxxxxx'.

**Explanation**
A right hand bracket has been omitted either in an EXEC CICS command or when using one of the translator builtin functions DFHRESP or DFHVALUE.

**System action**
The translator makes an assumption about the correct position of the missing right hand bracket. The assumed position is likely to be the wrong position however, which in turn is likely to produce incorrect results at runtime or possibly cause a compilation error.

For example in the following statement in a PLI program -

```
EXEC CICS SEND TEXT FROM(MYTEXT FREEKB ERASE;
```

the translator assumes that the position of the missing right hand bracket is immediately before the semicolon which delimits the command. This results in the options FREEKB and ERASE becoming part of the argument of the FROM option.

In the following example -

```
STATUS = DFHVALUE(CONNECTED ;
```

the translator's assumption about the position of the missing bracket is correct, and in this case the builtin function is correctly processed.

**User response**
Establish the correct position of the missing bracket and edit the program accordingly.

**Module:**
DFHEIM11 DFHEIM12

**Destination**
SYSPRINT

**DFH7062I** INCORRECT SYNTAX FOR EXEC COMMAND. COMMAND NOT TRANSLATED.

**Explanation**
An EXEC CICS command contains too many options with arguments. The number of options with arguments allowed is, for most commands, kept within the allowed maximum by the command definition.
However certain commands such as the HANDLE and IGNORE commands allow more options than the maximum allowed on each command instance.

**System action**

When the maximum number of options is reached, this number usually being 16, the remaining options specified are rejected. In other words the command together with the first 16 options specified is accepted.

**User response**

If the problem occurs on a HANDLE or IGNORE command, spread the options over two or more commands. However if a program is trying to deal with a large number of conditions, this may be accomplished more easily by using the RESP and NOHANDLE options.

**Module:**

**Module:**

DFHEIM??

**Destination**

SYSPRINT

**DFH7066I I**  BEFORE TRACING OF ANY SYSTEM CONTROL PROGRAM OCCURS THE MAIN SYSTEM TRACE FLAG MUST BE ON.

**Explanation:**

A command or option has been mispelt in an EXEC CICS statement. The translator executes an algorithm which compares the mispelt verb or option with valid option spellings and, in most cases, manages to select the option intended by the user.

In some cases, the translator may select an unintended command or option. For example, in the mispelt command -

```
EXEC CICS SENT SYSTEM GMMTEXT('hello world')
```

SENT is assumed to be SEND, whereas the user clearly intended to code SET.

**System action**

The translator substitutes the mispelt command or option with an assumed command or option.
This will probably cause the translator to detect further errors, and issue additional messages.

User response

Edit the program and correct the spelling of the mispelt command or option. Then rerun the translation step.

Module: DFHEIMS2

Destination SYSPRINT

DFH7077I S USE OF 'SYSID' OPTION IMPLIES 'LENGTH' OPTION MUST BE SPECIFIED. COMMAND NOT TRANSLATED.

Explanation
When the SYSID option is specified in a C or C++ program in a command which reads from or writes to a file, temporary storage queue or transient data queue, the LENGTH option must be specified when either the FROM or INTO options are specified.

System action
The command is rejected and not translated.

User response
Refer to the Developing CICS Applications, if necessary, for more information about the usage of this command, and then edit the command by specifying a LENGTH option.

Module: DFHEIMS2

Destination SYSPRINT

DFH7077I E 'xxxxxxxxx' IS NOT A VALID LANGUAGE DEFINITION TABLE.

Explanation
The translator has loaded a language definition table into storage, but the table does not appear to be valid. The translator checks the address held in a certain pointer in the table, and also checks an 'eyecatcher' value. If either of these contain unexpected values, the translator considers the table to be corrupted, and issues this message.

System action
The table is flagged as unusable by the translator, and it will not allow the use of any commands or built-in functions defined in this table.

User response
Refer the problem to your installation's CICS systems programming personnel.

Module: DFHEIM06

Destination SYSPRINT

DFH7078I I LITERAL BEGINNING xxxxxxx CONTAINS A xxxxxxx. A QUOTE MAY BE MISSING.

Explanation
A PLI program contains a literal which has a length exceeding 40 characters and a semicolon character has been found in the literal which may indicate that a quote symbol is missing and should have been coded before the semicolon.

System action
The translator cannot make any assumption about the extent of any literal because a literal may legitimately contain any characters including delimiters such as parentheses and semicolons. Therefore the translator...
continues to scan the program until a quote symbol is found.

**User response**
This is only an informational message and does not necessarily indicate that the program is incorrectly coded.

DFH7200I E  TOO MANY ARGUMENTS FOR 'keyword'. EXCESS ARGUMENTS IGNORED.

Explanation
In an EXEC CICS command, an option has been coded with too many arguments.
Currently most options which carry an argument only allow a single argument. The text of this message allows for the possibility that an option may carry multiple arguments (or a sub-operand list).
The current meaning of this message for nearly all options which carry an argument is that more than one argument has been coded.

System action
The first argument is processed but the remaining argument(s) are ignored. Otherwise the command is processed in the normal way.
Remove the excess arguments and repeat the translation step.

Module:
DFHEIMKW

Explanation:
In an EXEC CICS command, an option has been defined with too few arguments.
Currently most options which carry an argument only allow a single argument. The text of this message allows for the possibility that an option may carry multiple arguments (or a sub-operand list), and that a minimum number of arguments must be specified. This message therefore should rarely, if ever, occur in the current implementations of CICS.

System action
The complete command is rejected.

User response
Insert the additional arguments required and repeat the translation step.

Module:
DFHEIMKW

Explanation:
In an EXEC CICS command, an option has been defined without any arguments, but requires at least one argument.
Currently most options which require an argument only allow a single argument. The text of this message allows for the possibility that an option may carry multiple arguments (or a sub-operand list).

System action
The complete command is rejected.

User response
Insert the additional argument(s) required and repeat the translation step.

Module:
DFHEIMKW, DFHEIMS2

Explanation:
This message indicates that the translator has insufficient working storage with which to translate an EXEC CICS command.

System action
The command is rejected and not translated.

User response
The most likely reason for this error is that the REGION size specified in the JCL EXEC statement for this...
The translator is unable to supply a default argument in an EXEC CICS command. The message usually occurs when either the FROM option is omitted from a SEND MAP command or the INTO option is omitted from a RECEIVE MAP command.

When the argument of the MAP option is a literal, i.e. self-defining, argument, the translator is able to generate the required FROM or INTO argument from the MAP argument.

However when the MAP argument is a data reference, i.e. the name of a variable which contains the MAP name, the translator cannot default the FROM or INTO argument and issues this message.

**System action**
The option in error is ignored, but the translator continues to process the command.

**User response**
Edit the program inserting an appropriate specification of the FROM or INTO option.

**Module:** DFHEIMS2

**Destination**
SYSPRINT

---

The translator has located a potential CICS command, but 'EXEC' or 'EXECUTE' is not followed either by 'CICS' or by some other text, such as 'DLI', which indicates that this is a CICS command.

The translator refers to words such as 'EXEC', 'CICS' and 'DLI' as 'triggers' since they cause the invocation of the translator's command processing routines.

When a trigger is not known to the translator, this message is issued.

**System action**
The command is ignored and not translated.

**User response**
Ensure that the required triggers have been coded in the command.

**Module:** DFHEIMTG

**Destination**
SYSPRINT

---

The translator has encountered a program statement which has been continued over a large number of lines in the program. The translator attempts to read the whole statement into a buffer. This buffer is of a considerable size however, and a program statement would normally have to occupy more than 400 lines before this error occurred.

**System action**
The translator terminates processing after issuing this message.

**User response**
The error may have occurred due to a syntax error such as a missing quotation mark. Check any other messages which have been issued during this translation. Correcting other errors may also correct this error.

If the program statement is syntactically correct, it will be necessary to split the statement into two or more statements in order to avoid the buffer size restriction imposed by the translator. It is possible that
the compiler for which ever language is in use will also impose a similar restriction.

**Module:** DFHEIM14

**Destination**
SYSPRINT

**DFH7209I E** A BLANK IS ASSUMED BETWEEN 'option1' AND 'option2'.

**Explanation**
The translator has encountered an incorrect option in an EXEC CICS command, but has established that inserting a blank results in a correct option specification.

For example in the following incorrect command -

```
EXEC CICS SEND MAP(MYMAP) FROM(MYMAPO)
FREEKB ERASE
```

the translator assumes a blank between 'FREEKB' and 'ERASE'.

**System action**
The translator continues to process the command after insertion of the blank. It is possible however there will still be errors in the command specification.

**User response**
Review the statement specification and insert the missing blank if this is the correct action.

**Module:** DFHEIMKW

**Destination**
SYSPRINT

**DFH7210I U** INSUFFICIENT STORAGE TO LOAD MODULE 'modname'. PLEASE RE-TRANSLATE IN LARGER PARTITION.

**Explanation:**
The translator has attempted to load a component, such as a language definition table, but the component was not found in any of the libraries specified for use in this execution of the translator.

**System action**
The translator attempts to continue processing. If the missing component is a language definition table, none of the commands specified in that table can be used in this execution of the translator. It is probable therefore that the translation will be unsuccessful.

**User response**
Review the Job Control statements used for the translation. If you are using a procedure provided by your installation CICS systems programming facility, refer the problem to them.

If you have constructed your own job stream, ensure that a JOBLIB or STEPLIB statement references a library which contains the missing component specified in this message.

**Module:** DFHEIM15

**Destination**
SYSPRINT

**DFH7211I U** 'option' CONFLICTS WITH OTHER KEYWORDS SPECIFIED ON STATEMENT.

**Explanation:**
The translator has attempted to load a component, such as a language definition table, but the component was not found in any of the libraries specified for use in this execution of the translator.

**System action**
The translator attempts to continue processing. If the missing component is a language definition table, none of the commands specified in that table can be used in this execution of the translator. It is probable therefore that the translation will be unsuccessful.

**User response**
Review the Job Control statements used for the translation. If you are using a procedure provided by your installation CICS systems programming facility, refer the problem to them.

If you have constructed your own job stream, ensure that a JOBLIB or STEPLIB statement references a library which contains the missing component specified in this message.

**Module:** DFHEIM15

**Destination**
SYSPRINT

**DFH7212I E** 'option' SUB-OPERAND 'keyword' KEYWORD SHOULD BE A LITERAL.
**Explanation**

An argument must be coded as a literal and must be of an appropriate data type, depending on whether the option carries a character or arithmetic argument.

**System action**

In its current implementation, the translator should never issue this message since all arguments are allowed to be data references. There are no arguments which can only be literal, i.e. self-defining, terms.

**User response**

Refer the problem to your installation CICS systems programming facility.

**Module:**

DFHEIMKW

**Destination**

SYSPRINT

---

**Explanation**

An argument has been coded as a null argument. With only a few exceptions, null arguments are not excepted as a valid argument.

**System action**

The argument is accepted even though this will result in errors occurring at either compile time or run time.
For example, the following statement contains null arguments which would be rejected by the translator -

```
EXEC CICS SEND TEXT FROM(      ) LENGTH()
```

**System action**
The complete command is rejected.

**User response**
Code an argument of the required type, if necessary with reference to the CICS Application development reference.

**Module:** DFHEIMKW

**Destination**
SYSPRINT

**Explanation**
In this EXEC CICS command, an option may be defined with a list of arguments, i.e. more than one sub-operand, but none of the items specified are allowed to be null arguments.

This message is issued when one or more arguments other than the first argument in the list are null arguments. Currently most options which carry an argument only allow a single argument. The text of this message allows for the possibility that an option may carry multiple arguments (or a sub-operand list).

Consequently, in the current implementation of CICS this message should rarely, if ever, be issued.

**System action**
The complete statement is rejected.

**User response**
Ensure that all arguments are non-null for the option given in the message text.

**Module:** DFHEIMKW

**Destination**
SYSPRINT

---

**DFH7219I** 'option1' MUST BE PRECEDED BY: 'option2' IS ASSUMED.

**Explanation**
In the EXEC DLI command syntax, there are some options defined as 'second' options. This means that when a 'second' option is coded in an EXEC DLI statement, it must be preceded by an associated 'first' option. These second options are 'PCB', PARENT', UNIQUE', 'NEXT' and 'CHECKPOINT'.

**System action**
The translator assumes the existence of the required preceding option. For example if 'PCB' is found without a preceding 'USING', the 'USING' option is assumed.

**User response**
Ensure that the required 'first' option is coded preceding the 'second' option.

**Module:** DFHEIMKW

**Destination**
SYSPRINT

**DFH7220I** MULTIPLE OCCURRENCE OF 'keyword' KEYWORD IS IGNORED.

**Explanation**
In an EXEC CICS command, an option which carries an argument has been specified more than once.

**System action**
The translator processes the first instance of the option specification and ignores all additional instances.

In the following example -

```
EXEC CICS SEND TEXT FROM(TEXT1) LENGTH(88) FROM(TEXT2)
```

the translator takes FROM(TEXT1) as the FROM specification and ignores FROM(TEXT2).

**User response**
Decide which instance of the option specification is required and delete all other instances.

**Module:** DFHEIMKW

**Destination**
SYSPRINT
DFH7221I U IMPLEMENTATION RESTRICTION - TABLE TOO COMPLEX.
data.

Explanation

This message may be issued following message 7119, but should only occur when either an extremely large number of options have been specified on an EXEC DLI statement, or the REGION size specified for the execution of the translator is too small.

It is expected that this message would never be issued.

System action

The translator rejects the complete command.

User response

This problem might be caused by a syntax error such as a missing quotation mark. Check through other messages issued by the translator. Solving another error in the program might also resolve this problem. Ensure that an appropriate REGION size has been specified in your JCL procedure.

Module: DFHEIMKW

DFH7222I E SUB-OPERAND LIST FOLLOWING 'keyword' KEYWORD SHOULD NOT BE PRESENT AND IS IGNORED.

Explanation

An option has been coded with an argument in an EXEC CICS command, but the option does not carry an argument.

System action

The argument is ignored and the translator continues processing the statement.

For example, in the following statement -

EXEC CICS SEND TEXT FROM(MYTEXT) LENGTH(80) ERASE(SCREEN)

the argument 'SCREEN' following the ERASE option is ignored.

DFH7223I E A BLANK IS ASSUMED AFTER 'option'.

Explanation:

System action:

User response:

Module:

DFH7224I E NO option1 IN 'option2' OPERAND. OPERAND IGNORED.

Explanation:

System action:

User response:

Module:

DFH7225I W SUB-OPERAND 'option' OF 'keyword' KEYWORD IS TOO LONG AND IS TRUNCATED.

Explanation

A character literal has been coded as an argument in an EXEC command but the literal exceeds the length specified for the argument.

System action

The argument is truncated by removing characters from the rightmost end of the character string.

For example, in the following statement -

EXEC CICS SEND MAP('HUURSLEY')

since map names must be seven characters in length, the character string 'HUURSLEY' is truncated to 'HUURSLE'. The translator continues processing the statement using this truncated map name.
It's probable that the truncated value is not the intended value, and will cause a runtime error.

Refer to the Developing CICS Applications to determine the correct length required for this argument. Then recode the literal with the correct length.

**Module:**
DFHEIMKW, DFHEIMS1

**Explanation**
An argument has been defined as a literal, i.e. a self-defining term, but a data reference type argument is required for this option.

**System action**
The command is rejected and not translated.

**User response**
An example of this error is -

```
EXEC CICS SEND MAP('MYMAP ') FROM('Hello')
```

where the FROM option must be a data reference.
The above command should be correctly coded as -

```
EXEC CICS SEND MAP('MYMAP ') FROM(MYMAPO)
```

**Module:**
DFHEIMKW, DFHEIMS1, DFHEIMS2

**Explanation**
This error is only likely to occur in an EXEC DLI statement, when a field name is incorrectly coded in a WHERE statement.
The following example would cause this message to be issued -

```
WHERE(1GNORANCE = 'BLISS')
```

because the field name ‘1IGNORANCE’ starts with a numeric character.

**System action**
The incorrect field name is accepted by the translator, although this will probably cause the compilation of the translated program to fail.

**User response**
Edit the field name so that it begins with an alphabetic character, and rerun the translator step.

**Module:**
DFHEIMS1

**Explanation**
A mandatory option has been omitted from an EXEC CICS command, and the translator cannot make a default specification.

**System action**
The command is rejected and not translated.
User response
An example of this error is -

EXEC CICS SEND TEXT ERASE

where the FROM option is omitted but is mandatory.
Code an appropriate specification of the missing option, and then execute the translation step again.

Module: DFHEIMXK

Destination
SYSPRINT

DFH7230I E 'option1' CONFLICTS WITH 'option2' AND HAS BEEN IGNORED.

Explanation
Mutually exclusive options have been specified in an EXEC CICS command.

System action
The option which appears first in the EXEC CICS command is accepted and the other option is ignored.
The translator then continues normal processing of the command.

User response
An example of this error is -

EXEC CICS SEND PAGE RELEASE RETAIN

Here the translator accepts the RELEASE option but ignores the RETAIN option. Decide which of the mutually exclusive options is required in the command and then remove the conflicting option specification.

Module: DFHEIMXK

Destination
SYSPRINT

DFH7231I E 'option1' IS NOT VALID FOR 'option2' AND IS IGNORED.

Explanation: System action:
User response:
Module:

DFH7232I S 'option1' MUST SPECIFY A LENGTH FOR 'option2'.

Explanation
A mandatory option which specifies a length has been omitted in an EXEC CICS command and the translator is unable to supply a default specification of the option.

System action
The CICS API contains many options which supply lengths. These options usually provide the length of a variable length character argument supplied with another option in that command.

For example, in the EXEC CICS WRITEQ TS command the LENGTH option specifies the length of the FROM argument.

The translator is usually aware of this association between options and is able to default the length specification. However when the associated argument is a data reference, the ability of the translator to default the length argument depends on the programming language of the user program.
When the language is C or C++, the translator issues this message and rejects the complete command. The 'C' languages provide the 'sizeof' function, but this cannot be used with all data types supported by those languages.

User response
Code an appropriate length specification in the EXEC CICS command, and then rerun the translation step.

Module: DFHEIMAB DFHEIMXS

Destination
SYSPRINT

DFH7233I E 'argument' IS INVALID IN THIS POSITION. KEYWORD IGNORED.

Explanation: System action:
User response:
Module:
User response
Code an appropriate keyword argument in the EXEC CICS command, and then rerun the translation step.

SYSPRINT

DFH7234I S UNABLE TO APPLY DEFAULT FOR KEYWORD 'FROMLENGTH'.

Explanation:
System action:
User response:
Module:

Destination
SYSPRINT

DFH7235I E MORE THAN number OCCURRENCES OF option. EXCESS IGNORED.

Explanation:
The SEGMENT option has been coded more than 15 times in an EXEC DLI command.

System action
The excess instances of the SEGMENT option are rejected. The translator continues to process the command.

User response
This error might result from a missing quotation mark or some other syntactic error.
If the command is intended to contain more than 15 segments, refer to the relevant IMS manuals for further information.

Module:
DFHEIMG1

Destination
SYSPRINT

DFH7236I S UNABLE TO APPLY DEFAULT FOR KEYWORD 'LENGTH'.

Explanation:
System action:
User response:
Module:

Destination
SYSPRINT

DFH7237I S INCORRECT SYNTAX AFTER 'command option'. COMMAND NOT TRANSLATED.

Explanation
Following triggers such as 'EXEC' and 'CICS', the translator has found text which is syntactically incorrect. The translator is expecting either another 'trigger', or a command specification.

System action
The complete command is rejected and not translated.

User response
This error might be a typographical error, as in this example

EXEC CICS INQUIRE PROGRAM('MYPROGGY')

where INQUIRE has been keyed with '1' instead of 'I'.
The translator expects to find an 'identifier' in this position. An identifier must begin with an alphabetic character, and the remaining characters must be either alphabetic or numeric. The text must not be coded as a literal, i.e. enclosed in quotation marks.

Module:
DFHEIMAN

Destination
SYSPRINT

DFH7238I S 'type' COMMANDS ARE NOT ALLOWED IN PROGRAMS WRITTEN IN language. COMMAND IGNORED.

Explanation
An EXEC CICS command is not supported in the language in which this program is written.

System action
The complete command is rejected and not translated.
In the current implementation of CICS, this restriction applies only to the GDS commands, which are not allowed in either COBOL or PLI programs.

The GDS commands may be coded in Assembler, C and C++ programs.

**Module:**
DFHEIMSA, DFHEIMSC, DFHEIMSD, DFHEIMSP

**Destination**
SYSPRINT

**Explanation**
An EXEC CICS ADDRESS command specifies the CSA option.

**System action**
The CSA option is accepted by the translator. However when the program executes, the CSA address returned will be invalid unless the level of the CICS system executing the program is CICS/ESA 3.1.1 or an earlier version of CICS.

**User response**
The translator accepts the option in order to provide downward compatibility, i.e. to allow the latest level of the translator to process programs intended to execute both at the current and earlier release levels of CICS.

The user is responsible for any incorrect processing which results from the use of this option when used in CICS systems at a level later than CICS/ESA 3.1.1.

**Module:**
DFHEIMS2

**Destination**
SYSPRINT

**Explanation**
An EXEC CICS ADDRESS command specifies the CSA option.

**System action**
The command is rejected and not translated.

**User response**
Refer to the Developing CICS Applications for a full description of the command syntax, and make suitable changes in the application program.

**Module:**
DFHEIMS2

**Destination**
SYSPRINT

**Explanation**
In an EXEC DLI command, a FIELDLENGTH option includes more expressions than the number of qualification statements in the preceding WHERE option.

The following statement would cause this error - EXEC DLI GU SEGMENT(PATIENT) WHERE(PATNO>PATNO1 AND NAME=PATN) FIELDLENGTH(3,4,8)

**System action**
The excess length or lengths are ignored.

The translator matches qualification statements and lengths reading from left to right. In the example above, the length of 8 cannot be matched and is ignored.

**User response**
Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

**Module:**
DFHEIMS1

**Destination**
SYSPRINT

**Explanation**
An EXEC CICS command contains an 'AT', 'AFTER', 'FOR' or 'UNTIL' option, but does not contain the required specification of any of the 'HOURS', 'MINUTES' or 'SECONDS' options.
**Explanation**

In an EXEC DLI command, a WHERE option contains too many Boolean (or logical) operators, such as 'AND' and 'OR'. The translator sets a limit of 11 Boolean operators in each WHERE option, which allows 12 qualification statements to be connected.

**System action**

The remaining text in the WHERE option is ignored.

**User response**

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

**Module:** DFHEIMS1

**Destination**

SYSPRINT

**DFH7253I E**  
MISSING QUALIFICATION STATEMENT IN 'option' OPERAND. OPERAND IGNORED.

**Explanation**

In an EXEC DLI command, a WHERE option contains a qualification statement which has no comparison operator.

The following example would cause this message to be issued -

```
WHERE(DOCTOR = 'SPOCK' OR DOCTOR = 'NO   ')
```

because there is no comparison operator between 'DOCTOR' and 'SPOCK'.

**System action**

The incorrect qualification statement and the Boolean operator which follows it are ignored. In the example above, the WHERE option would be reduced to -

```
WHERE(DOCTOR = 'NO   ')
```

**User response**

Insert an appropriate comparison operator in the incorrect qualification statement.

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

**Module:** DFHEIMS1

**Destination**

SYSPRINT

**DFH7254I E**  
MISSING COMPARISON OPERATOR IN 'option' OPERAND. OPERAND IGNORED.

**Explanation**

In an EXEC DLI command, a WHERE option contains only a single operand and no other text.

**System action**

The Boolean operator at the end of the WHERE argument is ignored.

**User response**

Either remove the Boolean operator or code an appropriate qualification statement after the operator.

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

**Module:** DFHEIMS1

**Destination**

SYSPRINT

**DFH7255I E**  
ARGUMENT TO 'keyword' KEYWORD CONTAINS NO COMPARISON OPERATORS. KEYWORD IGNORED.

**Explanation**

In an EXEC DLI statement, a WHERE option contains only a single operand and no other text.
The following example would cause this message to be issued -

```
WHERE (DOCTOR)
```
because the field name 'DOCTOR' is not followed by either a comparison operator or a value.

**System action**
The entire WHERE option is ignored.

**User response**
Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

**Module:**
DFHEIMS1

**Destination**
SYSPRINT

**Explanation**
A program statement references a translator builtin function such as DFHRESP or DFHVALUE, but the function reference is not followed by a condition name or CVDA name which is known to the translator.

**System action**
The builtin function specification cannot be translated.

**User response**
Refer to the CICS Application development reference for details of valid conditions and CVDAs.

If an EXEC CICS command might raise a condition, a list of the relevant conditions and their meanings in the context of this command is given in each command description.

If an EXEC CICS command contains options whose arguments can be expressed or interpreted using CVDAs, the command description specifies which CVDAs are valid for each option.

**Module:**
DFHEIM11

**Destination**
SYSPRINT

**Explanation**
A program statement references a translator builtin function such as DFHRESP or DFHVALUE, but the function reference is not followed by a left bracket.

**System action**
The builtin function specification cannot be translated.

**User response**
DFHRESP or DFHVALUE must be followed by, respectively, a condition name or a CVDA name, and this name must be enclosed in parentheses.

Refer to the CICS Application development reference for a description of the usage of the translator builtin functions.

**Module:**
DFHEIM11

**Destination**
SYSPRINT

**Explanation**
A program statement references a translator builtin function such as DFHRESP or DFHVALUE, but the function reference is not followed by text in the form of an identifier. A valid identifier is a string of text in which the first character is alphabetic and the remaining characters are either alphabetic or numeric. The string must not be enclosed in quotes.

**System action**
The builtin function specification cannot be translated.

**User response**
This error would be caused by the following statement -

```
IF MYRESP = DFHRESP('INVREQ') ....
```
because the argument of DFHRESP is coded as a literal, and also in the following statement -

```
IF STATUS = DFHVALUE(228) ........
```
because the argument of DFHVALUE is an arithmetic value.

Refer to the CICS Application development reference for details of how to make use of the DFHRESP and DFHVALUE builtin translator functions.

**Module:** DFHEIM11

**Destination**

**SYSPRINT**

**DFH7259I**  
OPERAND 'INS#1' OF KEYWORD 'INS#2' IS INVALID FOR COBOL. A DATA-AREA RATHER THAN A DATA-VALUE MUST BE SPECIFIED. COMMAND NOT TRANSLATED.

**Explanation**

In a COBOL program, an argument is coded as a data value but it must be coded as a data reference.

When arguments are coded as data values, i.e. literals or self-defining terms, in a COBOL program, such arguments are passed 'by content' in the 'Call' statement generated by the translator.

This error occurs when the data is of a type which cannot be passed 'by content', and is only likely to occur when the data type is pointer.

**System action**

The EXEC CICS command is rejected and not translated.

**User response**

This error would be caused by the following statement -

```
EXEC CICS FREEMAIN DATAPORTER(54560) END-EXEC.
```

where the argument of the DATAPORTER option must be a data reference, i.e. a reference to a variable in the program, and not a data value. It's unlikely that this statement would succeed anyway, since addresses of GETMAINed storage cannot be known at compilation time.

**Module:** DFHEIMAC

**Destination**

**SYSPRINT**

**DFH7260I**  
ERROR WHEN PROCESSING DECLARATIVES SECTION. END OF FILE FOUND BEFORE END DECLARATIVES.

**Explanation**

In a COBOL program, the translator has found a DECLARATIVES section but has not found a subsequent END-DECLARATIVES statement.

**System action**

Any EXEC CICS commands which follow the DECLARATIVES statement are neither recognised nor translated.

**User response**

An END-DECLARATIVES statement should be coded in an appropriate position in the program.

Note that there are restrictions on the use of declaratives when used in CICS applications written in COBOL. For details refer to the Developing CICS Applications

**Module:** DFHEIM10

**Destination**

**SYSPRINT**

**DFH7261W**  
"ins#1" IS NO LONGER SUPPORTED BUT HAS BEEN TRANSLATED.

**Explanation**

An obsolete option has been specified in an EXEC CICS statement.

**System action**

The obsolete option has been accepted by the translator and processed in the same way as in the earlier releases of CICS which fully supported this option. However at runtime the specification of this option is ignored.
**User response**

The translator accepts the option in order to provide downward compatibility, i.e. to allow the latest level of the translator to process programs intended to execute both at the current and earlier release levels of CICS.

The user is responsible for any unexpected results which may occur due to the removal of execution time support for this option when used in CICS systems in which the option is obsolete.

If the translated program is not intended to execute at earlier levels of CICS, the obsolete option specification should be removed so that unnecessary warning messages are no longer issued by the translator.

**Module:**

DFHEIMKW

**Destination**

SYSPRINT

DFH7262I S  TRANSLATOR OPTION 'INS#1' REQUIRED BUT NOT SPECIFIED. COMMAND NOT TRANSLATED.

**Explanation**

An EXEC CICS command is recognised by the translator, but is not allowed unless a certain translator option is specified.

For example, the program contains an EXEC CICS INQUIRE command but the translator option 'SP' has not been specified.

**System action**

The EXEC CICS command is rejected and not translated.

**User response**

Specify the option given as part of the message. If necessary, refer to the Developing CICS Applications for information about how to specify translator options.

SYSPRINT

DFH7263I W  SHIFT-IN CODE ENCOUNTERED WHILE SCANNING SINGLE BYTE CHARACTERS. A SHIFT-OUT CODE MAY BE MISSING.

**Explanation**

The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is a PLI program and the GRAPHIC option is in effect.

A shift out character (with hexadecimal code X'0F') has been found in SBCS data.

**System action**

The incorrect data is copied into the translated program, and this would most probably cause a compiler warning or error.

**User response**

If the translated output is compiled, carefully check all messages in the compiler listing.

However the safest action is to establish the reason for the unexpected shift out character, change the program in an appropriate way, and rerun the translation step.

**Module:**

DFHEIM11

**Destination**

SYSPRINT

DFH7264I W  SHIFT-OUT CODE ENCOUNTERED WHILE SCANNING DOUBLE BYTE CHARACTERS. A SHIFT-IN CODE MAY BE MISSING.

**Explanation**

The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is a PLI program and the GRAPHIC option is in effect.

A shift in character (with hexadecimal code X'0E') has been found in DBCS data.

**System action**

The incorrect data is copied into the translated program, and this would most probably cause a compiler warning or error.
User response

If the translated output is compiled, carefully check all messages in the compiler listing.

However the safest action is to establish the reason for the unexpected shift in character, change the program in an appropriate way, and rerun the translation step.

SYSPRINT

DFH7265I E CHARACTER AT RIGHT MARGIN IMMEDIATELY FOLLOWS A SHIFT-IN CODE. A BLANK IS ASSUMED.

Explanation:

System action:

User response:

Module: DFHEIM01, DFHEIM15

Destination

SYSPRINT

DFH7268I S RIGHT MARGIN ENCOUNTERED WHILE SCANNING DOUBLE BYTE CHARACTERS. A SHIFT-IN CODE MAY BE MISSING.

Explanation

The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect.

When this message is issued, the translator is scanning a DBCS string and has reached the right hand margin of a line, but has not found a shift in character. Both compilers require shift in and shift out characters to be coded as 'matching pairs' on each program line where they are used.

System action

Because there are only one or two characters between the last (or only) shift out character and the right margin, there is insufficient space for a DBCS string. The translator removes both the shift out character, and the one or two characters following the shift out, from the data copied into the translated program.

User response

Although the translated program is syntactically correct, the data string is probably incorrect for the application's purposes.

Examine the incorrect data and make appropriate changes to the program and rerun the translation step.

Refer to the relevant Programming Language Reference manual for rules regarding the coding of DBCS strings.
**Module:** DFHEIM14

**Destination**
SYSPRINT

**DFH7269I S**
RIGHT MARGIN ENCOUNTERED WHILE SCANNING DOUBLE BYTE CHARACTERS. A SHIFT-IN CODE IS ASSUMED.

**Explanation**
The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect, or because this is a C or C++ program.

When this message is issued, the translator is scanning a DBCS string and has reached the right hand margin of a line, but has not found a shift in character. The compilers require each DBCS string to be contained on a single line within the program.

**System action**
For programs written in COBOL and PLI, the translator substitutes either the last or the penultimate character in the line with a shift in character, ensuring that an even number of characters are positioned between the shift out and shift in.

In the following examples, < represents shift out, > represents shift in and '.' represents x'42'. If a line ends with the following data characters -

```
.<.A.B.C.D
```

the translator converts the string to -

```
.<.A.B.C>D
```

If a line ends with following data characters -

```
.<.E.F.G.
```

the translator converts the string to -

```
.<.E.F.G>
```

For programs written in the C languages, the translator assumes the existence of a shift in character at the right margin, but copies the incorrect data string into the translated program.

**User response**
Although the translated program may be syntactically correct, the data string is probably incorrect for the application’s purposes.

Examine the incorrect data and make appropriate changes to the program and rerun the translation step.

**Module:** DFHEIM11, DFHEIM14

**Destination**
SYSPRINT

**DFH7270I S**
FOLLOWING A SHIFT-OUT CODE AN ODD NUMBER OF BYTES WERE ENCOUNTERED BEFORE A SHIFT-IN CODE. THE SHIFT-IN CODE HAS BEEN MOVED.

**Explanation**
The translator is validating DBCS data in the input program, either because this is a COBOL program and the translator option DBCS is in effect, or because this is PLI program and the GRAPHIC option is in effect.

When this message is issued, the translator is scanning a DBCS string and has found an odd number of characters between the shift out and shift in characters delimiting this string.

**System action**
The translator moves the shift in character so that it trades places with the character immediately preceding the shift in character.

In the following example, '<' represents shift out, '>' represents shift in and '.' represents x'42'.

If a line contains the following DBCS string -

```
.<.A.B.C.>
```

the translator converts the string to -

```
.<.A.B.C>
```

If a line contains the following DBCS string -

```
.<.E.F.G.
```

the translator converts the string to -

```
.<.E.F.G>
```

in the translated program.

**User response**
Although the DBCS string is now syntactically correct, the data string is probably incorrect for the application’s purposes.

The SBCS data following the DBCS data may also be incorrect because of the translator’s action.
Examine the incorrect data and make appropriate changes to the program and rerun the translation step.

**Module:**
DFHEIM14

**Destination**
SYSPRINT

**DFH7271I E**
The data following 'option' is not considered to be part of the field name and is ignored. Perhaps the field name should be enclosed in quotes.

**Explanation**
In an EXEC DLI statement, a field name in a WHERE clause has been mispelt or is followed by incorrect data.

The following example would cause this message to be issued -

```
WHERE(DOCTOR = 'SPOCK')
```

where a '%' has been coded instead of an alphameric character.

**System action**
The translator discards the incorrect text and continues processing the command.

**User response**
Edit the source program to change or remove the incorrect data in or following the field name.

**Module:**
DFHEIMS1

**Destination**
SYSPRINT

**DFH7272I E**
A field value should be followed by a boolean operator or a right parenthesis. 'option' is ignored.

**Explanation**
In an EXEC DLI statement, a Boolean operator has been omitted or mispelt in a WHERE option.

The following example would cause this message to be issued -

```
WHERE(DOCTOR = 'SPOCK' OR DOCTOR = 'NO ')
```

where the user has coded 'OF' instead of 'OR'.

**System action**
The translator is unable to diagnose this error until it finds a non-alphabetic character following the mispelt or missing Boolean operator. The next non-alphabetic character will usually be the comparison operator in the next qualification statement.

The effect of this is that the translator misinterprets the value field which starts immediately before the missing or mispelt Boolean operator, and rejects the qualification statement following the mispelt or missing Boolean operator.

**User response**
Insert or correctly code an appropriate Boolean operator.

Refer to the relevant IMS reference manual for a full description of the command syntax, and make suitable changes in the application program.

**Module:**
DFHEIMS1

**Destination**
SYSPRINT

**DFH7273I W**
A shift-in code was found in the second byte of a DBCS character. The shift-in has been accepted.

**Explanation**
The translator is validating DBCS data in a C or C++ program. When this message is issued, the translator is scanning a DBCS string and has found an odd number of characters between the shift out and shift in characters delimiting this string.

**System action**
The translator moves the data unchanged into the translated program.

**User response**
Examine the incorrect data and make appropriate changes to the program and rerun the translation step.
**Module: DFHEIM14**

**Destination**
SYSPRINT

**DFH7274I W** AN INVALID DBCS CHARACTER HAS BEEN FOUND - IT IS ACCEPTED.

**Explanation**
The translator is validating DBCS data in a C or C++ program. When this message is issued, the translator is scanning a DBCS string and has found an invalid DBCS character.

A valid DBCS character must either contain the value X'4040', or each byte must contain a value in the range X'41' thru X'FE' inclusive.

**System action**
The translator moves the data unchanged into the translated program.

**User response**
Examine the incorrect data and make appropriate changes to the program and rerun the translation step.

---

**Module: DFHEIMAC**

**Destination**
SYSPRINT

**DFH7275I S** THE FIGURATIVE CONSTANT VALUE constant IS NOT COMPATIBLE WITH THE DATA TYPE 'PACKED INTEGER' WHICH IS REQUIRED FOR THE ARGUMENT OF KEYWORD keyword.

**Explanation**
In a COBOL program, a figurative constant has been coded as the argument for an option which takes a packed decimal data value.

However the translator only accepts the ZERO figurative constant (or the ZEROS and ZEROES equivalents) for packed decimal arguments.

**System action**
The translator rejects the command.

**User response**
Replace the figurative constant with an argument of the correct data type.

---

**Module: DFHEIMAC**

**Destination**
SYSPRINT

**DFH7276I S** THE FIGURATIVE CONSTANT VALUE constant IS NOT COMPATIBLE WITH THE DATA TYPE 'BINARY INTEGER' WHICH IS REQUIRED FOR THE ARGUMENT OF KEYWORD keyword.

**Explanation**
In a COBOL program, a figurative constant has been coded as the argument for an option which takes a binary data value.

However the translator only accepts the ZERO figurative constant (or the ZEROS and ZEROES equivalents) for binary arguments.

**System action**
The translator rejects the command.

**User response**
Replace the figurative constant with an argument of the correct data type.

CSMT and Terminal End User

DFHAC2016 date time applid Transaction tranid cannot run because program programname is not available.

Explanation
Transaction tranid is not executable because the initial program for transaction tranid is not available. Possible reasons for this are:
1. The program is missing.
2. The installed program definition is missing.
3. The program is disabled.
4. The program name in the installed transaction definition is invalid.
5. The installed transaction has been defined as remote and therefore has no program name, but the name of the remote system is the same as that of the local system.
6. The program requires a JVM to run but JVM initialization failed.
7. The autoinstall program abended while attempting to load the program.
8. The program requires a JVM server to run but the JVM server is not available.

Note that destination CSMT is used for non-terminal transactions only.

**System action**
Other processing continues.

**User response**
Determine the cause of the error using the list given in the Explanation. The response depends on the reason as follows:

1. Load the program into the CICS program library.
2. Create an installed program definition for the program.
3. Enable the program.
4. Use a valid program name in the installed transaction definition.
5. Carry out whichever of the following is appropriate:
   - Use a local version of this transaction.
   - Use the correct remote version of this transaction.
   - Logon to the correct system and retry the transaction.
6. For JVM programs check the CSMT log for further information as to why JVM initialization failed.
7. Check the job output for further information as to why the autoinstall program abended.

DFHAC2023 time applid A request from node netname has invalid security parameters.

Explanation
The received attach header did not match the required security parameters specified in the bind.

Note that destination CSMT is used for non-terminal transactions only.

System action
The attach request is rejected.

User response
Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified. The value of the ACC requirements in the attach header and the bind should be compared.

Module:
DFHACP

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. netname

Destination
CSMT

DFHAC2025 time applid An invalid Unit of Work Identification (UOWID) has been supplied by node netname.

Explanation
The received attach header contained an invalid unit of work ID (UOWID). Either the format was wrong, or no UOWID was received when the sync point level required it. This error may also be raised if no conversation correlator is supplied when it is needed.

System action
The attach request is rejected.
User response

Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified. The value of the UOWID/conversation correlator and the sync point level in the attach header should be compared.

Module:
DFHACP

Destination

Terminal End User

**DFHAC2026**

*time applid* An invalid Function Management Header (FMH) has been supplied by node *netname*.

Explanation

The length field in the attach header was invalid.

System action

The attach request is rejected.

User response

Notify the system programmer. The validity of the attach function management header (FMH) should be checked and the cause of the error identified.

Module:
DFHACP

Destination

Terminal End User

**DFHAC2027**

*date time applid* Transaction *tranid* does not support conversation restart.

Explanation

CICS will not accept LU type 6.2 attach headers with restart requested.

Note that destination CSMT is used for non-terminal transactions only.

System action

The attach request is rejected.

User response

Notify the system programmer. The subsystem that sent the attach header should be inspected to determine why restart was requested.

Module:
DFHACP

Terminal End User

DFHAC2054  
date time applid You are not authorized to access this system.
Explanation

The attach header that was sent to the remote system did not match the required security parameters specified in the bind.

System action

The attach request is rejected by the remote system and the session is unbound. The remote system issues messages DFHAC2055 on CSMT and DFHZC4946 on CSNE.

User response

Inform the system programmer. Investigate the reason why the attach request failed. See messages DFHAC2055 on CSMT and DFHZC4946 on CSNE issued by the remote system for more diagnostic information.

Module:

DFHACP

Destination

Terminal End User

DFHAC2055  date time applid  An attach request from node netname has sent BIND/FMH5 security data that is invalid.

Explanation

A request to attach a task has been received across an APPC link. However, there is an error in the FMH attach parameters. An attach parameter is present that is not authorized by the bind security indicators.

System action

The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued, tracing the invalid attach header (FMH type 5). Message DFHZC4946 on CSNE contains sense information to help identify the reason for the failure. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace, to determine why the remote system sent an invalid attach request.

Module:

DFHACP

Destination

Terminal End User

DFHAC2056  time applid  You are not authorized to access this system.

Explanation

The attach header that was sent to the remote system did not conform to the APPC protocol.

System action

The attach request is rejected by the remote system and the session is unbound. The remote system will produce messages DFHAC2057 on CSMT and DFHZC4947 on CSNE.

User response

Inform the system programmer. Investigate the reason why the attach request failed. See messages DFHAC2057 on CSMT and DFHZC4947 on CSNE issued by the remote system for more diagnostic information.

Module:

DFHACP

Destination

Terminal End User

DFHAC2057  date time applid  While performing an attach for node netname a security violation was detected.

Explanation

A request to attach a task has been received across an APPC link. However, the FMH attach parameters do not conform to the APPC protocol.

System action

The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued tracing the invalid attach header (FMH type 5). Message DFHZC4947 is issued.

Chapter 2. CICS messages 151
Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace to determine why the remote system sent an invalid attach request. See message DFHZC4947 on CSNE which contains sense information to help identify the reason for the failure.

If the remote system has an earlier release of CICS or CICS on another platform then you may need to set USEDFLTUSER. See Attach Time Security and the USEDFLTUSER option in the CICS Security.

**Module:** DFHACP

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. netname

**Destination**

CSMT and Console

**Explanation**

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction tranid has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. In accordance with the transaction definition (WAIT YES), the unit of work is not completed but is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

If possible, a conditional message condmsg from the linked system is appended to this message.

**System action**

CICS writes an exception trace entry, takes a system dump and writes message DFHAC2058 to the console and CSMT. CICS will continue processing but system log management will be severely compromised.

User response

It is strongly recommended CICS is shut down. Investigate why DFHRMXN3 could not be loaded and restart CICS when the problem is resolved.

**Module:**

DFHACP

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid

**Destination**

CSMT and Console

**Explanation**

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction tranid has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. In accordance with the transaction definition (WAIT YES), the unit of work is not completed but is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

If possible, a conditional message condmsg from the linked system is appended to this message.

**System action**

Message DFHAC2231 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

**User response**

None. Any updates performed by the unit of work are resolved automatically when resynchronization with the coordinator takes place.
Alternatively, the user may force resolution of the updates independently of the coordinator system by making a CEMT request to commit or to back out the unit of work.

Module: DFHTFP

Destination
Terminal End User

DFHAC2202  

\textit{time applid} Transaction \textit{tranid} has lost contact with its coordinator system during syncpoint processing and has abended with code ASPO. All updates will be unilaterally committed. \textit{condmsg}

Explanation
Transaction \textit{tranid} has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. The transaction is abnormally terminated with abend code ASPO.

In accordance with the transaction definition (WAIT NO and ACTION COMMIT), all recoverable updates performed by the unit of work are unilaterally committed. Note that integrity of updates may be lost because the coordinator system may either commit or back out its changes.

If possible, a conditional message \textit{condmsg} from the linked system is appended to this message.

System action
Message DFHAC2232 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response
None. In accordance with the transaction definition, all updates are unilaterally committed.

Module: DFHTFP

Destination
Terminal End User

DFHAC2204  

\textit{time applid} A commit failure has occurred during syncpoint processing for transaction \textit{tranid}. \textit{condmsg}

Explanation
An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources local to this CICS system, for example files, temporary storage, transient data, have been updated. A commit failure occurred during phase 2 of the syncpoint protocol for a local resource owner.

If possible, a conditional message \textit{condmsg} from the linked system is appended to this message.

System action
Message DFHAC2234 is sent to the main terminal operator (destination CSMT). For an EXEC CICS
SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the commit failure remain locked and the unit of work is shunted.

User response
Refer to earlier messages output by the local resource owner to discover the cause of the commit failure.

Module:
DFHTFP

Destination
Terminal End User

DFHAC2205 time applid A backout failure has occurred during syncpoint processing for transaction tranid. condmsg

Explanation
An attempt to backout a unit of work has suffered a backout failure. For the local resource owner(s) that suffered the backout failure, the resources updated by the unit of work remain locked. All other resources are backed out.

If possible, a conditional message condmsg from the linked system is appended to this message.

System action
Message DFHAC2235 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response
Refer to earlier messages output by the local resource owner to discover the cause of the backout failure.

Module:
DFHTFP

Destination
Terminal End User

DFHAC2206 time applid Transaction tranid failed with abend abcode. Updates to local recoverable resources backed out. condmsg

Explanation
Transaction tranid is abnormally terminated with abend code abcode. Any changes to recoverable resources in the local system that have been performed by the current unit of work are backed out.

abcode is either a CICS transaction abend code or a user abend code generated by a CICS ABEND ABCODE(abcode) command. This command is issued either by a user program or by an IBM program (for example, a programming language library module).

If possible, a conditional message condmsg from the remote system will be appended to this message.

When this message is issued in the terminal owning region because a remote transaction has failed, there may be no recoverable resources to be backed out in the local system. In this case, the conditional message tells you whether or not resources in the remote system have been backed out.

System action
Message DFHAC2236 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response
Use the abend code, abcode, to diagnose the problem. In a transaction routing environment, the original cause of the failure is usually indicated in the conditional message. If the abend is issued by an IBM program product other than CICS, the code is documented in the library of that other product.

Resubmit the transaction after the cause of the original abend has been removed.

Module:
DFHTFP

Destination
Terminal End User

DFHAC2215 time applid A CICS-generated syncpoint request has failed because a connected system has requested that the UOW be rolled back. Transaction tranid has been abnormally terminated with code ASPF. condmsg

Explanation
A CICS-generated syncpoint request has failed because a connected system has requested that the UOW be rolled back. Transaction tranid has been abnormally terminated with code ASPF. condmsg.

System action
Message DFHAC2236 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response
Refer to earlier messages output by the local resource owner to discover the cause of the commit failure.

Module:
DFHTFP

Destination
Terminal End User
**Explanation**

CICS has been unable to comply with an internally generated syncpoint request because a connected system has notified it that the unit of work must be rolled back. (This may also occur as a result of a session failure or a protocol error).

Transaction `tranid` is abnormally terminated with abend code ASPF. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message `condmsg` from the linked system is appended to this message.

**System action**

Message DFHAC2245 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

**User response**

Determine why the connected system sent the indication to roll back the unit of work.

Resubmit the transaction after the cause of the indication to roll back has been removed.

**Module:**
DFHTFP

**Destination**

Terminal End User

**DFHAC2216**

`time applid` Transaction `tranid` has requested rollback, but was using a type of processing for which rollback is not supported. The transaction has been abnormally terminated with code ASP8. `message`  

**Explanation**

A transaction has issued an EXEC CICS RETURN in backout required program state. The backout required program state is set when an application receives a backout request on a protected conversation.

Recoverable resources updated by the unit of work are backed out and locks released.

If possible, a conditional message `condmsg` from the linked system is appended to this message.

**System action**

Message DFHAC2247 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

**User response**

Refer to the explanation of abend ASP8.

**Module:**
DFHTFP
**Explanation**

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources local to this CICS system, for example files, temporary storage, or transient data, have been updated, and so the local resource owners have been sent a syncpoint request. A local resource owner has replied 'No' to a request to 'Prepare', during the two phase syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASP7. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

**System action**

Message DFHAC2249 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

**User response**

Refer to the explanation of abend ASP7.

**Module:**

DFHTFP

---

**Destination**

Terminal End User

DFHAC2218  

*time applid* Transaction *tranid* has failed with abend ASP7 following the failure of a local resource owner in the prepare phase of syncpoint. Updates will be backed out. *condmsg*

**Explanation**

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system, for example files, temporary storage, transient data on remote CICS systems, or database managers communicating via the RMI, have been updated, and so the remote resource owners have been sent a syncpoint request. A remote resource owner has replied 'No' to a request to 'Prepare', during the two phase syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASP7. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

**System action**

Message DFHAC2249 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

**User response**

Refer to the explanation of abend ASP7.

DFHAC2219  

*time applid* Transaction *tranid* has failed with abend ASP7 following the failure of a remote system in the prepare phase of syncpoint. Updates will be backed out. *condmsg*

**Explanation**

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote. During the syncpoint protocol the remote coordinator has decided that the unit of work cannot be committed and must be backed out.

Transaction *tranid* is abnormally terminated with abend code ASP3. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.

**Explanation**

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote. During the syncpoint protocol the remote coordinator has decided that the unit of work cannot be committed and must be backed out.

Transaction *tranid* is abnormally terminated with abend code ASP3. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

If possible, a conditional message *condmsg* from the linked system is appended to this message.
System action
Message DFHAC2250 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response
Refer to the remote coordinator system to discover the reason why the unit of work was backed out.

Module:
DFHTFP

Destination
Terminal End User

DFHAC2221  
Time applid Transaction tranid has failed with abend ASPQ. Syncpoint commit processing has failed while communicating with a remote system. condmsg

Explanation
An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote. Transaction tranid has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. However no recoverable resources have been updated by this system, so there is no data integrity problem. Transaction tranid is abnormally terminated with abend code ASPR.

If possible, a conditional message condmsg from the linked system is appended to this message.

System action
Message DFHAC2252 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response
Refer to messages on the remote system to determine if the remote resources were backed out or committed.

Module:
DFHTFP

Destination
Terminal End User

DFHAC2222  
Time applid Transaction tranid has lost contact with its coordinator system during syncpoint processing. No updates have been performed by this system; it has abended with code ASPR. condmsg

Explanation
An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote. Transaction tranid has lost contact with its coordinator system during syncpoint processing.

Transaction tranid is abnormally terminated with abend code ASPR.

If possible, a conditional message condmsg from the linked system is appended to this message.

System action
Message DFHAC2251 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

User response
Refer to the associated messages already issued by the communication components of CICS to determine the cause of the intersystem session problem.

Module:
DFHTFP

Destination
Terminal End User

DFHAC2223  
Time applid Transaction tranid has failed with abend ASP2 due to the links to the remote systems being in an invalid state. Updates will be backed out. condmsg

Explanation
An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system, for example files, temporary storage, transient data on remote CICS systems, or database managers communicating via the RMI, have been updated, and...
so the remote resource owners would be sent a syncpoint request. The links to the remote resource owners are in an invalid state to be sent the PREPARE request of the two phase syncpoint protocol.

Transaction `tranid` is abnormally terminated with abend code ASP2. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

**System action**

Message DFHAC2253 is sent to the main terminal operator (destination CSMT). Normal abend processing continues.

**User response**

See the explanation of abend ASP2 for guidance.

**Module:** DFHTFP

**Destination**

Terminal End User

**DFHAC2230**

Transaction `tranid` not executed due to I/O error at session startup.

**Explanation**

Transaction `tranid` could not be executed because an I/O error occurred in the start-up program on terminal `termid`.

**System action**

Transaction `tranid` is not executed.

**User response**

Correct the cause of the I/O error, which is probably due to the terminal not being powered on.

**DFHAC2231**

Transaction `tranid` running program `program_name` has lost contact with its coordinator system during syncpoint and has abended with code ASP1. The unit of work is shunted until contact is restored. `EXCI job = exci_id`

**Explanation**

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction `tranid` has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'.

In accordance with the transaction definition (WAIT YES), the unit of work is not completed. It is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

`EXCI job = exci_id` is added when `tranid` is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The `exci_id` consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and proctype may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal `termid` represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, `termid` is a terminal identifier (transaction routing) or a session identifier, `sysid` is the identifier of the linked CICS system. The display ends with the termination message `condmsg` issued by the linked system.

**System action**

If possible, message DFHAC2201 is sent to the terminal user. Normal abend processing continues.

**User response**

Refer to explanation of abend code ASP1.

| CSMT | DFHAC2234 date time applid A commit failure has occurred during syncpoint processing for transaction tranid, terminal termid. The transaction will be allowed to complete normally. EXCI job = } exci_id. condmsg |

**Explanation**
An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources local to this CICS system, for example files, temporary storage, or transient data, have been updated. A failure occurred during phase 2 of the syncpoint protocol for a local resource owner. The affected unit of work has recorded its outcome (either forwards or backwards) on the system log, but the resources managed by the local resource owner that failed will remain locked.

Exci Job =exci_id is added when tranid is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and proiname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal termid represents the connection between the EXCI client and CICS rather than a real terminal.

**System action**
If possible, message DFHAC2204 is sent to the terminal user. For an EXEC CICS SYNCPOINT, processing completes normally and processing continues with the next unit of work. For EXEC CICS RETURN, the transaction completes normally.

Resources affected by the failure remain locked and the unit of work is shunted.

**User response**
Refer to earlier messages issued by the local resource owner to determine the cause of the failure.

The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal

Chapter 2. CICS messages 161
termid represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, termid is a terminal identifier (transaction routing) or a session identifier, and sysid is the identifier of the linked CICS system. The display ends with the termination message condmsg issued by the linked system.

When this message is issued in the Terminal Owning region because a remote transaction has failed, there may be no recoverable resources to be backed out in the local system. In this case, the conditional message will tell you whether or not resources in the remote system have been backed out.

Program programe will be unknown when the message is issued in a Terminal Owning region.

**System action**

If possible, message DFHAC2206 is sent to the terminal user. Normal abend processing continues.

**User response**

See the description of the abend code abcode for guidance. In a transaction routing environment, the original cause of the failure is usually indicated in the conditional message. If abcode is not a CICS abend, it is a user code, in which case you should consult the programmer responsible for this area.

datetime applid Transaction termination processing for transaction tranid could not be completed normally because a connected system has requested that the unit of work be rolled back. EXCI job = exci_id. condmsg

Explanation

A transaction has issued an EXEC CICS RETURN in 'backout required' program state. The backout required program state is set when an application receives a backout request on a protected conversation. Recoverable resources updated by the unit of work are backed out and locks released.

Exci Job = exci_id is added when tranid is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The exci_id consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal termid represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, termid is a terminal identifier (transaction routing) or a session identifier, and sysid is the identifier of the linked CICS system. The display ends with the termination message condmsg issued by the linked system.

System action

If possible, message DFHAC2216 is sent to the terminal user. Termination processing continues.

User response

To avoid the error, the application should code an EXEC CICS SYNCPOINT command before the EXEC CICS RETURN. A syncpoint issued in 'backout required' program state results in a backout being performed, and the ROLLEDBACK condition returned on the EXEC CICS SYNCPOINT command. If this condition is then handled, a subsequent EXEC CICS RETURN will complete successfully.

Resubmit the transaction after the cause of the indication to roll back has been removed.

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system such as files, temporary storage, and transient data on remote CICS systems have been updated, and so the remote resource owners have been sent a syncpoint request. A failure occurred during phase 2 of syncpoint protocol.

Transaction *tranid* is abnormally terminated with abend code ASPQ in program *program_name*. Recoverable resources have successfully been committed but a subsequent error occurred.

**EXCI job =** *exci_id* is added when *tranid* is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The *exci_id* consists of *jobname.stepname.procname* - *MVSid* and identifies the EXCI client job. The stepname and proconame may be omitted. *MVSid* identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active. Terminal *termid* represents the connection between the EXCI client and CICS; not a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, *termid* is a terminal identifier (transaction routing) or a session identifier, *sysid* is the identifier of the linked CICS system, and the display ends with the termination message *condmsg* issued by the linked system.

**System action**

If possible, message DFHAC2221 is sent to the terminal user. Normal abend processing continues.

**User response**

Refer to associated messages already issued by the communication components of CICS to determine the cause of the intersystem session problem.

8. *condmsg*
**Destination**

CSMT

**DFHAC2252**

`date time applid` Transaction `tranid` in program `program_name` term `termid` has lost contact with its coordinator system during syncpoint processing. No updates have been performed by this system; it has abended with code ASPR.  

_Explanation_

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.

Transaction `tranid` has lost contact with its coordinator system during the critical period of syncpoint processing known as the 'indoubt window'. However no recoverable resources have been updated by this system and so there is no data integrity problem.

Exci Job = `exci_id` is added when `tranid` is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The `exci_id` consists of 'jobname.stepname.procname - MVSid' and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence the MVSid will be omitted if SMF is not active.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, `termid` is a terminal identifier (transaction routing) or a session identifier, and `sysid` is the identifier of the linked CICS system.

The display ends with the termination message `condmsg` issued by the linked system.

(System action)

If possible, message DFHAC2222 is sent to the terminal user. Normal abend processing continues.

(User response)

Refer to messages on the remote system to determine if the remote resources were backed out or committed.

**Module:**

2. `time`
3. `applid`
4. `tranid`
5. `program_name`
6. `termid`
7. Value chosen from the following options:
   - `1= EXCI job =`
   - `8. exci_id`
   - `9. condmsg`

**Destination**

CSMT

**DFHAC2253**

`date time applid` Transaction `tranid` running program `program_name` term `termid` has failed with abend ASP2 due to the links to the remote systems being in an invalid state. Updates will be backed out.  

_Explanation_

An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. Resources remote to this CICS system, for example files, temporary storage, transient data on remote CICS systems, or database managers communicating via the RMI, have been updated, and so the remote resource owners would be sent a syncpoint request. The links to the remote resource owners are in an invalid state to be sent the PREPARE request of the two phase syncpoint protocol.

Transaction `tranid` is abnormally terminated with abend code ASP2 in program `programname`. Any changes to recoverable resources that have been performed by the current unit of work are backed out.

Exci job = `exci_id` is added when `tranid` is a server transaction running on behalf of a non CICS job using the external CICS interface (EXCI). The `exci_id` consists of `jobname.stepname.procname - MVSid` and identifies the EXCI client job. The stepname and procname may be omitted. The MVSid identifies the MVS system on which the EXCI client job is running. If MRO/XCF is being used, this can be different from the MVS system on which this CICS system is running. The MVSid is the SMF system identification (SID), hence...
the MVSid will be omitted if SMF is not active. Terminal termid represents the connection between the EXCI client and CICS rather than a real terminal.

In the case of an MRO or an ISC APPC (parallel sessions) connected system, termid is a terminal identifier (transaction routing) or a session identifier and sysid is the identifier of the linked CICS system. The display ends with the termination message condmsg issued by the linked system.

System action
If possible, message DFHAC2223 is sent to the terminal user. Normal abend processing continues.

User response
See the explanation of abend code ASP2 for guidance.

DFHAC2259 date time applid Transaction tranid abend primary_abcode in program program_name term termid DFHPEP not linked.

Explanation
Transaction tranid is abnormally terminated with abend code abcode. An error occurred in attempting to link to the user-written program error program (DFHPEP). The error prevented DFHPEP from being given control.

If CICS terminates abnormally because of a program control restart failure, this message can appear during shutdown.

System action
Depending on the reason for the failure, CICS may abnormally terminate or continue.

User response
The transaction abend code, abcode, gives the reason for the original transaction failure.

Determine why DFHPEP could not be invoked. It may be disabled.

Module:
DFHACP

The system was unable to execute the transaction at this time.

### System action

The transaction is purged.

### User response

Resubmit the transaction later.

**Module:** DFHACP

### DFHADnnnn messages

**DFHAD0001**  *applid* An abend (code *aaa/bbbb*) has occurred at offset *X*offset* in module *modname*.

### Explanation

An abnormal end (abend) or program check has occurred in module *modname*. This implies that there may be an error in CICS code.

Alternatively:
• Unexpected data has been input,
• Storage has been overwritten, or
• There has been a program check within a user program.

The code \textit{aaa} is, if applicable, a 3-digit hexadecimal MVS system completion code (for example, OC1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code \textit{bbbb}, which follows \textit{aaa}, is a user abend code produced either by CICS or by another product on the user's system.

If \textit{X'offset'} contains the value X'FFFF', module \textit{modname} was in control at the time of the abend, but the program status word (PSW) was not addressing this module.

\textbf{System action}

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

\textbf{Either} this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

\textbf{Or} CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

\textbf{User response}

Notify the system programmer.

Look up the MVS code \textit{aaa}, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If the \textit{modname} insert contains the value ????\textbf{,} CICS was unable to determine which module has abnormally terminated. In this case, examine the system dump to determine which area of code has caused the program check.

The user should examine other messages to determine what the module which issued this message was doing at the time the abend occurred. From these messages they can deduce which product has produced the abend code \textit{bbbb}. If \textit{bbbb} is identified as a CICS code, it may be either alphanumeric or numeric.

• If the CICS code is alphanumeric (for example AKEA), it is a CICS transaction abend code.
• If the CICS code is numeric (for example 1310), it refers to a CICS message (DFHTS1310 in our example).

If the user abend code is from another product (for example, IMS), refer to the appropriate messages and codes manual to determine the cause of the abend.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response.

\textbf{Note:}

The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the \textit{Configuring}.

You may need further assistance from IBM to resolve this problem. See \textit{Working with IBM to solve your problem} for guidance on how to proceed.

DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. filename

Destination
Console and Terminal End User
DFHAM4805 E applid Unable to perform operation: name is locked to
Explanation
An attempt has been made to lock, or update, a group or a list that is currently locked to another user.

System action
Processing continues.

User response
Reenter the command when the group or the list is not locked.

Module:
DFHAMP

Destination
Terminal End User

DFHAM4806 E applid Group name grpname exists as a LIST name.

Explanation
The system initialization table (SIT) GRPLIST parameter names a list that contains an unusable group name grpname. CICS cannot find this group because no resources are defined as belonging to it, and also because a list of the same name already exists in the CSD.

Note:
A group and a list cannot coexist with the same name.

System action
CICS issues the request 'IS START-UP TO BE CONTINUED? REPLY GO OR CANCEL'.

If you reply 'GO', CICS is initialized with all the valid definitions in the list.

User response
If you do not require group grpname, enter 'GO'.
If group grpname is essential, enter 'CANCEL', and reinitialize CICS with a different GRPLIST name as a SIT override parameter. Then use the CEDA transaction to review and correct the faulty list.

DFHAM4812 W applid Install of LIBRARY libname encountered a data set {allocation | concatenation | open} failure. The LIBRARY is installed but disabled.

Explanation
Install of the dynamic LIBRARY resource libname has completed but one of the steps required for the successful completion of the LIBRARY install process has failed. The error occurred while attempting to do one of the following:
• Allocate a data set that was defined as one of the DSNAME attributes in the LIBRARY resource definition
• Concatenate the data sets together
• Open the LIBRARY concatenation.

The message text indicates which of these errors has occurred. Due to the error, the LIBRARY has been installed, but with an enablement status of DISABLED, which means that it will not participate in the search order used when loading programs and program artifacts.
**System action**

Processing continues. Even if the LIBRARY was defined with enablement status of ENABLED, the resource has been installed as DISABLED. Also, this LIBRARY will not be searched when program artifacts are loaded. Therefore, program artifacts that reside in the data sets defined for LIBRARY `libname` will not be loaded from this LIBRARY.

**User response**

Examine the messages issued by the Loader domain to determine the type of failure that occurred during install processing for this LIBRARY. When the problem has been resolved, SET LIBRARY `libname` to ENABLED in order for the LIBRARY to participate in the dynamic library search order process.

**Module:**

DFHAMP

DFHAMP

**XMEOUT parameters/Message inserts**

1. `applid`
2. `libname`

**Destination**

Console and Terminal End User

**Explanation**

The GRPLIST parameter of the system initialization table (SIT) specifies an invalid list name `listname`. CICS cannot find the list because a group of the same name already exists in the CSD.

**Note:**

A group and a list cannot coexist with the same name.

**System action**

CICS issues the request 'ENTER ALTERNATIVE NAME OR CANCEL'.

**User response**

Enter a valid list name, or enter 'CANCEL', correct the GRPLIST system initialization parameter and reinitialize CICS.

**Module:**

DFHAMP

**XMEOUT parameters/Message inserts**

1. `applid`
2. `listname`
**DFHAM4815 E applid Group grpname not found in this list.**

**Explanation**
The AFTER/BEFORE name entered in the command could not be found in this list. The definition could have been deleted while the user was viewing the outcome of an EXPAND command.

**System action**
Processing continues.

**User response**
Reenter the command with a group name that exists on this list.

**Module:**
DFHAMP

---

**DFHAM4816 E applid Install of LIBRARY libname failed with an MVS ABEND. The LIBRARY is not installed.**

**Explanation**
Install of the dynamic LIBRARY resource `libname` has failed because of an MVS ABEND. Due to the error, the LIBRARY has not been installed, which means that it will not participate in the search order used when loading programs and program artifacts.

**System action**
Processing continues. This LIBRARY will not be searched when program artifacts are loaded. Therefore, program artifacts that reside in the data sets defined for LIBRARY `libname` will not be loaded from this LIBRARY.

**User response**
Examine the messages issued by the Loader domain to determine the type of MVS abend that occurred during install processing for this LIBRARY. When the problem has been resolved, re-install LIBRARY `libname` in order for the LIBRARY to participate in the dynamic library search order process.

**Module:**
DFHAMP

---

**DFHAM4817 E applid Unable to install group grpname - group not found.**

**Explanation**
Group `grpname` specified in the list being installed was found to be empty. This error can occur either at group list install during CICS start-up or when using the CEDA transaction to install a list. If the error occurs during CICS start-up, the GRPLIST parameter of the system initialization table (SIT) names a list that contains an unusable group name `grpname`. CICS cannot find group `grpname` because no resources are defined as belonging to it.

**System action**
The system action depends on when the error occurs. During group list install at CICS start-up, CICS issues the request 'IS START-UP TO BE CONTINUED? REPLY GO OR CANCEL'.

If you reply 'GO', CICS is initialized with all the valid definitions in the list.

However, with CEDA, install of the complete list will be unsuccessful and an error message will be returned to the terminal end user. Valid definitions will be installed, but the empty group will not.

DFHAM4825 S applid Unable to perform request - File Control has returned an INVREQ response.

Explanation
The file control file request handler (DFHFCFR) does not have sufficient function to support the CEDA command entered.

System action
The CEDA command is ignored.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHAMP

XMEOUT parameters/Message inserts
1. applid

Destination
Console and Terminal End User

DFHAM4826 S applid Unable to perform request - CSD corrupted or not initialized.

Explanation
During initialization, CICS finds a GRPLIST parameter in the SIT, but cannot access the CSD file because:

1. The CSD file has not been initialized, or
2. CSD initialization did not complete successfully, or
3. the CSD file has been corrupted.

System action
CICS terminates.

User response
If you have not used the CSD file before, initialize it using the offline utility, DFHCSDUP, and check the output listing from the utility for successful completion.

If you have used the CSD file before, it has probably been corrupted. In this case, load a backup copy of the CSD file and use it in place of the corrupted file.

Module: DFHAMP
XMEOUT parameters/Message inserts

1. applid

Destination
Console and Terminal End User

DFHAM4827 S applid Unable to perform request - DFHCSD could not be installed.

Explanation
During initialization, CICS finds a GRPLIST parameter in the system initialization table (SIT), but cannot access the CSD file because file control failed to install it.

System action
CICS terminates.

User response
Before the next CICS initialization, ensure that you have a SIT with the correct parameters for the definition of the DFHCSD file.
Assemble a new SIT as necessary.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. applid

DFHAM4828 E applid Group grpname not found.

Explanation
The group name grpname in the command could not be found.

System action
The command is ignored.

User response
Retry the command with a group name that exists.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. applid

Destination
Console and Terminal End User

DFHAM4829 S applid Storage violation. CSD primary control record not updated.

Explanation
The in-store version of the CSD primary record was corrupted.

System action
The version on the CSD was not updated and is not necessarily affected.

User response
None.

Module:
DFHAMP

XMEOUT parameters/Message inserts

1. applid

DFHAM4830 E applid restype resname already exists in the target group.

Explanation
The COPY operation could not be performed, as a duplicate has been found in the target group.

System action
The COPY command is ignored.

User response
Reenter the command with the MERGE or the REPLACE option.

Module:
DFHAMP

Chapter 2. CICS messages 181
Destination
Terminal End User

DFHAM4831 E applid The new name name is longer than the four characters allowed for restype names.

Explanation
The specified name name is invalid because it is longer than four characters.

System action
The command is ignored.

User response
Enter a valid name.

Module: DFHAMP

Destination
Terminal End User

DFHAM4832 E applid Unable to open TDQUEUE tdqname because the DFHINTRA data set is not open.

Explanation
An attempt to install the transient data queue tdqname on the CICS system has been rejected because the DFHINTRA data set is not open.

System action
Processing continues. The definition is not installed.

User response
It is not possible to install intrapartition definitions on a system that does not have a DFHINTRA data set defined and opened. If DFHINTRA has been defined, it may have failed to open during initialization. It is necessary to repair the data set and restart the system in order to open it.

Module: DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. tdqname

Destination
Terminal End User

DFHAM4833 E applid A security error has occurred while attempting to install {TDQUEUE | URIMAP} resourcename. The definition has not been installed.

Explanation
An attempt to install the resource resourcename on the CICS system has been rejected because of an error encountered while performing a security check for the userid included within the definition.

System action
Processing continues. The definition is not installed.

User response
Refer to the associated messages issued by the security manager for further guidance. Reinstall the definition once the error has been corrected.

Module: DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. Value chosen from the following options:
   1=TDQUEUE,
   10=URIMAP
3. resourcename

Destination
Terminal End User

DFHAM4834 E applid Install of {TDQUEUE | PROCESSTYPE | LIBRARY | URIMAP | ATOMSERVICE} resourcename failed because the installed definition is not disabled.

Explanation
An attempt to install the resource resourcename on the CICS system has failed because the resource is not disabled.

System action
Processing continues. The definition is not installed.
User response
The specified resource must be disabled before it can be installed. Ensure that the resource is in the required state and then install the new definition.

Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. tdqname
3. resourcename

Destination
Console and Terminal End User

DFHAM4835 E applid Install of TDQUEUE
   tdqname failed because the queue has already been defined to the system, and initialization is still in progress.

Explanation
An attempt to install the transient data queue tdqname on the CICS system has failed because the queue has already been defined to the system and initialization has not completed.

It is not possible to replace a TD resource definition while CICS is still initializing. This problem only occurs during a cold or initial start of the system where more than one group is being installed as part of GRPLIST processing.

System action
Processing continues. The definition is not installed.

User response
Remove the duplicate resource definition so that the failure does not recur on a subsequent cold or initial start.

Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. db2conn-name

Destination
Console and Terminal End User

DFHAM4836 E applid Install of DB2CONN
   db2conn-name failed because a DB2CONN is already installed and is in use.

Explanation
An attempt to install the DB2CONN db2conn-name on the CICS system has failed because there is an existing DB2CONN installed and it is in use by the CICS-DB2 adapter.

System action
Processing continues. The definition is not installed.

User response
Only one DB2CONN can be installed on the CICS system at a time. The install of a second DB2CONN implies the discarding of the first DB2CONN and all its associated DB2ENTRYs and DB2TRANs.

A DB2CONN definition can be replaced or discarded only when it is not in use by the CICS-DB2 adapter. Ensure that the CICS-DB2 interface has been stopped before trying to install a DB2CONN definition.

Module:
DFHAM

XMEOUT parameters/Message inserts
1. applid
2. db2conn-name

Destination
Console and Terminal End User

DFHAM4837 E applid Install of { DB2ENTRY | DB2TRAN } name failed because a DB2CONN is not installed.

Explanation
An attempt to install the DB2ENTRY or DB2TRAN name on the CICS system failed because there is no DB2CONN installed. DB2TRANs and DB2ENTRYs can be installed only after a DB2CONN has been installed.
**System action**
Processing continues. The definition is not installed.

**User response**
Install a DB2CONN definition and then retry the install of the DB2ENTRY or DB2TRAN.

**Module:**
DFHAMP

**XMEOUT parameters/Message inserts**
1. **applid**
2. Value chosen from the following options:
   1. **DB2ENTRY**
   2. **DB2TRAN**
3. **name**

**Destination**
Console and Terminal End User

**Explanation**
An attempt to install the DB2ENTRY `db2entry-name` on the CICS system has failed because there is an existing DB2ENTRY of the same name which is not in a disabled state.

**System action**
Processing continues. The definition is not installed.

**User response**
Existing DB2ENTRY definitions can be replaced only when the DB2ENTRY is in a disabled state. Issue a command to disable the DB2ENTRY and then retry the install.

**Module:**
DFHAMP

**XMEOUT parameters/Message inserts**
1. **applid**
2. **db2entry-name**

---

**Definition**
Console and Terminal End User

**DFHAM4839 E ** **applid** List **listname** not found.

**Explanation**
The specified list **listname** could not be found in the CSD file and therefore cannot be installed. This error could occur either when using the CEDA transaction to install the list or during group list install at CICS start-up. If group list install is being performed, the error is because the system initialization table (SIT) used for CICS start-up contains a GRPLIST parameter, but CICS cannot find list **listname** which was specified in the GRPLIST.

**System action**
With the CEDA transaction, this message is simply returned to the terminal end user. During start-up, however, CICS issues the request 'ENTER ALTERNATIVE NAME OR CANCEL'.

**User response**
Enter a valid list name.

If no suitable user-defined list exists, you can initialize a minimum-function system with GRPLIST=DFHLIST, then use the CEDA transaction to build an appropriate list. Finally, cancel CICS, correct the GRPLIST parameter in the SIT, and reinitialize CICS.

**Module:**
DFHAMP

**XMEOUT parameters/Message inserts**
1. **applid**
2. **listname**

**Destination**
Console and Terminal End User

**DFHAM4840 W ** **applid** Group **grpname** not appended - group already exists in target list.

**Explanation**
The group **grpname** already exists in the target list.

**System action**
The group definition is not appended.
User response
None.
Module:
DFHAMP

Destination
Terminal End User

DFHAM4841 E  applid Install failed because definition of restype resname is in use by task no. taskno (transaction id. tranid).

Explanation
An attempt was made to install object definition restype resname on the CICS system, but the installation failed because a read lock was held on that definition by task taskno.

System action
No definitions have been installed.

User response
Try the command again later.
Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. restype
3. resname
4. taskno
5. tranid

Destination
Console and Terminal End User

DFHAM4842 W  applid GROUP/LIST name is internally locked to OPID opid APPLID applid.

Explanation
The identified GROUP or LIST name is internally locked to operator opid on CICS system applid when an attempt to install the GROUP or LIST occurred. This could occur at a cold or initial start when the CSD is shared between several CICS regions and operations on that group or list are incomplete.

System action
The installation continues.

User response
Check that the installed definitions correspond to your requirements.
Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. GROUP/LIST
3. name
4. opid
5. applid

Destination
Console and Terminal End User

DFHAM4844 W  applid restype resname1 in group grpname1 has the same name as a restype later in group grpname2.
**Explanation**
The CHECK command encountered a duplicate object name.

**System action**
None in the CHECK command, but the earlier definition will be ignored when the definitions are installed, because they both belong to the same CICS table in which duplicate entries may not exist.

**User response**
Determine why the duplicate condition exists and rectify it if necessary.

**Module:**
DFHAMP

**Destination**
Terminal End User

**DFHAM4845 W** applid restype1 resname1 referenced by restype2 resname2 in group grpname cannot be found.

**Explanation**
The CHECK command found a reference in a transaction definition to an object definition that does not exist.

**System action**
None in the CHECK command, but errors may occur if that definition is installed and used.

**User response**
Determine why the object definition cannot be found and rectify it if necessary.

**Module:**
DFHAMP

**Destination**
Terminal End User

**DFHAM4846 W** applid The xxxxxxxx of transaction tranid1 in group grpname duplicates that of transaction tranid2 in group grpname.

**Explanation**
The CHECK command found a transaction definition with the same alias as another transaction.

**System action**
No system action occurs for the CHECK command. However, errors may occur if that definition is installed and used.

**User response**
Determine why the duplicate situation occurs and rectify it if necessary.

**Module:**
DFHAMP

**Destination**
Terminal End User

**DFHAM4847 W** applid RELOAD(YES) has been specified for non-RPG program progname referenced by transaction tranid in group grpname.

**Explanation**
The CHECK command found a transaction definition that referenced a non-RPG II program for which RELOAD=YES was specified.

**System action**
If the definition is installed, CICS will not release storage for the first program invoked by a transaction unless the language is RPG II.

**User response**
Specify RELOAD (NO).

**Module:**
DFHAMP

**Destination**
Terminal End User

**DFHAM4848 W** applid Program progname in group grpname specifies language RPG which is not supported on CICS.

**Explanation**
The CHECK command, executing under CICS Transaction Server for OS/390 encountered an RPG II program definition. RPG II is not supported on CICS.
System action
If the definition is installed, the program language is overwritten.

User response
Change the language as appropriate.

Module: DFHAMP

Destination
Terminal End User

DFHAM4849 W applid NETNAME netname of {CONNECTION | TERMINAL} rsrcreame1 in group grpname1 duplicates that of {CONNECTION | TERMINAL} rsrcname2 in group grpname2.

Explanation
The CHECK command found a connection or terminal definition with a NETNAME that is the same as the NETNAME defined in another connection or terminal definition.

System action
None in the CHECK command. However, it is not possible to install two terminals or a terminal and a connection with the same NETNAME. Also, you cannot have two or more APPC links with the same NETNAME, an APPC link and an UTYPB6.1 link with the same NETNAME or two or more IRC connections with the same NETNAME.

User response
Determine why the duplication exists and rectify the problem.

Module: DFHAMP

XMEOUT parameters/Message inserts
1. applid

Destination
Console and Terminal End User

DFHAM4851 E applid Install of DB2ENTRY | DB2TRAN | DB2CONN | LIBRARY | ATOMSERVICE } name failed because of a security error.

Explanation
An attempt to install the ATOMSERVICE, DB2CONN, DB2ENTRY, DB2TRAN, or LIBRARY name on the CICS system has been rejected because of an error encountered while performing a security check.

System action
Processing continues. The definition is not installed.

User response
See the associated messages issued by the security manager for further guidance. Correct the error. Then reinstall the definition.

Module: DFHAMP

XMEOUT parameters/Message inserts
1. applid

Value chosen from the following options:
1= DB2ENTRY,
2= DB2TRAN,
3= DB2CONN,
5= LIBRARY,
11= ATOMSERVICE

3. name

Destination
Console and Terminal End User

DFHAM4852 W  applid restype name resname
begins with 'DFH' or 'EYU'. Such names are reserved and may be
redefined by CICS.

Explanation
A name beginning with DFH or EYU was specified.

System action
If the definition is installed, errors may occur.

User response
Names beginning with "DFH" and "EYU" are reserved and may be
redefined by CICS. You should avoid starting names with "DFH" and "EYU".

Module:
DFHAMP

Destination
Terminal End User

DFHAM4853 E  applid Install of DB2TRAN
db2tran-name failed because
another DB2TRAN is installed with
the same transid.

Explanation
An attempt to install the DB2TRAN db2tran-name
on the CICS system has failed because there is an
other DB2TRAN installed that specifies the same
transid. You cannot install two DB2TRANs that specify
the same transid.

System action
Processing continues. The definition is not installed.

User response
Examine the installed DB2TRAN definitions using
inquire DB2TRAN commands to determine the name
of the DB2TRAN specifying the same transid. If
appropriate, discard that DB2TRAN and then reinstall
this DB2TRAN.

Module:
DFHAMP

DFHAM4854 W  applid The specified (GROUP |
LIST) contains objtype objects but
no restype found.

Explanation
The specified GROUP or LIST contains objects that
need a resource type of restype but no such resource
type is listed in the GROUP or LIST.

System action
Processing continues.

User response
This may not be an error, but ensure that the resource
type restype is installed before installing the GROUP or
LIST.

Module:
DFHAMP

Destination
Terminal End User

DFHAM4855 W  applid DVSUPRT(VTAM) must be
specified for PROFILE profname
referenced by transaction tranid in
group grpname.

Explanation
The CHECK command found a definition for a CICS-
supplied transaction tranid without DVSUPRT(VTAM)
specified in profile proiname.
System action
Unpredictable results occur if the definition is installed and used.

User response
Specify DVSUPRT(VTAM).

Module:
DFHAMP

Destination
Terminal End User

DFHAM4856 W applid INBFMH(ALL) must be specified for PROFILE profname referenced by transaction tranid in group grpname.

Explanation
The CHECK command found a definition for a CICS-supplied transaction tranid without INBFMH(ALL) specified in profile profname.

System action
The system abnormally terminates with abend code AXFO if the definition is installed and used.

User response
Specify INBFMH(ALL).

Module:
DFHAMP

Destination
Terminal End User

DFHAM4857 W applid The specified {GROUP / LIST} contains more than one objtype.

Explanation
The specified GROUP or LIST contains more than one resource type objtype.

System action
Processing continues.

User response
Remove the duplication.

Module:
DFHAMP

DFHAM4858 S applid Unable to perform request - DFHCSD not enabled.

Explanation
The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter, but CICS cannot use the CSD file because it is disabled.

System action
CICS terminates.

User response
If you want to use the CSD file, check the system initialization parameters for DFHCSD and your JCL before the next CICS initialization.

Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid

Destination
Console and Terminal End User

DFHAM4859 S applid Unable to perform request - The CSDSTRNO operand in the System Initialization Table (SIT) is too small.

Explanation
Insufficient VSAM strings are available to allow CEDA to proceed.

System action
No CEDA commands may be executed.

User response
Wait until other CEDA users have terminated their sessions, or specify a CSDSTRNO value of twice the number of concurrent CEDA transactions in the SIT.

Module:
DFHAMP
XMEOUT parameters/Message inserts

1. applid

Destination
Console and Terminal End User

DFHAM4860 W applid The specified LIST contains DB2ENTRY or DB2TRAN definitions before a DB2CONN definition.

Explanation
The specified LIST contains DB2ENTRY and/or DB2TRAN definitions in a group containing no DB2CONN definition. No DB2CONN definition precedes it in the list.

System action
Processing continues.

User response
Determine why the duplication exists and rectify the problem.

Module:
DFHAMP

Destination
Terminal End User

DFHAM4861 W applid XTRANID of transaction tranid in group grpname duplicates transaction ID tranid in group grpname.

Explanation
The check command found a transaction tranid in group grpname whose XTRANID duplicated a previous transaction ID.

System action
No system action occurs for the CHECK command. However, the first transaction in the message is ignored if the definitions are installed.

User response
Determine why the duplication exists and rectify the problem.

Module:
DFHAMP

Destination
Terminal End User

DFHAM4863 I applid name is now locked. No group or list of that name exists.

Explanation
The LOCK command executed successfully, but no group or list of name name was found on the CSD file.

System action
The name is locked.

User response
None.

Module:
DFHAMP
Explanation
The system initialization table (SIT) used for CICS initialization contains a GRPLIST parameter. However, CICS cannot use the CSD file for one of the following reasons:

1. The startup JCL does not contain the definition of the CSD file (DFHCSD).
2. The DDNAME or data set name of the CSD file is incorrectly coded in the startup JCL.
3. VSAM has diagnosed that the CSD file cannot be opened.
4. CICS file control cannot open DFHCSD because insufficient storage has been allocated by the job REGION= parameter.

System action
CICS terminates.

User response
The action to solve the problem depends on the cause as follows:

1. Correct the JCL.
2. Correct the JCL.
3. Check the system operator's console for VSAM messages, and correct all VSAM errors.
4. Increase the size limit of the DSAs or EDSAs.

DFHAM4885E applid Install of IPCONN resourcename failed. Duplicate applid applid found.

Explanation
IPCONN resource resourcename was being installed but was found to have the same applid applid as an IPCONN which is already installed.

System action
The resource is not installed; CICS continues.

User response
If you want the definitions to be installed, use CEDA to correct the applid on this IPCONN and then reinstall the definition.

Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. resourcename
3. applid

Destination
Console and Terminal End User
DFHAM4886I applid Installing list listname which matches specified generic list genlist.

Explanation
The GRPLIST parameter of the system initialization table (SIT) specifies a list name genlist that contains generic characters. While searching the CSD file, the list name listname was found to match the specified generic list.

System action
The list name listname is installed.

User response
None.

Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. listname
3. genlist
Explanation
CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action
The resource is ignored and the operation continues.

User response
Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHAMP

Explanation
During the execution of a DELETE command, the group groupname was deleted from the CSD. As a result of that, the list listname was updated to remove the deleted group from it.

System action
Processing continues.

User response
None.

Module:
DFHAMP

Destination
Terminal End User

DFHAM4889 E applid Install of {JOURNALMODEL | TSMODEL | TCPIPSERVICE | CORBASERVER | IPCONN | URIMAP} resourcename failed because attribute attname is invalid.

Explanation
An attempt to install the JOURNALMODEL, TSMODEL, TCPIPSERVICE, CORBASERVER, IPCONN, or URIMAP named resourcename on the CICS system failed because the attribute attname specified is not valid.

If the attribute is CERTIFICATE, this may be due to one of the following reasons:

• The specified certificate does not exist
• The specified certificate is not properly constructed
• The specified certificate does not have an associated private key
• The specified certificate is not connected to the key ring with a correct USAGE.

System action
The definition is not installed.

User response
Correct the invalid parameter of the resource definition.

DFHAM4891 W applid restype name resname begins with 'C'. Such names are reserved and may be redefined by CICS.

Explanation

A resource name starting with C was specified. Names starting with C are reserved and may be redefined by CICS.

System action

If the definition is installed, errors may occur.

User response

Specify a different resource name.

Module:

DFHAMP

Destination

Terminal End User

DFHAM4892 W DATE TIME APPLID Install for group grpname has completed with errors.

Explanation

The install of group grpname is now complete. All resources that are valid for installation have been installed, and recorded if appropriate, on the CICS catalog. There were errors during the installation of some resources in the group and these resources have been backed-out.

System action

CICS continues. CICS issues messages identifying the cause of each installation failure.

User response

Use the associated messages, available via the messages panel if CEDA is being used, or issued to transient data queues CSMT and CADL during system startup, to determine the cause of the errors. Once the cause of the errors has been eliminated, reinstall the group to install the missing definitions.

DFHAM4911 W applid Transaction tranid installed but at least one of ALIAS, TASKREQ or XTRANID failed to be replaced because it exists as a primary transaction.

Explanation
Transaction tranid was successfully installed but at least one of the specified aliases (ALIAS, TASKREQ or XTRANID) failed to be installed because it already exists as a primary transaction, and this includes the current transaction.

System action
The resource is installed but the alias is not.
User response
Find out which of the aliases is conflicting with a primary transaction id and change its name.
Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. tranid

Destination
Console and Terminal End User
DFHAM4912 E applid Install of resource resourcename failed because attribute is invalid for this release.

Explanation
An attempt to install the resource resource named resourcename on this CICS system failed because the attribute specified is not valid as it is an obsolete attribute.

System action
The definition is not installed.

User response
Remove the invalid parameter of the resource definition.
Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. resource
3. resourcename
4. attribute

Destination
Console and Terminal End User
DFHAM4913 E applid Install of {IPCONN} resourcename failed because a CONNECTION resource with this name and a different APPLID is already installed.

Explanation
An attempt to install the resource specified, resourcename, on the CICS system has failed because there is already an existing CONNECTION resource of this name installed that has a different APPLID.

System action
Processing continues. The definition is not installed.

User response
An IPCONN and a CONNECTION with the same name must represent the same system, so the IPCONN APPLID and the CONNECTION NETNAME must be the same. Establish which is incorrect and re-install.
Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. Value chosen from the following options:
   9=IPCONN
3. resourcename

Destination
Console and Terminal End User
DFHAM4914 E applid Install of resourcetype resourcename failed. The specified targetresource is unusable.

Explanation
Resource resourcename cannot be installed because the target resource targetresource with which it is associated is not usable.

System action
The resource is not installed.

User response
Discover why the target resource is not usable. It may not exist, or may not have been defined before it is being used. Create or define the referenced target resource.
Module:
DFHAMP
XMEOUT parameters/Message inserts
1. applid
2. resourcetype
3. resourcename
4. targetresource

Destination
Console and Terminal End User

DFHAM4915 E applid Install of resourcetype resourcename failed. Open for data set dsname has abended.

Explanation
Resource resourcename cannot be installed because an abend occurred when opening the data set dsname that contains it.

System action
The resource is not installed.

User response
Look for an earlier IEC143I, IEC144I, IEC145I, IEC148I, IEC150I, or IEC153I message that explains why the dataset could not be opened. Correct whatever problem is described in the related message.

Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. tcpipservice

Destination
Console and Terminal End User

DFHAM4916 E applid TCPIPSERVICE tcpipservice has not been opened because the MAXSOCKETS limit has been reached.

Explanation
TCPIPSERVICE tcpipservice has not been opened because the number of active sockets in the system is equal to the current MAXSOCKETS value.

System action
The resource is installed but left in the closed state.

User response
Determine whether your MAXSOCKETS setting is adequate to handle normal system loads. If it is, then this may be a transient condition caused by a peak in work that uses sockets, and you may be able to use CEMT to open the TCPIPSERVICE once the workload diminishes. If not, use CEMT SET SYSTEM to increase the number of sockets in the system.

Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. Value chosen from the following options:
   1= CORBASERVER ,

Console and Terminal End User

DFHAM4918 E applid The installation of { CORBASERVER | TCPIPSERVICE | IPCONN | URIMAP } resourcename has failed because its requested CIPHER list was rejected.

Explanation

Resource resourcename cannot be installed because all of the cipher codes specified for the resource have been rejected by the running system.

System action

The resource is not installed.

User response

Determine what your CIPHERS setting should be for the current MVS system.

Module:

DFHAMP

XMEOUT parameters/Message inserts

1. applid
2. Value chosen from the following options:
   1= CORBASERVER ,
   7= TCPIPSERVICE ,
   9= IPCONN ,
   10= URIMAP
3. resourcename
4. filename

Destination

Console and Terminal End User

DFHAM4920 E applid The installation of { CORBASERVER | DJAR | PIPELINE | WEBSERVICE | LIBRARY | BUNDLE | JVMSERVER } resourcename has failed because it is a duplicate of one that already exists.

Explanation

The installation of the specified resource resourcename has failed because a resource with this name already exists in your running CICS system.

System action

The resource is not installed.

User response

For some resources, it is not possible to do an update (add/replace). Select a different resource name which is not known to the system. Or, if you want to use the same resource name, you must discard the resource first. The resource may need to be disabled before it can be discarded or updated.
Module: DFHAMP

XMEOUT parameters/Message inserts

1. applid
2. Value chosen from the following options:
   1= CORBASERVER,
   2= DJAR,
   3= PIPELINE,
   4= WEBSERVICE,
   5= LIBRARY,
   6= BUNDLE,
   7= JVMSERVER
3. resourcename

Destination
Console and Terminal End User

DFHAM4928 E  applid Install of {TCPIPSERVICE / CORBASERVER / IPCCONN / URIMAP} resourcename failed because the specified certificate attname {is expired / is not yet current / does not have a private key / is not trusted / is not found}.

Explanation
Resource resourcename cannot be installed because the specified certificate is unusable. An explanatory phrase in the message describes why:

is expired
The date and time at which the certificate is no longer valid has already passed.

is not yet current
The date and time at which the certificate is to become active has not yet been reached.

does not have a private key
The specified certificate does not have a private key. SSL with client authentication is only possible if you possess the private key associated with the certificate.

This error may occur if the user does not have access to the private key due to a lack of authority to access IRR.DIGTCERT.GENCERT.

is not trusted
The certificate has been given the NOTRUST attribute by the security administrator. This indicates that the certificate is not to be used.

is not found
The certificate is not found.

System action
The resource is not installed.

User response
Replace the certificate in the keyring with one that is usable, or specify a different certificate.

For a message insert of 'does not have a private key' check the system log for RACF messages that indicate a lack of authority to access IRR.DIGTCERT.GENCERT.

Module: DFHAMP

   5=is not found

Destination
Console and Terminal End User

DFHAM4929 E  applid {URIMAP}(resourcename) was not installed because of conflicting attributes.
**Explanation**

Resource `resourcename` cannot be installed because the specified attributes are inconsistent. This could indicate an internal problem within CICS, because attribute inconsistencies should be resolved in the RDO DEFINE command.

**System action**
The resource is not installed.

**User response**
Remove the conflicting attributes.

**Module:** DFHAMP

**XMEOUT parameters/Message inserts**
1. `applid`
2. Value chosen from the following options:
   10=URIMAP
3. `resourcename`

**Destination**
Console and Terminal End User

DFHAM4930 E `applid` URIMAP(`urimap1`) not installed because it maps the same URI as `urimap2`.

**Explanation**
URIMAP `urimap1` cannot be installed because it will map the same HOST and PATH (and optional TCPIPSERVICE) as `urimap2`, which is already installed. Each URIMAP must map a unique combination of these parameters.

**System action**
The resource is not installed.

**User response**
Specify a different HOST, PATH, or TCPIPSERVICE attribute.

**Module:** DFHAMP

**XMEOUT parameters/Message inserts**
1. `applid`
2. `resourcename`
3. Value chosen from the following options:
   2=WSBIND file,
   3=PIPELINE

**Destination**
Console and Terminal End User

DFHAM4931 E `applid` The installation of WEBSERVICE `resourcename` failed because the associated `{WSBIND file | PIPELINE}` does not exist.

**Explanation**
WEBSERVICE `webservice` cannot be installed because the associated PIPELINE cannot be found.

**System action**
The resource is not installed.

**User response**
Ensure that the PIPELINE definition is correct and the PIPELINE is installed.

**Module:** DFHAMP

**XMEOUT parameters/Message inserts**
1. `applid`
2. `resourcename`
3. Value chosen from the following options:
   2=WSBIND file,
   3=PIPELINE

**Destination**
Console and Terminal End User

DFHAM4932 E `applid` The installation of `{PIPELINE | WEBSERVICE}` `resourcename` failed because the `{zFS file | PIPELINE}` setup was not correct.

**Explanation**
WEBSERVICE `webservice` or PIPELINE `pipeline` cannot be installed because of setup errors. Either the zFS file does not have the correct authorization or the PIPELINE mode is not correct.

**System action**
The resource is not installed.
Ensure that the zFS file definitions of the pipeline and webservice are correct.

**Module:**  
DFHAMP

**XMEOUT parameters/Message inserts**

1. `applid`
2. Value chosen from the following options:
   - `3=PIPELINE`,
   - `4=WEBSERVICE`
3. `resourcename`
4. Value chosen from the following options:
   - `2=zFS file`,
   - `3=PIPELINE`

**Destination**  
Console and Terminal End User

**DFHAM4933 E**  
`applid` The installation of `PIPELINE resourcename` failed because the WSDIR file specified is not accessible.

**Explanation**  
PIPELINE `pipeline` cannot be installed because the WSDIR specified is not correct and therefore the directory cannot be accessed.

**System action**  
The resource is not installed.

**User response**  
Ensure that the zFS file definitions of the WSDIR are correct, remembering that case is significant.

**Module:**  
DFHAMP

**XMEOUT parameters/Message inserts**

1. `applid`
2. `resourcename`
3. `hcodepage`
4. `charset`

**Destination**  
Console and Terminal End User

**DFHAM4934 E**  
`applid` The installation of `URIMAP resourcename` failed because `HOSTCODEPAGE hcodepage` is not valid in combination with `CHARACTERSET charset`.

**Explanation**  
The URIMAP resource `resourcename` cannot be installed because the specified attributes are inconsistent. Most inconsistencies are eliminated at resource definition time. However, for a URIMAP resource, the consistency between the value specified for the HOSTCODEPAGE attribute and that specified for the CHARACTERSET attribute cannot be determined until install time.

**System action**  
The resource is not installed.

**User response**  
Check that the combination of CHARACTERSET and HOSTCODEPAGE values specified for the URIMAP is supported by the CICS system on which you are attempting to install the resource `resourcename`.

**Module:**  
DFHAMP

**XMEOUT parameters/Message inserts**

1. `applid`
2. `resourcename`
3. `hcodepage`
4. `charset`

**Destination**  
Console and Terminal End User

**DFHAM4935 E**  
`applid` Install of `{TCPIPSERVICE | CORBASERVER | IPCCONN | URIMAP} resourcename` failed because the KEYRING has no default certificate.

**Explanation**  
The specified resource `resourcename` is not installed because no certificate label was specified in the CERTIFICATE attribute, and no default certificate exists in the keyring for this CICS system.

**System action**  
The resource is not installed.
Either specify a valid certificate label in the CERTIFICATE attribute for resourcename, or designate one of the certificates in the keyring as a default.

If you are using the z/OS Security Server (RACF) you designate a certificate as default using the RACDCERT command.

Note:
Whenever you change a keyring, either by adding or removing certificates, or by changing a certificate's status to or from default, the changes are not reflected in CICS until you restart the CICS address space.

Module:

Console and Terminal End User

DFHAM4939 E applid The installation of ATOMSERVICE resourcename failed due to a configuration error.

Explaination
ATOMSERVICE resourcename cannot be installed because it could not be configured successfully.

System action
The resource is not installed.

User response
Ensure that the CONFIGFILE defined for ATOMSERVICE resourcename is correct.

Module:
DFHAMP

DFHAM4940 E applid Install of MQCONN mqconn-name failed because an MQCONN is already installed and is in use.

Explanation
An attempt to install the MQCONN mqconn-name on the CICS system has failed because there is an existing MQCONN installed and it is in use by the CICS-MQ adapter.

System action
Processing continues. The definition is not installed.

User response
Only one MQCONN can be installed on the CICS system at a time. The install of a second MQCONN implies the discarding of the first MQCONN and its associated MQINI.

An MQCONN definition can be replaced or discarded only when it is not in use by the CICS-MQ adapter. Ensure that the CICS-MQ interface has been stopped before trying to install an MQCONN definition.

XMEOUT parameters/Message inserts
1. applid
2. mqconn-name

Destination
Console and Terminal End User

DFHAM4941 E applid The installation of {ATOMSERVICE} resourcename failed because the {CONFIGFILE | BINDFILE} does not exist.

Explanation
The specified resourcename cannot be installed because the UNIX System Services file specified as the CONFIGFILE or BINDFILE does not exist.

System action
The resource is not installed.

User response
Ensure that the appropriate file is defined.

Module:
DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. Value chosen from the following options:
   11=ATOMSERVICE
3. resourcename
4. Value chosen from the following options:
   1=CONFIGFILE,
   2=BINDFILE

Destination
Console and Terminal End User
The installation of \{ATOMSERVICE\} resourcename failed because CICS does not have authority to access the \{CONFIGFILE \| BINDFILE\}.

**Explanation**

The specified resourcename cannot be installed because the CICS region user ID does not have permission to access the UNIX System Services file specified as the CONFIGFILE or BINDFILE.

**System action**

The resource is not installed.

**User response**

Either specify the name of a different file to which the CICS region user ID has access, or use the file authorization facilities of UNIX System Services (such as the chmod command) to grant permission to the CICS region user ID to access the specified file.

**Module:**

DFHAMP

**DFHAPnnnn messages**

**DFHAP0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.**

**Explanation**
An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code.
Alternatively:

- Unexpected data has been input,
- Storage has been overwritten, or
- There has been a program check within a user program.

The code \textit{aaa} is, if applicable, a 3-digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code \textit{bbbb}, which follows \textit{aaa}, is a user abend code produced either by CICS or by another product on the user’s system.

If \textit{X'offset'} contains the value X'FFFF', then module \textit{modname} was in control at the time of the abend, but the program status word (PSW) was not addressing this module.

\textbf{System action}

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

\textbf{Either} this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

\textbf{Or} CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

\textbf{User response}

Notify the system programmer.

Look up the MVS code \textit{aaa}, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If the \textit{modname} insert contains the value ?????, then CICS was unable to determine which module has abnormally terminated. In this case, examine the system dump to determine which area of code has caused the program check.

The user should examine other messages to determine what the module which issued this message was doing at the time the abend occurred. From these messages they can deduce which product has produced the abend code \textit{bbbb}. If \textit{bbbb} is identified as a CICS code, it may be either alphabetic or numeric.

- If the CICS code is alphabetic (for example AKEA) then it is a CICS transaction abend code.
- If the CICS code is numeric (for example 1310), it refers to a CICS message (DFHTS1310 in our example).

If the user abend code is from another product (for example, IMS), refer to the appropriate messages and codes manual to determine the cause of the abend.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response.

\textbf{Note:}

The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the Configuring.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

\textbf{Module:}

DFHABAB, DFHAPDM, DFHAPDN, DFHAPEX, DFHAPIQ, DFHAPJC, DFHAPNT, DFHAPSM, DFHAPST, DFHAPSI, DFHAPXM, DFHAPXME, DFHDKMR, DFHEDFE, DFHEISR, DFHICXM, DFHMRXM, DFHSAIQ, DFHSIPLT, DFHSRSP, DFHSTDT, DFHSTFC, DFHSTLK, DFHSTLS, DFHSTSZ, DFHSTTD, DFHSTTM, DFHSTTR, DFHSTTS, DFHSUEX, DFHTDVM, DFHTMP, DFHTSUT, DFH62XM

\textbf{XMEOUT parameters/Message inserts}

1. \textit{applid}
2. \textit{aaa/bbbb}
3. \textit{X'offset'}
4. \textit{modname}

\textbf{Destination}

\textbf{Console}

DFHAP0002 \textit{applid} A severe error (code X'\textit{code}') has occurred in module \textit{modname}.

\textbf{Explanation}

An error has been detected in module \textit{modname}. The code X'\textit{code}’ is the exception trace point id which uniquely identifies what the error is and where the error was detected.
System action
An exception entry is made in the trace table (X'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

If this message is issued from DFHAPEX or DFHSUDEX, and the exit point is XDUREQ, then a system dump is not taken in order to prevent recursive dumping.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Notify the system administrator. This failure indicates a serious error in CICS. If you have not requested termination in the dump table, you may want to terminate CICS. For further information about CICS exception trace entries, see the Troubleshooting and support.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

XMEOUT parameters/Message inserts
1. applid
2. X'code'
3. modname

Destination
Console

DFHAP0003  applid Insufficient storage (code X'code') in module modname.

Explanation
A CICS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point id which uniquely identifies the place where the error was detected.

System action
An exception entry is made in the trace table (code X'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Inform the system programmer.

Try increasing the size of the DSA or EDSA. See the Configuring or the Developing system programs for CICS for further information on controlling CICS storage.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHAPDM, DFHAPSIP

XMEOUT parameters/Message inserts
1. applid
2. X'code'
3. modname

Destination
Console

DFHAP0004  applid A possible loop has been detected at offset X'offset' in module modname.

Explanation
A CICS function is taking more time to process than CICS expects. A possible loop has been detected in
module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

If this message is issued from DFHAPEX or DFHSUEX, and the exit point is XDUREQ, then a system dump is not taken in order to prevent recursive dumping.

**Either** this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

**Or** CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down. Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module modname will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

2. X'offset'
3. modname

**Destination**

Console

**DFHAP0005** applid A hardware error has occurred (module modname, code X'code'). MVS Store Clock found inoperative.

**Explanation**

A hardware error has occurred during the running of module module. The MVS store clock facility is the timing mechanism for the operating system.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

**System action**

An exception entry (code code in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Investigate the MVS store clock to determine whether it is working properly. If this is the case, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response.

Note:
The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the Configuring.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Console

**DFHAP0100** applid Suffixed module modname cannot be loaded. Enter new suffix, YES(unsuffixed), NONE(dummy), or CANCEL

Explanation

During AP domain initialization, a suffixed CICS module or table could not be loaded. This message is issued for all suffixable modules which cannot be located after CANCEL has been specified in response to a preceding DFHAP0100 message.

System action

The AP domain initialization continues until the end of the nucleus load process. CICS is then abnormally terminated with a dump.

User response

Determine whether the suffix is correct. If it is not, enter one of the replies listed in the System Action. If you enter 'CANCEL', correct the error by adding the module to the appropriate library and then restart CICS.

Console

**DFHAP0360** date time applid An attempt to establish security for userid userid has failed. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').

Explanation

An attempt was made to establish security for userid userid but it was rejected by the external security manager (ESM). Check that the userid has been defined correctly.

System action

Security has not been established for the userid. The attempt to start the transaction has failed.

User response

The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the z/OS MVS Programming: Authorized Assembler Services Guide, Chapter 2. CICS messages 225
Guide, and in z/OS Security Server RACROUTE Macro Reference (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

<tbody>
<tr>
<td>DFHAP0601</td>
<td><strong>APPLID Force purge of transaction id tranid transaction number trannum has been deferred because the transaction is executing post commit syncpoint processing.</strong></td>
</tr>
</tbody>
</table>

**Explanation**

CICS has received a request to force purge a transaction. The target of the force purge request is part way through processing the second phase of a two phase syncpoint. If the purge was accepted at this time, the target transaction would be abended and this would cause CICS to fail with a U0408 abend. There is no way of purging the target transaction while it is in this state. Transactions should only remain in this state for a short period of time. A subsequent attempt to force purge the transaction may preempt the deferred abend issued by the system when this condition was detected. This would result in the transaction being purged from the system faster than if the deferred purge is left to take effect.

**System action**

CICS defers the purge until the target transaction is no longer protected against purge.

**User response**

Retry the purge after a short interval if the target transaction has not ended.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Console

---

DFHAP0603 APPLID Force purge of transaction id tranid transaction number trannum has been deferred because the transaction is executing transaction backout.

Explanation

CICS has received a request to force purge a transaction. The target of the force purge request is waiting in DBCTL (or an IMS DC system which CICS thinks is a DBCTL) for the DLI request to complete. If the force purge was accepted at this time, the IMS system would fail with a U113 abend. The target transaction cannot be purged while it is in this state. Transactions should only remain in this state for a short time, unless the transaction is requesting some data or resource held by some other task in DBCTL. The recovery token may be used to identify which DBCTL thread corresponds to your task. (Issue /DIS CCTL ALL against the relevant DBCTL). One of the other active threads probably holds the resource you are waiting for. A subsequent attempt to force purge the transaction may preempt the deferred abend issued by the system when this condition was detected. This would result in the transaction being purged from the system faster than if the deferred purge is left to take effect.

System action

CICS defers the forcepurge until the target transaction is no longer protected against purge.

User response

Retry the forcepurge after a short interval if the target transaction has not ended. If the purge is still deferred, you will not be able to purge this transaction until the resource it is waiting for is released.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:

DFHAPXME

Destination

Console

---

DFHAP0604 applid Forcepurge of transaction ID tranid, transaction number trannum, recovery token X’rtoken’ has been deferred because the transaction is waiting for a DLI request in DBCTL to complete.
transaction is on a CICS-DB2 ready queue waiting for a thread or TCB to become available.

Explanation

CICS has received a request to forcepurge a transaction. The target of the forcepurge request is queued on a CICS-DB2 ready queue awaiting a DB2 thread or TCB to become available. The target transaction cannot be purged while it is in this state.

If the CEMT INQUIRE TASK panel shows the task with an htype value of 'CDB2TCB', this means the task is awaiting a CICS-DB2 subtask TCB to become available, meaning that the DB2CONN defined TCBLIMIT has been reached.

If the CEMT INQUIRE TASK panel shows the task with an htype value of 'CDB2CONN', this means the task is awaiting a CICS-DB2 connection to become available with which to associate with the CICS open tcb to be used for the request. This indicates that the DB2CONN defined TCBLIMIT has been reached which limits the number of open TCBs that can be used for DB2.

If the htype value is 'CDB2RDYQ', this means the task is awaiting a CICS-DB2 thread to become available, and Hvalue identifies the pool, or the particular DB2ENTRY against which it is queued.

Transactions should remain in these states only for a short time.

System action

CICS defers the forcepurge until the target transaction is no longer protected against purge.

User response

If the task is queued awaiting a CICS-DB2 subtask TCB, you can increase the value of TCBLIMIT in the DB2CONN. If the transaction is awaiting a CICS-DB2 thread, you can increase the THREADLIMIT value in the DB2ENTRY, or in the DB2CONN for the pool.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

DFHAP0701 applid An abend (code abcode) has occurred in exit program progname at exit point xxxxxxxxx.

Explanation

An abnormal end (abend) or program check has occurred in the program progname. This implies that there is an error in the error program, that unexpected data has been input, or storage has been overwritten.

The code is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to
a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action**

CICS makes an exception entry in the trace table and returns a zero return code to the exit point. CICS also produces a system dump unless:

- You have specifically suppressed dumps in the dump table, or
- The exit point is XDUREQ. No dump is taken in order to avoid recursive dumping.

**Either** CICS continues unless you have specified in the dump table that CICS should terminate.

**Or** This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. If this is the case, a zero return code is returned to the CICS management module.

**User response**

There might be a logic error in the user exit program `progname`. DISABLE the exit program from all exit points, by using the EXITALL operand in the EXEC CICS DISABLE, and correct the error.

For programming information about coding user exit programs see the Developing system programs for CICS.

Destination
Console

DFHAP0705 W date time applid The enable of task related user exit program proname has caused CICS to force TASKDATALOC(BELOW) for all transactions.

Explanation
Task-related user exit program proname has been enabled with options TASKSTART and LINKEDITMODE, and proname has been linkeded AMODE 24. This ensures that it is always invoked in amode 24. An amode 24 task-related user exit program can only be invoked if the calling transaction is defined with TASKDATALOC(BELOW).

By enabling the AMODE 24 task-related user exit for task start, the user has forced CICS to force all subsequent transactions to run with TASKDATALOC(BELOW).

System action
CICS continues, but for the remainder of the CICS run, CICS insists that all transactions run with TASKDATALOC(BELOW).

User response
To avoid all transactions having to run with TASKDATALOC(BELOW), modify the task-related user exit so that it is capable of running AMODE(31) when invoked for task start.

Ideally the task-related user exit should be modified so that it always runs AMODE 31 for whoever is the caller. In this case the exit program can be linkeded with the AMODE 31 attribute, and enabled with the LINKEDITMODE option. This ensures CICS always invokes it in AMODE 31.

Alternatively the task-related user exit could be modified so it is capable of being invoked in either amode. In this case the exit should be enabled without the LINKEDITMODE option. This means the exit will be invoked in the amode of its caller. For CICS calls such as task start, this will always be AMODE 31, but it does allow the exit to be invoked AMODE 24 for calls from an amode 24 application if this is desired.

Module: DFHSUEX, DFHUEH
See the Defining resources, for more information on the TASKDATALOC option.

See the Developing system programs for CICS for programming information on the LINKEDITMODE option when enabling task-related user exits.

A non-zero return code from CEEPIPI indicates that the function failed.

**System action**

Language Environment may have written diagnostic information to the CESE destination. CICS abends the transaction with an abend code of ALX1, ALX2, ALX3, ALX4 or ALX5 depending upon the reason for the call to CEEPIPI.

**User response**

Look at SYSOUT or the CESE destination for Language Environment messages. Look in z/OS Language Environment Programming Guide for the CEEPIPI function and the explanation of the return code which is in Register 15.

CSMT

**DFHAP1226**

| Date time applid | Program program is defined as EXECKEY(USER) but transaction transaction as TASKDATAKEY(CICS): these attributes are incompatible. |

**Explanation**

An attempt has been made to run a program defined as EXECKEY(USER) as part of a transaction defined as TASKDATAKEY(CICS). These attributes are incompatible. This incompatibility could occur as a result of the program definition being autoinstalled. See the Developing system programs for CICS and the Defining resources for more information about program autoinstall.

**System action**

The transaction will be abnormally terminated with abend code AEZD.

**User response**

Redefine and install a new definition either for the transaction with TASKDATAKEY(USER), or for the program with EXECKEY(CICS).

If this message occurs when running a CICS transaction, a possible cause is that you are not using the CICS-supplied definition for the program. If you are using your own copies of CICS-supplied program definitions, they must be defined as EXECKEY(CICS).

**DFHAP1300**

| DATE TIME APPLID | The JVM at address X'jvm_anchor' on thread X'thread_anchor' has encountered an error (reason code: X'reason_code') and has requested further diagnostic data from CICS. More information may be found in the STDERR file: stderr. |

**Explanation**

An error condition was detected by one of the JVMs in the JVMPool. The JVM invoked CICS services to capture a system dump. The JVM may recover, and continue processing, or may terminate. The JVM may write further data to the current stderr file indicated in the message.

**System action**

A system dump is taken. For critical errors in the JVM, the JVM is terminated. If a CICS program was in control at the time of the failure, the program is abended. If the failure occurred during task termination, the current transaction is rolled back.
Processing continues by recreating the JVM or using other JVMs in the JVMPool.

**User response**

Read the STDERR log for the JVM. The JVM will have written any of its own diagnostics messages to this location. Examine the system dump using the JVM formatting utility. Use the address (jvm_anchor) shown in the message to identify the JVM. Optionally, use the address (thread_anchor) shown in the message to identify the thread in the JVM. The failure may be due to a JVM internal error, or to a component loaded by the JVM as a Native method or plug-in. The reason code given (reason_code) may be a signal handle or other code defined by the JVM. Use the information generated by the JVM in the stderr file to assist in the diagnosis of the problem.

Chapter 2. CICS messages 241
DFHAS0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation
An abnormal end (abend) or program check occurred in module modname. This abend or program check implies that there might be an error in the CICS code. Alternatively, unexpected data was input, or storage was overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, the first three characters in the code are filled with three hyphens. The CICS code is an abend code or a number that refers to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action
An exception entry (code code in the message) is made in the trace table. A system dump is taken, unless you suppressed dumps in the dump table.

CICS continues unless you specify in the dump table that CICS must terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Notify the systems programmer. If CICS is still running, you must decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This code shows, for example, whether the error was a program check, an abend, or a runaway, and might give some guidance to the correct user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue, and terminate CICS at a convenient time to resolve the problem.

If you cannot continue without the full use of module modname you must terminate CICS in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHASAS, DFHASDM, DFHASNT, DFHASRM

1. applid
2. aaa/bbbb
3. X'offset'
4. modname

Destination
Console

DFHAS0002 applid A severe error (code X'code') occurred in module modname.

Explanation
An error occurred in module modname. The code X'code' is the exception trace point ID that uniquely identifies what the error is and where the error was detected. For more information about CICS exception trace entries, see Troubleshooting and support.

System action
An exception entry (code code in the message) is made in the trace table. A system dump is taken, unless you suppressed dumps in the dump table.

CICS continues unless you specified in the dump table that CICS must terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Inform the systems programmer. This exception entry indicates a possible error in CICS code. The severity of its impact depends on the importance of the function that was running at the time of the error.

CICS might not terminate.

If the message occurs once and module modname is not crucial to the running of your CICS system, you might decide to continue to run and terminate CICS at a convenient time to resolve the problem.
If the message recurs or if you cannot run without the full use of module modname, you must terminate CICS in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHASAS, DFHASDM

**XMEOUT parameters/Message inserts**
1. applid
2. X'code'
3. modname

**Destination**
Console

DFHAS0004  **applid** A possible loop has been detected at offset X'offset' in module modname.

**Explanation**
A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction that was executing at the time the error was detected.

**System action**
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module modname will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Explanation
A Scanner MVS GETMAIN or MVS FREEMAIN macro has failed to execute successfully.

System action
The Scanner is terminated.

User response
Check the appropriate MVS manual for the meaning of return_code, which is the value of GPR 15 after the macro call. Correct the problem and rerun the job.

Module: CAULMS
Destination
Console

DFHAU5041 CAUCAFDT CALL FAILED. REASON reason_code.

Explanation
The Transaction Affinities Utility date formatter program (CAUCAFDT) was unable to format the packed Julian date passed to it by its caller.

System action
Question marks are used for the date instead.

DFHBAnnnn messages

DFHBA0001 applid An abend (code code) has occurred at offset X'offset' in module module.

Explanation
An unexpected program check or abend occurred with abend code aaa/bbbb.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset X'offset' in module modname. This may have been caused by corruption of CICS code or control blocks.

System action
A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Investigate the cause of the program check or abend using the system dump and any previously output diagnostic information provided by CICS, the access methods, or the operating system.

If you cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

<td><strong>DFHBR0201</strong></td>
<td><strong>DATE</strong></td>
<td><strong>TIME</strong></td>
<td><strong>APPLID</strong></td>
<td><strong>TRANID</strong></td>
<td>abcode</td>
<td><strong>bridge exit</strong></td>
</tr>
</tbody>
</table>

**Explanation**

The Bridge exit brexit terminated abnormally with abend code abcode.

abcode is either a CICS transaction abend code or a user abend code generated by a CICS ABEND ABCODE(abcode) command. This command is issued either by a user program or by an IBM program (for example, a programming language library module).

Unless the abend occurred whilst the bridge exit was processing the termination or abend call, this abend will also result in CICS issuing a ABRQ abend. In this case a DFHAC2236 abend message will follow this message. See that message for details about recoverable resources.

**System action**

Abend ABRQ will be issued unless the transaction is calling the bridge exit for termination or abend processing.

**User response**

Use the abend code abcode to diagnose the problem. If the abend is issued by an IBM program product other than CICS, the code is documented in the library of that other product.

Alternatively, there might be a logic error in the bridge exit program brexit. For programming information about coding bridge exit programs see the Developing system programs for CICS.

**Module:**

DFHBRIC, DFHBRMS, DFHBRS, DFHBRTC, DFHBRXM, DFHBRRM

**XMEOUT parameters/Message inserts**

1. DATE
2. TIME
3. APPLID

<table>
<thead>
<tr>
<th>Message</th>

<th>TIME</th>
<th>APPLID</th>
<th>USERID</th>
<th>TRANID</th>
<th>Bridge facility autoinstall URM urmname has abended with code abcode.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DFHBR0202</strong></td>
<td><strong>DATE</strong></td>
<td><strong>TIME</strong></td>
<td><strong>APPLID</strong></td>
<td><strong>USERID</strong></td>
<td><strong>TRANID</strong></td>
<td><strong>Bridge facility autoinstall URM urmname has abended with code abcode.</strong></td>
</tr>
</tbody>
</table>

**Explanation**

The Bridge facility autoinstall URM terminated abnormally with abend code abcode.

abcode is either a CICS transaction abend code or a user abend code generated by a CICS ABEND ABCODE(abcode) command.

**System action**

The autoinstall URM is disabled. This prevents the autoinstalling of new bridge facilities, as well as the other functions of the autoinstall exit.

**User response**

Use the abend code abcode to diagnose the problem. If the abend is issued by an IBM program product other than CICS, the code is documented in the library of that other product.

Alternatively, there might be a logic error in the autoinstall URM.

When the error has been found and the problem corrected enable the autoinstall URM to re-enabled the mechanism.

**Module:**

DFHBRAI

**XMEOUT parameters/Message inserts**

1. DATE
2. TIME
Bridge facility autoinstall 
URM urmname could not be linked.
The autoinstall function has been disabled.

**Explanation**
The Bridge facility autoinstall URM could not be linked.

**System action**
The autoinstall function has been disabled. This prevents the autoinstalling of new bridge facilities, as well as the other functions of the autoinstall exit.

**User response**
Unless there are other messages preceding this message indicating the cause of the problem, the probable cause is that the URM cannot be found in the DFHRPL concatenation.

When the error has been found and the problem corrected enable the autoinstall URM to re-enabled the mechanism.

**Module:**
DFHBRAI

DFHBR0403 date time applid Transaction tranid definition conflicts with Bridge Link3270 routing requirements.

Explanation
The client request to execute the transaction in the BRIH cannot be routed to the AOR region because the transaction definition routing information conflicts with the routing information for the bridge facility.

The first application transaction definition that uses a bridge facility is used to determine where all transactions that use that facility are to be executed. The transaction definition of the transaction that the client has supplied in the BRIH conflicts with that definition.

All transactions that are to be executed under a bridge facility must have the same routing characteristics as the first transaction executed under the bridge facility.

System action
The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response
Ensure that the transaction definition of all transactions that are to be used by a bridge facility do not cause routing conflicts.

Module:
DFHBRM

DFHBR0432 *date time applid* Routing of the Bridge Link3270 request for transaction *tranid* to system *sysid* failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the session allocation was rejected.

Explanation
The transaction *tranid* supplied by the client in the BRIH is defined as dynamic. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote session allocation was rejected.

System action
The BRIH returned to the client contains information to enable the client to identify the reason for the error.
User response

Investigate the reason for the purge of the session allocation queue.

The transaction definition queuelimit and maxqtime field values determine when the queue will be purged. Global user exit ZXIQUE can also be used to control the queue. Refer to the Defining resources, the Developing system programs for CICS and the CICS intercommunication manuals for further information.

DFHBR0434 date time applid Routing of the Bridge Link3270 request for transaction tranid to system sysid failed. The dynamic transaction routing program completed with return code 8. Last attempt to route request failed because the remote system did not support the function.

Explanation

The transaction tranid supplied by the client in the BRIH is defined as remote. The dynamic transaction routing program completed with return code 8. The last attempt to route the request failed because the remote system did not support the function. The remote system would not support the function for one of the following reasons.

1. The remote system is connected via a LUTYPE 6.1 connection.
2. The remote system does not support the Bridge Link3270 function.

System action

The BRIH returned to the client contains information to enable the client to identify the reason for the error.

User response

Ensure that the dynamic transaction routing program does not route Bridge Link3270 request over TYPE6.1 connections and that the requests are routed to a remote region that is at the correct level to support Bridge Link3270 requests.

DFHBR0501  date time applid File filename is not available. (The file is disabled | The file is not open | The file was not found | SMSVSAM server is not available | CFDT server is not available | The dataset is being copied | An IO error occurred | The file is defined as recoverable).

Explanation
One of the following errors was detected when attempting to access the file:
- The file is disabled.
• The file is not open.
• The file was not found.
• The SMSVSAM server is not available.
• The CFDT server is not available.
• The dataset is being copied.
• An I/O error occurred.
• The file is defined as recoverable.

**System action**
The file is not available. The BRIH returned to the client will contain an unsuccessful return code.

**User response**
Investigate the error which caused the file to be made unavailable. Correct the cause of the problem and retry the failed transaction.

**Module:** DFHBRNS

DFHBR0508  

Explaination
The maximum number of times Link3270 bridge routing regions that use the same DFHBRNSF data set can be started is approaching or has already been reached. An invalid facility token is allocated if the number of times these CICS routing regions are connected (connection_number), exceeds the maximum.

This message is issued if you have exceeded 90% of the available times routing regions using the same DFHBRNSF data set can be started.

System action
The Link3270 bridge request continues to be processed. When 100% of the available times routing regions, using the same DFHBRNSF data set, can be started is reached, the request abends AEXZ.

User response
At a convenient time, stop all regions that use the Link3270 bridge routing data set, DFHBRNSF, and redefine it. This resets connection_number to 0. Restart your routing regions.

Module:
DFHBRNS

XMEOUT parameters/Message inserts
1. date

Install failed for LSRPOOL with LSRPOOLNUM(lsrpoolnum). The MAXKEYLENGTH is less than 22 which is incorrect for use by the CSD.

Explanation
An attempt to install an LSRPOOL with LSRPOOLNUM lsrpoolnum has failed. The system detected that the installation of this LSRPOOL would cause the CSD to become not readable. The MAXKEYLENGTH parameter on this LSRPOOL definition is invalid for an LSRPOOL used by the CSD.

System action
This install fails and the previous LSRPOOL definition remains installed.

User response
The MAXKEYLENGTH parameter on the LSRPOOL definition must be at least 22 as this is the keylength required by the CSD. To resolve this problem, either change the LSRPOOL definition to have a MAXKEYLENGTH of 22 or greater, or change the DFHCSD file definition to use RLS or NSR.

Explanation
Install of the dynamic LIBRARY resource libname has completed but one of the steps required for the successful completion of the LIBRARY install process has failed. The error occurred while attempting to do one of the following:

- Allocate a data set that was defined as one of the DSNAME attributes in the LIBRARY resource definition
- Concatenate the data sets together
- Open the LIBRARY concatenation.

The message text indicates which of these errors has occurred. Due to the error, the LIBRARY has been installed, but with an enablement status of DISABLED, which means that it will not participate in the search order used when loading programs and program artifacts.

System action
Processing continues. Even if the LIBRARY was defined with enablement status of ENABLED, the resource has been installed as DISABLED. Also, this LIBRARY will not be searched when program artifacts are loaded. Therefore, program artifacts that reside in the data sets defined for LIBRARY libname will not be loaded from this LIBRARY.

User response
Examine the messages issued by the Loader domain to determine the type of failure that occurred during install processing for this LIBRARY. When the problem has been resolved, SET LIBRARY libname to ENABLED in order for the LIBRARY to participate in the dynamic library search order process.

**Explanation**

The LOCK command executed successfully, but no group or list of name `name` was found on the CSD file.

**System action**

The name is locked.

**User response**

None.

**Module:**

DFHAMP

---

Chapter 2. CICS messages 285
Explanation
CICS cannot use the CSD file for one of the following reasons:
1. The DDNAME or data set name of the CSD file is incorrectly coded in the startup JCL.
2. VSAM has diagnosed that the CSD file cannot be opened.
3. CICS file control cannot open DFHCSD because insufficient storage has been allocated by the job REGION= parameter.

System action
The command is not executed.

User response
The action to solve the problem depends on the cause as follows:
1. Correct the JCL.
2. Check the system operator's console for VSAM messages, and correct all VSAM errors.
3. Increase the size limit of the DSAs or EDSAs.

the queue is not closed.

Explanation

An attempt to install the transient data queue tdqname on the CICS system has failed because the data set associated with this extrapartition TD queue is not closed.

System action

Processing continues. The definition is not installed.

User response

Intrapartition queues must be disabled, and extrapartition queues must be disabled and closed before they can be redefined. Ensure that the queue is in the required state and then install the new definition.

DFHCA4951 E date time applid The installation of {BUNDLE} resourcename failed because the BASESCOPE attribute is invalid.

Explanation
The specified resourcename cannot be installed because the BASESCOPE attribute is invalid.

System action
The resource is not installed.

User response
Ensure the BASESCOPE attribute is well formed for defined formats and reinstall the resource.

Module:
DFHAMP

XMEOUT parameters/Message inserts
1. date
2. time

Destination
CSMT

DFHCA4952 E date time applid The installation of standalone CICS bundle resourcename failed because its ID and version are a duplicate of a standalone CICS bundle that already exists.

Explanation
The installation of the specified resource resourcename has failed because your running CICS system already contains a CICS bundle with the same ID and version that was not installed as part of an application or platform.

System action
The resource is not installed.

User response
The existing bundle must be discarded before the new bundle can be created. Refer to message DFHRL0125, which is written to the transient data queue CRLO, to determine the bundle ID and version of the duplicate bundle.

Module:

1. applid
2. tcpipservice
3. speciftcps

Destination
Console and Terminal End User

DFHCA4958 E applid Opening TCPIPSERVICE tcpipservice has failed because its specific TCPIPSERVICE speciftcps is in use by another TCPIPSERVICE.

Explanation
Opening TCPIPSERVICE tcpipservice has failed because the specific TCPIPSERVICE speciftcps it requires is currently associated with another generic TCPIPSERVICE. Only one generic TCPIPSERVICE can use a specific TCPIPSERVICE at any time.

System action
The resource is installed but left in the closed state.

User response
Modify this TCPIPSERVICE so that it includes the name of a different specific TCPIPSERVICE and reinstall it.

Module: DFHAMP

XMEOUT parameters/Message inserts
1. applid
2. tcpipservice
3. speciftcps

Destination
Console and Terminal End User

DFHCA4960 E applid Opening TCPIPSERVICE tcpipservice has failed because its specific TCPIPSERVICE speciftcps is not one in use as a specific IPIC end point.

Explanation
Opening TCPIPSERVICE tcpipservice has failed because the specific TCPIPSERVICE speciftcps is not one in use as an IPIC specific end point. Generic TCPIPSERVICExs must reference a TCPIPSERVICE that is a specific IPIC end point for the local region.

System action
The resource is installed but left in the closed state.
**User response**

Modify the SPECIFTCPS attribute in the resource definition, so that it names a TCPIPSERVICE that can be used as a specific IPIC end point, and reinstall it.

Destination
CSMT

DFHCA5100 I date time applid netname tranid command command executed successfully.

Explanation
The execution of a CSD utility command command completed successfully.

System action
Normal processing continues.

User response
None.

Module:
Explanation
The CSD utility either found a syntax error in the utility
command command, or the command command failed
to execute correctly.

System action
Utility command execution is terminated.

If commands are being read from a SYSIN data stream
by the utility, subsequent commands (except LIST) are
checked for syntax only. (If the primary CSD file cannot
be opened, LIST is not processed either.)

If commands are being read from a get-command
exit, DFHCSDUP attempts to process subsequent
commands.

User response
If the command failed because of syntax errors,
correct the command.

If the command failed to execute correctly, this may
have been caused by a previous error. In this case,
an associated error message, such as DFHCA5275,
should have been issued. Refer to these error
messages for further guidance.

Correct all errors before trying to open the CSD file
again.

Module:
DFHCAP

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. netname
5. tranid
6. command

Destination
CSMT

DFHCA5104 W date time applid netname tranid
Subsequent commands (except
LIST) are not executed because of
error(s) above.

Explanation
After the CSD utility program encounters an error, it
ceases to execute any further commands read from a
data stream (as opposed to supplied by a put-message
exit routine). However, it continues to check the syntax of subsequent commands. The exception is the LIST command, which is still executed if the primary CSD file can be opened.

**System action**
Subsequent CSD utility commands (except LIST) are ignored.

**User response**
Check for a syntax error in the commands used, and correct it.

There should be associated error messages which identify the problem that caused DFHCSDUP to halt active processing. These messages should appear in the DFHCSDUP output before message DFHCA5104 is issued.

**Module:** DFHCAP

End of DFHCSDUP utility job.  
Highest return code was: *retcode*  

**Explanation**
The CSD utility job is complete.

**System action**
Control returns to the invoker, that is, either to the operating system or to an invoking program.

**User response**
None.
The CSMT utility issues this message if you try to break either of these rules, or if an attempt to initialize a CSD file fails to complete successfully.

**Explanation**
The primary CSD file must be initialized before any CSD utility command (other than the INITIALIZE or SERVICE commands) can be processed. If a secondary CSD file is used, it must always be initialized before this command can be processed. CICS issues this message if you try to break either of these rules, or if an attempt to initialize a CSD file fails to complete successfully.

**System action**
The CSD utility ignores the command.

**User response**
Initialize the CSD file. You may first have to determine why a previous initialization attempt failed.

CSMT

---

An INITIALIZE or a SERVICE command was encountered but the primary CSD file has already been initialized.

**Explanation**
An INITIALIZE or a SERVICE command was encountered but the primary CSD file has already been initialized.

**System action**
The INITIALIZE or SERVICE command is ignored.

**Destination**
CSMT
The primary CSD has been defined with an invalid record size. Processing is terminated.

Explanation
The CSD utility cannot initialize the CSD file, because it has been defined to VSAM with an invalid record length.

System action
The CSD file remains uninitialized, and no utility commands are processed.

User response
Delete the CSD file, using VSAM Access Method Services (AMS). In the JCL defining the CSD cluster, change the AMS control statements to specify RECORDSIZE(200 2000). Use this JCL to redefine the CSD file, and use the CSD utility to reinitialize it.

Module: DFHCAP

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. netname
5. tranid

Destination
CSMT

An I/O error occurred when reading or writing control records of the VSAM data set identified in the JCL as the primary or secondary CSD file.

System action
The utility command is not executed.

User response
Retry the utility command that failed. If the problem persists, restore the CSD file from your own backup procedures.

Module: DFHCAP

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. netname
5. tranid
6. csdtype
7. ddname
**Explanation**
A VSAM error occurred when opening the data set identified in the JCL as a primary or secondary CSD file.

**System action**
The utility command is not executed.

**User response**
Refer to the VSAM diagnostics output in message DFHCA5179 for further information and guidance.

**XMEOUT parameters/Message inserts**
1. date
2. time
3. applid
4. netname
5. tranid
6. csdtype
7. ddname

**Explanation**
The VSAM data set used as the primary or secondary CSD file has been successfully closed, with control records updated if necessary. (The primary CSD file is closed after all the utility commands have been processed; the secondary CSD file is closed after the command for which it was opened.)

**System action**
Normal processing continues.

**Module:** DFHCAP

---

**Explanation**
A storage corruption is preventing the CSD control records from being updated when the CSD file is being closed.

**System action**
No further CSD utility commands are processed.

**User response**
Obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a print out of the CSD, using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST will indicate where the errors have occurred because they do not print and are therefore easily identifiable. Using the information available, determine the cause of the errors and correct them. Resubmit the CSD utility commands that failed. If you cannot resolve the problem, or if the problem persists, you will need further help from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHCA5128 S  date time applid netname tranid
Processing terminated. csdtype
CSD accessed by another user and could not be shared. ddname:
  ddname

Explanation
An attempt to open the CSD has returned an error from VSAM because the data set is not available for the type of processing requested.

This usually means that

• An attempt has been made to open the CSD in non-RLS access mode, but the CSD is already being accessed from elsewhere in RLS access mode.
• An attempt has been made to open the CSD in RLS access mode, but the CSD is already being accessed from elsewhere in non-RLS access mode.
• An attempt has been made to open the CSD in non-RLS access mode, and the CSD is already being accessed in non-RLS access mode, but the CSD cluster has been defined with SHAREOPTIONS that restrict its concurrent use.

System action
The command is not executed.

User response
You can change the access mode in which you are trying to open the CSD.

Note:
You must specify PARM=CSD(READONLY) if you wish to open a recoverable CSD in RLS access mode from the DFHCSDUP utility program.

Alternatively, wait until the CSD file is no longer being accessed in the conflicting access mode, or until it becomes available again in accordance with the SHAREOPTIONS rules defined for the cluster.

If the conflict is due to SHAREOPTIONS and LIST is the only command you want to execute, you can specify PARM=CSD(READONLY).

<td><strong>Consider implications of migrating TYPE=SHARED entries.</strong></td>
</tr>
</tbody>
</table>

**Explanation**

CICS issued this message after migrating a CICS table. *nn* definitions of type *xxxxxxxxx* have been created on the CSD file.

**System action**

Normal utility processing continues.

**User response**

None.

**Module:**

DFHCAP

**XMEOUT parameters/Message inserts**

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxxxx*
7. *nn*

**Explanation**

The CSD utility detected a migrate of a TST TYPE=SHARED entry. A DFHTST TYPE=SHARED entry is not directly migrated. Only when a TYPE=REMOTE macro that specifies a SYSIDNT that matches a SYSID in the corresponding TYPE=SHARED macro is a TSMODEL created.

**System action**

The CSD utility continues processing of the MIGRATE command.

**User response**

If SYSID is explicitly specified on the EXEC CICS request, or added by a global user exit program, and the intent of the SYSID is to direct the request to a SHARED TS pool, you must use the migrated TST in order to satisfy the request to use the pool. See the Defining resources for more information.

DFHCA5141 S  date time applid netname tranid
Unable to create new group
grpname

Explanation
The MIGRATE command failed when calling the CSD manager routing program, DFHDMP, to create a new group grpname on the CSD file for the data in the table being migrated. The CSD file may be full, corrupt, or not initialized. The group name may be invalid.

System action
Processing of the MIGRATE command is terminated.

User response
Check the group name in the TOGROUP parameter. Reinitialize the CSD file with the INITIALIZE command, providing a larger data set size if necessary.

Module:  DFHCAP

Destination
CSMT

DFHCA5142 E  date time applid netname tranid
Command not executed. Igname was not updated because of a previous update failure.

Explanation
The list or group Igname cannot be used because an operation to update it, using the DFHCSDUP offline utility, failed to execute to completion.

This has probably happened in a previous execution of DFHCSDUP.

System action
The command is not executed, and the execution of subsequent DFHCSDUP commands in the job stream is suppressed.

User response
Use the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

1. date
2. time
3. applid
4. netname
5. tranid
6. grpname

Destination
CSMT

DFHCA5145 E  date time applid netname tranid
Command not executed. Igname has been locked by applid: applid opid: opid to prevent updating.
Explanation

The list or group \textit{lgname} cannot be used because a user of the CEDA or CEDB transaction has enforced a LOCK command to prevent updating by other users.

System action

The command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, the DFHCSDUP utility attempts to process subsequent commands.

User response

Negotiate with the user with the specified OPID and APPLID, or create a new group or list by taking a copy of the definitions in the locked one.

\textit{date} \textit{time} \textit{applid} \textit{netname} \textit{tranid}
Command not executed. \textit{lgname} is currently being updated by \textit{applid}: \textit{applid} \textit{opid}: \textit{opid}

Explanation

The list or group \textit{lgname} cannot be used because:

- A user of the CEDA or CEDB transaction is currently running a command to update it
- A previous operation to update it using CEDA or CEDB failed to execute to completion.

System action

The command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except the LIST command) are checked for syntax only. (If the primary CSD file cannot be opened, the LIST command is not processed either.)

If commands are being read from a get-command exit, the DFHCSDUP utility attempts to process subsequent commands.

User response

Resubmit the utility job to retry the command that failed. Perform the subsequent commands that were suppressed.

If this fails to resolve the problem, run the DFHCSDUP VERIFY command to remove the in-flight flag detected when this message is produced.

DFHCA5159 I date time applid netname tranid
resource object defined in group
grpname

Explanation
The CSD utility has successfully added a resource definition to a group, where:
• **resource** is the type of resource (CONNECTION, FILE, JOURNALMODEL, LSRPOOL, MAPSET, PARTITIONSET, PARTNER, PROFILE, PROGRAM, SESSION, TDQUEUE, TERMINAL, TRANCLASS, TRANSACTION, or TYPETERM).

• **object** is the name of the object.

• **grpname** is the name of the group.

**System action**
Normal utility processing continues.

**User response**
None.

**Module:**
DFHCAP

**XMEOUT parameters/Message inserts**

1. *date*
2. *time*
3. *applid*

**Destination**
CSMT

**DFHCA5164 W**

<table>
<thead>
<tr>
<th>date time applid netname tranid</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>resource</em> object created. This duplicates an existing definition in group <em>grpname</em></td>
</tr>
</tbody>
</table>

**Explanation**

The CSD utility detected a CSD record with a matching key before adding the definition to the CSD file, where:

• **resource** is the type of resource.

• **object** is the name of the object.

• **grpname** is the name of the group.

**System action**

The CSD utility does not migrate the resource definition to the CSD file. (If it is a transaction, a generated profile is not created either.)

**User response**

Use the CEDA transaction to define the resource with a unique name.

**Module:**
DFHCAP

<table>
<thead>
<tr>
<th>date time applid netname tranid</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing is terminated. An error occurred while writing <em>resource</em> <em>object</em> to the CSD.</td>
</tr>
</tbody>
</table>

**Explanation**

An error occurred when the CSD utility called DFHDMP to write the definition of the object *object* to the CSD file.

The CSD file may be full or corrupted.

**System action**

If the CSD is full, the CSD utility issues message DFHCA5176, and then terminates with a return code of 12 in message DFHCA5109.

If the CSD is not full, the CSD utility terminates abnormally with message DFHCA5175, usually accompanied by one or more of the explanatory messages, DFHCA5177, DFHCA5178, and DFHCA5179.

**User response**

Use the additional messages to determine the cause of the error and the appropriate user action required.

The CSECTs in table table have been link-edited in the wrong order.

Explanation
While processing a MIGRATE command, the CSD utility has detected that the CSECTs in table table are in the wrong order. Input to the linkage editor omitted a control statement to order the CSECTs.

System action
The CSD utility does not process the MIGRATE command.

User response
Use the IBM-supplied procedure, DFHAUPLK, to assemble and link-edit CICS tables. This procedure ensures the correct ordering of CSECTs within the tables.

Module:
DFHCAP

XMEOUT parameters/Message inserts

1. date
df
2. time
3. applid
4. netname
5. tranid
6. table

Destination
CSMT

DFHCA5168 S date time applid netname tranid
Table loaded from library member table is not a valid tabletype.

Explanation
After loading the table table, the migration routine checks the VMNAME field in the DFHVM expansion of the data area following the load point. This message is produced if VMNAME is not that of a valid table.

System action
The MIGRATE command is not processed.
User response
1. Ensure that the correct table is present in the library, and that the TABLE parameter of the MIGRATE command is correct.
2. Ensure that an ORDER statement was processed in the JCL of the link-editing of the table.

Module:
DFHCAP

XMEOUT parameters/Message inserts
1. date

Destination
CSMT

DFHCA5174 S date time applid netname tranid Processing cannot be executed because 'PARM=CSD(READONLY)' was specified.

Explanation
This command requires the CSD to be opened for read-write access. Your job step specified read-only access for the CSD in the DFHCSDUP utility job stream.

System action
This command is not executed.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

User response
Amend the JCL to specify 'PARM=CSD(READWRITE)'.

Note:
If the CSD is recoverable and you are accessing it in RLS mode, you cannot specify READWRITE access. In order to perform the command, you need to access the CSD in non-RLS mode.

DFHCA5179 S date time applid netname tranid
VSAM error. Return code = nn Error code = ddd(yy) Control block type = type

Explanation
VSAM returned the following diagnostics when an error occurred, where:

- $nn$ is the hexadecimal VSAM return code
- $yy$ is the hexadecimal VSAM error code ($ddd$ is its decimal equivalent)
- CONTROL BLOCK TYPE points to the relevant error code subset as follows:
  - RPL = Request macro responses from VSAM
  - ACB = OPEN/CLOSE responses

The error code is:

- For CONTROL BLOCK TYPE = RPL, the reason code from byte 3 of the feedback word field in the RPL (RPLERRCD)
- For CONTROL BLOCK TYPE = ACB, the reason code in the ERROR field in the ACB (ACBERFLG)

System action
The CSD utility terminates command processing, and in some situations, produces an operating system dump.

User response
For the meaning of the VSAM return and error codes, refer to the z/OS DFSMS Macro Instructions for Data Sets manual.

When interpreting these diagnostics, ensure that the data set referenced in the JCL exists.

Check the following:
- The data set is being concurrently accessed by CICS running in another region.
• You are not attempting to open a recoverable CSD as READWRITE if DFHCSDUP specifies RLS access mode. You must specify PARM=CSD(READONLY) in this case.

• LOG is defined on the base cluster if RLS access mode is specified.

If DFHCSDUP specifies RLS access mode, a 'record not found' error could mean that the CSD has not been initialized.

Note:
You must use non-RLS access mode to initialize a recoverable CSD.

DFHCA5197 S    date time applid netname tranid
Command is terminated. Unrecognized control record encountered while secondary CSD was being read.
**Explanations**

The contents of a control record of the secondary input CSD are invalid.

**System action**

The SERVICE command is terminated.

If commands are being read from a SYSIN data stream, subsequent commands (except LIST) are checked for syntax only. (If the primary CSD file cannot be opened, LIST is not processed either.)

If commands are being read from a get-command exit, DFHCSDUP attempts to process subsequent commands.

**User response**

Check that the input and output data sets have been correctly defined, and that the DDNAME for the secondary CSD file in the JCL corresponds to the OLDCSD parameter in the SERVICE utility command.

If the problem persists, you will need further help from IBM. First, obtain a dump from DFHCSDUP together with a listing of the DFHCSDUP run and its JCL. Also try to obtain a printout of the CSD using either IDCAMS or the DFHCSDUP LIST ALL option. The LIST indicates where the errors have occurred because they do not print and are therefore easily identifiable. See Working with IBM to solve your problem for guidance on how to proceed.

Command not executed. 'xxxxxxx' is incompatible with the MIGRATE command for tabletype tables.

Explanation
An attempt has been made to execute the MIGRATE command with an invalid table type and (or) an invalid keyword specified.

System action
The CSD utility terminates.

User response
Correct the command syntax and resubmit the job.

Module:
DFHCAP

Command not executed. 'xxxxxxx' parameter must not begin with 'DFH'.

Explanation
In a CSD utility MIGRATE command, the xxxxxxxx parameter contained an invalid table name or group name.

System action
The utility does not process the command.

User response
Resubmit with a valid table name or group name.

Module:
DFHCAP

Command not executed. 'tabletype' table type is not supported by RDO.

Explanation
An attempt has been made to execute the MIGRATE command with an invalid table type and (or) an invalid keyword specified.

System action
The CSD utility terminates.

User response
Correct the command syntax and resubmit the job.

Module:
DFHCAP
Explanation
The CSD utility detected a TABLE parameter that referred to a CICS table type not supported by RDO.

System action
The utility does not process the command.

User response
Correct the command.

DFHCA5259 I date time applid netname tranid
Unrecognized resource type found in the CSD file and has been ignored.

Explanation
CICS has found an unrecognized resource type code in a CSD record. The unrecognized code does not match any of the function codes in the language definition table. This can occur for one of the following reasons:

1. You are using a CICS release that does not support a type of definition that was created on the CSD file by a later CICS release.
2. The language definition table (DFHEITSP or DFHEITCU) is invalid for this CICS release.
3. The CSD manager (DFHDMP) has passed an invalid CSD record buffer to DFHPUP. This is a CICS internal logic error.

System action
The resource is ignored and the operation continues.

User response
Determine which of the possible reasons caused the error. If you can eliminate reasons 1 and 2, you can assume that reason 3 applies.

Take action corresponding to the reason you have established as follows:

1. Ignore the message.
2. Ensure that the library contains versions of DFHEITSP and DFHEITCU that are valid for the CICS release you are running.
3. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

DFHCA5262 S date time applid netname tranid
Insufficient storage to build types-matching chain.

Explanation
During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of lack of storage for TYPETERM definitions.

System action
The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

In any of the above cases, definitions that have already been migrated remain on the CSD.

User response
1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Allocate a larger region size in the utility JCL, and retry the command.

Destination
CSMT

DFHCA5263 S date time applid netname tranid
Error in input RDT. Incorrect sequence of commands.

Explanation
During CSD utility processing, an internal error has occurred in the migration of a TCT. This is because of abnormal data in the assembled table.

System action
The utility attempts to:
1. Close any files previously opened internally.
2. Unload any extract exit routines that were dynamically loaded.
3. Invoke the termination exit routine (if supplied).
4. Return control to the invoker of the utility.

Definitions that have already been migrated remain on the CSD. The MVS user abend code is 0308.

User response
1. Run the DFHCSDUP VERIFY utility.
2. Delete the groups created by the failing MIGRATE command.
3. Keep the assembly listing for the failing table and keep the DFHCSDUP dump, if available.
4. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

CSMT

DFHCA5264 W  date time applid netname tranid
Resource object not defined. Group grpname not available.

**Explanation**

During the migration of a TCT, the CSD utility could not define a resource object because the target group grpname was not available. The utility has issued a previous message indicating the reason.

**System action**

The utility creates no definition for resource object. Normal utility processing continues.

**User response**

Review the original message. If necessary, recode the TYPE=GROUP macro in the TCT source to name a suitable group.

**Module:** DFHCAP

CSMT

DFHCA5266 W  date time applid netname tranid
Sessions sessions not defined, because of error in associated connection.

**Explanation**

An error has been detected during the migration of a TCT. When migrating a session, DFHCSDUP checks that the associated CONNECTION has been defined successfully. If it has not, DFHCSDUP abnormally terminates the session definition.

**System action**

The specified SESSIONS resource is not migrated to the CSD. DFHCSDUP continues with the migration of subsequent TCT entries.

**User response**

Use the diagnostic information in the output listing from the MIGRATE utility to determine why the CONNECTION definition has failed. You can then use RDO to DEFINE the CONNECTION and the SESSIONS to the CSD.

7. xxxx
8. xxxx

Destination

CSMT

DFHCA5286 E date time applid netname tranid
Unable to create resource definition on CSD file: xxxx xxxx xxxx....

Explanation

This message is issued during the processing of the indicated (truncated) command for one of the following reasons:

1. The CSD is full (in which case, messages DFHCA5175 and DFHCA5176 accompanies this one)
2. The CSD was defined as read-only (in which case, message DFHCA5174 accompanies this message)
3. The TCT being migrated contained a terminal entry with a name unacceptable to RDO (in which case, message DFHCA5165 accompanies this message)
4. A list or group cannot be used due to the failure of a previous update operation (in which case, message DFHCA5142 accompanies this message)
5. The resource definition list being used to INITIALIZE or UPGRADE the CSD file contained a definition with an invalid resource name or group name
6. A logic error occurred in DFHCSDUP or an internal error was detected in the data contained in the loaded table.

System action

The system action depends on the reason the message is issued, as follows.

1. Migration of the TCT table is terminated immediately.
2. Processing of the UPGRADE or INITIALIZE command is terminated
3. The utility attempts to:
   a. Close any files previously opened internally.
b. Unload any extract exit routines that were dynamically loaded.

c. Invoke the termination exit routine (if supplied).

d. Return control to the invoker of the utility.

4. The command is not executed, and execution of further DFHCS DUP commands in the job stream is suppressed.

5. As in (3) above.

6. As in (3) above.

In all cases, all the definitions created by this command up to the point of failure remain on the CSD.

User response

The user response depends on the reason the message is issued, as follows.

1. See message DFHCA5175 and DFHCA5176.

2. See message DFHCA5174.

3. Change the name of the terminal and all references to it. Also refer to the user response for message DFHCA5165.

4. See message DFHCA5142.

5. This is a CICS logic error. See instruction for 6 below.

6. This is a CICS logic error. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed. A CICS background trace of the failure may aid them in problem diagnosis.

DFHCAP

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. netname
5. tranid
6. xxxxxxxx

Explanation
The value xxxxxxxx is not valid. The value yyyyyyyyy has been assumed.

System action
The value xxxxxxxx is not valid. The value yyyyyyyyy has been assumed.

User response
Correct the command.

Module:
DFHCAP

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. netname
5. tranid
6. xxxxxxxx
7. xxxxxxxx

**Destination**
CSMT

**Explanation**

`xxxxxxx` must have rows and columns specified.

**System action**

The utility ignores the command.

**User response**

Correct the command.

**Module:**
DFHCAP

### XMEOUT parameters/Message inserts

1. `date`
2. `time`
3. `applid`
4. `netname`
5. `tranid`
6. `keyword`

**Explanation**

CICS supplies standard programs which are not allowed to have remote attributes.

**System action**

The command is ignored.

**User response**

Correct the command by deleting the remote attributes from the program definition.

**Module:**
DFHCAP

### XMEOUT parameters/Message inserts

1. `date`
2. `time`
3. `applid`
4. `netname`
5. `tranid`
6. `keyword`

**Explanation**

Neither of the indicated keywords has been specified. When defining a resource, you must specify one of these keywords.
System action
The utility ignores the command.

User response
Supply one of the indicated keywords and retry.

Module: DFHCAP

Keyword1 and keyword2 attributes are inconsistent if definition is being shared with a back-level release.

Explanation
Keyword1 has been preceded by keyword2. However, keyword1 has been kept for compatibility reasons. After updating or creating the resource, the value specified for keyword1 has become inconsistent with the value specified for keyword2.

System action
The resource is created or updated.

User response
If sharing the resource with a back level release, ensure that the resulting resource definition is acceptable. Otherwise, ignore the message.

Module:
DFHCAP

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. netname
5. tranid

DFHCA5537 W  date time applid netname tranid
Prefix allowed to default. Use of defaults is recommended for MRO sessions only.

Explanation
A null value has been accepted for a send or receive prefix for an LU6.1 or MRO session. The default value '>' is supplied by CICS for send sessions and '<' for receive sessions. These values are the default prefixes for MRO session names. The use of these prefixes is allowed for LU6.1 sessions, but is not recommended if MRO session names with the same prefixes are in use, because duplicate names may occur if large numbers of sessions are defined.

System action
CICS generates session names using these prefixes.

User response
If this is an LU6.1 session, it is recommended that a different prefix should be chosen.

Module:
DFHCAP

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. netname

DFHCAS540 W date time applid netname tranid

value is greater than yyyyyyy value. The lower value takes precedence.

Explanation
A value has been specified that is not consistent with another. The value xxxxxxx is greater than value yyyyyyy. Value yyyyyyy takes precedence and overrides the higher value.

System action
The definition is created or updated with the two values as specified.

User response
Ensure that the two values are defined as you expect. You may decide to leave the values as specified and dynamically change the values online once the resource has been installed in the CICS system.

Module:
DFHCAP

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. netname
5. x
6. yyyyyyy

Destination
CSMT

DFHCAS542 E date time applid netname tranid

Command not executed. xxxxxxx and yyyyyyy must be the same length.

Explanation
Two options, xxxxxxx and yyyyyyy, have been specified but the length of the respective operands must be the same.
### System action
The utility ignores the command.

### User response
Correct the command.

**Module:** DFHCAP

#### XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. netname
5. tranid
6. xxxxxxx
7. yyyyyyy

### Destination
CSMT

**DFHCA5543 E**

#### Explanation
Two options, xxxxxxx and yyyyyyy, have been specified containing generic characters. The generic characters must be placed in the same position for both keywords.

### System action
The utility ignores the command.

### User response
Correct the command.

**Module:** DFHCAP

#### XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. netname
5. tranid
6. xxxxxxx
7. yyyyyyy

### Destination
CSMT

**DFHCA5544 E**

#### Explanation
The options, xxxxxxx, must be specified as yyyyyyy because a previous value is generic.

### System action
The utility ignores the command.

### User response
Correct the command.

**Module:** DFHCAP

#### XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. netname
5. tranid
6. xxxxxxx
7. yyyyyyy

### Destination
CSMT

**DFHCA5546 E**

#### Explanation
The options specified conflict. If TYPE EJB is specified, the respective ejb-type options must be specified. The ejb-type attributes are BEANNAME and INTFACETYPE. Likewise, for TYPE CORBA, the corba-type attributes must be specified. These are MODULE and INTERFACE. For TYPE GENERIC, either attributes may be specified but they should be generic.
**System action**
The utility ignores the command.

**User response**
Correct the command.

**Module:**
DFHCAP

**XMEOUT parameters/Message inserts**
1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxx*
7. *yyyyyyy*

**Destination**
CSMT

**DFHCA5547 E**

<table>
<thead>
<tr>
<th>date</th>
<th>time</th>
<th>applid</th>
<th>netname</th>
<th>tranid</th>
<th>xxxxxxx</th>
<th>yyyyyyy</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Explanation**
A value *yyyyyyy* has been specified for keyword *xxxxxxx* which is not valid. It may for instance be non-numeric.

**System action**
The utility ignores the command.

**User response**
Correct the command.

**Module:**
DFHCAP

**XMEOUT parameters/Message inserts**
1. *date*
2. *time*
3. *applid*
4. *netname*
5. *tranid*
6. *xxxxxxx*
7. *yyyyyyy*

**Destination**
CSMT

**DFHCA5548 E**

<table>
<thead>
<tr>
<th>date</th>
<th>time</th>
<th>applid</th>
<th>netname</th>
<th>tranid</th>
<th>xxxxxxx</th>
<th>yyyyyyy</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Explanation**
The options specified conflict. If CORBASERVER name is blank and the respective previous level attributes (OMGMODULE, OMGOPERATION, and OMGINTERFACE) are specified, the use of BEANNAME, MODULE, INTERFACE and OPERATION is not allowed. It is not possible to give a back level requestmodel definition new attributes. The old requestmodel must be discarded and redefined with the new attributes if it is required to be used on this level of CICS.

**System action**
The utility ignores the command.

**User response**
Correct the command. If this requestmodel is being maintained for a back level CICS system, specify only the attributes OMGMODULE, OMGOPERATION, OMGINTERFACE and TRANSID. However, to use an old requestmodel on this level of CICS, it must be discarded and redefined with the new attributes.

**Module:**
DFHCAP

CSMT

**DFHCA5634 W**

date time applid netname tranid resourcetype resourcename not found in user groups.

**Explanation**

An abnormal end (abend) or program check has occurred in module modname and will have occurred in either the local (DFHLCD) or the global (DFHGCD) catalog domains. This implies that there may be an error in CICS code.

Alternatively,

- Unexpected data has been input, or
- Storage has been overwritten.

The code aaa/bbbb is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

During initialization, CICS may not have access to the user's applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.
**System action**

An exception entry is made in the trace table, provided that trace is available at this time. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code in this manual. This will tell you, for example, whether the error was a program check, an abend, a runaway or a recovery percolation, and may give you some guidance concerning user response.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHCC0100 applid Global Catalog initialization failure. {GENERATE ACB | OPEN ACB | GENERATE RPL | OPEN, SHOWCB.} R15 = X'yy' VSAM error code = X'zz'

**Explanation**

A VSAM error has occurred during global catalog initialization.
The VSAM codes given are explained in the z/OS DFSMS Macro Instructions for Data Sets manual.

The possible versions of this message include the text

- "GENERATE ACB".
- "GENERATE RPL".

The GENCB failed with the R15 condition given in X'yy'.

The X'zz' code is only meaningful if X'yy' is X'04' when: X'zz' is the error code returned by VSAM Register 0 in response to a GENCB macro.

- "OPEN ACB".

OPEN has failed with the R15 condition code X'yy'. This was followed by a successful SHOWCB which has placed the OPEN error code into X'zz'. Also see the message that VSAM writes to the operator console and programmer's listing.

- "OPEN, SHOWCB".

OPEN has failed with the R15 condition code X'yy'. This was followed by a SHOWCB which failed, and the R0 return code from the SHOWCB is given in X'zz'. Also see the message that VSAM writes to the operator console and programmer's listing.

During initialization, CICS may not have access to the user's applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.

**System action**

A system dump is produced, then CICS is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Look up the error codes in the Introduction to VSAM Programming, correct it then retry.

If this fails, notify the system programmer. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

DFHCCDM

**XMEOUT parameters/Message inserts**

1. applid
2. Value chosen from the following options:

   1 = GENERATE ACB,
User response

Look up the error codes in the Introduction to VSAM Programming, correct it then retry. If this fails, notify the system programmer.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHCCDM

Destination Console

DFHCC0102 applid Global Catalog data set is already in use.

Explanation

The VSAM error reported in the previous DFHCC0100 message suggests that the global catalog is already being used, possibly by another CICS region. The global catalog data set cannot be shared.

System action

CICS is terminated.

User response

Ensure that the DFHGCD DD statement for this CICS specifies a different global catalog data set from any CICS job that is already running.

If CICS still fails, notify the system programmer. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHCCDM

Destination Console

DFHCC0104 AN ABEND HAS OCCURRED DURING INITIALIZATION OF CATALOG DOMAIN IN MODULE DFHCCDM.

Explanation

DFHCCDM's recovery routine received control during pre-initialization of the local catalog (CC) domain.

System action

A system dump with dump code KERNDUMP is taken and CICS terminates.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHCCDM

Destination Console

DFHCC0105 applid The {local | global} catalog is incorrectly defined. Expected:keylen=req_keylen, lrecl=req_lrecl. Defined:keylen=def_keylen, lrecl=def_lrecl.
Explanation
The catalog data set, DFHLCD or DFHGCD, has been defined incorrectly for this release of CICS. Either the key length or the maximum record size is incorrect. The key length must be equal to the expected key length  req_keylen. The maximum record size must be greater than or equal to the expected maximum record size  req_lrecl.

System action
An exception entry is made in the trace table, provided that trace is available at this time. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

User response
Recreate and initialize the catalog as described in the relevant section of the information center for this release of CICS.

Module: DFHCCDM

XMEOUT parameters/Message inserts
1. applid
2. Value chosen from the following options:
   1=local,
   2=global
3. req_keylen
4. req_lrecl
5. def_keylen
6. def_lrecl

Destination
Console

DFHCC0106 applid Insufficient MVS storage for {CC / GC} domain anchor block. Bytes requested=bytes.

Explaination
The catalog domain initialization module, DFHCCDM, was unable to obtain sufficient MVS storage for the CC or GC domain anchor block and associated storage. Note that the CICS local catalog data set buffers are located with the CC domain anchor block. The global catalog data set buffers are with the GC domain anchor block.

System action
A system dump is taken, unless you have specifically suppressed dumps in the dump table.

User response
Increase the CICS region size or decrease the size of an EDSA to allow the anchor block to be obtained from MVS storage.

Module: DFHCCDM

XMEOUT parameters/Message inserts
1. applid
2. Value chosen from the following options:
   1=CC,
   2=GC
3. bytes

Destination
Console

DFHCC0107 applid Local catalog data set is not initialized for this release of CICS.

Explaination
The catalog domain initialization module, DFHCCDM, has detected that the local catalog data set was not initialized with the current release's version of the DFHCCUTL utility program. A valid local catalog is essential for CICS to initialize correctly.

System action
A system dump is taken, unless you have specifically suppressed dumps in the dump table.

User response
Initialize the local catalog data set using the version of DFHCCUTL for this release.
DFHCC0201 VSAM ERROR ON THE LOCAL CATALOG DATA SET, VSAM RETURN CODE IN R15 = X'yy' FDBK=X'zz'.

Explanation
A local catalog VSAM operation has produced the VSAM error given.
An exception trace, code CC 2B60 or GC 2B60 has also been made.

System action
A system dump is produced then CICS is terminated. This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

User response
If possible correct the VSAM error and restart CICS. For the meaning of the return codes, refer to the Introduction to VSAM Programming.
Inform the system programmer as this indicates a possible error in CICS code. You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHCCCC

Destination
Console

DFHCC0202 applid The {local | global} catalog has started to use new secondary space allocation.

Explanation
Secondary space may be specified when the catalog data sets DFHLCD and DFHGCD are defined. This message is issued when the catalog starts using an additional space allocation.
See the Configuring for more information on controlling CICS storage.

System action
An exception entry is made in the trace table, provided that trace is available at this time.

Module:
DFHCCCC

Destination
Console

XMEOUT parameters/Message inserts
1. applid
2. Value chosen from the following options:
   1=local,
   2=global
3. yy
4. zz
User response

There are two possibilities.

- The system is in a loop which involves calls to the catalog to write onto the catalog data set. This is the most likely cause if the system suddenly starts to produce this message repeatedly.
- Insufficient primary space was allocated for the catalog when it was defined. This is the most likely cause if this message is produced either:
  - during or shortly after CICS initialization, or
  - this message is only produced infrequently (and only a few are ever produced).

Look for any other symptoms of possible looping, and act accordingly. If looping has occurred then the system programmer should redefine the catalog during the next CICS initial start.

If CICS was not looping then notify the system programmer, who should increase the primary space allocated for this data set during the next CICS initial start.

Module:
DFHCCCC

XMEOUT parameters/Message inserts

1. applid
2. Value chosen from the following options:
   1=local,
   2=global

Destination

Console

DFHCC0203 applid The {local | global} catalog is full.

Explanation

The specified catalog data set (DFHLCD or DFHGCD) is full. There are two possible reasons for this error:

- The system is in a loop which involves calls to the catalog to write onto the catalog data set.
- Insufficient primary space was allocated for the catalog when it was defined. This is the most likely cause if this message is issued during or shortly after CICS initialization.

System action

If the error occurs during initialization, a system dump is produced then CICS is terminated. If the error occurs after initialization, the domain invoking the catalog services will decide what action is appropriate.

User response

Check for any other symptoms of looping and act accordingly.

If CICS is not looping, notify the system programmer who should increase the primary space allocated for this data set. Either copy the catalog data from the old data set to the new larger data set (DFHRMUTL can be used to do this for a COLD start, otherwise use IDCAMS) and restart CICS, or perform an initial start of CICS with an empty catalog.

If CICS is looping, this indicates an error in CICS code. You might need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:

Your password has expired. Please type your new password=>@@@@@@@@

**Explanation**
The system requests a new password. @@@@@@@@@ represents a character string provided by CICS to prevent the new password being seen.

**System action**
The system waits for a response.

**User response**
Enter a new password.

**Module:**
DFHSNP

---

**Destination**
Terminal End User

**DFHCE3527**
Use your magnetic (OPID) card or press ENTER to cancel.
**Explanation**
A magnetic card is required.

**System action**
The system waits for an opid (magnetic) card.

**User response**
Supply badge or terminate transaction.

**Module:** DFHSNP

**Destination**
Terminal End User

DFHCE3528  Signon failed during SECLABEL checking.

**Explanation**
The signon request has failed because the external security manager (ESM) detected a critical error.

**System action**
The signon transaction terminates.

**User response**
Refer to message DFHSN1108 on the CSCS log for the information and actions necessary to resolve this problem.

**Module:** DFHSNP

**Destination**
Terminal End User

DFHCE3529  The ESM is currently not accepting signons. Please try later.

**Explanation**
The signon request has failed because the external security manager (ESM) was in a tranquil state. When in a tranquil state, only signons from special users are accepted.

**System action**
The sign on transaction terminates.

**User response**
The ESM has probably been put into a tranquil state to allow for ESM database maintenance. Determine whether maintenance is currently occurring and how long it will take. When maintenance is finished the tranquil state should be removed from the ESM which will allow you to sign on to CICS. If the ESM has not been put into a tranquil state then, refer to message DFHSN1108 on the CSCS log for the information and actions necessary to resolve this problem.

**Module:** DFHSNP

DFHCE3534  Your new password is invalid. Please retype.

**Explanation**
The new password entered was invalid.

**System action**
None.

**User response**
Enter a valid password.

**Module:** DFHSNP

**Destination**
Terminal End User

DFHCE3535  Your new password is invalid. Please retype=>@@@@@@@@

**Explanation**
The new password entered was invalid.

**System action**
The system waits for a response.

**User response**
Enter a valid password.

**Module:** DFHSNP
Destination
Terminal End User

DFHCE3536  Invalid OPID. Please enter a valid card or press ENTER to cancel.

Explanation
The OPID entered is invalid.

System action
The system waits for a response.

User response
Enter a valid card or press ENTER to cancel the signon.

Module:
DFHSNP

Destination
Terminal End User

DFHCE3537  Language is invalid. Please retype.

Explanation
The language code entered is invalid.

System action
The system waits for a response.

User response
Enter a valid language code.

Module:
DFHSNP

Destination
Terminal End User

DFHCE3538  Language is invalid. Please retype=>

Explanation
The language code entered is invalid.

System action
The system waits for a response.

User response
Enter a valid language code.

Module:
DFHSNP

Destination
Terminal End User

DFHCE3539  Please reenter the new password for verification.

Explanation
You have entered a new password in the new password field and you are now being prompted to reenter the same password to assure yourself of the new password data.

System action
The system waits for a response.

User response
Reenter the new password in the password field.

Module:
DFHSNP

Destination
Terminal End User

DFHCE3540  Ensure that passwords are entered in the correct case.

Explanation
This message is issued for CESL which supports passwords and password phrases. It is also issued for CESN on systems whose External Security Manager supports mixed case passwords. It is to remind you that passwords must be entered with exactly the correct lower case and upper case letters.

System action
The password will not be folded to upper case.

User response
Enter passwords in the correct case.

Module:

Destination
Terminal End User

DFHCE3541  Security interface error (rc). Sign-on is terminated.
**Explanation**
An error has been detected in an external security manager. rc is the return code from the external security manager.

**System action**
Signon terminates.

**User response**
For a RACF signon, rc is the return code from the RACINIT macro. See the appropriate RACF manual for details of the macro return codes. The return codes are macro specific.

**Module:**
DFHSNP

**Destination**
Terminal End User

**DFHCE3542**  Sign-on is not allowed at this terminal. Your sign-on is ignored.

**Explanation**
The sign on transaction cannot be executed at the current terminal for one of the following reasons:

- The terminal is defined with a preset userid that cannot be changed by signing on
- The terminal is a surrogate of a terminal in another CICS region, but the sign on transaction is not executing within a session established by the CRTE transaction.

**System action**
The sign on transaction terminates.

**User response**
Do not use the sign on transaction at this terminal.

**Module:**
DFHSNP

**Destination**
Terminal End User

**DFHCE3543**  You have cancelled your sign-on request. Sign-on is terminated.

**Explanation**
The user has pressed ENTER when an OPID card was requested or has entered PF3 on a 3270 terminal device.

**System action**
The sign on transaction terminates.

**User response**
Retry the sign on procedure.

**Module:**
DFHSNP

**Destination**
Terminal End User

**DFHCE3544**  Terminal authorization failed. Sign-on is terminated.

**Explanation**
RACF has responded to a security request with 'Terminal not authorized' and RACF response code X'30'.

**System action**
The sign on transaction terminates.

**User response**
Inform the systems programmer, who should refer to message DFHSN1118 on the CSCS log for the relevant information and actions necessary to resolve this problem.

**Module:**
DFHSNP

**Destination**
Terminal End User

**DFHCE3545**  Application authorization failed. Sign-on is terminated.

**Explanation**
RACF has responded to a security request with 'Application not authorized' and RACF response code X'34'.

**System action**
The sign on transaction terminates.
User response
Inform the systems programmer, who should refer to message DFHSN1119 on the CSCS log for the relevant information and actions necessary to resolve this problem.

Module:
DFHSNP

Destination
Terminal End User

DFHCE3546 Your signon {userid | group access} has been revoked. Signon is terminated.

Explanation
The response from RACF indicates that either the userid that you use to signon to CICS, or your access to the RACF group that contains it, has been revoked by the system.

System action
The signon transaction terminates.

User response
Contact your RACF administrator, who can re-authorize the revoked user ID.

Module:
DFHSNP

Destination
Terminal End User

DFHCE3547 Security is not active. Sign-on cannot be performed.

Explanation
A request to sign on to the CICS system was rejected because the CICS security system was not active.

A user can only sign on to CICS when CICS security is active.

The CICS security system is activated using the system initialization parameter SEC=YES.

System action
The sign on transaction terminates.

User response
None.

Module:
DFHSNP

Destination
Terminal End User

DFHCE3548 date time applid Critical error has occurred in DFHSNP. Codes: 1,2,3,4,5.

Explanation
The sign on program, DFHSNP, is abnormally terminated due to a critical error.

The five codes indicate the cause of the error and where the error occurred.

Code 1 is an abend code. It can be one of ASNA, ASNB or ASNC.

Codes 2, 3, 4 and 5 are codes which help IBM to identify the source of the error. They are id_location, EIBFRCODE, EIBRESP and EIBRESP2.

System action
DFHSNP is abnormally terminated with a transaction dump. Message DFHAC2206 is normally issued, but if no terminal is associated with the task, DFHAC2236 may be issued instead.

User response
Refer to message DFHAC2206 or DFHAC2236. If DFHAC2236 has been issued, the absence of a terminal is probably the reason for the abend.

Use the abend code given in the message to determine the reason for the error and the course of action to take. This enables you to determine whether the abend was caused by user error or by an error in CICS code. (An error in CICS code is signalled by abend code ASNA.)

If you suspect an error in CICS code, you need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSNP

XMEOUT parameters/Message inserts
1. date
2. time
Destination
CSMT

DFHCE3549  Sign-on is complete (Language language).

Explanation
The user has successfully signed on to the CICS system.

System action
CICS is ready to receive user transactions.

User response
Use terminal as required for CICS transactions.

Module:
DFHSNP

Destination
Terminal End User

DFHCE3550  Sign-off option must be LOGOFF or GOODNIGHT. Sign-off is ignored.

Explanation
An option other than LOGOFF|GOODNIGHT was detected.

System action
The sign-off transaction terminates.

User response
Specify the correct option when invoking sign-off.

Module:
DFHSFP

Destination
Terminal End User

DFHCE3551  date time applid termid DFHSNP has detected an invalid COMMAREA. It has been ignored. The data is lost.

Explanation
While processing a CESN transaction DFHSNP was passed a commarea that was not its own. This may be the result of an application issuing the EXEC CICS RETURN TRANSID(...) COMMAREA(...) with a transid of nulls (X'00000000'). This could be because the pointer to the transid is incorrectly set up or may be part of the system design.

System action
DFHSNP continues with CESN transaction processing.

User response
Investigate whether this message is issued validly as part of the system design, in which case the message can be ignored, or is an error. Investigate the previous transaction at this terminal.

Module:
DFHSNP

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. termid

Destination
CSMT

DFHCE3554  You cannot mix passwords and password phrases in a change request.

Explanation
You cannot authorize a new password with a password phrase or a new password phrase with a password.

System action
None.

User response
Use a password to change a password, or a password phrase to change a password phrase.

Module:
DFHSNP
**Destination**
Terminal End User

**DFHCE3560**   Sign-off is not allowed at this terminal. Sign-off is ignored.

**Explanation**
The sign-off transaction cannot be executed at the current terminal for one of the following reasons:
- The terminal is defined with a preset userid that cannot be changed by signing off
- The terminal is a surrogate of a terminal in another CICS region, but the sign-off transaction is not executing within a session established by the CRTE transaction.

**System action**
The sign-off transaction terminates.

**User response**
Do not use the sign-off transaction at this terminal.

**Module:** DFHSFP

---

**Destination**
Terminal End User

**DFHCE3570**   Invalid credentials entered.

**Explanation**
An invalid userid or password or groupid was entered. Signon requires valid values.

**System action**
The system waits for a response.

**User response**
Enter valid credentials.

**Module:** DFHSNP

---

**Destination**
Terminal End User

**DFHCE3571**   Your groupid is invalid. Please retype==>

**Explanation**
Your group identifier is invalid. The system requests a group identifier.

**System action**
The system waits for a response.

**User response**
Enter a valid group identifier.

**Module:** DFHSNP

---

**Destination**
Terminal End User

**DFHCE3587**   You cannot signon at this terminal at this time.

**Explanation**
You cannot signon at this terminal at this time. The SNSCOPE initialization parameter disallows signon to more than one terminal at a time. An internal failure during SNSCOPE checking means that CICS is unable to confirm if the user is already signed on elsewhere. The failure has occurred because the limit of concurrent MVS ENQ requests has been reached.

**System action**
The signon transaction terminates. Message DFHUS0120 will have been written to the console. See the explanation of this message for further information.

**User response**
Please report this problem to your CICS systems programmer.

**Module:** DFHSNP

---

**Destination**
Terminal End User

**DFHCE3588**   You are already signed on at another terminal. Signon cannot be performed.

**Explanation**
You cannot sign on at the current terminal because you are already signed on at another terminal. The
SNSCOPE initialization parameter for the CICS system does not allow you to sign on to more than one terminal at a time.

**System action**
The sign on transaction terminates.

**User response**
Sign off from the other terminal before you attempt to sign on again.

**Module:** DFHSNP

**Destination**
Terminal End User

DFHCE3589 The external security manager is inactive. Signon cannot be performed.

**Explanation**
You cannot sign on because the external security manager is not active.

**System action**
The sign on transaction terminates.

**User response**
Wait until the external security manager has been reactivated before attempting to sign on again.

**Module:** DFHSNP

**Destination**
Terminal End User

DFHCE3590 Sign-off is complete.

**Explanation**
If the user issued a CESN to sign on to the system, then sign-off has been successful. If the user was not signed on, and CICS security was active (SEC=YES system initialization parameter) then message DFHSN1213 is written to the CSCS log to indicate that the user has logged off but has not been allowed to sign off.

**System action**
Other processing continues.

**User response**
Use the terminal as required for CICS transactions.

**Module:** DFHSFP

**Destination**
Terminal End User

DFHCE3591 Sign-off is complete. LOGOFF option is invalid when using CRTE.

**Explanation**
The terminal is now signed off. The LOGOFF option which was specified has been ignored as it is invalid when using CRTE.

**System action**
The CICS system, to which the user has connected via CRTE, has been signed off.

**User response**
Do not use the LOGOFF option when signing off via CRTE.

**Module:** DFHSFP

**Destination**
Terminal End User

DFHCE3592 Sign-off is complete. GOODNIGHT option is invalid when using CRTE.

**Explanation**
The terminal is now signed off. The GOODNIGHT option which was specified has been ignored as it is invalid when using CRTE.

**System action**
The CICS system, to which the user has connected via CRTE, has been signed off.

**User response**
Do not use the GOODNIGHT option when signing off via CRTE.

**Module:** DFHSFP

Chapter 2. CICS messages 415
**Destination**

Terminal End User

**DFHCE3598**

`date` `time` `applid` Critical error has occurred in DFHSFP. Codes: 1,2,3,4,5.

**Explanation**

The signoff program, DFHSFP, will abnormally terminate due to a critical error.

The five codes indicate the cause of the error and where the error occurred.

Code 1 is an abend code. It can be ASFA, ASFB or ASFC.

Codes 2, 3, 4 and 5 are codes which help IBM to identify the source of the error. They are id_location (in hexadecimal), EIBFRCODE, EIBRESP and EIBRESP2.

**System action**

DFHSFP is abnormally terminated with a transaction dump. Message DFHAC2206 is normally issued, but if no terminal is associated with the task, DFHAC2236 may be issued instead.

**User response**

Refer to message DFHAC2206 or DFHAC2236. If DFHAC2236 has been issued, the absence of a terminal is probably the reason for the abend.

**DFHCFnnnn messages**

**DFHCFO1011** CF data table server initialization is in progress.

**Explanation**

The coupling facility data table server program has started execution.

**System action**

Initialization continues.

**User response**

None.

**Module:** DFHCFMN

**Destination**

Console and SYSPRINT

**DFHCFO1021** CF data table server for pool `poolname` is now active.

**Explanation**

The coupling facility data table server for the named pool has completed initialization and is now ready to accept connections.

**System action**

The server waits for connection requests or operator commands.

**User response**

None.

**Module:** DFHCFMN
Destination
Console and SYSPRINT

DFHCF0103 CF data table server initialization failed because the POOLNAME parameter was not specified.

Explaination
The coupling facility data table server program needs to know the name of the associated coupling facility data table pool in order to complete initialization, but no pool name was specified in the SYSIN or PARM field parameters.

System action
The server is terminated.

User response
Ensure that the parameter POOLNAME= name is specified either in the SYSIN parameters or in the PARM field of the JCL for the server.

Module: DFHCFMN

Destination
Console and SYSPRINT

DFHCF0104 CF data table server initialization failed because program DFHCFMN is not APF authorized.

Explanation
The coupling facility data table server main program DFHCFMN cannot complete initialization because it is not running with APF authorization.

System action
The server is terminated.

User response
Ensure that the coupling facility data table server program DFHCFMN is loaded from an APF authorized library and has been link-edited with the option AC(1).

Module: DFHCFMN

Destination
Console and SYSPRINT

DFHCF0105 CF data table server initialization failed because program DFHCFMN is not licensed for use.

Explanation
The coupling facility data table server main program DFHCFMN cannot complete initialization because the validate license check failed.

System action
The server is terminated.

User response
Ensure that the coupling facility data table server program DFHCFMN is licensed for use by adding the required licensing dataset to the STEPLIB DD statement.

Module: DFHCFVL

Destination
Console and SYSPRINT

DFHCF0111I CF data table server for pool poolname is terminating.

Explanation
The coupling facility data table server has started termination processing, so no further requests will be processed.

System action
Termination continues.

User response
None.

Module: DFHCFMN

Destination
Console and SYSPRINT

DFHCF0112I CF data table server has terminated, return code retcode, reason code rsncode.

Explanation
The coupling facility data table server has completed termination processing. For normal termination, the
return code and reason code are both zero. If the termination was caused by an error, the return code will be 8 and the reason code will be the number of the previous DFHCFnnnn message giving the reason for termination.

**System action**
The coupling facility data table server program returns control (via the AXM termination routines) to MVS for job step termination.

**User response**
None.

**Module:**
DFHCFMN

**Destination**
Console and SYSPRINT

**Explanation**
The coupling facility data table server has terminated after intercepting an abnormal termination (ABEND) request. If the completion code is a system completion code, it is shown as three hexadecimal digits, otherwise it is shown as four decimal digits for a user completion code. Any associated reason code is shown as a four byte hexadecimal value, which will be zero if no reason code was provided.

**System action**
The coupling facility data table server program returns control (via the AXM termination routines) to MVS for job step termination.

**User response**
None.

**Module:**
DFHCFMN

**Explanation**
The server attempted to generate a default ARM element identifier to use for automatic restart registration, using the one or two character &SYSCLONE value to identify the MVS system. Normally, MVS verifies during start-up that &SYSCLONE is unique within the sysplex. However, the server is running on a level of MVS where this check is optional and has not been performed, so the server is unable to generate a unique element identifier.

**System action**
The server is terminated.

**User response**
Servers should not normally be run on a level of MVS which does not enforce unique &SYSCLONE values. However, the problem can be bypassed by specifying an ARM element name explicitly on the server ARMELEMENT parameter.

**Module:**
DFHCFRS

**Destination**
Console and SYSPRINT

**Explanation**
A request to the MVS automatic restart manager (ARM) gave an unexpected return code. The return code and reason code are shown in hexadecimal notation.

**System action**
The server is terminated.

**User response**
See the IXCARM macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

**Module:**
DFHCFRS

**Destination**
Console and SYSPRINT
DFHCF0123 IXCARM REQUEST=regtype failed, return code retcode, reason code rsncode.

Explanation
Automatic restart support is not available. The MVS automatic restart manager (ARM) gave a return code and reason code which indicates that ARM services are not available, but the reason could possibly be intentional or unavoidable, so the server is being allowed to continue execution without automatic restart support. The return code and reason code are shown in hexadecimal notation.

System action
The server continues initialisation without automatic restart support.

User response
See the IXCARM macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHCFRS

Destination
SYSPRINT

DFHCF0202 Unknown parameter keyword: keyword

Explanation
This parameter keyword did not match any of the defined parameter keywords for the coupling facility data table server.

System action
Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response
Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHCFPR

Destination
Console and SYSPRINT

DFHCF0203 Value value for parameter keyword is incorrect. It must be a name of up to maxlen characters.

Explanation
The value of this parameter should have been specified as a name containing not more than the indicated number of characters.

System action
Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response
Correct the parameter value and reenter the command or restart the server.

Module:
**Explanation**
The value of this coupling facility data table server parameter exceeded the maximum allowed value, given in the message. This message also occurs if the numeric part of a decimal value exceeds the maximum unsigned 32-bit integer (4294967295) even if a larger value is allowed to be specified by using a suffix "K", "M", "G" or "T".

**System action**
Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**
Correct the parameter value and reenter the command or restart the server.

**Module:**
DFHCFPR
**System action**

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**

Correct the parameter value and reenter the command or restart the server.

**Module:**
DFHCFPR

**Destination**

Console and SYSPRINT

DFHCF0208 Parameter keyword *keyword* is not supported for command.

**Explanation**

A coupling facility data table server parameter keyword was specified in a context where it is not valid, such as an attempt to SET a parameter which can only be specified at initialization time, or to specify at initialization time a parameter which is only valid on DISPLAY.

**System action**

Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**

Correct the parameters (or remove the incorrect parameter) and reenter the command or restart the server.

**Module:**
DFHCFPR

**Destination**

Console and SYSPRINT

DFHCF0210 Parameter keyword *keyword* should not have a value for command.

**Explanation**

A coupling facility data table server parameter keyword was specified in the form *keyword*=*value* in a context where it was not expected, for example on a DISPLAY command.

**System action**

Processing of the current line of parameters is terminated.

**User response**

Reenter the command without specifying a value for the parameter to be displayed.

**Module:**
DFHCFPR

**Destination**

Console and SYSPRINT

DFHCF0211 Parameter value: *keyword*=*value*

**Explanation**

The coupling facility data table server parameter processing routine found some unexpected text when attempting to process parameters.
Explanation
This message is issued to show the current value of a coupling facility data table server parameter setting in response to a **DISPLAY** or **PRINT** command.

**System action**
Processing continues normally.

**User response**
None.

**Module:**
DFHCFPR

**Destination**
Console and SYSPRINT

**DFHCF0212** Value value for parameter keyword is incorrect. It must be one of validlist.

Explanation
The value of this coupling facility data table server parameter was not recognized. It should have been specified as one of the indicated list of values.

**System action**
Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**
Reenter the parameter specification in the correct form keyword=value.

**Module:**
DFHCFPR

**Destination**
Console and SYSPRINT

**DFHCF0214** Value value for parameter keyword is incorrect. Pattern matching is not supported in this context.

Explanation
A parameter value containing one of the pattern matching (wild card) characters '*', '%' or '?' was specified in a context where only a single identifier is supported.

**System action**
Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**
Correct the parameter value and reenter the command.

**Module:**
DFHCFPR

**Destination**
Console and SYSPRINT

**DFHCF0213** Value for parameter keyword is missing. The correct form is keyword=value.

Explanation
A parameter keyword was specified without an associated parameter value on a coupling facility data table server **SET** command or in a SYSIN or PARM parameter string. Note that the only character which should appear between the parameter keyword and its intended value is the equals sign, without any extra spaces.

**System action**
Processing of the current parameter string (command parameter list, PARM field or SYSIN input line) is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**
Correct the parameter value and reenter the command.
DFHCF0215  Value value for applid.uowid parameter keyword is incorrect. The APPLID part should be a name of up to 8 characters.

Explanation
The value of this coupling facility data table server parameter did not conform to the correct syntax for the APPLID part of a unit of work identifier.

System action
Processing of the current line of parameters is terminated.

User response
Correct the parameter value and reenter the command.

Module: DFHCFPR

DFHCF0216  Value value for applid.uowid parameter keyword is incorrect. The UOWID part should be 16 hexadecimal digits or '*'.

Explanation
The value of this coupling facility data table server parameter did not conform to the correct syntax for a unit of work identifier.

System action
Processing of the current line of parameters is terminated.

User response
Correct the parameter value and reenter the command.

Module: DFHCFPR

Destination
Console and SYSPRINT

DFHCF0217  Parameter keyword keyword requires a table name. It should be preceded by TABLE=name in the same command line.

Explanation
A coupling facility data table server parameter can only be set for a specific table, but it was not preceded by a TABLE=name parameter in the same command line.

System action
Processing of the current line of parameters is terminated.

User response
Insert the parameter TABLE=name before the specified keyword and reenter the command.

Module: DFHCFPR

Destination
Console and SYSPRINT

DFHCF0218  TABLE=table was specified without any table-related parameter.

Explanation
A coupling facility data table server SET command was issued including a parameter of the form TABLE=name to select a specific table, but it was not followed by any table-related parameter within the same command.

System action
The table name parameter is ignored.

User response
If a table-related parameter was to be set, ensure that it is included on the same SET command as the table name.

Module: DFHCFPR

Destination
Console and SYSPRINT

DFHCF0301I  Console operator consname issued command: command

Explanation
A coupling facility data table server operator command has been issued via the MVS MODIFY or STOP
command. This message identifies the console name (or TSO userid) from which the command was issued and the text of the command.

**System action**
Processing continues.

**User response**
None.

**Module:** DFHCFO

**Destination**
Console and SYSPRINT

**DFHCF0302I** command command ignored because no valid parameters were given.

**Explanation**
A coupling facility data table server command was issued which had no valid parameters on it but was otherwise syntactically valid. The command has had no effect.

**System action**
Processing continues normally.

**User response**
Ensure that the command was entered correctly.

**Module:** DFHCFO

**Destination**
Console and SYSPRINT

**DFHCF0303I** command has been processed.

**Explanation**
A coupling facility data table server command has been processed successfully.

**System action**
Processing continues.

**User response**
None.

**Module:** DFHCFO

**Destination**
Console and SYSPRINT

**DFHCF0304I** STOP command is waiting for connections to be closed. Number of active connections = connections.

**Explanation**
A coupling facility data table server STOP command has been issued (either via an MVS STOP command or via an MVS MODIFY command with the text STOP) but there are still active connections to the server, so the STOP command has not yet taken effect.

**System action**
The server rejects any further attempts to establish new connections, but continues processing requests for existing connections. Each time a connection is terminated, this message will be repeated as long as there are more active connections.

**User response**
Further information about the connections which are still active may be obtained using the command DISPLAY CONNECTIONS.

If the server needs to be shut down without waiting for connections to be closed, issue the server CANCEL command. Note that this will immediately terminate any active connections, causing any further requests for that server to be given a SYSIDERR indication. (The MVS CANCEL command can also be used, but should preferably be avoided because it will prevent the server from producing its normal closedown statistics and reports).

Note that if a CICS region is abnormally terminated while server connect or disconnect processing is in progress, or is terminated without going through end of task processing (for example using the FORCE command) there is a slight chance that the server will not be notified that the connection has been terminated. In this case the server will not be able to be closed down with the server STOP command, but only with the server CANCEL command.

**Module:** DFHCFO

**Destination**
Console and SYSPRINT
DFHCF0305I STOP command has been processed.

Explanation
Processing of a coupling facility data table server STOP command has now been successfully completed. This means that there are no longer any active connections and the server is ready to close down.

System action
The coupling facility data table server starts termination processing.

User response
None.

Module: DFHCFOP

Destination
Console and SYSPRINT

DFHCF0306 CF data table server does not support this command: command

Explanation
An operator command was addressed to the coupling facility data table server using the MVS MODIFY command, but the first word of the MODIFY parameter text is not a recognized server command (SET, DISPLAY, PRINT, STOP, CANCEL or an accepted abbreviation for one of these).

System action
The command is ignored.

User response
Correct and reenter the command.

Module: DFHCFOP

Destination
Console and SYSPRINT

DFHCF0308 CF data table server does not support CICS commands. To close it down, you can use the STOP command.

Explanation
An operator command which appears to be a CICS command (a four-character transaction code of the form 'CExx') was addressed to the coupling facility data table server using the MVS MODIFY command.

System action
The command is ignored.

User response
Correct and reenter the command. If the intention is to close down the server, use the server STOP or CANCEL command.

Module: DFHCFOP

Destination
Console and SYSPRINT

DFHCF0307I CANCEL parm command has been processed. Number of active connections = connections.

Explanation
A coupling facility data table server CANCEL command has been issued, either from an operator console or internally by the server in response to a severe error such as coupling facility failure. This message includes any restart parameter specified on the command and the number of active connections which may be affected by this command.

System action
The server terminates immediately, without waiting to close connections.

User response
None.

Module: DFHCFOP

Destination
Console and SYSPRINT

DFHCF0309 Parameter parm on CANCEL command is incorrect. The only valid parameters are RESTART=YES or RESTART=NO.
Explanation
A coupling facility data table server CANCEL command was issued with a parameter which did not match the valid parameter keywords.

System action
The command is ignored.

User response
Correct and reenter the command.

Module: DFHCFOP

Destination
Console and SYSPRINT

DFHCF0310 Parameter parm on STOP command is incorrect. No parameters should be specified.

Explanation
A coupling facility data table server STOP command was issued with parameters, but the STOP command does not support any parameters.

System action
The command is ignored.

User response
Correct and reenter the command.

Module: DFHCFOP

Destination
Console and SYSPRINT

DFHCF0311 Pool state error, reason code reason, processing request request for table table, key key, task task, region region.

Explanation
Integrity checks during coupling facility data table request processing found that data or control information in the pool list structure was in a state that should not be possible in normal processing. The reason codes are based on the response codes returned by the internal coupling facility interface.

- Reason codes:

  2 Entry exceeds maximum data length.
  3 Entry not found.
  4 Wrong version.
  5 Wrong list authority.
  6 Maximum number of entries in list reached.
  7 No space left in structure.

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed. For example, a wrong version response from the coupling facility interface normally simply indicates that an entry has changed, causing the entry to be read again, and this is only treated as a pool state error if the data or control information in the changed entry is not consistent with the expected state of the record.

System action
The request is terminated with a pool state error exception.

User response
This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for data records in a particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

Module: DFHCFRQ

Destination
Console and SYSPRINT

DFHCF0331I Table table maximum records limit now set to maxrec (was oldmax). Current number of records is records.
Explanation
The maximum number of records allowed to be stored in the specified table has been successfully modified in response to a coupling facility data table server SET TABLE command with the MAXRECS parameter. The previous maximum number is shown, and the current number of records. The new or previous maximum number may also be shown as NOLIMIT for the special value indicating that no limit applies. (For a recoverable table with uncommitted updates, this number includes the original versions of changed records, as these are retained until syncpoint time to allow for possible backout).

System action
Processing continues using the new value for the maximum number of records. If the current number of records already exceeds this value, no further records can be added (or, for a recoverable table, updated) until enough records have been deleted to bring the current number below the limit.

User response
None.

Module:
DFHCFOC

Destination
Console and SYSPRINT

DFHCF0332I Table table was not found.

Explanation
The table specified on a coupling facility data table server SET TABLE command was not found in the pool.

System action
The command is ignored.

User response
Ensure that the table name was entered correctly, and that the command was addressed to the correct pool server.

Module:
DFHCFOC

Destination
Console and SYSPRINT

DFHCF0333 Pool state error, reason code reason, processing SET command for table table.

Explanation
The status of the table specified on a coupling facility data table server SET TABLE command could not be modified because the control information in the list structure was in a state that should not be possible in normal processing. The reason codes are based on the response codes returned by the internal coupling facility interface.

• Reason codes:
  2
  Entry exceeds maximum data length.
  3
  Entry not found.
  4
  Wrong version.
  5
  Wrong list authority.
  6
  Limit number of entries in list reached.
  7
  No space left in structure.

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed.

System action
The command is ignored.

User response
This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for attempts to modify a particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

Module:

**Explanation**
The state of the specified table has been changed from available to unavailable in response to a coupling facility data table server SET TABLE command with the option AVAILABLE=NO.

**System action**
Processing continues. New OPEN requests for the table will be rejected with an indication that the table is unavailable.

**User response**
None.

**Module:**
DFHCFOC

**Destination**
Console and SYSPRINT

**DFHCF0337I** Table table was already marked as available.

**Explanation**
This is a response to the coupling facility data table server SET TABLE command with the parameter AVAILABLE=YES when the table is already marked as available.

**System action**
Processing continues.

**User response**
None.

**Module:**
DFHCFOC

**Destination**
Console and SYSPRINT

**DFHCF0338I** Table table was already marked as unavailable.

**Explanation**
This is a response to the coupling facility data table server SET TABLE command with the parameter AVAILABLE=NO when the table is already marked as unavailable.
Server request statistics for table  

**Table:**  

<table>
<thead>
<tr>
<th>Table:</th>
<th>Open</th>
<th>Close</th>
<th>Set Attr</th>
<th>Delete</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stats</td>
<td>n</td>
<td>n</td>
<td>n</td>
<td></td>
</tr>
</tbody>
</table>

**Record:**  

<table>
<thead>
<tr>
<th>Record:</th>
<th>Point</th>
<th>Highest</th>
<th>Read</th>
<th>Read Del</th>

<th>Write</th>
<th>Rewrite</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>n</td>
<td>n</td>
<td>n</td>
<td></td>
<td>n</td>
<td>n</td>
<td>n</td>
<td></td>
</tr>
</tbody>
</table>

**Delete Del Mult**  

<table>
<thead>
<tr>
<th>Delete Del Mult</th>
<th>n</th>
<th>n</th>
</tr>
</thead>
</table>

**Explanation**  

This message gives table access statistics for the current coupling facility data table server, listing the total number of requests of each type handled since the previous statistics reset. It is issued in response to a **DISPLAY** or **PRINT** command which includes the **TABLESTATS** parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output. Note that this message is suppressed if all statistics are zero.

The detailed message layout is as follows:

- **Table requests:**
  - **Open**  
    Number of successful OPEN requests for the table
  - **Close**  
    Number of successful CLOSE requests for the table
  - **Set Attr**  
    Number of times new table status was set
  - **Delete**  
    Number of times the table of that name was deleted
- **Extract**  
  Number of times table access statistics were extracted
- **Record requests:**
  - **Point**  
    Number of POINT requests
  - **Highest**  
    Number of requests for current highest key
  - **Read**  
    Number of READ requests (including those for UPDATE)
  - **Read Del**  
    Number of combined READ and DELETE requests
  - **Unlock**  
    Number of UNLOCK requests
  - **Loads**  
    Number of records written by initial load requests
  - **Write**  
    Number of WRITE requests for new records
  - **Rewrite**  
    Number of REWRITE requests
  - **Delete**  
    Number of DELETE requests
  - **Del Mult**  
    Number of multiple (generic) delete requests

The coupling facility architecture supports some options and types of request such as combined READ and DELETE which are not currently supported by CICS File Control, but the server supports them for completeness. Server request counts for such options and request types are always zero.

**System action**  

Processing continues.

**User response**  

The statistics are described in detail in the DFHCFS7D data area. The individual fields have the following meanings:

- **Table requests:**
  - **Open**  
    Number of successful OPEN requests for the table

**User response**

The statistics are described in detail in the DFHCFS8D data area. The individual fields have the following meanings:

- **Table requests:**
  - **Open**
    - Number of successful OPEN requests for the table
  - **Close**
    - Number of successful CLOSE requests for the table
  - **Set Attr**
    - Number of times new table status was set
  - **Delete**
    - Number of times the table of that name was deleted
  - **Extract**
    - Number of times table access statistics were extracted
  - **Inquire**
    - Number of inquire table requests

- **Record requests:**
  - **Point**
    - Number of POINT requests
  - **Highest**
    - Number of requests for current highest key
  - **Read**
    - Number of READ requests (including those for UPDATE)
  - **Read Del**
    - Number of combined READ and DELETE requests
  - **Unlock**
    - Number of UNLOCK requests
  - **Loads**
    - Number of records written by initial load requests
  - **Write**
    - Number of WRITE requests for new records
  - **Rewrite**
    - Number of REWRITE requests
  - **Delete**
    - Number of DELETE requests
  - **Del Mult**
    - Number of multiple (generic) delete requests

- **UOW requests:**
  - **Prepare**
    - Number of units of work prepared
  - **Retain**
    - Number of units of work whose locks were retained
Commit
Number of units of work committed

Backout
Number of units of work backed out

Inquire
Number of unit of work inquire requests

Restart
Number of times recoverable connections were restarted

The coupling facility architecture supports some options and types of request such as combined READ and DELETE which are not currently supported by CICS File Control, but the server supports them for completeness. Server request counts for such options and request types are always zero.

DFHCF0363I Details for table `table`:

Explanation
This message shows table details in response to the coupling facility data table server command `DISPLAY TABLE= name` or `PRINT TABLE= name`.
The detailed message layout is as follows:

| Attributes: Recsize Keylength Max recs |
|----------|------------------|------------------|
|          |                  |                  |

Upd Model n n n
n x
Init Load x

Status: Available Open mode Access Sharing x x
x x
Loaded x

Statistics: Users Servers Opens
Records n n n
n n

System action
Processing continues.

User response
The individual fields have the following meanings:

- Attributes:
  - `Recesize` Record size specified when table was created.
  - `Keylength` Key length specified when table was created.
  - `Max recs` Indicate the current limit value if any which has been set on the number of records in the table, or 'NO' if there is no current limit value.

- `Upd model` Indicates the update model being used: 'CONT' or 'CONT+' for the contention model, 'LOCK' for the non-recoverable locking model or 'RECOV' for the recoverable locking model. For a contention model table where the maximum record size is 63 or less, this usually shows 'CONT+', which indicates that access has been further optimized by storing the record data in the coupling facility entry adjunct area, instead of using separate data elements.

- `Init Load` Indicates whether initial load was required: 'YES' or 'NO'.

- Status:
  - `Available` Indicates whether new opens are currently allowed: 'YES' or 'NO'.

432 CICS TS for z/OS: CICS Messages
Open mode
Indicates whether the table is open for read/write access, open for read-only access or not open: 'R/W', 'R/O' or 'NONE'.

Access
Indicates whether the table is currently open for exclusive access, or otherwise indicates shared: 'EXCL' or 'SHR'.

Sharing
Indicates what level of shared access is currently allowed for the table, 'R/W', 'R/O' or 'NONE'.

Loaded
Indicates 'YES' if the table has been loaded or if loading is not required, otherwise 'NO'.

• Statistics
Users
Indicates the current number of users of this table, which is normally the number of CICS regions that currently have it open. It is also possible for a CICS region to have the same table open more than once at a time using different file names.

Servers
Indicates the number of server regions that currently have the table open internally for recoverable access. For a non-recoverable table this is zero. For a recoverable table, this is normally the same as the number of CICS regions which have currently have the table open, but when there are unresolved recoverable changes a server may have the table open internally even when the CICS region has not explicitly opened it, or has explicitly closed it.

Opens
Indicates the total number of opens issued for this table since it was created.

Records
Indicates the current number of records in the table.

Module:
DFHCFIQ

Destination
Console and SYSPRINT
DFHCF0364 No table was found matching table.

Explanation
A table name specified on the coupling facility data table server command DISPLAY (or PRINT) TABLE= name or TABLEUSERS= name did not match any existing table in the pool.

System action
The command is ignored.

User response
Ensure that the table name was entered correctly, and that the command was addressed to the correct pool server.

Module:
DFHCFIQ

Destination
Console and SYSPRINT
DFHCF0365I The number of tables in the pool matching table is tables.

Explanation
This indicates the number of matching tables within the pool for which information was displayed in response to the coupling facility data table server command DISPLAY (or PRINT) TABLES= name or TABLEUSERS= name where the table name contained one or more wild card characters.

System action
Processing continues.

User response
None.

Module:
DFHCFIQ

Destination
Console and SYSPRINT
DFHCF0366I Table table users: region1 region2 region3 region4

Explanation
This message lists the names (normally the CICS APPLIDs) of up to four regions which are currently using the named coupling facility data table, in response to the coupling facility data table server command.
command DISPLAY (or PRINT) TABLEUSERS. A region is considered to be using a table if it has one or more files open for the table, or if it has one or more unresolved units of work which have made recoverable updates to the table.

**System action**

This message is issued as many times as is necessary to list all regions which are currently using the table (sorted by name). If one of the regions was in the process of loading the table, message DFHCF0367I is issued to identify that region. Finally, message DFHCF0368I is issued to show the total number of users.

**User response**

None.

**Module:** DFHCFIQ

**Destination**

Console and SYSPRINT

**DFHCF0367I** Table table is being loaded by region region.

**Explanation**

If a table specified on the coupling facility data table server command DISPLAY (or PRINT) TABLEUSERS is currently open for loading, this message is issued to identify the name (normally the CICS APPLID) of the region which is loading it. This name also appears in the list of regions using the table.

**System action**

Processing continues.

**User response**

None.

**Module:** DFHCFIQ

**Destination**

Console and SYSPRINT

**DFHCF0368I** The number of regions using table table is users.

This message is issued in response to a coupling facility data table server DISPLAY UOWID command.

**System action**
Processing continues.

**User response**
Check that the correct UOWID was entered.

**Module:** DFHCFSP

**Destination**
Console and SYSPRINT

DFHCF0390I UOWID applid.uowid total matching entries: uowids

**Explanation**
This message is issued at the end of the responses to a coupling facility data table server DISPLAY UOWIDs command to summarize the total number of units of work listed. The total is zero if no matching units of work were found.

**System action**
Processing continues.

**User response**
None.

**Module:** DFHCFSP

**Destination**
Console and SYSPRINT

DFHCF0391I APPLID applid does not have any unresolved units of work.
Explanation
This message is issued in response to a coupling facility data table server \texttt{SET} command which attempted to modify the recovery status for the given APPLID. There are no unresolved units of work in the pool which match the given APPLID.

System action
The requested function is ignored.

User response
Check that the correct APPLID was entered.

Module:
DFHCFSP

Destination
Console and SYSPRINT

\texttt{DFHCF0392} APPLID \texttt{applid} recovery status cannot be modified while it is connected.

Explanation
This message is issued in response to a coupling facility data table server \texttt{SET} command which attempted to modify recovery status for the given APPLID. This is not possible if the APPLID is already connected to the pool, on this server or another server.

System action
The requested function is ignored.

User response
Check whether the correct APPLID was entered.

Module:
DFHCFSP

Destination
Console and SYSPRINT

\texttt{DFHCF0393} APPLID \texttt{applid} recovery status cannot be modified because connection restart failed with reason code \texttt{reason}.

System action
The requested function is ignored. The attempt failed because the server was unable to establish a recoverable connection on behalf of that APPLID. The reason code from the failing internal FCCU RESTART function is included.

User response
See the server trace file and job log for further details about the failure.

Module:
DFHCFSP

Destination
Console and SYSPRINT

\texttt{DFHCF0394} UOWID \texttt{applid.uowid} is not in doubt.

Explanation
This message is issued in response to a coupling facility data table server \texttt{SET} command which attempted to modify the recovery status of a specific unit of work. The APPLID had one or more unresolved units of work and was successfully restarted, but the UOWID did not match any in-doubt unit of work owned by that APPLID after restart completed. Note that if the unit of work was previously in the process of being committed or backed out, restart processing will have resolved it.

System action
The requested function is ignored. A further message will appear indicating whether any units of work remain unresolved after the successful restart.

User response
Check that the correct APPLID and UOWID were entered.

Module:
DFHCFSP

Destination
Console and SYSPRINT

\texttt{DFHCF0395} APPLID \texttt{applid} now has no unresolved units of work.
Explanation
This message is issued in response to a successful coupling facility data table server SET command to perform restart processing. All units of work associated with the APPLID were resolved by restart processing (which means that they must have been in commit or backout processing).

System action
Processing continues.

User response
None.

Module: DFHCFSP

Destination
Console and SYSPRINT

DFHCF0396I APPLID applid units of work remaining in doubt: indoubts.

Explanation
This message is issued in response to a successful coupling facility data table server SET command to perform restart processing. One or more units of work remain in doubt.

System action
Processing continues.

User response
None.

Module: DFHCFSP

Destination
Console and SYSPRINT

DFHCF0397I APPLID applid units of work now committed: commits.

Explanation
This message is issued in response to a successful coupling facility data table server SET command which committed one or more units of work.

System action
The requested function is ignored.

User response
See the server trace file and job log for further details about the failure.

Module: DFHCFSP

Chapter 2. CICS messages 439
Destination
Console and SYSPRINT

DFHCF0401I Connected to CF structure strname.

Explanation
The coupling facility data table server has successfully established a connection to the coupling facility list structure for the table pool, using the IXLCONN macro.

System action
Processing continues.

User response
None.

Module:
DFHCFCF

Destination
Console and SYSPRINT

DFHCF0402I CF structure strname was allocated by this connection.

Explanation
The coupling facility data table pool list structure did not previously exist and was allocated as part of the connection process.

System action
List structure initialization will be performed if necessary.

User response
None.

Module:
DFHCFCF

Destination
Console and SYSPRINT

DFHCF0404 CF structure strname cannot be used because it has been allocated with attribute attribute.

Explanation
The coupling facility data table server has successfully connected to its pool list structure but has found that the structure has been allocated using an IXLCONN structure attribute keyword which is not supported by the server.

System action
The server is terminated.

User response
This probably indicates that the structure has been allocated or modified by some program other than the coupling facility data table server program. In this case, the incorrect structure should be deleted (using the MVS SETXCF FORCE command) so that it will be reallocated correctly when the server is restarted.

Module:
DFHCFCF

Destination
Console and SYSPRINT

DFHCF0405 CF structure strname element size elemsize is incorrect. It should be a power of 2 in the range 256 to 4096.

Explanation
The IXLCONN macro to connect the coupling facility data table server to its pool list structure failed.
**Explanation**

The list structure element size specified in the **ELEMSIZE** initialization parameter for the coupling facility data table server is not a power of two, or is outside the range supported by the coupling facility interface.

**System action**

The server is terminated (without attempting to connect to the list structure).

**User response**

Correct the **ELEMSIZE** parameter and restart the server.

**Module:** DFHCFCF

**Destination**

Console and SYSPRINT

---

**Explanation**

**DFHCF0406**

Initialization failed for CF structure **strname** with response **response**.

**Explanation**

Coupling facility data table server processing to initialize the pool list structure failed with an abnormal internal response code.

**System action**

The server is terminated.

**User response**

If the response code is 8 (I/O error), it indicates that an IXLLIST macro gave an abnormal return code, in which case a previous DFHCF0441 message will have been issued giving the IXLLIST return code and reason code. If this response code is any other value, this indicates that the list structure is in a state which should not occur, probably indicating that it was allocated or modified by a program other than the coupling facility data table server. In this case the structure may need to be deleted (using the MVS SETXCF FORCE command) so that it will be reallocated when the server is restarted.

**Module:** DFHCFCF

**Destination**

Console and SYSPRINT

---

**Explanation**

**DFHCF0407**

CF structure **strname** is not available for shared use.

**Explanation**

The coupling facility data table pool is currently locked for exclusive use by some other job such as a pool unload or reload job. (This serialization uses an MVS ENQ with scope SYSTEMS, major name 'SYSZDFH' and minor name equal to the structure name, 'DFHCFLS_poolname').

**System action**

The server is terminated.

**User response**

Check whether a pool maintenance job is currently running. If it is, wait until it has finished before trying to start the server again. You can find out what jobs are currently using the pool using this MVS command:

```
DISPLAY GRS,RES=(SYSZDFH,'DFHCFLS_poolname')
```

Note that for this command the pool name must be exactly eight characters, padded with trailing spaces if necessary.

**Module:** DFHCFCF

**Destination**

Console and SYSPRINT

---

**Explanation**

**DFHCF0408**

CF structure **strname** is not available for exclusive use.

**Explanation**

The current coupling facility data table unload or reload job requires exclusive use of the pool, but some other job is running which already has shared or exclusive use of the pool. (This serialization uses an MVS ENQ with scope SYSTEMS, major name 'SYSZDFH' and minor name equal to the structure name, 'DFHCFLS_poolname').

**System action**

The server is terminated.

**User response**

Check whether a coupling facility data table server or maintenance job is currently running. If it is, wait until it has finished before trying to run the current job.
again. You can find out what jobs are currently using the pool using this MVS command:

```
DISPLAY GRS, RES=(SYSZDFH, 'DFHCFLS_poolname')
```

Note that for this command the pool name must be exactly eight characters, padded with trailing spaces if necessary.

**Module:**
DFHCFCF

**Destination**
Console and SYSPRINT

**DFHCF0409**
CF structure *strname* could not be allocated in facility *cfname*, reason code *rsncode*.

**Explanation**
If a previous coupling facility data table server message DFHCF0403 indicated an IXLCONN failure because the structure could not be allocated, this message is issued for each coupling facility in which allocation was attempted to show the facility reason code indicating why structure allocation failed. If the reason code is known to the server, the name of the reason code is given (as defined in the MVS macro IXLYCONA, but without the 'ConaRsn' prefix), otherwise its decimal value is shown.

If the response indicates InvalidStructureSize, this means that the initial list structure size (specified on the server POOLSIZE parameter or in the CFRM policy INITSIZE parameter) is not large enough to contain the required structure control information. The size of the control information is affected by the number of list headers (determined by the server MAXTABLES parameter) and by the maximum structure size specified in the CFRM policy.

**System action**
The server is terminated.

**User response**
Ensure that the required level of coupling facility maintenance is applied.

**Module:**
DFHCFCF

**Destination**
Console and SYSPRINT

**DFHCF0410**
CF structure *strname* cannot be used, coupling facility maintenance level is too low.

**Explanation**
Initialization test routines executed against the allocated list structure gave incorrect results, indicating that the coupling facility control code does not include all maintenance necessary to support coupling facility data tables.

**System action**
The server is terminated.

**User response**
Ensure that the required level of coupling facility maintenance is applied.

**Module:**
DFHCFCF

**Destination**
Console and SYSPRINT

**DFHCF0411I**
CF structure *strname* now has *percentage*% of entries in use.

**Explanation**
This message is issued by the coupling facility data table server when the percentage of list entries in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after a structure alter request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio. The percentage is calculated using information that is returned by successful coupling facility access requests, so if the message was triggered by structure alter completion and the current server has not processed any successful requests recently, the information may not be accurate.
System action

The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User response

Note that the structure may soon become full, preventing tables from being created. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS SETXCF command with the START,ALTER option, and any active servers will be able to use the increased space immediately.

Module: DFHCFCF

Destination

Console and SYSPRINT

DFHCF0412I CF structure strname now has percentage% of elements in use.

Explanation

This message is issued by the coupling facility data table server when the percentage of list data elements in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after a structure alter request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio. The percentage is calculated using information that is returned by successful coupling facility access requests, so if the message was triggered by structure alter completion and the current server has not processed any successful requests recently, the information may not be accurate.

System action

The server continues by issuing the IXLALTER macro. A further message will be issued when the structure alter request is accepted or rejected by MVS.

User response

None.

Module: DFHCFCF

Destination

Console and SYSPRINT

DFHCF0413I Issuing alter request to adjust CF structure strname entry/element ratio to entries/elements.

Explanation

The coupling facility data table server has determined that the ratio of free entries to free elements is significantly different from the ratio of entries to elements actually in use. It is issuing an IXLALTER macro to request the coupling facility to adjust the ratio to make better use of the coupling facility storage.

System action

The server continues by issuing the IXLALTER macro. A further message will be issued when the structure alter request is accepted or rejected by MVS.

User response

None.

Module: DFHCFCF

Destination

Console and SYSPRINT

DFHCF0414I Alter request successfully started for CF structure strname.

Explanation

The coupling facility data table server has successfully started a structure alter request to change the entry to element ratio for the list structure.
System action
The server event exit will be notified by MVS when the structure alter request completes and a further message will then be issued.

User response
None.

Module: DFHCFCF

Destination
Console and SYSPRINT

DFHCF0415I Alter request rejected for CF structure strname, another alter request for this structure is already active.

Explanation
The coupling facility data table server attempted to start a structure alter request using IXLALTER to change the entry to element ratio for the list structure, but this was rejected by the system because another structure alter request was already active.

System action
The server event exit will be notified by MVS when the structure alter request completes and a further message will then be issued.

User response
None.

Module: DFHCFCF

Destination
Console and SYSPRINT

DFHCF0416I Alter request failed for CF structure strname, IXLALTER return code retcode, reason code rsncode.

Explanation
The coupling facility data table server attempted to start a structure alter request to change the entry to element ratio for the list structure, but this was rejected by the system with an unexpected return code.

System action
None.

Module: DFHCFCF

Destination
Console and SYSPRINT

DFHCF0417I Alter request completed normally for CF structure strname.

Explanation
The coupling facility data table server has been notified by the system that a structure alter request has completed normally.

System action
New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHCF0411 and DFHCF0412 to indicate the new usage percentages.

User response
None.

Module: DFHCFCF

Destination
Console and SYSPRINT

DFHCF0418I Alter request ended abnormally for CF structure strname with status status.

Explanation
The coupling facility data table server has been notified by the system that a structure alter request has ended abnormally. The two bytes of status information in this message are taken from EEPLALTERENDSTATEFLAGS in the event exit parameter list (defined in the MVS macro IXLYEEPL).
**System action**
No action is taken as a result of this notification, but any problem which caused the alter request to fail may result in other related problems.

**User response**
If further information is required, look for MVS messages on the system log indicating the reason for the structure alter request failure. For further information about the status flags, see the source of the MVS macro IXLYEEPL.

**Module:** DFHCFCF

**Destination**
Console and SYSPRINT

**Explanation**
The coupling facility data table server has been notified by the system that connectivity has been lost to the coupling facility containing the pool list structure. If the loss of connectivity was due to an IPL of the coupling facility, all tables and data records are lost.

**System action**
The server issues an internal CANCEL command to terminate itself immediately.

**User response**
Restart the server when connectivity to the coupling facility from the current system has been reestablished. If connectivity is still available from other systems, CICS transactions which require access to the affected pool should be diverted to those systems if possible.

If the loss of connectivity was due to an IPL of the coupling facility the restart causes a fresh copy of the list structure to be allocated.

**Module:** DFHCFCF

**Destination**
Console and SYSPRINT

**Explanation**
The coupling facility data table server has been notified by the system that connectivity has been lost due to coupling facility structure failure. All tables and data records in the pool have been lost.

**System action**
Each server for the affected pool issues an internal CANCEL command to terminate itself immediately.

**User response**
If another coupling facility is available and is included in the CFRM preference list for the failed structure, restart the servers to cause a fresh copy of the list structure to be allocated on the alternate coupling facility. If no other coupling facility is available, wait until the original coupling facility has been made available again before restarting the servers.

**Module:** DFHCFCF

**Destination**
Console and SYSPRINT
Access statistics for CF structure strname:

Explanation
This message gives a summary of coupling facility access statistics. It is issued in response to a coupling facility data table server DISPLAY or PRINT command which includes the CFSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

<table>
<thead>
<tr>

| User response
The statistics are described in detail in the DFHCFS6D data area. The individual fields have the following meanings:

- **Table data record request counts:**
  - **Reads**
    - Number of data entry reads.
  - **Writes**
    - Number of data entry writes.
  - **Rewrites**
    - Number of data entry rewrites.
  - **Deletes**
    - Number of data entry deletes.
- **Data list controls request counts:**
  - **Reads**
    - Number of data entry reads.
  - **Writes**
    - Number of data entry writes.
  - **Rewrites**
    - Number of data entry rewrites.
  - **Deletes**
    - Number of data entry deletes.
- **Table index list request counts:**
  - **Reads**
    - Number of table index reads.
  - **Writes**
    - Number of table index writes to create new tables.
  - **Rewrites**
    - Number of table index writes to update table status.
  - **Delete**
    - Number of table index deletes.
- **Unit of work index list request counts:**
  - **Reads**
    - Number of UOW list reads.
  - **Writes**
    - Number of UOW list writes (usually at PREPARE).
  - **Rewrites**
    - Number of UOW list rewrites (usually at COMMIT).
  - **Deletes**
    - Number of UOW list deletes (usually after COMMIT).
- **Lock release notify message request counts:**
  - **Reads**
    - Number of lock release messages read by this server.
  - **Writes**
    - Number of lock release messages sent by this server.
- **Response counts:**
  - **Reads**
  - **Writes**
  - **Rewrites**
  - **Deletes**
  - **Vers chk List chk List full Str full I/O err**
Asynch
Number of requests for which completion was asynchronous.

Normal
Number of normal responses.

Unavail
Number of times requests were deferred because the structure was temporarily unavailable, for example because system-managed rebuild was in progress.

Len error
Entry data was larger than the input buffer length, which normally results in a retry with a larger buffer.

Not fnd
The specified entry (table or item) was not found.

Vers chk
A version check failed for an entry being updated, indicating that another task had updated it first.

List chk
A list authority comparison failed, usually meaning that the table is in the process of being deleted.

List full
A table reached the maximum number of items, causing the relevant list to be marked as full.

Str full
The list structure became full.

I/O err
Some other error code was returned by IXLLIST.

User response
The statistics are described in detail in the DFHCFS6D data area. Pool usage statistics are calculated from information returned by recent coupling facility requests, and are not always very accurate, especially if the relevant information has not been accessed recently by the current server. The number of tables and the number of lists are updated each time the server opens or closes a table, but are not reliably updated at other times. The element and entry counts are updated on successful completion of most types of coupling facility access request.

The individual fields have the following meanings:

- Structure:
  - Size
    - Current allocated size of the list structure.
  - Max size
    - Maximum size to which this structure could be altered.
Elem size
Data element size used for the structure.

• Tables:
  Current
  Number of tables currently in existence.
  Highest
  Highest number of tables at any time (since last reset).

• Lists:
  Total
  Maximum number of list headers in the structure.
  In Use
  Number currently in use.
  Max Used
  Maximum number in use (since last reset).
  Control
  Number of lists in use for control information.
  Data
  Number of lists in use for table data.

• Entries:
  Total
  Total entries in the currently allocated structure (initially set at structure connection time and updated on completion of any structure alter request).
  In Use
  Number of entries currently in use.
  Max Used
  Maximum number in use (since last reset).
  Free
  Number of entries currently free (total minus used).
  Min Free
  Minimum number of free entries (since last reset).
  Reserve
  Number of entries reserved for rewrites and server use.

• Elements:
  Total
  Total data elements in the currently allocated structure (initially set at structure connection time and updated on completion of any structure alter request).
  In Use
  Number of elements currently in use.
  Max Used
  Maximum number in use (since last reset).
  Free
  Number of elements currently free (total minus used).
  Min Free
  Minimum number of free elements (since last reset).
  Reserve
  Number of elements reserved for rewrites and server use.

Module:
DFHCFCF

Destination
Console and SYSPRINT

DFHCFO441  CF structure strname request failed, IXLLIST return code retcode, reason code rsncode.

Explanation
A coupling facility access request issued by the coupling facility data table server using the IXLLIST macro gave an abnormal return code.

System action
The failing request is given an I/O error indication, giving an IOERR condition if it originated from a CICS API request.

User response
See the documentation of the IXLLIST macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHCFCF
Destination
Console and SYSPRINT

**DFHCF0442**  CF structure *strname* request failed, structure is full.

**Explanation**
A coupling facility access request issued by the coupling facility data table server using the IXLLIST macro failed because there are insufficient free entries or elements to store the new data in the structure.

**System action**
The failing request is given a NOSPACE indication if it originated from a CICS API request. For reload processing, if an automatic structure alter is in progress, the request may be suspended until the outcome of the alter request is known, then retried. This message will not be issued again for further failures until the used numbers of elements and entries fall well below the warning threshold.

**User response**
Any tables which are no longer in use should be deleted so that the space can be reused. If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS SETXCF command with the START,ALTER option, and any active servers will be able to use the increased space immediately. However, if this action is possible it should normally have been taken in response to earlier warning message before the structure became full.

**Module:**
DFHCFCF

**Destination**
Console and SYSPRINT

**DFHCF0444I**  CF request has been suspended to await structure alter completion.

**Explanation**
A coupling facility access request issued from the coupling facility data table server address space (during reload processing) ran out of space in the list structure, but an automatic structure alter attempt to free up more space is either already active or is being started at this point. The request is therefore being suspended to await the outcome of the structure alter attempt.

**System action**
The request is suspended until the structure alter request completes (normally or abnormally), then message DFHCF0445I is issued and the request is retried.

**User response**
None.

**Module:**
DFHCFCF

**Destination**
Console and SYSPRINT

**DFHCF0445I**  CF request is being retried after structure alter completion.
**Explanation**
A coupling facility data table access request which was suspended to await the completion of a structure alter request is now being retried because the alter request has either completed or failed.

**System action**
The suspended request will be restarted.

**User response**
None.

**Module:**
DFHCFCF

**Destination**
Console and SYSPRINT

**Explanation**
The coupling facility data table server has detected that the number of free list entries or data elements in the pool structure has fallen below the reserve levels specified on the server parameters ENTRYRESERVEMIN, ENTRYRESERVEPC, ELEMENTRESERVEMIN and ELEMENTRESERVEPC.

**System action**
Any request to create a new record or table in the pool will be rejected for as long as the amount of free space remains below the reserve levels. The failing request is given a NOSPACE indication if it originated from a CICS API request. If free space later increases beyond the reserve levels, requests will be allowed again, and when the amount of free space exceeds the reserve levels by a reasonable margin (based on the server ENTRYWARNINC and ELEMENTWARNINC parameters) message DFHCF0447 will be issued.

**User response**
Use the server command DISPLAY POOLSTATS to obtain further information about the current pool usage. Note that even if this message is produced, the structure may still be very short of space and further action may be necessary, as described for message DFHCF0446.

**Module:**
DFHCFCF

**Destination**
Console and SYSPRINT

**Explanation**
A coupling facility data table access request was terminated abnormally and the server issued an IXLPURGE macro to ensure any active IXLLIST request was purged before releasing the I/O buffer, but the IXLPURGE macro gave a non-zero return code.

**START,ALTER** option, and any active servers will be able to use the increased space immediately. However, if this action is possible it should normally have been taken in response to earlier warning messages.

**Module:**
DFHCFCF

**Destination**
Console and SYSPRINT

**DFHCF0447** CF structure strname free space is no longer below reserve level.

**Explanation**
The coupling facility data table server issues this message after a recent shortage of free space caused message DFHCF0446 to be issued but the free space has now increased to beyond the reserve levels by a reasonable margin (based on the server ENTRYWARNINC and ELEMENTWARNINC parameters).

**System action**
Processing continues.

**User response**
Use the server command DISPLAY POOLSTATS to obtain further information about the current pool usage. Note that even if this message is produced, the structure may still be very short of space and further action may be necessary, as described for message DFHCF0446.

**Module:**
DFHCFCF

**Destination**
Console and SYSPRINT

**DFHCF0451** Purge for CF structure strname failed, IXLPURGE return code retcode, reason code rsncode.
System action
The error is ignored because this only occurs when a request is already being terminated abnormally.

User response
See the documentation of the IXLPURGE macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module: DFHCFCF

Destination
Console and SYSPRINT

DFHCFO471 CF structure strname already has the maximum of maxconn servers active.

Explanation
An attempt was made to connect an additional coupling facility data table server to a pool list structure which already has the maximum number of active connections supported by the current version of the server. The coupling facility accepted the connection, but the server does not support this number of simultaneous connections to the pool, so the connection could not be used.

The server has been designed to support a fixed maximum number of connections per pool, which is the same as the maximum number of connections to a list structure supported by current coupling facility implementations, and the maximum number of systems in a sysplex. This means that if this message occurs, a level of coupling facility must be in use which supports more connections, and one or more of those connections must be in use by a program other than the coupling facility data table server, as the server only supports one connection per system within a sysplex.

System action
The server is terminated.

User response
Ensure that no programs other than the data table server are connected to the list structure.

Module: DFHCFCF

Destination
Console and SYSPRINT

DFHCFO481I Waiting for structure strname to become available.
Explanation
The coupling facility data table server was unable to connect to its coupling facility structure because of an environmental error, such as the structure being unavailable, as described in a previous DFHCF0403 message. The server is now waiting for this problem to be fixed, and will retry the connection request when it is notified via the ENF facility that the specific structure may now be available or that some change has occurred in the status of general coupling facility resources.

System action
The server waits to be notified of a relevant event.

User response
No action is required, but the waiting server can optionally be terminated using the MVS CANCEL command if it is no longer required.

Module:
DFHCFEN

Destination
Console and SYSPRINT

DFHCF0482I Retrying connection to structure strname.

Explanation
The coupling facility data table server has been notified via ENF that its list structure may now be available or that a change has occurred in the status of some general coupling facility resources, so it is about to make another attempt to connect to the structure.

System action
The original IXLCONN request is retried.

User response
None.

Module:
DFHCFEN

Destination
Console and SYSPRINT

DFHCF0491 ENFREQ ACTION=action failed, return code retcode.

Explanation
An ENF request issued by the coupling facility data table server gave an unexpected return code.

System action
If this occurs on the ENFREQ ACTION=LISTEN request and the server is subsequently unable to connect to the list structure, the server will be terminated instead of waiting for the structure to become available.

User response
See the documentation of the ENFREQ macro in z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) (GC28-1765) for the explanation of the return and reason code.

Module:
DFHCFEN

Destination
Console and SYSPRINT

DFHCF0501 External security manager was not found, table security cannot be supported.

Explanation
Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager data areas needed by the server security interface (in particular the RCVT) were not found.

System action
The server is terminated.

User response
If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, ensure that the external security manager is installed and active before starting the server.

Module:
DFHCFXS

Destination
Console and SYSPRINT

452 CICS TS for z/OS: CICS Messages
DFHCF0502  External security manager is inactive, table security cannot be supported.

Explanation
Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager is not active.

System action
The server is terminated.

User response
If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, ensure that the external security manager is installed and active before starting the server.

Module:
DFHCFXS

Destination
Console and SYSPRINT

DFHCF0503  External security manager does not support global in-storage profiles, table security cannot be supported.

Explanation
Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager does not support the GLOBAL option for loading security profiles (known as global RACLIST), which is required in order to support cross-memory mode security checking.

System action
The server is terminated.

User response
If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, it will be necessary to upgrade the external security manager to a level which supports global in-storage profiles.

Module:
DFHCFXS

Destination
Console and SYSPRINT

DFHCF0504  External security manager does not support cross-memory mode, table security cannot be supported.

Explanation
Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager does not support authorization (FASTAUTH) requests in cross-memory mode, which are required in order to perform table security checks.

System action
The server is terminated.

User response
If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool. If table security checks are required, it will be necessary to upgrade the external security manager to a level which supports cross-memory mode authorization requests.

Module:
DFHCFXS

Destination
Console and SYSPRINT

DFHCF0505  RACROUTE REQUEST=EXTRACT gave R15=rc, SAFPRRET=retcode, SAFPRREA=rsncode.

Explanation
Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager EXTRACT function used to obtain the userid during server initialization gave an unexpected non-zero return code. This message shows the RACROUTE register 15 return code and the
external security manager return and reason codes returned in the SAF request parameter list.

**System action**
The server is terminated with message DFHCF0506.

**User response**
See the documentation of the RACROUTE macro with REQUEST=EXTRACT in z/OS Security Server RACROUTE Macro Reference (GC28-1922) for the explanation of the return and reason codes.

**Module:**
DFHCFXS

**Destination**
Console and SYSPRINT

**DFHCF0506**  
Security EXTRACT function failed, table security cannot be supported.

**Explanation**
Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager EXTRACT function issued to obtain the userid during server initialization gave an unexpected return code.

**System action**
The server is terminated.

**User response**
See the preceding message DFHCF0505 for the details of the reason for the failure. If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool.

**Module:**
DFHCFXS

**Destination**
Console and SYSPRINT

**DFHCF0507**  
RACROUTE REQUEST=LIST, ENVIR=CREATE, CLASS='class', GLOBAL=YES gave  
R15=rc, SAFPRRET=rcode, SAFPRREA=rsncode.

**Explanation**
Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager LIST function to load the security profiles during server initialization gave an unexpected non-zero return code. This message shows the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

**System action**
The server is terminated with message DFHCF0508.

**User response**
See the documentation of the RACROUTE macro with REQUEST=LIST in z/OS Security Server RACROUTE Macro Reference (GC28-1922) for the explanation of the return and reason codes.

**Module:**
DFHCFXS

**Destination**
Console and SYSPRINT

**DFHCF0508**  
Security LIST function failed, table security cannot be supported.

**Explanation**
Table-specific security checks for coupling facility data table OPEN, SET and DELETE requests were requested in the server parameters or assumed by default, but the external security manager LIST function issued to load the security profiles during server initialization gave an unexpected return code.

**System action**
The server is terminated.

**User response**
See the preceding message DFHCF0507 for the details of the reason for the failure. If these security checks are not required, specify SECURITY=NO in the server parameters, in which case each CICS region that is authorized to connect to the server will be able to open or delete any table in the pool.

**Module:**
DFHCFXS
DFHCF0511  Attempt to open table table was rejected because the external security manager is not available.

**Explanation**
The coupling facility data table server was attempting to perform a security check for whether the connected region was allowed to open that data table, but the external security manager was unexpectedly unavailable, even though it had been available at server initialization time.

**System action**
The table open request is rejected.

**User response**
Note that no further table open requests will succeed unless the external security manager is reactivated.

Module: DFHCFXS

---

DFHCF0512  RACROUTE REQUEST=FASTAUTH for resource resource gave R15=rc, SAFPRRET=retcode, SAFPRREA=rsncode.

**Explanation**
A coupling facility data table OPEN, SET or DELETE security check gave a non-zero return code. This message indicates the resource name used for the check, the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

**System action**
Access to the table is rejected with message DFHCF0513.

**User response**
See the documentation of the RACROUTE macro with REQUEST=FASTAUTH in z/OS Security Server RACROUTE Macro Reference (GC28-1922) for the explanation of the return and reason codes.

Module: DFHCFXS

---

DFHCF0513  Attempt to open table table was rejected by the external security manager.

**Explanation**
A security check was performed by the coupling facility data table server to determine whether the connected region was allowed to open the named table, and the external security manager indicated that access was not allowed.

**System action**
The table open request is rejected.

**User response**
See the preceding message DFHCF0512 for the specific reason that access was rejected. Check that the correct table name was specified. Ensure that the client region is authorized to access the resource matching the table name (prefixed by the server region userid if SECPRFX=YES was specified) in the CICS file resource class (usually 'FCICSFCT').

Module: DFHCFXS

---

DFHCF0521  RACROUTE REQUEST=LIST, ENVIR=DELETE, CLASS='class' gave R15=rc, SAFPRRET=retcode, SAFPRREA=rsncode.

**Explanation**
The external security manager LIST function to unload the in-storage security profiles during coupling facility data table server termination gave an unexpected non-zero return code. This message shows the RACROUTE register 15 return code and the external security manager return and reason codes returned in the SAF request parameter list.

**System action**
Server termination processing continues.
User response

See the documentation of the RACROUTE macro with
REQUEST=LIST in z/OS Security Server RACROUTE
Macro Reference (GC28-1922) for the explanation of
the return and reason codes.

Module:
DFHCFXS

Destination

Console and SYSPRINT

DFHCF0601I Starting statistics collection for
interval since last time.

Explanation

The coupling facility data table server is about to
collect interval, end of day or closedown statistics.
This message identifies the start of the time interval
to which the statistics apply, which is either the time
that the server was started up or the time of the last
reset, which occurs whenever interval or end of day
statistics are produced. The format of the timestamp is
yyyy-mm-dd hh:mm:ss.

System action

The server proceeds with statistics collection.

User response

None.

Module:
DFHCFST

Destination

SYSPRINT

DFHCF0602I Statistics collection completed,
reset performed.

Explanation

Coupling facility data table server statistics have been
collected and counters have been reset. This occurs
for interval or end of day statistics.

System action

Processing continues.

User response

None.

Module:
DFHCFST

Destination

Console and SYSPRINT

DFHCF0604 Timer SET failed, return code retcode, reason code rsnccode.

Explanation

The statistics subtask in the coupling facility data table
server tried to set up a timer wait interval but failed.

System action

The interval statistics function is terminated with
message DFHCF0606.

User response

Check the return code and reason code. A return code
of 4 indicates an attempt to set up more than one
concurrent timer interval, which indicates a logic error
in the server. The reason code in this case is the MVS
STIMERM identifier for the existing timer interval. A
return code of 8 indicates that the MVS STIMERM
macro failed, in which case the reason code indicates
the return code received from STIMERM SET.

Module:
DFHCFST

Destination

Console and SYSPRINT
Explanation
The statistics subtask in the coupling facility data table server tried to cancel a timer wait interval but failed.

System action
The interval statistics function is terminated with message DFHCF0606.

User response
Check the return code and reason code. A return code of 4 indicates an attempt to cancel a nonexistent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM CANCEL.

Module: DFHCFST

Destination
Console and SYSPRINT

DFHCF0606 Statistics collection function is no longer available.

Explanation
The statistics collection subtask in the coupling facility data table server was unable to continue processing and has terminated. The reason will have been indicated by an earlier message.

System action
The interval statistics subtask terminates and no further interval statistics or end of day statistics will be produced for this run of the server.

User response
See the earlier message indicating the reason for the termination of the subtask.

Module: DFHCFST

Destination
Console and SYSPRINT

DFHCF0651 Restart processing cannot open table table, reason code reason.

Explanation
An application region has attempted to restart its connection to the coupling facility data table server, but an unresolved unit of work for that region has updated a table which cannot be opened at present, so restart processing cannot be completed. This message only occurs if the table is still in existence; if it has been deleted, the updates are simply discarded. The reason code is from the file open routine in module DFHCFOC, and indicates why the file could not be opened. In the current implementation, there are no user functions which could prevent a file from being opened by restart, so this condition should not be possible.

System action
Restart processing is terminated and recoverable tables cannot be accessed until it is successfully retried.

User response
None.

Module: DFHCFSP

Chapter 2. CICS messages 457
Destination
Console and SYSPRINT

**DFHCF0652**  Pool state error, reason code reason, processing function request for UOWID uowid, task task, region region.

**Explanation**
Integrity checks during coupling facility data table server syncpoint or restart processing found that data or control information in the list structure was in a state that should not be possible in normal processing. The reason codes are based on the response codes returned by the internal coupling facility interface.

- Reason codes:
  2  
  Entry exceeds maximum data length.
  3  
  Entry not found.
  4  
  Wrong version.
  5  
  Wrong list authority.
  6  
  Limit number of entries in list reached.
  7  
  No space left in structure.

All of these conditions can also occur in normal processing. This message is only issued if the condition occurs in a case where it should not occur, or when the normal retry action following the condition cannot be performed. For example, a wrong version response from the coupling facility interface normally simply indicates that an entry has changed, causing the entry to be read again, and this is only treated as a pool state error if the data or control information in the changed entry is not consistent with the expected state of the record.

**System action**
The current syncpoint or restart operation is terminated with a pool state error exception.

**User response**
This indicates that some data in the pool has become inconsistent or corrupted. There is no known way that this can happen unless a program other than the coupling facility data table server is used to access the pool. If this error occurs for changes to a particular table, it may be necessary to delete the table to clear up the problem. If it occurs for other control information, it may be necessary to recreate the pool.

**Module:**
DFHCFSP

**Destination**
Console and SYSPRINT

**DFHCF0701I**  CF data table pool poolname is to be unloaded.

**Explanation**
The coupling facility data table server program has been started with the **UNLOAD** option requesting that the table pool is unloaded to a sequential data set.

**System action**
The server starts to process the unload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

**User response**
None.

**Module:**
DFHCFUL

**Destination**
Console and SYSPRINT

**DFHCF0702I**  CF data table pool poolname has been successfully unloaded.

**Explanation**
The coupling facility data table pool has been unloaded successfully.

**System action**
The server closes down normally.

**User response**
None.

**Module:**
DFHCFUL
Destination
Console and SYSPRINT

DFHC0703I  Number of unloaded tables: tables. Blocks written: blocks.

Explanation
This message provides additional information about the results of the coupling facility data table pool unload process, giving the number of tables which were unloaded and the number of 4K data blocks written to the unloaded table pool data set.

System action
Server termination continues.

User response
None.

Module:
DFHCFUL

Destination
Console and SYSPRINT

DFHC0704  DFHCFUL data set for unload could not be opened.

Explanation
The data set to contain the unloaded coupling facility data table pool could not be opened.

System action
Unload processing is terminated and the server is closed down with message DFHC0706.

User response
Check that the DFHCFUL DD statement is present in the JCL for the unload job.

Module:
DFHCFUL

Destination
Console and SYSPRINT

DFHC0706 Unload for CF data table pool poolname was unsuccessful.

Explanation
The coupling facility data table pool unload process failed. The reason will have been described in a previous message.

System action
The server is terminated.

User response
See the previous message giving the reason for the unload failure. Note that any unload data set produced in this case will be incomplete and will not be valid for reload purposes.

Module:
DFHCFUL

Destination
Console and SYSPRINT

DFHC0721  CF data table table has been successfully unloaded, records records.
**Explanation**
The named coupling facility data table has been unloaded. Note that if any recoverable updates were pending, the number of table entries unloaded may be slightly larger than the number of records, as the entry for the original record is retained until syncpoint in case it is needed for backout.

**System action**
Unload processing continues.

**User response**
None.

**Module:** DFHCFUL

**Destination**
SYSPRINT

---

**Explanation**
One or more unresolved recoverable units of work were found for the specified recoverable connection identifier during coupling facility data table pool unload processing.

**System action**
Unload processing will include the status of those units of work in the unloaded data, to allow them to be resolved after the pool is reloaded.

**User response**
None.

**Module:** DFHCFRL

**Destination**
Console and SYSPRINT

---

**Explanation**
The coupling facility data table pool has been reloaded successfully.

**System action**
The server closes down normally.

**User response**
None.

**Module:** DFHCFRL

**Destination**
Console and SYSPRINT

---

**Explanation**
This message provides additional information about the results of the coupling facility data table pool reload process. Tables on the unloaded data set are bypassed during reload processing if they already exist in the pool (for example as a result of a previous reload which could not be completed due to lack of space).

**System action**
Server termination processing continues.
DFHC0804  DFHCFRL data set for reload could not be opened.

Explanation
The data set containing the coupling facility data table pool to be reloaded could not be opened.

System action
Reload processing is terminated and the server is closed down with message DFHCF0808.

User response
Check that the DFHCFRL DD statement is present in the JCL for the reload job.

DFHC0805  Reload access to CF structure strname failed with response response.

Explanation
The coupling facility data table pool reload process failed because of a problem with coupling facility access.

System action
Reload processing is terminated and the server is closed down with message DFHCF0808.

User response
If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHCF0441 will have been issued. Any other response code indicates an internal logic error.

DFHC0807  Reload data set contains incorrect data near block block, offset offset.

Explanation
The coupling facility data table pool reload process failed because the unloaded pool data set is not in the correct format.

System action
Reload processing is terminated and the server is closed down with message DFHCF0808.

User response
Check that the correct data set is being used and that the unload process completed normally.

DFHC0808  Reload for CF data table pool poolname was unsuccessful.
Explanation
The coupling facility data table pool reload process could not be completed. The reason will have been described in a previous message.

System action
The program is terminated.

User response
See the previous message giving the reason for the reload failure.

Module:
DFHCFRL

Destination
Console and SYSPRINT
DFHCF0809  Reload for CF structure strname failed, structure is full.

Explanation
Coupling facility data table pool reload processing failed because there are insufficient free entries or elements to store the new data in the structure.

System action
Reload processing is terminated and the server is closed down with message DFHCF0808.

User response
If the structure is currently allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be increased dynamically using the MVS SETXCF command with the START,ALTER option, and the reload job can then be run again as soon as the alter request completes, in which case it will skip over duplicate information which has already been successfully reloaded. If the structure is at its maximum size, use the MVS SETXCF FORCE command to delete the structure, then increase the SIZE and INITSIZE parameters in the current CFRM policy and activate the updated policy, and rerun the reload job. The approximate amount of information which could not be reloaded can be estimated by comparing the numbers of blocks read and tables reloaded, as described by following message DFHCF0803, with the corresponding numbers from message DFHCF0703 in the unload job.

Module:
DFHCFRL

Destination
Console and SYSPRINT
DFHCF0821  CF data table table has been successfully reloaded, records records.

Explanation
The named coupling facility data table has been reloaded. Note that if any recoverable updates were pending, the number of table entries reloaded may be slightly larger than the number of records, as the entry for the original record is retained until syncpoint in case it is needed for backout.

System action
Reload processing continues.

User response
None.

Module:
DFHCFRL
**Destination**

**SYSPRINT**

**DFHCF0822**  
*CF data table table is already defined, reloading has been bypassed.*

**Explanation**

A coupling facility data table which was being reloaded was found to have the same name as an existing table within the pool.

**System action**

Reloading of the table is bypassed, and reload processing continues with the next table.

**User response**

None.

**Module:**  
DFHCFRL

**Destination**

**SYSPRINT**

**DFHCF0831**  
*uowids units of work were reloaded for recoverable connection applid.*

**Explanation**

Coupling facility data table pool reload processing has reloaded one or more unresolved recoverable units of work for the specified recoverable connection identifier.

**System action**

Reload processing restores the status of those units of work from the unloaded data, to allow them to be resolved when the connection is next restarted.

**User response**

None.

DFHCF0942I  R12=prv CF IXLLIST  Req=request
            Adj=adjarea  Buf=buffer
            List=listnum  Rsn=rsncode

Explaination
Coupling facility data table server tracing for coupling facility accesses is active and the result from an IXLLIST macro is being traced. The information traced includes an abbreviation of the type of request being performed, the addresses of the adjunct area and data buffer (zero when not used), the number of the list being accessed and the reason code returned by the macro. See the documentation of the IXLLIST macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for further details, including the explanation of the reason code.

DFHCF0944I  R12=prv CF Exit response table

Explanation
Coupling facility data table server tracing for coupling facility accesses is active and information from the request interface parameter list is being traced on exit from the CF request module DFHCFCF.

• Response codes:
  OK
    Normal completion.
  LEN ERROR
    Data to be read exceeds buffer length.
  NOT FOUND
    No entry was found with the given key.
  DUPLICATE
    Add was rejected because key already exists.
  WRONG VER
    Change was rejected because version did not match.
  AUTH FAIL
    List authority value did not match.
  LIST LIM
    List has reached maximum number of entries.
  I/O ERROR
    IXLLIST error other than any of the above.

System action
Processing continues.

DFHCPPnnnn messages

DFHCP0101I applid CPI initialization has started.

Explanation
This is an informational message indicating the start of CPI initialization.

System action
Initialization continues.

User response
None. You can suppress this message with the system initialization parameter MSG_LVL=0.

Module: DFHCPIN1

XMEOUT parameters/Message inserts

1. applid

Destination Console

DFHCP0102I applid CPI initialization has ended.

Explanation
This is an informational message indicating that CPI initialization has completed successfully.

System action
Initialization continues.
User response

None. You can suppress this message with the system initialization parameter MSG_LVL=0.

Module:
DFHCPIN1

XMEOUT parameters/Message inserts

1. applid

Explanation

The application program has used an unrecognized conversation_ID on one of its calls to CPI-C. This could mean that:

- The application program has not created a conversation successfully using either the CMINIT (Initialize_Conversation) or the CMACCP (Accept_Conversation) verbs, or
- The application program has used the conversation_ID supplied to it by CPI-C incorrectly.

System action

CICS returns control to the application program with return code CM_PROGRAM_PARAMETER_CHECK. The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Determine which error has occurred and amend the application program accordingly.

The z/VM: CPI Communications User’s Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module:
DFHCPIC

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. tranid
5. program_name
6. verb
7. Conversation_ID

Explanation

The CPI-C state machine detected a state error. This means that the conversation was in the wrong state to issue this verb.

The application program has used an unrecognized conversation_ID on one of its calls to CPI-C. This could mean that:

- The application program has not created a conversation successfully using either the CMINIT (Initialize_Conversation) or the CMACCP (Accept_Conversation) verbs, or
- The application program has used the conversation_ID supplied to it by CPI-C incorrectly.

System action

CICS returns control to the application program with return code CM_PROGRAM_PARAMETER_CHECK. The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Determine which error has occurred and amend the application program accordingly.

The z/VM: CPI Communications User’s Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Module:
DFHCPIC

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. tranid
5. program_name
6. verb
7. Conversation_ID

Explanation

The CPI-C state machine detected a state error. This means that the conversation was in the wrong state to issue this verb.

The application program has used an unrecognized conversation_ID on one of its calls to CPI-C. This could mean that:

- The application program has not created a conversation successfully using either the CMINIT (Initialize_Conversation) or the CMACCP (Accept_Conversation) verbs, or
- The application program has used the conversation_ID supplied to it by CPI-C incorrectly.
System action

CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.
The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Use the state machine defined in the z/VM: CPI Communications User’s Guide manual, (SC26-4399), and the CICS trace information to determine the sequence of CPI-C calls issued that caused the state error. Amend the application program in accordance with the supplied guidelines.

The tp_name_length parameter (tp_name_length) supplied on the CMSTPN (Set_TP_Name) verb is not in the range 1-64.

Explanation
The application program has called CMSTPN (Set_TP_Name) with an tp_name_length parameter outside the range 1-64.

System action
CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.

The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response
Amend CMSTPN in the application program to use a valid tp_name_length parameter.

The z/VM: CPI Communications User's Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called.

Destination
CCPI

DFHCP0752I date time applid tranid program_name conversation_ID data passed on call to CMSEND contains an invalid GDS record.
Explanation

The application program has called CMSEND (Send_Data). Data passed on this call contains an invalid generalized data stream (GDS) record.

Note: This message is only issued on a basic conversation. That is, when conversation_type is set to CM_BASIC_CONVERSATION.

System action

The data is not sent.
CICS returns control to the application program with return_code CM_PROGRAM_PARAMETER_CHECK.
The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Amend the application program to ensure that this parameter is correct.

The z/VM: CPI Communications User's Guide, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called together with information about GDS records.
The CICS documentation provides additional information about GDS records.

2. time
3. applid
4. tranid
5. program_name
6. conversation_ID
7. send_length

Destination
CCPI

DFHCP0754I date time applid tranid program_name conversation_ID data sent so far is currently in the middle of a GDS record so cannot send CMDEAL, CMCFM or CMPTR requests.

Explanation

The application is using a basic conversation (that is, the conversation_type characteristic has been set to CM_BASIC_CONVERSATION).
The application has not sent all the data associated with the last Generalized Data Stream (GDS) record.
However, the application has tried to send one of the following requests:
• a CMDEAL (Deallocate),
• a CMCFM (Confirm), or
• a CMPTR (Prepare_to_receive).
System action

CICS returns control to the application program with return_code CM_PROGRAM_STATE_CHECK.
The CPI-C verb has no effect on either the conversation or the conversation characteristics.

User response

Inspect the data sent to determine why the previous send was in error. Check if the error was caused by the application truncating the last record or if there was an error in one of the length fields which caused CPI-C to misinterpret the data-stream and amend the application program accordingly.

The z/VM: CPI Communications User's Guide manual, (SC26-4399), provides a detailed description of all the CPI-C verbs and how they should be called together with information about GDS records.

The CICS documentation provides additional information about GDS records.

7. X'sense_code'
8. Value chosen from the following options:
   2=program,
   1=program -
9. tp_name

Destination

CCPI

Explanation

A sense code received from the partner program on a remote system was unrecognized. This could be for one of two reasons.
• a protocol error, or
• the partner program is running on a later release and new sense codes have been added to the APPC architecture.

System action

CICS returns control to the application program with either return_code CM_DEALLOCATE_ABEND or CM_PROGRAM_ERROR_PURGING. This depends on whether the unrecognized sense code has been interpreted as an error or interpreted as a conversation abend.

Note:

tp_name is present only if this message is being issued on the front-end system.

User response

Use the sense code provided in the message and your knowledge of the two communicating systems to determine which of the two possible cases documented above is the error.

If the error is a protocol error, you need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Explanation

A sense code received from the partner program on a remote system was unrecognized. This could be for one of two reasons.
• a protocol error, or
• the partner program is running on a later release and new sense codes have been added to the APPC architecture.
Explanation
The allocation of a session for this conversation failed
due to an unrecognized netname netname.

This value is derived from the partner.lu_name
specified either in the partner resource for the
conversation, or on a CPI-C CMSPLN
(set_partner.lu_name)
verb.

System action
CICS returns control to the application program with
return_code CM_PARAMETER_ERROR.

No session is allocated.

User response
Amend the application program to use a recognized
netname.

**Destination**
CCPI

**DFHCPC0760I**
date time applid tranid
program_name conversation_ID
an invalid partner_lu_name partner_lu_name was specified for the CMALLC (Allocate) verb.

**Explanation**
The allocation of a session has failed. This is because the partner_lu_name specified in the conversation control block (CPC) does not conform to the following rules.

1. The partner_lu_name may take one of the following forms:
   - Netname (1-8 characters long), or
   - Network.netname (where network and netname are EACH 1-8 characters long).
2. Netname and network both consist of the following character sets, where the first character is always alphabetic.
   - A-Z
   - a-z
   - @
   - $
   - #
   - 0-9
   **Note:** Lower case letters are translated to uppercase.

**System action**
The session is not allocated.
CICS returns control to the application program with return_code CM_PARAMETER_ERROR.

**User response**
Depending on the application, the partner_lu_name either comes from the partner resource (specified on the CMINIT (initialize_conversation) verb in the sym_dest_name parameter) or an optional CMSPLN (set_partner_lu_name) verb. This value needs to be changed to conform to the rules above.

P**CPI-C verb verb** was disallowed  
because of the BACKOUT-  
REQUIRED program state.

**Explanation**  
The CPI-C state machine has detected a state  
error. The verb **verb** cannot be issued in BACKOUT-  
REQUIRED program state.

**System action**  
CICS returns control to the application program with  
return code CM_PROGRAM_STATE_CHECK.

**User response**  
Amend the application program in accordance  
with the supplied guidelines. See the z/VM: CPI  
Communications User’s Guide (SC26-4399), which  
contains a description of CPI-C verbs and how they  
should be called.

**Module:**  
DFHCPIC
**DFHCQnnnnn messages**

**DFHCQ0001**

`applid` An abend (code `aaa/bbbb`) has occurred at offset `X'offset'` in module `modname`.

**Explanation**

An abnormal end (abend) or program check has occurred in module `modname`. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code `aaa/bbbb` is a three 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, OC1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; TS1310 refers to message DFHTS1310).

**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the z/OS MVS System Codes manual. Then look up the CICS alphanumeric code. This tells you, for example, whether the error is a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module `modname`, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to resolve your problem for guidance on how to proceed.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

**Module:**

DFHCQCQ, DFHCQSY

**XMEOUT parameters/Message inserts**

1. `applid`
2. `aaa/bbbb`
3. `X'offset'`
4. `modname`

**DFHCQ0002**

`applid` A severe error (code `X'code'`) has occurred in module `modname`.

**Explanation**

An error has been detected in module `modname`. The code `X'code'` is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the Troubleshooting and support.

**System action**

An exception entry (code `X'code'` in the message) is made in the trace table. A system dump is taken,
unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMMD). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

The severity of this error depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

The system continues normally.

| User response |
Check the syntax of the CEKL command.

| Module: |
DFHCQSY
Destination
Console
DFHCQ0224I applid CEKL INQUIRE command ignored; keywords conflict.

Explanation
The CEKL INQUIRE command has been rejected. Conflicting keywords have been specified.

System action
The system continues normally.

User response
Check the syntax of the CEKL command.
Module: DFHCQSY

Destination
Console
DFHCQ0223I applid CEKL SET command ignored; TASK keyword must be specified.

Explanation
The CEKL SET command has been rejected. The TASK keyword is expected but has not been specified.

System action
The system continues normally.

User response
Check the syntax of the CEKL command.
Module: DFHCQSY

Destination
Console
DFHCQ0232I applid CEKL SET command ignored; PURGE or FORCEPURGE or KILL keyword must be specified.

Explanation
The CEKL SET command has been rejected. A keyword, PURGE or FORCEPURGE or KILL, is expected but has not been specified.

System action
The system continues normally.

User response
Check the syntax of the CEKL command.
Module: DFHCQSY

Destination
Console
DFHCQ0231I applid CEKL SET command ignored; keyword expected.

Explanation
The CEKL SET command has been rejected. A keyword is expected but has not been specified.

User response
Check the syntax of the CEKL command.
Module: DFHCQSY
**Destination**

Console

**DFHCQ0234I applid CEKL SET command ignored; keywords conflict.**

**Explanation**

The CEKL SET command has been rejected. Conflicting keywords have been specified.

**System action**

The system continues normally.

**User response**

Check the syntax of the CEKL command.

**Module:**

DFHCQSY

---

**Destination**

Console

**DFHCQ0240I applid CEKL INQUIRE: task number taskno not found.**

**Explanation**

Task number `taskno` has not been found.

**System action**

The system continues normally.

**User response**

Check the value that you specified for `taskno`.

If this is correct then the task has been removed from the system.

**Module:**

DFHCQSY

---

**Destination**

Console

**DFHCQ0241I applid CEKL INQUIRE: task no tasks matched selection criteria.**

**Explanation**

CICS has not found any tasks that match the options specified on the CEKL INQUIRE command.

**System action**

The system continues normally.

**User response**

Check the options specified on the CEKL command. For example specify a lower value for the SUSPENDED option.

**Module:**

DFHCQSY

---

**Destination**

Console

**DFHCQ0242I applid CEKL INQUIRE: no tasks matched selection criteria.**

**Explanation**

CICS has not found any tasks that match the options specified on the CEKL INQUIRE command.

**User response**

Check the options specified on the CEKL command. For example specify a lower value for the SUSPENDED option.

**Module:**

DFHCQSY

---

**Destination**

Console

**DFHCQ0243I applid CEKL INQUIRE: notasks task(s) matched selection criteria.**

**Explanation**

`notasks` tasks have been found matching the options specified on the CEKL INQUIRE command.

**System action**

CICS displays information about these tasks on the console and job log.

**User response**

You should use the information to determine, which task, if any, should be removed from your system.

If the list of tasks is too long you may decide to invoke the CEKL INQUIRE command again specifying a different set of options.

**Module:**

DFHCQSY
Destination

Console

**DFHCQ0250I** applid CEKL SET: task number taskno not found.

**Explanation**
The request to remove task number taskno from the system has been rejected. The task can not be found.

**System action**
The system continues normally.

**User response**
Check the value that you specified for taskno. If this is correct then the task has been removed from the system.

**Module:**
DFHCQSY

Destination

Console

**DFHCQ0251I** applid CEKL SET: deferred PURGE request issued for task number taskno.

**Explanation**
The request to remove task taskno from the system has been deferred as it has not yet been attached to the dispatcher; the task either belongs to a transaction class that is at its MAXACTIVE limit or the system is at its MXT limit.

**System action**
CICS will purge the task when it has been attached to the dispatcher.

**User response**
None.

**Module:**
DFHCQSY

Destination

Console

**DFHCQ0252I** applid CEKL SET: PURGE request issued for task number taskno.

**Explanation**
A request has been passed to the dispatcher to purge task number taskno.

**System action**
CICS continues normally.

**User response**
The CEKL INQUIRE TASK(taskno) command can be used to display the progress of the request.

**Module:**
DFHCQSY

Destination

Console

**DFHCQ0253I** applid CEKL SET: PURGE request ignored; task number taskno is being purged.

**Explanation**
The request to purge number taskno has been ignored. A previous request was passed to the dispatcher to purge the task.

**System action**
CICS continues normally.

**User response**
None.

**Module:**
DFHCQSY

Destination

Console

**DFHCQ0254I** applid CEKL SET: PURGE request ignored; task number taskno is being forcepurged.

**Explanation**
The request to purge number taskno has been ignored. A previous request was passed to the dispatcher to forcepurge the task.
**System action**
CICS continues normally.

**User response**
None.

**Module:**
DFHCQSY

**Destination**
Console

**Explanation**
The request to kill purge number taskno has been ignored.
A previous request was passed to the dispatcher to kill the task.

**Module:**
DFHCQSY

**Destination**
Console

**Explanation**
A previous request was passed to the dispatcher to kill the task.

**System action**
CICS continues normally.

**User response**
None.

**Module:**
DFHCQSY

**Destination**
Console

**Explanation**
The request to forcepurge number taskno has been ignored.
A previous request was passed to the dispatcher to forcepurge the task.

**System action**
CICS continues normally.

**User response**
None.

**Module:**
DFHCQSY

**Destination**
Console

**Explanation**
The CEKL INQUIRE TASK(taskno) command can be used to display the progress of the request.

**Module:**
DFHCQ0259I  applid CEKL SET: KILL request issued for task number taskno.

Explanation
A request has been passed to the dispatcher to kill task number taskno.

System action
CICS continues normally.

User response
The CEKL INQUIRE TASK(taskno) command can be used to display the progress of the request.

Module:
DFHCQSY

Destination
Console

DFHCQ0260I  applid CEKL SET: KILL request ignored; task number taskno is being killed.

Explanation
The request to kill task number taskno has been ignored.
A previous request was passed to the dispatcher to kill the task.

System action
CICS continues normally.

User response
The CEKL INQUIRE TASK(taskno) command can be used to display the progress of the request.

Module:
DFHCQSY

Destination
Console

DFHCQ0261I  applid CEKL SET: FORCEPURGE request rejected for system task number taskno.

Explanation
The request to forcepurge system task number taskno from the system has been rejected.

System action
The system continues normally.

User response
None.

Module:
DFHCQSY

Destination
Console

DFHCQ0262I  applid CEKL SET: KILL request rejected for system task number taskno.

Explanation
The request to kill system task number taskno from the system has been rejected.

System action
The system continues normally.

User response
None.

Module:
DFHCQSY

Destination
Console

DFHCQ0263I  applid CEKL SET: PURGE request rejected for system task number taskno.

Explanation
The request to purge system task number taskno from the system has been rejected.

System action
The system continues normally.

User response
None.

Module:
DFHCQSY
Destination
Console
DFHCQ0264I applid CEKL SET: PURGE request rejected; task number taskno is not purgeable.

Explanation
The request to purge task number taskno from the system has been rejected. The transaction definition specifies SPURGE(NO).

System action
The system continues normally.

User response
Retry the request to remove the task from the system specifying either the FORCEPURGE or the KILL option.

Module:
DFHCQSY

Destination
Console
DFHCQ0266I applid CEKL SET: KILL request ignored; task number taskno is being purged.

Explanation
The request to kill task number taskno has been rejected.

System action
CICS will purge the task when it has been attached to the dispatcher.

User response
If the task can not be attached to the dispatcher because the system is under stress then

• the CEKL INQUIRE command can be used to identify another task that is already attached to the dispatcher
• the CEKL SET command can be used to remove that task from the system so reducing the stress

DFHCR4300 date time applid Transaction tranid
not executed on terminal termid on system sysid. Transaction invalid on that system

500 CICS TS for z/OS: CICS Messages
Explanation
A request was made to start a task on remote system sysid. The request could not run because transaction tranid is not defined on system sysid.

This message is also displayed for static routing under the following circumstances:

- The transaction transid is not eligible for enhanced routing and
- The transaction is defined on system sysid with a REMOTESYSTEM name that does not match the name of the connection to this system (or the name of an intermediate system, if the request is daisy-chained).

System action
Other processing continues.

User response
Ensure that terminal termid and transaction tranid are defined correctly on system sysid.

Module: DFHCRS

**DFHCR4310**  
```
date time applid  
Request from system sysid to initiate transaction tranid on that system on terminal termid was not executed.  
Transaction invalid on this system.
```  

**Explanation**  
A request was received from remote system sysid to start transaction tranid on system sysid on terminal termid. The request could not be met because transaction tranid is not defined in this system.  

This message is also displayed for static routing under the following circumstances:  
- The transaction transid is not eligible for enhanced routing and  
- The transaction is defined with a REMOTESYSTEM name that does not match the name of the connection to the remote system sysid that sent the request (or the name of an intermediate system, if the request is daisy-chained).

**System action**  
Processing continues.

**User response**  
Ensure that terminal termid and transaction tranid are defined correctly on both systems.

**Module:**  
DFHCRS

CCZM

DFHCZ0106 date time applid userid termid tranid program_name CICS exception summary: exceptno class::method type=type.

Explanation

The method reported in the message failed because an internal call to CICS returned a failure condition.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

You need to correct the cause of the underlying CICS failure before retrying this command. You should look at other messages and the trace log for further indication of the root cause.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

This method failed because of a severe internal error. Diagnostic information: diaginfo1, diaginfo2.

The method reported in the message failed because of a severe internal error.

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

Make a note of the diagnostic information and contact IBM for assistance. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
ICCBASIC, ICCCLKEC, ICCCTLEC, ICCFILEC, ICCFLIEC, ICCRESEC, ICCRESIC, ICCTIMEC, ICCTRMEC, ICCTSKEC

Explanation
The constructor/operator reported in the message failed because it is not supported on the current platform of env.

For further guidance, see the Foundation Classes: reference.

The constructor/operator failed because it is not supported on the current platform (MVS).

If the calling program is user written then you need to establish why this program was running on an MVS platform; and then, either change the program not to call this method, or change the platform as appropriate.

If you are using vendor written software that fails in this way, you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Chapter 2. CICS messages 507
**Explanation**

The method/operator reported in the message failed because CICS has been configured to restrict its functionality to that of the CICS family subset. This method/operator is not part of this subset.

For further guidance, see the Foundation Classes: reference.

**System action**

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response**

If the calling program is user written, then you need to establish why this program was running on an MVS platform, and then either change the program to avoid using this method/operator.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

8. class
9. method
10. env
This method failed because the system is configured with CICS family subset enforcement.

Explanation

The method reported in the message failed because CICS has been configured to restrict its functionality to that of the CICS family subset. This method is not part of this.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If the calling program is user written then you need to establish why this method was called, and if appropriate, switch off the CICS family subset enforcement or change the program to avoid using this method.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
ICCABDEC, ICCCLKEC, ICCCONNECT, ICCCTLEC, ICCSESEC, ICCSRQIC, ICCTMDEC, ICCTRMEC, ICCTSKEC

This method failed because the object being accessed was incomplete.

Explanation

The method reported in the message failed because the object being accessed was incomplete as shown below:

<table>
<thead>
<tr>
<th>Method Name</th>
<th>Required Resource</th>
</tr>
</thead>
<tbody>
<tr>
<td>IccSession::connectProcess</td>
<td>Partner Id</td>
</tr>
<tr>
<td>IccSession::convId</td>
<td>Conversation identifier name</td>
</tr>
<tr>
<td>IccSession::PIPList</td>
<td>PIP list</td>
</tr>
<tr>
<td>IccSession::process</td>
<td>Process name</td>
</tr>
<tr>
<td>IccSession::syncLevel</td>
<td>Sync level</td>
</tr>
</tbody>
</table>

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response

If the calling program is user written then you need to change it so that the object being accessed, is built correctly.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

CCZM

DFHCZ0117  date time applid userid
termid tranid program_name
class::method This method failed
because the object being accessed
was of type object_type.

Explanation

The method reported in the message failed because
the object being accessed was not of the correct type.

For example the method IccSession::extractProcess() is
restricted to access objects of type Back-End only.

For further guidance, see the Foundation Classes:
reference.

System action

The system creates an exception entry in the trace
table, writes this message to the TD queue CCZM, and
throws an exception.

User response

If the calling program is user written then you need
either to change it or the related CICS definitions,
so that the object is of the correct type before it is
accessed in this way.

If you are using vendor written software that fails
in this way then you will need assistance from the
vendor.

If the error condition persists, you will need assistance
from IBM. See Working with IBM to solve your problem
for guidance on how to proceed.

DFHCZ0120  
date time applid userid termid tranid program_name  
class::method This method failed because the current number of 
nested program calls made using 
this method is already at the 
maximum of max.

Explanation
The method reported in the message failed because 
its usage is restricted to a maximum of 15 nested 
calls, while the current request would cause this to be 
exceeded.

For further guidance, see the Foundation Classes: reference.

System action
The system creates an exception entry in the trace 
table, writes this message to the TD queue CCZM, and 
throws an exception.

User response
If the calling program is user written then you need to 
change it so that it does not cause the depth of nesting 
to exceed 15.

If you are using vendor written software that fails 
in this way then you will need assistance from the 
vendor.

If the error condition persists, you will need assistance 
from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

class::method This method failed because the call is invalid for 
the object being accessed. The 
resource type of the object is 
resourcetype.

Explanation
The method reported in the message failed because 
the method is only valid for a restricted set of resource 
types, and is invalid for the object being accessed.

This method is valid for the following resource 
types; cDataQueue, cFile, cFileIterator, cProgram, 
cStartRequestQ, cTempStore.

For further guidance, see the Foundation Classes: reference.

System action
The system creates an exception entry in the trace 
table, writes this message to the TD queue CCZM, and 
throws an exception.

User response
If the calling program is user written then you need to 
change it so that it does not call this method for this 
type of object.

If you are using vendor written software that fails 
in this way then you will need assistance from the 
vendor. 
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

10. pname
11. length
12. max

**Destination**

CCZM

**DFHCZ0129**

This method detected an exception which resulted in data being truncated.

**Explanation**

The method/operator reported in the message failed because the target object was not big enough and could not be extended to accommodate the new string.

For example, assuming the definition, `IccBuf buffer(5,IccBuf::fixed)`, the assignment, `buffer = "toolong"`, would fail because the length of "toolong" is greater than 5. The resulting text value of the object buffer would be "toolo".

For further guidance, see the Foundation Classes: reference.

**System action**

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, throws an exception, and completes the request having truncated the excess data.

**User response**

If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Destination**

CCZM

**DFHCZ0130**

This method detected an exception which resulted in data being truncated.
This constructor method failed to create an object because a parameter of type string contained a value that was too long. It was set to 'stringvalue...' while the maximum length allowed is maxstringlength.

Explanation

The constructor method reported in the message failed because one of the string parameters supplied contained a value that was too long.

For example, the method call

IccFileId::IccFileId("LONGFILENAME") would fail

because the value "LONGFILENAME" is greater than

IccGI::maxFileNameLength.

For further guidance, see the Foundation Classes: reference.

System action

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and

throws an exception.

User response

If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

7. program_name
8. class
9. method
10. pname
11. plength
This method failed because the parameter named `param_name` contained conflicting flags specified as `flag1` and `flag2`.

**Explanation**

The method reported in the message failed because one of the parameters supplied was invalid.

This parameter of the method is defined as an integer, where each bit denotes a flag, some of which must not be set simultaneously. The calling parameter had a contradictory pair of flags set. For example, the method call `IccFile::setAccess(3)` would fail because the access value of 3 contains the two contradictory flags `readable` and `notReadable`.

For further guidance, see the Foundation Classes: reference.

**System action**

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response**

If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

ICCFILEC

**XMEOUT parameters/Message inserts**

1. `date`
2. `time`

---

This constructor failed to create an object because the parameter named `pname` contained an invalid value of `pvalue`.

**Explanation**

The method reported in the message failed because one of the parameters supplied was invalid.

This parameter of the method is restricted to a defined range, while the value supplied on the call was not within this range. For example, the the constructor method call `IccJournalId::IccJournalId(987)` would fail because the `journalNum` value of 987 is outside the range 1 to 99.

For further guidance, see the Foundation Classes: reference.

**System action**

The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

**User response**

If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

10. pname
11. pvalue

Destination
CCZM

DFHCZ0138 date time applid userid termid tranid program_name class::method This method failed because the parameter named pname contained an invalid value of pvalue.

Explanation
The method reported in the message failed because one of the parameters supplied was invalid.

This parameter of the method is defined as an integer (general sense), while the value supplied on the call was not sensible for the functional content of the method. For example the method call IccTerminal::sendLine(9876,buffer) would fail, because the column value of 9876 is greater than the height of the screen.

For further guidance, see the Foundation Classes: reference.

System action
The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.

User response
If the calling program is user written then you need to check the invalid parameter on the calling statement, and if appropriate, change it.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

10. pname
11. pvalue

Destination
CCZM

DFHCZ0140 date time applid userid termid tranid program_name class::method This constructor failed to create an object because it is a singleton class which already exists.

Explanation
The constructor method reported in the message failed to create an object because it is a singleton class which already exists. Such classes only allow a single instance of itself to exist at any one moment.

For further guidance, see the Foundation Classes: reference.

System action
The system creates an exception entry in the trace table, writes this message to the TD queue CCZM, and throws an exception.
User response
If the calling program is user written, then you need to change it so that it does not call this method more than once per transaction.

You might consider using the method instance(). All CICS singleton classes provide a method of this name or similar, which returns a reference to the unique object, creating it should it not pre-exist. This method can be safely called multiple times, each time returning the reference to the same object.

If you are using vendor written software that fails in this way then you will need assistance from the vendor.

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

A JNI call, NewByteArray(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action
The system writes this message to the TD queue CCZM and takes a system dump.

User response
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts
1. date
time
3. applid
4. userid
5. termid
6. tranid
7. program_name
8. module

Destination
CCZM

DFHCZ0254
date time applid userid termid tranid program_name JNI call 'FindClass()' in module failed.

Explanation
A JNI call, FindClass(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action
The system writes this message to the TD queue CCZM and takes a system dump.

User response
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

1. date
time
3. applid
4. userid
5. termid
6. tranid
7. program_name
8. module

Destination
CCZM

DFHCZ0255
date time applid userid termid tranid program_name JNI call 'ThrowNew()' in module failed.

Explanation
A JNI call, ThrowNew(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action
The system writes this message to the TD queue CCZM and takes a system dump.
User response
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. userid
5. termid
6. tranid
7. program_name
8. module

Destination
CCZM

DFHCZ0256  date time applid userid termid tranid program_name JNI call 'GetFieldID()' in module failed.

Explanation
A JNI call, GetFieldID(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action
The system writes this message to the TD queue CCZM and takes a system dump.

User response
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. userid
5. termid
6. tranid
7. program_name
8. module

Destination
CCZM

DFHCZ0257  date time applid userid termid tranid program_name JNI call 'GetMethodID()' in module failed.

Explanation
A JNI call, GetMethodID(), for setState(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action
The system writes this message to the TD queue CCZM and takes a system dump.

User response
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. userid
5. termid
6. tranid
7. program_name
8. module

Destination
CCZM

DFHCZ0258  date time applid userid termid tranid program_name JNI call 'GetMethodID()' in module failed.

Explanation
A JNI call, GetMethodID(), for setConvId(), in code written to support Java native methods used by the JCICS Java class library has failed.
**System action**
The system writes this message to the TD queue CCZM and takes a system dump.

**User response**
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFJCZDTC (DTCSupport.c)

**XMEOUT parameters/Message inserts**
1. date
2. time
3. applid
4. userid
5. termid
6. tranid
7. program_name
8. module

**Destination**
CCZM

**Explanation**
An attempt to allocate storage in code written to support Java native methods used by the JCICS Java class library has failed.

**System action**
The system writes this message to the TD queue CCZM and takes a system dump.

**User response**
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Destination**
CCZM

**Explanation**
A JNI call, NewObject(), to construct a Conversation object, in code written to support Java native methods used by the JCICS Java class library has failed.

**System action**
The system writes this message to the TD queue CCZM and takes a system dump.

**User response**
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFJCZDTC (DTCFile.c)

**XMEOUT parameters/Message inserts**
1. date
2. time
3. applid
4. userid
5. termid
6. tranid
7. program_name
8. module

**Destination**
CCZM

**Explanation**
A JNI call, NewObject(), to construct a Conversation object, in code written to support Java native methods used by the JCICS Java class library has failed.

**System action**
The system writes this message to the TD queue CCZM and takes a system dump.

**User response**
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.
Explanation
A JNI call, GetMethodID(), to find the constructor for Conversation, in code written to support Java native methods used by the JCICS Java class library has failed.

System action
The system writes this message to the TD queue CCZM and takes a system dump.

User response
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts
1. date
2. time
3. applid

1. `date`
2. `time`
3. `applid`
4. `userid`
5. `termid`
6. `tranid`
7. `program_name`
8. `module`

**Destination**

CCZM

**DFHCZ0265**

`date time applid userid termid tranid program_name JNI call 'GetMethodID()' in module failed.`

**Explanation**

A JNI call, GetMethodID(), in code written to support Java native methods used by the JCICS Java class library has failed.

**System action**

The system writes this message to the TD queue CCZM and takes a system dump.

**User response**

If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

DFJCDZTC (DTCSupport.c)

**XMEOUT parameters/Message inserts**

1. `date`
'CallVoidMethod()' in module failed.

Explanation
A JNI call, CallVoidMethod(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action
The system writes this message to the TD queue CCZM and takes a system dump.

User response
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. userid
5. termid
6. tranid
7. program_name
8. module

Destination
CCZM

DFHCZ0269 date time applid userid termid tranid program_name JNI call 'GetMethodID()' in module failed.

Explanation
A JNI call, GetMethodID() for setProcess(), in code written to support Java native methods used by the JCICS Java class library has failed.

System action
The system writes this message to the TD queue CCZM and takes a system dump.

User response
If the error condition persists, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFJCZDTC (DTCSupport.c)

security manager of class className installed.

Explanation

The Environment constructor has been unable to install the CICS security manager because a non-CICS security manager of class className is installed.

System action

The system writes this message to the TD queue CCZM.

User response

The CICS security manager ensures, for example, that a Java program cannot issue the exit command. Check that the security manager you have installed is compatible with running a CICS java program.

A JNI call, GetStringUTFChars(envp, userId), in code written to support Java native methods used by the JCICS Java class library has failed.

**System action**

The system writes this message to the TD queue CCZM and takes a system dump.

**DFHDBnnnn messages**

**DFHDB2001**

resynchronization with db2id for unit of work X'uowid' cannot take place due to initial start of CICS.

**Explanation**

CICS cannot resolve the disposition of unit of work (UOW) uowid that DB2 subsystem db2id holds from a previous connection because CICS was initial started. A CICS initial start should be avoided when resynchronization is outstanding. CICS cold, warm and emergency starts do not affect resynchronization, which occurs automatically when CICS and DB2 are connected.

**System action**

The CICS is connected to DB2 but UOW uowid will remain indoubt in DB2.

**User response**

The UOW uowid will have to be resolved manually using DB2 -DISPLAY THREAD and -RECOVER INDOUBT operator commands.

**Explanation**
This message is in response to a CICS-DB2 attachment facility DSNC DISPLAY or MODIFY command. Only one CICS-DB2 attachment facility may be active in a CICS region.

**Module:**
DFHD2CM1

**Destination**
Terminal End User

**System action**
The CICS-DB2 attachment facility command is not processed.

**User response**
Reenter the command with the correct plan name.

**Module:**
DFHD2CM1

**Explanation**
This message is in response to a CICS-DB2 attachment facility DSNC DISPLAY or DISCONNECT command. No threads were found using the specified plan name plan-name. The plan-name may be blank if a specific plan was not requested.

**System action**
The CICS-DB2 attachment facility command is not processed.

**User response**
Reenter the command with the correct transaction name.

**Module:**
DFHD2CM1

**Destination**
Terminal End User

**Explanation**
This message is in response to a CICS-DB2 attachment facility DSNC MODIFY DESTINATION command. The destination ID dest specified on the command to be modified is not one of the destinations currently defined in the DB2CONN as a message queue.

**System action**
The CICS-DB2 attachment facility command is not processed.

**User response**
Reenter the command with the correct destination ID.

**Module:**
DFHD2CM1

**Destination**
Terminal End User

**Explanation**
This message is in response to a CICS-DB2 attachment facility DSNC MODIFY DESTINATION command. The destination ID dest specified on the command to be modified is not one of the destinations currently defined in the DB2CONN as a message queue.

**System action**
The CICS-DB2 attachment facility command is not processed.

**User response**
Reenter the command with the correct destination ID.

**Module:**
DFHD2CM1

**Destination**
Terminal End User

**Explanation**
This message is in response to a CICS-DB2 attachment facility DSNC DISPLAY or MODIFY command. The transaction tran specified in the command was not defined as a CICS DB2 transaction. That is, there was no DB2TRAN defined for the transid, or the DB2TRAN referred to a DB2ENTRY that does not exist, or the case of the DISPLAY command, no threads were found for the transaction.

**System action**
The CICS-DB2 attachment facility command is not processed.

**User response**
Reenter the command with the correct transaction name.

**Module:**
DFHD2CM1

**Destination**
Terminal End User
Explanation
The CICS-DB2 attachment facility does not recognize the verb entered on the DSNC command.

System action
The command is not processed.

User response
Reenter the command with the correct syntax.

Module: DFHD2CM1

Destination
Terminal End User

DFHDB2008  date time applid  Keyword missing or invalid.

Explanation
The CICS-DB2 attachment facility DSNC command contains an unknown positional keyword or a keyword is missing.

System action
The command is not processed.

User response
Reenter the command with the correct syntax.

Module: DFHD2CM1

Destination
Terminal End User

DFHDB2009  date time applid  The value in the command is invalid.

Explanation
The numeric value in the DSNC modify command is invalid. The error is caused by one of the following:

- The value in the command is greater than 2000.
- The value in the command is greater than the TCBLIMIT specified in the DB2CONN.
- If the pool is being changed - for example, using transaction id CEPL - the value is less than 3.

System action
The CICS-DB2 attachment facility command is not processed.

User response
Reenter the command with a correct value.

Module: DFHD2CM1

Destination
Terminal End User

DFHDB2010  date time applid tranid  Transaction abended because DB2 thread tcbs are unavailable.

Explanation
The transaction was abnormally terminated because a DB2 thread TCB was not available on which to create a thread for the transaction.

System action
The transaction is abnormally terminated.

User response
Determine if more subtask TCBs should be made available to the CICS-DB2 connection by increasing the TCBLIMIT value of the DB2CONN. The TCBLIMIT value can be altered using a SET DB2CONN command.

Module: DFHD2EX1

Destination
CDB2

DFHDB2011  date time applid tranid  Transaction abended because threads are unavailable for resource resname

Explanation
The transaction was abnormally terminated because a thread connection to DB2 was not available for
the transaction. Resname identifies the name of the DB2ENTRY or the POOL from which the thread was to be allocated. This error can occur when:

- The DB2ENTRY specifies Threadwait(no) and all threads are currently being used.
- The DB2ENTRY specified Threadwait(pool), but the pool definition within the DB2CONN specifies Threadwait(no), and all threads are currently being used both in the DB2ENTRY and the Pool.
- The transaction was using the pool directly, the pool specifies Threadwait(no) and all pool threads are currently in use.

**System action**
The transaction is abnormally terminated.

**User response**
Determine if more threads can be made available to the DB2ENTRY or the POOL by increasing the THREADLIMIT value on the DB2ENTRY or the DB2CONN respectively. The THREADLIMIT value can be increased using SET DB2ENTRY and SET DB2CONN commands.

**Module:**
DFHD2EX1

**DFHDB2012**

*date time applid* Stop quiesce of the CICS-DB2 attachment facility from DB2 subsystem *db2-id* is proceeding.

**Explanation**
A DSNC STOP command entered by the main terminal operator is being processed. CICS is disconnected from DB2 subsystem *db2-id*. When the disconnect is complete message DFHDB2025 is output to the terminal.

**System action**
New CICS transactions attempting to issue SQL commands is abended or receives a negative SQL reason code dependent on the CONNECTERROR setting in the DB2CONN definition.

Existing transactions using the CICS-DB2 interface are allowed to complete before the CICS-DB2 attachment facility is stopped.

**User response**
If the quiesce is not completed within an acceptable time period, a DSNC STOP FORCE command should be issued from another terminal.

**Module:**
DFHD2CM1

**Destination**
Terminal End User

**DFHDB2013**

*date time applid* Display report follows for threads accessing DB2 *db2-id*

**Explanation**
A CICS-DB2 attachment display plan or display tran command was requested and the results follow this message. If not blank, *db2-id* is the name of the DB2 subsystem involved.

The following information is displayed for each thread:

**DB2ENTRY**
The name of the DB2ENTRY which contains the thread.

S
The thread status:

* The thread is active within a unit of work and is currently executing in DB2.

A
The thread is active within a unit of work but is not currently executing in DB2.

I
The thread is inactive. It is a protected thread waiting for new work.

**PLAN**
The current plan name.
PRI-AUTH
The DB2 primary authorization ID.

SEC-AUTH
The DB2 secondary authorization ID.

CORRELATION
The DB2 thread correlation ID.
For active threads only:

TRAN
The CICS transaction ID.

TASK
The CICS task number.

UOW-ID
The CICS unit-of-work ID.

System action
Processing continues normally.

User response
None.

Module:
DFHD2CC

XMEOUT parameters/Message inserts

2. time
3. applid
4. db2-id

Destination
CDB2 and Terminal End User

DFHDB2014

Explaination
A CICS-DB2 attachment facility statistics display was requested and follows this message. The name of the DB2CONN that is currently in use is db2conn-name and db2-id, if not blank, is the name of the DB2 subsystem involved.

The statistics displayed are those that have been accumulated after the expiry of the last statistics collection interval, end of day expiry, or requested reset. These statistics represent a subset of those available as CICS-DB2 Global and resource statistics collected via the CICS statistics spi commands.

The following information is displayed for each DB2ENTRY and for the command and pool sections of the DB2CONN:

• DB2ENTRY
  The name of the DB2ENTRY or "COMMAND" for the command section and "POOL" for the pool section.

• PLAN
  DB2 Plan name

• CALLS
  Total number of SQL calls made

• AUTHS
  Total number of sign-on invocations for transactions associated with this entry. A sign-on does not indicate whether a new thread is created or an existing thread reused. If a thread is reused a sign-on may occur dependent on the ACCOUNTREC setting of the DB2ENTRY.

• W/P
  Number of times all available threads for this entry were busy and the transaction had to wait or the thread request was diverted to the POOL.

• HIGH
  Maximum number of concurrent threads required by transactions associated with this DB2ENTRY at any time since the last reset.

• ABORTS
  Total number of units of work that were rolled back.

• COMMITS
  One of the following two fields is incremented each time a DB2 transaction associated with this DB2ENTRY takes an explicit or implicit (end of task) syncpoint.

  • 1-PHASE
    The total number of single-phase commits for transactions associated with this DB2ENTRY.

  • 2-PHASE
    The total number of two-phase commits for transactions associated with this DB2ENTRY.

System action
Processing continues normally.

User response
None.
**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. db2conn-name
5. db2-id

**Destination**

CDB2 and Terminal End User

**DFHDB2015**

*date time applid* The CICS-DB2 attachment facility is in standby for DB2 subsystem db2-id

**Explanation**

The CICS-DB2 attachment facility has dropped into standby mode because DB2 subsystem db2-id has stopped and STANDBYMODE=RECONNECT was specified in the DB2CONN.

**System action**

The CICS-DB2 attachment facility waits for the DB2 subsystem to become active again, at which time it automatically reconnects. While in standby mode, all SQL requests receive a negative SQLCODE or an AEY9 abend depending on whether CONNECTERROR=SQLCODE or CONNECTERROR=ABEND was specified in the DB2CONN.

**User response**

Notify the system programmer.

CDB2

**DFHDB2018**

*date time applid db2-id DB2* {subsystem is not active. | group has no active members.}

---

**Explanation**

The CICS-DB2 attachment facility startup cannot complete because an error occurred while connecting to DB2 sub-system or group db2-id. The response from DB2 was reason-code.

**System action**

The CICS-DB2 attachment facility initialization does not complete.

**User response**

Analyze the DB2 reason code given and any prior messages issued to the attachment error destination or CDB2 TS queues to determine the source of the error. Some possible causes include:

- incorrect DB2 subsystem or group specified
- the DB2 subsystem or group was not initialized during MVS IPL processing.
- Another CICS or IMS region has connected to the DB2 coordinator with the same name as the region issuing this message. For CICS the connection name is the same as the applid.

Destination
Terminal End User

$DFHDB2022$ $date$ $time$ $applid$ Stop force of the CICS-DB2 attachment facility from $db2-id$ is proceeding.

Explanation
A DSNC STOP FORCE command entered by the main terminal operator is being processed. CICS will be disconnected from DB2 subsystem $db2-id$. When the disconnect is complete, message $DFHDB2025$ is output to the terminal.
**System action**

New CICS transactions attempting to issue SQL commands are abended or receive a negative SQL reason code dependent upon the CONNECTERROR setting in the DB2CONN definition.

Existing transactions using the CICS-DB2 interface will be force purged.

**User response**

None.

**Module:** DFHD2CM1

**Destination**

Terminal End User

**DFHDB2023I** 

*date time applid* The CICS-DB2 attachment has connected to DB2 subsystem *db2-id { | group } db2-group*

**Explanation**

The CICS-DB2 attachment facility startup has successfully connected to DB2 subsystem *db2-id* group *db2-group*. The DB2 subsystem is running in restart-light mode and connection has been made purely to allow resynchronisation to take place.

**System action**

The CICS-DB2 attachment facility remains in standby for new work, but allows resynchronisation tasks to complete. The DB2 restart-light subsystem is terminated when resynchronisation is complete. If STANDBYMODE(RECONNECT) has been specified in the DB2CONN definition and when the DB2 restart-light subsystem is terminated, the CICS-DB2 attachment facility reverts to standbymode and connection to another active DB2 subsystem is made.

**User response**

If a group name does not appear, group attach is not active. You can suppress this message with the SIT parameter, MSGLVL = 0.

**DFHDB2027**  date time applid CICS-DB2 attachment is shutting down. DSNC DB2 commands may not be entered.

**Explanation**
The CICS-DB2 attachment facility cannot accept commands directed to DB2 during or after the termination of the CICS-DB2 attachment facility.

**System action**
The command is rejected.

**User response**
Refer to the Messages for CICS Db2 for a description of the rc and reason-code.
A DSNC command cannot be executed as there is no DB2CONN installed. For all DSNC commands (including the STRT command) a DB2CONN definition must be installed before issuing the command. Likewise a CEMT or EXEC CICS SET DB2CONN CONNECTED command cannot be issued to startup the CICS-DB2 Attachment Facility if no DB2CONN definition is installed.

**System action**
The command is rejected.

**User response**
Install the necessary DB2CONN. The command can then be re-issued.

**Module:** DFHD2CM1, DFHD2STR

**Explanation**
This message is issued in response to a CICS-DB2 attachment facility command, or DB2 command that requested an alternative destination for the response. CICS basic mapping support (BMS) encountered an error while routing to the requested terminal named `termid`.

**System action**
Output from the command may be suppressed.

**User response**
Ensure that the terminal ID was correctly entered. Otherwise notify the system programmer. This message may occur if the destination device is not supported by BMS, or is not defined to CICS.

**Module:** DFHD2CC

**Explanation**
The DSNC DISPLAY command to an alternate destination is complete. The output should be available at the requested destination.

**System action**
Processing continues normally.

**User response**
None.

**Module:** DFHD2CC

**Explanation**
The DSNC DISPLAY command to an alternate destination display command complete.

**System action**
Console and Terminal End User

**User response**

**Explanation**
CICS indicates that recovery should not be required for uowid but DB2 subsystem db2id is indoubt.

**System action**
The CICS is connected to DB2 but the UOW remains indoubt in DB2.

**User response**
The indoubt UOW will have to be resolved manually using DB2 -DISPLAY THREAD and -RECOVER INDOUBT operator commands. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Explanation**
The CICS-DB2 attachment facility cannot accept commands directed to DB2 while it is waiting for the DB2 subsystem to start. The name of the DB2 subsystem that is not yet operational is db2id.

**System action**
The command is rejected.

**User response**
Re-issue the command when DB2 has been started and the attachment facility has connected to DB2.

**Module:**
DFHD2CM1

**Destination**
Terminal End User
**Explanation**

This message is in response to a CICS-DB2 attachment facility DSNC MODIFY DESTINATION command and lists the currently active message destinations known to the attachment facility. Null entries show as '****' and can be modified so they identify actual destinations.

**System action**

Processing continues.

**User response**

None.

**Module:** DFHD2CM1

**Destination**

Terminal End User

**DFHDB2040**

`date time applid tranid` Module `modname` could not be found.

**Explanation**

During CICS-DB2 attachment facility initialization, an attempt was made to locate and load the named module, but it was not found in any of the libraries accessible to MVS through the MVS LOAD macro.

**System action**

CICS-DB2 attachment facility initialization does not complete.

**User response**

Check the CICS JOBLIB/STEPLIB and ensure that the required DB2 library is defined there and contains the named module. Alternatively, ensure the required DB2 library is in the MVS linklist.

**Module:** DFHD2CC

**Destination**

Terminal End User

**DFHDB2042**

`date time applid` Connection not authorized to `db2-id`

**Explanation**

The attempt to connect to the `db2-id` DB2 subsystem or group failed because the user was not authorized to access DB2. Authorization was denied by either RACF or a user-written connection exit.

**System action**

The CICS-DB2 attachment does not connect to DB2.

**User response**

The userid specified on the CICS job was not authorized to connect to the named DB2 subsystem or group. Refer to the Administering CICS with Db2 and the CICS documentation for information on how to authorize a user to access DB2.

**Module:** DFHD2STR
DFHDB2044  
\textit{date time applid} Authorization parameters for \textit{resname} have been corrupted.

\textbf{Explanation}

The CICS-DB2 attachment facility detected that the AUTHTYPE or AUTHID parameters for \textit{resname} have been corrupted since it was last installed or updated by a SET command. \textit{Resname} is the name of the DB2ENTRY involved, or it is set to 'POOL' or 'COMMAND' if it is the pool or command thread authorizations of the DB2CONN that are involved.

\textbf{System action}

The transaction is abnormally terminated.

\textbf{User response}

If it is a DB2ENTRY involved, the DB2ENTRY needs to be reinstalled, or the AUTHID or AUTHTYPE parameters reset using a SET command to make the DB2ENTRY usable.

For pool or command thread authorizations, a SET DB2CONN command needs to be issued to reset the AUTHID or AUTHTYPE parameters, or the DB2CONN needs to be reinstalled. Note however that a DB2CONN cannot be re-installed without stopping the CICS-DB2 attachment facility first.

\textit{Module:} DFHD2EX1

DFHDB2047I  
\textit{date time applid} The CICS-DB2 Attachment cannot find DB2 \{subsystem | group\} \textit{id}

\textbf{Explanation}

The CICS-DB2 attachment facility failed to connect because the DB2ID or DB2GROUPID \textit{id} cannot be found.

\textbf{System action}

The CICS-DB2 attachment facility is inactive.

\textbf{User response}

None.

\textit{Module:} DFHD2STR

DFHDB2048 date time applid Unable to interpret SQL call while formatting an EDF display for transaction transid task taskid

Explanation
The CICS attachment facility was unable to call its EDF processor DFHD2EDF or the CICS attachment facility was unable to decipher storage associated with an SQL statement for CICS transaction transid and task taskid. Either the SQL communications area (SQLCA) or the RDS input parameter list (RDI) storage could not be interpreted by the CICS-DB2 attachment facility.

System action
If the CICS attachment facility was unable to call its EDF processor DFHD2EDF and a transaction dump is taken with dump code AD29.

If DFHD2EDF was called but it was unable to decipher storage, a transaction dump of the storage in question is taken with dump code AD22.

User response
For an AD29 dump, analyze the trace in the CICS transaction dump to determine why the call to DFHD2EDF failed. For an AD22 dump, analyze the CICS transaction dump of the storage in question. In this situation the information supplied by the Execution Diagnostic Facility (EDF) of CICS for SQL statements consists of:
   • The EDF status: ABOUT TO EXECUTE or COMMAND EXECUTION COMPLETE
   • The processing status: CALL TO RESOURCE MANAGER DSNCSQL
   • The ARG values associated with this call to the CICS-DB2 attachment facility

No other information is provided about the SQL statement.

The INITPARM specified for the CICS-DB2 attachment is invalid. The attachment facility cannot start.

**Explanation**
The initparm for the CICS-DB2 attachment facility is not in the correct format. The format of the INITPARM should be:

\[
\text{INITPARM=(DFHD2INI='yyyy')}
\]

where yyyy is a one to four character DB2 subsystem id.

---

**System action**
The CICS-DB2 attachment facility initialization does not complete.

**User response**
Correct the INITPARM and restart the CICS region, or specify a DB2 subsystem id on a DSNC STRT command or in the DB2CONN. INITPARM is only used when the DB2CONN definition does not contain a DB2ID and a DB2ID is not specified on the startup command.

3. applid
Resynchronization outstanding for subsystem db2id after DB2 Group Attach has connected to subsystem db2id2.

Explanation
CICS indicates that resynchronization is outstanding for subsystem db2id after DB2 Group Attach has connected to subsystem db2id2.

System action
The CICS is connected to DB2 subsystem db2id but UOWs remain outstanding for DB2 subsystem db2id2.

User response
The DB2CONN definition either has RESYNCMEMBER(NO) specified, or RESYNCMEMBER(YES) is specified but CICS detected that all the UOWs outstanding are shunted indoubt meaning that resynchronisation with DB2 cannot take place immediately. Both these situations allow group attach to proceed, and the result is CICS has connected to a different DB2 subsystem than previously. The user must manually reconnect to the original DB2 subsystem which automatically resynchronizes the outstanding (non shunted) units of work. Shunted units of work wait to be unshunted at which point resynchronisation takes place if CICS is connected to the original DB2 subsystem.

2. termid
3. X'eibresp'

Destination
Console and Terminal End User
DFHDB2070   date time applid Syncpoint rollback failed for transaction transid with eibresp2 X'eibresp2'.

Explanation
DB2 detected a deadlock and the CICS-DB2 attachment facility attempted a syncpoint rollback command for transaction transid because DROLLBACK(YES) was specified for the DB2ENTRY or POOL. The syncpoint rollback command failed with EIBRESP2 set to eibresp2.
System action
The transaction is abnormally terminated with abend code AD2Z.

User response
Examine the eibresp2 value eibresp2 to determine why the syncpoint rollback request failed. One possible reason could be that the transaction running is a DPL server transaction which was DPLed to by a client transaction without specifying the SYNONRETURN parameter. In this case syncpoints or syncpoint rollbacks cannot be taken by the server transaction, so DROLLBACK(YES) is invalid in this case.

DFHDB2071 date time applid The first error destination cannot be null.

Explanation
This message is in response to a CICS-DB2 attachment facility DSNC MODIFY DESTINATION command. An attempt was made to nullify the first error destination by setting it to ‘****’. The CICS-DB2 attachment facility does not allow a null first error destination. The second and third error destinations may be nullified.

System action
The CICS-DB2 attachment facility command is not processed.

User response
Re-enter the command with a correct destination ID.

Module: DFHD2CM1

Chapter 2. CICS messages 595
does not exist. A DB2TRAN cannot be installed unless its associated DB2ENTRY has been installed first. Hence either the DB2ENTRY has subsequently been discarded or the DB2TRAN modified by a SET command to refer to a non-existent DB2ENTRY.

System action
The transaction will use a DB2 thread from the pool. This message is output only when an attempt is made to locate a DB2ENTRY for the transaction. Having decided to use the pool, the CICS-DB2 attachment facility will use the pool for all subsequent transactions of the same name without locating the DB2ENTRY each time. When any DB2TRAN or DB2ENTRY is installed or modified will this force a relocate of the DB2ENTRY next time the transaction is run.

User response
Determine why the DB2ENTRY is not installed. If appropriate re-install the DB2ENTRY.

date time applid MaxopentCBS value of xxx conflicts with the tcblimit setting of yyy in the DB2CONN definition.

**Explanation**
The CICS-DB2 Attachment Facility detected that CICS is connected to DB2 Version 6 or later and that the value of MAXOPENTCBS is lower than the TCBLIMIT setting in the DB2CONN definition. If the MAXOPENTCBS value has not been specified the value is based on the max tasks (MXT) value, namely (2*MXT)+32.

When CICS is connected to DB2 Version 6 or later, the CICS-DB2 Attachment Facility uses CICS open TCBs to access DB2 rather than privately managed subtask TCBs. The MAXOPENTCBS value defines the maximum number of open TCBs allowed in the CICS system for use by all openapi enabled task related user exits. The TCBLIMIT parameter on the DB2CONN definition defines how many of the open TCBs can be used for DB2, that is, a subset of MAXOPENTCBS for use with DB2.

**System action**
Startup of the CICS-DB2 attachment continues.

**User response**
Review the setting of TCBLIMIT in the DB2CONN and the MAXOPENTCBS or MXT value.

You can suppress this message with the SIT parameter, MSGLEVEL = 0.

1. date
2. time
3. applid
4. xxxx
5. rc
6. reason

DFHDB8103 E \textit{date time applid IDENTIFY request to DBCTL xxxx has failed. MVS SSI return code rc, reason code reason.}

Explanation
CICS has attempted to connect to DBCTL. The attempt has failed. CICS has been notified that DBCTL is not currently executing. The return code from MVS SSI, reported in PAPLRETC, is \textit{rc}. The reason code from MVS SSI, reported in PAPLRCOD, is \textit{reason}. The return and reason codes reported in PAPLRETC and PAPLRCOD are explained in the IMS messages and codes.

System action
CICS attempts to connect to DBCTL at 5 second intervals, issuing this message at each attempt, and message DFHDB8297 at 1 minute intervals, until either:

1. Disconnection is requested via the CICS supplied DBCTL support menu transaction, CDBC.
2. 10 minutes have elapsed, after which time CICS stops attempting to connect and IMS message DFS0690 is issued, requesting the operator to type in \textit{WAIT} (retry the connection attempt) or \textit{CANCEL} (abandon the connection attempt).

Refer to the explanation of DFHDB8297 for more information. Refer to the IMS messages and codes for further information on message DFS0690.

User response
Check why DBCTL is not running. You can cancel the connection attempts by using the CDBC transaction to issue a disconnect request. If message DFH0690 has been issued you should reply to this.

Destination

CDBC

DFHDB8104 E date time applid IDENTIFY request to DBCTL xxxx has been rejected by DBCTL. {System abend code | IMS user abend code | DBCTL return code} rc.

Explanation

CICS has attempted to connect to DBCTL. The attempt has failed. CICS has been notified that DBCTL has rejected the identify request.

System action

The attempt to connect to DBCTL is abandoned and the storage associated with the CICS-DBCTL interface is cleaned up. Message DFHDB8102 is output.

User response

For further information about the nonzero response code, if rc is:

- A system abend code, refer to the z/OS MVS System Codes manual
- An IMS user abend code, refer to the IMS messages and codes

An IMS user abend code U0402 can occur when there is a mismatch of IMS code. Check:

- The correct DRA startup table suffix is specified on the CDBC panel or on the SIT INITPARM parameter.
- The DSNNAME parameter in the DRA startup table specifies the correct IMS RESLIB.
- The correct IMS RESLIB library is specified if present in the CICS Steplib or in Linklist.
- A DBCTL return code, refer to the IMS messages and codes.

**Destination**

CDBC

DFHDB8110 E date time applid Non zero return code from DFHDBAT. Return code rc for request request.

**Explanation**

The module DFHDBAT, which is a task related user exit forming part of the CICS-DBCTL interface, returns a nonzero return code in reply to a request issued from CICS to DBCTL.

**System action**

The request to DBCTL fails.

Three types of request to DBCTL can fail in this way:

1. A request to connect to DBCTL from module DFHDBCON
2. A request to disconnect from DBCTL from module DFHDBDSC
3. A DL/I request from an application program via module DFHDLIDP

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

The return code is one of the following:

**4 ? CALL NOT UNDERSTOOD**

This can be returned when attempting to connect, disconnect or issue DL/I requests to DBCTL. The most likely cause is a storage overwrite. If CICS detects a storage overwrite, a dump is taken.

**8 ? REDUNDANT INTERFACE CALL**

This can be returned when attempting to connect or disconnect from DBCTL. The request is ignored.

**16 ? DISCONNECT PRE-EMPTED**

This can be returned when attempting to disconnect from DBCTL while a disconnection request is already being processed.

**24 ? ADAPTER NOT READY**

A request has been made to the adaptor DFHDBAT but CICS is still in the process of connecting to DBCTL.

**28 ? ADAPTER IS DISABLED**

This indicates that the CICS-DBCTL interface is not available.

**Note:**

The DBCTL interface terminates normally after any inflight tasks accessing DBCTL complete the unit of work. Subsequently any new unit of work or ATI task can receive this return code because of a PCB schedule failure.

Destination
CBDC

date time applid Connection to DBCTL xxxx has been rejected by CICS. Reason code rc.

Explanation

CICS has rejected the connection attempt to DBCTL for reason rc. The value in the reason code field is 4. This indicates an invalid IMS/ESA release for storage protection. That is, CICS storage protection was active, and an attempt was made to connect to a DBCTL system running a release of IMS/ESA that does not support the storage protection function.

System action

On completion of phase 2 connection processing, CICS indicates to the database resource adapter (DRA), in the control exit, that the DRA should terminate. CICS then completes cleanup of the CICS-DBCTL interface. The status of the interface is that CICS is not connected to DBCTL.

User response

Connection to this DBCTL system is only possible if CICS is run with storage protection turned off. To run with storage protection on, install a release of IMS/ESA that supports the storage protection function.

Destination
CBDC

date time applid CICS is INDOUBT about the LUW with recovery

Explanation

CICS was attempting to syncpoint updates made to IMS databases via DBCTL for the logical unit of work (LUW) identified by unit of recovery X’rectok’.

CICS has detected that updates were made to only one resource manager, DBCTL, in this LUW, and hence has issued a single-phase commit to DBCTL, in place of the normal two-phase commit process. An unexpected response to the single-phase commit has been received from DBCTL, and so CICS is INDOUBT about this LUW. CICS is unable to report whether the updates made via DBCTL have been committed or backed out. No local CICS resources are affected.

System action

The transaction terminates abnormally with abend code ADCS and a transaction dump. CICS processing continues.

User response

The unit of recovery X’rectok’ output with this message can be used in conjunction with IMS message DFSxxxx output on the IMS console to determine the outcome of the LUW.

If the IMS region has failed, on restart of the IMS region, IMS will output DFSxxxx messages for each LUW that has committed using the single-phase commit protocol. The DFSxxxx message contains the same X’rectok’ recovery token as output in this message. While matching up the recovery tokens, if a DFSxxxx message is found with the same recovery token, then the LUW was committed. Failure to find a relevant DFSxxxx message means that the LUW has been backed out.

Rather than the IMS region failing, if the bad response to single-phase commit was caused by an individual thread failure and the LUW has been committed, then IMS outputs a DFSxxxx message for just this LUW.

For further information on IMS message DFSxxxx, refer to the IMS messages and codes.

For further information about the nonzero response code, if rc is:

- A system abend code, refer to the z/OS MVS System Codes manual
- An IMS user abend code, refer to the IMS messages and codes
• A **DBCTL return code**, refer to the **IMS messages and codes**.

CDBC

DFHDB8120 I  

**date time applid**  

DBCTL may be INDOUBT about the LUW with recovery token X'n', which CICS has {committed | backed out},  

{SYSTEM ABEND CODE | IMS USER ABEND CODE | DBCTL RETURN CODE} rc.

**Explanation**

CICS has received a bad return code from DBCTL for a commit or backout request for the logical unit of work (LUW) identified by unit of recovery X'n'.

**System action**

CICS has either backed out or committed this LUW. CICS continues.

**User response**

At the next reconnection, CICS and DBCTL resolve all INDOUBTS.

Alternatively you can request DBCTL to find out if the LUW is INDOUBT, and instruct DBCTL to commit it or back it out. For more information on how to do this, refer to the CICS documentation.

For further information about the nonzero response code, if *rc* is:

• a **system abend code**, refer to the z/OS MVS System Codes manual

Destination
TERMCDDBC

DFHDB8207D Connection to DBCTL requested.
Press PF5 to confirm.

Explanation
The terminal operator has requested that CICS should be connected to DBCTL.
This message is not used when you are running the CDBC transaction at the console. If you are running the CDBC transaction on the console, the terminal PF5 key function (to confirm the request) is not used.

System action
If the PF5 key is pressed, then CICS will connect to DBCTL. If any other key is pressed in response to this message, CICS will not connect to DBCTL.

User response
Press the PF5 key if you wish to proceed with connecting CICS to DBCTL. If you do not wish the connection to proceed then press the PF3 key to terminate the transaction, or change the input data and press enter.

Module:
DFHDBME

Destination
TERMCDDBC

DFHDB8208D DBCTL immediate disconnection requested. Press PF5 to confirm.

Explanation
The terminal operator has requested that CICS should be disconnected from DBCTL immediately.
This message is not used when you are running the CDBC transaction at the console. If you are running the CDBC transaction on the console, the terminal PF5 key function (to confirm the request) is not used.

System action
If the PF5 key is pressed, then all DL/I requests issued from this CICS system and currently being processed in DBCTL will complete and then CICS will disconnect from DBCTL. Tasks which have been using DBCTL but have not yet issued a CICS SYNCPOINT, either explicitly in the application or implicitly as a result of CICS task termination processing, will abnormally...
terminate with abend code ASP7. If any other key is pressed in response to this message, CICS will not disconnect from DBCTL.

User response
Press the PF5 key if you wish to proceed with disconnecting CICS from DBCTL immediately. If you do not wish the disconnection to proceed then press the PF3 key to terminate the transaction, or change the input data and press enter.

Module:
DFHDBME

Destination
TERMCDBC

DFHDB8209D DBCTL orderly disconnection requested. Press PF5 to confirm.

Explanation
The terminal operator has requested that CICS should be disconnected from DBCTL in an orderly manner.

This message is not used when you are running the CDBC transaction at the console. If you are running the CDBC transaction on the console, the terminal PF5 key function (to confirm the request) is not used.

System action
If the PF5 key is pressed, then all tasks running in this CICS system that have already used DBCTL will complete and then CICS will disconnect from DBCTL. No new tasks running in this CICS system will be permitted to use DBCTL until CICS is connected to DBCTL again. If any other key is pressed in response to this message, CICS will not disconnect from DBCTL.

User response
Press the PF5 key if you wish to proceed with disconnecting CICS from DBCTL in an orderly way. If you do not wish the disconnection to proceed then press the PF3 key to terminate the transaction, or change the input data and press enter.

Module:
DFHDBME

Destination
TERMCDBC

DFHDB8210D Connection to DBCTL is proceeding. Check CDBC TD queue.

Explanation
The operator has pressed PF5 in response to message DFHDB8209. CICS issues further messages concerning the disconnection to the CDBC transient data destination. Additionally, DBCTL issues some messages to the MVS console.

System action
CICS proceeds with the disconnection attempt.

User response
You are now able to use your terminal to perform other functions. You can check to see how the disconnection attempt is proceeding by using the refresh key to refresh the CICS-DBCTL status information on the screen. In case of problems, for example, CICS does not disconnect from DBCTL, check the CDBC transient data destination.

Module:
DFHDBME

Destination
TERMCDBC

Chapter 2. CICS messages 617
**Explanation**

The operator has pressed PF5 in response to message DFHDB8208. CICS issues further messages concerning the disconnection to the CDBC transient data destination. Additionally, DBCTL issues some messages.

**System action**

CICS proceeds with the disconnection attempt.

**User response**

You are now able to use your terminal to perform other functions. You can check to see how the disconnection attempt is proceeding by using the refresh key to refresh the CICS-DBCTL status information on the screen. In case of problems, for example, CICS does not disconnect from DBCTL, check the CDBC transient data destination.

**Module:** DFHDBME

**Destination**

TERMCDBC

**DFHDB8213** Connection to DBCTL is already in progress. Request is ignored.

**Explanation**

The terminal operator has either:

- Requested that CICS should disconnect from DBCTL when CICS is already disconnected from DBCTL, or
- Requested that CICS should connect to DBCTL when CICS is still disconnecting from DBCTL.

**System action**

This connection request is ignored.

**User response**

Use the PF2 key to refresh the CICS-DBCTL status information on the screen. If the 'DBCTL connected and ready' message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was connecting to DBCTL. The operator should also check the MVS console as the message DFS0690 may have been issued, and be waiting for a reply.

**Module:** DFHDBME

**Destination**

TERMCDBC

**DFHDB8214** Connection to DBCTL has already been done. Request is ignored.

**Explanation**

The terminal operator has requested that CICS should connect to DBCTL when CICS is already connected to DBCTL.

**System action**

This connection request is ignored.

**User response**

If you did not expect DBCTL to be connected to CICS then check the CDBC transient data destination to see when CICS did connect to DBCTL (message DFHDB8101).

**Module:** DFHDBME

**Destination**

TERMCDBC

**DFHDB8215** Orderly disconnection from DBCTL in progress. Request is ignored.

**Explanation**

The terminal operator has either:

- Requested that CICS should disconnect from DBCTL when CICS is already disconnected from DBCTL, or
- Requested that CICS should connect to DBCTL when CICS is still disconnecting from DBCTL.

**System action**

This disconnection request is ignored.

**User response**

Use the refresh key to refresh the CICS-DBCTL status information on the screen. If the 'DBCTL not connected to CICS' message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was disconnecting from DBCTL.

**Module:** DFHDBME
Immediate disconnection from DBCTL in progress. Request is ignored.

**Explanation**

The terminal operator has either:

- Requested that CICS should disconnect from DBCTL while CICS is already disconnected from DBCTL, or
- Requested that CICS should connect to DBCTL while CICS is still disconnecting from DBCTL.

**System action**

This disconnection request is ignored.

**User response**

Use the PF2 key to refresh the CICS-DBCTL status information on the screen. If the 'DBCTL not connected to CICS' message is not displayed, check the CDBC transient data destination to ensure that no errors have occurred while CICS was disconnecting from DBCTL. If necessary, check the location of the CDBC destination with your system programmer.

DBCTL not currently connected to CICS. Request ignored.

**Explanation**

The terminal operator has requested that CICS should disconnect from DBCTL when CICS is not connected to DBCTL.

**System action**

This disconnection request will be ignored.

**User response**

If you did not expect DBCTL to be disconnected from CICS then check the CDBC transient data destination to see when and why CICS did disconnect from DBCTL (message DFHDB8102). If you do not know where the CDBC destination is, then please check with your system programmer.

DBCTL connection phase 1 in progress. Request is ignored.

**Explanation**

The first phase of connecting CICS to DBCTL has not completed yet, but the terminal operator has requested disconnection from DBCTL.

**System action**

This disconnection request is ignored.

**User response**

Try requesting disconnection again if you wish to proceed with disconnecting CICS from DBCTL. If you still cannot disconnect then check the CDBC transient data destination to see if any messages have been issued which indicate that there are problems with the connection attempt. Also check if any messages have been issued from DBCTL.
Destination
TERMCDBC

DFHDB8220  CICS-DBCTL connection is unusable. Request is ignored.

Explanation
A failure has occurred in the CICS-DBCTL interface.

System action
Any requests to connect or disconnect from DBCTL is ignored.

User response
Look for earlier messages identifying the source of the error by checking the CDBC transient data destination for any messages issued from CICS and also by checking for any messages issued from DBCTL.

Module:
DFHDBME

Destination
TERMCDBC

DFHDB8221  Non-zero return code rc from DFHDBAT. The request is ignored.

Explanation
The module DFHDBAT returns a nonzero return code in reply to a request issued to DBCTL. DFHDBAT is a task-related user exit and forms part of the CICS-DBCTL interface.

System action
The request to DBCTL fails.

User response
See message DFHDB8110 for further guidance.

Module:
DFHDBME

Destination
TERMCDBC

DFHDB8222  Module DFSPRRC0 cannot be found. Connection cannot be done.

Explanation
The DRA router module, DFSPRRC0, could not be found during an attempt to connect to DBCTL.

System action
The connection does not proceed.
**User response**

Place the module DFSPRRC0 in a CICS STEPLIB library. For guidance on how to do this, see the CICS documentation.

**Module:**

DFHDBME

**Destination**

TERMCDBC

**Explanation**

This message is issued from module DFHDBME when CDBC, the DBCTL support menu transaction, is used from the MVS operator's console. This message is issued from module DFHDBIQ when CDBI, the DBCTL support inquiry transaction, is used from the MVS operator's console.

**System action**

Processing continues.

**User response**

None.

**Module:**

DFHDBME, DFHDBIQ

**Destination**

TERMCDBC

**Explanation**

An attempt was made to connect to DBCTL but there was an error when linking to the connection module.

**System action**

The connection attempt fails.

**User response**

Look for earlier messages identifying the source of the error on the CDBC or CSMT transient data destinations. Check that module DFHDBCON is available.

**Module:**

DFHDBME

**Destination**

TERMCDBC

**Explanation**

A comment was found at the end of the command. The CDBM transaction has removed the comment before sending the IMS command. Comments start with the period character (.) and continue to the end of the command.

**System action**

The IMS command is sent without the comment.

**User response**

None.

**Module:**

DFHDBMP

**Destination**

Terminal End User

**Explanation**

Spaces immediately after the CRC (/) have been removed.
Explanation
One or more spaces were found between the command recognition character (CRC) and the IMS verb. The default CRC is the oblique stroke (/). Spaces in this position would normally cause an IMS command to fail.

System action
The CDBM transaction removes the spaces before sending the IMS command.

User response
None. The operator should not add spaces between the CRC and the command.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8230 The key that you pressed has no meaning on this panel.

Explanation
The terminal operator has pressed the wrong key.

System action
CICS ignores the key pressed.

User response
Check the display of key functions at the bottom of the screen and try a valid key.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8231 FORCE IMS LOG END OF VOLUME was not set to 1 or 2.

Explanation
When entering a /DBDUMP or /DBRECOVER IMS command, the value in the FORCE IMS LOG END OF VOLUME field must be set to either 1 or 2. If you select 1, which is the default, the command has the NOFEOV option set; this does not force IMS End OF LOG for this command. To override this, select option 2; the NOFEOV option is not added.

System action
The command is not sent.

User response
Choose option 1 or 2 and press Enter.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8232 Initial CRC (/) was not found. Reenter the IMS command.

Explanation
The command recognition character (CRC) is expected at the start of the command line. The default CRC is the oblique stroke (/).

System action
The command is not sent.

User response
Reenter the command with the CRC as the initial character.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8233 A second CRC (/) was found. Reenter the IMS command.

Explanation
The command field can accept only one command. A command must start with the command recognition character (CRC). The default CRC is the oblique stroke (/). A second CRC within the command field is not allowed and must be removed before the command is sent to IMS.

System action
The command is not sent.

User response
Correct the command field by removing the second command or correcting the command syntax.
User response
Correct the command by moving the wildcard to a position where it can refer to a database name or names.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8234 An invalid wildcard was found. Reenter the IMS command.

Explanation
More than one database name contains a wildcard. You can use the asterisk (*) to refer to any number of characters, or the plus sign (+) to refer to a single character. However, in a command you can use wildcard characters in one database name only. Wildcards in more than one database name are not permitted and should be removed.

System action
The command is not sent.

User response
Remove the invalid wildcard. Either change the first wildcard string to include the database names matched by the second wildcard string, or explicitly name the databases. Alternatively issue the command with the first wildcard string, retrieve the command by pressing F9 (Retrieve) and replace the first wildcard string with the second. If there are other database names within the command, you may need to remove them before sending the command.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8235 Incorrect wildcard position. Reenter the IMS command.

Explanation
You can use a wildcard character in a command only to refer to database names. In this case a wildcard character, an asterisk (*) or plus sign (+), has been wrongly positioned in the command.

System action
The command is not sent.

User response
Correct the command by moving the wildcard to a position where it can refer to a database name or names.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8236 Invalid IMS command verb. Reenter the IMS command.

Explanation
The command has been rejected by IMS because the verb is not recognized as a valid IMS operator command.

System action
IMS rejects the command.

User response
Correct the command and press Enter.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8237 Command not allowed. Enter a valid IMS command.

Explanation
This command has been rejected by IMS because it cannot be executed using the AIB interface used by CICS.

Certain IMS operator commands such as /MODIFY are not valid with the CDBM transaction and must be issued via the MVS console.

System action
IMS rejects the command.

User response
Enter a valid IMS operator command.

Module: DFHDBMP
**DFHDB8238 Command not authorized. Enter a valid IMS command.**

**Explanation**
The command has been rejected by IMS because the application or user does not have the necessary authorization to execute the command as entered.

**System action**
IMS rejects the command.

**User response**
Get the necessary authorization and reissue the command.

**Module:**
DFHDBMP

**DFHDB8239 aaaa call failed, AIB Return X'bbbb' Reason X'cccc'**

**Explanation**
The command has been rejected by IMS.

**System action**
IMS rejects the command.

**User response**
For the IMS function code, examine the AIB return code and reason code to determine the cause of the error. See the IMS Database Administration manual, SC26-8015 for an explanation of these codes.

**Module:**
DFHDBMP

**DFHDB8240 DBCTL not connected. Run CDBC to connect.**

**Explanation**
CICS was unsuccessful in its attempt to schedule the program specific block (PSB) DFHDBMP before issuing the IMS command.

**System action**
The command is not sent.

**User response**
Ensure that the DBCTL system is attached using the CICS supplied transaction CDBC.

**Module:**
DFHDBMP

**DFHDB8241 PSB schedule unsuccessful. UIB return codes (X'aaaa')**

**Explanation**
CICS was unsuccessful in its attempt to schedule the program specification block (PSB) DFHDBMP before issuing the IMS command.

**System action**
The command is not sent.

**User response**
Ensure that PSB DFHDBMP is available to your system. See the summary of abends and return codes in the CICS documentation for an explanation of the UIB return codes.

**Module:**
DFHDBMP

**DFHDB8242 Command in progress. Issue /DISPLAY command for status.**

**Explanation**
The command sent to IMS has not returned a segment but has sent an acknowledgment.

**System action**
The IMS command is proceeding or has completed.
User response

Issue a /DISPLAY command to determine the status. Press F9 (Retrieve) to retrieve the IMS command and change the command to a /DISPLAY command. Alternatively press F12 (Cancel) and enter a new command to display the status.

Module:
DFHDBMP

Destination
Terminal End User

DFHDB8243 No match has been found for wildcard (aaaaaaaa).

Explanation
CICS was unsuccessful in its attempt to match any IMS databases with the wildcard supplied.

System action
The command is not sent.

User response
Check the names of the databases required and/or the wildcard supplied.

Module:
DFHDBMP

Destination
Terminal End User

DFHDB8244 The requested command cannot be found in the command file.

Explanation
The group command entered does not exist in the command file.

System action
No action

User response
Check that the group name and command were typed correctly. A list of all available commands can be found using the browse function in the group command maintenance section of CDBM.

Module:
DFHDBMP

Destination
Terminal End User

DFHDB8245 The command file, DFHDBFK, cannot be opened.

Explanation
CDBM failed to open the command file, DFHDBFK.

System action
CDBM will not allow the user to enter the maintenance section.

User response
Determine the cause of the open failure, and correct the error. Retry selecting the maintenance option from within CDBM.

Module:
DFHDBMP

Destination
Terminal End User

DFHDB8246 An error has occurred reading the command file, DFHDBFK.

Explanation
An error occurred whilst CDBM was trying to read a record from the command file, DFHDBFK.

System action
CDBM cannot read and execute the requested group command.

User response
Determine the cause of the read failure, and correct the error. Retry issuing the group command again from within CDBM.

Module:
DFHDBMP

Destination
Terminal End User

DFHDB8247 Record not found.

Explanation
There was no record in the group command file, DFHDBFK, for the specified group and command.
System action
None.

User response
Browse the group command file to locate the correct record. If this message was issued during a browse request, clear the group and name fields and retry the browse.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8248 End of file reached during browse. Press enter to wrap.

Explanation
The end of the file was reached during a browse request on the group command file, DFHDBFK.

System action
None.

User response
Press return to browse the group command file from the beginning.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8249 A record already exists for this command in this group.

Explanation
A record with a matching group and command names already exists in the group command file, DFHDBFK.

System action
A new group command record is not added to the group command file.

User response
Check the command name is correct. If it is, use a different group name.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8250 A record must be read before updating.

Explanation
Before a record in the group command file, DFHDBFK, can be updated, it must first be read.

System action
The group command record is not updated in the group command file.

User response
Read the record and apply the changes before issuing an update request.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8251 A record must be read before deletion.

Explanation
Before a record in the group command file, DFHDBFK, can be deleted, it must first be read.

System action
The record is not deleted from the group command file.

User response
Read the record before issuing a delete request.

Module: DFHDBMP

Destination
Terminal End User

DFHDB8252 Group and command must not be altered. Record not updated.
**Explanation**
The group and command fields must not be altered during a group command record update request.

**System action**
The record is not updated in the group command file, DFHDBFK.

**User response**
Add a new record with the required group and name fields. Delete the unwanted record.

**Module:** DFHDBMP

**Destination**
Terminal End User

**Explanation**
The group and command fields must not be altered during a group command record delete request.

**System action**
The record is not deleted from the group command file, DFHDBFK.

**User response**
Read the correct record before issuing a delete request.

**Module:** DFHDBMP

**Destination**
Terminal End User

**Explanation**
The group and command fields must both be specified when adding a new group command record to the group command file, DFHDBFK.

**System action**
A new group command record is not added to the group command file.

**User response**
Enter data in both the group and command fields and issue the add request.

**Module:** DFHDBMP

**Destination**
Terminal End User
DFHDB8257  Function invalid. Must be A, B, D, R
or U.

Explanation
An action requested was not valid.

System action
None.

User response
Enter a valid action letter.

Module:
DFHDBMP

Destination
Terminal End User

DFHDB8258  File \{write \| rewrite \| delete \| read \| browse\} failure. EIBRESP=eibresp,
EIBRESP2=eibresp2.

Explanation
An unexpected error has occurred during a file
operation on the group command file, DFHDBFK.

System action
The requested update to the group command file is not
made.

User response
Determine the reason for the failure using the
EIBRESP and EIBRESP2 values. Fix the cause of the
error and retry the operation.

Module:
DFHDBMP

Destination
Terminal End User

DFHDB8259  Group command, group command,
\{added \| updated \| deleted \| read \| browsed\}.

Explanation
The operation indicated has been performed on the
group command file, DFHDBFK.

System action
The group command file has been successfully
modified.

User response
None.

Module:
DFHDBMP

Destination
Terminal End User

DFHDB8260  Record length exceeds screen size.

Explanation
The record read from the group command file,
DFHDBFK, was found to contain more data than could
be displayed on the screen.

System action
None.

User response
The data set associated with the group command file,
DFHDBFK, has been created with a larger record size
than allowed. Recreate the data set with the correct
record size, and reload the data.

Module:
DFHDBMP

Destination
Terminal End User

DFHDB8290I  DBCTL not connected to CICS.

Explanation
This message is issued when CICS is not connected to
DBCTL.
If you are using the CDBC transaction, the DBCTL
Support Menu transaction, then the message is issued
from module DFHDBME.
If you are using the CDBI transaction, the DBCTL
Support Inquiry transaction, the message is issued
from module DFHDBIQ.

System action
Processing continues.
User response
None.

Module:
DFHDBME, DFHDBIQ

Destination
TERMCDBC

DFHDB8291I DBCTL connect phase 1 in progress.

Explanation
CICS is in phase 1 of connecting to DBCTL and has not yet moved into phase 2 of connection processing.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, this message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, this message is issued from module DFHDBIQ.

System action
Processing continues.

User response
Press the PF2 key to refresh the status information on the screen. Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

Module:
DFHDBME, DFHDBIQ

Destination
TERMCDBC

DFHDB8292I DBCTL connected and ready.

Explanation
CICS is connected to DBCTL.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

System action
Processing continues.

User response
Press the PF3 key to terminate the transaction.
Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

Module:
DFHDBME, DFHDBIQ

Destination
TERMCDBC

DFHDB8293I DBCTL connected and ready.

Explanation
CICS is connected to DBCTL.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.
**DFHDB8294I** DBCTL orderly disconnect in progress.

**Explanation**

CICS is disconnecting from DBCTL in an orderly manner. (That is, all tasks using DBCTL from this CICS system will run to termination before CICS is disconnected from DBCTL.)

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

**System action**

Processing continues.

**User response**

Press the PF3 key to terminate the transaction.

Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

**Module:** DFHDBME, DFHDBIQ

**Destination**

TERMCDBC

**DFHDB8295I** DBCTL immediate disconnect in progress.

**Explanation**

CICS is disconnecting from DBCTL immediately. (That is, all DL/I requests issued from this CICS system and currently being processed by DBCTL will complete before CICS is disconnected from DBCTL.)

If you are using the CDBC transaction, the DBCTL Support Menu transaction, this message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

If there is an IMS console message DFS0690 waiting for an operator reply, this message continues to be displayed until the operator replies to the IMS console message.

**User response**

Press the PF3 key to terminate the transaction.

Press the PF2 key to refresh the status information on the screen.

Check the CDBC transient data message destination for any other messages issued from CICS concerning the CICS-DBCTL interface.

**Module:** DFHDBME, DFHDBIQ

**Destination**

TERMCDBC

**DFHDB8296I** DBCTL cannot be connected to CICS.

**Explanation**

A failure has occurred in the CICS-DBCTL interface.

If you are using the CDBC transaction, the DBCTL Support Menu transaction, the message is issued from module DFHDBME.

If you are using the CDBI transaction, the DBCTL Support Inquiry transaction, the message is issued from module DFHDBIQ.

**System action**

Processing continues.

**User response**

Look for earlier messages identifying the source of the error by checking the CDBC transient data destination and checking any messages issued from DBCTL.

**Module:** DFHDBME, DFHDBIQ

**Destination**

TERMCDBC

**DFHDB8297** applid CICS/DBCTL CONNECTION BEING ATTEMPTED

**Explanation**

This message only occurs when there is no recoverable service table (RST). CICS has attempted to connect to DBCTL but has failed on one or more
occasions. DBCTL may not be running, or it may be restarting after a DBCTL abend.

**System action**

CICS continues to attempt to connect every 5 seconds. This message is reissued every minute for ten minutes or until connection is made.

If the connection is not made in ten minutes, CICS will stop attempting to connect and IMS message DFS0690 is issued. If the user replies WAIT to the IMS DFS0690 message, then the IMS DRA will take over responsibility for retrying the connection attempt. The TIMER parameter in the DRA startup table specifies how often the DRA will retry the connect to DBCTL.

**User response**

Check why DBCTL is not running. You can cancel the connection attempts using the CDBC transaction by issuing a disconnect request.

**Module:**

DFHDXAX

**Destination**

Console

**DFHDB8300**

| date time applid BUNDLE bundlename has failed to install the PACKAGESET packageset because its name contains invalid characters. | the PACKAGESET XML data could not be parsed. | its not defined in a platform or application bundle. | the PACKAGESET XML encoding is invalid. |

**Explanation**

The CICS BUNDLE bundlename has failed to install the PACKAGESET packageset. Possible reasons include:

- **name contains invalid characters**
  - The PACKAGESET name packageset contains invalid characters. Valid characters are: A-Z, a-z, 0-9 and special characters _#@$. Leading and embedded blank characters are not permitted.

- **PACKAGESET XML data could not be parsed**
  - The parse of XML for PACKAGESET packageset failed. A preceding DFHPIInnnn message may give further information about the cause of the problem.

- **not defined in a platform or application bundle**
  - The PACKAGESET packageset is defined in a standalone CICS bundle. CICS only supports PACKAGESET installed as part of a platform or application.

- **XML encoding invalid**
  - The conversion of the XML to IBM 037 failed.

**System action**

The BUNDLE resource is disabled and the PACKAGESET is not created.

**User response**

The probable cause is an error or inconsistency in the PACKAGESET XML. Check for any previous messages which may give you more information about the reason for the failure. Correct the PACKAGESET XML, discard the BUNDLE, and reinstall it.

CDB2

DFHDB8302  

`applid An abend (code aaa/bbbb) has occurred at offset X’offset’ in module modname.`

**Explanation**
An abnormal end (abend) or program check has occurred in module `modname`. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code `aaa/bbbb` is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, OC1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action**
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module `modname` you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see **Working with IBM to solve your problem** for guidance on how to proceed.

DFHDB8311 date time applid BUNDLE bundlename has failed to install the PACKAGESET packageset because (its schema level is not supported | pkgsetSchemaVersion is invalid | pkgsetSchemaRelease is invalid): error_data.

Explanation
The CICS BUNDLE bundlename has failed to install the PACKAGESET packageset. Possible reasons include:

schema level is not supported
The pkgsetSchemaVersion and pkgsetSchemaRelease of PACKAGESET packageset are higher than the schema level supported by this release of CICS.

pkgsetSchemaVersion is invalid
The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be a value in the range 1-99.

pkgsetSchemaRelease is invalid
The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be a value in the range 0-99.

System action
The BUNDLE resource is disabled and the PACKAGESET is not created.

User response
The probable cause is an error or inconsistency in the PACKAGESET XML. Check for any previous messages which may give you more information about the reason for the failure. Correct the PACKAGESET XML, discard the BUNDLE, and reinstall it.

DFHDDnnnn messages

DFHDD0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation
An unexpected program check or abend occurred with abend code aaa/bbbb.

The program status word (PSW) at the time of the program check or abend indicated that CICS was executing at offset X'offset' in module modname. This may have been caused by corruption of CICS code or control blocks.

System action
A system dump is taken and the system attempts to continue operation unless otherwise directed by entries in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Investigate the cause of the program check or abend using the system dump and any previously output...
diagnostic information provided by CICS, the access methods, or the operating system.

If you cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHDDAP, DFHDDDM, DFHDDDI, DFHDDLO, DFHDDBR

1. applid
2. aaa/bbbb
3. \text{x'}offset\text{'}
4. modname

Destination
Console

DFHDD0002 \text{applid} \text{A severe error (code X'code')} has occurred in module \text{modname}.

Explanation
Directory Domain has received an unexpected error response from some other part of CICS. The operation requested by Directory Domain is described by code X'code'.

For further information about CICS exception trace entries, refer to the Troubleshooting and support.

System action
A system dump is taken and the system attempts to continue operation unless specifically inhibited by dump table entries.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Investigate the cause of the problem as follows:

1. Determine if the problem can be explained by any previous messages output from some other part of CICS.
2. Examine the symptom string.
3. Examine the dump.

If you cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHDDAP, DFHDDDM, DFHDDDI, DFHDDLO, DFHDDBR

XMEOUT parameters/Message inserts

1. applid
2. X'code'
3. modname

Destination
Console

DFHDD0004 \text{applid} A possible loop has been detected at offset X'offset' in module \text{modname}.

Explanation
A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module \text{modname} at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module \text{modname} in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module \text{modname} has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module \text{modname}, and you consider that it was not a runaway, you should
increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Chapter 2. CICS messages 639
**Explanation**

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module `modname` at offset `X'offset'`. This is the offset of the instruction which was executing at the time the error was detected.

**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function, so there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the ICVR system initialization parameter, which is measured in milliseconds. This means that module `modname` in the message is terminated and CICS continues.

But if you have specified ICVR=0 you consider that module `modname` is looping, you must terminate CICS in order to terminate the runaway function.

If CICS has terminated module `modname`, and you consider that it was not a runaway, you should increase the ICVR system initialization parameter. You can change the RUNAWAY time interval temporarily using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**DFHDM0005** `applid` A hardware error has occurred (module `modname`, code `X'code'`). The Time-of-Day clock is invalid.

**Explanation**
A hardware error has occurred during the running of module `modname`. The MVS Store Clock facility is the timing mechanism for the operating system.

The code `code` is the exception trace point id which uniquely identifies the place where the error was detected.

**System action**
An exception entry (code `code` in the message) is made in the trace table. A dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
This is in all probability a hardware error and you should in the first instance investigate the MVS Store Clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHDMDM, DFHDMWQ, DFHDMDS

**XMEOUT parameters/Message inserts**
1. `applid`
2. `modname`
3. `X'code'`

**Destination**
Console

**DFHDM0101I** `applid` CICS is initializing.

**Explanation**
This message is for information only.

CICS initialization has started. The domain (DM) manager is about to attach an initialization task for each domain defined in the local CICS catalog, DFHLCD.

**System action**
Processing continues.

**User response**
None. You can suppress this message with the system initialization parameter, MSGLVL=0.

**Module:**
DFHDMDM

**XMEOUT parameters/Message inserts**
1. `applid`

**Destination**
Console
DFHDM0102I  applid CICS is quiescing.

Explanation
This message is for information only.
The controlled shutdown of CICS has started. The domain (DM) manager is about to attach a quiesce task for each CICS component.

System action
Processing continues.

User response
None. You can suppress this message with the SIT parameter, MSGLEVEL=0.

Module:
DFHDMDM

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHDM0103  applid Unsuccessful quiesce of domain domain. CICS will terminate.

Explanation
A domain has failed to quiesce.

System action
CICS terminates. An exception trace and a dump are issued by the domain in error.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDMDM

XMEOUT parameters/Message inserts
1. applid
2. domain

Destination
Console

DFHDM0104  applid Unsuccessful load of program domain. CICS will terminate.

Explanation
The domain (DM) manager has called the loader to load a program for an initialization task but the load has failed. The module is missing from the DFHRPL concatenation, possibly because the SDFLOAD is missing. Alternatively, if the module name given in the message is not a legitimate CICS module, the CICS catalog could be corrupted.

System action
CICS terminates. A system dump with dump code DM0006 is taken unless you have suppressed dumps in the dump table.

An exception trace is issued by the domain manager. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDMDM

XMEOUT parameters/Message inserts
1. applid
2. domain

Destination
Console

DFHDM0105  applid Unsuccessful initialization of domain domain. CICS will terminate.

Explanation
A domain has failed to initialize.

System action
CICS terminates with a dump.
Diagnostics are issued by the domain in error. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Review the diagnostics and take remedial action for any installation-related problems. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHDMDS

**XMEOUT parameters/Message inserts**

1. applid
2. domain

**Destination**

Console

DFHDM0106 applid The Domain Manager records on the CICS Catalog may have been corrupted.

**Explanation**

A problem was detected when calling the CICS catalog to browse the domain (DM) manager records. For example, the domain manager records may not be present.

**DFHDPnmmn messages**

DFHDP0001 applid An abend (code aaaa/bbbb) has occurred at offset X'offset' in module modname.

**Explanation**

An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, OC1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHDP1310).

This message may follow message DFHDM0002.

**System action**

This is a critical error and CICS terminates, even if you have specified in the dump table that CICS should not terminate.

A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Try reinitializing the local CICS catalog, DFHLCD, using DFHCCUTL, and perform an initial start of CICS.

If this does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHDMDM

**XMEOUT parameters/Message inserts**

1. applid

**Destination**

Console

DFHDM0106 applid The Domain Manager records on the CICS Catalog may have been corrupted.

**Explanation**

A problem was detected when calling the CICS catalog to browse the domain (DM) manager records. For example, the domain manager records may not be present.

**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.
Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If you cannot continue without the full use of module modname you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHDP*

**XMEOUT parameters/Message inserts**

1. applid
2. aaa/bbbb
3. X'offset'
4. modname

**Destination**
Console

**DFHDP0002** applid A severe error (code X'code') has occurred in module modname.

**Explanation**
An error has been detected in module modname. The code X'code' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

**System action**
An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHDPFM, DFHDPLM, DFHDPUM.

**XMEOUT parameters/Message inserts**

1. applid
2. X'code'
3. modname

**Destination**
Console

**DFHDP0100** applid An unexpected exception response with reason code X'code' has been returned by CICS file control to module modname. The debugging profiles file, filename, is not usable.

**Explanation**
A call to CICS file control from a DP domain module has received an unexpected exception response from DFHFCFR. The reason code given in the message is the reason from the FCFR parameter list on return from file control.

**System action**
The file given in the message is not usable.
The application debugging profiles manager will fail until the problem has been corrected. It the CICS supplied transaction, CADP, is being used to define debugging profiles it will fail with an ADPA abend.
The meaning of the reason code in the message is given below:
- X'08' (FCFR_CACHE_FAILURE)
There has been an input/output (IO) error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- **X'15' (FCFR_DATASET_BEING_COPIED)**
  The data set for the debugging profiles file, DFHDPFMB, is currently unavailable because it is being copied. Retry when it becomes available.

- **X'1F' (FCFR_FILE_DISABLED)**
  The file definition for the debugging profiles base data set, DFHDPFMB, or path data set, DFHDPFMP, is disabled. Enable the disabled file and retry.

- **X'20' (FCFR_FILE_NOT_OPEN)**
  The file definition for the debugging profiles base data set, DFHDPFMB, or path data set, DFHDPFMP, is not open. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- **X'22' (FCFR_FILENOTFOUND)**
  A definition for the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, could not be found. Sample definitions for these files are available and should be defined and installed before retrying.

- **X'27' (FCFR_INSUFFICIENT_SPACE)**
  The debugging profiles base file, DFHDPFMB, is full. Investigate whether there are debugging profiles that can be deleted. Or, increase the storage allocation for the underlying VSAM data set, and recreate. Existing profiles could be backed up on another data set and then copied to the newly defined debugging profiles data set as part of the JCL to recreate it. To achieve this, replace REPRO INFILE with REPRO INDATASET in the JCL and replace SYS01 with the name of the data set containing the backed up profiles.

- **X'2B' (FCFR_IO_ERROR)**
  There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- **X'31' (FCFR_LOCKED)**
  An attempt has been made to write a record to the debugging profiles base file, DFHDPFMB, but a retained lock exists against the key of the record being written.

- **X'32' (FCFR_LOST_LOCKS)**
  There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- **X'37' (FCFR_READ_NOT_AUTHORISED)**
  The user is not authorized to use the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. If the user should have access to the files, allow access and retry.

- **X'39' (FCFR_PREVIOUS_RLS_FAILURE)**
  The debugging profiles file, DFHDPFMB, has been defined as record level sharing (RLS) but RLS is currently unavailable due to a failure. Investigate the reason for the RLS failure by looking for messages from file control and VSAM on the console. Retry when RLS is available.

- **X'3B' (FCFR_READ_NOT_AUTHORISED)**
  The external security manager would not allow the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, to be accessed. If the user should have access to the files, allow access and retry.

- **X'3D' (FCFR_DATE_DS_RULES_VIOLATED)**
  A journal referenced in the definition for the debugging profiles file, DFHDPFMB, is using an MVS which in turn, is using a coupling facility structure that has been defined with a MAXBUFSIZE parameter less than the recommended 64000. Redefine the coupling facility structure that the logstream is using with a MAXBUFSIZE parameter of 64000. The journal in error can be the forward recovery log or the journal used for auto-archiving.

- **X'46' (FCFR_RLS_DISABLED)**
  The debugging profiles file, DFHDPFMB, has been defined as record level sharing (RLS) but RLS is currently disabled. Investigate why RLS is disabled by examining the console for file control and VSAM messages. Retry when RLS is available.

- **X'47' (FCFR_RLS_FAILURE)**
  The debugging profiles file has been defined as record level sharing (RLS) but RLS is currently unavailable due to a failure. Investigate the reason...
for the failure by examining the console for file control and VSAM messages. Retry when RLS is available.

- **X'4B' (FCFR_SERVREQ_VIOLATION)**
  The definition for the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, does not allow all types of file request to be issued. Alter the file definitions to allow all file requests and retry.

- **X'4E' (FCFR_SUPPRESSED)**
  A user exit has suppressed the writing of records to the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. The exit should not be allowed to suppress records being written to these files. Correct the exit and retry.

- **X'4F' (FCFR_SYSIDERR)**
  The SYSID for the file definition for the debugging profile base file, DFHDPFMB, or path file, DFHDPFMP, specifies a name that is neither the local CICS region nor a remote system defined to CICS by a CONNECTION definition. SYSIDERR can also occur if the link to the remote system is closed. Correct the SYSID or reopen the link and retry.

- **X'52' (FCFR_TIMEOUT)**
  A request to file control has timed out. Investigate the reason for the timeout by examining the console for messages.

- **X'58' (FCFR_UPDATE_NOT_AUTHORISED)**
  The external security manager would not allow the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP, to be accessed. If the user should have access to the files, allow access and retry.

- **X'59' (FCFR_VSAM_REQUEST_ERROR)**
  There has been an IO error trying to access the debugging profiles base file, DFHDPFMB, or path file, DFHDPFMP. Examine the console to find file control or VSAM messages that will indicate the reason for the error.

- **X'61' (FCFR_RREPL_VIOLATION)**
  The file is flagged as RREPL and the program is not a REPLICATOR. If the program should be allowed to modify the file then change the file or program attributes.

**User response**
Investigate and correct the error based on the reason given and retry. In the case of an X'20' (FCFR_FILE_NOT_OPEN) reason code, once the underlying data set problem has been resolved, CICS Debug Profile support can be reactivated.

**Module:**
DFHDPFM, DFHDPLM, DFHDPUM.

**Extension**

| DFHDS0003 | applid | Insufficient storage (code X’code’) in module modname. |

**Explanation**

A CICS GETMAIN was issued by module modname but there was insufficient storage available to satisfy the request.

The code X’code’ is the exception trace point id which uniquely identifies the place where the error was detected. This error has occurred above the 16M line.

**System action**

An exception entry is made in the trace table (code code in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.
User response

Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module modname, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the overall size limits of the DSAs or EDSAs. If CICS is not already terminated, you will need to bring CICS down to do this. See the Configuring or the Improving performance for more information on CICS storage.

You may need further assistance from IBM to fully resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDSBR

XMEOUT parameters/Message inserts

1. applid
2. X'code'
3. modname

Destination
Console

DFHDS0004 apllid A possible loop has been detected at offset X'offset' in module modname.

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module module will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHDS0005 appllid A hardware error has occurred (code X'code', module modname). The Time-of-Day clock is invalid.
Explanation
A hardware error has occurred during the running of module module. The MVS Store Clock facility is the timing mechanism for the operating system.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

System action
An exception entry (code code in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Inform the system programmer. This is in all probability a hardware error and you should in the first instance investigate the MVS Store Clock and find out whether it is working properly. If this is the case, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDSTCB

XMEOUT parameters/Message inserts
1. applid
2. X'code'
3. modname

Destination
Console

Explanation
An MVS GETMAIN was issued by module modname but there was insufficient storage available to satisfy the request.

The code code is the exception trace point ID which uniquely identifies the place where the error was detected.

This error may occur either above or below the 16M line. This depends on context.

The code mvscode is the MVS GETMAIN return code.

System action
An exception entry is made in the trace table (code code in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Or this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

The system action depends on the context.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module modname, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the overall size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you will need to bring CICS down to do this. See the Configuring or the Improving performance for more information on CICS storage.
You may need further assistance from IBM to fully resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

**DFHDS0007** `applid Module module has detected a {suspend resume area overflow | architecture limit} (code X'code')|. CICS will be terminated. |

**Explanation**
A dispatcher architecture limit has been detected. This could be one of the following limits.

- Suspend resume area overflow
- Architecture limit

The code `code` is the exception trace point ID which uniquely identifies the place where the error was detected.

**System action**
An exception entry is made in the trace table (code `code` in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either If the message does not state that CICS will be terminated then CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message will be issued to this effect.

Or This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. The message will state that CICS will be terminated.

The system action depends on the context.

**User response**
Inform the system programmer. The exception trace may help you identify the architecture limit that has been detected. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem might be a temporary one that you can resolve by retrying the operation.

You may need further assistance from IBM to fully resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

   1. CICS will be terminated,
   2.

**Destination**
Console

**DFHDS0010** `applid Kill request accepted for transaction id transid, transaction number tranum, userid userid.

**Explanation**
A request to kill a CICS task has been accepted.

**System action**
The CICS task has been marked to be killed. The kill will be actioned as soon as possible. Message DFHME0116, which contains the symptom string for this problem, is produced.
User response
Check for subsequent messages or abend codes to determine the state of the task when the kill was actioned and the possible repercussions of the kill.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHDSAT

XMEOUT parameters/Message inserts
1. applid
2. transid
3. tranum
4. userid

Destination
Console

DFHDS0011 applid Kill request reaccepted for transaction id transid, transaction number tranum, userid userid.

Explanation
A request to kill a CICS task has been reaccepted. A kill has previously been accepted for this task but has not been actioned yet.

System action
The CICS task has been marked to be killed. The kill will be actioned as soon as possible. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Check for subsequent messages or abend codes to determine the state of the task when the kill was actioned and the possible repercussions of the kill.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHDSAT

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHDS0101 applid Dispatcher cannot enable the CICS post exit.

Explanation
The dispatcher has been unable to gain authorization to enable the CICS post exit. This is probably because the CICS SVC number has been defined incorrectly in the SIT.

System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Check to see whether the CICS SVC number has been defined correctly in the SIT and the SIT overrides. Check that the SVC and other code has been correctly installed as described in the Installing CICS TS. In particular, ensure that the CICS post-exit stub (DFHDSPEX) is in the LPA.

Module:
DFHDSDM

1. applid

Destination
Console
**DFHDUUnnnn messages**

| DFHDU0001 | applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname. |

**Explanation**

An abnormal end (abend) or program check has occurred in module **modname**. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code **aaa/bbbb** is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action**

An exception entry is made in the trace table.

For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

For module DFHDUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

For module DFHDUDU, a system dump cannot be taken as doing so could cause CICS to loop. CICS processing continues.

For other modules, a system dump is taken. CICS processing continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, a runaway or a recovery percolation, and may give you some guidance concerning user response.

If module **modname** is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module **modname**, you should bring CICS down in a controlled shutdown.

If the abend occurred in modules DFHDUDT or DFHDUTM, the dump table is not available. Therefore, any EXEC API commands relating to dump codes fail and any dumps taken are processed using default information (for example, whether to terminate CICS or not) rather than information you may have put on the dump table for specific dump codes.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**XMEOUT parameters/Message inserts**

1. applid
2. aaa/bbbb
3. X'offset'
4. modname

**Destination**

Console

| DFHDU0002 | applid A severe error (code X'code') has occurred in module modname. |

**Explanation**

An error has been detected in module **modname**. The code **code** is the exception trace point ID which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the Troubleshooting and support.

**System action**

An exception entry (code **code** in the message) is made in the trace table.
For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you've specified in the dump table that CICS should terminate.

For module DFHDUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller. A message will be issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

If the error occurred in modules DFHDUDT or DFHDUTM, the dump table may not be available. Therefore, any EXEC API commands relating to dump codes may fail and any dumps taken may be processed using default information (for example, whether to terminate CICS or not) rather than information you may have put on the dump table for specific dump codes.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDUDT, DFHDUTM

XMEOUT parameters/Message inserts

1. applid
2. X'code'
3. modname

Destination
Console

DFHDU0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation
A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which happened to be executing at the time when the error was detected.

System action
An exception entry is made in the trace table.

For module DFHDUDT, a system dump is taken unless you have specifically suppressed the dumps (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

For module DFHDUTM, a system dump is taken. This dump cannot be suppressed. CICS processing continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See
Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHDUDT, DFHDUTM, DFHDUXD, DFHDUIO, DFHDUSU, DFHDUXW, DFHPCXDF, DFHSAXDF, DFHDLXDF, DFHXDXDF, DFHXRXDF, DFHTCXDF, DFHTRXDF, DFHFCXDF

**XMEOUT parameters/Message inserts**
1. `applid`
2. `X'offset'`
3. `modname`

**Destination**
Console

| DFHDU0006 | `applid` Insufficient storage to satisfy Getmain (code `X'code') in module `modname`. MVS code `mvscode`. |

**Explanation**
An MVS GETMAIN was issued module `modname`, but there was insufficient storage available to satisfy the request.

The code `X'code'` is the exception trace point id which uniquely identifies the place where the error was detected. This error has occurred above the 16M line.

The code `mvscode` is the MVS GETMAIN return code.

**System action**
An exception entry is made in the trace table (code `code` in the message) and a system dump is taken. This dump cannot be suppressed. CICS processing continues.

**User response**
Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module `modname`, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

As the problem is in module DFHDUTM, EXEC API commands for browsing the dump tables may not work, or additions to the dump tables may not work.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the size limit of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you need to bring CICS down to do this.

**Module:**
DFHDUTM

| DFHDU0102 | `applid` DFHDUIO could not be loaded. Transaction dump is inoperative. |

**Explanation**
CICS could not locate module DFHDUIO during initialization.

**System action**
An exception trace entry is produced, and CICS continues with the transaction dump facility inoperative.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
Use the exception trace entry and any other relevant messages to determine why module DFHDUIO was not available.

**Module:**
DFHDUDM

**Destination**
Console

| DFHDU0103 | `applid` An abend has occurred during initialization of dump domain in module DFHDUDM. |
Explanation
A dump domain has failed to initialize.

System action
CICS terminates.

An exception trace and a kernel dump are issued by the dump domain. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHDUDU

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHDU0201 applid About to take SDUMP.
Dumpcode: dumpcode, Dumpid: dumpid.

Explanation
An error, possibly signalled by a previous message, has caused a call to the CICS dump (DU) domain. Dump domain will issue this message immediately before calling the MVS SDUMP facility if the following conditions are satisfied:

• The SIT option, DUMP=YES, for SDUMPS has been specified.
• The dump table entry for dump code dumpcode specifies that a system SDUMP is required.
• The maximum dump limit for this dump code in the dump table entry has not been exceeded.
• The user exit XDUREQ does not suppress the taking of this dump.

The dump code dumpcode is an 8-character system dump code identifying the CICS problem. However some of these characters may be blanks. A system dump code is a CICS message number with the DFH prefix removed.

The dumpid dumpid is the unique 9-character string identifying this dump.

System action
When the dump is complete, message number DFHDU0202 is issued.

User response
Inform the system programmer, who should refer to the CICS message indicated by dumpcode to resolve the problem.

Module:
DFHDUDU

Destination
Console

DFHDU0202 applid SDUMP complete.

Explanation
This message is issued on successful completion of an SDUMP.

System action
Processing continues unless a CICS shutdown is requested by either the dump table entry for this dump or the dump call to the dump (DU) domain.

User response
Print off the system dump if required. A previous MVS message identifies in which SYS1.DUMP data set this dump can be found.

Module:
DFHDUDU

Destination
Console

DFHDU0203I date time applid A transaction dump was taken for dumpcode: dumpcode, Dumpid: dumpid, Tranid: tranid, Tranum: tranum, Program: program.

Explanation
A CICS transaction has abnormally terminated, possibly signalled by a previous message, and the CICS dump (DU) domain has taken a transaction dump.

The dump code dumpcode is normally the 4-character CICS transaction abend code if the dump was requested as a result of a transaction abend. It may
also be the value of the DUMPCODE operand on an EXEC CICS DUMP TRANSACTION request.

The dump ID dumpid is the unique 9-character string identifying this dump.

The transaction name tranid, transaction number trannum and program name program provide more information about the circumstances when the dump was taken.

**System action**

A transaction dump is written to the current CICS dump data set, either DFHDMPA or DFHDMPB.

CICS may terminate if the dump table entry for the specified abend code specifically requests it.

**User response**

Print off the transaction dump if required.

**Module:**

DFHDUDU

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. dumpcode
5. dumpid
6. tranid
7. trannum
8. program

**Destination**

CDUL

DFHDU0205 applid A system dump for dumpcode: dumpcode was suppressed by the reason.

**Explanation**

An error, possibly signalled by a previous message, has caused a call to the CICS (DU) dump domain, which failed to take a system dump for reason reason. Reason reason indicates what has caused dump suppression.

- The XDUREQ user exit.
- The dump table option for dump code dumpcode.
- The global system dump suppression option.

The dump code dumpcode is an 8-character system dump code identifying the CICS problem. However some of these characters may be blanks. A system dump code is a CICS message number with the DFH prefix removed.

**System action**

A system dump is not produced. However, CICS is terminated if the dump table entry for this dump code or the caller of the dump domain requests CICS termination.

**User response**

If a system dump is required for this dump code, perform the user action appropriate to the reason reason given in the message.

- If the user exit XDUREQ has suppressed the dump, either inactivate this exit, or as a more permanent measure change the user exit program not to suppress the dump.
- If the dump table has suppressed the dump, use CEMT or CECI to browse and update the dump table entry for dump code dumpcode.
- If the global system dump suppression option has suppressed the dump, specify DUMP=YES on the SIT to allow future system dumps to be taken.

The SIT DUMP option can be over-ridden by using CEMT or the system programming interface for SET SYSTEM DUMPING (NOSYSDUMP|SYSDUMP).

**Module:**

DFHDUDU

**Destination**

Console

DFHDU0206I date time applid A transaction dump for dumpcode: dumpcode was suppressed by the reason.

**Explanation**

A CICS transaction has abnormally terminated, possibly signalled by a previous message, and the CICS dump (DU) domain has failed to take a transaction dump for the reason reason. Reasons reason indicates the reason for dump suppression.

- XDUREQ user exit.
- Dump table option for this dump code.

The dump code dumpcode is the 4-character CICS transaction abend code.
**System action**

A transaction dump is not produced. However, CICS is terminated if the dump table entry for this dump code or the caller of the dump domain specifically requests such.

**User response**

If a transaction dump is required for this dump code, perform the user action appropriate to the reason given in the message:

- If the user exit, XDUREQ, has suppressed the dump, either inactivate this exit, or as a more permanent measure, change the user exit program so that it does not suppress the dump.
- If the dump table has suppressed the dump, use CEMT or CECI to browse and update the dump table entry for dump code `dumpcode`.

**Module:**
DFHDUDU

**XMEOUT parameters/Message inserts**

1. `date`
2. `time`
3. `applid`
4. `dumpcode`
5. `reason`

**Destination**
CDUL

**Explanation**

Either an EXEC CICS DUMP TRANSACTION DUMPCODE command has been issued, or a CICS transaction has abnormally terminated, possibly signalled by a previous message, and the CICS dump (DU) domain has failed to take a transaction dump or a system dump for reason `reason`. Reasons `reason` indicates what caused dump suppression.

- XDUREQ user exit.
- Dump table option for this dump code.

The dump code `dumpcode` is the 4-character CICS transaction abend code.

---

**System action**

Neither a transaction nor a system dump is produced. However, CICS is terminated if the dump table entry for this dump code or the caller of the dump domain makes such a request.

**User response**

If a transaction dump and/or a system dump is required for this dump code, perform the user action appropriate to the reason given in the message:

- If the user exit XDUREQ has suppressed the dump, either inactivate this exit, or as a more permanent measure change, the user exit program so it does not suppress the dump.
- If the dump table has suppressed the dump, use CEMT or CECI to browse and update the dump table entry for this dump code.

**Module:**
DFHDUDU

**XMEOUT parameters/Message inserts**

1. `date`
2. `time`
3. `applid`
4. `dumpcode`
5. `reason`

**Destination**
CDUL

**Explanation**

At the time of the MVS SDUMP request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This caused MVS to reject the new request. A non-zero value for the DURETRY parameter on the SIT means that CICS is waiting for five seconds before reissuing the SDUMP request.

**System action**

CICS issues an MVS STIMERM macro which caused CICS to stop for five seconds. The request is reissued when the delay interval has expired. CICS will delay and retry every five seconds for a total time equal to the number of seconds specified on the DURETRY SIT parameter.
User response

None.

Module:
DFHDUDU

Destination
Console

DFHDU0209 applid Retrying SDUMP.

Explanation
At the time of the MVS SDUMP request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This caused MVS to reject the new request. CICS has waited for five seconds (as indicated by message DFHDU0208) and is now about to reissue the SDUMP request.

System action
CICS reissues the SDUMP request.

User response
None.

Module:
DFHDUDU

Destination
Console

DFHDU0210 applid SDUMPX REQUEST FAILED - reason.

Explanation
An MVS SDUMPX request from CICS signalled by message DFHDU0201 has failed to complete successfully. The possible reasons, (reason) for the failure are as follows:

SDUMPX RETURN CODE X'nn' REASON X'mm'

At the time of the MVS SDUMPX request issued by CICS, another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. If a nonzero value is specified for the DURETRY SIT parameter, CICS retries the SDUMPX request every five seconds for the specified period. This message is only issued if SDUMPX is still busy after the final retry.

SDUMPX RETURN CODE X'nn' ONLY PARTIAL DUMP

See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the SDUMPX return code X'nn'. Use
MVS problem determination methods to determine why a partial dump was taken.

SDUMPX RETURN CODE X'nn' REASON X'mm'

Cause the SDUMP to be reissued after, if appropriate, increasing the value of the DURETRY system initialization parameter. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the SDUMPX return code X'nn' and reason X'mm'.

SDUMPX RETURN CODE X'nn' REASON X'mm' NO DATA SET AVAILABLE

Clear a SYS1.DUMP data set and then cause the SDUMP request to be reissued. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the SDUMPX return code X'nn' and reason X'mm'.

SDUMPX RETURN CODE X'nn' REASON X'mm'

No action is required if the dump was suppressed deliberately. If the dump has failed because of an error in the MVS SDUMP routine, use MVS problem determination methods to fix the error and then cause the SDUMP request to be reissued. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the SDUMPX return code X'nn' and reason X'mm'.

STIMERM FAILED

Use MVS problem determination methods to fix the STIMERM failure and then cause the SDUMP request to be reissued.

NOT AUTHORIZED IN CICS

This reason is unlikely to occur because SDUMPX is unconditionally authorized during CICS initialization, and should be authorized throughout the CICS run. If you do get this reason, the CICS AFCB (authorized function control block) has probably been accidentally overwritten.

INSUFFICIENT STORAGE

Ensure sufficient storage is available to MVS for subpool 253 requests.

DFHDUSVC FESTAE FAILED

Use MVS problem determination methods to fix the FESTAE failure and then cause the SDUMP request to be reissued. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the FESTAE macro.

DFHDUSVC INVALID PROBDESC

The SDUMPX PROBDESC parameters, created by DFHDUSVC during the processing of the SDUMPX request, are invalid. The PROBDESC parameters have probably been accidentally overwritten.

IWMWQWRK RETURN CODE X'xx' REASON X'yy'.

CICS issued an MVS IWMWQWRK request during the processing of the SDUMPX request. The IWMWQWRK request has been rejected by MVS return code X’xx‘ and reason X’yy‘. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the return and reason codes.

DFHDUSVC INVALID PROBDESC

The SDUMPX PROBDESC parameters, created by DFHDUSVC during the processing of the SDUMPX request, are invalid. The PROBDESC parameters have probably been accidentally overwritten.

Module: DFHDUDU

Destination Console

DFHDU0211 applid THE XDUREQ USER EXIT IS NOT CALLED FOR DUMPCODE dumpcode.

Explanation

Because of a severe system error, the XDUREQ user exit (which allows you to suppress system dumps) has not been called for system dump dumpcode.

System action

The XDUREQ user exit is not called.

If DFHDU0211 is followed either by message DFHDU0201, indicating that dump dumpcode was taken, or by message DFHDU0205, indicating that dump dumpcode was suppressed. Message DFHDU0201 or DFHDU0205 is followed by message DFHDU0309 if CICS terminates.

The XDUREQ user exit is called for subsequent system dumps.

User response

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHDUDU

Destination Console

DFHDU0212 applid Requested transaction dump code dumpcode is invalid.
Explanation
A requested transaction dump code has unprintable characters, or has leading or imbedded blanks.

System action
A transaction dump is produced unless suppressed by the user exit XDUREQ. However, no dump statistics are committed. The transaction dump is complete when message DFHDU0203 is issued. The invalid dump code is shown in dump domain (DU) trace points X’0600’ and X’0601’.

User response
Print off the transaction dump and determine how an abend or EXEC CICS request was issued with an invalid dump code.

Module:
DFHDUDU

XMEOUT parameters/Message inserts
1. applid
2. dumpcode

Destination
Console

DFHDU0213 REMOTE SDUMPX REQUEST
FAILED - reason.

Explanation
A remote MVS SDUMPX request from CICS has failed to complete successfully. The possible reasons, (reason) for the failure are as follows:

DFHDUMPX AUTOMATIC STORAGE GETMAIN FAILED.
CICS issued an MVS GETMAIN for Subpool 253 storage during the processing of the SDUMPX request. The GETMAIN has been rejected by MVS.

DFHDUMPX NOT RUNNING IN THE MAIN ADDRESS SPACE.
DFHDUMPX must run in the MAIN address space. CICS stops processing the remote SDUMPX request if it detects that DFHDUMPX is running in another address space.

IWMWQWRK FOUND NO ADDRESS SPACES TO DUMP.
The MVS IWMWQWRK service found no CICS address spaces with work relating to the remote SDUMPX request.

IWMWQWRK FAILED WITH A WARNING.
CICS issued an MVS IWMWQWRK request from DFHDUM PX during the processing of the remote SDUMPX request. MVS has rejected the IWMWQWRK request with a warning return code.

IWMWQWRK FAILED WITH AN ERROR.
CICS issued an MVS IWMWQWRK request from DFHDUM PX during the processing of the remote SDUMPX request. MVS has rejected the IWMWQWRK request with an error return code.

DFHDUMPX OUTPUT WORKAREA GETMAIN FAILED
CICS issued an MVS GETMAIN for Subpool 253 storage during the processing of the SDUMPX request. The GETMAIN has been rejected by MVS.

DFHDUMPX RECOVERY ROUTINE ENTERED
An abnormal end (abend) or program check has occurred in DFHDUMPX. This implies that there is an error in CICS code.
Alternatively, unexpected data has been input, or storage has been overwritten.
CICS adds diagnostic data to the MVS SDWA and makes an entry in SYS1.LOGREC.

System action
CICS proceeds as if the dump had been successful.

User response
The user response depends on the reason, (reason), for the failure.

DFHDUMPX AUTOMATIC STORAGE GETMAIN FAILED.
Ensure sufficient storage is available to MVS for subpool 253 requests.

DFHDUMPX NOT RUNNING IN THE MAIN ADDRESS SPACE.
This reason is unlikely to occur because CICS requests that the MVS CSVDYNEX service adds DFHDUMPX as an IEASDUMP.QUERY exit in the MAIN address space.
If you do get this reason, there was probably an error during CICS initialization.
Notify the system programmer.
You will need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.
IWMWQWRK FOUND NO ADDRESS SPACES TO DUMP.

This is unlikely to be an error. DFHDUMPX is invoked on all the MVS images in a SYSPLEX for a remote SDUMPX request. Some of the images may not have any CICS address spaces with work relating to the CICS system which originated the remote SDUMPX request.

IWMWQWRK FAILED WITH A WARNING.

The IWMWQWRK return code and reason are included in a CICS trace entry which is written to the GTF data set. The trace entry is not written to the CICS internal trace or in the CICS auxiliary trace data set because DFHDUMPX does not execute under a CICS TCB.

See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the IWMWQWRK return code and reason.

IWMWQWRK FAILED WITH AN ERROR.

The IWMWQWRK return code and reason are included in a CICS trace entry which is written to the GTF data set. The trace entry is not written to the CICS internal trace or in the CICS auxiliary trace data set because DFHDUMPX does not execute under a CICS TCB.

See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the IWMWQWRK return code and reason.

Explanation

DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message immediately before returning to MVS if the following conditions are satisfied:

- a dump has been requested for a CICS dump code, whose dump table entry specified that related dumps are required, and DFHDUMPX has found related CICS work on this MVS image or
- the operator requested remote dumps from the console, including the CICS DFHJOBN keyword in the MVS PROBDESC parameters, and DFHDUMPX has found CICS jobs on this MVS image which match the DFHJOBN data.

System action

Processing continues.

User response

None.

Module:

DFHDUMPX

Destination

Console

DFHDU0215  DFHDUMPX IS ABOUT TO SUPPRESS A REMOTE SDUMPX.

Explanation

DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message immediately before returning to MVS if it has found that a remote dump should be suppressed.

The remote dump is suppressed under the following conditions:

- A dump has been requested for a CICS dump code, whose dump table entry specified that related dumps are required, and DFHDUMPX has found no related CICS work on this MVS image or
- The operator requested remote dumps from the console, including the CICS DFHJOBN keyword in the MVS PROBDESC parameters, and DFHDUMPX has found no CICS jobs on this MVS image which match the DFHJOBN data.
The remote dump is also suppressed if an error occurred during the DFHDUMPX processing. Look for a previous DFHDU0213 message to find the reason for the error.

**System action**
Processing continues.

**User response**
To determine whether action is necessary refer to any DFHDU0213 message preceding this one.

**Module:**
DFHDUMPX

**Destination**
Console

**DFHDU0216**
PROBDESC DOES NOT CONTAIN CICS DATA.

**Explanation**
DFHDUMPX is called under the MVS IEASDUMP.QUERY exit and determines whether a remote dump should be taken.

DFHDUMPX issues this message if it has found that the SDUMPX PROBDESC parameters do not contain CICS data. It is probable that this is not an error and that the remote dump was requested by a product other than CICS. However, if you were expecting a CICS remote dump it could be that the PROBDESC parameters were accidentally overwritten.

**System action**
DFHDUMPX will request that MVS suppresses the remote dump and then processing continues.

**User response**
You need to take the action only if you were expecting a remote CICS dump.

Notify the system programmer.

To resolve the problem, collect any data from GTF trace, any dumps and any relevant messages. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHDUMPX

**Destination**
Console

**DFHDU0217**
applid SDUMPX request completed with a return code of X'04'. A complete or partial dump has been taken.

**Explanation**
An MVS SDUMPX request from CICS signalled by message DFHDU0201 may have resulted in a complete or partial SVC dump. Even though the request completed with an SDUMPX return code x'04', it is possible that sufficient information has been dumped to enable successful diagnosis of the problem that caused the dump to be taken. The accompanying message(s) IEA611E/IEA911E should be used to determine the suitability of the dump for successful diagnosis.

**System action**
CICS proceeds as if the dump had been successful.

**User response**
See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the SDUMPX return code X'04'.

**Module:**
DFHDUDU

**Destination**
Console

**DFHDU0218**
NO PROBDESC PARAMETERS SUPPLIED TO DFHDUMPX.

**Explanation**
A remote MVS SDUMPX request has failed to complete successfully because there were no SDUMPX PROBDESC parameters supplied.

MVS invokes DFHDUMPX under the IEASDUMP.QUERY exit and without the SDUMPX PROBDESC parameters DFHDUMPX cannot determine whether to take or suppress a remote dump.

This is only an error if the remote SDUMPX request was made by CICS for a system dump code that included the RELATED option, or if the operator entered a remote SDUMPX request that included PROBDESC parameters. This is not an error if another non-CICS component intentionally calls DFHDUMPX without PROBDESC.

**System action**
CICS proceeds as if the dump had been successful.
User response
If you believe this is an error you will need further assistance from IBM to resolve this problem. Collect any data from GTF trace, any dumps, and any relevant messages then see Part 4 of the "Troubleshooting and support" for guidance on how to proceed.

Module: DFHDUMPX

Destination
Console

DFHDU0302I  applid Transaction Dump Data set dataset to be closed due to text-descr

Explanation
This message is output when attempting to write a record to the transaction dump data set. text-descr is one of the following:
- DCB ABEND
- TASK TIMEOUT
- TASK CANCEL

System action
None unless text-descr is DCB ABEND, in which case an exception entry is made in the trace table and a system dump is taken.

User response
Notify the system programmer.

In the case of DCB ABEND, there will normally be an accompanying MVS error message to help identify the problem with the data set.

If the problem is not due to a major corruption of CICS, successful switching of dump data sets will reinstate the transaction dump environment. Otherwise, the transaction dump environment will be available only if the XDUOUT user-exit is active.

The message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHDUIO

XMEOUT parameters/Message inserts
1. applid
2. dataset
3. text-descr

Destination
Console

DFHDU0303I  applid Transaction Dump Data set dataset closed.

Explanation
This message is issued in one of the following situations:
- A request to close the dump data set is issued by the operator.
- The CICS system is shut down.
- A request to switch between dump data sets is issued by the operator.
- A transaction dump data set becomes full.

The insert dataset indicates the name of the data set being closed.

System action
Processing continues.

If autoswitching of the transaction dump data set is not active, the transaction dump environment is available only if the XDUOUT user-exit is active.

If autoswitching is enabled, this message is followed by DFHDU0304 and DFHDU0305 to indicate that the data set switch is successful.

If the switch is unsuccessful, this message is followed by DFHDU0306.

The message can be suppressed with the system initialization parameter MSGLVL=0.

User response
None.

Module: DFHDUSU

XMEOUT parameters/Message inserts
1. applid
2. dataset

Destination
Console

DFHDU0304I  applid Transaction Dump Data set dataset opened.
Explanation
This message is output when any of the following situations occur:
• A request to open the dump data set is issued by the operator.
• The CICS system is brought up.
• A request to switch between dump data sets is issued by the operator.
• Automatic switching between dump data sets is being performed.

dataset in the message indicates the name of the data set being opened.

System action
Processing continues.

User response
None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHDUSU

XMEOUT parameters/Message inserts
1. applid
2. ddname

Destination
Console

DFHDU0305I applid Transaction Dump Data set switched to ddname

Explanation
This message is issued when one of the following situations occurs:
• A command is issued by the operator to switch dump data sets.
• Automatic switching is being performed between dump data sets due to a dump data set being full.

This message is always preceded by message DFHDU0304 and also, if the old dump data set was open, by message DFHDU0303.
ddname in the message indicates the ddname of the active transaction dump data set (either DFHDMPA or DFHDMPB).

System action
Processing continues.

User response
Print or copy the completed dump data set, and if required, reissue the command CEMT SET DUMP AUTO.
The message can be suppressed with the system initialization parameter MSGLVL=0.

Module: DFHDUSU

XMEOUT parameters/Message inserts
1. applid
2. ddname

Destination
Console

DFHDU0306 applid Unable to open Transaction Dump Data set dataset - text-descr

Explanation
This message occurs when attempting to open a transaction dump data set.
text-descr is one of:

OPEN ERROR
An attempt was made to open the dump data set, and an abend exit was invoked. This condition is usually accompanied by MVS system messages.

INSUFFICIENT STORAGE
An MVS GETMAIN was issued to obtain storage below the 16MB line. This request was unsuccessful.

System action
An exception entry is made in the trace table.
In both cases, the transaction dump data set is not open, and unless the XDUOUT exit is active, the transaction dump is inoperative.
Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
See any associated MVS messages for further guidance.
Module: DFHDUIO

XMEOUT parameters/Message inserts
1. applid
2. dataset
3. text-descr

Destination
Console

DFHDU0307 applid Module DFHDUIO is unavailable. Transaction dump is inoperative.

Explanation
This message is issued either when an attempt is made to open or close a dump data set, or when switching between dump data sets, to remind the user that CICS could not locate module DFHDUIO during initialization. CICS will have issued message DFHDU0102 during initialization to warn the user of this condition.

System action
CICS continues with the transaction dump facility inoperative.

User response
If necessary, refer to the user response for message DFHDU0102.

Module: DFHDUSU

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHDU0308I applid CICS will terminate because the Dump Table entry for the transaction dump code: dumpcode specifies shutdown.

Explanation
This message is issued when a transaction dump has been requested for the transaction dump code dumpcode and the associated dump table entry specifies that CICS should be terminated.

System action
CICS is terminated.

User response
Print off any system dump if required.

Module: DFHDUDU

XMEOUT parameters/Message inserts
1. applid
2. dumpcode

Destination
Console

DFHDU0309I applid CICS will terminate because the Dump Table entry for the system dump code: dumpcode specifies shutdown.

Explanation
This message is issued when a system dump has been requested for the system dump code dumpcode and the associated dump table entry specifies that CICS should be terminated.

System action
CICS is terminated.

User response
Print off any system dump if required.
On a warm or emergency start, explicitly defined dump table entries are restored from the catalog. If the dump table entry for dumpcode was explicitly defined, it can be modified to prevent CICS from terminating using CEMT or EXEC API commands.

Implicitly defined dump table entries are not recorded on the catalog and are therefore not restored. On a cold or initial start, CICS does not restore the dump table from the catalog.

Module:
DFHDUDU

Destination
Console

DFHDU0310 applid XDUCLSE auto-switch request overridden. Transaction dump data sets are too small.

Explanation
This message is issued when
- the transaction dump is too large to fit in the current dump data set.
- a request to auto-switch between transaction dump data sets is issued by the XDUCLSE user-exit.
- the transaction dump is too large to fit in the newly opened dump data set.
- a second request to auto-switch between transaction dump data sets is issued by XDUCLSE.

System action
CICS cannot write the transaction dump to a transaction dump data set because the data sets are too small. CICS closes the data sets and processing continues.

User response
Inform the system programmer.

You need to bring CICS down and increase the space allocation for the transaction dump data sets to resolve this problem.

You may decide to delay terminating CICS until a convenient time. You can issue the command CEMT SET DUMP OPEN to reinstate the transaction dump environment but you will continue to lose any dumps that are too large to be written to the data sets.

Module:
DFHDUSU

XMEOUT parameters/Message inserts

1. applid

Destination
Console

DFHDU1601 DATA SET READ ERROR.

Explanation
The access method has indicated a read error. The dump data set may not have been opened during the most recent CICS execution.

System action
The record is skipped.

User response
Either ensure that the JCL is correct, or determine the reason for the read errors.

Module:
DFHDU720

Destination
Console

DFHDU1602 36 CONSECUTIVE UNIDENTIFIABLE RECORDS, DUMP UTILITY TERMINATED.

Explanation
An identification record has an incorrect code or format. The most common reasons for this error include the following.
- The wrong data set is being processed.
- The dump data set that the utility is trying to process has not been used in the current CICS execution.

In the latter case, the error would arise because no dumps were produced in the current execution or because the data sets had been switched.

System action
Records are skipped and execution is terminated with a return code of 8.

User response
Ensure that the correct data set is being processed. Alternatively, check for a possible error in the dump control program, DFHDCP.
If two dump data sets are being used, check that the data set being processed has been used before in the current CICS execution.

Module:
DFHDU720

Destination
Console

DFHDU1603 NO {DUMP | PRINT} DATA SET DD CARD {DFHDMPDS | DFHPRINT}, DUMP UTILITY TERMINATED.

Explanation
A dump or a print data set was not successfully opened.

System action
If it was a dump data set that failed to open successfully, the system prints the message on the print data set and terminates execution with a return code of 12.

If it was the print data set that failed to open successfully, the system terminates execution with a return code of 16.

User response
If the JCL is correct with the stated ddnames as in the message, determine why the data set cannot be opened. The return codes are issued by DFHDU720. They only identify whether a dump or print data set failed.

Module:
DFHDU720

Destination
Console

DFHDU1604 END OF FILE ENCOUNTERED, LAST DUMP MAY BE INCOMPLETE.

Explanation
The dump data set has been filled.

System action
The dump utility program DFHDU720 terminates.

User response
Check that the dump is complete and that no incomplete message is at the end of it. If there is an incomplete message at the end of the dump, the last dump in the data set may not contain all the information required. You should recreate the problem to try and get a complete dump. If dump data set auto-switching was active at the time the dump was taken, a complete version of the dump is present on the alternate dump data set.

Module:
DFHDU720

Destination
SYSPRINT

DFHDU1609 36 READ ERRORS ENCOUNTERED. DUMP UTILITY TERMINATED.

Explanation
The access method has indicated 36 invalid records in the dump data set. The most probable cause of this problem is an invalid end-of-file marker which caused the access method to attempt to read beyond the last record in the data set. This problem may also have been caused if:

• DFHDU720 has been run with a data set that has never been accessed by CICS before. The data set may contain an invalid type of record format.

• DFHDU720 has been run with a data set that has been copied with the wrong block size and record format.

System action
The dump utility execution is terminated with a return code of 8 from DFHDU720.

User response
Determine and correct the reason for the access failure. Recreate the dump if necessary.

Module:
DFHDU720

Destination
Console

DFHDU1610 DUMP FORMATTING HAS ENCOUNTERED AN INVALID TRACE BLOCK. TRACE ENTRIES MAY BE LOST.
Explanation
The dump utility program, DFHDU410, has detected an error while copying trace records from the trace data set. Trace records may be omitted from the formatted output.

System action
DFHDU410 attempts to read the next trace block and continues formatting trace records.

User response
To resolve the problem, keep the dump and contact your IBM Support Center. Further guidance on how to prepare information for IBM support is given in the Troubleshooting and support section. If you are not familiar with this process, refer to the guide before contacting IBM.

Module: DFHDU720

Destination
Console

DFHDU1611 FILE ERROR, FULL TRACE FAILED. DUMP Formatting WILL CONTINUE WITH ABBREVIATED TRACE.

DFHDXnmmmm messages

DFHDX8300I applid GETMAIN REQUEST FAILED. NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.

Explanation
The CICS system, with specific applid given, was unable to obtain working storage to control the sequencing of DBCTL connection attempts defined in the RST. (Recovery Service Table).

System action
CICS attempts to connect only to the DBCTL subsystem defined in the DBCTL start-up table.

User response
The working storage can be above the 16MB line so the GETMAIN request is unlikely to fail for genuine lack of space. If the error is persistent it may be necessary to cancel CICS with a dump to resolve the problem.

Module: DFHDAX

Destination
Console

DFHDX8301I applid LOAD REQUEST FAILED FOR rstname. NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.

Explanation
The CICS system, with the specific applid given, was unable to load the RST rstname while looking for the names of alternative DBCTL subsystems to which to connect.

System action
CICS will attempt to connect only to the DBCTL subsystem defined in the DBCTL start-up table.
User response
Check that the RST suffix in the SIT is correct and that the RST is actually present in the authorized library.

Module:
DFHDAX

Destination
Console

DFHDX8302I applid VALIDATION FAILED FOR rstname. NOT ATTEMPTING TO CONNECT TO ALTERNATE SYSTEMS.

Explanation
The CICS system, with the specific applid given, found that the RST rstname was invalid.
It is unable to use it to look for the names of alternative DBCTL subsystems to which to connect.

System action
CICS will attempt to connect only to the DBCTL subsystem defined in the DBCTL start-up table.

User response
Check that the RST suffix in the SIT is correct and that the RST has been correctly prepared using the DFHRST macro that is supplied as part of the CICS product.

Module:
DFHDAX

Destination
Console

DFHDX8303I applid DELETE REQUEST FAILED FOR rstname.

Explanation
The CICS system, with the specific applid given, was unable to delete the RST rstname after completing an attempt to connect to a DBCTL subsystem.

System action
CICS continues normally.

User response
If the error is persistent it may be necessary to cancel CICS with a dump to resolve the problem.

Module:
DFHDAX

Destination
Console

DFHDX8304 applid CICS/DBCTL RECONNECTION IN PROGRESS.

Explanation
This message occurs in an XRF environment only. It occurs when CICS attempts to connect to DBCTL but believes that DBCTL is restarting.
The message is displayed two minutes after the attempted connection, and then after each subsequent minute.

System action
CICS continues to attempt to reconnect.

User response
Check why DBCTL is not restarting. You can cancel the connection using the CDBC transaction.

Module:
DFHDAX

Destination
Console

DFHDX8309 applid Unable to detach subtask during CICS termination.

Explanation
CICS has detected that a subtask, attached during CICS XRF support of DBCTL, cannot be detached during CICS termination.

System action
CICS abends with code A03.
Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
None. This abend occurs as a result of a previous error. Check for earlier DFHDX832x, DFHDX833x, or DFHDX834x error messages for further information and guidance.

DFHDX8324 applid Unable to restart DBCTL for reason X’nn’.

Explanation
CICS was unable to restart DBCTL owing to an internal failure indicated by the value of n. n may be one of the following.

<table>
<thead>
<tr>
<th>n</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X’08’</td>
<td>An MVS GETMAIN failed.</td>
</tr>
<tr>
<td>X’09’</td>
<td>An MVS ATTACH failed.</td>
</tr>
</tbody>
</table>

System action
The active CICS continues but was not able to restart DBCTL automatically. However, it will attempt to reconnect to DBCTL in the normal way.

User response
It may be necessary to restart DBCTL manually.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

2. subsysid
3. X’xx’
4. X’yy’

Destination
Console

DFHDX8325 applid Restart command issued unsuccessfully to subsysid for reason X’xx’ X’yy’.

Explanation
The user exit XXDFA requested a restart of DBCTL. The restart request was issued to subsysid but was rejected with hexadecimal reason codes X’xx’ and X’yy’.

System action
The active CICS continues normally and will attempt to reconnect to DBCTL.

User response
It may be necessary to restart DBCTL manually.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. applid

Destination
Console

DFHDX8326 applid DBCTL state message lost owing to message services error.

Explanation
The user exit XXDFA requested a restart of DBCTL. The user exit XXDFA requested a restart of DBCTL. The restart request was issued to subsysid but was rejected with hexadecimal reason codes X’xx’ and X’yy’.

System action
The user exit XXDFA requested a restart of DBCTL. The user exit XXDFA requested a restart of DBCTL. The restart request was issued to subsysid but was rejected with hexadecimal reason codes X’xx’ and X’yy’.

User response
It may be necessary to restart DBCTL manually.

Module:
DFHDBCT

XMEOUT parameters/Message inserts

1. applid

Destination
Console
DFHD8X327  applid DBCTL state message lost owing to CAVM services failure.

Explanation
The active CICS system was unable to report a change of DBCTL connection status to the overseer.

System action
Processing continues.

User response
Check for any other CICS messages relating to CAVM data set problems (DFH66xx).

Were the overseer to oversee a takeover now it might try to restart the wrong DBCTL. There would be no database integrity exposure but there might some loss of availability as well as operational inconvenience.

If the overseer is being used to control XRF takeovers then disconnecting and reconnecting to the DBCTL will cause a re-write of the status record.

Module: DFHDBCT

XMEOUT parameters/Message inserts
1. applid

DFHD8X328  applid Unable to determine Jes affiliation of (jobname, jobid).

Explanation
CICS can offer full XRF support only if the DBCTL to which it is connected is running under the same JES as CICS itself.

System action
The active CICS continues, but, in the event of failure, CICS will not attempt to restart DBCTL automatically.

User response
It is recommended that DBCTL should be run under the same JES as the active CICS system.

The message indicates that either a system or set-up problem has occurred. If there is a system problem then message DFHD8X321 will also be displayed.

Module: DFHDBCT

XMEOUT parameters/Message inserts
1. applid
2. jobname
3. jobid

DFHD8X329  applid Restart request after DBCTL failure ignored for reason X'nn'.

Explanation
The user exit XXDFA requested a restart of DBCTL. This request has been ignored for the reason indicated by nn.

The reason code nn should be one of the following.

nn  Meaning
X'09'  There is no alternate DBCTL to be restarted.
X'10'  Possibly, the DBCTL subsystem is under a different JES from the active CICS system.
X'11'  The DBCTL subsystem was an IMS DB/DC system.

System action
The active CICS continues as if the user exit had indicated 'no action'.

User response
Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options.

Module: DFHDBCT

XMEOUT parameters/Message inserts
1. applid
2. X'nn'

Destination
Console
**DFHDX8330**  
*applid IMS DB/DC region has requested XRF support.*

**Explanation**  
This message is produced when CICS connects to an IMS system for which the user has requested XRF support (via the RST), but which is unable to participate in XRF. For example, in an IMS/DC system without the XRF option.

**System action**  
The system continues to run without XRF.

**User response**  
Either enable IMS/DC for XRF, or remove SSID from RST.

**Module:**  
DFHDDBCCT

**XMEOUT parameters/Message inserts**

1. applid

**Destination**  
Console

**DFHDX8331I**  
*applid Connection to notified after failure initiated takeover.*

**Explanation**  
The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has received a message from the CAVM message input service, after a takeover decision from the global user exit XXDFB has been accepted.

This problem is usually caused by a setup or an operational error.

**System action**  
The takeover continues. If the message is a notification of a successful connection, then the global user exit XXDTO may be driven.

**User response**  
In order for the active CICS system to reconnect to an element of the RSE, a DBCTL must have been restarted in the active CEC. Consequently, the alternate CICS will not be able to restart an element of the RSE in the alternate CEC without terminating this new active DBCTL.

The global user exit XXDTO will be driven as part of CICS takeover processing. This exit could be used to request a takeover of the DBCTL that was restarted in the active CEC.

Locate and correct any setup or operational errors.

**Module:**  
DFHDDBCRT

**Destination**

Console

**DFHDX8333** **applid** Unrecognized message type received by DBCTL tracking task.

**Explanation**

The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has received an unrecognized message from the CAVM message input service.

**System action**

The tracking transaction terminates. No further action will be taken in response to DBCTL status changes. The global exits XXDFB and XXDTO will never be invoked and no attempt at a DBCTL restart will be made in the event of a takeover. An ADMB transaction dump is produced. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

In the event of a takeover it may be necessary to restart DBCTL manually.

**Module:** DFHDXCU

**XMEOUT parameters/Message inserts**

1. **applid**
2. 

**Destination**

Console

**DFHDX8334** **applid** Error detected in for reason **nn**.

**Explanation**

The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has detected an invalid recovery service table (RST) during processing of a CICS|DBCTL failure. **nn** may be one of the following.

**nn**

**Meaning**

**01**

The CICS SVC detected an error in the RST. Refer to the accompanying DFHXG64xx or DFHXA65xx message for the reason for the error.

**02**

The RST could not be loaded by the XRF/DBCTL tracking task, or the XRF/DBCT tracking task detected that the RST was invalid.

**03**

The CICS SVC detected an error in the RST during initialization. Refer to the accompanying DFHXG64xx or DFHXA65xx message for the reason for the error.

**04**

The CICS SVC detected an error in the RST during connect time. Refer to the accompanying DFHXG64xx or DFHXA65xx message for the reason for the error.

**System action**

The tracking transaction continues as if no XRF support had been requested via the RST for the connected DBCTL.

**User response**

In the event of a takeover it may be necessary to restart DBCTL manually. When the failure is detected during the initialization of the XRF/DBCTL tracking task the RST should be assembled and link-edited to resolve the problem.

**Module:** DFHDBC

**XMEOUT parameters/Message inserts**

1. **applid**
2. 

**Destination**

Console

**DFHDX8335** **applid** Unable to complete search for DBCTL alternate.

**Explanation**

The alternate CICS system task responsible for tracking the DBCTL connection status of the active CICS has been unable to complete its search for a DBCTL alternate, possibly due to an unexpected return code from an IEFSSREQ request.
System action
The tracking transaction continues as if no DBCTL alternate had been found. An ADMC transaction dump will be produced.

User response
In the event of a takeover it may be necessary to restart DBCTL manually.

Module:
DFHDBCR

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHD8336 applid Unable to provide DBCTL/XRF support for reason: X'nn'.

Explanation
The user exit XXDFB or XXDTO requested a restart of DBCTL. This request has been ignored for the reason indicated by the value of nn.

nn
Meaning
X'46'
No valid RST was found. Refer to DFHD8334.
X'50'
DBCTL subsystem is an IMS DB/DC system.
X'51'
There is no alternate DBCTL to be restarted.
X'52'
The DBCTL subsystem is, or may be, under a different JES from the active CICS system.
X'53'
The active CICS system has already attempted a restart of DBCTL.

System action
The alternate CICS continues as if the user exit had indicated 'no action'.

User response
Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options.

Module:
DFHDBCR

XMEOUT parameters/Message inserts
1. applid
2. X'nn'

Destination
Console

DFHD8337 applid Takeover request rejected by CAVM, reason code X'nn'.

Explanation
The user exit XXDFB requested a takeover as a result of a DBCTL failure, but the CAVM rejected the takeover request.

System action
The alternate CICS continues as if the user exit had indicated 'no action'.

User response
Check that the user exit is performing as intended and that the CICS and DBCTL systems have been set up with the correct options. The message indicates that a CICS internal error has occurred, normally as a result of an earlier problem. It may be necessary to initiate a manual CICS takeover.

Module:

1. applid
2. command
3. subsysid
4. X'nn'

Destination
Console

DFHD8340 applid DBCTL tracking task started
in an invalid environment reason
X'nn'.

Explanation
The alternate CICS system task responsible for
Tracking the DBCTL connection status of the active
CICS has been started in an environment which does
Not support DBCTL/XRF.
Reason code X'nn' may be one of the following.
nn
Meaning
X'65'
XRF=NO specified in the SIT.
X'67'
CICS system is running as active.
X'69'
MVS GETMAIN failure.

System action
The tracking transaction terminates. No further action
Will be taken in response to DBCTL status changes.
The global exits XXDFB and XXDTO will never be
Invoked and no attempt at a DBCTL restart will be
Made in the event of a takeover.

User response
The user response depends on the reason code
Issued.
For reasons X'65' and X'67', there is a possible error
In CICS code. In this case you will need further
Assistance from IBM. See Working with IBM to solve
Your problem for guidance on how to proceed.
For reason X'69', specify a smaller overall size limit for the EDSAs.

2. X'nn'

**Destination**  
Console

**DFHDX8341R applid**  
Takeover request accepted.

**Explanation**  
The DBCTL/XRF tracking task issued a takeover request due to a request from user exit XXDFB. The request has been accepted.

**System action**  
Takeover continues.

**User response**  
None. You can suppress this message with the system initialization parameter MSGLVL = 0.

**Module:**  
DFHDBCRR

**XMEOUT parameters/Message inserts**

1. **applid**

**DFHECnnnn messages**

**DFHEC0001 applid** An abend (code aaaa/bbbb) has occurred at offset X'offset' in module modname.

**Explanation**  
An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action**  
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this component. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.
User response
Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module `modname` you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHECEB, DFHECEC, DFHECEI, DFHECIN1, DFHECIS, DFHECRRL, DFHECSE

**XMEOUT parameters/Message inserts**

1. `applid`
2. `aaa/bbbb`
3. `X'offset'`
4. `modname`

**Destination**
Console

**Explanation**
An error has been detected in module `modname`. The code `X'code'` is the exception trace point ID that uniquely identifies what the error is and where the error was detected.

**System action**
An exception entry (code `X'code'` in the message) is made in the trace table. A system dump is taken, unless you have suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS might be terminated by the caller. A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
This message indicates a possible error in CICS code. The severity of the impact depends on the importance of the function being performed at the time of the error.

CICS might not have been terminated. If the message occurs once and module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring down CICS at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module `modname`, you should bring down CICS in a controlled manner.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHECDF, DFHECEB, DFHECEC, DFHECEI, DFHECIN1, DFHECIS, DFHECRRL, DFHECRP, DFHECSE, DFHECSC

**XMEOUT parameters/Message inserts**

1. `applid`
2. `X'code'`
3. `modname`

**Destination**
Console

**Explanation**
A possible loop has been detected at offset `X'offset'` in module `modname`.

**System action**
A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module `modname` at offset `X'offset'`. This is the offset of the instruction which was executing at the time the error was detected.

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

If this message is issued from DFHAPRX or DFHSUXEX, and the exit point is XDUREQ, then a system dump is not taken in order to prevent recursive dumping.
Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module modname will be terminated and CICS will continue.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHECIN1

XMEOUT parameters/Message inserts

1. applid
2. X'offset'
3. modname

Destination
Console

**Explanation**

A call was made to module modname of the Event Capture (EC) component of the AP domain during the processing of a request but the parameter list was not valid. This is probably because of a storage overwrite or an internal error in the calling component.

System action

An exception trace is written by EC component, a system dump is taken, and the task in progress is abnormally terminated. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the dump to determine the fault in the calling component.

*date time applid EVENTBINDING evbname from BUNDLE bundle discarded successfully.*

**Explanation**  
An EVENTBINDING of name *evbname* from BUNDLE *bundle* has been successfully discarded and removed from this system.

**System action**  
Processing continues.

**User response**  
None required.

**Module:**  
DFHECRL  

---

**XMEOUT parameters/Message inserts**

1. date  
2. time  
3. applid  
4. evbname  
5. bundle  

**Destination**  
CECO  

**DFHEC1003**  
The CICS event capture component failed to create the EVENTBINDING resource *evbname* in BUNDLE *bundle* because {the event binding name is invalid. | XML data in the event binding could not be parsed. | the eventDispatcher is missing or invalid. | the EPADAPTER create failed. | the eventBinding is invalid. | there are no capture specifications. | the EVENTBINDING is a duplicate in the BUNDLE.}

**Explanation**  
An error has occurred creating EVENTBINDING *evbname* in BUNDLE *bundle*. Possible reasons include:

**The event binding name is invalid**  
The acceptable 1-32 characters of an event binding name are A-Z a-z 0-9 and _. Leading and embedded blank characters are not permitted. The name must not begin with 0-9, _ or the characters xml (in any case).

**XML data in the event binding could not be parsed**  
The preceding DFHPInnnn message gives further information about the cause of the problem.

**The eventDispatcher is missing or invalid**  
The eventDispatcher section of the event binding cannot be located by the XML parser.

**The EPADAPTER create failed**  
An unexpected exception was received from the CREATE_EPADAPTER function for the embedded EP adapter specification.

**The eventBinding is invalid**  
The eventBinding section of the event binding XML contains invalid data.

**There are no capture specifications**  
The event binding must include at least one capture specification.

**The EVENTBINDING is a duplicate in the BUNDLE**  
An EVENTBINDING of the same name has already been installed from this BUNDLE.

**System action**  
An exception entry is made in the trace table. An exception response is returned to the caller of this domain and the event binding create is terminated. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**  
This is probably caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor, this might indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages. Validate the event binding against the event processing schema for the CICS system into which the
bundle is being installed. Correct the event binding, discard the bundle, and reinstall it.

CECO

DFHEC1009  
*date time applid* The CICS event capture component found an inconsistency in one or more values during install of EVENTBINDING *evbname* in BUNDLE *bundle* because the capture specification *capspec* ( 

*has an overlength formatPrecision in data item:*, 

*has an invalid formatlength in data item:* )  

*dataItem.*

---

**Explanation**

A potentially incompatible value was found during install of event binding *evbname* in bundle *bundle*. One or more attributes may be specified incorrectly in data item *dataItem* in capture specification *capspec*. Possible reasons include:

**Overlength formatPrecision**

The formatPrecision value of a capture data item is too big for the formatLength and/or formatType of the item. For example, it may be too big for:

- the formatLength of a numeric item when sign, decimal point and leading digit are taken into account.
- the formatLength of a scientific item when signs for both mantissa and exponent are taken into account.
- the maximum precision of a scientific item. Hexadecimal floating point has a maximum precision of 6 for short (fullword) and 15 for long (doubleword) floating point.

**Invalid formatLength**

The formatLength of a capture data item is invalid for the capture data type. This message is issued when:

- the format length of HEX data doesn't allow space for a leading 0x
- the format length of HEX data isn't a multiple of 2.
- the format length of numeric data doesn't allow space for a sign.

Note: When formatted by the IBM supplied EP adapters, negative data is prefixed with a minus sign. When formatted into one of the XML formats by the IBM supplied EP adapters, positive data is not prefixed with a plus sign but positive data in the CFE or CCE formats is prefixed with a plus sign.

**System action**

An exception entry is made in the trace table.

The event binding is installed. The IBM supplied EP adapters may be unable to format the item and might replace it with asterisks.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Inconsistencies in the format definition of the event specification are tolerated to allow flexibility for custom EP adapters. If IBM supplied adapters are in use, format definition problems should be corrected before using the EVENTBINDING to capture events. Other problems may be caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor this may indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages. Correct the event binding, discard the bundle and reinstall it.

**Module:**

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. evbname
5. bundle
6. caps
7. Value chosen from the following options:

   1= has an overlength formatPrecision in data item:
   
   2= has an invalid formatLength in data item:
The CICS event capture component failed to create the EVENTBINDING resource \texttt{evbname} in BUNDLE \texttt{bundle} because the capture specification \texttt{capspec} { \texttt{filter predicate could not be built.} | \texttt{has an invalid name.} | \texttt{is a duplicate.} }

**Explanation**

An error has occurred creating event binding \texttt{evbname} in bundle \texttt{bundle} due to a problem with capture specification \texttt{capspec}. Possible reasons include:

- **Filter predicate could not be built**
  
  An unexpected exception was received from the \texttt{BUILD_PREDICATE_LIST} function.

- **Capture specification name is invalid**
  
  The acceptable 1-32 characters of a capture spec name are A-Z a-z 0-9 and _. Leading and embedded blank characters are not permitted. The name may not begin with 0-9, _ or the characters xml (in any case).

- **Capture specification is a duplicate**
  
  The event binding has another capture spec of the same name.

**System action**

An exception entry is made in the trace table.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

This is probably caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor, this may indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages. Validate the event binding against the event processing schema for the CICS system into which the bundle is being installed. Correct the event binding, discard the bundle and reinstall it.

**Module:**

DFHECRL

---

**Explanation**

An error has occurred creating event binding \texttt{evbname} in bundle \texttt{bundle} due to a problem with capture specification \texttt{capspec}. Possible reasons include:

- **Event name is invalid**
  
  The acceptable 1-32 characters of an event name are A-Z a-z 0-9 and _. Leading and embedded
blank characters are not permitted. The name may not begin with 0-9, _ or the characters xml (in any case).

**Exceeds the maximum number of data items**

The number of capture data items is bounded by the maximum size of the EPDE descriptor which must fit into a global catalog record.

**Invalid capture data type**

Capture data item number error_data is of an unknown or unsupported type.

**Business information name is invalid**

The acceptable 1-32 characters of a business information name are A-Z a-z 0-9 and _. Leading and embedded blank characters are not permitted. The name may not begin with 0-9, _ or the characters xml (in any case).

**Invalid formatPrecision**

The formatPrecision value of a capture data item is too large for the formatlength of the item when decimal point and leading digit are taken into account.

**Invalid captureDataPrecision**

The capture data precision exceeds the total number of digits captured.

**Invalid captureLength**

The capture data length is invalid for the capture data type. Numeric capture data types have the following restrictions:

- PACKED must be between 1-16 bytes
- ZONED must be between 1-32 bytes
- UHWORD must be 2 bytes
- UFWORD must be 4 bytes
- SHWORD must be 2 bytes
- SFWORD must be 4 bytes
- HEXFLOAT must be 4 or 8 bytes
- BINFLOAT must be 4 or 8 bytes
- DECFLOAT must be 4 or 8 bytes

**Invalid formatDataType**

The format data type is unsupported or invalid for the capture data type. For example, a format data type of scientific is only valid for one of the xxxFLOAT capture data types.

**Invalid formatLength**

The formatted data length is invalid for the format type. For example, a format type of scientific requires space for the mantissa, 'E' and the exponent: a minimum of 3 bytes. A format length must be specified for floating point capture data unless it has a format type of scientific.

**Invalid captureDataType**

The capture data type is unsupported.

**Invalid filterOperator**

The filter operator is invalid or unsupported for the filter keyword.

**Invalid keyword**

The filter keyword is invalid or unsupported for the capture point.

**Invalid filterValue**

The filter value is invalid for the filter keyword. For example this situation can occur when the filter keyword is a status field and the filter value given is not a valid status.

**Invalid context capture item**

The context capture item is invalid or unsupported for the capture point.

**Invalid capture point**

The capture point name is invalid or is not a supported system capture point.

**System action**

An exception entry is made in the trace table.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

This is probably caused by an error or inconsistency in the event binding XML. If the event binding was built by the CICS event binding editor, this message might indicate an error in CICS code. Inspect the CICS trace and EC domain message log for any related trace entries or messages. DFHEC1013 date time applid The CICS event capture component failed to create the EVENTBINDING resource evbname in BUNDLE bundle because {the LOCALCCSID SIT parameter is not supported | the event binding schema level is not supported | the event binding USERTAG is invalid | the EP adapter name is invalid | of an invalid numeric filter value | the EP adapterset name is invalid | CICSEPSchemaVersion is invalid | CICSEPSchemaRelease is invalid}: error_data.

LOCALCCSID SIT parameter is not supported
Event processing uses the LOCALCCSID system initialization parameter as the default CCSID for code page conversion of character data. It must be a CICS supported single or multibyte EBCDIC CCSID.

Schema level is not supported
The CICSEPSchemaVersion and CICSEPSchemaRelease of the event binding error data must not be higher than the schema level supported by this release of CICS. The schema level can be found using the INQUIRE EVENTPROCESS command.

USERTAG is invalid
The acceptable 1-8 characters of a userTag are A-Z a-z 0-9 and _. Leading and embedded blank characters are not permitted. The name must not begin with 0-9, _ or the characters xml (in any case).

EP adapter name is invalid
The eventAdapterName in the event binding XML is invalid. The adapter name has the same restrictions as the userTag mentioned previously.

Invalid numeric filter value
The value is invalid for a numeric filter predicate.

EP adapterset name is invalid
The eventAdapterSetName in the event binding XML is invalid. The adapterset name has the same restrictions as the userTag mentioned previously.

CICSEPSchemaVersion is invalid
The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be in the range 1-99.

CICSEPSchemaRelease is invalid
The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be in the range 0-99.

System action
An exception entry is made in the trace table.
An exception response is returned to the caller of this domain and the event binding create is terminated.
Message DFHME0116, which contains the symptom string for this problem, is produced.

Explanation
An error has occurred creating event binding evbname in bundle bundle. Possible reasons include:
User response

```
  date time applid tranid Transaction start EP adapter failed to emit an event to transaction tranid for event binding evbname. START TRANSID failed with RESP=resp and RESP2=resp2.
```

Explanation

The Event Processing Transaction Start adapter received a CICS EIB RESP of resp with RESP2 of resp2 from the START TRANSID command used to emit an event for event binding evbname to transaction tranid.

System action

The event is not emitted. An exception trace entry is made. The EP adapter program terminates abnormally with abend code AECO. If emission mode is synchronous, the capturing transaction terminates abnormally with abend code ASP7 at the next sync point.

User response

This is likely to be due to an error in the event definition or EP adapter configuration. Use the RESP and RESP2 values to determine the cause of the error. Verify that:

- the transaction specified for this event is defined to CICS and enabled
- the sysid, if specified, is valid and a connection to the target system is defined and available
- the userid, if specified, is valid, not revoked and security is active

Module:

DFHECEAS

DFHEC4007 E  
```
  date time applid tranid Transaction start EP adapter failed to emit an event to transaction tranid for event binding evbname. START TRANSID failed with RESP=resp and RESP2=resp2.
```

Explanation

The Event Processing Transaction Start adapter received a CICS EIB RESP of resp with RESP2 of resp2 from the START TRANSID command used to emit an event for event binding evbname to transaction tranid.

System action

The event is not emitted. An exception trace entry is made. The EP adapter program terminates abnormally with abend code AECO. If emission mode is synchronous, the capturing transaction terminates abnormally with abend code ASP7 at the next sync point.

User response

This is likely to be due to a problem in the CICS environment at the time the transaction was running. Use the RESP and RESP2 values to determine the cause of the error.

1. date
2. time
3. applid
4. tranid
5. queueName
6. evbname
7. resp
8. resp2

Destination
CECO

Explanation
The Transient data (TDQ) EP adapter was unable to emit an event for event binding evbname because TDQUEUE queueName is not defined as recoverable. Synchronous transactional events require a recoverable TDQUEUE. A TDQUEUE is recoverable if its defined as TYPE(INTRA) with RECOVSTATUS(LOGICAL) or RECOVSTATUS(physical).

System action
The event is not emitted. An exception trace entry is made. The transaction is abnormally terminated with abend code AECC.

User response
Correct and re-install the TDQUEUE resource definition for the queue, and rerun the capturing transaction.

Module:
DFHECEAQ
### Explanation

The Event Processing Transient Data (TDQ) adapter received a CICS EIB RESP of `resp` with RESP2 of `resp2` from the WRITEQ TDS command used to emit an event for event binding `evbname` to TDQUEUE `queue_name`.

### System action

The event is not emitted. An exception trace entry is made. The EP adapter program terminates abnormally with abend code AECC. If emission mode is synchronous, the capturing transaction terminates abnormally with abend code ASP7 at the next sync point.

### User response

This is likely to be due to an error in the event definition or EP adapter configuration. Check the WRITEQ TD condition in the CICS documentation and examine the trace to determine why the command failed.

### Module:
DFHECEAQ

DFHEJnnnn messages

DFHEJ0001 applid An abend (code aaa/bbbb) has occurred at offset X’offset’ in module modname.

Explanation
An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.
**User response**

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module `modname` is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If you cannot continue without the full use of module `modname` you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

DFHEJ**

**XMEOUT parameters/Message inserts**

1. `applid`
2. `aaa/bbbb`
3. `X'offset'`
4. `modname`

**Destination**

Console

**Explanation**

An error has been detected in module `modname`. The code `X'code'` is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

**System action**

An exception entry (code `X'code'` in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module `modname` is not crucial to the running of your CICS system, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot continue without the full use of module `modname`, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

DFHEJ**

**XMEOUT parameters/Message inserts**

1. `applid`
2. `X'code'`
3. `modname`

**Destination**

Console

**Explanation**

A possible loop has been detected at offset `X'offset'` in module `modname`.

**System action**

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module `modname` at offset `X'offset'`. This is the offset of the instruction which was executing at the time the error was detected.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller.
Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function, so there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module *modname* in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module *modname* has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module *modname*, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently, but you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

The Resolution of CorbaServer CorbaServer_name involved with the Object Store file file_name has failed.

**System action**
The CorbaServer is put into the DISABLED state.

**User response**
The most likely problem is that the file definition for VSAM file file_name has not been installed or is incorrectly defined. Verify that both the file and the file definition have been created with appropriate attributes. Check that the resource definition for the file has been installed. Sample definitions for files DFHEJDIR and DFHEJOS are available in groups DFHEJVS, DFHEJCF and DFHEJVR.

Discard and reinstall the resource. If the problem persists you may need to use the trace service to find the failing object store operation.

**DFHEJ0745 E**

Error found during install of CorbaServer CorbaServer_name because TCPIPSERVICE tcpipservice is not installed.
**Explanation**
CORBASERVER `CorbaServer_name` was being installed but the TCPIPSERVICE `tcpipservice` named is not installed.

**System action**
The CORBASERVER is not installed. Processing continues.

**User response**
Examine the CORBASERVER definition to check that the correct TCPIPSERVICE has been named and then delete the CORBASERVER, install the TCPIPSERVICE first and then retry the install of the CORBASERVER.

The TCPIPSERVICE needs to be installed in the listener region AND where the CORBASERVER is installed (AOR) if they are separate regions. If the CORBASERVER is in a separate region, the listener needs to have IIOPLISTENER=(YES) specified in the System Initialization Table (SIT) and the AOR needs to have IIOPLISTENER=(NO) specified.

Updating failed while copying the DJar to the shelf during Resolution processing for DJar *DJar_name*.

**Explanation**

The updating of the state, to record the status of Resolution processing, for DJar *DJar_name* has failed. The Resolution process was attempting to copy the DJar to the Shelf.

**System action**

Processing continues with the DJar in an incorrect state.

**User response**

Check that the CICS region id has write permission to the zFS shelf directory and that there is sufficient space available for the write operation to succeed.

Discard and reinstall the DJar.

If the problem persists you may need to use the trace facility to determine the cause of the problem.

**Module:**
Beans contained within DJar DJar_name were not correctly confirmed during Bean Resolution.

Explanation
All Beans within DJar DJar_name were correctly loaded. However, an error occurred while making the Beans within this DJar available for use during Resolution.

A System error has occurred which probably does not have anything to do with the DJar or the Beans themselves.

System action
The DJar is put into the UNRESOLVED state and is not available for use. An attempt is made to delete any Beans associated with the DJar.

User response
Discard and reinstall the DJar.
If the problem persists you may need to use the trace facility to determine the cause of the problem.

Module:
DFHEJDG

Destination
CEJL

Beans contained within DJar DJar_name within CorbaServer CorbaServer_name were not correctly confirmed during Bean Resolution.

Explanation
An error occurred while installing the Beans from DJar DJar_name during the Bean copying phase of Resolution.

The most probable reason is that an attempt was made to install a duplicate Bean twice within the scope of the CorbaServer. In other words the duplicate Bean occurs in more than one DJar.

System action
The partially processed Beans within the DJar are deleted and the DJar is put into the UNRESOLVED state.

User response
Investigate why the Beans within the DJar within the scope of the CorbaServer caused this error to occur. In the most likely case, check that the contents of the DJar are not already present within the scope of the CorbaServer (for example, copying a Bean and then using both copies).

Module:
DFHEJDG

Beans contained within DJar DJar_name within CorbaServer CorbaServer_name are invalid and unusable.

Explanation
Beans contained within DJar DJar_name within CorbaServer CorbaServer_name are invalid and unusable.

System action
The partially processed Beans within the DJar are deleted and the DJar is put into the UNRESOLVED state.

User response
Investigate why the Beans within the DJar within the scope of the CorbaServer caused this error to occur. In the most likely case, check that the contents of the DJar are not already present within the scope of the CorbaServer (for example, copying a Bean and then using both copies).

Module:
DFHEJDG
Explanation
Beans are being deleted due to an error in the Resolution process which was loading Beans from DJar DJar_name. This deletion has succeeded.

System action
Processing continues.

User response
A previous message should explain why the Bean failed to install.
Discard and reinstall the DJar.

5. DJar_name

Destination
CEJL

DFHEJ1540 I date time applid userid DJar DJar_name and the Beans it contains are now accessible.

Explanation
The DJar DJar_name has correctly Resolved. This means that the Resolution process successfully loaded all the Beans from this DJar. DJar DJar_name and all the Beans which are contained in the DJar are now accessible and ready for use. This message does not imply that the Beans have been published. If the DJar has been published then CICS is now ready to accept requests for the Beans.

System action
Processing continues.

User response
None.

Module:
DFHEJIO
The EJ domain attempted to invoke the Enterprise Java event URM module but failed with a code supplied as reason.

Possible causes of the problem and an indication of how to solve them are given in the following list of reason code meanings:

**Reason**

<table>
<thead>
<tr>
<th>Meaning and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>The user exit program should be linked with AMODE(31). Ensure that the user exit is linked to the correct AMODE.</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>The user exit program has no resource definition. Ensure that the PROGRAM resource definition for the user exit program is installed.</td>
</tr>
<tr>
<td>3</td>

DFHEM0001 applid An abend (code aaa/bbbb) has occurred at offset 'X'offset' in module modname.

**Explanation**
An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action**
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program
check, an abend, or a runaway, and may give you some guidance concerning user response.

If module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module `modname` you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHEMDM, DFHEMEM.

**Destination**
Console

**DFHEP0114**     **date** **time** **applid** **tranid**
The EPADAPTER user ID **adapter_userid** is revoked, not valid, or not defined. An event from EVENTBINDING **evbname** has been discarded.

**Explanation**
The user ID **adapter_userid** of the EP adapter for event binding **evbname** is revoked, not valid, or not defined.

**System action**
The event is not emitted.

**User response**
Correct the intended EP adapter userid.

**Module:**
DFHEPEV

**XMEOUT parameters/Message inserts**
1. **date**

**Explanation**
The upper limit of open TCBs used for event processing dispatcher tasks has been reached. Event processing limits the number of open TCBs used for EP dispatchers to one third of the value of MAXOPENTCBS, which if not specified, is set automatically based on the maximum number of tasks specified for the CICS region (the MXT value), using the following formula: (2 * MXT Value) + 32.

**System action**
The event processing event queue server task is not able to create any new dispatcher tasks but will append any new events to be dispatched to existing dispatcher tasks.

**User response**
If the configured event adapter is linked to by the dispatcher task then ensure that the consumer of the event is able to process the event. Increasing either MAXOPENTCBS, or MXT if MAXOPENTCBS allowed to default, may enable the event processing event queue server to start more dispatcher tasks.

**Module:**
DFHEPSY

**XMEOUT parameters/Message inserts**
1. **applid**

**Destination**
Console

**DFHEP0116**     **applid** Event Processing event dispatcher task limit relieved.

**Explanation**
Event processing dispatcher task limit is relieved.
System action
The event processing event queue server task is now able to create new dispatcher tasks to process any new events.

User response
If the configured event adapter is linked to by the dispatcher task then ensure that the consumer of the event is able to process the event. Ensure that event processing does not use an excessive number of open TCBs. Event processing limits the number of open TCBs used for EP dispatchers to one third of the value of MAXOPENTCBS, which if not specified, is set automatically based on the maximum number of tasks specified for the CICS region (the MXT value), using the following formula: (2 * MXT Value) + 32. Decreasing the value of MAXOPENTCBS, or MXT if MAXOPENTCBS allowed to default, will enable the event processing event queue server to limit the number of dispatcher tasks.

CEPO

| DFHEP2001 | date time applid The CICS event processing domain failed to create EPADAPTER resource adapter in BUNDLE bundle because the EP adapter, which is of type adapterType and emission mode emitmode {, requires a program name. | , does not support transactional events. | , requires a transaction ID. | , is invalid or unrecognised. | , has an invalid or unsupported event format. | , has an unsupported combination of attributes. | , failed the surrogate user check for some unexpected reason.} |

**Explanation**

An error has occurred creating EPADAPTER adapter in BUNDLE bundle because of a problem with the EP adapter specification. The EPADAPTER is either being installed as a separate EPADAPTER bundle part or as part of an EVENTBINDING bundle part of the same name. The EPADAPTER is of type adapterType and its emission mode is emitmode. Possible reasons include:

**Requires a program name**

A program name is required for a custom EP adapter when the emission mode is synchronous.

**Does not support transactional events**

The EP adapter cannot be used for assured transactional events because it does not emit events to a recoverable transport. Transactional events and synchronous emission mode are mutually exclusive options for this EP adapter type.
Requires a transaction ID

A transaction ID is required for a custom adapter when the emission mode is asynchronous.

Is invalid or unrecognized

The EP adapter type, emission mode or both are unrecognized by this release of CICS.

Has an invalid or unsupported event format

The format field in the EP adapter configuration container returned by the XML parse function is invalid or not supported by the EP adapter type.

Has an unsupported combination of attributes

The emission mode is not supported by this type of EP adapter.

Unexpected reason during the surrogate user check

The userid installing the EP adapter goes through a surrogate check for the userid specified in the EP adapter configuration. The surrogate user check failed for some unexpected reason.

System action

An exception entry is made in the trace table.
An exception response is returned to the caller of this domain and the EP adapter create is terminated.
Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If this is a separately installed EPADAPTER, the condition is probably caused by an error or inconsistency in the EP adapter XML. If installed as part of an EVENTBINDING, the condition is probably caused by an error in the eventDispatcherSpecification section of the event binding XML. If the XML was built by the CICS event binding editor, this condition might indicate an error in CICS code. Inspect the CICS trace and EP domain message log for any related trace entries or messages. Validate the XML against the appropriate event processing schema for the CICS system into which the bundle is being installed. Correct the XML, discard the BUNDLE, and reinstall it.

8. Value chosen from the following options:
   1=, requires a program name.,
   2=, does not support transactional events.,
   3=, requires a transaction ID.,
   4=, is invalid or unrecognised.,
   5=, has an invalid or unsupported event format.,
   6=, has an unsupported combination of attributes.,
   7=, failed the surrogate user check for some unexpected reason.

Destination
CEPO

DFHEP2002 date time applid The CICS event processing domain failed to create the EPADAPTER resource adaptername in BUNDLE bundle because {the EP adapter name is invalid. | the XML data for the EP adapter could not be parsed. | the eventDispatcher is missing or invalid. | the configuration data is too long. | it is a duplicate of another EPADAPTER in the BUNDLE.}

Explanation
An error has occurred creating EPADAPTER adaptername in BUNDLE bundle. The EPADAPTER is either being installed as a separate EPADAPTER bundle part or as part of an EVENTBINDING bundle part of the same name. Possible reasons include:

EP adapter name is invalid.
The acceptable 1-32 characters of an EP adapter name are A-Z a-z 0-9 and _. Leading and embedded blank characters are not permitted. The name must not begin with 0-9, _ or the characters xml (in any case).

XML data for the EP adapter could not be parsed.
The preceding DFHPInnnn message gives further information about the cause of the problem.

eventDispatcher is missing or invalid
The eventDispatcher section of the event binding or EP adapter cannot be located by the XML parser.
Configuration data is too long

The configuration data specified for a custom EP adapter is too long.

Duplicate of another EPADAPTER

The EPADAPTER being installed has the same name as a previously installed EPADAPTER from the same BUNDLE. Note that an EPADAPTER may be:

- standalone: installed from a separate epadapter part within the BUNDLE
- embedded: installed with an EVENTBINDING from an evbind part within the bundle. The EPADAPTER has the same name as the related EVENTBINDING.

System action

An exception entry is made in the trace table.

An exception response is returned to the caller of this domain and the event binding create is terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If this is a separately installed EPADAPTER, the condition is probably caused by an error or inconsistency in the EP adapter XML. If installed as part of an EVENTBINDING, the condition is probably caused by an error in the eventDispatcherSpecification section of the event binding XML. If the XML was built by the CICS event binding editor, this condition might indicate an error in CICS code. Inspect the CICS trace and EP domain message log for any related trace entries or messages. Validate the XML against the event processing schema for the CICS system into which the bundle is being installed. Correct the event binding, discard the BUNDLE, and reinstall it.

CEPO

DFHEP2003 date time applid The CICS event processing domain failed to create the EPADAPTER resource adaptername in BUNDLE bundle because the \{LOCALCCSID SIT parameter is not supported | EP adapter schema level is not supported | CICSEPSchemaVersion is invalid | CICSEPSchemaRelease is invalid\}: error_data.

Explanation

An error has occurred creating EPADAPTER adaptername in BUNDLE bundle. Possible reasons include:

LOCALCCSID SIT parameter is not supported

Event processing uses the LOCALCCSID system initialization parameter as the default CCSID for codepage conversion of character data. It must be a CICS supported single or multibyte EBCDIC CCSID.

Schema level is not supported

The CICSEPSchemaVersion and CICSEPSchemaRelease of EP adapter, error_data, must not be higher than the schema level supported by this release of CICS, which can be found by using the INQUIRE EVENTPROCESS command.

CICSEPSchemaVersion is invalid

The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be in the range 1-99.

CICSEPSchemaRelease is invalid

The specified 1-2 character string must consist of numeric characters only, i.e. 0-9, and be in the range 0-99.

System action

An exception entry is made in the trace table.
An exception response is returned to the caller of this domain and the EPADAPTER create is terminated. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
This is probably caused by an error or inconsistency in the EP adapter XML. If the EP adapter was built by the CICS event binding editor, this may indicate an error in CICS code. Inspect the CICS trace and EP domain message log for any related trace entries or messages. Validate the EP adapter against the event processing schema for the CICS system into which the BUNDLE is being installed. Correct the EP adapter, discard the BUNDLE, and reinstall it.

DFHEP2005  
*date time applid*  The CICS event processing domain found an inconsistency in the advanced options during install of EPADAPTER `adaptername` with emission mode `emitmode` and type `adapterType`. The option `option` is ignored.

**Explanation**
An incompatible option was found during install of EPADAPTER `adaptername`. The EPADAPTER is either being installed as a separate EPADAPTER bundle part.
or as part of an EVENTBINDING bundle part of the same name. The EPADAPTER is of type adapterType and its emission mode is emitmode. Possible reasons include:

**Transaction ID, User ID and Priority**
These options are irrelevant when the emission mode is synchronous as the EP adapter is invoked within the unit of work (UOW) of the originating application.

**Program name**
This option is only required for a custom EP adapter in synchronous emission mode.

**System action**
An exception entry is made in the trace table.
The incompatible option is ignored and the EPADAPTER installation continues.

**User response**
If this is a separately installed EPADAPTER, this is probably caused by an error or inconsistency in the EP adapter XML. If installed as part of an EVENTBINDING, this is probably caused by an error in the eventDispatcherSpecification section of the event binding XML. If the XML was built by the CICS event binding editor this might indicate an error in CICS code. Inspect the CICS trace and EP domain message log for any related trace entries or messages. Correct the XML, discard the BUNDLE, and reinstall it.

*date time applid The CICS event processing domain failed to create the EPADAPTERSET resource adaptersetname in BUNDLE bundle because {the EP adapterset name is invalid. | the XML data for the EP adapterset could not be parsed. | it is a duplicate of another EPADAPTERSET in the BUNDLE. | no EP adapter names are specified in the EP adapterset. | the EPADAPTER name has a duplicate in the EP adapterset. | an EPADAPTER name contained in the EP adapterset is invalid.}*

**Explanation**
An error has occurred creating EPADAPTERSET adaptersetname in BUNDLE bundle. Possible reasons include:

**EP adapterset name is invalid**
The acceptable 1-32 characters of an EP adapterset name are A-Z, a-z, 0-9 and _. Leading and embedded blank characters are not permitted. The name must not begin with 0-9, _, or the characters xml (in any case).

**XML data for the EP adapterset could not be parsed**
The preceding DFHPInnnn message gives further information about the cause of the problem.

**Duplicate of another EPADAPTERSET**
The EPADAPTERSET being installed has the same name as a previously installed EPADAPTERSET from the same BUNDLE.

**No EP adapter names are specified in the EP adapterset**
There should be at least one EP adapter name being specified in the EP adapterset XML data.

**Duplicate of EPADAPTER name**
The EPADAPTERSET contains duplicated EP adapter names.

**Invalid EPADAPTER name**
The EPADAPTERSET contains invalid EP adapter name.

**System action**
An exception entry is made in the trace table.
An exception response is returned to the caller of this domain and the EPADAPTERSET create is terminated. Message DFHME0116, which contains the symptom string for this problem, is produced.
User response

The condition is probably caused by an error or inconsistency in the EP adapterset XML. If the XML was built by the CICS event binding editor, this condition might indicate an error in CICS code. Inspect the CICS trace and EP domain message log for any related trace entries or messages. DFHEX0001    An abend (code aaa/bbbb) has occurred in module modname.

Explanation

An unexpected program check or abend aaa/bbbb has occurred in module modname. This implies that there may be an error in external CICS interface code.

Alternatively, unexpected data has been passed on an external CICS interface call or storage has been overwritten.

The code aaa/bbbb is, if applicable, a 3-digit hexadecimal MVS system completion code aaa (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code bbbb, which follows aaa is, if applicable, a user abend code produced by the external CICS interface. If the user abend code is not applicable, this field is filled with four hyphens.

System action

An exception entry is made in the external CICS interface internal trace table, and to the GTF trace dataset (if GTF is active), and a SYSMDUMP is taken.

The external CICS interface terminates the current request, and attempts to recover to a consistent state so that further EXCI requests can be serviced. For an application using the EXCI CALL API, a response of EXCI_SYSTEM_ERROR with a REASON of ESTAE_INVOKED is returned to the application. For an application using the EXCI EXEC API, an EXEC_RESP of LINKERR is returned to the application, together with an EXEC_RESP2 of ESTAE_INVOKED or EXEC_ESTAE_INVOKED, depending on whether the call level ESTAE routine, or the EXEC level ESTAE routine was invoked.

User response

Look up the MVS code aaa, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If applicable, see the description of abend code bbbb for further guidance.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Console
A severe error (code X'code') has occurred in module modname.

Explanation
An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action
An exception entry is made in the EXCI internal trace table (code X'code' in the message). This is a critical error and the EXCI request is terminated. The external CICS interface attempts to recover to a consistent state so that further EXCI requests can be issued.

For applications using the EXCI CALL API, the EXCI_REASON returned to the application indicates the point of failure.

For applications using the EXCI EXEC API, the point of failure is returned in the EXEC_RESP2 field of the RETCODE area.

For EXCI_REASON and EXCI_RESP of 603, the EXCI module DFHXCPRH also issues abend 0410 which drives the ESTAE exit. Message DFHEX0001 is issued and a SYSMDUMP is taken.

User response
Look up the MVS GETMAIN return code rc in the relevant MVS codes manual.

If the reason is insufficient storage, try increasing the size of the region for the batch EXCI job.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

DFHEX0100

The installed level of CICS SVC does not support the EXCI call.

Explanation
The external CICS interface module DFHXCPRH detected that the level of CICS SVC (DFHCSVC) in use does not support the external CICS interface.

System action
The EXCI request is terminated. An exception trace is made in the EXCI internal trace table, and if GTF is active, in the GTF trace data set. The external CICS interface module DFHXCPRH issues abend 0407 which drives the ESTAE exit. Message DFHEX0001 is issued, and a SYSMDUMP is taken.

User response
Check the level of DFHCSVC installed in the LPA. A CICS/ESA 4.1 level of DFHCSVC is required for the external CICS interface. Generally, the latest level of DFHCSVC must be used when running CICS and the external CICS interface. For more information about installing DFHCSVC see the Installing CICS TS.

Module:
DFHXCPRH

Destination
Console

DFHEX0110

EXCI SDUMP has been taken.

Explanation
This message is issued on successful completion of a MVS SDUMP issued by external CICS interface module
DFHXCDMP. An error, signalled by a previous message, caused a call to be made to DFHXCDMP to take a system dump.

The dump code dumpcode is an 8-character system dump code identifying the external CICS interface problem. A system dump code is the EXCI message number with the DFH prefix removed.

dumpid is the unique 9-character string identifying this dump.

**System action**
The EXCI request is terminated.

**User response**
See the EXCI message indicated by dumpcode for further guidance.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHXCDMP.

**Destination**
Console

**DFHEX0111** EXCI SDUMP attempted but SDUMP is busy - will retry every five seconds for nnnn seconds.

**Explanation**
At the time of the MVS SDUMP request issued by DFHXCDMP another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. A nonzero value for the dump retry parameter in the DFHXOPTS table means that the external CICS interface waits five seconds before retrying the SDUMP request. If necessary, the external CICS interface retries every five seconds for the total time specified on the retry parameter.

**System action**
The external CICS interface issues an MVS STIMERM macro which causes it to wait for five seconds. The request is reissued when the delay interval has expired.

**User response**
None.

**Module:** DFHXCDMP.

**Destination**
Console

**DFHEX0112** SDUMP request failed - reason X'nn'.

**Explanation**
An MVS SDUMP request issued from the external CICS interface has failed to complete successfully. The possible reasons, (reason) for the failure are as follows:

**ONLY PARTIAL DUMP**
The SYS1.DUMP data set to which the dump is written is not large enough to contain all of the dumped storage.

**SDUMP BUSY**
At the time of the MVS SDUMP request issued by the EXCI, another address space in the same MVS system was in the process of taking an SDUMP. This causes MVS to reject the new request. If a nonzero value is specified for the dump retry parameter in DFHXOPTS table, the EXCI has retried the SDUMP request every five seconds for the specified period. This message is only issued if SDUMP is still busy after the final retry.

**STIMERM FAILED**
In order to delay for five seconds before retrying SDUMP after an SDUMP BUSY condition, the EXCI issues an MVS STIMERM macro request. MVS has indicated that the STIMERM request has failed.

**NO DATA SET AVAILABLE**
No SYS1.DUMP data sets were available at the time the SDUMP request was issued.

**REJECTED BY MVS, REASON = X'nn'**
MVS has rejected the SDUMP request because of user action (for example, specifying DUMP=NO in the MVS IPL) or because of an I/O error or terminating error in the SDUMP routine. X'nn' is the SDUMP reason code.

**NOT AUTHORIZED FOR EXCI**
SDUMP is not authorized for the external CICS interface.

**INSUFFICIENT STORAGE**
The EXCI issued an MVS GETMAIN for subpool 253 storage during the processing of the SDUMP request. The GETMAIN has been rejected by MVS.
System action

The EXCI proceeds as if the dump had been successful.

User response

The user response depends on the reasons, (reason), for the failure.

ONLY PARTIAL DUMP

Increase the size of the SYS1.DUMP data sets and cause the SDUMP request to be reissued.

SDUMP BUSY

Cause the SDUMP to be reissued after, if appropriate, increasing the dump retry time in DFHXCOPT.

STIMERM FAILED

Use MVS problem determination methods to fix the STIMERM failure and then cause the SDUMP request to be reissued.

NO DATA SET AVAILABLE

Clear a SYS1.DUMP data set and then cause the SDUMP request to be reissued.

REJECTED BY MVS, REASON = X'nn'

No action is required if the dump is suppressed deliberately. If the dump has failed because of an error in the MVS SDUMP routine, use MVS problem determination methods to fix the error and then cause the SDUMP request to be reissued. See the z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) for an explanation of the SDUMP reason code X’nn’.

NOT AUTHORIZED FOR EXCI

This reason is unlikely because SDUMP is unconditionally authorized during EXCI initialization, and should be authorized throughout the EXCI run. If you do get this reason, the EXCI AFCB (authorized function control block) has probably been accidentally overwritten.

INSUFFICIENT STORAGE

Ensure sufficient storage is available to MVS for subpool 253 requests.

Explanation

An attempt to initialize external CICS interface (EXCI) trace facilities during EXCI initialization has failed.

System action

The EXCI request continues without trace facilities. An earlier message identifies the cause of the failure.

User response

Refer to the earlier message to determine the cause of the failure.

Module: DFHXCTRI

Destination

Console

DFHEX0114 Incorrect data has been passed for EXCI tracing causing a program check in DFHXCTRP.

Explanation

Some data passed to the external CICS interface (EXCI) trace module DFHXCTRP for addition to the EXCI internal trace table, or GTF trace, caused a program check to occur when an attempt was made to access it.

The most likely cause of this error is incorrect data passed on an EXCI CALL API request that the trace program DFHXCTRP is attempting to access.

System action

The EXCI request is terminated and a SYSMDUMP is taken.

User response

Examine the dump to determine the source of the incorrect data.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHXCTRI

Destination

Console

DFHEX0115 EXCI trace services have been disabled due to a previous error.
Explanation
An error occurred in the external CICS interface (EXCI) trace module DFHXCTRP indicated by message DFHEX0001. In trying to recover from the error, module DFHXCTRI determined that the error was not caused by accessing incorrect data passed to DFHXCTRP, but was due to a program check in DFHXCTRP.

System action
The EXCI trace facilities are disabled to prevent further errors. A SYSMDUMP is taken.

User response
See the DFHEX0001 message and the SYSMDUMP to determine the cause of the error.
You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHXCTRI

Destination
Console

DFHEX0116 Program check occurred within global trap exit - DFHXCTRA now marked unusable.

Explanation
After making a trace entry, the external CICS interface (EXCI) trace program DFHXCTRP called the EXCI field engineering global trap program DFHXCTRA. A program check occurred during execution of DFHXCTRA.

System action
The EXCI marks the currently active version of DFHXCTRA as unusable and ignores it on subsequent calls to DFHXCTRP for all subsequent calls made under this TCB. The EXCI request is terminated, and a SYSMDUMP is taken.

User response
Use the dump to find the cause of the program check.
You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

You should use the global trap exit only in consultation with an IBM support representative.

Module:
DFHXCTRI

Destination
Console

DFHEX0400 Channel storage exceeds 5% of MEMLIMIT.

Explanation
The EXCI has refused to store data in a Container because the total storage allocated for the Channel will exceed 5% of MEMLIMIT.

System action
EXCI abends the transaction with code 0417.

User response
Review the storage requirements for the PROGRAM. If the volume of data is correct, either delete any unnecessary Containers from the Channel, or increase MEMLIMIT so that the program does not use more than 5% of the storage available.

Module:
DFHXCCR

Destination

DFHFCnmmn messages

DFHFC0001 applid An abend (code aaa/bbbb) has occurred at offset X’offset’ in module modname.

Explanation
An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code.
Alternatively,
• Unexpected data has been input, or
Storage has been overwritten.
The code `aaa/bbbb` is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

### System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.
CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

### User response
Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Then look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some further guidance.

If module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module `modname`, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

The code X' code' is the exception trace point ID which uniquely identifies the place where the error was detected.

System action
An exception entry is made in the trace table (code code in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from the domain manager, for example), and look up the user response for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module modname, you may decide to continue and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the size limits of the DSAs or EDSAs. See the Configuring or the Improving performance for further information on CICS storage.

Module:
DFHFCRP

XMEOUT parameters/Message inserts
1. applid
2. X'code'
3. modname

Destination
Console

DFHFC0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation
A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname is terminated and CICS continues.

But if you have declared ICVR=0 as a system initialization parameter and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.
If CICS has terminated module *modname*, and you consider that it was not a runaway, increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will require further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**  
DFHFCAT, DFHFCDN, DFHFCDTX, DFHFCFR, DFHFCFS, DFHFCMT, DFHFCRL, DFHFCRP, DFHFCSD, DFHFCST, DFHFCVR, DFHFCVS

**XMEOUT parameters/Message inserts**

3. **modname**

**Destination**  
Console

DFHFC0005  
**applid** A hardware error has occurred (module *modname*, code X’code’). The Time-of-Day clock is invalid.

**Explanation**

A hardware error has occurred during the running of module *modname*. The MVS store clock facility is the timing mechanism for the operating system.

The code *code* is the exception trace point ID which uniquely identifies the place where the error was detected.

**System action**

An exception entry (code *code* in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message to this effect is issued.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. This is in all probability a hardware error and you should in the first instance investigate the MVS store clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will require further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHFC0150  date time applid termid tranid  An attempt to release locks for unit of work X'uowid' failed. VSAM return code X'rrrr' reason code X'cccc'.

Explanation
Unit of work uowid for transaction tranid has attempted to release its RLS locks. The release locks request made to VSAM has failed because VSAM detected an error.

The IDALKREL response is rrrr and the reason code is cccc.

termitid identifies the terminal running this transaction.

System action
CICS continues with the completion of the unit of work.

The unit of work is shunted. The shunt reason indicates that a further release locks attempt is required.

Some records may remain locked until a successful lock release command can be processed by VSAM.

If the failure is caused by the SMSVSAM server being unavailable, CICS automatically retries the completion of the UOW when the server becomes available.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Use the VSAM codes to determine the cause of the problem. The most likely cause of this failure is that the SMSVSAM server failed at the time of the error. For the meaning of the VSAM codes, see z/OS DFSMS Macro Instructions for Data Sets.

When the condition that caused the lock release to fail has been resolved, you may need to retry the unit of work using

CEMT SET DSNAME RETRY

or

EXEC CICS SET DSNAME(dsname) ACTION(RETRY)

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:

DFHFC0151  date time applid termid tranid  An attempt to retain locks for unit of work X'uowid' failed. VSAM return code X'rrrr' reason code X'cccc'.

Explanation
Unit of work uowid for transaction tranid has gone indoubt because it has lost contact with
its coordinating system. Consequently CICS has attempted to convert all RLS locks owned by this unit of work into retained locks. This attempt has failed because VSAM has detected an error.

The IDARETLK macro response is rrrr and the reason code is cccc.

termid identifies the terminal running this transaction.

**System action**

CICS continues shunting this unit of work. It is possible that some locks may remain as active locks (which cause other transactions to wait until their timeout value is reached) rather than as retained locks (which cause other transactions to encounter LOCKED responses.)

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see z/OS DFSMS Macro Instructions for Data Sets. The most likely reason for the failure to convert locks into retained locks is that the SMSVSAM server was not available. Other VSAM codes may indicate a more severe error.

Normally no other action should be necessary. When contact is reestablished, the coordinating system instructs this system to commit or backout. At the end of commit or backout, all retained and active locks are released.

A problem that you may encounter is that some locks may have been left as active locks. This may cause slow response (and eventual failures) from transactions that wait for these locks and have to wait for their full timeout interval.

In this case, you can use the CEMT SET UOW command to force the unit of work to commit or backout, or to make a decision to commit or backout according to the ACTION attribute in the transaction definition. Alternatively, you can use the CEMT SET DSNAME command which will force all in-doubt units of work which had updated the specified data set. However, you should not normally use these commands because they can cause this CICS to become out of step with its coordinating system with consequent loss of data integrity.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**DFHFC0152**

*date time applid termid tranid* An attempt to retain locks for data set within unit of work X'uowid' failed. VSAM return code X'rrrr' reason code X'cccc'.

**Explanation**

Unit of work uowid for transaction tranid has failed backout for one of its data sets. CICS has attempted to convert all the RLS locks owned by this unit of work that are associated with the failing data set into retained locks. This attempt has failed because VSAM has detected an error.

The IDARETLK response is rrrr and the reason code is cccc.

termid identifies the terminal running this transaction.

This message is followed by message DFHFC0312 which identifies the failing data set.

**System action**

CICS continues shunting this unit of work. Some locks may remain as active locks (which cause other transactions to wait until their timeout value is reached) rather than as retained locks (which cause other transactions to encounter LOCKED responses.)

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Use the VSAM codes to determine the cause of the problem. For the meaning of the VSAM codes, see z/OS DFSMS Macro Instructions for Data Sets.
The most likely reason for the failure to convert locks into retained locks is that the SMSVSAM server was not available. It is also possible to get a failure because the specified logical unit of work ID does not exist for the subsystem (that is, the unit of work does not hold any locks) during lost locks recovery, or after a CICS restart which specified OFFSITE=YES as a system initialization override. If you are performing RLS lost locks recovery, message DFHFC0555 will have been issued when lost locks recovery started; if you are performing RLS offsite recovery, message DFHFC0574 will have been issued during file control initialization. Other VSAM codes may indicate a more severe error.

Normally no other action is necessary. When the condition that caused the backout failure has been resolved, the backout of this unit of work is retried. If the attempt to retry the backout succeeds, all locks are released.

Message DFHFC4701 specifies the cause of the backout failure. The most common cause of backout failures is a hardware problem causing I/O errors. In this case the data set needs to be restored and forward recovered. If CICSVR (or a functionally equivalent product) is used to perform forward recovery, and the data set was being accessed in RLS mode, units of work that have failed backout for this data set are retried automatically. If the data set was quiesced, you need to unquiesce it to allow the backout to succeed. When the data set is unquiesced, CICS automatically retries the backout.

Backouts may also be retried using

CEMT SET DSNAME RETRY
or

EXEC CICS SET DSNAME(dsname) ACTION(RETRY)

The only problem that you may encounter is that some locks may have been left as active locks. This can cause a slow response (and eventual failures) from transactions that wait for these locks and have to wait for their full timeout interval.

In this case, consider releasing all locks held against this data set using the CEMT SET DSNAME RESETLOCKS command. This command should only be considered in extreme cases because it discards both the retained locks held by this CICS system against the named data set and all associated log records. The consequence is that the corresponding backout operations are never performed and data integrity is lost.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**DFHFC0153** applid The previous instance of the SMSVSAM server has failed. File control RLS access is being closed down.

**Explanation**

The SMSVSAM server is the separate VSAM address space that handles all VSAM requests made in RLS mode. The instance of this address space which CICS has been using has terminated, and CICS has just detected the failure. CICS must close down all accesses from file control to this instance of the SMSVSAM server in order to be able to register with the next server instance when the server restarts.

If message DFHFC0568 is issued before DFHFC0153, CICS did not detect the failure until the server restarted and notified CICS that a new instance was available. If message DFHFC0568 is not issued before DFHFC0153, CICS detected the failure when it tried to access the failed instance of the server.

**System action**

CICS disables all further RLS accesses, closes all files which were open in RLS mode, and attempts to unregister the RLS control ACB.

Transactions that attempt to access files previously opened in RLS mode abend. The abend code depends upon what the transaction was doing at the time of the failure.
User response
The SMSVSAM server address space should normally restart itself. If it does not, restart the SMSVSAM server address space manually. If the SMSVSAM server address space fails to restart, there may be a more severe error. In this case, you need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

1. applid
2. vsam-error-data

Destination
Console

DFHFC0159 applid A request issued to cold start the RLS subsystem has failed. VSAM return code X'rrrrr' reason code X'cccc'.

Explanation
A cold or initial start of CICS has been requested, or CICS has been started with OFFSITE=YES specified as a system initialization parameter. CICS has made a call to the RLS component of VSAM which requested RLS to cold start its status with respect to this CICS. This request has failed because VSAM RLS detected an error while performing cold start processing.

System action
CICS continues to initialize. However, the restart of the RLS component of file control has failed and all RLS eligible files are unusable.

No dump is taken with this message. However, file control restart may subsequently produce message DFHFC0001 and take a dump if the error is of a type which should not occur during normal running.

User response
If the VSAM return code indicates that the SMSVSAM server has failed, restart the SMSVSAM server (if it has not already automatically restarted). You also need to restart CICS because CICS has been warm started with respect to RLS when the server returns.

If the SMSVSAM server has not failed, this is probably an error in CICS or VSAM. You should keep the dump associated with message DFHFC0001. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHFCCA

XMEOUT parameters/Message inserts
1. applid
2. X'rrrr'
3. X'cccc'

Destination
Console

DFHFC0160 applid An attempt to notify VSAM that CICS has completed lost locks processing for a data set has failed. VSAM return code X'rrrrr' reason code X'cccc'.

Explanation
Following a failure of the VSAM lock structure, VSAM has marked a data set as being in lost locks state with regard to this CICS. CICS has performed all recovery actions necessary to resolve its locks against this data set and has attempted to inform VSAM that it has completed its recovery. This attempt has failed.

The VSAM response is rrrr and the VSAM reason is cccc.

This message is followed by message DFHFC0312 which identifies the failing data set.

System action
If the VSAM return code does not indicate that the SMSVSAM server has failed, CICS takes a system dump.
User response

The most likely cause of this failure is that the SMSVSAM server failed at the time that CICS issued the request.

If the problem was caused by the SMSVSAM server having failed at the time that the request was issued, restart the SMSVSAM server (if it has not already automatically restarted). Otherwise, you can make CICS retry the attempt to notify VSAM of the completion of lost locks processing either by restarting CICS or by restarting the SMSVSAM server.

It is possible that your installation may have performed some action, such as deleting the data set, which would cause VSAM not to recognize the data set and therefore return an error. If this is the case for the data set named in message DFHFC0312, you need take no further action.

If the VSAM return and reason codes suggest an internal CICS or VSAM error, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:

Console

DFHFC0162 applid A VSAM data cache has failed.

Explanation

A data cache structure being used by VSAM RLS has failed.

System action

The application request which encountered the error receives an 'IOERR' response.

CICS also issues message DFHFC0158 to display the VSAM diagnostic information for this error. The name of the failing cache can be derived from the information displayed in the following DFHFC0158 message.

While the data cache remains unusable, all data sets bound to this cache are also unusable. Any attempt to read from or write to such a data set cause an IOERR response.

CICS issues messages DFHFC0162 and DFHFC0158 the first time that an I/O request fails because of a cache failure. To prevent flooding the console with messages, CICS does not display these messages again until it is notified that a cache has been recovered. If several caches fail, DFHFC0162 and DFHFC0158 are only displayed for the first cache to fail. However, VSAM issues messages for all failed caches.
User response
Allocate a new data cache and bring it on line to VSAM.
CICS is notified as soon as the new cache is available and is able to take appropriate recovery action.

Module:
DFHFCRS

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHFC0163 applid Connectivity to a VSAM RLS data cache has been lost.

Explanation
Connectivity has been lost to a data cache that is being used by VSAM RLS.

System action
The application request which encountered the error receives an 'IOERR' response.

CICS also displays message DFHFC0158 to display the VSAM diagnostic information for this error. The name of the failing cache can be derived from the information displayed in the following DFHFC0158 message.

While the data cache remains unusable, all data sets bound to this cache are also unusable. Any attempt to read from or write to such a data set receives an 'IOERR' response.

CICS issues messages DFHFC0163 and DFHFC0158 the first time that an I/O request fails because contact has been lost between the processor running this MVS image and the coupling facility that holds the data cache. To prevent flooding the console with messages, CICS does not display these messages again until it is notified that a cache has been recovered. If contact with several caches is lost, messages DFHFC0163 and DFHFC0158 are only displayed for the first cache to fail. However, VSAM issues messages for all caches for which contact has been lost.

User response
Reestablish contact between the processor running CICS and the coupling facility that contains the cache.

CICS is notified as soon as contact has been reestablished and is able to take appropriate recovery action.

DFHFC0164 date time applid tranid trannum termid userid. A request has timed out waiting for an RLS lock. There are nn transactions or Transactional VSAM units of recovery holding this lock.

Explanation
This message and the following DFHFC0165 or DFHFC0175 messages are issued to assist in problem determination when transactions abend with the AFCV abend code, or when application programs receive the RECORDBUSY condition.

An attempt made by transaction tranid with task number trannum to update a file which is open in VSAM RLS mode has failed because the request timed out waiting to obtain a lock on a record.

VSAM RLS has detected that a request has waited for a lock for more than the timeout interval. However, RLS was unable to detect any deadlock. Possibly there is a deadlock between VSAM RLS requests and requests to another resource manager such as DB2 or DBCTL.

When the timeout occurred there were nn other transactions or Transactional VSAM units of recovery holding the required lock.

System action
If the application request which encountered the error specified NOSUSPEND, it receives the RECORDBUSY condition and continues. If the request did not specify NOSUSPEND, it receives an AFCV abend.

CICS displays message DFHFC0164 to identify the failing transaction and the number of owners of the lock. CICS also issues message DFHFC0165 or DFHFC0175 once for each lock owner. CICS issues message DFHFC0168 instead of DFHFC0165 or DFHFC0175 in the unlikely event that VSAM RLS is unable to identify the lock owner.
User response
The following DFHFC0165 or DFHFC0175 messages identify the transactions that are holding the required lock and the CICS systems that they are running in or the unit of recovery holding the required lock and the Transactional VSAM instance this is running in, respectively. Examine these transactions or units of recovery to see why they are not releasing VSAM RLS locks. For example:

- They may be holding VSAM RLS locks and waiting for terminal input.
- They may be trying to access resources from both VSAM RLS and another resource manager, creating an inter-resource manager deadlock.

DFHFC0165 date time applid tranid trannum termid userid. Transaction tranid (tasknum) unit of work X‘uowid’ running in job jobname with applid applid2 in MVS mvsid holds {add to end lock | internal lock | exclusive lock on key | shared lock on key} X‘keyid’ in data set dsname causing {true / false} contention.

Explanation
This message and the preceding message DFHFC0164 or DFHFC0174 are issued to assist in problem determination when transactions abend with the AFCV or AFCW abend codes, or when applications receive the RECORDBUSY condition.

Normally this message appears after VSAM returns a timeout response to CICS. However, it may also appear after VSAM returns a deadlock response to CICS when that deadlock arises as a result of a failure to promote a lock. When this message is associated with a timeout response from VSAM, it is preceded by message DFHFC0164. When this message is associated with a deadlock response from VSAM it is associated with message DFHFC0174.

There is one occurrence of message DFHFC0165 for each transaction currently owning the required lock.

The name of the transaction that has failed is tranid and it has task number trannum.

The message inserts that identify the owner of the lock which caused this transaction to time out are as follows:

- tranid is the name of the transaction running in the system that owns the lock. If the job that holds the lock is not a CICS system, this is displayed as ????.
- tasknum is the task number of tranid. If the job that holds the lock is not a CICS system, this is displayed as ????.
- uowid is the unit of work ID associated with the above transaction. The unit of work ID is also used by VSAM RLS as its logical unit of work ID (luwid).
- jobname is the job name of the CICS system that owns the lock.
- applid2 is the applid of the CICS system whose job name was given by the previous insert.
- mvsid is the name of the MVS in which this CICS is running.
- dsname is the name of the data set against which the lock is held.
- keyid identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that the transaction is waiting for an add to end lock or an internal lock, no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock:

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

A lock causes true contention if the request was for a lock against the locked key. A lock causes false contention if the request was for a lock against a different key but the lock requests clashed because of the RLS key hashing algorithm which is used when the key length exceeds 16 characters.
System action
This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the system action associated with this message.

User response
This message is preceded by DFHFC0164 or DFHFC0174. See the description of DFHFC0164 or DFHFC0174 for a description of the user actions associated with this message.

DFHFC0166 date time applid tranid termid userid. VSAM RLS has detected a deadlock. There are nn transactions or Transactional VSAM units of recovery in the deadlock chain.

Explanation
This message and the following DFHFC0167 or DFHFC0177 messages are issued to assist in problem determination when transactions abend with AFCW abend codes.

An attempt made by transaction tranid to update a file which is open in VSAM RLS mode has failed because VSAM RLS detected that this request would have caused a deadlock with other transactions.

At the time that the timeout occurred there were nn other transactions or Transactional VSAM units of recovery in the chain which caused deadlock.

System action
The application request which encountered the error receives an AFCW abend.

CICS issues message DFHFC0166 to identify the failing transaction and the number of transactions or units of recovery in the deadlock chain.

CICS also issues message DFHFC0167 or DFHFC0177 once for each transaction or unit of recovery involved in the deadlock chain. DFHFC0167 and DFHFC0177 identify the resource that the transaction or unit of recovery is holding and the resource that the transaction is waiting for.

User response
Examine the transactions or units of recovery in the deadlock chain to determine why deadlock arose. If necessary, correct the programming logic to avoid deadlock-creating situations.

For guidance on writing programs that avoid deadlock problems, see the Developing CICS Applications.

**Transaction**  
**transid(tasknum)** with unit of work id **X'uowid'** running in **jobname/applid2** in MVS **mvsid** holds {**add to end lock** | **internal lock** | **exclusive lock on key** | **shared lock on key**} **X'key1'** on data set **dsname1** and is waiting for {**add to end lock** | **internal lock** | **exclusive lock on key** | **shared lock on key**} **X'key2'** on data set **dsname2**.

**Explanation**

This message and the preceding DFHFC0166 message are issued to assist in problem determination when transactions abend with AFCW abend codes.

The preceding message DFHFC0166 reports that a deadlock has been detected and includes how many transactions exist in the deadlock chain.

Message DFHFC0167 is issued once for each transaction in the deadlock chain and includes the resource that transaction holds and which resource it is waiting for.

The message inserts are as follows:

- **transid(tasknum)** is the transaction name and the associated task number of a transaction that owns a lock and is waiting for another lock. If this participant in the deadlock chain is not a CICS system, this will appear as ????(??????).
- **uowid** is the unit of work ID associated with task **transid(tasknum)**. The unit of work is also used by VSAM as the logical unit of work ID (luwid).
- **jobname/applid2** is the job name and applid of the CICS system in which this transaction is running.
- **mvsid** is the name of the MVS in which this CICS job is running.
- **dsname1** is the name of the data set against which this transaction holds a lock.
- **key1** identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that an add to end lock or an internal lock is held then no key information is displayed.
- **dsname2** is the name of the data set against which this transaction is attempting to acquire a lock.
- **key2** identifies the key which this transaction is attempting to lock. If the message indicates that the transaction is attempting to obtain an add to end lock or an internal lock then no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock and whether the transaction is attempting to acquire an exclusive or shared lock.

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

**System action**

The application request which encountered the error receives an AFCW abend.

**User response**

See the description of message DFHFC0166.

DFHFC0168  date time applid tranid trannum termid userid.
{ An exclusive | A shared} lock on key X'keyid' in data
set dsname is causing {true | false} contention but the owner of this
lock is unknown.

Explanation
This message and the preceding DFHFC0164 message
are issued to assist in problem determination when
transactions abend with AFCV abend codes.

Message DFHFC0168 is issued whenever VSAM RLS is
unable to determine the owner of a lock. This is an
abnormal condition. It may indicate that a processor in
the sysplex is stopped.

dsname is the name of the data set against which the
lock is held. keyid identifies the key which is locked.
As it is not always possible to display keys in character
form, the key is displayed in hexadecimal notation.

The message identifies whether the lock is held as an
exclusive lock or a shared lock.

• A lock is exclusive if it can only have one holder. For
  example, exclusive locks are used to protect update
  operations.

• A lock is shared if it can have many holders. Shared
  locks are used to protect repeatable and consistent
  read operations.

A lock causes true contention if the request was for
a lock against the locked key. A lock causes false
contention if the request was for a lock against a
different key but the lock requests clashed as a result
of hashing algorithms used in creating RLS keys.

System action
Processing continues.

User response
None. The message is issued to assist in problem
determination.

DFHFC0169  date time applid termid userid. Transaction tranid with
transaction number trannum encountered an RLS retained lock
held on data set dsname by unit of work X'uowid' within CICS with
applid applid2.

Explanation
An attempt was made to update a record which is
currently held locked by a retained RLS lock.

Message inserts are as follows:

• applid2 is the applid of the CICS system which owns
  the lock.
• uowid is the identifier of the unit of work that owns
  the lock.
• dsname is the name of the data set against which the
  lock is held.

This message is issued to aid in problem diagnosis.
It identifies the owner of the lock that is causing a
request to fail with a 'LOCKED' response.

System action
The application request which encountered the error
receives a 'LOCKED' response.
### User response

If repeated LOCKED responses are causing a problem, note the name of the CICS system and the identifier of the unit of work and attempt to find why this unit of work is holding a retained lock. There are three reasons why a unit of work can hold a retained lock.

1. The unit of work was running in a CICS system that has failed. If this CICS system is restarted, the lock is normally released.
2. The unit of work has gone indoubt. Indoubt failures occur as a result of a failure in communication between two CICS systems, neither of which need be the CICS system that is encountering the ‘LOCKED’ response.
3. The unit of work has failed backout. From a terminal connected to the CICS system with applid applid2, issue the command:

   ```
   CEMT I UOW(uowid)
   ```

   or

   ```
   CEMT I UOWDSNFAIL
   ```

   to identify the applid of the CICS system that is coordinating the distributed unit of work. Then attempt to reestablish contact between the coordinating CICS and the system that owns the lock.

3. The unit of work has failed backout. From a terminal connected to the CICS system with applid applid2, issue the command:

   ```
   CEMT INQUIRE UOWDSNFAIL DATASET(dsname)
   ```

   to determine the reason why unit of work uowid failed backout while processing data set dsname. There are several reasons why a unit of work can fail backout, each identified by a different reason code from CEMT INQUIRE UOWDSNFAIL. See the Troubleshooting and support for guidance on how to resolve each of these types of backout failure.

### Destination

| CSFL | applid | An attempt to release locks which are held by RLS but unknown to CICS has failed. |

### Explanation

An attempt was made to release locks which are held on behalf of this CICS system by the VSAM RLS lock manager, but about which CICS has no knowledge. Such locks are known as "orphan" locks. The attempt to release the locks failed, either because the VSAM RLS server is not available or because there were no locks to release.

### System action

CICS continues. The locks are automatically released after the VSAM RLS server becomes available again.

The presence of these "orphan" locks could prevent the running of non-RLS applications against the data sets which hold such locks. "Orphan" locks can also cause LOCKED responses to be returned to applications running on CICS systems which have access to an available VSAM RLS server and try to update the locked records, or try to read the records with one of the read integrity options.

Since CICS has no knowledge of "orphan" locks, it is not possible to get information about them using CICS API commands.

### User response

If the failure is due to the server not being available, wait for the VSAM RLS server to restart. If it does not restart automatically, determine the reason and attempt to start it manually.

If the failure is due to there being no locks to release, this could either be a result of some user action resulting in locks being deleted such as deleting the data set, or it could indicate a severe VSAM error. If user action is not responsible, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.
**XMEOUT parameters/Message inserts**

1. applid

**Destination**

Console

DFHFC0171  applid Lost locks recovery might be delayed by inflight transactions.

**Explanation**

A coupling facility (CF) lock structure failure has occurred, and SMSVSAM has been unable to rebuild the lock structure dynamically. This has resulted in the loss of VSAM RLS locks. SMSVSAM has notified CICS of this event so that CICS can perform lost locks recovery processing. In the course of this processing, CICS has attempted to purge inflight transactions that hold one or more of the lost locks in order to expedite recovery from the lost locks condition. However, it has not been possible to purge all of the transactions.

RLS lost locks recovery cannot complete until all UOWs that have updated data sets in RLS mode are completed. It is unlikely that an inflight transaction can complete normally in a lost locks situation because it will abend at the next attempt to access RLS. CICS attempts to purge inflight transactions because allowing them to run to completion (when they will probably abend anyway) could take a long time. This is particularly the case for conversational transactions.

**System action**

CICS continues.

If the failure to purge a transaction is due to a severe error, message DFHFC0002 is issued and a dump is taken.

**User response**

It may not be necessary to take any action because the purging of transactions is only a precautionary measure.

This message indicates that there are inflight UOWs that have not yet completed only when there are data sets that return a LOSTLOCKS value of RECOVERLOCKS after you have resolved any failed units of work that had updated the data sets. (See the EXEC CICS INQUIRE DSNAMES(?) command for information about the LOSTLOCKS parameter.)

If it is possible to identify the transactions in question, either ensure that they run to normal completion, or attempt to force purge them using the CEMT main terminal command. However, as this should be a rare situation, consider performing an immediate shutdown of CICS followed by an emergency restart as an alternative solution. This causes all inflight transactions to be backed out.

**Module:**

DFHFCRR

---

**DFHFC0172 applid File control is unable to return to processing on the QR TCB because a change mode request has failed. CICS will terminate.**

**Explanation**

Normally most CICS functions are run on a TCB called the QR TCB. Exceptionally, file control issues OPEN and CLOSE requests on a TCB called the FO TCB. File control may also process VSAM read and write requests on a TCB called the CO TCB if SUBTSKS=1 has been specified in the SIT.

After completing its work on the RO or CO TCB, file control must return to processing on the QR TCB. In order to return to the QR TCB, file control has issued a CHANGE_MODE call to the CICS dispatcher. This request has failed.

**System action**

This is a severe error. CICS is unable to continue processing because it must be running on the QR TCB in order to do so. CICS is terminated with a dump.

The dispatcher domain has put out messages to describe the failure in the CHANGE_MODE request.

**User response**

See the messages issued by the dispatcher domain for further guidance.

**Module:**

DFHFCRO, DFHFCCA, DFFCRV, DFHFCFS

Console

DFHFC0173 date time applid VSAM has issued a {deadlock | timeout | locked} response but cannot supply problem determination data.

Explanation
After certain failures, VSAM normally provides problem determination information which CICS uses to issue diagnostic messages and create exception trace entries.

However, although VSAM set a return code indicating that a failure occurred, it is unable to provide any problem determination information.

The failure detected by VSAM RLS is one of the following:

- A deadlock - CICS normally issues message DFHFC0166 and two or more DFHFC0167 or DFHFC0177 messages.
- A timeout - CICS normally issues message DFHFC0164 and one or more DFHFC0165 or DFHFC0175 messages.
- A record locked by a retained lock - CICS normally issues message DFHFC0169 or DFHFC0179.

System action
CICS continues processing the error in the normal way but cannot issue any of the normal problem determination messages or create the usual exception trace entries.

CICS does not take a dump. However, you can request a dump via the dump table in the usual way.

User response
This indicates an error in VSAM RLS. You may wish to take a dump of the SMSVSAM server. See the appropriate DFSMS/MVS manual for further guidance.

DFHFC0175 date time applid tranid trannum termid userid. Transactional VSAM unit of recovery X'urid' running in job jobname on Transactional VSAM instance TVSInstance in MVS mvsid holds {add to end lock | internal lock | exclusive lock on key | shared lock on key} X'keyid' in data set dsname causing {true | false} contention.

Explanation

This message and the preceding message DFHFC0164 or DFHFC0174 are issued to assist in problem determination when transactions abend with the AFCV or AFCW abend codes, or when applications receive the RECORDBUSY condition.

Normally this message appears after VSAM returns a timeout response to CICS. However, it may also appear after VSAM returns a deadlock response to CICS when that deadlock arises as a result of a failure to promote a lock. When this message is associated with a timeout response from VSAM, it is preceded by message DFHFC0164. When this message is associated with a deadlock response from VSAM it is associated with message DFHFC0174.

There is one occurrence of message DFHFC0175 for each unit of recovery currently owning the required lock.

The name of the transaction that has failed is tranid and it has task number trannum.

The message inserts that identify the owner of the lock which caused this transaction to time out are as follows:

- urid is the unit of recovery id running in the Transactional VSAM instance which owns the lock.
- jobname is the job name of the CICS system that owns the lock.
- TVSInstance is the name of the Transactional VSAM instance whose job name was given by the previous insert.
- mvsid is the name of the MVS in which this Transactional VSAM instance is running.
- dsname is the name of the data set against which the lock is held.
- keyid identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that the transaction is waiting for an add to end lock or an internal lock, no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock:

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

A lock causes true contention if the request was for a lock against the locked key. A lock causes false contention if the request was for a lock against a different key but the lock requests clashed because of the RLS key hashing algorithm which is used when the key length exceeds 16 characters.

**DFHFC0177**  

This message and the preceding DFHFC0166 message are issued to assist in problem determination when transactions abend with AFCW abend codes.

The preceding message DFHFC0166 reports that a deadlock has been detected and includes how many units of recovery exist in the deadlock chain.

Message DFHFC0177 is issued once for each unit of recovery in the deadlock chain and includes the resource that unit of recovery holds and which resource it is waiting for.

The message inserts are as follows:

- `urid` is the unit of recovery ID which owns a lock and is waiting for another lock.
- `jobname/TVSInstance` is the job name and TVS instance in which this unit of recovery is running.
- `dsname1` is the name of the data set against which this unit of recovery holds a lock.
- `key1` identifies the key which is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation. If the message indicates that an add to end lock or an internal lock is held then no key information is displayed.
- `dsname2` is the name of the data set against which this unit of recovery is attempting to acquire a lock.
- `key2` identifies the key which this unit of recovery is attempting to lock. If the message indicates that the unit of recovery is attempting to obtain an add to end lock or an internal lock then no key information is displayed.

The message identifies whether the lock is held as an exclusive lock or a shared lock and whether the unit of recovery is attempting to acquire an exclusive or shared lock.

- A lock is exclusive if it can only have one holder. For example, exclusive locks are used to protect update operations.
- A lock is shared if it can have many holders. Shared locks are used to protect repeatable and consistent read operations.

**System action**

The application request which encountered the error receives an AFCW abend.

**User response**

See the description of message DFHFC0166.

**Module:**
**XMEOUT parameters/Message inserts**

14. X'key2'
15. dsname2

**Destination**

CSFL

**Explanation**

An attempt was made to update a record which is currently held locked by a retained RLS lock. Message inserts are as follows:

- **TVSInstance** is the number of the Transactional VSAM instance which owns the lock.
- **urid** is the identifier of the unit of recovery that owns the lock.
- **dsname** is the name of the data set against which the lock is held.

This message is issued to aid in problem diagnosis. It identifies the owner of the lock that is causing a request to fail with a 'LOCKED' response.

**System action**

The application request which encountered the error receives a 'LOCKED' response.

**User response**

If repeated LOCKED responses are causing a problem, note the name of the Transactional VSAM instance and the identifier of the unit of recovery and attempt to find out why the unit of recovery is holding a retained lock. The Transactional VSAM unit of recovery may have failed or suffered backout failure. If the Transactional VSAM application has failed the lock will normally be released if the application is rerun. If the Transactional VSAM application has suffered backout failure you will need to use Transactional VSAM procedures to perform backout failure retry in order to release the lock.

**User response**
None.

**Module:**
DFHFCMT.
Explanation

If one or more of the parameters, CI size, strings and maxkeylength are not defined for a LSR pool, either because there is no LSRPOOL definition or it is incomplete, then CICS will calculate the size by using information from the VSAM Catalog for data sets allocated to this LSR pool.

System action

CICS will issue SHOWCATS to obtain the information necessary to calculate the LSR pool size. If any data sets have been migrated the SHOWCAT could take longer than expected.

User response

If there are severe delays due to SHOWCAT processing, you will have to wait for migrated data sets to be recalled, and for the calculation of the LSR pool size to complete. If you wish to avoid similar problems in the future, consider defining the LSR pool explicitly. The missing parameters are contained in this message.

Normally, you will not experience delays, in which case no user action is required.

You can suppress this message with the system initialization parameter, MSGLEVEL=0.

Console

DFHFC0209I applid User exit XFCRLSC0 is allowing non-RLS file filename to bypass the RLS coexistence checks.

Explanation

User exit XFCRLSC0 is active and ran because non-RLS file filename is being opened. The user exit replied with a return code of UERCBYP. This return code means that a non-RLS file has read-only access and is already open against the same data set. The non-RLS file must stay in read only mode to continue to access the data set while the RLS file is open.

Console

DFHFC0300 applid (tranid termid) purge deferred due to incomplete I/O operation on VSAM file 'filename'.

Explanation

An attempt has been made to purge a transaction using FORCE. Transaction tranid is currently waiting for completion of an I/O operation on the VSAM file filename. termid identifies the terminal running this
transaction. The data set name appears in message DFHFC0305 which follows this message.

**System action**

The transaction waits until the I/O operation is completed before the purge is allowed to take effect. This is done to avoid a risk to data integrity. After the I/O operation is completed, the transaction is terminated with transaction abend code AFCY.

**User response**

If the transaction does not terminate within a few seconds, the I/O wait might be genuine (for example, another CEC has reserved the DASD volume). If this is the case, wait until the I/O situation is relieved before trying again.

Alternatively, there may be a system problem that warrants terminating CICS and using emergency restart to guarantee data integrity. If this is the case, terminate CICS and perform an emergency restart.

Console

**Explanation**

A DISASTER type error occurred when the transaction tranid was waiting for the completion of an I/O operation on the VSAM file whose file name and data set name appear in message DFHFC0305 which follows this message. termid identifies the terminal running this transaction.

**System action**

CICS is terminated with a system dump (dump code FC0302).

**User response**

This problem was caused by an earlier error. Look for earlier messages and return codes (for example, from the dispatcher domain) and associated trace entries and dumps.

If the problem cannot be traced to an application error, you will require further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHFC0303  applid (tranid termid) CICS terminating. Failure while waiting for I/O operation on BDAM file 'filename'.

Explanation
A DISASTER type error occurred when transaction tranid was waiting for the completion of an I/O operation on BDAM file filename. termid identifies the terminal running this transaction.

System action
CICS is terminated with a system dump (dump code FC0303).

User response
This problem was caused by an earlier error. Look for earlier messages and return codes (for example, from the dispatcher domain) and associated trace entries and dumps.

If the problem cannot be traced to an application error, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHFCBD

DFHFC0304  applid Dump taken in module_name due to a file control OPEN/CLOSE error.

Explanation
This message is issued after DFHFCFS has made an OPEN or CLOSE request which has completed with an error. The specific error is identified by another message. In most cases the other message appears before this message, but if the error occurs during the building of a shared resources pool, the other message appears after this message.

The failure is identified as one of the following:
- An invalid request (not OPEN or CLOSE) has been sent
- There has been a subtask failure
- There has been a system failure other than "DSNAME NOT FOUND" or "VSAM CATALOG DOMAIN NOT FOUND".
- There has been a failure during shared resources pool building.

System action
A trace entry is made and a dump is taken with dumpcode FC0304.

User response
Locate the fault by examining the trace entry and the dump.

Module: DFHFCL, DFHFCM, DFHFCN

DFHFC0305  applid Message msgno file 'filename' dsname 'dataset'.

Explanation
This message follows message DFHFC0300, DFHFC0302, DFHFC0307, DFHFC0308 or DFHFC0309. It identifies the VSAM data set name referred to in those messages.

If this message follows DFHFC0300 or DFHFC0302, it is issued from DFHFCVR.
If this message follows DFHFC0308 or DFHFC0309, it is issued from DFHFCRV.

If this message follows DFHFC0307, it is issued from DFHFCVS.

**System action**

Processing continues in the way specified in the preceding message from the list above, whichever is applicable.

**User response**

Find the earlier message to which this information refers and follow the user response for that message.

3. **filename**
4. **dataset**

**Destination**
Console

DFHFC0307  **applid I/O error on file 'filename', component code X'code'. File is temporarily disabled.**

**Explanation**

An I/O error was reported by VSAM after a request to update VSAM file *filename*.

The file has been specified with LSR so VSAM has not released the buffers it assigned to process the request. Therefore, CICS must take special action to release them.

The name of the data set associated with the file is in message DFHFC0305 which follows, although the error may have been encountered elsewhere. This is indicated by the value of the component code 'X'code'. Its possible values and the corresponding error locations are as follows.

- X'00' or X'01' - base cluster.
- X'02' or X'03' - alternate index.
- X'04' or X'05' - upgrade set.

**System action**

Activity against the file is stopped. The file is closed, then reopened in an attempt to release the VSAM output buffers. Further action might be required, see user response section.

Until the close has completed successfully, the file appears UNENABLED to new, potential users. They receive a NOTOPEN response to requests to use the file. The application request which encountered the error receives an IOERR response.

**User response**

The installation should follow the standard procedure for I/O errors. The data set name and component code might help in identifying the problem. To fully release the VSAM LSR output buffers, it might be necessary to close every file in this CICS region that uses the same LSRPOOL, and subsequently reopen those files. If that is not possible, then you should consider restarting CICS, to reclaim the full complement of buffers.

If there are sufficient buffers defined, subsequent requests are not prevented from processing normally after an IOERR response. You should close all the LSRPOOL files or restart CICS as soon as possible.

Console

**DFHFC0314I** applid VSAM has insufficient LSR buffers to fully backout the failed request.

**Explanation**
VSAM has returned an error for VSAM file mentioned in DFHFC0313 and an error code of X'98'.
An ILLOGIC response is returned to the application.
The error code indicates that VSAM has insufficient LSR buffers to backout the failed request fully.

**System action**
An ILLOGIC response is returned to the application.

**User response**
Increase the allocation of LSR buffers. You may also need to delete, redefine and re-build your alternate indices based on this file.

**Module:**
DFHFCVS

**XMEOUT parameters/Message inserts**
1. applid

**Destination**
Console

**DFHFC0400** applid This CICS system is not authorized to provide shared access to data tables - reason code X'code'.

**Explanation**
CICS is about to open a data table but has been unable to make provision for sharing the table with other CICS systems because a security check for update access to the resource name DFHAPPL..applid has failed. The value of the reason code, X'code', provides further information on the reason for the failure of the security check. It has the format X'ffraaaa' where ff identifies the authorization check which failed, rr gives the register 15 return code from SAF, and aaaa is the SAFPRRET value.
The values of X'ff' are
X'01'
Access was refused by an AUTH security check.
X'02'
Access was refused by a FASTAUTH security check.

**System action**
CICS continues normally but no other CICS systems are able to share any data tables it creates until authority is granted and a table is subsequently opened.

**User response**
Ensure that CICS has the necessary authorization to provide shared access to data tables. Refer to the description of either the AUTH or FASTAUTH macro in the RACF documentation for explanations of the values that were reported in the reason code, X'code', and to determine the changes to the security definitions or setup that are required to allow the CICS system to act as a shared data table server (assuming that this is desired).

**Module:**
DFHFCFS

**XMEOUT parameters/Message inserts**
1. applid
2. X'code'

**Destination**
Console

**DFHFC0401** applid This CICS system is now authorized to provide shared access to data tables.

**Explanation**
CICS is about to open a data table. On a previous occasion message DFHFC0400 was issued because authorization checks failed preventing this CICS system from making provision for sharing its data tables with any other CICS system. The check has been retried successfully.
**System action**

CICS continues normally. Subject to specific authorization checks, other CICS systems are now able to share this system’s data tables.

**Explanation**

CICS is about to access a remote file resource. However, shared data tables cannot be used to access any remote tables because CICS has not been defined as an MVS subsystem.

If this message is issued on a CICS system at release 3.2.1, it means that the shared data tables module DFHDTINS is installed in the LPA or in the load library used by this CICS system, and has therefore been loaded by mistake.

**System action**

CICS continues normally and function ships this and subsequent remote file requests.

**User response**

CICS must be defined as an MVS subsystem in order to permit the sharing of data tables between CICS systems.

If the message was issued by a CICS/ESA 3.2.1 system, check where the DFHDTINS module is located. If DFHDTINS is in the load library specified by this CICS, it should be removed: shared data tables support cannot be installed on a CICS system at a lower level than 3.3. If it is in the link pack area (LPA) of this MVS system, it should be removed: the DFHDTINS module should not be placed in the LPA of an MVS system which contains any CICS regions at release 3.2.1 which might want to use data tables, unless a PTF has been applied to the CICS 3.2.1 regions.

**Module:**

DFHFCFS

**XMEOUT parameters/Message inserts**

1. **applid**

**Destination**

Console

1. **applid**

**Destination**

Console

DFHFC0405  
**applid** This CICS system cannot provide shared access to data tables because an earlier job step has used MVS cross-memory services.
Explanation
CICS is prevented from using shared data tables because of the use of MVS cross-memory services by an earlier job step. CICS has attempted to create an entry table during LOGON as a shared data table server, but this has resulted in an MVS 052 ABEND because a prior jobstep owned space-switching entry tables. (MVS does not allow subsequent job steps to establish a cross-memory environment.)

System action
CICS continues normally but other CICS systems are unable to gain shared access to any data tables that this CICS system creates.

User response
In order to use the shared access to data tables feature, review the sequence of job steps in the job which includes this CICS system.

See the Introduction to shared data tables and also the explanation of system abend code 052, reason code 0314 in z/OS MVS System Codes for more guidance.

Module:
DFHFCFS

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHFC0406 applid This CICS system is not authorized for shared access to any data tables owned by the CICS system with applid applid2 - reason code X'code'.

Explanation
A file request for a remote file resource is about to be passed to a CICS system with the specified applid. The remote system has registered as a shared data table server, but this system cannot access any of its tables because a security check for read access to the resource name DFHAPPL.applid2 has failed, where applid2 is the applid of the data table owning CICS system. The value of the reason code, X'code', provides further information on the reason for the failure of the bind security check. It has the format X'ffraaaa' where ff identifies the authorization check which failed, rr gives the register 15 return code from SAF, and aaaa is the SAFPRRET value.

The values of X'ff' are

X'01'
Access was refused by an AUTH security check.

X'02'
Access was refused by a FASTAUTH security check.

System action
CICS continues normally and function ships this and subsequent requests directed to the specified remote system until authority is granted. Access is retried after about 10 minutes.

User response
If it was intended that this CICS system should be able to access data tables owned by the system applid2, refer to the description of either the AUTH or FASTAUTH macro in the RACF documentation for explanations of the values that were reported in the reason code, X'code', and to determine what changes to the security definitions or setup are required.

DFHFC0407 applid This CICS system is now authorized for shared access to data tables owned by the CICS system with applid applid2.

Explanation
The security check which failed earlier and was reported in message DFHFC0406, has now succeeded. This system can now attempt to access shared data tables owned by the CICS system with applid applid2.

System action
CICS continues normally. Subject to specific resource authorization checks, shared data tables owned by
the remote CICS system can now be accessed by this system.

User response
None.

Module:
DFHFCFS

XMEOUT parameters/Message inserts
1. applid
2. applid2

Destination
Console

DFHFC0408  applid This CICS system is not authorized for shared access to remote file filename - reason code X'code'.

Explanation
A file request to the specified remote file resource has just been processed. The file owning region contains shared data tables. An attempt was made to connect to any data table associated with the file but the connecting region failed the security check for shared access to the file resource. However, function shipped access was not similarly prevented.

This message can be issued whether or not the remote file has an associated data table. This is because it is not possible to determine whether a table exists until cross-memory linkage has been established to the file owning region, and this is only done after a connection attempt has passed all security checks. Once cross-memory linkage has been set up, any further connection attempts can first check whether a table exists. The shared access security check is then only needed when a data table is known to be available.

The value of the reason code, X'code', provides further information on the reason for the failure of the file security check. It has the format X'ffrraaaa'; where ff identifies the userid that was refused access, rr gives the register 15 return code from SAF, and aaaa is the SAFPRRET value.

The values of X'ff' are

X'01'
The requesting system's own userid was refused read access to the remote file filename.

X'02'
The default userid of the CICS system which owns the remote file filename was used in the security check for read access to the file, and access was refused.

System action
CICS continues normally and function ships this and subsequent requests directed to the specified remote file until authority to use shared access is granted. Access is retried after about 10 minutes.

User response
Check whether shared access from this system to the specified file is intended. If it is, use the additional information provided in the reason code to determine what changes to the security definitions or set-up are required.

See the Introduction to shared data tables for an explanation of the rules determining which userid is used for a file security check.

Console

DFHFC0410 applid Data table cannot be opened. Data table initialization has failed for reason X'code'.

Explanation

CICS is about to open a data table but has been unable to initialize shared data table services. The value of the reason code, X'code', provides further information about why CICS was unable to initialize shared data table services.

The format of the reason code is either: X'ffaaaaaa', in which ff is a value less than X'80' that identifies the type of failure, and aaaaaa is additional information provided for some of the failures, or when an abnormal termination (abend) has occurred, X'axxxrrrr' in which a is a value greater than or equal to X'8' that categorizes the type of abend, rrrr contains any register 15 return code from the attempt to call the CICS SVC, and xxx contains the system or user completion code as three hexadecimal digits.

When X'code' < X'80000000', the values of X'ff' are:

X'01'

An unexpected failure occurred. This code is reported when the data tables SVC detects an unexpected error.

X'04'

An error was returned by the MVS RESMGR macro, called to establish an MVS resource manager for end-of-task processing. The first byte of the additional information, X'aa00000' contains the low order byte of the register 15 return code from the MVS RESMGR macro.

X'06'

An error was returned by the CICS SVC. The first byte of the additional information, X'aa00000' is the register 15 return code from the attempt to call the CICS SVC.

X'08'

An error was returned by the MVS DSPSERV macro. The additional information in the reason code consists of 1 byte containing the register 15 return code followed by 2 bytes containing the middle bytes from the register 0 reason code returned by DSPSERV.

X'09'

An error was returned by the MVS ALESERV macro, called to create an access list entry either for the data space or for references to the primary address space. The additional information in the reason code consists of one byte containing the register 15 return code followed by two bytes containing the ALESERV function code (service type) and qualifier (options) which identify the failing request.

X'0E'

An attempt to serialize the use of shared data table services (thus ensuring that only one TCB per address space can use the services) has failed. The first byte of additional information contains the ENQ return code.

When X'code' > X'80000000', the values of X'a' are formed from combinations of:

X'8'

An abend was detected.

X'4'

A user abend was detected, in which case xxx contains the hexadecimal equivalent of the user completion code (otherwise, xxx contains the hexadecimal system completion code).

X'2'

An abend was detected but could not be analyzed fully because no SDWA was available.

X'1'

An asynchronous abend was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

System action

CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved. A system dump is taken for unexpected errors (X'ff'=X'01') and for abends (if dumps are requested for that abend code).

User response

The response depends on the reason for the failure as indicated in the first byte of the reason code:
X'01'
Use the system dump to help you determine the cause of the problem.

X'04'
Refer to the documentation of the MVS RESMGR macro to interpret the low-order byte of the register 15 return code reported in the reason code.

X'06'
The most likely reason for a failure of the CICS SVC call is that the data tables SVC module DFHDTSVC could not be loaded, in which case the return code value is X'02'. If this is the case, check that the DFHDTSVC module is in the LPA or in an authorized library in the link list of the MVS system. If the module is in the correct location, investigate why it could not be loaded. There might be a hardware fault on the disk. Another less likely value for the return code is X'06', which implies that DFHDTSVC has been relink-edited and not marked reentrant.

X'08'
Refer to the documentation of the MVS DSPSERV macro to interpret the register 0 and register 15 return codes reported in the additional information part of the reason code.

X'09'
The function code (service type) and qualifier (options) reported in the reason code can be used to determine which ALESERV request was being attempted. Refer to the MVS ALESERV documentation and macro to interpret the function code, qualifier, and register 15 return code reported in the reason code.

X'0E'
This might indicate that the limit on the number of ENQs per address space has been reached, or that another TCB running in this CICS address space has already initialized as a requester of shared data table services.

> X'80'
When the reason code indicates that an abend has been detected, use the additional information provided in the reason code to find out what the abend was, and refer to information on that abend code to determine the cause.

| Module: DFHFCFS |

**XMEOUT parameters/Message inserts**

1. applid

2. X'code'

**Destination**

**Console**

DFHFC0411 applid Data table cannot be opened. Data table initialization has failed owing to a storage failure - reason code X'code'.

**Explanation**

CICS is about to open a data table but has been unable to initialize shared data table services because of a failure to obtain storage. The value of the reason code, X'code', provides further information about the type of storage which could not be obtained.

The format of the reason code is X'ttnn
nnnnn' in which tt identifies the type of storage and, for some of the codes, nnnnnn gives the hexadecimal size in bytes of the storage which could not be obtained. For fixed-length storage blocks, the reason code does not usually report the size.

The values of X'tt' are:

- **X'01'**
  Private storage from MVS subpool 230 (key 0) for a work area used by the data tables SVC

- **X'02'**
  Private storage from MVS subpool 0 for the local header block used by a shared data table server

- **X'03'**
  Private storage from MVS subpool 0 for a pool for data table blocks

- **X'04'**
  Private storage from MVS subpool 0 for a pool for file blocks

- **X'08'**
  MVS/ESA data space storage

- **X'09'**
  Private storage from MVS subpool 230 (key 0) for a region anchor

- **X'11'**
  Private storage from MVS subpool 0 for a dummy recovery block

- **X'12'**
  Storage from MVS subpool 252 required to load the DFHDTAM load module
X'13'
Private storage from MVS subpool 230 (CICS key) for a parameter list used by the data tables SVC

X'14'
Private storage from MVS subpool 230 (key 0) for a new ALET list section

**System action**
CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved.

**User response**
The response depends on the type of storage indicated by the reason code. If it indicates private storage, you should reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

If it indicates data space storage, check whether the size of data spaces in this MVS system has been limited by use of the IEFUSI installation exit.

**Module:**
DFHFCFS

1. applid
2. X'code'

**Destination**
Console

DFHFC0412 applid Data table cannot be opened. Data table initialization has failed owing to a module loading failure - reason code X'code'.

**Explanation**
CICS is about to open a data table but a module loading failure has prevented the initialization of shared data table services. The value of the reason code, X'code', provides further information about which module was being loaded, and what went wrong with the attempt to load it.

**System action**
CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The format of the reason code is X'mfrraaaaa' in which m identifies the module and f is a code for the type of failure. For some failures, rr contains the register 15 return code from the failing macro call, and aaaa might contain additional information.

The value of X'm' can be:

X'1'
DFHDTFOR

X'2'
DFHDTAM

X'6'
DFHMVRMS

The values of X'f' are:

X'1'
module not found by a LOAD, BLDL or CSVQUERY macro call.

X'2'
an error was returned by the MVS LOAD macro. The two bytes X'aaaa' of additional information in the reason code contain the completion code from the LOAD. X'rr' is the register 15 return code.

X'3'
an error was returned by the MVS CSVQUERY macro. X'rr' is the register 15 return code.

X'4'
an error was returned by the MVS BLDL macro. The two bytes X'aaaa' of additional information in the reason code contain the R0 reason code returned by BLDL.

X'5'
the module is not reentrant.

X'6'
the module had the wrong AMODE.

X'7'
the module had the wrong RMODE.

:note text='Note for CICS/ESA 3.2.1 users'. There is an additional code of X'08000000' which is only seen on a CICS/ESA 3.2.1 system that has DFHDTINS installed in the LPA or in its load library, and has mistakenly loaded this module.
following message indicates the action taken for the table involved.

**User response**

The response depends on the reason for the failure as indicated in the second hex digit of the reason code:

- **X'1'**
  - Use the first hex digit to determine which module could not be found, and ensure that it is in the correct library.

- **X'2'**
  - Refer to the documentation of the MVS LOAD macro to interpret the return and completion codes given in the reason code. There might also be a message from the MVS LOAD which explains the reason for the failure.

- **X'3'**
  - Refer to the documentation of the MVS CSVQUERY macro to interpret the return code given in the second byte of X'code'.

- **X'4'**
  - This indicates an I/O error or a storage allocation failure. Refer to the documentation of the MVS BLDL macro to interpret the values in the reason code X'code'.

- **X'5', X'6', X'7'**
  - Use the first digit of the reason code to determine the name of the module, then check the status of that module. These errors imply that it is either not the module which was supplied with CICS or that it has become corrupted.

:note text='Note for CICS/ESA 3.2.1 users'. If the reason code was X'08000000', the shared data tables module DFHDTINS has been incorrectly installed in a library which is used by this CICS/ESA 3.2.1 system. If DFHDTINS is in the load library specified by this CICS, it should be removed: shared data tables support cannot be installed on a CICS system at a lower level than 3.3. If it is in the link pack area (LPA) of this MVS system, it should be removed: the DFHDTINS module should not be placed in the LPA of an MVS system which contains any CICS regions at release 3.2.1 which might want to use data tables, unless a PTF has been applied to the CICS 3.2.1 regions

**Module:**
DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid

<table>
<thead>
<tr>
<th>Destination</th>
<th>DFHFC0415 applid Remote data tables cannot be accessed. Shared data table initialization has failed for reason X'code'.</th>
</tr>
</thead>
</table>

**Explanations**

CICS is about to access a remote file resource which may have an associated shared data table. However, shared data tables cannot be used to access any remote tables because CICS has been unable to initialize data table services. Note that if CICS finds module DFHTDINS in the STEPLIB concatenation or in the LPA it will assume that shared data tables is required and will thus try to initialize it. The value of the reason code, X'code', provides further information about why this CICS region was unable to perform the initialization required to act as a requester of shared data table services.

The format of the reason code is either: X'ffaaaaaa' in which ff is a value less than X'80' that identifies the type of failure, and aaaaaaa is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, X'axxxrrrr' in which a is a value greater than or equal to X'8' that categorizes the type of abend, rrrr contains any register 15 abend reason code, and xxx contains the system or user completion code as three hexadecimal digits.

When X'code' < X'80000000', the values of X'ff' are:

- **X'01'**
  - An unexpected failure occurred. This code is reported when the data tables SVC detects an error which should never occur.

- **X'06'**
  - An error was returned by the CICS SVC. The first byte of the additional information, aa0000, is the register 15 return code from the attempt to call the CICS SVC.

- **X'0E'**
  - An attempt to serialize the use of shared data table services (thus ensuring that only one TCB per address space can use the services) has failed. The first byte of additional information contains the ENQ return code.

When X'code' > X'80000000', the values of X'a' are formed from combinations of:
An abend was detected.

A user abend was detected, in which case xxx contains the hexadecimal equivalent of the user completion code (otherwise, xxx contains the hexadecimal system completion code).

An abend was detected but could not be analyzed fully because no SDWA was available.

An asynchronous abend was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

CICS continues normally and function ships this and subsequent remote file requests. Initialization is retried after about 10 minutes. A system dump is taken for unexpected errors (X'ff' = X'01') and for abends (if dumps are requested for that abend code).

The response depends on the reason for the failure as indicated in the first byte of the reason code:

Use the system dump to help you determine the cause of the problem.

The most likely reason for a failure of the CICS SVC call is that the data tables SVC module DFHDTSTVC could not be loaded, in which case the return code value is X'02'. If this is the case, check that the DFHDTSTVC module is in the LPA or in an authorized library in the link list of the MVS system. If the module is in the correct location, then investigate why it could not be loaded; possibly there might be a hardware fault on the disk. Another less likely value for the return code is X'06', which implies that DFHDTSTVC has been relink-edited and not marked reentrant.

This might indicate that the limit on the number of ENQs per address space has been reached, or that another TCB running in this CICS address space has already initialized as a requester of shared data table services.

When the reason code indicates that an abend has been detected, use the additional information provided in the reason code to find out what the abend was, and refer to information on that abend code to determine the cause.

Module:

XMEOUT parameters/Message inserts
1. applid
2. X'code'

Console

DFHFC0416 applid Remote data tables cannot be accessed. Shared data table initialization has failed owing to a storage failure - reason code X'code'.

CICS is about to access a remote file resource. However, a failure to get storage has prevented CICS from initializing shared data table services. The value of the reason code, X'code', provides further information about the type of storage which could not be obtained:

The format of the reason code is X'tttnnnnnn' in which tt identifies the type of storage and, for some of the codes, nnnnnn gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of X'tt' are:

Private storage from MVS subpool 253 (below the 16MB line) for a work area required by module DFHQSSSS

Private storage from MVS subpool 0 for the shared data table header block required for this CICS to act as a data tables requester

Private storage from MVS subpool 230 (key 0) for a region anchor
X'0A'
ECISA storage from subpool 241 (key 0) for a qualified subsystem block

X'0B'
ECISA storage from MVS subpool 241 (key 0) for a system anchor

X'0E'
Private storage from MVS subpool 230 (key 0) for a connect header block

System action
CICS continues normally and function ships this and subsequent remote file requests. Initialization is retried after about 10 minutes.

User response
The response depends on the type of storage indicated by the reason code.

If it indicates private storage, you should reconsider the various region size parameters which have been specified on the CICS job or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

If it indicates ECSA (extended common service area) storage, you should review the CSA size specified in system parameter list IEASYSxx, or by use of the CSA override on initialization of the MVS system. You should also review the size of the ESQA, since the system might have started to use ECSA storage if the ESQA storage is depleted.

X'4'
    DFHDTCV
The values of f are:
X'1'
    module not found by LOAD
X'2'
    an error was returned by the MVS LOAD macro. The two bytes X'aaaa' of additional information in the reason code contain the completion code from the LOAD. X'rr' contains the register 15 return code
X'5'
    the module is not reentrant.
X'6'
    the module had the wrong AMODE.

System action
CICS continues normally and function ships this and subsequent remote file requests. Initialization is retried after about 10 minutes.

User response
The response depends on the reason for the failure as indicated in the second hex digit of the reason code:
X'1'
Use the first hex digit to determine which module could not be found, and ensure that it is in the correct library.
Refer to the documentation of the MVS LOAD macro to interpret the return and completion codes reported in the reason code. There might also be a message from the MVS LOAD which explains the reason for the failure.

Use the first digit of the reason code to determine the name of the module, then check the status of that module. This error implies that it is either not the module which was supplied with CICS or that it has become corrupted.

Module:
DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid
2. X’code’

**Destination**
Console

**DFHFC0420** applid Shared access to data tables cannot be provided by this CICS system because it has not been registered as a shared data table server - reason code X’code’.

**Explanation**

CICS is about to open a data table but has been unable to do so because this CICS system has not been registered as a shared data table server. The value of the reason code, X’code’, provides further information about why this CICS system was unable to register (LOGON) as a shared data table server.

The format of the reason code is either: X’ffaaaaaa’ in which ff is a value less than X’80’ that identifies the type of failure, and aaaaaa is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, X’axxxrrrr’ in which a is a value greater than or equal to X’8’ that categorizes the type of ABEND, rrrr contains any register 15 ABEND reason code, and xxx contains the system or user completion code as three hexadecimal digits.

When X’code’ < X’80000000’, the values of X’ff’ are:

- X’01’
  This code is reported when the data tables SVC detects an unexpected error.

- X’02’
  Another region within the MVS image with the same APPLID as this region is already registered (logged on) as a shared data tables server.

- X’03’
  DFHDTRM has supplied the data tables SVC with an invalid address for the PC vector, or the PC vector specifies an invalid number of entry table entries (ETEs). In the latter case, X’aahaaaaa’ contains the number of ETEs that were requested.

- X’04’
  A failure occurred when attempting to establish an MVS resource manager for end-of-memory processing. The first byte of the additional information, X’aahaaaaa’, contains the low order byte of the register 15 return code from the MVS RESMGR macro.

- X’05’
  A failure occurred when attempting to make the server address space permanently non-swappable. The additional information, X’aahaaaaa’, contains the low order 3 bytes of the code posted in an ECB that was specified when the SYSEVENT TRANSWAP macro was issued.

- X’06’
  An error was returned by the CICS SVC. The first byte of the additional information, X’aahaaaaa’, contains the low order 3 bytes of the code posted in an ECB, which contains the register 15 return code from the attempt to call the CICS SVC.

- X’0D’
  An error occurred when issuing an MVS ENQ to ensure that, at any given time, only one server per MVS system can be active for a given APPLID. The first byte of the additional information, X’aahaaaaa’, contains the return code from ENQ.

- X’10’
  An attempt to create the environment for shared data tables connect security checks has found that the security environment has already been set up.

- X’11’
  There is a disparity between the actual version of the CICS security block and the version which was used to assemble the shared data tables module DFHDTXS.

When X’code’ > X’80000000’, the values of X’a’ are formed from combinations of:

- X’01’
  An ABEND was detected.
A user ABEND was detected, in which case xxx contains the hexadecimal equivalent of the user completion code (otherwise, xxx contains the hexadecimal system completion code).

An ABEND was detected but could not be analyzed fully because no SDWA was available.

An asynchronous ABEND was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

**System action**

CICS continues normally and attempts to open the table for local use only. A system dump is taken for unexpected errors (X'ff' = X'01') and for ABENDs (if dumps are requested for that ABEND code).

**User response**

The response depends on the reason for the failure as indicated in the first byte of the reason code:

**X'01'**

Use the system dump to help you determine the cause of the problem.

**X'02'**

There cannot be more than one region with a given APPLID acting as a shared data table server within the same MVS image.

**X'03'**

This error might indicate that some corruption of the system has occurred, or that there is an error in CICS code.

**X'04'**

Refer to the documentation of the MVS RESMGR macro to interpret the return code reported in the additional information part of the reason code.

**X'05'**

Refer to the documentation of the MVS SYSEVENT macro to interpret the ECB contents reported in the additional information part of the reason code.

**X'06'**

Server initialization should have been completed before LOGON is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDT SVC should not be encountered.

Therefore this error probably indicates a logic problem or corruption of your system.

**X'0D'**

Refer to the documentation of the MVS ENQ macro to interpret the return code reported in the additional information part of the reason code.

**X'10'**

This error might indicate that some corruption of the system has occurred, or that there is an error in CICS code.

**X'11'**

This error might indicate that service has been applied which requires PTFs to both base CICS and the shared data tables code, and only one has been correctly updated, or that some corruption of the system has occurred, or that there is an error in CICS.

When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that ABEND code to determine the cause.

private storage from MVS subpool 0 for a file block

X'05'

data space storage from data space DFHDT001 for a pool of backout cells (the pool is created if the file being opened is the first recoverable user-maintained table to be opened in this CICS run)

X'06'

data space storage from data space DFHDT001 for a pool of table entry descriptor blocks, or for a descriptor block to be used when loading the table

X'07'

data space storage from data space DFHDT002 for data table index storage
X'08'

Data space storage from data space DFHDT003 upwards for a pool of data table records

**System action**

CICS continues normally. This message is followed either by message DFHFC0931 or by DFHFC0932. The following message indicates the action taken for the table involved.

**User response**

The response depends on the type of storage indicated by the reason code.

If it indicates private storage then you should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

If it indicates data space storage then check whether the size of data spaces in this MVS system has been limited by use of the IEFUSI installation exit.

**Module:**
DFHFCFS

XMEOUT parameters/Message inserts

1. applid
2. filename
3. X'code'

**Destination**

Console

DFHFC0432 applid Data table request for file filename has failed because the table is full for reason eibresp2.

**Explanation**

CICS has attempted to add or rewrite a record to the data table for file resource filename but has failed with a NOSPACE condition. The value of eibresp2 can be:

102

The maximum number of table entries specified for the user-maintained table or coupling facility data table has already reached. This condition can also occur for a recoverable coupling facility data table when the table apparently contains fewer than the maximum number of records allowed if there are uncommitted updates outstanding.

103

CICS is unable to get sufficient storage in the CICS address space to create an in-memory table entry for the record being written.

108

There is insufficient space in the coupling facility data table pool to store the record.

**System action**

CICS continues normally.

**User response**

Examine the eibresp2 reason code to determine why the NOSPACE condition occurred. Increase the appropriate storage available to the data table or the number of entries allowed in the table.

**Module:**
DFHEIFC

XMEOUT parameters/Message inserts

1. applid
2. filename
3. eibresp2

**Destination**

Console

DFHFC0435 applid Data table access request for remote file filename has failed for reason X'code'.

**Explanation**

An error has occurred while the requesting region was attempting to establish a connection to the remote file filename owned by the serving region. The value of the reason code, X'code', provides further information about why CICS was unable to connect to the remote file.

The format of the reason code is either: X'ffaaaaaa' in which ff is a value less than X'80' that identifies the type of failure, and aaaaaa is additional information provided for some of the failures; or, when an abnormal termination (ABEND) has occurred, X'axxxrrrr' in which a is a value greater than or equal to X'8' that categorizes the type of ABEND, rrrr contains any register 15 ABEND reason code, and xxx
contains the system or user completion code as three hexadecimal digits.

When X'code' < X'80000000', the values of X'ff' are:

X'01'
An unexpected failure occurred. This code is reported when the data tables SVC detects an error which should never occur.

X'06'
An error was returned by the CICS SVC. The first byte of the additional information, aa0000, is the register 15 return code from the attempt to call the CICS SVC.

X'07'
The connection index returned by the data tables SVC exceeds the maximum value supported by the calling module (2\(^{20} - 1\)).

X'0A'
The scan of the chain of files owned by the serving region has failed because there is a permanently invalid entry on the chain which indicates that the chain has become damaged.

X'0B'
The number of connections by this requesting CICS region to the remote file is already at the allowed maximum (2\(^{32} - 1\)).

X'0C'
The vector which records details of all connections to shared data tables by this requesting CICS region needs expanding, but this would cause it to equal or exceed a size of 16MB.

X'0F'
An attempt to serialize with termination of the server has failed because the number of ENQs has reached the address space limit. The first byte of the additional information, X'aa0000', contains the return code from the ENQ.

When X'code' > X'80000000', the values of X'a' are formed from combinations of:

X'8'
An ABEND was detected.

X'4'
A user ABEND was detected, in which case xxx contains the hexadecimal equivalent of the user completion code (otherwise, xxx contains the hexadecimal system completion code).

X'2'
An ABEND was detected but could not be fully analyzed because no SDWA was available.

X'1'
An asynchronous ABEND was detected (otherwise, the abend was synchronous or could not be classified because there was no SDWA).

**System action**
CICS continues normally and function ships this and subsequent remote file requests. Use of shared tables is retried after about 10 minutes. A system dump is taken for unexpected errors (X'ff' =X'01') and for ABENDs (if dumps are requested for that ABEND code).

**User response**
The response depends on the reason for the failure as indicated in the first byte of the reason code:

X'01'
Use the system dump to help you determine the cause of the problem.

X'06'
Requester initialization should have been completed before CONNECT is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDT SVC should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.

X'07'
This indicates corruption of subpool 0 storage in the server region.

X'0B'
This indicates that either the requesting region contains more than 2\(^{32} - 1\) remote file definitions, all of which refer to the same file in the server region, or that storage has been corrupted.

X'0C'
Same response as X'07'.
Refer to the documentation of the MVS ENQ macro to interpret the return code reported in the additional information part of the reason code.

> X'80'

When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that ABEND code to determine the cause.

**Module:**
DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid
2. filename
3. X'code'

**Destination**
Console

DFHFC0436 applid Data table access request for remote file filename has failed because of a storage failure - reason code X'code'.

**Explanation**
CICS has attempted to access the remote file resource filename but cannot do so because of a failure to get storage.

The value of the reason code, X'code', provides further information about the type of storage which could not be obtained:

The format of the reason code is X'ttnnnnnn' in which tt identifies the type of storage and, for some of the codes, nnnnnn gives the hexadecimal size in bytes of the storage which could not be obtained. For storage blocks whose length is fixed, the reason code does not usually report the size.

The values of X'tt' are:

X'01'

Private storage from MVS subpool 230 (key 0) for a work area used by module DFHDTXS or for a work area used by data tables SVC CONNECT processing.

X'0F'

Private storage from MVS subpool 230 (key 0) for a connect vector

**System action**
CICS continues normally and function ships this and subsequent remote file requests. Use of shared tables is retried after about 10 minutes.

**User response**
The response depends on the type of storage indicated by the reason code.

As it indicates private storage, you should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It might be necessary to take an SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

**Destination**
Console

DFHFC0440 applid Data table close request for file filename has failed for reason X'code'.

**Explanation**
CICS has attempted to close a data table for file resource filename but has been unable to do so.

**System action**
CICS continues normally. The table is treated as having been closed.

A system dump is taken for unexpected errors (X'ff' =X'01') and for abends (if dumps are requested for that abend code).

**User response**
The response depends on the reason for the failure as indicated in the first byte of the reason code:
Use the system dump to help you determine the cause of the problem.

Server initialization should have been completed before LOGON is issued, so CICS SVC errors associated with the loading of the data tables SVC module DFHDTSVC should not be encountered. Therefore this error probably indicates a logic problem or corruption of your system.

The function code (service type) and qualifier (options) reported in the reason code can be used to determine which ALESERV request was being attempted. Refer to the MVS ALESERV documentation and macro to interpret the function code, qualifier, and register 15 return code reported in the reason code.

When the reason code indicates that an ABEND has been detected, use the additional information provided in the reason code to find out what the ABEND was, and refer to information on that abend code to determine the cause.

The values of X'tt' are:

- **X'14'**
  - private storage from MVS subpool 230 (key 0) for a new ALET list section

**System action**

CICS continues normally. The table is treated as having been closed.

**User response**

You should probably reconsider the various region size parameters which have been specified on the CICS job, or have been set as defaults for the system by IEALIMIT or the IEFUSI installation exit. It may be necessary to take a SDUMP of the CICS job and process it using the VERBEXIT VSMDATA in order to investigate the way in which MVS storage has been allocated to the various subpools.

Console

**DFHFC0502** applid RLS OPEN of file filename failed. Access type switch to RLS attempted while other files open for the same data set have non-RLS access type.
While CICS was opening file *filename*, the CICS file control RLS open/close routine detected that the access type for the file has been changed to RLS but there are still other files open for the data set with non-RLS access type. The file cannot be opened until all the other files have closed.

**System action**

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

**User response**

Close all the other files or change access of this file back to non-RLS. Files for the same data set should have the same access type.

**Module:**

DFHFCRO

**XMEOUT parameters/Message inserts**

1. applid
2. filename

**Destination**

Console

**DFHFC0503** applid Non-RLS OPEN of file *filename* failed. Access type switch to non-RLS attempted while other files open for the same data set have RLS access type.

While CICS was opening file *filename*, the CICS file control open/close routine received a return code of X'1A' in register 15. This means that the RLS VSAM server is not available so file control has disabled RLS access. The return code was returned by the SHOWCB macro when CICS was attempting to find the reason for the open failure that had just been detected.

**System action**

CICS continues processing with file *filename* closed and its state UNENABLELED. Any transaction attempting to use RLS files is sent a NOTOPEN condition. CICS reenables RLS access when the RLS VSAM server restarts.

**User response**

None.

**Module:**

DFHFCRO

**XMEOUT parameters/Message inserts**

1. applid
2. filename

**Destination**

Console

**DFHFC0505** applid RLS CLOSE OF file *filename* failed. The VSAM SHOWCB macro has detected a RLS VSAM server failure. RLS access has been disabled.
Explanation

While CICS was closing file filename, the CICS file control RLS open/close routine received a return code which indicates that the RLS VSAM server is unavailable. Consequently file control has disabled and closed down RLS access. This does not affect the rest of the close processing. The return code is returned by the SHOWCB macro which is invoked during CICS close.

System action

CICS continues processing with file filename closed and its state UNENABLED. Any subsequent close requests for other files which are issued while the server is unavailable also receive the error return code but do not issue this message. CICS reenables RLS access when the RLS VSAM server restarts.

User response

None.

Module:
DFHFCRO

XMEOUT parameters/Message inserts

1. applid
2. filename

Destination

Console

DFHFC0507 applid RLS OPEN of file filename failed. Callable service IGWARLS is not present.

Explanation

Callable service IGWARLS is required by file control for processing files which have update SERVREQs and are using the VSAM catalog as a repository for data set recovery attributes. CICS expects to find IGWARLS in the LPA. IGWARLS resides in library SYS1.CSSLIB. If SYS1.CSSLIB is not in the LPA concatenation, RLS files with update SERVREQs cannot be opened.

System action

CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use RLS files is sent a NOTOPEN condition.

User response

None.

Module:
DFHFCRO

XMEOUT parameters/Message inserts

1. applid
2. filename

Destination

Console

DFHFC0510 applid (RLS | Non-RLS) OPEN of file filename failed because the data set is unavailable. Module module.
Explanation
An attempt to open file *filename* failed because CICS has internally marked the data set as unavailable. This is the result of an earlier EXEC CICS SET DSNAME UNAVAILABLE command, or CEMT equivalent. This prevents the opening of new RLS and non-RLS files against the data set.

System action
CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

User response
Close all the other files or change access of this file to non-RLS mode. Files accessing the same base data set from within a given CICS region must all have the same access mode. This includes access via a path data set.

Module:
DFHFCRO

XMEOUT parameters/Message inserts
1. *applid*
2. Value chosen from the following options:
   1.=RLS,
   2.=Non-RLS
3. *filename*
4. *module*

Destination
Console

DFHFC0512 *applid* Non-RLS OPEN of file *filename* failed. This CICS has other files open for the data set (or its associated base) with RLS access mode. The data set name is *dsname*.

Explanation
While CICS was opening file *filename*, the CICS file control non-RLS open/close routine detected that this region has other files open for the data set *dsname*, or its associated base data set, in RLS access mode. This file cannot be opened in non-RLS access mode until all the other RLS mode files have closed, even if this file is opening the data set in read-only mode. This constraint is to ensure a consistent view of this data set from within each CICS region.

System action
CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

User response
Close all the other files or change access of this file to RLS mode. Files accessing the same base data set from within a given CICS region must all have the same access mode. This includes access via a path data set.

Module:
DFHFCFS

XMEOUT parameters/Message inserts

1. applid
2. filename
3. dsname

Destination

Console

DFHFC0513

applid Non-RLS OPEN of file filename has failed. CICS has unresolved RLS recovery work for the data set (or its associated base). The data set name is dsname.

Explanation

While CICS was opening file filename, the CICS file control non-RLS open/close routine detected that this region has unresolved recovery work for the data set dsname, or its associated base data set, which requires the base data set and any associated path data sets to be accessed in RLS mode. This file cannot be opened until all the RLS recovery work has been resolved. This constraint ensures that any automatic resolution of the recovery work is not impeded by non-RLS accesses to the data set.

System action

CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use the file is sent a NOTOPEN condition.

User response

Use the INQUIRE UOWDSNFAIL command to investigate the RLS recovery work, and take action to resolve it. This may involve retrying backout-failed units of work and resynchronising indoubt-failed units of work. See the Administering recovery and restart for more information on unit of work failures and their resolution.

DFHFC0527 applid Recovery attributes for file filename have been overridden by new settings found on the catalog.

Explanation

While CICS was opening file filename, the CICS file control open/close routine detected that the recovery settings for the sphere have changed.

System action

Processing continues. The new recovery settings are assumed for the sphere.

User response

Ensure that the change is as required.

Module:
DFHFCRO

XMEOUT parameters/Message inserts

1. applid
2. filename

Destination
Console

DFHFC0528 applid RLS OPEN of file filename failed. Recovery attributes on the catalog have changed while there are other files still open for the sphere.

Explanation

While CICS was opening file filename and retrieving information from the VSAM catalog using callable service IGWARLS, the CICS file control open/close routine detected that the recovery attributes on the catalog have changed. There are currently other files open for the sphere which have assumed the previous recovery attributes. Further opens will fail until all files have closed or the recovery attributes are returned to their previous settings. Recovery attributes on the catalog should not be changed without first quiescing the associated sphere in all CICS systems that use it.

System action

CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response

Quiesce the sphere and start again with the new settings.

Module:
DFHFCRO

XMEOUT parameters/Message inserts

1. applid
2. filename

Destination
Console

DFHFC0529 applid Recovery attributes for file filename have been reset as there has been a switch of access type. Module module.

Explanation

While CICS was opening file filename, the CICS file control open/close routine in module module detected that the access type had been changed from RLS to non-RLS VSAM or vice versa. This has the effect of clearing out existing recovery attributes and starting again.

System action

Processing continues. The new recovery settings are assumed for the sphere.

User response

None.
Module:

**DFHFC0536**
`applid` Recovery attributes for file `filename` previously taken from the FCTE have been overridden by new settings from the VSAM catalog. Module `module`.

**Explanation**
While CICS was opening file `filename`, the CICS file control open/close routine in module `module` detected that the recovery settings for the sphere on the VSAM catalog are no longer undefined. The new recovery attributes now take effect because there are no other files open for the data set.

**System action**
Processing continues. The new recovery settings are assumed for the file.

**User response**
Ensure that this change to the recovery attributes is correct.

**Module:**
DFHFCFS

**XMEOUT parameters/Message inserts**
1. applid

**Destination**
Console

**DFHFC0537**
`applid` OPEN of file `filename` failed. The request to write a tie up record for the OPEN failed.

**Explanation**
While CICS was opening file `filename`, a request to write a tie up record for the OPEN failed. CICS has closed the file again and failed the OPEN request.

**System action**
CICS continues processing with file `filename` closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response**
This is likely to be an internal CICS error. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHFCFS

**XMEOUT parameters/Message inserts**
1. applid
2. filename

**Destination**
Console

**DFHFC0539**
`applid` (RLS | Non-RLS) OPEN of file `filename` failed. IGWARLS call has returned that the LOG parameter is not set to ALL but the BWO setting has been defined as TYPECICS. Module `module`.

**Explanation**
While CICS was opening file `filename` and retrieving information from the VSAM catalog using callable service IGWARLS, the CICS file control open/close routine in module `module` detected that BWO has been set to TYPECICS but LOG(ALL) has not been specified.
**System action**
CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response**
If BWO(TYPECICS) is required, specify LOG(ALL). Alternatively, the setting BWO(NO) is recommended.

**Module:**
DFHFCFS

**XMEOUT parameters/Message inserts**
1. applid
2. Value chosen from the following options:
   1. RLS,
   2. Non-RLS
3. filename
4. module

**Destination**
Console

**DFHFC0540** applid The BWO setting for file *filename* has not been explicitly set to NO or TYPECICS and is assumed to be BWO(NO). Module *module*.

**Explanation**
While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the BWO setting for the sphere on the VSAM catalog had not been explicitly specified as either BWO(TYPECICS) or BWO(NO). The setting is assumed to be BWO(NO).

**System action**
Processing continues. The BWO(NO) setting is assumed for the file.

**User response**
If you require to use backup while open, use the ALTER function of access method services to set BWO(TYPECICS) for this data set. If you do not require to backup while open, you do not need to take any action, but you may wish to use the ALTER function of access method services to explicitly set BWO(NO).

**Module:**
DFHFCFS

**DFHFC0542** date time applid Forward recovery log ID *fwdrecovlog*, journalname *journalname* opened for file *filename* is not of type MVS. Module *module*.

**Explanation**
While CICS was opening file *filename*, the CICS file control open/close routine in module *module* detected that the forward recovery log, *journalname*, was not of type MVS. For example, it might be a dummy log, or you might be logging to an SMF data set. This message informs you of this in case the log type is not what you intended.
**fwdrecovlog** is the forward recovery log ID specified in the file definition. If the forward recovery log stream is specified in the VSAM catalog rather than in the file definition, it must be of type MVS, so this message can be issued only when the forward recovery log is specified in the file definition.

**System action**
CICS continues processing.

**User response**
Correct the definition of the forward recovery log if it was not what you had intended.

**Module:**
DFHFCFS

**XMEOUT parameters/Message inserts**
1. applid
2. filename
3. dsname

**Destination**
Console

**DFHFC0555** applid One or more data sets are in lost locks status. CICS will perform lost locks recovery.

**Explanation**
CICS had one or more data sets open in RLS access mode at the time of a failure of the coupling facility lock structure from which SMSVSAM was not able to recover transparently. As a result, the RLS locks held by CICS for those data sets have been lost.

SMSVSAM has informed CICS that one or more data sets are in a lost locks state with respect to this CICS. CICS must therefore perform lost locks recovery for those data sets.

This can occur on a CICS warm or emergency restart, and on a dynamic RLS restart. On a CICS cold or initial start, if there are any data sets with lost locks status, that status is cleared with respect to this CICS.

**System action**
The data sets with lost locks status are marked as being unavailable for general use. Units of work that attempt to access such data sets abend with an AFCU abend code.

CICS performs lost locks recovery for the data sets. For each data set, lost locks recovery involves waiting until all units of work that had made uncommitted updates to the data set have completed. These units of work are allowed to access the data set, in order to perform their recovery. When CICS has completed lost locks recovery for a data set, it reports this fact to SMSVSAM. When all CICS regions that had been accessing the data set have completed their lost locks recovery, then the data set is made available for general use again. Note that a data set becomes
available for general use as soon as its lost locks recovery has been completed; it does not have to wait for all data sets to be recovered.

CICS takes the following actions to expedite lost locks recovery:

- Backout-failed and commit-failed units of work are driven for retry
- On a dynamic RLS restart, inflight transactions that had updated the data set are purged (on a warm or emergency restart, inflight units of work are automatically backed out).

User response
Lost locks recovery normally completes automatically without requiring any action from the user. However, if there are shunted units of work which had updated a data set with lost locks status, these prevent lost locks recovery from completing until they are resolved. Use the INQUIRE UOWDSNFAIL command to investigate these shunted units of work.

If lost locks recovery appears to be taking a long time, you can compare the output obtained by issuing the IDCAMS SHCDS LISTSUBSYS(ALL) command at different intervals, to determine what progress has been made.

See the Administering recovery and restart for guidance on resolving shunted units of work which hold RLS retained locks.

Module: DFHFCRR

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHFC0556 applid Unexpected notification of completion of lost locks recovery for data set dsname.

Explanation
CICS has received a notification from SMSVSAM that lost locks recovery has completed for data set dsname, but CICS still has outstanding lost locks recovery work for that data set. This notification has therefore been issued out of sequence.

System action
CICS continues processing. The data set remains in a lost locks state, and CICS continues with its lost locks recovery. New file control requests against the data set will continue to be rejected with AFCU abends. When all CICS regions have completed their lost locks recovery for the data set, then a valid notification will be received and CICS will remove the data set from the lost locks state.

There will be an instance of this message on each CICS system for each data set when an unexpected notification is received.

User response
Lost locks recovery processing should complete normally without any user intervention.

However, this message is an indication of a probable logic error in SMSVSAM, so you should take dumps of all the SMSVSAM servers and their associated data spaces in the sysplex. See Working with IBM to solve your problem for guidance on how to proceed.

Chapter 2. CICS messages
829
User response
None.

Module:
DFHFCRR.

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHFC0571 applid RLS access cannot be restarted.

Explanation
An error has occurred while attempting to restart CICS access to VSAM RLS, either at startup, or during a dynamic RLS restart which took place when the VSAM RLS server became available while CICS was running. Because of this error, it may not be possible to access VSAM RLS again during this CICS run.

Access is made available again only if the VSAM RLS server in this MVS system fails causing CICS to perform dynamic RLS restart processing when it restarts, or if you choose to deliberately recycle the RLS server to trigger a dynamic restart.

System action
CICS continues, but with access to VSAM RLS disabled (unless an offsite restart is being performed). Other CICS functions, including access to non-RLS VSAM files, should continue.

At the time the error affecting RLS restart is detected, CICS issues one or more messages and takes a system dump.

This error might also affect other aspects of this CICS system, for example if it is due to the corruption of internal CICS control structures.

If an offsite restart is being performed; that is, if OFFSITE=YES was specified as a system initialization override, then CICS does not continue, but is terminated with a system dump. When RLS offsite recovery is required, then there is no value in continuing without RLS, because it will be needed in order for the offsite restart to be able to complete. Until all CICS systems complete their offsite recovery work, including this one, no other CICS system in the CICSpixel will be allowed to perform new RLS work either.

User response
If you do not need access to any VSAM RLS files from this CICS system, you can allow CICS to continue. For example, this CICS system might never open files in RLS access mode, or you might prefer to continue without RLS access in order to continue this CICS run.

If you do need to access VSAM RLS files from this CICS, consider shutting CICS down and restarting it, or recycling the VSAM RLS server. However, be aware that recycling the server causes all CICS systems in this MVS to go through dynamic RLS restart processing, which implicitly closes all files that were open in RLS access mode.

To determine the cause of the original error, examine the messages and the system dump that were issued when the error was detected.

If you are performing an offsite restart, then restart CICS with OFFSITE=YES still specified as a system initialization override.

Module:
DFHFCRR.

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHFC0574 applid RLS offsite recovery will be performed. Normal RLS access is not allowed.

Explanation
OFFSITE=YES has been specified as a SIT override, and RLS is supported by this CICS (RLS=YES has been specified and the level of DFSMS/MVS supports RLS). This message is issued during file control initialization to indicate that RLS offsite recovery processing is to be carried out during this CICS run.

System action
RLS access is not allowed until after this CICS has performed its RLS recovery work. Only tasks performing the recovery work are allowed RLS access. Message DFHFC0575 is issued when RLS recovery has been completed by this CICS. RLS access for normal work is not allowed until this CICS has issued message DFHFC0575 and received the reply GO. The description of message DFHFC0575 explains when it is safe to reply to the message.
User response

Wait for message DFHFC0575 to be issued. If this does not happen shortly after CICS restart has completed, there are probably some backout failed or indoubt failed units of work which had updated RLS data sets, and which are now delaying the completion of RLS recovery. In this case you should use the INQUIRE UOWDSNFFAIL command to determine the causes of such failures, and to resolve them.

If some of the failures cannot be resolved cleanly, you may decide to force indoubt units of work and to reset locks for backout failed units of work. See the Administering recovery and restart for guidance on resolving RLS retained locks.

If CICS terminates for any reason before message DFHFC0575 is issued, specify OFFSITE=YES on the restart.

OFFSITE=YES must be specified on all restarts until the offsite recovery has completed and you have responded to message DFHFC0575.

Module:
DFHFCRP

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHFC0575D applid Reply GO only after all CICS regions have completed offsite recovery and issued this message.

Explanation
This message is issued when a CICS system is participating in an offsite recovery of a CICSpix.

The message is issued when this CICS system has completed all of its RLS recovery work. CICS has backed out or committed all units of work which had made updates to data sets open in RLS mode, and which were either inflight or shunted at the time of the disaster at the primary site (or, more exactly, which were in that state at the common point in time to which the CICS system logs have been pruned).

System action
CICS processing continues, but the system task which issued this message waits for your reply. RLS access is not allowed for user applications until the reply is received, after which CICS allows new RLS work to run.

The User Response explains when it is safe for you to reply.

User response

The message indicates that RLS recovery work has been completed by a particular CICS region. Replying to it indicates that all RLS recovery for the offsite CICSpix has been completed. Do not reply until all CICS regions in the CICSpix have issued this message. When this has happened, you should reply GO. When you next restart this CICS region after having replied GO, you should revert to the default value of NO for the system initialization parameter OFFSITE.

GO is the only reply allowed. If you supply any other response, the message is reissued with a new reply number.

If you suspect that there will be a problem getting some of the CICS regions in the CICSpix to complete their RLS recovery work, and would therefore prefer to shut this CICS down in the meantime, you can use the main terminal to do so. You must specify OFFSITE=YES when you restart the CICS region because offsite recovery for the CICSpix has not been completed. Remember that OFFSITE=YES must be specified on all restarts until the offsite recovery has completed and you have responded to message DFHFC0575.

Module:
DFHFCOR

XMEOUT parameters/Message inserts
1. applid
2. GO

Destination
Console

DFHFC0577 applid RLS offsite recovery is now complete. RLS access is allowed.

Explanation
This message is issued when a CICS system is participating in an offsite recovery of a CICSpix.

The message is issued when the reply GO has been supplied to message DFHFC0575.

System action
CICS allows user applications to access RLS because it is assumed that a reply of GO means that all CICS systems in the CICSpix have completed their RLS
recovery work, and it is therefore safe to allow sharing of RLS data sets.

User response
Once you have received this message, you can recode your SIT overrides so that OFFSITE=NO is specified when this CICS is next restarted.

Module:
DFHFCOR

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHFC0578 applid File Control has opened file filename which is a recoverable filetype, however no XFCLDEL global user exit program is enabled.

Explanation
If CICS is required to back out a unit of work that performed a write operation to a VSAM ESDS, or a BDAM data set, a backout failure will occur.

System action
None. The message is informational.

User response
To prevent a backout failure in the case described above, enable and start a suitable XFCLDEL exit program. For further information, refer to Exit XFCLDEL, file control logical delete exit.

Module:

DFHFC0931 applid OPEN of data table name failed for reason n.

Explanation
CICS was unable to OPEN the user-maintained data table name for reason n, where n may have one of the following values:

1
The data table support initialization module DFHDTINS could not be loaded.

2
Initialization of data table support has failed. This message is preceded by one of messages DFHFC0410, DFHFC0411 or DFHFC0412 which identifies the reason for the failure.

3
The source data set for the data table is not a KSDS base data set.

4
The data table OPEN module DFHDTST has reported an error. This message is preceded by one of messages DFHFC0430 or DFHFC0431 which identifies the error.

6
The file definition for the data table allows neither read nor browse access.

System action
The data table remains closed and is DISABLED. CICS processing continues.

User response
The appropriate user response depends on the reason code n as follows:

1
Check that module DFHDTINS is present in the library.

2
See the user action for the preceding message (which will be one of DFHFC0410, DFHFC0411 or DFHFC0412).

3
Check whether the data table has been associated with the intended source data set.

4
See the user action for the preceding message (which will be one of DFHFC0430 or DFHFC0431).

6
Change the SERVREQs in the file definition. There is no benefit in using data tables support for a file which cannot be read or browsed.

Module:
DFHFCFS

XMEOUT parameters/Message inserts
1. applid
2. name
3. n

Destination
Console

DFHFC0932 applid OPEN of data table name was incomplete for reason n.
Explanation
CICS was unable to treat name as a CICS-maintained data table for reason n.

System action
The data table’s source data set is opened for access as a normal VSAM data set, and no main storage table is built. CICS processing continues.

User response
The appropriate user response depends on the reason code n. Refer to message DFHFC0931 for a list of reason codes and their appropriate user responses. Urgent action is probably not necessary when this message occurs, as no function has been lost. However, READ performance may be adversely affected.

Module:
DFHFCFS

XMEOUT parameters/Message inserts
1. applid
2. name

Destination
Console

DFHFC0933 applid MVS FREEMAIN failure detected during CLOSE of data table name.

Explanation
An MVS FREEMAIN, issued while CICS was attempting to release the storage associated with data table name, returned the error response R15=4. Some storage in the CICS address space has not been freed. The error is probably the result of some earlier overwriting of data table control areas.

System action
CICS closes data table name. CICS processing continues.

User response
This condition does not adversely affect the data tables function. However, if the problem recurs take a system dump (SDUMP) as soon as possible after the appearance of this message. For example, by means of a CEMT PERFORM SNAP command.

Module:
DFHFCFS

XMEOUT parameters/Message inserts
1. applid
2. name

Destination
Console

DFHFC0935 applid SHAREOPTIONS of the source for data table name allow inconsistencies between table and source.

Explanation
The cross region SHAREOPTION for the source data set associated with the data table name is 3 or 4, or the SHAREOPTION is 2 and the table is being opened only for read access. It is possible for another job in this MVS system to update the source without notifying CICS. The result of this is that the data table may no longer match the source data set.

System action
Opening and loading of the data table continues normally. CICS processing continues.

User response
Check that the SHAREOPTION is specified correctly and that the DISP parameter is correct. Note that source data set changes are reflected in the data table only when the changes are made by the CICS system which owns the table.

Module:
DFHFCFS

XMEOUT parameters/Message inserts
1. applid
2. name

Destination
Console

DFHFC0936 applid Initiation of loading of data table name has failed.
Explanation
An attempt to initiate the table loading transaction for the data table name has failed.

System action
CICS processing continues. The effect this has is that the table always appears to be in the process of being loaded and the load completion exit, XDTLC, is not invoked.

One consequence of this is that the table is effectively demand loaded. This means that an entry is only made in the table when a transaction refers to it explicitly. A further consequence is that, for user maintained tables, API requests (other than READ) always result in a LOADING condition.

User response
Take remedial action after determining the cause of the failure from the trace of the OPEN request and from any related messages and dumps. It may be that the system action of leaving the table open, but not loaded, adversely affects your application. For example, if the application depends on being able to update a user maintained table as soon as loading is complete. If so, closing and reopening the data table may be successful as an immediate response, if the problem was simply a temporary lack of resources.

Module:
DFHFCFS

XMEOUT parameters/Message inserts
1. applid
2. name
3. name2

Destination
Console

DFHFC0937 applid OPEN of name1 as a data table was not possible. The file has been opened and will use data table name2 which has the same source.

Explanation
File name1 could not be opened as a CICS-maintained data table (CMT) because another CMT name2 is already open for the source data set specified in the file definition of name1. However, name1 is still able to benefit from shared data tables support by accessing the already open CMT.

System action
name1 is opened as a normal CICS file, and therefore automatically uses the existing data table name2 whenever possible.

User response
This is not normally a problem, but you should ensure that the data table name2 has the required characteristics in terms of its maximum number of records and in the behavior of any data table user exits that refer to it.

Module:
DFHFCFS

XMEOUT parameters/Message inserts
1. date
2. time

4. name

Destination
CSFL
**DFHFC0941 I**  
*date time applid* CICS data table load has completed successfully for data table *name*.

**Explanation**

The task that was attached to load the data table *name* has successfully completed loading.

**System action**

The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate a successful load. CICS processing continues.

**User response**

None.

**Module:** DFHDTLX

**XMEOUT parameters/Message inserts**

1. *date*  
2. *time*  
3. *applid*  
4. *name*

**Destination**

CSFL

**DFHFC0942 E**  
*date time applid* CICS data table load has terminated abnormally for data table *name*, reason code = *X'xx'*.  

**Explanation**

The CICS task that is loading data table *name* has received a reason code *X'xx'* where *X'xx'* has one of the following values:

**X'FB'**

CICS file control has requested that the data table load be abandoned. This may occur, for example, if a close request has been made against the data table.

**X'FD'**

An attempt has been made to add more entries to the data table than the maximum specified in the table definition.

**X'FE'**

A shortage of virtual storage has been reported by the add entry (from DASD) service, due to a failure to get storage for the record. DFHDTUP trace entry AB 0B26 gives further information on the function, response and reason code, error code, and qualifier flags, associated with the failing request.

**System action**

The user exit XDTLC is invoked, if enabled, unless file control has requested that the load be abandoned (reason code X'FB'). The value of the UEPDTORC parameter passed to the exit indicates that loading completed abnormally. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added are retrieved from the source data set to satisfy API requests.

If the table is user-maintained, requests to access any record which was not added results in a "not found" response code. If the table has been closed, then API requests result in an "unenabled" response code.

CICS processing continues.

**User response**

The appropriate user response depends on the reason code. User responses are as follows:

**X'FB'**  
no action necessary

**X'FD'**  
increase the size specified for the data table using the MAXNUMRECS field in its resource definition

**X'FE'**  
review the dataspace storage use. For lack of storage problems, the most common error codes will be 06 (table entry descriptor storage), 07 (index node storage), or 08 (data storage). CICS uses dataspace DFHDT001 for descriptor entries, DFHDT002 for index nodes, and DFHDT003 through to DFHDT100 for data records. If there is insufficient space for entry descriptors or index nodes, consider splitting the data tables into different CICS regions; for example, different FORs. If a single data table has run out of space on its own, the limit of space for it has been reached, in which case consider whether it should be split into two or more separate tables. See the section "Storage use for shared data tables" in the CICS TS for z/OS 5.1: Shared Data Tables Guide for more information on storage usage.

Chapter 2. CICS messages 837
DFHDTLX

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. name
5. X’xx’

Destination
CSFL and Console

DFHFC0943 E  date time applid CICS data table load has terminated abnormally for data table name, reason code = X’xx’.

Explanation
The CICS task that is loading data table name has received an unexpected return code from CICS file control while browsing the source data set. The reason code X’xx’ should be one of the following.

X’02’
   ILLOGIC?A VSAM error which does not fall into one of the other categories.

X’0C’
   NOTOPEN?The file is CLOSED and UNENABLED, or still open and in use, but a CLOSE request has been received.

X’0D’
   DISABLED?The file is disabled.

X’80’
   IOERR?I/O error.

System action
The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added are retrieved from the source data set to satisfy API requests.

If the table is user-maintained, requests to access any record which was not added result in a “not found” response code. If the table has been closed, API requests result in an “unenabled” response code.

CICS processing continues.

User response
Investigate the reason for the return code from CICS file control. For further information about the reason code, see the description of exception conditions for the STARTBR and READNEXT commands, in the CICS Application development reference.

Module:
DFHDTLX

XMEOUT parameters/Message inserts

2. time
3. applid
4. name
5. X’xx’

Destination
CSFL and Console

DFHFC0945 E  date time applid CICS data table load has terminated abnormally for data table name.

Explanation
The special CICS transaction that was loading data table name has detected an abnormal termination.

System action
Depending on the cause of this abnormal termination, CICS may produce either a system dump or a transaction dump.

The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. CICS then terminates the loading transaction with abend code AFCM. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, those records which were not added are retrieved from the source data set to satisfy API requests.

If the table is user-maintained, requests to access any record which was not added result in a “not found” response code. If the table has been closed, then API requests result in an “unenabled” response code.

CICS processing continues.
User response

Look at the system log for related CICS messages to determine the original abend detected by the loading transaction. Refer to the description of abend code AFCM for further information about the cause of the original termination.

For more information on how to determine system problems, refer to the Troubleshooting and support.

Module:

CSFL and Console

DFHFC0946 E date time applid CICS data table load has terminated abnormally for data table name, a call to FCFR has failed for reason code = n.

Explanation

The CICS task that is loading data table name has failed while calling file control to browse the source data set. The value of the reason code n indicates the type of failure as follows:

1. Response from FCFR was INVALID.
2. Response from FCFR was DISASTER.
3. Response from FCFR was PURGED.
4. FCFR failed for some unexpected reason.

System action

The user exit XDTLC is invoked, if enabled, with parameter UEPDTORC set to indicate that loading has completed abnormally. CICS then terminates the loading transaction with abend code AFCM. No more records are loaded into the data table. The user exit may ask for the file to be closed.

If the table is CICS-maintained, provided that the user exit has NOT requested that the file be closed, records which were not added are retrieved from the source data set to satisfy API requests. If the table is user-maintained, requests to access any record which was not added result in a "not found" response code. If the table has been closed, API requests result in an "unenabled" response code.

CICS processing continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Determine the cause of the failure of the domain call using the diagnostic information provided by file control.

Module:
DFHDTLX

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. name

Destination

CSFL and Console

DFHFC0947 E date time applid CICS data table load has failed to close data table name, a call to FCFS has failed for reason code = n.

Explanation

The CICS task that is loading data table name has failed while trying to close the file at the request of an exit program invoked at exit point XDTLC. The value of reason code n indicates the type of failure as follows:

1. Response from FCFS was INVALID.
2. Response from FCFS was DISASTER.
3. Response from FCFS was PURGED.
4. FCFS failed for some unexpected reason.

System action

CICS terminates the loading transaction with abend code AFCM.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

It is unlikely that the user exit invoked at the XDTLC exit point would request that the file should be closed...
unless a previous problem had occurred with the load. Determine the cause of any such previous problem by checking for earlier messages which may have been issued referring to data table name. Diagnostic information provided by file control may be used to investigate the failure of the close file call.

CICS processing continues.

Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

**Module:** DFHDTLX

**XMEOUT parameters/Message inserts**

1. `date`
2. `time`
3. `applid`
4. `name`
5. `n`

**Destination**

CSFL and Console

**DFHFC0949**

`date` `time` `applid` CICS shared data table load has terminated abnormally. A call to DFHXMIQ to retrieve the parameters for the load transaction has failed with response code = `n`.

**Explanation**

The CICS task to load a shared data table has failed while trying to inquire on the parameters passed to it during attach. The value of the reason code `n` indicates the type of failure as follows:

1. Response from XMIQ was INVALID.
2. Response from XMIQ was DISASTER.
3. Response from XMIQ was PURGED.
4. XMIQ failed for some unexpected reason.

**System action**

The user exit XDTLC is not invoked as failure to retrieve the attach parameters means the filename is not known. CICS terminates the loading transaction with abend code AFCL. No records are loaded into the data table.

Requests to access any record which was not added result in a "not found" response code.

CICS processing continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Determine the cause of the failure of the domain call using the diagnostic information provided by the CIS Transaction Manager.

The file should be closed so that a load may be attempted again when it is next opened.

**DFHFC0950**

`applid` Warning. File `filename` Opened with VSAM SHROPT 3 or 4. CICS cannot prevent concurrent updates

**Explanation**

VSAM share options 3 and 4 permit updating of a data set from multiple regions. Under these circumstances, CICS cannot prevent concurrent updates.

The file is being opened for update against a data set defined with share options 3 or 4, and the file has been defined with the following auto-journaling options:

JNLADD = BEFORE, AFTER, or ALL

**System action**

The file is opened and a warning message is issued.

**User response**

None.

**Module:** DFHFCN

**XMEOUT parameters/Message inserts**

1. `applid`
2. `filename`
Explanation

A CICS attempt to open file *filename* failed because neither the JCL nor the resource definition specified the data set name.

CICS file control did not open file *filename*, because:

1. At initialization time, the startup JCL did not include a DD statement, and
2. No user-submitted routine allocated the file dynamically, and
3. The resource definition does not contain a DSNAME parameter to enable CICS to allocate the file dynamically.

System action

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response

Before resubmitting the transaction, you must supply the data set name in the JCL or the resource definition. You can set the name in the resource definition while CICS is running by using the CEMT transaction or by using CEDA to correct and reinstall the FCT entry.

Module:
DFHFCFS, DFHFCRO

XMEOUT parameters/Message inserts

2. Value chosen from the following options:
   1. RLS,
   2. Non-RLS
3. filename
4. X’rrrr’
5. X’cccc’
6. module

Destination

Console

DFHFC0953   applid Non-RLS OPEN or CLOSE of file *filename* failed. CICS logic error *eeee*,*cccc*

Explanation

While processing a request to open or close file *filename*, CICS detected an internal logic error in the file control services program. The value of *eeee* identifies the error as follows:
The DFHFCFS setbase dsname block failed. cccc is the return code from DFHFCFS.

Request to DFHFCN for a pool that is not defined to CICS.

Request to DFHFCN is not OPEN or CLOSE.

Request to DFHFCL is not BUILD or DELETE.

Request to DFHFCL is for invalid pool number cccc.

Request to DFHFCL is for pool number cccc that is not defined to CICS.

DFHFCL failed to build BLDVRP parameters. cccc is the pool number.

Logic error at OPEN detected in DFHFCN at offset cccc.

CICS file control cannot open file filename, because it is not allocated. It is not allocated because:

1. At initialization time, the startup JCL did not include a DD statement, and
2. The resource definition does not contain a DISPOSITION attribute to enable CICS to allocate the file dynamically.

CICS terminates the task abnormally, produces a dump and continues processing with the status of file filename unchanged.

Message DFHME0116, which contains the symptom string for this problem, is produced.

If you want to use file filename in this run, supply the DISPOSITION attribute with the CEMT transaction or with a user transaction using the EXEC CICS SET command. When you have done this, transactions are able to access the file successfully.

The change described above is only effective for the lifetime of the CICS system. You can change the disposition of a file permanently using a JCL DD statement or the CEDA DEFINE FILE command.

Module: DFHFCFS DFHFCRO

3. module

Destination

Console

DFHFC0956 applid {RLS | Non-RLS} OPEN of file filename failed. VSAM catalog error. Return code - X'eeee',X'cccc' in module module.

Explanation

While reading the VSAM catalog to open the VSAM data set filename, CICS file control received the return code cccc from a SHOWCAT macro. The value of eeee is an error code from DFHFCN as follows:

8112

SHOWCAT for the AIX of a path failed.

8113

SHOWCAT for the data component of a base failed.

8116

SHOWCAT for the base of a path failed.

8117

SHOWCAT for an upgrade member failed.

System action

CICS writes a system dump, and continues processing, with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

For the meaning of the SHOWCAT return code, see z/OS DFSMS Macro Instructions for Data Sets.

Module:

DFHFCFS, DFHFCRO

XMEOUT parameters/Message inserts

1. applid
2. Value chosen from the following options:
   1=RLS,
   2=Non-RLS
3. filename
4. X'eeee'
5. X'cccc'
6. module

Destination

Console

DFHFC0958 applid Non-RLS OPEN of file filename failed. VSAM resource usage conflict with open file.

Explanation

CICS did not open file filename because it found that its access method control block (ACB) specified a different buffer/string resource (NSR or LSR pool) from that specified by another ACB that is already open for the same base cluster.

VSAM provides integrity for different ACBs open for the same base cluster only if they use the same buffer/string resource.

System action

CICS writes a system dump and continues processing with file filename closed and its state UNENABLED.
Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response**
Determine the correct buffer/string resource and modify the resource definition.

Alternatively, if you specify DSNSHARING(MODIFYREQS) in the resource definition and open the file for read only, CICS permits the use of different buffer/string resources because no integrity exposure exists.

**Module:** DFHFCFS

**XMEOUT parameters/Message inserts**
1. applid
2. filename

**Destination**
Console

**DFHFC0960 applid Non-RLS OPEN of file filename failed. Unable to build its LSR pool n. Return code - cccc.**

**Explanation**
CICS has requested VSAM to build the local shared resource (LSR) pool specified in the resource definition for file filename. However, VSAM was unable to complete the request. n is the pool number, and cccc is the VSAM BLDVRP return code.

**System action**
CICS processing continues.

Without a DSNAME, CICS cannot use the VSAM catalog to determine the file attributes. Therefore, in the LSR calculation, CICS uses the number of strings specified in the STRINGS attribute of the FILE resource definition but does not use the BUFFERS or KEYLEN information.

**User response**
Ensure that each FILE resource definition has either a DSNAME, or a DD statement corresponding to its DATASET name.

Exceptionally, if you use CPSM, please note that this message is normal for file EYUDREPN in a CMAS. Do not attempt to allocate a DSNAME or a DD statement for EYUDREPN in the JCL for the CMAS.

**Module:** DFHFCFS

**XMEOUT parameters/Message inserts**
1. date
2. time
3. applid
4. n
5. filename
**Explanation**

While CICS was dynamically calculating the parameters for the local shared resource (LSR) pool $n$, a VSAM SHOWCAT or a VSAM LOCATE failed with return code $cccc$. Parameters for file $filename$ are incomplete.

**System action**

CICS retains the accumulated LSR parameters for file $filename$ and continues processing. No further attempts at calculating LSR parameters for file $filename$ are made.

An exception trace is taken which identifies the failing VSAM request and its return code.

**User response**

For the meaning of the SHOWCAT return code, see z/OS DFSMS Macro Instructions for Data Sets. For the meaning of the LOCATE return code, see z/OS DFSMSdfp Advanced Services. This error indicates a corrupted VSAM catalog. If you cannot restore the catalog, you will need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHFCFS

**XMEOUT parameters/Message inserts**

1. $applid$
2. $n$
3. $cccc$

---

**Explanation**

CICS requested VSAM to delete a local shared resource (LSR) pool $n$. During processing of the request, a VSAM DLVRP macro failed with return code $cccc$. ($cccc$ is the VSAM DLVRP return code.)

**System action**

CICS takes a system dump and continues processing with the pool still in existence.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

For the meaning of the DLVRP return code, see the z/OS DFSMS Macro Instructions for Data Sets.

**Module:** DFHFCFS

**XMEOUT parameters/Message inserts**

1. $applid$
2. $n$
3. $cccc$

---

**Explanation**

CICS file control issued an open for a VSAM file, $filename$. The open has failed with VSAM return code, $cccc$. $eeee$ has a value of 8502 and represents the CICS internal error code and $rrrr$ is the return code in register 15.

**System action**

CICS continues processing, with file $filename$ closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

VSAM will have issued a console error message. Use the VSAM message and the VSAM return code in the CICS message to solve the problem.
Note that if the eeee,rrrr,cccc values are 8502,0008,0088, then this is a storage issue and VSAM was unable to obtain sufficient storage for some area needed to open the dataset. In some instances, even if the file is defined to use an LSRPOOL, CICS will open it in NSR mode. This will happen if the file is empty. When the file is empty, CICS will open it in Load Mode until the first record is written. The file will then be closed and reopened to use LSRPOOLS as defined in the file definition. When opened in Load Mode, bit FCTDLFLG in byte FCTSVSR2 will indicate this, and VSAM will issue GETMAINs for NSR buffers. These buffers are not part of the CICS DSAs, and the size of the GETMAINs will depend on the BUFFERSPACE(size) used in the IDCAMS DEFINE command.

For the meaning of the VSAM return code, see z/OS DFSMS Macro Instructions for Data Sets.

DFHFC0965 applid Open of BDAM file filename failed.

Explanation

CICS file control issued an open for a BDAM file, filename. The open failed.

System action

CICS takes a system dump and continues processing, with file filename closed and with its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

BDAM will have issued a console error message. Refer to the BDAM message for further guidance to solve the problem.

Module: DFHFCFS

XMEOUT parameters/Message inserts

1. applid
2. filename

Destination

Console

DFHFC0966 applid Non-RLS OPEN of file filename failed. Unable to position ESDS. Error codes: eeee,rrrr,cccc.

Explanation

Before opening the VSAM ESDS file filename for output, CICS file control could not determine the end-of-data relative byte address (RBA) correctly. During the positioning process, CICS may perform any of the following steps, each of which can fail:

- Dynamically allocate the base cluster to DDname DFHESDS (if it is a path that is being opened)
- Open the base cluster for control interval (CI) processing
- Read the last CI in the file
- Determine the end-of-data in the file
- Close the base cluster
- Dynamically deallocate the base cluster.

The value of eeee in the message indicates the error or the failing function as follows:

8503
Open base cluster. rrrr is the VSAM return code in register 15. cccc is the error field in the VSAM ACB.

8504
Read last control interval (CI). rrrr is the VSAM return code in register 15. cccc is the FDBK field in the VSAM RPL.

8505
Last CI middle of spanned record.

8506
Close base cluster. rrrr is the VSAM return code in register 15. cccc is the error field in the VSAM ACB.

8507
Insufficient storage to get CI
Dynamic allocation of base. rrrr is the MVS return code in register 15. cccc is the MVS DYNALLOC return code.

**System action**
CICS continues processing with file filename closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
For the meaning of the VSAM return codes, see z/OS DFSMS Macro Instructions for Data Sets. For the meaning of the DYNALLOC return codes, refer to the z/OS MVS Programming: Authorized Assembler Services Guide.

**Module:** DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid
2. filename
3. eee
4. rrrr
5. cccc

**Destination**
Console

**DFHFC0967** applid Error detected while closing {RLS / Non-RLS} file filename - VSAM codes X'rrrr',X'cccc' in module module.

**Explanation**
CICS file control issued a close for VSAM file filename. The close failed with VSAM return code cccc. rrrr is the return code in register 15.

**System action**
CICS processing continues. CICS marks file filename as closed because VSAM will have closed the access method control block (ACB).

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
Use the VSAM return code, cccc and the preceding VSAM console message to determine the cause of the problem.

For the meaning of the VSAM return code, see z/OS DFSMS Macro Instructions for Data Sets.

**Module:** DFHFCFS, DFHFCRO

**Destination**
Console

**DFHFC0968** applid Close of BDAM file filename failed

**Explanation**
CICS file control issued a close for a BDAM file, filename. The close failed.

**System action**
CICS takes a system dump and continues, with file filename still open.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
BDAM will have issued a console error message. Use the BDAM message to solve the problem.

**Module:** DFHFCFS

---

**XMEOUT parameters/Message inserts**

1. applid

2. filename

**Destination**

Console

DFHFC0969  applid Non-RLS CLOSE of file filename failed. CICS logic error - 8799 rrrr,cccc.

**Explanation**

While attempting to close file filename, CICS detected internal logic error 8799 in the file control services program. cccc is the offset in DFHFCN at which the error occurred.

**System action**

CICS terminates the task abnormally, takes a system dump, and continues processing with the status of file filename unchanged. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid
2. filename

**Destination**

Console

DFHFC0970  applid Recoverable non-RLS file filename opened with VSAM SHROPT 3 or 4. CICS cannot ensure integrity.

**Explanation**

While opening the recoverable VSAM file filename for update, CICS detected that it was defined with SHAREOPTION 3 or 4, which allows updating from multiple regions. CICS issues this message to warn you that it cannot ensure data integrity.

**System action**

CICS opens file filename and continues processing.

**User response**

If this integrity exposure is acceptable, no further user action is required. If this integrity exposure is unplanned and unacceptable, cancel CICS, redefine file filename with a different SHAREOPTION, and restart.

**Module:**

DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid

**Destination**

Console

DFHFC0971  applid Non-RLS OPEN of file filename returned warning when positioning ESDS. Error codes: rrrr,cccc.

**Explanation**

Before opening the VSAM ESDS file filename for output, CICS file control had to determine the end-of-data relative byte address (RBA). The positioning process involved the dynamic allocation and deallocation of the base cluster to DDname DFHESDS. The deallocation failed. The MVS DYNALLOC return code is cccc. rrrr is the additional return code in register 15.

**System action**

CICS opens the file filename and continues processing. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

For the meaning of the DYNALLOC return codes, see the z/OS MVS Programming: Authorized Assembler Services Guide.

**Module:**

DFHFCFS

5. X'cccc'
6. module

**Destination**

Console

**Explanation**

While CICS was opening file *filename* and retrieving information from the VSAM catalog, CICS file control open/close detected a CICS logic error. eeee is as follows:

8118

A VSAM catalog entry for a path does not have a base cluster or an AIX as its first association.

8119

In a VSAM catalog entry for an AIX, either the data association or the base cluster association is missing.

811A

In a VSAM catalog entry for a base cluster, the data association or the index association is missing.

811C

The open was requested against the data association or the index association. The base cluster, AIX or path should be specified instead.

**System action**

CICS continues processing with file *filename* closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response**

Obtain a VSAM LISTCAT listing for file *filename*. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHFC0979 date time applid LSR pool n parameters incomplete for file *filename* because the DSNNAME specified in the resource definition could not be found on the VSAM catalog. VSAM has returned code rrrr in R15.
Explanation
While dynamically calculating VSAM local shared resource (LSR) parameters, CICS attempted to retrieve information from the VSAM catalog using the data set name in the resource definition for file *filename*. The catalog access failed with the VSAM return code *rrrr* from the SHOWCAT macro.

System action
CICS continues processing, but does not use any parameters for file *filename* in calculations for the LSR pool.

User response
Ensure that you have correctly specified the JCL for the file, and that the catalog containing the file is included in the JCL. If these checks do not reveal the error, see the meaning of the SHOWCAT return code, *rrrr*, in z/OS DFSMS Macro Instructions for Data Sets.

Module:
DFHFCFS

Console

DFHFC0981 *applid* Dynamic allocation of base for non-RLS file *filename* failed. Return code *rrrr*,*cccc*.

Explanation
While trying to open the VSAM ESDS base of a path through which a record insert has been requested for file *filename*, CICS file control issued an MVS DYNALLOC command which failed with the return code *cccc*. *rrrr* is the return code in register 15.

System action
CICS takes a system dump and terminates the transaction abnormally.

User response
For the meaning of the DYNALLOC return codes, refer to the Application Programming on z/OS.

Module:
DFHFCM

XMEOUT parameters/Message inserts
1. *applid*
2. *filename*
3. *rrrr*
Destination
Console
DFHFC0982  applid Non-RLS OPEN of base for file filename failed. VSAM codes - rrrr, cccc.

Explanation
While trying to open the VSAM KSDS base of a path through which a record insert has been requested for file filename, CICS file control issued an OPEN which failed with the VSAM error code cccc from the ACB. rrrr is the VSAM return code in register 15.

System action
CICS takes a system dump and terminates the transaction abnormally.

User response
VSAM issues a console error message. Use the VSAM message and the VSAM return code in the CICS message to solve the problem.

For the meaning of the VSAM return code, see the z/OS DFSMS Managing Catalogs.

Module:
DFHFCM

XMEOUT parameters/Message inserts
1. applid
2. filename
3. rrrr
4. cccc

Destination
Console
DFHFC0987  applid {RLS | Non-RLS} OPEN of file filename failed: Not available for type of processing. VSAM codes - 0008, 00A8 in module module.

Explanation
When CICS attempted to open the VSAM file filename, the OPEN failed with the VSAM return codes shown in the message text. The probable reason for the failure is that the data set is in use by another region or another ACB in the CICS region, and that the VSAM share options prohibit the level of sharing needed to permit the OPEN.

A data set cannot be opened by different files in both RLS and non-RLS mode at the same time, with two exceptions:

- Another CICS region or batch process can open a data set in non-RLS read-only mode at the same time as the data set is open in RLS mode.
• The XFCRLSCO user exit can override the default behavior and open the data set using both RLS and non-RLS files, provided that the non-RLS files have read-only access.

System action
CICS continues processing, with the file left closed and its state UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
If the data set is in use by another user, wait until it is free and then retry the OPEN.

If the problem recurs and you cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHFCFS, DFHFCRO

XMEOUT parameters/Message inserts

Console

DFHFC0989I applid Non-RLS OPEN of file filename will be delayed because the associated data set dataset is being recalled.

Explanation
File filename is taking longer than expected to open because the associated data set has been migrated and has to be recalled before the file open processing can complete.

System action
The open of file filename will be delayed until its associated data set has been recalled.

User response
None.

Module:
DFHFCN

XMEOUT parameters/Message inserts
1. applid
2. filename
3. dataset

Destination
Console
**Explanation**

An attempt was made to open a recoverable file, associated with a VSAM path over an alternate index, for update processing (SERVREQ=ADD, DELETE or UPDATE set). However, the alternate index is not in the upgrade set of the base. CICS detects this condition and does not attempt to open the file.

If the alternate index is not in the upgrade set of the base, any updates made via the base are not reflected in the alternate index and so updates made via the path may compromise data integrity. Note the open of the path fails if RECOVERY=ALL or RECOVERY=BACKOUTONLY is specified on the resource definition for the path, or on the base data set.

The base takes the recovery attributes of the first file to open for update against it since a cold or initial start. Those attributes remain in force on the data set, and consistency checks are performed between the resource definition and the data set at file open time.

**System action**

CICS continues processing with file `filename` closed and not enabled.

**User response**

Take the data set offline and modify the resource definition for the alternate index. Run a BLDINDEX job to bring the alternate index up to date with the base data set and then retry the open of the file.

**Module:**

DFHFCFS, DFHFCRO

**XMEOUT parameters/Message inserts**

- Value chosen from the following options:
  - 1=RLS,
  - 2=Non-RLS
- **filename**
- **dsname**
- **module**

Destination

**Console**

**DFHFC0991** applid Non-RLS OPEN of file `filename` failed. Recovery attributes conflict with those on the VSAM data set - `cccc`. Base data set `dsname`

**Explanation**

An attempt was made to open a file `filename` for update processing. (SERVREQ=ADD, DELETE or UPDATE set), CICS detected that the recovery attributes on the file were inconsistent with those currently in force for the VSAM data set as recorded in the CICS data set name block. The file was not opened in order to maintain data integrity.

The data set takes the recovery attributes of the first file to open for update against it since a cold or initial start. Code `cccc` identifies the inconsistency found and takes the following values:

**8514**

Both the file and the data set have RECOVERY=ALL specified, but the forward recovery logs specified are different.

**8515**

The data set has RECOVERY=BACKOUTONLY or RECOVERY=NULL specified, and the file is trying to open with RECOVERY=ALL.

**8516**

The data set has RECOVERY=NULL specified. The file is attempting to open with RECOVERY=BACKOUTONLY.

**851B**

The file specified RECOVERY=NULL or BACKOUTONLY. The VSAM data set had RECOVERY=ALL specified.

**851C**

The file specified RECOVERY=NULL. The VSAM data set had BACKOUTONLY specified.

**System action**

CICS continues processing with file `filename` closed and not enabled.

**User response**

Ensure that files referencing the same VSAM data set have the same recovery attributes specified.
Modify the FILE resource definitions and reinstall them.

To nullify the recovery attribute set for the base data set, the user can issue a CEMT SET DSNAME REMOVE or EXEC CICS SET DSNAME REMOVE command. This deletes the base cluster block, and leaves CICS with no record of prior recovery settings for this VSAM data set. The first file to subsequently open against this data set causes a new base cluster block to be built. If the file is opened for update processing, the recovery attributes of this file are copied into the base cluster block.

If you want to have files referencing the same VSAM data set with different backout recovery attributes you should use Global User Exit XFCNREC.

**Module:**
DFHFCFS

DFHFC0997I  applid RLS OPEN of file filename is delayed because the associated data set dsname is being recalled.

Explanation
RLS file filename is taking longer than expected to open because the associated data set has been migrated and has to be recalled before the file open processing can complete.

System action
The open of file filename is delayed until its associated data set has been recalled.

User response
None.

Module:
DFHFCRO

XMEOUT parameters/Message inserts
1. applid
2. filename
3. dsname

Destination
Console

DFHFC0998  applid User exit XFCNREC is causing file filename to be opened even though a file recovery inconsistency of type X'code' exists. CICS cannot guarantee data integrity for base data set dsname

Explanation
An attempt was made to open file filename for update processing, (SERVREQ=ADD, DELETE or UPDATE set), and CICS detected that the backout recovery attribute on the file was inconsistent with that on the VSAM base data set. Normally CICS would fail the open on detection of an inconsistency. However, a program running at user exit XFCNREC has indicated that the open should continue even though an inconsistency has been detected. CICS can no longer guarantee the integrity of the data on the associated data set. Code X'code' identifies the inconsistency and can take one of the following values:

X'8516'
The data set has RECOVERY=NONE specified. The file is attempting to open with RECOVERY=BACKOUTONLY.

X'851C'
The file specified RECOVERY=NONE. The VSAM data set had BACKOUTONLY specified.

An INQUIRE on the RECOVSTATUS for the data set from this point onwards returns a NOTRECOVERABLE response. The data set is marked as not recoverable until the next CEMT SET DSNAME REMOVE, EXEC CICS SET DSNAME REMOVE command or cold or initial start.

System action
CICS opens file filename and continues processing using the recovery setting from the file definition to determine whether backout logging should be performed.

User response
Ensure that it is correct for the backout recovery attribute inconsistency to be ignored for this data set.

If the backout recovery attribute inconsistency should not have been ignored, ensure that files referencing the same VSAM data set have the same recovery attributes. If they do not, modify and reinstall their resource definitions.

To nullify the recovery attribute set for the base data set, issue a CEMT SET DSNAME REMOVE or EXEC CICS SET DSNAME REMOVE command. This deletes the base cluster block and leaves CICS with no record of prior recovery settings for this VSAM data set. The first file to subsequently open against this data set causes a new base cluster block to be built. If the file is opened for update processing, the recovery attributes of this file are copied into the base cluster block.

**DFHFC3001**  *date time applid Record not backed out because it may have been overridden by a non-RLS batch job. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work X'local-uowid' for file *filename*, base data set *data-set-name* *

**Explanation**
A log record was presented to file control for backing out, but although the updated record was protected by a VSAM RLS lock, a non-RLS batch job had elected to override the RLS locks held on this data set and therefore the condition of the record can no longer be guaranteed. The update had been made to the base data set *data-set-name* via the CICS file *filename*, under the unit of work identified by *local_uowid*.

**System action**
The update is not backed out because the condition of the updated record cannot be guaranteed, The updated data is committed instead. Diagnostic information is provided by this message and the subsequent message DFHFC3010.

**User response**
See the associated message DFHFC3010 for more information and guidance.

**Module:** DFHFCRC

2. *time*
3. *applid*
4. *X'local-uowid'*
5. *filename*
6. *data-set-name*

**Destination**
CSFL
**Explanation**

A log record was presented to file control for backing out, but although the updated record was protected by a VSAM RLS lock, a non-RLS batch job had elected to override the RLS locks held on this data set. However, an exit program enabled at the XFCBOVER exit point decided that the non-RLS batch job would not have caused corruption of the record, and requested that the backout should go ahead. The update had been made to the base data set via the CICS file, under the unit of work identified by local_uowid.

**System action**

An attempt to backout the update is made because the user exit requested that backout should go ahead. Diagnostic information is provided by this message and the subsequent message DFHFC3010.

**User response**

See the associated message DFHFC3010 for more information and guidance.

**DFHFC3004**

*date time applid* Record backed out because of the forced back out of an indoubt unit of work. Diagnostic information follows in message DFHFC3010. The record was updated by unit of work X'local-uowid' for file *filename*, base data set *data-set-name*.
Explanation

A log record has been presented to file control for backing out because the local unit of work local-uowid, which was part of a distributed unit of work, has gone in-doubt, and CICS has backed out the local unit of work. This decision to back out the record is the result of one of the following:

- CICS received an SPI SET UOW or SET DSNAME command that specified BACKOUT.
- CICS received an SPI SET UOW or SET DSNAME command that specified FORCE and the indoubt attributes on the transaction definition specified BACKOUT.
- An indoubt WAIT timeout occurred, and the transaction definition specified BACKOUT.
- One of the resource managers involved in the unit of work did not support waiting during the indoubt period.

The update being backed out was made to the base data set data-set-name via the CICS file filename. This and the subsequent message provides diagnostic information which is of use in correcting the situation if the actual resolution of the distributed unit of work was to commit it rather than to back it out.

System action

The update is backed out, and diagnostic information is provided by this message and the subsequent message DFHFC3010.

User response

See the associated message DFHFC3010 for more information and guidance.

DFHFC3010  date time applid Diagnostic information for unit of work

X'local-uowid' and file filename. Update was a \{read-update | write-add\} made by transaction tranid at terminal termid under task number tasknum. Key length key-length, data length data-length, base ESDS RBA X'base-RBA-or-zero', record key X'record-key'

Explanation

This message follows each DFHFC3001, DFHFC3002, DFHFC3003, or DFHFC3004 message, and provides additional information to help diagnose and correct the situation reported in the preceding message.

For any given filename and unit of work CICS normally issues messages of only one type; for example, a series of DFHFC3001 messages each followed by DFHFC3010, or a series of DFHFC3003 messages each followed by DFHFC3010.

The exception to this is when an exit program enabled at the XFCBOVER global user exit point elects to backout some updates and not to backout others. In this situation CICS might issue a combination of DFHFC3001 and DFHFC3002 messages (each followed by DFHFC3010) for the same filename and unit of work.

This message includes the following information:

- **local-uowid**
  - The local unit-of-work identifier for correlation with the preceding message.

- **filename**
  - The file name for correlation with the preceding message.

- **read-update** or **write-add**
  - The type of before-image log record presented to file control. The type is read-update if the update made to the file was either: a READ UPDATE, READNEXT UPDATE or REAPDREV UPDATE request (which will normally have been followed by a REWRITE or DELETE request), or a DELETE request which specified a RIDFLD. The type is write-add if the update made to the file was a WRITE request.

- **tranid**
  - The transaction under which the original update was made.

- **termid**
  - The terminal from which the transaction which made the original update was run.
**System action**

None beyond the system action described under the preceding message.

**User response**

Use the diagnostic information to determine any changes that need to be made to the data set to ensure that the contents are correct. Once you have identified the record which may not now contain the correct contents, and the transaction which originally updated it, a knowledge of your application programs should allow you to determine the necessary action.

CSFL

DFHFC4700 applid {An unexpected | A VSAM | A length | A lock | A timeout | An unexpected delete} error has occurred during file backout. (Module DFHFCFR has returned reason code (X'xx'), access method code (X'cccccccc') and length error code (X'yy').)

**Explanation**

File backout has called module DFHFCFR as part of its processing, and an error has been returned which should not be possible during backout. The message text includes the type of error that has occurred.

Additional diagnostic information is provided by: the reason code xx returned from DFHFCFR, the code ccccccccc which was returned to DFHFCFR from the access method that it called, and the length error code yy.

The length error code is normally either X'00', indicating that length errors are not applicable to the type of request which was in error, or X'01', indicating that there was no length error. A value greater than X'01' occurs when the message text indicates that the type of error is a length error.

**System action**

An exception trace point is written, and a system dump is taken.

The error is processed as a backout failure. Unless a user exit program enabled at the XFCBFAIL exit point bypasses backout failure processing, message DFHFC4701 or DFHFC4702 follows and gives details of the file and data set involved.

CICS continues. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Inform the system programmer. This indicates a possible error in CICS, VSAM or BDAM code. The severity of its impact depends on whether the backout can be successfully retried.

If the data set being backed out is a VSAM data set, you can retry the backout. Message DFHFC4701
names the data set, and the failed backout can be retried using SET DSNAME RETRY. If the problem is due to some transient condition which has since cleared, the backout will now succeed.

If the data set being backed out is a BDAM data set, the backout cannot be retried. The data is committed and the locks are released, unless an exit program enabled at the XFCBFAIL exit point terminates CICS, in which case data integrity can be preserved by performing an emergency restart.

If the backout cannot be successfully retried, then take action depending on the type of error indicated in the message text:

- An unexpected error
  This probably indicates either a corruption of storage or an error within CICS code. It might also indicate an error within the access method called to process the request (VSAM or BDAM).

  The reason code xx is the reason code from the DFHFCFR parameter list and has been included as additional documentation in case you need further help from IBM.

  The access method code ccccccccc is information returned to file control in the VSAM RPL if the error was detected by VSAM, or the BDAM DECB if the error was detected by BDAM. For VSAM, the first byte is the VSAM return code and the second byte is the VSAM reason code; the third and fourth bytes may contain additional VSAM diagnostics (for more information, see z/OS DFSMS Macro Instructions for Data Sets). For BDAM, the access method code is the 4-byte exception codes field from the DECB (for more information, see z/OS DFSMS Using Data Sets).

- A VSAM error
  This indicates that an error has occurred within VSAM.

  The access method code ccccccccc is information returned to file control in the VSAM RPL. The first byte is the VSAM return code and the second byte is the VSAM reason code; the third and fourth bytes may contain additional VSAM diagnostics (for more information, see z/OS DFSMS Macro Instructions for Data Sets).

- A lock error
  When a length error is reported, the length error code yy will be greater than X'01'. This normally indicates a serious error in CICS, VSAM, or BDAM processing. If it occurs for a BDAM data set, check the FCT and DCB definitions in case there is a mismatch between, for example, the block sizes, which would result in a length error.

- A timeout error
  This indicates that backout processing has timed out attempting to acquire an RLS lock. This should not be possible during backout because the record should already be locked by the unit of work being backed out. If this error occurs then it probably indicates an error in the SMSVSAM server.

- An unexpected delete error
  This indicates that the request to be backed out was a delete request, but that the file type is one for which deletes are not supported (VSAM ESDS or BDAM). The most likely cause of this error would be some corruption of the data set, although it might also indicate an error within CICS, or a storage corruption.

  You may need assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Console
DFHFC4701  date time applid  Backout failed for transaction tranid, VSAM file filename, unit of work X'local_uowid', task task_number, base base_dsname, path path_dsname, failure code X'bfail_code'.

**Explanation**

File backout has been unable to backout an uncommitted change made to a VSAM data set via file filename, that was made by the unit of work local_uowid.

The file is associated with the data set path_dsname. This is either a base cluster data set if the path_dsname and base_dsname given in the message are the same, or is a path data set whose base cluster is the base_dsname given in the message if the two names differ.

The change that is being backed out was originally made by task task_number servicing transaction code tranid, running under the unit of work local_uowid. The current task number will differ from the original one that is given in the message if this backout is itself a retry of an earlier backout which also failed, or is a backout being carried out following resolution of an indoubt situation, and the current transaction code will differ from the original one if the transaction has been disabled.

The failure code X'bfail_code' indicates the reason for the failure.

**System action**

The system continues normally.

Backing out of the unit of work continues, but no further attempts to backout updates made by this unit of work to the base_dsname named in the message are made.

When the unit of work has been backed out as far as is possible, those updates which could not be backed out are deferred (shunted) until the backout can be retried.

It is possible for other work to continue to access the base cluster data set, but the records in that data set that were changed by this unit of work are locked by retained locks. This ensures that any attempt to access these records results in a LOCKED response being returned to the application. The records must remain locked until the backout has been successfully retried in order to preserve data integrity.

If, when the backout is retried, it fails again for either the same or another reason, this message is issued again, with the failure code indicating the reason for the failure on this occasion.

**User response**

You may decide to leave the data set online for any of the errors indicated by X'bfail_code', especially if you believe that the backout failure may have been due to some transient situation, and that the backout may succeed if retried. You can manually drive retry of the backout using the SET DSNAME RETRY command, or alternatively wait until some event triggers retries of the shunted backouts in the system.

As a last resort, and at the cost of losing data integrity, you could bypass the deferred backout of uncommitted changes to this data set using the SET DSNAME RESETLOCKS command.

The user response depends on the value of the failure code X'bfail_code'.

10  

The backout attempted to add a duplicate key value to a unique alternate index. The backout can never be carried out unless you can delete the existing record with this alternate key value, then retry the backout using SET DSNAME RETRY. This failure can only occur for a file being accessed in non-RLS mode.

20  

The data set ran out of storage while the request was being processed. You should reallocate the data set with more space, then retry the backout using SET DSNAME RETRY. Do not forward recover the data set. If you accessed the file in RLS mode, there are extra steps required to ensure that the retained locks remain associated with the data set. These are explained in the Administering recovery and restart.

24  

An I/O error has occurred on the data set. You should consider the possibility that the data set needs restoring, especially if there have been a large number of these messages referring to the same base cluster data set, or if there have also been I/O errors issued during request processing for that data set.

If you do decide to restore the data set, you should take the following steps:

1. Prevent access to the data set
2. Restore a backup copy and forward recover the data set (for example, using CICSVR)
3. Reallow access to the data set
4. Retry deferred backouts.
For an RLS mode data set, prevent access by issuing a SET DSNAME QUIESCED command which closes all open files throughout the sysplex and prevents further RLS opens. Reallow access by issuing a SET DSNAME UNQUIESCED command, which also retries deferred backouts automatically.

For a non-RLS mode data set, prevent access by issuing a SET DSNAME UNAVAILABLE command to prevent further non-RLS opens and issue SET FILE CLOSED commands for all open files. Reallow access by issuing a SET DSNAME AVAILABLE command, and retry deferred backouts using SET DSNAME RETRY.

C4

VSAM has returned a response indicating that the RLS lock structure in the coupling facility is full. Allocate a larger lock structure, rebuild into it and retry the backout using set dsname retry. See MVS Setting Up a Sysplex, (GC28-1779) and z/OS DFSMSdfp Storage Administration, (SC26-4920) for further information on how to allocate, and build into, larger lock structures.

F0

There was no space to add another alternate key value to a non-unique alternate index. You should rebuild the data set with a larger alternate index data CI size (unless you are already at the maximum), and then retry the backout using SET DSNAME RETRY. If you accessed the file in RLS mode, there are extra steps required to ensure that the retained locks remain associated with the data set. These are explained in the Administering recovery and restart. Do not forward recover the data set.

FB

An error occurred when opening the file for backout. Determine why the file would not open, and if it is possible to correct it, do so and then issue SET DSNAME RETRY to retry the backout. If the error occurred because the data set was quiesced, the backout is automatically retried when the data set is unquiesced. If the error occurred because the VSAM RLS server was not available, the backout is automatically retried when it becomes available again.

FE

An error occurred which is not expected to be possible during backout. An exception trace point is written, message DFHFC4700 is issued and a system dump is taken. Use these to determine the cause of the error. It might be worth retrying the backout, using SET DSNAME RETRY, since the problem could have been some transient condition which has since cleared.

1. date
2. time
Destination
CSFL and Console

DFHFC4702 date time applid Backout failed for transaction tranid, BDAM file filename, unit of work X'local_uowid', task task_number.

Explanation
File backout has been unable to backout an uncommitted change made to a BDAM data set via file filename, that was made by the unit of work local_uowid.

The change that is being backed out was originally made by task task_number servicing transaction code tranid, running under the unit of work local_uowid. However, if this backout is being attempted after waiting for an indoubt situation to be resolved, the current task number will be different from the original one given in the message, and transaction code will be different from the original one if the transaction has been disabled.

System action
The system continues normally.

Backing out of the unit of work continues, and any further failures to backout changes made to this BDAM data set result in the message being reissued.

Unless a program invoked at the backout failure exit point, XFCBFAIL, took some action to prevent it, it is possible for other work to continue to access the BDAM data set, but data integrity is compromised because the changes have not been backed out.

User response
Unless you are prepared to continue using the data set in spite of the loss of data integrity, you should take some action to correct matters, such as closing all files that are using the data set and backing out the uncommitted changes offline.

One possible cause of a BDAM backout failure is that a logical delete could not be performed because the XFCLDEL exit either chose not to carry out the logical delete or was not enabled. If this is the case then you may want to ensure that a suitable exit program is enabled at the XFCLDEL exit point, so that any future attempts at backing out writes made to BDAM data sets will succeed.

| DFHFC5801A | applid | File OPEN has failed for VSAM data set. The BWO values in the ICF catalog indicate that |
data set needs to be restored and forward recovered. Data set 'dsname'.

Explanation
CICS has rejected a file open for the VSAM base data set dsname. This base data set could not be opened because the integrated catalog facility (ICF) catalog backup while open (BWO) flags indicated a corrupted data set.

This message is accompanied by message DFHFC5806 which includes the name of the file involved in the OPEN failure.

System action
The file open for data set dsname fails. CICS continues processing but the file is closed and its state is set to UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response
Carry out the following procedure:

1. If a BWO copy of this VSAM data set is available:
   a. Restore the BWO copy of this data set via DFHSMS and/or DFDSS.
   b. Apply the CICS forward recovery logs via a log-apply utility, such as CICS VSAM Recovery (CICSVR), to bring the data set to a point of consistency.

2. If no BWO copy of this base data set exists but a normal quiesced copy does, apply the forward recovery logs to the data set in the normal way to bring the data set to a point of consistency.

3. Set the ICF catalog BWO flags to indicate that the data set has been recovered to the point of failure. This can be done by issuing a CEMT SET DSNAME RECOVERED or EXEC CICS SET DSNAME RECOVERED command.

4. Rename the data set to that of the original data set prior to the failure.

5. Make the data set available.

Note:
Some log-apply utilities, such as CICS VSAM Recovery MVS/ESA (CICSVR MVS/ESA) Version 2, set the ICF catalog BWO flags to a RECOVERED state after the CICS forward recovery logs have been applied.

Module:

Console

DFHFC5802A applid File OPEN has failed for VSAM data set. The BWO values in the ICF catalog indicate that data set needs to be forward recovered. Data set 'dsname'.

Explanation
CICS has rejected a file open for the VSAM base data set dsname. This base data set could not be opened because the ICF catalog backup while open (BWO) flags indicated that the data set was back-level and needed to be forward recovered. This failure occurs if a BWO of a VSAM base data set is restored but not forward recovered. This message is accompanied by DFHFC5806 which includes the name of the file involved in the OPEN failure.

System action
The file open for data set dsname fails. CICS continues processing but the file is closed and its state is set to UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response
Carry out the following procedure:

1. Apply the CICS forward recovery logs via a log-apply utility, such as CICS VSAM Recovery (CICSVR), to bring the data set to a point of consistency.

2. Set the ICF catalog BWO flags to indicate that the data set has been recovered to the point of failure. This can be done by issuing a CEMT SET DSNAME RECOVERED or EXEC CICS SET DSNAME RECOVERED command.

Note:
Some log-apply utilities, such as CICS VSAM Recovery (CICSVR), set the ICF catalog BWO flags to a RECOVERED state after the CICS forward recovery logs have been applied.

Module:
DFHFCAT
DFHFC5803  applid A severe error (code X'code') has occurred while inquiring/setting VSAM data set BWO attributes. Data set 'dsname' Return Code X'xxxxxxxx' Reason Code X'yyyyyyyy' Prob Det X'zzzzzzzzzzzzzzz'.

**Explanation**

A severe error has been detected in DFHFCAT while inquiring or setting ICF catalog backup while open (BWO) attributes of base data set dsname. The error code is the exception trace point ID which uniquely identifies the call which has failed. The code X'code' can take the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'OB57'</td>
<td>A call to Using DFSMSdfp Callable Services to inquire if a data set is known to a SMS sub-system has failed</td>
</tr>
<tr>
<td>X'OB59'</td>
<td>A call to Using DFSMSdfp Callable Services to update the BWO flags to a forward recovered state for a data set has failed</td>
</tr>
<tr>
<td>X'OB5A'</td>
<td>A call to Using DFSMSdfp Callable Services to update the recovery point for a data set has failed</td>
</tr>
<tr>
<td>X'OB5B'</td>
<td>A call to Using DFSMSdfp Callable Services to update the BWO flags to a BWO disabled state for a data set has failed</td>
</tr>
<tr>
<td>X'OB5C'</td>
<td>A call to Using DFSMSdfp Callable Services to inquire if the BWO flags for a data set were in a BWO enabled state has failed</td>
</tr>
<tr>
<td>X'OB5D'</td>
<td>A call to Using DFSMSdfp Callable Services to update the BWO flags to a BWO enabled state for a data set has failed</td>
</tr>
</tbody>
</table>

For further information about CICS exception trace entries, see the Troubleshooting and support.

The values xxxxxxxxx, yyyyyyyyy and zzzzzzzzzzzzzz are the BWO return code, reason code and problem determination code from the Using DFSMSdfp Callable Services Interface call to update/inquire the ICF catalog BWO attributes.

This message is accompanied by message DFHFC5806 when a file open failure occurs or by message DFHFC5810 when a file close failure occurs.

**System action**

CICS makes an exception trace point entry and issues this message. No system dump is taken. The actions taken depend on the operation in progress at the time of the error.

If the error occurs while opening a file, the open request fails, the file is closed, and its state is set to UNENABLED.

If the error occurs while closing a file, the status of the file is unchanged.

If the error occurs during activity keypoint when updating the recovery point, CICS tries to update the recovery point on the next activity keypoint that creates a keypoint directory element (KPDE).

If the error occurs while setting the data set RECOVERED via CEMT or EXEC CICS commands, a non-OK response is returned.

**User response**

Use the return code, reason code and problem determination code to determine why the call to Using DFSMSdfp Callable Services has failed. For further information see Using DFSMSdfp Callable Services in the z/OS DFSMSdfp Advanced Services.

Ensure that the appropriate level of MVS/DFP is installed on the processor where CICS is running. Also ensure that the data set is SMS managed and known to the SMS subsystem.

DFHFC5804  applid File CLOSE failed during CICS termination. File 'filename'.

Explanation
An attempt to close file filename during orderly CICS termination has failed. This message is produced only as a warning that this file could not be closed. Data integrity has been maintained.

System action
CICS termination continues.

If this file was open against a base data set open for update with BACKUPTYPE=DYNAMIC specified, one of the following messages is issued on the first open for update for this base data set in the next CICS run:

   DFHFC5807
   DFHFC5808
   DFHFC5809.

User response
In order to avoid repetition of this failure, try to determine why the file was not closed from any other DFHFCxxxx messages produced during termination.

Module:
DFHFCSD

XMEOUT parameters/Message inserts
1. applid
2. filename

Destination
Console

DFHFC5805  applid File OPEN failed. RECOVERY attributes of VSAM data set are not valid. File 'filename' data set 'dsname'.

Explanation
The file filename is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC). An attempt to open this file for update processing (SERVREQ=ADD, DELETE or UPDATE set), has failed because CICS has detected that the RECOVERY attributes have not been validated for the VSAM base data set dsname. A data set cannot be defined with BACKUPTYPE=DYNAMIC without RECOVERY=ALL specified.

System action
The file open for data set dsname fails. Processing continues but the file is closed and its state set to UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

User response
This is probably caused by a logic error in CICS. You should, however, check if there are any other DFHFCxxxx messages that indicate the cause of the error.

Console

DFHFC5806  applid File OPEN failed. DFHFCAT returned an error response from a BWO action on a VSAM data set. File 'filename' data set 'dsname'.

Explanation
An attempt to open file filename has failed due to the failure of a call to Using DFSMSdfp Callable Services or due to an invalid state returned from a call to Using DFSMSdfp Callable Services for the VSAM base data set dsname. This message is accompanied by one of the following messages depending on the type of error being reported:

   DFHFC0002
   DFHFC5801
   DFHFC5802
   DFHFC5803

System action
CICS fails the file open request for data set dsname. Processing continues but the file is closed and its state set to UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.
**User response**

See the accompanying message for the appropriate action to take in resolving this error.

**Module:**
DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid  
2. filename  
3. dsname

**Destination**

Console

DFHFC5807  
**applid File OPEN failed.**  
BACKUPTYPE attributes conflict with those currently defined for the VSAM data set. File 'filename' data set 'dsname'.

**Explanation**

An attempt to open file filename for update processing, (SERVREQ=ADD, DELETE or UPDATE set), against the VSAM base data set dsname has failed. This is because CICS has detected an attribute conflict between the opening CICS resource definition and the base data set’s DSNB which was already opened for update. A FILE resource definition with a BACKUPTYPE=STATIC cannot be opened against a DSNB which already has or had a FILE resource definition opened against it with BACKUPTYPE=DYNAMIC. Similarly, a FILE resource definition with a BACKUPTYPE=DYNAMIC cannot be opened against a DSNB which already has or had a resource definition opened against it with BACKUPTYPE=STATIC.

**Note:**

A CICS base data set’s DSNB cannot change BACKUPTYPE midway through a CICS run. In order to do this, you must destroy the DSNB and create a new one. There are three ways of doing this:

- CEMT SET DSNAME REMOVE
- EXEC CICS SET DSNAME REMOVE
- Terminate CICS and restart with a cold start.

If you respecify a DSNB with BACKUPTYPE=DYNAMIC, where previously it was specified with RECOVERY=NONE or BACKOUTONLY and BACKUPTYPE=STATIC, no forward recovery logging exists for the time that the DSNB had RECOVERY=NONE or BACKOUTONLY specified. Therefore you should take a backup copy of the data set before the change. This ensures that the data set can be recovered to a consistent point should a failure occur.

**System action**

The file open for data set dsname fails. CICS continues processing but the file is closed and its state set to UNENABLED. Any transaction attempting to use this file is sent a NOTOPEN condition.

**User response**

Determine the correct values for the BACKUPTYPE and RECOVERY attributes, and if necessary, modify the resource definition for the file.

Alternatively, remove the old DSNB as already described and reattempt the open.

**Module:**
DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid  
2. filename  
3. dsname

**Destination**

Console

DFHFC5808  
**applid File OPEN warning. VSAM data set already set eligible for BWO on first open for update. File 'filename' data set 'dsname'.**

**Explanation**

The file filename is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC). While opening this file for update processing, (SERVREQ=ADD, DELETE or UPDATE set), against the VSAM base data set dsname, CICS detected that the ICF catalog has already defined this base data set as eligible for BWO.

If a batch job has updated this data set in a prior batch window and a DFHSM backup was scheduled for the same time, you should discard the backup produced in the batch window as it is not possible to forward recover it to a consistent point should a failure occur. This is because updates made to the data set in the batch window are not reflected in the CICS forward recovery logs. This situation is likely to arise if CICS fails to close a file defined with BACKUPTYPE=DYNAMIC during CICS termination.
**System action**

CICS updates the ICF catalog recovery point and open processing continues.

**User response**

To ensure complete data integrity, quiesce all files opened against this base data set and take a backup copy. This can now be forward recovered at a later date and reflects updates made to this data set during a prior batch window.

**Module:**

DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid
2. filename
3. dsname

**Destination**

Console

DFHFC5809  
applid File OPEN warning. BACKUPTYPE attributes conflict with BWO values defined in ICF catalog. BWO values have been updated. File 'filename' data set 'dsname'.

**Explanation**

The file *filename* is defined as not eligible for backup while open for update (BACKUPTYPE=STATIC). While opening this file for update processing (SERVREQ=ADD, DELETE or UPDATE set), against the VSAM base data set *dsname*, CICS detected that the BWO flags in the ICF catalog already defined this base data set as eligible for BWO. However, the CICS resource definition and the DSNB define the base data set as not eligible for BWO.

If a batch job has updated this data set in a prior batch window and a DFHSM backup was scheduled for the same time, you should discard the backup produced in the batch window as it is not possible to forward recover it to a consistent point should a failure occur. This is because updates made to the data set in the batch window are not reflected in the CICS forward recovery logs.

This situation is likely to arise if CICS fails to close a file that is defined with BACKUPTYPE=DYNAMIC, during CICS termination and the file is redefined with BACKUPTYPE=STATIC on a subsequent CICS run.

**System action**

CICS updates the ICF catalog to indicate that the data set is no longer eligible for BWO. File open processing continues.

**User response**

Determine the correct value for the BACKUPTYPE attribute, and if necessary, redefine it via CEDA.

**Module:**

DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid
2. filename
3. dsname

**Destination**

Console

DFHFC5810  
applid File CLOSE failed. DFHFCAT returned an error response from a BWO action on a VSAM data set. File 'filename' data set 'dsname'.

**Explanation**

An attempt to close file *filename* has failed because of the failure of a call to Using DFSMSdfp Callable Services for the VSAM base data set *dsname*. This file is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC), and is open for update processing, (SERVREQ=ADD, DELETE or UPDATE set). This message is accompanied by message DFHFC5803 or DFHFC0002, depending on the type of error reported.

**System action**

The file close request for data set *dsname* fails. Processing continues and the file remains open.

**User response**

See the accompanying message for the appropriate action to take in resolving this error.

**Module:**

DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid
2. filename
3. dsname

**Destination**

Console

DFHFC5811  applid File OPEN warning. BACKUPTYPE=DYNAMIC attribute has been ignored. File `filename` data set `dsname`.

**Explanation**

The file `filename` is defined as eligible for backup while open for update (BACKUPTYPE=DYNAMIC). During an attempt to open this file for update processing, (SERVREQ=ADD, DELETE or UPDATE set), against the VSAM base data set `dsname`, either:

- CICS has detected that the appropriate levels of software needed for VSAM backup while open (BWO) support have not been installed, or
- The appropriate Using DFSMSdfp Callable Services modules could not be loaded.

**System action**

CICS ignores the BACKUPTYPE=DYNAMIC parameter and continues as if STATIC were specified. File open processing continues.

**User response**

If BWO support is required, ensure that the appropriate level of Using DFSMSdfp Callable Services is installed.

If BWO support is not required, ensure that the file is defined with the BACKUPTYPE=STATIC attribute.

**Module:**

DFHFCFS

**XMEOUT parameters/Message inserts**

1. applid
2. filename
3. dsname

**Destination**

Console

DFHFC5812  applid File OPEN warning. BACKUPTYPE=DYNAMIC has been ignored for VSAM AIX data set. STATIC has been defaulted. File `filename` data set `dsname`.

**Explanation**

You have opened a VSAM file for update and requested backup while open (BWO) support by specifying BACKUPTYPE=DYNAMIC in the resource definition. However, CICS has detected that the software release level of DFHSM and/or DFDSS required for BWO support has not been installed on the processor on which CICS is running.

This message is issued once for the first file to open for update and be defined as eligible for BWO after a cold or initial start.

**System action**

CICS file open processing continues. If the file open completes without error, the file is defined as eligible for BWO. However, no BWO backup facilities are available using DFHSM and/or DFDSS on the processor on which CICS is running.
User response
Ensure that DFHSM and/or DFDSS, both of version 2.5.0 or later, are installed on the processor on which the BWO backup is to be made.

Note:
DFSMS/MVS 1.1 (DFSMShsm and DFSMSdss) supersedes DFHSM 2.5 and DFDSS 2.5.

Module:
DFHFCAT

XMEOUT parameters/Message inserts

   3=DFHSM and DFDSS

Destination
Console

DFHFC5814 applid An error (code X'code') has occurred while inquiring on VSAM data set attributes in the ICF catalog. [SHOWCAT | LOCATE] return code X'rrrr'. Data set dsname.

Explanation
While reading the ICF catalog to obtain attributes of data set dsname, CICS received return code rrrr from a VSAM SHOWCAT or LOCATE macro or detected an associated error. The error code code is the exception trace which uniquely identifies the error. It can take the following values:

Value
Meaning
X'237A'
SHOWCAT for the data set failed with return code rrrr.
X'237B'
In the VSAM catalog entry for an AIX, either the data association or the base cluster association is missing.
X'237C'
SHOWCAT for the AIX of a path failed with return code rrrr.

X'237D'
The VSAM catalog entry for a path does not have a base cluster or an AIX as its first association.
X'237E'
LOCATE for the data set failed with return code rrrr.

For further information about CICS exception trace entries, see the CICS Diagnostics reference.

System action
CICS processing continues after making an exception trace entry and taking a system dump with dumpcode FC5814.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Use the SHOWCAT or LOCATE return code if present to determine the cause of the problem. For the meaning of the SHOWCAT return code, see z/OS DFSMS Macro Instructions for Data Sets. For the meaning of the LOCATE return code, see z/OS DFSMSdfp Advanced Services. A VSAM LISTCAT listing for the data set may also be useful.

If you cannot resolve the problem or the problem recurs, there may be a more severe error. In this case, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

1. `applid`
2. `X'rrrr'`
3. `X'cccc'`
4. `X'dddddddd'`
5. `dsname`

**Destination**

Console

**Explanation**

File `filename` was the first file to open a dynamically allocated data set `dsname`. This file is being closed leaving one or more files still open against the same base data set. However, if one of these files requires secondary extents, the request will fail with a CICS ILLOGIC error (EIBRCODE X'08BA0000').

**System action**

Close processing completes normally.

**User response**

To avoid this potential problem, you are advised to close and reopen the files that remain open against the base data set. If you are unsure of the data set associations, run a LISTCAT against the above base dataset to produce a list of all associated data sets. Use CEMT INQ FILE(*) to identify which files are affected. All of these should be closed and reopened, for example, using the CEMT SET FILE(file name) CLOSE and CEMT SET FILE(file name) OPEN.

**Module:** DFHFCFS

**XMEOUT parameters/Message inserts**

1. `applid`

5. dsname

**Destination**
CSFL and Console

DFHFC6005 date time applid Attempt by {CICS / user} to quiesce a data set has failed. Quiesce was cancelled. Data set dsname

**Explanation**
A request to VSAM RLS to quiesce base data set dsname throughout the sysplex has been cancelled by a participating CICS region. The CICS region could be any CICS in the sysplex. The quiesce was cancelled for one of the following reasons.

- An end user issued an EXEC CICS SET DSNAME UNQUIESCED command
- User code at global exit XFCVSDS suppressed the quiesce
- User code at global exit XFCSREQ suppressed the close of a file that is open against the data set
- The quiesce would not complete and was timed out

A preceding console message in the sysplex indicates the reason. For XFCVSDS the message is DFHFC6023. For XFCSREQ the message is DFHFC6024. For timeout the message is DFHFC6020. If there is no preceding message, EXEC CICS SET DSNAME UNQUIESCED has been used.

**System action**
CICS processing continues. The quiesce state of the data set in the ICF catalog is set to unquiesced as a result of the cancel.

**User response**
The response depends on the reason for the cancellation. If a preceding message was issued, refer to the explanation for that message for background information.

If EXEC CICS SET DSNAME UNQUIESCED was the reason, determine what the desired quiesce state should really be. If it should be quiesced, issue an EXEC CICS SET DSNAME QUIESCED command or the CEMT equivalent.

If an exit suppressed the quiesce, the user code at XFCVSDS or XFCSREQ must be disabled on all CICS regions in the sysplex before the data set can be quiesced.

If the quiesce timed out, retry the quiesce using EXEC CICS SET DSNAME QUIESCED or the CEMT equivalent. If the timeout occurs again, consider using EXEC CICS SET DSNAME IMMQUIESCED or the CEMT equivalent. This force-purges transactions accessing the data set, thereby speeding up the closing of files. Alternatively, attempt to identify any long-running transactions that are using the data set, and terminate them.

**Explanation**
A request to VSAM RLS to cancel a DFSMSdss-initiated backup for base data set dsname has failed with an unexpected error. The VSAM IDAQUIES macro failed with reason code cccc. rrrr is the return code in register 15.

**System action**
CICS processing continues after taking a system dump with dumpcode FC6019. The BWO or non-BWO backup is not cancelled.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
Use the IDAQUIES reason code to determine the cause of the problem. For the meaning of the IDAQUIES reason code, see the z/OS DFSMSdfp Diagnosis.
If you cannot resolve the problem, or the problem recurs, a more severe error is indicated. In this case, you will assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**DFHFC6020** Timeout has occurred while quiescing a data set. Quiesce will be cancelled.
Data set dsname

**Explanation**
The request made to VSAM RLS to quiesce base data set dsname throughout the sysplex has timed out. The timeout limit is given by the system initialization parameter QUIESTIM.
This is probably due to the presence of long-running transactions on a participating CICS region failing to reach syncpoint, and therefore preventing the close of files open against the data set.

**System action**
CICS cancels the quiesce throughout the sysplex by issuing an unquiesce for the data set. Depending upon the timing of the unquiesce request, one of two situations can result:
1. Normally the unquiesce is processed immediately and the quiesce request is canceled by VSAM. In this case, message DFHFC6020 is followed by messages DFHFC6000 and DFHFC6001 for the unquiesce completing.
2. Occasionally, depending on the timing of the unquiesce, the original quiesce request completes before the unquiesce request has been processed. Because the unquiesce cannot be canceled, it completes thereby canceling the original quiesce. In this case, message DFHFC6020 is followed by messages DFHFC6000, DFHFC6027, a DFHFC6001 for the quiesce completing, and another DFHFC6001 for the unquiesce completing.

**User response**
If timeouts occur regularly, the following action can be taken to resolve the problem
- Increase the QUIESTIM SIT value. This can be useful if the system is particularly busy when quiesces are likely to be issued.
- Change the long-running transaction which is holding up the request. Note that the transaction can be on any CICS in the sysplex.
The SET DSNAME IMMQUIESCED command can be used to force purge any transaction and quiesce the data set. This should not be used regularly because force purges can occasionally abend CICS. The messages issued as part of the force purge enable the system programmer to identify the long-running transaction if no other method is available.

See also the Explanation of message DFHFC6005 for guidance.

**DFHFC6021**

**date time applid** An error has occurred while notifying VSAM RLS of the completion of CICS processing for a data set quiesce or backup. VSAM RLS codes X'rrrr', X'cccc'. Data set dsname

**Explanation**

An unexpected error occurred when CICS notified VSAM RLS that it had completed its processing for a data set quiesce, or for a BWO or non-BWO backup. The VSAM IDAQUIES macro failed with reason code cccc. rrrr is the return code in register 15.

**System action**

CICS processing continues after taking a system dump is taken with dumpcode FC6021. The failure of the IDAQUIES macro may cause the data set operation to timeout or fail.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Use the IDAQUIES reason code to determine the cause of the problem. For the meaning of the IDAQUIES reason code, see the z/OS DFSMSdfp Diagnosis.

If the data set operation has failed, retry the data set operation once the problem has been resolved, if you cannot resolve the problem, or the problem reoccurs, a more severe error is indicated. In this case, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

CSFL and Console

DFHFC6026 *date applid* An error has occurred while notifying VSAM RLS of the completion of CICS processing for a data set quiesce or backup. The SMSVSAM server is not available. Data set dsname
Explanation
CICS has notified VSAM RLS that it has completed its processing for a data set quiesce, or a BWO or non-BWO backup, but the SMSVSAM server address space is not available.

System action
CICS processing continues. The SMSVSAM server address space should attempt to restart automatically. The data set operation may fail or succeed, depending on whether the SMSVSAM server concerned was coordinating the operation or not.

User response
The SMSVSAM server address space should normally restart itself. If it does not, restart the SMSVSAM server address space manually. Retry the data set operation if it has failed.

If the SMSVSAM server address space fails to restart, a more severe error is indicated. In this case, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

4. transid

Destination
CSFL

DFHFC6029 date time applid File Control RLS quiesce system transaction transid has failed. Reattach will be attempted.
Explanation
CICS system transaction CFQS or CFQR has failed due to a serious error. An attempt will be made to reattach the transaction transid.

A preceding message should indicate the cause of the error.

CFQS and CFQR provide support for VSAM RLS data set quiesce and unquiesce operations, DFSMSdss-initiated BWO and non-BWO backups, and certain other data set related operations.

System action
The transaction is reattached and CICS processing continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Check Transient Data Queue CSFL for message DFHFC6028, indicating that the reattach of the transaction was successful. If the reattach fails, VSAM RLS data set quiesce support is lost. If this happens, CICS must be restarted.

If it is not possible to restore VSAM RLS quiesce support, a more severe error is indicated. In this case, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHFCQT

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. transid

Destination
CSFL and Console

DFHFC6030 date time applid The CICS RLS quiesce exit was unable to process data set operation request X’type’ for {data set | cache} name

Explanation
The CICS RLS quiesce exit was driven by VSAM RLS to process data set operation request type for data set or cache name, but encountered a severe error and was unable to process the request. The error is normally caused by a STORAGE OBTAIN macro failure

A preceding console message (normally DFHFC6022) gives more information about the error.

This message is issued by DFHFCQQR on behalf of the CICS RLS quiesce exit DFHFCQX.

Note:
The CICS RLS quiesce exit is used by VSAM RLS to notify CICS that processing is required for the following data set related operations. The number corresponds to type in the message.

01 The quiesce of a data set
02 The unquiesce of a data set
03 The start of a DFSMSdss non-BWO backup
04 The end of a DFSMSdss non-BWO backup
05 The start of a DFSMSdss BWO backup
06 The end of a DFSMSdss BWO backup
07 The recovery of lost locks for a data set
08 The completion of forward recovery for a data set
09 The recovery of a coupling facility cache structure.

System action
CICS continues after taking a system dump with dumpcode FC6030. The data set operation request is not processed by CICS.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Referring to the preceding console message, attempt to determine the cause of the problem.

Because CICS could not process the request, this might invalidate later processing. For example, if the request was for the quiesce of a data set, open files against the data set must be closed manually, or
the quiesce retried using EXEC CICS SET DSNAME QUIESCED or the CEMT equivalent. If the request was in connection with a BWO or non-BWO backup, the backup may be invalid and should be discarded.

If you cannot resolve the problem, or the problem recurs, a more severe error is indicated. In this case, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHFC6037 I  
<DATE> <TIME> <APPLID> Program <PROGRAM_NAME> has issued an RBA request against an extended addressing ESDS data set. File <filename>. Data set <dsname>

Explanation
A program has issued a request using a 32-bit RBA against an extended addressing ESDS data set, which would normally be accessed by a 64-bit XRBA. The name of the file used is <filename>. The data set is <dsname>.

This message is informational.

Use of 32-bit RBAs with an extended addressing ESDS is allowed to enable existing programs to be used with extended addressing data sets. There are some limitations to what can be done by such programs because the RBA supplied is actually the low 32-bits of the 64-bit XRBA and is potentially ambiguous.

Existing programs that write records, and then subsequently browse the data set either from the beginning or the end will work. This is the normal way of using ESDS data sets.

An attempt to read a record by RBA or an attempt to start a browse at anywhere other than the beginning (RBA 0) or end (RBA -1) of the data set is unsupported and will fail.

If you do issue an unsupported RBA request you will receive one instance of message DFHFC6038 for each file against which an unsupported request is issued.

In order to avoid flooding the system with messages, this message is only produced once per CICS run. It is possible that other programs are issuing RBA requests against other extended addressing ESDS files.

System action
CICS continues processing.
**User response**

None. However, you may wish to review the program to ensure that it does not use RBAs in an unsupported way. You may wish to check that you have not received any instances of message DFHFC6038.

**Module:**
DFHFCVS, DFHFCRS

**XMEOUT parameters/Message inserts**

1. DATE
2. TIME
3. APPLID
4. PROGRAM_NAME

CSFL

**DFHFC6038**  
*DATE*  
*TIME*  
*APPLID*  
*PROGRAM_NAME*  
*filename*  
*dsname*

**Explanation**

A program has issued a request using a 32-bit RBA against an extended addressing ESDS data set, which would normally be accessed by a 64-bit XRBA. The request failed. For extended addressing ESDS data sets, some types of file control commands are only supported with the XRBA keyword and are not supported with the RBA keyword.

The name of the file used is *filename*. The data set name is *dsname*.

Use of 32-bit RBAs with an extended addressing ESDS is allowed to enable existing programs to be used with extended addressing data sets. There are some limitations to what can be done by such programs because the RBA supplied is actually the low 32-bits of the 64-bit XRBA and is potentially ambiguous.

The normal way of using ESDS data sets is to write records sequentially and then subsequently read the records back by a browse. This method of using an extended addressing ESDS with RBAs is supported and it should be possible to use most existing programs with an extended addressing ESDS. Programs that write records to an ESDS will work.

Programs that browse the data set either from the beginning or the end will work.

However the following are not supported because they all rely on the value of the RBA.

- An attempt to read a record by RBA by a READ or READ UPDATE command.
- An attempt to start a browse (by STARTBR) at any position other than the beginning of the data set (RBA 0) or the end of the data set (RBA -1).
- An attempt to reposition a browse (by RESETBR) at any position other than the beginning of the data set (RBA 0) or the end of the data set (RBA -1).
- An attempt to change the position of the browse by changing the value of the RBA between successive READNEXT requests.
- An attempt to change the position of the browse by changing the value of the RBA between successive READPREV requests.
- An attempt to change the direction of a browse by following a READNEXT by a READPREV or by following a READPREV by a READNEXT.

In order to avoid flooding the system with messages, you will only receive one instance of message DFHFC6038 for each file against which an unsupported request is issued. It is possible that other programs are issuing unsupported RBA requests against the same file.

**System action**

CICS continues processing.

**User response**

If you do not need to store more than 4 gigabytes of data in the data set, you may be able to leave the program unchanged and convert the data set to one that does not use extended addressing. Otherwise you must change the program to use XRBA rather than RBA. When changing the program, you must change all 4-byte areas that hold RBAs into 8-byte areas to hold XRBA, as well as changing the RBA keyword to XRBA.

DFHFC6040 I DATE TIME APPLID Timeout period has expired processing a generic delete against an RLS file. The task was waiting on a get for update request for a locked record that was beyond the range of the generic delete. Once the get for update request has timed out, the delete command completes and the task resumes normal execution. File name filename. Data set name dsname.

Explanation
A program has issued a generic delete request against an RLS file. The request involves a series of get update and erase requests to VSAM to remove the records in the range of the delete. If a record with a key outside the range of the delete is encountered, the request completes. If a record that is locked to another request is encountered, the generic delete waits for the other request to complete or will eventually timeout. If the get update request times out, CICS treats this as a successful completion of the generic delete request and the task resumes normal execution.

The name of the file used is filename. The data set is dsname.

System action
This is an informational message that identifies when a generic delete request against an RLS file is delayed for this particular reason. CICS continues processing.

User response
Investigate the other users of the file if appropriate.

4. poolname

**Destination**

Console

**DFHFC7004**

*applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the table is not yet loaded.*

**Explanation**

The OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the table requires loading and is not already being loaded. The user has tried to open it for shared access. A shared
access open will only succeed if the table is already being loaded or has completed loading.

**System action**
The table cannot be opened.

**User response**
Investigate why the table has not already been loaded or started loading. Change the file definition to make this OPEN do the load if that is appropriate.

**Module:**
DFHFCDO

**XMEOUT parameters/Message inserts**
1. applid
2. dddd
3. filename
4. poolname

**Destination**
Console

**DFHFC7005**  
applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because of a shared access conflict.

**Explanation**
The OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because of a shared access conflict. CICS either requests an EXCLUSIVE open (for the purposes of loading) or a SHARED open (for all other cases).

For a shared open request, this error means that the open mode which CICS has specified for this data table conflicts with the shared access mode which has been specified by an existing exclusive open for the data table. For an exclusive open request, this means that the shared access mode which CICS has specified on the open conflicts with one or more existing shared opens for the data table. CICS should not normally specify conflicting open or shared access modes.

**System action**
The file cannot be opened.

**User response**
Investigate the access modes of other opens against the data table dddd in pool poolname, using a server query, to determine whether there is an error.

**Module:**
DFHFCDO

**XMEOUT parameters/Message inserts**
1. applid

3. filename
4. poolname

**Destination**
Console

**DFHFC7006**  
applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because of an exclusive access conflict.

**Explanation**
The OPEN of coupling facility data table dddd for file filename, pool poolname has failed because of an exclusive access conflict. Exclusive access to the data table is not available. This error can occur when CICS has requested an exclusive open in order to load the data table from a source data set, if another open already has exclusive access. The error can also occur on a request to delete a data table if there are any opens against the data table. CICS should not normally specify access modes which could result in an exclusive access conflict.

**System action**
The table cannot be opened.

**User response**
Investigate any other opens against the data table dddd in pool poolname, for example using a server query, to determine whether it is expected that access is denied.

**Module:**
DFHFCDO

Destination
Console

DFHFC7007 applid OPEN of coupling facility data table ddd for file filename, pool poolname, has failed because one or more attributes on the file definition are incompatible with those that were set for the table when it was created.

Explanation
An OPEN request naming an existing table specifies one or more attributes for the table which are not compatible with those for the existing table. The coupling facility data table server has rejected the open.

The attributes that may be incorrect are:

- record length
- key length
- initial load option
- update model
- recovery status

This can also occur if the coupling facility data table server that is attempting to open the table is at a lower release level than the server which created the table, as the newer server may have set internal attributes when it created the table which are not supported by the older server.

System action
CICS fails the open.

User response
Use the coupling facility data table server DISPLAY command to view the attributes for the table and then determine whether:

- the file definition for the table just opened should have its attributes changed to match the server values
- the already created table is incorrect because the file definition whose open caused the creation of the table has incorrect attributes. In this case the table should be deleted and recreated either by correcting the file definition or via a file definition which already has the correct values.

Note that this problem could occur if there has been unintentional use of the same table name in different file definitions.

When the problem has been corrected, retry the open.

2. dddd
3. filename
4. poolname

Destination

Console

DFHFC7018 applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the table requires loading.

Explanation

The OPEN of file filename has failed because it requires the associated coupling facility data table dddd, which resides in coupling facility data table pool poolname, to have been pre-loaded, but the table has not yet been loaded. Automatic loading of the data table could not be initiated because there is no source data set specified for this file, either in the file definition or in the CICS startup JCL.

System action

The file cannot be opened.

User response

There are a number of possible operational errors which might have resulted in this failure:

1. The application does not require the coupling facility data table dddd to be pre-loaded. The 'load required' parameter should be removed from the file definition for file filename.

2. The application does require the coupling facility data table dddd to be pre-loaded, but it should already have been loaded before file filename was opened.

   If this is the case, then there should be at least one file definition within the sysplex that names data table dddd in pool poolname and which specifies a source data set, or for which the source data set is supplied in the CICS startup JCL. You should issue an open for one of the files which specifies the source data set, after which an open of this file should succeed.

   You may also want to put operational procedures in place which will ensure that in future this file is only opened after the data table has been loaded. Use of the data tables load complete global user exit point, XDTLC, might be one way of achieving this.

3. The application does require the coupling facility data table dddd to be pre-loaded, and it is intended that the load should be automatically initiated by opening file filename (unless the table has already been loaded).

   A source data set name should have been specified, either in the file definition for file filename or in the CICS startup JCL as a DD card for file filename, depending on whether dynamic allocation or preallocation is required respectively.

DFHFC7019 applid OPEN of coupling facility data table dddd for file filename, pool poolname, has failed because the table requires loading but the supplied data set is not KSDS.

Explanation

The OPEN of file filename has failed because it requires the associated coupling facility data table dddd, which resides in coupling facility data table pool poolname, to have been pre-loaded, but the table has not yet been loaded. Automatic loading of the data table could not be initiated because there is no source data set specified for this file, either in the file definition or in the CICS startup JCL.

System action

The file cannot be opened.

User response

There are a number of possible operational errors which might have resulted in this failure:

1. The application does not require the coupling facility data table dddd to be pre-loaded. The 'load required' parameter should be removed from the file definition for file filename.

2. The application does require the coupling facility data table dddd to be pre-loaded, but it should already have been loaded before file filename was opened.

   If this is the case, then there should be at least one file definition within the sysplex that names data table dddd in pool poolname and which specifies a source data set, or for which the source data set is supplied in the CICS startup JCL. You should issue an open for one of the files which specifies the source data set, after which an open of this file should succeed.

   You may also want to put operational procedures in place which will ensure that in future this file is only opened after the data table has been loaded. Use of the data tables load complete global user exit point, XDTLC, might be one way of achieving this.

3. The application does require the coupling facility data table dddd to be pre-loaded, and it is intended that the load should be automatically initiated by opening file filename (unless the table has already been loaded).

   A source data set name should have been specified, either in the file definition for file filename or in the CICS startup JCL as a DD card for file filename, depending on whether dynamic allocation or preallocation is required respectively.
poolname, to have been pre-loaded, but the table has not yet been loaded. Automatic loading of the data table could not be initiated because the source data set specified for this file, either in the file definition or in the CICS startup JCL, is not a KSDS. Coupling facility data tables can only be loaded from VSAM KSDS data sets.

**System action**
The file cannot be opened.

**User response**
Investigate whether the reason for this error is that the file should not have been defined as requiring loading, or that the data set name specified is incorrect, or that no data set name should have been specified (because the data table should be pre-loaded via some other file definition before this file is opened). Correct the file definition, re-install and retry the open.

Destination
Console

**DFHFC7081**  
**applid** OPEN of coupling facility data table **dddd** for file **filename**, pool **poolname**, has failed because the key length or record length parameter on the file definition is inconsistent with the equivalent for the source data set.

Explanation
The OPEN of coupling facility data table **dddd** has failed because before the call to the server to perform the actual open, CICS has found that the record length and/or keylength specified by the user on the file definition does not match that returned by VSAM when the associated source data set was opened.

System action
The table cannot be opened.

User response
Check whether the file definition is in error or whether the wrong data set has been specified. It is not necessary to specify the parameters on the file definition if there is a source data set. Clear the parameters or make them the same as the source.

Module:
DFHFCDO

XMEOUT parameters/Message inserts
1. **applid**
2. **dddd**
3. **filename**
4. **poolname**
Explanation
The OPEN of coupling facility data table dddd has failed because the values for record length and/or key length returned for the table on the open do not match those for the source data set specified in the file definition.

System action
The table cannot be opened.

User response
Check whether the wrong data set has been specified in the file definition. If the table is opened and loaded by another user, it is not necessary for this user to specify source data set in the definition.

Module:
DFHFCDO

XMEOUT parameters/Message inserts
1. applid
2. dddd
3. filename
4. poolname

Explanation
When a coupling facility data table server fails, all the files which were accessing tables in that pool are marked as requiring a re-open after connection to a new server instance. This is required so that a valid table token is obtained for the new instance. The re-open for coupling facility data table dddd for file filename, pool poolname, has failed because the table has gone away (possibly due to a failure of the coupling facility) since it was last opened for this file.

System action
The table cannot be opened. CICS closes and enables the file so that a full open can be tried later. The full open will recreate the table (unless the file definition specifies that the table must already have been recreated, in which case another file definition which specifies it is capable of recreating and loading the table must be opened first).
User response
Retry when the table is available.

Module:
DFHFCDO

XMEOUT parameters/Message inserts
1. applid
2. ddd
3. filename
4. poolname

Destination
Console

DFHFC7085 applid On a request to process [OPEN | CLOSE | EXTRACT STATISTICS] for coupling facility data table ddd for file filename, it has been found that the server for coupling facility data table pool poolname, is down. The server should be restarted.

Explanation
CICS has issued a request to a file which is defined to use a coupling facility data table which resides in the pool poolname. CICS did not currently have a connection established to the pool, so an attempt to connect to the pool has to be made. Before the connect, a query is issued to check whether the server for the pool is available. The query has failed because the server is currently down.

A coupling facility data table server is a separate address space which handles all requests made to coupling facility data tables that reside in the pool which it serves.

System action
If the request is an open, CICS fails the request to the coupling facility data table.

If the request is a close, CICS can complete close processing as normal.

If the request is to extract statistics, issued while gathering file control statistics, the request to obtain the statistics will fail. If the request is to extract statistics, issued as part of INQUIRE FILE processing in order to return the current MAXNUMRECS limit, then the INQUIRE FILE request can complete as normal, but the MAXNUMRECS value returned may differ from the current actual value.

New requests to coupling facility data tables which reside in this pool will check whether the server is available, and will attempt another connect if it is.

User response
Determine the reason for the failure. Diagnostic messages issued by the coupling facility data table server address space should assist you in doing this. The most likely cause of this error is a problem with the coupling facility. The coupling facility data table server does not automatically restart itself, so after you have corrected the cause of the error, you should resubmit the job which starts the server.

Module:
DFHFCDO

XMEOUT parameters/Message inserts
1. applid
2. Value chosen from the following options:
   1=OPEN,
   2=CLOSE,
   3=EXTRACT STATISTICS
3. ddd
4. filename
5. poolname

Destination
Console

DFHFC7086 applid OPEN of coupling facility data table ddd for file filename, pool poolname, has failed because the (keylength | recordsize) of the source data set is greater than the supported maximum.

Explanation
The OPEN of file filename, associated with coupling facility data table ddd in coupling facility data table pool poolname, has failed because the key length and/or record size of the source data set specified for the file is greater than the value supported.

For a coupling facility data table, the key length must be less than or equal to 16 bytes, and the record size must be less than or equal to 32767 bytes.

The message indicates whether it was the key length or the record size which was found to be too large.
System action
The file is left closed.

User response
Check whether the wrong data set has been specified for this file (either in the file definition or in the CICS start-up JCL), and whether this data table really requires pre-loading from a source data set.

If the correct data set was specified, then this file may not be suitable for use as a coupling facility data table. If this was because the key length was beyond the range supported for coupling facility data tables, then consider redefining the file as a user-maintained data table or as an RLS file.

If the data table does not need to be pre-loaded, then specify LOAD(NO) on the file definition, and a key length and record size which are in the supported ranges.

DFHFC7093 date time applid CICS data table load has terminated abnormally for coupling facility data table dddd, file filename, pool poolname, reason code = X'xx'.

Explanation
The CICS task that is loading coupling facility data table dddd has received a reason code X'xx', where X'xx' has one of the following values:

X'02'
ILLOGIC - A VSAM error which does not fall into one of the other categories.

X'0C'
NOTOPEN - The file is CLOSED and UNENABLED, or still open and in use, but a CLOSE request has been received.

X'0D'
DISABLED - The file is DISABLED.

X'0F'
ENDFILE - The file is CLOSED and UNENABLED, or still open and in use, but a CLOSE request has been received.

X'80'
IOERR - I/O error.

X'84'
TABLE_FULL - Maximum records exceeded.

X'85'
RLS_DISABLED - RLS access currently not available.

X'86'
RLS_FAILURE - The RLS server has failed.

X'87'
PREVIOUS_RLS_FAILURE - The RLS server has been recycled in this unit of work.

X'88'
CACHE_FAILURE - Cache connectivity failure.

X'89'
CFDT_POOL_FULL - No more space available in the coupling facility structure for the table pool.

X'8A'
DATASET_BEING_COPIED - DSS is performing a sharp copy

System action
The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. The user exit may ask for the file to be closed. No more records are loaded into the coupling facility data table.
If the user exit did not request the file to be closed (or if no user exit program was enabled at the XDTLC exit point), then API requests to access records within the range of keys which has already been loaded into the data table will succeed, but requests to access any record beyond the loaded range will receive the "LOADING" condition.

If the file has been closed, then API requests will receive a "NOTOPEN" condition.

CICS processing continues.

User response

Investigate the reason for the return code from CICS file control. For further information about the reason code, see the description of exception conditions for the STARTBR, READNEXT and WRITE commands in the CICS Application development reference.

You may be able to correct the cause of the failure, for example by explicitly enabling the file if the reason is DISABLED, or re-cycling the RLS server if it has failed. If the error is TABLE_FULL, meaning that the number of records to be loaded into the table exceeds the MAXNUMRECS parameter, then you can increase this parameter using the coupling facility data tables server command SET TABLE=tablename,MAXRECS=n. (Note that although altering the MAXNUMRECS parameter on the file definition within CICS, using SET FILE for example, will not have any effect on the current setting for the data table, you should consider resetting it to the new value in order to avoid getting a warning message about the mismatch.) If the error is CFDT_POOL_FULL, then you can increase the size of the coupling facility data table pool that this data table resides in.

If it is possible to correct the problem which caused the load to fail, then you can complete the load of the coupling facility data table by closing the file which attempted the load (if it has not already been closed) and re-opening it, or any other file which is capable of loading the table; that is, which has access to the source data set. This will cause the load to be restarted from the point at which it failed.

DFHFC7100 date time applid CICS data table load has terminated abnormally for coupling facility data table name, file filename, pool poolname, a call to FCFR to BROWSE the source data set has failed for reason code = n.
Explanation

The CICS task which is loading coupling facility data table *dddd* has failed while calling file control to browse the source data set. The value of the reason code *n* indicates the type of failure as follows:

1. Response from FCFR was INVALID.
2. Response from FCFR was DISASTER.
3. Response from FCFR was PURGED.
4. FCFR failed for some unexpected reason.

System action

The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. The user exit may ask for the file to be closed. No more records are loaded into the coupling facility data table, and CICS terminates the loading transaction with abend code ACFA.

If the user exit did not request that the file be closed (or if no user exit program was enabled at the XDTLC exit point), then API requests to access records within the range of keys which has already been loaded into the data table will succeed, but requests to access any record beyond the loaded range will receive the "LOADING" condition.

If the file has been closed, then API requests will receive a "NOTOPEN" condition.

CICS processing continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Determine the cause of the failure of the domain call using the diagnostic information provided by file control.

If it is possible to correct the problem which caused the browse to fail, then you can complete the load of the coupling facility data table by closing the file which attempted the load (if it has not already been closed) and re-opening it, or any other file which is capable of loading the table; that is, which has access to the source data set. This will cause the load to be restarted from the point at which it failed.

| date | time | applid | CICS data table load has failed to close coupling facility data table *dddd*, file *filename*, pool *poolname*, a call to FCFS has failed for reason code = *n*. |

Explanation

The CICS task that is loading coupling facility data table *dddd* has failed while trying to close the file at the request of an exit program invoked at exit point XDTLC. The value of reason code *n* indicates the type of failure as follows:

1. Response from FCFS was INVALID.
2. Response from FCFS was DISASTER.
3. Response from FCFS was PURGED.
4. FCFS failed for some unexpected reason.

System action

CICS terminates the loading transaction with abend code ACFA.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

It is unlikely that the user exit invoked at the XDTLC exit point would request that the file should be closed unless a previous problem had occurred with the load. Determine the cause of any such previous problem by checking for earlier messages which may have been issued referring to data table *dddd*. Diagnostic information provided by file control may be used to investigate the failure of the close file call.

CICS processing continues.

Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

DFHFC7103 date time applid CICS data table load has terminated abnormally for coupling facility data table dddd, file filename, pool poolname.

Explanation
The special CICS transaction that was loading coupling facility data table dddd has detected an abnormal termination.

System action
Depending on the cause of this abnormal termination, CICS may produce either a system dump or a transaction dump.

The user exit XDTLC is invoked, if enabled, with the parameter UEPDTORC set to indicate that loading completed abnormally. The user exit may ask for the file to be closed. No more records are loaded into the coupling facility data table, and CICS terminates the loading transaction with abend code ACFA.

If the user exit did not request that the file be closed (or if no user exit program was enabled at the XDTLC exit point), then API requests to access records within the range of keys which has already been loaded into the data table will succeed, but requests to access any record beyond the loaded range will receive the "LOADING" condition.

If the file has been closed, then API requests will receive a "NOTOPEN" condition.

CICS processing continues.

User response
Look at the system log for related CICS messages to determine the original abend detected by the loading transaction. Refer to the description of abend code ACFA for further information about the cause of the original termination.

For more information on how to determine system problems, refer to the Troubleshooting and support.

If it is possible to correct the problem which caused the load to abend, then you can complete the load of the coupling facility data table by closing the file which attempted the load (if it has not already been closed) and re-opening it, or any other file which is capable of loading the table; that is, which has access to the source data set. This will cause the load to be restarted from the point at which it failed.

DFHFC7110 applid An attempt to connect to coupling facility data table pool poolname, issued by module modulename, has failed.

Explanation

CICS has issued a request to a file which is defined to use a coupling facility data table which resides in the pool poolname. CICS did not currently have a connection established to the pool, so an attempt to connect to the pool has been made. This attempt has failed. The connect attempt was issued from module modulename.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool which it serves. CICS must have a connection to the server before it can open and access coupling facility data tables in the pool.

System action

CICS fails the request to the coupling facility data table.

New requests to coupling facility data tables which reside in this pool will check whether the server is available and will attempt another connect if it is.

User response

Determine the reason for the failure to connect. Diagnostic messages issued by the coupling facility data table server address space should assist you in doing this. The most likely cause of this error is a problem with the coupling facility. The coupling facility data table server does not automatically restart itself, so after you have corrected the cause of the error, you should resubmit the job which starts the server.

Module:
DFHFCDR, DFHFCDO, DFHFCDU

Destination
Console

DFHFC7111 applid An attempt to disconnect from the coupling facility data table server for pool poolname for connection token X'connecttoken', issued by module modulename, has failed.

Explanation

CICS has detected that an instance of the coupling facility data table server for pool poolname has failed. CICS has therefore attempted to disconnect from this pool server, but this attempt has failed. The disconnect has been issued by module modulename,
and connecttoken is the token which was associated with the connection to this pool server.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool which it serves.

**System action**

CICS continues. As soon as a new instance of the pool server is available (which it might already be) then CICS can re-establish a connection to the server and continue to process coupling facility data table requests.

In many cases, CICS will later be able to disconnect from the server automatically. If not, the only effect of this failure is that some storage allocated by the server to the connection will not be freed until CICS terminates, at which time a disconnect message will be issued by the pool server for each instance from which CICS failed to disconnect.

**User response**

Determine the reason for the failure to disconnect. Diagnostic messages issued by the coupling facility data table server address space should assist you in doing this.

**Module:**

DFHFCDR, DFHFCDO, DFHFCDU

4. modulename,

**Destination**

Console

**DFHFC7112**  applid Resynchronization of coupling facility data table pool poolname issued from module modulename has failed.

**Explanation**

CICS has issued a request to a file which is defined to use a coupling facility data table which resides in the pool poolname. CICS did not currently have a connection established to the server for this pool, so an attempt to connect to and resynchronize the pool server has been made, but the resynchronization has failed. The attempt to resynchronize was issued from module modulename.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool which it serves. When CICS re-establishes its connection to a coupling facility data table pool server, it must perform resynchronization in order to complete recovery processing for any unresolved units of work which had made recoverable updates to coupling facility data tables residing in the pool.

**System action**

CICS fails the request to the coupling facility data table.

Other requests to coupling facility data tables which reside in this pool will succeed if they do not require the pool to have been resynchronized, or might attempt another resynchronization if they do.

**User response**

Determine the reason for the failure to resynchronize. Diagnostic messages issued by CICS components involved in the resynchronization and by the coupling facility data table server address space should assist you in doing this.

Depending on the stage during resynchronization at which the failure occurred, any subsequent request to a recoverable file which uses a coupling facility data table in the pool might trigger an attempt to retry the resynchronization. If such requests do not trigger a retry, then you should recycle the server region for this pool (by stopping or cancelling the server region using a server command, and then restarting it).

**Module:**

DFHFCDR, DFHFCDO, DFHFCDU

**XMEOUT parameters/Message inserts**

1. applid
2. poolname
3. modulename

**Destination**

Console

**DFHFC7113**  applid An attempt to retry resynchronization of coupling facility data table pool poolname issued from module modulename has failed.
Explanation
CICS has issued a request to the coupling facility data table server for pool poolname. This request requires the pool to have been resynchronized.

Although CICS currently has a connection established to the pool server, an earlier attempt to resynchronize the pool failed, so the resynchronization has been retried. This retry has also failed. The attempt to retry resynchronization of the pool was issued from module modulename.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool which it serves. When CICS has re-established its connection to a coupling facility data table pool server, it must perform resynchronization in order to perform recovery processing for any unresolved units of work which had made recoverable updates to coupling facility data tables residing in the pool.

Certain requests require the coupling facility data table pool to have been resynchronized before they can succeed. Such requests include:

• Open requests for files which are defined to use recoverable coupling facility data tables (open requests against non-recoverable coupling facility data tables do not require the pool to have been resynchronized).
• Syncpoint requests for units of work which have made recoverable updates to coupling facility data tables such as commit or rollback requests.

These requests do not require all the units of work to have been resolved, but they do require CICS to have successfully restarted its recoverable connection to the pool server.

System action
CICS fails the request to the coupling facility data table pool.

Other requests to this pool server will succeed if they do not require the pool to have been resynchronized, or will attempt another resynchronization if they do.

User response
Determine the reason for the failure to resynchronize. Diagnostic messages issued by CICS components involved in the resynchronization and by the coupling facility data table server address space should assist you in doing this.

Module:
DFHFCDO, DFHFCDU

2. poolname
3. modulename

Destination
Console

DFHFC7114 applid Force purge of transaction trannum which made recoverable updates to coupling facility data table pool poolname has failed.

Explanation
An attempt to force purge transaction trannum has failed. The system attempted to force purge the transaction because it had made recoverable updates to one or more coupling facility data tables residing in the coupling facility data table pool poolname, and the server for that coupling facility data table pool is undergoing resynchronization. The fact that this resynchronization is taking place is an indication that a failure has occurred which will have resulted in all recoverable updates made to the coupling facility data table pool poolname, which have not yet been committed, having been backed out. This transaction had therefore made updates which have since been backed out, so the transaction needs to be abended, in order to ensure that any updates which it made to other recoverable resources will also be backed out. However, it has not been possible to purge this transaction.

The effect of the failure to purge this transaction is that updates made to other recoverable resources may be committed, with the result that the overall unit of work will not be commit-consistent. It is also possible that the transaction will try to make subsequent updates to the coupling facility data table pool which will cause it to be abnormally terminated.

System action
Resynchronization of the coupling facility data table server pool continues.

User response
If the transaction is still active, then attempt to force purge the transaction using the CEMT main terminal command. However, as this should be a rare situation, consider performing an immediate shutdown of CICS followed by an emergency restart as an alternative solution. This causes all inflight transactions to be backed out.
**Module:** DFHFCDY

**XMEOUT parameters/Message inserts**
1. applid
2. trannum
3. poolname

**Destination**
Console

DFHFC7115  
*applid* The coupling facility data table server for pool *poolname* has failed and restarted. One or more in-flight transactions which had made recoverable updates to coupling facility data tables residing in the pool will be abended.

**Explanation**
The coupling facility data table server for pool *poolname* is undergoing resynchronization. The fact that this resynchronization is taking place is an indication that a failure has occurred which will mean that any recoverable updates made to the coupling facility data pool *poolname* that had not yet been committed will have been backed out. Any in-flight transaction which had made recoverable updates to one or more coupling facility data tables residing in data table pool *poolname* therefore needs to be abended, in order to ensure that any updates which it made to other recoverable resources will also be backed out.

This message is issued to inform you that one or more such in-flight transactions has been found, and that CICS will attempt to abend the transactions and cause them to back out by force purging them. You should therefore expect that one or more transactions will be abnormally terminated with an ATCH transaction abend code (or possibly, in some instances, with an AKC3 abend code).

**System action**
Resynchronization of the coupling facility data table server pool will complete, and one or more in-flight transactions will be abnormally terminated.

**User response**
None.

This message is purely informational, to indicate that transactions will be abended in order to preserve data integrity.

**Module:** DFHFCDY

**XMEOUT parameters/Message inserts**
1. applid
2. poolname

**Destination**
Console

DFHFC7120  
*applid* The coupling facility data table pool *poolname* has an unresolved unit of work X'UOWid' for this CICS region of which CICS has no knowledge.

**Explanation**
CICS is resynchronizing the coupling facility data table server for pool *poolname*.

A coupling facility data table server is a separate address space that handles all requests made to coupling facility data tables which reside in the pool that it serves. When CICS has established its connection to a coupling facility data table pool server, it must perform resynchronization in order to perform recovery processing for any unresolved units of work which had made recoverable updates to coupling facility data tables residing in the pool. The resynchronization involves restarting the recoverable connection to the pool server, and completing any unresolved units of work known to the server for which the resolution is now known.

The server has an unresolved unit of work UOWid, but CICS has no knowledge of a link to the pool server for this unit of work. Knowledge of links will be lost when CICS performs an initial start, but in the case of unit of work UOWid there has not been a CICS initial start since the unit of work was created.

**System action**
CICS resolves the unit of work by backing out the updates that it made to coupling facility data tables within the pool, and completes resynchronization of the pool.

**User response**
Since CICS will have resolved the unit of work, you do not need to take any immediate action. This message
is issued to provide diagnostic information which you may want to use to understand why CICS had no knowledge of the link.

**Module:**

**Destination**
Console

**DFHFC7130**  
date time applid tranid trannum termid userid. Unit of work X’uowid’ running in region owner-applid in MVS system MVSid holds a lock on key X’keyid’ in coupling facility data table tablename in pool CFDTpool, which caused this request to wait.

**Explanation**
This message is issued to aid problem determination when a transaction that has accessed, or attempted to access, a coupling facility data table is about to terminate abnormally with an AFCY abend code.
The message is issued when a request to a coupling facility data table times out waiting on a lock. A request that requires a lock on a coupling facility data table has been issued, but was forced to wait because the record was locked by another unit of work. The wait has been purged by one of the following actions:
- The timeout time for the transaction has been exceeded.
- CICS has purged transactions in an attempt to alleviate a short-on-storage (SOS) condition.
- The transaction has been purged by an operator request.
The name of the transaction that has failed is tranid and it is running under task number trannum, at terminal termid, for user userid.
The message inserts identify the owner of the lock that caused this transaction to timeout:
- uowid is the local UOW id of the unit of work running in the region that owns the lock.
- owner-applid is the applid of the region that owns the lock.
- MVSid is the name of the MVS system in which the region that owns the lock is running.
- keyid identifies the key that is locked. As it is not always possible to display keys in character form, the key is displayed in hexadecimal notation.
• `tablename` is the name of the coupling facility data table against which the lock is held.
• `CFDTpool` is the name of the coupling facility data table pool in which the CF data table `tablename` resides.

The locks held against coupling facility data tables are always exclusive locks, and can only have one holder. Therefore, this message uniquely identifies the owner of the required lock.

**System action**
The transaction is abended with an AFCY abend code.

**User response**
This message identifies the unit of work that is holding the required lock and the region in which it is running. Examine this unit of work to see why it is not releasing the lock; for example:

- The unit of work may be holding CF data table locks and waiting for terminal input.
- The unit of work may be trying to access both coupling facility data table resources and resources owned by another resource manager, creating an inter-resource manager deadlock.

**DFHHCnnnnn messages**

### DFHHC0101I `applid` CICS has registered successfully to the z/OS Health Checker.

**Explanation**
CICS has registered successfully to z/OS Health Checker.

It will check definitions periodically and update the z/OS Health Checker.

**System action**
CICS continues.

**User response**
None. The message can be suppressed with the system initialization parameter MSGLVL=0.

**Module:** DFHHCHK

### DFHHC0102I `applid` CICS failed to register with the z/OS Health Checker: code(X'code') reason(X'reason') response(X'response').

**Explanation**
CICS failed to register with the z/OS Health Checker: code(code) reason(reason) response(response).

**System action**
CICS continues.

**User response**
The code for the failure denotes the macro call that has failed. 1 = GETMAIN, 2 = IARV64, 3 = CSVDYNEX, 4 = HZSCHECK. Depending upon the failure code, refer to the following:
The GETMAIN macro is described in the z/OS MVS Programming: Authorized Assembler Services Reference EDT-IXG.
The IARV64 macro is described in the z/OS MVS Programming: Authorized Assembler Services Reference EDT-IXG.

The CSVDYNEX macro is described in the z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN.

The HZSCHECK macro is described in the IBM Health Checker for z/OS Users Guide.

If the z/OS Health Checker is not active, you will need to start the Health Checker inorder to collect CICS health checks. After restarting the Health Checker, you will need to start this region, or start a new region in this LPAR in order to register.

If the health checker is active, you will need assistance from IBM. Take a system dump of CICS and the z/OS Health Checker. See Working with IBM to solve your problem for guidance on how to proceed.

DFHICnnnn messages

DFHIC0002 applid A severe error (code X'code') has occurred in module modname.

Explanation
An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where it was detected.

System action
An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you will need assistance. Bring CICS down in a controlled shutdown and collect the dumps and any relevant messages sent by the module identified in the message. See Working with IBM to solve your problem for guidance on how to proceed.

A STARTed nonterminal transaction is ending abnormally and automatic transaction restart was requested via the user replaceable module DFHREST. A severe error occurred when CICS attempted to restart the transaction.

System action
Message DFHAP0002 with a dump is issued for the severe error that caused the restart to fail. Abnormal termination of the transaction for which restart was requested continues. The transaction is not automatically restarted.

User response
Investigate the reason for the earlier severe error. See message DFHAP0002 for further guidance. Restart the transaction manually if necessary.

Module:

4. tranid

Destination
CSMT and Console

DFHIC0310  date time applid Unable to attach transaction - tranid to terminal - termid

Explanation
An attempt was made to start transaction tranid on terminal termid as a result of:

• a START command, or
• a DFHIC TYPE=PUT macro, or
• a DFHIC TYPE=INITIATE macro.

The attempt was rejected. The most likely cause is that, at the time the attempt was made, the terminal was unknown in the system.

This message is also issued when:

• A START command is issued in an application owning region (AOR) for a terminal that exists as a remote terminal entry in the AOR, but the destination system ID associated with the remote terminal has not been defined.
• A START command is issued against a pipeline device, or other device which is not eligible for ATI requests.

System action
The request is deleted from the system.

User response
Ensure that a valid terminal name is being specified. If the name is valid, examine the trace (if one is available) to determine why the attempt was rejected.

Console

DFHIC0360  date time applid An attempt to establish security for userid userid has failed. Transaction tranid cannot be started without a terminal. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').

Explanation
An attempt was made to establish security for userid userid but it was rejected by the external security manager (ESM).
A time ordered request, such as an EXEC CICS START command, required security to be established for the userid in order to start the transaction tranid without a terminal.

**System action**

Security has not been established for the userid. The attempt to start the transaction has failed.

**User response**

The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the z/OS MVS Programming: Authorized Assembler Services Guide, and in z/OS Security Server RACROUTE Macro Reference (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

CSCS

**Explanation**

This console message is printed when the operating system-maintained time of day has been rolled back or rolled forwards (for example, when the operating system clock is reset to zero at midnight). Where:

- **applid**
- **hh.mm.sss** is the time in hours minutes and tenths of a second
- **dddddddd** is the current date in the format specified by the DATFORM parameter in the system initialization table
- **rrr** is the day number relative to the day CICS was started.

**System action**

CICS has recognized the condition and adjusted its own time of day to agree with that of the operating system.

**User response**

None

**Module:** DFHTAJP

**XMEOUT parameters/Message inserts**

1. applid
2. hh.mm.sss
3. hh.mm.sss
4. dddddddd
5. rrr

**Destination**

Console

**Explanation**

CICS execution is dependent on the continued operation of the processor time-of-day clock. This warning message is sent to the console operator during the execution of the time adjustment program if the system detects a processor clock failure at that time. Immediate corrective action (if possible) must be taken by the console operator, if the clock has been disabled for any reason.

**System action**

CICS abnormally terminates itself after the condition is detected.

**User response**

The ability to enable or disable the time-of-day clock is under the control of the console operator. If the clock is disabled, it must be enabled immediately.

**DFHIEEnnnn messages**

<table>
<thead>
<tr>
<th>Message Code</th>
<th>Explanation</th>
<th>System action</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHIE0001</td>
<td>applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.</td>
<td>An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect. Message DFHME0116, which contains the symptom string for this problem, is produced.</td>
</tr>
</tbody>
</table>

**Explanation**

An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

DFHIEXM

<table>
<thead>
<tr>
<th>Message Code</th>
<th>Explanation</th>
<th>System action</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHIE0002</td>
<td>applid A severe error (code X'code') has occurred in module modname.</td>
<td>An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.</td>
</tr>
</tbody>
</table>

**Explanation**

An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

**System action**

An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.
User response

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHIEXM

XMEOUT parameters/Message inserts

1. applid
2. X'code'
3. modname

Destination
Console

DFHIE0003 applid Insufficient storage to satisfy Getmain (code X'code') in module modname.

Explanation

A CICS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

System action

An exception entry is made in the trace table (code code in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. This is a critical error.

If DFHIEDM issues this message, CICS terminates, even if you have specified in the dump table that CICS should not terminate.

If DFHIEXM issues this message, an exception trace and a system dump is taken and CICS continues.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module modname, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the size limits of the DSAs or EDSAs. See the Configuring or the Improving performance for further information on CICS storage.

Module: DFHIEXM

XMEOUT parameters/Message inserts

1. applid
2. X'code'
3. modname

Destination
Console

DFHIE0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction that was executing at the time the error was detected.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. This is a critical error.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message
DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module `modname` will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module `modname` has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module `modname`, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

| DATE TIME APPLID | A security error has been detected whilst processing an attach from a TCP/IP attached client. |
Explanation
A request to attach a transaction failed due to a security problem. The security fields extracted from the Attach FMH5 were passed to the Security Domain to signon the user, but the signon call failed.

System action
The attach request is rejected.

User response
Refer to previous security messages which are written to TDQ CIEO such as DFHIE0360 for further information and guidance. If no previous messages were issued, examine the trace to determine the reason for the signon failure. Check that if the userid or password are passed on the Attach FMH5, then they are valid.

1. DATE
2. TIME
3. APPLID

Destination
CIEO
DFHIE0998 date time applid Mirror transaction processing ECI request from TCP/IP connected client has abended with code abcode.

Explanation
A mirror transaction processing an ECI request for a TCP/IP connected client has abended with the specified abend code. This is because of an error in the user program linked for the ECI request, or because of an error in CICS. The abend processing has invoked IE domain to inform the client of the failure.

System action
If the original problem was in IE domain, the appropriate error actions will already have been taken. If the problem was not in IE domain, this message will be attached as Error Log Data to an FMH7 that is sent to the client to abend the conversation.

User response
Use the messages and dumps from the transaction abend to determine the root cause of the problem.

Module:
DFHIEIE

1. DATE
2. TIME
3. APPLID

Destination
CIEO
DFHIE1001 date time applid client_ip_addr tcpipservice Data received from
the client violated the bracket protocol.

**Explanation**

Data received from the client violated the bracket protocol used in communication between the client and CICS to delimit the start and end of conversations. One of the following situations has occurred.

- A flow without Begin Bracket arrived when there was no active conversation
- A flow with Begin Bracket arrived when there was an active conversation
- An FMH7 (conversation abend) flow without End Bracket was received.

This has probably happened because a separate error has caused CICS and the client to have a different view of the current state of conversations on the connection, or because the data has been corrupted at some point in the transmission.

**System action**

An exception trace is written. It contains the data received from the client, and the state of any relevant conversation in CICS. The data is then ignored.

**User response**

If there are any other errors preceding this one, then take action to correct them and retry the client transaction. If there are no other errors apparent, restart the client connection and retry the client transaction.

**Module:**

DFHIEIE

**XMEOUT parameters/Message inserts**

1. date

4. client_ip_addr
5. tcpipservice

**Destination**

CIEO

**Explanation**

Data received from the client violated the chaining protocol used in communication between the client and CICS. All flows must have the Only In Chain (OIC) indicators set on.

This has probably happened because a separate error has caused the data to be corrupted at some point in the transmission.

**System action**

An exception trace is written. It contains the data received from the client, and the state of any relevant conversation in CICS. The data is then ignored.

**User response**

If there are any other errors preceding this one, then take action to correct them and retry the client transaction. If there are no other errors apparent, restart the client connection and retry the client transaction.

**Module:**

DFHIEIE

**XMEOUT parameters/Message inserts**

1. date
time applid
4. client_ip_addr
5. tcpipservice

**Destination**

CIEO

**Explanation**

A mirror task processing work for a client was waiting to receive more data, but nothing arrived before the RTIMOUT interval had expired. The PING protocol was then used to see if the client was still active, and this also failed to receive a response.

**System action**

An exception trace is written. It contains information on the current state of the client and the state of the relevant conversation in CICS. An AIEA abend is issued for the mirror task. CICS attempts to purge any
active conversations for the client. The connection to
the client is terminated.

User response
Determine why the client has stopped responding.
If there are any other errors preceding this one,
then take action to correct them, restart the client
connection and retry the client transaction. If there
are no other errors apparent, restarting the client
connection and retrying the client transaction may also
work.

Module:
DFHIEIE

5. tcpipservice

Destination
CIEO

DFHIE1004 date time applid client_ip_addr
tcpipservice Data received from
the client had an invalid length
field.

Explanation
Data received from the client contains a standard
header, the first four bytes of which contain the length
of the rest of the data. This length was either less than
the length of the standard header, or more than the
maximum possible for an ECI flow. This has probably
happened because a separate error has caused the
data to be corrupted at some point in the transmission.

System action
An exception trace is written. It contains the data
received from the client in the install flow. The
connection to the client is terminated. There should be
messages and (possibly) dumps from a component of
CICS other than IE to indicate the cause of the failure.

User response
Proceed as recommended by the messages issued by
the failing component.

**DFHIE1107** `date time applid client_ip_addr tcpipservice` Error freeing IE domain storage. Task terminated.

**Explanation**
The IP ECI (IE) domain issued a storage manager freemain which did not complete successfully. This is probably because of a storage overwrite or an internal error in SM domain. This message should be preceded by an SM failure message.

**System action**
An exception trace is written by IE domain and the IP ECI listener task (CIEP) or the mirror task is abended.

**User response**
Determine the reason for the storage manager failure.

**Module:**
DFHIEIE

CIEO

DFHIE1201  date time applid client_ip_addr tcpipservice  Error attaching mirror transaction id transid.

Explanation

The IP ECI (IE) domain issued a transaction manager attach for a mirror task to process an ECI request received from a client. The attach did not complete successfully. This is probably because of a storage overwrite or an internal error in XM domain. This message should be preceded by an XM failure message.

System action

An exception trace is written by IE domain. An error flow (FMH7) is sent to the client to inform it of the failure of the request.

User response

Determine the reason for the XM failure.

Module: DFHIEIE

XMEOUT parameters/Message inserts

4. client_ip_addr
5. tcpipservice
6. transid

Destination

CIEO

DFHIE1202  date time applid client_ip_addr tcpipservice  ECI request timed out. Abnormal termination initiated.

Explanation

The conversation ping protocol was used because a current ECI conversation appeared to be inactive. The protocol confirmed that the client and CICS were both unable to continue so the decision was taken to abend the conversation. The most likely cause of this is that the user program specified in the ECI request has issued calls that have caused the mirror task to go into a prolonged wait state, so preventing a reply to the ECI request being sent to the client.

System action

An exception trace is written by IE domain. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response

Determine the reason for the mirror task going into a prolonged wait state.

Module: DFHIEIE

CIEO

DFHIE1204  
\[ date time applid client_ip_addr tcpipservice \]
Data lost during ECI request processing.

Explanation
The conversation ping protocol was used because a current CIEO conversation appeared to be inactive. The client returned NOT_ABENDED to the conversation ping request sent by CICS, indicating that it is in RECEIVE state having sent the data that CICS timed out waiting to receive. However, CICS has not received the data. This error is probably due to other errors that occurred during the lifetime of the conversation.

System action
An exception trace is written by IE domain. An error flow (FMH7) is sent to the client indicating that the conversation is to be abended. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response
Determine the reason for the loss of data by analyzing the cause of the associated errors.

CIEO

DFHIE1205  
\[ date time applid client_ip_addr tcpipservice \]
Unrecognizable data received from a TCP/IP connected client.

Explanation
CICS has received data from TCP/IP on a port number for which the TCPIPSERVICE specifies transaction ID CIEP. This means that CICS expects it to be an ECI request or an ECI-related flow. The data was not recognizable as either of these. This error is probably due to an incorrect TCPIPSERVICE definition or to other errors related to the TCP/IP connection that have corrupted the flow sequence.

System action
An exception trace is written by IE domain. If the first part of the flow was recognizable as the header of an ECI flow then CICS may have matched it up with its state for an existing conversation. If so, an attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

User response
Ensure that only ECI requests are sent in on the specified TCPIPSERVICE or determine the reason for the corrupted data by analyzing the cause of the associated errors.

**DFHIE1210  
*date time applid client_ip_addr tcpipservice ECI request timed out. Client says conversation not known.*

**Explanation**

The conversation ping protocol was used because a current ECI conversation appeared to be inactive. The client indicated that it did not know about the specified conversation so CICS will attempt to purge the associated mirror task. The most likely cause of this is that the client program encountered an error and lost track of current requests.

**System action**

An exception trace is written by IE domain. An attempt is made to purge the mirror task that is responsible for processing the ECI request. If this fails, the task is marked so that it will abend when it next attempts to communicate with the client.

**User response**

Determine the reason for the client losing track of the conversation.

**Module:**

DFHIEIE

**Destination**

CIEO

---

**DFHIE1211  
*date time applid client_ip_addr tcpipservice ECI request mirror task abended because of read time out or earlier error.*

**Explanation**

This ECI request mirror task was flagged for abend for one of the following reasons.

- There was no response within the RTIMOUT period when CICS was waiting for data from the client on this conversation.
- There was an error on the conversation and the mirror task purge request could not be completed (probably because the mirror has the recommended setting of SPURGE(NO)).

**System action**

An exception trace is written by IE domain. The mirror task issues a transaction abend.

**User response**

Determine why the client has not sent the next flow in this conversation or see the user response for the earlier IE domain message.

DFHINnnnnn messages
\textbf{DFHIN1001} date time applid termid userid The indoubt tool is now active for DFHTCIND tranclass transactions.

\textbf{Explanation}
The indoubt tool is active and causes all units of work (UOWs) running under transactions defined to be in
transaction class DFHTCIND to fail indoubt when they reach syncpoint.

A unit of work that fails indoubt is either shunted by the recovery manager domain or is unilaterally committed or unilaterally backed out by recovery manager. A unit of work is shunted if the transaction definition under which it is running specifies WAIT(yes) as an indoubt option, and the unit of work has not accessed any resources that force a unilateral decision to be taken.

**System action**
CICS processing continues with the indoubt tool active.

**User response**

CICS processing continues with the indoubt tool inactive.

User response
None.

Module:
DFHINDT

Destination
Terminal End User

DFHIN1007  date time applid termid userid  Initiation of resynchronization for units of work awaiting coordinator DFHINDSP is now complete.

Explanation
A CIND RESYNC COMMIT or CIND RESYNC BACKOUT request was issued. The indoubt tool has successfully initiated resynchronization of all units of work (UOWs) currently awaiting resynchronization with coordinator DFHINDSP.

System action
Shunted UOWs awaiting the return of coordinator DFHINDSP are unshunted by the recovery manager (RM) domain. All participants in the UOW are notified of the outcome of the unit of work. The outcome of the unit of work is defined by the user of CIND, for example, CIND RESYNC COMMIT tells the RM domain to unshunt the UOWs and commit them. Likewise, CIND RESYNC BACKOUT tells the RM domain to backout the UOWs. Message DFHIN1012 is issued to transient data for each UOW resynchronized.

For UOWs awaiting the return of coordinator DFHINDSP which were not shunted, that is, they abended before syncpoint, or a unilateral decision was taken, a CIND RESYNC command merely results in message DFHIN1012 being issued to transient data. DFHIN1012 reports on whether this CICS system and DFHINDSP are synchronized.

User response
See the associated transient data DFHIN1012 messages.

Destination
CSMT

DFHIN1011 date time applid Coordinator DFHINDSP is not available, but UOW X'uowid' for transaction tranid task number taskno is not indoubt and has not been shunted.

Explanation
UOW X'uowid' for transaction tranid was not shunted, and is not indoubt despite being monitored by the indoubt tool. One of the following has occurred:
• The unit of work abended before syncpoint.
• The unit of work was rolled back.
• The unit of work failed indoubt at syncpoint time but the recovery manager domain was forced to take a unilateral decision instead of shunting the UOW.
• The unit of work failed indoubt at syncpoint time but the recovery manager domain detected that the unit of work was read-only, that is, no recoverable resources were updated, and therefore no shunting was required.

**System action**
CICS processing continues.

**User response**
If the unit of work was abended, rolled back, or a unilateral decision was taken, recovery manager keeps the resolution of the unit of work pending the return of the coordinator DFHINDSP.

To synchronize the outcome of the UOW with coordinator DFHINDSP, issue a CIND RESYNC command.

**Module:**
DFHINDT

**XMEOUT parameters/Message inserts**

1. `date`
2. `time`

DFHIN1014  date time applid The indoubt tool will not operate on transaction tranid task number taskno as it is an internal CICS system transaction.

Explanation
The indoubt tool task related user exit DFHINTRU, invoked when a transaction is first started, has detected that the transaction is part of transaction class DFHTCIND. However it has also detected that the transaction is an internal CICS system transaction. CIND cannot be used on internal CICS system transactions.

System action
The named transaction and task continue processing and are not forced indoubt at syncpoint time.

User response
None.

Module: DFHINDT

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. tranid
5. taskno

Destination
CSMT

DFHIN1015  date time applid The indoubt tool has already previously resynchronized UOW X'uowid' for transaction tranid task number taskno. DFHINDSP coordinator UOW status is {commit. | backout.} Recovery manager UOW status is {commit. | backout. | heuristic commit. | heuristic backout.}

Explanation
The named unit of work (UOW) for the named transaction and task has already been resynchronized as a result of a previous CIND RESYNC command. The message documents the UOW status as defined by the coordinator DFHINDSP, and the unit of work status held by the recovery manager domain.

No messages are issued by the recovery manager domain in this case and no resynchronization takes place. Processing of a previous CIND RESYNC command did not complete fully before CICS failed. In particular, 'forget processing' whereby CICS removes DFHINDSP as a coordinator of the unit of work did not complete. This caused CICS to recover the unit of work on restart with DFHINDSP as coordinator, causing it to be processed by the subsequent CIND RESYNC command.

System action
CICS continues processing.

DFHIR2321  applid MRO/IRC Communication being Terminated. Session(s) with the following Netname(s) are still Active:

Explanation
CICS is attempting to close MRO/IRC communication. This message is normally followed by the netname of each session that is still active, and additionally for EXCI sessions, the jobname, stepname, procname and MVS ID of the batch program communicating on that session.

For EXCI sessions, a netname of GENERIC indicates a generic pipe. For the batch job information to appear in the message, at least one DPL request must have been issued on that session.

Note:
In some circumstances the message is not followed by any netnames. This can occur if CICS is using the cross-system coupling facility (XCF) to communicate across CECs, and CICS is unable to deliver an earlier message to XCF because, for example, the XCF buffer is full.

System action
CICS issues IRC STOP IMMEDIATE to force close the remaining session(s). This message is reissued at 30 second intervals, or until the last session is closed.

User response
None, unless the delay in closedown appears abnormally long. If this is the case, investigate why the session(s) are still active. Take appropriate action to allow the session(s) to close. If no netnames are displayed, investigate why XCF is unable to accept a message from CICS.

Console
DFHIR3747  
**APPLID CONNECTION connid**
with protocol(EXCI) has been connected to by a NON-BATCH system. Connection set out of service.

**Explanation**
A CICS connection has been defined with the protocol EXCI and an attempt has been made to connect to it by a non-batch system.

There are two possible explanations for this message:
- The non-batch system is attempting to communicate with the wrong target connection definition.
- The target connection definition has incorrectly been defined as an EXCI connection.

**System action**
CICS sets the connection out of service.

**User response**
Investigate and correct the relevant connection definitions and set back in service.

**Module:**
DFHCRNP

**XMEOUT parameters/Message inserts**
1. APPLID
2. connid

**Destination**
Console

**Explanation**
A new logname was received during the MRO bind process from the connected system. This indicates that the connected system has restarted with a start type of INITIAL, since it last communicated with this CICS. If the message-issuing system has any resynchronization data relating to units of work from a previous usage of the connection, this data is kept but cannot be used by the system for automatic resynchronization.

**System action**
New MRO work for the connection is not inhibited.

**User response**
Examine the resynchronization information kept by the system from the previous usage of the connection using the

```
EXEC CICS INQUIRE UOWLINK RESYNCSTATUS
```

command (or the equivalent CEMT command) for the named connection in order to locate UOWLINKs with a RESYNCSTATUS of COLDSTART. You can use this information to resolve manually any indoubt units of work that existed on this system or the connected system. When the information is no longer of use, issue the

```
EXEC CICS SET CONNECTION PENDSTATUS(NOTPENDING)
```

command (or the CEMT equivalent) for the named connection to discard the resynchronization data relating to the previous usage. Note that any new resynchronization data generated for the newly established connection is still kept.

The session remains active.

User response
If the session must be stopped, you may have to re-IPL. (To diagnose the underlying problem, contact your IBM Support Center.)

Module:
DFHCRNP

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHIR3751 applid Unable to stop interregion communication session during shutdown.

Explanation
A request has been received (by means of system termination, abnormal termination, or main terminal) to stop the interregion communication session during the shutdown process. This request has failed.

System action
The session remains active.

User response
If the session must be stopped, you may have to re-IPL. (To diagnose the underlying problem, contact your IBM Support Center.)

Module:
DFHSTP

XMEOUT parameters/Message inserts
1. applid
2. modname

Destination
Console

DFHIR3760 applid Unable to break lines with interregion communication. (Modname: modname)

Explanation
A request has been made to shut down the interregion session. This has caused module DFHZCX to issue a request to the interregion communication program to terminate the association between CICS and the interregion communication program, but the request failed because of a system error.

System action
Any running batch (database sharing) programs are left in the wait state, and should be canceled. Any CICS tasks (in other CICS systems) that are in communication with this system are also left in the wait state. These other CICS systems should issue CEMT SET CONNECTION(sysid) OUTSERVICE PURGE, where sysid is the CONNECTION name of the system for which DFHIR3760 was issued. Also, any attempt to restart the interregion session (in the current or any subsequent CICS session) fails.

User response
To run further batch CICS interregion communication, you must re-IPL. You will need further assistance to resolve the underlying problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHZIS2, DFHSTP

XMEOUT parameters/Message inserts
1. applid
2. modname

Destination
Console

DFHIR3762 date time applid Inter-region activity now complete

Explanation
A CEMT SET INTERREGION COMMUNICATION (IRC) CLOSED request was issued at the main terminal. The IRC session is now complete.

System action
Processing continues.

User response
None.

Module:
### DFHIR3765 UNABLE TO STOP INTERREGION COMMUNICATION SESSION AFTER SYSTEM ABEND.

**Explanation**
A request has been received (by means of system termination, abnormal termination, or main terminal) to stop the interregion session. This request has failed.

**System action**
The session remains active.

**User response**
If the session must be stopped, you may have to re-IPL. You will need further assistance to resolve the underlying problem. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHCRC

### DFHIR3767 applid The interregion startup program DFHCRSP is not present.

**Explanation**
Module DFHCRSP is required to start an IRC session, but is missing from the CICS program library or has no installed program definition.

**System action**
The IRC session is not started.

**User response**
Install DFHCRSP definition (group DFHISC) and/or supply module DFHCRSP

**Module:** DFHCRNP

### DFHIR3771 applid Unable to start interregion communication because (E)STAE macro failed.

**Explanation**
CICS issued an ESTAE macro that did not execute successfully, probably because storage for a ESTAE control block (SCB) was not available. For more information about the SCB, refer to the Application Programming on z/OS.

**System action**
The IRC session is not started.

**User response**
Correct the cause of (E)STAE failure.

**Module:** DFHSIJ1

### DFHIR3772 applid Error while attempting to start interregion communication.

**Explanation**
CICS has evidence that the IRC session has already started. This is probably because the previous session could not be stopped (see messages DFHIR3760 and DFHIR3765).

**Note:**
The session, although apparently started, is not in a usable state.

**System action**
The IRC session is not started.
User response
Perform another IPL.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHIR3773 applid Unable to start interregion communication because the APPLID option has a blank value.

Explanation
Either the default value of applid (specified in the APPLID system initialization parameter) must be used, or a value which is not a null value must be used.

System action
The IRC session is not started.

User response
Correct the applid value.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHIR3775 applid Unable to start interregion communication because short on storage.

Explanation
Main storage is required to start the IRC session, but the storage is not available.

System action
The IRC session is not started.

User response
Wait until the storage condition has eased, then issue CEMT SET IRC OPEN command at the main terminal.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHIR3776 applid Unable to start interregion communication because another CICS system of the same name is active.

Explanation
A CICS system is named by its applid value. If two CICS systems have the same applid value, the interregion communication SVC cannot distinguish between the systems.

Note:
This situation may arise if a previous interregion communication (IRC) session could not be stopped; see message DFHIR3760. In this case, the IRC SVC would consider that the new session conflicted with the old (unstoppable) session.

System action
The IRC session is not started.

User response
Use a different generic applid for each CICS system.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHIR3777 applid The interregion communication table is full

Explanation
The interregion communication SVC's user table is full.
**System action**
The IRC session is not started.

**User response**
When there are fewer batch-sharing programs running, issue CEMT SET IRC OPEN at the main terminal.

A common cause of this error is that MAXGROUP is set too low in an XCF Sysplex environment. Check the value of MAXGROUP and, if necessary, raise it to suit your environment. For further information, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHSIJ1

**XMEOUT parameters/Message inserts**
1. applid

**Destination**
Console

**DFHIR3778**
applid Insufficient storage is available for interregion communication blocks.

**Explanation**
There is insufficient key 0 storage for the IRC control blocks. Storage is required from the CICS region but from outside the CICS DSA.

**System action**
The IRC session is not started.

**User response**
Ensure that sufficient storage is available. See the Improving performance for further guidance on how to determine the CICS DSA size limits in relation to the REGION size.

**Module:**
DFHSIJ1

**XMEOUT parameters/Message inserts**
1. applid

**Destination**
Console

**DFHIR3780**
applid Unable to start interregion communication. Return code=X'retcode', Reason code=X'rsncode'.

**Explanation**
CICS attempted to establish itself as a user of the interregion communication (IRC) services, but the attempt failed.

**System action**
The IRC session is not started.

**User response**
The return code and reason code (if any) correspond to a number of possible errors. The four byte return code field displays the following information starting with the high order byte:
- One byte error qualifier (if any)
- One byte MVS return code (if any)
• Two byte IRC return code

See Interregion control blocks in the CICS Data Areas manual for a complete list of return codes and error qualifiers. (The names of all the return codes and error qualifiers start with IRERR and IRERQ respectively.)

The return codes should be referenced from the documentation for the version of CICS that supplied the IRP program in use rather than the version of CICS that issued the message.

Check that the following requirements are satisfied:

• A copy of DFHIRP providing an adequate level of function is present in the link pack area (LPA).
• CICS has been defined as an operating system subsystem. The Installing CICS TS explains how to define CICS as a subsystem.
• The XCF couple data sets have been formatted with enough XCF groups and members per group to satisfy the requirements of your installation.
• The userid of the CICS job is authorized to log on to the CICS interregion program (DFHIRP) using the generic applid specified.
• The CICS region has a unique generic applid within the MVS sysplex.
• The CICS DB2 attachment has not been initialized before the first start of IRC in a CICS system that is using both of the following:
  – Multiregion operation (MRO) or CICS shared database, where any of the installed MRO or CICS shared database resource definitions specify ACCESSMETHOD(XM)
  – The DB2 CICS attachment to run DB2 applications.

If the message is issued when all of these conditions have been met, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts

1. applid
2. X’reetcode’
3. X’rsncode’

Destination
Console

DFHIR3781 applid Unable to start interregion communication because task CSNC cannot be attached.

Explanation
Definitions for CSNC or DFHCRNP have not been installed, or DFHCRNP is missing from the CICS program library.

System action
The IRC session is not started.

User response
Make CSNC or DFHCRNP available.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts

1. applid

Destination
