Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

2. **aaa/bbbb**
3. **X'offset'**
4. **modname**

**Destination**
Console

**DFHS00002 applid A severe error (code X'code') has occurred in module modname.**

**Explanation**

An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

**System action**

An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

If the exception entry made in the trace table has a trace ID with a value of X'0425', message DFHKE0501 was issued by the CICS Kernel earlier during CICS initialization.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

If the exception entry made in the trace table has a trace ID with a value of X'0425', further information...
can be found in message DFHKE0501 issued by the
CICS Kernel earlier during CICS initialization.

CICS may not have been terminated. If the message
occurs once and module modname is not crucial to
the running of your CICS system, you may decide to
continue to run and bring CICS down at a convenient
time to resolve the problem.

If the message recurs or if you cannot run without the
full use of module modname, you should bring CICS
down in a controlled shutdown.

If you need further assistance from IBM to resolve this
problem, see Working with IBM to solve your problem
for guidance on how to proceed.

2. X'code'
3. modname

**Destination**
Console

DFHSO0004 applid A possible loop has been
detected at offset X'offset' in
module modname.

**Explanation**
A CICS function is taking more time to process than
CICS expects. A possible loop has been detected in
module modname at offset X'offset'. This is the offset
of the instruction which happened to be executing at
the time when the error was detected.

**System action**
An exception entry is made in the trace table.
A system dump is taken unless you have specifically
suppressed the dump (by a user exit program at the
XDUREQ exit, in the dump table or by global system
dump suppression). CICS processing continues unless
you have specified in the dump table that CICS should
terminate.
Message DFHME0116, which contains the symptom
string for this problem, is produced.

**User response**
If CICS has not been terminated, it is necessary to
decide whether the problem is serious enough to bring
CICS down.

Since some CICS functions can use a lot of CPU time,
this message may have been caused by a long-running
function, and there may not be an error. Usually, CICS
purges a CICS function which exceeds the runaway
task time interval that you have specified in the
ICVR system initialization parameter. This means that
execution of module modname is terminated and CICS
continues.

If you have specified system initialization parameter
ICVR=0 and you consider that module modname is
looping, you must terminate CICS in order to terminate
the runaway function.

If CICS has terminated module modname, and you
consider that it was not a runaway, you should
increase the value of the ICVR system initialization
parameter. You have to close down CICS at a suitable
time to do this permanently. You can change the
ICVR time interval temporarily online using the CEMT
transaction.

If raising the ICVR time does not solve the problem,
you may need further assistance from IBM to resolve
the problem. See Working with IBM to solve your
problem for guidance on how to proceed.

| DFHS00107 | `date time applid` TCPIPSERVICE `tcpipservice` has been opened on port `portnumber` at IP address `ipaddress`. |

Explanation
The TCPIPSERVICE `tcpipservice` has been opened on port `portnumber` at the IP address specified.

If you have specified a low IPv6 address, that is, the address has leading zeros in the first six or more segments, CICS stores and displays the IPv6 address in IPv4 format.

System action
CICS continues.

User response
None.

Module: DFHSOCK

XMEOUT parameters/Message inserts
1. `date`
2. `time`
3. `applid`
Specifically, this message is issued when the TCP/IP bind call fails with a return code of EADDRINUSE.

**System action**
The TCPIPSERVICE does not open, but remains closed. An exception trace entry is written detailing the return values from the TCP/IP bind call. An application using the EXEC API to set the TCPIPSERVICE open receives an RESP(INVREQ) RESP2(9).

**User response**
Check that there are no other TCPIPSERVICES open using the same port number and IP address as the failing one. If there is another TCPIPSERVICE open using the port, it must be closed before the new one can be opened.

If no TCPIPSERVICESs are using the requested port, there might be another application acting as a TCP/IP server already listening on the port. Use the TSO command NETSTAT to display TCP/IP servers on the system. Choose an unused port for the TCPIPSERVICE.

If your system has more than one TCP/IP stack you can specify another stack's IP address on the TCPIPSERVICE definition. This will allow you to install multiple TCPIPSERVICES each using the same port number. You can also configure support in TCP/IP for virtual IP addresses on a single system. This will also allow more than one TCPIPSERVICE to share the same port.

Finally, TCP/IP can be configured with port sharing. This allows multiple servers (TCPIPSERVICES) to use the same port with TCP/IP using load balancing to direct incoming connections to the set of servers on the port. If port sharing is enabled, multiple TCPIPSERVICESs can each be opened on the same IP address with the same port, if port sharing is supported by the protocol specified in the TCPIPSERVICE resource definition.

The TCPIPSERVICE tcpipservice could not be opened because the port portnumber is already in use on the IP address ipaddress.

**Module:** DFHSOCK

### XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. tcpipservice
5. portnumber
6. ipaddress

---

**Explanation**
This message is issued when the open of a TCPIPSERVICE cannot be completed. The port number specified is already in use in combination with the IP address. By default, TCP/IP allows only one server to be listening on a port at any one time.
**Explanation**

Opening the TCPIPSERVICE has failed because the IP address specified on the definition is not known to TCP/IP.

This message is issued when the TCP/IP bind call fails with the return value of EADDRNOTAVAIL.

**System action**

The IP address must be a valid address known to TCP/IP. It must also be an address that the TCP/IP stack supports. IPv6 addresses can only be supported if the stack is dual-mode and therefore supports IPv4 and IPv6 addresses. It is possible to configure multiple TCP/IP stacks for a single OS/390 system, or to have virtual IP addresses on a single stack. If the system only has one IP address then the IP address field of the TCPIPSERVICE definition can be left blank, or specified as ANY. This causes the bind to use the default IP address for the system. To use an alternative, a valid address must be specified.

**User response**

Check that the address specified on the TCPIPSERVICE definition is known to TCPIP on the system.

If you have specified a low IPv6 address, that is, the address has leading zeros in the first six or more segments, CICS stores and displays the IPv6 address in IPv4 format.

If IPv6 addresses are being used, check that the TCP/IP stack supports IPv6. See the z/OS Communications Server IP Diagnosis Guide on using Netstat to find information about the stack.

**Module:** DFHSOCK

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. tcpipservice
5. ipaddress

**Explanation**

Opening the TCPIPSERVICE has failed because the jobname of the region is not authorized to use the port number specified.

Binding to port numbers below 1024 requires TCP/IP configuration directives specifying the CICS jobname to TCP/IP and associating it with the specified port. This may also be done for ports greater than 1024, thus a CICS region may also fail to open a port greater than 1024 if the port has been associated with another job.

This message is issued when the TCP/IP bind call fails with a return value of EPERM.

**System action**

The TCPIPSERVICE is not opened. If an application has used the EXEC API to open the TCPIPSERVICE, it receives RESP(INVREQ) RESP2(3) values.

**User response**

The CICS region's jobname must be authorized to open the specified port. Consult the z/OS Communications Server IP Configuration Guide for details on how to do this.

**Module:** DFHSOCK

**XMEOUT parameters/Message inserts**

1. date
2. time

4. tcpipservice

**Destination**

CSOO

---

**Explanation**

CICS has issued the Unix System Services function BPX1GNI to resolve the IP address ip_address to a host name, but the call failed.

**System action**

An exception trace entry is made. CICS will continue to attempt to access the name server for subsequent requests.

**User response**

The BPX1GNI function will usually perform a name server reverse lookup to resolve the IP address into a host name. This can fail if CICS is unable to contact a name server.

If a SYSTCPD DD name has been defined in the CICS job, check that the file it references correctly defines the name server. If SYSTCPD is not used, then check that the name server defined to TCP/IP in the /etc/resolve.conf file is valid and responding correctly. You can issue the TSO NSLOOKUP command to query the name server. If the name server is defined correctly to CICS, then contact the administrator to determine why the IP address lookup failed.

The TCP/IP RESOLVERTIMEOUT parameter can be used to control the duration of a BPX1GNI call.

**Module:**

DFHSOIS

**Socket listener cannot attach the transaction transaction, the TCPIPSERVICE tcpipservice will be closed.**

**Explanation**

The TCP/IP listener task has received a connection from a client but the attach for the transaction associated with the TCPIPSERVICE definition has failed. The associated transaction may not have been installed or the TCPIPSERVICE definition could have specified the wrong transaction.

**System action**

The TCPIPSERVICE that is defined on the port that the connection arrived on is closed. The socket accepted for the client is closed.

**User response**

Determine why the attach for the transaction has failed. Correct the error and re-open the TCPIPSERVICE.

CSOO

**DFHSO0115**  
*date* *time* *applid* CICS has registered the group name *groupname* with Workload Manager. The TCP/IP host name *genericname* will become available for DNS connection optimization.

**Explanation**

The group name has been registered with Workload Manager for Domain Name Service (DNS) connection optimization. This occurs when a TCPIPSERVICE is opened where its name begins with the character 'D'. The new generic TCP/IP host name becomes available for clients to use to access the CICS system, and any others that have registered with the named group name.

**System action**

CICS has issued the Workload Manager macro IWMSRSRG to register the specified group name for DNS connection optimization. This occurs when the name of the TCPIPSERVICE begins with a 'D'. Workload manager registration only occurs once for a given group name. If multiple TCPIPSERVICES define the same group name, then registration will only occur once.

The group name registered is taken from a combination of part of the name of the TCPIPSERVICE and the transaction defined for the TCPIPSERVICE. Any characters of the name following a dot '.' are concatenated with the transaction identifier to form the group name. For example, a TCPIPSERVICE has the name D1.CICS and is defined with the transaction IIOP (the IIOP transaction being an alias of the CICS-supplied CIRR transaction). The group name generated is 'CICSIIOOP'. If the TCPIPSERVICE name does not contain a dot, then only the transaction identifier is used. For example, a TCPIPSERVICE with a name of 'DYNWEB' and a transaction of WWW will generate a registration for the group 'WWW'.

The group name registered effectively becomes a new name in the sysplex TCP/IP domain. When multiple CICS systems in a sysplex each register with the same group name, the DNS server uses Workload Manager to resolve the group name into one of the IP addresses of the associated systems. The IP address returned is that of the system that is most eligible according to Workload Manager's load balancing rules. For example, two OS/390 systems in a sysplex are mvs1.plex.hursley.ibm.com and mvs2.plex.hursley.ibm.com; and on each system, CICS registers with the group name cicsiioop. The new name cicsiioop.plex.hursley.ibm.com is dynamically added to the DNS name server's tables. Client TCP/IP applications can use this name instead of the name of one of the specific OS/390 images. When a client resolves the name to an IP address using the DNS, it will get the IP address of the most eligible system. Since the DNS dynamically knows when systems register and deregister, additional CICS systems can be registered as required to expand the list of available IP addresses returned for a group name. If a system fails, its IP address will be removed from the DNS server's list of associated addresses for any groups with which it was registered.

**User response**

No user action is necessary.

Console

DFHS00118 applid The BPX1GNI call to resolve IP address ip_address to a host name took over 3 seconds to complete.

Explanation

CICS has issued the Unix System Services function BPX1GNI to resolve the IP address ip_address to a host name. This call took over three seconds. During this time, the sockets TCB was blocked, and no socket IO was possible.

System action

CICS continues.

User response

The BPX1GNI function will usually perform a name server reverse lookup to resolve the IP address into a host name. This call took over three seconds to complete. The BPX1GNI function is most commonly driven by EXEC CICS EXTRACT TCPIP CLIENTNAME.

If a SYSTCPD DD name has been defined in the CICS job, check that the file it references correctly defines the name server. If SYSTCPD is not used, then check that the name server defined to TCP/IP in the /etc/ resolv.conf file is valid and responding correctly. You can issue the TSO NSLOOKUP command to query the name server. If the name server is defined correctly to CICS, then contact the administrator to determine why the IP address lookup has not completed within 3 seconds.

The TCP/IP RESOLVETIMEOUT parameter can be used to control the duration of a BPX1GNI call.

| Return code rc received from function | {unknown | gsk_environment_init | gsk_environment_open | gsk_environment_close | gsk_secure_socket_init | gsk_secure_socket_open | gsk_secure_socket_close | gsk_secure_socket_read | gsk_secure_socket_write | gsk_attribute_set_buffer | gsk_attribute_set_callback | gsk_attribute_set_enum | gsk_attribute_set_numeric_value} of System SSL. Reason: |
|------------------|-----------------------------------|
| Unrecognized return code | Key database not found | Key database access not authorized | Invalid password for key database | Expired password for key database | Stashed password file not found | Session timeout value is invalid | An I/O error occurred | An unknown error occurred | Invalid distinguished name | No common ciphers negotiated | No certificate available | Certificate validation failed | Root certificate authority not supported | Unsupported operation | Invalid certificate signature | SSL protocol violation | Not authorized | Self-signed certificate | Invalid session state | Handle creation failed | No private key | Untrusted Certificate Authority | Certificate date invalid |

Explanation

A non-zero return code rc was received from the specified function of the z/OS System SSL service. A brief interpretation of the return code is shown. The service was processing a connection with a partner at IP address peeraddr to TCPIPSERVICE tcpipservice. When the error reason is certificate related the CERTIFICATE named on the TCPIPSERVICE resource is checked.

System action

The secure sockets operation is abandoned. A sockets domain severe error message, DFHSO0002, may be produced with error code X'080C'.

User response

If this message is not accompanied by message DFHSO0002, the error is probably due to some unexpected action by the connected partner, and this message is for information only. If this message is accompanied by message DFHSO0002, the error is probably due to some sort of configuration error. If the message shows Peer: 0.0.0.0, TCPIPSERVICE: *NONE* the error is probably due to a PERFORM SSL REBUILD failure. A PERFORM SSL REBUILD failure should preserve the old SSL environment. Use the description in the message to determine what is wrong. For descriptions of the return code rc (which is in decimal and may need converting to hex), see z/OS Cryptographic Services: System SSL Programming, SC24-5901. For further guidance see the CICS documentation.
If the brief interpretation of the return code is Certificate date invalid the certificate may either have expired or be not yet valid, and may refer to either the local certificate or the remote partner's certificate.

If the brief interpretation of the return code is No certificate available the certificate may have been recently added to the keyring. Issue a PERFORM SSL REBUILD to refresh the SSL environment.

If the brief interpretation of the return code is Certificate validation failed then either the server or client certificate (if client certificates are being used) is invalid.

CSO0

**DFHSO0124**  

**APPLID** The MAXSOCKETS system initialization parameter has a value of mmmmm which exceeds the MAXFILEPROC value of nnnnn. The MAXSOCKETS value has been set to the lower value.

**Explanation**

The value specified in the MAXSOCKETS system initialization parameter is greater than the value specified in the z/OS UNIX System Services MAXFILEPROC option.

CICS has attempted to set the MAXSOCKETS value higher than the MAXFILEPROC value, but has been unable to do so, because the userid under which CICS is running does not have superuser authority.

**System action**

CICS continues execution with the MAXSOCKETS value set equal to the MAXFILEPROC value.

**User response**

You may:

- Restart CICS with a value of MAXSOCKETS that does not exceed MAXFILEPROC. This will limit the number of sockets that CICS can have active at one time.
- Increase the MAXFILEPROC value and then restart CICS. This will affect all z/OS UNIX System Services processes in this system.
- Restart CICS with a userid that has superuser authority.

**Module:** DFHHSOIS

Console

**DFHSO0125**  

**APPLID** The MAXSOCKETS parameter retrieved from the catalog has a value of mmmmm which exceeds the MAXFILEPROC value of nnnnn. The MAXSOCKETS value has been set to the lower value.

**Explanation**

The value of the MAXSOCKETS system initialization parameter retrieved from the catalog during a warm or emergency restart is greater than the value specified in the z/OS UNIX System Services MAXFILEPROC option.

CICS has attempted to set the MAXSOCKETS value higher than the MAXFILEPROC value, but has been unable to do so, because the userid under which CICS is running does not have superuser authority.

This situation may arise when:

- CICS was previously running under a userid that had superuser authority, but has restarted under a different userid
- CICS was previously running under a userid that had superuser authority, but the authority was changed before CICS restarted
- CICS was previously running under a userid that did not have superuser authority, and the value of MAXFILEPROC was reduced before CICS restarted.

**System action**

CICS continues execution with the MAXSOCKETS value set equal to the MAXFILEPROC value.

**User response**

You may:

- Restart CICS with a value of MAXSOCKETS that does not exceed MAXFILEPROC. This will limit the number of sockets that CICS can have active at one time.
- Increase the MAXFILEPROC value and then restart CICS. This will affect all z/OS UNIX System Services processes in this system.
- Restart CICS with a userid that has superuser authority.

**XMEOUT parameters/Message inserts**

1. **APPLID**
2. mmmmm
3. nnnnn
An attempt to create a tcpip socket has failed as the number of open sockets in the system would exceed the current MAXSOCKETS value.

**Explanation**
An attempt to create a tcpip socket has failed because the MAXSOCKETS limit has been reached.

**System action**
The socket is not opened and failure is reported.

**User response**
If this behaviour is undesireable, use CEMT SET TCPIP to increase the number of sockets in the system.

**Module:** DFHSOMG

**XMEOUT parameters/Message inserts**
1. applid

**Destination**
Console

**Explanation**
The CRLPROFILE system initialization parameter has been specified, but the information required by CICS and System SSL to perform a bind to an LDAP server cannot be obtained from the profile that it identifies.

CICS has attempted to extract the following information from the PROXY segment of the profile profile in the LDAPBIND class of the external security manager's database:

**LDAPHOST**
The Uniform Resource Locator (URL) of an LDAP server that contains certificate revocation information

**BINDDN**
The LDAP distinguished name of a user who is authorized to access certificate revocation lists in the specified LDAP server

**BINDPW**
The password used to authenticate the user specified by BINDDN.

Either the specified profile does not exist, or CICS does not have authority to access the profile, or one or more of the required components are missing from the profile.

**System action**
The CICS SSL function cannot retrieve certificate revocation lists to determine whether certificates have been revoked. To prevent further error messages, the CRLPROFILE function has been disabled. Therefore CICS will be unable to check whether SSL certificates are revoked.

**User response**
Ensure that the profile profile in the LDAPBIND class of the security manager is defined with a PROXY segment that contains all three required components. Also ensure that the CICS region userid had READ access to the profile, then restart CICS.

**Module:** DFHSOSE

**XMEOUT parameters/Message inserts**
1. applid
2. profile

**Destination**
Console

**Explanation**
The LDAP server, whose name was obtained from CRLPROFILE is inactive. Certificate revocation checks have been disabled.

**Explanation**
The LDAP server, whose name was obtained from the PROXY segment of the external security manager's profile specified by the CRLPROFILE system initialization parameter, cannot be accessed.
**System action**

The CICS SSL function cannot retrieve certificate revocation lists to determine whether certificates have been revoked. To prevent further error messages, the CRLPROFILE function has been disabled. CICS will not make any further attempts to acquire certificate revocation lists from the LDAP server. Therefore CICS will be unable to check whether SSL certificates are revoked.

**User response**

To re-enable certificate revocation list checking, the LDAP server specified within the CRLPROFILE must be restarted. All CICS systems, that specify a CRLPROFILE definition that references this server, must then also be restarted.

**Module:**
DFHSOSE

DFHS00147 W applid A non-secure client connection has been received for ATTLSAWARE TCPIPSERVICE tcpipservice. Client IP address: clientaddr. TTLS_IOCTL value 'x'ttlsioctl'

Explanation
The TCP/IP listener task has received a connection from a client that is not secure. The TCPIPSERVICE is defined with SSL(ATTLSAWARE) so new connections must be secured by AT-TLS.

System action
CICS always sends an HTTP 403 error response to the client for a non-secure connection on an SSL(ATTLSAWARE) TCPIPSERVICE. This message is only ever issued once per active TCPIPSERVICE.

User response
You should make sure that the port used by the TCPIPSERVICE has been secured by an active AT-TLS policy.

If after receiving this message you activate AT-TLS for the TCPIPSERVICE port, you should close and re-open the TCPIPSERVICE.

Module:
DFHSOLS

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. tcpipservice

Destination
CSOO

DFHS00148 date time applid The use of TCPIPSERVICE tcpipservice may result in a violation of NIST SP800-131A.

Explanation
The SSL(ATTLSAWARE) TCPIPSERVICE tcpipservice has been opened. SIT parameter NISTSP800131A=CHECK is set which requests conformance to the NIST SP800-131A security standard.

This warning message is issued because the cryptographic environment to support this TCPIPSERVICE has been configured by an AT-TLS policy. You should ensure that this policy conforms to the NIST SP800-131A security standard.

System action
CICS continues.

User response
Refer to the NIST SP800-131A section of the CICS product documentation for advice on how to handle NIST SP800-131A compliance.

Module:
DFHSOLS

Reason: {Unrecognized return code | Key database not found | Key database access not authorized | Invalid password for key database | Expired password for key database | Stashed password file not found | Session timeout value is invalid | An I/O error occurred | An unknown error occurred | Invalid distinguished name | No common ciphers negotiated | No certificate available | Certificate rejected by peer | Root certificate authority not supported | Unsupported operation | Invalid certificate signature | SSL protocol violation | Not authorized | Self-signed certificate | Invalid session state | Handle creation failed | No private key | Untrusted Certificate Authority | Certificate date invalid | Invalid cipher suite | Handshake abandoned by peer | Cannot open key database | Host certificate not yet valid | Certificate parsing error | Certificate is revoked | LDAP server is inactive | Unknown Certificate Authority | Internal error on partner | Unknown alert received | Client authentication alert | Incorrect key usage | Server name not recognized | Bad message length | Cryptographic error detected | Export restriction}. Peer: peeraddr, TCPIPSERVICE: tcpipservice.

DFHSO0202I applid The CICS socket listener task has stopped accepting all inbound TCP/IP connections.

Explanation
The CICS socket listener task, CSOL, is no longer accepting new inbound connections. The listener sockets for all OPEN TCPIPSERVICEs have now been closed. This happens during CICS shutdown or as part of the SET TCPIP CLOSED or SET TCPIP IMMCLOSED commands.

System action
CICS shutdown or SET TCPIP processing continues.

User response
None.

Module: DFHSOLS

XMEOUT parameters/Message inserts
1. applid
Explanation

A non-zero return code rc was received from the specified function of the z/OS System SSL service. A brief interpretation of the return code is shown. The service was processing a connection with a partner at IP address peeraddr to TCPIPSERVICE tcpipservice.

System action

The secure sockets operation is abandoned. A sockets domain severe error message, DFHSO0002, may be produced with error code X'080C'.

User response

If this message is not accompanied by message DFHSO0002, the error is probably due to some unexpected action by the connected partner, and this message is for information only. If this message is accompanied by message DFHSO0002, the error is probably due to some sort of configuration error. If the message shows Peer: 0.0.0.0, TCPIPSERVICE: "NONE" the error is probably due to a PERFORM SSL REBUILD failure. A PERFORM SSL REBUILD failure should preserve the old SSL environment. Use the description in the message to determine what is wrong. For descriptions of the return code rc, see z/OS Cryptographic Services: System SSL Programming, SC24-5901. For further guidance see the CICS documentation.

If the brief interpretation of the return code is Certificate date invalid the certificate may either have expired or be not yet valid, and may refer to either the local certificate or the remote partner's certificate.

If the brief interpretation of the return code is No certificate available the certificate may have been recently added to the keyring. Issue a PERFORM SSL REBUILD to refresh the SSL environment.

DFHSO1000 date time applid A request for TCP/IP communication failed (code X'code') for IPCONN ipconn using applid applid. z/OS UNIX system services supplied bpx_return_value( bpx_return_value) bpx_return_code( bpx_return_code), and bpx_reason_code( X'bpx_reason_code').

Explanation

A request to z/OS UNIX system services for TCP/IP communications failed. The request was made for IPCONN communication with another CICS region using IPCONN ipconn and applid applid. The code X'code' is an SO domain exception trace point ID that identifies what the error is and where the error was detected, for example:

- 0E02 BPX1AIO asynco failure
- 0E03 BPX1AIO asynco request failure
- 0E09 BPX1GIV give socket failure
- 0E0C BPX1TAK take socket failure
- 0E0F BPX1GCL get client id failure
- 0E13 BPX1SOC socket failure
- 0E16 BPX1BND bind failure

- 0E19 BPX1LSN listen failure
- 0E1C BPX1GNM get socket name failure
- 0E1F BPX1IOC ioctl failure
- 0E20 BPX1AIO asynco return failure
- 0E23 BPX1OPT socketopt failure

System action

An exception trace entry (code X'code' in the message) is made in the trace table.

This message indicates an error in the execution of CICS to communicate using IPIC communication. CICS continues but IPIC communication using IPCONN ipconn might have failed temporarily or permanently.

Additional error messages are produced to report the effect this failing request has on IPIC communication.

User response

The exception trace entry will tell you which z/OS UNIX system service was called. Refer to the z/OS UNIX System Services Messages and Codes manual to determine the cause of the error. If the value of the z/OS UNIX system services reason code bpx_reason_code is not zero, you might be able to use the z/OS UNIX System Services command BPXMTEXT to provide more information.

The impact of this failure depends on the IPIC processing that is being executed at the time. Refer to other messages for IPIC communication using the specified IPCONN to obtain more information.

If IPIC communication using IPCONN ipconn does not subsequently resume normal operation successfully, verify the IPCONN and its related TCPIPSERVICE resource definition have attributes that are correct for your installation. Also, verify these resource definitions are correct in the CICS region that issued this message and the CICS region with which IPIC communication is being attempted. It might also be necessary to verify parameter definitions for z/OS Communications Server are correct for operation of this IPCONN. When doing so consider the z/OS system on which the CICS region that issued this message runs and the z/OS system with which IPIC communication is being attempted.

Communications Server TCP/IP callable NMI error (code X'code') has occurred in module modname.

Explanation
An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected, for example:
- 043A statistics SVC call abended
- 043B statistics SVC call rejected
- 043C statistics NMI INQUIRE failed
- 0CA6 SVC call rejected
- 0CA7 SVC call abended
- 0CA8 NMI INQUIRE failed

NMI INQUIRE is used to obtain the value of z/OS Communications Server TCP/IP parameter SOMAXCONN for use with a TCPIPSERVICE attribute BACKLOG. It is also used to obtain information on socket backlog and connections dropped for TCPIPSERVICE resource statistics.

System action
An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
A possible cause of this error is an incorrect set up of the CICS Type 3 SVC. Verify the CICS Type 3 SVC has been correctly installed. The exception trace entry may tell you the value returned by the CICS Type 3 SVC in register 15. Values other than -1 and 0 indicate a failure with the call to the CICS Type 3 SVC itself. This can occur with an incorrect set up of the CICS Type 3 SVC.

Alternatively if the CICS Type 3 SVC has been correctly installed, this indicates a possible error in CICS code or the called Communications Server TCP/IP NMI request. This can be the case when the value returned in register 15 is -1 or 0. The exception trace entry will tell you which request was called and the response values that were returned. z/OS Communications Server IP Programmer’s Guide and Reference provides more information. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

In the case of a failed NMI INQUIRE for obtaining SOMAXCONN (codes 0CA6-8), the value used for a TCPIPSERVICE attribute BACKLOG cannot be set to the value of z/OS Communications Server TCP/IP parameter SOMAXCONN. In the case of a failed NMI INQUIRE for obtaining TCPIPSERVICE resource statistics (codes 043A-C), the statistics will report 0 for the following fields for the appropriate stack:
- SOR_CURR_BACKLOG
- SOR_CURR_MAX_BACKLOG
- SOR_CONNS_DROPPED
- SOR_CONN_LAST_DROPPED

CICS is unable to determine the secure state of a new connection received on ATTLSAWARE TCPIPSERVICE tcipipservice from client IP address ipaddress. UNIX System Services values returned are bpx_return_value( bpx_return_value ), bpx_return_code( bpx_return_code ), and bpx_reason_code( X'bpx_reason_code' ).

**Explanation**

A web client attempted to connect to a CICS region which is secured by an Application Transparent Transport Layer Security (AT-TLS) aware TCPIPSERVICE.

The socket listener task (CSOL) made a UNIX BPXIOCTL call to obtain information relating to a new connection but the call failed.

If the IP Address is 'UNKNOWN' then the client has already disconnected before CICS could obtain the IP Address.

**System action**

An exception trace entry is made in the trace table. No system dump is taken, unless specifically requested in the dump table.

CICS continues unless the dump table specifies that CICS should terminate.

The socket accepted for the client is closed.

**User response**

Refer to the z/OS UNIX System Services Messages and Codes z/OS UNIX System Services Messages and Codes manual to determine the cause of the error.

CICS is using minimum key sizes of 256 (ECC) and 2048 (DH/DSA/RSA) during TLS handshakes.

**Explanation**

CICS is using a minimum key size of 256 for ECC keys and 2048 for RSA, DSA and Diffie-Hellman keys during TLS handshakes. The following System SSL settings are in effect:

- GSK_CLIENT_ECURVE_LIST=0025002400230030029
- GSK_SERVER_ALLOWED_KEX_ECURVES=00250024002300300029
- GSK_CLIENT_EPHEMERAL_DH_GROUP_SIZE=2048
- GSK_SERVER_EPHEMERAL_DH_GROUP_SIZE=2048
- GSK_PEER_DH_MIN_KEY_SIZE=2048
- GSK_PEER_DSA_MIN_KEY_SIZE=2048
- GSK_PEER_ECC_MIN_KEY_SIZE=256
- GSK_PEER_RSA_MIN_KEY_SIZE=2048

**System action**

System initialization continues.

**User response**

The System SSL settings are in effect because feature toggle com.ibm.cics.tls.minimumkeystrength=2048 was set. If the settings are not required then remove the feature toggle. The message can be suppressed with the system initialization parameter MSGLEVEL=0.

Console
DFHSRnnnn messages

DFHSR0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in program progname.

Explanation
An abnormal end (abend) or program check has occurred in program progname. Storage protection is active, and CICS was executing in USER key at the time of the abend or program check.

The code aaa is a three digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The four digit code bbbb, which follows aaa, is a user abend code, produced either by CICS or by another product on the user's system. Message DFHME0116, which contains the symptom string for this problem, is produced.

System action
An exception trace entry is made giving details of the error. System dump SR0001 is taken unless you have specifically suppressed dumps for that dumpcode in the dump table.

CICS continues and abends the transaction, unless you have specified in the dump table that CICS should terminate. The transaction abend code is ASRA, ASRB, ASRD or ASRE.

User response
As the execution key was USER key, modname is probably a customer application program. Review this program and correct the error.

Note that if the error was an 0C4 program check caused by an attempt to overwrite a CICS DSA, the exception trace entry indicates which DSA the program attempted to overwrite. If this is the case, also refer to the explanation for message DFHSR0622.

For advice on problem determination, refer to the Troubleshooting and support.

Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

If you want to suppress system dumps that precede ASRA, ASRB, ASRD or ASRE abends when the execution key is USER, you must specify this on an entry in the dump table for system dumpcode SR0001. Use either CEMT or an EXEC CICS command. Further guidance on this can be found in the Configuring.

Console

DFHSR0601 applid Program interrupt occurred with system task taskid in control

Explanation

A program check has been detected in a system task. taskid is the system task identifier (for example, TCP, III) as set in field TCAKCTTA.

System action

CICS abnormally terminates with system dump SR0601 and an exception trace entry which gives the kernel error data for the program check. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the dump to determine the cause of the program check. The most likely causes are either an error in a CICS module, or an error in a user-written PLT program.

For advice on problem determination, refer to the Troubleshooting and support.

Module: DFHSRP

XMEOUT parameters/Message inserts

1. applid
2. taskid

Destination

Console

DFHSR0602 applid Program interrupt routine has been entered while processing program interrupt for same task

Explanation

A program check occurred. CICS started to abend the task with an abend code of ASRA when another program check occurred. As this is a potentially recursive situation, DFHSRP terminates CICS.

System action

CICS abnormally terminates with system dump SR0602 and exception trace entries giving the kernel error data for each program check. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Try to discover where and why the first program check occurred. The most likely cause is an error in the application program. The second program check may be due to a CICS error while terminating the task.

For advice on problem determination, refer to the Troubleshooting and support.

Module: DFHSRP

XMEOUT parameters/Message inserts

1. applid

Destination

Console

DFHSR0603 applid Program interrupt has occurred
Explanation
A program check occurred, and CICS did not attempt to recover, because SRT=NO was specified in the system initialization table or by the operator at startup time.

System action
CICS abnormally terminates with system dump SR0603 and an exception trace entry giving the kernel error data for the program check. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Initially, check that the specification of SRT=NO is correct. If it is incorrect, change it as described in the Configuring.

Module: DFHSRP

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHSR0606 applid Abend (code aaa/bbbb) has been detected.

Explanation
DFHSSP has detected an abnormal termination which CICS is not able to handle fully (for example, the abend code cannot be found in the SRT). In this instance it is the CICS system and not merely a transaction, that has abnormally terminated.

The code aaa is a three digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The four digit code bbbb, which follows aaa, is a user abend code produced either by CICS or by another product on the user’s system. Message DFHME0116, which contains the symptom string for this problem, is produced.

System action
CICS abnormally terminates. A system dump (dumpcode SR0606) can be taken with this message depending on the abend code. An exception trace entry is produced giving the kernel error data for the abend.

User response
Use the dump to determine the abnormal termination, and to investigate its cause.

Module: DFHSRP

XMEOUT parameters/Message inserts
1. applid
2. aaa/bbbb

Destination
Console

DFHSR0612 applid Abend recovery has been entered by same task

Explanation
An operating system abnormal termination occurred. CICS started to abend the task with abend code ASRB.
when another operating system abnormal termination occurred. As this is a potentially recursive situation, DFHSRP terminates CICS.

**System action**
CICS abnormally terminates with system dump SR0612 and exception trace entries giving the kernel error data for each operating system abend. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
The most likely cause of the second operating system abend is an error in a global user exit program running at the XSRAB exit. This is the global user exit that can be invoked when an abend code is found in the SRT. If such a program was running, determine the cause of the second abend and take steps to prevent a recurrence.

Note that this message will also be issued if a global user exit program running at the XSRAB exit gets into a loop (runaway), or issues an unknown XPI call (kernerror). The second exception trace entry should help to diagnose this.

For advice on problem determination, see the Troubleshooting and support.

CDB2 and Console

DFHSR0622  applid An attempt to {overwrite | access} the dsaname has caused the abend which follows

Explanation

An 0C4 program interrupt (protection exception) has occurred. CICS has diagnosed the cause of the 0C4 as an attempt to either access or overwrite storage in DSA dsaname. The DSA is one of CDSA, RDSA, UDSA, ECDSA, ERDSA, ETDSA, EUDSA or GCDSA for overwrite, or either UDSA or EUDSA for access.

If dsaname is CDSA, ECDSA, ETDSA or GCDSA:

CICS is running with storage protection active. The CDSA, ECDSA, ETDSA and GCDSA therefore contain CICS key storage. They are write protected from user programs executing in User key. The most likely causes of the 0C4 are:

• A program executing in CICS key passed the address of CICS key storage in the CDSA, ECDSA, ETDSA or GCDSA to a user program executing in User key and this user program attempted to write to this storage.
• A user program executing in User key contains an error and accidentally attempted to write to CICS key storage in the CDSA, ECDSA, ETDSA or GCDSA.
A user program executing in User key deliberately attempted to write to CICS key storage in the CDSA, ECDSA, ETDSA or GCDSA.

If dsaname is ERDSA or RDSA:

CICS may be running with or without storage protection active. The ERDSA or RDSA contains only reentrant CICS and user programs. If RENTPGM=PROTECT was specified as a system initialization parameter, the ERDSA or RDSA is write protected from programs executing in both CICS key and User key. If RENTPGM=NOPROTECT, the ERDSA or RDSA is only protected from user programs executing in User key. The most likely causes of the OC4 are:

- A user program residing in the ERDSA or RDSA has attempted to modify its own storage, (that is, the program is not reentrant).
- A user program contains an error and accidentally attempted to overwrite program storage in the ERDSA or RDSA.

If dsaname is EUDSA or UDSA:

CICS is running with both storage protection and transaction isolation active. The EUDSA and UDSA contain only USER key non-shared storage. The most likely causes of the OC4 are:

- If the action is overwrite, a program has attempted to modify the non-shared storage belonging to another transaction.
- If the action is access, a program has attempted to either read storage or execute an instruction within another transaction's non-shared storage.

System action

Either, the transaction abends with abend code ASRA. This message is followed by message DFHAP0001 or DFHSR0001 which gives the name of the program in error and the offset into that program at which the error occurred. Additionally, an exception trace entry is taken which gives program, offset, execution key and the DSA in question.

Or, this is a critical error and CICS is terminated. This message is followed by a DFHSR06xx message giving the reason for the termination.

User response

Depending on the cause and dsaname, do one of the following:

- Correct any error in the program.
- Redefine transactions with ISOLATE(NO) where they have to share storage.
- Change the program resource definition so that it executes in CICS key (and the basespace).
- Ensure that the program is not loaded into the ERDSA by not link-editing it with the RENT option.

Module:
DFHSRP

DFHSTnnnn messages

DFHST0001

applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation

An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code.

Alternatively, unexpected data has been input, or storage has been overwritten.

Note:
There is NO applid for DFHSTUP modules.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, OC1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table.
For modules DFHSTST and DFHSTTI, a dump is taken and the collection interval is set to 24 hours. Message DFHST0101 is also issued.

For module DFHSTDM, the action depends on the initialization error action value which is used by the domain (DM) manager. The usual action is to terminate CICS with a dump.

For module DFHSTUE, processing continues.

For modules DFHSTWR, DFHSTRD, and DFHSTUx (modules within DFHSTUP), the job step is terminated with a dump.

For ALL modules, a system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the z/OS MVS System Codes manual. Then look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, a runaway or a recovery percolation, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

2. X'code'
3. modname
Destination

Console

DFHST0003 applid Insufficient storage to satisfy GETMAIN (code X'code') in module modname.

Explanation

A CICS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request. The code X'code' is the exception trace point id which uniquely identifies the place where the error was detected. This error has occurred above the 16MB line.

System action

An exception entry is made in the trace table (code X'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Inform the system programmer. If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which will right itself if more storage becomes available. If you can manage without module modname, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

Try increasing the size limits of the DSAs or EDSAs. If CICS is not already terminated, you need to bring CICS down to do this. See the Configuring or the Improving performance for further information on CICS storage.

Module:

DFHSTDM

XMEOUT parameters/Message inserts

1. applid
2. X'code'
3. modname

Destination

Console

DFHST0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

Note that no applid is included for DFHSTUP modules.

System action

An exception entry is made in the trace table.

For modules DFHSTST and DFHSTTI, a system dump is taken and the collection interval is set to 24 hours. Message DFHST0101 will also be issued.

For module DFHSTDM, the action depends on the initialization error action value which is used by the domain (DM) manager. The usual action will be to terminate CICS with a dump.

For module DFHSTUE, processing continues.

For modules DFHSTWR, DFHSTRD, and DFHSTUX (modules within DFHSTUP), the job step is terminated with a dump.

For ALL modules, a system dump is taken, unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in
milliseconds). This means that module modname is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHST0005  applid A hardware error has occurred (module modname, code X'code'). The Time-of-Day clock is invalid.

Explanation
Execution of the STCK machine instruction resulted in a non-zero condition code.

System action
A system dump is taken and interval collections are cancelled. Message DFHST0102 is also issued.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Notify the system programmer. This is in all probability a hardware error and you should in the first instance investigate the MVS Store Clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTST, DFHSTDM

XMEOUT parameters/Message inserts

1. applid
2. modname
3. X'code'

Destination
Console

DFHST0101I  applid The Statistics Domain has set the collection interval to 24 hours.

Explanation
A problem has been detected by, or has been passed back to, the statistics (ST) domain. As a result, the collection interval has been set to the maximum value. The end-of-day collection time is unchanged.

A message explaining the problem has already been issued by the module in error.

System action
Other processing continues.

User response
Refer to the associated message for guidance on resolving the original problem.

Use CEMT SET STATISTICS to reset the interval when the problem has been resolved.

Module:
DFHSTST, DFHSTDM, DFHSTTI

XMEOUT parameters/Message inserts

1. applid

Destination
Console

DFHST0102I  applid The Statistics Domain has cancelled interval collections.
Explanation
A problem has been detected by, or has been passed back to, the statistics (ST) domain. A message explaining the problem may have already been issued by the module in error.

To reduce the occurrence of this problem, the interval collections have been cancelled. The end-of-day collection time is unchanged.

System action
Other processing continues.

User response
Refer to any associated message for guidance on resolving the original problem.

If no associated message has been issued, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTST, DFHSTDM, DFHSTTI

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHST0103 applid An SMF error has occurred with return code X'rc'.

Explanation
SMF has returned to the statistics (ST) domain with an error return code X'rc' from the SMFEWTM macro.

System action
Other CICS processing continues.

User response
Refer to the z/OS MVS System Management Facilities (SMF) manual for a detailed explanation of the meaning of the return code.

Module:
DFHSTST

XMEOUT parameters/Message inserts
1. applid

2. X'rc'

Destination
Console

DFHST0201 S An attempt to open the statistics data set has failed.

Explanation
DFHSTUP has tried to open the unloaded SMF data set but has failed.

System action
A dump is taken and the job step is terminated.

User response
Ensure that the JCL for the job is correct. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS documentation.

If incorrect JCL is not the cause of the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSTRD

Destination
SYSPRINT

DFHST0202 S A read error on the statistics data set has occurred.

Explanation
A read error was encountered on the unloaded SMF data set.

System action
A dump is taken and the job step is terminated.

User response
Inform the system programmer. First check that the JCL for the job is correct. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS documentation. Resubmit the job.

Module:
DFHSTRD
**Destination**

SYSPRINT

**DFHST0203 W** The statistics data set is empty.

**Explanation**

An end-of-file condition was detected during the first attempt to read the unloaded SMF data set, or the unloaded SMF dataset contained no CICS statistics from any CICS system.

**System action**

The job step is terminated.

**User response**

The most likely cause is an error in the JCL which unloads the SMF dataset. First check that the JCL is correct. A sample set of JCL to unload the SMF dataset is contained in the CICS documentation. Also check that you have unloaded the correct SMF dataset. Resubmit the job.

**Module:**

DFHSTIN

**Destination**

SYSPRINT

**DFHST0206 S** An invalid parameter ("parameter") has been specified for the DFHSTUP utility.

**Explanation**

One or more of the parameters specified in the SYSIN data set were incorrect.

**System action**

The job step is terminated.

**User response**

Correct the erroneous parameter as identified in the message and resubmit the job.

**Module:**

DFHSTUP1

**Destination**

SYSPRINT

**DFHST0207 W** An incomplete data record has been encountered on the statistics data set.

**Explanation**

A record input from the unloaded SMF data set specifies that the data it contains is incomplete.

**System action**

Processing continues.

**User response**

For an incomplete data record to have been encountered, there must have been an error in the running of CICS. This should result in an exception trace and perhaps a dump being issued.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

DFHSTUX (modules within DFHSTUP)
Destination

SYSPRINT

DFHST0208 S  An attempt to open the SYSIN data set has failed.

Explanation

DFHSTUP has tried to open the SYSIN data set but has failed.

System action

A dump is taken and the job step is terminated.

User response

Ensure that the JCL for the job is correct. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS documentation.

If incorrect JCL is not the cause of the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHSTRD

Destination

SYSPRINT

DFHST0209 S  A read error on the SYSIN data set has occurred.

Explanation

A read error was encountered on the SYSIN data set.

System action

A dump is taken and the job step is terminated.

User response

Inform the system programmer.

To resolve the problem, collect the dumps and any relevant messages and determine why the read failed. Resubmit the job.

Module: DFHSTRD

Destination

SYSPRINT

DFHST0210 I  No statistics are available for applid applid.

Explanation

No statistics data records exist for applid applid in the unloaded SMF data set. This is because

• Applid applid is unknown, or
• You have unloaded the wrong SMF data set, or
• You have specified a COLLECTION TYPE= parameter for which applid applid has no statistics, or
• No CICS statistics records were written for applid applid.

System action

The job step continues.

User response

Check that you have specified the correct applid. If necessary, respecify the correct applid. Check that you have unloaded the correct SMF data set. If necessary, unload the correct SMF data set. If you have specified the correct applid and unloaded the correct SMF data set, then there are no statistics data records for applid applid.

Module: DFHSTUP1

Destination

SYSPRINT

DFHST0211 S  Processing terminated. Getmain failed with a short on storage condition.

Explanation

The DFHSTUP utility detected an error from a GETMAIN macro while obtaining working storage. This was because DFHSTUP had exhausted the available storage.

System action

A dump is taken and the job step terminates.

User response

Check that you have specified the correct REGION size on the EXEC JCL command used to execute the DFHSTUP utility. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS documentation.
If you have specified the correct REGION size, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:** All DFHSTUP modules

**Destination**
SYSPRINT

**Explanation**
The dataset used by the DFSORT utility to output its messages is missing.

**System action**
A dump is taken and the job step is terminated.

**User response**
Check the JCL used to execute the DFHSTUP utility to ensure that the SYSOUT DD was correctly specified. A sample set of JCL to execute the DFHSTUP utility is contained in the CICS documentation.

If you have specified the correct SYSOUT DD statement, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHSTUP1

**Destination**
SYSPRINT

**Explanation**
An error was detected by the DFSORT utility and the DFHSTUP utility terminated.

**System action**
A dump is taken and the job step is terminated.

**User response**
The user must inspect the DFSORT message dataset and search for messages indicating the reason for the failure of the DFSORT utility. A detailed explanation of the messages produced by DFSORT can be found in the z/OS DFSORT Application Programming Guide (SC33-4035).

After analyzing the DFSORT error message, take the appropriate corrective actions and resubmit the job.

**Module:** DFHSTUP1

**Destination**
SYSPRINT

**Explanation**
The statistics utility program has detected that a statistics record has a version number which is incompatible with the version number expected by the DFHSTUP utility.

**System action**
The statistics record containing the invalid version number is ignored. Statistics records immediately following which are of the same type and which also...
contain an invalid version number are also ignored. Processing continues.

**User response**

Obtain a dump of the SMF data set. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
All DFHSTUP modules.

**Destination**
SYSPRINT

**DFHST0217 S**  An attempt to open the DFHSTWRK data set has failed.

**Explanation**
The statistics utility program has detected an error while attempting to open the DFHSTWRK data set during non-summary statistics processing.

**System action**
The statistics utility program ends abnormally.

**User response**
Ensure that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

**Module:**
DFHSTU17

**Destination**
SYSPRINT

**DFHST0218 S**  A write error has occurred on the DFHSTWRK data set.

**Explanation**
The statistics utility program has detected an error while attempting to write to the DFHSTWRK data set during non-summary statistics processing.

**System action**
The statistics utility program ends abnormally.

**User response**
Ensure that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

**Module:**
DFHSTU17

**Destination**
SYSPRINT

**DFHST0220 S**  An attempt to open the DFHSTWRK data set has failed.

**Explanation**
The statistics utility program has detected an error while attempting to read from the DFHSTWRK data set during non-summary statistics processing.

**System action**
The statistics utility program ends abnormally.

**User response**
Check that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

**Module:**
DFHSTU17

**Destination**
SYSPRINT

**DFHST02219 S**  A read error has occurred on the DFHSTWRK data set.

**Explanation**
The statistics utility program has detected an error while attempting to open the DFHSTWRK data set while processing summary statistics.

**System action**
The statistics utility program ends abnormally.

**User response**
Check that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct.

**Module:**
DFHST17X
Destination
SYSPRINT

DFHST0221 S A write error has occurred on the DFHSTWRK data set.

Explanation
The statistics utility program has detected an error while attempting to write to the DFHSTWRK data set during summary statistics processing.

System action
The statistics utility program ends abnormally.

User response
Check that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Module:
DFHST17X

Destination
SYSPRINT

DFHST0222 S A read error has occurred on the DFHSTWRK data set.

Explanation
The statistics utility program has detected an error while attempting to read from the DFHSTWRK data set during summary statistics processing.

System action
The statistics utility program ends abnormally.

User response
Check that the DFHSTWRK data set has been specified on the job, that the attributes of the data set are correct, and that the data set is large enough.

Module:
DFHST17X

Destination
SYSPRINT

DFHST0223 I There are no data table statistics to report.

Explanation
The file subsection of the DFHSTUP report entitled 'Data Table Requests Information' only contains formatted information if the data currently being processed contains statistics records for files accessed as data tables. This message is written to the DFHSTUP report, when the utility program detects that there are no data table statistics in this section of the statistics report.

System action
Processing continues normally.

User response
Take no action unless you expect data table statistics in the DFHSTUP report. In this case, ensure that the data tables feature is in use during the time period covered by the statistics being processed.

Module:
DFHSTU17, DFHST17X

Destination
SYSPRINT

DFHST0224 I There are no intrapartition queues to report.

Explanation
The transient data subsection of the DFHSTUP report entitled 'Transient Data - Intrapartition' contains no data.

System action
Processing continues normally.

User response
Take no action unless you expect TD intrapartition statistics in the DFHSTUP report.

Module:
DFHSTUTQ, DFHSTTQX

Destination
SYSPRINT

DFHST0225 I There are no extrapartition queues to report.
Explanation
The transient data subsection of the DFHSTUP report entitled 'Transient Data - Extrapartition' contains no data.

System action
Processing continues normally.

User response
Take no action unless you expect TD extrapartition statistics in the DFHSTUP report.

Module:
DFHSTUTQ, DFHSTTQX

Destination
SYSPRINT

DFHST0226 I  There are no indirect queues to report.

Explanation
The transient data subsection of the DFHSTUP report entitled 'Transient Data - Indirect' contains no data.

System action
Processing continues normally.

User response
Take no action unless you expect TD indirect statistics in the DFHSTUP report.

Module:
DFHSTUTQ, DFHSTTQX

Destination
SYSPRINT

DFHST0227 I  There are no remote queues to report.

Explanation
The transient data subsection of the DFHSTUP report entitled 'Transient Data - Remote' contains no data.

System action
Processing continues normally.

User response
Take no action unless you expect TD remote statistics in the DFHSTUP report.

Module:
DFHSTUTQ, DFHSTTQX

Destination
SYSPRINT

DFHST0228 S  An invalid extract parameter ("parameter") has been specified for the DFHSTUP utility.

Explanation
One or more of the parameters on the extract command specified in the SYSIN data set were incorrect.

System action
The job step is terminated.

User response
Correct the erroneous parameter as identified in the message and resubmit the job.

Module:
DFHSTUP1

Destination
SYSPRINT

DFHST0229 W  A duplicate extract command has been detected. Command ignored.

Explanation
A duplicate EXTRACT USERPROGRAM command has been detected.

System action
The duplicate command is ignored and the extract exit program specified on the first command is used. Processing continues.

User response
Remove the erroneous command.

Module:
DFHSTUP1
**Explanation**

During processing of an EXTRACT command, a program check or abend \texttt{aaa/bbbb} has occurred in extract exit program \texttt{modname}.

The code \texttt{aaa/bbbb} is, if applicable, a 3-digit hexadecimal MVS system completion code \texttt{aaa} (for example, \texttt{0C1} or \texttt{D37}). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code \texttt{bbbb}, which follows \texttt{aaa} is, if applicable, a user abend code produced by the extract exit program. If the user abend code is not applicable, this field is filled with four hyphens.

**System action**
The EXTRACT command is terminated.

**User response**
For a program check, refer to prior messages to resolve the error in the extract exit program. For a user abend code consult the relevant documentation of the user exit program to determine the error.

**Module:**
DFHSTUP
Destination
SYSPRINT

**DFHST0234 S** EXTRACT terminated at user's request RC=retcode.

**Explanation**
A batch job has issued a DFHSTUP utility EXTRACT command. The EXTRACT command has been terminated because of a non-zero value in register 15 on return from an extract user exit program.

**System action**
Execution of the utility EXTRACT command is terminated.

**User response**
Determine the cause of the error detected by the user exit program using the return code retcode provided and the relevant documentation of the user exit program.

**Module:**
DFHSTUP

**Destination**
SYSPRINT

**DFHST0235 S** An abend (code aaa/bbbb) has occurred in program modname.

**Explanation**
During processing of an DFHSTUP command, a program check or abend aaa/bbbb has occurred in module modname.

The code aaa/bbbb is, if applicable, a 3-digit hexadecimal MVS system completion code aaa (for example, OC1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code bbbb, which follows aaa is, if applicable, a Language Environment abend code. If the abend code is not applicable, this field is filled with four hyphens.

**DFHSZnnnnn messages**

**DFHSZ4001 I** date time applid FEPI initialization has started.

**Explanation**
The Front End Programming Interface (FEPI) is being initialized.

**DFHSZ0001 I** DFHSTUP has reached its reporting limit of 2000 applids, subsequent applid reporting is now suppressed.

**Explanation**
DFHSTUP has reached its limit of 2000 for the number of applids it can produce a report for. Reports for subsequent applids are suppressed.

**System action**
Processing continues.

**User response**
Consider reducing the number of applids in the statistics data.

**Module:**
DFHSTOT

**Destination**
SYSPRINT

This means the CSZI transaction - FEPI - has started its processing. CSZI is started as part of CICS system initialization, if the system initialization parameter FEPI is set to YES.

If you specified FEPI=YES and this message does not appear during CICS initialization, CSZI failed to start; the most common reason for this is that group **DFHSZ4001 I** date time applid FEPI initialization has started.
DFHFEPI is not included in the list specified by the GRPLIST system initialization parameter.

If message DFHSZ4001 is not followed by message DFHSZ4002, FEPI failed to start. In this case, a DFHSZnnnn message is issued to indicate the error.

**System action**
FEPI initialization proceeds.

**User response**
None.

**Module:**
DFHSZRMP(DFHSZSIP)

**XMEOUT parameters/Message inserts**
1. date
2. time
3. applid

**Destination**
CSZL and Console

**DFHSZ4002 I** date time applid FEPI initialization has ended.

**Explanation**
The Front End Programming Interface (FEPI) has finished initialization.

**System action**
EXEC CICS FEPI commands are made available.

**User response**
None.

**Module:**
DFHSZRMP(DFHSZSIP)

**XMEOUT parameters/Message inserts**
1. date
2. time
3. applid

**Destination**
CSZL and Console

**DFHSZ4003 I** date time applid FEPI termination complete.

**Explanation**
The Front End Programming Interface (FEPI) has finished.

A DFHSZnnnn message may precede message DFHSZ4003 to indicate what caused FEPI to terminate.

**System action**
EXEC CICS FEPI commands are made unavailable.

**User response**
Resolve the problem indicated by the messages, then restart CICS.

**Module:**
DFHSZRMP(DFHSZSIP)

**XMEOUT parameters/Message inserts**
1. date
2. time
3. applid

**Destination**
CSZL and Console

**DFHSZ4004 E** date time applid FEPI cannot be started: FEPI=YES not specified in the SIT.

**Explanation**
The Front End Programming Interface (FEPI) cannot be started because the FEPI system initialization parameter was set to NO indicating that FEPI is not required.

This message usually means that you attempted to start the FEPI transaction (CSZI) manually, but did not set up the correct environment for it to run.

**System action**
The FEPI transaction is not run.

**User response**
If you require FEPI in the CICS system, restart CICS specifying the system initialization parameter FEPI=YES. You do not need to start the FEPI transaction manually.

**Module:**
DFHSZRMP(DFHSZSIP)
XMEOUT parameters/Message inserts

1. date
2. time
3. applid

Destination
CSZL and Console

DFHSZ4005 E date time applid FEPI cannot be started: FEPI is already active, in state X’sssssss’s.

Explanation
The Front End Programming Interface (FEPI) cannot be started because FEPI is already active in the system.

This message usually means that you attempted to start a new instance of FEPI manually by running the FEPI transaction (CSZI), but the previous instance of FEPI failed in some way that caused an 'active' indication to be left in error.

The possible FEPI states (X'sssssss') are:

<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000002'</td>
<td>FEPI is being initialized</td>
</tr>
<tr>
<td>X'00000003'</td>
<td>FEPI is active</td>
</tr>
<tr>
<td>X'00000004'</td>
<td>FEPI is terminating as CICS is undergoing a normal shutdown</td>
</tr>
<tr>
<td>X'00000005'</td>
<td>FEPI is terminating as CICS is undergoing an immediate shutdown</td>
</tr>
<tr>
<td>X'00000006'</td>
<td>FEPI is terminating as CICS is undergoing an abnormal shutdown</td>
</tr>
</tbody>
</table>

System action
The request to start a new instance of FEPI is rejected.

User response
If the state suggests that a previous instance of FEPI failed, you must restart CICS to resolve the problem. You do not need to start the FEPI transaction manually.

Module:
DFHSZRMP(DFHSZSIP)

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. X’sssssss’s

Destination
CSZL and Console

DFHSZ4006 E date time applid FEPI initialization failed: enqueue failure, code X'rr'.

Explanation
The Front End Programming Interface (FEPI) cannot be initialized because an attempt to enqueue on the FEPI enqueue name SZENQRMI failed, indicating that FEPI is already active in the system. FEPI initialization issues this enqueue to prevent a second instance of FEPI being present in the system.

This message usually means that you attempted to start the FEPI transaction (CSZI) manually, but there is a previous instance of CSZI still running.

The possible values of X'rr', the reason for failure, are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'31'</td>
<td>Duplicate enqueue on SZENQRMI attempted.</td>
</tr>
<tr>
<td>X'32'</td>
<td>Failure during enqueue processing.</td>
</tr>
</tbody>
</table>

System action
The request to start a second instance of FEPI is rejected.

User response
None.

Module:
DFHSZRMP(DFHSZSIP)

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. **X'rr'**

**Destination**
CSZL and Console

`DFHSZ4007 E  date time applid FEPI initialization failed: storage ADD_SUBPOOL failure for subpool pppppppp, reason X'rr' response X'ee'.`

**Explanation**
The Front End Programming Interface (FEPI) cannot be initialized because creating the named storage subpool for FEPI use failed.

The values of X'rr', the reason for failure, are:

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'01'</td>
<td>Insufficient storage available for the subpool</td>
</tr>
<tr>
<td>X'03'</td>
<td>Subpool requested with an invalid fixed length</td>
</tr>
<tr>
<td>X'04'</td>
<td>Subpool requested with an invalid boundary alignment</td>
</tr>
<tr>
<td>X'05'</td>
<td>Subpool requested with an invalid initial number of elements</td>
</tr>
<tr>
<td>X'06'</td>
<td>Subpool requested with an invalid name</td>
</tr>
<tr>
<td>X'08'</td>
<td>Subpool requested already exists</td>
</tr>
<tr>
<td>X'11'</td>
<td>Access to the Storage Manager was denied</td>
</tr>
</tbody>
</table>

The values of X'ee', the response to the failed request, are:

<table>
<thead>
<tr>
<th>Response</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'01'</td>
<td>Request completed successfully</td>
</tr>
<tr>
<td>X'02'</td>
<td>Exception response generated</td>
</tr>
<tr>
<td>X'03'</td>
<td>Disaster response generated</td>
</tr>
</tbody>
</table>

**System action**
FEPI initialization ends, and EXEC CICS FEPI commands are unavailable. An exception trace entry is generated.

**User response**
The only action you can take is when there is insufficient storage, in which case you can increase the storage available to CICS on restart.

All other errors are system failures, and you should consult the system programmer. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHSZRMP(DFHSZSIP)

**XMEOUT parameters/Message inserts**
1. date
2. time
3. applid
4. pppppppp
5. X'rr'
6. X'ee'

**Destination**
CSZL and Console

`DFHSZ4008 E  date time applid FEPI initialization failed: Non-runaway task setting failure, reason X'rr' response X'ee'.`

**Explanation**
The Front End Programming Interface (FEPI) cannot be initialized. Because FEPI is a long-running transaction (CSZI), it must not be subject to a runaway task time out. The request to prevent this failed.

The value of X'rr', the reason for failure, is always X'00'.

The values of X'ee', the response to the failed request, are:
Response  
Meaning  
X'01'  
Request completed successfully  
X'02'  
Exception response generated  
X'03'  
Disaster response generated  
X'04'  
Invalid response generated  

System action  
FEPI initialization ends, and EXEC CICS FEPI commands are made unavailable. An exception trace entry is generated.

User response  
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:  
DFHSZRMP(DFHSZSIP)

DFHSZ4012 E  date time applid FEPI storage GETMAIN failed in subpool DA, reason X'rr' response X'ee'.

**Explanation**

The Front End Programming Interface (FEPI) issued a GETMAIN storage request in the SZSPVCDA storage subpool for general usage which failed.

The values of X'rr', the reason for failure, are:

**Reason**

**Meaning**

X'01'  
Insufficient storage for the request.

X'02'  
Invalid subpool token given.

X'04'  
Invalid length of element requested.

X'05'  
Length of element not specified.

X'08'  
Access was denied to the storage subpool.

X'11'  
Invalid initial image supplied.

X'12'  
An abnormal end occurred in the storage manager.

X'13'  
A loop was detected in the storage manager.

The values of X'ee', the response to the failed request, are:

**Response**

**Meaning**

X'01'  
Request completed successfully.

X'02'  
Exception response generated.

X'03'  
Disaster response generated.

X'04'  
Invalid response generated.

X'05'  
A kernel error was detected.

X'06'  
The request was purged.

All of these responses indicate that a system error occurred.

**System action**

An exception trace entry is generated.

FEPI tries to recover from this error by retrying the request. However, no action is taken to prevent multiple occurrences.

**User response**

DFHSZ4015 I date time applid FEPI {normal | immediate | forced} termination has started.

Explanation
The Front End Programming Interface (FEPI) has acknowledged a shutdown request and is starting to terminate.

Message DFHSZ4003 is issued when FEPI completes termination.

FEPI terminates only in response to a CICS shutdown request (such as CEMT PERFORM SHUTDOWN). Some types of CICS shutdown can result in more than one DFHSZ4015 message being issued.

System action
Certain EXEC CICS FEPI commands are made unavailable during FEPI termination.

Normal termination allows all transactions using FEPI resources to end before FEPI itself ends. However, no new usage of FEPI resources is permitted.

Immediate termination stops usage of FEPI facilities immediately but does a controlled shutdown of communication functions.

Forced termination stops usage of FEPI facilities immediately, and does the quickest possible shutdown of communication functions (which may lead to many VTAM messages being issued).

DFHTAnnnn messages

DFHTA0001 applid An abend (code aaa/bbbb) has occurred at offset 'x'offset' in module modname.

Explanation
An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, OC1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHTADM, DFHTASO
XMEOUT parameters/Message inserts

1. applid
2. aaa/bbbb
3. X'offset'
4. modname

Destination
Console

DFHTA0002 applid A severe error (code X'code') has occurred in module modname.

Explanation
An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action
An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMRM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

DFHTCnnnn messages

DFHTC1001 applid Terminal control initialization failed (modname).

Explanation
The CICS terminal control restart task could not complete because a necessary step failed. The task has done some essential recovery operations and has abnormally terminated itself with code ATC1.

System action
CICS writes a transaction dump for the terminal control restart task. CICS sends two messages to the console, one to identify the error detected by the terminal control restart task, and one, DFHTC1001, to say that the task has failed. A third message follows, either to say that CICS has terminated abnormally with a dump or to ask you to reply GO or CANCEL. Depending on the nature of the original error, you may see messages from some other system component (for example, an access method).

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
First, if CICS has requested a response, you must reply. If you reply 'GO', CICS continues processing, but without terminal control. If you reply 'CANCEL', CICS terminates abnormally with a dump. Use the messages and dumps to find out the cause of the failure. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHSII1, DFHTCRP

XMEOUT parameters/Message inserts
1. applid

DFHTC1002 applid Unable to link to program DFHTCRP.

Explanation
The CICS terminal control recovery program, DFHTCRP, is unavailable. CICS cannot find DFHTCRP in any data set concatenated in the DFHRPL DD statement in the CICS startup job stream.

System action
CICS terminates abnormally with a dump.

User response
To correct this error, place DFHTCRP in a partitioned data set in the DFHRPL DD statement.

Module:
DFHSII1

XMEOUT parameters/Message inserts

Console
DFHTC1011  applid Unable to load xxxxxx
Explanation:

System action
CICS initialization continues, but, even if it completes, VTAM resource initialization will be incorrect in some respect, depending on the function of module DFHxxxxxx.

User response
If CICS completes initialization, processing of VTAM resources will be invalid. You should cancel CICS, make module DFHxxxxxx available and then restart CICS.

Module: DFHTCRP

XMEOUT parameters/Message inserts
1. applid
2. xxxxxx

Destination
Console
DFHTC1012  applid Failure in installing VTAM resources

Explanation:
During a cold or initial start, CICS could not install all the VTAM resources defined to CICS. CICS has issued other message(s) identifying which resources could not be installed.

System action
CICS initialization continues.

User response
If any of the uninstalled resources is essential, use RDO to make it available, or cancel CICS. The most likely reasons for this message are:

• A previous CICS message such as DFHTC1011, or
• CICS code contains a logic error.

If you suspect an error in CICS, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHTCRP

XMEOUT parameters/Message inserts
1. applid

Destination
Console
DFHTC1013  applid Restore failed for xxxxxx

Explanation:
During a warm or emergency restart, CICS could not restore the resource xxxxxx.

System action
CICS continues initialization.

User response
If resource xxxxxx is essential to your system, cancel CICS. This problem is probably caused by a CICS logic error. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHTCRP

XMEOUT parameters/Message inserts
1. applid
2. xxxxxx

Destination
Console
DFHTC1014  DATE TIME APPLID Communication resource definition for (resname) was not restored from the catalog because the resource definition for (highname) was not installed.

Explanation:
During an emergency restart, CICS could not restore the resource resname from the catalog, because the definition for another resource highname that it depends on is not present. Usually resname is a session or modegroup and highname is a connection.
System action
CICS continues restart, and deletes this resource from the CICS catalog. If the definition referred to was being installed when the previous CICS failed, both definitions are restored from the system log later in the restart.

User response
If resource resname is essential to your system and is not restored later in initialization you can reinstall the resource having first installed the resource that it depends on. This message can be caused by:

- An install which was not complete when CICS failed, in which case it is forward recovered from the system log later, and no action is needed.
- A failure during warm shutdown in the previous run. In this case messages are produced for connections that were autoinstalled and were not uncataloged by the warm shutdown. In this case some autoinstalled connections which would have been removed from the catalog if the warm shutdown had completed are recovered, but those which cause these messages are not.
- A corrupted CICS catalog. If large numbers of unrelated resources are missing, and the preceding CICS run was not warm keypointing at the time of failure, the catalog may have been corrupted. CICS continues, but you may want to initial start in order to get your definitions to a known state.
- A CICS logic error. In this case you need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHTC1022 applid Error for XRF tracking record - Type: type - Key: key

Explanation
An error during XRF tracking prevented a change to a resource from being tracked. The resource is of type type and is associated with key key.

type is the tracking record type. This is one of the following:
- TCT CONTENTS
- ZCP SESSIONS

key is the location of an object in the TCTTE hierarchy.

System action
The associated resource is in an incorrect state, missing, or not deleted at the end of takeover.

User response
Decide whether the named resource is critical and see if you can resolve the problem.

Module:
**Explanation**

During XRF tracking, a condition was detected which is not possible within the intended design. The insert indicates which of the checked conditions has been detected:

1. No broadcast message accepted outside tracking. The GETMSG routine in DFHTCRP should only accept broadcast messages and those whose id matches that in field GETMSPEC. This field should only be set during tracking.
2. Broadcast message with null key. A null-key record indicates that the catch-up stream that it arrives in is complete. This can only happen to the broadcast tracking stream if the active has just done a normal (warm) shut-down.

**System action**

The message in question is ignored.

**User response**

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Chapter 2. CICS messages 1979
**XMEOUT parameters/Message inserts**

1. **applid**

**Destination**
Console

**DFHTC1046I**  
**applid** Flushing terminal control tracking.

**Explanation**
An alternate is taking over and is processing the remaining few tracking records from the active. Message DFHTC1042 has been issued twice. DFHZXQO is now doing a controlled flush of the outstanding activity.

**System action**
CICS posts one outstanding action every 2 seconds in an attempt to free the hold-up. A system dump is taken for the first action only.

**User response**
This processing only occurs when an error or unforeseen circumstance arises. If the problem can be reproduced, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHZXQO

**XMEOUT parameters/Message inserts**

1. **applid**

**Destination**
Console

**DFHTC1047I**  
**applid** Higher node missing.  
Record dropped for **key**

**Explanation**
An XRF alternate has received a tracking message from the active CICS, but either the associated system entry for this terminal is not present, or the ordering of terminal catalog records on the restart data set is incorrect (in that the terminal in error comes before the associated system entry).

**key** is the location of an object in the TCTTE hierarchy. This situation occurs if the active CICS was unable to send all of its tracking messages. This sometimes results in the system entry not being sent.

**System action**
The tracking message is discarded and so the associated action (an INSTALL or LOGON) is not performed.

**User response**
Ensure the CAVM message data set is large enough and restart the alternate. Check that the active CICS job is referring to the correct restart data set.

**Module:**
DFHTCRP

**XMEOUT parameters/Message inserts**

1. **applid**
2. **key**

**Destination**
Console

**DFHTC1060**  
**applid** Insufficient storage - code('X'code') in module DFHTCRP.

**Explanation**
A request for storage could not be satisfied in module DFHTCRP. The specific error is identified by the 'X'code' in the message. This implies that the dynamic storage area (DSA) size is too small. The 'X'code' identifies an exception trace record.

**System action**
Terminal control initialization is terminated with a system dump and message DFHTC1001 is issued.

**User response**
Since sufficient storage should be obtainable from within the minimum size DSA, this may imply a logic error within CICS. Try to increase the CDSASZE parameter in the system initialization table (SIT). If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Terminal End User

**DFHTC2502**  
date time applid TCT search error
{on line w/term | at term } termid
{, trans | , dest } tranid|destid {, rel line=} rr,time

**Explanation**

An invalid terminal address was received on the line identified by terminal termid. This error can normally occur only on control unit devices such as a 2980 or a 3270. This is because CICS uses general polling and not all terminals on the control unit may be defined to CICS. All other conditions are undefined. The optional part of the message " dest destid " applies only to TCAM. The destination destid is given when it does not match any of the network names (netnames) specified on the TCTTE generation.

**System action**

The control unit is placed out of service or, if it is not a general polled device, the line is placed out of service.

**User response**

Ensure that all terminals on the failing control unit are defined to CICS.

Where applicable, ensure that the TCAM MCP terminal generation names match the CICS DFHTCT TYPE=TERMINAL NETNAME parameter.

Destination

CSTL

DFHTC2515  date time applid Output area exceeded {on line w/term | at term} termid {, trans} tranid {, rel line=} rr, time

Explanation

A unit check error has occurred on the line defined by terminal termid. The sense (SNS=ss) is provided. D/T 3275 dialed gives an automatic two-minute time out if there is no activity on the line.

System action

The line is placed out of service on SAM lines.

Intervention on a switched line causes the task to be abnormally terminated and the line to be logically disconnected. Intervention on a non-switched line with a dummy (unidentified) terminal causes the line to be placed out of service. With a real terminal, intervention causes the terminal to be placed out of service and the transaction to be abnormally terminated.

Lost data on a READ,TEXT command causes a MESSAGE TOO LONG response to be sent to the terminal. The transaction is abnormally terminated.

Time-out on a READ,TEXT command causes a MESSAGE TOO LONG response to be sent to the terminal. Time-out with a dummy terminal causes the line to be placed out of service. With a real terminal, it causes the terminal to be placed out of service and the transaction to be abnormally terminated.
**User response**
Examine the system console log message generated by SAM for this error and have the unit error corrected.

DFHTC2536  date time applid Link to DFHTEP
from DFHTACP failed because
{module DFHTEP is not AMODE
31 | module DFHTEP could not
be loaded | there is no resource
definition for program DFHTEP}.

Explanation
While processing an error for a non-VTAM terminal,
CICS attempted to link to user replaceable module
DFHTEP. The link failed. One or more of the default
actions described in message DFHTC2538 have been
taken.

System action
The default action(s) set by DFHTACP are taken.

User response
Refer to message DFHTC2538 for an explanation of
the default action(s) that have been taken.
Possible solutions are:
• Ensure that DFHTEP is linked with AMODE 31.
• Ensure that DFHTEP is contained in one of the data
sets concatenated in the DFHRPL DD statement and
has the correct name.
• Ensure that the PROGRAM resource definition for
module DFHTEP is installed.

DFHTEP

Destination
CSMT

DFHTC2537  date time applid Abend abcode has
occurred in module DFHTEP.
Explanation

While processing an error for a non-VTAM terminal, user replaceable module DFHTEP was linked to and the program has abended with abend code abcode. One or more of the default actions described in message DFHTC2538 have been taken.

System action

Control is passed back to the calling module DFHTACP. DFHTACP reinstates the default action(s) set before DFHTEP was called. The action(s) are then taken.

User response

Refer to message DFHTC2538 for an explanation of the default action(s) that have been taken. Refer to abend code abcode for details of the original error. Follow the user response given in abend code abcode to solve the problem.

Module:

DFHTACP

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. abcode

Destination

CSMT

DFHTC2538 date time applid Default actions actions have been taken for message number relatedmessage.

Explanation

A problem has arisen during the processing of an error for a non-VTAM terminal and message msgno has been issued. The explanations for all possible default actions are as follows:

Action

Meaning
LINEOS
Place line out of service
NONPRGT
Non purgeable task
TERMOS
Place terminal out of service

1990 CICS TS for z/OS: CICS Messages
**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid

**DFHTDnnnn messages**

DFHTD0001 applid An abend (code aaa/bbbb) has occurred at offset X’offset’ in module modname.

**Explanation**

An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a three 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; TS1310 refers to message DFHTS1310).

**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the z/OS MVS System Codes manual. Then look up the CICS alphanumeric code. This tells you, for example, whether the error is a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

**Module:**

DFHTDA, DFHTDB, DFHTDRM, DFHTDOC

**XMEOUT parameters/Message inserts**

1. applid
2. aaa/bbbb
3. X’offset’
4. modname

**Destination**

Console

DFHTD0002 applid A severe error (code X’code’) has occurred in module modname.

**Explanation**

An error has been detected in module modname. The code X’code’ is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS exception trace entries, refer to the Troubleshooting and support.

**System action**

An exception entry (code X’code’ in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller.
Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

The severity of this error depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Console

DFHTD0100I  applid Transient Data initialization has started.

Explanation

This is an informational message indicating that transient data initialization has started.

System action

System initialization continues.

User response

None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:

DFHTD0101I  applid Transient Data initialization has ended.

Explanation

This is an informational message indicating that transient data initialization has completed successfully.

System action

System initialization continues.

User response

None. The message can be suppressed with the system initialization parameter MSGLVL=0.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:

DFHTD0102  applid Transient Data initialization has failed.

Explanation

Transient data initialization has failed.

The SETXIT routine in DFHTDRP has been entered following abnormal termination of the transient data initialization task.
Alternatively an attempt to open the intrapartition data set failed.

**System action**

Provided there are no subsequent serious errors which prevent further initialization of CICS, CICS issues one of two messages depending on what other errors, if any, have occurred during initialization.

If DFHSI1521 is issued, CICS initialization is terminated. If DFHSI1522 is issued, decide if CICS initialization is to be continued in degraded mode or to be terminated.

If, as part of a restart of CICS rather than during an initial start or a cold start, the intrapartition data set fails to open successfully when it was successfully opened on the previous CICS run, message DFHSI1521 is issued and CICS is terminated.

**User response**

Check previous console messages, one of which should explain why transient data initialization has failed.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

**Module:**

DFHTDRP

**XMEOUT parameters/Message inserts**

1. `applid`

**Destination**

Console

DFHTD0103I `applid` Transient Data initialization has been suspended pending takeover.

**Explanation**

This is an informational message indicating that transient data initialization has been suspended pending takeover. Some transient data initialization can be performed while CICS is operating in standby mode. However the remaining initialization can not be performed until takeover is complete because transient data sets, with the exception of the DFHCXRF data set, are assumed to be passively shared.

**System action**

System initialization continues.

**User response**

None. The message can be suppressed with the SIT parameter MSGLEVEL=0.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

**Module:**

DFHTDRP

**XMEOUT parameters/Message inserts**

1. `applid`

**Destination**

Console

DFHTD0104I `applid` Transient Data initialization has been resumed following takeover.

**Explanation**

This is an informational message indicating that transient data initialization has been resumed following takeover.

**System action**

System initialization continues.

**User response**

None. This message can be suppressed with the system initialization parameter MSGLEVEL=0.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

**Module:**

DFHTDRP

**XMEOUT parameters/Message inserts**

1. `applid`

**Destination**

Console
Explanation
This is an informational message indicating that transient data is being initialized with TDINTRA=EMPTY specified on the SIT. This has the effect of initializing all intrapartition TD queues in an empty state. The TDINTRA SIT parameter is ignored during a cold or initial start.

System action
System initialization continues.

User response
None. The message can be suppressed with the system initialization parameter MSGLEVEL=0.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHTD0170 applid The intrapartition data set has been corrupted.

Explanation
During a warm or emergency restart, CICS has found that the contents of the intrapartition data set are not consistent with that recorded by CICS. The intrapartition data set could have been corrupted.

System action
CICS terminates after producing a dump and writing an exception trace.

A system dump with dumpcode TD0170 is taken unless you have specifically suppressed dumps in the dump table.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDA, DFHTDB, DFHTDOC, DFHTDRM
XMEOUT parameters/Message inserts

1. applid
2. X'response'
3. X'reason'
4. dfhxxyym

Destination
Console

DFHTD0182 applid Unexpected response (code $X'response') and reason (code $X'reason') from a dfhxxyym call during processing of intrapartition queue queue.

Explanation
The trigger level has been reached for intrapartition transient data queue queue.
Module DFHTDB or DFHTDRM could not initiate the associated transaction following the response of a dfhxxyym call to domain xx.
The response (code $X'response') and reason (code $X'reason') are those returned from the domain call (that is, xxyy_response and xxyy_reason).
Initiation of the associated transaction has failed.

System action
This is probably a CICS logic error.
Each subsequent write to the transient data queue causes another attempt to initiate the transaction, which will fail. However, this message is only issued the first time the error is detected.
CICS writes a dump and continues processing.
Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

XMEOUT parameters/Message inserts

1. applid

Destination
Console

DFHTD0244 applid An I/O error has occurred during an output operation to an extrapartition dataset for queue queue. (DD name = ddname).

Explanation
An I/O error has occurred during the processing of an output operation to the extrapartition data set ddname on queue queue.

System action
An IOERR condition is returned. Subsequent put requests are returned IOERR.

User response
Close data set ddname via CEMT. If the I/O errors persist after a subsequent open, you probably need to reallocate this data set on a different volume.
Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDA, DFHTDOC

XMEOUT parameters/Message inserts
1. applid
2. queue
3. ddname

Destination
Console

DFHTD0245 applid NOSPACE condition on a PUT to the intrapartition data set (DD name ddname). The RBA of the next CI would have exceeded 2 gigabytes.

Explanation
An attempt to write to intrapartition transient data set with ddname ddname has failed due to a NOSPACE condition. CICS did attempt to extend the data set but the relative byte address (RBA) of the next control interval (CI), if it were added, would have exceeded 2 gigabytes (x’7FFFFFFF’).

System action
The system continues normally.

User response
Delete unwanted transient data queues from the intrapartition data set.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDB

XMEOUT parameters/Message inserts
1. applid
2. ddname

Destination
Console

DFHTD0246 applid An I/O error has occurred during an input operation to an extrapartition dataset for queue queue. (DD name = ddname).

Explanation
An I/O error has occurred during the processing of an input operation to the extrapartition data set ddname on queue queue.

System action
An IOERR condition is returned. Subsequent put requests are returned IOERR.

User response
Close data set ddname via CEMT. If the I/O errors persist after a subsequent open, you probably need to reallocate this data set on a different volume.

Check the definition of the extrapartition transient data queue. The specification of an invalid blocksize or recordsize may have caused the I/O error.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDA, DFHTDOC

XMEOUT parameters/Message inserts
1. applid

1. applid
2. queue
3. X'rrrr'

DFHTD0252 applid Open of queue queue failed. DSNAME not available from JCL
or resource definition. Module module.

Explanation

An attempt by CICS to open queue queue failed because neither the JCL nor the resource definition for the queue specified the data set name.

CICS transient data has not opened queue queue, for the following reasons:

- At initialization time, the startup JCL did not include a DD statement.
- No user-submitted routine allocated the queue dynamically.
- The TDQUEUE resource definition does not contain a DSNAME attribute to enable CICS to allocate the file dynamically.

System action

CICS continues processing with queue queue closed.

User response

Before resubmitting the transaction, supply the data set name in the JCL or the resource definition.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module: DFHTDOC

XMEOUT parameters/Message inserts

1. applid
2. queue
3. module

Destination

Console

DFHTD0340 applid Transaction tranid initiated when the trigger level is reached for Transient Data queue queue is defined as REMOTE. The transaction initiation has failed.

Explanation

The trigger level has been reached for transient data queue queue. The transaction associated with the queue is remote, which is invalid for trigger transactions. The initiation of the transaction has, therefore, failed.

System action

Until the error is corrected, each subsequent write to the transient data queue causes another attempt to initiate the transaction, which fails. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User response

If the transaction ID specified in the TDQUEUE resource definition is incorrect, amend the resource definition to specify a transaction that is local.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module: DFHTDXM

XMEOUT parameters/Message inserts

1. applid
2. tranid
3. queue

Destination

Console

DFHTD0341 applid Transaction tranid associated with the trigger level for Transient Data queue queue has not been initiated.

Explanation

The trigger level has been reached for transient data queue queue. Initiation of the associated transaction has failed due to an error in system set up.

System action

Until the error is corrected, each subsequent write to the transient data queue causes another unsuccessful attempt to initiate the transaction. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User response

Check the TDQUEUE resource definition for the transient data queue. The queue must have a
transaction associated with it that exists, is defined as local, and is installed.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDB, DFHTDRM

XMEOUT parameters/Message inserts
1. applid
2. tranid
3. queue

Destination
Console

DFHTD0342 applid Transaction tranid associated with the trigger level for Transient Data queue queue has not been scheduled.

Explanation
The trigger level has been reached for the transient data queue queue. The schedule of the associated transaction has failed due to an error in system set up.

System action
Until the error is corrected, each subsequent write to the transient data queue causes another attempt to schedule the transaction, which fails. However, in order to avoid filling the log with messages, this message is only issued the first time the error is detected.

User response
Check the following and amend if necessary:

- The queue must have a transaction associated with it that exists, is defined as local, and is installed. The transaction was local since the Remote attributes were not set in the transaction definition, yet the dynamic parm indicated that it could be remote.
- For a transient data queue defined with an ATIFACILITY attribute of SYSTEM or TERMINAL, the named facility must exist, and any required system links must be installed and in service.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

DFHTD0343 DATE TIME APPLID Automatic transaction restart for transaction tranid processing TD queue queue-name has failed.

Explanation
A transaction that was attached when a TD trigger level was reached is ending abnormally and automatic transaction restart was requested for this transaction via the user replaceable module DFHREST. A severe error occurred when CICS attempted to restart the transaction.

System action
Message DFHAP0002 is issued with a dump for the severe error that caused the restart to fail. Abnormal termination of the transaction for which restart was requested continues. The transaction is not automatically restarted.

The system attempts to reattach the trigger level transaction when the next TD request is received for this TD queue and the trigger level has been reached or exceeded.

User response
Investigate the reason for the earlier severe error. See message DFHAP0002 for further guidance.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Console

DFHTD0360  applid Logical I/O error occurred during a GET request to the intrapartition data set (DD name ddname); VSAM return codes are R15=X'retcode', FDBK=X'fdbkcode'.

Explanation

An attempt to read a control interval from the intrapartition data set with ddname ddname has failed due to a logical I/O error. retcode is the return code in register 15 and fdbkcode is the value of the feedback field in the request parameter list (RPL).

System action

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate. A system dump with dumpcode TD0360 is taken unless you have specifically suppressed dumps in the dump table.

User response

Message DFHME0116, which contains the symptom string for this problem, is produced. For the meaning of the codes in the message, refer to the z/OS DFSMS Macro Instructions for Data Sets.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Console

**DFHTD0363 applid Physical I/O error occurred during a PUT request to the intrapartition data set (DD name ddname); VSAM return codes are R15=X'retcode', FDBK=X'fdbkcode'.**
**Explanation**

Control interval 0 in the intrapartition data set is reserved for transient data control information. The remaining control intervals are allocated to hold data for queues as determined by transient data processing on behalf of application program requests.

An invalid attempt has been made to read control interval 0 for the intrapartition data set with ddname *ddname*.

**System action**

This is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

A system dump with dumpcode TD0380 is taken unless you have specifically suppressed dumps in the dump table.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Each CICS record for an intrapartition transient data queue contains pointers which, if the queue is not empty, are relative byte addresses (RBAs) associated with the intrapartition data set with *ddname*.

Furthermore each allocated control interval, apart from the first, contains one or more user records as well as a queue control record. This latter record, the first in the control interval, contains the forward chain pointer or RBA for the next control interval containing data for the queue.

In each case, transient data assumes that RBAs address record boundaries within the intrapartition data set.

The assumption can be violated in several ways. The type of violation may be determined from:

- a control interval print of the intrapartition data set,
- or using Access Method Services, or
- using the system dump.

Violations include:

- **THE WRONG INTRAPARTITION DATA SET WAS USED** If the wrong data set has been used, that is, the data set used for this CICS start up was not used for the previous CICS start up, then it is highly probable that most of the RBAs in the CICS records for an intrapartition transient data queue will not address record boundaries in the intrapartition data set. A cold start or an initial start of CICS must be carried out.

- **THE INTRAPARTITION DATA SET WAS ALTERED** If the records have been moved, possibly through data set compression, then it is highly probable that control interval 0 will contain more than one record and that most of the RBAs in the CICS records for an intrapartition transient data queue will not address record boundaries in the intrapartition data set. A cold start or an initial start of CICS must be carried out.

- **A CICS record for an intrapartition transient data queue WAS CORRUPTED** If a CICS record for an intrapartition transient data queue has been corrupted, it is highly probable that just one or two RBAs will not address record boundaries in the intrapartition data set. A specialized trap may be required to identify the offending program.

CICS may be restarted. An emergency restart for transient data will result in the RBAs being reconstructed from the system log and the intrapartition data set.

If an activity keypoint was taken between the occurrence of the error and its detection, it may prove necessary for a cold start or an initial start of CICS to be carried out.

- **AN I/O BUFFER WAS CORRUPTED** If an I/O buffer has been corrupted, it is highly probable one of the RBAs in the CICS record for an intrapartition transient data queue will not address record boundaries in the I/O buffer. A specialized trap may be required to identify the offending program.

CICS may be restarted. An emergency restart for transient data results in the RBAs being reconstructed from the system log and the intrapartition data set.

**Note:** If the contents of the I/O buffer were written to the intrapartition data set between the occurrence of the error and its detection, it may prove necessary to perform a cold start or an initial start of CICS.

- **A CICS LOGIC ERROR OCCURRED** If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

- The High Write RBA of the DFHINTRA data set may have reached, or exceeded, the allowed maximum value of x’7FFFFFFF’.

CICS may be restarted. An emergency restart for transient data will back out all uncommitted records from the intrapartition queues.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

DFHTD1210  applid DCT index in error, xxxx failed

Explanation
While carrying out operation xxxx (INSTALL) CICS found an error in the destination control table (DCT) index. This message is issued on warm or emergency restarts when transient data is installing entries from
the global catalog. The most likely reasons for this error are:

1. Storage violation.
   - An application program has overwritten the index, or
2. CICS logic error
   - The CICS Directory Domain created the index incorrectly, or
3. Corrupt global catalog entries
   - The global catalog has been corrupted.

**System action**

CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Respond GO or CANCEL to message DFHSI1522.

Look at the contents of the global catalog, to determine if the catalog entry has been corrupted for the DCTE that is failing to install.

Assuming that the error is a storage violation, and that you have activated the trace facility, find in the trace the unsuccessful attempt to access the DCT by DFHTDP. Then find the last preceding successful access. You have now narrowed the search to programs that were running between these two accesses. Examine these programs for an error that could cause a storage violation.

If you have not activated trace, but you can recreate the error, activate trace, recreate the error, and proceed as in the previous paragraph.

**Note:**
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

**Module:**
DFHTDRP

**XMEOUT parameters/Message inserts**

1. applid
2. xxxx

**Destination**

Console

---

**DFHTD1217 applid Unable to install resource definition for transient data queue xxxx.**

**Explanation**

During a warm or emergency restart, CICS was unable to install the resource definition for the transient data queue xxxx.

**System action**

CICS ignores the definition and continues initialization.

**User response**

The cause of this install failure may be indicated in earlier messages issued from the transient data (TD) component. It may be the result of a failure to open the DFHINTRA data set, or a security error associated with any userid included in the definition. In the latter case, it is possible to create an RDO definition for the entry, with the correct userid, once CICS has initialized, and then to install it using the CEDA transaction.

**Note:**
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

**Module:**
DFHTDRP

**XMEOUT parameters/Message inserts**

1. applid
2. xxxx

**Destination**

Console

---

**DFHTD1221 applid Transient data queue definitions not restored, xxxx failed**

**Explanation**

During a warm start, while carrying out operation xxxx (STARTBROWSE, GETNEXT or ENDBROWSE), the transient data recovery program (DFHTDRP) found an error in the catalog table of transient data queue definitions.

The most likely reasons for this error are I/O errors in the catalog data set, or a logic error in the CICS module, DFHCCCC.
System action
CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Respond GO or CANCEL to message DFHSI1522.

Determine and correct the I/O errors on the catalog data set. If you cannot restore the catalog data set, or suspect that there might be a CICS logic error in DFHCCCC, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:
DFHTDRP

Destination
Console

DFHTD1261 applid Intrapartition data set ddname not defined as VSAM ESDS

Explanation
CICS is unable to open the intrapartition data set ddname because it is not defined as VSAM ESDS.

System action
During a cold or initial start, transient data initialization continues until any transient data queue resource definitions have been processed. Any intrapartition queues found are not installed and message DFHTD1217 is issued for each install failure encountered. At the end of TD initialization, message DFHTD0102 is issued. If no other initialization errors occur, message DFHSI1522 is issued.

For all other starts, TD checks the catalog to see if DFHINTRA had opened successfully on the previous CICS run. If it did, initialization is terminated. If it did not, TD initialization continues normally.

User response
On a cold or initial start, respond GO or CANCEL to message DFHSI1522.

Recreate the intrapartition data set as a VSAM ESDS and restart CICS.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module: DFHTDRP

XMEOUT parameters/Message inserts

1. applid
2. ddname

Destination
Console

**DFHTD1262 applid Intrapartition data set ddname not formatted**

Explanation
The intrapartition data set ddname is not formatted (it is empty). Initial formatting is done (if necessary) when CICS is cold or initial started.

System action
CICS continue to initialize until all resource definitions for transient data queues have been installed. Any intrapartition definitions being read from the global catalogue will fail to install because of the original failure. When DFHTDRP completes its processing, CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

User response
Respond GO or CANCEL to message DFHSI1522.
Perform a cold or initial start when CICS is next brought up.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module: DFHTDRP

| **applid An error occurred during initialization of intrapartition queue **queueuname** for userid **userid**. The queue has not been installed.** |

**Explanation**

An error occurred during initialization of intrapartition queue **queueuname** for userid **userid**. The queue has not been installed.

**System action**

CICS writes a dump. The transaction abnormally terminates with abend code ATDY and message DFHSI1522 is issued.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Respond GO or CANCEL to message DFHSI1522.

Check the return code and error code in the z/OS DFSMS Macro Instructions for Data Sets.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

**Module:**
DFHTDRP
Explanation
Transient data initialization detected an error with userid userid during installation of the intrapartition queue for automatic transaction initiation.

The specified userid is not valid for use by this CICS job for non-terminal transactions initiated by the transient data trigger.

There may be a previous message which gives the cause of this error.

System action
Transient data initialization continues. The intrapartition queue definition is not installed.

User response
Notify the system programmer.

If the userid is invalid, correct the userid specified in the resource definition for the intrapartition queue.

If the userid is valid, ensure that it can be used by non-terminal transactions that are initiated by trigger for the intrapartition queue. See the CICS Security for guidance.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

DFHTD1280 applid An attempt to establish security has failed for userid userid. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').

Explanation
An attempt was made to establish security for userid userid. The attempt was rejected by the external security manager (ESM).

System action
Security has not been established for the userid.
The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the z/OS MVS Programming: Authorized Assembler Services Guide and in z/OS Security Server RACROUTE Macro Reference (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Note:
Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

DFHTFnnnnn messages

DFHTF0001 applid An abend (code aaaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation
An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error occurred in a crucial XM domain module.
Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual.

If module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module `modname` you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Destination**

Console

DFHTF0002  
`applid` A severe error (code `X'code'`) has occurred in module `modname`.

**Explanation**

An error has been detected in module `modname`. The code `X'code'` is the exception trace point id which uniquely identifies what the error is and where the error was detected.

**System action**

An exception entry (code `X'code'` in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error is critical.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module `modname`, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

DFHTF0200  date time applid termid netname userid tranid Ipaddr Ipaddr Mapset map Map map Field field Attr attr Invalid 3270 datastream from client

Explanation
The 3270 datastream received from a terminal emulator client attempted to override a protected field.

The field value returned in the DFHTF0200 message is a 3270 buffer address in decimal. This address represents the position of a field on the screen, 0 being Row 1 Column 1 and 1919 being Row 24 Column 80 for a 24X80 display image screen size.

The field value can be converted into Row/Column using the following method below (where W is the column width of the display screen):

- (Field value / W) + 1 = Row number
- The remainder + 1 = Column number

For example, given a display image of 24 rows and 80 columns the Row/Column of FIELD value 1602 is:
- (1602 / 80) + 1 = Row 21
- (1602 -(20 * 80)) = 2 + 1 = Column 03

The attr values returned are:

Value
- P Protected
- N Non display
- M Modified

### DFHTInnnn messages

**DFHTI0001**

```plaintext
applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.
```

**Explanation**

An abnormal end (abend) or program check has occurred in module *module*. This implies that there may be an error in CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code *aaa/bbbb* is a three digit hexadecimal MVS code (if applicable), followed by a four digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

Message DFHME0116, which contains the symptom string for this problem, is produced.

**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

**User response**

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual. Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

3. X'offset'
4. modname

**Destination**
Console
A possible loop has been detected at offset X'offset' in module modname.

Explanation

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time when the error was detected.

Message DFHME0116, which contains the symptom string for this problem, is produced.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

User response

If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Console

applid A hardware error has occurred (module modname, code X'code'). The Time-of-Day clock is invalid.

Explanation

An error has occurred during the running of module modname. The MVS Store Clock facility is the timing mechanism for the operating system.

The code X'code' is the exception trace point id which uniquely identifies the place where the error was detected.

Message DFHME0116, which contains the symptom string for this problem, is produced.

System action

An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues if possible, unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example the domain manager, DFHDMDM). A message is issued to this effect.

User response

If CICS is still running, it is necessary to decide whether to terminate CICS. First, investigate the MVS Store Clock and find out whether it is working properly. If this is the cause, you should take the appropriate action to have it repaired or replaced.

In the unlikely event that this is not a hardware problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**DFHTO6020 E**

`date time applid SESSIONS sesdef refers to single-session CONNECTION condef but has an invalid MAXIMUM option specified.`

**Explanation**

The value specified for the MAXIMUM option in the SESSIONS definition **sesdef** is incompatible with the CONNECTION definition **condef** because **condef** is defined as single-session. This was detected when **sesdef** referred to **condef** during installation of a
GRPLIST at initialization, during CEDA INSTALL of a GROUP, or following a CHECK command, or during an EXEC CICS CREATE.

When a SESSION definition refers to a single-session CONNECTION definition, the value of the MAXIMUM option should be \((1,0)\).

**System action**
The SESSIONS definition is not installed.

**User response**
There are two ways to solve this problem:
- Correct the SESSIONS definition by specifying MAXIMUM\((1,0)\) using either CEDA or the CSD batch update utility DFHCSDUP.
- Redefine the CONNECTION definition so that it is no longer single-session by specifying SINGLESESS=NO.

**Module:**

</table>

### Explanation

**DFHTP4101**

A terminal requested that it be reset from temporary paging status to autopaging status. However, the terminal is defined as a paging terminal, or the message is marked to state that the operator must purge it.

**System action**

Other processing continues.

**User response**

If the terminal is defined as a purging terminal, use the main terminal program to change the status of the terminal.

If the message is so marked, the operator must purge the message. The system then automatically resets the status to autopaging.

**Module:** DFHTPR

**Destination**

Terminal End User

---

**DFHTP4102**

The operator requested the nnnn messages to be delivered via the page retrieve command queue.

**System action**

The count of messages queued for this operator or terminal is displayed.

**User response**

None.

**Module:** DFHTPR

**Destination**

Terminal End User

---

**DFHTP4103**

There are currently no tasks attached to this terminal.

**System action**

Other processing continues.

**User response**

None.

**Module:** DFHTPR

**Destination**

Terminal End User

---

**DFHTP4104**

The CICS paging command (CSPG) or a request for paging was entered from a terminal in transaction status, but there are no pages to be displayed at the terminal.

**System action**

Other processing continues.

**User response**

None.

**Module:** DFHTPR

**Destination**

Terminal End User

---

**DFHTP4105**

The terminal operator tried to retrieve or purge a specific message using a message identifier (rather than the current or next available message). However, the specified message does not exist, or is not destined for this terminal.
DFHTP4106 You are not allowed to RETRIEVE or PURGE this message.

Explanation
The terminal operator tried to retrieve or purge a specific message using a message identifier (rather than the current or next available message). However, the specified message is not destined for this operator identifier.

System action
Other processing continues.

User response
None.

Module: DFHTPR

DFHTP4108 Requested page pageno does not exist (it is less than 1 or more than the number of pages in the message).

Explanation
The page pageno, as indicated by the page retrieval command, is either less than one or is greater than the number of pages in the message. This can be caused, for example, by requesting the previous page after the first page, or the next page after the last page.

System action
Other processing continues.

User response
None.

Module: DFHTPR

DFHTP4109 The requested command command was not recognized. Check that you have the correct value.

Explanation
Transaction CSPG was entered at the terminal, but what follows cannot be identified as a paging command. command represents the first four nonblank characters after CSPG.

System action
Other processing continues.

User response
None.

Module: DFHTPR

Chain value chain is less than 1 or greater than the level of chaining allowed.

Explanation
The chain value, chain, as indicated by the page retrieval command, is either less than one or is greater than the level of chaining at that terminal.

System action
Other processing continues.

User response
None.

Module: DFHTPR
Destination
Terminal End User

DFHTP4110  function is not valid. Page RETRIEVE function must be A, C, L, N, P, Q, or a number.

Explanation
The page retrieve function represented by function is not one of the following: A, C, L, N, P, Q, or a number that may be preceded by a + (plus) or a - (minus) sign, where:

Function  Meaning
A  All logical messages destined for and being displayed on that terminal.
C  The current (level) logical message.
L  The last page.
N  The next page.
P  The previous page.
Q  (Query) display the identifier of all logical messages destined for this terminal. If the message is security protected, its identifier is displayed only if the operator identifier and class for the signed-on operator match those in the message. The identifier consists of 1-to-6-digit hexadecimal number, and optionally, a message title.

System action
Other processing continues.

User response
Use a valid page retrieve function.

Module:
DFHTPR

Destination
Terminal End User

DFHTP4111  function is not valid. Page PURGE function must be A, B, C, H, or R.

Explanation
The page purge function represented by function is not A, B, C, H, or R. The functions have the following meanings.

Function  Meaning
A  All logical messages destined for and being displayed on that terminal.
B  The logical message being displayed on that terminal and all logical messages chained to it.
C  The current (level) logical message.
H  All logical messages chained to the base logical message being displayed on that terminal.
R  All logical messages queued for immediate delivery (routed) to the terminal.

System action
Other processing continues.

User response
Use a valid page purge function.

Module:
DFHTPR

Destination
Terminal End User

DFHTP4112  The terminal identifier termid is unknown or is not supported.

Explanation
The terminal identifier represented by termid does not exist or is not supported under basic mapping support (BMS).

System action
Other processing continues.
User response

Use a valid terminal identifier.

Module:
DFHTPR

DFHTP4113 date time applid msgno termtype pageno I/O error on MCR or Page (MODULE NAME: modname).

Explanation

While attempting to retrieve a message control record (MCR) or page of a message, a temporary storage I/O error occurred. msgno represents the message number in hexadecimal; termtype is the terminal type; pageno is zero if the error occurred for the MCR, or is the page number. The message or page noted may be lost for this and/or other terminals.

System action

If pages are being displayed at an autopaging terminal, the next page if any is displayed. Otherwise no action takes place.

User response

None.

Module:
DFHTPQ

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. msgno
5. termtype
6. pageno
7. modname

You must purge messages from the terminal before issuing a new transaction.

Destination

CSMT

DFHTP4114 You must purge messages from the terminal before issuing a new transaction.

Explanation

While messages were being displayed at the terminal, the operator entered data that was not a paging command, either in error or to initiate a new transaction. However, at least one of the messages on the terminal is marked that the operator must specifically purge it before initiating a new transaction.

System action

Other processing continues.

User response

Purge all messages being displayed at this terminal (T/A), or chain the desired transaction using the chaining command.

Module:
DFHTPR

Destination

Terminal End User

DFHTP4115 You must purge the message from your terminal to continue.

Explanation

A transaction is displaying pages at the terminal. Before the operator can continue with the transaction, the message must be purged.

System action

Other processing continues.

User response

Purge the current message (T/C).

Module:
DFHTPR

Destination

Terminal End User

DFHTP4116 Your message request cannot be done while another message is being displayed.

Explanation

While viewing a message, the operator entered a request for a specific message (for example, P/1,xxx) or requested the message identifiers of messages waiting to be displayed (P/Q). CICS cannot service
this request while another message is being displayed. xxx is the message identifier of one of the messages waiting to be displayed.

**System action**
Other processing continues.

**User response**
If desired, reenter the request when there are no messages being displayed at the terminal.

**Module:**
DFHTPR

**Destination**
Terminal End User

**DFHTP4117** Purge display % after viewing.

**Explanation**
The operator at a 3270 has requested a display of message identifiers waiting to be displayed. The reply is constructed as one or more pages stored in temporary storage and can be viewed like any page message. % is the page number indicator.

**System action**
Other processing continues.

**User response**
If desired, reenter the request when there are no messages being displayed at the terminal.

**Module:**
DFHTPR

**Destination**
Terminal End User

**DFHTP4118** An ID error occurred while retrieving a Message Control Record (MCR) or Message Page. Message bmsid, terminal type termtype, page pageno.

**Explanation**
CICS was trying to retrieve page pageno of a message from temporary storage when an identifier error was received.

Alternatively, if page pageno is equal to zero, CICS could have been trying to retrieve a message control record (MCR) when the identifier error was received.

The probable cause of the error is that temporary storage was cold started after the message was scheduled or after the message was saved. Otherwise the message had already been purged.

The insert bmsid is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page or message. The insert termtype identifies the terminal type.

**System action**
The message or page may be lost. Other processing continues.

**User response**
None.

**Module:**
DFHTPR

**Destination**
Terminal End User

**DFHTP4119** An invalid request on Message Control Record (MCR) or Page Retrieval has occurred. Message bmsid, terminal type termtype, page pageno.

**Explanation**
CICS was trying to store or retrieve page pageno of a message when a temporary storage invalid request occurred. Alternatively, CICS could have been trying to store or retrieve a message control record (MCR) if the page pageno equaled zero when the temporary storage invalid error was received.

The message or page may be lost. The probable cause is that temporary storage was not loaded. bmsid is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page or message. termtype is the terminal type.

**System action**
Other processing continues.

**User response**
Ensure that the temporary storage program is loaded.

**Module:**
DFHTPR

<tr>
<th>Destination</th>
<th>Terminal End User</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHTP4124</td>
<td>Page copied from terminal termid (Message number msgno).</td>
</tr>
</tbody>
</table>

**Explanation**
This message appears in the display of messages waiting to be displayed (P/Q) and identifies a copied page. msgno is the message number of the copied page and termid is the terminal for which it is queued.
**System action**
Processing continues.

**User response**
None.

**Module:** DFHTPR

**Destination**
Terminal End User

**DFHTP4126** msgno has been copied.

**Explanation**
This message is issued in response to a request to copy to another terminal. msgno is the message number of the message being displayed.

**System action**
Processing continues.

**User response**
None.

**Module:** DFHTPR

**Destination**
Terminal End User

**DFHTP4127** nnnn must be a number. Please try again.

**Explanation**
The characters nnnn are not valid. The system expected a decimal value for a page or chain number, or a hexadecimal value for a message number.

**System action**
Other processing continues.

**User response**
Reenter the paging command. Use a valid number.

**Module:** DFHTPR

**Destination**
Terminal End User

**DFHTP4128** command is undefined for page retrieval.

**Explanation**
After a page retrieval (PR) session had been started, the operator pressed a PA or PF key for which no PR command had been defined in the SIT.

**System action**
The command is ignored. The display status bit is not altered.

**User response**
Ensure that the PR command in question is defined in the SIT.

**Module:** DFHTPR

**Destination**
Terminal End User

**DFHTP4130** You have used an unrecognized logical device. The valid names are xxx,yyy.

**Explanation**
A paging command containing an invalid logical device mnemonic was entered. xxx,yyy,... indicates the valid logical device mnemonics for the requested logical message.

**System action**
Input is discarded and other processing continues.

**User response**
Reenter the paging command with a logical device mnemonic chosen from those listed in the message.

**Module:** DFHTPR

**Destination**
Terminal End User

**DFHTP4131** Requested page cannot be copied to that terminal.

**Explanation**
The operator has tried to copy a page that refers to an outboard format:
• To a terminal that does not support outboard formats, or
• To a terminal that does support outboard formats, but which has a different page width or a smaller page depth than the source terminal.

**System action**
The paging request is ignored.

**User response**
Carry out whichever one of the following is appropriate:
• Copy the offending page to a terminal that supports outboard formatting
• Make the referenced format nonoutboard
• Copy the offending page to a terminal that does support outboard formatting and which has a page size the same as that of the source terminal.

**Module:**
DFHTPR

**Destination**
Terminal End User

**DFHTP4132**
No pages have been built for this partition.

**Explanation**
This an information message issued during a page retrieval session. It appears in a screen partition for which no pages have been built.

**System action**
Processing continues.

**User response**
None, unless a display was expected in the affected partition. In this case, check for an operator or application error.

**Module:**
DFHTPR

**Destination**
Terminal End User

**DFHTP4133**

**Explanation**
CICS was trying to retrieve page *pageno* of a message when an identifier error was received. Alternatively, CICS could have been trying retrieve a message control record (MCR) if the page *pageno* equaled zero when the identifier error was received. The message or page may be lost.

The probable cause is that temporary storage was cold-started after the message was scheduled or saved, or the message has already been purged.

*bmsid* is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page/message. *termtpe* is the terminal type.

**System action**
Other processing continues.

**User response**
None.

**Module:**
DFHTPR

**Destination**
CSMT

**DFHTP4134**

**Explanation**
CICS was trying to store or retrieve page *pageno* of a message when a temporary storage invalid request error occurred. Alternatively, CICS could have been trying to store or retrieve a message control record (MCR) if the page *pageno* equaled zero when the temporary storage invalid request error occurred. The message or page may be lost.

The probable cause is that temporary storage was not loaded.
*bmsid* is the BMS logical message identifier, which is a unique hexadecimal identifier used in the generation of a TS key for saving this page/message. *termtype* is the terminal type.

### System action
Other processing continues.

### User response
Ensure that the temporary storage program is loaded.

CSMT

DFHTP4190 Please enter your data again in the partition containing the cursor.

Explanation

The terminal operator entered data from a partition other than the expected input partition. The expected input partition is activated (that is, the cursor is moved into it), and the terminal operator should reenter data in this partition.

DFHTRnnnn messages

DFHTR0001 applid An abend (code abcde) has occurred at offset X'offset' in module modname.

Explanation

An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code.

Alternatively, unexpected data has been input, or storage has been overwritten.

The code abcde is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Module: DFHTRSR, DFHTRPT, DFHTRDM, DFHTRFT

Console

DFHTR0002 applid A severe error (code X'code') has occurred in module modname.

Explanation

An error has been detected in module modname. The code X'code' is the exception trace point id which uniquely identifies what the error is and where the error was detected. For further information about CICS.
exception trace entries, refer to the Troubleshooting and support.

System action
An exception entry (code X'code') is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
There may be an error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated.

If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

3. modname

Destination
Console

DFHTR0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation
A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Explanation**
The DCB abend exit for named auxiliary trace data set dataset was driven after a request to BSAM.
The 3-digit abend code is indicated as X’abcode’

**System action**
CICS continues with auxiliary trace inactive.

**User response**
Refer to the z/OS MVS System Codes manual for an explanation of the abend code, X’abcode’.

**Module:**
DFHTRAO

**Destination**
Console

**DFHTR0108**
I/O ERROR ON AUXILIARY TRACE DATA SET dataset - AUXILIARY TRACE STOPPED.

**Explanation**
The SYNAD exit for the auxiliary trace data set dataset was driven after a request to BSAM.

**System action**
CICS continues with auxiliary trace inactive.

**User response**
Use this message and any BSAM messages to determine the source of the error.

**Module:**
DFHTRSU

**Destination**
Console

**DFHTR0109**
AUXILIARY TRACE DATA SET dataset FULL - AUXILIARY TRACE HAS BEEN STOPPED.

**Explanation**
The auxiliary trace data set dataset is full. Auxiliary trace has been stopped because autoswitch is not active.

**System action**
CICS continues with auxiliary trace inactive.

**User response**
The auxiliary trace data set dataset can now be processed by the print routine DFHTU720.

**Module:**
DFHTRSU

**Destination**
Console

**DFHTR0110**
AUXILIARY TRACE DATA SET dataset1 FULL - SWITCHING TO dataset2.

**Explanation**
The auxiliary trace data set dataset1 is full. Auxiliary trace is continuing on data set dataset2 because autoswitching was requested.

**System action**
CICS continues with auxiliary trace active on the data set dataset2.

**User response**
Process the full data set if required.

**Module:**
DFHTRSU

**Destination**
Console
DFHTR0111  applid Unable to acquire storage for GTF buffer - GTF trace inoperative.

Explanation
An attempt to start CICS tracing to the MVS Generalized Trace Facility (GTF) failed because there was insufficient storage available from MVS for the 256-byte buffer required.

This message can be issued by DFHTRDM during CICS initialization if GTFTR=ON is specified on the SIT or start-up overrides, or by DFHTRSU if the request to start GTF was made after CICS was up and running.

System action
CICS continues with GTF tracing inactive.

User response
The failure to acquire even 256 bytes of storage indicates that the CICS region is probably in a stall condition. This can only be relieved by removing some of the users of MVS storage or by restarting CICS, possibly with a larger region size.

Module:
DFHTRDM, DFHTRSU

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHTR0112  applid Bad data passed for tracing to module modname.

Explanation
Some data passed to the trace (TR) domain for addition to the internal trace table, auxiliary trace data set or GTF trace caused a program check when an attempt was made to access it.

This could either be as a result of a request made by CICS system code or a request made by a user program through the API or XPI.

If transaction isolation is active, this message can be issued if a transaction passes another transaction's storage to CICS. A program check occurs when CICS attempts to trace this storage because the storage is fetch protected.

System action
A system dump with dump code TR0112 is taken.

If the message was issued by DFHTRPT the dump contains an exception trace entry (point ID TR0102) that includes the erroneous parameter list passed to DFHTRPT.

If the message was issued by DFHTRFT the dump contains an exception trace entry (point ID TR0402) that includes the erroneous parameter list passed to DFHTRFT.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Examine the interpreted exception trace entry to determine the domain that issued the call and the ID of the entry. Then look at the specified addresses and lengths in the data fields to see if they contain reasonable values. The fault is in the module that set up these fields for the trace call.

If transaction isolation is active, examine the calling domain's parameter list, data2, for storage that belongs to another transaction. Correct the offending application program. It should not be passing another transaction's storage. Alternatively, alter the definition of the application so that it can validly access another transaction's storage. See the Defining resources for more information on how to alter the definition.

**DFHTR0119 applid No DCB storage available for auxiliary trace data set. Auxiliary trace is inoperative.**

**Explanation**

An attempt to start auxiliary trace failed because there was insufficient storage available from MVS for the auxiliary trace data set DCB.

**System action**

A CICS system dump with dump code TR0119 is taken. CICS then continues with auxiliary trace inactive.
User response
Determine why so little MVS storage below 16MB is available and retry if possible.

Module: DFHTRSR

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHTR0120 applid DFHTRAOX could not be loaded. Auxiliary trace is inoperative.

Explanation
An attempt to start auxiliary trace failed because the CICS module, DFHTRAOX, which is the auxiliary trace DCB abend exit, could not be loaded.

System action
The loader domain (LD) will have issued messages and dumps as necessary. CICS continues with auxiliary trace inactive.

User response
Refer to the associated loader domain messages for further information and guidance.

Module: DFHTRSR

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHTR0122 Storage for internal trace table not available - trace inoperative.

Explanation
During CICS initialization, there was insufficient storage available to allocate even the minimum size (1MB) of above the bar storage for the internal trace table.

System action
CICS terminates with a system dump.

User response
The failure to allocate even 1MB of above the bar storage at this stage of initialization almost certainly means that other areas of CICS and other system functions will not be able to acquire the storage they require to operate, so the system is unlikely to initialize completely. A possible solution is to increase the value of the MEMLIMIT parameter.

Module: DFHTRDM

Destination
Console

DFHTR0123 Requested trace table size not available.

Explanation
CICS issues a GETSTOR request to MVS for the internal trace table storage. This message indicates that there is insufficient above the bar storage available to allocate the size of trace table specified on the TRTABSZ parameter, but a subsequent request for the minimum possible size of 1MB succeeded.

Message DFHTR0103 which follows this message gives the actual size of the trace table that will be used.

System action
CICS continues with an internal trace table of the size given by message DFHTR0103.

User response
There are three possible courses of action:
• Allow CICS to run with the decreased table size if this is thought to be adequate.
• Terminate the system and reinitialize after increasing the MEMLIMIT parameter for 64-bit storage available to CICS.
• Once the system is initialized, use CETR to increase the table size to the required value.

Module: DFHTRDM

Destination
Console
DFHTR0124 applid UNABLE TO BUILD TRACE CELL POOL IN 64-BIT STORAGE.

**Explanation**
An attempt to allocate the cell pool for trace failed because there was insufficient 64-bit storage available. This cell pool is used to allocate working storage for the global trap trace exit, DFHTRAP, and the buffer for GTF trace. Therefore, neither of these facilities can be used.

**System action**
CICS continues but DFHTRAP cannot be activated and GTF trace is disabled.

**User response**
There are two possible courses of action: 1. If neither DFHTRAP nor GTF trace are required, allow CICS to continue 2. If DFHTRAP or GTF trace is required, increase the MEMLIMIT parameter to allow CICS access to more 64-bit storage. Then restart CICS.

**Explanation**
A request to start internal trace has been successfully processed.

**System action**
CICS continues with internal trace active.

**User response**
None.

**Module:** DFHTRSR

**XMEOUT parameters/Message inserts**
1. applid

**Destination**
Console

DFHTR0140 applid GTF trace is being started.

**Explanation**
A request to start GTF trace has been successfully processed.

**System action**
CICS continues with GTF trace active.

**User response**
None.

**Module:** DFHTRSR

**XMEOUT parameters/Message inserts**
1. applid

**Destination**
Console

DFHTR0141 applid GTF trace has been stopped.

**Explanation**
A request to stop GTF trace has been successfully processed.
System action
CICS continues with GTF trace not active.

User response
None.

Module:
DFHTRSR

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHTR1000 applid CICS abend requested by global trap exit DFHTRAP in module modname.

Explanation
The field engineering global trap exit program (DFHTRAP) requested termination of CICS.

System action
CICS disables the trap exit so that it will not be reentered, and terminates CICS.

User response
Determine why DFHTRAP has requested system termination and act accordingly. You should use the global trap exit only in consultation with an IBM support representative.

Module:
DFHTRPT, DFHTRFT

XMEOUT parameters/Message inserts
1. applid
2. modname

Destination
Console

DFHTR1000 applid CICS abend requested by global trap exit DFHTRAP in module modname.

Explanation
After making a trace entry, the CICS trace domain (TR) called the field engineering global trap exit program (DFHTRAP). A program check occurred during execution of DFHTRAP.

System action
CICS marks the currently active version of DFHTRAP unusable, and will ignore it on future calls to TR domain. CICS then takes a dump with system dump code TR1001, and continues execution.

User response
Use the dump to find the cause of the program check. To replace the currently active but unusable DFHTRAP by a new version in the CICS program library, issue the following commands in the sequence shown:

- CSFE DEBUG,TRAP=OFF (to deactivate the current trap)
- CEMT SET PROGRAM(DFHTRAP) NEWCOPY (to update the trap disk address known to CICS)
- CSFE DEBUG,TRAP=ON (to activate the new version of the trap)

You should use the global trap exit only in consultation with an IBM support representative.

Module:
DFHTRPT, DFHTRFT

XMEOUT parameters/Message inserts
1. applid
2. modname

Destination
Console

DFHTR1002 applid Program DFHTRAP is not available - global trap not activated

Explanation
CICS could not activate the field engineering global trap exit program, DFHTRAP, during processing of the TRAP=ON SIT keyword or override in CICS initialization. This is almost certainly because DFHTRAP is not present in the program library.

System action
CICS takes a system dump with dump code TR1002 and continues with the global trap not activated.
User response
Ensure that DFHTRAP is defined to RDO and made available in the program library.
You should use the global trap exit only in consultation with an IBM support representative.
Module:
DFHTRDM

XMEOUT parameters/Message inserts
1. applid

Destination
Console
DFHTR1003 applid CICS system dump requested by global trap exit DFHTRAP in module modname.

Explanation
The user-coded global trap exit program (DFHTRAP) has requested a system dump in its return action settings.
System action
CICS takes a system dump with dump code TR1003 and continues with the global trap still active.
User response
Analyze the requested dump.
Use the global trap exit only in consultation with IBM support.
Module:

XMEOUT parameters/Message inserts
1. applid
2. modname

Destination
Console
DFHTR2000 INCOMPLETE ENTRY IGNORED.

Explanation
CICS trace entries longer than 256 bytes have to be split into multiple Generalized Trace Facility (GTF) entries because of GTF’s length restriction. The CICS entry becomes a header entry followed by one or more continuation entries. This message in the GTF printout indicates that a CICS entry on GTF longer than 256 bytes has not been printed because a new header entry from the same MVS TCB was encountered before all of the continuation entries from a previous split entry were received.
System action
The incomplete entry is ignored.
User response
This situation can arise in one of two ways:
• The MVS TCB making the first split trace entry abnormally terminated while writing the continuation entries.
  This results in messages and a system dump during the CICS run.
Refer to the associated messages for further information and guidance. Use the dump to determine and solve the problem.

- GTF has failed to record one or more of the continuation entries because of an internal error. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHTRPRG

**Destination**
SYSPRINT

**DFHTR2001** INSUFFICIENT STORAGE FOR RECONSTRUCTION BUFFER.

**Explanation**
A CICS entry longer than 256 bytes has been split into a header record and one or more continuation records on the generalized trace facility (GTF). It cannot be formatted because MVS could not allocate sufficient working storage for a buffer to allow reconstruction of the segmented entry.

**System action**
The entry is printed in hexadecimal and the print job continues.

**User response**
Rerun the GTF print job with a larger region size.

**Module:**
DFHTRPRG

**Destination**
SYSPRINT

**DFHTR2002** INVALID ENTRY PASSED FOR Formatting.

**Explanation**
A GTF entry with the CICS format identifier (X'EF') has been passed to the CICS GTF print routine but the data it contains is not part of a valid CICS trace entry.

**System action**
The invalid entry is printed in hexadecimal and the print job continues.

**User response**
Examine the entry for clues to its origin.

**Module:**
DFHTRPRG

**Destination**
SYSPRINT

**DFHTR2003** UNEXPECTED CONTINUATION ENTRY ENCOUNTERED.

**Explanation**
CICS trace entries longer than 256 bytes have to be split into multiple GTF entries because of GTF's length restriction. The CICS entry becomes a header entry followed by one or more continuation entries. This message in the GTF printout indicates that a GTF entry has been passed to the CICS GTF print routine that is not the start of a CICS segmented entry and the entry type is not one for which a continuation is currently expected.

**System action**
The invalid entry is printed in hexadecimal and the print job continues.

**User response**
This situation could arise if the header record for a segmented entry is overwritten because of GTF's normal cyclic re-use of space in its data set. In this case the invalid entries would be very close to the start of the printout.

If this is not so, examine the entry for clues to its origin.

**Module:**
DFHTRPRG

**Destination**
SYSPRINT

**DFHTR2004** THE MAXIMUM NUMBER OF BUFFERS (nn) HAVE BEEN ALLOCATED. NONE ARE FREE FOR REUSE.

**Explanation**
A CICS trace entry longer than 256 bytes has been split into a header record and one or more continuation records on the generalized trace facility (GTF). However, it cannot be formatted.
because the maximum number of buffers allowed for reconstruction of segmented entries for a specific type has been reached. This maximum is currently set to \( nn \). The number of buffers for a specific type relates directly to the number of regions or systems writing trace entries to the GTF trace data set. During writing, the segmented entries for some of the different regions or systems could become interleaved in the data set. To ensure that the entries are formatted completely and correctly, it is necessary to have a buffer available for each region or system whose trace entries have become interleaved in this way. For further information on trace types and segmented entries see the section on trace formatting in the CICS Diagnostics reference.

**System action**
The entry is printed in hexadecimal and the print job continues.

**User response**
None, but if the situation occurs regularly, contact your IBM Support Center to discuss whether the maximum value set is too low.

**Module:** DFHTRPRG

**Destination**
SYSPRINT

**DFHTR2005** THE LOAD FAILED FOR LOAD MODULE \( modname \). PLACE MODULE IN THE LINK LIST AND TRY AGAIN.

**Explanation**
The generalized trace facility (GTF) trace formatter tried to load the correct release of trace formatter for the trace entry being processed.

**System action**
The job continues printing trace entries in hexadecimal only.

**User response**
Place the named trace formatter load module into the link list and rerun the job. If the named trace formatter is not available, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHTRPRG

SYSPRINT

**DFHTR3001** ERROR IN OPENING DFHAXPRT FILE.

**Explanation**
The auxiliary trace print program DFHTU720 could not open the data set defined to receive the print output.

**System action**
The print job terminates with a return code of 8.

**User response**
Ensure that the DD statement for DFHAXPRT is present and correct in the DFHTU720 job.

**Module:** DFHTRPRA

**Destination**
Console
**DFHTR3002**  ERROR IN OPENING DFHAUXT FILE.

**Explanation**
The auxiliary trace print program DFHTU720 could not open the auxiliary trace data set to be processed.

**System action**
The print job terminates with a return code of 8.

**User response**
Ensure that the DD statement for DFHAUXT is present and correct in the DFHTU720 job.

**Module:** DFHTRPRA

**Destination**
Console

**DFHTR3003**  ERROR IN OPENING DFHAXPRM FILE.

**Explanation**
The auxiliary trace print program DFHTU720 could not open the parameter input data set DFHAXPRM.

**System action**
The print job terminates with a return code of 8.

**User response**
Ensure that the DD statement for DFHAXPRM is present and correct in the DFHTU720 job, or specify your input parameters on the PARM keyword of the EXEC statement.

**Module:** DFHTRPRA

**Destination**
Console

**DFHTR3010**  ERROR IN TRACE DATA - ENTRIES MAY HAVE BEEN LOST.

**Explanation**
The trace block being formatted contains invalid length and/or pointer fields. This can happen if the trace table is accidentally overwritten.

**System action**
The trace formatting code scans the block to try and find valid entries. Any that are found are printed. The rest of the data is ignored.

**User response**
Try and determine what caused the overwriting of the internal trace table.

Ignore the trace entries immediately before and after this message in the print out as they might contain incorrect data.

**Module:** DFHTRFPB

**Destination**
SYSPRINT

**DFHTR4001**  Pos position, Blank record.

**Explanation**
The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. There were no valid selective trace print parameters found.

**System action**
The print job terminates with a return code of 8.
User response
Ensure that the DD statement for DFHAXPRM is present and correct in the print job, or specify your input parameters on the PARM keyword of the EXEC statement. A blank line has been found as input on a job control statement. Specify at least one valid selection parameter on this job control statement and rerun the print job. Please refer to the CICS documentation for a list of valid trace print selection parameters.

Module:
DFHTRFPP

Destination
SYSPRINT
DFHTR4002 Pos position, Invalid keyword.

Explanation
The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. The keyword found in position of the control statement is not a valid trace selection parameter or has been specified incorrectly.

System action
The print job terminates with a return code of 8.

User response
Ensure that the DD statement for DFHAXPRM is present and correct in the print job, or specify your input parameters on the PARM keyword of the EXEC statement. Specify the trace selection parameters correctly. Refer to the CICS documentation for further information on how to do this.

Module:
DFHTRFPP

Destination
SYSPRINT
DFHTR4004 Pos position, Missing parenthesis.

Explanation
The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. Keywords have been specified which need matching parentheses and one of these is missing.

System action
The print job terminates with a return code of 8.

User response
Specify a valid selective trace print parameter and rerun the job. Please refer to the CICS documentation for a list of valid trace print selection parameters.

Module:
DFHTRFPP

Destination
SYSPRINT
DFHTR4005 Pos position, Null data.

Explanation
The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. Null data has been found at position in the trace selection parameter statement.

System action
The print job terminates with a return code of 8.

User response
To specify more than one entry for a selection, you must put the list of entries in parentheses. For example, to select tranids ABRQ, AORD, and MYTR, specify TRANID=(ABRQ,AORD,MYTR). Ensure you have specified matching pairs of parentheses as required.

Module:
DFHTRFPP

Destination
SYSPRINT
DFHTR4006 Pos position, Unexpected end of data.

Explanation
The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. An unexpected end of data has been encountered.
**System action**
The print job terminates with a return code of 8.

**User response**
Ensure you put valid data in the trace selection parameters. Please refer to the CICS documentation for guidance on valid trace print selection parameters.

**Module:**
DFHTRFPP

**Destination**
SYSPRINT

**DFHTR4007**  *Pos position, Invalid separator.*

**Explanation**
The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. An invalid separator has been found at position.

**System action**
The print job terminates with a return code of 8.

**User response**
Ensure that the length of the specified trace selection parameter is correct.

**Module:**
DFHTRFPP

**Destination**
SYSPRINT

**DFHTR4009**  *Pos position, Parameter value invalid.*

**Explanation**
The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. A trace selection parameter has been specified with an invalid value at position.

**System action**
The print job terminates with a return code of 8.

**User response**
You must use commas to separate keywords and entries in a list.

**Module:**
DFHTRFPP

**Destination**
SYSPRINT

**DFHTR4008**  *Pos position, Parameter length invalid.*

**Explanation**
The trace selection parameters for the auxiliary trace print program DFHTU720 the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. A trace selection parameter has been specified with an incorrect length.

**System action**
The print job terminates with a return code of 8.

**User response**
Correct the incorrect parameter value. Refer to the CICS documentation for guidance on valid trace print selection parameters.

**Module:**
DFHTRFPP

**Destination**
SYSPRINT

**DFHTR4010**  *Pos position, Parameter range invalid.*

**Explanation**
The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. A value has been specified at position which is outside the valid range for this parameter.

**System action**
The print job terminates with a return code of 8.
User response

Ensure that the value specified is in the correct range for this selection parameter. Refer to the CICS documentation for guidance on valid trace print selection parameters.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR4011  Pos position, Invalid page size range.

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, or the system dump print program DFHPD720 are not correctly specified. The value specified at position for the PAGESIZE=(value) selection parameter is outside the valid range allowed.

System action

The print job terminates with a return code of 8.

User response

Specify a value for PAGESIZE=(value) in the range 20 through 9999 lines per page.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR4012  Pos position, Invalid combination of FULL, ABBREV and SHORT trace.

Explanation

The trace selection parameters for either the auxiliary trace print program DFHTU720, the system dump print program DFHPD720, or the GTF trace print program DFHTR720 are not correctly specified. Two or more of the selection parameters ABBREV, SHORT, or FULL have been specified together. These parameters are mutually exclusive.

System action

The print job terminates with a return code of 8.

User response

Specify either ABBREV or SHORT or FULL and rerun the print job.

Module:
DFHTRFPP

Destination

SYSPRINT

DFHTR5001  THE LOAD FOR A FEATURE PROGRAM HAS FAILED.

Explanation

The load for a feature formatting program has failed. This can happen if the program text is not included in one of the named datasets for the job.

System action

The trace formatting continues without feature tracing.

User response

Try and determine what caused the load error.

Module:
DFHTRFFE

Destination

SYSPRINT

DFHTR5002  FEATURE FORMATTING PROGRAM HAS FAILED.

Explanation

A feature formatting program has failed.

System action

The trace formatting continues without feature tracing.

User response

Refer to the documentation provided with your feature.

DFHTSnnnn messages

DFHTS0001  
\textit{applid} An abend (code \textit{aaa/bbbb}) has occurred at offset \textit{X'offset'} in module \textit{modname}.

\textbf{Explanation}

An abnormal end (abend) or program check has occurred in module \textit{modname}. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code \textit{aaa/bbbb} is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

\textbf{System action}

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

\textbf{User response}

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module \textit{modname} is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module \textit{modname} you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

\textbf{Module:}

DFHTSAM, DFHTSBR, DFHTSDM, DFHTSPT, DFHTSQR, DFHTSRM, DFHTSSH, DFHTSSR, DFHTSST, DFHTSWQ.

1. \textit{applid}
2. \textit{aaa/bbbb}
3. \textit{X'offset'}
4. \textit{modname}

\textbf{Destination}

Console

DFHTS0002  
\textit{applid} A severe error (code \textit{X'code'}) has occurred in module \textit{modname}.

\textbf{Explanation}

An error has been detected in module \textit{modname}. The code \textit{X'code'} is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

\textbf{System action}

An exception entry (code \textit{X'code'} in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

\textbf{User response}

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module \textit{modname} is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.
If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

Destination
Console

DFHTS1310 \text{applid} Temporary storage data set does not match bit map

Explanation
The temporary storage domain has detected an inconsistency between its control blocks. The inconsistency was detected either during compression of an I/O buffer or by the TS control block checking which is enabled via TS trace level 3.

Possible causes of the inconsistency are:

- An incorrect temporary storage data set (DFHTEMP) was used.
- The control interval size (CISIZE) of the temporary storage data set was changed between CICS runs.
- A storage overlay has occurred.
- An internal error has occurred within the TS domain.
**System action**

CICS is abnormally terminated with a dump. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

To determine the cause of the error, check that:

- The correct data set was used.
- The CISIZE of DFHTEMP was not altered between CICS runs (if CISIZE was altered, temporary storage should have been cold started).

Whatever the cause of the error, temporary storage must now be cold started.

See the Troubleshooting and support for more guidance in dealing with temporary storage problems. If an overlay has occurred, you will need further assistance from IBM.

See Working with IBM to solve your problem for guidance on how to proceed.

1. **applid**
2. **xx**

**Destination**

Console

---

**DFHTS1602**  
**applid** Main temporary storage has attempted to exceed the TSMAINLIMIT storage limit.

**Explanation**

An attempt has been made to exceed the TSMAINLIMIT storage limit. This specifies the maximum amount of above the bar storage which can be used by main temporary storage queues.

**System action**

Attempts to write to temporary storage queues in main storage fail until storage becomes available.

**User response**

Consider whether it is possible to delete some temporary storage queues which have not been accessed for a long time or whether to increase TSMAINLIMIT.

**Module:**  
DFHTSMN

---

**DFHTS1603**  
**applid** The TSMAINLIMIT storage limit has been changed from **xxxx** Mb to **yyyy** Mb.

**Explanation**

The TSMAINLIMIT setting has been changed. If you requested a decrease in TSMAINLIMIT, the new value will be either the value requested or the current utilization plus 33%. If the value you requested would not leave 33% of the current utilization free, CICS will change the value so as to leave 33% of current utilization as a buffer, subject to not increasing the TSMAINLIMIT. This means that 25% of the new limit is free. TSMAINLIMIT will not increase if you request a decrease. If you requested an increase in TSMAINLIMIT, the new value will be the requested value, assuming that a valid value was requested.

**System action**

Processing continues.

**User response**

If CICS has set the new value higher than the value you requested when you reduced the limit, consider deleting some temporary storage queues and re-issuing the command to lower the TSMAINLIMIT.

**Module:**  
DFHTSMN

---

**DFHTS1604**  
**applid** Main temporary storage usage has fallen below 70% of TSMAINLIMIT.

**Explanation**

The current utilization of storage by main temporary storage queues has fallen below 70% of the TSMAINLIMIT setting.

**System action**

Processing continues.

**User response**

None.

**Module:**  
DFHTSMN, DFHTSSR

---

**DFHTS1605**  
**DATE TIME APPLID** Scan of temporary storage queues completed. **XXXX** temporary
storage queues were scanned and YYYY were deleted.

**Explanation**
A scan of temporary storage queues has been performed and zero or more have been deleted. The decision to delete or not is based on the last used time.

**System action**
Processing continues.

**User response**
None.

**Module:** DFHTSCL

5. YYYY

**Destination**
CSMT

DFHTS1606 **APPLID** The TSMAINLIMIT has been left unchanged at xxxx Mb.

**Explanation**
This message can be issued when an attempt has been made to decrease the TSMAINLIMIT setting. The requested value would not have left at least 33% of the currently used amount of storage as a buffer for future use. CICS will not reduce the limit below this level, so as to avoid temporary storage write requests immediately causing the TSMAINLIMIT to be reached. The TSMAINLIMIT is left unchanged. This message will also be issued if the TSMAINLIMIT requested was the same as the current setting.

**System action**
Processing continues.

**User response**
Consider deleting some temporary storage queues and re-issuing the command to lower the TSMAINLIMIT if it is required to decrease TSMAINLIMIT.

**Module:** DFHTSSR

**XMEOUT parameters/Message inserts**
1. APPLID
2. xxxx

**Destination**
Console

DFHTS1607 **DATE TIME APPLID** An attempt to increase TSMAINLIMIT has failed. The TSMAINLIMIT setting has been left unchanged.

**Explanation**
An attempt to increase the TSMAINLIMIT setting has failed. This is because the requested value would have exceeded 25% of the MEMLIMIT setting. This is not allowed.

**System action**
The TSMAINLIMIT has not been changed.

**User response**
It is only possible to increase TSMAINLIMIT to a value less than or equal to 25% of MEMLIMIT. If an increase of TSMAINLIMIT is required, calculate the upper limit allowed and try again.

**Module:** DFHTSSR

**XMEOUT parameters/Message inserts**
1. DATE
2. TIME
3. APPLID

**Destination**

**Destination**

Console

**DFHUSnnnn messages**

**DFHUS0001** applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

**Explanation**

An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.
The code `aaa/bbbb` is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain.

In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module `modname` you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

**XMEOUT parameters/Message inserts**

1. `applid`
2. `aaa/bbbb`
3. `X'offset'`

4. `modname`

**Destination**

Console

**DFHUS0002** `applid` A severe error (code `X'code'`) has occurred in module `modname`.

**Explanation**

An error has been detected in module `modname`. The code `X'code'` is the exception trace point ID which uniquely identifies what the error is and where it was detected.

**System action**

An exception entry (code `X'code'` in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain.

In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module `modname`, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

1. applid
2. X'code'
3. modname

Destination

Console

**DFHUS0004**    **applid** A possible loop has been detected at offset X'offset' in module **modname**.

**Explanation**

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module **modname** at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module **modname** in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module **modname** has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module **modname**, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. However you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

**Module:**

DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM

**Module:**

DFHUSAD, DFHUSDM, DFHUSFL, DFHUSIS, DFHUSST, DFHUSXM
terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the User Response for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module `modname`, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. See the Configuring or the Improving performance for more information on CICS storage.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

DFHUS0150 applid An attempt to establish security has failed for userid userid in group groupid, {no terminal, | netname | console} portname applid applid. Unable to initialize the transaction tranid. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').

Explanation

An attempt was made to establish security for userid userid in group groupid with access to resources allowed for the terminal or console portname and the application applid. The attempt was rejected by the external security manager (ESM).

The transaction tranid cannot be initialized.

System action

Security has not been established for the userid. The attempt to initialize the transaction has failed.

User response

The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the z/OS MVS Programming: Authorized Assembler Services Guide and in z/OS Security Server RACROUTE Macro Reference (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Module:

DFHW2nnnn messages

DFHW20001  applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation
An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.
The code `aaa/bbbb` is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual.

Next, look up the CICS alphanumeric code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem. If you cannot run without the full use of module `modname` you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

4. `modname`

**Destination**

Console

DFHW20002 `applid` A severe error (code X'`code`) has occurred in module `modname`.

**Explanation**

An error has been detected in module `modname`. The code `X'code'` is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

**System action**

An exception entry (code `X'code'` in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module `modname`, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

1. `applid`
2. `X'code'`
3. `modname`
Destination
Console

DFHW20004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation
A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction that was executing at the time the error was detected.

System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module modname will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHW2AC, DFHW2AT, DFHW2FD, DFHW2RP, DFHW2SD, DFHW2UE, DFHW2W2

1. applid
2. X'offset'
3. modname

Destination
Console

DFHW20006 applid Insufficient storage to satisfy Getmain (code X'code') in module modname. MVS code mvscode.

Explanation
An MVS GETMAIN was issued by module modname but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code mvscode is the MVS GETMAIN return code.

During initialization, CICS may not have access to the user’s applid coded in the SIT. If CICS produces this message in these circumstances, it uses the default applid value DBDCCICS.

System action
CICS will terminate with a system dump. An exception entry is made in the trace table (code code in the message).

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Inform the system programmer. You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the overall size limit of the DSAs or EDSAs. Or, try increasing the size of the whole region,
if it is not already at maximum size. If CICS is not already terminated, you will need to bring CICS down to do this. See the Configuring or the Improving performance for further information on CICS storage.

System action
An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWBST, DFHWBTC, DFHWBDM, DFHWBQM, DFHWBSR, DFHWBXM

XMEOUT parameters/Message inserts
1. applid
2. X'code'

Destination
Console
DFHWB0004  applid A possible loop has been detected at offset X'offset' in module modname.

Explanation
A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction that was executing at the time the error was detected.

System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Notify the system programmer. If CICS has not been terminated, it will be necessary to decide whether the problem is serious enough to bring CICS down.

Because some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS will purge a CICS function that exceeds the runaway task time interval that you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that the module modname will be terminated and CICS will continue.

If you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you will have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You will have to bring CICS down at a suitable time to do this permanently. However, you can change the ICVR time interval temporarily online, using the CEMT transaction.
If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHWBST, DFHWBTC

**Module:**

**XMEOUT parameters/Message inserts**

1. `applid`
2. `X'offset'`
3. `modname`

**Destination**

Console

**DFHWB0006**

| applid Insufficient storage to satisfy Getmain (code `X'code'`) in module `modname`. MVS code `mvscode`. |

**Explanation**

An MVS GETMAIN was issued by module `modname` but there was insufficient storage available to satisfy the request.

The code `X'code'` is the exception trace point ID which uniquely identifies the place where the error was detected.

The code `mvscode` is the MVS GETMAIN return code.

During initialization, CICS may not have access to the user’s `applid` coded in the SIT. If CICS produces this message in these circumstances, it uses the default `applid` value DBDCCICS.

**System action**

CICS will terminate with a system dump. An exception entry is made in the trace table (code `code` in the message).

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Inform the system programmer.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the overall size limit of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is not already at maximum size. If CICS is not already terminated, you will need to bring CICS down to do this. See the Configuring or the Improving performance for further information on CICS storage.

CWBO

DFHWB0101 date time applid tranid The CICS Web Interface alias program DFHWBA detected a failure in program DFHWBBLI. Host IP address: hostaddr. Client IP address: clientaddr.

Explanation
Program DFHWBBLI has returned an error response to the alias.

System action
The request is abandoned. The error response returned by program DFHWBBLI is returned to the Web Browser in an HTTP response:

403
The userid associated with the request is not authorized to invoke the requested converter program, or the requested server program.

404
A link to the converter program or to the server program failed because CICS could not locate the requested program.

500
A link to the converter program or to the server program failed with an unexpected error.

503
A link to the converter program or to the server program failed for one of the following reasons:
   • The server program is defined as remote, but the link to this program failed with a SYSID error, so the remote connection is either not defined correctly, or not active.
   • The link to the converter or the server program failed with the ROLLEDBACK response.

The alias abends with abend code AWBM unless suppressed by the URM DFHWBEP.

User response
Check program DFHWBBLI and the programs which it calls.

Module:
DFHWBA

CWBO

DFHWB0131  date time applid tranid An error code 'code' occurred in DFHWBLT while accessing the Web state data for this transaction. { | TCPIPSERVICE: } tcpipservice

Explanation
The Web Bridge Exit program, DFHWBLT, has detected an error when attempting to access the Web state data held for this transaction.

System action
An exception trace entry is made in the trace table using code 'code'. The transaction abends with abend code AWC1 if the Bridge Exit was trying to establish a partnership with the CICS Web Interface alias transaction.

User response
Use the error code code to determine the reason for the failure:

4106
Unable to establish a partnership with the associated CICS Web Interface alias transaction.

4107
A call to terminate the partnership between this instance of DFHWBLT and its associated CICS Web Interface alias transaction failed.

4108
A call to wait for the CICS Web Interface alias transaction associated with this instance of DFHWBLT failed.

4109
A call to reactivate the CICS Web Interface alias transaction associated with this instance of DFHWBLT failed.

4112
A call to update the state data for this transaction failed.
A call to retrieve the state data for this transaction failed.

The alias task associated with this instance of DFHWBLT was not in the required state.

A call to break the partnership between this instance of DFHWBLT and its associated CICS Web Interface alias transaction failed.

A call to destroy the state data for this instance of DFHWBLT failed.

The most likely cause of the error is that the timeout interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the timeout interval for the state data is set to a suitable value. You may need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

**Destination**
CWBO

DFHWB0134  
*date time applid tranid Error X'code' occurred resolving the AID from HTTP forms data in the CICS Web terminal translation application.*

{ | TCPIPSERVICE: } tcpipservice

**Explanation**
Program DFHWBTTA is unable to resolve an attention identifier from the HTTP forms data returned from a web browser. DFHWBTTA translates the HTTP forms data into the correct 3270 format required by the CICS terminal-oriented transaction that is the target of this request. The attention identifier or AID is a mandatory part of this format. DFHWBTTA cannot locate a name=value pair in the HTTP forms data that adheres to the naming convention defined by the CICS Web Interface to represent an AID, and so cannot return an AID value to the terminal-oriented transaction.

**System action**
DFHWBTTA returns an internal server error (HTTP response 500) to the HTTP client, and terminates the exchange with the terminal-oriented transaction.

**User response**
The error code code identifies the CICS trace entry that corresponds to the failure. The HTTP forms data is produced as trace data. Collect the CICS trace output.

Examine the HTTP forms data to determine what was returned from the web browser. Identify what HTML input type caused the web browser to submit the HTML form. Corruption of the HTTP forms data may be the cause of the problem. You may need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

CWBO

DFHWB0135  
*date time applid tranid Error X'code' occurred resolving the next transaction identifier from HTTP forms data in the CICS Web terminal translation application.*

{ | TCPIPSERVICE: } tcpipservice

**Explanation**
Program DFHWBTTA is unable to resolve the next transaction identifier from the HTTP forms data returned from a web browser. DFHWBTTA translates the HTTP forms data and extracts the identifier of the next transaction to be executed. DFHWBTTA cannot locate a name=value pair in the HTTP forms data that adheres to the naming convention defined by CICS to represent the next transaction identifier and so it cannot determine which terminal-oriented transaction to start.

**System action**
DFHWBTTA returns an internal server error (HTTP response 500) to the HTTP client.
User response

The error code code identifies the CICS trace entry that corresponds to the failure. The HTTP forms data is produced as trace data. Collect the CICS trace output. Examine the HTTP forms data to determine what was returned from the web browser. Corruption of the HTTP forms data may be the cause of the problem. You may need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

DFHWB0136 date time applid tranid An error code X'code' has occurred as a result of the Web State Garbage Collection process. { / TCPIPSERVICE: } tcpipservice

Explanation
Program DFHWBLT detected an error when attempting to access the Web state data held for this transaction. The transaction wait time has exceeded the garbage collection limit and the state block has been deleted by the garbage collection process.

System action
If the error occurs in DFHWBLT, a TERMERR condition is returned to the application and processing continues. If the error occurs in DFHWBTTA, an error response is sent to the browser and processing continues.

User response

Use the error code code to determine which module received the error:

4108
The error occurred in DFHWBLT.

420B
The error occurred in DFHWBTTA.

The cause of the error is that the garbage collection interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the garbage collection interval for the state data is set to a suitable value. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:

Destination
CWBO

DFHWB0137 date time applid tranid An error code X'code' occurred in DFHWBTTA while accessing the Web state data for this transaction. { / TCPIPSERVICE: } tcpipservice

Explanation
The Web Terminal Translation Application program, DFHWBTTA, has detected an error when attempting to access the Web state data held for this transaction.

System action
An exception trace entry is made in the trace table using code X'code'.

2110 CICS TS for z/OS: CICS Messages
**User response**

Use the error code code to determine the reason for the failure:

4203

Unable to establish a partnership with the associated CICS Web Interface alias transaction.

4204

Unable to initialize a partnership with the associated CICS Web Interface alias transaction.

4205

The alias task associated with this instance of DFHWBT TA was not in the required state.

4206

A call to create the state data for this instance of DFHWBT TA failed.

4207

A call to destroy the state data for this instance of DFHWBT TA failed.

4208

A call to retrieve the state data for this instance of DFHWBT TA failed.

4209

A call to break the established partnership between the associated transaction and DFHWBT TA has failed.

420A

A call to reactivate the CICS Web Interface alias transaction associated with this instance of DFHWBT TA failed.

420B

A call to wait for the CICS Web Interface alias transaction associated with this instance of DFHWBT TA failed.

420C

A call to terminate the partnership between this instance of DFHWBT TA and its associated CICS Web Interface alias transaction failed.

4213

A call to update the state data for this transaction failed.

The most likely cause of the error is that the timeout interval for the Web state data has been exceeded, and the relevant state data has been deleted. Check that the timeout interval for the state data is set to a suitable value. You may need further assistance from IBM to resolve this problem. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Destination
CWBO

DFHWB0151  date time applid tranid The CICS Web Interface 3270 emulation code was unable to process the data it was passed. { / TCPIPSERVICE: } tcpipservice

Explanation
The CICS Web Interface routine that converts 3270 data streams to HTML, and vice versa, has detected an error. This is probably because it has been passed an invalid 3270 data stream on an EXEC CICS SEND command, or because the browser has returned some data that it is incapable of handling in response to an EXEC CICS RECEIVE command.

System action
The transaction is abended with code AEIP (INVREQ). There will be subsequent messages from the web state management code as it tidies up for the abending task. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Use CEDX or trace to look at the data that was in error and then correct the sending application. Report the details of the symptom string given in message DFHME0116. It will aid problem determination.

**DFHWB0360 date time applid** An attempt to establish security for userid userid has failed. Transaction tranid cannot be started. SAF codes are (X’safresp’,X’safreas’). ESM codes are (X’esmresp’,X’esmreas’). Host IP address: hostaddr. Client IP address: clientaddr. TCPIPSERVICE: tcpipservice.

**Explanation**
An attempt was made to establish security for userid userid but it was rejected by the external security manager (ESM).

In order to start transaction tranid CICS Web attach processing requires security to be established for userid userid, as selected for this transaction by the Analyzer URM specified for TCPIPSERVICE tcpipservice.

**System action**
Security has not been established for the userid. The attempt to start the transaction has failed.

**User response**
The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY or RACROUTE REQUEST=EXTRACT macros. These return codes are described in the z/OS MVS Programming: Authorized Assembler Services Guide, and in z/OS Security Server RACROUTE Macro Reference (SC28-1366). See these manuals for an explanation of the codes.

There may be further messages produced by CICS or the external security manager (ESM) which provide more information.

**Module:**
DFHWBSO

**Explanation**
The socket domain received a request for a TCPIP service which specified PROTOCOL(ISC). However, the socket notify gate in module DFHWBSO was unable to obtain storage. This is because a short-on-storage (SOS) condition has caused the failure of a GETMAIN.

**System action**
Exception trace point 0B09 is issued.

**User response**
Investigate the reason for the SOS condition. See the Troubleshooting and support for guidance on dealing with the SOS condition.

Retry the request later.

**DFHWB0723**
*date time applid tranid The CICS Web analyzer program returned an error response. Program name: programe. RESPONSE: response. REASON: reason. Host IP address: hostaddr. Client IP address: clientaddr. { / TCPIPSERVICE: } tcpipservice*
Explanation
As part of its normal processing of a request, CICS Web attach processing invokes the user replaceable analyzer to tailor the required actions. This program returns RESPONSE and REASON values. If a CICS supplied sample analyzer is being used, possible RESPONSE code values are:

0  OK
4  Exception
8  Invalid
12. Disaster

possible REASON code values are:

1  URL of incoming HTTP request is too short
2  No "/" character in the URI of the HTTP request
3. There is more data to be received for this request
4  Converter program name is less than 1 or greater than 8 bytes long
5  Alias transaction ID is less than 1 or greater than 4 bytes long
6  Server program name is less than 1 or greater than 8 bytes long
7  User token passed as query string data on this request is not valid
8  URL passed on this request is not valid

Users can also architect their own response and reason code values to be returned by the analyzer, but they should use values other than those defined in the CICS supplied copybook DFHWBUCD.

If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN" in the message.

System action
An error response is sent to the client and processing of the request is terminated.

User response
Examine the RESPONSE and REASON code values in the message to determine the cause of the error.

DFHWB0731 date time applid tranid CICS Web attach processing detected an HTTP header longer than 32767 bytes. Host IP address: hostaddr. Client IP address: clientaddr. | TCPIPSERVICE: } tcpipservice

Explanation
An HTTP request was being received by DFHWBSR when it detected that the header data of the request exceeded the currently supported maximum of 32767 bytes. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action
Trace entry 0418 is issued containing the web request block. The length of the HTTP header data can be inferred from the user_data_offset field.

User response
Examine the input HTTP request and reduce the length of the header information to be within the allowed limit. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWBXN, DFHWBXM

DFHWB0732 date time applid tranid CICS Web attach processing encountered a sockets I/O error while receiving a client request. Host IP address: hostaddr. Client IP address: clientaddr. | TCPIPSERVICE: } tcpipservice

Explanation
A sockets I/O error has forced CICS Web processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action
The Web error program DFHWBEP is driven, but no error response can be sent to the client. The request is terminated.

User response
Check for any associated sockets domain error messages, which may give more details on the error which has occurred. The error may have been caused by a user terminating their Web Browser before CICS has been able to process the request. The error might also have been caused by a user sending a non-SSL HTTP request to an SSL-enabled CICS region. If the problem persists, there may be a problem with the TCP/IP network, ensure HTTPS is used to replace HTTP when sending an SSL request. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. tranid
5. hostaddr
6. clientaddr
7. Value chosen from the following options:
A Secure Sockets Layer connection from a client with address ipaddr was received on TCPIPSERVICE(service), but there were no available TCBs to process the request.

The socket for the connection is closed. No message is sent to the client because the client expects the response to be encrypted by SSL, but SSL services cannot be provided. The reason for the handshake failure may be displayed in an earlier DFHSO0123 message.

If the DFHSO0123 message indicates a CICS configuration error, correct it. Otherwise, the problem is likely to be a client error, and can be ignored. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

If this message occurs frequently, consider raising the value of the MAXSSLTCBS system initialization parameter. See External Interfaces Guide and Working with IBM to solve your problem for guidance on how to proceed.

The socket for the connection is closed. No message is sent to the client because the client expects the response to be encrypted by SSL, but SSL services cannot be provided. The reason for the handshake failure may be displayed in an earlier DFHSO0123 message.

**DFHWB0736**  
*date time applid tranid*  
The method in the received HTTP request is not implemented by the server.  
Host IP address: *hostaddr*.  
Client IP address: *clientaddr*.  
TCPIPSERVICE: *tcpipservice*.

**Explanation**

As part of its normal processing of a request, CICS Web Support checks the supplied method with the HTTP version of the request and the version of HTTP supported by the server. The HTTP version supported by CICS depends on the version that the server application is running at. CICS may also report this error if the method is valid but any of the supplied headers are incorrect, as this means that CICS cannot implement the method.

**System action**

An error response is sent to the client and processing of the request is terminated.

**User response**

Correct the method in the request to one supported by the version of HTTP being used and the version that the server application is capable of running at. The version of the server is that supplied on the HTTP response. If the method is correct, check that all the headers supplied in the request are correct.

**Module:**

---

**DFHWB0738**  
*date time applid tranid*  
CICS Web Support has detected that the incoming HTTP request has a version that is at least HTTP/1.1 but has no host header.  
Host IP address: *hostaddr*.  
Client IP address: *clientaddr*.  
TCPIPSERVICE: *tcpipservice*.

**Explanation**

As part of its normal processing of a request, CICS Web Support checks the version of the incoming HTTP request. If it is at least HTTP/1.1 and there is no host header, the request is rejected as it is not compliant.
System action
An error response is sent to the client and processing of the request is terminated.

User response
Issue the request again after adding a host header.

DFHWB0741
date time applid tranid
An HTTP socket receive request has timed out. Client IP address: clientaddr.
TCPIPSERVICE: tcpipservice

Explanation
There are two possible reasons for this message
• CICS has timed out while receiving data from the client.
• CICS has sent a 100 Continue header in response to an EXPECT: header however the request has timed out before the client has sent the message body.
The possible causes are

- The value of the SOCKETCLOSE parameter on the TCPIPSERVICE is too low
- The client has sent an incorrect Content-Length header
- The client has not sent the body of the request

Possible solutions are

- Increase the value of the SOCKETCLOSE parameter on the TCPIPSERVICE.
- Correct the HTTP Client.

Module:
DFHWBXN, DFHWBXM

**XMEOUT parameters/Message inserts**

DFHWBXN

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. tranid
5. clientaddr
6. tcpipservice

Destination
CWBO

DFHWB0762  date time applid tranid The received HTTP request specifies the OPTIONS method but cannot be handled by CICS. Status code: statuscode. Host IP address: hostaddr. Client IP address: clientaddr. TCPIPSERVICE: tcpipservice.

Explanation
As part of its normal processing of a request, CICS Web Support checks the validity of the request for the specified method. In this case the method is OPTIONS but CICS cannot process the request. The status code statuscode indicates the reason for this as follows:
• 400 : the request is not valid HTTP/1.1

System action
An error response is sent to the client and the request is terminated.

Chapter 2. CICS messages 2133
User response
The host and path information in the HTTP request determine which URIMAP definition is being used. Determine why that URIMAP definition has been disabled. If the URIMAP has not been disabled to prevent these HTTP requests being processed, enable the URIMAP definition.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. tranid
5. hostaddr
6. clientaddr

Destination
CWBO

DFHWB0764 date time applid tranid An attempt was made to use URIMAP urimap which is disabled.

Explanation
An attempt to use the specified URIMAP has failed because the URIMAP is disabled. You might receive another message that shows the failed request.

System action
Processing continues, but the current request will subsequently fail.

User response
Check the reason for the URIMAP being disabled - enable the URIMAP if necessary.

Module:

XMEOUT parameters/Message inserts

CWBO

DFHWB0765I applid URIMAP urimap was not restored because its cipher list could not be installed.

Explanation
The ciphers list that was specified on URIMAP urimap was valid when the resource was installed, but invalid when CICS restarted.

System action
The URIMAP is not restored from the catalog.

User response
Investigate why the ciphers list has become invalid and replace it with a valid ciphers list. Then reinstall URIMAP urimap manually.

Module:
DFHWBRP

XMEOUT parameters/Message inserts
1. applid
2. urimap

Destination
Console

DFHWB0770 date time applid tranid The CICS OPTIONS handler program returned an error response. Program name: programe. Host IP address: hostaddr. Client IP address: clientaddr. TCPIPSERVICE: tcpipservice

Explanation
An OPTIONS handler user replaceable analyzer has been invoked. This program has failed to return normally.

Users can architect their own response and reason code values to be returned by the handler.

If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN" in the message.
System action
An error response is sent to the client and processing of the request is terminated.

User response
Examine the OPTIONS handler to determine the cause of the error.

Module:
DFHWBXN, DFHWBXM

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. tranid
5. progname
6. hostaddr
7. clientaddr
8. tcpipservice

Destination
CWBO

DFHWB0771  date time applid tranid
CICS Web attach processing detected an error linking to the OPTIONS handler user replaceable module progname. Host IP address: hostaddr. Client IP address: clientaddr. TCPIPSERVICE: tcpipservice

Explanation
An error linking to the OPTIONS handler user replaceable module forced CICS Web attach processing to abandon a client request. If the host IP address and the client IP address are not available when this error occurred, these addresses will be displayed as "UNKNOWN".

System action
An error response is sent to the client and the request is terminated. The tcpipservice remains open and usable.

User response
Ensure that the program specified has been correctly installed and defined to CICS. If the user replaceable module (URM) has been set dynamically using CEMT or the SPI command, then ensure that the module is defined to CICS and enabled, or available in the library if autoinstall is active.

Module:
DFHWBXN, DFHWBXM

DFHWB1020 date time applid CICS Web State Manager could not find state data for state token stoken for a {destroy | retrieve | store} request. { | TCPIPSERVICE: } tcpipservice

Explanation

The CICS Web State Manager could not find the state data for the state token stoken or the supplied state token stoken does not exist.

System action

The requested state data cannot be destroyed, updated or retrieved by the Web State Manager. An exception trace entry is made in the trace table.

User response

Ensure that the supplied state token stoken is correct. On a busy CICS region, the most likely cause of this error is that the state data has been discarded by the Web garbage collection process before the Web state manager could access it. Check that the system initialization WEBDELAY parameters are appropriate values. See the Configuring for guidance on setting the values of the Web garbage collection interval and the Web terminal timeout interval.

DFHWB1200 date time applid tranid
The CICS Web Interface analyzer program set parameter WBRA_USER_DATA_LENGTH to more than the maximum. Program name: progname. RESPONSE: reason. Host IP address: hostaddr. Client IP address: clientaddr. Data offset: X'dataoffset'. Data length: X'datalength'. Buffer length: X'bufferlength'.

Explanation
As part of its normal processing of a request, Web attach processing invokes the user replaceable analyzer to tailor the required actions. This program is passed the length of the user data part of the HTTP request in parameter WBRA_USER_DATA_LENGTH, which it can modify. However, the modified value is greater than the maximum allowable value which represents the available space in the data buffer.

user application that is longer than expected.
**System action**
An error response is sent to the client and processing of the request is terminated.

**User response**
Modify the analyzer program so that it does not set the parameter WBRA_USER_DATA_LENGTH to be greater than the maximum. The sum of the data offset and the data length should not exceed the buffer length.

DFHWB7001 HTTPD_extract for envvar failed. Processing of this request terminated rc=retcode.

Explanation
The CICS GWAPI program received an error response retcode when it executed the HTTPD_extract function to retrieve the specified environment variable envvar.

System action
The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

User response
Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the CICS documentation for further information.

Module:
DFHWBAPI
**Destination**  
SYSPRINT

**DFHWB7002**  
HTTPD_read for HTTP user data failed. Processing of this request terminated rc=retcode.

**Explanation**  
The CICS GWAPI program received an error response *retcode* when it executed the HTTPD_read function to retrieve the user data sent with an HTTP request.

**System action**  
The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

**User response**  
Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the CICS documentation for further information.

**Module:**  
DFHWBAPI

**Destination**  
SYSPRINT

**DFHWB7003**  
Invalid URL passed to DFHWBAPI: *url*. Processing of this request terminated rc=retcode.

**Explanation**  
The CICS GWAPI program has attempted to analyze the path name section of the Uniform Resource Locator *url* that it received from the Web browser, but has determined that its syntax is not in the standard format expected to decide which CICS region, transaction, and program should process the request.

The reason for the failure is given by one of the following values for the return code *retcode*.

1. The path name contains fewer than eight characters.
2. The path name does not begin with a leading slash (/) character.
3. The CICS applid is invalid.

**System action**  
The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

**User response**  
Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the CICS documentation for further information.

**Module:**  
DFHWBAPI

**Destination**  
SYSPRINT

**DFHWB7006**  
Link to program *program_name* at applid *applid* failed for URL *url*. Processing of this request terminated RESP=resp RESP2=resp2.

**Explanation**  
The CICS GWAPI program has attempted to use the CICS External Call Interface (EXCI) to link to the Business Logic Interface program *program_name* in the CICS region with applid *applid*, but the link was unsuccessful. The EIBRESP and EIBRESP2 values from the EXEC CICS LINK command are *resp* and *resp2*.

**System action**  
The CICS GWAPI program terminates and returns an HTTP error response to the Web browser. If *resp* and *resp2* indicate that there is a temporary problem establishing an Inter-Region Communication connection, the HTTP error response is 503 (system not available), otherwise it is 500 (server error).

**User response**  
Investigate whether the target CICS region has been correctly configured to receive EXCI requests from this ICSS/390 server address space.
The following must be set up:

- The target CICS region must be active.
- There must be a generic EXCI pipe, or a specific EXCI pipe for `applid`, installed in the target CICS region.
- Inter-Region Communication must be active in the target CICS region.

Refer to the CICS documentation for further information.

**Module:**
DFHWBAPI

**Destination**
SYSPRINT

**DFHWB7007**  
Error detected by program `program_name`. Processing of this request terminated `rc=retcode`.

**Explanation**

The CICS GWAPI program has attempted to use the CICS External Call Interface (EXCI) to link to the Business Logic Interface program `program_name` in a CICS region, but an error response was returned by the program. The return code `retcode` is the Business Logic Interface response that was returned in `wbb1_response`.

**System action**

The CICS GWAPI program terminates and returns `retcode` as the HTTP server response to the Web browser.

**User response**

Investigate the reason for the error response. The values that can be returned in `wbb1_response` are documented in the CICS documentation, and are generally caused by a programming error in either the converter program or the server application program.

**Module:**
DFHWBAPI

**Destination**
SYSPRINT

**DFHWB7009**  
HTTP_write failed for URL `url`. Processing of this request terminated `rc=retcode`.

**Explanation**

The CICS GWAPI program received an error response `retcode` when it executed the HTTPD_write function to write the user data to be sent with an HTTP response for URL `url`.

**System action**

The CICS GWAPI program terminates and returns an HTTP server error response (code 500) to the Web browser.

**User response**

Investigate whether the ICSS/390 server has been correctly configured to use the CICS GWAPI DLL. Refer to the CICS documentation for further information.
DFHWUnnnn messages

DFHWU0001 E  applid  An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation

An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in CICS code.

Alternatively:

• Unexpected data has been input,
• Storage has been overwritten, or
• There has been a program check within a user program.

The code aaa is, if applicable, a 3-digit hexadecimal MVS system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The 4-digit code bbbb, which follows aaa, is a user abend code produced either by CICS or by another product on the user’s system.

If X'offset' contains the value X'FFFF', then module modname was in control at the time of the abend, but the program status word (PSW) was not addressing this module.

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

Either this is a critical error and CICS is terminated, even if you have specified in the dump table that CICS should not terminate.

Or CICS will continue unless you have specified in the dump table that CICS should terminate. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Notify the system programmer.

Look up the MVS code aaa, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

If the modname insert contains the value ?????, then CICS was unable to determine which module has abnormally terminated. In this case, examine the system dump to determine which area of code has caused the program check.

The user should examine other messages to determine what the module which issued this message was doing at the time the abend occurred. From these messages they can deduce which product has produced the abend code bbbb. If bbbb is identified as a CICS code, it may be either alphameric or numeric.

• If the CICS code is alphameric (for example AKEA) then it is a CICS transaction abend code.
• If the CICS code is numeric (for example 1310), it refers to a CICS message (DFHTS1310 in our example).

If the user abend code is from another product (for example, IMS), refer to the appropriate messages and codes manual to determine the cause of the abend.

The entries in the appropriate manuals will give the user guidance regarding the nature of the error, and may also give some guidance concerning the appropriate user response.

Note:

The program check may have occurred in a user program. If this is the case, the program check is usually followed by an ASRA or an ASRB transaction abend and a transaction dump.

If you want to suppress system dumps that precede ASRA and ASRB abends, you must specify this on an entry in the dump table, using either CEMT or an EXEC CICS command. Further guidance on suppressing system dumps can be found in the Configuring.

You may need further assistance from IBM to resolve this problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWUIPG

XMEOUT parameters/Message inserts

1. applid
2. aaa/bbbb
3. X'offset'
4. modname

Destination

Console

DFHWU0002  applid  A severe error (code X'code') has occurred in module modname.
Explanation
An error has been detected in module modname. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

System action
An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS will continue unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Inform the system programmer. This indicates a possible error in CICS code. The severity of its impact will depend on the importance of the function being executed at the time of the error.

For further information about CICS exception trace entries, refer to the Troubleshooting and support.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

1. applid
2. X'code'
3. modname

Destination
Console

DFHWU0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation
A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Console

**DFHWU0910 I applid Instruction address X'aaaaaaaa', offset X'offset' in CSECT csect.**

**Explanation**
The CICSPlex SM recovery routine has been entered as a result of an abend in a CICS system.

This message describes the location of an abend that occurred in CICSPlex SM, where:

- **applid**
  - is the VTAM application ID of the CICS system that abended.

- **aaaaaaaa**
  - is the address of the instruction that caused the abend.

- **offset**
  - is the offset of the instruction in the CSECT that caused the abend.

- **csect**
  - is the name of the CSECT that contains the instruction that caused the abend.

**System action**
The recovery routine attempts to capture and format any relevant diagnostic information. All available information is presented in the DFHWU09nn messages that follow this message.

**User response**
Collect as much of the following information as possible, and contact your IBM support center.

- Job log for the job that received the abend. If the job log is not available, get the system log.
- EYULOG file. If a CMAS abended, get the EYULOG file for that CMAS. If a CICS system abended, get the EYULOG file for the CMAS to which the CICS system was connected.
- Formatted transaction dump, if one was taken.
- Unformatted SVC dump, if one was taken.
- AUXTRACE file, if available. If a CICS system abended and AUXTRACE was not active in that CICS system, get the AUXTRACE file from the CMAS to which the CICS system was connected.

**Explanation**
An error has occurred in the CICS management client interface. The request cannot be processed. Multiple NODISCARD expressions were found in the URI.

**System action**
The system stops processing the request.

**User response**
Remove the multiple NODISCARD expressions from the URI and resubmit the request.

**Module:** DFHWUIPG

**DFHWU4016** Multiple NODISCARD expressions were found in the URI.

---

**Explanation**
An error has occurred in the CICS management client interface. The request cannot be processed. NODISCARD is only valid for HTTP GET requests.

**System action**
The system stops processing the request.

**User response**
Remove the NODISCARD expressions from the URI and resubmit the request.

**Module:** DFHWUIPG

**DFHWU4017** NODISCARD is only valid for HTTP GET requests.

---

**Explanation**
An error has occurred in the CICS management client interface. The request cannot be processed. CRITERIA is not valid for HTTP POST requests.

**System action**
The system stops processing the request.

**User response**
Remove the CRITERIA expressions from the URI and resubmit the request.

**Module:** DFHWUIPG

**DFHWU4018** CRITERIA is not valid for HTTP POST requests.
System action
The system stops processing the request.

User response
Remove the CRITERIA expressions from the URI and resubmit the request.

Module:
DFHWUIPG

DFHWU4019 PARAMETER is not valid for HTTP POST requests.

Explanation
An error has occurred in the CICS management client interface. The request cannot be processed. PARAMETER is not valid for HTTP POST requests.

System action
The system stops processing the request.

User response
Remove the PARAMETER expressions from the URI and resubmit the request.

Module:
DFHWUIPG

DFHWU4020 Multiple SUMMONLY expressions were found in the URI.

Explanation
An error has occurred in the CICS management client interface. The request cannot be processed. Multiple SUMMONLY expressions were found in the URI.

System action
The system stops processing the request.

User response
Remove the multiple SUMMONLY expressions from the URI and resubmit the request.

Module:
DFHWUIPG

DFHWU4021 CRITERIA is not valid for result cache operations. CRITERIA value: criteria

Explanation
An error has occurred in the CICS management client interface. The request cannot be processed. CRITERIA is not valid for result cache operations. The value specified for the CRITERIA expression is criteria.

System action
The system stops processing the request.

User response
Remove the CRITERIA expression from the URI and resubmit the request.

Module:
DFHWUIPG

DFHWU4022 PARAMETER is not valid for result cache operations. PARAMETER value: parameter

Explanation
An error has occurred in the CICS management client interface. The request cannot be processed. Using a PARAMETER expression is not valid for result cache operations. The value specified for the PARAMETER expression is parameter.

System action
The system stops processing the request.

User response
Remove the PARAMETER expression from the URI and resubmit the request.

Module:
DFHWUIPG

DFHWU4025 A specified attribute was not valid for this resource.

Explanation
An error has occurred in the CICS management client interface. The request cannot be processed. A specified attribute was not valid for this resource.

System action
The system stops processing the request.

User response
Supply an appropriate attribute and resubmit the request.
**Module:** DFHWISE

**DFHWU4026** The DEFVER attribute was not specified or was specified with a value of zero.

**Explanation**
An error has occurred in the CICS management client interface. The request cannot be processed. The DEFVER attribute was not specified or was specified with a value of zero.

**System action**
The system stops processing the request.

**User response**
Supply a valid DEFVER attribute and resubmit the request.

**Module:** DFHWISE

**DFHWU4027** A value of a specified attribute was out-of-range or not valid.

**Explanation**
An error has occurred in the CICS management client interface. The request cannot be processed. A value of a specified attribute was out-of-range or not valid.

**System action**
The system stops processing the request.

**User response**
Supply a valid attribute and resubmit the request.

**Module:** DFHWISE

**DFHWU4029** The result cache token specified exceeded its maximum allowable length. CACHETOKEN value: cachetoken

**Explanation**
An error has occurred in the CICS management client interface. The request cannot be processed. The result cache token specified exceeded its maximum allowable length. The cachetoken is the value specified for the cache token.

**System action**
The system stops processing the request.

**User response**
Supply a cache token value of the correct length and resubmit the request.

**Module:** DFHWISE

**DFHWU4030** The resource name was not specified in the URI.

**Explanation**
An error has occurred in the CICS management client interface. The request cannot be processed. The resource name was not specified in the URI.

**System action**
The system stops processing the request.

**User response**
Specify the resource name in the URI and resubmit the request.

**Module:** DFHWISE

**DFHWU4031** Multiple ORDERBY expressions were found in the URI.

**Explanation**
An error has occurred in the CICS management client interface. The request cannot be processed. Multiple ORDERBY expressions were found in the URI.

**System action**
The system stops processing the request.

**User response**
Remove the multiple ORDERBY expressions in the URI and resubmit the request.

**Module:** DFHWISE

**DFHWU4032** ORDERBY is only valid for HTTP GET requests.

**Explanation**
An error has occurred in the CICS management client interface. The request cannot be processed. Use of
an ORDERBY expression is only valid for HTTP GET requests.

**System action**
The system stops processing the request.

**User response**
Remove the ORDERBY expression on this request and resubmit.

**Module:**
DFHWUIPG

**DFHWU4033** Multiple OVERRIDEWARNINGCOUNT expressions were found in the URI.

**Explanation**
An error has occurred in the CICS management client interface. The request cannot be processed. Multiple OVERRIDEWARNINGCOUNT expressions were found in the URI.

**System action**
The system stops processing the request.

**User response**
Remove the multiple OVERRIDEWARNINGCOUNT expressions in the URI and resubmit the request.

**Module:**
DFHWUIPG

**DFHWU4300** The result cache token specified in the URI does not belong to the user who made the request.

**Explanation**
An error has occurred in the CICS management client interface. The result cache token specified in the URI does not belong to the user who made the request.

**System action**
The system stops processing the request.

**User response**
Respecify the request with the correct result cache token.

**Module:**
DFHWUIPG

**DFHWU4301** It is not possible to run requests in this environment. This region is not configured correctly.

**Explanation**
An error has occurred in the CICS management client interface. It is not possible to run requests in this environment. This region is not configured correctly. The CICS management client interface should only be started on either a CICSPlex SM Web User Interface or a single server (SMSS) region.

**System action:**

**User response:**
Ensure that you are using the correct environment for your requests.

**Module:**
DFHWUIPG

**DFHWU4302** The requested record count will exceed the current default warning count limit.

current_record_count value: currcount
default_warning_count value: warncount
override_warning_count_allowed value: override_warning_count_allowed

**Explanation**
An error has occurred in the CICS management client interface. The request has been denied as it exceeded a resource limit. The requested record count will exceed the current default warning count limit.

**System action**
The system stops processing the request.

**User response**
Respecify the request to reduce the number of records returned or specify the OVERRIDEWARNINGCOUNT URI query parameter if override_warning_count_allowed is set to "YES".

**Module:**
DFHWUIPG

**DFHWU4303** An error has occurred in the CICS management client interface. The request cannot be processed.
**Explanation**
An error has occurred in the CICS management client interface.

**System action**
Access to the CICS management client interface has been denied.

**User response**
See the full message description for further details.

**Module:**
DFHWUIPG

**DFHWU4400**
The resource specified in the URI could not be found.

**Explanation**
An error has occurred in the CICS management client interface. The resource specified in the URI could not be found. The resource type is not supported by this version of the CICS management client interface.

**System action**
The system stops processing the request.

**User response**
Check that the specified CICS resource name is correct. Specify a valid resource in the URI and resubmit the request.

**Module:**
DFHWUIPG

**DFHWU4401**
The result cache record specified could not be found.

**Explanation**
An error has occurred in the CICS management client interface. The result cache record specified could not be found because the result cache record index was out of range.

**System action**
The system stops processing the request.

**User response**
Check that the specified result cache record index is correct.

**Module:**
DFHWUIPG

**DFHWU5000**
There was insufficient GCDSA storage available to complete the request.

**Explanation**
An internal error has occurred in the CICS management client interface. There was insufficient GCDSA storage available to complete the request.

**System action**
The system stops processing the request.

**User response**
Check that you have specified a valid HTTP method and resubmit the request.

**Module:**
DFHWUIPG

**DFHWU4500**
A method has been specified that is not valid for the URI sent to the CICS management client interface. METHOD value: method

**Explanation**
An error has occurred in the CICS management client interface. The specified HTTP method is not allowed for the URI. The method is not valid for the URI sent to the CICS management client interface.

**System action**
The system stops processing the request.

**User response**
Check that you have specified a valid HTTP method and resubmit the request.

**Module:**
DFHWUIPG
User response
Contact your system administrator.

Module: DFHWUIPG

DFHWU5001 The CICS management client interface server has gone Short On Storage BELOW the bar.

Explanation
An internal error has occurred in the CICS management client interface. The CICS management client interface server has gone short-on-storage below the bar.

System action
The system stops processing the request.

User response
Contact your system administrator.

DFHXAnnnn messages

DFHXA6521I applid CICS shutdown initiated by CEBT event

Explanation
This is an informational message issued from the CICS TCB.

System action
CICS terminates normally.

User response
None.

Module: DFHXRPC

XMEOUT parameters/Message inserts

1. applid

Destination
Console

DFHXA6526I applid MESSAGE RECEIVED FOR UNSUPPORTED QUEUE X'queue'.

Explanation
This message is issued from the CAVM TCB. A tracking message has been received for a queue with hexadecimal name X'queue'. However this queue is not recognized by CICS.

System action
CICS processing continues, but tracking messages for queue X'queue' are ignored.

User response
Check that the active CICS system and the alternate CICS system are at the same functional level with respect to XRF.

If both CICS systems are at the same level, check why the active CICS system has written data to the alternate system.

Ensure that the queue name has not been corrupted.

Module: DFHXRB

Destination
Console

DFHXA6528I applid Unable to link to program progname

Chapter 2. CICS messages 2161
Explanation
This message is issued from the CICS TCB. CICS is unable to link to program progname.

System action
CICS terminates abnormally with a system dump and abend code 0210.

User response
Examine the dump to determine why CICS was unable to link to program progname.
Ensure that the named program is not missing from the data sets concatenated in the DFHRPL DD statement. If progname is missing, obtain a copy of the program and include it in the library. In addition, ensure that enough storage is available for the dynamic storage areas.

Module:
DFHXRE

XMEOUT parameters/Message inserts
1. applid
2. progname

Destination
Console

DFHXA650I XRF HAS FAILED. ERROR NUMBER nn ON XRF MESSAGE DATA SET IN CONTROL INTERVAL WITH RBA HEX'xx'.

Explanation
The XRF message manager has encountered a problem with the contents of the given control interval in the message data set. The message includes an error number nn which can take one of the following values:

01
The CI does not contain an XRF message manager control record.
02
The XRF message control record contains a cycle number less than that of the current read cycle.
03
The XRF message manager did not find a message record boundary where it expected one.
04
There is an XRF message sequence number error.
05
The CIDF is invalid (for example, the free area length is negative).
06
The length in the RDF is less than the length of a message record header, or is inconsistent with the data length in the message record header.
07
The end of the record lies outside the data area defined by the data length field of the CIDF.

System action
Surveillance by the alternate system ceases.

User response
Correct the conflicting values of the operands START and XRF.

Module:
DFHSIC1

XMEOUT parameters/Message inserts
1. applid

DFHXA6530 applid START=STANDBY specified. CICS start-up is terminated because XRF=NO is specified

Explanation
START=STANDBY and XRF=NO cannot be specified together.

System action
CICS terminates abnormally with a dump.

User response
Correct the conflicting values of the operands START and XRF.
Module: DFHWMRD

Destination: Console

**DFHXA6541I**
XRF HAS FAILED. THE XRF MESSAGE READER IN THE ALTERNATE SYSTEM HAS FALLEN TOO FAR BEHIND.

**Explanation**
The alternate system has been unable to keep up with the messages generated by the active CICS system. Its read position in the wrap-round message data set has been 'lapped' by the active system.

**System action**
Surveillance by the alternate system ceases.

**User response**
Try to determine and correct the reason for the delay to the alternate system. It may be that the message data set is too small to allow adequate buffering, or the message data set has been reserved by the active CEC - not necessarily by the active CICS.

Module: DFHWMRD

Destination: Console

**DFHXA6560I**
applid TERMINATION COMMAND FAILED: command.

**Explanation**
The command issued by the alternate CICS during takeover to terminate the active CICS failed. MVS rejected the system operator command command issued under program control as being invalid.

**System action**
Message DFHXA6581 or DFHXA6582 is also displayed. The alternate CICS continues with its processing to detect termination of the active CICS job.

**User response**
Ensure that the active CICS job terminates. See messages DFHXA6581 and DFHXA6582. For problem determination, hard copy of the console log may be required.

Module: DFHWTI

Destination: Console

**DFHXA6561D**
applid WHEN jesno jobname ENDS REPLY JOB OR WHEN CEC sid HAS FAILED REPLY CEC.

**Explanation**
During a takeover attempt, the issuing CICS system was unable to determine whether job jobname, running on a different CEC, has terminated. This is for one of the following reasons:

- CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560, DFHXA6569 or DFHXA6570 has been produced.
- CICS has either successfully issued a cancel command, or job jobname is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If jobname is the active CICS. Takeover cannot continue until jobname has ended. If jobname is a DBCTL subsystem, an alternate DBCTL cannot be started until jobname has ended.

**System action**
The system waits for a reply. In the meanwhile, the issuing CICS system continues processing to detect termination of the job.

If termination is detected while the reply is still outstanding, this message is deleted and message DFHXA6564 is displayed. In this case, a reply is no longer required.

If the reply is 'JOB', then processing continues as if CICS had detected the termination itself.

This also happens if the reply is 'CEC', but in addition an internal record is created indicating that the CEC is inoperative at this time. Other alternate CICS which have issued this message for jobs executing on the CEC specified, and which are still waiting for a reply, will detect the internal record of the failed CEC. Having done so they delete their outstanding replies and issue message DFHXA6563.
User response
The operator should either:-
- Ensure that job jobname with JES number jesno terminates, and then reply 'JOB', or
- Ensure that the CEC with MVS system identifier sid is inoperative at this time, for example by selecting SYSTEM RESET on that CEC, and then reply 'CEC'.

No action is necessary if at any time CICS deletes this message, as described above.

Module:
DFHWTI

Destination
Console

DFHXA6563I  applid jesno jobname ENDED DUE TO FAILURE OF CEC sid.

Explanation
During takeover, the alternate CICS has detected that the CEC with MVS system identifier sid has failed and therefore that the active CICS job with job name jobname and JES job number jesno is regarded to have ended.

System action
The alternate CICS continues with its takeover processing.

User response
None.

Module:
DFHWTI

Destination
Console

DFHXA6564I  applid TERMINATION OF jesno jobname DETECTED.

Explanation
During takeover, the alternate CICS has detected that the active CICS job with specified job name and JES job number has ended.

System action
The alternate CICS continues with its takeover processing.

User response
None.

Module:
DFHWTI

Destination
Console

DFHXA6566I  applid modname NOT LINK-EDITED REENTERABLE.

Explanation
Module modname, the CLT or RST currently in use, was found not to have been link-edited with the reenterable module attribute.

System action
Further messages are issued which describe the action taken by CICS.

User response
The appropriate response is indicated by subsequent messages.

Module:
DFHWTI

Destination
Console

DFHXA6567I  applid APPLID applid2 NOT FOUND IN modname.

Explanation
Module modname, the CLT or RST currently in use by this alternate CICS, was found not to contain the APPLID applid2.

System action
Further messages are issued which describe the action taken by CICS.

User response
The appropriate response is indicated by subsequent messages.

Module:
DFHWTI

Destination
Console

DFHXA6568I  applid JOBNAME jobname NOT FOUND IN modname.

Explanation
Module modname is either a CLT or an RST.
If the module is a CLT, it was found not to contain the job name jobname associated with the APPLID of this alternate CICS.
If the module is an RST, it was found not to contain the job name jobname associated with the DBCTL subsystem identified in the message.
jobname is the job name which the alternate CICS would have used to cancel the active CICS job or DBCTL job during a takeover

System action
Further messages are issued which describe the action taken by CICS.

User response
The appropriate response is indicated by subsequent messages.

Module: DFHWTI

Destination
Console

DFHXA6569I  applid MVS SYSTEM IDENTIFIER sid NOT FOUND IN DFHCLTxx.

Explanation
The CLT currently in use was found not to contain the specified MVS system identifier sid, which identifies the CEC on which the active CICS was executing.
The initialization option CLT=xx specifies the suffix of the CLT currently in use by this alternate CICS.

System action
Further messages are issued by the alternate CICS to describe the action taken.

User response
The appropriate response is indicated by subsequent messages.

Module: DFHWTI

Destination
Console

DFHXA6570I  applid JES SUBSYSTEM NAME jesname NOT FOUND IN DFHCLTxx FOR MVS SYSTEM sid.

Explanation
The CLT currently in use does not contain the JES subsystem name jesname associated with the MVS system sid of the CEC on which the active CICS was executing.
The initialization option CLT=xx specifies the suffix of the CLT currently in use by this alternate CICS.

System action
Further messages are issued by the alternate CICS to describe the action taken.

User response
The appropriate response is indicated by subsequent messages.

Module: DFHWTI

Destination
Console

DFHXA6571I  applid CICS IS NOT DEFINED AS AN MVS SUBSYSTEM.

Explanation
The alternate CICS attempted to access an internal record of CEC failures to determine whether the CEC on which the active CICS job was executing had failed. To access this information CICS has to be defined as an MVS subsystem. Because it is not, the attempt failed.

System action
Processing continues.
User response
None. For further information about defining CICS as an MVS subsystem, see the Installing CICS TS.

Module:
DFHWTI

Destination
Console

DFHXA6572I  applid UNABLE TO LOAD modname.

Explanation
The module modname, defined by the CLT or RST for use by the alternate CICS that issued this message, cannot be loaded.

System action
Further messages are issued by the alternate CICS to describe the action taken.

User response
The appropriate response is indicated by subsequent messages.

Module:
DFHWTI

Destination
Console

DFHXA6573I  applid LOAD MODULE modname IS NOT VALID.

Explanation
Module modname, the CLT or RST defined for use by this CICS system, is not valid.

System action
Further messages are issued by the alternate CICS to describe the action taken.

User response
The appropriate response is indicated by subsequent messages.

Module:
DFHWTI

Destination
Console

DFHXA6575I  applid SUBSYSTEM NAME subsysid NOT FOUND IN rstname FOR THIS APPLID.

Explanation
This is an informational message indicating that RST rstname, which was selected via the SIT, does not include an entry for DBCTL subsystem subsysid in any RSE containing the specific APPLID applid of this CICS.

System action
No action results directly when this message is issued. Other messages may be issued following this verification failure.
**User response**

Check the RST suffix specified in the SIT, the RST, and the DBCTL subsystem to which CICS is connected. Check any other messages that may also have been issued.

**Module:** DFHWTI

**Destination**

Console

**DFHXA6576I** applid CLT PROCESSING NOT POSSIBLE OWING TO ERROR IN DFHCLTxx.

**Explanation**

During takeover, the alternate CICS that issued this message performed a check on the CLT contents and found an error.

A previous message specifies the error.

**System action**

Commands in the CLT are not issued by this alternate CICS. Other takeover processing continues.

**User response**

Verify that the alternate CICS job is authorized to perform a takeover of the active CICS and take appropriate action if it is not.

If the takeover is to be successful, the system operator should monitor and coordinate execution of the active CICS and alternate CICS jobs in the XRF complex.

Perform the source edit, assembly and link-edit tasks necessary to correct the CLT.

**Module:** DFHWTI

**Destination**

Console

**DFHXA6578I** applid NOT AUTHORIZED TO CANCEL jesno jobname.

**Explanation**

The issuing alternate CICS is attempting a cancel of the specified active CICS job. It has been unable to find the data that is needed to fully authorize the cancellation in the CLT or RST. This may be because the alternate cannot load the table, or because job jobname cannot be found:

- In the CLT, for an active CICS, or
- In the RST, for a DBCTL subsystem, or
- Because the CLT or RST is invalid.

Further messages specify the error with the CLT or RST, or define why the CLT or RST is invalid.
System action
The issuing CICS system cannot issue a CANCEL, but attempts to alert the active CICS system to the takeover request via the XRF control data set. In most cases this causes the active system to initiate termination. The alternate continues processing to detect termination of the job.

When termination is detected, message DFHXA6564 is displayed.

User response
Verify that the alternate CICS job is authorized to perform a takeover of the active CICS. Take appropriate action if the alternate CICS job is not authorized.

Your CLT and/or RST may require maintenance action.

Module: DFHWTI

Destination
Console

DFHXA6580I PROGRAM LOGIC ERROR DETECTED.

Explanation
An internal error has been detected that prevents the CICS XRF CAVM supervisor state processing from continuing.

Depending on the CAVM supervisor state service being processed at the time, CICS may or may not abnormally terminate.

The CAVM TCB for processing the service has abnormally terminated.

Job output should include a dump of MVS LSQA associated with the SYSABEND DD statement.

Diagnostics: Register 2 is the base register for DFHWTI global storage. This storage begins with the eye catcher WTISTOR. The format of this storage is defined in DSECT WSTORAGE in source member DFHWTI.

DFHWTI request arguments copied to global storage begin at field WGLOADATA.

Source member DFHWTADS defines the format of global storage arguments.

Field WGLOLOCA contains the address of the first register save area for a routine in DFHWTI.

In the SVRB for the CICS SVC call that invoked DFHWTI, the first fullword in the FEPARM field contains the address of DFHWTI global storage.

Register 4 is the base register for local storage for each routine in DFHWTI. Its format is defined in a DSECT whose name is of the form WLOCxxx where xxx is the short name of the routine (see below for a list of routine names).

These DSECTs are in source member DFHWTI. The first halfword is the internal return code for the routine. The values used for internal return codes are the same as the DFHWTI request reason codes as defined in source member DFHWTADS field name WTARRC.

In addition, internal return codes of the format X'40nn' are used. X'40F0' is 'Internal Logic Error' variable name, RCLOGERR.

Other internal return codes of this format are defined in the local storage DSECTs.

The DFHWTI request type for the CAVM supervisor state service is copied into local storage associated with the DFHWTI initialization and termination routine, field name WWTIREQ, DSECT WLOCWTI in source member DFHWTI.

Register 6 is the base register for each routine in DFHWTI. When set, it points at a location immediately following an eye catcher of the routine's long name (see list of routine names).

Register 13 is the base register for a register save area local to a routine in DFHWTI. These save areas are standard MVS format except the first fullword contains the routine's short name (see list of names). They are chained in the standard way with backward and forward pointers set on entry to a routine and zeroed on return.

Register save areas physically precede the storage local to a routine.

If a routine has to access the CLT, its address is in local storage for the routine. The field name for the CLT address is of the form WxxxCLTA, where xxx is the short name of the routine.

System action
In general, the CAVM request issued by this CICS job will fail. For the effect this has on processing by this CICS job, refer to messages issued after this one.

CAVM XRF supervisor state processing issues an MVS abend with system abend code 0214 and an MVS SYSABEND dump is produced.
User response

Keep the job output and console log for problem determination.

Using the SYSABEND dump of the MVS LSQA, and if available, the MVS symptom dump output, find the DFHWTI routine that detected the error from the value of register 6 or register save area chain fields.

Find the internal return code currently set in local storage for the routine.

Using the reason code value, remaining content of local storage and global storage, try to determine the cause of the action by the routine.

An assembly listing of the CLT assembled with the PRINT NOGEN option may be required.

Routine names Long names are used for:
• The routine entry point name, and
• The routine entry eye catcher.

Short names are used for:
• The routine register save area eye catcher,
• Characters 2 to 4 of routine local storage field names,
• Characters 5 to 7 of routine local storage DSECT names, and
• Characters 1 to 3 of routine labels.

Routines are as follows:

<table>
<thead>
<tr>
<th>Long Name</th>
<th>Short Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1)</td>
<td>WTI</td>
</tr>
<tr>
<td></td>
<td>TIPENTRY</td>

Console

\texttt{DFHXA6581I applid UNABLE TO DETERMINE STATUS OF JOB jesno jobname.}

Explanation

The issuing CICS system was unable to determine whether job \textit{jobname}, running on the same CEC, has terminated. This is for one of the following reasons:

1. CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560 has been produced.

2. CICS has successfully issued a cancel command, but the job still appears to be running after the time period specified by the initialization parameter JESDI.
3. Job jobname is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

If jobname is the active CICS, takeover cannot continue until jobname has ended.

If jobname is a DBCTL subsystem, an alternate DBCTL cannot be started until jobname has ended.

**System action**

Takeover is suspended until the issuing CICS system detects the termination of the named job.

When termination is detected the message DFHXA6564 is displayed.

**User response**

Ensure that the active CICS job terminates.

**Module:**

DFHWTI

**Destination**

Console

DFHXA6582I applid UNABLE TO DETERMINE STATUS OF JOB jesno jobname ON MVS SYSTEM mvsname(sid).

**Explanation**

The issuing CICS system was unable to determine whether job jobname, running on MVS image mvsname, has terminated. This is for one of the following reasons:

- CICS was unable to issue a system operator command under program control to cancel the named job. In this case, message DFHXA6560, DFHXA6569, or DFHXA6570 has been produced.
- CICS has successfully issued a cancel command, but the job still appears to be running after the time period specified by the initialization parameter JESDI.
- Job jobname is a failing DBCTL subsystem, but the job still appears to be running after the time period specified by the initialization parameter JESDI.

**DFHXCnnnn messages**

DFHXC6600I applid CAVM DATA SET INITIALIZATION FAILED.

**Explanation**

The CICS job which displayed this message attempted to sign on to the CAVM but the signon request failed because the CAVM data sets could not be initialized properly. This is due to one of the following:
• The data set formatting subtask had not completed its processing in 2 minutes. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs cause a CAVM data set's DASD volume or a VSAM catalogue to remain inaccessible for a protracted period.

• SIGNON found that one of the CAVM data sets had already been formatted by a different CICS job but that the other was either empty or could not be opened because of conflict with another user of the data set. SIGNON waited for the other CICS job to finish the data set formatting, but 5 minutes later, this still had not been done. This might occur if a CICS job failed during data set formatting. A specific error reported in a previous message prevented successful completion of data set initialization.

**System action**
See following message issued by this CICS job.

**User response**
Correct the JCL or redefine the CAVM data sets if necessary and resubmit the CICS job. See the Configuring for information on CAVM data sets.

DFHXC6608I
applid I/O ERROR ACCESSING CAVM DATA SET dsname DURING SIGNON.

Explanation
The CICS job which displayed this message issued a sign on to the CAVM. CAVM is attempting to reserve or access the CAVM data set indicated in the message text, but for some considerable time, either the required resource has remained unavailable or an outstanding I/O request has not completed. The reason for issuing this particular message cannot be failure of a conditional reserve request unless new empty CAVM data sets are being used for the first time. The reserve attempt should not fail anyway unless another CICS job using the same CAVM data set and executing a sign on, sign-off or takeover request has been held up, possibly by I/O delays, after issuing a successful reserve. I/O delay might be caused by reserves issued by jobs (not necessarily CICS) running in other CECs that have made the CAVM data set's DASD volume temporarily inaccessible.

System action
After a short delay, the CICS job that displayed this message either reissues the conditional reserve macro or checks for completion of the outstanding I/O. If the required resource is now available or the I/O request has completed, normal processing continues. Otherwise, this message is reissued.

User response
None, unless the condition persists. If so, another CEC might have failed after reserving the DASD volume containing a CAVM data set. In this case, follow your installation’s operations procedure for removing an outstanding reserve for a shared DASD. (For example, issue system reset on the failed CEC.)

DFHXC6626D applid POSSIBLE CAVM SIGNON CONFLICT. IS JOB jobname,jesno RUNNING ON SYSTEM sid? REPLY YES OR NO.

Explanation
The CICS job which issued this message issued a SIGNON to the CAVM but the CAVM needs the operator's help in order to decide whether it is safe to accept the request. The CAVM has found that the control data set refers to a job satisfying all the following conditions:

• JES believes that this job is still executing.
• If JES is right, the current sign on request must be rejected because the presence of this job would conflict with it.
• This job is not running in the same CEC as the CICS job which is attempting to sign on.
• This job's surveillance signals appear to be absent.

Such a situation might have arisen as a result of a failure of the CEC in which the conflicting job was running and if so, the CAVM should not reject the sign on request unless it finds another reason for doing so. If the job which displayed this message is a CICS active, the conflicting job is another active or an alternate which has started a takeover. If the job which displayed this message is a CICS alternate, the conflicting job is another alternate. The jobname, JES job identifier and CEC SMF identifier of the conflicting job are specified in the message text.

System action
The CICS job waits for a reply.

User response
If the job which displayed this message is a CICS active job, reply NO only if:

1. You are certain that the job referred to in the message text is not executing. It might be necessary to perform a System Reset of the CEC where it was running to guarantee this.
   AND
2. The job which issued this message ought to continue with its CAVM sign on request and become the CICS active job.

Otherwise reply YES.

If the job which displayed this message is a CICS alternate job, reply NO only if:

1. You are certain that the job referred to in the message text is not executing. It might be necessary to perform a System Reset of the CEC where it was running to guarantee this.
   AND
2. The job which issued this message ought to continue with its CAVM sign on request and become the CICS alternate job.

Otherwise reply YES.

DFHXC6627I applid CAVM SIGNON IMPOSSIBLE BECAUSE THIS JOB IS CURRENTLY SIGNED ON OR WAS ONCE AN ACTIVE SYSTEM.

Explanation
The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

System action
See following message issued by this CICS job.

User response
This message indicates an internal error has occurred.

Module: DFHWSSN2
**Destination**
Console

DFHXC6628I  **applid** CAVM SIGNON IMPOSSIBLE AT PRESENT BECAUSE CONFLICTING JOB(S) HAVE NOT YET SIGNED OFF OR TERMINATED.

**Explanation**
The CICS job which issued this message issued a SIGNON to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

**System action**
See following message issued by this CICS job.

**User response**
None unless the wrong START option has been requested for the new job or the conflicting job(s) were started by mistake. If so, resubmit the failing CICS job with appropriate corrections or after canceling the conflicting job(s).

**Module:**
DFHWSSN2

**Destination**
Console

DFHXC6629I  **applid** CAVM SIGNON IMPOSSIBLE BECAUSE REQUESTING JOB AND SIGNED-ON JOB(S) DO NOT SHARE A COMMON JES JOB QUEUE.

**Explanation**
The CICS job which issued this message issued a sign on to the CAVM, but the request cannot be accepted because the error condition described in the message text has been detected.

**System action**
See following message issued by this CICS job.

**User response**
If any of the signed on jobs are running under the control of the wrong JES, cancel them. Resubmit the failing job and any that had to be canceled, ensuring that all are running under the control of either a single JES or multiple JESs that share a common job queue.

**Module:**
DFHWSSN2

**Destination**
Console

DFHXC6630I  **applid** TAKEOVER REJECTED BECAUSE LAST ACTIVE SIGNED OFF NORMALLY.

**Explanation**
The CICS job that issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text.

**System action**
See following message issued by this CICS job.

**User response**
None

**Module:**
DFHWSTKV

**Destination**
Console

DFHXC6631I  **applid** TAKEOVER REJECTED BECAUSE LAST ACTIVE INSTANCE NUMBER DOES NOT MATCH THAT SPECIFIED.

**Explanation**
The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text. This error would occur if a new CICS active job signed on to the CAVM after this CICS alternate job had already made the decision to attempt to take over from the previous CICS active job.

**System action**
See following message issued by this CICS job.

**User response**
None

**Module:**
DFHWSTKV

Destination
Console

DFHXC6632I applid NON PRE-EMPTIVE TAKEOVER REJECTED BECAUSE LATEST ACTIVE VERSION NUMBER DOES NOT MATCH THAT SPECIFIED.

Explanation
The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text.

System action
See following message issued by this CICS job.

User response
None

Module: DFHWSTKV

Destination
Console

DFHXC6633I applid NON PRE-EMPTIVE TAKEOVER REJECTED BECAUSE A TAKEOVER IS ALREADY IN PROGRESS.

Explanation
The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text.

System action
See following message issued by this CICS job.

User response
None

Module: DFHWSTKV

Destination
Console

DFHXC6634I applid TAKEOVER REJECTED BECAUSE NECESSARY TOD CLOCK DIFFERENCE INFORMATION IS NOT AVAILABLE.

Explanation
The CICS job which issued this message issued a takeover request to the CAVM but the request has been rejected due to the error condition described in the message text. This error cannot occur unless both the following conditions are satisfied:

- The CICS active and alternate jobs are running in different CECs.
- A TAKEOVER has been attempted before the alternate job has had the chance to observe the active job’s surveillance signals for the short time (less than 1 minute) needed to deduce the maximum possible difference between the respective TOD clocks.

The takeover cannot be performed unless the difference between the CECs' TOD clocks is known because normal CICS processing must not be resumed until the current TOD clock reading is later than the TOD clock reading when the old CICS active job terminated as observed in the CEC where it had been running.

System action
See following message issued by this CICS job.

User response
None

Module: DFHWSTKV

Destination
Console

DFHXC6635I applid TAKEOVER PROCESSING TERMINATED BECAUSE ANOTHER BACKUP HAS STARTED A PRE-EMPTIVE TAKEOVER.

Explanation
The CICS job which issued this message issued a takeover request to the CAVM and the request was accepted, but the error condition described in the message text was encountered before the completion of TAKEOVER.
System action
See following message issued by this CICS job.

User response
None

Module: DFHWSTKV

Destination
Console

DFXC6636I applid TAKEOVER PROCESSING TERMINATED BECAUSE STATUS OF ACTIVE JOB CANNOT BE DETERMINED.

Explanation
The CICS job which issued this message issued a takeover request to the CAVM and the request was accepted, but takeover processing could not be completed because of an error encountered in using the CAVM services provided by the CICS SVC.

System action
See following message issued by this CICS job.

User response
For problem determination, consult the Troubleshooting and support. The console log and job output may be required.

Module: DFHWSTKV

Destination
Console

DFXC6637I applid TAKEOVER IS WAITING TO RESERVE OR ACCESS THE CAVM CONTROL DATA SET.

Explanation
The CICS job that issued this message issued a TAKEOVER request to the CAVM. CAVM is attempting to reserve or access the CAVM control data set in order to process the request, but for some considerable time, either the required resource has remained unavailable or an outstanding I/O request has not completed. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a SIGNON, SIGOFF or TAKEOVER request has been held up, possibly by I/O delays, after issuing a successful reserve.

System action
See message DFXC6607.

User response
See message DFXC6607.

Module: DFHWSTKV

Destination
Console

DFXC6638I applid NOTIFY RC= retcode - text

Explanation
The CICS job that displayed this message has found that the return code passed back to CAVM by the NOTIFY exit (DFHXRB) was non-zero. The message includes the actual return code value retcode (or greater than 99) and some text identifying the type of event which was being processed when the error occurred. This message always indicates either an internal error in CAVM or CICS or that code or data has become corrupted.

System action
Processing continues but XRF function is probably degraded.

User response
Inform your installation's system programmer.

Module: DFHWSTKV

Destination
Console

DFXC6640I applid ALL STATUS WRITERS ARE IN I/O WAIT.

Explanation
The CICS job which displayed this message has found that the writes of its latest status issued to the control data set and the message data set are both taking a long time to complete. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs have made the DASD volumes of both CAVM data sets temporarily inaccessible.
System action

The CICS job re-issues this warning message at intervals until one of its status writes completes. Meanwhile, it continues to perform any processing which is not dependent on status write completion. If the job which displayed this message is a CICS active and the condition persists for long enough, it is possible that an unwanted takeover will be initiated when the alternate (assuming that it is able to read the CAVM data sets because it is running in a different CEC) notices that the active system's surveillance signals have ceased.

User response

If this message is issued by an CICS active job which does not seem to be experiencing other problems, it might be advisable to issue a suitable command to the corresponding alternate job to prevent it from initiating an unnecessary takeover. See also message DFHXC6607.

Module: DFHWSSW

Destination

Console

DFHXC6641I applid STATUS WRITE I/O ERROR ON dsname

Explanation

The CICS job which displayed this message has encountered an I/O error in writing its latest status to either the control data set or the message data set.

System action

If the CICS job is able to write its status successfully to either the control data set or the message data set, processing continues. Further writes to the failing data set might be attempted later on because it is possible that the error condition was transient. If both data sets become unusable simultaneously, the CAVM TCB ABENDs.

User response

Inform your installation's system programmer.

Module: DFHWSSW

Destination

Console

DFHXC6642I applid ALL STATUS READERS ARE IN I/O WAIT.

Explanation

The CICS job which displayed this message has found that the reads it has issued to the control data set and the message data set to obtain the latest available status of its partner system are both taking a long time to complete. This might occur if reserves issued by jobs (not necessarily CICS) running in other CECs have made the DASD volumes of both CAVM data sets temporarily inaccessible.

System action

The CICS job reissues this warning message at intervals until one of the status reads completes. Meanwhile, it continues to perform any processing which is not dependent on status read completion. If the job which displayed this message is a CICS alternate, It is possible that a takeover will not be initiated if the active fails, since the alternate cannot detect that the active's surveillance signals have ceased.

User response

See message DFHXC6607.

Module: DFHWSSR

Destination

Console

DFHXC6643I applid STATUS READ I/O ERROR ON dsname

Explanation

The CICS job which displayed this message has encountered an I/O error in reading the latest available status of its partner system from either the control data set or the message data set. dsname is the name of the data set.

System action

Processing continues but XRF function will be degraded because the affected system might not be able to detect changes in its partner's status. Further reads from the failing data set might be attempted later on because it is possible that the error condition was transient. If this error is encountered in an alternate system while it is processing a takeover request, the takeover will fail.
Module:
DFHWSSR

Destination
Console

DFHXC6644I applid NOTIFY RC= retcode - text

Explanation
The CICS job which displayed this message has found that the return code passed back to CAVM by the NOTIFY exit (DFHXRB) was non-zero. The message includes the actual return code value retcode (or a value greater than 99) and some text identifying the type of event that was being processed when the error occurred. This message always indicates either an internal error in CAVM or CICS or that code or data has become corrupted.

System action
Processing continues but XRF function is probably degraded.

User response
Inform your installation's system programmer.

Module:
DFHWSTI

Destination
Console

DFHXC6645I applid ERROR CALLING CICS SVC - xxxxxxxxxx

Explanation
The CICS job which displayed this message has encountered an error calling the CICS supervisor code (SVC) to determine the status of another MVS image in the same XCF sysplex as the calling CICS MVS image.

System action
Processing continues but XRF function is probably degraded.

User response
Ensure that the correct level of CICS SVC has been specified. Also ensure that MVS has issued an acceptable return code as this error can be caused by a change in MVS response codes. If the error is caused by neither of these, it could be the result of an internal error in CAVM. If this is the case, you need further guidance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHXC6649I applid SIGNOFF IS UNABLE TO RESERVE THE CAVM CONTROL DATA SET.

Explanation
The CICS job which issued this message issued a SIGNOFF request to the CAVM or SIGNOFF processing was invoked implicitly by abnormal termination of the CAVM TCB. CAVM attempted to reserve the CAVM control data set in order to process the request, but for some considerable time, the required resource remained unavailable. The reserve attempt should not fail unless another CICS job using the same CAVM data set and executing a SIGNON, SIGNOFF or TAKEOVER request has been held up, possibly by I/O delays, after issuing a successful reserve.

System action
Processing continues but XRF function is probably degraded.

User response
Inform your installation's system programmer.
**System action**
The CAVM TCB terminates without updating the CAVM data sets to indicate that this CICS job has signed off. See also any following message issued by this CICS job.

**User response**
None.

**Module:** DFHWSSOF

**Destination**
Console

**DFHXC6650I** applid CAVM HAS FAILED, CODE = code

**Explanation**
The CICS XRF job that issued this message has encountered an unexpected severe error during CAVM processing. The code code in the message identifies both the error, and the CAVM module that detected it, as follows:

Errors detected by DFHWSRTR (00xx)

0002  
CAVM dispatcher has no ready processes to dispatch and no external event to wait for.

Errors detected by DFHWSSN1 (10xx)

1001  
Nonzero return code from ATTACH for CAVM TCB.

Errors detected by DFHWSSN2 (20xx)

2001  
Function code in SIGNON parameter block is invalid.

2002  
Function modifier in SIGNON parameter block is invalid.

2003  
Length of SIGNON parameter block extension is incorrect.

2004  
Requested surveillance interval is not positive.

2005  
Nonzero return code from ESTAE to establish recovery for CAVM TCB.

2006  
Nonzero return code from asynchronous VSAM GET or CHECK while reading the state management record. (This could be caused by an I/O error.)

2007  
Nonzero return code from asynchronous VSAM PUT or CHECK while updating the state management record. (This could be caused by an I/O error.)

2008  
Nonzero return code from a request to start a check for the presence of surveillance signals.

2009  
Unexpected return code from a request to complete a check for the presence of surveillance signals.

200A  
Nonzero return code from asynchronous VSAM GET or CHECK while reading a status CI to check for the presence of surveillance signals. (This could be caused by an I/O error.)

200B  
Routine to check for the presence of surveillance signals found that the sequence number in a status CI has decreased.

200C  
Nonzero return code from asynchronous VSAM GET or CHECK while reading a status CI in order to update it. (This could be caused by an I/O error.)

200D  
Content of the state management record has changed but its security count is unaltered.

200E  
Nonzero return code from asynchronous VSAM PUT or CHECK while updating a status CI in the control data set. (This could be caused by an I/O error.)

200F  
Unexpected return code from the conditional RESERVE macro.

2010  
Nonzero return code from VSAM MODCB macro to change OPTCD in RPL to UPD.
2011
Nonzero return code from VSAM MODCB macro to change ACB address in RPL.

2012
Nonzero return code from ATTACH for TCB to issue a job STATUS enquiry request to the CICS SVC.

2013
Unexpected return code from CICS SVC (A version of DFHCSVC which includes XRF support might not have been installed on the MVS/ESA system, or the wrong SVC number might have been specified on the SIT or as an override.)

2014
Unexpected return code from a requested JES job STATUS enquiry function. (This error could also be caused by using a wrong SVC number which does not correspond to any version of the CICS SVC.)

2015
Unexpected return code from a XCF IXCQUERY function.

2016
Unexpected response code from CICS SVC when attempting to determine details of a job that is running under a release of MVS which supports XCF.

2017
Unexpected reason code from CICS SVC when attempting to determine details of a job that is running under a release of MVS which supports XCF.

Errors detected by DFHWSSN3 (30xx)

3001
Nonzero return code from VSAM GENCB macro to build an RPL.

3002
Nonzero return code from VSAM SHOWCB macro to obtain the length of an ACB.

3003
Nonzero return code from VSAM SHOWCB macro to obtain the length of an RPL.

3004
Nonzero return code from VSAM SHOWCB macro to obtain ACB OPEN error code.

3005
Nonzero return code from VSAM SHOWCB macro to obtain ACB CI size and RBA data.

3006
The high-used RBA of a CAVM data set is zero when it should not be empty.

3007
Nonzero return code from asynchronous VSAM GET while reading the Control CI from a CAVM data set.

3008
Nonzero return code from VSAM MODCB macro to change STRNO in an ACB.

3009
Unexpected return code from the conditional RESERVE macro.

300A
Nonzero return code from ATTACH for TCB to format a new pair of CAVM data sets.

300B
Internal logic error while processing a new pair of CAVM data sets.

300C
Nonzero return code from VSAM TESTCB macro to test whether the data set associated with an open ACB is an ESDS.

300D
Nonzero return code from VSAM SHOWCB macro to obtain ACB CI size and RBA data during the data set formatting.

300E
Nonzero return code from synchronous VSAM PUT while formatting a new pair of CAVM data sets. (This could be caused by an I/O error.)

300F
Nonzero return code from VSAM GENCB macro to build an ACB.

3010
Nonzero return code from VSAM SHOWCB macro to obtain ACB CI size and RBA data.

3011
Nonzero return code from VSAM MODCB macro to change the ACB address in RPL.

Errors detected by DFHWSSOF (40xx)

4001
Nonzero return code from VSAM GENCB macro to build RPLs.
4002
Error return code from PURGE macro (SVC 16).

4003
Nonzero return code from VSAM MODCB macro or synchronous GET, or I/O request was purged by the timer exit, when trying to read the state management record. (This could be caused by an I/O error.)

4004
The MVS/ESA system no longer has an SMF SMCA although it existed when this CICS XRF job signed on to the CAVM.

4005
This CICS XRF job no longer has an SMF TCT although it existed at SIGNON.

4006
This CICS XRF job no longer has an SMF JMR although it existed at SIGNON.

4007
State management record contains invalid duplicate entries for this CICS XRF job.

4008
The location of this CICS XRF job's description in the state management record is inconsistent with the current value of SMDR1NDX.

4009
The sequence numbers in this CICS XRF job's pair of status CIs in the control and message data sets are equal but nonzero.

400A
Unexpected return code from the conditional RESERVE macro.

400B
Unable to RESERVE control data set after repeated attempts.

400C
Nonzero return code from VSAM MODCB macro or synchronous PUT when trying to update status CI.

400D
Nonzero return code from VSAM MODCB macro or synchronous GET, or I/O request was purged by the timer exit, when trying to update the state management record. (This could be caused by an I/O error.)

Errors detected by DFHWSSR (50xx)

5001
Nonzero return code from VSAM GENCB macro to build an RPL.

5002
The alternate has detected that the active's status CI was still being updated after the active job had signed off or terminated. (This error could be caused by an invalid XRF configuration in which the active and alternate do not share a common JES job queue. The problem was not discovered when the second job signed on to the CAVM because at that time it was unable to detect the first job's surveillance signals.)

5003
The sequence number in a status CI of an XRF partner job has decreased.

5004
The alternate has detected that the sequence numbers in the active's pair of status CIs in the control and message data sets are equal but nonzero.

5005
The estimate of the lower bound of the difference between the active's and alternate's TOD clocks derived from the time-stamp in the status CI which has just been read is greater than the existing estimate of the upper bound of this difference.

5006
The estimate of the upper bound of the difference between the active's and alternate's TOD clocks derived from the time-stamp in the status CI which has just been read is less than the existing estimate of the lower bound of this difference.

5007
The sequence numbers in an XRF partner job's pair of status CIs in the control and message data sets are equal but nonzero.

5008
The sequence number in a status CI of an XRF partner job is now inconsistent with previously observed values.

5009
The instance and version numbers in a status CI of an XRF partner job are now less than the corresponding values in the public status area.

500A
The instance and version numbers in a status CI of an XRF partner job are unaltered but the job state
indicator has changed from 'signed off' to 'signed on'.

500B
Public status area seems to contain valid data about an XRF partner job before it should.

500C
Attempt to indicate that public status is available for another XRF partner job when it is already available for all partners.

500D
The alternate has encountered I/O errors in consecutive attempts to read the active's status CIs from both control and message data sets.

500E
The alternate has encountered an I/O error in trying to read one of the active's status CIs during a takeover.

500F
Logical error return code from VSAM CHECK of an asynchronous GET.

5010
Nonzero return code from asynchronous VSAM GET.

5011
This alternate has been invalidated by the active, probably because of message transmission difficulties. This can also be caused by a message data set that is too small. In this case, increase the size of the message data set to allow the alternate CICS to apply its updates before they are overwritten by those of the active CICS.

Errors detected by DFHWSSW (60xx)

6001
Logical error return code from VSAM CHECK of an asynchronous PUT.

6002
I/O errors have been encountered in consecutive attempts to write to this job's status CIs in both control and message data sets.

6003
Nonzero return code from asynchronous VSAM PUT.

6004
The 'status write completed' event masks have been corrupted.

6005
WSAGINDX has been corrupted.

6006
Nonzero return code from VSAM GENCB macro to build an RPL.

6007
The sequence number in one of this job's status CIs has been corrupted in the control or message data set. (This error could be caused by an invalid XRF configuration in which two actives or two alternates do not share a common JES job queue. The problem was not discovered when the second job signed on to the CAVM because at that time, it was unable to detect the first job's surveillance signals.)

Errors detected by DFHWSTKV (80xx)

8001
Nonzero return code from VSAM GENCB macro to build an RPL.

8002
State management record indicates that the alternate attempting to take over already holds the takeover lock.

8003
State management record indicates that the alternate attempting to take over already holds the resources which are freed by SIGNOFF of the active job.

8004
State management record indicates that the alternate attempting to take over already holds the resources which are freed by termination of the active job.

8005
DFHWTI encountered an error in trying to confirm termination of the active job after the alternate performing the takeover had already acquired the resources freed by the active SIGNOFF.

8006
Another alternate has started a preemptive takeover after this alternate had already acquired the resources freed by the active SIGNOFF.

8007
The time-stamp associated with the resources freed by termination of the active job cannot be updated because an unexpected problem has arisen with the TOD clock difference data after this
alternate had already acquired the resources freed by the active SIGNOFF.

8008
Nonzero return code from asynchronous VSAM GET to read the state management record.

8009
Nonzero return code from VSAM CHECK of asynchronous GET for the state management record. (This could be caused by an I/O error.)

800A
Nonzero return code from asynchronous VSAM PUT to update the state management record.

800B
Nonzero return code from VSAM CHECK of asynchronous PUT for the state management record. (This could be caused by an I/O error.)

800C
Nonzero return code from asynchronous VSAM GET to read the state management record in QUIESCE routine.

800D
Nonzero return code from VSAM CHECK of asynchronous GET for the state management record in QUIESCE routine. (This could be caused by an I/O error.)

800E
Nonzero return code from VSAM MODCB macro to change OPTCD in RPL to UPD.

800F
Nonzero return code from VSAM MODCB macro to change OPTCD in RPL to NUP.

8010
Unexpected return code from the conditional RESERVE macro.

8011
Invalid request code passed to the routine which attaches subtask TCBs to issue XRF requests to the CICS SVC.

8012
Nonzero return code from ATTACH for TCB to issue XRF request to the CICS SVC.

8013
Nonzero return code from DETACH for subtask TCB.

System action
An ABEND U0218 is issued with a reason code equal to the code in message DFHXC6650. This results in abnormal termination of the CICS XRF job. See also any following messages issued by this CICS XRF job.

User response
Inform your installation's system programmer.

Module:
DFHWSRTR, DFHWSSN1, DFHWSSN2, DFHWSSN3, DFHWSSOF, DFHWSSR, DFHWSSW, DFHWSTKV

Destination
Console

DFHXC6651I  applid CAVM HAS DETECTED AN INVALID REQUEST.

Explanation
CAVM has found that the parameter block passed to it is invalid, or that the request is being made at an inappropriate time.

System action
An ABEND U0218 is issued with reason code 1. This results in the abnormal termination of the CICS job. See also any following messages issued by this CICS job.

User response
Restart the failing CICS job and inform your installation's system programmer.

Module:
DFHWSRTR

Destination
Console
DFHXGnnnn messages

**DFHXG6215**  applid proname operation failure, response code cccc cccc keyrange: rrrr { | key: } key

**Explanation**
Table builder services (DFHTBSS) failed in an operation on the global catalog (DFHCCCC).

The failing operation is shown in the message, and is a DELETE, WRITE_NEXT, START_WRITE or END_WRITE request.

- cccc cccc are the response and reason codes from the catalog domain.
- rrrr is the internal RQ token passed to the catalog domain.
- key appears in the message only for a WRITE or DELETE operation, and usually includes the name of the resource for which CICS failed to record information on the global catalog.

This is normally an internal CICS error, however, it can occur during shut down if one task initiates a normal shut down, and another initiates an immediate shut down shortly afterwards. This is because the immediate shut down closes resources that are being used by the normal shut down task.

This can also occur if the global catalog is not big enough and a large group is being installed.

**System action**
CICS terminates.

**User response**
Check the size of the global catalog. Redefine a larger one if necessary.

Alternatively this message could be caused by an immediate shutdown of CICS because tasks not yet quiesced may abend trying to access a service removed by the shutdown process.

**Module:**
DFHTBSS

has been rejected by the CAVM. (Refer to message DFHXG6408.)

Messages are produced by the CAVM to note the reasons for rejecting the request.

**System action**
CICS termination continues.

**User response**
Refer to the messages produced by the CAVM for further information.

**Module:**
DFHXRF

**Destination**
Console

**DFHXG6411I**  
applid Sign off abnormal from the CAVM detected.

**Explanation**
This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the alternate CICS has signed off from the CAVM.

**System action**
The system continues with normal processing. However, you should be aware that takeover does not occur if the active CICS fails.

**User response**
Determine the reason for the abnormal sign-off.

**Module:**
DFHXRF

**XMEOUT parameters/Message inserts**

1. **applid**

**Destination**
Console

**DFHXG6415I**  
applid CICS is being taken over. Execution will be terminated.

**Explanation**
This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the alternate CICS has recovered from the apparent failure reported by message DFHXG6416.

**System action**
The system continues with normal processing. However, you should be aware that takeover may not occur should the active CICS fail.

**User response**
Determine the reason for the apparent failure of the alternate CICS.

**Module:**
DFHXRF

**Destination**
Console

**DFHXG6417I**  
applid Recovery of alternate CICS detected.

**Explanation**
This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the alternate CICS has recovered from the apparent failure reported by message DFHXG6416.
**System action**
The system continues with normal processing.

**User response**
None.

**Module:** DFHXRSP

**XMEOUT parameters/Message inserts**
1. `applid`

**Destination**
Console

**Explanation**
This is an informational message issued from the CICS TCB. It indicates that CICS has assumed that the alternate CICS has signed off from the CAVM.

This is likely to occur when the active CICS is running on CEC 1 and:
1. the CICS alternate is started on CEC 2, or
2. the CEC 2 initial program load is repeated, or
3. CICS alternate is restarted on CEC 2.

**System action**
CICS processing is continued.

**User response**
None.

**Module:** DFHXRSP

**XMEOUT parameters/Message inserts**
1. `applid`

**Destination**
Console

**Explanation**
This is an informational message issued from the CICS TCB. It indicates that CICS has been notified that the CAVM has failed.

Messages are produced by the CAVM to note the reasons for failure.

**System action**
CICS terminates abnormally with abend code 212.

**User response**
Correct the error.

**Module:** DFHXRSP

**XMEOUT parameters/Message inserts**
1. `applid`

**Destination**
Console

**Explanation**
This is an informational message issued from the CICS TCB. It indicates that the terminal control restart task has not failed. It is no longer possible for CICS to continue either as active or as alternate.

Messages are produced by the terminal control restart task to note the reasons for failure.

**System action**
CICS terminates abnormally with abend code 209.

**User response**
Correct the error.

**Module:** DFHXRSP

**XMEOUT parameters/Message inserts**
1. `applid`

**Destination**
Console
**Explanation**

This is an informational message issued from the CICS TCB. It indicates that CICS is unable to attach transaction CXCU. Therefore, CICS is unable to initiate the transmission of tracking messages. Takeover is adversely affected if CXCU cannot be attached. This can occur if:

1. CXCU is not defined to CICS, or
2. CICS is short on storage

**System action**

CICS attempts to attach CXCU at regular intervals.

**User response**

Either install CXCU using RDO, or alleviate the storage shortage.

**Module:**

DFHXRSP

**XMEOUT parameters/Message inserts**

1. applid

**Destination**

Console

DFHXG6440I  
 applid  I/O ERROR ON XRF MESSAGE DATA SET. RPL ADDRESS = HEX'xx'.

**Explanation**

VSAM reported a physical I/O error on the XRF message data set. The address X'xx' is that of the VSAM RPL which reported the error.

**System action**

Surveillance by the XRF system ceases.

**User response**

It is necessary to restart both the active and alternate CICS systems with a fresh pair of surveillance data sets. For diagnostic purposes, the message gives the address of the RPL being used at the time the error was reported. The RPL has an associated VSAM message area.

**Module:**

DFHWMMT

**Destination**

Console

DFHXG6441I  
 applid  LOGICAL ERROR ON XRF MESSAGE DATA SET. VSAM FEEDBACK DATA = HEX'xx'.

**Explanation**

VSAM reported a logical error on the XRF message data set.

**System action**

Surveillance by the XRF system ceases.

**User response**

This is an error in the CICS system. For diagnostic purposes the message contains the VSAM feedback data for the error.

**Module:**

DFHWMMT

**Destination**

Console
**DFHXG6442I** INTERNAL ERROR IN XRF MESSAGE MANAGER.

**Explanation**
Request chains maintained by the CICS message manager are in an inconsistent state.

**System action**
Surveillance by the XRF system ceases.

**User response**
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHWMQS

**Destination**
Console

**DFHXG6443I** INTERNAL ERROR IN XRF SURVEILLANCE COMPONENT.

**Explanation**
An invalid internal call has been made to a routine in XRF surveillance component.

**System action**
Surveillance by the XRF system ceases.

**User response**
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHWCCS

**Destination**
Console

**DFHXG6444I** VSAM REQUEST REJECTED FOR XRF MESSAGE DATA SET.

**Explanation**
A VSAM PUT or GET request directed to the XRF message data set has been rejected.

**System action**
Surveillance by the XRF system ceases.

**User response**
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHWMMT

**Destination**
Console

**DFHXG6445I** XRF MESSAGE DATA SET FORMATTING STARTED.

**Explanation**
The XRF message data set is new and must be formatted before it can be used to pass messages from the active to the alternate.

**System action**
Normal service continues.

**User response**
Depending on the size of the message data set, there will be some delay before the active can send messages to the alternate. It may be advisable to defer starting an alternate system until the corresponding message DFHXG6446 has been received.

**Module:** DFHWMMT

**Destination**
Console

**DFHXG6446I** XRF MESSAGE DATA SET FORMATTING COMPLETED.

**Explanation**
The XRF message data set has now been formatted. It can be used to pass messages from the active to the alternate.

**System action**
Normal service continues.
User response
None. See message DFHXG6445.

Module:
DFHWMMT

Destination
Console

**DFHXG6447I**  NON CRUCIAL XRF MESSAGE(S) DISCARDED.

Explanation
The XRF message data set is full. Some messages are being discarded in preference to invalidating the alternate system by overwriting messages that it has not yet read.

System action
Normal service continues.

User response
This situation is likely to arise in circumstances similar to those described for message DFHXA6541. The alternate has not yet become invalid but is likely to become so and corrective action is warranted. Refer to message DFHXA6541 for further guidance.

Module:
DFHWMWR

Destination
Console

**DFHXG6450I**  SVC GETMAIN FAILED IN XRF SURVEILLANCE.

Explanation
An SVC GETMAIN issued by the CICS surveillance component has failed. The GETMAIN may have been issued under either the CICS TCB or the XRF TCB.

System action
An MVS abend 0191 is issued.

User response
Since the GETMAIN requests storage above the 16MB line it is extremely unlikely that the request cannot be satisfied. A system error may have occurred. If this is the case, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHWLGET

Destination
Console

**DFHXG6452I**  INTERNAL ERROR IN XRF SURVEILLANCE.

Explanation
A consistency check made by the XRF LIFO storage manager has failed. The failure may have occurred while running under either the CICS TCB or the XRF TCB.

System action
An MVS abend 0192 is issued.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.
Module: DFHWLFRE

Destination
Console

DFHXG6453I INTERNAL ERROR IN XRF SURVEILLANCE.

Explanation
A consistency check made by the XRF process manager has failed. A process has made an invalid internal lock request.

System action
An MVS abend 0193 is issued.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHWDWAT

Destination
Console

DFHXG6454I PROGRAM CHECK IN XRF SURVEILLANCE. PSW = HEX'xx' 'xx'. ADDRESS OF EPIE COPY = HEX'xx'.

Explanation
A program check occurred from which the XRF process was unable to recover.

System action
An MVS abend 0194 is issued and a dump is produced.

User response
This is an error in the CICS system. The message gives the PSW at which the check occurred. Further information is preserved in the dump.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHWDSRP

Destination
Console

DFHXG6475 applid iii Backup simlogon(s) abandoned

Explanation
An XRF alternate is taking over, and is processing the last few session tracking requests.
CICS has issued a SIMLOGON for a standby session, but VTAM has not yet returned the logon request to CICS's VTAM logon exit.
Message DFHXG6480 has been issued twice, and CICS has now assumed that the logons will not appear.
Normal processing continues, though the state of the sessions currently pending backup SIMLOGON is unpredictable at the end of CICS initialization.
The reconnection process attempts to BIND these sessions normally.

System action
Normal takeover processing continues.

User response
The CSTL log and CICS trace should be collected.

Module: DFHZXST

Destination
Console

DFHXG6476I applid XRF catch-up abandoned - all XRF alternates signed off

Explanation
A run of the XRF catch-up transaction has been abandoned because there are no XRF alternates. A failing alternate may have issued some messages.

System action
Normal processing continues.
**User response**
None.

**Module:**
DFHZXCU

**XMEOUT parameters/Message inserts**

1. applid

**Destination**

Console

DFHXG6477I  applid Generic and Specific Ids have same value

**Explanation**

A CICS system has issued the command to re-assign the VTAM USERVAR representing the XRF complex so that from now on logon requests to the XRF complex are directed to this CICS. However, this system is an XRF primary, and the value of the specific ID is the same as the generic ID for the XRF complex.

**System action**

Normal processing continues.

**User response**

None. However special care must be taken when using the application ID. You must make it clear whether reference is being made to the CICS system or to the XRF complex.

**Module:**
DFHZXSTS

**XMEOUT parameters/Message inserts**

1. applid

2. nn

**Destination**

Console

DFHXG6480I  applid Waiting for backup simlogon processing to drain

**Explanation**

A CICS system has unsuccessfully issued a command to re-assign the VTAM USERVAR representing the XRF complex.

**System action**

This message is issued twice and then message DFHXG6475 is issued.
User response
If this message is repeated look for other evidence of failure in CICS or VTAM.

Module:
DFHZXQO

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHXG6481I applid Autoconnect delayed for hh hours, mm minutes, ss seconds.

Explanation
CICS has delayed running the reconnection transaction CXRE for an interval of hh hours, mm minutes, ss seconds, to either:
• acquire AUTOCONNECT terminals after a CICS startup, or
• reacquire terminal sessions after an XRF takeover.

The delay value, hh hours, mm minutes, ss seconds, is taken from the AUTCONN system initialization parameter. In the case of XRF takeover, a value calculated from the number of standby BINDs held at the time of takeover. This extra interval allows the switching of XRF-capable terminals before non-XRF sessions are reconnected by CXRE.

System action
Normal processing continues.

User response
None.

Module:
DFHSIJ1

XMEOUT parameters/Message inserts
1. applid
2. hh
3. mm
4. ss

Destination
Console

DFHXG6482 applid Unable to issue SETLOGON HOLD (reqcode,reg15,reg0)

Explanation
This message is issued if VTAM SETLOGON START fails during initialization or if in preparation for changing the routing of VTAM logons, this system (which is currently doing an XRF takeover) has attempted to request VTAM to stop passing any more logon requests to it. The attempt failed, and the details of the failure are given in the message, as follows. The first insert is one of the following.
• 'S'?The SETLOGON START request failed.
• 'H'?The SETLOGON HOLD request failed.

The second and third inserts are the values of registers 15 and 0, respectively, at the time of the failure.

See the z/OS Communications Server: SNA Programming manual for your release of VTAM for the interpretation of these values.

Valid logons reaching CICS before message DFHSI1517 is issued may be rejected.

System action
Normal processing continues.

User response
Note the message.

Module:

4. reg0

Destination
Console

DFHXG6483I applid This will be the last pass.

Explanation
The reconnection transaction CXRE is about to scan the VTAM terminals and sessions that were to be (re)connected for the last time. All those found are listed in message DFHXG6486.
System action
Processing continues

User response
If any of the VTAM terminals or sessions listed in message DFHXG6486 are crucial, then check whether they are successfully connected as a result of this pass.

Module: DFHZXRE

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHXG6484I applid Autoconnect processing now complete.

Explanation
The reconnection transaction CXRE has just scanned all the VTAM terminals and sessions, and all those that were to be (re)connected are now connected.

System action
Processing continues

User response
None.

Module: DFHZXRE

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHXG6485 applid termid may not be acquired after takeover

Explanation
The reconnection transaction, CXRE, is making its last run, but has discovered that terminal or session termid is still not bound in the same status that it was in during the previous failed run of CICS.

System action
Normal processing continues.

User response
None.

Module: DFHZXRE0

XMEOUT parameters/Message inserts
1. applid
2. termid

Destination
Console

See following message DFHXG6487 or DFHXG6488 for the reason.

System action
The reconnection process is not run.

User response
CEMT must be used to restore individual terminals to the desired state.

Module: DFHZOPA

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHXG6486I applid may not be acquired after takeover

Explanation
CICS initialization attempted to schedule the reconnection process, but was unable to do this as CICS rejected the DFHPC TYPE=LINK call.

Chapter 2. CICS messages 2199
**Explanation**

The reconnection transaction CXRE could not be scheduled or rescheduled, as the DFHIC TYPE=INITIATE or DFHPC TYPE=LINK was rejected with code X'code'. This is caused by a CICS logic error.

This message follows either:

- DFHXG6485 if CICS was unable to schedule CXRE, or
- DFHXG6489 if CICS was unable to reschedule CXRE.

**System action**

The action taken by CICS depends upon whether the error occurred during scheduling or rescheduling of CXRE.

Refer to the system action for either DFHXG6485 or DFHXG6489 for further details about the action taken by CICS.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

DFHSIJ1, DFHZOPA

**XMEOUT parameters/Message inserts**

3. modname

**Destination**

Console

**DFHXG6487 applid Unexpected IC/PC error code X'code'. Module modname**

This message follows DFHXG6489 or DFHXG6485

**System action**

The current run of the reconnection transaction is the last one. Message DFHXG6486 is issued for all terminals and sessions found.

**User response**

If non-XRF terminals are to be reconnected, correct the problem.

**Module:**

DFHSIJ1, DFHZOPA

**XMEOUT parameters/Message inserts**

1. applid
2. modname

**Destination**

Console

**DFHXG6488 applid Unable to schedule Autoconnection / Reconnection transaction CXRE. Module modname.**

**Explanation**

The reconnection transaction, CXRE, attempted to reschedule itself, but was unable to as CICS interval control rejected the DFHIC TYPE=INITIATE call.

This message is followed either by DFHXG6487 or DFHXG6488, which provides further information about the cause of the error.

**System action**

The current run of the reconnection transaction is the last one. Message DFHXG6486 is issued for all terminals and sessions found.

**User response**

See the following message. CEMT may be used to acquire individual terminals.

**Module:**

DFHSIJ1

**XMEOUT parameters/Message inserts**

1. applid
2. modname

**Explanation**

The reconnection transaction, CXRE, could not be rescheduled. This was because either the transaction code required no longer has an installed transaction definition, or the program required does not have an installed program definition.
Destination
Console
DFHXG6490I applid Reconnecting VTAM session
- pass number xxxx

Explanation
Control has recently been given to CICS after an XRF takeover. The reconnection transaction, CXRE, which attempts to start acquire processing for logical units that were in session in the failed active, has just started for the pass number xxxx.

System action
Normal processing continues.

User response
Note any error messages arising as CICS attempts to reconnect terminals and sessions.

Module: DFHZXRE0

XMEOUT parameters/Message inserts
1. applid
2. xxxx

Destination
Console
DFHXG6491 applid Logic error during session tracking. REASON rcode terminal/session event

Explanation
XRF session tracking encountered an unexpected circumstance probably due to a design error. The reason code (rcode) is one of the following.

1. POST called but no pending action for terminal or session.
   Inserts:
   • name of terminal or session.

2. DFHZXST called with bad request value.

3. XRF-capable session lacks a correlation id.
   Inserts:
   • name of terminal or session,
   • code for event being tracked.

The following are valid for DFHSUSX only.
• X’01’?Send sign on data
• X’02’?Send sign on data (catchup)
• X’03’?Receive sign on data

The following are valid for DFHZXST only.
• X’F1’?BIND
• X’F2’?Free LOGON data
• X’F3’?UNBIND

4. Could not get key to build tracking message.
   Inserts:
   • name of terminal or session
   • code for event being tracked (see 3 above)

5. Could not get send tracking message.
   Inserts:
   • name of terminal or session
   • code for event being tracked (see 3 above)

6. Could not find session named in tracking message.
   Inserts:
   • name of terminal or session
   • code for event being tracked (see 3 above)

7. Illegal entry named in tracking message.
   Inserts:
   • name of terminal or session
   • code for event being tracked (see 3 above)

8. Bad request code in tracking message.
   Inserts:
   • name of terminal or session
   • bad request code (see 3 above for valid DFHZXST codes)

9. Correlator in tracking message is longer than 8.
   Insert:
   • name of terminal or session
Unable to schedule standby BIND.

Insert:
- name of terminal or session.

System action
Normal processing continues.

User response
Note the message. Resources and states may be incorrect should the backup take over. If many of these messages are issued, then it is likely that there is a more general problem.

Module:
DFHSUSX, DFHZXST

XMEOUT parameters/Message inserts
1. applid
2. rcode
3. terminal/session
4. event

Destination
Console

Explanation
The XRF catch-up program encountered an unexpected circumstance probably due to a CICS design error. The reason, indicated by the first insert, is one of the following:

1. Catalog record internal length value not correct.
2. Catalog record format error. There is no room for a key.
3. Catalog record format error. The key is longer than 16.
4. Catalog record too long for buffer (variable CUBUFFER). The second insert gives the required length.

Unexpected ABEND or response from EXEC CICS command.

Catalog record format error. There is no resource manager prefix.

System action
In cases 1, 2, 3, and 6 above, normal processing continues.

In case 4, DFHZXCU abends with abend code AZXB. In case 5, DFHZXCU abends with abend code AZXA.

User response
Note the message. Resources and states may be incorrect should the alternate take over. If many of these messages are issued, it is likely that there is a more general problem.

Module:
DFHZXCU

XMEOUT parameters/Message inserts
1. applid
2. reason
3. length

Explanation
The XRF catch-up program obtained a bad return code from the XRF message manager and was unable to send a record that the alternate would require to obtain a correct copy of the active. The inserts (internal diagnostic information) are:

1. WMSRETC
DFHWMS return code. (For values and meanings of the return codes, refer to the XRF CICS manager request interface block (WMPS) listing in the CICS Data Areas.)

2. WMSREASNO
DFHWMS reason code. (For values and meanings of the reason codes, please refer to the XRF CICS
manager request interface block (WMSPS) listing in the CICS Data Areas.

3. XTR-KEY-VALUE is the key of the tracking record.
4. XTR-ID is the record ID, where
   - zero = tracking, and
   - non-zero = catch-up.
5. XTR-TYPE is the record type (see DFHZXTR), where
   - X = tracking control,
   - C = TCT contents,
   - S = ZCP session tracking, and
   - U = sign on data

The message is issued from module `modname`.

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHXG6518A applid APPARENT FAILURE OF ACTIVE CICS DETECTED. REPLY TAKEOVER OR IGNORE

Explanation
This is an action message issued from the CICS TCB. It is issued when the current value of the active CICS appears to have failed.

System action
If the reply is 'TAKEOVER', CICS requests the CAVM to initiate takeover.
If the reply is 'IGNORE', CICS assumes one of the following:
• The active CICS system recovers from the apparent failure.
• The active CICS system is restarted.
• The CEBT PERFORM TAKEOVER command is used to initiate takeover.
Subsequent events may mean that the user need not reply to message DFHXG6518A. Examples of this are:

- If CICS is notified that the active CICS system has recovered from the apparent failure reported by message DFHXG6516, messages DFHXG6517 and DFHXG6519 are sent to the console.
- If CICS is notified that the active CICS system has signed off abnormally from the CAVM, messages DFHXG6511 and DFHXG6519 are sent to the console.
- If takeover is initiated (from the alternate CICS system) at the same time as the active CICS recovers from the apparent failure reported by message DFHXG6516, messages DFHXG6513 and DFHXG6539 are sent to the console.

**User response**

Determine the reason for the apparent failure of the active CICS. If possible, resolve the failure and make the appropriate reply.

**Module:** DFHXRSP

Console

DFHXG6680I applid TIME-OF-DAY CLOCK DIFFERENCE IS AT LEAST sss SECONDS.

**Explanation**
This is an informational message issued from the CICS TCB. Active CICS and alternate CICS systems are executing on different CECs, and the time-of-day clock on the alternate CEC is earlier than that on the active CEC. If takeover occurs then some CICS processing will have to be delayed until the time-of-day clock on
the alternate CEC is later than that on the active CEC. The CAVM has estimated the lower bound to the clock difference and this is at least 15 seconds; the message contains the estimated difference. Note that the lower bound may change as more surveillance signals are processed by the CAVM. This may be the case within the first 3 to 5 surveillance signals of the active CICS starting. An elapsed time of some 10 seconds. This message is repeated as necessary.

**System action**
CICS processing continues.

**User response**
Ensure that the time-of-day clocks are synchronized as closely as possible. Note that takeover times may be increased if the difference in values is significant.

**Module:** DFHXRSP

**Destination**
Console

**DFHXG6681I applid TIME-OF-DAY CLOCK DIFFERENCE IS AT MOST sss SECONDS.**

**Explanation**
This is an informational message issued from the CICS TCB. Active CICS and alternate CICS systems are executing on different CECs, and the time-of-day clock on the alternate CEC is earlier than that on the active CEC. If takeover occurs then some CICS processing will have to be delayed until the time-of-day clock on the alternate CEC is later than that on the active CEC. The CAVM has estimated the upper bound to the clock difference and this is at least 15 seconds; the message contains the estimated difference. Note that the upper bound may change as more surveillance signals are processed by the CAVM; message DFHXG6681 will be repeated as necessary.

**System action**
CICS processing continues.

**User response**
Ensure that the time-of-day clocks are synchronized as closely as possible. Note that takeover times may be increased if the difference in values is significant.

**Module:** DFHXRSP

**Destination**
Console

**DFHXG6682I applid XRF clock synchronization started**

**Explanation**
This is an informational message issued from the CICS TCB. The time-of-day clock on the alternate CEC is earlier than that on the active CEC; time dependent processing must be suspended. Such processing is delayed until the time-of-day clock value on the alternate is later than that on the active CEC when the active job terminated.

**System action**
Some CICS initialization continues.

**User response**
Ensure that the time-of-day clocks are synchronized as closely as is possible. Note that takeover times may be increased if the difference in values is significant.

**Module:** DFHXRA

**Destination**
Console

**DFHXG6683I applid XRF clock synchronization ended**

**Explanation**
This is an informational message issued from the CICS TCB. The time-of-day clock on the alternate CEC is now later than that on the active CEC; time dependent processing can be resumed.

**System action**
CICS initialization continues.

**User response**
None.

**Module:** DFHXRA
XMEOUT parameters/Message inserts

1. applid

DFHXMnunn messages

DFHXM0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation

An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEB is a CICS abend code; 1310 refers to message DFHTS1310).

System action

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. In some circumstances CICS is terminated directly if the error occurred in a crucial XM domain module.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual for further guidance.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Chapter 2. CICS messages 2211
CICS may not have been terminated. If the message occurs once and module `modname` is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module `modname`, you should bring CICS down in a controlled shutdown.

If severe error code is X'1112', there are no free transaction numbers to allocate to new transactions as all available transaction numbers are in use. If you are using transaction classes to limit the number of CICS tasks within your system, you should specify a transaction class purge threshold (PURGETHRESH) for any transaction class bearing a heavy transaction load. See the Defining resources and the Improving performance for more information.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**XMEOUT parameters/Message inserts**

1. applid
2. X'code'
3. modname

**Destination**

Console

DFHXM0004 `applid` A possible loop has been detected at offset `X'offset'` in module `modname`.

**Explanation**

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module `modname` at offset `X'offset'`. This is the offset of the instruction which happened to be executing at the time when the error was detected.

**System action**

An exception entry is made in the trace table.

A system dump is taken unless you have specifically suppressed the dump (by a user exit program at the XDUREQ exit, in the dump table or by global system dump suppression). CICS processing continues unless you have specified in the dump table that CICS should terminate.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of CPU time, this message may have been caused by a long-running function. So there may not be an error. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that execution of module `modname` is terminated and CICS continues.

If you have specified ICVR=0 in the SIT and you consider that module `modname` has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module `modname`, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online using the CEMT transaction.

If raising the ICVR time does not solve the problem, you may need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

CSKL

**DFHXM0110**

*date time applid* Transaction definition transid1 has been installed with the same REMOTENAME and REMOTESYSTEM as existing definition transid2.

**Explanation**

Transaction definition transid1 has been installed with the same REMOTENAME and REMOTESYSTEM as transaction definition transid2.

If this CICS system routes a transaction to the CICS system named as the REMOTESYSTEM of both the definitions and that transaction issues an EXEC CICS START request for the transaction-id named as the REMOTENAME of transid1 and transid2, CICS can either attach transid1 or transid2 on the local system to satisfy the START request.

**System action**

The install of transaction definition transid1 continues normally.

If an EXEC CICS START request is issued on a remote system as described in the message explanation, CICS attaches transid1 and not transid2 on the local system.

CICS does not always resolve this ambiguity in the same way after a warm or emergency restart, however.

**User response**

This situation usually causes no problems because the correct transaction is attached in the remote system. However, the correct transaction in the local system may not have been attached and this can manifest itself in the following ways:

- Inconsistent statistics being accumulated in the local system.

- The incorrect TRPROF being used when routing the START request back over to the remote system.

- CEMT INQUIRE TASK showing the wrong set of transactions running in the local system.

Although these are not necessarily problems, you may want to check the definitions of the remote transactions in this system in case they have been defined incorrectly.

If remote START requests are issued as described, and it does matter which transaction CICS attaches in the local system, you should modify and reinstall the transaction definition that should not be attached. This removes any ambiguity.

5. transid2

**Destination**

CSMT

**DFHXM0111**

*date time applid* Catalog failure while processing {INSTALL / SET / DISCARD} request for transaction definition transid.

**Explanation**

An error has occurred while altering the catalog during the processing of an install, set, or discard request for transaction definition transid.

**System action**

The request continues as normal.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the image of transaction definition transid and the following problems may occur only on a warm or emergency restart.
INSTALL
If it is a reinstall, the old version of the transaction definition is recovered. If it is an install, the transaction definition is not recovered.

SET
The change requested by the SET is not recovered. Instead the transaction definition is recovered to the state prior to the SET request being issued.

DISCARD
The transaction definition is recovered on the restart even though it is currently discarded.

User response
No immediate action is required. Consider performing a cold or initial start the next time CICS is restarted to remedy the problem. If a cold or initial start is not appropriate and the problem is only localized to transaction definition transid, remedy the effects outlined for each case previously.

For example,

INSTALL
Reinstall the tranclass definition after the restart.

SET
Reissue the SET command after CICS has been restarted.

DISCARD
Reissue the DISCARD command after CICS has been restarted.

If the catalog problem persists after the restart, you need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHXM0115 date time applid The install of transaction definition transid1 has removed TPNAME tpname of transid2.

Explanation
Transaction definition transid1 has been installed with a TPNAME of tpname. However, TPNAME tpname currently invokes transaction definition transid2.

System action
The install of transid1 continues as normal.
The TPNAME tpname now invokes transaction definition transid1 and not transid2 as previously.

User response
If removal of transaction definition transid2's TPNAME was expected, no action is required. However, transaction definition transid2 should be modified on the CSD so that it no longer specifies the TPNAME.

If the TPNAME has been removed in error, reinstall transaction definition transid2 to reinstate its TPNAME. Transaction definition transid1 should be modified on the CSD so that it no longer specifies the TPNAME.

DFHXMO116

Parameter missing from transaction definition transid.
PROGRAM is required because REMOTESYSTEM is the same as the local system.

Explanation
Transaction definition transid has been installed without a PROGRAM parameter. Since it has been defined with a REMOTESYSTEM equal to the local system, a program is required if the transaction is executed on this system.

System action
The install of transid continues as normal. Any attempt to run the transaction transid will fail because there is no program to link to.

User response
This message is issued for information only. There is no problem if transaction transid is not executed on this system. If it is to be executed, the definition of transid needs to be modified and then reinstalled.

If the transaction is not executed, you may wish to investigate why the transaction definition has been installed. It could be that the transaction is defined in an RDO group that is shared between a number of different CICS systems. For example transid may be TTT1 in the following pair of definitions used to implement transaction routing to this local system CICB.

<table>
<thead>
<tr>
<th>Transaction Program</th>
<th>Remotesystem</th>
<th>Remotename</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTT1</td>
<td>CICB</td>
<td>TTT1</td>
</tr>
<tr>
<td>TTT2</td>
<td>-</td>
<td>PROGA</td>
</tr>
</tbody>
</table>

In this example, a single definition would suffice if the transaction was made to have the same name on this system.

DFHXM0211  

date time applid Catalog failure 
while processing {INSTALL | SET | 
DISCARD} request for TRANCCLASS 
definition tranclassname.

Explanation
An error has occurred while altering the catalog during the processing of an install, set, or discard request for tranclass definition tranclassname.

System action
The request continues normally.

Depending upon the error that has occurred with the catalog, there may be severe problems if a warm or emergency restart of CICS is attempted. The catalog
domain will have issued a message outlining the problem in this case.

Alternatively the problem may only be local to the catalog record containing the image of tranclass definition `tranclassname` and the following problems may occur only on a warm or emergency restart.

**INSTALL**

If it is a reinstall, the old version of the tranclass definition is recovered. If it is an install, the tranclass definition was not recovered.

**SET**

The change requested by the SET is not recovered. Instead the tranclass definition is recovered to the state it was in before the SET request was issued.

**DISCARD**

The tranclass definition is recovered on the restart even though it is currently discarded.

**User response**

No immediate action is required. To fully resolve the problem, consider performing a cold or initial start the next time CICS is restarted. If a cold or initial start is not appropriate and the problem is only localized, to tranclass definition `tranclassname`, you can resolve each of the symptoms separately.

For example:

**INSTALL**

Reinstall the tranclass definition after CICS has been restarted.

**SET**

Reissue the SET command after CICS has been restarted.

**DISCARD**

Reissue the DISCARD command after CICS has been restarted.

If the catalog problem persists after the restart, you may need further assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

CSMT and Console

**DFHXM0212** `applid` Transaction `transid` has been attached with unknown `TRANCLASS tranclassname`.

**Explanation**

Transaction `transid` has just been attached. It is defined as belonging to tranclass `tranclassname` but `tranclassname` does not exist.

This message is only issued the first time transaction `transid` is attached with the unknown tranclass.

**System action**

The attach of transaction `transid` proceeds as normal but without being subject to any tranclass scheduling constraints.

**User response**

If transaction `transid` should belong to tranclass `tranclassname`, install that tranclass. If not, modify the transaction definition for `transid` as appropriate, and reinstall.

The CEDA CHECK command can be used to ensure that each of the tranclasses referenced by transaction definitions are defined within the same startup GRPLIST.

**Note:**

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

**Destination**

Console
DFHXM0213 applid Insufficient storage for system attach of transaction transid.

Explanation

There is insufficient storage for a new task to be created for the attach of transaction transid.

Since the majority of the storage required for the new task is obtained from DSA storage, CICS is probably short on storage in one of the DSAs.

System action

The attach request is queued. It is retried later when more storage should have become available. If the retried attach fails, it is queued and retried repeatedly until it succeeds.

User response

If CICS is short on storage, message DFHSM0133 is also issued. Refer to that message for advice on how to resolve the condition.

If message DFHSM0133 has not been issued, the problem has been caused by insufficient MVS storage. In this case consider lowering the EDSALIM of the system to increase the amount of available MVS storage.

Note:

Because of the circumstances under which this message is issued, it can only be issued to the console. It should not be rerouted to a transient data queue.

Console

DFHXM0302 applid An abend abcode occurred in the user-replaceable transaction restart program (DFHREST) under task number tasknum. Transaction restart is not performed for transaction TRANID.

Explanation

A restartable transaction abended and the transaction manager attempted to link to the user-replaceable transaction restart program (DFHREST) but the link has failed. Likely reasons are:

- DFHREST is not defined (and not autoinstalled)
- DFHREST is not present in any library specified in the DFHRPL concatenation.
- DFHREST has been linked with AMODE(24).

System action

The transaction is not restarted.

User response

If the problem is not rectified, a message is issued each time the link to DFHREST fails. To avoid this, ensure that DFHREST is properly defined and present in a library specified in the DFHRPL concatenation.

See the Developing system programs for CICS for more information about user-replaceable programs.

DFHXMTA.

**XMEOUT parameters/Message inserts**

1. applid
2. X'code'
A severe error (code X'code') has occurred while initializing task number tasknum with transaction identifier tranid. The task is suspended indefinitely.

Explanation
An internal error has prevented the initialization of task number tasknum with identifier tranid. The task cannot run and cannot be abended. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on this message.

System action
The task is suspended indefinitely. First failure diagnostics should be produced by the component which first detects the error. The transaction manager also takes a dump. Message DFHME0116, which contains the symptom string for this problem, is produced.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User response
You must cancel CICS if you need to destroy the task. You cannot quiesce CICS since this task will not terminate. You cannot purge or force purge the task.

Note the error code X'code'. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHXMTA.

A severe error (code X'code') has occurred while terminating task number tasknum with transaction identifier tranid. The task has not been released. The task is suspended indefinitely.

Explanation
An internal error has prevented the termination of task number tasknum with identifier tranid. It is not possible to abend the task or send a message to its terminal principal facility. Rather than terminate CICS, the transaction manager keeps CICS running and preserves its integrity by suspending the task.

The suspended task will hold its MXT slot until CICS is terminated.

Note that the task may hold resources (for example, locks and enqueues) so you should cancel CICS at your earliest convenience. Otherwise you may risk other tasks being prevented from running because they also need access to the same resources. You may wish to add a dump table entry to always terminate CICS on this message.

System action
The task is suspended indefinitely. First failure diagnostics should be produced by the component which detected the error. The transaction manager also takes a dump. Message DFHME0116, which contains the symptom string for this problem, is produced.

The terminal principal facility of the task is unusable until CICS is canceled.

The task is suspended with a resource type of FOREVER and a resource name of DFHXMTA.

User response
You must cancel CICS if you need to free up the terminal associated with the task. You cannot quiesce
CICS since this task will not terminate. You cannot purge or force purge the task.

Note the error code X'code'. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHXM0501 applid CICS cannot satisfy request for MXT. Value mxtvalue has been used instead.

Explanation
The value entered for MXT cannot be handled by the system. mxtvalue is the largest value for which CICS has been able to acquire task storage.

The majority of the task storage required is now acquired from CICS DSAs.

System action
The system continues to run with a MXT value of mxtvalue.

User response
Check that the original value entered for MXT was correctly typed. If the value is mistyped, use CEMT to amend the MXT value (you are unlikely to be able to force the value higher). Remember that MXT now only includes user tasks and so it should not need to be set to a value as high as in previous releases.

If the value mxtvalue is acceptable, no action is necessary.

If the value mxtvalue is too small, check to see which programs, apart from CICS, are running in this region. To relieve the storage constraint, either increase the DSALIM or EDSALIM of the system to give CICS more storage for its own use. For further details about storage allocation at initialization, see the Installing CICS TS.

DFHXM0603 I date time applid numICEs scheduled tasks for Bundle installed TRANSACTION trandef have been cancelled.

Explanation
Bundle installed TRANSACTION trandef is being disabled. As part of this process, all scheduled work for the transaction is cancelled.

System action
The Interval Control Elements associated with the Transaction are cancelled.
**User response**
If this behaviour is undesirable, consider redeploying the Transaction into a separate Bundle.

**DFHXM0606**

*date time applid BUNDLE resource bundlename has {associated | disassociated} an application entry point for operation operationname with TRANSACTION trandef.*

Chapter 2. CICS messages 2229
Explanation
The CICS BUNDLE resource `bundlename` has successfully associated or disassociated an application entry point with the TRANSACTION `trandef`.

Only one application entry point can be associated with a TRANSACTION resource at any time. To associate or disassociate an application entry point with the TRANSACTION resource you must enable or disable the CICS bundle, respectively.

System action
CICS continues normally.

User response
After associating an application entry point with the TRANSACTION resource make the bundle available to allow the application operation to be set with the TRANSACTION resource or disable the bundle to remove the association of the application entry point with the TRANSACTION resource.

Module:
DFHXMRL

XMEOUT parameters/Message inserts
1. `date`
2. `time`
3. `applid`
4. `bundlename`
5. Value chosen from the following options:

6. `operationname`
7. `trandef`

Destination
CSMT

DFHXM0607 `date time applid BUNDLE resource bundlename unable to enable TRANSACTION trandef as an entry point for operation operationname because {the TRANSACTION does not exist. / an internal error occurred. / the TRANSACTION resource name is invalid. / the TRANSACTION resource is already defined as an application entry point.}`

Explanation
The CICS BUNDLE resource `bundlename` has failed to enable TRANSACTION `trandef` as an entry point for operation `operationname`. The reason for the error is also given.

System action
The BUNDLE resource is disabled.

User response
Investigate and correct the cause of the failure. If updates are needed to the `<modify>` statement in the bundle manifest file then discard and reinstall the BUNDLE.

Module:
DFHXMRL

XMEOUT parameters/Message inserts

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHXO6700</td>
<td>OPTION STARTING xxx HAS ILLEGAL SYNTAX.</td>
</tr>
</tbody>
</table>

**Explanation**
The option xxx has illegal syntax.

**System action**
The overseer program is abnormally terminated after completion of parameter analysis.

**User response**
Correct the error and resubmit the overseer program.

Module:
DFHWOSA

**Destination**
Console

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHXO6702</td>
<td>JOB STEP IS NOT APF-AUTHORIZED.</td>
</tr>
</tbody>
</table>

**Explanation**
Part of CICS initialization must be done in an APF-authorized state. The kernel has detected that DFHSIP is not APF-authorized.

**System action**
The overseer program is abnormally terminated.

**User response**
Ensure that the job step is APF-authorized. All libraries concatenated in the STEPLIB concatenation should be APF-authorized, and DFHSIP should be link-edited with an authorization code of 1.

Module:
DFHWOSA

**Destination**
Console

Correct the error.

Module: DFHWOSB

**Destination**
Console

**DFHXO6721**  
**THE CICS XRF OVERSEER HAS BEEN UNABLE TO GET STORAGE FOR A SUBSYSTEM INTERFACE REQUEST.**

**Explanation**
The XRF overseer application program has issued a DFHWOSM FUNC=JJC, JJS or QJJS macro. The MVS subsystem interface request issued by the overseer services program while processing this request has failed. The response indicates that the reply area is too small. The MVS GETMAIN request to obtain a larger area is not satisfied.

**System action**
The subsystem options block (SSOB), indicating 'status array too small' (SSOBRETN=SSCSMALL), is returned to the caller in the 256 byte SSOB return area specified in the DFHWOSM macro.

**User response**
Since the areas involved are small, the condition should not normally occur. If it persists, or disrupts the effectiveness of your overseer application, you may need to cancel the overseer job with a dump to investigate the reason for the shortage of storage.

Module: DFHWOSB

Console

**DFHXQ0101I**  
**Shared TS queue server initialization is in progress.**

**Explanation**
The queue server program has started execution.
**System action**
Initialization continues.

**User response**
None.

**Module:** DFHXQMN

**Destination**
Console and SYSPRINT

**DFHXQ0102I**  Shared TS queue server for pool *poolname* is now active.

**Explanation**
The queue server for the named pool has completed initialization and is now ready to accept connections.

**System action**
The server waits for connection requests or operator commands.

**User response**
None.

**Module:** DFHXQMN

**Destination**
Console and SYSPRINT

**DFHXQ0103**  The pool name parameter is missing.

**Explanation**
The shared TS queue server program needs to know the name of the queue pool in order to complete initialization but no pool name was specified in the SYSIN or PARM field parameters.

**System action**
The queue server is terminated.

**User response**
Ensure that the parameter POOLNAME= name is specified either in the SYSIN parameters or in the PARM field of the JCL for the queue server.

**Module:** DFHXQVL

**Destination**
Console and SYSPRINT

**DFHXQ0104**  Shared TS queue server initialization failed because program DFHXQMN is not APF authorized.

**Explanation**
The queue server main program DFHXQMN cannot complete initialization because it is not running with APF authorization.

**System action**
The queue server is terminated.

**User response**
Ensure that the queue server program DFHXQMN is loaded from an APF authorized library and has been linkedited with the option AC(1).

**Module:** DFHXQMN

**Destination**
Console and SYSPRINT

**DFHXQ0105**  Shared TS queue server initialization failed because program DFHXQMN is not licensed for use.

**Explanation**
The queue server main program DFHXQMN cannot complete initialization because the validate license check failed.

**System action**
The queue server is terminated.

**User response**
Ensure that the queue server program DFHXQMN is licensed for use by adding the required licensing dataset to the STEPLIB DD statement.

**Module:** DFHXQVL

**Destination**
Console and SYSPRINT
DFHXQ0111I  Shared TS queue server for pool poolname is terminating.

Explanation
The queue server has started termination processing, so no further requests will be processed.

System action
Termination continues.

User response
None.

Module: DFHXQMN

Destination
Console and SYSPRINT

DFHXQ0112I  Shared TS queue server has terminated, return code retcode, reason code rsncode.

Explanation
The queue server has completed termination processing. If the termination was caused by an error, the return code will be non-zero and the reason code will normally be the number of a previous DFHXQnnnn message giving the reason for termination.

System action
The queue server program returns control (via the AXM termination routines) to MVS for job step termination.

User response
None.

Module: DFHXQMN

Destination
Console and SYSPRINT

DFHXQ0113  Shared TS queue server completion code is cmpcode, reason code rsncode.

Explanation
The queue server has terminated after intercepting an abnormal termination (ABEND) request. If the completion code is a system completion code, it is shown as three hexadecimal digits, otherwise it is shown as four decimal digits for a user completion code.

System action
The queue server program returns control (via the AXM termination routines) to MVS for job step termination.

User response
None.

Module: DFHXQMN

Destination
Console and SYSPRINT

DFHXQ0121I  Automatic restart support is not available because &SYSCLONE may not be unique within the sysplex.

Explanation
The server attempted to generate a default ARM element identifier to use for automatic restart registration, using the one or two character &SYSCLONE value to identify the MVS system. Normally, MVS verifies during start-up that &SYSCLONE is unique within the sysplex. However, the server is running on a level of MVS where this check is optional and has not been performed, so the server is unable to generate a unique element identifier.

System action
The server is terminated.

User response
Servers should not normally be run on a level of MVS which does not enforce unique &SYSCLONE values. However, the problem can be bypassed by specifying an ARM element name explicitly on the server ARMELEMENT parameter.

Module: DFHXQRS

Destination
Console and SYSPRINT

DFHXQ0122I  IXCARM REQUEST=reqtype failed, return code retcode, reason code rsncode.
Explanation
A request to the MVS automatic restart manager (ARM) gave an unexpected return code. The return code and reason code are shown in hexadecimal notation.

System action
The server is terminated.

User response
See the IXCARM macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHXQRS

Destination
Console and SYSPRINT

DFHXQ0123 IXCARM REQUEST= reqtype failed, return code retcode, reason code rsncode.

Explanation
Automatic restart support is not available. The MVS automatic restart manager (ARM) gave a return code and reason code which indicates that ARM services are not available, but the reason could possibly be intentional or unavoidable, so the server is being allowed to continue execution without automatic restart support. The return code and reason code are shown in hexadecimal notation.

System action
The server continues initialisation without automatic restart support.

User response
None.

Module:
DFHXQPR

Destination
SYSPRINT

DFHXQ0201I Processing type parameters

Explanation
The queue server parameter processing routine is interpreting the specified parameter string. The first word gives the type of parameter (SYSIN/PARM/SET/DISPLAY/PRINT) and the rest is the specified parameters optionally followed by descriptive comment text after one or more spaces. If the parameters start with an asterisk or a space, the whole line is taken as descriptive comments.

System action
Any specified parameters will be processed.

User response
None.

Module:
DFHXQPR

Destination
Console and SYSPRINT

DFHXQ0202 Unknown parameter keyword: keyword

Explanation
This parameter keyword did not match any of the defined parameter keywords for the queue server.

System action
Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response
Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHXQPR

Destination
Console and SYSPRINT

DFHXQ0203 Value value for parameter keyword is incorrect. It must be a name of up to maxlength characters.
**Explanation**
The value of this parameter should have been specified as a name containing not more than the indicated number of characters.

**System action**
Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**
Correct the parameter keyword (or remove the incorrect parameter) and reenter the command or restart the server.

**Module:** DFHXQPR

**Destination**
Console and SYSPRINT

**DFHXQ0204** Value value for parameter keyword is incorrect. It must be a decimal number.

**Explanation**
The value of this queue server parameter should have been specified as a decimal number but was not in a valid format. (Numeric parameters can optionally be followed by the letter K, M, G or T to denote the appropriate powers of 1024).

**System action**
Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**
Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

**Module:** DFHXQPR

**Destination**
Console and SYSPRINT

**DFHXQ0205** Value value for parameter keyword is greater than the maximum allowed value maximum.

**Explanation**
The value of this queue server parameter exceeded the maximum allowed value maximum. This message also occurs if the numeric part of a decimal value exceeds the maximum unsigned 32-bit integer (4294967295) even if a larger value is allowed to be specified by using a suffix "K", "M", "G" or "T".

**System action**
Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**
Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

**Module:** DFHXQPR

**Destination**
Console and SYSPRINT

**DFHXQ0206** Value value for parameter keyword is less than the minimum allowed value minimum.

**Explanation**
The value of this queue server parameter was less than the minimum allowed value minimum.

**System action**
Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**
Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

**Module:** DFHXQPR

**Destination**
Console and SYSPRINT
**Destination**

Console and SYSPRINT

DFHXQ0207  Value value for parameter keyword is incorrect. It should be a time hh:mm:ss or hh:mm or a number of seconds.

**Explanation**

The value of this queue server parameter did not conform to the correct syntax for a time interval.

**System action**

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**

Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

**Module:**

DFHXQPR

**Destination**

Console and SYSPRINT

DFHXQ0208  Parameter keyword keyword is not supported for command.

**Explanation**

A queue server parameter keyword was specified in a context where it is not valid, usually indicating an attempt to SET dynamically a parameter which can only be specified at initialization time.

**System action**

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**

Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

**Module:**

DFHXQPR

**Destination**

Console and SYSPRINT

DFHXQ0209  Parameter text contains invalid character: text

**Explanation**

The queue server parameter processing routine found some unexpected text when attempting to process parameters.

**System action**

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**

Correct the parameters (or remove the incorrect parameter) and reenter the command or restart the server.

**Module:**

DFHXQPR

**Destination**

Console and SYSPRINT

DFHXQ0210  Parameter keyword keyword should not have a value for command.

**Explanation**

A queue server parameter keyword was specified in the form keyword=value in a context where it was not expected, for example on a DISPLAY command.

**System action**

Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

**User response**

Reenter the command without specifying a value for the parameter to be displayed.

**Module:**

DFHXQPR
DFHXQPR

Destination
Console and SYSPRINT

DFHXQ0211I Parameter value: keyword=value

Explanation
This message is issued to show the current value of a queue server parameter setting in response to a DISPLAY or PRINT command.

System action
Processing continues normally.

User response
None.

Module:
DFHXQPR

Destination
Console and SYSPRINT

DFHXQ0212 Value value for parameter keyword is incorrect. It must be one of validlist.

Explanation
The value of this queue server parameter was not recognized. It should have been specified as one of the indicated list of values.

System action
Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response
Reenter the parameter specification in the correct form keyword=value.

Module:
DFHXQPR

Destination
Console and SYSPRINT

DFHXQ0301I Console operator consname issued command: command

Explanation
A queue server operator command has been issued via the MVS MODIFY or STOP command. This message identifies the console name (or TSO userid) from which the command was issued and the text of the command.

System action
Processing continues.

User response
None.

Module:
DFHXQOP

Destination
SYSPRINT

DFHXQ0213 Value for parameter keyword is missing. The correct form is keyword=value.

Explanation
A parameter keyword was specified without an associated parameter value on a queue server SET command or in a SYSIN or PARM parameter string. Note that the only character which should appear between the parameter keyword and its intended value is the equals sign, without any extra spaces.

System action
Processing of the current line of parameters is terminated. For an initialization parameter specified in SYSIN or the PARM field, a return code is set which will cause the server to terminate when initialization parameter processing is complete.

User response
Correct the parameter value (or remove the incorrect parameter) and reenter the command or restart the server.

Module:
DFHXQPR
DFHXQ0302I command command ignored because no valid parameters were given.

Explanation
A queue server command was issued which had no valid parameters on it but was otherwise syntactically valid. The command has had no effect.

System action
Processing continues normally.

User response
Ensure that the command was entered correctly.

Module: DFHXQOP

Destination
Console and SYSPRINT

DFHXQ0303I command command has been processed.

Explanation
A queue server command has been processed successfully.

System action
Processing continues.

User response
None.

Module: DFHXQOP

Destination
Console and SYSPRINT

DFHXQ0304I STOP command is waiting for connections to be closed. Number of active connections = connections.

Explanation
A queue server STOP command has been issued (either via an MVS STOP command or via an MVS MODIFY command with the text STOP) but there are still active connections to the server, so the STOP command has not yet taken effect.

System action
The server rejects any further attempts to establish new connections, but continues processing requests for existing connections. Each time a connection is terminated, this message is repeated for as long as there are more active connections.

User response
Further information about the connections which are still active can be obtained using the command DISPLAY CONNECTIONS.

If the server needs to be shut down without waiting for connections to be closed, issue the queue server CANCEL command. Note that this immediately terminates any active connections, causing any further requests for that server to be given a SYSIDERR indication. (The MVS CANCEL command can also be used, but should preferably be avoided because it prevents the server from producing its normal closedown statistics and reports).

Note that if a CICS region is abnormally terminated while server connect or disconnect processing is in progress, or is terminated without going through end of task processing (for example using the FORCE command) there is a slight chance that the server will not be notified that the connection has been terminated. In this case the server is not able to be closed down with the server STOP command, but only with the server CANCEL command.

Module: DFHXQOP

Destination
Console and SYSPRINT

DFHXQ0305I STOP command has been processed.

Explanation
Processing of a queue server STOP command has now been successfully completed. This means that there are no longer any active connections and the server is ready to close down.

System action
The queue server starts termination processing.

User response
None.

Module:
DFHXQ0306 Shared TS queue server does not support this command: command

Explanation
An operator command was addressed to the queue server using the MVS MODIFY command, but the first word of the MODIFY text is not a recognized queue server command (SET, DISPLAY, PRINT, STOP or CANCEL).

System action
The command is ignored.

User response
Correct and reenter the command.

Module:
DFHXQOP

Destination Console and SYSPRINT

DFHXQ0307I CANCEL parm command has been processed. Number of active connections = connections.

Explanation
A queue server CANCEL command has been issued, either from an operator console or internally by the queue server in response to a severe error. This message includes any restart parameter specified on the command and the number of active connections which may be affected by this command.

System action
The queue server terminates immediately, without waiting to close connections.

User response
None.

Module:
DFHXQOP

Destination Console and SYSPRINT

DFHXQ0310 Parameter parm on STOP command is incorrect. No parameters should be specified.

Explanation
A queue server STOP command was issued with parameters, but the STOP command does not support any parameters.

System action
The command is ignored.

User response
Correct and reenter the command.

Module:
DFHXQOP

Destination Console and SYSPRINT

DFHXQ0351I Connection: Job jobname Appl applid Idle idletime

Explanation
This describes a single connection in response to the command DISPLAY CONNECTIONS or PRINT CONNECTIONS. The information shows the job name, the specific APPLID and the time in hours, minutes
and seconds since the most recent queue request or inquire call was issued using the connection.

**System action**
This message is issued for each active connection then message DFHXQ0352I is issued to show the total number of active connections.

**User response**
None.

**Module:**
DFHXQCN

**Destination**
Console and SYSPRINT

**Explanation**
This describes the total number of active connections to the queue pool server, in response to the server command DISPLAY CONNECTIONS or PRINT CONNECTIONS.

**System action**
Processing continues.

**User response**
None.

**Module:**
DFHXQCF

**Destination**
Console and SYSPRINT

**Explanation**
The list structure did not previously exist and was allocated as part of the connection process.

**User response**
None.

**Module:**
DFHXQCF

**Destination**
Console and SYSPRINT

**Explanation**
The IXLCONN macro to connect the queue server to its coupling facility list structure failed.

**User response**
See the IXLCONN macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code. If the reason code is of the form xxxx0C08, indicating structure allocation failure, this message is followed by message DFHXQ0409 giving the facility reason code for each CF in which allocation was attempted.

**Module:**
DFHXQCF
Destination
Console and SYSPRINT

DFHXQ0404 CF structure strname cannot be used because it has been allocated with attribute attribute.

Explanation
The queue server has successfully connected to its list structure but has found that the structure has been allocated using an IXLCONN structure attribute keyword which is not supported by the queue server.

System action
The queue server is terminated.

User response
This probably indicates that the structure has been allocated or modified by some program other than the queue server. In this case, the incorrect structure should be deleted (for example using the SETXCF FORCE command) so that it will be reallocated correctly when the queue server is restarted.

Module:
DFHXQCF

Destination
Console and SYSPRINT

DFHXQ0405 CF structure strname element size elemsize is incorrect. It should be a power of 2 in the range 256 to 4096.

Explanation
The queue server list structure element size (specified via the ELEMSIZE initialization parameter) is not a power of two, or is outside the range supported by the list structure hardware.

System action
The queue server is terminated (without attempting to connect to the list structure).

User response
Correct the ELEMSIZE parameter and restart the queue server.

Module:
DFHXQCF

Destination
Console and SYSPRINT

DFHXQ0406 Initialization failed for CF structure strname with response response.

Explanation
Queue server processing to initialize the list structure failed with an abnormal internal response code.

System action
The server is terminated.

User response
If the response code is 8 (I/O error), it indicates that an IXLLIST macro gave an abnormal return code, in which case a previous DFHXQ0441 message will have been issued giving the IXLLIST return code and reason code. If this response code is any other value, this indicates that the list structure is in a state which should not occur, probably indicating that it was allocated or modified by a program other than the queue server. In this case the structure may need to be deleted (using SETXCF FORCE) so that it will be reallocated when the server is restarted.

Module:
DFHXQCF

Destination
Console and SYSPRINT

DFHXQ0407 CF structure strname is not available for shared use.

Explanation
The queue pool is currently locked for exclusive use by some other job such as a queue pool unload or reload job. (This serialization uses an MVS ENQ with scope SYSTEMS for major name SYSZDFH minor name DFHXQLS_poolname).

System action
The server is terminated.

User response
Check whether a queue pool maintenance job is currently running. If it is, wait until it has finished before trying to start the server again.

Module:
**DFHXQCF**

**Destination**
Console and SYSPRINT

**Explanation**
The current job (an unload or reload) requires exclusive use of the queue pool, but some other job is running which already has shared or exclusive use of the pool. (This serialization uses an MVS ENQ with scope SYSTEMS for major name SYSZDFH minor name DFHXQLS_poolname).

**System action**
The server is terminated.

**User response**
Check whether a queue pool server or maintenance job is currently running. If it is, wait until it has finished before trying to run the current job again.

**Module:**
DFHXQCF

**DFHXQ0409** CF structure *strname* could not be allocated in facility *cfname*, reason code *rsncode*.

**Explanation**
If a previous message DFHXQ0403 indicated an IXLCONN failure because the structure could not be allocated, this message is issued for each CF in which allocation was attempted to show the facility reason code indicating why structure allocation failed. If the reason code is known to the server, the name of the reason code is given (without the ConaRsn prefix), otherwise its decimal value is shown.

If the response indicates InvalidStructureSize, this means that the initial list structure size (specified on the server POOLSIZE parameter or in the CFRM policy INITSIZE parameter) is not large enough to contain the required structure control information. The size of the control information is affected by the number of list headers (determined by the server MAXQUEUES parameter) and by the maximum structure size specified in the CFRM policy.

**System action**
The queue server is terminated.

**User response**
See the descriptions of the reason codes in the MVS macro IXLYCONA which maps the connect answer area.

If the response was InvalidStructureSize, increase the initial structure size specification in the server POOLSIZE parameter or the CFRM policy INITSIZE parameter to ensure that there is enough space for data in addition to the structure control information. Also, check that the server MAXQUEUES parameter and the maximum structure size specified in the CFRM policy are not unnecessarily large. See the Configuring for more information on how to estimate temporary storage queue pool sizes.

**Module:**
DFHXQCF

**Destination**
Console and SYSPRINT

**DFHXQ0410** CF structure *strname* cannot be used, coupling facility maintenance level is too low.

**Explanation**
Initialization test routines executed against the allocated list structure gave incorrect results, indicating that the coupling facility control code does not include all maintenance necessary to support shared temporary storage.

**System action**
The queue server is terminated.

**User response**
Ensure that the required level of coupling facility maintenance is applied.

**Module:**
DFHXQCF

**Destination**
Console and SYSPRINT

**DFHXQ0411** CF structure *strname* now has percentage% of entries in use.
Explanation
This message is issued by the queue server when the percentage of list entries in use within the list structure increases past certain set threshold levels, or when it decreases past a threshold level after previously being at a higher level. This message is also issued immediately after an ALTER request has completed in order to show how the percentage has been affected by changes in the structure size or entry to element ratio.

System action
The warning threshold is increased to the next higher level (normally 5% higher if less than 95%, otherwise 1% higher), or decreased to the previous lower level depending on whether the usage is increasing or decreasing. If the structure usage is increasing and the structure element to entry ratio is not making full use of the available space, the server may issue an automatic IXLALTER request to adjust the ratio.

User response
Note that the structure may soon become full, preventing queues from being created. If the structure was allocated at less than its maximum size and the coupling facility has enough free space, the size of the structure can be altered dynamically using the MVS SETXCF command with the START,ALTER options.

Module: DFHXQCF

Destination
Console and SYSPRINT

DFHX0413I Starting ALTER to adjust CF structure strname entry/element ratio to entries/elements.

Explanation
The queue server has determined that the ratio of free entries to free elements is significantly different from the ratio of entries to elements actually in use. It is issuing an IXLALTER macro to request the coupling facility to adjust the ratio to make better use of the coupling facility storage.

System action
The server continues by issuing the IXLALTER macro. A further message will be issued when the ALTER request is accepted or rejected by MVS.

User response
None.

Module: DFHXQCF

Destination
Console and SYSPRINT

DFHX0414I ALTER started for CF structure strname.

Explanation
The queue server has successfully started an ALTER request to change the entry to element ratio for the list structure.
**System action**
The queue server event exit will be notified by MVS when the ALTER request completes and a further message will then be issued.

**User response**
None.

**Module:** DFHXQCF

**Destination**
Console and SYSPRINT

**Explanation**
The queue server attempted to start an ALTER to change the entry to element ratio for the list structure, but this was rejected by the system because another ALTER was already active.

**System action**
The current ALTER attempt is abandoned. Another attempt may be made when the minimum alter interval has expired.

**User response**
See the IXLALTER macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

**Module:** DFHXQCF

**Destination**
Console and SYSPRINT

**Explanation**
The queue server has been notified by the system that an ALTER request has completed normally.

**System action**
New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHXQ0411 and DFHXQ0412 to indicate the new usage percentages.

**User response**
None.

**Module:** DFHXQCF

**Destination**
Console and SYSPRINT

**Explanation**
The queue server attempted to start an ALTER to change the entry to element ratio for the list structure, but this was rejected by the system with an unexpected return code.

**System action**
The current ALTER attempt is abandoned. Another attempt may be made when the minimum alter interval has expired.

**User response**
See the IXLALTER macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

**Module:** DFHXQCF

**Destination**
Console and SYSPRINT

**Explanation**
The queue server has been notified by the system that an ALTER request has ended abnormally. The two bytes of status information in this message are taken from EEPLALTERENDSTATEFLAGS in the event exit parameter list (defined in the IXLYEEMPL macro).
System action
No action is taken as a result of this notification, but the problem which caused the ALTER to fail will probably result in other related problems.

User response
None.

Module:
DFHXQCF

Destination
Console and SYSPRINT

DFHXQ0419I ALTER ended normally for CF structure strname but target was not attained.

Explanation
The queue server has been notified by the system that an ALTER request has ended normally but that the target ratio or target size was not attained.

System action
New values for the structure size and numbers of elements and entries are stored. This message is followed by messages DFHXQ0411 and DFHXQ0412 to indicate the new usage percentages.

User response
None.

Module:
DFHXQCF

Destination
Console and SYSPRINT

DFHXQ0424 Connectivity has been lost to CF structure strname. The shared TS queue server cannot continue.

Explanation
The queue server has been notified by the system that connectivity has been lost to its list structure.

System action
The server issues an internal CANCEL command to terminate itself immediately.

User response
None.

Module:
DFHXQCF

Destination
Console and SYSPRINT

DFHXQ0425 CF structure strname has failed. The shared TS queue server cannot continue.

Explanation
The queue server has been notified by the system that its list structure has been lost due to coupling facility failure. All data in the queue pool has been lost.

System action
Each queue server for the affected pool issues an internal CANCEL command to terminate itself immediately.

User response
If another coupling facility is available and is included in the CFRM preference list for the failed structure, delete the failed structure and restart the servers to cause a fresh copy of the list structure to be allocated on the alternate coupling facility. If no other coupling facility is available, wait until the original coupling facility has been made available again before restarting the servers.

Module:
DFHXQCF

Destination
Console and SYSPRINT

DFHXQ0431I Access statistics for CF structure strname:

Explanation
This message gives a summary of coupling facility access statistics. It is issued in response to a DISPLAY or PRINT command which includes the CFSTATS parameter, and may also be produced on the
SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

<table>
<thead>
<tr>
<th>Index:</th>
<th>Wrt Adjs</th>
<th>Writes</th>
<th>Reads</th>
<th>Deletes</th>
<th>Rereads</th>
</tr>
</thead>
<tbody>
<tr>

<td>n</td>
<td>n</td>
<td>n</td>
<td>n</td>
<td>n</td>
</tr>
</tbody>
</table>

**System action**
Processing continues.

**User response**
The statistics are described in detail in the DFHXQS1D data area. For queues which do not exceed 32K bytes, the data is included in the queue index, otherwise it is stored as a separate list. The individual fields have the following meanings:

- **Index access counts:**
  - **Wrt Adjs**
    Number of index writes to update adjunct area only. (This area contains the read cursor for small queues and the queue status including last used data).
  - **Writes**
    Number of queue writes (new or update) including data.
  - **Reads**
    Number of queue index reads.
  - **Delete**
    Number of queue deletes.
  - **Rereads**
    Number of reads which had to be repeated because the data was larger than the default data transfer size.
  - **Read Adjs**
    Number of index reads for the status area only. This is used for inquire processing, and also to read the queue details if necessary during delete processing.

- **Data access counts:**
  - **Creates**
    Number of times a separate data list was created.
  - **Writes**
    Number of writes to add items to separate data lists.
  - **Reads**
    Number of reads from separate data lists.
  - **Delete**
    Number of times a separate data list was deleted.
  - **Rereads**
    Number of reads which had to be repeated because the data was larger than the default data transfer size.
  - **Rewrites**
    Number of writes to replace items in separate data lists.

- **Response counts:**
  - **Asynch**
    Number of requests for which completion was asynchronous.
  - **Unavail**
    Number of times requests were deferred because the structure was temporarily unavailable, for example because system-managed rebuild was in progress.
  - **Normal**
    Number of normal responses.
  - **Len err**
    The input buffer was too small to contain the data. The server often tries a buffer size of only 4K in order to use a synchronous read if possible. If this response occurs, the server sets up the maximum sized buffer and reissues the read.
  - **Not fnd**
    The specified entry (queue or item) was not found.
  - **Vers chk**
    A version check failed for an entry being updated or created, indicating that another task had updated it first.
List chk
A list authority comparison failed, usually meaning that the queue is in the process of being deleted.

List full
A queue reached the maximum number of items, causing the relevant list to be marked as full.

Str full
The list structure became full.

I/O err
Some other error code was returned by IXLLIST.

Module:
DFHXQCF

Destination
Console and SYSPRINT

DFHXQ0432I  Queue pool statistics for CF structure strname:

Explanation
This message gives a summary of the usage statistics for the queue pool list structure. It is issued in response to a DISPLAY or PRINT command which includes the POOLSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

| Structure: Size Max size Elem size nK nK n n |
| Queues: Current Highest n n |
| Lists: Total In use Max used Control Data n n n n |
| n 100% n% n% n% |
| n% Entries: Total In use Max used Free Min free n n n |
| n 100% n% n% |
| n% Elements: Total In use Max used Free Min free n n n |
| n 100% n% n% |

System action
Processing continues.

User response
The statistics are described in detail in the DFHXQS1D data area. Pool usage statistics are calculated from information returned by coupling facility requests, and are not always very accurate, especially if the relevant information has not been accessed recently by the current server. The individual fields have the following meanings:

- Structure:
  - Size
    Current allocated size of the list structure.
  - Max size
    Maximum size to which this structure could be altered.
  - Elem size
    Data element size used for the structure.

- Queues:
  - Current
    Number of queues currently in existence.
  - Highest
    Highest number of queues at any time (since last reset).

- Lists:
  - Total
    Maximum number of list headers in the structure.
  - In Use
    Number currently in use.
  - Max Used
    Maximum number in use (since last reset).

- Control
  - Number of lists in use for control information.

- Data
  - Number of lists in use for queue data.

- Entries:
  - Total
    Total entries in the currently allocated structure. (Obtained at connection time, may be updated by ALTER).
**In Use**
Number of entries currently in use.

**Max Used**
Maximum number in use (since last reset).

**Free**
Number of entries currently free (total minus used).

**Min Free**
Minimum number of free entries (since last reset).

**Elements:**
- **Total**
  Total data elements in the currently allocated structure. (Obtained at connection time, may be updated by ALTER).

**In Use**
Number of elements currently in use.

**Max Used**
Maximum number in use (since last reset).

**Free**
Number of elements currently free (total minus used).

**Min Free**
Minimum number of free elements (since last reset).

**Module:**
DFHXQCF

**Destination**
Console and SYSPRINT

**DFHXQ0441**
**CF structure strname request failed, IXLLIST return code retcode, reason code rsncode.**

**Explanation**
A coupling facility access request issued via the IXLLIST macro failed because there are insufficient free entries or elements to store the new data in the structure.

**System action**
The failing request is given a NOSPACE indication if it originated from a CICS API request. For reload processing, if an automatic ALTER is in progress, the request may be suspended until the outcome of the ALTER is known, then retried. This message will not be issued again for further failures until the used numbers of elements and entries fall well below the warning threshold.

**User response**
Any queues which are no longer in use should be deleted so that the space can be reused. If the structure is not at its maximum size, it may be possible to start an ALTER request to increase the size using the MVS SETXCF command.

**Module:**
DFHXQCF

**Destination**
Console and SYSPRINT

**DFHXQ0443**
**CF structure strname request failed, all lists are in use.**

**Explanation**
A coupling facility access request issued via the IXLLIST macro failed because all list headers defined in the structure are now in use. The number of list headers is determined by the MAXQUEUES server initialization parameter when the structure was allocated.
**System action**

The failing request is given a NOSPACE indication if it originated from a CICS API request. This message will not be issued again for further failures while the shortage of list entries remains. The number of list entries in use needs to have fallen below 75% of the value specified by MAXQUEUES before the server will issue this message again for a further failure.

**User response**

Any queues of total size greater than 32K bytes which are no longer in use should be deleted to free up data lists. As the number of lists is fixed when the structure is allocated, the only way to increase the number of lists is to unload the structure, use SETXCF FORCE to delete it then reload it with a larger MAXQUEUES parameter.

**Module:** DFHXQCF

**Destination**

Console and SYSPRINT

<table>
<thead>
<tr>
<th>Code</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHXQ0444I</td>
<td>CF request has been suspended to await ALTER completion.</td>
</tr>
</tbody>
</table>

**Explanation**

A coupling facility access request issued from the server address space (during reload processing) ran out of space in the list structure, but an automatic ALTER attempt to free up more space is either already active or is being started at this point. The request is therefore being suspended to await the outcome of the ALTER attempt.

**System action**

The request is suspended until either the ALTER request completes (normally or abnormally), then the request is retried.

**User response**

None.

**Module:** DFHXQCF

**Destination**

Console and SYSPRINT

<table>
<thead>
<tr>
<th>Code</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHXQ0451</td>
<td>Purge for CF structure strname failed, IXLPURGE return code retcode, reason code rsncode.</td>
</tr>
</tbody>
</table>

**Explanation**

A queue access request was terminated abnormally and the queue server issued an IXLPURGE macro to ensure any active IXLLIST request was purged before releasing the I/O buffer, but the IXLPURGE macro gave a non-zero return code.

**System action**

The error is ignored because this only occurs when a request is already being terminated abnormally.

**User response**

See the IXLPURGE macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

**Module:** DFHXQCF

**Destination**

Console and SYSPRINT

<table>
<thead>
<tr>
<th>Code</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHXQ0461I</td>
<td>Disconnected from CF structure strname.</td>
</tr>
</tbody>
</table>

**Explanation**

The server has successfully disconnected from the CF structure (using the IXLDISC macro).
System action
Processing continues.

User response
None.

Module:
DFHXQCF

Destination
Console and SYSPRINT

DFHXQ0462 Disconnect from CF structure strname failed, IXLDISC return code retcode, reason code rsncode.

Explanation
The IXLDISC macro to disconnect the queue server from its coupling facility list structure failed.

System action
The error is ignored, as disconnection only occurs when the server is already terminating.

User response
See the IXLDISC macro in z/OS MVS Programming: Sysplex Services Reference (GC28-1772) for the explanation of the return and reason code.

Module:
DFHXQCF

Destination
Console and SYSPRINT

DFHXQ0481I Waiting for structure strname to become available.

Explanation
The queue server was unable to connect to its coupling facility structure because of an environmental error, such as the structure being unavailable, as described in a previous DFHXQ0403 message. The server is now waiting for this problem to be fixed, and will retry the connection request when it is notified via the ENF facility that the specific structure may now be available or that some change has occurred in the status of general coupling facility resources.

System action
The server waits to be notified of a relevant event.

User response
No action is required, but the waiting server can optionally be terminated using the MVS CANCEL command if it is no longer required.

Module:
DFHXQEN

Destination
Console and SYSPRINT

DFHXQ0482I Retrying connection to structure strname.

Explanation
The queue server has been notified via ENF that its list structure may now be available or that a change has occurred in the status of some general coupling facility resources, so it is about to make another attempt to connect to the structure.

System action
The original IXLCONN request is retried.

User response
None.

Module:
DFHXQEN

Destination
Console and SYSPRINT

DFHXQ0491 ENFREQ ACTION=action failed, return code retcode.

Explanation
An ENF request issued by the queue server gave an unexpected return code.

System action
If this occurs on the ENFREQ ACTION=LISTEN request and the server is subsequently unable to connect to the list structure, the server will be terminated instead of waiting for the structure to become available.

User response
See the documentation of the ENFREQ macro in z/OS MVS Programming: Authorized Assembler Services Reference (Volume 1) (GC28-1765) for the explanation of the return and reason code.
**Module:** DFHXQEN

**Destination**
Console and SYSPRINT

**DFHXQ0501**  
Insufficient storage, only actual of requested data buffers allocated.

**Explanation**
The queue server was unable to allocate the specified number of data buffers (of 32K bytes) during initialization because the relevant storage pool (AXMPGANY) was exhausted.

**System action**
The server is terminated.

**User response**
Decrease the BUFFERS initialization parameter to a value less than the number which were successfully allocated (to leave plenty of storage for request processing) and restart the server. Alternatively, increase the region size for the queue server to allow more buffers to be allocated.

---

**Module:** DFHXQBF

**Destination**
Console and SYSPRINT

**DFHXQ0511I**  
Queue index buffer pool statistics:

**Explanation**
This message gives a summary of the usage statistics for the queue index buffer pool, which is used to read and write queue index entries and their associated data, and to save recently accessed index entries in storage to reduce coupling facility I/O. It is issued in response to a DISPLAY or PRINT command which includes the BUFSTATS parameter, and may also be produced on the SYSPRINT file during interval statistics if the statistics options include print file output.

The detailed message layout is as follows:

<table>
<thead>
<tr>
<th>Buffers: Total</th>
<th>Max used</th>
<th>Active</th>
<th>On LRU Empty</th>

<tr>
<th>Waits: Pool lock</th>
<th>Buf lock</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>n</td>
</tr>
</tbody>
</table>

**System action**
Processing continues.

**User response**
The statistics are described in detail in the DFHXQS2D data area. The individual fields have the following meanings:

- **Buffers:**
  - **Total**
    Number of buffers in the pool.
  - **Max used**
    Highest number ever used (not affected by reset).
  - **Active**
    Buffers currently in use.
  - **On LRU**
    Buffers with valid contents on LRU chain to allow reuse.
  - **Empty**
    Buffers previously used but now empty.

- **Requests:**
  - **Gets**
    Requests to get a buffer.
  - **Puts**
    Requests to put back a buffer with valid contents.
  - **Keeps**
    Requests to put back a buffer with modified contents. (This function is not currently used by the queue server).
  - **Frees**
    Requests to put back a buffer as empty.

- **Purges**
  Requests to discard contents of a previously valid buffer.

- **Results (Get):**
Got hit
Request found a valid match on the LRU chain.

Got free
Request obtained an empty buffer.

Got new
Request obtained a buffer not previously used.

Got LRU
Request discarded and reused the oldest valid buffer.

No buff
Request failed to obtain a buffer.

• Errors:
  Not freed
  Request tried to free a buffer which it did not own. (This can occur during error recovery).
  No purge
  A purge request did not find any matching buffer.
  Not owned
  A purge request hit a buffer owned by another task.

• Waits:
  Pool lock
  Number of waits for the buffer pool header lock.
  Buf lock
  Number of waits because another request owned the buffer.

2256 CICS TS for z/OS: CICS Messages

System action
The queue server proceeds with statistics collection.

User response
None.

Module:
DFHXQST

Destination
SYSPRINT

DFHXQ0602I Statistics collection completed, reset performed.

Explanation
Queue server statistics have been collected and counters have been reset. This occurs for interval or end of day statistics.

System action
Processing continues.

User response
None.

Module:
DFHXQST

Destination
SYSPRINT

DFHXQ0603I Statistics collection completed.

Explanation
Queue server statistics have been collected but counters have not been reset. This normally occurs at server closedown.

System action
Processing continues.

User response
None.

Module:
DFHXQST

Destination
SYSPRINT
DFHXQ0604  Timer SET failed, return code retcode, reason code rsncode.

**Explanation**
An attempt by the queue server statistics subtask to set up a timer wait interval failed.

**System action**
The interval statistics function is terminated with message DFHXQ0606.

**User response**
Check the return code and reason code. A return code of 4 indicates an attempt to set up more than one concurrent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM SET.

**Module:**
DFHXQST

**Destination**
Console and SYSPRINT

DFHXQ0605  Timer CANCEL failed, return code retcode, reason code rsncode.

**Explanation**
An attempt by the queue server statistics subtask to cancel a timer wait interval failed.

**System action**
The interval statistics function is terminated with message DFHXQ0606.

**User response**
Check the return code and reason code. A return code of 4 indicates an attempt to cancel a nonexistent timer interval, which indicates a logic error in the server. A return code of 8 indicates that the MVS STIMERM macro failed, in which case the reason code indicates the return code received from STIMERM CANCEL.

**Module:**
DFHXQST

**Destination**
Console and SYSPRINT

DFHXQ0610I  Statistics written to SMF, return code was retcode.

**Explanation**
Queue server statistics have been sent to SMF. The return code from the SMFEWTM macro is indicated in this message. A non-zero return code usually indicates that SMF recording was suppressed because of current SMF options or an installation exit.

**System action**
Processing continues.

**User response**
If the return code is non-zero but SMF statistics were expected to be successfully written, see the SMFEWTM macro in z/OS MVS System Management Facilities (SMF) (GC28-1457) for more information about return codes.

**Module:**
DFHXQST

**Destination**
SYSPRINT

DFHXQ0701I  Shared TS queue pool poolname is to be unloaded.

**Explanation**
The queue server statistics collection subtask was unable to continue processing and has terminated. The reason will have been indicated by an earlier message.

**System action**
The interval statistics subtask terminates and no further interval statistics or end of day statistics will be produced for this run of the server.

**User response**
See the earlier message indicating the reason for the termination of the subtask.

**Module:**
DFHXQST

**Destination**
Console and SYSPRINT

Chapter 2. CICS messages 2257
Explanation
The server program has been started with the UNLOAD option requesting that the queue pool is unloaded to a sequential data set.

System action
The server starts to process the unload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

User response
None.
Module: DFHXQUL

Destination
Console and SYSPRINT
DFHXQ0702I Shared TS queue pool poolname has been successfully unloaded.

Explanation
The queue pool has been unloaded successfully.

System action
The server closes down normally.

User response
None.
Module: DFHXQUL

Destination
Console and SYSPRINT
DFHXQ0704 DFHXQUL data set for unload could not be opened.

Explanation
The data set to contain the unloaded queue pool could not be opened.

System action
Unload processing is terminated and the server is closed down with message DFHXQ0706.

User response
Check that the DFHXQUL DD statement is present in the JCL for the unload job.
Module: DFHXQUL

Destination
Console and SYSPRINT
DFHXQ0705 Unload access to CF structure strname failed with response response.

Explanation
The unload process failed because of a problem with coupling facility access.

System action
Unload processing is terminated and the server is closed down with message DFHXQ0706.

User response
If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous error message will have been issued. Any other response code indicates an internal logic error.
Module: DFHXQUL
**Destination**

Console and SYSPRINT

DFHXQ0706  Unload for shared TS queue pool *poolname* was unsuccessful.

**Explanation**

The queue pool unload process failed. The reason will have been described in a previous message.

**System action**

The server is terminated.

**User response**

See the previous message giving the reason for the unload failure. Note that any unload data set produced in this case will be incomplete and will not be valid for reload purposes.

**Module:**

DFHXQUL

**Destination**

Console and SYSPRINT

DFHXQ0801I  Shared TS queue pool *poolname* is to be reloaded.

**Explanation**

The server program has been started with the RELOAD option requesting that the queue pool is to be reloaded from a sequential data set produced using the UNLOAD option.

**System action**

The server starts to process the reload request. In this case, the rest of cross-memory server initialization is bypassed as it will not be needed.

**User response**

None.

**Module:**

DFHXQRL

**Destination**

Console and SYSPRINT

DFHXQ0803I  Queues reloaded: *queues*. Queues bypassed: *duplicates*. Blocks read: *blocks*.

**Explanation**

This message provides additional information about the results of the reload process. Queues on the unloaded data set are bypassed during reload processing if they already exist in the pool (for example as a result of a previous reload which could not be completed due to lack of space).

**System action**

Server termination processing continues.

**User response**

None.

**Module:**

DFHXQRL

**Destination**

Console and SYSPRINT

DFHXQ0804  DFHXQRL data set for reload could not be opened.

**Explanation**

The data set containing the queue pool to be reloaded could not be opened.

**System action**

Reload processing is terminated and the server is closed down with message DFHXQ0808.
User response
Check that the DFHXQRL DD statement is present in the JCL for the reload job.

Module:
DFHXQRL

Destination
Console and SYSPRINT

DFHXQ0805 Reload access to CF structure strname failed with response response.

Explanation
The reload process failed because of a problem with coupling facility access.

System action
Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response
If the response code is 8, this indicates that an unexpected IXLLIST error occurred, for which a previous message DFHXQ0441 will have been issued. Any other response code indicates an internal logic error.

Module:
DFHXQRL

Destination
Console and SYSPRINT

DFHXQ0806 Unexpected end of file encountered on reload data set.

Explanation
End of file was encountered on the unloaded data set before the logical end of the unloaded data was encountered.

System action
Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response
This indicates that the unloaded data set is incomplete, perhaps because the unload process was abnormally terminated.

Module:
DFHXQRL

Destination
Console and SYSPRINT

DFHXQ0807 Reload data set contains incorrect data near block block, offset offset.

Explanation
The reload process failed because the unloaded queue pool data set is not in the correct format.

System action
Reload processing is terminated and the server is closed down with message DFHXQ0808.

User response
Check that the correct data set is being used and that the unload process completed normally.

Module:
DFHXQRL

Destination
Console and SYSPRINT

DFHXQ0808 Reload for shared TS queue pool poolname was unsuccessful.

Explanation
The queue pool reload process could not be completed. The reason will have been described in a previous message.

System action
The program is terminated.

User response
See the previous message giving the reason for the reload failure.

Module:
DFHXQRL

Destination
Console and SYSPRINT

DFHXQ0809 Reload for CF structure strname failed, structure is full.
**Explanation**
Reload processing failed because there are insufficient free entries or elements to store the new data in the structure.

**System action**
Reload processing is terminated and the server is closed down with message DFHXQ0808.

**User response**
If the structure is not at its maximum size, use the MVS SETXCF FORCE to delete the structure, then change the reload parameters to specify a larger POOLSIZE parameter and rerun the reload job. The approximate amount of information which could not be reloaded can be estimated by comparing the numbers of blocks read and queues reloaded, as described by following message DFHXQ0803, with the corresponding numbers from message DFHXQ0703 in the unload job.

**Module:**
DFHXQRL

**Destination**
Console and SYSPRINT

**DFHXQ0810**
Reload for CF structure **strname** failed, all lists are in use.

**Explanation**
Reload processing failed because all list headers defined in the structure are now in use.

**System action**
Reload processing is terminated and the server is closed down with message DFHXQ0808.

**User response**
Use the MVS SETXCF FORCE to delete the structure, then change the reload MAXQUEUES parameter to a large value and rerun the reload job.

**Module:**
DFHXQRL

**Destination**
Console and SYSPRINT

**DFHXQ0911I**

**Explanation**
Request tracing is active and a request is being traced on entry to the request module DFHXQRQ.

**System action**
Processing continues.

**User response**
None.

**DFHXSnnnn messages**

**DFHXS0001**  
applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

**Explanation**

An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).

**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.
**User response**

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the relevant MVS codes manual which is detailed in the book list in the front of this manual.

Next, look up the CICS alphanumeric code in this manual. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module modname you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFIL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSS, DFHXSM

**XMEOUT parameters/Message inserts**

1. applid
2. aaa/bbbb
3. X'offset'
4. modname

**Destination**

Console

DFHXS0002 applid A severe error (code X'code') has occurred in module modname.

**Explanation**

An error has been detected in module modname. The code X'code' is the exception trace point id which uniquely identifies what the error is and where the error was detected.

**System action**

An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module modname is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module modname, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:** DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFIL, DFHXSIS, DFHXSLU, DFHXSPW, DFHXSRC, DFHXSS, DFHXSM

**XMEOUT parameters/Message inserts**

1. applid
2. X'code'
3. modname

**Destination**

Console

DFHXS0004 applid A possible loop has been detected at offset X'offset' in module modname.

**Explanation**

A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.
**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
- DFHXSAD, DFHXSCL, DFHXSDM, DFHXSFL, DFHXSIS, DFHXSLL, DFHXSPW, DFHXSRC, DFHXSST, DFHXSXM

**XMEOUT parameters/Message inserts**

1. applid
2. X'offset'
3. modname

**Destination**

Console

DFHXS0006  applid Insufficient storage to satisfy Getmain (code X'code') in module modname. MVS code mvscode.

**Explanation**

An MVS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

The code mvscode is the MVS GETMAIN return code.

**System action**

An exception entry is made in the trace table (code X'code'). A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

If CICS has been terminated by another module, look out for the relevant termination messages (from, for example, the domain manager), and look up the user response suggested for these messages.

If CICS is still running, the problem may be a temporary one which rights itself if more storage becomes available. If you can manage without module modname, you may decide to continue and bring CICS down at a convenient time to resolve the problem. If the message recurs or if you cannot run without the full use of all CICS modules, you should bring CICS down in a controlled shutdown.

You can get diagnostic information about the MVS return code by consulting the relevant MVS codes manual which is listed in the book list at the front of this book.

Try decreasing the size limits of the DSAs or EDSAs. Or, try increasing the size of the whole region, if it is
not already at maximum size. See the Configuring or
the Improving performance for further information on
CICS storage.

**Module:**

2. time
3. applid
4. X’xx’
5. X’yy’

**Destination**
Console

**DFHXS0201I**  
*date time applid*  
External security initialization has been tracked, and has failed with return code X’xx’ and reason code X’yy’.

**Explanation**
An external security initialization performed on an active CICS system (via CEMT PERFORM SECURITY, or EXEC CICS SECURITY REBUILD).

The external security initialization has been tracked to the XRF alternate system, but has failed with return code xx and reason code yy.

xx and yy are the values placed in registers 15 and 0 by the external security manager.

**System action**
CICS provides a system dump of the XRF alternate system, and continues tracking security initializations.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
The security characteristics of the alternate system no longer match those of the active system. Either shut down the alternate system, perform a security rebuild at takeover, or accept the difference.

Use the return codes in the message, to determine why the security initialization failed.

If the codes are invalid, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHXSDM

XMEOUT parameters/Message inserts
1. applid

Destination
Console
DFHXS1103I applid Default security for userid dfltuser has been established.

Explanation
CICS has established a security environment for the default userid dfltuser.

System action
The authorities that are assigned to this userid by the external security manager will be used in CICS resource checks whenever no other userid has been established.

User response
None.

Module:
DFHXSDM

XMEOUT parameters/Message inserts
1. applid
2. dfltuser

Destination
Console
DFHXS1104 applid Default security could not be established for userid
**Explanation**

CICS could not establish a security environment for the default user id `dfltuser`. The security domain cannot continue without a default user. The response and reason codes (`safresp` and `safreas`) returned by the system authorization facility (SAF), and the response and reason codes (`esmresp` and `esmreas`) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=VERIFY macro.

**User response**

Use the external security manager codes to determine why the RACROUTE REQUEST=VERIFY operation failed. Then, either correct the errors for the failing default user and restart CICS, or restart CICS with a different default userid.

**Module:**

DFHXSDM

**XMEOUT parameters/Message inserts**

1. `applid`

3. `X'safresp'`
4. `X'safreas'`
5. `X'esmresp'`
6. `X'esmreas'`

**Destination**

Console

**Explanation**

The security resource profiles for the class `classname` have been successfully loaded into storage by the external security manager.

**User response**

None.

**Module:**

DFHXSRC

**XMEOUT parameters/Message inserts**

1. `applid`
2. `classname`

**Destination**

Console

**Explanation**

The security resource profiles for the class `classname` could not be loaded into storage by the external security manager. The response and reason codes (`safresp` and `safreas`) returned by the system authorization facility (SAF), and the response and reason codes (`esmresp` and `esmreas`) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following:

- The initialization of the security domain
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

**System action**

CICS is unable to provide reliable resource security, so it terminates.

**User response**

Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

**Module:**

DFHXS1107 applid Partner-LU profiles for class APPCLU have been built.

Explanation
The partner-LU profiles for the class APPCLU have been successfully loaded into storage by the external security manager.

System action
The profiles are used in subsequent bind authorization checks for LU6.2 sessions whose CONNECTION definition specifies BINDSECURITY(YES).

User response
None.

Module: DFHXSRC

DFHXS1108 applid Partner-LU profiles could not be built for class APPCLU. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas').

Explanation
The partner-LU profiles for the class APPCLU could not be loaded into storage by the external security manager. CICS therefore has no APPCLU security profiles. The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=LIST macro.

The build of the profiles was requested by one of the following:

- The initialization of VTAM support in terminal control
- The CEMT command SET VTAM OPEN
- The CEMT command PERFORM SECURITY REBUILD
- A user-supplied transaction invoking the EXEC CICS SET VTAM OPEN command.
- A user-supplied transaction invoking the EXEC CICS PERFORM SECURITY REBUILD command.

System action
If the failure occurs during CICS initialization or PERFORM SECURITY REBUILD, CICS terminates. If the failure occurs during SET VTAM OPEN, the VTAM ACB is closed and CICS continues.

User response
Use the external security manager codes to determine why the RACROUTE REQUEST=LIST operation failed. Rectify the problem in the external security manager, then restart CICS.

Module: DFHXSIS, DFHXSRC

4. X'esmresp'
5. X'esmreas'

Destination
Console

DFHXS1109 applid APPC PROFILE profile COULD NOT BE AUDITED. SAF CODES ARE (X'safresp',X'safreas'). ESM CODES ARE (X'esmresp',X'esmreas').

Explanation
An audit request for a partner-LU verification check has failed for profile profile.
During the start-up of an APPC session, each partner can validate the other. During this validation process, the system:

- Retrieves the relevant APPCLU profile from the external security manager
- Checks that the session key is still usable
- Requests the external security manager to write audit records concerning this profile and the validation to the system management facility (SMF).

The following events are audited:

- Whether the session partner was correctly validated
- Whether the session partner failed validation
- Whether the session key will expire in less than six days
- Whether the retrieved profile is "locked"
- Whether the session key is null, or all zero
- Whether the session key has expired.

The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=AUDIT macro.

**System action**

The CICS system is not affected by this event, and CICS continues.

**User response**

Use the external security manager codes to determine why the RACROUTE REQUEST=AUDIT operation failed. Correct the problem in the external security manager, then perform a security rebuild, if appropriate.

**Module:**

1. *applid*

**Destination**

Console

**DFHXS1110**  
*date time applid tranid Security violation by user userid { at netname | at console } portname for resource resource in class classname. SAF codes are (X'safresp',X'safreas'). ESM codes are (X'esmresp',X'esmreas'). RACF request made was reqtype.*

**Explanation**

CICS has detected a security violation by user *userid* while performing an authority check for resource *resource* in resource class *classname*.

If the userid causing the violation is signed on at a VTAM terminal, the phrase "at netname *portname* " reports the netname at which the violation occurred. If the userid causing the violation is signed on at a console, the phrase "at console *portname* " reports the console name at which the violation occurred. If the userid causing the violation is not signed on or this is a non terminal task, the entry port does not appear in this message as it is not available.

The response and reason codes (safresp and safreas) returned by the system authorization facility (SAF), and the response and reason codes (esmresp and esmreas) returned by the external security manager (ESM) are those issued by the RACROUTE REQUEST=FASTAUTH or RACROUTE REQUEST=AUTH macros. These return codes are described in the z/OS MVS Programming: Authorized Assembler Services Guide and in z/OS Security Server RACROUTE Macro Reference.
CICS can also issue this message when you use the EXEC CICS QUERY SECURITY command with the LOGMESSAGE(LOG) option.

**System action**
CICS abnormally terminates the task requesting the invalid access except under one of the following conditions:
- The command is issued within the scope of an EXEC CICS HANDLE NOTAUTH command.
- The command is issued as a result of an EXEC CICS QUERY SECURITY command.

**User response**
Note the security violation.

Destination
CSCS

DFHXS1218 applid The CICS region userid userid is not authorized to access key ring keyring.

Explanation
The KEYRING system initialization parameter has been used to specify a key ring named keyring, but the CICS region userid userid does not have sufficient authority to access it.

System action
If the PARMERR=ABEND system initialization parameter is specified, CICS initialization terminates.

If the PARMERR=IGNORE system initialization parameter is specified, CICS initialization continues without a key ring. CICS does not initialize support for secure sockets layer, is not able to install TCPIPSERVICEs that specify SSL(YES) or SSL(CLIENTAUTH), or CORBASERVERs that specify CERTIFICATE.

If the PARMERR=INTERACT system initialization parameter is specified, you are prompted to enter a new key ring name, but you can only reply with a blank name, which causes CICS to continue initialization without a key ring.

User response
If CICS is to use the secure sockets layer, the CICS region userid must be given READ access to the IRR.DIGTCERT.LIST and IRR.DIGTCERT.LISTRING resources in the FACILITY class. For further information, see the CICS Security.

DFHX51402  

Explanation

There has been a request to an External Security Manager to inquire the client principal of a kerberos token obtained from a Security Token Service but the request failed. A request to inquire a client principal results in a call to one or more z/OS callable services that may have failed. An example of when an inquire the client principal request can be issued is with EXEC CICS VERIFY TOKEN. The reason shown in the message indicates the cause of the failure.

Reasons:

R_TICKETSERV service responded not authorized by ESM

The External Security Manager did not authorize a request to the z/OS R_TICKETSERV callable service to inquire a client principal.

Security not active

CICS security is not active.

ESM not active

The External Security Manager is not active.

KDC not active

The Key Distribution Center is not active.

KDC not responding

The Key Distribution Center is not responding.

R_TICKETSERV service responded not a kerberos region

A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response from the External Security Manager that the CICS region is not defined to use kerberos.

R_TICKETSERV service responded invalid client principal name

A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response from the External Security Manager that the client principal name is invalid.

R_TICKETSERV service responded invalid kerberos token

A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response from the External Security Manager that the kerberos token is invalid.

R_TICKETSERV service responded ticket expired

A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response from the External Security Manager that the interval during which the ticket is valid has expired.

R_TICKETSERV service responded authenticator expired

A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response that the difference between the time in the kerberos token and the current system time exceeds the limit for the External Security Manager to authenticate.
Unclassified ESM error
A response from the External Security Manager was received which is not classified by CICS.

R_TICKETSERV service responded invalid server principal name
A request to the z/OS R_TICKETSERV callable service to inquire a client principal returned a response that the server principal in the kerberos token does not match the principal name associated with the CICS region userid.

R_USERMAP service responded no userid for client principal
A request to the z/OS R_USERMAP callable service responded that the External Security Manager does not have a userid mapped to the client principal name.

R_USERMAP service responded not authorized by ESM
The External Security Manager did not authorize a request to the z/OS R_USERMAP callable service to obtain the userid mapped to the client principal name.

R_GENSEC ACCEPT service responded attempted replay
The External Security Manager detected an attempt to replay a prior request. For example, there has been a second attempt to run EXEC CICS VERIFY TOKEN KERBEROS ENCRYPTKEY for the same kerberos token.

R_GENSEC ACCEPT service did not return an output token
The External Security Manager did not return an output token when expected for EXEC CICS VERIFY TOKEN KERBEROS OUTTOKEN.

Kerberos not configured
This CICS region is not configured to support Kerberos. To enable Kerberos support, specify the SIT parameter KERBEROSUSER with the user id associated with the service principal.

System action
CICS continues.

Destination
Console

DFHXS1500 date time applid A PassTicket request for task userid (userid) with ESM application name (esmappname) failed because the request is not authorized by the ESM. Taskid (taskid) Tranid (tranid)

Explanation
A request to an External Security Manager was made for a PassTicket for task userid userid for use in

DFHZCnnnn messages

DFHZC0001 applid An abend (code aaa/bbbb) has occurred at offset X'offset' in module modname.

Explanation
An abnormal end (abend) or program check has occurred in module modname. This implies that there may be an error in the CICS code. Alternatively, unexpected data has been input, or storage has been overwritten.

The code aaa/bbbb is a 3-digit hexadecimal MVS code (if applicable), followed by a 4-digit alphanumeric CICS code. The MVS code is a system completion code (for example, 0C1 or D37). If an MVS code is not applicable, this field is filled with three hyphens. The CICS code is an abend code or a number referring to a CICS message (for example, AKEA is a CICS abend code; 1310 refers to message DFHTS1310).
**System action**

An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

Notify the system programmer. If CICS is still running, it is necessary to decide whether to terminate CICS.

Look up the MVS code, if there is one, in the z/OS MVS System Codes manual.

Next, look up the CICS abend code. This tells you, for example, whether the error was a program check, an abend, or a runaway, and may give you some guidance concerning user response.

If module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If you cannot run without the full use of module *modname* you should bring CICS down in a controlled shutdown.

For further information about *code*, see the Troubleshooting and support.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**XMEOUT parameters/Message inserts**

1. applid
2. *aaa/bbbb*
3. *X'offset'*
4. *modname*

**Destination**

Console

DFHZC0002  *applid* A severe error (code X'code') has occurred in module *modname*.

---

**Explanation**

An error has been detected in module *modname*. The code X'code' is the exception trace point ID which uniquely identifies what the error is and where the error was detected.

**System action**

An exception entry (code X'code' in the message) is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

This indicates a possible error in CICS code. The severity of its impact depends on the importance of the function being executed at the time of the error.

CICS may not have been terminated. If the message occurs once and module *modname* is not crucial to the running of your CICS system, you may decide to continue to run and bring CICS down at a convenient time to resolve the problem.

If the message recurs or if you cannot run without the full use of module *modname*, you should bring CICS down in a controlled shutdown.

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Console

DFHZC0003  *applid* Insufficient storage (code X'code') in module *modname*.  

---

Chapter 2. CICS messages
Explanation
A CICS GETMAIN was issued by module modname, but there was insufficient storage available to satisfy the request.

The code X'code' is the exception trace point ID which uniquely identifies the place where the error was detected.

System action
An exception entry is made in the trace table (code X'code' in the message). A system dump is taken, unless you have specifically suppressed dumps in the dump table. CICS will continue unless you have specified in the dump table that CICS should terminate.

If appropriate, an error return code is sent to the caller of this domain. In this case, CICS could be terminated by the caller. A message will be issued to this effect. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Inform the system programmer.

Try increasing the size of the DSA or EDSA. See the Configuring or the Improving performance for more information on CICS storage.

Module:
DFHTCRP, DFHZGRP

XMEOUT parameters/Message inserts
1. applid
2. X'offset'
3. modname

Destination
Console

DFHZC0004 applid A possible loop has been detected at offset X'offset' in module modname.

Explanation
A CICS function is taking more time to process than CICS expects. A possible loop has been detected in module modname at offset X'offset'. This is the offset of the instruction which was executing at the time the error was detected.

System action
An exception entry is made in the trace table. A system dump is taken, unless you have specifically suppressed dumps in the dump table.

CICS continues unless you have specified in the dump table that CICS should terminate. If appropriate, an error return code is sent to the caller of this domain. In this case CICS could be terminated by the caller (for example, the domain manager, DFHDMDM). A message is issued to this effect.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Notify the system programmer. If CICS has not been terminated, it is necessary to decide whether the problem is serious enough to bring CICS down.

Since some CICS functions can use a lot of processor time, this message may have been caused by a long-running function. So there may not be an error here. Usually, CICS purges a CICS function which exceeds the runaway task time interval which you have specified in the SIT (this is the ICVR which is measured in milliseconds). This means that module modname in the message is terminated and CICS continues.

But if you have declared ICVR=0 in the SIT and you consider that module modname has gone into a loop, you have to terminate CICS in order to terminate the runaway function.

If CICS has terminated module modname, and you consider that it was not a runaway, you should increase the ICVR time interval in the SIT. You have to bring CICS down at a suitable time to do this permanently. But you can change the ICVR time interval temporarily online, using the CEMT transaction.

If raising the ICVR time does not solve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Destination
Console
A predatory takeover has forced VTAM to allow another application to open the ACB which CICS was using.

**Explanation**

A predatory takeover is occurring. This means that a job is initializing which has the same applid as the CICS system. This initiates a takeover of the network. As a normal part of this process, VTAM drives the TPEND exit.

**System action**

All requests on VTAM sessions are abnormally terminated and the sessions closed. The VTAM ACB is then opened by the application which is using the same APPLID as the CICS region. The new system recovers any persisting sessions.

**User response**

If this takeover of the network was unintentional, you can prevent it happening in future by using RACF to protect the APPLID. Refer to the VTAM application security section in the z/OS Communications Server: SNA Network Implementation Guide, SC31-6434 for details of how to do this.

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid

**Destination**

CSNE and Console

A node initialization block (NIB) has been passed to CICS by VTAM during a persistent sessions restart. An attempt was made by CICS to match the NIB to a session TCTTE. The reason code explains the cause of the mismatch.

**Reason**

1. Single/parallel session indication did not match.
2. LU type did not match.
3. LU type and single/parallel session did not match.

**System action**

The attempt to match a persisting session with a TCTTE has failed. The session is unbound. CICS ignores this session and continues with the next session if there is one.

**User response**

The production of this message means that there is no suitable global catalog record to match the NIB which VTAM has passed in. This implies that the wrong global catalog is being used for this initialization of CICS, or that the catalog records are corrupted. Ensure that the global catalog being used is correct.

**Module:**

DFHZGPC

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. sessid
5. X’n’

**Destination**

CSNE

**Explanation**

During persistent sessions restart VTAM has returned more node initialization blocks (NIBs) than the current CNOS session limit values require. This is probably because a CNOS from a high session limit to a lower session limit was in progress when CICS failed.
**System action**

The process NIB function is terminated. The session is unbound. CICS ignores this session and continues with the next session if there is one.

This situation has no effect on the restored CICS. The last catalogued CNOS values are restored.

**User response**

None.

**Module:** DFHZGPC

CSNE

**DFHZC0120I** applid VTAM sessions persisted for a cold or initial start. Sessions terminated. Inquire issued icount, sessions persisting spcount, sessions terminated stcount.

**Explanation**

CICS is initializing with a cold or initial start, but some VTAM sessions have persisted from a previous CICS with a nonzero PSDI value.

CICS has attempted to terminate all persisting sessions. The message inserts are as follows:

- **icount** is the number of VTAM INQUIRE OPTCD=PERSESS commands issued.
- **spcount** is the number of VTAM sessions that persisted.
- **stcount** is the number of sessions that CICS has terminated with a CLSDST or TERMSESS macro. This should be equal to **spcount**. If it is not, persistent session recovery probably failed. Earlier messages explain why.

If there are no earlier messages, it is possible that the count obtained from the VTAM INQUIRE counts macro, indicating the number of active sessions, was not equal to the number of sessions that VTAM held persisting. This is not a problem.

**System action**

CICS continues.

**User response**

None.

Console

DFHZC0130 applid VTAM INQUIRE PERSESS failed. Cannot restore any persisting sessions. RTNCD,FDB2: X'rc',X'fd'. Code: X'code'

Explanation
CICS is processing VTAM persistent sessions but VTAM returned a RTNCD,FDB2 of rc,fd in response to the INQUIRE OPTCD=PERSESS macro.

System action
An AP exception trace entry, X'code', is made.
A system dump is taken unless dumps have been specifically suppressed in the dump table.
If this occurs during initialization, CICS terminates.
If this occurs during a dynamic open of the ACB, CICS closes the ACB and continues to run without VTAM.
The sessions persist until the PSDI value times out or until VTAM operator commands are issued to terminate the sessions. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Use the dump or the exception trace entry and the z/OS Communications Server: SNA Programming to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct it.
If the problem occurs during initialization, try to correct the error and then retry the start up, or wait until the PSDI value time expires and restart CICS.
If the problem occurs when the ACB was opened dynamically, you can repeat the command to open the VTAM ACB, or wait until the PSDI time expires and then repeat it.

**Explanation**
An error has prevented the recovery of an APPC
corveration which persisted across an emergency
restart.
The session with a termid of *termid* is terminated. The
reason and the corresponding AP exception trace entry
are indicated by the *instance* in the message;

**Instance**

**Point ID and explanation**

1. X'FB79' SEND not executed due to invalid bracket state.

2. X'FB7B' Insufficient storage for session recovery.

3. X'FB76' Recovery status byte TCTE_PRSS contains an unexpected value.

4. X'FB7A' RECEIVE not executed due to invalid bracket state.

5. X'FB78' Unexpected sense received during persistent sessions recovery.
An AP exception trace with a point ID as above is issued. The session is terminated and CICS continues.

If recovery failed due to insufficient storage, try increasing the DSA or EDSA size limits (see the Developing system programs for CICS). If any of the other instances occur, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHZC0148 date time applid termid VTAM send or receive failed during persistent sessions recovery.
sense ((instance) Module name: {DFHZGDA | DFHZGDA})

As part of session recovery following a persistent session restart CICS issued a VTAM SEND or RECEIVE. The VTAM request failed leaving the session in an unknown state. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense , see message DFHZC2400.

System action
The session is terminated.

To determine the cause of the problem, see the associated DFHZCnnnn message in the CSNE log. This message gives further diagnostic information on the failing VTAM request.

Module: DFHZGDA

Destination
CSNE

DFHZC0149 date time applid termid Connection failure occurred during a persistent sessions restart
sense ((instance) Module name: {DFHZNSP})

During a persistent sessions restart, CICS has been notified of the failure of a session initiation request issued during the previous instance of CICS. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense , see message DFHZC2400.

System action
Processing continues.

DFHZC0150 date time applid termid Error
processing the session state
data returned after a persistent
sessions restart. sense ((instance)
Module name: {DFHZXRC | DFHZXRC | DFHZXRC | DFHZXRC | DFHZXRC | DFHZXRC | DFHZXRC | DFHZXRC | DFHZXRC | DFHZXRC | DFHZXRC | DFHZXRC})

Explanation
The VTAM session for terminal termid persisted during a CICS persistent sessions restart, but an error occurred while processing the session state data returned by VTAM. The reason is indicated by the instance in the message as follows.

Instance Explanation
01 DFHZXRC called with an invalid request.
02 TCTTEDA contains null characters instead of the expected address.
03 Reserved
04 The vector key of the data passed by VTAM is not correct.
05 The length of the vector_29 data is too short.
06 Unidentified cleanup action detected.
07 Unidentified recovery option detected.
08 Invalid cleanup action for RECOVOPTION(NONE).
09 Invalid cleanup action for RECOVOPTION(MESSAGE).
10 Invalid cleanup action for RECOVOPTION(TRANSACTION).
11 Reserved.
12 DFHZXRC has been driven to process an LU6 session.
13 Neither XRF nor persistent sessions recovery is in progress DFHZXRC has been called in error.

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
The state of the session after the persistent sessions restart cannot be determined, and the session is terminated in order to reset the states. Non-APPC sessions are restarted.

User response
If the session is not successfully restarted, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

CSNE

**DFHZC0152** *date time applid termid* Signon of user at termid *termid* failed following a persistent sessions restart. Return code *rc* was received from the user domain.

**Explanation**

CICS attempted to sign on a user following a persistent sessions restart. The user domain replied with one of the following return codes:

**Return code**

**Explanation**

005  
The user is already signed on.

006  
The userid is not authorized for this terminal.

008  
The user's access to the specific group has been revoked.

009  
The security label associated with the userid in the ESM does not have the necessary authority.

010  
The userid was not contained in the group specified.

011  
The userid has been revoked.

012  
The userid is not known to the ESM.

015  
SEC=NO was specified in the SIT.

016  
The ESM is not responding.

017  
The ESM is not responding.

018  
The ESM returned a response which was not recognized by the CICS security domain.

27  
The user domain returned a disaster response.

**System action**

An AP exception trace with point ID FB9B is issued.
The terminal is available but the user is not signed on to it. The terminal has the attributes of the default user.

**User response**

Note the return code and take the necessary action. Look for messages output earlier by the ESM or the security domain. If no reason can be found:

CSNE

**DFHZC0153**

*date time applid* A catalog write failed in the restart timer program.

**Explanation**

The restart timer program DFHZRTP has failed in an attempt to write a timer record to the catalog. If no timer records are written to the catalog terminals will not be signed on again after a Persistent Sessions restart.

**System action**

An exception trace is output.

**User response**

Investigate the cause of the error. There may be a problem with the global catalog. Look for other messages confirming this.

**Module:**
DFHZRTP

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid

**Destination**
CSNE

**DFHZC0154**

*date time applid* Timed start or cancellation of the restart timer program failed.

**Explanation**

A timed start or cancellation of the restart timer program DFHZRTP failed. This means that no timer records will be written to the global catalog and terminals will be timed out if a Persistent Sessions restart occurs.

**System action**

CICS initialization continues. In the event of a Persistent Sessions restart terminals will not be signed on.

**User response**

Look for earlier messages and trace entries output by the timer domain which may indicate the reason for the failure. The most likely reason is that CICS is short on storage.

Chapter 2. CICS messages 2299
Explanation

The VTAM APPC session sysid termid persisted during a CICS persistent session restart, but an error occurred while processing the session state data returned by VTAM following an OPNDST OPTCD=RESTORE.

If the error needs further investigation, a dump is taken.

No dump is taken if one has already been taken for an earlier problem, or if the problem is known as one for which a session cannot be allowed to persist. An example of this is bind security processing not completing for this session when CICS terminated.

The reason and the corresponding AP exception trace entry are indicated by the instance in the message.

**Instance**

**Point ID and Explanation**

1

X'FBFD'

During reject attach processing a call was made to DFHZGDA but DFHZGDA rejected the call with invalid format or invalid function.

2

X'FBFD'

An error occurred during reject attach processing. The session is in an unknown state.

3

X'FBD2'

The TCTE_PRSS status byte was set to 0 but reject attach processing was not taking place. This session state is not valid for entry to DFHZXPS.

4

X'FBE4'

An error occurred during DEALLOCATE ABEND processing. This will have been handled by DFHZGDA so no dump is taken but the session is terminated.

5

X'FBD2'

The TCTE_PRSS byte (persistent sessions status byte) contained an unknown value on entry to DFHZXPS.

6

X'FBE6'

The TCTE_PRSS_CV29_PTR (pointer to data returned by VTAM) contained zeroes on entry to DFHZXPS.

7

X'FBD3'

The CV29 data returned from VTAM had a zero length on entry to DFHZXPS.

8

X'FBD4'

The BIS flow data returned by VTAM showed BIS RQE1 received but the outbound BIS flow was not consistent with this.

9

X'FBD4'

The BIS flow data returned by VTAM showed BIS RQE3 received but the outbound BIS flow was not consistent with this.

10

X'FBD4'

The BIS flow data returned by VTAM showed that no BIS flow had been received but the outbound BIS flow was not consistent with this.

11

X'FBD4'

The BIS flow data returned from VTAM was not recognized.

12

X'FBD5'

The bid flow data returned by VTAM showed a request that was not recognized where this session is the contention winner.

13

X'FBD5'

The bid flow data returned by VTAM showed that a negative X'088B' response had been sent but there was nothing to indicate that the session was closing down. This session is the contention winner.
The bid flow data returned by VTAM contained a response that was not recognized where this session is the contention winner.

The bid flow data returned by VTAM was not recognized. This session is the contention winner.

The bid flow data returned by VTAM contained a request that was not recognized where this session is the contention loser.

The bid flow data returned by VTAM contained a negative X'088B' response but there was nothing to indicate that the session was closing down. This session is the contention loser.

The bid flow data returned by VTAM contained a response that was not recognized where this session is the contention loser.

The bid flow data returned by VTAM was not recognized. This session is the contention loser.

The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the primary and the last flow was an outbound response.)

The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the primary and the last flow was an inbound response).

DFHZXPS could not determine the direction of the last flow from the CV29 data returned by VTAM. (This session was the primary).

The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the secondary and the last flow was an inbound request.)

The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the secondary and the last flow was an outbound request.)

The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the secondary and the last flow was an inbound request).

The RU category returned by VTAM in the CV29 data was not valid for LU6.2. (This session was the secondary and the last flow was an outbound request).

CICS could not determine the direction of the last flow from the CV29 data returned by VTAM. (This session was the secondary.)

The last_byte_to_flow byte contained an invalid value. This indicates a logic error in DFHZXPS.
The last flow was an inbound command that could not be identified.

The last flow was an outbound LUSTAT command that could not be identified.

The last flow was an outbound RTR request that was not processed by the bid analysis routine.

The last flow was an outbound command request that could not be identified.

The last flow was an inbound command that could not be identified.

The last flow was an inbound response to BIS that was not processed with the BIS flow data.

The last flow was an inbound positive response to a command that could not be identified.

The last flow was an inbound response to an LUSTAT command but there was no corresponding outbound request.

The last flow was an inbound negative response to an LUSTAT request which could not be identified.

The last flow was a negative response inbound to a BIS request that did not show up in the BIS flow data.

The last flow was a negative response inbound to a command that could not be identified.
The last flow was a positive response outbound to BIS that was not consistent with the BIS flow data.

51
X'FBDD'
The last flow was a positive response outbound to a command that could not be identified.

52
X'FBDC'
The last flow was a negative response outbound to BIS that was not consistent with the BIS flow data.

53
X'FBDD'
The last flow was an outbound negative response to a command that could not be identified.

54
X'FBE1'
The last request to flow was SIGNAL (expedited flow) but no normal flow data appears in the CV29 normal flow data area.

55
X'FBE1'
The last flow was a SIGNAL request (expedited flow). However analysis of the normal flow data shows both sides sending which is not possible. (Outbound flow was with EC.)

56
X'FBE1'
The last flow was a SIGNAL request (expedited flow). However analysis of the normal flow data shows both sides sending which is not possible. (Outbound flow was in chain.)

57
X'FBD5'
The tctewin/tctelse bits in the TCTTE have not been set correctly.

58
X'FBDF'
The session is not in CS mode when analysis of the CV29 data shows that a call to DFHZGDA to ABEND the current transaction is required.

59
X'FBE7'
A SEND_FMH7 call to DFHZGDA was rejected with invalid_format or invalid_function.

60
X'FBE7'
A SEND_FMH7 call to DFHZGDA was rejected because of a disastrous error in DFHZGDA.

61
X'FBE7'
A RECEIVE_FMH7 call to DFHZGDA was rejected with invalid_format or invalid_function.

62
X'FBE7'
A RECEIVE_FMH7 call to DFHZGDA was rejected because of a disastrous error in DFHZGDA.

63
X'FBE0'
Internal DFHZXPS logic error. The input parameters are invalid when a call is about to be made to DFHZGDA.

64
X'FBE5'
An invalid return code was received from a call to DFHTCPCL with ENTRY=DFHZRST1.

65
X'FBDE'
The tcte_bid_status byte contained an unrecognized value.

System action
An AP exception trace with a point ID is issued. The state of the session after the restart cannot be determined, and the session is terminated in order to reset the states. The session is restarted. A system dump is produced for all instances except 04.

User response
If the session is not successfully restarted, check the CSNE log for messages indicating why the new BIND failed. The session may have been set out of service by the VTAM operator.

CSNE

DFHZC0157 date time applid sysid VTAM APPC session termid could not be recovered following a persistent sessions restart. The session will be unbound. sense (instance) Module name: {DFHZXPS}  

Explanation
CICS was unable to restore the APPC persisting session for sysid termid following a persistent sessions restart. There are three possible reasons for this:

1. The BIND processing was incomplete when CICS failed.
2. Resynchronization was in progress for the session when CICS failed.
3. The recovery data returned by VTAM for the session was capable of more than one interpretation.

The TCTTE and TIOA are output for information only.

System action
The session is unbound and rebound.

User response
None.

Module: DFHZXPS

8. Value chosen from the following options:
   1=DFHZXPS

Destination
CSNE

DFHZC0158 date time applid Persistent sessions signon data for terminal termid could not be written to the catalog.

Explanation
CICS was attempting to write signon data for termid to the global catalog so that the signon status could be recovered after a persistent sessions restart, but the catalog write failed.

System action
An exception trace is output. Loss of the data may mean that termid will not be signed on or off correctly after a persistent sessions restart.

User response
Investigate the cause of the error. Look for earlier messages and trace entries from the catalog domain indicating the cause of the error, for example the catalog may be full.
**Module:**
DFHZSGN, DFHZPCT, DFHSNTU

**XMEOUT parameters/Message inserts**

2. time
3. applid
4. tranid

**Destination**
CSNE

**DFHZC0160**

| date time applid tranid CNOS changes for modename modename to node netname connection sysid are incomplete. |

**Explanation**
CICS has made two attempts to implement the change number of sessions (CNOS) command for the modename `modename` on the APPC connection `sysid`. The command was not successful because of other activity on the modegroup. This only happens on modegroups which are very busy. The state of one or more of the sessions has changed during the processing of the CNOS request.

The CNOS command results from a connection acquire, a connection release, or a request for a specific modename on this system or the connected system. If the connected system is not CICS, commands specific to that system may have been used.

**System action**
The modegroup is left in the state reached after the second attempt to implement the changes.

**User response**
Use the CEMT INQUIRE MODENAME command to determine the current state of the modegroup. The command may show the modegroup as you expect for successful CNOS completion. This is because the command only shows data for available and active sessions. CICS may have had problems with CNOS values for loser sessions, which would not be apparent by using CEMT. If the values are not as required, reissue the original command.

**Module:**
DFHZGCA

7. sysid

**Destination**
CSNE

**DFHZC0161**

| date time applid tranid CNOS command for modename modename to node netname connection sysid has failed with code X'code'. |

**Explanation**
CICS has encountered an error while attempting to execute a change number of sessions (CNOS) command for the modename `modename` on the APPC connection `sysid`. The failure code `X'code'` is one of the following:

- X'FBA2'
The request to create a lock manager lock for `modename` failed.
- X'FBA3'
CICS could not allocate a session for the CNOS negotiation conversation.
- X'FBA6'
The request to obtain a lock manager lock for `modename` failed.
- X'FBAA'
`modename` was not found or has been defined with one of the reserved names SNASVCMG or CPSVCMG.
- X'FBA8'
`sysid` is known, but not as a connection.
- X'FBAC'
The specified connection `sysid` has no modegroups. This is probably caused by a storage overwrite.
The first modegroup on the specified connection sysid has no sessions. This is probably caused by a storage overwrite.

The receive command for the CNOS reply failed.

The send command for the CNOS command or CNOS reply failed.

The session for the single-session connection could not be found. This is probably caused by a storage overwrite.

sysid is not a known connection name.

The connection is defined to CICS as not supporting CNOS. This is probably caused by a storage overwrite.

CICS sent a CNOS command for a specific modename but the partner system returned a CNOS reply indicating all modegroups. This is a protocol violation.

CICS makes an exception trace with ID AP xxxx; where xxxx is the code in the message. CICS takes a system dump for all failure codes except X'FBA2', X'FBA3', X'FBA6', X'FBAF', X'FBAB', and X'FBAC9'. CICS continues without completing the request. The task does not abend. Message DFHME0116, which contains the symptom string for this problem, is produced.

This depends on the error code as follows:

Follow the guidance given for the lock manager console message that precedes this.

If all the sessions are busy, make one available and retry.

Follow the guidance given for the lock manager message that precedes this.

Reissue the request with the correct modename.

Reissue the request with the correct connection name.

See the Troubleshooting and support for further guidance on storage problems.

Same as for X'FBAC9'.

Same as for X'FBAF'.

Same as for X'FBAF'.

Same as for X'FBAC9'.

Same as for X'FBAC9'.

Investigate why the connected system is not following the APPC protocols.

DFHZGCN

1. date
2. time
3. applid
4. tranid
5. modename
6. netname
7. sysid
8. X'code'

CSNE

DFHZC0162 date time applid tranid CNOS transaction for connection sysid
has failed with code X'code'
subcode X'subcode'.

**Explanation**

The change number of sessions (CNOS) transaction program DFHZLS1 could not complete successfully. The error code X'code' is one of the following:

- **X'FB92'**
  
  The transaction was not started as an IC request with data or by an attach flow from a connected system. The insert subcode is the start code from XMIQ_START_CODE.

- **X'FB93'**
  
  The transaction was started with data, but no data was found.

- **X'FB94'**
  
  The transaction was started with data, but the data was not in the form of the correct parameter list.

- **X'FB95'**
  
  The transaction was started with the correct format parameter list, but the function code was invalid.

- **X'FB96'**
  
  The transaction was started by an attach from a connected system but there was no CNOS data.

- **X'FB97'**
  
  The transaction was started by an attach from a connected system but the associated data was not a CNOS command.

- **X'FB9E'**
  
  The transaction was started but CICS is shutting down and the VTAM ACB is closed.

  This may have occurred because a number of CLS1 tasks were started before shutdown was issued but are held up because CICS was at MAXTASK. During shutdown the VTAM ACB was closed and this task was then started.

**System action**

CICS produces an exception trace, and except for in the case of an invalid start, a system dump is taken. The task terminates. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

This depends on the error code as follows:

- **X'FB92'**
  
  The transaction was probably started by entering the transaction ID at a terminal. This is not allowed.

- **X'FB93'**
  
  Analyze the dump to determine why IC could not find the data.

- **X'FB94'**
  
  Analyze the dump to determine what the data was.

- **X'FB95'**
  
  Analyze the dump to determine what the data was.

- **X'FB96'**
  
  Analyze the dump to determine why no data was available.

- **X'FB97'**
  
  Analyze the dump to determine why the correct data was not sent with the attach.

- **X'FB9E'**
  
  No action to take.

DFHZC0167 date time applid termid An attempt to sign off a user at termid termid failed following a multinode persistent sessions restart. Response code rc1 and reason code rc2 were received.

Explanation
CICS attempted to sign off a user at termid termid because of a signon timeout following a multinode persistent sessions restart. An exception or disaster response was received from the signon program DFHSNTU with one of the following reason codes:

Reason code
Explanation

002
There is no active ESM.

003
The ESM is not responding.

010
The terminal type is invalid for this operation.
The terminal has preset security.

Security is not active for this CICS.

The terminal is a surrogate terminal.

The ESM returned a response which was not recognized by the CICS security domain.

The signon program went into recovery following an ABEND.

The signon program detected a loop and went into recovery.

The signon program received a bad response from transaction manager.

System action
An AP exception trace with point ID FB9D is issued.

User response
Reason codes 002, 003, 019 and 028 indicate a problem with the ESM or the security domain. The remaining reason codes may indicate an internal error in CICS. Look for messages output earlier by the ESM or the security domain. If security was active when the problem occurred and there was no problem with the ESM or the security domain contact your IBM support center.

DFHZC0171 applid CICS registration as a VTAM generic resource in the group grname failed. VTAM return code: X'rc'. FDB2: X'fd'.

Explanation
CICS failed to register as a VTAM generic resource in the group grname.

System action
An AP exception trace entry is output with trace point FB8E.

CICS continues without generic resource support.

User response
Use the z/OS Communications Server: SNA Programming to determine the meaning of the RTNCD,FDB2 and the actions necessary to correct the problem.

When the problem has been corrected a further attempt may be made to register CICS as a generic resource by closing and reopening the VTAM ACB.
Module: DFHZGSL

Destination
Console

DFHZC0172I applid CICS deregistered successfully from VTAM generic resource name grname.

Explanation
CICS has deregistered from VTAM generic resource group grname.

System action
None. CICS will not reregister to the generic resource until the VTAM ACB has been closed and opened again.

User response
None.

Module: DFHZGSL

XMEOUT parameters/Message inserts

1. applid
2. grname

Destination
Console

DFHZC0173 applid CICS deregistration from VTAM generic resource name grname failed. VTAM return code: X'rc'. FDB2: X'fd'.

Explanation
CICS failed to deregister from VTAM generic resource group grname.
VTAM returned a RTNCD,FDB2 of rc,fd in response to the SETLOGON OPTCD=GNAMEDEL macro.

This may be due to a hardware failure in another part of the sysplex or to corruption of the TCT prefix causing CICS to attempt to deregister with the wrong name.

System action
An AP exception trace entry is output with a trace point of X'FB8E'.

User response
Use the z/OS Communications Server: SNA Programming to determine the meaning of the register 15 and register 0 values output by VTAM. If the problem is not caused by use of the wrong version of VTAM, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHZGLS

1. applid
2. grname
3. \x{5c}rc\x{27}
4. \x{5c}fd\x{27}

Destination
Console

DFHZC0174 applid Control block initialization has failed. Generic resource registration or deregistration will not be attempted. Return codes r15,r0.

Explanation
A call to a VTAM macro to initialize the node initialization block (NIB) before registering or deregistering as a VTAM generic resource has failed.
A possible explanation is that the wrong level of VTAM is being used.

System action
The values of register 15 and register 0 returned by VTAM are output.
An exception trace is output with trace point X'FBED'.
If registration was about to be attempted, CICS continues without generic resource support.
If deregistration was about to be attempted, ACB shutdown continues. VTAM removes CICS as a member for the generic resource name when the ACB is closed.

User response

Use the z/OS Communications Server: SNA Programming to determine the meaning of the register 15 and register 0 values output by VTAM. If the problem is not caused by use of the wrong version of VTAM, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

1. applid
2. r15
3. r0

Destination

Console

DFHZC0175 applid A value was specified for GRNAME but the assemble time or run time VTAM does not support generic resource registration.

Explanation

A value was specified for the GRNAME system initialization parameter. This indicates that CICS is to register as a VTAM generic resource. However, either DFHTCTxx was assembled against a release of VTAM that cannot support generic resource registration, or CICS is running on a VTAM earlier than release 4 version 2.

System action

CICS sets the generic resource name to blanks and continues without attempting generic resource registration.

User response

If you are running with ACF/VTAM Release 4 Version 2 or higher, reassemble the TCT against this level of VTAM in order to take advantage of CICS support for generic resource registration.

To prevent this message being issued when using an earlier release of VTAM, do not specify a value for the GRNAME system initialization parameter.

Module: DFHZSLS

XMEOUT parameters/Message inserts

1. applid

Destination

Console

DFHZC0176 date time applid VTAM was unable to execute a CHANGE OPTCD=ENDAFFIN macro to end an affinity between this application, which is a member of generic resource grname, and a remote LU with netid netid netname netname. VTAM return code: X'rc', FDB2: X'fd', R15: X'r15'.

Explanation

An attempt was made to end an affinity between this CICS, which is a member of generic resource grname, and a remote LU with netid netid and netname netname by means of a SET CONNECTION ENDAFFINITY or PERFORM ENDAFFINITY command. The attempt has failed because a problem with VTAM prevented the VTAM CHANGE OPTCD=ENDAFFINITY macro from being issued.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'rc',X'fd' in response to the CHANGE OPTCD=ENDAFFINITY macro.

R15 r15 is the register 15 value returned by VTAM.

System action

Processing continues. VTAM has made no attempt to end the affinity.

User response

See the z/OS Communications Server: SNA Programming for the meaning of the RTNCD,FDB2 and for guidance on correcting the problem.

When the problem has been corrected retry the command.

Module: DFHZGCH

2. time
Destination
CSNE

DFHZC0177  date time applid Connection
sysid has created an affinity
between this application, which
is a member of generic resource
gname, and a remote LU with
netid netid netname netname.

Explanation
A generic resource member has established an
APPC synlevel 2, APPC limited resource, or LU6.1
collection with another LU. For connections of these
types VTAM creates affinities which are owned by CICS
and have to be ended by the CICS operator using
the SET CONNECTION ENDAFFINITY or PERFORM
ENDAFFINITY command. The message is output
whenever the connection is acquired but the affinity
is not recreated for each acquire unless it has been
ended in the meantime.

System action
Processing continues.

User response
None, but note that the affinity has to be ended before
the partner LU can establish a connection with another
generic resource member.

The affinity may be ended automatically by the
connection quiesce transaction when the connection is
released. However, it is not done if the system crashes
or is shut down 'immediate' whilst the connection is
still acquired.

DFHZC0182 date time applid VTAM was unable to execute an INQUIRE OPTCD=NQN macro to determine the network qualified netname of logical unit luname. VTAM return code: X’rc’, FDB2: X’fd’, R15: X’r15’.

Explanation

CICS has attempted to determine the network qualified netname of logical unit luname. The attempt has failed because a problem with VTAM prevented the VTAM INQUIRE OPTCD=NQN macro from being issued.

VTAM has issued the return code-feedback (RTNCD,FDB2) X’rc’,X’fd’ in response to the INQUIRE OPTCD=NQN macro.

R15 r15 is the register 15 value returned by VTAM.

System action

The CICS component which requires the network qualified name of the logical unit decides whether further action is called for.

User response

See the z/OS Communications Server: SNA Programming manual for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.

Module:
DFHZGIN

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. luname
5. X’rc’
6. X’fd’
Explanation

CICS has attempted to determine the member of a generic resource set \textit{grname} to which logical unit \textit{netid.luname} is logged on. The attempt has failed because a problem with VTAM prevented the VTAM INQUIRE OPTCD=SESSNAME macro from being issued.

VTAM has issued the return code-feedback (RTNCD,FDB2) X'rc',X'fd' in response to the INQUIRE OPTCD=NQN macro.
R15 \textit{r15} is the register 15 value returned by VTAM.

System action

The CICS component which requires the member name decides whether further action is called for.

User response

See the z/OS Communications Server: SNA Programming manual for the meaning of the RTNCD,FDB2 code and for guidance on correcting the problem.

8. X'fd'
9. X'r15'

Destination

CSNE
**Explanation**

Node `nodeid` attempted to log on to CICS but the logon is invalid.

The `nodeid` in the message always starts with the netname of the node attempting to connect to CICS. For some instances of the message resulting from an APPC log on, the modename of the session is concatenated to the netname with a dot separator. Since a string consisting of eight blanks is the default modename, this can lead to idiosyncratic formatting of the message.

If the message is issued by DFHZATA, CICS has failed in its attempt to autoinstall the terminal or connection.

The instance `instance` is one of the following:

1

   During the acquire process for a secondary session CICS attempted to add the membername of the partner to a table but this name already exists for a different generic resource connection.

2

   During the acquire process for a secondary session CICS attempted to add the membername of the partner to a table but this name has just been used as the netname of a terminal by an install occurring at the same time as the install of this connection.

**System action**

The acquire of the connection continues.

**User response**

Use the instance number to determine why the netname already exists:

1

   Use the CEMT INQUIRE CONNECTION API to see which generic resource has the same membername.

   Since this problem should not occur under normal circumstances, you may need further assistance from IBM.

2

   Investigate why the LU name of the partner is the same as the LU name of a terminal and remove one of the definitions.

**DFHZC2115**

`applid termid` Potential CICS hang detected following a SEND to node `netname`, CID `X'cid'`. Investigation is required. `((instance) Module name: (DFHZRAC))`

**Explanation**

A SEND response issued on a receive-any RPL failed, or was not accepted by VTAM. This imbed is inserted in DFHZC `xxxx` messages with `sense` inserts. For the meaning of `sense`, see message DFHZC2400.
Additionally, while the RPL is hanging, a normal CICS shutdown might be unable to complete.

The CID is the 32-bit VTAM communication identifier which was assigned when the session was established.

**System action**

CICS continues to monitor for the SEND operation to complete. Until this happens, CICS reissues this message at approximately three minute intervals.

**User response**

This problem is usually caused by a failure in the network which stops the SEND completing. Check the session and the associated logical unit to ensure that there is no error condition which stops VTAM completing the SEND request.

**Module:**

DFHZRAC

Console

DFHZC2116 E  date time applid
Resynchronization of LU6.1 session termid with remote system sysid failed.

**Explanation**

Resynchronization of an LU6.1 session with a remote system has failed to complete for one of the following reasons:

1. There is an apparent inconsistency between the sequence numbers in the two systems
2. There was a protocol error during the exchange of the sequence numbers
3. Neither system requested resynchronization, but there was a shunted unit of work associated with the session.

**System action**

1. A system dump is taken unless dumps have been specifically suppressed in the dump table.
2. The TCTTE for the session on which the error occurred is printed. The local system's sequence numbers, and the numbers or responses received from the remote system can be found in the TCTTE.
3. The failure of resynchronization is reported to recovery manager. Recovery manager issues diagnostics relating to any unit of work affected by the failure.

**User response**

1. Determine whether changes to data in the local and remote system are synchronized. Diagnostics issued by recovery manager will help you to do this. If necessary, take action to resynchronize the data.
2. Determine why the resynchronization failure happened. You will normally need assistance from IBM to do this. See Working with IBM to solve your problem for guidance on how to proceed.

CSNE

DFHZC2118 applid Receive Any stall for netname netname.

**Explanation**

All the CICS Receive Any RPLs have been posted but the TCTE for each one is waiting for a response from a VTAM terminal or session. All the Receive Any RPLs have been stalled for 10 dispatches of the TCP task (CSTP). This message is produced for each session that is in this situation. A VTAM session has not responded to a command such as BID or SHUTD sent by CICS. This is typically caused by a protocol error.

**System action**

CICS is NOT running with system initialization parameter RAPOOL=(n,n,FORCE) so CICS VTAM activity is held up until one of the commands completes.

**User response**

Issue the VTAM command V NET,INACT,ID=netname,I for one or more of the sessions indicated by netname, to try and free a Receive Any RPL. Note - if the sessions are LU6.2 then the above command will inactivate the partner APPLID to VTAM.

Investigate why the CICS terminal control commands that have caused the stall have not completed. If this is due to a protocol error from the partner or device, attempt to get the protocol error corrected.

Consider increasing the number of Receive Any RPLs specified in the RAPOOL System Initialization parameter. For instance, if you were using the old default of 2, increase this to the new default of 50.

If you still get this message after changing the RAPOOLO value consider running CICS with system initialization parameter RAPOOL=(n,n,FORCE), which attempts to issue CLSDST for all the offending sessions or terminals and to re-issue the Receive Any RPLs.

DFHZC2300 | APPLID Recovery action requested for connection sysid.

Explanation

The XZIQUE global user exit program has been invoked by CICS because of a potential problem with the connection. The global user exit has used return code UERCAKLL indicating that throughput on the connection is abnormally low and some exceptional action is required. The poor performance of the connection can be caused by:

- Poor response on the receiving end
- Increased load on the sending end.

The condition may be intermittent. Message DFHZC2301 may follow indicating that the connection has recovered.

This message may also occur when the XZIQUE global user exit is disabled but the connection has been at the QUEUELIMIT for MAXQTIME where both parameters are specified in the connection definition.

System action

CICS cancels all transactions which have outstanding queued requests to use the connection.

User response

Investigate the cause of the poor performance of the connection. Check the availability and condition of the connected system.

Console

DFHZC2302 | applid SETLOGON start command rejected

Explanation

CICS issues the SETLOGON START command after a successful OPEN VTAM ACB. The SETLOGON START command is rejected in the following cases:

- The CICS OPEN VTAM ACB was successful, but VTAM subsequently terminated abnormally, or
- The CICS OPEN VTAM ACB was successful, but insufficient system storage was available to satisfy the SETLOGON START command, or
- The CICS OPEN VTAM ACB was successful, but VTAM was subsequently terminated by a VTAM HALT QUICK command.

System action

If the error occurs during CICS initialization, CICS abnormally terminates with a U2302 abend and a system dump.
If the error occurs as a result of a CEMT or EXEC CICS SET VTAM OPEN, CICS terminates the task abnormally with abend code ATC2 and a transaction dump, and the VTAM ACB is closed.

User response

The VTAM return code can be found in RTNCD-FDBK2 in the first RPL in the RA pool addressed from TCTVRVRA in the system dump or the transaction dump.

Use the z/OS Communications Server: SNA Programming manual, (SC23-0115-3), to determine the cause of the error and the actions necessary to correct it.

After correcting the error, either reinitialize CICS (for abend U2302) or follow the suggestions documented for abend ATC2.

Module:

DFHZC2305I  applid Termination of VTAM sessions beginning

**Explanation**
Either CICS or VTAM is being terminated, or a dynamic close of the VTAM ACB has been requested.

**System action**
All CICS-VTAM sessions are closed and the ACB is closed. If termination is not orderly, active transactions are abnormally terminated.

**User response**
When VTAM is active, communication may be resumed by using the main terminal operator command CEMT SET VTAM OPEN.

**Module:** DFHZSHU

**XMEOUT parameters/Message inserts**
1. applid

**Destination**
Console

DFHZC2307  applid CICS VTAM ABNORMALLY QUIESCING (modname).

**Explanation**
An RPL request has completed without a TCTTE token, for other than a VTAM storage shortage.

**System action**
CICS performs a FORCECLOSE of the ACB.
CICS may produce this message twice as both module DFHZRAC and module DFHZSYX may detect the condition.

**User response**
When VTAM has been restarted, issue a CEMT SET VTAM OPEN.

**Module:** DFHZRAC, DFHZSYX

**Destination**
Console

DFHZC2308  applid TCP Task WAIT failed.
Unexpected response from DSSR WAIT_OLDW call (RESPONSE X'xx', REASON X'yy').

**Explanation**
The TCP task wait has failed. The TCP dispatcher module, DFHZDSP, has received an unexpected response, with response code 'X'xx' and reason code 'X'yy' from the DSSR WAIT_OLDW call.

**System action**
CICS abends with abend U1800 and a system dump is produced.

**User response**
Determine the cause of the TCP task wait failure. Investigate the dump in conjunction with any other accompanying error messages or exception trace entries which may have been issued by dispatcher domain.

**Module:** DFHZDSP

**XMEOUT parameters/Message inserts**
1. applid
2. X'xx'
3. X'yy'

**Destination**
Console

DFHZC2309  APPLID Recovery action requested for connection sysid using mode group modename.

**Explanation**
The XZIQUE global user exit program has been invoked by CICS because of a potential problem with the connection. The global user exit has used return code UERCAKLM indicating that throughput on the connection is abnormally low and some exceptional action is required. The poor performance of the connection can be caused by:
- Poor response on the receiving end
- Increased load on the sending end.

The condition may be intermittent. Message DFHZC2310 may follow indicating that the mode group has recovered.
System action
CICS cancels all transactions which have outstanding queued requests to use this mode group.

User response
Investigate the cause of the poor performance of the mode group. Check the availability and condition of the connected system.

Module:
DFHZISP

XMEOUT parameters/Message inserts
1. APPLID
2. sysid
3. modename

Destination
Console

DFHZC2310I  APPLID Connection sysid using mode group modename operating normally following recovery action.

Explanation
Message DFHZC2309 has been issued for this mode group. The mode group has now recovered and is operating normally.

System action
Processing continues.

User response
None.

Module:
DFHSIT

Destination
Terminal End User

DFHZC2316  applid VTAM ACB is closed

Explanation
CICS and VTAM have been disconnected. This may be because:
• CICS is terminating, or
• VTAM is terminating, or
• The CICS main terminal operator has issued

SET VTAM {CLOSED|IMMCLOSE|FORCECLOSE}

System action
The VTAM ACB is closed.

User response
If VTAM has not terminated, connection with VTAM can be reestablished by using main terminal operator commands.

Module:
DFHZSHU

XMEOUT parameters/Message inserts
1. applid

Destination
Console

DFHZC2312  *** WELCOME TO CICS ***
The autoinstall user program progname is not enabled.
Module modname.

Explanation
While opening the VTAM ACB, CICS found that no installed program definition exists for the autoinstall user-program progname specified in the SIT.

System action
Other processing continues.

User response
If you want to use autoinstall, produce an installed program definition for the autoinstall user-program progname specified in the SIT.

Module:
DFHSIJ1, DFHZOPA

XMEOUT parameters/Message inserts

2. xx
3. yy

Destination
Console

CORRUPTED TCTTE ADDRESS FOUND DURING SHUTDOWN.

Explanation
A DFHTC CTYPE=LOCATE macro has returned an error indication while shutting down VTAM. This implies that the TCTTE chain has been corrupted, possibly by an overlay of the table manager control blocks.

System action
CICS is abnormally terminated with a system dump.

User response
Investigate the dump to determine the cause of the problem.

Module:
DFHZSHU

Destination
Console

Date Time Applid CICS Terminal Control shutdown threshold (mm minutes) exceeded. Sessions still active: sesslist ((instance) Module name: (DFHZSHU))

Explanation
CICS' attempt to shut down the network has not been completed within the time period allowed. This time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter.

In the message, mm is the value of TCSWAIT, and sesslist is the VTAM network names of the first 10 (if there are that many) hung VTAM terminals.

System action
CICS issues this message to both the CSNE transient data queue and the operating system console. This message is issued to the operating system console.
with an MVS write to operator (WTO) message descriptor code of 2. This means that the message is held by the operating system (that is, it does not roll off the screen) until the operator deletes it. For each hung VTAM session, message DFHZC2351 is also issued. DFHZC2351 gives further details of the session and is issued only to the CSNE transient data queue. CICS may attempt a FORCECLOSE on the session (see message DFHZC2351 for further details) but otherwise CICS terminal control shutdown continues as normal.

This message, DFHZC2350, is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation's DFHZNEP (node error program). Note however that DFHZC2351 is processed by DFHZNAC and may be intercepted by the installation's DFHZNEP.

**User response**

Note the message, then delete it from the operating system console using the MVS CONTROL E (or KE) system command. See message DFHZC2351 for further guidance.

**Module:**

DFHZSHU

| DFHZC2351          | Date Time Applid termid netname Session still active after TC shutdown threshold expired. Reason: 01 Request in progress | 02 Task still active | 03 Waiting for SHUTC | 04 Waiting for BIS | 05 Waiting for UNBIND | 06 Waiting for RTR | 07 BID in progress | 08 Other TC work pending | 09 Undetermined | sense ((instance) Module name: {DFHZSHU}) |

**Explanation**

CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter. This message is issued for each VTAM terminal that is still active (not shut down) after the time period has expired.

In the message `termid` and `netname` are respectively, the CICS terminal identifier, and the VTAM network name of the hung terminal. One of the following is also included in the message to indicate the reason for the hang:

01

Request in progress

02

Task still active

03

Waiting for SHUTC

04

Waiting for BIS

05

Waiting for UNBIND

06

Waiting for RTR

07

BID in progress

08

Other TC work pending

99

Undetermined

**System action**

CICS may attempt a FORCECLOSE on the session but otherwise CICS terminal control shutdown continues normally. Whether CICS attempts a FORCECLOSE depends upon:

- The coding of the TCSACTN system initialization parameter, and
- How the installation's DFHZNEP (node error program) handles this condition.

If either of the following conditions is true:

- TCSACTN=UNBIND, and this action is not changed by DFHZNEP,
• TCSACTN=NONE, and this action is changed to FORCECLOSE (UNBIND) by DFHZNEP

CICS terminal control issues a VTAM CLSDST and sends an SNA UNBIND command. If neither of the conditions is true, no special action is taken.

Note:
CLSDST is not guaranteed to work in all circumstances.
The first 10 terminals (if there are that many) reported by this message are also included in message DFHZC2350.

User response
Check the state of the terminal. Check whether the associated DFHZC3437 message includes CLSDST. If DFHZC3437 does not include CLSDST, or it does but the CLSDST still fails to complete, take appropriate action outside of CICS to shut down the terminal.

If after a reasonable interval, terminal control shutdown still fails to complete (message DFHZC2316 is not displayed), take one of the following actions:

• FORCECLOSE the CICS/VTAM ACB.
• Perform a CICS CEMT PERFORM SHUTDOWN IMMEDIATE.
• Cancel the CICS job from the operating system console.

Warning: Do not perform one of these actions unless there are no other suitable actions to take.

The reason why the terminal does not shutdown is more likely to be a problem with the terminal device or the network, than with CICS.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TCSWAIT system initialization parameter on future runs of CICS. Once CICS has initialized, TCSWAIT cannot be changed.

CSNE

DFHZC2352 DATE TIME APPLID sysid netname
Intersystem parallel connection still active after TC shutdown threshold expired. ((instance) Module (DFHZSHU)).

Explanation
CICS' attempt to shut down the network has not been completed within the time period allowed. The time period, the terminal control shutdown wait threshold, is specified by the TCSWAIT system initialization parameter. This message is issued for the first VTAM intersystem parallel session in each connection (LU Type 6.1 and LU Type 6.2, but not LU Type 6.2 single-session APPC terminals) that is still active (not shut down) after the time period has expired.

In the message sysid and netname are respectively, the CICS system identifier and the VTAM network name.

System action
If the TCSACTN=FORCE system initialization parameter has been specified CICS will attempt to force close the CICS VTAM ACB, provided that CNOS close processing has completed for LU Type 6.2 parallel session connections, otherwise CICS terminal control shutdown continues as normal. This message is not processed by DFHZNAC (node abnormal condition program), so the condition cannot be intercepted by the installation's DFHZNEP (node error program). Parallel connections reported by this message are not included in message DFHZC2350.
User response

If the TCSACTN=FORCE system initialization parameter has not been specified, or has been specified but the VTAM ACB still does not close, check the state of the connection. Take appropriate action outside of this CICS system to shut down the connection.

If messages DFHZC2350, DFHZC2351, and DFHZC2352 are issued too early or too late in the shutdown process, take appropriate steps to change the TCSWAIT system initialization parameter on future runs of CICS. Once CICS has initialized TCSWAIT cannot be changed.

DFHZC2400 E date time applid termid tranid Error not supported. sense ((instance)
Module name: {DFHZSYX | DFHZSYX | DFHZSYX | DFHZSYX | DFHZSYX | DFHZSYX | DFHZSYX | DFHZSYX})

Explanation

CICS received an unexpected error code from VTAM.

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

The sense data consists of three hexadecimal values - xx yy zzzz, where xx is the VTAM sense information byte, yy is the VTAM sense modifier byte, and zzzz represents two bytes of user sense information. The possible values of xx are as follows:

xx meaning

   X'00' User sense data only (see zzzz)
   X'08' Request reject
   X'10' Request error
   X'20' State error
   X'40' Request header (RH) usage error
   X'80' Path error

For the meaning of yy, see the Systems Network Architecture Formats (GA27-3136) manual.

System action

CICS terminates the session. If a task is attached, it is abnormally terminated with a transaction dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Use the symptom string, and if necessary the transaction dump, to determine the source of the error.

CSNE

DFHZC2402 I  

netname VTAM has returned error on synchronous receive. sense ((instance) Module name: \{DFHZRAS\})

Explanation

VTAM has indicated that a synchronous receive issued by DFHZRAS during receive-any slow-down processing did not complete successfully. This indicates a serious mismatch between CICS's view of the state of the session and that of VTAM. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

The request is ignored. CICS prints the associated session TCTTE on the CSNE transient data destination. The RPL returned by VTAM is included in exception trace entry AP FCA2.

User response

Determine from the RPL in the exception trace why VTAM raised the error.

CSNE

**DFHZC2403 E**  
date time applid termid tranid Bind failure. sense ((instance) Module name: {DFHZSYX | DFHZSYX})

**Explanation**  
An attempt to establish a session has failed. This can be because a physical path to the device could not be found for one of the following reasons:

- The device does not exist
- The device has been defined incorrectly
- The device has rejected the bind

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

If this is a LU62 or LU61 session and the partner LU has sent sense bytes of X'0835nnnn' where nnnn is the offset of the NETNAME in the BIND. This indicates that the partner LU was unable to find a suitable session.

If the sense bytes are X'08010000', this can mean that the partner LU has failed to autoinstall a connection.

If the VTAM RETURN CODE FEEDBACK is X'1018': the logon can be retried once the coupling facility becomes available.

If instance is 1 with sense X'0805', determine if TOR2 was started intentionally with a different APPLID and the same generic resource name and if not, correct the problem. If it was and you need a connection between these two systems you need to end the affinity between AOR and TOR1. The affinity can be ended by:

1. Bring up TOR1, acquire the connection and release it or  
2. Bring up TOR1 and use the CEMT SET CONNECTION ENDAFFIN, CEMT PERFORM ENDAFFIN or EXEC CICS ENDAFFIN command.  
3. Use a batch program described in 'Writing a batch program to end affinities' in the CICS intercommunication.

However, if the AOR is within the same sysplex as the TOR you should be using MRO connections rather than APPC - you then get no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired from the TOR you need to use a HUB as described in 'Using a HUB' in the CICS
intercommunication to prevent two TORs from attempting to connect to one AOR using the generic resource name.

Alternatively you can change the AOR connection to address TOR2 by its real name as opposed to its generic resource name and always acquire the connection from the AOR. This implies that you must not use AUTOCONNECT in the TOR connection.

You should release the connection as soon as possible.

DFHZC2404 E  

VTAM Detected Logic Error.

sense (instance) Module name: 
{DFHZLEX | DFHZLEX | DFHZLEX | DFHZLEX | DFHZLEX | DFHZLEX | DFHZLEX | DFHZLEX}

Explanation
VTAM detected an error in a request. The request was either incomplete or not executable. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
CICS breaks communication with the node (CLSDST), abnormally terminates any attached task, places the node out of service and produces a transaction dump.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Ensure that all application programs running concurrently have proper addressability, thereby avoiding alteration of CICS control blocks such as the TCTTE or the RPL. If this message occurs during normal system execution, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

This message may also occur if VTAM is terminating. Under these conditions it is not a serious problem, and usually no response is necessary.

For more information about VTAM return codes, see the Feedback code data structure page of the z/OS 2.1.0 documentation.

DFHZC2405 E 

Node netname not activated.

sense (instance) Module name: 
{DFHZSIM | DFHZSIM | DFHZSIM | DFHZSIM | DFHZSIM | DFHZSIM | DFHZSYX | DFHZSYX | DFHZSIX | DFHZSYX | DFHZSYX}

Explanation
The node was not activated, or was deactivated by the network operator, or a generic resource affinity
already exists with another system in the same generic resource.

Instance 6 - If the partner is a member of a generic resource (TOR2) and this system (AOR) is not and an affinity already exists between the AOR and another member of the same generic resource (TOR1) because TOR1 crashed, then VTAM has indicated that you cannot acquire this connection. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

All outstanding SEND and RECEIVE requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node, and internal LOGONs are prevented.

If this message is issued during takeover, the acquire is retried at intervals of 1, 2, 4 and 8 minutes after the first attempt. This allows time for sessions which require manual intervention before the acquire can succeed.

User response

Use the VTAM VARY command to activate the node before using it in the network. Alternatively, for ISC with IMS, enable IMS for LOGONs.

It is possible that the node in question has previously been used as a generic APPLID (or in VTAM terms - a USERVAR). Use the VTAM operator command DISPLAY USERVAR to see if this is the case. If it is, you can use MODIFY USERVAR,OPTION=DELETE,ID=node to delete the USERVAR.

Instance 6 - Determine if TOR2 was started intentionally with a different APPLID and the same GR name and if not, correct the problem. If it was and you need a connection between these two systems then you need to end the affinity between the AOR and TOR1. The affinity can be ended by:

1. Bring up TOR1, acquire the connection and release it cleanly or
2. Bring up TOR1 and use ENDAFFIN via CEMT or EXEC CICS or
3. Use a batch program described in 'Writing a batch program to end affinities' in the CICS intercommunication.

However, if the AOR is within the same sysplex as the TOR you should be using MRO connections rather than APPC - you then get no problems with affinities.

If the AOR is outside the sysplex and the connection is acquired from the TOR then you need to use a HUB as described in 'Using a HUB' in the CICS intercommunication to prevent two TORs from attempting to connect to one AOR using the generic resource name.

Alternatively you can change the AOR connection to address TOR2 by its real name as opposed to its generic resource name and always acquire the connection from the AOR. This implies that you must not use AUTOCONNECT in the TOR2 connection.

**System action**

The VTAM CLSDST macro is issued to release any control blocks previously built for the node. If a
task is attached, it is abnormally terminated with a transaction dump.

**User response**

See the appropriate z/OS Communications Server: SNA Programming manual for an explanation of the error code.

**Module:** DFHZLTX

**Destination**

CSNE

**Explanation**

Node nodeid attempted to log on to CICS but the logon is invalid.

The nodeid in the message will always start with the 'netname' of the node attempting to connect to CICS. For some instances of the message resulting from an LU6.2 log on, the modename of the session will be concatenated to the 'netname' with a dot separator. Since a string consisting of eight blanks is the default modename, this can lead to idiosyncratic formatting of the message.

If the message is issued by DFHZATA, CICS has failed in its attempt to autoinstall the terminal or connection.

The instance instance is one of the following:

1. For LU6.1 no suitable TCTTE can be found, or no session TCTTE exists. This could occur for one of the following reasons:
   1. The bind did not contain a modename.
   2. There is an RDO definition for a member name connection in a generic resource communicating with another generic resource over an LU6.1 link.

2. No PLUNAME has been found in the LU6.2 bind processed by CICS.

3. An attempt to autoinstall a member name connection in a generic resource system has failed because the bind was not for a SNA service manager.

4. Autoinstall is not allowed because the system is terminating.

5. Autoinstall is not allowed because the VTAM ACB is closing.

6. ISC support is not present because ISC=NO specified in the SIT.

7. Used by DFHZATA for several reasons, for example BIND bad and user exit bad.

8. The TCTTE address restored and the address found by NIBSEARCH do not agree.
The system is terminating.

VTAM is terminating.

RESERVED.

RESERVED.

No address is present in the RPL.

LU6.1 cannot autoinstall.

If both CICS systems are registered as different generic resources, the LU61 connections must be defined with each other’s generic resource netnames; they cannot communicate by member name. In this case CICS looked for the generic resource netname and was unable to find it.

ISC support is not present.

A CINIT arrived for an APPC parallel session. This is not supported. All input for an APPC parallel session should be via a BIND. Also, no connection exists with this NETNAME.

Session is not bound.

Not used.

LU is not enabled. Typically it is an XRF alternate CICS.

A second CINIT with the same netname has arrived.

Logon rejected due to CATA abend.

A CINIT initiated by SIMLOGON occurred for an APPC paralleled session. A matching connection exists, but it is being deleted. This should not occur because either the delete should have been cancelled (if it had been scheduled but not started) or the SIMLOGON should have been queued until the delete was attempted and fails because there is SIMLOGON activity.

A BIND was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.

Change the partner's connection definition for this system to use a NETNAME of this system's generic resource name.

Not used.

A CINIT was received for an LU6.1 connection. This CICS is registered as a generic resource but the partner addressed CICS by its MEMBER name instead of its generic resource name.

Change the partner's connection definition for this system to use a NETNAME of this system's generic resource name.

A BIND was received for an LU6.1 connection. This CICS is registered as the same generic resource as the partner. However, the partner addressed CICS by the generic resource name instead of the member name which it should use for intra-plex communication.

Change the partner's connection definition for this system to use a NETNAME of this system's member name.

A CINIT was received for an LU6.1 connection. This CICS is registered as the same generic resource as the partner. However, the partner addressed CICS by the generic resource name rather than the member name which it should use for intra-plex communication.

Change the partner's connection definition for this system to use a NETNAME of this system's member name.

An LU62 bind was received for the netname specified. CICS has found a connection with the relevant netname but the connection was not defined as APPC.

A system entry for the connection indicated by the bind has been found but none of its sessions are usable.
30
No modename field UDSS02 was found in the bind.

31
Examination of the session tctte has indicated it to be out of service, a non-SNA service manager session and to have the associated connection released.

32
An attempt to autoinstall a GR name or XRF connection has failed because the bind was not for a SNA service manager.

33
This bind is a SNA service manager request for an existing partner.

34
There is a problem with the user data supplied in the bind. Specifically one of the following.
- There is no user data.
- The user data supplied is too short.
- The user data is not architected.

35
A delete is pending for the connection found. This delete is for a non-transient terminal definition and has been requested explicitly.

36
For a non-generic resource request, examination of the bind has indicated that it is not for a SNA service manager.

This instance also indicates that you should not acquire this connection if the partner is a member of a generic resource, and this system is not, and an affinity already exists between this system and another member of the same generic resource. See message DFHZC2403, which is issued for the partner's equivalent sessions, for how you correct the situation.

37
The current session count has exceeded the maximum session count indicated in the mode group entry.

This can be caused by a VTAM LU definition with a duplicate netname. At session initiation time VTAM cannot detect that there may be two Independant Logical Units (ILUs) with the same netname. This can lead to CICS being requested to bind more sessions than specified in the mode group.

38
An attempt to acquire a generic resource connection failed because there is a member name connection defined for the generic resource member to which VTAM has chosen to route it.

39
This CICS has deregistered from a generic resource but a remote partner is attempting to bind an APPC session using a generic resource name. This indicates that VTAM affinities have not been ended on both sides.

40
This CICS has deregistered from a generic resource but a remote partner is attempting to bind an LU6.1 session using a generic resource name. This indicates that VTAM affinities have not been ended on both sides.

41
A bind has been received for an APPC SNA Service Manager session while the connection is in the process of being released. As the maximum number of SNASVCMG sessions has already been set to zero, acceptance of this bind would leave the connection in a Freeing state and is therefore rejected. Retry the Acquire of the connection when all the user sessions have been CLSDST and the connection is released.

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

If ???????? is displayed in the second half of the nodeid field, the BIND may contain a SESSION QUALIFIER or MODENAME with an invalid length.

System action
The logon is rejected. If the reject is from DFHZSCX via the dummy TCTTE, an attempt is made to print the failing BIND and sense code with which it was rejected as part of the message.

User response
Use the instance number to determine why the attempted logon has been rejected and take the appropriate action.

Receive any request failed.
sense ((instance) Module name: {DFHZRAC | DFHZRAC})

Explanation
A receive-any request to VTAM failed. VTAM was terminated. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense , see message DFHZC2400.

System action
The VTAM RPL control block is logged to the CSMT log for visual inspection.
Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Determine the reason why the receive-any failed. First, check to see if the VTAM RPL has been altered. If it has been altered, check to see if the alterations could have caused any problems. Correct any obvious errors. It may be useful to refer to the z/OS Communications Server: SNA Programming manual, (SC23-0115), during problem determination.

Unsupported command received.

**Explanation**

An unknown command or request was detected, or the RPL contains logical unit (LU) status. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**

If an invalid command or request was detected, all outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A VTAM CLSDST macro is issued to halt communication with the node.

For ISC sessions, this error may be caused by specifying incompatible session types at each node. (For example, SESSIONTYPE=SEND in one node and SESSIONTYPE=FASTRECV in the other node.)

If the RPL contains logical unit (LU) status, one of the following messages is issued:
DFHZC2461, DFHZC2462, DFHZC2464, DFHZC2465, or DFHZC2466.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

An invalid command or request indicates inconsistencies or errors in the definitions of the named terminals/sessions in CICS, VTAM or the connected system for LU6 sessions. Ensure that these definitions are consistent and correct for the device or session characteristics.

ZCP Logic Error. sense ((instance)

**Module name:** {DFHZDET |
DFHZSIM | DFHZSIM | DFHZERH |
DFHZERH | DFHZERH | DFHZERH |
DFHZRAC | DFHZRAC | DFHZRAC |
DFHZRVS | DFHZRVS | DFHZRVS |
DFHZOPN | DFHZEV1 | DFHZEV1 |
DFHZSDS | DFHZSKR | DFHZSSX |
DFHZSLX | DFHZSLX | DFHZSLX |
Explanation

During terminal processing, CICS detected an invalid internal state in DFHZCP.

Instance 1 of the message could be caused by a loss of data following a persistent sessions restart in a partner system. In this case, no logic error has occurred because any updates are backed out. This normally follows an AZCD for the same session and the message DFHZC0144 for the partner session. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

All outstanding send and receive requests are purged, and the task is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to the CSMT destination for debugging purposes.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response

Ensure that the application programs running concurrently do not alter the TCTTE. If the TCTTE is not being altered, use the dump to locate the source of the error.

It may be useful to examine the debugging data printed on the CSMT log for clues about what possibly went wrong.

XMEOUT parameters/Message inserts

1. date

Explanation
A request to send data synchronously was incomplete. Possible reasons are as follows:

1. The TCTTE was altered.
2. A logic error was encountered.
3. The TCTTE was inadvertently placed on the send-synchronous queue.

This imbed is inserted in DFHZCxxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro instruction.

User response
For reasons 1 to 3 listed above, ensure that application programs running concurrently do not alter the TCTTE.

If you suspect a logic error (2), check that the VTAM RPL has not been corrupted. If you still cannot resolve the problem, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

nodeid Logon has failed because autoinstall is disabled.
sense ((instance) Module name: 
{DFHZLGX | DFHZLGX | DFHZBLX | DFHZBLX})

Explanation
Node nodeid attempted to log on to CICS. The logon has failed because autoinstall is disabled. Possible reasons are:
• Autoinstall system initialization parameters have been incorrectly defined.
• An error has been detected in CICS terminal attach processing.
• The system is short on storage. Autoinstall is reenabled once the SOS condition ends.

System action
The logon is rejected.

User response
Ensure that the value for the AIQMAX system initialization parameter is greater than zero. If an autoinstall user program has been specified for system initialization parameter AIEXIT, check that the program name has been defined to CICS. See the Configuring for further information about autoinstall parameters.

If the system is short on storage, see the associated messages for further guidance.

DFHZC2435 E  date time applid termid tranid RPL missing. sense ((instance) Module name: (DFHZRVS))

Explanation
CICS issued a receive-specific request VTAM without specifying a request parameter list (RPL). This condition could result from one of the following reasons:
• An RPL was not allocated
• An RPL was allocated, but later freed
• TCTERPLA was altered.
This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.
System action

All outstanding receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A CLSDST macro is issued to terminate communication with the node.

User response

Use the dump to determine whether the TCTTE was altered by an application program. If it was, correct the error. If the TCTTE has not been altered, check for potential RPL problems.

DFHZC2459 E  date time applid termid tranid
No TIOA available for send.

sense (instance) Module name:
{DFHZSDS | DFHZSDS}

Explanation
TCTTEDA was not loaded before issuing a DFHTC TYPE=WRITE, or it was inadvertently cleared. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
If a task is attached, it is abnormally terminated with a transaction dump. The send is purged.

User response
Ensure that TCTTEDA is loaded with the TIOA address before issuing the write.

Module:
DFHZSDS

DFHZC2460 E  date time applid termid tranid
Sense receive not supported.
   sense ((instance) Module name: {DFHZNAC})

Explanation
Sense codes not supported by CICS were received from the logical unit. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense , see message DFHZC2400.

System action
All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro, and the node is placed out of service.

User response
The user’s node error program (DFHZNEP) can process the sense codes.

Bracket Error.
   sense ((instance) Module name: {DFHZNAC})

Explanation
The secondary logical unit and CICS both sent a begin-bracket indicator concurrently. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense , see message DFHZC2400.
System action

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing the VTAM CLSDST macro.

User response

Correct the controller application program so that it cannot send a begin-bracket indicator.

Module:
DFHZNAC

Destination

CSNE

DFHZC2464 E date time applid termid tranid
Terminate chain. sense ((instance) Module name: {DFHZZNAC})

Explanation

The secondary logical unit asked CICS to terminate transmission of further data in the current chain. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. A cancel indicator is issued to the logical unit permitting discard of the data in the current chain.

User response

Use the supplied dump to determine why the logical unit requested the chain to be discarded.

For the meaning of the sense data, refer to the explanatory paragraph in message DFHZC2461.

Module:
DFHZNAC
XMEOUT parameters/Message inserts

1. date

2. time
3. applid
4. termid
5. tranid
6. sense
7. instance
8. Value chosen from the following options:
   1=DFHZNAC
**Explanation**

CICS issued a VTAM request containing a communications identifier (CID) which VTAM did not recognize. This may be due to the TCTECID field having been altered. Alternatively, it may mean that the session is in the process of being closed down by VTAM and that CICS has tried to use it before the process was complete. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service.

**User response**

Ensure that application programs running concurrently do not alter the TCTECID field in the TCTTE. Also check that the session is still active; that is, that the system being communicated with is still functioning.

**Destination**

CSNE

**DFHZC2467 E**

Invalid communications ID (CID) detected. sense ((instance) Module name: {DFHZLEX})

**Explanation**

Either the node has not been activated by VARY ACTIVATE or CICS issued a VTAM request containing an invalid symbolic node name where:

- The name may have been altered in the node initialization block (NIB)
- The name was specified during VTAM definition and does not agree with the name in the TCT.

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**

All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service.

**User response**

Either issue VARY ACTIVATE for the node, or ensure that application programs running concurrently do not alter the NIB name. Names specified during VTAM definition must agree with those in the CICS definitions.

DFHZC2470 E  date time applid termid tranid
Task active at Shutdown.
sense ((instance) Module name: (DFHZASX))

Explanation

One of the following has occurred:

- A request shutdown indicator was received from the controller application program on behalf of the node while a task was still attached.
- During VTAM shutdown, a shutdown complete indicator was received from the controller application program on behalf of the node while a task was still attached.
- During VTAM shutdown, a task was still attached to a VTAM 3270 (which cannot send request shutdown or shutdown complete).

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

In the first two cases, CICS honors the command. In all cases, all outstanding send and receive requests are purged, and if a task is attached, it is abnormally terminated with a transaction dump. Communication with the node is terminated by issuing a VTAM CLSDST macro.

User response

None.

</table>

Explanation

A connection request was rejected. CICS is temporarily unable to carry out the connection request. The TCTTE for node nodeid indicated that the session could not be established. returncode gives the reason, as follows:

1. The CLSDST macro has been scheduled for this node
2. The node is in an abnormal condition
3. The node has an error condition raised against it
4. The node is already in use
5. CICS is terminating
6. VTAM is terminating

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

The connection request is rejected.

User response

Retry the connection request when the node becomes available. See the Developing system programs for

CICS for more information on the CLSDST macro and for an explanation of abnormal node conditions.

   1=DFHZSYX

**Destination**
CSNE

**Explanation**
This message is sent to the CSNE message log when an INTERVENTION REQUIRED condition is detected on a 3270 printer. This condition could occur for any of the reasons listed below.

- A transaction has requested the use of a printer that does not exist.
- The printer adapter feature is not present.
- There is no paper in the printer.
- The printer cover is open.
- The printer is offline.

This imbed is inserted in DFHZCxxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**
No action is performed except printing of the RPL and the TCTTE.

---

**User response**
Check that the printer is in proper working order. If it is, check that the printer is properly defined to CICS and that the transaction requests proper printer operations.

date time applid termid tranid  
Error status sense received from 3270.  
((instance) Module name:  
{DFHZNAC})

Explanation
An error status message sense was received from a 3270 Information Display System. An INTERVENTION REQUIRED condition causes an "intervention required" message to be output instead of this message.

System action
If a task is attached, it is abnormally terminated with a transaction dump. If bad data, sent by Basic Mapping Support (BMS), causes an operation check, the bad data is purged.

User response
Analyze the error status codes to determine the proper course of action required to correct the unit error or program error.

For non-SNA 3270 devices, the sense code is 0000 xxxx, where xxxx is sense data returned by the control unit to which the 3270 device is attached. Datastream errors are rejected with an Operation Check, and commands with a Command Reject. Details of error status codes are given in the IBM 3274 Control Unit Planning, Setup, and Customizing Guide (provided in Archived CICS documentation).

DFHZC2495 E  
date time applid termid tranid  
Printer Outserv/int reqd/ ineligible. Req queued.  
sense ((instance) Module name:  
{DFHZNAC})

Explanation
DFHZNAC has performed an interval control PUT to a 3270 printer on behalf of a DFHZC2497 "unavailable printer" condition. The printer is:
• Out of service,
• Has an intervention situation, or
• Does not have a RECEIVE or TRANSCEIVE status.

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
Other processing continues.

User response
Determine why the printer is unavailable. If the terminal is out of service, put it back into service. If the terminal has an intervention situation, determine what this situation is and correct it. If the terminal does not have a RECEIVE or TRANSCEIVE status, place it into RECEIVE or TRANSCEIVE status.

Module:
DFHZNAC

2. time
3. applid
4. termid
5. tranid
6. sense
7. instance
8. Value chosen from the following options:
Destination
CSNE
DFHZNAC

Explanation
DFHZNAC has attempted to perform a DFHIC TYPE=PUT macro as the result of a DFHZC2497 "unavailable printer" condition and has failed. This message is written to the CSNE log. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
DFHZNEP is recalled by DFHZNAC to allow for further processing.

User response
Ensure that:
- The interval control program (ICP) is capable of handling the request that DFHZNAC is issuing for the IOERROR and INVREQ errors
- CSPP is an installed transaction definition for the TRNIDER error
- DFHZNEP is passing DFHZNAC as a valid terminal address for the TRMIDER error.

DFHZC2496

Explanation
A print function was requested on a 3270 display device. Neither the PRINTTO or the ALTPRT printer was available to receive the information. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
If no NEP action is specified, the print request is halted.

User response
A possible solution is to route the data available at TCTTEDA in the provided terminal entry to a transient data queue that causes automatic task initiation later to a printer. This would be done in DFHZNEP. For more information, see the Developing system programs for CICS.

CSTL

DFHZC3202 E date time applid Transaction CCIN
VTAM netname netname. The value codepage in the codepage parameter is not supported.

Explanation
A CCIN transaction has been run from a CICS client. The codepage which the CICS client has requested is not supported.
netname is the VTAM netname of the CICS client.

System action
CICS cannot perform the translations required to support the CICS client with the requested character set and codepage. CICS continues but uses a default codepage instead of the supplied one. For details of the default codepage, see the Using SNA manual.

The request to install the CICS client continues, but uses the default codepage. A response code of EXCEPTION and a reason code of INVALIDCODEPAGE is sent to the client.

User response
See the Using SNA manual for a list of the client codepage values which are supported. It may be necessary to reconfigure the client locale.

Module:
DFHZCN2
XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. netname
5. codepage

Explanation
A CCIN transaction has been run from a CICS client. One of the parameters which must be supplied is the codepage which the CICS client intends to use. This parameter is missing.

netname is the VTAM netname of the CICS client.

System action
Exception trace point AP301A is written.
The request to install the CICS client is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module: DFHZCN2

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. netname
5. codepage

Explanation
A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation.

CICS was checking the codepage specified by the CICS client and the codepage specified by the virtual terminal. However one of the following occurred:
n.a. - not applicable and should not occur.

unsUPPORTED COMBINATION OF CICS CLIENT AND VIRTUAL TERMINAL CODEPAGE indicates that the two codepages above are known about but CICS does not support data conversion between the CICS client codepage and the virtual terminal codepage.

unsupported CICS client codepage indicates that CICS is unable to support the codepage supplied by the CICS client in the CCIN or CTIN transaction.

unsupported virtual terminal codepage indicates that the CGCSSGID parameter defining the virtual terminal codepage is not supported for CICS data conversion. If the virtual terminal was autoinstalled, CGCSSGID was specified in the autoinstall model requested by the CICS client. If the virtual terminal was defined, CGCSSGID was defined in the TYPETERM named by the virtual terminal definition.

CICS cannot perform the translations required to support the CICS client with the requested codepage. Netname is the VTAM netname of the CICS client.

System action
Exception trace point AP3035 is written.

unsUPPORTED COMBINATION OF CICS CLIENT AND VIRTUAL TERMINAL CODEPAGE.

A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.

unsupported CICS client codepage.

The request to install the virtual terminal continues and the invalid codepage is replaced by a default as specified in the Using SNA manual.

A response code of EXCEPTION and a reason code of INVALIDCODEPAGE is sent to the client.

unsupported virtual terminal codepage.

A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client. The virtual terminal is NOT installed.

User response
See the Using SNA manual and check the list of the client codepage values then reconfigure the workstation locale or correct the virtual terminal TYPETERM definition.

The exception trace point AP3035 contains the CICS client codepage and the virtual terminal CGCSSGID values.

Destination
CSCC

DFHZC3206 E date time applid Transaction CTIN - virtual terminal termid VTAM netname netname. The client's terminal install limit has been exceeded.

Explanation
A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However the CICS client whose VTAM netname is netname already has 512 virtual terminals.

termid is the name that would have been given to the new virtual terminal. If the CICS client did not supply the name it is blank.
**System action**

The request to install the virtual terminal is rejected. A response code of DISASTER and a reason code of INVALIDREQUEST is sent to the client.

**User response**

Check why the CICS client has sent so many CTIN installs without corresponding CTIN uninstall functions.

To correct the problem the CICS client must send a CTIN uninstall for each virtual terminal that needs to be deleted.

**Module:**
DFHZCT1

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. termid
5. netname

**Destination**

CSCC

**Explanation**

A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. However there was no previous CCIN install request for the CICS client with the VTAM netname of netname. CCIN must always run before CTIN.

This may have been caused by a CICS restart.

netname is the VTAM netname of the CICS client.

**System action**

If the request was to install a virtual terminal then it is rejected with a response code of CTIN_ERROR and a reason code of CTIN_CCIN_INACTIVE.

**User response**

The CICS client must carry out CCIN uninstall/install before the next CTIN install.
**Explanation**

A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. The parameter list did not supply a NetName indicating that CICS should supply the name. However there are only 46,656 possible names available and they are all currently in use.

*netname* is the VTAM netname of the CICS client.

**System action**

The request to install the virtual terminal is rejected. A response code of ERROR and a reason code of INSTALLCANCELLED is sent to the client.

**User response**

As CICS clients issue CTIN uninstalls for autoinstalled virtual terminals these termids will be freed.

It is possible that some of the CICS clients were switched off leaving autoinstalled virtual terminals around. When these are switched back on again they should issue CCIN install which will free the virtual terminals if they are not in use.

DISCARD can be used to delete a virtual terminal but this should be done with discretion.

If the SIT VTPREFIX coincides with the first character of the termid allocated to a normal autoinstall terminal by the autoinstall URM (default DFHZATDX), there may be some names reserved because the autoinstall terminal existed when CTIN install tried to use the same name. Avoid doing this if possible because the only way to free these names is to restart CICS.

**Module:**
DFHZCT1

**XMEOUT parameters/Message inserts**

1. *date*
2. *time*
3. *applid*
4. *netname*
Explanation
A CTIN install request has been received from a CICS client as a result of a CICS_EpiAddTerminal function or terminal emulator operation. The NetName parameter termid starts or ends with a character that conflicts with CICS standards. netname is the VTAM netname of the CICS client.

System action
The request to install the virtual terminal is rejected. A response code of DISASTER and a reason code of INVALIDTERMID is sent to the client.

User response
Investigate why the CITS transaction was unable to start or was hanging.
You may need to increase MAXTASK or the CITS TRANCLASS allocation.

DFHZC3240 E  DATE TIME APPLID Transaction CCIN - VTAM netname netname.
CICS has received a client request on an unsupported sync level.

Explanation
A CCIN request has been received on a conversation which is not at synchronization level 0 or 1. netname is the VTAM netname of the CICS client.

System action
Exception trace point AP3003 is written. The CCIN transaction abnormally terminates with abend code AZAF.

User response
Ensure that the CICS client converses at sync level 0 or 1.

Module: DFHZCN1

CSCC

DFHZC3246 date time applid Transaction CCIN - virtual terminal termid VTAM netname netname. CICS cannot attach the CDTS transaction.

Explanation

A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction was called to delete virtual terminal termid. However CICS was unable to attach the CDTS transaction.

netname is the VTAM netname of the CICS client.

System action

The attempt to delete the virtual terminal fails. If this is a CCIN install request, the install continues.

User response

Check to see why the CDTS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CITS TRANCLASS allocation.

Module: DFHZCN2

XMEOUT parameters/Message inserts

2. time
3. applid
4. termid
5. netname

Destination

CSCC

DFHZC3247 date time applid Transaction CCIN - virtual terminal termid VTAM netname netname. The CCIN transaction has timed out waiting for CDTS to run.

Explanation

A CCIN request has been received from a CICS client. As part of the processing, the CDTS transaction is called to delete virtual terminal termid. However the CCIN transaction has waited for the CDTS transaction for two minutes and has timed out.

netname is the VTAM netname of the CICS client.

System action

The CDTS attempt to delete the virtual terminal continues and occurs when the CDTS transaction starts or is 'unsuspended'.

If this is a CCIN install request, the install continues.

User response

Check to see why the CDTS transaction was unable to start or was hanging.

You may need to increase MAXTASK or the CITS TRANCLASS allocation.

4. termid
5. netname

Destination

CSCC

DFHZC3248 E date time applid Transaction CCIN - virtual terminal termid VTAM netname netname. The surrogate TCTTE is in use and cannot be deleted.
Examination

A CCIN request has been received from a CICS client. There should not be any virtual terminals installed, however, one or more were located. The surrogate TCTTE attached to the virtual terminal is still in use and cannot be deleted. If this was caused by an immediate shut down of the client the transaction abend might not have completed before CICS attempted to delete the client.

`netname` is the VTAM netname of the CICS client.

System action

Exception trace point AP301C is written. The attempt to delete the virtual terminal is rejected.

If this is a CCIN install request, the install continues.

User response

Determine why the virtual terminal was installed when CCIN was run.

Either wait for the transaction to finish or PURGE the transaction. Once the transaction completes the virtual terminal will be deleted at the next CCIN install/uninstall.

`Chain exceeds max chain size. sense ((instance) Module name: {DFHZRVS | DFHZRVS | DFHZRVS | DFHZRVS | DFHZRVS | DFHZRVS | DFHZRVS | DFHZRVS | DFHZRVS | DFHZRVS})`.

Explanation

If chain assembly (BUILDCHAIN) has been specified in the TCTTE, the chain being assembled does not fit into the IOAREALEN for a maximum chain (IOAREALEN Value 2). The remaining space in the IOAREALEN for a maximum chain is smaller than the maximum RECEIVESIZE.

If chain assembly (BUILDCHAIN) has been specified in the TCTTE, but maximum chain value equals zero, either the maximum chain value has been set incorrectly at build time or the value has been overwritten. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

If a task is attached, it is abnormally terminated with a transaction dump.
User response
Ensure that the maximum chain size, generated in CEDA TYPETERM with IOAREALEN (value 2) keyword, is large enough for the maximum chain expected.

DFHZC3407 E  date time applid termid tranid READ command does not carry change direction indicator.

Explanation
A request for input (for example, a READBUF command) sent to a logical unit (LU) type 2 (3270 compatibility mode logical unit) must carry the SNA change direction indicator. The LU has received such a request, but the indicator is not set.

Since the setting of the change direction indicator is controlled by terminal control, this message indicates that an internal logic error may have occurred. The error is not necessarily in terminal control, but may be in the logical unit or some other element of the network. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
The task and the VTAM session for the logical unit are abnormally terminated.

Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
Identify the request that caused the error, and locate the element of the network responsible.

CSNE

DFHZC3408 E  date time applid termid tranid Presentation space integrity lost.

Explanation
The contents of data for screen presentation by a logical unit has been altered. This is usually due to operator action. For example, the TEST/NORMAL key may have been used or the 3270 SYS REQ key may have been pressed.

It may also have been caused by factors other than operator action, for example, 3270 regeneration buffer failure. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
Any outstanding requests are canceled. If a task is attached, it is abnormally terminated with a transaction dump.

Explanation
A request for input (for example, a READBUF command) sent to a logical unit (LU) type 2 (3270 compatibility mode logical unit) must carry the SNA change direction indicator. The LU has received such a request, but the indicator is not set.

Since the setting of the change direction indicator is controlled by terminal control, this message indicates that an internal logic error may have occurred. The error is not necessarily in terminal control, but may be in the logical unit or some other element of the network. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.
Determine reason for failure at the remote terminal.

8. Value chosen from the following options:
   1. DFHZZNAC

**Explanation**
CICS received a negative response to a command for which a negative response would not normally be expected. This imbed is inserted in DFHZC xxxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**
All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to CSNE.

Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
Ensure that the application programs running concurrently do not alter the TCTTE. Check that the SNA flows on the session are valid and that the logical unit is not violating SNA protocols.

**Module:**
DFHZZRAC

**XMEOUT parameters/Message inserts**
1. date
2. time
3. applid

**Explanation**
Input (other than a logical unit status message) was received after a request was rejected with a system sense code indicating a possibly rectifiable error condition at the terminal node: for example, Intervention Required. The subsequent LU status message indicates that the error situation has now been corrected, or that the request is permanently not executable. This imbed is inserted in DFHZC xxxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**
If a task is attached, it is abnormally terminated with a transaction dump.

**User response**
Conform to SNA protocol by ensuring that the next transmission is an LSTATUS message with a system sense for either Resource Available (0001) or Function Not Executable (081C).

CSNE

DFHZC3411 E  

Resource temporarily unavailable. 

sense ((instance) Module name: {DFHZNAC})

Explanation

A terminal resource required to complete a request is temporarily unavailable. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

The request is retried unless the device is one that sends an LUSTATUS message after receiving a "resource temporarily unavailable" notification.

If "resource temporarily unavailable" notification is received, an associated VTAM message is usually issued.

User response

Refer to the associated VTAM message, if applicable, and follow the guidance provided.

Module: DFHZNAC

Logical Unit busy.

sense ((instance) Module name: {DFHZNAC})

Explanation

Operator action is requested for the secondary resource of a logical unit (LU). However, no such resource is immediately available. In the case of a 3270-compatible LU, this message means that the printer most likely to be available for a PRINT request has an Intervention Required status. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

The system waits for a logical unit status message and, when this is received, takes appropriate system action.

User response

Correct the problem that relates to the device.

Module: DFHZNAC

Destination

CSNE

DFHZC3412 E  

Intervention required on secondary resource. sense ((instance) Module name: {DFHZNAC})
Explanation

The logical unit has rejected a request because its resources are busy (for example, it is communicating with the system services control point (SSCP)), and thus is unable to process the request. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

The system waits for a logical unit status message and then takes appropriate action.

User response

None.

CICS has received a negative response (VTAM sense code 0826). The receiver does not support the function requested by the sender. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**

All outstanding SENDs and RECEIVEs are purged. If a task is attached, it is abnormally terminated with a transaction dump.

**User response**

Investigate the reason for issuing a request for a function that the receiver does not support.

**Module:**

DFHZNSP

7. instance
8. Value chosen from the following options:
   - 1=DFHZNSP,
   - 2=DFHZNSP,
   - 3=DFHZNSP

---

**Explanation**

Communication with a node was interrupted during a session because a session outage was detected, or because a VTAM VARY INACT command was issued.

Error messages produced for the same session after this message may be caused by the session failure and may not be the reason for it. If this is the case, they can be ignored. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**

The session is canceled. The session may be recovered later by VTAM. See also messages DFHZC2409 and DFHZC2410.

**User response**

Check if the failure was caused by an operator-issued VTAM VARY INACT. If this is not the case, use the sense data and any associated messages to investigate the reason for the failure.

**Module:**

DFHZC3433 E  date time applid termid tranid
FMH7 was received on ISC session. Sense code is : xxxxxxxx
{ Error log data is : | No error log data received. | No error log data available. } xxxxxxx
sense ( (instance) Module name: 
{DFHZRVX | DFHZRAC | DFHZRAC | DFHZERH})

Explanation
The transaction is communicating with a logical unit (LU) type LU6.1 or LU6.2.
The logical unit sent an FMH7 which may carry error log data. If error log data is included, then the text is inserted in this message. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
The action taken depends upon the sense code.

User response
If the receiving transaction is designed to handle this situation, no action is necessary. However, if this is not the case, use the sense code and any error log data to determine why the connected logical unit sent the FMH7.
If the connected LU is another CICS system, the error log data is a CICS message.
If the connected LU is not a CICS system, see that product's documentation for details of error log data. Some products permit the user to define the contents of error log data.

Signal received - Code xxxx.

Explanation
Following the issue of a READ command to a logical unit, or the completion of a transaction associated with the logical unit, CICS has received a status message from the logical unit indicating that it currently has no data to send. This imbed is inserted in DFHZCxxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
If a data interchange (DFHDI) receive request is outstanding, it will complete with DSSTAT condition and a response code X'15'.

If no task is active and no work is outstanding for the terminal, the soft CLSDEST action flag is set and DFHZNEP is called. Unless it is reset by DFHZNEP, the session is terminated.

User response
Ensure that no more receive requests are issued to the terminal.

Module: DFHZNAC

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. termid
5. tranid
6. sense
7. instance
8. Value chosen from the following options:
   1=DFHZNAC

Signal received - Code xxxx.
**Explanation**

CICS has received a SIGNAL command from a logical unit. The SIGNAL codes received with the SIGNAL command are made available to the DFHZNEP user program.

If a task is active, the SIGNAL condition is raised on return to the application program. This message is produced only when SIGNAL codes are passed to the node abnormal condition program (DFHZNAC). CICS does this for Type 4 logical units only. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**

If the SIGNAL code is 0001 0000 (request change direction), any further output request will cause the IGREQCD condition to be raised. All SIGNAL codes will cause the SIGNAL condition to be raised.

**User response**

For logical units for which CICS enforces SIGNAL request change direction, if the code is 0001 0000, issue a receive request or terminate transaction tranid.

If the code is NOT 0001 0000, terminate transaction tranid and refer to the z/OS Communications Server: SNA Programming manual for further guidance.

DFHZC3463 I date time applid VTAM ACB opened. VTAM Return Code = X’rc’. Time = time sense ((instance)
Module name: {DFHZOPA})

Explanation
The main terminal operator issued a CEMT or CSMT command to open the VTAM ACB. This imbed is
inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense , see message DFHZC2400.

System action
Processing continues.

User response
This depends on the return code:
• If the value is zero, VTAM sessions can be enabled.
• If the value is 1, this is not a VTAM return code. It is inserted by DFHZOPA if a VTAM OPEN is received when the ACB is already open.
• If the return code is some other value, the operation has failed. See the section on z/OS Communications Server: IP and SNA Codes in the z/OS Communications Server: SNA Programming manual to determine why the VTAM ACB was not opened.

3. applid
4. termid
5. tranid
6. netname
7. sense
8. instance
9. Value chosen from the following options:

1=DFHZSTU
Explanation
CICS received a positive response in one of the following circumstances:
• The response was to data sent with exception response
• The response was to a command sent with exception response
• The response was to a send to which a response has already been sent.

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
All outstanding send and receive requests are purged. If a task is attached, it is abnormally terminated with a transaction dump. The node is placed out of service and the TCTTE, RPL, and action flags are logged to CSNE.

User response
Ensure that the application programs running concurrently do not alter the TCTTE. Check that the SNA flows on the session are valid and that the logical unit is not violating SNA protocols.

DFHZC3470 E  date time applid termid tranid LU
session failure caused by: {restart/takeover. LU does not support
ACTLU(ERP). | route extension
to cluster failed. | LU abend,
disconnect, DACTPU or ANS. }

Explanation
An LU session has failed because an UNBIND
command has been received.
Possible reasons are:
• Restart or takeover. LU does not support ACTLU(ERP)
• Route extension to cluster failed
• Session failed due to LU abend, disconnect, DACTPU,
or ANS.
This imbed is inserted in DFHZC xxxx messages with
sense inserts. For the meaning of sense, see message
DFHZC2400.

System action
If a task is attached, it is abnormally terminated with a
transaction dump.

User response
Use the symptom string, a VTAM trace, and the dump,
if available, to determine the source of the UNBIND
before attempting to reestablish the session.

DFHZC3481 E  
3270 Data Stream protocol error.  
sense (((instance)) Module name: {DFHZRVX | DFHZRAC})

Explanation

CICS has received zero length data from a device defined to CICS as a 3270 terminal. This violates the protocol for 3270 devices. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense , see message DFHZC2400.

System action

CICS cancels the session and any transactions attached to the terminal.

User response

Determine why zero length data was received from a device purporting to be a 3270 terminal, and correct the error.

The most likely reasons are an incorrect resource definition for the terminal, or incorrect programming of a terminal that is simulating 3270 protocols.

Destination
CSNE

DFHZC3488 E  date time applid netname
   ISC session connection failure.
   sense ((instance) Module name: {DFHZSIX})

Explanation
A simlogon request to an ISC system was rejected because the netname was not known. CICS has now issued the INQUIRE OPTCD=USERVAR command in order to determine if netname had been defined as a user variable. That INQUIRE command has been rejected because the user variable does not exist in the USERVAR table. This may be because the USERVAR is either not known or invalid, or the MODIFY USERVAR command has not been issued to define the user variable. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
CLSDST is issued to reset the session.

User response
Determine if the netname has been defined correctly to CICS. If the netname is to be used as a user variable then determine why the MODIFY USERVAR command has not been issued to set it.

Module:
DFHZSIX

   1=DFHZSIX

Destination
CSNE
DFHZC3489 E  date time applid netname  The LU is inhibited for sessions.
sense ((instance) Module name: {DFHZSYX})

Explanation
CICS has attempted to acquire a session to the logical unit (LU), but VTAM has rejected the request because the LU is inhibited for sessions.

The partner LU could be inhibited because it has issued the VTAM macro SETLOGON OPTCD=QUIESCE. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
The request is rejected and the session is set into NOINTLOG state to prevent further requests being issued.

User response
After the partner LU has enabled itself, it can initiate the session request to CICS. Alternatively, the CICS main terminal operator could reset the NOINTLOG state and allow CICS to initiate the session request.

Module:

Destination
CSNE

DFHZC3490 E  date time applid netname  Unable to pass to node nodeid.
sense ((instance) Module name: {DFHZLEX | DFHZSYX | DFHZCLX})

Explanation
In executing an ISSUE PASS command, CICS attempted to pass control of the named VTAM logical unit to a system identified as node nodeid. VTAM has notified CICS that this request has failed.

This may occur if the LUNAME specified is a generic resource name and this CICS is the only system registered under this name. You are effectively passing the terminal to yourself.

However, if there is more than one CICS registered under the generic resource name, the terminal should pass successfully to another member (chosen by VTAM) in the same resource. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
A VTAM CLSDST macro is issued to halt communication with the node.

User response
Ensure that the node nodeid is defined and active to VTAM.

Module:
DFHZSYX, DFHZLEX, DFHZCLX

   3=DFHZCLX

Destination
CSNE

DFHZC3491 E  date time applid netname  Unable to make session XRF capable.
sense ((instance) Module name: {DFHZLEX})
Explanation

The active CICS system has attempted to OPNDST the session as "XRF capable", but has been refused because the Network Control Program (NCP) has insufficient space to hold the control blocks for a future backup session from the alternate CICS system. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

CICS performs a SIMLOGON, but does not deem the session to be "XRF capable". CICS therefore treats the terminal as class 2.

User response

No immediate action is necessary. You may need to increase the number of buffers in the NCP.

*date time applid*
System dump has been taken for terminal termid ((instance))
Module name: {DFHZNAC}

**Explanation**
Terminal termid has been found to be in error by terminal control.
As terminal termid had no task attached to it at the time of the error, DFHZNAC was unable to cause a transaction abend with a transaction dump.

The TWAODNTA flag in the DFHZNAC-DFHZNEP commarea is set ON and DFHZNAC produces a system dump for terminal termid instead.

**System action**

An exception trace entry is made in the trace table at trace point FC73.

A system dump is produced unless you have specifically suppressed dumps in the dump table.

**User response**

To determine the nature of the problem that caused the dump to be taken, refer to the CSNE log. There should be an associated CICS message which will provide further information.

For more information about TWAODNTA, refer to the Developing system programs for CICS.

```
  date time applid Link to module DFHZNEP from DFHZNAC failed because {module DFHZNEP is not AMODE 31. / module DFHZNEP could not be loaded. / module DFHZNEP could not be autoinstalled. / of an unexpected error.} ((instance) Module name: {DFHZNAC})
```

**Explanation**

While processing an error for a VTAM terminal, CICS attempted to link to user-replaceable module DFHZNEP. The link failed.

See message DFHZC3437 for the default action or actions taken.

**System action**

The default action or actions set by DFHZNAC are taken.

**User response**

The reason for the failure is specified in the message. Possible solutions are:

- Ensure that DFHZNEP is linked with AMODE 31.
- Ensure that DFHZNEP is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
- Ensure that there is a valid resource definition for DFHZNEP, and that DFHZNEP can be successfully autoinstalled.

Chapter 2. CICS messages 2435
Explanation

While processing an error for a VTAM terminal, user-replaceable module DFHZNEP was linked and the program abended with abend code abcode. See message DFHZC3437 for the default action or actions that are taken.

System action

Control is passed back to the calling module, DFHZZNAC. DFHZZNAC reinstates the default actions set before DFHZNEP was called. The actions are then taken.

User response

Refer to abend code abcode for details of the original error. Follow the user response given in the abend code to solve the problem.

DFHZC3499 E date time applid OS Getmain failure in module DFHmodname with return code X'return_code' while attempting to process message DFHZCmessage_number. sense ((instance) Module name:
{DFHZLEX | DFHZSHU | DFHZSCX | DFHZSX | DFHZSYX | DFHZSY | DFHZTPX | DFHZRAC | DFHZRAC | DFHZATA | DFHZLGX | DFHZLGX})

Explanation

An error has been detected by module modname. The OS GETMAIN request by this module has failed with return code X'return_code', and as a result, the diagnostic information relating to the original error has not been saved and cannot be processed by DFHZZNAC.

The only information available for diagnosis of the error is message_number which is the number of the message that would have been issued had the OS GETMAIN request not failed. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

Processing continues normally.

User response

Refer to message message_number for further guidance.

Refer to the z/OS MVS Programming: Authorized Assembler Services Guide for the meaning of the OS GETMAIN return code.

CSNE

DFHZC4900 I  

\textit{date time applid termid tranid}  
\textit{CNOS \{sent to / received from\}}  
\textit{Node netname System sysid}  
\textit{Modename modename, Max = n1, Win=n2, \{race detected / successful / values amended / modename not recognized / modename closed / CNOS failed\}. ((instance) Module name: \{DFHZGCN\})}

\textbf{Explanation}

A CHANGE-NUMBER-OF-SESSIONS command has been sent or received. The inserts are identified as follows:

- \textit{sysid} is the system identifier.
- \textit{modename} is the modename.
- \textit{n1} is the maximum session count.
- \textit{n2} is the maximum source contention winner sessions.

If the "values amended" option is displayed, the values of the \textit{n1} (maximum session count) and \textit{n2} (maximum source contention winner sessions) have been renegotiated by the target system.

If the "race detected" option is displayed, the CNOS command could not be implemented because the modename \textit{modename} was already locked for a CNOS command from the other system.

If a modename of ALL is produced, it has been set internally by CICS and all of the modegroups for this connection will be affected by the CNOS command.

If the "CNOS failed" option is displayed, the CNOS command could not be implemented because the modename lock was still held on the remote system when a second CNOS command was sent by this CICS, as the CNOS race winner, following a previous CNOS race condition.

\textbf{System action}

The negotiated values are applied.

\textbf{User response}

None.

\textbf{Module:}  
DFHZGCN

\begin{itemize}
  \item \textit{modename} is the modename,
  \item \textit{n1} is the maximum session count,
  \item \textit{n2} is the maximum source contention winner sessions.
\end{itemize}

This message follows message DFHZC4900 when the maximum session count (\textit{n1}) and the maximum...
source contention winner sessions (n2) have been renegotiated.

If a modename of ALL is produced, it has been set internally by CICS and all of the modegroups for this connection will be affected by the CNOS command.

System action
The negotiated values are applied.

User response
None.

DFHZC4902 E date time applid termid tranid
Attach FMH or subfield length error. sense ((instance) Module name: {DFHZATT | DFHZATT | DFHZATT | DFHZATT | DFHZATT | DFHZATT})

Explanation
A request to attach a task has been received across an APPC link. However, there is an error in the function management header (FMH) length or in the length of one of the subfields. As a result, CICS is unable to determine which task to attach. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense , see message DFHZC2400.

System action
The task is abnormally terminated with a dump.

User response
The remote APPC system is sending an invalid attach header (FMH type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

Single session shutdown with DRAIN=CLOSE. sense (instance)
Module name: (DFHZRAC | DFHZGDA | DFHZERH)

Explanation
The connected logical unit has sent Bracket Initiation Stopped (BIS) and can accept no more work. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
If a conversation was active, it is treated as though rollback had occurred on it for full syncpoint (syncpoint level 2), or as session failure for confirm-level syncpoint (syncpoint level 1).
If there was no conversation, it is treated as a BID failure (as for 0813 sense code).

User response
None.

DFHZC4924 E date time applid termid tranid Bind security password missing or invalid. sense ((instance) Module name: (DFHZOPX | DFHZBLX | DFHZBLX | DFHZBLX | DFHZOPX | DFHZOPX | DFHZOPX | DFHZOPX | DFHZSCX))

Explanation
Bind-time security data sent to CICS by its partner LU is missing or invalid. CICS’s password for the partner LU system differs from the partner's password for CICS. This can be caused by an attempt to sign on to CICS by an unauthorized user. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
The bind is rejected.
**User response**

Check that an unauthorized user has not tried to log on to CICS. Ensure that the unsuccessful connection is correctly defined to CICS (using RDO or the DFHTCT macro) and to its partner LU system. Ensure that the security requirements are equal at both partners, that is, both have security off, or both have security on. A mismatch is one cause of this message.

CSNE

DFHZC4925 E date time applid termid tranid  
Inconsistent attach security required. sense ((instance) Module name: (DFHZOPX | DFHZOPN | DFHZOPN | DFHZOPX))

**Explanation**

This message can be issued for any of the reasons listed below.

1. CICS has received a bind request specifying attach time security requirements different from those specified in the first bind.  
2. CICS has received a bind requesting persistent verification.  
3. CICS has received a bind which does not include an SNA functional management header (FMH12).  
   
This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**

CICS rejects the bind.

**User response**

CICS does NOT allow subsequent binds to specify different security requirements from the first bind. It will not support persistent verification on input either.

Where applicable, alter your applications to meet these requirements.

**Module:**
DFHZOPX, DFHZOPN

2. time
3. applid
4. termid
5. tranid
6. sense
7. instance
8. Value chosen from the following options:
   1 = DFHZEV1

Explanation

CICS has detected an error while validating the BIND supplied by VTAM for a CICS typeterm definition defined with LOGMODE=0 or LOGMODE=LOGMODE=logmode.

The reason code indicates:

X'04'
The BIND supplied does not match the TCTTE - detected by DFHZBANS.

X'08'
The BIND supplied is unsupported - detected by DFHZBANV.

X'0C'
The BIND supplied is invalid - detected by DFHZBANV.

The reason code for a response of X'04' is as follows:

X'1B'
Unsupported TCTTE type or not VTAM

X'1C'
No NIB descriptor chained from TCTTE

X'1D'
No BMS extension chained from TCTTE

X'1E'
Same as for reason code X'1D'

X'1F'
LU6.2 BIND, but TCTTE does not match.

The reason code for a response of X'08' or X'0C' is as follows:

<table>

CSMT

DFHZC4930 E  
_session unbound following read timeout. sense ((instance) Module name: {DFHZARL / DFHZARL / DFHZARER})

**Explanation**

A READ timeout has occurred on the SNA link. SNA unbinds the session and CICS returns control to the application program. This allows the program to override the system action (for example, the program could free the APPC session). This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**

CICS abends the task abnormally with a dump.

**User response**

This is probably a network problem caused by a high level of network traffic. To avoid this problem, increase the Read Timeout (RTIMOUT) to a sufficiently high value to compensate for the level of network traffic. Alternatively, this problem may have arisen simply because the partner application failed to respond due to a programming error. If this is the case, correct the partner application and retry the request.

CSNE

DFHZC4931 E  
VTAM detected bad logmode name. sense ((instance) Module name: (DFHZLEX))

**Explanation**

Either a MODENAME passed to VTAM during an attempt to bind an APPC session is not known to VTAM, or the logmode name of a VTAM 3270-type terminal is not valid. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**

CICS places the session permanently out of service and for APPC, the mode entry is flagged unusable.

**User response**

Either redefine the sessions using a MODENAME that is known to VTAM, or add the MODENAME to the VTAM LOGMODE table. Alternatively, if the logmode name specified for a VTAM terminal is invalid, redefine the terminal entry using the correct name.

Explanation

A request to attach a task has been received across an APPC link. However, there is an error in the FMH length or in the length of one of the sub-fields. This results in CICS being unable to determine which task to attach.

The instance instance is one of the following:

1

The FMH Length is not equal to the length of the fixed length portion + the length of all the sub fields.

2

The Conversation Correlator length within the FMH is greater than 8.

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

The task abends and a dump is produced.

User response

The remote APPC system sends an invalid attach header (FMH Type 5). Use the supplied dump to determine the error and investigate the cause at the remote system.

DFHZC4937 E date time applid SAF request for LU6.2 bind has been rejected.

Manager are: RF= X'rf' and RO= X'r0' sense ((instance) Module name: (DFHZOPN | DFHZOPN | DFHZOPN | DFHZOPN | DFHZOPN | DFHZOPN | DFHZOPN | DFHZEV1 | DFHZEV1 | DFHZEV1 | DFHZEV2 | DFHZEV2 | DFHZEV2 | DFHZEV2)

Explanation

A security authorization facility (SAF) request to extract APPC bind-time security information from the external security manager (ESM) has been rejected with return code RF=X'rf' and RO=X'r0'.

This is due either to the ESM being inactive or to the appropriate APPC profile not being defined to the ESM.

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

CICS rejects the bind.

User response

Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes which may have been produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the z/OS Security Server RACF System Programmer’s Guide manual for the meaning of the return codes.

If the appropriate APPC profile had not been defined to the ESM, define the profile, perform a CICS security rebuild and then attempt to reestablish the APPC connection.

DFHZC4940 E **date time applid Bind time failure.**
No session key found in LU6.2 profile. sense ((instance) Module name: {DFHZOPN | DFHZOPN | DFHZEV1 | DFHZEV2})

**Explanation**
APPC bind-time validation has failed. No session key has been found in the requested APPC profile information. When bind-time security has been defined between two logical units (LUs), a valid session key must have been defined for the encryption process. A null session key (that is, when no key is defined) is regarded as an error. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**
CICS rejects the bind.

**User response**
Check the profiles defined to the external security manager (ESM). Create a valid session key for the appropriate APPC profile entry. DO NOT use the NOSESSKEY ESM option for XAPPC security profiles when using RACF.

Refer to the ESM manuals appropriate to your system to obtain information about the meanings of any return codes or reason codes which produced by the ESM.

If you are using RACF as your security manager, refer to the RACXTRT macro guidance documented in the z/OS Security Server RACF System Programmer's Guide manual for the meaning of the return code and the reason code.

RPL B FSM error. sense ((instance)
Module name: {DFHZSDL})

Explanation

The finite state machine (FSM), for the APPC alternate RPL (RPL 'B'), has detected an error in the use of the RPL. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense , see message DFHZC2400.

System action

The task is abnormally terminated with abend code ATNI and a dump is produced.

User response

If this message occurs when VTAM is terminating, it is not a serious problem and usually no response is necessary.

If this message occurs during normal system execution, you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

DFHZC4944 date time applid termid tranid
Protocol Violation detected within bind security indicators.
sense ((instance) MODULE NAME: {DFHZBLX | DFHZBLX | DFHZOPX | DFHZOPX})

Explanation
CICS has detected an error while validating the bind security specification. LOCAL security has been specified, but the bind contains data that indicates NON LOCAL security. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
CICS rejects the bind.

User response
Ensure that the correct data is sent in the bind for the required type of security.

DFHZC4945 E date time applid termid tranid
Session unbind request due to the forcepurge of a task.
sense ((instance) Module name: {DFHZARER})

Explanation
A task was purged or forcepurged while it was suspended, waiting for an ISC request to complete. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action
An unbind is requested for the session against which the ISC request was waiting and the task is abended. A FORCEPURGE command causes the task to be abended irrespective of the state of the session. Other VTAM error messages may result from this action.

User response
Investigate the reasons the task was purged or forcepurged because it may have been the result of an application error. In addition, the partner task in the connected CICS system will have session failure notification returned on the next ISC request after the session has been unbound. Check that the partner task has handled the situation.

Module: DFHZARER

DFHZC4946 E date time applid termid tranid
Invalid attach parameter was received. sense ((instance) Module name: (DFH62XM | DFH62XM | DFH62XM))

Explanation
A request to attach a task has been received across an APPC link. However there is an error in the FMH attach parameters. An attach parameter is present that is not authorized by the bind security indicators.
The instance data can take the following values:

\[
\begin{array}{ll}
\text{instance} & \text{Meaning} \\
1 & \\
& \text{The bind security indicators show that the connection is defined as ATTACHSEC(LOCAL) indicating that this LU does not accept any security parameters in an attach from the partner LU. One or more of the following security parameters has been found: Userid, Password, Profile, AV, PV1 and PV2.} \\
2 & \text{An already-verified (AV) indicator has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the AV indicator.} \\
3 & \text{A persistent verification signon (PV2) indicator, or a persistent verification signed-on (PV1) indicator, has been received in an attach from the partner LU, but the bind security indicators show that this LU does not support the receipt of the PV indicators.}
\end{array}
\]

System action
The task abends and a dump is produced and the session is unbound. An exception trace point (number 1737) for component TF is issued, tracing the invalid attach header (FMH type 5).

User response
Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace to determine why the remote system sent an invalid attach request.

Module:
DFH62XM

Attach time security check has failed. Security not valid. sense ((instance) Module name: (DFH62XM | DFH62XM | DFH62XM | DFH62XM | DFH62XM | DFH62XM | DFH62XM | DFH62XM | DFH62XM))

Explanation
A request to attach a task has been received over an APPC link. However the FMH5 attach parameters do not conform to the APPC protocol.
The instance data can take the following values:

\[
\begin{array}{ll}
\text{instance} & \text{Meaning} \\
1 & \\
& \text{Unrecognized access security subfield} \\
2 & \text{Multiple userid access security subfields present} \\
3 & \text{Multiple profile access security subfields present}
\end{array}
\]
Multiple password access security subfields present

Userid required in FMH but not received

PV1 and PV2 security indicators both present in FMH5

Password received when AV indicator set

Password received when PV1 indicator set

Password required for PV2 but not received.

System action
The attach request is rejected and the session is unbound. An exception trace point (number 1737) for component TF is issued tracing the invalid attach header (FMH type 5).

User response
Investigate the cause of the error which is in the remote system. Use the FMH5 in the exception trace, to determine why the remote system sent an invalid attach request.

If the remote system has an earlier release of CICS or CICS on another platform and the sense value given is 5 then you may need to set USEDFLTUSER. See 'Attach Time Security and the USEDFLTUSER option' in chapter 12 of the CICS Security.

DFHZC4948 E date time applid An error has been detected when processing an{ unknown | inbound | outbound} {request. | Persistent Verify Signoff request. | Persistent Verify Timeout request.} Transaction tranid is{ continuing. | terminating. | terminating abnormally.} Error code: X'xxxxx' Connection: yyyy

Explanation
An error has been detected during the execution of transaction CLS3. The error code indicates the nature of the error:

X'01'
Transaction CLS3 issued an unsuccessful communications request on an APPC session.

X'02'
Transaction CLS3 was started by a START command with data, but the format of the data was incorrect.

X'04'
Transaction CLS3 is attempting to send a signoff request to a remote system, but the connection to the remote system is not an APPC connection.

X'06'
Transaction CLS3 was not started by terminal input, nor by a START command.

X'09'
Transaction CLS3 was started by a START command with data, but the data could not be retrieved.
X'0A'
Transaction CLS3 is attempting to send a signoff request to a remote system, but there is no connection to the remote system.

X'0B'
Transaction CLS3 unsuccessfully attempted to allocate an APPC session to a remote system.

System action
Depending upon the nature of the event that gave rise to the message, the transaction continues execution, terminates normally, or terminates abnormally. The message text indicates which action is being taken.

User response
This depends upon the error code:

X'01'
Determine why the communications request on the APPC session failed. Possible reasons are:
• There has been a session failure.
• The connected transaction has abended.
   :pc. This error produces an exception trace, which helps to determine the cause of the problem.

X'02'
Ensure that transaction CLS3 was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X'04'
Check the connection definition for the remote system. It should be an APPC connection.

X'06'
Ensure that transaction CLS3 was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X'09'
Determine why the data could not be retrieved. If you are unable to do so, contact your IBM Support Center.

X'0A'
Ensure that the connection has been correctly defined

X'0B'
Ensure that the connection is acquired and in service

Explanation
All the CICS Receive Any RPLs have been posted but the TCTTE for each one is waiting for a response from a VTAM terminal or session. All the Receive Any RPLs have been stalled for 10 dispatches of the TCP task (CSTP). This message is produced for each session that is in this situation. A VTAM session has not responded to a command such as BID or SHUTD sent by CICS. This is typically caused by a protocol error.
**System action**

CICS is running with system initialization parameter RAPOOL=(n,n,FORCE) causing CICS to issue a VTAM CLSDST against the session, which causes the TCTTE's RPL to be completed and the session to be unbound.

The default NEP action is CLSDST, which causes CICS to clean up the TCTTE after the pending command has been terminated.

The Receive Any data received is discarded and the RA RPL is reissued.

**User response**

Investigate the reason why the command has not completed. The TCTTE RPL is printed with the message.

It is important to look at any earlier DFHZC4949 messages because of the asynchronous nature of DFHZNAC. If the CLSDST has not completed, the RPL printed will be active and will show the RPL that can not complete. If the CLSDST has completed when DFHZNAC runs, the RPL printed will have a RTNCD/FDB2 of X'0C0B' but RPLREQ still shows what command would not complete.

If the CLSDST return code rc is non 0, the CLSDST macro has failed in DFHZRAC and the session remains hung. You may be able to free the session by using VTAM command V NET,INACT,ID=netname,1. You can find the reason for the CLSDST failure by looking at the RPL in the APFC90 trace point for the CLSDST.

CSNE

**DFHZC4950 E date time applid** An error has occurred when attempting to attach the outbound Connection Quiesce Protocol transaction CQPO on session termid. Release of connection sysid is continuing. (instance) Module name: (DFHZCLS)

**Explanation**

An error has been detected while attempting to attach the outbound transaction for the Connection Quiesce Protocol (CQPO) on an APPC session.

**System action**

The release of the connection continues, but the Connection Quiesce Protocol will take place only if the partner system successfully initiates it.

**User response**

Determine why transaction CQPO failed to attach. If you have installed the correct definition for the transaction, you should never see this message, and you may need to contact your IBM Support Center for assistance.

If the partner system did not initiate the Connection Quiesce Protocol, you may need to determine if there are units of work awaiting resync, or VTAM affinities to be ended before you can INITIAL start either of the connected systems.

**Module:**

DFHZCLS

5. sysid
6. instance
7. Value chosen from the following options:
An error has been detected when processing an {unknown / inbound / outbound} Connection Quiesce Protocol request. Transaction
tranid is{terminating. / terminating
abnormally.} Error code: X’xxxxx’ Connection: yyyy

An error has been detected during the execution of transaction tranid. The error code indicates the nature of the error:

X'01'
Transaction tranid was not started by terminal input, nor by an internal CICS command.

X'02'
Transaction tranid was started by an inbound FMH5, but the TPN was not the correct value for the Connection Quiesce Protocol.

X'03'
Transaction tranid issued an unsuccessful communications request on an APPC session.

X'04'
Transaction tranid has been attached by an inbound FMH5. The format of the data received from the remote system did not comply with the architecture for the Connection Quiesce Protocol.

X'05'
Transaction tranid has received an unexpected response from the Recovery Manager.

X'06'
Transaction tranid has been attached by an internal CICS command and has sent a Connection Quiesce Protocol request to the remote system. The format of the reply received from the remote system did not comply with the architecture for the Protocol.

X'07'
Transaction tranid was started, but its principal facility is not a terminal or session.

Depending upon the nature of the event that gave rise to the message, the transaction continues execution, terminates normally, or terminates abnormally. The message text indicates which action is being taken.

This depends upon the error code:

X'01, 02, 07'
Ensure that transaction tranid was started by CICS-supplied code, and not by application code. If it was started by CICS-supplied code, contact your IBM Support Center.

X'03'
Determine why the communications request on the APPC session failed. Possible reasons are:

• There has been a session failure.
• The connected transaction has abended.

This error produces an exception trace, which helps to determine the cause of the problem.

In other cases, contact your IBM Support Center.

DFHZC5913 E  date time applid Deletion of node id failed.  {A table entry is locked. | A table entry was not found. | There was a logic error.} Table=tabname Key(key) Module(modname) Instance=inst.

Explanation
CICS cannot delete node id. The message explains the reason for the failure.

1. One of its TMP table entries is locked by other tasks.
2. A TMP table entry could not be found, possibly because the node was already deleted by another task.
3. There was a CICS logic error. A DFHTM0002 error message may have been issued as well.

The TMP table entry is identified by tabname. The key used in the table has a value key. The module that issued the message is identified by modname and the instance of the message in that module by inst.

System action
The resource is not deleted. If the entry was locked, CICS issues one or more message DFHZC5980.

User response
Choose the action which corresponds to the reason identified in the message:

1. See message DFHZC5980 for further information and guidance.
2. If the node is deleted, no action is needed. If the node exists, determine whether it was replaced while this request was running. If the entry exists and has not been replaced, you will need assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

3. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**DFHZC5918**
*date time applid* Deletion of terminal *termid* failed. It has pending DFHZCP activity.

**Explanation**
The MVS console *consname* has outstanding activity that prevents its deletion.

**System action**
CICS continues.

**User response**
After replying to any outstanding replies requested of this console, put the console briefly into service and then take it out of service again, using the CEMT transaction.

**Module:**
DFHBSTZO

CSMT

**DFHZC5919**
*date time applid* Deletion of terminal *termid* failed. CICS logic error

**Explanation**
CICS cannot delete terminal *termid* because of an error in disconnecting remote terminals.

**System action**
CICS continues. A system dump is taken with dumpcode ZC5919. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**
DFHBSSZ

1. date
2. time
3. applid
4. termid

**Destination**
CSMT

**DFHZC5920**
*date time applid* Install of terminal *termid* failed. CICS logic error

**Explanation**
This CICS system failed to install terminal *termid*. No terminals can be accepted yet because the system does not have a local system entry. There was probably a failure during CICS initialization.

**System action**
CICS continues. A system dump is taken with dumpcode ZC5920. Message DFHME0116, which contains the symptom string for this problem, is produced.

Chapter 2. CICS messages 2471
User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSTZ

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. termid

Destination
CSMT

DFHZC5921 E  date time applid Install of terminal termid failed. VTAM support not loaded.

Explanation
CICS failed to install terminal termid because CICS was initialized without VTAM support.

System action
CICS continues processing.

User response
To use VTAM, shut down CICS and restart with the system initialization parameter VTAM=YES, a TCT that does not specify ACCMETH=NONVTAM, and appropriate RDO terminal definitions.

Module:
DFHBSZZV

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. termid

Destination
CSMT

DFHZC5924 E  date time applid Install for terminal termid failed. CICS logic error

Explanation
CICS failed to install terminal termid because the bind-image was invalid.

System action
CICS continues. A system dump is taken with dumpcode ZC5924. Message DHME0116, which contains the symptom string for this problem, is produced.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSZZV

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. termid

Destination
CSMT

DFHZC5923 E  date time applid Install for terminal termid failed. CICS logic error

Explanation
CICS failed to install terminal termid because the TCTTE contained no node information block (NIB) descriptor.

System action
CICS continues. A system dump is taken with dumpcode ZC5924. Message DHME0116, which contains the symptom string for this problem, is produced.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.
XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. termid

Destination
CSMT

DFHZE5925 E  date time applid Deletion of connection cccc failed. Its AID-Chains are not empty

Explanation
CICS did not delete connection cccc because the AID-chains for the remote system cccc are not empty.

System action
CICS continues.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSSA

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. cccc

Destination
CSMT

DFHZE5927 E  date time applid Install for connection cccc failed. CICS logic error

Explanation
CICS did not install the connection cccc because DFHZCP received no RECORDFORMAT operand.

System action
CICS continues. A system dump is taken with dumpcode ZC5927. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSSZ6
Remote connection (sysid) could not be deleted because it was in use by number of sessions.

When remote connection sysid was being deleted, it was still in use by number of sessions.

The resource is not deleted. CICS continues.

Wait until access to this remote connection has quiesced and then retry the deletion.

Install connection cccc.

CICS did not install a SESSIONS definition using MODENAME modename because of an unknown name cccc in the CONNECTION parameter.

CICS continues.

Install connection cccc.

The maximum number of sessions depends on whether the PTF shipped for APAR PQ27823 is installed. The basic limit is 46656 and the names are in the range -AAA to -999. The APAR doubles this limit to 93312 giving an additional range of AAA- to 999-.
DTZC5933 E  date time applid Install for modename modename failed. Connection cccc is not valid here

Explanation
CICS did not install a SESSIONS definition using MODENAME modename because the CONNECTION is not valid in this context.

System action
CICS continues.

User response
Modify your definition of remote system cccc.

Module: DFHBSM62

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. modename
5. cccc

Destination
CSMT

DTZC5934 E  date time applid Install for modename modename failed. Single-session connection cccc is already in use.

Explanation
CICS did not install a SESSIONS definition using MODENAME modename because the single-session CONNECTION cccc is already in use.

System action
CICS continues.

User response
Modify the definition of cccc.

Module: DFHBSM61, DFHBSM62

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. modename
5. cccc
6. xxxx

Destination
CSMT

DTZC5936 E  date time applid Install for modename modename failed. Connection cccc has active modegroup xxxx

Explanation
CICS has not installed a SESSIONS definition with MODENAME modename because the connection cccc already has an active MODEGROUP, xxxx.

System action
CICS continues.

User response
Put the connection briefly into service and then take it out of service again, using the CEMT transaction.

Module: DFHBSM62

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. modename
5. cccc
6. xxxx

Destination
CSMT

DTZC5937 I  date time applid Deletion of modename modename found another deletion of it in progress

Explanation
CICS has not deleted a SESSIONS definition with MODENAME modename because the definition is already pending deletion.
System action
CICS continues.

User response
Check if a CEDA user was installing the SESSIONS definition.

Module:
DFHBSM62

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. modename

Destination
CSMT

DFHZC5938 E  date time applid Deletion of modename modename failed. Unable to delete session(s)

Explanation
CICS is unable to delete a SESSIONS definition with MODENAME modename because of one or more errors reported in previous messages.

System action
CICS continues.

User response
Refer to any preceding messages for further information and guidance. Correct the reported errors.

Module:
DFHBSM61

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. name
5. sysid

Destination
CSMT

DFHZC5940 E  date time applid Install for terminal termid failed. Error console cannot be deleted

Explanation
You have tried to replace the error console, CERR. CICS does not allow this.

System action
CICS continues with original error console.

User response
Note this restriction.

Module:
DFHZCQDL

modegroup-name for connection sysid

modegroup-name for connection sysid

modegroup-name for connection sysid
XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. termid

Destination
CSMT

DFHZC5941 E  
**date**  **time**  **applid**  Install for terminal **termid** failed. Console **consname** has a conversation outstanding

Explanation
CICS was unable to install terminal **termid** because the console **consname** has posted an ECB.

System action
Processing continues.

User response
Put the terminal briefly into service and then take it out of service again, using the CEMT transaction.

Module:
DFHBSTZO

XMEOUT parameters/Message inserts

1. date
2. time
3. applid
4. termid
5. consname

Destination
CSMT

DFHZC5942 E  
**DATE TIME APPLID** Node **nodeid** was not installed. The addition of key **key** to table **tablename** failed. **RC=X'return'.** Module(modname).

Explanation
CICS cannot install the definition of node **nodeid** because an addition to a TMP table failed. CICS was trying to add the key **key** to the table **tablename**.

The return code from TMP is given in **return**. If the return code is 4, the entry was a duplicate. It is possible that another entry was added at the same time as this entry and used the same key. If this is not the case, CICS has suffered a logic error. The module that issued the message is indicated by **modname**.

System action
CICS does not install the definition.

User response
If the entry was not overlapped by another definition which conflicted with its key, or if the return code is not 4, you will need assistance from IBM to resolve the problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSS, DFHBSTZ, DFHBSTZS, DFHBSTZZ, DFHBSTZ1, DFHBSTZ2

XMEOUT parameters/Message inserts

1. DATE
2. TIME
3. APPLID
4. nodeid
5. key
6. tablename
7. X'return'
8. modname

Destination
CSMT

DFHZC5943 E  
**DATE TIME APPLID** MRO connection **conname** could not be deleted because IRC is open.

Explanation
CICS cannot delete the connection **conname** because it is an MRO connection and interregion communication (IRC) is open.

System action
The connection is not deleted.

User response
Close the IRC definition and retry the Delete or Replace.

Module:
DFHBSS
XMEOUT parameters/Message inserts

1. DATE
2. TIME
3. APPLID
4. connname

Destination
CSMT

**Explanation**
CICS cannot install definition of type called id because it would make a loop of connection definitions. The connection type may be an indirect connection or a remote connection. Indirect connections point to other connections with the INDSYS field, and remote connections point to other connections with the REMOTESYSTEM field. The module that issued the message is identified by modname.

**System action**
CICS does not install the definition.

**User response**
Determine the source of the loop either in the already installed definitions or in this definition, and change it before attempting to reinstall this definition.

**Module:**
DFHBSSZI, DFHBSTZ2

---

**XMEOUT parameters/Message inserts**

1. DATE
2. TIME
3. APPLID
4. type
5. id
6. modname

Destination
CSMT

**Explanation**
CICS has not deleted the SESSIONS definition, ssss, because the CONNECTION is still defined to IRC.

**System action**
CICS continues.

**User response**
Issue a CEMT SET IRC CLOSED command.

**Module:**
DFHBSTZR

---

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. ssss
5. cccc

Destination
CSMT

**Explanation**
CICS has not installed the SESSIONS definition, ssss, because the CONNECTION is already defined to IRC.

**System action**
CICS continues.

**User response**
Issue a CEMT SET IRC CLOSED command.

**Module:**
DFHBSTZR

---

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. ssss
5. cccc
**Destination**

CSMT

**Explanation**

CICS has not installed the SESSIONS definition, ssss, because the CONNECTION name is not specified.

**System action**

CICS continues. A system dump is taken with dumpcode ZC5947. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**

If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**Module:**

DFHBSMIR, DFHBSTZR

**XMEOUT parameters/Message inserts**

1. `date`
2. `time`
3. `applid`
4. `ssss`

**Destination**

CSMT

**Explanation**

CICS has not installed the SESSIONS definition, ssss, because the CONNECTION specified is not suitable for IRC.

**System action**

CICS continues.

**User response**

Modify your definition of `cccc`.

**Module:**

DFHBSMIR, DFHBSTZS, DFHBSTZR

**XMEOUT parameters/Message inserts**

1. `date`
2. `time`
3. `applid`
4. `ssss`
5. `cccc`

**Destination**

CSMT

**Explanation**

CICS has not installed the SESSIONS definition, ssss, because the CONNECTION specified does not support the required type of session. If you are replacing a connection of the same name but of a different type and the install fails for some other reason then this message may occur.

**System action**

CICS continues.

**User response**

Modify your definition of `cccc`.

**Module:**

DFHBSMIR, DFHBSTZS, DFHBSTZR

**XMEOUT parameters/Message inserts**

1. `date`
2. `time`
3. `applid`
4. `ssss`
5. `cccc`

**Destination**

CSMT

**Explanation**

CICS has not installed the SESSIONS definition, ssss, because the CONNECTION specified is incompatible with connection `cccc`.

**System action**

CICS continues.

**User response**

Modify your definition of `cccc`.

**Module:**

DFHBSMIR, DFHBSTZS, DFHBSTZR

**XMEOUT parameters/Message inserts**

1. `date`
2. `time`
3. `applid`
4. `ssss`
5. `cccc`

**Destination**

CSMT

**Explanation**

CICS has not installed the SESSIONS definition, ssss, because the CONNECTION specified is not suitable for IRC.

**System action**

CICS continues.

**User response**

Modify your definition of `cccc`.

**Module:**
Explanation
CICS has not installed the CONSOLE definition termid because the console ID, consname, already exists.

System action
CICS continues without installing the terminal.

User response
Use the CEDA transaction to define a different console ID in the CONSNAME of the terminal definition and reinstall the terminal.

Module:
DFHBSTZ0

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. termid
5. consname

Destination
CSMT

DFHZC5951 E date time applid Deletion of connection ssss failed. Unable to delete sessions

Explanation
CICS has not deleted the CONNECTION definition, ssss, because it cannot delete one or more sessions. A preceding message or messages should explain this failure.

System action
CICS continues.

User response
Refer to the preceding message for further information and guidance.

Module:
DFHBSSZR, DFHBSSZ6

XMEOUT parameters/Message inserts
1. date
2. time
3. applid

Destination
CSMT

DFHZC5952 E date time applid Deletion of terminal termid failed. It needs to be SET RELEASED

Explanation
CICS cannot delete terminal termid because of its current state.

System action
CICS continues.

User response
Use the CEMT transaction to set terminal termid released and out of service.

Module:
DFHBSTZV

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. termid

Destination
CSMT

DFHZC5953 E date time applid CICS logic error

Explanation
An object being installed did not have a bind-image.

System action
CICS continues. A system dump is taken with dumpcode ZC5953. Message DFHME0116, which contains the symptom string for this problem, is produced.

User response
If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

Module:
DFHBSM62
**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid

**Destination**

CSMT

**DFHZC5954 E**

*date time applid Install for resource resource failed. Unable to install sessions component*

**Explanation**

CICS has failed to install resource resource. Previous message(s) should give the reason for the failure.

**System action**

CICS continues.

**User response**

Refer to any preceding messages for further information and guidance.

**Module:**

DFHBSTZC

---

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. resource

**Destination**

CSMT

**DFHZC5957 E**

*date time applid Arch. User-Data ID X'xx occurs in bind. CICS logic error*

**Explanation**

The APPC SESSIONS object being installed is invalid because architected user-data IDs greater than X'02' occur in bind.

**System action**

CICS does not install the object. A system dump is taken with dumpcode ZC5957. Message DFHME0116, which contains the symptom string for this problem, is produced. If you need further assistance from IBM to resolve this problem, see Working with IBM to solve your problem for guidance on how to proceed.

**User response:**

**Module:**

DFHBSM62

---

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. xx

**Destination**

CSMT

**DFHZC5958 E**

*date time applid Install failed for xxxx. This is the name of the local system which must not be replaced.*

**Explanation**

A terminal or a connection was defined with the same name as the local system entry during the last run of CICS. This is not allowed as the local system entry cannot be replaced.

During cold or initial start of the current run of CICS, CICS attempted to install the group which included the invalid definition. CICS then issued this message.

**System action**

CICS continues, but this terminal or connection is not installed.

**User response**

Use the CEDA transaction to correct the terminal or connection name and install the group.

**Module:**

DFHBSSZL

---

CSMT

**DFHZC5965**

*DATE TIME APPLID Pool delete for pool poolid failed. Terminal termid was being replaced at the same time.*

**Explanation**

CICS failed in an attempt to install or delete POOL definition poolid. A terminal termid in the pool was being deleted at the same time as the pool was being installed or deleted. This probably due to changing the terminal from a pooled terminal to a non-pooled terminal, or changing the pool name for a terminal in the same group. CICS cannot continue to modify the pool until the change to the terminal has completed.

**System action**

CICS continues.

**User response**

Once the deletion or modification of the terminal has succeeded, retry the installation.

4. pppp
5. termid

Destination
CSMT

DFHZZC5983 E date time applid Unable to replace resource

Explanation
CICS failed to install resource resource either because it already exists, or for reasons explained in previous messages.

Possible causes are:
• Non-VTAM and VTAM terminals defined with the same name. If a non-VTAM terminal is installed, CICS will not autoinstall a VTAM terminal with the same name.
• An attempt to replace your own terminal, or a terminal with the same name as the terminal being used to issue the CEDA command.

System action
CICS continues but reverses the effects of the installation or deletion.

User response
Wait until the other task has completed then retry the action.

Module:
DFHBSTZ, DFHBSTZ1, DFHBSTZ2, DFHBSSZI

- An attempt to replace a terminal with the same REMOTENAME and REMOTESYSTEM as an earlier definition in the same group.

System action
CICS continues.

User response
 Refer to previous messages for further information and guidance.
If no previous messages were issued, check your terminal identifiers.

Module:
DFHBSS, DFHBSTZ, DFHBSTZ1, DFHBSTZ2

XMEOUT parameters/Message inserts
1. date
2. time

3. applid
4. xxxx

DFHZC6210 E date time applid Table builder could not obtain storage for control block code X'code', module modname.

Explanation
While executing a BUILD, a DESTROY or a RESTORE request, CICS table builder services could not obtain storage for a control block. The control block could be a RRAB, a RABN, an action_block, a recovery record, or a recovery segment. The error code code identifies the element that could not be obtained by the module modname.

System action
CICS rejects the request. It has already written an exception trace record identified by code.

User response
This failure may be a symptom of a expanded dynamic storage area (EDSA) that is too small. If so, you can solve the problem by increasing the size of your CICS region. For guidance on estimating the size of the DSA and the CICS region, see the Configuring and the Improving performance. You can identify which control block that could not be obtained by formatting the exception trace record.

The failure may also be caused by an error in another transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

Module:
DFHTBSB, DFHTBSD, DFHTBSL, DFHTBSBP, DFHTBSDP, DFHTBSLP, DFHTBSS

CSMT

DFHZC6212 E date time applid Level mismatch with catalog record. DFHBS xxx
**Explanation**

While executing a request during a warm or emergency start, CICS Table Builder Services has detected that the CC record is not compatible with the pattern it names. xxx is the builder ID.

**System action**

CICS rejects the request.

**User response**

The CC record was probably written by an earlier level of CICS. That is, you have applied one or more PTF maintenance fixes to the system since the CC record was written. Assuming this is the case, you must either:

- Cold or initial start CICS, or
- Remove the maintenance to enable a warm start or emergency restart.

**Module:** DFHTBSR, DFHTBSRP

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. xxx

**Destination**

CSMT

**Explanation**

While processing a RESTORE request, CICS Table Builder Services detected an error reported in a previous message. key is the catalog key for the abandoned record, or, if the key is unknown to CICS, key is the single character ?.

**System action**

See the previously issued message for the cause of the problem, and follow the recommended user action.

**User response:**

**Module:** DFHTBSR

**DFHZC6214 E**

**Explanation**

While processing a CATALOG request, CICS Table Builder Services could not obtain recovery record storage.

**System action**

CICS rejects the request.

**User response**

This failure may be a symptom of a dynamic storage area (DSA) that is too small. If so, you can solve the problem by increasing the size of your CICS region. For advice on estimating the size of the DSA and the CICS region, see the Configuring and the Improving performance.

The failure may also be caused by an error in another transaction, for example, a looping program with an EXEC CICS GETMAIN within the loop.

**Destination**

CSMT

**DFHZC6216 E**

**Explanation**

Install for restype1 (resname1) failed and caused the backout of the whole set of RDO resources for restype2 (resname2).
Explanation
The RDO definition for a resource of type restype1 named resname1 could not be installed because of an error. This causes the installable set of RDO definitions associated with restype2 named resname2 to be backed out.

The resource type of the definition that failed restype1 can be connection, session, modegroup, pool, or pooled terminal. The resource type of the associated definition restype2 can be connection, or a pool_name for pipeline terminals.

System action
CICS backs out the installation of the set of associated RDO definitions and continues without them.

User response
Correct the reason for the failure of the definition, identified by previous DFHZXnnnn messages, and then retry the install.

Module:
DFHTBSB

XMEOUT parameters/Message inserts

7. resname2

Explanation
A resource tttt was being installed but was found to have the same network name netname as resource rrrr.

System action
The resource is not installed, CICS continues.

User response
If you want the definitions to be installed, use CEDA to correct the network name and reinstall the definition.

Module:
DFHBSTZV

XMEOUT parameters/Message inserts
1. date
2. time
3. applid
4. tttt
5. netname
6. rrrr

Explanation
A connection cccc was being installed but was found to have the same network name netname as resource rrrr.

System action
The resource is not installed, CICS continues.

User response
You cannot have an APPC connection with the same network name as another APPC connection or an LU6.1 connection. That is, you cannot have more than one APPC connection between two systems and an APPC connection cannot be installed with an LU6.1 connection between two systems.

Neither APPC or LU6.1 network names can be the same as a terminal's network name. Also you cannot have an IRC (or XM) connection with the same network name as another IRC (or XM) connection. However, an IRC network name can be the same as any VTAM network name (APPC or LU61 connection or terminal).

If you want the definitions to be installed, use CEDA to correct the network name and then reinstall the definition.
If you need to replace a connection with a different network name, it must have the same connection name as the one you are replacing.

DFHZC6333 E  date time applid INSTALL for modename modename failed. Zero sessions specified

Explanation
CICS has not installed a mode group modename because the maximum number of sessions specified was 0. The CEDA SESSION MAXIMUM parameter cannot be set to 0, so this was possibly caused by a storage overwrite, or by an invalid builder parameter set being shipped into CICS.

System action
The install fails, but CICS continues.

User response
Find the offending builder parameter set and set ZC_MAXSESS_1 to a minimum value of 1.

Module:
DFHBSM61

XMEOUT parameters/Message inserts

5. bymodule

Destination
CADL

DFHZC6350 I date time applid The type session name BITMAP was corrupt and
has been rebuilt. Error code: AP FB05.

**Explanation**
A connection was being installed but the APPC or MRO session name BITMAP which is used to create a session name, was corrupt. The corrupt BITMAP has been rebuilt.

The APPC session name BITMAP is always used for an APPC session, however the MRO session name BITMAP is only used if the session name is prefixed with '<' or '>'.

**System action**
A dump is taken with dumpcode ZC6350. Trace point ID AP X'FB05' is produced. The install continues. CICS continues. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
Use the dump provided to determine the cause of the storage overwrite. See the Troubleshooting and support for guidance on dealing with storage problems.

**Module:**
DFHZGBM

**XMEOUT parameters/Message inserts**
1. date
2. time
3. applid
4. type

**Destination**
CSMT

**DFHZC6360 W**

**Explanation**
A ZCP install has failed. This would normally result in a message being issued. However, the GETMAIN attempting to obtain storage from the CDSA for use as a message area has failed. This means that there is no more free storage available in the CDSA.

**System action**
The message which should have reported the ZCP install failure cannot be issued. Subsequent messages also cannot be issued while there is no free storage available in the CDSA. However, subsequent messages can be issued if storage becomes available on subsequent GETMAIN attempts. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
Use trace to determine the source of the problem. Trace point AP FCDD, the TBSM entry, gives the message number which should have been issued and the message insert data. Refer to the description of this message for further guidance.

Destination

CSNE

DFHZC6595 I  date time applid termid tranid
Node netname backup session not attempted. sense ((instance)
Module name: {DFHZOPN | DFHZOPN | DFHZOPN})

Explanation

Before the OPNDST is issued, the backup system has abandoned the attempt to establish a backup session for one of the following reasons:
• There is no XRF support in VTAM (TCTVXRFS), or
• the TCTTE is flagged as a secondary. This CICS receives the BIND, but does not send it (TCTE2RY),
• the TCTTE indicates that the LOGMODE keyword was specified on the terminal definition.

This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

System action

If this system takes over, the autoconnect process attempts to acquire a session. In this case, it probably
takes longer for the session to become available for use.

**User response**

Do not attempt a backup session.

Rectify error, or downgrade the recovery option specified for this terminal.

**DFHZC6596**

applid CICS terminal control program cannot support XRF functions. sense ((instance) Module name: (DFHZSEX | DFHZSLS))

**Explanation**

The VTAM ACB has been opened, and the function level of the terminal control program (ZCP) and VTAM has been examined. It has been determined that XRF terminal functions cannot be supported in this execution of CICS.

This can be because one of the DFHZCx modules, or the TCT, was assembled against a version of VTAM earlier than 3.1, or because the level of VTAM that has just been opened is pre-3.1. This imbed is inserted in DFHZC xxxx messages with sense inserts. For the meaning of sense, see message DFHZC2400.

**System action**

Processing continues. Processing continues, but no VTAM XRF functions can be supported.

**User response**

If VTAM XRF functions are required, check the assembly of each of the DFHZCx modules and the TCT.

If a pre-3.1 release of VTAM was used in the assembly process, then a warning MNOTE will have been issued.

The relevant modules should then be reassembled against the correct level of VTAM.

If the assembly of all modules is correct, then the VTAM used in this execution is at a pre-3.1 level.

Console

DFHZC6901 W  date time applid  Autoinstall BIND for NETNAME netname is invalid. Internal RC(X’reponse’).

Explanation

The bind passed for AUTOINSTALL of a resource has shown an error in the bind image check call. The fixed part of the BIND is printed (this is the part on which the validation code operates ? see the Systems Network Architecture Formats (GA27-3136) for details of the BIND RU). The internal return code X‘code’ identifies the location within the module that invalidated the BIND.

System action

CICS continues but the session is not installed. The request is rejected and message DFHZC2411 is issued. The terminal is not usable until a VTAM LOGOFF command is issued.

User response

Investigate the fixed part of the BIND data to determine the reason for the rejection. The internal return code gives more information that can be used by IBM to help you to determine the cause of the problem. See Working with IBM to solve your problem for guidance on how to proceed.

Module:

DFHZATA

**XMEOUT parameters/Message inserts**

1. *date*
2. *time*
3. *applid*
4. *resource*
5. *resid*
6. Value chosen from the following options:
   - 1=*netname*,
   - 2=*consolename*
7. *id*
8. *model*

**Destination**

CADL

**Explanation**

Transaction CATA was autoinstalling a terminal or console, *id*, when the task abended with abend *abend*. If the resource being autoinstalled was a terminal, then the issuing module was DFHZATA. Otherwise, the issuing module was DFHZATA2 if the resource was a console. The *id* can be either a netname or a consolename.

**System action**

CICS continues but the resource is not installed.

**User response**

Retry the logon attempt. If the abend indicates a TIMEOUT and this occurs frequently, increase the CATA DTIMOUT value. If you do not want the CATA transaction to time out, remove the DTIMOUT parameter from the CATA DEFINE TRANSACTION command. However, if you do this, and if the system is short on storage, a large number of CATA transactions running at the same time with no other transactions present could cause a deadlock.

**Module:**
DFHZATA, DFHZATA2

**XMEOUT parameters/Message inserts**

1. *date*
2. *time*
3. *applid*
4. Value chosen from the following options:
   - 1=*netname*,
   - 2=*consolename*
5. *id*
6. *abend*

**Destination**

CADL

**Explanation**

Transaction CATD, program DFHZATD was deleting an autoinstalled resource *resid*, when the task abended with abend *abend*.

**System action**

CICS continues. If the resource still exists, it is reused next time the same TERMID or SYSID is used.

**User response**

See the description of abend *abend* for further guidance.

If the abend indicates a TIMEOUT and this occurs frequently, increase the CATD DTIMOUT value. If you do not want the CATD transaction to time out, remove the DTIMOUT parameter from the CATD DEFINE TRANSACTION command. However, a large number of CATD tasks running at the same time with no purgeable tasks present could cause a deadlock if the system is also short on storage.

   2=consolename  
7. id  
8. abend

**Destination**

CADL

**DFHZC6906** *date time applid* Install or delete of remote terminal *termid* failed. *tranid* task abended (abend *abend*).

**Explanation**

One of the functions of DFHZATS (transaction CITS, CDTS, CMTS or CFTS) has abended with abend *abend*.

**System action**

CICS continues.

For CITS (remote install), if the remote terminal (skeleton) was actually built, CICS might use it.

For CDTS (remote delete), if the remote terminal (skeleton) has not been deleted, it might be reused.

For CMTS (remote mass delete), terminals which have not been deleted by CMTS might be deleted at a later stage.

For CFTS (remote mass flag), terminals which have been flagged for deletion might be deleted at a later stage. If any terminals have not been flagged, attempts might be made to reuse them. This can have unpredictable results.

**User response**

See the description of abend *abend* for further guidance.

The most likely reason for this message is a timeout of CITS or CDTS. In the case of CITS, reissue your transaction if necessary.

If the TIMEOUTs occur frequently, consider increasing the CITS or CDTS DTIMOUT values. If you do not want the transactions to time out, remove the DTIMOUT parameter from the CITS or CDTS DEFINE TRANSACTION command. However, a large number of CITS tasks running at the same time with no purgeable tasks present could cause a deadlock if the system is also short on storage.

Note that CFTS and CMTS do not have a DTIMOUT parameter and should not be given one because they only run once after a warm or emergency restart and should not be allowed to time out.

Destination
CADL

DFHZC6911 W date time applid Delete for remote terminal termid failed.

Explanation
A DELETE for remote terminal termid has failed. Possible causes are that the terminal has already been deleted or that it is in use by another task.

If this message is repeated a number of times, there could be a more serious problem.

System action
If the message is associated with message DFHZC6912, CICS continues normally. If message DFHZC6912 is not issued, DFHZATS is abnormally terminated with a transaction dump.

User response
If the message is associated with message DFHZC6912, no action is necessary. If DFHZC6912 is not issued, see the associated DFHZC59xx, DFHZC62xx and DFHZC63xx messages for the reason for the DELETE failure.

Destination
CADL

DFHZC6912 I date time applid Unable to delete remote terminal.
Explanation

This message is issued during a mass delete of remote terminals following a warm or emergency restart. A terminal which had been flagged for deletion could not be deleted. The most likely explanation is that the terminal has already been deleted by another task.

An associated DFHZC6911 message gives the identity of the terminal. This might be associated with one or more DFHZC59xx and DFHZC62xx messages giving the reason for the failure.

System action

Processing continues normally.

User response

See the associated messages for further information.

Destination

CADL

DFHZC6915 E  

date time applid Unable to sign off remote terminal termid. Bad Return Code (RC = \texttt{X'SNUS\_RESPONSE}') from signon domain call.

Explanation

An unexpected response (INVALID, DISASTER or EXCEPTION) has been received on a call by DFHZATS
to function SIGNOFF_TERMINAL_USER during sign-off processing for a remote terminal session running under CRTE.

**System action**
The terminal sign-off process fails to complete and the terminal user remains signed on. CICS processing continues. Message DFHME0116, which contains the symptom string for this problem, is produced.

**User response**
See the related message produced by the domain that detected the original error.

**Module:** DFHZATS

**XMEOUT parameters/Message inserts**

1. *date*
2. *time*
3. *applid*
4. *termid*
5. *X‘SNUS_RESPONSE’*

**Destination**
CADL

**Explanation**
An autoinstall attempt to install APPC NETNAME netname has failed. The autoinstall program call to the autoinstall control program failed with return code x.

The return codes are mapped from the program manager LINK_URM response and reason. More precise reasons for failure can be obtained from trace point PG 0A02.

**System action**
CICS continues.

**User response**
The appropriate response depends on the return code as follows:

1. The user exit program has no resource definition. Ensure that the PROGRAM resource definition for the user exit program is installed.
2. The user exit program could not be loaded. Ensure that the user exit program is contained in one of the data sets concatenated in the DFHRPL DD statement and has the correct name.
3. The user exit program has abended. This is a possible error within the user exit program. Check for any abend codes that may have been issued.
4. Loading of the user exit program failed for some other reason. Check the DFHPGLU exit trace entry (PG 0A02) to see why the program manager was unable to load the program.

**Module:** DFHZGAI

**XMEOUT parameters/Message inserts**

1. *date*
2. *time*
3. *applid*
4. *netname*
5. *x*

**Destination**
CADL

**Explanation**
An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has given a nonzero return code indicating that the install cannot go ahead.

If you do not support APPC autoinstall, the autoinstall control program (DFHZATDX is the default name) automatically returns a nonzero return code to disallow this function.
**System action**

The exception trace entry code shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

**User response**

The failure code X'code' is as follows:

X'FA07'

If APPC autoinstall is not supported, use the netname to determine which device is attempting autoinstall.

If APPC autoinstall is supported, examine the autoinstall control program to determine why it has not set the return code to allow the install.

**Module:**

DFHZGAI

**XMEOUT parameters/Message inserts**

1. date
2. time
3. applid
4. netname
5. X'code'

**Destination**

CADL

DFHZC6922 E date time applid Parameter list error during autoinstall for NETNAME netname. Code X'code'

**Explanation**

An APPC connection not known to CICS has attempted to connect to CICS. However, the autoinstall control program has returned an invalid parameter, or a parameter that has led to an invalid template being used.

**System action**

The exception trace entry code shows the parameter list for the autoinstall control program. The session is terminated. CICS continues.

**User response**

The failure code X'code' is one of the following:

**X'FA08'**

No netname or sysid was supplied for the template. Change the autoinstall control program to supply either the netname or the sysid.

**X'FA09'**

The sysid for the new connection has invalid characters. It can only contain A-Z a-z 0-9 and £#@ (where £ is X'5B') Redefine the connection name in the autoinstall control program.

**X'FA0A'**

The sysid for the new connection already exists. Change the autoinstall control program to supply a unique name.

**X'FA0B'**

CICS is unable to locate the supplied template netname. Change the autoinstall control program to supply the correct template name, or use CEDA to install the template connection.

**X'FA0C'**

CICS is unable to locate the supplied template sysid. Change the autoinstall control program to supply the correct template sysid or use CEDA to install the template connection.

**X'FA0D'**

The template is not an APPC connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

**X'FA0E'**

The bind indicates that a parallel session connection is required. The template is a single session connection. Change the autoinstall control program to supply the correct template name, or use CEDA to reinstall the template correctly.

**X'FA0F'**

The bind indicates that a single session connection is required. The template is a parallel session connection. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

**X'FA10'**

The modename in the bind does not match the modename in the connection.

For parallel sessions, the SNASVCMG modegroup is missing. The install for the template may have failed - check for any CADL messages mentioning the template name. The template connection may have been corrupted. Try and re-install the template.
For single sessions, the user modegroup name does not match. Change the autoinstall control program to supply the correct template name or use CEDA to reinstall the template correctly.

X'FA11'
The program that attempted to INQUIRE on the template has detected an error in the template and is unable to create a BPS with which to install the new connection. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the CONNECTION is correct.

X'FA12'
The program that attempted to INQUIRE on a user modegroup for the named template has detected an error in the template and is unable to create a BPS with which to install a user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and CADL log to determine whether the template installed correctly. Also use CEMT to ensure that the MODEGROUP is correct.

X'FA13'
The template connection has no user modegroup. This problem may be caused by a failure in the initial install of the template. Check the console and the CADL log to determine whether the template installed correctly. Also, use CEMT to ensure that the MODEGROUP is correct.

X'FA14'
The template connection is out of service so this install cannot continue. If the install should have been allowed to continue, put the relevant template connection INSERVICE using CEMT.

X'FA15'
The incoming bind user data does not have a PLUNAME Network Name subfield (id 04). This is required and should have been supplied by the PLU.

X'FA16'
The incoming bind user data does not have a MODENAME Network Name subfield (id 02). This is required and should have been supplied by the PLU.

3. applid
4. netname
5. X'code'

Destination

CADL

DFHZC6923 E date time applid Unacceptable bind parameter during autoinstall for NETNAME netname. Code X'code'

Explanation

CICS has received a BIND from an unknown APPC node. The autoinstall process was initiated, but an invalid bind parameter has been detected. The parameter in error is indicated by the failure code X'code' which is one of the following:

X'FA18'
There was no session instance ID field in the bind user data.

X'FA19'
There was no primary logical unit (PLU) name in the bind user data.

X'FA1A'
The PLU name in the bind user data is the same as the LU name of this CICS.

X'FA1B'
Security information (an encryption seed) was expected, but not present, in the bind user data.

X'FA1C'
Security information (an encryption seed) was found in the bind user data but its length was too high for it to be valid.

X'FA1D'
Security information (an encryption seed) was found in the bind user data when none was expected.

X'FA1E'
The received bind indicated that it was not negotiable. This is not acceptable for an APPC connection.

X'FA1F'
The received bind specified a primary RU size of zero.
The received bind specified a secondary RU size of zero.

The received bind contained inconsistent access security indicators.

Two security information fields (seed and nonce field) were found in the received BIND where only one was expected.

The received BIND contained a nonce field with an incorrect length.

The received BIND did not contain a nonce field.

The received BINDs security mechanisms field length was smaller than the minimum defined by the Architecture.

The received BINDs security mechanisms field contained an invalid length for the mechanism identifier field.

The exception trace entry with trace point ID 'AP xxxx' (where xxxx is X'code') shows the bind that was received. The session is terminated. CICS continues.

Change the definitions on the connecting LU so that the bind parameters are acceptable to CICS.

CICS has successfully installed resource restype resid with {netname / consolename} id using model or template model successful.

CICS continues. This message is informational.
User response
There are four possible ways of correcting this problem:

• Use the CEDA transaction to define and install the autoinstall model
• Change the VTAM MTS MDLTAB MODEL= entry to the name of an existing autoinstall model.
• Logon to CICS with a MODEL= parameter that defines an existing autoinstall model.
• Code an Autoinstall User Program. Examples are given in the Sample Programs and Copybooks section of the Developing system programs for CICS.

Destination
CADL

DFHZC6939 W date time applid Autoinstall for NETNAME netname, Invalid length nn found in cinit control vector at offset offset

Explanation
CICS verification checks on the format of the control vectors in the CINIT have failed. offset indicates the first point of failure. This is either a length field greater than 128, or a length field which would cause CICS to overrun the end of a CINIT vector or subvector.

This is either due to incorrect format of the CINIT RU (and therefore probably a VTAM logic error), or due to incorrect parsing of the CINIT RU by DFHZATD, which is a CICS logic error.

System action
CICS continues. The logon request is rejected.

User response
Inspect the format of the CINIT RU as captured by the autoinstall program for all rejected logon requests. The first point of failure may be at offset or before it since CICS verification checks are permissive.

If the format is incorrect, the origin of the invalid CINIT should be tracked and the problem resolved there.

If the format is correct, this is a CICS logic error. In this case you will need further assistance from IBM. See Working with IBM to solve your problem for guidance on how to proceed.

7. \( \text{id} \)

---

An autoinstall attempt has failed for lack of an exact match.

\( \text{netname} \) is the netname of the LU which failed to logon,
**model** is the name of the model that gave the best failure (that is, the one that had the fewest bits different from the BIND image supplied by VTAM).

The following associated information is also written to CADL:

- **xxxxxxxx...** is a string of hexadecimal digits, where **xx** represents one byte, and each byte position represents the corresponding byte position in the BIND image.
- **CINIT BIND: xxxxxxxx** is the bind image supplied by VTAM.
- **MODEL BIND: xxxxxxxx** is the best model.
- **MISMATCH BITS: xxxxxxxx** represents a comparison of the relevant bits from above. A bit set to '1' indicates a mismatch in that position between the BIND image from VTAM and the BIND image associated with the model.

**System action**

CICS continues.

**User response**

1. Determine whether the model **model** is suitable. If there are several models which have options, such as TRANSECKEYS, then only the first such model is named in the above message. It will be up to the user-program to make the choice, when the logmode table entry is corrected.
2. Identify the entry in the VTAM logmode table that is being used.

**DFHZEnnnn messages**

**DFHZE2600 Syst.sense sysSense,termid,taskid, Unidentified sense information**

**Explanation**

The error message writer (DFHEMW) was scheduled to send an error message, but could not identify the system sense code.

**System action**

The task is abnormally terminated.

**User response**

Refer to the associated messages that were issued previously for further information and guidance.

**Module:**

DFHZEMW

3. Check that this logmode table entry is not successfully in use with other applications, so that to change it might cause this other use of it to fail.
4. Amend the logmode table entry by switching the bits corresponding to '1' bits in the mismatch string. That is, if the bit in the VTAM bind image corresponding to the bit position set to '1' in xxxxxxxx... is '1', set it to '0'. If it is '0', set it to '1'.

For further information, refer to the Developing system programs for CICS.

More on the meaning of the various bits in a bind image may be found in z/OS Communications Server: SNA Programming manual, (SC27-0611).

Details of the preparation of VTAM logmode table entries are given in z/OS Communications Server: SNA Resource Definition Reference manual, (SC27-0613).

DFHZN2130  

date  time  applid  A unit of work has been shunted but the connection with the remote system does not support the shunt protocols. Resources on the remote system may be out of sync with those on this CICS after the UOW is resynchronized.  

Failure date  mm/dd/yy  failure time  hh:mm:ss  remote system  netname  transaction  tranid  task number  trannum  operator terminal  termid  user  userid  network UOW  netuowid  local UOW  X'localuow'.

Explanation

This message is preceded by message DFHAC2231. An application has requested syncpoint, either via EXEC CICS SYNCPOINT or implicitly via EXEC CICS RETURN. The coordinator of the syncpoint is not this CICS system but is remote.  

Transaction  tranid  has lost contact with its coordinator system during the indoubt period.

System action

In accordance with the transaction definition, the unit of work is not completed. It is allowed to wait for resynchronization with the coordinator system. The transaction is abnormally terminated with abend code ASP1. The unit of work is shunted to await the return of the coordinator system.

As part of this processing, CICS has attempted to pass on the shunt request to another partner system. However, this partner does not support the shunting protocols, and so this partner may backout or commit changes to its resources independently of this shunted unit of work.

User response

Following resynchronization with the coordinator system, determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the CICS intercommunication for information on design considerations in a distributed environment.
System action
CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further. On completion of the syncpoint, CICS abends the user task.

User response
Determine whether the remote function shipped resources are out of synchronization. The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the CICS intercommunication for information on design considerations in a distributed environment.

DFHZN2132 date time applid Rollback received in response to CICS synclevel one commit. Local resources are out of sync with those on the remote system. Failure date mm/dd/yy failure time hh:mm:ss remote system netname transaction tranid task number trannum operator terminal termid user userid network UOW netuowid local UOW X’localuowid’.

Explanation
A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the resource voted to backout.

System action
Synclevel 1 commit processing continues with the intention of committing as many synclevel 1 resources as possible. For APPC synclevel 1, CICS does not attempt to resolve the situation any further. On completion of the syncpoint, CICS abends the user task.

User response
The action to take depends on local procedures and the design of the application program. For example, it may be possible to rerun the application but only making updates to remote resources. Refer to the CICS intercommunication for information on design considerations in a distributed environment.

DFHZN2133 date time applid Error detected during CICS synclevel one commit. Reason code rc. Local resources may be out of sync with those on the remote system. Failure date
A CICS application has been using APPC synclevel 1 to process remote function shipped resources. The application took a syncpoint, either implicitly or explicitly, and this has caused all local resources and synclevel 2 partners to be committed. However, when a commit message was sent to a synclevel 1 function shipped resource, the reply indicated that an error has occurred. The reason code provides details of the error and has the following values:

01
   Protocol violation by partner system - unexpected FMH data

02
   Protocol violation by partner system - unexpected syncpoint message data

03
   Abend received

04
   Deadlock or read timeout.

System action
CICS synclevel 1 commit processing continues, with the intention of committing as many synclevel 1 resources as possible.

For reason code 01, a transaction dump with dump code ASPI is taken. For reason code 02, a transaction dump with dump code ASPJ is taken. On completion of the syncpoint, CICS abends the user task.

User response
The action to take depends on local procedures.

For reason codes 01 and 02, examine the dump to determine what message data was received from the partner. This information is held in one of the terminal input/output areas. A failure in the communication system might have caused corruption of the data.

Reason code 03 indicates that the partner system has sent an abend. There is an error in the partner system which may need to be investigated.

Reason code 04 indicates that the partner system took too long to respond to the synclevel 1 commit.

There could be a problem with the remote system, or the communication system. It may be necessary to increase the deadlock timeout or read timeout values to prevent this recurring.

DFHZN2200  date time applid FREE IMPLICIT
failed during syncpoint processing
for session session id, remote
system netname. Transid transid.
The original abend code was
abend code.

Explanation
A DFHTC FREE IMPLICIT request for a non-principal facility MRO session has failed.

System action
CICS writes an exception trace entry with code '0D86' before issuing a DFHTC FREE DETACH request for the session.

User response
If the task was purged by the operator causing abend AZI9 or a read timeout occurred causing abend AZIG this error may be expected and no further action may be necessary.

Otherwise this failure may represent an error. To investigate further set up a system dump table entry
for system dump code ZN2200. You may need further assistance from IBM to resolve this problem. See Part 4 of the Troubleshooting and support for guidance on how to proceed.

Chapter 3. IBM Health Checker for z/OS messages related to CICS

IBM Health Checker for z/OS identifies potential configuration problems in CICS regions before they impact availability or cause outages. If any CICS regions are identified as non-compliant with any of the best practices for CICS system configuration, IBM Health Checker for z/OS issues warning messages containing details of the non-compliant regions for you to take corrective actions.

For details on health checker rules, see Checking CICS configuration with IBM Health Checker for z/OS.

DFHH0001E The CEDA transaction is accessible to unauthenticated users.

**Explanation**
The IBM supplied transaction CEDA is accessible to the default user or CICS security is turned off. This means anyone who can connect to the IP address and port number of one of the CICS regions shown can change the configuration of CICS.

To review the details of the Health Check output use the TSO SDSF CK command. For more information, see Health Check panel (CK).

The regions shown have a RC/RSN with more specific information about why the region failed the check:

- 0801 CEDA installed and SEC=NO
- 0802 CEDA installed and DFLTUSER can run it
- 0807 The checking module can't be linked to

**System action:**
The system continues processing.

**Operator response:**
Report this error to the System Programmer.

**System programmer response:**
Correct the security exposure which has been identified.

**Reference Documentation**
Refer to the topic "Checking CICS configuration with IBM Health Checker for z/OS" in the CICS Knowledge Center for advice on best practice.

DFHH0002E The spool is accessible to unauthenticated users.

**Explanation**
The SPOOL=YES is defined and the IBM supplied transaction CECI is accessible to the default user or CICS security is turned off. This means anyone who can connect to the IP address and port number of one of the CICS regions shown can submit jobs to run on the z/OS system remotely without authentication.

To review the details of the Health Check output use the TSO SDSF CK command. For more information, see Health Check panel (CK).

The regions shown have a RC/RSN with more specific information about why the region failed the check:

- 0803 SPOOL=YES, CECI installed and SEC=NO
- 0804 SPOOL=YES, CECI installed and DFLTUSER can run it
- 0807 The checking module can't be linked to
- 0809 Surrogate user check for spool jobs is disabled

**System action:**
The system continues processing.

**Operator response:**
Report this error to the System Programmer.

**System programmer response:**
Correct the security exposure which has been identified.

**Reference Documentation**
Refer to the topic "Checking CICS configuration with IBM Health Checker for z/OS" in the CICS Knowledge Center for advice on best practice.

DFHH0003E A TDQ defined to the internal reader is accessible to unauthenticated users.

**Explanation**
At least one TD QUEUE defined to the internal reader and the IBM supplied transaction CECI are accessible to the default user or CICS security is turned off. This means anyone who can connect to the IP address and port number of one of the CICS regions shown can submit jobs to run on the z/OS system remotely without authentication.

To review the details of the Health Check output use the TSO SDSF CK command. For more information, see Health Check panel (CK).

The regions shown have a RC/RSN with more specific information about why the region failed the check:
• 0805 A TDQ accesses INTRDR, CECI is installed and the DLFTUSER can run it
• 0806 The SVC99 does not support inquire of SYSOUT
• 0807 The checking module can't be linked to
• 0808 A TDQ accesses INTRDR, CECI is installed and SEC=NO

**System action:**
The system continues processing.

**Operator response:**
Report this error to the System Programmer.

**System programmer response:**
Correct the security exposure which has been identified.

**Reference Documentation**
Refer to the topic "Checking CICS configuration with IBM Health Checker for z/OS" in the CICS Knowledge Center for advice on best practice.

---

**DFHH0200E** The CICS Health Checker cannot run due to error.

**Explanation:**
The CICS Health Checker was unable to find the storage used by CICS regions to record health checks.

**System action:**
The system continues processing, but cannot report on any CICS regions.

**Operator response:**
Report this error to the System Programmer.

**System programmer response:**
Use the debug option on the health check to find further details about the problem. Report the problem to IBM Service.

---

**DFHH0301I** All CEDA transactions are protected from unauthenticated users.

**Explanation:**
No problems were found with the configuration of CEDA which would allow default users access. This applies to all CICS regions on this LPAR running during the last health check interval.

**System action:**
The system continues processing.

---

**DFHH0302I** The spool is protected from unauthenticated users.

**Explanation:**
No problems were found with the configuration of the spool which would allow default users access. This applies to all CICS regions on this LPAR running during the last health check interval.

**System action:**
The system continues processing.

---

**DFHH0303I** No TDQs defined to the internal reader can be written to by unauthenticated users.

**Explanation:**
No problems were found with the configuration of TDQs defined to the internal reader which would allow default users access. This applies to all CICS regions on this LPAR running during the last health check interval.

**System action:**
The system continues processing.

Programming Interface Information

IBM CICS supplies some documentation that can be considered to be Programming Interfaces, and some documentation that cannot be considered to be a Programming Interface.

Programming Interfaces that allow the customer to write programs to obtain the services of CICS Transaction Server for z/OS, Version 5 Release 5 (CICS TS 5.5) are included in the following sections of the online product documentation:

- Developing applications
- Developing system programs
- CICS security
- Developing for external interfaces
- Reference: application development
- Reference: system programming
- Reference: connectivity

Information that is NOT intended to be used as a Programming Interface of CICS TS 5.5, but that might be misconstrued as Programming Interfaces, is included in the following sections of the online product documentation:

- Troubleshooting and support
- Reference: diagnostics

If you access the CICS documentation in manuals in PDF format, Programming Interfaces that allow the customer to write programs to obtain the services of CICS TS 5.5 are included in the following manuals:

- Application Programming Guide and Application Programming Reference
- Business Transaction Services
If you access the CICS documentation in manuals in PDF format, information that is NOT intended to be used as a Programming Interface of CICS TS 5.5, but that might be misconstrued as Programming Interfaces, is included in the following manuals:

- Data Areas
- Diagnosis Reference
- Problem Determination Guide
- CICSPlex SM Problem Determination Guide

Terms and conditions for product documentation

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability
These terms and conditions are in addition to any terms of use for the IBM website.

Personal use
You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

Commercial use
You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights
Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NONINFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

IBM online privacy statement

IBM Software products, including software as a service solutions, (Software Offerings) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user or for other purposes. In many cases no personally identifiable information (PII) is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect PII. If this Software Offering uses cookies to collect PII, specific information about this offering’s use of cookies is set forth below:

For the CICSPlex SM Web User Interface (main interface):
Depending upon the configurations deployed, this Software Offering may use session and persistent cookies that collect each user’s user name and other PII for purposes of session management, authentication, enhanced user usability, or other usage tracking or functional purposes. These cookies cannot be disabled.

For the CICSPlex SM Web User Interface (data interface):
Depending upon the configurations deployed, this Software Offering may use session cookies that collect each user’s user name and other PII for purposes of session management, authentication, or other usage tracking or functional purposes. These cookies cannot be disabled.

For the CICSPlex SM Web User Interface ("hello world" page):
Depending upon the configurations deployed, this Software Offering may use session cookies that do not collect PII. These cookies cannot be disabled.
For CICS Explorer®:
Depending upon the configurations deployed, this Software Offering may use session and persistent preferences that collect each user’s user name and password, for purposes of session management, authentication, and single sign-on configuration. These preferences cannot be disabled, although storing a user's password on disk in encrypted form can only be enabled by the user's explicit action to check a check box during sign-on.

If the configurations deployed for this Software Offering provide you, as customer, the ability to collect PII from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM Privacy Policy and IBM Online Privacy Statement, the section entitled Cookies, Web Beacons and Other Technologies and the IBM Software Products and Software-as-a-Service Privacy Statement.
