

Under the Centers for Medicare & Medicaid Services (CMS) Hospital Readmission Reduction Program:

\$528M

in penalties for avoidable inpatient readmissions within 30 days of discharge is projected this year

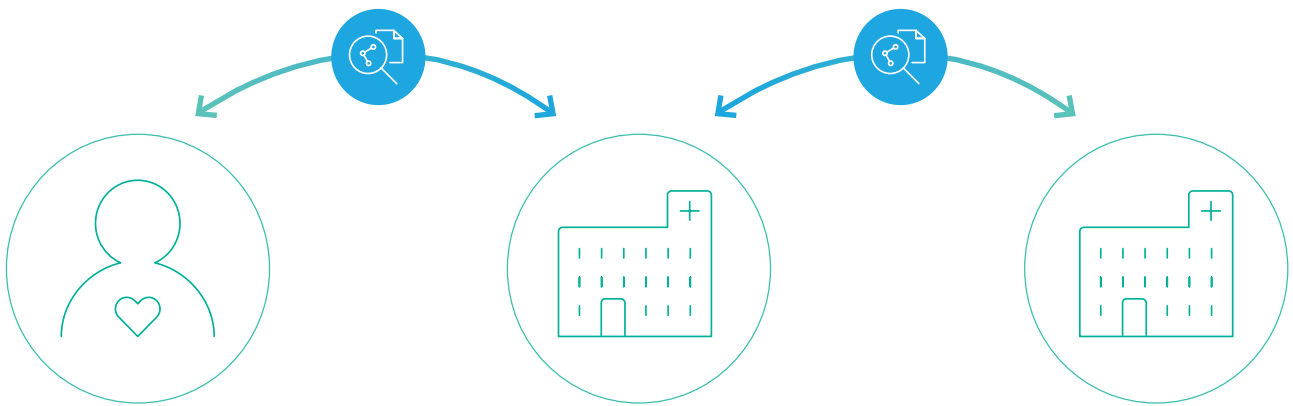

That's a **25%** increase since 2016

In the CMS Hospital Inpatient Quality Reporting Program: **Excess days in acute care measures** will help determine payment

The IBM® CareDiscovery® Episodic Bounce-Back (EBB) Analysis:

Helps clients avoid reimbursement penalties by identifying where readmission and bouncebacks to other hospital settings are occurring. By identifying which patients are returning to the Emergency Room, observation status, or were not properly discharged, clients can modify processes to prevent extra days and reduce variation.

CareDiscovery uses proprietary methodologies, created from one of the largest healthcare claims databases in the United States, to represent 90% of US discharges, allowing you to see avoidable complications, mortality, readmissions and costs.

Compared to non-CareDiscovery clients, CareDiscovery clients have seen:

10% decrease in mortality rates

7% fewer complications

3% shorter length of stay
