

A clinical trial can be a critical treatment option for a patient with cancer, but clinicians have no easy way to search across eligibility criteria of the hundreds of trials open today.

Inefficiency and low enrollment rates have the potential to affect research advancement and patient care:

1 out of every 10 investigative sites will fail to enroll a single patient in their trials

1 out of 4 investigative sites will under-enroll

In the US, **80% of clinical trials fail to meet recruitment timelines**

Only **15% of patients are aware** of clinical trial options

Only **3% of adults with cancer** are enrolled in clinical trials
