

A Tale of Two SIEMs

The difference between operating in the best of times and worst of times is choosing the right SIEM. Keeping pace with advanced threats on a **legacy SIEM** can usher in an **age of uncertainty** for your corporate security. Operate in an **age of wisdom** with **IBM Security QRadar**, an intelligent, next-gen SIEM platform that takes the fight directly to threats.

ONCE UPON A TIME
in a SOC with
legacy SIEM...

MEANWHILE, in a
SOC with a
next-gen SIEM...

How's the **QRadar deployment** and configuration going?

DONE! It took less than **8 hours** and we've already identified over **150,000 assets**.

Great! But surely we can't see activity on **user and entity behavior** yet?

Surely we can. It was a simple grab off the **IBM AppExchange**.

Ok then. I hope you didn't have to eat up all of our **support hours** to make this happen.

Not a-one. IBM has a full **online support area** with hundreds of videos, articles, and even a **community** where other users offer tips and tricks.

Are we now getting visibility across our environment?

Inside and outside the organization. And I'm not surprised.

IBM Security QRadar has been a **leader for over 10 years** in the Gartner SIEM Magic Quadrant.

It's **fast to deploy** and even **faster in reducing noise** so we can start hunting the real threats to our business.
