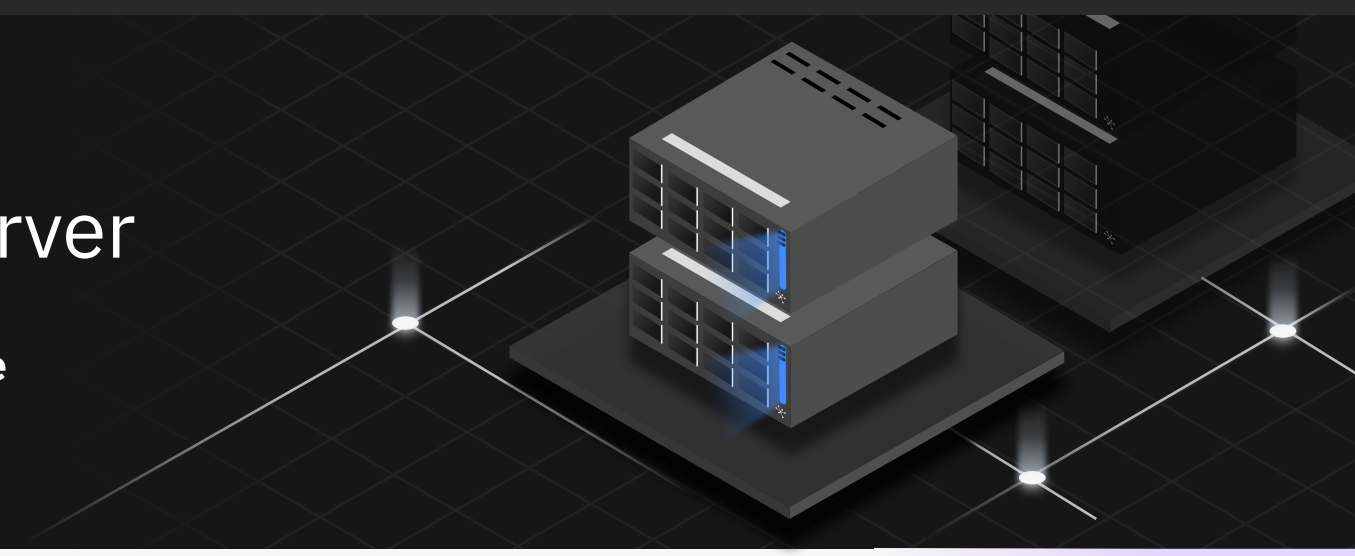
Netezza Performance Server

for Cloud Pak for Data

Upgrade with a single command — **nz_migrate**



Netezza Performance Server for Cloud Pak for Data allows customers to augment the market leading in-database capabilities of legacy IBM PureData Systems with the full spectrum of analytics and AI solutions modern businesses require. The upgrade to Netezza Performance Server on Cloud Pak for Data and Cloud Pak for Data System is 100% compatible with existing Netezza appliances. Upgrading to the new version is a seamless lift and shift, not a migration. It's as simple as "nz_migrate." This saves time, effort and ultimately cost that would have gone toward migrations.

Netezza Performance Server is powered by the state-of-the-art Cloud Pak for Data platform—a highly modular and extensible cloud-native data and AI platform built on Red Hat OpenShift. This provides a true cloud-ready software-defined environment, enabling you to build composable microservices-based insights. Since it is cloud-native, Netezza can be deployed anywhere: on premise, on private clouds or on public clouds such as IBM Cloud and Amazon Web Services (AWS).
