

Improve project management with IBM Connections

Run projects on a single digital platform to keep progress on track

One of the most difficult tasks in any organization is keeping projects on schedule and on task. At any given time, an employee, project team or executive will need to collaborate with people across boundaries, internally and externally, to achieve specific goals. How do you manage the many moving parts? How do you eliminate bottlenecks and keep communications transparent?

Improving project and task management is one of eight core capabilities of IBM Connections™, an intelligent digital workplace that provides all the tools and content you need within the context of your job to get work done. Organizations can use these capabilities to elevate performance and deliver value at the individual level as well as across teams, departments and the enterprise.

Support project goals with a singular focus

While email has its place, it's not the best tool for running projects. Use IBM Connections to create reliability and transparency in your projects and bring them to a conclusion quickly and efficiently.

A single platform for all dialog and documents means that all team members have access to the latest information at the same time. Tasks can be easily allocated and bottlenecks readily identified. To-do lists and completion dates are visible to all. The result: asynchronous collaboration across multiple teams is streamlined and clutter-free.

3 ways IBM Connections helps improve project management

Co-edit documents in real time with simultaneous access to the latest version using Connections Docs.

Check off your tasks at hand with to-do lists that can also be shared with others or across teams.

Maintain accountability throughout the project lifecycle with action items for organized collaboration and intelligent recommendations of related documents and files.

Engage participants with ease and efficiency

The IBM Connections management and workflow engine provides a standard approach to managing changes and tracking progress across teams and departments.

Finance teams can use restricted communities to communicate privately with those involved in a merger or acquisition—both inside and outside the firewall—as it progresses.

Operations teams can use Activities capabilities to create a template for meetings and provide a central location for coordinating activities and capturing best practices.

IT leaders can create standardized planning activities for each planning period to ensure milestones are hit and project quality remains high.
