

Manage AI risk and reputation

Proactively detect and mitigate risks monitoring for fairness, bias, drift and new LLM metrics

79% of organizations report that keeping up with the speed of digital and other transformations is a significant risk management challenge.¹

Achieving responsible AI is crucial to driving fair and ethical business decisions.

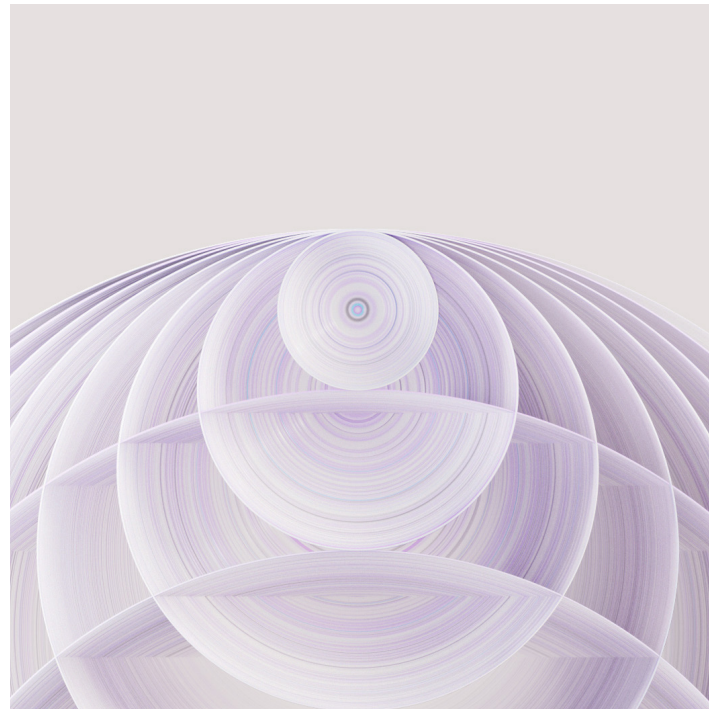

Moreover, organizations that base their decisions on unfair or biased results can face audits, fines, costly litigation and reputational damage. These issues often occur because:

Large language models (LLMs) drive different risk profiles and complexities. Organizations that adopt generative AI need to consider how they will manage and monitor AI and machine learning (ML) models.

Lack of transparent models can inhibit the proactive detection and mitigation of bias, drift and security risks. Black box models make it difficult to identify, manage and report on risk at scale.

Risk management teams have inadequate tools to communicate and collaborate across their organizations.

Organizations can achieve fairness, accuracy and ethical outcomes for ML and LLMs with proper governance.

The IBM® watsonx.governance™ toolkit is an automated, scalable, user-focused AI platform that helps organizations monitor, catalog and govern generative AI, ML and LLMs from anywhere across the AI lifecycle.

The **watsonx.governance toolkit** allows organizations to:

- Provide a single repository to maintain risk assessment results, key indicators, issue management and action plans related to managing operational risks.
- Establish tolerances based on risk profile while proactively detecting and mitigating bias, drift, accuracy and performance through monitoring and alerting capabilities.
- Use what if analysis to set risk thresholds and identify and explain optimal outcomes for regression, classification and image.
- Automate tracing and documenting for model training, hyperparameters, metadata and metrics.
- Use factsheets for reporting and audit support.
- Use dynamic user-based dashboards and on-demand dimensional reporting to improve corporate-wide visibility.

Protect your organization with the AI governance solution built for business.
