

IBM Global High-Resolution Atmospheric Forecasting System (IBM GRAF)

IBM GRAF is a high-precision, rapidly updating global weather model that updates hourly and at a 3km resolution to provide a clearer picture of weather activity around the globe. IBM GRAF helps ensure that virtually everyone has access to reliable weather information no matter who you are or where you live.

IBM GRAF by the numbers

Driving decisions that propel the world

Off-shore E&U companies can help keep workers safe

Governments can better prepare for severe weather

Farmers can better time when to fertilize

Insurers can adjust messaging in regions to help customers in need

Broadcasters can present smoother animations

Aviation companies and airports can help ensure smoother take offs and landings

Improved predictions are enhancing IBM enterprise offerings and available across IBM apps and websites (The Weather Channel & Weather Underground).
