Next- generation hybrid cloud powers next- generation business

The Australia point-of-view

IBM Institute for
Business Value

By Eric Schnatterly,
Timothy Gunnell,
Anthony Marshall, and
Lynn Kesterson-Townes

Talking points

Core workloads

Despite the growth of cloud over the past decade, for most organizations, only 20 percent of workloads have made their way to the public cloud—and these are not yet companies' core mission-critical workloads. The 80 percent that remains is where real enterprise value lies. We are now at an inflection point.

Hybrid cloud

Hybrid cloud permits public clouds, private clouds, and on-premises IT to interoperate seamlessly. Standardized technology interfaces across these three enable businesses to innovate with scale and agility, improving responsiveness and constraining cost, despite growing complexity.

Multi public cloud

Enterprises have on average at least five clouds—each with different management processes and interfaces. What was supposed to simplify has, in many cases, increased complexity. What is needed is a single management approach to cloud—regardless of what cloud is used.

Secure and assure

Security is central to a successful cloud deployment. Hybrid cloud allows apps to run—and data to be stored—in the IT environment best aligned with specific security, regulatory, and governance requirements.

Chapter one: Clouds everywhere

Spending on public cloud services in Australia is expected to be USD 10 billion by 2022.¹ Hybrid cloud will comprise nearly 50 percent of Australia's managed cloud services industry by 2022.²

Low-hanging opportunities for public cloud have already been exploited by most organizations. “Front-office” applications, such as client inquiries (checking account balances, for example), social media, and digital shopping carts, make up a large portion of what has gone to public cloud.

These initial opportunities have validated the benefits of the cloud architectures, including speed of deployment, dynamic resource acquisition, application elasticity, and service reuse across workloads. Because of cloud, organizations are thinking about innovation, speed, deployment, new markets, and disruption in a new light.

Executives report a range of successes with public cloud initiatives, especially around their abilities to scale and grow (see Figure 1).

At the same time, mission-critical, security-dependent applications, such as customer data bases, transaction processing, finance and accounting, supply chain, and manufacturing—have moved slowly—or not at all—to public cloud. This is especially true for highly regulated industries, such as banking and healthcare, where the highest proportion of processes are yet to move to the cloud.³ In many cases, these workloads are better suited to private cloud—or a mixture of public, private, and traditional IT.

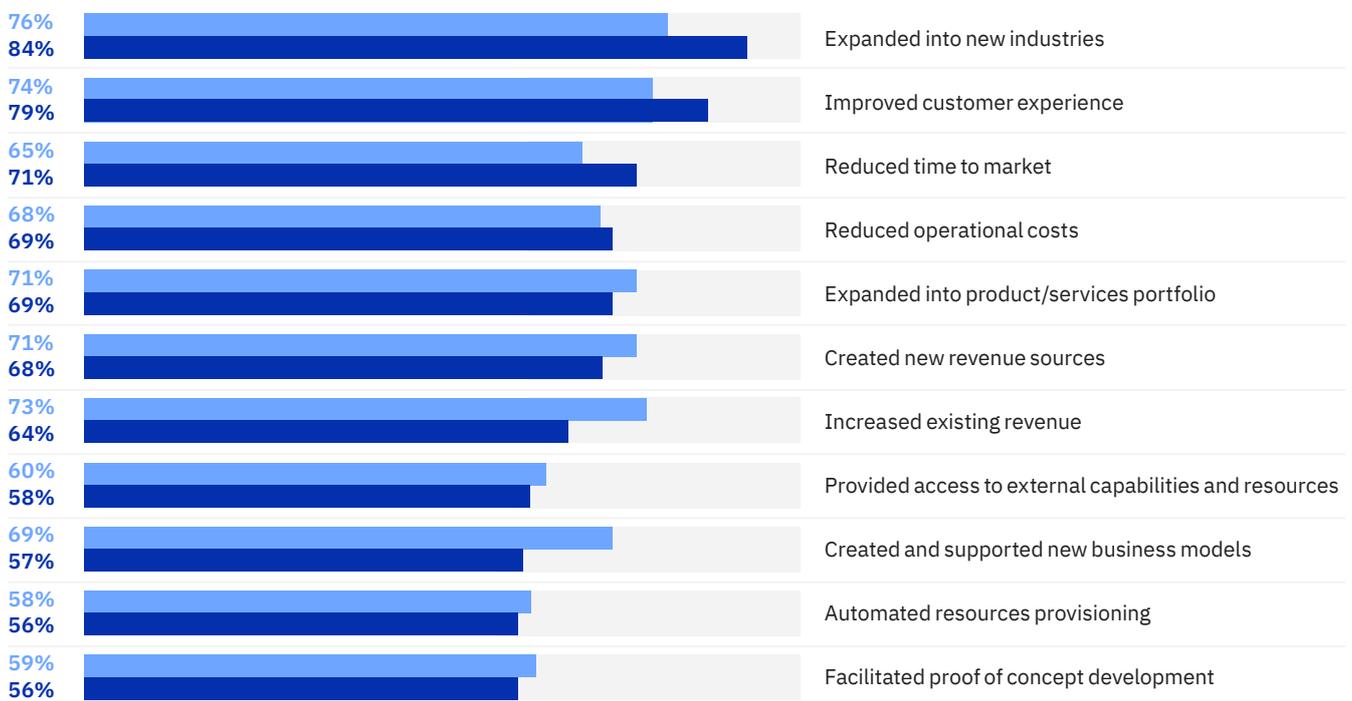

If the next phase of cloud benefits is to be realized, a new approach is needed to address these workloads that have been left behind.

Hybrid cloud permits public and private clouds to operate seamlessly with on-premises IT across standard technology interfaces.

Figure 1

Importance of strategic reasons for establishing multi-cloud environment

Most successful cloud initiatives: global versus Australia

Global
Australia

A new era of cloud computing

Australian organizations expect extensive adoption of cloud technologies in the next few years. More than 60 percent of the Australian organizations surveyed plan to have all their data on cloud in the next 10 years. Ninety-two percent of Australian organizations surveyed plan to use multiple hybrid clouds within three years.⁴

Hybrid cloud permits public clouds, private clouds, and on-premises IT to interoperate seamlessly across all three standardized technology interfaces: Linux, Open Container Initiative, and Kubernetes. These enable businesses to innovate with scale and agility, improving responsiveness and constraining cost, despite growing complexity.

Hybrid cloud allows workloads to be deployed to whichever is the best environment for that workload:

- *Public clouds* are well suited for many front-office workloads
- *Private clouds* are well suited for many of the mission-critical workloads where the benefits of cloud are desirable—but the security and assurance of a private environment are fundamentally important
- *Traditional IT environments* are suited for workloads that don't inherently take advantage of cloud benefits—and demand the dedication of computing resources.

Furthermore, as hybrid cloud becomes widespread, we are seeing variations of adoption across companies and industries. In the more regulated industries—such as banking, healthcare, telecom, and government itself (half of the global economy)—the cloud mix will tilt more toward private cloud than public cloud. In the less regulated industries, the mix will tilt the other way (see Figure 2). In all cases, however, there remains a universal need to interoperate between public, private, and traditional IT.

Hybrid cloud’s intrinsic interoperability and portability means organizations are not locked-in either to one environment or one individual public cloud vendor. They can place their workloads in the best spots—and have interoperability among environments and different public cloud providers.

of new applications
will be developed
using containers

WIN Corporation Pty Ltd.: Hybrid cloud adoption⁶

WIN Corporation Pty Ltd. is an Australian media company that owns the WIN Television network, Crawford Productions, and several local radio stations. As a broadcaster, the company needs to provide regular data updates to a host of internal and external stakeholders.

For its enterprise-class extract, transform, and load (ETL) tool, the company relies on a hybrid cloud solution to simplify its data-management processes.

As a result of using hybrid cloud, the time required for an ETL job was 5 minutes, down from 45 minutes, a decrease of 89 percent. Hybrid cloud also serves as a common platform for ETL development, streamlining maintenance and development, and as a single point of control for all ETL jobs.

Secure to the core

Hybrid cloud can help address security and other barriers that determine the difference between successful and unsuccessful cloud deployments. Our research indicates that security and governance are the two top reasons cited as justification not to put core applications onto public clouds.⁷ With hybrid cloud, companies can run applications and store data in the specific environments best aligned with security, regulatory, and governance requirements.

Hybrid cloud also allows enterprises to manage their cloud transition dynamically, selecting acceptable levels of downtime and overcoming the constraints of legacy systems and siloes.

Hybrid cloud's data portability and interoperability can help companies realize the value of "write once, run anywhere."

Chapter two: Time for action

Next in cloud's story, businesses unlock the door to a new layer of benefits, especially those relating to "cloudification" of mission-critical applications. New levels of data portability and interoperability offered by hybrid cloud help companies realize the virtue of "write once, run anywhere." Four key steps to get started include:

1. *Architect the destination.* Think open, multi-cloud, hybrid cloud. Your organization will live with the decisions you make today for years. Think through which of your workloads fit best in the public cloud, private cloud, and traditional IT environments. Avoid both environment lock-in (to only one of the three) and vendor lock-in, and reassess approaches that might not survive as standards and technologies evolve.
2. *Sequence the journey.* Avoid "ready, fire, aim" approaches. Lay out a careful, clear roadmap of what you want to do and in what order. You may experience pressure to skip ahead without building a solid, open foundation. Resist it.
3. *Mobilize the right skills and assets.* Draw upon talent within and outside your enterprise. It's important to develop and maintain in-house skills, but working with trusted third-party services providers, enabled by greater interoperability, can help bridge short-term gaps while reducing fixed costs. *In Australia, the use of vendors to help manage clouds is expected to increase 26 percent within the next three years according to our survey.*⁸
4. *Manage to clear outcomes.* Establish meaningful qualitative and quantitative measurements and be tenacious in holding to them. Remain flexible and incorporate new technologies as they emerge. Always stay true to your business, architectural, and technical principles.

– Are you ready to make the most of hybrid cloud environments?

- To what extent do your people understand the implications and opportunities of next-generation cloud on your business and your competitive environment?
- How is your organization, and your competition, taking advantage of hybrid cloud, particularly data and processes that, until recently, have been difficult to move?
- What adjustments have you made in hiring and training to have the right people at the right time working on the right things in dynamic ecosystems powered by hybrid cloud?

About the authors

Eric Schnatterly

[linkedin.com/in/ericschnatterly/](https://www.linkedin.com/in/ericschnatterly/)
etschnat@ibm.com

Eric Schnatterly is Vice President for Cloud and Cognitive Software for IBM Australia and New Zealand. Eric has more than 30 years of IT industry experience leading and managing a variety of portfolios across IT hardware, software, and services.

Anthony Marshall

The right partner for a changing world

At IBM, we collaborate with our clients, bringing together business insight, advanced research, and technology to give them a distinct advantage in today’s rapidly changing environment.

IBM Institute for Business Value

The IBM Institute for Business Value (IBV), part of IBM Services, develops fact-based, strategic insights for senior business executives on critical public and private sector issues.

How IBM can help

IBM Cloud enables seamless integration into public and private cloud environments. The infrastructure is secure, scalable and flexible, providing tailored enterprise solutions that have made IBM Cloud the hybrid cloud market leader. For more information, please visit ibm.com/cloud-computing
