

# IBM LinuxONE Security and Compliance Center

*Simplifying the compliance experience*

## Compliance Automation

Enterprises typically have a manual process when it comes to compliance. This includes audit readiness, evidence collection, interpreting industry regulations, and demonstrating current compliance posture to auditors or internal stakeholders. IBM is introducing compliance automation for Linux® applications which will help adopters save time, mitigate risk, and streamline compliance operations.

---

## What is the IBM LinuxONE™ Security and Compliance Center?

IBM LinuxONE Security and Compliance Center is a Linux browser-based application which is specially built for IBM LinuxONE Emperor 4™ and introduces compliance automation in a containerized, dashboard style, interface deployed on Red Hat® OpenShift® Container Platform.

---

## Benefits of IBM LinuxONE Security and Compliance Center

### **Auto Discovery**

The solution can identify sysplexes where a user would want to collect compliant relevant information from. Removing the need to manually identify every relevant destination for collection.

### **Automated Evidence Collection**

Configurable frequencies will enable the solution to collect evidence at the discretion of the organization. With a built in CLI tool, those who take advantage of Linux based tooling like Oracle and PostgreSQL will have their compliant relevant information collected and normalized and shared with the IBM LinuxONE Security and Compliance Center.

### **Pre-Defined Goals & Profiles**

Goals are regulatory requirements which are used for validating evidence. Many rules will map to a profile. Out of the box, the IBM LinuxONE Security and Compliance Center will have pre-defined profiles for PCI-DSS and NIST SP 800-53. We will also allow users to map existing goals to custom profiles.

### **Simplified Reporting**

Reports available in near real time with the click of button. This streamlines auditing engagements when asked for data dumps or compliance reports. Stay vigilant in audit preparedness.

### **Streamlined Compliance**

The required number and level of skills required for compliance operation can be greatly reduced by using this new solution. Keeping IBM LinuxONE Emperor 4 in a state of audit readiness and mitigating risk of data breaches through exposing any compliance failures and accelerating time to start remediation, all while augmenting the rest of regular business operations keeping skilled engineers focused on core job responsibilities are all ways IBM plans on making the compliance experience better.

---

## System Requirements

IBM LinuxONE Security and Compliance Center requires the following:

IBM LinuxONE Emperor 4 with 8 cores  
Red Hat OpenShift Container Platform 4.10
