

Highlights

- Frees you up from managing infrastructure
 - Delivers 2.3X superior price-performance
 - Simplifies Dev/Ops
 - Eliminates bottlenecks
 - Increases security without adding silos
-

MongoDB Enterprise with IBM Hyperconverged Systems powered by Nutanix

MongoDB is the industry's leading modern database platform. Widely deployed by organizations across the world, it provides rapid access to a constant stream of small reads and writes for millions of records that don't fit into traditional relational database structures. MongoDB NoSQL can be a better option than relational databases for state-of-the-art applications in that it also preserves the core database capabilities required to build modern applications.

The explosive growth of social applications, big data, mobile access and cloud computing is changing the way applications are developed. There's less time to build applications than ever before as competition is fierce. Today, apps ship in a few weeks or months, not years.

To support this time scale, organizations need an agile IT infrastructure that is quick to start, simple to scale and fully built with the data services fit for the needs of the developer. Reducing complexity, improving data security, and eliminating bottlenecks are top priorities. Traditional IT infrastructure is ill-suited to address the needs of growing MongoDB installations.

Focus on MongoDB data, not MongoDB infrastructure

IBM® Hyperconverged Systems powered by Nutanix take the complexity out of deploying infrastructure for MongoDB, allowing MongoDB experts to spend more time extracting insight from data.

Throughput and ease with a difference

Simplicity meets performance with the combination of Nutanix and IBM POWER®. IBM Power Systems™ and the POWER microprocessor are designed for big data and analytics, providing more threads per core and cache than other platform options. These benefits translate into over 2X superior price performance gains for MongoDB running on POWER servers.

Eliminate bottlenecks

MongoDB deployments can grow rapidly as the volume of data grows and as new data sources are added. With IBM Hyperconverged Systems powered by Nutanix you start small and scale out without worrying about the bottlenecks that occur with traditional architectures:

- **Superior performance.** 84% more throughput per server
- **Lower acquisition cost.** 75% of the price of comparable x86 processor-based appliances
- **Scale incrementally.** Start small and grow linearly by adding nodes one at a time

Traditional storage systems can experience significant I/O bottlenecks, particularly in virtual environments. By ensuring data is accessed locally by all MongoDB indexers, the Nutanix Distributed Storage Fabric eliminates the “I/O Blender” effect that can plague conventional infrastructure.

Administrators can scale existing Nutanix clusters or deploy new clusters in minutes with less concern for storage and network bottlenecks. IBM Hyperconverged Systems powered by Nutanix cloud provides linear scaling, so MongoDB deployments can scale without worry. Each additional node delivers predictable performance to support MongoDB search heads, indexers, and other shared workloads. Because of its distributed architecture, a Nutanix enterprise cloud prevents one workload from starving another, allowing the infrastructure to be shared if desired.

In concert with POWER performance, Nutanix allows MongoDB to take full advantage of server virtualization without the limitations of other solutions.

Ease of DevOps

- **Lifecycle management.** With the Nutanix Distributed Storage Fabric (DSF), MongoDB indexers access data locally. MongoDB data is automatically stored on the right media and the resources allocated to each indexer can be changed effortlessly.

- **Data locality.** Nutanix continuously monitors data access patterns and places data in the most appropriate location, complementing the MongoDB lifecycle.
- **Next generation virtualization.** Designed for the era of unstructured data, Nutanix AHV is a hypervisor that accelerates deployment and eases management. It is included at no extra cost with purchases of IBM Hyperconverged Systems powered by Nutanix eliminating virtualization licensing costs.
- **Self-healing infrastructure.** Both MongoDB and Nutanix enterprise cloud are resilient by design. If a drive or node fails, workloads are automatically restarted and full resiliency is restored quickly without operator intervention, protecting MongoDB from unplanned downtime.
- **Built-in availability.** Data protection, disaster recovery, and high availability are integral to the Nutanix environment, delivering higher MongoDB availability with less time and effort.
- **One-click management.** With Nutanix Prism coupled with MongoDB Ops Manager, database administrators easily monitor and manage all infrastructure used by MongoDB, gaining full visibility of storage, CPU, and memory runway. Also, with Prism’s one-click software, hypervisor, and firmware upgrades and one-click problem remediation take the pain out of day-to-day operations.

Increase security without adding silos

To ensure the security of sensitive data, many IT architects find they have no choice but to deploy dedicated infrastructure for MongoDB. However, MongoDB can be deployed securely on a Nutanix cluster with other workloads, avoiding the need for a separate silo of infrastructure.

Nutanix software combines features such as two-factor authentication and data-at-rest encryption with a security development lifecycle. IBM Hyperconverged Systems powered by Nutanix are certified across a broad set of evaluation programs to ensure compliance with the strictest standards.

68% faster deployment of storage¹

61% less time to manage²

97% fewer occurrences of downtime³

*2.3x better price performance over commodity
processor architectures for MongoDB⁴*

Benefits

- Frees you up from managing infrastructure
- Accelerates MongoDB deployment
- Delivers superior performance and economics via POWER architecture
