

Automate integrations to improve application speed and quality.

Businesses are on a break-neck journey to digital transformation. But speed without the right approach will only get you to the wrong place faster.

Challenges:

- Traditional approaches to integration are slow to implement, hard to scale and laden by skill-intensive, complex technologies.
- Balancing traditional and modern integration styles can be costly, particularly when considering maintenance downtime and multiple licensing fees from different vendors.
- Companies are more connected to the outside world than ever before, but still need to reduce exposure to business and security risks while adhering to compliance policies.

Without a new approach, integration work will account for

50%

of the time and cost of digital initiatives¹.

To integrate faster and better, every integration must be automated, leveraging best practices and built-in reuse.

The IBM Cloud Pak for Integration helps you

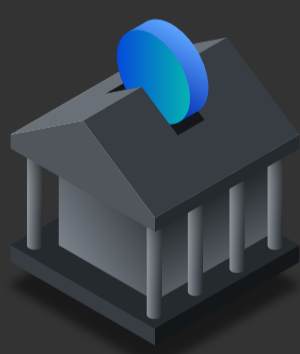

Speed delivery through automation powered by AI.

Improve integration quality with continuous feedback based on real-world data.

Lower risk and improve workload and integration operations with DMZ-deployable security.

Deliver ROI by employing multiple integration styles and approaches.

Deliver ROI

300%

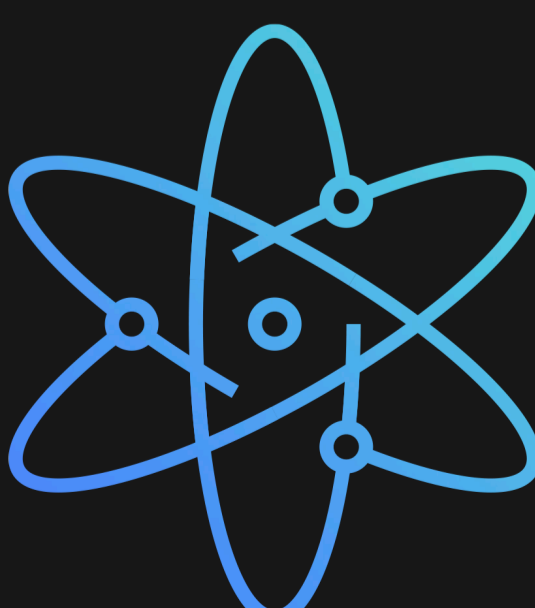

increase in the speed of integration development.

33%

reduction in integration costs.

IBM is your trusted and experienced partner.

IBM can help you build and implement an agile, AI-infused approach to integration, transforming your data in to the fuel that helps you solve complex business problems.
