

IBM Red Hat and Application Health Check

Are your Red Hat environment and cloud applications working as hard as you are?

Highlights

Understand your progress and align to your vision and roadmap.

Gain operational efficiencies in the cloud for applications and Red Hat OpenShift.

Achieve improvements in your Red Hat OpenShift environment, microservices and containerization.

Realize efficiencies in your CI/CD processes.

Your journey to cloud has many stops along the way. And, as with all journeys it's crucial to know where you want to be and how you'll get there. No one solution is perfect without some tweaking of the software, nor do individuals have the experience in Red Hat® and cloud application development to fine tune software as they progress. And, that's where IBM can help.

IBM Services™ provides the IBM Red Hat and Application Health Check services to help you get the most from your cloud investment by highlighting areas for you to consider adjusting. The IBM specialists perform an assessment based on common challenges, such as microservices architecture, containerization and virtualization, playbooks and processes, including automation and continuous integration/continuous deployment (CI/CD) and your cloud environment. Following the 2.5-hour assessment session, you'll receive a report that will identify areas of concern, provide recommendations and help you make more informed decisions for your cloud environment.

Helping understand the complexities of refactoring and migrating applications

Refactoring an application to run on the cloud has many considerations, including the range from 'lift and shift' to complete modernization through refactoring. Is your CI/CD process supportive of this range of options? Is your containerization strategy in alignment with the current and future architecture? Do you need to refactor applications, if so which ones? These are just a few of the questions we can help you answer.

Red Hat OpenShift® tuning

Running your OpenShift clusters is a balance of compute, network and storage resources. How are these components working together in your environment? What are your workload considerations? Do you have use cases for your container plan? How are you using DOCKER® computer software and do you plan to migrate to CRI-O? These are some questions we can help you think through to achieve best practices for your Red Hat OpenShift environment.

Why IBM?

The IBM technical specialists have decades of application and industry-based experience, along with years of containerization and virtualization experience. We can exploit our deep expertise and experience in cloud engagements, as well as our own cloud transformation. This enables us to work with virtually all types of environments, tools, technology, architectures and applications across any industry.
