

Highlights

- Helps define an identity governance and administration program that supports business goals and stakeholder needs
 - Helps reduce costs and improve operational efficiencies with a roadmap to support implementation
 - Supports improved return on investment and time to value for your governance initiative
-

Identity governance and administration services from IBM

Organizations struggle to effectively manage identity governance and administration (IGA) processes, leaving systems vulnerable to risks and challenges such as:

- Applying appropriate user accesses across business-critical assets, including regulated systems and applications
- Demonstrating regulatory mandates to monitor and remediate security and access violations
- Streamlining user lifecycle management and compliance improvement with analytics
- Reducing the costs of managing identity and access services while improving business-user experience and adoption without sacrificing controls

IBM® Identity and Access Management Services for identity governance and administration includes three micro-service modules: adoption, accelerated deployment and advanced integration. You can purchase these modules together or separately, based on your business goals and IT ecosystem needs, and on the maturity level of your IGA program. All services are designed to support the most widely-proven identity governance and administration solutions, including cloud-based, hybrid and on-premises.

Defining a detailed IGA program to support your business goals

The identity governance and administration adoption module takes a product-agnostic approach to IGA strategy, regardless of your technology. IBM IGA specialists help you develop a direction, conceptual architecture and a detailed IGA adoption roadmap, and assist with prioritizing IGA integrations. This module helps you improve the effectiveness of your IGA adoption strategy as well as support your migration to the next maturity level of your identity and access management (IAM) program.

Supporting an effective implementation of your chosen IGA tools

The identity governance and administration accelerated deployment module implements your chosen IGA product foundational capabilities, integrates in-scope business applications and demonstrates governance capabilities, starting with a recertification campaign for in-scope applications. This accelerated foundational deployment service provides blueprints to help guide seamless implementation and can enhance the value of your governance tooling. This module can deliver high-value and low-risk functionality early and consistently to help build trust and sustain the IGA program.

Helping provide higher value and ROI on your IGA migration initiatives

The identity governance and administration advanced integration module provides detailed design for broader governance implementation project scope, including expanded integrations, custom development and operationalization of end-to-end IGA services with established business processes. IBM teams with you to support business areas in using a set of consistent processes, workflows and tools for managing user identity and access across the enterprise.

Why IBM?

With virtually unparalleled IGA expertise, IBM can be a trusted advisor to augment your security staff. Backed by IBM Research and development resources, the large data set of IBM X-Force® command centers and managed security services clients, IBM Security specialists can offer the business, IGA and IAM security experience to help you optimize your IGA program for your business goals and IT ecosystem.
