

Endpoint management with real-time visibility

Automated endpoint management for all your nodes

As remote work proliferates, the call for visibility across businesses continues to grow. So has the need for security. With companies expected to manage, secure, and maintain software for hundreds of thousands of endpoints, and cyber-attacks on the rise, full visibility is essential.

That's where Tanium with IBM Automation® can help. Unlike other endpoint management tools, which are more limited in function and not up to today's standards, Tanium provides full visibility at scale. The outcome is reliable data and faster decision-making processes combined with rapid endpoint management that reduces security risks with ease and efficiency.

\$2.5M

tool consolidation savings from eliminating siloed point solutions.¹

\$1.5M

FTE efficiency savings to manage and secure environments.¹

277%

ROI over three years.¹

100%

ROI within 6 months.¹

In addition to reduced time and maintenance costs, Tanium offers secure peer-to-peer architecture that allows for speed and scale without any additional infrastructure or tooling. Rather than relying on outdated hub-and-spoke management architecture which causes WAN saturation and network slowdown, Tanium provides real-time visibility. It's one streamlined tool with zero additional infrastructure: no extra agents; no relay servers to add complexity.

A precise view of your endpoint connections in real time can help pinpoint malware and decrease strain on your resources. In IBM's unique approach, integrating Tanium with IBM Automation and IBM Turbonomic® Application Resource Management, you can automate from a single point of context across IT to ensure app performance and application health while mitigating security risks. What's more:

- Unifying context across performance and security supports an automation-first approach
- Endpoint management—scanning, patching, updating—never puts application performance at risk
- Business-critical applications are automatically isolated from known vulnerabilities

Resilient in design and equipped to weather the complex environments of today, Tanium delivers a compliance and monitoring solution for real-time visibility across endpoints everywhere.
