Preface

About this document

This document describes the small programming enhancement (SPE) known as the dialog trace facility (DTF). This guide explains how to use DTF in the CL/SUPERSESSION® environment to debug dialogs coded in Structured Session Procedure Language (SSPL).

This guide is designed for programmers who are familiar with CL/SUPERSESSION, CT/Engine™, and SSPL.

Related documentation

Familiarity with the following Candle documents is recommended.

- CL/SUPERSESSION Customization Guide
- CL/SUPERSESSION Messages Manual
- CT/Engine SSPL Programming Guide
Customer Support

Introduction

Candle provides electronic support and telephone support to assist you when you have questions about Candle products. Customer support is available 24 hours a day, seven days a week.

Electronic support

Candle Electronic Customer Support® (CECS®) enables you to search for existing questions, answers, problems, and fixes; review preventive service planning (PSP) information; and open incidents for Candle products. CECS is available through the Advantis™ network and by direct PC dial-up. For registration information, call your nearest Candle Support Services office.

Telephone support

If you have an urgent problem or need to talk to a Candle Support Services representative, contact the Support Services office nearest you.

International customers

When your local support office is unavailable, you may contact Candle's North America support center. If USADirect® service is available in your country, use the 800 telephone number. If USADirect service is not available, ask your international operator for assistance in calling Candle's local (310) number.

Incident information

A Candle support representative may request the following information when you call to report a problem:

• your Candle personal ID (PID) number
• the release level of the Candle product
• the release level of IBM® or other vendor software
• identifying information and dates of recently applied maintenance to the Candle product
• a detailed description of the problem (including the error message) and what led up to the failure
• a description of any unusual events that occurred before the problem

Incident documentation

You may be asked to send incident documentation to Candle Support Services. On the outside of all packages you send, please write the incident number given to you by the Candle Support Services representative.

Send tapes containing the incident information to the following address, unless directed otherwise by your Candle Support Services representative:

Candle Support Team
Candle Support Center, Incident number
2425 Olympic Boulevard
Santa Monica, CA 90404

Send all other documentation, for example, diskettes or paper documentation, such as screen prints, to the address that will be given to you by your Candle Support Services representative.
Documentation Conventions

Introduction

Candle documentation adheres to accepted typographical conventions for command syntax. Conventions specific to Candle documentation are discussed in the following sections.

Panels and figures

The panels and figures in this document are representations. Actual product panels may differ.

Revision bars

Revision bars (|) may appear in the left margin to identify new or updated material.

Variables and literals

In examples of command syntax, uppercase letters are actual values (literals) that the user should type; lowercase letters are used for variables that represent data supplied by the user. Default values are underscored.

LOGON APPLID(ccccccc)

In the above example, you type LOGON APPLID followed by an application identifier (represented by cccccccc) within parentheses. The application identifier can have at most eight characters.

Note: In ordinary text, variable names appear in italics.
## Symbols

The following symbols may appear in command syntax.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The 'or' symbol is used to denote a choice. Either the argument on the left or the argument on the right may be used. Example:</td>
</tr>
<tr>
<td>YES</td>
<td>NO</td>
</tr>
<tr>
<td>[ ]</td>
<td>Denotes optional arguments. Those arguments not enclosed in square brackets are required. Example:</td>
</tr>
<tr>
<td>APPLDEST DEST [ALTDEST]</td>
<td></td>
</tr>
<tr>
<td>}</td>
<td>Some documents use braces to denote required arguments, or to group arguments for clarity. Example:</td>
</tr>
<tr>
<td>COMPARE {workload} - REPORT={SUMMARY</td>
<td>HISTOGRAM}</td>
</tr>
<tr>
<td>_</td>
<td>Default values are underscored. Example:</td>
</tr>
<tr>

<td>The symbol b indicates a blank space, when needed for clarity.</td>
</tr>
</tbody>
</table>
Introduction

Candle provides a complete set of documentation for CL/SUPERSESSION and CL/GATEWAY. Each manual in this documentation set contains a specific type of information to help you use the product.

Candle welcomes your comments and suggestions for changes or additions to the documentation set. A user comment form, located at the back of each manual, provides simple instructions for communicating with Candle's Information Development department.

Product documentation

The documentation listed in the following table is available for CL/SUPERSESSION and CL/GATEWAY. To order additional product manuals, contact your Candle Support Services representative.

Overview

Definition

The dialog trace facility (DTF), a component of CT/Engine's dialog manager, is an interactive, panel-driven tool for tracing dialogs written in Structured Session Procedure Language (SSPL).

Advantages

With various tracing options and an easy-to-learn interface, the dialog trace facility can be of great assistance in testing and debugging SSPL dialogs.

With DTF, you can

• trace the flow of control between dialogs and applications
• trace a group of statements within a dialog
• store trace output in a table
• store trace output in the General Trace Facility (GTF).

These tracing features are described in the sections that follow.

Implementation

To implement this SPE, apply PTFs QLV1109 and QLV1215. The dialog trace facility is presented only in English.
Types of Traces

Introduction

You can use DTF to generate two types of trace records: flow trace and statement trace.

Flow trace

Flow trace provides an overview of dialogs, generating trace entries that show the transfer of control between dialogs. Once you activate flow trace, all dialogs that are executed on a specific LU are traced.

Statement trace

Statement trace provides detailed information about statements executing within a dialog. You can specify a display of all executable statements or a selected range of statements from a dialog.

The breakpoint processing option of statement trace allows you to stop the execution of dialogs at a specific statement. At the breakpoint, you can check the value of variables, modify variables, and change the current trace environment before the statement is executed. You can specify any number of breakpoints in a dialog.
Storing Trace Output

User trace table

Select the user trace table as your output destination when you want to view trace information as soon as tracing completes. The user trace table displays the dialogs or statements that you have selected for tracing immediately after they are executed. (Figure 1 on page 36 is an example of a user trace table.)

**Breakpoint processing:** Trace table storage allows interactive tracing, via breakpoint processing. Breakpoint processing stops an executing dialog at each breakpoint. This enables you to check dialog flow and dialog statement execution and to modify variables before the dialog completes execution.

This output destination is not recommended when you plan to generate a great deal of trace data. When the table is filled, DTF begins overlaying existing table entries with newer ones (FIFO).

Generalized trace facility

You can also use the generalized trace facility (GTF) as your output destination. Use GTF when you plan to generate large quantities of trace records. You can print the output and thus have all data at hand at one time. Interactive tracing is not available when GTF output is specified.

For examples of GTF output, see “Generalized Trace Facility Output” on page 85.

Resource Requirements

Caution

CPU and storage usage due to DTF can be significant. Therefore, Candle recommends that the system administrator limit the number of DTF users.

Compiled dialog storage

Statement tracing results in a 15% increase (approximately) in dialog object module size. You must ensure that you have adequate storage space for the statements from dialogs that are compiled for statement trace. To review current storage allocation, issue the STORAGE DETAIL command from the CUA™ operator.
The table below contains the storage estimates for CL/SUPERSESSION and CT/Engine. These storage estimates are calculated for traceable compilation of all CL/SUPERSESSION and CT/Engine dialogs. Selective compilation, which is the recommended option, uses less storage.

<table>
<thead>
<tr>
<th>Component</th>
<th>Number of Members</th>
<th>Number of Statements</th>
<th>Storage Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>CL/SUPERSESSION</td>
<td>458</td>
<td>13K</td>
<td>460 KB</td>
</tr>
<tr>
<td>CT/Engine</td>
<td>377</td>
<td>20K</td>
<td>337 KB</td>
</tr>
</tbody>
</table>

Compiled dialog storage is obtained from contiguous, page-isolated storage, so that it does not contribute to the working set size when DTF is not on. It is allocated in 100 KB blocks.

**Table storage**

Several temporary, nonshared tables are used for interactive tracing. These tables require approximately 2 to 8 KB of storage per interactive trace user when you use the default user trace table size (255). More table storage is used if a larger user trace table size is specified when enabling an LU for trace.

**Range storage**

Range storage is required whenever ranges are declared for users. The requirement is approximately 0.5 to 1 KB per enabled user.

Range storage is obtained from a contiguous, page-isolated pool common to all users so that it does not contribute to the working set when statements are not being traced (for example, when enabled users are not invoking dialogs with declared ranges).
Chapter 2. Preparing to Use DTF

Getting Ready to Begin a Trace ...................... 24

Traceable Compilation Mode ......................... 26
Security .................................................. 27
Invoking DTF .......................................... 28
Getting Ready to Begin a Trace

Introduction

Before you actually begin to trace dialogs, you must be authorized and the system must be prepared. These actions often require the services of the operator and system administrator.

Procedure

The following table describes the steps to be performed, who performs them, and where instructions for performing them can be found in this document.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Explained in . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Have the operator turn on DTF (if it is not already on).</td>
<td>“Turning DTF On and Off” on page 25</td>
</tr>
<tr>
<td>2</td>
<td>Invoke DTF.</td>
<td>“Invoking DTF” on page 28</td>
</tr>
<tr>
<td>3</td>
<td>Enable your session for tracing either by having the operator enable your session or by executing the trace dialog (DIALOG KLVDTRC).</td>
<td>“Overview” on page 30</td>
</tr>
</tbody>
</table>

When you have completed these steps (which are described in the specified sections), you are ready to perform a trace. (See “Performing a Trace” on page 29.)
Turning DTF On and Off

Introduction

Before a user can turn on DTF, the system administrator must give administrator authority to that user's ID.

Important

Users enabled for DTF can circumvent normal security procedures by altering dialog flow. Therefore, Candle recommends that the system administrator is the only person who authorizes users to turn on DTF.

Turning on DTF

To turn on DTF, use the following procedure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select **Trace** on the CT/Engine operator facility action bar.  
**Result:** The Trace pull-down menu appears. |
| 2    | Select **Dialog Trace**.  
**Result:** The DTRACE Commands pop-up appears. |
| 3    | Select **Turn Dialog Trace On**.  
**Result:** The CT/Engine Operator panel displays the confirming log message: **KLVOP416 DIALOG TRACE IS ON**. |

Turning off DTF

Use the following procedure to turn off DTF.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select **Trace** from the CT/Engine operator facility action bar.  
**Result:** The Trace pull-down menu appears. |
| 2    | Select **Dialog Trace**.  
**Result:** The DTRACE Commands pop-up appears. |
| 3    | Select **Turn Dialog Trace Off**.  
**Result:** The CT/Engine Operator panel displays the confirming log message: **KLVOP416 DIALOG TRACE IS OFF**. |
Traceable Compilation Mode

Introduction

Traceable compilation mode is a selection that you can make on the DTRACE Commands pop-up. While this mode is turned on, each time a dialog is refreshed it is compiled with object modules that can be traced.

Important

Use of traceable compilation mode can significantly increase overhead. Candle recommends that you instead use the REFRESH command to recompile a specific dialog that you want to trace.

Procedure to start

To activate traceable compilation mode, use the following procedure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select Trace on the CT/Engine operator facility action bar.  
**Result:** The Trace pull-down menu appears. |
| 2    | Select Dialog Trace.  
**Result:** The DTRACE Commands pop-up appears. |
| 3    | Select Start Traceable Compilation Mode.  
**Result:** The CT/Engine Operator panel displays a message confirming that traceable compilation mode is on. |

Procedure to end

Use the following procedure to turn off traceable compilation mode.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select Trace from the CT/Engine operator facility action bar.  
**Result:** The Trace pull-down menu appears. |
| 2    | Select Dialog Trace.  
**Result:** The DTRACE Commands pop-up appears. |
| 3    | Select End Traceable Compilation Mode.  
**Result:** The CT/Engine Operator panel displays a message confirming that traceable compilation mode is off. |
Security

Caution

Users enabled for DTF have the ability to refresh dialogs, run dialogs from the DTF panels, and alter dialog flow. Altering dialog flow can circumvent normal security procedures at your site.

Because of this security circumvention, enabling users for DTF should be controlled by the system administrator.
Invoking DTF

Introduction

You can invoke DTF with the dialog KLVDTRC using the following procedure.

On the command line

Invoke DTF with the dialog KLVDTRC using the following procedure.

*Note:* You must have administrator authority to issue DIALOG KLVDTRC.

- Type `DIALOG KLVDTRC` on the CL/SUPERSESSION Main Menu command line and press Enter.

  **Result:** The first panel to appear depends on several factors. See the table under “Next step” on page 30 to determine your next step.

If you receive the message `DIALOG TRACE IS NOT TURNED ON`, ask your product administrator or system operator to turn on DTF, then invoke dialog trace again.
Chapter 3. Performing a Trace

Overview ............................................. 30
Enabling the User's Terminal ................. 31
Selecting a Trace Type ......................... 33
Performing Flow Trace .......................... 34
Performing Statement Trace .................... 37
Breakpoint Destination ......................... 44
Stopping a Trace .................................. 45
Maintaining Variables ............................ 48
Invoking the Trace Environment with an Empty Table ..... 49
Using the Action Bar Selections ............. 50
Overview

Introduction

Now that you have invoked DTF, you are ready to start a trace. But first you must establish the trace environment and specify the DTF features you want to use.

Required authority

You must be an administrator or be authorized by an administrator to perform a trace.

Next step

After invoking DTF, your next step depends on whether or not you have already enabled your terminal and established the trace environment. Use the following table as a guide.

<table>
<thead>
<tr>
<th>IF . . .</th>
<th>THEN . . .</th>
<th>EXPLAINED IN . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>the Dialog Trace Enable Options pop-up appears</td>
<td>you must enable yourself for DTF</td>
<td>“Enabling the User’s Terminal” on page 31</td>
</tr>
<tr>
<td>the Dialog Trace pop-up appears</td>
<td>you can now select a trace option</td>
<td>“Selecting a Trace Type” on page 33</td>
</tr>
<tr>
<td>the Dialog Trace Output — Trace View panel appears</td>
<td>you can begin to analyze trace data</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Flow trace</td>
</tr>
<tr>
<td></td>
<td></td>
<td>“Performing Flow Trace” on page 34</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Statement trace</td>
</tr>
<tr>
<td></td>
<td></td>
<td>“Performing Statement Trace” on page 37</td>
</tr>
</tbody>
</table>
Enabling the User’s Terminal

Introduction

If your terminal has not yet been enabled for DTF, perform the following procedure.

Procedure

1. Complete the following fields on the Dialog Trace Enable Options pop-up.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Trace entries                | The maximum number of entries to be stored in the user trace table. The default is 255.  
The expected number of entries varies depending on the type of trace you are running:  

**Flow trace**  Consider how many dialogs you want to display as output.  

**Statement trace**  Consider the size of the test dialog and the number of ranges you want to examine.  

| Keep trace environment       | Specifies whether or not to retain the trace environment when you log off. The default is YES.  
If you will be logging on and off during testing, specify YES so you will not have to re-establish the trace environment each time. |

2. When you have completed your entries, press Enter.

   **Result:** The trace environment is now established.

3. Proceed as instructed in the following table.
<table>
<thead>
<tr>
<th>IF . . .</th>
<th>THEN . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>the user trace table contains no entries</td>
<td>the Dialog Trace pop-up appears. Proceed to “Selecting a Trace Type” on page 33.</td>
</tr>
</tbody>
</table>
| the user trace table does contain entries| the Trace View Panel appears. Proceed to one of the following:  
   Flow trace
   “Performing Flow Trace” on page 34
   Statement trace
   “Performing Statement Trace” on page 37 |
Selecting a Trace Type

Introduction

If your user trace table contains no entries, the Dialog Trace pop-up appears, enabling you to select the kind of trace that you want to run.

Procedure

1. Select an option from the Dialog Trace pop-up.
2. Follow the appropriate procedure. (The table below directs you to helpful information.)

<table>
<thead>
<tr>
<th>IF . . .</th>
<th>THEN . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>you selected <strong>Flow trace processing</strong></td>
<td>proceed to “Performing Flow Trace” on page 34</td>
</tr>
<tr>
<td>you selected <strong>Statement trace processing</strong></td>
<td>proceed to “Performing Statement Trace” on page 37</td>
</tr>
<tr>
<td>you selected <strong>Refresh a dialog</strong></td>
<td>proceed to “Refreshing a dialog (using pop-up)” on page 37</td>
</tr>
<tr>
<td>you selected <strong>Invoke trace environment with empty table</strong></td>
<td>proceed to “Invoking the Trace Environment with an Empty Table” on page 49</td>
</tr>
</tbody>
</table>
Performing Flow Trace

Introduction

If you selected the flow trace option on the previous panel, the Set Flow Destinations pop-up appears. This panel allows you to start a flow trace.

Procedure

To perform a flow trace, do the following steps.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Fill in the Set Flow Destinations fields using the following guidelines:  
|      | **Table destination**  
|      | Specifies that output is written to the user trace table.  
|      | **Note:** This destination is invalid if the trace environment was established with TBLSIZE=0.  
|      | **Breakpoint destination**  
|      | Specifies dynamic invocation of the breakpoint dialog when one dialog transfers control to another dialog. When Breakpoint is On, output is written to the user trace table. See “Breakpoint Destination” on page 44 for more information.  
|      | **Note:** This destination is invalid if the trace environment was established with TBLSIZE=0.  
|      | **GTF destination**  
|      | Specifies that output is written to GTF.  
|      | **Note:** Before trace records can be written to GTF, GTF must be started and the GTF operator command issued.  
| 2    | Press Enter after making your selection.  
|      | **Result:** A message displays, confirming flow trace processing and the destination type you selected.  
| 3    | Press F3 to return to the application in which the test dialog runs, and execute the dialog. |
Viewing trace data

Your access to the information generated by the trace is determined by your chosen destination.

<table>
<thead>
<tr>
<th>IF . . .</th>
<th>THEN . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>you specified Table destination</td>
<td>after the traced dialog has completed, invoke the DTF dialog again (using one of the methods listed in “Invoking DTF” on page 28)</td>
</tr>
<tr>
<td></td>
<td><strong>Result:</strong> The Dialog Trace Output — Trace View panel, shown in Figure 1 on page 36, is displayed.</td>
</tr>
<tr>
<td>you specified Breakpoint destination</td>
<td>the DTF dialog is invoked automatically while the dialog is being traced</td>
</tr>
<tr>
<td></td>
<td><strong>Result:</strong> The Dialog Trace Output — Trace View panel, shown in Figure 1 on page 36, is displayed. Press F3 to proceed to the next breakpoint. (If you have already reached the last breakpoint, you exit from the panel when you press F3.)</td>
</tr>
<tr>
<td>you specified GTF destination</td>
<td>you stay in your application while tracing continues; later, use GTF to access trace data</td>
</tr>
</tbody>
</table>

User trace table

The Dialog Trace Output — Trace View panel displays the user trace table. This panel shows the flow of control, indicating calls and SYSPARM information for each dialog. A scroll indicator in the upper right area of the panel indicates line and column location.
Panel actions

For more information about a particular dialog, enter an action code next to the dialog name. The following actions are available.

<table>
<thead>
<tr>
<th>Action</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source list (S)</td>
<td>Lists dialog source statements for dialogs that have been compiled for trace.</td>
</tr>
<tr>
<td></td>
<td>If you select a dialog that has not been compiled for trace, no data will be displayed. If this happens, refresh the dialog for traceable compilation and try again. “Refreshing a dialog (using pop-up)” on page 37 contains instructions for dialog refresh.</td>
</tr>
<tr>
<td>Range update (R)</td>
<td>Displays a currently defined range of statements. You can then add and delete ranges for trace.</td>
</tr>
</tbody>
</table>
Performing Statement Trace

Introduction

In order to perform a statement trace on a dialog, you must perform the following procedures:

- Refresh the dialog, that is, recompile the dialog in traceable compilation mode.
- Specify the trace, that is, define a dialog statement or range of statements for tracing.

These procedures are described in the following sections.

Refreshing a dialog (using pop-up)

To refresh a dialog, perform the following steps.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select **Refresh a dialog** from the Dialog Trace pop-up.  
**Result:** The REFRESH Dialog pop-up appears. |
| 2    | Fill in the fields using the following guidelines:  
**Member Name** Specify the dialog you want to refresh.  
**Compile mode** Specify the compilation mode for the refresh.  
**TRACE** Traceable compilation mode. The dialog is compiled to enable tracing and produces output that can be routed to a table or GTF.  
**NOTRACE** Nontraceable compilation mode. The dialog is compiled normally and with no trace output available. |
| 3    | Press Enter when you have finished filling in the panel.  
**Result:** A message confirming that the dialog has been refreshed displays. If the dialog does not refresh, review the output in the view log for error messages. |
Refreshing dialogs (using a CLIST)

Instead of manually issuing an individual REFRESH command for each dialog, you can create a CLIST member in TLVCMD to issue the REFRESH commands for all the dialogs that you are testing.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | In &lvddcmd, create a new member. Remember to begin the member name with a dollar sign ($).  
**Note:** Do not name your CLIST member $REFRESH (or dollar sign followed by the name of any other CT/Engine command). In such a case, when you try to call up the CLIST member (by issuing the name without the dollar sign), CT/Engine interprets and executes REFRESH as the command, not the member name. |
| 2    | On the first line, type `REFRESH P name` where name is the name of the dialog that you want to refresh. Repeat this procedure (on separate lines) for each dialog that you want to refresh. |
| 3    | Press F3.  
**Result:** You exit from the member and your entries are saved. |
| 4    | On the CT/Engine operator panel command line, type the name of the CLIST member without the dollar sign and press Enter.  
**Result:** The dialogs are refreshed in their order of listing in the CLIST member. A confirming message appears on the CT/Engine operator panel as each dialog is refreshed. |
### Specifying the trace

To select a dialog for tracing and specify the characteristics of the trace, perform the following steps.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select **Statement trace processing** from the Dialog Trace pop-up.  
**Result:** The Traceable Dialog Selection pop-up appears. |
| 2    | Make a selection from the list of dialogs that have been compiled for tracing.  
**Result:** The executable statements in the selected dialog are displayed in the Source Statement List pop-up. |

```
+------------------------------------------------------------------------+
| KLVDTTST Source Statement List                                         |
| ! Enter an action for the member, then press Enter.                   |
| ! R=Range Update RA=Range Add V=Variable Update VA=Variable Add        |
| ! Lines _1 to _11 of 38                                               |
| ! Columns _1 to _51 of 71                                             |
| ! -------- ----- ----+----+----+----+----+----+----+----+----+----+-       |
| __ KLVDTTST 32 set testzz 'Shared variable'                          |
| __ KLVDTTST 33 set zz 3                                              |
| __ KLVDTTST 37 while (&zz > /zerodot) /*                              |
| __ KLVDTTST 38 do                                                   |
| __ KLVDTTST 39 set zz &zz-1 /* Decrem                                 |
| __ KLVDTTST 40 end                                                  |
| __ KLVDTTST 41 set xx 0                                             |
| __ KLVDTTST 43 if (&zz = /zerodot) /*                                |
| __ KLVDTTST 44 do                                                  |
| __ KLVDTTST 45 set zz &zz-1                                         |
| __ KLVDTTST 46 end                                                  |
| F1=Help F2=Keys F7=Bkwd F8=Fwd F12=Cancel                           |
+------------------------------------------------------------------------+

**Note:** If the dialog is encrypted, the Data field will be blank. |

| 3    | Select **Range Add** to add a range of statements for trace. (This selection is a fast path for the Range Update and Add selection combination.)  
**Result:** The Add Statement Range pop-up appears. |
| 4    | Set the range characteristics as follows:  
* Type the dialog name in the **Member** field.  
* Type the number of the dialog statement at whose execution trace will start.  
* Type the number of the dialog statement at whose execution trace will end. The limit is 32,767 statements. |
<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Select one of the following statement trace destinations:</td>
</tr>
<tr>
<td></td>
<td><strong>Table destination</strong>&lt;br&gt;Specifies that output is written to the user trace table.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This destination is invalid if the trace environment was established with TBLSIZE=0.</td>
</tr>
<tr>
<td></td>
<td><strong>Breakpoint destination</strong>&lt;br&gt;Specifies dynamic invocation of the breakpoint dialog when one dialog statement transfers control to another dialog statement. When Breakpoint is On, output is written to the user trace table. See “Breakpoint Destination” on page 44 for more information.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This destination is invalid if the trace environment was established with TBLSIZE=0.</td>
</tr>
<tr>
<td></td>
<td><strong>GTF destination</strong>&lt;br&gt;Specifies that output is written to GTF.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Before trace records can be written to GTF, GTF must be started and the GTF operator command issued.</td>
</tr>
<tr>
<td>6</td>
<td>Press Enter.</td>
</tr>
<tr>
<td></td>
<td><strong>Result:</strong> The Trace Ranges pop-up appears with the range and destination for the specified dialog displayed.</td>
</tr>
<tr>
<td>7</td>
<td>Press F12.</td>
</tr>
<tr>
<td></td>
<td><strong>Result:</strong> The Source Statement List appears.</td>
</tr>
</tbody>
</table>
### Step 8 Action

(Optional) Select any of the following actions to specify the table characteristics.

| **Range Update** | Displays a list of the currently defined ranges. You can then add and delete ranges for trace. |
| **Variable Update** | Displays a list of the currently defined variables. You can then add and delete variables for trace. |
| **Variable Add** | Defines a variable. (This selection is a fast path for the Variable Update and Add selection combination.) |

Variables are discussed in detail in “Maintaining Variables” on page 48.

---

### Running the trace

To trace the dialog statements, perform the following steps:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>From the Source Statement List pop-up, return to the application in which the test dialog runs.</td>
</tr>
<tr>
<td>2</td>
<td>Execute the test dialog.</td>
</tr>
</tbody>
</table>

---

### Viewing trace data

Your access to the information generated by the trace is determined by your chosen destination.

<table>
<thead>
<tr>
<th>IF . . .</th>
<th>THEN . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>you specified <strong>Table destination</strong></td>
<td>after the traced dialog has completed, invoke the DTF dialog again (using one of the methods listed in “Invoking DTF” on page 28)</td>
</tr>
</tbody>
</table>

**Result:** The Dialog Trace Output — Trace View panel, shown in Figure 2 on page 42, is displayed.
<table>
<thead>
<tr>
<th><strong>IF</strong>...</th>
<th><strong>THEN</strong>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>you specified <strong>Breakpoint</strong> destination</td>
<td>the DTF dialog is invoked automatically while the dialog is being traced</td>
</tr>
<tr>
<td><strong>Result:</strong></td>
<td>The Dialog Trace Output — Trace View panel, shown in Figure 2 on page 42, is displayed.</td>
</tr>
<tr>
<td>you specified <strong>GTF</strong> destination</td>
<td>you stay in your application while tracing continues; later, use GTF to access trace data</td>
</tr>
</tbody>
</table>

**User trace table**

The Dialog Trace Output — Trace View panel displays the user trace table. This panel shows the dialog, the dialog member, the statement number, and the statement. A scroll indicator in the upper right area of the panel indicates line and column location.

```
Enter an action or select an Action Bar item, then press Enter.
S=Source list  R=Range update

F1=Help  F2=Keys  F3=Exit  F7=Bkwd  F8=Fwd  F10=Action Bar

Figure 2. Dialog Trace Output — Trace View Panel (Statement Trace)
```

**Panel actions**

For more information about a particular dialog, enter an action code next to the dialog name. The following actions are available.
<table>
<thead>
<tr>
<th>Action</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source list (S)</td>
<td>Lists dialog source statements for dialogs that have been compiled for trace.</td>
</tr>
<tr>
<td></td>
<td>If you select a dialog that has not been compiled for trace, no data will be displayed. If this happens, refresh the dialog for traceable compilation and try again. “Refreshing a dialog (using pop-up)” on page 37 contains instructions for dialog refresh.</td>
</tr>
<tr>
<td>Range update (R)</td>
<td>Displays a currently defined range of statements. You can then add and delete ranges for trace.</td>
</tr>
</tbody>
</table>
Breakpoint Destination

Description

Breakpoints are present in the code of some dialog statements. If you select **Breakpoint destination**, execution of a dialog is stopped each time a statement that contains a breakpoint is encountered.

Breakpoint process

The table below describes the process that allows you to view each breakpoint and make changes as required.

<table>
<thead>
<tr>
<th>Step</th>
<th>Agent</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | User  | Executes a dialog or dialog statement.  
**Result**: Control is transferred from one dialog to another or from one dialog statement to another. |
| 2    | DTF   | Invokes the DTF dialog.  
**Result**: The Dialog Trace Output — Trace View panel (Figure 1 on page 36) is displayed. |
| 3    | User  | Presses F3 repeatedly.  
**Result**: Each time the user presses F3, the Dialog Trace Output — Trace View panel reappears with a new entry. |

If, at some point during statement processing, you want to make a change (for instance, modifying a variable, as explained in “Maintaining Variables” on page 48), do so, then begin the process again at step 1.
Stopping a Trace

Introduction

You may decide to stop a trace before the traced dialog has completed. For example, if the trace table is full you may wish to prevent DTF from overwriting the older entries.

There are several ways to suspend or stop tracing. The one you choose depends on the desired consequences:

**Suspend trace output**
- Trace environment remains active but no entries are added to the user trace table

**Turn off flow trace**
- The trace environment is terminated.

**Bypass breakpoint**
- Trace environment remains active but any remaining breakpoints for that specific dialog are bypassed during execution. Thus no entries are added to the user trace table for that specific dialog.

**Delete range**
- The trace environment is terminated.

Suspending trace output

Use the following procedure to suspend trace output:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select **Suspend trace output** on the Options pull-down.  
**Result:** The trace environment remains active but no new entries are added to the user trace table. |
| 2    | Press F3.  
**Result:** You exit the Dialog Trace Output — Trace View panel and return to the CL/SUPERSESSION Main Menu. |
Turning off flow trace

Use the following procedure to turn off flow trace:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select *Flow trace* on the Environment pull-down.  
      | *Result:* The Set Flow Destinations pop-up appears. |
| 2    | Turn off the flow trace destination.  
      | *Result:* The trace environment is deactivated. |
| 3    | Press F3.  
      | *Result:* You exit the Dialog Trace Output — Trace View panel and return to the CL/SUPERSESSION Main Menu. |

Bypassing breakpoint

Use the following procedure to bypass the currently executing dialog's remaining breakpoints:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select *Bypass breakpoint once* on the Options pull-down.  
      | *Result:* The trace environment remains active but no entry is added to the user trace table for that specific dialog. |
| 2    | Press F3.  
      | *Result:* You exit the Dialog Trace Output — Trace View panel and return to the CL/SUPERSESSION Main Menu. |

Deleting ranges

Use the following procedure to delete the statement range of a currently executing dialog:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Type `R` to the left of any dialog statement on the Dialog Trace Output — Trace View panel and press Enter.  
<pre><code>  | *Result:* The Trace Ranges pop-up appears listing all refreshed dialogs and their ranges. |
</code></pre>
<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 2    | Type D to the left of the current dialog (that is, the dialog currently being processed on the Dialog Trace Output — Trace View panel) and press Enter.  
**Result:** The Delete Confirmation pop-up appears. |
| 3    | Select **Delete range entry** and press Enter.  
**Result:** The dialog is deleted from the Trace Ranges pop-up. |
| 4    | Press F12.  
**Result:** You return to the Dialog Trace Output — Trace View panel. |
| 5    | Press F3.  
**Result:** You exit the Dialog Trace Output — Trace View panel and return to the CL/SUPERSESSION Main Menu. |

**More information**

See “Using the Action Bar Selections” on page 50 for more information on the Options and Environment action bar choices.
Maintaining Variables

Introduction

Once you have generated output through statement trace processing, you can add, delete, or modify the value of variables within executing statements.

Procedure

Perform the following procedure to add, delete, or modify variables.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>On the Dialog Trace Output — Trace View panel, type V next to a dialog name and press Enter. Result: The Trace Variables pop-up displays the current variables and their values. Note: If no variables have been previously defined, a placeholder row is displayed.</td>
</tr>
</tbody>
</table>

```
+--------------------------------------------------------------------------+
| Trace Variables for LU123456                                           |
| Enter an action for the variable, then press Enter.                     |
| A=Add Variable D=Delete Variable M=Modify Variable                     |
| Variable Scope Dialog Value Lines 1 to 1 of 1                          |
| -------- -------- -------- ----------------------------------------- |
| TESTUSER Session USER01                                               |
| ***********************************************************           |
| BOTTOM OF DATA *********************************************************|
+--------------------------------------------------------------------------+
```

2 Take any of the following actions:

Add Variable (A) Adds a variable to a list that can be checked during tracing to determine the value.

Delete Variable (D) Deletes a variable from a list.

Modify Variable (M) Modifies the value of a variable during the trace process.
Invoking the Trace Environment with an Empty Table

Introduction

Use this option if you want to display an empty user trace table. Then, before you begin a trace, you can perform preparatory actions. For example, you can

- execute a dialog via the Utility pull-down to gain diagnostic information that dialog trace may not provide
- do pretrace processing (for example, setting up conditions and/or tables) before performing tracing
- define ranges via the Environment pull-down
- define variables via the Environment pull-down

If you already know the trace environment that you want, skip this option and choose Flow trace processing or Statement trace processing.

Procedure

Perform the following steps to display an empty user trace table.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | On the Dialog Trace pop-up, select **Invoke trace environment with empty table**.  
   **Result:** The Dialog Trace Output — Trace View panel appears. |
| 2    | Make a selection from the action bar to perform the desired preparatory action. (Action bar selections are described in “Using the Action Bar Selections” on page 50.) |
Using the Action Bar Selections

Introduction

The DTF action bar allows you to modify the trace environment in a variety of ways.

Some of the action bar selections duplicate actions that you can select in other ways. For example, you can refresh a dialog using a selection from the Utility pull-down, or you can perform the same action as explained in “Refreshing a dialog (using pop-up)” on page 37.

Action bar selections

The DTF action bar is displayed on the Dialog Trace Output — Trace View panel.

Each of the selections available from the action bar selections is briefly described below.

Actions pull-down

The Actions pull-down menu lets you perform an action on a specific entry on the current panel. To access Actions, use the following procedure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Place a slash (/) next to the table entry on which you want the selected action to be performed.</td>
</tr>
<tr>
<td>2</td>
<td>Press F10 to move the cursor to the action bar.</td>
</tr>
<tr>
<td>3</td>
<td>Type A and press Enter to access the Actions menu.</td>
</tr>
<tr>
<td>Step</td>
<td>Action</td>
</tr>
<tr>
<td>------</td>
<td>--------</td>
</tr>
<tr>
<td>4</td>
<td>Select one of the following options:</td>
</tr>
</tbody>
</table>

**Source member list**
Displays the dialog source statements for those dialogs compiled with the trace option. See “Specifying the trace” on page 39 for an example of this display.

**Range update**
Displays ranges defined for trace. You can then add and delete ranges from the list.

**Variables**
Displays the dialog variables and their values. You can then add and delete variables from the list.

**Exit Dialog Trace**
Exit the Dialog Trace Output — Trace View panel.

---

**Environment pull-down**

The Environment pull-down menu lets you perform an action on a dialog in the trace environment, whether or not it is listed in the table. To access Environment, use the following procedure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select Environment from the action bar.</td>
</tr>
<tr>
<td>Step</td>
<td>Action</td>
</tr>
<tr>
<td>------</td>
<td>--------</td>
</tr>
<tr>
<td>2</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td><strong>Flow trace</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Source member</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Ranges</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Variables</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Trace status</strong></td>
</tr>
</tbody>
</table>

### View pull-down

The View pull-down menu allows you to change the view for the dialog trace table. To access View, use the following procedure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select View from the action bar.</td>
</tr>
<tr>
<td>2</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td><strong>All</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Flow</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Statement</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Clear trace table</strong></td>
</tr>
</tbody>
</table>

If you plan to rerun test dialogs after viewing trace output, you can use this option to clear the original entries from the trace table before generating new output.

**Note:** If you clear the table, the Dialog Trace pop-up appears when you next invoke DTF. (See “Selecting a Trace Type” on page 33 for instructions.)
**Utility pull-down**

The Utility pull-down menu allows you to refresh or execute a dialog. To access **Utility**, use the following procedure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select <strong>Utility</strong> from the action bar.</td>
</tr>
<tr>
<td>2</td>
<td>Select one of the following options:</td>
</tr>
</tbody>
</table>
|      | **Refresh a dialog**  
|      | Refresh a dialog. |
|      | **Execute a dialog**  
|      | Execute a dialog. This may be a custom dialog written by your site to display variable names or specific debugging information that is beyond the scope of DTF. |
|      | **Note:** Do not use this option to execute a dialog for tracing. It does not produce trace output. |

**Options pull-down**

The Options pull-down menu allows you to modify the dialog trace environment. To access **Options**, use the following procedure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select <strong>Options</strong> from the action bar.</td>
</tr>
<tr>
<td>2</td>
<td>Select one of the following options:</td>
</tr>
</tbody>
</table>
|      | **Preferences**  
|      | Set user session preferences. |
|      | **Bypass breakpoint once**  
|      | Bypass the remaining breakpoints for the current dialog. If you execute the same dialog later, the breakpoint dialog and destination will be invoked. |
|      | **Suspend trace**  
|      | Suspend generating dialog trace output. |
|      | **Resume trace**  
|      | Resume generating dialog trace output. |
The Help pull-down menu lets you access help. To access **Help**, use the following procedure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select <strong>Help</strong> from the action bar.</td>
</tr>
<tr>
<td>2</td>
<td>Select one of the following options:</td>
</tr>
</tbody>
</table>

**Help for help**
- Explains how to navigate through the CT/Engine operator help panels.

**Help index**
- Provides an alphabetic index of help information.

**Glossary**
- Lists words and phrases alphabetically that have special meaning to the CT/Engine operator.

**About**
- Shows logo, copyright, and product version information.

**User information**
- Shows information about your current session, such as user ID, terminal ID, system ID, VTAM® logmode name, and current ACB name.
Chapter 4.
Putting It All Together

Overview ............................................. 56
Dialog Trace Scenario ........................... 57
Overview

Introduction

The following scenario begins with a flow trace to check the flow of dialogs and then moves into a statement trace for more detailed analysis of individual dialogs.

Sample dialogs

The dialogs used in this scenario are the CL/SUPERSESSION sample dialogs KLSZPTRK and KLSZPLOG.
Dialog Trace Scenario

Introduction

You have written a new dialog, KLSZPTRK. To test it, you perform the following series of actions.

Preparing to trace

You perform these steps to access the dialog trace facility.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Log onto CL/SUPERSESSION.  
**Result:** The CL/SUPERSESSION Main Menu appears. |
| 2    | Select **Features** on the action bar.  
**Result:** The Product Features pop-up appears. |
| 3    | Select **Dialog Trace**.  
**Result:** The Dialog Trace Enable Options pop-up appears. |
| 4    | Type **Yes** in the Keep trace environment field to ensure that the trace environment remains active if you're interrupted. You decide to accept the default of 255 trace entries on the table. |
| 5    | Press Enter.  
**Result:** The Dialog Trace pop-up appears. |

Running a flow trace

You decide to first check the dialog flow by running a trace as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | On the Dialog Trace pop-up, select **Flow trace processing**.  
**Result:** The Set Flow Destinations pop-up appears. |
| 2    | Turn on **Table destination** (for your output destination).  
**Result:** A pop-up message confirms your destination. |
| 3    | Press F12 twice.  
**Result:** You return to the application, in this case, the CL/SUPERSESSION Main Menu. |
Step | Action
--- | ---
4 | On the command line, enter **DIALOG KLSZPTRK**.
**Result:** You enter the ACME Industries Personal Computer Inventory sample application.
5 | Log onto the application and press Enter.
**Result:** The ACME Industries Personal Computer System panel appears.
6 | Press F3.
**Result:** You exit the application.
7 | Log onto CL/SUPERSESSION again.
**Result:** The CL/SUPERSESSION Main Menu appears.
8 | Reinvoke DTF on the Features pull-down by entering FD on the action bar (fast path).
**Result:** The DTF dialog is reinvoked and the user trace table appears.

Checking flow

The user trace table presents trace records of that application as well as records of whatever dialogs were concurrently executing in CL/SUPERSESSION.

---

Figure 3. Dialog Trace Output — Trace View Panel (KLSZPTRK)
You look at the dialogs that were being executed. You decide to check dialog KLSZPLOG for errors. Before you do so, however, you turn off flow trace as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>On the user trace table (Dialog Trace Output - Flow View panel) action bar, select Environment. Result: The Environment pull-down appears.</td>
</tr>
<tr>
<td>2</td>
<td>Select Flow trace. Result: The Set Flow Destinations pop-up appears.</td>
</tr>
<tr>
<td>3</td>
<td>Turn the table destination off. Result: Flow trace ends.</td>
</tr>
<tr>
<td>4</td>
<td>Press F12. Result: You return to the user trace table.</td>
</tr>
</tbody>
</table>

Preparing for a statement trace

You prepare for a statement trace by refreshing dialog KLSZPLOG according to the following steps.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>On the user trace table (Dialog Trace Output - Flow View panel) action bar, select Utility. Result: The Utility pull-down appears.</td>
</tr>
<tr>
<td>2</td>
<td>Select Refresh dialog. Result: The Refresh Dialog pop-up appears.</td>
</tr>
<tr>
<td>3</td>
<td>Check that the Compile mode field is set to trace (default).</td>
</tr>
<tr>
<td>4</td>
<td>Type the dialog name, KLSZPLOG, in the Member Name field.</td>
</tr>
<tr>
<td>5</td>
<td>Press Enter. Result: A message confirms that KLSZPLOG has been refreshed.</td>
</tr>
<tr>
<td>6</td>
<td>Press F12 twice. Result: You return to the user trace table.</td>
</tr>
</tbody>
</table>
Beginning a statement trace

You begin a statement trace by selecting dialog KLSZPLOG for processing and setting the statement range according to the following steps.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | On the user trace table (Dialog Trace Output - Flow View panel) action bar, select **Environment**.  
**Result:** The Environment pull-down appears. |
| 2    | Select **Source members**.  
**Result:** The Traceable Dialog Selection pop-up appears. |
| 3    | Select dialog KLSZPLOG for processing.  
**Result:** The Source Statement List pop-up appears. |
| 4    | Enter **RA** (for Range Add) next to a statement number.  
**Result:** The Add Statement Range pop-up appears. |
<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 5    | Fill in the Add Statement Range pop-up as follows:  
|      | 1. Type **KLSZPLOG** as the name of the member containing the statement range to be added.  
|      | 2. Type **44** as the first statement number of the range.  
|      | 3. Type **32767** as the last statement number of the range.  
|      | 4. Type a slash in the Breakpoint destination field to specify transfer from one dialog statement to another, resulting in dynamic invocation of the breakpoint dialog.  
|      | **Note:** Output is stored in the user trace table when Breakpoint destination is selected.  
|      | The figure below shows the fields filled in.  
|      | ![Add Statement Range](image)  
| 6    | Press Enter.  
|      | **Result:** A message confirms the range that you have defined.  
| 7    | Press F12 twice.  
|      | **Result:** You return to the user trace table.  
| 8    | Press F3.  
|      | **Result:** You return to the CL/SUPERSESSION Main Menu.  

Chapter 4. Putting It All Together 61
Running a statement trace

You run a statement trace with breakpoint processing for dialog KLSZPLOG by performing the following steps.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | On the CL/SUPERSESSION Main Menu command line, reinvoke DIALOG KLSZPTRK.  
**Result:** You enter the application. |
| 2    | Proceed through the application.  
**Result:** When dialog KLSZPLOG executes you return to the user trace table (Dialog Trace Output — Trace View panel) with the first breakpoint displayed at the bottom of the panel body. A message above the function keys confirms that a breakpoint has been encountered. |
| 3    | Press F3.  
**Result:** The statement executes and a new breakpoint is encountered. |
| 4    | Continue to execute statements (via F3) until you reach statement 65. |
Checking a variable

You decide to check a variable in statement 65 of dialog KLSZPLOG, using the following procedure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Type `V` to the left of statement 65 and press Enter.  
**Result:** The Trace Variables pop-up appears with a dummy entry on the table. |
| 2    | Type `A` to the left of the dummy entry and press Enter.  
**Result:** The Add Variable pop-up appears. |
| 3    | Fill in the fields as follows:  
- Type `KLSZPLOG` in the Dialog field.  
- Place the cursor in the Variable field and press FD.  
  **Result:** The Variable Name Selection pop-up appears.  
- Select `VALID` as your variable (VALID was the variable in statement 65) and press Enter.  
  **Result:** The Add Variable pop-up appears with the Variable field (`VALID`) and the Scope field (`Local`) filled in. |
| 4    | Press Enter again.  
**Result:** The Trace Variables pop-up appears. VALID is listed as the variable. |
| 5    | Press F12.  
**Result:** The user trace table appears. |
| 6    | Press F3.  
**Result:** Statement 65 executes. (A new breakpoint is encountered at statement 66.) |
| 7    | Type `V` beside statement 65 and press Enter.  
**Result:** You return to the Trace Variables pop-up. The value of 0 (zero) appears for the variable VALID. |
You decide that the value for variable VALID is correct. You then want to exit from DTF, using the following procedure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Press F12.</td>
</tr>
<tr>
<td></td>
<td><strong>Result:</strong> The user trace table appears.</td>
</tr>
<tr>
<td>2</td>
<td>On the action bar, select <strong>Options</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Result:</strong> The Options pull-down appears.</td>
</tr>
<tr>
<td>3</td>
<td>Select <strong>Bypass breakpoint once</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Result:</strong> A message tells you that the remaining breakpoints will be bypassed once (that is, F3 will not invoke breakpoint processing when you next press it.)</td>
</tr>
<tr>
<td>3</td>
<td>Press F12.</td>
</tr>
<tr>
<td></td>
<td><strong>Result:</strong> You return to the user trace table.</td>
</tr>
<tr>
<td>4</td>
<td>Press F3.</td>
</tr>
<tr>
<td></td>
<td><strong>Result:</strong> You exit from the application.</td>
</tr>
</tbody>
</table>
Chapter 5.
Function and Command Reference

Overview ................................................. 66
DTRACE ..................................................... 67
REFRESH .................................................... 72
REFRESH Function .............................. 74
Overview

Introduction

You can use CT/Engine operator commands to perform the same functions that you can execute using the dialog trace facility. A new command and a modified command are described in this chapter.

This chapter also describes a change to the REFRESH dialog language function, which has been modified to support DTF.

New command

The new DTRACE command allows you to control the dialog trace facility. This command is described on page 67.

Modified command

The REFRESH command compiles a specified dialog or panel. You can now specify traceable or nontraceable mode. This command is described on page 72.

Modified function

The REFRESH function now allows you to indicate whether or not the dialog to be refreshed is traceable or nontraceable. This function is described on page 74.
DTRACE
Controls the CT/Engine dialog trace facility.

Type
CT/Engine operator command.

Format
DTRACE function
DEST=dest
LUNAME=luname
MEMBER=member
RANGE=(stmtno - stmtno) | stmtno
[KEEP=YES | NO]
[NTD=NO | YES]
[TBLSZ=255 | nnnn]

function
One of the following:

ADD    Adds statement ranges for specified members.

COMPEND    Ends traceable compilation mode. Once traceable compilation mode ends, any compilation generates object modules that cannot be traced.

COMPSTRT    Starts traceable compilation mode. Once started, all compilations (for example, REFRESH) generate traceable object modules. You can override traceable compilation mode by including explicit parameters on the REFRESH command.

DELETE    Deletes statement ranges for specified members.

DISABLE    Disables tracing for the specified LU or nonterminal dialogs, taking either the specified or default disposition of the specified user’s trace environment.

ENABLE    Enables tracing for the specified LU or nonterminal dialogs. Once tracing is enabled, statements can be traced only after further commands or dialog functions have specified which dialogs and statements should be traced.
**FLOWOFF**  Turns off dialog flow trace for an enabled user.

**FLOWON**  Turns on dialog flow trace for an enabled user.

**INQ**  Displays global trace status, individual trace user status, DTF storage statistics, and statement ranges for specified dialogs. INQ displays information for all users when issued with no other parameters.

**OFF**  Turns off dialog tracing for all users. If KEEP=YES is specified, the users' trace environments are left intact so that tracing can resume when tracing is turned on. The contents of the interactive users' trace tables are lost when tracing is turned off.

**ON**  Turns on dialog tracing. Tracing must be turned on before functions controlling tracing are accepted, except for COMPSTRT, COMPEND, and INQ.

**LUNAME**  Terminal LU name.

After trace is enabled for a specified LU name, the same LU name must be used to identify the user in DTRACE commands issued to control tracing for that user. This parameter is required with NTD=NO.

**NTD**  Specifies whether the command applies to nonterminal dialogs or an LU name.

**YES**  The command applies to nonterminal dialogs. NTD=YES and LUNAME parameters are mutually exclusive. DEST=BP and DEST=TABLE are invalid when NTD=YES.

**NO**  The command applies to an LU name. When NTD=NO, the LUNAME parameter is required.

**DEST**  The destination for trace output. Valid values are:

**BP**  Execution of the statement causes dynamic invocation of the breakpoint dialog. Output to the table destination is implicit with BP.

**TABLE**  Trace output is written to the interactive user's trace table.
GTF  Trace output is written to GTF. To write data to GTF, you must also start GTF and use CT/Engine operator commands GTF and GTRACE.

KEEP  Determine whether or not the user's trace environment is retained at logoff or when tracing is disabled.

YES  The user's trace environment is retained.

NO  The user's trace environment is deleted.

Defaults: If ENABLE is specified, the default is KEEP=YES. If DISABLE is specified, the default is the value of KEEP when ENABLE was last specified.

MEMBER  Source member name.

RANGE  Starting and ending statement numbers within the source dialog. Statement numbers must be enclosed by parentheses and separated by a dash if starting and ending numbers are specified. If only a starting statement number is specified, you can omit the parentheses and dash.

With the ADD parameter, if the starting statement number is specified and the ending statement number is omitted, the range consists of one statement.

With the DELETE parameter, if the ending statement number is omitted, all ranges declared with the same starting statement number are deleted for the specified destination. If RANGE is omitted, all ranges for the given dialog are deleted. If DEST is omitted, applicable ranges for all destinations are deleted.

TBLSZ  Indicates the maximum number of trace entries in the user trace table.

Note: A single entry has a maximum size equal to the source statement length plus 20 bytes. This results in an average size of approximately 50 bytes per entry.

Usage Notes

1. The allowable forms of DTRACE are:
DTRACE ADD LUNAME=luname | NTD=YES
    MEMBER=member
    RANGE=(nn-nn) | nn
    DEST=dest

DTRACE COMPEND

DTRACE COMPSRTT

DTRACE DELETE LUNAME=luname | NTD=YES
    MEMBER=member
    RANGE=(nn-nn) | nn
    DEST=dest

DTRACE DISABLE LUNAME=luname | NTD=YES
    KEEP=YES | NO

DTRACE FLOWON LUNAME=luname | NTD=YES
    DEST=dest

DTRACE FLOWOFF LUNAME=luname | NTD=YES

DTRACE INQ LUNAME=luname | NTD=YES

DTRACE OFF

DTRACE ON

2. The COMPSTRT, COMPEND, INQ, and ON functions are the only functions that can be used while tracing is turned off.

3. Statement numbers for a range need not correspond exactly to SSPL procedural statements. For example, statement numbers may represent comment lines, or the ending statement number may be greater than the last statement number of a source member.

---

Example

To display trace status for the system and the status and ranges for each user, issue:

DTRACE INQ

CT/Engine Messages has the KLVOPnnn messages that are issued by the DTRACE command, and a description of the data contained in them.
See Also

“REFRESH” on page 72.
REFRESH
Loads a new copy of a dialog, module, or sense code table, and makes it available for subsequent execution requests.

**Type**
CT/Engine operator command.

**Format**

```
REFRESH {PANEL | DIALOG} name
[TRACE | NOTRACE]

MODULE name

SENSE name dsname
```

**PANEL**
Specifies that a dialog in the TLVPNLS concatenation is to be refreshed. **DIALOG** may be used interchangeably with **PANEL**. **P** and **D** may be used as abbreviations.

**MODULE**
Specifies that a module in the TLVLOAD concatenation is to be refreshed. **M** may be used as an abbreviation.

**SENSE**
Specifies that the global sense table is to be refreshed. **S** may be used as an abbreviation.

**name**
The 1–8 character name of the dialog, module, or sense code member that is to be refreshed.

**dsname**
The 1–44 character data set name that contains the sense code rule definition member, **name**.

**TRACE**
Specifies that the dialog, **name**, is to be compiled with additional information that may be used by dialog trace.

**NOTRACE**
Specifies that no dialog trace information is to be included in the compilation of **name**.

**Usage Notes**

1. If neither **TRACE** nor **NOTRACE** is specified, the default is based on the TRCCOMP keyword in the Dialog Manager initialization member, KLVINDM, in TLVPARM.
2. If you update a dialog in your panel library, REFRESH causes the updated version to be used for subsequent invocations. If the modified dialog fails to compile during REFRESH, the old dialog is still available for execution.

3. *dsname* must be enclosed in single quotation marks if the REFRESH command is issued from the MVS console.

4. REFRESH MODULE is effective only for programs invoked by the LINK dialog function. It will not replace user exits or CT/Engine programs.

---

### Example

To refresh panel LOGNT04 in your panel library, enter:

```
REFRESH P LOGNT04
```

Dialog trace information will be included if KLVINDM requested it. To ensure no extra data is included:

```
REFRESH PANEL XYZ NOTRACE
```

To refresh the global sense table located in MYLIB.USER.SENSETBL(SNSIN):

```
REFRESH S SNSIN MYLIB.USER.SENSETBL
```

---

### See Also

“DTRACE” on page 67.
REFRESH Function

Description

Loads and compiles a new copy of the specified dialog name.

Type

Dialog language function.

Format

REFRESH(dialog [bool])

dialog Name of the dialog to be reloaded.
bool A boolean expression indicating traceability:

0 (FALSE) The specified dialog is not traceable.
Not 0 (TRUE) The specified dialog is traceable.

Return Codes

0 (FALSE) The specified dialog did not compile successfully.
1 (TRUE) The specified dialog was successfully refreshed.

Usage Notes

1. Compilation errors appear in TLVLOG
2. If bool is omitted, the compilation is performed according to the current traceable compilation mode.
CL/ENGINE Messages

Introduction

CT/Engine messages for the dialog trace facility follow in alphanumerical order.

Messages

KLVDT001  LUNAME, luname, NOT UNIQUE AND WILL NOT TRACE
Explanation: A duplicate LUNAME exists on the system, and tracing of luname will not occur.
System Action: luname will not be traced.
User Response: Rename luname so that it is unique to the system.
Message Type: INFO.

KLVDT002  DIALOG TRACE ENVIRONMENT INTEGRITY ERROR
Explanation: There is a severe problem with the DTF environment.
System Action: None.
User Response: Contact Candle Support Services.
Message Type: ERROR.

KLVOP411  DIALOG TRACE STATUS(ON|OFF) TRACEABLE
COMPILATION MODE(ON|OFF)
Explanation: Dialog trace is on so that tracing of dialogs will occur, or it is off so that tracing of dialogs will not occur.
Traceable compilation mode is on so that compilation creates an object module that is traceable, or it is off so that compilation creates an object module that is not traceable.
System Action: None.
User Response: None.
Message Type: REPLY.

KLVOP412  DIALOG TRACE STORAGE ALLOCATED nnmn KB
Explanation: The amount of storage used by DTF for the retention of source statements and control blocks is displayed.
System Action: None.
User Response: None.
Message Type: REPLY.
KLVOP413 \textit{luname}|\texttt{NTD ENABLED}|\texttt{DISABLED} \\
\texttt{[TBLSZ(nnnn)]SUSPENDED} \\
\textbf{Explanation:} The specified LU or a nonterminal dialog (NTD) was enabled or disabled. If interactive tracing capabilities were granted, user trace table size, \texttt{nnnn}, is displayed. For interactive users, suspension of output to the table destination may be indicated with SUSPENDED. \\
\textbf{System Action:} None. \\
\textbf{User Response:} None. \\
\textbf{Message Type:} REPLY. \\

KLVOP414 \textit{luname}|\texttt{NTD MEMBER}(\texttt{memname}) \texttt{RANGE}(\texttt{start-end}) \\
\texttt{DEST(BP|GTF|TABLE)} \\
\textbf{Explanation:} A range of statements, \texttt{start} through \texttt{end}, will be traced from source member \texttt{memname} for dialogs (which copy the member and have been compiled for trace) executing at either the specified LU or as nonterminal dialogs. The dialog manager generates trace output to BP, GTF, or TABLE. \\
\textbf{System Action:} None. \\
\textbf{User Response:} None. \\
\textbf{Message Type:} REPLY. \\

KLVOP415 \textit{luname}|\texttt{NTD FLOWON DEST}(\texttt{BP|GTF|TABLE}) \\
\textbf{Explanation:} FLOW tracing is active for the specified LU or for a nonterminal dialog (NTD). The dialog manager generates trace output to BP, GTF, or TABLE. \\
\textbf{System Action:} None. \\
\textbf{User Response:} None. \\
\textbf{Message Type:} REPLY. \\

KLVOP416 \textbf{DIALOG TRACE IS OFF|ON} \\
\textbf{Explanation:} Indicates the status of the dialog trace facility. \\
\textbf{System Action:} If trace was turned on, the DTRACE command can be used to enable terminals or nonterminal dialogs and to add and delete ranges. Commands specifying users, dialogs, and ranges to be traced are rejected if tracing was turned off. When trace is turned on, all enabled LUs and nonterminal dialog resources can generate trace output. \\
\textbf{User Response:} None. \\
\textbf{Message Type:} INFO. \\

KLVOP417 \textbf{DESTINATIONS BP AND TABLE INVALID FOR NON-TERMINAL DIALOOGS AND NON-INTERACTIVE USERS} \\
\textbf{Explanation:} A command specifying the BP or TABLE destination was issued for a noninteractive user or for nonterminal dialogs. These output destinations are valid only for interactive users enabled by LU name.
System Action: The command completes unsuccessfully.
User Response: Reissue the command using a different destination or enable the terminal for interactive tracing.
Message Type: INFO.

KLVOP418 luname|NTD ENABLED FOR DIALOG TRACE TBLSZ(nnmn)
Explanation: The specified LU or a nonterminal dialog was enabled for tracing of dialogs. When a terminal identified by luname is granted interactive capabilities, user trace table size, nnnn, is displayed.
System Action: Commands affecting the enabled LU or nonterminal dialogs are accepted.
User Response: None.
Message Type: INFO.

KLVOP419 luname|NTD DISABLED FOR DIALOG TRACE, ENVIRONMENT RETAINED|DELETED
Explanation: Tracing for the specified LU or the nonterminal dialogs was disabled. The trace environment is deleted or retained.
System Action: When the trace environment is deleted, all dialogs and ranges that were declared traceable for the user are no longer traceable, even after the user is re-enabled.
User Response: None.
Message Type: INFO.

KLVOP420 RANGE(start-end) ADDED FOR luname|NTD: MEMBER(member) DEST(BP|GTF|TABLE)
Explanation: A range of statements, start through end, was added for the specified LU, specified member and specified destination, or for the nonterminal dialogs (NTD).
System Action: When statements within the range for member are executed, trace output can be directed to a trace output destination: BP, GTF, or TABLE.
User Response: None.
Message Type: REPLY.

KLVOP421 RANGE(start-end|ALL) DELETED FOR luname|NTD MEMBER(member|ALL)
Explanation: A range of statements, start through end, has been deleted for the specified LU or nonterminal dialogs (NTD), specified or all members, and specified or all destinations.
System Action: The specified range that was deleted for the specified member, destination, and LU or NTD will no longer be traced.
User Response: None.
Message Type: REPLY.
KLVOP422  TRACEABLE COMPILATION MODE IS ON|OFF
Explanation: Indicates the status of traceable compilation mode.
System Action: Output from automatic compilation and the REFRESH command using parameter defaults is a traceable dialog if the mode is ON; it is nontraceable if the mode is OFF.
User Response: None.
Message Type: INFO.

KLVOP423  COMMAND INVALID WHILE DIALOG TRACE IS OFF
Explanation: A command was issued that requires that DTF be activated.
System Action: The command completes unsuccessfully.
User Response: Turn on DTF and reissue the command.
Message Type: ERROR.

KLVOP424  luname|NTD NOT ENABLED FOR TRACING
Explanation: An attempt was made to disable an LU or nonterminal dialogs (NTD), but the command completed unsuccessfully because the LU or NTD was not enabled for tracing.
System Action: The command completes unsuccessfully.
User Response: Correct the LU name and reissue the command.
Message Type: ERROR.

KLVOP425  RANGE(start-end|ALL) DOES NOT EXIST FOR luname|NTD MEMBER(member|ALL) DEST(BP|GTF|TABLE|ALL)
Explanation: The statement ranges being deleted for the specified LU or nonterminal dialogs (NTD), specified members, and specified destinations do not exist.
System Action: The command completes unsuccessfully.
User Response: Use the DTRACE command to display the correct range information and reissue the command.
Message Type: ERROR.

KLVOP426  TRACEABLE COMPILATION MODE UNCHANGED
Explanation: A command was issued to change the compilation mode to the mode that already exists.
System Action: The command completes unsuccessfully.
User Response: Reissue the command to set the desired mode. If the desired mode is the current mode, no user response is necessary.
Message Type: ERROR.
KLVOP427  FLOW TRACE STATUS UNCHANGED
Explanation: A command was issued to change the state of the flow trace to the state that already exists.
System Action: The command completes unsuccessfully.
User Response: Reissue the command to set the flow trace to the desired state, or do nothing if the desired state is the current one.
Message Type: ERROR.

KLVOP428  keyword = value INVALID
Explanation: A command containing an invalid parameter keyword was issued.
System Action: The command completes unsuccessfully.
User Response: Consult the command documentation, and then reissue the command.
Message Type: ERROR.

KLVOP430  luname|NTD ALREADY ENABLED FOR TRACING
Explanation: An attempt was made to enable an LU or nonterminal dialog (NTD), but the LU or NTD was already enabled for tracing.
System Action: The command completes unsuccessfully.
User Response: Correct the LU name or disable the LU or nonterminal dialogs, and reissue the command.
Message Type: ERROR.

KLVOP431  STORAGE ISOLATION POOL NOT INITIALIZED
Explanation: A storage isolation pool could not be initialized during DTF initialization.
System Action: DTF is not on.
User Response: Use the STORAGE command to display storage utilization. Adjust storage allocation parameters and recycle CT/Engine if storage was underallocated. Otherwise, contact Candle Support Services.
Message Type: ERROR.

KLVOP432  DIALOG TRACE HANDLE POOL NOT INITIALIZED
Explanation: An attempt to turn DTF on has been made, but a handle pool could not be initialized.
System Action: DTF is not turned on.
User Response: Contact Candle Support Services.
Message Type: ERROR.
KLVOP433  TRACE ENVIRONMENT INTEGRITY ERROR
Explanation: Data structures used for representation of
dialog trace information are corrupted.
System Action: DTF is turned off and cannot be restarted.
User Response: Contact Candle Support Services.
Message Type: ERROR.

KLVOP434  LUNAME= AND NTD= PARAMETER CONFLICT
Explanation: The LUNAME and NTD keyword parameters
are mutually exclusive.
System Action: The command completes unsuccessfully.
User Response: Reissue the command with either the
LUNAME or NTD keyword parameter.
Message Type: ERROR.

KLVOP441  INTERACTIVE DIALOG TRACING INVALID FOR
NTD
Explanation: An attempt to enable nonterminal dialogs for
tracing was made with the TBLSZ parameter specified.
System Action: The command completes unsuccessfully.
User Response: Reissue the command, omitting the TBLSZ
keyword parameter.
Message Type: ERROR.

KLVOP443  luname|NTD FLOWOFF DEST(BP|GTF|TBL)
Explanation: Flow trace has been turned off for the
specified LU or nonterminal dialogs (NTD) and for the
specified destination.
System Action: Transfers of control between dialogs for
NTD or luname will no longer be traced.
User Response: None.
Message Type: INFO.

KLVOP444  DIALOG TRACE IS ALREADY ON
Explanation: An attempt was made to activate DTF, but it
was already activated.
System Action: The command completes unsuccessfully.
User Response: None.
Message Type: ERROR.

KLVOP445  UNEXPECTED RETURN CODE nn FROM KLV$TEM
Explanation: KLV$TEM1 returned an unanticipated return
code.
System Action: The command completes unsuccessfully.
User Response: Contact Candle Support Services.
Message Type: ERROR.
KLVOP446 TRACING ALREADY SUSPENDED|RESUMED
Explanation: An attempt was made to suspend or resume dialog trace, but it was already suspended or resumed.
System Action: The command completes unsuccessfully.
User Response: None.
Message Type: ERROR.

KLVOP447 RANGE (start-end) FOR luname|NTD MEMBER member, DEST dest, ALREADY EXISTS
Explanation: An attempt was made to add a specified range that already exists.
System Action: The command completes unsuccessfully.
User Response: None.
Message Type: ERROR.

KLVOP448 LU luname NOT ENABLED FOR INTERACTIVE TRACING
Explanation: An attempt was made to suspend tracing for luname or an NTD that was not enabled for interactive tracing.
System Action: The command completes unsuccessfully.
User Response: None.
Message Type: ERROR.

KLVOP450 mmmmm, A REQUIRED PARAMETER, IS MISSING
Explanation: A command was issued without a required parameter.
System Action: The command completes unsuccessfully.
User Response: Reissue the command with required parameter.
Message Type: ERROR.

KLVOP451 LUNAME= OR NTD=YES ARE REQUIRED
Explanation: A command was issued that requires the LUNAME or NTD keyword parameter.
System Action: The command completes unsuccessfully.
User Response: Reissue the command for a specified LU or NTD.
Message Type: ERROR.

KLVOP452 TBLSZ= IGNORED FOR REENABLE
Explanation: A nonzero trace table size was specified for a disabled, interactive trace user with a retained trace environment. The trace table size cannot be changed when the user is re-enabled.
System Action: The command completes successfully, but the newly-specified trace table size is ignored.
User Response: If a new trace table size is desired, disable the user with the KEEP=NO option to delete the user's trace
message type:  info.

klvop703  dialog  dliname  refreshed  (trace|notrace)

explanation:  dialog  dliname  specified  in  the  refresh command  was  successfully  refreshed.  trace  is  indicated  if the  current  compilation  mode  is  traceable,  or  an  explicit traceable  refresh  overrides  a  nontraceable  compilation mode.

system action:    none
user response:   none.
message type:      reply.

klvdm055  compilation  mode  is  traceable|non-traceable

explanation:    indicates  the  status  of  compilation  mode  set during  dialog  manager  initialization.

system action:  output  is  a  traceable  or  nontraceable  dialog, depending  on  the  compilation  mode.
user response:  none.
message type:      info.

klvdm134  statement  resource  initialization  failed

explanation:    the  dialog  manager  was  unable  to  establish the  traceability  of  statement  ranges  for  a  dialog  user  who  was enabled  for  tracing.

system action:  dialogs  execute,  but  no  tracing  occurs.
user response:  contact  candle  support  services.
message type:      error.
Appendix A.
Generalized Trace Facility Output

Formatted Output

Dialog trace output

When GTF has been started and the command GTF ON is issued, dialog trace output can be directed to GTF through any of the following means:

- the DTRACE basic operator command
- the CUA operator menus
- the DTRCNTL SSPL function
- the KLVDTRC dialog

Instructions for GTRACE and the formatting of GTF output are in the Operator's Guide and the Problem Determination Guide.

GTF trace output

An example of GTF trace output from the dialog trace facility follows.
GTF trace output from an encrypted source

When the corresponding source statement is encrypted, the output for a source statement is replaced with the constant:

*** ENCRYPTED SOURCE STATEMENT ***

The following is an example of GTF trace output from the dialog trace facility when the statements from the source dialog are encrypted.
### Output keywords

The following keywords are used in GTF output.

<table>
<thead>
<tr>
<th>Table 4 (Page 1 of 2). GTF Output Keywords</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Keyword</strong></td>
</tr>
<tr>
<td>ASCB</td>
</tr>
<tr>
<td>JOBN</td>
</tr>
<tr>
<td>SQ</td>
</tr>
<tr>
<td>SG</td>
</tr>
<tr>
<td>LRN</td>
</tr>
<tr>
<td>LU</td>
</tr>
<tr>
<td>NTD</td>
</tr>
</tbody>
</table>
Table 4 (Page 2 of 2). GTF Output Keywords

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>DLG</td>
<td>The name of the dialog that was executing.</td>
</tr>
<tr>
<td>MEM</td>
<td>The name of the member that was executing.</td>
</tr>
<tr>
<td>SNUM</td>
<td>The statement number of the statement that was executing.</td>
</tr>
<tr>
<td>FLOW</td>
<td>Indicates that the last line of data is flow trace data. <strong>Note:</strong> If FLOW is not present, the last line of data is statement trace data.</td>
</tr>
</tbody>
</table>

**SYSPARM**

Whenever SYSPARM is a packed variable, the following constant is displayed in place of the value of SYSPARM:

```
*** PACKED STRUCTURE ***
```

In flow trace entries the SYSPARM= and RC= values are omitted when their representation is a string of length 0. Numeric values are represented as strings of 11 characters, of which the first character is either zero (0) or a minus/hyphen (-).
