

In the payment transaction industry, trust is a key commodity. For QIWI, that means demonstrating total commitment to data security.

Business challenge

When it's your job to facilitate the movement of money between individuals and businesses, you'd better be sure you're keeping those transactions as safe as possible. Although QIWI plc had never experienced a serious security breach, its confidence was flagging because it relied on a disparate set of security solutions, lacked a clear hierarchy among security notifications and had limited visibility into cross-platform threats.

Transformation

QIWI's new security intelligence solution automatically logs security events from thousands of devices and over 1,800 event sources, consolidating them on a single system and then using sophisticated algorithms to identify and analyze true threats. By automatically prioritizing mitigation efforts, the solution helps QIWI's security staff address threats promptly and proactively, selectively blocking threatening users, IP addresses or domains.

Business benefits

Reduces costs

by simplifying security operations and eliminating redundancies

Increases efficiency

by standardizing event management and allowing users to track several events simultaneously

Bolsters reputation

by helping manage compliance with industry regulations and showing a commitment to data security
