Empowering Enterprise IT via a Managed Services Framework

Barry Becker

Vice President, Systems Services

IBM Center of Competency

December 11th, 2015

In the age of cloud, mobility and the Internet of Things, digital transformation is imperative

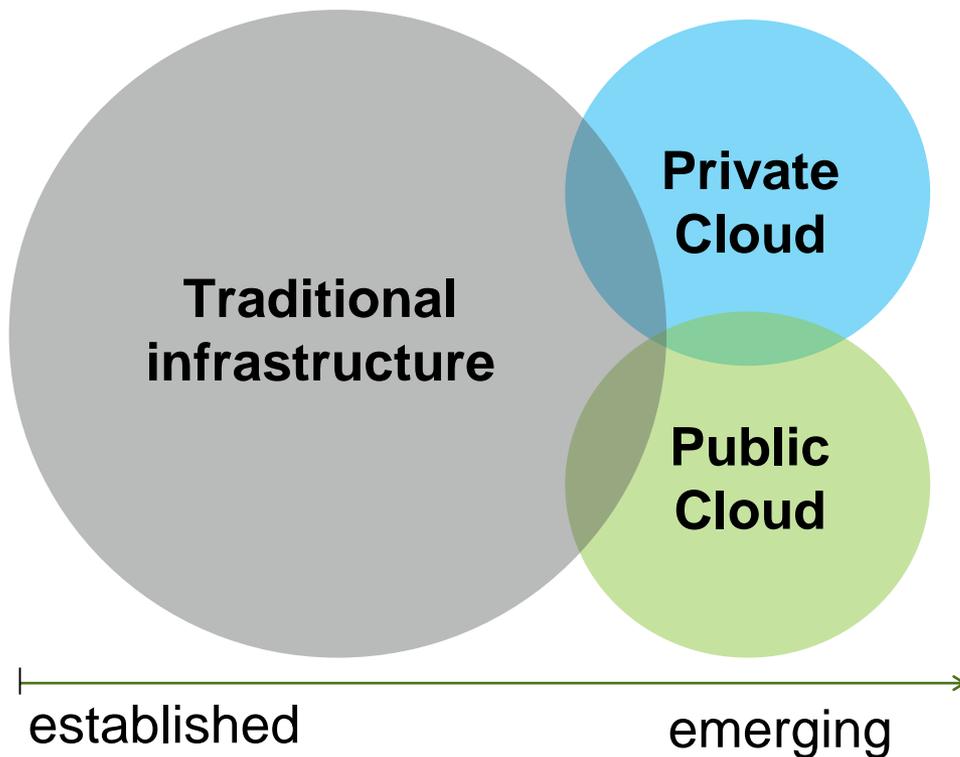

Businesses are developing new ways of working, new business models and new levels of customer engagement

This requires a more agile infrastructure, one that can:

- Adopt emerging technologies at the speed required by the business
- Integrate new technologies with core systems
- Simplify management across increasingly diverse delivery models, vendors, processes and technologies

The hybrid environment is the new norm of enterprise IT

- Accelerate innovation
- Speed adoption of new technology
- Maximize return on existing investment
- Approach technology holistically

Enterprise IT

Most organizations are unprepared to manage a hybrid infrastructure

65%

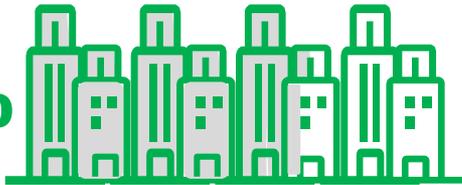

of enterprise IT organizations will commit to hybrid cloud technologies before 2016¹

... yet only **10%**

of organizations say their systems are fully prepared to address cloud, analytics, mobile and social trends²

70%

of IT of enterprises begin by handling their own hybrid sourcing and management³

... and end up facing **2x**

the sourcing and procurement costs due to redundancies, inefficiencies and incompatibility with current practices and policies³

¹IDC FutureScope: Worldwide Cloud 2015 Predictions, December, 2014.; ²IBM, "The IT infrastructure conversation: New content, new participants, new tone," July 2014.;

³Saugatuck Technology, "Optimized Sourcing in Hybrid IT Environments," April 2014;

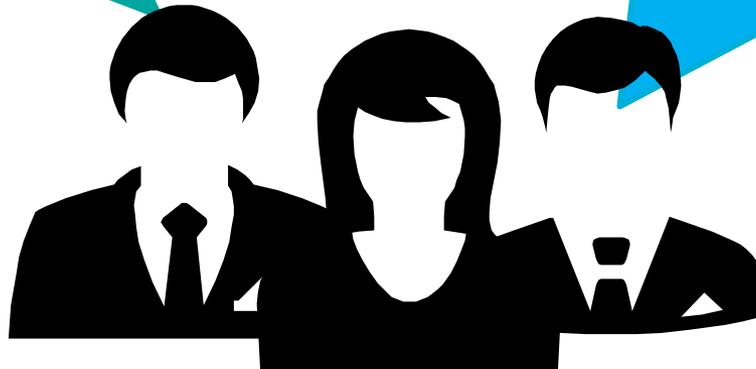

Supporting this increasingly complex enterprise IT can be daunting for today's CIOs

Without specialized talent and capabilities, we can't keep up with rapid technology change

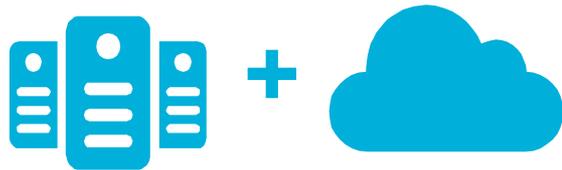

The infrastructure has grown more heterogeneous and complex, and it lacks the agility, speed and visibility required by the business

Managing today's explosion of data and transaction volume demands a more integrated and scalable approach, using advanced automation and analytics

According to IDC, enterprises want to procure managed services as a single hybrid engagement

Objectives

Procure managed services as a single hybrid engagement, including both traditional and cloud services

Enable business agility and adaptation

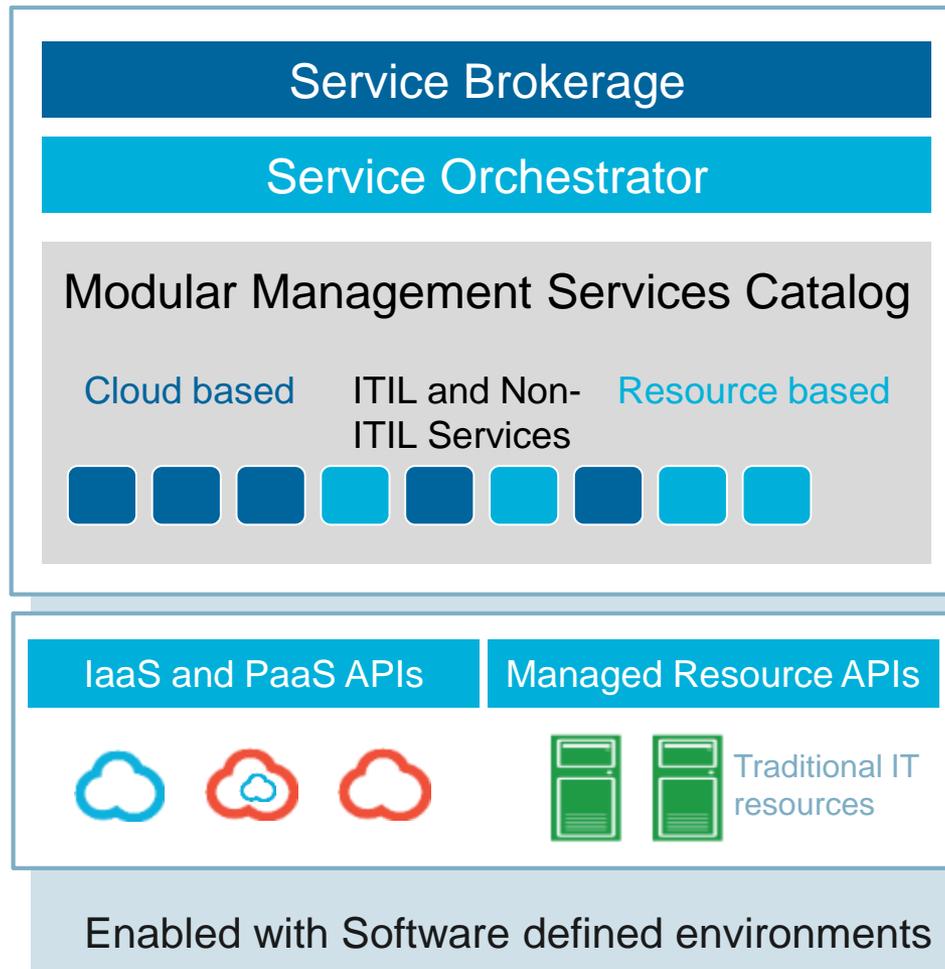

Optimize productivity and performance

Ensure integrated, end-to-end hybrid IT service delivery and management

Our enterprise IT model is designed to intelligently integrate across heterogeneous environments

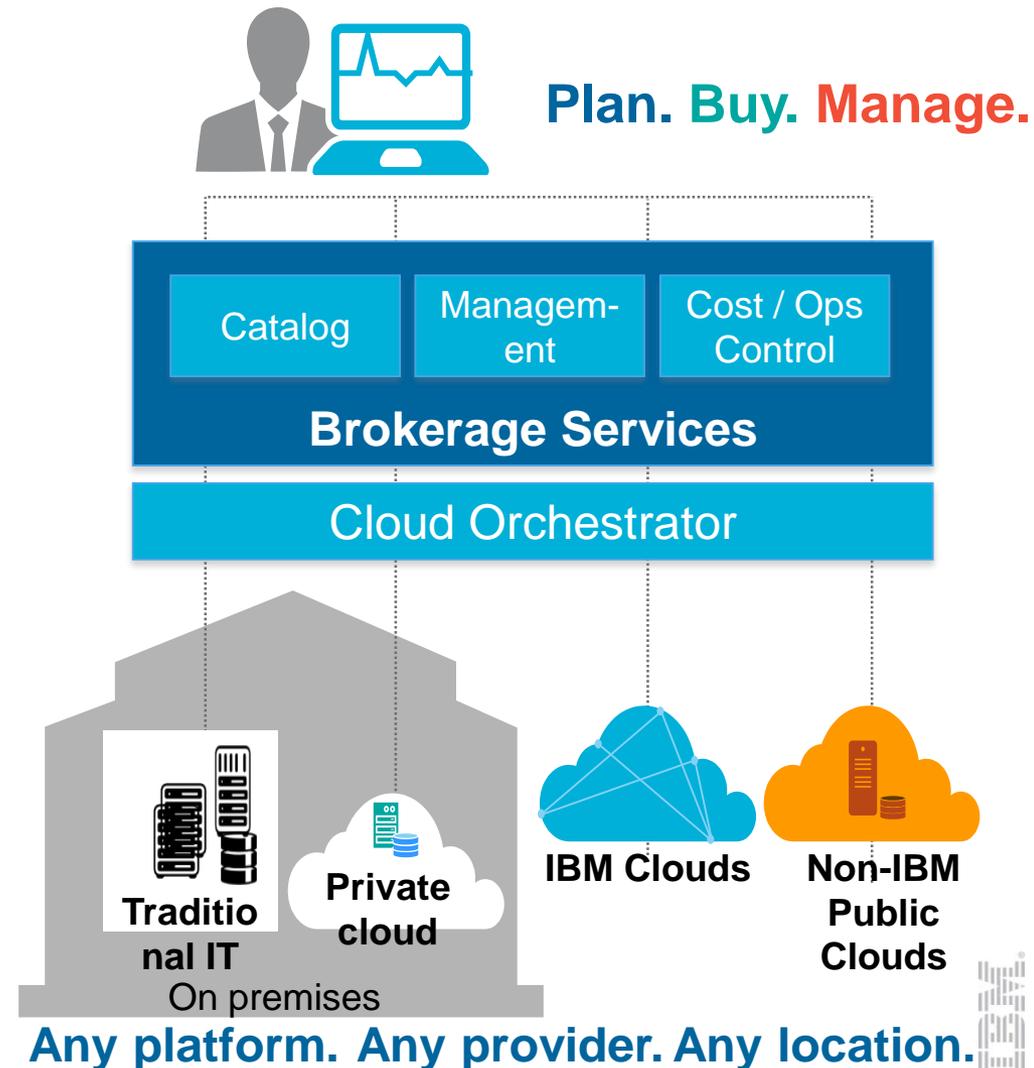

Enterprise IT Framework

Brokerage services simplify, integrate, and optimize the consumption across cloud-based services

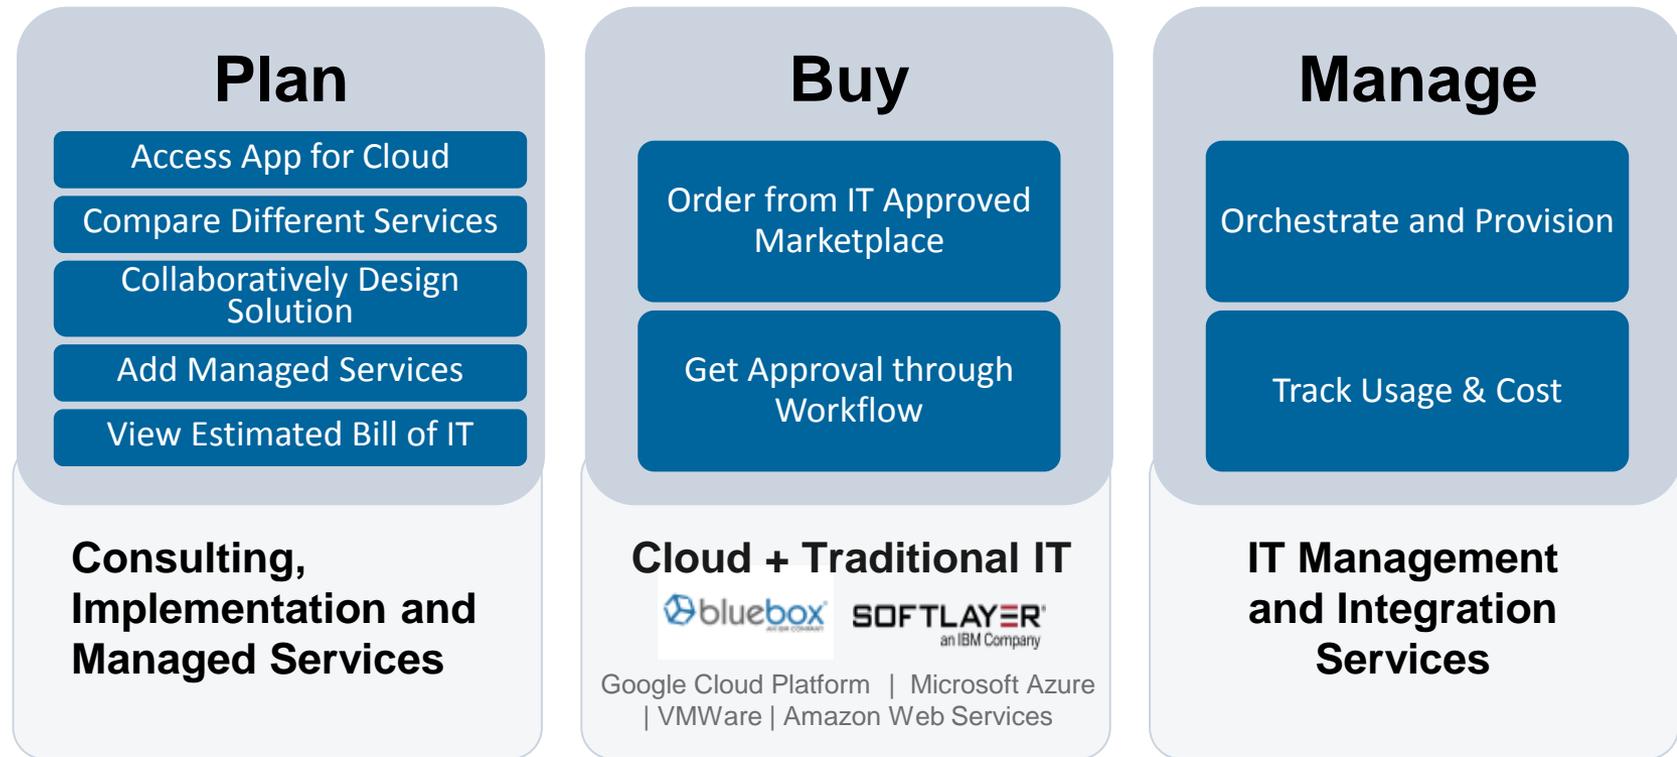

Benefits

- **Reduce shadow IT**
- **Rapid financial decision making** with visibility to all cloud service costs on a single dashboard
- **Negotiate better T's&C's** with Cloud providers
- **Enforce organizational policy compliance** for service selection
- **Integrated service management** across traditional and cloud IT services

Plan, buy, and manage – or “broker,” – software and computing power from multiple suppliers

End-to-End Brokerage Service

Any platform. Any provider. Any location.

Gravitant
an IBM Company

- Tools for early planning and provider selection
- Comprehensive IT Service Catalog

- Marketplace of IT approved solutions
- Transparency into cost, spend and usage

IBM Integrated Managed Infrastructure services enable a fully integrated and managed IT infrastructure

**Modular
flexibility**

**Application
visibility**

**Broad platform
support**

**Global talent
and reach**

**Rapid
innovation
platform**

**Advanced
automation**

**Automated
orchestration**
