

# AI regulatory compliance

Manage AI to meet upcoming safety and transparency regulations and policies worldwide—“a nutrition label” for AI

## Improve adherence to internal AI policies, industry standards laws, and regulations

As the AI landscape grows, so does the need for proper optimization and governance. Without these capabilities, organizations increase their risk for regulatory noncompliance and unforced manual errors.

**Noncompliance** leads to costly audits, fines, negative press and, in extreme cases, criminal penalties. Highly regulated industries, such as finance, government and healthcare, are especially vulnerable. Global organizations are challenged to meet multiple local laws and country-specific regulations.

**Manual tracking and documentation** for reporting can be time-consuming and expensive. Manual spreadsheets used to translate and record complicated regulatory documentation can lead to misinterpretations and regulatory gaps.

**Lack of model transparency** and documentation hinders the ability to explain AI outcomes and supply information needed for reporting, inquiries and audits.

Organizations today need a way to manage the risks and regulations of AI adoption without compromising innovation.

The IBM® watsonx.governance™ toolkit is a governance platform for both generative AI and machine learning (ML) models.

The **watsonx.governance toolkit** allows organizations to automate and align AI compliance processes to their specific business needs. For example, users can:

- Automate the translation of AI regulations into enforceable standards and policies.
- Provide a single repository of obligation management to classify complex regulations.
- Simplify compliance with industry and regulatory requirements by enabling organizations to govern their environmental, social and governance (ESG) programs and maintain sustainability.
- Track provenance and document model performance against key performance indicators (KPIs) determined by the business.
- Provide visibility to key stakeholders through dynamic, user-based dashboards, charts and dimensional reporting.
- Use factsheets to document model facts in support of inquiries or audits.

Discover the AI governance solution built for business with everything needed to identify, manage, monitor and report on risk and regulatory compliance.
