Is your MDM/EMM measuring up?

It's time you learned the truth:

Mobile device management (MDM), enterprise mobility management (EMM) and unified endpoint management (UEM) solutions are valuable tools for corporate IT teams. They can help you understand what's happening in your environment—what happened, what can happen, and what can be done—in the context of your environment.

Unfortunately, most of these solutions are too generic to measure up against the needs of the modern enterprise. Many vendors today tout their support for the latest mobile operating systems (OS). Great! But what do you get when the support for the OS is limited?

Some are costly. Most vendors charge for support for all platforms. IBM MaaS360 provides support for all platforms, including laptops, desktops, and mobile, wearable and Internet-of-Things (IoT) devices.

Sure, your MDM/EMM vendor offers technical support—but it may come with a hefty price tag.

IBM MaaS360 includes 24x7 support, staffed by subject matter experts (SMEs), to all customers at no additional charge. Customer support is available via email, phone, web and chat. At no additional cost.

IBM MaaS360 provides built-in mobile threat management, mobile expense management, and cognitive/AI approach to UEM. No other solution offers cognitive insights, contextual analytics and deep technical capabilities to help you protect your network and data.

Your MDM/EMM vendor should help you protect your network. You shouldn't have to pay for it.
