Safety notices

Safety notices may be printed throughout this guide:

- **DANGER** notices call attention to a situation that is potentially lethal or extremely hazardous to people.
- **CAUTION** notices call attention to a situation that is potentially hazardous to people because of some existing condition.
- **Attention** notices call attention to the possibility of damage to a program, device, system, or data.

World Trade safety information

Several countries require the safety information contained in product publications to be presented in their national languages. If this requirement applies to your country, a safety information booklet is included in the publications package shipped with the product. The booklet contains the safety information in your national language with references to the U.S. English source. Before using a U.S. English publication to install, operate, or service this product, you must first become familiar with the related safety information in the booklet. You should also refer to the booklet any time you do not clearly understand any safety information in the U.S. English publications.

German safety information

Das Produkt ist nicht für den Einsatz an Bildschirmarbeitsplätzen im Sinne § 2 der Bildschirmarbeitsverordnung geeignet.

Laser safety information

IBM® servers can use I/O cards or features that are fiber-optic based and that utilize lasers or LEDs.

Laser compliance

All lasers are certified in the U.S. to conform to the requirements of DHHS 21 CFR Subchapter J for class 1 laser products. Outside the U.S., they are certified to be in compliance with IEC 60825 as a class 1 laser product. Consult the label on each part for laser certification numbers and approval information.

**CAUTION:**
This product might contain one or more of the following devices: CD-ROM drive, DVD-ROM drive, DVD-RAM drive, or laser module, which are Class 1 laser products. Note the following information:

- Do not remove the covers. Removing the covers of the laser product could result in exposure to hazardous laser radiation. There are no serviceable parts inside the device.
- Use of the controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

(C026)

**CAUTION:**
Data processing environments can contain equipment transmitting on system links with laser modules that operate at greater than Class 1 power levels. For this reason, never look into the end of an optical fiber cable or open receptacle. (C027)

**CAUTION:**
This product contains a Class 1M laser. Do not view directly with optical instruments. (C028)
CAUTION:
Some laser products contain an embedded Class 3A or Class 3B laser diode. Note the following information: laser radiation when open. Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam. (C030)

Power and cabling information for NEBS (Network Equipment-Building System) GR-1089-CORE

The following comments apply to the IBM servers that have been designated as conforming to NEBS (Network Equipment-Building System) GR-1089-CORE:

The equipment is suitable for installation in the following:
• Network telecommunications facilities
• Locations where the NEC (National Electrical Code) applies

The intrabuilding ports of this equipment are suitable for connection to intrabuilding or unexposed wiring or cabling only. The intrabuilding ports of this equipment must not be metallically connected to the interfaces that connect to the OSP (outside plant) or its wiring. These interfaces are designed for use as intrabuilding interfaces only (Type 2 or Type 4 ports as described in GR-1089-CORE) and require isolation from the exposed OSP cabling. The addition of primary protectors is not sufficient protection to connect these interfaces metallically to OSP wiring.

Note: All Ethernet cables must be shielded and grounded at both ends.

The ac-powered system does not require the use of an external surge protection device (SPD).

The dc-powered system employs an isolated DC return (DC-I) design. The DC battery return terminal shall not be connected to the chassis or frame ground.
Chapter 1. What’s new in Managing devices

See what is new and what has changed in Managing devices since the last edition of this topic.

October 2009

A new section has been added for the "USB Removable Disk Drive (FC 1103, 1104, 1106, 1107)" on page 73.

November 2008

There have been no significant changes.
Chapter 2. Managing tape drives

Learn about using and managing removable media devices. Find specifications and installation notes for specific drives.

Tape drives

Learn general information about tape drives.

Select the appropriate information from this list:
- Tape drive overview
- Tape drive environment and use
- Tape handling and storage
- Environmental issues
- Tape drive cleaning
- SCSI hardware issues
- Microcode updates

Tape drive overview

Your tape drive must be installed in the cleanest possible environment. Additionally, tape drives require high quality, data grade tapes and cleaning on a regular basis. Media must also be stored and handled properly. Improper use, storage or handling of tape drives or media may void your warranty or service agreement. If a tape drive stops functioning due to a component failure during the tape drive warranty or maintenance time, the tape drive supplier will replace the tape drive unit. The tape drive supplier will replace any defective tape drive under the terms and conditions of the warranty or service agreement.

The tape drive is a streaming device used primarily for:
- Saving and restoring system data files
- Archiving important records
- Distributing operating system software upgrades

Note: The following information describes hardware features and functions. While the hardware supports them, the availability of these features and functions depends upon support from the operating system. For information about support for features and functions, see the documentation for your operating system.

Tape drive environment and use

Tape drives require specific maintenance and environmental conditions to operate well over time. Using high-quality, data-grade media, handling and storing this media correctly, operating the tape drive in a clean environment, and keeping the tape drive correctly cleaned can help you to avoid problems with your tape drive.

If a tape drive stops functioning due to a component failure during the tape drive warranty or maintenance time, the service provider will replace the tape drive unit. The service provider will replace any defective tape drive under the terms and conditions of its warranty or service agreement. It is the service provider’s objective to work with you to identify the cause of any tape-drive problem and provide a solution.
Tape handling and storage

Most tape is supplied in a sealed cartridge so that the tape will remain clean. Opening the cartridge allows dirt and airborne particles to enter and then become a source of contamination. The cartridge should only be opened by the tape drive and not an operator. The tape also is held under proper tension inside the cartridge. If the cartridge is dropped, this tension will be relaxed.

Attention: Inserting a dropped cartridge into a tape drive can cause incorrect loading and result in a jam. This action will ruin the tape and can cause physical damage if the cartridge is not removed correctly.

When the tapes are stored, they must be replaced in their protective containers and stored on their end. The storage area must be clean, dry, at normal room temperature, and away from any magnetic fields. Improper use, storage, or handling of tape drives or media might void your warranty or service agreement.

Environmental issues

Tape drives are designed to operate in a clean environment. Problems can be caused by dirt, dust, fibers, and airborne particles. Airborne particles are the most difficult to address. When a tape is installed into the tape drive, the clearance between the heads and the tape is measured in microns. Particles can damage the tape or the head if they come in contact with either. Customers are responsible to provide a clean operating environment for the tape drive and system.

Tape drive cleaning

No matter how clean the environment, debris can build up on the heads of any tape drive. Every time tape motion occurs, some of the media surface comes off on the heads. Over time, this surface builds up and causes errors in reading and writing. Customers are responsible to clean the tape drive in accordance with the cleaning information that was provided with the tape drive.

Cleaning cartridges can be used a limited number of times. After a cleaning cartridge has been used to its maximum number of times, the cartridge is considered expired. When cartridges expire, they must be replaced. Never reuse an expired cleaning cartridge. Doing so allows previously removed dirt to be reintroduced to the tape drive. Place a mark on the cleaning cartridge after each use, to best determine when your cleaning cartridge has expired.

SCSI hardware issues

Note: If you are installing the auto-docking version of this device on your system, this section does not apply to your system. For information about the auto-docking feature, see your system documentation.

SCSI bus cables and terminators can affect tape drive performance. Use cables and terminators that are designed specifically to keep the SCSI bus as free of noise as possible. Generic cables or terminators can adversely affect the SCSI bus performance. If your service provider’s analysis indicates a problem with inferior cables, it might be necessary for the customer to replace them.

Microcode updates

To make certain that the tape drives work their best, your system supplier might release changed microcode for the tape drives. When a microcode change is developed, your system supplier makes the change available to you through its service organization or by electronic delivery. You might be responsible for installing new microcode as it becomes available. However, microcode can be installed by your service provider or your system administrator. For more information, contact your authorized service provider.
Tape drive media

Learn about using the different types of tape drive media.

Attention: Your system supplier might support only the media that it sells. If the supplier’s analysis indicates that the problem is caused by using inferior media, it is the customer’s responsibility to replace the inferior media.

Select the appropriate information from this list:
- Types of cartridges
- Recommendations for data cartridge usage
- Prolonging head life
- Storage and shipping environments
- Tape cartridge storage
- Operating in harsh environments
- Ordering tape cartridges

Types of cartridges

Tape devices use the following media cartridges.

Data cartridge
Use the data cartridge to save or restore programs or data.

Test cartridge
Use the specially labeled test cartridge to run the AIX® system diagnostics (for information about running diagnostics, refer to your AIX documentation). Do not use the test cartridge to save or restore customer programs or data.

Cleaning cartridge
Use the specially labeled cleaning cartridge to clean the device.

Attention: Use of other than the IBM specified cleaning cartridge can damage your device and might void your warranty.

To order additional cartridges, refer to Ordering tape cartridges.

Recommendations for data cartridge usage

The following list describes recommended guidelines that will help to protect your data and prolong the life of your tape cartridges and the device:
- Use only the tape cartridge specified for your type of tape device.
- Remove the tape cartridge from the drive when the drive is not in use.
- Back up and then discard any tape cartridge that repeatedly produces error messages (the error information is in the System Error Log).
- On the data cartridge, do not open the door that covers the tape. The door protects the tape from dirt, dust, and damage.
- Do not touch the tape. Any substance transferred to the tape by touching could cause loss of data.
- To avoid problems with loading and unloading, use only one label on a cartridge. Multiple or poorly placed labels can clog the drive load mechanism.
- Do not use poor-quality tape cartridges. They can cause excessive read or write errors, and they might damage the tape drive.
- Discard any tape cartridges that are dropped, because the impact might damage the tape’s internal mechanism.
• Make sure the environment is kept clean and constant. Do not operate in a dusty environment and always maintain a constant environment. A consistent storage and operating environment reduces media exposure to climatic stress.

• Use only the recommended cleaning cartridge to clean the tape drive. Use of other than recommended cleaning cartridges can damage your drive and might void the warranty.

• Printers and copiers can produce paper dust and toner dust. Locate the tape unit away from these items. High traffic areas near hallways and doors can also produce excess dust and dirt.

• Record all important information on the tape label. Information, such as the model and number of the system or tape drive, the date, the density, any error statistics, and include a log number. Also note the operating environment and compression mode.

**Prolonging head life**

New technology found in the tape device is read and write compatible with newer tape cartridges. Due to media characteristics, extended use of older tape cartridges might increase head wear on the drive. An indication of this head wear is an increase in soft (recoverable) errors. Using newer tape cartridges may have enhanced characteristics that can reduce drive head wear and maximize the overall advantages of the tape device.

**Storage and shipping environments**

Before using a tape cartridge, let it acclimatize to the operating environment by placing the cartridge in the operating environment for as long as it has been away from the environment or for 24 hours, whichever is less. Acclimatization is necessary for any data cartridge exposed to an environmental change in humidity or to temperature changes of 11°C (20°F) or more. To determine the appropriate operating environment, see Table 1. Tape drive environment and use.

Retrieval of archived data can be performed on a tape unit that is clean and fully operational. Try to make the recovery environment the same as the operating environment. Allow tapes at least 24 hours to acclimatize to the environment of the tape unit.

The recommended environment for storage and shipment of cartridges is shown in Table 1.

*Table 1. Recommended environment for data cartridges*

<table>
<thead>
<tr>
<th>Environmental Factor</th>
<th>Storage</th>
<th>Shipping</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>5°C to 32°C (41°F to 90°F)</td>
<td>-40 to 52°C (-40 to 125°F)</td>
</tr>
<tr>
<td>Relative Humidity</td>
<td>20 to 60%</td>
<td>5 to 80%</td>
</tr>
<tr>
<td>Maximum Wet Bulb</td>
<td>26°C (79°F)</td>
<td>26°C (79°F)</td>
</tr>
</tbody>
</table>

**Tape cartridge storage**

Tape drives record data using densities similar to hard disk drives. Because most computer systems are not located in a dust-free, climate-controlled environment, you must exercise special care when dealing with tape cartridges and tape drives. They must be treated as a valuable asset used to protect your business data.

Use the following guidelines for storing your tape cartridges:
• Keep temperature and humidity constant at the levels listed in Table 1.
• Always store tape cartridges in their protective cases. The storage case helps prevent damage from dust and physical misuse. When the tape cartridges are not in use or being stored, keep them in their storage cases and stand on edge in a designated storage location. Do not stack cartridges on the flat side or stack other items on top of the tape cartridges. Handle your tape cartridges with care to reduce archival problems.
• Keep protective cases for tape cartridges closed except when inserting or removing a cartridge. Contamination can build up and be transferred to the tape cartridge if the protective case is left open.
• Exercise stored tapes at least once every 12 months. Run the tape from Beginning of Data (BOD) to End of Data (EOD) and back to BOD at normal operating speeds. Exercise tapes stored in a warmer environment more frequently.
• Sunlight can damage the tape and the cartridge shell. Store tape cartridges out of the direct sunlight.

**Attention:** Operation outside of the recommended environment can result in possible loss of data or failure of the drive.

**Operating in harsh environments**

The device is suited to streaming operations, as opposed to multiple stop-and-start, random-search tape operations. When the tape is used for frequent stop-and-start operations, it is beneficial to still have as much streaming movement as possible. This can be accomplished by ensuring that any save or restore operation is the only active operation being performed.

Do not use any tape for archival purposes if it has been used outside of the ranges specified in Table 1 on page 6 for an extended period of time. The magnetic and physical strength of the tape will have deteriorated as a result of its exposure to the environment. Do not store important data on such a tape; transfer the data to a newer tape for reliable archiving.

**Ordering tape cartridges**

All tape cartridges are not alike. The tape composition and length, and the construction of the cartridge itself can all affect the quality and capacity of the recording and the performance of your tape drive. A poor quality tape cartridge might appear to work adequately in your system, yet it can leave contamination in the tape path or impede the speed of the recording.

The length and composition of the tape, and the size, shape, and construction of the cartridge shell must all be considered when selecting the tape cartridge to be used with your system. IBM supports using only data and cleaning cartridges supplied by IBM. Use only data-grade tape media for backup and data processing.

To order cartridges in the United States and Canada, call 1-888-IBM-MEDIA or, on the internet, see [www.storage.ibm.com/media/](http://www.storage.ibm.com/media/).

To order cartridges in other locations, contact your local provider of IBM storage products.

The following tables list all available data cartridges for a specific type of cartridge:

Preparing the tape drive for installation

Find what you need to know before you install a SCSI tape drive.

Select the appropriate information from this list:

- Handling recommendations
- "Planning your serial-attached SCSI (SAS) device layout"
- Planning your SCSI device layout
- Determining your SCSI address
- Setting the SCSI address
- Configuring the tape drive
- Updating microcode levels

Handling recommendations

**Attention:** Be sure to read these instructions before you remove the device from its anti-static bag or any time you handle it.

For optimum performance, always follow these recommendations:

- Handle the drive carefully and by its external metal chassis. Keep your hands away from the printed circuit boards, components, and printed circuit (flex) cables.
- If possible, work on a cushioned surface, and do not drop the device onto the work surface.
- If you move the device to an environment that is colder or warmer than its previous environment, keep the drive in its package and allow the package to reach the current room temperature. This action prevents potential data loss or damage to the device. Allow one hour of acclimatization for each 10 degrees C (18 degrees F) difference between the ship or storage temperature and the room temperature.

**Note:** If you are installing the auto-docking version of this device on your system, the remainder of this information does not apply to your system. For information about the auto-docking feature, see your system documentation.

Planning your serial-attached SCSI (SAS) device layout

SAS devices do not require you to set a SCSI address before connecting to a SAS bus.

Planning your SCSI device layout

SCSI devices are attached in a daisy-chain configuration to a SCSI adapter inside your system unit. SCSI devices can be installed inside your system unit or connected externally. When you connect more than one SCSI device, it is important that you plan the layout of your SCSI chain. Each device in the chain has a unique SCSI address (also called a **SCSI ID**). A terminator is required at each end of the SCSI chain.

Determining your SCSI address

Before you install the drive, you must set the SCSI address on the drive. First, determine which SCSI addresses are available to use. Then choose an address and install jumpers on the drive to set the selected address. The drive supports addresses 6 through 0 and 8 through 15. You can use any available SCSI address.
address as long as no two SCSI devices on the same chain use the same address. Usually, no device can use address 7, which is reserved for the SCSI adapter.

Note: Drives are usually shipped with an SCSI address of 0.

SCSI addresses are in sequential order from highest to lowest priority. All SCSI devices can use SCSI addresses 6 through 0. If your system unit and adapter support the wide (16-data bit, 68-conductor cable) SCSI interface, you might see addresses in the range of 0 through 15.

**Setting the SCSI address**

The drive is provided with jumpers packaged in a small plastic bag. After you choose an available SCSI address, you can install the jumpers on the drive to match the selected address.

**Attention:** Each tape drive has different jumper settings and pin locations.

To set the SCSI address complete the following steps:
1. Remove the drive from its anti-static bag.
2. Find the pin positions located on the jumper block on the back of the drive. These positions are always used to set the SCSI address on the drive.
3. Refer to the drawing labeled **SCSI ID Setting** on the tape drive to determine in which pin positions you insert the jumpers to correctly set the SCSI address.
   a. To set a position to **On**, insert a jumper onto both the top and bottom pins.
   b. To set a position to **Off**, either insert a jumper onto the top pin only or remove the jumper from the jumper block.

**Configuring the tape drive**

To configure the drive after installation, boot your system unit. Device drivers are provided in the operating systems that support the drive. Your operating system recognizes the drive and automatically updates your system unit configuration.

**Updating microcode levels**

Media devices contain microcode that you can update. Contact your authorized service provider for instructions on how to obtain and install the latest microcode levels for your device.

---

**800/1600 GB Ultrium 4 SAS tape drive (FC 5746)**

Learn about the features of this media device.
The Ultrium 4 serial attached SCSI (SAS) tape drive is a half-high tape drive designed for Open Systems backup and restore applications. The tape drive is an LTO Ultrium 4 standard interchange device. The drive will read tapes written by other Ultrium 4 drives, and will write to tapes readable by other Ultrium 4 drives. For an illustration of the drive, see Figure 1 on page 13.

**Characteristics:**
- FRU part number is 45E1127. For media part numbers, see “Tape cartridges (FC 5746)” on page 15.
- Custom card identification number (CCIN) number is 63A0
- Data transfer rate: 120 MB per second native mode, 240 MB per second at 2:1 compression
- Bootable device, depending on the host system configuration
- Operation: Streaming
- Form Factor: 5.25-inch half high
- Attributes required: One 1.6-inch (41 mm) half-high media bay and one integrated, internal SAS controller

**Tools**
The following tools and documentation are needed to complete the installation:
- A flat-blade screwdriver (if this device is not an auto-docking feature on your system)
- Your system unit documentation, including any service documentation
- Your operating system documentation

Contact the place of purchase if an item is missing or damaged.

**Note:** If you are installing the auto-docking version of this device on your system, see your system documentation for information about the auto-docking feature.

**Media**
The drive will read and write on Ultrium 4 and Ultrium 3 cartridges, and read Ultrium 2 cartridges. The drive will not write on Ultrium 2 cartridges. or read or write on Ultrium 1 cartridges.

Each Ultrium 4 tape cartridge can store up to 800 GB of uncompressed data, or up to 1600 GB of compressed data.

**Note:** The actual capacity varies depending on the application, the type of data, and the tape cartridge. When data compression is activated, 800 GB is typical and 1600 GB is possible. The default setting of data compression is controlled by the host system. The user and the application software can control the activation or deactivation of the data compression setting. The drive can optimally achieve a 2:1 compression ratio.

**Related information**
Your package contains the following items:
- The tape drive
- Media kit containing:
  - One cleaning cartridge
  - One test tape
- Specific hardware for attaching the drive to your specific system, as detailed on the parts listing provided with your drive.

---

**Eject button functions on the tape drive (FC 5746)**

You might need to eject a tape, reset the drive, or place the drive in maintenance mode. Use the information in this topic to perform these tasks.

The drive has an eject button that enables you to perform the functions shown in the following table. The eject button is illustrated in Figure 1 on page 13.
Table 7. Eject button functions on the tape drive

<table>
<thead>
<tr>
<th>Function</th>
<th>How to start the function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reset the drive</td>
<td>Press and hold the eject button on the drive for 20 seconds. The drive saves a dump of the current drive state, and then reboots to allow communication. Do not cycle power because this will erase the contents of the dump.</td>
</tr>
<tr>
<td>Rewind the tape into the cartridge and eject the cartridge from the tape drive</td>
<td>Press the eject button once. The status light flashes green while the tape drive is rewinding and unloading.</td>
</tr>
<tr>
<td>Place the tape drive in maintenance mode</td>
<td>Ensure that the tape drive is unloaded. Then, press the eject button three times within one second. You are in maintenance mode when the light becomes solid amber and 0 appears in the single-character display.</td>
</tr>
<tr>
<td>Scroll through the maintenance functions</td>
<td>While in maintenance mode, push the eject button once per second to increment the display characters by one. When you reach the character of the diagnostic or maintenance function that you want, press and hold the eject button for 3 seconds. For a list of Maintenance functions, see Table 10 on page 18.</td>
</tr>
<tr>
<td>Exit maintenance mode</td>
<td>Press the eject button once per second until 0 displays. Then press and hold the eject button for 3 seconds. Maintenance mode is exited when the status light becomes solid green and the single-character display becomes blank.</td>
</tr>
<tr>
<td>Force a drive dump (part of the maintenance mode)</td>
<td><strong>Attention:</strong> If the tape drive detects a permanent error and displays an error code, it automatically forces a drive dump. If you force a drive dump, the existing dump will be overwritten and data will be lost. After you force a drive dump, do not turn off the power to the tape drive or you might lose the dump data. If the tape drive is in maintenance mode (status light is solid amber), select function code 4. For a list of Maintenance functions, see Table 10 on page 18. If the tape drive is in operating mode (status light is solid or flashing green), press and hold the eject button for 10 seconds. If captured dump data exists, the tape drive places the data into a dump area.</td>
</tr>
</tbody>
</table>

Status lights (FC 5746)
You might need to read the status lights on your tape drive to determine the operating status of the drive. Use the information in this topic to perform this task.

The following illustration shows a front view of the tape drive:
The combinations of the lights and their definitions are shown in the following table.

### Table 8. Definition of Status Light Combinations

1 When used in this table, *flashing* refers to a 1 Hz flash rate (1 flash per second), and *flashing rapidly* refers to a 4 Hz flash rate (4 flashes per second).

2 Immediately following a power-on self-test sequence or drive reset, both LEDs, all segments of the single-character display, and the SCD dot will be on solid for approximately 3 seconds.

3 When a drive needs cleaning, the Fault LED will be on solid and a C will show on the single character display. In most cases the drive will continue to function, but it should be cleaned as soon as possible. Do not ignore the indicator by cycling the power to turn the LED off.

4 Error code on single-character display is cleared when cartridge is removed from drive.

5 The Fault LED will be on solid to indicate an over-temperature condition. If a tape is present it will be ejected. This LED will remain on until the drive temperature drops below a lower secondary-temperature limit and one of the following two conditions is also met:
   - A data or cleaning cartridge is inserted.
   - The drive is powered off and on.

6 A drive dump will be stored before the drive is powered off. The SCD light serves as a dump indicator. When this light is lit, a dump file is stored in the drive and can be retrieved.

7 Failure cannot be isolated to either a faulty drive or faulty media.

8 Error condition will be cleared when the drive is powered off. The drive is not disabled.

9 The firmware update failed and the drive is not functional. The drive boot code is in control and you should retry the firmware download.

10 When the drive is in maintenance mode, the Fault LED will be on solid and the single character display will indicate the current maintenance mode state.

---

**Tape cartridges (FC 5746)**

</tr>
</tbody>
</table>

**Attention:** Do not attempt to bulk erase an LTO data cartridge for reuse. Bulk eraser devices cannot properly erase an LTO data cartridge and cause permanent damage to the cartridge.
Setting the write-protect switch (FC 5746)

You might need to set the write-protect switch on your tape drive. Use the information in this topic to perform this task.

Attention: Do not attempt to change the write-protect settings after the tape cartridge is loaded in the drive because this might cause unpredictable results and might damage the tape or the drive.

The position of the write-protect switch on the tape cartridge determines when you can write to the tape. Before loading cartridges into magazines, set the write-protect switch of each cartridge to enable or disable data recording. When the switch is set to the left, data can be written to the tape. When the switch is set to the right, data cannot be written to the tape.

Cleaning the tape drive (FC 5746)

You might need to clean your tape drive. Use the procedure in this topic to perform this task.

Clean the device whenever the Fault status light comes on and a C is displayed in the single-character display (SCD), or when a system I/O error occurs that is related to the device.

Attention: Use only the recommended cleaning cartridge to clean the tape drive. Use of other than recommended cleaning cartridges can damage your drive and might void the warranty.

The tape drive will set the cleaning indicator when one of the following conditions occurs:
- The tape drive exceeds internal preset error thresholds in the drive.
- The tape drive exceeds the maximum recommended time between cleaning.
  This is an internal drive calculation where the drive maintains information on the amount of data written and read and when this value reaches a total of approximately 20 full tape writes or reads the drive will request cleaning. The cleaning indicator will be turned on when the tape is ejected.
- There is a write or read failure of the tape drive to the data cartridge.

Note: When a cleaning cartridge that has been used the maximum number of times is inserted in the drive, the drive will turn on the fault indicator. The SCD displays 6 or 7 to indicate that the cleaning process is not done and the cleaning cartridge is no longer usable. If the fault indicator was on and a C
was in the SCD prior to the cleaning process, the indicators will stay on after the depleted cleaning cartridge is removed. If these indicators were off prior to inserting the depleted cleaning cartridge, they will turn off once the depleted cleaning cartridge is removed from the drive.

To clean the tape drive, complete the following steps:
1. Make sure that the power is on for the tape drive.
2. If a tape cartridge is in the tape drive, eject and remove the cartridge.
3. Grasp the cleaning cartridge by the outer edges, with the insertion arrow on top and the write-protect switch facing you.
4. Slide the cartridge into the opening on the front of the drive until the loading mechanism pulls the cartridge into the drive.

After the cleaning cartridge has been inserted, the remainder of the cleaning process is automatic. The tape drive does the following actions:
- Loads the cleaning cartridge into the tape drive.
- Cleans the drive by moving the cleaning tape forward for approximately 30 seconds.
- Unloads the cleaning cartridge when the cleaning operation is complete.
- Indicates a successful cleaning operation by turning off the C in the SCD, if the C in the SCD was on prior to the cleaning process.

Note: If the cleaning operation is completed but the C in the SCD remains on, the cleaning cartridge might not be usable. Repeat the cleaning procedure with a new cleaning cartridge. If the C in the SCD still remains on, contact your authorized service provider.

To determine how many times a cleaning cartridge can be used, check the information printed on the cartridge. If you attempt to use a depleted cleaning cartridge the fault indicator will be turned on and the SCD displays 6 or 7 to indicate that the cleaning process was not done and the cleaning cartridge is no longer usable. If the fault indicator was on and a C was in the SCD prior to the cleaning process, the indicators will stay on after the depleted cleaning cartridge is removed. If these indicators were off prior to inserting the depleted cleaning cartridge, they will turn off once the depleted cleaning cartridge is removed from the drive.

If a system error occurs, clean the drive and retry the operation. If the operation fails, replace the data cartridge, clean the drive again, and then retry the operation.

**Maintenance mode (FC 5746)**
Learn about using maintenance mode functions on the 5746 tape drive.

**Performing operations using the front panel**

Perform maintenance operations by pushing the eject button while observing the status LED and the single-character display.

**Entering maintenance mode**

To enter maintenance mode (if the drive is not already in maintenance mode and no cartridge is loaded), press and hold the eject button for 6 seconds. While the drive is in maintenance mode, the status LED is shows solid amber and the operator can perform maintenance or diagnostic functions. In maintenance mode, the tape drive is offline to SCSI commands.

**Note:** If a tape is loaded, the eject button is interpreted as an eject request. The drive cannot be put into maintenance mode while a tape is loaded.
Scrolling through maintenance options

With the drive in maintenance mode, press the eject push button at a rate of once per second. The single-character display code increments by one each time you press the eject push button.

*Note:* Do not press the eject push button more frequently than once per second or the selected maintenance function will occur instead of the desired scrolling operation.

After the last maintenance function is reached, the display code wraps to 0. Unassigned digits (B, D, and G) are not displayed when the options are incremented.

The following table lists the maintenance functions.

<table>
<thead>
<tr>
<th>Maintenance functions</th>
<th>Display code</th>

<td>U</td>
</tr>
</tbody>
</table>
Running a maintenance function

To run the maintenance function indicated by the character on the single-character display, press and hold the eject button for 2 seconds. The single digit flashes the selected maintenance function code during the running of the operation. If the drive runs the function successfully, the single-character display indicates 0. If the function fails, the status LED indicates continuous yellow and the single-character display indicates the reason for the error by displaying an error code. For a list of error codes, see Table 8 on page 13.

Exiting maintenance mode

To exit maintenance mode, press the eject button twice within one second:
• While the single-character display indicates 0.
• When the selected maintenance function is completed either successfully or unsuccessfully.
• When the eject button is pressed during any currently running maintenance function.

Running a dump operation when not in maintenance mode

To perform a drive dump operation, press and hold the eject button for 10 or more seconds. The microcode goes to its initialized state after a dump operation.

Note: Data from a dump operation is for use by trained personnel for problem determination.

Resetting the tape drive

You might need to reset your tape drive. Use the procedure in this topic to perform this task.

Use this information to reset your tape drive, without affecting server operation. Allow up to 2 minutes for the entire tape drive process to complete.

Attention: Resetting a tape drive before the current backup operation has completed can cause loss of customer data.

To reset the tape drive, follow these steps:
1. Press and hold the eject button for 20 seconds, and then release the button. The LEDs on the drive will be flashing while the reset function is in process.
2. When the LEDs stop flashing, wait approximately one minute for the drive to complete the reset operation. The drive will then be ready to use.

Performing the internal self-test (FC 5746)

Use the information in this section to perform an internal self-test on your tape drive.

This procedure is designed to allow you to quickly perform a complete set of diagnostic tests on your LTO-4 tape drive, without impacting server operation. This 4-minute test can also be used to verify good performance of individual LTO tape cartridges. For an illustration of the tape drive and the LED status lights that are referred to in this procedure, see Figure 1 on page 13.

Prerequisites

In order to perform the test you need a blank LTO-4 (Ultrium 4) data cartridge. If an Ultrium-4 data cartridge is not available, an Ultrium-3 cartridge can be substituted.
Performing the test

Follow these steps to perform the test:

**Attention:** Use a blank data cartridge to perform the test. During the test, the tape will be overwritten with a test pattern and all data on the tape will be destroyed.

1. Enter diagnostic mode by doing the following steps:
   a. Verify that a tape cartridge is not loaded in the drive. To unload a cartridge, press the eject button on the front of the drive.
   b. Press and hold the eject button for 7 seconds, until all LEDs become active, and then release the button.
      The Ready LED will continue flashing, the Fault LED will remain on, and a 1 is displayed in the Single-character display (SCD). This combination indicates that the drive is waiting for a cartridge to be inserted.

2. Start the self-test by inserting a blank, Ultrium 4 data cartridge into the drive.
   If an Ultrium-4 data cartridge is not available, an Ultrium-3 cartridge can be substituted.

**Notes:**
- A cartridge must be loaded within 15 seconds or the drive will automatically revert back to normal operation. If necessary, return to step 1 to reenter diagnostic mode.
- The test takes about 4 minutes.
- Use a cartridge that is not write-protected. If a write-protected cartridge is inserted while the drive is in diagnostic mode, the cartridge will be ejected. See Table 11.
- Self-testing can only be performed using a write-compatible (either Ultrium-4 or Ultrium-3) cartridge type, and with a cartridge that is not damaged. See Table 11.
- If a cleaning cartridge is inserted while the drive is in diagnostic mode, it will be ejected.

While self-testing is in progress, the LEDs will remain active and the following test steps are performed:
- The hardware test runs for about one minute. During that time, a static test is performed on the electrical components of the drive, and proper operation of the cartridge load/unload mechanism is verified.
- The write/read test runs for about three minutes.

Interpreting the results

**Table 11. Interpreting the results of the self-test**

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test passed</td>
<td>When self-testing has completed successfully and no problems were detected, the cartridge is unloaded from the drive and all LEDs are off. Proper function of both the drive and tape cartridge have been verified. The drive is no longer in diagnostic mode, and has been returned to normal operation. If the yellow Fault LED remains on and a 7 is displayed in the SCD, this combination indicates that self-testing has completed successfully but that cleaning is required. Clean the drive by inserting an IBM cleaning cartridge, part number 35L2086.</td>
</tr>
<tr>
<td>Drive failure</td>
<td>When a drive problem is detected, the cartridge remains loaded inside the drive, the yellow Fault LED flashes, and a 5 is displayed in the SCD. Replace the tape drive.</td>
</tr>
<tr>
<td>Media failure</td>
<td>When a media problem is detected, the cartridge remains loaded inside the drive, the yellow Fault LED remains on, and a 7 is displayed in the SCD. Repeat the self-test using another blank tape cartridge and discard the defective media.</td>
</tr>
</tbody>
</table>
Interpreting the results of the self-test (continued)

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incorrect cartridge</td>
<td>When an incorrect tape cartridge is used for the test, the cartridge is unloaded, the yellow Fault LED remains on, and a P, 7, or J is displayed in the SCD. This can happen if the cartridge is:</td>
</tr>
<tr>
<td></td>
<td>• Write-protected (P is displayed in the SCD.)</td>
</tr>
<tr>
<td></td>
<td>• Damaged (7 is displayed in the SCD.)</td>
</tr>
<tr>
<td></td>
<td>• Not write-compatible with the drive (J is displayed in the SCD.)</td>
</tr>
</tbody>
</table>

Press the eject button to end the self-test and return the drive to normal operating mode. Then return to step 1 and run the self-test again using a suitable cartridge.

Returning to normal operation

When self-testing has completed successfully, the tape cartridge is unloaded. The drive is no longer in diagnostic mode and returns to normal operation.

When self-testing fails, the tape cartridge remains loaded inside the drive, and the drive remains in diagnostic mode. Press the eject button to unload tape cartridge and return drive to normal operation.

200/400 GB Half High Ultrium 2 tape drive (FC 5755)

Learn about the features of this media device.

The LTO half-high tape drive is a SCSI device that can be used for backing up, restoring and archiving data. These files can include multimedia, imaging, transaction processing, large databases, and other storage-intensive applications. Each tape cartridge can store up to 200 GB of data (uncompressed), or up to 400 GB of data (compressed), assuming a 2 to 1 compression ratio.

**Note:** The actual capacity varies depending on the application, the type of data, and the tape cartridge. 200 GB is typical and 400 GB is possible when the Data Compression setting is activated. The default setting of Data Compression is controlled by the host system. The user and the application software can control the activation or deactivation of the data compression setting. The drive can optimally achieve a 2:1 compression ratio.

The LTO half-high tape drive FRU part number is 96P1775

The custom card identification number (CCIN): 63A0

The LTO half-high tape drive features:

• A sustained native data transfer rate of up to 24 MB per second, 48 MB per second at 2:1 compression
• Downward read and write compatibility with earlier LTO-type data cartridges.
• Uses the self-configuring SCSI device driver native to the host operating system.
• Can be used as an bootable device, depending on the host system configuration.
• 5.25-inch half-high form factor
• Streaming operation

Attributes required: One 1.6-inch (41 mm) half-high media bay and one SCSI-2 internal 16-bit address

Cleaning the tape drive (FC 5755)

You might need to clean your tape drive. Use the procedure in this topic to perform this task.
Clean the device whenever the Fault status light comes on or a system I/O error related to the device occurs.

**Attention:** Use only the recommended cleaning cartridge to clean the tape drive. Use of other than recommended cleaning cartridges can damage your drive and might void the warranty.

The tape drive will turn on the cleaning indication for several reasons:
- The tape drive exceeds internal preset error thresholds in the drive.
- A cleaning cartridge that has been used the maximum number of times is inserted in the drive. The cleaning indicator is turned on to indicate that the cleaning process was not done and the cleaning cartridge is no longer usable.
- The tape drive exceeds the maximum recommended time between cleaning.

The maximum recommended time between preventive-maintenance cleaning is 100 tape motion hours. Tape motion hours are defined as the time that the tape drive is moving tape. If the tape drive reaches 100 tape motion hours since the tape drive was last cleaned, the drive will turn on the cleaning required LED to indicate the drive needs cleaning. The tape drive will continue to operate but it is recommended the tape drive be cleaned at the next opportunity to insert a cleaning cartridge.

To clean the tape drive, complete the following steps:
1. Make sure that the power is on for the tape drive.
2. If a tape cartridge is in the tape drive, eject and remove the cartridge.
3. Grasp the cleaning cartridge by the outer edges, with the window-side up and the write-protect switch facing you.
4. Slide the cartridge into the opening on the front of the drive until the loading mechanism pulls the cartridge into the drive.

After the cleaning cartridge has been inserted, the remainder of the cleaning process is automatic. The tape drive does the following actions:
- Loads the cleaning cartridge into the tape drive.
- Cleans the drive by moving the cleaning tape forward for approximately 30 seconds.
- Unloads the cleaning cartridge when the cleaning operation is complete.
- Indicates a successful cleaning operation by turning off the Cleaning status light (if the Cleaning light was on prior to the cleaning process. Otherwise, the Cleaning light remains solid to indicate that the cleaning cartridge is no longer usable. Obtain a new cleaning cartridge and repeat the process.)

**Note:** If the cleaning operation completes but the Cleaning light remains on, repeat the cleaning procedure with a new cleaning cartridge. If the light still remain on, contact your authorized service representative.

To determine how many times a cleaning cartridge may be used, check the information printed on the cartridge. If you attempt to use a depleted cleaning cartridge, the drive automatically detects the error and ejects the cartridge. If the Cleaning status light was on prior to the cleaning process, it stays on; if the Cleaning light was off, the depleted cartridge causes the light to come on.

If a system error occurs, clean the drive and retry the operation. If the operation fails, replace the data cartridge, clean the drive again, then retry the operation.

**Setting the write-protect switch (FC 5755)**
You might need to set the write-protect switch on your tape drive. Use the information in this topic to perform this task.
Attention: Do not attempt to change the write-protect settings after the tape cartridge is loaded in the drive because this might cause unpredictable results and might damage the tape or the drive.

The position of the write-protect switch on the tape cartridge determines when you can write to the tape. Before loading cartridges into magazines, set the write-protect switch of each cartridge to enable or disable data recording. When the switch is set to the left, data can be written to the tape. When the switch is set to the right, data cannot be written to the tape.

Status lights (FC 5755)
You might need to read the status lights on your tape drive to determine the operating status of the drive. Use the information in this topic to perform this task.

The following illustration shows a front view of the tape drive:
The status lights and their ISO symbols are on the device as follows:

**Ready** 🟢 (green)

**Activity** ➤ (green)

**Cleaning** 🔴 (amber)

**Fault** ⚠️ (amber)

The combinations of the lights and their definitions are shown in the following table.

*Table 12. Definition of Status Light Combinations*

</table>
Attention: Do not attempt to bulk erase an LTO data cartridge for reuse. Bulk eraser devices cannot properly erase an LTO data cartridge and will permanently damage the cartridge.

**Resetting the tape drive (FC 5755)**

You might need to reset your tape drive. Use the procedure in this topic to perform this task.

Use this information to reset your half-high LTO-2 tape drive, without impacting server operation. Please allow up to 2 minutes for the entire tape drive process to complete.

Attention: Resetting a tape drive before the current backup operation has completed may cause loss of customer data.

To reset the tape drive, follow these steps:

1. Press and hold the eject button for 7 seconds, until the green Ready LED starts flashing rapidly, then release the button. The Ready LED will continue flashing, indicating that the drive is waiting for a cartridge to be inserted.
2. Press and release the eject button. The green Activity LED will begin flashing rapidly.
3. Double-click the eject button. The Activity LED will continue flashing slowly while the reset function is in progress. When the reset function is complete, the tape cartridge will remain in the drive and the Ready LED will be lit. Allow up to 2 minutes for the reset function to complete.

Note: A solid amber Cleaning LED light indicates that the reset is complete, but the tape unit requires cleaning. Clean the tape unit by inserting an IBM Universal LTO Cleaning Cartridge (part number 35L2086).

After the reset function completes, the tape unit is restored to normal operating mode. To remove the cartridge, press the eject button.

**Performing the internal self-test (FC 5755)**

Use the information in this section to perform an internal self-test on your tape drive.

Use the following procedure to quickly perform a complete set of diagnostic tests on your LTO-2 tape drive, without affecting server operation. This 5-1/2 minute test can also be used to verify good performance of individual LTO tape cartridges. For an illustration of the tape drive and the LED status lights that are referred to in this procedure, see Figure 2 on page 24.

**Prerequisites**

In order to perform the test you need the following items:

- Half High LTO-2 Tape Drive: Firmware code v0330 or higher
- One LTO cleaning cartridge
- One IBM test tape (P/N 24R0395) or one blank LTO-2 (Ultrium 2) data cartridge

**Performing the test**

Follow these steps to perform the test:

Attention: Use a test tape or blank (scratch) tape to perform the test. During the test, the tape will be overwritten with a test pattern and all data on the tape will be destroyed.

1. Enter diagnostic mode by doing the following steps:
a. Verify that a tape cartridge is not loaded in the drive. To unload a cartridge, press the eject button on the front of the drive.

b. Press and hold the eject button for 7 seconds, until the green Ready LED starts flashing rapidly, and then release the button. The Ready LED will continue flashing, indicating that the drive is waiting for a cartridge to be inserted.

2. Start the self-test by inserting a test tape into the drive. If a test tape is not available, you can substitute any blank LTO Ultrium-2 cartridge.

A cartridge must be loaded within 15 seconds or the drive will automatically revert back to normal operation. If necessary, return to step 1 to reenter diagnostic mode.

Notes:
- The test takes about 5-1/2 minutes.
- At any time, self-testing can be stopped by pressing the eject button. After a current test operation is completed, the cartridge will be ejected and drive will return to normal operation.
- Use a cartridge that is not write-protected. If a write-protected cartridge is inserted while the drive is in diagnostic mode, the cartridge will be ejected.
- Self-testing can only be performed using an undamaged, write-compatible, Ultrium-2 cartridge. If a write-protected or damaged cartridge is used, refer to Incorrect cartridge in Table 14.
- If a cleaning cartridge is inserted while the drive is in diagnostic mode, cleaning will occur and the drive will then return to normal operating mode. To reenter diagnostic mode, return to step 1.
- While self-testing is in progress, the Ready LED continues to flash. The following three test steps are performed:
  - The initialization sequence has an approximate duration of 20 seconds. The Activity LED indicates tape movement.
  - The hardware test has an approximate duration of 2 minutes. During that time, a static test is performed on the electrical components of the drive, and proper operation of the cartridge load/unload mechanism is verified.
  - The write/read test has an approximate duration of three minutes. The Activity LED indicates tape movement.

Interpreting the results

Table 14. Interpreting the results of the self-test

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test passed</td>
<td>When self-testing has completed successfully and no problems were detected, the cartridge is unloaded from the drive and all LEDs are off. Proper function of both the drive and tape cartridge have been verified. The drive is no longer in diagnostic mode, and has been returned to normal operation. If the yellow Clean LED remains on, it indicates that self-testing has completed successfully but that cleaning is required. Clean the drive by inserting an IBM cleaning cartridge.</td>
</tr>
<tr>
<td>Drive failure</td>
<td>When a drive problem is detected, the cartridge will remain loaded inside the drive and the yellow Fault LED will flash. Contact your service provider for assistance.</td>
</tr>
<tr>
<td>Media failure</td>
<td>When a media problem is detected, the cartridge will remain loaded inside the drive, and the yellow Clean LED will flash. Repeat self-test using another blank tape cartridge.</td>
</tr>
</tbody>
</table>
Table 14. Interpreting the results of the self-test (continued)

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
</table>
| Incorrect cartridge | When an incorrect tape cartridge is used for the test, the cartridge is unloaded and both the Activity and Clean LEDs will flash. This can happen if the cartridge is:  
  - Write-protected  
  - Damaged  
  - Not write-compatible with the drive  
    Press the eject button to end the self-test and return the drive to normal operating mode. Then return to step 1 and run the self-test again using a suitable cartridge. |

Returning to normal operation

When self-testing has completed successfully, the tape cartridge is unloaded. The drive is no longer in diagnostic mode and returns to normal operation.

When self-testing fails, the tape cartridge remains loaded inside the drive, and the drive remains in diagnostic mode. Press the eject button to unload tape cartridge and return drive to normal operation.

160/320 GB internal tape drive VXA-320 (FC 6279)

Learn about the features of this media device.

| Description                                                                 | The IBM 160/320 GB Internal Tape Drive with VXA Technology is a 5.25-inch, half-high, Ultra2 LVD 16-bit tape drive, which provides a high capacity for save/restore and achieve functions. This tape drive uses VXA tape data cartridges and is capable of compression, providing a capacity of up to 320 GB.  
Characteristics:  
  - FRU part number: 95P1976  
  - Custom card identification number (CCIN): 63A0  
  - Capacity: 160 GB native mode, 320 GB (typical) compression mode  
  - Form Factor: 5.25-inch half high  
  - Media: uses VXA tape data cartridges  
  - Technology: Helical scan, rotating head  
  - Operation: Streaming  
  - Data Transfer Rate: 12 MBps native mode, 24 MBps (typical) compression  
  - Interface: SCSI-2 (LVD/SE) asynchronous/synchronous  
  - Compatibility: 160 GB mode (Read/Write), 320 GB compression (Read/Write)  
  - Attributes provided: One 160/320 GB internal tape drive  
  - Attributes required: One 1.6-inch (41 mm) half-high media bay and one SCSI-2 internal 16-bit address |

To further understand the features and specifications of the tape drive, you can visit the IBM website or contact your local IBM representative.

Tools

The following tools and documentation are needed to complete the installation:  
  - A flat-blade screwdriver (if this device is not an auto-docking feature on your system)  
  - Your system unit documentation, including any service documentation  
  - Your operating system documentation  

If an item is missing or damaged, contact the place of purchase.
Cleaning the tape drive (FC 6120 and 6279)

You might need to clean your tape drive. Use the procedure in this topic to perform this task.

Clean the device whenever the Fault status light comes on or a system I/O error related to the device occurs.

Attention: Use only the recommended cleaning cartridge to clean the tape drive. Use of other than recommended cleaning cartridges can damage your drive and might void the warranty.

The tape drive will turn on the cleaning indication for several reasons:

- The tape drive exceeds internal preset error thresholds in the drive.
- A cleaning cartridge that has been used the maximum number of times is inserted in the drive. The cleaning indicator is turned on to indicate that the cleaning process was not done and the cleaning cartridge is no longer usable.
- The tape drive exceeds the maximum recommended time between cleaning.

The maximum recommended time between preventive-maintenance cleaning is 75 tape motion hours. Tape motion hours are defined as the time that the tape drive is moving tape. If the tape drive reaches 75 tape motion hours since the tape drives was last cleaned the drive will turn on the cleaning required LED to indicate the drive needs cleaning. The tape drive will continue to operate but it is recommended the tape drive be cleaned at the next opportunity to insert a cleaning cartridge.

To clean the tape drive, complete the following steps:

1. Make sure that the power is on to the tape drive.
2. If a tape cartridge is in the tape drive, eject and remove the cartridge.

   Note: Some cleaning cartridges have white dots on the window side that are designed to be used to log the use of the cartridge. Each time the cartridge is used, mark one of the dots on the cartridge with a pen or marker. When all of the dots have been marked, discard the cleaning cartridge.

3. Grasp the cleaning cartridge by the outer edges, with the window-side up and the write-protect switch facing you.
4. Slide the cartridge into the opening on the front of the drive until the loading mechanism pulls the cartridge into the drive and the drive door closes.

After the cleaning cartridge has been inserted, the remainder of the cleaning process is automatic. The tape drive does the following actions:

- Loads the cleaning cartridge into the tape drive.
- Cleans the drive by moving the cleaning tape forward for approximately 30 seconds.
- Unloads the cleaning cartridge when the cleaning operation is complete.
- Indicates a successful cleaning operation by turning off the Cleaning status light (if the Cleaning light was on prior to the cleaning process. Otherwise, the Cleaning light remains solid to indicate that the cleaning cartridge is no longer usable. Obtain a new cleaning cartridge and repeat the process.)
Note: If the cleaning operation completes but the Cleaning light remains on, repeat the cleaning procedure with a new cleaning cartridge. If the light still remain on, contact your authorized service representative.

To determine how many times a cleaning cartridge may be used, check the information printed on the cartridge. If you attempt to use a depleted cleaning cartridge, the drive automatically detects the error and ejects the cartridge. If the Cleaning status light was on prior to the cleaning process, it stays on; if the Cleaning light was off, the depleted cartridge causes the light to come on.

If a system error occurs, clean the drive and retry the operation. If the operation fails, replace the data cartridge, clean the drive again, then retry the operation.

Loading and unloading cartridges
Learn about loading and unloading tape cartridges from this drive.

To avoid problems with loading and unloading, use only one label on a cartridge. If the cartridge has too many or poorly-placed labels, the drive-load mechanism might clog.

Loading a cartridge

To load a cartridge, complete the following steps:
1. Make sure that the tape device power is on.
2. Grasp the cartridge by the outer edges, with the window side up and the write-protect switch facing you.
   
   Note: Make sure that the write-protect switch is correctly set.
3. Slide the cartridge into the opening on the front of the device until the loading mechanism pulls the cartridge into the drive and the drive door closes.

To indicate that the load operation was successful, the Ready status light comes on.

Unloading a cartridge

To unload a cartridge, complete the following steps:
1. Make sure that the tape device power is on.
2. Press the Unload button. The device rewinds, unloads, and ejects the tape cartridge.
   
   The process might take from 15 seconds to several minutes, depending on the position of the tape and the amount of data written. During this task, the status lights do the following sequence:
   • The Ready status light turns off.
   • The Activity status light flashes during the unload operation.
   • The Activity status light turns off when the cartridge is ejected from the tape drive.

Attention: An emergency eject and reset feature can be used to release the tape cartridge and reset the drive. Use the emergency eject feature if the cartridge does not move correctly or if the unload process fails. The emergency eject and reset feature procedure might result in loss of data. To perform an emergency eject operation of the tape cartridge or a reset operation of the drive, press and hold the Unload button for at least 10 seconds. If a cartridge is in the drive, the cartridge automatically ejects without rewinding the tape.

Setting the write-protect switch (FC 6279)

You might need to set the write-protect switch on your tape drive. Use the information in this topic to perform this task.
Attention: Do not attempt to change the write-protect settings after the tape cartridge is loaded in the drive because this might cause unpredictable results and might damage the tape or the drive.

The position of the write-protect switch on the tape cartridge determines when you can write to the tape.

Status lights (FC 6279)
You might need to read the status lights on your tape drive to determine the operating status of the drive. Use the information in this topic to perform this task.

The following is a front view of the tape drive:

1. When the switch is set to the left, data can be written to and read from the tape.
2. When the switch is set to the right, data can only be read.

Figure 3. Front view of tape drive

1. Ready (green)
2. Active (green)
3. Cleaning (amber)
4. Fault (amber)
The status lights and their ISO symbols are on the device as follows:

**Ready** \( \bigcirc \) (green)

**Activity** \( \leftrightarrow \) (green)

**Cleaning** \( \sigma \Rightarrow \sigma \) (amber)

**Fault** \( \uparrow \) (amber)

The combinations of the lights and their definitions are shown in the following table.

*Table 15. Definition of Status Light Combinations*

</tr>
</tbody>
</table>

**Notes:**

1. If the drive completes the power-on self-test (POST) within the 2.0 second Power On LED Test time, the POST indicator sequence is eliminated.

2. A solid amber LED indicates the drive needs cleaning. The drive will continue to function, but, needs cleaning as soon as possible. A power cycle does not turn off this indicator.

3. The Fault LED will flash to indicate an unrecoverable error. An unrecoverable error is an error condition that results in the drive not being able to function unless initiator, operator, or service...
intervention is applied. An unrecoverable drive failure is usually the result of a hardware error condition. One of the following actions will be needed to clear the flashing Fault LED:

- Hard SCSI Reset
- Cartridge Eject
- Power Cycle
- Retry microcode download

An unrecoverable cartridge (media) failure is usually the result of a defective cartridge, media, or cartridge state and will require the drive to eject the cartridge (if possible) to clear the flashing LED.

4. The firmware download failed and the drive is not functional. The drive boot code is in control and the microcode download should be retried. The drive can be identified using the Inquiry command and is bootable while in this state.

5. The Fault LED will be on solid to indicate an over temperature condition.

**Performing the internal self-test (FC 6120 or 6279)**

Use the information in this topic to perform an internal self-test on your tape drive.

**Prerequisites**

In order to perform the test, you need the following items:

- One VXA-2 tape drive with firmware code V2123 or higher, or one VXA-320 tape drive with firmware V3209 or higher
- One VXA cleaning cartridge X style
- One blank VXA X23 data cartridge

**Performing the test**

Follow these steps to perform the internal self-test:

**Attention:** Use a blank tape to perform the test. During the test, the tape is overwritten with a test pattern and all data on the tape is destroyed.

1. Clean the tape drive.
2. Press the blue eject button for 7 seconds. When the Ready LED blinks rapidly, insert the blank, X23 data cartridge.

The tape drive performs the internal self-test. The test can take up to 15 minutes. After successful completion, the media is ejected.

**Interpreting the results**

The following table shows how to interpret the results of the internal self-test using the status lights. To see a front-view illustration of the tape drive and status lights, see one of the following illustrations.

- VXA-320 tape drive: [Figure 3 on page 32](#)
- VXA-2 tape drive: [Figure 4 on page 40](#)

If the internal self-test passes, then the tape drive has no hardware fault and no further tests are required. If the internal self-test indicates a drive failure, contact your service provider.

\(^2\) Repeat the internal self-test with a write-enabled, blank X23 data cartridge.

**Tape cartridges (FC 6279)**

Learn about the types of tape cartridges that are available for this drive.

**Compatible tape cartridges**

Types of tape cartridges are supported by this tape drive:
- X cartridges are the newer version of the VXA cartridge
- V cartridges are the original VXA cartridge

The V and X cartridges have similar shells and come in a variety of tape lengths. Both cartridges use Advanced Metal Evaporated (AME) media and offer the similar read/write speeds and capacities.

**Available tape cartridges**

Most bulk eraser devices do not have the capability to erase the data cartridge. To properly erase a VXA data cartridge with a bulk eraser device, the erasure field strength must be a minimum of 4000 gauss.
**Resetting the tape drive**  
You might need to reset your tape drive. Use the procedure in this topic to perform this task.

Use this information to reset your tape drive, without affecting server operation. Allow up to 2 minutes for the entire tape drive process to complete.

**Attention:** Resetting a tape drive before the current backup operation has completed can cause loss of customer data.

To reset the tape drive, follow these steps:
1. Press and hold the eject button for 20 seconds, and then release the button. The LEDs on the drive will be flashing while the reset function is in process.
2. When the LEDs stop flashing, wait approximately one minute for the drive to complete the reset operation. The drive will then be ready to use.

### 80/160 GB internal tape drive VXA-2 (FC 6120)

Learn about the features of this media device.

| Description | The IBM 80/160 GB Internal Tape Drive with VXA Technology is a 5.25-inch, half-high, Ultra2 LVD 16-bit tape drive, which provides a high capacity for save/restore and achieve functions. This tape drive uses VXA tape data cartridges and is capable of compression, providing a capacity of up to 160 GB.  
| Characteristics: |  
| • FRU part number: 19P4898  
| • Custom card identification number (CCIN): 63A0  
| • Capacity: 80 GB native mode, 160 GB (typical) compression mode  
| • Form Factor: 5.25-inch half high  
| • Media: uses VXA tape data cartridges  
| • Technology: Helical scan, rotating head  
| • Operation: Streaming  
| • Data Transfer Rate: 6 MBps native mode, 12 MBps (typical) compression  
| • Interface: SCSI-2 (LVD/SE) asynchronous/synchronous  
| • Compatibility: 80 GB mode (Read/Write), 160 GB compression (Read/Write)  
| • Attributes provided: One 80/160 GB internal tape drive  
| • Attributes required: One 1.6-inch (41 mm) half-high media bay and one SCSI-2 internal 16-bit address |

### Tools

The following tools and documentation are needed to complete the installation:
1. A flat-blade screwdriver (if this device is not an auto-docking feature on your system)
2. Your system unit documentation, including any service documentation
3. Your operating system documentation

If an item is missing or damaged, contact the place of purchase.
Check that your package contains the following items:
- The device
- Media kit containing:
  - 1 data cartridge
  - 1 cleaning cartridge
  - 1 test tape
  - Jumpers (located in a plastic bag)
- Specific hardware for attaching the device to your specific system, as detailed on the parts listing provided with your device

Cleaning the tape drive (FC 6120 and 6279)

You might need to clean your tape drive. Use the procedure in this topic to perform this task.

Clean the device whenever the Fault status light comes on or a system I/O error related to the device occurs.

**Attention:** Use only the recommended cleaning cartridge to clean the tape drive. Use of other than recommended cleaning cartridges can damage your drive and might void the warranty.

The tape drive will turn on the cleaning indication for several reasons:
- The tape drive exceeds internal preset error thresholds in the drive.
- A cleaning cartridge that has been used the maximum number of times is inserted in the drive. The cleaning indicator is turned on to indicate that the cleaning process was not done and the cleaning cartridge is no longer usable.
- The tape drive exceeds the maximum recommended time between cleaning.

The maximum recommended time between preventive-maintenance cleaning is 75 tape motion hours. Tape motion hours are defined as the time that the tape drive is moving tape. If the tape drive reaches 75 tape motion hours since the tape drives was last cleaned the drive will turn on the cleaning required LED to indicate the drive needs cleaning. The tape drive will continue to operate but it is recommended the tape drive be cleaned at the next opportunity to insert a cleaning cartridge.

To clean the tape drive, complete the following steps:
1. Make sure that the power is on to the tape drive.
2. If a tape cartridge is in the tape drive, eject and remove the cartridge.

   **Note:** Some cleaning cartridges have white dots on the window side that are designed to be used to log the use of the cartridge. Each time the cartridge is used, mark one of the dots on the cartridge with a pen or marker. When all of the dots have been marked, discard the cleaning cartridge.
3. Grasp the cleaning cartridge by the outer edges, with the window-side up and the write-protect switch facing you.
4. Slide the cartridge into the opening on the front of the drive until the loading mechanism pulls the cartridge into the drive and the drive door closes.

After the cleaning cartridge has been inserted, the remainder of the cleaning process is automatic. The tape drive does the following actions:
- Loads the cleaning cartridge into the tape drive.
- Cleans the drive by moving the cleaning tape forward for approximately 30 seconds.
- Unloads the cleaning cartridge when the cleaning operation is complete.
• Indicates a successful cleaning operation by turning off the Cleaning status light (if the Cleaning light was on prior to the cleaning process. Otherwise, the Cleaning light remains solid to indicate that the cleaning cartridge is no longer usable. Obtain a new cleaning cartridge and repeat the process.)

**Note:** If the cleaning operation completes but the Cleaning light remains on, repeat the cleaning procedure with a new cleaning cartridge. If the light still remain on, contact your authorized service representative.

To determine how many times a cleaning cartridge may be used, check the information printed on the cartridge. If you attempt to use a depleted cleaning cartridge, the drive automatically detects the error and ejects the cartridge. If the Cleaning status light was on prior to the cleaning process, it stays on; if the Cleaning light was off, the depleted cartridge causes the light to come on.

If a system error occurs, clean the drive and retry the operation. If the operation fails, replace the data cartridge, clean the drive again, then retry the operation.

**Loading and unloading cartridges**

Learn about loading and unloading tape cartridges from this drive.

To avoid problems with loading and unloading, use only one label on a cartridge. If the cartridge has too many or poorly-placed labels, the drive-load mechanism might clog.

**Loading a cartridge**

To load a cartridge, complete the following steps:

1. Make sure that the tape device power is on.
2. Grasp the cartridge by the outer edges, with the window side up and the write-protect switch facing you.

   **Note:** Make sure that the write-protect switch is correctly set.

3. Slide the cartridge into the opening on the front of the device until the loading mechanism pulls the cartridge into the drive and the drive door closes.

To indicate that the load operation was successful, the Ready status light comes on.

**Unloading a cartridge**

To unload a cartridge, complete the following steps:

1. Make sure that the tape device power is on.
2. Press the Unload button. The device rewinds, unloads, and ejects the tape cartridge.

   The process might take from 15 seconds to several minutes, depending on the position of the tape and the amount of data written. During this task, the status lights do the following sequence:
   - The Ready status light turns off.
   - The Activity status light flashes during the unload operation.
   - The Activity status light turns off when the cartridge is ejected from the tape drive.

**Attention:** An emergency eject and reset feature can be used to release the tape cartridge and reset the drive. Use the emergency eject feature if the cartridge does not move correctly or if the unload process fails. The emergency eject and reset feature procedure might result in loss of data. To perform an emergency eject operation of the tape cartridge or a reset operation of the drive, press and hold the Unload button for at least 10 seconds. If a cartridge is in the drive, the cartridge automatically ejects without rewinding the tape.
Setting the write-protect switch (FC 6120)

You might need to set the write-protect switch on your tape drive. Use the information in this topic to perform this task.

**Attention:** Do not attempt to change the write-protect settings after the tape cartridge is loaded in the drive because this might cause unpredictable results and might damage the tape or the drive.

The position of the write-protect switch on the tape cartridge determines when you can write to the tape.

1. When the switch is set to the left, data can be written to and read from the tape.
2. When the switch is set to the right, data can only be read.

Status lights (FC 6120)

You might need to read the status lights on your tape drive to determine the operating status of the drive. Use the information in this topic to perform this task.

The following illustration is a front view of the tape drive:
The status lights and their ISO symbols are on the device as follows:

**Ready** (green)

**Activity** (green)

**Cleaning** (amber)

**Fault** (amber)

The combinations of the lights and their definitions are shown in the following table.

</tbody>
</table>

Notes:

1. If the drive completes the power-on self-test (POST) within the 2.0 second Power On LED Test time, the POST indicator sequence is eliminated.
2. A solid amber LED indicates the drive needs cleaning. The drive will continue to function, but needs cleaning as soon as possible. A power cycle does not turn off this indicator.
3. The Fault LED will flash to indicate an unrecoverable error. An unrecoverable error is an error condition that results in the drive not being able to function unless initiator, operator, or service intervention is applied. An unrecoverable drive failure is usually the result of a hardware error condition. One of the following actions will be needed to clear the flashing Fault LED:
   - Hard SCSI reset
   - Cartridge eject
   - Power cycle
   - Retry microcode download

   An unrecoverable cartridge (media) failure is usually the result of a defective cartridge, media, or cartridge state and will require the drive to eject the cartridge (if possible) to clear the flashing LED.
4. The firmware download failed and the drive is not functional. The drive boot code is in control and the microcode download should be retried. The drive can be identified using the Inquiry command and is bootable while in this state.
5. The Fault LED will be on solid to indicate an over-temperature condition.

Performing the internal self-test (FC 6120 or 6279)

Use the information in this topic to perform an internal self-test on your tape drive.

Prerequisites

In order to perform the test, you need the following items:

- One VXA-2 tape drive with firmware code V2123 or higher, or one VXA-320 tape drive with firmware V3209 or higher
- One VXA cleaning cartridge X style
- One blank VXA X23 data cartridge
Performing the test

Follow these steps to perform the internal self-test:

Attention: Use a blank tape to perform the test. During the test, the tape is overwritten with a test pattern and all data on the tape is destroyed.

1. Clean the tape drive.
2. Press the blue eject button for 7 seconds. When the Ready LED blinks rapidly, insert the blank, X23 data cartridge.

The tape drive performs the internal self-test. The test can take up to 15 minutes. After successful completion, the media is ejected.

Interpreting the results

The following table shows how to interpret the results of the internal self-test using the status lights. To see a front-view illustration of the tape drive and status lights, see one of the following illustrations.

- VX-320 tape drive: Figure 3 on page 32
- VX-2 tape drive: Figure 4 on page 40

If the internal self-test passes, then the tape drive has no hardware fault and no further tests are required. If the internal self-test indicates a drive failure, contact your service provider.

<table>

\(^1\) Repeat the internal self-test with a different, blank X23 data cartridge.

\(^2\) Repeat the internal self-test with a write-enabled, blank X23 data cartridge.

Tape cartridges (FC 6120)

Learn about the types of tape cartridges that are available for this drive.

Compatible tape cartridges

Two types of tape cartridges are supported by this tape drive:

- X cartridges are the newest version of the VXA cartridge
- V cartridges are the original VXA cartridge
The V and X cartridges have similar shells and come in a variety of tape lengths. Both cartridges utilize AME media and offer the similar read/write speeds and capacities.

**Note:**

1. To use X cartridges, the tape drive must have a minimum microcode level of 2105. To display the microcode level of the tape drive in the AIX operating system, do the following steps:
   a. Open an AIX command prompt.
   b. Type the `lscfg -vl rmtx` command, where x is the tape drive number, then press Enter.

   The output will contain the following line:
   
   ```
   Device Specific.(Z1)........2105
   ```

   In the previous example, 2105 represents the microcode level. If the command output contains a value of 2105 or higher, the tape drive supports the use of X cartridges. If the command output contains a value of 2104 or lower, update your microcode to 2105 or higher to use X cartridges in this tape drive.

2. X cartridges are only supported in VXA-2 tape drives. A user can write an X cartridge in VXA-1 format on a VXA-2 tape drive, but it will only be readable on a VXA-2 drive.

3. The VXA-2 drive supports use of V10 media, but this cartridge is not offered.

### Resetting the tape drive

You might need to reset your tape drive. Use the procedure in this topic to perform this task.

Use this information to reset your tape drive, without affecting server operation. Allow up to 2 minutes for the entire tape drive process to complete.

**Attention:** Resetting a tape drive before the current backup operation has completed can cause loss of customer data.

To reset the tape drive, follow these steps:

1. Press and hold the eject button for 20 seconds, and then release the button. The LEDs on the drive will be flashing while the reset function is in process.
2. When the LEDs stop flashing, wait approximately one minute for the drive to complete the reset operation. The drive will then be ready to use.

### 60/150 GB 16-bit 8-mm internal tape drive (FC 6134)

Learn about the features of this media device.

<table>
<thead>
<tr>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>The 60/150GB 16-bit 8-mm Internal Tape Drive consists of a 5.25-inch half-high, 16-bit tape drive. This drive provides a high capacity tape drive for save/restore and archiving functions. This tape drive uses IBM 8-mm data cartridges and is capable of compression, providing a capacity of up to 150 GB. The 60/150 GB 16-bit 8-mm Internal Tape Drive, is limited to a maximum system ambient operating temperature of 31°C (87.8°F) at a maximum operating altitude of 2134m (7000 ft). Lower altitudes have higher maximum ambient operating temperatures.</td>

### Cleaning the tape drive (FC 6134)

You might need to clean your tape drive. Use the procedure in this topic to perform this task.
Clean the device whenever the Fault status light comes on or a system I/O error related to the device occurs.

**Attention:** Use only the recommended cleaning cartridge to clean the tape drive. Use of other than recommended cleaning cartridges can damage your drive and might void the warranty.

The tape drive will turn on the cleaning indication for several reasons:
- The tape drive exceeds internal preset error thresholds in the drive.
- A cleaning cartridge that has been used the maximum number of times is inserted in the drive. The cleaning indicator is turned on to indicate that the cleaning process was not done and the cleaning cartridge is no longer usable.
- The tape drive exceeds the maximum recommended time between cleaning.

If SmartClean data cartridges are not used, clean the tape drive with a cleaning cartridge when the tape drive amber LED (Disturbance LED) indicates the drive needs cleaning due to time of tape movement or recording quality problems. The LCD will say “CLEAN SOON”. The maximum time between cleaning will be 30 tape motion hours.

**Note:** The 6134 tape drive is optimized to use SmartClean media. Extended use of AME media that is not SmartClean media is not recommended.

To clean the tape drive, complete the following steps:

1. Make sure that the power is on to the tape drive.
2. If a tape cartridge is in the tape drive, eject and remove the cartridge.

   **Note:** Some cleaning cartridges have white dots on the window side that are designed to be used to log the use of the cartridge. Each time the cartridge is used, mark one of the dots on the cartridge with a pen or marker. When all of the dots have been marked, discard the cleaning cartridge.

3. Grasp the cleaning cartridge by the outer edges, with the window-side up and the write-protect switch facing you.
4. Slide the cartridge into the opening on the front of the drive until the loading mechanism pulls the cartridge into the drive and the drive door closes.

After the cleaning cartridge has been inserted, the remainder of the cleaning process is automatic. The tape drive does the following actions:
- Loads the cleaning cartridge into the tape drive.
- Cleans the drive by moving the cleaning tape forward for approximately 30 seconds.
- Unloads the cleaning cartridge when the cleaning operation is complete.
- Indicates a successful cleaning operation by turning off the Fault status light (if the Fault light was on prior to the cleaning process).

   **Note:** If the cleaning operation completes but the Fault light remains on, repeat the cleaning procedure with a new cleaning cartridge. If the light still remains on, contact your authorized service provider.

To determine how many times a cleaning cartridge can be used, check the information printed on the cartridge. If you attempt to use a depleted cleaning cartridge, the tape drive automatically detects the error and ejects the cartridge. If the Fault status light was on prior to the cleaning process, it stays on; if the Fault light was off, the depleted cartridge causes the light to come on.

If a system error occurs, clean the drive and retry the operation. If the operation fails, replace the data cartridge, clean the drive again, then retry the operation.
Loading and unloading cartridges

Learn about loading and unloading tape cartridges from this drive.

To avoid problems with loading and unloading, use only one label on a cartridge. If the cartridge has too many or poorly-placed labels, the drive-load mechanism might clog.

Loading a cartridge

To load a cartridge, complete the following steps:
1. Make sure that the tape device power is on.
2. Grasp the cartridge by the outer edges, with the window side up and the write-protect switch facing you.

   **Note:** Make sure that the write-protect switch is correctly set.
3. Slide the cartridge into the opening on the front of the device until the loading mechanism pulls the cartridge into the drive and the drive door closes.

To indicate that the load operation was successful, the Ready status light comes on.

Unloading a cartridge

To unload a cartridge, complete the following steps:
1. Make sure that the tape device power is on.
2. Press the Unload button. The device rewinds, unloads, and ejects the tape cartridge.
   
   The process might take from 15 seconds to several minutes, depending on the position of the tape and the amount of data written. During this task, the status lights do the following sequence:
   
   - The Ready status light turns off.
   - The Activity status light flashes during the unload operation.
   - The Activity status light turns off when the cartridge is ejected from the tape drive.

   **Attention:** An emergency eject and reset feature can be used to release the tape cartridge and reset the drive. Use the emergency eject feature if the cartridge does not move correctly or if the unload process fails. The emergency eject and reset feature procedure might result in loss of data. To perform an emergency eject operation of the tape cartridge or a reset operation of the drive, press and hold the Unload button for at least 10 seconds. If a cartridge is in the drive, the cartridge automatically ejects without rewinding the tape.

Setting the write-protect switch (FC 6134)

You might need to set the write-protect switch on your tape drive. Use the information in this topic to perform this task.

The position of the write-protect switch on the tape cartridge determines when you can write to the tape.
When the switch is set to the left in the SAVE position 1, data cannot be written to or read from the tape (data is saved). When the switch is set to the right in the REC (Record) position 2, data can be written to and read from the tape.

**Status lights (FC 6134)**

You might need to read the status lights on your tape drive to determine the operating status of the drive. Use the information in this topic to perform this task.

The following illustration is a front view of the tape drive:
The status lights and their ISO symbols are on the device as follows:

- **Ready** (green)
- **Activity** (green)
- **Fault** (amber)

The combinations of the lights and their definitions are shown in the following table.

### Resetting the tape drive

You might need to reset your tape drive. Use the procedure in this topic to perform this task.

Use this information to reset your tape drive, without affecting server operation. Allow up to 2 minutes for the entire tape drive process to complete.

**Attention:** Resetting a tape drive before the current backup operation has completed can cause loss of customer data.

To reset the tape drive, follow these steps:

1. Press and hold the eject button for 20 seconds, and then release the button. The LEDs on the drive will be flashing while the reset function is in process.
2. When the LEDs stop flashing, wait approximately one minute for the drive to complete the reset operation. The drive will then be ready to use.

### 80/160 GB DAT160 SAS Tape Drive (FC 5619)

Learn about the features of this media device.

**Description**
The 80/160 GB DAT160 SAS Tape Drive is a 5.25-inch, half-high, SAS drive, which provides a high capacity for save/restore and achieve functions. To see an illustration of this drive, see [Figure 6 on page 53](#). This tape drive uses IBM DAT160, 4 mm data cartridges and is compression capable, providing a capacity of up to 160 GB with 2:1 compression ratio.

**Characteristics:**
- FRU part number: 23R9723
- Custom card identification number (CCIN): 63A0
- Media part numbers: see "Tape cartridges (FC 5619)" on page 55
- Capacity: 80 GB native mode, 160 GB (typical) compression mode
- Form factor: 5.25-inch half high
- Media: DAT160, DAT72, and DDS4 media
- Technology: helical scan, rotating head
- Operation: streaming
- Data transfer rate: 6 MBps native mode, 12 MBps (typical) compression
- Interface: integrated, internal SAS
- Compatibility: DDS4 (read/write), DAT72 (read/write), and DAT160 (read/write)
- Attributes provided: 4 mm tape capability, test cartridge, cleaning cartridge, and a data cartridge
- Attributes required: One 1.6-inch (41 mm) half-high media bay and one integrated, internal SAS
The following tools and documentation are needed to complete the installation:

- A flat-blade screwdriver (if this device is not an auto-docking feature on your system)
- Your system unit documentation, including any service documentation
- Your operating system documentation

Contact the place of purchase if an item is missing or damaged.

Note: If you are installing the auto-docking version of this device on your system, see your system documentation for information about the auto-docking feature.

This tape drive uses 4 mm data cartridges for saving and restoring system data. It is designed to use only DDS (Digital Data Storage) data cartridges. The cartridges are identified by one of the following DDS symbols:

- DDS4
- DAT72
- DAT160

The tape drive reads and writes data to tape cartridges that are in the DDS4, DAT72, or DAT160 format.

Your package contains the following items:

- The tape drive
- Media kit containing:
  - One cleaning cartridge
  - One test tape
- Specific hardware for attaching the drive to your specific system, as detailed on the parts listing provided with your drive.

Cleaning the tape drive (FC 5619)

You might need to clean your tape drive. Use the procedure in this topic to perform this task.

Clean the device whenever the Fault status light comes on or a system I/O error related to the device occurs.

Attention: Use only the recommended cleaning cartridge to clean the tape drive. Use of other than recommended cleaning cartridges can damage your drive and might void the warranty. The cleaning cartridge for this drive is P/N 23R5638. The cartridge is physically larger than previous cleaning cartridges and it is the only cleaning cartridge that can be used in this drive. The older, narrower cleaning cartridges do not work in the 5619 tape drive and are ejected from the drive without cleaning the drive.

The tape drive will turn on the cleaning indicator for the following reasons:

- The tape drive exceeds internal preset error thresholds in the drive.
- A cleaning cartridge that has been used the maximum number of times is inserted in the drive. The cleaning indicator is turned on to indicate that the cleaning process was not done and the cleaning cartridge is no longer usable.
- The tape drive exceeds the maximum recommended time between cleaning.

The maximum recommended time between preventive-maintenance cleaning is 50 tape motion hours. Tape motion hours are defined as the time that the tape drive is moving tape. If the tape drive reaches 50 tape motion hours since the tape drives was last cleaned, the drive will turn on the cleaning required LED to indicate the drive needs cleaning. The tape drive will continue to operate but the tape drive should be cleaned at the next opportunity to insert a cleaning cartridge.
Operating the tape drive in a low-humidity environment causes the drive to request cleaning more often than in normal humidity environment. In extreme low-humidity conditions of less than 15% relative humidity, the tape drive might request cleaning every 10 tape motion hours or even more frequently. For this reason, it is best not to use the tape drive in extremely low-humidity environments.

To clean the tape drive, complete the following steps:
1. Make sure that the power is on for the tape drive.
2. If a tape cartridge is in the tape drive, eject and remove the cartridge.
3. Grasp the cleaning cartridge by the outer edges, with the window-side up and the write-protect switch facing you.
4. Slide the cartridge into the opening on the front of the drive until the loading mechanism pulls the cartridge into the drive and the drive door closes.

After the cleaning cartridge has been inserted, the remainder of the cleaning process is automatic. The tape drive does the following actions:
• Loads the cleaning cartridge into the tape drive.
• Cleans the drive by moving the cleaning tape forward for approximately 30 seconds.
• Unloads the cleaning cartridge when the cleaning operation is complete.
• Indicates a successful cleaning operation by turning off the Cleaning status light (if the Cleaning light was on prior to the cleaning process. Otherwise, the Cleaning light remains solid to indicate that the cleaning cartridge is no longer usable. Obtain a new cleaning cartridge and repeat the process.)

Note: If the cleaning operation completes but the Cleaning light remains on, repeat the cleaning procedure with a new cleaning cartridge. If the light still remain on, contact your authorized service representative.

If you attempt to use a depleted cleaning cartridge, the drive automatically detects the error and ejects the cartridge. If the Cleaning status light was on prior to the cleaning process, it stays on; if the Cleaning light was off, the depleted cartridge causes the light to come on.

If a system error occurs, clean the drive and retry the operation. If the operation fails, replace the data cartridge, clean the drive again, then retry the operation.

**Loading and unloading cartridges**

Learn about loading and unloading tape cartridges from this drive.

To avoid problems with loading and unloading, use only one label on a cartridge. If the cartridge has too many or poorly-placed labels, the drive-load mechanism might clog.

**Loading a cartridge**

To load a cartridge, complete the following steps:
1. Make sure that the tape device power is on.
2. Grasp the cartridge by the outer edges, with the window side up and the write-protect switch facing you.

   Note: Make sure that the write-protect switch is correctly set.
3. Slide the cartridge into the opening on the front of the device until the loading mechanism pulls the cartridge into the drive and the drive door closes.

To indicate that the load operation was successful, the Ready status light comes on.
Unloading a cartridge

To unload a cartridge, complete the following steps:
1. Make sure that the tape device power is on.
2. Press the Unload button. The device rewinds, unloads, and ejects the tape cartridge.
   - The process might take from 15 seconds to several minutes, depending on the position of the tape and the amount of data written. During this task, the status lights do the following sequence:
     - The Ready status light turns off.
     - The Activity status light flashes during the unload operation.
     - The Activity status light turns off when the cartridge is ejected from the tape drive.

Attention: An emergency eject and reset feature can be used to release the tape cartridge and reset the drive. Use the emergency eject feature if the cartridge does not move correctly or if the unload process fails. The emergency eject and reset feature procedure might result in loss of data. To perform an emergency eject operation of the tape cartridge or a reset operation of the drive, press and hold the Unload button for at least 10 seconds. If a cartridge is in the drive, the cartridge automatically ejects without rewinding the tape.

Setting the write-protect switch (FC 5619)

You might need to set the write-protect switch on your tape drive. Use the information in this topic to perform this task.

Attention: Do not attempt to change the write-protect settings after the tape cartridge is loaded in the drive because this might cause unpredictable results and might damage the tape or the drive.

The position of the write-protect switch on the tape cartridge determines when you can write to the tape.

1 When the switch is set to the right, data can be written to and read from the tape.
2 When the switch is set to the left, data can only be read.
Status lights (FC 5619)

You might need to read the status lights on your tape drive to determine the operating status of the drive. Use the information in this topic to perform this task.

The following illustration is a front view of the tape drive:

![Front-view of tape drive](image)

Figure 6. Front-view of tape drive

<tr>
<td>23R5638</td>
<td>4 mm Cleaning Cartridge</td>
</tr>
</tbody>
</table>

Most bulk eraser devices do not have the capability to erase the 4 mm data cartridge. To correctly erase a 4 mm data cartridge with a bulk eraser device, the erasure coercivity rating must be a minimum of 3900 Oersted.

Resetting the tape drive
You might need to reset your tape drive. Use the procedure in this topic to perform this task.

Use this information to reset your tape drive, without affecting server operation. Allow up to 2 minutes for the entire tape drive process to complete.

Attention: Resetting a tape drive before the current backup operation has completed can cause loss of customer data.

To reset the tape drive, follow these steps:
1. Press and hold the eject button for 20 seconds, and then release the button. The LEDs on the drive will be flashing while the reset function is in process.
2. When the LEDs stop flashing, wait approximately one minute for the drive to complete the reset operation. The drive will then be ready to use.

36/72GB Data72 4 mm internal tape drive (FC 6258 or 5907)

Learn about the features of this media device.

**Description**

The 36/72 GB Data72 4 mm Internal Tape Drive is a 5.25-inch, half-high, LVD or SAS drive, which provides a high capacity for save/restore and achieve functions. This tape drive uses IBM 4 mm data cartridges and is capable of compression, providing a capacity of up to 72 GB.

Characteristics:
- FRU part number for FC 6258: 18P8779
- FRU part number for FC 5907: 23R2530
- Custom card identification number (CCIN): 63A0
- Capacity: 36 GB native mode, 72 GB (typical) compression mode
- Form Factor: 5.25-inch half high
- Media: DAT72, DDS4, and DDS3 media
- Technology: Helical scan, rotating head
- Operation: Streaming
- Data Transfer Rate: 3 MBps native mode, 6 MBps (typical) compression
- Interface for FC 6258: Low voltage differential
- Interface for FC 5907: Serial-Attached SCSI
- Compatibility: 12 GB mode (read/write), 20 GB (read/write), and 36 GB mode (read/write)
- Attributes provided: 4 mm tape capability
- Attributes required: One 1.6-inch (41 mm) half-high media bay and one SCSI internal LVD or SAS 16-bit address

**Tools**

The following tools and documentation are needed to complete the installation:
- A flat-blade screwdriver (if this device is not an auto-docking feature on your system)
- Your system unit documentation, including any service documentation
- Your operating system documentation

Contact the place of purchase if an item is missing or damaged.

**Note:** If you are installing the auto-docking version of this device on your system, the remainder of this section does not apply to your system. See your system documentation for information about the auto-docking feature.

**Media**

This tape drive uses 4mm data cartridges for saving and restoring system data. It is designed to use only DDS (Digital Data Storage) data cartridges. The cartridges are identified by one of the following DDS symbols:

- DDS3 (DDS-3 format)
- DDS4 (DDS-4 format)
- DAT 72

The tape drive reads and writes data to tape cartridges that are DDS-3, DDS-4, or DAT 72 format.

**Note:** This tape drive only supports DDS-3, DDS-4, and DAT 72 tape cartridges. If any other cartridge is inserted in the drive, it will be ejected.

This tape drive has been designed to operate with DDS media that meet the following standards of the European Computer Manufacturers Association (ECMA):
- ECMA-236 DDS-3 format
- ECMA-288 DDS-4 format
Your package contains the following items:

- The tape drive
- Media kit containing:
  - 1 cleaning cartridge
  - 1 test tape
  - Jumpers (located in a plastic bag)
- Specific hardware for attaching the drive to your specific system, as detailed on the parts listing provided with your drive.

### Cleaning the tape drive (FC 6258 or 5907)

You might need to clean your tape drive. Use the procedure in this topic to perform this task.

Clean the device whenever the Fault status light comes on or a system I/O error related to the device occurs.

**Attention:** Use only the recommended cleaning cartridge to clean the tape drive. Use of other than recommended cleaning cartridges can damage your drive and might void the warranty.

The tape drive will turn on the cleaning indicator for the following reasons:

- The tape drive exceeds internal preset error thresholds in the drive.
- A cleaning cartridge that has been used the maximum number of times is inserted in the drive. The cleaning indicator is turned on to indicate that the cleaning process was not done and the cleaning cartridge is no longer usable.
- The tape drive exceeds the maximum recommended time between cleaning.

The maximum recommended time between preventive-maintenance cleaning is 50 tape motion hours. Tape motion hours are defined as the time that the tape drive is moving tape. If the tape drive reaches 50 tape motion hours since the tape drives was last cleaned, the drive will turn on the cleaning required LED to indicate the drive needs cleaning. The tape drive will continue to operate but the tape drive should be cleaned at the next opportunity to insert a cleaning cartridge.

To clean the tape drive, complete the following steps:

1. Make sure that the power is on to the tape drive.
2. If a tape cartridge is in the tape drive, eject and remove the cartridge.

   **Note:** Some cleaning cartridges have white dots on the window side that are designed to be used to log the use of the cartridge. Each time the cartridge is used, mark one of the dots on the cartridge with a pen or marker. When all of the dots have been marked, discard the cleaning cartridge.

3. Grasp the cleaning cartridge by the outer edges, with the window-side up and the write-protect switch facing you.
4. Slide the cartridge into the opening on the front of the drive until the loading mechanism pulls the cartridge into the drive and the drive door closes.

After the cleaning cartridge has been inserted, the remainder of the cleaning process is automatic. The tape drive does the following actions:

- Loads the cleaning cartridge into the tape drive.
- Cleans the drive by moving the cleaning tape forward for approximately 30 seconds.
- Unloads the cleaning cartridge when the cleaning operation is complete.
- Indicates a successful cleaning operation by turning off the Fault status light (if the Fault light was on prior to the cleaning process).
Note: If the cleaning operation completes but the Fault light remains on, repeat the cleaning procedure with a new cleaning cartridge. If the light still remains on, contact your authorized service provider.

To determine how many times a cleaning cartridge can be used, check the information printed on the cartridge. If you attempt to use a depleted cleaning cartridge, the tape drive automatically detects the error and ejects the cartridge. If the Fault status light was on prior to the cleaning process, it stays on; if the Fault light was off, the depleted cartridge causes the light to come on.

If a system error occurs, clean the drive and retry the operation. If the operation fails, replace the data cartridge, clean the drive again, then retry the operation.

**Loading and unloading cartridges**

Learn about loading and unloading tape cartridges from this drive.

To avoid problems with loading and unloading, use only one label on a cartridge. If the cartridge has too many or poorly-placed labels, the drive-load mechanism might clog.

**Loading a cartridge**

To load a cartridge, complete the following steps:

1. Make sure that the tape device power is on.
2. Grasp the cartridge by the outer edges, with the window side up and the write-protect switch facing you.
   
   Note: Make sure that the write-protect switch is correctly set.
3. Slide the cartridge into the opening on the front of the device until the loading mechanism pulls the cartridge into the drive and the drive door closes.

To indicate that the load operation was successful, the Ready status light comes on.

**Unloading a cartridge**

To unload a cartridge, complete the following steps:

1. Make sure that the tape device power is on.
2. Press the Unload button. The device rewinds, unloads, and ejects the tape cartridge.
   
   The process might take from 15 seconds to several minutes, depending on the position of the tape and the amount of data written. During this task, the status lights do the following sequence:
   - The Ready status light turns off.
   - The Activity status light flashes during the unload operation.
   - The Activity status light turns off when the cartridge is ejected from the tape drive.

Attention: An emergency eject and reset feature can be used to release the tape cartridge and reset the drive. Use the emergency eject feature if the cartridge does not move correctly or if the unload process fails. The emergency eject and reset feature procedure might result in loss of data. To perform an emergency eject operation of the tape cartridge or a reset operation of the drive, press and hold the Unload button for at least 10 seconds. If a cartridge is in the drive, the cartridge automatically ejects without rewinding the tape.

**Setting the write-protect switch (FC 6258 or 5907)**

You might need to set the write-protect switch on your tape drive. Use the information in this topic to perform this task.
Attention: Do not attempt to change the write-protect settings after the tape cartridge is loaded in the drive because this might cause unpredictable results and might damage the tape or the drive.

The position of the write-protect switch on the tape cartridge determines when you can write to the tape.

1 When the switch is set to the right, data can be written to and read from the tape
2 When the switch is set to the left, data can only be read.

Status lights (FC 6258 or 5907)
You might need to read the status lights on your tape drive to determine the operating status of the drive. Use the information in this topic to perform this task.

The following illustration is a front view of the tape drive:

Figure 7. Front view of tape drive

</tr>
</tbody>
</table>

Notes:
- The device needs cleaning when the tape drive turns on the Fault status light (solid amber). The light turns on when the device exceeds a preset operating limit.
- The recommended preventive-maintenance cleaning frequency is approximately 50 tape motion hours. Tape motion hours are defined as the time that the tape drive is moving tape.
- When the Fault light turns on (solid amber), the device causes AIX to log an information error (TAPE_ERR6) in the AIX log, indicating that the tape drive needs to be cleaned.
- Use only quality media and cleaning cartridges.
- The device is designed to operate in typical office environments. Dirty environments or other poor environments might damage the tape drive. It is the customer’s responsibility to provide the proper operating environment.
- When the tape drive indicates that the drive needs to be cleaned, it is the customer’s responsibility to clean the tape drive with the recommended cleaning cartridge.
- If a tape cartridge that is not DDS-3, DDS-4, or DAT72 format is used, that cartridge will be immediately ejected as an incorrect cartridge type.

Most bulk eraser devices do not have the capability to erase the 4mm data cartridge. To correctly erase a 4mm data cartridge with a bulk eraser device, the erasure coercivity rating must be a minimum of 3900 Oersted.

Resetting the tape drive
You might need to reset your tape drive. Use the procedure in this topic to perform this task.
Use this information to reset your tape drive, without affecting server operation. Allow up to 2 minutes for the entire tape drive process to complete.

**Attention:** Resetting a tape drive before the current backup operation has completed can cause loss of customer data.

To reset the tape drive, follow these steps:
1. Press and hold the eject button for 20 seconds, and then release the button. The LEDs on the drive will be flashing while the reset function is in process.
2. When the LEDs stop flashing, wait approximately one minute for the drive to complete the reset operation. The drive will then be ready to use.
Chapter 3. Managing DVD drives

Learn about using and managing removable media devices. Find specifications and installation notes for specific drives.

IDE Slimline DVD-ROM Drive (FC 5756)

Learn about the specifications of this DVD-ROM drive.

The IDE Slimline DVD-ROM drive is an internal DVD-ROM drive. This drive can read type II (removable from cartridge) DVD-RAM discs at 2x speeds. System boot and installation functions are supported with CD-ROM, DVD-ROM, and DVD-RAM media.

Specifications

- FRU part number: 42R5293
- Custom card identification number (CCIN): 6337
- Interface: IDE/ATAPI
- Connector: Ultraslim enhanced (USE)
- Form factor: 12.7 mm Slimline
- Loading tray: supports 12 cm and 8 cm discs
- Operating positions: vertical or horizontal (8 cm discs require horizontal operation)
- Interface: uses standard and extended XA formats
- DVD video: not supported
- AIX 5.1 only reads CD-type formatted DVD media
- Requirements: 1 Slimline media bay

Related reference

“Opening a DVD tray manually”
Under usual conditions, the tray automatically opens when you press the Load/Unload button. If it does not automatically open, you can use the emergency eject feature to open the tray manually.

“DVD-RAM type II disc” on page 66
The DVD-RAM type II disc can be removed from its cartridge and played in a DVD-ROM or DVD-RAM drive that is compatible with the DVD-RAM type II disc.

Opening a DVD tray manually

Under usual conditions, the tray automatically opens when you press the Load/Unload button. If it does not automatically open, you can use the emergency eject feature to open the tray manually.

Follow these steps to manually open the tray:

1. Follow your operating system instructions for shutting down your system, then turn off the power to your system unit. Unplug the power cord from the wall outlet.
2. Insert the straightened end of a paper clip into the emergency eject hole until you feel some resistance.
3. Continue to push in the paper clip while you pull out the tray with your fingernail.
4. Pull the tray completely open and remove the disc. It is usual for the tray to make a clicking sound while you are pulling it open.

**DVD-RAM type II disc**

The DVD-RAM type II disc can be removed from its cartridge and played in a DVD-ROM or DVD-RAM drive that is compatible with the DVD-RAM type II disc.

**Attention:** Be careful when handling removed discs. Debris, dust particles, fingerprints, smears, or scratches can affect recording and playback of discs. Do not use solvents to clean disc surfaces. To clean a disc, use a soft, lint free cloth and gently wipe the disc surface outwards from the center hole to the outer edge. Do not rub, make circular motions or try to follow the circular lines in the disc. When labeling a disc, write only on the printed label side, using a soft felt-tip marker. Do not use a hard-tip pen to write on disc surface. Keep out of direct sunlight, high temperatures, and humidity. Do not attach labels to either side of the disc.

**Removing a disc from the cartridge**

To remove a disc from the cartridge, do the following steps:

**Note:** Handle the disc only by its edges.
1. Use the tip of a ballpoint pen to push the locking pin up and out of the disc cartridge.
2. Use the tip of a ballpoint pen to push down on the lock button while pulling the cartridge lid open.
3. With the cartridge lid open, slide the disc out of the cartridge.
Returning a disc to the cartridge

To return a disc to the cartridge, do the following steps:

Notes: Both the disc label and the cartridge label should be facing up. Handle the disc only by its edges.
1. Slide the disc into the cartridge.
2. Close the cartridge lid. Make sure the lock button snaps into position.
3. Install the locking pin.
Chapter 4. Managing diskette drives

Learn about the features of specific diskette drives.

External USB 1.44 MB diskette drive (FC 2591)

Learn about the features of this media device.

The following provides information about the external USB 1.44 MB diskette drive.

### Installation and removal

To install this external USB 1.44 MB diskette drive, complete the following steps:

1. Unpack the device and ensure you have all the cables and parts.
2. Connect the USB cables to an available USB port on the system unit.
3. Wait for the system to recognize the new device (approximately 1-3 minutes).

To remove this external USB 1.44 MB diskette drive, complete the following steps:

1. Ensure you complete any processes running from or to the diskette drive.
2. Eject any diskette you have in the device.
3. Disconnect the device from the system unit.

If you are installing this device on system unit or partition running the AIX operating system, you can refer to the manual at the following URL: USB 1.44 MB External Diskette Drive Installation and Using Guide http://publib16.boulder.ibm.com/pseries/en_US/incenter/base/hardware_docs/pdf/231332.pdf

If you are installing this device on a system or partition running any other operating system, see the documentation for that operating system.

### Description

The externally attached USB diskette drive provides storage capacity up to 1.44 MB on a high-density (2HD) diskette and 720 KB on a double-density diskette. Includes 350mm (13.7 in) captured cable with standard USB connector.

Limitations:

- Maximum 1 USB diskette per adapter
- Up to 1 Keyboard and Mouse also supported on the adapter with the diskette drive at the same time
- No system boot capability
- Not to be operated upside down or with eject button down

Characteristics:

- FRU part number: 033P3339
- Capacity - 1.44 MB (2HD disk) or 720 KB (double-density disk)
- Physical Dimensions: Width=103mm (4.05 in), Height=17.6mm (.69 in), Depth=141.8-mm (5.58 in)
- Color: Black
- Data Rate: 12 Mbits/sec
- Maximum Power Consumption: 2.36 Watt (seek)
- Operates in all positions except those noted in the preceding limitations
- Attributes provided: External diskette drive
- Attributes required: 1 available USB port

USB Removable Disk Drive (FC 1103, 1104, 1106, 1107)

Learn about the features of this drive.

Description

The USB Removable Disk Drive consists of a docking station, which holds a removable disk drive. The docking station is available as an internal or external device. The disk drive is a backup and restore device that can be used as an alternative to tape drives. The removable disk drive is not a replacement for regular disk drives and cannot be used as part of a disk array. The following illustrations show the internal and external drives.

*Figure 8. Internal drive, front view*

A  Emergency eject hole  
B  Cartridge indicator light  
C  Eject button and power indicator light

*Figure 9. External drive, front view*

Figure 11. External drive, rear view, and connectors
Feature codes and part numbers

Learn about the feature codes (FCs) and part numbers for the USB Removable Disk Drive.

**FC 1103 - USB Internal Docking Station for Removable Disk Drive**

FC 1103 uses an internal USB cable to connect to the internal USB port on the control panel of a system that supports this feature. The USB and power cable are included in the feature code.

FC 1103 provides the following parts:

- 46C5370 (FRU: 46C5380) - USB Internal docking station
- 46K7435 - Internal USB cable (12 inch)
- 46K7434 - Internal power cable (11 inch) with right angle power connector
- 44V3429 - Two drive slide assembly rails
- 1621187 - Four flat blade screws

**FC 1104 - USB External Docking Station for Removable Disk Drive**

FC 1104 uses an external USB cable to connect to an external USB port. The 1104 feature code includes a USB cable, external power supply, and power cord as part of the feature code.

FC 1104 provides the following parts:

- 46C5381 - USB external docking station
- 44E8889 - External USB cable
- 49Y9890 - External power supply with power cord and universal plugs for all supported geographies
- 39M5516 - Power cord (1 m) from the power supply to the rack power distribution unit

Purchasing additional removable disk drives

For best results, use only the removable disk drives that are shown in Table 29.
The removable disk drives are a supply item that can be ordered as a feature code. To order in the United States and Canada, call 1-888-IBM-MEDIA. To order drives in other locations, contact your local provider of IBM storage products or visit the following Web site: [http://www.storage.ibm.com/media/](http://www.storage.ibm.com/media/).

Removable disk drives are not a service item and IBM service representatives are not dispatched to service or replace removable disk drives.

**Storing removable disk drives**

Store removable disk drives in their protective containers, on a flat surface with the top side up. The storage area must be clean, dry, normal room temperature, and away from any magnetic fields. For best storage life, use the removable disk drives every six months.

**Supported USB adapters and cables**

**Attention:** The docking station only supports the USB cable that is provided as part of the feature code. The docking station does not support attachment using USB hubs, add-on USB cables, or USB cable extenders.

The external docking station can be connected to the external, integrated USB ports on POWER6™ systems or to the USB ports on 4-Port USB PCI Express™ Adapter (FC 2728).

The internal docking station can be connected to the internal USB port on the control panel of POWER6 systems.

**Note:** When the USB port on the control panel is used for the docking station, that port is disabled for other uses.

**Specifications**

**Interface**

- USB 2.0

**Mksysb**

**Supported operating systems**

USB Removable Disk Drive is supported on the following versions of the AIX and Linux® operating systems:

- AIX 5L Version 5.3 with the 5300-11 Technology Level, or later
Using the USB Removable Disk Drive for backup and restore

The disk drive is a backup and restore device that can be used as an alternative to tape drives. The removable disk drive is not a replacement for regular disk drives and cannot be used as part of a disk array.

**Note:** If power is lost during a backup to the disk, the data can be compromised. Verify the data or rerun the backup.

**Using the drive with AIX**

AIX names the drive usbmsx. For example, usbms1 and usbms2. AIX also can use the device as a raw device. For example, rusbms1 and rusbms2.

AIX uses the removable disk drive differently depending on the program being used. The AIX mksysb command builds a list of files to back up, creates a universal disk format (UDF) file system, and puts a boot image and the root volume group on the removable disk drive. When the mksysb process is complete the removable disk drive can be used to boot the system. If you mount the removable disk drive, you can display and copy files to and from the UDF file system on the removable disk drive.

The AIX tar, backup, restore, dd, and cpio commands can write to the removable disk drive as a raw device or non raw device. You might get improved performance by using the device as a raw device.

See the AIX documentation for additional information.

**Using the drive with Linux**

Linux configures the drive as a disk drive with a name in the format sd\text{x}, for example, sda, sdb, and sdc. See the Linux documentation for information about using Linux copy and backup commands.

**Setting the write-protect switch**

The removable disk drives have a red, write-protect tab that is located on the back of the drive. To write-protect a drive, slide the write-protect tab toward the lock symbol. To disengage write protection, slide the tab to the unlock symbol.

**Using the emergency eject function**

To eject a removable disk drive, press the eject button. If a drive is stuck, follow these steps:

1. If you using the internal docking station, power off the system. If you are using the external docking station, unplug the power cable from the device.
2. Insert a large straightened paper clip (or similar object) into the emergency eject hole. Do not insert the object in the hole at an angle. Keep the object straight and apply some force to eject the drive.
3. When the drive has been ejected by the docking station, grasp the exposed sides of the drive and pull the drive straight out.
4. Restart your system to reset the docking station. If you are using the external docking station, reconnect the power cable for the docking station and then restart the system.
Status lights

Learn about the power indicator and drive indicator status lights on the USB Removable Disk Drive.

Power indicator

The eject button is illuminated by a power indicator light. The following table describes the operation of the power indicator.

Installing the docking station for the removable disk drive

For comprehensive installation instructions, see the Media devices topic.

Keep in mind the following points when you install FC 1104, the USB External Docking Station for Removable Disk Drive:

- A rack shelf is not included with FC 1104.
- The docking station can be rested on a flat surface in a rack or on a table top next to a rack.
- Ensure that the device is on a flat surface, is right side up, and is not likely to be bumped, dropped, or otherwise damaged or jolted.
- If the docking station is placed by itself on a rack shelf, it will have space on the sides of the device. No filler panels are provided with the docking station.
- If the docking station is placed on a rack shelf, ensure that the docking station has sufficient air flow but that is does not affect the air flow of the other systems in the rack.
- Do not block the fan on the back of the docking station.
Chapter 7. Managing communications devices

Learn about the LAN-Attached Remote Asynchronous Node (RAN) 16 (model 7036-P16).

LAN-Attached Remote Asynchronous Node 16 (model 7036-P16)

Learn about installing, removing, replacing and managing the LAN-Attached Remote Asynchronous Node (RAN) 16 (model 7036-P16).

Note: Additional information can be found on the software CD provided with this device.

7036-P16 description and overview

Learn about the product description, characteristics, and throughput considerations for this device.

Product description

The 7036-P16 is a 16-port EIA-232 LAN-Attached Remote Asynchronous Node (RAN) for IBM System p® servers. The 7036-P16 provides connectivity to asynchronous EIA-232 devices, such as modems, terminal type (tty) terminals, printers, and so on.

The 7036-P16 can be used in a rack-mounted or table-top configuration. Hardware to mount the 7036-P16 in a rack or to use on a table top is included in the package. When installed in a rack, take care with routing the cables to ensure the cables do not interfere with other devices mounted in the rack.

The 7036-P16, when used with Digi RealPort software, will convert the serial data stream to and from attached asynchronous EIA-232 devices into TCP/IP traffic. After the data is on the TCP/IP network, a host system attached to the same network can treat the attached devices as if the devices were connected directly to the host system.

Product characteristics

Electromagnetic Compatibility (EMC) Certifications:

- FCC Rules Part 15, Subpart B, Class A limit
- EN55022: 1998 + Amendment 1:2000 Class A
- AS/NZS CISPR 22.2002
- Japan VCCI V3.2001.04
- ICES-003, CLass A
- Australian EMC Framework (C-Tick Mark) consisting of AS/NZS CISPR 22:2002

Safety:

- UL CD certified to EN60950 3rd Edition
- CSA C22.2 No 60950
- UL recognized to UL60950 3rd Edition

Physical characteristics:

Throughput considerations

The limits on throughput are a function of the network and the server or server partition to which the 7036-P16 ports are configured.

System port throughput:

The 7036-P16 supports full-duplex operation up to 230K bps on all ports. Operation with all sixteen ports running full-duplex at 230K bps is supported.

Network throughput:

The 7036-P16 is an Ethernet attached device and as such, any number may be attached to a given network. However, attaching more devices to any network reduces the overall network throughput and care must be taken to not overload any given network.

Testing has shown that as many as eight 7036-P16 devices may be attached to a network without adversely affecting network throughput. Eight 7036-P16 devices will support up to 128 asynchronous EIA-232 connections. More devices may be attached, but network performance may be adversely affected.

Server or partition throughput:

Each 7036-P16 provides 16-Ports of asynchronous EIA-232 connectivity over a 10/100 Ethernet port at speeds up to 230K bps. Given that any number of 7036-P16s may be attached to a server or partition, a single server or partition could in effect have a very large number of asynchronous EIA-232 connections that could adversely affect any single server or partition.
Installing 7036-P16 hardware

You might need to install this hardware. Use the procedure in this section to perform this task.

The following information describes the materials and procedures for installing this device. A Phillips screwdriver is required to complete the installation of this unit.

Before you install the 7036-P16 unit, verify that the hardware package contains the following items:

- 7036-P16 unit
- 7036-P16 software and documentation CD
- 7036-P16 Quick Setup Guide
- Brackets to mount 7036-P16 on rack
- Rubber feet for tabletop usage
- Power cord (North American 120 V ac use only)
- RJ-45 to DB25 serial cable
- RJ-45 to DB09 serial cable
- RJ-45 wrap plug for diagnostics.

Installing the deskside 7036-P16 unit

To install the deskside 7036-P16 unit, do the following steps:

1. Unpack the hardware.
2. Remove the rubber feet from the plastic bag.
3. Attach the rubber feet to the bottom of the 7036-P16 in the locations indicated.
4. Attach the power cord. A power cord for use in North America is provided.
5. Use an Ethernet cable to connect the 7036-P16 to the network.
6. Connect serial devices as needed.

Installing the rack-mounted 7036-P16 unit

To install the rack-mounted 7036-P16 unit, do the following steps:

1. Unpack the hardware.
2. Remove the right-angle brackets and screws from the plastic bag.
3. Use a Phillips screw to attach the brackets in the predrilled holes on the sides of the 7036-P16.
4. Mount the 7036-P16 in the same location from which the 7036-P16 was removed.
5. Attach the power cord. A power cord for use with 120 V ac is provided.

Optional rack power cord feature codes (FC) are available to connect the 7036-P16 to the rack Power Distribution Unit (PDU). These cords come in various lengths. They are identified by the following feature codes:

- FC 6458: Power Cord (14-foot), Drawer to IBM PDU, 250V/10A
- FC 6672: Power Cord (9-foot), Drawer to IBM PDU, 250V/10A
- FC 6671: Power Cord (5-foot), Drawer to IBM PDU, 250V/10A

The previous features are only available for use in racks less than 25U in size.
6. Use an Ethernet cable to connect the 7036-P16 to the network.
7. Connect serial devices as needed.
Installing Digi RealPort software for the 7036-P16 device

You might need to install the Digi RealPort software on an AIX or Linux host server. Use the procedure in this section to perform this task.

Digi RealPort software-support packages

The following is a list of the software packages available on the software CD provided with the 7036-P16 unit:

- The Digi RealPort software package for AIX supports the following AIX levels:
  - AIX 5L™ 5.2.0.75 (and later)
  - AIX 5L 5.3.0.30 (and later)
- The Digi RealPort software package for Linux supports the following Linux levels:
  - Linux Red Hat Version RHEL4, Update 3
  - Linux SUSE Version SLES 9 SP2

Installing the Digi RealPort software

To install the Digi RealPort software, do the following steps:

1. Install all updates and packages required to bring the operating system to the supported levels.
2. Install all Linux packages required to compile and create binaries from the Digi RealPort Software source code.
   The following is a list of Linux packages that are required to install the Digi RealPort software:
   - gcc
   - gcc-64bit
   - gcc-c++
   - gcc-g77-64bit
   - gcc-info
   - gcc-locale
   - gcc-objc
   - gcc-objc-64bit
   - kernel sources
   - glibc-devel-64bit
   - ncurses-64bit
   - ncurses-devel
3. Install the Digi RealPort software. To install the software, see the following procedures.

Installing the AIX Digi RealPort software

To install the software package for the AIX environment, do the following steps:

1. Log in to the host server as the root user.
2. Insert the CD-ROM into the CD-ROM drive.
3. Type the following command: smitty install_all
5. Select digiasync, then press Enter.
6. Use the cursor to scroll to ACCEPT new license agreement
8. Select Yes, then press Enter.
When installation commences, do not interfere until the installation completes. A successful installation will return an OK message. An unsuccessful installation will return a FAILED message. If you receive an OK message, continue to the next step. If you receive a failed message, review the `smit.log` file to determine why the installation failed.

10. Type: `lslp -1 | grep digi`

If the Digi RealPort package installed correctly, you will receive a message. The following are examples of return messages:

- `digiasync.realport.obj 3.8.7.0 COMMITTED Digi RealPort Driver`
- `digiasync.realport.obj 3.8.7.0 COMMITTED Digi RealPort Driver`

11. After the Digi RealPort Software is installed, the user may configure the 7036-P16 onto the network, if it is not already configured. For instructions on how to perform the network configuration, see “Configuring the 7036-P16 into the network” on page 86.

### Installing the Linux SUSE Digi RealPort software

To install the software package for the Linux SUSE environment, do the following steps:

1. Log in to the server as the root user.
2. If the CD-ROM is already inserted and mounted, then proceed to step 5.
3. Insert the CD-ROM into the CD-ROM drive.
4. Type: `mount -t auto /dev/cdrom /mnt`
5. Type: `cp /mnt/linux/40002086_M.src.rpm /usr/src/packages/SOURCES`
6. Type: `umount /mnt`
7. Type: `cd /usr/src/linux`
8. Type: `make mrproper`
9. Type: `make oldconfig`
10. Type: `cd /usr/src/packages/SOURCES`
11. Type: `rpmbuild --rebuild 40002086_M.src.rpm`
12. Type: `rpm -i /usr/src/packages/RPMS/ppc64/dgrp-1.9-6.ppc64.rpm`
13. Type: `rpm -qa | grep dgr`

If the Digi RealPort Package installed correctly, the following is an example of the return message:

```
 dgr-1.9.6
```

14. After the Digi RealPort software is installed, the user may configure the 7036-P16 onto the network, if it is not already configured. For instructions on how to perform the network configuration, see “Configuring the 7036-P16 into the network” on page 86.

### Installing the Linux Red Hat Digi RealPort software

To install the software package for the Linux Red Hat environment, do the following steps:

1. Log in to the server as the root user.
2. If the CD-ROM is already inserted and mounted, then proceed to step 5.
3. Insert the CD-ROM into the CD-ROM drive.
4. Type: `mount -t auto /dev/cdrom /mnt`
5. Type: `cp /mnt/linux/40002086_M.src.rpm /usr/src/packages/SOURCES`
6. Type: `umount /mnt`
7. Type: `cd /usr/src/packages/SOURCES`
8. Type: `rpmbuild --rebuild 40002086_M.src.rpm`
9. Type: `rpm -i /usr/src/packages/RPMS/ppc64/dgrp-1.9-6.ppc64.rpm`
10. Type: `rpm -qa | grep dgr`
   If the Digi RealPort Package installed correctly, the following is an example of the return message:
   `dgr-1.9.6`

11. After the Digi RealPort software is installed, the user may configure the 7036-P16 onto the network, if
   it is not already configured. For instructions on how to perform the network configuration, see
   "Configuring the 7036-P16 into the network" on page 86.

**Configuring the 7036-P16 device and tty**

You might need to configure the 7036-P16 as a serial device on a host server. Use the procedure in this
section to perform this task.

The task consists of the following steps:

1. Configure the 7036-P16 as a serial device on a host server installed with one of the following
   operating systems:
   - AIX 5L 5.2.0.75, or later
   - AIX 5L 5.3.0.30, or later
   - Red Hat Enterprise Linux version 4, Update 3, or later
   - SUSE Linux Enterprise Server 9, SP2, or later
   This in effect binds the 7036-P16 to the host server.

2. Configure 7036-P16 system ports for use with Digi RealPort software.

### Configuring a 7036-P16 device on an AIX host server

**Assumptions:**
- The target 7036-P16 and the host server are configured on an Ethernet network.
- The target 7036-P16 and the host server are attached to an Ethernet network.
- The Digi RealPort software is installed on the server.

**Gather the following information:**
- IP Address of the target 7036-P16: [7036-P16 IP Address]
- IP Address of the host server: [Host Server IP Address]
- Root password of target 7036-P16

**Configure the 7036-P16 as a serial device on an AIX server:**

1. Ensure that the 7036-P16 and the server are on the network. Ping the 7036-P16 by typing the
   following command: `ping -c 1 [IP Address of target 7036-P16]`
   If the 7036-P16 responds to the ping, then it is on the network and the user can proceed to the next
   step. If the 7036-P16 does not respond to the ping, then the 7036-P16 is not on the network and the
   user must perform the network configuration procedure, see "Configuring the 7036-P16 into the
   network" on page 86.

2. Ensure that the Digi RealPort Software is installed on the server. Type the following command: `ls1pp
   -l | grep digi`
   The response indicates that the digiasync.realport.obj file is installed.

   **Note:** If the response indicates the Digi RealPort Software is installed then proceed to step 3. If there
   is no response, then the Digi RealPort Software is not installed and the user must install the Digi
   RealPort Software, see "Configuring the 7036-P16 into the network" on page 86.

3. Type: `smitty devices`

4. Use the cursor to select: Digi Device and Terminal Servers, then press Enter.

5. Use the cursor to select: Add a Digi Device and Terminal Servers, then press Enter
6. Use the cursor to select: cts_16_r, then press Enter.
7. Move the cursor to the IP Address box and type: [IP Address], then press Enter. This is the [IP Address of the target 7036-P16] used in Step 1.
   Upon successful completion of this command the user will see the following on the screen: Command:
   OK stdout: yes stderr: no Before command completion, additional instructions may appear.
   sa[device number] Available

9. To configure additional devices, repeat Steps 7. through 10.
10. Press F10 to exit from smitty and return to the server’s command line.

After the serial device is configured, the terminal type (tty) ports may be configured.

**Configuring a 7036-P16 system port tty on an AIX host server**

Assumptions:
- The target 7036-P16 and the host server are configured on an Ethernet network.
- The target 7036-P16 and the host server are attached to an Ethernet network.
- The Digi RealPort software is installed on the server.

Gather the following information:
- IP Address of the target 7036-P16: [7036-P16 IP Address]
- IP Address of the host server: [Host Server IP Address]
- Root password of target 7036-P16

Procedure:
1. Ensure that the 7036-P16 and the server are on the network. Ping the 7036-P16 by typing the following command: ping -c 1 [IP Address of target 7036-P16]
   **Note:** If the 7036-P16 responds to the ping, then it is on the network and the user may proceed to the next step. If the 7036-P16 does not respond to the ping, then the 7036-P16 is not on the network and the user must perform the network configuration procedure, see “Configuring the 7036-P16 into the network” on page 86.
2. Ensure that the Digi RealPort Software is installed on the server. Type the following command: lslpp -l | grep digi
   **Note:** The response indicates that the digiasync.realport.obj file is installed. If the response indicates the Digi RealPort Software is installed then proceed to the next step. If there is no response, then the Digi RealPort Software is not installed and the user must install the Digi RealPort software, see “Configuring the 7036-P16 into the network” on page 86.
3. Type: smitty tty, then press Enter.
4. Use the cursor to select: Add a tty, then press Enter.
5. Use the cursor to select: tty rs232 Asynchronous Terminal, then press Enter.
6. Use the cursor to select: sa[device number] Available IBM LAN Attached RAN 16, then press Enter.
7. Enter a port number not already assigned to a tty, for example 1, and press Enter
   Upon successful completion of this command the user sees the following on the screen: Command: OK stdout: yes stderr: no Before command completion, additional instructions may appear.
   tty[number] Available
   **Note:** The [number] is the number assigned by smitty as the next available tty device.

10. Press F10 to exit from **smitty** and return to the server’s command line.

This concludes the system port tty configuration on an AIX Server.

**Configuring the 7036-P16 as a tty device on a Linux host server**

**Assumptions:**
- The target 7036-P16 and the host server are configured on an Ethernet network.
- The target 7036-P16 and the host server are attached to an Ethernet network.
- The Digi RealPort software is installed on the server.

**Gather the following information:**
- IP Address of the target 7036-P16: [7036-P16 IP Address]
- IP Address of the host server: [Host Server IP Address]
- Root password of target 7036-P16

**Procedure:**
1. Ensure that the 7036-P16 and the server are on the network. Ping the 7036-P16 by typing the following command: `ping -c 1 [IP Address of target 7036-P16]`

   **Note:** If the 7036-P16 responds to the ping, then it is on the network and the user may proceed to the next step. If the 7036-P16 does not respond to the ping, then the 7036-P16 is not on the network and the user must perform the network configuration procedure, see “Configuring the 7036-P16 into the network.”

2. Ensure that the Digi RealPort software is installed on the server. Type the following command: `rpm -qa | grep dgr`

   The response from the command is: `dgr-1.9.6`

   **Note:** If there is no response, then the Digi RealPort software is not installed and the user must install the Digi RealPort Software, see the Linux Red Hat or the Linux SuSE installation procedure, see “Configuring the 7036-P16 into the network.”

3. Type the following command:
   
   `dgrp_cfg_node -v init [Device ID] [IP Address] [7036-P16 Port(s)]`

   Where: [Device ID] is any two characters that the user uses to identify the target 7036-P16. [IP Address] is the IP Address of the target 7036-P16. [7036-P16 Port(s)] correspond to the port number(s) being configured.

This concludes the system port tty configuration on a Linux Host server.

**Configuring the 7036-P16 into the network**
You might need to configure the 7036-P16 device to work within the system network. Use the procedure in this section to perform this task.

The following sections describe methods for configuring the 7036-P16 in a network: the Ethernet method, the ping-ARP method, and the direct-terminal attach method.

**Network configuration methods and considerations**
The 7036-P16 is an Ethernet device and as such it must be configured onto the network like any other Ethernet device. Various network configuration methods are available to the user.
Configuring the 7036-P16 onto an Ethernet network

If the 7036-P16 is to be used in a network that supports Dynamic Host Configuration Protocol (DHCP), then the configuration will be performed by simply connecting to the network and powering up the 7036-P16. The 7036-P16 is shipped from the factory with the DHCP option enabled.

If DHCP is not supported on the network, then the user must choose between the ping-ARP configuration or the direct terminal attach method.

The ping-ARP configuration method is recommended for the following reasons:

- This method does not require the user to be in the same room as the 7036-P16.
- This method does not require any extra hardware, such as a terminal type (tty) terminal or cabling to attach the 7036-P16 to the tty terminal.
- This method works equally well for AIX and Linux installations.
- This method does not require the 7036-P16 be connected into a network that supports DHCP.

Ping-ARP network configuration method

To configure the 7036-P16 device into the network using this method, do the following steps:

1. Gather the following information from the system or network administrator:
   - MAC Address: [MAC Address] (MAC Address label is on the back of the 7036-P16)
   - IP Address: [IP Address]
   - Default Gateway: [IP Gateway Address]
   - Name Server: [Name Server Address]
   - Subnet Mask: [Subnet mask]
   - Host Name: [Host Name]
   - Domain Name: [Domain Name]

2. Connect the power cord from the 7036-P16 to a power source and turn the power on.

3. Connect the Ethernet cable from the 7036-P16 to an Ethernet network.

4. Log in to a server as root user, and make sure the server is on the same subnet as the 7036-P16.

5. Manually update the server’s ARP table.

6. Use the IP address and the 7036-P16’s MAC address gathered in Step 1.
   The AIX and the Linux command line entries to update the ARP table are different, use the following examples on how to update the server’s ARP table:
   AIX Command: arp -s ether [IP Address] [MAC Address]
   Linux Command: arp -v -H ether -s [IP Address] [MAC Address]

7. Ping the 7036-P16 using the IP address by typing: ping -c 1 [IP Address] The ping may time out before there is a response from the 7036-P16. Repeat the ping until the 7036-P16 responds. The ping response indicates that the IP address has been configured.

8. Use telnet to access the 7036-P16, using the IP address from the ping command: telnet [IP Address]

9. Log in to the 7036-P16 as root. Use the default password: dbps

10. After logging in, you can change the root password. To change the password, type: newpass Follow the prompts provided after entering the command.

11. To view the current configuration, type: set config

12. Type the following commands on the 7036-P16 command line using the information gathered in Step 1 to complete the IP Address configuration:
   ```
   set config ip=[IP Address]
   set config submask=[Subnet Mask]
   set config gateway=[IP Gateway Address]
   ```
set config dns=[Name Server Address]
set config dhcp=off
set config hostname=[Host Name]
set config domain=[Domain Name]

13. As a precaution, you can deactivate the ping-ARP and RARP options. To deactivate the ping-ARP and RARP options type the following commands:
   set config Ping-ARP=off
   set config RARP=off

14. If the user plans to use the Digi RealPort software on the host server to control all the 7036-P16 ports, then the system ports must be configured for use with the Digi RealPort software. Type the following command: set port range** dev=rp

15. Issue the reboot command to the 7036-P16 in order to permanently set the changes. Type the following command: boot action=reset

When the 7036-P16 reboots, then the network configuration is complete.

The 7036-P16 can now be accessed through the Ethernet connection. The user can program other features as required. See additional documentation on the 7036-P16 Software and Documentation CD.

**Direct-attach configuration method**

A regular tty terminal or a PC running a terminal emulation program, may be attached directly to any one of the 16 ports and commands entered on the 7036-P16 command line to configure the 7036-P16 onto the network.

This method requires the user to be in the same room as the 7036-P16. This method requires the user to have a tty terminal or a PC available. This method requires a serial cable to connect the tty terminal or PC to the server. This method is independent of the operating system installed on the server.

To configure the 7036-P16 device into the network using this method, do the following steps:

1. Gather the following information from the system or network administrator:
   - MAC Address: [MAC Address] (MAC Address label is on the back of the 7036-P16)
   - IP Address: [IP Address]
   - Default Gateway: [IP Gateway Address]
   - Name Server: [Name Server Address]
   - Subnet Mask: [Subnet mask]
   - Host Name: [Host Name]
   - Domain Name: [Domain Name]

2. Connect the power cord from the 7036-P16 to a power source and power up.
3. Connect the serial cable from tty terminal to the 7036-P16.
4. Log in to the 7036-P16 as the root user, use the default password dbps.
5. After login, you can change the root password. Type: newpass
6. To view the current configuration, type: set config
7. Type the following commands on the 7036-P16 command line using the information gathered in Step 1 to complete the IP Address configuration:
   - set config ip=[IP Address]
   - set config submask=[Subnet Mask]
   - set config gateway=[IP Gateway Address]
   - set config dns=[Name Server Address]
   - set config dhcp=off
   - set config hostname=[Host Name]
   - set config domain=[Domain Name]
8. As a precaution, you can deactivate the Ping-ARP and RARP options. To deactivate the Ping-ARP and RARP options, type the following commands:
   ```
   set config Ping-ARP=off
   set config RARP=off
   ```

9. If you plan to use the Digi RealPort software on the host server to control all the 7036-P16 ports, then the system ports must be configured for use with the Digi RealPort software. Type the following command:
   ```
   set port range=** dev=rp
   ```

10. Issue the reboot command to the 7036-P16 in order to permanently set the changes. Type the following command:
    ```
    boot action=reset
    ```

When the 7036-P16 reboots, then the network configuration is complete.

The 7036-P16 may now be accessed via the Ethernet connection. The user can program other features as required. See additional documentation on the 7036-P16 Software and Documentation CD.

**Using diagnostic aids for the 7036-P16**

You might need to use diagnostic programs to identify hardware problems. Use the procedure in this section to perform this task.

The 7036-P16 is not supported under AIX Diagnostics. A means to diagnose hardware problems with the 7036-P16 is provided by an executable program.

The purpose of this program is to diagnose hardware problems with the 7036-P16, such as bad connectors, faulty electronic components, and so on. The diagnostic is not intended to resolve protocol problems, network problems or a faulty host server to which the 7036-P16 may be attached.

**Requirements for using the 7036-P16 diagnostic program**

- The 7036-P16 and the AIX host server must be on the same network.
- The Digi RealPort Software for AIX Package must be installed.
- The user must ensure the problems are not caused by a faulty host server, the network or a device attached to any one of the 16 system ports.
- The Diagnostic Program is run from the AIX host server.
- Wrap Plug IBM part number 43G0928.

**7036-P16 diagnostic program capabilities**

- Wrap data on each of the 16 system ports
- Monitor data on each of the 16 system ports
- Provide VPD (vital production data)

**Using the 7036-P16 diagnostic program**

1. Log in to the AIX host server as root.
2. From the root home directory type:
   ```
   ./usr/lbin/tty/dpa-ncxa
   ```
3. Press Enter.
4. The next screen will present a list of all the 7036-P16s configured on the host server. The list includes the device name and the IP Address for each 7036-P16. The user should look at the bottom of the screen for options.
5. Select a 7036-P16 on the list by using the cursor keys. The 7036-P16 selected is highlighted.
6. Type D to see the 7036-P16 product information.
7. Press enter to test an individual terminal type (tty) port on the selected 7036-P16. The next screen will present Port-1 of the 7036-P16 that was selected.
8. To select a different tty port, use the cursor keys to either increment or decrement the port number.

9. Once a tty port is selected, then select one of the following items:
   a. Wrap data by typing a T. If this option is chosen, use wrap plug part number 43G0928. Insert the
      wrap plug into the tty port.
   b. Monitor the data on the selected port by typing a D.

10. To exit the diagnostic program, press ESC.

**General purpose diagnostic procedures, visual inspections**

**Ethernet cables**
- Ensure an Ethernet cable is attached to the 7036-P16 and the host server.
- Ensure the Ethernet cable is wired correctly.
- Ensure the Ethernet cable is good.

**Serial cables**
- Ensure a serial cable is attached to every 7036-P16 port that is in use.
- Ensure the serial cables are wired correctly.
- Ensure the serial cables are good.

**Investigating Ethernet network problems associated with the 7036-P16**

1. Gather the following information:
   - For the 7036-P16:
     - MAC Address: [MAC Address] (MAC Address label is on the back of the 7036-P16)
     - IP Address: [7036-P16 IP Address]
     - Default Gateway: [IP Gateway Address]
     - Name Server: [Name Server Address]
     - Host Name: [Host Name] (if a host name is assigned)
   - For the host server:
     - Machine Type and Model
     - AIX Level
     - IP Address: [Host server IP Address]
     - Default Gateway: [IP Gateway Address]
     - Name Server: [Name Server Address]
     - Host Name: [Host Name] (if a host name is assigned)

2. Ping the 7036-P16 from the host server by typing: ping -c 1 [7036-P16 IP Address]
   - If the 7036-P16 responds to the ping, then both devices are on the network; the problem is not a
     network attachment problem. If the ping times out, then either the 7036-P16 or the host server is not
     on the network.

3. Use traceroute to see where the link between the 7036-P16 and the host server is broken. Type:
   - traceroute [7036-P16 IP Address]

**Replacing and reconfiguring the 7036-P16**

You might need to create a 7036-P16 configuration file, reconfigure a 7036-P16 from a stored configuration
file, or replace a 7036-P16. Use the procedures in this section to perform this task.

This section provides instructions on how to perform the following tasks:
- Creating a 7036-P16 configuration file
- Reconfiguring a 7036-P16 from a stored configuration file
Replacing a 7036-P16

Creating a 7036-P16 configuration file

Create a copy of the 7036-P16 configuration and to store it on the host server.

Hardware requirements:
- AIX or Linux host server with Web access
- 7036-P16 attached to an Ethernet network

Gather the following information:
- IP Address of the target 7036-P16: [7036-P16 IP Address]
- IP Address of the host server: [Host Server IP Address]
- Root password of target 7036-P16

7036-P16 configuration file creation methods

The following are methods for creating a 7036-P16 configuration file:
- Web user interface method
- Command line method

Access the 7036-P16 command line and enter commands directly onto the 7036-P16. This method requires TFTP to be enabled on the host server.

Web user interface method

To create a configuration file using the web user interface method, do the following steps:
1. Use the host server to access the web interface of the target 7036-P16 by entering the 7036-P16 IP address in a browser’s URL window, then log in as the root user.
2. Select Backup/Restore
3. Select Backup
4. Select Save
5. The program will create a file named backup.cfg. Consider changing that name to something more meaningful. Example: backup_[IP Address].txt
6. When the task is completed a Download Complete message will be posted to the screen.

Command line method

To create a configuration file using the command line method, do the following steps:
1. Ensure the TFTP daemon is enabled on the host server. On an AIX server type the following on the command line: ps -ef | grep tftp
   If the TFTP daemon is enabled, the response will include two active TFTP processes and the user should proceed to Step 8. If the response indicates that only the grep process is active, then the TFTP daemon must be enabled.
2. To enable the TFTP daemon, type the following command: smitty subsys
3. Select Start a Subsystem, then press Enter.
4. Press F4
5. Search the resulting list for tftpd, then press Enter.
6. Telnet to the target 7036-P16. Type: telnet [IP Address of target 7036-P16], then press Enter.
7. Login as the root user, use the root password.
8. Type the following on the 7036-P16 command line:
Reconfiguring a 7036-P16 from a stored configuration file

Use a stored configuration file when replacing a 7036-P16.

Hardware requirements:
- AIX or Linux host server with Web access
- 7036-P16 attached to an Ethernet network

Gather the following information:
- IP Address of the target 7036-P16: [7036-P16 IP Address]
- IP Address of the host server: [Host Server IP Address]
- Root password of target 7036-P16

7036-P16 reconfiguration methods

The following are methods for creating a 7036-P16 configuration file:
- Web user interface method
- Command line method
  Access the 7036-P16 command line and enter commands directly onto the 7036-P16. This method requires TFTP to be enabled on the host server.

Web user interface method

To modify the configuration file using the web user interface method, do the following steps:
1. Use the host server to access the web interface of the target 7036-P16 by entering the 7036-P16 IP address in a browser’s URL window, then log in as the root user.
2. Select Backup/Restore
3. Select Browse and navigate to the directory where the stored file is kept on the host server.
4. Select the stored configuration file and click on Open. For example: backup_[IP Address].txt The complete path to the stored file will appear in the Browse window.
5. Click on Restore.
6. Wait for the configuration to complete, then click on Done.
7. Click on Reboot.
8. The task is complete when the 7036-P16 reboots.

Command line method

To modify the configuration file using the command line method, do the following steps:
1. Telnet to the target 7036-P16. Type: telnet [IP Address of target 7036-P16], then press Enter.
2. Login as root, use the root password.
3. To reconfigure the 7036-P16, type the following command:
   cpconf fromhost=[Host Server IP Address]:/tmp/backup_[IP Address].txt
4. Reboot the 7036-P16. Type: boot action=reset
5. When the 7036-P16 reboots, then the task is complete.
Replacing a 7036-P16

Attention: Before replacing a 7036-P16, create a 7036-P16 configuration file.

You need a Phillips screwdriver to replace this unit.

To replace a 7036-P16 unit, do the following steps:

1. Gather the following IP information for the 7036-P16 unit to be replaced:
   - MAC Address: [MAC Address] (MAC Address label is on the back of the 7036-P16)
   - IP Address: [IP Address]
   - Default Gateway: [IP Gateway Address]
   - Name Server: [Name Server Address]
   - Subnet Mask: [Subnet mask]
   - Host Name: [Host Name]
   - Domain Name: [Domain Name]

2. Power off the 7036-P16.

3. Remove the power cord.

4. Remove the Ethernet cable.

5. Remove each serial cable, and make sure each cable is marked indicating from which tty port it was removed.

6. If the 7036-P16 is installed as a desktop unit, then remove the rubber feet from the plastic bag and attach them to the replacement 7036-P16.

7. If the 7036-P16 is used as a rack mounted device, then undo the screws from the rack and remove the 7036-P16 from the rack.

8. Remove the replacement 7036-P16 unit from the shipping package.

9. Remove the right angle brackets and screws from the plastic bag.

10. Use a Phillips screw to attach the brackets in the predrilled holes on the sides of the 7036-P16.

11. Mount the new 7036-P16 in the same location from which the previous 7036-P16 was removed.

12. Attach the power cord.

13. Attach the Ethernet cable.

14. Attach the serial cables, using the markings from Step 5 in order to restore each cable to its previous port.

15. After the 7036 is configured on the network, telnet to the target 7036-P16. Type: telnet [IP Address of target 7036-P16]

16. Log in as the root user.

17. To reconfigure the 7036-P16, type the following command:

   `cpconf fromhost=[Host Server IP Address]:/tmp/backup_[IP Address].txt`

Field replacement units for the 7036-P16

Identify field replacement units (FRUs) for the 7036-P16.

The following table lists the FRUs for the 7036-P16.

Appendix. Notices

This information was developed for products and services offered in the U.S.A.

The manufacturer may not offer the products, services, or features discussed in this document in other countries. Consult the manufacturer’s representative for information on the products and services currently available in your area. Any reference to the manufacturer’s product, program, or service is not intended to state or imply that only that product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any intellectual property right of the manufacturer may be used instead. However, it is the user’s responsibility to evaluate and verify the operation of any product, program, or service.

The manufacturer may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to the manufacturer.

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law: THIS INFORMATION IS PROVIDED “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. The manufacturer may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to Web sites not owned by the manufacturer are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this product and use of those Web sites is at your own risk.

The manufacturer may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning products not produced by this manufacturer was obtained from the suppliers of those products, their published announcements or other publicly available sources. This manufacturer has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to products not produced by this manufacturer. Questions on the capabilities of products not produced by this manufacturer should be addressed to the suppliers of those products.

All statements regarding the manufacturer’s future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.
The manufacturer’s prices shown are the manufacturer’s suggested retail prices, are current and are subject to change without notice. Dealer prices may vary.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

If you are viewing this information in softcopy, the photographs and color illustrations may not appear.

The drawings and specifications contained herein shall not be reproduced in whole or in part without the written permission of the manufacturer.

The manufacturer has prepared this information for use with the specific machines indicated. The manufacturer makes no representations that it is suitable for any other purpose.

The manufacturer’s computer systems contain mechanisms designed to reduce the possibility of undetected data corruption or loss. This risk, however, cannot be eliminated. Users who experience unplanned outages, system failures, power fluctuations or outages, or component failures must verify the accuracy of operations performed and data saved or transmitted by the system at or near the time of the outage or failure. In addition, users must establish procedures to ensure that there is independent data verification before relying on such data in sensitive or critical operations. Users should periodically check the manufacturer’s support websites for updated information and fixes applicable to the system and related software.

**Trademarks**

IBM, the IBM logo, and ibm.com are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the Web at [Copyright and trademark information](http://www.ibm.com/legal/copytrade.shtml).

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Red Hat, the Red Hat "Shadow Man" logo, and all Red Hat-based trademarks and logos are trademarks or registered trademarks of Red Hat, Inc., in the United States and other countries.

Other company, product, or service names may be trademarks or service marks of others.

**Electronic emission notices**

**Class A Notices**

The following Class A statements apply to the IBM servers that contain the POWER6 processor.

**Federal Communications Commission (FCC) statement**

*Note:* This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this
equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. IBM is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user’s authority to operate the equipment.

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

**Industry Canada Compliance Statement**

This Class A digital apparatus complies with Canadian ICES-003.

**Avis de conformité à la réglementation d’Industrie Canada**

Cet appareil numérique de la classe A respecte est conforme à la norme NMB-003 du Canada.

**European Community Compliance Statement**

This product is in conformity with the protection requirements of EU Council Directive 2004/108/EC on the approximation of the laws of the Member States relating to electromagnetic compatibility. IBM cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the fitting of non-IBM option cards.

This product has been tested and found to comply with the limits for Class A Information Technology Equipment according to European Standard EN 55022. The limits for Class A equipment were derived for commercial and industrial environments to provide reasonable protection against interference with licensed communication equipment.

**Warning:** This is a Class A product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

**VCCI Statement - Japan**

この装置は、クラスA情報技術装置です。この装置を家庭環境で使用すると電波妨害
を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求され
ることがあります。

The following is a summary of the VCCI Japanese statement in the box above:

This is a Class A product based on the standard of the VCCI Council. If this equipment is used in a domestic environment, radio interference may occur, in which case, the user may be required to take corrective actions.
Japanese Electronics and Information Technology Industries Association (JEITA)
Confirmed Harmonics Guideline (products less than or equal to 20 A per phase)

Electromagnetic Interference (EMI) Statement - People’s Republic of China

声明
此为A级产品，在生活环境中，该产品可能会造成无线电干扰。在这种情况下，可能需要用户对其干扰采取切实可行的措施。

Declaration: This is a Class A product. In a domestic environment this product may cause radio interference in which case the user may need to perform practical action.

Electromagnetic Interference (EMI) Statement - Taiwan

警告使用者:
這是甲類的資訊產品，在居住的環境中使用時，可能會造成射頻干擾，在這種情況下，使用者會被要求採取某些適當的對策。

The following is a summary of the EMI Taiwan statement above.

Warning: This is a Class A product. In a domestic environment this product may cause radio interference in which case the user will be required to take adequate measures.

Electromagnetic Interference (EMI) Statement - Korea

Please note that this equipment has obtained EMC registration for commercial use. In the event that it has been mistakenly sold or purchased, please exchange it for equipment certified for home use.

Germany Compliance Statement

Deutschsprachiger EU Hinweis: Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit

EN 55022 Klasse A Geräte müssen mit folgendem Warnhinweis versehen werden:
"Warnung: Dieses ist eine Einrichtung der Klasse A. Diese Einrichtung kann im Wohnbereich Funk-Störungen verursachen; in diesem Fall kann vom Betreiber verlangt werden, angemessene Maßnahmen zu ergreifen und dafür aufzukommen."

Deutschland: Einhaltung des Gesetzes über die elektromagnetische Verträglichkeit von Geräten

Dieses Produkt entspricht dem "Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG)". Dies ist die Umsetzung der EU-Richtlinie 2004/108/EG in der Bundesrepublik Deutschland.

Zulassungsbescheinigung laut dem Deutschen Gesetz über die elektromagnetische Verträglichkeit von Geräten (EMVG) (bzw. der EMC EG Richtlinie 2004/108/EG) für Geräte der Klasse A.

Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen.

Verantwortlich für die Konformitätserklärung nach des EMVG ist die IBM Deutschland GmbH, 70548 Stuttgart.
Generelle Informationen:

Das Gerät erfüllt die Schutzanforderungen nach EN 55024 und EN 55022 Klasse A.

Electromagnetic Interference (EMI) Statement - Russia

ВНИМАНИЕ! Настоящее изделие относится к классу А.
В жилых помещениях оно может создавать радиопомехи, для снижения которых необходимы дополнительные меры

Terms and conditions

Permissions for the use of these publications is granted subject to the following terms and conditions.

**Personal Use:** You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative works of these publications, or any portion thereof, without the express consent of the manufacturer.

**Commercial Use:** You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of the manufacturer.

Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any data, software or other intellectual property contained therein.

The manufacturer reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by the manufacturer, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.
