| <strong>LENGTH</strong> | INTEGER NOT NULL | Maximum length or precision for a data type that is based on the IBM-defined DECIMAL data type. The data type can be a distinct type or an array type. | G |</p>
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
</table>
| SCALE       | SMALLINT  | One of the following values: G  
  - For a data type that is based on the IBM-defined DECIMAL data type, the scale. The data type can be a distinct type or an array type. Number of fractional second digits for a data type that is based on the IBM-defined timestamp or timestamp with time zone type.  
  - For a data type that is based on the IBM-defined TIMESTAMP or TIMESTAMP WITH TIME ZONE type, the number of fractional-second digits.  
  - For any other data type, the value is 0.  
If the value is a timestamp, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6. | G |
| SUBTYPE     | CHAR(1)   | Subtype of the data type, if the source type is one of the character types. The data type can be a distinct type or an array type. Possible values are: G  
  - B The subtype is FOR BIT DATA.  
  - S The subtype is FOR SBCS DATA.  
  - M The subtype is FOR MIXED DATA.  
  - blank The source type is not a character type. | G |
| CREATEDTS   | TIMESTAMP | Time when the data type was created. | G |
| ENCODING_SCHEME | CHAR(1) | Encoding scheme of the data type: G  
  - A ASCII  
  - E EBCDIC  
  - U UNICODE | G |
| IBMREQD     | CHAR(1)   | A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead. | G |
| REMARKS     | VARCHAR(762) | A character string provided by the user with the COMMENT statement. | G |
| OWNERTYPE   | CHAR(1)   | Indicates the type of owner: G  
  - blank Authorization ID  
  - L Role | G |
| RELCREATED  | CHAR(1)   | The release of Db2 that is used to create the object. See Release dependency indicators for the values. | G |
| INLINE_LENGTH | INTEGER  | The inline length attribute of the type if it is based on a LOB source type: G  
  -1 This type does not specify INLINE LENGTH  
  greater than or equal to 0 The inline length attribute (in byte) of the type if it is based on a LOB source type | G |
### ARRAYLENGTH column
- **Data type**: BIGINT NOT NULL WITH DEFAULT
- **Description**: Maximum cardinality, if the data type is an array type. For all other data types, the value is 0.
- **Use**: G

### ARRAYINDEXTYPEID column
- **Data type**: INTEGER NOT NULL WITH DEFAULT
- **Description**: Data type of the index, if the data types is an associative array type. For all other data types, the value is 0.
- **Use**: G

### ARRAYINDEXTYPELEN column
- **Data type**: BIGINT NOT NULL WITH DEFAULT
- **Description**: Maximum length of the array index, if the data type is an associative array type. For all other data types, the value is 0.
- **Use**: G

### ARRAYINDEXSUBTYPE column
- **Data type**: CHAR(1) NOT NULL WITH DEFAULT
- **Description**: Subtype of the array index:
  - B: The subtype is FOR BIT DATA.
  - S: The subtype is FOR SBCS DATA.
  - M: The subtype is FOR MIXED DATA.
  - blank: The array index is not a character type.
- **Use**: G

### SYSDBAUTH catalog table
The SYSDBAUTH table records the privileges that are held by users over databases. The schema is SYSIBM.

<table>

**SYSDUMMY1 catalog table**

The SYSDUMMY1 catalog table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

Unlike the other catalog tables, which reside in Unicode table spaces, SYSIBM.SYSDUMMY1 resides in table space SYSEBCDC, which is an EBCDIC table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td>The value in this field is not a reliable indicator of release dependencies.</td>

</tr>
</tbody>
</table>

**SYSDUMMYA catalog table**

The SYSDUMMYA table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

SYSIBM.SYSDUMMYA resides in table space SYSTSASC, which is a ASCII table space.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>

**SYSDUMMYE catalog table**

The SYSDUMMYE table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

SYSIBM.SYSDUMMYE resides in table space SYSEBCDC, which is a EBCDIC table space.
### SYSDUMMYU catalog table

The SYSDUMMYU table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

SYSIBM.SYSDUMMYU resides in table space SYSTSUNI, which is a UNICODE table space.

<table>
<thead>
<tr>
<th>Column name</th>

Appendix. Additional information for Db2 SQL  2583
SYSDYNQRYDEP catalog table

The SYSDYNQRYDEP table contains information about dependencies for dynamic query packages. The schema is SYSIBM.

Access paths for SQL statements might depend on objects that Db2 does not actually use when it processes the selected access paths. Such dependencies are recorded in the SYSDYNQRYDEP catalog table, but they are not be shown in EXPLAIN output.

<td>Indicates the meaning of the value of the DAY column:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'M' The value indicates the day of the month.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>'W' The value indicates a day of the week.</td>
<td></td>
</tr>
<tr>
<td>MONTH</td>
<td>SMALLINT</td>
<td>The month in which the time window applies. For example a 1 value indicates January and a 12 value indicates December. If this column contains NULL, the time window applies to all months. If the value of the MONTH_WEEK column is 'W', this value must be NULL.</td>
<td>G</td>
</tr>
<tr>
<td>DAY</td>
<td>SMALLINT</td>
<td>The day of the month or the day of the week for which the time window applies, as specified by the value of the MONTH_WEEK column. For example, if MONTH_WEEK='W', a 1 value indicates Monday and 7 indicates Sunday. If the value of this column is NULL, the time window applies to every day of the month or every day of the week.</td>
<td>G</td>
</tr>
<tr>
<td>START_TIME</td>
<td>TIME</td>
<td>The local time at the beginning of the time window specified by the row. When this column contains a null value, the row applies at all times on the specified days. This column must contain NULL if the END_TIME column contains NULL.</td>
<td>G</td>
</tr>
<tr>
<td>END_TIME</td>
<td>TIME</td>
<td>The local time at the end of the time window specified by the row. When this column contains a null value, the row applies at all times on the specified days. This column must contain NULL if the START_TIME column contains NULL.</td>
<td>G</td>
</tr>
</tbody>
</table>

**Related tasks:**

- Controlling index cleanup processing (Db2 Performance)

**Related reference:**

- INDEX CLEANUP THREADS field (INDEX_CLEANUP_THREADS subsystem parameter) (Db2 Installation and Migration)

**SYSINDEXCONTROL catalog table**

The SYSINDEXCONTROL table contains rows that specify time windows to control the use of memory allocated for an index. Each row specifies a time window for enabling or disabling the use of memory for a specific index object. The schema is SYSIBM.

**Important:** Fast index traversal is intended to be automatically controlled by Db2. Use the SYSIBM.SYSINDEXCONTROL catalog table only to define exceptions, when the automatic processing is unacceptable. Index performance optimization might be impeded if the number of rows in this catalog table becomes too large.
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>

**SYSINDEXPART_HIST catalog table**

The SYSINDEXPART_HIST catalog table contains rows from SYSINDEXPART. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>PARTITION</td>
<td>SMALLINT NOT NULL</td>
<td>Partition number. Zero if index is not partitioned.</td>
<td>G</td>
</tr>
<tr>
<td>IXNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Name of the index.</td>
<td>G</td>
</tr>
<tr>
<td>IXCREATOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The schema of the index.</td>
<td>G</td>
</tr>
<tr>
<td>PQTY</td>
<td>INTEGER NOT NULL</td>
<td>For user-managed data sets, the value is the primary space allocation in units of 4KB storage blocks or -1.</td>
<td>G</td>
</tr>
</tbody>
</table>

For user-specified values of PRIQTY other than -1, the value is set to the primary space allocation only if RUNSTATS INDEX with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER INDEX statement. Unlike PQTY, however, PRIQTY asks for space in 1KB units.

A value of -1 indicates that either of the following cases is true:

- PRIQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements.
- -1 was the most recently specified value for PRIQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement.

If a storage group is not used, the value is 0.
<table>
<thead>
<tr>
<th>Column name</th>

<th>Description</th>
<th>Use</th>
</tr>
</thead>
</table>
| SECQTYI     | INTEGER       | For user-managed data sets, the value is the secondary space allocation in units of 4KB storage blocks or -1. For user-specified values of SECQTY other than -1, the value is set to the secondary space allocation only if RUNSTATS INDEX with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. SECQTY is based on a value of SECQTY in the appropriate CREATE or ALTER INDEX statement. Unlike SQTY, however, SECQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true:  
- SECQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements.  
- -1 was the most recently specified value for SECQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement.  
If a storage group is not used, the value is 0. |
<p>| LEAFDIST    | INTEGER NOT NULL WITH DEFAULT -1 | 100 times the average number of leaf pages between successive active leaf pages of the index. The value is -1 if statistics have not been gathered. |
| SPACEF      | FLOAT(8) NOT NULL WITH DEFAULT -1 | Number of kilobytes of DASD storage allocated to the index space partition. The value is -1 if statistics have not been gathered. |
| STATSTIME   | TIMESTAMP NOT NULL | If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column. |
| FAROFFPOSF  | FLOAT(8) NOT NULL WITH DEFAULT -1 | Number of referred to rows far from optimal position because of an insert into a full page. The value is -1 if statistics have not been gathered. The column is not applicable for an index on an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index. |
| NEAROFFPOSF | FLOAT(8) NOT NULL WITH DEFAULT -1 | Number of referred to rows near, but not at optimal position, because of an insert into a full page. Not applicable for an index on an auxiliary table. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index. |
| CARDF       | FLOAT(8) NOT NULL WITH DEFAULT -1 | Number of RIDs in the index that refer to data rows or LOBs. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index. |</p>

**SYSINDEXSPACESTATS catalog table**

The SYSINDEXSPACESTATS table contains real time statistics for index spaces. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

In data sharing environments, the values in SYSIBM.SYSINDEXSPACESTATS can be negative for short periods of time for certain situations.

**History table:** SYSIBM.SYSIXSPACESTATS_H is a history table for the SYSIBM.SYSINDEXSPACESTATS catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be inserted, updated, and deleted with proper authorization. For information about enabling the temporal relationship, see [“Temporal versioning for Db2 catalog tables” on page 2809](https://www.ibm.com/support/knowledgecenter/SS27AM_11.1.0/sqllib/...).

<td>VARCHAR(24)</td>
<td>The name of the index space.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LASTUSED</td>
<td>DATE</td>
<td>The date when the index was last used in an access path for a SELECT, FETCH, searched UPDATE, or searched DELETE statement, or was used to enforce referential integrity constraints. If this field value indicates that an index has not been used for an extended period of time, consider dropping the index. For a data-partitioned secondary index, this column is only updated for one partition, even though more than one partition is accessed. The default value is NULL.</td>
<td>G</td>
</tr>
<tr>
<td>REORGINDEXACCESS</td>
<td>BIGINT</td>
<td>The number of times since the object was created, or since the last REORG, REBUILD INDEX, or LOAD REPLACE, that the index was used in one of the following situations: • In an access path for a SELECT, FETCH, searched UPDATE, or searched DELETE statement • For enforcement of referential integrity constraints For hash overflow indexes, this value is the number of times that Db2 used the hash overflow index. Use this value with other recommendations to determine when to run REORG INDEX. For example, when the ratio of SYSTABLESPACESTATS.TOTALROWS to SYSINDEXSPACESTATS.TOTALENTRIES indicates that REORG INDEX needs to be run, but this value is very low, REORG INDEX might not yet be necessary. A null value indicates that the number of times the index was used is unknown.</td>
<td>G</td>
</tr>
</tbody>
</table>
### Column name | Data type | Description | Use
---|---|---|---
DRIVETYPE | CHAR(3) NOT NULL WITH DEFAULT | The drive type on which the index or index partition data set is defined. | G
**HDD** | Hard Disk Drive | | |
**SSD** | Solid State Drive | For multi-volume data sets, the drive type is set to SSD if any volume is SSD. For multi-piece linear page sets, the drive type of the first data set is used. | |
--- | BIGINT | Reserved for future IBM use. | R
GETPAGES | BIGINT | The number of getpage requests for the index space since the last REORG was run, or since the object was created. | G
SYS_START | TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN | The row-begin column of the SYSTEM_TIME period, for system-period data versioning. | G
SYS_END | TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END | The row-end column of the SYSTEM_TIME period, for system-period data versioning. | G
TRANS_START | TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS TRANSACTION START ID | The transaction-start-ID column, for system-period data versioning. | G

**SYSINDEXSTATS catalog table**

The SYSINDEXSTATS table contains one row for each partition of a partitioning index or a data-partitioned secondary index. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

**Important:** Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

### Column name | Data type | Description | Use
---|---|---|---
FIRSTKEYCARD | INTEGER NOT NULL | For the index partition, number of distinct values of the first key column. | S
<p>| | | For a sparse index, the statistic is based on the actual contents of the index. |</p>

Appendix. Additional information for Db2 SQL
**SYSKEYTARGETSTATS catalog table**

The SYSKEYTARGETSTATS table contains partition statistics for selected key-targets. For each key-target, a row exists for each partition in the table.

Rows are inserted when RUNSTATS collects indexed key statistics or non-indexed key statistics for a partitioned table space. No row is inserted if the table space is nonpartitioned. Rows in this table can be inserted, updated, and deleted.

**Important:** Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

CARDF | FLOAT NOT NULL WITH DEFAULT -1 | Number of distinct values for the key target. | S

### SYSKEYTARGETS_HIST catalog table

The SYSKEYTARGETS_HIST table contains rows from the SYSKEYTARGETS table. The schema is SYSIBM.

Whenever rows are added or changed in SYSKEYTARGETS, the rows are also written to this table. Rows in this table can be inserted, updated, and deleted.

SYSKEYTGTDISTSTATS catalog table

The SYSKEYTGTDISTSTATS table contains zero or more rows per partition for the first key-target of a data-partitioned secondary index.

Rows are inserted when RUNSTATS scans a data-partitioned secondary index. No row is inserted if the index is a secondary index. Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

## SYSLOBSTATS catalog table

The SYSLOBSTATS table contains one row for each LOB table space. The schema is SYSIBM.
### SYSLOBSTATS_HIST catalog table

The SYSLOBSTATS_HIST table contains rows from SYSIBM.SYSLOBSTATS. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATSTIME</td>
<td>TIMESTAMP NOT NULL</td>
<td>If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.</td>
<td>G</td>
</tr>
<tr>
<td>AVGSIZE</td>
<td>INTEGER NOT NULL</td>
<td>Average size of a LOB, measured in bytes, in the LOB table space.</td>
<td>S</td>
</tr>
<tr>
<td>FREESPACE</td>
<td>INTEGER NOT NULL</td>
<td>Number of kilobytes of available space in the LOB table space.</td>
<td>S</td>
</tr>
<tr>
<td>ORGRATIO</td>
<td>DECIMAL(5,2) NOT NULL</td>
<td>The percentage of organization in the LOB table space. A value of '100' indicates perfect organization of the LOB table space. A value of '1' indicates that the LOB table space is disorganized. A value of '0' indicates that the LOB table space is totally disorganized.</td>
<td>S</td>
</tr>
<tr>
<td>DBNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>Name of the database that contains the LOB table space named in NAME.</td>
<td>G</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>Name of the LOB table space.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>. The value in this field is not a reliable indicator of release dependencies.</td>
<td>G</td>

**SYSPACKDEP catalog table**

The SYSPACKDEP table records the dependencies of packages on local tables, views, synonyms, table spaces, indexes, aliases, functions, and stored procedures. The schema is SYSIBM.

Access paths for SQL statements might depend on objects that Db2 does not actually use when it processes the selected access paths. Such dependencies are recorded in the SYSPACKDEP catalog table, but they are not be shown in EXPLAIN output.

<table>
<thead>
<tr>
<th>Column name</th>

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS</td>
<td>CHAR(1)</td>
<td><strong>Status of binding the statement:</strong></td>
<td>S</td>
</tr>
<tr>
<td></td>
<td>NOT NULL WITH DEFAULT</td>
<td><strong>A</strong> - Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using defaults for input variables during access path selection.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>B</strong> - Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using values for input variables during access path selection.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>C</strong> - Compiled - statement was bound successfully using defaults for input variables during access path selection.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>D</strong> - Distributed - statement references a remote object using a three-part name. Db2 will implicitly use DRDA access either because the DBPROTOCOL bind option was not specified (defaults to DRDA), or the bind option DBPROTOCOL(DRDA) was explicitly specified. This option allows the use of three-part names with DRDA access but it requires that the package be bound at the target remote site.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>E</strong> - Explain - statement is an SQL EXPLAIN statement. The explain is done at bind time using defaults for input variables during access path selection.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>F</strong> - Parsed - statement did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using values for input variables during access path selection.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>G</strong> - Compiled - statement bound successfully, but REOPT is specified. The statement will be rebound at execution time using values for input variables during access path selection.</td>
<td></td>

<tr>
<td>EXPANSION_REASON</td>
<td>CHAR(2) NOT NULL</td>
<td>This column applies to only static statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSBIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. If one of these special registers or the global variable is set to Y and the corresponding bind option is set to YES, Db2 implicitly adds certain syntax to the statement. This column indicates whether this implicit query transformation occurred when the package was bound and why. For dynamic statements, this column is blank. For static statements, this column can have one of the following values: A The statement was bound with implicit query transformation as a result of the SYSBIBMADM.GET_ARCHIVE built-in global variable. B The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. S The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. SB The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank One of the following events occurred: • The statement did not bind successfully and the VALIDATE(RUN) bind option was used. • The statement was bound without implicit query transformation. If this column is not blank, you can see the resulting access path for the transformed statement by using EXPLAIN. Related information: Built-in global variables CURRENT TEMPORAL BUSINESS_TIME CURRENT TEMPORAL SYSTEM_TIME BIND and REBIND options for packages, plans, and services (Db2 Commands)</td>

### Column name | Data type | Description | Use
---|---|---|---
PARTITION | SMALLINT NOT NULL | The physical partition number that was specified in the alter statement. The value is 0 if no physical partition number was specified. | G
PARTITION_KEY | VARCHAR(18) NOT NULL WITH DEFAULT | This column is populated if the PARTITION column has a non-zero value. The keyword that is associated with the PARTITION clause of the ALTER TABLE statement. For example, suppose that you issued the following statement: ALTER TABLE ALTER PARTITION In that case, this column contains ALTER. | G
COLUMN_KEY | VARCHAR(18) NOT NULL WITH DEFAULT | This column contains the keyword that corresponds to the column that is listed in COLNAME. | G
REORG_SCOPE_LOW | SMALLINT | Logical partition number of the lowest partition in the range for REORG to materialize pending definition changes. Adjacent logical partitions must be reorganized together to materialize pending definition changes. The value is 0 if the range is the entire partitioned table space or index space, or if the record is generated by the RECOVER utility. This column contains the null value when the value is unknown for pending definition changes executed prior to Db2 12. |
REORG_SCOPE_HIGH | SMALLINT | Logical partition number of the highest partition in the range for REORG to materialize pending definition changes. Adjacent logical partitions must be reorganized together to materialize pending definition changes. The value is 0 if the range is the entire partitioned table space or index space, or if the record is generated by the RECOVER utility. This column contains the null value when the value is unknown for pending definition changes executed prior to Db2 12. |

---

### SYSPENDINGOBJECTS catalog table
The SYSPENDINGOBJECTS table contains the name of and OBID information about objects that are the pending creation. The data sets for these objects are created but the object definition have not been materialized to the catalog. The entries in this table only exist during the time between when the names of the new objects are generated and when the catalog definition of the new objects are materialized. The schema is SYSIBM.

</tbody>
</table>
| KEEP_DYNAMIC     | CHAR(1) NOT NULL WITH DEFAULT 'N' | Whether prepared dynamic statements are to be purged at each commit point:  
N  The bind option is KEEP_DYNAMIC(NO). Prepared dynamic SQL statements are destroyed at commit or rollback.  
Y  The bind option is KEEP_DYNAMIC(YES). Prepared dynamic SQL statements are kept past commit or rollback. | G   |
| PATHSCHEMAS      | VARCHAR(2048) NOT NULL WITH DEFAULT | SQL path specified on the BIND or REBIND command that bound the plan. The path is used to resolve unqualified data type, function, and stored procedure names used in certain contexts. If the PATH bind option was not specified, the value in the column is a zero length string; however, Db2 uses a default SQL path of: SYSIBM, SYSFUN, SYSPROC, plan qualifier. | G   |
| DBPROTOCOL       | CHAR(1) NOT NULL WITH DEFAULT 'P' | Whether remote access for SQL with three-part names is implemented with DRDA or Db2 private protocol access:  
D  DRDA  
P  Db2 private protocol | G   |
| FUNCTIONTS       | TIMESTAMP NOT NULL WITH DEFAULT | Timestamp when the function was resolved. Set by the BIND and REBIND commands, but not by AUTOBIND. | G   |
| OPTHINT          | VARCHAR(128) NOT NULL WITH DEFAULT | Value of the OPTHINT bind option. Identifies rows in the owner.PLAN_TABLE to be used as input to Db2. Contains blanks if no rows in the owner.PLAN_TABLE are to be used as input. | G   |
| ENCODING_CCSID   | INTEGER NOT NULL WITH DEFAULT | The CCSID corresponding to the encoding scheme or CCSID as specified for the bind option ENCODING. The Encoding Scheme specified on the bind command:  
cssid  The specified or derived CCSID.  
0  The default CCSID as specified on panel DSNTIPF at installation time. Used when the plan was bound prior to Version 7 | G   |
| IMMEDWRITE       | CHAR(1) NOT NULL WITH DEFAULT | Indicates when writes of updated group buffer pool dependent pages are to be done. This option is only applicable for data sharing environments.  
N  Bind option IMMEDWRITE(NO) indicates normal write activity is done.  
Y  Bind option IMMEDWRITE(YES) indicates that immediate writes are done for updated group buffer pool dependent pages.  
1  Bind option IMMEDWRITE(PH1) indicates that updated group buffer pool dependent pages are written at or before phase 1 commit.  
blank  A migrated package. | G   |
| RELBOUND         | CHAR(1) NOT NULL WITH DEFAULT | The release when the package was bound or rebound.  
blank  Bound prior to Version 7  
For all other values, see Release dependency indicators | G   |
<p>| CATENCODE        | CHAR(1) | Not used. | N |</p>

</tbody>
</table>
| STMTTEXT         | CLOB(2M) INLINE LENGTH 2048 | The text of the matching SQL statement. The value is populated from the value of the QUERY_TEXT column of the DSN_USERQUERY_TABLE table, with the following items removed:  
  - Blanks including leading and trailing blanks, and embedded blanks that are not within literal strings between pairs of quotation mark symbols
  - White space, including leading and trailing white space, and white space that is not within a literal string between a pair of quotation mark symbols
  - SQL comments
  - EXPLAIN clauses | G   |
| QUERYNO          | INTEGER NOT NULL WITH DEFAULT '-1' | The query number.                                                          | G   |
| CLIENT_USERID    | VARCHAR(255)     | User ID of the client.                                                      | G   |
| CLIENT_WRKSTNNAME| VARCHAR(255)     | Name of the client workstation.                                            | G   |
| CLIENT_APPLNAME  | VARCHAR(255)     | Name of the client application.                                            | G   |
| SELECTIVITY_OVERRIDE | CHAR(1) NOT NULL | Whether selectivity overrides are in effect for the query:  
  - 'Y' Selectivity overrides are in effect
  - 'N' Selectivity overrides are not in effect. | G   |
| ACCESSPATH_HINT  | CHAR(1) NOT NULL | Whether access paths are specified for the matching statements:  
  - 'Y' An access paths is specified and in effect
  - 'N' An access path hints is specified and in effect
  - blank An access path might be specified. When the value is blank you must query the SYSIBM.SYSQUERYPLAN catalog table to determine whether an access path is specified | G   |
| OPTION_OVERRIDE  | CHAR(1) NOT NULL | Whether statement-level optimization parameters are in effect for matching statements:  
  - 'Y' Optimization parameters are in effect.
  - 'N' Optimization parameters are not in effect.
  - blank Optimization parameters might be in effect. When the value is blank you must query the SYSIBM.SYSQUERYOPTS catalog table to determine whether option overrides are in effect. | G   |
**FUNCTION_LVL**  
VARCHAR(10)  
The function level of the query.

**Related tasks:**  
[Influencing access path selection (Db2 Performance)]

**Related reference:**  
[Tables for influencing access path selection (Db2 Performance)]

**SYSQUERY_AUX catalog table**  
The SYSQUERY_AUX table is an auxiliary table for the STMTTEXT column of the SYSQUERY table. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>STMTTEXT</td>
<td>CLOB(2M)</td>
<td>The full text of the query.</td>
<td>G</td>
</tr>
</tbody>
</table>

**SYSQUERYOPTS catalog table**  
The SYSQUERYOPTS table contains optimization parameters for the queries that are in the SYSQUERY table. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYID</td>
<td>BIGINT NOT NULL ON DELETE CASCADE</td>
<td>Unique identifier for the query. This column corresponds to the QUERYID column in the SYSIBM.SYSQUERY table.</td>
<td>G</td>
</tr>
<tr>
<td>COPYID</td>
<td>SMALLINT NOT NULL</td>
<td>The version of the plan hints for the query in this row.</td>
<td>G</td>
</tr>
<tr>
<td>REOPT</td>
<td>CHAR(1) NOT NULL</td>
<td>The value of the REOPT bind option that is in effect for the plan:</td>
<td>G</td>
</tr>
</tbody>
</table>

| | | | |
| | | | |
### Column name | Data type | Description | Use
---|---|---|---
**STARJOIN** | CHAR(1) NOT NULL | Whether star join is enabled: | G
Y | Star join is enabled
N | Star join is disabled
blank | Star join is not specified
**MAX_PAR_DEGREE** | INTEGER NOT NULL | The maximum parallel degree. This column will contain a value between 0 and 254. If the value of the column is -1, the maximum parallel degree is not specified. | G
**DEF_CURR_DEGREE** | CHAR(3) NOT NULL | Whether query parallelism is enabled: | G
ONE | Query parallelism is disabled
ANY | Query parallelism is enabled
blank | Query parallelism is disabled
**SJTABLES** | INTEGER NOT NULL | The number of tables specified in a query to qualify for star join processing. If this column contains -1, star join processing is not specified. | G
| VARCHAR(128) NOT NULL | Internal use only. | I
**GROUP_MEMBER** | VARCHAR(24) NOT NULL | The group member name to which the parameters are to be applied. This column contains blank if the group member name is not specified. | G
**IBMREQD** | CHAR(1) NOT NULL | A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. | G

**Related tasks:**
- Specifying optimization parameters at the statement level (Db2 Performance)

**Related reference:**
- Tables for influencing access path selection (Db2 Performance)
- DSN_USERQUERY_TABLE (Db2 Performance)

### SYSQUERYPLAN catalog table
The SYSQUERYPLAN table contains the plan hint information for the queries in the SYSIBM.SYSQUERY table. It correlates to the SYSQUERY table by the QUERYID column. For a query, there can be up to 3 copies of plan hints stored in the SYSQUERYPLAN table, distinguished by the value of the COPYID column. The schema is SYSIBM.

### Column name | Data type | Description | Use
---|---|---|---
**QUERYID** | BIGINT NOT NULL ON DELETE CASCADE | Unique identifier for the query. The value of QUERYID corresponds to the value of the QUERYID column in the SYSIBM.SYSQUERY column. | G

## SYSQUERYPREDICATE catalog table

The SYSQUERYPREDICATE table contains information about predicates for queries in the SYSQUERY table that have been identified for extended optimization. It correlates to the SYSQUERY table by the QUERYID column. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYID</td>
<td>BIGINT</td>
<td>Identifier of the query.</td>
<td>S</td>
</tr>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
<td>S</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
<td></td>

</tbody>
</table>
### IXNAME
- **Data type**: VARCHAR(128)
- **Description**: Name of a unique non-primary index used to enforce the parent key of a referential constraint.
- **Use**: G

### ENFORCED
- **Data type**: CHAR(1)
- **Description**: Enforced by the system or not:
  - Y: Enforced by the system
  - N: Not enforced by the system (trusted)
- **Use**: G

### CHECKEXISTINGDATA
- **Data type**: CHAR(1)
- **Description**: Option for checking existing data:
  - I: Immediately check existing data. If ENFORCED = 'Y' and this is not a temporal referential constraint, this column will have a value of 'I'.
  - N: Never check existing data. If ENFORCED = 'N', this column will have a value of 'N'.
  - T: Immediately check existing data for a temporal referential constraint.
- **Use**: G

### RELCREATED
- **Data type**: CHAR(1)
- **Description**: The release of Db2 that is used to create the object. See [Release dependency indicators](#) for the values.
- **Use**: G

### SYSRESAUTH catalog table
The SYSRESAUTH table records CREATE IN and PACKADM ON privileges for collections; USAGE privileges for distinct types; and USE privileges for buffer pools, storage groups, and table spaces. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>

</table>
| DEBUG_MODE   | CHAR(1) NOT NULL WITH DEFAULT | Identifies whether or not this routine is enabled for debugging:  
- 1  This routine is enabled for debugging and can be debugged in a client debug session using the Db2 Unified Debugger.  
- 0  This routine is not enabled for debugging.  
- N  This routine can never be enabled for debugging.  
- blank  The LANGUAGE is not specified as JAVA, the value of ORIGIN is not 'N', or the row was created prior to Version 9. | G   |
| TEXT_ENVID   | INTEGER NOT NULL WITH DEFAULT | Internal identifier of the environment. The column is 0 if the value of ORIGIN is not 'N' or if the row was created prior to Version 9. | G   |
| TEXT_ROWID   | ROWID NOT NULL GENERATED ALWAYS | ID to support LOB columns for source text. | G   |
| TEXT         | CLOB(2M) NOT NULL WITH DEFAULT | The text of the statement that created the SQL routine, including the body of the routine. In some cases, this column might instead contain the text of a statement that altered the SQL routine. In many cases, changes to routines or to objects on which routines are dependent do not update this value. The value is a zero-length string if the value of ORIGIN is not 'N' or if the row was created prior to Version 9. | G   |
| OWNERTYPE    | CHAR(1) NOT NULL WITH DEFAULT | Indicates the type of owner:  
- blank  Authorization ID  
- L  Role | G   |
| PARAMETER_ VARCHARFORM | INTEGER NOT NULL WITH DEFAULT | A non-zero value that indicates the actual representation, to a LANGUAGE C routine, of any varying length string parameter that appears in the parameter list or RETURNS clause for that routine. | G   |
| RELCREATED   | CHAR(1) NOT NULL | The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values. | G   |
| PACKAGEPATH  | VARCHAR(4096) | The value of the PACKAGE PATH option of the CREATE FUNCTION, CREATE PROCEDURE, ALTER FUNCTION, or ALTER PROCEDURE statement that created or last changed the routine. PACKAGE PATH identifies the package path to use when the routine is executed. A blank value indicates the package path is the same as the package path of the program that invoked the routine. | G   |
| SECURE       | CHAR(1) NOT NULL WITH DEFAULT 'N' | Indicates if the routine is secured:  
- N  The routine is not secured  
- Y  The routine is secured | G   |

### SYSROUTINESTEXT catalog table

The SYSROUTINESTEXT is an auxiliary table for the TEXT column of SYSIBM.SYSROUTINES and is required to hold the LOB data. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEXT</td>
<td>CLOB(2M) NOT NULL</td>
<td>See the description of the TEXT column in <a href="#">SYSROUTINES catalog table</a></td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>WITH DEFAULT</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### SYSROUTINES_OPTS catalog table

The SYSROUTINES_OPTS table contains a row for each generated routine, such as one created by Db2 for z/OS Procedure Processor DSNTPSMP, that records the build options for the routine. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>

<tr>
<td>SEQNO</td>
<td>INTEGER NOT NULL</td>
<td>Number of the source statement piece in CREATESTM.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1) NOT NULL WITH DEFAULT 'N'</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <strong>Release dependency indicators</strong>. The value in this field is not a reliable indicator of release dependencies.</td>
<td>G</td>
</tr>
</tbody>
</table>
SYSSCHEMAAUTH catalog table
The SYSSCHEMAAUTH table contains one or more rows for each user that is granted a privilege on a particular schema in the database. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATESTMT</td>
<td>VARCHAR(7500) NOT NULL</td>
<td>Routine source statement.</td>
<td>G</td>
</tr>

**SYSSESSION catalog table**

The SYSSESSION table stores the session token that generated by the server and associated session data. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOKEN</td>
<td>CHAR(40) FOR BIT DATA NOT NULL</td>
<td>Session token for the session.</td>
<td></td>
</tr>
<tr>
<td>CORRTKN</td>
<td>VARCHAR(256) FOR BIT DATA</td>
<td>Extended client correlation token in use.</td>
<td></td>
</tr>
<tr>
<td>GV_FLAGS</td>
<td>CHAR(2) FOR BIT DATA</td>
<td>Flags for internal classification of global variables (such as whether it contains arrays or LOBs.)</td>
<td></td>
</tr>
</tbody>
</table>
### Column name | Data type | Description | Use
---|---|---|---
TOTAL | CHAR(4) FOR BIT DATA NOT NULL | The number of entries in the SYSIBM.SYSSESSION_EX table that correspond to the session token. |  
SPECIAL_REGISTERS | VARCHAR(16000) FOR BIT DATA NOT NULL | Special register values (as chained SQLSTTs). |  
GLOBAL_VARIABLES | BLOB(2G) | Global variable values (as GLBVRB). Arrays/lobs are stores as locator values that reference a row in the SYSIBM.SYSSESSION_EX table. |  
ROWID | ROWID NOT NULL GENERATED ALWAYS | Generated ROWID. |  

### SYSSESSION_EX catalog table
The SYSSESSION_EX table contains global variable data of LOB or array type that corresponds to the locator stored in the GLOBAL_VARIABLES column of the SYSSESSION table. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOKEN</td>
<td>CHAR(40) FOR BIT DATA NOT NULL</td>
<td>Session token representing the session.</td>
<td></td>
</tr>
<tr>
<td>LOCATOR</td>
<td>CHAR(8) FOR BIT DATA NOT NULL</td>
<td>Locator value corresponding to one of the global variables with DATATYPE as array oflobs.</td>
<td></td>
</tr>
<tr>
<td>HEADER</td>
<td>CHAR(89) FOR BIT DATA NOT NULL</td>
<td>Array static descriptor header when locator value corresponds to array type.</td>
<td></td>
</tr>
<tr>
<td>GVID</td>
<td>CHAR(8) FOR BIT DATA NOT NULL</td>
<td>Global variable identifier.</td>
<td></td>
</tr>
<tr>
<td>DATATYPE</td>
<td>CHAR(2) FOR BIT DATA NOT NULL</td>
<td>Data type of the global variable.</td>
<td></td>
</tr>
<tr>
<td>CCSID</td>
<td>CHAR(2) FOR BIT DATA NOT NULL</td>
<td>CCSID of the global variable.</td>
<td></td>
</tr>
<tr>

<td>VARCHAR(130) FOR BIT DATA</td>
<td>Name of the global variable.</td>
<td></td>
</tr>
<tr>
<td>DATA</td>
<td>BLOB(2G)</td>
<td>Data value stored in the global variable.</td>
<td></td>
</tr>
</tbody>
</table>

### SYSSESSION_STATUS catalog table
The SYSSESSION_STATUS table contains session token and timestamp values for when the corresponding session data was last referenced. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOKEN</td>
<td>CHAR(40) FOR BIT DATA NOT NULL</td>
<td>Session token representing the session.</td>
<td></td>
</tr>
<tr>
<td>TOKEN_TS</td>
<td>CHAR(16) FOR BIT DATA NOT NULL</td>
<td>Timestamp value when row was last referenced.</td>
<td></td>
</tr>
<tr>
<td>TOKEN_MEMBER</td>
<td>CHAR(16) FOR BIT DATA</td>
<td>Member where row was last accessed.</td>
<td></td>
</tr>
<tr>
<td>STATUS</td>
<td>CHAR(2) FOR BIT DATA</td>
<td>Status of session corresponding to the token (such as timed-out/clean disconnect).</td>
<td></td>
</tr>
</tbody>
</table>

Appendix. Additional information for Db2 SQL
SYSSTATFEEDBACK catalog table

The SYSSTATFEEDBACK table contains information about missing or conflicting catalog statistics for SQL statements. The schema is SYSIBM.

The following values control the collection of statistics feedback data in the SYSSTATFEEDBACK catalog table:

- The STATSDBK_SCOPE subsystem parameter controls whether the data is collected, and whether it is collected only for static SQL statements, only for dynamic SQL statements, or for both.
- The STATSINT subsystem parameter controls when and how frequently the data is externalized.
- The STATS_FEEDBACK column of the SYSTABLES catalog table controls whether the data is collected for a particular table.

The RUNSTATS utility removes data from the SYSSTATFEEDBACK catalog table when the recommended statistics are collected.

Tip: The SYSSTATFEEDBACK table might contain rows that recommend collection of statistics for DEFINE NO objects, or empty table space partitions. However, statistics cannot be collected for such objects until after data is inserted and the underlying data sets are created. For more information, see [Effect of utilities on objects that have the DEFINE NO attribute (Db2 Utilities)](https://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.admin.sqlref.doc/doc/r00349205.html?lang=en).

### SYSSTRINGS catalog table

The SYSSTRINGS table contains information about character conversion. Each row describes a conversion from one coded character set to another. The schema is SYSIBM.

Also refer to z/OS C/C++ Programming Guide for information on the additional conversions that are supported.

Each row in the table must have a unique combination of values for its INCCSID, OUTCCSID, and IBMREQD columns. Rows for which the value of IBMREQD is N can be deleted, inserted, and updated subject to this uniqueness constraint and to the constraints imposed by a VALIDPROC defined on the table. An inserted row could have values for the INCCSID and OUTCCSID columns that match those of a row for which the value of IBMREQD is Y. Db2 then uses the information in the inserted row instead of the information in the IBM-supplied row. Rows for which the value of IBMREQD is Y cannot be deleted, inserted, or updated. For information about the use of inserted rows for character conversion, see Db2 Installation Guide.

Db2 has two methods for character conversions and applies them in the following order:
1. Conversions specified by the various combinations of the INCCSID and OUTCCSID columns in the SYSIBM.SYSSTRINGS catalog table.
2. Conversions provided by z/OS support for Unicode. For more information, see z/OS Support for Unicode: Using Conversion Services.
If neither of these methods can be used for a particular character conversion, Db2 returns an error.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCCSID</td>
<td>INTEGER NOT NULL</td>
<td>The source CCSID for the character conversion represented by this row. The value of the source CCSID must be in the range of 1 to 65533 and must not be the same as the value for the OUTCCSID column.</td>
<td>G</td>
</tr>
<tr>
<td>OUTCCSID</td>
<td>INTEGER NOT NULL</td>
<td>The target CCSID for the character conversion represented by this row. The value of the target CCSID must be in the range of 1 to 65533 and must not be the same as the value for the INCCSID column.</td>
<td>G</td>
</tr>
<tr>
<td>TRANSTYPE</td>
<td>CHAR(2) NOT NULL</td>
<td>Indicates the nature of the conversion. </table>
| PAGENUM         | CHAR(1) NOT NULL WITH DEFAULT 'A' | Format of pages for the table space and indexes created on tables in the table space, indicating absolute or relative page numbering.  
  - **A**: Indicates absolute addressing so that PAGENUM contains the embedded partition number.  
  - **R**: Indicates relative addressing so that PAGENUM contains only the relative page number. | G    |
| BPOOL           | CHAR(8) WITH DEFAULT NULL | Name of the buffer pool used for the partition. | G    |
| PGSIZE          | SMALLINT WITH DEFAULT NULL | Size of pages in the table space in kilobytes. | G    |
| DSSIZE          | INTEGER WITH DEFAULT NULL | Maximum size on a partitioned table space data set. 0 for a nonpartitioned table space. | G    |
| MEMBER_CLUSTER  | CHAR(1) WITH DEFAULT NULL | Indicates whether or not MEMBER CLUSTER is specified for the table space.  
  - **Y**: MEMBER CLUSTER is specified for the table space.  
  - **blank**: MEMBER CLUSTER is not specified for the table space. | G    |
| COMPRESSRATIO   | SMALLINT NOT NULL WITH DEFAULT | Average percentage of bytes saved by compression on each compressed data record in the partition when the table space is defined with the COMPRESS YES attribute.  
  This calculation includes overhead bytes for each row. The value is based on an average row length and varies depending on the actual length of the data rows.  
  - The value is -1 or 0 in the following cases:  
    - **-1**: This value has not been collected  
    - **0**: No compression exists or the average compressed record length is the same as or longer than the uncompressed record. | G    |

**SYSTABLEPART_HIST catalog table**

The SYSTABLEPART_HIST table contains rows from the SYSTABLEPART table. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

**SYSTABLES catalog table**

The SYSTABLES table contains one row for each table, view, or alias. The schema is SYSIBM. Each SYSTABLES table row indicates whether the object that it describes is a table, view, or alias, its name, who created it, the database that it belongs to, the table space it belongs to, and other information. The SYSTABLES table also has a REMARKS column in which you can store your own information about the table in question.

For an example query for the SYSTABLES catalog table, see [Retrieving catalog information about a table (Db2 Administration Guide)](#).

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
</table>
| CHECKRIDSB      | CHAR(5)    | RID of the first row of the table space partition that can violate referential constraints, check constraints, or both. The value of X'0000000000' indicates that any row can violate referential constraints. The value is blank if any of the following conditions are true:  
• The table or partition is not in CHECK-pending status (CHECKFLAG is blank)  
• The table space is not partitioned  
• The table is a created temporary table | S   |
| ENCODING_SCHEME | CHAR(1)    | Encoding scheme for a table, view, or the table or view that is referred to by a local alias:  
E  EBCDIC. This value is 'E' even if the table contains a Unicode column.  
A  ASCII  
M  Multiple CCSID set or multiple encoding schemes  
U  Unicode  
blank  For remote aliases | G   |
| TABLESTATUS     | VARCHAR(30)| Indicates the reason for an incomplete table definition:  
F  The table lacks a required BUSINESS_TIME WITHOUT OVERLAPS index on a foreign key.  
L  An auxiliary table or auxiliary index has not been defined for a LOB column.  
P  The table lacks a primary index.  
R  The table lacks a required index on a row ID.  
U  The table lacks a required index on a unique key.  
V  An error occurred when an attempt was made to regenerate the internal representation of the view.  
blank  Definition is complete. | G   |
<p>| NPAGESF         | FLOAT(8)   | Number of pages that are used by the table. The value is -1 if statistics have not been gathered or the table is an auxiliary table or accelerator-only table. This column can be updated. | G   |
| SPACEF          | FLOAT(8)   | Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. The value might be non-zero for an auxiliary table in the LOB table space. This column can be updated. | G   |</p>

</tbody>
</table>

**SYSTABLESPACESTATS catalog table**

The SYSTABLESPACESTATS table contains real time statistics for table spaces. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

**Important:** Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other
utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

In data sharing environments, the values in SYSIBM.SYSTABLESPACESTATS can be negative for short periods of time for certain situations.

**History table:** SYSIBM.SYSTABLESPACESTATS_H is a history table for temporal versioning of the SYSIBM.SYSTABLESPACESTATS catalog table. Both tables contain the same columns, with the same data types. The temporal relationship must be enabled before the history table can be used. Rows in the history table can be inserted, updated, and deleted with proper authorization. For information about enabling the temporal relationship, see “Temporal versioning for Db2 catalog tables” on page 2809.

### SYSTABLES_HIST catalog table
The SYSTABLES_HIST table contains rows from the SYSTABLES table. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>VARCHAR(128)</td>
<td>Name of the table, view, or alias.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CREATOR</td>
<td>VARCHAR(128)</td>
<td>The schema of the table, view, or alias.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>DBNAME</td>
<td>VARCHAR(24)</td>
<td>For a table, or a view of tables, the name of the database that contains the table space named in TSNAME. For a temporary table, an alias, or a view of a view, the value is DSNDB06.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TSNAME</td>
<td>VARCHAR(24)</td>
<td>For a table, or a view of one table, the name of the table space that contains the table. For a view of more than one table, the name of a table space that contains one of the tables. For a temporary table, a view of a view, or an alias, it is SYSTSTAB.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>COLCOUNT</td>
<td>SMALLINT</td>
<td>Number of columns in the table or view. The value is 0 if the row describes an alias.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>PCTPAGES</td>
<td>SMALLINT</td>
<td>Percentage of active table space pages that contain rows of the table. A page is termed active if it is formatted for rows, regardless of whether it contains any. If the table space is segmented, the percentage is based on the number of active pages in the set of segments assigned to the table. The value is -1 if statistics have not been gathered, or the row describes a view, alias, temporary table, accelerator-only table, or auxiliary table.</td>
<td>S</td>
</tr>
<tr>
<td></td>
<td>NOT NULL WITH DEFAULT -1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>PCTROWCOMP</td>
<td>SMALLINT</td>
<td>Percentage of rows compressed within the total number of active rows in the table. This includes any row in a table space that is defined with COMPRESS YES. The value is -1 if statistics have not been gathered, or the row describes a view, alias, temporary table, accelerator-only table, or auxiliary table.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL WITH DEFAULT -1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
<td>Use</td>
</tr>
<tr>
<td>------------</td>
<td>----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------</td>
</tr>
<tr>
<td>STATTIME</td>
<td>TIMESTAMP</td>
<td>If RUNSTATS updated the statistics, the date and time when the last invocation of RUNSTATS updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column. For a temporary table, the value of STATTIME is always the default value.</td>
<td>G</td>
</tr>
<tr>
<td>CARDF</td>
<td>FLOAT(8)</td>
<td>Total number of rows in the table or total number of LOBs in an auxiliary table. The value is -1 if statistics have not been gathered or the row describes a view, alias, accelerator-only table, or temporary table.</td>
<td>S</td>
</tr>
<tr>
<td>NPAGESF</td>
<td>FLOAT(8)</td>
<td>Total number of pages on which rows of the partition appear. The value is -1 if statistics have not been gathered.</td>

</tr>
<tr>
<td>AVGROWLEN</td>
<td>INTEGER</td>
<td>Average row length of the table specified in the table space. The value is -1 if statistics have not been gathered.</td>
<td>G</td>
</tr>
<tr>
<td>SPACEF</td>
<td>FLOAT(8)</td>
<td>Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. This is an updatable column.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.</td>
<td>G</td>
</tr>
</tbody>
</table>

**SYSTABLES_PROFILES catalog table**

The SYSTABLES_PROFILES table contains one row for each profile that is associated with a table in SYSIBM.SYSTABLES. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCHEMA</td>
<td>VARCHAR(128)</td>
<td>The schema (qualifier) for the table.</td>
<td>G</td>
</tr>
<tr>
<td>TBNAME</td>
<td>VARCHAR(128)</td>
<td>The table name.</td>
<td>G</td>
</tr>
<tr>
<td>PROFILE_TYPE</td>
<td>VARCHAR(32)</td>
<td>The type of profile. Allowed values are 'RUNSTATS'.</td>
<td>G</td>
</tr>
<tr>
<td>PROFILER_TYPE</td>
<td>VARCHAR(32)</td>
<td>The text of the profile.</td>
<td>I</td>
</tr>
<tr>
<td>ROWID</td>
<td>ROWID</td>
<td>The ROWID value for the LOB column of this table.</td>
<td>G</td>
</tr>
<tr>
<td>PROFILE_UPDATE</td>
<td>TIMESTAMP</td>
<td>The last time the profile was updated, or the timestamp for when the profile was inserted into the table.</td>
<td>G</td>
</tr>
</tbody>
</table>

**SYSSTABLES_PROFILE_TEXT catalog table**

The SYSSTABLES_PROFILE_TEXT table is an auxiliary table for the PROFILE_TEXT column of the SYSIBM.SYSTABLES_PROFILES table and is required to hold LOB data. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROFILE_TEXT</td>
<td>CLOB(2M)</td>
<td>The complete text for the profile that the row represents.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>WITH DEFAULT</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**SYSTABSTATS catalog table**

The SYSTABSTATS table contains one row for each partition of a partitioned table space. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

**Important:** Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

<table>
<thead>

**SYSTRIGGERS_STMT catalog table**

The SYSTRIGGERS_STMT table is an auxiliary table for the STATEMENT column of the SYSTRIGGERS table and contains LOB data. The schema is SYSIBM.
### Column name | Data type | Description | Use
---|---|---|---
**STATEMENT** | CLOB(2M) NOT NULL WITH DEFAULT | The text of the entire CREATE TRIGGER statement that was used to create the object. | G

---

**SYSUSERAUTH** catalog table

The SYSUSERAUTH table records the system privileges that are held by users. The schema is SYSIBM.

| Column name | Data type | Description | Use
---|---|---|---
**GRANTOR** | VARCHAR(128) NOT NULL | Authorization ID of the user who granted the privileges. | G
**GRANTEE** | VARCHAR(128) NOT NULL | Authorization ID of the user that holds the privilege. Could also be PUBLIC for a grant to PUBLIC. | G
— | CHAR(12) NOT NULL | Internal use only. | I
**DATEGRANTED** | CHAR(6) NOT NULL | Not used. | N
**TIMEGRANTED** | CHAR(8) NOT NULL | Not used. | N
**GRANTEETYPE** | CHAR(1) NOT NULL | Not used. | N
**AUTHHOWGOT** | CHAR(1) NOT NULL WITH DEFAULT | Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. | G
| **blank** | Not applicable | G
| C | DBCTRL |
| D | DBADM |
| E | SECADM |
| G | ACCESSCTRL |
| K | SQLADM |
| L | SYSCtrl |
| M | DBMAINT |
| O | SYSOPR |
| S | SYSADM |
**ALTERBPAUTH** | CHAR(1) NOT NULL | Not used. | N
**BINDADDAUTH** | CHAR(1) NOT NULL | Whether the GRANTEE can use the BIND subcommand with the ADD option: | G
| **blank** | Privilege is not held | G
<p>| G | Privilege is held with the GRANT option |
| Y | Privilege is held without the GRANT option |</p>

<td>DEFAULT</td>
<td>CHAR(3)</td>
<td>The default value of the global variable.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This column can contain one of the following values:

- **N**: The global variable does not have a default value. If the variable is an array type, the value is N.
- **S**: The default value is the value of the SQL authorization ID of the process at the time that a default value is used.
- **1**: The default value is a string constant.
- **2**: The default value is a floating-point constant.
- **3**: The default value is a decimal constant.
- **4**: The default value is an integer constant.
- **5**: The default value is a hexadecimal character string.
- **6**: The default value is a UX string.
- **7**: The global variable has a graphic data type and has a default value that is a character string constant.
- **8**: The global variable has a character data type and has a default value that is a character string constant.
- **9**: The default value is a DECFLOAT constant

If this column contains one of the following values, the default value of the global variable is the value of the indicated special register at the time that a default value is used:

- **AES**: CURRENT APPLICATION ENCODING SCHEME
- **ACT**: CURRENT CLIENT_ACCTNG
- **APN**: CURRENT CLIENT_APPLNAME
- **CID**: CURRENT CLIENT_USERID
- **WSN**: CURRENT CLIENT_WKSTNNAME
- **DAT**: CURRENT DATE
- **DBG**: CURRENT DEBUG MODE
- **DEC**: CURRENT DECIMAL Rounding Mode
- **DEG**: CURRENT DECIMAL Rounding Mode
- **EXP**: CURRENT Explain MODE
- **LCT**: CURRENT LOCALE LC_CTYPE
- **MTT**: CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION
- **MEM**: CURRENT MEMBER
- **HNT**: CURRENT OPTimization HINT
- **CPP**: CURRENT PACKAGE PATH
- **CPS**: CURRENT PACKAGESET
- **PTH**: CURRENT PATH
- **PRC**: CURRENT PRECISION
- **RFA**: CURRENT REFRESH AGE
- **RVS**: CURRENT ROUTINE VERSION
- **RUL**: CURRENT RULES
- **SCH**: CURRENT SCHEMA
- **SVR**: CURRENT SERVER
- **TIM**: CURRENT TIME
- **TST**: CURRENT TIMESTAMP
- **STZ**: SESSION TIME ZONE
- **U**: SESSION USER

<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see <a href="#">Release dependency indicators</a>. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDBY</td>
<td>VARCHAR(128)</td>
<td>Primary authorization ID of the user who created the database.</td>
<td>G</td>
</tr>
</tbody>
</table>

### SYSXMLTYPMSCHHEMA catalog table

The SYSXMLTYPMSCHHEMA table contains the XML schema information for an XML type modifier. It contains one row per XML schema for an XML type modifier. The schema is SYSIBM.
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>XML_TYPEMOD_ID</td>
<td>INTEGER</td>
<td>The id for the XML type modifier.</td>
<td>G</td>
</tr>
<tr>
<td>XSR_ID</td>
<td>INTEGER</td>
<td>The id for an XML schema registered in XSR.</td>
<td>G</td>
</tr>
<tr>
<td>ELEMENT_NAMESPACE</td>
<td>INTEGER</td>
<td>String id for the namespace name of the root element node. By default, it is the TARGETNAMESPACE of the XML schema. It would be 0 if it is NONAMESPACE.</td>
<td>G</td>
</tr>
<tr>
<td>ELEMENT_NAME</td>
<td>INTEGER</td>
<td>String id for the local name of the root element node. It would be 0 if it is not specified.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDTS</td>
<td>TIMESTAMP</td>
<td>The timestamp when this type modifier is created.</td>
<td>G</td>
</tr>
<tr>
<td>ALTEREDTS</td>
<td>TIMESTAMP</td>
<td>The timestamp when this type modifier is altered</td>
<td>G</td>
</tr>
<tr>
<td>RELCREATED</td>
<td>CHAR(1)</td>
<td>Release of Db2 that is used to create the object. See Release dependency indicators for the values.</td>
<td>G</td>
</tr>
<tr>
<td>IBMREQD</td>
<td>CHAR(1)</td>
<td>A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.</td>
<td>G</td>
</tr>
</tbody>
</table>

**Reorganizing the catalog**

The REORG TABLESPACE utility can be run on all the table spaces in the catalog database (DSNDB06) to reclaim unused or wasted space, which can affect performance.

The utility observes the PCTFREE and FREEPAGE values specified in the ALTER INDEX statement for all the catalog indexes and the following table spaces:

- DSNDB06.SYSDDF
- DSNDB06.SYSGPAUT
- DSNDB06.SYSGRTNS
- DSNDB06.SYSHIST
- DSNDB06.SYSJAVA
- DSNDB06.SYSJAUXA
- DSNDB06.SYSJAUXB
- DSNDB06.SYSSEQ
- DSNDB06.SYSSEQ2
- DSNDB06.SYSSSTATS
- DSNDB06.SYSTSCHX
- DSNDB06.SYSTSCKD
- DSNDB06.SYSTSCKS
- DSNDB06.SYSTSCPY
- DSNDB06.SYSTSSRG
- DSNDB06.SYSUSER
- DSNDB01.SCT02
- DSNDB01.SPT01
SQL statements allowed on the catalog

Certain SQL statements can be used to change the value of certain options for existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables.

**Table 263. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables**

<table>
<thead>
<tr>
<th>SQL statement</th>
<th>Index</th>
<th>Allowable clauses and usage notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER INDEX</td>
<td>IBM-defined</td>
<td>Only these clauses are allowed: CLOS</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You cannot alter the GBPCACHE value for indexes DSNXX01, DSNXX02, and DSNXX03, which are on catalog table SYSIBM.SYSINDEXES.</td>
</tr>
<tr>
<td>ALTER INDEX</td>
<td>User-created</td>
<td>All clauses are allowed, except for the following: BUFFERPOOL, REGENERATE, COMPRESS YES. Any partitioning clause is allowed.</td>
</tr>
<tr>
<td>ALTER SEQUENCE</td>
<td></td>
<td>The only clause allowed is MAXVALUE. You can only change the MAXVALUE value of the catalog sequence DSNSEQ_IMPLICITDB. The only value specific must be an integer between 1 and 60000, inclusive.</td>
</tr>
<tr>
<td>ALTER TABLE</td>
<td></td>
<td>Only these clauses are allowed: DATA CAPTURE CHANGES, ADD VERSIONING, DROP VERSIONING, ADD PERIOD. The ADD VERSIONING, DROP VERSIONING, and ADD PERIOD clauses can be specified on only the following tables: SYSIBM.SYSTABLESPACESTATS, SYSIBM.SYSINDEXSPACESTATS.</td>
</tr>
</tbody>
</table>

Temporal versioning for Db2 catalog tables

Db2 uses temporal versioning to record historical information for certain catalog tables. You can use the historical information to analyze, predict, and help prevent specific conditions in a subsystem.

The following table lists the catalog tables that have an associated history table for system-period temporal versioning.

<table>
<thead>
<tr>
<th>Catalog table</th>
<th>History table</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;SYSINDEXSPACESTATS catalog table&quot; on page 2612</td>
<td>SYSIBM.SYSIXSPACESTATS_H</td>
</tr>
<tr>
<td>&quot;SYSTABLESPACESTATS catalog table&quot; on page 2776</td>
<td>SYSIBM.SYSTABLESPACESTATS_H</td>
</tr>
</tbody>
</table>

The historical information for the real-time statistics catalog tables, SYSINDEXSPACESTATS and SYSTABLESPACESTATS, can be used to analyze the rate of change in size, organization, and activity for table space and index space partitions. This information can then be used to develop an automated response to conditions like table spaces and index spaces running out of space or becoming too disorganized.

Enabling the temporal relationship

The temporal relationship between a history table and its associated catalog table must be enabled before the history table can be used to record historical information. Each member Db2 externalizes rows whenever interval specified by the STATSINT subsystem parameter is reached.

**Tip:** It is best to develop and test an aggregation and purge strategy before enabling the temporal relationship.
To enable the temporal relationship for SYSIBM.SYSINDEXSPACESTATS and its associated history table, SYSIBM.SYSINDEXSPACESTATS_H, issue the following statement:

```sql
ALTER TABLE SYSIBM.SYSINDEXSPACESTATS
ADD VERSIONING
USE HISTORY TABLE SYSIBM.SYSINDEXSPACESTATS_H;
```

To enable the temporal relationship for SYSIBM.SYSTABLESPACESTATS and its associated history table, SYSIBM.SYSTABLESPACESTATS_H, issue the following statement:

```sql
ALTER TABLE SYSIBM.SYSTABLESPACESTATS
ADD VERSIONING
USE HISTORY TABLE SYSIBM.SYSTABLESPACESTATS_H;
```

If the temporal relationship between a catalog table and its associated history table later needs to be removed, you can issue the ALTER TABLE statement with the DROP VERSIONING clause on the catalog table.

**Related concepts:**
- Temporal tables and data versioning (Db2 Administration Guide)
- Recovery of temporal tables with system-period data versioning (Db2 Administration Guide)
- When Db2 externalizes real-time statistics (Db2 Performance)

**Related tasks:**
- Creating a system-period temporal table (Db2 Administration Guide)
- Querying temporal tables (Db2 Administration Guide)
- Collecting history statistics (Db2 Performance)

## Catalog indexes

Indexes are defined on most catalog tables to improve catalog access.

The following table identifies the Db2 catalog tables on which indexes are defined, the columns that are in each of the indexes, and the data types of those columns.

<table>
<thead>
<tr>
<th>Table</th>
<th>Index (type)</th>

Db2 directory tables

Db2 for z/OS maintains a set of tables (in database DSNDB01) called the Db2 directory. Authorized users can query the directory; however, it is primarily intended for use by Db2 and is therefore subject to change.

About these topics

These topics describe the directory tables that allow SELECT operations by describing the columns of those tables.

Users must have one of the following privileges to execute SELECT statements on the directory tables:
- Installation SYSADM
- SYSADM
- SYSCTRL
- ACCESSCTRL
- DATAACCESS
- SECADM
- SQLADM
- System DBADM
- DBADM on DSNDB01
- The SELECT privilege on a specific table

All directory tables are qualified by SYSIBM. Do not use this qualifier for user-defined tables.

The directory tables are not, in most cases, updated as part of Db2 operations.

The following table lists restrictions on SQL statements that reference directory tables:
<table>
<thead>
<tr>
<th>SQL statement</th>
<th>Restriction</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER TABLE</td>
<td><em>table-name</em> cannot specify a directory table.</td>
</tr>
<tr>
<td>ALTER TABLESPACE</td>
<td>The table space cannot be altered if it is associated with a directory table.</td>
</tr>
<tr>
<td>CREATE INDEX</td>
<td>ON <em>table-name</em> or <em>aux-table-name</em> cannot specify a directory table.</td>
</tr>
<tr>
<td>CREATE TRIGGER (basic)</td>
<td>ON <em>table-name</em> cannot specify a directory table.</td>
</tr>
<tr>
<td>CREATE TRIGGER (advanced)</td>
<td>ON <em>table-name</em> cannot specify a directory table.</td>
</tr>
<tr>
<td>DELETE</td>
<td>FROM <em>table-name</em> cannot specify a directory table.</td>
</tr>
<tr>
<td>DROP</td>
<td><em>table-name</em> cannot specify a directory table.</td>
</tr>
<tr>
<td>INSERT</td>
<td>INTO <em>table-name</em> cannot specify a directory table.</td>
</tr>
<tr>
<td>MERGE</td>
<td>INTO <em>table-name</em> cannot specify a directory table.</td>
</tr>
<tr>
<td>RENAME</td>
<td><em>source-table-name</em> cannot specify a directory table.</td>
</tr>
<tr>
<td>TRANSFER OWNERSHIP</td>
<td>TABLE <em>table-name</em> cannot specify a directory table.</td>
</tr>
<tr>
<td>UPDATE</td>
<td><em>table-name</em> cannot specify a directory table.</td>
</tr>
</tbody>
</table>

**Programming interface information**

None of the directory table columns are part of the general-use programming interface. The column labeled “Use” in the table that describes the column indicates whether the column is part of the product-sensitive interface or is for internal, IBM use, only. The values that “Use” can assume are as follows:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>Column is part of the product-sensitive interface</td>
</tr>
<tr>
<td>I</td>
<td>Column is for internal use only</td>
</tr>
</tbody>
</table>

For columns for which “Use” is I, the name of the column and its description do not appear in the explanation of the column.

**Directory table spaces and indexes**

Db2 directory tables are contained in certain table spaces and have indexes.

The following table lists the table space and indexes for each directory table and lists the index fields for each index. The indexes are in ascending order.

The directory table space, tables, and indexes are primarily intended for use by Db2 and are therefore subject to change.

*Table 265. Table spaces and indexes for the directory tables*

**DBDR table**

The DBDR table stores one row for each DBD section. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBID</td>
<td>SMALLINT</td>
<td>DBID of the database</td>

<td>S</td>
</tr>
<tr>
<td>DBD_DATA</td>
<td>BLOB(2G)</td>
<td>DBD data for the section</td>
<td>I</td>
</tr>
</tbody>
</table>

**SYSDBD_DATA table**

The SYSDBD_DATA table is an auxiliary table for the SYSIBM.DBDR table. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBD_DATA</td>
<td>BLOB(2G)</td>
<td>Contents of the DBD section.</td>
<td>I</td>
</tr>
</tbody>
</table>

**SYSIBM.SCTR table**

The SCTR table stores Skeleton Cursor Tables (SKCT) information. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCTLL</td>
<td>CHAR (4) FOR BIT DATA</td>
<td>The length of the record.</td>
<td>S</td>
</tr>
<tr>
<td>SCTNAME</td>
<td>CHAR (14) FOR BIT DATA</td>
<td>The plan name, section number, and sequence number.</td>
<td>S</td>
</tr>
<tr>
<td>SCTDAT</td>
<td>VARCHAR(4028)</td>
<td>SKCT data.</td>
<td>I</td>
</tr>
</tbody>
</table>
SYSIBM.SPTR table

The SPTR table stores skeleton package table (SKPT) information. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPTLL</td>
<td>INTEGER</td>
<td>The length of the record.</td>
<td>S</td>
</tr>
<tr>
<td>SPTLOCID</td>
<td>VARCHAR(128)</td>
<td>Package location.</td>
<td>S</td>
</tr>
<tr>
<td>SPTCOLID</td>
<td>VARCHAR(128)</td>
<td>Package collection ID.</td>
<td>S</td>
</tr>
<tr>
<td>SPTNAME</td>
<td>VARCHAR(128)</td>
<td>Package name.</td>

<td>Section number.</td>
<td>S</td>
</tr>
<tr>
<td>SPTSEQ</td>
<td>CHAR(2) FOR BIT DATA</td>
<td>Sequence number within the section.</td>
<td>S</td>
</tr>
<tr>
<td>SPTBODY</td>
<td>VARCHAR(1)</td>
<td>Reserved for future IBM use.</td>
<td>I</td>
</tr>
<tr>
<td>SPTVER</td>
<td>VARCHAR(64)</td>
<td>Package version.</td>
<td>S</td>
</tr>
<tr>
<td>SPT_ROWID</td>
<td>ROWID</td>
<td>ROWID that Db2 creates for the LOB columns in this table.</td>
<td>S</td>
</tr>
<tr>
<td>SPT_DATA</td>
<td>BLOB(2G)</td>
<td>Internal use only.</td>
<td>I</td>
</tr>
<tr>
<td>SPT_EXPLAIN</td>
<td>BLOB(2G)</td>
<td>Internal use only.</td>
<td>I</td>
</tr>
</tbody>
</table>

SYSSPTSEC_DATA table

The SYSSPTSEC_DATA table is an auxiliary table that contains package data for the SPTR table. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPT_DATA</td>
<td>BLOB(2G)</td>
<td>Contents of the SKPT section</td>
<td>I</td>
</tr>
</tbody>
</table>

SYSSPTSEC_EXPL table

The SYSSPTSEC_EXPL table is an auxiliary table that contains static package explain data for the SPTR table. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPT_EXPLAIN</td>
<td>BLOB(2G)</td>
<td>Contents of the SKPT section explain block</td>
<td>I</td>
</tr>
</tbody>
</table>

SYSLGRNX table

The SYSLGRNX table stores recovery log ranges that record the time an index space defined with COPY YES or a table space was open for updates. This provides an efficient way for Db2 to access the appropriate log records for recovery, rather than having to scan every record in the recovery log for a particular table. The schema is SYSIBM.
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LGRDBID</td>
<td>CHAR(2)</td>
<td>FOR BIT DATA</td>
<td>S</td>
</tr>
<tr>
<td>LGRPSID</td>
<td>CHAR(2)</td>
<td>FOR BIT DATA</td>
<td>S</td>
</tr>
<tr>

<td>SMALLINT</td>
<td></td>
<td>S</td>
</tr>
<tr>
<td>LGRSLRSN</td>
<td>CHAR(10)</td>
<td>FOR BIT DATA</td>
<td>S</td>
</tr>
<tr>
<td>LGRELRSN</td>
<td>CHAR(10)</td>
<td>FOR BIT DATA</td>
<td>S</td>
</tr>
<tr>
<td>LGRMEMB</td>
<td>CHAR(2)</td>
<td></td>
<td>S</td>
</tr>
</tbody>
</table>

**SYSUTIL table**

The SYSUTIL table stores status information about Db2 utilities that are active or stopped. Each record is uniquely identified by the utility identifier. Each row of the table contains the information for one utility execution step. When the utility completes, the corresponding entries in the SYSUTIL table are deleted. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>

</tbody>
</table>

### Performance information for SQL application programming

Efficient applications are an important first step to good system and application performance. As you code applications that access data in Db2, consider performance objectives in your application design.

The following topics can help you understand how application programmers can consider performance as they write applications that access data in Db2 for z/OS.

#### Concurrency and programming

The goal is to program and prepare applications in a way that:

- Protects the integrity of the data that is being read or updated from being changed by other applications.
- Minimizes the length of time that other access to the data is prevented.

For more information about data concurrency in Db2 and recommendations for improving concurrency in your application programs, see the following topics:

- [Designing databases for concurrency (Db2 Performance)](http://www.ibm.com/support/docview.wss?uid=sg24-70000)
- [Concurrency and locks (Db2 Performance)](http://www.ibm.com/support/docview.wss?uid=sg24-70000)
- [Improving concurrency (Db2 Performance)](http://www.ibm.com/support/docview.wss?uid=sg24-70000)
- [Improving concurrency in data sharing environments (Db2 Data Sharing Planning and Administration)](http://www.ibm.com/support/docview.wss?uid=sg24-70000)
Writing efficient queries

The predicates, subqueries, and other structures in SQL statements affect the access paths that Db2 uses to access the data.

For information about how to write SQL statements that access data efficiently, see the following topics:

- Ways to improve query performance (Introduction to Db2 for z/OS)
- Writing efficient SQL queries (Db2 Performance)

Analyzing access paths

By analyzing the access path that Db2 uses to access the data for an SQL statement, you can discover potential problems. You can use this information to modify your statement to perform better.

Tip: You can use tools such as IBM Data Server Manager and related Db2 Tools for z/OS solutions to simplify this task.

- IBM Data Server Manager (Introduction to Db2 for z/OS)
- Db2 Tools for z/OS

For information about how you can use EXPLAIN tables to analyze the access paths for your SQL statements, see the following topics:

- Investigating access path problems (Db2 Performance)
- 00C200A4 (Db2 Codes)
- Investigating SQL performance by using EXPLAIN (Db2 Performance)
- Interpreting data access by using EXPLAIN (Db2 Performance)
- EXPLAIN tables (Db2 Performance)
- EXPLAIN

Distributed data access performance

The goal is to reduce the amount of network traffic that is required to access the distributed data, and to manage the use of system resources such as distributed database access threads and connections.

For information about improving the performance of applications that access distributed data, see the following topics:

- Ways to reduce network traffic (Introduction to Db2 for z/OS)
- Managing Db2 threads (Db2 Performance)
- Improving performance for applications that access distributed data (Db2 Performance)
- Improving performance for SQL statements in distributed applications (Db2 Performance)

Stored procedures performance

For information about stored procedures and Db2 performance, see the following topics:

- Implementing Db2 stored procedures ()
- Improving the performance of stored procedures and user-defined functions (Db2 Performance)
Db2 XML schema repository tables

The Db2 for z/OS XML schema repository (XSR) is a set of Db2 tables where you can store XML schemas.

Db2 creates the XSR tables during installation or migration. After you add XML schemas to the Db2 XSR, you can use them to validate XML documents before you store them in XML columns.

An XML schema consists of a set of XML schema documents. To add an XML schema to the Db2 XSR, you register XML schema documents to Db2. The XML schema documents must be in the Unicode encoding scheme.

**Programming interface information**

Not all XSR table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled “Use” in the row that describes the table column. The meaning of the values for the “Use” column is indicated in the following table.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>Column is part of the general-use programming interface</td>
</tr>
<tr>
<td>S</td>
<td>Column is part of the product-sensitive interface</td>
</tr>
<tr>
<td>I</td>
<td>Column is for IBM use only</td>
</tr>
<tr>
<td>N</td>
<td>Column is not used</td>
</tr>
</tbody>
</table>

For columns for which “Use” is N or I, the name of the column and its description do not appear in the explanation of the column.
XML schema repository (XSR) table spaces and indexes

Db2 XSR tables are contained in certain table spaces and have indexes.

The following tables list the table space and indexes for each XRS table and lists the index fields for each index. The indexes are in ascending order, except where noted.

Table 267. Table spaces and indexes for the DSNXSR database tables

<table>
<thead>
<tr>
<th>Table space</th>

<td></td>
</tr>
</tbody>
</table>

Note: Index field is in descending order

**XSRCOMPONENT table**

The SYSIBM.XSRCOMPONENT table is an auxiliary table for the BLOB column COMPONENT in the SYSXSROBJECTCOMPONENTS table. It is in LOB table space SYSXSRA3. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPONENT</td>
<td>BLOB(30M)</td>
<td>Contents of the XML schema document</td>
<td>G</td>
</tr>
</tbody>
</table>

**XSROBJECTS table**

The SYSIBM.XSROBJECTS table contains one row for each registered XML schema. The schema is SYSIBM.
Rows in this table can only be changed using static SQL statements issued by the Db2-supplied XSR stored procedures.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>XSROBJECTID</td>
<td>INTEGER</td>
<td>Internal identifier of the XML schema. XSROBJECTID is generated as an identity column.</td>

Appendix. Additional information for Db2 SQL  2837
**XSROBJECTCOMPONENTS table**

The XSROBJECTCOMPONENTS table contains one row for each component (document) in an XML schema. The schema is SYIBM.

Rows in this table can only be changed using static SQL statements issued by the Db2-supplied XSR stored procedures.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>XSRCOMPONENTID</td>
<td>INTEGER</td>
<td>Internal identifier of the XML schema document. XSRCOMPONENTID is generated as an identity column.</td>

<td>The release of Db2 that is used to create the object. See <a href="#">Release dependency indicators</a> for the values.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td>NOT NULL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**XSROBJECTGRAMMAR table**

SYSIBM.XSROBJECTGRAMMAR is an auxiliary table for the BLOB column GRAMMAR in SYSIBM.SYSXSROBJECTS. It is in LOB table space SYSXSRA1. The schema is SYIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRAMMAR</td>
<td>BLOB(250M)</td>
<td>Internal binary representation of the XML schema</td>
<td>G</td>
</tr>
</tbody>
</table>
**XSROBJECTHIERARCHIES table**

The XSROBJECTHIERARCHIES table contains one row for each component (document) in an XML schema to record the XML schema document hierarchy relationship. The schema is SYSIBM.

Rows in this table can only be changed using static SQL statements issued by the Db2-supplied XSR stored procedures.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>XSROBJECTID</td>
<td>INTEGER</td>
<td>Internal identifier of the XML schema.</td>
<td>G</td>
</tr>
<tr>
<td>XSRCOMPONENTID</td>
<td>INTEGER</td>
<td>Internal identifier of the XML schema document.</td>
<td>G</td>
</tr>
<tr>
<td>HTYPE</td>
<td>CHAR(1)</td>
<td>Hierarchy type:</td>
<td>G</td>
</tr>
<tr>
<td>TARGETNAMESPACE</td>
<td>INTEGER</td>
<td>The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.</td>
<td>G</td>
</tr>
<tr>
<td>SCHEMALLOCATION</td>
<td>INTEGER</td>
<td>The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.</td>
<td>G</td>
</tr>
<tr>
<td>RELCREATED</td>
<td>CHAR(1)</td>
<td>The release of Db2 that is used to create the object. See Release dependency indicators for the values.</td>
<td>G</td>
</tr>
</tbody>
</table>

**XSROBJECTPROPERTY table**

The XSROBJECTPROPERTY table is an auxiliary table for the BLOB column PROPERTIES in SYSIBM.SYSXSROBJECTS. It is in LOB table space SYSXSRA2. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROPERTIES</td>
<td>BLOB(5M)</td>
<td>Contents of the additional property information of the entire XML schema.</td>
<td>G</td>
</tr>
</tbody>
</table>

**XSRPROPERTY table**

The XSRPROPERTY table is an auxiliary table for the BLOB column COMPONENT in XSROBJECTCOMPONENTS. It is in LOB table space SYSXSRA3. The schema is SYSIBM.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPONENT</td>
<td>BLOB(5M)</td>
<td>Contents of the additional property information of the XML schema document.</td>
<td>G</td>
</tr>
</tbody>
</table>
EXPLAIN tables

EXPLAIN tables contain information about SQL statements and functions that run on Db2 for z/OS.

You can create and maintain a set of EXPLAIN tables to capture and analyze information about the performance of SQL statements and functions that run on Db2 for z/OS. Each row in an EXPLAIN table describes some aspect of a step in the execution of a query or subquery in an explainable statement. The column values for the row identify, among other things, the query or subquery, the tables and other objects involved, the methods used to carry out each step, and cost information about those methods. Db2 creates EXPLAIN output and populates EXPLAIN tables in the following situations:

- When an EXPLAIN statement is executed.
- At BIND or REBIND with the EXPLAIN(YES) or (ONLY) bind options. Rows are added for every explainable statement in the plan or package being bound. For a plan, these do not include statements in the packages that can be used with the plan. For either a package or plan, they do not include explainable statements within EXPLAIN statements nor do they include explainable statements that refer to declared temporary tables, which are incrementally bound at run time.
- When an explainable dynamic statement is executed and the value of the CURRENT EXPLAIN MODE special register is set to YES or EXPLAIN.

**Important:** It is best to convert EXPLAIN tables to Db2 12 format during migration, or soon after migration. In Db2 12, the EXPLAIN function supports tables in Db2 12 or Db2 11 formats only. However, Db2 11 format EXPLAIN tables are deprecated. If you invoke EXPLAIN and Db2 11 tables are used, Db2 issues SQL code +20520. If tables of an unsupported format are found, Db2 issues SQL code -20008 and the EXPLAIN operation fails. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [ADMIN_EXPLAIN_MAINT stored procedure](#) for information about using the action input parameter to request each of these tasks.

**Related tasks:**

- Migration step 25: Convert EXPLAIN tables to the current format (Db2 Installation and Migration)

**Related reference:**

- BIND and REBIND options for packages, plans, and services (Db2 Commands)
- EXPLAIN
- Investigating SQL performance by using EXPLAIN (Db2 Performance)
- ADMIN_EXPLAIN_MAINT stored procedure

PLAN_TABLE

The plan table, PLAN_TABLE, contains information about access paths that is collected from the results of EXPLAIN statements.

**Tip:** You can use tools such as IBM Data Server Manager and related Db2 Tools for z/OS solutions to simplify this task.

- IBM Data Server Manager (Introduction to Db2 for z/OS)
- Db2 Tools for z/OS
Tip: You can use the *visual explain* feature of tools such as IBM Data Server Manager to create visual diagrams of the access paths for your SQL statements.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See `ADMIN_EXPLAIN_MAINT stored procedure` for information about using the action input parameter to request each of these tasks.

**Optional PLAN_TABLE formats**

A PLAN_TABLE instance can have a format with fewer columns than those shown in the sample CREATE TABLE statement. However instances of PLAN_TABLE must have one of the following formats:

**Db2 12 format**

All columns shown in the sample CREATE TABLE statement, up to and including the PER_STMT_ID column (COLCOUNT=67).

**Db2 11 format**

All columns shown in the sample CREATE TABLE statement, up to and including the EXPANSION_REASON column (COLCOUNT=66). This format is deprecated in Db2 12.

**Important:** If the EXPLAIN tables have any format older than the Db2 11 format, Db2 returns an error for any operation that tries to insert rows in the EXPLAIN tables. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See `ADMIN_EXPLAIN_MAINT stored procedure` for information about using the action input parameter to request each of these tasks.
Column descriptions

Your subsystem or data sharing group can contain more than one of these tables, including a table with the qualifier SYSIBM, a table with the qualifier DB2OSCA, and additional tables that are qualified by user IDs.

The following table shows the descriptions of the columns in PLAN_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Db2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.</td>
</tr>
</tbody>
</table>
### Table 268. Descriptions of columns in PLAN_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.</td>
</tr>
<tr>
<td>PLANNO</td>
<td>SMALLINT NOT NULL</td>
<td>The number of the step in which the query that is indicated in QBLOCKNO was processed. This column indicates the order in which the steps were executed.</td>
</tr>
<tr>
<td>METHOD</td>
<td>SMALLINT NOT NULL</td>
<td>A number that indicates the join method that is used for the step:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0  The table in this step is the first table that is accessed, a continuation of a previous table that was accessed, or a table that is not used.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1  A nested loop join is used. For each row of the current composite table, matching rows of a new table are found and joined.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2  A merge scan join is used. The current composite table and the new table are scanned in the order of the join columns, and matching rows are joined.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3  Sorts are needed by ORDER BY, GROUP BY, SELECT DISTINCT, UNION, INTERSECT, EXCEPT, a quantified predicate, or an IN predicate. This step does not access a new table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>4  A hybrid join was used. The current composite table is scanned in the order of the join-column rows of the new table. The new table is accessed using list prefetch.</td>
</tr>
<tr>
<td>CREATOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The creator of the new table that is accessed in this step, blank if METHOD is 3.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| TNAME       | VARCHAR(128) NOT NULL | The name of one of the following objects:  
  - Table  
  - Materialized query table  
  - Created or declared temporary table  
  - Materialized view  
  - Materialized table expression  
  - Any of the following object names that identify intermediate results:  
    -  'DSNWFQB(qblockno)' - The intermediate result of a UNION ALL, INTERSECT ALL, EXCEPT ALL, or an outer join that is materialized. If a view is merged, the name of the view does not appear.  
    -  'DSN_DIM_TBLX(qblockno)' - The work file of a star join dimension table.  
    -  'DSN_SPIX_TBLX(qblockno)' - A sparse index used for a sideways table reference.  
  The value is blank if METHOD is 3. |
| TABNO       | SMALLINT NOT NULL | Values are for IBM use only. |
| ACCESSTYPET | CHAR(2) NOT NULL | The method of accessing the new table |
| MATCHCOLS   | SMALLINT NOT NULL | For ACCESSTYPE I, IN, N, NR, MX, or DX, the number of index keys that are used in an index scan; otherwise, 0. |
| ACCESSCREATOR | VARCHAR(128) NOT NULL | For ACCESSTYPE I, IN, N, NR, MX, or DX, the creator of the index; otherwise, blank. |
| ACCESSNAME  | VARCHAR(128) NOT NULL | For ACCESSTYPE I, IN, H, MH, N, NR, MX, or DX, the name of the index; for ACCESSTYPE P, DSNPJW(mixopseqno) is the starting pair-wise join leg in MIXOPSEQ; otherwise, blank. |
| INDEXONLY   | CHAR(1) NOT NULL | Indication of whether access to an index alone is enough to perform the step, or Indication of whether data too must be accessed.  
  Y  Yes  
  N  No |
| SORTN_UNIQ  | CHAR(1) NOT NULL | Indication of whether the new table is sorted to remove duplicate rows.  
  Y  Yes  
  N  No |
| SORTN_JOIN  | CHAR(1) NOT NULL | Indication of whether the new table is sorted for join method 2 or 4.  
  Y  Yes  
  N  No |
| SORTN_ORDERBY | CHAR(1) NOT NULL | Indication of whether the new table is sorted for ORDER BY.  
  Y  Yes  
  N  No |
<table>

<td>SORC_PGROUP_ID</td>
<td>SMALLINT</td>
<td>The parallel group identifier for the parallel sort of the composite table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.</td>
</tr>
<tr>
<td>SORTN_PGROUP_ID</td>
<td>SMALLINT</td>
<td>The parallel group identifier for the parallel sort of the new table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.</td>
</tr>
<tr>
<td>PARALLELISM_MODE</td>
<td>CHAR(1)</td>
<td>The kind of parallelism, if any, that is used at bind time: C Query CP parallelism. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns, if the method that it refers to does not apply, or if the plan or package was bound prior to DB2 10.</td>
</tr>
<tr>
<td>MERGE_JOINCOLS</td>
<td>SMALLINT</td>
<td>The number of columns that are joined during a merge scan join (Method=2). This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.</td>
</tr>
<tr>
<td>CORRELATION_NAME</td>
<td>VARCHAR(128)</td>
<td>The correlation name of a table or view that is specified in the statement. If no correlation name exists, then the column is null. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.</td>
</tr>
<tr>
<td>PAGE_RANGE</td>
<td>CHAR(1) NOT NULL WITH DEFAULT</td>
<td>Indication of whether the table qualifies for page range screening, so that plans scan only the partitions that are needed. Y Yes blank No</td>
</tr>
</tbody>
</table>

<tr>
<td>---------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>EXPANSION_REASON</td>
<td>CHAR(2) NOT NULL WITH DEFAULT</td>
<td>This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. blank The query does not contain implicit query transformation.</td>
</tr>
</tbody>
</table>
Table 268. Descriptions of columns in PLAN_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PER_STMT_ID</td>
<td>BIGINT NOT NULL</td>
<td>The persistent statement identifier for SQL statements in Db2 catalog tables.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For example, this column corresponds to the following catalog table columns that identify SQL statements:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.</td>
</tr>
</tbody>
</table>

Notes:

1. For PLAN_TABLE rows in which ACCESSTYPE='A' and QBLOCK_TYPE='SELECT', the values of all other columns except QUERYNO, APPLNAME, and PROGNAME are the default values for those columns.
2. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallelism:
   • PARALLELISM_MODE
   • ACCESS_PGROUP_ID
   • JOIN_PGROUP_ID
3. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallel sort:
   • SORTN_PGROUP_ID
   • SORTC_PGROUP_ID
4. The ACCESSTYPE column contains the following values:
   'A'  The query is sent to an accelerator server.
   'DI' By an intersection of multiple DOCID lists to return the final DOCID list
   'DU' By a union of multiple DOCID lists to return the final DOCID list
   'DX' By an XML index scan on the index that is named in ACCESSNAME to return a DOCID list
   'E'  By direct row access using a row change timestamp column.
   'H'  By hash access. If an overflow condition occurs, the hash overflow index that is identified by ACCESSCREATOR and ACCESSNAME is used.
   'HN' By hash access using an IN predicate, or an IN predicate that Db2 generates. If a hash overflow condition occurs, the hash overflow index that is identified in ACCESSCREATOR and ACCESSNAME is used.
   'I'  By an index (identified in ACCESSCREATOR and ACCESSNAME)
   'IN' By an index scan when the matching predicate contains an IN predicate and the IN-list is accessed through an in-memory table.
   'II' By a one-fetch index scan
   'M'  By a multiple index scan. A row that contains this value might be followed by a row that contains one of the following values:
      • 'DI'
      • 'DU'
      • 'MH'
      • 'MI'
      • 'MU'
      • 'MX'
   'MH' By the hash overflow index named in ACCESSNAME. A row that contains this value always follows a row that contains M.
'MI'  By an intersection of multiple indexes. A row that contains this value always follows a row that contains M.

'MU'  By a union of multiple indexes. A row that contains this value always follows a row that contains M.

'MX'  By an index scan on the index named in ACCESSNAME. When the access method MX follows the access method DX, DI, or DU, the table is accessed by the DOCID index by using the DOCID list that is returned by DX, DI, or DU. A row that contains this value always follows a row that contains M.

'N'    One of the following types:
      • By an index scan when the matching predicate contains the IN keyword
      • By an index scan when Db2 rewrites a query using the IN keyword

'O'    Use of a work file was avoided when processing the result of a subquery, table expression, view, or intermediate result table.

'NR'   Range list access.

'P'    By a dynamic pair-wise index scan

'R'    By a table space scan

'RW'   By a work file scan of the result of a materialized user-defined table function

'V'    By buffers for an INSERT statement within a SELECT

blank  Not applicable to the current row

5. The QBLOCK_TYPE column contains the following values:

'SELECT'
   SELECT

'INSERT'
   INSERT

'UPDATE'
   UPDATE

'MERGE'
   MERGE

'DELETE'
   DELETE

'SELUPD'
   SELECT with FOR UPDATE OF

'DELCUR'
   DELETE WHERE CURRENT OF CURSOR

'UPDCUR'
   UPDATE WHERE CURRENT OF CURSOR

'CORSUB'
   Correlated subselect or fullselect

'COTBLX'
   A table expression with a sideways reference.

'TRUNCA'
   TRUNCATE

'NCOSUB'
   Noncorrelated subselect or fullselect

'TABLEX'
   Table expression
'TRIGGR'
    WHEN clause on CREATE TRIGGER

'UNION'
    UNION

'UNIONA'
    UNION ALL

'INTERS'
    INTERSECT

'INTERA'
    INTERSECT ALL

'EXCEPT'
    EXCEPT

'EXCEPTA'
    EXCEPT ALL

'PRUNED'
    Db2 does not generate an access path for the query because the query is guaranteed to qualify zero rows, such as the case of an always-false WHERE clause. For example: WHERE 0=1

6. Db2 inserts a value into the REMARKS column at bind or rebind when the EXPLAIN(ONLY) option is specified and reuse or comparison fails for an access path. The value might include the following information:
   • A reason code that corresponds to the reason codes in SQLCODE +395 when reuse fails
   • The name of the unmatched PLAN_TABLE column for which comparison failed
   • A string that identifies that unmatched rows where found

7. Db2 inserts a value into the REMARKS column when selectivity overrides cannot be used for a statement. The value contains a reason code that indicates why the selectivity override was not used. The value might also contain additional diagnostic information.
   The reason code values correspond to SQLCODE +395 reason codes:
   '1'-'41' Indicate that an optimization hint that was generated as part of the extended optimization process cannot be applied. Use only a single selectivity instance.
   '42' Indicates that the structure of the selectivity override is not valid. Generate the selectivity override again.
   '43' The selectivity override cannot be applied because of an unexpected error. If the problem persists, you might need to contact IBM Support.
   '44'-'99'
   Indicate that an optimization hint that was generated as part of the extended optimization process cannot be applied. Use only a single selectivity instance.

The PLAN_TABLE_HINT_IX index

The PLAN_TABLE_HINT_IX index improves prepare performance when access path hints are used. This index is required for statement-level access paths and optimization parameters. The PLAN_TABLE_HINT_IX index is optional, although strongly recommended, for PLAN_TABLE access path hints.
The statement that creates the PLAN_TABLE_HINT_IX index is included as part of the DSNTESC member of the SDSNSAMP library.

**Related concepts:**
- Interpreting data access by using EXPLAIN (Db2 Performance)

**Related tasks:**
- Preparing to influence access paths (Db2 Performance)

**Related reference:**
- EXPLAIN
- Support Portal: IBM Db2 Analytics Accelerator for z/OS

**DSN_COLDIST_TABLE**

The column distribution table contains non-uniform column group statistics that are obtained dynamically by Db2 from non-index leaf pages.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [ADMIN_EXPLAIN_MAINT stored procedure](#) for information about using the *action* input parameter to request each of these tasks.

**Column descriptions**

The following table shows the descriptions of the columns in the DSN_COLDIST_TABLE table.
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Db2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERNO clause is specified, its value is used by Db2. Otherwise, Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function or native SQL procedure, or advanced trigger, this column indicates the specific name of the compiled SQL function or native SQL procedure.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.</td>
</tr>
</tbody>
</table>
Table 269. Descriptions of columns in DSN_COLDIST_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLLID</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>GROUP_MEMBER</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.</td>
</tr>
<tr>
<td>SECTNOI</td>
<td>INTEGER NOT NULL</td>
<td>The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.</td>
</tr>
<tr>
<td>VERSION</td>
<td>VARCHAR(122) NOT NULL</td>
<td>The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The value is blank for a trigger package created prior to V12, or without V12 new function activated (TYPE='T') or when the package is created using the BIND PACKAGE command (the initial version of the package)(TYPE='blank'). When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>
| EXPANSION_REASON | CHAR(2) NOT NULL WITH DEFAULT | This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true:  
  • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values:  
  'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  
  'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  
  'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  
  'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  
  blank The query does not contain implicit query transformation. |

- Dynamic collection of index filtering estimates (Db2 Performance)

**DSN_DETDCOST_TABLE**

The detailed cost table, DSN_DETDCOST_TABLE, contains information about detailed cost estimation of the mini-plans in a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See **ADMIN_EXPLAIN_MAINT stored procedure** for information about using the action input parameter to request each of these tasks.
## Column descriptions

The following table describes the columns of DSN_DETCOST_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Db2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td>PLANNO</td>
<td>SMALLINT NOT NULL</td>
<td>The plan number, a number used to identify each mini-plan with a query block.</td>
</tr>
<tr>
<td>OPENIO</td>
<td>FLOAT(4) NOT NULL</td>
<td>The Do-at-open IO cost for non-correlated subquery.</td>
</tr>
<tr>
<td>OPENCPU</td>
<td>FLOAT(4) NOT NULL</td>
<td>The Do-at-open CPU cost for non-correlated subquery.</td>
</tr>
<tr>
<td>OPENCOST</td>
<td>FLOAT(4) NOT NULL</td>
<td>The Do-at-open total cost for non-correlated subquery.</td>
</tr>
</tbody>
</table>

### Column name | Data type | Description
---|---|---
IMSEQNO | SMALLINT NOT NULL | IBM internal use only.
DMPEREFH | FLOAT(4) NOT NULL | IBM internal use only.
DMCLUDIO | FLOAT(4) NOT NULL | IBM internal use only.
DMPREDS | INTEGER NOT NULL | IBM internal use only.
DMSROWS | FLOAT(4) NOT NULL | IBM internal use only.
DMSCANCST | FLOAT(4) NOT NULL | IBM internal use only.
DMCOLS | FLOAT(4) NOT NULL | The number of data manager columns.
DMROWS | FLOAT(4) NOT NULL | The number of data manager rows returned (after all stage 1 predicates are applied).
RDSROWCST | FLOAT(4) NOT NULL | IBM internal use only.
DMPAGECST | FLOAT(4) NOT NULL | IBM internal use only.
DMDATAIO | FLOAT(4) NOT NULL | IBM internal use only.
DMDATAIO | FLOAT(4) NOT NULL | IBM internal use only.
DMDATACPU | FLOAT(4) NOT NULL | IBM internal use only.
DMDATACPU | FLOAT(4) NOT NULL | IBM internal use only.
RDSROW | FLOAT(4) NOT NULL | The number of RDS rows returned (after all stage 1 and stage 2 predicates are applied).
SNCOLS | SMALLINT NOT NULL | The number of columns as sort input for new table.
SNROWS | FLOAT(4) NOT NULL | The number of rows as sort input for new table.
SNRECSZ | INTEGER NOT NULL | The record size for new table.
SNPAGES | FLOAT(4) NOT NULL | The page size for new table.
SNRUNS | FLOAT(4) NOT NULL | The number of runs generated for sort of new table.
SNMERGES | FLOAT(4) NOT NULL | The number of merges needed during sort.
SNIOCOST | FLOAT(4) NOT NULL | IBM internal use only.
SNCPUCOST | FLOAT(4) NOT NULL | IBM internal use only.

<td>PER_STMT_ID</td>
<td>BIGINT NOT NULL</td>
<td>The persistent statement identifier for SQL statements in Db2 catalog tables.  For example, this column corresponds to the following catalog table columns that identify SQL statements:  • STMT_ID in SYSBM.SYPACKSTM, for SQL statements in packages.  • SDQ_STMT_ID in SYSBM.SYSDYNQUERY, for stabilized dynamic SQL statements.</td>
</tr>
</tbody>
</table>
DSN_FILTER_TABLE

The filter table, DSN_FILTER_TABLE, contains information about how predicates are used during query processing.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [ADMIN_EXPLAIN_MAINT stored procedure] for information about using the action input parameter to request each of these tasks.
**Column descriptions**

The following table describes the columns of DSN_FILTER_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUER YNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUER YNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Db2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUER YNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUER YNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>PLANNO</td>
<td>SMALLINT</td>
<td>The plan number, a number used to identify each miniplan with a query block.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.</td>
</tr>
</tbody>

Table 273. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| FREQUENCYF | FLOAT NOT NULL      | The percentage of rows in the table with the value that is specified in the COLVALUE column when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%.
<p>| QUANTILENO  | SMALLINT NOT NULL   | The ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable. |
| LOWVALUE    | VARCHAR(2000) NOT NULL FOR BIT DATA | For TYPE='H', this is the lower bound for the quantile indicated by the value of the QUANTILENO column. Not used if the value of the TYPE column is not 'H'. This column is not updatable. |
| HIGHVALUE   | VARCHAR(2000) NOT NULL FOR BIT DATA | For TYPE='H', this is the higher bound for the quantile indicated by the value of the QUANTILENO column. This column is not used if the value of the TYPE column is not 'H'. This column is not updatable. |</p>
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| EXPANSION_REASON | CHAR(2) NOT NULL WITH DEFAULT      | This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true:
  • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES
  • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES
  • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES
This column can have one of the following values:
  • 'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.
  • 'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.
  • 'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.
  • 'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.
  • blank The query does not contain implicit query transformation.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| PER_STMT_ID    | BIGINT NOT NULL    | The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements:  
|                |                    | • STMT_ID in SYSIBM.SYSPACK_STMT, for SQL statements in packages.  
|                |                    | • SDQ_STMT_ID in SYSIBM.SYSDYN_QUERY, for stabilized dynamic SQL statements. |

Related concepts:

*Dynamic collection of index filtering estimates (Db2 Performance)*

**DSN_PGRANGE_TABLE**

The page range table, DSN_PGRANGE_TABLE, contains information about qualified partitions for all page range scans in a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTEC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTEC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See the [ADMIN_EXPLAIN_MAINT stored procedure](#) for information about using the action input parameter to request each of these tasks.
Column descriptions

The following table describes the columns of DSN_PGRANGE_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Db2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>TABNO</td>
<td>SMALLINT NOT NULL</td>
<td>The table number, a number which uniquely identifies the corresponding table reference within a query.</td>
</tr>
<tr>
<td>RANGE</td>
<td>SMALLINT NOT NULL</td>
<td>The sequence number of the current page range.</td>
</tr>
<tr>
<td>FIRSTPART</td>
<td>SMALLINT NOT NULL</td>
<td>The starting partition in the current page range.</td>
</tr>
<tr>
<td>LASTPART</td>
<td>SMALLINT NOT NULL</td>
<td>The ending partition in the current page range.</td>
</tr>
<tr>
<td>NUMPARTS</td>
<td>SMALLINT NOT NULL</td>
<td>The number of partitions in the current page range.</td>
</tr>
<tr>
<td>EXPLAIN_TIME</td>
<td>TIMESTAMP NOT NULL</td>
<td>The time when the EXPLAIN information was captured:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>All cached statements</strong></td>
</tr>
<tr>

<tr>
<td></td>
<td></td>
<td><strong>Non-cached dynamic statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.</td>
</tr>
<tr>
<td>GROUP_MEMBER</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>SECTNOI</td>
<td>INTEGER NOT NULL WITH DEFAULT</td>
<td>The section number of the statement. The value is taken from the same column in SYSPACKSTM or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL WITH DEFAULT</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.</td>
</tr>
</tbody>
</table>
| COLLID     | VARCHAR(128) NOT NULL WITH DEFAULT | The collection ID:  

'**DSNEXPLAINMODEYES**'

The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.

'**DSNEXPLAINMODEEXPLAIN**'

The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.

When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger. |
<p>| VERSION    | VARCHAR(122) NOT NULL WITH DEFAULT | The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. The value is blank for a trigger package created prior to V12, or without V12 new function activated (TYPE='T') or when the package is created using the BIND PACKAGE command (the initial version of the package)(TYPE='blank'). When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank. |</p>

<td></td>
<td>• SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.</td>
</tr>
</tbody>
</table>
The predicate table, DSN_PREDICAT_TABLE, contains information about all of the predicates in a query. It is also used as input when you issue a BIND QUERY command to override predicate selectivities for matching SQL statements.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [ADMIN_EXPLAIN_MAINT stored procedure](#) for information about using the action input parameter to request each of these tasks.
**Column descriptions**

The following table describes the columns of the DSN_PREDICAT_TABLE

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.</td>
</tr>
<tr>
<td>PREDNO</td>
<td>INTEGER NOT NULL</td>
<td>The predicate number, a number used to identify a predicate within a query.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| TYPE           | CHAR(8) NOT NULL  | A string used to indicate the type or the operation of the predicate. The possible values are:  
|                |                   | • 'AND'  
|                |                   | • 'BETWEEN'  
|                |                   | • 'EQUAL'  
|                |                   | • 'EXISTS'  
|                |                   | • 'COMPOUND'  
|                |                   | • 'HAVING'  
|                |                   | • 'IN'  
|                |                   | • 'LIKE'  
|                |                   | • 'NOT LIKE'  
|                |                   | • 'NOTEXIST'  
|                |                   | • 'OTHERS'  
|                |                   | • 'OR'  
|                |                   | • 'RANGE'  
|                |                   | • 'SUBQUERY'  
|                |                   | • 'XEXISTS'  
|                |                   | • 'NXEXISTS' |
| LEFT_HAND_SIDE | VARCHAR(128) NOT NULL | Describes the left side of the predicate. If the left side of the predicate is a table column, this value indicates the name of that column. Other possible values are:  
|                |                   | • 'VALUE'  
|                |                   | • 'COLEXP'  
|                |                   | • 'NONCOLEXP'  
|                |                   | • 'CORSUB'  
|                |                   | • 'NONCORSUB'  
|                |                   | • 'SUBQUERY'  
|                |                   | • 'EXPRESSION'  
<p>|                |                   | • Blanks |
| LEFT_HAND_PNO  | INTEGER NOT NULL  | If the predicate is a compound predicate (AND/OR), then this column indicates the first child predicate. However, this column is not reliable when the predicate tree consolidation happens. Use PARENT_PNO instead to reconstruct the predicate tree. |
| LHS_TABNO      | SMALLINT NOT NULL | If the left side of the predicate is a table column or a column expression in an expression-based index, then this column indicates a number which uniquely identifies the corresponding table reference within a query. |
| LHS_QBNO       | SMALLINT NOT NULL | If the left side of the predicate is a table column or a column expression in expression-based index, then this column indicates a number which uniquely identifies the corresponding query block within a query. |</p>
<table>

</tbody>
</table>
| CLAUSE       | CHAR(8) NOT NULL                 | The clause where the predicate exists:  

'HAVING '  
  The HAVING clause  

'ON '  
  The ON clause  

'WHERE '  
  The WHERE clause  

SELECT  
  The SELECT clause                                                                                                                                                                                                                                                                                                               |
| GROUP_MEMBER | VARCHAR(24) NOT NULL             | The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.                                                                                                                                                                                                                                                                 |
| ORIGIN       | CHAR(1) NOT NULL WITH DEFAULT    | Indicates the origin of the predicate.  

Blank  
  Generated by Db2  

C  
  Column mask  

R  
  Row permission  

U  
  Specified by the user                                                                                                                                                                                                                                                                                                           |
| UNCERTAINTY  | FLOAT(4) NOT NULL WITH DEFAULT   | Describes the uncertainty factor of a predicate's estimated filter factor. A bigger value indicates a higher degree of uncertainty. Value zero indicates no uncertainty or uncertainty not considered.                                                                                                                                                                                                 |
| SECTNOI      | INTEGER NOT NULL WITH DEFAULT    | The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier. |
| COLLID       | VARCHAR(128) NOT NULL WITH DEFAULT | The collection ID:  

'DSNEXPLAINMODEYES'  
  The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.                                                                                                                                                                                                                                                                     |

'DSNEXPLAINMODEEXPLAIN'  
  The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.                                                                                                                                                                                                                                                                 |

  When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.                                                                                                                                                                                                                                                                 |

<tbody>
<tr>
<td>VERSION</td>
<td>VARCHAR(122)</td>
<td>The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. The value is blank for a trigger package created prior to V12, or without V12 new function activated (TYPE='T') or when the package is created using the BIND PACKAGE command (the initial version of the package)(TYPE='blank'). When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.</td>
</tr>
</tbody>
</table>
| EXPANSION_REASON | CHAR(2)            | This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true:  
  • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES  
This column can have one of the following values:  
  'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  
  'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  
  'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  
  'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  
  blank The query does not contain implicit query transformation. |

| PER_STMT_ID  | BIGINT NOT NULL   | The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements:  
|              |                   | • STMT_ID in SYSIBM.SYSPACK_STMT, for SQL statements in packages.  
|              |                   | • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements.                                                                 |

**Related concepts:**

- Predicates
  - Predicates and access path selection (Db2 Performance)

**Related tasks:**

- Overriding predicate selectivities at the statement level (Db2 Performance)

**Related reference:**

- Tables for influencing access path selection (Db2 Performance)
- BIND QUERY (DSN) (Db2 Commands)

### DSN_PREDICATE_SELECTIVITY table

The predicate selectivity table contains information about the selectivity of predicates that are used for access path selection. It is used as an input table for the BIND QUERY command when selectivity overrides are specified.

When selectivity overrides are not specified, or specified selectivity overrides cannot not be used by Db2, the DSN_PREDICATE_SELECTIVITY table contains one row for each predicate in DSN_PREDICAT_TABLE that is used for access path selection. These rows contain ASSUMPTION='NORMAL' values. DSN_PREDICATE_SELECTIVITY does not contain rows from DSN_PREDICAT_TABLE for predicates that are not used for access path selection.

When selectivity overrides are specified and used by Db2, this table also contains one row for each selectivity override that was used. These rows contain ASSUMPTION='OVERRIDE' values.

Additionally, if the sum of the weights for all specified selectivity override instances is less than one, this table contains one row for each predicate in DSN_PREDICAT_TABLE that is used for access path selection. These rows contain ASSUMPTION='NORMAL' values and WEIGHT values equal to one minus the sum of the specified override weight values.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is
intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See ADMIN_EXPLAIN_MAINT stored procedure for information about using the action input parameter to request each of these tasks.

Column descriptions

Your subsystem or data sharing group can contain more than one of these tables, including a table with the qualifier SYSIBM, a table with the qualifier DB2OSCA, and additional tables that are qualified by user IDs.

The following table shows the descriptions of the columns in the DSN_PREDICATE_SELECTIVITY table.
Table 277. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table

</table>
| EXPANSION_REASON    | CHAR(2) NOT NULL WITH DEFAULT | This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true:  
  • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
  • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES  
  This column can have one of the following values:  
  'A'  The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  
  'B'  The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  
  'S'  The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  
  'SB'  The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  
  blank  The query does not contain implicit query transformation. |
| PER_STMT_ID         | BIGINT NOT NULL         | The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements:  
  • STMT_ID in SYSIBM.SYSPACKSTM, for SQL statements in packages.  
  • SDQ_STMT_ID in SYSIBM.SYSDYNQUERY, for stabilized dynamic SQL statements. |

**Notes:**

1. The name of these columns originally contained the # symbol as the last character in the names. However, the names that contain these characters are obsolete and are no longer supported.
DSN_QUERYINFO_TABLE

The query information table, DSN_QUERYINFO_TABLE, contains information about the eligibility of query blocks for automatic query rewrite, information about the materialized query tables that are considered for eligible query blocks, reasons why ineligible query blocks are not eligible, and information about acceleration of query blocks.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

- **userID** You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [ADMIN_EXPLAIN_MAINT stored procedure](#) for information about using the action input parameter to request each of these tasks.
**Column descriptions**

*Table 279. Descriptions of columns in DSN_QUERYINFO_TABLE*

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Db2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise, Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>QINAME1</td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>When TYPE='A':</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• When REASON_CODE=0, this value is the name of the accelerator server to which the statement is sent.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• When REASON_CODE&lt;&gt;0, the statement was not sent to an accelerator server. The REASON_CODE value indicates why the statement was not sent to the accelerator server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When TYPE='ACCELMDL', this statement used accelerator modeling.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For static queries, the value in this field might be the name of the accelerator server that is available at execution time.</td>
</tr>
<tr>
<td>QINAME2</td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>When TYPE='A' and REASON_CODE=0, this value is the name of the location name of the accelerator server to which the statement is sent.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For static queries, the value in this field might be the name of the accelerator server that is available at execution time.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>--------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.</td>
</tr>
<tr>
<td>VERSION</td>
<td>VARCHAR(122) NOT NULL</td>
<td>The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. The value is blank for a trigger package created prior to V12, or without V12 new function activated (TYPE='T') or when the package is created using the BIND PACKAGE command (the initial version of the package)(TYPE='blank'). When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.</td>
</tr>
<tr>
<td>COLLID</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>GROUP_MEMBER</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.</td>
</tr>
<tr>
<td>SECTNOI</td>
<td>INTEGER NOT NULL WITH DEFAULT</td>
<td>The section number of the statement. The value is taken from the same column in SYSPACK_STMT or SYSSMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.</td>
</tr>
<tr>
<td>SEQNO</td>
<td>INTEGER NOT NULL WITH DEFAULT</td>
<td>The sequence number for this row if QI_DATA exceeds the size of its column.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>EXPLAIN_TIME</td>
<td>TIMESTAMP NOT NULL</td>
<td>The time when the EXPLAIN information was captured:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>All cached statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the statement entered the cache, in the form of a full-precision timestamp value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Non-cached static statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the statement was bound, in the form of a full precision timestamp value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Non-cached dynamic statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.</td>
</tr>
<tr>
<td>TYPE</td>
<td>CHAR(8) NOT NULL WITH DEFAULT</td>
<td>The type of the output for this row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>A This row is for a statement that Db2 attempts to run on an accelerator server. The value in column REASON_CODE indicates the outcome.</td>
</tr>
<tr>
<td>QI_DATA</td>
<td>CLOB(2M) NOT NULL WITH DEFAULT</td>
<td>When TYPE='A':</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For REASON_CODE values other than 0, this value is the description of the REASON_CODE value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For a REASON_CODE value of 0, this value is the statement text, after it is converted for processing by the accelerator.</td>
</tr>
<tr>
<td>SERVICE_INFO</td>
<td>BLOB(2M) NOT NULL WITH DEFAULT</td>
<td>IBM internal use only.</td>
</tr>
<tr>
<td>QB_INFO_ROWID</td>
<td>ROWID NOT NULL GENERATED ALWAYS</td>
<td>IBM internal use only.</td>
</tr>
</tbody>
</table>
Table 279. Descriptions of columns in DSN_QUERYINFO_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| EXPANSION_REASON     | CHAR(2) NOT NULL WITH DEFAULT | Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true:  
- The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
- The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
- The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES  
This column can have one of the following values:  
'A'  
B'  
'S'  
'SB'  
blank  
1. The REASON_CODE column has the following values:  
0  
The query block qualifies for routing to an accelerator server. The values of QINAME1 and QINAME2 identify the accelerator server.  
For example, for version 1 of the IBM Db2 Analytics Accelerator for z/OS, the associated data mart name is recorded in the QINAME2 column, with the following naming convention: data-mart-name@accelerator-name@digits.  
1  
No active accelerator server was found or the table was not enabled for query offloading when the statement was executed.  
2  
The CURRENT QUERY ACCELERATION special register is set to NONE.  
Notes:
Db2 classified the query as a short-running query, or Db2 determined that sending the query to an accelerator server provided no performance advantage.

The query is not read-only.

The cursor is defined as a scrollable cursor or is a row set-positioned cursor.

The query references objects with multiple encoding schemes.

The FROM clause of the query specifies a data-change-table-reference.

The query contains a table expression with one or more correlated references to other tables in the same FROM clause.

The query contains a reference to a recursive common table expression.

The query contains an unsupported expression. The text of the expression is in QI_DATA.

The query references a table that has any of the following characteristics:
- The table is not defined in the accelerator server.
- The table is defined in a different accelerator server from another table in the query.
- The table is defined in the accelerator server, but is not enabled for processing by an accelerator.

The accelerator server that contains the tables that are referenced in the query is not started.

A column that is referenced in the query was altered by Db2 after the data was loaded in the accelerator server.

The query uses functionality that is available only in Db2 for z/OS Version 10 new-function mode or later, and the functionality is not supported by the accelerator server.

The query is an INSERT statement, but the Db2 subsystem parameter DSN6SPRM.QUERY_ACCEL_OPTIONS does not specify option 2 to enable its acceleration.

The query uses functionality that is available only in Db2 11 or later, and the functionality is not supported by the accelerator server.

The accelerator server is not at the correct level and does not support a function in the SQL statement. The QI_DATA column contains the function text or expression text that is using the unsupported function for the accelerator server.

The query is a rowset cursor that is declared WITH RETURN, runs remotely, or runs under an SQL PL routine.

The query contains a correlated subquery that is not supported for acceleration.

The statement references an accelerator-only table, but the statement is not offloadable. For example:
- MERGE statement references an accelerator-only table.
• UPDATE or DELETE statement references an accelerator-only table, but the target table of the UPDATE, DELETE is a normal Db2 table:
  UPDATE DB2_TABLE SET .. (SELECT .. FROM ACCEL_ONLY_TABLE).
• INSERT, UPDATE or DELETE of a row expression with subselect.
  UPDATE ACCEL_ONLY_TABLE SET (C1, C2) = (SELECT C3, C4 FROM TABLE2);

23 The SELECT INTO statement is bound for acceleration but is run as a remote SELECT INTO statement, which is not supported for acceleration.

24 The DDL or DML statement cannot be offloaded because the connection to the accelerator server does not allow updates. This problem can occur when a two-phase commit requester (for example, a Db2 for z/OS requester) connects to a Db2 for z/OS server to offload a DDL or DML statement.

25 The statement contains a reference to a column with an unsupported data type.

26 The CREATE TABLE statement clause IN ACCELERATOR specifies an accelerator alias that resolves to more than one accelerator.

27 The DROP TABLE statement specifies a referencing accelerator-only table, which cannot be removed by using the DROP TABLE statement.

To drop a referencing accelerator-only table, invoke the IBM Db2 Analytics Accelerator for z/OS ACCEL_REMOVE_REFERENCE_TABLES stored procedure.

30 Accelerator WAITFORDATA behavior is requested but cannot be achieved for this query. The query will not be accelerated. The query specifies a Db2 accelerated table, but the same Db2 unit of work includes a previous uncommitted Db2 change that will not be available to the query when it is run on the accelerator. The Db2 change might or might not be related to the Db2 accelerated table that is referenced in the query.

31 Accelerator WAITFORDATA behavior is requested but cannot be achieved for this query that specifies both an accelerator-only table (AOT) and a Db2 accelerated table. The query will not be accelerated and cannot be run in Db2. The same Db2 unit of work includes a previous uncommitted Db2 change that will not be available to the query when it is run on the accelerator. The change might or might not be related to the Db2 accelerated table that is referenced in the query.

32 Accelerator WAITFORDATA behavior is requested but cannot be achieved for this query. The query will not be accelerated. The query specifies a Db2 accelerated table, but the same Db2 unit of work includes a previous uncommitted accelerator-only table (AOT) change. This uncommitted change resulted in the creation of an accelerator database snapshot isolation (SI) for this unit of work before the query was run. This accelerator database SI can prevent committed and replicated Db2 changes, made either by this transaction or by a different transaction, from being available to the accelerated query, even if the Db2 changes are replicated to the accelerator before the query is run there.

33 The query could not be offloaded to the accelerator due to different reasons on different versions of the accelerator.

Support Portal: IBM Db2 Analytics Accelerator for z/OS

DSN_QUERY_TABLE
The query table, DSN_QUERY_TABLE, contains information about a SQL statement, and displays the statement before and after query transformation.

Unlike other EXPLAIN tables, rows in DSN_QUERY_TABLE are not populated for static SQL statements at BIND or REBIND with the EXPLAIN(YES) option.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers
Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement
You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See ADMIN_EXPLAIN_MAINT stored procedure for information about using the action input parameter to request each of these tasks.
**Column descriptions**

DSN_SORTKEY_TABLE

The sort key table, DSN_SORTKEY_TABLE, contains information about sort keys for all of the sorts required by a query.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.
Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [ADMIN_EXPLAIN_MAINT stored procedure] for information about using the action input parameter to request each of these tasks.

Column descriptions

### DSN_SORT_TABLE

The sort table, DSN_SORT_TABLE, contains information about the sort operations required by a query.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

### Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [ADMIN_EXPLAIN_MAINT stored procedure](#) for information about using the `action` input parameter to request each of these tasks.
## Column descriptions

The following table describes the columns of DSN_SORT_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Db2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>PLANNO</td>
<td>SMALLINT NOT NULL</td>
<td>The plan number, a number used to identify each miniplan with a query block.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.</td>
</tr>
</tbody>
</table>

Appendix. Additional information for Db2 SQL
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| COLLID       | VARCHAR(128)     | The collection ID: 'DSNEXPLAINMODEYES'  
|              | NOT NULL         | The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.                         |
|              |                  | 'DSNEXPLAINMODEEXPLAIN'  
|              |                  | The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.                       |
|              |                  | When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger. |
| SORC         | CHAR(5) NOT NULL | Indicates the reasons for sort of the composite table. The reasons are shown as a series of bytes:                                            |
|              | NULL WITH DEFAULT| • Byte 1 is 'G' if the reason is GROUP BY, or otherwise blank.                                                                               |
|              |                  | • The second byte is 'J' if the reason is JOIN, or otherwise blank.                                                                           |
|              |                  | • Byte is 'O' if the reason is ORDER BY, or otherwise blank.                                                                                  |
|              |                  | • The fourth by is 'U' if the reason is uniqueness, or otherwise blank.                                                                     |
| SORN         | CHAR(5) NOT NULL | Indicates the reasons for sort of the new table. The reasons are shown as a series of bytes:                                                |
|              | NULL WITH DEFAULT| • The first byte is 'G' if the reason is GROUP BY, or otherwise blank.                                                                          |
|              |                  | • The second byte is 'J' if the reason is JOIN, or otherwise blank.                                                                           |
|              |                  | • The third byte is 'O' if the reason is ORDER BY, or otherwise blank.                                                                         |
|              |                  | • The fourth by is 'U' if the reason is uniqueness, or otherwise blank.                                                                       |
| SORTNO       | SMALLINT NOT NULL| The sequence number of the sort.                                                                                                           |
| KEYSIZE      | SMALLINT NOT NULL| The sum of the lengths of the sort keys.                                                                                                       |
| ORDERCLASS   | INTEGER NOT NULL | IBM internal use only.                                                                                                                       |
| EXPLAIN_TIME | TIMESTAMP NOT    | The time when the EXPLAIN information was captured:                                                                                           |
|              | NULL             | All cached statements  
|              |                  | When the statement entered the cache, in the form of a full-precision timestamp value.                                                       |
|              |                  | Non-cached static statements  
|              |                  | When the statement was bound, in the form of a full precision timestamp value.                                                              |
|              |                  | Non-cached dynamic statements  
|              |                  | When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.                    |
| GROUP_MEMBER | VARCHAR(24) NOT  | The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed. |
|              | NULL             |

**DSN_STATEMENT_CACHE_TABLE**

The statement cache table, DSN_STATEMENT_CACHE_TABLE, contains information about the SQL statements in the statement cache, information captured as the results of an EXPLAIN STATEMENT CACHE ALL statement.

**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [ADMIN_EXPLAIN_MAINT stored procedure](#) for information about using the `action` input parameter to request each of these tasks.

**Column descriptions**

The following table shows the descriptions of the columns in DSN_STATEMENT_CACHE_TABLE.
### Table 283. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STMT_ID</td>

</tr>
</tbody>
</table>
| ACCELERATED | CHAR(10)  | Identifies whether a cached dynamic statement was prepared for acceleration to an accelerator server. Possible values are:  

- **'NO'** The cached statement was not prepared for acceleration. This is the default value.  
  This value also applies to cached statements under the following conditions:  
  - The query acceleration behavior was not specified or was explicitly set to NONE when the dynamic statement was prepared.  
  - A query acceleration behavior other than ALL was specified when the dynamic statement was prepared. Db2 did not prepare the statement for acceleration because it did not qualify for acceleration based on the query acceleration behavior that was specified.  

- **'YES'** The cached statement was prepared for acceleration to an accelerator server based on the query acceleration behavior that was specified. If query acceleration behavior is specified when a dynamic statement is prepared, Db2 can consider this cache entry for a possible cache match during the prepare operation of the dynamic statement. If query acceleration behavior is not specified, or is explicitly set to NONE when the statement is prepared, Db2 does not consider this cache entry for a cache match during the prepare operation.  

- **'NEVER'** The cached statement was not prepared for acceleration to an accelerated server, because the statement can never be accelerated.  
  - If the query acceleration behavior is set to ENABLE, ENABLE WITH FAILBACK, or ELIGIBLE for the prepare of the statement, Db2 considers this cache entry first as a possible cache match during the prepare operation. This action verifies whether the statement was cached previously as one that can never be accelerated.  
  - If the query acceleration behavior is set to ALL for the prepare of the statement, Db2 does not consider this cache entry as a possible cache match during the prepare operation.  
  - If the query acceleration behavior is not specified, or is explicitly set to NONE for the prepare of the statement, Db2 does not consider this cache entry as a possible cache match during the prepare operation. |
<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| ACCELERATED (continued)  |                | 'ACCEL-ONLY' The cached statement was prepared for acceleration to an accelerator. The statement references at least one accelerator-only table and can only be prepared to execute in the accelerator server. If query acceleration behavior is specified when a dynamic statement is prepared, Db2 can consider this cache entry for a possible cache match during the prepare operation of the dynamic statement. If query acceleration behavior is not specified, or is explicitly set to NONE when the statement is prepared, Db2 does not consider this cache entry for a cache match during the prepare operation. Query acceleration behavior is specified by either the QUERY_ACCELERATION subsystem parameter, the QUERYACCELERATION bind option, or the CURRENT QUERY ACCELERATION special register, and depends on their order of precedence. The order of precedence (lowest to highest) is:  
- The QUERY_ACCELERATION subsystem parameter  
- The QUERYACCELERATION bind option, if specified  
- An explicit SET CURRENT QUERY ACCELERATION statement  |
| STAT_ACC_ELAP            | BIGINT         | The accumulated elapsed time for the accelerator.                                                                                                                                                    |
| STAT_ACC_CPU             | BIGINT         | The accumulated CPU time for the accelerator.                                                                                                                                                          |
| STAT_ACC_ROW             | BIGINT         | The accumulated number of rows that are returned from the accelerator.                                                                                                                                   |
| STAT_ACC_BYTE            | BIGINT         | The accumulated number of bytes that are returned from the accelerator.                                                                                                                                  |
| STAT_ACC_IROW            | BIGINT         | The time waited for the first row of the query result to be available from the accelerator.                                                                                                               |
| STAT_ACC_DB2             | BIGINT         | The total time the accelerator waited for Db2 to request query results.                                                                                                                                    |
| STAT_ACC_EXEC            | BIGINT         | The accumulated execution time for the accelerator.                                                                                                                                                      |
| STAT_ACC_WAIT            | BIGINT         | The accumulated queue wait time for the accelerator.                                                                                                                                                     |
| STAT_ACC_TWDP            | BIGINT         | The accumulated wait time for the accelerator delay protocol.                                                                                                                                             |
| STAT_ACC_NWDP            | BIGINT         | The accumulated number of statements for which the wait time for the accelerator delay protocol has expired.                                                                                              |
| ACCEL_OFFLOAD_ELIGIBLE   | CHAR(1)        | 'NO' The statement is not eligible for acceleration. This is the default value.                                                                                                                             |
|                          |                | 'YES' The statement is a candidate for acceleration when an accelerator server is available to the Db2 subsystem.                                                                                           |
| ACCELERATOR_NAME         | VARCHAR(128)   | The concatenated name of the accelerator server that processed the query.                                                                                                                                    |
| CNO                      | BIGINT NOT NULL| The command number for the dynamic query capture monitor if applicable. Otherwise 0.                                                                                                                      |

<td>FLOAT NOT NULL WITH DEFAULT</td>
<td>The accumulated wait time for parallel query waits for the statement.</td>
</tr>
</tbody>
</table>

Notes:
1. If the specified value exceeds 2147483647, the column contains the value 2147483647.
2. Statistics are cumulative, across executions of the same statement, and across threads, if the value of COLLID is DSNDYNAMICSQLCACHE. If the value of COLLID is DSNEXPLAINMODEYES, the values are for a single run of the statement only. If the value of COLLID is DSNEXPLAINMODE EXPLAIN, the values of all statistics columns are 0.
3. The column is not applicable when the value of the COLLID column is 'DSNEXPLAINMODEYES' or 'DSNEXPLAINMODEEXPLAIN'

**PSPI**

**DSN_STATEMENT_TABLE**

The statement table, DSN_STATEMENT_TABLE, contains information about the estimated cost of specified SQL statements.
Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [ADMIN_EXPLAIN_MAINT stored procedure] for information about using the action input parameter to request each of these tasks.

Column descriptions

The following table describes the content of each column in STATEMNT_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td>WITH DEFAULT</td>
<td></td>
</tr>
</tbody>
</table>

For rows produced by EXPLAIN statements

The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.

For rows not produced by EXPLAIN statements

Db2 assigns a number that is based on the line number of the SQL statement in the source program.

When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.

When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.

<td>TOTAL_COST</td>
<td>FLOAT NOT NULL WITH DEFAULT</td>
<td>The overall estimated cost of the statement. If an accelerator is used, the benefit is reflected in this value. Use this value for reference purposes only. Db2 does not always choose the access path that has the lowest TOTAL_COST value. Db2 also uses other factors during access path selection, such as the reliability of the filter factor estimates.</td>
</tr>
<tr>
<td>SECTNOI</td>
<td>INTEGER NOT NULL WITH DEFAULT</td>
<td>The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.</td>
</tr>
</tbody>
</table>
Table 284. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VERSION</td>
<td>VARCHAR(122) NOT NULL WITH DEFAULT</td>
<td>The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. The value is blank for a trigger package created prior to V12, or without V12 new function activated (TYPE='T') or when the package is created using the BIND PACKAGE command (the initial version of the package)(TYPE='blank'). When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.</td>
</tr>
</tbody>
</table>
| EXPANSION_REASON | CHAR(2) NOT NULL WITH DEFAULT | This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true:  
  * The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES  
  * The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES  
  * The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES  
This column can have one of the following values:  
  'A' The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  
  'B' The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  
  'S' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  
  'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  
  blank The query does not contain implicit query transformation. |

Support Portal: IBM Db2 Analytics Accelerator for z/OS

**DSN_STAT_FEEDBACK**

The DSN_STAT_FEEDBACK table contains recommendations for capturing missing or conflicting statistics that are defined during EXPLAIN. Collecting these statistics by the RUNSTATS utility might improve the performance of the query.

The values in this table are updated only at EXPLAIN time, and are not modified by the RUNSTATS utility.

Information is captured in this table only for EXPLAIN operations that use the access path selection process. The access path selection process is not used when you issue an EXPLAIN statement with the STMTCACHE or PACKAGE options.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See [ADMIN_EXPLAIN_MAINT stored procedure](#) for information about
using the action input parameter to request each of these tasks.

**Column descriptions**

The following table contains descriptions of the columns in the DSN_STAT_FEEDBACK table.

*Table 285. Descriptions of columns in the DSN_STAT_FEEDBACK table*

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data Type</th>
<th>Descriptions</th>

## Column descriptions

The following table describes the columns of DSN_STRUCT_TABLE

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: For rows produced by EXPLAIN statements: The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. For rows not produced by EXPLAIN statements: Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>QBLOCKNO</td>
<td>SMALLINT NOT NULL</td>
<td>A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.</td>
</tr>
<tr>
<td>PARENT</td>
<td>SMALLINT NOT NULL</td>
<td>The parent query block number of the current query block in the structure of SQL text; this is the same as the PARENT_QBLOCKNO in PLAN_TABLE.</td>
</tr>
<tr>
<td>TIMES</td>
<td>FLOAT NOT NULL</td>
<td>The estimated number of rows returned by Data Manager; also the estimated number of times this query block is executed.</td>

<td>Generated by Db2</td>
</tr>
<tr>
<td></td>
<td><strong>C</strong></td>
<td>Column mask</td>
</tr>
<tr>
<td></td>
<td><strong>R</strong></td>
<td>Row permission</td>
</tr>
<tr>
<td></td>
<td><strong>U</strong></td>
<td>Specified by the user</td>
</tr>
<tr>
<td>SECTNOI</td>
<td>INTEGER NOT NULL WITH DEFAULT</td>
<td>The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.</td>
</tr>
<tr>
<td>COLLID</td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>The collection ID:</td>
</tr>
<tr>
<td></td>
<td><strong>'DSNEXPLAINMODEYES'</strong></td>
<td>The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register.</td>
</tr>
<tr>
<td></td>
<td><strong>'DSNEXPLAINMODEEXPLAIN'</strong></td>
<td>The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.</td>
</tr>
<tr>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.</td>
<td></td>
</tr>
<tr>
<td>VERSION</td>
<td>VARCHAR(122) NOT NULL WITH DEFAULT</td>
<td>The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable.</td>
</tr>
<tr>
<td></td>
<td>The value is blank for a trigger package created prior to V12, or without V12 new function activated (TYPE='T') or when the package is created using the BIND PACKAGE command (the initial version of the package)(TYPE='blank'). When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure.</td>
<td>When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| EXPANSION_REASON    | CHAR(2) NOT NULL WITH DEFAULT | This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMSSENSITIVE, SYSTIMSENSITIVE, and ARCHIVESSENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true:  
  - The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESSENSITIVE bind option is set to YES  
  - The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMSSENSITIVE bind option is set to YES  
  - The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMSENSITIVE bind option is set to YES  
This column can have one of the following values:  
  - 'A'  The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.  
  - 'B'  The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.  
  - 'S'  The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.  
  - 'SB'  The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.  
  - blank  The query does not contain implicit query transformation. |
| PER_STMT_ID         | BIGINT NOT NULL | The persistent statement identifier for SQL statements in Db2 catalog tables. For example, this column corresponds to the following catalog table columns that identify SQL statements:  
  - STMT_ID in SYSIBM.SYSPACKSTMT, for SQL statements in packages.  
  - SDQ_STMT_ID in SYSIBM.SYSDynQUERY, for stabilized dynamic SQL statements. |
**Recommendation:** Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

**Qualifiers**

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

**Sample CREATE TABLE statement**

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the prefix.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or completely delete other maintenance tasks. See the [ADMIN_EXPLAIN_MAINT stored procedure](https://www.ibm.com/support/knowledgecenter/en/library) for information about using the action input parameter to request each of these tasks.

**Column descriptions**

The following table describes the columns of DSN_VIEWREF_TABLE.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERYNO</td>
<td>INTEGER NOT NULL WITH DEFAULT</td>
<td>A number that identifies the statement that is being explained. The origin of the value depends on the context of the row:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>For rows not produced by EXPLAIN statements</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Db2 assigns a number that is based on the line number of the SQL statement in the source program.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>APPLNAME</td>
<td>VARCHAR(24) NOT NULL WITH DEFAULT</td>
<td>The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column is not used, and is blank.</td>
</tr>
<tr>
<td>PROGNAME</td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure. When the SQL statement is embedded in an advanced trigger, this column contains the name of the trigger.</td>
</tr>
<tr>
<td>VERSION</td>
<td>VARCHAR(122) NOT NULL WITH DEFAULT</td>
<td>The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. The value is blank for a trigger package created prior to V12, or without V12 new function activated (TYPE=T) or when the package is created using the BIND PACKAGE command (the initial version of the package)(TYPE=’blank’). When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the function or procedure. When the SQL statement is embedded in an advanced trigger body, this column is not used and will be blank.</td>
</tr>
<tr>
<td>COLLID</td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>The collection ID: 'DSNEXPLAINMODEYES' The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. 'DSNEXPLAINMODEEXPLAIN' The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function, native SQL procedure, or advanced trigger, this column indicates the schema name of the compiled SQL function, native SQL procedure, or advanced trigger.</td>
</tr>
<tr>
<td>CREATOR</td>
<td>VARCHAR(128) NOT NULL WITH DEFAULT</td>
<td>Authorization ID of the owner of the object.</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR(128)</td>
<td>Name of the object.</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TYPE</td>
<td>CHAR(1) NOT NULL WITH DEFAULT</td>
<td>The type of the object:</td>
</tr>
<tr>
<td></td>
<td>'V' View</td>
<td></td>
</tr>
<tr>
<td></td>
<td>'R' MQT that has been used to replace the base table for rewrite</td>
<td></td>
</tr>
<tr>
<td></td>
<td>'M' MQT</td>
<td></td>
</tr>
<tr>
<td>MQTUSE</td>
<td>SMALLINT WITH DEFAULT</td>
<td>IBM internal use only.</td>
</tr>
<tr>
<td>EXPLAIN_TIME</td>
<td>TIMESTAMP NOT NULL WITH DEFAULT</td>
<td>The time when the EXPLAIN information was captured:</td>
</tr>
<tr>
<td></td>
<td><strong>All cached statements</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>When the statement entered the cache, in the form of a full-precision timestamp value.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Non-cached static statements</strong></td>
<td>When the statement was bound, in the form of a full precision timestamp value.</td>
</tr>
<tr>
<td></td>
<td><strong>Non-cached dynamic statements</strong></td>
<td>When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.</td>
</tr>
<tr>
<td>GROUP_MEMBER</td>
<td>VARCHAR(24) NOT NULL</td>
<td>The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.</td>
</tr>
<tr>
<td>SECTNOI</td>
<td>INTEGER NOT NULL WITH DEFAULT</td>
<td>The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.</td>
</tr>
</tbody>
</table>
Table 287. DSN_VIEWREF_TABLE description  (continued)

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>
| EXPANSION_REASON       | CHAR(2) NOT NULL WITH DEFAULT | This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true:
• The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES
• The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES
• The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES
This column can have one of the following values:
'A'  The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable.
'B'  The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register.
'S'  The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register.
'SB' The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register.
blank The query does not contain implicit query transformation. |

Tables that support query acceleration

To interact with accelerator servers, Db2 requires several tables that record characteristics of accelerated servers and tables.

The following table lists these tables, the table spaces and indexes for these tables, and the index fields for each index. The indexes are in ascending order, except where noted.
### Table 288. Tables, table spaces, and indexes for tables that support acceleration of queries

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Table space*</th>
<th>Indexes</th>
<th>Index fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSACCELERATORS</td>
<td>Records the characteristics of accelerator servers.</td>
<td>SYSTSACC</td>
<td>DSNACC01</td>
<td>ACCELERATORNAME</td>
</tr>
<tr>
<td>SYSACCELERATEDTABLES</td>
<td>Records the characteristics of each table that is marked for acceleration.</td>
<td>SYSTSACT</td>
<td>DSNACT01</td>
<td>CREATOR, NAME, ACCELERATORNAME</td>
</tr>
<tr>
<td>SYSACCELERATEDPACKAGES</td>
<td>Records the characteristics of Db2 packages that are bound with the QUERYACCELERATION and GETACCELARCHIVE bind options.</td>
<td>SYSTSACP</td>
<td>DSNACP01</td>
<td>LOCATION, COLLID, NAME, VERSION</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>DSNACP02</td>
<td>LOCATION, COLLID, NAME, CONTOKEN</td>
</tr>
<tr>
<td>SYSACCELERATEDTABLESAUTH</td>
<td>Records the privileges that are held by user users over tables that are enabled for acceleration.</td>
<td>SYSTSATA</td>
<td>DSNATA01</td>
<td>TCREAT, TNAME, ACCELERATORNAME, GRANTEE</td>
</tr>
</tbody>
</table>

* The table spaces listed in this table are universal table spaces (UTSs). Prior to these table spaces being migrated to type UTS, all of the catalog tables for accelerated queries used the SYSACCEL segmented table space. SYSACCEL is still supported; however, segmented table spaces have been deprecated. If you want to migrate from the single SYSACCEL segmented table space, see [Migrating query acceleration tables to universal table spaces](#).

**Related tasks:**

### SYSACCEL.SYSACCELERATORS table

The SYSACCEL.SYSACCELERATORS table contains rows that describe the characteristics of each accelerator server.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCELERATOR-NAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>A unique name for the accelerator server. This is the name by which the accelerator server is known to the local Db2 accelerated query tables.</td>
<td>G</td>
</tr>
<tr>
<td>LOCATION</td>
<td>VARCHAR(128)</td>
<td>Identifies the location name that is associated with the accelerator server.</td>
<td>G</td>
</tr>
<tr>
<td>ACCELERATORSRL</td>
<td>CHAR(64) FOR BIT DATA</td>
<td>Internal use only</td>
<td>I</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
<td>Use</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------</td>
<td>------------------------------------------------------------------------------</td>
<td>-----</td>
</tr>
<tr>
<td>ACCELERATOR_TYPE</td>
<td>SMALLINT NOT NULL</td>
<td>The type of accelerator:</td>
<td>G</td>
</tr>
<tr>
<td>1</td>
<td></td>
<td>Indicates Version 5 or earlier of IBM Db2 Analytics Accelerator for z/OS (an on-premise accelerator hardware appliance based on IBM PureData® System for Analytics and IBM Netezza® technology).</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td>Indicates IBM Db2 Analytics Accelerator for z/OS on Cloud (built on the IBM Global Cloud infrastructure and based on IBM Db2 on Cloud software).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default value is 1.</td>
<td></td>
</tr>
</tbody>
</table>

**SYSACCEL.SYSACCELERATEDTABLES table**

The SYSACCEL.SYSACCELERATEDTABLES table contains rows that describe the characteristics of each table that is marked for acceleration.

Rows in this table can be inserted, updated, and deleted.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the table.</td>
<td>G</td>
</tr>
<tr>
<td>CREATOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The schema of the table.</td>
<td>G</td>
</tr>
<tr>
<td>ACCELERATORNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>A unique name for the accelerator server. This is the name by which the accelerator server is known to the local Db2 accelerated query tables.</td>
<td>G</td>
</tr>
<tr>
<td>REMOTENAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The name of the base alias object.</td>
<td>G</td>
</tr>
<tr>
<td>REMOTECREATOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The owner of the base alias object.</td>
<td>G</td>
</tr>
<tr>
<td>ENABLE</td>
<td>CHAR(1) NOT NULL</td>
<td>Indicates whether the remote table is enabled or disabled for query acceleration:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Y Enabled</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>N Disabled</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>T Transition state. Queries are not sent to an accelerator server.</td>
<td></td>
</tr>
<tr>
<td>CREATEDBY</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The primary authorization ID of the user who created the table.</td>
<td>G</td>
</tr>
<tr>
<td>CREATEDTS</td>
<td>TIMESTAMP NOT NULL WITH DEFAULT</td>
<td>The time when the CREATE statement was executed for the table.</td>
<td>G</td>
</tr>
<tr>
<td>ALTEREDTS</td>
<td>TIMESTAMP NOT NULL WITH DEFAULT</td>
<td>The time when the table was last altered.</td>
<td>G</td>
</tr>
<tr>
<td>REFRESH_TIME</td>
<td>TIMESTAMP NOT NULL WITH DEFAULT</td>
<td>The timestamp when the data was last refreshed. If the data was not refreshed, this column contains the default timestamp ('0001-01-01.00.00.00.000000').</td>
<td>G</td>
</tr>
<tr>
<td>Column name</td>
<td>Data type</td>
<td>Description</td>
<td>Use</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------</td>
<td>------------------------------------------------------------------</td>
<td>-----</td>
</tr>
<tr>
<td>SUPPORTLEVEL</td>
<td>SMALLINT NOT NULL</td>
<td>Internal use only.</td>
<td>I</td>
</tr>
<tr>
<td>ARCHIVE</td>
<td>CHAR(1)</td>
<td>The archive status of the table in the accelerator database:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>A</td>
<td>The table is archived in the accelerator server that is specified by the ACCELERATORNAME value. The accelerator server contains active and archived data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>B</td>
<td>The table is partially archived in the accelerator server that is specified by the ACCELERATORNAME value. The accelerator server can answer queries that contain active data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>C</td>
<td>The table is archived in other accelerator servers. The accelerator server that is specified by the ACCELERATORNAME value contains only active data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>X</td>
<td>The table was restored on another accelerator server. The accelerator server that is specified by the ACCELERATORNAME value cannot answer queries.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>blank</td>
<td>The table is not archived in an accelerator server.</td>
</tr>
<tr>
<td>REMOTELOCATION</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The location of the owner table of the referenced accelerator-only table. For tables that are not referenced accelerator-only tables, this column is blank.</td>
<td>G</td>
</tr>
</tbody>
</table>

**SYSACCEL.SYSACCELERATEDTABLESAUTH table**

The SYSACCEL.SYSACCELERATEDTABLESAUTH table records the privileges that are held by users over tables that are enabled for acceleration.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCELERATORNAME</td>
<td>VARCHAR(128) NOT NULL</td>
<td>A unique name for the accelerator server. This is the name by which the accelerator server is known to the local Db2 accelerated query tables.</td>
<td>G</td>
</tr>
<tr>
<td>GRANTOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Authorization ID of the user who granted the privilege.</td>
<td>G</td>
</tr>
<tr>
<td>GRANTEE</td>
<td>VARCHAR(128) NOT NULL</td>
<td>Grantee who holds the privileges to access the table in the accelerator.</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Currently, only a location name for a referencing Db2 for z/OS subsystem is supported.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>The location name must be the name of a Db2 for z/OS subsystem that was paired to the accelerator when the ACCEL_GRANT_TABLESREFERENCE stored procedure granted the privilege.</td>
<td></td>
</tr>
<tr>
<td>GRANTEETYPE</td>
<td>CHAR(1) NOT NULL</td>
<td>Indicates the type of grantee:</td>
<td>G</td>
</tr>
<tr>
<td></td>
<td></td>
<td>S</td>
<td>Subsystem location name</td>
</tr>
<tr>
<td>TCREATOR</td>
<td>VARCHAR(128) NOT NULL</td>
<td>The schema of the table.</td>
<td>G</td>
</tr>
</tbody>
</table>
## Column name   Data type                Description                                      Use
---           -------                -------                                          -------
TNAME        VARCHAR(128) NOT NULL The name of the table.                                    G

SELECTAUTH   CHAR(1) NOT NULL    Indicates whether the GRANTEE can select rows from the table or view: G
blank        Privilege is not held.
Y            Privilege is held without the GRANT option.

GRANTEDTS    TIMESTAMP NOT NULL WITH DEFAULT The time when the GRANT statement was executed for the table. G

### SYSACCEL.SYSACCELERATEDPACKAGES table

The SYSACCEL.SYSACCELERATEDPACKAGES table contains rows that describe the characteristics of Db2 packages that are bound with the QUERYACCELERATION and GETACCELARCHIVE bind options.

Do not modify the definition of the SYSACCEL.SYSACCELERATEDPACKAGES table or its indexes unless directed by IBM Support.

<table>
<thead>
<tr>
<th>Column name</th>
<th>Data type</th>
<th>Description</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCATION</td>
<td>VARCHAR(128) NOT NULL The name of the package.</td>

<tr>
<td>GETACCELARCHIVE</td>
<td>CHAR(1) NOT NULL</td>
<td>Indicates whether a static SQL query should retrieve archived data from the accelerator instead of active data from the accelerator. This behavior can also apply to dynamic queries in the package if the package does not issue an explicit SET for the CURRENT GET_ACCEL_ARCHIVE special register. The GETACCELARCHIVE bind option does not have a default value.</td>
<td>G</td>
</tr>
<tr>
<td>N</td>
<td>NO. No static SQL query is bound to retrieve archived data from the accelerator. If the static query also is not bound for acceleration, the query is bound to run in Db2. If the static query is bound for acceleration because the QUERYACCELERATION bind option is specified, when the application is run the query is routed to the accelerator. However, the query retrieves only active data on the accelerator. Archived data is not retrieved.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Y                 | YES. If the static query is bound for acceleration, the query retrieves archived data on the accelerator when the application runs if the following criteria is met:  
  • The QUERYACCELERATION bind option is also specified.  
  • The static SQL query references an accelerated table that has partitioned data archived on an accelerator. If the static query cannot be bound for acceleration, Db2 fails the BIND or REBIND PACKAGE operation with an error message for that query. |      |

### Tables that are used for program authorization

For program authorization, a table is provided to record the authorization for a program to execute a plan.

#### Table spaces and indexes for program authorization

Tables that are used for program authorization are contained in certain table spaces and have indexes.

The following table lists the table space and index for the table that is used for program authorization, and lists the index fields for the index. The index is in ascending order.

**Table 289. Table spaces and indexes for the tables that are used for program authorization**

<table>
<thead>
<tr>

Sample user-defined functions

Some sample user-defined functions are provided with Db2. You can use the functions in your applications just as you would use other user-defined functions, or as examples to help you define your own user-defined functions.

All REST functions are created by installation job DSNTIJRF or the createUDFzOS.sql script and can be used to allow applications to access REST-based services through SQL. For all other sample functions, the following points apply:

- To use these functions in your applications: Use the functions only if installation job DSNTEJ2U, which prepares the functions for use, has been run. Because the external programs that implement the logic of the sample functions are written in C and C++, the installation job requires that your site has IBM C/C++ for z/OS. For information on installation job DSNTEJ2U, see Db2 Installation Guide.
- If you want to use these functions as examples to help you define and implement your own user-defined functions: Data set prefix.SDSNSAMP contains the code for the sample functions.
- The detailed descriptions of the functions include their external program names and specific names. The functions are in schema DSN8. The functions are defined to treat character or graphic string parameters, both input and output, as EBCDIC-encoded data.
Related concepts:
- Job DSNTEJ2U (Db2 Installation and Migration)

Related tasks:
- Defining a user-defined function (Managing Security)
- Creating REST user-defined functions (Db2 Installation and Migration)

**ALTDATE**

The ALTDATE function returns the current date in the specified format or converts a user-specified date from one format to another.

```
ALTDATE(output-format, input-date, input-format)
```

The schema is DSN8.

The ALTDATE function returns the current date in one of the following formats or converts a user-specified date from one format to another:

- `D MONTH YY`  `D MONTH YYYY`  `DD MONTH YY`  `DD MONTH YYYY`
- `D.M.YY`  `D-M-YY`  `DD.MM.YY`  `DD-MM-YYYY`
- `M/D/YY`  `M/D/YYYY`  `MM/DD/YY`  `MM/DD/YYYY`
- `YY/M/D`  `YYYY/M/D`  `YY/MM/DD`  `YYYY/MM/DD`
- `YY.M/D`  `YYYY.M/D`  `YY.MM.DD`  `YYYY.MM/DD`
- `YYYY-M-D`  `YYYY-MM-DD`
- `YYYY-D-XX`  `YYYY-DD-XX`
- `YYYY-XX-D`  `YYYY-XX-DD`

where:
- `D`: Suppress leading zero if the day is less than 10
- `DD`: Retain leading zero if the day is less than 10
- `M`: Suppress leading zero if the month is less than 10
- `MM`: Retain leading zero if the month is less than 10
- `MONTH`: Use English-language name of month
- `XX`: Use a capital Roman numeral for month
- `YY`: Use a year format without century
- `YYYY`: Use a year format with century

The ALTDATE function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTDATE function has two forms.

**Form 1: ALTDATE(output-format)**

This form of the function converts the current date into the specified format.

```
output-format
```

A character string that matches one of the 34 date formats that are shown...
above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

**Form 2: ALTDATE(input-date, input-format, output-format)**

This form of the function converts a date (input-date) in one user-specified format (input-format) into another format (output-format).

**input-date**

The argument must be a date or a character string representation of a date in the format specified by input-format. The character string must have a data type of VARCHAR and an actual length that is not greater than 17 bytes.

**input-format**

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

**output-format**

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

The following table shows the external and specific names for the two forms of the function, which are based on the input to the function.

**Table 290. External program and specific names for ALTDATE**

<table>
<thead>
<tr>
<th>Conversion type</th>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current date</td>
<td>output-format (VARCHAR)</td>
<td>DSN8DUAD</td>
<td>DSN8.DSN8DUADV</td>
</tr>
<tr>
<td>User-specified date</td>
<td>input-date (VARCHAR)</td>
<td>DSN8DUCD</td>
<td>DSN8.DSN8DUCDVVV</td>
</tr>
<tr>
<td></td>
<td>input-format (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>output-format (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>input-date (DATE)</td>
<td>DSN8DUCD</td>
<td>DSN8.DSN8DUCDCCDVV</td>
</tr>
<tr>
<td></td>
<td>input-format (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>output-format (VARCHAR)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example 1:** Convert the current date into format 'DD MONTH YY', a format that will include any leading zero for the month, the name of the month in English, and the year without the two digits for the century.

VALUES DSN8.ALTDATE( 'DD MONTH YY' );

**Example 2:** Convert the current date into format 'D.M.YYYY', a format that will suppress any leading zero for the day or month and include the year with the century.

VALUES DSN8.ALTDATE( 'D.M.YYYY' );

**Example 3:** Convert the current date into format 'YYYY-XX-DD', a format that will include the century, the month of the year as a roman numeral, and the day of the month with any leading zero.
VALUES DSN8.ALTDATE( 'YYYY-XX-DD' );

Example 4: Convert a date in the format of 'DD MONTH YYYY' to a date in the format of 'YYYY/MM/DD'.

VALUES DSN8.ALTDATE( '11 November 1918', 'DD MONTH YYYY', 'YYYY/MM/DD' );

The result of the above example is '1918/11/18'.

Example 5: Convert the date that employee 000130 was hired, a date in ISO format, into the format of 'D.M.YY'.

SELECT FIRSTNAME || ' ' || LASTNAME || ' was hired on ' || DSN8.ALTDATE( HIREDATE, 'YYYY-MM-DD', 'D.M.YY' )
FROM EMP
WHERE EMPNO = '000130';

Assuming that the HIREDATE is '1971-07-28', the above example returns: 'DELORES QUINTANA was hired on 28.7.71'.

**ALTTIME**

The ALTTIME function returns the current time in the specified format or converts a user-specified time from one format to another.

```
ALTTIME(output-format, input-time, input-format)
```

The schema is DSN8.

The ALTTIME function returns the current time in one of the following formats or converts a user-specified time from one of the formats to another:

- **H:** Suppress leading zero if the hour is less than 10
- **HH:** Retain leading zero if the hour is less than 10
- **M:** Suppress leading zero if the minute is less than 10
- **MM:** Retain leading zero if the minute is less than 10
- **AM/PM:** Return time in 12-hour clock format, else 24-hour

The ALTTIME function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTTIME function has two forms.

**Form 1: ALTTIME(output-format)**

This form of the function converts the current time into the specified format.
**output-format**
A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

The result of the function is VARCHAR(11).

**Form 2: ALTTIME(input-time, input-format, output-format)**
This form of the function converts a time (input-date) in one user-specified format (input-format) into another format (output-format).

**input-time**
The argument must be a time or a character string representation of a time in the format specified by input-format. A character string argument must have a data type of VARCHAR and an actual length that is not greater than 11 bytes.

**input-format**
A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

**output-format**
A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

The result of the function is VARCHAR(11).

The following table shows the external program and specific names for the two forms of the function, which are based on the input to the function.

**Table 291. External and specific names for ALTTIME**

<table>
<thead>
<tr>
<th>Conversion type</th>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current time</td>
<td>output-format (VARCHAR)</td>
<td>DSN8DUAT</td>
<td>DSN8.DSN8DUATV</td>
</tr>
<tr>
<td>User-specified</td>
<td>input-time (VARCHAR)</td>
<td>DSN8DUCT</td>
<td>DSN8.DSN8DUCTTVV</td>
</tr>
<tr>
<td>time</td>
<td>input-format (VARCHAR)</td>
<td>DSN8DUCT</td>
<td>DSN8.DSN8DUCTTVV</td>
</tr>
<tr>
<td>User-specified</td>
<td>output-format (VARCHAR)</td>
<td>DSN8DUCT</td>
<td>DSN8.DSN8DUCTTVV</td>
</tr>
</tbody>
</table>

**Example 1:** Convert the current time into a 12-hour clock format without seconds, ‘H.MM AM/PM’.
VALUES DSN8.ALTTIME( ‘H:MM AM/PM’ );

**Example 2:** Convert the current time into a 24-hour clock format without seconds, ‘HH.MM’.
VALUES DSN8.ALTTIME( ‘HH.MM’ );

**Example 3:** Convert the current time into a 24-hour clock format with seconds, ‘HH.MM.SS’.
VALUES DSN8.ALTTIME( ‘HH.MM.SS’ );
**Example 4:** Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds.

```plaintext
VALUES DSN8.ALTTIME('00:00:00','HH:MM:SS','HH:MM AM/PM');
```

The function returns '12:00 AM'.

**Example 5:** Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds and without any leading zero on the hour.

```plaintext
VALUES DSN8.ALTTIME('06.42.37','HH.MM.SS','H:MM AM/PM');
```

The function returns '6:42 AM'.

**BASE64ENCODE and BASE64DECODE**

The BASE64ENCODE and BASE64DECODE helper REST functions complete Base64 encoding or decoding of the provided text.

- **Tip**: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

- **text**: Specifies the text to encode or decode. For BASE64ENCODE, this argument is provided as a VARCHAR(2732) value and the function returns a Base64-encoded string. For BASE64DECODE, this argument is provided as a Base64-encoded VARCHAR(4096) value and the function returns the data as binary.

**Related tasks:**

- Creating REST user-defined functions (Db2 Installation and Migration)

**CURRENCY**

The CURRENCY function returns a value that is formatted as an amount with a user-specified currency symbol and, if specified, one of three symbols that indicate debit or credit.
The schema is DSN8.

**input-amount**
An expression that specifies the value to be formatted. The expression must be a floating-point value.

**currency-symbol**
A character string that specifies the currency symbol. The string must have a data type of VARCHAR and an actual length that is not greater than 2 bytes.

**credit/debit-indicator**
A character string that specifies the symbol that is included with the result to indicate whether the value is negative or positive. The string must have a data type of VARCHAR and an actual length that is not greater than 5 bytes. If credit/debit-indicator is not specified or is the value null, the result is formatted without an indicator symbol. You can specify the following symbols:

- **CR/DB**
  *Bank style.* Negative input values are appended with 'DB'; positive input values are appended with 'CR'.

- **+/-**
  *Arithmetic style.* Negative input values are prefixed with a minus sign '-'; positive values are formatted without symbols.

- **(/)**
  *Accounting style.* Negative input values are enclosed in parentheses '( )'; positive values are formatted without symbols.

The result of the function is VARCHAR(19).

The CURRENCY function uses the C language functions strftime to facilitate formatting of money amounts and setlocale to initialize strftime for local conventions. If setlocale fails, the CURRENCY function returns an error.

The following table shows the external program and specific names for CURRENCY. The specific names differ depending on the input to the function.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>input-amount</td>
<td>DSN8DUCY</td>
<td>DSN8.DSN8DUCYFV</td>
</tr>
<tr>
<td>currency-symbol</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| input-amount    | DSN8DUCY      | DSN8.DSN8DUCYFVV |
| currency-symbol |               |               |
| credit/debit-indicator |       |               |

**Example 1:** Express ® '-1234.56' as an amount in US dollars, using the bank style debit/credit indicator to indicate whether the value is negative or positive.

```
VALUES DSN8.CURRENCY( -1234.56, '$','CR/DB' );
```

The result of the function is '$1,234.56 DB'.

**Example 2:** Express '-1234.56' as an amount in Deutsche marks, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

```
VALUES DSN8.CURRENCY( -1234.56, 'DM','(/)' );
```
The result of the function is '(DM 1,234.56)'.

Example 3: Express '-1234.56' as an amount in Canadian dollars, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

VALUES DSN8.CURRENCY( -1234.56, 'CD', '+/-' );

The result of the function is '-CD 1,234.56'.

DAYNAME

The DAYNAME function returns the name of the weekday on which a given date falls. The name is returned in English.

The schema is DSN8.

input-date

A valid date or valid character string representation of a date. A character string representation The string must have a data type of VARCHAR and an actual length that is not greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The DAYNAME function uses the IBM C++ class IDate.

The following table shows the external and specific names for DAYNAME. The specific names differ depending on the data type of the input argument.

Table 293. External and specific names for DAYNAME

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>input-date (VARCHAR)</td>
<td>DSN8EUDN</td>
<td>DSN8.DSN8EUDNV</td>
</tr>
<tr>
<td>input-date (DATE)</td>
<td>DSN8EUDN</td>
<td>DSN8.DSN8EUDND</td>
</tr>
</tbody>
</table>

Example 1: For the current date, find the day of the week.

VALUES DSN8.DAYNAME( CURRENT_DATE );

Example 2: Find the day of the week on which leap year falls in the year 2008.

VALUES DSN8.DAYNAME( '2008-02-29' );

The result of the function is 'Friday'.

Example 3: Find the day of the week on which Delores Quintana, employee number 000130, was hired.
The result of the function is 'DELORES QUINTANA was hired on Wednesday, 1971-07-28'.

HDFS_READ

The HDFS_READ function reads data from a delimiter-separated file in the Hadoop Distributed File System (HDFS).

\[
\text{HDFS}\_\text{READ}(\text{-file-url},\text{options-})
\]

The schema is SYSFUN.

**file-url**

An expression that specifies the server address and path of the input file in HDFS. file-url is a VARCHAR(512) value.

**options**

An expression that specifies a list of name=value pairs. Each pair must be separated from the following pair by a space character. options is a VARCHAR(256) value. options can contain any of the following name and value pairs:

- **delimiter=delimiter-value**
  Identifies the character that is used as the delimiter in the input file that is specified by file-url.

- **user=user-value**
  Specifies an IBM InfoSphere® BigInsights® user name that has access to the input file that is specified by file-url.

- **password=password-value**
  Specifies the password for the IBM InfoSphere BigInsights user that is identified by user=user-value.

- **authport=authport-value**
  Specifies the port for form-based authentication of the input. The default is 8080.

The HDFS_READ function returns a table with one row for each record in the input file. HDFS_READ is a generic table function, which means that the columns in the returned table are defined when the table is referenced, instead of when the table is defined.

*Example 1:* Read an HDFS file whose URL is http://hdfssrv.svl.ibm.com:8080. The input file delimiter is a comma. Use the default authorization port. The records in the input file have two fields: a DECIMAL(8,3) field, and an INTEGER field.
Example 2: Read an HDFS file whose URL is the location to which the output of a successful Jaql query is written. That location is specified by the return-string parameter of the JAQL_SUBMIT invocation that submits the Jaql query.

```
SELECT * FROM TABLE(
    HDFS_READ(
        'http://hdfssrv.svl.ibm.com:8080',
        'delimiter=', user=biadmin password=passw0rd'))
AS T1(C1 DECIMAL(8,3), C2 INTEGER);
```

JAQL_SUBMIT

Related information:

HTTPBLOB

The HTTPBLOB REST function completes an HTTP request with the specified HTTP verb. Response messages from the server are returned as BLOB data.

<table>
<thead>
<tr>
<th>HTTPBLOB</th>
<th>(url, method, httpHeader)</th>
</tr>
</thead>
</table>

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

**url**

Specifies the URL at which to complete the request. This argument is defined as a VARCHAR(2048) value.

**method**

Specifies the HTTP verb to use. Valid values are GET, POST, PUT, and DELETE.

**httpHeader**

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>

**headerAttribute**

Specify any of the following optional attributes:

- **connectionTimeout**
  Specifies an integer value for the connection timeout threshold in milliseconds.

- **readTimeout**
  Specifies an integer value for the read timeout threshold in milliseconds.

- **followRedirects**
  Specifies whether redirects should be followed. This is a boolean value.

- **useCaches**
  Specifies whether caches should be used. This is a boolean value.

- **responseMsgFormat**
  Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:
    - SQLCODE 0
    - The error message from the server, in the following format:
      ```xml
      <error httprc="{HTTP-status-code}">
        {error-message-returned-from-server}
      </error>
      ```

- **headerAttributeValue**
  Specifies a value for the headerAttribute. Separate headerAttribute and headerAttributeValue combinations with single spaces.

- **name**
  The header name.

- **value**
  The header value.

- **<input>**
  Specifies the data to update at the specified URL. This argument is defined as BLOB(5M).

**Related tasks:**

[Creating REST user-defined functions (Db2 Installation and Migration)](#)

**HTTPCLOB**

The HTTPCLOB REST function completes an HTTP request with the specified HTTP verb. Response messages from the server are returned as CLOB data. The character set is converted into the database code page if necessary.

- **Tip:** The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.
The schema is DB2XML.

url
Specifies the URL at which to complete the request. This argument is defined as a VARCHAR(2048) value.

method
Specifies the HTTP verb to use. Valid values are GET, POST, PUT, and DELETE.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```xml
<httpHeader
  headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

- connectionTimeout
  Specifies an integer value for the connection timeout threshold in milliseconds.

- readTimeout
  Specifies an integer value for the read timeout threshold in milliseconds.

- followRedirects
  Specifies whether redirects should be followed. This is a boolean value.

- useCaches
  Specifies whether caches should be used. This is a boolean value.

responseMsgFormat
Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

```xml
<error httprc="{HTTP-status-code}"
   {error-messagereturned-from-server} />
```

headerAttributeValue
Specifies a value for the headerAttribute. Separate headerAttribute and headerAttributeValue combinations with single spaces.

name
The header name.

value
The header value.
<input>

Specifies the data to update at the specified URL. This argument is defined as CLOB(5M).

Related tasks:

[Creating REST user-defined functions (Db2 Installation and Migration)]

**HTTPDELETEBLOB and HTTPDELETECLOB**

The HTTPDELETEBLOB and HTTPDELETECLOB REST functions delete a binary or text-based resource from the specified URL through an HTTP DELETE request. HTTPDELETEBLOB returns messages as BLOB data. HTTPDELETECLOB returns messages as CLOB data. The character set is converted into the database code page if necessary.

**Tip:** The sample HTTP user-defined functions are intended to be used within Db2 SQL statements to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

### url

Specifies the URL of the resource being accessed. This parameter is defined as a VARCHAR(2048) value.

### httpHeader

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```xml
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

**headerAttribute**

Specify any of the following optional attributes:

**connectionTimeout**

Specifies an integer value for the connection timeout threshold in milliseconds.

**readTimeout**

Specifies an integer value for the read timeout threshold in milliseconds.

**followRedirects**

Specifies whether redirects should be followed. This is a boolean value.

**useCaches**

Specifies whether caches should be used. This is a boolean value.
responseMsgFormat

Specifies the header attribute value errorTagged, to indicate that when
the server returns an error message to the user-defined function, the
user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:
  `<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
  </error>`

headerAttributeValue

Specifies a value for the headerAttribute. Separate headerAttribute and
headerAttributeValue combinations with single spaces.

name

The header name.

value

The header value.

### HTTPGETBLOB and HTTPGETCLOB

The HTTPGETBLOB and HTTPGETCLOB REST functions retrieve a binary or
text-based resource from the specified URL through an HTTP GET request.
HTTPGETBLOB returns the resource as BLOB(5M) data. HTTPGETCLOB returns
the resource as CLOB(5M) data. The character set is converted into the database
code page if necessary.

**Tip:** The sample HTTP user-defined functions are intended to be used within Db2
SQL applications to access remote non-Db2 REST-based services through SQL
statements. Do not confuse them with Db2 native REST services, which supports
using a REST-based interface to interact with Db2 data from web, mobile, and
cloud applications.

```
HTTPGETBLOB(url, httpHeader)
HTTPGETCLOB(url, httpHeader)
```

The schema is DB2XML.

**url**

Specifies the URL of the resource being accessed. This argument is defined as a
VARCHAR(2048) value.

**httpHeader**

Specifies an optional header XML document. This argument is defined as a
CLOB(10K) value.

The XML header document can provide additional HTTP header values in the
following format:

```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```
**headerAttribute**
Specify any of the following optional attributes:

**connectionTimeout**
Specifies an integer value for the connection timeout threshold in milliseconds.

**readTimeout**
Specifies an integer value for the read timeout threshold in milliseconds.

**followRedirects**
Specifies whether redirects should be followed. This is a boolean value.

**useCaches**
Specifies whether caches should be used. This is a boolean value.

**responseMsgFormat**
Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:
- SQLCODE 0
- The error message from the server, in the following format:
  ```
  <error httprc="{HTTP-status-code}">
    {error-message-returned-from-server}
  </error>
  ```

**headerAttributeValue**
Specifies a value for the **headerAttribute**. Separate **headerAttribute** and **headerAttributeValue** combinations with single spaces.

**name**
The header name.

**value**
The header value.

### Examples

The examples in this section assume that the following requirements have been met:
- `db2restudf.jar` is defined in your CLASSPATH.
- The REST user-defined function (UDF) has been created.
- The server that’s specified in the SQL statement is running.

In most cases, the results that are shown are truncated to include only the relevant parts of the output.

**Example 1.** The following SQL statement retrieves data from an IBM developer community. You can use this statement to verify your configuration.

```sql
SELECT DB2XML.HTTPGETCLOB(
    CAST(NULL AS CLOB(1K)))
FROM SYSIBM.SYSDUMMY1
```

The results will contain output that’s similar to this:

```xml
<!doctype html>
<html lang="en-US">
<head>
    <meta charset="UTF-8">
</head>
```
Example 2. The following SQL statement retrieves information, in JSON format, about a book based on its ISBN identifier:

```
SELECT DB2XML.HTTPGETCLOB(
    CAST ('https://www.googleapis.com/books/v1/volumes?q=isbn:9781583478608' AS VARCHAR(255)),
    CAST(NULL AS CLOB(1K)))
FROM SYSIBM.SYSDUMMY1
```

The results will contain output that's similar to this:

```
{
    "kind": "books#volumes",
    "totalItems": 1,
    "items": [
        {
            "kind": "books#volume",
            "id": "7qGQvgAACAAJ",
            "etag": "IfzEprGDfNA",
            "selfLink": "https://www.googleapis.com/books/v1/volumes/7qGQvgAACAAJ",
            "volumeInfo": {
                "title": "DB2 12 for Z/OS--The #1 Enterprise Database",
                "subtitle": "SECURE, SEAMLESS INTEGRATION for an Analytics, Mobile and Cloud World",
                "authors": [
                    "Surekha Parekh"
                ],
                "publisher": "MC Press",
                "publishedDate": "2016-11-01",
                "de"...

1 record(s) selected
```

Example 3. The following SQL statement retrieves information from the British National Library, and the results are returned in XML:

```
SELECT DB2XML.HTTPGETCLOB(
    CAST ('http://bnb.data.bl.uk/doc/resource/007446989.xml' AS VARCHAR(255)),
    CAST(NULL AS CLOB(1K)))
FROM SYSIBM.SYSDUMMY1
```

This statement returns results that are similar to this:

```
<?xml version="1.0" encoding="utf-8"?>
<result format="linked-data-api" version="0.2" href="http://bnb.data.bl.uk/doc/resource/007446989.xml"<sameAs href="http://bnb.data.bl.uk/"
<primaryTopic href="http://bnb.data.bl.uk/id/resource/007446989"><sameAs href="http://bnb.data.bl.uk/
</item>
1 record(s) selected
```

Example 4. When you query a server that requires authentication, you can use the following syntax to specify a user ID and password:

```
WITH Authorization AS (
    SELECT DB2XML.BASE64ENCODE(CAST('<userid>:<password>' AS VARCHAR(64) CCSID 1208)) AS Authorization_Identity
    FROM SYSIBM.SYSDUMMY1
)
SELECT DB2XML.HTTPGETCLOB(
    CAST('<httpHeader><header name="Authorization" value="Basic ' || Authorization_Identity || '"
</httpHeader>
FROM Authorization
```
Related tasks:

- Creating REST user-defined functions (Db2 Installation and Migration)

**HTTPGETBLOBFILE and HTTPGETCLOBFILE**

The HTTPGETBLOBFILE and HTTPGETCLOBFILE REST functions retrieve a binary or text-based resource from the specified URL through an HTTP GET request. The resource is stored in a temporary file, and the path of the temporary file is returned as VARCHAR data. The character set is converted into the database code page if necessary.

**Tip:** The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

```sql
HTTPGETBLOBFILE (url, httpHeader)
HTTPGETCLOBFILE
```

The schema is DB2XML.

**url**

Specifies the URL of the resource that is being accessed. This argument is defined as a VARCHAR(2048) value.

**httpHeader**

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```xml
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value"/>
</httpHeader>
```

**headerAttribute**

Specify any of the following optional attributes:

- **connectionTimeout**
  Specifies an integer value for the connection timeout threshold in milliseconds.

- **readTimeout**
  Specifies an integer value for the read timeout threshold in milliseconds.

- **followRedirects**
  Specifies whether redirects should be followed. This is a boolean value.

- **useCaches**
  Specifies whether caches should be used. This is a boolean value.

- **responseMsgFormat**
  Specifies the header attribute value errorTagged, to indicate that when
the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="[HTTP-status-code]">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue

Specifies a value for the headerAttribute. Separate headerAttribute and headerAttributeValue combinations with single spaces.

name

The header name.

value

The header value.

Related tasks:

[Creating REST user-defined functions (Db2 Installation and Migration)]

**HTTPHEAD**

The HTTPHEAD REST function verifies the HTTP header for the specified resource through an HTTP HEAD request. The HTTP header is returned as CLOB or XML data.

**Tip:** The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

```
HTTPHEAD(url, httpHeader)
```

The schema is DB2XML.

**url**

Specifies the URL of the resource. This argument is defined as a VARCHAR(2048) value.

**httpHeader**

Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value" />
</httpHeader>
```

**headerAttribute**

Specify any of the following optional attributes:
connectionTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

headerAttributeValue
Specifies a value for the headerAttribute. Separate headerAttribute and headerAttributeValue combinations with single spaces.

name
The header name.

value
The header value.

Related tasks:
- Creating REST user-defined functions (Db2 Installation and Migration)

HTTPPOSTBLOB and HTTPPOSTCLOB
The HTTPPOSTBLOB and HTTPPOSTCLOB REST functions update a binary or text-based resource under the specified URL through an HTTP POST request. Response messages from the server are returned as BLOB for HTTPPOSTBLOB or as CLOB for HTTPPOSTCLOB. The character set is converted into the database code page if necessary.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

```
The schema is DB2XML.

url
Specifies the URL at which to update the data. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.
```

The XML header document can provide additional HTTP header values in the following format:
**<httpHeader headerAttribute="headerAttributeValue">**
  <header name="name" value="value" />
</httpHeader>

**headerAttribute**
Specify any of the following optional attributes:

**connectionTimeout**
Specifies an integer value for the connection timeout threshold in milliseconds.

**readTimeout**
Specifies an integer value for the read timeout threshold in milliseconds.

**followRedirects**
Specifies whether redirects should be followed. This is a boolean value.

**useCaches**
Specifies whether caches should be used. This is a boolean value.

**responseMsgFormat**
Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:
  ```xml
  <error httprc="{HTTP-status-code}">
    {error-message-returned-from-server}
  </error>
  ```

**headerAttributeValue**
Specifies a value for the headerAttribute. Separate headerAttribute and headerAttributeValue combinations with single spaces.

**name**
The header name.

**value**
The header value.

**<input>**
Specifies the data to update at the specified URL. This argument is defined as BLOB(5M) for HTTPPOSTBLOB or CLOB(5M) for HTTPPOSTCLOB.

**Related tasks:**
[Creating REST user-defined functions (Db2 Installation and Migration)](http://example.com)

**HTTPPUTBLOB and HTTPPUTCLOB**
The HTTPPUTBLOB and HTTPPUTCLOB REST functions create or update a binary or text-based resource under the specified URL through an HTTP PUT request. Response messages from the server are returned as BLOB for HTTPPUTBLOB or as CLOB for HTTPPUTCLOB. The character set is converted into the database code page if necessary.

**Tip:** The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.
The schema is DB2XML.

**url**
Specifies the URL at which to create or update the data. This argument is defined as a VARCHAR(2048) value.

**httpHeader**
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```xml
<httpHeader headerAttribute="headerAttributeValue">
  <header name="name" value="value"/>
</httpHeader>
```

**headerAttribute**
Specify any of the following optional attributes:

**connectionTimeout**
Specifies an integer value for the connection timeout threshold in milliseconds.

**readTimeout**
Specifies an integer value for the read timeout threshold in milliseconds.

**followRedirects**
Specifies whether redirects should be followed. This is a boolean value.

**useCaches**
Specifies whether caches should be used. This is a boolean value.

**responseMsgFormat**
Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

```xml
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

**headerAttributeValue**
Specifies a value for the headerAttribute. Separate headerAttribute and headerAttributeValue combinations with single spaces.

**name**
The header name.

**value**
The header value.
<input>
Specifies the data to create or update at the specified URL. This argument is defined as BLOB(5M) for HTTPPUTBLOB or CLOB(5M) for HTTPPUTCLOB.

Related tasks:
[Creating REST user-defined functions (Db2 Installation and Migration)]

**JAQL_SUBMIT**
The JAQL_SUBMIT function invokes an IBM InfoSphere BigInsights Jaql query from a Db2 application.

```
JAQL_SUBMIT(=jaql-script,return-string,url,options=)
```

The schema is SYSFUN.

**jaql-script**
Specifies a script that contains one or more Jaql queries, with or without parameter declarations. `jaql-script` is a VARCHAR(8000) value.

**return-string**
Specifies a string that is used as the returned value when the Jaql script completes successfully. `return-string` is a VARCHAR(512) value.

**url**
Specifies the URL of a Jaql server that accepts requests from the Db2 client, runs the queries that are specified in `jaql-script`, and returns results. `url` is a VARCHAR(512) value.

**options**
An expression that specifies a list of `name=value` pairs. Each pair must be separated from the following pair by a space character. `options` is a VARCHAR(256) value. `options` can contain any of the following name and value pairs:

- **timeout=timeout-value**
  Specifies the maximum time in seconds to wait for results to be returned from the Jaql server that is specified in the `url` parameter.

- **user=user-value**
  Specifies an IBM InfoSphere BigInsights user name that has access to the Jaql server.

- **password=password-value**
  Specifies the password for the IBM InfoSphere BigInsights user that is identified by `user=user-value`.

The JAQL_SUBMIT function returns a VARCHAR(512) string that contains the results of executing the Jaql script.

Example 1: Submit a Jaql script to a Jaql server. The Jaql script writes an array to a file, in delimited format. The URL of the Jaql server is http://jaqlsrv.sv1.ibm.com:8080. Do not specify the string that is to be returned if the script completes successfully. Wait for a maximum of 60 seconds for output to be returned.
SELECT SYSFUN.JAQL_SUBMIT(
    '[[15.3, 16],[170.99,180]]->
    write(del(location='''/tmp/test1.csv'''));
',
',
'http://jaqlsrv.svl.ibm.com:8080',
'timeout=60 user=biadmin password=passw0rd')
FROM SYSIBM.SYSDUMMY1;

Related information:

**MONTHNAME**

The MONTHNAME function returns the calendar name of the month in which a given date falls. The name is returned in English.

The schema is DSN8.

**input-date**

A valid date or valid character string representation of a date. A character string representation must have a data type of VARCHAR and an actual length that is no greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The MONTHNAME function uses the IBM C++ class IDate.

The following table shows the external and specific names for MONTHNAME. The specific names differ depending on the data type of the input argument.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>input-date</strong></td>
<td>DSN8EUMN</td>
<td>DSN8.DSN8EUMNV</td>
</tr>
<tr>
<td><strong>input-date</strong></td>
<td>DSN8EUMN</td>
<td>DSN8.DSN8EUMND</td>
</tr>
</tbody>
</table>

**Example 1:** For the current date, find the name of the month.

```sql
VALUES DSN8.MONTHNAME( CURRENT DATE );
```

**Example 2:** Find the month of the year in which Delores Quintana, employee number 000130, was hired.

```sql
SELECT FIRSTNAME || ' ' || LASTNAME || ' was hired in the month of ' || DSN8.MONTHNAME( HIREDATE ) || CHAR( HIREDATE )
FROM EMP
WHERE EMPNO = '000130';
```
The result of the function is 'DELORES QUINTANA was hired in the month of July'.

**TABLE_LOCATION**

The TABLE_LOCATION function searches for an object and returns the location name of the object after any alias chains have been resolved.

```
TABLE_LOCATION(object-name, object-schema, location-name)
```

The schema is DSN8.

The starting point of the resolution is the object that is specified by `object-name` and, if specified, `object-schema` and `location-name`. If the starting point does not refer to an alias, the location name of the starting point is returned. The resulting name can be of a table, view, or undefined object. The function returns a blank if there is no location name.

`object-name`

A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. `object-name` must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

`object-schema`

A character expression that represents the schema that is used to qualify the value specified in `object-name` before resolution. `object-schema` must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If `object-schema` is not specified or is null, the default schema is used for the qualifier.

`location-name`

A character expression that represents the location that is used to qualify the value specified in `object-name` before resolution. `location-name` must have a data type of VARCHAR and an actual length that is no greater than 16 bytes.

If `location-name` is not specified or is null, the location name is equivalent to "any".

The result of the function is VARCHAR(16). If `object-name` can be null, the result can be null; if `object-name` is null, the result is the null value.

The following table shows the external and specific names for TABLE_LOCATION. The specific names differ depending on the number of input arguments to the function.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object-name</code> (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTILV</td>
</tr>
</tbody>
</table>
### Table 295. External and specific names for TABLE_LOCATION (continued)

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>object-name (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTILVV</td>
</tr>
<tr>
<td>object-schema (VARCHAR)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>object-name (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTILVV</td>
</tr>
<tr>
<td>object-schema (VARCHAR)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>location-name (VARCHAR)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Example:** Assume that:
- DSN8.ALIAS_RS_SYSTABLES is an alias of SYSIBM.SYSTABLES at location name 'REMOTE_SITE'.
- The CURRENT SQLID is DSN8.

Use TABLE_LOCATION to find the location name where the base object for ALIAS_RS_SYSTABLES resides.

```sql
VALUES DSN8.TABLE_LOCATION('ALIAS_RS_SYSTABLES');
```

The result of the function is 'REMOTE_SITE'.

---

### TABLE_NAME

The TABLE_NAME function searches for an object and returns the unqualified name of the object after any alias chains have been resolved.

```
TABLE_NAME(object-name, object-schema, location-name)
```

The schema is DSN8.

The starting point of the resolution is the object that is specified by `object-name` and, if specified, `object-schema` and `location name`. If the starting point does not refer to an alias, the unqualified name of the starting point is returned. The resulting name can be of a table, view, or undefined object.

**object-name**

A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. `object-name` must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

**object-schema**

A character expression that represents the schema that is used to qualify the value specified in `object-name` before resolution. `object-schema` must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If `object-schema` is not specified or is null, the default schema is used for the qualifier.
location-name

A character expression that represents the location that is used to qualify the value specified in object-name before resolution. location-name must have a data type of VARCHAR and an actual length than is no greater than 16 bytes.

If location-name is not specified or is null, the location name is equivalent to “any”.

The result of the function is VARCHAR(128). If object-name can be null, the result can be null; if object-name is null, the result is the null value.

The following table shows the external and specific names for TABLE_NAME. The specific names differ depending on the number of input arguments to the function.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td>object-name (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTINV</td>
</tr>
<tr>
<td>object-name (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTINVV</td>
</tr>
<tr>
<td>object-schema (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTINVVV</td>
</tr>
<tr>
<td>location-name (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTINVVVV</td>
</tr>
</tbody>
</table>

Example: Assume that:
• DSN8.VIEW_OF_SYSSTABLES is a view of SYSIBM.SYSTABLES.
• DSN8.ALIAS_OF_VIEW is an alias of DSN8.VIEW_OF_SYSSTABLES.
• The CURRENT SQLID is DSN8.

Use TABLE_NAME to find the name of the base object for ALIAS_OF_VIEW.
VALUES DSN8.TABLE_NAME( ‘ALIAS_OF_VIEW’ );

The result of the function is ‘VIEW_OF_SYSSTABLES’.

TABLE_SCHEMA

The TABLE_SCHEMA function searches for an object and returns the schema name of the object after any synonyms or alias chains have been resolved.

```
TABLE_SCHEMA(object-name, object-schema, location-name)
```

The schema is DSN8.
The starting point of the resolution is the object that is specified by `objectname` and `objectschema`. If the starting point does not refer to an alias or synonym, the schema name of the starting point is returned. The resulting schema name can be of a table, view, or undefined object.

`object-name`
A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. `object-name` must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

`object-schema`
A character expression that represents the schema that is used to qualify the value specified in `object-name` before resolution. `object-schema` must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If `object-schema` is not specified or is null, the default schema is used for the qualifier.

`location-name`
A character expression that represents the location that is used to qualify the value specified in `object-name` before resolution. `location-name` must have a data type of VARCHAR (and an actual length that is no greater than 16 bytes.

If `location-name` is not specified or is null, the location name is equivalent to “any”.

The result of the function is VARCHAR(128). If `object-name` can be null, the result can be null; if `object-name` is null, the result is the null value.

The following table shows the external and specific names for `TABLE_SCHEMA`. The specific names differ depending on the number of input arguments.

<table>
<thead>
<tr>
<th>Input arguments</th>
<th>External name</th>
<th>Specific name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object-name</code> (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTISV</td>
</tr>
<tr>
<td><code>object-name</code> (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTISVV</td>
</tr>
<tr>
<td><code>object-name</code> (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTISVVV</td>
</tr>
<tr>
<td><code>object-schema</code> (VARCHAR)</td>
<td>DSN8DUTI</td>
<td>DSN8.DSN8DUTISVVV</td>
</tr>
</tbody>
</table>

Example: Assume that:
- DSN8.ALIAS_OF_SYSTABLES is an alias of SYSIBM.SYSTABLES.
- The CURRENT SQLID is DSN8.

Find the name of the schema of the base table for A LIAS_OF_SYSTABLES.

VALUES DSN8.TABLE_SCHEMA('ALIAS_OF_SYSTABLES');

The result of the function is 'SYSIBM'.

**URLENCODE and URLDECODE**

The URLENCODE and URLDECODE helper REST functions complete URL encoding or decoding of the provided text.
Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

```
<table>
<thead>
<tr>
<th>URLENCODE (text,encoding)</th>
</tr>
</thead>
<tbody>
<tr>
<td>URLDECODE</td>
</tr>
</tbody>
</table>
```

The schema is DB2XML.

text
Specifies the text to encode or decode. This argument is defined as a VARCHAR(2048) value.

encoding
Specifies the character set that is to be used. It can be set to NULL where UTF-8 is used as the default.

Related tasks:

[Creating REST user-defined functions (Db2 Installation and Migration)]

WEATHER

The WEATHER function returns information from a TSO data set as a Db2 table. The TSO data set contains sample weather statistics for various cities in the United States. The statistics are returned to the client with a row for each city and a column for each statistic. The WEATHER function is provided primarily to help you design and implement table functions.

```
| WEATHER(input-data-set-name) RETURNS TABLE ( | name-of-city |
|                                               | temperature-in-fahrenheit |
|                                               | percent-humidity          |
|                                               | wind-direction            |
|                                               | wind-velocity             |
|                                               | barometer                 |
|                                               | forecast                  |
```

The schema is DSN8.

Unlike the other sample user-defined functions, which are scalar functions, WEATHER is a table function. WEATHER shows how to use a table function to make non-relational data available to a client for manipulation by SQL.

input-data-set-name
The name of the TSO data set that contains sample weather statistics. The name is a character string with a data type of VARCHAR and an actual length that is not greater than 44 bytes.
The result of the function is a Db2 table with the following columns. Each column can be null.

- **name-of-city**: VARCHAR(30)
- **temperature-in-fahrenheit**: INTEGER
- **percent-humidity**: INTEGER
- **wind-direction**: VARCHAR(5)
- **wind-velocity**: INTEGER
- **barometer**: FLOAT
- **forecast**: VARCHAR(25)

The external program name for the function is DSN8DUWF, and the specific name is `DSN8.DSN8DUWF`.

**Example:** Find the name of and the forecast for the cities that have a temperature less than 25 degrees.

```sql
SELECT CITY, FORECAST
FROM TABLE(DSN8.WEATHER('prefix.SDSNIVPD(DSN8LWC)')) AS W
WHERE TEMP_IN_F < 25
ORDER BY CITY;
```

This example returns:

- Bessemer, MI  Slight chance of snow
- Cheyenne, WY  Continued cooling
- Helena, MT    Heavy snow
- Pierre, SD    Continued cold
Information resources for Db2 12 for z/OS and related products

Information about Db2 12 for z/OS and products that you might use in conjunction with Db2 12 is available online in IBM Knowledge Center or on library websites.

Obtaining Db2 for z/OS publications

Current Db2 12 for z/OS publications are available from the following websites:

Links to IBM Knowledge Center and the PDF version of each publication are provided.

Db2 for z/OS publications are also available for download from the IBM Publications Center [http://www.ibm.com/shop/publications/order].

In addition, books for Db2 for z/OS are available on a CD-ROM that is included with your product shipment:

- Db2 12 for z/OS Licensed Library Collection, LKxT-xxxx, in English. The CD-ROM contains the collection of books for Db2 12 for z/OS in PDF format. Periodically, IBM refreshes the books on subsequent editions of this CD-ROM.

Installable information center

You can download or order an installable version of the Information Management Software for z/OS Solutions Information Center, which includes information about Db2 12 for z/OS, QMF, IMS, and many Db2 Tools for z/OS products. You can install this information center on a local system or on an intranet server. For more information, see [http://www-01.ibm.com/support/knowledgecenter/SSEPEK_11.0.0/com.ibm.db2z11.doc/src/alltoc/installabledzic.html].
Notices

This information was developed for products and services offered in the US. This material might be available from IBM in other languages. However, you may be required to own a copy of the product or product version in that language in order to access it.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user’s responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing IBM Corporation

### Programming interface information

This information is intended to help you to code SQL statements. This information primarily documents General-use Programming Interface and Associated Guidance Information provided by Db2 12 for z/OS. This information also documents Product-sensitive Programming Interface and Associated Guidance Information provided by Db2 12 for z/OS.
General-use Programming Interface and Associated Guidance Information

General-use Programming Interfaces allow the customer to write programs that obtain the services of Db2 12 for z/OS.

Product-sensitive Programming Interface and Associated Guidance Information

Product-sensitive Programming Interfaces allow the customer installation to perform tasks such as diagnosing, modifying, monitoring, repairing, tailoring, or tuning of this IBM software product. Use of such interfaces creates dependencies on the detailed design or implementation of the IBM software product. Product-sensitive Programming Interfaces should be used only for these specialized purposes. Because of their dependencies on detailed design and implementation, it is to be expected that programs written to such interfaces may need to be changed in order to run with new product releases or versions, or as a result of service.

Product-sensitive Programming Interface and Associated Guidance Information is identified where it occurs by the following markings:

PSPI

Product-sensitive Programming Interface and Associated Guidance Information...

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered marks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at “Copyright and trademark information” at: http://www.ibm.com/legal/copytrade.shtml.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Terms and conditions for product documentation

Permissions for the use of these publications are granted subject to the following terms and conditions:

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.
Personal use: You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

Commercial use: You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights: Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM’s Privacy Policy at [http://www.ibm.com/privacy] and IBM’s Online Privacy Statement at [http://www.ibm.com/privacy/details] the section entitled “Cookies, Web Beacons and Other Technologies” and the “IBM Software Products and Software-as-a-Service Privacy Statement” at [http://www.ibm.com/software/info/product-privacy].
Glossary

The glossary is available in IBM Knowledge Center.

See the Glossary topic for definitions of Db2 for z/OS terms.
